The labor problem is one of many ramifications. The effect of seasonal employment, the determination of the best methods of performing work and thereby increasing the output of the men, means of stimulating effort by special rewards, etc., the relative adaptability of various classes of labor to the laying of rail, ballasting, section work, and other problems and the training of men and particularly of foremen, are only a few of the many important problems which this committee should undertake to study at the earliest opportunity. With the overshadowing importance which the labor problem has now assumed in engineering and maintenance of way work, it would not be surprising if the Board of Direction should find it advisable to organize one or more additional committees and to subdivide the work now confronting the committee on Economics of Railway Labor, in order that these problems may receive adequate consideration in the immediate future. The American Railway Engineering Association can perform no greater service for the railways of the United States and Canada at present than to undertake aggressively the study of the problems of labor as reflected in railway work.

The report of the committee will be presented today, and should call forth a most interesting and instructive discussion.

Somewhere in America

"What time does the next train leave?"

Agent: "Don't know; haven't heard from Mr. McAdoo this week."

Track Committee Meeting

There will be a meeting of the Track committee in the Green Room of the Congress Hotel today at nine o'clock.

Veteran Railway Man Dies

Richard H. L'Hommedieu, formerly assistant to the vice-president of operation of the Michigan Central, died at Detroit, Mich., on March 18, at the age of 68 years.

C. C. Higgins Goes With Frisco

C. C. Higgins, consulting engineer with J. W. Kendrick, Chicago, has been appointed assistant to the vice-president of the St. Louis-San Francisco, with office at St. Louis, Mo., effective March 15.

The Labor Committee Meets

Several members of the committee on Economics of Railway Labor gathered at luncheon at the Chicago Engineers' Club to discuss the presentation of their report before the convention today. Owing to the rapidity with which conditions in the labor market have changed since the completion of the report of the committee in December, this meeting was called for the purpose of considering certain revisions in the report as printed before its presentation to the convention.

Today's Convention Program

The reports scheduled for presentation at the convention today are as follows:

Electricity.

Yards and Terminals—War Emergency Yard Improvements.

Economics of Railway Labor—Illustrated Use of Labor-Saving Devices.

Ballast—Illustrated Use of Mechanical Tampers.

Economics of Railway Operation.

Uniform General Contract Forms.

Roadway.

While it is planned to present seven reports, it is expected that most of the day will be devoted to the consideration of the report on Economics of Railway Labor, including descriptions of labor-saving devices, which will be illustrated by slides. It is expected this report will create active discussion.

A Correction for Mr. Talbot

In yesterday morning's issue we stated that A. N. Talbot, professor of civil engineering at the University of Illinois, had been appointed chairman of the newly-created construction division of the War department to carry on the immense building program of the government. This information was based upon a statement appearing in the daily papers and credited to the War department. Like the report of Mark Twain's death, which he stated was "greatly exaggerated," we find that there was some confusion relative to the position which Professor Talbot had accepted. The fact is that the newly-created construction division of the War department is simply a new title for the cantonment division. Coincident with this change in title, the duties of the construction division have been enlarged somewhat. In making preparations for the immense building program of the construction division the War department called in a temporary advisory committee, of which Professor Talbot was chairman, for the purpose of considering and

advising on the methods to be pursued in the execution of this work. Professor Talbot was advised of his appointment while in New York last Tuesday and went to Washington immediately, where he conferred with the other members of the committee, completing the report in time to return to his home in Urbana, Ill., Saturday evening. We are glad to make this correction in order that the friends of Professor Talbot may be correctly informed regarding this appointment.

J. B. Jenkins Enters Active Military Service

J. B. Jenkins, valuation engineer of the Baltimore & Ohio and for several years chairman of the Track Committee, received a commission as major in the army several months ago and has recently been called into active service. This accounts for his absence from the convention for the first time in several years.

B. & B. Committee Meeting

The executive committee and interested members of the American Railway Bridge and Building Association will meet at the Congress Hotel at four o'clock this afternoon to discuss plans for the convention of this association, which will be held next October. A number of important questions are to be considered, including a possible change in the location for the meeting selected last fall.

Indianapolis Track Elevation to Be Completed

(From Our Washington Correspondent)

Director-General McAdoo yesterday ordered track elevation work at Indianapolis to be continued to completion, with some modifications of the original plans. Over \$7,000,000 have already been expended and about \$6,000,000 more will be required. The decision is based on a report made by Commissioner Harlan of the Interstate Commerce Commission.

Wood Preservers Committee Meeting

Approximately 10 members of the executive committee of the American Wood Preservers' Association took dinner together in the Delft room of the Hotel Sherman last night and discussed a number of problems confronting the association. The meeting adjourned at 8 o'clock to permit the members to attend the meeting of the Western Society of Engineers. The committee will meet at lunch tomorrow to complete the work before it.

Attendance at N. R. A. A. Exhibit

The National Railway Appliances Association exhibit at the Coliseum has been very well attended during the first two days. Visitors attending seem to be particularly interested in the exhibit of labor-saving devices. On Monday, March 18, there was a total of 2,442 visitors. This figure does not include exhibitors and their representatives. At 5:30 last night there was a total of 3,600 visitors and the total registration of exhibitors and representatives at that time was 921, making a total of 4,500 for yesterday at last year. The total number of exhibitors and representatives for last year was 1,028. The registration of roadmasters for Monday was 38 and for yesterday 91, the secretary stating this is approximately one-third better attendance than last year. The Bridge and Building Association had a total registration of 67 yesterday.

The American Railway Engineering Association Convention in Session

American Railway Engineering Association Proceedings

A Report of the Tuesday Sessions, Including the President's Address
and Several Committee Reports and Discussions

THE NINETEENTH ANNUAL CONVENTION of the American Railway Engineering Association was called to order in the Florentine room of the Congress Hotel at 9:45 yesterday morning by President John G. Sullivan, chief engineer of the Canadian Pacific, Lines West. The convention room was unusually well filled at

the time the meeting was called to order, and many other members and guests registered during the day. In order to give more time for the consideration of the reports, the reading of the minutes of the last meeting was dispensed with and the convention passed immediately to the president's address.

Address of President John G. Sullivan

Since we last met in this Auditorium, events have occurred in this country of such world wide importance that ordinary problems, business and occupations are more or less disorganized. It is therefore gratifying to see such a large assembly at this, the 19th annual meeting of your Association. It is an evidence that you have come here determined to do what you can to help solve the all important problem of winning the war. What our members are doing in the service of their Country is indicated by this Service Flag you see before you; and what your committees have done during the year you will better realize when you have the reports they are to present.

One of the most serious problems that the railroads on this continent will have to meet in the next year or so is the one of Labor. Committee No. 22, studying the question of Economics of Railway Labor, has prepared for a very full discussion of this serious problem and it is hoped that all members of the Association will be present at this discussion, beginning Wednesday morning.

On behalf of the Association your President invited the director general of railways—the Hon. W. G. McAdoo—to send a representative to take part in this dis-

cussion. The Hon. Mr. McAdoo replied in part as follows:

"While I appreciate the suggestion and recognize the value of a discussion of this character, my organization has not been expanded to a point where, at this time, anyone can be spared. I hope you will have a very successful meeting."

Your President also sent a similar invitation to the Hon. W. B. Wilson, secretary of labor, to which we have received no written reply. If, however, there are any employees from the Department of Labor at the meeting, we will be very glad to hear from them and have them enter into the discussion.

The Railway Situation and Politics

A study of the railway situation in the United States for the past 30 years indicates that the boom year for construction was in 1887, when nearly 13,000 miles of new railway was constructed. In the years 1894 to 1897 this rate of construction dropped to less than 2,000 miles per year. From 1900 to 1907 the average was about 5,000 miles per year. It gradually decreased from that time until 1917, when the construction was less than 1,000 miles. In Canada, the rate of construction from 1901 to

1904 averaged about 500 miles. This rate gradually increased until 1913 when it reached a maximum of 3,000 miles. It has dropped from that time until the present and the track mileage last year was actually decreased on account of some lines being taken up; the steel being shipped to France.

During the past ten years we have not suffered in Canada through adverse railway legislation or regulation, but on the contrary the people and the country are suffering from the encouragement of legislation to unnatural rapid development, resulting in the expenditure of enormous sums of money and the building of unnecessary railways; railways that cannot for the present, or any time in the near future, pay operating expenses, to say nothing of paying interest on the investment.

The annual report of the Department of Railways and Canals to March 31, 1916 shows, for the nine years beginning with 1907 to 1916, that the Government had expended over \$22,000,000.00 per year on government railway construction. Their working expenses during this same period have exceeded their revenue by \$2,000,000.00 and at the present time the working expenses are considerably over \$1,000,000.0 per year greater than the revenue. In addition to this expenditure made directly by the Government, the Federal and Provincial governments have guaranteed the interest on bonds up to a sum between three-quarters of a billion and one billion dollars. During this same period they have also granted large sums of money in the way of subsidies to privately owned railways; some provincial Governments going so far as to get rich contractors to organize railway companies (tempted no doubt by the bait of profits on construction) to build railways where the present railway companies of Canada could not be tempted to build, even though the bonds might be guaranteed by the Government. Would it therefore be any great surprise, if assuming this great world war was not being carried on, public opinion regarding railways as represented by legislation would not show signs of modification in Canada and if we should hear threats of anti-railway legislation of the most radical character? Nevertheless, as already explained, the railway troubles of Canada are not due any more to the efforts of railway promoters and builders than to an uninformed and over-sanguine public opinion. Is it not logical to assume that similar boom conditions existed in the United States prior to the year 1887? Then came the Interstate Commerce Commission; followed by numerous State Commissions. A study of the Interstate Commerce Commission reports show that, for the past 30 years, probably only for two or three years did the dividend paid on the stocks of the companies amount to over 5 per cent on the total stock, while for 6 or 7 years the interest was less than 2 per cent and that never in that time has over 68 per cent of the stock paid any dividend; while there were years when less than 50 per cent of the railway stock of the United States paid any dividend. These reports also show that the interest on the bonded indebtedness never amounted to 5 per cent and there was always a considerable percentage of bonds

which paid no interest. The report also shows that by either comparing the tons of freight handled, or more properly, the tons of freight carried one mile, the tonnage of the country has increased nearly twice as fast as the capital invested. These reports also show that the number of cars and locomotives in service has not kept pace with the business. We must, of course, take into account in considering this factor, the increased weight of the individual locomotives and the increased capacity of the cars. These reports also show that the miles of track have not increased anything like the rate of increase in business. More significant is the rate of increase of sidings and yards. The reports do not separate passing sidings from terminal yards and other business yards, but when one considers the necessarily large increase in the mileage of passing sidings required for an increase in

business it is almost self-evident that the increase in terminals and business tracks has not kept pace with the business. It may seem strange to you that I should bring up this subject at this time when the "house is on fire" and when the Government has stepped in and has asked all hands to lend a hand to put out the fire, making no reference to what has caused the trouble, it only being intimated by a very few discredited radicals that the railwaymen were to blame for the setting of the fire. It is generally conceded that lack of capital has been the cause of the difficulty and that capital has been frightened away by anti railway legislation and regulation. A great many are apt to blame our Governments for this condition, when as a matter of fact, it is you and I, citizens and voters of this country, (the responsible parties) who are actually to blame and it is for this reason that I have brought up the subject and wish to discuss politics. I wish to emphasize that we Engineers as a body are more to blame than any

John G. Sullivan,
President

other class of men, for the reason that we take less interest in politics than any other body.

Another reason why I wish to discuss this subject somewhat further is the fact that if we do not win this war, nothing much matters. If however, as we all hope, Democracy will come out victorious, our responsibilities will be the greater and we must meet those responsibilities with courage and do our duty as men.

To make my meaning a little more clear, I will ask you to consider how you railroad men would think the railways of the country would be managed if all the offices were filled by office seekers rather than by men chosen on account of their ability and fitness to fill the office. I venture to say that there are very few chief engineers in this room who did not protest at their first promotion or take charge of a location party or a party in construction. I further venture to say, that there is not a leading engineer in this room who at some time did not have the experience of having a rodman or stakeman mistaken for the chief of the party, and I will go further and say that if his party had been a political organization the chances are ten to one that the rodman or stakeman would have been in charge of the party. Only the other day I asked a prominent citizen of a town in Western Canada, how it happened that a certain party had been elected a Mem-

ber of Parliament. His reply was, "The other man had a larger acquaintance and was better known." Every railroadman should realize that his own welfare depends on the welfare of the country and the company for whom he is working, no matter whether he is a section laborer, chief engineer or president, and he should take the same interest in selecting representatives to the legislature who will make laws controlling the actions of the railroads, as he would in selecting directors of a railroad if he was a stockholder.

In conclusion, let me impress on you the necessity of taking an active interest in politics, not alone in going to the polls and voting for the least objectionable office seeker, but by taking an active interest in choosing the candidates and, if necessary, sacrificing time and other interests to become officers if called upon to do so, remembering that when this war is over, the responsibility placed on the voters of democracies will be greatly increased and especially so in the United States where you have gone one step further than democratic Canada and other less radical democracies, by the fact that you not only elect your legislative bodies, but you also elect your judiciary and executive officers by popular vote. And realize further, that you need honest, intelligent and capable representatives more in times of prosperity than you do in times of adversity. In the meanwhile, let us join hands with the Government, put our shoulders to the wheel and do all in our power to win this war for freedom and democracy. Then after the victory, let us not shirk our duty, but assume the responsibility of self government, making sacrifices where necessary and thereby making democracy a real success.

Report of the Secretary

The following report on the general affairs of the Association for the past year is respectfully submitted:

| | |
|--|-------|
| Number of members at last annual report..... | 1,370 |
| Admitted during the year..... | (8) |
| Deaths..... | 8 |
| Resigned..... | 29 |
| Dropped..... | 26 |
| | 63 63 |
| Net gain for the year..... | 17 |
| Total membership..... | 1,387 |

One hundred and three members of the Association are in the military service of the United States and Great Britain or with the Canadian expeditionary forces in France. Captain L. V. Manspeaker, U. S. R., died on February 9, 1918.

The losses by death during the year were as follows:

| | |
|------------------------------------|--------------|
| A. H. Stead | James Burke |
| Prof. C. L. Crandall | W. S. Dimes |
| H. A. Weaver | G. W. Beam |
| Captain L. V. Manspeaker, U. S. R. | C. F. Cotter |

By references to the Financial Statement it will be noted that the cash balance on hand at the end of the fiscal year, December 31, 1917, was \$30,894.48. The Association has subscribed for \$3,500 of Liberty Bonds and \$1,000 of the Canadian Victory Loan.

In addition to the usual number of Bulletins and the annual volume of the Proceedings, issued during the year, the General Index to the Proceedings has also been published. This latter publication will make the vast amount of data in the several volumes more readily accessible.

The reports presented for consideration by the respective standing and special committees are of great value and interest. Taking cognizance of the prevailing conditions, several of the committees have submitted information that is of distinct service at the present time.

The chairmen, vice-chairmen and members of the several committees deserve credit for the good work per-

formed during the past year, more particularly in view of the fact that such work has been performed under difficulties due to the war conditions.

Financial Statement for Calendar Year Ending December 31, 1917

Balance on hand January 1, 1917.....\$30,809.38

RECEIPTS

| Balance on hand January 1, 1917..... | \$30,809.38 |
| Receipts during 1917..... | \$29,567.86 |
| Paid out on audited vouchers during 1917..... | 29,482.76 |

Excess of Receipts over Disbursements.....\$ 85.10

Balance on hand December 31, 1917.....\$30,894.48

| | |
|--|-------------|
| Consisting of: | |
| Railroad Bonds..... | \$25,574.57 |
| Liberty Bonds..... | 2,500.00 |
| Canadian Victory Bond..... | 991.08 |
| Cash in S. T. & S. Bank..... | 1,803.83 |
| Petty Cash Fund in Secretary's office..... | 25.00 |
| | \$30,894.48 |

STRESSES IN TRACK FUND

| | |
|---|-------------|
| Balance on hand January 1, 1917..... | \$ 4,126.36 |
| Received from interest during 1917..... | 110.39 |
| Total..... | \$ 4,236.75 |
| Paid out on audited vouchers during 1917..... | 1,547.78 |

Balance of fund on hand December 31, 1917.....\$ 2,688.97

The amounts listed above are in a safety deposit box of the Merchants' Trust and Safe Deposit Company, Chicago.
Respectfully submitted,
Geo. H. BRENNER, Treasurer.

Report of the Committee on Buildings

THE COMMITTEE had no recommendations to make as to the Manual, but submitted a series of definitions pertaining to the subject of "Buildings" as a progress report. The committee also submitted a report on safety-tread devices for stations and a report on the relative merits of high and low platforms for passenger stations.

Definitions

STATION.—A building for the accommodation of passengers or freight at termini or an intermediate points.

PASSENGER STATION BUILDING.—A building serving as a starting point or stopping place for passengers.

FREIGHT STATION BUILDING.—A building used exclusively for the receipt, storage, transfer, or delivery of freight.

COMBINATION STATION BUILDING.—A building used jointly for the accommodation of passengers, and for the receipt and delivery of freight.

TRANSFER SHED.—A long platform, generally covered and placed at distributing points on a railroad system, where loads for miscellaneous destination may be redistributed into full carloads for final delivery. These are sometimes combined in a freight house layout and called transfer platforms.

TRANSFER CRANE.—A stationary crane, having side supports and bridge framed together, spanning tracks, and used to facilitate the handling of heavy commodities from cars to tracks or vice versa.

GANTRY CRANE.—A power-driven crane with supports and bridge framed together, made to travel on a level grade, spanning tracks and running parallel to same, used for loading or unloading heavy commodities.

SHOP BUILDINGS.—Various structures for the making of repairs to locomotives, engine erecting, boiler and blacksmith work, car building and repairing, dry kiln for lumber, and other branches of work.

ROUNDHOUSE.—A semi-circular building, containing locomotive stalls centering toward a turntable or yard. These houses equipped with drop pits for cleaning and repair of locomotives; truck, driver and tender wheel pits at right angles to drop pits and covering at least two stalls for dropping the several wheels mentioned. Houses are sometimes fitted with traveling or stationary cranes for removing various parts of locomotives. When a house is built in rectangular form, the name "roundhouse" would hardly apply. The name "engine-house" would no doubt be more suitable.

TURNTABLE.—A revolving platform for turning locomotives or cars.

TRANSFER TABLE.—A traveling platform driven transversely for moving locomotives or cars from one parallel track to another.

COALING STATION.—A structure or appliance for the storing and delivering of coal to tenders.

SAND HOUSE.—A structure for the drying and storing of sand and delivering same to locomotives by gravity.

OIL HOUSE.—A structure above ground or a basement pit for the storage of oil tanks containing the various oils used for locomotives, cars and shop requirements.

WATER STATION.—A large receptacle or structure, built of wood, concrete or metal, for the storage of water supplying engine tanks and yard facilities.

PUMP HOUSE.—A building at or near a water supply station, containing the pumping apparatus.

SIGNAL TOWER.—A tower or structure from which to display a semaphore or other signal or to operate mechanical signals approximately to same.

INTERLOCKING TOWER.—A tower or structure containing the mechanism for operating the switches and signals in yards when of the interlocking type.

HOSE HOUSE.—A structure containing hose and other equipment in yards or other places for fire protection.

WATCH BOX.—A shelter at a road or street crossing to protect the crossing watchman.

TOOL HOUSE.—A storage place for shelter and safety of tools or other equipment used for track maintenance.

SECTION HOUSE.—A structure for housing section foreman and family.

BUNK HOUSE.—A structure for housing track or other railway laborers.

SUBWAYS.—An underground passageway at certain types of passenger stations leading from main building across under tracks. Where intermediate platforms occur, inclines or stairways are provided, leading from the main passage up to the train floor level. By this arrangement passengers are enabled to reach or leave trains without crossing tracks. Subways are sometimes used for other purposes, such as the handling of baggage in place of stairs or inclines. Elevators are installed at certain points for raising and lowering trucks from the sub to the main floors of buildings.

STOCK YARD.—An enclosure for stock, usually built with a running board fence. The enclosure is subdivided into pens facing on alleys or runways. This runways connects up with an incline and loading platform. Pens are sometimes fitted with feeding racks and water connections for taking care of stock till ready for loading, and shipping to destination.

POWER HOUSE.—A structure containing apparatus for supplying power, air, steam and current for various purposes.

SUB STATION.—A structure containing apparatus for transforming and distributing electrical current.

WAREHOUSE.—A building used for the storage of freight.

STOCK HOUSES.—Buildings for the storage and distribution of miscellaneous materials used in railway work. Oil basements are sometimes built in connection with

storehouses. Tanks are placed in an underground basement and filled by gravity from tank cars. Oil is distributed from the main floor by self-measuring pumps.

SCRAP BINS AND PLATFORMS.—A facility for the collection of cuttings and other merchantable scrap until disposed of.

CAR REPAIR SHEDS.—Buildings grouped in connection with car repair yards for shop work of various kinds in connection with same. These buildings are sometimes built with open sides, when more than one track, house provision should be made for ample light from overhead for lighting the working space between lines of cars.

ICE HOUSE.—A structure for the storage and distribution of ice for trains or other uses and the protection of perishable freight.

OFFICE BUILDING.—A structure for the accommodation of clerical, telegraphic, engineering or other forces.

REST ROOM.—A structure containing rest and recreation rooms, sleeping quarters, lunch rooms, lockers, baths, etc., for the accommodation of trainmen and other employees at terminals.

PIER (Dock or Wharf).—A covered or open structure extending out into the navigable waterway, or parallel to the shore of same for the receipt or delivery of freight from or to vessels with tracks on or adjacent to same, where used in connection with railway terminal.

LOCOMOTIVE WASHING PLATFORM.—A slightly depressed platform under engine tracks in terminals. These are used for washing and cleaning engines, and are drained to sewer.

THAWING SHED.—An insulated, heated structure used for thawing out frozen commodities in bulk at export terminals.

MONITOR.—A raised portion of roof to obtain light or ventilation from vertical sides or ends.

PENT HOUSE.—A projection above the roof of a building to provide exit onto roof, house elevator machinery or other similar purposes.

BENT.—A structural unit in a trestle or framed structure, placed at regular intervals.

PLATFORMS.—A raised walk upon which passengers alight from railroad cars. Platforms are built of wood, concrete, brick or cinders.

SAW TOOTH TRUSS.—A special form of room construction built in bents having a vertical or slightly sloping face. This portion of bent is glazed and usually built facing the north, so as to obtain light without sun rays.

ELEVATOR.—A building used for storage, cleaning, grading and distribution of grains.

TRAIN SHED.—Usually built covering two or more tracks. Roof and sides generally fitted with skylights or prismatic skylights and slots for ventilation.

BUTTERFLY SHEDS.—Usually a one-post structure having spreading eaves with drainage sloping back to center of same.

UMBRELLA SHEDS.—Same as butterfly, but roof slopes to outer edges. These sheds are built on depot platforms between lines of track and afford only partial protection to passengers.

SCALES.—An apparatus for weighing freight and baggage. In freight houses the dial scales are generally used. They afford quick reading of weights, and tend to rapid handling of loads over scale platforms. Track scales are used for weighing loaded or empty cars.

SCALE HOUSE.—A small structure generally built in con-

nection with track pit and scales. Scale beams are brought up inside of building.

Provisions to Insure Safe Walking

in and About Passenger Stations

Avoid steps and stairways where inclines and ramps can be satisfactorily used instead. Avoid any combination of sloping surfaces and steps.

Consider both the general design and details of stairway construction with a view of handling crowds of people with the individuals moving in parallel lines with ease and with safety, against slipping and falling, keeping such movement free from interference by other lines of travel. Place important stairways conspicuously in the main line of travel, keeping such travel in straight lines where possible. Arrange so that crowds at the head and foot of stairways can naturally assemble and disperse, with a minimum amount of confusion and cross-currents of walking. To this end, provide corridors or vestibules at the top and bottom of stairways, where possible, using the same width as for the stairway. Such corridors should open directly into the room served without any funnel-shaped entrances, and with plenty of room for quick distribution. Locate minor stairways away from regular lines of travel, and avoid combinations of service or minor stairways, with main stairways. Consider possible lighting arrangements, particularly from natural light, avoiding locations where stairways will be poorly lighted in cloudy weather or where they will appear dark to a person entering them from bright sunlight.

For main stairways, use a straight run of steps and landings wherever architecturally possible. Where turns cannot be avoided, provide landings and, if possible, restrict the turn to ninety degrees.

Proportion the width according to the character of traffic handled, the extent to which hand baggage will be carried, and the maximum stairway capacity desired during rush hours. Be guided by experience with local requirements rather than by thumb rules, bearing in mind that main stairways should be maintained wide enough so as not to check the movement of crowds, and that the width of minor stairways should often be determined by the rate at which people may continue to move away from them. Bevel, or round, landings to maintain a constant width, and keep people moving in concentric, or parallel lines. Where two stairways unite at a landing and form a single stairway, make the width of the latter equal to the combined widths of the other two. For minor and service stairways, use no width less than 3 ft. between hand rails.

The pitch of stairways, i. e., the inclination as determined by the dimensions of treads and risers, and the frequency and proportion of landings, should be such that stairways may be ascended with ease, and as nearly as may be with a free natural walking step. To fix the pitch and landings properly, the following should be approximately observed:

Provide treads not over 13 in. nor less than 11 in. in width, and risers not over 7 in. nor less than 6 in. in height; and make the sum of two risers and one tread be between 25 in. and 26 in. The width of treads should be taken as the horizontal distance face to face of risers. Where stairways require more than 16 risers, provide intermediate landings, keeping the length of single flights as near to 10 or 12 risers as may be possible. Use no steps with less than three risers. Where feasible, provide the same height of risers and width of treads for all stairways used by the traveling public in any one building. Always make risers and stringers of closed construction. Make the width of landings in the direction

of travel not less than four feet. Avoid, if possible, all minor entrances on landings or at the top or bottom of main stairways. If this cannot be done, provide suitable lengths of landings, so that doors can be opened and used freely by any minor class of traffic without, in anywise, causing interference with travel at the main stairway.

Provide hand rails on both sides of all stairways and center rails on stairways eight feet wide, and additional rails to keep the distance between adjacent hand rails not less than 3 ft. nor more than 6 ft. Where intermediate hand rails are used, a double hand rail is recommended. Place center line of hand rails at least 5 in. from face of sidewalls, or 8 in. center to center for intermediate hand rails. Make section of hand rail rigid to give uninterrupted travel for a secure grip. Provide a hand rail without sharp drops or raises, extend it beyond the last riser and turn it downward so that it offers no entanglement for clothes or baggage. Curve hand rails at all bends on landings. Provide such balustrades and hand rails as will prevent small children from falling or getting through them. In this connection, consider the use of curb to divide stairs under the center hand rails. Place top of hand rail 34 in. above tread, measured on line of face of riser. On the open side of stairways, provide barriers at least 42 in. high, to guard against accidental falls of persons over the balustrade. At intermediate hand rails, provide newels not less than 6 ft. high, and secure the rails to them without encroaching on hand clearance. Provide newels which will not present sharp edges and corners.

Obtain the necessary drainage at the ends of the treads, and not by sloping the surface in the line of travel. Where used, the nosings on treads should be limited to a projection of 1 in. Provide approved safety treads on all main stairways, using a renewable type securely fastened. Make the length of safety tread 4 to 6 in. shorter than that of the stair tread, and use a width of safety tread of from 5 in. to 8 in. Place the surface of the safety tread flush with the surface of the balance of the stair tread. Consider means, such as color schemes, which, used in connection with safety treads, will clearly indicate the location of the steps, particularly the outer edge or nosing. The use of wide safety treads, particularly those covering the entire width of the step, are of questionable necessity and value, as they present a uniform appearance for the entire flight of steps, and make it difficult for people to clearly see where they are stepping.

Where feasible, enclose, or roof over, all outside stairways not only to keep off sleet and snow, but also to prevent a slippery condition, due to rain and mud. Do not provide open risers. In choice of safety treads for outside stairways, consider means which will have to be used during winter weather to maintain the surface of steps in good condition.

Place no signs, mirrors or other objects of interest where they will attract the attention of persons using stairways, except such signs as are necessary to direct travel.

In making lighting arrangements, consider that many people with poor eyes cannot, at best, see very clearly in descending stairways, particularly when the appearance of the treads is uniform throughout. Provide ample natural and artificial light, avoiding direct light and shadows, and making certain that lights from adjacent rooms do not shine directly into the eyes of people using stairways.

In the choice of materials and arrangements, consider the maintenance conditions that will exist in daily use, particularly those in wet and stormy weather just before

stairways are cleaned, and also give consideration to that poorest condition of safety tread and other parts which will exist just before renewal is required and made.

Design and Merits of High and Low

Platforms at Passenger Stations

While very few railroads in this country have adopted platforms level with the car floors, they have always been the standard in use in Great Britain.

It is recommended that the following be taken into consideration in considering the adoption of high platforms:

(1) The facility and rapidity with which trains may be loaded or unloaded.

(2) The prevention of the public crossing the track.

(3) In stations below the street level, a saving of about 3 ft. in the vertical height to be traveled by the passengers.

(4) They form a convenient place for the housing of ducts, cables, signal equipment and sometimes elevator machinery.

They have certain disadvantages when used in conjunction with our present system of terminal operation:

(1) (Most important) The cost of changing passenger equipment to serve both high and low platforms.

(2) The difficulty of trucking across the tracks.

(3) The necessity for a special form of baggage trucks having a low floor.

(4) The disadvantage of placing a switch within the limits of the platform.

The committee recommends that the Association recommend to the Master Car Builders' Association that all cars in future be so constructed that they will fit either high or low platforms.

Conclusions

1. The committee recommended that the definitions be received as a progress report.

2. It recommended that the conclusions and recommendations relative to safe walking surfaces about passenger stations be approved and published in the Manual.

3. It recommended that the conclusions regarding high and low platforms at passenger stations be adopted and published in the Manual.

The committee recommended that the other subjects be reassigned for the coming year.

Committee: M. A. Long (B. & O.), chairman; G. H. Gilbert (Southern), vice-chairman; Geo. W. Andrews (B. & O.), D. R. Collin, W. H. Cookman (P. R. R.), C. G. Delo (C. G. W.), W. T. Dorrance (N. Y. N. H. & H.), K. B. Duncan (A. T. & S. F.), C. H. Fake (M. R. & B. T.), A. T. Hawk (C. R. I. & P.), F. F. Harrington (Virginian), F. A. Harrison (A. T. & S. F.), A. Larsen (S. N. E.), J. W. Orrock (C. P. R.), S. B. Phillips (U. P.), R. V. Reamer (C. R. R. of N. J.), C. W. Richey (P. R. R.), John Schott (C. N.), Z. H. Sikes (N. Y. C.), W. J. Watson.

Discussion

M. A. Long (chairman): We have ten subjects, and the committee this year concentrated its work on subject No. 6, "Report on Safety-Tread Devices for Stations Exposed to the Elements," and on No. 8, "Report on Design and Merits of High and Low Platforms at Passenger Stations." The other subject we did work on, but these portions of the report are only offered as progress reports.

Referring to subject No. 6, I want to call attention to the fact that we have changed the title to make it broader in scope. It now reads: "Provisions to Insure Safe Walking in and About Passenger Stations." The wording "safety tread" seemed to us to touch on a small part of the subject, and therefore we have made the title broad

enough to cover the whole subject of safety walking in and about a passenger station layout. This subject was treated very fully.

We ask that the first part of the report be received and published in the proceedings. Our conclusions we recommend for acceptance and to be published in the Manual.

The President: The chairman is of the opinion that this subject has been given pretty careful consideration by the committee, and unless there is some desire to the contrary, it will be sufficient to take these as a body, and if there is no discussion you will probably suggest a motion that these be published as recommended. We will read the titles and give time for discussion. If we hear none we will assume that there is absolutely no discussion or adverse criticism. The matter of pitch and landings is rather important here, and I would like to have a little time given to that.

C. E. Lindsay (N. Y. C.): In our experience, we

have had quite a number of accidents on stairways, and our investigations disclosed that the grade of the stairway, of the flight, was the important thing. Slight variation of rise or tread did not cut so much figure as long as the nosing was in a uniform grade line. Did the committee cover that point?

Mr. Long: The committee covered that point. We canvassed the situation very thoroughly, especially in New York, and got what we found was a good average, which that recommendation will give you.

The President: If there is no further discussion, these conclusions will be adopted and printed in the Manual.

Mr. Long: Subject No. 8. This report was recommended for publication in the Manual. The committee would request that this be turned back for another year.

The President: If there is no objection the subject will be reassigned to the committee.

The committee was dismissed with the thanks of the association.

Report on Conservation of Natural Resources

THE COMMITTEE PRESENTED a digest of previous reports to show at a glance the ground which has already been covered and the more important features of the reports which have already been made. This abstract outlined the results of the committee's investigations into the subject of timber conservation, particularly including reforestation, treatment of wood, protection of forests from fire, and the utilization of the by-products of timber. This report tended to show the excessive waste which has accompanied the use of timber up to the present time.

Coal Resources of Canada

The coal reserves of Canada are considerable, but a large proportion is unsuitable for use in the ordinary way as locomotive fuel. The coals of Manitoba, Saskatchewan and portions of Alberta are lignite or sub-bituminous coal, high in moisture, and cannot be used as locomotive fuel on account of the liability of setting out fires from excessive sparking. In 1916, the railways of Canada consumed over 8,675,000 tons of coal and nearly 50,000,000 gal. of fuel-oil, both of which have, during the last few years, steadily increased in price. On account of our large imports of coal and fuel-oil, anything that can be done to increase the efficiency of generating power from coal or to economically curtail the use of fuel-oil by the substitution of Canadian coal or lower grade "sparking" fuels should be investigated and introduced as soon as possible. Coal or lignite burned in the powdered form does not produce sparks, but burns in a similar manner to a gas. During the last few years this class of fuel has been used with success in connection with locomotives, stationary boilers, and various metallurgical industries. It is anticipated that, within a short time, it will be used to a much greater extent in Canada.

Water Power for Railway Purposes

The interest which railways have in water powers may be classed as indirect and direct. The former is probably

by far the most important of the two and relates to increase in traffic brought about by the industrial development which water powers have made possible. The direct connection between railways and water powers comes through their electrification by utilizing the latter in the supply of hydro-electric energy. That main line electrification of railways has not been more extensive in Canada is not due to lack of water power possibilities, but rather owing to the more important factors connected with this question, such as amount of traffic, frequency of service, etc. Thus far, if we exclude street and suburban lines, railway electrification in Canada has been confined to serve special purposes such as in the Canadian Northern tunnel, at Montreal; the St. Clair tunnel of the Grand Trunk, and the Detroit tunnel of the Michigan Central.

While main line electrification on a large scale for purely economic reasons may yet be far remote, we may look forward to a number of possibilities in the near future from the indirect benefits of electric operation. These often are controlling in any installation, and among them may be mentioned smoke elimination in tunnels and underground terminals, overcoming the smoke nuisance on surface lines in large centers, and increased comfort, speed and attractiveness in passenger service. Whatever may be the future of electrification in Canada, and whether conditions warrant it to be effected on a large or small scale, the generously distributed water powers of this country will always be an additional incentive in any project of this character.

Considerable work has been done by the Canadian Pacific in the direction of tree planting to replace portable snow fences. This work was first carried on in the prairie provinces, and the results secured are reported as being quite satisfactory. It may be interesting to know that on a section of the Canadian Government Railways—between Campbellton, N. B., and Bathurst, N. B.—there are spruce hedges primarily planted in order to protect the track from snow drifts, and which have in the course of years not only proved effective in that respect, but have appealed to the artistic taste of travelers.

Treated Timber

One difficulty in the way of the general use of treated ties by Canadian railways is the fact that there are, so far as known, only five plants in Canada at which rail-

way ties can be given preservative treatment on a commercial scale. These plants are at Vancouver, B. C.; Transcona, Man.; Fort Frances and Trenton, Ont., and Sydney, N. S. It will thus be noted, for example, that for Quebec and the greater portion of Ontario, no tie-treating plants are conveniently accessible. From one-third to nearly one-half of the ties used in Canada are jackpine. The increasing price and decreasing supplies of accessible material of this species suitable for the manufacture of ties, are necessarily bringing about serious consideration of the use of hardwoods, including birch, maple and beech. Of these, there are very large supplies of birch available in the more northerly forests of eastern Canada. Beyond any question, the hardwoods are admirably adapted to use as railway ties, providing they are given preservative treatment. This is indicated by the fact that between two and a half and three million ties of beech, birch and maple are now used annually in the United States. The use of these species has increased rapidly, the use of birch being first reported on a material scale in 1915.

In Canada, the use of birch for railway ties is in its infancy. Experience generally appears to indicate clearly that the use of birch ties without preservative treatment is undesirable, since the life of such ties is restricted to four or five years. However, with preservative treatment, the evidence indicates that such ties will have a life of twenty to twenty-five years.

Specific information with respect to this has been secured from the New York Central and Toronto, Hamilton & Buffalo. G. W. Vaughan, engineer maintenance of way of the New York Central, reports that during the past four years the company has used about 98,000 yellow or red birch ties. All of these have been treated with creosote at a cost of approximately 31cts. per tie. Mr. Vaughan states that he considers the life of birch ties untreated to be four years and treated, about 20 years. R. L. Latham, chief engineer, Toronto, Hamilton & Buffalo, reports that his company has been using from 20,000 to 25,000 birch, beech and maple ties per annum during the past three years. Of these, approximately 40 per cent. were birch, mostly yellow birch. All of these ties have been given a treatment of approximately 2½ gal. of creosote per tie. Mr. Latham considers the average life of an untreated tie to be approximately five years and of a creosoted tie from 20 to 25 years. The experience of this company is that beech, birch and maple all take treatment nicely and give splendid service when given the proper creosote treatment.

It is believed that the railways in Canada could render a very great service in forest conservation by investigating most carefully the possible use of yellow birch for railway ties and by bringing about, in one way or another, the construction of additional plants for giving preservative treatment to ties and other timbers.

Relation of Railways to Conservation Projects

Forest fire protection is a conservation problem in which the railways are interested both directly and indirectly. Information received through the Fire Inspection department of the Railway Commission indicates that on the whole very gratifying progress has been made in the direction of reducing fire losses along railway lines, due to railway agencies. Large areas of cut-over and burned-over non-agricultural lands along railway lines throughout Canada are again growing up to young forest, and it is of great importance that such reproducing areas be saved from further damage by fire. Such a course would add greatly to the attractiveness of the country from a tourist point of view, to say nothing of reducing

damage claims and the prospect for future freight traffic when such forests reach maturity. Considering the enormous areas involved, the prospects for future freight traffic from areas now carrying young forest growth are well worth the most careful consideration. Such areas will also serve as a source of supply for cross-ties, poles, posts and other timbers necessary to railway maintenance and operation.

Scrap Reclamation

The attention of the committee has been called to recent developments in saving and using what has heretofore been considered scrap material. Among the notable examples of this comparatively new industry are the plants of the Atchison, Topeka & Santa Fe at Corwith, Ill., near Chicago; the plant of the Chicago & Northwestern at the West Chicago shops of that company, and others. Another feature of economy worthy of mention recently developed is that of repairing frogs and switches by the oxy-acetylene method. It is being successfully used by a number of railroads.

Future Work

The committee recommends that the following subjects be reassigned for the coming year.

Report on the relation of railways to the different conservation projects, reviewing work that has been done by each company up to the present time, and make recommendations on policies economical for railways to follow.

Report on measures for the conservation of human life and energy, in order to promote efficiency.

Committee: R. C. Young (L. S. & I.), chairman; S. N. Williams, vice-chairman; R. H. Ashton (C. & N. W.), W. K. Barnard, C. B. Brown (Intercolonial), Moses Burpee (Ba. & Ar.), C. H. Fisk, E. E. King, C. F. Koppisch (S. N. E.), William McNab (G. T.), J. L. Pickles (D. W. & P.), J. W. Votey (Univ. of Ver.), W. C. Willard.

Discussion

(Prof. S. N. Williams, vice chairman, read the printed statement regarding the assignment of work of the committee and continued in part as follows:)

Before passing on to the conclusions of the report, there are one or two points which I wish to present to you. In the first place, we have practically received orders throughout the nation at the present time to save. That order could not be expressed more briefly and yet fully in case we undertook to send it across the waters to some distant point on the other side of the globe.

One of the most recent movements with reference to economy is the use of pulverized coal. The daylight saving plan, which has been discussed so much during recent months, has been officially approved by the Government and will be shortly put into operation.

There is one thing I have regretted to see, and that is according to the Federal Fuel Administration, 30,000,000 tons of impurities, such as slate, rock, etc., mixed with the coal which was sold in the various states. On the other hand there is one thing which I have seen with pleasure, and that is, that the New York, New Haven & Hartford estimates that the yearly fuel saving has amounted to more than 1,300,000 tons of coal, based on comparison of actual performance of locomotives in December, 1917. The Pennsylvania lines have announced recently that they have been specializing in car conservation with excellent results, chiefly by permitting the intensive utilization of car space.

A statement is made in the *Railway Age* of January 11, 1918 that the Canadian Pacific has developed 419 ready-made farms, each complete with house, barn, fencing, well, and a portion of the land under cultivation. In

9 months it has colonized nearly 500 bona fide emigrant settlers on its lands, and deserves to be classed as a nation builder. Also it makes loans of \$2,000 to new settlers on certain lands, extends payment for all farms over a period of 20 years.

I regret very much to see that the fire losses in this country have been increasing. In the year 1917 they were \$30,000,000 more than in 1916. I do not dare to tell you what the total was.

One of our subjects is the conservation of human life. A well known statement may be quoted here—"human life and human efficiency are the two most precious things on earth." The United States Public Health Department is doing great service in the prevention of the spread of

some of the communicable diseases. In that same connection we might remember that the Bureau of Mines in Washington has done a great deal of work in spreading information as to the saving in the use of coal.

We recommend that subjects 5 and 6 be reassigned for the coming year, and that these appendices be received as information, and we regret that space did not allow a larger and more complete presentation of the subject.

(R. K. Graham (A. T. & S. F.)) gave a brief account of the reclamation work done by the Santa Fe in its scrap yard at Corwith (Chicago), Ill. He described the various buildings making up the plant and outlined the results secured. The committee was then dismissed with thanks.)

Report of Committee on Signals and Interlocking

FIVE PLATES COVERING revisions of symbols were submitted to bring the Manual in accordance with revisions adopted by the Railway Signal Association. It was recommended that these five plates of symbols, the first four of which are revisions of those now shown in the Manual, and the fifth being a new one, be adopted and inserted in the Manual in place of those now shown.

R. S. A. Specifications

The committee submitted the following list of matters acted upon by the Railway Signal Association at its convention in 1917 and adopted by letter ballot:

Text.

Alternator (Specifications).
Battery, Storage.
Alkaline, Instructions for Maintenance of.
Electrical Instruments, D. C., Specifications for Ranges and Scales.
Ground Apparatus, Made, for Lightning Arresters (Specifications).
Hand Lantern Globes (Specifications).
Impedance Bond (Specifications).
Lightning Arresters, Made, Ground Apparatus for (Specifications).
Pipe Lines, Field Construction of.
Reactors, Air-cooled, for Line and Track Circuits (Specifications).
Resistors for Line and Track Circuits (Specifications).
Switchboard Material (General Specifications).
Switchboard Material (Requisite Sheets).
Transformers, Single-phase Line, Oil-immersed Self-cooled Outdoor type (Specifications).

Drawings.

It was recommended that this list of Railway Signal Association specifications and standards be published in the Manual, as supplementary to the list heretofore inserted.

Separation of Signals Into Types

The sub-committee assigned to report on the feasibility of separating into distinct types of their own (a) the signals for train operation and (b) the marker or signs which indicate the location or position, or both, of information signs and switch signals for conveying in-

formation to trainmen, reported that some of the so-called signs govern train operation just as much as the movable semaphore of an interlocking or block signal system and that these signs are recognized in the standard code of the American Railway Association as signals. The note as to the definition of fixed signals from the rule book of the A. R. A. reads as follows: "The definition of a 'Fixed Signal' covers such signals as slow boards, stop boards, yard limits, switch, train order, block, interlocking, semaphore, disc, ball or other means for displaying indications that govern the movement of a train." Eleven designs were submitted covering the following signs: stop, speed limit or slow, resume speed, yard limit, station one mile, yard one mile, junction one mile, crossing one mile, draw one mile, highway crossing whistle post, flanger sign.

The sub-committee was not ready to report on the switch target, derail sign and trackpan sign. It was recommended that the signs submitted be adopted and included in the manual. It was recommended by the committee that the report on the comparative merits in various locations of alternating current and direct current for operation of automatic signals be discontinued, as it was agreed the comparative values of the two systems depend entirely upon local conditions.

Recommendations for Next Year's Work

The committee considers that no further work can be done on the investigation of the relative merits in various locations of alternating current and direct current for the operation of automatic signals, and recommends that same be considered closed.

It further recommends that the following subjects be continued:

1. Make critical examination of the subject-matter in the Manual and submit definite recommendations for changes.
2. Report on the problem of signaling single-track roads with reference to the effect of signaling and proper locations of passing sidings on the capacity of the line.
3. Report on the specifications adopted by the Railway Signal Association, which, in the judgment of the committee, warrant consideration, conferring with the committee on Track on any appliances affecting track.
4. Report on the desirability of providing in connection with an automatic signal system:
 - (a) An overlap.
 - (b) Approach restricting speed indications.
5. Report on the various types of light signals for day and night indications.
6. Report on the feasibility of separating into distinct types of their own, the signals for train operation, and the

markers or signs which indicate the locations or position, or both, of information signs and switch signs for conveying information to trainmen, and design suitable day and night (if necessary) markers or signs for switches, derailing switches, stop signs, slow signs, resume speed signs, water station and trackpan markers, highway crossing sign, etc.

7. Report on requisites of signal locations for automatic block signals for single-track roads.

8. Report on automatic train control.

10. Report on applications of aspect indicating that train must take siding at a non-interlocked switch.

Committee: J. A. Peabody (C. & N. W.), chairman; W. J. Eck (Southern Ry.), vice-chairman; Azel Ames, C. C. Anthony, H. S. Balliet (N. Y. C.), A. M. Birt (N. P.), C. A. Christofferson (N. P.), C. E. Denney (N. Y. C. & St. L.), F. L. Dodgson (G. R. S. Co.), C. A. Dunham (G. N.), W. H. Elliott (N. Y. C.), G. E. Ellis (I. C. C.), M. H. Hovey, J. G. M. Leisenring (I. T. Co.), H. K. Lowry (C. R. I. & P.), J. C. Mock (M. C.), F. P. Patenall (B. & O.), A. H. Rudd (P. R. R.), W. B. Scott (S. P.), A. G. Shaver, T. S. Stevens (A. T. & S. F.), W. M. Vandersluis (I. C.), B. Wheelwright (G. T.).

Discussion

J. A. Peabody (chairman): Our committee were assigned 10 subjects, on which we are giving definite reports on four. Instead of going through these generally to start with, I will take up each one individually. First, the revision of the Manual.

(This was accepted and approved for publication in the Manual.)

Mr. Peabody: In part 2, report on handling signaling and proper location of sidings on single-track roads, we simply report progress. We have made considerable progress on this subject, and were able to make our report to the Signal Association, which will be reported to this association next year.

The next report on subject number 3, report on specifications adopted by the Railway Signal Association, we submit in Appendix B and move that this be printed in the Manual as information.

C. A. Lindsay (N. Y. C.): At the last convention we established a precedent in this regard, in the acceptance in blanket of the recommendations of the Railway Signal Association. I have the highest respect for the work done by that association, and ordinarily this association can accept most of its conclusions without questions.

It seems to the Committee on Outline of Work that it would be wise before accepting the entire blanket that now and hereafter recommendations of the Railway Signal Association be received and submitted to such a committee as may seem proper, for the purpose of criticism and report at the following convention. I move that this report be received for printing in the Manual subject to the criticism of such committees as the Committee on Outline of Work may deem necessary.

Mr. Peabody: It hardly seems to me that that is necessary, inasmuch as we are submitting this question as information to the members, and not to be adopted as standard by this association.

Mr. Lindsay: Our association does not adopt standards, and the Manual has a certain prestige, and carries with it the approval of this association of everything that is printed in the Manual. I think we ought to be very careful, and I think the Committee on Signals ought not to object to having its work reviewed by the other committees.

C. W. F. Felt (A. T. & S. F.): I think it is therefore desirable to follow the course outlined by Mr. Lindsay.

Mr. Peabody: It may clear the atmosphere a little if I read the title under which this appears in the Manual.

It reads: "List of the findings, conclusions, standards and specifications contained in the Manual of the Railway Signal Association." That does not in any way make this association responsible for these findings. It is simply put there as a convenience for the members of this association in finding this information.

Mr. Lindsay: If we are to take that attitude, that the word of the Railway Signal Association is the last word on signal appliances of all kinds, we might as well not have any Signal Committee.

(After further discussion of this matter, a motion offered by Mr. Lindsay, that the information in appendix B be submitted to the committees interested, and next year again brought before the association with the approval of these committees, was carried.)

(Mr. Peabody here read paragraph 6 of the preliminary portion of his report and also appendix 6 in full.)

W. C. Cushing (P. L. S. W. S.) said in part:

"I am at variance with the committee in its initial point with reference to its report on the feasibility of separating into distinct types of their own; the signals for train operation, and the markers or signs which indicate the location or position or both, of information signs or switch signals for conveying information to train men."

After presenting an analysis of the status of a fixed signal as outlined in the Standard Code and a discussion of the purpose of the various signs in the control of train movements, Mr. Cushing continued:

"It seemed very desirable to me, therefore, to have all of these signal adjuncts of a different form from the main signal system, and as that main signal system is very generally of the semaphore type, it seemed best to have all of the other adjuncts of a different type."

"I do not like the use of the semaphore arm for slow and stop posts at railroad crossings, and for track men when carrying on track work, and for switch signals, etc. They are all fixed in position and the stop post must always be passed in the stop position, whereas the general idea and plan of the semaphore signal is one whose aspects can be changed in order to indicate different train movements."

J. L. Downs (I. C.): This subject is an old one and it is one in regard to which many experts differ. All signs affect train movements to a greater or less degree. The fixed signal in a permanent "stop" position is just as important as any semaphore movable signal that would be at "stop" when stop is desired or "proceed" when proceed is desired. Therefore, it may seem to some that it should carry the same design as the other signals. I am in favor of Mr. Cushing's motion that this matter be deferred until it is gone into more by the association before it is finally adopted.

J. C. Mock (M. C.): The desirability of classifying into their various uses these signals is not, as indicated, a very easy distinction—there are some of them that are on the border line between the one and the other classification, whatever basis you assume for the classification.

The definition of a fixed signal is one of fixed location, which indicates a condition affecting the movement of a train. Very clearly these first three signals do affect the movement of a train. If it were not for the fact that they are a permanent location, giving only one indication, they might quite properly be made to conform to the ordinary semaphore arm indication, and I think very properly, because they do affect the movement of the train just as truly as any signal. The other signals, with the sign in the middle standard, are more nearly information signs, and may not affect the movement of the train; they are too far distant to require any action at

that location, but they invariably will be followed by a signal that does affect the movement of the train.

I think in the past there has been effort made in designing signs of this class or signals, to reduce the lettering to the minimum. In other words, we have here a stop signal lettered stop, whereas the idea as I took it was that we might get away from lettering. The same method has been carried all the way through, and in view of that fact I want to submit the amendment that this matter be referred back to the committee for further consideration on this point.

Mr. Lindsay: As railroading work has developed, we have gotten away from the idea that we must never pass a red blade wherever it is exposed, because we do it every day, mile after mile, train after train. Perhaps Mr. Cushing's objection to the shape of the stop sign might be overcome if we would make a pointed stop and proceed sign. The slow speed sign and the resume speed sign are of great importance with us, and we have adopted a sign that shows reasonably well in daylight and is illuminated at night, with perforated lettering on the front.

My objection to the arm signs is comparatively trivial, but where a yard limit at a junction and a crossing and a drawbridge are all together, near to a station, the place would look like a graveyard. Would not it be possible to have the lettering for those signs put on one sign, so that one stencil can be made to take care of all of them?

Mr. Stevens: It is probably proper that the action suggested should be taken, but the committee will be at a loss to present anything which means exactly what the signs mean that they have presented. They can present you a horizontal board with the word "stop" painted in red, or several different schemes of that kind, which will all mean that a train must stop at that particular point, and do certain things after it has stopped that the rules provide for.

The same argument applies to the 45-deg. sign marked 25 and 15. You can install a horizontal yellow board, or you can mark a horizontal board "slow" and put these numbers on, or you can install the sign as suggested by this committee, which is the almost universal method of indicating caution, or some form of reduced speed.

The same thing is true for the resume speed sign, and the effect on the train will be absolutely the same. It will take permission at that point to resume whatever speed is allowable.

We get away from the daylight sign and come to tackle the night problem, and here is where the difficulty comes in again with getting away from signal colors, because you have only three, red, yellow and green, that you can use satisfactorily. Lunar white, perhaps, is a possible color. But directly you get into the illumination of the signs, you must use the same things that are used on the movable semaphore arms. So I think if those things should be referred back to the committee, it is questionable whether they could submit something else to the association to which there would not be objection.

Louis Yager (N. P.): It seems to me that the association ought to act on this suggestion, that the committee has taken upon itself, to utilize the characteristic aspect of signals, but for the immovable fixed signal, it seems to me that is a step that is to be taken. It will not do any good, as I see it, to submit this back to the committee unless they get some intimation as to how the association feels on the point.

L. M. Perkins (N. P.): I understand this motion to refer this back to the committee will first come to a vote, and I hope it does not pass. I would offer an amendment to that motion, that it be referred for revision in details, and not in general shape. (This was not seconded.)

Mr. Patenall: I would like to point out one factor that must be considered under the field of signaling. If you adhere to various designs of markers by day, do not forget that you cannot have that shaped light at night.

Mr. Cushing's criticism is really the most constructive that we have heard to-day, although I am sorry I cannot align myself in his favor. The appearance of the first three signs would probably portend a simple design. At the same time there is a wonderful difference as to what the engine man is to do. It is not the position that would show that indication of what he is to do, and for that reason there seems to be so little conflict in the designs that we submit in comparison with signals with operative arms, that there is a very small amount of criticism in that direction.

(Mr. Cushing's amendment to the original motion, that the matter be referred back to the committee for further study, failed to carry. The original motion, that the information be adopted and printed in the Manual, was carried. The committee was then dismissed.)

Report of Committee on Rules and Organization

FOR FIVE SUCCESSIVE YEARS the directors have assigned to the committee on Rules and Organization the study of scientific management. Throughout this time very little has been done, apparently, because of a lack of interest on the part of the Association. A thorough and exhaustive consideration and discussion should be had of the necessity and the utility of organization. A like treatment should then be given to the resources which may be used in its development. Having shown the need and discovered the resources, attention should be given to their application and a means of solution presented for any specific problem.

It is hoped that some interest may be aroused among the members and a discussion started which will bring forth a series of monographs. Out of the abundant experience and careful thought of our members we should give freely to the world in its hour of trial. The discussion in the beginning might well be abstract and scientific.

At a later date it should pertain directly to the practical and important application of scientific principles to railroad operation. It will be conceded that a careful study of the subject in the unrivaled manner available in our society will achieve far better results than individual study, and no better justification for our being exists at present. To facilitate the study and discussion, the committee submitted a bibliography in which one can readily find abundant information and suggestions for various methods of treatment. Charts have been secured illustrating the maintenance organizations on many of the leading roads. These charts can be furnished by the committee on request, and if desired they may at a later date be published in a Bulletin.

Committee: Jos. Mullen (C. C. & St. L.), chairman; F. D. Anthony (D. & H.), vice-chairman; O. F. Barnes (Erie), W. C. Barrett (L. V.), L. L. Beall (A. B. & A.), H. L. Brieve (C. R. I. & P.), J. B. Carothers (C. F. & F. W.), S. E. Coombs (N. Y. C.), E. J. Correll (C. H. & D.), Curtis Dougherty (Soo),

H. H. Edgerton (C. G. W.), W. H. Finley (C. & N. W.), B. Herman (Soo), A. J. Himes (N. Y. C. & St. L.), F. D. Lakin (Erie), B. M. McDonald (N. Y. C.), H. A. Osgood (Wab.), F. T. Reisher, W. H. Rupp (G. T.), P. T. Simons, R. B. Warden (M. P.).

Discussion

(In the absence of the chairman, the report was presented by A. J. Himes [N. Y. C. & St. L.].)

Mr. Himes: There is one subject of more than ordinary interest at the present time, to which the committee has given attention during the year—"The Science of Organization." However, the committee has been busy with other work during the past year, and there appears to have been no demand for a report on the science of organization, and so it has been put aside from time to time for what seemed to be more pressing work.

Certain matter in appendix A suggests the idea that it may be possible, when we have given a sufficient amount of study to the subject of administration and organization, to have a field book covering the subject, enumerating the principles, and stated rules which can be profitably studied and used in great organizations to learn the way more quickly and more perfectly than is done usually in a brief experience.

The bibliography which is presented has been compiled from the library of the American Society of Civil Engineers, and from the New York public library. There are many good books not found in this list, some of them of recent date, which will be added thereto.

It is probably worth while to call attention to the difference between scientific management and scientific organization. I have synopses of four or five different books, among which is "The Principles of Scientific Management," by Frederick W. Taylor, another by Major (now Colonel) Hine and one by Harrington Emerson. These men are all talked of, and I want to point out that whereas Emerson and Taylor gave us scientific management, and the efficiency of the individual, Hine deals with the efficiency of the organization, two things which are very distinct and quite opposite to one another.

Both Taylor and Hine have in mind the elimination of the friction and loss of efficiency due to the chain which commonly prevails between the primary units of an organization and the principal officers.

We have, of course, to consider and compare the divisional and departmental organizations, line and staff, Hine's unit system and all other forms that may be presented by the different roads represented in the Association and these forms of organization which have been collected by the committee. We have a very great many which I hope some day to put into your hands, so that they may be compared, and it is very much desired that you will all contribute your experience and knowledge.

I want to call your attention further to the type of organization which pervades our thought, to which we, perhaps most all of us, would unhesitatingly subscribe our approval, and to suggest that you give it some careful thought. That is, a single-headed organization of dominant leadership.

Now, are we right about that? Things are undergoing a change, and to compare with that we have the representative organization in which the interests of the primary units shall be paramount. Now, what do you think about that, or, did you ever think of it at all? Is it possible that we shall have an efficient executive organization in which the leadership shall be representative and responsive to the primary units of the organization?

The President: Just at the present time, when the world has had a great lesson in what organization can do, this committee certainly can do a great and wonderful work, and I think that Mr. Himes has outlined a possibility of work that we should all take to heart, and anything we can do in furthering that interest we should do, and what we should do is to study. We have too many organizations to say that any one of them is perfect. We should make a study of them, and as Mr. Himes says, if we condense the information we get from the study of them we will get some good results.

(The committee was dismissed with thanks.)

Report of Committee on Water Service

A CONSIDERABLE NUMBER of changes in the Manual were recommended for adoption. These changes consisted principally of revisions in wording to clarify the meaning. They referred to definitions of scale-forming materials, to methods for the removal of these objectionable ingredients, and to definitions of foaming and means of eliminating or reducing it.

The committee also presented reports on five other subjects, Federal regulation of drinking water, relative merits

of continuous and intermittent water softeners, rules for the care of boilers, organization of the water service department and definitions of terms used in railway water service.

Complying With Federal Regulations in Regard to Purity of Drinking Water Supplied to Trains

The Public Health department now has seven cars fitted as traveling laboratories for checking the quality

of water supplies, but these of late have been used mostly for military purposes. The establishment of additional headquarters for the various sanitary districts has also been delayed on account of the fact that many men trained in this work are now being engaged for work for the army.

The principal steps in advancement were the adoption of new standard methods of analysis, and an amendment to the regulations pertaining to drinking water supplies, requiring a certificate showing not only that the water conforms to the bacteriological standards as outlined in last year's report, but also that it is from a supply which is not exposed to contamination. This enlarges the scope of the regulations and assures a greater probability of a suitable water being furnished than could be expected under a semi-annual bacteriological test alone. The sanitary survey governs features in connection with the matter of water supply which in a great measure are susceptible to correction and control.

It is contemplated by the Public Health department to call a conference in the near future of the State Health authorities for the purpose of standardizing water inspections as well as to define the requirements in source and method of supply. If it is the pleasure of this Association, the committee will be pleased to report on the engi-

neering and maintenance matters of interest brought out at this meeting.

Relative Merits of Continuous

and Intermittent Water Softeners

A survey of the field indicates that there are now in service on American railroads, approximately 550 water-softening plants, at which about 30,000,000,000 gal. of water are softened annually. In addition to this a large amount of water is partially treated in roadside tanks with soda ash alone, with no allowance for sedimentation. The total amount of water consumed annually for steam purposes by these railroads is approximately about 450,000,000,000 gal., or nearly 6.7 per cent. of the total water used for steam purposes is completely treated. The continuous type of plant seems to predominate, about 70 per cent. of the total number of plants installed being of that character.

As to the comparative economy of continuous and intermittent plants, the operating costs seem to be very nearly the same in well-designed plants of both types. The amounts of chemicals required should be the same in either type, although improper design in the agitating facilities of some types has been found to allow a part of the lime reagent to settle into the sludge before reaction has taken place. Investigation as to running repairs required indicates that these are so largely influenced by the design and location of the plant and the daily attention given to its operation that no general comparison of the two types can be made on this basis. The labor cost generally should also be the same, as with any type of treating plant in railroad service, the constant attention of a man is highly desirable and decidedly economical. There seems to be little difference in the fuel or power item, although conditions vary in different localities. The large variety of type of the many plants installed precludes a general comparison as to interest and depreciation.

The following are the general advantages of the two types:

Intermittent

1. The most advantageous arrangement for an intermittent plant consists of two settling tanks of road tank height, to serve alternately as treating and settling tanks. This arrangement provides duplicate tank facilities and increased the ratio of storage capacity to daily consumption.

2. The intermittent plant is of the most simple construction and its operation is readily understood by the low paid class of service usually engaged for this work.

3. The cost of maintenance of the type of intermittent plants generally in use is small, the necessary repairs simple, and the materials for making them readily available.

4. The uniformity of treatment is certain, large amounts of water being treated at a time, and the opportunity for error is slight.

5. The intermittent plant has no intricate or expensive parts to deteriorate, as are frequently present in some continuous types.

6. A portion of the old sludge remains in the tank and is mixed with the water on each addition of reagents. This acts as a foundation for the newly formed molecules of sludge, causing precipitation in larger particles, and thereby hastening the settling.

Continuous Type

1. In large plants, the continuous type can be designed to afford more economy in ground space.

2. It will handle a larger volume of consumption on a smaller rate of flow, since the action is continuous and there is no dead time for settling.

3. Where the pumping station is located at some distance from the delivery tank, some types of continuous plants adjacent to the point of delivery are advantageous.

4. At terminals, or where proper attention can be given to the plant at stated periods, attendance at continuous plants can be performed more readily by employees engaged primarily in other duties, but this brings uncertain results due to divided responsibility, and is, therefore, of doubtful advantage.

5. In a certain type of continuous plant, very thorough and gradual mixing is secured by introducing the water and reagents at the bottom of the mixing tank and keeping a portion of the old sludge continually agitated with the incoming mixture, thereby aiding reaction and sedimentation.

Rules for the Care of Boilers in Pumping Stations

Duties of Attendant: The pumper, station agent or other person in charge of the local water supply will be held responsible for the condition of the entire plant. His first duty will be to see that there is an ample supply of water available for locomotive use at all times. In case of trouble that affects the water supply he must wire the chief dispatcher as well as the water service foreman, stating fully the trouble and what is needed for repairs. He must make frequent inspections of all parts of the plant, make all repairs within his power and avoid sending for repair man except when absolutely necessary. He will be responsible for the safe-keeping and economical use of supplies furnished to the water station and place orders for fuel and supplies in ample time to avoid a shut-down of the plant.

Pumphouse: The attendant must keep the pumphouse neat and clean and take every precaution against loss or damage by fire. Waste or other combustible material must not be stored in the pumphouse. Oil and gasoline must be stored outside in proper receptacles. Cinders must not be dumped close enough to the house to endanger it. Proper places must be provided for all tools and they must be returned to their proper places after using.

Machinery: Machinery must be inspected daily and adjustments made to increase its efficiency and to prevent wear or breakdown. Particular attention must be given to the packing and lubrication of all parts. The attendant must be familiar with the location and purpose of all steam and water pipes, valves, levers, etc., so that in case of accident or leaks the valves controlling same may be properly used. When ordering repair parts for any piece of machinery the attendant must always give the name of manufacturer, shop number of the machine and repair number of the part wanted.

Boilers: Attendant must see that the boiler contains a sufficient amount of water before starting a fire and shall see that the gage-cocks, water glasses and safety valves are clean and in good condition. Fire must be cleaned frequently of clinkers. Ashes must not be allowed to accumulate beneath the grate. If muddy water is used, boilers must be blown down frequently. In doing this, boiler must be filled full of water and blown down to one gage with not over 30 lb. of steam. Foaming is due to a dirty boiler and can be stopped by blowing down and filling with fresh water. The boiler must be washed out once a week or oftener if, in the judgment of the water service foreman, it is necessary. Flues must be cleaned of ashes and soot frequently. If it develops, when the plant is operating, that no water appears in the water

glass the valve below the water column should be opened. If water then appears, the flow to the boiler can be increased; if not, fire must be pulled and boiler cooled before turning any water into the boiler. Where more than one shift is in charge of the pumping plant each oncoming man should be notified of any defects by the man leaving. Should the safety valve stick and steam gage show over-pressure, draft doors should be closed and boiler allowed to cool off to pressure at which valve is supposed to work before any repairs or adjustments of the safety valve is attempted.

Oil Engines: The attendant must be provided with a copy of and must be governed by the manufacturer's printed instructions for operating the particular type of engine in his charge. To secure economical and satisfactory operation, engines must be properly lubricated, the attendant must see that all moving parts are free from dirt, properly oiled and work easily. Lubricating oil must be fluid enough to be fed readily through the oiler. When the oiler is filled the lubricating oil should be run through a fine mesh strainer inserted in a funnel. The cover of the oiler should be in place at all times except when filling it. The oiler should be drained occasionally and washed out with gasoline. This applies also to the bearing oil cups. The machinery to be driven should be detached from the engine until the engine is in motion.

Before starting see that the tank contains fuel and that a supply of cooling water is available. Thermometers are frequently provided which show the temperature of the cooling water around the cylinder. When running the thermometer should register 140 to 180 deg. F. The most favorable temperature will be different with different fuels and the attendant should note the temperature at which the operation is best and attempt to keep it reasonably close to that figure. The temperature can be held at that point by regulating the supply of water to the cylinder jacket by means of the valve provided for that purpose. The pump, piping and water jacket of the engine must be drained when the engine is not in use to prevent freezing and cracking of the cylinder.

Fuel for an oil engine should be strained at the time the storage tank is filled. In some types of engines fuel is injected into the cylinder through a spray nozzle. Irregular operation may be caused by foreign matter in the oil sticking in the spray nozzle or in the check valve in the injector pump. The small hole in end of spray nozzle must be cleaned occasionally.

If a loss of compression is noticed, the piston should be inspected. The piston rings should be free in their grooves. If they stick, the compression or explosion will blow past them and the combustion will be poor, due to poor compression. Any accumulation of carbon which tends to stick to the rings should be washed out with gasoline.

Water Tanks: They should be filled at each pumping to prevent shrinkage of the wooden tanks, or deterioration in the sheets of metal tanks, as well as to safeguard the water supply in case of accident to the pumping plant. Tank spouts and grab ropes must be maintained at standard clearance. Defects in spouts, valves or discharge pipes must be reported at once. The attendant must watch engines take water and report unnecessary waste. Damage to fixtures or appliances by engines taking water must be reported to the water service foreman, giving date, train and engine number.

Water Columns or Stand Pipes: Water columns should be inspected frequently and maintained in good working order. Lifting rods should be tightened, leaky glands repacked and locks and rollers adjusted. On

double track, water column should be swung in the direction of traffic and locks maintained in such position that they hold the water column parallel to the track.

Electric Motor: The motor, control and pump should be inspected at least once each week, at which time the parts should be thoroughly cleaned and all contacts should be carefully inspected to see that they make and break at the proper time and that contact surfaces are clean. All wearing parts should be well lubricated and special attention should be given to the motor bearings. The building where the motor is located should be kept clean. No paper or oily waste should be allowed to collect in switch boxes or near a motor or any electrical contact or wires.

Waste must not be used around the commutator or brushes and gasoline or sandpaper must not be used to clean the commutator. If the motor sparks excessively the proper official should be notified.

The motor should be watched carefully for overheating. The commutator should not be allowed to be come worn or grooved by the brushes.

Any displaced wiring must also be reported. No attachments should be made to the wiring as serious damage may be done to the equipment and there is danger of personal injury. A fuse must never be replaced with anything but a proper fuse. If one of a higher ampere rating is used it may cause serious damage to the motor. The fuse is the electrical safety valve and should no more be tampered with than a steam safety valve. A test lamp should be used to find blown fuses, thus avoiding chances of electric shocks. A gage should be supplied to each alternating current motor to test the space between motor and field poles. If gage will not pass freely the bearings need immediate attention.

On pump motors controlled from a distance, the remote control starter located in the pumphouse should be tested frequently to see that it starts the motor properly. It should be inspected frequently and any badly burned contacts reported.

Organization for Railway Water Service Department

Establishing a water department organization does not necessarily mean that the division forces are materially changed where water service men are locally employed,

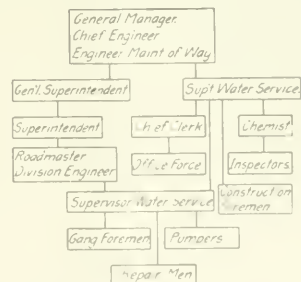

Diagram of Suggested Organization

but that the local officers and the engineering department are relieved of the duties incidental to the design and development of water facilities and the work placed in the hands of those trained along this particular line. That there is an urgent need for such an organization has been proved by the results obtained on roads that have established a department to handle this very important feature of railroad operation.

Inquiries as to the method of handling water supply were sent out to a number of railroads. Replies were

received from 38 railroads representing a mileage of 136,991. The total number of water stations was 7816. Of roads reporting seven have separate water departments, while on 20 roads the water supply is handled by the bridge and building department; on eight roads by the divisional water department, and on three roads jointly by the maintenance of way and motive power departments.

The graphical chart submitted herewith represents a complete water department organization and may be readily adapted to any road with such modifications as may be necessary for a road of greater or lesser mileage. For example, where there are no treating plants in service the work of making water analysis would probably come under the engineer of tests or outside chemists, rather than a department chemist.

The chart submitted represents the best practice in present water department organization on American railroads, and while it is not exactly typical of any particular water department organization, the committee feels that it embodies the best features of the existing water department organization.

Definitions of Terms Used in Railway Water Service

Group "A"—Wells

ARTESIAN WELL.—A flowing well from which the water is caused to rise above the surface of the ground by subterranean pressure.

DEEP WELL.—A well having a depth of 100 ft. or greater.

SHALLOW WELL.—A well less than 100 ft. in depth.

DRILLED WELL.—A well made by drilling or boring.

DRIVEN WELL.—A well constructed by driving the casing and then removing the material inside the casing.

DUG WELL.—A well made by digging or excavating.

WELL CASING.—A pipe forming the wall of a well.

WELL SCREEN.—A perforated device, usually a slotted or wire-wound pipe for the admission of water into and the exclusion of other matter from a well.

Group "B"—Water Tanks

TANK.—A basin or reservoir above ground for the storage of liquids.

TANK TOWER.—That portion of the tank structure between the tank and its foundation.

TANK VALVE.—The valve for delivery of water from the tank.

OUTLET PIPE.—The pipe for delivery of water from the tank to the spout.

TANK SPOUT.—An adjustable spout for delivery of water from the outlet pipe to the tender.

INDICATOR.—A device for indicating the height of water in tank.

FLOAT VALVE.—A valve operated by a float controlling the height of water in tank.

Group "C"—Pipe Lines

INTAKE LINE.—A line of pipe through which the water flows from the source of supply to the intake well.

SUCTION LINE.—A line of pipe through which water is drawn by suction to the pump.

DROP LINE.—A vertical line of pipe through which water is lifted out of a well.

DISCHARGE LINE.—A line of pipe from the discharge of pump to tank, or distribution system.

SERVICE LINES.—Lines of pipe through which the water is distributed.

Group "D"—Water Columns

WATER COLUMN.—An apparatus for delivering water into the tender at a distance from the tank.

Group "E"—Internal Combustion Engines

INTERNAL COMBUSTION ENGINE.—A prime mover in which the power is derived from the explosive force of the fuel, compressed and ignited in a cylinder, acting directly against a piston.

TWO-CYCLE ENGINE.—An internal combustion engine receiving a power impulse during each revolution.

FOUR-CYCLE ENGINE.—An internal combustion engine receiving a power impulse during each second revolution.

GASOLINE ENGINE.—An internal combustion engine using gasoline, naphtha or other volatile petroleum fuels.

GAS ENGINE.—An internal combustion engine using natural or manufactured gas as fuel.

OIL ENGINE.—An internal combustion engine that may be started and operated on a non-volatile oil of lower specific gravity than gasoline without passing the oil through a carburetor, mixing valve, or preheating the oil, in which the fuel is ignited by a bulb, tube or plate heated from previous combustion.

DIESEL ENGINE.—An oil engine in which the combustion is due to the heat generated by compression.

Group "F"—Water Treatment

UNTREATED WATER.—Water not subjected to treatment.

TREATED WATER.—Water subjected to treatment.

UNDERTREATED WATER.—Water to which insufficient chemicals has been added.

OVERTREATED WATER.—Water to which an excess of chemicals has been added.

INCrustING SOLIDS.—Matter in the water which forms scale on tubes and sheets of boilers.

NON-INCrustING SOLIDS.—Matter in the water which does not form scale.

SUSPENDED MATTER.—Matter in the water which may be removed by coagulation, sedimentation or filtration.

AERATION.—Bringing the water into intimate contact with air in order to introduce oxygen for the oxidation of iron or organic matter, and for washing out gases and volatile odors.

FILTRATION.—A process of passing water through layers of sand or other porous material for the removal of suspended matter or bacteria.

SETTLING TANK.—A reservoir in which water is retained for the sedimentation of suspended matter.

REAGENT.—A chemical used for the treatment of water.

HARDNESS.—The quality of water caused by dissolved incrusting solids or by acidity.

SLUDGE.—Resultant precipitant formed by sedimentation or by removal of incrusting solids in water treatment.

Group "G"—Pumps

PUMP.—An apparatus for raising or transferring water or other fluids.

RECIPROCATING PUMP.—One in which the piston or plunger alternately draws the water in and discharges it from the cylinder.

SINGLE ACTING PUMP.—One in which one end of the plunger only acts on the fluid column.

DOUBLE ACTING PUMP.—One in which the plunger acts upon the fluid column both upon the forward and return stroke.

PISTON PUMP.—One in which a finished cylinder is closely fitted with a reciprocating piston.

PLUNGER PUMP.—One in which the reciprocating part is a solid plunger which does not come in contact with the cylinder walls, but enters the cylinder through packing glands.

DIRECT ACTING PUMP.—One in which the piston is reversed by an impulse derived from itself at or near the end of each stroke.

ROTARY PUMP.—One in which two revolving pistons rotate in a pump case which they completely fill; the pistons alternately draw in and discharge the water.

CENTRIFUGAL PUMP.—One in which the pressure necessary to raise the water is derived from the velocity of a revolving impeller.

AIR LIFT.—An apparatus for introducing compressed air into a well and thereby raising water out of the well.

Conclusions

The committee requested the following action on its report:

1. That the changes in the subject-matter on Water Service under the heading, "Revision of Manual," be adopted and substituted for the matter now given in the Manual.

2. That the report on methods for complying with Federal Regulations in regard to purity of drinking water supplied to trains be received as information.

3. That the subject of the design of impounding reservoirs be reassigned to the committee for completion during the coming year.

4. That the report on the relative merits of continuous and intermittent water softeners be received as information.

5. That the report on rules and examination questions for the care of pumping stations be adopted by the Association and inserted in the Manual.

6. That the report on organization for railway water service departments be received as information.

7. That the definitions of terms be adopted by the Association and inserted in the Manual.

8. That Subject No. 8, on suitable types for water meters for use in rail water service, be reassigned to the committee for study and completion during the coming year.

Suggested Subjects for Next Year's Study and Report

1. Make a final report on the design of impounding reservoirs and conditions under which they are economical.

2. Make a final report on suitable types of water meters for use in railway water service, methods followed in testing and reading meters, and checking the consumption of city water.

3. Continue the study of methods for complying with Federal regulations in regard to the purity of drinking water supplied to the public and employes on interstate trains.

4. Submit plans and recommendations for typical water station layouts.

5. Make a study of prevalent locomotive flue failures alleged to be due to improper water conditions and suggest remedies.

6. Revision of the Manual.

Committee: A. F. Dorley (M. P.), chairman; J. L. Campbell (E. P. & S. W.), vice-chairman; J. T. Andrews (B. & O.), C. A. Ashbaugh (G. C. & S. F.), R. C. Bardwell (M. P.), F. T. Beckett (C. R. I. & P.), E. H. Brown (N. P.), C. Bucholtz (Erie), C. C. Cook (B. & O.), R. H. Gaines (K. C. S.), E. M. Grime (N. P.), W. C. Harvey (C. G. W.), C. R. Knowles (I. C.), E. G. Lane (B. & O.), J. D. Mathews (S. P.), W. A. Murray (N. Y. C.), E. H. Olsen (A. T. & S. F.), W. A. Parker (St. J. & G. I.), H. N. Rodenbaugh (Southern).

Discussion

A. F. Dorley (Chairman): Subject I was placed in the charge of a sub-committee, of which Mr. Campbell was chairman. In two articles the committee recom-

mends some decided changes in the essence of the subject matter in the Manual, but the other revisions consist of changes or improvements in the diction only, and involve only minor changes in the recommended practice. The Manual now reads: "The greatest disadvantage in treating water is the increased tendency to foam, due to the reaction of soda ash on the sulphate of lime and magnesia."

When the treatment of water on the railroads was first undertaken all those who engaged in it acted very cautiously, and the treatment was usually limited to the point where foaming would not occur, but gradually road began to complete the treatment to the point where all the suspended matter or the incrusting solids were removed, and they have found that by a proper education of the engine men in the handling of waters that are inclined to foam that with a judicious use of anti-foaming compound water can be handled, even though it is treated, irrespective of the foaming content or foaming solids. This article just quoted from the Manual is frequently used as an adverse argument by those who are not friendly disposed to water treatment. I move that this article be omitted from the Manual.

The President: If there is no objection the omission of this latter is approved.

Mr. Dorley: Under the head of "Foaming and Priming," the following occurs in the Manual: "Foaming from treated water is due to the presence of sodium salts, as a result of treatment for incrusting sulphates, together with such quantities of the alkali salts which may have been present in the raw water. This condition is aggravated by and to a large extent due to the presence of suspended matter in the water."

"Concentration of foaming solids in locomotive boilers reaches the critical point at about 100 grains per gallon. Concentration above this point must be avoided by changing the water, or else trouble from foaming will be experienced." The committee suggests that this paragraph be made to read:

"Concentration of foaming solids in locomotive boilers reaches the critical point between 100 and 200 grains per gallon, depending upon the character of the foaming solids and the amount of suspended matter in the water. To prevent foaming, the concentration must be kept below this point."

That means in any particular water, which has a fixed critical point—which may be anywhere from 100 to 200, for that particular water its concentration must be kept below its concentration point.

I move that this change be adopted.

The President: If there is no objection, the suggested revision will stand approved. It is so approved.

Mr. Dorley: We report on subject No. 2, "Methods for Complying with Federal Regulations in regard to Purity of Drinking Water Supplied to Trains." This subject has been watched, and progress reports are being made by R. C. Bardwell, the chairman of the sub-committee.

On Subject 3, "Make Final Report on Design of Impounding Reservoirs, and Conditions Under Which They are Economical," the committee reports progress.

The report on subject 4, "Relative Merits of Continuous and Intermittent Water Softeners." After a railway has decided to go into the problem of water purification, either on a district or at any particular point, the most important thing to decide is the question of the type of softener. As a rule, when railways begin water purification they have not any well developed plans of their own and they naturally turn to the manufacturers of water softeners for advice and help. Then the deciding

factor is frequently one of price. Each type has its own particular merits which fits it and makes it suitable for particular conditions, and this report is offered with the hope that it may be of some service to railroads who are about to install water softeners. This part of the report is offered as information only.

Subject 5: "Rules or Examination Questions for Care of Boilers in Pumping Stations." We would like to offer for your consideration and for insertion in the Manual the subject matter coming under the sub-head, "Duties of Attendant." (This was accepted without comment. Mr. Dorley then offered some corrections to the proposed "Rules or Examination Questions for Care of Boilers in Pumping Stations," after which the report was approved for insertion in the Manual.)

Mr. Dorley: In handling the report on subject 6, the sub-committee sent out inquiries to quite a number of roads to ascertain just what organization the water department had, and they found that the practice with reference to the care of water service varies more widely on American railroads than perhaps any other branch of the service, and the committee submits a chart showing a typical organization that, with some modifications, we believe can be made to fit into the existing organization of practically any road. There are a few large roads that have a distinct water department and the results secured on these roads prompts the committee to recommend that some such line-up of organization be considered on other railroads. This report is offered to the Association as information only for the time being.

On subject 7, "The Definitions of Terms Used in Railway Water Service," are offered for insertion in the Manual.

A. N. Talbot (U. of Ill.): With reference to the first definition, "Artesian Well," I call attention to the fact that this is the old definition of artesian well, a flowing well, but in modern practice we include in the term "artesian well" any well in which the water rises a con-

siderable distance above the level of the stratum from which it comes. It need not be a flowing well. The Association will be going against what is pretty well established practice if this definition is adopted.

C. E. Lindsay (N. Y. C.): Under the rules we are not allowed to discuss definitions on the floor of the convention, and, therefore, under these circumstances we are forced into the position of taking these definitions as they are, or rejecting them. We have, however, a good precedent in the case of the report of the Committee on Buildings, which submitted its report with the distinct understanding that the definitions would be open for discussion for a year, and I think it is a good course to pursue.

The President: I think Mr. Lindsay's position is correct, and I am personally of the opinion that the Association will yet get to the point where the materials that go into the Manual will be subject to letter ballot. The committee says that it will be able to take this matter up for another year if the members will really give them suggestions so that the report can be put in shape so that it can be adopted next year. It will also take into consideration Prof. Talbot's definition of artesian wells, or rather his comment regarding them.

(This matter will be postponed one year, and will be reported then with corrections.)

Mr. Dorley: Appendix G is headed, "Pollution of Wells from Overlying or Adjacent Cinder Deposits." It is generally known that the deposits of cinders such as we have around railroad terminals add a perceptible pollution to water they come in contact with, but it has not generally been known that the effects of cinder deposits would be as far reaching as they were found to be in East St. Louis, where the overlying cinder deposits in yards were found to be a very perceptible contamination to underlying ground waters.

(The committee was dismissed with the thanks of the Association.)

Report on Records and Accounts

THE COMMITTEE HAS NO specific recommendations to make for changes in the Manual, but submits a brief discussion on the standardization of forms and stationery. The committee desires to call attention to the desirability of reducing the number of forms used in the maintenance of way department in the interest of economy and efficiency. As an illustration may be cited the experience of an official of a large railway system, who, after making a careful analysis of the different blank forms used

in the several departments, reduced the number from 1500 to 500. This large decrease not only involved a great saving to the railroad in clerk hire and for stenographers, but it also relieved the different officials from the unnecessary labor of examining and considering the mass of details from which no adequate results would be obtained.

Another feature to which the committee would call attention is the need for standardizing the sizes of forms, stationery, specifications, drawings, etc. There is no

good reason why one railroad should use a letterhead of an odd size, like 8 by 10 in., or one of 7¾ by 12 in., or other odd dimensions. The standard size letterhead is 8½ by 11 in., which cuts from a sheet 17 by 22 in. without waste. Anything differing from that size is considered a "special," and consequently costs more money.

Specifications are also made of all sizes for no apparent reason except precedent. If specifications were uniformly written or printed on standard size sheets, it would effect a material saving and would fit in any ordinary letter file. The same argument applies to all sorts of drawings, which it would be an advantage to produce on letterhead-size sheets. The use of large sheets for drawings, except in special cases, has been discontinued in many engineering offices, the drafting now being done on letter-size paper. Instead of tracing cloth, cross-ruled thin paper from which blueprints can be made is recommended.

On pp. 759-768 of Vol. 18 of the Proceedings for 1917, the committee submitted specifications for maps and profiles, which were received as information at the last annual convention. These specifications have now been before the members for one year, but no comments or criticism have been received by the committee during the year. The committee therefore submits these specifications for maps and profiles for approval and publication in the Manual.

In response to a circular addressed to valuation engineers of railroads represented in the Association, the committee obtained a large amount of most valuable information regarding valuation forms for both field and office use. This data has been carefully studied by the committee, and after due consideration it has been decided not to recommend any additional valuation forms at this time. One reason for this conclusion is that the subject was quite fully covered in the last annual report of the committee, consisting of a large number of typical valuation forms; an additional reason is the difficulty of devising forms to cover the great variation of local conditions existing in different sections of the country. It is therefore the suggestion of the committee that the various forms collected by it be placed on file in the office of the Association for inspection and use of anyone interested.

The committee has interpreted the assignment of the subject of additional definitions to mean definitions covering valuation matters, and in accordance with that understanding it is preparing a series of definitions pertaining to valuation of railroads, but is not prepared to submit them with this report, preferring to give more consideration to the proposed glossary of terms.

The committee has gathered some data to aid it in making a report regarding various maintenance of way department forms, but owing to the unusual conditions prevailing during the past year, it has not been feasible to make a report. The information collected is being made use of in studying the matter, and it is hoped to present something to the Association at its next annual meeting that will be of value.

The committee recommended that all subjects assigned it last year, with the exception of one regarding the various methods of reproducing maps and profiles on tracing linen for permanent record, be again referred to it for the current year.

Committee: W. A. Christian (I. C. C.), chairman; M. C. Byers (W. M.), vice-chairman; F. L. Beal (L. & A.), Lester Bernstein (B. & O.), H. Bortin (C. R. R. of N. J.), W. S. Dames (Wabash), J. W. Fox (C. of Ga.), B. B. Harris, Geo. D. Hill (N. Y. C.), G. T. Kuntz (N. P.), Henry Lehn (N. Y. C.), J. H. Milburn (B. & O.), J. C. Patterson (Erie), J. H. Reinholdt (M. & St. L.), R. C. Sattley (C. R. I. & P.), Huntington Smith (N. Y. C. & St. L.), H. M. Stout (N. P.), W. D. Wiggins (P. L. W.).

Discussion

Mr. Christian (Chairman): Your committee submits a short report. Twelve subjects were assigned to this committee, and the sub-committees are not in position to submit anything to the convention for approval and publication in the Manual, with the exception of subject 6: "Submit Specifications for Maps and Profiles, Co-ordinating Them with Previous Work of the Association."

We submit number 6 for approval by the convention.

The President: These specifications were held over for a year to give the members an opportunity to study them. The chairman says that they have received very little comment upon them from the railroads. It appears to me that it would be no more than just to the committee that definite action be taken at this time.

Mr. Christian: I move that the specifications as published in Volume 18, Proceedings of 1917, for maps and profiles be accepted and published in the Manual.

J. L. Campbell (E. L. S. W.): I would like to ask the committee in this connection if there will be no conflict recommended between the requirements of Map Order No. 1, of the Division of Valuation, and the specifications.

Mr. Christian: Map Order No. 1 was considered and the specifications include a large portion of that order.

W. C. Cushing (E. L. S. W. S.): That is the reason that we do not want to accept, as far as our road is concerned, these recommendations. We do find in examination of the specifications that they do conform to the Map Order of the Bureau of Valuation, and we find the size specified in that map order are not suitable for our records.

Mr. Christian: In reply to Mr. Cushing's objection, I wish to state that one thing that the committee tried to secure in the specifications for the maps and profiles was to determine a size that would be generally acceptable, so that all maps and profiles would be the same size. As it is now every road has a different size. The committee would like to see the sizes as specified in these specifications used.

The President: A motion has been made and seconded that these specifications as published in the proceedings of 1917 from Pp. 759 to and including part of 768 be printed in the Manual. (The motion was carried.)

Mr. Christian: I would like to refer to the subject of formulating methods for reproducing maps and profiles on tracing linen for permanent records. In the proceedings of Volume 17, of the convention held in 1916, the committee presented such data as it was able to accumulate at that time on this subject, and there has been no new development in this matter, which the committee has been able to ascertain, and it suggests that this subject be discontinued. I move that Subject No. 4 be omitted from further consideration.

The President: That will be in the hands of the Committee on Outline of Work.

Mr. Christian: On page 211 there is an appendix A entitled, "Revision of Manual."

As an illustration of the matter treated in this appendix, one official after taking office with an eastern carrier, asked to have one of each kind of forms used submitted to him for his inspection, and after doing so he cut them down from 1,600 to 500 or 600. This reduction was a saving, not only in paper, printing, labor and time, but it facilitated the work of the various departments, and that was a very good thing. We do not submit this in the form of a motion, but we call attention to the fact that there are a great many odd sizes of maps, drawings, statements, etc., used by the carriers nowadays that we could well do away with.

The President: Will the Committee on Outline of Work bear that in mind.

Mr. Lindsay: For information, I would like to ask if that Sheet 17 x 22 is the generally recognized trade size?

Mr. Christian: It is the generally recognized trade size.

Mr. Cushing: On reading this recommendation of the committee I took it up with the purchasing agent of our line because of the fact we use 8 x 10 sheets standard size, and pointed out to him that we was wasting money by using that size, but he informed me that I was entirely wrong, that he was saving money, because we were such large consumers of paper there was no difficulty in obtaining the size required to produce 8 x 10.

It occurs to me that all that is necessary will be for the railroads to unite on a standard size, and the manufacturers will make it, and that will become the trade size. There is certainly less paper made 8 x 10, than 8 x 11, and if we do not root that extra half inch for our correspondence, we had better adopt the smaller size.

The President: The suggestion of Mr. Cushing seems to be a pertinent one, and I presume that the Committee on Outline of Work will take it up. The committee was dismissed with the thanks of the Association.

The Railway Engineering Association and the War

Over One Hundred A. R. E. A. Men With Colors—Many Prominent Members Now Commissioned Army Officers

MODERN WARFARE HAS developed into a keen engineering struggle demanding the highest grade of scientific skill and ability. It is not surprising, therefore, that many of the leading members of the engineering profession in this country have been called upon to assist our country in its great struggle against ruthless autocracy. The secretary of the American Railway Engineering Association reports that 103 members are now with the colors and many of these hold most important positions in the forces engaged in the prosecution of the war.

S. M. Felton, president of the Chicago Great Western, is now director-general of military railways in charge of the organization and equipment of railway regiments for service on the French railroads serving the American front. Mr. Felton has supervised the recruiting of 11 regiments of railway men which are now at work on the other side and is preparing new units for movement to France as rapidly as is practicable. In addition he organized and despatched a corps of railroad officers to Asiatic Russia for the purpose of rehabilitating the Trans-Siberian railroad. A. R. E. A. members are well represented on the regiments so far organized, holding many of the most important commissions. F. G. Jonah, formerly chief engineer of the St. Louis & San Francisco, is now major of the 12th Engineers (Rys.); Charles L. Whiting, formerly division superintendent of the Chicago, Milwaukee & St. Paul at Lewistown, Mont., is major of the second battalion of the 13th Engineers (Rys.); Benjamin W. Guppy, formerly engineer of structures of the Boston & Maine at Boston, Mass., is major of the first battalion of the 14th Engineers (Rys.); Geo. H. Webb, formerly chief engineer of the Michigan Central, is lieutenant-colonel, 16th Engineers (Rys.); W. G. Atwood, formerly assistant district engineer, division of valuation, of the Interstate Commerce Commission at Chattanooga, Tenn., is major, 17th Engineers (Rys.); E. B. Cushing, assistant general manager of the Southern Pacific lines, Houston, Tex., is major, 17th Engineers (Rys.); W. J. Wilgus, formerly vice-president of the New York Central, is now a colonel attached to the railway units and recently returned from France, where he has been serving on the military railroads, to co-operate with Director-General Felton in supervising the enlistment of men for additional railway regiments.

A. R. E. A. committees are particularly well represented in the army with one lieutenant-colonel, nine majors, eight captains, and one first lieutenant. H. J. Slifer, formerly consulting engineer at Chicago and a member of the committee on the Economics of Railway Labor, is now a lieutenant-colonel of the Twenty-first Engineers (Light Railways) in service in France. Azel Ames, formerly connected with the Kerite Insulated Wire & Cable Company and also consulting signal engineer at New York, is a major in the 61st Regiment Coast Artillery at Fort Screven, Savannah, Ga. Major Ames is a member of the committee on Signals and Interlocking. F. C. L. Bond, formerly division engineer of the Grand Trunk at Montreal, Que., and a member of the committee on Wood Preservation, is now a major assigned to Company C, 10th Battalion of the Canadian railway troops now in France. C. S. Coe, formerly engineer maintenance of way of the Florida East Coast at St.

Augustine, Fla., and a member of the committee on Masonry, is now major with the 17th Engineers (Railways) in France. Paul M. LaBach, until recently assistant engineer of the Rock Island Lines at Chicago, and a member of the committees on Economics of Railway Location and Stresses in Track, has been made mechanical and water supply engineer of military railroads in France with the rank of major. F. E. Lamphere, formerly assistant engineer of the Baltimore & Ohio Chicago Terminal and a member of the committee on Yards and Terminals, is now a major in the Quartermasters' Officers' Reserve, with headquarters at Port Newark Terminal, Newark, N. J.

T. E. Rust, until recently chief engineer of the Waterloo, Cedar Falls & Northern, Waterloo, Iowa, and a member of the committee on Signs, Fences and Crossings, is now a major in the Engineer Officers' Reserve Corps, with headquarters at Camp Lee, Va. E. C. Schmidt, professor of railway engineering at the University of Illinois, Urbana, Ill., is now a major in the conservation division of the United States Fuel Administration at Washington, where he has charge of the organization of work in connection with fuel conservation on the railroads. Major Schmidt is a member of the committees on the Economics of Railway Location and the Economics of Railway Operation. W. L. Webb, formerly public utility engineer at Philadelphia, Pa., and a member of the committee on the Economics of Railway Location, is now in France as a major with the U. S. Regular Engineers. Henry Stephens, formerly supervisor of materials of the New York Central Lines at Cleveland, Ohio, and a member of the committee on Wood Preservation, is a major with the 65th Engineers at Camp Meade, Md.

The eight committee members who now hold commissions as captains are as follows: W. G. Arn, formerly assistant engineer maintenance of way of the Illinois Central at Chicago, and a member of the committee on Yards and Terminals, 13th Engineers (Railways), France; H. Austill, formerly bridge engineer of the Mobile & Ohio at Mobile, Ala., and on the committee on Wooden Bridges and Trestles, 501st Battalion of Engineers, France; C. W. Coebran, formerly engineer maintenance of way of the Cleveland, Cincinnati, Chicago & St. Louis, and on the committee on Roadway, 321 Regular Engineers, Camp Grant, Rockford, Ill.; T. W. Fatherson, formerly engineer maintenance of way of the Chicago Great Western, Des Moines, Iowa, committee on Ballast, attached to headquarters 13th Engineers (Railways), France; F. W. Green, formerly assistant to the president of the St. Louis-Southern, St. Louis, Mo., and chairman of the committee on the Economics of Railway Operation, acting superintendent of army transport service at one of the important ports in France; J. de N. Macaulay, Jr., formerly office engineer Atchafalaya, Toledo & Santa Fe at Chicago, and a member of the committee on Economics of Railway Operation, Engineer Officers' Reserve Corps; W. M. Vandenberg, formerly signal engineer of the Illinois Central, Chicago, and a member of the committee on Signals and Interlocking, Engineer Officers' Reserve Corps, Fort Leavenworth, Kan.; W. K. Walker, formerly engineer maintenance of way of the Wabash, St. Louis,

Mo., committee on Ballast, Engineer Reserve Officers' Training Camp, Camp Lee, Va. Jerome S. Bassett, formerly assistant engineer of the Missouri Pacific, Monroe, La., and a member of the committee on Ballast, is now a first lieutenant detailed as instructor at the Third Officers' Training Camp, Leon Springs, Tex. R. C. White, superintendent of the Missouri Pacific at Wynne, Ark., and a member of the committee on Ballast, was chief engineer and first assistant to the constructing quartermaster on cantonment construction at Camp Pike, Little Rock, Ark., last summer.

Other members of the American Railway Engineering Association who have recently received important commissions in new railway units are R. K. Rochester, superintendent of the Northwest System of the Pennsylvania Lines, who will serve as a general superintendent on the American-operated lines in France with the rank of major, and H. M. Waite, formerly manager of the city of Dayton, Ohio, who has been commissioned lieutenant-colonel.

The first member of the association who has died in military service, according to the best information at hand, is Captain L. B. Manspeaker, who passed away following an attack of pneumonia on February 9, at Camp Lee, Va.

The great importance of the expeditious movement of troops and supplies from various sections of this country to the seaboard and across the water is a problem now receiving the attention of the best brains and ability in the railway world. In this field, also, members of the American Railway Engineering Association have been and are prominent. R. H. Aishton, president of the Chicago & Northwestern, is now regional director of western railroads, with headquarters at Chicago. L. W. Baldwin, vice-president and general manager of the Central of Georgia, is now operating assistant to the regional director of southern railroads, with headquarters at Atlanta, Ga. Howard Elliott, chairman of the board of directors of the New York, New Haven & Hartford, and Julius Kruttschnitt, chairman of the executive committee of the Southern Pacific Lines, were members of the Railroads' War Board which controlled the operation of the lines in this country until the government assumed their administration last December.

But for lack of space the activities of many other members of the association in connection with the prosecution of the war might be mentioned, but suffice it to say, all, whether in active military service or still in civilian life, are doing their utmost to ensure a decisive victory over Prussian militarism.

Provocation Enough

On a slow train in Arkansas sat a native, going up to Little Rock to testify in a shooting case. A deputy sheriff got aboard at a way station conveying an excited-looking person whose wrists were heavily manacled. Prisoner and warder took a seat directly in front of the countryman.

Presently, when his curiosity had mastered him, the first traveler bent forward and tapped the deputy on the shoulder.

"What's the trouble with the feller you got along with you?" he inquired in a whisper.

"He's got bugs," stated the deputy succinctly.

"He's got which?" inquired the yokel in a startled voice.

"He's buggy!" The deputy tapped his forehead meaningly. "He's crazy! Understand?"

"Bugs in his head, and his hands tied?" said the countryman. "Well, no wonder he's crazy!"

The New Committee Chairmen

OF THE 22 REGULAR and 2 special committees of the American Railway Engineering Association, 7 are headed by new chairmen this year, including the two new regular committees, Nos. 21 and 22, on Economics of Railway Operation, and Economics of Railway Labor.

F. R. Layng owes his position as head of the Tie committee to his long and active service with that body, of which he was vice-chairman for two years and has been a chairman of a sub-committee for several years. As engineer of track on the Bessemer & Lake Erie, the road with the heaviest ton mileage per mile of main track of any railway in the United States, he commands distinction as being in charge of tracks containing more steel ties than are to be found on any other line. In fact, he has been largely responsible for the development of these ties in actual service. This has made him of special value in connection with the work of the sub-committee on substitute ties. Mr. Layng is a close and critical student, who develops an unbounded enthusiasm for any subject he investigates. One of his hobbies, if it may be called such, is the care of laborers. He has been a pioneer in the movement for better living and working conditions for maintenance of way employees.

Joseph Mullen is a good man for the head of the Committee No. 12 on Rules and Organization, because he is himself a good organizer. Having been occupied until recently chiefly with construction projects, his friends say the success which has attended his various assignments are the result of his ability to build up an efficient and loyal organization, coupled with a faculty for sticking to a thing until he sees it through. A large part of his railway experience has been with the Cleveland, Cincinnati, Chicago & St. Louis, principally on construction work.

O. E. Selby, chairman of committee No. 15 of Iron and Steel Structures, is another Big Four man. While he bears the title of principal assistant engineer, he is essentially a bridge engineer, having carried that title for many years. Like all true bridge engineers, he is a man of technical attainment, a close student who must be thoroughly satisfied with his conclusions before he will commit himself. Given to scientific investigation, he has presented a number of valuable monographs both to this association and the American Society of Civil Engineers. He is primarily interested in bridge work in its various ramifications, but has also spent considerable time in studies of the mechanics of track.

Committee No. 16 on Economics of Railway Location has experienced some rather turbulent times during the last two or three years, as a result of which its reports at recent conventions have been marked by brevity and have been not infrequently supplemented by emphatic minority reports. In the light of this experience it is a curious fact that, under the leadership of a new chairman, R. N. Begien, it has presented no report at all. Be that as it may, the new head of the committee is eminently fitted for the position. At present general manager and formerly chief engineer of the Baltimore & Ohio and previously occupying various other engineering and operating positions with that road, he has been wont to view engineering problems from the operating standpoint, while using engineering knowledge in the solution of operating problems. He has been an active member of this committee and has contributed several valuable reports on special investigations conducted under his direction, among which may be mentioned

Dynamometer Tests on the Baltimore & Ohio, appearing in Volume 14 of the Proceedings.

E. B. Katte, the new chairman of committee No. 18 on Electricity, is well known because of his connection with the electrification of the New York Central lines into New York City. The fact that he succeeds Geo. W. Kittredge, chief engineer of the New York Central, would seem to give some ground for the impression that the New York Central had a monopoly on chairmanships of this committee, particularly since there is still other

Southwestern, but he had hardly entered upon his new duties with this committee before the call of his country led him to join the Twelfth Engineers as a captain. It is understood that Captain Green has since been detached from his company and is at present acting superintendent in army transport service at one of the important ports in France. Although the son of a railway officer and an engineer by training, Captain Green commenced his railway career as a laborer with the Rock Island, working up through various positions in the oper-

E. R. Lewis

R. N. Begien
O. E. Selby

good N. Y. C. timber in its personnel which will be available when Mr. Katte sees fit to give up the chairmanship. Mr. Katte comes from an engineering family. His father, the late Walter Katte, was chief engineer of the New York Central and Hudson River Railroad for 13 years and was known to engineers of the middle west as one of the founders of the Western Society of Engineers. Edwin B. Katte has been a hard-working member of the Electricity committee for a number of years, and it should make material progress under his leadership.

The new committee on Economics of Railway Operation was headed appropriately by an operating man, F. W. Green, assistant to the president of the St. Louis

Southwestern, but he had hardly entered upon his new duties with this committee before the call of his country led him to join the Twelfth Engineers as a captain. It is understood that Captain Green has since been detached from his company and is at present acting superintendent in army transport service at one of the important ports in France. Although the son of a railway officer and an engineer by training, Captain Green commenced his railway career as a laborer with the Rock Island, working up through various positions in the oper-

ating department to the post he gave up to enter the service of the government. The fundamental importance of the labor problem confronting the railways during the past year which promises even graver consequences during the coming season, made it eminently fitting that the Board of Directors should provide for a new committee on the Economics of Railway Labor, and the wisdom of the directors in the appointment of F. R. Lewis as chairman, is no less certain. Mr. Lewis is probably as well known as a writer on railway subjects as through his position as assistant to the general manager of the Duluth, South Shore & Atlantic. Commencing his railway career as a rodman on the Missouri Pacific in 1885, his experience

has carried him to most of the states in middle west and southwest, with two years on United States government work on the Mississippi river and six years on the Cape Government railways of South Africa. From 1906 to

1912 he was a division engineer on the northern lines of the Michigan Central and since that time he has been largely occupied in fighting the rigorous winters of upper Wisconsin and Michigan.

Annual Meeting of Appliances Association

President Bell's Address. M. J. Trees Elected President, P. C. Jacobs, Vice-President. Good Exhibit Showing

The tenth annual meeting of the National Railway Appliances Association was held in the Coliseum at 11 o'clock yesterday morning. E. H. Bell, president of the association, presided. In his address Mr. Bell said in part:

President Bell's Address

"Your directors and officers have had to meet many unusual and difficult problems in connection with carrying on the work of your association during the past year. We feel that our decision to hold our exhibition this year has been more than justified.

"It is unnecessary for me to recite the obvious uncertainty existing in all lines of commercial endeavor throughout our country during the past year.

"The industries of our exhibitors and members, representing devices and material used in the maintenance and construction of railroads, can only be considered as an extremely important factor in aiding our government in the prosecution of the war. We contribute to the efficiency and economy of the great transportation systems of this country. My conclusion, therefore, is that there is no reason to apologize for being here today, for, if we served a good purpose in pre-war times, we certainly can be of great service now.

"Our treasurer will give you his detail report on finances. However, I wish to say that during these uncertain times we should, in my opinion, feel grateful to our past officers and directors, who have, in years gone by, gradually built up and handed down to us a cash surplus which has placed us in a position where we can feel that our association could operate under adverse conditions for some time without financial embarrassment. In my opinion this surplus should be maintained.

"I have mentioned that we had a cash surplus, and when the second issue of Liberty Loan bonds, bearing 4 per cent per annum, was announced, your board of directors voted that it was not only advisable, but patriotic, for our association to invest in some of these bonds. Therefore, \$2,000.00 of these bonds were purchased.

"This year, in order to improve the harmony in color and to give a general lighter effect in the Coliseum, we changed the color of the fence from black to a gold bronze and repainted the bodies of the upright posts to harmonize. I believe that you will agree that the effect is pleasing. All of the flags decorating the ceiling are new. You will see that the balcony has been hidden by a bunting decoration. The same general scheme has been carried out in the annex, as we found that last year's decorations could not be materially improved upon.

"The attendance for the 1917 Exhibition was as follows:

| | |
|-----------|-------|
| Monday | 3,442 |
| Tuesday | 5,907 |
| Wednesday | 7,509 |
| Thursday | 5,494 |

Total22,352

"Many of us do not come into close contact with, and cannot, therefore, full appreciate the enormous amount of detail work necessary in carrying on the work of this association in efficiently preparing for the annual exhibition. Everything you need from the time your exhibit reaches the front door of the Coliseum is furnished you by your association or by reliable concerns who are responsible to your association for their work, and I feel that it is only fair to lay stress on the fact that your Director of Exhibits, Mr. Kelly, is entitled not only to the credit, but the thanks of this association for his most efficient work.

"I wish also to express my great appreciation to the board of directors and the executive board for their cooperation in handling the work of this association during the past year.

"I take this occasion to thank the enrollment committee under the direction of Mr. Kuerst of the Detroit Graphite Company for the efficient results they have accomplished."

Treasurer's Report

Secretary-Treasurer Kelly, in his report as treasurer, made the following report:

| | | |
|--|-------------|-------------|
| Cash on hand May 1, 1917, after charging for 1917 exhibit bills paid in 1918 | | \$15,752.75 |
| Receipts for 1918 business: | | |
| From memberships | \$ 4,727.50 | |
| From space rentals | 24,982.31 | |
| From interest on deposits | 496.20 | |
| | \$30,206.01 | |
| Estimated additional receipts | 860.43 | \$31,066.44 |
| (This income is an increase over 1917 of \$2,405.27.) | | |
| Expenditures for 1918 business: | | |
| General supervision | \$ 1,050.06 | |
| Estimated additional | 324.18 | 1,374.24 |
| Administration | 6,205.76 | |
| Estimated additional | 446.67 | 6,652.43 |
| Exhibition | 7,796.53 | |
| Estimated additional | 11,856.92 | 19,653.45 |
| Total estimated expenditures | | \$27,680.12 |
| (Which is \$3,955.23 over 1917.) | | \$ 3,386.32 |

Would advise that the cash balance on hand of the Association up to and including March 16, 1918, is as follows:

| | |
|---|-------------|
| Certificates of deposit in National City Bank | \$27,000.00 |
| Liberty Loan | 2,000.00 |
| Accrued interest on above | 406.67 |
| Cash in hands of treasurer | 600.00 |
| Checking account, National City Bank | 874.24 |
| Total | \$30,885.91 |

Secretary's Report

In his report as secretary, Mr. Kelly said: "Applications for membership and space were sent out as usual, accompanied by bulletin No. 10 and floor plan. The meeting of the board of directors for the assignment of space was held on November 12, 1917, with the result that the entire official floor space plan was filled with the exception of ten spaces, even though our floor plan arrangement affords us 31 more spaces this year than last, there having been 236 last year against 267 this year.

"Of the 267 spaces, 209 are occupied today by 119 of our 1917 exhibitors and 36 by new exhibitors, making a total number of exhibitors this year, 155.

"The annual invitations and passes were all prepared and ready for mailing, but owing to unsettled conditions were withheld until February 15, at which time 12,800 were mailed to a well selected list of railroad men, from presidents to roadmasters, on steam and electric lines; also to members of the American Railway Engineering Association, the Signal Association, Interstate Commerce Commission Engineering, staff of technical colleges and to many of the well-known railway contracting concerns. To these invitations we received acknowledgements equal to any former year, and requests for passes were in excess of former years. As a matter of fact, requests for passes have been larger in proportion from the railway people this year than from the supply concerns.

"We have taken great pains this year to thoroughly cleanse and prepare the dining room, and feel that we can personally guarantee the character of the supplies and foodstuffs to the extent that we would like to ask that as much as possible you patronize the cafe, so that we may keep the people in the building rather than invite them to some downtown restaurant which takes them away from our exhibits, which we have been planning for the last twelve months for their entertainment.

"I feel that the proposition of work orders is one which should be given some attention at this time and would like to ask the co-operation of each of our exhibitors to the extent that they help the work order cashier check up the work orders and get the accounts paid as quickly as possible so that we may have all our accounts in a good, clear manner at the earliest possible moment.

"The exit passes will be used this year the same as before, and will be issued to the exhibitor at the work order office by the cashier when paying the final bills.

"Kindly see that all parcels which you expect to take from the building are placed on your exit pass, as this will be your receipt to the association for the return of your exhibit.

"We will arrange to have bills of lading, both of freight and express for your convenience in shipping your exhibit from the Coliseum. The bills of lading and freight office will be in charge of Mr. Wertz of the Taft Cartage Company, who may be found at the secretary's office immediately after the close of our exhibition."

Election of Officers

The nominating committee, of which F. A. Poor was chairman, reported the following nominations for officers, and the nominees were unanimously elected:

President, Merle J. Trees, Chicago Bridge & Iron Works, Chicago.

Vice-President, P. C. Jacobs, Johns-Manville Co., Chicago.

Secretary-Treasurer, C. W. Kelly, Kelly-Derby Co., Chicago.

Directors for three years, T. W. Aishton, National Malleable Casting Co., Chicago; A. P. Van Schaick, Lackawanna Steel Co., Chicago.

Director for two years, L. W. Shugg, General Electric Co., Schenectady, N. Y.

On motion of N. M. Hench (Carnegie Steel Company), the board of directors was instructed to ascertain before January 1, 1919, the sense of the members of the association as to whether an exhibit should be held next year. It was felt that in view of present conditions unexpected changes might occur during the year. The board of directors retains authority to actually decide the matter.

Railway Night at the Western Society of Engineers

Three Discussions of the Material Situation and an Account of Labor Conditions in the Orient

"RAILWAY NIGHT" at the rooms of the Western Society of Engineers was a decided success. About 200 members and guests were present, among whom were included a considerable number of the members of the American Railway Engineering Association. Three general classes of materials were covered, namely, steel, timber and concrete, separate talks being given by representatives from each industry. Following these addresses a paper was presented by Frank Rhea on the labor situation in the Orient.

The Structural Steel Industry

F. J. Llewellyn, Division contracting manager, American Bridge Company, Chicago, presented the situation in the steel industry. He stated that the problem of the war was to turn gold into steel. The steel productive capacity of the world at the present time is 100,000,000 tons per annum, of which one-half is produced in the United States. Of this total 16,000,000 tons capacity has been added since the war began. Because of unfavorable weather early this year, about 10 per cent of this year's output has been lost, but conditions are improving and the mills are now approaching capacity production.

The car shortage has been the most serious obstacle encountered. The labor shortage has also interfered, but has not been at all serious. However, with the drain to result from the new draft requirements it is impossible to say what the condition will be later on in the year. In anticipation of this drain, boys of 17 and 18 are being trained to take the places of men. The speaker pointed out that the steel industry could claim no exemption on men except in cases where the work on which they were engaged held an A-1 priority order.

It is the opinion of the speaker that 50,000,000 tons of steel is more than can be made use of by manufacturers of this country, so there should be sufficient available to supply all reasonable needs. He believed that the fabricating shops of the middle west could readily take care of 100,000 to 150,000 tons of work in bridges and buildings this season. In conclusion he stated that the catching up process was now under way, but pointed out that the first consideration in any case was the supplying of any requirements that would help to win the war.

Timber Situation Improving

The conditions in the lumber market were presented by Herman Von Schrenk, consulting timber engineer, St. Louis, Mo., who expressed pleasure at being able to present a much more optimistic message last night than would have been possible two weeks ago. The situation has been gradually improving since the first serious congestion following the large orders placed by the Government when war was declared.

The industry has suffered from three principal ob-

stacles, car supply, labor shortage and determination of priority. The supply of lumber in the country is enormous, and the fears for a lumber famine repeatedly expressed 10 to 15 years ago have been discredited. The supply of southern pine is estimated at 350 billion ft. b. m., while the amount of uncut timber on the west coast is much greater.

In both the southern and the western fields there was a sharp congestion following the placing of the first government orders, but the rate of production was increased rapidly and 750,000,000 ft. b. m. of southern pine was supplied in the first nine months of the war. The demand resulted in embargoes of two kinds—restrictions as to sizes and curtailing of shipments for domestic use. In the South, the lumbermen were not allowed to dispose of any timbers 12 in. by 12 in. or larger. In the West the restriction covered any piece 12 in. on any face. The southern pine restrictions have been modified somewhat and the condition has been improved also by the use of laminated timbers.

The supply of the smaller sizes of lumber is ample, partly through their incidental production in the manufacture of larger sticks, and partly through a curtailing of the private building operations since the opening of the war. The hardwood industry has been more largely restricted and the market is in what may be termed a "receptive attitude."

Conditions in the Cement Industry

By B. F. AFFLECK

President Portland Cement Association, Chicago.

The cement plants of the United States have a capacity of about 120,000,000 bbls. of Portland cement annually. The maximum year's consumption, (in 1916) was 94,552,296 barrels. Under ordinary conditions all of the producing capacity can probably never be employed in any one year because at no time is it likely that normal conditions as affecting production, labor and the use of cement will prevail throughout the entire country.

From the foregoing statement it will readily be seen that the engineer in charge of railroad or other construction will have no difficulty in obtaining all of the Portland cement he may need provided cement makers are able to obtain material, labor, fuel, transportation and the numerous other smaller but none the less essential supplies.

Although the Portland Cement Association carefully refrains from any activities relating to prices or commercial transactions, I think I may with propriety say that the cost of making cement has been rising steadily at all or nearly all plants for many months. Wage rates have increased very substantially and, as is often the case, labor efficiency has diminished and the cost of fuel, explosives, material, repair parts, in fact everything entering into the production of cement has advanced so that while cement prices are now about as high as, or higher

than for some 12 or 15 years, the net return to most companies is quite meagre, and is likely to be, unless prices are advanced. Another cause contributing largely to this result is the fact that production and shipments at most plants are very much below normal, the statistics showing shipments from all plants in the United States for January and February to have been 31 per cent less this year than last. Production is curtailed because of inability to obtain material, fuel and labor, and shipments are curtailed by reason of inability to obtain cars. There is apparently a desire on the part of the cement user to use a normal quantity of cement but this desire does not materialize into actual demand for various reasons.

Of these reasons the railroad officer is chiefly concerned with those having a relation to railroad facilities and I give it as my judgment that most of our troubles are traceable to inadequacy of these facilities or, to state it more accurately, a sudden overloading of our transportation system. The railroads should not be blamed for this condition any more than we should blame a bushel basket because it will not hold a bushel and a half.

In the admirable article by Samuel O. Dunn, editor of the *Railway Age*, in *Colliers'* of March 9, he compares the two five-year periods ending with 1906 and 1916 and quotes James J. Hill, who in 1907 said that during the following five years there should be invested in railroad facilities, \$5,500,000,000 instead of which only \$4,500,000,000 was invested during the following nine years. On the basis of that reasoning the railroads are now about five years behind the country. He states further that until Government control was adopted, Government regulation compelled competition, thereby making it impossible to use existing facilities to the best advantage. This is not said in criticism of the railroads. They have, for the most part, undoubtedly been managed well and efficiently and had Government authority recognized their needs and permitted them to earn adequate revenue, there can be no doubt that large quantities of stocks and bonds would have been sold and the proceeds put into equipment, improvements, extensions and enlargement of facilities, and at a time when labor and material were both comparatively cheap and plentiful.

Cement, unlike other materials of construction cannot be used alone. For every ton of cement the builder must have from four to eight tons of sand, stone, pebbles, slag or brick, and while I can assure you that the cement makers can furnish all the cement you may need, provided cars, labor and materials are obtainable, it will do you no good unless the other materials are also available, and they are to a great extent dependent also on these same factors—cars, labor and material.

I will take advantage of this opportunity to say a word concerning the use of cement in bulk instead of in packages. It has been demonstrated conclusively on many works of various kinds that cement can be received and handled in bulk as readily as in packages, and in many instances with a considerable economy. The cement maker offers cement in bulk at a lower price than in packages, the difference representing substantially the saving to him in labor. There is another reason, however, why the cement user should receive cement in bulk if he possibly can. Cotton is about three times as high in price today as normally. The demands of our Government and the Allies are very large and the material is scarce. It will readily be seen that to wear out cotton cement sacks unnecessarily is not only an economic waste which should be prevented, but it tends further to advance the price of everything else made of cotton, thereby increasing the cost of conducting the war.

As far as railroad construction is concerned, I believe

it goes without saying that the Government now realizes so completely the necessities of the railroads that there will be a classification which will give this particular work a place very close to the head of the list. I need scarcely say that those in authority at Washington having complete responsibility for the railroads during the war desire their capacity increased and operation to be at maximum efficiency. This result cannot be accomplished without a great deal of new construction for which, if it is authorized, the Government will certainly arrange for necessary materials.

May I mention briefly two other means of transportation—highways and waterways. A very large percentage of the freight handled by rail has its initial or final movement, or both, over the highways. Practically all food and package freight belongs in this class. It seems to me the railroads should encourage the construction of good roads in every way possible. They supplement rather than compete with rail transportation. It is true that trucks are now handling much freight which under normal conditions would move by rail but this is for the most part short haul traffic which is unprofitable to the rail lines and on which they cannot, even in normal times, furnish as rapid service as the truck which can handle direct from store door to store door.

As to the waterways, it is doubtful if we can afford at this time to spend much money or effort in connection with the inland, artificial waterway of shallow draft. The results would be too small and the time consumed too long. The limitations of such waterways greatly reduces their value in relation to their cost. They serve only those immediately adjacent to them, others being under the necessity of getting their freight to and from the water's edge with rehandling often at both ends. The railroad has not that limitation.

Concerning the natural deep waterways, requiring a relatively small expenditure to make them available, while laws were passed divorcing steamship lines from railroad ownership or control, it is to be hoped that under Government operations such arrangements will be resumed as will enable the railroads to use steamboat connections to the best possible advantage.

This will, of course, necessitate the construction of ships, barges, and lighters for lake and harbor navigation. For this purpose, if it appears that there will not be an adequate supply of material or labor to build ships of steel or wood, it may be that relief may be had by turning to concrete. While the term concrete ship suggests cement this is something of a misnomer. The percentage of reinforcing steel in a concrete ship's hull is so large that I am told the actual cost of the steel bars in a concrete ship is about 12 times the cost of the cement. The largest vessel ever built of concrete and the only going concrete ship ever built in this country was launched at San Francisco last Thursday. The Portland Cement Association received by special messenger this morning a moving picture of the launching, which I believe you will be interested in seeing.

This ship was built by the San Francisco Shipbuilding Co. from designs by McDonald & Kahn of San Francisco. It is 336 ft. long, 141 ft. wide and 30 ft. deep. It was christened "Faith" and has a dead weight capacity of 5,000 tons. Immediately after launching, she was towed to the Union Iron Works for installation of engines, boilers and machinery and by June 1 will have made her trial trip.

In conclusion let me repeat the current industry stands ready to meet any demands the railroads or the Government may make or is subject only to its ability to obtain coal, material supplies, transportation and labor.

Labor Conditions in Japan and China

By FRANK RHEA

United States Department of Commerce, Washington, D. C.

I have been asked to talk about the labor and economic conditions prevailing at present in China and Japan. I can only give you the benefit of my observations gathered in a period of seven months. There are two conditions which have been generally supposed to exist both in China and Japan, namely, that there are no limits to the amount of labor and time available for doing anything. This is still true in China, but the results of the war have changed the situation very materially in Japan, and I am satisfied that it is a fact that today there is a shortage of labor in almost every line of industry in Japan. It is possible that this is not as acute now as during the time when I was in Japan last year. The reason, if so, is on account of Japan not being able to obtain the necessary supplies of steel.

The purpose of my investigation was to ascertain the possible markets for railway materials, equipment and supplies, such as could be furnished by American manufacturers. My reports on Australia and China are taking somewhat of the form of reference reports and as a matter of fact my investigation was really one more of materials than of labor and economic conditions. However, after going over the matter in a preliminary way, in each country, I concluded that in order to report intelligently on the possibilities of the markets, it was necessary to study the labor conditions, the supplies of raw materials and the iron and fuel resources of the countries. Today the supply of steel is the problem which concerns Japan more than any one question, and they are thoroughly aroused to the necessity of securing an adequate supply from the standpoint of defense. This desire and also to supplement their present inadequate supply of fuel explains many features of the so-called Japanese aggression. It is true, however, that the Japanese show more capacity for organization and administration than any other division of the yellow race. They are also seeking permanent markets for their home factories and look to China as their natural markets. At the present time, however, the coal production is being restricted on account of the shortage of labor. An estimate was made to me that this shortage of labor amounts to as much as 25 per cent of the labor which could actually be utilized.

Wages in the industrial districts have increased very substantially.

There is some discussion going on in Japan today regarding the lifting of the restrictions on the bringing in of other labor, particularly from China and Korea. Early in July, the Imperial Government Railways brought from the Korean railways some 400 Korean coolies experienced in track work, but only one attempt was made, for the reason that there was a universal protest from all classes of labor in the Moji industrial district, the point where these Korean coolies were landed and worked.

The labor situation in China has been affected little by the war except in the particularly limited localities. The railways of China are located principally north of the Yangste river, and I spent a greater part of my time in this part of China. The northern Chinaman is much more robust than some of the central and southern Chinese. The Shantung man, who is probably the best laborer in China, is usually a well-built upstanding, muscular man, with very little surplus

weight. It is not generally known that the British have recruited up to date about 150,000 Shantung coolies, who have been sent to France, generally by way of the Canadian Pacific Railway.

One interesting situation in connection with the Japanese development in Manchuria is the fact that annually there is a migration of 250,000 of these robust Shantung coolies across the Bay of Chihli. These men usually embark at Weiheiwai and Chefoo to Dairen and Newchwang, and the Japanese are thus able to select the best of these men for the operation of the shipyards and shops at Dairen and the Fushun and Penchihiu collieries. The Japanese have also been using this class of labor for the railway building and railway reconstruction and their other various enterprises in South Manchuria. The other Chinamen, such as the Chihli, Shansi and Honan, are all well built, upstanding men. The labor in the province of Hupih, where the Han-Yeh-Ping Iron Works are located, are much less robust than the above described men. This is particularly noticeable in the steel plant, where the men prove incapable of withstanding the hard work around the rolling mills satisfactorily, although it is surprising to see the work they do in such items as carrying coal, ore and coke, all of which is done at this plant by hand. The Cantonese Chinese is probably the frailest of the Chinese. This is to be expected, as Canton is practically the same latitude of Havana, Cuba, Haupow being almost exactly the latitude of New Orleans. Therefore, while there is a large quantity of labor in some parts of China, its quality is certainly very inferior, the two last named places being examples of the least capable and the first named the most robust, with probably all varying degrees between them. The labor of the province in which Shanghai is located is fairly robust and the labor along the China coast to Hongkong is fairly robust. The methods of labor on both the Japanese and Chinese railways were very interesting, although I was not as favorably impressed with the capacity of the Japanese track labor as I was with the Chinese. Possibly I was prejudiced in this, but undoubtedly the labor situation in Japan is becoming troublesome, and I was able to notice the results of this in connection with track labor. Notwithstanding the fact that I, of course, made no success of learning to speak the Japanese language, earmarks of labor unrest seemed to me to be noticeable. In addition, while the Japanese are capable workmen, when they so incline, they are, however, inclined to be more troublesome and are not of the natural good nature of the Chinese coolie.

There is one rather interesting fact, however, and that is that neither the Chinese coolie nor the Japanese coolie can be successfully driven. They are both inclined to take their time. The wages on the Chinese railways are rather variable. On the Shanghai-Nanking I was able to get very definite information. Here a section foreman in charge of three gangs over a territory of 15 miles is paid from \$25 to \$30 silver money, or, as it usually termed, "Mex." Foremen of gangs, or, as they are called, "ganggers," are paid from Mex. \$15 to \$20 per month. Gangs are organized with two leading coolies, and these are paid Mex. \$10.50; ordinary coolies are paid Mex. \$8 per month, and each gang is furnished with a cook, who is paid Mex. \$5. Crossing watchmen are paid Mex. \$6.50. These wages are paid to really capable and experienced men, and, as I have seen on a number of occasions, doing real railway sectionmen's

work. The wages on the other railways are comparable to the above for the reason that the Shanghai-Nanking Railway is in a territory where there has been considerable industrial development around Shanghai and Woosung and Soochow. In the workshop at Tongshan the wages paid for common coolie labor is Mex. \$.30. This is for ordinary labor around the shops. The shop mechanics are paid wages varying from Mex. \$.60 to \$1.30, the latter applying to the most experienced boilermakers.

One of the most interesting situations is the Japanese development in Southern Manchuria, particularly the Shinkaho workshops at Darien. There are about 4,150 men in these shops, of which 72 per cent are Chinese. All executive, administrative and technical and such positions as cranimen, engineers, etc., are filled with Japanese. Chinese labor is depended upon entirely for the doing of all work, including such skilled occupations as molders. The Chinese are particularly good foundry workmen and he is one of the best masons in the world today. Regarding the question of business to be secured, there is no doubt in my mind that there will be a great deal of business done in this part of the world in the next 25 years, but there is one point which I would like to emphasize particularly, and that is that I do not agree with the ideas of some people which now prevail that this business can be secured practically for the asking. Instead of that, the business to be secured will take close attention and there will have to be a thorough study made of the conditions to be met. I made some analysis of the investment assets as shown on the balance sheets, a study of the fixed obligation, and the Chinese railways to-day are profitable and in my opinion will be increasingly so. Furthermore, there is need for a considerable amount of additional railway mileage and if built will prove profitable. I am also of the opinion that the American manufacturers should combine in their efforts for securing this business instead of competing against each other as has been the practice in the past. I was very much impressed with the thorough study which the British are giving post-war trade conditions. In every instance the British houses are carefully studying the matter of holding their own organizations together to be in position to resume business promptly at the termination of the war. In addition, the British government has representatives on the ground carefully studying and reporting on all the fundamental conditions.

New Signaling on Grand Trunk

The Grand Trunk is just completing a section of automatic signals between Shelburne, Me., and Bethel. This stretch covers 22 miles of single track and consists of the A. P. B. signaling. A contract has been awarded to the General Railway Signal Company for the necessary material to signal 16½ miles of single track between Bethel, Me., and West Paris. This work is to be a continuation of the first section and will be installed by railway company forces.

The A. R. E. A. Service Flag

One of the impressive features of yesterday morning's session was the unfurling of the service flag of the American Railway Engineering Association containing the figures "103," to commemorate the part which members of this Association are taking in the service of their country. Aside from this personal service on the part of the 103 members, service pins are on the coat lapels of not a few of the older members who have come to the convention. Secretary Fritch is one of the wearers of such a pin, having a son in the artillery service.

Cuts and Fills

Opportunity Missed

An El Paso man tells of one Westerner's opinion of Chicago. It appears that this man had occasion to visit the city, which he had never seen before. He remained for a week or two longer than he had expected, and, in writing of his experiences to his wife in the West, he said:

"Chicago is a great city, but I do wish I had come here before I was converted."

No Chance to Sue

The following is the official report furnished by a station master of the Shanghai-Nanking railroad, in China, of an accident which occurred October 8:

1. The death named—was smashed by the engine on 3-10-07.
2. Has two sons—and—
3. The death without ticket.
4. The death's fault.
5. The death no relative see.
6. The death is deaf and blind no cannot say what was.

Dangerous Illness

An old negro, riding on the train, fell asleep with his mouth wide open. A mischievous drummer came along and, having a convenient capsule of quinine in his pocket, uncorked it and sifted the bitter dose well into the old negro's mouth at the root of his tongue. Soon the darky awoke and became much disturbed. He called for the conductor, and asked:

"Boss, is dere a doctor on dis here train?"

"I don't know," said the conductor. "Are you sick?"

"Yas, suh, I sho' is sick."

"What is the matter with you?"

"I dunno, suh, but it tastes like I busted my gall."

Oh, Well! I'll Try It Tomorrow

A traveler in Ireland relates the following conversation with an innkeeper:

"At Brodigan's all the clocks are from ten to twenty minutes fast or slow.

"How do you catch trains?" I asked Mr. Brodigan.

"Sure, that's not an every-day matter, and why be foosthering over it? But we do four times out of five, ma'am."

"How do you like it the fifth time when you miss it?"

"Sure, it's no more trouble to miss the wan time than to hurry five times. A clock is an overrated piece of furniture to my mind."

On a Narrow Margin

A committee member, after attending a meeting last night and conversing for some time in the hotel lobby, entered the grill at a late hour. He glanced at the clock, then at the calendar, then at the menu, from which he ordered a frugal repast. Then he waited, nervously.

At the end of ten minutes, he succeeded in catching his waiter's eye.

"Look here, how long am I going to have to wait for that grub I ordered?" he inquired.

"Oh, I guess it won't be long, now," yawned the waiter. "In a hurry?"

"In a hurry? Say, I ordered a meal without meat because it is meatless day. And if I have to wait five minutes longer it will be wheatless day, and I won't get a darned thing!"

An Improved Design of Armored Rope

A ROPE FOR USE ON hoisting, haulage, dredging and steam shovel equipment which involves radical and important departures in wire rope construction is being manufactured by the Waterbury Company of New York. The rope is known as armored rope, Gore patent, and is comprised of six strands and either 19, 37 or 61 wires to the strand, as conditions may demand. Its feature of construction is that each strand is covered or wound with flat wires having convex edges which

A Section of Waterbury Armored Rope

form a protection armor, relieving the wires carrying tensile stresses of all abrasive wear and thus retaining the strength of the rope, even after the flat wires are worn completely through. These flat wires are specially drawn and annealed and for that reason they do not project and break off when worn through, but are gradually crowded into the interstices of the rope, thus adding to the wearing surface and hermetically sealing the lubrication within.

By reason of the armor protection at the crowns of the strands and the internal points of wear where the

Cross Sections of the Rope

wires and strands converge, and chafe during flexing movements it is possible to select for the wires in tension those which show a high torsion test. This, together with the internal lubrication, insures flexibility and a long bending life.

It is also claimed for the rope that, because the tensile strength wires are relieved from abrasion, the factor of safety is maintained longer than in rope of other construction. In addition to the added life of the rope itself, it is economical in that the rope wears with use to a smooth, round surface and does not affect the score of the sheaves and drums.

Service Life of Manganese

Frogs and Crossings

SOME VERY INTERESTING DATA relative to the life and the economy derived from the use of solid manganese construction in frogs and crossings have been compiled by the Indianapolis Switch and Frog Company, Springfield, O. During the last 10 years more than \$1,000,000 worth of manganese construction has been installed on over 100 of the leading roads. The service records on these roads indicates that, on the average, the

life of manganese frogs and crossings is about 4 times that of Bessemer and open hearth construction. In several instances manganese frogs have shown a life 20 times that of fabricated frogs used in the same location previously, notwithstanding increases in the traffic and the weight of rolling stock since the installation of the manganese.

At the present time the use of manganese construction is particularly advantageous for several reasons. Solid manganese construction is virtually confined to the patterns and integral or unit construction. Fabricated construction requires numerous sections of rail, fillers, bars, plates, bolts, special shapes and forgings which under present conditions are difficult to obtain and require considerable labor. The use of manganese reduces the renewals necessary with other construction.

The Indianapolis Frog & Switch Company's specialties are so designed that the rails, as they come from the mill, join to the manganese portion in self contained easer arms, forming a lap joint protecting the rail ends as well as the manganese from joint pounding.

Improved Concrete Mixing Equipment

CONCRETE MIXER plants mounted on railway flat cars have been in use so long for doing concrete work on railway structures that they possess little that is novel except when some new modification of design is introduced to secure special adaptation to a particular class of work. In the earlier designs, particularly those on track elevation work in Chicago and elsewhere, the problem was essentially simple, as practically all of the forms could be filled with concrete from a mixer car standing on a temporary track at the new grade by the use of a spout placed directly under the mixer outlet. With the introduction of the tower and spouting system of handling concrete, it was not long before steps were taken to apply this system to mixer plants on cars. Towers were added so that the concrete could be elevated to

A Counterweight Chute Suspended From the Tower Boom

a sufficient height to permit the spouting of the concrete at some distance to either side of the track upon which the mixer car was stationed. To permit ready moving of the mixer car, the towers were usually made either of a folding type or facilities were provided for the ready removal of the tower when it was necessary to transport the car to some other point.

A more recent development is the application of a special counter-weight chute supported from a boom and thereby giving a greater flexibility in distribution. This special chute consists of a structural steel truss of tri-

angular shape, supported from its apex by means of a rope tackle attached to a steel boom suspended from the side of the tower. This triangular truss carries a spout on its top chord extending from the apex down one side of the triangle, the weight of this spout and its contents being balanced by a concrete counter-weight suspended from the opposite end of the truss. The truss can be readily revolved in a horizontal plane about the point of suspension at the apex and as this is also the point where the concrete is received from the spout above, it is readily possible to turn the counter-weight spout in any direction without interfering in any way with the discharge of the concrete.

With concrete work close to the track or under other conditions in which it is more convenient to use the direct spout, the counter-weighted spout can be readily removed and can be as readily re-attached when work demands its use. This equipment is manufactured by the Insley Manufacturing Company, Indianapolis, Ind., and has been applied to concrete mixer equipment on the New York, Chicago & St. Louis, the Delaware, Lackawanna & Western and several other railroads.

Re-Use of Forms Results in Important Economies

IN THE RECONSTRUCTION of the Illinois Central bridges over the track elevation subways within the city of Chicago, important savings both of materials and money are being effected by the use of "Blawforms." Under the construction plan adopted the railroad purchased all forms for use on this work, and the erection of the forms and the placing of concrete has been done by contractors. The furnishing of the forms by the railroad permitted their use by the different contractors

Forms Ready for Filling

engaged in the work, thus making it unnecessary for the individual contractors to invest heavily in equipment that after the completion of their portions of the work would be of no further use to them. It is possible for the railway to secure service from the forms after the completion of this particular project by adopting a similar design in future work. The construction was begun in the spring of 1915 and has been carried on continuously up to the present time. During this period the forms

have been used by three different contractors, and on an average of about 20 times each. In spite of this heavy service the forms are still in good shape, and it is estimated that by the time the work is completed they will have been used 30 times each.

In 1915 the work consisted of the construction of six bridges, each of which contained three rows of columns and cross girders. Forms were furnished for two complete rows, 114 ft. wide. These bridges were built by the John J. O'Heron Company of Chicago. In 1916 Bates & Rogers, contractors, built two bridges, and in 1917 the Gould Construction Company built four bridges.

Completed Rows of Columns and Cross Girders

Each of the contractors utilized the forms furnished by the railroad. As the work progressed northward the width of the bridges was increased, and at Sixty third St. the width is 160 ft. In some of the crossings four rows of columns and cross-girders were built, and on some only three. The contractor had at all times enough forms to set up two rows. The forms are coated with a light form of oil after each use and the work obtained is very satisfactory.

This project is being carried on under the direction of the bridge department of the Illinois Central, C. C. Westfall, bridge engineer. M. D. Thompson, assistant bridge engineer, is in direct charge of the work. The "Blawforms" are manufactured by the Blaw-Knox Company of Pittsburgh, Pa.

The Steel Fence Post as a Labor Saver

TIME, WEATHER and fire continue their unceasing attacks on right of way fence posts, notwithstanding the fact that the American railroads at the present time cannot find enough men to dig the holes necessary to replace the posts that are being destroyed. This is probably the most important reason why steel fence posts which can be driven with a maul in a few minutes' time are being used in large quantities by the railroads in current renewals as well as on new work. Records kept by the Madden Company, Chicago, go to show that under average conditions two men, one driving the posts and the other one holding them, can set about 320 posts, or sufficient for a mile of fence in one day.

The details of this type of posts is shown in the accompanying drawing, and is seen to consist of an 1 1/4-in. by 1 1/4-in. structural steel angle to which a triangular plate is riveted to increase its resistance to overturning. The lower end of the angle is chamfered to facilitate driving. Holes in one leg of the angle, punched two inches center to center, afford a convenient means of fastening any type of fencing by means of staples, which are clinched with a special tool on the inside face of

the angle. These posts are considerably lighter than a standard wooden post, a fact which has been of no small advantage in shipping them during the current shortage of cars. This, in combination with their small

Steel Posts in Service 15 Years

cross section, enables a car which will hold 800 ordinary wooden posts to carry 5,200 of the steel posts.

Aside from the ready driving feature the users of these posts draw attention to the fact that grass fires on the right-of-way which destroy so many wooden posts before their natural service life has expired, do no damage to the metal posts. This fact has been found of particular advantage by the track men on those railroads in the west where it is the custom to burn the grass to a

Details of the Post and Fencing

furrow plowed some distance outside of the right-of-way line. Where the steel posts are used there is no longer any need of detailing men to protect the fence posts as the fire burns across the right-of-way line.

The accompanying photograph illustrates the character of service that has been secured from steel posts

along railway lines. The posts shown are on the right-of-way line of the Indiana Harbor Belt near Chicago, and have been in service since 1903. They are still in good condition. They are of practically the same design as those now being made, except that the plate is omitted from the base. These posts were treated with an asphalt paint, whereas the coating now applied is either a standard galvanizing or a rust inhibitive baked enamel.

An Improvement in Concrete Fence Posts

ONE OF THE MOST DIFFICULT problems to solve in concrete fence post construction has been the provision for the necessary additional strength at the ends and corners of the fences. For a long time the prevailing solution was the use of a timber stick for the brace post in connection with a concrete end or corner post that differed from the standard line post only in size. Various obstacles have made it difficult to produce a brace post in concrete possessing the same desirable qualities readily obtained in the standard post.

These difficulties seem to have been solved by the National Concrete Machinery Company, Madison, Wis., in a new design for the combination of an end or corner post with a brace post. A special feature of this combination is the use of castings on each end of the brace post having the form of short pins, which fit into corre-

The Corner Post and End Post Arrangement

sponding holes in the corner or end posts. Through this arrangement a secure connection is formed which is capable of resisting adequately any tension applied to the fencing material.

Another important feature of the design is that both the corner post and the brace post conform to the standard design followed in the line fence posts manufactured by the above company. The reinforcement consists of National woven steel wire as in the line posts, and the posts are cast in a cylindrical sheet steel mold, whereby it is possible to make use of the casting machinery in which the concrete is poured into the end of the mold while it is being jostled or worked rapidly up and down. This feature of the manufacture of these concrete posts has been instrumental in producing concrete of high compressive strength.

The corner post is 5 in. in diameter at the top and 7 in. in diameter at the bottom, and has a total length of 8 ft. The brace post has a uniform diameter of 4 in. and a length of 8 ft.

While the end or corner fence arrangement shown in the photograph is new, the novelty lies in the combination of the end and brace post rather than in the use of features that are entirely new. The end post in combination with another type of brace post has been in use for 8 years on the Cleveland, Cincinnati, Chicago & St. Louis, while the brace post with another type of end casting has been used in rural fencing for about 10 years.

The Trackless Train Saves Time, Men and Money

IN THIS DAY when labor is so scarce and operating costs are so high, railway officers are turning more and more to means of reducing handling costs and of saving time and labor as well. Never has the need of saving men been so apparent. Never have labor and money-saving devices been so much in demand, and of these the electric tractor for hauling is probably one of those most in demand because of the savings which have been effected with its use.

As a tangible example of a tractor's capability, attention is drawn to the Forty-third Street station of the Chicago Junction Railway. In this station approximately 1,800 tons of l. c. l. freight are handled daily. The installation of "The Trackless Train" system was brought about in this case, as in many others, by neces-

Rounding a Curve with a Trackless Train

sity. When this freight station was first opened hand trucking was entirely adequate to handle the business, but as the tonnage increased it was soon apparent that the cost of handling was becoming too high and congestion was occurring almost daily. The hand truckers were unable to keep the platforms clear and transfer the freight as fast as it came in. As a result of this condition, after careful consideration, electric trucking was installed with entirely satisfactory results.

In installing the electric tractors, no changes were made to accommodate the new equipment. Operating arrangements were maintained exactly the same as when hand trucks were used. The hauls were the same; the

floor and working conditions were the same, no sharp turns or corners were taken out; in a word, no effort was made to smooth the way for the tractors. Careful deduction and calculations show that even under prevailing labor and wage conditions, the saving effected by use of the tractors amounts to 4 cents per ton. Figuring on a total daily tonnage of 1,800 tons, the daily reduction cost is \$72 and amounts in one year to \$22,536.

The saving was brought about primarily by the fact that the use of the electric tractor reduced each gang of men from five and six to three and four. With the electric tractor in operation it became possible to make up trains of 3 to 12 or 14 loaded trailers. The installation of the tractor did not mean that the old trucking equipment was discarded. The old trucks were adapted

The Tractor Hauling a Train of Loaded Trailers

to the new system by a few simple changes or additions and by the application of ingenious but simple hitches. They track perfectly, even around sharp right angle turns. The cost of the tractor was practically the entire cost of the "Trackless Train" installation, as the converting of the trucks and the addition of the hitches involved but minor expenditures.

The tractors used by the Chicago Junction are four Type Z machines, made by the Mercury Manufacturing Company, Chicago.

A New Form of Track Spike

IN KEEPING ABREAST with the demands placed on it by an ever-increasing traffic and the use of heavier motive power and equipment, the design of the track as a structure has been constantly changed and improved. There is, however, one important unit in the structure which has not been subjected to the radical changes and improvements common to the remaining units. This is the track spike which, with the single exception of the screw spike, has remained practically unchanged in its fundamental design since its early use.

Recently a track spike has been developed and placed on the market by George A. Post of New York, which embodies radical changes both in design and in method of application. As may be seen in the photograph, this is a round, arch-head spike which is applied at an angle of 60-deg. from the horizontal. It is used with tie plates with diagonally disposed, tight-fitting holes, and when applied this combination effects a unit construction of the tie, tie plate and rail, which tends to prevent the creeping, spreading or canting of the rails. The diagonal in-

clination of the spike with reference to the wood fibers in the tie, together with the tight fit in the holes in the tie plate, prevents the spike from being withdrawn from the tie by the lifting action developed by the undulation of the rail under traffic.

Four spikes per tie are used except at rail joints. At joints the spikes are driven outside of the slots in the angle bars. The spikes may be driven either in holes bored in advance or in holes made when the rail is laid.

While the action of the rail under traffic will not loosen the spikes, they may be pulled with an ordinary claw-bar when ties are being renewed. In renewing rail it is not necessary to pull the spikes. Instead they are lifted slightly and given a quarter turn off the flange which permits the old rail to be removed and the new one set in.

The Arch-head Spike

In addition to effecting a saving of labor this feature also conserves the tie as the creating of additional spike holes is avoided.

This spike has been tested out on two important eastern roads under conditions ranging from tangent track to a compound curve with a maximum of 6 deg. curvature in a track carrying traffic amounting to more than 100,000 tons per day and have shown highly satisfactory results.

A New Switch Stand

For the U. S. Army

THE UNITED STATES ARMY has adopted a new switch stand for use with portable turnouts built of 25-lb. rail in track of 25 $\frac{3}{4}$ inch gage. In addition to the use by the army this stand is of interest because of the difficulties encountered in working out the design. It was specified that the stand should not be over 3-in. high, that it should throw parallel to the track and that nothing should project below the level of the tie. This meant the exclusion of all existing types of switch stands and the development of a new and original stand.

By referring to the drawings it will be seen that the stand as built meets these specifications fully. In addition the stand has only three moving parts, the throwing lever, the crank lug and the sliding block. It can be disassembled instantly in the field without tools by simply removing the cotter pin. Another important feature of the stand is the absence of bolts, it being a boltless switch stand. The stand can be virtually renewed after becoming worn by hard service by removing the sliding block,

Plan and Front Elevation of the Stand

giving it a quarter turn, and replacing it. This brings two entirely new surfaces into play, and has the same effect as using a new part.

A spring connecting rod is used with the stand, making it automatic. The lever is on "dead center" when in normal position so that latches are not required. The stand can be locked if desired by utilizing the hole in the lever and the one in the upright flange of the base casting which registers when the lever is in either position.

This stand was designed and manufactured to the specifications of S. M. Felton, director general of military railways, by the Bethlehem Steel Company, Bethlehem, Pa.

An Illustration of the Destruction Wrought by the Germans During Their Retreat on the Western Front

EDITORIAL

Railway Age

EDITORIAL

DAILY EDITION

In spite of the fact that the large attendance in the convention hall when the report of the Committee on

Discussion of Labor Report Restricted

Economics of Railway Labor was presented indicated the widespread interest in this subject, the discussion of the report was very limited and in this way disappointing. Either the larger portion of the membership is not yet awake to the seriousness of the labor situation or the men hesitated to speak because of the conditions existing on the railways at the present time and the fact that the director-general and his staff are studying labor among other problems. The latter is very probably the more correct explanation. By failing to take part in the discussion much information was withheld from the membership at large which would be of great importance in arriving at the correct solution of the problem.

The most gratifying feature of this year's exhibit is the very large number of railway men who are spending

Large Crowds at the Coliseum

a good deal of time in the Coliseum not merely looking at but carefully studying the devices on display. *The Railway Age* doubts if any previous exhibit ever received as much intelligent, practical attention from railway men as this one is receiving. Many railway officers who attend conventions under present conditions naturally and properly feel that they must use their time to better purpose than ever in order to give the railways the very best return for the time they take away from their offices. The exhibit at the Coliseum will be closed tonight at 10 o'clock. It is to be hoped that every railway officer attending the conventions who has not visited the exhibit will yet do so.

The Discussion of the Report on Economics of Railway Labor points to the need of a definite policy concerning

Methods of Recruiting Labor

the recruiting and distribution of available labor under the existing status of the railroads as brought about by Government control and War conditions. Government control if necessity will require certain departures from current practice and many such changes are being made as the administration of the railroads under Government control assumes definite form. The question arises regarding the policy which will be pursued in the hiring of laborers. As pointed out in the discussion, various state and national labor bureaus have indicated a desire to be of assistance in the railway labor field, while in at least one case there has been an expression of a desire on the part of the Government that the railways abandon existing methods of recruiting men in favor of the Government bureaus. While overcoming the exploitation of labor, which is all too common with the operation of private labor agencies, available testimony goes to show that many governmental bureaus for securing labor are subject to serious objections, prominent among which is

a general lack of efficiency, assigned in some cases to an over-abundance of red tape. In view of this, any movement tending to destroy existing means of recruiting labor before insuring the effectiveness of Government bureaus would seem ill advised.

In the report of the Committee on Ballast it was pointed out that while the consensus of opinion of railway men is strongly against ballasting by con-

Some Advantages of the Contract System

tract in normal times, such a plan is considered a necessary evil by many men in times of acute labor shortage. This is significant of the trend towards carrying on maintenance work by contract, which is now being tried out to a greater or less extent on several important roads. In the report 11 reasons are given as arguments against ballasting by contract on operated lines. While most of these reasons may also be advanced against contracting other maintenance work, the advantage of contracting such work as farmers or others living along the line, are equipped to do as well or better than the railroad forces is evident. This work includes fencing, mowing of the right-of way, small jobs of ditching, etc. Again there are many advantages in the plan of contracting small repair work such as renewing the plank in station platforms, replacing broken window panes, repairing broken locks and many such items. Such a plan makes it possible to make these small repairs without delay; does away with the necessity of sending a man from headquarters to do an hour's work or less with the probability that his entire day will be taken up by the trip, and enables the men to be utilized on more important work without interruption, thus making it possible to carry on a greater amount of work than otherwise could be done. With the present absolute necessity of securing the maximum service from their forces, railway men can ill afford to overlook the possibilities of developing the contract plan of doing maintenance work even to the point of including the more important items such as ballasting, or the renewing of ties and rail.

Reports presented by several of the committees this year include glossaries of terms peculiar to the subject in hand. As it is an established custom of the Association that definitions are not subject to discussion on the floor of the convention, it is entirely probable that they do not receive as careful consideration by the association members attending, as do the other portions of committee reports. However, upon acceptance these definitions become a part of the Manual and as such they should conform to the high standards set by this Association for its established rules of practice. This means that the definitions must fulfill the prime and only justifications for their publication—that they convey the accepted meaning of a technical term to one not familiar with it, and eliminate any confusion of meaning resulting from

Definitions Must Be Accurate

a current looseness in the use of the term. To comply with these requirements the definition must have literary merit—the diction must be accurate, and the construction sufficiently lucid to convey a word picture while allowing no opportunity for confusion, even to one entirely unfamiliar with the subject. Limitations as to space in the manual require that definitions be given only when the term is not defined in a standard dictionary or when its meaning as applied to a particular branch of engineering differs from the definition found in the dictionary. A perusal of the definitions submitted by the committees this year will convince the reader that some of them have been drawn without adequate consideration of the principles outlined above.

The Analysis of Yard Operation

THE PAST WINTER HAS demonstrated the lack of terminal facilities at many points, particularly in the east. The lines converging at the terminals have been able to deliver more cars than these yards have been able to classify and forward, so that the capacity of entire divisions and even of systems has been limited to that of one or more yards.

Where increased capacity cannot be secured by the construction of an entirely new and independent terminal, it is generally inadvisable, if not absolutely impractical, to enlarge and rebuild a yard under traffic conditions such as those which have existed during recent months for the interference with operation which will necessarily result will decrease the capacity and add still further to the congestion. However, as the Committee on Yards and Terminals pointed out in its report presented yesterday, there are frequently points of local congestion in a terminal which can be relieved by relatively simple changes. Frequently the adoption of as simple an expedient as the moving of a crossover has eliminated interference between opposing movements and resulting serious delays. It may be claimed that all such points of congestion have been eliminated so far as possible in the design of a yard and that there is not, therefore, opportunity for further improvements. However, conditions change rapidly and they have changed particularly during the last year. Such changes frequently lead to revisions in operating methods and give rise to conditions differing materially from those existing when the terminal was laid out. It is for this reason that a detailed analysis of a yard and its operation at intervals is valuable in bringing to light the changes which have taken place and in directing attention to those points where delays occur. There is no better time to make such analyses than the present, both because the need for improvements is great and also because the defects are now most evident.

Control of Tie Renewals

THE REPLIES RECEIVED from 100 railways in answer to questions sent to all the principal roads of this country have brought out the fact that in the majority of cases the responsibility for tie renewals rests on the section foremen. This is in direct contrast with the practice followed on a few roads where tie inspectors are employed or where the roadmasters are required to make detailed inspections and to indicate the ties which are to come out.

Probably an average of 300 ties per mile of track are renewed each year or approximately 2,500 ties per section. With ties costing one dollar each this means that a section foreman is responsible for the expenditure of

from \$2,000 to \$3,000 annually for this one account. Some of the larger roads employ 2,000 or more section foremen, in which cases the foremen collectively authorize an annual expenditure of \$5,000,000 to \$6,000,000.

It is often urged as an objection to the plan of holding the roadmasters responsible for this work that they are already overburdened and if given this duty they will be unable to give it the time necessary to insure good results. This argument is not without merit. It, of course, does not hold true if "tie spotters" or inspectors are employed. Instead the chief objection to the last plan is based on the fact that the "spotter" has no responsibility in the maintenance of track after passing over it.

On the same roads which are leaving this work to the section foremen, with its responsibility of deciding on the expenditure of millions of dollars annually, it is safe to say that the division officers are required to secure the approval of the management for expenditures much smaller than the cost of tie renewals on a single section. The practice presents the opportunity for a foreman to show a low cost of maintenance per mile of track at the expense of safe track or to go to the other extreme and sacrifice economy to appearance. In other words, it introduces the personal element to a great extent. Certainly the amount of money involved is sufficient to warrant the responsibility being concentrated in one with wide experience and good judgment.

Plans for Next Year

WITH THE SUCCESS OF THIS CONVENTION a most natural question arises as to plans for the meeting next year, for surely the convention in 1919 should prove of equal if not greater benefit than the one now in progress. Assuming that a convention should be held, it would seem desirable to give immediate consideration to the program since the effectiveness of the meeting depends upon the work done by the committees and this work should commence as soon as possible.

Obviously some matters presented at the meeting this year have been of more immediate importance than others from the standpoint of the most vital object of the times—the winning of the War. However, owing to an inability to control the discussion under prevailing rules of order, some matters but remotely concerned with the all-important object of the hour were given as much if not more time before the convention than subjects of vital concern. An improvement in this situation as applied to future conventions would seem to demand an arrangement of the work of committees, and the reports to be presented by them, whereby particular emphasis should be given to matters closely allied to current needs. However, in making plans along any such line due consideration must be given to the fact that these are times of rapid changes. The measures of today may not meet the emergencies of tomorrow, so it would seem desirable to give the committees a certain amount of latitude in their instructions in order that they may be enabled to adjust their work and reports to the changing conditions. This would require some supervision, but a general instruction, to consider the matters of most immediate and vital importance, would seem to require but little amplification.

There is no question but that the convention has been justified by the results obtained this year. It can be done again, but the greatest good can be secured only by definitely molding the activities of the association to the changing times, not only as to the work of the committees but as to the discussions at the various sessions. But the duty of the membership does not end here, for as

pointed out by Chairman Lewis of the Committee on Economics of Railway Labor, it is the patriotic obligation of all members to participate in the work by giving conscientious and prompt attention to any circulars sent out by committees. It is only by doing their part in full measure that the association can accomplish the desired end.

Bridge and Building Meeting

About 20 members of the American Wood Preservers' Association, including a number of members of the Executive committee, met in room 1124 of the Congress Hotel at 4:30 yesterday to make plans for the convention next October. At the annual meeting held in Chicago last October, New York was selected as the location for the next convention. Owing to the conditions prevailing in the east it was the sense of those present at yesterday's meeting that the 1918 convention should again be held in Chicago.

Sir Edmund Walker

Sir Edmund Walker, who was a speaker at the dinner of the American Railway Engineering Association last night, is one of the most prominent men in Canada, and is almost equally interested in matters of finance, of education and of art. Besides being president of the Canadian Bank of Commerce, he is chairman of the Board of Governors of the University of Toronto, chairman of the Board of Trustees of the National Gallery of Canada at Ottawa, chairman of the Royal Ontario Museum, and chairman of the Art Museum of Toronto.

Today's Program

The reports scheduled for presentation before the convention today are as follows:

- Roadway.
- Iron and Steel Structures.
- Wooden Bridges and Trestles.
- Masonry.
- Ties.
- Stresses in Railroad Track.
- Rail.
- Signs, Fences and Crossings.
- Track.
- Wood Preservation.

Following the presentation of these reports the officers-elect will be installed and other business transacted.

The Necessity of Coal Conservation

A talk was given before the association yesterday morning by O. Monnett, a member of the Coal Conservation Committee, United States Fuel Administration, Illinois section, on the necessity of coal conservation and the precautions to take in the storage of coal. He stated that the United States will demand bituminous coal during 1918 to the extent of 600,000,000 tons and from the best available knowledge and information the production will not be in excess of 550,000,000 tons, the country being confronted with a shortage of 50,000,000 tons, which will have to be made good by more scientific methods of combustion and by conservation in other ways or it will be necessary to shut down some of the less important industries. Bituminous coal can be stored under water for any length of time without deterioration or loss. Where it is necessary to store it in open piles precautions should be taken to prevent spontaneous com-

bustion. Mr. Monnett gave a few of the suggestions gotten up by the Fuel Administration with reference to precautions recommended for minimizing the danger from spontaneous combustion of coal in storage.

A Relic of Cambrai

The photograph shows a German helmet which Fred Poor, president of the P. & M. Company, Chicago, has recently received from Captain Fred A. Preston, aircraft division, Signal Corps, located in France and formerly manager of sales with this company. This helmet was taken from a dead German soldier after the battle

A German Trench Derby

of Cambrai. The condition of the sweat band in the helmet indicated that the German had been running some before being killed. This helmet is considerably heavier than the French helmet, which in turn is heavier than those worn by the American troops. It is of pressed manganese steel construction and weighs approximately three pounds.

Signal Committee Dines

The annual dinner of Committee X of the A. R. E. A. and R. S. A. was held Tuesday evening in the Engineers' Club.

The following members and past members were present:

J. A. Peabody, signal engineer, C. & N. W., Chicago.
 Frank Rhea, Saltburg, Pa.
 G. E. Ellis, signal engineer, Division of Safety, I. C. C.
 F. P. Patenall, signal engineer, B. & O., Baltimore, Md.
 A. M. Bart, chief engineer, main of way, N. P., St. Paul, Minn.
 Mott Sawyer, Supt. C. M. & St. P., Spokane, Wash.
 M. H. Hovey, consulting engineer, Madison, Wis.
 W. H. Elliott, signal engineer, N. Y. C., Albany, N. Y.
 F. L. Dodgson, consulting engineer, Geo. Ry. S. C., Richmond, Va.
 J. C. Mock, signal-electrical engineer, M. C., Detroit, Mich.
 T. S. Stevens, signal engineer, Santa Fe, Toledo, Ohio.
 A. G. Slaver, consulting electrical and signal engineer, Chicago.

Too Mucha da Big Eyed Chick

A bunch of "dagos," working on the track, killed a big hoot owl which they dressed, broiled and sold as a delicacy to the noonday meal. About 3 p. m., the boss noticed a cessation of work on the part of the dagos. An investigation found them crawling to the railroads and vigorously hollering "Too mucha da eye!" The boss proceeded to address them. "Hey there! What's all the matter with you 'dagos'? Lookin' fur another job? Hey!" One of the Italians replied in a faint voice: "Oh, God! Sicka da bel. Too mucha da big-eyed chick."

American Railway Engineering Association Proceedings

A Report of Wednesday's Sessions Including the Presentation of Six Committee Reports With Discussions

THE SECOND DAY'S SESSION of the American Railway Engineering Association was called to order at 9:30 a. m. by President Sullivan, with the room well filled. Reports were presented during the day by the committees on Electricity, Yards and Terminals, Economics of Railway Labor, Ballast, Economics of Rail-

way Operation and Uniform General Contract Forms. Abstracts of these reports and of the discussions are given below. The report of the Committee on Roadway was postponed until today, while the report of the Track committee, originally scheduled for presentation on Tuesday, will also come up today.

Report on Yards and Terminals

THE PRINCIPLE OF good yard design comprises three fundamental requirements, which are:

- (1) To get the train into the yard and clear the main line.
- (2) To classify the cars in the yard, which includes all intra-yard movement of cars and engines.
- (3) To get the train out on the main track and clear the yard.

With these principles in mind, the following suggestions arise in the form of direct questions:

1. Can you extend your yard lead or construct one adjacent to the main track of sufficient length to hold a maximum train, so that an arriving train can clear the main track quickly before entering the yard and a departing train may clear the yard quickly before going out on the main track? If trains arrive or depart at close intervals, can a second lead track be constructed? These lead tracks are sometimes called receiving or departure tracks.

2. Are your connections between (a) main tracks, (b) lead tracks, (c) drill tracks (or tracks on which switch engines operate), (d) yard tracks, so arranged

that trains may enter and leave the yard with a minimum of interference with switching movement?

3. Are your yards so arranged and have you sufficient running tracks so that you can take a transfer from one end of the yard to the other without interfering with the usual switching? Could the efficiency and capacity of the yard be increased by the enforced holding open of a track (otherwise used for holding cars) as a running track?

4. Are your crossovers so arranged as to give the least interference with switching and the greatest elasticity of movement, or can additional crossovers be put in to secure these results? Where the number of tracks in the classification yard is fixed and where the number of classifications has increased, can connecting crossovers be so located between these classification tracks as to reduce the number of movements for the required classification?

5. If your receiving or departure tracks are too short, can you lengthen one track in each yard in order to take care of the maximum train?

6. Are your caboose tracks so located and have they such connections at each end that cabooses may be handled with the least amount of switching service?

7. Can you take the engine off your train and get it to the roundhouse, and also get it from the roundhouse to an outbound train without materially interfering with switching?

8. Can you facilitate handling road engines by providing a "tie-up," "parking" or "engine storage" track near the engine terminal?

9. Can your yard engines clean fires and take coal, sand and water without delay? Do you change switching crew where engine works, or do you send the engine to "tie-up" track for change?

10. Are the trackmen given an opportunity to repair busy tracks? Are you having yard derailments or delays due to bad tracks, particularly at curves, switches and frogs?

11. Can you quicken the movement of trains through the throats of the yard by putting on switch tenders at these points during the busiest part of the day?

12. Is the present assignment of tracks in the yard for the various operations the proper one?

13. Can you in any case improve the yard movement by reversing the movement of traffic?

14. Can you facilitate switching by making inexpensive changes in grade in the yard at any point? If you are operating a hump, can you change the grades of the hump and facilitate switching?

15. Are you using the cut-list system in hump yards to avoid confusion in classification and to fix responsibility for damage while handling cars?

16. Can you improve switching conditions after dark by installing lights?

17. Are you handling any cars through the yard with more movements than are absolutely necessary?

18. Could you facilitate weighing and lessen interference with other switching by rearrangement of existing connections or by the addition of other connections to the scale track?

19. Are your bad-order and repair tracks so located as to require the least amount of engine service?

20. Can you lessen the cost of icing cars by changing the track layout?

21. Are your car inspectors properly organized, and so located and equipped that they do not delay switching or the departure of trains?

22. Can some terminal delays be avoided by the installation of compressed air lines to charge the brake equipment of trains and avoid the delay of pumping air on the train after an engine is coupled on?

23. Are your outgoing trains delayed "Waiting for Orders?"

24. Is your yard or road service hampered due to lack of proper telephone facilities or other means of communication?

25. Is the time of switching crews wasted by faulty handling of waybills?

Scale Specifications and Rules.

The committee presented specifications for track scales which were practically the same as those submitted a year ago and published in the *Railway Age Gazette* of March 22, 1917, page 583.

The committee also submitted as information the rules adopted by the American Railway Association on Equipment for Testing Track Scales and on the subject of Scale Test Cars. The committee has not as yet made a study of these questions and is, therefore, not in a position to recommend the adoption of these additional rules and specifications by printing them in our Manual.

Conclusions

The committee recommended:

(1) That the Catechism of Yard Design be printed in the Manual.

(2) That the Track Scale Specifications and Rules be adopted and printed in the Manual.

(3) That the rules adopted by the American Railway Association on Equipment for Testing Track Scales and on the subject of Scale Test Cars be received as information and printed in the Proceedings.

Suggestions for Next Year's Work.

(1) Make critical examination of the subject matter in the Manual and submit definite recommendations for changes.

(2) Report on the handling of freight in double deck freight houses and the cost of operation. Also report on handling freight by mechanical means.

(3) Continue study of typical situation plans of passenger stations and methods of their operation.

(4) Report on classification yards.

Committee: E. B. Temple (P. R. R.), chairman; B. H. Mann (M. P.), vice chairman; W. G. Arn (I. C.), H. Baldwin (C. C. C. & St. L.), Miles Bronson (G. C. T.), G. H. Burgess (D. & H.), A. E. Clift (I. C.), L. G. Corbus (B. & O.), H. T. Douglas, Jr. (C. & A.), A. C. Everham (U. P.), F. M. Hastings (R. F. & P.), H. W. Hudson (N. Y. Conn.), D. B. Johnston (P. L. W.), F. E. Lamphere (B. & O.), H. A. Lane (B. & O.), A. Montzheimer (E. J. & F.), H. J. Piefer (T. R. R. of St. L.), S. S. Roberts (Cons. Engr.), C. H. Spencer (I. C. C.), E. E. R. Tratman, E. P. Weatherly, W. L. Webb (Cons. Engr.), A. J. Wharf (P. & P. V.), J. G. Wishart.

Discussion

H. B. Mann (vice-chairman): The question of the present emergency, as far as terminals is concerned, seemed to be divided into two parts: first, congestion in the yards and terminals, which may be created either by some big error in a certain yard, which is apparent to everyone, and may be corrected by the mere spending of money in large amounts; and second, a collection of little things, such as congestion in certain yards and terminals due to little defects, which have as much of an effect as one big one.

The committee sent out a circular to a number of railroads, and while they received very encouraging replies from a few men, the consensus of opinion seemed to be that the experts that were required were not available. If experts were not available, the committee felt that the association had matter in the Manual that might assist, and if it could be placed in a form that those who were interested could handle it, we still might have the necessary results.

With that end in view, they felt that a catechism was perhaps something that officers not interested in the association, or not having the time to read the Manual, could handle in the best way. The committee then formulated a list of 25 simple questions, taken almost entirely from matter in the Manual, put up in a form that men who do not read the Manual might apply, and apply in two ways. First, through the members of the association on their individual roads; second, railroads, big lines or those who knew how to handle associations, but had not had that interesting Manual of recent and practical practice.

That handling could be begun in two ways. First, by the committee of experts that they might send out; second, by sending out the list of questions to each division or each officer interested, and have him answer for or not for that division, and send those replies in to the headquarters of the property, and then the correct headquarters could take the necessary action.

E. B. Temple (N. Y. C.): I wish to see an explanation of conclusion 2 that this year. But worked in a co-operative way not only with the Special Committee on Track of the American Railway Association but the Com-

mittee on Iron and Steel Structures of this association; also a committee of the Scale Manufacturers' Association, and there is one correction that the committee would like to have you consider as made without objection. That is with reference to the capacity of scales. Leave out all after the first paragraph. This suggestion has been made after a careful consideration of the specification by a member of the Committee on Iron and Steel Structures of this association.

The President: It is understood that under the heading "Capacity" the vice-chairman suggested that everything after the first paragraph will be omitted. That includes the matter under the second paragraph down to (b) under section 3, paragraph A.

(Mr. Baldwin then read the balance of the heads of the reports, numbers 3 to 11.)

O. E. Selby (C. C. C. & St. L.): I move the adoption of the conclusion and the placing of the specifications in the Manual.

(Motion carried.)

The President: The third conclusion simply recommends that the matter be received as information, which the Board will take cognizance of.

(The committee was dismissed with a vote of thanks.)

The President: We have the following letter from the Regional Director, R. H. Aishton:

"This will acknowledge receipt of your letter of the 30 instant, together with proof of the current report of the Committee on Yards and Terminals relating to 'War Emergency Yard Improvements' and the 'Catchism of Yard Design Operation.'"

"I think that your suggestion at this time that a copy of this report be placed in the hands of every operating officer would be of very material advantage in the consideration of the various matters in so far as this particular regional district is concerned, and I will be very glad, indeed, to see that a copy of the report is placed in the hands of each of the regional western railroads, and will, furthermore, suggest similar action to the other regional directors. One of the large problems confronting us is increasing our capacity and the suggestions are directly in line with this policy.

"I would suggest that a sufficient number of copies be printed for distribution, and I will see that they reach the various railroads, together with some comment of your own about the matter."

Report on Economics of Railway Labor

THERE IS NO SUBJECT of more importance to the railways than labor. The increasing cost of living, and the removal from the American field of many thousands of workers from all walks of life for military duty, and of other thousands to war industries, only partially explains the present difficulties of employers. There is an unrest among men; there is a labor atmosphere surcharged with an energy which must be wisely directed to prevent dire calamity.

The committee presented an indexed tabulation of publications each of which treats wholly or in part on some phase or phases of the Economics of Labor. This tabulation gives the name of the author, the title and date of the publication, and the shortest possible description for the guidance of the investigator.

Methods of Securing Labor

The following are the principal methods employed on American Railways for obtaining maintenance of way and construction labor:

(1) Through the Foremen: This is generally applicable in rural districts.

(2) Through Padrones or Interpreters: This is the method generally used in obtaining foreign labor. The laborers are engaged through their representative who, as a rule, either acts as an assistant or intermediary between the foreman and the men and is paid at the rate of an assistant foreman.

(3) Through Labor Agents: These agencies are generally located in the larger cities where surplus labor congregates, the labor agent acting as a sort of middleman between the laborers and the railway. In many cases the railways undertake to obtain all their supply from some representative labor agent. The latter also may represent several railways.

(4) Through Contract Feeding Companies: These companies contract with the railways to feed their labor and, in order to keep the camps full, they will also arrange with the railways to supply the laborers. As a rule, the latter are confined to the floating labor, but not to gangs of foreign labor. The feeding companies usually arrange with labor agents to supply the men for them.

(5) Through Exclusively Operated Railway Labor Agencies: A few roads have provided their own labor agencies in about the same manner as that usually employed by the labor agent, but this has not been developed to any great extent.

(6) Through State and Federal Labor Bureaus: This has been attempted to a greater or less extent of late years, but for various reasons it is seldom that these agencies can supply the class of labor that is required for railway purposes.

(7) Through Representatives of Foreign Governments: In some of the larger cities these men have acted as labor agents for recent arrivals of immigrants from their respective countries in much the same manner as the independent labor agent does. Of late years, this has not been an appreciable factor and since the war it has ceased altogether.

The methods employed by the railways for obtaining labor have, in general, remained the same for many years. They have competed in the past with contractors and manufacturing establishments employing large numbers of common laborers. Labor agents or padrones were formerly the sources of the labor supply, but there has been a steady decline of late years in the classes of men that reach the labor agents. A large part of the better class of unskilled or common foreign labor that formerly went directly to the railways now reaches the mills and factories through channels other than the labor agent, which results, as a rule, in a poorer class of labor only being left available for the railways through these agencies. There has also been a steady decline of all classes of common labor available for railway work, due to better and more remunerative opportunities in other lines of industry. The railways have met this condition in an unorganized and desultory fashion, adhering to original

methods of employment and endeavoring to obtain the additional labor required by various practices such as maintaining a low hourly rate, but adding for extra hours not actually worked in order that the daily wage may be increased without affecting the hourly rate. Also a gradual lessening of supervisory effort on the part of the foreman and others in order to hold the men, has contributed to a greatly decreased efficiency.

The National Immigration law, which became effective May 1, 1917, requires a literacy test and, it is believed, will tend seriously to curtail the supply of common labor; but, with the exception of Mexico, its full effect may not be felt until after the war.

It is believed by the committee that the time has come when there must be a better understanding by the railways of their labor problems; and more study given to the improvement in methods of securing, organizing and educating unskilled or common labor; also that there must be co-operation among the railways, looking towards the conservation of the labor supply, especially in the large centers. Committees consisting of a representative from each railway entering the larger labor centers could, to advantage, be formed to study local labor conditions and to keep their respective companies informed of labor conditions generally. These local committees might be made up of persons who are directly concerned with the employment of the greatest number of laborers in the territory tributary to such centers.

In a study of cost for common labor by the sub-committee on labor of the Chicago Zone Railways (an organization consisting of all the roads entering in Chicago and supporting the Presidents' Conference Committee), the sub-committee has grouped and defined common or unskilled labor as follows:

(a) Native: Consists of laborers who reside in the vicinity, most of whom maintain homes within access of the work. As a rule, this class of labor is the most efficient and no expense, other than the daily wage, is incurred by the employer. The amount of this class of labor available for construction work is usually insufficient.

(b) Foreign: Consists of laborers who come to work in groups usually through a labor agent or one of their own number who acts as a leader. These men usually board themselves. Transportation and free housing are provided by contractors or the railway company.

(c) Hobo Labor: Consists of tramp laborers, nearly all of whom are employed through labor agents; and for whom transportation, housing and feeding facilities are furnished by the contractor or railway company. Laborers in this group differ from those grouped as foreign laborers principally from the fact that they are employed singly and their continuity of service is of such short duration.

It is customary for railways to provide free transportation for common labor when entering their employ. Special equipment is sometimes necessary, and frequently these trips cover long distances. Foreign labor will generally arrive at the destination without desertion; but in the case of the hobo, there is considerable loss, the amount being proportional to the length of the trip and weather conditions. Cases are reported where special equipment was provided for shipments of over 200 miles and less than 20 per cent. of the men arrived at destination. The average arrivals for all distances is probably about 85 per cent.

There is frequently a further loss of about 15 per cent. caused by the failure of laborers to accept actual service upon their arrival at the work. While this is especially true of the hobo, it applies, to a more or less extent, to all classes of laborers who come to the work

singly. For extra gang and construction work it is customary, where possible, to ship men from the labor center so that they may arrive at the work in the morning or early part of the day in order that the men may be set to work immediately; otherwise, the loss from those not accepting service is increased. A certain percentage may be expected to desert after having obtained supper, lodging and breakfast without having performed any work whatever.

Foreign labor is affected quickly by rumors of slight increases in pay and better working conditions. It is not unusual for an entire force to leave the work on a few hours' notice. The rate of pay is not relatively so important with hobo labor as with other types of laborers.

Studies extending over some years indicate that free transportation and intoxicating liquors are among the important factors in promoting short service, which, in the case of hobo labor, is its greatest drawback. These conditions are aggravated by poor working conditions and surroundings. While longer service is obtained from foreign labor transported free of cost, the practice is open to more or less criticism. By means of this universal free movement, common labor is enabled, often upon a mere whim, to move back and forth without cost to the laborer from one part of the country to the other, causing a great decrease in man-power with resulting disorganization and increased cost of work to the railways. It is a question whether better results would not be obtained if all roads were to discontinue this practice and charge for transportation on some basis that, while protecting work at a distance from labor centers, would discourage this wandering tendency of much of the common labor.

Unfortunately, it does not rest with the railways to remove entirely this source of difficulty. A large percentage of free travel is on freight trains, between, in and under cars, which for various reasons, the railways have apparently been unable to control. Town and city ordinances contribute, to some extent, to this troublesome problem. Better co-operation between the railways and states would do much to improve this condition.

Unfortunately, the true reasons are not always given and the figures can only be taken as pointing to the probable cause; the desire for ready money is more frequently the reason. Laborers will leave and return to the same job in the course of a few days, the lost time being spent in idleness. Co-operation between railways and local authorities and better housing and working conditions would greatly ameliorate this condition.

It will be noted in the above statement that the average length of service for the year 1917 is materially increased over that of 1916. This is in part due to greatly improved boarding and housing facilities.

The stopping of immigration caused by the war and the effects which must culminate because of it has, however, completely changed conditions. The conditions brought about by the war now make it imperative that readjustments be worked out which will have for their purpose better conservation of man-power, and more careful selection and continuity of service of the common labor necessary to maintain the railroads.

The committee desires that this be considered a progress report, and that the subject be continued during the coming year.

Feeding and Housing Maintenance of

Way and Construction Employees

No one type of camps or method of feeding men can be offered as a standard applicable to all roads or even

to all gangs on one road or on one division of a road. In many ways each camp is a problem in itself, although a successful plan at one point will be applicable to other camps of the same general character. The most important condition governing the character of the housing and of the food provided is the nationality of the men in the gang. The Italian does not desire the same kind of food as the hobo, nor does he want it provided in the same way. Almost every nationality and class of labor employed on track work has its peculiarities and customs which must be respected, if the men are to be retained in the service of the road.

The highly localized labor of a few years ago has now become a thing of the past. The conditions of the last three years have caused almost all classes of men to move more freely from one part of the country to another than ever before, with the result that there is a greater diversity of forces on almost every road than was found a few years ago. This condition makes necessary the closer study of the housing and feeding of these men in order that their wants may be satisfied in a manner approximating that to which they have been accustomed, for unless this is done they will become dissatisfied and go to other work. On many roads the class of men now employed demand widely differing accommodations from those provided a few years ago.

Extent to which housing is necessary depends on a number of conditions other than the nationality of the men employed. Important among these are the availability of local accommodations and the extent to which the gangs are moved from place to place. The practice is quite general over the country to provide houses for section foremen at points where the foremen find difficulty in arranging for them. Although limited originally to such points where they were provided to enable the roads to hold foremen, this practice has spread on some roads until it has become standard to provide such houses. In past years it was unnecessary, except in isolated instances, to provide housing for section forces, as they were recruited locally and lived at home. With the advent of the foreigner into track work it has been necessary to provide lodging for him, as he is unable to secure accommodations in many communities along the line. This has led to the very common provision of bunk houses at section headquarters in which these men can live. Such facilities are provided for about 75 per cent. of the track forces on the Long Island, which employs foreign labor almost exclusively.

The character of the housing provided for section laborers varies widely. On the Seaboard Air Line, where the negro is employed almost exclusively, it is the standard practice to provide four houses for the use of that number of laborers and their families at section headquarters in addition to the house for the foreman, enabling each negro laborer to bring his family with him. On those roads in the Middle West on which both native and foreign laborers are employed in section gangs, housing is commonly provided only for the foreigner, although no difference is made in the wage.

Car bodies removed from the trucks and placed on the ground are most commonly provided as living quarters for these men, although a number of roads have designed and built bunk houses for this purpose. Where it is necessary to provide housing for laborers of this character, the latter practice is much to be preferred. The car body has little to recommend it other than its ready portability and its supposedly low first cost. At section headquarters, where accommodations of this character will be required permanently or for extended periods, a road can well afford to provide more convenient and sanitary arrangements.

The provision of housing accommodations is even more necessary with extra gangs. Even if the work is such that a gang may be located at one point for a considerable period, it is frequently impossible to recruit a sufficient force locally; and it then becomes necessary in most instances to house such gangs in camps.

In addition to these fixed camps it is necessary to house the men in floating gangs who move from one place to another as the work progresses. This is the more common condition, particularly on the railways in the West, where extra gang work is confined very largely to the renewal of rail and ballast and to similar work which progresses from one point to another. The earliest and the most common type of portable camp is the converted box car. In most cases the cars which are in this service are small and of light capacity, and for this reason they have frequently been condemned as unfit for revenue service. From the nature of its construction a car of this character is difficult to maintain in a sanitary manner and, as a result, it has come into quite general disfavor among laborers in recent years. Because of the important advantage of ready portability the railways have been hesitant about giving up cars for the housing of men, but the general prejudice against them because of their unsanitary condition has led a number of roads to revise their standard plans materially to improve conditions during the last three or four years.

One of the most important objections to the old type of car was the number of men crowded into it, bunks being ordinarily provided for 16 men in a 34-ft. car. Probably the most important improvement which a number of roads have made in the design of their cars has been to reduce the number of men housed in each car. Another important consideration in the design of a bunk car is ventilation. Until recently it has been the common practice to place two windows in each end of a car, one on each side. A practice much to be preferred is that of the Missouri Pacific car, whereby a window is placed opposite each upper and lower berth.

In many cases it is not possible to equip a sufficient number of cars from those condemned for revenue service and it then becomes necessary to take other cars from commercial traffic. The car shortage of this year has illustrated the cost of this practice and has given an incentive to the development of substitutes for the box car which still possess the advantage of portability. Thus the Chicago, Milwaukee & St. Paul has designed a sectional building about the size of a car body, which is built of new lumber by company carpenter forces and which can be taken down and loaded on a flat car for movement from place to place. The Chicago & Northwestern has developed a somewhat larger building which can be handled in the same way. The Southern Railway and a number of other roads have equipped some of their gangs with portable steel buildings, several types of which are now on the market. An important advantage of these portable buildings is the readiness with which they may be fumigated and maintained in a sanitary condition.

Other roads have resorted to tents in which to house floating gangs. The Los Angeles & Salt Lake housed a number of gangs in tents equipped with board floors last year. The Buffalo, Rochester & Pittsburgh also used tents for two or three years, although it has recently abandoned them for portable shanties.

Equipment Provided in Camps

The character of the equipment provided in bunk cars and the responsibility for its provision vary greatly on different roads and, in many cases, between different camps on the same road. It is the common practice for

a railroad to provide the bunks in the cars and also stoves. Beyond this point the responsibility varies, the men providing their own bedding in some instances and the contractor doing this on other roads, while on still others all bedding equipment is provided directly by the railways.

Until a few years ago wooden bunks were almost universally employed in cars and in camps, these bunks frequently being installed in the cars by carpenters in the spring and removed at the close of the season when the cars were returned to revenue service. Aside from the expense of equipping the cars with wooden bunks, these bunks have been objectionable because of the great difficulty in keeping them free from vermin and dirt; and they have been unsatisfactory in other ways. This has resulted in a rapidly increasing use of metal bunks of which several types are now available. While wooden bunks are still to be found in many camps and on many roads, they cannot now be considered in accord with the best modern practice and are not to be recommended for a modern camp.

The men are required to provide their own bedding on a number of roads. On other roads bedding is furnished by the boarding contractor in connection with his arrangement for the feeding of the men. Other roads, particularly in the East, provide the bedding themselves.

Other facilities commonly provided by the railways at camps include stoves, washbasins, etc. There is also a distinct tendency in the more modern camps to provide conveniences for the men, such as shower baths, hot and cold running water, sanitary toilets, etc. In addition to these facilities the Baltimore & Ohio has added a steaming room for the steaming of clothing, and stationary tubs for the washing of clothes in some of its more recent camps.

Another development in some of the more modern camps is the provision of a separate room or car for a lounging or clubroom in which the men can spend their spare time. In some instances where camps have been so equipped, daily and illustrated papers are provided and other inexpensive attractions offered to occupy the spare time of the men and keep them more contented in the service.

The Feeding of Employees

The best method of feeding track laborers is a much disputed question and one concerning which there is much controversy at the present time. Without doubt no one method is equally applicable to all nationalities and to the widely varying conditions. At the same time no one phase of the treatment of track labor is more open to criticism at the present time than this, and it is important that the railways give this subject more attention.

With some nationalities, as, for instance, the Italian, it is necessary to allow the men to feed themselves in their own way. While this frequently results in their underfeeding and lessens their efficiency, it appears to be the only arrangement under which the men will work. However, in most cases it is not only possible for a road to feed its men directly, but it is actually necessary for it to do so, as the only practical way in which the men can be fed.

In the South it is the very general practice for a foreman to feed his men and to charge them for board, the company protecting the foreman against loss by deducting the amounts due him from the pay of the men. With this plan it is possible for the men to express their desires regarding the amount and character of their food directly to the foremen and to secure what they want more readily. The most serious objection to the plan

is the difficulty in preventing some foremen from taking advantage of the men through excessive charges and in other ways. While most roads on which this system is in effect provide supervision of the charges for board made by the foremen, it is very difficult to detect and to prevent irregularities, particularly among colored laborers. On the New York Central Lines west of Buffalo it was formerly the universal practice for the foreman of each gang to buy the provisions and collect from the men pro rata for the exact cost of the food, and this practice is still followed with white men. Foreign laborers are now fed by the track supervisor through the foreman at a fixed rate per man which allows the supervisor no profit, while negro gangs are boarded at a fixed price per week, the charge being deducted by the company in all cases.

The practice most commonly followed in the West is to contract the boarding of all gangs to a contractor specializing in this work and to leave all details regarding the purchase and preparation of the food to him, the company deducting the amount for board from the pay of each man and turning it over to the contractor directly. With such an arrangement the railway usually provides the cars or camps and supplies such as stoves and tables, while the contractor furnishes the dishes and cooking utensils and all kitchen help. Generally the contractor who feeds the men in the camps also operates a labor agency with a view to keeping the gangs full. By this method a railway transfers the responsibility for the feeding of its men to an organization specializing in this work and gains the benefit of this specialization. At the same time this arrangement introduces a third party between a railway and its employes whose interests generally do not coincide with those of either of the other two.

This conflict of interest has led to the operation of commissaries and the feeding of men directly by the railways in a number of cases. The New York, New Haven & Hartford, the Delaware, Lackawanna & Western and the Pennsylvania Railroad have adopted this plan, and the latter road reports that camps operated in this manner are much preferred by the men. In general the policy of a road furnishing its own camps is to provide the men with a sufficient amount of proper food and without profit, removing the tendency for the exploitation of the foremen.

Where the boarding of the men is contracted to a commissary company the rate per meal, or more commonly per week, at which the men are to be charged is determined by agreement between the company and the contractor, and the men are advised of this arrangement when hired. The amount due the contractor is then deducted by the company from the wages due each man and is remitted directly to the contractor.

On the Nashville, Chattanooga & St. Louis the company boards its own men in every gang except one or two special organizations employed on construction work. The men are charged for board on the basis of cost which was computed several years ago, this amount being deducted from the daily wage. No deduction is made for rainy days, while gangs are moving, or where men fail to work for any other reason. No readjustment of this charge has been made in recent years on account of the increased cost of supplies.

To compensate a boarding contractor for the increased cost of foodstuffs and at the same time to keep the rates charged the men for board at a reasonably low figure, the Buffalo, Rochester & Pittsburgh now pays the contractor five cents for each meal furnished a laborer actually at work. The Maine Central accomplishes the same

purpose by reimbursing its foremen, who feed their men, for the actual cost of board in excess of 50 cents per day. The New Haven pays part of the cost of board in still another way, charging the men \$4 per week for the first four weeks they are in the service of the company and \$3.50 per week thereafter. This latter rate, which is less than the actual cost to the company, is offered as an inducement to the men to remain in the service. The Southern goes still further with its extra and construction gangs, paying them a fixed wage in addition to board and then paying the contractor for all meals served without making any deductions from the pay of the men. This eliminates all accounting between the company and the men and removes all uncertainty and cause for dispute concerning deductions from the pay checks, a very important consideration in the mind of the negro.

Another method to protect a boarding contractor against the high cost of foodstuffs is to pay him the actual cost of the food and service plus a fixed percentage. This plan was adopted at several camps on the Big Four last year and has also been tried on other roads.

The committee also presented descriptions of a modern camp on the Baltimore & Ohio and of the system adopted by the New York, New Haven & Hartford to feed its men. Abstracts of the laws of the various states governing the housing of men in camps were also included.

Equating Track Sections

The committee reported progress in compiling data based on the reports received from 20 railroads of the distribution of labor on 76 special track sections. Two of these roads have reported discontinuing this report on account of insufficient force and abnormal conditions of labor.

Conclusions

The committee recommends:

1. That the Bibliography be accepted as information and printed in the Proceedings.
2. That the report on Methods of Securing Labor be accepted as information and printed in the Proceedings.
3. That the report on Feeding and Housing of Maintenance of Way and Construction Employees be accepted as information and printed in the Proceedings.

Suggestions for Next Year's Work

1. Study and report on plans for organizations to obtain labor for railways.
2. Continue the study of equating track sections.
3. Study and report on typical plans of boarding-cars and boarding-houses for railway laborers.

Committee: E. R. Lewis (D. S. S. & A.), chairman; C. H. Stein (C. R. R. of N. J.), vice-chairman; W. J. Backes (N. Y. N. H. & H.), R. A. Baldwin (C. N.), J. O. Barlow (S. P.), A. F. Blass (I. C.), W. M. Camp (Railway Review), H. M. Church (B. & O.), W. R. Dawson (N. & W.), R. C. Falconer (Erie), R. H. Ford (C. R. I. & P.), W. R. Hillary (P. L. W.), E. T. Howson (Railway Age), C. B. Hoyt (N. Y. C. & St. L.), C. M. James (A. C. L.), W. A. James (C. P.), A. C. Mackenzie (C. P.), Thos. Mancy, J. C. Nelson (S. A. L.), C. A. Paquette (C. C. & St. L.), J. W. Pfau (N. Y. C.), H. R. Safford (G. T.), H. J. Slifer.

Discussion

E. R. Lewis (Chairman): In introducing this report, the committee asks that the members keep in mind the date when this report was written. It was completed in November last year, and the committee realized at that time the impossibility of anticipating the probable changes in the situation, and it was decided in committee at that time that it would be necessary to consider such changes as we were pretty sure would occur on the floor of the convention today.

These changes have come thick and fast. At the present time the railroads are definitely under active government control. It is presumable that the railway employees, including maintenance of way labor, will receive the benefit of employment under some sort of governmental agency, and that the railways will be benefited by the furnishing and the equitable distribution of adequate man power in this crisis. But the labor question is none the less a serious question. It is becoming daily more apparent that the railways must conserve labor in every manner possible.

There are various methods of conserving labor in railways. There is the possibility for improving working conditions and the methods of hiring, distribution, feeding, housing, the grading of wages and the opportunities for advancement. There is also the possibility of the introduction of labor saving devices along these lines. The vast importance of the labor problem to this association and to the world is a matter of common knowledge to us all. The maintenance of way department of the railway may be expressed in relative money terms. There is more money spent for labor in the maintenance of way department of railways than is spent for maintenance of way material. I think it is safe to say that labor amounts to from 53 to 56 per cent of the money spent. You are urged, therefore, to give this committee and the association the benefit of the very fullest discussion and interchange of thought here today. We want results now for the season of 1918. We want it not only for this association, for the railways that we represent, but for the governments of the countries at war. In this period of unrest this is a matter that I think should receive the serious consideration of us all. We are on a war basis. We have had many routine duties and still have, but they are changing from a peace basis—have changed—and we must look at things from a war standpoint. This matter of labor is the most important thing we have to consider, and there are routine duties that we can put off from time to time or delegate to someone else, while we respond to inquiries relating to this matter of getting and keeping matter for the railways, for any labor that we conserve means conservation for all, and further than that, there have been times when the circulars from committees have not received the attention they should receive at the time of a world crisis like this, when our work is important. As you know, the association must depend on the committees, and the committees must depend on the membership for these responses.

Last October, while the committee was formulating its report, matters were brought up in connection with the securing of labor, with a great deal of emphasis, which have not been included in the report, because of rapid change in the situation. It is believed, however, that suggestions along the following lines represent the fast crystallizing thought of the members at large of this association, as well as the members of the committee. These points are as follows:

1. In order to secure a more uniform distribution, especially of unskilled, floating, or unemployed labor, it is recommended that centralized agencies (preferably under the control of the Regional Directors) shall be maintained in all large labor centers throughout the United States. Such agencies should, where possible, co-ordinate with state and municipal agencies. They should contain a division or bureau especially devoted to securing common labor for railways.

2. For the purpose of strengthening centralized agencies, in the event that they shall be established, the railways should call upon them for such additional labor

as cannot be obtained in their local fields before endeavoring to obtain it through other agencies.

3. In order that the railways may meet the demands of transportation with safety and promptitude, it is essential that they shall be efficiently maintained. As an aid in its accomplishment, as well as to permit co-operative effort to be more quickly effected between the railways themselves or through the duly constituted governmental authorities, it is recommended that each railway designate some person familiar, by training and experience with such matters, to study in detail the labor requirements necessary for the proper maintenance of its roadway, also to collect all available data looking toward the utilization of the various kinds of floating and other railway labor which in the past it has been found difficult to hold in continuous employment.

Very often a gang of laborers are disorganized after leaving the service of one railway when with a little preparation they might easily be employed without loss of time and without loss of efficiency to the railways by a second railway and again by a third.

In connection with "bibliography" Mr. Lewis said: After some consideration it was believed that the members of the committee had better compile this bibliography themselves, in order to make sure that nothing might be overlooked, which at the time of compilation existed and should be included.

The report on "Methods of Securing Labor" is presented by the committee as a matter of information.

In connection with the subject, "Feeding and Housing of Maintenance of Way and Construction Employees," the matter presented in this report is offered as information which we would desire to have printed in the Proceedings.

E. F. Wendt (I. C. C.): I wish to inquire what provision is made to insure the sanitary condition in these camps, and to ascertain the medical conditions. Is there any inspection of the camps by trained and experienced medical officers?

E. T. Howson (*Railway Age*): That is covered in the report, but for the sake of saving time that part was not read. Certain roads do have regular periodic inspections. On the Chicago Terminal division of the Rock Island inspection is made by local company physicians each month. The Chicago & Northwestern has a medical officer who gives particular attention to the sanitation of camps, the refrigeration of food supplies, and the character of the water, even to the extent of requiring that water for camps be hauled to these camps from sources of known quality where the water at the location of the camp has not been analyzed and proved. Such inspections, however, are all too limited, in fact, they are not common, but are made on only a few roads.

J. V. Hanna (K. C. Term.): May I ask if the committee knows anything about the work of the Federal employment bureau?

Mr. Lewis: The committee has some information on this subject, and I have also had experience with state agencies. We have been informed that state agencies were ready and willing to organize and could provide labor. I have on several occasions given them direct orders for labor.

F. R. Layng (P. & L. E.): We received a circular from the Federal employment bureau and I went to Pittsburgh to confer with a local government representative there, who is also representative of the Pennsylvania Department of Labor. He told me he was in no position to give us any help in securing common labor. He was giving his attention primarily to the securing of skilled labor for the Government, particularly the ship-building

industry. I then went to Erie at the other end of our line and consulted with the Government agent there with the same result. I think that the bureaus of the Government are really competing with the railroads for labor, and that we cannot look to them for any help as they are at present organized.

On our own road we have established a local agent in Pittsburgh and one in Erie, and we have been moderately successful in securing labor through them. We make no charge for securing a man a job, as the usual employment agent does. We furnish transportation. I think it was the intention that the Regional Director rather expected us to discontinue that practice. My investigation resulted in the conclusion we would not dare do that under present conditions.

W. H. Courtenay (L. & N.): The committee in its able report has not referred to the economic waste of moving labor from one section of the country to the other.

The Louisville & Nashville, which I represent, has lines extending from St. Louis and Cincinnati to the gulf.

In the last two years there has been an enormous quantity of negro labor travel over our lines to industrial establishments and other roads in the North. That militates against the interest of the cotton planter, the saw-mill man, and every other employer in the South. Of course, it is a difficult matter to regulate.

I can appreciate the situation of the roads which do not have a supply of labor living on the lines. They must get it somewhere. The South has suffered greatly from that condition.

As a general proposition there is almost no foreign labor employed on the L. & N. Our two sources of supply are the negroes of the South and the white people living in the mountainous districts which we touch at many points for many miles. It seems to me the best way, looking to the future, is in providing houses for them and endeavoring to locate them with their families. A negro will not work without the negro women about him. The practice on the road which I represent is almost invariably to provide a good house for the section foreman and generally provide at least two double laborers' houses and sometimes more. I think that is a good plan.

Another wise provision in order to obtain labor, which can be done in the South, if not in the North, is to retain the track laborers the year around, or at least retain the majority of them. Formerly it was the custom on our road to work different numbers of men on the track in the winter season than in the summer season, the summer season lasting seven months and the winter season five months.

We have departed from that and authorized our roadmasters to use a given number of men per year. That enables us to use the labor to better advantage. There are a great many men who are attached to a locality and they will not work away from that neighborhood. But in some cases men are content if they can go home once a week or once in two weeks.

Reference has been made to the boarding car, which has been condemned in pretty general terms, but the boarding car is not disliked by the negro. He is a gregarious animal and rather prefers the boarding car. He does not object to sixteen men in a car, while a white man might prefer a little more accommodation.

As to building the camps, such as have been alluded to here, it is a rather expensive project. If a road can get men without doing that, it would hardly seem that we were justified in going to such enormous expense, particularly in a moderate climate.

As to what the roads will do for labor, it is a difficult proposition. We have managed to hold a good many of our men, notwithstanding that the coal mines are paying boys of 16 \$4 to \$4.16 a day to drive a mule in the mine.

Notwithstanding the fact that laborers can get employment at high rates, they frequently prefer working on the railroad, and much depends on the treatment of the men by the foremen. I do not mean the men getting good food, but having the foreman treat the men with reasonable consideration, as a matter of justice. We have had men leave us and go to other roads, and we were surprised to see them come back very often, and the reason they came back was they said they were treated better. If the laborer is given even-handed justice by the foreman he will appreciate it, and much can be done by that sort of treatment.

(The President adjourned the meeting for lunch.)

Afternoon Session

Mr. Lewis: In answer to the remarks made by Mr. Courtenay before lunch, it was not intended by the committee to put forth the recommendation for bunk-houses and to condemn cars for all cases. There are some kinds of labor that are not like the negro labor. Some of them would rather have houses than cars if it were possible. Of course, the sanitary feature is something that we do not want labor to lead in. It never will lead in it. We have to at least give the help that is necessary along that line as near as possible.

Mr. Courtenay mentioned the economic waste of labor in its transportation. That matter has been covered by the committee. In this connection there is an important matter, which is car conservation. Cars are scarce in this country, and in order that cars be available for laborers, they would have to be conserved for that purpose. Probably on account of the scarcity of cars, there will be more bunk-houses needed. There will be many more cases where we will have to use bunk-houses than cars on account of car scarcity. We will be repairing cars that before were not considered necessary.

Edward Gray (C. & O.): I would like to call attention to the fact that the railways are not alone in wanting labor. The important matter is to increase the general supply of labor in the country for all of the really necessary industries, the railroads among them. The measures that we are considering have been considered by the committee, and of course look to the railways getting their own supply. They are competitive in their nature. Every other industry can also serve labor in the same way, offer them the same advantages, offer them an equal measure of justice, offer them superior accommodations.

There is a broader aspect. It is necessary that the supply should be increased, or rather, the total labor supply of this country should be used for the essential things, and gradually taken from the non-essential things. I don't think there is any other way in which labor can be had for the things we want. As it stands now, the least important of any industry in the country competes with the railways, with the shipbuilders. I don't think that any industry can be named so unimportant that it is not left free to compete, possibly with advantages in the matter of securing labor.

The railways have, of course, a fixed price level. Their power to buy is limited, their power of earning is limited. We try to keep prices down by the artificial fixing of prices, on essentials, but in the matter of luxuries and the non-essentials, there is no such fixing of prices. In the matter of employing labor they have a possible advantage. They can give all they want, and the public can buy at any price that they fix. Meanwhile, of course,

we are led to think it is necessary to keep up every kind of activity.

I don't think it is possible to solve the matter without concentration. It is a matter of sacrificing someone, deciding what is less necessary in favor of what is more necessary. Of course, there cannot be an exact definition, but I think all of us with a little consideration could easily choose the things that are of less importance.

P. G. Lang, Jr. (B. & O.): There is one feature in connection with the handling of labor at this time that we experience in Pennsylvania, and that is the influence of liquor on the large overturn among common labor. I simply want to call attention to this as one factor in this problem. Those of you that are in dry territory do not have this problem probably at all. At least, not to the extent that we do. We find that on pay day there is a large percentage of our men who leave us for several days at a time.

The President: That is a subject I would like to hear discussed. If there are some people from dry states I think the association would be interested in hearing what their experience has been.

L. M. Perkins (Nor. Pac.): We have had some experience in the state of Washington on the west end of the Northern Pacific, and our experience is that it is complicated with the large amount of other work. Under the existing conditions, men are able to get work very readily, and they quit just as often as they did before, but the pay check lasts a good deal longer and they stay out longer. We have more idle men lying around.

J. L. Pickles (D. W. & P.): Another aspect of this is the influence of the commercial labor agents. Their interests are diametrically opposite to the interests of the company. The oftener men leave, the oftener they get their fee, and I believe they offer every inducement to these men to quit. The railroads would gain a point if they could get away from the use of the commercial agents.

Mr. Lindsay: I think we will all agree that the latest offspring of the association, the Committee on Economics of Railway Labor, gives promise of being an infant prodigy. I hope that it will continue its work and realize all we expect of it.

Labor Saving Devices

An Ice Cutter Car

E. R. Lewis, of the Duluth, South Shore & Atlantic, described an ice cutter car which he is using to remove solid ice and densely packed snow from track centers. The device consists essentially of a row of teeth of tire steel, bolted to a steel plate set across the track above the rails in front of a small plow, both the teeth and the plate being hung under the middle of the car and being raised and lowered by means of a counter-weighted lever operated by compressed air obtained from the locomotive. The teeth rip the ice loose while the plow throws it outside the rail. The ice cutter can be operated at from 4 to 6 miles per hour in heavy snow and from 2 to 5 miles per hour in solid ice, the total cost of operation being about \$75 per day. It is estimated that it will do the work which would cost \$1,500 per day to do with pick and shovel. This car costs approximately \$1,000.

Discussion

R. C. Ford (C. R. I. & P.): The Rock Island has used the Jordan leveler about the same as Mr. Lewis has described. We cleaned two tracks at a time and took the ridge out between the tracks. All that Mr. Lewis has

stated is equally true as to the Jordan leveler. It has the additional advantage that it of course takes the ridge out and throws the snow out well beyond the two tracks. This winter in our large Burr Oak yards we took and abandoned one track and threw the snow over for five tracks, piled it up and then took a clam shell and loaded the snow out. I don't know how much the saving was there, but it was a simple thing.

Edwin F. Wendt (I. C. C.): I understood Mr. Lewis to say this device cost about \$1,200. Does that cost include the cutter as well as the car, and if so, was it the cost in 1917, or some other year?

Mr. Lewis: No, it does not include the car. This ice-cutter car is not made to do the work of a leveler; in fact, it is not designed to handle soft snow, but in a yard after you have used your leveler and all your other appliances, and you have left snow and ice four or five inches above the top of your rails. I don't think you can get clear of that ice with any plow. I have tried plows many times and never have had any success until I got this tooth arrangement.

Mr. Lindsay: I know many roads in the east would have given considerable for it if they could have had it this winter. They experienced such prolonged cold weather that the ice formed in the yards faster than they could possibly get labor to remove it. Finally in desperation we took a tie 8x12, with a beveled front, put a 6 in. flanged angle iron on the top of it, sharpened the edge and put teeth in every 6 in., put it in front of a wheel like we used to spread cinders, and we pushed it through the ice with good results.

Oxyacetylene Welding of Pipe Lines

G. J. Ray, chief engineer of the Delaware, Lackawanna & Western submitted a description of the economies resulting from the application of oxyacetylene welding to the construction and repair of steam, air and other pipe lines. In this discussion the weakness of screw joints was pointed out and was illustrated with a number of photographs and drawings. It was emphasized that good results are obtained by substituting:

(1) Welded joints for screwed joints in smaller pipe lines.

(2) The more general use of improved flanged joints on larger pipes under low pressure, to say nothing of the positive necessity for them in high pressure lines.

(3) The use of long sweep bends and elbows to take care of expansion instead of the primitive double swing or the complicated patent slip expansion joint.

Discussion

J. V. Hanna (K. C. Ter.): I might say that we get a good deal of service from a device such as was just shown in making repairs. We cut rails. We cut bolt holes and repair frog points. The street railway companies repair frogs by taking a hard metal, hard steel of some sort—possibly they use electric steel and they harden up these worn points right in the track without removing them.

A Weed Grader

G. W. Vaughan, engineer maintenance of way of the New York Central, submitted a description of a weed grader consisting of an attachment for a roadbed spreader to loosen up stone ballast and to destroy vegetation between tracks and on the shoulders. This grader can be operated at the rate of six miles per hour and, on the basis of eight hours per day, will cover 48 miles of track at an approximate cost of \$31. It would require 10 men 6 days to clean one mile of track by hand. At present

labor rates the cost of cleaning 48 miles of track would amount to \$7,200. When in use the grader is swung at right angles to the track. It can be fitted over obstructions readily by the mechanism of the spreader.

Discussion

C. E. Lindsay (N. Y. C.): That weed remover was used primarily in stone ballasted track on the western division of the New York Central line in the vicinity of Batavia. It was designed by the superintendent of track, A. M. Clough. I cannot speak of my own knowledge as to the results attained. I have seen some of the track on which the apparatus has been used. It apparently loosens up the weeds and they die by exposure to the sun. Just how efficacious it is in ultimately killing the weed, or whether it acts as a cultivator to promote the growth of weeds, has yet to be determined, but apparently it has considerable merit.

Melting Snow and Ice With Steam

C. A. Paquette, chief engineer of the Cleveland, Cincinnati, Chicago & St. Louis, presented a description of a hose attachment on an engine tender to permit snow and ice to be removed from frogs and switches by steam. A man at the rear of the tender regulates the flow of steam by means of a globe valve. Actual practice has demonstrated that two men can clean a switch in six minutes. The steam is of sufficient pressure to blow the water away from the switch points and prevent its freezing again. It has been found that two men with this equipment will do the work of 8 or 10 men under ordinary methods.

Mr. Lewis: On the subject of the use of steam for cleaning out snow and ice, I might say that we have for a long term of years used steam hose for other purposes in connection with snow and ice, thawing out locomotive water tanks, cleaning the snow and ice off the trucks of cars, and for the running gear of locomotives, and have found it even more successful there at times than for cleaning out switch points, because if the temperature is low enough the use of steam, and the resulting compensation, if you do not have perfect drainage, the water resulting from the use of steam is likely to freeze very quickly. It would not say that it is cold enough in the northern part of this country to freeze the steam into ice before it hits the switch point, but it is pretty nearly cold enough to do it.

Mr. Lindsay: I have used this winter in Albany an electrical device for thawing switches. It has been used very extensively on the New York Central in the electric zone, where power is easily accessible and comparatively cheap, and it has given remarkable results. In my case, I was using it experimentally, to see what it would accomplish in cold climates than the zone around the Grand Central Terminal, and we had two switches equipped with this device, which consists of a resistance coil buried in the bed between the ties and the switch rails, to a depth of about three inches below the top of the ballast. When a storm starts the snow immediately goes on and turns the switch, and after the switch has been on for a time the area of ground between the rails is so hot you can feel it, and the current is left on until the storm subsides. During the winter we never touch these two switches, although we had an army of men on the others. In that particular experiment the cost of current was \$25 per month per switch.

Mr. Ford: What did the installation cost?

Mr. Lindsay: I could not tell you that offhand. If you will write to Francis Borden, the division engineer of the Grand Central Terminal, he will be able to give you all the information you desire.

A Tractor for Railway Service

C. A. Morse, chief engineer of the Rock Island, spoke on the uses of tractors in railway work. He said in part: The proposition I am to present to you is the result of my spending my life on the granger roads. The result is that I have become somewhat of a farmer. Last fall I was over on the northwestern lines and we found a lot of work was being done that should be done, and we found that we were offering 60 cents an hour for farmers' teams for mowing rights of way, and matters of that kind, and could not get the teams. It also occurred to me that the farmers were substituting tractors for teams, and I wondered where we would be when the farmers got through with the teams and used tractors.

Returning home, I took the matter up to find out what there was in the way of a tractor that might be applicable to railroad work, and I finally got knowledge of a small caterpillar tractor, and I took up the matter with the parties manufacturing it, and I got some estimates and asked authority to purchase one. I figured in using it, to use it in connection with the shoulder ballast, and I hope to show you one before we get through with this meeting which is used a good deal in the northwest on level ballast, by which you can clean about ten miles of shoulder ballast a day and do it at one-tenth of what it would cost to do it by manual labor. Also it can be attached to a mowing machine, by which you can fix up the shoulder of the bank, or repair a ditch, or plow ditches, or use

it as a scraper, or do anything of the kind that you desire.

I finally persuaded the makers of the tractor to take an interest in the matter of constructing tractors for railway work. I got them to ship one of these tractors to the Exhibit, and send their advertising man down here to show some slides and to explain a little in regard to it. My idea was when this was done we could judge for ourselves whether or not it was applicable to railroad work and maintenance work.

After the talk a number of slides were thrown on the screen illustrating the Cleveland tractor.

A Derrick Car

G. W. Vaughan, engineer maintenance of way of the New York Central, submitted a description of a ten-ton derrick car which was first developed on this road in 1910. The car consists of a steel platform approximately 40 ft. long, supported on two 4-wheel standard M. C. B. trucks. A boom and supports, together with engine, coal and water pockets are placed on the platform. The boom consists of 10-in. channels thoroughly braced with channel diaphragms and lacing and is approximately 22 ft. long to the main hoist and 30 ft. long to the auxiliary hoist. The boom is swung with a bull wheel which is equipped with roller bearings. The car is equipped with a 20-h.p. engine capable of a direct pull of 5,000 lb. It has a lifting capacity of 3,000 lb., with the boom at right angles to the car and working 28 ft. from the center line of the track. The car is operated by one man. When unloading rail, three men are required, one to operate the derrick car, one man to haul on the rails and another one to release the hook. From 150 to 400 rails can be unloaded per day.

Report on Economics of Railway Operation

A NEW COMMITTEE ON Economics of Railway Operation was created by the Board of Direction subsequent to the 1917 convention, to which it assigned the following subject: Study the relations between railway operation and the location, construction and maintenance of railways, and report on the possible scope and field of action which should be assigned to the committee on Economics of Railway Operation, and make such progress reports as are possible, in the order of relative importance.

The committee feels that its function should be the consideration of matters coming within the classification of "Transportation" together with such other matters as affect transportation costs, or as are affected by transportation methods. For instance, economics due to water treatment, which affects transportation expense, would involve a consideration of the maintenance and operating costs of water softening plants, etc.; this committee could use maintenance data secured from other committees in such cases in so far as possible. On the other hand, the matter of treating ties is one which does not affect any transportation costs, and should not come within the province of this committee. The subsequent

use of the word "Operation" in this report is on the basis of this interpretation of the committee's duties.

At the initial meeting of the committee it was decided to be the sense of the committee that its scope or field include all matters affecting the operation of a railroad; but that for the present the committee confine its efforts to developing economy of operation of existing physical plants, including such additions as may be necessary for economical operation, but not including changes in alignment or grade reduction; that its efforts may be extended, from time to time, as the necessity or desirability arises; that as an essential preliminary it proposes to make an analysis of operating costs, as conclusions and rules cannot be arrived at without analysis of costs and the effect of capital expenditures.

An extensive Bibliography, prepared by the Library Service Bureau of the United Engineering Society and covering 12 subjects under 8 headings, was presented as an Appendix to this report.

Recommendations for Future Work

The committee recommends that the following topics be assigned for the ensuing year:

1. Collect data on operation costs from rate case investigations and any other available sources, and report on the additional investigations necessary to a complete analysis of operation costs. The committee on Economics of Railway Location should be conferred with by this committee.
2. Effect of variation in the speed of trains on costs of operation and maintenance.

3. Effect of the construction of additional main tracks on costs of operation and maintenance.

4. Economic length of operating districts.

5. Continue work on Bibliography.

Committee: F. W. Green (St. L. S. W.), chairman; V. K. Hendricks (St. L. S. F.), vice-chairman; G. D. Brooke (B. & O.), Ralph Budd (G. N.), Maurice Coburn (P. L. W.), C. E. Denney (N. Y. C. & St. L.), J. M. Egan (I. C.), L. C. Fritch (S. A. L.), U. E. Gillen (G. T.), C. M. Himmelberger (C. R. R. of N. J.), M. V. Hynes (C. I. & W.), W. J. Jenks (N. & W.), Paul M. LaBach (C. R. I. & P.), Frank Lee (C. P. R.), J. deN. Macomb, Jr. (A. T. & S. F.), Jos. Mullen (C. C. C. & St. L.), R. J. Parker (A. T. & S. F.), Wm. G. Raymond (University of Iowa), H. E. Riggs (University of Michigan), S. S. Roberts, E. F. Robinson (B. R. & P.), L. S. Rose (C. C. C. & St. L.), Mott Sawyer (C. M. & St. P.), E. C. Schmidt (University of Illinois), J. E. Teal (B. & O.), G. S. Waid (S. P.), C. C. Williams (University of Kansas).

Discussion

(In the absence of the chairman, Mr. Green, and the vice-chairman, Mr. Hendricks, the report was presented by S. S. Roberts, a member of the committee.)

Mr. Roberts: It is the thought of the committee that we should have the Board of Direction outline to it definitely the division between the work of this committee and that on Economics of Railway Location. It appears that the work in many respects overlaps, and we were not quite sure where the division should be drawn. We will be glad, indeed, to have suggestions, either now or in writing, as to what that division should be.

The President: The Chair would like to state as his personal opinion that this is one of the most important committees of our Association. Railways are in the transportation business. The work of this association for the past 19 years has been largely confined to the constructing of the machine by which the work is done. We have just awakened at this time that there may be a question as to how the work shall be done, and I would recommend to the Chairman of the Committee on Outline of Work that no obstacle be put in the way of the work of this committee and its further development.

H. R. Safford (G. T.): I think Mr. Roberts has stated that the Board of Direction should give a little more definite instruction than they have possibly done in the past, but we have been trying to feel our way a little with this committee. My thought is, speaking to the principal point that you made, which relates to transportation, that it is our duty as an association, to try to interest more transportation men to become members, and this is one of the committees with which the transportation men should be most closely related. At the present time I think that one of the greatest fields for this association to consider for committee work has been that related to the economics of railway operation, and in connection with that comes more or less the question of transportation.

Maurice Coburn (P. L. W.): There is one point about this committee and the Committee on Location, and that is the data that the Committee on Location needs for the solution of its problems is the same data this committee needs for the solution of its problems and both need the same information. To avoid wasted effort we will have to work together, and see to it that we do not duplicate effort in the same field.

C. P. Howard: It seems to me that this sub-committee has pointed out one thing which is eminently true, which we should all have known beforehand, and that is that the subject is tremendously vast and could be well divided between two or three committees.

As I understand the question, their idea is that the Committee on Economics of Railway Locations should

take the first division of expense, that is the maintenance of way, and that they will give their effort for the present to the second, which is transportation. I am unable to see how the economics of operation can be very much separated from the economics of location, unless you take the very broad field that this committee is to cover the whole subject and tell the people how to run the railroad. As a practical matter it seems that dividing the work among the two committees is all right, but they are obliged to work along parallel lines.

Mr. Roberts: One of the members of the committee at one of our meetings sized the situation up in this way—he said that heretofore the Committee on Economics of Location has considered which of two or more things was the most economic for one condition of use, and that our field was to consider which of one or more different usages was best for a given line.

Mr. Coburn: Some of us understand it. Before we can solve these problems we must know certain things about operating costs, and the information you need to solve operating problems is the same information the other committee needs to solve their problems of location, and the other committee came to a point where they found they were up against it, but there was a lack of definite, complete information, so that they could correctly solve their problem, and one of the first moves we have proposed is that we will take advantage of the expensive work being done in some rate cases, to see if there is anything in that that will be any help to this committee.

Mr. Roberts: I think the general idea of the committee agrees very closely with one of the former speakers, that the subject is wonderfully wide, and we would like to narrow it down so that we could get a good firm footing on which to make a start.

J. L. Campbell (E. P. & S. W.): It appears to me that there is a field for the work of this committee parallel to, and in correlation with, the work of the Committee on Economics of Railway Location, and that that field should be occupied by this committee. My view of the matter is, the economics of operation is the foundation on which the economics of railway location is to be determined. The problem involved in the economics of railway location is the question of finding the place on which to build the transportation machine, and the proper solution of that problem involves a knowledge of the elements of the economics of railway operation, possibly not a knowledge of all the elements, but certainly requires a good knowledge of many of them, most of the fundamentals.

It appears to me that the work of this committee in many important respects ought to precede the work of the Committee on Economics of Railway Location and that this committee should be valuable in the determination of the economics of railway location, and it will be valuable if it provides this association and this Committee on Economics of Railway Location with such knowledge and information as may not be now available.

H. Churchill (N. & W.): I think this committee should take up these various economic questions which have been brought out by the several committees on such expense in the first place, and then bear in mind that the cost of cost is the cost per ton-mile, and that not a cost per ton-mile applies to maintenance as well as it does to running cars over the road. We have recognized that on the Norfolk & Western we worked out that for many years it runs a possible solution for many questions that come up. In handling the traffic over the line of cars, the larger cars and the larger engines, without increasing the receipts at the same time, form the basis

for our gains. Electrification at certain points makes a large saving. This, however, is limited to points where density of traffic is great enough to warrant it, but I believe as the others have said, that there is a direct work for this committee to do, and they can get information from various roads that will show, irrespective of the increases of labor, that economies are obtained by different railroads.

The President: The Committee on Outline of Work will take careful consideration of the suggestions made by the committee, and I believe that if this committee has some difficulties in starting they will overcome them and make one of the most important committees the association has.

(The committee was dismissed with the thanks of the association.)

Report of Committee on Electricity

THE FOLLOWING definitions were submitted for publication in the Proceedings with a view of their final adoption for the Manual after a

year's trial. These definitions, so far as possible, conform with those adopted by the U. S. Bureau of Standards, printed in the National Electric Safety Code, and those of the American Institute of Electrical Engineers. It is recommended that the definitions be adopted tentatively, with the understanding that they will be reconsidered in the light of suggestions which may be received during the coming year.

BOND.—A metallic means for connecting two rails to permit of passage of electric current.

BONDER.—An employee qualified to install or maintain bonds and their appurtenances.

BRACKET SUPPORT.—An arm supporting the trolley wire or catenary.

BRIDGE SUPPORT.—A rigid overhead structure upheld at each end, supporting the trolley wire or catenary.

CABLE.—Wires bound together, acting as a conductor.

CATENARY SUSPENSION.—All forms of overhead trolley construction in which the trolley wires are attached to one or more supporting cables, which in turn are attached to the main supporting system.

CLEARANCE LINE (EQUIPMENT).—The line beyond which no part of the equipment shall project. Allowance must be made by equipment manufacturers for new equipment for wear on journals and brasses on axle collars, on rails, on wheels, compression of springs, sagging of center of car, constructional variations, end play, broken springs, etc.

CLEARANCE LINE (THIRD RAIL).—Lines beyond which no part of the third rail structure shall project.

CONDUCTOR.—A continuous metallic path for the flow of electricity.

CONTACT CONDUCTOR.—That part of the distribution system other than the traffic rails which is in immediate electrical contact with the circuits of the cars or locomotives.

CONTACT RAIL.—A rigid contact conductor.

CONTACT RAIL (OVERHEAD).—A contact rail above the elevation of the maximum equipment line.

CROSS SPAN SUPPORT.—Flexible overhead wires or cables upheld at each end, supporting the trolley wire or catenary.

DIRECT SUSPENSION.—All forms of overhead trolley construction in which the trolley wires are attached by insulating devices directly to the main supporting system.

DISTRIBUTION SYSTEM.—That portion of the conductor system which carries current of the kind and voltage received by the cars or locomotives.

DUCT LINE.—A structure consisting of one or more pipes laid up in banks in which may be placed wires or cables.

ELECTRICAL SUPERVISOR.—An official of the division staff, qualified to supervise the maintenance of the electrical transmission and working conductors, outside of the power stations and sub-stations.

JUMPER.—A cable used to connect the ends of two contact conductors.

PATROLMEN.—Employees qualified to inspect and make minor repairs to track and third-rail structure, cables and wires, and to use hand signals for the protection of trains.

PULLING CHAMBER.—A chamber similar to but smaller than the splicing chamber, and used primarily for pulling cables and wires into ducts.

SPLICING CHAMBER.—A chamber in a duct line where cables are spliced and inspected.

SUB-STATION.—A group of apparatus or machinery which receives current from a transmission system, changes its kind or voltage and delivers it to a distribution system.

THIRD RAIL.—A contact conductor placed at either side of the track, the contact surface of which is a few inches above the level of the top of the track rails.

THIRD RAIL GAGE.—Distance measured parallel to plane of top of both running rails between gage of nearest running rail and inside gage line of third rail.

TRACTION LINEMEN.—Employees qualified to maintain wires and cables and their appurtenances for all railroad voltages.

TRANSMISSION SYSTEM.—That portion of the conductor system carrying current of a kind or voltage different from that received by the cars or locomotives.

TRANSMISSION LINE.—A system of towers or poles and cables or wires carrying current from the source of power to the sub-stations.

TROLLEY WIRE—A flexible contact conductor customarily supported above the cars.

Water Power

The committee is of the opinion that all water power developments, both from the point of view of generation and utilization, are subject to such wide variations, both physical and operative, that every situation is individual to itself; and it is the committee's conviction that now, as never before, there is reason for railroads to investigate anew the financial possibilities to be gained by the development of some of the water powers within their territories, which, under past conditions, may have been considered unprofitable.

The committee reported progress and suggested the following underlying principles as governing a choice between steam and water power developments, or the use of combined water and steam plants.

1. The increased cost of coal, being the largest single factor of cost, outside of fixed charges, in the production of steam generated power, places such higher values upon hitherto undeveloped water powers.

2. Water power on rivers, the average stream flow which can be increased by storage, may now figure attractively against steam generated power in some locations.

3. Water powers on rivers from which continuous flow cannot be obtained may now figure attractively in combination with steam plants against steam development alone.

Proposed National Electrical Safety Code

The preliminary edition of the proposed National Electric Safety Code was issued April 29th, 1915, and submitted for criticism by Dr. E. B. Rosa, Chief Physicist, U. S. Bureau of Standards, Department of Commerce, Washington, D. C. Since that time the code has been the subject of discussion by the officers of the Bureau of Standards and by the representatives of the national engineering societies. The object of the code is to prescribe good electrical practice for all industries, including railroads, and will be recommended by the Bureau of Standards to the various public service commissions and other state legislative bodies for adoption as mandatory law. The second edition of the code was issued November 15th, 1916, for examination, trial and constructive criticism. The most serious defect in the code relates to the requirements for the crossing of foreign wires and cables over railroad company's rights-of-way. The standards used for many years by the railroad companies have been reduced in some important details, as will be shown in the comparison of the A. R. E. A. specifications for overhead transmission line crossings.

General Conclusions in Regard to the Code

1. That the general principles of the code are acceptable and desirable as tending to establish uniform electrical rules in the several states of the Union.

2. That the code is cumbersome and overburdened with cross references and would be made more useful if separated into several pocket-size pamphlets to cover each of the industries.

3. That the requirements of the code pertaining to the crossing of railroad company's rights of way by electric cables and wires are deficient and below the specifications of the American Railway Association, the American Railway Engineering Association and the American Electric Railway Association, and should be revised upwards.

4. That the legality of the code should be established

by the opinion of an authority high in the Federal Government.

Recommendations

1. The committee recommended the tentative adoption and publication in the Proceedings of the Electrical Definitions.

2. Acceptance and publication in the Proceedings, as information, of tabulated statements showing third rail clearances and data relative to overhead clearances on railroads, revised up to November 1, 1917. Continue the subject next year.

3. Acceptance and publication in the Proceedings, as information, of the report on Catenary Construction.

4. Acceptance and publication in the Proceedings, as information, of the report on Electrolytic Effect on Concrete in Salt Water, and a continuation of the general subject of Electrolysis, with the sending of authorized representatives to the American Committee on Electrolysis; and asks for further instructions in the matter of a report on Insulation.

5. Acceptance of the progress reports on Maintenance Organization, Water Power and Electrical Interference, with a continuation of these subjects.

6. That the report on the National Electrical Safety Code be accepted and published in the Proceedings, as information, and that the committee be authorized to send delegates to present a copy of this report to the Director of the U. S. Bureau of Standards, Washington, D. C., and to object to the provisions of the National Electrical Safety Code, which tend to reduce the present requirements of the A. R. E. A. specifications for overhead and underground wire crossings, where the safety of life or property is involved.

7. That the Contract Form on Location of Power Lines and Wires on Railroad Company's Rights of Way be referred to a committee composed of members from the proper standing committees of the American Railway Association and of the American Railway Engineering Association.

Committee: Edwin B. Katte (N. Y. C.), chairman; A. G. Shaver, vice-chairman; A. H. Armstrong, H. M. Bassett (N. Y. C.), Z. M. Briggs (P. L. W.), D. J. Brumley (I. C.), R. D. Coombs, A. O. Cunningham (Wabash), Walt Dennis (Wabash), R. H. Ford (C. R. I. & P.), W. F. Graves, George W. Kittredge (N. Y. C.), C. E. Lindsay (N. Y. C.), W. L. Morse (N. Y. C.), W. S. Murray, J. A. Peabody (C. & N. W.), Frank Rhea, J. R. Savage (L. I.), M. Schreiber, H. U. Wallace.

Discussion

E. B. Katte (chairman): Ten subjects have been assigned by the Board of Direction to the Committee on Electricity, and these subjects have been considered by seven sub-committees. Three of the sub-committees are merely reporting progress, and the others are submitting reports which are briefly as follows:

The revision of the Manual is entirely confined to the suggestion of 28 electrical definitions. Some of them are already contained in the Manual, but are slightly rearranged. Others are proposed definitions, while still a third class are definitions that have been taken from definitions of the Institute of Electrical Engineers. The committee in this connection recommends not the formal adoption at this time of these definitions, but rather that they be tentatively accepted for the year, and that during that period those with suggestions to offer send the revised definitions to the committee, and they will be considered in time for final action the following year.

The Committee on Third Rail and Overhead Clearances submit practically a progress report, with tables showing third rail clearances and overhead clearances.

The Transmission Lines and Overhead and Underground Crossings Committee have submitted a report on Item 5, Item 5 being on the proper type of overhead catenary construction, with particular reference to the consideration of providing clear vision for signals, co-operating with the committee on signals and interlocking.

A special subject was assigned during the summer by the secretary to this committee, being a contract form on location of power lines and wires, on railroad companies' right-of-way. The committee was not able to get very far on this, and believes that it is a subject that should be assigned to standing committees of the two associations, and your committee recommends that this be referred to a committee composed of members from the proper standing committees of the American Railway Association and of the American Railway Engineering Association.

The main subject that is in the report is the proposed national electric safety code. The code as a whole has been very favorably received by all of the railroads. It is a very helpful and a very good work. Railroad engineers really only have two objections to make, and these objections have consistently been made ever since the code was first considered. The first is clearances. The code proposes to reduce railroad standard clearances.

The second objection is a structural objection. The code permits lighter structures carrying wires over railroad companies' rights of way, and your committee feels that the code, representing a government document, should not reduce railroad standards. The code is a safety code. Our crossing specifications are distinctly crossing specifications. They do not interfere one with the other.

(Mr. Katte, after reading the matter headed "General Conclusions in Regard to the Code," stated that the code was a voluminous publication and that while it is a very safe guide for electrical construction work, due to the cross references, it was too difficult for the average railroad engineer to use as a specification. Five recommendations were then presented and acted upon by the convention.)

Morton G. Lloyd (U. S. Bureau of Standards): In regard to the comparison which is made in this report between the Joint Specification and rules of the Safety Code, there are a few matters I want to point out only as illustrative that this comparison is not as accurate as we would like to have it. In regard to the provisions for heavy, medium and light loading, our code takes account of the differences in the climatic conditions between the different parts of the country. It provides in territories with medium loading the loading requirements shall be only two-thirds as great as that for heavy loading, and that in the case of light loading it is only to be two-thirds as great as in the medium district. The committee evidently thought we were taking one-third off for the medium and one-third for the light, and stated we had only one-third left.

Another matter is regarding the factors of safety given in this comparison which are quite erroneous. One thing stated is that we only require a factor of safety of one for steel. The Code very distinctly specifies that the stress to be used shall be 27,000 lb. How the committee got a factor of safety of one out of that I am not able to say. The factor of safety for wood poles is stated to be two. That is correct in a sense, and yet very misleading in another sense. The same thing is true of concrete poles.

Another thing to be remembered there is that the Joint Committee specification has not any requirement whatever as to maintenance. We permit them to build

a weaker line, but require them to maintain it at a strength where it will do the work required. That seems to us a much more reasonable requirement and a much safer one for you as well as for the general public.

In view of these matters and these positively erroneous items of comparison, I think it would be very regrettable if that part of this report were passed to final publication as it now stands. As to our strength specifications, I might point out that they also are minimum requirements. What we have done is to draw up a Code of rules which, when finally revised, will be effective as far as possible and we hope will be suitable for the mandatory requirements that may be made as an official order by state commissions or other administrative bodies who have jurisdiction over this kind of construction.

One other thing that is not at all in the joint committee specifications, which we consider very important, is the matter of provision for the safety of the men who are doing the work. In that connection I will say that any code of this kind which is developed with the idea of being eventually made a local standard has got to cover points of that kind. State commissions are deeply concerned with the matter. A specification which does not cover these items is, from their point of view, as well as ours, very defective and unsuitable for the purpose.

Mr. Katte: I don't think there is anything that Mr. Lloyd brought out that has not been considered by your committee, not only at this time but during the past three or four years. Your committee, by representation and by individuals, have been to Washington twice. There is no antagonism on the part of the committee to the Code. The committee is strongly in favor of it. If there is anything in the Code that will strengthen our specifications, we will recommend it to you for adoption. It is the items of the Code that reduce your specifications that we object to. The two principal items are clearances and factors of safety.

The objection to our specification is made by the National Electric Light Association. These men want to cross our railroads with their standard construction. They cannot afford to build their entire line as strong as that line ought to be where it crosses a railroad, no matter whether it is a branch line or a trunk line railroad. The construction should be stronger at railroad crossings than throughout the country.

In the matter of comparison between our specifications and the Code, it is naturally very difficult to compare a precise specification with a very general statement of safety requirements. The Code is not a specification. It is a very general statement of good common practice. We will all follow that Code, but we want to follow the best parts of the Code, not the minima.

The other speaker said that our specifications are not up to date. They are not up to date. The last report was made in 1915, and that revision was merely minor changes. Your committee intends to revise this specification and make it more logical and easily read and interpreted.

Regarding the legality of the Code, there are portions of the Code which are merely constructional which can be enforced legally, there is no question about that. But part 4 is the principal part the lawyers have questioned. They brought out the point that when inspection is made mandatory, that the municipality or United States government appoints the inspectors, as in the case of fire inspection, city police inspection of boilers and electric light installation inspection.

Regarding the structural features of factors of safety, Dr. Lloyd is quite right regarding our contention. It

is our impression that the Bureau of Standards is trying to make the plans between the strong specifications the railroads require for their own structures, and the somewhat lighter construction which the National Electric Light Association permits for their line construction generally. He has proposed a balance between the two.

F. Auryansen (Long Island): I would like first to call your attention to Rule 201 of the Code, which provides that the minimum requirement in the Code may be waived.

To get down to specific examples, this association's specification for structural steel is 18,000 lb. for tension, and corresponding values throughout; whereas the Code increases that figure 50 per cent on the basis of increasing the wind load from 8 lb. to 12 lb. in what is called the heavy loading territory. That is not strictly a 50 per cent increase of both load and stress, because the dead load and the ice load are constant, so that as you increase the stress in the steel you are diminishing your factor of safety.

The Code specifies 700 lb. as the strength of cross arms, pins, etc., in one place, and in another place it says that the entire pulling of the wires shall be provided for. Those are two directly contradictory statements, because the pull in a wire may be very much more than that.

Regarding the minimum requirements, I think there are very few here that would adhere to those. When

we are building a line of this character for ourselves we certainly must take full account of probable growth for a number of years.

The clearance, which may be cut down to 25 ft., according to the Code, is too low. There is the possibility of a cross arm burning, so that instead of a single span you may have two spans combined into one, with a very much larger sag.

The President: I would like to give a little experience that we had in the northwest. In January last we had a rain followed by a cold spell, and for a distance of 35 miles the moment the rain touched any solid matter it turned into ice. All of the telegraph wires were broken in that district. Of course, against a catastrophe of that kind, nobody could have any reasonable factor of safety. The telegraph line that came down weighed seven pounds per running foot. That means it was four or five inches in diameter, and the power wire, being much heavier, would be correspondingly greater with the ice on it.

This subject is not a quarrel by any means between the Bureau of Standards and this committee. Our interest lies in protecting ourselves against construction companies or electric companies that may take advantage of rules that you might promulgate.

(After some further discussion the President stated that the Board would approve the suggestions of the committee, which was excused with the thanks of the association.)

Report of Committee on Ballast

UNDER THE HEADING "Depth of Ballast" in the Supplement to the Manual as published in Bulletin No. 197, Vol. 19, insert the word "proper" after the first word "the," making the paragraph read, "The *proper* depth of ballast under the tie," etc.

Additional Definitions

SKELETONIZING TRACK.—The digging out and removal of all material from over and between the ties down to a level with or below the bottom of the ties.

SHELL BALLAST.—A ballast composed of marine shells of all kinds which are washed into heaps in the shallow water along the Gulf Coast. These shells, for use as ballast, mixed with small per cent of sand, are secured by dredging.

GRANULATED SLAG.—Granulated slag is the product of the blast furnace, formed by having a jet of water injected into the molten slag as it runs from the furnace. This treatment reduces the slag to a granular form.

BLAST FURNACE SLAG.—Slag from blast furnaces, which is poured out as molten slag and allowed to cool. It is then broken up by blasting or otherwise, for use as ballast. This type of slag is of a light gray color, is quite porous and lighter in weight than majority of stone ballast.

OPEN-HEARTH SLAG.—Open-hearth slag is a product of the open-hearth steel furnaces, is very black and dense, and contains a considerable quantity of iron, is quite heavy, and breaks in angular form, and therefore makes excellent ballast.

PRECIOUS METAL SLAG.—A slag from smelters for reducing precious metals; is very similar in appearance and consistency to the open-hearth slag. The precious metal slag is usually black or very dark in color, is very hard and heavy, and, when properly crushed, makes an excellent ballast.

VOLCANIC CINDERS.—Volcanic cinders are the cinders thrown out by volcanic eruptions and deposited in hills and mountains, partially free from lava. In appearance, they are much like "burnt clay" or "gumbo" ballast, but are usually darker in color, and much harder and more durable.

Methods and Cost of Applying Ballast

Mechanical devices used to save labor and expense and to expedite the work fall naturally into sequence from the pit, quarry or ballast pile to the finished track. Cars for transporting ballast should be carefully chosen with regard to the work to be done, whether it is to be on track already laid or for an additional parallel track.

If for raising track, hopper cars should be used with the ballast plow or tie drag. If for parallel track, side dumps are to be preferred, especially when an open steel Convertible car where the sides swing out and in, when used with the side plow and unloading engine, drum and cable, are fairly satisfactory when these cars are not available, which is usually the case. When stone ballast is furnished from a private quarry, and when the train and loading the plow, drag, or hopper are made from the locomotive is a poor substitute for the mechanical engine. It does beat unloading by hand.

The spreader car, especially when air operated, is effective and works in general use. With this car, ballast from a sand and gravel bank or from a dump alongside the running track from which it can be unloaded by self-acting, can be spread out to a grade two inches below the bottom of tie and to the outside shoulder at a

speed of eight miles per hour. When not in use on ballast work the spreader can be used on a grading dump and in wet clay or rock will do the work of 50 men and remain idle most of the time at that.

The only other mechanical tool which seems to require particular mention is the mechanical tamper. This tool has passed the stage where its usefulness under favorable circumstances needs further defense. Around terminals and yards where there is a large amount of frog and switch work, so far as this committee knows, there is no disposition to question the expediency of its use based on its merits alone, entirely apart from any question of scarcity of labor. Opinions differ as to the amount of labor the mechanical tamper will save. It is probably conservative to say that a gang consisting of 1 foreman and 12 men, with 4 pneumatic tampers can do as much work in a day as 20 men with picks or tamping bar, and do it better. Some supervisors set the figure much higher in congested territory.

An outline of a typical four-unit and two-unit gang follows:

Maintenance Gang for Pneumatic Tamper

| Four-Machine Outfit | Two-Machine Outfit |
|------------------------|------------------------|
| Foreman: | Foreman: |
| 1 Compressor runner | 1 Compressor runner |
| 2 Hose and utility men | 1 Hose and utility man |
| 4 Tampers | 2 Tampers |
| 4 Shovel and bar men | 2 Shovel and bar men |
| 1 Lookout | |

In either case on maintenance work it is assumed that the whole crew working as a unit would renew ties, clean out for tamping and do other preliminary work in advance of the machines. It should be borne in mind, however, that the outfit required with mechanical tampers is complicated and will break down if not properly handled. It is a gas engine and is susceptible to all the potential troubles that go with an automobile, substituting hose troubles for tire troubles. It is an air compressor and requires the same care and is susceptible to the same troubles as any other compressor. The tamping tool is much like a "Jap" Drill and has its own peculiar troubles.

When used at a terminal when the apparatus can receive proper attention from a mechanic, these troubles are not serious. When sent out on a section and left to the tender mercies of the average foreman of an outlying section gang, unless regularly inspected and "tuned up" by someone having the necessary mechanical knowledge not only to put the outfit in shape, but to instruct the foreman in its use, it is liable to be out of order, and consequently out of service a considerable portion of the time.

The carriers were circularized about ballasting by contract and were asked to give the committee their views in regard to the practicability and the desirability of contracting for the application of ballast: (a) On new construction, and (b) on an operated line, first stating whether they had or had not handled ballast work by contract in recent years under either or both of the two classes.

One hundred and seven replies were received in connection with new work. Of this number 18 replied that they had within recent years handled ballast work by contract on new construction, 9 were in favor of continuing such method of procedure, 6 were non-committal, and 3 were opposed. Of the 86 who had not within recent years handled ballast by contract on new work, 13 were

in favor of trying such a method, 36 were non-committal and 37 were opposed.

One hundred and three replies were received in connection with contract ballasting on an operated line. Of the 6 who have within recent years handled ballast by contract on operated lines, 2 were in favor of continuing such practice, 3 were in doubt and one opposed. Of the 87 who have not within recent years handled ballast by contract on an operated line, 8 were in favor of trying such procedure, 32 were non-committal, and 57 were opposed.

On new lines the arguments in favor of contract work as brought out by the replies were two:

1. Flexibility of supply and control over labor owing to freedom in fixing rates of pay.

2. A possible low price owing to some local condition, such as lack of proper equipment on the part of the carrier.

The disadvantages were:

(a) Loss of control over the work.

(b) Less thorough work even under close inspection.

(c) The ultimate cost may be increased.

(d) Dispute over the character and sequence of the work.

(e) Dispute over distribution of ballast.

(f) Dispute over whether or not contractor has fully performed his duty.

On an operated line the same two reasons favorable to ballasting by contract will apply as in the case of a new line.

The same objections are raised and in addition the following are cited:

(g) Some added danger owing to loss of direct control.

(h) Less complete co-ordination between the constructing and operating forces.

(i) Greater interruption to traffic.

(j) Claims for extras on account of interference with the work.

(k) Difficulty of ensuring the maintenance of a surface in the working sector that will prevent surface bending the rail.

Conclusion

The consensus of opinion expressed is strongly against ballasting by contract in normal times and especially so on an operated track. Advocates of ballasting by contract do so largely as an emergency measure because of the greater flexibility of a contractor's organization in changing the rates of pay and so securing labor in time of stress. The matter is best summed up in the language of one of the men listed as favorable to this method. He says:

"My experience on this and other railroads is that contract ballasting * * * is to a large extent a necessary evil."

Comparative Merit of Different Stones

and Gravel and Other Material for

Ballast. Physical Tests of Ballast

Under date of July 24, 1917, approximately 30 carriers were requested to list the various ballasts used of each kind in the order of their effectiveness and the answers of sixteen are tabulated in an appendix to the report. At the meeting in March, 1917, the Association approved the recommendation of the Ballast committee on the order of effectiveness of the various kinds of ballast and the committee has endeavored to obtain from the data in the

appendix the order of effectiveness of the various classes of each kind of ballast as follows:

- CONCLUSIONS.**
- (1) Stone
 - (a) Trap rock.
 - (b) Limestone.
 - (c) Sandstone.
 - (2) Washed Gravel.
 - (3) Broken Slag (not granulated)
 - (a) Precious metal slag.
 - (b) Open-hearth slag.
 - (c) Blast furnace slag.
 - (4) Pit Run Gravel.
 - (a) River or stream gravel.
 - (b) Hill gravel (not cementing).
 - (c) Hill gravel cementing.
 - (5) Cherts
 - (a) Cherts from zinc ore, which is coarse.
 - (b) Cherts from lead ore, which is fine.
 - (6) Burnt Clay or Gumbo.
 - (7) Cinders
 - (a) Hard coal cinders.
 - (b) Volcanic cinders.
 - (c) Soft coal cinders.

The committee obtained from the Library Service Bureau of the United Engineering Society, New York, a list of publications on "Ballast and Ballasting." This

section shown be adopted for "Class A track with 24 in. of ballast."

Conclusions

The committee recommended:

1. That the changes in the Manual be approved.
2. That the additional definitions be approved and published in the Manual.
3. That the phraseology in regard to "Physical Tests of Ballast," be approved for the Manual.
4. That the ballast sections be approved and published in the Manual.

Committee: H. E. Hale, chairman; J. M. Meade (A. T. & S. F.), vice-chairman; C. W. Baldrige (A. T. & S. F.), J. S. Bassett (M. P.), W. J. Bergen (N. Y. C. & St. L.), H. E. Boardman (N. Y. C.), C. J. Coon (N. Y. C.), T. W. F. Johnson (C. G. W.), G. H. Harris (M. C.), F. A. Jones (M. P.), J. S. McBride (C. & E. I.), William McNab (G. T.), F. J. Parrish (C. H. & D.), S. B. Rice (R. F. & P.), H. L. Ripley (N. Y. N. H. & H.), H. E. Stansbury (E. P. & S. W.), Paul Sterling (N. Y. N. H. & H.), F. J. Stimson (P. L. W.), D. W. Thayer

Recommended Sections for Stone Ballast on Class A

is not a complete bibliography, but it is a continuation of a search made on the same subject in the library of the American Society of Civil Engineers on October 10, 1906.

Ballast Sections, With Particular

Reference to Sub and Top Ballast

The committee made a composite drawing of the ballast sections of 10 principal roads. Through this composite drawing was drawn in red the outlines of the Class A track sections recommended by the committee for 24 in. of ballast to indicate to the members of the Association how the proposed new section compares with other sections now in use. The committee feels that the Class A section should have 24 in. of ballast under the tie as compared with 12 in. shown in the 1915 Manual, page 55. To agree on all the points at one time is rather difficult and, therefore, the committee divided the section into its parts in the following diagram for the purpose of reaching a conclusion on each part separately.

The committee recommended that the ballast cross-

(I. C.), W. Trapnell (C. & C.), D. L. Sommerville (N. Y. C.), W. K. Walker (Wab.), R. C. White (M. P.), W. D. Williams (Cin. Nor.).

Discussion

H. E. Hale (chairman): The first part that is of interest will be found under the head of Miscellaneous. The committee was fortunate to obtain a copy of the Pennsylvania Railroad's specifications for stone ballast. The most interesting part of these specifications is the inclusion of physical tests for stone ballast. This is the first case of the physical test being included in a specification that the Ballast committee has found.

The committee was assured the question of proper depth of ballast of various kinds to secure uniform distribution of loads to the roadway. No conclusion could be reached by the committee, on account of the fact that the committee on stresses in track had not completed its report. We must wait until that committee has the report completed.

Under the heading of Methods and Cost of Apply-

ing Ballast is given a proposed typical gang for ballasting. Your committee feels that more economy can be gained by proper organization of ballast gangs than any other subject that has been given to the Ballast committee. We have been able this year to include several different organizations used by different railroads, and have presented them simply as information, with the hope that we will get from other carriers additional gangs or organizations, so that we can in the coming year give you a definite recommendation. That given is rather tentative. The conclusions are simply to carry this question over until next year.

The next subject given to the committee was the use and limitation of mechanical tools. We have just given you moving pictures of one of the principal mechanical tools, and our conclusions are in the report which we propose to be printed in the Manual.

(It was moved and carried that they be put in the Manual.)

Mr. Hale: In regard to the mechanical tamper, our conclusions are given in the third paragraph. I would like to move that that be put in the Manual.

(Motion carried.)

Mr. Hale: We have received from time to time some rather interesting data on the cost of the mechanical tamper. Some of it has been printed in this report and previous reports. It was quite discouraging, and the committee felt it was due to the method of keeping the record. However, they felt that the members of the association would like to have some data on cost, and we did not try to summarize it or average it, but simply reported it to you as received by us.

The next subject given us was "Ballasting by Contract." We had quite a difference of opinion on the committee, and the conclusions of the majority of the committee are printed in the report.

(Mr. Hale read the first two paragraphs.) I would like to move that those be put in the Manual.

(Motion carried.)

Mr. Hale: The next subject assigned to the committee was on Comparative Merit of Different Stones and Gravel and other Material for Ballast. The effectiveness of different kinds of ballast was approved last year by the association, and the committee would recommend that this be included in the Manual as written.

(Motion carried.)

Mr. Hale: In regard to the subject of physical tests of ballasts, there is one recommendation for the Manual.

(Mr. Hale read the first paragraph.)

The committee would like to have that in the Manual, because that bulletin has a great many tests carefully tabulated, and anybody that is studying the tests of stone ballast will get some good information, not only in the eastern part of the country, but from all parts of the country.

I move that that be put in the Manual.

(Motion carried.)

Mr. Hale: The last subject assigned to the Ballast committee was Ballast Section, with particular reference to sub and top ballast. Your committee has had this subject up for several years, and each year they have recommended some section and it has not been approved. The Ballast committee now comes back with the same section recommended to you. The committee itself was not able to agree until we divided the section into three parts. When this was done there was very little differ-

ence of opinion when we realized it was necessary to have 24 in. of ballast under the ties.

Mr. Ford: As I understand the recommendation of the committee, they are seeking to have adopted here a standard ballast section for Class A traffic. I haven't any particular fault to find with this section for some railroad, but I do think it is unfortunate for this association to go on record as committing itself to any particular ballast section.

Mr. Lindsay: In support of Mr. Ford I would like to call attention to what the committee says: "The Ballast committee is not in a position to recommend any addition or changes in the matter in the Manual under the heading of 'proper depth of ballast.' The committee therefore recommends that this subject be reassigned for the coming year's work." And yet in the picture they show a definite depth ballast.

Mr. Hale: That is quite true, and the committee feels that both those statements are correct. The one is the question of the proper depth of ballast for uniform distribution of loads, and on that subject we have no information, or really we have quite a good deal of information, but not what we consider sufficient to make a definite recommendation. In this section the committee recommend the ballast cross section as shown be adopted as Class A track with 24-in. ballast. We specify 24 in. of ballast. We have quite a number of roads with a great deal more than 24 in. In fact, 24 in. is quite common on our trunk lines, and yet the association has shown no section for over 12 in., and instead of being objectionable in valuation work, we were confronted at one time with the question that everything under 12 in. would not be considered ballast, because this association only showed 12 in. of ballast in their cross section. It appears to your committee that the committee is very lax in not recommending a 24-in. section.

H. R. Safford (G. T.): It has been, I think, nearly 14 or 15 years since the 12-in. ballast section in the Manual was adopted. I have no hesitation in supporting the 24-in. section, because I believe that if we will only take cognizance of the increase in locomotives and cars in that length of time we will find that 24 in. is just about necessary. I hope that this motion will prevail.

The President: They are not asking the approval of the 24 in. They are simply asking for approval where you do use 24 in.

Mr. Ford: I am not objecting to any question of 12 in. or 24 in. or any other depth, but I do object to the specific dimensions that are shown as being the outline for the standard ballast section when 24 in. of ballast is being used. I want to make it clear there is no question of 24 in. at all, or any other depth that I object to.

Mr. Hale: If that is the case, we have quite a number of ballast sections in the Manual, and if it is against recommending a specific section, then, as I understand it, Mr. Ford, you would recommend that those sections now in the Manual be taken out.

Mr. Ford: I don't believe that the recommendation of the committee should be agreed to, for publication in the Manual.

Mr. Pickles: I think the form of the section is all right. Why not make it apply to ballast available, so it would answer in any depth of ballast?

Mr. Hale: That is the idea, that we have to get more than 12 in. under certain conditions. We know that 24 in. is used. What we would like to do is to put up a section that, if 24 in. is necessary, this is the proposed section, not recommend definitely 24 in., because we could not pass it. We know that the association would not approve it. If the wording which the committee has recom-

mended is not satisfactory to the association, we would be glad to change that; in fact, we would change anything at all in this section the association desires. But the committee strongly recommend that some section be shown in the Manual with 24 in. It is possible that a

railroad will want 18 in. and they could very easily split the difference between the 12 in. recommended and the 24 in. recommended.

(Mr. Hale's motion prevailed unanimously and the committee was dismissed with thanks.)

Report on Uniform General Contract Forms

THE PREPARATION of a form of agreement for industry tracks has recently become a matter of interest and attention before a number of different railway associations. This committee learned that it has been the subject of consideration by a committee of the Railway Development Association, composed of representatives of industrial departments of railroads, for quite an extended period. It has also recently been under consideration by other associations, including the General Managers' Association of New

York, and by the presidents and executives of the railroads centering in Chicago.

Members of this committee present at its first meeting of the current season in New York City felt that an effort should be made to secure joint action between the Railway Development Association and our Association relative to the preparation of a standard form of agreement for industry track. Arrangements were therefore made for joint meetings of committees of the two associations. Three such meetings have been held and the form herewith submitted has been agreed upon by the two committees for recommendation to their respective associations.

Members of the Association will note, in the form of agreement submitted, that no specific provisions relative to the bargain to be made between the railroad and the shipper as to division of expense, or ownership of track, have been incorporated in the proposed form of agreement. These are left open, for insertion at the option of each railroad, following the lines of the general policy which it may adopt relative to these matters.

A recommendation as to the general policy to be adopted by the railroads is appended to the agreement. The tendency at the present time is undoubtedly toward requiring the shipper to bear all the expense of the construction and maintenance of the industry track beyond the clearance line, while retaining in the railroad the ownership of that portion of the track located upon its right-of-way. This general policy has already been adopted in many parts of the country, while in others the railroad companies have not yet been able to entirely agree upon it. Its uniform adoption, however, in so far as practicable, is recommended for the whole country by members of the two committees acting as a joint committee.

Industry Track Agreement

This agreement, made this.... day of in the year..... by and between..... party of the first part, hereinafter called the railroad company, and.....

party of the second part, hereinafter called the shipper:

Witnesseth:

WHEREAS, The shipper desires industry track facilities, hereinafter called sidetrack, for the more economical and convenient conduct of ^{his} business, at or near..... Station, County of....., State of....., described as follows:

(Here describe length and exact location of track.)

in accordance with plans dated..... (Note—If desired insert "identified by the signature of.....") hereto attached and hereby made a part hereof; and

WHEREAS, The operation of cars and engines over said sidetrack at other than the regularly established station facilities of the railroad company involves the risk of damage to or destruction of property and injury to or death of persons;

Now, therefore, in consideration (Note—If necessary insert one (\$1) dollar, etc.) of the above premises, the covenants and agreements herein contained to be kept and performed by the parties hereto, and of the payments hereinafter to be made, it is mutually agreed that the said sidetrack shall be constructed and maintained, and the railroad company hereby agrees to operate the same, under the following terms and conditions:

Right-of-Way

1. The shipper shall furnish at ^{his} _{its} own expense all necessary right-of-way outside of the right-of-way of the railroad company, required for the proper construction and operation of said sidetrack, said right-of-way to be satisfactory to the..... of the railroad company.

The cost and expense of procuring or complying with any ordinance, order, permit or consent whatsoever required by municipal, state or other lawfully constituted authorities for the construction, operation, maintenance and use of said sidetrack shall be borne by the shipper.

During the continuance of this agreement the railroad company shall have the right at all times to enter upon the property of the shipper, for the purpose of constructing, maintaining and operating said sidetrack.

Construction

2. The actual cost of constructing said sidetrack, including roadbed, trestles, bridges, and all other expenditures in connection therewith, shall be borne by the shipper.

(Herein insert details covering terms and conditions as to furnishing labor and material and division of expense as agreed upon.)

(NOTE—If desired insert "The shipper shall also assume the expense of recording this agreement.")

Maintenance

3. The sidetrack shall be maintained and renewed to the satisfaction of the..... of the

railroad company; the work shall be performed and the cost thereof borne as follows:

(Herein insert details.)

Ownership

4. The title and ownership of said sidetrack shall be vested as follows:

(Herein insert details.)

Use

5. The railroad company shall have the right to use, without cost, the whole or any part of said sidetrack for general railroad purposes, provided such use shall not unreasonably interfere with the use thereof by the shipper.

The shipper agrees that he will not permit or authorize the use of said sidetrack by or for the benefit of any other person, firm or corporation not one of the parties hereto, nor assign this contract or any rights thereunder, without the written consent of the railroad company.

Changes or Enlargement

6. If any change, rearrangement, extension or enlargement of said sidetrack or its structures shall at any time be required by reason of any change in the railroad company's track or tracks, or because of any changes in the operating practice of the railroad, or for any other cause, all expense resulting therefrom shall be borne by the shipper, unless otherwise mutually agreed by the parties hereto.

Clearances

7. The shipper shall not erect nor permit to be erected any building or structure, nor permit any material to be placed above top of rail within..... (.....) feet of the nearest rail of said sidetrack on straight track, or within..... (.....) feet on curve, nor permit anything to be placed above said sidetrack lower than a height of..... (.....) feet above the top of rail.

Accidents

8. The shipper agrees to exercise the greatest care in the use of said sidetrack to prevent cars or other obstructions from getting upon or too close to main or other tracks and generally to use such means and care as will avoid accidents of every kind.

Liability

9. The shipper hereby agrees to indemnify, protect, and save harmless the railroad company for loss of, damage to, or destruction of ^{its} property, or the property of any other person or persons upon the premises of the shipper by ^{its} request or consent, whether by fire or otherwise, or of death or injury to any person or persons (except where it can be shown that such death or injury to person or persons was due solely to negligence on the part of employees of the railroad company) arising out of the construction, maintenance, use or operation of said sidetrack.

Discontinuance

10. The shipper shall assume and bear any and all loss or damage sustained by ^{him} in consequence of any temporary or permanent elimination of said sidetrack, due to the relocation or change in the grade of the track or tracks of the railroad company by virtue of any municipal action or otherwise, or in event the disposition of the property of the railroad company or its future

use or development shall make it impracticable in the judgment of the..... of the railroad company to continue the connection, and the shipper hereby waives any and all claims therefor.

Cancellation, Termination and Removal

11. It is expressly understood and agreed that if for the space of..... consecutive months said plant be not operated, unless prevented by a strike or strikes, or if the title to said plant become vested in or the operation thereof be transferred to some party other than the shipper, or if any other party operating said plant refuses to adopt this agreement and to agree in writing to be bound thereby, or if the shipper fails to keep and perform any of the covenants, agreements, terms, or condition, hereinbefore set forth to be by ^{him} kept and performed, then the railroad company reserves the right to terminate this agreement upon..... days' written notice to the shipper.

Upon termination of this agreement the railroad company shall have the right to enter upon the property of the shipper and take up and remove any or all the material owned by the railroad company as aforesaid, and shall not be liable to account in any way to anyone for any monies paid or expended on account of any of the track or tracks covered by this agreement, nor for any damages resulting from the removal of the track or tracks owned by the railroad company as aforesaid.

Until terminated as hereinbefore provided, this agreement shall inure to the benefit of and be binding upon the parties hereto, their heirs, executors, administrators, successors and assigns.

In witness whereof, the parties hereto have executed this agreement in..... the day and year first above written.

Recommended Basis for Division of Cost

of Construction and Maintenance, and

Ownership of Industry Tracks

After leaving the right-of-way of the railroad company, all responsibilities of the company as a common carrier cease and in going beyond the right-of-way, the railroad company becomes the agent of the shipper in the operation of said sidetrack, thereby contributing to the economical operation and efficiency of its plant. This fundamental principle should, therefore, be considered in determining the basis for dividing the cost of construction and maintenance, and the ownership of such industry track.

An industrial sidetrack is essentially a plant facility and furnishes the shipper with service elsewhere than at the regular station of the railroad company. It is, therefore, recommended, as a matter of equity, in constructing such track, that the following terms as to division of expense and the ownership of property, should govern:

1. The railroad company may pay for and shall maintain that portion of the sidetrack from the switch point to the clearance point.

2. The shipper shall pay for and maintain that portion of the sidetrack beyond the clearance point, including roadbed, trestles, bridges and all other appurtenances.

3. That portion of the sidetrack upon the right-of-way of the railroad company shall be and remain the property of the railroad company.

4. That portion of the sidetrack beyond the right-of-way of the railroad company shall be and remain the property of the shipper.

Form of Agreement for Interlocking Plant

Your committee considered this form of agreement at three of its meetings, and also discussed it with a sub-committee of the Signal and Interlocking Committee of the Association. The Form of Agreement for Interlocking Plant herewith submitted is the result of action taken at these various meetings.

Members of the association will note that in the submitted form of agreement no attempt has been made to specify a basis upon which the expense for construction, maintenance and operation should be divided, because that portion of the agreement is part of the consideration which must be determined in each case by negotiation between the companies interested; and because conditions vary so widely in different parts of the country that no specific basis for apportioning the expense has been considered feasible. This portion of the agreement is therefore left open to be negotiated and written into the agreement in each case.

The articles covering Liability and Arbitration are incorporated in the submitted form, in order to complete the same. The committee recognizes the fact, as will doubtless also members of the Association, that these two articles are peculiarly the province of the legal officers of the railroads, and that they will therefore probably be modified in many cases, to meet local conditions, et cetera.

Agreement for Interlocking Plant

This agreement, made this day of, 19.., by and between....., hereinafter called the..... company, and hereinafter called the..... company.

Witnesseth that:

WHEREAS (Note—Include brief description of conditions, including the location of existing or proposed grade crossing; an enumeration of all existing agreements, if any; the names of the companies between which agreements were made, their dates, purpose, et cetera).

WHEREAS, The parties hereto mutually desire to construct, maintain, renew and operate an interlocking plant at said crossing, the location of said crossing being shown, and the said interlocking plant to be arranged as shown on the blue print marked "Exhibit A," dated....., identified by the signatures of the..... of the..... company, and of the..... of the..... company, hereto attached, and hereby made a part of this agreement.

Now therefore, in consideration of the premises and of the mutual conditions and agreements hereinafter set forth, the parties hereto do covenant and agree as follows:

Definition

1. The term interlocking plant, herein contained, shall be held and taken to include any and all houses, towers, power plants, machinery, appliances and appurtenances required for the operation of the same.

Construction

2. The..... company agrees to construct an interlocking plant, as shown on said "Exhibit A," and

in accordance with specification which have been approved by the of the parties hereto, and identified by their signatures.

The cost of removing any existing safety appliances or devices shall be divided in like manner as the maintenance and renewal expense of said appliances or devices has heretofore been divided.

The..... company agrees to begin the construction of said interlocking plant within..... days after the execution of this agreement, and to carry the same forward to a prompt completion.

(Note—Insert penalty clause if desired.)

Apportionment of Cost

3. (a) The cost of constructing, maintaining and renewing said interlocking plant, as shown on said "Exhibit A," shall be borne by the parties hereto as follows:

Each party hereto shall participate in the ownership of said interlocking plant in the ratio which the payments made by it for construction of said interlocking plant, including extensions and changes chargeable to capital account, bear to the total cost of construction thereof.

The expense of maintaining and renewing said interlocking plant shall include taxes, assessments and insurance; all losses by fire, flood or other damage caused by the elements; also any change made necessary by an act, law or ordinance, of a lawfully constituted public authority.

(b) The cost of operating said interlocking plant, including power, heat, light, and supplies, shall be borne by the parties hereto as follows:

Spare Space

4. Spare levers, machine spaces, and building space, may be provided for its exclusive use upon request of either of the parties hereto, at the sole cost and expense of such party; provided, further, that the other party to this agreement may hereafter acquire the right to the exclusive use of the same by either paying the original cost, or by providing an equal amount of space of the kind used when the same shall be required, at the election of the party which originally provided the spare space.

Extensions and Changes

5. Either party shall have the right to make extensions or changes in said interlocking plant, provided that they shall not materially impair the efficiency of the same. All such extensions or changes, arising from changes made in any existing track or tracks, or made to cover any future track or tracks or connections, which either party hereto may have the right to construct, or which may be required by reason of any changes made in the standard appliances of either party, or which may be ordered by a lawfully constituted public authority, shall be made by the..... company, and the cost of such extensions or changes shall be borne by the party hereto for whose benefit said extensions or changes are made, and the amount chargeable to each party for maintenance, renewal and operation in such case shall be determined as follows:

Control of Plant

6. MAINTENANCE—(a) The maintenance and renewal of said interlocking plant shall be under the sole charge and control of the..... company, and it shall employ competent persons to maintain and renew the same, and such parties from time to time so em-

ployed shall be removed for good and sufficient reason upon request in writing of a general managing officer of the company.

Each of the parties hereto, through its authorized employees and representatives, shall have the right at all times to inspect said interlocking plant, as well as the accounts covering the construction, maintenance, renewal and operation of the same; and in the event that the company shall notify the company in writing of renewals and repairs that may be necessary for the safe and proper operation of said interlocking plant, and if the company neglects for a period of thirty days to make said necessary renewals and repairs, then the company shall have the right to make such renewals and repairs, and the company shall, upon presentation of proper bills, and within the time provided in Section Ten hereof, pay its proportion of the amount so expended.

(b) Each of the parties hereto shall, at its own expense, keep all switches and derails in its own tracks free from ice, snow, dirt or other obstructions which may interfere in any way with the proper working of said interlocking plant; and in case either party fails to do so, the other party may enter upon the premises of the party at fault and remove such ice, snow, dirt or other obstructions; in which event, the party at fault shall reimburse the party doing such work, as provided in Section Ten hereof, for all expense thereby incurred.

OPERATION.—(c) The operation of said interlocking plant shall be under the sole charge and control of the company, and it shall employ competent persons to operate the same, and such persons from time to time so employed shall be removed for good and sufficient reasons upon request in writing of a general managing officer of the company.

It is further mutually understood that either party may use the operators at said interlocking plant in its telegraph or telephone service, provided said party shall give the other party at least ten days' prior written notice of the same; but in the event that additional expense is so incurred, either on account of increased wages of operators over levermen, or on account of additional employees required, the party using the operators in its service shall bear the additional expense. If for any reason it becomes necessary to temporarily take the said interlocking plant out of service, the control of the flagmen required to protect said grade crossing shall also be in the company, and the expense of said flagmen shall be considered, for the purpose of apportionment, as an expense of operating said interlocking plant.

Material and Labor Supplied by Parties

7. Each of the parties hereto shall, without cost to the other, furnish and install its own derails, switch points, switch rods, special switch and derail ties and timbers, all track insulations, poles, cross-arms, pins and insulators, and will maintain and renew them from time to time thereafter; likewise, without cost to the other party, do all the track work and grading along its own tracks necessary to prepare the same for the installation of said interlocking plant, and also provide and maintain proper drainage; likewise, bear the cost and expense of raising and adjusting pipe carrier and mechanism foundations, or the renewal of detector bars, clips or any other appliances required or made necessary by the resurfacing, rebalasting or rail renewal of its tracks within the limits of said interlocking plant; likewise, furnish and install at its own expense any signal bridges,

or other special signal supports, which may be required to support signals governing the movement of trains on its tracks.

Either party shall have the right to carry its automatic block signaling through the limits of the interlocking plant at its own expense. Where signals perform the function of both block and interlocking signals, the party hereto whose train movements are controlled by said block signals shall maintain the same at its expense.

Precedence

8. In the use of said interlocking plant passenger, mail and express trains shall have precedence over freight trains and light engines; and freight trains shall have precedence over light engines. The trains and engines of the company shall have precedence over the trains and engines of like class of the company.

Wage Rates

9. The wages of employees connected with maintenance, renewal and operation of said interlocking plant shall be the same as the standard wages paid by the company for similar service to its other employees in the same territory.

Payment of Bills

10. All payments hereunder shall be made within thirty days after rendition of proper bills.

The company shall render bills covering the cost of constructing said interlocking plant, such expense to be billed in one statement unless otherwise agreed upon by the parties hereto.

Bills covering the operation, maintenance and renewal of said interlocking plant shall be rendered monthly; and those covering insurance, taxes and assessments, annually.

Such of said bills as are based upon payroll cost of labor and stock prices of material shall include a fair arbitrary charge to cover supervision, inspection, handling, transportation, accounting and similar undistributed items of expense. Such fair arbitrary charge shall be in accordance with the recommendations of the General Managers' Association of in effect from time to time, or in the absence of any such recommendations, shall be agreed to by the parties, or determined by arbitration as hereinafter provided.

Should dispute arise as to the correctness of any items included in bills rendered under this agreement, the party against which such bills are rendered shall pay all items concerning which there is no dispute, and the other items shall be paid promptly when the correctness thereof has been ascertained by arbitration or otherwise.

Liability

11. Each party hereto assumes for itself the responsibility and risk of using and operating its own trains and engines over the space covered by the said interlocking system, and also responsibility for the negligent acts and omissions or the alleged negligent acts or omissions of its own officers, agents, servants and employees engaged in connection therewith; and in performance of any of its separate duties under this contract; and will pay to the other party and to third persons all damages which may arise and for which it may be liable from such negligence and in such operation.

The party having special charge of the management and operation of said interlocking system shall not be liable to the other party for the negligent acts or omissions, or the alleged negligent acts or omissions of any person employed in the operation, maintenance or repair of said interlocking mechanism, but all persons so

employed shall, as respects any injury caused by such negligence, be regarded and treated as the agents or servants of each party hereto, and each of said parties hereby assumes the responsibility for all damages resulting from the negligence of such agents or servants in the operation of its own engines, cars and trains, and those of its tenants, lessees and licensees, at the said crossings, and shall indemnify and save the other party harmless therefrom. Any expense caused or growing out of the injury or any workman or employee engaged upon the construction of said interlocking plant shall be held and considered to be a construction expense, and shall be divided as herein in Section 3 provided.

Arbitration

12. In case of any differences or dispute arising under this agreement or concerning the subject-matter thereof, the parties hereto agree to submit such difference or dispute to three arbitrators, one of whom shall be appointed by the company, and another by the company, and each party shall give to the other party written notice of appointment of its arbitrator, together with his name and address. The two arbitrators so chosen shall select a third arbitrator. If either party shall fail to choose an arbitrator as herein provided, the arbitrator selected by the other party hereto, at the expiration of days after the date of its said written notice, shall select a second arbitrator, and the two arbitrators so chosen shall select a third arbitrator. If within days after the appointment of a second arbitrator, as herein provided, the two so chosen shall have failed to select a third arbitrator, either party hereto may apply to any judge of the District Court of the United States for the district which shall then include....., or who shall thereupon appoint the third arbitrator. The three arbitrators so chosen in any manner as herein provided, or a majority of them, shall hear and decide said difference or dispute, and their decision, or that of a majority of them, shall be final and binding on the parties hereto.

The expense of an arbitration under the terms hereof shall be borne by the parties hereto in the proportions fixed by the arbitrators.

Cancellation of Conflicting Agreements

13. It is mutually understood and agreed that any and all agreements existing between the parties hereto or their predecessors, so far as they conflict, or are inconsistent with the terms and conditions of this agreement, are hereby annulled, but in all other respects they shall continue in full force and effect.

Duration and Succession

14. This agreement shall take effect on the days of, 19.., and shall continue in force during the existence and operation of the interlocking plant, or until discontinued by the mutual agreement of the parties hereto.

The provisions of this agreement shall be binding upon and inure to the benefit of the parties hereto, their successors, lessees and assigns.

In witness whereof, the parties hereto have caused this agreement to be executed in duplicate, by their respective officers, thereunto duly authorized, the day and year first above written.

Committee: E. H. Lee (C. & W. T.), Chairman; C. A. Wilson, vice-chairman; C. Frank Allen, S. D. Bracy (Little Kanawha), O. P. Chamberlain (C. & I. W.), John P. Congdon, Thos. Earle, W. D. Faucette (S. A. L.), G. F. Gifford, J. C. Irwin (B. & A.), R. G. Kenly (M. & St. L.), A. S. Kent (C. I. & L.), C. I. Parker (N. Y. C.)

Discussion

E. H. Lee (Chairman). The preliminary statement as to the scope of the committee's work for the association will not be read. We suggest no revisions for the Manual this year. Briefly stated, we prepared a form and submitted it to the association last year. For reasons internal to the committee itself, the form was not recommended for introduction into the Manual, and during the current year we found this same question of a uniform contract form of agreement for industry tracks was a subject before several other associations and railroad bodies, and it therefore seemed desirable to coordinate our efforts, so far as possible, with these other bodies, and after several joint meetings with representatives of the association which is principally interested in this particular agreement, we offered to this association this agreement for its approval and for introduction into the Manual.

I will just briefly run over Appendix A, and name the various headings, so if any objections are made or suggestions offered we can consider them.

(Mr. Lee then read the sub-divisions of Appendix A, and there was no discussion on them.)

(Mr. Lee then read Appendix B, "recommendations," and said):

I wish to call attention to the fact that nothing in the side-track agreement is intended to exclude or prevent any carrier from inserting: (1) any routing clause, (2) any clause for the continued use of the right of way to other established industries beyond, or being served through, said track (under clause No. 5) by payment of a per cent on fair valuation of land used; mutually valued or arbitrated if not agreed upon.

I move the adoption of the agreement for industry track and its incorporation in the Manual. (Approved.)

Mr. Lee then read the matter headed, "Report on form of Agreement of Interlocking Plant," and then read the headings in the agreement in Appendix C.

The President: Is there anything in this contract as to what company shall operate the plant?

Mr. Lee: That is left to negotiation between the parties.

H. R. Safford (G. T.): As I read the agreement, it is predicated on a situation where two parties are jointly involved, and where the relation of the two is not that of junior on one side and senior on the other, and I have no criticism to offer to the agreement as to that feature, but this agreement would not apply and would not protect the senior company in the case of a crossing where one company was responsible for all of the expenditures. In that case the junior company should take at least all of the liabilities in connection with the operation and maintenance of that crossing. Has the committee given any consideration to the fact that there must be a change in the form of the contract to cover that condition?

Mr. Lee: The committee considered that phase of the subject thoroughly, as one or more members of the committee had identical conditions in the territory served.

I wish to move the adoption of the uniform contract form for interlocking plants and its incorporation in the Manual.

(The motion was duly put and carried, and the committee addressed with the thanks of the association.)

WINDY CITY ECHO

(COUNT THE LETTERS)

13TH ENGINEERS, (RY) U. S.

Vol. 1. No 1.

FEBRUARY 13, 1918

PRICE 2½ Washers

THE COLONEL'S MESSAGE

The members of this regiment, having grown accustomed to the more or less novel conditions which surround the work upon which they are engaged and to the equally novel if not always comfortable conditions under which they must live, it is natural that they should turn their attention to devising ways and means of recreation and amusement to while away the hours when not on duty. It is in that spirit and largely with that object in mind that the Windy City Echo makes its first appearance. Unlike commercial newspapers it does not aspire to a large number of subscribers and advertisers but to a large number of contributors and its success or failure will be measured in part by the extent to which this aim is realized.

It is in no sense an official organ. On the contrary it is the work of the soldiers of the Regiment acting through representatives chosen from each company and only such restrictions will surround its publication as are required by the censorship regulations and for the maintenance of military discipline.

The Echo has before it a great field of usefulness. Besides its success as an entertainer and as a medium for the exchange of ideas, which seems to be assured, it can do much to stimulate Regimental Spirit and to initiate and foster various other forms of recreation and amusement.

That it will seize these opportunities and thus become a powerful instrument for good in shaping the destiny of the Regiment is the earnest wish of the Regimental Commander.

C. W. KUTZ.

OBITUARY

Prudent R. Van Rissinghem, Company B, was fatally injured by being thrown from his train at S----- on December 27th, 1917. He was born in Nevele, Belgium, and enlisted from East Moline, Illinois, where he was employed on the Chicago, Rock Island & Pacific Railroad. He was a good soldier and a good friend, and the first man of the regiment to lose his life on active service. He was buried with military honors at F----- the day following his death. The services were conducted jointly by Lt. Cutler, Chaplain, and a French priest from the hospital.

Jesse C. Main, Company D, died at Ameri-

can Base Hospital No. 15 on December 16th, 1917, from a complication of diseases resulting from typhoid and pneumonia. He was removed to the Base very shortly after being taken sick, and during his five weeks there was in daily communication with friends from this regiment convalescing there. He was 27 years old and enlisted from Stillman Valley, Ill. and had worked for the Chicago, Milwaukee & St. Paul Railroad. He was buried at the Base, and a dozen men from the regiment, were able to attend the funeral service. He was a very cheerful, willing worker and was widely known in the regiment.

BUCK UP

Buck up boy, it ain't so bad
Dog-gone, it might be worse,
A soldier's alive until he's dead
So why climb into the hearse.

Of course you're takin' a gambler's chance,
But it's a hundred to one you'll win,
So just buck up it ain't so bad,
Accept it all with a grin.

You wanta go back? Well so do I
And it's that that'll make you fight,
But you can't give in to the inner man
And expect to do things right.

Why cuss it kid, think of the guy
Who ain't seen home in years,
If you've gotta feel bad, feel bad for him,
He hasn't got time for tears.

So forget about the lonely streak,
Remember the part you play,
You're over here to do your bit
And until then you've gotta stay.

You're thinkin' about the folks back home?
Well they're thinkin' about you too,
They're mighty proud you're over here
So why the devil feel blue?

So just buck up, do your share,
And don't it wear a smile,
It's the things we here to fight hard for
That makes our lives worth while.

Why it's all a part of Life's big game,
Loneliness, love and joy,
But it's things like that, that make the man,
Be a man, Buck Up, my boy!

TED SULLIVAN

Med. Dept.

APPRECIATION

The 13th wishes to thank each and every one of the friends back home who were instrumental in making our Christmas more enjoyable by sending over here Christmas boxes and various other forms of presents:

A large proportion of the Christmas boxes received by the men were grouped in Chicago and shipped in large boxes, which secured very prompt handling and insured their arrival with minimum of loss and breakage. Every man in the regiment appreciated the amount of trouble it was to do all the work in connection with notifying their relatives and getting the packages together. On behalf of the men we take this opportunity of expressing their hearty thanks to Mrs. W. C. Langfitt, Mrs. R. D. Black, Mrs. N. L. Howard, Mrs. C. A. Holmes, Mrs. F. E. Sloup, Mrs. E. H. Shaughnessy, and Mrs. V. H. Hagelbarger.

In addition to this the employees of the following railroads, which are represented by a company in this regiment, are tendered the grateful acknowledgment for work they have done for the men:

Illinois Central
Chicago, Rock Island & Pacific
Chicago Great Western
Chicago, Milwaukee and St. Paul
Chicago & Northwestern
Atchison, Topeka & Santa Fe.

Another of our benefactors was Vice President E. A. Howard of the Chicago Burlington & Quincy Railroad, who provided cigars for every man in the regiment.

In spite of the fact that the men from the Chicago, Burlington & Quincy are scattered among different regiments, the employees of that railroad got together a fund of more than \$300.00 which will go far toward providing the little extras which help so much in padding up the regular ration allowance.

Officer of the day: « I saw you lying in the gutter last night. »

Joe Burnes: « Yes sir, two Master Engineers were holding me down. »

O. of D.: « Who were they? »

J.B.: « Haig and Haig. »

o

Have you noticed that all the French girls have the Arc de Triomphe in their eye?

A copy of the first paper published by the 13th Engineers (Railway) regiment, which is now operating railways "somewhere in France." Among the officers of this regiment are a number of members of the American Railway Engineering Association, including Charles L. Whiting, major, Second Battalion (formerly division superintendent, C. M. & St. P.); W. G. Arn, captain adjutant (formerly assistant engineer, maintenance of way, I. C.); C. E. Carson, captain adjutant (formerly superintendent, F. D. D. M. & S.); and T. W. Fatherson, captain engineer (formerly engineer maintenance of way, C. G. W.)

Banquet of American Railway Engineering Association

Annual Dinner of the Engineering Association

Abstracts of Addresses at the "War-Fare" Dinner Held in the Gold Room of the Congress Hotel Last Evening

THE NINETEENTH ANNUAL DINNER of the American Railway Engineering Association was held in the Gold Room of the Congress Hotel last evening with President John G. Sullivan presiding as toastmaster. The speakers included Sir Edmund Walker, president of the Canadian Bank of Commerce, who spoke on "Canada's Part in the War"; Edward R. Kelsey, governor of the International Association of Rotary Clubs, whose topic was "Good Fellowship," and Rev. Stephen K. Mahon, the title of whose address was "Unsolved Problems."

The program was highly patriotic in character. All of the speakers laid emphasis on the necessity of taking all possible measures to back up our troops at the front.

Two tables were occupied by Santa Fe men, while the Rock Island men filled three tables. The Cornell University alumni also occupied a table as in previous years.

Canada's Part in the War

Sir Edmund Walker spoke in part as follows:

In speaking to an audience consisting, as this gathering does, of men who deal with facts scientifically the message must be free of camouflage and boasting while retaining the courage to give praise where due. Canada is much misunderstood by Americans, but it is to Americans like George Louis Beer and Clarence W. Alvord that the British owe their knowledge of the colonial system of Great Britain.

The early Canadians were French, clinging to their own systems, United Empire loyalists determined to build on Great Britain's mistakes, the Scotch and the Irish who love fighting and the English who would not readily lose touch with the old land. These are the people who won successive victories in parliamentary struggles

and brought to the British dominions beyond the seas autonomy so complete that only a silken thread is left.

How would such a people act when Great Britain was in trouble? Tribal feeling is the strongest instinct in man. So we did not hesitate. Great Britain had pledged her honor for Belgium and by the end of July, 1914, men from all parts of Canada were either offering military regiments or volunteering to raise them. Step by step there were raised about 400,000 men and then we resorted to conscription to carry out our pledge of 500,000 men. To make this army effective we soon realized that we alone must clothe, feed and arm our men.

The manufactures in Canada are not highly developed. Our problem was to secure machinery, plan factories and train men and eventually women. The Munitions Board had to guarantee deliveries of raw materials, build factories and increase the output generally. The articles grew from shrapnel shells to aeroplanes and ships. Now Canada is producing these articles in 550 factories. On these plants the sum of \$13,500,000 has been expended for the account of the Imperial Government. The Board has contracted for a large number of high power aeroplane engines and there are now under contract in Canada 112 steel and wooden ships with 405,000 tons capacity, aggregating in value over \$90,000,000. The cost of the war to Canada at the end of 1917 had totaled \$70,000,000. In our last loan we asked for \$150,000,000 from our people. We received subscriptions for \$417,000,000.

We in Canada are not war weary. It is turned into us that if the war is lost it will be by the civilian people at home. Our civilian soldiers made in a few months have armed us. I shall not try to follow them from the

first fight at St. Elou by the battle of Ypres and many other fights which will be associated with the name of Canada forever.

Between 20,000 and 30,000 English women are now in France serving as nurses and searchers, etc. Canadian women are serving everywhere. In Canada they are the bulwark of every charity and are filling men's places in every walk of life.

Despite submarines the number of vessels coming and going in all United Kingdom ports was greater in December, 1917, than in February, 1917, when submarine war really began. The British Navy alone has made this possible. Great Britain has carried safely across the sea 13,000,000 soldiers and has only lost 9 transports and 9,000 men. She has also convoyed safely 2,000,000 horses, 25,000,000 tons of war supplies and 53,000,000 tons of coal and oil.

With the entry of the United States into the War our boys are fighting together. If we can but make democracy workable, we can together make the world worth while, which it certainly is not just now.

Dr. Mahon's Address

Dr. Mahon spoke in part as follows:

Unsolved Problems, we have had them. We have always had them. Some have been easy to solve. Some have caused the midnight oil to burn. Solution has come when there was a willingness to accept the facts no matter how unpleasant, and to deal honestly, vigorously, and persistently with them. The Pilgrims solved the Indian problem with shotguns, and it was not General Sherman, but General Miles Standish, who first said, "The only good Indians are the dead ones."

The American ideal is essentially an ideal of democracy. In the three great tidal waves of immigration, the first was for religious liberty; the second for political liberty, and the third for economic liberty. America, with all her mistakes, has kept clearly in the conscience of her body politic those ideals of justice, liberty, equality and righteousness which are dearer than life itself. She has always desired peace. Her wars have always been wars in which principles were involved. If sometimes the nation has seen "through a glass darkly" the progress has nevertheless been up and not down. The policy has been that of good will, generosity and co-operation. The standard nationally has been "of the people, by the people and for the people," and not "of the people, by the rascals, for the rich."

Over against the American ideal of democracy with its reverence for law and reverence for the rights of others is the Roman ideal, modernized as we see it today in Germany where the big word is that of "Verboten"—forbidden. It is found everywhere throughout the nation; it is the rule of fear. The leaders of Germany are out for a modern Roman Empire; they believe in it. They have prepared for it; at all stages they have been game for the colossal risks involved. The object is power; the state has no morals. Like the monster in Mrs. Shelley's "Frankenstein," there is the body, the brute, the mind with its cunning, but it has no soul, no sense of justice, no sense of obligation—a monster who victimizes.

It is said that when the German army entered Louvain, the priests and preachers prayed, the nuns wept, the young girls besought brutal men for mercy; but all to no avail. You cannot argue with a drunken man, nor preach to a lion, or persuade a brigand. America, standing in the presence of treaties violated, all the finer instincts of our civilization desecrated, its liberties denied—what must she ask herself? What have I to gain by war? What would I lose? Would it be the popular

move, the expedient thing? Would it be profitable?

Lincoln said, "A house divided against itself cannot stand; we cannot exist half-slave and half-free." We accepted that doctrine for our nation, a war was waged, and justice was established. Now we say, we cannot exist half-autocracy and half-democracy, and in using these terms I mean them in no platitudinous way. But interpreted by our text we cannot exist with one half seeking to have Lordship over the faith of the people while the other half is seeking to be helpers of their joys.

Which shall conquer? Germany says, "We shall win"; Bernstorff says, "America is too far away"; Von Hindenburg says, "America has come in too late." No one knows what a night will bring forth, changing the destinies of centuries. In such a situation, we must do more than simply stand and wait.

The Great Adventure

Study the great characters of history. Where did they come from? The Joan of Arc, the Washingtons, the Lincolns, the Lafayettes—they are those who, in response to the common experiences of their day, gave themselves to the bettering of those conditions. This is the challenge of today—justice, hate, greed, ambition, autocracy trampling the rights of humanity under foot; there leaps up in the soul resentment, we see red, we feel a passion to correct wrong; we must respond to the challenge or the soul shrivels. When some of the white stars of our service flags are being splashed with red and some being turned to gold, there is no place for the profiteer and the greedy. Each must sacrifice. Every man is in the war. It is the glory of America that she answers the call of the oppressed.

Christianity is the single solid hope of world peace—so far from Christianity having failed, this is a war for Christian principles. The rule of Christ only can usher in the rule of peace. Therefore, we must not only win the war, we must win the world. The great issue in the world today is the Kingdom of God. Underlying the material are the ultimate spiritual issues. Col. House, on his return from Europe, said to President Wilson, "There can be no permanent peace until the churches christianize international relationships."

Good Fellowship

The last speaker was Edward R. Kelsey, governor of the International Association of Rotary Clubs. He outlined some of the things to be gained by "good fellowship" in an organization such as the American Railway Engineering Association. He expressed, by example, what real friendship means. However, to secure the maximum good a man must do his part, the "I-don't-like-that-man" spirit will not do. How much sunshine have you spread in his path? Optimism is another attribute now so essential. Acquire the "I-can-do-it" habit. The success of the Liberty Loan campaigns illustrate what can be done, and what must be done again with the help of these characteristics.

Meeting of Committee V—R. S. A.

Committee V of the Railway Signal Association on Maintenance and Operation, L. R. Mann, chairman, held a meeting yesterday in Room 344 at the Auditorium Hotel. Rules were drafted for the instruction of mechanical men and maintainers for use at mechanical interlocking plants. These are to be printed in card form for placing in towers. Similar rules are also to be formulated for electro-mechanical electric and electro-pneumatic plants.

A. R. E. A. Election of Officers

An announcement of the results of the balloting for officers for the ensuing year was made at the close of yesterday's session. The officers are as follows:

President, C. A. Morse, chief engineer, Chicago, Rock Island & Pacific, Chicago.

First Vice-President, Earl Stimson, engineer maintenance of way, Baltimore & Ohio, Baltimore, Md.

Second Vice-President, H. R. Safford, chief engineer, Grand Trunk Railway System, Montreal, Canada.

Secretary, E. H. Fritch.

Treasurer, George H. Brenner, district engineer Bureau of Valuation, Interstate Commerce Commission, Chicago.

Directors, J. L. Campbell, engineer maintenance of way, El Paso & Southwestern, El Paso, Texas; E. A. Frank, principal assistant engineer, Seaboard Air Line,

Chicago Engineers' Club will be announced tomorrow, although as first vice president of this organization he has been performing the duties of the president for the last eight months owing to the absence of the regularly elected president in Russia. He is chairman of a sub-committee on water waste of the Chicago Association of Commerce. He is also a member of a special committee on public affairs of the Western Society of Engineers, Chicago, and is the member of the nominating committee of the American Society of Civil Engineers from the eighth district. He is equally active in the work of the American Railway Association, being chairman of the sub-committee on engineering, which has been considering clearance legislation among other problems and being a member of the maintenance committee of that same organization.

Mr. Morse is an enthusiast in any work which he undertakes, in his railway work as well as in his asso-

Earl Stimson,
First Vice-President Elect

C. A. Morse,
President Elect

H. R. Safford,
Second Vice-President Elect

Norfolk, Va., and E. H. Lee, vice-president and chief engineer, Chicago & Western Indiana, Chicago.

Nominating Committee, J. E. Crawford, chief engineer, Norfolk & Western, Roanoke, Va.; H. T. Douglas, Jr., chief engineer, Chicago & Alton, Chicago; J. V. Hanna, chief engineer, Kansas City Terminal Railway, Kansas City, Mo.; J. B. Jenkins, formerly valuation engineer, Baltimore & Ohio, now in military service; J. E. Wiloughby, chief engineer, Atlantic Coast Line, Wilmington, N. C.

President Charles A. Morse

Charles Adelbert Morse, whose election as president of the American Railway Engineering Association was announced yesterday, is an enthusiastic believer in the value of engineering organizations. Although he came to Chicago only four years ago and is carrying the responsibilities of the position of chief engineer of the Rock Island Lines, a system of over 8,000 miles, he has found time to take active part in the work of a number of important engineering organizations and has made his influence felt strongly in them. In addition to assuming the presidency of the American Railway Engineering Association today, his election as president to the

association activities, his success can be contributed largely to the enthusiasm which he instills in those with whom he comes in contact. With this enthusiasm is combined an aggressiveness and a disregard for restrictive precedents which enable him to cut any obstructive red tape to secure the desired results. Under his leadership the American Railway Engineering Association should make important progress during the next year, a period in which many problems will be presented, the proper solution of which is essential to the continued welfare of the organization.

Charles A. Morse was born at Bangor, Me., on January 1, 1859, and was educated at the University of Maine. After completing his education, he immediately came west and began railway work as a chairman with the Chicago, Burlington & Quincy. After spending four years with that company he became division engineer on the Mexican Central, where he remained for a year and a half before returning to the Burlington. He entered the service of the Atchafalaya, Topeka & Santa Fe as a transition in January, 1890, and remained continuously in the employ of that road for almost 27 years, during which time he passed through all the grades to that of

chief engineer of the system. He was division engineer and resident engineer at Fort Madison, Iowa and Pueblo, Colo., until July, 1901, after which he was assistant to the chief engineer at Topeka for seven months and then principal assistant engineer at La Junta, Colo., for 13 months. From March 1, 1903, to July 1, he was engineer of the eastern grand division at Topeka, after which he was acting chief engineer of the Atchison, Topeka & Santa Fe until July 8, 1904, on which date he was appointed assistant chief engineer. On September 1, 1905, he was appointed chief engineer of the Coast Lines, with headquarters at Los Angeles, Cal., and one year later he was appointed chief engineer of the lines east of Albuquerque, N. M., with headquarters at Topeka, Kan. In November, 1909, he was appointed chief engineer of the Santa Fe System, which position he held until March, 1913, when he became chief engineer of the Chicago, Rock Island & Pacific at Chicago.

of the plate come to bearing on the fishing surfaces of the rails, only at the middle where the two rails join, and with the inside face of the fish plate at some distance from the web of the rail as in the ordinary angle bar. At the ends of the bar, however, the fishing surfaces are not in contact, so the bolting up of the joint has the effect of bending the splice bars until their inside surfaces come in contact with the web of the rail. Under this construction and with sufficient allowance in the bolt holes for expansion and for the bending of the rails under traffic, the joint bars may serve to hold the rails in coincidence at the joint without being themselves subjected to bending stresses by the load.

Some of the claims made for this joint are that it eliminates rail breakages in the joints and breakage of the

The Roach Joint in Track

joint itself; that stresses in the bolts are reduced, that the joint has only half as much metal as the lightest form of any other type of joint; that it is the simplest joint and therefore the easiest to apply; that it can be applied at the heels of switches and frogs with the same ease as on other joints and without change of design; that the spacing of ties is unnecessary, that the bases of rails can be spiked opposite the Roach bars the same as at any other part of the rails, and that standard tie plates can be used throughout. The bars may also be removed and replaced without having to draw the spikes. Joints of this type have been in use on several southwestern railroads for several months.

An Improved Design of the Roach Rail Joint

MOST OF THE RAIL joints now in use are designed on the principle of connecting the rail ends by members intended to continue the stiffness of the rail across the joints. A rail joint must also act as an expansion joint for the rail, and provide for the necessary slipping of one or both rails within the clasp of the joint members as the rails change in length, with variations in temperature. Because of these two conflicting requirements, the primary office of the rail joint—to make the separate rails act as continuous members by the joints—

Details of a Joint Bar

has been difficult to accomplish. This is one reason why a different solution of the joint problem has been submitted in the form of the new Roach Joint, manufactured by the Reinforced Rail Joint Company, St. Louis, Mo.

The principal function of this joint is to keep the trends of adjoining rails co-incident at the point of juncture while leaving the rails free to bend independently under load. As seen in the accompanying photograph, this joint is essentially a pair of fish plates, although presenting a marked difference from the old-fashioned fish plates in that the fishing surfaces are on convex curves, that is, the splice bar is deeper at the midpoint than at the ends. Because of this, the fishing surfaces

The Clarification of Boiler Waters

ONE OF THE ADVANTAGES of the large riser pipe type of water tank arises from the opportunity it affords for sedimentation and disposal of matter held in suspension in the water. The water may be naturally muddy as when coming from a stream like the Missouri river, or it may contain precipitated solids through the use of soda ash or some other reagent to accomplish a partial water treatment where for any reason it has not been thought desirable to install a complete water softening plant.

The manner in which the base of the large riser pipe acts as a settling basin or sludge sump is shown in the sectional illustration. The outlet and inlet pipe extend up into the riser pipe for a distance of 10 ft. or more so that there is a considerable portion of the riser pipe below the tops of the inlet and outlet pipes which can serve for the accumulation of the suspended matter. A specially arranged wash-out valve is provided at the bottom which is easily operated from the outside by a lever while the tank is in service.

In accordance with this idea, a large number of the tanks furnished by the Chicago Bridge & Iron Company for the Chicago, Burlington and Quincy have been equipped and are operated as treating tanks. The soda-ash is sprayed over the top of the inlet pipe as the water is pumped into the tank, the sediment being precipitated

to the bottom of the large riser pipe. All of the tanks which have been furnished to this railroad in the past few years have been equipped for water treatment so that the process may be installed at any time without the delay or expense incident to putting the tank out of service. The Wabash has also applied this method of water treatment to a number of tanks furnished by the same company.

As many water stations are located where water is pumped from mud-bearing streams, the large riser pipe is more generally used for the collection and discharge

Sectional View of the Riser Pipe Base, Showing Arrangement

of mud than for soda-ash treatment. The matter held in suspension soon settles in the bottom of the large riser where it may be discharged through the washout valve. The Illinois Central tanks at Dyersburg and Obion, Tenn., are both supplied from muddy streams so that it is necessary during certain seasons of the year to sludge the sediment out through the washout valve every few days. The problem of securing cleaner and purer water for locomotive service is of particular importance at this time and the method of securing these results by means of this type of tank is of interest, as the results are obtained with practically no labor expense.

A New and Economical Coal Handling System

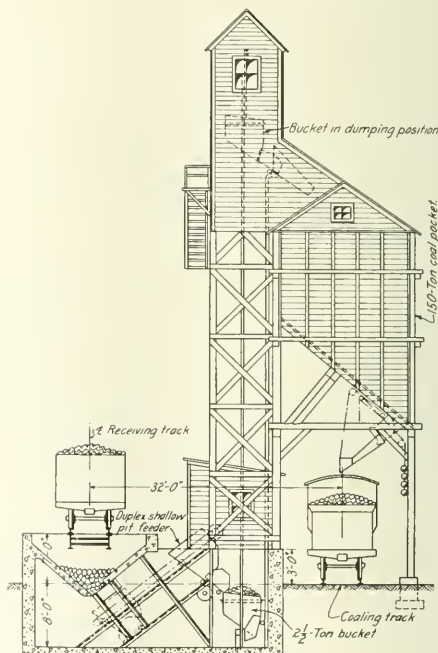

THE BUCKET PITS 24 to 25 ft. deep required with the counterbalanced or balanced bucket-type coal handling plants are occasionally a source of trouble and expense where wet excavation, rock or quicksand are encountered. Because of this, the Roberts & Schaefer Company, Chicago, perfected a duplex shallow pit loader which eliminates the deep pit while still retaining the advantages of the large bucket, and during the past two years installations involving this type of pit have been made at Paintsville, Ky.; East Ely, Nev.; Las Vegas, N. M.; South Chicago; South Brownsville, Pa., and Chicago.

In this new design the coal is received in a 20-ft. long track hopper in the regular manner. Directly in front of the aperture of the hopper is an undercut gate made

of ½-in. steel plate operating on rollers. This gate, in its opening and closing feature, is actuated by the ascent and descent of the duplex feeder, which has a capacity of 2½ tons. This feeder is a large structural steel box, which rolls on flanged rollers on a heavy angle-iron track carried on the structural steel supporting frame in the bucket pit. The loader is direct connected by gears to the hoist which elevates the bucket; the gears being so timed that the loader makes its trip upward as the bucket descends, the ratio being about five to one.

On the front of the measuring receptacle is an apron equipped with a roller which likewise travels on a guide, which prevents its opening except when discharging the load into the bucket. The apron folds over a pair of pulleys in discharging coal into the elevating bucket. With this design noise is eliminated and the operation of machinery in pit is silent.

The duplex shallow pit loader permits the installation

A Cross Section of the Plant

of a 12-ft. pit by elevating the receiving track 2 ft. above the coaling track. It also permits coaling on a track which is located 32 ft. from the receiving track, as shown in the plan.

"Never Again"

He found his own front porch with wonderful accuracy, navigated the steps with precision, and discovered the keyhole by instinct. Once in the dimly lighted hall, there was an ominous silence followed by a tremendous crash.

"Why, what has happened, George?" came a voice from above.

"It's all right, Mary, but I'll—I'll learn those goldfish to snap at me!"

EDITORIAL

Railway Age

EDITORIAL

Is the Railway Supply Industry Awake, or "Asleep at the Switch"?

THE RAILWAY BUSINESS ASSOCIATION originally was organized chiefly as an agency of conciliation. Its purpose was to help bring about better relations between the railways and the public, and between the railway supply companies and the railways. It has done this.

Conditions in both the railway and the railway supply fields have been greatly changed by the adoption of government control of railways. The railways and railway officers have been deprived of many means which they formerly employed to defend themselves before the court of public opinion. No railway officer at present feels free to discuss frankly the relations between the railways, on the one side, and the government and the public, on the other side. Most railway advertising and publicity work have been discontinued; and that which is continued is under government control.

As for the railway supply companies, they suddenly find themselves in a position where they must not merely do what they can to secure fair treatment for the railways from the government, but where they must adopt measures to insure fair treatment for themselves from the government.

For the railway supply companies not promptly to recognize the greatness of the changes in their own situation which government control has wrought, and act accordingly, would be very stupid, and might prove absolutely fatal for many of them. The time has come when they must organize to fight every wrong tendency of the government in dealing with the railways, and to fight to protect every right and every legitimate interest of the railway supply industry.

The term "railway supply industry," as here used, is a very broad one. We include in it every class of concern which directly or indirectly produces equipment, material or supplies of any kind for railways. The number of concerns which come within this description is very large, the amount of their invested capital runs into billions of dollars, the number of their employees runs into millions. Thus broadly considered, the railway supply industry is one of the largest, and by organizing on sound lines and acting courageously and energetically, it can make itself one of the most influential industries, if not the most influential, in the United States.

Every concern and individual in any way engaged in the railway supply business is invited to be represented at the meeting under the auspices of the Railway Business Association at the Hotel LaSalle in Chicago on April 8. The purpose of the meeting is to so reorganize this association as greatly to broaden its activities and make it a potent force in the determination of the country's future railway policy

and for the protection and promotion of the welfare of those who furnish necessities to railways.

Unless the railway supply interests of the country are "asleep at the switch," the meeting will be largely attended and will result in the formation of an organization at once inclusive enough, many-sided enough, flexible enough, and strong enough to play a very important part in the affairs of this country.

America must awaken to and stamp out the insidious German propaganda which is striving to cut down production,

What Doth it Profit a Man?

restrict transportation, and place other stumbling blocks in the way of our hearty and successful participation in the fight against autocracy and Prussianism. We must recognize the great danger in this propaganda which is specially devised to suit local conditions and national characteristics. It laid the great giant Russia prostrate, defeated Italy's splendid army, controls the commerce of Spain and is largely responsible for our Mexican troubles. It is hard at work in many places and in many ways in this country and every loyal citizen must do his duty in fighting it—this is just as important and just as necessary as actual fighting in the trenches on the other side. The stirring appeal on the opposite page is addressed by the Conference Committee on National Preparedness to the American workmen. The term "workmen," must be construed in its broader sense to include all workers, whether manual or brain, and this includes every railroad employee from the apprentice boy or beginner to the president and the chairman of the board. The Conference Committee on National Preparedness has offices in the Metropolitan Life Building, New York City, and is prepared to furnish posters or leaflets in large quantities, containing the message, "What Doth It Profit a Man?"

The only item of railway revenues that showed a decrease for the calendar year 1917, as compared with 1916,

Reduction in Mail Revenues

was the item of revenue from the mail traffic, according to the recent summary of railway returns published by the Interstate Commerce Commission. The earnings of the railways for carrying the mails amounted to \$58,681,549 in 1917, a reduction of \$2,546,216 from those of 1916. This is a reduction of 4.4 per cent per mile of road. For the same year freight revenues per mile of road increased 9.6 per cent, passenger revenues increased 16.4 per cent and express revenues increased 18.1 per cent. In the face of these figures it would be extremely unlikely that the mail traffic had not increased also and while no statistics of the amount of mail carried are available we have the authority of a recent statement issued by Postmaster General E. A. Tamm that the first class mail increased during the year by 25 per cent while the parcel post increased approximately 40 per cent. The statement was issued in January for the purpose of transferring the blame for delays in the mail from the

post office department to the railroads whose pay for their service in carrying the mails had been reduced.

If the present railway mail pay rates and the present methods of the department of handling the railway mails are continued, and the question whether they are to be continued is being investigated by the Interstate Commerce Commission, a still greater reduction in the payments to the railroads will be shown for the present year, because the new methods had not been in full effect for all of last year. However, the slight saving to the public will hardly be appreciated by those who have reason to depend to any considerable extent upon the speed or regularity of the mails because the methods by which the saving is being effected do not tend to improve the service in either of these respects. The reduction in mail pay for last year has been principally at the expense of the railways. If continued it will hereafter be at the expense of the United States government because the less the post office department pays for its transportation service the less the railroad administration will have with which to pay its expenses.

The annual report of the Pennsylvania, which traverses the territory where the greatest increase in the mail has occurred, shows that compared with 1915 the passenger revenues had increased 37.1 per cent and express revenues increased 49.2 per cent but mail revenues decreased although there was an extraordinary increase in the quantity of mail carried. How this reduction in the compensation of the railroads for carrying the mail has been accomplished, under the space system which has been substituted for the weight system of payment, has been explained several times in these columns.

What Does Standardization of Locomotives Mean?

WITH THE WORK of the Government's Committee on Standard Locomotives drawing to a close, it is well to review what standard locomotives will mean to the railways of this country. It is assumed that the committee plans to recommend light (about 55,000 lb. axle load) and heavy (about 60,000 lb. axle load) classes of Mikado, Mountain, Pacific, Santa Fe, Mallet and Switcher types of locomotives.

By restricting future orders to the above twelve designs our railways will have locomotives which in many cases will be too light for the service in which they are placed and in some cases too heavy for the particular needs of the roads. This means a decrease in operating efficiency—it will cost more to operate the locomotives, more trains will have to be run, more locomotives will have to be built, or if, for instance, the Santa Fe type is to be used for purposes in which the heaviest Mikados are now being used, the locomotives will cost more and be more expensive to maintain. The heavy investments many roads have made in strengthening bridges and in improving the track for wheel loads above 60,000 lb. will not be giving the anticipated return. Advantage cannot be taken of large clearance limits on some roads, particularly those in the West. In fact, the increase in cost of train operation due to locomotives of a compromise design will more than offset the saving in first cost.

The maintenance of these standard locomotives, which will be "new" locomotives to all the roads, must be given serious consideration. The repair facilities of the railroads are overtaxed as it is. What will be the conditions when these standard locomotives are placed in operation? New drawings, templates, jigs, patterns and the many conveniences the roads have developed for repairing locomotives standard to their lines will have to be made for the new

locomotives and all at a time when every ounce of energy is required to repair and maintain the existing locomotives. With the 400 or more locomotives that are now being operated on foreign lines there is an excellent opportunity of finding out what confusion a new locomotive creates when it comes in for repairs. It has been stated by one who has handled such locomotives that they are out of service 30 per cent more time than the home road locomotives.

With the increase in operating expenses and the increase in maintenance costs, will the money saved by contracting for standard locomotives be worth while? Will the country have any more motive power—not locomotives, but motive power—by adopting standard locomotives rather than having the builders construct locomotives of existing designs, which meet the particular operating conditions and which the roads are organized to maintain? Is it wise to burden further the railways' already overtaxed facilities? There can be but one answer, particularly at this time, when the nation is at war.

Australia as a Future Market

THERE WILL BE many countries looking towards the American railway supply field to help fill their urgent and belated demands after the war, but there will be few markets that will offer the opportunities open to us in Australia and New Zealand. These countries in normal times import great quantities of railway materials each year, principally from England and the United States, and our machine tool exports there have been especially large. Since the shipping situation became so acute, however, the demands have not been met and Australia and New Zealand today are in urgent need of railway materials for both maintenance and contemplated improvements. The Australians are already familiar with many American railway products and keenly appreciate their excellence, as has been evidenced by the continued sales, particularly of such things as signal material and machine tools. The opportunity for American railway supply manufacturers, in short, is there. Are these manufacturers doing their share now to lay their plans to make the most of this opportunity?

It is this question that makes especially interesting and timely the report issued this week by the Bureau of Foreign and Domestic Commerce on American markets for railway equipment, materials and supplies in Australia and New Zealand. Frank Rhea, a man with extended experience in both the railway and the railway supply field, has just returned to this country after a trip covering about one year, during the course of which he investigated, as commercial agent for the Bureau, the markets for railway equipment in Australia and New Zealand, and in China, Japan, Korea and Manchuria. His report on Australia and New Zealand, published as Special Agents Series No. 156, is to be followed later by a similar report on the other countries which he visited.

In the abstract of Mr. Rhea's conclusions published on another page it will be seen that he speaks very conservatively of the trade opportunities in railway supplies in Australia. It is this fact and the standing which Mr. Rhea has in the field which give the report no small share of its value. Mr. Rhea has not exaggerated, but the opportunities for trade that he found stand out in the report as sharp and clear as crystal, showing Australia and New Zealand to be among the best markets that the American railway business man could hope to enter after the demands of war have given way to those of peace.

Mr. Rhea emphasizes the vast possibilities that lie before the American manufacturer of car and locomotive specialties and parts, the builder of machine tools, the maker of

signal apparatus and accessories and the manufacturer of maintenance of way material and track tools. The Australians, he says, will prefer to build their own cars and locomotives because labor is so well organized that this work in most cases will not be allowed to go out of the country. They will not be able, however, to supply the parts and specialties efficiently; but, on the other hand, the fact that so much work will be done in company shops will stimulate as it has in the past the steady and continued sale of American machine tools which have already proved their excellence in Australia and have furnished a large proportion of our total exports to that continent.

The suggestions that Mr. Rhea presents on "application" or commercial engineering are not to be confined to Australia and New Zealand. They are world-wide. They are of particular importance at this time, however, because they emphasize the necessity of getting at this export proposition now. England, France and Canada have been in this war longer than we, and although their every energy is being bent to win the war, they nevertheless are already laying their plans for after-the-war business. American industry—the railway supply industry included—must do the same.

The Rate Decision

TOO LATE to be of any particular advantage to the railroads, except possibly as a vindication of their judgment, the Interstate Commerce Commission has rendered a decision allowing the eastern roads most of the remainder of the general advance in freight rates which they asked about a year ago and which was granted in part last June. The present effect of the advance will be to make it that much easier for the railroad administration to make the railroads earn enough to pay its guarantees to the companies for the use of their properties and the expenses of operation.

Whether the effect on railroad credit, if it had been ungrudgingly and promptly allowed at the time the railroads urged its necessity, would have been sufficient to have made it unnecessary for the government later to take over the railroads in order to stabilize the credit structure of the country, is, of course, now problematical. As the commission has not seen fit to accompany its formal orders with any opinion as to its reasons, it may also be considered problematical whether the same decision would have been rendered had the railroads remained under private management.

In its decision of June 30, 1917, the commission declared that the record had not disclosed the existence of a situation requiring "so heroic a remedy" as the 15 per cent advance asked by the railroads, although it was only five months later that it addressed a special report to Congress recommending two alternative plans which many would consider even more heroic.

The commission also indicated in its report to Congress on December 1, after the railroads had renewed their petition for higher rates, that it thought that no advance in rates would be sufficient to relieve the situation confronting the carriers and the country. Probably, in view of the fact that railroad financing at that time had come into competition with government financing, the commission was right in that statement. It was then too late to repair the damage which had been done in earlier years by a governmental policy of railroad regulation which had discouraged the adequate development of the transportation system by making investment in railroad securities unattractive and uncertain.

Railroads have been asking higher rates with indifferent success for several years. Their original petition last year was made on March 22, before this country was at war.

They hoped then for an increase which would stimulate their credit. By the time they made their supplemental application, which the commission has now passed upon, they were chiefly engaged in a struggle to keep up with mounting expenses.

Now that the inadequacy of railroad facilities has become painfully evident there are occasional criticisms because the railroads did not invest more out of what surpluses some of them had, or use what credit they had left, in adding to their plant. Such criticisms overlook the fact that the new money invested for several years had been allowed little or no additional return and that in most cases new capital would cost more than there was any likelihood that it would be allowed to earn.

Whether the commission considers the latest decision, handed down the day after the railroad control bill was passed, as an act of heroism or one of martyrdom is not disclosed, because the commission confines its expression on the subject to a series of formal orders vacating its previous suspensions. Perhaps we shall never know whether the commission was guided by a conviction that Mr. McAdoo would need the money or whether it had reached a belated conclusion that the railroads had needed it. Possibly there is some significance in the fact that the decision was rendered only a few days after the publication of the revenues and expenses of the railroads for the calendar year 1917, whereas when its former decision was issued it had only a forecast.

During the hearings in the 15 per cent case and since that time it has been frequently stated that the railroads, in urging the need for higher rates, were unduly alarmed because of the extremely unfavorable showing for the month of February and that the results for the year would not bear out the prediction they made at that time of the effect of increasing expenses. The commission itself took that view to a considerable extent and before deciding the case had its own statisticians prepare careful estimates for the whole year based on the actual results for the first four months. It predicted that the operating revenues for the year 1917 would be in excess of those for any preceding calendar year and gave estimates for both the operating revenues and the operating income per mile of road, saying that its estimate as to operating income was entitled to less confidence than that of operating revenues and might be reduced somewhat by anticipated increased costs, if realized.

Its estimates, compared with the actual results as given in its recent summary, are as follows:

| Per mile of road: | United States | Eastern District | Southern District | Western District |
|---|---------------|------------------|-------------------|------------------|
| Average operating revenues (as estimated) | \$17,104 | \$20,443 | \$11,667 | \$15,867 |
| Average operating revenues (as reported) | 17,248 | 20,458 | 11,673 | 15,661 |
| Average operating income (as estimated) | 4,334 | 5,801 | 1,727 | 1,891 |
| Average operating income (as reported) | 4,185 | 6,027 | 1,700 | 1,905 |

This comparison shows that the commission's estimate of the expected increase in revenues was considerably exceeded not only for the roads as a whole but for these in all three districts. For the roads as a whole the revenues were \$378 greater per mile of road than the estimate and for the eastern, southern and western districts they were \$1,056, \$581 and \$19, respectively, greater than the estimate. On the other hand, the anticipated increase in expenses were more than realized and as a result the operating income of the roads as a whole was \$149 less than the estimate in spite of an increase in revenues \$378 greater than the estimate, so that the increase in expenses must have been \$527 per mile greater than the estimate. In the case of the eastern roads the operating income per mile was \$470 per mile greater than the estimate, or less than half of the increase in revenues. Applying this to the mileage of the eastern roads, 59,157, gives a total increase as compared with the estimate of \$27,805,790. It was estimated that the increase

in rates which the commission allowed at that time amounted to about \$97,000,000 a year and as the higher rates were actually in effect for a little over three months the increased operating income as compared with the commission's estimate is about equal to the amount of the rate increase for the period during which the rates were in effect. In other words, it took an increase of \$586 a mile in revenues, resulting from a greater increase of traffic than was expected, to make the operating income as high as the commission estimated it would be, if the higher rates allowed be left out of consideration, as they were in making the estimate, and the expenses were, therefore, \$586 per mile more than the first four months indicated they would be.

For the southern and western roads, in spite of the increased revenues, the operating income per mile was \$189 less than the estimate, and for the western roads it was \$418 less than what the commission thought it would be when it declined their request for a general advance.

If we disregard the influence which Mr. McAdoo's wishes may or may not have had on the commission's latest decision, these comparisons would indicate that it is merely another example of hind sight that is more acute than foresight.

Revolutionizing Railroad Organizations

IN HIS MESSAGE TO CONGRESS announcing the adoption of government control of the railways, President Wilson said, "Nothing will be altered or disturbed which it is not necessary to disturb." It would appear that the director general of railroads gives the word "necessary" a very broad definition. Mr. McAdoo is proving a bold innovator. Radical changes are being made in the organizations of the railroads.

When Mr. McAdoo was appointed he had the choice of constituting himself, in fact, whether nominally or not, the head of the Railroads' War Board and using the organization it had built up, or of setting it aside and creating a new organization. He did the latter. He has made and still is making great changes in the personnel of the railroad organizations. The Railroads' War Board consisted of five men whom the railway presidents of the country themselves selected. Mr. McAdoo has created a council of his own which does not include any of these men. The railways, under the Railroads' War Board, divided the country into seven districts in each of which there was a committee of railway executives charged with the duty of handling matters primarily concerning their districts. Mr. McAdoo has divided the country into three regions and appointed three regional directors, only one of whom was chairman of one of the former railway district committees. The Railroads' War Board created several committees to handle various branches of its work. Mr. McAdoo has created various offices and committees which have superseded the more important sub-committees of the War Board.

The railway men Mr. McAdoo has appointed on his immediate staff, and his regional directors, are among the ablest in the country. When he has called upon them to help him they have promptly and loyally responded. Probably they are as well equipped to fill the new positions he has created as any men he could have selected. But since the railways, under private control, did not work out the present organization, or create the various positions in it and determine their functions, the responsibility of railway officers for general results under the new system necessarily will be secondary, while that of government control, and of Mr. McAdoo, as the official exercising the authority of government, will be primary. Doubtless nobody recognizes this more clearly than himself.

However good the personnel of an organization, the re-

sults it gets always depend very largely on the form of the organization and on the duties assigned and the opportunities for efficient work afforded to its members. In an editorial in its issue for January 18 (page 148) the *Railway Age* expressed the opinion that one of the greatest dangers to the success of government control was the danger that it would lead to excessive centralization. There seemed reason then to hope that excessive centralization would be avoided. Almost every step Mr. McAdoo has taken, however, has been toward centralization. An increase of centralization under governmental control probably was inevitable, but he seems to be carrying it farther than is necessary. Instead of dividing the country into a considerable number of regions for railroad purposes he has divided it into only three. In the eastern district there are 60,000 miles of railway; in the southern, 51,000 miles, and in the western, 144,000 miles. In each of them there are more miles of railway than in any other entire country. The mileage in the western district is almost three times as great as in any other country. Mr. McAdoo in his instructions to the regional directors said, "Broadly speaking, I wish to give you power to direct railroad operations in your territory so as to handle traffic with the least congestion, the highest efficiency and the greatest expedition. As far as is consistent with these objects you will, of course, keep down operating expenses. I have put responsibility upon you for the entire operating situation."

"Railroad operations" consist in moving traffic, in maintaining equipment, in maintaining way and structures, and in making improvements and enlargements of facilities. The responsibility for "the entire operating situation" of 50,000 to 145,000 miles of railroad is an enormous thing. No railway officers, under private control, ever had responsibility for operation of so much mileage. One of the fundamental principles of organization is that authority should go with responsibility and be commensurate with it. To enable them to bear their great responsibility the regional directors should have great authority, so they can give authority to and hold responsible the executives of the lines in their charge. What is actually being done? The budgets of the individual lines for improvements and maintenance are required to be submitted to the Railroad Administration in Washington. Committees in Washington are determining what kind of locomotives and cars shall be bought for all the railways, and all locomotives, cars and rails are to be bought in Washington. Changes in passenger train service must be submitted to Washington. All wage questions are being submitted to the Railroad Wage Commission in Washington, and Mr. McAdoo said in his instructions to the regional directors that "at least at the outset and until the matter shall take more definite shape" all important labor problems are to be submitted to him.

Examples of this tendency toward centralization might be multiplied. It would appear that initiative regarding most important and some unimportant matters is being taken from the managers of the individual lines, and that even the regional directors are not being given authority commensurate with their responsibility as it has been defined by Mr. McAdoo. Under this system all the brains of the railroad business are not being, and cannot be, fully utilized. Railroad presidents who have been accustomed to planning years ahead regarding the development and operation of the properties in their charge are being obliged to postpone action on many matters of immediate importance until they can get authority and instructions from Washington. The situation is due in part to the fact that Congress took ten weeks to act on the question of the basis of the compensation to be paid to the companies, a matter the British Parliament settled in 48 hours. But in the centralization of organization which is going on Congress has had no part.

The *Railway Age* said in the editorial already quoted

from (issue of January 18) "The central authority can and should indicate the general principles on which the railways are to be managed. It can and should indicate the general methods by which these principles are to be carried out;" but when the controlling authority begins to try to do more than this "centralized control will slow down everything instead of speeding up everything, and the increases of efficiency gained by eliminating competition will become small compared with the losses of efficiency caused by impairing the initiative and lessening the sense of keenness and responsibility on the part of the units." The tendency regarding which apprehension was then expressed, has plainly manifested itself, and its effects are beginning to appear. At least so it seems to us. Perhaps we are wrong. Perhaps after Mr. McAdoo feels he is in complete control of the situation he will begin to decentralize as much as is compatible with unified operation. While no signs of any intention to do so are now visible, Mr. McAdoo has shown more than once that he is no rigid doctrinaire, and, therefore, conclusions drawn regarding his policy after he has been in office only 10 weeks may, of course, be shown by further development of his policy, to have been based on inadequate evidence.

Step by step the size of individual railroad systems has increased. Every stage of this development has presented problems of organization and administration of great difficulty. Many of the biggest and finest brains on our railroads have struggled with the problem of so balancing centralization and decentralization on systems of five to ten thousand miles as to get the best results. In many cases, where large systems have not been successfully managed, the failure has been due to centralization which has deprived the officers of divisions and grand divisions of the initiative and authority they needed. How much more important must be the effects of centralization on a system of 260,000 miles. To operate the railways efficiently under present conditions will require not only the greatest exertion and loyalty, but the best thought and judgment, of all their strong men. Great centralization would prove incompatible with the utilization of the best thought and judgment of the most of them.

Mr. McAdoo is an able man and a very hard worker, as are all of his principal lieutenants. Perhaps they can get the desired results with the organization he is forming and the methods he is using. But he is making changes which do not seem consistent with the President's assurance that nothing would be disturbed which it was not necessary to disturb; and it does seem to us that he is seriously handicapping himself, his immediate lieutenants and the managers of the individual lines by a tendency to carry centralization too far.

New Books

74. *National Association of Corporation Schools. Proceedings of Fifth Annual Convention*, 893 pages, 6 in. by 9 in. Bound in cloth. Published by The National Association of Corporation Schools, F. C. Henderschott, secretary, 170 Lexington Ave. and 15th street, New York City. Price, \$10.

The functions of the association are (1) to develop the efficiency of the individual employee, (2) to increase efficiency in industry, and (3) to influence courses of established educational institutions more favorably toward industry. Among the subjects which were reported upon and discussed at the fifth annual convention were: Administration and supervision of corporation educational work; corporation continuation schools; educational methods; employment plans; special training schools; trade apprenticeship schools; unskilled labor; and vocational guidance.

Letters to the Editor

The Depreciation of Railroad Property

KANSAS CITY, MO.

TO THE EDITOR:

A contribution by Julius Kruttschnitt appeared in your issue of December 21, 1917, in criticism of my article on Depreciation, printed two weeks earlier. It would be unfortunate for the cause of the transportation industry if the views there expressed were permitted longer to remain unchallenged.

My distinguished critic affirms that, repairs being adequate and renewals proportionate to the average life of materials, an element of property less than a service-producing unit, exemplified by a series of ten ties, suffers no depreciation by reason of exhaustion. He thereby implies that no value attaches to an element, as such, in dissociation from the organism which it goes to compose; that a non-existent value undergoes no change; and that, while the capacity for usefulness remains perpetually unimpaired, a serviceable unit is incapable of depreciation from inherent causes.

Thus far we are in complete agreement, as abundantly appears, even from a superficial reading of my memorandum. The theory which asserts a 50 per cent mean of depreciation in the ties of a seasoned track when fully maintained, was introduced, not with approbation, but for the purpose of demonstrating the absurd consequences of its adoption. Controversy, therefore, centres upon questions of method.

Rejecting the scientific evidence available, he prefers to rest his case upon the unsupported claim that in the aggregate no deterioration of matter has occurred or is destined to occur. This is supposed to be manifest from responses to the interrogatories following:

Question 1. What kind of ties are used in construction and repairs by the ———— R. R. Answer: Ties whose lives range from zero to as much as 20 years, but which under our traffic and climatic conditions will last on the average 10 years.

Question 2. What kind of ties will be found in the track of the ———— R. R., which makes renewals currently as the necessity therefore becomes apparent? Answer: Ties whose lives range from zero to 20 years, but which under our traffic and climatic conditions last on the average 10 years.

Mr. Kruttschnitt concludes:

As the answers are identical, the average life of ties as found at any time in a properly maintained track is the average life of the class of ties used.

The answer to Question 1 is erroneous. It is not true that ties with a life of zero are employed in the construction or maintenance of any railroad. The foreman of a track gang or a section force who is so irresponsible as habitually to lay ties requiring immediate removal, would invite discipline. The inaccuracy affects the number of terms and the sum of the series, if not the mean coefficient or average life, and violates the conditions hypothesized. Comparison is therefore instituted at a time, not coincident with the date of construction, but remote from it by a term not less than the life of the least durable tie. So much being evident the affirmed identity of response is probably incorrect; but even though established, it would afford insufficient proof to sustain a disclaimer of exhaustion.

It is more probable that the duration of service in a series of 10 ties will vary from 5 to 15 years, upon the assumed average of 10 years, with an aggregate of 100 years. Theoretically no renewals will be necessary until the end of the fifth year. At that time exhaustion will amount to

50 service years (10×5), equal to 50 per cent of the initial sum. During the succeeding 10 years all ties in the series will be renewed, and 100 years of useful life (10×10) will have been added. But in that term 100 years of serviceable existence (10×10) will have expired. Depletion is then equal to 50 per cent, as at the close of the fifth year. Replacement has now become regular, and thenceforth that condition may be expected to remain virtually unaltered. It is manifestly untrue that the expectancy of life in a stated group, collectively regarded, is so great at any time subsequent as when the original installation was made.

The defect in argument is indifferently concealed behind a fanciful distinction between the product obtained by multiplying the number of ties constituting a series into a quantity representing the average life, upon the one hand, and the sum of the several lives whence the average is derived, upon the other; that is to say, between multiplication and continued addition.

The reasoning is sufficiently maintained, if limited in its application to a term following the point where renewals become rhythmic, a matter concerning which there is no dispute. But it fails to dispose of the change in physical condition which takes place in the interval between the date of construction and the time when the seasoning process is complete. It is upon the occurrence of this change that issue is joined.

A conclusion is sound or unsound according as the basis upon which it relies for support is valid or invalid. The ground of explanation excludes the matter to be explained, and the proposition topples to its fall or awaits an efficacious demonstration.

Physical deterioration is a condition which can neither be disguised nor evaded. It is profitable to admit its existence and show that, upon the presumption of effective maintenance, the inference of depreciation consequent upon it is fallaciously deduced; rather than attempt the establishment of one fact by disproving another. Because too much is undertaken nothing is accomplished, and at the same time discredit is cast upon meritorious argument advanced in support of the same conclusion.

Value is not directly related to physical magnitude or duration, unless upon the condition that economic quality is imputed and remains constant. It follows thence that there is no point of correlation between a change in value and any extension or intension of matter, in space or time. Fallacy is insistently perpetrated in the nugatory, though subtle and elusive, attempt at the identification of things that differ; namely, the extent of material substance and the quantum of value.

Argument in refutation commits its sponsor to the elimination of economic quality, involves the abrogation of economic science through its absorption into mathematics, and leads to a purely quantitative theory of value. In its final consequence, he is excluded from the field of economics and restricted in his approach towards value, appreciation or depreciation, to speculation upon concrete quantity. Whenever he crosses that boundary, he is involved in self-contradiction.

Quality in a railroad consists in the capacity for and performance of an efficient service, in consideration of a net reward, present or prospective. Within the limitations above stated, matter expired and to expire is in the nature of excess plant which, although a necessary element of investment, and as such conditionally entitled to reimbursement, is seldom reimbursed currently, and which the devices of perverse ingenuity would expose to uncompensated sacrifice. Moreover, there is always left a remainder fully capable of discharging the office required of it. A state of undiminished or productive efficiency is perpetually maintained.

Value exists solely by virtue of the net force of demand;

that is, demand affected by supply. Railroad property is divorced from all demands other than that for transportation service. Value consequent upon such other demands is in suspense, has no actual existence, and is distinctively hypothetical. Such are actual investment, to which the prevailing concept of depreciation stands imperfectly related, and cost of reproduction.

If the foregoing were not true, it would follow that the premature renewal of ties would occasion an enhancement of value, sufficient in extent to neutralize the depreciation alleged to have accrued; but, so far from that being the case, such course would involve a flagrant dissipation of assets, in the form both of labor and materials, causing no appreciation, and removing no depreciation, but actually producing an augmentation of it. A consideration of unexpired useful life implies instrumentality, imports function, and introduces economic quality. Resort to the monetary unit involves a like consequence.

Once scientific principle is surrendered, control becomes arbitrary, and the carrying trade is exposed helpless to the intrigues of its adversaries.

G. C. HAND,

Vice-President Kansas City Southern.

Who Wastes the Fuel?

TO THE EDITOR:

Referring to the letters from Messrs. Anderson and Coss (*Railway Age*, March 1, 1918,) criticising my article on fuel waste (*Railway Age*, February 8, 1918,) I would state that there was no intention on my part to pick out any individual or class as being particularly responsible for this waste; the article was written with the idea of demonstrating that it was unjust to place all of the responsibility on the engine crew, which is usually done.

I also wished to start something that would be of value in fuel saving, and to get others thinking of their responsibility for this waste.

That there are other things outside of engine service that need correction has been strongly in evidence this winter, especially the lack of proper terminal facilities. Articles such as those by Messrs. Anderson and Coss will help bring out other factors that need correction, and betterments may result.

Nothing will save fuel or accomplish results like co-operation on the part of all concerned, and I think if we could all get around a big round table, both officials and men (and forget all about departments or position), to talk over conditions and troubles in a friendly manner and a co-operative spirit, and then go out and use the Golden Rule a little more, we would see a wonderful improvement in the results obtained.

For the benefit of the gentlemen who were pleased to criticise my article, I would state that the reason I singled out train dispatchers as wasting more coal than anyone else, was that their opportunities for saving or wasting fuel were so much larger per unit than other employees, that I thought it best to make it strong, in order to bring it home to them. If I have done them any injustice or unduly hurt their feelings, I hereby extend to them my apologies. I would, however, call their attention to the fact that engineers have been and are receiving even stronger criticism constantly, with no more reason for it.

Quite a lot of other shots were made. Was this the only one that hit the mark? I hope not!

MASTER MECHANIC.

FRANCE TO RAISE PASSENGER FARES.—Passenger rates on the seven trunk railroads of France are to be raised 25 per cent, according to a cable despatch dated March 17 to the New York Sun.

American Railway Supplies in Australia

Frank Rhea of the Bureau of Foreign and Domestic
Commerce Returns with Encouraging Reports

On the Recently Electrified Lines at Melbourne, Victoria.

THE RAILWAY SUPPLY MANUFACTURER who has become interested in export trade will find that in Australia and New Zealand he will have one of his biggest and most permanent markets. The several state-owned railways of Australia and New Zealand with their 22,000 miles of railway, import in normal times a large part of their annual requirements in materials and supplies. A steady business combined with an immediate "after the war" demand to make up for the supplies impossible to obtain now because of the lack of shipping, are what lie before the American manufacturer who is going to be wide awake enough to realize his possibilities in this extensive market. The Australians are ready and waiting to buy in the American market car and locomotive specialties and parts, machine tools, signal and signal supply material and maintenance supplies and track tools.

These are the conclusions that follow a reading of the report on American markets for railway materials, equipment and supplies in Australia and New Zealand by Frank Rhea, commercial agent for the Bureau of Foreign and Domestic Commerce, who has recently returned to this country after an extensive trip in Australia and the Far East. Mr. Rhea's investigations have made him an optimist on the opportunities for American railway supply manufacturers in Australia and New Zealand. Although he does not believe that there is a market for finished cars and locomotives in Australia, in view of the desire of Australian labor to build its own railway equipment, he has been particularly impressed by the very fact that the Australians want to build their own cars and locomotives, for to him it means that there is for American manufacturers an important market in Australia for car and locomotive specialties and parts. American built machinery has constituted one of the leading imports into Australia from America for several years. The tendency of the Australians to build their own equipment, the recognized excellence of American machine tools in Australia and the skill with which they are sold there, Mr. Rhea believes, will guarantee a continuance of this extensive business. He emphasizes the necessity, however, of what he terms "application engineering" and draws attention to the fact that the most successful firms are those which have been represented by keen men who have seen to it that the machines sold were the ones best fitted for the work that they were to be called upon to do, and by men who have followed the progress of the work done by these machine tools and assured themselves that they were giving entire satisfaction.

Mr. Rhea spent about one year in the Far East. He left

Vancouver in October, 1916, and spent about four months in Australia and one in New Zealand. He visited all the headquarters of the state and Commonwealth railways and made extensive trips over the various lines. After leaving Australia he spent some time in the Philippine Islands and then went on to China, Japan, Korea and Manchuria in which countries he spent some seven months. His investigations will be issued in two separate reports, the one on Australia with which this article deals, and one on markets in China, Japan, etc., which will be issued later.

Mr. Rhea is well qualified to speak on railway matters, for he has had an extensive experience in both railway and railway supply work. He graduated from the University of Pittsburgh with the degree of civil engineer in 1892. He was first engaged in railway work in the maintenance department of the Norfolk & Western. He later went into the employ of the Union Switch & Signal Company and spent one and one-quarter years as an apprentice on electrical and mechanical work. He then returned to railway service and spent one year as general foreman of signals at the Pennsylvania's Broad-street station. He later spent 12 1/2 years in the service of the Pennsylvania Lines West, 5 1/2 years as chief signal inspector in charge of signal construction and reconstruction work, and 7 years as engineer maintenance of way at Zanesville, Ohio, and Loganport, Ohio. Being at the latter place in charge of some important reconstruction and double track work. It was at about this time, too, that Mr. Rhea assisted in the preparation of the Rudd-Rhea report relative to unifying the signal practice of the Pennsylvania system which attracted considerable attention. Mr. Rhea then left railway work to enter the railway supply business and spent some five years as commercial engineer with the General Electric Company on all kinds of electrical equipment for railway work. For the three years following, and immediately preceding his trip to the Far East, he was district engineer of the western district of the division of valuation of the Interstate Commerce Commission.

Mr. Rhea's Conclusions

Mr. Rhea's report has been issued by the Bureau of Foreign and Domestic Commerce as Special Agents Series No. 156. It bears the title "Railway Materials, Equipment and Supplies in Australia and New Zealand," and covers 164 pages with illustrations. The report covers the Australian and New Zealand railway situation in great detail, both in general and in relation to the special states. Lack of space prevents the inclusion of all the salient features brought out.

but suppliers will no doubt be greatly interested in Mr. Rheu's conclusions and suggestions.

In instances where it is believed that American concerns have a chance to obtain future business, attention will be called to that fact, and there will also be a definite indication of the cases in which no such opportunity exists. As an example one may cite the erection of rolling stock either in the railway department's own shops or by Australian manufacturers, with the restriction of the work in some instances to the particular state (as in Victoria and New South Wales). If the railway development of Australia proceeds gradually for the next few years it is probable that little rolling stock will be purchased outside the Commonwealth, but it is likely that, in order to get the benefit of improve-

warranted in giving them little consideration in forecasting what will occur when conditions again become normal. As regards some requirements, the Australian railways are compelled to obtain their present supplies in the United States or do without, and there are really a good many things which they are doing without or of which they are very much reducing their consumption.

During the war and the period of adjustment after its termination, there seems little doubt that American concerns can obtain business if they offer reasonable prices and delivery and if ocean transportation can be secured. What will happen after the end of the war and the period of adjustment it is impossible to forecast, other than to assume that in the course of time matters will again become normal and the development of Australia will resume the tendencies of the past. In this event there will doubtless develop considerable competition for the business of all classes, and apparently much will depend on capable application engineering. Aside from some special lines, such as electrical equipment and lubrication, it would seem that the business in the past has been handled with very little special engineering knowledge on the part of the selling concerns in Australia.

This situation has been well illustrated by the small sales recently of a concern that formerly did considerable business, but that now seems to pay very little attention to the application of the products sold. On the other hand, one notes the very substantial increase in the business of another firm that is making excellent applications in the sales it is handling. The manager of the first concern stated that its policy is to furnish what the customer asks for without giving any particular consideration to its application and that, since the firm handles a first-class line of machine tools, it is the customer's loss if the best application is not had; whereas the other concern not only goes over the application with the customer, studying the best machine available for the purpose before the selection is made, but in addition follows up the performance after installation. The adoption of such a policy, carried out by seasoned and experienced engineers, will, in the writer's opinion, be a necessary arrangement in the future. In brief, it is believed that future business will be largely obtained by competent application or commercial engineering. The adoption of such a policy for certain lines will secure paying business, and, unless it is adopted where it does not now prevail, new business will not be obtained and that which is now being done will be lost in the future when the situation becomes normal after the close of the war.

The Question of Representation

The question of representation should be divided into two parts, first as to whether American concerns doing business in Australia will handle the business with their own representatives, negotiating directly with the purchaser, or through agent or indent concerns and, second, what kind of representative should handle the business directly with the customer, whatever arrangement prevails in the first instance.

The answer to the first depends on circumstances to a very great extent, but when the amount of business warrants there are usually good reasons for the parent concern to have a representative in Australia, although a considerable amount of business may be done through agent concerns. For the average American concern the amount of business will only warrant its being handled by agent or indent concerns, but in many instances it seems that the business will justify the sending of special representatives to Australia, as hereafter suggested.

In Australia as in all other parts of the world, there are active, indifferent, and poor agents now in the field, and much depends on the capability of such representatives. In

The Government Railway Systems of Australia

The Port Augusta-Kalbarrie Railway, the Trans-Continental, has been completed since this map, taken from the Official Year Book, was made.

ments, very considerable quantities of accessory parts will be brought from overseas. In the case of New Zealand it would appear that, if all the necessary railway equipment is built in the Dominion, it will be done at the sacrifice of labor that could be more profitably employed in other ways.

Past, Present, and Future Business

In forecasting future business it seems wise to consider the business done in the past and the methods employed in obtaining it. A very considerable amount of railway business has been done in the past, although statistics as to the actual value are difficult (in fact practically impossible) to identify and segregate. At one time a great deal of rail went to Australia, and the supply of mineral oils and lubricants has always come very largely from the United States. A varying amount of accessory rolling-stock parts and shop machinery has come from America, and the electrical equipment has come very largely from this country or from American concerns with British branches.

Past business has been obtained mostly in one of the three following ways: First, by concerns with direct representatives in Australia; second, by agent concerns in Australia; third, by the medium of indent orders, in which instances the purchasers either knew just what they wanted or were able to give the indent agent definite information or specifications so that the desired articles could be obtained.

The present war conditions, involving high prices, long delivery, United States export regulations, and almost prohibitive ocean freight rates, are so unusual that one seems

some instances it is probable that agencies were taken as filling-in lines and to fall back on when the regular supply was not available.

With the conviction of the desirability and the probable necessity of application or commercial engineering as the best means of obtaining and holding railway business in Australia, and also the advisability of sending seasoned men who will naturally command good salaries, the question arises how this can be arranged and made workable without costing more than would be warranted. It is the writer's opinion, based on investigation and discussion with several men experienced in handling Australian business, that one high-grade man could frequently represent several

experienced engineering salesman might reasonably be expected to be familiar with, and is also somewhat along the lines of that made by some of the larger concerns handling railway business in America.

Contracting

In the writer's opinion, with the present arrangement of handling all public works and the prevailing labor conditions, Australia is not an attractive field for American contracting concerns to enter into and follow the present American practices of pushing the work to a conclusion in the shortest possible time by the use of labor-saving machinery, particularly expensive outfits worked with day and night shifts. There is no doubt that, to develop fully the material resources of Australia, the situation warrants such treatment, but organized labor objects to such procedure and public opinion supports this position, or at least permits this condition to exist. It would seem, however, that if some of the large projects contemplated, such as the unification of the railway gages, are undertaken, some concessions will have to be made.

Roadway Machines

Steam shovels and other similar equipment are little used in Australian railway construction. While this class of equipment could no doubt be used to very considerable advantage, particularly in some of the grade and alignment revision work being undertaken in several of the states, it is very doubtful whether such methods will be adopted so long as the present labor conditions continue. The New Zealand railways are much better equipped in this respect and may increase this equipment if further extensive grade and alignment revisions now under contemplation are undertaken.

Bridges

Bridges are not frequent, and those that do occur are usually small, with few foundation difficulties. In addition, there is a decided tendency for the railway departments to do their own fabricating and erection. This is

One of the Latest Type of Freight Locomotives in Use in New South Wales

firms whose products can be grouped—for example, an experienced mechanical-branch man could represent all branches of shop machinery, another man could represent all lines of locomotive and car appliances, or one man could represent both permanent way and works materials and track appliances. Also, with the conditions existing in Australia, there appears to be no reason why a man of the proper adaptability could not work with several concerns in Australia (even when these concerns are handling competing lines), if such a man is sent out at the expense of the American concerns. This, of course, would require men of good common sense but not necessarily men of any unusual ability. Since there are a number of associations among the manufacturers of railway materials, equipment and supplies for furthering the interests of these manufacturers with the American railways, it would seem desirable that these same associations should get together for the advancement of their foreign business. For instance, such associations as the Railway Business Association, the National Railway Appliance Association, the Electric Railway Manufacturers Association, or even a community of the associations might get together and arrange for experienced application engineers to visit Australia—doing so as actual representatives to obtain business for the interested concerns and working with such representatives as these concerns may have in Australia or arranging for additional agents. There are also a number of concerns organized for the handling of foreign business (particularly some of those recently organized) that might arrange for the representation of complete lines as above suggested, and then follow up by sending out special application engineers.

In considering such an extensive field as railway materials, equipment, and supplies, a division into groups seems advisable. The following grouping is based on what one

Sydney (N. S. W.) Express Leaving Wallangarra on the Queensland Border

encouraged by the much higher tariffs on fabricated materials than on plain materials. Also the New Zealand Railways are the only system that has adopted a set of standard designs and is prepared to let bridges erected to design as used. In the future the New Zealand Railways expect to buy their bridges in quantity.

Bridge paints, on account of the large proportion of dry weather last much longer in Australia than the average in America. This does not apply to New Zealand, where on

account of the amount of wet and warm weather the life of bridge paint is probably shorter than in America.

Building Materials

The principal market for building materials is for galvanized or substitute roofing material which will not require sheeting, and such substitutes for wood as beaver board. The supply of Australian hardwoods will take care of the needs for building wood, except soft wood required for drawers, shelving, and similar uses where it has to be worked and for which pine will probably continue to be imported from America. Just how far it is economical to go in Australia in the use of protected materials as a substitute for galvanized iron is dependent to a very large extent on the location. Where not subject to special deteriorating influences, galvanized iron apparently has a longer life in Australia and New Zealand than is the average in America, and its use is very much more extensive in all parts of Australasia than in America; in fact, this is the case everywhere in the Far East.

Coaling Stations

The handling of locomotive coal is done to a very large extent by the use of coaling trestles or man-powered handling outfits or, in some instances, with small locomotive cranes, the latter being particularly the case in New Zealand. Thus far very few really up-to-date coal and ash handling plants have been installed in Australia. At many points it seems probable that these will be installed in the future, but in a number of instances an impression seemed to prevail that the present arrangements were much more reliable than the more modern devices; therefore it is difficult to predict what the future improvements will be along

Former Method of Route Signaling on Victorian Railways

this line, although it would appear almost a necessity to make improvements in some cases to take care of the business as it grows.

Water-Treatment Plants

Considerable up-to-date water-treatment apparatus has been installed in a number of the states and, with the water conditions existing in a large part of Western Australia, South Australia, and the western sections of Queensland and New South Wales, further installations will no doubt be made. In some instances neutralizing compounds are practicable, and an American company is introducing its products, which, in view of some of the results obtained in the United States and Canada, should make a decided success in some parts of Australia.

Grain Elevators

The question of grain elevators was covered at some length in connection with the New South Wales Railways. In the writer's opinion, there is no doubt of the desirability of adopting arrangements to handle grains (particularly wheat) in bulk in all of the Australian states, but the project of a wholesale conversion according to the plans now out for tenders for the erection of elevators seems of doubtful practicability. It is advised, therefore, that American concerns go over this situation very carefully before contracting for erection complete, which would probably include the financing of the project for the government of the state in which the work is done. These remarks, of course, do not apply to the furnishing of the machinery and materials for some one else to erect and finance.

Wharf and Pier Equipment

The use of wharf and pier machinery has been, to a considerable extent, influenced by the labor situation, the wharf

Present Method of Speed Signaling on Victorian Railways

workers being one of the most powerful unions in Australia and New Zealand. At present, however, a necessity exists for speeding up the movement of shipping. The wharves in New Zealand are much better equipped in this respect than those in Australia. To a certain extent this is probably due to the authority exercised by the various harbor boards in New Zealand, who have power to borrow money for improvements and collect wharfage charges in a more comprehensive way than is the case in Australia.

Fencing Materials—Ties

Practically all railway lines have to be fenced by the department in all the Australian states and New Zealand. The present practice is to use a rather heavy, smooth, straight wire with frequent anchor posts equipped with expensive slack adjusters. In some instances intervening strands of barbed wire are used, but in no case did the writer see any of the special spiraled wire that is commonly used for right-of-way fences on most American railways. On inquiry, not a single case was found where attention had been called to this wire by the sellers of fencing materials, and none of the sellers seem to know of the product. Consequently there appears to be a very good opportunity for the general introduction of American fencing materials. These remarks also apply to the use of steel fence posts, especially for the drier parts of Australia, where the ravages of the white ants are most serious.

In general, Australia has sufficient timber in sight to take care of present needs, including those of South Australia and New Zealand, both of which have to draw on outside

supplies. The ravages of the white ants, the favorable weather conditions, and the light traffic would appear to make certain parts of Australia, particularly the northern lines of South Australia, a good place for the use of steel ties if they can be delivered there at a reasonable price. The engineering branch of the South Australian railways has already looked into the use of steel ties and is satisfied with respect to their practicability. Up to the present time, however, it has been found more economical to use jarrah sleepers from Western Australia, costing something over \$1 each.

Rails

It is presumed that the two steel plants now in operation in Australia will be able to take care of the normal rail requirements, but in such case the entire production would apparently be required for this purpose and other lines would not be produced. Such a condition seems very unlikely. During the present very difficult period as regards the obtaining of materials, it is safe to say that the normal rail renewals are not being made, although with the lighter wheel loads and lighter traffic it is probable that the same relative wear does not occur as takes place on the American railways, even when allowances are made for the greater amount of curvature and the steeper grades. New Zealand, having no steel plants, gets all its supplies from abroad, and it is not probable, for the present at least, that New Zealand will depend to any great extent on Australia, although this may possibly be the case when a scarcity of shipping prevails.

Frogs and Switches (Points and Crossings)

The present practice is for all the state railway departments of Australia and the New Zealand railways to manufacture in their own shops, or to have manufactured by concerns in their respective states, all their requirements in frogs, switches, crossings, switch stands, derails, and guard rails, and there seems little doubt that this practice, for the present at least, will be continued. It would appear, however, that they might advantageously employ the special types of light-weight guard rails now coming into general use in America, that they would at least be warranted in installing hardened-faced frogs and switches in some particular situations, and that these could be produced by importing the hardened parts and completing the work in the railway shops. A few of the lifting type of derails, especially the "Hayes" design, have been used, but these are very infrequent as compared to the total in service. Many are of the complete switch type, which are more expensive to install and maintain than the most costly designs of the lifting type.

Rail Fastenings

As a general practice, the angle bars are bought with the rail. All the Australian state railways follow the same course with the manufacture or purchase of their supply of dog spikes and track bolts as with their frogs and switches. The supply in New Zealand is usually purchased abroad, particularly fang bolts and screw spikes. At present no guard rail clamps are used, and few tie plates, except in some cases around turnouts. It would seem that both of these, particularly the guard-rail clamps, could be adopted with much advantage, and the track men to whom the writer explained the use of guard rail clamps were very much interested in their application. The use of rail anchors is becoming very extensive, and most of those used thus far are of the Vaughn design, furnished by the Railway Track Supply Co., of London. One point that applies to the maintenance of all the patented rail anchors, when employed on Australian railways, is the necessity of inspection to prevent the ballast from loosening the rail anchor as the result of

the very much fuller ballast section used, because of the sleepers being only 5 in. in thickness.

Roadway and Track Tools

The writer assumed at first that it would not be worth while to follow up the subject of roadway and track tools, but after some inspection and inquiry it was found that there was not the difference in the design and equipment of tools that might naturally be expected, and that in a considerable number of instances the American track tool would be very well received by the Australian "ganger," as he is called. A very considerable use of American hand tools by all classes of railway mechanics was also noted.

Signals

Materials and supplies for mechanical interlockings, lock and block, and staff or tablet, will probably be bought as in the past, particularly as all these requirements are fully standardized; but in the materials and supplies that enter into power interlocking, automatic signals, electric parts for the control of lock and block and staff or tablet, and all kinds of electrical accessory parts, considerable business has been and will continue to be done. This is one of the lines of business that requires a very considerable amount of application engineering.

The signal situation is a good example of the inclination on the part of some of the Australian state railway departments to manufacture their own requirements. In some instances the signal branch has a considerable manufacturing plant and manufactures not only the well-established parts but the more difficult electrical parts as well—this in some instances with apparent disregard of any existing patent restrictions or objections to the adoption bodily of designs that are trade assets as a result of years of experience. The writer has yet to find an American railway that has made a success of this policy, although it has been tried in several instances and at times seemed desirable on account of the apparently high prices demanded by the manufacturers. It is not probable that the Australian railways will succeed any better, although they may in the meanwhile acquire a supply of poor (and in some cases possibly unsafe) electrical railway-signal apparatus. These remarks regarding patents also apply in connection with several other situations, particularly as regards patented locomotive and car devices.

As already stated, there seems to be a very substantial field for the installation of selective telephone apparatus for the "central control" of train movements, supplementing the signal equipment or rather co-ordinating with the signal systems. The fact should be appreciated that this is not an introduction of the American method of train running, which is in bad repute with Australian railway officials.

Both of the two largest American railway signaling companies have representatives in Australia, who are doing excellent work in promoting the sale of American electric railway signaling devices and also signal accessory apparatus.

Rolling Stock

It is the general policy for the railway department of each state to erect its own equipment in its own shops or to purchase in Australia or, in some cases, in the United States. It is probable that no great amount of complete equipment will be purchased abroad. South Australia and Western Australia will probably go to the other Australian states for locomotives, and New Zealand and Tasmania may go abroad. Purchases have been made in the past and now being made under the present modified conditions, and probably will be made in the future of much material and equipment in the form of slabs for engine frames, boiler plates and flues, axles, tires, wheel centers, air hose, injectors, lubricators, greases and similar parts, notwithstanding

ing the decided tendency to manufacture these parts as well as to erect the rolling stock. The American railways have found as a result of long experience that while they may be able to erect their own rolling stock to advantage they seldom succeed in manufacturing the specialties as well or as cheaply as the concerns that devote all their attention to such lines, with a specially trained staff. There will probably be in Australia a growing realization of this truth; therefore it seems warranted to conclude that a considerable amount of this business will continue to go to the concerns producing special lines unless inferior products are to be used. It seems probable that in the course of time improvements will be made in the adoption of automatic car couplers, particularly for the handling of coal to expedite its classification, and that air train signals will be adopted.

In connection with any materials or equipment going to New Zealand it may be noted that the North American hardwoods experience the same short life in New Zealand as in the tropics, and therefore care should be exercised not to use such woods but, instead, suitable woods that will resist the deteriorating influences of this climate. These same remarks apply to agricultural implements, which are often condemned on account of the failure to use woods that will stand the New Zealand climate. It is also well, in furnishing locomotives, to consider the matter of very robust frames and bearings, on account of the excessive wear occasioned by the sharp curves and steep grades on most of the lines. This applies especially to New Zealand and Tasmania.

Machinery for Shops

Among the imports from the United States during the last few years, machinery constitutes the largest item, and in the writer's opinion this will continue to be the case, particularly if there is a continuance of the present policy by which the railway departments manufacture and erect their own rolling stock and similar requirements. It is believed that in this line competent application engineering will be necessary in Australia and New Zealand to develop and hold the business for American products, though as a rule the railway officials are inclined to admit the superiority of most of the American machine tools.

Oil Storage and Handling

In general, very little modern apparatus for oil storage and handling has been installed, and that which has been employed is nearly all of special design, usually manufactured by the department, and generally quite expensive. An American company now has a representative in Australia and in time should build up a large line of business with its excellent equipment, especially if it follows the methods of application engineering that have characterized much of its work in the United States.

Electrical Equipment

The line of business connected with power houses and substations is well looked after by American concerns now in the field, which have always obtained a considerable portion of the business either directly or through British branches.

The same remarks apply to electrical car equipment.

As regards overhead-contact materials, substantially the same remarks apply, although some of the American concerns manufacturing certain specialties might obtain additional business from Australian and New Zealand tramways.

Mention might also be made of the electrification of the Melbourne Suburban Railways and the Sydney metropolitan scheme and also the probable electrification of the Perth suburban lines. For this last-named project Mertz & McLellan are the consulting engineers.

Fuel and Lubricants

For the present and for a long time to come all fuel for Australian and New Zealand railways will be furnished locally or from other Australian states.

At present a very large part of all the lubricants, and also a large part of the mineral oils, used by the Australian and New Zealand transportation systems, are furnished by American concerns.

Financial and Corporate Offices Not to be Charged to Operating Expenses

THE EXPENSES OF RAILROAD OFFICES, including salaries of officers, devoted to financial and corporate affairs as distinguished from operation, may not be charged to operating expenses after April 1, except as expressly authorized by the Railroad Administration, according to Circular No. 10, issued on March 18, by Director General McAdoo. Although no official explanation has been made, it is understood that the order applies to such officers as chairmen of boards of directors and of executive committees and in some cases to vice-presidents, as well as to stock transfer and bond registering offices and other offices maintained in New York and elsewhere which are considered not necessary for the purposes of the Railroad Administration in its control of the roads, but properly chargeable to the corporations.

On February 23 Mr. McAdoo addressed a circular to the roads asking for detailed information regarding the expense of financial offices in New York and elsewhere and the circular is the result.

Circular No. 10 is as follows:

"The question has been raised as to whether the Government ought to pay any part of the expense of the New York offices (including salaries of officers at New York) of railroad companies, except to the extent that such expenses are on account of operating offices properly located at New York; and, on the same principle, as to whether the Government is under any obligation to pay the expenses of offices of any of the companies in any locality, devoted to financial and corporate matters as distinguished from matters pertaining to the physical operation of the railroad properties.

"Even if it should be decided that the necessary expenses for some of the purposes for which such New York offices, and to some extent similar offices at other places, should be chargeable against the government, it seems very clear that in many instances the expenses currently so charged are greatly in excess of what is necessary to accomplish the purposes which, according to a reasonable construction, would be chargeable against the government.

"Under the circumstances it is desired that each carrier claiming that any such expense should be chargeable against the government shall present a statement showing the amount of this expense and what amount, if any, it is claimed should fairly be charged to the government, and the reasons why the carrier believes such expense is so chargeable. And on and after April 1, 1918, the said expense shall cease to be charged against operating income, except in so far as the same shall be expressly authorized after the facts shall have been considered as provided herein."

In cases where the same man is both chairman of the board or of the executive committee and president, or where other officers devote their time both to financial and operating matters, it is expected that application will be made to the Railroad Administration as provided in the circular and it is understood that in such cases the portion of the expense or the salary considered chargeable to corporate affairs will be segregated, to be paid by the company out of its guarantee.

Railroad Control Bill Passed by the House

Passed in Form Reported by Conferees After Elimination
of Restriction on State Taxation

WASHINGTON, D. C.

THE RAILROAD CONTROL BILL, which was passed by the Senate on March 13 after the conferees had struck out the provision intended to prevent states from increasing their taxation of railroad property, was passed by the House on March 14 by a vote of 303 to 26.

The conference report was passed with comparatively little debate in the House, although several representatives took occasion to express their objection to the broad powers granted to the President in Section 10, which provides that carriers while under federal control shall be subject to all laws and liabilities as common carriers "except in so far as may be inconsistent with the provisions of this act or any other act applicable to such federal control or with any order of the President." Chairman Sims of the Committee on Interstate and Foreign Commerce defended this section and Representative Esch, one of the conferees, declared that if the words are properly interpreted they do not give the President the broad and unlimited power to repeal or suspend any statute of the United States or any state that so many had objected to.

Mr. Esch also pointed out that the language of the conference report adopted no longer includes the term "standard return" but provides for "just compensation, not exceeding a sum equivalent as nearly as may be" to the average annual operating income.

The compromise as to the rate-making power seemed to be generally satisfactory to the House.

Those who voted against the bill were Representatives Bankhead, Burnett, Church, Dowell, Good, Green of Iowa, Haugen, Helm, Huddleston, Johnson of Washington, Kearns, Knutson, McLaughlin of Michigan, McLemore, Mason, Ramseyer, Reavis, Reed, Steenerson, Sweet, Thomas, Townner, Williams, Wingo, Wood of Indiana, and Woods of Iowa.

Three Congressmen voted "present" and 96 did not vote.

The passage of the bill in the Senate on March 13, as reported in last week's issue, was attended with a rather lively controversy over the provision inserted by the conferees in Section 15, providing that no state or subdivision thereof should assess taxes on railroad property during the period of federal control in excess of the ratio which the taxes derived from railroad property bore to the total taxes of such state or subdivision for the year previous to federal control. The objection to this was that it unduly restricted the taxing powers of the states, whereas both the Senate and House bills as originally passed had contained a provision that nothing in the act should be construed to amend, repeal, impair or affect the existing laws or powers of the states in relation to taxation. The House bill, however, had added a further provision which made it necessary for the conferees to adopt a compromise and the compromise proposed aroused the objection of Senators who wished all the rights of states to be preserved. Other Senators advocated the compromise on the ground that it was necessary to protect the federal government against the power of a state to increase taxation in such a way as to impose a burden on the federal government, which is now responsible for the expenses of the railroads, including taxes.

After considerable discussion the vice president, sustained a point of order against this provision of the conference report as being new matter not contained in either of the original bills and the ruling of the chair was sustained by a vote of 51 to 23. The conference report was then re-com-

mitted to the conference committee which held a hurried meeting and reported back, striking out the provision objected to in time to secure the passage of the bill in the Senate on the same day.

The final vote was 47 to 8, those who voted against the bill being Senators Borah, Cummins, Gore, Gronna, Johnson of California, Kenyon, Norris and Townsend. Forty Senators did not vote. When the bill was originally passed in the Senate no roll call was taken. Several Senators who were opposed to the bill took occasion to express their arguments against it before the final passage. Senator Townsend of Michigan objected on the ground that the representative of the Director General who had written most of the bill had included in it many provisions which he did not consider necessary for war purposes, such as the provision that state and federal laws could be set aside by the President's order and the provision allowing the President to initiate rates. "I do not believe that any new law is necessary," he said, "in order to give the President ample power to do everything that is necessary to be done for the railroads for facilitating the prosecution of the war or growing out of the war emergency."

Senator Lewis of Illinois declared that while he was in favor of government ownership it would have been an exhibition of bad faith for the government to use the war emergency for the purpose of taking over the roads permanently and that the question of government ownership should be settled on its merits. He also took occasion to say that if he had his way he would repeal the act creating the Interstate Commerce Commission, giving the President power to make rates and to create bodies representing the government to be located in various parts of the country so that shippers could be heard without coming to Washington.

Senator Johnson of California reiterated his objection that the bill is "unfair and unjust to the people and so outrageously generous to the railroad companies that its enactment into law is shameful and iniquitous."

Senator Cummins also made a speech against the bill objecting to the compensation as too liberal and against giving the President power to initiate rates. He predicted that within six months there would be a stupor and advance in freight rates and that the commission would be prove them.

Senator Jones of Washington declared that although he thought the bill was unfair and unjust to the people it was necessary for the conduct of the war and that he would vote for it.

The text of the conference report was published in full in last week's issue. As passed and the provision in Section 15 was eliminated, but the conference report as it is ultimately stated last week.

Rate-Making Under Government Control

Shippers are waiting around to see how the rate-making committee will be composed by the Railroad Administration when the bill becomes a law. While it is understood that the Director General does not care to commit himself to any unreasonable claim with regard to carriers pertaining to rates, and that at least it is his perfectly well understood that he is vitally interested in the power to increase rates sufficiently to cover all expenses and the guarantees to the railroads as well as in the power to make any important change in rates that he considers desirable without the necessity for first securing the approval of the

interstate and state commissions. Under the new law he can act first and put a rate into effect and the federal commission can overrule him later if it wants to, but nothing is said that would give a state commission any authority to interfere in any way with any rates he should initiate in the same way that he initiated the increased demurrage rates and put them into effect for both state and interstate traffic. Even before the passage of the law the President's proclamation assumed, and Mr. McAdoo has been acting on the assumption, that he had the power to change rates, and while he has gone through the form of requesting the approval of the commission, the commission in every case has authorized the filing of the tariffs. On the day that the law was expected to be signed the Railroad Administration announced an excess fare on the Pennsylvania's parlor car train between New York and Washington, although the commission a short time ago denied the railroad permission to impose such a charge. On the following day the commission announced its approval of the tariff.

What is concerning shippers is the question as to the extent to which the Railroad Administration intends to initiate rates without hearings or notice to the shippers. Under the amendment to the fifteenth section of the law passed last August railroads have had to secure the commission's approval before even filing a tariff and the tariff when filed, of course, might be suspended. Now, apparently the administration can put a rate into effect practically without notice, and there has been much complaint upon the part of shippers that this power is lodged in a man whose principal advisors are railroad men.

The case of the proposed "spotting charge" is an example of the reason for this attitude as expressed by shippers who have recently been in Washington. The proposal to charge \$2 a car for placing on an industrial siding and \$1 a car for spotting at a particular point on the siding was drawn up in the Traffic Division. It is understood that it had not yet been referred to Mr. McAdoo when the shippers of the country heard about it and began to protest vigorously. How far the proposal had gone and what were the chances of its being put into effect are still matters of uncertainty, but it appears that a member of Mr. McAdoo's staff thought it would be well to find out what the state commissions thought about it and that the news was very rapidly disseminated among them and through them to the shippers, by way of C. E. Elmquist, the Washington representative of the state commissions. Even before the proposed plan had traveled from the traffic department on the tenth floor of the Interstate Commerce Commission building to Mr. McAdoo's office on the ninth floor a flood of telegrams had come to Mr. McAdoo from all points of the compass. Telegrams also went to the senators and representatives on Capitol Hill, arriving there about the time that the conferees were trying to adjust the differences between the Senate and the House bills as to the final rate-making authority. This was also about the time that a committee representing the National Industrial Traffic League, including G. M. Freer, H. C. Barlow, W. H. Chander, R. D. Sangster and C. E. Childe, arrived in Washington in an effort to rescue the commission's final authority over rates which was then trembling in the balance. While it is understood that the results of the shippers' visit to the capital was not entirely satisfactory to them it is believed that the storm aroused over the spotting charges may have added to the difficulty which prevented the conferees from accepting the proposed compromise which Senator Smith had brought from the White House, which would have required the commission to make rates high enough to pay all expenses, instead of merely requiring it to take them into consideration.

The following petition regarding the rate-making powers was presented to the conferees on behalf of the National Industrial Traffic League:

Protest of National Industrial Traffic League

"Your petitioner, the National Industrial Traffic League, an organization comprising in its membership the principal commercial organizations and industrial and commercial concerns located throughout the United States, and representing, substantially speaking, 300,000 shippers, addresses your honorable committee in respect to the railroad bill, now in conference. Your petitioner is particularly concerned respecting section 10 of the Senate bill and section 11 of the House bill, that portion of the same which refers to the making and prescribing of rates, fares, classifications, rules and regulations of the carriers while under federal control.

"No one appreciates more fully than the members of this organization the fact that the country is at war and further that many old ways of doing things must bend, to the end that supreme effort of the nation to win the war shall not be embarrassed; but we are convinced this bending can be done in an orderly form and manner, as now provided by law, and all the necessary and desired results be obtained.

"The railways of the country are in the hands of the government for the period of the war and for some fixed period following the close of the war.

"We understand, in general terms, the purpose of taking over the roads was principally twofold, viz., to co-ordinate their activities to the great aim of winning the war and the further purpose of fairly conserving their financial status through the period of great borrowing by the government. In these laudable efforts we are all in accord. In the bringing of these aims to a successful conclusion it may be necessary for the government to deal with the rates, fares, rules, regulations, etc., of the carriers, and it is to this phase of the pending bills that we address ourselves.

"We take it for granted the welfare of the commerce and industry of the country is second only to the one great purpose of winning the war. Our contention is that as the railroad bills now read, the welfare of the commerce and industry of the country may be unnecessarily placed in jeopardy.

"The government is in possession of the roads; it exercises its control through the agency of the Director-General, who has surrounded himself with a cabinet of principals and assistants drawn almost exclusively from the railroad service. None of these gentlemen has had, substantially speaking, any training on the commercial or industrial side of the question, outside of the railroad point of view. These men are undoubtedly of ability and capacity in their particular line of training, yet we may say with propriety their training has given them in many respects an entirely different point of view from that held by many gentlemen trained in commerce and industry. We take it to be a fair assumption that the Director-General will be guided in great measure in his conduct of the railroads by the counsel and advice of those he has called about him. Our point is this: In the very nature of things, can these gentlemen always have as clearly in mind the interests of the public as those of the carriers?

"Permit us to illustrate what we have particularly in mind. The demurrage rules were the outcome of eight years' negotiations between shippers and carriers under the guidance of the Interstate Commerce Commission. They had been changed from time to time by mutual agreement. So far as the shippers were advised, this method of handling the question was mutually satisfactory to the shipping public and to the carriers. In January of this year there appeared, without notice to the shipping public, a new set of rules differing materially from those long in effect. After a fruitless personal appeal to the Director-General, a written protest was filed in behalf of the shippers by your petitioner. It was pointed out that the new rules would not accomplish the desired results. The final outcome was that the representatives of your petitioner were

requested to return to Washington for conference with representatives of the carriers and the Interstate Commerce Commission. In this conference we proceeded in the manner long followed; the rules were again revised by mutual agreement and at the request of the Director-General went into effect in place of those previously promulgated by him.

"It is our desire to avoid and prevent a repetition of such instances. For more than thirty years the Interstate Commerce Commission, created under the authority of Congress, has had the full confidence of the shipping public; nowhere can be found a more useful and patriotic arm of the government. To that body may safely be left the determination of all questions affecting rates, fares, rules, etc.

"It is contended by some that the ultimate control of rate-making is a necessary part of the war power of the President. Your petitioner cannot conceive of any condition arising out of the war in which the President could be hampered or embarrassed in his control and operation of the carriers by reason of the rate-making power remaining in the jurisdiction of the Interstate Commerce Commission. Under the stress of war it may be desirable to change existing rates, fares, charges and regulations affecting shippers; but the successful operation of the railroads for war purposes would not be affected by the amount of the rates charged. As a matter of justice and public policy the commerce of the country should pay an adequate charge for transportation. If changes in rates become necessary, the burden should be equitably distributed by a tribunal well versed in all phases of the subject, so as to disturb the commerce and well-being of the country as little as possible. The rate adjustments of the United States are delicately balanced and related; any disturbance thereof should be had only after a full investigation by a disinterested body.

"For more than thirty years Congress has authorized the Interstate Commerce Commission to execute and enforce a well-considered and well-rounded form of regulation of carriers. That body may well be said to be the only body qualified by long years of experience and training fully and adequately to consider and determine all questions within the jurisdiction of the act to regulate commerce. The control of rate-making is a legislative function vested in Congress and delegated by Congress to the Interstate Commerce Commission as a branch of the legislative department of the government. We earnestly insist that the power and jurisdiction be left unimpaired, to be exercised in accordance with the act to regulate commerce as amended.

"It is our firm conviction that this can safely be done and all necessary and desirable results be obtained. By so doing this legislative function will be retained where you have placed it, viz., in the agency of the Congress created for the purpose and qualified by experience.

"We are persuaded that even the necessities of war do not justify or make necessary the destruction of all that has been accomplished during the past 30 years of regulation of the carriers by the Interstate Commerce Commission.

"As a war measure Congress authorizes the President to make regulations as to the imports which should be permitted, but does not authorize him to fix the customs duties; it permits the Postmaster-General to operate the postal system, but does not authorize him to fix rates of postage. There certainly is no greater necessity to authorize the President to fix the rates of transportation over the railroads which you permit him to operate as a war measure.

"Wherefore, your petitioner earnestly prays that the paragraphs in the two bills dealing with rate regulation and control shall be so amended as to leave to the Interstate Commerce Commission the determination of all questions arising in respect thereof as now embodied in the act to regulate commerce and its amendments."

Since the first protests were received, the Director General has received a considerable number of communications from

other shippers urging him to impose the proposed charge for service on industrial sidings. Apparently these have come from the shippers who use the public team tracks.

Express Companies

No decision has yet been reached on the question as to whether the express companies are to be taken over by the government, but the impression is being gained that they will not be. It is understood that the four principal express companies, the Wells Fargo, the Adams, the American and the United States, have asked to be taken over on terms similar to those applied to the railroads on the ground that their business is so closely intertwined with that of the railroads and because their financial position has been steadily growing worse. It is understood that the influence of the post office department has been against taking over the express business because the Postmaster General has always taken the position that the post office department could handle the business through the parcel post and that if it were taken under the wing of the Railroad Administration, two departments of the government would be competing against each other.

The Railroad Administration has endeavored to sound the opinion of the state railroad commissions on the subject through their representative at Washington, Charles E. Elmquist, and he has asked the commissions for an expression of their views in reply to a circular letter. Among the questions he asked were as to whether the four companies or all of them should be taken over as a war measure, what compensation should be allowed if they are taken over, and whether they should be returned to private ownership after the war.

The director-general is now authorized to proceed with the negotiations with the railroads regarding their compensation and with plans for expenditures for equipment and improvements as well as for financing the roads. It is understood that work has been under way for some time on the preparation of contracts to be made with the roads and that the Interstate Commerce Commission is about ready to certify the amount of the average net operating income for three years which is made the basis of compensation except in special cases. A plan of accounting will be devised by Director Prouty of the division of public service and accounting. Conferences regarding the form of contract are being held between Judge Payne, general counsel of the Railroad Administration and the Law Committee of the Railway Executives Advisory Committee.

Improvements may be paid for in part out of the revolving fund consisting of the \$500,000,000 appropriation and the surplus earnings above the guarantee when the railroads are not able to finance them. Aid may be extended to the roads in refunding maturing obligations and financial assistance may also be given the roads in the form of loans by the War Finance Corporation if the bill providing for it now pending before Congress is passed. In hearings on that bill Director-General McAdoo stated that one of its purposes was to aid some of the railroads in meeting their requirements and that that was one of the reasons why the appropriation asked was only \$500,000,000. That sum he said would not be sufficient to take care of the needs even for this year.

BRIGHTON RAILWAY ROLL OF HONOR.—The Brighton Railway of England has issued the sixth edition of its Roll of Honor containing the names of its staff who have died in active service. The figures are up to the end of the year 1917 and show that the total number of men enlisted from the Brighton Railway up to that date was 4,814 which represents 29.6 per cent of the staff, 338 have died in active service which is 7.02 per cent of the men enlisted.

Planting Trees As Protection Against Drifting Snow

THE MINNEAPOLIS, ST. PAUL & SAULT STE. MARIE has undertaken an active program of tree planting as a means of protecting its tracks from drifting snow. It is planned to plant these trees along 100 miles of right of way each year and although this work was first undertaken as late as 1914, trees have already been planted along 250 miles of right of way and 70 miles additional line is ready for planting this spring. Up to the present time these trees have all been planted along the lines in North Dakota but

Original Condition of Many of the Cuts

it is planned to extend this work into Wisconsin this year.

In undertaking this work it was first necessary to develop a method of planting the trees economically. For this purpose a machine has been devised which will plant 8,000 trees a day with three men, or as many trees as 80 men could set in a day by hand. These trees are also said to be planted more satisfactorily, while they are all set at a uniform depth.

Careful consideration was given to the selection of the type of tree to plant, bearing in mind the kinds of soil which would be encountered along the cuts to be protected.

The Tree Planter in Action

Several kinds of willows were tried and the laurel-leaved willow was finally selected as the hardiest. It is planted in the outer row and also in some of the rows nearest the track. The Buffalo berry, carragana, buckthorn and artemisia are also used to some extent in the outside row, the purpose being to provide a low growing spreading tree or shrub with no big openings through which the wind can pass readily. Green ash or cottonwood is planted in the second row and green ash or box elder in the third row with the remaining five rows in willows. Eight rows of

trees are planted on the north and west sides of cuts and six rows on the south and east sides. These will be cut back periodically one row at a time as the trees develop.

The original right of way was 50 ft. wide in most instances, but this was soon found to be too narrow for effective tree planting so that 75 ft. additional is being purchased on the north and west sides of the cuts and 50 ft. on the opposite sides. The trees are set three and four feet apart in rows placed 8 ft. apart.

Most of the trees, which have been placed up to the present time, have been purchased from nurseries, although a nursery has been started by the company and trees are now being raised there. They are taken to the point of planting in refrigerator cars, as it has been found possible in this way to keep them dormant until as late as July.

While this work has not been carried on a sufficient length of time for the trees to become full grown and to demonstrate the entire success of the plan, the cost of plant-

A View of the Tree Protection

ing and caring for these trees compares very favorably with that of snow fences. The first cost is about 25 per cent of that for snow fences, while the maintenance expense will be very small after the first three or four years. This work has been handled under the supervision of T. A. Hoverstad, agricultural commissioner of the Soo Line.

FREE PASSES TO ENGLISH RAILWAY DIRECTORS.—The president of the British Board of Trade was recently asked whether, seeing that all the railways of the country were now under government control, he would give orders that the privilege hitherto enjoyed by the 500 or more railway directors of the United Kingdom of unrestricted traveling over all the railway systems first-class, without payment of fares, should now be withdrawn, and thus ease the prevailing congestion as regarded seating accommodation as well as adding to the railway revenue. To this, Sir Albert Stanley replied that he had no reason to suppose that the issue of free passes to railway directors results in any abuse of traveling facilities, and it did not seem to him that a departure from the existing practice would lead to the result which the member desired to attain.

C. B. Seger

CHARLES BRUNSON SEGER has been elected temporary chairman of the executive committee of the Union Pacific, succeeding Judge Robert S. Lovett. Judge Lovett resigned from the Union Pacific to give his entire services to the United States government and it would appear, therefore, that, although Mr. Seger at present has the word temporary prefixed to his title, this actually will have little, if any, significance.

Superficially, at least, there is a contrast between Judge Lovett and his successor. Judge Lovett was diplomatic, kindly, sympathetic, but none the less keen. Mr. Seger is keen, uncompromising, downright, clear thinking to an unusual degree. In other words, the contrast between Judge Lovett and Mr. Seger is entirely as to methods.

It may be presumed that Mr. Seger has the confidence and backing of Kuhn, Loeb & Co. In the matter of choosing a head for the Union Pacific system, it is pretty safe to say that the bankers have had the ruling voice.

Mr. Seger has been vice-president and controller of the Union Pacific since the Union and Southern Pacific were separated in 1915. As an accounting officer he stands unquestionably at the very head of his profession. His grasp of detail and his memory for figures are remarkable. He is naturally intolerant of slipshod or petty theories. His organization of the accounting system of the companies which go to make up the Union Pacific has been the admiration of accounting officers and railroad executives both here and in England.

Mr. Seger's entire railroad career has been in the accounting department but, notwithstanding this, it is the opinion of operating officers who have worked with him that he could make a superlatively good general manager or, so far as that is concerned, fill any operating position; and, although he might not be capable of acting as superintendent of motive power or chief engineer of construction, he knows intimately what a good mechanical officer or engineering officer ought to accomplish under a given set of conditions. As vice-president and controller, in practice if not in theory, the presidents of the Union Pacific companies conferred with or reported to—as you have a mind to call it—Mr. Seger. Much of Mr. Seger's time and thought were given to operating statistics.

Probably there is no other accounting officer in the history of American railroads who has had as clear an insight into the limitations of the use of operating statistics as a guide to operating efficiency or who has worked more persistently and more successfully to so collate these statistics as to reflect actual conditions. Accounting officers are apt sometimes to make something of a sacred mystery of their profession. To Mr. Seger, a mystery, like an unweighted average, was an anathema. Mr. Seger was fearless in his opposition to theorists and to those who held views contrary to his own. He opposed vigorously and without subtleties the

Interstate Commerce Commissioner's desire to separate all operating expenses between freight and passenger. It could not be done accurately and, therefore, it was a falsehood to attempt to do so, was the substance of his argument.

It is very interesting to note an apparent tendency in Kuhn, Loeb & Co.'s policy toward the roads that they control. When they reorganized the Wabash, W. H. Williams, vice-president of the Delaware & Hudson and an accounting officer, was made chairman of the board. Now we have an accounting officer made chairman of the executive committee of the Union Pacific.

Charles Brunson Seger was born August 29, 1867, at New Orleans, La. He went to common school and began railroad work as an office boy on Morgan's Louisiana & Texas Railroad & Steamship Company, which is part of the Southern Pacific. He had become a clerk before 1887 and in that year was given the title of steamship auditor. In 1889 he was made traveling auditor and two years later was appointed chief clerk to the general auditor.

In November, 1893, Mr. Seger was made auditor and secretary of the Galveston, Harrisburg & San Antonio, the Texas & New Orleans, and the Direct Navigation Company. On January 18, 1900, he was made also auditor and secretary of the Galveston, Houston & Northern.

On November 1, 1904, Mr. Seger was appointed auditor of the Southern Pacific-Pacific system, with office at San Francisco, Cal. In January, 1910, he was made general auditor of the Union Pacific and Southern Pacific systems—the Harriman system; and in 1911 was made deputy comptroller of the Harriman Lines. When the courts ordered the dissolution of the Harriman system and the separation of the Union and Southern Pacific, William Mahl, who had been controller of the Southern Pacific under Colis P. Huntington and later under F. H. Harriman, controller of the Harriman Lines, resigned and C. B. Seger became controller of the Union Pacific and

A. D. MacDonald of the Southern Pacific.

AMERICAN ENGINEERS ROBBED IN CHINA Press despatches from Peking dated March 8, report that two American engineers have been robbed and captured by bandits near Yeh-Sien, in the Province of Ho-Nan. A Chinese assistant also was taken prisoner. The party was on its way to inspect and survey the site of a proposed railway between Chow Kai-kow and Siang Yangfu. They were carrying a large sum of money with which to pay survey parties. An escort of 20 soldiers resisted the bandits until their ammunition was exhausted, when the party surrendered. Two of the Chinese escaped and reported the outrage. Officials of the American International Corporation which is associated with the Siam-Carey Railway & Canal Company in railway building in China, announced that they intended calling the attention of the State Department at Washington to the bandit outrage near Yeh Sien, and would ask protection for their employees now in that section.

C. B. Seger

Approximate Cost of Stopping a Train

By R. E. W.

FREQUENTLY THE QUESTION of cost incidental to stopping a train comes up in court actions and commission hearings, and heretofore the answer has been an estimate based upon general railroad experience and without any supporting data. If, however, such an estimate is not accurate enough for the purpose, some way of actually figuring the cost must be chosen and the following method will be found to give good results.

Since energy is the capacity for performing work, we may divide the energy dissipated in stopping a train from a given speed, by the work required to move the same train a mile at the speed from which the stop was made, and this quotient will represent the distance the train would have traveled due to its stored up energy. It is evident then, that this quotient, which may be called the equivalent miles run, multiplied by the cost of coal, repairs and wages per train-mile, will give the total cost of the stop. Train resistance figures which enter into the computation are based on a wide range of experiments and the respective costs mentioned above are taken from railway company statistics. These must be average values, because the cost of stopping a train even from the same speed, is not always the same due to varying brake action, slipping of drivers, etc.

To express the energy relations algebraically, let,

S = total energy in the train due to its speed,
 R = work required to move the train a mile at the given speed,
 F = distance the train could travel due to S .

Then from the preceding paragraph:

$$\text{Equivalent miles} = F = \frac{S}{R} \quad (1)$$

To find the value of S consider the general equation

$$E = \frac{1}{2} M V^2 \quad (2)$$

Where:
 E = energy in foot pounds,
 M = weight in pounds divided by G (acceleration due to gravity),
 V = velocity in feet per second.

Expressing the weight M , in tons and the velocity V , in miles per hour, equation (2) becomes

$$E = \frac{1}{2} \frac{W \times 2,000}{32.2} \times \left(\frac{V \times 5,280}{3,600} \right)^2 = 66.8 W V^2 \quad (3)$$

Adding about 5 per cent for energy of rotation, the total energy in the train becomes:

$$S = 70 W V^2 \quad (4)$$

$$R = 5,280 \times \text{total train resistance at the given speed in pounds} \quad (5)$$

$$\text{Therefore: } F = \frac{70 W V^2}{5,280 \times \text{total train resistance}} \quad (6)$$

To apply this method to a particular case, consider an eight-car passenger train of the following description, running at 30 m.p.h.

| | |
|--|------------|
| Total weight of Pacific type engine..... | 120 tons |
| Weight on driving wheels..... | 75 tons |
| Weight of tender (2% load)..... | 63 tons |
| Weight of eight coaches at 110,000 lb..... | 440 tons |
| Total car resistance at 6.0 lb. per ton [*] | 2,640 lb. |
| Tender and engine truck resistance at 6.0 lb. per ton [*] | 648 lb. |
| Engine friction and head air resistance..... | 2,663 lbs. |
| Cost of coal per car mile..... | 2.60 cents |
| Cost of engine repairs per mile..... | 9.49 cents |
| Cost of car repairs per mile per car..... | 1.75 cents |

Substituting in equation (6):

$$F = \frac{S}{R} = \frac{70 (120 + 63 + 440) \times 30^2}{5,280 \times (2,640 + 648 + 2,090)} = 1.38 \text{ miles.}$$

The cost of coal and repairs for the above distance is as follows:

| | |
|--|------|
| Cost of coal = $1.38 \times 2.63 \times 8 =$ | 29.0 |
| Cost of engine repairs = $1.38 \times 9.49 \times 1 =$ | 13.1 |
| Cost of car repairs = $1.38 \times 1.75 \times 8 =$ | 19.3 |

Cost chargeable to stop = 61.4 cents

This does not include the cost of time lost by the crew

which may be figured by applying 1.38 miles to the rate of pay per mile in case the crew gets overtime.

Also there are other items such as track repairs, lubrication, depreciation and taxes, a proportion of which is properly chargeable to these stops, but the amount is small and can properly be neglected.

For the sake of comparison, the above method is applied to a 50-car freight train of the following description running at 30 m.p.h.:

| | |
|--|------------|
| Total weight of Mikado type engine..... | 130 tons |
| Weight on driving wheels..... | 100 tons |
| Weight of tender (2% load)..... | 63 tons |
| Weight of 50 loaded freight cars at 75 tons..... | 3,750 tons |
| Total freight car resistance at 4.4 lb. per ton [*] | 16,500 lb. |
| Tender and engine truck resistance at 4.4 lb. per ton [*] | 409 lb. |
| Engine friction and head air resistance..... | 2,715 lb. |
| Cost of coal per freight car mile..... | .40 cents |
| Cost of freight car repairs per car mile..... | .87 cents |
| Cost of engine repairs per mile..... | 9.49 cents |

Substituting in equation (6):

$$F = \frac{S}{R} = \frac{70 \times (130 + 63 + 3,750) \times 30^2}{5,280 \times (16,500 + 409 + 2,715)} = 2.40 \text{ miles}$$

$$\begin{aligned} \text{Cost of coal} &= 2.40 \times .40 \times 50 = 48.0 \text{ cents} \\ \text{Cost of car repairs} &= 2.40 \times .87 \times 50 = 104.5 \text{ cents} \\ \text{Cost of engine repairs} &= 2.40 \times 9.49 \times 1 = 22.8 \text{ cents} \end{aligned}$$

Total cost of labor charges as stated before, = 175.3 cents exclusive

The relative costs of stopping the above passenger and

Approximate Cost of Stopping Freight and Passenger Trains from Different Speeds

freight trains from a speed of 30 m.p.h., is shown in the following table:

| | Passenger | Freight |
|-----------------------------|------------|-------------|
| Total cost of coal..... | 29.0 cents | 48.0 cents |
| Cost of car repairs..... | 19.3 cents | 104.5 cents |
| Cost of engine repairs..... | 13.1 cents | 22.8 cents |
| Total..... | 61.4 cents | 175.3 cents |

It will be observed that the cost of coal and especially the cost of freight car repairs, is what makes the charge so much higher in the case of the freight train. The same thing is shown graphically by plotting speeds against costs, as obtained by the above method.

In case exceptions are taken to this method due to the fact that the costs of repairs are usually based on the actual mileage, which does not include the constructive or equivalent miles due to stops, it must be remembered that the relative mileage is small and the only effect would be to slightly reduce the cost of the stop.

*All car resistances were taken from data obtained by Professor E. C. Schmidt for the University of Illinois. Engine truck and tender resistance is assumed to be equal to car resistance.

†Engine friction and head air resistance were taken from the Locomotive Handbook, published by the American Locomotive Company.
 All other data are taken from railway company statistics.

New Reading Coal Pier Has Interesting Features

The Installation of a Modern Car Unloading Machine Doubles Capacity of Port Reading Terminal

TO PROVIDE INCREASED FACILITIES for handling the rapidly increasing tidewater shipments of coal at its Port Reading (N. J.) coal terminal the Philadelphia & Reading has recently completed and placed in operation a modern car dumping plant to supplement the old facilities at this point. The new facilities include a pier, a car dumper, a thawing plant and additional yard tracks. While the project involved an outlay of approximately \$1,000,000, the expenditure is justified by the increased capacity of the plant and the reduction effected in operating expenses. By operating two shifts a day, the new car dumper has a capacity equal to that of the old plant. A force of

terminal for the handling of coal. The line is single track, with passing sidings holding 75 to 100 cars at intervals of about three miles to permit of flexible operation. The inbound or loaded coal trains average about 50 cars each and the outbound or empty trains 60 to 70 cars.

Prior to the completion of these improvements, the coal handling facilities at this terminal consisted of three high-type gravity trestles with a combined capacity for handling approximately 7,000,000 tons of coal per annum and a coal storage yard having a capacity for 2,800 cars. The trestles handle both bituminous and anthracite coal in the approximate proportions of 60 per cent bituminous and 40

General View of the Terminal

175 men is employed to handle the maximum capacity of 600,000 tons a month over the three trestles comprising the old plant, as compared with 12 operators required to handle the same amount of coal over the car dumper.

The Port Reading Coal Terminal

The Port Reading coal terminal, which provides the facilities for the trans-shipment to vessels of coal transported over the lines of the Philadelphia & Reading and its connection, was first placed in operation in 1892. It is located about 17 miles below New York City on the Arthur Kill, which separates Staten Island from the New Jersey mainland and at the terminal of the Port Reading Railroad, a subsidiary of the Reading system.

This railroad is 19 miles long and extends from Manville, on the New York division of the Reading, to the terminal. It is operated for freight only, its principal function being to provide the connection from the Reading main line to the

per cent anthracite. The bituminous coal comes from Ohio, Pennsylvania and West Virginia and the anthracite mainly from Pennsylvania.

While by far the greater amount of the coal handled in Port Reading is destined for New York and vicinity, a considerable amount is also handled for export, coastwise and bunker purposes. Twelve locomotives are employed in the regular shuffling force, working 24 hours per day. The engine crews and car riders work in eight-hour shifts. A fleet of four tugs is maintained to handle the vessels for New York City, a flotilla consisting of from 25 to 30 boats. The loading is done as far as possible during the day, and the loaded boats are moved out on the low tide at night. The empties at New York are picked up during the day, assembled at a stake boat in the lower harbor and are returned to the terminal at night for the next morning's performance.

The new facilities consist of a timber pier 900 ft. long

by 78 ft. wide and an electrically-operated car dumping machine, a sub-station for generating the power used to operate the dumper, a boiler house built of concrete and brick, a thawing house of fire-proof construction with a capacity for 44 cars and additional yard facilities. The new track facilities provide storage for 1,200 cars, making a total storage capacity in the entire plant of 4,000 cars. The car dumper is capable of handling one car of 100-ton capacity per minute and it is expected that an average of 30 cars per hour over the dumper will be maintained. Working day and night shifts at this hourly capacity the car dumper will handle an amount of coal equal to that handled over the three gravity trestles. The dumper will be utilized chiefly for unloading bituminous coal and the smaller sizes of anthracite. As the trestles will be maintained in service to supplement the dumper, this installation doubles the coal-handling capacity of the terminal.

The site upon which the new facilities are now located was originally a salt marsh which was under water at high tide. This marsh was filled in with sand pumped from the sound by an hydraulic dredge to an elevation of 10 ft. above mean low water. The dredge also made the fill upon which the thawing house is located and for the empty and loaded car tracks serving the machine. The fill at the thaw-

with the bottoms of the cars. The air heating apparatus is located in the center of the house on the second floor and consists of steam engines, fans, steam coils, and recording thermometers by which the temperature in any of the four stalls is ascertained and recorded. Steam is supplied to the thawing house through asbestos covered pipes leading from the boiler house, and the condensation from the steam coils is returned to the boilers both because of the saving in heat and the difficulty of securing good boiler water in this locality.

The efficiency of the plant is increased by using the same air over and over instead of securing a new supply from the outside atmosphere. This is done by drawing the air from the top of the stalls through the steam coils and forcing it through ducts which have outlets between the rails, thus bringing the hot air in contact with the bottoms of the cars. The severe weather during the winter at Port Reading makes it necessary to use the thawing plant about three months in the year.

Other Facilities

The pier is a timber structure 75 ft. wide and 900 ft. long. The central portion is of low water construction and comprises the foundation for the unloading machine. This

Plan of the Track Layout and Coal Pier

ing house has an elevation of about 30 ft. above mean low water at its summit, and in making these fills 588,764 cu. yd. of material were moved. This part of the work was done in 60 days, the dredge maintaining an average of 9,800 cu. yd. of material moved per day.

The Thawing Plant Is an Important Feature

The thawing house, which is one of the most interesting and important units of the layout, is located between the storage yard and the dumper. It is 440 ft. long and 70 ft. wide and has four stalls, each capable of holding 11 cars. It is of fire-proof construction, with a frame work of light steel channels to which triangular wire mesh was welded electrically on each side and covered with gunite, forming two solid walls about 1½ in. thick with an air space between them. This type of construction is particularly adapted to this kind of a structure inasmuch as the air space between the walls reduces the radiation of heat to a great extent. The house rests on a concrete foundation which in turn is supported on timber piles driven into the sand fill.

The thawing of coal is done by forcing air, heated to a temperature of 250 deg. F., into any one or all of the four stalls or tunnels of the house and bringing it into contact

foundation contains 880 timber piles which are cut off at low water, clamped, capped and covered with an 8-in. deck. This deck supports the concrete machine foundation as well as the concrete face wall of this portion of the pier which encloses the entire machine foundation. The space between the various units of the concrete foundation is earth filled. The remainder of the pier is of high water construction, the piles being cut off 10 ft. above mean low water, clamped, capped and covered with a 3-in. deck. All of the piles and timber used in the construction of the pier are creosoted except the top clamps, caps and 3 in. decking in the high water construction.

The boiler house which supplies steam to the thawing house and the sub-station for the operation of the car dumping machine, is located midway between the thawing house and the dumping machine. The house is built of brick and concrete with its boilers arranged in three batteries of two boilers each, having a total capacity of 1,200 h.p. The boiler house is equipped with elevating and conveying machinery which delivers the fuel into a suspended bunker from which it is fed to the boilers by gravity.

The sub-station is located under the dumper and is fitted with 250 h.p. direct connected electric generators which are

used on alternate days. The generators supply the power for the entire operation of the dumper with the exception of the haulage car, which is steam operated. The exhaust steam from the sub-station is utilized in preheating the boiler water to about 210 deg. F. before it reaches the boilers.

Another important feature of the plant is the electric boat hauling machine which moves the loaded boats away from the unloader, the empties into place and warps the boats being loaded up and down the pier for trimming so as to bring the proper hatch under the chute. This machine

The Thawing House

consists of a drum located under the car dumper and sheaves anchored to the pier in both directions from the drum over which cables are operated.

The Operation of the Car Dumper

As may be seen in the map, the layout is simple and convenient of operation. The approach to the thawing house is on a 2 per cent compensated grade which permits the locomotives in use at the terminals to push eleven 100-ton capacity cars into the thawing house, or all that one stall of the house will accommodate. The tracks through the house and down to the car haulers pit were built on a 1.25

The Unloader in Operation

per cent descending grade. Sufficient room is provided in front of the thawing house to store 11 cars on each of the four tracks through the house. When the house is filled with cars and the first stall thawed these cars are run out of the house by gravity and 11 more cars are put in. In severe weather about two to four hours is required to properly thaw a car.

A fifth track provided south of the house permits the operation of the dumper without the necessity of the cars passing through the house. Like the other four tracks, this track is on a 1.25 per cent descending grade in the direc-

tion of the dumper. The thawed cars and coals brought in by way of the No. 5 track run down one by one from the storage tracks in front of the thawing house to the haulage pit, from which point they are taken up the heavy track trestle over an 11 per cent grade to the cradle of the dumper by a steam-operated car haulage machine. At the machine the car is clamped in place elevated and turned over, dumping the coal into a pan conveyor. From the pan the coal runs through a telescopic chute into the hold of the boat, and by always keeping the chute full the breakage is reduced to a minimum. The oncoming loaded car pushes the empty car from the cradle. It then runs down a 4 per cent grade to a switch back at the end of the pier and returns on the light track trestle down a 1 per cent grade to the light car storage yard.

The plant was designed and built under the direction of Samuel T. Wagner, chief engineer of the Philadelphia & Reading, and F. Jasperson, engineer in charge of construction. The construction work on the pier, foundations and boiler house was done by railroad forces under the supervision of Mr. Jasperson. The thawing house was built un-

The Unloader and the Loaded and Empty Cars

der contract with the Surety Engineering Company of New York, and the McMyler Interstate Company furnished and erected the dumping machine. The operation of the plant is under the direction of William Brown, shipping and freight agent at Port Reading, and its maintenance is in charge of I. A. Seiders, superintendent of the motive power and rolling equipment department of the Reading.

DOCK CONSTRUCTION IN FRANCE.—Several thousands of men are employed in construction work at the various American depots in France says a Paris correspondent in the New York Times. A total of 125 miles of tracks has been laid to the depots, and \$15,000,000 has been expended. The docks under construction at one port will cost millions of dollars.

AMERICAN ENGINEERS BUILD WAREHOUSES IN FRANCE.—Remarkable progress has been made, by the American engineers in constructing tracks and building warehouses and ordnance depots, despite the difficulties of transferring all the materials from America. A cable dispatch to the New York Times dated March 12, says that the advance regulating station has 19 warehouses completed, with a capacity of 5,000 tons each, to supply an army of 1,000,000 men. The number of warehouses will be increased to 59 by July. All this work, including the construction of the ordnance depot, 50 miles of railroad tracks, and barracks for several thousand men, has been completed since October.

Rate Advances Allowed on Eastern Railroads

THE INTERSTATE COMMERCE COMMISSION in a series of orders handed down on March 15 allowed most of the increases in rates asked by the railroads in Official Classification territory at the hearings held before the commission during November in the supplemental 15 per cent case and the other cases considered in connection therewith, which in general cover the commodity rates which were not increased by the commission's decision of June 27, 1917. That decision allowed increases in class rates and on a few specific commodities, estimated to amount to approximately \$97,000,000 a year, and the latest decision allows, with some exceptions, the remaining increases originally asked which it was estimated by the railroads at the time of the hearing would add approximately \$58,000,000 more.

No opinion accompanies the latest decision, which is merely a series of orders vacating the suspension of the proposed tariffs with a statement of the exceptions and a set of rules governing the relationship and adjustment of the rates involved in the 15 per cent case.

In general the advances allowed are on a 15 per cent basis, but the increase on anthracite coal is a maximum of 15 cents a ton, the increase on cement is 1 cent per 100 lb., and on lumber and forest products 1 cent per 100 lb.

As to anthracite coal, the commission vacated and set aside its order of July 30, 1915, docket No. 4914, in the matter of rates, practices, rules and regulations governing the transportation of anthracite coal and the modifying orders entered on September 1, November 22 and December 30, 1915, and February 24, March 9 and March 23, 1916, thereby allowing the advances to go into effect. In Investigation and Suspension docket No. 111, in which proposed increases were suspended until April 29, 1918, the commission vacated as of March 25, 1917, its order suspending the operation of schedules in tariffs of the Norfolk & Western, and ordered that the commodity rates on anthracite coal, in so far as increased by 15 cents per long ton or less, as stated in the schedules, be approved, provided that such rates between points in Official Classification territory shall not be increased by more than 15 cents per long ton, and that where a through rate between two such points is made by combination appropriate provision is made in the schedules that the aggregate increase of the factors applicable in such a combination shall not exceed 15 cents per long ton. The proposed schedules will be held under suspension until cancelled by new schedules filed in conformity with these conclusions. The orders in the anthracite investigation, 35 I. C. C. 220, will be vacated and set aside.

In the eastern livestock-fresh meat case, I. & S. docket No. 1124, in which the proposed increases were suspended until July 13, 1918, the orders are vacated as of March 25 and the proceeding discontinued.

In the eastern commodity case, I. & S. docket No. 1125, in which proposed increases were suspended until June 30, 1918, the carriers are required to cancel the schedules on or before April 25, 1918, in so far as they proposed increased rates on condensed milk and canned vegetables from Wisconsin and Illinois points, and increased rates on lumber, mine props and mine timbers in carloads, and furnace castings in less than carloads, and an increase in the minimum carload weight on woodenware from Escanaba, Mich., to eastern points. With this exception, the orders are vacated as of March 25 and the proceedings discontinued.

In the case involving commodities between trunk line and western points, I. & S. docket No. 1131, in which the increases were suspended until July 13, the orders are vacated as of March 25 and the proceeding discontinued.

In the Central Freight Association territory petroleum

case, I. & S. docket No. 1134, in which the increases were suspended until July 18, the orders are vacated as of March 25 and the proceeding discontinued.

In the eastern grain case, I. & S. docket No. 1142, in which increases were suspended until July 29, 1918, the orders are set aside as of March 25 and the proceeding discontinued.

The supplementary 15 per cent case, No. 57 ex parte, involves increases in commodity rates within Official Classification territory, and increases in class and commodity rates between Official Classification territory and other territories. The commission ordered that commodity rates on brick clay and articles grouped therewith in present tariffs from Canton, O., to points in Central Freight Association territory and Illinois, and on the Mississippi river, may be increased by 15 per cent and rates from other points in western Pennsylvania, West Virginia, central, southern and eastern Ohio and the Ashland, Ky., group, may be made on the established differentials over or under the Canton rates so increased.

It is further ordered:

That commodity rates on cement may be increased by 1 cent per 100 lb.

That commodity rates on lumber and forest products may be increased by 1 cent per 100 lb.

That commodity rates, other than on ice, bituminous coal, coke, and iron ore, which are not otherwise covered by this order or by the foregoing orders, and which have not been increased since June 27, 1917, may be increased by 15 per cent, observing established rate groupings, relationships, and differentials in manner provided in paragraphs designated I to XIII of this order.

That joint rates, whether class or commodity, between Official Classification territory on the one hand, and southeastern territory, the southwest, and points on or east of the Missouri river on the other, may be increased by amounts not exceeding the increases in rates now and heretofore allowed to the carriers in Official Classification territory under this proceeding and the C. F. A. Class Scale Case, 45 I. C. C., 254. If these increases involve a change in the relationship under the long-and-short-haul rule between intermediate points and more distant points outside of official classification territory relief from the fourth section of the act must first be secured on regular application.

That in establishing rates increased by 15 per cent, the existing groupings and relationships as hereinafter specified may be preserved, even though by so doing some rates are increased slightly more than 15 per cent.

That in establishing the increases, rates from Chicago to New York and Montreal, and from New York to Chicago, may be increased 15 per cent, and such increased rates may be scaled to or from percentage points or groups upon the established percentage groupings and percentages; that rates via the established all-rail differential lines may be made the same differentials under the standard all-rail rates as now exist; and that the established groupings of points of origin or of points of destination under common rates may be preserved; even though so doing results in increasing some rates slightly more than 15 per cent.

The commission also prescribed in detail the percentage relationship of rates and the differential and arbitrary adjustment of rates, authorized but not specifically designated above, in cents per hundred pounds. Specific commodity rates which were on June 27, 1917, the same as the class rates, or established percentages of class rates, from and to the same points, may be increased the same amounts or percentages as such class rates have been increased. Rates per ton may be increased on the basis per hundred pounds, using 2,000 lb. as the ton.

Rates authorized in the foregoing orders may be established upon notice to the commission and to the general pub-

lie by not less than five days' filing and posting of tariffs and schedules under suspension in the foregoing proceedings may be supplemented or cancelled on one day's notice, but where rates are held by any unexpired order of the commission other than those in the anthracite investigation, there must be appropriate application in each case for modification of the order.

In the case involving commodity rates in Official Classification territory, Fifteenth section order No. 176, a large number of applications for approval for filing of certain increased rates are denied without prejudice to applicants' right to renew any of them as to which the authority sought is not granted in whole or in part or denied in the above orders.

Handling Locomotives at Railway Terminals*

An Increase in Locomotive Miles Can Be Accomplished
By Better Enginehouse Facilities

By Frank C. Pickard

Master Mechanic, Delaware, Lackawanna & Western, Buffalo, N. Y.

WE ARE ENGAGED in the business of transporting necessities from where they are produced to where they are needed and the connecting link between these two places is the railroad, its motive power, vehicles of conveyance, tracks, etc. This country needs locomotives as it does ammunition and big guns. The locomotive must be kept as nearly 100 per cent efficient as possible and must be detained at the terminals as little as necessary. The fol-

tween the different classes of power. The chart shown in Fig. 2 is for an organization where such division is desired.

It is desirable to have an inspection pit, so located that the locomotive may be placed on it immediately after it has been washed. This pit should be long enough to take the entire locomotive and tender and it should be equipped with sufficient lighting facilities to enable the inspector properly to do his work.

A first-class turntable of ample length and sufficiently strong so that it will not spring under the heaviest loads is very necessary for handling locomotives at a large enginehouse. One essential matter that is many times overlooked is the alinement of the tracks across the table. It is highly desirable to have the turntable line up with the fixed tracks on both ends.

An enginehouse is not complete unless it is equipped with a tool room that contains suitable and enough tools properly

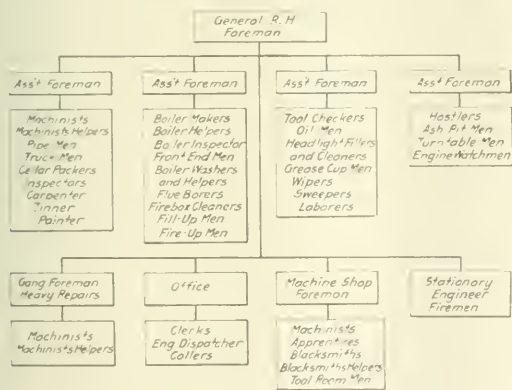

Fig. 1

lowing are a few suggestions that will help to accomplish these results.

A water-type asphalt served by a gantry crane should be provided at the terminals. With such equipment one man can handle the cinders from 125 locomotives in 24 hours. The labor for cleaning fires can be handled to the best advantage on a piece work basis.

After the fire of a locomotive has been cleaned or dumped, the machinery of the locomotive and the running gear of the tender should be carefully cleaned so that it may be inspected properly. The larger types of locomotives can be thoroughly cleaned in from seven to ten minutes by washing them with a combination of fuel oil and water sprayed through a nozzle by compressed air.

Each enginehouse must have a well defined organization. The chart shown in Fig. 1 gives the plan of an organization for a terminal handling approximately 100 locomotives every 24 hours, where it is not desired to specialize be-

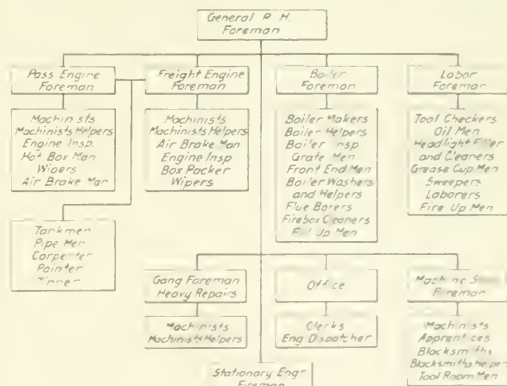

Fig. 2

and promptly to handle the work. Each enginehouse of any considerable size should be equipped with portable tools, such as boring bars, valve facing machines, crank pins, turning machines, portable tool boxes, portable benches, small trucks, wagons, etc.

Water cranes should be located on the tracks leading to and from the enginehouse. With these properly located, no time will be lost in moving locomotives back and forth to give them water. Every enginehouse should have a sufficient steam pressure to provide a blower system of adequate

* Abstract of a paper presented before the American Railway Club.

capacity. A hot water washout plant of sufficient capacity to take care of all locomotives to be washed is important. By its use a large amount of boiler maintenance is eliminated, for when cold water is used the expansion and contraction of the boiler due to the quick change of temperature will cause trouble. The hot water system also saves fuel and time in preparing the locomotive for service. Electric and autogenous welding outfits are essential in every enginehouse, as by their use much time in repairing the engine can be saved.

Each enginehouse should have suitable pits for removing engine truck wheels, tender wheels and drivers. Every locomotive terminal should be provided with adequate means for handling the locomotive fuel. The coal dock should be located so that it will cover locomotives as they approach the enginehouse. A suitable record should be kept to show the terminal detention of locomotives which is chargeable to both the mechanical and transportation departments separately.

Check up the enginehouses at night and in the morning and finish the day's work with as few locomotives held as possible. Everything should be done to keep them in service. It may be that a tender from one locomotive can be transferred to another and thus a locomotive gained, or if two engines of the same class are held, many times one may be released by replacing defective material of one with its duplicate on the other. Everything must be done to produce more locomotive-miles.

Discussion

As a stimulus to the discussion of the subject, the author added to the paper a list of twelve questions. The majority of those who spoke favored cleaning locomotive fires on a piece work basis rather than on a day wage. Some roads pay 35 cents per engine for this work. The Lackawanna pays 35 cents for locomotives having 65 sq. ft. of grate surface and under, and 45 cents for locomotives having more than 65 sq. ft. of grate area. The washing of engines, as described by the author in his paper, was considered good practice and it was deemed inadvisable to use this system when the temperature got below 10 above zero, as it was difficult to keep the water from freezing on the locomotive. For this work the Lackawanna pays 39 cents per locomotive. The majority of the members favored the use of inspection pits. Mr. McIlvaine, superintendent motive power of the Northern division of the Pennsylvania, stating that the use of inspection pits was practically universal on the Pennsylvania. The majority of the members found that more supervision was necessary under present labor conditions. None of those who spoke found it necessary to use women in enginehouse work except as clerks. Most of the members stated that the locomotives were coaled on going into the roundhouse. The plan of organization shown in Fig. 1 was preferred.

W. H. Flynn, superintendent of motive power of the Michigan Central, discussed the paper at length saying, in part, as follows:

Mr. Pickard's mention of the necessity of a well equipped tool room is a pertinent point, but I would go further and recommend that every large roundhouse, and possibly some of the smaller ones, be provided with a small but well equipped machine shop, even though the general repair or "back shop" were not very far away. Motor driven tramp or portable lathes will also be found to be of great value, and as the current can be obtained from an ordinary lighting circuit, the use of such machines is very flexible.

The fundamental principles of a good engine terminal are plenty of room inside as well as out; necessary equipment inside for doing work; good heat and ventilation; plenty of light, both day and night; a good turntable; good road, water and clinking facilities, and last but not least, a good organization with system. The best designed and

equipped terminal will not produce results if the organization is weak or the system poor. I am convinced that by careful selection and thorough training, good roundhouse foremen with future possibilities can be developed.

Turning engines promptly is most necessary, but in so doing the maintenance must not be overlooked. It is in doing the necessary work that system is so essential, for without a well defined plan of taking care of boiler work, wedges, rods, packing, tires and wheels, turning engines out rapidly goes for naught, if they fail between terminals. I am a firm believer in doing the necessary work at the proper time, even if it retards the despatching of the engine, which it sometimes will, but engines cared for properly will pull cars, which is what the country needs so urgently today. There have been times when we could figure on slack periods to catch up with work, but such a policy would be disastrous in the present crisis.

Well laid out, well equipped, properly managed engine terminals are mighty big factors in the successful operation of every railroad. It is a live and vital subject today.

A resolution of co-operation to Director General McAdoo was adopted by the club members.

Hearing on Kansas City Southern Valuation

TESTIMONY REGARDING the "other values and elements of value" in the Kansas City Southern system, which, according to the tentative report of the Bureau of Valuation of the Interstate Commerce Commission, were not found to exist, was presented at a hearing before the Interstate Commerce Commission at Washington beginning on March 14. Samuel Untermeyer, representing the road, and C. A. Prouty, director of the Bureau of Valuation, stated that the company and the bureau have practically completed the testimony as to the physical valuation and have reached a stipulation on an agreed statement of facts to be signed probably this week; but the director stated that no basis had been found for the determination of the intangible values in such a way that they could be stated in dollars and cents. He contended that it could not be done without reference to the purpose for which the valuation was made and that it would be proper for the commission to report to Congress on the physical property with a statement that the other values had not been determined.

Mr. Untermeyer urged that the earning capacity of the road depended more upon the intangible elements than on the physical property and while he was prepared to introduce testimony he filed a motion that it be deferred until after the commission has completed the physical valuation of the other five roads in the territory. After considerable argument, during which Director Prouty and P. J. Farrell, chief counsel for the commission, stated that the finding of the bureau was not meant as a declaration that there were no intangible values, but as a statement that they were not found, the commission took the motion under advisement and directed that the testimony be introduced.

Mark Wymond, a civil engineer of Chicago, who has had a broad experience and is the author of a book on valuation and rates, was introduced as the first witness and amid considerable wrangling as to whether or not he was going to make an argument and as to the relevance of his testimony he read a statement explaining his opinion, after an investigation of the property, that its total value was \$76,500,000. In reaching this conclusion he had assumed the value of the physical property, on the basis of the stipulation, as \$50,000,000.

L. F. Loree, chairman of the Kansas City Southern, explained in detail the reasons for his judgment that the road was worth \$80,000,000. He based this largely on the earn-

passenger train. The engine and first three cars of the passenger train were derailed, also six cars of the freight train, the freight cars catching fire and being partly destroyed. Four passengers were killed and four slightly injured.

The trains in collision near Radford, Va., on the night of the 30th were an eastbound passenger and a westbound freight. Two enginemen, one fireman, and one brakeman were killed and three other trainmen were injured. Responsibility for the collision is charged against an operator, for failure in manual block-signal working, and to neglect on the part of the conductor of the freight, who overlooked the passenger train.

The trains in collision at Sedro Woolley, Wash., on the night of the 31st were a southbound freight of the Northern Pacific and an eastbound passenger of the Great Northern. The freight ran into the passenger train at the crossing of the two roads. The freight engine struck the rear car of the passenger train, and pushed it about 100 ft. to the station building. The car broke through the station office and was itself completely wrecked. Five passengers were killed and 15 passengers and three trainmen were injured.

The train derailed near Cleveland, Va., on the 9th was a westbound freight. The engineman was killed and two trainmen were slightly injured. The cause of the derailment was not determined.

The train derailed on the Houston & Texas Central at Hammond, Tex., on the morning of January 14, about 3 o'clock, was northbound passenger No. 17. One steel coach was crushed by running violently against a locomotive on the side track. Seventeen passengers were killed and twelve were injured. The derailment was due to a loose switch which had been deranged by a brakebeam which fell from a car in a freight train. This accident was reported in the *Railway Age* of January 18.

The train derailed at Bemis, N. H., on the 14th was an eastbound freight. The train became uncontrollable on a steep descending grade at Crawford, and ran at high speed to Bemis where the engine and 30 freight cars were ditched and wrecked. The engineman was killed and the fireman and one brakeman were injured.

The train derailed near Beloit, Kan., on the 15th was a westbound passenger. The engine was not thrown off the rails, but the two passenger coaches were overturned and fell down a bank into Plum Creek. Three passengers were killed and 23 passengers and three employees were injured.

The train derailed at Groseclose, Va., on the 18th was a westbound express. The engine and 7 cars ran off the track. The cause of the derailment was an unfastened switch.

The train derailed on the Pennsylvania Lines West of Pittsburgh, at Amo, Ind., on the 11th, was an eastbound freight. In the train were eleven cars of gasoline, which took fire, and the contents of the whole was consumed, together with a small dwelling house. The cause of the derailment was a cylinder head of the locomotive, which was knocked out, fell to the ground, and then struck a switch stand so as to loosen the lever and allow the switch point to open slightly. The third car in the train was the first one to be disturbed by the loose switch point; and the rest of the train ran along the side track and into a string of standing cars.

The train derailed at New Castle, Ala., on the night of the 21st was northbound passenger No. 4. The train ran through a damaged switch and the engine and two baggage cars were ditched. The engineman, fireman and one other employee were injured.

The train derailed near Middlebury, Vt., on the morning of the 22nd was a southbound passenger. The locomotive was wrecked by the explosion of its boiler, and the fireman was killed. The engineman was fatally injured.

The train derailed near Marion, Ohio, on the 23rd was

westbound passenger No. 5. Three passenger cars were overturned and 29 passengers were injured. The cause of the derailment was obscure but was believed to be spreading of rails.

The trains involved in the accident on the Pennsylvania Railroad at Girard avenue, Philadelphia, Pa., on the 23rd, were eastbound passenger No. 22, the Manhattan Limited, and eastbound passenger No. 230. A mail car in No. 22 was derailed by the failure of a journal, and it was thrown to one side so as to foul the track on which the other train was traveling, both trains moving eastward. The mail car was badly damaged and of the several clerks in it, one was killed and eight injured. Four passengers were slightly injured.

The train derailed on the Nashville, Chattanooga & St. Louis near McCarty, Tenn., on the 23rd was a northbound local passenger. Two cars were overturned. The fireman, two passengers, one mail clerk, and one other employee were injured, all of the injuries being reported as slight. The cause of the derailment was excessive speed on a curve of 5 deg. 47 min., with super-elevation of 6 inches.

The train derailed at Conway, Ky., on the 24th was northbound passenger No. 34. The train, four hours behind time, was drawn by two engines; the second engine was overturned and one baggage car was wrecked. One engineman, one fireman and an express messenger were injured. The cause of the derailment was not determined, but it is believed to have been due to a defect in the track.

The train derailed at Middleville, N. Y., on the night of the 29th was a southbound passenger. One coach was overturned and fell down a bank. Nine passengers were injured.

The train derailed at Granger, Ill., on the 29th was an eastbound express passenger, drawn by two locomotives. Both of the engines remained on the track, but ten of the eleven steel cars in the train fell down a bank. Three passengers were killed and fourteen were injured. The cause of the derailment was not determined. The track where the derailment took place was relaid in December with new 90-pound rail on new zinc-treated ties fully ballasted, and rails fully spiked. Track was in good condition and where the cars ran off was straight, on a descending grade 26 feet per mile on a slight fill. An officer of the road writes that "the engines and cars were in first-class condition and, so far as could be determined, did not contribute to the accident. The fact remains, however, that the rails were forced out of position by some unknown cause at or prior to time this train arrived."

The derailment reported at Bradenville, Pa., on the 30th occurred on a short branch of the Pennsylvania Railroad. The train consisted of a snowplow and flanger, two locomotives and a caboosse. One engine was overturned in a drift and two members of a gang of shovelers on the tracks were killed. Three others were injured.

ELECTRIC CAR ACCIDENTS.—Serious accidents to trolley cars were reported in January from Eliot, Me., Thompsonville, Conn., and Louisville, Ky. Of the three, the last-named was the only one attended by fatal results. In this, a rear collision on a bridge, on the 14th, three persons were killed and 20 or more injured. The accident occurred in a blinding snowstorm, a very unusual occurrence in that latitude.

CANADA.—Of the four notable train accidents reported in Canadian newspapers in January one only was fatal. This was a rear collision on the Canadian Pacific at Dorval, near Montreal, on the 4th. The leading train, just entering a side track, was loaded with soldiers, seven of whom were killed and 20 or more injured.

IMPORTS INTO BOMBAY, INDIA, of railway supplies and equipment were valued at \$7,861,433 in 1915 and \$2,961,085 in 1916.

Four Improved Types of Electric Locomotives

Recent Developments Which Have Been Brought About
By Demands of Traffic and Profile

RECENT ELECTRIC LOCOMOTIVES were described and illustrated at the fourteenth annual electrical meeting of the New York Railroad Club, March 14, 1918. The New York, New Haven & Hartford's new 180-ton passenger locomotive was described by E. R. Hill, of Gibbs & Hill, consulting engineers. The Chicago, Milwaukee & St.

Paul company were described by A. H. Armstrong of the latter company. E. B. Katté, chief engineer of electric traction, New York Central, described the new electric passenger locomotives for that road. The meeting was of particular interest because the papers read showed how the manufacturers were meeting the conditions imposed upon them by the demands of traffic, profile and limits of load on bridges in different parts of the country.

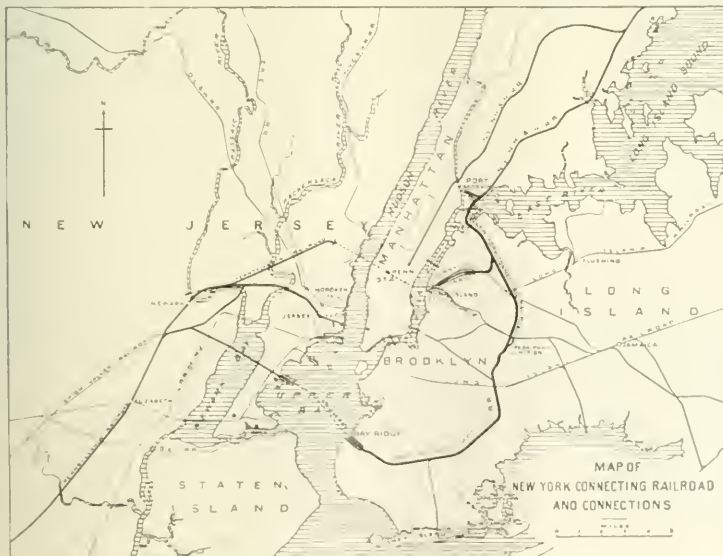

Fig. 1—Map of New York Connecting Railroad

Paul's new quill geared locomotives under construction by the Westinghouse Electric & Manufacturing Company were described by F. H. Shepard of the latter company. The new Chicago, Milwaukee & St. Paul bi-polar passenger locomotives under construction by the General Electric Com-

pany were described by A. H. Armstrong of the latter company. E. B. Katté, chief engineer of electric traction, New York Central, described the new electric passenger locomotives for that road.

The meeting was of particular interest because the papers read showed how the manufacturers were meeting the conditions imposed upon them by the demands of traffic, profile and limits of load on bridges in different parts of the country.

180-Ton Locomotive for the New Haven

The following information is taken from Mr. Hill's paper. The new electric locomotives for the New York, New Haven & Hartford are of the Baldwin-Westinghouse type designed to operate on the New York Connecting Railroad (Fig. 1). The profile of this is shown in Fig. 2. The Hell Gate bridge, erected at a cost of \$4,000,000, is shown in the illustration at the top of the page. The total cost of line, including the Bay Ridge improvement of the Long Island Railroad, was \$40,000,000.

Express trains operated between the Grand Central station and New Haven average 11 steel cars and weigh about 770 tons. Maximum trains of this character are of 12 steel Pullman cars and weigh from 850 to 900 tons. To handle these over the New York Connecting it was found necessary to provide heavier locomotives than are

now in use on the New Haven, or double head the present locomotives, as is frequently done on the heavier trains.

Another condition limiting the New Haven operation is the restriction imposed by the New York Central as to total weight and axle loading of locomotives using the draw-

bridges and viaducts on their lines into the Grand Central station. The New York Central's conditions limit loads on four driving axle locomotives to 47,500 lb. per axle and of locomotives with six driving axles to 41,000 lb. per axle. There are limitations also as to total weight of locomotives and the extent to which double heading is permitted.

The new 180-ton locomotives now on order represent the

PROFILE OF NEW YORK CONNECTING RAILROAD AND CONNECTIONS

Fig. 2. Profile of New York Connecting Railroad and Connections

maximum in weight and capacity of the A. C. D. C. type that will not exceed the New York Central's structural limitations. This, however, does not quite meet the maximum desired performance for through express trains on the New York Connecting Railroad grades. The new locomotives will handle 12-car trains on the Pennsylvania direct current terminal grade and eastbound on the New York Connecting Railroad 0.2 per cent grade, but will only handle 11-car trains on the westbound 1.2 per cent New York Connecting

Fig. 3. Old and New Types of New Haven Locomotives

Railroad grade. This latter grade is two miles long and it is proposed to employ electric pushers for assisting westbound trains of over 11 cars up the grade; an alternative to this is to double head the engine with one of the old gearless types of locomotives.

Prior to this the latest and largest type of locomotives on the New Haven road was the 2-4-4-2 locomotives of the 073 075 series shown at the top of Fig. 3, having four driving axles and two pony axles in two trucks, each driving axle being equipped with a pair of single reduction geared motors with quill drive. The new locomotive shown on the

lower part of Fig. 3 is a duplicate of the present type of locomotive in all essential respects, the main differences being that there are three pairs of drivers on each truck instead of two, and pony axles are used at both ends of each truck instead of at the outer ends only. In all principal respects the details of the locomotives are identical with the 34 freight and heavy passenger straight single phase locomotives built in 1911 for use in freight service. The principal data regarding the three types of passenger locomotives of the road are given in Tables 1 and 2.

The motors are connected in groups of three permanently

TABLE I

| Principal Design Data— | New 180-ton | Present 120-ton | Present 109-ton |

in series and the speed characteristics are substantially the same as those of the original gearless locomotives; the control is to be arranged for multiple unit doubleheading of these two types. They are geared for a higher speed than the present geared type locomotives and cannot be operated in multiple unit with them.

The motors are grouped in pairs and connected by means of bearings and single reduction gearing to a quill which surrounds the axle with ample radial and end clearance to prevent it coming in contact with the axle when in normal running condition. The motors, gearing and quill, are sup-

ported from the truck frame independent of the axle and wheels, the motors being directly above the center line of the axle. With this arrangement the weight of the motors, gearing and quill, is carried on springs and the only dead weight coming directly on the track is that of the driving wheels and axle. The center of gravity is high and good riding qualities and tracking conditions are secured.

The only connection between the motors and the driving wheels is through a group of six helical springs in each driving wheel, center connected at one end to the spokes of the wheel and at the other end to the disk at the end of the

quill. This arrangement is in use on all of the geared passenger, freight and switching locomotives of the New Haven and has given excellent satisfaction. The motors are also identical with those used on certain of the passenger, and on all of the geared freight locomotives, the total of such motors being over 400. By adopting this same type of motor, suspension and drive duplication and uniformity of parts is secured and savings in shop maintenance and operation is thereby effected.

The truck center pin is located between the first and second driving axles, thus making the truck unsymmetrical fore and aft of the center pin; this will tend to prevent oscillation or nosing of the trucks.

The drawbar pull between trucks is transmitted through a radial bar coupling and not through the cab. The weight of the cab is borne on each truck by six spring mounted pads. The truck frames are of the integral cast steel type, the entire frame and crossies being cast in one piece. The saving in weight by the use of this type of truck frame is estimated to be 3,200 lb. per locomotive. This feature is important not only because it is desirable to minimize the dead weight of the locomotives in general, but also because of the weight limitations of the bridge structures over which these engines are to operate and the guarantee which the manufacturers were required to give was that the total weight should not exceed 181 tons.

The motors and transformers are ventilated by two motor-driven blowers mounted in the cab. For train heating purposes the locomotives will be equipped with flash type, kerosene fired boilers capable of evaporating 4,200 lb. of water per hour. Tanks having a capacity for 1,440 gal. of water and 370 gal. of oil will be provided as part of the heating equipment of each locomotive.

These locomotives illustrate in a general way the adaptability of electric traction in meeting the constantly increasing requirements of railroad service. In this case, without modifying the general type or any of the mechanical or electrical details and without exceeding existing weight limitations on bridge structures, a locomotive 50 per cent larger than the present has been produced simply by the addition of a driving axle and a pair of motors to each truck with adaptation of mechanical and electrical details for the mounting and control of the additional parts.

Baldwin-Westinghouse Passenger Locomotive for St. Paul

The map, Fig. 4, shows the electrified section of the Chicago, Milwaukee & St. Paul. The profile for this section of

118 tons, and the heating equipment, including water, 27 tons.

The locomotive consists of two running gears, with the Pacific type wheel arrangement, coupled back to back, supporting a single cab, with the control auxiliaries and heating apparatus. The drive wheels are 68 in. in diameter, the driving wheel base is 16 ft. 9 in., the wheel base for

Fig. 4. Map of Electrified Sections of the Chicago Milwaukee & St. Paul

each truck is 36 ft. 2 in., the total wheel base is 79 ft. and the total length of the locomotive between knuckles is 88 ft. 7 in. A large portion of the cab is occupied by the heating equipment, which includes boiler, water and oil tanks. The rheostats are placed near the top of the cab close to the controlling switches, the locomotive may be operated from either end and each end has its complement of meters, air brake valve, master control, sanders, etc. The controller has nine running positions corresponding to one-third, two-

Fig. 5. Profile of Electrified Sections of the Chicago, Milwaukee & St. Paul

thirds and full speed positions, with two speed control positions on each. This gives economical operation over a wide range of speed. Regeneration from maximum speed down to a minimum of about 10 miles per hour is provided for the purpose of holding the train on down grade or for making slow-downs.

The continuous capacity of the locomotives is 2,000 horse-

Fig. 6 Baldwin-Westinghouse Electric Locomotive for the Chicago, Milwaukee & St. Paul

line is shown in Fig. 5. The following information is taken from the paper read by Mr. Shepard.

This new locomotive, Fig. 6, ten of which are now under construction, was designed for passenger service. The weight of the locomotive complete is 260 tons, of which the electrical equipment weighs 121 tons, the mechanical parts

power, corresponding to a tractive effort of 44,000 lb. at 24.5 miles an hour. The maximum starting tractive effort will be 110,000 lb.

The motor equipment consists of six twin motors with quill drives, two of which are mounted above each driving axle. Each armature carries a single pony and the two

for variable speeds is made by shunting the motor fields in all combinations of motors, but it is probable that the greatest value of the field shunt will be obtained with the full-speed connection of three motors in series. The speed possibilities of this locomotive are shown in Table 4.

It is especially desirable that a passenger locomotive have sufficient weight on the drivers and reserve motive power to haul additional train weight on occasion, and in this respect the gearless locomotives under construction present attractive possibilities. The manufacturer's guarantees cover the operation of a 12-car train weighing 960 tons against an adverse 2 per cent grade at a speed of 25 miles per hour. Under these conditions there is a demand for 55,200 lb. tractive effort at the rim of the driver, equivalent to 12 per cent co-

efficient of adhesion to the weight upon the driver. There is, therefore, ample margin both in weight upon drivers and capacity of the motors to haul not only 12 cars, but on occasion 13 or 14 cars with practically no sacrifice in schedule speed and without overloading the motors or exceeding known and conservative practice as regards loading of driving wheels. For example, the gearless locomotive now being built will permit the starting of a 12-car train on a two per

TABLE IV

cent grade with a coefficient of adhesion of only 20 per cent, and accelerate the train at 0.3 miles per hour per second.

While the manufacturing guarantees are limited to 42,000 lb. tractive effort as a continuous output of this locomotive, the preliminary tests upon a sample motor indicate that this rating is conservative and that the final test upon a completed locomotive may show values materially higher than the guarantees made. This fact is of the greatest importance and holds out wide visions of radical changes in the operation of transcontinental trains, both passenger and freight. The total weight upon drivers of 455,000 lb. is practically the same as the driver weight of the present freight locomotives now in operation on the St. Paul. If, therefore, the completed locomotive meets the expectations of the builders it offers a possibility of using the same locomotives interchangeably for both passenger and freight service.

The control of the gearless locomotives will in many respects be a duplicate of that now in operation on the geared locomotives previously installed. Provision will be made for regenerative electric braking on down grades. The geared locomotives now running utilize a motor generator set for the purpose of motor field excitation while regenerating. Careful experiments made during the past two years have demonstrated that motor generator field excitation is not essential, and taking advantage of the advance of the art, the control for the new gearless locomotives will dispense with this fea-

ture. This simplification of the control and reduction in weight and cost constitutes a marked improvement.

The original installation of the St. Paul was undertaken with a single type of road locomotive for both passenger and freight service, differing only in the ratio of the gearing between the motors and drivers. The locomotives were therefore interchangeable, except as to gears, with consequent simplifications of shop repair practice. The geared locomotives operate at a high efficiency in heavy freight service where pushers are used on up grades, but accumulated gear losses result in a low all-day efficiency of the geared locomotive in passenger service, when the profile is broken and contains long stretches of practically level track. On the other hand, the gearless motor operates at high efficiency when on level tracks or on lesser grades and it is this class of service that constitutes the bulk of the all-day duty of a passenger locomotive. The average operating speed of about 50 miles an hour shows a gain of 10 per cent in efficiency of the gear-

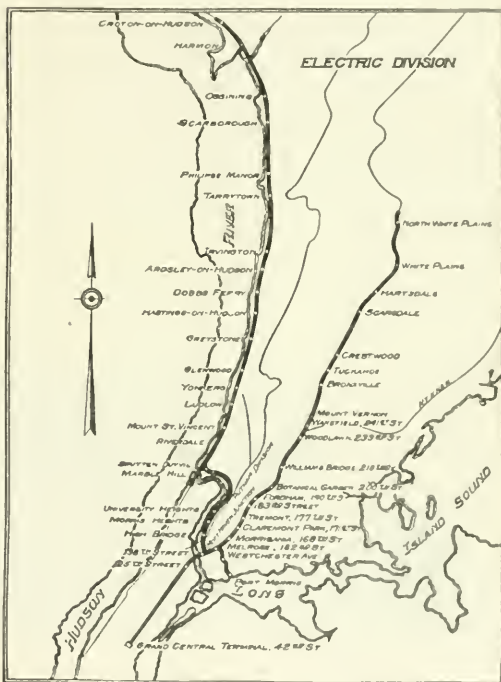

Fig. 8. Map of New York Central's Electrified Sections

less locomotive as compared with the geared type and in fact throughout the entire range of speed from 50 miles up the gearless locomotive will operate at over 90 per cent efficiency, as compared with the drooping characteristics of the geared locomotive.

The exclusion of mechanical parts, such as gears, quills, jack-shafts, side rods, etc., utilized to transmit the power from the motors to the drivers with some forms of locomotive construction, not only results in a marked improvement in the all-day efficiency of the locomotive, but is followed by an equally attractive increase in reliability and a marked reduction in maintenance expense. It is felt, therefore, that the introduction of the gearless locomotive upon the St. Paul marks a distinct advance in electric railroading and that this sort of construction, now for the first time made possible for

mountain service will result in a marked improvement in the method of handling both passenger and freight trains on this most difficult class of railroad service.

Gearless Locomotive for New York Central

The section of road on which the new locomotives for the New York Central will operate is shown in Fig. 8. This section of track follows the Hudson river for the greater part of the distance from Harmon to the Grand Central Terminal and no steep grade has to be contended with. One of the new locomotives designed for service on this road is shown in Fig. 9. In describing the locomotive, Mr. Katte stated:

"During the past year we have received on the New York Central nine new passenger locomotives known as class T-2B. The tenth locomotive will be delivered next month. These locomotives are very similar to the earlier class T locomotives, in fact, when we asked the operating department if it desired to suggest any changes its representative held up his hands and exclaimed, 'For goodness sake, don't make any changes, you will spoil them.' As a matter of fact, there were 30 or 40 minor modifications and improvements made.

"These locomotives are driven by eight motors of the bipolar type, one on each axle. The total weight of the locomotive is 134 tons and the drawbar pull at 25 per cent adhesion is 66,000 lbs. The load is about equally divided on all wheels. The motors are known as G. E.-91-A and have a one hour blown rating of 325 hp., or a total of 2,600 hp. for the locomotive. The capacity of the locomotive is the hauling of a 1,200-ton train at 60 miles per hour. The maximum speed of the locomotive with lighter trains is 75 miles per hour.

"As a typical example of regular service a class T locomotive hauls train No. 71, weighing 1,035 tons, between the

All-Metal Steam Heat Connection

WITH A VIEW TO PROVIDING a connection for the steam lines for passenger cars that would reduce the trouble and expense incident to the use of rubber hose, the Barco Manufacturing Company, Chicago, has developed a connection in which no rubber is used. This

Passenger Car Equipped with Barco Steam Heat Connection

device has recently been placed upon the market after it had been in use for four years.

The Barco car steam heat connection is made up of two Barco joints of a special type and two sections of extra heavy steel pipe. Any standard steam-heat coupler head can be used on it. A locking clamp secures the upper flexible joint to the train line end valve, making it impossible for the con-

Fig. 9. Latest Type of New York Central Electric Locomotive

Grand Central Terminal and Harmon, a distance of 32 miles, making one stop, in 54 minutes running time. The average maximum speed is 57 miles per hour, and the current consumption has been shown to be equivalent to 21.9 watt hours per ton mile.

"The cost of inspecting, maintaining and repairing our electric locomotives has averaged 3½ cents per mile during the past year. The locomotives are inspected after traversing an average of 5,000 miles, which is equivalent to 33 days, between inspections. As a measure of reliability I can say that class T locomotives average 32,000 miles per locomotive detention."

THE CANAL CONTROL COMMITTEE OF ENGLAND has issued a handbook on canals, giving information relating to the controlled canals, lists of the towns served by them and names and addresses of public carriers.

nection to fall to the track. If desired lagging can be applied to the connection, but in most of the installations this has not been done. It is desirable to have a flexible bracket at the end of the train line of a type similar to that shown in the illustration.

No special tools are required to apply or remove these connectors. They will couple to cars equipped with rubber hose as well as to those having the Barco connection. The joints are more flexible than rubber hose, which makes them easier to couple. They will stand the full boiler pressure of the locomotive without leaking or bursting. The steel pipe gives a larger opening for the passage of the steam than rubber hose and eliminates the trouble due to the rubber lining becoming loose and stopping the pipe or catching in the valves. The all-metal connections remain serviceable for a long time and they also do away with frequent renewals.

The New Zone System of Coal Distribution

Railroad and Fuel Administrations Have Worked Out a Plan for Avoiding Cross Hauling of Coal

THE UNITED STATES FUEL ADMINISTRATION in co-operation with the Director General of Railroads announces a zone system to govern the distribution of bituminous coal during the coal year beginning April 1, 1918.

Heretofore coal has been distributed practically without regard to the distance between the mine and the consumer. Under the zone system coal will be distributed to consuming territory under restrictions that will avoid as far as possible waste of transportation facilities, but nevertheless consistent with the maintenance of the greatest possible production and a proper coal supply to all coal users. Every effort has been made, however, to preserve long established trade relations.

A statement describing the system issued by the Fuel Administrator says:

"In view of the necessities and of the serious danger of coal shortage the United States Fuel Administration and the United States Railroad Administration have devoted several months to the study of what can be done to remove the causes which have hampered the enlargement of coal production. It has been found that a factor which has largely diminished the number of cars available for loading in the mines and the number of locomotives available to haul coal is that in a substantial sense the country has been engaged in 'carrying coals to Newcastle'; cars and locomotives have been occupied for many unnecessary days in hauling coal hundreds of unnecessary miles in order to deliver it at places much more accessible to other coal fields, whence coal could be obtained with far less tax upon the transportation energies of the country.

"The Fuel and Railroad Administrations have therefore been confronted with the responsibility of deciding whether they shall knowingly be parties to this waste of transportation, which, if not so wasted, could be used so as to make practicable the production of more coal sorely needed to carry on the war. It is clear that in the interest of the nation there should be a different policy for the future. The coal zoning plan is the result of this decision.

"After prolonged conferences with coal producers, jobbers and consumers, and with the traffic and operating officials of the railroads, zones have been established so that coal supply shall be normally derived from mines relatively near, thus preventing these abnormal and wasteful transportation movements, insuring more equal distribution of cars to the mines and more steady employment of mine labor.

"The patriotic co-operation of the many interests and individuals who may be affected by this cutting out of unnecessary transportation is confidently hoped for. When a consumer finds that he no longer has the opportunity to get his coal from a distant mine according to his custom, it is hoped that he will realize that his using another sort of coal is an essential part of the scheme of conservation in the interest of the national defense. When a coal producer finds that he no longer has a market to which in the past, regardless of the unnecessarily long haul, he has sent his coal, it is hoped he too will realize that the resulting adjustment of his business is in the national interest; that there will be more cars and locomotives and transportation energy to transport more coal from his mines to the markets he can reach within his zone; that his business in consequence should be increased rather than diminished.

"The situation with which the Fuel and Railroad Administrations have thus had to grapple is one of infinite complexity, and no first effort to remove the waste can be perfect, or can fully meet all the constantly changing conditions. Real-

izing these limitations, the plan as established provides for elasticity through a system of special permits issued by the Fuel Administration when and as necessary.

Effect of Zone System

The general effect of the zone system is to restrict eastern coal to eastern markets and fill the vacancy in the central and western states with nearby coal produced in those states.

In addition to the saving in transportation the system will provide for the possible retention of something like 5-6,000,000 tons of coal for the eastern states which heretofore has gone west all-rail. This tonnage can be readily utilized in the east. As an indication of the saving to be effected by the system, it will eliminate the movement of more than 2,000,000 tons of Pocahontas coal to Chicago and other western points over a haul of about 660 miles. Chicago can obtain this tonnage of coal, and under this system must obtain it, from southern Illinois mines with an average haul of 112 miles. Allowing for the differences in quality in the two coals, it is estimated that there will be thus saved 11,400,000 car miles or, very conservatively figured, 285,000 car days. This will permit 14 additional round trips of 20 days each from West Virginia mines to zone destinations, permitting an additional production of at least 700,000 tons of Pocahontas coal.

Similar comparisons show that on the movement of 550,000 tons annually from Kanawha districts to Wisconsin points there can be saved about 2,500,000 car miles with a consequent increased production of some 300,000 tons. On the movement from southeastern Kentucky to Chicago the saving will be about 800,000 car miles and 50,000 tons production. The elimination of the Indiana to Iowa movement will save 1,600,000 car miles and permit 100,000 tons additional production. These are only a few of the instances of transportation saving to be effected by the system.

The bituminous coal, the movement of which is regulated by the zone system, is about 300,000,000 tons, or 60 per cent of the total production. Based on this production, there will be saved on the round trip from and to the mines almost 160,000,000 car miles. This will permit the same cars to make almost 500,000 additional trips from the mines, equivalent to an increase of 5 per cent in the production. The increase in total production in 1917 over 1916 resulting from all efforts was about 8 per cent.

A large part of the coal which the system will prevent from moving west out of the eastern producing districts will be available for use in New England insofar as it can be transported there. Production in the district supplying New England via all rail routes can be increased somewhat—but there is difficulty in moving by all-rail routes the amount of coal needed and the capacity of the rail gateways to New England has been nearly reached. Improvements now being made will increase the capacity of the Poughkeepsie bridge route, but it is said to be impossible to escape the conclusion that provision must be made for a much larger movement by water in 1918 than in 1917 or New England and its people and industries will suffer.

This situation will be made the subject of a separate study by a committee representing the Shipping Board, the Railroad Administration, the Fuel Administration, coal operators in the territory involved, the railroads involved in the movement of this coal and consumers in the territory affected.

The restrictions imposed upon the movement of coal by

the zone system will make necessary some readjustment in fuel practices in various communities affected by these restrictions.

Special Permits

Under regulations of the fuel administrator, coal of particular quality or characteristics for a special purpose, such as by-products, gas, blacksmith and metallurgical coal, will be permitted to move by permit beyond the limits imposed by the zone system.

The zone system affects all bituminous coal except:

Coal for railroad fuel for which special arrangements will be made by the Fuel Administrator and the Director General of Railroads.

Coal for movement on inland waterways which is in no way restricted by the system.

Coal delivered to Canada which is subject to regulations of the Fuel Administrator.

Heretofore, many of the mines in many of the producing districts throughout the country have been unable to keep up their production in the summer months because of the decreased demand for their product. Under the zone system these producing districts have been allotted consuming territory which will demand a large increase in production. Thus, coal which has long been available, but not used, will be added to the aggregate supply for the country as a whole. The early buying of next winter's supply of coal by consumers throughout the country is considered imperative by both the Fuel Administrator and the Director General of Railroads.

Ample production capacity has been assigned to each of the consuming zones outlined in the system, but these producing fields must be kept working as nearly as possible at their maximum capacity if the system is to be a success.

The method of enforcement of the zoning system is that the Fuel Administration will prohibit distribution beyond the limits of the zone and the Railroad Administration will supplement these prohibitions by railroad embargoes. When permits shall be issued by the Fuel Administration to admit of distribution beyond the zone limits, such permits will operate as exemptions from the embargoes, and the embargoes will so provide.

The zone system was worked out by a joint committee appointed by the railroad and fuel administration in January, consisting of Howard Elliott, of the New York, New Haven & Hartford; A. G. Gutheim, assistant manager of the car service section of the Railroad Administration; G. N. Snider, traffic manager of the Fuel Administration; S. A. Taylor, a mining engineer, and C. E. Leshner, of the Bureau of Mines.

Such a plant was repeatedly recommended by the Railroads' War Board last year for the purpose of eliminating cross-hauling and on December 19 it recommended to the Fuel Administration a carefully worked out plan prepared under its direction by F. S. Peabody, chairman of the committee on Coal Production of the Council of National Defense.

Limitations Imposed by Zone System

The zone system will impose the following limitations upon the movement of bituminous coal.

All producing districts in Missouri, Arkansas, Kansas, Oklahoma and Iowa will be restricted in their shipments of coal to the following markets:

The states of Nebraska, Kansas, Oklahoma, Missouri and Arkansas, that portion of the state of Iowa on and west of a line via the C. R. I. & P. from Glenville, Minnesota to Mason City, Iowa, thence via the C. M. & St. P. to Nora Junction, thence via the C. R. I. & P. through Waterloo to Cedar Rapids, thence via the C. M. & St. P. to Ottumwa, thence via the C. R. I. & P. to Keokuk; that portion of the state of Texas east of the Pecos river; that portion of the

state of Louisiana on and west of the Mississippi river (both sides).

Lake Michigan and Lake Superior coal docks will be restricted in their shipments of coal to the following markets:

The states of North Dakota, South Dakota and Minnesota; that portion of the states of Iowa and Wisconsin on and north of a line from Milwaukee, Wis., via the C. M. & St. P. through Milton Junction to Madison, Wis.; thence via the C. & N. W. to Woodman, Wis.; thence via the C. M. & St. P. through McGregor, Mason City and Rock Valley, Iowa, to Sioux City, Iowa; and the upper peninsula of Michigan.

All producing districts in Illinois are restricted in their markets to the following:

From April 1 to September 30 to the states of:

Wisconsin, Minnesota and South Dakota.—On and south and east of a line via the G. B. & W. from Kewaunee, Wis., to Amherst Junction; thence via the M. St. P. & S. S. M. through Abbottsford and Chippewa Falls to Minneapolis, Minn.; thence via the C. M. & St. P. through Benton Junction, Ortonville and Aberdeen, S. D., to the Missouri river; thence by said river to Sioux City, Iowa.

Iowa and Missouri.—On and east of a line from Sioux City via the C. M. & St. P. through Manilla and Adell to Des Moines; thence via the C. B. & Q. to Albia; thence via the Wabash to Moravia; thence via the C. M. & St. P. to Chillicothe, Mo.; thence via the Wabash to Moberly; thence via the M. K. & T. to North Jefferson City; thence via the western boundary of Cole, Miller and Pulaski counties, Mo.; to the St. L. S. F.; thence via the St. L. S. F. through Neosho to the Missouri-Oklahoma state line.

Arkansas.—On and north of a line via the C. R. I. & P. from Memphis, Tenn., through Little Rock and Mansfield, Ark.; also, points on the St. L. I. M. & S. and St. L. S. W. south of said line of the C. R. I. & P.

Louisiana.—Points on the St. L. I. M. & S. and St. L. S. W.

Tennessee and Kentucky.—On and west of a line via the I. C. from Memphis, Tenn., through Fulton and Clinton, Ky., to Cairo, Ill.

Illinois.

Indiana and Michigan.—On and west of a line via the C. & E. I. from Evansville, Ind., through Otter Creek Junction and Brazil to Wheatfield; thence via the New York Central to South Bend; thence via the M. C. to Niles, Mich., thence via the Cleveland, Cincinnati, Chicago & St. Louis, to Benton Harbor.

All producing districts in Illinois are restricted in their shipments of coal to the following markets, from October 1 to March 31—

States of:

Wisconsin.—On and south of a line via the C. M. & St. P. from Milwaukee, Wis., through Watertown, Madison and Woodman to Prairie du Chien.

That Part of Iowa and Missouri.—on and south of the C. M. & St. P. (I. & D. Div.) from North McGregor to Sioux City and on and east of a line from Sioux City via the C. M. & St. P. through Manilla and Adell to Des Moines; thence via the C. B. & Q. to Albia; thence via the Wabash to Moravia; thence via the C. M. & St. P. to Chillicothe, Mo.; thence via the Wabash to Moberly; thence via the M. K. & T. to North Jefferson City; thence via the western boundary of Cole, Miller and Pulaski counties, Mo.; to the St. L. S.; thence via the St. L. S. F. through Neosho to the Missouri-Oklahoma state line.

Arkansas.—On and north of a line via the C. R. I. & P. from Memphis, Tenn., through Little Rock and Mansfield, Ark.; also, points on the St. L. I. M. & S. and St. L. S. W. south of said line of the C. R. I. & P.

Louisiana.—Points on the St. L. I. M. & S. and St. L. S. W.

Tennessee and Kentucky.—On and west of a line via the

J. C. from Memphis, Tenn., through Fulton and Clinton, Ky., to Cairo, Ill.

Illinois.

Indiana and Michigan.—On and west of a line via the C. & E. I. from Evansville, Ind., through Otter Creek Junction and Brazil to Wheatfield; thence via the New York Central Lines to South Bend; thence via the M. C. to Niles, Mich.; thence via the C. C. & St. L. to Benton Harbor.

All producing districts in Indiana will be restricted in their shipments of coal to the following markets:

Those portions of the states of Illinois, Kentucky, Wisconsin and Michigan on and within the following boundary lines:

On the East.—From Joppa, Ill., via the Ohio river (both banks) to Madison, Ind.; thence via the P. C. C. & St. L. to North Vernon; thence via the C. C. C. & St. L. to Rushville; thence via the P. C. C. & St. L. through Richmond to Indiana-Ohio State line, thence north to Michigan State line; thence via the N. V. C. through Jackson, Mich., to Lansing; thence via the P. M. to Howard City; thence via the G. R. & I. to Mackinaw City, Mich.

On the West.—From Joppa, via the C. & E. I. to Arthur; thence via the Vandalia to Peoria; thence via the C. & N. W. through Nelson, Sycamore and Belvidere, Ill., to Beloit, Wis.; thence via the C. M. & St. P. through Elkhorn and Waukesha to Milwaukee, Wis.

Producing districts in western Kentucky on the Illinois Central, Louisville & Nashville and L. H. & St. L. railways will be restricted in their shipments of coal to the following markets: States of—

Kentucky and Tennessee.—On and west of a line via the L. & N. from Louisville, Ky., through Bowling Green, Ky., Nashville, Tenn. (including branches to Glasgow, Ky., Scottsville, Ky., and Hartsville, Tenn.); Columbia and Baugh, Tenn., to the Tennessee-Alabama state line.

Mississippi.

Arkansas.—On and south of the line of the C. R. I. & P. from Memphis, Tenn., through Little Rock and Mansfield, Arkansas.

Louisiana.

Texas.—On and east of the line of the H. E. & W. T. from Logansport, La., to Houston; thence via the G. H. & H. to Galveston.

Illinois and Wisconsin.—On and east and south of a line via the I. C. from Cairo, Ill., through Centralia, Clinton and Freeport to Madison, Wis.; thence via the C. M. & St. P. through Watertown to Milwaukee, Wis.

Indiana.—On and west of a line via the C. & E. I. from Evansville, through Otter Creek Junction and Brazil to Wheatfield; thence via the N. Y. C. to South Bend; thence via the M. C. to Indiana-Michigan state line.

The producing districts in Virginia on the L. & N., all producing districts in eastern Kentucky on the L. & N. and the C. N. O. & T. P. and short line connections, Tennessee mines on the Cumberland Valley division of the L. & N. and on the Middleborough R. R. are restricted in their shipments of coal to the following markets: States of—

Kentucky.—On and east of a line via the L. & N. from Louisville to Lebanon Junction and east of the main line and branches to Glasgow and Scottsville, Ky., of the L. & N. from Lebanon Junction through Bowling Green, Ky., to Nashville, Tenn.

Indiana and Ohio.—On and within the following boundaries:

On the West.—from Louisville via the C. I. & L. to Michigan City, Ind.

On the East.—from Cincinnati to Toledo, Ohio, via the C. C. C. & St. L. through Springfield, Bellefontaine and Berwick, Ohio.

Michigan.—Lower Peninsula

All producing districts in Tennessee, Georgia, Kentucky

mines on the L. & N. main line and branches connecting at and south of Corbin and on the C. N. O. & T. P. south of Somerset; all Black Mountain and Stonega districts in Lee, Wise and Western Russell counties of Virginia will be restricted in their shipments of coal to the following markets:

The states of North Carolina, South Carolina, Georgia, that portion of Tennessee on and east of a line via the L. & N. from Mitchellville to Collinswood through Nashville, Columbia and Iron City; that portion of Alabama north of the Tennessee river; that portion of Virginia on and south of the N. & W. from Norton through Roanoke and Petersburg to Norfolk, including branches connecting at Petersburg; that portion of Florida east of the Apalachicola river.

All producing districts in Alabama will be restricted in their shipments of coal to the following markets:

The states of Louisiana, Mississippi, Alabama, Georgia and Florida; that portion of the state of Texas on and east of a line via the H. E. & W. T. from Logansport, La., to Houston; thence via the G. H. & H. to Galveston; that portion of the state of Arkansas on and south of the line of the C. R. I. & P. from Memphis, Tenn., through Little Rock and Mansfield, Ark.; that portion of the state of Tennessee lying west of the Tennessee river and on and south of the line of the N. C. & St. L. from Memphis, through Jackson and Perryville.

All producing districts in Ohio will be restricted in their shipments of coal to the following markets:

Those portions of the states of Ohio, Indiana and Michigan on and within the following boundary lines:

On the East.—from Ironton, Ohio, via the Ohio river to East Liverpool; thence via the Y. & O. to Washingtonville; thence via the Erie through Niles to Cleveland.

On the South and West.—from Ironton, Ohio, via the Ohio River to Cincinnati, thence via the P. C. C. & St. L. through Hamilton, Ohio, to Richmond, Indiana; thence via the G. R. & I. to Mackinaw City, Mich.

In the West Virginia high volatile fields, mines on the Kanawha & Michigan and the Kanawha and West Virginia and on the C. & C. west of Dundon will be restricted in their shipments of coal to the following markets:

Those portions of the states of West Virginia, Ohio and Indiana on and within the following boundary lines:

On the East.—from Charleston, W. Va., via the K. & M., Z. & W. and T. & O. C. through Zanesville to Bucyrus; thence via the Pennsylvania Lines west to Sandusky, Ohio.

On the West.—from Charleston, W. Va., via the K. & M. to Athens, Ohio; thence via the B. & O. through Chillicothe and Washington Court House to Dayton; thence via the P. C. C. & St. L. to Richmond, Indiana; thence via the line of the G. R. & I. north.

Michigan.—Lower Peninsula.

In the high volatile fields of West Virginia and Kentucky, mines in West Virginia and Kentucky, in the Thacker-Kenova and Kanawha districts on the N. & W. and the C. & O. and Kentucky mines in the eastern Kentucky districts on the C. & O. and the S. V. & E. will be restricted in their shipments of coal to the following markets:

The lower peninsula of Michigan

Those portions of the states of Ohio and Indiana on and within the following boundary lines:

On the East.—from Kenova, W. Va., via the N. & W. to Sciotoville, Ohio; thence via the C. & O. Northern to Waverly; thence via the N. & W. to Columbus; thence via the H. V. to Marion; thence via the Pennsylvania Lines west to Sandusky, Ohio.

On the West.—from Cincinnati via the C. C. C. & St. L. to Indianapolis; thence via the C. I. & L. to Michigan City, Indiana.

Kentucky, West Virginia and Virginia.—Points on the main line of the C. & O. westbound to and including Cincinnati and eastbound on all lines of the C. & O. and N.

& W. to and including tidewater. From Big Sandy district of northeastern Kentucky on the C. & O. and Sandy Valley & Elkhorn coal may also move to Kentucky points on the line of the C. & O., Ashland to Louisville, Kentucky, inclusive.

In the low volatile fields of West Virginia, mines in the Pocahontas, Tug river and New river districts on the N. & W., the C. & O. and the Virginia and Clinch Valley districts in Tazewell and Eastern Russell counties along the N. & W., will be restricted in their shipments of coal to the following markets:

District of Columbia, North Carolina and Virginia, including tidewater terminals.

Kentucky and Ohio—Points on the direct lines of the C. & O. and N. & W., westbound to and including Cincinnati, Ohio and Columbus, Ohio.

West Virginia—Points on the direct lines of the C. & O., N. & W. and Virginian eastbound.

South Carolina—On and east and north of a line via the Southern from Charlotte, N. C., through Chester, S. C., to Columbia; thence via the S. A. L. to Denmark; thence via the Southern to Charleston.

Lake Erie Ports for lake transshipment only.

All mines in Northern West Virginia, Pennsylvania and Maryland on the B. & O., Western Maryland, and the Coal & Coke east of Dundon, as well as all of the mines north of these lines will be allowed to ship eastbound to all points in the states of West Virginia, Maryland, District of Columbia, Delaware, Pennsylvania, New Jersey, New York and the New England states reached by customary eastbound routes, including coal for transshipment to vessels at tidewater. They will not be allowed to ship westbound except to all Lake Erie ports for lake transshipment only, with the further exception that Pennsylvania producing districts will be allowed to ship as far west in Ohio as the line of the P. & W. V., and the W. & L. E. through Wellington to Lorain and the Pan Handle, West Virginia, producing district on and east of the line of the B. & O., C. L. & W. Branch. Bridgeport to Lorain, Ohio.

Electric Trucks in Station Service

TO REDUCE THE TIME required in handling baggage, mail and express matter at the Union Terminal, Dallas, Tex., three electric trucks developed by the Orenstein-Arthur Koppel Company, Koppel, Pa., have been installed. These are tractor trucks following the general lines of the standard trucks manufactured by this company, ex-

Handling Four Loaded Trucks with the Tractor

cept for several modifications designed to facilitate their application to this special service.

The Dallas Union Terminal station, which was described in the *Railway Age Gazette* of November 17, 1916, is of the through type, with 10 station and three stub tracks. The station building is located opposite the middle of the station tracks with the baggage room on the track level, while the express companies are provided with a building near one

end of the station tracks. The platforms are 15 ft. wide and extend about 750 ft. each way from the axis of the station. Trains entering the station are stopped with the forward ends near the ends of the platforms, so that mail and baggage cars are worked without interference with the passengers who have access to the platforms by means of an overhead passageway leading from the station building. The baggage, mail and express trucks are moved to and from the platforms over plank roadways crossing the tracks at the ends of the platforms. This arrangement involves a long haul which formerly required the efforts of two or more men for fully 10 minutes to bring a single baggage truck from the station to a train. It was the expense of this system and the frequent delays to trains resulting from it

Two-Seated Tractor Used at Dallas

that led to the introduction of the three electric tractors. One of these tractors now hauls four trucks over the same distance in about one third the time formerly required for one.

The trucks are equipped with batteries having sufficient storage capacity to operate for 18 hours. They are charged during a period of six hours when no trains are coming in. The busy periods extend for three hours in the early morning, and in the evening, but more or less work is done also during the 10 or 12 hours intervening. There is a seat on each end of the car and the direction of the tractor may be reversed by the operator changing his position from one seat to the other. Consequently it is not necessary to turn the truck on the platform.

The operator sitting on either of these seats controls the speed by an upright bar with a U-shaped handle at the top, and controls the steering by another similar handle. There are two pedals on the platform which can be used sitting in either direction. There is likewise an electric foot push brake in the center of the platform. The truck is steered by pushing the second handle forward or backward.

PROPOSED RAILWAY FOR BRITISH GULANA.—The British Guiana press publishes brief details of a scheme, as prepared by the Director of Public Works of that colony, for a railway extending from Huntley, on the Georgetown-Rosignol Railway, in a general southwesterly direction toward the interior. The line will be of meter gage. It is proposed to lay down a third rail from Georgetown, to Rosignol, thus providing the meter gage along the existing line while leaving its present standard gage undisturbed. This would enable trains from the hinterland to divide into two sections at Huntley, one going to Georgetown and the other to Rosignol, with a consequent saving of the transfer of freight and passengers and a considerable economy of time.

Paint Spraying System

THE AERON SYSTEM of applying paint in the form of a spray by means of compressed air, developed by the De Aeron Manufacturing Company, Toledo, Ohio, is used extensively in the industrial field and has wide possibilities in the railroad field. It is now used by some roads for painting equipment and buildings and is a great time

Fig. 1—Paint Spraying Nozzle

and labor saver. The system is so designed that it may be operated without materially wasting paint.

The nozzle is in the form of a pistol with the control trigger always under the operator's finger and within 4 in.

Fig. 2—A Difficult Painting Job Made Easy

els, lacquers and oil paints may be used with the Aeron system, which is easy to install and operate and does a uniformly high grade of work. It may be used to good advantage in the painting of car bodies, trucks, stencils, locomotives, car interiors and exteriors.

Among the advantages of paint spraying as compared with the old hand brush method, may be mentioned the following: Greater speed, less paint used, less wasted, rough and inaccessible surfaces covered more uniformly and the possibility of cleaner and better working conditions. A portable painting equipment has been developed which consists of a suitable air compressor, belt driven from a small gasoline engine and mounted on a portable truck. A paint tank and regulating head, together with an air receiver are also mounted on the truck. Suitable hoses and connections are provided for use with the nozzle. Where compressed air is available the air compressor and gas engine are unnecessary.

The really vital part of the Aeron equipment is the nozzle, which is shown in Fig. 1 with the connections and attachments plainly indicated. The flow of air and paint is under

Fig. 3—Paint Sprayer Used for Stenciling

the instantaneous control of the operator by means of the trigger and the universal spray head produces a flat spray which may be adjusted horizontally or vertically, or for wide or narrow surfaces. Wide surfaces may be covered with rapidity and uniformity.

In operation, the paint tank regulating head inlet is connected by 1/2-in. air hose to the compressor air system. One or more nozzles are then connected by 3/8 in. air hose and 1/2-in. fluid hose to the regulating head outlet. The paint is put into the tank through a filler plug hole. With the regulator shown in Fig. 2 and the fluid adjusting nut on the nozzle, the air pressure is controlled to meet varying conditions of size of nozzle, viscosity of paint, height of nozzle above tank, etc. Special extension nozzles are provided for use in unusually difficult places.

Painting car trucks is a slow, troublesome job by the old paint brush method and Fig. 2 shows how the work may be done by use of the Aeron system. Fig. 3 illustrates the stenciling of a car body. The system is flexible and may be easily adapted to the varying conditions that have to be met in railway practice.

of the spray head. This allows the paint to be applied exactly where it is needed and reduces to a minimum any loss in paint. An adjustable nozzle is provided which governs the width of the spray. All kinds of varnishes, enam-

General News Department

The coaling plant of the Chesapeake & Ohio, at Maysville, Ky., was destroyed by fire on March 17, together with a large quantity of coal. Estimated loss over \$55,000.

The Philadelphia Bourse has adopted resolutions asking congress to act promptly on the bill now before it, Senate Bill No. 3530, calling for discontinuance of the valuation of the railroads of the country.

At Glasgow, Ky., March 14, a fire, of unknown origin, destroyed the freight house of the Louisville & Nashville, together with other buildings and seven loaded freight cars; estimated total loss \$300,000.

Two important new subways in New York city, in Lexington avenue northward from the Grand Central Terminal, and in Seventh avenue, past the Pennsylvania station, now substantially completed, are likely to lie unused until about July 1, because of difficulty in getting materials for the electrical equipment of the power houses.

The regional and central purchasing committees of the railroad administration held a conference in Washington Wednesday for a general discussion. The committees on standardization of cars and locomotives have practically completed their specifications for Director General McAdoo's approval. The regional directors went over the plans Monday and Tuesday.

The New England Railroad Club, at its annual meeting in Boston, March 12, elected F. A. Ryer, purchasing agent of the Boston & Albany, as president of the club for the ensuing year. W. J. Backes, engineer of maintenance of way of the New York, New Haven & Hartford, was chosen vice-president.

The right of the Texas Railroad Commission to prescribe freight rates is to be tested in court, the Missouri, Kansas & Texas, and other roads, having entered a suit at Austin on March 15, asking for an injunction against the commission on the ground that, while the railroads are under the control of the federal government, the state commission has no rate-making authority.

In a fire in the Southern Pacific terminal at Lordsburg, N. M., on the 14th of March, a roundhouse, six locomotives, a number of freight cars and a large amount of stores, including fuel oil, were destroyed, the total loss being estimated at several hundred thousand dollars. The fire spread to and destroyed a number of dwellings in that part of the town occupied by Mexicans.

The proposed tunnel for automobiles beneath the Hudson river, between Jersey City, N. J., and New York city, is now definitely recommended by the New York State Bridge and Tunnel Commission, which has sent a report to the governor saying that the work of construction ought to be begun at once. This recommendation is based on the original designs of Jacobs & Davies, prepared in 1913, with certain modifications made recently, at the request of the commission, by Gen. George W. Goethals. The cost is estimated at \$12,000,000 and the time of construction three years.

A garden at every section-house is one of the food-producing measures which the Southern Pacific hopes to put into effect this season. Agents, section foremen and trackmen, from Portland to El Paso and San Francisco to Ogden, are being instructed to convert to vegetable gardens all suitable ground available. In addition, the company is endeavoring to lease all cultivable land which it owns (not used by employees) and a good deal of the right-of-way land adapted to truck gardening or agriculture, is being leased. Vegetable gardens were made last year by hundreds of employees with great success.

Congestion of freight at the north Atlantic ports continues about the same as it has been for the past three weeks. Great progress has been made, since the advent of mild weather, in

moving delayed shipments, but large quantities of food, machinery and other things for Europe have been shipped from western points since March 1, and these take the place of the delayed shipments which have been moved. At the six principal ports about 8,000 carloads are still held, in cars; and over 20,000 carloads of freight are lying in storehouses and on piers or on the ground. At the beginning of this week the number of eastbound loaded cars above normal in "eastern" territory was 40,294.

Thirty-fifth Engineers in France

Word received from Capt. William R. Pearson, of Company C, 35th Engineers (Railways), indicates that that regiment is now in service in France. Capt. Pearson was formerly assistant valuation engineer of the Nashville, Chattanooga & St. Louis. The 35th Engineers was stationed at Camp Grant, Rockford, Ill., previous to its departure for Europe.

Universal Interline Billing

Director General McAdoo has issued an order establishing universal interline billing of freight between all railroads subject to Government control. This order also contemplates a simplification of divisions, so that much of the accounting work connected with the making of these divisions will be avoided.

The order goes into effect May 1, and is in the form recommended by the Accounting Officers' Association. A subsequent order will be issued for simplified bases for apportioning inter-road freight revenues.

Car Shortage Increased

The net shortage of freight cars on March 1, according to reports compiled by the American Railway Association, amounted to 138,102, as compared with 98,044 on February 1, 89,995 on January 1 and 117,132 on December 1. The bulletins giving these figures are not being issued in the form they were before the government assumed control of the railroads but the figures are still being compiled in comparative form. On January 1 there were surpluses amounting to 20,337 and a total shortage of 110,332. On February 1 the surplus was 24,297 and the total shortage was 122,341. On March 1 the surplus was 21,890 and the shortage 159,992, making the excess of unfilled orders 138,102.

Locomotive Consulting Board

Frank McManamy, manager of the Locomotive Section of the United States Railroad Administration, has appointed the following railroad officers as a consulting board to consider matters relative to the maintenance of locomotives, the distribution of locomotives to various shops for repairs, shop production and practices, and other matters of a similar character: H. T. Bentley, superintendent of motive power, Chicago & North Western; C. E. Chambers, superintendent of motive power, Central of New Jersey; C. E. Fuller, superintendent of motive power, Union Pacific; J. Hainen, assistant to the vice-president, Southern; D. R. MacBain, superintendent of motive power, New York Central Lines West; John Purcell, assistant to the vice-president, Atchison, Topeka & Santa Fe.

Indianapolis Improvement to Be Finished

Director General McAdoo, on the recommendation of Commissioner Harlan, of the Interstate Commerce Commission, has ordered that the work of track elevation at Indianapolis, Ind., be continued until completed. In a report to the director general, Commissioner Harlan recommended that the work be permitted to go on in a modified form. The partial completion has left streets in the business district of the city in a condition dangerous to pedestrians, a menace to health and

costly to traffic. Between \$7,000,000 and \$8,000,000 has been expended already in this elevation work. Practically 75 per cent of the steel necessary is on the ground. The cost of completing the work will be approximately \$6,000,000, to be borne equally by 14 different railroads.

Extensive Inventories Called For

Director General McAdoo has issued a general order calling on all carriers subject to federal control to commence, prior to May 1, taking an inventory of materials and supplies by actual count, measurement, weight, etc., and immediately upon completion thereof to adjust the inventory, by additions and deductions, to December 31, 1917. But any carrier that has taken an inventory in the form indicated within 90 days prior to December 31, 1917, or subsequent to the latter date, is not required to take an additional inventory, but is directed to adjust the inventory previously taken to December 31, 1917.

The inventory is to be preserved in the files of the carrier and is presumably required for the purpose of keeping an accurate record of the property taken over by the government.

Railway Exempts Soldiers from Land Payment

B. A. McAllister, land commissioner of the Southern Pacific, San Francisco, Cal., announces that soldiers and sailors who have been buying Southern Pacific lands on the installment plan are exempted from payments until nine months after the termination of the war, or of their service with the army or navy. All that will be required of a purchaser is that he apply to the company within ninety days after he is released from service and the date will be fixed, within nine months, when the first of his payments will fall due, the others to follow a year apart in their original sequence. No interest will be charged him in the meanwhile. In making this arrangement the Southern Pacific has anticipated the so-called Soldiers' and Sailors' Civil Rights or Moratorium Bill, as it has had this rule in effect since May 10, 1917.

Extensive Floods

Press despatches of Thursday, March 14, reported disastrous floods at Hornell, Corning and other places in New York state; at Dover, N. H.; Charleston, W. Va., and in southern Michigan. Derailments because of flood conditions occurred at Knoxville, Pa., on the Buffalo & Susquehanna; near Corning, N. Y., on the Erie; at Lindley, N. Y., on the New York Central, and near Nunda Junction, N. Y., on the Pennsylvania Railroad. In the last named accident three trainmen were killed. At Dover, N. H., a wooden bridge of the Boston & Maine, 400 ft. long, was carried off its foundations. In lower Michigan, railroad traffic had to be suspended in many places.

Recuperation Camp for Soldiers

Guy Adams, manager of mail traffic of the Union Pacific has given a part of his Double Header ranch as a camp for convalescent soldiers and sailors who were previously in railroad service. For the purpose of administering this project the Railroad Men's Mountain Home Association has been incorporated, and to this the land, about 40 acres, has been leased. The Double Header ranch is situated in Turkey Creek Canyon, 16 miles above Morrison, Colorado. The ranch comprises 160 acres and is covered with pine, spruce and cottonwood timber. The property has seven of the finest springs in the state at the foot of Double Header mountain after which the ranch was named.

Mr. Adams' plan to finance the project is to give every railroad employee in the country from president to section hand a chance to contribute to its support. No fixed amount will be asked for but all contributions large or small will be welcome. The First National Bank of Denver will act as treasurer of the association and custodian of the funds, and all gifts should be sent to this bank. None of the trustees will receive remuneration for services, and the association will be a non-profit-making association. It is hoped to be able to take care of 100 railroad men by July 1, and 1,000 men on January 1, 1919.

Bad Results of Government Control

From lakes and seashore resorts, from Hawaii and the White Mountains comes a wail over the government abolition of the "literary bureaus" of the railways. No more of the multichrome folders, with crystal mountains, emerald lakes, and golden landscapes! No more alluring photographs mounted over a still more alluring text! An actual holiday is often a prosaic affair. But what joy compares with tramping over piles of resort advertisements, each dealing with a perfect paradise? Where is there a style like that of the railways' literary agents? Often they are weak in grammar but like Ruskin they are not afraid of wild adjectives and word-pictures. One can only hope that the folders on hand will last out this season, and that the war will end in time to renew a glowing succession.—*New York Evening Post*.

A Very Unusual Train Accident

This over-worked title was used in the newspaper last Friday, March 15, with entire appropriateness—to denote the derailment and wrecking of steel sleeping cars by a boulder, weighing about three hundred tons, which fell from a ledge at the side of the roadway just at the moment when these cars were passing, and after the engine and first three cars of the train had cleared the spot.

This accident happened to westbound express train No. 19, of the Pennsylvania Railroad, near Elizabethtown, Pa., 17 miles east of Harrisburg, at 1 a. m. on March 15. The boulder measured 24 ft. long, 12 ft. wide and 8 ft. thick and it fell from near the top of a cut about 70 ft. deep. It first struck the third car in the train and this and the two following cars were knocked off the rails and wrecked. The rock had to be blasted to clear the track.

Two passengers were killed and 24 passengers and 2 trainmen were injured.

Union Pacific Roster of Employees in Military Service

In a recent circular sent to heads of all departments, E. E. Calvin, president of the Union Pacific and the Oregon Short Line, asks that the following information be secured concerning each employee of the System who has answered the call of his country: (1) The name of the man in service; (2) the character of his employment on the Union Pacific and length of service; (3) his rank; (4) the branch of service to which he has been assigned; (5) his regiment; (6) his company or corps (or ship, if he is in the navy); (7) place of encampment; (8) name and address of parents or nearest relative. This information will be kept up to date and whenever a Union Pacific man meets with a mishap abroad assistance will be rendered him or to members of his family, should such assistance be needed. Ballard Dunn, special representative of the president of the Union Pacific, will have general supervision of the preparation of these rosters. Each district terminal, main shop and such other points as may be necessary will secure information concerning the men formerly employed who are now under arms and will forward duplicate rosters from time to time to the company's headquarters at Omaha.

Daylight Saving Bill Passed

The daylight saving bill, by which standard time throughout the United States will be advanced one hour at 2 a. m. on the last Sunday in March, which this year comes on March 31, and be set back one hour on the last Sunday in October, was passed by the lower House of Congress on March 15, after having been passed by the Senate last year, and on the following day the Senate concurred in the House amendment, changing to seven months instead of five the period in which the abnormal time shall be used. The law provides that the Interstate Commerce Commission shall define the limits of five zones of standard time "having regard for the convenience of commerce and the existing junction points and division points of common carriers," and that the standard time of each zone shall govern the train movements of all common carriers. In other words the railroads' standard times, Eastern, Central, Mountain and Pacific, and also Alaska time, one hour slower than Pacific time, will now be United States Government standards. This law, giving

statutory authority to our standard times will be in effect, not only during the seven months in which clocks are run ahead of time, but also throughout the whole year.

Trade Paper Advertisers to Co-operate in Third Liberty Loan

One of the features of the Third Liberty Loan, or at least as far as the trade and technical papers are concerned, will be a plan whereby advertisers will devote their space for one or more issues to Liberty Loan advertising, the papers themselves, in most cases, supplying the copy, art work and cuts. The idea originated with a committee of the New York Business Publishers' Association and has received the sanction of Secretary McAdoo in the following letter to Guy Emerson, director of publicity for the Liberty Loan Committee for the Second Reserve District:

Washington, D. C.

I have your letter of the 5th of March with regard to the liberal advertising space which members of the Business Publications' Association will devote in business papers to the Third Liberty Loan. Will you kindly convey to the association the secretary's sincere thanks for their patriotic action? The business papers co-operated most effectively in the first and second campaigns and the secretary deeply appreciates their promise of loyal support for the third issue.

(Signed) G. R. Cooksey, Asst. to the Secretary.

Railroad Administration to Have Early Statistical Reports

Director General McAdoo has perfected arrangements for obtaining statistics of railroad operations for his own use and for the information of the public so that information will be available more promptly than heretofore.

Some 15 to 20 of the principal carriers will be required to send by telegraph a statement of weekly earnings. These will be available about the fifth or sixth day after the close of the period which they cover and are expected to fairly indicate the trend of earnings for the entire country.

About the twentieth of the following month all Class 1 roads will report earnings and expenses for the previous month. Joint facility rents, car rents, etc. and tax accruals, exclusive of war tax, will be included.

All Class 1 carriers will be required to make promptly the monthly reports of operating results now required by the Interstate Commerce Commission, and the data will be published about the tenth or fifteenth of the second month. The bulletin of the commission has been modified in certain respects so that the earnings for the month and the period can be examined upon the basis of the three years' average which is used in fixing the compensation of the carriers.

All of this information will be placed at the service of the public as soon as compiled at Washington and will, it is believed afford earlier and more reliable information of this sort than has ever been available in the past.

Canadian Society of Civil Engineers

The first general professional meeting of the Canadian Society of Civil Engineers to be held in Toronto March 26 and 27 will be devoted to a discussion of the present fuel and power situation and there will be several papers of particular interest to railway men.

The headquarters for the convention will be located at, and the meetings will be held in the theatre lecture room of the Physics building, Toronto University.

Among the papers of interest to railway men will be the following:

Transportation from the Fuel Viewpoint, by W. N. Neal, general secretary of the Canadian Railway Association for National Defence, Montreal, Que.

An Illustrated Address on "The Erection of the Quebec Bridge," by Geo. F. Porter, engineer of construction, St. Lawrence Bridge Company, Montreal, Que.

Railway Electrification, by John Murphy, Chief Electrical Engineer, Department of Railways and Canals, Ottawa, Ont.

Traffic News

In St. John, New Brunswick, it is reported that the Canadian Pacific is considering a proposal from the United States government to send two hundred thousand tons of export freight, monthly, through that port during the coming summer.

The chairman of the Texas Railroad Commission has notified R. H. Aishton, regional director, that Texas farmers expect to ship north, within the next six weeks, about 400 carloads of spinach, this being the estimated crop from 5,000 acres. Most of this spinach is to be sent by express.

Passengers to and from stations on the Long Island road now constitute nearly three-fourths of the total number using the station of the Pennsylvania Railroad at Seventh avenue, New York city. The total number of passengers serving the station in the year 1917 was 18,148,605, of whom 13,224,258 were Long Island passengers and 4,924,347 were those of the Pennsylvania Railroad.

The Food Administration has appointed three regional traffic managers to co-ordinate the work of the Food Administration and the Railroad Administration by facilitating the movement of foodstuffs, reducing delays in loading, unloading and returning cars, etc. The men appointed are: Charles Barham, general freight agent of the Nashville, Chattanooga & St. Louis, at Atlanta, Ga.; J. H. Cherry, assistant general freight agent of the Illinois Central, at Chicago, and Nat Duke, assistant freight traffic manager of the Delaware, Lackawanna & Western at New York.

The car service section of the Railroad Administration has issued a circular to all railroads, stating that Col. J. S. Fair, of the Quartermaster Corps, in charge of the remount division of the National Army, has requested that arrangements be perfected whereby cars will be promptly furnished for the shipment of animals from points of assembling by contractors to various central points for inspection by the purchasing officers of the army. If for any reason the necessary cars are not available or cannot be furnished without delay the facts must be promptly reported to the car service section.

The Senate Committee on Interstate Commerce has begun holding hearings at Washington on a bill introduced by Senator Poindexter, of the State of Washington, proposing an amendment to the fourth section of the interstate commerce act calculated to impose an absolute prohibition against charging higher rates for short hauls than for long. Former Senator J. L. Bristow, chairman of the Kansas Public Utilities Commission, and J. F. Shaughnessy, of the Nevada Railroad Commission, testified before the committee on March 13, declaring that the present law imposes a hardship on shippers and asked that discretion in the matter be taken out of the hands of the Interstate Commerce Commission.

The Advisory Committee on Waterways recently appointed by Director General McAdoo has submitted a preliminary report recommending the increased use of a number of canals to transport coal during the summer. The membership of the committee has been increased by the appointment of Calvin Tomkins, former dock commissioner, New York, and M. J. Sanders, of New Orleans, manager of the Leyland Steamship lines.

Congressional Limited Restored

Director General McAdoo has decided that in reducing the passenger train service between New York and Washington shortly after the first of the year he cut too deep. After an investigation of the increasing travel he has ordered the restoration of the Pennsylvania's Congressional Limited, effective on March 17, as a train of 10 parlor cars leaving Washington at 4 p. m. and arriving at New York at 9:15 p. m., and leaving New York at 3:07 p. m. and arriving at Washington at 8:45 p. m. There is an extra fare of \$1.50 between New York and Washington and of \$1.25 between New York and

Baltimore. Formerly there were no extra rates on this train other than the regular Pullman charge for seats.

Anti-Loss and Damage League

This organization, the purpose of which is indicated by its title, has taken for its special mission the campaign for the adoption of proper containers for freight; that is to say, for the abolition of flimsy pasteboard boxes and such like things, and the substitution of wooden or metal boxes of sufficient strength for the uses to which they are put. The managing director is J. H. Leonard, 1133 Broadway, New York City, and the other directors are L. O. Hedden New York; H. C. Yost, New York; John Meigs, Philadelphia, W. J. Kelly, New York; H. C. Guiremand, New York; J. C. Barker, Richmond; F. B. Haile, Washington; Chas. C. Kain, Chicago; E. F. Brooks, Buffalo; J. C. Post, St. Louis; and L. S. Heald, Baltimore.

Increase in Live Stock Movement

Director General McAdoo has received the following report of the comparative receipts of live stock at various stock yards for the month of February, showing a substantial increase over the same period of last year:

| | 1918. | 1917. | Increase. |
|------------------|--------|--------|-----------|
| Chicago | 26,083 | 20,841 | 5,242 |
| Kansas City | 10,136 | 10,401 | 1,035 |
| Omaha | 11,142 | 10,146 | 1,016 |
| East St. Louis | 8,342 | 7,221 | 1,121 |
| St. Joseph, Mo. | 6,137 | 4,200 | 1,937 |
| Denver, Colorado | 1,909 | 1,802 | 17 |
| Sioux City, Iowa | 5,098 | 5,263 | 5 |
| South St. Paul | 4,067 | 3,814 | 253 |
| Total | 73,174 | 61,488 | 11,626 |

Store-Door Delivery in New York City

The committee of commissioners which is investigating the subject of freight delivery in New York city, and which is to make a report to Director-General McAdoo, held a conference with mercantile interests, trucking men and railroad officers in New York city, on Tuesday of this week, and the result is a "report of progress"; but when the proposed plan will be ready for presentation to Mr. McAdoo is not stated. Commissioner James S. Harlan, of the Interstate Commerce Commission, chairman of this committee, says that on account of the vital importance of New York city as a freight terminal for goods which are being sent to Europe, or are otherwise necessary in the prosecution of the war, a radical change in the present practices must be made, and he feels assured already of the co-operation of the railroads and the team owners.

The New York and Connecticut Freight Line

This is the name of a corporation, with headquarters, at 38 Park Row, New York City, which announces that, beginning April 1, it will run five-ton automobile trucks, with five-ton trailers, daily, between New York City and New Haven, Conn., a distance of about 75 miles. It is proposed to run a regular through and interurban auto truck service doing business at New Rochelle, Mamaroneck, Port Chester, Greenwich, Stamford, South Norwalk and Bridgeport. Freight will be taken from the door of the shipper and delivered at the door of the consignee, on the same day. Including the store-door delivery and the elimination of handlings, the new concern hopes to do as well as the express companies, in the way of efficiency, and to make rates "virtually on a par with freight rates" when the cartage at both ends is considered, and the uncertainty of present freight conditions is taken into account. The general manager of the company is W. G. L'Hommedieu, and the New Haven office is at 185 Church street.

A tariff printed on the back of the company's card, showing rates on lots of one ton or over and not more than five tons, names 50 cents per 100 lb. as the through rate between New York and New Haven and 30 cents per 100 lb. for the shortest distances. On lots weighing over five tons special rates will be made.

Union Ticket Office at Atlanta

Director General McAdoo has authorized C. H. Markham, Regional Director, Southern District, to consolidate the city ticket offices in Atlanta, Ga., into one union office at 74 and 80 Peachtree street. The lines now maintaining separate offices in Atlanta are the Nashville, Chattanooga & St. Louis, the Louisville & Nashville, the Atlanta and West Point, the Southern, the Georgia Railroad, the Central of Georgia, the Seaboard Air Line and the Atlanta, Birmingham & Atlantic.

This change will result in a substantial saving in rentals and will also add to the convenience of passengers, as the new office is centrally located and will be well manned by efficient and experienced men. The consolidation will take effect on April 1 or as soon thereafter as possible.

Investigations as to the possibility of consolidating the ticket offices in New York, Chicago, St. Louis and other cities are under way.

The Canadian Railroad Rate Advance

The Canadian Government has approved the order of the railway commissioners authorizing a general increase of 15 per cent in both passenger and freight rates throughout the Dominion of Canada. This matter had been under consideration for more than two months because of an appeal from western Canada against the proposed increase. The Order in Council which is now issued stipulates that the increased rates shall terminate one year after the close of the war and that the Canadian Pacific, the only large road which is now prosperous, shall pay to the government, as a war tax, all income above what was received in the year 1917. This special tax must in no case be less than \$7,000,000 a year unless the total net revenue of the company from all sources should be insufficient to pay normal dividends of 10 per cent.

Appeal to Canadian Shippers

[From Canadian Railway Association Bulletin.]

The average freight car, carrying your goods, (Canadian Shipper, goes only half-filled. You may perhaps be loading a little better than that average. You may think it is "nobody's funeral but your own," since you pay the railways the legal rate and should be allowed to waste space if you like.

But the fact is that all Canada is vitally concerned. The waste of car space is not your "funeral," but the country's "funeral." There are fewer freight cars in Canada than are needed every day. Munitions shipments, shipments of most essential materials, such as food, coal, raw materials are being held up for lack of cars. If you would see to it that your shipping department filled its cars to full capacity or weight-carrying capacity, you would be helping to double the freight car equipment of Canada at a time when cars are almost priceless. Please have a personal interview with the men who handle your shipping. They will remind you, of course, of the convenience of loading "one order to a car." They may say there is additional labor cost for packing a car beyond a certain point. They may indicate that your shipping department would thus have to be altered, or that your customers' convenience would not be as suitably met. Possibly not. But since your prosperity depends upon the prosperity of the whole country and our successful conduct of the war, you will surely see the importance of making your shipping department maximum service in minimum time.

By an appeal for heavier loading the Director of Overseas Transport has succeeded in making 1,000 cars do the work of 1,200 which had previously been considered full cars. One implement concern in Canada found that by a skilful packing of parts and the building of a rough "deck" in each car it was able to save 12 cars on a shipment of 800 wagons, 22 cars on a shipment of 3,000 rubber plungers, 52 cars on 1,200 binders.

A flour shipper told us he could not afford to load cars to full capacity because of the high labor cost in doing so. On investigation it was found that he had been trying to load each row of bags to the top of the car while the loaders were still working from ordinary floor level. Naturally the job was heavy and awkward. When his shippers were shown the simple little trick of laying the bags in "steps" running down from the ends of the car to the door the difficulty was solved.

Commission and Court News

Personnel of Commissions

Oscar S. Straus, chairman of the New York State Public Service Commission, first district, has been reappointed for a term of five years.

Winthrop M. Daniels was elected on March 16 as chairman of the Interstate Commerce Commission for the ensuing year, succeeding Henry C. Hall, in conformity with the commission's practice of rotating its members in the chairmanship with seniority. Mr. Daniels has been a member of the Interstate Commerce Commission since early in 1914. He was appointed by President Wilson in January, but the appointment was not confirmed by the Senate for several weeks because of some opposition on account of the position he had taken in a valuation case while he was a member of the Board of Public Utilities of New Jersey. He was born at Dayton, Ohio, on September 30, 1867, and was graduated from Princeton in 1888. For nearly 20 years he was Professor of Political Economy at Princeton University, of which President Woodrow Wilson was then president. When Mr. Wilson became governor of New Jersey, in 1911, he appointed Professor Daniels to membership on the Board of Public Utilities, which position he held until his appointment to the Interstate Commerce Commission. While a member of the faculty of the university he wrote several text books which have been used in many colleges, including "The Elements of Public Finance." He also lectured on public finance and on railway economics and has been an editorial writer on the New York Evening Post. He was reappointed a member of the Interstate Commerce Commission on the expiration of his term a little over a year ago and the confirmation was again delayed in the Senate by the opposition of Senator Cummins. He is regarded as one of the ablest members of the Interstate Commerce Commission and displays a keen interest in the economic questions which arise in connection with the regulation of railroads.

W. M. Daniels

Court News

Recovery of Illegal Taxes

The federal district court for the Eastern District of Pennsylvania holds that in a suit against the United States to recover internal taxes alleged to have been erroneously or illegally collected, the suit is "brought" within the meaning of the statutory provision (limiting the time for bringing suit to two years after the cause of action accrued) when the summons subsequently served is issued.—Mill Creek & Minehill N. & R. v. United States, 246 Fed., 1013. Decided November 22, 1917.

Injuries to Employee Engaged in Repairs

A helper to the boiler maker was sent into the water tank of an engine tender, brought to the shop for repairs, to fasten the inside brace rods. Before finishing his work he started to leave the tank through the manhole, and for that purpose stood on a brace rod which was loose at the end, though this fact had not been discovered by him. It yielded to the pressure, and he fell

to the floor. In an action for his resulting injuries the Iowa Supreme Court holds that the railroad was not negligent, as the place of work was not inherently dangerous, but was only dangerous because the brace rod was loose, which could be discovered only from observation on the inside. It was for the very purpose of discovering and repairing the brace rod that he was in the tank, and some observation on his part was a part of the work of repairs delegated to him.—Rihack v. C. St. P., M. & O. (Iowa), 166 N. W., 292. Decided February 9, 1918.

Boarding Train from Unsafe Place

In an action for injuries to the plaintiff while preparing to board the defendant's train, when struck by the running board or step board, the Massachusetts Supreme Judicial Court holds that the act of a railroad in tolerating a practice on the part of the public to take trains from a certain unsafe space beside the track was not an inducement or invitation from the railroad to an intending passenger to use such space, and one using it was not a passenger. To one not a passenger, because seeking to board a train at an improper place, and therefore a trespasser, or at most a licensee, the railroad merely owed the duty to refrain from wilfully, recklessly and wantonly exposing him to injury. The evidence was held to show that the place to which the public, in entering and leaving trains, was invited was the space made level for such purpose between the station and the nearer rail of the track; not the manifestly narrow, inappropriate and dangerous space between the ends of the sleepers and a riprap wall to protect the station and tracks from the action of the advancing sea, which the plaintiff used.—Doherty v. N. Y., N. H. & H. (Mass.), 118 N. E., 281. Decided January 4, 1918.

"Switching Service" or "Line Haul"

In an action to compel a railroad to accept for services in hauling freight a less sum than its published tariff rate for long distance haul on the theory that the services were switching services, the Iowa Supreme Court holds that services rendered by intersecting railroads in transporting gravel from the plaintiff's gravel pit within a city to a point where the plaintiff was building a bridge within the city were not "switching services," independent of a "line haul," so that one railroad was entitled to the tariff rate fixed for line haul services per car of gravel, and not merely to a switching rate. And the fact, if it were a fact, that the railroad had violated the state statute against unjust discrimination by charging certain other shippers a less rate for line haul services than it demanded of the plaintiff for such services could not justify the court in compelling the railroad, by decree or judgment, to violate, in the plaintiff's case, the statute prohibiting it from charging or receiving more or less than the published tariff rate. Cummings Sand & Gravel Co. v. Minneapolis & St. L. (Iowa), 166 N. W., 354. Decided February 13, 1918.

Construction of Tariffs

Tariff Circular 18A of the Interstate Commerce Commission, March 31, 1911, provides that a tariff shall contain an alphabetical index of the points from and to which it applies, and, further, that "this is not to be understood as prohibiting the incorporation in a tariff of a rule for the affirmative and definite application of the rates or fares named in that tariff to or from points not indexed, and which are distinctly intermediate on the same line with points that are indexed." A certain tariff had a clause of this kind, and the Circuit Court of Appeals, Eighth Circuit, holds that this provision must be construed in connection with the circular under which it was issued, and that it had no application to points which were indexed, and to or from which specific rates were named. In such a tariff the word "intermediate" refers to stations between those named.

The company concerned was the C. M. & St. P., and the action against it was for alleged excessive charges. Its tariffs, so far as material, were substantially as follows:

| | | Rates in cents per 100 pounds | |
|-----------------|--------|-------------------------------|-----|
| From | | To | |
| Coswell, N. D. | Duluth | Flax seed | 14 |
| Grampton, N. D. | Duluth | Wheat, barley and oats | 14 |
| Newark, S. D. | Duluth | | 15 |
| | | | 19½ |

*Coswell is the station farthest from Duluth.

The question was whether the quoted provision in the tariff is applicable to the rates from Newark to Duluth, and thus whether its rates are fixed the same as from Brampton, notwithstanding the rates specifically fixed from Newark in the table. The court answered the question in the negative and affirmed a judgment for the railroad.—*National Elevator Co. v. C. M. & St. P.*, 246 Fed., 588. Decided October 6, 1917.

Ejection from Station—What Constitutes a Passenger

In an action for wrongful ejection from a station, it appeared that about 10.30 or 10.45 a. m. on December 24, 1916, the plaintiff was in the defendant's station at Sedalia, Mo., and bought a ticket to Dresden; that the next train to Dresden was to depart at 6 p. m. of that day; that shortly after the purchase of that ticket one of the defendant's employees, with great force and violence, ejected him from the station. The station was crowded at the time. The plaintiff testified that he knew there would not be a train for Dresden until that evening, but he said on account of its being cold outdoors he thought he would buy a ticket so that if the watchman came around and asked him why he was sitting in the waiting room he would have something to show for it. The Kansas City Court of Appeals sustained the railroad's contention that the plaintiff on his own testimony was not a passenger. The court said in part: "In order for the relation of passenger and carrier to exist in cases of this kind it is necessary that the intending passenger come to the station, and within the implied care of the carrier, a reasonable time before the departure of the train by which he is to travel. The right to enter and remain at a railroad station extends only so far as is reasonably necessary to secure to the traveler the full and perfect exercise of his right to be carried upon the cars, and what is a reasonable time will depend upon the circumstances of each particular case; one's right to remain at a railroad station depends on his intent to take a train expected soon to leave. *Kidwell v. Chesapeake & Ohio*, 71 W. Va., 664, 77 S. E., 285, 43 L. R. A. (N. S.), 909. From plaintiff's evidence above it is seen that he intended to use the station for a period of more than seven hours, until his train should arrive, as a convenient and warm place to spend the day. Under these circumstances plaintiff was not a passenger at the time he was ejected from the station." Judgment for \$50 actual and \$50 punitive damages was reversed and the cause remanded.—*Thomas v. Bush* (Mo.), 300 S. W., 501. Decided January 28, 1918.

United States Supreme Court

Title to Sections in Spokane Indian Reservation

Suit was brought in ejectment by the Northern Pacific to recover possession of eighty acres of land in the Spokane Indian Reservation, (the title to 64,000 acres depending on the decision). The stipulated facts were substantially as follows: By the act of Congress of July 2, 1894, the railroad was granted, to aid in the construction of its line, 20 alternate sections of land per mile on each side of the line in any territory, and 10 in any state. In October, 1880, the company filed its plat locating its line opposite the land in controversy. Meanwhile, in 1877, a representative of the Commissioner of Indian Affairs had made an agreement with the Spokane Tribe of Indians setting aside certain land in Washington Territory, of which that in question forms part, for the use of the tribe. The report of the representative was sent to the Senate in 1878, but the Executive Order of the President, formally setting aside and reserving the territory described in the agreement, was not signed until January 18, 1881. The Supreme Court of the United States holds that the Secretary of the Interior and the Commissioner of Indian Affairs approved the action of their representative "not later, certainly, than the sending of the secretary's report to the Senate on January 23, 1878, which was almost three years prior to the filing of the railway company's plat, and that the Executive Order of the President on January 18, 1881, simply continued and gave formal sanction to what had been done before." The Spokane Indian Reservation having thus been lawfully created prior to the filing of the plat of the plaintiff's line on October 4, 1880, judgment for the defendant was affirmed.—*Northern Pacific v. Wismer*. Decided, March 4, 1918.

Equipment and Supplies

Railway supplymen will be particularly interested this week in the editorial on page 691 entitled:

Is the Railway Supply Industry Awake or "Asleep at the Switch?"

and in the article on page 697;

American Railway Supplies in Australia.

Locomotives

THE PENNSYLVANIA EQUIPMENT COMPANY, 1420 Chestnut street, Philadelphia, is in the market for 3 second-hand standard gage switching locomotives weighing 45 tons or more.

Freight Cars

THE BIRMINGHAM SOUTHERN is reported as having issued an inquiry for 20 70-ton flat cars.

THE GUANTANAMO & WESTERN has ordered 25 40-ton steel frame box cars from the American Car & Foundry Company.

FELS & Co.—The item in the *Railway Age* of March 8, to the effect that this company was in the market for a number of 8,000 and 10,000 gal. tank cars, has been denied.

Iron and Steel

THE CHICAGO, BURLINGTON & QUINCY has ordered 4 100 ft. and 1 50 ft. through turntables, totaling 365 tons.

Signaling

THE ESSEN TERMINAL has ordered from the Union Switch & Signal Company material for mechanical interlocking at Ojibway, Ont.; two machines, Saxby & Farmer, 8 levers each.

THE PENNSYLVANIA LINES WEST OF PITTSBURGH have ordered from the Union Switch & Signal Company materials for an interlocking plant at Boone, Ind.; 35 working levers.

THE CANADIAN PACIFIC has ordered from the Union Switch & Signal Company material for a mechanical interlocking, 18 working levers, at Komoka, Ont., to replace an old machine.

THE JACKSONVILLE TERMINAL COMPANY, Jacksonville, Fla., has ordered from the Union Switch & Signal Company the material for two electro-mechanical interlockings, Towers 1 and 2.

THE PENNSYLVANIA has ordered from the Union Switch & Signal Company material for a mechanical interlocking at Port age, Pa., 24 levers; an electro-pneumatic interlocking, 11 levers, at Paoli, Pa.; two electro-mechanical machines at the same place, and for extensive additions at Mettlen, N. J.; Harrisburg, Pa., and Denholm, Pa.

FIRE LOSS IN U. S. IN 1917.—Losses by fire throughout the United States in 1917 amounted to \$230,000,000, making it the worst year for fires in the history of the country, with the exception of 1906 when the San Francisco earthquake and subsequent conflagration occurred. An acknowledgment of this fact was made to the New Jersey State Council on Fire Losses in a communication from the Council to General Roberts.

U. S. TRADE WITH CHINA GROWS.—The volume of trade between the United States and China reached a value of \$447,000,000 last year, according to a compilation maintained by the National City Bank of New York. This figure compares with \$196,000,000 in 1913, the year preceding the war. The more important of the manufactures exported to China in 1917 included approximately \$6,000,000 worth of railway supplies, including rails, cars and locomotives.

Supply Trade News

The **Gulick-Henderson Company, Inc.**, announces the removal of its New York offices to the Herald Square building, 141-145 West 36th street, in order to provide larger and more suitable quarters.

J. M. Woodruff, who has been representing the Warren Brothers Company in the South for the past five years, is now connected with the Standard Asphalt & Refining Company, Chicago.

Frank J. Hurley, who for a number of years was a representative connected with the New York office of the Independent Pneumatic Tool Company, died in East Orange, N. J., March 10, at the age of 29 years.

The **Galena Signal Oil Company** is to establish a large manufacturing and distributing plant at Houston, Tex., having bought the refinery and pipe lines of J. S. Cullinan for a consideration said to approximate \$10,000,000.

E. E. Adams, consulting engineer, and **F. W. Sercombe**, assistant controller of the Union Pacific System, have been appointed assistants to **R. S. Lovett**, director of the division of capital expenditures of the United States Railroad Administration at Washington.

W. L. Reid has been elected vice-president and general manager of Lima Locomotive Works, Inc., with offices at Lima, Ohio. Mr. Reid was born at Paterson, N. J. His entire business life has been connected with locomotive building. He served his apprenticeship in the drawing office and shops of the Rogers Locomotive & Machine Works at Paterson and became successively erecting shop foreman, assistant superintendent and superintendent of the same plant. Leaving the Rogers works he was appointed assistant superintendent of the Brooks Locomotive Works and two years later superintendent of the Brooks works. After serving only 20 days in the latter position he was appointed superintendent of the Schenectady works of the American Locomotive Company. He was later appointed manager of the Schenectady plant and general works manager of the American Locomotive Company. Resigning from the American Locomotive Company he became general manager of the National Brake & Electric Company, Milwaukee, Wis. Six months later he resigned to become general superintendent of the Baldwin Locomotive Works at Eddystone, which position he held up to the time of his recent election.

The **Permutit Company**, manufacturers of water softening and water rectification apparatus and for several years past located at 30 East Forty-second street, New York, announces its removal to 440 Fourth avenue, New York, where after March 15 the entire top floor will be occupied by its offices. The entire top floor will be occupied by its offices.

Tar Carbolineum Wood Preserving Company, of 34 Greene street, New York, which for over 40 years has sold Avenarius Carbolineum, has changed the name of its product to Protexol and under this trade name will continue to supply a wood preservative identical in every respect with the one sold for many years under the name Avenarius Carbolineum.

W. L. Reid

Ira C. Rogers, formerly general purchasing agent for the Worthington Steam Pump Company at New York, has recently been appointed general manager of W. R. Keene & Co., also of New York. W. R. Keene & Co., represent the Bay State Tap & Die Company, Alvord Reamer & Tool Company, Sterling Products Company, Keene Twist Drills and Massey Vise Company. Mr. Rogers, before his connection with the Worthington Steam Pump Company, was assistant general purchasing agent of the Pittsburgh & Lake Erie until 1915, at which time he became general purchasing agent of the Worthington Steam Pump Company and resigned February 1, to take the above position with W. R. Keene & Co.

Karl J. Eklund has been appointed general manager of Mudge & Co. in charge of the engineering and manufacturing departments, with headquarters at Chicago. Mr. Eklund was born on July 8, 1884, and was educated in the grammar and high schools of Keene, N. H. He started his railroad service as a blacksmith helper in the Boston & Maine shops, and from March, 1903, to April, 1906, served his apprenticeship as machinist on that railroad. During the next two years he was employed on various railroads as journeyman machinist, and in 1908 returned to the Boston & Maine as machinist and foreman in the Keene, N. H., shops. On March 1, 1910, he left the service of this road to accept a position with the Pilliod Company, of New York and Swanton, Ohio, as Baker valve gear inspector, and on February 1, 1915, he was appointed assistant to the president of the Pilliod Company, with headquarters at New York. He occupied this position until April 1, 1917, when he was appointed assistant to the president of Mudge & Co., Chicago, the western representatives for the Pilliod Company, and served in this capacity until his appointment as general manager on March 1, 1918. In this capacity he will continue to direct the service departments of the Pilliod Company and the Chambers Valve Company, both of whom are represented in the west by Mudge & Co. He will also have charge of the service department of Mudge & Co. in addition to the engineering and manufacturing departments.

K. J. Eklund

Western Electric Company

The Western Electric Company in its fiscal year ended December 31, 1917, did the largest business in its history, the gross sales of \$150,340,359 being 41 per cent greater than in 1916. After the deduction of expenses, taxes, interest and a reserve of \$2,000,000 for contingencies on account of the large merchandise investment and the prevailing high costs, there was a balance available for dividends of \$2,851,716, an increase of \$527,100 over 1916. After allowing for dividends of \$2,550,000 there was left a surplus of \$301,716 or \$7,100 more than in 1916. These dividends compared with \$2,100,000 in 1916 and included the usual 6 per cent dividends on the preferred and \$3 a share on the common.

The company is controlled by the American Telephone & Telegraph Company, and a large part of its output is for the Bell Companies. The balance sheet showed that plant and equipment were increased \$4,200,000 in value during the year and investments were marked up with \$1,000,000. Inventories on December 31 were valued at \$44,415,028, an increase of \$11,414,000 over the same date in 1916.

In his report to the stockholders, H. B. Thayer, president of the company, draws attention to the fact that the business of the company was larger than in any previous year.

"This is true of both the sale of its own manufactures and in

the sale of equipment is not made by it. In our own manufactures the demands from regular customers (the Bell Telephone companies) were very heavy at the beginning of the year, but as the demands for equipment to meet emergency requirements directly or indirectly caused by the war have increased, the ordinary requirements have decreased so that to a large extent a more expensive and less profitable business kept us busy during the latter part of the year. Therefore, while the profits in this class of business have been larger than in 1916, they have not, as compared with earlier years, been in proportion to the increased activity in the business.

"On sales of merchandise not made by us the profits have been very satisfactory.

"There is no return from foreign investments included in the profits of the company for 1917. As to some, information is entirely lacking, and as to others, it is incomplete. It is our belief, however, that, as a whole, a conservative valuation of them would require no addition to reserves, the earnings of some of them being amply sufficient to offset the possible losses of others.

"On the entry of this nation into the war we practically placed our Engineering Department at the service of the nation and believe that it has rendered important service. This has involved large expense and indirect loss through the interruption of our regular engineering program, but because we believed that we were able to render great service, we believed also that the responsibility upon us to render it was great and that our stockholders would approve of our action. On such orders as we undertake for the military departments we have agreed to a basis of cost plus a fair, moderate profit.

"Our shop force increased during the year from 18,928 to 21,549 employees. The total number of employees at December 31, 1917, was 30,737.

"The sales for 1917 were \$150,340,000. For 1916 they were \$109,987,000 and for 1915 they were \$63,852,000.

"The orders on hand at December 31, 1917, were \$1,950,000 in value less than at December 31, 1916. The average value of an order filled during 1917 was \$107 as compared with \$75 for 1916."

United States Rubber Company Buys

American Locomotive Plant

The United States Rubber Company announced last Friday the purchase of the plant of the American Locomotive Company at Providence, R. I. It is understood that the price paid for the property was around \$500,000. The property consists of about ten acres of land with extensive buildings, centrally located in the city of Providence, and adjoins the Goodyear tire plant of the rubber company. The plant was used for many years by the American Locomotive Company when it was engaged in the automobile manufacturing business.

President of the rubber company said that the plant will be used for the extension of the manufacture of truck tires. One of the buildings will probably be used for the manufacturing of all sorts of goods for the United States government.

A LUMBER PRODUCTION IN THE UNITED STATES OF 39,200,000,000 feet in 1917, or an increase of 2 per cent as compared with the output of 1916. The estimate made by the Forest Service based on incomplete reports received up to February 26.

U. S. AVIATORS MAKE FIRST FLIGHT IN ITALY.—Two American aviators on March 15 accomplished a fast flight from Foggia to Rome flying the 212 miles in 158 minutes. The aviators were Major Ryan, commander of the American Flying Corps at Foggia, who acted as pilot, and Captain Frost, who made the trip as observer.

Railway Financial News

CANADIAN PACIFIC.—The Canadian Government has passed an order in council providing for special taxation of the Canadian Pacific Railway. The Wall Street Journal says the order provides that the company shall pay:

1st—Half its net earnings from railway operations in excess of 7 per cent on its common stock (after paying fixed charges, appropriation for pension fund and dividends on the preferred stock).

2nd—Income tax on the company's special income (including all of the company's income except earnings from railway operations) under provisions of the income war tax act of 1917, or any amendment thereof hereafter enacted.

The order in council provides that the total amount to be paid in taxes each year by the company shall not be less than:

1st—The company's net earnings in such year from railway operations and from special income as defined above in excess of 10 per cent on its common stock, after paying fixed charges, appropriation for pension fund and dividends on the preferred stock, up to \$7,000,000, or

2nd—The amount by which its net earnings from railway operations exceed net earnings from railway operations for the fiscal year ended December 31, 1917, due to increase in freight and passenger rates granted by order of the Board of Railway Commissioners dated December 26, 1917.

This order shall be deemed to have come into force and effect on the first day of January, 1918, and to continue in force and effect during the present war and until further orders.

DENVER & RIO GRANDE.—A judgment for \$367,088,529 was entered in the Supreme Court at New York on March 13 against the Denver & Rio Grande in favor of the Equitable Trust Company as the balance due with interest on a judgment for \$38,270,343 recovered in the United States District Court at New York on May 18, 1917, in favor of the trust company which sued for the payment of interest on a \$50,000,000 bond issue guaranteed by the Rio Grande for the Western Pacific Railway.

Ernest Howard of New York has issued a protest against the decision which adjudged to the Western Pacific damages of approximately \$38,000,000 against the Denver & Rio Grande. Mr. Howard claims that the Western Pacific property was worth from \$40,000,000 to \$60,000,000 when the court sold it for the absurd price of \$18,000,000.

GRAND TRUNK.—This company has issued a statement regarding its inability to pay dividends on its guaranteed or preferred stocks, owing to the enormous increase in operating expenses notwithstanding the fact that during the past year the company carried the largest traffic in its history. The hope is expressed that the Canadian Government will, in the near future, take such action as will enable the company to meet its financial obligations under the war conditions.

NEW YORK, NEW HAVEN & HARTFORD.—The directors have issued a circular to the stockholders outlining the terms of a new issue of preferred stock, which if authorized for in 1918 will raise \$43,588,300, sufficient to pay on the \$43,000,000 of the company's 5 per cent notes falling due on May 1, next. The circular states that stockholders are entitled to the first 100 shares of business on March 20, will be offered one share of the new preferred stock for each four and one-half shares now held, and that holders of the company's 5 per cent convertible bonds will get one share of the new preferred for every \$450 held of the bonds in their possession. The total amount of stock now outstanding is \$157,177,000, all of the class while \$39,020,000 of the bonds are in the hands of the public. It is significant that the new stock shall be paid for in full on or before Jan. 5, or in four quarterly installments, the first on that date and those made later on July 1, September 1 and January 2, 1919, respectively. The stock to be a 7 per cent cumulative issue, the dividends to be paid quarterly. Howard Elliott represents the New Haven in conference with John Skelton Williams, director in the management of the railroad administration, in the proposed offering, but a final decision has not been reached.

Railway Officers

Executive, Financial, Legal and Accounting

H. A. Taylor, general attorney of the Erie, has been appointed assistant to **Walker D. Hines**, assistant to Director General McAdoo.

William J. Moule, auditor of disbursements, of the Canadian Pacific with office at Montreal, Que., has been appointed assistant controller.

The election of **C. B. Seger** as acting chairman of the executive committee of the Union Pacific, to succeed **R. S. Lovett**, is commented on elsewhere in this issue.

Walter J. Stevenson was appointed auditor of commissary accounts of the Northern Pacific, with office at St. Paul, Minn., succeeding **J. A. Swanson**, resigned, effective March 16.

C. C. Higgins, consulting engineer, with **J. W. Kendrick** has been appointed assistant to vice-president, of the St. Louis-San Francisco, with office at St. Louis, Mo., effective March 15.

William Ellis, formerly commerce counsel of the Chicago, Milwaukee & St. Paul, and **Nathan Matthews**, of Boston, Mass., have been appointed assistants to **John Barton Payne**, general counsel of the United States Railroad Administration at Washington.

E. E. Adams, consulting engineer, and **F. W. Sercombe**, assistant controller of the Union Pacific System, have been appointed assistants to **R. S. Lovett**, director of the division of capital expenditures of the United States Railroad Administration at Washington.

C. C. Barry, auditor of the Los Angeles & Salt Lake, with office at Los Angeles, Cal., has been elected secretary, with headquarters at Los Angeles, vice **W. H. Comstock**, assigned to other duties, and **P. J. Hunt** has been appointed acting freight claim agent, with office at Los Angeles, vice **J. R. Bordeaux**, resigned.

Operating

George Masten has been appointed superintendent of the Tennessee Central, with office at Nashville, Tenn.

A. J. Hasenbalg, trainmaster of the Chicago, Milwaukee & St. Paul, with office at Chicago, has been appointed assistant superintendent of the Chicago Terminal succeeding **W. C. Bush**, transferred.

J. C. Stamm, trainmaster of the Alabama & Vicksburg, with office at Vicksburg, Miss., has been appointed superintendent of the Vicksburg, Shreveport & Pacific, vice **H. B. Hearn**, resigned to engage in other service, and **L. B. Harris** has been appointed trainmaster of the Alabama & Vicksburg, vice Mr. Stamm.

H. C. Nutt, general manager of the Los Angeles & Salt Lake with headquarters at Los Angeles, Cal., having accepted a commission as deputy director general of American railroads for service in France, **W. H. Comstock**, secretary, with office at Los Angeles, has been appointed acting general manager during Mr. Nutt's absence.

S. L. Racey, superintendent of the Third division on the Colorado lines of the Denver & Rio Grande, with headquarters at Gunnison, Col., was transferred to the Green River division, with headquarters at Helper, Utah, succeeding **J. A. Shepherd**, transferred. **C. E. Leverich**, chief dispatcher on the Utah line, with headquarters at Salt Lake City, Utah, has been appointed trainmaster of the Salt Lake division, with the same headquarters, succeeding **W. R. McPherson**, who was appointed assistant superintendent of the Green River division, with headquarters at Green River, Utah, succeeding **G. E. Wilcox**, promoted, effective March 14.

E. L. Desjardines, who has been appointed superintendent of the Canadian Government Railways, Transcontinental

division, with headquarters at Edmundston, N. B., as has already been announced in these columns was born on August 17, 1859 at St. Jean Port Joli, Que., and was educated at the St. Anne College. He began railway work in August, 1876, as a telegraph operator on the Intercolonial Railway and subsequently served as train baggage master. From 1880 to 1898 he was train despatcher at Riviere du Loup, and then became chief despatcher at Levis. In 1912 he was appointed assistant superintendent, which position he held at the time of his recent appointment as superintendent as above noted.

W. F. Kirk who has been appointed superintendent of the Central Division of the Missouri Pacific, with headquarters at Van Buren, Ark., as announced in these columns March 1, was born at Osage City, Kan., on August 19, 1881. He was first employed as a messenger on the Atchison, Topeka & Santa Fe in November, 1897. In April of the following year he was transferred to the maintenance of way department as a section laborer. In November, 1899, he entered the service of the Wells-Fargo Express Co. as a messenger. In February, 1900, he was employed by the Pecos Valley as a telegrapher, being promoted to despatcher in June, 1900. From December, 1900, to March, 1901, he was a despatcher on the Michigan Central, and from April, 1901, to January, 1902, he was a telegrapher with the Missouri Pacific, since which time he has served consecutively to date as despatcher, chief despatcher, trainmaster, assistant superintendent and assistant to the general superintendent of transportation. In December, 1917, he became acting superintendent of the Wichita division and served in that capacity until his appointment as noted above.

Traffic

H. L. Hammill, traveling agent of the Chicago & North Western with office at St. Louis, Mo., is to assume the duties of **G. F. Brigham**, general agent, resigned, effective April 1.

H. J. Titus, superintendent of the dining car service of the Northern Pacific, with headquarters at St. Paul, Minn., has resigned to become associated with the Chauncey Wright Restaurant Company of Seattle, Wash.

Engineering and Rolling Stock

Arthur Crohn has been appointed general master mechanic of the Missouri, Kansas & Texas, with headquarters at Denison, Tex.

H. R. Manby, superintendent and engineer maintenance of way of the Tennessee Central with office at Nashville, Tenn., has been appointed chief engineer and the position of engineer maintenance of way has been abolished.

G. B. Herington has been assigned as supervising engineer of the Tucson division of the Southern Pacific, with headquarters at Tucson, Ariz., and during such assignment will have general charge of all matters pertaining to maintenance of way and structures.

Purchasing

A. H. Young, tie and timber agent of the Seaboard Air Line, with office at Hamlet, N. C., has been appointed general storekeeper, with office at Portsmouth, Va., vice **D. D. Cain**, resigned to accept services with another company, and **J. G. Calori** has been appointed tie and timber agent, vice Mr. Young.

Obituary

Richard H. L'Hommiedieu, formerly assistant to the vice-president of operation of the Michigan Central, died in Detroit, Mich., March 18, age 68 years.

WOOD AS FUEL is proving quite popular at Brantford, Canada. The West Brantford municipal yards are being turned into a wood depot for next winter, the city authorities being determined that this city shall not be caught by a fuel famine as was the case during the past winter. Orders will be placed for 5,000 cords of wood, and to facilitate handling, a railway siding will be laid into the yard, the rails being available from the street railway there.

Railway Age

EDITORIAL

DAILY EDITION

Further proof of the wisdom of the action of the American Railway Engineering Association in proceeding with this convention is evidenced by the registration of its members. In spite of the statements frequently made by pessimists previous to the convention, that railway men would be so busy that they could not attend the convention, the registration of members for the first day was 293, or 4 more than last year; for the second day 103, for the third day 20, or a total registration of 416 members. Including guests, over 600 railway men attended the meeting. A feature which characterized all of the sessions was the large number of men present in the hall. Although the convention extended well beyond the usual time of closing on Thursday afternoon, over 200 men remained until adjournment and the discussion was active until the close of the meeting. The attendance at the Coliseum was equally encouraging, that on Wednesday being 6,203, and up to 6 p. m. yesterday 2,656. The outstanding feature of this year's attendance was the fact that the people who visited the exhibit showed greater interest in what the exhibitors had to show, this being particularly true with reference to labor-saving devices and economical methods of doing work. Another outstanding feature is the very small attendance of the local public, who have attended the exhibits in fairly large numbers in other years. The attendance this year has been limited almost entirely to railroad officers and men who, realizing the serious conditions existing at the present time, came here to make a thorough and careful study of all devices that can help them to obtain more efficient results.

The report on the comparative merits of ballast and reinforced concrete trestles, resubmitted by the committee on Wooden Bridges and Trestles after reconsideration by that body since its original presentation last year, revives a controversy between the advocates of these two types of structures which was carried on at some length at previous conventions, notably in 1911, when the committee on Masonry submitted a report on reinforced concrete trestles. As presented so lucidly in the report considered yesterday, the problem is purely one of the relative life as compared with the relative costs of the two structures, for, as pointed out in the report, "even though actual installation costs of the two structures under comparison are lacking, their relative ultimate economy can be computed as a ratio of the two costs regardless of the numerical value thereof." There are, however, other factors that enter into a consideration of this subject, some of which have been discussed in detail at previous conventions. Among these may be mentioned the appearance; relative sense of security or solidity as affecting the traveling public; fire hazard, etc. The life to assume in the case of "permanent" structure is also a question. There is a stone arch viaduct on the Baltimore & Ohio that has been in service since 1829 and is apparently good

for many years to come. On the other hand, many structures have been abandoned in connection with grade and line revisions after very limited periods of service. The contention in the discussion yesterday was entirely concerned with the principles of economics involved. As long as the same method of financing is assumed in each case, the results to be obtained with the use of the several formulae are the same. Just which method is correct seems to be still a matter of question, and in view of this, the action of the association in adopting both analyses for publication in the Manual seems well taken.

Obviously the convenience of railway officers and employees cannot be taken into consideration in the program for curtailing passenger service now being undertaken to expedite the movement of freight. Nevertheless, a reduction in the number of passenger trains will tend to reduce the efficiency of many employees of the engineering and maintenance of way departments. While railway officers, including the division engineer, are usually supplied with annual passes on neighboring roads, enabling them to make the most of the train service on adjoining lines in the same territory, it has not been customary to make similar provision for men in subordinate positions. Reductions in passenger service will not only work a hardship on the men not now enjoying the privilege of foreign passes whose duties take them over various parts of the line, but even with a material increase in night traveling the proportion of their time devoted to effective employment will suffer a pronounced decrease. It is true that such men are commonly accorded the privilege of riding on freight trains, but with time freights making only a limited number of stops and tonnage trains moving at low speeds, the use of freight trains will fall far short of compensating for the reductions in the passenger train service. The natural remedy for this situation would seem to be an extension of the foreign pass privilege to the men in the subordinate positions. With the unified operation obtaining under government control there would seem to be less objection to this practice than under normal competitive operation, while the unavoidable abuses of such transportation can be reduced to the minimum by limiting the passes to the territory in which the employee can make use of them in his daily work.

The announcement of the Committee on Iron and Steel Structures that it has undertaken the revision of the Association's General Specifications for Steel Railway Bridges is an evidence of the progress that has been made in steel railway bridge design since the adoption of these specifications in 1906. That these rules for bridge design fulfilled a definite need is indicated by their very general acceptance throughout the country. It is also in keep-

Timber and Concrete Trestles Compared

An Excellent Attendance Record

More Foreign Passes Required

ing to call attention to the fact that much of the progress which is rendering these specifications obsolescent is the direct result of the efforts of this same committee.

Chief among the results secured through its efforts has been a determination of the actual impact influence of moving trains. The committee has supplied definite information on a subject which was formerly a matter of pure conjecture. Further progress on this subject is contained in the contemporary report and demonstrates specifically that the influence of electric locomotives is materially less than that of steam locomotives of the usual types. While the committee indicates that further work must be done on the subject of secondary stresses before the information now at hand can be made available for general use, it has already done much to clear up this perplexing subject.

In giving this committee credit for the work it has done, it is necessary in all fairness to mention the epoch making work of the Special Committee on Columns of the American Society of Civil Engineers, the results of which were made available early this year. The report on column tests presented by the A. R. E. A. committee this year contains information which is in a measure supplementary to the work of the A. S. C. E. committee.

A Great Opportunity

THE AMERICAN RAILWAY ENGINEERING ASSOCIATION is entering the most important and the most critical period in its history. Never before has it been confronted with greater responsibilities or with larger opportunities for constructive work. The extent to which it will measure up to its full opportunities will be determined largely by its actions during the next few months.

The association is now entering the twentieth year of its existence. A study of the proceedings of the annual meetings and the Manual cannot fail to impress one with the wide range and the high value of the work which has been done. The fact that these volumes are to be found in the libraries of almost every railway officer having to do with engineering and maintenance of way matters in this country indicates the high esteem in which they are held.

The entrance of the United States into the world war last April has led to radical changes in conditions in every line of activity. No industry has been affected more directly or more deeply than the railroads. These changes are creating new problems in all branches of railway service, not excluding the engineering department. It is now the primary duty of all organizations to concentrate on the solution of the main problem confronting this country—that of winning the war. The Engineering Association made important progress in this direction during the past year, as was evidenced during the meeting which closed yesterday afternoon. The committee on Yards and Terminals presented a valuable questionnaire on yard improvements for use by railway officers confronted with the problem of increasing the capacity of their yards with minimum changes. The discussion of the report of the committee on Iron and Steel Structures was directed largely toward means of carrying structures over rather than renewing them under present conditions. The committee on Economics of Railway Labor also reported on certain phases of the labor problem which is now of paramount importance.

The coming year will present to this association greatly enlarged opportunities for service. In order to be of the

maximum value to its members, to the railways and to the government it may be necessary to modify existing practices and to disregard long-established precedents, but this has been almost universally necessary in every activity. The Board of Direction can do much to facilitate the war-time activities of the association by giving primary consideration in the assignments of subjects, to the selection of those topics which are of the greatest importance in the light of present day conditions.

It may also be considered advisable to issue advance reports or bulletins on certain subjects for which there is a demand for immediate information without attempting to hold them for the annual convention. Conditions are changing so rapidly and the association has such an excellent opportunity for collective work that it would seem eminently fitting to take up for consideration some of the more pressing problems and, by concentrating the attention of certain committees upon them, to prepare reports for presentation very early. A considerable amount of valuable information regarding labor saving devices was developed during the discussion of that part of the report of the committee on Economics of Railway Labor bearing on that subject and it has been suggested that an attempt be made to collect all of the available material of this character into a booklet for publication within the next few weeks. This is illustrative of similar opportunities in other phases of the work.

Since the government has assumed control of the railroads and is now directing their operations it must necessarily assume responsibility for the maintenance of these properties. This in itself will give rise to many problems. The director-general has shown his desire to call upon railway men and railway organizations for assistance in the solution of his problems. The American Railway Engineering Association has been engaged in the study of maintenance of way problems for 20 years. It includes in its membership almost all of the more prominent railway engineers in the country. Its proceedings, therefore, may fairly be considered to represent the consensus of opinion regarding best practices in engineering and maintenance of way matters. As expressed in the resolution passed yesterday afternoon the association has offered to co-operate with the director-general in any way in which it can be of assistance and it is very probable that he may desire to call upon this organization for information concerning practices already established as well as to practices which are still in the process of development.

The Effect of Speed on Maintenance Charges

IN UNDERTAKING AN ANALYSIS of the influence of the speed of trains on the cost of maintenance the Track committee has directed its attention toward a problem, the solution of which will be of much importance to the railways. It is a matter of common knowledge among railway men that a high-speed train is more destructive to track than a slow one. The difficulty has been in determining the amount of this increased destruction.

This question has been brought prominently to the front in litigation relative to passenger fares in a number of middle western states. Following the general enactment of two-cent fare legislation in these states a few years ago, the roads have attempted to prove that these rates were confiscatory. This has made necessary an analysis of operating expenses and the allocation of these expenses to the various classes of traffic. Many of the operating expenses can be charged directly to the

traffic giving rise to them. Others cannot be divided so readily. This is particularly true of a large part of the maintenance of way expenditures for the tracks are used in common by trains of all classes. These expenses must be distributed on some arbitrary basis and the difficulty has been to arrive at a basis which can be mutually agreed upon between the representatives of the railroads and the states as fair and equitable.

In their desire to prove the reasonableness of low passenger rates, the states have contended for a low distribution of maintenance expenses chargeable to passenger traffic, while the representatives of the railroads have contended for a high ratio which would add to the expenses of passenger traffic, and tend to prove that the rates were unreasonably low. In one instance a state has endeavored to maintain the position that the distribution should be on the basis of the gross ton miles of freight and passenger traffic, in this way disregarding entirely the effect of speed. This is typical of conditions which exist in a number of states and of controversies which will rise in the future because of the present tendency to make each class of service bear its full proportion of operating costs. The Track committee has cut out for itself a hard problem, but its proper solution will be of great value to the roads.

Illinois Central Signal Men at Coliseum

The Illinois Central signal department was well represented at the Coliseum, nine out of eleven of its signal supervisors attending the exhibit, in addition to seven foremen and a large number of maintainers, helpers and repairmen.

W. C. Pembroke Promoted

W. C. Pembroke, assistant engineer of the Coal & Coke railway, with headquarters at Gassaway, W. Va., has been appointed engineer maintenance of way with the same headquarters, succeeding A. C. Hawkins, who has resigned.

Signal Department Changes

J. W. Peck, signal supervisor of the Missouri, Kansas & Texas with headquarters at Waco, Tex., has been appointed general signal inspector of the Chicago Great Western with office at Chicago. J. A. Murrell, signal foreman, has been appointed supervisor to succeed Mr. Peck.

A. R. Eitzen Appointed

Bridge Engineer on "Katy"

Arthur R. Eitzen, formerly office engineer in the bridge department of the Kansas City Terminal railway, and more recently with the Kansas City Bridge Company, has been appointed bridge engineer of the Missouri, Kansas & Texas with headquarters at Dallas, Texas.

Union Pacific Promotions

C. B. Segar, vice-president and controller of the Union Pacific system, was elected a member of the executive committee, and also acting chairman of the committee, succeeding R. S. Lovett, resigned, to become director of the Department of Capital Expenditures on the staff of Director-General McAdoo. He was also elected a member of the executive committee and acting chairman of the Oregon Short Line and the Oregon, Washington Railroad & Navigation Company. W. A. Harriman, vice-president, was made a member of the executive commit-

tee of the Union Pacific and also elected a director of the Oregon Short Line, succeeding Mr. Lovett. C. A. Peabody, vice-president of the Delaware & Hudson, was elected a director of the Oregon, Washington Railroad & Navigation Company, succeeding Mr. Lovett.

Changes in Illinois Central Signal Organization

P. G. Pendorf, formerly signal supervisor of the St. Louis division of the Illinois Central at Centralia, Ill., resigned effective March 16 to accept a position with the sales department of the Buda Company, with headquarters at Chicago. E. E. Goddard was appointed signal supervisor in his place. Mr. Keller has been appointed signal supervisor, with headquarters at Champaign, Ill., effective March 16.

Orders of Railroad Administration

Regarding Capital Expenditures

(From Our Washington Correspondent)

President Wilson yesterday (Thursday) signed the Railroad Control Bill.

Designs for standard cars and locomotives have been practically approved. They were gone over by the regional directors Monday and Tuesday and the final specifications are being revised in Pittsburgh this week for submission to the director-general next Monday.

Director-General McAdoo yesterday issued General Order No. 12, giving rules to be observed with respect to railroad work involving charges to capital account. He declared it is important to avoid expenditures not absolutely necessary. The construction of new lines, branches or extensions is not to be entered upon without the director-general's approval.

No new locomotives or cars are to be ordered or constructed without the director-general's approval.

Work contracted for or started before January 1 may be continued. No work involving charges to capital account of more than \$25,000 shall be contracted for unless authorized by the director-general.

Changes on the Salt Lake Line

Owing to the practical cessation of construction work and the approaching completion of the valuation work on the Los Angeles & Salt Lake, the office of engineer of maintenance has been consolidated with that of chief engineer and the duties have been assumed by Arthur McGuire, chief engineer. R. K. Brown, engineer maintenance, has been appointed division engineer at Salt Lake, succeeding Frank Strong, who has resigned to enter military service. W. H. Comstock, secretary of the Los Angeles & Salt Lake, has been appointed acting general manager, succeeding H. C. Nutt, general manager, granted leave of absence to accept a commission as major with the railway forces in France.

American Railway Engineering Association Proceedings

A Report of Thursday's Sessions Including the Presentation of Ten Committee Reports With Discussions

THE FINAL SESSIONS OF THE American Railway Engineering Association were held on Thursday. The morning meeting was called to order promptly at 9:30 by President Sullivan. Owing to the large amount of time taken up in the discussion of the report on

Wooden Bridges and Trestles, seven reports were held over for the afternoon session. Final adjournment was taken about 5:30. The abstracts of the reports and discussion of the various subjects considered are given below:

Report of Committee on Wooden Bridges and Trestles

THE COMMITTEE RECOMMENDED the following revisions in the Manual:

(1) In the standard specifications for Southern yellow pine bridge and trestle timber, change the heading, "Standard heart grade, longleaf yellow pine," above paragraph 4, on page 231, to read, "Standard heart grade, dense yellow pine," and change the heading, "Standard grade, longleaf and shortleaf yellow pine," above paragraph No. 10, on page 232, to read, "Standard grade, sound yellow pine." This is to conform to the classification of yellow pine timber as adopted by the Association in 1916.

(2) That all illustrations, tables and diagrams in the Manual be designated by the number of the page on which they appear, instead of being numbered consecutively, using subscripts when more than one reference appears on any single page.

(3) On page 246, change the last part of paragraph No. 2, "The inner guard rail should not be higher or over one inch lower than the running rail," to read, "* * * should not be higher or more than one inch lower * * *"

(4) On page 232, paragraph No. 9, and on page 241, paragraph No. 26, change the term "guard rails" to "guard timbers" to conform to the definitions given on

page 220 and to the use of the term of page 234, paragraph No. 6.

Comparative Merits of Ballast and Reinforced Concrete Trestles

All conclusions of the committee's report of last year were adopted by the Association except one, namely: "Creosoted Timber Trestles are more economical than concrete, except when the cost of the concrete structure is less than one and one-half times the cost of the wooden structure."

Upon presentation of the report to the convention considerable discussion occurred, the general purport of which was that this conclusion should be reconsidered by the committee, principally with respect to the method employed in reaching the results.

The suggestion has been made that the sinking fund method is more nearly correct in principle for indicating the comparative ultimate economy than the method used by the committee and heretofore called the "Capitalization Method." Accordingly, much effort and study has during the past year been devoted to the practical effects of the application of the methods to the problem at hand, and the committee desires to present to the Association the results of its endeavors along this line, both for the specific purpose under discussion and for other purposes of a similar nature.

To ascertain whether application of the sinking fund method of financing in matters of the kind under discussion is generally used or advocated by railway officers, the chairman of the committee sent out 154 inquiries. Out of a total of 122 replies, answering for an aggregate of

218,078 miles of line, received thus far, but one, covering a total of 2,085 miles, or less than 1 per cent., reports the use of the sinking fund method; eight, with a mileage of 13,002, or 6 per cent., while not using it, deem it desirable or have it under consideration; 121 reporting for a total of 215,993 miles of line, or more than 99 per cent., indicate no actual application whatever. It would seem, therefore, improper to assign any merits to the method on the grounds of widespread favor or extended use as representative of good practice.

From the replies received to the committee's inquiry, it appears that, with one exception, all roads either (a) set aside a reserve in their working capital to provide for renewals, or else (b) replace structures with money from current funds or money borrowed for the purpose at the time the structure needs renewal. Note that (a) is the sinking fund method, with interest return not less

of interest in financing the recurring renewals of perishable structures.

(3) Wider departure between actual monetary demands and available financial provision therefore occurs with the sinking fund method, as compared with the capitalization method, if an error has been made in expected length of life.

(4) That the sinking fund method, by reason of its extended use and general favor, should be adopted in comparing ultimate economy of railway structures is entirely unwarranted.

(5) The sinking fund method is cumbersome, complex and difficult of strict application in practical use, while the capitalization method is relatively simple and meets with equity every requirement necessary for comparative purposes.

(6) The capitalization method is virtually the only method in use to-day.

CAPITALIZATION METHOD COMPARATIVE ECONOMIC VALUE BALLAST DECK TRETTLES

w = Cost of Wooden Trestle

c = Cost of Concrete Trestle

r = Rate of interest

m = Life in years of wooden trestle

n = " " " " concrete " "

x = Amount capitalized which will replace wooden trestle every m years

y = " " " " concrete " " n years

f = Ratio of first cost of concrete trestle to first cost of wooden

trestle to produce equal ultimate economy, that is

$f = \frac{c}{w}$ or $f = \frac{w}{c}$

Then $x(i+r)^m = w + x$ and $y(i+r)^n = c + y$, whence $x = \frac{w}{(i+r)^m - 1}$

and $y = \frac{c}{(i+r)^n - 1} = \frac{fw}{(i+r)^n - 1}$

To produce equivalent ultimate economy $w + x = c + y$, which by substituting values of x and y gives

$$w + \frac{w}{(i+r)^m - 1} = fw + \frac{fw}{(i+r)^n - 1}$$

Dividing by w and solving for f it is found that

$$f = \frac{1 + \frac{1}{(i+r)^m - 1}}{1 + \frac{1}{(i+r)^n - 1}}$$

which is variable only with respect to m and n the assumed lives of wood and concrete. By using as an argument

first cost of wooden trestle with a constant life regardless of such cost, the first cost of a concrete trestle with a life of n years is found by applying to cost of wooden trestle the coefficient f determined for n years.

Analysis of Relative Economy of Wooden and Concrete Trestles

than the cost of borrowed money, which method has been shown to be identical in ultimate cost with the capitalization method, while (b) is the method in most general use and is herein called the replacement method. Computing the total cost by the replacement method, it also is found to be identical with the capitalization method.

It appears, therefore, that the capitalization method proposed by this committee is virtually in use to-day by practically all roads.

(1) The sinking fund method is identical with the capitalization method when the interest rate on annuities is the same as the interest rate on the original investment cost, which equality of interest rate is logical, desirable and imperative for the conservation of finance.

(2) There is not only improvidence but extravagance in the use of the sinking fund method with a lower rate

of interest in financing the recurring renewals of perishable structures.

It is impossible to secure reliable figures for the cost of repairs to keep in serviceable condition throughout their lifetime ballast deck creosoted trestles, principally because no record thereof has been kept for sufficiently long periods to establish any basis for computation. No additional data of value for this factor of the case could be collected during the year. With respect to the extra cost of maintenance of way and structures, due to keeping free from dry grass, weeds or other inflammable debris the right-of-way at the bridge site, the committee has already expressed its judgment that such service should be equally well performed whether the trestle is a concrete or wooden structure, and, therefore, should be neglected in a comparison of the two types. This opinion is based on very obvious requirements of eliminating hazard of fire damage to contiguous property, both of railway and others, and of general neatness and thrift. Finally, we may add with propriety, that concrete structures will not be entirely free from charges for maintenance and inspection.

Insurance

Attention is directed to the committee's discussion of "Fire Hazard" in the report of last year, to the effect that there is little probability of fire loss in the ballast deck timber trestle. During the year inquiries have been sent out to the larger railways of the United States and Canada, in an endeavor to ascertain current practice with respect to whether insurance is placed on either open deck or ballasted deck timber trestles, and if so, whether a difference in percentage of value for which the two types of wooden trestles are insured prevails. Out of a total of 157,673 miles of line reporting, 69,039 miles, or 43.8 per cent., carried no insurance on such structures; 28,623 miles, or 18.2 per cent., maintain their own insurance fund; 60,011 miles, or 38 per cent., insure with outside companies. While generally it seems to be the practice of roads using both open deck and ballasted deck trestles not to differentiate between the two kinds, either in percentage of value insured or rates paid therefor, we find there is so great a divergence in such rates paid by the several lines that no general rule is applicable. It is evident, however, that with the prevalent low insurance rates and drafts, inconsiderable in magnitude and infrequent in occurrence, on company insurance funds, we are not justified in introducing into the question of ultimate economy any numerical value for a factor of so uncertain and elusive a character. It seems to us far better to point out the probable degree of fire hazard to be considered in the adoption of type

rather than to attempt the assignment of what must necessarily be a speculative monetary value thereto, and this course has been followed.

Conclusions.

Attention is invited to the committee's recommended disposition of its report of last year of all these uncertain and indeterminate factors, which were mentioned in detail, and we beg to submit briefly a repetition of such recommendation, based on the following considerations:

(1) The capitalization method properly shows the relative worth of the capital invested in structures of

Comparative Cost of Installation of Ballast Deck Trestles per Linear Foot to Produce Equivalent Economic Value; Interest at 6 Per Cent. Per Annum Assuming Creosoted Timber Trestle Will Serve 20 Years.

| CREOSOTED TIMBER SERVICE LIFE 20 YEARS | JUSTIFIABLE EXPENDITURE FOR CONCRETE SERVICEABLE FOR | 30 Yrs | 40 Yrs | 50 Yrs | 60 Yrs | 70 Yrs | 80 Yrs | 90 Yrs | 100 Yrs |
|--|---|---------|---------|---------|---------|---------|---------|---------|---------|
| \$10.00 | \$12.00 | \$13.09 | \$13.74 | \$14.09 | \$14.28 | \$14.39 | \$14.46 | \$14.49 | |
| 11.00 | 13.20 | 14.39 | 15.12 | 15.50 | 15.71 | 15.83 | 15.90 | 15.94 | |
| 12.00 | 14.40 | 15.70 | 16.49 | 16.91 | 17.14 | 17.26 | 17.35 | 17.39 | |
| 13.00 | 15.60 | 17.01 | 17.86 | 18.32 | 18.57 | 18.70 | 18.79 | 18.83 | |
| 14.00 | 16.80 | 18.32 | 19.24 | 19.73 | 20.00 | 20.14 | 20.24 | 20.28 | |
| 15.00 | 18.00 | 19.63 | 20.61 | 21.14 | 21.43 | 21.58 | 21.68 | 21.73 | |
| 16.00 | 19.20 | 20.94 | 21.99 | 22.54 | 22.86 | 23.02 | 23.13 | 23.18 | |
| 17.00 | 20.40 | 22.24 | 23.36 | 23.95 | 24.28 | 24.46 | 24.57 | 24.63 | |
| 18.00 | 21.60 | 23.55 | 24.74 | 25.36 | 25.71 | 25.90 | 26.02 | 26.09 | |
| 19.00 | 22.80 | 24.86 | 26.11 | 26.77 | 27.14 | 27.34 | 27.46 | 27.53 | |
| 20.00 | 24.00 | 26.17 | 27.48 | 28.18 | 28.57 | 28.77 | 28.91 | 28.98 | |

different serviceable lives and is, therefore, a desirable criterion for comparing ultimate economy.

(2) In the absence of authentic data as to cost of current maintenance, inspection, insurance and uncertain renewal cost of both or either of two types of structures, the annual expense of upkeep should evidently be omitted in any comparative statement of cost, leaving the relative influence thereof to be considered by the investigator.

The committee has been guided by these two principles in reporting its conclusions—the first in using the

in assumed life of timber trestle we think ample to compensate for the indeterminate elements and consider further refinement totally unnecessary, especially since there is likely to be a difference of opinion, even to the extent of 100 per cent., in the assumption as to the probable life of the concrete.

We, therefore, believe conclusion No. 6 of last year's report wholly warranted, and, after thorough reconsideration, again recommend its adoption for printing in the Manual in the order and substance as therein stated: "Creosoted timber trestles are more economical than concrete, except when the cost of the concrete structure is less than 1½ times the cost of the wooden structure."

A recommendation is also made for the adoption by the Association for printing in the Manual of the formula for the capitalization method.

In order that the members may also have at hand for convenience in any purpose for which applicable all the results of the committee's work, it is further recommended that the statement of ratios of installation costs developed by the capitalization method be adopted and printed in the Manual.

Use of Lag Screws in Trestle Construction

For several years the committee has had the subject of lag screws under investigation. A comparison of the best methods of application has been made the subject of careful study. Early in 1914 various inquiries were sent to a large number of carriers throughout the country, outlining to them the desire of the committee and requesting certain information to enable it to further study the merits of lags. The constant aim of the committee has been to locate the source of trouble where lags had been in use, and later discarded on account of not meeting requirements.

A study of the 131 replies received to inquiries of the committee, aggregating 203,000 miles of railway, showed that 103 roads, with a combined mileage of 159,000 miles, never used lag screws in any form, while 28 roads, with a combined mileage of 44,000 miles, had used them in some form or other with varied success. To formulate a more conclusive comparison, another circular was sent to such carriers as had not yet used lags to induce them

Ratio of Installation Costs of Structures to Produce Equivalent Ultimate Economy in Their Perpetual Maintenance. Based on an Interest Rate of 6 Per Cent. Per Annum for Capital Invested Therein, and Neglecting Costs of Repairs.

| SERVICE LIFE YEARS | 5 | 10 | 15 | 20 | 25 | 30 | 40 | 50 | 60 | 70 | 80 | 90 | 100 |

This statement is developed from formula in Addenda (1), Analy. No. 1.

capitalization method for indicating the justifiable expenditure in installation costs of concrete trestles to produce ultimate economy equivalent to various installation costs of creosoted timber trestles, and the second in its suggestion as to the assumed life of the timber structure to be used as the argument, for notwithstanding the practical unanimity of the best authorities in that the creosoted structure will last 25 years, it has recommended to the Association the use of a 20-year life in considering economic value. This arbitrary reduction

to make a test along lines outlined by the committee. Of the 75 replies received in answer to this circular, 37 roads, with a combined mileage of 74,000 miles, indicated their willingness to make a test of lag screws along such lines and under such instructions as the committee might direct. A plan was prepared illustrating the recommendations of the committee. On this same plan there were shown designs illustrating the practice of a few of the roads relative to their method of use of lags. This plan was sent to each of the 37 roads previously express-

ing its willingness to give lags a trial on one or more structures on the line of its road. To this request, 17 roads, with a combined mileage of 39,600, complied and reported the results of their test to the committee. Only two of these roads reported in any way adversely, while the large majority of them were convinced that lags had certain advantageous features not common to bolts.

The principal features of the test, as recommended by the committee, are the elimination of the dapping of guard timbers and ties, and the use of lags in each tie with a drift bolt in each second tie to securely fasten the tie to the stringer. It is also evident from an examination of the plan that the lining of the track on the stringers is materially simplified, since there is no dapping of ties over stringers to interfere.

Where the suggestions of the committee were followed in the test almost universal satisfaction was obtained.

Conclusions

1. The committee recommends that the changes in the Manual be adopted.

2. The committee recommends that the following conclusions in regard to the use of lag screws in trestle construction be adopted and published in the Manual:

(a) Lag screws require greater care than ordinary bolts and nuts to properly install, but are cheaper on account of ease of application.

(b) Lag screws, where properly applied, hold ties from bunching equally as well as bolts and nuts, and better than daps, in timber guard rails.

(c) If the lag screws are tightened after timber has shrunk, there is less cost of maintenance than with bolts and nuts.

(d) Use of lag screws renders unnecessary the dapping of guard timbers, and, therefore, decreases cost of trestles without impairing quality.

(e) Surfacing (sizing) ties and guard timbers is better construction than dapping; makes a better riding track, thus decreasing impact stresses, and is therefore good practice.

(f) For proper application of lag screws, holes in guard timbers should be bored with auger bits $\frac{7}{16}$ in. less in diameter than the nominal size of lag screws used.

The committee recommends the following subjects for next year's work:

1. Revision of the Manual.—Revise the table of recommended stresses on page 244 of the Manual and enlarge it to include stresses in treated timber.

2. Revision of Manual.—Consult with the Committee on Grading of Lumber and prepare changes required to eliminate duplication.

3. Continue study of details of docks and wharves.

4. Select the best types of timber trestles and prepare standard details.

Committee: E. A. Frink (S. A. L.), chairman; W. H. Hoyt (D. M. & N.), vice-chairman; F. Auryansen (L. I.), H. C. Brown, Jr., A. D. Case (B. & A.), A. H. Freygang (B. & O. S. W.), E. A. Hadley (M. P.), F. F. Hanly (B. & O.), G. A. Haggander (C. B. & Q.), H. T. Hazen (C. N.), C. S. Heritage (K. C. S.), A. O. Ridgway (D. & R. G.), F. S. Schwinn (I. & G. N.), C. S. Sheldon (P. M.), I. L. Simmons (C. R. I. & P.), D. W. Smith (H. V.), A. M. Van Auker (M. C.), W. H. Vance (St. L. S. W.), D. R. Young (D. L. & W.).

Discussion

(Earl Stimson, B. & O., presiding.)

E. A. Frink (Chairman): The Board of Direction assigned four subjects to the committee for this year's work. I do not think it necessary to read any of this preliminary matter.

The first thing I will call your attention to is the revision of the Manual and Appendix.

The committee recommends four changes in the wording of the Manual. These do not make any changes in the subject matter of the Manual, but the first one simply makes the specification of the Committee on Wooden Bridges and Trestles agree with the standard wording of the Yellow Pine Rules that we have adopted.

(Mr. Frink then read the matter under appendix A.)

Mr. Frink: I move the adoption of the changes recommended by the committee.

C. W. Baldridge (Santa Fe): Does that motion cover all four sections?

The Vice-President: All except No. 2.

Mr. Baldridge: In No. 3, in which they propose a change of importance, in regard to the inside guard rail, providing that the inside guard rail should not be higher or over one inch lower than the running rail. I think that is important, and suggest that the words "or more than one inch lower" be omitted, and that you make a little wider variation.

Mr. Frink: The change the committee makes completes the meaning of the clause now in the Manual. We are not changing the provision now in the Manual, we are making it clear and grammatical. It now says "the inner guard rail should not be higher or over one inch lower than the running rail."

The expression "one inch lower" does not seem good sense, and we want to make it something that is sensible, and that is the only purpose of the change. If the convention desires a revision of the inner guard rail specifications, that is another matter.

Mr. Baldridge: If I am not mistaken the present minimum height fixed was adopted prior to the adoption of our present heavy rail section, and it seems to me in view of the height of the heavy rail sections, a change should be made in the minimum height permissible for inner guard rails. A high guard rail has one disadvantage, in that it is more likely to follow the arch bar bolts or anything hanging down over a track, and if the truck is derailed, it may prevent the guard rail from acting as it should. I think we should alter the minimum height in line with the heavier rail sections, which are now recommended.

The Vice-President: The committee will consider that during the coming year.

(The motion made to adopt the four recommendations was put to vote and carried.)

Mr. Frink: The second subject assigned to the committee this year was to report on Docks and Wharves. We are now planning various details of wharf structures as a beginning, but are not prepared to make anything but a progress report on this subject.

The third subject was to report on the comparative merits and economic features of ballast deck and reinforced concrete trestles. In appendix B you will find a full discussion of the question and the reasons which led us to bring back to you the same conclusion we presented last year. I move that this section be adopted and printed in the Manual.

J. G. Sullivan (C. P.): I discussed this matter last year, and I want to say that it has been not so much a difference of opinion, but a misunderstanding on the part of the committee of the stand I took at that time. That there may be no misunderstanding, you will note that the committee says: "The replacement method consists in renewing a structure with new money or with funds taken from operating income. This method is in practically universal use in this country." That, I think,

is a fact. "The capitalization method as used by the committee is the investment of a fund of such an amount and in such manner"—now, mark this—"is the investment of a fund in such amount and in such manner that the accumulation of interest thereon will periodically amount to a predetermined sum." I think that is correct, and exactly the idea I had of the capitalization method. The committee further says, "The Sinking Fund as used in the Sinking Fund Method employed by this committee is a fund accumulated by equal periodical increments invested in such manner that at the end of a certain cycle the total will amount to a predetermined sum." That also is a statement of fact.

Now the committee says: "The Sinking Fund Method is identical with capitalization method, when interest rate on annuities is same as interest rate on original investment cost, which equality of interest rate is logical, desirable and imperative for the conservation of finance." I do not know what that has to do with the problem under consideration, when you are figuring to decide in your own mind what you are going to do.

Another difference of opinion is that the committee has evidently understood that because I said in our company and in our experience, to be on the safe side I figured the interest on our sinking fund or reserve, or whatever you call it, at a lower rate of interest—because I made the mistake, if it was one, of working on the conservative side, and figuring at a lower rate of interest, it did not by any means vitiate the method.

The committee then sent out a circular letter to all of the railways to find out, as they said, how many roads use the sinking fund method. They found that only one or two roads use the sinking fund method, but all the other roads wrote they believed it was the proper method to apply.

But had they asked the question, how many roads did their financing on the capitalization method, I venture to say that they would not have got one single solitary positive answer.

I have never heard of any concern, commercial, railroad or any other concern, doing business on such a basis. I have shown this discussion to two or three prominent railroad auditors and vice-presidents in charge of finance, and they seemed to pooh-pooh the idea of any commercial business being done on that method.

To sum up, the committee admits that if you take the same rate of interest, the results will be identical. Of course, they must be identical. That is just a matter of figuring.

If I had a certain amount to figure and I assumed the wrong rate of interest, that is not going to affect the finances of my company nor change its condition.

Mr. Frink: It seems that there has been a pretty general misunderstanding all around on this proposition. What this committee has been engaged in trying to do is to make a yard-stick to make a more definite measure of relative value of structures, not to either create or designate as proper a method of financing renewals. But in getting our yard-stick shaped up, we ran across these various methods to provide for renewals, and it seemed to us that an investigation of them and an explanation of them to the convention was necessary in order to understand the basis of the conclusions that we have formulated.

It seems to me that practically the effect of the three methods, the replacement method, the capitalization method and the sinking fund method, is the same. To my mind, those things are practically alike. Mr. Sullivan says no concern on earth that he knows of provides for the replacement of structures by the capitalization

method. You are all doing it, every one of you, as far as I know, except one concern. You are providing for replacements of structures by taking the money out of accumulated earnings, or else borrowing new money when the time comes. In order to get a sinking fund, you have got to put aside capital. Therefore, you have used the capitalization method.

Mr. Sullivan: I agree with everything that Mr. Frink has said, only that that applies to the sinking fund method, and not to the capitalization method. Renewals are charged to maintenance, but charging has nothing to do with it. The cost of replacements may be three or four times the amount of earnings.

Mr. Frink: If you set aside an amount of capital to draw interest to produce a certain annual sum for repairs, you are doing just exactly the same thing as if you had that capital in your business earning that money. There are two points that I want to speak of very briefly. One is the ultimate cost. It seems to me unquestionably that the ultimate cost of a structure is the measure of value of that structure to you. In the formulas the annual cost is given as to the ratio of the ultimate cost; therefore, in this particular case, the question of cost is a proper criterion, and that may be so in all cases. The committee is perfectly willing to concede that.

The other point is the sinking fund.

You will all agree with me that the popular conception of a sinking fund is a fund that is detached entirely from your capital. If that is true, necessarily a sinking fund must earn a lower rate of interest, because it is, I think, always true that the more secure an investment is, the more detached it is from ordinary business, the lower the return.

It has been the contention of the committee, and it is still their belief and conclusion, that any method used for the replacement of structures should keep, in the working capital of the company, all the money that is to be accumulated for a reserve, so that whatever interest you earn on your money will be devoted entirely to replacement. Of course, if you are so unfortunate as not to earn anything on the money, then the argument of the committee would fall to the ground; but we are assuming you can earn at least as much as capital is worth.

S. S. Roberts (consulting engineer): I spoke last year in support of this committee, and I wish to again speak in their support. I have used satisfactorily similar formulas to those proposed by the committee. The formulas are not new and untried. I agree thoroughly with the chairman, that these formulas have nothing to do with the methods of financing. They are simply means of comparing relative merits. I believe that the method this committee proposes is the best method for making comparison.

Mr. Sullivan: I have no objection to these formulas as such, and on the assumption on which they were worked out, I think they are admirable. On that assumption we will get correct results. I think the committee is entitled to the approval of the association for the care with which they have worked out this problem on a theoretical basis. The formula justifies itself, in so far as the assumptions on which it was worked out go, and if those assumptions are in accordance with the method of financing railway operations, then this is the proper formula to use; but if your particular railroad does not finance its operations, on the assumption on which this formula rests, then that formula is not a correct formula for you to use in advising your company as to the financial economics involved in the question of the expenditure of money. You must take this formula

or any other formula to the auditor of a railway company and have the auditor justify it before you can say that the results from the formula represent the financial results to the company.

(The motion for the adoption of the committee's conclusion was put to a vote and carried, and on a motion of Mr. Sullivan, Mr. Frink's motion to adopt the analysis on the capitalization method was amended to include also the fund method, and the comparison of the two.)

Mr. Frink: The next subject assigned to the committee was the use of lag screws in trestle construction. We believe that we have gotten sufficient information to justify a final report and conclusion. Our final report is shown in appendix C.

G. H. Gilbert (Sou. Ry.): The Queen & Crescent, for a period of six or eight years, at least, used bolts, and I regard that as much safer than the use of lag screws. Your ties may be split, and then you will have derailments under those conditions. A washer on the bottom of a tie will hold the bolt from falling out. I have seen many derailments through split ties, but only a very few bolts were out. Under the same conditions, I believe that you will find all of your lag screws will be torn out, therefore it does not seem to me that the lag screw is as safe to use.

J. C. Nelson (S. A. L.): I happened to be connected with the Queen & Crescent during this period that the gentleman mentions. One of our great difficulties at that time was to keep the nuts on the bolts, and I think I am safe in saying that after a year's period you can go to any trestle and pick up 80 or 90 per cent of the nuts. We adopted the plan of turning the bolts with the heads down, and putting in a slotted washer with a nail in it. Even with that, the bolt itself would turn and fall out, and we did not get any better results from that than we had with the other. I had never used lag screws until going to the Seaboard Air Line Railway in 1907. I found it in use there, and at first I was very skeptical about it, but I watched it for two years, and I found that there were fewer ties bunched on that railroad, where it had at that time something like 60-odd miles of wooden trestles, all of which used lag screws for their rails—I found fewer ties bunched than on any railroad I have known of or been connected with, and I have been watching them now for a little over 11 years.

(A motion that the conclusions be adopted and printed in the Manual was carried.)

The committee was dismissed with the thanks of the association.

Report of Committee on Masonry

TO THE CLASSIFICATION of Masonry on page 247 of the Manual should be added under the column headed "Dressing, Face or Surfaces," the different finishes of concrete, viz., spaded, rubbed, faced, unfaced, washed, acid treated, sand blast, tooled. This should be placed opposite "Bridge and Retaining Wall and Arch." Opposite "Culvert" "spaded" should be placed. On page 248 the definitions should be changed to agree with the definitions given in the adopted Specifications for Cement.

On page 249 under "Dressing" the definitions of concrete surface finishes as follows should be added:

SPADED FINISH.—Having surface formed by spading coarse aggregate back from the form into the mass concrete, so as to bring a surface of mortar next to the form.

RUBBED FINISH.—Having surface treated by rubbing with Carborundum or Cement Bricks, or Wooden Floats to remove all form marks and irregularities.

FACED SURFACES.—Having surface formed by placing a special aggregate not less than one inch next to the forms and contiguous with the body concrete.

UNFACED SURFACE.—Having surface formed by careful grading of the entire mass mixture and spading mixture to prevent voids leaving the coarse aggregate next to the forms.

WASHED OR SCRUBBED FINISH.—Having surface formed by rubbing or scrubbing to expose the aggregate.

ACID TREATED FINISH.—Having surface formed by dissolving cement with acid together with scrubbing to expose the aggregate.

SAND BLAST FINISH.—Having surface formed by the wearing effect of the sand blast.

TOOLED FINISH.—Having surface formed by dressing with bush hammer, crandall or other desired tool to a uniform depth and finish.

Page 252 should show after masonry specifications the new specifications for cement in accordance with the Supplement to the Manual, of July, 1917.

Report on Cost and Method of Constructing Concrete Piles and Make Recommendations on How and Where to Be Used. Present Additional Typical Designs for Concrete Piles for Different Loading and Rules for Driving Under Various Conditions and Loading

The committee, during the past year, has revised the definitions, specifications and information as to the manufacture and use of concrete piles which was submitted last year and presents with other data typical plans for their construction. The committee has not attempted to go into the details of design, as each condition of loading and of sub-soil demands special designs.

Advantages of Concrete Piles

In general, the more important advantages gained by the use of concrete piles are as follows:

(1) Foundations can be constructed above ground water level.

(2) As their size is not limited, piles of large diameter may be used in confined areas to reduce size of foundation and increase supports at points of greatest pressure.

(3) Concrete piles may be used in trestles where the height is such as to permit their use, making possible a permanent structure at a considerably less cost than the ordinary type of pier bridge.

(4) Concrete piles may be used to advantage for sheet piling for docks and wharves where lateral loads as well as vertical loads are to be resisted.

Classification and Description of Concrete Piles

Concrete piles may be properly divided into two classes:

(A) Pre-molded piles. Piles which are molded previous to driving.

(B) Molded-in-place piles. Piles which are molded in holes in the ground.

Pre-Molded Piles

There are many patented piles that are now available, many of which vary in some degree from the types submitted, each one having its particular advantages for some classes of work. The more common shapes used are the square and octagonal sections, depending upon the style of structure the piles are to carry. The square pile may best be used where a maximum top section is required to distribute the load. The octagonal pile, by reason of its comparative constant diametric section, presents the most suitable shape for general conditions. All shapes are used in the uniform section and in the tapered pile.

The uniform section pile should be used when the pile rests on solid rock or hardpan, or is driven through sand or other similar material which is subject to flow on account of future excavations or from other causes, tending to cause the piles to act as a column. The uniform section pile is more commonly used for all purposes on account of its greater strength for handling and lower cost of construction. The tapered pile possesses advantages over the uniform section pile when conditions require a close spacing, as its smaller volume causes less displacement of surrounding soil and piles. In general the tapered pile can be driven advantageously in all cases where the soil is clay or similar material, where skin friction will serve as a factor in the bearing power of the pile.

The typical designs for concrete piles, accompanying specifications for construction of concrete piles furnish, in the opinion of the committee, a sufficient variation to give information in regard to design of pre-molded piles that may be suitable for various classes of work. In general, piles which are designed to withstand handling are of sufficient strength for driving. The length, design and amount of steel reinforcement required depend upon the following factors:

- (1) The load which the pile is to carry.
- (2) The nature of the soil into which it is to be driven.
- (3) Whether the pile acts as a single column or whether skin friction may be obtained.
- (4) Forces to which the pile is subjected in handling.
- (5) The method employed in driving, including the use of the water jet.

The forms for concrete piles are generally supported on skids and are collapsible, the bottom being left under the piles until they are sufficiently seasoned to permit turning on the skids. The cost of constructing pre-molded piles depends upon the requirements as to design and on the manufacturing facilities.

The total cost of constructing and driving pre-molded concrete piles varies from 75 cents to \$2 per linear foot, with an average price of about \$1 per foot, varying with the conditions, length and number of piles made. Where the ordinary method of sheltered curing is employed, piles should be seasoned not less than 28 to 40 days before handling and driving, depending upon the amount of driving expected and the season of the year when the piles are made. The use of steam or other similar methods may be used to reduce the period of seasoning, or as a means of maintaining a uniform seasoning temperature during the winter season of the year.

Specifications for Constructing

Pre-Molded Concrete Piles

1. Piles shall be made in accordance with the dimensions shown on the drawings.

2. The workmanship and materials shall be in accordance with the Specifications for Plain and Reinforced Concrete and Steel Reinforcement of the American Railway Engineering Association, with the following modifications:

Aggregates

3. The coarse aggregate shall consist of material such as crushed stone or gravel varying in size from $\frac{1}{4}$ in. to $\frac{3}{4}$ in.

Proportions

4. The proportions of the concrete shall be one part cement, two parts fine aggregate and four parts coarse aggregate.

Forms

5. The forms shall be supported vertically or on skids sufficiently close to prevent sagging of forms.

Reinforcement

6. The longitudinal and transverse reinforcement shall be assembled and securely wired together in accordance with plan before being placed in form. Care shall be taken to maintain the proper position of reinforcing unit in the form until concrete has been placed and compacted.

Freezing Weather

7. In freezing weather concrete materials shall be stored, and mixing and placing shall be done in a building maintained at a temperature of not less than 40 deg. F. Piles shall not be exposed to a lower temperature for at least 10 days after forms are removed.

Curing

8. Where the ordinary method of sheltered curing is employed, piles shall be seasoned for a period of not less than three days before being moved on the skids and not less than twenty-eight days before handling and moving to the site or driving. No method of accelerated seasoning shall be used until approved by the engineer.

Marking

9. Each pile shall be stamped or marked with the date of its manufacture.

Handling

10. Piles shall be handled carefully, avoiding any dropping or heavy jarring while in horizontal positions.

Explanatory Notes

Longitudinal Reinforcement

Piles not exceeding 30 ft. in length are reinforced with 8 longitudinal bars, of which 4 are cut so as to stop at the beginning of the tapered point.

Piles exceeding 30 ft. in length are shown as having additional reinforcing bars placed midway between the longer bars throughout the middle third length of the pile in order to provide for handling.

Specifications for Driving Pre-Molded Concrete Piles

1. Piles shall be protected while being driven with an approved cushion cap.

2. The driving or jetting of piles shall be governed by "Pile Driving—Principles of Practice," given in the Specifications for Workmanship for Pile and Frame Trestles in the Manual of the Association.

3. In driving, a steam hammer shall be used unless otherwise specified by the engineer. Where a drop ham-

mer is permitted, a heavy hammer with a short drop shall be used.

4. Any pile injured in driving or driven out of place shall be either replaced by a new pile or pulled and re-driven, as the case may require.

5. On sloping ground, and where necessary, a suitable hole shall be dug at the location of each pile, sufficiently deep to hold the pile in proper position for the first few blows.

6. Before driving, the piles shall be carefully located and set to the line called for on the plan, and the pile driver leads held in proper position by means of guy lines. Unless otherwise called for on the plans, piles shall be driven as nearly as possible in a plumb position. Any pile out of plumb more than one-half inch per foot shall be pulled and re-driven if so required by the engineer.

7. Reasonable efforts shall be made to drive the concrete piles to plan cut-off, the lengths of the piles having been determined by borings or test piles. Driving will be continued until this point is reached or until the following rate of penetration is secured, as specified by engineer. (Cases where driving is through soft soil to hard bottom or rock excepted.)

8. Piles shall be driven to a point requiring the following minimum number of blows for the last 2 in. of penetration of single-action steam hammer (weight of plunger 5,000 lb., drop 36 in.), or hammer of like mechanical effect.

(a) When piles are to carry 18 net tons—3 blows to last 2 in.

(b) When piles are to carry 25 net tons—4 blows to last 2 in.

(c) When piles are to carry 50 net tons—10 blows to last 2 in.

(d) When piles are to carry a load in excess of 50 tons, number of blows will be as specified by the engineer.

9. When driving is interrupted before final penetration is reached the record for degree of penetration shall not be taken until after at least 2 in. of penetration has been obtained. When necessary to obtain the required penetration, piles may be driven not to exceed 4 in. below plan cut-off.

Cutting-off Piles

Where it is not possible to drive concrete piles to plan cut-off, the portion of the pile above this point shall be removed, but, unless otherwise specified, a variation of 4 in. will be allowed above the plan cut-off for the inequalities of the tops of the piles. All loose parts of the head of cut-off piles shall be removed. Where reinforcement has to be cut off, it shall be done by a hack saw or oxy-acetylene torch.

"Molded-in-Place" Piles

"Molded-in-place" piles may be divided into three general groups, according to their method of construction. The successive steps in each method are briefly enumerated below:

(a) A collapsible steel mandrel encased with a spirally reinforced sheet-steel casing is driven to the required penetration. The steel mandrel is then withdrawn and the steel casing which is left in the ground as a form, is filled with concrete.

(b) A cylindrical casing with a protecting point is driven to the required penetration. The casing after being filled with wet concrete is removed, and the space left by the casing is allowed to fill with concrete, thus forming the pile.

(c) A cylindrical casing with a core as a protecting and driving point is driven to the required penetration.

The core is removed. A charge of concrete is placed and the core is used as a rammer to compress the surrounding soil at the base, thus forming an enlarged base to the pile.

Under conditions where "molded-in-place" piles may be used, the main advantages over the pre-molded piles are as follows:

(1) The length of the pile need not be definitely predetermined on account of being able to vary the lengths in driving.

(2) Saving in labor and material on account of the length of each pile being determined before concrete is placed, thus saving cut-offs.

(3) The delay resulting from allowing sufficient time for piles to season before they are handled is eliminated.

(4) Entire omission of reinforcement against handling.

The "molded-in-place" piles, by the nature of their construction, are essentially foundation piles, and may not in all cases be a substitute for the pre-molded piles. In the use of "molded-in-place" piles it is necessary to consider the effects of vibration and soil movement due to the driving of adjacent piles. When the core of the pipe casing is driven for a given pile, it displaces and compresses the earth adjacent to the hole which is formed, and the elastic earth tends to relieve its stress by crowding back. Many rules have been formulated for driving these piles in order to protect the unseasoned concrete of piles previously placed. As the result of tests, each of the following rules have been adopted on various pieces of work:

(a) No concrete shall be deposited in any pile form until all driving is completed within a radius of 9 ft. center to center of the pile to be filled.

(b) The setting of the concrete in any pile must not, under any consideration, be disturbed by driving another pile or piles within a radius of less than 9 ft. from it center to center, after a minimum interval of three hours or before the expiration of seven days from the time the concrete was mixed with water for that pile. The contractor may, however, at his own option drive pile forms within the 9-ft. radius to a depth not more than 3 ft. from the total estimated penetration inside of the 3-hour limit, and before the expiration of the seven-day limit, complete the driving of those forms.

The requirements necessary vary with the plans and the soil encountered. The unseasoned concrete is more liable to damage on account of the driving of piles when soil is made up of thin, hard strata alternating with soft strata.

The above rules for driving of adjacent piles have been neglected in many cases, on account of the expense incurred in their operation and the lack of definite knowledge as to their necessity.

It should also be added that the construction of molded-in-place piles requires more careful supervision to secure good results on account of the manner in which concrete is deposited, and the surrounding conditions which preclude inspection of the pile after the concrete is all in place.

All "molded-in-place" piles are patented and are generally driven by companies either owning or controlling the patented features. The diameter and shape of the piles vary; tapered piles average an 8-in. tip and an 18-in. top diameter for a pile 25 ft. in length. The uniform section piles are circular and average 17 in. in diameter. No general specifications can be made for their construction, as each type of pile has its individual features demanding special methods of construction.

The cost will vary from 85 cents to \$2 per linear foot,

with an average cost of \$1, depending upon the number of piles driven and their lengths. Lengths of piles are always measured from cut-off to tip of pile. The expense of moving and setting up the special equipment necessary for this type makes them more economical on larger rather than smaller pieces of work.

Loading of piles may be calculated from the same data as that given for pre-molded piles.

**Typical Design of Foundations for Piers,
Abutments, Retaining Walls and Arches
in Various Soils and Depths of Water
(Not Including Pneumatic Foundations)**

There are a number of important elements entering into the design of foundations and on which the committee has found a large divergence of opinion, and it is on these points that the committee presents the following as its opinion of the best practice to be used in designing foundations:

(1) That for important structures wash borings as a means of determining character and bearing values of foundation soils are not generally reliable. That for important structures core borings give the most reliable data. The borings should in general be carried at least 10 ft. into rock, when encountered. Diamond, calyx or similar drills furnish cylindrical cores of all stratas of hard material. Soil, sand, clay and lighter materials will be brought to the surface similar to wash borings.

(2) That for important structures, where there is no reliable data, or where there is any question of the safe bearing value, soil bearing tests be made; the test loads being increased until settlement occurs or until twice the bearing load it is proposed to use in the design has been reached. That one-half the ultimate load thus found be used in designing the foundation except that $\frac{3}{4}$ of the ultimate load may be used for maximum toe pressures produced by tractive force or wind; provided, however, that the safe load thus found does not exceed the safe crushing value of the materials of the substructure.

(3) That pile bearing formulas based on the fall and weight of the hammer are not always a true index of the safe bearing value of the pile, but are of value in determining the extent to which driving is necessary in a soil of known resistance. That for important structures where data is lacking or where there is any question of the safe bearing value, load tests be made; the loading being increased until settlement occurs or until twice the load per pile it is proposed to use in the design is reached.

That one-half the ultimate load thus found be used in designing the foundations except that $\frac{3}{4}$ of the ultimate load may be used for the maximum pressures produced by tractive force and wind; provided, however, that the safe bearing value of the piling or materials of the substructure are not exceeded.

(4) That in general the buoyancy of structures in water be not considered as reducing the foundation load except in the case where water has free access to the base of the foundation or when calculating stability from overturning.

(5) That the loads to be considered in designing foundations are the total dead load of the substructure and superstructure, the live load, including an allowance for impact, tractive force, wind and ice pressure, and earth pressures in the case of retaining walls and abutments.

(6) That in general the cut-off of wood foundation piles in tidal waters shall not be above mean daily tides and shall not exceed 2 ft. above mean low water. That in general timber in foundations in tidal waters shall

not be used above mean daily tides nor shall it be used at a greater elevation than 2 ft. above mean low water. That in general wood foundation piling and timbers be kept entirely below the probable lowest ground water level, except in the case of tidal waters as above noted. That in all waters where marine borers exist, no untreated timbers should be used above the permanent mud line of the bottom.

(7) That the spacing of wooden piling in foundations be not less than 2 ft. 6 in., center to center.

(8) That the bottom of foundations should be placed entirely below the line of frost action, the depth of foundation depending on the locality.

(9) That the calculations of foundation pressures be made in accordance with the rules and formula for the design of retaining walls published in the Supplement to the Manual, Vol. 19, No. 197, pp. 47-55.

**The Wisdom of the Use of Blast Furnace Slag
in Reinforced Concrete Work, Taking Into
Special Consideration Its Probable Duration**

The use of slag as an aggregate in concrete covers a period of 20 years or more, but it is only within recent years that it has had extended use, particularly in reinforced concrete. Beginning with its utilization for the concrete structures of the steel companies the greatest development has been in the communities tributary to the steel mills. Large quantities of slag are used in building operation, particularly in Birmingham, Cleveland and Youngstown, Ohio. The use of slag in concrete is sanctioned by the building ordinances of Detroit, Cleveland, Chicago, Philadelphia and Youngstown. Probably the most general use has been at Cleveland, where a large number of reinforced concrete buildings have been constructed with slag as a coarse aggregate. Specific examples of concrete structures in which slag is used include the grade separation structures of the Seaboard Air Line at Birmingham, involving 11,000 cu. yd.; the Rocky River Bridge at Rocky River, Ohio; subway structures of the Philadelphia Rapid Transit Company and the North Howard Street Bridge at Akron, Ohio. The last is an arch bridge nearly 800 ft. long with a roadway 190 ft. above the bed stream and required the use of 5,000 cu. yd. of concrete.

Numerous tests have been made of slag concrete which show conclusively that a properly selected slag when used as the coarse aggregate with a good quality of sand as the fine aggregate will produce a strong concrete. These tests brought to notice in recent years go to show that slag concretes are as strong as stone or gravel concretes containing the same quantity of cement, provided a properly selected material is used. The strength bears little relation to the weight of the slag used, the porous varieties producing concretes of fully as great strength as the dense materials for tests at 28 days. For greater ages the concretes made of denser slags show a greater increase in strength. Owing to the fact that slag is generally more porous than stone it is necessary to exercise care in proportioning to provide sufficient mortar to fill the voids in the particles as well as between them.

Soundness

A more important question is that of the soundness of slag concrete. This question is raised by the fact that some slags slake or disintegrate upon exposure to the air and are entirely unsuitable for use as aggregate. It is common practice to allow the slag to weather for a number of months before removing from the bank. This results in a hardening or toughening of the stable slags

and permits the detection of those that disintegrate upon exposure to the atmosphere. A considerable difference of opinion and practice exists as to this seasoning, but good practice would seem to demand a period in the bank of six months to a year. However, it is a fact that some slags are used after only a few weeks' exposure with apparently satisfactory results.

The most discussed point in the use of slag as an aggregate in concrete arises from the presence of sulphur. It is contended that a lack of stability of the compounds of this element occurring would result in the eventual disintegration of the concrete and also that its presence would lead to the formation of sulphuric acid which would result in the corrosion of embedded steel. Sulphur usually occurs as a sulphide of calcium, a form in which it is inactive, but in the presence of water it is contended that sulphuric acid would result. On the other hand, slag concrete has been used extensively in foundation work and numerous examples are cited of anchor bolts and other embedded pieces of iron and steel which have been in close contact with slag concrete containing sulphur for many years without any sign of injury.

Summary

(1) The strength of concrete in which selected slag is used as the coarse aggregate is equal to that of a concrete made of stone if an equal amount of cement is used per volume of concrete.

(2) The extensive use of slag concrete over a period of years has demonstrated its permanence for buildings, retaining walls, bridges and foundations work where the structure is exposed to ordinary conditions.

(3) No data on water-tightness, or behavior when submerged, were obtained.

(4) No case has been brought to notice where embedded steel became corroded in a slag concrete.

(5) In general, slag concretes are superior to stone or gravel concretes where exposed to high temperatures.

(6) The user of slag for a concrete aggregate should satisfy himself as to suitability of the material tributary to his locality, from observation of the method of production and the service records of structures previously built.

Designs and Recommended Specifications

for Construction of Concrete Culvert Pipe

Plans and specifications of concrete pipe were obtained from all railroad companies known to have plans and specifications of their own, from firms manufacturing concrete pipe and from the highway departments of several states. The designs are of four types as to form and reinforcement:

1. Circular in cross-section with two concentric layers of reinforcement, one near the outside surface and the other near the inside surface of the pipe.

2. Circular in cross-section with one layer of reinforcement placed elliptically so as to pass continuously through all parts of the pipe that are subject to tension.

3. Oval in cross-section with one layer of circular reinforcement placed so as to pass continuously through all parts of the pipe that are subject to tension.

4. Circular in cross-section with one layer of concentric reinforcement.

As the points of greatest bending moments in the pipe are the segments crossed by the vertical and the horizontal diameters with the resulting tensile stress in the inner portion of the pipe for the vertical and in the outer portion for the horizontal moments, the fourth type of design does not provide reinforcement for the tensile stress from the horizontal moments and is, therefore, not recommended for use for culverts. Pipes reinforced

as in types No. 2 and No. 3 should have the top plainly marked in order that the pipe may be placed so that the reinforcement is in the proper position to carry the tensile stresses.

In designing reinforced concrete culvert pipe the use of unit stresses per square inch of 700 lb. compression in the concrete and 16,000 lb. tension in the steel may be considered good practice, and to develop these stresses approximately 0.88 per cent of reinforcement is required. The following formulae are proposed for the thickness of the pipe and the area of the reinforcement, in which:

t = distance in inches from the center of the reinforcement to the compression face of the concrete.
 a = distance in inches from the center of the reinforcement to the tension face of the concrete.
 $t' = t + a$ = total thickness of the pipe.
 A = area of reinforcement in square inches.
 d = mean diameter of the pipe in feet.
 w = weight per square foot of the load on the pipe in pounds.
 p = 0.83 per cent of reinforcement.
 f_s = 16,000 lbs. = unit tensile stress in the reinforcement.
 f_c = 680 lbs. = unit compressive stress in the concrete.

- (1) $t = 0.023d\sqrt{w}$ or
- (2) $t = 0.03d\sqrt{w}$
- (3) $A = 0.10t$
- (4) $t' = t + a$

These formulae are derived from those developed by Prof. A. N. Talbot from his experiments and tests of the strength of pipe published in Bulletin No. 22 of the Engineering Experiment Station of the University of Illinois.

In view of the possible lack of extreme care in bedding the pipe and in filling around it, the value of equation (2) for the value of "t" is recommended, viz.:

$$t = 0.03d\sqrt{w}$$

The load per square foot "w" will be the weight of the prism of earth above the pipe, the load from an engine and the load from impact. The weight of the earth will increase with the height of the fill while the load from the engine and from impact will decrease; the latter probably need not be considered except for low fills. It is evident also that the proportion of the weight of the prism of earth coming on the pipe decreases as the height increases. The committee has given considerable study to the problem, to find a value for the load per square foot that would be sufficient for general use, but have been unable to find enough data to determine this satisfactorily.

The desirability of one value for all heights of fill under ordinary conditions is very evident, and we ask that further investigation be made for that purpose.

Specifications for the Construction of Reinforced Concrete Culvert Pipe Concrete Material

Cement

1. The cement shall be Portland and shall meet the requirements of the Standard Specifications for Portland cement of the American Railway Engineering Association. Cement that has deteriorated or become damaged during transportation or storage shall not be used.

Fine Aggregate

2. The fine aggregate shall consist of sand or crushed stone, graded from fine to coarse, and passing when dry a screen having 4 meshes per linear inch. It shall preferably be of hard silicious material, clean, coarse and free from dust, soft particles, lumps and vegetable or other foreign matter.

Not more than 20 per cent shall pass a sieve having 50 meshes per linear inch and not more than 6 per cent shall pass a sieve having 100 meshes per linear inch.

Coarse Aggregate

3. The coarse aggregate shall consist of crushed stone or gravel which is retained on a screen having 4

meshes per linear inch and shall not exceed $\frac{3}{4}$ in. in greatest dimension for pipe $\frac{1}{2}$ in. or less in thickness, or 1 in. in greatest dimension for pipe of thickness greater than $\frac{1}{2}$ in. The coarse aggregate shall be a gradation of sizes from the smallest to the largest particles, and shall be clean, hard, durable and free from all deleterious matter. Aggregates containing dust, soft or elongated particles shall not be used.

Water

4. The water shall be free from oil, acid, alkali and vegetable matter.

Steel Reinforcement

5. The steel for reinforcement shall meet the requirements of the Standard Specifications for Steel Reinforcements of the American Railway Engineering Association.

Workmanship

Proportions

6. The proportions of the materials for the concrete shall be: 1 part Portland cement, 2 parts fine aggregate, and 4 parts coarse aggregate.

Measurement

7. The unit of measure shall be a cubic foot. A bag containing not less than 94 lb. of cement shall be assumed to measure one cubic foot of cement. The fine and coarse aggregate shall be measured as loosely thrown into the measuring receptacle. The various ingredients, including the water, shall be measured separately, and by such methods as to invariably secure the proper proportions.

Mixing

8. The concrete materials shall be mixed to the desired consistency in a batch mixer of an approved type. The mixing shall continue for at least 2 min. after all the materials, including the water, are in the mixer.

Consistency

9. Sufficient water shall be used to produce a concrete of such consistency that it will flow around the reinforcement, but not enough to allow the coarse aggregate to separate from the mortar.

Retempering

10. Retempering of mortar or concrete, that is, re-mixing with water after it has partially set, will not be permitted.

Placing Concrete

11. The concrete shall be placed in layers so as to completely fill the entire space between the inner and the outer forms in one continuous operation; and shall be well spaded and compacted around the reinforcing metal, to obtain a concrete of maximum density, thoroughly bonded with the reinforcement, and smooth, dense watertight surfaces inside and outside of the pipe.

Temperature

12. No pipe shall be manufactured in a temperature below 40 deg. F. Both aggregates shall be heated if necessary to remove frost and frozen lumps.

Forms

13. The forms shall be steel or metal-lined, true to plan, substantial and unyielding. They shall be kept free from rust, carefully cleaned of all adhering concrete after each use, and well oiled or greased each time before the concrete is placed.

Design

Classes

14. Reinforced concrete culvert shall be of the following classes or forms:

A—Circular in cross-section with 2 concentric layers of reinforcement.

B—Circular in cross-section with 1 layer of reinforcement placed elliptically.

C—Oval in cross-section with 1 circular layer of reinforcement.

In all classes the location of the reinforcement shall be so designed that it will receive and carry the tensile stresses.

Thickness and Area Reinforcement

15. The thickness of the pipe and the area of the reinforcement shall be based upon unit stresses of 700 lb. per square inch compression in the concrete and 16,000 lb. per square inch tension in the steel and 0.83 per cent. of reinforcement, and shall be determined by the following formulae:

$$t^2 = t + a$$

$$t = 0.03d\sqrt{w}$$

$$A = 0.10t$$

In which:

t = total thickness of the pipe in inches.

d = mean diameter of the pipe in feet.

w = load per square foot on the pipe in pounds.

a = distance from the center of the reinforcement to the tension face of the concrete.

t = distance from the center of the reinforcement to the compression face of the concrete.

A = area of the reinforcement in square inches.

"a" shall not be less than $\frac{3}{4}$ in. for pipe less than 4 in. thick, and not less than 1 in. for pipe of thickness greater than 4 in.

"w" shall be the weight of the earth fill, assumed at 130 lb. per cubic foot to which shall be added for the engine load an amount obtained by dividing 4500 lb. by one plus one-half the height of the fill above the pipe in feet. In no case shall "w" be less than 2000 lb.

Details of Construction

Reinforcement

16. The reinforcement shall consist of transverse and longitudinal rods of the size and spacing required by the design; or of triangular wire mesh or similar wire mesh of the size and weight required. The transverse and longitudinal rods shall be securely wired together at their intersections with No. 16 gage soft steel wire.

When 2 layers of reinforcement are used they shall be connected together at proper intervals by tie struts so arranged that the two layers may be handled as one member.

The reinforcement shall be thoroughly cleaned of all rust and scales, accurately placed and rigidly secured against displacement during the placing of the concrete.

Splicing Reinforcement

17. All splices shall be made at points of minimum stress. The splices in wire mesh shall lap at least two spaces or not less than 8 in. Rods shall lap not less than 24 diameters and the laps shall be tightly wired with No. 16 gage soft steel wire.

Joints

18. The joints shall be of the bell and spigot type. Where the thickness of the pipe is sufficient the bell may have the same external diameter as the body of the pipe; where the thickness is not sufficient to permit this the end of the pipe shall be flared out to form the bell.

The reinforcement shall be extended into the bell and bent to its form; with rod reinforcement 2 transverse rods shall be placed in the bell and the longitudinal rods, bent if necessary to the form of the bell, shall be securely wired to these transverse rods.

The top of pipe with reinforcement placed as in Classes "B" and "C" shall be marked on both ends with the word "Top" in order to insure the proper placing of the pipe.

Finish

19. All pipe shall have a clean, smooth finish both inside and outside. All smoothing, trimming or cleaning shall be done immediately after the forms are removed.

Curing

20. The forms shall not be removed until the concrete has thoroughly hardened and will not be injured or the pipe deformed in handling; and in no event in less than 24 hrs. after the concrete is placed.

The pipe shall be kept moist by frequent sprinkling

with water for not less than 7 days, sheltered from the sun during hot weather, and allowed to cure for 28 days before shipping; and shall not be subject to full loading in less than 45 days after casting.

Patents

21. The contractor or manufacturer shall pay all royalties for the use of patented designs or devices or forms of construction, and shall protect the railroad company from all claims of infringements or liability for the use of such patents.

Inspection

22. All material and all processes of manufacture shall be subject to inspection and approval at all times. Free access shall be provided for all authorized inspectors to all parts of factories and plants in which the pipe or the materials for the same are made or prepared.

All facilities for the desired inspection of materials and workmanship shall be furnished free of charge by the contractor as requested. In general the cement and reinforcing material will be inspected at the factory or mill. The aggregates and process of manufacture will be inspected at the pipe plant.

At the time the forms are removed the inspector shall carefully examine each piece of pipe and shall stamp or print the date of manufacture on the bell end of each pipe accepted.

Pipe that is injured or develops imperfections while stored at the manufacturer's plant will be rejected, notwithstanding the inspector's previous acceptance. No defective pipe shall be loaded for shipment. All pipe shall be so loaded and braced that they will not be broken in transit.

Suggestions for Future Work

1. Preparation of new specifications for plain and reinforced concrete and steel reinforcement.

2. An investigation of different methods of depositing concrete under water and disintegration of concrete and corrosion of reinforcing material in connection with use of concrete in sea water.

3. Preparation of specifications for slag concrete.

Committee: F. L. Thompson (I. C.), chairman; J. J. Yates (C. R. R. of N. J.), vice-chairman; R. Armour (G. T.), John C. Beye (A. T. & S. F.), G. E. Boyd (D. L. & W.), H. A. Cassil (P. M.), C. S. Coe (F. E. C.), T. L. Condon (Cons. Engr.), J. K. Conner (L. E. & W.), C. S. Davis (P. L.), J. L. Harrington (Cons. Engr.), W. K. Hatt (Purdue Univ.), L. J. Hotchkiss (Cons. Engr.), Richard L. Humphrey (Cons. Engr.), Noah Johnson (Wab.), M. S. Ketchum (Univ. of Colo.), W. M. Kinney, W. S. Lacher (Ry. Age.), A. E. Owen (C. R. R. of N. J.), W. M. Ray (B. & O.), C. P. Richardson (C. R. I. & P.), G. H. Scribner, Jr. (Cons. Engr.), F. P. Sisson (G. T.), I. E. Smith (Univ. of Ill.), Job Tuthill (P. M.), B. A. Underwood (S. N. E.).

Discussion

F. L. Thompson (Chairman): I will take up the subjects as assigned to the committee.

The changes suggested in connection with the revision of the Manual are only changes that are necessary to make it conform to specifications heretofore adopted by the association.

The President: As this appears to be a matter of diction and uniformity, unless there is some objection these revisions will be approved and printed in the supplement to the Manual.

Mr. Thompson then read appendix B and said: Last year these specifications were temporarily adopted by the convention and later the question came up of submitting these specifications with plans and the commit-

tee was instructed to resubmit them this year, with a set of plans. That has been done.

H. S. Jacoby (Cornell Univ.): Last year the report of the committee used the term "cast in place" for class B, and I do not recall that a single voice was raised against its appropriateness, I therefore move that the line be amended to read: (B) Cast-in-place piles. Piles which are constructed in holes in the ground.

The President: The committee will accept that suggestion.

Mr. Thompson: I move that the specifications for constructing pre-molded concrete piles be accepted by the convention and printed in the Manual.

The President: Unless there is objection, the motion made by Mr. Thompson will stand approved.

Mr. Thompson: The next thing is the specifications for driving pre-molded concrete piles. These specifications have been gone over and revised in accordance with the suggestions made on the floor last year, and are now recommended for adoption by the convention and insertion in the Manual. I move that they be adopted and printed in the Manual.

A. A. Robinson (Santa Fe): I want to urge that the committee, in submitting these specifications either remove or remodel paragraph 8. I do not believe we are entitled to give any such set of rules for the last two inches of penetration of the piles that there shall be used a single-action steam hammer of 5,000 lb., drop 36 in., or a hammer of like mechanical effect. I do not think as an association we want to go on record as saying that they shall be driven in a certain manner, if they are going to have 50 tons load or more, and prescribe that in the case of 50 tons there shall be 10 blows to the last 10 in.

The President: The committee will accept the suggestion, leaving the paragraph out.

Mr. Ford: I think the committee was right in the way it prepared this paragraph. I hope if the paragraph is dropped that the committee will ultimately bring in something as a guide on the load for concrete piles. The situation is different from wooden piles.

Mr. Robinson: I move that the paragraph be omitted and passed back to the committee, with the suggestion that they investigate that phase of the matter further and report later on.

The President: The committee will take cognizance of that.

C. P. Richardson (Rock Island): There is a misunderstanding here. Paragraph 8 was written as a continuation of paragraph 7, as an alternative method.

Mr. Robinson: Paragraph 8 is misleading and not clear and it should be left out.

The President: The committee will accept the recommendation and will look after it.

I. L. Simmons (Rock Island): Paragraph 3 does not seem to be clear in the last part, which says: "Where a drop hammer is permitted, a heavy hammer with a short drop shall be used." Would it not define what we mean if we said: "and a short drop used?"

The President: The committee will accept that.

(The motion that paragraphs 1 to 9 be approved, with the exception of paragraph 8, and be included in the Manual, was carried.)

Mr. Thompson: With relation to the matter on "molded-in-place piles," this is submitted as information to be printed in the Proceedings.

(Mr. Thompson then referred to the matter in appendix C, reading a part of the beginning.)

Mr. Thompson: This subject has been before the con-

vention for the past three years, and it is the recommendation of the committee that the matter on pages 731-2-3 be accepted as information and printed in the Proceedings.

Mr. Jacoby: I move that the paragraph marked (3) and the following one be amended to read as follows: "(3) That the computed bearing value of a pile given by a formula based upon the fall and weight of the hammer is not always a true index of its actual bearing power, but is of value in determining the extent to which driving is necessary in a soil of known resistance.

The bearing value of a pile computed by means of a formula measures the resistance of the pile immediately after driving ceases. Therefore, in the case of soft soils, in which the frictional resistance of a pile increases materially after a period of rest, a test should be made with the hammer after such period of rest, in order that the computed bearing value may be a fair measure of

the actual bearing power of the pile when supporting the structure. Formulas for the bearing power of a pile are not applicable to piles driven through very soft soil to rock or other hard material, since they act like columns under those conditions.

The President: The committee will accept that.

Mr. Jacoby: There is one more point that I would like to make and that is, should not the word "static" be inserted in the 3rd line from the bottom of p. 732 before the word "load tests?"

Mr. Thompson: Yes, that is right. In appendix D is given the report, "The wisdom of the use of blast furnace slag in reinforced concrete work, taking into especial consideration its probable duration." This matter is submitted as information.

The President: That will be accepted.

(The committee was excused with the thanks of the association.)

Report of Committee on Roadway

A CIRCULAR LETTER was addressed to representatives of about 50 of the larger roads asking for information concerning the practice followed in draining the roadway through station grounds. About 20 replies were received.

After consideration and discussion of the above replies the following conclusions were drafted and submitted for approval:

1. The drainage of the roadway through stations and yards should be treated in accordance with local conditions.
2. Surface water should be carried off the roadbed into drains as quickly as possible.
3. Items influencing the mode of procedure are: Soil condition, the contour of adjacent grounds, the grade of tracks, the number of tracks, the amount of rainfall, etc.
4. Surface water should be taken care of first by open ditches as much as possible, where they will not interfere with the work of employees or the safety of passengers.

5. Where the subgrade is of such a nature that it will absorb water and not retain it, a sub-ballast of engine cinders should be used, the surface of which should not be allowed to become foul, but kept open so that water will penetrate the subgrade through the cinder. Where the subgrade will hold water, special effort should be made to carry it away from the subgrade by means of drains.

6. Tracks in yards should be so constructed where practicable that tracks adjacent to main lines will be about two inches below them and each succeeding track stepped down to suit the normal trend of drainage, thus providing drainage laterally as well as longitudinally.

7. Cross-drains of cast iron pipe, with catch basins between tracks, should be placed where necessary.

8. If the subsoil is of such a nature that it retains water and becomes saturated therewith, place bell and vitrified drain pipe with open joints between tracks and about four feet below base of rail, using special care to put them below frost and deep enough to get below the movement of the soil; these pipes running into cross-drains leading to natural drainage.

9. If the subsoil is silty or of such consistency as to fill up the pipe quickly, a wide ditch should be dug, preferably between tracks, and filled with large stone, having pipes leading off from it to the natural drainage.

10. At station platforms a subdrain of iron pipe, with catch basins at frequent intervals, should be laid alongside the curbing, or bell end vitrified pipe may be laid between tracks a sufficient depth to be below frost and movement of the soil. These drains to be connected by means of side drains to natural ditches, or in cuts to bell end vitrified subdrain laid in the ditch line.

Recommendations for Next Year's Work

The committee recommended that all subjects assigned for consideration this year, except the one reported on above, be reassigned for next year's work.

Committee: W. M. Dawley (Erie), chairman; J. A. Spielmann (B. & O.), vice-chairman; J. R. W. Ambrose (T. T.), H. E. Astley (N. Y. N. H. & H.), C. W. Brown (L. & N. E.), S. P. Brown, B. M. Cheney (C. B. & Q.), C. W. Cochran (C. C. & St. L.), W. C. Curd, Paul Didier (B. & O.), S. B. Fisher (M. K. & T.), W. C. Kegler (C. C. & St. L.), F. Ringer (M. K. & T.), H. W. McLeod (C. P.), C. M. McVay (K. & M.), F. M. Patterson (I. C.), W. H. Petersen (C. R. I. & P.), P. Petri (B. & O.), W. F. Purdy (P. & W. Va.), R. A. Rutledge (A. T. & S. F.), W. H. Sellow (M. C.), J. M. Sills (St. L.-S. F.), G. R. Talcott (A. T. & S. F.), W. P. Wiltse (N. & W.).

Discussion

J. A. Spielmann (Vice Chairman): Our committee was assigned to subjects as found on page 403. We are only able to report on No. 6. In regard to No. 6 we sent out inquiries to 50 of the principal railroads in the country and received 20 replies.

(Mr. Spielmann then read the conclusions).

C. E. Lindsay (N. Y. C.): In number 7, I approve of the conclusion generally, but I think it ought not to be confined to cast iron pipe. If the committee would omit the words "cast iron pipe," the conclusion would be just as clear and less restricted. The same criticism will apply to No. 10, where they specify iron pipe.

The President: The committee will accept that suggestion.

C. W. Baldrige (Santa Fe): In regard to conclusion No. 8, it seems to me that the committee should make a little wider provision there for cases where it is not feasible to place the drain 4 ft. deep. In such cases it might be advantageous to use a drain composed of a ditch filled with rock or something of that nature.

Mr. Spielmann: In this we state about 4 ft., we do not specify exact depth, but it is well to get it below the frost line.

Mr. Baldrige: It is not the depth I object to particularly, but frequently, if you lay pipe that is not deep enough below the surface of the ground it will be broken in the winter time by frost, and in that case it might be better to use some other kind of drain than pipe drain.

W. P. Wiltsee (N. & W.): I believe we can get around this if we would change the wording, place bell and vitrified drain pipe with open joints, or other drains between tracks, and cut out: And about four feet below base of rail."

Earl Stimson (B. & O.): I think that it is essential that mention be made as to the depth the vitrified pipe drain be placed. I believe the paragraph as it covers the situation very well, and that we ought not to say something and then modify it so it really does not mean anything, or becomes very indefinite. I would suggest that the committee stand pat on this section.

The President: The necessity for putting in drains is evidently where we disagree, on the kind of drain and

the depth. That is controlled by local conditions to such a great extent that I am afraid it will be hard to get a convention of men from so many different parts of the country to agree on a depth. We would have to put our pipe 8 ft. below the surface to keep away from frost.

Mr. Spielmann: Your committee now suggests that this clause read: "If the sub-soil is of such a nature that it retains water, and becomes saturated therewith, place bell and vitrified drain pipe or other drains with open joints between tracks," leaving out the words "and about four feet below base of rail"; "using special care to put them below frost, and deep enough to get below the movement of the soil."

The President: If there is no further discussion, No. 8 will stand as the committee has amended it.

(Mr. Spielmann read paragraphs 9 and 10, leaving out the words "of iron pipe" in the first line.

The President: If there are no objections, the conclusions will be adopted and printed in the Manual as reported by the committee.

(The committee was dismissed with the thanks of the Association.)

Report of Committee on Ties

THE COMMITTEE recommended that forms M. W. 301, 302, 303 and 304 be withdrawn from the Manual. The membership lines were asked as to their use of these forms and 100 replies, representing 232,026 miles, were received. Not a single road is using them and but 12, representing approximately 10,521 miles, contemplate doing so.

Methods in Use by Various Railroads for Controlling Tie Renewals

The committee submitted as information a report on the methods in use by various roads to control tie renewals. The following questions were sent to all the principal railroads, represented in the Association:

1. Who originates the data on which the estimates of tie renewals are based?
2. Are these estimates based on
 - (a) Detailed inspection of the entire track, or,
 - (b) Detailed inspection of portions of the track, or,
 - (c) Tie renewal statistics, or,
 - (d) Otherwise?
3. Are these estimates checked independently in the field, in whole or in part?
4. By whom are these estimates revised before approval?
5. Are individual ties designated to be renewed, or is the estimate merely to determine the number of ties required for renewals?
6. What latitude, if any, is allowed the Section Foreman in deviating from the approved inspection?
7. What check is made of the Section Foreman's work?
8. Please submit any general instructions you may have covering tie renewals.

Replies were received from 100 railroads, with an ag-

gregate mileage of 223,000. A summary of these replies is appended to this report.

| | Per Cent. of Total Number of Roads Reporting | Per Cent. of Total Mileage of Roads Reporting |
|---|---|--|
| Renewals based primarily on detail inspection of track..... | 89 | 92 |
| Renewals based partly or exclusively on tie renewal statistics..... | 16 | 14 |
| Renewals based exclusively on tie renewal statistics..... | 9 | 4 |
| Detail inspection made by section foremen..... | 58 | 54 |
| Detail inspection made by others than section foremen..... | 33 | 42 |
| Individual ties for renewal designated by spots or otherwise..... | 38 | 52 |
| Individual ties for renewal not designated..... | 62 | 48 |
| Section foremen limited in renewals to ties authorized except such additional as are required for safety..... | 67 | 67 |
| Section foremen not limited in renewals to those authorized..... | 33 | 33 |
| Work of making renewals checked by roadmaster (or supervisor)..... | 77 | 74 |
| Work of making renewals checked by others than roadmaster (or supervisor)..... | 33 | 19 |

The committee wishes to point out that the method in most general use is not necessarily the best, and that methods may very properly differ on different roads, depending upon the organization, physical conditions, and other factors. A study of the replies shows that all roads depend largely upon an inspection of ties removed for the purpose of checking renewals. A majority of the roads place the principal responsibility for renewals upon the section foreman, while a considerable number place this responsibility primarily upon an inspector working independently of the section foreman. The other variations in method represent individual opinions as to the best method of checking the original source of information. This checking takes the form of an independent review of the original check in the field and also checking same against statistics.

Report on Trials of Substitute Ties

The information furnished by the various railroads using substitute ties was abstracted as usual, and the results to date were shown on a tabulated statement. This statement is intended to include all installations on steam railroads in America reported to the Association, and is

thought to cover practically all substitute ties used so far in this country.

Conclusions

(1) The committee recommends that forms Nos. M. W. 300, 301, 302, 303, 304 be withdrawn from the Manual.

(2) That the report as to methods in use by various railroads for controlling tie renewals be received as information.

(3) That the report on substitute ties be received as information.

Committee: F. R. Layng (B. & L. E.), chairman; H. S. Wilgus (P. S. & N.), vice-chairman; C. C. Albright (Purdue Univ.), W. C. Baisinger (A. T. & S. F.), M. S. Blaiklock (G. T.), Theo. Bloecher (B. & O.), F. Boardman (N. Y. C.), W. J. Burton (M. P.), W. A. Clark (D. & I. R.), S. B. Clement (T. & N. O.), E. L. Crugar (I. C.), L. A. Downs (I. C.), G. F. Hand (N. Y. N. H. & H.), L. C. Hartley (C. & E. I.), E. D. Jackson (B. & O.), J. B. Myers (B. & O.), A. J. Neafe (D. L. W.), R. R. Paine (N. P.), G. P. Palmer (B. & O. C. T.), Louis Yager (N. P.).

(The report was accepted without discussion and the committee was dismissed with the thanks of the association.)

Report of Committee on Iron and Steel Structures

THE COMMITTEE HAS undertaken a revision of the subject-matter of the Association's General Specifications for Steel Railway Bridges which were adopted as part of the committee's report to the 1906 convention. There has been no substantial revision of them since. In this work, it is expected to co-operate with a corresponding committee of the Canadian Society of Civil Engineers, which has in progress a revision of that society's specifications. Incidental to the revision of the specifications, there will have to be a revision

of the rules and unit stresses for the capacity rating of existing bridges.

The committee is investigating the use of plastic compounds for the protection of steel work exposed to the blast action from locomotive stacks. The committee this year has investigated the Schoop metal spraying process for the protection of iron and steel from corrosion. It was found that laboratory tests made by certain railroads, showed unsatisfactory results. In all cases it was reported that the coatings were pervious to water. Where bronze, lead and aluminum coatings were exposed to brine, the bronze and lead coatings were practically destroyed after a few weeks' exposure; the aluminum coating was in good condition, but was raised off the plate, showing the action of rust beneath the coating. It is concluded from information obtainable to date that the Schoop metal spraying process does not afford satisfactory protection from corrosion.

The committee submitted detailed Specifications for Movable Bridges and recommended that they be printed in the Proceedings as information. The purpose of this recommendation was to make the specifications available for use, and to incite constructive criticism, with the expectation that the specifications may be adopted in revised and satisfactory form for inclusion in the Manual a year or two later.

Impact Tests on the Electrified

Section of the C. M. & St. P. in 1917

The question of impact under electric locomotives has been thoroughly studied by the committee, and during the summer of 1917 some important tests were made on bridges on the electrified section of the Chicago, Milwaukee & St. Paul in Montana. The tests on the Norfolk & Western made in 1916 did not include spans exceeding 90 ft. in length, and the speeds available did not exceed about 29 miles per hour. Those tests, therefore,

while of very considerable value, did not have sufficient range to be as conclusive as might be desired. The results obtained were very satisfactory, so far as they went, and tended strongly to confirm the opinion previously expressed that impact under well-balanced electric locomotives would be very small. The value of the results of those tests was very considerably enhanced by making use on the same structure of two types of steam locomotives; the consolidation type and the Mallet type. The very great difference between the results obtained with the steam locomotives and with the electric locomotives, especially on the longer spans, was very significant as tending to show the relatively small impact from electric locomotives. However, the limited range of span length and the limited speed made it very desirable to continue the tests if possible on longer spans and at higher speeds. The very best conditions for such tests were to be obtained on the electrified lines of the C. M. & St. P. in Montana, and a request by the committee for the necessary facilities was promptly acceded to by this company.

Character of Structures Tested

The structures tested consisted of the following types and span lengths:

FIRST CROSSING OF MISSOULA RIVER NEAR MISSOULA, MONT.

60-ft. through girder.

80-ft. through girder.

100-ft. riveted pony truss.

SECOND CROSSING OF MISSOULA RIVER NEAR CYR, MONT.

210-ft. deck truss.

THIRD CROSSING OF MISSOULA RIVER NEAR CYR, MONT.

240-ft. deck truss.

VIADUCT NEAR SALTESE, MONT.

62-ft. and 46½-ft. span lengths.

The test load consisted of an electric locomotive composed of two units, followed by a sufficient number of loaded cars to cover the structure. The locomotive had its motors geared to the driving-wheel axles, no side rods being used in this type. All rotating parts are presumed to be balanced, so that any impact effect would be due to such causes as roughness of wheels and track and deflection of structure.

The apparatus used in these tests was the same as that used in previous tests made by the committee. In addition to this apparatus, the committee made use, to a small extent, of certain extensometers employed by Prof. A. N. Talbot in the track experiments which he is conducting on behalf of the joint committee established for the study of track stresses. These extensometers record directly, without multiplication, the strains in the members to which they are attached. These instruments were used on a floor beam and on a short stringer. The re-

sults obtained on the floor beam indicated small impact, and tended to confirm the results obtained by the other type of extensometer which was applied to another beam of the same bridge. The results from the stringer indicated considerable impact, but many more observations would be necessary and much more experience with this type of apparatus before reliable results on the short spans could be secured. It is hoped that this field of experimentation can be adequately covered at some future time.

The tests were made in the same general manner as those previously reported, namely, the special test train was run over the structure a considerable number of times at various rates of speed. Movements were made at low speeds of 8 to 12 miles per hour so as to secure readings not affected by impact. These readings were considered to represent static stresses, and the excess of stress resulting from movements at higher speeds was considered to represent the impact effect. Speeds were readily obtained up to about 60 miles per hour and above. No tests were made with steam locomotives. It was thought the very numerous experiments heretofore made with steam locomotives on structures of the kind herein described were sufficient to furnish a basis of comparison. The results of these tests, therefore, may be compared with the general results of those heretofore presented.

In general, the impact effects were in most cases very small, and particularly so in the long truss spans. The relatively large impact of 23 per cent in the top flange of the pony truss was probably due more to lateral movement than to vertical vibration. In the 60-ft. girder, instrumental vibration for speeds greater than about 50 miles per hour made the records valueless, but the results obtained for speeds below 50 miles per hour indicate that there was very little impact stress in the structure. The deflectometer readings are reliable.

Conclusions

From the results of the tests on the electrified section of the Chicago, Milwaukee & St. Paul, the tests made in 1916 on the Norfolk & Western, and the few tests made in 1909 at Schenectady, New York, it would appear to be fairly well established that the impact effect from electric locomotives is very much less than from steam locomotives of the usual type. Comparing results obtained in these tests with the results from steam locomotives, it would appear that the impact from electric locomotives on structures exceeding, say, 25 ft. span length, is not more than one-third of the impact produced by steam locomotives.

Column Tests

The program of column tests to be made by the Bureau of Standards for this Association was described fully in Vol. 16, p. 636. Of the eight column sections which it was originally decided to have tested, only Column No. 1 of Series No. 1, consisting of two channels with flanges turned in, has been touched so far.

Complete reports of the tests of the first eighteen columns tested already have been published. (Vol. 14, page 96; Vol. 15, page 435; Vol. 16, page 636, and inset at back of Volume, and Bulletin No. 173 for January, 1915.)

The present report covers tests of 24 columns made during 1916 by the Bureau of Standards under the direction of Dr. S. W. Stratton. These columns are variations of Column No. 1, Series No. 1; the same general dimensions, area of cross-section, and slenderness ratios are used, the variations consisting of (1) changes in

size of rivets and lacing bars; (2) the leaving off of wing and base plates; (3) the substitution of batten plates for lacing with varying distances between the batten plates.

The Bureau of Standards intended to supplement these tests by a series of compression tests of short specimens, cut from the channels of the columns, which tests were intended to bring out the reason why the columns made of thick material always fail at lower unit stresses than those made of thin material. It was hoped that these short compression tests could have been made during 1917, and, in fact, many of these tests have actually been made, but, owing to stress of other business, the Bureau has been unable to complete the series and to furnish the committee with reports of the results. However, it may be stated that the short specimen tests show that, in compression, the thin material has a higher elastic strength than the thick material, although the original tensile specimen tests on which the material was accepted, gave practically identical results as regards the elastic limit in tension for the thick and the thin material. While the specimen tensile tests, in all cases, gave results reasonably close to the prescribed limits of 37,000 to 39,000 lb. per sq. in., the short compressive tests showed yield points varying from below 30,000 lb. per sq. in. to above 41,000 lb. per sq. in.

This series of column tests proves, as have all the previous ones both for this Association and for the American Society of Civil Engineers, that the columns built of thin material almost invariably show higher unit stresses at failure than the similar columns built of thick material. The series also seems to show that, with lacing bars and rivets somewhat larger than standard practice calls for, the column will show additional strength.

As regards the substitution of batten plates instead of lacing bars, this series of tests shows conclusively that, in order to develop the full strength of the column, batten plates should not be used. It also shows that, where the distance from center to center of outer rivets on adjacent battens is fixed so that the $1/r$ distance for the individual channel is about the same as that for the column considered as a whole, the column is weaker than when this distance is reduced. In all cases, the columns with battens failed at an ultimate strength from 6,000 to 9,000 lb. per sq. in. less than the corresponding column with lacing, and, in one case, the heavy section with $120\ 1/r$, as much as 15,000 lb. per sq. in. less.

In all cases, the length for computing the slenderness ratio of the column was taken as the entire length of the column, or the length between base plates, where base plates were used. When failure is emphasized by the complete visible destruction of the column, it usually becomes quite apparent that points of inflection occur not far from the ends of the column. This is less noticeable in the batten-plated columns, where the method of failure is usually by sudden bending at the batten plates.

Conclusions

The conclusions that seem warranted from the tests so far made in the proposed series are:

- (1) Columns in which batten plates are substituted for lacing bars will not develop the full strength of the section and should not be used.
- (2) The specimen tensile tests on which material is ordered and accepted afford no proper criterion for the strength of a column.
- (3) A column designed so that it fails as a whole and not by reason of local weakness will have an ultimate strength of which the compressive yield point of the

material of which it is made up is an index, since the higher this yield point is, the stronger will be the column.

Specifications for Bronze Bearing Metals for Turntables and Movable Railroad Bridges

1. Phosphor bronze shall be a homogeneous alloy of crystalline structure. It shall be made from new metals, except that scrap of known composition produced by the foundry at which the bronze is cast may be used. It shall not contain sulphur. The phosphorus shall be introduced in the form of phosphor-tin or phosphor-copper. Castings shall be sound, clean, and free from blowholes, porous places, cracks and other defects.

2. The alloy shall be cast into ingots and allowed to cool, and the castings shall be poured from the remelted ingots. Care shall be exercised that the metal is not overheated and that the temperature at pouring and the conditions of cooling are such as will be most likely to secure dense castings.

3. There shall be four grades:

Grade A is to be used for contact with hardened steel discs under pressures exceeding 1,500 lb. per sq. in., such as are used in turntables and center-bearing swing bridges.

Grade B is to be used for contact with soft steel at low speeds under pressures not exceeding 1,500 lb. per sq. in., such as trunnions and journals of bascule and lift bridges.

Grade C is to be used for ordinary machinery bearings.

Grade D is to be used for gears, worm wheels, nuts, and similar parts which are subjected to other than compressive stresses.

4. The chemical and physical qualities shall conform with the requirements in the table following:

Chemical and Physical Qualities

| Alloy of | GRADE | | | |
|---|------------------------|------------------------|--|--|
| | A Copper and Tin | B Copper and Tin | C Copper, Tin and Lead and Zinc | D Copper, Tin and Lead and Zinc |
| Copper per cent. | 20 max. | 17 max. | 82 max. | 89 max. |
| Tin per cent. | 20 max. | 17 max. | 11 max. | 11 max. |
| Lead per cent. | | | 11 max. | 25 max. |
| Zinc per cent. | | | 0.7 min. | 0.25 max. |
| Phosphorus per cent. | 1.0 max. | 1.0 max. | 0.7 min. | 0.25 max. |
| Other elements per cent. | 0.5 max. | 0.5 max. | 0.5 max. | 0.5 max. |
| Elastic limit in compression, pounds per square inch. | 24,000 min. | 18,000 min. | | |
| Permanent set under 160,000 pounds. | .06 min. | .10 min. | | |
| Permanent set under 80,000 pounds. | .10 max. | .20 max. | | |
| Yield point in tension, pounds per square inch. | To be recorded | recorded | recorded | To be recorded |
| Ultimate strength in tension, pounds per square inch. | | | | 33,000 min. |
| Elongation in 2 in. per cent. | | | | 14 min. |

5. The chemical analysis of each heat shall be furnished.

6. Test specimens shall be made from coupons which are a part of the casting and which have been fed and cooled under the same conditions as the casting.

7. Compression test specimens shall be cylinders one inch high and of one square inch area. The elastic limit in compression shall be the load which gives a permanent set of 0.001 in.

8. Tension test specimens shall be turned from a coupon not less than one inch in diameter to the form shown in Fig. 2 of the American Railway Engineering Association, General Specifications for Steel Railway Bridges. The diameter of the turned specimen shall be one-half inch.

9. At least one compression test shall be made from each melt for grades A, B, and C; and one compression and one tension test for grade D. For castings weighing

over 100 lb. finished the prescribed tests shall be made for each casting.

10. The hardness of the finished castings shall be tested by the Brinell ball method and a record of the test furnished. The ball shall be of hardened steel 10 mm. in diameter. The load shall be 500 kg. and shall be applied for 30 seconds to a finished plane surface. At least two hardness tests shall be made upon each heat. A test shall be made on each trunnion bearing and each disc.

Cracks or other evidence of excessive brittleness in compression test specimens after load may be cause for rejection.

Recommendations

The committee recommended:

(1) That the conclusion regarding methods of protection of iron and steel structures against corrosion be approved.

(2) That the Specifications for Movable Bridges be received as information and published in the Proceedings, with a view of revising and adopting them for inclusion in the Manual a year hence.

(3) That the report on impact tests be received as information and published in the Proceedings.

(4) That the report on Column Tests be received as information and that the conclusions therein be approved for publication in the Manual.

(5) That the Specifications for Bronze Bearing Metals for Turntables and Movable Railroad Bridges be approved for publication in the Manual.

Suggestions for Future Work

1. Examination of the subject-matter in the Manual and definite recommendations for changes.

(a) Revise the General Specifications for Steel Railway Bridges.

(b) Revise the rules and unit stresses for classifying and rating the capacity of existing bridges.

2. Methods of Protection of Iron and Steel Structures against Corrosion.

Report upon the use of plastic compounds for the protection of steel work exposed to the blast action from locomotive stacks.

3. Relative Economy of Various Types of Movable Bridges.

Revise the Specifications for Movable Bridges and report them for adoption.

4. Secondary Stresses and Impact.

(a) Report definite principles for design to reduce secondary stresses and rules for computing or allowing for them.

(b) Study and draw conclusions from records of impact tests.

(c) Continue impact tests and stress measurements as funds may be available.

5. Column Tests.

Continue with program of column tests as far as the work of the Bureau of Standards will permit.

6. Design, Length, and Operation of Turntables.

(a) Report specifications for the design of turntables and turntable pits.

(b) Report specifications for steel for turntable roller and disc bearings.

7. Ballast Floor Bridges and Methods in Use for Waterproofing.

Report principles for detailed design of flashing, drainage, and reinforcement for waterproofing purposes.

8. Track Scales.

Collaborate with the committee on Yards and Terminals in the design of track scale superstructures.

Committee: O. E. Selby (C. C. & St. L.), chairman; F. E. Turneure (Univ. of Wis.), vice-chairman; J. A. Bohlund (G. N.), W. S. Bouton (B. & O.), A. W. Carpenter (N. Y. C.), Charles Chandler (I. C.), J. E. Crawford (N. & W.), F. O. Dufour, W. R. Edwards (I. C. C.), A. C. Irwin (Port. Cem. Assoc.), J. M. Johnson (I. C.), B. R. Lottler (N. Y. C.), Crosby Miller (C. & O.), W. H. Moore (N. Y. N. H. & H.), P. B. Motley (C. P. R.), C. D. Purdon (St. L. S. W.), Albert Reichmann (Am. Br. Co.), J. W. Reid (C. & A.), A. F. Robinson (A. T. & S. F.), H. B. Seaman (Cons. Engr.), C. E. Smith (Cons. Engr.), I. F. Stern (Cons. Engr.), H. B. Stuart (G. T.), G. E. Tebbetts (K. C. T.), L. F. Van Hagan (Univ. of Wis.), Dr. J. A. L. Waddell (Cons. Engr.), H. T. Wely (N. Y. C.).

Discussion

O. E. Selby (Chairman): Reference is made to subject 1, "Revision of Manual." (Mr. Selby then read this matter down to "submitted" in the second paragraph.)

I want to impress that on the members, that these specifications are 12 years old, far from complete and more or less out of date in many respects. We cannot hope to get a complete and satisfactory revision unless we get the ideas of members who have given the subject study. The only way to get that in satisfactory form, is to have them send the matter in to the committee in time to be incorporated in the draft. It would be out of the question to submit specifications to this convention, and have them acted on in detail. The committee presents one conclusion, which is as follows:

"It is concluded from information obtainable to date that the Schoop metal spraying process does not afford satisfactory protection from corrosion."

(After discussion this conclusion was accepted as information only.)

(Mr. Selby then read the matter relating to Subject No. 3.)

The President: I must confess that I have not read these specifications carefully, but they show evidence of hard work and considerable thought and study. It is hoped the members of the association will offer their criticisms as invited by the committee, as in this way only can we get the best work done.

(Mr. Selby read the matter under No. 4.)

Mr. Selby: These tests, as you know, are a continuation of tests that have been made by Prof. Turneure's subcommittee for several years past, and the results of these particular tests are given in the form of a conclusion, although the matter is not presented to the convention in the form of a conclusion for adoption in the Manual.

C. P. Howard (I. C. C.): I ask whether that reference to electric locomotives includes the kind that have counterbalance and rods like a steam engine, like the Pennsylvania type, does that refer to that type?

Mr. Selby: The committee will revise that conclusion by the addition of a paragraph showing that there were no reciprocating parts in the locomotives used.

The President: The members will be interested in knowing that the Railway Bureau of the Government of India has requested by cable this week that two of the extensometers used by this committee and designed by Prof. Turneure, be shipped to Simla, India, for the making of impact tests on the locomotives in that country.

(Mr. Selby read the matter under No. 5.)

Mr. Selby: These tests, as you know, have been continued as a series during several years past at the Bureau of Standards in Washington, and they have produced exceedingly valuable results.

(Mr. Selby then read the matter under No. 1, No. 2 and No. 3, on page 793.)

The President: There being no discussion, the matter will be approved and printed in the Manual.

(Mr. Selby here read the matter on subject No. 6.)

The President: As these have been before the members for a year, if there is no further discussion, the chair will entertain a motion to adopt them as a whole.

The President: That completes this report, and while we have a long program, I would suggest that we have a little general discussion on the subject of carrying over bridges and maintenance of bridges that probably would otherwise be replaced, but owing to the present conditions in the world and the difficulty of getting steel, cannot be. Some of the members may have some valuable information if they will tell us what they are doing in this direction.

P. B. Motley (C. P. R.): It seems to me that the Committee on Wooden Trestles and Wooden Stringers should be consulted in regard to the unit stresses in considering carrying over, as far as specifications are concerned, and the subject of over-stress. The Canadian Pacific has a long mileage, and about 68 miles of bridges, if they were all added together. These structures date from about 1887 to the present time. Last year we put in some concrete bridges which are of an extremely interesting character. I refer to two reinforced concrete trestles over 100 ft. high and 600 ft. long, where we are using 37-foot open spans. These trestles were erected by the usual methods of concrete building construction; that is to say, the towers were put up with the usual form work, and the slabs or open spans were put in by a 100-ton wrecking crane. The slabs themselves are made in T-sections, the upper part being used as a deck slab, as well as a compression member. They weigh about 55 tons, and the system of erection is decidedly interesting.

I mention this to show one of the ways in which we can carry over. The cost of steel is just now such as to lead our engineers to consider reinforced concrete, and these two instances are examples of what can be done. So that if our respective managements will not buy 300-foot spans of arch construction or other orthodox steel details, we can go to concrete for such things as trestle work. This is, in other words, the season for short spans. I think that is all I have.

R. H. Ford (C. R. I. & P.): It seems to me there are two thoughts that have to be kept in mind. The first is that we are in, probably, for a very long war. The second is that the roads of this country are going to be placed at a tremendous strain to carry the traffic with decreased manpower, as they have got to do during that period.

A. F. Robinson (A. T. & S. F.): Mr. Chairman and gentlemen: We have got to meet unusual conditions. It is generally relatively easy to determine as to just how much unit stress we dare carry in our steel structures. We may not be able to hold to the unit stress under these conditions even to reasonable limits. I have been asked to rate our bridges on the Cooper's series, with the idea that the Government Committee might be able to make our ratings, say, to E-50, E-55, or something of that sort.

We have got to consider not always what every one of us may count absolutely safe. We have got to find out just how far it is reasonably safe to go, and there will be different locations, different traffic conditions which will modify the judgment. We cannot lay down the rule positively.

There is one phase of this matter, gentlemen, which is not exactly a part of the work of this Committee, you may not call it. It is the timber bridges and timber stringers: 7 in. by 8 in. by 16 in. stringers, it is almost an impossibility to obtain today, because of the shipping work. It is an extremely difficult matter to lay down

fixed rules as to the maximum fiber stress permitted on the stringers. I have recommended to our people something in the way of a sliding rule. We do not adopt any maximum fiber stress. We found that on certain sections of the line we had broken stringers, say with a 3-ply chord, and on other sections of the line with very similar loading we had almost no broken stringers.

The only rule we can go by, I think, is this matter of the percentage or number of broken stringers. We cannot always expect to get along without broken ones. We must, however, use the limit. We have to consider those features, and not attempt to establish a fixed fiber stress. It is going to vary with the different climatic conditions and with different traffic conditions.

E. A. Frink (S. A. L.): Mr. President, it seems to me that judging the capacity of an existing structure is perhaps the most important and at the same time the most difficult problem that the engineer has to face. You can make formulæ for it, you can establish criteria, but they do not answer the full purpose that you want. You can establish certain limits of stress beyond which you ought not to go. But there are so many other questions that come in, that the unit stresses in themselves bear a comparatively small part. I realize the importance at this time of being as liberal as we can safely in allowing overloading of bridges, but personally I think that the matter already contained in the Manual, which establishes the limits which are considered safe for stresses, will be hard to improve upon, except that it would be very well, indeed, to make any investigation possible on the question; but I seriously doubt if we will be able to exceed those limits.

W. H. Courtenay (L. & N.): In many structures it is advisable to strengthen them and carry them over for several years, until the times become better for rebuilding, and a very simple expedient is to put false-work under them. We have had several viaducts we have treated in that way, and some girder bridges. Oftentimes it is feasible to strengthen any ordinary truss bridge by going over it carefully, and if we find the floor weak, or other parts, or the members subject to counter-stresses, strengthen them. That has been done to a considerable extent. Also improve the columns, particularly the top chord sections in some of the older bridges, triangular trusses, inserting additional columns, shorten the length of the top chord sections, and also suspending the web compression members so as to get rid of the effect of their weight. (Mr. Courtenay then described some unique strengthening work done on a trestle in Rigolets pass, on the Gulf coast.)

I. L. Simmons (C. R. I. & P.): It would seem to me with the material conditions as they are now today, that there has never been a time when railroads could so well afford to spend money on engineering as at the present time. You undoubtedly all have a number of bridges built prior to 1892. We have a great many, some of these are truss bridges and some of them are girder bridges. In the case of the truss bridges that were designed prior to 1892, you will find undoubtedly, even for the main sections in most cases they are very good, while the details are not strong enough. It is, therefore, for the engineer to determine what part of the structure is weak. You can well afford to spend considerable money to find out what is the matter and what are the determining features as to the rating of the bridge.

You may find the rivet connections are weak, and that it is a simple matter to ream out the $\frac{3}{4}$ -in. rivet holes, and put in $\frac{7}{8}$ -in. rivets, which will usually take care of the trouble. After you determine what part of the struc-

ture is weak, and whether or not it can be repaired and strengthened, the next question is if the structure has to be changed, what can you put in, and that is the point where you can put in good time and money at this time. Many of the structures cannot be reduced in size. Some, of course, you will have to lengthen.

I believe we should then make a study to find out what kind of structure we can put in and where we can get material of bridge size. This will lead us into the use of concrete, of which I am very much in favor. I am not very much in favor of carrying bridges on false-work. I believe that isn't safe. You are justified in such a procedure only when the work has to be done and you do not have the money to do it properly. I believe it should be worked out gradually.

I believe it would be a good thing for this association to establish a permissible loading for branch lines, or recommended loading for branch lines. We cannot all make our branch lines the same strength we do our main lines. If we could work to that, I believe we would get somewhere with it.

B. R. Leffler (N. Y. C.): I wish to call attention to some methods of reinforcing old steel trestles. In one particular case a trestle was about 75 ft. in height, and an attempt was made to reinforce it by putting timber bents in the middle of the span. I regard that as a questionable practice. In fact, it may be absolutely dangerous. If timber had a co-efficiency of elasticity as high as steel it might work, but being only about one-twentieth the co-efficiency of steel, it can be easily seen that any load on a high trestle supported or re-enforced by wooden bents, the wooden bents would not take the load as might be supposed.

The same applies to re-enforced trusses. We have seen trusses with framed bents underneath panel points. The idea being to decrease the span. The result is some eye-bars are placed in compression, and there are a few of these points which must be borne in mind in using timber in conjunction with steel. Think of it in this way—a plate girder is supported rigidly at each end, and in the middle you attempt to support it by a spring about one-twentieth the elasticity of steel.

P. B. Motley (C. P.): If I may be permitted to say something more, I would like to make one remark about the question of overloading. One of the speakers spoke of arriving at a decision as to how we shall allow in our steel bridges for engines that are heavier than the ideal engine for which the bridge is designed.

After a long experience, I consider that it was impossible for this association or this committee to state a definite figure for this purpose. In our experience the only way we have found satisfactory is to classify the floor of a given bridge according to Cooper's loading, and the trusses likewise. Then the engine is also reduced to Cooper's loading, and then one sees quickly whether the flooring or the trusses are overstressed and how much.

Each bridge has to be considered from the point of view of its design, and sometimes a certain point is discovered to be the ruling factor, and then the engineer must use his common sense and fix the limit for the fiber stresses at that particular point. It is no easy task, and especially when the Vice-President and certain other officials want to run certain heavy engines over the road, and put up to you the problem of the investment at stake.

W. S. Bouton (B. & O.): The unit stresses given in the Manual are 22,000 lb. for iron and 26,000 lb. for steel, as the maximum limits for bridge spans used on our road for many years, and we have used those limits without any trouble. The bridges are figured on the

basis of the Cooper E loading and the engines are rated in accordance with the Cooper loading, and the structures worked out in detail. It was, of course, necessary to watch the action of the structures very carefully after they are put in service for some time, but normally there is no trouble at all under such loading. I do not think we can go much beyond the 26,000 lb. on steel. I think that in order to carry structures over during this period, that possibly the trestling of structures offers the quickest remedy.

(F. Auryansen (L. I.) described in some detail a method used for strengthening iron bridges that had steel beam floors carrying brick jack arches. J. L. Campbell (E. P. & S. W.) outlined an example of conservation in the case of the viaduct of the Southern Pacific over the Pecos river. This structure is one of the high bridges of the world. It became necessary to have a heavier structure, and a scheme was worked out for reinforcing the bridge, which was accomplished by putting in a third truss in the center line of the track and strengthening the columns by riveting additional angles to them.)

Mr. Leffler: I happen to think of another important

feature in connection with taking care of old bridges. I have in mind bridges constructed with plate girders. In all my experience I have not found a plate girder that failed by direct tension in the bottom flange. It is nearly always a failure, if there is one, by buckling of the top flange, due to improper lateral bracing.

In many old concrete spans such as were made along in the 90's, the lateral system did not receive the attention in designing that it should have received, and by removing the lateral system, which requires a very small amount of steel, many plate girder spans can be made very serviceable.

Another feature is to make old girder spans and double them up, and it seems to me that right there lies a field where the different roads could interchange material.

Mr. Auryansen: One simple expedient is to revert to the slow order. That immediately reduces our load. The only trouble is that it is very apt to be overlooked. These orders have to be observed, and it is not sufficient to have some papers in the file. Otherwise that method would automatically reduce our loads and increase the capacity of the bridges by just that much.

(The committee was excused with thanks.)

Report of Committee on Signs, Fences and Crossings

LAST YEAR THE committee submitted considerable information relative to the depth and width of flangeways in use on steam and electric railways throughout the United States. Owing to the great variety in dimensions of flangeways and to the great amount of information submitted by the railroads, the committee was not able to present this information in the form it desired, nor was it able to make any study looking to a recommendation for standard dimensions of flangeways.

During the year this information has been tabulated showing the dimensions of flangeways in use on the different steam and electric railways. After a careful consideration of this data, the committee recommends the following dimensions for flangeways:

| STEAM RAILWAYS | | | ELECTRIC RAILWAYS | | |
|-------------------|--------------------|--------------------|-------------------|--------------------|--------------------|
| Depth of Flange | Width of Flangeway | Depth of Flangeway | Depth of Flange | Width of Flangeway | Depth of Flangeway |
| M. C. B. Standard | 1 1/4 in. | 1 7/8 in. | 1 1/2 in. | 1 3/4 in. | 1 3/4 in. |
| | | | 1 1/2 in. | 1 3/4 in. | 1 3/4 in. |

For flangeways in curved tracks of steam railways an increase in width of 1 1/16 in. for every 2 deg. of curvature over 2 deg. is recommended. For flangeways in curved tracks of electric railways no special increase is recommended, as the above dimensions cover ordinary operating conditions. On some roads the width of flangeway is increased as the gage is increased, so as to keep the distance between the gage line and the wearing surface of the opposite guard rail uniformly 4 ft. 6 3/4 in., which is good practice and recommended for excessive curvature.

For flangeways of steam railway tracks located in paved streets, the reports show widths generally ranging from 1 1/2 in. to 2 1/2 in., with one case each of 3 in. and 4 in. These flangeways are formed by rails laid on side, rails placed upright with separators, planks and other

paving materials, and special guard rails. For flangeways of electric railway tracks, located in paved streets, the widths generally range between 1 1/2 in. and 2 in., although one case reported a width of 3 in., another 3 1/2 in.

The depth of flangeways of steam railway tracks varies generally from 1 1/4 in. to 2 in., with two cases of 3 in.; while the depth of flangeways of electric railway tracks varies generally from 7/8 in. to 1 3/4 in.

Signs—The Principles of Design and Rules for Their Use

The committee had prepared a progress report embodying a set of signs for general use, the scheme being a rather radical departure from the signs at present in use on the railroads of the United States and Canada, in that lettering was largely eliminated. The underlying principle in the design was that signs used in connection with the operation of trains and for warning the public at highway crossings should be made as prominent as possible, while those delineating property and marking corporation limits, mileage, bridges, etc., should be made less conspicuous.

Upon taking the matter up with the committee on Signals and Interlocking, it was found that that committee had given the matter very careful consideration, and had arrived at the following conclusion:

"Some of the so-called signs govern train operation just as much as the movable semaphore of an interlocking or block signal system, and these signs are recognized in the standard code of the American Railway Association as signals. A note to the definition of fixed signal, on page 235 of the Rule Book of the American Railway Association, reads as follows: 'The definition of a "Fixed Signal" covers such signals as slow boards, stop boards, yard limits, switch, train order, block, interlocking, semaphore, disc, ball or other means for displaying indications that govern the movement of a train.' Under this definition, slow boards, stop boards, etc., are in fact signals. It seems that the work of this committee should be confined to designing these signals, and that the designing of information signals is properly a subject to be handled by committee No. 9, excepting that there

should be conference between the two committees to the end of avoiding any conflict which might result in confusion."

The committee is in accord with the above conclusion and can see no advantage in submitting another set of designs at this time.

In view of the fact that we now have government control of railroads, which may lead to the transfer of men from one road to another, as is being done with equipment, it would seem most desirable that uniform signs should be adopted by all railroads. As efforts are being made from year to year to secure more permanent materials for various structures, it is considered most desirable that concrete be utilized for all information signs and, when possible, for other signs, all suitably marked to convey the necessary information.

Legal Requirements Relative to Right-of-Way Fences and Stock-Guards

Last year the committee submitted abstracts from the laws of the various states of the Union and Canada, on the legal requirements relative to the provision of fences for right-of-way and installation of stock-guards. In the discussion of the report at that time, it was suggested that a tabulated statement be prepared, giving the principal information shown in the abstracts—when the laws were passed, what constituted a legal fence, and other information of this character. The committee therefore presented, in tabulated form, the information suggested in the discussion.

The laws of but 19 states and the Dominion of Canada specify the height of a legal fence, and the laws of but 26 states and the Dominion of Canada specify the material to be used in their construction. The laws of a number of the remaining states are entirely silent on the matter of what constitutes a legal fence, some of the laws making no mention whatever of the material to be used or the height, but specifying in a general way that the right-of-way shall be fenced so as to turn the various kinds of live stock. In a few instances, the railroad companies are obliged to secure the approval of the railroad commission for both fences and stock-guards.

From the above, it would seem apparent that some concerted action should be taken by this Association, or by some other similar body, looking to the adoption of a uniform fence law. Under present conditions, it is difficult in many cases to decide damage cases on account of the uncertainty as to what constitutes a legal fence.

Types of Fences

This year the committee collected a number of photographs illustrating special fences suitable for use around industrial plants, railroad yards, etc. The investigation has disclosed the fact that there is a great variety of fences in use at this time for the above purpose, ranging from the ordinary wood picket fence, in general use years ago, to the solid board fence surmounted by strands of barbed wire, and from the ordinary iron picket fence to the heavy galvanized woven wire fence, surmounted by strands of barbed wire, shown in the accompanying illustrations. These fences are usually about eight feet in height, and their use has increased very rapidly within the last year or two, particularly around industrial plants engaged in the manufacture of material used in connection with the prosecution of the war.

Another rather common form of fence around railroad property consists of angle iron rails and pickets with flat iron bars for posts and braces.

Over and Under Grade Crossings

The committee presented abstracts of laws or regulations of the public utilities commissions of 47 states and the District of Columbia relative to over and under grade crossings—their method of construction, distribution of cost, etc.

End or Strain Posts

It does not appear that special devices, which have been introduced by the manufacturers of steel posts to avoid the expense attendant upon the use of concrete with strain and corner posts, have been adopted by railroads to any extent. But one correspondent reports the use of such devices with tubular posts and, as these were only installed in 1917, their effectiveness has not been determined. The cost of the 8 ft. 6 in. No. 9 gage post in this instance is given at \$2.80 and the cost of setting at 40 cents. Two of these devices are shown on the accompanying drawing. With that marked "A," a hole is dug for the strain post large enough to admit the anchor plate. After backfilling the hole the face plate is driven. The brace plate is driven after attachment to the brace rod. It is necessary to dig a trench to receive the lower end of the brace rod. The post shown at "B" is driven into the ground as indicated, the post is split at the bottom and is spread out as it nears its final position. This is accomplished by first driving to proper depth a rod having a wedge-shaped enlargement at the lower end greater in diameter than the interior of the post. This arrangement does not work very well in soft ground because the spreader will be forced down with the post.

Some information has been received from the manufacturers concerning a steel line post of U section. These posts are about 2 in. square. Rectangular steel pegs about 18 in. long are driven through slots in clips bolted on to the posts just below the ground surface to hold the fence in line. Strain and corner posts are tubular, 2½ in. or 3 in. in diameter. A horizontal tubular strut is placed between the strain post and the adjacent line post at about two-thirds the height of the fence and a tie wire or rod leads from the line post end of this strut to the strain post at the ground line. The manufacturers report considerable use of this fence about industrial plants and two railroad companies are also reported to be users. This post is also shown in the drawing.

Another form of anchor post is shown at "D." This post consists of two standard line posts placed back to back, and either bolted or riveted together, and braced by a standard line post attached to the anchor post as shown by the illustration. This style of post has been used considerably for fences subjected to the lighter service, and has also been used to some extent in railroad right-of-way fences.

Some companies have continued the use of wood strain and corner posts with steel line posts. This has the advantage of cheaper first cost, but its final economy depends, of course, on the relative length of life of the wood post, the steel line post and the wire.

The ordinary method of setting steel strain and corner posts in concrete is well illustrated in the standard fence of the Elgin, Joliet & Eastern. There is considerable variation in the amount of concrete used by different companies. Blocks 8 in. square by 36 in. deep are reported by one company, while another uses a block 20 in. square and 42 in. deep. A fair average for such blocks is 18 by 18 by 30 in. Brace rod blocks have about one-half the above volume.

Angular strain posts are provided with a cross angle, similar to a cleat, attached at the bottom by means of a triangular plate. Brace angles, which are attached to the

post by means of a bolt or rivet, are similarly enlarged at the bottom. Sufficient information to form an opinion as to the effectiveness of this arrangement has not been received.

Concrete Fence Posts

While the committee does not have any definite data as to the annual expenditure of the railroads for fence posts, it is probable that it is considerably over \$1,000,000. There are more than 250,000 miles of railroad lines in the United States and, while this committee does not know just what percentage of this mileage is fenced, it

extensively have abandoned using concrete posts until a more satisfactory design has been gotten out or brought to their attention.

Of the 18 roads that have tried concrete posts, 10 favor their use, 1 favors steel, 3 favor wood and 4 are undecided. Of the 66 roads that are not using concrete posts, 3 favor the use of concrete posts, 1 favors steel and 8 favor wood. The other 54 roads did not express a preference. Thus, of the 25 roads that did express a preference about 50 per cent favor concrete posts, 10 per cent favor steel, and 40 per cent favor wood.

The committee is led to the conclusion that concrete

Several Designs of Fence Construction

is quite certain that there are at least 75 to 100 million posts in use, costing on the average 15 cents or more each.

Apparently the Pennsylvania Railroad began experimenting with concrete fence posts about five years before any of the other roads, the first posts being set by them in 1904. Such good results were obtained with these first posts that in 1909 they began to experiment on a larger scale. Since 1909 the use of concrete posts by railroads has gradually increased until at the present time there are about 800,000 in service. In a general way, it may be said that these posts are giving good satisfaction, although for various reasons a great many failures have occurred and several roads that have experimented quite

line posts having a strength sufficient to resist a force of 200 lb. acting along or at right angles to the fence line and applied 60 in. above the ground line, the post acting as a cantilever beam, are strong enough to give good results. Too much stress can hardly be laid on the use of an adequate amount of steel properly placed. In 1914, under the direction of this committee, 78 concrete line posts of different types were tested to destruction at the Lewis Institute, Chicago. In spite of the fact that the concrete used in the posts varied in its crushing strength from 1,530 to 3,250 lb. per sq. in., every post failed in tension. It is probable that some of the failures were indirectly due to poor concrete, allowing the steel to slip,

but by far the greater number were due to the failure of the steel itself. Among the other things that were brought out by these tests was that stranded or crimped reinforcing should not be used, but that the steel, whether smooth or deformed, should be in the form of a straight, stiff bar. The committee also believes that square or round rods, moderately deformed, are preferable to strap iron, since the former permit the concentration of the steel further from the neutral axis and since the latter tend to set up lines of cleavage in the concrete.

The committee, in sending out its inquiry blanks this year, asked the members to describe the methods used to fasten the fencing to the line posts and to state what success they were having with such methods. Ten companies are using tie wires around the posts and 8 of the 10 express themselves as satisfied with this method. Five are using posts with a hole in the same through which a wire or a nail is passed and fastened to the reinforcing. Four of the 5 are satisfied with this method. Three companies are using staples embedded in the concrete, through which the tie wires or nails are passed for fastening the fencing; this method being satisfactory to all three. When posts are tapered, a tie wire around the post, if properly applied, will prevent stock from crowding the fencing down, but the experience of some roads indicates that it will not prevent hogs from raising it up, so that in districts where hogs are raised extensively some other method of fastening is preferable.

As to the annual cost of concrete line posts, it seems probable that with prices as high as they now are and will doubtless be for several years, the minimum will be about two and a half cents. In the case of materials that have a comparatively short life, such as wooden fence posts, anything that materially increases or decreases the average life will have a considerable effect on the annual cost. For example, if a wooden fence post costing 35 cents in place has a life of 10 years, its annual cost will be 4.55 cents; whereas, if its life were 15 years the annual cost would be only 3.22 cents. On the other hand, if concrete line posts costing 45 cents have an average life of 50 years, the annual cost would be 2.47 cents, and increasing the average life to 60 years would only reduce the annual cost to 2.38 cents. In other words, if we can produce concrete line posts that will have an average life of, say, 50 years, we gain very little, as far as annual cost is concerned, by adding a few more years to their life, and any material decrease in this annual cost will have to be effected by reducing the first cost. This brings out the fact that excessively large and expensive concrete posts are to be discouraged and that a post should be built to the size and strength that is economically profitable and no larger.

In line with this idea, it appears to this committee that any specification as to minimum size and reinforcing of concrete posts is a mistake. In spite of all devices and safeguards the quality of concrete is and will always be largely dependent on the human element and on local conditions, and the committee believes that such posts should be built to a minimum strength rather than size. Just what this strength should be, the committee is not prepared to say at this time, but it is quite certain that posts capable of withstanding a load of 200 lb. when tested as a cantilever beam would be strong enough and it is thought that this strength may be greater than is necessary, particularly in some localities.

Conclusions

The conclusions of the committee, based on the information obtained this year, may be summed up as follows:

1. The committee repeats its conclusion of 1914 that, "Concrete fence posts are practical, economical and a suitable substitute for wood."
2. Reinforcement should be placed as near to the surface of the post as practicable, say $\frac{1}{2}$ in. from the surface.
3. Posts should taper from base to top.
4. Square corners of posts should be rounded off to a radius of not less than 1 in.
5. Concrete should be made from clean, hard, aggregates, the percentage of the various sized grains being such as to produce a dense concrete, using screen analysis as a guide. The minimum size of the particles of gravel or crushed stone should not be less than $\frac{3}{4}$ in. nor more than $\frac{1}{2}$ in. Concrete should be mixed in the proportion of one part cement to not more than four parts of mixed aggregate. Concrete should be of such a consistency that water can be brought to the surface by tamping; the use of an excess of water is detrimental. Concrete should be very thoroughly mixed in a batch, not a continuous mixer.
6. Reinforcing should be in the form of stiff round or square rods, preferably deformed, made from steel with a high elastic limit. Crimped or stranded reinforcing that would be straightened out when brought into tension should not be used. Some method of positively holding the reinforcing in its proper place in the post throughout its entire length should be used.
7. Jogging or vibrating molds to compact the concrete in the post, or some other method that will accomplish the same purpose, should be employed.
8. Posts should be carefully made so as to secure a uniform strength in substantially all posts, and this strength should usually be such that the post will withstand a force of not less than 180 lb. at right angles to the axis of the post, the post acting as a cantilever beam supported at the ground line and the force being applied 60 in. above the ground line. It is not economical to make posts that will have the strength to resist a force of over 200 lb. when the post is tested in the manner above described.
9. Square, or nearly square, posts are more efficient than round posts in resisting the forces that ordinarily cause failure, but the difference is not very great and may in some cases be offset by an increased resistance to deterioration and better methods of manufacture.
10. On account of the rapid failure of reinforced concrete when exposed to air containing salt spray, concrete fence posts should not be used within twenty or twenty-five miles from large bodies of salt water.
11. Posts should not be made out of doors in freezing weather. They should not be exposed to the sun, and should be sprinkled with water the first eight or ten days after being made to aid curing.
12. Molds should be carefully oiled or soaped to prevent concrete sticking to them.
13. Posts should be cured for not less than 90 days, when cured naturally, before being set or shipped.
14. Posts should be carefully handled and packed in straw, sawdust or other suitable material for shipment.
15. The study of the results obtained from concrete line posts should be continued from year to year and the results tabulated for the information of the Association.

Analysis of Cost

For the purpose of making a revised analysis of the comparative annual cost of fences, inquiries were sent out soliciting data on concrete and steel line posts only, the intention being to use the data collected in 1915 for wood posts. In 1913, information was submitted with

respect to the comparative cost and economy of steel and wood posts. The figures relative to steel posts given at that time were furnished largely by the manufacturers. This year information has been received from 20 users of about 140,000 steel posts and 18 users of about 800,000 concrete posts and a comparison has been made between this and the rather full information relating to wood line posts, presented in 1915.

From 1915 data it appears that the average cost and life of wood posts is as follows:

| Kind of Wood | Life | First Cost | Handling | Setting | Total Cost |
|--------------|---------|------------|----------|---------|------------|
| Bois D'arc | 26 Yrs. | 14c | 1.72 | 8.52 | 244½c |
| Catalpa | 12 Yrs. | 17c | 1.72 | 8.52 | 273½c |
| Cedar | 15 Yrs. | 16c | 1.72 | 8.52 | 264½c |
| Chestnut | 11 Yrs. | 14c | 1.72 | 8.52 | 244½c |
| Cypress | 11 Yrs. | 20c | 1.72 | 8.52 | 304½c |
| Locust | 17 Yrs. | 20.5c | 1.72 | 8.52 | 303½c |
| Oak | 9 Yrs. | 14.5c | 1.72 | 8.52 | 244½c |
| Pine | 8 Yrs. | 11c | 1.72 | 8.52 | 214½c |

Of the above the cedar post is the cheapest, with the exception of the Bois D'arc, and is used in much larger quantities than any of the others. The steel and concrete posts will be compared with it. Information received this year indicates the average first cost of the steel line post to be 27 cents and the cost of handling and setting, 7 cents. The average estimate of life is from 15 to 20 years. The average first cost of concrete line posts is about 25 cents, and the cost of handling and setting about 20 cents. The estimated life of concrete posts is placed at 50 years.

As in the 1913 report, interest is assumed at 6 per cent. The result of this comparison is as follows:

| | Wood 15 yrs. | Steel 20 yrs. | Concrete 50 yrs. |
|--|-----------------|------------------|---------------------|
| Estimated average life | 15 yrs. | 20 yrs. | 50 yrs. |
| Average first cost in place | 0.2625 | 0.340 | 0.4500 |
| Annual Cost | | | |
| Interest on first cost at 6 per cent. | 0.0157 | 0.0204 | 0.0270 |
| Amount to be set aside annually to reproduce first cost at end of life | 0.0113 | 0.0092 | 0.0015 |
| Total annual cost | 0.0270 | 0.0296 | 0.0285 |
| Cost per mile (640 posts) | 17.28 | 18.97 | 18.24 |

The above comparison should be considered as roughly approximate only, when applied to a particular case, because the life of wood, steel and concrete posts is affected by locality and the weight of metal and quality of galvanizing must be taken into account. At the present time steel posts are from 50 per cent to 75 per cent higher in price than quoted above, and deliveries are very indefinite.

The information received relative to the cost of strain and corner posts in place is so meager and variable that a comparison similar to the above for line posts does not seem warranted.

Conclusions

The committee recommended in its report:

1. That the recommendations under "Flangeways" be approved and published in the Manual.
2. That the recommendations of the committee in reference to "Types of Fences" be approved and published in the Manual.
3. That the recommendations of the committee in reference to "Concrete Fence Posts" be approved and published in the Manual.
4. That the remainder of the report be accepted as information.

Committee: W. F. Strouse (B. & O.), chairman; Arthur Crompton (G. T.), vice-chairman; F. D. Batchelor (C. H. & D.), H. E. Billman (M. P.), C. G. Bryan (I. C.), G. F. Black (Me. C.), A. C. Copland (C. & O.), A. S. Butterworth (M. P.), B. J. Dalton (M. K. & T.), F. T. Darrow (C. B. & Q.), G. N. Edmondson (N. Y. C.), R. C. Gowdy (E. W. & D. C.), Paul Hamilton (C. C. & St. L.), Maro Johnson (I. C.), L. C. Lawton (A. T. & S. F.), S. L. McClanahan (C. R. I. & P.), L. A. Mitchell (Un. Tr. Co.), T. E. Rust (W. C. F. & N.),

A. Swartz (T. & W.), W. D. Warren (N. Y. N. H. & H.), W. D. William (Cin. Nor.), K. G. William (C. R. I. & P.)

Discussion

W. F. Strouse (Chairman): The committee was assigned eight different subjects. In reference to subject number 1, the report on this subject appears in appendix A, and the recommendations of the committee are given at the end of that section for approval and publication in the Manual. In connection with that report you will find series of tables giving the dimensions of flangeways of electric railways, steam railways, etc., and the conclusions that are recommended for placing in the Manual. I move the adoption of the sections concerning flangeways.

(Motion carried.)

C. E. Lindsay (N. Y. C.): I apprehend that there might be a possibility in widening the flangeway $\frac{1}{8}$ in. for every 2 deg. of curvature that it might in some cases violate the action of the guard-rail; that is, it might decrease the distance between the top of the rail and the frog point so that it would strike.

Mr. Strouse: I would say in answer to that, this contains the statement:

(Mr. Strouse read the sentence beginning "on some roads.")

I think that will take care of it, and that impression is borne out by the information that was furnished the committee, a great deal of which was not published in this report.

Mr. Lindsay: That is obligatory, that it shall not violate that distance.

Mr. Baldrige: I should like to ask the committee whether or not it has taken into consideration in fixing this width of flangeway, the proposal which has been acted upon, I think, by some other committee, sanctioning the thickening of the flanges of the wheels?

Mr. Strouse: So far as I know that matter has not been given consideration.

Mr. Baldrige: If I remember correctly, one of the other committees has in its report a statement sanctioning the proposal of the Master Car Builders' Association thickening the car wheel flange $\frac{1}{8}$ in. If that matter has not been considered by this committee, it seems to me it would be advisable to hold this another year to consider that.

John R. Leighty (M. P.): There is no reason why we should defer action on this committee's work on account of the subject just mentioned, so long as this report does not violate any of the conditions proposed. The design of frogs and switches and their flangeways will be taken care of in the same way as the other.

Mr. Baldrige: If I remember our flanges for frogs and switches, they provide for $1\frac{1}{2}$ in. on the rail side and $1\frac{3}{4}$ in. on the frog side. That gives $\frac{1}{8}$ in. more in that case than we are providing in this case. Unless that matter has been considered, I think the committee should take it up. As I remember, the other report provided for sanctioning the thickening of the flange of the wheels, provided the face of the flange of the wheel extended a certain amount. Why not refer this back and have the adjustment made?

The President: My idea was that it was the face to face distance, wasn't it?

Mr. Baldrige: I understand the face is the side of the flange next the rail.

The President: The point that seems to be dangerous here, if you get up to 25 deg. you have gone beyond the limit of that equation. However, it is immaterial.

Mr. Strouse: Last year copies of the laws relating to

fences for rights of way were presented, and the committee was asked to tabulate the principal information contained in those laws. This has been done, and is presented as information.

The President: It will be so accepted.

Mr. Strouse: Subject No. 5 is, report on Classification of Fences into Types. Several years ago the committee revised the specification for fences as given in the Manual and submitted considerable other information as in connection therewith. This year we have some photographs of a number of different styles of fences that are used. The committee recommends the inclusion of these photographs in the Manual as supplementing the sketches that are already in the Manual for illustrating other styles of fence.

I remember several years ago that in discussing the specifications for fences, the association was very guarded in recommending any particular type of fence; but it seems to me that that point could be covered very nicely by the passage of uniform fence laws. As it is now some of the fences are 4 ft. high, some are 4½ ft., some are allowed to be constructed of wood in various combinations, and others posts of various types, the result being that a different construction might be placed on what constitutes a legal fence in every state.

Mr. Lindsay: I was going to ask, whether the committee considered that with these illustrations and the material already in the Manual, they have shown all types of fences that are used on railroads.

Mr. Strouse: No, I would not say all types.

Your chairman was somewhat in doubt as to just what was meant by being asked to report on classification of fences into types. It did not seem to me to be anything very definite in the wording of the subject.

F. Auryansen (L. I.): There are two types of fence, one you can see through and the other that you cannot. I think the committee ought to get some data regarding concrete fences.

Mr. Baldridge: As there seems to be divergence of opinion, I move that this be referred back to the committee for another year.

The President: The committees say they will accept that suggestion.

R. C. Gray (B. & O.): Under the title, Ohio, the statement is made "the power to deal with matters of this nature is vested in municipalities." I think that statement should be made in counties and municipalities. In Ohio we have about as many overtures from boards of county commissioners as we have from municipalities.

The President: The committee will accept that.

Mr. Strouse: Appendix G is a further study on the subject of concrete fence posts; in other words, the subject has been brought down to date. Tables were prepared from information received from various railroads which have given the use of square posts, round posts, etc. The conclusions arrived at by the committee under the subject of concrete posts are similar to the conclusions that are at present in the Manual, except that they are somewhat more elaborate. This is supposed to be a substitute for what is in the Manual.

Prof. Talbot: In Sec. 10 I find no reference to the data on which that conclusion was based. Can the committee give us any further information in their report?

Mr. Auryansen: I might say in answer to Prof. Talbot that 25 miles from salt water includes all of Long Island, and the Long Island Railway built quite a number of fences having 3-in. slabs which were reinforced and properly held in place so that they could remain in the center of the slab. The fences are over 10 yrs. old and there is absolutely no sign of deterioration.

Prof. Talbot: In view of that statement, I make the motion that that No. 10 be referred back to the committee.

A. O. Wilson (S. A. L.): Mr. President, the Navy Yard at Charleston is enclosed with reinforced concrete posts, and they show no deterioration whatever. This fence has been up a number of years, and I don't think that paragraph 10 will hold.

Mr. Strouse: In regard to that point, I only know in a general way that there have been a good many failures in concrete exposed to salt water, but whether it is necessary to place such a distance between the salt water and the structure is another question. I rather feel myself that that is a little too great a distance. I move that these conclusions, with the exception of No. 10, be adopted and placed in the Manual, as revised.

(The motion was carried.)

Mr. Strouse: There is one other subject, number 8. The committee undertook to revise the cost and bring it down to date, but found the present time rather a bad one to attempt anything elaborate in that direction, on account of the excessive cost of labor and material, and the cost analysis that is given deals with the cost of various kinds of posts that have been in vogue the last few years. It is only submitted as information.

The President: It will be so accepted.

(The committee was dismissed with the thanks of the association.)

Report of Special Committee on Stresses in Track

THE JOINT COMMITTEE of the American Railway Engineering Association and the American Society of Civil Engineers has been conducting elaborate experiments on the action of track under standing and moving loads for the last five years. An extensive progress report was published in the Proceedings of the American Society of Civil Engineers for January, 1918. This same report was also presented to the American Railway Engineering Association yesterday. This report was abstracted in the *Railway Age* of February 22, page 403.

Committee: A. N. Talbot (Univ. of Ill.), W. M. Dawley (Erie), A. S. Baldwin (I. C.), G. H. Bremner (I. C. C.), W. J. Burton (M. P.), Chas. S. Churchill (N. & W.), W. C. Cushing (P. L. W.), Dr. H. P. Dudley (N. Y. C.), Robt. W. Hunt (Con. Engr.), J. B. Jenkins (B. & O.), George W. Kittredge (N. Y. C.), P. M. LaBach (C. R. I. & P.), G. J. Ray (D. L. & W.), H. R. Safford

(G. R.), Earl Stimson (B. & O.), F. E. Turneure (Univ. of Wis.), J. E. Willoughby (A. C. L.).

Discussion

Prof. Talbot (Chairman): The committee on Stresses in Track presents its first progress report. The report includes first an analysis of the action of track as an elastic structure; second, the description of the instruments and apparatus used, and the methods of conducting tests; and third, the results of the tests.

It is felt that the analysis of the action of the track as an elastic structure is of value, in giving something to permit comparison of results, and to add comprehension to what may be expected in track action. The Manual assumes a uniform elastic support, which, of course, is not the condition where ties are used, and is not the condition where the track is not well tamped, but it does

indicate some of the effects of the kind of ballast, of spacing and size of ties and the effect of the moment of inertia of the rail section. These enter into the treatment.

The results of the tests given here are mainly those relating to stresses in the rail, the work on stresses in ties, depression of the ties and the conclusion of distribution of the pressure downward and laterally through the ballast being held for a later report.

In regard to the stresses in rails, the report gives something on the effect of the load itself in forming a stress in the rail; of the distribution of the load along the rail as in the case of trucks or drivers of different spacing; gives something about the effect of the weight of rail with reference to the bending moment, as well as to the weight the moment develops, as well as to the stresses found in the rail.

Since this report was presented, tests have been made further, on the matter of the counter-weight. It seems

best to refer to that here, in order that the impression may not prevail that since no differences were found in the tests made as reported here on the effect of the position of the counter-weight of the drivers of the locomotive, that may not be considered to be the finding of the committee. In a case where tests have just been worked up, rather excessive effects were found from a locomotive which was undoubtedly either badly balanced or poorly designed.

The President: I would say that this was a little better than a report, that this was a classic, and judging from a mere glance at it, it would look as though we might spend considerable time in the discussion of it if the lateness of the hour did not forbid. I understand the committee will continue this work and submit another report at the next convention.

(The committee was dismissed with the very sincere thanks of the association for the very good work that apparently has been done.)

Report of Committee on Rail

THE MANUAL for 1915, page 88, shows three locations of borings for chemical analyses of rails, one in an upper corner of the head, one in the interior of the head near the web and the third in a flange. Experience and special tests have shown that the samples from the corner of the head and from the flange have about the same chemical composition and for general purposes the flange sample may be omitted.

The same page of the Manual also shows a drawing for the tensile test specimen of

$\frac{1}{2}$ -in. diameter and 2-in. gage length, with threaded ends. This followed the standard of the American Society for Testing Materials, which have modified its standard by omitting the threaded ends and allowing the ends to be of any form which will fit the holders of the testing machine. Our drawing should also be modified in the same manner to accord with current practice in testing laboratories. The Rail Committee recommends this drawing be substituted for the one on page 88 of the 1915 Manual.

The 1915 Manual contains "Specifications for High-Carbon Steel Joint Bars" (page 89) and "Specifications for Heat-Treated, Oil-Quenched Steel Joint Bars" (page 91). At the convention of the Association in March, 1916, the committee submitted "Specifications for Quenched Carbon and Quenched Alloy Steel Joint Bars," to be held over for one year. At the 1917 convention, some changes were submitted and it was again recommended that the specifications be held over for another year. The committee now presents these specifications as modified last year, with the recommendation that they be adopted and supersede in the Manual the "Specifications for Heat-Treated, Oil-Quenched, Steel Joint Bars."

Specifications for Quenched Carbon and Quenched Alloy Steel Joint Bars

Access to Works

1. Inspectors representing the purchaser shall have free entry to the works of the manufacturer at all times

while the contract is being executed and shall have all reasonable facilities afforded them by the manufacturer to satisfy them that the joint bars have been made in accordance with the terms of the specifications.

Place for Tests

2. All tests and inspection shall be made at the place of manufacture, prior to loading, and shall be so conducted as not to interfere unnecessarily with the operation of the mill.

Rejection at Destination

3. Joint bars which show injurious defects subsequent to their acceptance at the place of manufacture or sale will be rejected and returned to the manufacturer, who shall pay the freight charges both ways.

Material

4. Material for joint bars shall be steel made by the Open-Hearth process or an acceptable alloy steel.

Chemical Properties

5. The chemical composition of each melt of steel from which joint bars are manufactured shall be within the following limits:

Carbon, per cent..... 0.42 to 0.55
Phosphorus, per cent, maximum..... 0.04

Note.—In the event of nickel and chromium being present to the extent of 1.00 per cent and 0.35 per cent, respectively, these elements will be considered as the equivalent of 0.07 per cent of carbon in the above requirements.

6. The manufacturer shall furnish the inspector a complete report of ladle analysis showing carbon, manganese, phosphorus and sulphur content of each melt represented in the finished material. The purchaser may make a check analysis from the finished material; such analysis shall conform to the requirements of Section 5.

Physical Properties and Tests

7. Joint bars shall conform to the following physical requirements:

| | Quenched Steel | Alloy Steel |
|---|----------------|-------------|
| (a) Tensile strength, lb. per sq. in., minimum..... | 100,000 | 100,000 |
| (b) Elastic limit, lb. per sq. in., minimum..... | 75,000 | 85,000 |
| (c) Elongation, per cent in 2 in., not less than..... | 1.00 | 1.00 |
| Minimum, 12 per cent..... | Ten Str. | 3.50 |
| (d) Reduction in area, per cent, not less than..... | Ten Str. | Ten Str. |
| Minimum, 25 per cent..... | | |
| (e) Cold bending of the quenched bar without sign of fracture on the outer edge of the bent portion through 180 deg around an arc, the diameter of which is three times the thickness of the test specimen. | | |

8. All test specimens shall be cut from finished bars.

(a) The tension test specimens shall be about $4\frac{1}{4}$ in. long with threaded or unthreaded ends, and with the central 2-in. length turned to a $\frac{1}{2}$ -in. diameter, in accordance with the form and dimensions for tension test specimens of the American Society for Testing Materials.

(b) The bend test specimens shall be $\frac{1}{2}$ -in. square in section or a rectangular bar $\frac{1}{4}$ -in. thick with two parallel faces as rolled.

(c) The elastic limit shall be determined by the use of the Berry strain gage, or similar instrument, and will be the load when the elongation shows a change in the rate of stretch, the machine being operated at not more than $\frac{1}{4}$ -in. per minute. After the elastic limit is reached the speed shall not exceed 2 in. per minute.

Quenching

9. (a) Joint bars shall be quenched in oil, or water if so specified, from a temperature of about 810 deg. C. (1490 deg. F.) and shall be kept in the bath until cold enough to be handled. A group thus treated is known as a quenching charge.

(b) Material which requires quenching in water will be acceptable at the option of the purchaser, provided it meets the requirements of the specification in all other respects.

General Requirements

10. Joint bars shall be rolled to dimensions specified in drawing furnished by the purchaser. No variation will be allowed in the dimensions affecting the fit and the fishing spaces of the rail. The maximum camber in either plane shall not exceed $1/32$ -in. in 24 in.

11. Joint bars shall be sheared to the length prescribed by the purchaser and shall not vary therefrom by more than $\frac{1}{8}$ in.

12. (a) All joint bars shall be punched, slotted and shaped at a temperature of not less than 800 deg. C. (1470 deg. F.).

(b) All bolt holes shall be punched in one operation without bulging or distorting the section, and the bars shall be slotted when required for spikes in accordance with the purchaser's drawing, the slotting being done in one operation. A variation of $1/32$ -in. in location of the holes will be allowed.

13. All types of joint bars shall be finished smooth and true without swelling over or under the bolt holes, and shall be free from flaws, seams, checks or fins. The fishing angles shall be fully maintained.

Branding

14. The rolled bar shall be branded or marked for identification in the following manner and a portion of this marking shall appear on each finished joint bar:

(a) A portion of the name of the manufacturer, the year of manufacture, the numbered design and the kind of material shall be rolled in raised letters and figures on the outside of the bars.

(b) The letters "O H" shall be used to indicate "Open-Hearth Steel."

(c) The letter "Q" shall be used to show that the joint bars have been "quenched." If the joint bars are also tempered, the letters "Q T" shall be used to show that they have been "quenched and tempered."

(d) The number of the melt shall be plainly stenciled on each lot of bars.

Inspection

15. The joint bars from each melt or heat treatment lot shall be piled separately until tested and inspected by the inspector. One joint bar for tension test shall be selected by the inspector for each melt or heat treat-

ment lot represented in finished bars. One joint bar for bend test shall be selected by the inspector for each lot of 1,000 bars or less presented or from each heat treatment lot.

Rail Failure Statistics

The statistics covering rail failures for the period ending October 31, 1916, were issued in Bulletin 199 for September, 1917. The average failures per 100 track miles of the rollings for the several years, including both Bessemer and open-hearth rails, are given herewith. This summary includes statistics from reports for 1913, 1914, 1915 and 1916:

| Year Rolled | Years Service | | | | |
|-------------|---------------|-------|-------|-------|-------|
| | 1 | 2 | 3 | 4 | 5 |
| 1908 | | | | | 398.1 |
| 1909 | | | | 224.1 | 277.8 |
| 1910 | | | 124.0 | 152.7 | 198.5 |
| 1911 | | 77.0 | 104.4 | 133.3 | 176.3 |
| 1912 | 28.9 | 32.1 | 49.3 | 78.9 | |
| 1913 | 12.5 | 25.8 | 44.8 | | |
| 1914 | 8.2 | 19.8 | | | |
| 1915 | 8.9 | | | | |

It will be noted that the four years' rollings from 1908 to 1911, inclusive, show successively decreased numbers of failures compared on a basis of five years' service and the later rollings compared on a shorter period of service also show reductions. The improvement may probably be ascribed mostly to three things, namely, the gradual replacement of Bessemer by open-hearth rails, the adoption of heavier rails with stronger bases, and the improvement of the metal used for rails.

Special Investigations

During the year special reports have been presented by the Rail committee as follows:

No. 64—Mill Inspections of Rail in 1915 and 1916, by M. H. Wickhorst.

No. 65—Rail Failure Statistics for 1916, by M. H. Wickhorst.

No. 66—Influence of Gage Length on Elongation in Drop Test of Rails, by M. H. Wickhorst.

No. 67—Tests of Manganese Steel Rails, by M. H. Wickhorst.

No. 68—Inhibited or Delayed Transformations in Rail Heads, by Dr. P. H. Dudley.

No. 69—Intensity of Pressure on Rails, by a Sub-Committee, J. R. Onderdonk, chairman.

Track Bolts and Nutlocks

At the convention in March, 1916, the Rail committee submitted "Specifications for Quenched Carbon and Quenched Alloy Steel Track Bolts with Nuts," and "Specifications for Medium Carbon Steel Track Bolts with Nuts," as shown on pages 490-494, inclusive, of the 1916 Proceedings. The action of the convention was that these specifications be "held under consideration during the coming year with a view to final action next year." No action was taken on this matter at the 1917 convention. The committee now recommends that the specifications submitted in 1916, with some changes, be adopted by the Association for insertion in the Manual in place of the "Specifications for Track Bolts" appearing on pages 123, 124 and 125 of the 1915 edition.

Specifications for Quenched Carbon and Quenched Alloy Steel Track Bolts with Nuts

Access to Works

1. Inspectors representing the purchaser shall have free entry to the works of the manufacturer at all times while the contract is being executed and shall have all reasonable facilities afforded them by the manufacturer

to satisfy them that the bolts and nuts have been made in accordance with the terms of the specifications.

Place for Tests

2. All tests and inspection shall be made at the place of manufacture, prior to loading, and shall be so conducted as not to interfere unnecessarily with the operation of the mill.

Rejection at Destination

3. Bolts and nuts which show injurious defects subsequent to their acceptance at the place of manufacture or sale will be rejected and returned to the manufacturer, who shall pay the freight charges both ways.

Material

4. Material for bolts shall be steel made by the Open-Hearth process or an acceptable alloy steel. It shall be homogeneous and when broken in tension, shall show a uniformly silky fracture. Material for the nuts shall be soft, untreated steel.

Chemical Properties

5. The chemical composition of each melt of steel from which track bolts are manufactured shall be within the following limit:

Phosphorus, per cent, maximum.....0.04

6. The manufacturer shall furnish the inspector a complete report of ladle analysis showing carbon, manganese, phosphorus and sulphur content of each melt, represented in the finished material and any other elements used to obtain the specified physical properties. The purchaser may make a check analysis from the finished material; such analysis shall conform to the requirements of Section 5. The drillings for check analysis shall be taken parallel to the axis and from the end of the finished bolt.

Physical Properties and Tests

7. Track bolts shall conform to the following physical requirements:

| | Carbon Steel | Alloy Steel |
|---|--------------|-------------|
| (a) Tensile strength, lb. per sq. in., minimum..... | 100,000 | 110,000 |
| (b) Yield point, lb. per sq. in., minimum..... | 70,000 | 85,000 |
| (c) Elongation, per cent, in 2 in., not less than..... | 1,600,000 | |
| Minimum, 12 per cent. | Ten. Str. | |
| | 3,500,000 | |
| (d) Reduction in area, per cent, not less than..... | Ten. Str. | |
| | | |
| (e) Cold bending of the unthreaded portion of the finished bolt without fracture on the outside of the bent portion through 90 deg. around an arc, the diameter of which is three times the thickness of the test specimen. | | |

8. All test specimens shall be from the finished bolts.

(a) The tension test specimens shall be about $4\frac{1}{4}$ in. long with threaded or unthreaded ends, and with the central 2-in. length turned to a $\frac{1}{2}$ -in. diameter, in accordance with the form and dimensions for tension test specimens of the American Society for Testing Materials.

(b) The yield point shall be determined by the strain gage.

Quenching

9. (a) Track bolts shall be treated by quenching in oil or water, if so specified, from a temperature of about 810 deg. C. (1490 deg. F.) and shall be kept in the bath until cold enough to be handled; a group thus treated being known as a quenching charge.

(b) Material which requires quenching in water will be acceptable at the option of the purchaser, provided it meets the requirements of the specification in all other respects.

General Requirements

10. Track bolts and nuts shall be made to dimensions specified in drawing furnished by the purchaser with al-

lowable variations in dimensions of bolts from standard as follows:

Length, $1\frac{1}{8}$ in.

Diameter of shank, 1.64 in.

Shoulder, 1.64 in.

Diameter of rolled thread not more than 1.16 in. over the diameter of the body of $\frac{7}{8}$ -in. bolts.

Diameter of rolled thread not more than 3.32 in. over the diameter of the body of 1-in. bolts.

Variation in dimensions of elliptical shoulders under head of bolt of 1.32 in.

11. The heads and nuts shall be free from cheeks or burrs of any kind. All finished pieces shall be smooth, straight, of uniform size, with well-shaped symmetrical bends and well filled heads, free from injurious mechanical defects, and be finished in a first class, workmanlike manner. The head shall be concentric with and firmly joined to the bottom of the bolt with the underside of the head at right angles to the body of the bolt. The threads on the bolts shall be rolled, unless otherwise specified, shall be full and clean and shall be made in section and pitch according to the purchaser's standard. The fit between threads on the bolt and nut shall be accurate and nut shall go on with a 10-in. wrench from second to fifth turn. The force to turn the nut completely on the bolt with a 24-in. wrench shall not be more than 60 nor less than 40 lb.

12. (a) The nuts shall be made of soft untreated steel and shall be $\frac{1}{4}$ -in. thicker than the standard nuts used for untreated bolts. They shall be of sufficient strength to develop the ultimate breaking strength of the bolts.

(b) Nuts of standard thickness will be accepted at the option of the purchaser if proved to be of sufficient strength to equal the ultimate breaking strength of the bolts. The length of the bolts shall be correspondingly reduced.

Branding

13. The heads of the bolts shall bear the manufacturer's identification symbol. The letter "Q" shall be used to show that the bolts have been "quenched." If the bolts are also tempered, the letters "QT" shall be used to show that they have been "quenched and tempered."

Marking and Shipping

14. When the bolts are shipped they shall have the nuts applied for at least two threads, be well oiled to prevent rust, and shall be packed in securely hooped kegs of 200 lb. net. All kegs shall be plainly marked as to material, size of bolts and name of manufacturer.

Inspection

15. Tension and bend tests shall be made of the test specimens selected by the inspector from each lot of 50 kegs. One specimen shall be selected for each test, and if it meets the requirements of the specification, the lot will be accepted. If the test specimen fails, two additional specimens shall be tested in the same manner as the one which failed, and if they meet the requirements of the specification, the lot will be accepted. If, however, either one of the pieces fails, the lot will be rejected. Both tension and bend tests shall pass the requirements for acceptance.

Specifications for Medium Carbon

Steel Track Bolts with Nuts

Access to Works

1. Same as above.

Place for Tests

2. Same as above.

Rejection at Destination

3. Same as above.

Material

4. Material for bolts shall be steel made by the Open-Hearth or Bessemer process. It shall be homogeneous and when broken in tension, shall show a uniformly silky fracture. Material for nuts shall be of soft steel.

Chemical Properties

5. The chemical composition of each melt of steel from which track bolts are manufactured shall be within the following limits:

| Phosphorus, Maximum. | Per Cent. |
|----------------------|-----------|
| Open-Hearth | 0.05 |
| Bessemer | 0.10 |

6. The manufacturer shall furnish the inspector a complete report of ladle analysis showing carbon, manganese, phosphorus and sulphur content of each melt represented in the finished material and any other elements used to obtain the specified physical properties. The purchaser may take a check analysis from the finished material; such analysis shall conform to the requirements of Section 5. The drillings for check analysis shall be taken parallel to the axis and from the end of the finished bolt.

Physical Properties and Tests

7. Track bolts shall conform to the following physical requirements:

| | |
|--|-----------|
| (a) Tensile strength, lb. per sq. in., minimum | 55,000 |
| (b) Yield point not less than 50 per cent of the ultimate breaking stress | 1,500,000 |
| (c) Elongation, per cent in 2 in., not less than | Ten. Str. |
| Minimum, 20 per cent. | 2,200,000 |
| (d) Reduction in area not less than | Ten. Str. |
| Minimum, 30 per cent. | |
| (e) Cold bending of the unthreaded part of the finished bolt without sign of fracture on the outside of the bent portion, through 180 deg. flat on itself. | |

8. All test specimens shall be from the finished bolts.

(a) The tension test specimens shall be about $4\frac{1}{4}$ in. long with threaded or unthreaded ends, and with the central 2-in. length turned to a $\frac{1}{2}$ -in. diameter, in accordance with the form and dimensions for tension test specimens of the American Society for Testing Materials.

General Requirements

9. Same as above.

11. The nuts shall be made of soft, untreated steel and shall be of sufficient strength to develop the ultimate breaking strength of the bolts.

Branding

12. Manufacturers' identification shall appear on the head of each bolt.

Marking and Shipping

13. Same as above.

Inspection

14. Tension and bend tests shall be made of the test specimens selected by the inspector from each lot of 50 kegs. One specimen shall be selected for each test, and if they meet the requirements of the specifications the lot will be accepted. If one of the test specimens fails, two additional specimens shall be tested in the same manner as the one which failed, and if they meet the requirements of the specifications, the lot will be accepted. If, however, either one of the specimens fails, the lot will be rejected. Both tension and bend tests shall pass the requirements for acceptance.

Mill Practice

Information was gathered from the members of the Rail committee as to the results of their inspections of

rail at the mills which were given in the paper on "Mill Inspections of Rail in 1915 and 1916." This paper gave the general results of the mill inspections of rail manufactured in 1915 and 1916 for some of the railroads and also gives some discussion of the specifications on which the rails were bought. According to these results the average top discard from the ingot, of all rails, was 17.9 per cent; the average elongation in the drop test was 14.5 per cent, and the rejections were 6.4 per cent. Of all rejections, 42 per cent were A rails.

Intensity of Pressure and Rail Resistance

Extensive tests were made on the reciprocating wheel load machine at Sparrows Point, Md., dealing with the crushing effect on rail metal of various wheel loads. Small tapered holes were drilled through from side to side of the head of test rails at various distances below the top of the head and accurately fitted with tapered pins. Any flowage of the metal under rolling wheel loads would cause a flattening of the holes and its amount could be measured by the distance the pins lacked of going into their original position.

Dr. P. H. Dudley has made some extensive measurements on rails in track, of the areas of contact and the distribution of the intensity of the pressure within the area of contact. For the present, the only conclusions that can be drawn from the tests which have been made are but indications, as follows:

Laboratory Tests:

1. That for this section and composition of rail, initial loads of 30,000 lb. or more per wheel of cast iron and chilled tread, of 33 in. in diameter, were too great for the transverse holes, and produced flow or closure at least $\frac{3}{8}$ -in. below the bearing surface.

2. That loads of 25,000 lb. produced but slight flow or closure in the three uppermost transverse holes, and this extending not more than $\frac{1}{4}$ in. in depth.

3. That preliminary light loads, by cold-rolling the surface, may adapt the material to subsequent heavier loads.

Field Tests:

4. The diagrams of the plotted tables show that the stresses in the metals are locally less severe than we had expected to find in the surfaces of the pressure zone contacts of the wheel tread and the rail head.

5. It is important, as the theory and evidence show, that the metal of the circumjacent layer of each pressure zone of contact for the wheel tread, also that of the rail head, is in position not only to utilize the elasticity of the metal to help carry a given load, but to increase in area within the elastic limits of the metals nearly in proportion to the loads applied.

6. The action of the rolling wheels on the rail heads is a gradually applied load from zero to the maximum, then reducing again to zero, both for a unit length in the wheel tread or rail head, and is not a suddenly applied load, even for a mile-a-minute or faster trains.

7. The round type of area of contact shows the greatest average unit intensity of pressure.

8. The longitudinal oval, or the transverse oval type indicates the lowest average unit intensity of pressure.

9. The longitudinal elliptical or transverse elliptical, in which the major axis is two or more times the width of the minor axis, indicates also a favorable average unit intensity of pressure.

10. The transverse oval or elliptical under steel or cast-iron wheels is more favorable for the rail head than the round.

11. The reciprocal relations of the loads carried on

the metal of the wheel treads to the metal of the rail heads should be studied from the voluminous service tests now available.

Recommendations

The committee submitted the following recommendations:

1. That the locations for the physical test specimens and for chemical samples from rails as submitted with this report, be adopted by the Association to replace the diagrams shown on page 88 of the 1915 Manual.

2. That the "Specifications for Quenched Carbon and Quenched Alloy Steel Joint Bars," submitted with this report, be adopted by the Association and be substituted for the "Specifications for Heat-Treated, Oil-Quenched, Steel Joint Bars," on pages 91 to 93 of the 1915 Manual.

3. That the specifications for "Quenched Carbon and Quenched Alloy Steel Track Bolts with Nuts" and the "Specifications for Medium Carbon Steel Track Bolts with Nuts," submitted with this report, be adopted by the Association and be substituted for the "Specifications for Track Bolts," on pages 123 to 125 of the 1915 Manual.

The committee recommended that the same topics be reassigned for 1918 as were given the committee for the past year.

Committee: John D. Isaacs (S. P.), chairman; R. Montfort (L. & N.), vice-chairman; E. E. Adams (U. P.), E. B. Ashby (L. V.), J. A. Atwood (P. & L. E.), S. Baldwin (L. C.), W. C. Barnes (S. P.), Chas. S. Churchill (N. & W.), W. C. Cushing (P. L. W.), G. M. Davidson (C. & N. W.), Dr. P. H. Dudley (N. Y. C.), J. M. R. Fairbairn (C. P. R.), L. C. Fritch (S. A. L.), A. W. Gibbs (P. R. R.), Howard G. Kelley (G. T.), C. F. Loweth (C. M. & St. P.), H. B. MacFarland (A. T. & S. F.), C. A. Morse (C. R. I. & P.), A. W. Newton (C. B. & Q.), J. R. Onderdonk (B. & O.), G. J. Ray (D. L. & W.), H. R. Safford (G. T.), J. P. Snow, F. S. Stevens (P. & R.), Earl Stinson (B. & O.), R. Trimble (P. L. W.), M. H. Wickhorst.

Discussion

Mr. Churchill: The subjects assigned to this committee this year are the same as for the year previous, practically, and it will not be necessary to refer to them. The

first matter upon which the committee desires action is the revision of the Manual as far as test pieces on rails are concerned. It will be recalled that the Manual shows test pieces from three positions, which it has been found unnecessary to have. I move that this revision of the Manual be adopted.

(Motion carried.)

M. H. Wickhorst (Rail Committee): The laboratory tests consisted of pieces of rail being rolled over, and in order to measure the deformation or flow of the metal, holes were drilled through the rails from side to side at different depths, some close to the top surface, and others lower, and some farther down. These holes were small in diameter, a little over $\frac{1}{8}$ in., fitted with tapered pins, so that a reduction in diameter of 0.000,01 in. could be measured by the distance the pin would go into the holes.

The results of these laboratory tests are given in the paper, and the rails were put into track for a field test. The rails in the laboratory tests were rolled over with a load finally of 35,000 lb. on one wheel. When put into the track the maximum load was perhaps 25,000 lb., and the average load less than that. It was found that there was considerable closure of the holes after the rails were in service a short time.

Mr. Churchill: We have prepared a specification on Track Bolts and Nutlocks. We also submit in appendix A, Specifications for Quenched Carbon and Quenched Alloy Steel Joint Bars. I make a motion that these specifications be adopted and printed in the Manual.

(Motion carried.)

Mr. Churchill: We also offer in appendix B, "Specifications for Quenched Carbon and Quenched Alloy Steel Track Bolts with Nuts."

I move that these specifications be adopted for printing in the Manual.

(Motion carried.)

Mr. Churchill: We give specifications for "Medium Carbon Steel Track Bolts with Nuts." I move that this be adopted for printing in the Manual.

(The motion was carried and the committee was dismissed with thanks.)

Report of Committee on Track

NUMBER OF CHANGES in the Manual were suggested of a detailed character and consisting principally in revisions of dimensions on the plans for standard turnouts and switches. Several changes in the spacing of ties throughout turnouts were recommended to make these dimensions agree with those on turnout plans. The committee did not believe it necessary to make any further changes in the specifications for tie plates for the present, but recommended that the revision of the tie plate specifications be given careful consideration by the next committee.

Typical Plans of Turnouts, Crossovers,

Slip-Switches and Double Crossovers

Drawings were submitted showing typical plan of a No. 10 turnout and a typical layout of a No. 10 crossover to conform with those now in the Manual for a No. 8 turnout and crossover.

The 16 ft. 6 in., style "A," switch submitted is a development of 16 ft. 6 in. switch shown on page 176 of the 1915 Manual, with changes that were thought advisable. The throw has been recommended as $4\frac{1}{2}$ in. at center line of the switchhead rod, which brings the throw at the end of the point $4\frac{1}{8}$ in. The throw is specified at the end of the point to be not less than 4 in. or greater than 5 in. On page 178 in the 1915 Manual the throw is specified as 5 in. at the center of No. 1 rod, which would make the throw $5\frac{1}{8}$ in. at the point. The committee considers this excessive. The risers for style "A" switch are specified $\frac{1}{8}$ -in., which affords a better shoulder for holding the stock rail in position, especially for heavy flange rails, than the $\frac{1}{4}$ -in. specified on pages 178 and 179 of the 1915 Manual. The angle of planing the chime cut has been specified as 78 deg., as the 70-deg. angle specified on page 179 in the 1915 Manual is generally considered too abrupt and is not in common use. The switch point planing has been specified in much fuller detail and conforms to planing extensively used. The detail of stile plates has been specified to allow the use of rectangular plate or of special rolled plates having risers narrower than the width of the plate, sufficient detail being given so that the plates and braces will be interchangeable. The heel plates have been specified to provide a shoulder, both for the lead rails and the stock rails, and the

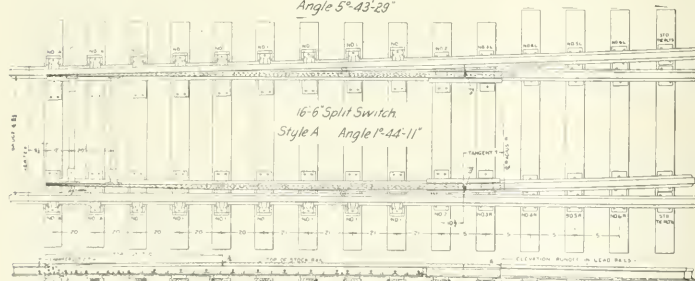

Typical Layout of No. 10 Crossover.

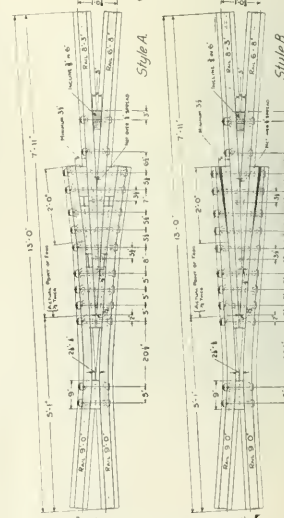

Typical Plan of No. 10 Turnout.

No. 10 Rigid Frog
Angle $5^{\circ}-43'-29''$

No. 6 Rigid Frog
Angle $9^{\circ}-31'-3$

No. 8 Rigid Frog.
Angle 7°-09'-10"

tie spacing given so that the same detail of plates will apply for turnouts Nos. 7 to 10, inclusive. The bars are specified 1 in. by 2½ in., instead of ¾-in. by 2½ in., as specified on page 180 of the 1915 Manual, and other details to conform to heavier materials now being largely used.

The style "B" switch has been developed for use where materials for style "A" switch have been considered heavier than warranted on class B or class C railways, and also for emergency requirements. On the style "B" switch the plates have been detailed 6 in. wide and a lesser quantity than specified for the style "A" switch. The tie bars are ¾-in. by 2½ in., and reinforcing on one side only. The planing, spacing of tie bars, spread, throw and essential details are the same as specified for the style "A" switch. The style "B" switch is especially intended where the style "A" switch is considered too expensive, and where the track is not tie-plated throughout.

The No. 8 frog has been detailed 13 ft. long, instead of 13 ft. 6 in. long, as specified on page 184 in the 1915 Manual, the 6 in. difference in length being made on the heel end of the frog. This change will not interfere with the theoretical alignment data heretofore published. The reason for the change is so that a No. 8 frog will cut out of a 33 ft. rail without waste in cutting. This is an important item of economy. If the 13 ft. 6 in. length is maintained the frog would not cut economically out of a 33 ft. rail, unless the wing rails are made too short for a first-class frog.

The No. 10 frog has been detailed 16 ft. 6 in. long, conforming to the previous established length, and will cut out of a 33 ft. rail with comparatively little waste.

The No. 6 frog has been detailed 10 ft. long, as this length provides ample room for splice bars. A longer frog has been considered objectionable in a sharp turnout. Plans have been detailed for style "A" and style "B" frogs in each case. The style "A" frog, with cast filling, is similar to what is being used on many of the large eastern railroads, while the style "B" frog, with rolled filling, is similar to what is being used on many of the western railroads. Both styles of frogs are widely used and are proposed for standard without recommendations as to which is the best. The cost will be practically the same, and there are arguments in favor of each style.

Reduction of Taper of Tread of Wheel to 1 in 38 and Canting the Rail Inward

At an early period in the history of car building it was found that a certain amount of cone in the tread of a new wheel was advantageous from many viewpoints. The amount of coning varied until in 1878 the ratio of 1 and 38 was adopted by the M. C. B. Association. This remained the standard until 1907, when the association revised the taper, making it 1 in 20, which is the present standard.

When a wheel rests on the rail, the location of the point of contact depends upon the taper of the wheel and the radius of the top of the rail. The normal position of the rails in track is with the vertical axes parallel and at right angles to the plane of the track. In this normal position the point of contact of wheels having a coning of 1 in 20 and rail of A. R. A. section with a 14-in. top radius of head is slightly less than ¾-in. inside of the center of the rail toward the gage side. For wheels having a coning of 1 in 38 the point of contact is slightly less than ¾-in. inside of the center of rail toward the gage side.

This eccentric loading appears to be a condition that should be corrected. It has been the practice of section

foremen to incline, or cant, the rail slightly to distribute wear over the top of the head. The result obtained is to bring the point of contact over the center of the rail. The heavier taper is carried on an inclined surface and produces stresses on the outside of the flange of the rail 40 per cent to 50 per cent greater than the stress on the inside flange due to outward thrust, as has been shown by the results obtained by the committee on "Stresses in Track."

It has been suggested that heavier coning with the resultant eccentric load on rail accounts for the location of transverse fissures on the gage side of the rail. While they are most common on the gage side, their appearance at the center and outside of the head would seem to indicate that they are developed in the line of contact or application of load. With the heavier coning the surface of the rail gradually wears to an inclined surface similar to the cone of the wheel. In this condition the abrasion of metal and slippage resistance is considerably increased.

Car wheel manufacturers have claimed that heavy taper supplies the condition favorable to true rolling motion and reduces to a minimum sliding of surfaces in contact.

Excessive wear on frogs is an objection to heavier coning. A wheel with a heavy cone trailing through a frog has its load carried by the narrow frog point and the load is not transferred to the wing rail until the frog point is passed. Theoretically, the drop from the frog point to the wing rail with a 1 in 20 tread having ⅜-in. chamfer is very near ¼-in. The result is damage to the frog point, as the concentrated wheel load is too great for the narrow section of metal at the point.

Even though the heavy taper is better from the standpoint of wheel-wear, in view of the fact that rail must be designed for the heaviest wheel-loads while the wheels are designed for a definite car capacity, it may be expedient to sacrifice some degree of service of wheel to favor the factor of safety and life of rail.

The very general use of taper of 1 in 20 makes the proposed departure from this standard a move needing to be fully substantiated by theory and practice. The use of 1 in 38 taper by the New York Central Railroad and the use of 1 in 13 taper by the Baltimore & Ohio, the former being flatter and the latter heavier than M. C. B. standard, represents some considerable difference of opinion. In any change of taper it would appear desirable to have the taper uniform from the throat radius to the radius of the sand chill, or the full width of tread.

Thirty railroads, representing 95,000 miles, report the use of canted tie-plates. Of these, four roads, with 15,000 miles, report that the rail is canted by adzing the ties where canted tie-plates are not used. Fourteen roads, with 52,900 miles, report the general use of canted tie-plates. Ten roads, with 32,900 miles, report canted tie-plates used, but not generally. Nineteen roads, with 55,000 miles, report canted tie-plates with slope varying from 1 in 20 to 1 in 174.

From these general conditions it would seem that if the rail was installed and maintained so as to provide a uniform bearing and wear on the head of rail, the best results would be obtained from both wheel wear and rail wear. If the rail does not have the full and proper contact, as well as bearing on the tie-plates or on the tie, whether the tie-plates are canted or not, the best results cannot be secured.

Consider Design of Cut Track Spikes

During the past season the committee has made a careful canvass of several mills in the United States, and found a uniformity of opinion among the manufacturers

that the standard as proposed by the committee in 1917 cannot be made with the automatic machines now in use. We understand that the main difficulty is overcome by the Canadian mills by using special rolled bars a little over-size in one dimension. We can see no reason why the same practice could not be utilized by United States mills. Nevertheless, on account of this general complaint, and because of the present war conditions, the committee has decided to make a reduction in the amount of reinforcing under the head, and accordingly submit a revised design.

The Effect of Fast Trains Upon the Cost of Maintenance of Way and Equipment

The economic value of a solution of this question depends upon the desirability of making each class of traffic

Revised Design of Track Spike

bear its own proportion of the total expense of transportation. There are three general speed classifications:

First and lowest: Commodity freight tonnage.

Second and intermediate: Merchandise and perishable freight tonnage.

Third and highest: Passenger traffic or tonnage.

The committee does not feel that it is prepared to offer a conclusive report until it has given the matter further study. We have made an analysis of the actual expense for maintenance of way and structures for the year reported by the Interstate Commerce Commission's report of 1914 on all of the railroads in the United States having a gross earning of one and one-half million dollars and over. These roads comprise somewhat over 213,000 miles, so that averages deduced from this one year's experience may be taken as at least indicative of the real effect on maintenance cost of increasing speeds.

In this analysis, high speed and low speed are considered as synonymous with passenger traffic and freight traffic. The committee is conscious that this is not an entirely true assumption, but it offers the only opportunity for classifying the expense as incurred by the railroads in accordance with speed differences.

In making the analysis of the expenses, the car mile was chosen as the common unit of the two classes of traffic, on the assumption that it measured more nearly

the facilities required by each class of traffic than any other. The car mile and train mile were the only two common units reported by the Interstate Commerce Commission and, taken as a whole, there would be a fairly definite relation maintained between these two units so that the conclusions drawn would not be materially different, whichever unit is chosen. In making the analysis, a determination was made for each road; first, of the car miles per mile of road; second, the proportion of those car miles which were passenger car miles; third, the cost per mile of road for maintenance of way and structures.

In order to eliminate two of these three variables, the roads were grouped into classes:

First, into groups of similar density of traffic, measured in car miles per mile of road.

Second, within each density group, roads of like per cent of passenger traffic were segregated.

The total car miles on all roads of like density and like per cent of passenger traffic were added, as were also the miles of road and the total cost of maintenance of way and structures. The total miles of road was divided into the total car miles, to get an average density, and the total miles of road was divided into the total cost to arrive at an average cost per mile of road for each group of like density and like per cent of passenger traffic. From the tables thus produced, there were picked out groups of like per cent passenger traffic and different densities of traffic. These groups of like per cent of passenger traffic were plotted as shown in the accompanying diagram.

A separate line represents each of the various per cents of passenger traffic to a horizontal scale of the average cost of maintenance of way and structures per mile of road, and the vertical scale represents the density of traffic in thousands of car miles per mile of road.

Three lines only were plotted, representing passenger traffic of 7.5 per cent, 12.5 per cent and 20.3 per cent of

Relation of Proportion of Passenger Traffic to Cost of Maintenance of Way and Structures

the total traffic. These particular percentages were chosen because a sufficiently large number of roads could be obtained at these per cents to produce more accurate platings than of any other.

There are three factors which influence the cost of maintenance of way and structures:

(1) The elements, sometimes called weather stress.

(2) Density of traffic. (3) Character of traffic, here separated as between passenger and freight.

There may be a fourth factor, i. e., the ability of the management to regulate the expenditures in strict accordance with the demand of the traffic. If there be this fourth factor, it will lose force or disappear entirely

in the consideration of a large number of roads as is here done.

The three factors are disclosed by this chart, the weather stress being shown on the line of zero traffic, and having a different value for roads carrying different per cents of passenger traffic as might be expected because of the different amount and character of material entering into the construction of the lines doing these different kinds of business. The influence of the increased density of traffic on roads carrying a given proportion of passenger traffic is shown by all of the lines on the chart, showing an increased cost per mile of road with an increased density of traffic. The factor of increased cost due to speed (when used synonymous with passenger versus freight) is shown by the decreased cost per mile of road for any given density of traffic for the smaller proportions of passenger traffic.

The committee asked that this report be considered conclusive only in so far as passenger traffic versus freight traffic can be considered synonymous with fast speed versus low speed, and that the subject be referred back for further investigation and future report.

Report on Whether Widening of the Flanges of the Wheels Would Not Be Detrimental to the Present Standard of Track Construction

The committee was requested by the Secretary to report to the Board on subject 9 before the fall meeting of the American Railway Association. We submit herewith copy of a letter sent to the Secretary on October 23, 1917:

"With reference to the subject assigned to the Association by the American Railway Association and referred to the Track committee relative to the contour of chilled car wheels, throat clearances for frogs, guard rails and crossings, and the effect of an increase of thickness of wheel flanges, I beg to advise that at the last meeting of the Track committee, held in Chicago, October 15, the chairman was directed to send you the following communication:

"The Track committee is willing to agree that the flanges can be increased, as recommended by the Chilled Car Wheel people, without any serious detriment from a track standpoint, provided:

"(1) That the wheels are in all cases accurately mounted to $\frac{3}{16}$ -in. additional spread gage;

"(2) That the allowable flange wear before wheels are removed be changed so that wheels will be removed when the flange is worn to within $\frac{1}{8}$ -in. of the present limit of removal;

"(3) That more care be used in matching wheels on any given axle on account of the reduction in play and the corresponding reduction in compensation from coning;

"(4) That this flange width be confined to flanges of four-wheel freight car trucks;

"(5) That this conclusion on the part of the Track committee be not construed as an invitation to increase the axle load.

"With the above provisions, it is believed that it will be unnecessary to make any difference in the width of flangeway of frogs and crossings, or change the present method of track construction."

Conclusions

The committee makes the following definite recommendations to the Association:

Received as Progress Report

(To be considered further at the next convention.)

Subject 2 plans submitted for:

Typical plan of No. 10 turnout and typical layout

of No. 10 crossover;

16 ft. 6 in. split switch, style "A,"

16 ft. 6 in. split switch, style "A," details

16 ft. 6 in. split switch, style "B,"

16 ft. 6 in. split switch, style "B," details

No. 8 rigid frog, style "A" and style "B,"

No. 10 rigid frog, style "A" and style "B,"

No. 6 rigid frog, style "A" and style "B,"

Sections and details for rigid frog.

For Adoption and Publication in the Manual

Subject (1) Proposed revisions to be made in the Manual.

Subject (5) Proposed specifications for relayer rails for various uses.

Subject (7) Proposed design of cut track spike.

Accept as Information

Subject (3) Report on reduction of taper of tread of wheel to 1 in 38, and on canting the rail inward.

Subject (8) Report upon the effect of fast trains upon the cost of maintenance of way and equipment.

Subject (9) Report on whether widening of the flange of the wheels would not be detrimental to the present standard of track construction.

Future Work

The continuation of subjects 1, 2, 3, 4, 6, 8 and 9.

Committee: G. J. Ray (D. L. & W.), chairman; J. R. Leighty (M. P.), vice-chairman; M. C. Blanchard (A. T. & S. F.), Geo. H. Bremner (I. C. C.), H. M. Church (B. & O.), Garrett Davis (C. R. I. & P.), A. L. Grandy (P. M.), G. W. Hegel (C. J.), T. H. Hickey (M. C.), T. T. Irving (G. T.), J. B. Jenkins (B. & O.), H. A. Lloyd (Erie), F. H. McGuigan, Jr., (G. T.), J. V. Neubert (N. Y. C.), R. M. Pearce (P. & L. E.), C. D. Perkins (N. Y. N. H. & H.), H. T. Porter (B. & L. E.), Thomas Quigley (I. C.), J. B. Strong (Kamapo Iron Works), W. P. Wiltsee (N. & W.).

Discussion

E. R. Leighty (Vice-Chairman): In connection with subject No. 2, in preliminary explanation of this plan for type A switch, I would say that there seemed to be a demand for a switch which was of somewhat stronger construction than the switch that is ordinarily used to meet that demand, and type A switch has been designed for that purpose. This report is not offered for the purpose of going into the matter this year.

Mr. Leighty: The statement in regard to subject 3 is submitted as information only, and we ask you to receive it as such and have it printed in the Proceedings.

The President: This is an important matter, and we will be glad to have written discussion on this subject.

Mr. Leighty: As to the fourth subject, this is a matter which has been before the association for some years, and we have had progress reports on it during the last few years, and nothing specially important has developed in the past year to warrant taking up time and space to make a report on it.

With reference to the fifth subject, we are asking that this subject be referred back to the committee to straighten out.

The President: The committee's suggestion will be accepted.

Mr. Leighty: With reference to subject 7, the design of cut track spikes, I move that the matter be present be adopted for printing in the Manual.

(Motion carried.)

Mr. Leighty: With regard to the 8th subject, the effect of fast trains upon the cost of maintenance of way and equipment, what we present is the beginning of an

investigation of this subject and is submitted as information only.

The President: This seems to be the beginning of an interesting subject.

A. B. Talbot (U. of Ill.): The data which are given in the chart is very interesting, and it seems to me it is worth while to call attention to the results which come from this diagram.

C. E. Lindsay (N. Y. C.): Will the committee give a statement regarding the weather stress?

Mr. Leighty: One of the costs of the maintenance of way structures is called weather stress, which is the course that would have to be incurred to keep the tracks and other facilities in operating condition, or in the same operating condition as when constructed, provided they were not used for traffic. This cost per mile of road is reduced down to the line of zero traffic. That is a projection carrying the averages found from the roads

where there is traffic, but when they are projected down to zero traffic we have an indication of what could be expected to be the weather stress cost on the different character of lines.

Mr. Lindsay: Why does the committee use "miles of road" instead of "miles of track?"

Mr. Leighty: Because we automatically use all the facilities required for increasing the traffic. If we used "miles of track" we would at once have to begin to adjust matters, and what we were after was to find the overhead or entire average cost.

The matter which we submit covering the 9th subject is submitted as information. It does not properly belong in the Manual, and the only action we can take, under the instruction we had, was that it be submitted as information to the American Railway Association.

(The committee was dismissed, with the thanks of the association.)

Report of Committee on Wood Preservation

THE COMMITTEE REPORTED PROGRESS on the subjects assigned. But little work was accomplished during the year, as the members were widely scattered and busily engaged with their regular work, which the war conditions have made increasingly exacting. The work of the committee is now of such a nature that it requires laborious experimental and research work and subsequent study to arrive at conclusions, all of which must be done by the individual effort of the members, so that under conditions such as prevailed during the past year but little can be accomplished.

It is the recommendation of the committee that the program assigned for this year be continued the coming year and that in addition it should report on:

(1) The preservative treatment of Douglas fir.

(2) Indicators for determining penetration of the preservative in freshly Burnetized ties and timbers.

Committee: Earl Stimson (B. & O.), chairman; C. M. Taylor (P. & R.), vice-chairman; F. J. Angier (B. & O.), F. C. L. Bond, E. H. Bowser (I. C.), J. F. Burns (L. & N.), W. A. Fisher, C. F. Ford (C. R. I. & P.), C. J. Graff (N. Y. C.), R. H. Howard (Wabash), C. H. R. Howe (B. & O. S. W.), J. E. Johnson (M. C.), George E. Rex (A. T. & S. F.), H. Stephens (N. Y. C.), E. A. Sterling, Lowry Smith (N. P.), O. C. Steinmayer (St. L.-S. F.), C. H. Teesdale, Dr. Hermann von Schrenk, J. H. Waterman (C. B. & Q.).

(The report was presented by the chairman by title only and without any discussion.)

Closing Business

Just prior to the installation of officers yesterday afternoon several resolutions were presented, among which were the following:

To the Honorable Wm. G. McAdoo,

Director-General, Washington.

The American Railway Engineering Association, in convention assembled, expresses its desire to render all possible assistance to you and your staff in maintaining the high degree of efficiency of railway operation and maintenance so essential to an early victory in the great world-wide conflict. The members are principally officers in railway service, although some are in government and other branches of engineering service related to railways operating on the North American continent. They are intensely interested in the many problems incidental to the construction, maintenance and operation of railways and particularly in the standardization of materials and methods of doing work. We are hopeful that our efforts may be the means of assistance to the Federal Government and that you will feel free to call upon us for such assistance.

Among other resolutions adopted was one calling attention to the shortage of creosote and to the fact that large quantities of coal tar are now being burned as fuel in the steel mills. In view of the importance of protecting timber against decay this resolution stated, "In view of the above factors the American Railway Engineering Association respectfully suggests to the Railway Administration at Washington that an investigation be undertaken to determine whether it will be possible to adjust the burning of the crude

coal tar by the steel companies in such manner that steel production will not be interfered with and at the same time a certain amount of the tar now being burned can be released to the tar distillers and thereby increase the amount of creosote oil available."

Organizing the Supply Industry

CONCERNS ENGAGED in the manufacture and sale of railway equipment and supplies suddenly have come to a realization that they have many important problems and many important interests in common. The purpose of the meeting to be held at the Hotel La Salle, in Chicago, on April 8, under the auspices of the Railway Business Association, is to so reorganize this association as to make it an agency for helping effectively to solve these common problems and promote these common interests.

Two things, at least, are essential to fitting the organization to accomplish these purposes. One is to make a concise, simple statement of what it ought to try, and is going to try, to do. The other is to provide means and machinery suitable and adequate to attaining the objects sought.

It ought to be made clear that the sole purpose of the organization is going to be to protect the rights and further the legitimate interests of the railway equipment and supply industry. Heretofore the association has devoted itself to trying to bring about better relations between the railways and the public. This has been the right and desirable thing to do.

It has been well done, but conditions have changed. Government control of railways has been adopted. The supply companies consequently find that they have not merely the railways, but the government itself to do business with. Furthermore, as a result of the war, they have got a large amount of business abroad which they ought to make concerted and strenuous efforts to hold and increase.

Therefore, while the supply companies should take even more interest than ever in the solution of the railroad problem, they should meet and deal with several problems which are peculiarly their own. They can best help the railways and the country, as well as themselves, by organizing primarily to protect their own particular rights and promote their own particular interests.

The railroads and the public are greatly indebted to railway supply interests for the improvements which they have made possible in efficient and economical operation, as well as for the cultivation of better relations between the railroad and the public. Undoubtedly, however, the railway supply industry will be in a position to do still greater things for the public and the railways.

The means to be used ought not to be narrowly defined at the start. It will be enough for the present to set forth that the railway equipment and supply interests are organizing to protect their rights and safeguard their legitimate interests by every legitimate means. What is needed is a flexible, effective fighting organization; the exact methods it will be desirable to use will become clear only in the course of developments.

Doubtless the exact way in which the association should be reorganized in order to have the maximum effectiveness will be thoroughly discussed at the meeting in Chicago, but here are a few suggestions:

(1) Make the constitution simple, concise and broad, avoiding detail statements of policies which no one is wise enough now to formulate.

(2) Assign broad questions of policy, such as export trade, trade acceptances, relations with the government, education of public opinion regarding the railway problem, etc., to committees with large power for quick and decisive action. In other words, the new organization should take the form of a board of trade. The cardinal defect of many associations is that they do not give to those to whom they assign specific tasks the authority and opportunity necessary to accomplish them.

Every concern or individual engaged, even though on a small scale, in the making or selling of railroad equipment, materials or supplies should be represented at the meeting in Chicago, and there should be full discussion of all the important questions in which the railroad supply industry is so vitally interested.

The holders of all classes of railroad securities are vitally interested in the adequacy of the equipment which the company owns. Many railroad companies

The Equipment Situation

for the last few years have not been buying new equipment in sufficient quantities to replace worn-out equipment and adequately to provide for a normal growth in traffic from year to year. In many cases making public this fact would not have changed the policy of the management because the company was already making purchases on as large a scale as its net earnings and credit would justify. On the other hand, even though security holders may be powerless to remedy a deplorable situation, they should be kept fully informed by the management as to what the facts actually are. All companies are required to report in some detail an inventory of their equipment to the Interstate Commerce Commission. Some include a detailed inventory in their annual reports to stockholders. A good many others fail to do so. While the roads were operating under the control of the Railroad War Board, L. L. Loree, president of the Delaware & Hudson, and chairman of the eastern department of the War Board organization, urged that all Class A roads be requested by the War Board to include a detailed inventory of equipment in their annual report. Before action was taken by the board, the government took control, but it is more important than ever that railroad security holders be kept informed as to each company's ownership of equipment. Under government orders, not only freight cars but also passenger cars and locomotives will be operated more or less away from the home roads. The failure to provide new equipment by a particular company might not be apparent in the operating figures, as shown in the company's annual

report, unless a detailed inventory is given. Each railroad president ought, therefore, to make it his duty to see that during the period of government control his stock and bond holders are kept fully informed, so that when the roads are returned to their owners there may be no unpleasant surprises. Copies of a suggested inventory are reproduced elsewhere in this issue.

What has become of our American efficiency that both the Bureau of Mines and people in general should find it necessary to lay such stress upon the excep-

The Nation Must

Have Better Coal

tionally poor grade of fuel that is being given the railways to haul and our industries to use. Now as never before should our industries have the best coal obtainable and our railways be relieved of hauling more than 50,000,000 tons per year of worthless dirt and slate. E. G. Bailey in a lecture recently before the Johns Hopkins University, which is abstracted elsewhere in this issue, refers to the large percentage of ash and impurities in the coal we are now receiving as "sand in the bearings of transportation." And such it is, clogging our transportation system with 1,000,000 more car loads a year than if the normal attention was given to cleaning the coal. The remedy suggested by Mr. Bailey is to give a premium to those mines which produce the best coal. The consumers would be glad to pay it, for the loss in efficiency and the increased cost of maintenance caused by poor coal, costs more in the long run than if a higher price were paid for the better grade of coal. Price fixing has resulted in the working of mines that had previously been abandoned on account of the poor grade of coal produced. It has eliminated competition and with it, the incentive for the production of good coal. More attention must be paid to the quality of the fuel.

Postmaster General Burleson has recommended and Congress is considering the government acquiring the telephone

Postal versus Telephone Service

exchange in Washington, D. C., and having it operated by the postoffice department. The *Railway Age* recently has had much experience with both telephone and postal service in, and into and out of Washington. We are also familiar with the experience of many other people with them. The postal service is so much worse than the telephone service that to suggest having the telephone business handled by the postoffice department sounds like irony. The local mail service in Washington is very poor. The movement of mails in and out is slow and uncertain. When, last winter, train service was demoralized, the postoffice department blamed the railways. Now trains to and from Washington are running about normally, and the mail service is still almost as bad as ever. This applies to the first class as well as to other classes of service. The delays to all classes of mail between New York and Washington are unprecedented; and meantime the long distance telephone service between these cities is just as good as ever. The *Railway Age* is mailed in New York on Thursday. The postal department did not deliver the issue mailed in New York on Thursday, March 7, to subscribers in Washington until Wednesday, March 13; and it did not deliver the issue mailed in New York on March 21 to subscribers in Washington until March 27. Trains run between New York and Washington in five hours; but it takes six days for our "efficient" postal department to handle second class mail between the two points! The telephone company, the railways and the postal depart-

ment have had difficult problems presented to them by the great increases of population and of activities of many kinds at Washington. According to our experience and observation the postal department has shown far less capacity for promptly and satisfactorily solving these problems than either the telephone company or the railways. The postmaster general should be devoting his time to restoring the service of the postal department to the basis of comparative efficiency it was on before he took charge instead of seeking to add other services whose efficiency also probably would be reduced under his management.

The Railroad Man's Duty in This Hour of Peril

THE GREAT GERMAN OFFENSIVE has been launched. It looks as though the Kaiser has elected to risk all on one determined effort to smash his way through the lines of the Allies on the Western front. America and those with whom she has joined forces are being subjected to the acid test. The victory will not be gained without terrible toll in men and in money. Without money—and money in huge sums—the men cannot be supplied. Courage is needed at home as well as in the trenches. The whole-hearted co-operation and earnest endeavor of every citizen is necessary at this time.

A third issue of Liberty Bonds is announced for April 6. It should be a point of honor for every patriotic American to see that subscriptions exceed the amount demanded, however large this may be.

Railroad officers have a particular duty and privilege in this matter. They have been trained to direct and co-ordinate. They know the value of team work. If anyone knows the public, it is the railroad man who serves the public. He knows his fellow Americans in all their moods. He has had experience with more delegations than any government official. He has seen Americans irate and difficult; he has coped with Americans of every character and disposition. Now is the time for the railroad man to turn his experience to the good of his country. If the railroad officers of the country take off their coats and determine to make this Third Loan a grand success, they can come very near to doing it.

It is not sufficient that they should subscribe liberally themselves. Each must constitute himself a missionary to spread the gospel of this loan for Liberty. He must make the personal appeal in season and out of season. He must use every means of advertising that he controls. All of us can gain inspiration and increase our zest of living by entering with our whole souls into the campaign. It is well that we should get away for a time from the strictly sordid aspects of life.

As missionaries we must be prepared to be educators. All around us are hundreds and thousands who have been able as a result of conditions greatly to increase their earning power beyond all records of the past. Few of these know anything of investments. They should be taught what Liberty Bonds are, what they mean as a method of saving, as well as what they mean in their higher significance as contributions for the protection of those who are offering their lives that the cause of freedom may prevail.

All railroad men know what service means. All know the meaning of difficulties and how they are to be met and overcome. The greatest opportunity for service that can come to those who stay at home is offered by this Liberty Loan campaign; the best chance to tackle a really difficult task and see it through presents itself.

"Over there" are hundreds of boys from all branches of

the railroad service. Let us think of them. Let us make others think of them. Let us see that these others do more than think of those who but yesterday were working beside them. Money is needed to feed and clothe and protect these boys. It should pour in from every railroad centre in a great flood.

United States Standard Cars

WITHIN THREE MONTHS from the time of taking the office of director general of the railways of the United States, Mr. McAdoo has approved designs for standard freight cars. Specifications have been drawn and drawings made for bodies of a 40 and 50 ton steel frame, single sheathed box car (the designs are identical for both cars, different trucks being used); a 40-ton steel under-frame, double sheathed box car; a 50-ton steel high side gondola; a 50-ton composite high side gondola; a 70-ton low side steel gondola; a 50-ton hopper car and a 70-ton hopper car. There are three designs of trucks to be used on these body designs, having capacities of 40 tons, 50 tons and 70 tons.

A study of the specifications which appear elsewhere in this issue indicates that the government's standardization program has been along broad and rational lines. Adequate strength and interchangeability of parts have been given careful consideration. The M. C. B. standards have been used to a large degree and options have been left for detailed parts of different designs provided they are made to fit the limiting dimensions and to conform to the strength requirements. This should be of particular interest to the Railway Business Association which has sought so earnestly to keep the field open for further development of the special appliances that form a vital part in the construction of railway equipment. There are, of course, certain specialties which cannot be used on this equipment, either because they do not measure up to the strength or dimension requirements, or because the committee deemed it inexpedient to include them in the designs. For instance, only the wrought steel wheel is to be used on the 70-ton truck. It has been questioned by some engineers whether or not this was expedient. The all-steel roof has been excluded in favor of the outside metal roof laid over the roof boards. To be sure, the all-steel roof is somewhat more expensive than the design specified, but it saves approximately 500 lb. per car in weight. The specialties to be used are to be determined upon when the contracts for the cars are made.

The specifications call for friction draft gears and the M. C. B. standard coupler on all of the cars. Steel ends and outside steel roofs are required for the box cars. The arch bar type of truck frame is permitted on the 40 and 50 ton trucks and the cast steel frame either with the removable journal box or with the journal box cast integral is permitted on all three designs. A definite strength requirement has been made for the cast steel truck side frames, which in some cases will require new designs. The M. C. B. No. 2 brake beam is specified for the 40 and 50 ton trucks and the M. C. B. No. 3 brake beam is required for the 70-ton trucks. Specifications are also given for the paint to be used, for the journal box packing and for the journal box oil.

In so far as it is possible to determine from a study of the drawings, which have only just been released, it is apparent that the railways will be given car equipment of good design and adequate strength. While the weights of the different cars have not as yet been given out, it appears that they will be fairly heavy, which must always be the case where designs are more or less of a compromise. Interchangeability of parts has been given careful consideration

Many parts of the foundation brake gear are common to all cars and various other details of construction are interchangeable. With the care taken to provide limiting dimensions for the various optional material used, there should be little difficulty in properly maintaining the cars. As in the case of any new set of standards, however, the railways will be called upon to provide themselves with new material with which to repair the cars, which will take time and money. This feature will, of course, create some disturbance in the repair forces.

Canadian Pacific

THERE WAS NO INCREASE in freight business on the Canadian Pacific in the calendar year 1917 as compared with the previous year and no increase in the number of passengers carried, although the average passenger journey was about eight miles longer in 1917 than in 1916. The Canadian Pacific earned, however, \$13,000,000 more in 1917 than in 1916; the total earnings in 1917 amounting to \$152,389,335. In other words, there was a considerable increase in the average rates received for both freight and passenger. The ton mileage average in 1917 was 7 mills and in 1916 6.5 mills. The passenger rate per mile per passenger was 2.03 cents in 1917 and 1.96 cents in 1916.

The increase in rates, however, was not sufficient to offset the higher rate of wages paid and higher costs of material. There was no increase in the amount spent on maintenance of way; the 1917 expenditure being \$17,470,000 and the 1916 \$17,250,000. It is probably safe to assume, however, that scarcity of men was the limiting factor in the amount spent for maintenance of way.

The increased costs of actually moving the business (transportation expenses) and of maintenance of equipment are rather startling. Maintenance of equipment cost \$23,404,000 in 1917 and \$18,908,000 in 1916.

Transportation expenses mounted to \$53,029,000 in 1917 and \$42,385,000 in 1916. Trainmen, engineers and station agent and dispatchers' wages and fuel costs make up the bulk of the transportation expenses. This increase of 25 per cent in these expenses took place, notwithstanding the fact that passenger, freight and mixed train mileage all decreased. Total train mileage in 1917 was \$45,333,000, or 3.42 per cent less than the train mileage in 1916.

It is remarkable what progress the Canadian Pacific has made in car-loading and train-loading during the three years of the war. In the fiscal year ended June 30, 1915, the average loading per loaded car was 21.57 tons. In the calendar year ended December 31, 1917, this average was 26.19. In 1915 the average train load, including both revenue and company freight, was 463 tons. In 1917 the average train-load was 594 tons. When we remember that Canada has raised by the volunteer system 400,000 men and is now to raise another 100,000 by conscription which, in proportion to population, would be equivalent to raising an army of 7,000,000 men in the United States, we get some conception of the handicap of scarcity of labor which the Canadian railways have had to contend with. Increased train loading without any large change in the average power of locomotives or any considerable grade reduction is a matter of more skillful operation. To show such a marked increase in skill of operation as that on the Canadian Pacific is something that both the Canadian Pacific management and the people of Canada may well feel proud of. The Canadian Pacific management ascribes the better car-loading almost entirely to the success of the company's appeal to the patriotism of shippers. One thing that undoubtedly helped to bring up the average train-load in 1917 was a

reduction of 12 per cent in the mileage made by empty cars.

The principal changes in the character of traffic moved were an increase in the tonnage of flour and a decrease in the tonnage of grain and a very considerable increase in the tonnage of manufactured articles. The following table shows the classification of freight traffic and the quantities of each class moved in 1917 and 1916.

| | 1917. | 1916. |
|------------------------------------|---------------|---------------|
| Flour (bbls.) | \$13,727,970 | \$11,119,890 |
| Grain (bushels) | 213,340,507 | 256,106,690 |
| Live stock (head) | 2,190,596 | 2,172,437 |
| Lumber (feet) | 3,178,554,667 | 3,017,964,134 |
| Fire wood (cords) | 295,277 | 289,471 |
| Manufactured articles (tons) | 10,148,568 | 8,871,928 |
| All other articles (tons) | 8,788,423 | 8,487,785 |

The economies effected in passenger service have been almost as great proportionately as in freight service. The number of passengers carried in the calendar year ended 1917 was 15,462,000 and in 1915, 13,086,000. Passenger car mileage in 1917 totaled 139,842,000. In the fiscal year ended June 30, 1915, passenger car mileage totaled 130,805,000; but the 1915 mileage was nearly 17 per cent smaller than 1914 mileage. In other words, curtailment of passenger car mileage was begun almost immediately after the outbreak of the war.

In 1916, the Canadian Government and the Canadian Pacific had outlined a plan under which the Canadian Pacific was to issue something less than \$200,000,000, 5 per cent collateral trust bonds and lend them to the Imperial treasury. This plan, however, was abandoned; but an issue of \$40,000,000 currency, 4 per cent consolidated debenture stock was made and this stock was loaned to the Imperial treasury, and an option given to the government to buy this stock at any time within five years at \$80 per \$100 share. No other security issue was made by the Canadian Pacific; but the company spent \$4,570,000 for additions and betterments on its own lines and \$7,505,000 on leased and acquired lines.

In 1917 the balance sheet shows under "Investments and Available Resources" \$10,586,734 cash and under "Working Assets" \$31,424,894 "Cash in Hand." In the 1916 balance sheet under "Working Assets" there is \$57,076,019 "Cash in Hand." Miscellaneous accounts payable totaled \$8,821,809 at the end of 1917 as compared with \$6,199,837 at the end of 1916.

The following table shows the operating revenues and expenses for 1917 and 1916.

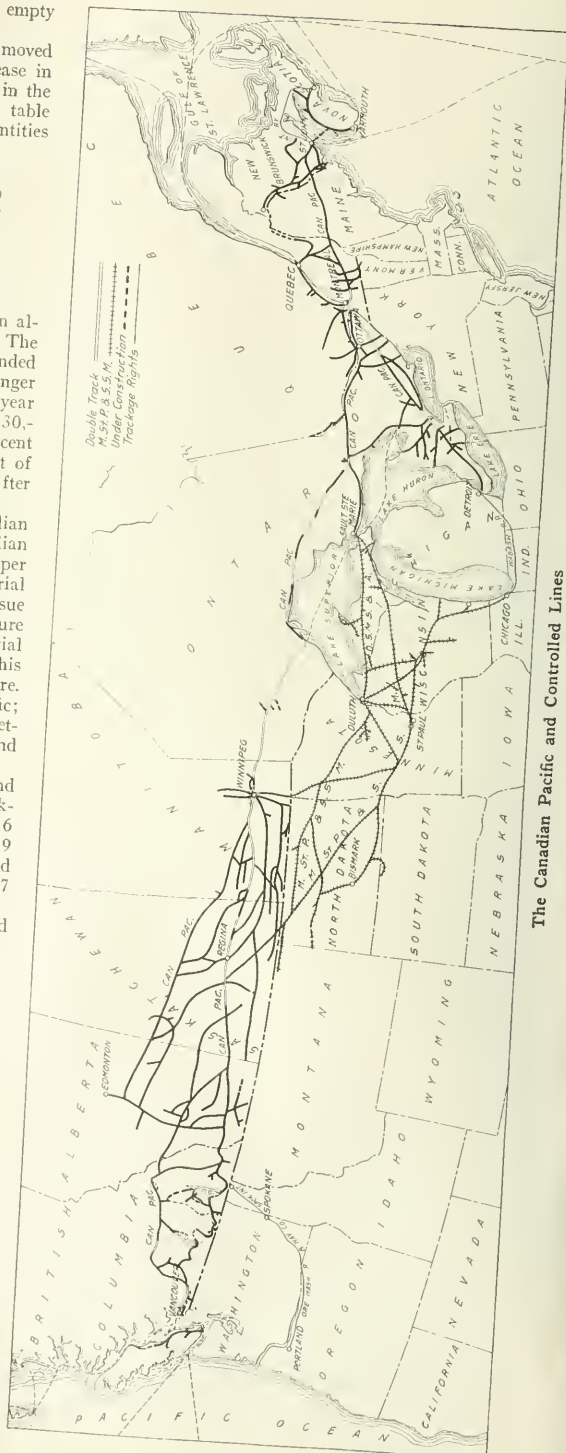

| | 1917. | 1916. |
|---|---------------|--------------|
| Mileage operated | 13,380 | 13,768 |
| Freight revenue | \$103,635,795 | \$96,454,896 |
| Passenger revenue | 30,238,986 | 26,849,282 |
| *Total operating revenue | 152,389,335 | 139,729,687 |
| Maintenance of way and structures | 17,470,069 | 17,249,500 |
| Maintenance of equipment | 23,404,263 | 18,908,464 |
| Traffic expenses | 3,084,944 | 2,940,872 |
| Transportation expenses | 53,029,260 | 42,385,348 |
| General expenses | 5,023,609 | 4,345,852 |
| †Total operating expenses | 105,843,317 | 89,253,188 |

* Includes revenue from mails, sleeping car, express, telegraph and miscellaneous.

† Includes parlor and sleeping car, lake and river steamers, and commercial telegraph expenses.

The following table shows the income account of the Canadian Pacific for the calendar year 1917.

| | |
|---|---------------|
| Gross earnings | \$152,389,335 |
| Operating expenses | 105,843,317 |
| Net earnings | 46,546,018 |
| Interest and fixed charges | 10,229,143 |
| Appropriation for pension fund | 500,000 |
| Transferred to special income | 1,968,683 |
| Dividends paid from railroad earnings | 21,427,276 |
| Special income (interest and dividends received, earnings of steamship lines, etc.) | 10,713,294 |
| Dividends from special fund | 7,800,000 |

The Canadian Pacific and Controlled Lines

Letters to the Editor

Breaking in Locomotives

CHICAGO, Ill.

TO THE EDITOR:

I notice on page 594 of the February 22 issue of the *Railway Age*, a suggestion from J. L. Coss, that locomotives be broken in after being turned out of the shop by having them handle bad-order cars or other work of a light nature, as the locomotive would reach the next terminal and be in condition to handle a full train on return trip.

I believe, if Mr. Coss had taken a second thought before making this suggestion, it might have occurred to him that the object in running a locomotive light as is customary on a trial trip, is to give the bearings a chance to find a permanent bearing and to prevent failures from hot boxes, or the journal heating up, as would be the case if Mr. Coss' suggestion were followed. Very often a failure or a hot-box caused from such handling would more than offset the saving made by utilizing the services of this locomotive for handling bad-order cars or light equipment.

To make the illustration a little plainer, it is customary with all manufacturers to break in and run the machines light before the load is placed on them. The breaking in trip also gives the shop organization a chance to correct any errors that may have been made, or to discover any imperfect work which has been done on the machine, thus making it a much safer machine to place in service than would be the case if handled the other way.

L. A. NORTH.

Shop Superintendent, Illinois Central.

Why Standardize Equipment Now?

NEW YORK, N. Y.

TO THE EDITOR:

Whatever may be the reason for the standardization of equipment, whether, as an emergency measure, to provide equipment for the country quickly, or to inaugurate a comprehensive and permanent standardization scheme, it seems that effort is being made to complete, within at most a few months, standardization work which should require years to accomplish.

Standardization means stagnation. It will remove from the car and locomotive construction field a vast amount of talent and effort heretofore expended upon improvement therein. Standardization means retarded development to an extent proportional to the field covered. A small line or a small territory can and does entertain the adoption of improvement much more freely than larger lines covering more extended territory, because the introduction of a new standard always involves a change which is usually expensive in proportion to the amount of territory covered. The benefits to be derived from the new standard must be weighed against the cost of its adoption more and more carefully the more widely extended the territory affected. The consideration of a standard of construction or maintenance applying to a large system receives much more careful consideration than on the smaller roads for obvious reasons. When the territory of standardization is extended to the entire United States, the inertia and delay which must be reckoned with, in the introduction of equipment design improvements, will be multiplied many times.

The determination, for the entire country, of the "best" in car and locomotive equipment, to the last detail, is a

colossal problem which cannot efficiently be solved within the time at the disposal of those with whom is lodged the responsibility for completion of the contemplated work. The task appears to be an impossible one, because the "best" for the United States cannot be obtained unless the "best" is also obtained for its various sections, territories or lines. There is not nor can there be a common "best" for all these sections, territories or lines, for many of the details to which, it appears, it is intended that standardization be applied.

In approaching this problem one first encounters consideration of the type of equipment to be adopted. It is needless to suggest anything on this subject, because the loss of efficiency to the country due to the use of standard types instead of other more efficient ones, especially adapted to the needs of the territory within which they are to be operated, must be apparent. The same applies to general dimensions and weights for the equipment types selected. Then comes the details of design and the specialties which are developed, manufactured and sold to the railroad companies and equipment builders by interests outside the ranks of railroad managers and employees, who must be accorded a large amount of the credit for the present state of the development of the art of railroad transportation. The standardization or the adoption of standards covering detail design and the selection of specialties will be an easy task for one vested with authority to make the necessary decisions, but the loss of efficiency which must become common throughout the country in connection, particularly with standardized locomotive equipment, will be enormous.

The details of design and the specialties referred to are all important factors, because they represent parts with which the men, immediately busied in repair and operation of equipment, come personally in contact and to which, through years of experience, they have adjusted themselves, their methods and their tools. The new design details and the new specialties are the points where "the shoe will pinch" by adversely affecting the operating efficiency, because these will affect the operating efficiency of the masses of men who have immediately to do with maintenance and operation of the equipment involved. The adoption of general standards involves an attempt to reconcile differences, which to many may appear to be only psychological, between the expressions of representatives of various sections on the matter of what design details or what specialties are most efficient. The number of such differences which might be cited even on a single large railroad system would be most astonishing and such a list would be greatly expanded if applied to all the lines in the United States. Though some of these differences might be dismissed as "only psychological," they must still be reckoned with. Failure to recognize the importance of the "human element" must very seriously and adversely affect operating efficiency.

The maintenance facilities, small and hand tools at shops and enginehouses, together with the stock of repair materials on hand is, in every section, in keeping with the needs of specialties and design details obtaining in that section. The introduction of new details or new specialties will involve immediately the expense of providing new repairing instruments and materials, a loss in efficiency until such are provided and the men interested in operation and maintenance accumulate experience and familiarity with the new. The country can now ill-afford to suffer the loss of efficiency and expense of the transitional period.

To summarize the whole situation it seems that standardization can only be part of an emergency program for quickly providing this country with the needed locomotive and car equipment, or a comprehensive permanent program which its sponsors believe will operate to the ultimate benefit of the country. If the purpose is the former, the standardization scheme as applied to the entire country appears to be unnecessary, detrimental and retarding; if the latter,

it is ill-advisedly considered now, because there are certainly greater things at stake than the final solution of this railroad equipment standardization problem, which should be postponed until after the present crisis is passed.

A CITIZEN WITH SOME RAILROAD EXPERIENCE.

An Unsafe Ruling

CLEVELAND, Ohio.

TO THE EDITOR:

Recently the conductor and engineman of a train were given an order stating, among other things, that a certain order was annulled. They did not hold a copy of that order and protested that they should be given a copy of it. The superintendent took the position that it was not necessary for the crew to hold the order, and further stated that if it were necessary for them to have a copy of the order the despatcher would have given it to them.

The point at issue here is vital to every operating officer because upon the correct understanding of the rules the safety of operation under the present train order system must depend. By denying the right of the trainmen to hold a copy of the original order the superintendent has placed himself in the position of having assumed that (a) the despatcher invariably supplies all orders which a train requires for safe movement under the rules and that (b) all orders placed by the despatcher at various points for a train are delivered to that train without failure; and that (c) such ruling violates no rule for movement by train order.

The ruling, to be safe, must be upheld by the rules and by experience in all three particulars. If a copy of the original order is denied the crew it must be shown that (a) the despatcher performs his duty perfectly, which manifestly is out of the question. But if the despatcher could be depended upon to issue all necessary orders there would be still the possible failure of the operator to deliver them. The government reports of accidents afford ample evidence on this point.

Nor do the rules permit such a ruling to stand unchallenged. Rule 201 in defining exactly what can enter into a train order, says "They must contain neither information nor instructions not essential to such movements"; and an order directing a train to annul an order which it does not hold would be "not essential" to the movement of that train. The superintendent's ruling created a hazard by the assumption that the crew could annul an order which it did not hold, or could take the alternative and disregard that portion of the order without danger.

The exact hazard in the ruling rests no less in the loose method of viewing the contents of a train order than in the actual danger which can result therefrom. Take an example. No. 108 is a train moving from A to Z, and is superior by direction. No. 121 is a train of the same class in the opposite direction. Order No. 4, directed No. 121 to meet No. 108 at B. This order was delivered to both trains. Order No. 15, directed No. 108 to meet No. 121 at C instead of B. This order was placed for No. 121 at D and delivered to No. 108 at A. No. 121 was delayed and the despatcher issued order No. 16 to No. 121 at E and to No. 108 at C, reading, "Order No. 15 is annulled." When No. 108 received order No. 16, it proceeded on its way without having any orders in effect concerning No. 121. No. 121 still held order No. 4 to meet No. 108 at B, as it had not received order No. 15. The conductor and engineman of No. 121 received order No. 16 at E, but as they did not hold order No. 15, they disregarded the annulling portion of the order, as instructed by the despatcher (after receiving their protest and conferring with the superintendent) and proceeded towards D, meeting No. 108 between E and D.

Should the operator fail to deliver a superseding order

the same thing obtains. It follows that the occasional failure of the despatcher to issue or properly place orders and the failure of the operator, at times, to deliver all orders held, uphold the wisdom of the rule which forbids the inclusion in an order of instructions not essential; and upholds the crew in demanding a copy of an order which it has been instructed to annul.

G. E. COLLINGWOOD.

Local Freight Agent Responsible for Unjust Criticism of Railroads

WASHINGTON, D. C.

TO THE EDITOR:

In spite of denials from authoritative sources a large percentage of the public is still convinced that the railroads are bent on making a failure of the present experiment of direct governmental operation of the carriers. I think no one acquainted with the situation will fail to agree that the charge is untrue so far as it concerns the vast majority of officers of individual lines. Why, then, the persistency of this belief?

A careful analysis of the great volume of appeals for transportation help which reach the United States Department of Agriculture, after due allowance is made for the abnormal, leads to the conclusion that the opinion is fostered by the attitude of the local freight agent. He has more work than he ever had before, with less and poorer help to get it done. He is human enough to follow the line of least resistance, and the imperative duty rests upon higher officers to keep before him the whole picture of our transportation problems. When a patient, but exasperated, shipper tries to get some information as to the whereabouts and probable arrival of a shipment which has been out from six weeks to three months, and which under normal conditions should have reached destination in six days, and is met with the statement, "The government is running the railroads, and we are doing no tracing," what other conclusion can he reach than that somebody is "laying down on the job?"

Some two years ago the American Railway Association adopted a resolution looking toward putting an end to the tracing abuse, an abuse for which, under the competitive system, the railroads were more responsible than the shippers. The resolution was a move in the right direction and it has had the support of all right-thinking people. It is recognized that the same conditions which today make the tracing of some shipments so necessary, militate against their efficient tracing. When, however, such commodities as agricultural implements, spraying material, seeds and fertilizers, imperatively needed at once for spring planting in order that there may be no curtailment of the production of food in the United States this year, have been in transit far beyond the length of time necessary to get them to destination, they should be traced. If they can't be traced, the shipper is at least entitled to an intelligent explanation of why it can't be done.

I cite tracing merely as one example. There are others. Are we going to educate the local agent at this crisis and put him in a position to help to forestall baseless criticism?

CHARLES BRAND,

Chief of Bureau of Markets, United States Dept. of Agriculture.

THE JAPANESE GOVERNMENT RAILWAYS with a view to relieving the enormous freight congestion are pushing forward the construction of hundreds of freight cars at the workshops by offering a bonus of Y.300 (\$150) a car for speedy completion.—*The Far Eastern Review*.

The Big Black River Bridge Nearly Completed

Improvements on the Yazoo & Mississippi Valley

Track Grades on 44 Miles of Line Near Vicksburg Have
Been Raised to Protect Against Floods

BECAUSE FLOOD WATER in the Mississippi river reached a higher stage early in 1916 than had been recorded previously, submerging the main line of the Yazoo & Mississippi Valley in the vicinity of Vicksburg, Miss., with a resulting suspension of traffic for a period of three weeks, the railway undertook an extensive project for raising the grade of its tracks over a distance of 44 miles. Of this distance 27 miles was north of Vicksburg and 17 miles south of that city. While the raises made were relatively light, the work taken in the aggregate assumed rather large proportions, over 1,500,000 cu. yd. of grading being required. The details of this work, much of which was carried on under traffic, are of considerable interest and the following account, taken from an article by M. P. Black, assistant engineer, in the *Illinois Central Magazine* of January, 1918, presents the salient features:

South of Vicksburg the proximity of the existing track to the foot hills made it possible to obtain the desired raise in grade more economically by a change of alignment, pushing the new line farther away from the river, but north of the city the work was necessarily confined to a raise of grade on the existing alignment. After exhaustive surveys, it was decided to raise the top of rail from Vicksburg north to the Yazoo river, a distance of 10 miles, to an elevation three feet above the highest recorded water level. From the Yazoo river to Smedes, a distance of 17 miles, it was determined to raise the top of rail to the elevation of the hydraulic gradient of the 1916 flood. It was considered unnecessary to go higher on this part of the line because the United States Government is contemplating the construction of a levee, from Terrapin Neck cut-off to the mouth of the Yazoo canal, an improvement which, it is thought, will reduce the flood level in the area north of the Yazoo river.

The work from Vicksburg to the Yazoo river was authorized in the early part of 1916 and begun on July 10. The raise on this piece of track ranged from one to five feet, all

of which was done under traffic. The earthwork amounted to 216,000 cu. yd., measured in excavation, and the raising of pile trestles to a total of 1151 lineal vertical feet. Besides this, 351 ft. of old trestle was eliminated. The total cost was \$150,000 and, except for a few minor details, was finished in December, 1916.

From Vicksburg to Smedes

The work from the Yazoo river to Smedes was authorized in March 1917. The raise on this part of the line was from one to four feet and was done under traffic. It included 600,000 cu. yd. of earthwork, 4743 lineal vertical feet of trestle raised and 637 lin. ft. of additional pile trestle.

On account of inadequate drainage, side borrow for the embankment was not permissible. A borrow pit was secured at Kings, in a desirable location, making the average haul for the work 1.3 miles. Work on the track lay-out at the pit was started on July 13, 1916, and a steam shovel was put at work on August 1. The pit was opened with a 15C Atlantic type Bucyrus shovel, but later a 60C Bucyrus shovel was installed. Other equipment including 40 western automatic steel air dump cars of 20 cu. yd. capacity, thirty 30-cu. yd. Western cars of an older type, one Mann McCann steel spreader and four 60-ton locomotives belonging to the railroad.

The spreader used was well adapted to this class of work as the main wings were designed to force the dirt back from the track for the passage of trains, but not so far as to increase the cost of placing the dirt in the track while it is being raised. The steel dump cars used were also satisfactory for this class of track raising work, especially where the embankment was not over eight feet high. The 30-cu. yd. cars of the same manufacture were too large for a low embankment, but would be satisfactory on a higher fill. For handling the dump cars, the locomotives were equipped with three-way valves, connected with the dumping apparatus so

that the engineman could dump the entire train in either direction on a signal from the dump foreman. The maintenance on the steel dump cars was light as one car repairer was sufficient to handle the running repairs on 70 cars.

The track was raised in one-foot lifts 1000 ft. long using gangs of 40 men working with ordinary No. 6 track jacks. The plan followed was to raise the track as high as possible on the available dirt, and then dump more. In this way the raising was always ahead of the dumping, giving the track

Typical Excavating and Hauling Equipment Used on the Work

good drainage, which was of great benefit during bad weather. The plans for the work called for an 18-ft. crown on the embankment with $1\frac{1}{2}$ to 1 slopes. An allowance of 10 per cent was made for shrinkage and this seemed to work out very well for the material used.

To raise the ballast deck trestles, where the raise was two feet or less, additional caps were inserted, drifting them

and the dirt pit by the construction department. The work is now practically completed. The ballast used was of a cementing gravel type, hauled from Whittaker pit, 106 miles south of Vicksburg.

South of Vicksburg

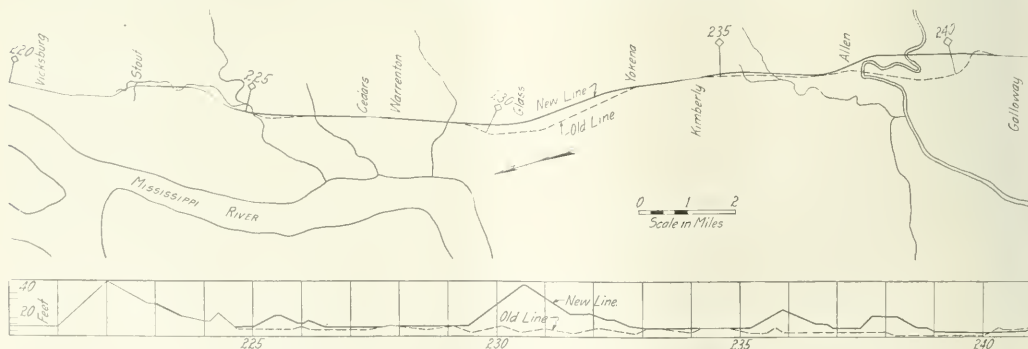

Of the 17 miles of reconstruction south of Vicksburg, all but five miles is on new alignment. The terrain being such that changes of line were advantageous in obtaining the desired raise in grade, further benefits in the new location were found in that it relieved the embankment of the wave wash to which it was subjected on the old location during high water and because an improved alignment could be secured. These improvements reduced the length of the line 0.32 miles and eliminated 233 deg. of curvature. The maximum grade used was 0.5 per cent and the maximum curve 2 deg. The work was authorized in July 1916, and it was started in August of the same year.

The work included 739,000 cu. yd. of earthwork, 2,197 lin. ft. of ballast deck trestle, 210 lin. ft. of open deck trestle, 80 ft. of concrete trestle and 1,173 lineal vertical feet of pile trestle raised, in addition to a new bridge over Big Black river consisting of six 75-ft. girder spans, one of which was equipped for hand operation as a Straus bascule span. The substructure is of concrete. The entire structure cost \$170,000. By the construction of two subways, an overhead bridge and one mile of road change, all public grade crossings over the new alignment on the main road from Vicksburg to Yokena, a distance of 13 miles, have been eliminated.

The grading was done by the H. W. Nelson Company of Chicago, and the bridge work was done by company forces except the masonry work on the Big Black river bridge which was done by the Union Bridge & Construction Company of Kansas City, Mo.

The equipment of the grading contractor consisted of three 70C Bucyrus shovels, two pumping plants and tanks, one water distilling plant, one Jordan steel spreader, one wooden spreader, seventy-five 12-cu. yd. wooden dump cars, eight 16-cu. yd. wooden dump cars, and four to eight 60-ton locomotives, (leased from the railroad company). A night and day shift were operated on the grading work during a portion of the time.

Considerable difficulty was experienced in three places

Map and Profile of the Improvements South of Vicksburg

thoroughly. Where the raise was more than two feet it was made in like manner, but greater stability was secured by driving an additional pile at the ends of each bent and providing a top cap of sufficient length to bear on the two new piles. Additional sway bracing was also applied. The track raising was handled by the Vicksburg division forces

on account of the abrupt rise of the natural surface of the ground, as heavy as 10 per cent grades being used by dirt trains in reaching the shovels on the upper lifts. A very troublesome blue marl was encountered in several places in the excavation six feet above grade line, which would not sustain the load of the upper strata after the lateral pres-

sure had been removed. In one case the grade line was raised to the highest point of this material and in others the excavation was widened until an angle of repose was reached.

During the winter of 1916-17 a very high stage of the Mississippi river occurred, which overflowed the Big Black Bottom and caused the failure of a frame bent trestle used

A Section of New Embankment

for dumping on the main line embankment there. This necessitated the construction of a temporary pile trestle, which was driven with a creeping driver during the high stage of water. Through Big Black bottom on a 32 ft. fill, approximately 4 ft. of subsidence and 10 per cent shrink-

Building a New Line Higher Up on the Hill Side

age of the embankment material took place during this overflow.

Big Black River Bridge

The bridge over Big Black river and a 1,200 ft. ballast deck trestle south of it were constructed in advance of the grading. The material for these bridges was moved over

a 7,000 ft. temporary track constructed through the bottom from the main track near Galloway. The first four bents of the 1,200-ft. trestle were driven with a track driver, after which a creeping driver was landed on top and used to complete the structure. Pile foundations with a penetration of 25 to 35 ft. were required at the river bridge. Wakefield sheet piling was placed around each pier as a precaution against high water, but weather conditions and the stage of water in the Big Black river were entirely favorable throughout the work, the channel piers being constructed with only five feet of water in the channel.

The work was well planned and carried through efficiently. The plant consisted of three hoisting engines, three stiff leg derricks, one barge, one power saw, a 1 1/2-cu. yd. Ramsey mixer, two steam hammers and a compressed air plant complete. A temporary trestle was driven across the river and all material was transported on this. The mixer was located on the south bank of the river, concrete being moved across the trestle in dump buckets loaded on a push car and operated by a continuous cable, attached to the drum of

A Filling Trestle for a New Embankment

one of the hoisting engines. The material was then placed in forms by a second derrick.

Washed river gravel was used in the piers, but on account of a large percentage of sand it was screened. A large steel screen was rigged over the hoppers and the aggregate unloaded onto the screen with a clam shell direct from the cars. The screen was set at an angle of 40 deg. with the horizontal and distributed the material to the respective bins.

The bridge superstructure was erected by one of the system steel gangs with an ordinary track derrick. Two temporary pile bents were driven in advance of each pier to afford sufficient reach for the derrick to land the 75-ft. girders.

This work is now complete, but as 5,000 ft. of the new embankment has not sustained an overflow period, the old main track from Allen to Galloway will be kept in condition for service until after the next overflow to insure the regular movement of trains in case there is an excessive subsidence and shrinkage of the fill during high water. With these improvements complete, the entire line through the overflow territory except the Vicksburg terminal is ade-

quately protected from probable high water, and plans for improving the latter are now under consideration. The work described was carried on under the direction of A. S. Baldwin, chief engineer of the Illinois Central, with M. P. Black, assistant engineer, in direct charge.

Changing Standard Time

DIRECTOR GENERAL McADOO has issued an order to the railroads containing instructions, based on a report by the Committee on Transportation of the American Railway Association, to be followed in connection with the change in standard time caused by the daylight saving bill, which becomes effective at 2 a. m. Sunday, March 31. Immediately after the change is made, as no change will be made in the time-tables, all trains then on the road would be one hour late according to the time table. On the other hand, trains which do not start until after the change in time naturally would not be late, except for other causes. This creates a problem of adjustment to be worked out in arranging meeting points. The instructions are as follows:

"At 2 a. m., Sunday, March 31, all clocks and watches in train dispatchers' offices, and in all other offices open at that time, must be advanced one hour, to indicate 3 a. m.

"Employees in every open office must, as soon as the change has been made, compare time with the train dispatcher. Clocks and watches in all offices at the first opening, at or after the time the change becomes effective, must be advanced to conform to the new standard time and employees, before assuming duties in such offices, must, after the change is made, compare time with the train dispatcher.

"Each railroad will issue necessary instructions and arrange for such supervision and check of the watches of its employees as to insure that they have been properly changed to conform to the new standard time.

"Owing to the varying conditions which will prevail on the railroads of the United States, it is not advisable to issue a uniform rule or order to cover the details involved in the movement of trains at the period the change in standard time becomes effective. Therefore, each railroad must adopt such measures as may be necessary to properly safeguard the movement of its trains on the road at the time of the change."

Instructions for Train Dispatchers

On a double-track line, with each of the two tracks occupied only by trains moving in one direction, a general order, directing that, after 2 a. m., all scheduled trains shall run one hour late will afford all necessary simplification of the dispatcher's problems in ordinary cases. On a single track line, worked according to the Standard Code (with trains in one direction superior to all those of the same or a lower class moving in the opposite direction) the simplest plan for fixing meeting points safely is to annul all schedules and run the trains as extras. This is the plan adopted on a number of roads from whose officers information has been received. A typical general order, that of the Western Maryland, places on the dispatchers the following requirements:

1. Annul all regular trains which, according to their schedules, would be on the road at the time of the change, and run them as extras.

2. Make no use of time orders for one hour before the change and until twelve hours after the change.

3. Require trainmen on the road to have a general comparison of time. That is, require the conductor, engineman, fireman, head brakeman and middle brakeman to get together and see that they all have the same time; the conductor then to compare time with the flagman.

4. Require trains to stop at the first telephone booth

after the change and the conductor compare time with the train dispatcher, who will make a record of it. Train orders are transmitted by telephone and there are telephone booths not farther than three miles apart, so that this comparison can be made almost immediately after the change becomes effective.

5. Have local time inspectors make the change in standard clocks.

6. Require all train and enginemen, both road and yard, to compare time before starting out after the general change.

7. The local time inspectors will furnish a man at large departure points for the first twelve hours after the change, to compare and record the time of all men before they go on duty.

8. Clocks other than standard will be changed by the clerks in local offices.

It was expected that the commercial telegraph companies would couple in their master clocks and send time on the Morse wires on the first hour after the change, for the benefit of all within hearing.

On the Erie Railroad the instructions for single track lines require all trains between terminals at 2 a. m. to be at an open telegraph office at that hour. Before proceeding from such station, the conductor and the engineman are to compare time with standard clock, or with the train dispatcher; and to proceed only after receiving instructions from the dispatcher. All train orders in effect at 2 a. m. are automatically annulled; trains holding orders must then proceed only on new orders.

Absolute Meeting Points

On the New York, New Haven & Hartford all scheduled trains on the road at 2 a. m. are ordered to run to destination not less than one hour late. On the single track lines of this company all scheduled trains have the right to the road to schedule meeting points unconditionally as regards opposing scheduled trains of the same class, and whichever of two such trains arrives first must wait for the other. The order to the dispatchers provides, therefore, as regards opposing trains, simply that the dispatchers shall arrange meeting points for trains not of the same class. Prior to the change they must issue no time orders to be in effect after 2 a. m.

After 2 a. m. dispatchers must get from all conductors and enginemen then on the road acknowledgments that they have changed their watches, using for this purpose train-order form No. 31.

To provide against any possible misunderstanding the general manager of the New Haven ordered that at each train terminal and engine terminal a trainmaster, assistant trainmaster, road foreman of engines or other suitable officer should be on duty from 4 p. m. on Saturday, March 30, until 10 p. m. on Sunday, March 31.

JAPANESE TO EXTEND SHANTUNG RAILWAY.—An engineer of the Shantung Railway with an assistant started from Tsingtao recently to conduct preliminary surveys for the extension of the railway from Tsinan to Taokowchen.

SOUTH MANCHURIA RAILWAY TO BUY EQUIPMENT.—The management of the South Manchuria Railway is considering the appropriation of some Y.6,000,000 (\$3,000,000) for buying at least 600 freight cars and 12 locomotives in the estimates for the next fiscal year. This is at the rate of Y.150,000 (\$75,000) per locomotive and Y.7,000 (\$3,500) per freight car. This estimate is of course subject to variation according to the price of iron and steamer freights and is based upon a plan to buy not materials for construction, but ready-made rolling stock. This is reported to be decidedly cheaper than the purchase of materials. All these purchases are to be made from the United States.—*The Far Eastern Review.*

Specifications for the United States Standard Cars

Seven Types of Bodies for Box, Hopper and Gondola Cars and Three Types of Trucks Are Provided

THE DIRECTOR GENERAL has issued specifications for the standard cars recently designed by the government's car committees and which have been approved by the director general. These specifications cover designs for bodies of a 40-ton steel underframe, double sheathed box car; a 40 and 50-ton steel frame, single sheathed box car; a 50-ton steel high side gondola car; a 50-ton composite high side gondola car; a 70-ton low side steel gondola car with drop ends, a 55-ton hopper car, and a 70-ton hopper car. There are only three designs of trucks for these cars. They are of 40, 50 and 70 tons capacity. Those parts of all designs which could, have been made common to all of the designs.

Car Body Specifications

The friction type of draft gear has been specified on all cars and the following five types may be used: Cardwell, Murray, Sessions type "K," Westinghouse and Miner. The M. C. B. Type D standard coupler with the 6-in. by 8-in. shank is specified on all cars. M. C. B. specifications have been followed to a large extent and a complete specification for paint is included to be used for all cars. The dimensions

to meet M. C. B. specifications. Brakes to be applied to all wheels and also arranged to be operated from one end of the car by hand. Braking power to be about 60 per cent of light weight of car based on 50-lb. cylinder pressure. Piston travel to be between 5 and 7 in. Hand brake power to be approximately the same as the air brake power. All piping to be black steel, merchantable, standard weight, and fittings to be malleable iron.

Draft Gear.—To be of the friction type, having a minimum capacity of 150,000 lb. and a maximum travel of 2 3/4 in., designed so as to fit into the space provided by the drawings. Clearance between coupler horn and striking plate to be 3 in. The following types may be used: Cardwell, Murray, Sessions type "K," Westinghouse, Miner.

Drawbar Yoke.—To be of the vertical plane type of an approved design, arranged to take the key shown on drawing.

Coupler.—To be cast steel, in accordance with M. C. B. contour and specification, having 6-in. by 8-in. shank, 21 1/4 in. long, as shown on coupler condition drawing, and slotted tail of proper depth to suit draft gear.

Coupler Operating Device.—To be of the top operating

| Cubic capacity—level full | | | 2,310 cu. ft. | 2,230 cu. ft. | | 2,235 cu. ft. | |
| Cubic capacity—with 30 deg. heap | | | | | | | |

of these seven types of cars are shown in the accompanying table. Following is a list of the specifications that are common to the bodies of all of the cars:

Center Sill Requirements.—The center sill construction is designed to meet the M. C. B. requirements, having an area of not less than 24 sq. in. in cross section and a ratio of stress to end load not exceeding .06.

Safety Appliances.—To be applied in accordance with United States safety appliances standard in effect on date of proposal.

Material Options.—Wherever more than one kind of material or construction is shown on drawing or mentioned in specification, it is understood that either may be furnished by the builder unless otherwise specified. Specialties to be as covered in contract.

Bolts and Nuts.—All bolts to have square head and nut unless otherwise specified. All bolts for securing steel against steel to have cotters, lock washers or lock nuts, in addition to common nut, and all bolts for securing wood against steel to be riveted over nuts.

Brakes.—Cars to be equipped with Westinghouse KD-10-12 type (the box cars are to be equipped with the KC-10-12 type) of air brakes of either Westinghouse or New York Air Brake Company's manufacture. Hose and gas-

type without the use of clevises, links and pins; that is, to be direct connected to the locking block. Apparatus to be in accordance with condition drawings.

Center Plate.—To be, first, drop forged, or second, cast steel.

Side Bearing.—To be, first, frictionless, or second, plain. Frictionless side bearings to be of approved type to meet conditions shown on drawing. Drawings are arranged so that plain side bearing can be used in repairs.

Material Specification.—The following M. C. B. specifications for materials are to apply:

| | |
|---------------|---------------|
| A. 1. Steel | F. 1. Steel |
| A. 2. Steel | F. 2. Steel |

Freight Car Paint Specifications No. 1008

Freight Car Color. I. This material will be bought in the paste form, and the paste must contain nothing but oil, pigment and moisture.

11. The proportions of oil, pigment and moisture must be as nearly as possible as follows:

| | |
|----------------|-----------------------|
| Pigment | 74 per cent by weight |
| Oil | 25 per cent by weight |
| Moisture | 1 per cent by weight |

III. The oil must be pure raw linseed oil, as free as possible from foots, and well clarified by settling and age.

IV. The pigment desired if it contains sulphate of lime or gypsum should have this fully hydrated. It may have as inert material sulphate of lime of gypsum fully hydrated, silica, kaolin, soapstone or asbestine, or mixtures of any of these, sulphate of lime and silica preferred. The pigment should have the following composition:

| | |
|---------------------------|------------------------|
| Sesquioxide of iron | 25 per cent by weight |
| Inert material | 71½ per cent by weight |
| Carbonate of lime | 3½ per cent by weight |

V. Material must conform to shade furnished and in fineness of grinding meet test in accordance with approved method of Standard Railway laboratories.

VI. Shipments will not be accepted which:

1. Contain less than 23 per cent or more than 27 per cent of oil.

2. Contain more than 2 per cent volatile matter, including the moisture, the oil being dried to 250 degrees Fahrenheit, and the pigment dried in air which has been passed through oil of vitriol, at from 60 degrees to 90 degrees Fahrenheit.

3. Contain impure or boiled linseed oil.

4. Contain in the pigment sulphate of lime not fully hydrated, less than 20 per cent of sesquioxide of iron, less than 2 per cent or more than 5 per cent of carbonates, calculated as carbonate of lime, or have present any barytes, carbonates of alkalis, aniline colors, lakes or any other organic coloring matter, or any soaps or other emulsifying material.

5. Vary from shade.

6. Do not pass fineness of test.

7. Are a liver or so stiff when received that they will not readily mix for spreading.

Carbon Black. 1. This material must be furnished in paste form.

II. The material desired under this specification is a paste, made on the following formula:

| | |
|---------------|-----------------------|
| Pigment | 65 per cent by weight |
| Oil | 35 per cent by weight |

The oil must be pure raw linseed oil, as free as possible from foots, and well clarified by settling and age.

The pigment desired should consist of:

| | |
|---|-------------|
| Lampblack, or carbon black | 15 per cent |
| Red lead | 2 per cent |
| Asbestine | 10 per cent |
| Silica or other approved material | 70 per cent |

The lampblack must be of good quality, and of such a character as to produce the standard shade. Ground coal, etc., will not be considered. Phosphates, barytes, sulphates of lime or gypsum, carbonate of lime or whiting or any other carbonates of sulphates, or any constituents other than those given in the composition of the pigment desired, must not be used.

III. Material must conform to shade furnished and in fineness of grinding meet test in accordance with approved method of Standard Railway laboratories.

IV. Shipments will not be accepted which:

1. Contain less than 32 or more than 38 per cent oil.

2. Contain more than 2 per cent of volatile matter, including the moisture, the oil being dried at 250 degrees Fahrenheit, and the pigment dried in air which has been passed through oil of vitriol at from 60 to 90 degrees Fahrenheit.

3. Contain impure linseed oil.

4. Contain in the pigment less than 13 per cent or more

than 16 per cent carbon, preferably in the form of lamp-black or carbon black, less than 4 per cent of lead representing the red lead, or have present any phosphates, barytes, sulphate of lime or gypsum, carbonate of lime or whiting, or any other sulphates or carbonates or any other caustic substances, such as caustic lime, or any soaps or other emulsifying materials, or any constituents other than those given in the formula for the pigment desired.

5. Do not pass fineness test.

6. Do not contain asbestine according to the formula of the pigment desired.

7. Are a liver, or so stiff when received that they will not readily mix for spreading.

Red Lead. This paint shall be furnished in prepared form ready for application. It shall contain not less than 64 per cent or more than 68 per cent of pigment. The pigment portion of the paint shall contain 60 per cent red lead. The red lead used shall contain not less than 85 per cent Pb_2O_4 . The balance of the pigment portion of the paint shall consist of silicious matter such as magnesium or aluminum silicate or silica or a mixture thereof.

The vehicle shall consist of not less than 90 per cent linseed oil, the balance to be liquid drier and volatile thinner. The volatile thinner may be turpentine or mineral spirits or a mixture of the two. No rosin shall be present in the vehicle.

The prepared paint as received must have satisfactory working qualities and durability. It must be free from objectionable caking in the can. When applied to a smooth iron surface it must dry in twelve hours without running, streaking or sagging.

Box Cars

All designs of the box cars will have a steel underframe and steel ends. The bodies of the 40 and 50-ton single sheathed box cars are identical, the only difference is in the trucks. The specifications peculiar to the box cars and similar to all of the box car designs are as follows:

Flooring.—To be of fir or long leaf yellow pine, square edge and sound, 2¼ in. thick, tongued and grooved, 5¼-in. to 7¼-in. face width, secured to side and center sills, as shown on drawing.

End Lining.—To be yellow pine, No. 1 common, or fir 1½ in. thick, tongued and grooved, 5-in. face width.

Roof.—To be galvanized steel No. 22 gage, outside metal roof, laid over yellow pine roof boards, No. 1 common, or fir 13-16 in. thick by 3¼-in. or 5¼-in. face width as shown on drawing No. 1337. (The drawings state that the Murphy, Hutchins, or Chicago-Cleveland outside roofs may be used if they interchange with the designs shown.)

Steel Ends.—First, horizontal corrugated of three sheets: top sheet 3-16 in. thick, intermediate and bottom sheets ¼ in. thick with corrugations 2¼ in. deep. Second, vertical corrugated of two sheets, all ¼ in. thick with corrugations 2¼ in. deep. Third—Plain steel end with U-shape vertical stakes, as shown on drawings.

The following specifications apply only to the 40-ton steel underframe double sheathed box car:

Framing.—All dimension framing to be yellow pine, square edge and sound grade, or fir of sections shown on drawings.

Side Sheathing.—To be long leaf yellow pine, B and better, or No. 2 clear and better fir 13/16 in. thick, tongued and grooved, 3¼-in. or 5¼-in. face width, securing to framing as shown on drawings.

Side Lining.—To be yellow pine, No. 1 common, or fir 13/16 in. thick, tongued and grooved, 3¼-in. or 5¼-in. face width, secured to framing, as shown on drawings.

The side lining for the 40 and 50-ton steel frame, single

sheathed box cars is to be of, first, fir No. 2 clear and better, or second, yellow pine B and better. Lumber is to be thoroughly kiln dried, having maximum moisture of 5 per cent, tongued and grooved and with a 5-in. face.

The underframe for the double sheathed car is of different construction from that of the single sheathed car.

Gondola Cars

The gondola cars are designed to carry a concentrated load of two-thirds of the capacity of the car over a distance of 10 ft. at the center. Eight doors are provided on the 50-ton all-steel and composite high side cars. Those on the all-steel car are hinged cross-wise of the car, while those on the composite car are hinged along the center sill to dump toward the side. In both cases the doors are operated in pairs. The flooring for the composite cars is to be of long leaf yellow pine or fir, 2 3/4 in. thick, having a face of 5 1/4 in. to 7 1/4 in. The siding for these cars is of long leaf yellow pine or fir and 1 3/4 in. thick.

The underframe on all three of these designs is not the same in its entirety. There are, however, details which are similar. For instance, the draft sill construction and the body bolster center brace of both the 50-ton gondolas are the same as those used on the single sheathed box cars. The body bolster center brace and the rear of draft lug on the 70-ton gondolas are the same as those used on the 40-ton double sheathed box car. There are similarly other details which are common to the various designs.

Hopper Cars

The hopper cars are of all-steel construction, the 55-ton car having double hoppers and the 70-ton, triple hoppers. The four doors forming the center opening in the 70-ton car are operated by one mechanism and in all other cases the doors forming the openings are operated in pairs. These cars have the same end and draft sill and have the same design of rear draft lug. There are many details in the door opening mechanism which are common to both types of cars. The floor construction is the same and the hopper construction with the details is common to both. The side hopper sheets are the same.

Trucks

The trucks for all of the standard cars are covered by three specifications, one for 40-ton cars, one for 50-ton cars and one for 70-ton cars. The specification numbers for these trucks are 1274-B, 1276-B and 1241-B, respectively.

The following table gives the general dimensions of the three trucks:

| | 40-ton | 50-ton | 70-ton |
|---|----------------|---------------------|-----------------|
| Wheel base | 5 ft. 6 in. | 7 ft. 6 in. | 5 ft. 8 in. |
| Distance center to center of journals | 7 ft. 4 in. | 6 ft. 5 in. | 6 ft. 6 in. |
| Size of journals | 5 in. by 9 in. | 5 1/2 in. by 10 in. | 6 in. by 11 in. |
| Diameter of wheels | 33 in. | 33 in. | 33 in. |

The specifications for all three trucks are similar, the provisions in the majority of cases being identical. The trucks for the 40- and 70-ton cars are each required to be of ample strength to carry a load 10 per cent above the rated capacity in addition to the light weight of the car body. The 50-ton truck, while nominally for cars of that capacity, is required to carry a load of 121,000 lb. in addition to the light weight of the car body, thus making it available for use under 55-ton cars. Except in the case of those sections which are not identical for all three trucks, the text of the specifications is given in full. Sections where differences occur have been summarized to cover all three trucks and the difference clearly pointed out.

Material Options.—Wherever more than one kind of material or construction is shown on drawing or mentioned in specification, it is understood that either may be furnished

by the builder unless otherwise specified. Specialties to be as covered in contract.

Pattern Numbers.—All castings shall have a pattern number, as shown on drawing, with the initials "U. S. S." as a prefix.

Forgings.—Forgings may be made of either steel or wrought iron.

Truck Frames.—For the 40- and 50-ton trucks, the truck frames are to be: (1) Cast steel side frame of U-section members with M. C. B. standard removable journal box, (2) cast steel side frame of U-section members with journal box cast integral, or (3) arch bar type. Except for the exclusion of the arch bar type, the same types of side frame are specified for the 70-ton truck.

The bars for cast steel truck side frame to be of the short type, two per frame.

Cast steel side frame must meet limiting dimensions shown on limiting dimension drawing, and interchange in all respects with arch bar truck where this type of truck is permitted. They must be made in accordance with M. C. B. specifications and have a transverse section modulus in the top member of eight for the 40-ton truck, 10 for the 50-ton truck, and 12 for the 70-ton truck.

Truck Bolsters.—To be: (1) Cast steel bolster with integral center plate; (2) cast steel bolster with separate center plate, or (3) pressed steel or built-up bolster. Inside bearing surface of cast steel center plate to be dressed. Cast steel and built-up bolsters must interchange with pressed steel bolsters. Cast steel bolsters must have a section modulus vertically 10 per cent greater than pressed steel bolsters. Built-up bolsters must be as strong vertically as pressed steel bolsters. All bolsters to have a transverse strength at least 50 per cent of vertical strength.

Center Plates.—To be: (1) Drop forged, or (2) cast steel.

Side Bearings.—See body specifications.

Brake Beams.—Each 40-ton and 50-ton truck to be equipped with two M. C. B. No. 2 brake beams, and each 70-ton truck to be equipped with two M. C. B. No. 3 brake beams, all conforming to limiting outline and general conditions shown on drawing.

Brake Shoes.—To be: (1) With reinforced back, or (2) plain cast iron.

Wheels.—For the 40-ton trucks the wheels are to be M. C. B. standard for cars having axles with 5-in. by 9-in. journals. To be cast iron, weighing about 700 lb. each. Wheels to be in accordance with M. C. B. specification, and to be mounted on axles with a pressure of from 40 to 60 tons.

For 55-ton hopper cars, the wheels are to be: (1) wrought steel, (2) cast steel, or (3) cast iron. For all other 50-ton cars the wheels are to be cast iron. Wheels to be M. C. B. standard for cars having axles with 5 in. by 10-in. journals. Cast iron wheels to have a nominal weight of 725 lb. each. Cast iron wheels to be mounted on axles with a pressure of from 45 to 65 tons, and steel wheels with a pressure of from 65 to 85 tons.

The wheels for the 70-ton truck are to be M. C. B. standard, wrought steel, for cars having axles with 6 in. by 11-in. journals. They are to be in accordance with M. C. B. specifications, and to be mounted on axles with a pressure of from 70 to 95 tons.

Flanges.—To be of medium hard steel, smooth forged or round turned between wheel seats and journals to be finished. To be in accordance with M. C. B. specifications with sulfur and phosphorus content modified to limit of .06.

Journal Boxes.—To be of medium hard iron, cast or pressed steel, complete with lids and M. C. B. type reinforced wooden dust guards suitable for axles with 5-in. by 9-in. journals, 5 1/2 in. by 10-in. journals, or 6 in. by 11-in. journals, as the case may be. All boxes to be thoroughly cleaned and packed

with journal box packing which has been saturated with freight car lubricating oil.

Journal Bearings.—To be of brass, lead lined, M. C. B. specification grade "A."

Journal Bearing Wedges.—To be: (1) drop forged, or (2) cast steel. Wedges to be M. C. B. type, suitable for axles with 5-in. by 9-in., 5½-in. by 10-in., or 6-in. by 11-in. journals, as the case may be.

Painting.—Trucks to receive two coats of carbon black paint. Paints to be in accordance with United States Standard Specification, No. 1008.

Material Specifications.—The following M. C. B. specifications for materials are to apply:

| | |
|---------------------------------------|--|
| Axles | Journal bearings |
| Bolts and nuts | Malleable iron castings |
| Boiled linseed oil | Mild steel bars |
| Brake beams | Steel castings |
| Brake shoes | Pressed steel bolsters |
| Carbon steel bars for railway springs | Raw linseed oil |
| Cast iron wheels | Red lead |
| Cast steel bolsters | Rivet steel and rivets |
| Cast steel truck side frames | Structural steel, steel plates and steel sheets for freight equipment cars |
| Steel wheels | Turpentine |
| Helical springs | White lead for lettering |
| Japan drier | Wrought iron bars |

The following United States Standard Specifications are to apply:

Journal box packing (Specification No. 1009)
Journal box oil (Specification No. 1010)
Paint (Specification No. 1008)

Journal Box Packing

The following is the text of the United States Standard Specification No. 1009 for journal box packing:

The material desired under these specifications is curled vegetable fiber so curled as to impart to it the maximum resiliency; wool and cotton threads free from large lumps of any one component part and thoroughly machined and intimately mixed with the curled fiber in the following proportions:

(A)—Vegetable fiber—20 per cent
(B)—Wool waste —40 per cent
(C)—Cotton waste —40 per cent

Journal Box Oil

United States Standard Specification No. 1010 covers oil for journal boxes. The following is the text:

The oil required shall be well oil, and will not be accepted if it: (1) flashes from May 1 to October 1, below 298 deg. F., or from October 1 to May 1, below 249 deg. F.; (2) has a gravity at 60 deg. F. below 28 deg. or above 31 deg. Beaume; (3) from October 1 to May 1, has a cold test above 10 deg. F., and from May 1 to October 1, has a cold test above 32 deg. F.; (4) shows any precipitation when five cubic centimeters are mixed with 95 cubic centimeters of gasolene.

The precipitation test is to exclude tarry and suspended matter. It is made by putting 95 cubic centimeters of 88 deg. B. gasolene, which must not be above 80 deg. F. in temperature, into a 100 cubic centimeter graduate, then adding the prescribed amount of oil and shaking thoroughly. Allow to stand 10 minutes. With satisfactory oil no separate or precipitated material can be seen.

PERSHING TO USE CANALS.—The inland waterway system of France in the region occupied by American troops will be used for transporting some of General Pershing's supplies. A request from the American commander calls for the organization here of special engineer units for the operation and maintenance of the canals. The new units will probably be known as inland waterway companies. Men trained on American canals and rivers will be sought to fill up the ranks of the companies, and canal engineers will be selected as officers.

Rules for Capital

Expenditures on Railroads

Director General McAdoo has issued General Order No. 12, prescribing the following rules to be observed with respect to all railroad work involving charges to capital account, viz.:

First: In determining what additions and betterments, including equipment, and what road extensions should be treated as necessary, and what work already entered upon should be suspended, please be guided by the following general principles:

(a) From the financial standpoint it is highly important to avoid the necessity for raising any new capital which is not absolutely necessary for the protection and development of the required transportation facilities to meet the present and prospective needs of the country's business under war conditions. From the standpoint of the available supply of labor and material, it is likewise highly important that this supply shall not be absorbed except for the necessary purposes mentioned in the preceding sentence.

(b) Please also bear in mind that it may frequently happen that projects which might be regarded as highly meritorious and necessary when viewed from the separate standpoint of a particular company, may not be equally meritorious or necessary under existing conditions, when the government has possession and control of the railroads generally, and therefore when the facilities heretofore subject to the exclusive control of the separate companies are now available for common use, whenever such common use will promote the movement of traffic.

Second: The construction of new railroad lines or branches or extensions of existing lines shall not be entered upon or contracted for without the Director General's approval.

Third: No new locomotives or cars shall be ordered or shall be constructed without the Director General's approval.

Fourth: Work contracted for or actually commenced prior to January 1, 1918, and unfinished, may be continued until further order, except insofar as in the judgment of the carrier concerned it may be possible to discontinue or curtail it without substantial loss, in order to conform to the general principles outlined in paragraph "First" hereof.

Fifth: Other work which does not involve charges to capital account in excess of \$25,000 may be contracted for and commenced without approval of the Director General, provided that:

(a) it conforms to the policy outlined in paragraph "First" hereof; that

(b) it also falls clearly within the policy of the particular carrier as that policy has been applied in practice during the two calendar years 1916 and 1917; and that

(c) a report giving a brief description of each project involving not less than \$5,000 nor more than \$25,000 chargeable to capital account and showing also the amount chargeable to operating expenses, shall be made in duplicate to the Director of the Division of Capital Expenditures at Washington and Regional Director for the District within ten days after the work shall be contracted for or commenced.

Sixth: No work involving a charge to capital account in excess of \$25,000 shall be contracted for or commenced subsequent to January 1, 1918, unless

(a) it conforms to the policy outlined in paragraph "First" hereof; and unless

(b) it be authorized by the Director General.

Seventh: The Director of the Division of Capital Expenditures is authorized to prescribe such forms, require such reports and issue such regulations and instructions as may be necessary to carry out this order.

Railway Wage Adjustment Board

A NEW PLAN for the adjustment of controversies between the railroads and the organizations of train service employees, growing out of the interpretation or application of the provisions of wage schedules or agreements, was formulated at a conference between the regional directors for the railroads and the executive officers of the four brotherhoods at Washington on March 22 and has been adopted and put into effect by Order No. 13 issued by Director General McAdoo. The plan provides for the creation of Railway Board of Adjustment No. 1 to deal with relations between the railroads and the brotherhoods. It is understood that announcement is to be made later of a similar board to deal with relations with other classes of employees, and that the entire plan was initiated by W. S. Carter, director of the division of labor of the railroad administration.

The plan is described in the following memorandum:

"Between A. H. Smith, C. H. Markham and R. H. Aiston, regional directors, representing the railroads in their respective regions, and W. S. Stone, grand chief engineer, brotherhood of Locomotive Engineers; A. B. Garretson, president, Order of Railway Conductors; W. G. Lee, President Brotherhood of Railroad Trainmen; and Timothy Shea, acting president, Brotherhood of Locomotive Firemen and Enginemen:

"It is understood that all controversies growing out of the interpretation or application of the provisions of the wage schedule or agreements which are not promptly adjusted by the officials and the employees on any one of the railroads operated by the government, shall be disposed of in the following manner:

"1.—There shall be at once created, a commission to be known as Railway Board of Adjustment No. 1, to consist of eight members; four to be selected by the said Regional Directors and compensated by the railroads, and one each by the chief executive officer of each of the four organizations of employees hereinbefore named, and compensated by such organizations.

"2.—This Board of Adjustment No. 1 shall meet in the city of Washington, within 10 days after the selection of its members, and elect a chairman and vice-chairman, who shall be members of the board. The chairman or vice chairman will preside at meetings of the board, and both will be required to vote upon the adoption of all decisions of the board.

"3.—The board shall meet regularly, at stated times each month, and continue in session until all matters before it are considered.

"4.—Unless otherwise mutually agreed, all meetings of the board shall be held in the City of Washington, provided that the board shall have authority to empower two or more of its members to conduct hearings and pass upon controversies, when properly submitted, at any place designated by the board; provided, further, that such subdivision of the board will not be authorized to make final decision. All decisions shall be made and approved by the entire board, as herein provided.

"5.—Should a vacancy occur in the board for any cause, such vacancies shall be immediately filled by the same appointing authority which made the original selection.

"6.—All authority vested in the Commission of Eight, to adjust disputes arising out of the application of the eight-hour law, is hereby transferred to the Railway Board of Adjustment No. 1, in the same manner as has heretofore been done by the Commission of Eight. All decisions of a general character heretofore made by the Commission of Eight are hereby confirmed, and shall apply to all railroads under governmental operation, unless exempted in said eight-hour law. Decisions which have been rendered by the

Commission of Eight, and which apply to individual railroads, shall remain in effect until superseded by decisions of the Railroad Board of Adjustment No. 1 made in accordance with this understanding.

"7.—The Board of Adjustment No. 1 shall render decisions on all matters in dispute as provided in the preamble herof, and when properly submitted to the board.

"8.—The broad question of wages and hours will be considered by the Railroad Wage Commission, but matters or controversies arising from interpretations of wage agreements, not including matters passed upon by the Railroad Wage Commission, shall be decided by the Railway Board of Adjustment No. 1 when properly presented to the board.

"9.—Wages and hours, when fixed by the Director General, shall be incorporated into existing agreements on the several railroads, and should differences arise between the management and the employees of any of the railroads, as to such incorporation, such questions of difference shall be decided by the Railway Board of Adjustment No. 1, when properly presented, subject, always, to review by the Director General.

"10.—Personal grievances or controversies arising under interpretation of wage agreements, and all other disputes arising between officials of a railroad and its employees, covered by this understanding, will be handled in their usual manner by general committees of the employees, up to and including the chief operating officer of the railroad (or someone officially designated by him) when, if an agreement is not reached, the chairman of the general committee of employees may refer the matter to the chief executive officer of the organization concerned, and if the contention of the employees' committee is approved by such executive officer, then the chief operating officer of the railroad and the chief executive officer of the organization concerned shall refer the matter, with all supporting papers, to the director of the Division of Labor of the United States Railroad Administration, who will, in turn, present the case to the Railway Board of Adjustment No. 1, which board shall promptly hear and decide the case, giving due notice to the chief operating officer of the railroad interested and to the chief executive officer of the organization concerned, of the time set for hearing.

"11.—No matter will be considered by the Railway Board of Adjustment No. 1 unless officially referred to it in the manner herein prescribed.

"12.—In hearings before the Railway Board of Adjustment No. 1, in matters properly submitted for its consideration, the railroad shall be represented by such person or persons as may be designated by the chief operating officer, and the employees shall be represented by such person or persons as may be designated by the chief executive officer of the organization concerned.

"13.—All clerical and office expenses will be paid by the United States Railroad Administration. The railroad directly concerned and the organization involved in a hearing, will respectively assume any expense incurred in presenting a case.

"14.—In each case, an effort should be made to present a joint concrete statement of facts as to any controversies, but the board is fully authorized to require information in addition to the concrete statement of facts, and may call upon the chief operating officer of the railroad or the chief executive officer of the organization concerned, for additional evidence, either oral or written.

"15.—All decisions of the Railway Board of Adjustment No. 1 shall be approved by a majority vote of all members of the board.

"16.—After a matter has been considered by the board, and in the event a majority vote cannot be obtained, then any four members of the board may elect to refer the matter

upon which no decision has been reached to the director general of railroads for a final decision.

"17.—The Railway Board of Adjustment No. 1 shall keep a complete and accurate record of all matters submitted for its consideration, and of all decisions made by the board.

"18.—A report of all cases decided, including the decision, will be filed with the director, Division of Labor of the United States Railroad Administration; with the chief operating officer of the railroad affected; the several regional directors, and with the chief executive officers of the organizations concerned.

"19.—This understanding shall become effective upon its approval by the director general of railroads, and shall remain in full force and effect during the period of the present war, and thereafter, unless a majority of the regional directors, on the one hand, as representing the railroads, or a majority of the chief executive officers of the organizations, on the other hand, as representing the employees, shall desire to terminate the same, which can, in these circumstances, be done on 30 days' formal notice, or shall be terminated by the director general himself, at his discretion, on 30 days' formal notice."

In the order approving the agreement Director General McAdoo says: "In existing circumstances, it is the patriotic duty of both officers and employees of the railroads under federal control, during the present war, promptly and equitably to adjust any controversies which may arise, thereby eliminating misunderstandings which tend to lessen the efficiency of the service."

Pershing Reports Railway Engineers in Battle of Picardy

THE AMERICAN RAILWAY ENGINEERS, true to the record they made last fall at the battle of Cambrai, are again apparently giving a good account of themselves in the present great drive.

General Pershing in his despatch to Washington Monday, said:

"Summary of activities, noon, March 24-25:

"Nothing to report but usual patrol and trench activities, with some gas shelling by the enemy north of Toul.

"Reference to the German communiqués of the 24th and 25th regarding American troops: Two regiments of railway engineers are with the British armies involved in this battle. Three companies of engineers were working in the areas mentioned in the communiqué in the vicinity of the Crozat canal.

"No report other than the German communiqué yet received regarding these troops."

Associated Press despatches also report that the American railway engineers are engaged.

An Associated Press despatch from the American headquarters also dated Monday said: "The fact that the enemy has officially mentioned the presence of Americans on the battlefield of the Somme and has repeatedly reported that some were captured indicates the good account that American engineers gave of themselves when the Germans attacked.

"They probably threw down their picks and shovels, took up guns, and fought as they did at Cambrai. Such Americans as were captured were engineers, who may have fought like infantry, as they have carried rifles as well as tools since Cambrai.

"Official details, telling the part that American engineers have taken in the battle, are eagerly awaited here."

From British Army Headquarters in France the despatch said: "American engineers have again been in the throes of fierce conflict, in which they have done excellent work in transportation."

The Pennsylvania Railroad Accident at Elizabethtown

FURTHER DETAILS of the derailment of westbound passenger train No. 19, on the Pennsylvania Railroad, near Elizabethtown, Pa., on the morning of March 15, when two passengers were killed, increase the wonder that the number of injuries to persons was not larger. This accident, due to the falling of a mass of rock weighing several hundred tons, occurred about 1 a. m., and most of the passengers who were injured are said to have been asleep. Of the total number of injuries, 24, a large majority are said to have been classed as not grave. The conductor of the train, E. E. Edwards, sustained fractures of both legs and also suffered internal injuries.

In one of the day coaches there was a party of soldiers, going to Camp Taylor, Louisville, Ky., who promptly got out their first aid kits and rendered valuable service in attending to injured passengers. The physicians gave the soldiers credit for manifesting remarkable knowledge of first aid treatment.

The scene of the wreck is shown in the large photographic illustration. The smaller picture of the same scene, viewed from a different point, was taken a little earlier.

The sleeping cars which were wrecked were the Limedale, the Collington, and the Irvineton. The car which is completely wrecked at one end, shown in the view where no wheels are visible, is the Collington; and the other two views show the right and the left sides, respectively, of the Limedale.

The train was moving at about 40 or 50 miles an hour. There are at this point only two main tracks. The fall of rock, from the north, struck the side of the Limedale, the third car in the train, overturned it, and pushed it across the south track into the ditch. The next car was partly overturned and the next one, the fifth in the train, ran up on one of the rocks, and, although remaining upright, was inclined about 40 deg. above horizontal.

The fall of rock consisted principally of four large pieces. The heaviest weighed between 150 and 200 tons, and the smaller ones from 15 to 20 tons each. Including smaller pieces, about 600 tons fell altogether, and 400 lb. of dynamite was used in breaking up the large pieces so that they could be removed.

The body of rock which fell did not roll from the top of the cut but became detached from a larger body of stone; the upper part being about 27 ft. above the top of the rail. It fell over toward the track with its base acting as a pivot. The parting of the rock is thought to have been due to the action of the extremely severe frost during the winter, followed by heavy rains a few days before the accident.

An officer of the road writes that this track is patrolled by watchmen day and night, every hour; and the records of the watchman show proper performance on that night. An investigation was made by the coroner, who exonerated the company from blame.

In the first sleeping car, the Limedale, there were 25 persons, all in their berths. The mass struck the car a glancing blow and turned it almost completely upside down. The disaster came with such appalling swiftness and surprise that the passengers were unable to describe the first shock.

The Masonic Home, at Elizabethtown, prepared beds to care for the injured, and sent motorcars to the cut to take them away; but the machines were not able to get near enough, so it was decided to send all of the injured to hospitals in Harrisburg and Lancaster. They were sent in the uninjured cars at the front and the rear of the train, the rear cars east to Lancaster and the front cars west to Harrisburg.

Reprinted from the Railway Age

Meeting of the National Industrial Traffic League

THE NATIONAL INDUSTRIAL TRAFFIC LEAGUE held its spring meeting at the Hotel La Salle, Chicago, on March 21 and 22, with a good attendance. H. C. Barlow, chairman of the executive committee, called attention to the proposed switching and spotting charges recommended at a recent joint meeting of Trunk Line, Central Freight Association and Western Trunk Line representatives, in Chicago. At this meeting it was recommended that in addition to the through rates applying between origin and destination points, the following charges be made for trap car service: (a) For trap cars containing minimum weight of 10,000 lb. the charge will be \$3.50 per car; (b) for trap cars containing less than 10,000 lb. the charge will be \$8.50 per car; (c) for trap cars containing 15,000 lb. or more, consigned to one consignee at one destination, no charge will be made, with the exception that for trap cars containing shipments of light and bulky articles no minimum weight will apply providing the car is loaded to full visible capacity. In order to avoid misuse of equipment carriers prefer not to furnish trap car service for cars containing less than 10,000 lb. and the charge of \$8.50 per car (which equals the charge of \$3.50 per car for trap car service plus a penalty charge of \$5 per day) is recommended to provide a basis for cars containing less than 10,000 lb. which may be delivered to carriers.

A motion was made and passed to the effect that the chair appoint a committee to express the opposition of the League to these proposed spotting and switching charges. Accordingly, the president appointed H. G. Wilson, traffic commissioner of the Toledo (Ohio) Commerce Club, chairman of the committee.

The executive committee announced that it had received a letter from Edward Chambers, traffic director to the director-general of railroads suggesting that shippers may now be expected to show the correct weight on I. C. I. shipments and that on c. l. shipments the weight shown by the originating carrier should govern. On this point the executive committee called attention to the report of the weighing committee and added its endorsement. The recommendation of the weighing committee was as follows:

"The weighing committee believes the present code of weighing rules should be maintained; that the use of weighing agreements should be extended rather than abolished and that Mr. Chambers should be advised, that before any action is taken by the director-general, the weighing committee of the League and the committee on relations of the American Railway Association should be called into conference, at which time those interested might present their views as to the best method of securing correct weights."

The committee on freight claims submitted new forms for the reporting of concealed loss and damage claims, one of which must be executed by the shipper and the other by the consignee. No definite action was taken at the meeting concerning these forms, but each member was requested to send his approval or disapproval of them to the secretary after he has had an opportunity to examine them.

Constructive Placement Under Demurrage Rules

The committee on car demurrage and storage submitted for approval a proposed amendment to Demurrage Rule 5, Section A. At the annual meeting of the League in New York last November, attention was directed to changes in this rule proposed by the American Railway Association to make it conform with the decisions of the United States Supreme Court in the cases of the Menasha Paper Company vs. the Chicago & North Western and the United States vs. the Denver & Rio Grande, 41 I. C. C. 712. These pro-

posed changes proved unsatisfactory to the League and subsequent conferences between representatives of the League and the American Railway Association brought out the suggestion that the following clause be added to the present form of section A: "Under this rule any railroad delay in making deliveries shall not be computed against the consignee." As amended in this manner Section A of Demurrage Rule 5 reads as follows:

"When delivery of a car consigned or ordered to an industrial interchange track or to other than a public delivery track cannot be made on account of the inability of a consignee to receive it or because of any other conditions attributable to the consignee, such car will be held at destination, or if it cannot reasonably be accommodated there, at the nearest available hold point, and written notice that the car is held and that this railroad is unable to deliver, will be sent or given to the consignee. This will be considered constructive placement. Under this rule any railroad delay in making delivery shall not be computed against the consignee."

The bill of lading committee reported that in accordance with the instructions of the League at the November meeting, the committee suggested to the Interstate Commerce Commission that two extra lines be provided in the new bill of lading, one to show the address of the consignee and the other to show the terminal delivery desired. A reply was received from the commission voicing the sentiment that no opposition to this amendment was anticipated on the part of either shippers or carriers and that it would receive due consideration by the commission in disposing of the bill of lading case.

The weighing committee reported that the adoption by the Trunk Lines of the National Code of Weighing Rules had apparently been shelved because of pressing war time duties. The committee called attention to the misinterpretation on the part of some roads of Section A, Rule 9, of the code of weighing rules and suggested the following interpretation to eliminate any chance for a misconstruction.

Rule 9, Section A, of the National Code of Weighing Rules provides: "When weights are obtained for the assessment of freight charges no charge will be made by the carrier for the service."

A car is weighed at point of origin by a switching line to ascertain weights for the assessment of freight charges.

Question: Can the switching line make a charge against the shipper for the weighing service?

Answer: No. Section A, Rule 9, applies regardless of whether the service is performed by a switching line or by a road haul carrier.

Question: Can the switching line make a charge for the service against the road haul carrier?

Answer: This is a matter of allowances and divisions between the railroads and does not come within the purview of the weighing rules.

Tracing Declared More Important than Ever Before

The special committee on tracing reported that there was even more need for tracing under present conditions than ever before. The committee considered the fundamentals of the question only, but recommended that detailed rules be worked out later and that the League should offer to appoint a committee to work with the office of the director general of railroads on this subject. The report read in part as follows:

"Unnecessary tracing is now condemned and discouraged as it has always been by this League. The necessity for tracing cannot now be determined by the length of time which has elapsed from date of shipment, nor by the distance traveled or to be traveled. No tracer shall be started where freight has not had a reasonable time to reach its destination, provided, however, that where the expedition of a particular

shipment is imperative because of its relation to the war, or where the preservation of life or property is involved, tracers shall be started by the railroad immediately upon request. Information as to forwarding, routing, passing records at junction or interchange points, arrival at destination and other information of record shall be promptly given upon specific request of consignor or consignee or their accredited representatives and is not to be construed as tracing.

The committee recommended (a) that whenever the shipper or consignee is willing to assume the telegraph expense the tracer shall be handled by wire and the information furnished promptly; (b) that when the carrier cannot secure and furnish promptly the desired information by mail, the tracing or expediting shall be done by wire at carrier's expense as at present. It was the view of the committee that a large part of the burden of tracing would be removed and the expediting of traffic materially aided if the records of passing at junctions, interchange and terminal points were maintained by the carriers and it recommends that the director general instruct the carriers to establish or reinstate such records.

The Poindexter Bill

The report of the executive committee endorsing the present fourth section of the Interstate Commerce Act and instructing the president of the League to appoint a committee to go to Washington and appear before the committees of Congress against the Poindexter bill was adopted. H. C. Barlow, chairman of the executive committee was appointed chairman of the special committee for this purpose.

Luther M. Walter Speaks at Banquet

Luther M. Walter, formerly attorney of the National Industrial Traffic League and now assistant to C. A. Prouty, director of public service and accounting of the United States Railroad Administration, addressed the League at dinner on the evening of March 21. He stated that the administration would make no changes merely for the sake of change, but would operate the railroads as economically as possible, with the prime purpose of winning the war. Rate relations, he said, would not be upset until shippers interested had opportunity to be heard. He said the same was true concerning the matter of uniform classification. He stated that railroad traffic men had become unduly alarmed by the turn of events and that although the duties of soliciting and advertising men might be seriously modified no one would be thrown out of employment. It was his understanding that the present routine methods of making and changing rates would be followed absolutely, except on such occasions as the President might wish to establish what might be called large percentage increases.

AUSTRIAN RAILWAYMEN STRIKE.—Austrian workers on the Northwestern Railway, the Ferdinand-Northern and several other lines have struck, according to the Lokal Anzeiger of Berlin. The military ordered the strikers to return to work, but they refused.

ITALY'S COAL FAMINE ACUTE.—Press despatches from Rome report that during interrogations in the Chamber of Deputies on February 21 regarding the question of coal, lack of which is crippling Italy's transportation facilities, it was shown that no importations of American coal were expected in view of the arrangement made with the English Government, that only one-third the necessary coal was arriving in Italy, and that locomotives were being ruined by burning clinker coal and lignite. Unless America acts to relieve the situation it will eventually be impossible to distribute food supplies throughout Italy or work mines properly. War industries face a shortage of coal. The present situation requires action and not discussion.

800 Miles of Railway at Front in 1918

“WE ARE BUILDING over here to fight a thirty-year war, if necessary, in order to establish the principles of democracy.” This is the answer of America's director general of transportation, W. W. Atterbury, vice president of the Pennsylvania Railroad, at the time when Germany is hammering on the Western gates, as given in an interview cabled by Wilkes Forrest to the New York Tribune Tuesday.

America's vast project to feed and equip her army in France rests on the shoulders of this American civilian. Next to the man whose responsibility is ships and then more ships, his is the responsibility of railroads in France and then more railroads in France.

Sitting in his map-walled office in a Paris boulevard today, this American civilian, garbed in the uniform of an American brigadier-general, talked to the Tribune correspondent while shells were falling in the capital. The dull booms hardly interrupted the conversation.

Like Working at Home

“We are building railroads, docks and transportation yards in France today as we would build them at home,” he said. “Our task is to make two lines of railroads from the sea bases to the front, wherever this front may be. We must Americanize the spurs, sidings, branch lines and yards, and it is most important that we do not interfere with the belts of French railroads which cross our path. We are digging under or going over these roads whenever we encounter them.

“The French lines have their own problems. The diversion of traffic due to the war has placed a heavy burden on the French ports, shipping and railway facilities. It is America's policy not to interfere. The French Government deserves the highest praise for its administration of the railroads under war conditions and the constantly depreciating equipment.

“France is giving us every possible assistance, but her great network of strategic railroads, planned and built for the protection of her frontiers, necessarily falls short of the heavy requirements of the constantly growing American army. America, therefore, must build, and is building, all the excess lines necessary to handle our problem.

“Before the end of 1918 we will have not less than 800 miles of railroad constructed. All of our labor, rails and equipment must be shipped from home. We are now getting some of our ties from American forestry regiments working in French forests.

“You have seen many locomotives already here labelled ‘U. S. A.’ We will use about 1,500 locomotives, and of these 200 have arrived, and have been assembled, and 400 more have been generously contributed by the Belgian government. We will use about 20,000 American box cars, now under orders and being constructed. These will be shipped to France and rebuilt.

Yards Cover Miles

“Several of our great transportation yards cover many square miles and thousands of acres of storage space are being rapidly provided in order to act as a reserve for the enormous army which we will have at the front.”

Railroad building thousands of miles from America is an enormous task. It surpasses even the difficulties of the Hills, the Harbors and the O'Shaughnessys of North America. They faced the North American wilderness. America's military railway builder faces the wilderness of sea water, weather and submarines. He faces other things which cannot be told just now. But American military railroads are almost as vitally important to the American soldiers as ships are. They are gradually linking the sea to the firing line.

As the army grows, so must the railroads on which the army depends for the never-ending stream of everything that

keeps a fighting army fighting. These railroads, with their energetic American civilian builders, depend entirely on ships.

"Everything vital to America's success in this war reverts to ships. As the army will depend on the railroads, both the army and railroads depend on ships."

He added:

"Did any one ever stop to think that in order to supply one pair of shoes to a soldier at the front, there must be not less than twenty-four pairs in various stages; from manufacturer to storage on the American side, from storage to docks, from docks to ships, then the 3,000-mile ocean transportation with sea and submarine menace, from ships to docks here, from docks to storage, and then the gradual movement through the supply depots, and finally to the soldier?"

Difficulties Faced

"When you realize that this situation applies to everything that the soldier eats and wears, and to all military supplies,

it must be recognized why these railroads and storehouses are necessary.

"Our difficulties are great in order to avoid tearing down parts of French towns for the enlargement of our railroad yards. We sometimes are forced to go outside of town and rebuild a complete new yard. Sometimes it is necessary to mar the landscape and the ancient landmarks which have made France famous.

"In one case we were forced to destroy an ancient chateau and fill the beautiful grounds with tracks and storehouses. The owners remonstrated, but it was 'c'est la guerre.'"

"Is America's vast project in France of a flimsy, temporary character?" I asked the general.

"No," he answered, as a German shell broke not far away. "We are building over here to fight a thirty-year war if necessary, to establish the principles of democracy."

But, like the man at the front, his success depends on ships.

Universal Interline Freight Waybill Adopted

To Be Used With or Without Through Rates. Last Road to Be the Final Arbiter of Rates and Divisions

THE UNIVERSAL INTERLINE WAYBILL, prescribed by Director General W. G. McAadoo and noticed in the *Railway Age* last week, page 728, is shown on the opposite page. The director general's order, No. 11, dated March 10, is addressed to the "chief executive officer" of each road and is as follows:

1. Effective May 1, 1918, all freight forwarded from one point in the United States to another point in the United States (including freight passing through Canada or Mexico enroute), and moving over two or more railroads or boat lines under federal control, must be waybilled through from point of origin to destination, regardless of the absence of joint rates. When destination station is on a railroad not under federal control, freight should be waybilled to the junction point with such road; provided, however, that nothing in this paragraph shall prohibit through waybilling arrangements between carriers now under federal control and others not so controlled.

2. A separate waybill must be made for each less carload consignment and for each carload; provided, however, that a single waybill may be made to cover a special train moving at a lump sum charge for the train, or for shipments which, on account of their length, require more than one car.

3. Waybills for carload freight must move with the cars. Waybills for less carload freight must be moved with the cars when practicable; otherwise so as to reach the transfer point or destination station with or in advance of the cars. In the event that waybills for solid cars of less carload freight are mailed direct to destination or transfer stations, a separate waybill [to go with the car] must be made on standard form, showing destination of car, and bearing notation:

"Merchandise car, waybills mailed to _____" Junction agents must show stamps on this waybill in the same manner as provided in Paragraph 4.

4. Complete routing must be specified on each waybill as and when made, in the space provided therefor. Each forwarding junction agent must stamp each waybill in the space at the bottom of the waybill. . . . Stamp must be 1 1/2 in. by 3/4 in.

5. When freight moves on a joint through rate, each waybill must show freight charges from point of origin to destination.

6. Freight moving on a combination of rates: (a) If the billing agent is in possession of all necessary tariffs, the rate and freight charges to and beyond the rate breaking points must be shown successively, one beneath the other, and the total of all freight charges indicated. For example, a shipment from New York to Denver will show:

| | Weight | Rate | Freight |
|----------------------------|--------|---------|---------|
| To Miss. River..... | 200 | \$1.055 | \$2.11 |
| Miss. River to Denver..... | 1.62 | | 3.24 |
| Total | | | \$5.35 |

(b) If the billing agent is not in possession of the rates beyond the rate breaking point, the waybill must be headed to destination, and the rate and freight charges shown to the via which the shipment moved, in the following manner: rate breaking point, with the movement beyond indicated. For example:

| | Weight | Rate | Freight |
|----------------------------|--------|---------|---------|
| To Miss. River..... | 200 | \$1.055 | \$2.11 |
| Miss. River to Denver..... | | | |

In this case the billing agent will stamp or endorse waybill as follows: "Shipment not rated through. Junction or destination agent will insert charges omitted." (c) The junction receiving agent must revise rates on inbound billing to the rate breaking point, insert the divisions of revenue accruing to the roads up to the rate breaking point, and certify to their correctness, by use of an appropriate rubber stamp. (d) Agents forwarding shipments from rate breaking points must insert rates and freight charges applicable to destination or to the next rate breaking point. If in any case this plan is not practicable arrangements may be made to have such rates and charges inserted by destination agents.

7. When miscellaneous charges, of any character, accrue in transit, and they are to be collected from consignee, they should be shown as separate items in the freight charges column on waybills, with notation opposite each item indicating the nature of the charge, the point at which it accrued, and the road to which due. In final settlement, such charges will be allowed as an arbitrary to carrier to which they are due.

8. A standard form of waybill [8 1/2 in. x 11 in.] is hereby prescribed, and must be used on and after May 1, 1918. (a) This waybill blank must be printed on paper equal in weight to "80 pound No. 1 Manila, 24 x 36 in."

(b) Only the original and one copy of waybill shall be made. The original must accompany the shipment as herein provided and the copy must be retained by the company making the waybill. (c) This waybill shall also be used for astray freight. (d) This waybill is designed to be folded vertically, the left side contains all information for the physical movement of the car. (e) For special classes of traffic, requiring a larger waybill, the form may be 8½ in. by 22 in. (f) Supplies of waybill forms now on hand may be used for local business.

9. The Plan of Audit Office Settlement recommended

will be made, except as to advance and prepaid, and to establish lists of unreported waybills.

11. The following forms must be used in preparing Audit Office Settlement accounts: (a) Interline abstract, Form A. A. R. A. O. 104. (b) Division sheet, Form A. A. R. A. O. 105. (c) Summary of interline accounts, Form A. A. R. A. O. 110. These forms are recommended by the Association of American Railway Accounting Officers, and samples are shown in that Association's 1917 Synopsis.

12. Unless and until otherwise ordered revenues shall be apportioned among carriers in accordance with the route via which the shipment moved, in the following manner:

(a) Where joint through rates are in effect, established divisions, or any simplifications thereof which may have been perfected, shall be used. (b) Combination rates shall be divided as made. If one or more of the factors in the combination are joint through rates, such factors shall be divided as provided in sub-paragraph a preceding. (c) When neither of the above division bases can be used, revenues shall be divided on twenty mile block mileage basis, each carrier to be allowed at least twenty miles and originating and terminal carriers an additional twenty miles each as constructive mileage.

13. Simplified bases for apportioning inter-road freight revenues are now being considered upon their determination carriers will be advised thereof in a subsequent order.

14. Immediate steps shall be taken to make the foregoing regulations effective as of May 1, 1918, and to procure supplies of the prescribed waybill and accounting forms, and to issue the necessary instructions to all concerned.

BRITISH CAR REPAIR COMPANY'S AMALGAMATION—The annual report of the British Wagon Company said that for some time past the directors have experienced inconvenience in the freight car repairing branch of the business. A large number of the employees are now engaged on military service, thereby causing a serious shortage of labor of all kinds, and there is great difficulty in obtaining the necessary materials. Owing to these factors considerable losses have occurred

in the repair of freight cars, and serious consideration has been taken place in traffic. The Railway Executive Committee appealed to the car repairing companies to take steps to deal with the difficult position. Recognizing the necessity for immediate action, some of the directors have conferred with directors of the other principal car repairing companies, and it has been decided to form a new company, which will take over the freight car repairing business.

United States Standard Interline Way-Bill

Revised _____

by the Association of American Railway Accounting Officers, as outlined in that Association's 1917 Synopsis—Paragraphs 16, 17, 18, 28, 29 and 30 shall govern. This plan requires that destination carriers shall make settlement with each of the carriers in interest for its proportion of revenue.

10. The total freight charges, as reported by destination carrier, and the divisions thereof, must be accepted by all interested carriers as final. No recheck of such settlement

The Coal Problem*

By E. G. Bailey

THE LARGEST AND MOST IMPORTANT QUESTION before the American people today is the coal problem. Some may disagree and claim that it is transportation but sift the present situation to the bottom and you will find that the coal problem, or rather the abnormally high percentage of ash and impurities in the coal, is like sand in the bearings of transportation, of ocean shipping and of practically all industries, slowing them down at the most critical time in our history.

The less ash and impurities in coal, the less number of tons you need. The greater the demand for coal, the higher the price and, under present conditions, the poorer its quality. Price has been regulated; but quality has run riot.

Why have we allowed this to happen just at the time when we need heat units in their most concentrated form? Why are the railroads burdened today with hauling millions of tons of utterly worthless dirt? To say that this excess of ash in the coal is worthless, does not describe the situation. The price paid for this dirt is only a small fraction of the damage. The rest of its cost is in the decreased efficiency, the lowered capacity, the increased labor and the excessive repair bills involved in the combustion of this coal, and in the necessity of closing down industries because of the lack of the coal which might have been shipped in place of these so-called "worthless," but costly impurities.

Coal Shortage or Dirt?

Results show a 10 per cent decrease in quality of coal delivered to many plants during the past year. Considering that the navy and other government requirements receive a greatly increased tonnage of the best coal, a very conservative estimate of 5 per cent is made as representing the increased demand for coal due solely to the poorer quality of that received. With a total production of about 600,000,000 tons of coal in 1917 this means that 30,000,000 tons of utterly worthless slate and dirt were loaded into cars and delivered to the consumer, where it caused additional trouble in burning the coal with which it was mixed.

Cost of Dirty Coal

On the basis of the average price of coal delivered to the consumer being \$4 per ton, this excessive amount of impurities has cost the country \$120,000,000 during the past year. Adding to this the various estimates made of the cost of our heatless holidays, ranging from \$1,000,000,000 on up, it is obvious that this question of impurities in coal is of such tremendous importance that an effective remedy must be found immediately. Manufacturers would be glad to pay a dollar per ton more for coal of standard quality.

Competition normally compels the mine operator to clean his coal, but when the coal shortage began in 1916 manufacturers were so anxious to get coal that they offered and gladly paid prices of \$5 to \$6 per ton at the mines and took anything that was black. For this reason quality went from bad to worse. A similar condition existed in the bituminous coal industry during the anthracite strike of 1902 and 1903. Prices went sky high and quality dropped off decidedly. The same economic factors which caused this condition then prevail today. Under the present system of paying the operator prices fixed by the government, no distinction whatever is made between the best and poorest grades of coal. So why should one operator go to additional expense of shipping clean coal when he receives no more pay than his competitor who loads dirt?

To simply appeal to the miners and operators, even on the grounds of patriotism, is not sufficient. To increase the

government price on the present basis of control to \$5 per ton at the mines would not reduce the percentage of impurities in the coal one iota.

The remedy suggested is to establish standards of quality and pay a premium for clean coal. The price paid to the operator should be based on standards established by the Fuel Administration according to different mining districts, etc., with premiums based almost entirely upon percentage of ash, and especially the free ash, as slate and rock which can and should be eliminated at the mines.

Coal sampling stations should be established by the government at certain central points where large quantities of coal are received direct from mines such as New York, Philadelphia, Baltimore, Hampton Roads and the lake loading ports. Each station should be equipped with machinery for obtaining representative samples from as many individual cars as necessary to determine the average quality of coal shipped from each mine during each month.

Load Cars with the Cleanest Coal

The operator would not know what cars were to be sampled, for the Fuel Administration could consign or reassign any cars in transit to the coal piers or power houses where the sampling stations were located. The mine operator would therefore have a real incentive to load every car with as clean coal as possible.

The car distribution at the mines, which is an important point to the operator, should also be based upon the quality of coal produced so that there would be an added incentive to load clean coal, and the market would always be supplied with a greater proportion of the better quality of coal, than if the empty cars were pro-rated equally among the poorer and better mines as at present.

Actual knowledge of the quality of coal would also be of great benefit to the Fuel Administration in classifying various mines into pools so that the consumer, and particularly the railroads, would receive coal of uniform quality, thereby enabling them to obtain maximum capacity and efficiency in the combustion of this coal.

There is sufficient labor at the mines to clean the coal, and the railroads can haul enough good coal, but they can not get the necessary heat units to the consumer if they must be burdened with hauling 30,000,000 tons of unnecessary dirt. We have our choice of either building thousands of locomotives and a hundred thousand cars and adding to the terminal facilities of our railroads within the next few months or removing the excessive impurities from the coal. The latter can be done quickly and effectively. It is the only feasible remedy for our present "Coal Problem."

Clean Coal or Heatless Holidays Next Winter?

Are we going to have coal enough to see us through the coming winter? The present indications are that, unless some radical steps are taken immediately, the coal shortage will be much worse than it has been. To be satisfied with preferential shipments and permit many of our basic industries to close down, is to play the quitter's game, when, by concentrating our efforts on loading clean coal at the mines, and improving the efficiency of its combustion in furnaces we can have ample coal for all, thereby helping instead of hindering the Thrift Campaign.

We have heard the argument that we should be patriotic and be content with inferior coal, old culm banks and other refuse fuel the same as we are with wheat substitutes in our bread. But the food and fuel problems are very different. Economy in their use applies equally to both, but the neck of the bottle of the food question is production, while the weakest link of the coal problem is transportation. It is a crime to burden our railroads with hauling dirt when it is within our power to ship clean coal and supply heat units in their most concentrated form.

China's Greatest Need Today Is Transportation

This Enormous and Rich Country Has Only 6,000 Miles of Railway and Practically No Good Roads

CHINA NEEDS MANY THINGS TODAY, but one of the things that it needs most is means of communication. Today there are in China with its enormous area of 1,335,000 square miles and 386,000,000 population, only about 6,000 miles of railroad—3 miles to each 100 square miles and 0.19 miles to each 10,000 people. In a recent series of three articles in *Engineering* of London, a writer examining this situation clearly brings out these facts and

per ton mile would be greater than either on roads or standard gage railways, their capacity would not be sufficient and there would also be comparatively costly transshipment required. But further than that he draws attention to the fact that practically all the railways at present in China are of standard gage and emphasized that narrow gage lines would not be proper for a country so enormously rich and of such great potential traffic as China.

An abstract of the three articles follows:

The war in Europe has undoubtedly set back the development of China for many years unless the government can gain the confidence of the people and foster some spirit of patriotism. China at the outbreak of the war was committed to the construction of some 6,300 miles of railway, practically all of which was to be built by foreign loans. Had this scheme been carried out, the very slow development of the country would have made great strides. As it is, the country is nearly bankrupt, the government insecure and without the confidence of the country. The people as a consequence are very chary of investing in government controlled concerns. It is fairly obvious that China must still look for money abroad, and there is very little doubt that it will be more costly than heretofore. Consequently, the study of economy will be more of a necessity than it has been in the past.

The Great Plain

It will be seen from the above table that the bulk of the population is concentrated in the following provinces: Anhwei, Honan, Hupeh, Chih, Shantung, Kiangsu and Northern Chekiang. These provinces form what is known as the Great Plain of China.

Roughly, the area of this plain is 140,000 sq. miles, with a population of 132,000,000, or 625 persons to the square mile, the densest in the world. In fact, the nine eastern provinces in or near the Great Plain have an area of 502,192 square miles (two-fifths of the whole 18 provinces) and an average population of 458 persons to the square mile.

The necessity of railways for the development of this area

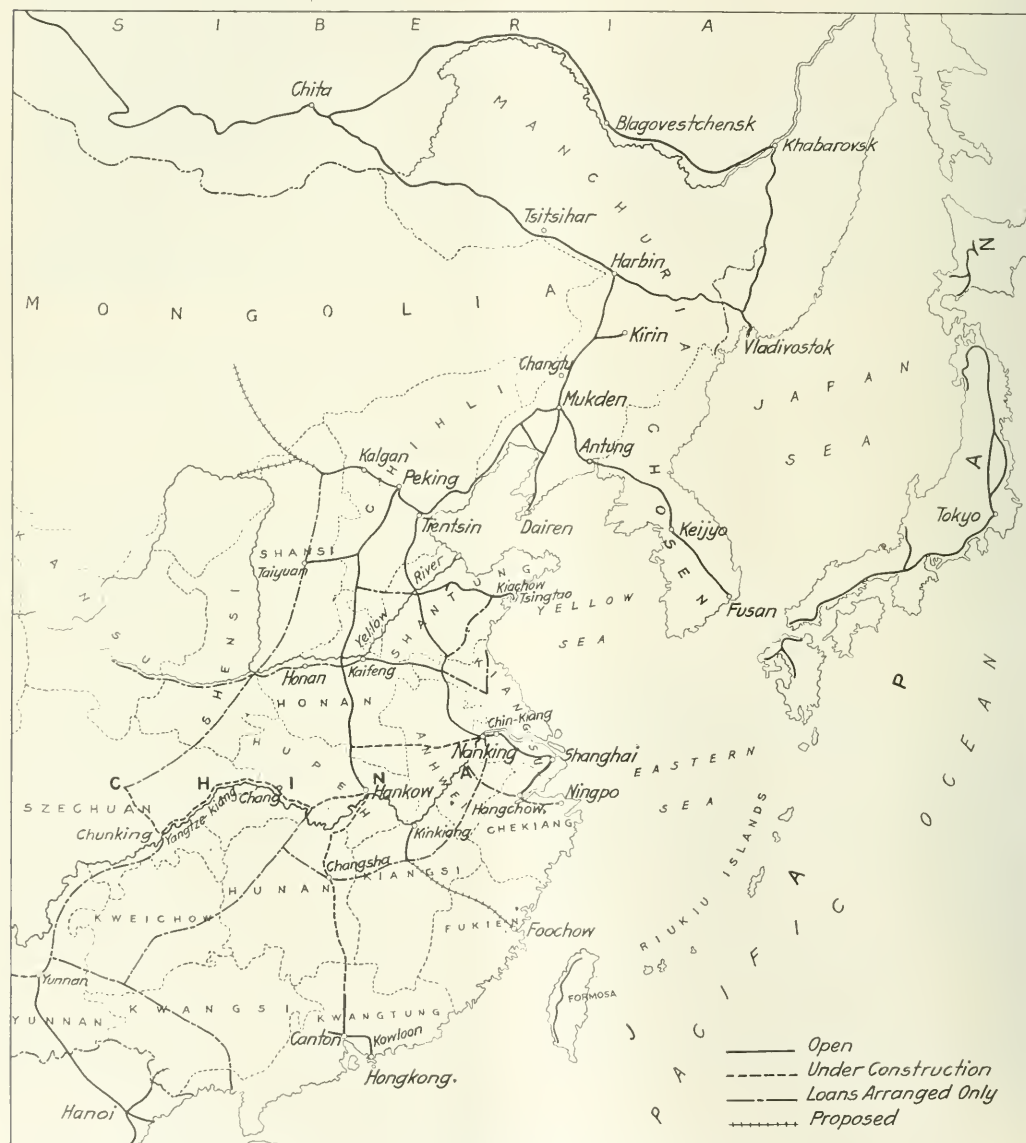

Type of Wheelbarrow in Common Use

emphasizes the necessity of constructing new lines of standard gage railway and of feeder lines of good roads for use by steam or motor tractors or motor trucks. He also discusses the proposal to build light 2 ft. narrow gage lines as feeders in place of roads, but dismisses the idea as extremely unwise. There would be small savings in the first cost of light railway construction, he says, but operating costs

is extremely obvious when its mineral wealth, cheap labor and present lack of transport facilities are considered. Practically the whole of the western portion of this plain is one vast coalfield, with smaller coalfields in central Shantung and northern Chili. Other minerals, ironstone in particu-

also responsible for a large proportion of the coal production of China. It is served by the Peking-Hankow, Peking-Mukden, and Peking-Kalgan railways, the Peking-Mukden Railway providing its outlet to the sea via Tientsin and the Peiho. This river, the only one of importance, is navigable

The Railways of China

lar, are also present in large quantity on the eastern boundary. The mineral and other resources, agricultural and transport, are as follows:

Chili, the metropolitan province, has an area of 58,949 sq. miles. It produces wheat, maize, oats and salt, and is

for steamers drawing 15 ft. of water as far as Tientsin, 40 miles from its mouth. This port is kept ice-free in mild winters at considerable expense, but is always liable to be closed from December to March on account of ice. The Peiho is tortuous, has a bar at its mouth, and is continually

silting up). Most of the coal produced is shipped through the ice-free port of Chingwangtao, the property of the Chinese Engineering & Mining Company, whose accommodation for shipping has been designed with a view to its own requirements only.

The estimated populations of the 18 provinces of China proper, together with their areas, are given in the accompanying tables.

Shantung

Shantung has an area of 65,104 sq. miles. It is extremely fertile. Cotton, the clothing of the people, silk, straw-braid,

very poor. The province is traversed by the Grand canal, which runs from Tientsin to Hangchow, but this in some places has been allowed to silt up and is generally in poor condition, and of little use as a waterway. The Yellow river, the only one of importance, is only navigable in parts, for small steamers as far as Tsinanfu, the provincial capital, 200 miles from the mouth of the river. This river owing to its tendency to silt up and burst its banks is of more ex-

| | 1,335,841 | 386,000,000 | 292 |

A Scene Outside the Peking Wall

glass, earthenware and bean oil, are some of its products. It has considerable mineral wealth, producing a fair quantity of coal, some gold and copper.

This province prior to the war was the German sphere

pense than utility, costing the government about 750,000l. (\$3,750,000) per annum for conservancy. A railway along its banks for efficient handling administration of the conservancy works would appear to be one of China's most urgent needs. All railways and mines in the province are now worked by the Japanese.

Honan

Honan has an area of 66,913 sq. miles and is extremely fertile. Its principal agricultural product is beans, and a large amount of coal is produced. It is served by the Peking-Hankow Railway, which provides its outlet to the sea via Hankow and the Yangtse river. It has also another outlet to the same river via the Huai river and the Tientsin-Pukow

A Heavy Load for Poor Pavements

of influence and has been exploited with the usual thoroughness. It is served by the trunk line from Tientsin to Pukow, and has rail connection with the excellent once German port of Tsingtau. All the railways were either German owned or under German control. Internal water communication is

Railway, but this route, which would serve much of Central Honan and Northern Anhwei, is at present undeveloped, only junks of 80 tons maximum carrying capacity at present using this river.

Anhui has an area of 48,461 sq. miles, and is said to

be the poorest province in China. It has never got over the devastating effect of the Taiping rebellion of 1866, and is in more of an arrested state of development than the other provinces of the plain. It produces tea, hides, rice and silk, and has deposits of coal and copper which have not been developed. The province is served by one line of railway, the Southern Section of the Tientsin-Pukow Railway, which is a British-built line. Water communication is poor, the only navigable rivers being the Yangtse and the Huai, the latter providing the only outlet to the sea for the northern part of the province via the above railway. This last river,

of canals, of which there are some 50,000 miles. In addition, they are traversed north and south by the Grand canal, and east and west by the Yangtse river, so that there is no very crying need for railways in this section of the country.

Hupei

Hupei has an area of 70,450 sq. miles, and produces tea, hides, iron and coal. It is served by the Peking-Hankow Railway, which provides its outlet to the sea via the port of Hankow and the Yangtse. Water communication is indifferent, the only navigable rivers being the Yangtse forming the southern boundary of the province and the Han

and lack of maintenance on the Grand canal, have been responsible for a series of most disastrous floods and their attendant famines. To properly conserve this river is one of the most urgent needs of the province, both for the above reason and because the usefulness of the river below its junction with the railway is very limited at present, as it loses itself in the very extensive but extremely shallow Hungtse lake.

Kiangsu and Chekiang

Kiangsu and Chekiang have an area of 45,000 sq. miles and 39,150 sq. miles respectively, and they produce beans,

The Chinese Equivalent of the American Live Poultry Car

silk, tea and salt, among other things agricultural. Mineraally these provinces are of small value. There are practically no railways within this area except the Shanghai-Nanking Railway in Northern Chekiang, whose usefulness is very limited, as it can never compete with a magnificent waterway like the Yangtse, with which it runs practically parallel. At present this line is merely a link in the trunk system and can only prosper when feeder lines are built. These provinces have, however, a most wonderful system

A Chinese Cart Whose Destructive Effect on Roads Can Be Readily Appreciated

river, a tributary, flowing in a northerly direction from Hankow. This province is in the center of the modern iron industry of China and should, if properly developed, be of huge importance in the opening-up of the country.

Resources Enormous—Communications Poor

From the above very summary details it is obvious that the resources of this area are enormous, and that communications are extremely poor. The provinces are like watertight compartments as far as communications are concerned. At present there may be famine in one and excess in another, and no attempt is made to manufacture for more than local needs.

The railway situation in China can be summarized thus. With some 6,000 miles of railway in operation China proper has 0.3 miles of railway to each 100 sq. miles and 0.19 miles for each 10,000 people. For comparative purposes the United States has 253,000 miles of railway and one mile to each 360 people, Australia has one mile of railways for each 250 people, and the United Kingdom one mile to each 11 sq. miles. If the length of railway is summarized for the areas under consideration it will be found to amount to 2,679 miles, or one mile for each 127 sq. miles of country.

Water transport within this area is practically confined to the Yangtse river, which forms the southern boundary of the plain. This river, as far as Hankow, 600 miles from the mouth, is navigable for ocean-going steamers. The great drawback to the river is the enormous variation in the summer and winter levels, amounting to as much as 40 ft. at Hankow, and rendering navigation above this place difficult at low water. Above Hankow, in addition to the lack of water between Hankow and Ichang, there is also this difficulty coupled with the existence of rapids. However, small river steamers run between Hankow and Ichang all the year and between Ichang and Chungking when water permits; usually the river is closed from December to April. Ichang is 970 miles from the mouth of the river and Chungking about 1,400 miles.

This handicap makes a railway connecting Hankow and Chengtu, the capital of the enormously populous and rich province of Szechuan, one of the most urgent needs of the country. Another railway of some urgency is a line through the province of Shansi and Shensi to the capital of the isolated province of Kansu. All these provinces are said to be very rich mineraly, but owing to lack of transport have no chance of development.

South of the Yangtse the country, with the exception of the province of Fukien, is less populous and much more mountainous. Railway construction would therefore be more expensive, and is less needed, as the bulk of the wealth and population is concentrated either on the southern side of the Yangtse valley or on the seaboard where there is water communication. China should, therefore, concentrate on the Great Plain, the development of which will entail least investment of much-needed capital and offers more certain returns than elsewhere.

Road Transportation

One form of transport has been altogether neglected in the above summary, namely, road transport, which is of very little value owing to the neglected state of the roads. There are said to be 2,000 imperial roads in China, but

And Then the Modern Automobile

with the exception of the courier roads these highways are mere tracks or footpaths. The chief roads radiate from Peking, connecting that place with the various provincial capitals. In some places these roads are paved with stone blocks of large size, and the ruins of signal towers and military posts at fixed intervals show that one time some importance was attached to them.

The upkeep of the roads is at the present time in the hands of local officials, each village taking responsibility for its own roads. Only what are considered, according to local ideas, necessary repairs, are undertaken, with the consequence that no real road maintenance has been done for some centuries. The roads as built are unmetalled, and the bridging scanty, so scanty in fact that the majority of bridges have only been designed to take the dry-weather flow, with the consequence that for most of the year the approaches are flooded. In addition, where country of any difficulty has been encountered, the road has degenerated into a mere footpath capable of taking only wheelbarrow, coolie or mule traffic, so that all car-borne goods have to be transhipped.

On all these so-called roads in the plain goods are circulated by mule, wheelbarrow or carts, but transport is rendered difficult and often impossible by the state of the roads, which are purely of the dry-weather order. Mule, donkey and wheelbarrow transport are universal all over China, but

the cart is only met with north of the Yangtse, with the consequence that the roads in South China have degenerated into tracks of footpath width. Into the cart usually seen in North China the farmer will put a load of 1 ton to 1.5 tons, or rather more than is put into the English cart, which has a tire width of 5 in. against 2 in. in the Chinese cart. That roads in a country with 30 in. or more of rain per annum become impassable in the wet season is not to be wondered at, when their unmetalled state, their poor drainage and the traffic they carry are considered. North China has the great advantage of so severe a winter that even these roads would take the heaviest traffic, but this only holds from December to March, for the rest of the year the roads are as much dependent on weather for their usefulness as the rest of the country.

In the southern part of the Great Plain the cart is used; it is pulled by a trace, and carries the same loads as the northern cart, but has even narrower tires in a district with about twice the rainfall of the north. The wheelbarrow is even more destructive of roads, as it is, as often as not, unevenly loaded, causing the wheel to tilt and thus present less than the normal tire surface. The tire width is usually about 1 1/4 in., and the barrow often carries as much as 800 lb. The wheelbarrow is as much used for passenger traffic as for anything else; it will seat four people the charge being about 4 cents a mile. The wages of a wheelbarrow coolie vary from about 12 cents a day in North China to 16 cents in the Yangtse valley.

Such ill-designed transport and abominable roads make the stagnation, ignorance and misery which exist within 30 miles of any railway or treaty port easily understandable. The civilizing influence of railways in this country needs little illustration, but it may be stated as an instance, that previous to the building of the Southern Section of the Tientsin-Pukow Railway, there were in existence three entirely different systems of coinage in a length of about 150 miles. The units of length and capacity varied from village to village, and most men believed their market town to be the biggest city in the world. This is typical of conditions in the closed portions of the country. It should also be stated that the roads all over the country are infested by bandits.

Finally, that this, the richest part of China, has repeatedly suffered from famine, is another proof of the wretchedness of communications. Thus, in 1877-8, a famine in Honan, Shansi, Shantung and Chili is estimated to have wiped out 8,000,000 people. Also in 1910-11, famine and floods in Northern Anhwei and Kiangsu were responsible for thousands of deaths. With regard to the cost of the various modes of transport, this necessarily varies somewhat in a country where labor increases in cost from north to south, wages in the Yangtse valley being about 50 per cent and in Canton 100 per cent higher than North China. The following are fair averages:

| Type | Cost per ton-mile | Remarks |
|-------------|---|--|
| Cart | 4 cents to 8 cents per ton-mile | M. A. 1.5 tons, 15 ft. 15 in. tire, 5 in. wide |
| Water | 2 to 4 cents per ton-mile | See below for details |
| Wheelbarrow | 4 cents to 1 cent, 10 ft. 10 in. tire, 5 in. wide | M. A. 1.5 tons, 15 ft. 15 in. tire, 5 in. wide |
| Mule | 6 cents to 1 cent, 10 ft. 10 in. tire, 5 in. wide | M. A. 1.5 tons, 15 ft. 15 in. tire, 5 in. wide |
| Railway | 4 cents to 1 cent, 10 ft. 10 in. tire, 5 in. wide | M. A. 1.5 tons, 15 ft. 15 in. tire, 5 in. wide |

It is of some interest to compare the cost of water and rail carriage in European countries:

| Country | Water carriage per ton-mile | Rail carriage per ton-mile |
|---------|--------------------------------|-------------------------------|
| Russia | 18 to 84 (A. I. G.) | 18 to 84 |
| Germany | 1 cent to 2.53 | 1 cent to 2.53 |
| Austria | 74 cents (Danube) | 74 cents |
| France | 22 to 1.56 cents | 22 to 1.56 cents |
| Belgium | 16 to 1.56 cents | 16 to 1.56 cents |

Considering that the price paid for labor generally is

about one-tenth that paid in Europe, transport in China is expensive, uncertain and under present conditions incapable of handling any large volume of traffic except on the railways, which are too few.

China Needs Roads and Railways

What China needs most are roads and additional standard gage railway lines, the roads to act as feeders to the railways and to enable these railways to be operated nearer to capacity. Narrow gage railroads have been proposed, but their savings over roads or standard gage lines are not sufficient to justify their use.

Turning now to the question of economy the most obvious one is for the country to build the railways with the revenue of the existing lines or to induce the people themselves to invest in railways under government control and guarantee. Foreign loans increase the cost of Chinese railways owing to commission and other charges, by \$5,000 to \$4,000 per mile, according to the cost of the line. It is believed that this, the greatest economy, might be to a large extent effected by the reorganization of the road system.

These roads might serve as feeders to the existing railways, and would be infinitely cheaper both in first cost and operation than branch lines. The financial position of the government railways shows that the majority of the lines are not worked to their full capacity. Thus, in 1915, of the 15 government railways, only five were run at a profit, the net profit on all the railways amounting to about \$4,000,000, practically all of which is derived from the Peking-Mukden, Peking-Kalgan and Peking-Hankow railways. Even on these lines receipts have apparently reached a maximum. Not one of the railways, even the paying lines, has reached the maximum capacity for single-line traffic. It is then obvious that an enormous source of revenue lies in the development of the existing railways. Thus, if the present mileage of government railways would produce a net revenue of \$3,000 per mile, the annual revenue from this source would amount to \$11,040,000 sufficient to build 300 miles of new line per year. It should be stated that the net revenue per mile on the Peking-Mukden Railway amounts to \$6,350 at present. This line does not traverse the richest part of the country by any means, so that a net revenue of \$3,000 per mile can not be called an extravagant expectation.

Undoubtedly this development would be carried out most cheaply by road development, and in doing this China would only be following the example of European nations in the development of their overseas possessions. In every case road construction has gone hand in hand with the construction of railways, roads being built to tap those districts not sufficiently prosperous to be able to afford a railway. China can build first-class roads in this part of the country (the Great Plain) at a maximum cost of \$5,750 per mile, proximity to quarries would reduce this to \$4,500 per mile, and in districts where both government land and stone were available the cost might be still further reduced to \$3,600. On this basis 800 miles of good roads could be built every year if only the present income from the railways were allocated to this purpose. Convict labor would still further reduce the cost if properly handled.

Roads should undoubtedly be built as pioneers of railways in the hill country south of the Yangtse. In this way the undoubtedly great mineral wealth of the province of Yunnan might be most cheaply developed; at present this province is dependent on mule and coolie transport over the most appalling roads for those districts off the metre-gage line, traffic on which is regularly interrupted in the wet season for weeks at a time.

With good roads and motor truck transportation encouraged by the government, it is estimated that freight could be carried at a cost of something like 6 mills per ton mile.

Wages 22 to 30 Cents a Day

Should the government adopt this road policy, it will, at any rate, have given the people a chance of development they never had before. Easy access to the existing railway zones would be of enormous educational value, and would probably stimulate trades now stagnant or dying, while it would render easily possible the absolute suppression of the brigandage so rife everywhere at present.

The government would of necessity encourage the idea of motor traction. There is no difficulty about the supply of drivers and mechanics. The Chinese make excellent drivers, are fair fitters and, best of all, have no trade unions, strikes or eight-hour days. The Chinese mechanic is a sober, quiet, and quite contented person on his magnificent wage of 22 cents to 30 cents per day. Roads at a maximum cost of \$6,000 per mile, of unlimited traffic-handling capacity, are undoubtedly a sounder investment than 2-ft. gage lines costing \$8,000 per mile and with very limited capacity.

Narrow Gage Railways Not Justified

On standard gage railways the cost per ton mile would probably be about 4 mills, but on 2 ft. gage light railways it would more likely approach twice that amount. Narrow gage railways, can be constructed at from 7 to 12 per cent cheaper than standard gage railways, but their capacity is not great and transfer of freight is a comparatively costly matter even in China.

But what is most important is the fact that 2-ft. gage railways have no place in a populous and potentially rich country like China. When the enormous potential wealth, the high order of intelligence of the population, their great numbers and small wages are considered there is very little room for doubt that at no very distant date every railway in this area will be able to work at its full capacity. Breaks of gage should, therefore, on no account be tolerated here when the small savings which result are considered. The future must also be considered from a strategic point of view.

In connection with this gage question it is significant that the Japanese, at the close of the Russo-Japanese war, at once converted what is now the South Manchuria Railway from 3-ft. 6-in. gage to 4-ft. 8½-in. gage and shortly afterwards the 2-ft. 6-in. gage line from Antung to Mukden. The Japanese are also seriously considering altering all the lines in Japan from 3-ft. 6-in. to 4-ft. 8½-in. gage. China has already to cope with the gage question but not to any serious extent. All the lines not of standard gage are metre, and the only one in the Plain is the Cheng Tai Railway, but as this may be important in the future trunk system, and as the country traversed is mineral rich the break of gage is regrettable. This line is at present only 151 miles in length but was exceeding costly, the country being rather difficult. The line cost \$57,500 per mile, whereas the standard-gage line from Peking to Kalgan which is through very heavy country cost \$41,000 per mile exclusive of interest and financial charges.

Of other non-standard gage lines the biggest is the Franch Yunnan Railway of which 289 miles is in Chinese territory out of a total of 534 miles. This is an isolated system, and if ever connected up with the Burmese Railways there would be no break of gage. Another small metre-gage line is the Tsi-Tsi-Har Light Railway, 17 miles in length, which was built at a cost of \$8,675 per mile in country similar to that in the Plain. It has 30-lb. rails and is run at a loss. China is thus not so far committed, at any rate, in the richest part of the country, to more than one gage and should, therefore, profit by the experience of the world which is undoubtedly against break of gage in a populous and potentially wealthy country.

Train Accidents in February¹

THE following is a list of the most notable train accidents that occurred on the railways of the United States in the month of February, 1918:

| C O L L I S I O N S | | | | | | |
|---------------------|--------------------|--------------|------------------|---------------|-------|-------|

The trains in collision at St. Clair, Pa., on the first of February were an eastbound freight and a train consisting of a locomotive and a caboose. The freight had become uncontrollable on a steep descending grade and collided with the other train at high speed. Both engines were dished and the caboose and 20 cars were wrecked. One conductor, one engine man and one brakeman were killed.

The trains in collision at Toledo, Ohio, on the 2nd, were a northbound freight of the Pennsylvania and a southbound freight of the Pere Marquette. One engine and several cars fell down a bank. One trainman was killed and two were injured. One of the trains had run past a signal set against it.

The trains in collision near Nashville, Tenn., on the 2nd were southbound freight No. 53, drawn by two locomotives, and a part of a preceding freight No. 55, sixteen cars of which had run back on a steep grade. These cars had been detached because of the inability of the locomotive to take the whole train to the top of the grade, and it appears that they were left standing without enough handbrakes set to hold them. One fireman was killed and four other trainmen were injured. Both of the locomotives and about fourteen cars of No. 53, as well as four cars of No. 55 were wrecked.

The trains in collision at Bristol, Conn., on the evening of the 2nd, were an eastbound passenger, standing at the station, and a following freight. The freight had become uncontrollable on a steep descending grade. Five passengers were slightly injured.

The trains in collision near Albert Lea, Minn., on the 3rd, were northbound passenger No. 5 and a southbound freight (Extra 450). Both engines and 3 cars were damaged. Ten passengers and 8 trainmen were slightly injured. The collision was due to the error of the conductor and the engine man of No. 5 in assuming that a train which they found on the side track at Manchester where they were to meet No. 450, was that train; whereas, it was No. 96.

The trains in collision on the Bangor & Aroostook near Caribou, Me., on the 6th, were an eastbound passenger, a snowplow ahead of the passenger train and another behind it.

The leading plow had been losing time and was run into by the passenger, and a short time after this collision the second plow ran into the rear of the passenger train. Three passengers and one employee were killed and 18 passengers and three employees were injured. The first snowplow was running as extra (X142) from Houlton to Van Buren, 94 miles. Passenger train No. 9 followed, and had a copy of the orders given to the plow. The collision occurred about 15 miles north of Presque Isle, and two miles south of Caribou. The passenger train left Presque Isle at 10:27 p. m., ten minutes behind the plow. Extra 142 was running at about 15 miles an hour; the man in the rear car, attending the flanger, was killed and the flagman in the caboose was injured. Train No. 9, scheduled at 32 miles an hour, had run from Presque Isle at about 27 miles an hour. It was several hours late. The second plow, which was X59, left Presque Isle 40 minutes behind No. 9. It ran into the passenger train and killed three passengers and injured 21. The flagman of the passenger train was back a full half-mile on straight track, and had put torpedoes on the rail, but it is thought that they did not explode. There was much ice and the temperature was about 30 deg. below zero. The flagman swung a red lantern with one hand and held up a lighted fusee with the other; he threw his lantern at the engine; and all of these signals failed to attract the notice of the engine man of the plow. Inspectors for the Interstate Commerce Commission investigated this case on February 8. It appears that the engine man of the passenger train had no notice of the proximity of the train ahead, as the markers on the flanger were, it is believed, obscured by snow thrown up by the flanger itself.

The trains in collision near Mangum, Okla., on the 10th, were northbound freights No. 914 and No. 558. The leading train had been stopped because of failure of steam. Two cabooses at the rear of this train were wrecked and destroyed by fire. Two trainmen were killed and their bodies were destroyed in the fire. Three other trainmen were injured. The cause of the collision was insufficient protection by flag.

The train involved in the collision at Ashley, Pa., on the 22nd, was a northbound freight which had become uncontrollable on a steep descending grade. It collided with a standing locomotive in the yard at Ashley and the crash included also four other standing engines. The engines and about 30 cars were wrecked. The wreck took fire and 12 loaded cars were mostly burnt up. One trainman was killed and six were injured, one of the six fatally. The cause of the runaway was not determined; but the brakes had been properly tested, and there is no evidence that they were not properly managed. The only theory that will account for the inability of the engine man to control the train is that an angle cock had been closed or partly closed.

The trains in collision at Frost, S. C., on the 25th, were southbound passenger trains, a local train which had been stopped because of failure of an air hose being run into at the rear by a following through train. Twelve passengers were killed and 30 were injured. The cause of the collision is said to have been the failure of the leading train to protect itself by torpedoes; that the flagman had been back a sufficient distance but had returned to his own train without placing the audible signal, and the express train came on just as the local was starting.

The train derailed near Greensburg, Pa., on the 8th, was an eastbound freight, consisting of a locomotive, 39 cars, 2 helping engines and a caboose. One of the locomotives fell down a bank and an engine man, fireman, conductor and two brakemen were injured. The engine man and brakemen were scalded, the former fatally. The cause of the derailment was a broken wheel on one of the cars.

The train derailed near Guernsey, Ark., on the 17th, was northbound passenger No. 6. No passenger cars ran off and no passengers were injured. The engine man and one tres-

¹ Abbreviations and marks used in Accident List:—re, Rear collision—bc, Pointing collision—sc, Other collisions—b, Broken—d, Defective—inf, Infringed obstruction—unx, Unexplained—derail, Open derailing switch—ps, Misplaced switch—acc, Accidental obstruction—ml, Malicious obstruction of track—boiler, Explosion of locomotive on road—fire, Cars burned while running—P, or Pass, Passenger train—F, or Ft, Freight train (including empty engines, work trains, etc.)—Asterisk, Wreck wholly or partly destroyed by fire—Dagger, One or more passengers killed.

passer were killed. The cause of the derailment was malicious tampering with a switch.

The train derailed near Curtis, Neb., on the 19th, was an eastbound passenger. Two coaches were overturned, and two passengers were killed and four injured.

The train derailed at Chilhowie, Va., on the night of the 20th, was eastbound passenger No. 42. Five passengers and five employees were slightly injured. The cause of the derailment was the failure of a baggage-car truck equalizer.

The train involved in the accident at Major, Pa., on the 21st, was a southbound passenger. The only vehicle derailed was a freight caboose at the rear of the train, which ran off the track and fell down a bank. One brakeman was killed and four other trainmen were injured. The cause of the derailment was settlement of track due to recent heavy rains followed immediately by a badly heaved condition due to zero weather, resulting in an irregularity of about 3 inches in the surface.

The train derailed at Summerhill, Pa., on the 21st, was westbound passenger No. 25. The train was running at high speed and the engine and seven cars left the rails, but the injuries to persons were reported as slight. The cause of the derailment was a broken trailer-truck spring on the engine.

The train involved in the accident at Georges Creek Junction, Md., on the 25th, was an eastbound freight. The engine and one car had been detached and 59 cars left standing on a grade had not been properly held by hand brakes and they ran away, most of the cars being thrown off the track at a curve. Most of them were loaded with coal.

The train involved in the accident near Hutton, Md., on the 4th, was eastbound passenger No. 46. A connecting rod was broken and the boiler was punctured; the fireman was fatally scalded.

The train involved in the accident near Wayland, N. Y., on the evening of the 18th, was an eastbound passenger. An express car was badly damaged, and its contents destroyed by a fire which is supposed to have been caused by the explosion of an oil lamp. The car was of steel. The express messenger was partially asphyxiated.

Electric Car Accidents.—The most serious electric car accident reported in February was a rear collision on the elevated line of the Brooklyn Rapid Transit Company, Brooklyn, N. Y., at Oxford avenue, February 3, in a fog, when 37 persons were injured, including a number of passengers standing on the station platform. Only three of the injured had to be sent to hospitals.

Shippers Required to Own and Maintain Industry Tracks

DIRECTOR GENERAL McADOO on March 26 issued General Order No. 15 prescribing the following requirements to be observed in respect of the construction, maintenance and operation of new industry tracks, and in respect of the operation and maintenance of existing industry tracks:

1. As to new industry tracks:

(a) The industry shall pay for, own and maintain that part of the track beyond the right of way of the railroad.

(b) The railroad company shall pay for, own and maintain that part of the track on the right of way from the switch point to the clearance point.

(c) Generally speaking, an industry shall pay for and maintain (although in special cases the railroad company may do so) and the railroad company shall own, that part of the track on the right of way from the clearance point to the right of way line.

(d) If the industry fails to maintain in reasonably safe condition the part of the track which it is required to maintain, the railroad company may disconnect the track or refuse to operate over it when not in such condition.

(e) The railroad company shall have the right to use the track when not to the detriment of the industry.

(f) The foregoing terms and conditions should be embodied in a written contract between the industry and the railroad company.

2. Where existing industry tracks are not covered by written contracts, they shall be maintained and operated in accordance with the provisions stated in paragraph 1 hereof.

3. Where industry tracks are covered by written contracts, such contracts shall be adhered to until otherwise ordered; but where any such contracts appear to work inequalities or injustice the circumstances should be brought to the regional director's attention, who will report thereon to the director general, if conditions seem to warrant.

4. The requirements of state statutes and of state commissions in respect of the construction, maintenance and operation of industry tracks shall be complied with, but in cases where such compliance involves what appears to be an unreasonable burden upon the United States Railroad Administration the circumstances should be brought to the attention of the regional director, who will report thereon to the director general if the conditions seem to warrant.

A Modern Plant for Thawing Coal in Cars

Severe Winter Has Emphasized the Difficulty of Unloading
Materials Shipped in Open Top Cars

By Scott W. Linn,
General Contractor, Cleveland, Ohio.

THE UNUSUAL CONDITIONS EXISTING THIS WINTER AS TO the great demand for materials and finished products on one hand and the difficulty in producing and moving these products on the other have emphasized a number of problems which in previous years have been considered of minor importance. The specific causes of most of these troubles are perhaps due to circumstances over which the individual has little or no control. Scarcity of labor and prolonged severely cold weather have had much to do with the delay in moving materials from producer to consumer, and very little can be done on short notice to offset the retarding effect of either of these conditions. Expense and delay in handling materials is not due entirely to the inability of the carrier to make prompt delivery, but is often supplemented and greatly increased by conditions at terminals and other points of delivery.

In winter, freezing of these materials adds greatly to the cost and delay of unloading of coal, ore, sand, gravel or other materials which are usually shipped in open top cars. When these commodities are shipped any considerable distance or are held on cars for several days, they are in a more or less frozen condition depending on the severity of the weather and the amount of moisture in them. The percentage of moisture held in the materials varies greatly according to the coarseness or fineness of the material. A car of sand freezes harder than a car of stone. Crushed bituminous coal or finely divided anthracite coal will freeze harder than the coarser grades of either.

At tide water coal shipping ports, the handling of frozen coal forms one of the most serious problems in winter operation. It is necessary at most of these ports where coal is unloaded from cars to boats by car dumper that the work be carried on in winter weather at about the same rate as in summer. Much of the coast towns' supply of coal depends on shipment from these ports. Various schemes for thawing coal in the cars have been used, most of them without great

success from an economical operating standpoint. The plan mostly used until about seven years ago was the so-called point system. Thawing was attempted by driving gas pipe into the frozen coal and introducing hot steam into the coal through these pipes. This was an expensive and awkward method and was attended by considerable danger to workmen as well as carrying the objection that the coal was left in a saturated condition.

The thawing plants operated by the Eastern Coal Dock Company at its coal unloading plants at Philadelphia and at South Amboy, N. J., have been successful in producing satisfactory results economically. The unloading equipment at South Amboy consists of two McMyler car dumpers located on Pennsylvania Railroad property and are under the management of D. W. Reed, superintendent. Two thawing plants are in use at this place. The first, built in 1911, is a wooden building, 500 ft. long, with two rooms longitudinally through the building, each room containing one track. This plant has thawed an average of over 500,000 tons of coal each winter since it has been in operation. The principal objections to the use of a frame building for this purpose appear to be the rapid deterioration of the wood under the high temperatures carried and the fire hazard attending such construction.

The latest thawing plant was put in operation in January, 1917. It is the same in principle as the other hot air plant but embodies a more modern type of building construction. The latter plant is a building 570 ft. long with three rooms each containing one track. The building was constructed on a new fill, a part of which occupied the location of a former slip which had been used at one time for the storage of boats when trestles were used for unloading coal at Amboy.

The building is of pre-cast unit concrete construction and all members were cast in a yard near by. The structural members comprise columns, girders, beams, roof slabs and slabs for walls, ceilings and various partitions. All parts

were reinforced to suit requirements and were properly cured before erection. In a building of this type there are such a great number of duplicate parts that erection can be carried on very rapidly. A row of piling under each wall carried the reinforced concrete foundation.

Each room of the building has an inside horizontal clearance of 14 ft. and 16 ft. vertically. In the center of the building is a two-story part about 50 ft. in length, in which the heating and blowing apparatus is located. Two hot-air ducts and one return air duct for each room lie between the ceiling and the roof and extend from the apparatus room to each end of the building. Openings in the bottom of the hot air ducts connect with flues extending downward along the walls and under the track. These flues are spaced about 5 ft. center to center. Kinnear rolling steel doors are used for end closures.

Steam is brought from the boilers about 400 ft. distant to the apparatus room. Water of condensation from the heaters

long and, under severe freezing conditions and with the average coal, from 1½ to 2 hrs. are required to thaw the coal so that it will unload freely.

Patents covering the hot air system of thawing materials in transit are held by the Walter S. Newhall Company, Cleveland, Ohio, which company was the engineer and general contractor in the design and installation of these plants.

Car Service Section Urges the Sailing Day Plan

THE CAR SERVICE SECTION of the Railroad Administration has issued a bulletin to all railroads requesting those that have not already adopted the plan to make immediate study of the adoption of the so-called "Sailing Day Plan" in the handling of less than carload freight in order to effect further economical use of freight equipment. The bulletin says that some railroads have found the arrangement productive of very good results, as indicated by the figures furnished to the car service section by some of the lines that have adopted the method at some of their larger stations. Some examples of the successful operation of this plan are given in the circular, as follows:

During the month of October the Buffalo, Rochester & Pittsburgh effected a decrease of 41 per cent in cars used and an increase of 83 per cent in weight. The scheduling of local service for intermediate stations three instead of six days per week made it possible to effect a reduction of 10 local freight runs.

On the Boston & Maine, during the first week of October, 1917, which was prior to the adoption of the "Sailing Day" plan, at 13 stations 3955 cars were loaded with 30,761 tons of freight, an average of 7.77 tons per car, while for the week ending December 7, 1917, there was loaded at the same stations 3601 cars with 31,096 tons, an average of 8.63 tons per car, resulting in a saving of 354 cars, or 8.9 per cent, and at the same time an increase in track standing space at the platforms.

The New York Central for four months preceding December 1, 1917, handled 3,154,699,000 lb. of 1 c. l. freight, using 221,688 cars. The average loading per car in the period named for 1917 was 14,230 lb. per car, and in the same period in 1916 was 10,279 lb. per car, an increase in 1917 per car of 38.44 per cent or an average saving per month of 21,305 cars.

The New York, New Haven & Hartford reports a saving of 780 cars a week, with standing room at freight houses materially improved. Two freight trains and entire crews have been discontinued and several train movements in the aggregate have been eliminated by reduction in cars to be handled, particularly in prevailing tonnage direction where trains are started only when full tonnage is available.

On the Pennsylvania Railroad 600 cars have been saved daily, and local train service has been reduced on a number of divisions. The former daily set up has been reduced to tri-weekly, semi-weekly and weekly service, according to the volume of business, which results in a saving of 25 per cent of track standing room. It is also estimated that 25 per cent of the freight is kept out of transfers.

The bulletin says: "There is no plan incapable of improvement from time to time and the results to be obtained in efficiency, reduction in train units, decrease in cost, increasing despatch and elimination of freight congestion, will be of material consequence; and the Car Service Section suggests that the arrangement be given very prompt and careful consideration; and . . . immediate study is requested, with definite outline of your plans."

Section Through Blower House.

Section Near End of Building.

Sections Through the Thawing House

is returned to the boilers for feed water. The heaters and blowers are of B. F. Sturtevant make and are of sufficient size to provide a frequent change of air in the building at a temperature of 250 deg. for the air as it leaves the heaters. The blowers are the double discharge type and are arranged to blow through the heaters into the hot air ducts. Heated air is carried the full length of the building through the ducts and down through the flues and is discharged upwardly toward the bottom of the cars.

The air after contact with the bottom, sides and ends of the cars, enters the return air duct in its passage back to the blowers for re-heating. Frequent openings in the return air duct admit the air. It has been found that better results in circulation are had when the return air openings near the center of the building are closed and air is admitted at intervals some distance from the center and toward the ends of the building. The system of circulation and re-circulation gives a very uniform distribution of hot air in the building so that the material in cars is thawed well in from all surfaces.

This plant has a holding capacity of 42 cars each 40 ft.

Forms for Equipment Inventory

THE FORMS for an inventory of equipment are those which L. E. Lorce sent to the Railroad War Board before it was superseded by the Director General. Mr Lorce made the suggestion that the War Board request all class A roads to include an inventory in such detail as

is here shown in their annual reports to stockholders. See editorial comments elsewhere in this issue.

ENGLISH RAILWAYMEN CULTIVATE LANDS.—Six thousand employees of the London & South-Western cultivated plots of land by the side of the line last year.

Inventory of Steam Railway Passenger Train Cars

Freight Operations for December

THE BUREAU OF RAILWAY ECONOMICS has issued its monthly report of freight operations of steam railways for the month of December and the combined months April to December, 1917, in the series which was compiled for the Railroads' War Board. Revenue ton miles handled in the month of December amounted to 29,050,017,536, a decrease of 2.6 per cent, as compared with December, 1916. Total freight train miles decreased 6 per cent, loaded freight car miles decreased 11.7 per cent, and empty freight car miles decreased 15.9 per cent. Freight locomotive miles decreased 5 per cent. The revenue ton miles per freight locomotive amounted to 943,979, a decrease of 2.7 per cent, and the revenue ton miles per freight car amounted to 12,509, a decrease of 6.1 per cent. The average number of freight locomotives in service was .2 per cent greater than December, 1916, and the average number of freight cars 3.8 per cent greater, and the tons per train increased 3.3 per cent, while the tons per loaded car increased 10.2 per cent, but the effect of the congestion in eastern territory is reflected by a decrease in the average miles per locomotive per day from 65 to 61.6, a reduction of 5.2 per cent, and a decrease in the average miles per car per day from 25.4 to 21.3, or 16.1 per cent. There was a reduction in the average mileage per car and per locomotive in all districts.

For the combined nine months, April to December, which marks the period during which the Railroads' War Board was in existence, there was an increase in revenue ton miles of 9.8 per cent, while the number of freight train miles increased only 2.6 per cent and the loaded freight car miles increased only .6 per cent. The revenue ton miles per freight locomotive show an increase of 8.6 per cent and per freight car of 6.7 per cent. The average number of freight locomotives in service shows an increase of 1.1 per cent and there was a reduction of 7.4 per cent in the average number of freight locomotives in shop or awaiting shop. The average number of freight cars in service increased 2.9 per cent, while the average number of freight cars in shop or awaiting shop decreased 3.9 per cent. The tonnage per train was 667 as compared with 624 in the corresponding period of 1916, an increase of 6.9 per cent. The tonnage per loaded car was 27.3 as compared with 25, an increase of 9.2 per cent. The average miles per locomotive per day increased from 66.6 to 67.9, an increase of 2 per cent, but the average miles per car per day had decreased 1.8 per cent, from

27.3 to 26.8. The percentage of empty car miles increased from 29.8 to 30.

Cash Disbursements

DIRECTOR GENERAL MCADOO has issued the following circular to the railroads:

Unless and except so far as reasonable showing shall be made to the contrary, the Director General will proceed upon the theory that the total of accounts "cash," "demand loans and deposits," and "time drafts and deposits," appearing on the railroad company's books at the close of business December 31, 1917, was for railroad purposes and is therefore subject to the control and order of the Director General. If, and to the extent that, the Director General shall find it appropriate, in the mobilization and unification of the resources of the railroad companies, to transfer any such cash from the control of the officers of the company, full accounting provision will of course be made for the protection of the company's rights.

The Director General will entertain any applications which may be made to him to show that any portion of the cash on hand December 31 was not for railroad purposes and should not be under the Director General's control.

Carriers subject to federal control must not make disbursements out of the cash represented by the accounts above designated as of December 31, 1918, except as follows:

(a) The payment of interest maturing up to and including July 1, 1918, upon obligations of the railroad company.

(b) The payment of dividends not in excess of regular rate of dividends during the three years ended June 30, 1917, in the regular installments, according to the established practice of the company, payable up to and including July 1, 1918.

(c) The payment for materials and supplies for railroad use and for other expenses of operation. Operation to include, both upon the debit and credit side, joint facility rents, car hire, and all items of that character which accrue out of the operation of the property.

(d) Taxes, including war taxes.

(e) Expenditures for permanent improvements.

Application will be entertained for any payments which the carrier may desire to make out of cash on hand December 31, 1917, for purposes other than those above specified or, as to clauses a and b, at dates beyond July 1, 1918.

In the Midst of the Fire at Jersey City Tuesday. Photo by Central News

General News Department

Among consumers of fuel oil, classified in a circular which has been issued by the Fuel Administration, prescribing the order in which manufacturers and distributors are required to give priority, railroads are placed first.

The sub-committee on war tax of the Association of American Railway Accounting Officers has issued a pamphlet of 35 pages giving final rules and regulations promulgated by the commissioner of internal revenue on the application of the war revenue tax to the transportation of persons and property.

Use of varnish is a subject on which Director-General McAdoo desires information. He has addressed to the railroads a questionnaire asking information concerning the use of varnish on cars and locomotives during the calendar year 1917. Reports must show the brand, vendor, manufacturer, amount used for various purposes, total cost and price per gallon.

No railroad legislation at this session, or until after the war, is the decision of the Committee on Common Carriers in the Kentucky legislature; and this rule has been confirmed by a vote in the Senate, where a bill to extend the powers of the State Railroad Commission was laid on the table; but not until after a discussion in which the "strangle-hold of the railroads" on the business of the state was emphasized with all due seriousness.

In an explosion and fire at the Jarvis warehouse, Jersey City, N. J., on March 26, the repair shops of the Erie Railroad, on the north side of the main line near the Jersey City passenger station, were destroyed; estimated loss, \$300,000; loaded freight cars to the value of \$200,000 (estimated) were also destroyed. The explosion caused, altogether, damage to the amount of about \$1,500,000, and fire brands were blown across the river to New York. The Erie station and ferry-house on the New York side were damaged \$8,000. The shop buildings destroyed were old, and it is understood that the company will not rebuild on the same site.

Ownership of coal mines is the subject of a circular which Director-General McAdoo has issued to the railroads. It calls for reports concerning ownership, operation or control of anthracite, bituminous and lignite mines, lands and operations. Each road is required to report regarding lands owned, leased or controlled which are not under development and which are under development; expenses of operation, cost per net ton of coal, proportion of production used for other than railroad purposes, etc. Names of railroad officers or directors who are interested directly or indirectly in any of the lands or mines are also asked.

"Whole-hearted and loyal support to Director-General McAdoo, and the officers of the New York, New Haven & Hartford Railroad," is the keynote of resolutions which have been adopted by the lodges of the Order of Railroad Telegraphers on the New Haven road, and sent to Mr. McAdoo. The telegraphers have "resolved not only to do their bit but to do their best," in maintaining the highest standard of efficiency. Mr. McAdoo, in a reply sent to L. J. Ross, general chairman, expresses his deep gratification. "Such a spirit," says Mr. McAdoo, "cannot fail to aid our beloved country immeasurably, and to enable it to become victorious in this great war for America's vital rights and for the freedom and democratization of the world."

The Chestnut Hill branch of the Pennsylvania Railroad is now completely electrified and electric trains are to begin running regularly next week. A test train was run over the line on March 22. This branch is about six miles long and the passenger trains run through over the New York division, the main line to and from the Broad Street Terminal, Philadelphia, twelve miles. Connection with the main line, electrified two

years ago, is made at Zoological Gardens. The cost of this electrification has been about \$1,500,000. The work has taken a little more than two years and has cost 20 per cent more than was estimated at the beginning. Difficulty in procuring materials has been one cause of delay in completion. In connection with the electrification and the installation of position light signals, twenty signal bridges were put up.

Track Elevation Work in Chicago Checked

The Chicago council committee on track elevation, which was prepared to recommend track elevation work in the city to cost about \$5,000,000, has been requested by W. G. McAdoo, director-general of railroads, to defer further consideration of this work until the conclusion of the war. The elevation work was planned to be done in the southwestern section of Chicago on the Grand Trunk Western, the Indiana Harbor Belt, the Chicago River & Indiana and the Atchison Topeka & Santa Fe. Mr. McAdoo's ground for his recommendation was that railroad improvements involving large expenditures should be avoided when they interfere with the execution of work absolutely essential to the successful conduct of the war.

Embargo on Movements East of Chicago Removed

R. H. Aishton, regional director of western railroads removed the embargo on carload freight destined for points east of the Illinois and Indiana state lines on March 20, after it had been in effect 10 days. The movement of freight to points east of Chicago is now limited only by the capacity of the eastern lines. The special attention which the western lines have been giving the movements of grain during the past two months has evidently taken care of the large quantities of grain which demanded transportation to prevent deterioration. At any rate, Mr. Aishton has recommended to Mr. McAdoo that he discontinue giving preference to grain in the loading of box cars, except as to wheat from points of origin to primary markets.

Reasons for Mail Delays

E. J. Ryan, president of the Railway Mail Association, which represents employees in the railway mail service, contributes the following in a Washington newspaper to the discussion of the reasons for delays in the mails.

"The statement that the delay of mails is only between New York and Washington is an error, as reports show that mails are being delayed practically throughout the entire service. Delayed mails exist on lines not so congested as the railroads operating on the Atlantic seaboard. The fact is that the policy of curtailing space for distributing mails on route in the railroad mail cars, and also reductions in the number of railway postal clerks, who performed this very important work of the postal service, is the real cause for the present situation. The war is not to blame.

"This policy has been adopted and was actually in effect for months before this country entered the struggle and before the abnormal demands arose which now cripple the transportation system. Even now there should be not very little, if any, delay in mails upon their arrival in Washington. Mail cars are attached to passenger trains, not to freight trains. Frequent regular train service exists between New York and Washington.

"Six trains a day mail cars arrive in Washington each day from New York. Twelve trains carrying mails in closed pouches, but without mail cars or clerks, arrive each day from New York. Eight trains carrying mail mail cars and clerks, leave Washington each day for New York, and also eight trains carrying closed pouches without mail cars or clerks."

Railroad Liberty Loan Purchases

Director General McAdoo has issued a circular to the railroads calling for the following information regarding Liberty bonds: 1—State the total amount, if any, of Liberty Loan 3½'s, and separately of Liberty Loan 4's, bought by your company or subsidiaries, (a) as investment; (b) for employees. 2—State aggregate amount now held of each of said issues, (a) as investment; (b) for employees.

Of amounts of each issue disposed of by you, other than bonds disposed of to employees, please show: (a) amounts sold in the market, or through brokers; (b) amounts sold at private sale to investors; (c) prices realized for each lot sold; dates of sale.

Railroad Bill Signed by President

The railroad control bill was signed by President Wilson on March 21, immediately after the passage of the war finance corporation bill by the House. The President held the bill for a week because if there had been a failure of the finance corporation bill, which provides for loans to railroads and other corporations whose operation is necessary for the war, it would have been necessary to seek a larger appropriation than the \$500,000,000 provided for in the railroad bill.

The war finance corporation bill had previously passed the Senate and is now in conference. It provides for a corporation of \$500,000,000 capital stock to be owned by the government, with a board of directors consisting of the Secretary of the Treasury and four others. Under the Senate bill the corporation would be authorized to issue \$4,000,000,000 of bonds, but in the House bill this was reduced to \$2,000,000,000 and the corporation is to make loans or advances direct or through banks for the assistance of industries whose operations are necessary or contributory to the prosecution of the war. The bill also provides for a capital-issues committee to investigate, pass upon and determine whether proposed issues of securities are compatible with public interest.

Contracts for Exchange of Transportation for Advertising to Be Honored

Contracts for the exchange of intrastate passenger transportation for advertising, which are not repugnant to state laws, may be carried out, provided they do not extend beyond the present calendar year. This is announced in a modification of General Order No. 6 issued by Director General McAdoo. The order prohibited the issuance of free transportation except as expressly authorized by the federal law. The carriers, in obedience to the order, withdrew the passes or mileage books which had been issued for newspaper advertising.

It later came to Mr. McAdoo's attention that contracts for newspaper advertising to be paid for in transportation at a fixed rate had been made in various sections of the country; that mileage books had been issued pursuant to such contracts; and that the war tax thereon had been paid as required by law. The legality of such contracts and a number of other questions growing out of General Order No. 6 were thereupon referred to the Interstate Commerce Commission for consideration, and the commission advised the modification of Order No. 6 to the extent of permitting a continuance of contracts already made for the exchange of intrastate passenger transportation for advertising to the termination of such contracts, but in no instance beyond the end of the current calendar year. It is pointed out that transportation issued under such contract may not be used in connection with other transportation on any interstate journey.

Railway Business Association

Indications are that the special meeting of the Railway Business Association, called for April 8 in Chicago, will be well attended, replies to the invitations to the meeting having come in in a very satisfactory manner.

Those in charge of the meeting are making every effort to secure the attendance of members of every company engaged in the manufacture or sale of railway supplies, whether they are at present members of the association or not. As has been previously announced in the *Railway Age*, the discussion will deal with the matters of present great importance to the railway and supply field and consideration will be given to the idea of reorganizing the association to make it better fitted to deal with the new aspects of the railway situation.

Traffic News

Distribution of anthracite coal has been put in charge of a supervising committee, announced by the Fuel Administration on March 26: J. B. Dickson, S. D. Warring and W. J. Richards.

The Car Service Section of the Railroad Administration has found considerable delay in transmission of embargo revisions which are sent to zone chairmen by third-class United States, or railroad mail. It is desired that these notices be sent as first-class matter.

Cheap Sunday excursions from Philadelphia to seaside resorts in New Jersey are to be restored. Congressmen from New Jersey have appealed to Director General McAdoo, and he has authorized the restoration of certain Sunday trains, run to accommodate round-trip passengers at low rates, which were taken off because of freight congestion early in the winter.

On Wednesday, March 20, the post-office department made an experimental run with a motor truck, carrying parcels, from Lancaster, Pa., to New York City, 180 miles, leaving Lancaster at 4:17 a. m. and arriving at New York 4:15 p. m. The merchandise weighed about 2,900 lb., and was made up mainly of eggs, butter and honey. About 20 gal. of gasoline was used and the postage paid on the goods was \$31.01.

An embargo against all l.c.l. freight shipments to New York city, excepting perishable goods, foods, and other usual exceptions, was announced on March 23. It was concurred in by all of the trunk lines, and the notice, signed by George D. Ogden, chairman of the Freight Traffic Committee, said that it was to continue one week from Saturday night, March 23. Responding to recommendations presented by the Merchants' Association of New York, the railroads terminating in Manhattan have agreed to have freight stations open for the delivery of freight at 7 a. m. with cashiers and check clerks on hand; to allow consignees to take carload freight from piers after 6 p. m., and to pile inbound freight on the pier floor with more care, so that teamsters can locate their shipments more quickly. J. C. Lincoln, manager of the Traffic Bureau of the Merchants' Association, at the same time has issued an appeal to merchants and manufacturers to do their part towards reducing the unparalleled congestion of freight in New York stations.

Intermediate Rate Association

Representatives of the intermediate territory, including commercial organizations and state railroad commissions in the territory west of Denver, Colo., and immediately east of the Pacific Coast terminals, have organized the Intermediate Rate Association with the primary purpose of securing an amendment to the fourth section of the act to regulate commerce which will prohibit railroads from charging a higher rate for a shorter than for a longer distance when the haul is included within the longer and over the same line and in the same direction—for the purpose of bringing about a change in the freight rate adjustment to the intermediate territory which has long been the subject of constant litigation and controversy. Headquarters have been opened in Washington in charge of J. F. Shaugnessy, a member of the Nevada Railroad Commission, as president, and Charles W. Smith, commerce attorney, of Washington, as secretary. President Shaugnessy has issued a statement outlining the history of the transcontinental rate adjustment and the arguments in favor of the proposed amendment to the law. He declares that because of the discriminatory rate adjustment capital is withheld from investment in the intermediate territory and that this condition will continue until the Director General of Railroads should declare the discrimination during the period in government control unless there is a declaration by Congress that such a policy should be made permanent. Several bills have been introduced in Congress to amend the long and short haul clause so as to remove all restriction in the matter from the Interstate Commerce Commission, and hearings have been held before the Senate Committee on Interstate Commerce since March 13. An active

campaign of letter-writing to Congress has also been carried on by the representatives of the intermountain territory.

Coal Production

The output of soft coal during the week ending March 16 was the largest since November 24, according to the weekly bulletin by the Geological Survey, Department of the Interior. The total bituminous production during the week ending March 9 is estimated at 11,228,000 net tons. The daily average for the week was exceeded in the week of January 5, but at that time the total production was reduced by the New Year holiday. The improvement has been made possible, the report says, by relief of the railroad freight congestion. Anthracite and coke, both beehive and by-product, reflect the increase in bituminous production. The total production for the week ending February 23 was 10,616,000 and for the week ending March 2, 11,111,000. Anthracite shipments arose to 42,207 cars, the largest since the week of December 1. Bituminous shipments by carloads on 121 roads have shown a steady increase since the week ending February 2 from 170,552 carloads to 199,582 carloads in the week ending March 9. The percentage of full time output lost on account of the car shortage for the last six weeks as shown by the report, has been as follows: January 26, 26.6; February 2, 29.2; February 9, 27.7; February 16, 20.2; February 23, 22.3; March 2, 20.8.

Uniform Classification of Freight

One result of the elimination of competition between railroads is to be a speeding up of the work which has been in progress for years toward a uniform classification of freight. Director General McAdoo has appointed a committee, composed of R. N. Collyer, chairman of the Official Classification Committee, R. C. Fyfe, chairman of the Western Classification Committee, J. E. Crosland, chairman of the Southern Classification Committee, J. E. Williams, chairman of the Uniform Classification Committee, and J. C. Colquitt, classification agent of the Interstate Commerce Commission, to formulate a report as to uniform rules, descriptions and weights, with a view to completing that part of the work. A considerable degree of uniformity as to the rules, descriptions and weights has already been accomplished and as the recommendations of the uniform committee have been made they have been gradually adopted by the regional classification committees. Uniformity of ratings has not been attempted. The committee appointed by the director general has been sitting in continuous session in Chicago for over two weeks. The report is to be submitted to the Interstate Commerce Commission and a public hearing will be had before the final regulations are put into effect.

Real-Life in New York; a Florida View

[From the New York Tribune.]

Carl C. Hutches, of Bradentown, Fla., who came to New York a week ago as a representative of about 100 farmers of Manatee County, Fla., to find out why they were losing money on produce they sent to New York, declared that he has solved the mystery.

"Just malicious destruction," he said. "The freight handlers employed by the Pennsylvania Railroad at Pier 29 have wasted thousands of dollars' worth of celery and cauliflowers from Florida during the week I have been here, and I have seen them do it. They use the longshoremen's hooks to drag down crates of perishable goods, the packages fall to the ground, fall to pieces and are tossed aside, to be trampled under horses' feet." He was asked if he thought the vegetables were destroyed in the attempt to keep food prices up.

"No," he said. "The commission men are glad to get the stuff. It's the laborers at the piers. Either they are incompetent workers or they are simply destroying stuff out of pure malice. Their wages are too low. They get 28 cents an hour, and it is raised to 30 cents if they work twenty-two consecutive days in each month.

"I will say, however, that there is police protection. I saw a policeman chase away a little boy who tried to snatch a cauliflower out of the mud and stuff it in a bag. In a few minutes the cauliflower was trampled down by horses' hoofs and wagon wheels."

Commission and Court News

Interstate Commerce Commission

The St. Louis Chamber of Commerce has filed a complaint with the Interstate Commerce Commission, through Joseph W. Folk, its general counsel, asking for an order requiring the railroads to cease from charging rates on coal to St. Louis higher than the rates to East St. Louis and other cities in the St. Louis industrial district. Mr. Folk recently resigned as chief counsel of the Interstate Commerce Commission to conduct a campaign against the arbitrary of 20 cents a ton on coal crossing the Mississippi river, against which St. Louis has been protesting for many years. The petition charges that the bridge arbitrary constitutes a discrimination against St. Louis which is a severe handicap to its manufacturing interests.

State Commissions

The New York State Public Service Commission, second district, has issued a memorandum, dated March 13, telling of a rear collision of freight trains, recently investigated, which resulted from the negligent acts of seven different employees. One employee was killed in the collision and two were injured. The date and location of this interesting collision are not given, nor is there any explanation of what was done or omitted by the different persons charged with responsibility; but the commission in its memorandum makes a special appeal "to all men engaged in operating trains to acquaint themselves thoroughly with operating rules, to observe them rigorously and to be vigilant and careful in the performance of their duties."

Court News

Setting Fires by Locomotives—Sufficiency of Evidence

Evidence for the plaintiff was circumstantial that an engine of the railroad company set the fire which damaged plaintiff's property. The evidence for the railroad was positive and uncontradicted that the engines alleged to have set the fire were equipped with proper spark arresters and were not emitting and did not emit sparks. The Georgia Court of Appeals holds that a verdict for the plaintiff was unauthorized by this evidence.—*Savannah & N. W. v. Guann (Ga.)*, 94 S. E., 914. Decided January 29, 1918.

Elimination of Grade Crossings—

Apportionment of Expenditures

The New York Appellate Division holds that the Long Island was entitled to an apportionment of all expenditures necessarily incurred by it in the elimination of a crossing pursuant to order of the Public Service Commission, although such expenditures were in part for moving structures of other companies, who could have been compelled by the commission to move them; the Long Island having no power to compel these companies to act.—*People ex rel. Long Island v. Commission*, 168 N. Y. Supp., 832. Decided February 1, 1918.

Power-Brake Law

The Safety Appliance Act, of March 2, 1903, §2, as amended, requires air brakes to be in operation on 85 per cent of the cars in each train, and more, if more cars properly equipped are "associated with" the 85 per cent. The Circuit Court of Appeals, Fourth Circuit, holds that if the required 85 per cent of the cars were operated, it was not a violation of the act to haul other cars in such train, which although power-braked, had their air brakes cut out, because defective and not in condition for use.—*United States v. Chesapeake & Ohio*, 247 Fed. 49. Decided October 8, 1917.

Implied Powers in Sales of Land

In an action against a railroad for commissions on the sale of land in which it was interested, but which it did not own, the Circuit Court of Appeals, Eighth Circuit, holds that it is within the implied powers of a railroad company, whose line runs through a territory largely unsettled as an aid to its own business, to encourage settlement of lands tributary to its road, and to that end it may make a valid contract to pay a reasonable commission on sales of such lands to settlers, although it does not own the lands.—*Thrallkill v. Crosbyton-Southplains*, 246 Fed. 687. Decided October 15, 1917. Rehearing denied, January 16, 1918.

Automatic Car Coupler Law

The Circuit Court of Appeals, Fourth Circuit, holds that it is a compliance with the coupler section of the Safety Appliance Act, 1893, for a railroad to provide appliances that would automatically couple by impact when the knuckles were open and provided with levers extending outside of the car by means of which the knuckles could be opened, so that a coupling could be made or cars uncoupled. Where a brakeman went between cars to open the knuckle of a coupling, although the lever was in good condition, there could be no recovery on the theory that the railroad should have provided automatic couplers the knuckles of which would at all times be open and ready for coupling.—*Chesapeake & Ohio v. Charlton*, 247 Fed. 34. Decided November 9, 1917.

Classification of Freight

The Alabama Supreme Court holds, by a divided court, that a tank wagon necessary to use with a traction engine and shipped with the engine, both set up, should be shipped under the same classification as the engine; and it is immaterial that it was not actually attached to the engine during its course of shipment, nor that each could be used without the other, or that there was a tank on the engine itself of a limited capacity. The ground of the dissenting opinion was that the engine was complete in itself and could be used without such an appendage, however convenient and desirable the latter might be for some of the uses to which the engine might be put; therefore, the tank wagon was complete in itself, and could be used, and was designed to be used, separate and apart from the engine. *L. & N. v. Newell* (Ala.), 77 So., 553. Decided June 7, 1917. Rehearing denied December 24, 1917.

Excess Charge from Passengers Without Tickets

The Mississippi Railroad Commission in 1907 prohibited all railroads from charging passengers who boarded trains without tickets a fare in excess of 3 cents a mile. In 1915 the Illinois Central and the Yazoo & Mississippi Valley adopted a rule requiring each passenger who had an opportunity to buy a ticket to pay 10 cents in excess of the regular fare of 3 cents a mile. The commission declined to approve the extra charge of 10 cents, and entered an order directing that if the charge was made after a given date the railroads would be fined \$500 for each offense. The railroads sought to enjoin the imposition and enforcement of such fines. The Mississippi Supreme Court holds that railroads may require a higher rate from passengers not having secured tickets, but cannot collect in excess of the fixed maximum rate of 3 cents a mile.—*Illinois Central v. Commission* (Miss.), 77 So., 314. Decided January 21, 1918.

Absence of Showing of Railroad's Negligence

The body of a brakeman was found beside the track so that his death might have been caused by his falling from his moving freight train and crushing his head on the frozen ground as well as by coming in contact with a car on a side track while standing in the stirrup of a car of his own train to look for a hot box. In an action against the railroad for his death there was evidence that when the body was discovered the car on the side track was covered by frost which could not be touched without leaving marks, and yet gave no indication that the deceased had come in contact with it. The Utah Supreme Court held that judgment for the plaintiff

could not stand, since, where the proximate cause of the injury is left to conjecture, the plaintiff must fail as a matter of law. Although it were assumed that the deceased came in contact with the standing car, yet that would not necessarily establish the proximate cause of his death. Suppose he had come in contact with the car after he had lost his hold on the freight car on which he was riding, the proximate cause then would be the loosening of his handhold and falling from the moving car. Regarding the evidence from any point of view, therefore, the result would be the same, namely, that the cause of death was left wholly to conjecture.—*Tremelling v. Southern Pacific* (Utah), 170 Pac., 80. Decided December 4, 1917.

Effect of Interference of Plaintiff's

Agent in Loading of Live Stock

In an action for damages to a shipment of calves, alleged to have been caused by the negligence of the railroad, the defense was that the plaintiff, through his agent, undertook to load and did load the calves; that over its protest the car was overloaded; and that this and rough handling by the plaintiff's agent caused the damage. The Texas Court of Civil Appeals held that it was the duty of the railroad to load the cattle, but if the plaintiff, by his agent, undertook to so load them, and as a result of his negligence in overloading or rough handling the animals were injured, the defendant was not liable. On the other hand, if the plaintiff's agent merely assisted the trainmen in the loading, under the control of the conductor, and the car was negligently overloaded, then the railroad was liable for the resulting damage. In any event, the railroad would not be liable for any injuries sustained by rough handling of the cattle by the plaintiff's agent while loading. There was no evidence that the conductor authorized any such conduct by him. Judgment for the railroad was reversed and a new trial ordered on account of the improper admission of evidence.—*Massey v. Texas & Pacific* (Tex.), 200 S. W., 409. Decided January 17, 1918.

Warning Trespassers

A woman left a highway to walk around a freight train on a side track blocking the crossing. There was another freight on the side track, its engine facing that of the first train. Observing that there was a space of about 20 feet between the two engines, the woman walked between them over the side track and on to the main track, and in thus attempting to cross the main track was struck and killed by a passing passenger train. In an action for her death the petition alleged that her death was caused by the negligence of the railroad's servants in charge of the freight trains, in failing to warn her of the danger of going on the main track immediately before she was struck by the passenger train, and that the danger was not known to her, but was known to them. The Kentucky Court of Appeals held that to recover for such negligence of the freight train crews it would be necessary to allege that they saw her peril in time to warn her, and that she could not, by the exercise of ordinary care, have known of its approach; the trainmen owing no duty to warn a trespasser, and having the right to believe that she had ordinary intelligence and would not walk in front of the passenger train or place herself in a perilous position. There was no complaint that the passenger train did not give the usual signals for the crossing, or approaching it, or that its rate of speed was unusual. A demurrer to the petition was held properly sustained.—*Sweat's Admr. v. L. & N.* (Ky.), 200 S. W., 14. Decided January 25, 1918.

Effect of Federal Employers' Liability Act

on Contract Requiring Notice of Injuries

It is definitely settled by the holders of the Supreme Court of the United States that it was the intention of Congress, by its legislation on the liability of railroads for injury to employees while engaged in interstate commerce, to take entire and exclusive control over this subject with a view to making the liability in such cases uniform throughout the United States (*N. Y. C. v. Woodell*, 244 U. S., 147). And, as in the case of liability of the initial carrier in interstate shipments, this liability is to be determined by the provisions of the legislation itself and the general common law, as administered by the Federal courts, unaffected by State legislation and decisions of

State courts, except as they may announce the common law. The Texas Court of Civil Appeals holds that, under sections 1 and 5 of the Federal Employers' Liability Act, the written contract of employment between a railroad and an employee, in so far as it provided that the road should not be liable for injuries unless the employee gave notice in writing of his claim, was void. The court held that, in the absence of legislative prohibition, such a contract would be valid at common law.—*Panhandle & Santa Fé v. Brooks* (Tex.), 199 S. W., 665. Decided December 5, 1917. Rehearing denied December 19, 1917.

Boarding Moving Train

In an action by a passenger for injuries received while attempting to board a moving train with a child in his arms, when his foot slipped through a defective step, the Indiana Appellate Court held that the questions of the railroad's negligence and the plaintiff's contributory negligence were for the jury. It was prejudicial error to charge the jury that "the defendant owed to the plaintiff the duty of exercising the highest degree of care for the plaintiff's safety, and to permit the plaintiff to enter upon the defendant's train in safety." This instruction makes the standard of care due to a person merely on the station platform about to take passage on a train the same as that due one already on the train. Under it the railroad was, in effect, required not only to stop the train a reasonable length of time to allow passengers to get on, but it was also required to see and know that no one was attempting or intending to get on the train before starting it. The law recognizes a distinction between the care due to a passenger on the train and that due to one who is merely on the platform waiting to get on. To the former the railroad company owes the highest degree of care, while to the latter it owes ordinary care not to injure him. Judgment for the plaintiff was reversed and a new trial ordered.—*Pittsburgh, C. & St. L. v. Friend* (Ind.), 118 N. E., 598. Decided February 8, 1918.

Injury to Trackman Cutting Rails

A trackman, while cutting a rail with a sledge hammer and cold chisel, was injured by a piece of steel which was chipped off and driven into his eye. A rule of the company required that goggles, provided for that purpose, should be worn when cutting rails, and goggles were in the toolhouse when the accident occurred. A short time before the accident, while cutting other rails, a piece of steel chipped off and struck this man on the wrist. On the day of the accident he told his foreman that he wanted something to protect his eyes, and the foreman replied, "Go on, that is all right; we never use them." Fearing to lose his job, he did as he was directed. In an action for his injuries the Circuit Court of Appeals, Eighth Circuit, holds that the plaintiff could not recover, for three reasons: (1) Because there was undisputed evidence that the company by adopting the rule and by providing the goggles had exercised reasonable care to discharge its duty; (2) as the work of cutting the rails was merely operation, the foreman was the plaintiff's fellow servant, for whose negligence the railroad was not liable; and (3) as the danger was obvious to the plaintiff, having been brought to his attention by the previous chip of steel which struck him in the wrist, he assumed the risk, and the company was not liable, though the foreman be treated as a vice principal.—*Union Pacific v. Marone*, 246 Fed., 916. Decided October 26, 1917.

Redemption of Unused Tickets

In an action to recover the value of a ticket and a penalty of \$100 under Iowa Code, Sec. 2,128c., for failure to redeem unused tickets, it appeared that the plaintiff bought a ticket over the Chicago & N. W. from Ottawa to Turin, but because of the lateness of the train abandoned his proposed passage and got there some other way. Five days later he presented his ticket to the agent from whom he had bought it and demanded the return of the fare, 14 cents. His demand not having been complied with within 10 days he brought action. The principal question was whether the company's rules were reasonable. The statute requires railroads to redeem unused tickets within 10 days from date of sale at the place of purchase and six months from date of sale at the general passenger agent's office. It requires the "provision and privilege of redemption" to be conspicuously

posted at each office. The defendant company's rules, properly posted, called for written notice, "stating reason why ticket was not wholly used and certifying that passage was not received for any portion stated to be unused." Blank forms were furnished to the ticket agent for use by claimants. The Iowa Supreme Court holds that these rules are a reasonable compliance with the requirements of the statute. "It would be an idle ceremony to require the railway to post conspicuous notices for the information of ticket holders if the rules thus published had no influence upon the course to be followed by them in demanding redemption. . . . The agent proposed to take the ticket and send it to the general passenger agent for redemption. The plaintiff refused to permit this to be done because the ticket constituted his evidence. The plaintiff had not, in fact, observed the posted notice, and did not, in fact, know of the regulations of the company. This fact would have its importance as bearing upon the good faith of the plaintiff, which is unquestioned in this case, but it cannot be made effective to penalize the defendant. The plaintiff was necessarily charged with notice of the regulations. While such rule of constructive notice might operate harshly in some cases where a ticket holder was ignorant and unable to read, such harshness is absent as to the plaintiff, who is one of the foremost lawyers in his county." It was therefore held the plaintiff's suit was premature, as his demand should have conformed to the company's regulations; and judgment for the plaintiff was reversed.—*Prichard v. Chicago & N. W.* (Iowa), 166 N. W., 299. Decided February 9, 1918.

Loss by Act of God; Unprecedented Flood

The New York Court of Appeals, reversing the judgment of the Appellate Division (167 A. D., 738, 153 N. Y. Supp., 374), has decided in favor of the railroad in an action for the loss of goods destroyed in the New York Central freight yard at Troy in the flood of March 26, 1913, by fire from a car of unslaked lime. The court holds that the Carmack Amendment, making the railroad liable to the shipper of interstate freight for loss caused by it and prohibiting relief by contract from such liability, does not change the common law rule as to the effect of the act of God in excusing the railroad from loss resulting approximately therefrom. The court says: "In both the state and the United States courts where proof is given that goods are damaged in the hands of the carrier, the burden is upon him to show that the damage arose from some cause for which he was not liable. They differ, however, in this: In the United States courts where the carrier shows that the loss was occasioned by the act of God, he has done all that is required. If the shipper then claims that the carrier's negligence also directly contributed to the injury, he must show that fact. In New York, on the other hand, the burden is upon the carrier to show both the act of God and his own freedom from contributing negligence. *Michels v. N. Y. C.*, 30 N. Y., 564, 86 Am., Dec., 415; *Read v. Spaulding*, 30 N. Y., 630, 86 Am., Dec., 426. That is the only distinction. Both jurisdictions hold that to relieve the carrier the act of God must be the immediate, direct and efficient cause of the loss. Neither excuses him if his own negligence also directly and proximately contributes to the result. They may have differed as to when negligence did so directly contribute, as in the case of delays. Not as to the rule, only as to its application. *Condit v. Grand Trunk*, 54 N. Y., 500; *Cormack v. N. Y. N. H. & H.*, 196 N. Y., 442, 90 N. E., 56, 24 L. R. A. (U. S.), 1,209, 17 Ann. Cas., 949; *St. Louis I. M. & S. v. Com. Un. Ins. Co.*, 139 U. S., 223, 11 Sup. Ct., 554, 35 L. Ed., 154; *R. R. Co. v. Reeves*, 10 Wall., 176, 19 L. Ed., 909. As to the question of proximate cause, when we have to do with interstate shipments we must follow the United States courts." The court finds that the carrier's negligence did not directly contribute to the loss. "We must hold that any alleged delay on the part of the defendant, or any action on its part in placing the car near the car of lime, even were there evidence of negligence with regard to such delay, or with regard to placing the car, was not the proximate cause of the loss. Nor is there any evidence that the defendant knew or should have known that the car was in danger at the time it placed it in the yard, or in time to have permitted its removal. The flood was unprecedented, as has been said, and no such warning was given, so far as appears, and no such physical conditions existed, as to allow a jury to impute this knowledge."—*Barnet v. N. Y. C. & H. R.* (N. Y.), 118 N. E., 625. Decided January 8, 1918.

Equipment and Supplies

Locomotives

THE CANADIAN GOVERNMENT RAILWAYS are expected to place orders shortly for 150 locomotives, 100 to the Montreal Locomotive Works, and 50 to the Canadian Locomotive Company.

UNITED STATES GOVERNMENT LOCOMOTIVES.—The Central Advisory Purchasing Committee of the Railroad Administration will hold a meeting in Washington next Monday with the manufacturers of locomotive specialties to consider the specialties to be used on the government's standard locomotives.

Freight Cars

J. R. WALSH, Savannah, Ga., is inquiring for 5 to 10 8,000-gal. capacity tank cars.

THE NEW JERSEY ZINC COMPANY, New York, is inquiring for 4 Goodwin Class C dump cars.

THE RONAKA PETROLEUM COMPANY, Tulsa, Okla., is inquiring for 100 10,000-gal. capacity tank cars.

THE CHICAGO, MILWAUKEE & ST. PAUL has been authorized by the Railroad Administration to build 5,000 freight cars in its own shops.

THE CANADIAN GOVERNMENT has placed orders for 8,150 freight cars as follows: Canadian Car & Foundry Company, 5,000 40-ton steel frame box cars, 450 40-ton, wooden ballast cars and 300 30-ton stock cars. Eastern Car Company, 750 40-ton steel frame flat cars and 650 50-ton coal cars; National Steel Car Company, 1,000 40-ton steel frame box cars. Other cars, including refrigerator, tank and passenger cars, are also expected.

UNITED STATES GOVERNMENT.—The United States Railroad Administration on Monday asked car builders to submit prices by Wednesday, March 27, on 100,000 cars to be built to standard specifications which were given to builders at a conference that day. Probably 50,000 more cars will be ordered in the next six months.

It is understood that the 100,000 cars to be ordered at this time will include 50,000 box, 25,000 gondola and 25,000 hopper cars.

The specifications and plans issued by the director general on Monday cover eight types of cars, as follows:

- 40-ton steel underframe, double sheathed box car.
- 40-ton steel underframe, single sheathed box car.
- 50-ton steel underframe, single sheathed box car.
- 50-ton steel high side gondola with 8 drop doors.
- 50-ton composite high side gondola with 8 drop doors.
- 70-ton steel low side gondola car with drop ends.
- 55-ton hopper car.
- 70-ton hopper car.

These specifications are particularly broad and those parts which are possible of interchange have been made common to all of the cars. An item under "material options" in all of the specifications, to the effect that the specialties to be used will be as covered in the contract, indicates that the government intends to maintain a liberal policy in this respect.

Further details concerning the design and specifications will be found elsewhere in this issue.

The car builders met with the purchasing committee on Monday regarding the 100,000 car purchase, and it is reported that the committee will meet with the car specialty men to consider the specialties to be used on these cars in the latter part of the week.

Signaling

THE LEHIGH VALLEY has ordered from the General Railway Signal Company, an interlocking machine, to be installed at Easton, Pa.; 38 working levers, style A.

Supply Trade News

This week's Railway Age contains articles of special interest to railway supplymen as follows:

Organizing the Supply Industry—an editorial, page 775.
Specifications for the United States Standard Cars, page 785.
China's Greatest Need Today Is Transportation, page 797.

Next week's issue will be a Special Quarterly Issue and will contain several articles that railway men will ill afford to miss. There will be articles on the railway supply industry's part in the recent developments of the day, a number of articles on export trade in railway supplies—a matter which is receiving increasing attention on the part of progressive railway supply manufacturers—as well as many other articles on the general railway problems that are proving of prime importance at the present moment.

Warren R. Roberts, president of the Roberts & Scheaffer Company, who has been a major in the emergency construction division of the Quartermaster Reserve Corps at Washington, has been promoted to lieutenant-colonel.

Richard Ward Baker, superintendent of outside construction, of the Watson-Stillman Co., New York, died March 24, at his home at Roselle, N. J., at the age of 68 years. He spent his entire business life in the services of the Watson-Stillman Co., having entered its employ at the age of 14, finally becoming superintendent, which post he held for many years. Upon the completion of 50 years' service in 1914, the Board of Directors of the Watson-Stillman Co. celebrated the event by the presentation of a substantial check and an engrossed copy of the resolution setting forth the company's appreciation.

Pettibone-Mulliken Company

The Pettibone-Mulliken Company, Chicago, reports net earnings of \$1,682,354 for 1917, as compared with \$617,751 in 1916. The surplus, after all charges and deferred dividends, amounted to \$628,458, as compared to \$178,724 available for dividends on the common stock in the previous year. The income accounts for the two years follow:

| | 1917 | 1916. |
|--|-------------|-----------|
| Manufacturing profits, less maintenance, taxes, selling and administration expenses..... | \$1,669,002 | \$606,151 |
| Interest, dividends, etc., received..... | 13,151 | 11,591 |
| Net income..... | 1,682,354 | 617,751 |
| Surplus carried forward..... | 398,059 | 225,335 |
| Total..... | 2,080,413 | 843,086 |
| First preferred dividend, 7 per cent..... | 112,072 | 122,500 |
| Second preferred dividend, 7 per cent..... | 59,890 | 52,500 |
| Depreciation of plant..... | 100,709 | 95,000 |
| First preferred stock sinking fund..... | 500,235 | 175,000 |
| Excess profits and income taxes..... | 440,000 | |
| Surplus..... | 1,067,517 | 398,059 |

Trade Publications

STONE FRANKLIN LIGHTING EQUIPMENT is the title of an instruction book and part catalogue just issued by the Franklin Railway Supply Company, Inc., 30 Church Street, New York. The first part of the book contains illustrations and wiring diagrams of the different types of Stone-Franklin car lighting equipment. Following this there are given information pertaining to terminal inspection, some condensed maintenance information, instructions for the application of generators and detailed statements of the principal features to be observed in operating and maintaining the equipment. The latter part of the book is given over to a complete list of parts. Cross-section drawings of the generators show exactly where these parts are located. The book contains many illustrations and will be found to be of much value to all users of Stone-Franklin lighting equipment.

THE UNITED STATES NAVY in the year ending June 30, 1916, used 47,000,000 gallons of oil fuel.

Railway Construction

ALABAMA INTERURBAN.—A contract has been given to A. T. Newell & Brothers, Birmingham, Ala., to build this line. The plans call for building a double track main line between lock 17 on the Warrior river and Birmingham, Ala., also numerous spurs to reach ore, coal and timber lands.—T. L. Cannon, managing director, Birmingham (March 1, p. 480).

HAVRE DE GRACE & TANEYTOWN ELECTRIC RAILWAY.—Incorporation has been granted to this company to build an electric line from Havre de Grace, Md., on the Baltimore & Ohio and the Pennsylvania Railroad, west via Towson to Finksburg, thence northwest via Westminster to Taneytown, on the Pennsylvania Railroad, about 70 miles. C. Stanley Stirling, president, 423 Calvert building, Baltimore.

MORGANTOWN & WHEELING.—This company is planning to carry out improvements during 1918 to reduce the grades to a maximum of 1.2 per cent and the curvature to a maximum of 16 degrees. The work will also include relocating the main track between Randell and Cassville, and building one steel bridge 100 ft. long and another 70 ft. long.

NASHVILLE, CHATTANOOGA & ST. LOUIS.—This company recently completed a line from Hermitage, Tenn., to Hadley's Bend, 7.1 miles in 28 days. The new line will serve a \$60,000,000 powder plant of the government. The work involved 67,000 cu. yd. of embankment and 8,000 cu. yd. of excavation, as well as the construction of two large trestles, one over 1,000 ft. and the other 800 ft. long. The first day's work was done with two grading gangs numbering 50 men each. Because of the pressing need of the speedy completion of the line, the forces were rapidly increased until the number of men employed on work totaled 3,360.

TAMIAMI RAILWAY.—Construction work is to be started at once on this projected line, from Miami, Fla., west to Chevelier about 65 miles, thence northwest to Fort Myers, an additional 75 miles. There will be one steel bridge over the Miami river. The promoters expect to develop a traffic in lumber, farm products and sea food. J. F. Jaudon, president; F. K. Ashworth, chief engineer, Miami.

SOUTH MANCHURIA ROLLING STOCK.—The South Manchuria Railway Company has planned to construct eight hundred freight cars and three hundred locomotives as a piece of continuation work extending over the fiscal years of 1918 and 1919. This rolling stock construction program has been further supplemented by the intended construction of three hundred freight cars and one hundred locomotives for the exclusive purpose of transporting coal and materials for the Anshan Steel Works.—*The Far Eastern Review.*

NEW RAILWAYS FOR JAPAN.—The Japanese Railway Council at an extraordinary meeting January 18, adopted in toto Baron Goto's project for the construction of 589 miles of cross-country railways in Japan to link the present trunk lines. The Council voted a special appropriation of nearly \$46,000,000, which, added to \$62,500,000 previously appropriated, releases \$108,500,000 during the next ten years for the construction of these new lines. In addition to the \$121,000,000, which the present railway lines have standing to their credit in the form of appropriations already made for expenditure in improvements, the Council voted a special appropriation of \$9,000,000, totaling \$130,000,000 for improvements. Of this \$9,000,000, somewhat over half is to provide for the rising cost of rolling stock, and \$4,300,000 is to be expended in the widening of tunnels and in the widening of the space on the roadbed between the double tracks. This is done so that in the future, no physical obstacles will stand in the way of the installation of a broader gage. The Council's action, combined with previous appropriation yet unspent, provides that an expenditure of \$238,789,357 for building new railways and improving the present ones within the next ten years has been assured.—*The Far Eastern Review.*

Railway Financial News

CHESAPEAKE & OHIO.—The directors of this company, at their meeting on March 21, voted to appropriate out of the net earnings for the twenty months ended December 31, 1917, \$7,500,000 for property expenditures under the agreement made with Kuhn, Loeb & Co. and the National City Company in the spring of 1916 for the purchase of \$40,180,000 of the railroad's thirty-year 5 per cent convertible bonds. By this action the company anticipated its requirements for expenditures on additions and betterments by more than a year, as the agreement with the bankers stipulated that the road had until June 1, 1919, in which to spend the full \$7,500,000. In all the Chesapeake & Ohio agreed to spend \$15,500,000 to meet the requirements of the bankers before they would consent to underwrite the convertible bonds. The larger part of this issue was set aside to pay off \$33,000,000 five-year 5 per cent notes that mature on June 1 next year. Frank A. Trumbull, chairman of the board of directors, announced after the meeting that the surplus for the twenty months ended December 31, after the reserve for betterments had been set aside, amounted to \$1,768,500. "Thus we have done in twenty months," he said, "what we were allowed to do in three years."

CINCINNATI, FINDLAY & FORT WAYNE.—This road, which had been ordered discontinued by the district court at Cincinnati, will be kept running by the government, having been included among the government controlled roads.

GEORGIA & FLORIDA.—J. F. Lewis, president of the Citizens Bank of Valdosta, Ga., and his brother, E. S. Lewis, of Montezuma, Ga., have bought the interests of the Baltimore Trust Co. in the Georgia & Florida Railroad.

GULF, MOBILE & NORTHERN.—At the annual meeting of the stockholders of the company the following directors were elected for the ensuing year: John W. Platon, Charles K. Beekman, William H. Cloverdale, Joseph S. Dale, C. H. Murphy, New York; W. F. Owen, J. C. Rich, Mobile, Ala.; A. H. S. Post, T. Nelson Strother, Baltimore, Md.; I. B. Tigrett, Jackson, Tenn.; and Frederick W. Scott, Richmond, Va.

OREGON SHORT LINE.—W. A. Harriman, vice-president of the Union Pacific System, has been made a member of the executive committee and also elected a director of the Oregon Short Line, succeeding R. S. Lovett, resigned.

OREGON-WASHINGTON RAILROAD & NAVIGATION COMPANY.—C. A. Peabody, vice-president of the Delaware & Hudson, has been elected a director of the Oregon-Washington Railroad & Navigation Company, succeeding R. S. Lovett, resigned.

GOVERNMENT CONTROL OF COPPER IN SWEDEN.—By a decree dated January 18, effective the same day, the Swedish Government takes control of all trade in copper and copper scrap, including copper unmanufactured or in the rough, electrolytic copper, as well as all scrap or waste containing copper, such as copper scrap, brass scrap, nickel (white metal) scrap, britannia (yellow metal) scrap, and all other scrap in which copper forms a part.—*Commerce Reports.*

LONDON FOG CAUSES RAILWAY ACCIDENTS.—The densest fog for over 30 years occurred in the southwestern districts of London on the evening of Thursday, January 31. Road traffic was practically stopped, and railway transport completely disorganized. Many railway passengers fell off the platform, and three were killed from this cause on the Metropolitan District Railway.—*The Engineer, London.*

PROJECTED STEEL WORKS FOR NORWAY.—The village of Risør, Norway, which is between Christiansand and Christiania, is projecting steel works and roller mills to turn out 30,000 to 40,000 tons per year. It will utilize as far as possible electric power and electric heat for smelting. This will be derived from the Høne Falls, the first transmission project being 22,000 horsepower.—*Commercial Reports.*

ANNUAL REPORT

CANADIAN PACIFIC RAILWAY COMPANY—THIRTY-SEVENTH ANNUAL REPORT

To the Shareholders

The accounts of the Company for the year ended December 31st, 1917, show the following results:—

| | |
|---|------------------|
| Gross Earnings | \$152,389,334.95 |
| Working Expenses | 105,843,316.50 |
| Net Earnings | \$46,546,018.45 |
| Deduct Fixed Charges | 10,229,143.43 |
| Surplus | \$36,316,875.02 |
| Contribution to Pension Fund | 500,000.00 |
| | \$35,816,875.02 |
| Deduct Net Earnings of Pacific Coast Steamships, Commercial Telegraph, and News Department, transferred to Special Income Account | 1,968,682.56 |
| | \$33,848,192.46 |
| From this there has been charged a half-yearly dividend on Preference Stock of 2 per cent., paid October 1st, 1917 | \$1,613,638.42 |
| And three quarterly dividends on Ordinary Stock of 1 1/4 per cent. each, paid June 30th, 1917, October 1st, 1917, and December 31st, 1917 | 13,650,000.00 |
| | 15,263,638.42 |
| | \$18,584,554.04 |
| From this there has been declared a second half-yearly dividend on Preference Stock, payable April 1st, 1918 | \$1,613,638.42 |
| And a fourth quarterly dividend on Ordinary Stock of 1 1/4 per cent., payable April 1st, 1918 | 4,550,000.00 |
| | 6,163,638.42 |
| Leaving net surplus for the year | \$12,420,915.62 |

In addition to the above dividends on Ordinary Stock, three per cent. was paid from Special Income.

SPECIAL INCOME FOR YEAR ENDED DECEMBER 31st, 1917

| | |
|--|-----------------|
| Balance at December 31st, 1916 | \$12,872,451.54 |
| Less: Dividend paid March 31st, 1917 | 1,950,000.00 |
| | \$10,922,451.54 |
| Net Revenue from Investments and Available Resources, Exhibit "C" | 2,010,911.76 |
| Interest on Deposits, and Interest and Dividends on Other Securities | 2,697,087.20 |
| Net Earnings Ocean and Coastal Steamship Lines | 3,724,720.27 |
| Net Earnings Commercial Telegraph and News Department | 2,280,580.09 |
| Rentals and Miscellaneous | \$21,635,750.86 |
| Less: Payments to Shareholders in dividends; June 30th, 1917, October 1st, 1917, and December 31st, 1917 | 5,850,000.00 |
| | \$15,785,750.86 |

From this a dividend has been declared payable April 1st, 1918, \$1,950,000.00.

The working expenses for the year amounted to 69.46 per cent of the gross earnings, and the net earnings to 30.54 per cent, as compared with 63.30 and 36.70 per cent, respectively, in 1916.

3. The sales of agricultural land in the year were 789,055 acres for \$14,330,811, being an average of \$18.16 per acre. Included in this area were 58,681 acres of irrigated land which brought \$43.90 per acre, so that the average price of the balance was \$11.90 per acre.

4. Before the substantial amount of 1913 of the right of selling lands to settlers for speculative purposes. Nearly all of these purchases were in default and nothing was being done with the lands. To remedy this your Directors negotiated the cancellation of the contracts and the restoration of the lands to the Company. Some of these have already been resold to settlers, and through the Company's agency purchasers will be found for the balance at prices somewhat better than those specified in the cancelled contracts. The cancellations have been adjusted in the accounts submitted.

5. Besides the substantial amount already invested in the securities of, and loans to, Great Britain, Canada, and the United States, your Company subscribed to \$10,000,000 of the recent Canadian Victory Loan. A substantial amount has been set aside to meet the requirements of the allotment payable in the current financial year.

6. The arrangement for the redemption by the Company of Collateral Trust Bonds to be loaned to His Majesty's Imperial Treasury was abandoned for the reasons given at the last Annual Meeting of the Shareholders. As stated by the President in his address to the Shareholders the Company had, however, with due authority, issued and deposited by way of loan with the nominees of the Imperial Treasury \$40,000,000 currency 4 1/2 per cent Consolidated War Loan Stock. The period of the loan is 5 years from January 1st, 1917, but the Lords of the Treasury reserved the right to return the Stock to the Company at any time after January 1st, 1919, on giving three months' notice, or to purchase the Stock in whole or in part at 80% of its face value in New York funds or their equivalent. The annual premium of 1/2% resulting from this transaction was not taken into the revenue of the year, but was written off against the face value of the security. Apart from this the having been met from surplus revenue.

7. The gross earnings of your transportation system in the fiscal year 1917 exceeded those of the previous year by \$13,000,000, but the net earnings were less by \$4,000,000. This large addition of \$17,000,000 to the working expenses may be attributed almost entirely to the advance in wages and in the cost of fuel and materials of every description.

8. Subject to your approval, your Directors have authorized expenditures on Capital Account during the present year of \$3,200,000, apportioned to the following works, viz.:—Replacement of temporary structures on branch lines by permanent work, \$512,000; transfer slip at Vancouver, additional coaling plants, small stations and section houses, \$815,000; interlocking and protective signal apparatus, \$160,000; additional terminal and side track accommodation, \$450,000; and a variety of additions and improvements to the property designed to secure greater convenience and economy, \$1,263,000.

9. The undermentioned Directors will retire from office at the approaching Annual Meeting. They are eligible for re-election.

MR. I. K. J. ROSS,
 RT. HON. LORD SHAUGHNESSY, K.C.V.O.,
 SIR THOMAS SKINNER, BART.

For the Directors,
 SHAWNEE
 President and Chairman.

MONTREAL, March 11th, 1918.

Sending Aeroplanes Back for Repairs

Railway Officers

Executive, Financial, Legal and Accounting

H. G. Strode has been appointed auditor of the Pittsburgh & West Virginia and the West Side Belt, with office at Pittsburgh, Pa., vice **F. J. Brummer** resigned.

Operating

G. W. Nelson has been appointed superintendent of dining cars of the Northern Pacific, with headquarters at St. Paul, Minn., vice **H. J. Titus**, resigned to go into other business.

E. L. Gamble, general agent of the Western Pacific at Stockton, Cal., was appointed manager, in charge of operation and traffic of the Tidewater Southern, with same headquarters, succeeding **W. C. Peck**, resigned.

A. D. Parsons, assistant superintendent of terminals of the Erie, with office at Jersey City, N. J., has been appointed superintendent of the Wyoming division, with headquarters at Dunmore, Pa., succeeding **J. W. Foote** who is now in the United States service in the engineering department.

F. A. Rutherford, trainmaster of the Grand Trunk, with office at Durand, Mich., has been appointed inspector of transportation, with headquarters at Montreal, Que., and **T. J. Wrennich** has been appointed superintendent of terminals, with office at Black Rock, N. Y., in place of **T. W. Saunders**, resigned to take service with another company.

E. L. Wise, trainmaster of the Louisville & Nashville, has been promoted to assistant superintendent with headquarters at Ravena, Ky.; **J. H. Fish**, assistant trainmaster of the same road at Earlington, has been promoted to trainmaster, succeeding **Mr. Wise**, and **Steve Mothershead**, general yardmaster at Earlington will become assistant trainmaster.

Traffic

William Fitzgerald, assistant general freight agent of the Chesapeake & Ohio, the Chesapeake & Ohio of Indiana and the Chesapeake & Ohio Northern, with office at Chicago, having been transferred to Richmond, Va., in the same position, **H. P. Hathaway** will, in addition to his duties as general agent of the Kanawha Dispatch and the Blue Ridge Dispatch Fast Freight Lines, act as general agent of these companies; effective March 15.

Engineering and Rolling Stock

C. S. Henning has been appointed chief engineer of the New Mexico Central, with office at Santa Fe, N. M.

T. Devaney has been appointed master mechanic of the Toledo, St. Louis & Western, with office at Frankfort, Ind.

W. C. Pembroke, assistant engineer of the Coal & Coke, with office at Elkins, W. Va., has been appointed engineer maintenance of way, vice **W. C. Hawkins**, resigned.

Thos. B. Dickerson has been appointed acting superintendent of shops of the Central of New Jersey, with office at Elizabethport, N. J., vice **G. L. Van Doren**, resigned.

A. R. Eitzen, formerly office engineer in the bridge department of the Kansas City Terminal, and more recently with the Kansas City Bridge Company, has been appointed bridge engineer of the Missouri, Kansas & Texas, with headquarters at Dallas, Tex.

J. W. Peck, signal supervisor of the Missouri, Kansas & Texas, with headquarters at Waco, Tex., has been appointed general signal inspector, of the Chicago Great Western, with office at Chicago, succeeding **W. J. Mullins**, who has entered government service. **J. A. Murrell**, signal foreman, has been appointed supervisor to succeed **Mr. Peck**.

E. E. Goddard has been appointed supervisor of signals of the St. Louis division, of the Illinois Central, with headquarters at Carbondale, Ill., succeeding **P. G. Pendorf**, who

has resigned to accept a position with the sales department of the Buda Company, with headquarters at Chicago. **A. H. Keller** was appointed supervisor of signals, with headquarters at Champaign, Ill., to succeed **R. J. Frost**, resigned. The above changes were effective March 16.

R. N. Clark, assistant engineer on the Missouri Pacific, has been promoted to assistant engineer in the office of the engineer maintenance of way, at Kansas City, Mo., succeeding **C. A. Hewes**, who becomes assistant engineer of the Kansas City Terminals. **E. H. Hawkins**, assistant engineer of the South Kansas division, with headquarters at Coffeyville, Kan., has been transferred to the North Kansas division, succeeding **Mr. Clark**. **R. H. Hallsted**, assistant engineer of the Kansas City Terminal, becomes general roadmaster of the Omaha division with headquarters at Falls City, Neb., succeeding **C. O. Congdon**. **R. P. Hayes** has been appointed assistant engineer of the Joplin division and **Mr. Freeland** has been appointed assistant engineer of the South Kansas division, succeeding **Mr. Hawkins**.

Purchasing

Thomas Spratt, assistant purchasing agent of the Norfolk & Western, with office at Roanoke, Va., will perform the duties of purchasing agent.

Railway Officers in Government Service

C. A. Lahey, assistant general freight agent of the Chicago, Milwaukee & St. Paul at Chicago, has been appointed assistant director of transportation of the Food Administration, with headquarters at Washington.

F. A. Bushnell, purchasing agent of the Great Northern, has been appointed a member of the western regional purchasing committee, in place of **Ira O. Rhoads**, of the Southern Pacific.

Obituary

W. L. McWhirter, division freight agent of the Atchison, Topeka & Santa Fe, Texas Lines, with headquarters at Fort Worth, Texas, died in that city on January 7.

C. J. Kulp, treasurer of the Lehigh Valley, with office at Philadelphia, Pa., died at his home in that city on March 23 at the age of 55. He was born in Philadelphia, and entered the service of the Lehigh Valley in 1887 as a clerk in the accounting department. In 1910 he became assistant treasurer, and since 1915 had been treasurer of the road.

Francis Fisher Flagg, first vice president of the American Express Company, and president of the National Express company, with office at New York, until his resignation on March 1, 1918, because of ill-health, died on March 26, at his home in Pelham Manor, N. Y., at the age of 67. Mr. Flagg was also a Director of the Westcott Express Company.

S. C. Stickney, assistant to vice-president of the Erie, with office at New York, died on February 20, at his home in Englewood, N. J. He was born in 1865, in Minnesota, and began railway work in 1886 as locating engineer on the Chicago, St. Paul & Kansas City, now the Chicago Great Western. From 1894 to 1909, he was general manager of that road, and from September 1905, to March 1909, also second vice-president. He later engaged in special work under the vice-president of the Erie and at the time of his death was assistant to vice-president of that road.

Sir Collingwood Schreiber, for 12 years chief engineer of the department of railways and canals of the Canadian government and for several years before that chief engineer of the Canadian Pacific, died at Ottawa on March 23. He was born in Essex, England, on December 14, 1831. He came to America in 1852, and his first railroad service was as assistant engineer on the Hamilton & Toronto, now a part of the Grand Trunk. This was from 1852 to 1855. In 1860-1862 he was superintending engineer of the Northern Railway, Canada; in 1873 was appointed chief engineer of the Canadian Government Railways, and in 1880 became chief engineer of the Canadian Pacific. From 1893 to 1905 he was deputy minister and chief engineer of the Department of Railways and Canals. He had also served as superintendent of construction on the Grand Trunk Pacific.

EDITORIAL

Railway Age

EDITORIAL

Announcement of the opening of the third Liberty Loan campaign will be found elsewhere in this issue. It is vitally

Third Liberty Loan Campaign

important that the campaign be a striking success in order to encourage and back up our boys on the other side who are rushing into the thick of the fight. It is necessary also in order to discourage and wipe out the insidious German propaganda which is tirelessly at work throughout our nation. That the loan will be a success is assured by the businesslike and thorough way in which our people as a whole are planning for the campaign. One evidence of this may be found in our advertising pages. At a time when advertisers would naturally want to use their space for telling of the advantages of their equipment and devices, they have used this space fully and generously in order to advertise and push the loan. Let each one of us do our full duty in making the campaign a big success.

The present issue of the *Railway Age* is devoted largely to reviewing the developments in the railway and the railway

The Quarterly Review Number

supply field during the first three months of 1918, and is therefore called a "Quarterly Review Number." We have believed that developments are occurring so rapidly that it is worth while to make a survey of them at shorter intervals than has been our custom in the past. But the issue is not devoted entirely to review matter. Rather, it is devoted to an attempt to project the developments of the quarter of a year just closed into the future largely as a means of estimating where prevailing tendencies are carrying us. Both the officers of railways and those of railway supply companies have under present conditions more difficult problems to solve than they ever have had before. Full, frank, fearless discussion of these problems and presentation of the facts bearing upon them is essential to their proper solution; and the reader, whether railway or railway supply man, will, it is believed, find in the present issue many facts and much discussion which will be of interest and value to him.

This week's issue of the *Railway Age* is in two sections. The first section is a quarterly review of affairs in the railway world; the second is a discussion

The Investment Economist Section

of the effect which the political and economic events of the last few months have had on investment securities. While, of course, somewhat the large part of this discussion deals with railway securities, the broad field of corporation, municipal and national investment securities is included in the scope of the paper. The

new section is devoted to the science of the utilization of wealth as capital. The distinction between wealth and capital is that capital is wealth used to produce more wealth. Idle wealth is not capital. There are a number of millions of people in the United States who made the first investment of their lives in one or other of the Liberty Loan offerings. It may well be that the motive leading to this investment on the part of a large number, even a majority of these subscribers was patriotism rather than a desire to save and to utilize their savings as an investment. Nevertheless, whatever the initial motive may have been, the fact is that these people are now investors; they have been given a taste and a new appetite has been created.

While the war lasts, this appetite will be fed almost exclusively by the sale of government bonds. With the end of the war will come a cessation of government offerings, and the stimulus of patriotism as an incentive to investment will be withdrawn. It would be a national calamity, however, if the capacity for saving and investment created under war conditions was allowed to die out in peace times for lack of stimulation. The public's interest in saving and investment must be sustained. It will be the object of the Investment Economist section of the *Railway Age* to help arouse this public interest, to strengthen it and educate it while the war lasts and to try to maintain it after the war ends.

Railroad Supply Industry and the Government

THE RAILROAD SUPPLY INDUSTRY is one of the largest industries in America. It has been built up to its present magnitude to make and furnish equipment, devices and supplies of all kinds to railways. It represents an investment of billions of dollars. The securities of the numerous companies composing it are held by people throughout the United States. It has large and small manufacturing plants scattered all over the country. It is estimated that it normally employs a million and a half men. So large and important an industry is entitled to demand and to receive fair treatment from the government. The public cannot afford to have the government treat it otherwise.

Reports from Washington are arousing great apprehension that the government does not intend to treat the railway supply industry fairly or intelligently or to the best advantage of the government. The Railroad Administration has made the specifications of the locomotives and cars. It is preparing to order wide enough open to give all the manufacturers of the various kinds of specialties with which they are to be equipped a chance to bid for business. That is a fair and sound policy. But, this having been done, the Railroad Administration's purchasing department called the makers of locomotive and car specialties to Washington this

week, and asked them, in bidding for business, to relinquish their patents, to forego their royalties on patented devices, and to lay before it all their cost accounts. The apparent purpose is to force the prices the government must pay down to the lowest possible basis.

Twelve years ago the government passed the Hepburn railroad rate regulation act, and began to pursue the policy of forcing railway rates down to the lowest basis it could without having the courts hold them confiscatory. Everybody knows the results. Railroad credit was destroyed; railroad expansion was stopped; in the midst of the greatest of all wars, transportation facilities have proved entirely inadequate to the country's needs; and because of the government's own stupid, restrictive, destructive policy it has had to take control of railroad operation and guarantee the financial return of the railways for the period of the war.

The railway supply industry has suffered greatly for ten years from the government's restrictive policy in dealing with its market, the railways. Does the government now intend to go still farther, and, by directly attacking the railway supply industry itself, complete the destruction of its prosperity? Is it so well pleased with the results of its regulation of railways that it considers it desirable to apply a like policy to a related industry? Does the public think the government's methods in regulating the railways have conferred such great benefits upon the nation that it will hail with satisfaction the prospect of the prescription of the same medicine for a very important part of the manufacturing industry?

What would the pooling of patents and the renunciation of royalties upon patented devices mean? The railway supply companies always have done business under conditions of intense competition. When, in a highly competitive field, a concern succeeds in developing and securing a substantial market for a patented device, that is an almost infallible sign that the device has merit in proportion, or more than in proportion, to the prices for which it has been sold. If a device has been worth to the railways what it has been sold to them for under private control, it must be worth an equal amount to them under government control. If so, how can the government, under government control of railways, fairly use its monopoly power to beat down the prices of railway supplies? To do so would be to deprive numerous companies of profits to which they are entitled by virtue of the enterprise and the ability which have been shown in their management. How does the government expect supply companies to forego their royalties? The various companies are under contract to pay the royalties to the inventors of the devices; and these contracts can not be abrogated without the consent of the inventors.

The officers of the railways of America deserve the highest praise for the receptiveness they have always shown to new devices the adoption of which would promote the technical development of the railroad machine. But the greater part of the work of originating and developing new and improved devices, whether parts of track, or signalling apparatus, or rolling stock, has been done by the railway supply concerns. They have taken commercial risks in carrying on this work; they have met with innumerable failures as well as successes; and every failure has meant loss of capital to them.

Their only incentive in carrying on this work and taking these risks has been the prospect of profit. To the enterprise and initiative of railway owners and managers, and of railway supply company owners and managers, the American public owes the fact that today our railways are able to handle traffic cheaper, while paying higher wages than any other railways in the world. The partial withdrawal of the incentive of prospective profit has stopped the expansion of our railroads. The withdrawal of the same incentive from the railway supply business will speedily interfere with the technical development of our railroads. Unfair and arbitrary treatment of the supply companies by the government will also speedily affect adversely the welfare of every community in which their plants are located and that of all their employees, as well as of their stockholders. It will be economically harmful as well as morally wrong.

It is hard to believe that Director General McAdoo will finally carry out a policy such as now seems to be contemplated. Such a policy would be highly inconsistent with what he said to George A. Post, president of the Railway Business Association, as reported in the *Railway Age* of March 15, 1918, page 559. The railway supply interests should recognize the fact, however, that it is high time for them to strongly organize to protect their interests. They are engaged in an absolutely legitimate and extremely important business, a business whose efficiency and prosperity is just as important to the nation during the war as that of mining coal, or farming, or operating a railroad. They should go as far as the government can reasonably ask in co-operating with it and subordinating their interests to those of the public, but they should not surrender rights which other essential industries are not being asked to surrender, and the surrender of which might mean not merely temporary adversity for the supply industry, but a permanent loss to the industrial efficiency of the country. They should not, in a moment of panic, give up what the government cannot, without a gross and indefensible abuse of power, exact.

Will Aircraft Conditions Be Repeated on the Railroads?

THE NATION'S AIRCRAFT production program has come in for a great deal of notoriety during the last two weeks because of the disclosures in the Senate relative to the extravagant statements appearing in the captions of some photographs of aircraft production issued by the Committee of Public Information. It is apparent that the results so far obtained in the production of aircraft are exceedingly inadequate. After a year of nominal warfare the net result of all the planning and promises of enormous quantity production is practically nothing. Whatever contributing causes there may be to this situation, it is evident that the scheme of standardization which found expression in the so-called Liberty motor has failed to accomplish the result for which it was adopted, i. e., enormous and rapid production of effective aircraft. Indeed a suspicion is beginning to be voiced that not enough advice was sought from expert air men and too much from engine builders when the standardization scheme was formulated.

The director general of railroads has now had the task of supervising the operation of the railroads of the United States for three months. In that short space he has formulated a plan for an innovation in railroad practice which had never before even been seriously discussed by men in the business—the general standardization of locomotives. The director general, who is also secretary of the treasury and holds several other important offices, is a very capable but a very busy man. It is inconceivable that he can have given more than superficial consideration to some of the many matters of vast import of which he has the duty of final settlement.

The standardization of locomotives is a plan all of the advantages of which appear on a superficial inspection. Indeed, they are readily grasped by the public mind, just as was the standardization of aeroplane motors. But begin to study the whole bearing of such a plan, not on production of locomotives or first cost alone, but on the whole problem of railroad transportation, and the apparent advantages rapidly disappear. The locomotive is no more a machine complete in itself than is an aeroplane motor without the rest of the aeroplane. It is but one part of a vast and complicated instrument with all the other parts of which it must mesh if the whole is to function smoothly and produce the kind of results that ought to be produced now. And on every railroad the relation of all these parts is different. But apparently an attempt is to be made to force the same set of standard locomotives into all of these different machines and make the rest of the parts strain themselves into conforming shape.

It now appears possible that conditions similar to those apparently existing in the case of aircraft production may soon exist in the case of the railroads. One of the great needs of the railroads is locomotives; they need them immediately and they need all and more than they can get—not next year, but before next winter. With space soon to become available in the plants of the builders, the standard locomotive designs are not yet in final shape and today there have been no orders placed for material by the builders for use in building locomotives ordered this year. After all the details for the standard locomotives are finally settled there still remains a large amount of work to be done by the builders before production can begin; there are patterns, templates and formers to be made and castings to be secured, and there is a variety of material to be secured in a market already plentifully affected by priorities. Before production can be started, the builders are confronted with all the preliminary work required on a number of entirely new classes of locomotives equal to the number of standards finally settled upon. From now on every day of delay is piling up a loss at locomotive production which will soon overcome any possible advantage of production offered by the standardization plan. If orders for locomotives of designs already in service on the railroads in greatest need of additional power had been placed as soon as their requirements could have been canvassed, orders for material for much of the year's production might already have been placed and the builders assured of being able to take full advantage of every vacancy in shop space as it occurred.

The country needs this year locomotives to fit local con-

ditions, rather than an enormous production next year of wholesale locomotives which will not be well adapted to conditions anywhere.

Three Months of Government Control

FOR A LITTLE OVER THREE MONTHS the government has been making the most interesting and important experiment with public control of railroads which any government in the world has ever made with public control of any large industry. The general lines along which government control is going to be developed now seem to be pretty clearly defined.

The Railroad Administration in January, the first month of its existence, had unprecedented difficulties to overcome. The railways, and especially the eastern railways, were terribly congested when it took control, and the movement of traffic had been showed down to a portentous degree by government priority and preference orders. There were the uncertainty and confusion unavoidably incidental to any change of such importance; and the weather was as bad as was ever known. In consequence, the railways during the first month of control failed to earn enough to pay their operating expenses and taxes. The eastern lines did not even earn their operating expenses. This is the first time this has occurred since the Interstate Commerce Commission began to compile monthly reports of railway earnings and expenses in July, 1907.

In the matter of weather, the Railroad Administration was as peculiarly favored in February and March as it was disfavored in January. Some of the confusion and uncertainty incidental to the adoption of government control had passed. One of the first acts of the Railroad Administration was to set aside all priority and preference orders, and it adopted vigorously the policy of embargoing traffic which it did not wish to move over certain railways or which it thought it could not move at all. In consequence, the congestion on the eastern lines has been greatly ameliorated. Meantime, however, the car shortage has increased.

The railroad control bill has become a law, establishing a reasonable basis for compensating the companies for the use of their properties.

The Railroad Administration has handled the problem of passenger train service very skilfully thus far. It has reduced passenger train mileage, and at the same time so rearranged schedules as to render it possible for people to travel in reasonable comfort.

The Railroad Administration has dealt fairly and skilfully with the railway labor problem. Its Railroad Wage Commission has not yet made its report but it is understood the result will be advances in the wages of both organized and non-organized employees proportionate rather to their needs and deserts than to the amount of force it may be thought the different classes could put behind their demands. Arrangements are also being made by the creation of permanent conciliation boards to settle all questions regarding wages and conditions of employment as they come up.

The Railroad Administration is adopting, or appears to be adopting some other policies of more dubious character.

In standardizing freight cars it has done good work from the railroad point of view, and at the same time has left the specifications wide enough open to give most supply concerns a chance to bid for business. Its plans for the standardization of locomotives are far more questionable. Freight cars do and must go everywhere and be operated under every variety of conditions. On the other hand, the greatest efficiency in locomotive operation cannot be obtained unless locomotives are designed and built to be operated under special conditions. A locomotive designed and built to be operated everywhere will hardly be a highly efficient machine anywhere. Furthermore, no new type of locomotive ever works well at first. The government, by attempting to standardize locomotives, is making a dangerous experiment.

At the same time it is asking railway supply companies to relinquish their patents and forego royalties on them. There does not seem to be any more reason why the railway supply companies should have such a request made upon them than why any other class of business concerns should be asked to destroy the foundation upon which their business is built.

The director general is creating a new and very highly centralized organization in an effort to bring about the unified operation of all the railways as a single system. He has appointed able and experienced railway men to most of the important posts in his organization. He is, however, carrying centralization so far that he is depriving many important railway officers of initiative, while loading down his regional officers and the members of his staff in Washington with an amount of work which can hardly fail to un-

dermine their efficiency, if not break them down physically.

There is an evident tendency on the part of the director general entirely to sever the railway companies from the physical properties. In circular No. 16, issued on March 28, he orders that the presidents of the railroads shall in future be their operating executives under his direction, and that the chairmen of the boards and the directors shall exercise no functions connected with operation. In circular No. 17, issued on March 30, he directs that expenses incurred for corporate and financial purposes shall not be charged to operating expenses.

These orders raise some most interesting and important questions. Every railway does not have a chairman and also a president. Evidently on roads which do have both, the chairman of the board is to have nothing to say about operation, and is to get his salary, if he gets it at all, out of the company's guaranteed compensation. What about a road whose president performs both corporate and operating functions? Is he going finally to be required to choose whether he will devote himself exclusively to operating the property for the government, or exclusively to performing corporate functions for the company? If the chairmen are to have nothing to say about the operation of the roads, and if many presidents who have performed both corporate and operating functions are to cease to perform operating functions, it is evident that the government is going to lose the services of some of the ablest railway officers and that there is going to be a revolution of the railroad organizations far greater than was anticipated when President Wilson said to Congress, "Nothing will be altered or disturbed which it is not necessary to disturb."

Gen. A. A. Plate Service

Testing the Mechanism of an Allied Gun

First Three Months of Government Control

Policies Being Developed by Railroad Administration for Welding the Railroads Into a Single System

THE RAILROADS OF THE UNITED STATES have now been operated under the possession and control of the government, and under the administration of William G. McAdoo, as director general of railroads, for three months. During that time many important developments have taken place in the process of unifying and co-ordinating the roads into a single system and while the time has probably been too short to warrant any judgment as to the results obtained, ample opportunity has been afforded by means of the various statements and orders of the director general, and the various measures he has already adopted, for a study in a general way of the policies which he is inaugurating and some of the objects he is seeking to attain.

On the other hand, while a great many things have already been done under government control which could not have been done before and considerable progress has already been made toward substituting a centralized organization for the separate management that formerly existed, it is to be understood that only a beginning has been made, and many and perhaps some of the most important developments of the new regime are still under consideration and have yet to manifest themselves. Mr. McAdoo has already gone far enough to demonstrate that he does not intend to confine himself to mere supervision and a policy of supporting the separate railroad managements with the authority of the government, but he is building up an organization to operate the roads as a single system. While the railroad control law is expressly declared to be emergency legislation enacted to meet conditions growing out of the war, it is evident that the breadth of construction to be placed on such a declaration depends to a considerable degree on the assumption as to the duration of the emergency, and the policies already adopted and put into effect by the railroad administration clearly contemplate much more than a temporary status.

At the outset, after accepting the resignation of the Railroads' War Board, Mr. McAdoo appointed a temporary organization, consisting of five railway officers as advisers and assistants to him, with A. H. Smith in particular charge of operation in eastern territory. Later he effected a permanent organization, which has been described in these columns as it has developed, consisting of directors of divisions of finance and purchases, transportation, traffic, capital expenditures, labor and public service and accounting, a general assistant and a general council, and each of these departments has built up its own organization. Where the war board, in its organization, had divided the country into seven districts Mr. McAdoo created three districts, each under a regional director, and the regional directors have established organizations of their own. Numerous special committees have been appointed to carry on special investigations. In addition a vast amount of information has been called for by means of numerous questionnaires that have been sent out, so that a great deal of detail has been centered in the offices of the railroad administration at Washington. How much of this centralization and detail is attributable to the desire for obtaining information necessary for the inauguration of new policies and to what extent centralization will be made permanent has not yet been indicated.

Separation of Corporate Officers

One of the results of the new regime that has already become evident is a separation between the corporate affairs of the railroads and their operations. Railway officers that

have become members of Mr. McAdoo's organization have severed their connection with their railroads and by an order effective on April 1 the expenses of offices, including salaries, devoted to financial and corporate purposes as distinguished from operating affairs may no longer be paid out of operating revenues, but, to the extent that they are continued, will have to be defrayed by the corporations out of the amount paid to them as compensation by the government.

This is on the theory that the functions heretofore performed by such officers are now taken care of by the railroad administration, as far as their effect on operation is concerned, and that whatever else it is necessary for them to do is for the benefit of the corporation itself and not properly chargeable to operating expenses. This idea has been illustrated by the analogy of a landlord, who, having rented his property, naturally pays his own operating expenses from his rental income.

There have also been persistent reports, as yet entirely without confirmation, that the process of centralization will finally be developed much further, in the effort to reduce "overhead" and that the functions of many general and executive officers will be absorbed in a centralized organization.

After the decision had been reached to take over the railroads under the President's war power and the law of August 29, 1916, it was considered necessary to act at once, both because of the seriousness of the railroad situation existing at that time and because of the opportunity to make the change effective for accounting purposes with the opening of the new year. Although it is understood that the change was contemplated as early as the first part of November, the director general took charge of the railroads with little opportunity for preparation or for the formulation of policies in advance yet with a great many problems pressing for immediate solution.

Mr. McAdoo acted with characteristic promptness in dealing with the emergencies that existed, while perfecting an organization to carry out the purposes for which the roads were taken over. Orders were immediately issued to the railroads to disregard competitive conditions and to move freight by the shortest routes. Drastic reductions were made in passenger service. Demurrage rates were increased to a scale ranging from \$3 to \$10 and instructions were issued to embargo shippers who would not load and unload cars promptly. Embargoes were issued on some of the principal eastern lines against practically all freight except food, fuel and munitions, and to a considerable extent local embargoes were placed on other lines.

For the entire month of January unprecedentedly severe weather was experienced and for a time the activities of the railroad administration and the individual railroad managements were concentrated almost exclusively on keeping the railroads open sufficiently to handle the most essential business. With the improvement of weather conditions there has been an enormous improvement, the most pressing emergencies have been met and congestion on the eastern lines has been relieved to such an extent that operating conditions are now on an approximately normal basis. This improvement has given further opportunity for the development of more permanent policies and the past month has witnessed a considerable development of the permanent organization.

In a general way the objects which Mr. McAdoo has in

mind may perhaps be best explained by his statement before the Senate and House committees in January, during their consideration of the railroad control bill, regarding the reasons which impelled the administration to take over the railroads. Mr. McAdoo said:

Mr. McAdoo's Purpose

"The administration was confronted with the necessity of taking an extraordinary step to solve an extraordinary transportation problem. What I have already said has emphasized some of the controlling needs which could only be met by putting the power of the government back of railroad operations. The absolute co-ordination and, as far as necessary common use of all railroads and their rolling stock regardless of any private interests; the entire disregard of established routes for the movement of traffic when other routes would insure more or quicker service; the necessity for economy in the use of labor and material so as to do all that might be necessary for transportation with the least drain on the country's other demands for labor and material; the need for insuring the supply of capital necessary, notwithstanding the impaired credit of many railroads; the co-ordination of the government demands for priority in shipments—impossible under private railroad management; the absolute necessity for assuring railroad labor that its just demands would be met without necessity for strikes or threats of strikes. All these things and others which I shall not attempt to enumerate made it imperative that the government should, without delay, assume possession and control of the railroads as a war measure. It did this, and thereby brought into existence full governmental power to readjust methods of railroad operations and the currents of railroad traffic absolutely regardless of the interests of any particular railroad company or of any private or selfish interest.

"This extraordinary step being necessary, it was essential that it should be taken in a manner calculated to help rather than to hurt a financial situation of fundamental importance. Such action was calculated to cause the gravest disturbance to the whole financial structure of the country unless unquestioned assurance could be given by the government of an adequate protection to the holders of railroad securities, representing something like \$16,000,000,000 in bonds and stocks. Even in time of peace the public interest would have made it highly important to avoid any such financial disturbance, but in the present war, when success cannot be achieved without the raising of unprecedented amounts of capital, it would have been unthinkable and self-destructive for the government in taking over the railroads to do so in such a way as to disturb rather than reassure the general financial situation."

Car Service

Common use of the rolling stock of the roads was attained to a considerable extent under the direction of the Railroads' War Board, and its subsidiary, the Commission on Car Service, which ordered cars from one road to another in accordance with the demands of traffic. Under government control this process has been carried further. The Commission on Car Service has been reorganized as the Car Service Section of the Transportation Division of the Railroad Administration and has charge of all matters pertaining to car service, including the re-location of freight cars as between individual railroads and regions. Its control over car distribution is more direct than it was before for the reason that there is no longer any incentive to consider the interests of individual roads, and the managements of the individual roads are no longer required to consider the effect on their earnings.

One of the first matters to which Mr. McAdoo directed his attention was the possibility of eliminating unnecessary ton miles by re-routing traffic on the principle that the railroads

are being operated as a national system of transportation. Solicitation was discontinued and in his first general order he declared that all terminals, ports, locomotives, rolling stock and other facilities are to be fully utilized to carry out this purpose without regard to ownership; that the designation of routes by shippers is to be disregarded when speed and efficiency of transportation service may be thus promoted; that contract agreements between carriers must not be permitted to interfere with expeditious movements; and that through routes which have not heretofore been established are to be established and used whenever expedition and efficiency of traffic will thereby be promoted. The purpose has been to avoid as much as possible the use of circuitous routes by which a great deal of freight has been moved as the result of solicitation by individual carriers and at the request of shippers in order to obtain the benefit of differential rates. Railroad officers were requested to make every possible effort to move traffic by the most convenient and expeditious routes, and this policy has been carried out thus far mainly as directed by the regional directors and by the staff of the Railroad Administration as opportunity has presented itself in particular cases.

Re-Routing

However, committees have been appointed by the regional directors to make studies of the possibility of securing the most economical and efficient routing of freight in their territories and a general traffic investigating committee to study and make recommendations on the entire subject has been appointed by Mr. McAdoo, with B. L. Winchell, traffic director of the Union Pacific, as chairman, and George F. Randolph, commissioner for the lines in Official Classification territory, and T. C. Powell, vice-president of the Southern Railway, as the other members.

It is essential, to secure the best operating results, that traffic shall be sent over the shortest line between the point of origin and the point of destination, provided the short line is not overloaded. If the shortest line is congested, traffic should be routed over the shortest line that is open. The policy of the Railroad Administration is to bring about a distribution of traffic over all lines in proportion to their capacity. The difficulty of effecting a readjustment of the traffic currents has been greatly complicated by the fact that most of the lines in the eastern part of the United States have been carrying nearly their full capacity, and in many cases have been attempting to handle more freight than could be satisfactorily handled and there have been few lines sufficiently open to permit the diversion of a great deal of freight to them from other lines. The committees that have been working on this problem are still engaged in their investigations and have thus far only submitted tentative reports, although something has been accomplished by diverting traffic from circuitous routes into more direct channels.

Capital Expenditures

In order to effect economy in the use of labor and material in view of the demands for them for other purposes than transportation the director general, through the Division of Capital Expenditures, has undertaken a survey of the requirements of the roads in the way of improvements and extensions and the budgets submitted by the roads are being studied to the end that only the most essential work shall be undertaken. Without government control a railroad that was financially able to do so might have expended money, labor and materials on a project fully warranted from its own standpoint but which, from the standpoint of military necessity or of the public interest in general, might better have been used on some other road. Under the policy adopted the Railroad Administration will have the decision as to where the expenditures shall be made.

The policy of the Railroad Administration as to capital

improvements has been outlined in General Order No. 12 issued on March 21. In determining what additions and betterments, including equipment and road extensions, should be treated as necessary, the following principles are to be followed. From the financial standpoint it is highly important to avoid the necessity for raising any new capital which is not absolutely necessary for the protection and development of the required transportation facilities to meet the present and prospective needs of the country's business under war conditions. It is likewise highly important that the available supply of labor and material shall not be absorbed except for the most necessary purposes.

Railroads are also asked to bear in mind that projects which might be regarded as highly meritorious and necessary when viewed from the separate standpoint of a particular company may not be equally meritorious or necessary under existing conditions, when the facilities heretofore subject to the exclusive control of the separate companies are available for common use whenever such common use would promote the movement of traffic.

Robert S. Lovett, formerly chairman of the executive committee of the Union Pacific, has been appointed Director of the Division of Capital Expenditures and has organized a staff of assistants. To him have been referred budgets prepared by the individual railroad companies outlining their ideas as to necessary expenditures for the year. For the eastern district a sub-committee of engineers has been appointed to go over these estimates for the purpose of making recommendations.

General Order No. 12 also provided that the construction of new lines or branches or extensions of existing lines shall not be entered upon or contracted for and that no new locomotives or cars shall be ordered or contracted for without the approval of the director general. Work contracted for or actually commenced prior to January 1, 1918, and unfinished may be continued until further order except in so far as in the judgment of the carrier it may be possible to discontinue or curtail it without substantial loss. Work involving a charge to capital account in excess of \$25,000 shall not be contracted for or commenced unless it conforms to the general policy as to necessity, and unless it has been authorized by the director general. Other work which does not involve charges to capital account in excess of \$25,000 may be contracted for and commenced without approval, provided it conforms to the general policy as to necessity and also falls clearly within the policy of the particular carrier as that policy has been applied in practice during 1916 and 1917. However, a report regarding work involving between \$5,000 and \$25,000 is to be made in duplicate to the director of the division of capital expenditures and to the regional director.

Where minor capital expenditures are needed to establish new connections for the better use of terminals the regional directors have been authorized to endeavor to get some or all of the interested companies to arrange therefor by voluntary action and to refer to him cases of expenditures which cannot be so arranged.

As an example of the policy of the Railroad Administration, the work of track elevation at Indianapolis, which was half completed, was held up until the director general had assigned Interstate Commerce Commissioner Harlan to make a report on it. On the commission's recommendation an order was issued permitting the work to be completed in a modified form. Also the city council of Chicago, which was prepared to recommend track elevation work at Chicago to cost about \$5,000,000, has been requested by the director general to defer further consideration of the work until the conclusion of the war.

Regarding passenger service the policy of the administration is to curtail the number of trains to the minimum necessary to afford ample accommodations for necessary

travel while discouraging unnecessary travel. In England passenger fares were increased 50 per cent to discourage travel. It is understood that Mr. McAdoo felt that a policy of increasing fares would have little effect in this country in discouraging unnecessary travel while in some cases it would impose a hardship on persons obliged to travel and that a more effective plan would be to reduce the service to a degree approaching discomfort. The purpose of reducing passenger service is to conserve the use of fuel, labor, locomotives and shop capacity for freight service but Mr. McAdoo has insisted that due consideration shall be given to the public convenience and, for the purpose of avoiding the local antagonism which might arise if such matters were decided by the railroad managements, he has ordered that questions of train service and similar matters be referred to him for decision. His idea is that policies which substantially affect the character of the service rendered the public or the rights of the public will be more readily accepted if he, as the direct representative of the government, has the deciding voice, than if they are decided upon by railroad men themselves.

Passenger Service

Mr. McAdoo expects that a considerable reduction of train service may be effected without any reduction of the available accommodations for the public by eliminating duplications of service resulting from competition. A rearrangement of the Chicago-St. Louis passenger service was put into effect, reducing the number of trains from 15 to 9 while giving the public approximately the same number of times in the day when trains are available. Studies have also been made of the possibility of similar rearrangement of service between other large cities where the various competing roads have maintained competitive schedules.

Another policy regarding passenger service has already been put into effect by the consolidation of city ticket offices at Washington, D. C., and Atlanta, Ga., thereby effecting a considerable saving in rentals while affording the advantages of a centralized location; and studies are being made of the possibility of making similar changes in other cities.

Priority in Transportation

Co-ordination of the government's demands for priority in transportation which had so much to do with causing the congestion on the eastern roads during the latter part of 1917, was one of the first problems with which the Railroad Administration was called upon to deal. As a first step all priority orders were abolished and a plan was worked out by the Traffic Division by which experienced traffic officers have been placed in the War and Navy departments, the Shipping Board and the Food and Fuel Administrations, reporting to the Traffic Division, for the purpose of co-ordinating the traffic needs of these various departments. A new plan of ordering preferential shipments on government account has also been put into effect, superseding the old "blue tag" system.

Wages and Labor

The policy of the administration regarding wages was made evident within a very short time after the government had taken over the railroads. At that time the brotherhoods representing the firemen and hostlers, the conductors and the trainmen, had pending demands for a considerable increase in wages which had been formerly declined by the railroads, who had placed the entire question in the hands of President Wilson. Other classes of employees also had various demands pending and the railroads had made numerous settlements during the year which had to some extent increased the wages of the lower paid classes of employees. However, the cost of living had been steadily increasing and the railroads were having great difficulty in retaining ex-

perienced men in their service in competition with the munitions plants and other industries. Mr. McAdoo, therefore, let it be known that the government intended to increase wages to a point which would represent recognition of the higher cost of necessities and bring about a greater degree of contentment on the part of railway employees, and he appointed a Railroad Wage Commission to investigate the entire subject of railway wages and make a report to him for his action.

In order to obtain the benefit of the effect on the spirit of the employees at a time when most of them were being called upon for special exertion it was promised that any increases awarded would be effective as of January 1. The wage commission held public hearings at which representatives of all classes of employees were given an opportunity to present their requests but the investigation has not been conducted as an arbitration proceeding and boards of statisticians and examiners were appointed to aid the commission in a determination, from a study of the available facts and statistics, of what would be a fair adjustment of wages. The commission has now practically completed its work and will shortly render to Mr. McAdoo a report recommending general increases which will aggregate several hundred million dollars. Pending action on the report of the commission, Mr. McAdoo has told the railroads that there ought to be no radical change in existing practices without submitting the matter to him for approval, and that no interruption of work should be allowed because of any controversies between employers and employees.

Mr. McAdoo has adopted a conciliatory policy toward labor and is apparently endeavoring to iron out some of the causes for friction between the officers and employees. He has appointed a labor representative, W. S. Carter, president of the Brotherhood of Locomotive Firemen and Enginemen, as a member of his staff to give special attention to labor problems, and permanent wage boards will be organized to adjust questions affecting labor which may arise after the wage commission has rendered its report. Mr. McAdoo has had frequent conferences with representatives of labor organizations and recently reached an agreement with the officers of the railway employees' department of the American Federation of Labor regarding working conditions in the mechanical department for the purpose of meeting the emergency as to locomotive repairs.

Financial Assistance

The first step toward rendering financial assistance to a railroad was taken on March 27 when the director general, after many conferences, agreed to advance \$43,964,000 to the New York, New Haven & Hartford to protect its maturing note issue. While it is expected that most roads will be able to take care of such requirements it is the intention to give such assistance as may be necessary, either by the purchase of securities by the government, or from the revolving fund consisting of the \$500,000,000 appropriation and any surplus earnings above the guaranteed compensation, which fund is also to be available for expenditures for improvements. It is also contemplated that advances may be made under the terms of the War Finance Corporation bill.

Purchases

As far as purchases of materials, supplies and equipment for the railroads are concerned, the policy of the administration contemplates a considerable degree of centralized supervision but, for the present at least, by no means complete centralization. All purchases of locomotives, cars and rails are to be made directly through the office of the director of purchases and he will be assisted by an advisory committee of three experienced railroad purchasing agents, who will formulate plans for the co-ordination and supervision of rail-

road purchases. There are also three regional purchasing committees which are to give consideration to the opportunities for standardizing and consolidating purchases of every kind that may admit of such treatment, with a view to increasing efficiency and economy.

Most supplies needed for current operations will be purchased, at least for the time being, through the purchasing departments of the respective roads, but all contracts for periods of six months or longer must be approved by the regional committees before completion. Information as to prices paid will be furnished monthly by all roads to the regional committees so that they may be compared and checked and full statistics as to prices will be exchanged between the regional committees and the central committee for comparison and checking. This will naturally tend to promote standardization.

Standardization

Mr. McAdoo believes that he has inaugurated an important reform by the adoption of standard designs for cars and locomotives, which will reduce their first cost and also make it possible to build them more quickly. Very early in his administration he called on committees of car and locomotive builders to submit standard designs and these were later referred to a committee of mechanical officers, appointed by the regional directors, with H. T. Bentley, mechanical assistant in the transportation division as chairman. After revisions suggested by the railroad committee the designs and specifications were approved by the regional directors and by the director general, after which they were turned over to the builders and bids were asked on March 25. It is understood that 100,000 freight cars will be ordered. The locomotive designs are also practically approved and a conference between the central advisory purchasing committee and manufacturers of specialties was held at Washington on Monday of this week.

Considerable apprehension had been aroused among both railroad men and the supply interests during the progress of the work on the standard designs lest the standards adopted should be so rigid as to exclude many patented devices and tend to discourage improvement; but when the car specifications were finally issued they were found to be along broad and rational lines. It is understood that the locomotive designs are equally liberal.

It is also expected that purchases of railway supplies and materials under government control will show a considerable increase over those of recent years, and Mr. McAdoo has indicated that his policy will be to keep the door open for giving full and fair trial to new and improved devices.

Railway Organizations

In General Order No. 6, issued on January 28, the director general ordered that railway operating revenues should not be expended for the payment of persons or agencies constituting associations of carriers unless such association is approved in advance by the director general.

This at once raised a question as to the status of a host of railroad committees and organizations of various kinds, such as the American Railway Association and the various operating associations that report to it, the traffic associations and such organizations as the Railway Mail Pay Committee, the Railway Executives' Advisory Committee and the Bureau of Railway Economics. Many of these bodies applied to the director general for approval, giving a description of their purposes and functions and the amount of their expenses; and the subject was turned over to C. A. Prouty, director of public service and accounting, for investigation. Pending a decision the various organizations were given letters authorizing them to continue until April 30, after which it is expected that some of them will be told that if they are to be continued they will have to be sup-

ported out of corporate funds rather than from operating revenues, while others will be continued and others will be consolidated.

The general policy is that only those associations whose work is considered necessary to the operation of the railways as a system may continue to have their expenses charged to operating expenses. Order No. 6 also provided that operating revenues shall not be expended for the payment of agents or other persons employed in any way to affect legislation, for the employment of attorneys not actually engaged in the performance of necessary legal work, or for political purposes or to influence any election. In accordance with this order the office of the general counsel of the Railroad Administration has been holding conferences with the representatives of the legal departments of various companies arranging for a readjustment and a considerable reduction of expenses in the legal department. A considerable number of lawyers, whose chief function has been to represent the companies before legislatures and Congress, will be dropped from the payroll.

Rates

One of the principal sources of difference encountered during the consideration of the railroad control bill in Congress was the question as to the power of the President, or rather of the director general acting for him, to make rates.

Mr. McAdoo took the position before the bill was passed that the President undoubtedly had the power to control rates during the time of federal possession, on the theory that the Interstate Commerce Commission had no power to regulate the President in the exercise of his war powers; and that he ought to have the power, but that it ought not to be exercised except in such cases as may be necessary in the public interest. There was much opposition to any curtailment of the powers of the Interstate Commerce Commission and, as the law was finally passed, it authorized the President to initiate rates and to put them into effect, subject to the final authority of the commission, which was required to take into consideration the circumstance of federal control and a certification of the President that higher rates were necessary.

Even this compromise has not entirely satisfied the shippers, because rates initiated by the administration may go into effect at once without a hearing or a suspension and they have been considerably concerned, according to reports, for fear that arbitrary action will be taken. Mr. McAdoo indicated, however, in his testimony before the Congressional committees, his opinion that it would be very unwise for him to undertake to pass upon rate questions except in a general way and that the judgment of the Interstate Commerce Commission ought to prevail except in so far as it might be wise for the President to modify it. It is generally expected that he will consider it necessary to ask for a general increase in rates to meet increased expenses, particularly after the wages are increased, and that he thought the President ought to have full power to make such increases if he considered it necessary, without interference, but that he has no desire to interfere in ordinary rate cases. Speaking before the Senate Committee, Mr. McAdoo said the President ought to have the power, but that the commission ought to hear the cases just as before and that when they have reached a conclusion it ought to be in the form of a recommendation to the President.

During the period before the law was passed, Mr. McAdoo wished to inaugurate several measures requiring tariff changes, and he did so by following the course pursued by the railroads of requesting the commission's permission, which was in every case promptly granted. Since the law was passed the railroads have followed their usual practice of filing fifteenth section applications for permission to

file tariffs of increased rates and the Railroad Administration has not yet attempted to initiate a rate. The committee on Uniform Classification has been directed to submit an early report, but it has already been announced that hearing will be held by the Interstate Commerce Commission before any action is taken.

Some of the things that have been accomplished under government control which have been more or less agitated in the past but have not been put into effect because of failure to agree or lack of a central authority to put them into effect, have been the higher demurrage rates, which railroads have been agitating for years; a universal interline waybill, which the accounting officers have been urging for many years and which the Railroads' War Board strongly recommended last fall, and uniform rules for packing and marking freight. Railroads at various times have also made unsuccessful efforts toward a curtailment of competitive passenger service such as has been put into effect between Chicago and St. Louis. They have been somewhat more successful in efforts to secure greater economy by joint or centralized ticket offices, but a much greater impetus to this movement has been given by government control.

The standardization of freight cars represents another field in which the Railroad Administration has been able to accomplish in a short time something that railroad men have been working toward for a long time.

Prospects for the Future

The railroads had no more than passed under government control when eager discussion began as to whether they would ever be returned to their owners or to their former status, and the discussion then aroused has continued. Both in the way of criticism and with approval interested men have commented on each succeeding development of the director general's policies with remarks that they did not bear the earmarks of temporary policies. But Mr. McAdoo has not dodged the issue. He has frankly stated the opinion that it is going to be impossible ever to restore precisely the status of the railroads that existed before December 28, 1917.

In explaining his reasons for opposing a definite time limit in the railroad control bill before the House Committee in January, he said: "I believe that a very much larger measure of strong, effective, intelligent government regulation and control of these properties is going to be inevitable in the future, and I favor such control. If it turns out that public operation of railroads in the United States is beneficial to the common interest, to the public interest, I think the people are going to demand that government control be retained upon some terms which Congress must determine at the time and in the light of experience then existing."

During his testimony before the Senate Committee, Mr. McAdoo was asked whether he personally believed in government ownership of railroads.

"I do not," he replied, "or I have not, at least, felt that it was necessary to take the actual ownership of the railroads. I believe that it will be impossible after the return of peace to restore the competitive conditions to the same extent as they existed prior to the outbreak of the war."

"I favor some form of governmental regulation and control of a far stronger, more intelligent and effective character than we have had heretofore, because I am satisfied that a stronger government control will be demanded and will have to be worked out, both in the interest of the public and in the interest of the security-holders of these railroads."

While the President said in his message to Congress on January 4, that "nothing will be disturbed or altered which it is not necessary to disturb," Mr. McAdoo made it evident in his testimony on January 23 that he interpreted that language rather broadly. "From the public standpoint it is

necessary," he said, "that government possession and control of railroads shall be employed to remove for the time being competitive practices and wasteful duplication of effort to the end that every energy shall be mobilized upon the production of the greatest amount of transportation with the least expenditure of labor, material and money."

"The result of this process of unification will be that when the war ends the railroads will be, to a large extent, disabled for the immediate resumption of their old competitive status. Shippers and the public generally will be accustomed to new methods of doing business with the railroads. They will find that the old methods under which they have been routing freight and have been doing business will be substantially and perhaps permanently altered."

All this indicates very clearly that Mr. McAdoo is not going to be deterred from putting into effect some policy which he believes will result in an improvement, merely because of any idea that his control of the roads is to be temporary. He interprets the word "temporary" to contemplate a period of time long enough to enable him to manage the railroads as he thinks they ought to be managed; he has confidence in his ability to produce successful results and he hopes that the policies he is putting into effect will be so successful that everybody will want them continued whether or not the period of government control is prolonged beyond the period contemplated in the law.

Perhaps this may be stated by saying that Mr. McAdoo is proceeding on the only safe assumption, that the war is likely to last for a long time. At any rate he has already gone far enough and said enough to give a strong impression that he is not worrying about a time when the government will no longer be in control. He is in control now

and he is directly concerned now with the present problem of winning the war and of so increasing the efficiency of the railroads as to contribute to that result. Possibly he is doing some things that he would not consider necessary if he expected the war to be over in six months, because he does not expect that; and he is trying to do the things which he believes will produce the greatest efficiency in transportation and with the greatest possible economy consistent with that result.

He hopes to be able to effect considerable economies in railroad operation, but he also knows that many factors enter into the situation which are likely to increase expenses, and he considers economy secondary to efficiency. For example, he knows that the report of the Railroad Wage Commission will result in a great increase in expenses by advancing wages, but he considers that higher wages are necessary to promote a better feeling on the part of the employees; are necessary not only to offset in part the increased cost of living, but that they will tend to improve efficiency. Testifying before the House Committee, he said:

"It may be possible, through economies that can be practiced under combined and co-ordinated operation of the railroads of the country, to overcome any advances that may have to be made in wages and in the extra cost of material and supplies, due to the very high prices prevailing throughout the country. Certainly every effort will be made, consistent with good management and with the public interest, to make the roads earn a surplus. Naturally we want to do that, but I have not felt that we ought to rely too much upon that possibility. If that is the situation it will be developed. If it does not develop, we must be prepared to act without reference to it."

What Government Ownership Would Mean

Effect on Other Businesses and Persons of Establishing a
Gigantic Monopoly. Shall We Prussianize?

By Samuel O. Dunn

I RECOGNIZE that all of us ought, while this war lasts, in all our thoughts and acts, to subordinate every other object to the winning of the war. If we do not win, it will make little difference what we think or desire regarding government ownership of railways or any other economic or political question.

But we are not going to lose. Nor are we going to accept a draw. We are going to win so decisively that we shall look back with astonishment to the time when we had our doubts and apprehensions.

In all the affairs of human life there are imponderable as well as ponderable, moral as well as physical, values; and in the long run they are the decisive things. You can't throw the opinion of mankind into a scale and weigh it as you can Hindenburg's sword, but in the long run men's opinion proves weightier than any man's sword. Germany, by the things she is seeking and the methods she is using, has convinced a great majority of mankind that her victory would destroy the liberties and stop the moral and political progress of the human race. Therefore the more victories she wins the more she arouses the fears and opposition of the rest of the world, and the more certain she makes it that she will finally go down in disaster. You remember what Napoleon said of the English. Somebody remarked that they lost many battles. Napoleon replied that was true, but that in every war they always won the last battle. Democracies such as ours and those of England and France, when pitted against a military autocracy such as that of Prussia, are likely to lose the early battles, but it is the last battle which decides, and no man who understands the spirit of the world, and especially that of Italy, France, England and America, doubts on what country's soil the last struggle of this war will be fought, or what nation it will bring to its knees.

When we have won, as win we shall, we shall have the opportunity and duty, in fact be under the necessity, of solving rapidly a number of great problems, and foremost among these will be our railroad problem. We are making a most interesting experiment with government control of railways during the war; we must settle the railroad question soon after it is ended; and, therefore, while we are devoting ourselves primarily to winning the war, we ought to give all the study, all the discussion, to the railway question that we can. "In time of peace prepare for war," said Washington. He might have added, "In time of war prepare for peace." This is especially good advice now, for it is plain to every observing and far-seeing man that the conditions, national and international, which will exist after the war will subject our economic and political institutions to strains different from, but hardly less severe than, those to which they are being subjected by the war. We shall have problems created by the economic and political conflicts of class with class, of section with section, of nation with nation. We shall have problems regarding the production of wealth, regarding its division between capital and labor; problems regarding the assimilation of soldiers into civil life, and of domestic and foreign trade—in brief, problems of peace unprecedented in their number, their complexity and their magnitude. It is so important that we should be studying and thinking about the railway question now because on the way

it is settled will largely depend the success or shall most in solving all our other problems of peace.

Government and Business After the War

Never since the destruction of the ancient regime in France by the Great Revolution have the governments of civilized countries taken such extensive control of business as in this war. Is government intervention in business to continue after the war on anything approaching the present scale? If so, is it going to take the form of ownership and operation of large industries, or of restrictive control of them, or will it take the form of strict control for the protection of the public, supplemented by helpful co-operation in solving business problems?

I believe it is desirable during the war to operate our railways under a single direction, and that to protect investors while this is being done it is necessary to guarantee the financial return of the companies. I do not believe it was necessary or desirable for the government to assume the complete control of operation it has. Now that this has been done, however, it is the duty of every citizen, whether an officer or employee of the railways, or a user of their service, or, like myself, a humble commentator on their affairs, to do all possible to make government control a success.

Last winter, soon after government control was adopted, and the railways were struggling with the largest and most complex traffic, and the most adverse weather conditions ever known, the charge was made and widely circulated that railway officers were "lying down" to discredit government control. I know many of the railway officers of this country, high and low, and I know their attitude and spirit as well as any man living, and the most fitting comment I can make on that charge is that, in the language of Shakespeare, "It is an odious, damned lie; upon my soul, a wicked lie." There may be railway officers and employees who are so selfish or disloyal that they want to see government control fail; but with negligible exceptions they desire, for patriotic reasons, to see it, and are working to make it, a success.

Some people contend that if government control is a success it will afford a conclusive argument for government ownership. It is impossible to accept that view. The results of operation of the railways under government control in war should be better than the results of government operation probably could be in peace. The officers and employees are inspired by more patriotic zeal than they would be in peace, and the Railroad Administration probably will not be subjected to the political and other vitiating influences that it would be in peace. Therefore, the results of government control cannot afford a basis for a rational argument for government ownership.

Effect of Government Ownership on Other Industries

If government ownership of railways should be adopted the railways would not be the only class of concerns directly and indirectly affected. No argument can be made for government ownership of them which cannot be made with equal force for government ownership of telegraphs, telephones, local public utilities, coal mines, lake and river shipping, and many other lines of industry. If by adopting government ownership of railways, we break down the dam which

*An address delivered before the Buffalo Club, Buffalo, N. Y. on March 30.

holds back the rising tide of radicalism, the country will be fortunate if it is not speedily overwhelmed with a flood of socialistic measures which will revolutionize our economic and industrial system. The railways constitute in value one-twelfth of all the property in this country. If the public could be convinced they should be taken over, what argument could be effectively made against government acquisition of other large classes of property whose purchase and management would present problems much less complex and difficult?

Even though state socialism should be carried only as far as the ownership and management of the railways, the effects would be felt by every kind of business concern and every class of our people. The railways are the largest consumers of coal, of lumber and of iron and steel. They are among the largest advertisers in the newspapers and magazines. Since government control was adopted, many of those who produce and sell to the railways have become aroused to the fact that that control has given the government a power almost of life and death over their businesses. When a large number of concerns are buying things, and a large number are selling them, there is competition on both sides. When one concern is doing all the buying and many are competing in selling, all the advantages in the negotiations are on one side. The situation which has developed under government control has caused great anxiety among concerns having billions of invested capital and hundreds of thousands of employees which have been established and built up to produce and sell goods to railways. They have become aware that a permanent government monopoly of railroads would have a meaning and an effect for them which had never entered the minds of most of them before.

A Gigantic Government Monopoly?

On the other side are the patrons of the railways, the traveling and the shipping public. Under government ownership they also would have to do business with a single gigantic railroad monopoly. Now, most of us believe that there has been too much of certain kinds of competition between railways, and that it has resulted in wastes and other evils. Many, in fact, believe that the system of railroad regulation and management which prevailed before the war was extremely deficient, and that if the railways are to be returned to the operation of private companies both our system of ownership and our system of regulation should be changed. But there are few who, as patrons of the roads, can contemplate with equanimity the prospect of their being welded permanently into a single great monopoly owned and managed by the government.

What effective means of protecting their rights and legitimate interests would those who sell goods to the railways and those who buy transportation from them have if this great monopoly were disposed to abuse its power? None, except that of resorting to political action of some kind. What means would railway employees have of protecting themselves if this great monopoly should be disposed to abuse its power? None, apparently, except strikes or political action of some kind.

Looking at the matter from the standpoint of the public as a whole, it is evident that the main thing it wants from railways is transportation service adequate to move the available traffic satisfactorily and to develop the resources of the country. The nation has suffered recently from inadequate service; and the losses it has incurred as a result have exceeded what a higher scale of freight rates would have cost it over a long period of years.

No system of railways can be said to be a success which does not maintain a fair and reasonable relationship between the rates it charges and the service it renders to its patrons, the wages it pays to its employees and the return which it earns for its owners. This is true whether the railways are owned by private companies or by a government.

Now, what one thing is absolutely essential to enable a railway system to render good and adequate service, to make reasonable rates, to pay reasonable wages and to earn a fair return? The answer, of course, is far-sighted, enterprising and efficient management. But it is contended government ownership would possess some advantages which private ownership cannot have. The government, it has been argued, could raise at 3 per cent all the capital required to buy the railways and increase their facilities. Facts recently have exploded this theory. The government since we entered the war has not raised one-fourth as much capital as would be required to buy the railways, but already it is preparing to float a large loan at 4½ per cent, and it would have to pay more if the people were not impelled by patriotism to make it loans at an artificially low rate. There is not, as some seem to think, an unlimited supply of 3 per cent, or even 4 per cent, capital. Most capital in this country prefers investment in speculative enterprises offering a chance of large returns to investments offering a certain but low return.

Good Management Absolutely Essential

It is questionable whether even before the war our government could have raised enough capital to buy the railways for less than 4½ per cent. On this basis the saving made by substituting the government's credit for that of private companies would have been small. Furthermore, for some years the prevailing rate of interest probably will be high, and for the government to acquire the railways soon after the war would be to saddle itself with inflated fixed charges for many years to come.

Again, it is said the government could operate the railways as a single system and avoid the wastes incidental to competition. But it is extremely doubtful if centralized management of the railways as a single huge monopoly in time of peace would have any advantages. Our railway system includes 260,000 miles of line. This is five times more mileage than there is in any other country. It is one-third the mileage of the entire globe. Perhaps the present system of centralized control will point the way, but the problem of organizing and managing such an immense mileage operating over such a vast area as a single unit so as to get good results seems almost insoluble. Even under government ownership it probably would be necessary, in order to get the best results, to divide this system into several parts and operate them almost independently. If you should divide our railways into ten units of equal mileage, each unit would have more mileage than the railways of France, or those of Great Britain and Ireland, or those of Prussia. If you should divide them into five units of equal mileage each unit would have more mileage than the railways of any entire country except the United States. Even under the most skillful and energetic management possible all the benefits gained by complete consolidation of our railways probably would be more than nullified by disadvantages inevitably arising from the unwieldy magnitude of the undertaking.

Furthermore, whatever rate might be paid for capital, and whatever might be the advantages of consolidation, there is no adequate substitute, in the railroad or any other business, for far-seeing, enterprising and efficient management. A weak and short-sighted management will always fail to profit by its advantages, and at the same time will fail to increase economy and efficiency in many directions in which a strong management would increase them. After all, therefore, the vital question is whether private management, if given a fair chance by government regulation, probably would be more or less far-seeing, enterprising and efficient than government management. If private management, if given a fair chance by regulation, would be the more efficient, the American public's duty to itself is to preserve private management and cause government regulation to give it a fair chance.

Recent experience has demonstrated that the transportation

facilities of this country have become inadequate. They are insufficient satisfactorily to move the available traffic, especially in eastern territory, despite the fact that in eastern territory the capacity of the railways in proportion to area and population is larger than anywhere else in the world. There have been no such congestions in the south and west as in the east; but even in those territories there is need of much additional mileage to enable them to support a larger population and to develop their natural resources. Both the intensive and the extensive development of the railways has greatly declined. A few years ago the average annual investment in them was about \$750,000,000. Before the war began it had declined to \$310,000,000. In 1916 it was only \$280,000,000. This decline of railway investment is the main cause of our present transportation plight.

Would Government Management Be Efficient?

The public must consider whether the expansion of our railway facilities is more likely to be adequate, and to be secured with reasonable economy, under private or under government management. There are certain incontrovertible facts which bear upon this question. One is that until the present restrictive policy of regulation was adopted the facilities of our railways were relatively greater, and were being increased faster, than those of any other railways in the world. Prior to the war our railways had almost six times as much freight carrying capacity in proportion to our population as those of Germany; and the railways of Germany had the greatest freight-carrying capacity in proportion to population of any system of government railways in the world. Our freight-carrying capacity was 8,662 tons per 10,000 inhabitants; that of Germany about 1,500 tons. We had car shortages, it is true; but they had relatively worse ones in Germany. Our railways actually moved almost five times as much freight traffic in proportion to our population as did those of Germany.

Not only have our railways, under private ownership, furnished larger facilities in proportion to population than those of other countries, but they have furnished them more economically. Some people charge that our railways are over-capitalized. Some individual companies are, but the average capitalization of all, which is about \$66,500 a mile, is lower than the average cost of construction or capitalization of any other important system, government or private. The railways of Germany, most of which are government owned, have cost \$120,000 a mile. Those of New South Wales, Australia, which always have been owned by the government, which have been built and developed in a new country, and which have nowhere near the capacity per mile that ours have, have cost \$90,000 a mile.

When we turn to the operating results of our railways, to the rates they have made and to the wages they have paid, we find similar facts. Their average wage in 1913 was higher than that in any other country, except one of the Australian states. Between 1913 and 1916 the average railway wage in this country increased from \$757 to \$869; probably at present it is at least \$900, and increases now in contemplation probably will advance it to \$1,100. The average wage in Germany in 1913, the latest year for which the information is available, was \$409.

Similarly as to rates. Our average freight rate per ton per mile in 1913, 7.29 mills, was the lowest in any country except in India, where the wages paid are measured in cents, not dollars. The only European country in which the average was less than 12 mills was France, and most of the railways of France are privately managed. The average in Germany was 12½ mills. The answer is often made, when the average rate of Germany is compared with that of the United States, that the average haul is shorter there than here; and, of course, you always have two terminal expenses, whatever the length of the haul. Those who make

this answer overlook the important fact that the very high wages paid in this country enter into terminal expenses as well as road expenses; and that, therefore, assuming that the same number of men are employed, it costs more in wages to operate one terminal in this country than to operate two in Germany.

Why Has Railway Development Stopped?

Until recent years, in spite of the high wages they paid, the low rates they charged and the service they provided, the managements of our railways were able to attract enough capital into the business to go on increasing their facilities. Why has the development of facilities been almost stopped? There have been various causes, but the main one has been punitive and restrictive regulation. In 1916, when there was a sudden abnormal increase in business, the railways earned a large net return, but the tendency of net return for a long period had been downward, and this tendency was renewed at an accelerated pace in 1917. To return the railways to their owners after the war subject to the kind of regulation which has prevailed would be disastrous to both the companies and the country. Private ownership and management cannot be made a success from the standpoint either of the owners of the railways or of the public unless the owners and managers are given incentives and opportunities to increase the facilities of the railroads and to operate them efficiently.

Suppose, however, that our policy of regulation should be so altered as to afford reasonable incentives to investment and to efficient management. Would private management under such a policy probably be better or worse for the public than government management? There is nothing in the experience of our own or any other country on which to base a rational argument that government ownership and management would produce better results for the public than private ownership and management, under sane and fair regulation.

Even if you exclude our railways from consideration a comparison of the results of private and government management in other countries argues strongly in favor of private management. Most of the railways of Germany are state managed, while most of those of France are privately managed. On any fair basis of comparison the private railways of France can be shown to be more efficiently operated than the state railways of Germany. Australia and Canada are the two greatest English-speaking possessions of the British Empire. In Australia government management has prevailed, while in Canada private management has predominated. The private railways of Canada have made a record of efficient operation which far surpasses the record of any of the state railways of Australia.

It is only reasonable to assume that if private ownership and management are retained in this country, and our policy of regulation is so altered as to make investment in railways attractive, and to give the managements reasonable freedom of initiative and action, the expansion of railway facilities will be revived on a large scale, and the results will be as efficiently operated as ever. On the other hand, if government ownership is adopted, doubtless the government will recognize the need for investing large sums in new facilities. But will these facilities be provided with the wisdom and economy they would be under private management? Private management would, of course, aim to provide them where the new investment would earn the largest return, and that would be where there was the largest available or prospective traffic to be handled or developed, and where, therefore, the facilities were most needed. Is there not very great danger that, under government management, the places where the additional capital would be invested would be determined not by business but by political considerations? We have had a wealth of experience with expenditures for rivers and harbors, public buildings, and army and navy posts. No

body would contend that the expenditures have been made regardless of political considerations and where they would do the most good.

Why Government Management Would Be Inefficient

Again, what reason is there for believing that under government management the railways would be operated with as much efficiency and economy as under private management? The efficiency with which any business is conducted depends mainly on the extent to which able men are attracted into it, are given positions whose importance is in proportion to their fitness, and are afforded incentives to do the best work of which they are capable. The railways of this country have almost two million employees and about twenty thousand officers. The officers get only $3\frac{1}{2}$ per cent of the billion and a half dollars paid in salaries and wages, while the employees get the other $96\frac{1}{2}$ per cent. But the efficiency with which the railways will be operated in future will depend mainly on the men who are put in those twenty thousand offices and on the incentives and opportunity they are given to organize and direct to the best of their ability the work of the two million employees.

Does any man familiar with the facts have any doubt as to whether, on the whole, the policy followed by the railways or that followed by our government departments has been better adapted to securing and putting into official positions the men who are the best fitted to fill them? We have heard much recently about the alleged fancy salaries paid by the railways. As a matter of fact, the highest salaries paid by the railways are small compared with the incomes derived by many successful men from other lines of business and professional activity. It goes without saying, however, that under government ownership the salaries of the higher officers would be sharply reduced. Would the abolition of all the larger prizes in railway service increase the attractiveness of that service to men of ability and ambition? Excepting cabinet offices, with the great honor attaching to them, do we find many able and ambitious men struggling to secure appointments to offices in the government service, with the small salaries they pay? We do not; and if we adopt government ownership we shall see an exodus of men of ability out of the railroad business, rather than into it.

Even if men of ambition and ability did seek appointment and advancement solely on the ground of merit, they would not secure them. In all the government departments, except the army and navy, appointments and promotions to important offices are determined by politics, not by fitness. Government control of the railways as a measure of war has not resulted and probably will not result in political appointments, but that it would in time of peace all our experience indicates.

An answer often made to such arguments is that the post-office department is efficiently managed. Where is the evidence? The postal department keeps its books so that nobody can tell what is the total cost of rendering its service, and it shows far less ability to meet new and difficult conditions than concerns under private management. I have spent the last five months in Washington. The great changes which have taken place there have imposed heavy new burdens on railway service, on telephone service and on postal service. Both the railway and the telephone service have met the new conditions far better than the postal service. The paper of which I am editor is printed in New York. I have never had a serious delay in getting a long distance call through to New York, and the railways run trains between New York and Washington in five hours, but recently it has been taking six days for the postal department to get the *Railway Age* from the postoffice in New York to our office in Washington. The first-class mail service, as well as the local service in Washington, have become so unreliable as almost to justify the charge that they have

broken down. Congress is considering turning the telephone service in Washington over to the postal department. The postal service is so much worse than the telephone service that the proposal to turn the telephone service over to the postal department sounds like irony.

If, as seems certain, there would be under government ownership a deterioration of the official personnel of the railways and an impairment of the incentives of the officials to energetic and efficient work, the inevitable result would be a decline of the efficiency of management and operation. The adoption of improved machinery and better methods of operation, the increases in the amount of traffic handled per car, per train, per mile of track, and per employee, which have been the outstanding features of our railway operation, would be arrested. It was the large economies due to these things which long made it possible for our railways to pay ever increasing wages without advancing rates.

The Certainty of Political Interference

If there should be under government ownership a decline in the efficiency of management and operation, somebody would have to pay the bill. It would have to be paid either by railway employees in lower wages, or by travelers and shippers in higher rates, or by the public in taxes to defray a railway deficit. Who would determine what the wages, the rates and the taxes should be? It would have to be done by government officials, and in the last resort by Congress. But Congress is a political body. Inevitably, under normal conditions, it is influenced chiefly by political considerations. And so the unavoidable outcome would be that under government ownership in time of peace we should have the questions of what expenditures the railways should make for improvements and where they should be made, of the wages and conditions of work of their employees, of the appointments and promotions of their officers, of the freight and passenger rates they should charge, of who should pay the taxes to meet a railway deficit, if there was one, thrown into the maelstrom of politics. I do not say that any man or class of men would purposely throw these questions into politics. I simply say that under a democratic government such as ours, they inevitably would get into politics whether anybody wanted them to or not, and even though most people tried to prevent it.

The railways of this country employ one and three-quarter million men, to whom in 1916 they paid almost a billion and a half in wages; and an increase of \$350,000,000 in wages is now under consideration. The railways, under normal conditions, spend over a billion dollars annually for fuel, equipment and supplies, and the concerns which sell them fuel, equipment and supplies employ many hundreds of thousands of men. The effect which the introduction of politics into the management of the railways would have upon their efficiency would be bad enough for the country. How much worse for the country might be the throwing into politics of the governmental power to employ, promote or discharge millions of men, and to spend billions of dollars. You may say the government in carrying on the war is employing literally millions of men and spending billions of money. But the conditions of war, the motives and influences by which people are directed and controlled in time of war, are not those of peace.

Shall We Prussianize Our Government?

You frequently encounter the argument that Germany has made a success of government ownership of railways, and that we should adopt it and could make a success of it because Germany has. If you bar Germany from the discussion, the advocate of government ownership is rendered unable to find anywhere upon earth a country in which government ownership has had results affording any reasonable basis for contending that government management has been

efficient. The argument from the experience of Germany proves too much. Accepting it at its full face value, what it proves is not that government management can be made a success everywhere, but that it can be made a success under an autocratic government. Now, doubtless by Prussianizing our government, we could fit it to do many things which it is not fit to do now. The characteristics of Prussia in the management of railways are the same as its characteristics in the management of many other things. The Prussian Minister of Public Works, who is the manager of the railways, is appointed by the Kaiser and is absolutely beyond the reach of public opinion or of Parliament. The Prussian Government forbids its railway employees to belong to labor unions, and arbitrarily keeps wages low and freight rates high to get a large revenue for its military purposes. It treats the railways as primarily a part of its war machine and applies to their employees a military discipline. For obvious reasons there are no strikes or threats of strikes over there.

Do we want to Prussianize our government to fit it for Prussianizing our railways? I have never heard anybody say so. But if we are not going to Prussianize our government, we cannot Prussianize our railways, and if we are not going to Prussianize our railways, arguments drawn from the experience of Germany with government ownership have no place in the discussion of that subject in this country.

Private ownership of railways is a democratic policy. Government ownership is an undemocratic policy. In every leading country which is fighting under the leadership of the Kaiser—Germany, Austria-Hungary, Bulgaria, Turkey—government ownership prevails. In almost every leading country which is fighting against the Kaiser, including the United States, England, France and Canada, private ownership is preponderant. The natural policy for an autocratic state is to prevent its citizens from doing anything which the state can do. The appropriate policy for a democratic state is to do nothing which its citizens can do as well as

or better than the state. If, as we are invited to do, we are going to embark upon a policy of state socialism in imitation of Germany, then let us set up an autocratic government in place of our democratic government so that we can get the efficiency in our government necessary to enable it to manage our socialistic projects efficiently. If we are not going to set up an efficient autocracy, then let us leave our business enterprises in the hands of private concerns which can and will manage them efficiently.

Surely the fact is not without significance that the most autocratic government in the world has made the greatest success of government management of railways, and that the failure of government management in other countries has been almost in proportion to the degree of Democracy of their governments. One may sincerely and ardently believe that democracy is the best form of government to secure to the citizen the inalienable rights to life, liberty and the pursuit of happiness, and be willing to fight for that belief; one may have confidence that democracy can succeed in so regulating the relations between business concerns and the public as well as between individuals and individual as to protect the rights and further the interests of all; and in spite of all this one may be convinced that so far as democratic government is as yet developed in most parts of the world, it is not a good form of government for managing commercial enterprises. Many go much further and fear that under government ownership in this country politics would so corrupt the railroads and the railroads would so of regulation the continuance in this country of private corrupt politics as not only to destroy the efficiency of the railroads, but as to destroy democratic government itself. I ask you, is it worth while to take the enormous risks involved in a change to government ownership when past experience justifies the belief that under a wise and just system ownership and management will continue to result in the provision of the most ample facilities and in the most efficient management of railways that can be found in the world?

The Best Cure for Such Bad Dreams Is to Wake Up and Buy Liberty Bonds

Every Railroad Officer a Liberty Bond Salesman

Three Regional Committees of Railway Presidents to Assist in Third Campaign

WITH AN ENTHUSIASM, if possible matching that reflected 3,000 miles overseas from our boys now hurrying to take their part in the pending counter drive against the Hun—with a solemn determination to show themselves worthy of those railway engineers who were with the British armies in Picardy—the supervising officers of the railways of this country are waiting the opportunity to subscribe for Liberty Bonds and the signal to begin the drive for subscriptions among the men in their shops and offices.

Railway officers have a three-fold duty in a Liberty Bond campaign—to subscribe themselves, to encourage their employees and friends to subscribe and to vie with the honor that has come to our railwaymen overseas.

Just what plans the railroad Liberty Loan campaign is to follow are not yet definite. To encourage railway officers

subscriptions may begin not later than three months from now in which even the ten months shall date from the time payments shall begin on the new subscription.

When the Third Liberty Loan Campaign begins the railways of this country are going to be even better organized than ever to assist their employees to subscribe for bonds. One committee in the first two campaigns succeeded with the co-operation of the railway officers and employees the country over in raising \$56,000,000—20 million in the first campaign and 36 million in the second. This time there will be not one committee but three committees—one for each railway regional district.

The committee in the eastern district will be headed by F. D. Underwood, president of the Erie, and will consist, in addition to the chairman, of Frank Trumbull, chairman of the Chesapeake & Ohio; E. E. Loomis, president of the Lehigh Valley; L. F. Loree, president of the Delaware & Hudson; Howard Elliott, chairman of the committee on inter-corporate relations of the New Haven, and J. B. Dennis, of Blair & Co., bankers of New York. The committee has been appointed only a few days at this writing and its plans have not yet reached concrete form. But it is significant that the committee is getting on the job early in the game, much earlier in fact than the committee was able to in the first two campaigns.

Similarly there is a committee for the western regional district with office in Chicago and one for the southern district, the headquarters of which are in Atlanta, Ga.

R. H. Aishton, regional director of the western railroads, has appointed a standing committee of presidents of western lines as his Liberty Loan Committee as follows: Chairman, W. G. Bied, president of the Chicago & Alton; J. E. Gorman, president of the Chicago, Rock Island & Pacific; H. E. Byram, president of the Chicago, Milwaukee & St. Paul; H. G. Hetzler, president of the Chicago & Western Indiana; C. H. Markham, president of the Illinois Central; A. M. Schoyer, resident vice-president, of the Pennsylvania Lines; C. G. Burnham, executive vice-president of the Chicago, Burlington & Quincy.

C. H. Markham, regional director of the Southern railroads, is sending out two special war relic trains, leaving Atlanta at 7:30 a. m., April 6, on a tour to last twenty-seven days. One train will cover central and eastern Tennessee, all of Georgia and a large part of Florida. The second train will cover portions of central Tennessee, all of Alabama, southern Mississippi and southern Louisiana. Each train will carry ten American artillery officers accompanied by French and Canadian soldiers and officers and Liberty Loan speakers.

"COME ACROSS OR THE KAISER WILL!"

and employees to subscribe to the Third Liberty Loan, Director-General McAdoo has issued a circular authorizing carriers to take such amount of bonds as may be necessary to care for such subscriptions and to use current operating revenues as far as necessary in paying for such bonds. In paying for such bonds officers and employees may be permitted to pay in installments covering a period not exceeding ten months. In case they have not completed payments on prior subscriptions and in order to avoid making payments on both subscriptions at the same time, payments on new

NIPPON YUSEN KAISHA TO BRAVE U-BOATS.—Merchants in Japan who are engaged in trade with France and Italy will be glad to learn, says the Japan Advertiser, that the Nippon Yusen Line has decided to brave the submarines and revive its direct line between Yokohama and Marseilles, which has been suspended for some time because of U-boats' activity in the Mediterranean. The Nippon Yusen Kaisha recently decided to start a line between Yokohama and Port Said, with the object of helping trade between Japan and France. Owing to the submarine dangers, the company proposed to dispatch steamers only as far as Port Said. But now the company has put on a connecting steamer and will land cargo at Marseilles.

The World Market for American Railway Supplies

Like England, France, Japan and Germany We Must Prepare
Now for This After-the-War Business

By A. Stephens

GOING AFTER THE FOREIGN MARKET in railroad supplies is like buying Liberty Bonds—good business and at the same time a patriotic duty. The business is there and our railway supply manufacturers will be missing the chance of a lifetime for themselves and will fail to do their duty by their country if they do not make the most of it. The foreign market offers new and profitable business and the present moment is the time to lay our plans. England, France and even Germany, despite their tremendous efforts in the war, already realize the necessity of preparing for the war after the war—the battle of trade that will begin with the treaty of peace—and are making most extensive plans to that end. The most progressive manufacturers in this country are doing likewise. It is just as much our duty to prepare for this great expansion in trade as it is theirs.

As Manuel Gonzales, a foreign trade authority puts it, "Because they can get it is the reason why our railway supply manufacturers will seek export trade. Coupled with the fact that foreign business is just as profitable as domestic business this is certainly a good enough reason for an American business man at any time. Yet if this opportunity of profit did not exist many sound reasons point to the conclusion that the American manufacturer should develop the foreign market as a patriotic duty to his country."

No Mystery in Foreign Trade

There is no mystery about the profitable business to be secured in the foreign field. If we will consider the rest of the world merely an extension of the territory of the United States, stretching north, south, east and west and then realize that much of this territory is suffering from a very acute shortage of railroad supplies there would be no difficulty in projecting the mind over the imaginary boundary. The fact that there are seas to cross, new languages to learn, new customs to study and new competitors to fight obscures the opportunity, it is true. Yet these conditions are merely human conditions to meet and overcome by ordinary human effort. Fundamentally they are not different from the conditions we meet every day. They are simply new conditions and offer perplexities because they are strange. At the same time the facts point to conclusions that are sure.

A World Famine in Railroad Supplies

Readers of the *Railway Age* know that the world is facing nothing less than a severe famine in railway supplies today. In many localities the famine already exists, the result either of diversion of equipment and manufacturing capacity to the needs of war or of the lack of shipping, depending upon whether the country is a manufacturing or an importing nation. Spain's railways are in fearful shape; Mexico's lines are worse. The statement is made as to South Africa that a large percentage of the locomotives are laid up for lack of materials and repair parts. The railways of South America are similarly suffering severely. Even Japan in its advantageous position has had to offer a bonus to manufacturers to hurry the construction of freight cars. Railway development in China has been brought almost to a complete standstill and China has only 6,000 miles of railway to serve nearly 400,000,000 people. Even England and

France are suffering, although the needs of war have compelled a continued high efficiency of railway operation behind the fighting fronts.

Trains in all these countries are still running and commerce has not been brought to a stop by any means, but one can realize what this means to the countries that will have the facilities for manufacturing railway equipment on a large scale after the war. The real significance of the world shortage of railroad supplies is for "after the war" business. That practically the whole world is looking to us for relief is not so important as that it still must look to us for much of its supplies after the war is over. While present conditions forbid a great development of export, excepting, of course, on allied government orders, it is evident that the great rehabilitation of the "run down" railroad systems of the world will have to come largely from the greatest source of supply. The manufacturing capacity of those who will be our competitors is not sufficient to meet the demand.

Germany as Railroad Supply Exporter

The dearth of railway supplies is perhaps the most pronounced in enemy countries. Germany was a great factor in the export of nearly all kinds of railway supplies, particularly locomotives, before the war, but in the judgment of our leading business men Germany has received a set back that will almost nullify her efforts for many years after the war. Outside of military roads the railway situation in Germany must be desperate. Because of the chaotic condition of Germany's railroad industry it took nine months to get the captured supplies out of Rumania. For the same reason wheat is rotting in improvised warehouses in Russia, while children are dying of malnutrition in Berlin and Vienna. As the war goes on this shortage in the Teutonic countries will doubtless become more acute.

In fact, Germany's weakest spot today is her railway rolling stock, according to Maurice Bavies writing in the *Echo de Paris*. Every locomotive of hers our airmen destroy, he says, is a vital injury to her, because she cannot replace them. He quotes the statement of a German general who said Germany could always manufacture sufficient munitions but, if she must go under it would be due to lack of railway material.

When peace arrives a bankrupt Germany will face the prospect of rebuilding her wornout railways before seeking export in an unfriendly world.

Despite these paralyzing conditions Germany is expected to make efforts to regain her foreign trade that are unprecedented in any scheme of national trade development hitherto attempted. Isaac F. Marcossan said recently:

"Germany today has secret hoards of raw material wherever it has been possible to mobilize them. The moment the war is over she is going to be a going business concern. She is a going concern in Spain today. If you could slip off the roofs of 150 warehouses in Spain you would find them packed to the doors with the oil and copper and all the other resources with which to do business, everything which Germany has mobilized in Spain as she has been mobilizing in this country from the day the war began."

Belgium's great manufacturing capacity in industrial railroad cars unfortunately has been practically wiped out. Belgium's chances of coming back are infinitely less than

Germany's. She will enter the calculation only as an importer of railroad supplies from Great Britain, the United States or other countries of the allied group.

France Will Import Railway Supplies

France was not one of the greatest competitors in railway export before the war. Afterwards she will have her hands full at home. In fact, the members of the French Purchasing Commission now in this country expect that they will continue to buy large amounts of American railroad supplies after the war. Captain Raymond Michel, head of the railroad department of the French Commission said recently:

"The salesman of American railroad supplies will have no difficulty in getting orders in France after the war. He may have difficulty in filling them because we shall be in the market for nearly everything used on a railroad. The American manufacturer who will establish a branch plant in France and do business on a French basis will stand a particularly good opportunity of getting a large amount of business. The French government and French business men will encourage such enterprises." The export efforts of the French will be in other things than railway supplies.

These conditions are expected to eliminate much of the international competition in selling to the railroad market of the world. The United States, and Great Britain should be the principal factors and Japan and Germany lesser factors in the after the war scramble for railroad business.

England Our Biggest Competitor

Britain will be our great competitor, not only because of what her manufacturers could turn out before the war, but also because of what she may be able to produce as the result of her great plans to transform war industries into peace industries. Britain was never a great producer of railroad cars, but she has been one of the largest exporters of locomotives, rails and other heavy materials.

On the basis of before the war manufacturing capacity the entire output of the British railway supply industry for one year's time would be required to provide for the immediate wants of the railroads of India alone. British efforts will be great but cannot be expected to rise to filling all the accumulated needs of her colonies and her home railways.

Japan Another Competitor

Japan is and will be another real competitor. Japan's activity in railroad supplies will be felt principally in the Far East. Her resources in coal and iron and manufacturing capacity before the war permitted Japan to export one-third of her production of railway supplies. The railroad supply industry in Japan has expanded considerably during the war, but it is still too small to offer serious competition in all parts of the world. In the course of time Chinese coal and iron mines and Chinese steel mills may be developed to the point of furnishing Japan with the materials to become a great factor in producing railway supplies.

We Have Greatest Manufacturing Capacity

Of all nations, the United States will have the greatest manufacturing capacity, the greatest resources in raw materials and probably the greatest surplus of investing capital. Our car manufacturing capacity is 350,000 per annum, something like 150,000 in excess of normal domestic production. We can easily deliver abroad 3,000 locomotives annually and supply the domestic market at the same time. In rails, car wheels, axles, sheets and plates, structural steel, parts and specialties we have a capacity that is vastly beyond our own requirements in ordinary times and which no other nation approaches. The market open for our manufacturers will include nearly the whole world.

Our financial condition is perhaps the heart of our future export situation. Investing capital is the first requirement

of railroad construction in our country. The United States has the money now and should have a revived, strong position at the end of the war.

Will Capture the World Car Market

"Provided we come out of the war in a strong financial condition and provided Germany comes out with increased strength broken the American railroad car manufacturer expects to capture the market." This opinion was expressed by one of our greatest car manufacturers who has had years of experience in selling in foreign countries. Manufacturers of most other railroad supplies are not in such strong positions as the car manufacturers, but their thoughts are running in the same direction though they cannot expect to dominate the foreign field as the car manufacturer may.

American Investments Bring Export Business

The financial side of the development of our export business in railroad supplies is as interesting as it is important. Almost invariably a foreign railway buys its materials from that country whose investors supplied the capital for its construction. The investors in European countries, and particularly the Germans, took great care, however, to guarantee the continuance of this railway supply business. The English investors, for instance, sent over British engineers and operating men to run their railways and the latter brought with them a familiarity with British standards and equipment which resulted in their purchasing that kind of equipment from home in England. The Germans usually embodied in their loans a strict proviso that all materials and supplies for the construction and equipment of the railroad should be purchased of German interests. In this way they tied up the investment forever and a day and made every mark invested in a railway abroad show a quick and continued return in the sale of railway supplies. The plight of many of these German built railways today is evident. Several lines in South America and some in China are bound hand and foot, and it is not unlikely that some of the contracts at least will have to be broken.

Our own export and financial interests have adopted this method in a somewhat different form to a number of projects, many of which are now held up by the war. In our case, however, the practice seems to depend on the specifications—they are so made that only an American firm can fill them to advantage.

Our great financial institutions have put their shoulder to the wheel in promoting export by the investment of American capital. A leading investment banker said recently: "Americans have shown a new interest in investing in American built foreign railroads. We believe that when the time comes, they will put their money into railroads in South America or China, etc., just as readily as they will into a promising industrial in Ohio."

Although we cannot let the money go out of the country at this time, tentative contracts for financing and building railroads in nearly all parts of the world have been entered into by various large American interests. Construction work awaits only the signing of the treaty of peace. As far as anyone can see into the future projected American built railroads are certainties in South America, Africa, China, Central America and Mexico and, if conditions permit, in Russia and Siberia.

To leave the realm of practical certainties and contemplate what are only strong possibilities, there are several large American projects that appeal powerfully to the imagination.

One group of our financiers and business men is looking forward to the construction of the railroad that will link the Americas, North, Central and South, with continuous standard gauge lines. This road would utilize existing lines for most of the way. It would doubtless be in operation today

if it were not for the difference in gage on many of the railroads to the south of us.

Hitherto Africa has been the domain of the English, French, German or Belgian railroad promoter, but today some American built and owned standard gage mileage is assured and more projected.

A plan to connect the French railway system that goes southward from the Mediterranean with an American railroad that will continue it to the Atlantic coast in Liberia is another dream that is near to being a reality.

In China our railroad builders are prepared to build 2,600 miles of standard American railroad. They are already looking forward to the day when American built mileage will handle much of the passenger and freight traffic in some of the richest provinces of a country that supports 400,000,000 people.

The importance of these American projects is the business it guarantees in the future for American railway supply manufacturers. The American built railroads in foreign lands will supply a large part of our export market in railroad materials and equipment.

Now the Time to Prepare

The export houses and investment firms realize one thing more than anything else and that is that now is the time to lay the plans for export trade after the war. We are fighting a war that affects the prosperity as well as the political security of the American nation. England and France thus far have been far more heavily engaged than we, but they are making tremendous plans for their export business after the war. It is to our unending advantage that our war preparations will also be of value for the preparations for export trade. The exports of railway supplies that we have been making to the warring nations have brought us in contact with the foreign ways of doing business, and no one doubts that our railway engineers in France will return with ideas that will prove of great advantage from the standpoint of export trade and our commercial dealings with our friends overseas or in the other parts of the world. The shipping program has perhaps even a greater advantage, for if there is one thing that has handicapped our export trade hitherto it has been the lack of shipping under the American flag or over trade routes that were typically American. After the war we are still going to be able to use the ships that during the war will be used to carry our men and supplies to France.

Ships Are Half the Battle

"Shipping is half the battle at any time in securing export trade" is the way a large exporter of American made railway supplies put it recently. This concern had just lost a large Argentine order for locomotive tires because the freight rate from London to Buenos Ayres was \$20 less per ton than the rate from New York. The reason was not that the English had established unjustly discriminatory rates. It was for no other reason than that the main trade routes of the world converge at London and Liverpool and because the route from London to Argentina had far more shipping than that from New York to the Argentine ports.

What are some of the great export plans that our allies are already at work on? Great Britain and her dominions and colonies are working out a plan of great trade routes, joining all parts of the empire with direct trunk lines whereby the great volume of tonnage will provide the lowest rates, thereby protecting the British shipper as effectively as high import and export preferential tariffs. The Dominion's Royal Commission is working out this protective measure in a broad and impressive manner. The February issue of *The Americas* says:

"If the idea is carried out, we will see in the future, a great empire that, instead of using political power in the

form of restraint of commerce for national purposes, will use its wealth as a great business corporation would in building up a great mechanical plant for the use of its commerce with efficiencies so great that its economies will be irresistible. The master builders of England's great shipyards have contributed their expert advice to the commission, and in one of its recent reports it is shown in tabular form how the cost per ton of freight transportation can be cut to a fraction of the tramp steamer's cost by the use of immense vessels, of steam or motor type, that the commission recommends. The future may see these ships running regularly, with seasonable variations from one route to another on lines stretching out from London to the Far East by way of the Cape of Good Hope, on fast mail and freight lines involving a transfer to rail on the imperial line from London to Halifax or Quebec, thence by rail to Vancouver, thence by great steamer again to Honolulu, Sydney or to Hongkong. Or it may be along a third projected all-sea route via London, Liverpool, Halifax, Bermuda, Kingston, Panama, Tahiti, Auckland and Sydney, with alternates to Singapore and Hongkong. These will be the heavy 'trunk lines' to the Far East, with others through the Suez Canal to India and Hongkong."

This plan includes a reorganization of rates of English and colonial and Dominion railways for the benefit of the importer and the exporter. German railroads by means of government support give generous rebates to exporters and to importers of raw materials to be exported after manufacture.

The English system similarly will include both the railways and steamships and reduce all transportation rates to both exporter and importer.

Great Britain's Big Plans

Development of shipping is only part of the program of the Dominion's Royal Commission which is working to unify the efforts of the empire. Other important measures are:

1. An empire policy of preference for British industry in the supply of raw materials of which the empire has a monopoly or dominant position.
2. The establishment by government ownership or subsidy of several great steamship lines connecting the ports of the empire and an inter-imperial scheme of deep-harbor development to accommodate the ships, 660 ft. long, and 38 ft. draught, calculated to have the ultimate practical economies of freight transportation. This would make tariff discrimination unessential.
3. Government control of at least one independent telegraph and cable line connecting all parts of the empire.
4. An English national and British imperial policy of preferential employment of British capital and British institutions in the development of empire resources including the encouragement of home establishments for the primary treatment and manufacture of Dominion ores, materials, etc.
5. The foundation of the British Trade Corporation is not only to assist in the general expansion of British commerce, but to work out the financial phases of inter-imperial developments.

These are only a few planks of the broad platform of the British trade battle that will begin with the treaty of peace. Most of the measures which the British have set out to accomplish are already largely worked out. Other plans that cannot be put into operation at this time have been thoroughly mapped out and are ready to be put in operation on very short notice.

Foreign Agents Active Everywhere

England and France are not only doing now all they can to prepare for future foreign business but also are maintaining as great an export trade as is possible without reducing their efforts in the war. England's preparations for future

export business are being carried out on a scale hitherto unequalled by any country. All of her industries are being organized for bringing the whole national resources—manufacturing and financial to bear on the export field as soon as the war ends. England is a practical foreign trade country and her preparations are based on experience. Like Germany, she believes in the potency of the man on the ground. Her commercial agents swarm in all the great capitals and centers of the world. New York is full of them. The part the French will play is a minor one indeed compared to the English, but France also is active.

The British preparations are literally an economic mobilization of the resources of the whole empire. The parliament of Great Britain in January, 1916, debated a resolution:

RESOLVED, That with a view to increasing the power of the Allies in the prosecution of the war his Majesty's Government should enter into immediate consultation with the governments of the Dominions in order with their aid to bring the whole economic strength of the Empire into co-operation with our Allies in a policy directed against the enemy.

Bodes Ill for German Trade

This policy has since been worked out with a thoroughness that bodes ill for Germany's foreign trade aspirations. All of the Allies have entered heart and soul into this preparation. The United States is a great asset to this program. The primary purpose at present is to break down the Germanic commercial organization and influence in all parts of the world and to shut off every form of aid to Germany.

The inauguration of this policy in Britain was the beginning of a world-wide movement including the United States, in which German firms have been black-listed, German trade boycotted, exports restricted by license, the sale of raw products controlled, and coal refused for ships that were indirectly aiding Germany.

In British colonies and dominions this policy has resulted in the cancellation by law of contracts with Germans, the expulsion of all resident and even naturalized Germans from all public trade bodies, the closing of telegraphs and mails and the working out of a world-wide boycott that effected not only the German mercantile establishments, but also neutral concerns that maintained close business relations with them.

The control of raw material is the most vital power in the hands of Great Britain in carrying on a war against German commercial aggression. Joined with the United States the entente Allied group could exert such a control over raw materials, shipping, trade routes, etc., that it is difficult to see how the Central Powers could maintain their existence as powerful industrial countries in a trade war after the war.

Eighty-seven British Reconstruction Commissions

All told 87 commissions and committees are working under the direction of the British Ministry of Reconstruction for the regeneration of British industry. This vast scheme includes provision for every conceivable phase of commercial activity. To determine what steps should be taken to recover home and foreign trade lost during the war and to secure new markets is part of the objective of one of these commissions of which the prime minister is chairman. Devising ways and means whereby the sources of supply within the empire can be prevented from falling under foreign control, is another duty of the same commission.

The commission on trade relations after the war is actively taking measures for the promotion of British trade and with equal enthusiasm is devising means for the prevention of the resumption of Germany's policy of peaceful penetration.

Methods whereby the endless munitions factories can be adapted to industrial purposes is an activity of the commission in the engineering trades. Seeking new industries to

be adopted is another duty of this commission. How the machinery may be adapted to other uses and the suitability of the labor of existing munitions factories for other industrial work will be shown. In each case, this commission will show whether skilled or unskilled labor is needed, and if female labor can be used.

Other preparations dealing with finance, demobilization of the army, foodstuffs, control of raw materials, etc., etc., are organized under these commissions with a searching viewpoint of leaving nothing undone.

Japan Has Great Plans

What Britain is prepared to do in foreign trade has a parallel on a lesser scale in what the Japanese will do and to a considerable extent are doing now. Japanese manufactured goods are pouring out from the island empire in unprecedented volume to new markets in all parts of the world. Our Pacific Coast merchants are buying textiles and jewelry, novelties, light metal goods, etc., from Japan because our own manufacturers cannot meet the Japanese prices. Japanese goods of all kinds are being sold in great quantities in South America, Australia, Africa, India and even compete with British goods in England itself.

Japan is a formidable competitor in the export of railway supplies to the Far East. Her manufacturing capacity is not sufficient to endanger the development of American or British railway exports, but possibilities of Japanese development of these resources are great. The vast Chinese iron and coal mines are being organized under her direction. Grown enormously rich by the war Japan is preparing to father the industrial development of China. Her first activities will be railroad and mining development. She will manufacture much of the finished products at home. Her domestic railway supply manufacturing industry had a capacity of one-third in excess of her own needs at the beginning of the war but it has been greatly expanded. Japan hopes to get the raw materials such as iron and steel, sheets and plates, structural steel from the United States until she can develop Chinese iron and steel resources sufficiently to meet her needs. The whole world is preparing for a new industrial era, and Spain and Australia are striving for locomotive building capacity, Chile and Brazil are building railroad shops. Italy is looking forward to the end of the war as the time when she will harness her water power to a reorganized and electrified system of railroads when machinery will be manufactured in hydro-electrical driven plants. Brazil is pushing the application of pulverized fuel for locomotives and industrial plants because that will make available the large deposits of lignite for industrial purposes. Siberia is awakening to her needs of transportation and manufacturing. Wherever we look we see a world full of new ideas getting ready for an era of industrial development. Everywhere railroads will play the first part in this great development, because transportation is the forerunner of all material progress.

Our Own Part in This Expansion

Our railroad supply manufacturers will play a big part in this reconstruction. Much business will come to them almost without their seeking, but with so many competing interests this first rush of business is likely to be transitory unless we are prepared to give service as well as products.

The American made car, the American made locomotive and other American railroad supplies are well suited to the needs of many countries. Large unit equipment is the kind that will probably be used in future railroad construction in most of the large continental countries of Australia, Africa, South America and Asia, because the grades, long hauls and materials to be handled make for conditions similar to those in the United States for which this equipment was evolved. European equipment is generally designed for short trips. Speedy delivery in small lots is more important than large

carrying capacity. Therefore, Europe is handicapped, at the start, at least as far as competition with us is concerned, in the attempt to sell its kind of equipment in the great continental areas.

For these much of our equipment can be sold just as it is for foreign use. On the other hand foreigners have many preferences that are founded on conditions peculiar to their own countries. It is to the credit of our railway supply manufacturers that they have keenly realized this fact. They have in many cases shown the engineers on the foreign railways that many American practices could be adapted most advantageously to their problem and many cars and locomotives are going abroad with American ideas and devices on them that should be well received. On the other hand, the American manufacturers have apparently been most careful not to overstep the line. The American Car & Foundry Company is very careful not to try to run counter to any of the natural preferences of the foreign purchaser. In supplying passenger cars to Italian railroads this company recommended that the cars should be built on the compartment system rather than the American seat arrangement although the Italians had asked for cars built entirely on the American system. The American company knew that the compartment arrangement was better suited to Italian needs and wanted to avoid a come-back.

Perhaps the most notable question that has come up has been that of journal box lubrication. We have supplied American M. C. B. journal boxes on an order for Italian locomotives. The Russian cars were built very largely to M. C. B. standards and had M. C. B. journal boxes even on a large proportion of the four-wheel cars. We have supplied large eight-wheel cars with M. C. B. journal boxes to companies in France. The French use a scheme of journal box lubrication in which they have a felt pad. American railway supply companies have essayed to show the French mechanical officers the advantages of our M. C. B. lubrication, but American railroad engineers now in France have conceived a great admiration for the French felt pad arrangement. When these railroad engineers come back it is even predicted that they will make recommendations that this method be considered for adoption in this country. However, true this prediction may prove, the point is that both sides are learning with open minds. The education that will result for us, whatever the outcome, will prove of untold advantage in the trade campaign later on.

There are thus many instances in which the preferences of the foreign buyer should be followed and others where the efforts of our supply trade should be to sell its own designs.

Thinking Financially in Dollars

The purpose of this article is not so much to describe the methods of getting export business as to show that the business is there and can be had by practical business methods, and that to go after it is so important that it can be said to be a patriotic duty.

Despite the scarcity of ships much of this business is available today. This is evident from the monthly reports of railway supplies from several countries, including the United States. No matter how scarce shipping is, it is necessary to keep commerce moving on the ocean routes and railroad supplies are a necessary part of this traffic.

That the development of export is for the best interests of the country is evident when we look ahead to the end of the war. Then is when our present preparations will show a dividend. Development of our export trade is developing the resources of the country to be utilized in time of war. In times of peace export trade in railway supplies will serve to balance the volume of production of our supply factories. When bad times exist in the United States the demand for railway material is likely to be particularly brisk in South Africa, Italy or the Far East. Economists say that when the

United States develops an export trade that sizes up to the immensity of her resources, bad times or boom times will no longer exist. An even measure of prosperity will be our constant condition. Export trade is already bringing the American in contact with other people with a consequent breaking down of old prejudices and the establishment of new friendships and also a broadening of the culture hitherto provincial.

The Latin is beginning to think financially in terms of dollars and he is looking to America to get the dollars for financing railway developments of his country. Export trade is needed to fill the ships that will travel abroad from the Atlantic and Pacific or Gulf ports to all parts of the world, so that by establishing a great volume of shipping to and from the United States we all may benefit by the cheapening of rates. This means the end of the Chinese wall of high freight rates that has cut us off from a full realization of our opportunity as a great industrial country. What Great Britain would be without ships is as easy to imagine as what the United States should be with an adequate merchant marine and a volume of export trade in proportion to our great resources and our national traits of initiative and business talent.

That the position of the United States is such that our preparations are sure to result in a great development of our export business is the opinion of Burwell S. Cutler, chief of the Bureau of Foreign and Domestic Commerce, who voiced this opinion recently by saying: "I, myself, have supreme faith in the genius of our commercial public to use good common sense in the contemplation of after-the-war trade. You can not make me believe that the sturdy figures who have in the last 50 years won a place for us as one of the three or four greatest world powers will ever be stamped into fear or uncertainty on account of what competition will do. When reconstruction is actually at hand, the American business man will find perfectly normal ways of holding his own in every market of the world without recourse to any selfish national schemes designed to hoodwink our commercial brethren abroad. Indeed, it may be assumed that our trouble will be one chiefly of satisfying the tremendous demand for our goods both at home and abroad."

"ACH. THEY'VE GOT OUR RANGE AGAIN"

Why Locomotives Should Not Be Standardized

There Can Be No Justification Either in Time or Money
for the Standard Locomotives

THERE ARE SO MANY REASONS against the standardization of locomotives for the railways of the United States that it is hard to understand why so much consideration is being given by the Railway Administration to this particular phase of railway operation. Unlike cars, locomotives are built to meet specific operating and physical conditions. Upon the size and design of the locomotive depends to a very great degree the efficiency of railroad operation. A design adapted to the physical and traffic conditions of one road, or even to one division of a road,

Fig. 1—Number of Six and Eight-Wheel Switchers Ordered During the Past Five Years According to the Weights

may be unsuited to the conditions of another road, or another division of the same road. To effect greater increases in the efficiency and economy of operation, the railroads have given much study to the proper characteristics of the locomotives to be used, and to upset such carefully laid plans by the introduction of standard locomotives, which at best must be of a compromise design and can only be made to meet average conditions, is a decided step backward.

There is ample justification for the standardization of freight cars. Due to the extent to which such cars are interchanged between roads and because of the fact that such a large amount of repairs are made on foreign lines, it is entirely proper that a certain degree of standardization obtain in order that these repairs may be made promptly and that the repaired parts be interchangeable, so that the number of such repair parts to be carried in stock may be maintained at a minimum. This, the chief argument in favor of standard cars, does not apply to locomotives. Locomotives have not and should not to any great extent be interchanged between roads if the best results in train operation are to obtain. The experience of the past few months with locomotives that have already been interchanged will show clearly the inexpediency of such practice.

There are six distinct problems that must be considered carefully in the discussion of standard locomotives today. They are first cost, increased locomotive production, operating efficiency, development in design, locomotive repairs, and the expediency of such an experiment in time of war.

It is, of course, an indisputable fact that the cost per locomotive will be less when a large number of locomotives

of the same design are built than the cost per locomotive when the same number of locomotives are built to the same general weight, but of different designs, provided that in both cases all of the designs are new. It is, however, a grave question whether locomotives of a new design, of a number which will probably be built this year, can be built any cheaper than locomotives of existing designs for which all the manufacturing equipment has been provided. In building any new design of locomotives, such as the new standard locomotives, there will be a large expense for the time taken to develop the designs, for making new drawings, patterns, templates and jigs, and other manufacturing equipment which is necessary to the construction of any locomotive. Prices for such locomotives must in all fairness to the builder, include the extra cost occasioned by developing the new design. Were locomotives of existing designs built, this extra cost would not have to be considered, as it has already been absorbed by the first locomotives built to those designs.

First Cost

There is another point concerning which but little has been said and which will add a considerable amount to the first cost of the standard locomotives. The following argu-

Fig. 2—Number of Mikado and Santa Fe Type Locomotives Ordered During the Past Five Years

ment is based on what is believed to be the government's plans, namely, that 12 designs are to be built, having approximately the following total weights:

| | |
|----------------------|-------------|
| Six-wheel switcher | 120,000 lb. |
| Eight-wheel switcher | 140,000 lb. |
| Pacific type | 160,000 lb. |
| Mikado type | 180,000 lb. |
| Mountain type | 200,000 lb. |
| Santa Fe type | 220,000 lb. |
| Santa Fe type | 240,000 lb. |
| Santa Fe type | 260,000 lb. |
| Santa Fe type | 280,000 lb. |
| Santa Fe type | 300,000 lb. |
| Santa Fe type | 320,000 lb. |
| Santa Fe type | 340,000 lb. |

The manner in which the first ten locomotives will fit into the requirements of the country is well illustrated in Figs. 1, 2 and 3. Fig. 1 shows the number of locomotives ordered during the past five years, by weights, for the six-

wheel and eight-wheel switchers. Heavy vertical lines are drawn at points representing the approximate weights of the standard switchers. The same is shown for the Pacific and Mountain types in Fig. 2, and for the Mikado and Santa Fe types in Fig. 3. From these charts it will be seen that if the government builds only those standard locomotives

would not be required for these locomotives. If the work of all of these 367 locomotives were concentrated at one point, this would undoubtedly be true, but these locomotives were purchased for use in various parts of the country and they were not built as heavy as the standard locomotives, as the conditions did not require locomotives of such capacity.

This same line of argument can be applied in the case of all the other types to the extent that it will be safe to say that millions will have to be spent for excess locomotive material if the standard locomotives obtain. It is hardly conceivable that any savings that could be made in manufacture, could be enough to counteract these additional costs.

Increased Production by Standardization

As an abstract proposition, the output of any plant can be increased if the work done in that plant is systematized to the extent that it produces but one product year in and year out. In the case of locomotive construction, standardization will to some extent aid in reducing the time taken for making the various parts after the program gets thoroughly started. But will this mean increased locomotive production? The foundation upon which the locomotive builder's plants and the locomotive repair shops is based is the number of pits, or the erecting shop space. In other words, the erecting shop is the neck of the bottle in locomotive construction. The various manufacturing departments have been designed and arranged to keep the erecting shop working to full capacity. The question then is, how much can the erecting shop forces speed up their work if they have large numbers of one design to assemble rather than small numbers of different designs. Men in authority have expressed the opinion that this would have but little effect on increased output, but that it may have some.

With conditions as they exist today, however, the inauguration of standard locomotives at this time bids fair to interfere greatly with the output of locomotives this year. About the time the Railroad Administration decided to investigate the problem of standard locomotives, the railways were forbidden to place orders for new locomotives. Instructions were given the builders to place existing domestic orders ahead of all foreign orders. As the matter stands today, the builders due to lack of orders and the fact that the work on foreign locomotives has been held up, have open space beginning in June or July. Unless orders are placed immediately, the materials cannot be assembled or made ready for erection by that time. It has been estimated by those who know that from the first of April every day's delay in placing orders for locomotives means a decrease of about ten locomotives in the year's output.

It has been said by some that deliveries of the standard locomotive can be made within two months after designs have been definitely determined upon. Such a statement represents the utmost optimism. It is difficult to see how with all the detail work that must be done in connection with any new design, together with the condition of the material market today, the innumerable details can be designed, the patterns, jigs, templates and castings made, machine work done and the locomotive erected in two months. Others say that this can be done in three months, but even that is optimistic. Until such time as the standard designs can be determined upon, and this by no means should be done in a hurry, the locomotive builders should be kept working to capacity, if necessary by orders from the individual lines.

The business of the railroad is transportation. Its measure of efficiency is the cost for transportation per ton-mile. It was the aim of every road to bring this cost per ton-mile to a minimum. The locomotive plays a very important part in reducing this cost. The many different conditions surrounding railroad operation make it necessary carefully to design the hauling unit if the different conditions are to be met economically. A locomotive usually operates over a distance of not more than 150 miles. There are probably

Fig. 3—Number of Pacific and Mountain Type Locomotives Ordered During the Past Five Years

which it is now considering, many roads will be furnished, if the same requirements obtain as in the past, with power that is either too heavy for its demands, or of a more complicated construction. For instance, those roads that could economically use Pacific type locomotives weighing less than 270,000 lb.—and as the curves show there will be quite a number—will be obliged to use a heavier locomotive. Those roads that have found it desirable to use Pacific type locomotives weighing over 300,000 lb. will either have to take the standard Pacific weighing 295,000 lb., which will be deficient in tractive effort, or take the more complicated design of the 325,000-lb. Mountain type.

The first cost of the locomotives will from such an analysis appear to be greater inasmuch as heavier and more complicated locomotives will be required for services in which locomotives of less weight could be used. For instance, last year there were 367 Mikado type locomotives ordered, each of which had a total weight below the 295,000 lb. standard. The sum total weight of these locomotives was in the neighborhood of 97,000,000 lb. If the same requirements obtain this year, and there is no question but what they will, the need for the 367 locomotives would undoubtedly be filled by 367 standard locomotives which would have a sum total weight of about 108,000,000 lb. In other words, about 10,000,000 lb. of locomotive material—1,000,000 being subtracted for water in the boiler—would be required to fill these requirements under the standardization program. Taking a conservative cost of locomotives at the present time as 15 cents per pound, in this particular case the increase in first cost, due to the fact that standard locomotives are being used, would amount to \$1,500,000. There is no question but what last year's requirements will be doubled this year and it can safely be said that the loss in first cost of the lighter Mikado types will easily reach \$3,000,000, if they are to be supplied by the standard locomotive. This does not take into consideration requirements for Consolidation locomotives which will still further increase this sum.

It may be argued that on account of the increase in tractive effort, an equivalent number of standard locomotives

2,000 such engine divisions throughout the country. Many of these, of course, are similar in nature, but each with its physical limitations and its traffic conditions must be given careful study that the most economical method be followed in getting the trains over the road. Water and fuel conditions affect the detail design of the power to be used.

Operating Efficiency

It would be folly to place powerful locomotives on single track lines whose sidings would not permit the length of a train that could be hauled by the locomotive. It would be a waste of money to sacrifice the high wheel engine of the plain for the low wheel engine of the mountains, simply for the sake of standardization. Considerable money has been spent to strengthen tracks and bridges for the purpose of using more powerful locomotives which have wheel loads heavier than those contemplated by the government. It would be impractical for the sake of standardization not to take advantage of these improvements by using the heavier axle load locomotives which can be operated more economically. There are many, many cases where locomotives of special design, built to meet the special requirements of division or road, have made possible a material decrease in operating costs. To upset such carefully laid plans by requiring the use of a locomotive which must of necessity be a compromise design, removes the incentive for further study along these lines, and increases the operating costs.

It has been said that many roads today are operating locomotives of similar design, the only difference being in some minor detail which was more or less a hobby of the chief mechanical officer. In such instances there is no question but that the same design of locomotive could be used on such roads, but there are many other instances where the operating conditions are so different that to insist upon the use of standard locomotives would be to give the operating men inadequate tools with which to do their work.

Development in Locomotive Design

With the fixing of any standards there cannot help but be a feeling that it is hopeless to further improve "our power." The quotations are used advisedly, for there is nothing so close to the heart of a railroad mechanical man as the locomotives he has under his jurisdiction. He is constantly seeking to further improve their efficiency and capacity, and make them operate better and do more work. This, of course, results in a number of idiosyncrasies and whimsical things which find their way on locomotives throughout the country, but be that as it may, the careful study and interest that has been taken in the locomotive by the men that operate it, has made it as efficient as it is today. By standardizing, the initiative for further improvements and betterments is removed from these men. It is no longer "their" locomotive, but "something somebody has designed who does not know our conditions."

This psychological view of the situation is one that enters into the problem of standard locomotives to a large extent. There is hardly a railroad mechanical man who does not think his power is better than that of his neighbor. It is this attraction in the railroad game that keeps the men on the job at, in many cases, ridiculously low wages. It is these men who from their practical experience in handling the locomotives, provide their roads with power which on other roads would not make nearly as good showing.

The railway supply concerns have been a great factor in developing the locomotive to its present standing. This industry has devoted large sums of money to development work and has among its organization the experts in their respective lines. The country cannot afford to standardize locomotives to the extent that any incentive for these companies to still further improve their products be removed. In most cases, a new device that is developed is experimented upon on locomotives of roads that had the conviction of its

merit and the courage to try it. This has been necessary in order that the device be properly developed. Such practices should not be discontinued even though all the railroads are compelled to purchase none but standard locomotives. If it is, the development work which has done so much for locomotives during the past five years will be greatly handicapped. Further, after such experiments have been made and proven practical, experiments should be continued on a larger scale, such as by equipping new locomotives for perhaps one road with the device that it may be still further developed. To equip any large quantities of locomotives, such as would undoubtedly be ordered if the standard locomotives are to obtain, would be perhaps impractical on account of the extent to which the particular device in question has been developed. To this end, therefore, it is highly desirable to permit the roads for which locomotives are to be purchased by the government to specify the appliances to be used on those locomotives.

Naturally, if development is to continue along these lines as it has in the past, standardization should not be carried beyond the basic locomotive design. While it is understood that the plans and specifications are about to be submitted by the government, it is not known just the extent to which the standardization has been carried. If the same policy is to be followed as was followed in the development of the designs for standard cars, there need be no fear for any serious restrictions on this point. If by standardization any incentive is removed from either the railroad men or the railway supply men, future development will suffer.

It is hard to believe that good designs of a set of locomotives which are so radically new, could be developed in the time allotted to the designing committee by the Railroad Administration. The problem is such an all-important one and bears such a vital relation to the future efficiency of our railroads that it is deserving of the most careful attention and painstaking investigation. According to report, as soon as the designs have been completed and approved, large orders will be placed immediately. If by any chance a mistake has been made in any design, the effect on the railroads would be that many times worse.

Locomotive Repairs

The railroads have in the past standardized to a certain extent the various details of their locomotives in order that repairs may be easily made and that the amount of material to be carried in stock may be reduced to a minimum. Almost every road has what is called standard practices, which are described both by drawings and instructions in *folio* form, in order that the standards of repairs will be the same in all of the main shops and enginehouses. Their locomotives are built to meet these detail standards. Special tools, dies, patterns, templates, jigs, etc., have been developed to meet these standards so that repairs may be made at less cost.

With the introduction of standard locomotives, these standard practices would have to be revised to a very large extent. New facilities for making repairs would have to be created and the foremen and men in the shops would be obliged to readjust themselves to many little detail changes that would be found in the standard locomotives, all of which would materially interfere with the output of the shops and create a confusion that the country could ill afford to experience at this time. This matter is a tremendously important one and must be given very careful thought. The railway shops of today, taking the country over, are wholly inadequate for handling the repair work on the locomotives the roads now have. There is hardly a road in the eastern territory but that will own up to a deficiency in this respect. The shop and terminal facilities for maintaining locomotives have not kept pace with the improvements to the locomotives. To overtax these shops further by calling upon them to repair locomotives with which they are not familiar and for which they have not the proper facilities

will greatly increase the burden of the already overtaxed facilities. An excellent illustration of the difficulties that will be found in the repairing of the standard locomotives may be found in any railway shop that is now called upon to repair locomotives for other roads.

The fact that any standard locomotive would be a foreign locomotive to all roads makes the problem increasingly serious. Furthermore, as was pointed out above, in a large number of cases heavier locomotives will be provided for certain work which was done before with smaller power. This again will increase the difficulties in making repairs. With the introduction of any large number of heavy locomotives on the railways must come a material improvement in the shop facilities. Some roads have adopted larger power without increasing their facilities and are well able to testify exactly what this means in decreased shop output and inefficiently maintained power. While, of course, the repairs to the standard locomotives do not loom up as being a vital question in the immediate future, it must be remembered that it is a question which will have to be met about a year hence. The lack of repair facilities during the past winter was responsible to some extent for the deficiency in motive power. With a design of locomotive which is new to all of the roads demanding repairs a year from now, which perhaps might be a more critical period than the present, it behooves every one who has to do with the establishing of the standard locomotives, to give this matter the most careful thought.

Regardless of the arguments against the standardization of locomotives as an abstract proposition, and assuming for the moment that there are certain substantial benefits to be obtained by standardizing locomotives which make it expedient at least to build from 4,000 to 5,000 of them, should we undertake such a gigantic experiment at this time when the country is at war? There can be only two logical reasons for building standard locomotives as a war measure. The first is an increase in the production of new locomotives,

and the second is a reduction in the cost of locomotives. The answer to the first question may be found in the section discussing the production. The answer to the second question is found in the section discussing the first cost. The condition in the locomotive market today is such that the very consideration of standard locomotives is in danger of decreasing the output of the builders for the year. In the matter of first cost it is shown that money will be wasted, because the locomotives will be provided that are heavier than necessary and, therefore, more expensive. Added to this, the increased cost of operation of the locomotives and the increased cost that must arise from their repair would make it appear that the introduction of standard locomotives at any time would result in a net loss rather than a saving.

Conclusions

It would be far from constructive if this article should close without offering some suggestions as to what can be done to do what the government is evidently trying to do by the inauguration of standard locomotives, namely, improving the motive power situation the country over. The motive power situation of the railroads of this country can be improved; (1), by properly maintaining the locomotives that are in service at the present time and bringing them up to serviceable condition; (2), by increasing their capacity by the addition of devices, which have been found to increase the service and give more power to the locomotives; (3), by improving engine terminals in order that locomotives may be turned more promptly than they are now; (4), by properly loading locomotives to their full capacity; (5), by properly dispatching locomotives over the road; (6), by giving the railroads locomotives best suited to their conditions and which may be easily repaired by them; (7), by giving priority orders so that the builders may obtain material for new locomotives; and (8), by placing orders for locomotives immediately.

Signal Department Encounters New Problems

Shortage of Labor and Delayed Deliveries of Materials Hinder Work. Outlook Good for Much New Work

AT THE PRESENT TIME the signal field is quiet. This condition is a result of the uncertainty regarding railway affairs, although this uncertainty is disappearing rapidly and the outlook for the signal department organizations and work is decidedly bright. As the director general expects to spend from one to two billion dollars on the railroads this year, it is to be expected that the signal departments of the country will come in for their share of this expenditure. The location, class and kind of work will depend upon the necessity for the protection and development of facilities to meet the country's present and expected needs under war conditions. Another consideration that will also govern will be the needs of the lines under unified operation rather than their needs as individual carriers.

The greatest opportunity in the history of American railways is presented to the signal engineers of the country today to demonstrate the value of signals in the movement of the heavy war-time traffic. The future progress in the signal field very largely depends on the manner in which the present situation is handled by signal officers. It is logical to assume that an optimistic view is warranted when it is considered that no other class of work can be installed in as short a length of time, with less expense and with less labor, which will increase the traffic capacity of existing tracks to an equal extent.

The construction work that has been carried on during

the last three months has been mainly that which had been started prior to January 1. Very little new work has been contracted for or authorized this year. General order No. 12, issued by the director general, will be the guide in determining the kind of signal as well as other work which should be installed. The work which should be undertaken first is that in connection with unsignaled lines which have reached their maximum track capacity and over which it is necessary to move still more traffic. The importance of the installation of interlocking plants should also not be overlooked, as material savings may be effected at a large number of busy points by the elimination of stops by heavy trains, facilitating train movement and preventing considerable wear and tear on rolling stock.

Possibilities for economy in the handling of traffic should be considered very thoroughly and where it is found that an installation of signals will better conditions materially, even though the track capacity has not been reached, it is important that such installations be made. While work which has been under way for some time has been hampered by the delay in receipt of materials, this is a problem which can and no doubt will be remedied by the priorities board. Construction work can also be greatly facilitated by the ordering of material, where practicable, a year or two in advance.

Some of the work now under way, nearing completion,

or contemplated, is referred to below. While it is not complete for the country, it is indicative of the class and character of work which will undoubtedly be undertaken in connection with new programs.

Work Now Under Way

The *Alabama & Vicksburg* is just completing automatic block signals on 11 miles of road, with the expectation of putting them in service within 60 days. The management proposes to install automatic signals on 11 miles additional, but has taken no action thus far except to recommend this improvement to the director general.

The *Atchison, Topeka & Santa Fe* is to install mechanical interlockings at Atchison, Kan., orders for which were recently noticed.

The *Atlantic Coast Line* has authority outstanding for the construction of a mechanical interlocking plant near Marion, S. C., with six levers of the cabin door lock type; one at the Roanoke river draw with a five lever mechanical machine, and one at Orient, Fla., with a nine lever mechanical machine of the cabin door lock type.

The *Boston & Maine* has completed one interlocking plant during the past three months. Plans are ready for the early installation of a number of other interlockings, and also some semi-automatic signals at entrances to yards; also several "automatic flagmen" for highway crossings; but the difficulties of the manufacturers in securing raw material and the impossibility of agreeing on prices except where the contracts can be closed at once, have greatly enhanced costs, delays and other difficulties.

The *Boston Elevated*, in connection with its extension northward to Everett, Mass., 3 miles, is installing 14 automatic block signals and is making extensive changes and additions to its interlocking at Sullivan square, Boston, where the new extension leaves the existing line. Light signals are used throughout this improvement.

On the *Buffalo, Rochester & Pittsburgh* work has progressed on interlockings at C. & M. Junction, Pa., and at Brockwayville, Pa., since January 1, and on the installation of signals on the second track between Marion Center, Pa., and Home. This work will all be completed in the near future.

During the past three months the *Baltimore & Ohio* has completed two temporary interlocking plants at Annapolis Junction, Md., which were needed in connection with the movement of traffic to and from Camp Meade; a 48-lever interlocking at the west end of the Magnolia cutoff; the changing of the signals on a single track line to double track for about 23 miles in Indiana, including interlocking at a passing track at Bremen and automatic signals between Hamilton, Ohio, and Toledo, on the Toledo division, sufficient to provide continuous automatic block signal operation from Cincinnati to South Lima, 150 miles, with the exception of one short section in Dayton. At Bremen, Ind., take-siding indicators and leave-siding indicators have been provided, both of which are controlled from LaPaz Junction. Every effort is being made to complete extensive additions to the automatic signals between Cumberland, Md., and Connelville, Pa., between Willard, Ohio, and Greenwich, and between Willard and Attica; but the progress of this work has been hampered by the scarcity of labor and by slow delivery of material.

On the *Chicago, Burlington & Quincy* 47 miles of double track automatic signals between Mt. Pleasant, Iowa, and Ottumwa, which have been under construction for some time, are now approximately 90 per cent completed. A number of interlocking plants on this road are also being repaired or rebuilt and are about ready to go into service again.

The *Eric* has completed automatic block signals on 35 miles of double track line from Lomax, Ind., to Griffith during the past three months. It is also hoped to start work

during the present month on an extensive interlocking plant at Salamanca, N. Y., and at three other large plants.

The *Grand Trunk* is installing automatic block signals on its line in Maine, about 30 miles, single track. High cost of materials and shortage of labor have thus far prevented the completion of further plans.

The *Great Northern*, as noted in the *Railway Age* of February 8, is to install automatic block signals on its line in Montana, 31 miles, and in Minnesota, 11 miles.

The *Illinois Central* has been building automatic signals on 198 miles of single track and 12 miles of double track which will be put in service about July 1. An electric interlocking plant at a junction with the Michigan Central at Pullman Junction, Chicago, will be ready for service about April 20, while an interlocking plant at Baton Rouge, La., will be completed about the middle of the summer.

The *Jacksonville Terminal Company*, Jacksonville, Fla., has ordered material for two interlockings, tower 1, and tower 2, at its new terminal.

The *Lehigh Valley* has ordered a 38-lever interlocking for Easton, Pa.

The *Louisville & Nashville* is making extensive additions to its electric interlocking plants at Louisville, Ky., and Amqui, Tenn.

The *Missouri, Kansas & Texas* has ordered materials for an interlocking plant, 12 levers, at Clinton, Mo.

The *New York Municipal Railways* has substantially completed all of the signaling in the Broadway subway, Manhattan, and across the Manhattan bridge between 42nd street and the Brooklyn end of the bridge.

The *New York, New Haven & Hartford* has under construction about 80 miles of automatic block signalling, of which a small part is four-track line and the rest two-track; and in addition has prepared plans for about 72 miles additional; but in the present situation as to scarcity of help and delays in delivery of raw and manufactured material, no definite calculations can be made as to when this work can be completed. The additional lines included in the budget since the report made in January are those from Boston Switch, near Providence, R. I., to Readville, Mass., from Devon, Conn., northward to Waterbury Conn.; and from Hopewell, N. Y., to West Pawling, N. Y. The extensive improvements in existing interlocking plants, reported in January, are still under construction, rather slow progress being made.

In connection with passing sidings on the main line between New Haven, Conn., and Boston, Mass., 157 miles, operated by the controlled manual block system, about 25 outlying switches are to be provided with low-voltage switch movements, and operated and controlled from towers usually about one mile from the switches. These switches will be provided with home signals.

The *Norfolk & Western* has completed the installation of automatic signals between East Radford, Va., and Atkins, a distance of about 88 miles, during the first quarter of 1918. It is expected that automatic signals will also be completed between Atkins and Bristol during the next few months. The following work was also completed in 1917: installation of automatic signals between Norton, W. Va., and Fort Gay for the purpose of shortening the present blocks from two miles to one mile; the installation of automatic signals in connection with the opening of the electrification from East Vivian, W. Va., to Farm and Wilcox; installation of double track in North yard, approximately 4 miles. Addition to the interlocking plant at Glen Jean, Conn., to take care of the C. & O. N. connection.

The *Norfolk, Chesapeake & St. James* is engaged on the construction of the large electro-pneumatic interlocking plants at Norfolk, noted in our Annual Review Number of January 4, but material is being received so slowly that only a small part of workmen can be kept busy.

The *Pennsylvania* has been able to complete some of the

work started in 1917 and in 1916, notwithstanding the generally slow receipt of material. This includes the Woodlands Tower interlocking on the Philadelphia Terminal division and an 8-lever mechanical plant at Phelps Junction, N. Y., on the Elmira division. Automatic signals of the position-light type are now in service between Rahway and South Elizabeth, Sunbury and Selinsgrove Junction, Schuylkill River bridge and North Philadelphia. The Chestnut Hill branch installation is coincident with the extension of the electric train service on that portion of the system and carries with it the building of a new electro-mechanical style P-4 U. S. & S. Co. interlocking at Chestnut Hill. This plant will have eight electric and four mechanical levers. Thirty miles of position-light automatic signals on the N. Y. P. & N. are about ready to go into service. In addition to the above work, a number of changes have been made in existing installations and plants.

The *Pennsylvania Lines West of Pittsburgh* will install a mechanical interlocking, 35 levers, at Boone, Ind.

On the *Philadelphia & Reading* construction will soon start on an A. C. signal installation between Delaware river bridge and Hillman, Pa. An extension of the present signal system to Bound Brook Junction, N. J., an addition of 12.6 miles of four track road is also contemplated. Construction will soon be started on five new interlocking plants, while changes or additions will be made to the present plants at five other points.

The *St. Louis-San Francisco* has ordered a mechanical interlocking, 35 working levers, to be installed at Durant, Okla.

The *Southern Railway (C. N. O. & T. P.)* has ordered, as noticed in the *Railway Age* February 8, automatic block signals for its lines in Kentucky and Tennessee, 46 miles, to take the place of automatic signals of earlier types.

The *Washington, Baltimore & Annapolis* is to install automatic block signals on 14 miles of its (electric) line, double-track, to accommodate the increased traffic due to the establishment of Camp Meade.

General Maintenance Conditions

During the past three months the railroads of the United States have passed through one of the worst winters in their history, marked by extreme cold weather over the greater part of the country and by very heavy snowfalls through the middle west. In spite of the combination of the extreme weather and the heavy transportation requirements the signal property at the close of winter was normal in practically all cases. This condition is the result primarily of the fact that maintenance work is taken care of during the summer and the late fall in order to get all signal apparatus in shape so that the least amount of work will be required during the winter months. The needs for the present year are with very few exceptions practically the same as have confronted the railroads in previous years at this time and no extraordinary measures should be necessary to maintain the signals in proper condition. The maintenance programs on a large number of the roads are practically up to schedule owing to the fact that safety in signal operation depends primarily upon such care, and this work can not be deferred.

The extent of the maintenance work to be undertaken during the present year necessarily depends upon the attitude which the government will take toward such work, this attitude no doubt conforming to such recommendations as may be made through the regional directors to the director general. Some roads are making requests for their regular maintenance appropriations and are outlining their work accordingly until such time as definite information may be obtained as to whether the appropriations will be authorized. Other signal department organizations, while submitting their regular maintenance programs for the coming year and asking for appropriations to cover, find that these are be-

ing restricted to a certain extent by the officers on their roads. In general, plans are being made to carry on the maintenance work as it has been handled heretofore.

The worst condition encountered during the past three months was in connection with the operation of interlocking plants. The main trouble experienced was in keeping the plants cleared of snow and ice and open for operation. This condition was brought about by the lack of labor more than any other one contributing cause, although even with this shortage of labor the signal departments generally were able to keep interlocking open ahead of any necessary traffic moves that were to be made over them. Some of the roads utilized their construction forces on interlocking plants during this period, while waiting for necessary materials to arrive to continue work which was under way.

Material Situation

While the material situation confronting the signal departments of the country looks bad, the prospects are bright for an early solution of this trouble. On a number of roads new work has been suffering for a lack of material, and maintenance work has also been interfered with to a certain extent. Some roads have had material ordered for over a year which they have not yet received. Other roads report no great difficulty with delayed material as they have anticipated their wants as much as a year and a half or two years ahead and as a consequence have been able to keep the work moving. The troubles encountered in securing material are due primarily to three conditions, the difficulty the manufacturers are encountering in obtaining raw materials, the labor situation and the effect of priority orders. While the situation at present is bad, the future may be considered as bright since the government can arrange for manufacturers to obtain the raw materials necessary, and the priority orders can be used to the advantage instead of to the detriment of this class of work.

Labor Situation

The signal department, in common with other branches of railway service, is hard hit by the shortage of experienced men. For the class and nature of work the labor turnover is entirely too great. Maintenance work is beginning to suffer on many roads. The new men coming into the service often regard the work as temporary until something better offers. It is impossible to get such men enthusiastic over their work and unless they are enthusiastic and interested, the work suffers. It has been found necessary in some cases to lengthen the territories of the maintainers in order to put an experienced man over each section, giving him inexperienced men as helpers and lampmen. It has been found necessary on some roads to conduct an educational campaign among the new men entering employment, this taking the form of lessons and practical questions which may be considered as part of their regular work.

Federal Valuation

During the past three months the work carried on by the government in the valuation of signals and interlocking has been mostly in the southern part of the country where the average mileage of line inventoried per month is greater than that covered in the north. This is because signaling on the southern lines is not as heavy as that on the trunk lines in the central west and the east. The railroads are now confronted with a lack of men in the valuation department and the work is handicapped accordingly. Unless it is intended to place final figures of value on the railways on which inventories have been made, many railway men consider it advisable under present conditions to postpone such work, employing the men engaged on valuation in other capacities more essential to the winning of the war.

Brain-Racking Problems for Canadian Roads

Winter of Unparalleled Severity; Shortage of Equipment;
Unprecedented Business

By J. L. Payne

Comptroller of Statistics, Department of Railways and Canals, Ottawa, Canada.

TRAFFIC AT ALL TIMES being the reflection of commerce, it is not surprising that the railways of Canada throughout the year 1917, and down to the end of March, enjoyed uninterrupted, though qualified, prosperity. Their gross earnings for the past 15 months have been unprecedented as to volume, which is another way of saying that freight tonnage has been moved on a steadily rising scale. The official statistics are not yet available, and it would be unsafe to speculate in terms of dollars as to what has been won by way of net operating revenue; but it is unnecessary to have definite figures in hand in order to forecast a decline in the final credit balance. Railways have no occult nor other means of working miracles, and therefore, while business has been exceedingly active, profits have been undoubtedly reduced by conditions. There was no escape from the stern forces which have operated to make the movement of traffic unusually difficult and costly.

The winter of 1917-18 was unparalleled in severity, from the railway standpoint. We have had cold dips in the

past. They are inseparable from our northern climate. But we have never had such prolonged periods of low temperature. It was peculiarly difficult to maintain a free movement of trains under such circumstances. Even though the over-worked boiler was willing to keep up an adequate supply of steam against an abnormal condensing pressure from without, the human factor at all times has its limitations. Men could not do their full part in such a struggle against paralyzing cold. The fall of snow has also been above the average, but not seriously beyond it. Drifting gave more trouble than mere depth of snow. Long spells of intense cold, however, created the most serious obstacle to comfortable and satisfactory operating conditions. Nature was in a hostile mood, and made the railways pay her price

Shortage of Equipment

Trying as was the cold, deep as were the drifts, chilled as were the men who carried on the freight, there was another adverse force against which courage, endurance and skill

J. H. Walsh

Sir George Burd

C. E. Brown

H. W. Scott

Members of Administration Committee of the Canadian Railways' War Board

were unavailing. There were not enough locomotives and cars in the Dominion to meet the demands upon the railways. In mathematics three will not go twice into five. In the railway realm an equally inexorable law prevails. It was impossible to make three cars serve where four were imperatively needed; and that about sums up the situation during the past 15 months. In 1914 the railways of Canada made a very substantial addition to equipment, following the prosperous year 1913. Then came the most severe pinch of adversity within two decades, without any reference whatever to the war. It all happened before the mad dog of Europe broke loose. The year 1915 brought the reverse pretty well up to the magnitude of a disaster. The war did that; and, of course, it would have been madness under such circumstances to add to rolling stock. In 1916 gross earnings went over the top, and in 1917 created an entirely new and conspicuous peak. More earnings meant more tons, more train miles, more everything. They sent out their own S. O. S. for more motive power and for more cars; but the most insistent call for help could not be answered in 1917. The war glutton was gobbling everything in sight.

The equipment situation at this time of writing presents the following equation: With nearly 30 per cent more tonnage to be moved there are actually fewer locomotives and cars with which to move it. The answer should be, "It cannot be done." Nevertheless it is being done; but it is being done under conditions which give a pungent meaning to the term "qualified prosperity" with which the cursory review opens. It is being done under a terrific and perilous strain on every department of operation. Embargoes were almost constant throughout the long winter. The repair shops were despair shops; for the problem of keeping enough wheels on the tracks seemed at all times beyond human capacity. The situation, however, gave vital meaning to the familiar saying: "You never know what you can do until you've got to do it." Efficient co-ordination of all departments accomplished what would have been impossible on the part of any single department. All the courage of the country had not gone overseas, and there ought to be a barrel of military crosses somewhere for the men who helped out by increasing the trainload and carload, as well as for the other fellows who did wonderful things in the shops, in the car distribution offices and in every branch of the service. The railways certainly did their bit, and what they did bore its relationship to the war in only minor degree to what was being done in Flanders and France.

No Relief in Sight

Whether or not the extreme pressure will relax is a matter of sheer conjecture at this moment. During the past three months the weekly traffic returns do not show the 1917 bulge; but they are nevertheless in advance of the corresponding period. The coal situation and the priority claims of war shipments have eased up; but both suggest abundant cause for anxiety in the outlook. Experience is a stern teacher, and the railways quite naturally feel compelled to make large plans for the possible demands of next winter, plus the prospect of a larger movement of food for export. At this juncture commerce, which creates traffic, is exceedingly active and gives no indication of a let up. Taken altogether, either a prolongation of the war or the coming of peace will keep the railway offices occupied with brain-racking problems. Happily, there are big men on the job.

Within the past month effect has been given by the Railway Commission to the appeal of the railways for higher transportation rates. While the advance is nominally 15 per cent in freight and passenger tolls, the former are subject to qualifications which bring the increase down to practically 12½ per cent. For example, wheat in the West

will pay but 10 per cent more, while coal between the Niagara frontier and Toronto will pay about 27 per cent more. This long-deferred concession was given in the face of determined opposition, chiefly from the West, and that opposition had really a single aspect. It was directed almost wholly against the Canadian Pacific; for the sufficient reason that the position of practically every other road was undeniably in the nature of distress. The Canadian Pacific stood out alone as an abundantly prosperous system, and there was a positive feeling against giving it higher rates. Yet the dissidents were impotent against the obvious question from the commission: "How can we help the struggling roads without at the same time increasing the earnings of the Canadian Pacific?" To meet that question there was put up to the commissioners a greater variety of impracticable suggestions than is usual in a railway rates case. As a matter of fact, no sound answer was possible. Some way had to be found of satisfying public feeling while permitting all lines to share in the increase of rates.

Special Taxes for Canadian Pacific

The way out was found in imposing special taxes on the Canadian Pacific in the following measure: One-half of its net earnings from railway operation in excess of 7 per cent on its common stock, after paying fixed charges, appropriation for pension fund and dividends on preferred stock; and income tax on the company's special income, inclusive of all its income except earnings from railway operations, under the Income War Tax Act. It is also provided that the total amount to be paid by the company each year shall not be less than (1) its net earnings in such year from railway operations, and from special income, in excess of 10 per cent of its common stock, after paying fixed charges, appropriations for pensions and dividends on preferred stock, up to \$7,000,000, or (2) the amount by which its net earnings from railway operations exceed the net earnings from railway operations for the fiscal year ended December 31, 1917, due to the increase in freight and passenger rates, just allowed.

This action must be accepted as indicating the situation which has been created by the exigencies of war. Those who are gifted with a spirit of divination may see a great deal more in it than that. To say the least, we are all living in grave times.

Getting Practical Results

Turning to the activities of the Canadian Railway Association for National Defence, it may be said that a vast amount of useful, necessary and effective work has been done. This is not essentially a body created by government and operating under government control. It is rather a voluntary association, organized by the railways and having powers from within itself; yet it has the direct approval and co-operation of government, and lacks little which wholly official control could give. In some respects it is able to do what government could not very well do. Under its comprehensive name are grouped a Special Committee on War and National Defence, an Administrative Committee, a Commission on Car Service, a Committee on Passenger Transportation, a Committee on Tariffs and Statistics and a Committee on Materials and Supplies. As the work of the Association is of considerable interest to American railways a summary may be given of what has been accomplished during the recent months:

1. Great assistance has been given to shippers in the handling of freight traffic during a season of such unprecedented severity as to cause persistent hindrances.

2. The construction of freight cars in Canada was imperilled because of the inability of manufacturers to obtain materials from the southern states on account of embargoes. Arrangements were made with the regional directors of the

United States Railroad Administration whereby the acceptance of such consignments was brought about.

3. The diversion of freight has given great relief to congested lines, facilitated the movement of foodstuffs to the seaboard and saved much delay to vessels. The handling of troops was improved by the same process.

4. The net balance against Canada on freight car exchange with the United States has been decreased from 22,219 on December 15 last to 16,058.

5. The average load per car has been bettered. As compared with January of last year the carload to St. John, New Brunswick, was this year raised from 26.4 to 32.3 tons. The saving was equal to 1,313 cars, 7,300 tons of coal, and a month's time of eleven locomotives.

Snappy Bulletin

As a result of what this association has done, it is now a common thing to see a Canadian Pacific locomotive on the Grand Trunk or any other line. The bulletin which is periodically sent out contains a good deal of snappy and appealing matter, as the following excerpts will show:

"The average freight car, carrying your goods, Mr. Canadian shipper, goes only half-filled—this is a fact, government statistics show that Canadian cars are loaded to an average of only 46 per cent of their weight-carrying capacity. You may perhaps be loading a little better than that average. You may think it is 'nobody's funeral but your own,' since you pay the railways the legal rate and should be allowed to waste space if you like. But the fact is that all Canada is vitally concerned with your treatment of the freight car."

"Attention of the shipping public is directed to changes ordered by the War Board in methods of loading l. c. l. (less than carload lot) freight. The custom which prevailed until recently was to load a car for, say, 'Xboro and

points east'. This car might contain freight even for St. B——, at the far end of that line. The shed was 'pulled' probably every day. The car for Xboro 'and points east' reached Xboro, we will say, in 24 hours. It was placed at the freight shed. The goods for Xboro were unloaded and car forwarded in possibly 24 hours after its arrival. The car proceeded then to Yville Junction. Here it lost another 24 hours in switching and unloading. This process was repeated at perhaps another point between Yville Jct. and St. B——. The car reached St. B—— in five days instead of two. The cargo for St. B—— in the meantime had been subjected to the usual strain of over-much shunting and switching. The car had lost three days' working time.

"The new method was put in force in December. The sheds may not be 'pulled' as often. The cars are now held long enough to obtain a full cargo for some definite point. Each car then proceeds to its destination, is unloaded at one time, and is released within 24 hours of its arrival! The time it lost waiting for a full load at the point of shipment is much less than it previously would have occupied in being switched to the freight sheds at several terminals. This economizes the time of the car, saves time for the l. c. l. shipper, and reduces the wear and tear on his shipment.

"In November, before the new system was put into general effect, 34,829 cars of l. c. l. freight were loaded at points loading five cars and upwards of such freight per day. The average weight of the contents of a car was then 11,442 lb. The change in methods brought into effect in December increased the average load per car to 12,407 lb. A gain of 965 lb. per car. There were in this month, 29,647 cars loaded at points, such as the above. Had the same average per car obtained in December as in November, 32,149 cars would have been required. Therefore 2,502 cars were saved by the better handling of the cars."

Severe Winter Hampers Railway Operation

Unprecedented Season of Storms Complicates Transportation Under Government Control

THE GOVERNMENT had scarcely assumed control of the railroads when a succession of record breaking snow storms and a protracted period of extreme cold created unprecedented operating difficulties in the larger part of the country. Most of this extreme weather was experienced in January, which was a most unusual month in many ways. Statistics recorded at Chicago show that 40.9 in. of snow, or four more inches than falls in an average winter, fell in that city in January, 1918. The mean temperature for the month was 13.3 deg. F., as compared with an average of all records in January of 23.7 deg. Only once during the month did the thermometer rise above freezing. The "snow map" of the country on the first of February showed that only a little strip of the lower Atlantic coast, Florida, the shores of the Gulf of Mexico, and a thin strip west of the Cascade mountains on the Pacific coast were free from snow. Miami, Fla., had snow for the first time on record and Houston, Tex., for the first time in 23 years; in New Orleans, La., the thermometer fell as low as 16 deg.

A Succession of Severe Storms

The first severe storm swept over the Central West and passed on east, beginning on the evening of January 5. This storm was accompanied by a snowfall of 15 in. and by a gale which at times registered a velocity of 55 miles an

hour. The storm was confined to a zone with a width of about 100 miles of Chicago and paralyzed transportation in that territory for from 24 to 48 hours. The railroads had hardly cleared the rails and yards of snow when a second storm passed through the same section of the country and swept on through the eastern states. It started on Friday evening, January 11, and while not accompanied by as heavy a snow fall—the maximum being eight inches and in many localities not exceeding three in.—it was of longer duration and driven by a gale as severe, if not worse, than that which accompanied the first storm. This second blizzard practically stopped the wheels of the railroads in the territory affected, on the 12th and 13th, but passenger service began to be resumed on something approaching normal schedules on January 14. The first break in Chicago's isolation from the East came when the Twentieth Century on the New York Central arrived at 10 a. m. January 13, a little over 24 hours late. The New York Chicago Limited of the Baltimore & Ohio, due at 9 a. m. on the 13th, arrived at 1:30 p. m. on the 14th. The Manhattan Limited and the Mercantile Express on the Pennsylvania, due in Chicago on the afternoon of the 12th, did not reach their destination until January 14.

The two remaining storms were more severe in the East than in the West. Although a blizzard which threatened to

rival those earlier in the month struck the Central West on January 26, it practically disappeared on the following day and had no ill effects on transportation other than delaying the arrival of trains in Chicago from one to six hours and causing the annulment of a number of trains scheduled to leave that city. Farther east the storm proved far more serious in its results. The new snowfall and low temperature neutralized all the gains made by the operating departments following the previous storms. Throughout eastern territory freight traffic was generally suspended and passenger trains were many hours late. The Pennsylvania Railroad on the 28th found itself in the most difficult position in many years. Passenger trains were stalled all along the line between Philadelphia, Pa., and Pittsburgh, and even at Broad street station, Philadelphia, train movements were seriously hampered by a shortage of men to keep the switches in working order.

In Kentucky and throughout a large area tributary to the Ohio river floods and floating ice did extensive damage at this time. In eastern Kentucky a number of railroad bridges were carried away. On the Pocahontas division of the Norfolk & Western traffic was suspended because of washouts. Considerable sections of other roads in that territory were also closed to traffic for similar reasons.

The last serious storm of the winter started on February 3 and continued until February 6. Freight traffic had to be suspended on the New York Central main line west of Albany and the difficulties on the other trunk lines were almost as severe. On the morning of February 5, A. H. Smith, regional director of eastern railroads, reported that the weather was seriously impeding operations all the way from Albany, N. Y., to Elkhart, Ind. (101 miles east of Chicago). Data gathered at his office on the same day indicated a reduction of freight tonnage, because of severe weather conditions, of from 20 to 50 per cent throughout the entire eastern district. The Lake Shore Limited of the New York Central, which was due to arrive in New York on February 4, was stalled in a drift for 24 hours. Throughout New England high winds frustrated all attempts to keep tracks open, and practically all freight trains that started out were held up in snow. The snow was so hard and packed so solid that a number of serious derailments of plows, locomotives and cars further impeded operations. In northwestern New York six to eight inches of new snow had fallen by February 6, with the result that no freight trains operated in that section. In the coal regions of Pennsylvania cuts were blocked with drifts 16 to 20 ft. deep.

Emergency Measures to Remove the Snow

The heavy snowfalls and high winds and the almost incessant cold between storms made the clearing of tracks and yards a most difficult problem. Railroads throughout the territory most seriously affected withdrew large numbers of their employees from their regular work for "shovel" service when occasion demanded. In some instances the shutting down of industrial plants on account of the snow blockade made large forces of men available for work on the railroads. Some of these industries voluntarily loaned men to the carriers for snow work.

In Chicago the railways recruited a large share of their men from freight handlers, office clerks and draftsmen, many of whom could not be employed at their regular work on account of the suspension of traffic. In the East similar classes of employees were used. The Pennsylvania Railroad, which had unusual difficulties to overcome in the Allegheny mountains, drafted large numbers of shop employees for snow shoveling. Between December 20 and January 21, the men of the Altoona (Pa.) shops spent 9,225 ten-hour days in snow-shoveling and switch-clearing. On the Bellwood division, a shop force of only 259 spent 11,000 hours in shoveling snow during the same period.

The problem of removing snow and ice was one of large scope in Chicago, the country's largest railroad center. Aside from the men recruited from their own forces or loaned to them by industries, the roads had to secure additional forces from regular employment agencies, free labor agencies, or direct from the streets and lodging houses. To encourage men to offer their services for this work, arrangements were made to pay them daily, a measure which seriously complicated time-keeping and accounting. On account of the severity of the weather and the arduousness of the work it was necessary to feed the men one or more meals a day and to supply them with hot coffee at frequent intervals. Some lines were able to billet their men at nearby restaurants or boarding houses, while others ran special trains with sandwiches and coffee to the men at intervals.

The supervision of the snow removal work in the Chicago terminals constituted an administrative problem of no mean proportions. In this connection the Baltimore & Ohio Chicago Terminal improvised a most interesting organization. Men experienced in fighting snow were placed in charge of various sections of the terminals and were made responsible for the progress of the work of restoring the tracks to operation. An intelligence bureau was established in the office of the district engineer where telephone connections were available to all parts of the terminals. To facilitate this work all the telephones in this office were assembled on a single table where a staff of men received and answered calls while the information given and received was recorded on an improvised chart. By this method the needs of the men engaged in removing the snow were taken care of expeditiously.

Most of the snow was handled by shovels, although snow plows were used on the main tracks and locomotive cranes with clam-shell buckets were employed to a limited extent for excavating snow and for unloading snow from cars.

By no means all the difficulties arising during the winter were snow troubles. The freezing of coal in cars and of the lubrication in the journal boxes, frozen switches and frozen ash pans, the wear and tear on locomotives and cars because of the unyielding character of the frozen roadbed, the freezing of air hose, hot boxes due to the stripping off of journal boxes by snow and ice, broken rails, frozen signals and signal wires, the failure of interlocking plants—all these were factors contributing to the trials of the roads during the protracted period of severe weather.

In spite of the unprecedented difficulties developed during the winter, the loyal and indefatigable efforts of railroad officers and employees kept traffic moving as much as possible and enabled the government to suspend its coalless holidays several weeks before it was at first thought feasible.

The government could not have taken over the railroads at any better time to learn at first hand the difficulties of operation confronting the roads during the periods of extreme weather. Director General McAdoo, however, took a philosophic view of the situation and labored as determinedly as the operating executives under him to meet the difficulties as they arose. Preliminary reports from 172 of the 196 large roads in the country show a deficit in railway operating income for January of \$2,227,000 as compared with earnings in January of last year. To the discerning observer, these figures neither prove the superiority of government operation or private ownership, but simply indicate that the railroads passed through a most unprecedented winter, one which would slow up the wheels of transportation under any form of operation.

SCRAP IRON EXPORT has been prohibited entirely by the Canadian Government with a view to conserving in Canada the limited supplies of iron and steel raw material easily convertible for manufacturing purposes. The United States prohibited export of scrap iron some time ago.

Railroads Need Large Quantities of Material

Exercise of Priority Orders Should Afford the Carriers Maintenance Supplies in Adequate Amounts

IT IS MAINTAINED BY SOME that the production of pig iron and steel ingots in this country exceeds the capacity of existing shops and factories to convert the plain materials into finished products, and further that there is no occasion for an increase in the production of the completed articles because the railroads are now taxed to the utmost in transporting the present output. Such a broad statement is, of course, subject to controversy and may be seriously questioned as applied to certain areas, but taking the country as a whole, it probably represents as nearly an accurate statement as can be hazarded on any question subject to such serious complications. If we are to assume from this that the railroads represent the crux of the situation, there can be no question but that the government, in making every effort to increase the production of war materials and domestic necessities, will see that they do not want for equipment and materials required to attain and maintain a maximum transportation capacity.

The procuring and distribution of rails to the various carriers is now definitely in the hands of the director-general. The purchasing section of the Division of Finances and Purchases under the general supervision of John Skelton Williams, will not only purchase and distribute rails, but also ties and lumber on those roads which do not traverse timber country in which they can purchase these materials locally. While rails, ties and lumber represent large items in the railroad purchases, both from the standpoint of the quantity of materials and the money value involved, there are still larger amounts of other materials which will be purchased by the railroads through their regular purchasing departments subject to the approval of the regional purchasing committees. Such purchases will no doubt also receive whatever priority ratings are necessary to insure reasonable deliveries in all cases where the supplies are necessary for the expeditious conduct of the transportation business.

Iron and Steel

The production of iron and steel in the United States has increased remarkably since the outbreak of the European war, so that the output of this country is now about 50,000,000 tons per annum, or fully one-half of the total production of the world. This represents an increase of 25 per cent in production in the past two years. However, the severe winter just past imposed such enormous obstacles, largely through the curtailment of fuel and ore supplies, that the production was seriously reduced during the winter months, particularly in January, when pig iron production aggregated only 2,403,000 tons as compared to 3,198,000 tons for November. In all there has been a set back of 1,500,000 to 2,000,000 tons at the beginning of this year, which has had a marked influence on the program outlined for the production of all finished materials in which iron or steel are used, and undoubtedly this accounts for some of the irregularities in production schedules now being experienced.

As this great industry is probably more closely allied than any other with the conduct of the war, it was the first to be considered in plans for price fixing. After three years of almost continuous advances from month to month, prices were established for pig iron, bars, plates and shapes on September 24, 1917. Other prices have been established from time to time but it was not until late in December that any items of vital concern to the railroads were affected. At that time

prices were established for angle bars, track bolts and spikes, rolled steel tie plates and a number of items of scrap sold by railroads. All of the prices established are materially lower than those in effect some months previous. The President has just approved the recommendations of the price fixing committee for a reduction of \$1 in the prices of basic pig iron and scrap steel, these prices and those previously established to remain in effect until July 1, 1918.

The unprecedented prices attained before they were fixed were largely caused by the keen competition between the buyers for the limited amounts of products which the manufacturers had to sell. This competition has now been virtually done away with through the institution of the priority orders, and it is in the iron and steel industry more than in any other that resort must be had to this means of securing deliveries.

Rails

The history of rail purchases by the railroads during the last four years is of unusual interest. Following the lean year of 1914 when rail orders amounted to only about 1,000,000 tons, the revival of business late in 1915 caused rail orders to increase to about 2,200,000. During 1916 the business of the steel industry grew so rapidly from month to month that it became apparent that there would be serious delays in deliveries. Many of the roads placed orders for dates much farther in advance than had ever been done before, and as a result nearly 4,000,000 tons of rails were ordered in 1916, most of the roads arranging not only for their 1917 requirements, but for their needs for the year following. In 1917 the remaining requirements for 1918 were placed, but when some of the roads attempted to place orders for rails for 1919 delivery the mills declined to take them. The result was that practically no rail orders were placed after May, 1917, and the total domestic orders during the entire year aggregated less than 1,000,000 tons.

In April, 1916, after almost 15 years of fixed prices for steel rails, the quotations were advanced from \$28 and \$30 per gross ton for Bessemer and open hearth rails respectively to \$33 and \$35. In November of that year the second raise brought the prices to \$38 and \$40 respectively, and these were maintained as the nominal prices all through 1917. However, these prices have meant little or nothing since early last year and the few orders that were taken from time to time during the later months were placed at considerable premiums over these nominal figures.

Since the first of the year there has been a tendency to drop the old nominal prices and higher figures are being quoted, but owing to the limited number of orders placed there is no definite price for standard rails today. Inability to buy new rails has sent the roads into the market for relayer and re-rolling rails, with the result that the prices of these have attained unusual heights.

The real problem at the present time lies not in the placing of new orders for rails, but in securing the delivery of rails ordered 12 to 18 months ago. Because of the necessity of rolling rounds for shells and structural material for ships, the mills are now rolling rails to less than one-third of normal capacity and for this reason are far behind their schedules. The rail laying season is at hand and the roads have not received their allotments. Clearly the situation is one for the Railroad Administration to handle. The subject is now under consideration, for the various roads have already been asked to report on their minimum requirements in rails

for the coming year, and presumably arrangements will be made to supply them with this most necessary material.

Structural Steel

On account of the high price of structural steel the roads have avoided the construction of new steel bridges wherever possible during the last two years. For the most part, the bridge shops have not been working to capacity, since the high prices have deterred all classes of builders or have caused them to divert their activities to forms of structures not requiring steel. There are, of course, cases where the use of structural steel has been imperative and the mills have not been so congested but that the structural shops could secure the necessary plain material. With the inception of the ship building campaign the bridge shops have been recruited in the fabrication of parts for standard steel ships, but even with this additional business the shops are not working to more than 75 per cent of capacity at the present time and new business taken in February amounted to only 55 per cent of capacity. They are therefore in a position to take any reasonable amount of domestic work offered them, provided the necessary priority orders can be obtained to secure the plain material, where prompt delivery is required. According to an opinion expressed recently by the officer of one of the large fabricating companies, the shops of the Middle West can take at least 100,000 tons of domestic construction work during the coming season.

Lumber

Like the steel industry, the lumber business has been occupied extensively with war contracts. During the first nine months of our participation in the War, the southern pine manufacturers supplied 750,000,000 ft. b. m. of lumber to the government, a large part of which was used in building the cantonments. These mills are now engaged in filling an order for 365,000,000 ft. b. m. for the wooden ship building program, and up to March 1 had delivered 240,000,000 ft. b. m. of this total. When these amounts are compared with 12,226,000,000 ft. b. m. cut in the United States in 1917, and 12,749,000,000 ft. b. m. cut in 1916, it is seen that the consumption of wood is largely affected by other influences than government requirements. It is true that owing to the large sized pieces used in ship construction, it was necessary to place prohibitions on the use for other than government work of southern pine 12 in. by 12 in. in section or larger, and of Douglas fir timber 12 in. or more on one face. These restrictions have naturally influenced the supply of posts, caps and stringers for use in railway trestles, but owing to the progress which has been made on the government work, and the movement toward the use of built-up or laminated timbers some of these restrictions on the use of large sizes have been modified.

Building work for other than government purposes has decreased materially since our entrance into the War. This has tended to reduce the use of the smaller size timbers with the result that there is a good supply of this class of material available. Lumber manufacturers and others have been more or less exercised by the movement on foot in some quarters to discourage if not prohibit all building work unnecessary for the prosecution of the war, and it is pointed out that the building operations in the United States for 1917 aggregated somewhere in the neighborhood of \$3,000,000,000 worth of work, whereas government building operations during the past year amounted to only \$300,000,000, or one-tenth of the total activity. Whether or not any steps are taken to restrict building operations, the present indications in the lumber market are that there will be a plentiful supply of this building material for all anticipated requirements.

As mentioned above the Railway Administration has notified the railroads that it will purchase ties for the roads in all cases where the latter are unable to secure them locally

along their own lines at prices equal or less than were paid last year. This order has the effect of restricting the roads to the purchase of ties from the small producer who cuts them on his own wood lot. The production of ties during the last year has decreased materially; enlistments and the draft seem to have caused a material reduction in the number of men engaged in this industry as small producers. As a result many of the railways' purchasers have had to go much further afield in securing their requirements than was the case in years past. There is also much doubt as to whether the railroads will be able to obtain ties at the same prices that were paid last year.

The large producer who must now deal largely with the Railroad Administration has also been hampered by a shortage of labor and a decided increase in the cost of operation through higher costs of tools and equipment and the scarcity of horses and mules with which to move the ties. In at least a few instances the tie operators have been diverted to lumbering on a small scale since it was found profitable to cut tie logs into certain small sizes of lumber.

Concrete Materials

No more favorable market for the buyer is available at the present time than that of concrete materials. Decreased building operations has curtailed the demand for these materials to a considerable extent. Production has been affected to some extent by a shortage of labor and materials and the shortage of cars needed for delivery. The latter has been the most serious problem, particularly during the winter months when embargoes were issued at different times against the use of open top cars for the handling of sand, stone and gravel. In the case of cement there is a greater argument than ever before for the use of bulk material since the high price of cotton makes the use of cement sacks much more expensive than during normal times. While subject to increases in manufacturing costs encountered in all work carried on in this country the advances in the price of cement have been moderate, and following a reduction of about 10 cents per barrel taking place last summer the price of cement has been practically stationary.

Conclusions

Purchases of supplies and materials for the railroads involving the steel market will in most cases require the use of priority orders which, because of the urgent needs of the railroads, ought to be forthcoming. As regards lumber and concrete materials the problem is largely one of the cars necessary for delivery, for the supply of these materials is adequate for any reasonable needs. The situation as regards rails and ties and to a certain extent regarding lumber is now in the hands of the Railway Administration, and involves an apportionment of the available supply, taking into account the relative needs of the railroads, the War Department and the ship building program.

AN ENGLISH RAILWAY'S WAR RELIEF SERVICE.—Of the staff of the Great Eastern Railway 8,800, or 25 per cent, have joined the colors, of whom 671 have been killed and 470 have been discharged and have re-entered the company's service. At the annual meeting of the company the chairman said that much useful work had been done in assisting those who had been discharged from the army to obtain their proper pensions and gratuities, and what was, perhaps, more important still, no dependents of those who are serving with the colors are allowed to get out of touch with the railway. The services of the company's war relief committee were always freely at the disposal of the dependents in any troubles and difficulties which arose, and in regard to which, in the ordinary way, they would depend on their husbands and relatives.

Improve the Equipment of the Railway Shops

Earning Power of Modern Locomotives Is Limited Greatly
by the Lack of Repair Facilities

By H. L. Burrhus

"YES, we do need a new planer, and, if we could get one, we would save our company more than \$10 a day in machine work alone," said a machine shop foreman on a busy Eastern road.

"Why don't you speak to your master mechanic about your conditions and have him make a requisition for a new machine?" he was asked.

"I have done so already, but the machine tool builders are so tied up with Government work, they wouldn't even listen to a request from our railroad for a new tool," replied the machine shop foreman.

"You are entirely mistaken about the delivery conditions of the machine tool builders, as many of the largest companies are prepared right now to make deliveries in from 60 days to seven months of such standard tools as planers, lathes, shapers, slotters, drill presses, etc.," he was told.

"Well, granting that the machine tool builders might be able to build us a machine, the 'old man' (meaning the master mechanic) wouldn't take any action right now, for you know we are under government control, and he is not just sure where we stand," continued the foreman.

"To answer this objection," replied the questioner, "let me ask you to imagine that you own a house and lot. You want to sell, but just because you expect to get the property off your hands soon, will you stand idly by while the house goes to ruin, or will you make such improvements as will tend to increase the value of that property? Bringing the argument back to our subject, don't you believe that a railroad property whose equipment is modern and kept up in good shape will bring a better return than a property that is far inadequate for its needs? Irrespective of whether or not you expect to soon turn your property over to the government, you should not leave any stone unturned to bring your shop up to the most efficient and economical condition."

"Well, so far you have gotten the best of the argument," answered the foreman, "but here is one objection you cannot get around. Everything is so high right now that it would be madness to purchase any machine tools at their present high prices. We have gotten along so far without the planer, and, until machine tool prices come down to a reasonable figure, I would not like to be the one responsible for making requests for new machine tool equipment."

Easy to Answer

"That was the first objection I expected you to make, and it is the easiest one for me to answer," was the quick reply. "While it is admitted that machine tool prices have advanced considerably, have you overlooked the fact that your own labor has also advanced in cost—in many cases proportionately more than the advance in machine tools? Where you formerly could figure an approximate saving of 20 per cent on the investment of a new machine tool, you are now able to easily show this saving to be from 25 per cent to 30 per cent under the new prices, because of the many wage increases you have granted your workmen. And here is another item you have overlooked—the value of a locomotive service day now, as compared with a service day several years ago.

"Today the locomotives are so much larger that, when idle, a large sum of invested money is tied up. There was a time when an idle locomotive represented only about 25 or 30 cars,

but today one of our modern engines is capable of hauling 100 cars. So, you see, an engine waiting for repairs also means 100 cars standing still, while, in turn, perhaps affects the working of some big factory which is depending on that freight. You have admitted there are several jobs which require two days to machine with your present equipment, while with modern equipment you could turn the work out of your department in five hours, thus giving your company the services of a high-power locomotive for one and one-half days which is now unnecessarily lost. How many of these additional service days do you think it would take to buy one or two modern machines?"

This is a typical condition on many railroads today, for the maintaining of power is the keynote of successful transportation. New locomotives will not altogether solve the problem, as in a short time even new locomotives will require attention, and unless proper facilities are provided, the cost of upkeep and the revenue loss of locomotives out of service will be excessively high.

There is a big opportunity right now for the purchase of machine tools. Whether the railroads will look the issue squarely in the face and take immediate steps to protect their interests is a question. While there are many large modern up-to-date shops and terminals, it is a fact that the majority of shops and terminals are small and inadequately equipped. This has never been so well illustrated as during the past winter. On some roads the roundhouses were so small that it was impossible to get the engines in the house and shut the doors. This meant that the locomotives had to stand outside, where it was impossible for the workmen to give them proper attention, and where it was a very easy matter to freeze up. Even where the engines were pushed partly into the roundhouse, working conditions were such that the locomotives soon showed what attention they received by their performance on the divisions.

Inadequate Machine Tool Equipment

And just as true as these roundhouse conditions is that of the machine tool equipment. Machine tools were old or in many cases the size of the jobs has far outgrown their capacities. Yet the railroads hesitate to purchase. The requests made by the machine shop foreman—the fellows on the job—are side-tracked on one excuse or another and no attention or thought given to the steady daily loss from this department.

Many railroads—in fact, all railroads—keep accurate records of coal consumption, lubrication and many other items of daily use, yet overlook the one big item of machine shop output. We are all guilty of looking upon the machine shop foreman as a "kicker" or upon a machine tool salesman as a person who is simply trying to get our money. Yet the machine tool salesman is many times the good Samaritan in disguise.

The recommendations and purchase of machine tools on the railroads should be handled and should receive the same attention as in privately owned factories. How often we pick up a magazine and read of some factory that has installed a modern machine to speed up its output or to produce mechanically a job that was formerly done by hand, but where, due to the shortage of help, it was necessary to install a machine. Then compare these conditions by visit-

ing a railroad shop in almost any part of the country and notice three or four husky men pounding a piece of iron into shape in the blacksmith shop, where a power operated hammer would do the trick in much less time; notice boiler-makers driving rivets by hand or putting in staybolts by hand—all jobs of frequent occurrence and which can be handled much quicker and better by power tools; and in the machine department there are so many comparisons it is a hard matter to select any one.

However, let us look at just this one case. During one of the cold spells this past winter, when engines were so scarce, a big, high-power locomotive reached a certain roundhouse at seven o'clock in the morning with a loose piston head. Outside of this one job the engine could have been turned and despatched by nine o'clock, but it was necessary to make a new piston head. By eight o'clock the machine department had started to machine the new head, but due to antiquated machine equipment, the new head was not completed and ready for application until after seven o'clock that night, with the result that it was necessary to work men at overtime rates to complete the job, besides unnecessarily holding an engine which could have been earning money. All this delay and increased costs were directly traceable to inefficient machine tool equipment, for a modern machine could have completed that head in five hours less time, which would have saved the overtime rates paid the workmen and would also have given these five hours to the locomotive for revenue service, instead of a dead loss standing in the roundhouse.

The necessity of machine tool purchases is obvious, and the only question is whether the railroads will take steps to build up their equipment or whether they will allow conditions to exist as at present and then, over night, try to make all the corrections at once.

We are just emerging from a hard winter, and with our past experiences fresh in mind, now is the logical time not only to lay plans to prevent a recurrence, but also to take immediate action. It is so easy to offer the old excuse that roads have gotten along so far without making purchases, and they can still get along. But every day's delay means that much more loss and confusion eventually.

Not an Unusual Case

As conclusive proof of the fallacy of new equipment solving transportation problems altogether, let us look at the results on one road which secured 50 new heavy type locomotives, but paid no attention to providing proper housing or machine tool equipment to keep these engines in repair. For a time there was no shortage of power, but eventually one could find locomotives in the roundhouse tied up for poor tire flanges, but no machine on hand to turn the tires. Or it was a broken guide bar, or side rod or driving box; however, there was no machine tool equipment to make emergency repairs, and the engines had to wait that much longer while these parts were made up at some other shop and shipped in by way of the congested freight route, in one specific case taking over two weeks for a repair part to be received.

As to just what tools are required for immediate use it is hard to make up a satisfactory list. Planers, shapers, lathes, drill presses, etc., are in many cases so old and unfit for use that it would appear as if some shops ought to put in a complete new equipment. Then again it is not necessary to purchase new tools altogether, for the roads are, in some rare cases, in a position to help themselves upon the introduction of heavy power, as proven by one road. In this case it was found that there was not a lathe on the road with a bed of sufficient length to enable the turning of extended piston rods used on the new locomotives. This matter was easily taken care of by making and applying extensions on one lathe at each terminal. On another road, after it had been

decided to apply cylinder bushings in all cylinders, it was found that there was not a lathe of sufficient swing to permit the turning of the bushing to fit the cylinders. In this case the raising of the head and tailstock on filler blocks was a very unsatisfactory arrangement, for the lathes so equipped were not rigged enough to do efficient work, and every bushing turned really cost three times as much as it should.

Poor Tools Cause Waste of Fuel

Another road made a big campaign on coal saving, but lost sight entirely of its greatest waste. In this case, the equipment for machining piston heads was very poor, and piston heads were changed only as a last resort, which meant that the amount of steam wasted by small heads really amounted to a big waste in the coal pile and in the efficiency of the engines.

As before stated, the comparatively few large modern shops are quite well equipped with modern machinery, but the innumerable medium sized shops and roundhouses are, as a rule, very much in need of new machine tools. To keep down the percentage of power under repairs for more than 12 hours means quick and accurate machine work. To purchase needed tools for this will require the investment of a large sum of money, but there is no investment more profitable right now for any railroad than to put in new machine tool equipment.

The effect on the workmen is important, for good workmen often get disgusted and quit because of poor machine equipment. A good workman has pride in his work and his ability to produce, but when you tie his hands by giving him a machine to run that was built before the Civil War, he will soon throw up the sponge and leave.

The Value of Good Tools

In conclusion let us quote the stand taken by one successful master mechanic who realizes the value of good machine tool equipment. He said: "We speak of the work of a locomotive in terms of horsepower, yet some people abuse their power worse than they would a horse. They let their engines stand outdoors in all kinds of weather and feed them sawdust, yet expect a full horse-power return. Now, common sense tells us that no horse would stand these conditions, so why expect it from a locomotive? I want my locomotives under cover and fed with the best materials possible, together with good workmanship. To get good workmanship, you must have good tools, and I have been here 23 years, and so far have not been refused a single item I have put on my requisition. And as to my costs, you can see we have the best of everything; our shop is modern and our power up in A-No. 1 condition, yet my cost per locomotive-mile is not more than, or is lower than, that of neighboring roads. When we start a locomotive from the roundhouse, we know it will give perfect service, for we give it good attention. I figure our success is due to good materials, good machine tool equipment and good workmanship."

It might be well to draw attention to the fact that right now is the logical time to place machine tool requisitions because of the valuation work which is being so extensively carried on. This work has developed some interesting data as to the age of various machine tool installations, and officials who have occasion to check up the findings of their various valuation committees will be astonished to learn how antiquated and inefficient their machine tool installations are. Brought face to face with the facts that shops are trying efficiently and economically to maintain modern power with machinery that is 30, 40 or 50 years old is sufficient reason for the immediate purchase of modern machine tools. It may be a question of borrowing money to make purchases, but money cannot be expended to any better advantage than to protect efficient and economical locomotive service with efficient and economical machine tools.

The Assistance Available for the Exporter

A Government Bureau, Export Associations, Commission Houses and Banks All Want to Help Him

WHEN ONCE THE RAILWAY SUPPLY MANUFACTURER has been converted to the idea of export trade the first question he will ask himself is "What steps should I take to secure and maintain an export business?"

The agencies that stand prepared to help the exporter, experienced or new to the export field, are legion. There is the government's very efficient Bureau of Foreign and Domestic Commerce. There are several export associations such as the American Manufacturers' Export Association, as well as a number of other bodies such as the National Association of Manufacturers, or the Philadelphia Commercial Museum which have extensive export departments.

There are likewise a large number of export or commission houses many of them with very extensive financial backing which are prepared to advise the manufacturer or practically handle for him his export business in a particular country or perhaps throughout the world.

The banks also have been leaders in American export activities. A number of them, as will be noted later, have built up important export service departments and are in a position to advise and to extend the financial credit necessary.

And last, but not least, there are today in this country several purchasing commissions whose offices have been buying war necessities for their governments, or who are keeping in touch with the American market with a view to

making large purchases here as soon as material and shipping space can be secured.

One export authority stated to a *Railway Age* representative that there were three ways in which an American manufacturer unacquainted with export trade might go about establishing a foreign trade.

First, and for many manufacturers best, he said, the manufacturer should go himself or send a competent man to the countries he wishes to do business with. This representative should investigate and study conditions, possibly try to secure orders and establish agencies.

Second, if the manufacturer cannot send a competent representative he can efficiently build up a foreign trade through a good commission house or reliable export firm. In such case, of course, he should deal only with well-known houses. Most of them have offices in New York. They know their markets thoroughly and if treated generously will build up an export trade for the manufacturer, handling his missionary work, the placing of the orders, the shipments and the financing.

The third way to build up an export trade is by advertising and circular matter. This method is slower but will achieve results. It is usually advisable to start an export business through circular matter and advertising so that when representatives are sent out they will have less missionary work to do.

Bureau of Foreign Commerce

Railway supply manufacturers have not begun to realize the services that are available to them practically free of cost through the Bureau of Foreign and Domestic Commerce. The Bureau is doing a big work and with the present growing interest in export trade its value to American industry will be better understood and its services utilized to a greater extent.

Burwell S. Cutler, chief of the Bureau, made the statement at a meeting in Boston last week that as a trade promoting agency the bureau was equal, if not superior, to the corresponding organizations in foreign governments, the truth of which statement, he added, has been conceded by foreign officials themselves. Those railway supply manufacturers who have seen Frank Rhea's report on markets for American railway materials in Australia and New Zealand, or the abstract of his conclusions in a recent issue of the *Railway Age*, have come to realize the value of the Bureau and will bear out Mr. Cutler's remarks.

The Bureau of Foreign and Domestic Commerce is charged by law with the duty of "developing the various manufacturing industries of the United States and markets for their products at home and abroad, by gathering and publishing useful information, or by any other available method."

The bureau is a clearing house for commercial information of all kinds, and has a well-organized and efficient system for its collection and distribution.

Consular Service

There are three principal sources through which the bureau secures foreign trade information—through the consular service, through commercial agents and through commercial attachés.

The United States Government maintains abroad nearly 300 consular offices and in addition many agencies. These consular officers furnish the bureau a great fund of information relating to the trade of their districts, including annual reviews of commerce, special reports called for by the Department of Commerce, lists of importers, notices of bids for contract work, requests of merchants to be placed in communication with American exporters, etc.

Commercial Agents

Most of the commercial agents are taken from native work in some particular industry or some special branch of commerce and are experts in their respective lines. They travel widely and make reports as to methods of manufacture and special requirements in the lines that they are investigating.

Commercial Attachés

While stationed at one post like the consular officer, the commercial attaché is free to travel within the field to which he is assigned. He has but one function—the facilitation of commerce between the United States and the country to which he is assigned. Each attaché speaks the language of the country in which he is located and is thoroughly conversant with its commercial usages.

In addition, the bureau receives numerous official and other publications from foreign countries, which are utilized in answering requests for information. It also avails itself of trade journals published in this country and of the assistance of commercial organizations.

But the method of making this information available is as important as its gathering. Most important of the publications of the bureau is the daily *Commerce Reports*,

These contain articles submitted by consular officers and commercial agents of the Department of Commerce and trade information through other sources. It is the organ through which current information on foreign trade matters is distributed to American business men. It is sold by the superintendent of documents, Government Printing Office, Washington, D. C., for \$2.50 per year. (Subscriptions will also be received at the district offices.) The annual reports of consular officers, formerly published in this daily journal are now issued as supplements to it and are mailed to all subscribers to Commerce Reports.

Daily Commerce Reports

Not the least important section in Commerce Reports is the trade opportunity service. Announcements of specific opportunities for the sale of American goods abroad are published in Commerce Reports. The names and addresses of the foreign importers desiring the goods are not given in these announcements, but are furnished to bona fide American firms upon application to the bureau at Washington, or to any of the district offices.

In applying for such names and addresses the inquirer need refer only to the number of the announcement as published in the Daily. A separate application on the firm's letterhead should be made for each "opportunity" desired.

When the confidential information furnished regarding an opportunity for sales in foreign countries is too detailed to be given in a "trade opportunity" announcement, it is embodied in a confidential bulletin or circular, which is sent to firms that are listed in the trade index files maintained by the bureau and its district offices.

There are also many other publications of the bureau but

those of most interest to railway supply men are the special bulletins, of which Frank Rhea's report on railway supplies in Australia is typical. These bulletins are issued from time to time on all kinds of commodities, but it is of great interest to railway supply men to know that in addition to Mr. Rhea's first report, another will soon follow on markets for American railway materials, equipment and supplies in China and Japan.

Use the Bureau

No railway supply man who is going after foreign trade can neglect the opportunities offered him by the Bureau of Foreign and Domestic Commerce. As Mr. Cutler says:

"Exporters should learn to utilize more fully the economic laboratory which the bureau has built up during the last six years. If used continuously, the public will acquire habits of scientific precision, which will prove a surer means to successful foreign trade than any other. It isn't enough to be satisfied with casual applications for data from the bureau. Requests for information should automatically renew themselves, so that the exporter is currently informed on the slightest change which affects his business abroad. If German efficiency comes from any one thing, it is just that habit of laboratory thoroughness.

"You may look upon your Bureau of Foreign and Domestic Commerce as the headquarters for American business. Our success will be proportionate only to the use which you make of us, and I may state confidently that the Department of Commerce will receive from Congress funds and authority to exercise its functions up to the limit of your requirements so long as you let them be known with the positive voice of people who have the right to command us."

The Philadelphia Commercial Museum

The Philadelphia Commercial Museum is more or less typical of a number of large and efficient agencies assisting in foreign trade, including the Pan-American Union at Washington which has proved itself of particular service to exporters to South and Central America; the National Association of Manufacturers, the American Manufacturers' Export Association, and to a lesser degree, the Chicago Association of Commerce, the Business Men's League of St. Louis, etc.

The Commercial Museum's efforts in foreign trade are centered in its foreign trade bureau. This bureau publishes a foreign trade paper, Commercial America, a Spanish edition of which is sent to South America. In addition it supplies the following services to its members:

Compiles lists of established business houses in foreign countries.

Translates business correspondence.

Publishes a weekly export bulletin, containing inquiries from foreign firms, general export news, changes in tariff, trade mark and patent laws, travelers' regulations, business suggestions and trade openings, a schedule of steamship sailings for the month, etc.

Offers assistance in securing selling representatives in foreign countries.

Replies to inquiries about foreign firms.

Answers special commercial inquiries for information covering such subjects as consular invoices, regulations, duties, and more general matters such as the character and possibilities of particular markets and the development of business in any foreign country.

Circulates among foreign buyers typewritten and printed lists of members, etc.

Assists in the collection of accounts.

National Foreign Trade Council

The National Foreign Trade Council will hold its fourth annual convention in Cincinnati, April 18 to 20. At this convention there will be brought together the leaders in thought in the foreign trade activities of the nation and questions will be brought up of vital interest to the manufacturer or exporter. A considerable number of supply men are planning to attend the meeting, and they may later obtain a copy of the proceedings of the meeting from the secretary, L. K. Davis, 1 Hanover square, New York.

The Commission Houses

It is through the commission house or export firm that most manufacturers of railway supplies will probably find it most advisable to carry on their direct export activities. As would naturally have been expected from our vastly increased export trade of late, the commission houses have seen a tremendous development within the last two or three years. New companies have been organized and have at-

tained an enormous growth in a space of only a few months.

The commission houses and export firms are of many kinds and carry on their businesses in different ways. Some with powerful financial backing are able to conduct a combined import and export business in all kinds of commodities with almost the entire world for their bailiwick, combining in many cases with their extensive corps of foreign

representatives, a financial or even a shipping service that proves of great advantage to their clients. Other export firms specialize on particular countries or markets and offer to the exporter the services of a trained corps of experts with special knowledge of markets and conditions in their special fields. There are further a number of companies that specialize in certain commodities such as steel or railway supplies, having the advantage of a corps of engineers versed not only in the conditions in their markets but with a detailed knowledge of the steel or railway supply industry. The manufacturer of a particular commodity may find it to his advantage to tie up with one or with another kind of export houses, depending upon the market he desires to cultivate, his product or his organization. Many manufacturers who have a well organized export department of their own and with representatives abroad often find it to their advantage to secure also the assistance available through an export firm.

Typical, more or less, of a considerable number of the export houses that are in a position to be of service to the railway supply manufacturer are three export organizations connected with the American International Corporation.

American International Corporation

This corporation was organized in 1915 to develop international trade, American enterprises—both domestic and foreign—and to promote organizations of mutual advantage to American bankers, business men and engineers.

Among the important undertakings since its organization, the corporation has formed several exporting companies, of which three are of particular interest to the manufacturer

of railway material and supplies. The Allied Machinery Company of America was organized to export machine tools; the Allied Construction Machinery Corporation to export construction machinery; and the American International Steel Corporation to export iron and steel, and iron and steel products—including locomotives, cars, and railway supplies.

These three companies have formed large foreign distributing organizations which include executives, salesmen, and demonstrators of ability. Offices have been opened in the principal markets of Europe, and the companies are extending eventually to cover every important market of the world.

One of the interesting features of these organizations is their affiliation with the American International Corporation. This connection is necessarily of distinct advantage because of that corporation's world-wide activities in financing, managing, trading, and construction and engineering work.

Like other exporting companies, they render such service to the manufacturer of American products as the assumption of exchange liabilities, insurance risks, and the negotiations for shipping space, as well as making shipping collections and obtaining the export licenses necessary under the present national emergency. They are also in a position to extend credits to customers abroad.

With a view to showing even more definitely what the export firm can do to help the railway supply manufacturer obtain and conduct his export trade, the *Railway Age* reproduces on another page an article on "How the Export Houses Help in Foreign Trade."

The Export Services of the Banks

They say that trade follows the flag—they ought to add also that it follows the banking facilities. When one realizes how far reaching are the plans now being made to further export business by some of America's leading banking houses, he begins to see in a clearer light how favorably the bankers and the progressive business men in general of this nation look on foreign trade. It has been generally conceded that England, Germany, France and Japan had as one of their best weapons in foreign trade their efficient foreign banking systems and the means for financing long term credits. The American bankers today are fast putting themselves in as favorable a position in foreign trade as the banks in Europe and the interest that is being manifested by them in this matter augurs well for our future position in export trade.

The expansion "foreignwards" of American banking has accompanied an increase in our foreign commerce, including both imports and exports, from \$3,902,900,051 in 1914 to the huge total of \$9,183,712,931 in 1917, an increase that in three short years has made us the greatest exporting nation in the world. One cannot yet say that American bankers the country over have taken the keen interest in export trade that should be commensurate with this expansion but such powerful financial houses can be named as the National Bank of Commerce in New York, the National City Bank and its affiliate the International Banking Corporation, the Guaranty Trust Company, New York; the Irving National Bank of New York, the Chase National Bank of New York, the Mercantile Bank of the Americas, the American Foreign Banking Corporation, the National Shawmut Bank of Boston, the First National Bank of Boston, the Hibernia Bank & Trust Company of New Orleans, the recently organized Foreign Trade Banking Corporation, etc.

These banks are leaving no stone unturned to emphasize

to their clients the advantages of foreign trade; they have established foreign trade service departments to advise and assist their customers and they stand ready with the capital to arm the exporter who goes forth in quest of foreign business.

What can these banks do to assist the exporter?

National Bank of Commerce

"The National Bank of Commerce in New York," said an officer of that bank, "established its foreign department many years ago. During the course of years connections have been established with practically all the leading banks throughout the world, many of them government institutions. By adopting the policy of establishing connections with the leading banks of the various countries, the bank's clients receive service in the form of close co-operation with large local banks that are thoroughly conversant with local conditions.

"Until the outbreak of the war in August, 1914, New York was the financial center of the world for exporters and importers. The war caused a disastrous disruption of foreign trade, with heavy fluctuations in all financial conditions. The American dollar was practically the only stable medium of exchange. The dollar letter of credit was issued and gradually a dollar exchange market developed throughout the world. The National Bank of Commerce in New York has played a large part in the stabilization of dollar exchange. Its foreign department has been instrumental in a view to the offering of personal service of all kinds to importers and exporters. It is prepared to assist new markets to exporters and to provide adequate facilities for the development of such markets. It maintains a list of foreign affiliations lists of which persons are firms among its customers who have not deemed it advisable to send a representative abroad. It secures information regarding their

prospective customers, suggests the terms under which shipments should be made, assists in the details of actual shipment and forwards and collects their drafts through its foreign correspondents.

"The relations with correspondents abroad permit the bank to offer to its customers a wide range of facilities, among which may be enumerated the transfer of funds abroad by cable or check, purchase and sale of securities, negotiations of drafts or checks on foreign banks, firms or individuals, etc. A method which the foreign department of the National Bank of Commerce in New York has developed with especial success is that by which the foreign importer instructs his bank to open letters of credit through its New York correspondent in favor of the American exporter. The latter presents his documents and payment of the amount prescribed in the credit is made to him. In making these payments an attitude as liberal as possible, consistent with interests of the bank's foreign correspondents under whose instruction it acts, has been adopted. To the traveller overseas the National Bank of Commerce in New York offers travelers' checks which may be exchanged for local currency in all foreign countries, or travelers' letters of credit, which can be cashed at the many offices of the various correspondents throughout the world. If he is a commercial traveler the bank can furnish him with letters of introduction to the leading correspondents in the cities he intends to visit, can make arrangements with the correspondents to put him in touch with the leading merchants in his line, and furnish him with credit reports regarding his prospective customers."

National City Bank

The National City Bank has done more in foreign branch banks than most of the other banks. It now has branches which do a regular deposit banking business in 13 foreign cities and its affiliated institution, the International Banking Corporation, does what is better known as exchange banking in something like 18 cities, principally situated in the Far East. The branches of the National City Bank are located at Havana; Santiago de Cuba; Caracas, Venezuela; Bahia, Rio de Janeiro, Sao Paulo, and Santos, Brazil; Montevideo, Paraguay; Buenos Aires, Argentina; Valparaiso, Chile; Genoa, Italy, and Petrograd and Moscow, Russia. It also has representatives in London, Copenhagen and Milan. The International Banking Corporation, in addition to its offices in New York and San Francisco, has four branches in the West Indies, and at Panama and Colon in the Canal Zone; Medellin, Colombia; Bombay and Calcutta, India; Singapore, Borneo; Batavia, Java; Manila and Cebu in the Philippine Islands; Kobe and Yokohama in Japan; and Peking, Tientsin, Shanghai, Hankow, Canton and Hongkong in China.

When asked to explain what services the National City Bank could render to an exporter of railway supplies, a representative of the bank's foreign trade division said:

"The National City Bank of New York is ready to be of service to manufacturers of railway material and equipment, and to engineering and construction enterprises, in handling foreign business and contracts. The bank's foreign branches are in close business touch with foreign interests where they are located.

"The bank is able, after conference with manufacturers here, in order to have a comprehensive enough grasp of the details of their production, plans and policies to enable our managers and commercial representatives abroad to discuss the affair intelligently, to obtain preliminary information for them, and get them in touch with foreign possibilities.

"Any large financing that would be required for increase of manufacturing, or long-term credit arrangements in the case of large foreign contracts or semi-public works, would be matters for special negotiations, as every manufacturer knows. The commercial financing of the business would

be easily handled in the foreign division of The National City Bank of New York. The bank's organization is so extensive, handling the immense volume of foreign business as it does, that it has special machinery ready for the many variations of foreign business conditions, extraordinary or accidental, that have in the past made the handling of foreign business settlements through banks that were not equipped for it the occasion of American manufacturers' keeping away from export and import business. The bank has direct sources of credit information. It handles all foreign business either completely through its own organization, with the obvious advantages of safety, secrecy and care, or through its direct correspondents.

"The National City Bank of New York commands the facilities for the most economical financing of sound foreign business transactions, no matter how big. Based, of course, upon negotiations by which manufacturers would establish their credit, the bank is able to arrange the financing of shipments on terms to fit the conditions of the business, whether by loans, discounting of individual bills, or re-financing by means of acceptances, according to the circumstances of the individual manufacturer's affairs and the transactions concerned. In business as extensive as that of selling railway materials, equipment, or construction abroad, the organization represented in the foreign division of the National City Bank of New York would probably be of more than ordinary assistance, since the bank is in a position to open foreign deposit accounts for the receipt of foreign payments, thus avoiding the cost and uncertainty of many exchange transactions. In other words, through the National City Bank of New York's world-wide banking organization, such big exportation as is involved in foreign business in railway materials would be carried on with the banking transactions hardly more intricate than in the case of extensive business inside the United States."

Foreign Trade Banks

A bank that is organized to take charge of a manufacturer's foreign trade and handle it entirely without assistance from the manufacturer is a new development for America, but is an old idea to many business men in foreign countries. The foreign trade banks of Germany are credited with being one of the most active agencies in securing the great volume of export business that that country enjoyed before the war.

Such a bank is the Mercantile Bank of the Americas organized about two years ago and now having headquarters at 38 Pine street, New York, with branches all over the world. The American Foreign Banking Corporation of 56 Wall street, is another trade bank that was organized recently and the Canadians have also formed at least one bank of this kind.

The secret of the strength of the trade bank is that it has a world-wide organization with branches and agencies in all parts of the world. The men in these branches and agencies are seasoned business men and capable of undertaking almost any kind of business transaction in the interest of the clients of the bank. They make reports of all kinds, ranging from the financial standing of a single foreign dealer to the trend of business in a whole country or the state of a given industry, and can give expert advice on the prospects of success for a projected foreign railroad, etc. This service is maintained for the benefit of the clients of the bank and in addition the client has the opportunity of consulting the staff of the bank at the American headquarters. The home staff includes an adequate number of men who have had extensive experience in doing export business and who are well acquainted with conditions in foreign countries. A little of the time of such men is worth a great deal to the manufacturer who is trying to organize an export branch to his business. In fact concerns with years of experience in dealing

with foreign markets do not hesitate to consult the foreign trade banks when in need of information.

Mercantile Bank of the Americas

The Mercantile Bank of the Americas was organized by Brown Bros. & Co., J. W. Seligman & Co., and the Guaranty Trust Company of New York and is closely connected with the National Shawmut Bank of Boston, the Anglo London, Paris National Bank of San Francisco and the Ibernia Bank & Trust Company of New Orleans.

In reply to a question as to what service the bank offered to the exporter, Mr. Van Deusen of the bank said:

"We have organized especially to finance export orders. Where the foreign customer wants long credits we will finance the transaction. We give the American manufacturer cash as soon as the goods are shipped and the customer has accepted the shipment. This is done by cable so that the manufacturer is paid almost immediately after shipping his goods. This is called financing acceptances.

"If a manufacturer with an attractive export proposition does not want to go after export business we will do it for him. All he needs to do is make his product, pack it, as we direct him, address it and load it onto a freight car at his factory.

"When a manufacturer wants to develop an export business, but does not know how to go about it, we will show him. We are creating branches and connections in all countries in order to give a complete service to clients. We will help a manufacturer find customers, establish his connections, tell him where his market is, and make up for his deficiencies as an exporter in any respect.

"We have one branch in Paris and in Barcelona; one branch in Lima, Peru, and ten agents in other Peruvian cities; one branch in Ecuador and agents in six cities of Ecuador; seven agents in Colombia; four banking connections in Chile, Venezuela, Costa Rica, Salvador, Guatemala and Honduras; one branch in Brazil and close banking connections in Bolivia. Other branches and agencies will be established as rapidly as there is need for them."

American Foreign Banking Corporation

The American Foreign Banking Corporation was organized for the same purposes as the Mercantile Bank of the Americas. The directors of the American Foreign Banking Corporation are the presidents of the following: Chase National Bank, New York; Trust Company of Cuba, Havana; Essex County National Bank, Newark; Corn Exchange National Bank, Chicago; Fifth-Third National Bank of Cincinnati; Canal Bank & Trust Company, New Orleans; First & Security National Bank, Minneapolis; National Bank of Commerce, St. Louis; Philadelphia National Bank; First National Bank of Cleveland; Merchants' National Bank, Boston; First National Bank, Milwaukee; Merchants-Mechanics First National Bank of Baltimore.

The Foreign Trade Banking Corporation is a very recent development, the announcement of its organization having been made only a week ago. The bank is a discount

bank and the first of the kind to be organized in the United States. Its president is George A. Gaston, head of Gaston, Williams & Wigmore, Inc., and its managing director is Max May, until recently vice-president and manager of the foreign exchange department of the Guaranty Trust Company.

Foreign Trade Banking Corporation

In stating the purpose of the bank the announcement said:

"The company will be operated along the same lines as similar institutions have been conducted for years in England and France and which have done so much toward building up the large and profitable overseas patronage of those countries prior to the war. Comparatively little was known of trade acceptance in this country before the war, but during the last two or three years its importance and value in international business relations have become widely recognized, and it is now one of the most popular and helpful financial instruments. On the surface it appears strange that a banking institution of this kind has not been organized in this country earlier. There are a considerable number of them operating in London, and in addition to being highly profitable to their owners they have proved of great assistance to all parties concerned—the buyer and seller as well as regular banking institutions, through creating a larger volume of remunerative business for them."

George A. Gaston, the president, said in commenting on the new bank: "We hear much these days about rendering service for the purpose of fixing up and holding our foreign patronage. Most of this propaganda consists of statements relative to proper packing and other features—important, but matters of detail. Of greatest importance is the matter of credit to help us achieve this most desirable result. What this country needs to maintain its recently won supremacy as an exporter is adequate shipping facilities and a more elastic credit system. It appears now that in the future we will have less trouble about overseas shipping, so the matter resolves itself more or less down to one of credits and proper or beneficial financing. The new discount company will not accept deposits like banks, nor transact a general banking business. In other words, it will not compete in any way with the established banking institutions. Naturally enough a great amount of educational work must be done among the banking institutions generally throughout the country, so they will understand fully the value of trade acceptances. Such knowledge will enable them to render a real and constructive service to their own patrons."

"Beyond dispute the establishment of the Federal Reserve Bank was the most progressive step taken by this country in many years. It has proved a great boon to the industrial and commercial life of the country, and while it gives needed elasticity to the country's banking capacity through its discounts of commercial paper, it maintains direct relations only with banks. Our rediscount bank will offer rediscount facilities to banks, and will go even a step further by extending service to firms and individuals."

The Visiting Purchasing Commissions

So many railway supply men are already familiar with the foreign railroad purchasing commissions that are now in this country that but a few words concerning them will suffice.

The commissions have been here not only to place orders for much needed railway supplies for their country's railroads, but to inspect the material ordered, to assist and superintend its shipping and in some cases to keep in touch with the market here with a view to placing orders for requirements after the war. The personnel of the commissions

consists as a rule of important railway government officials.

The Japanese Commission has been in New York with headquarters at 17 Madison avenue. Akio Katsura, secretary of the Imperial Government Railways who has been in charge since Dr. Shima left for Japan last December is, however, also about to leave for Japan.

Captain Raymond Michel, a distinguished French officer, is in charge of the railroad department of the French High Commission.

The purchasing board of the railroads of Italy is headed

by V. Pizzorno, president of the Italian State Railways' Commission of Inspection at 291 Broadway, New York. A. Palanca, at 291 Broadway, is head of the Italian Ministry of Shipping. General Tozzi of the Italian Military Commission in the Metropolitan building, New York, is also interested in the buying of railway supplies.

Russia

The Russian Mission of Ways of Communications has offices in New York and in Washington, D. C. It consists of Professor G. Lomonosoff, Count S. I. Shulenberg, Alphonse I. Lipetz, and M. N. Groten. Professor Lomonosoff is president of the commission with headquarters in New York. He is a member of the council of engineers of the Russian Ministry of Ways of Communications in Petrograd. Mr. Lipetz, head of the locomotive department of the Russian Mission and formerly an important officer of the Russian Government Railways is responsible for the design of the Russian Decapod locomotive built in this country as described in the *Railway Age Gazette* of October 12, 1917. Mr. Groten is chief of the car department of the Russian Mission of Ways of Communication and is responsible for the design of the Russian railroad cars built in this country. The mission has a large staff of engineers and inspectors who have been in charge of the construction in this country.

Netherlands

The government of the Netherlands has a purchasing office for the East Indian possessions in the Whitehall building, New York. This office has been purchasing railway supplies which have been shipped from Pacific Coast ports. As an indication of what the future policy of the Hollanders will be in regard to the purchase of railway supplies in this country a member of this commission said:

"After the war Holland will make every effort to continue to buy supplies in the United States. They will do this regardless of the price of supplies, because it is not desirable for Holland to let either England or Germany continue to sell them all their supplies. Holland does not build railway supplies and formerly bought almost wholly in England and Germany. By buying at least part of our supplies in the United States we shall prevent either Germany or Great Britain from getting too great an interest in the business of our Colonial possessions."

French High Commission

The New York offices of the French High Commission which occupy two floors of the American Express building at 65 Broadway, present a scene of intense office activity. Speed and brevity are the order of the day, although all proceedings are tempered by delightful French courtesy.

Selling to railroad commissions forms a practically new experience to railroad supply concerns, and certainly not an undesirable method of securing foreign business. By coming to this country and doing business here with many American concerns the commissions have gone a great way in bridging the gulf between their and our methods of doing business. Although the commissions may be discontinued after the war, their coming will at least have been a great boon to the supply industry. In numerous cases American specialties have been purchased, and the American supply concerns have secured a foothold in the foreign market.

\$54,000,000 W. S. S. IN MARCH.—Sales of War Savings and Thrift Stamps in March were \$54,000,000, and brought the total receipts from that source in the four months since the War Savings campaign started to \$128,000,000. Officials estimated, however, that actual sales, some of which have not been reported, have been about \$150,000,000.

Canadian Engineers in

France of Stern Stuff

"THE MEN WHO DRIVE the big mogul engines of Canada's ocean-to-ocean trains across the prairies and through the mountains are made of stern stuff and have nerves as steady as the steel roads they travel. You meet many of them here at the war."

So writes Roland Hill, from war correspondents' headquarters in France, regarding the operations of the Canadian railway troops. The story was received by the Canadian Militia Department and published in press despatches.

"There is the story of one of these engineers—in charge, too, of a 'built-in-Canada' engine—whose great hospital train had just completed lading at a siding when the Huns opened deliberate fire on the casualty clearing station. They said it was a reprisal for the 'bombing of German hospitals' by British airmen (British airmen, of course do not bomb hospitals). The track ahead had been hit but not broken by the shells which were ranging closer to the hospital with every shot. Without hesitation the Canadian engineer piloted his train safely over the damaged track to a clear line ahead and hundreds of helpless wounded were carried to safety. If the engine had ditched it meant certain destruction for the train.

Aid Salvage Corps

"Another driver, who had charge of a Canadian construction train at Gouzeaucourt when the Huns broke through after Cambrai, stayed with full steam up until all possible men and material had been loaded, and although the enemy were actually on the track behind him, tore down the grade to a safe siding well behind the new British line.

"The Canadian railway troops in their spare time have been assisting the hard-worked salvage corps. After Passchendaele they collected thousands of pounds' worth of British and German shells and hauled them back to the rear on their now famous light railways. Late one afternoon one large dump caught fire through spontaneous combustion or perhaps a defective shell, and in the first explosion half a score of men were wounded. A young Canadian engineer, a sergeant, who in peaceful days used to drive the Canadian Pacific Imperial Limited from Moose Jaw to the west, in spite of the bursting ammunition backed his little engine into the middle of the dump where the fire was blazing most fiercely. He connected up a hose with his main steam pipe and for half an hour pumped a stream into the burning mass, finally getting the fire under control. His little engine was pitted with shrapnel holes and his own escape was nothing short of miraculous. Several of the flying fragments tore his clothes. His example rallied other men and the fire was subdued before very great damage had been done.

"There was two hundred thousand dollars' worth of British shells in that dump. We couldn't stand by and see that go up," he explained afterwards.

"And when the dump was safe he and his companions gathered the wounded into empty dinky cars and rushed them back along the little steel line to the safety of a dressing station."

EMPLOYMENT FOR ENGLAND'S DISABLED RAILWAYMEN.

Speaking at the annual meeting of the Lancashire & Yorkshire Railway, on February 13, Sir George Armytage, the chairman, said with reference to those members of the company's staff who were crippled while serving their country: "These men, I need hardly say, receive the most sympathetic treatment, and every endeavor is made, in accordance with the terms of our promise, to reinstate those concerned in their former positions, and in any case every effort is made to find employment for them."

The Locomotive Repair Shop Situation

The Railways Need Increased Facilities for Maintaining Power;
Labor Must Give Its Best

TAKE THE COUNTRY AS A WHOLE the railroads are deficient in repair shop capacity and facilities. It is here that the government can, during its control of the railways, make the greatest showing in improvements to railway equipment. The lack of proper facilities for making both general and running repairs to locomotives was responsible to a large extent for the condition of the motive power last winter. While it was not the sole cause, it contributed very largely to the conditions. Some prominent men in the railway mechanical field have made the statement that it is not new locomotives the country needs, but properly repaired and well maintained locomotives. Facilities must be provided for this purpose. However, very few roads have made anywhere near in proportion the improvements in their shops that they have in their locomotives. Heavy power has been purchased with no provision for properly handling the repairs. This has not only made it necessary to hold these large locomotives with their proportionately increasing earning capacity out of service longer than should be necessary, but it has made it impossible to maintain them properly. The old saying, "a stitch in time saves nine," applies most aptly to repairing the large locomotives. Let them begin to pound or have excessive wear in their running parts and they soon hammer themselves to pieces.

What is needed most, particularly in the east, and far more than standard locomotives, is increased shop facilities for maintaining the power which has and will in the next few years be called upon to do a greater amount of work than ever before in the history of the country. Back shops are needed with adequate crane service and machine tool equipment for handling the heavy repairs. Improved terminal facilities are required that the light running repairs may be properly made. One road owning over 2,000 locomotives estimates that its repair facilities can only be brought up to the proper standard by an expenditure of over \$10,000,000. Another road located in the east operating about 1,500 locomotives has only repair facilities for 750 and these are old shops with inadequate facilities. So great is the demand that one road is planning to equip various buildings with temporary facilities for repairing the lighter class of power, such as switch engines, and keep the larger shops free to handle repairs to the heavier power.

Those roads, which, because of lack of proper back shop facilities, followed the practice of making most of the light repairs in the engine houses, suffered greatly during the extremely cold winter because of this fact, their roundhouses being crowded with locomotives under repair and no house room being available for making the running repairs to the road locomotives. This necessitated keeping them outside where it was impossible for the men to do efficient work and where it was impossible to prevent locomotives freezing.

The motive power of the country, taken as a whole, is perhaps in worse condition than it has ever been before. It has been estimated that during the next seven months 60 per cent of the power must pass through the back shops for repairs, if the railroads are going into the next winter in proper shape. This means that almost heroic work must be done. Facilities should be improved to better meet the demands. Extensions to roundhouses which will permit more locomotives being taken under cover during the winter months will be money well invested. Additional inspection pits, strategically located, will contribute toward prompt repairs. A well designed and modern asphalt with adequate facilities for removing the cinders is important. A study

should be made immediately of the conditions as they exist and improvements made where they will do the most good.

It is useless still further to overcrowd our shops and engine terminals with new locomotives unless provision is provided to take care of them. It may be possible to build during the next few months a well equipped, modern shop at some centralized point in the east to provide facilities for repairing locomotives for those roads whose repair facilities are so greatly overtaxed. No stone should be left unturned which will lead toward improved shop conditions that the roads may better maintain their power.

Repairing Locomotives in Foreign Shops

At the present time about 225 locomotives have been sent to those roads which are in a position to handle repairs to other than their own locomotives. It is a question as to how far such practice should be followed. In no case should a road be asked to sacrifice repairs to its own equipment for the purpose of helping out other roads, as the difficulties encountered in repairing locomotives of a design different from those of the roads to which they are sent make this practice costly both in time and money. Wherever this is done, the repairing road finds it necessary to obtain most of the repair parts from the owning road. The practices followed in the general details of construction are usually different and considerable time is required for the repairing forces to acquaint themselves with the peculiarities of the foreign locomotives.

The following while not strictly up to date will give some idea of the extent to which locomotives have been sent to foreign roads for repair since January 1.

Of this number 26 have been repaired and returned to the owning road.

When this practice was first started locomotives were sent indiscriminately throughout the country. It was not until that some eastern locomotives were being sent to repair points 2,000 miles away. This, of course, was entirely impractical and with a concentration of such work in the hands of the Manager of the Locomotive Shop, such occurrences need not now exist. It is the plan of Mr. McManamy, and a most logical one too, so to centralize repairs to foreign locomotives that one shop will handle only repairs for one road besides itself. Great care must be exercised in making inspection of locomotives that are sent to other roads for repairs, so that a full complement of repair parts will accompany the locomotives to the shop. Occasions have been found

where the work has been materially delayed because the more rigid inspection made when the locomotive was stripped, developed the need for repairs that were not reported. As the workmen in the repair shops become accustomed to the requirements of the road for which they are making repairs, the difficulties and delays will be reduced. In some cases it has been found necessary to send inspectors with full sets of detail prints and standard practices of the home road to the shops at which the locomotives are to be repaired. These inspectors should work with the shop forces and be given definite gangs, so that the workmen may be educated in the requirements of the owning roads, and these gangs should be kept solely on this work. They will soon become accustomed to the road's requirements and will be able to make the repairs with less confusion in the shop.

Cases have been reported of locomotives being sent as far west as Parsons, Kan.; Brainerd, Minn., and Ogden, Utah, to be repaired, all these locomotives coming from eastern roads. It would be far better practice to "step" the repairs westward, than to require the locomotives to travel such great distances for repairs.

Repairing locomotives in foreign shops is at best only a makeshift proposition and should not be done except in case of absolute necessity because of the hardships it will impose upon the repairing roads and the increased length of time a locomotive will have to be held out of service from the home road. If it is possible to increase the repair facilities of the owning road, this should be done by all means, as a great deal of confusion will be eliminated and there will be a net gain in locomotives repaired throughout the country.

The Labor Situation

Perhaps the greatest trial the railway mechanical officers have borne during the past year has been the difficulty of securing a sufficient amount of efficient shop mechanics and labor. Because of the extreme demand for mechanics of all kinds by the navy yards, munition works and on account of the draft, the railway shops throughout the country have been sorely hit. While it is true that the larger roads, taken as a whole, have about eight per cent more men working on locomotive repairs than last year, a large number of the men employed represent a class of labor that is unfamiliar with railway shop practice. This is particularly true in the East. It has been necessary to educate these men and generally speaking they have not been able to do the work efficiently. The labor situation, however, is becoming more stabilized and with the promise of consideration being given the workmen by the Railroad Wage Commission, the men have been more willing to remain on the job.

Due to the law of supply and demand, the railroads have been forced to increase the wages to the men in order to hold them. With these increases in wages, however, it has been increasingly difficult to keep the men from laying off. To overcome this situation one road has granted a bonus of one minute per hour to men who have not absented themselves from work during the week. The matter of absentees is an important one and every possible attempt should be made to appeal to the patriotic duty of the men to remain at work. It is no longer necessary for each one in this country to do his "bit," but each one of us must do all that is possible to the limit of physical endurance. The men must be made to realize the seriousness of the situation. They must be made to feel that the government is depending upon them to provide the railways with adequate power.

It is necessary, if the roads are to go into the next winter in good condition, for labor to give its full time. In fact, the matter is so tremendously important that the Manager of the Locomotive Section of the Railroad Administration has issued orders to increase the working hours of railway shops, where necessary, for making proper repairs to the locomotives, to 70 hours a week. Some roads have done

this; others have not. The success with which this order can be met depends a great deal upon the manner in which it is handled. One road on which it was attempted to put this order into effect, issued a notice to the men an hour or two before closing time, requiring the men to start that night on the 70-hour schedule. This was manifestly unfair to the men, and as might be expected, was met with a great deal of opposition. After two days' trial the plan was considered a failure and discontinued. A representative of the Railroad Administration, however, consulted the representatives of the shop men and even addressed the men en masse. After explaining to them the necessity for the overtime and the importance of properly repairing the locomotives, the system was again scheduled to go into effect a few days later with lasting results. To obtain the 70 hours a week, some shops are operating 10 hours a day for the entire seven days. Other shops are working 14 hours on Monday, Tuesday and Thursday, 10 hours on Wednesday and Friday and nine hours on Saturday, leaving Sunday free for the workmen.

Labor Must Do Its Part

Some shops are arranging to provide for the increased output where men can be obtained, by working night shifts. This, of course, is a desirable thing to do where possible. In every case, however, all shops, regardless of the condition of the motive power on their particular road, should increase the working hours in order that they may lend assistance to roads whose repair facilities may not be sufficient to meet their needs. It is a time for the closest co-operation and every assistance must be given to the weaker roads.

Labor must be ready to do its part in this gigantic world struggle. Those roads that have become strongly unionized are bound hand and foot by agreements with organized labor, which make it practically impossible for overtime to be obtained without greatly increasing the cost of labor. One labor agreement which was put into effect the middle of last year, which is distinctly unfair to the railroads and may be justly termed unpatriotic at the present time, reads as follows: "Overtime shall be paid for at the rate of time and one-half for all service after the hours in force (eight-hour day) up to the end of the first hour immediately following the shift upon which employed. If required to work after the first hour immediately following the shift upon which employed, five hours will be allowed for 3 hours and 20 minutes, or less service." Here the road, if it attempts to even work a 10-hour day, is required to pay for 14½ hours, and this contract was made while our nation was at war. This same contract also reads: "When vacancies occur in foreman or gang boss positions, men from the class represented in this agreement will be given preference in promotion, seniority, character and ability to govern." This rule certainly removes the incentive for good work and it makes it practically impossible to secure the best supervision. Whether or not the Railroad Wage Commission will permit such agreements to exist, remains to be seen, but in view of the necessity of the government for this class of labor, it seems hardly possible that even the government will permit such absurd labor contracts.

Throughout the past winter labor has been subjected to very trying circumstances. Due to the lack of adequate facilities, much of the repair work had to be done outdoors, which during the exceptionally cold winter made it a physical impossibility to have the work done properly. Even inside in some places, with the average arrangements for heating roundhouses, it was not possible for a man to perform an efficient day's work. In addition to this there were natural losses of efficiency because of many of the men laying off on account of sickness due to the extreme weather conditions.

Laborers in the mechanical department have been ex-

tremely difficult to obtain. This has been felt more in the south, where negro labor obtains, than ever before on account of the increase in laborers' wages paid by industries and the fact that a large number of negroes were brought north to fill in the gaps there.

Throughout the winter extreme difficulty has been experienced in maintaining proper roundhouse forces. The conditions have been so trying that it has been almost impossible to get the men to stick and the percentage of absentees mounted to a very large figure—for some roads at some periods during the winter, being as high as 40 and 50 per cent. The asphalt men were particularly hard hit and it was not an uncommon occurrence for a whole asphalt crew to quit in the middle of the night or during the day through some of the extremely cold weather. This all makes necessary the provision of adequate facilities for handling this class of work in order that it can be done with a minimum of discomfiture to the men.

The discipline maintained at some of the shops has, on account of the difficulty that has occurred in keeping the men at work, been allowed to sag. This is disastrous in any organization and will do more to decrease the efficiency of the shop than most any other one thing. The class of supervision obtaining is generally responsible for such conditions. The supervising officers must insist upon proper respect and hold the men strictly to their tasks.

It has been found necessary throughout almost the entire country, and particularly where the labor turnover has been very large, to increase the number of foremen or supervising officers in the shops. The class of labor now being obtained is such that unless adequate supervision is provided, either through gang foremen or demonstrators, it will take a long time to bring the quality of work up to the proper grade. Some roads have complained of the difficulty of obtaining competent foremen and of even retaining the foremen in their positions. In a very large number of cases, the difficulty thus encountered is due to the fact that the supervising officers have not been granted an increase in wages in proportion to the mechanics or men working under them. It is impossible to expect a man, undoubtedly a good mechanic, who is capable of holding the position of foreman, to give his best work and remain satisfied when the men under him are receiving more in wages than he obtains in salary. Some roads have been quick to recognize this and have granted the supervising officers increases of even a larger per cent than was given the men. Such roads have had no difficulty in retaining the foremen and they have been willing to work as never before to pull their road out of a serious situation. Full cognizance must be given to this condition and it must be remembered that labor or workmen without a competent leader will never give maximum output.

The Labor Shortage in the Maintenance Department

A Resume of Possible Sources of Supply and of Means of Reducing the Demand for Men

THE AMOUNT OF WORK which the railways can do this year depends directly on the quantity of labor which can be secured. The supply of materials of certain kinds is inadequate, but priority regulations can be so administered as to meet the most pressing needs. However, there are no priorities as to labor. The shortage is universal. Industries are working with only partial effectiveness because of a lack of men. The shipyards are handicapped for the same reason. It is not therefore surprising that the roads, which employ normally about 450,000 men in maintenance of way work, are short from 10 to 50 per cent of their forces, depending on localities. Not only are the railways facing a shortage of track and other maintenance labor now but this condition will continue. The problem is therefore to prepare for the future as well as for the present and to adopt those measures which will be of most lasting benefit.

The causes of the labor shortage are those common to all industries—a demand far exceeding the supply, supplemented by the withdrawal from productive work of large numbers of men for military activities. The result has been a general moving up into the better paying trades of the men formerly classed as unskilled laborers, leaving these ranks most depleted. In those industries employing skilled mechanics such shortages as have existed have been caused by increased demands for men more than by desertions to other work, while in maintenance of way work the reverse has been true and it has been impossible to retain even normal forces.

The shortage varies widely from one locality to another. It is least evident in the agricultural communities and those removed from industrial activities. In such places it has generally been possible to maintain normal forces and in some instances to recruit floating gangs for service in districts less fortunately placed. The greatest difficulty is being encountered in the industrial centers in the east where men cannot be held in the face of the high wages offered by industries. In many such places the forces have been so de-

pleted that it has been impossible to do more than patrol the tracks and do the most urgent repair work, postponing all other work.

With the shortage over the country becoming steadily more acute, little hope can be held out for relief this summer. Instead, with the speeding up of the ship building program and with the continued withdrawal of men for military service, the shortage may be expected to become more acute. The problem confronting railway men is that of developing new sources of supply of labor and of using the men available more efficiently to increase the unit output of work per man.

Increasing Sources of Supply

For many years track forces have been recruited largely from the immigrants coming from Europe, but with the outbreak of the war in 1914 this source was closed. As a matter of fact the number who have returned to Europe since August, 1914, has greatly exceeded that of men entering the United States, so that the net result has been a severe drain on the labor supply of the country. No relief can be expected from this source until the close of the war.

The next most inviting source of labor is Mexico. Up to a year ago Mexicans were coming into this country in increasing numbers and were the main reliance of the roads in the Southwest, but with the imposition of a head tax, and a literacy test by our government in legislation which became effective on May 1, 1917, this source of labor was shut off, for almost none of the Mexicans can pass these requirements. It is understood that large numbers of Mexicans are willing to work in the United States if it were made possible for them to do so, but in spite of the urgent need for them, the government has taken no step publicly to bring them in.

Many railway men have urged that the restrictions against the importation of Chinese labor be raised for the period of the war. Large numbers of men can be secured in China of a class which makes good workmen. England

has transported over 150,000 across Canada to France, where they are employed in civilian work in the interior. China possesses a surplus of labor sufficient for our needs. However, public sentiment, particularly in the western states, is so strong against Oriental labor that there is little hope of securing relief from this source.

The most promising field for the importation of labor is Porto Rico. Investigations of the United States department of labor have shown a large surplus there and statements have been made from time to time that as many as 100,000 to 150,000 men would be brought into this country in the near future. As early as last fall it was announced that plans had been perfected to bring these men in but so far none have arrived. If they are secured, these men will necessarily be distributed mainly in the south where climatic conditions approach those to which the men are accustomed. It is doubtful if any noticeable relief will be secured from this source in the north.

It would seem therefore that no great relief can be expected from outside the United States except in so far as help may be secured from Porto Rico. Within our own borders much comment has been made regarding the employment of women in the maintenance of way department. Some roads have hired considerable numbers for a short time but in general they have not proved successful. While they can be employed in clerical positions they will not offer any material relief in the general run of maintenance of way work.

A greater benefit can be secured through the recruiting of boys 16 to 18 years of age for track work. While the agitation for the enlistment of boys in farm work will draw many in this direction this year, a number of boys of high school age are to be found in almost every village for whom railroad work holds a fascination. By taking the proper measures, many of these boys can be recruited for maintenance work, either as members of regular gangs or in gangs by themselves. One eastern road which gave this subject special attention last spring, sent its supervisors to speak before the older boys of the high schools in the towns along its line, pointing out the advantages of track work during the summer. As a result as many as 150 boys were employed on single divisions. These boys were organized into separate gangs and were assigned to ditching and similar work, but in general were kept off the track itself. In this way it was possible to keep the men working on the track and still to complete much of the other work. If this plan were developed throughout the country it would mean a considerable addition to the available track forces of the country.

Working Conditions

In general maintenance forces are recruited by the individual roads through their foremen locally and through labor agents in the larger centers who are either directly in the employ of the roads or work on a fee basis. This year the government has stated that it is prepared to secure the men desired by the roads through its national and the state agencies with which it is affiliated. It has intimated further in some instances that it is prepared to supplant the organizations maintained by the roads in previous years to secure men. Railway officers are inclined to look at this suggestion with some apprehension, for in spite of frequent assertions to the contrary the government-operated labor bureaus have not shown any marked ability to supply experienced railway labor in the past. Railway men will welcome any help which the government-operated bureaus can render them this year but it would appear highly advisable to retain those methods in use previously until the ability of the government to provide the desired men has been demonstrated.

One wasteful practice incident to the present methods of hiring men for which a practical remedy has not yet been secured is that resulting from shipping labor long distances.

As long as this practice is followed, certain classes of men will continue to hire out for work far removed from the point of employment. The waste of time and of transportation in hauling large numbers of men across the country in this way is great. At the same time, it cannot be eliminated entirely for it is necessary to take the men from their headquarters to the site of the work if the work is to be done. Any proposal to prohibit the shipment of men to work will create a hardship on the job away from the city which it will be difficult if not impossible to overcome.

The wage question assumed a prominent place in all studies of the labor situation last year and it will be even more important this year. It is to be expected that wages will rise in any period of labor shortage. It is also the experience that this rise is facilitated in every such period by the bidding of one road against another, the only effect of which is to increase the cost to all, without benefiting any one, as few new men are drawn into the work. To overcome this practice there is a feeling among many railway men at the present time that, as the roads are now operated under a common control, a uniform rate should be paid on all roads, at least in a common territory. This will effectively stop all bidding of one road against another with its resulting demoralization. However, once established, the tendency will be to standardize this wage over too wide an area and to place too great an impediment to its change, with the result that authority will have been taken from local officers to make changes on their own initiative to meet local conditions quickly as they arrive. While it is not desirable for one road to compete with another for men, particularly under present conditions, each road must compete with the farmers and the industries along its lines for men. Any regulation which removes from the men on the local road the authority to meet this competition gives all the advantage to the industry with the result that the roads will be more seriously handicapped than before.

Conserving Men

With the scarcity of men, which is certain to prevail this year, it is to be expected that they will be harder to hold on the work than ever and that the turnover will be higher even than last year. Men will leave on the least complaint, or on no complaint at all. High wages foster rather than arrest such tendencies, for those men whose sole ambition is to earn a stake will get it quicker and therefore work a shorter time.

A feature which will be given greater prominence than previously will be the provision of more comfortable housing facilities and more attention to boarding. A great improvement has been made in the character of many of the camps, but these modern camps are still so few as to constitute the exception. When the men have the power of selection as they have this year, it is to be expected that they will prefer to work at those places where modern conveniences are provided and will refuse to stay at other camps. This will lead to the more general installation of modern conveniences, first at those points where labor is most difficult to hold and then to points of less difficulty.

With the lack of an adequate supply of labor this year there will need to be more supervision to get the best results from that which is available. Division engineers, supervisors and foremen will need to employ their men so as to get the most work from them and create the least lost motion. This should be planned well in advance and every opportunity taken to secure the most efficiency from the forces.

Of equal or greater importance is the necessity of substituting mechanical equipment for men wherever possible. The maintenance of way department has been very backward in this work and as a result railway men and manufacturers alike have made little progress in the development of labor saving equipment. It is true that the motor cars and

certain other devices have come into general use but these are exceptions to the general practice. Now when labor cannot be secured, there is a great demand for machinery which will do the work of men and this year will probably see the introduction of many new devices. In the meantime it is important that equipment be used in place of men wherever possible, even where there is no reduction in the cost of doing the work, although in nearly all cases the adoption of mechanical equipment is accompanied by a decrease in the cost of doing work.

Conclusions

In brief, the supply of men is insufficient for this year's demands. No help can be expected from European immi-

gration. Men are available in Mexico, but the immigration restrictions prevent those who are willing to come from entering this country. China has a surplus of labor but the sentiment in the west will not permit any letting down of the bars against their entrance. Some relief may be secured from Porto Rico. However, the most ready means of assistance lies in the employment of boys in the work for which they are best suited. With the inadequate forces under the most favorable conditions railway men can also conserve their own interests by providing such arrangements for the care of the men as will tend to hold them on their work. Material relief can also be secured through the adoption of labor saving equipment wherever it can be adapted to the work in hand.

How the Export Houses Help in Foreign Trade

The Reliable Export Firms Can Offer Many Advantages to the Railway Supply Manufacturer

By Homer C. Johnstone

Manager Steel & Railway Supply Department, Gaston, Williams and Wigmore, Inc.

THE WRITER HAS BEEN REQUESTED to outline the advantages presented to the manufacturers of railway supplies for extending their business into foreign countries through the aid of the reliable export firms of this country.

The first question that confronts the manufacturer, and it is a serious one, is how to introduce his goods to foreign markets. There are several ways. The first that suggests itself is to place advertisements in foreign papers, in the language of the country, setting forth the desirability of his particular product. This necessitates considerable initial expense and the results obtained by manufacturers who have tried this method have been very unsatisfactory, for they find that, even though the advertisement arouses interest in the product advertised, by the time a letter of inquiry, written in the language of the country and necessitating translation, is received here and replied to, several months have elapsed and the interest of the inquirer has waned. Even should an inquiry develop into an order, the manufacturer is generally unacquainted with the methods of packing goods for foreign shipment, with the ways and means of getting steamship space at a rate on which he can count and with money values in foreign countries. Also, he is handicapped in ascertaining the credit of the concern to which he is shipping, in consequence of which he is left with an indefinite idea as to the actual sum of money he will make on the transaction, if it goes through, and is, therefore, compelled to demand money deposited in a bank in this country to make safe the financial end.

All of this process covers a long period, if it is done by writing, and costs a good deal of money if done by cable, making the transaction unsatisfactory in the long run and very slow in operation.

There is another method which has been tried without showing returns for the expenditure involved. This has been to send a special man to a certain country. He calls upon the trade and immediately finds himself handicapped if he does not speak the language of the country. While he may take a small initial order, he is very soon forgotten when he goes away, as is also his product. The writer has known firms to spend a good many thousands of dollars in endeavoring to introduce their products in this way and, after several years, find the returns but a small fraction of the money expended.

The modern export company of today, with its organizations in various trade centers of the different countries, offers to the manufacturer the following facilities:

Offices equipped, generally, with an American manager having under him salesmen of the country in which the office is located, and, therefore, speaking the language. These salesmen go out and call upon the trade, having lists of various customers in the various lines. They, of course, by their frequent calls, have become acquainted with the trade and are able to present to customers, in an intelligent manner, the advantages of the product they wish to introduce. If the product is a specialty, they have to depend upon the information they have received from the manufacturer, through the home office, catalogues and other literature. Should the device be so special that it needs a man from its own factory to introduce it, this man could be sent over, accompany the salesman who speaks the language and introduce the product in that way. When he left, the salesman would have absorbed sufficient information to carry on the campaign in the future.

These foreign offices of the large export companies handle a great deal of material and advertise in the countries in which they are located, so they become a sort of center for inquiries regarding American products. Also, the export companies handle imports and are, therefore, buying and trading with the various merchants abroad, which keeps them in closer touch. They are able to make a price, expressed in the money of the country, and the purchaser knows exactly what the material is going to cost when it arrives. Buyers in foreign countries, in ordinary times, are loth to pay for material until it has been delivered. This facility the foreign office of the export company can extend to them because of its acquaintance with the financial standing of concerns abroad.

Starting a Foreign Trade

The modus operandi of starting a foreign trade through one of these export companies would be as follows:

The manufacturer would first get in communication with the export company and state the country or countries in which he desires to introduce his product. If the export company is not versed in the appliances of a similar nature or design used in the country or countries in which it is to be introduced, it can, by correspondence with headquarters

in those countries, have the situation canvassed and, in a month or so, furnish the manufacturer with an intelligent statement as to the possibility of placing his product on the foreign markets. After this information is obtained, if it is still desirable to acquire the business, the manufacturer can, through the export company, send abroad a letter, written by his expert and descriptive enough to give the salesman on the other side a working knowledge. Then, the salesman of the export company abroad can start his campaign. On the orders which might result from this, the export company will buy the material direct from the manufacturer and take all the risk of shipping and safe arrival of the material, as well as the risk of the credit. The manufacturer will get his money at the mill, and know exactly what profit he will make in each instance. He will, therefore, save a large expense in advertising abroad and in the cost of sending representatives to canvass the foreign market.

The exporters or, as some firms call themselves, international traders, who have these foreign offices fully equipped for handling export and import trade, offer facilities along the line above mentioned that have never before been presented to the people of any country. The volume of their business enables them to obtain these various offices, and the salesmen in connection therewith, at a minimum expense compared with that which any single company, regardless of its size, could do in handling only one product. The cost to the manufacturer in introducing his product to the foreign trade is, therefore, very small.

The writer knows of one manufacturing concern in the West which spent a number of years and a good deal of money, advertising abroad in an effort to introduce its machine. The only result was a casual letter, in some foreign language. When the letter had been translated and answered, in 99 cases out of 100, nothing further was ever heard from it. After a number of years, therefore, they had sold a few machines. Then they went to an international trading company and, as a result, their descriptive matter (including a letter sufficient to acquaint the foreign offices with the advantage of the product to be introduced) went to every office of the trading company abroad, immediately, from Tokyo to Capetown and from Rome to Valparaiso.

Accordingly, 14 offices, distributed all over the world, right away took up the pushing of this machine and the result has been a large number of cabled inquiries and of letters asking about the machine, its price, terms, etc. In a few months, therefore, this manufacturer has had an introduction to the world that he could not have acquired through any other source or means.

We have known of manufacturers, who have either paid the entire expense of a man to cover a country, or a considerable part of it, and allowed the man to carry several other accounts, endeavoring to market their railway equipment in a country that had no cars on which the equipment could be used, under any circumstances, and the net result of their ventures was simply a large expense account.

If the manufacturer of railway supplies in this country will co-operate with the large, reliable merchants who are able to offer these facilities, it will simply be a question of time when these concerns can afford to establish specialty men on railway equipment in a large number of their offices abroad and the interests of the manufacturer would be taken care of just as carefully as they are in his various offices in this country.

Keep in mind that the magnitude of the business of these international merchants enables them to handle a product on a very small percentage of profit, probably less than a manufacturer might pay in extra freight and handling charges, being unaccustomed to the shipping proposition, to say nothing of the losses that would come to the manufacturer from credits which he would have to give abroad, in ordinary times.

The position at the present time, because of shortage of shipping and abnormal conditions all over the world is, of course, exceptional and what the writer has said is not applicable to a crucial time like the present in the same proportion to which it would apply under normal conditions. However, now is the time for a manufacturer to lay his plans to obtain information and to get in touch with the foreign situation so that, when ordinary business methods are again assumed, foreign trade will have a foundation laid. Of course, after the start, the future of the product depends upon its own intrinsic worth, as well as the manner in which it is kept before the eyes of the consumer.

Designs of the United States Standard Cars

Simple Construction, Interchangeable Parts and Use of Pressed Steel Noteworthy Features

IN THE *RAILWAY AGE* for March 29, the specifications for the United States standard box cars were published on page 785. The principal drawings of these standard cars have been reproduced and are shown in the following pages. From a study of these drawings in connection with the specifications, it is quite apparent that the government's standardization committee has provided some cars which no railroad need fear to operate. The designs are simple and strong.

Every attention has been made to make as many parts of

sills, are made up of 9-in., 17.44-lb. shipbuilding channels. In the open-top cars a 13.2-lb. bull angle is used on practically all the designs. The draft sill arrangement is identical, with the exception of some details, to all cars, and a standard distance of 127 7/8 in. is maintained between the center sills.

In addition to this, detail parts have been made of the same designs where it has been possible to do so, among which may be mentioned the body center plate, body side bearing, front draft lug, striking plate, coupler yoke key and

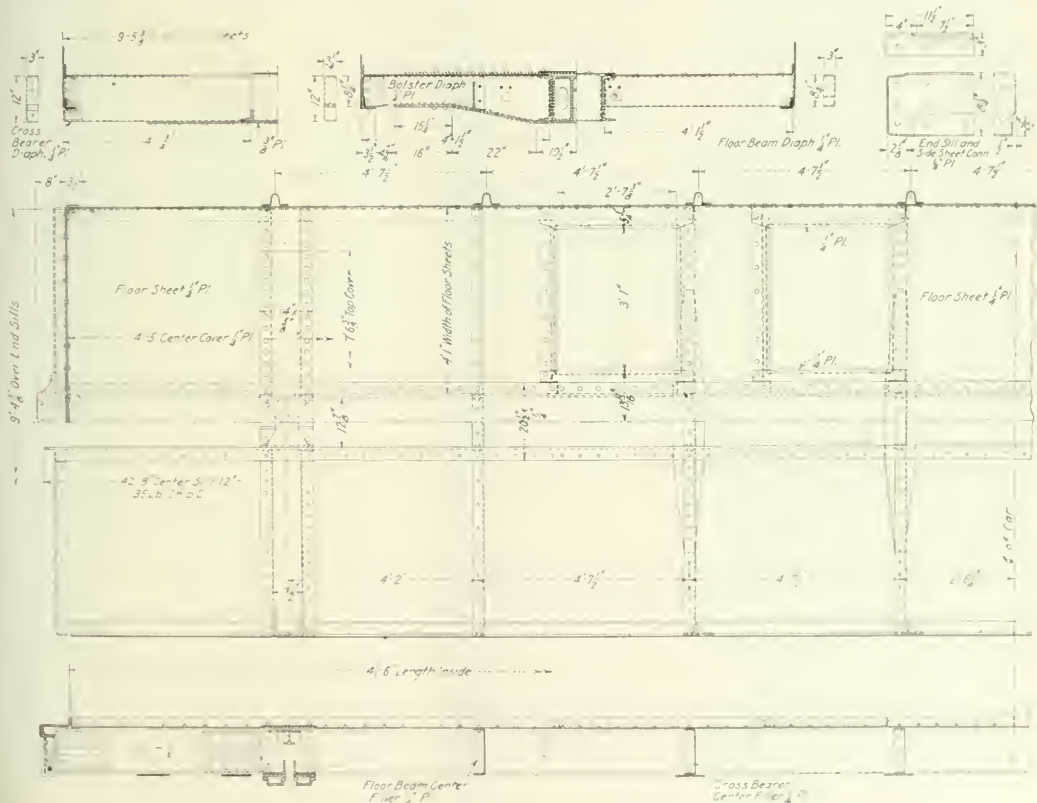

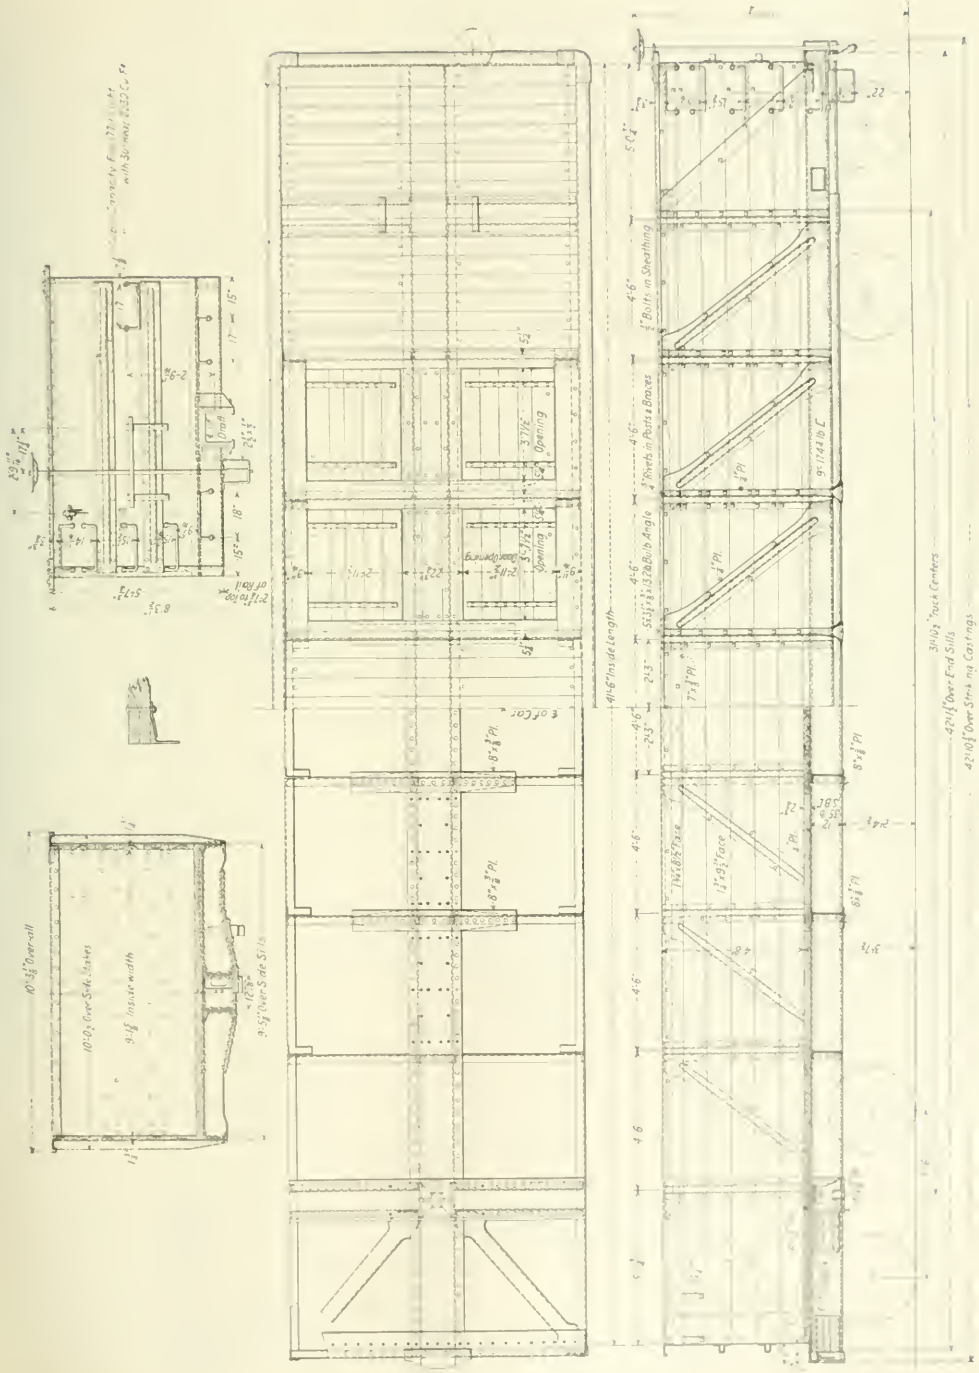

Fig. 1—Underframe for the Standard 50-Ton Steel Gondola Car

the cars as possible adaptable to more than one design, in order to reduce the number of dies, patterns, etc., the builders must make in constructing the cars. It is noteworthy the amount of pressed steel shapes that have been used in the designs and the small amount of commercial shapes. Where commercial shapes have been used, however, a strenuous attempt has been made to use the same shapes. For instance, the 12-in., 35-lb. channels are used to a large extent for the center sills. The end sills, and in some cases side

cotter, coupler carrying iron and ladder rungs, are also made of pressed steel. These are common to all of the designs. There are also other parts which are common to more than one design. For instance, one design of body bolster, center brace, rear draft lug and draft sill is used for the 40- and 50-ton single sheathed box cars, the 50-ton steel gondola and the 50-ton composite gondola. The trucks are similar in construction and have a center plate and center plate support common to all three. The limiting dimensions for brake beams is also

the same. Following is a brief description of the details of construction of the cars, which will facilitate a study of the drawings.

Gondola Cars

There were three different designs of gondola cars adopted, namely a 50-ton high side composite car, a 50-ton high side all-steel car, and a 70-ton low side all-steel car. These are shown in Figs. 1, 2, 3, 4 and 5. There is a marked similarity in the general dimensions between the 50-ton steel and composite cars.

Fifty-Ton Composite Gondola.—This car has an estimated weight of 40,000 lb. It has eight drop doors swinging from the center sill, the general plan being shown in Fig. 3.

The underframe in common with the other designs is made

stakes on each side and six braces of the same material. These are made from $\frac{1}{4}$ -in. plates and are 7 $\frac{1}{4}$ -in. wide and 3 $\frac{1}{2}$ in. deep. The end braces are also pressed from a steel plate in U-section, being 7 $\frac{1}{4}$ in. wide, 4 in. deep and $\frac{1}{4}$ in. thick. There is a 5-in. by 3 $\frac{1}{2}$ -in. by $\frac{1}{8}$ -in., 152 lb. bulb angle, extending around the top sides and ends. The floor boards used on these cars are 2 $\frac{3}{4}$ in. thick and the side boards are 1 $\frac{3}{4}$ in. thick.

Fifty-Ton Steel Gondola Car.—This car has an estimated weight of 42,000 lb. As in the composite design, it has eight drop doors which are set flush with the floor. The general plan of this car is shown in Fig. 2, and the underframe is shown in Fig. 1.

The chief difference between the underframe of this car and that of the composite gondola is in the crossbearers and

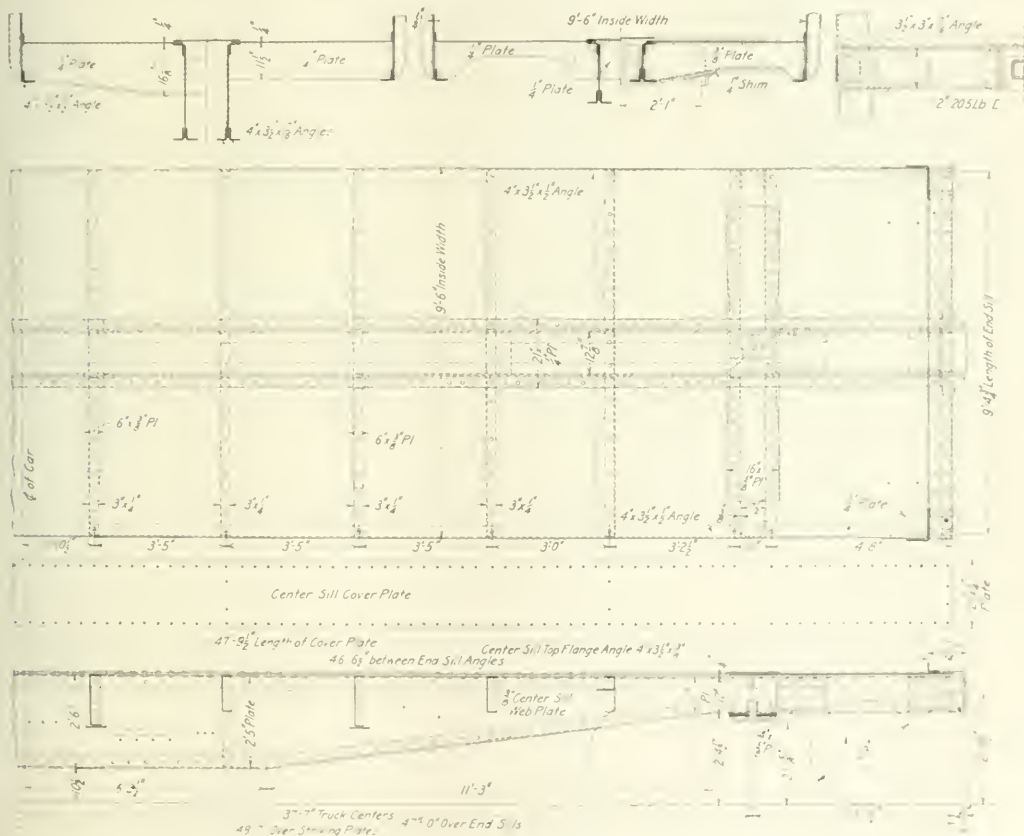

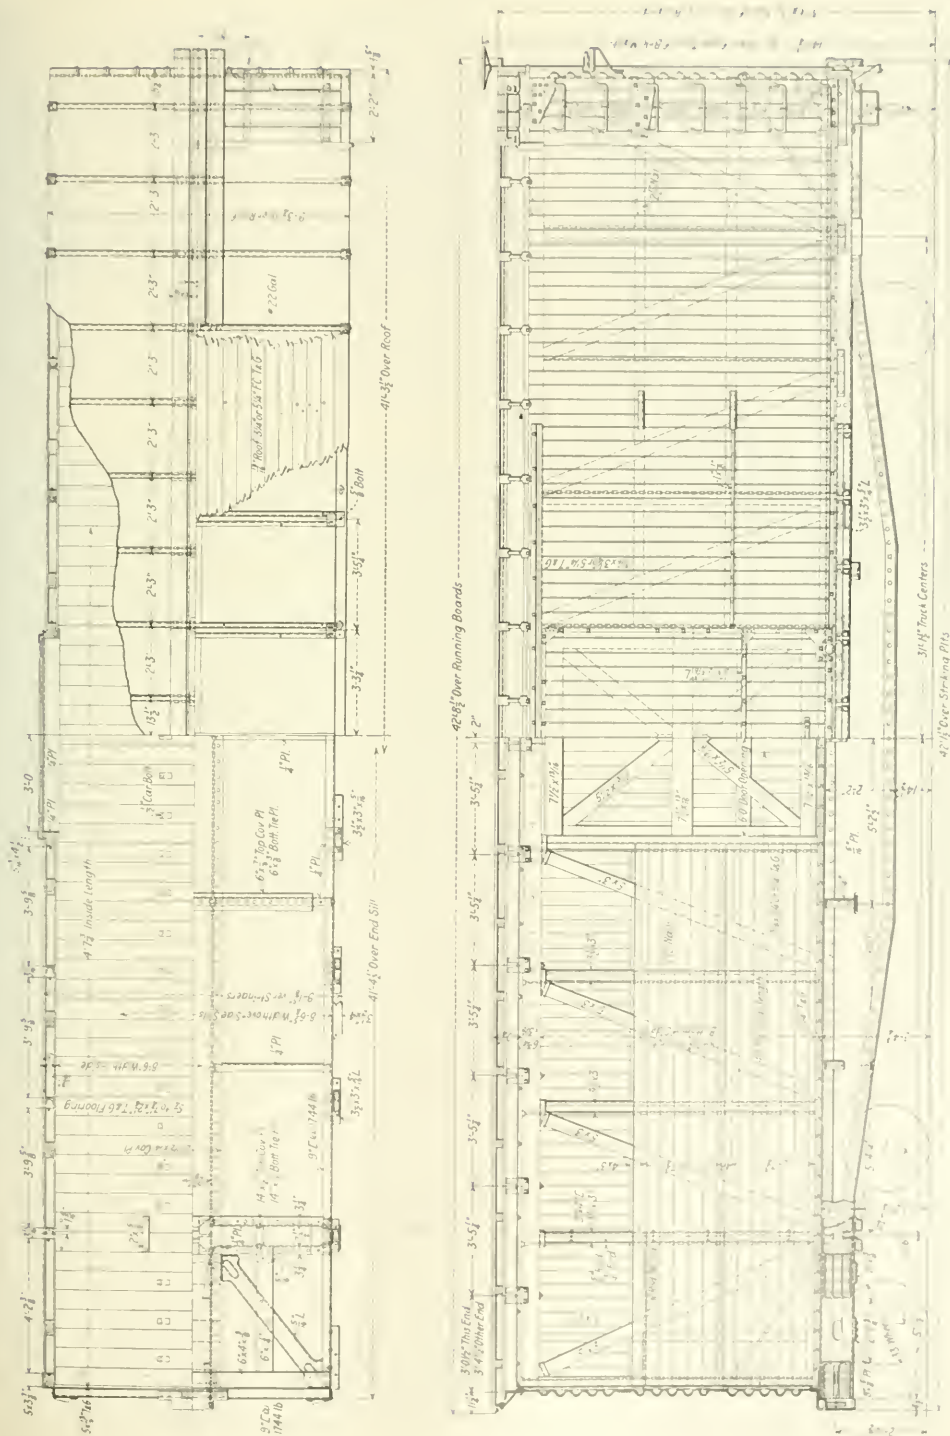

Fig. 5—Underframe for the 70-Ton Steel Gondola Car

up of a number of steel pressings. The center sills are 12-in. channels, having a standard distance of 127 $\frac{1}{2}$ in. between the webs and a top cover plate 20 $\frac{1}{2}$ in. by 1 $\frac{1}{4}$ in. There are four crossbearers of the fish-belly type, made up of $\frac{1}{4}$ -in. pressed steel diaphragms, having top and bottom cover plates of 8-in. by $\frac{3}{8}$ -in. material. The side sills are 9-in., 17.44-lb. shipbuilding channels. The body bolsters are built up of steel diaphragms made from 5/16-in. steel plate, having top and bottom cover plates of 5/8-in. steel. The end sills are 9-in., 17.44-lb. ship channels, the same as the side sills.

The body of the car has eight U-shaped pressed steel

side sills. The crossbearers are straight, being made of $\frac{1}{4}$ -in. pressed steel pans 12 in. deep. They have bottom cover plates $\frac{3}{8}$ in. thick and 5 ft. 8 $\frac{1}{4}$ in. long, with no top cover plate. The side construction consists of 5 $\frac{1}{2}$ -in. by 3-in. by $\frac{1}{2}$ -in. angles and side stakes of the same dimensions as those used in the composite car, but made from 5/16-in. plate. The end braces and the end sills are the same as used in the composite car. Both the floor and side plates for this car are $\frac{1}{4}$ in. sheets, and the same bulb angle is used at the top of the sides as on the composite car.

Seventy-Ton Steel Gondola.—This design has an esti-

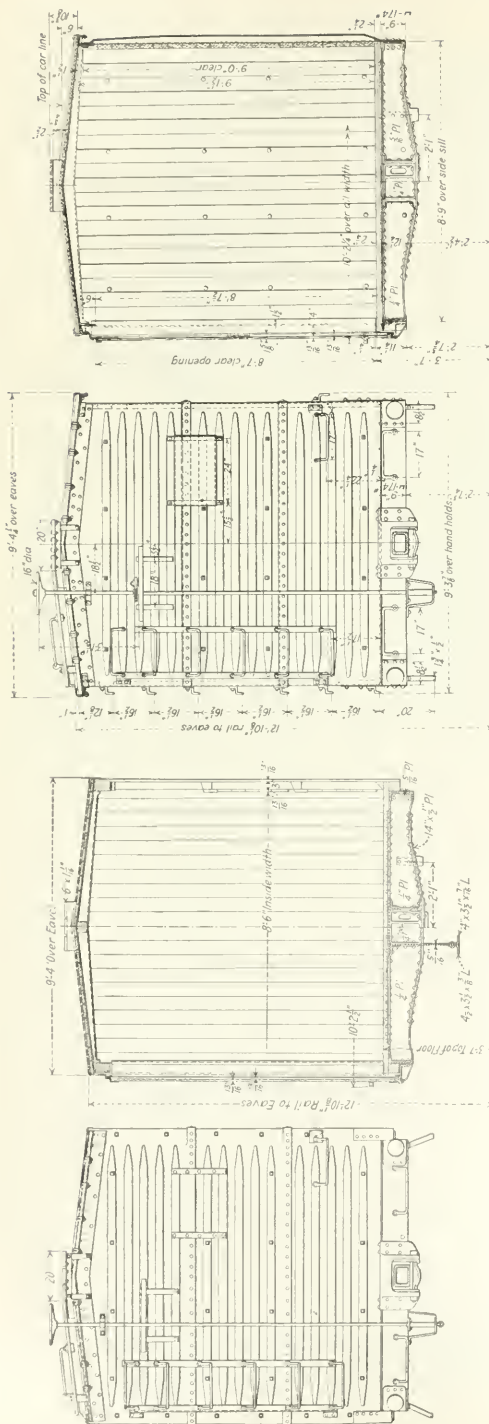

Fig. 8—Sections of the 40- and 50-Ton Single Sheathed Box Car

Fig. 9—Sections of the 40-Ton Double Sheathed Box Car

estimated weight of 49,500 lb. It is to be built entirely of steel and is provided with drop ends. The general plan of this car is shown in Fig. 4, and the underframe is shown in Fig. 5.

This car has a center sill of the fish-belly type, being 2 ft. 6 in. deep at the center. The center sill girder has a $\frac{3}{8}$ -in. web plate with a top flange angle 4 in. by $3\frac{1}{2}$ by $\frac{3}{8}$ in., bottom flange angles on each side of the webs 4 in. by $3\frac{1}{2}$ in. by $7/16$ in. and a top cover plate 21 in. wide by $1\frac{1}{4}$ in. thick. The crossbearers are $\frac{1}{4}$ -in. pressed steel diaphragms $16\frac{1}{8}$ in. deep at the center, reinforced at the bottom by a 6-in. by $\frac{3}{8}$ -in. cover plate which passes through the web of the center sill. The body bolsters are of the same general construction as those used on the other gondola cars, having $\frac{5}{8}$ -in. top and bottom cover plates. The bottom side angle used in this design is 4 in. by $3\frac{1}{2}$ in. by $\frac{1}{2}$ in., and the same bulb angle is used at the top of the sides. The side, end and door sheets of the car are $\frac{1}{4}$ in. thick. There are 12 pressed steel stakes on each side of the car made from $5/16$ -in. plate.

Box Cars

The designs include a 40-ton steel underframe, double sheathed box car and a 40- and 50-ton single sheathed box car, and are illustrated in Figs. 6, 7, 8, 9, 10 and 11. The 40- and 50-ton steel frame cars have identical body construction, the only difference being in the trucks. There are certain details in the construction of the bodies of the double-sheathed and single-sheathed cars which are the same in both. Steel ends are specified for all box cars, and these may be either of the Murphy, vertically corrugated or the plain steel end type. Outside steel roofs are required, which may be either of the Murphy, Hutchins or Chicago-Cleveland type. In many cases the same steel pressings and commercial shapes are common to both types of cars. A brief description of these cars follows:

Forty-Ton Double Sheathed Box Car.—This design has an estimated weight of 44,000 lb. The underframe has a center sill of the fish-belly type, which is 2 ft. 2 in. deep at the center. It is made up of $5/16$ -in. web plates, with a top 4-in. by $3\frac{1}{2}$ -in. by $5/16$ -in. angle and a bottom 4-in. by $3\frac{1}{2}$ -in. by $\frac{3}{8}$ -in. angle on the outside and a 4-in. by $3\frac{1}{2}$ -in. by $7/16$ -in. angle on the inside of the web plate. There is a top cover plate $20\frac{1}{2}$ in. wide by $\frac{1}{4}$ in. thick. There are two crossbearers made up of $\frac{1}{4}$ -in. pressed steel diaphragms, having a top cover plate 6 in. by $7/16$ in. and a bottom cover plate which extends through the webs of the sills, of 6-in. by $\frac{3}{8}$ -in. plate. The body bolsters are built up of $\frac{1}{4}$ -in. pressed steel diaphragms and have top and bottom cover plates 14 in. by $\frac{1}{2}$ in., which extend almost out to the side sills. The side and end sills are 9-in. shipbuilding channels, which are used so commonly throughout the design of these cars. The end sills are made from the standard 9-in. shipbuilding channels. There is a diagonal brace extending from the junction of the center sill with the body bolster to the corners made of $5/16$ -in. plate. A 6-in. by $\frac{1}{4}$ -in. plate extends between the body bolsters and the end sill midway between the center sills and the side sills to further reinforce the ends. These are riveted to the diagonal brace mentioned above.

The superstructure of the car is of standard double sheathed construction, with $3\frac{1}{2}$ -in. by 3-in. posts and 5-in. by 3-in. braces. The side posts are reinforced by the 3-in. 4-lb. channel, which fits over the post, being bolted to it, and by a $\frac{5}{8}$ -in. tie rod which extends between the side plate and the side sill. The last intermediate side post is tied to the corner post by $\frac{5}{8}$ -in. rods at the upper belt rail. The brace and side post pocket casting of the same post is tied to the end of the car by a diagonal tie rod $1\frac{1}{8}$ in. in diameter. The side plates are $6\frac{3}{4}$ in. by $3\frac{1}{2}$ in.

The doors are made up of $7\frac{1}{2}$ -in. by $13/16$ -in. transverse

and vertical framing, with 5½-in. by 13 16-in. diagonal braces. They are of the underhung type. A 1½-in. by 1½-in. by 13 16-in. angle is placed on the outside for additional stiffness.

Forty and Fifty-Ton Single Sheathed Box Cars.—These cars weigh 44,000 lb., the same as the double sheathed car. In common with the double sheathed car, they have the underhung door and the same draft sills. The center sills are

12-in. ship-building channels. These cars have two cross-bearers made up of 1½-in. pressed steel diaphragms with a 6-in. by 3⁄8-in. top cover plate and a 6-in. by 7⁄16-in. bottom cover plate. The bolsters are made up of 15⁄16-in. pressed steel diaphragms with a 14-in. by 3⁄8-in. top and bottom cover plate. The side sills and end sills are 9-in. shipbuilding channels.

The side posts and braces are of pressed steel U-sections,

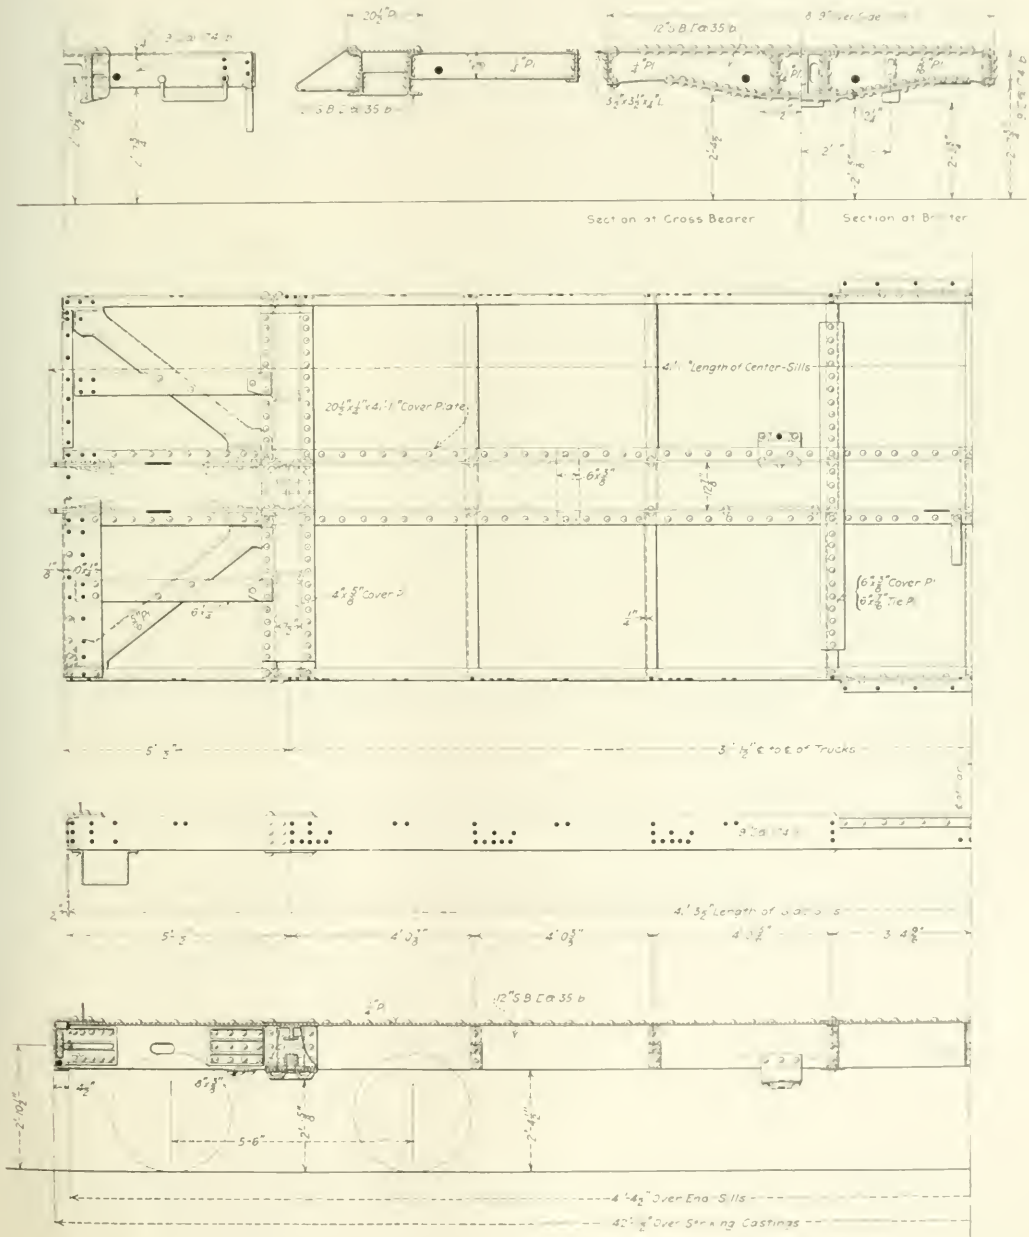

Fig. 10—Underframe of the 40- and 50-Ton Standard Single Sheathed Box Car

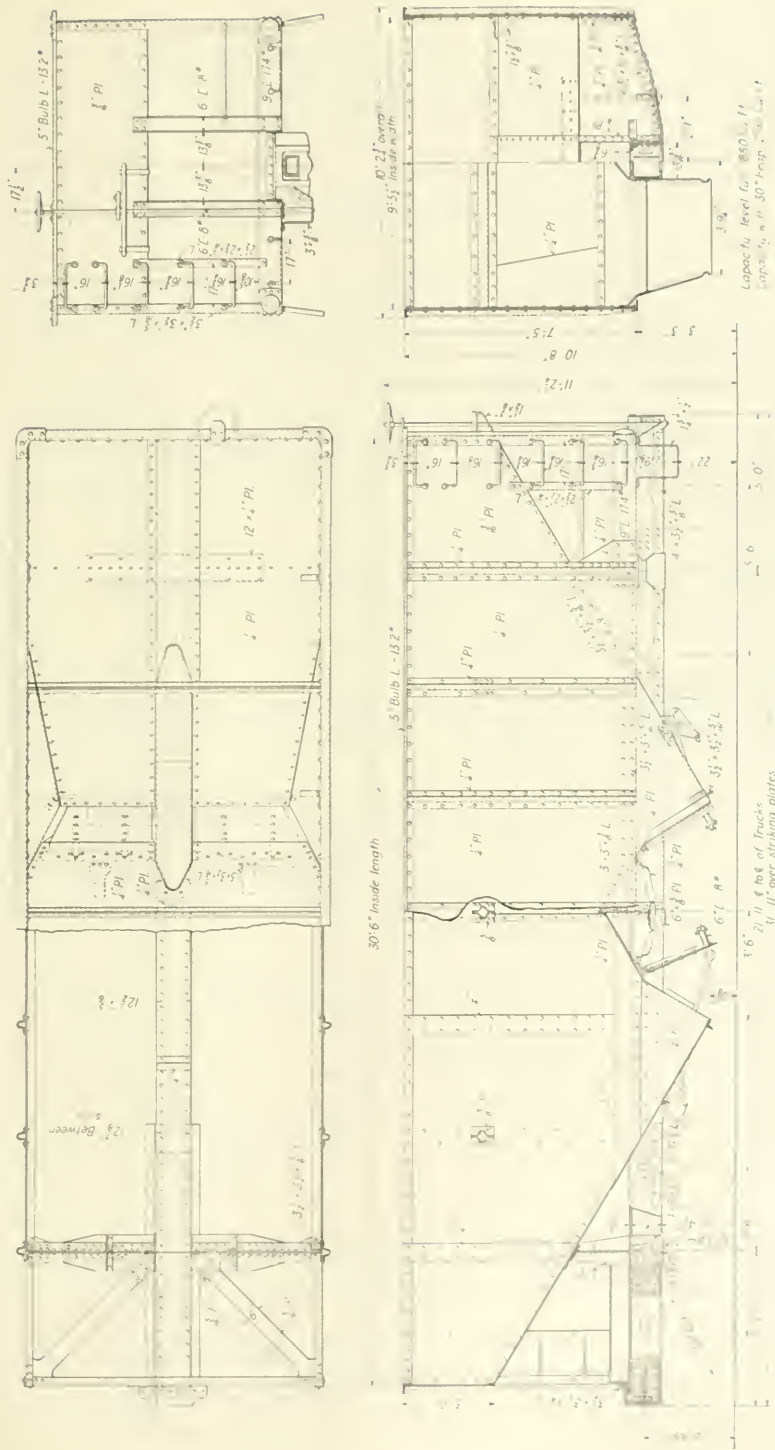

Fig. 12—General Plan of the Standard 55-Ton Hopper Car

Fig. 12, and those for the 70-ton car are shown in Figs. 13 and 14. As in the gondolas, there are many parts of these cars, particularly in the door operating mechanism, that are common to both. A brief description of these designs follows:

Fifty-five-Ton Hopper. This car has an estimated weight

with reinforcing plates $\frac{1}{4}$ -in. thick and bottom angles $3\frac{1}{2}$ -in. by $3\frac{1}{2}$ -in. by $\frac{3}{8}$ in. There is a bottom cover plate 14 in. wide of $\frac{1}{2}$ -in. plate. The end sills are 9-in. ship-building channels. The standard 5-in. bulb angle is used at the top of the sides and ends. There are six side stakes of U-section pressed from $\frac{1}{4}$ -in. plate. The side end and

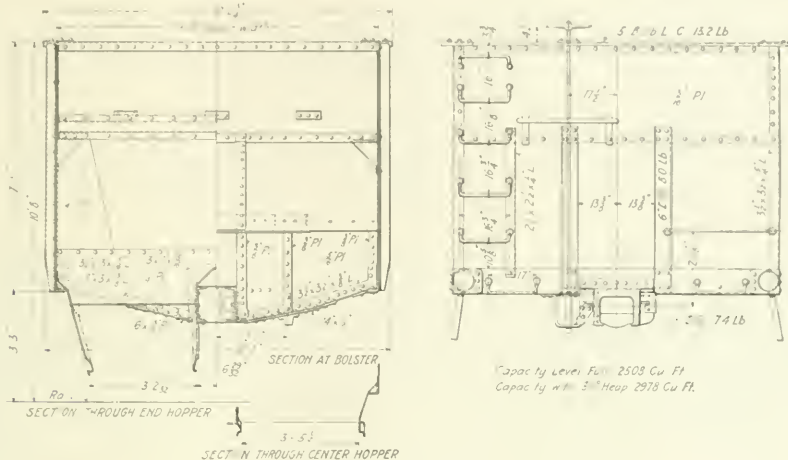

Fig. 14—Sections of the Standard 70-Ton Hopper Car

of 40,000 lb. It has the 12-in. channel center sills, which are reinforced at the ends by a 4-in. by $3\frac{1}{2}$ -in. by $\frac{3}{8}$ -in. angle. The center sills cover plate is $12\frac{1}{2}$ in. wide by $15\frac{1}{16}$ in. thick. The body bolster is built up of a $5\frac{1}{16}$ -in. plate,

floor plates are $\frac{1}{4}$ in. thick, with the exception of the last panel at the sides and the top panel on the ends, which is $\frac{3}{16}$ in. thick. Two 6-in., 8-lb. channels form the end posts. *Seventy-Ton Hopper Car.* This car has an estimated

Fig. 15—General Plan of the Standard 70-Ton Truck

Fig. 16—General Plan of the Standard 50-Ton Truck

Fig. 17—Pressed Steel Bolster for the Standard 70-Ton Truck

Fig. 18—Pressed Steel Bolster for the Standard 50-Ton Truck

weight of 49,500 lb. The center sill and plates are very similar to the 55-ton car. The body bolsters are made up of 5/16 web plates with 3/8-in. reinforcing plates, 3 1/2-in. by 3 1/2-in. by 3/8-in. bottom angles and a 14-in. by 1 1/2-in. bottom cover plate. The side stakes are pressed from 1/4-in. plate, and the end posts are 6-in., 8-lb. channels with 3 1/2-in. by 3 1/2-in. by 5/16-in. angle corner posts. The floor construction is in general common to both cars.

Trucks

There have been three general designs of trucks developed for use with the standard car. They have capacities of 40,

In general, the trucks have been so designed that a number of the parts are made similar to all. For instance, the truck center plate, the suspension spring clamp, truck center plate support and other minor details are the same.

THE TIME-TABLES IN BELGIUM and in the occupied territory of France present a sorry picture, says a correspondent in the London Times. Except for the military trains there are but few ordinary trains, and these are stopping (accommodation) trains. The journey from Ostend to Brussels takes about five hours instead of one hour and

Fig. 19—Limiting Dimensions for the Cast Steel Truck Side Frames

50 and 70 tons. Illustrations showing the designs will be found in Figs. 15, 16, 17, 18, 19 and 20. Both the 40- and 70-ton trucks are required to carry an overload of 10 per cent above the rated capacity, while the 50-ton truck is designed to carry a load of 121,000 lb., in addition to the light weight of the car body, thus making it available for use under the 50-ton cars.

There is a marked similarity between the 40- and 50-ton trucks, and for that reason but one has been shown in the illustrations. The 40-ton truck calls for arch bars of 1 1/4-in. material, while the 50-ton truck calls for arch bars of 1 1/4-in. material. The 70-ton truck is shown with the cast steel side frame, as the arch bar type is not permitted to be used on this truck. The limiting dimensions which all side frames must meet is shown in Fig. 19.

The pressed steel bolsters for the 40- and 50-ton trucks

three-quarters as in peace time. Moreover, all sorts of restrictions are in force, and no journey can be made without a permit from the military authorities.

MODERN INDUSTRIES IN CHINA.—With regard to the question of newer industries in China, modern shipbuilding and the other departments of mechanical engineering have received very little attention. There are 23 shipbuilding and engineering works on the coast, of which three only are Chinese property. Of all these works, only three build ships, the remainder confining themselves to repairs and general engineering work. There are about 12 railway works in the country, but with the exception of those belonging to the Peking-Mukden and Shanghai-Nanking railways, the shops are employed on general maintenance work, and very little outside work is done. All machinery used

Fig. 20—Limiting Outline for the Standard Brake Beams

are of similar design, the chief difference being in the weight of material used. The 50-ton bolster design is shown in Fig. 16. The bottom plate is 5/8 in. thick in the 50-ton and 1/2 in. thick in the 40-ton. The 70-ton truck bolster, which is shown in Fig. 17, it will be noted, is of somewhat different design. Cast steel and built-up bolsters may be used instead of the pressed steel bolster. All of the brake beams must conform to the limiting outline shown in Fig. 20.

is imported, as is also all steel for structural purposes. This market was in the hands of Great Britain and Germany before the war, the latter dealing principally in electrical machinery. In this department Germany had attained a paramount position, largely owing to the long credit system and curious notions of commercial morality, also by the employment of men with a knowledge of the country, who did not stick to the treaty ports, but went to look for orders.

The Powerful Foreign Trade Combinations of Europe

We Must Form Combines of Equal Fighting Power to Maintain Our Export Trade After the War

By P. Harvey Middleton

Executive Assistant, Railway Business Association

"IF YOU CAN IMAGINE a squad of recruits, responding patriotically to their country's call for foreign service, paying for their equipment and training out of their own pockets, studying their equipment without any aid from the government except a correspondence course of instruction, and then, without any company or battalion drill, being sent to the front with the plaudits and best wishes of their country, and with the warning that if they ever drill or fight, as a co-ordinated army, or in any way, except as unrelated individuals, they will be liable to court-martial and public punishment upon their return, you have a very good idea of what your predicament is now."

That was how a New York lawyer described the present position of American exporters under the existing anti-trust laws. He might have gone still further with his striking analogy, and depicted what actually happens when our soldier of commerce practises the role of individual fighter against the "mass formations" of Europe. One man with a machine gun in No Man's Land can tear tragic gaps in the onrushing hordes, but one American railway supply manufacturer competing in foreign markets with a German cartel or a French comptoir has as much chance of capturing a profitable order as a snowball has of remaining five minutes in the ultimate destination of the Kaiser.

Half the trade of the world has, during the war, been cut loose from its Old World moorings, and has drifted to the new. Do you think that the eighteen billions of dollars invested by the British in foreign countries, the eight billions of dollars of French foreign investments, or the nine billions of Germany, will let it remain here without a mighty struggle? Not on your life. Signs multiply that the bitterest commercial fight in the history of the world will follow the war, and if Americans are to have a sporting chance they will need all the powers provided in the Webb-Pomerene bill permitting combinations in export trade—a measure which may be signed by President Wilson before this goes to press.

Germany Already Making Plans to Regain Her Foreign Trade

If you think for a moment that the Germans will be so crippled at the close of hostilities that they will be unable to turn their attention to reknitting the rents which have been torn by American and British manufacturers in the foreign trade net of the German Empire, ponder for a moment over the fact that there has just been launched in Hamburg the Corporation for the Promotion of German Foreign Trade, with an initial capital of \$5,000,000, for the purpose of exploring foreign markets and building new foreign railways. The *Kölnische Zeitung* gives the following summary of this Association's plans:

"This great new concern is to occupy itself exclusively with the development of German overseas trade. Important export houses, manufacturing corporations, shipping lines, and banks in Hamburg and all the other commercial and industrial centres of the Empire will be interested. The company is to serve as an active and efficient axis, round which all Germany's efforts to reknit her old relations, and establish new ones will revolve. It is not to be a bank in the ordinary sense or an export bank. It will, on the contrary, refrain from banking operations of the usual sort.

It will act primarily as a syndicate for exploring foreign markets, and when advantageous opportunities present themselves will fulfill the functions of a financial promoting company. It will take up, on behalf of all German interests concerned, promising projects abroad, such as waterworks construction and operation, railway building, harbor and dock works, and transactions of similar magnitude. These the company will not only promote and carry out, but if necessary provide the money for. The initial capital of \$5,000,000 is wholly provisional. It will be multiplied many times over as required."

But perhaps you are deluding yourself with the belief that Germany won't have any ships, that we have captured all their big ones, and that embargoes have prevented their getting the materials to replace them. Wrong again. The *Berlin Tageblatt* publishes details of the development of the German shipbuilding yards, showing that in 1916 and 1917 all the private yards, except some of the largest, like the Vulkan concern, increased their capital. Blohm & Voss of Hamburg raised their capital from \$3,000,000 to \$5,000,000, and the Howaldt yards at Kiel raised theirs from \$1,000,000 to \$2,500,000. In other respects the German concerns have anticipated the needs for the reconstruction of the German merchant marine. The Hamburg American Line and the Allgemeine Elektricitäts Gesellschaft have founded the new Hamburg Shipbuilding Company, and among the new establishments and projects are two at Lubeck, one at Hamburg, several at Stettin and Emden, and one at Tönning.

At the Vulkan yards near Bremen the Hamburg American line recently launched a 16,000-ton steel vessel, christened Rhineland, which is the largest ship ever laid down in Germany for purely freight carrying purposes. The German press acclaims the launching not only as a sign of Germany's determination to make her presence felt in world trade after the war, but because, despite the strain imposed on her industries for purely war purposes, her shipyards are able to turn out this "record-breaking" merchantman. The Hamburg American Line's 50,000-ton sister ship of the *Vaterland*, the *Bismarck*, has been completed, and this same line is credited with having at least one other giant and a flock of two-score or more medium and small-calibered ships built and building. The North German Lloyd has completed a 35,000-ton express steamer, the *Hindenburg*, and is pushing work on an ambitious building program.

The German Cartel

Do you know what a cartel is? It is the application of brute force to commercial enterprise. The concerns entering it renounce a part of their industrial and commercial autonomy in order to secure the advantages of cohesion. The cartel differs from the American trust in that it allows the individual enterprises attached to it to remain independent, and restricts itself to enforcing certain controlling principles in regard to production, prices, and competition. It aims at removing conflicts and losses resulting from ruinous competition and lack of organization. A uniform system of cost accounting and standardization of products eliminates waste. Only the strongest cartels undertake to influence foreign business, maintaining a firm export policy and exporting at

lower prices than are charged home customers, finding foreign markets an excellent outlet for excess production.

The Stahlwerksverband or steel syndicate is, next to the coal syndicate, the leading German cartel. It monopolizes the production and distribution of steel in Germany. At the time of its foundation in 1904 it had a total output of 7,900,000 metric tons. Its products include rails, ties, fish-plates, spikes, bedplates, structural steel, railroad axles, and steel forgings. The administration of the syndicate is vested in a general assembly of all the members, a supervisory council, and managing directors. The stock is exclusively in the hands of the owners of the steel works, and may be transferred only with the consent of the general assembly. Each member has one vote in the assembly for every 10,000 tons quota of production.

The Germans, through the Stahlwerksverband, are formidable competitors, not only because of the advantages of export bounties and freight rebates, but because they keep in close touch with the requirements of foreign markets through effective and expensive representation on the ground, and because the syndicate backs up the credits granted by individual manufacturers to secure initial business. This cartel believes in dumping in order to keep its plants working without interruption at maximum capacity. It controls over 90 per cent of the production in Germany of steel products. Before the war this cartel had an annual turnover of \$238,000,000, and held down English steel production by delivering steel billets in England at lower prices than the English could produce steel. In 1914 steel bars were offered in New Orleans at 80 per cent below the lowest figure at which an American firm could manufacture them.

This steel cartel controls the sale of its products by merchants in Germany, Austria, Switzerland, Belgium, and France. It has been aptly termed a giant octopus, whose eyes are at Bremen, at Dusseldorf and at Berlin, with tentacles, armed with innumerable suckers, reaching out to Asia Minor, by way of Constantinople, threatening London through Rotterdam and Antwerp, stretching across Switzerland into Italy, extending over the Atlantic and South America, embracing Chile, spreading out over Brazil, Argentina, and Mexico, and in another direction to the Indian Ocean and the China seas, and fixing themselves firmly on the Far Eastern strands.

There are other German organizations for securing foreign trade in railway supplies. The Orenstein Koppel Aktien Gesellschaft represents a syndicate of producers of Decauville (narrow gauge) railway materials. This combination has practically stamped out the French and Belgian competition which formerly controlled the supply to Turkey. The Verband Deutscher Waggon Fabrikanten controls 90 per cent of the total German production of railway cars.

The Association of German Machine Tool Manufacturers has made a study of export trade with special reference to the competition of American manufacturers, whom they have actively opposed. The German Electrical Manufacturers Association has made a special study of tariffs and commercial treaties, and secured many changes in both for the benefit of German exporters of electrical equipment. It keeps its members informed of new street railway and power plant projects in other countries, and suggests valuable foreign connections. German business men have realized the great importance of commercial treaties and there is a special organization for this particular purpose—the Commercial Treaty Association (Handel-vertrag-verein) with 9,000 members and 150 affiliated associations. Electrical equipment is controlled by two powerful syndicates, the Allgemeine Elektrizitäts Gesellschaft, and the Siemens-Schuckert.

Great Britain's Commercial Counteroffensive

The British are preparing a commercial counteroffensive which will make things interesting for the Germans in the

foreign field. They have formed the British Trade Corporation, with a capital of \$50,000,000, which will devote its energies to expanding the trade of the British Empire in every part of the world, and will grant loans to exporters with more distant maturities than the banks can offer. The British Manufacturers Corporation was also formed recently with a thousand members, each subscribing from \$500 to \$1,000 annually, and will employ high grade men as resident representatives in all foreign countries, whose business it will be to find and appoint local selling agents for individual firms, to look out for new trade openings, to report on the general reputation of prospective customers, and generally superintend the business interests of all firms in the organization. Then there is the newly created British Commercial Intelligence Department, with 738 officials in the London office and a multitude of assistants in the principal centres of the world. All this army of officials is in constant contact with the British Government, and all are contributing to make British commerce a greater world power than ever.

Here, too, we find special organizations of railway supply manufacturers, such as the North British Locomotive Company, Ltd., capitalized at \$9,000,000, a combination of eight plants which handles nearly the whole private production of British locomotives. As the British railway companies build and repair most of their own rolling stock, this company is engaged almost entirely in export trade. Another amalgamation is the Metropolitan Carriage Wagon & Finance Company, a combine of five companies making rolling stock for export. This company also has a capital of \$9,000,000, and owns a blast furnace and steel-smelting concern, enabling the company to make its own axles and tires. There is known to be a very close and monopolistic combination among British firms manufacturing cables for street railways, and other British railway equipment industries are understood to have a complete understanding as to many important trade policies. Practically all the rail manufacturers of Great Britain belong to the British Rail Makers' Association, which enjoys almost a monopoly in colonial markets and in those countries in which a great deal of railway construction is carried out with British capital.

The French Comptoirs

In France there are various "comptoirs" or central selling organizations, such as the Comptoir for the Exportation of Metallurgical Products, which exports rails and their accessories, ties, girders, and channels. All business is secured by means of established agencies in various cities, such as Buenos Aires and Rio de Janeiro. Each agency is placed in charge of a large exhibit of samples, consisting of cross-section cuttings of various sizes of rails, beams and channels, mounted on a wooden frame, and each agency has advertising matter for distribution at the expense of the Comptoir. The sales are made by the comptoir outright to the agency, which finds the customers and carries the accounts in the district allotted to it. Business is conducted on a purely commission basis. The comptoir takes all the export output of its members for sale abroad and reimburses them when payment has been made by the customer. Brazil, Argentina, and China have been the principal fields of operation of this combine, and in six years the exports of the rails in which it is interested increased from 40,000 to 200,000 tons. There are also axle and car-spring comptoirs.

There is a French association of manufacturers of locomotives which fixes the price on the various types, order being apportioned among all the manufacturers in proportion to their output. The association has had a successful career for ten years. There is also a railway material syndicate which is one of the principal constituents of the central organization of the metal industries Union des Industries Metallurgiques et Minières.

In Egypt, China and Japan export combinations of Ger-

man and British engineering concerns have fought each other tooth and nail for the profitable business of those countries—how profitable may be gathered from the fact that in three years engineering contracts valued at \$450,000,000 were obtained in the Chinese market. The report of the Federal Trade Commission on Co-operation in American Export Trade, published in 1916, points out that in the Chinese market it would be difficult for a single firm manufacturing machinery or railway supplies to represent itself. It states that one German organization embraced 47 engineering firms, besides Krupps, two shipping houses, one marine insurance company, one life insurance company, and one fire and building insurance firm. It had branches with one or more Chinese-speaking Germans in charge at all important Chinese cities.

The Enormous Markets in China

While American and British competitors were endeavoring to sell their products individually the Germans began by saving the Chinese trouble. Thus, if there was a mining venture, the representative of the allied German manufacturers would go to the local governors or parties interested and offer to take the whole job, i.e. sink the shafts, develop the mines, put in all the equipment, build the railways or boat lines, erect power plants and equip them, put up workmen's dwellings and finance the undertaking. Such an organization could sell a Chinaman a five-cent handsaw or develop an entire province.

In 1915 the Anglo-Chinese Engineers' Association was formed for the purpose of securing an outlet for British machinery and engineering supplies of all descriptions. It is strictly a non-competing group of 75 concerns making machinery, railway supplies, engineering material and tools. Each of these firms was required to take stock in the combine, the value of which was determined in each instance by the ratio that the line bore to the whole of the imports of machinery and engineering supplies to China in any one average year. Each of the firms was bound to an agreement to work in unison with other members of the combine in the case of contracts for combined plant, and no firm was accepted for more than two lines of its manufactures, and no two firms in the combination were accepted for similar plants. For instance, if A. B. is represented by the combine for textile machinery, no other house will be represented for this line. The organization has branch houses in charge of Chinese-speaking European assistants at selected ports and industrial centres, with a managing director in Peking. In large cities such as Peking, Hankow and Canton, there are competent mechanical engineers with Chinese experience, while the selling staff includes men with intimate knowledge of the localities in which they are used.

The United States Must Make Similar Plans

American manufacturers and exporters of blast furnace and rolling mill products have expressed themselves to the Federal Trade Commission generally in favor of some further measure of co-operation among themselves for the export trade than at present exists. Three of the largest of such manufacturers have stated their conviction that their export trade would be increased if they could join with all, or a large part, of the other independent producers in a company organized along similar lines to those of the United States Steel Products Company, and empowered to fix prices. Another concern which favors a voluntary export combination or association in its line advocated that activities should be confined strictly to joint selling.

Among the advantages which were hoped for from such increased co-operation is a broader market, which would stabilize prices, keep the furnaces and mills in more continuous operation, and by running the plants at capacity lessen overhead expenses. Lower selling costs could also be expected through the greater economies resulting from a common

selling organization. By such an organization the smaller producers in the United States believe they could materially extend their export trade.

At the Fourth National Foreign Trade Convention, held in Pittsburgh in January, 1917, several methods were suggested for co-operation in foreign trade by a committee which included E. P. Thomas, president of the United States Steel Products Company, and Charles M. Muchnic, vice-president of the American Locomotive Sales Corporation. These plans were predicated on the passing of the Webb bill. One plan was for a group of large manufacturers closely identified making kindred but generally non-competing products. A general fund was to be formed and shares issued to each manufacturer in proportion to his contribution. There was to be a selling organization which would consolidate all existing foreign agencies of the members and would assume credit risks. Such an organization could secure ocean transportation to best advantage and undertake with the aid of experts all the miscellaneous details connected with export business.

Another plan was for five or ten concerns making allied products to get together, each company subscribing from \$2,000 to \$4,000 for initial expenses. A manager would be hired who would familiarize himself with territories and decide upon the best markets in which to commence operations. Each concern would consign its goods at lowest export prices, payment to be made as received from the purchaser. After three or four years the capital could be increased and the consignment accounts cut out. Another plan was for a number of manufacturers to divide the expense of sending a competent man to investigate certain markets and then either to raise capital among themselves or interest a responsible commission house with foreign connections to put in a local stock of goods.

At the Fifth National Foreign Trade Convention to be held in Cincinnati on April 18, 19 and 20, the subject of combinations in foreign trade will be again discussed, one of the speakers being George H. Charls, vice-president of the American Rolling Mill Company, of Middletown, Ohio, who has recently returned from a trip to England and South America.

"There is only one avenue to success," says Mr. Charls, "and that lies in co-operation; if possible, the forming of syndicates equally as strong and well organized as those of our foreign competitors. Under present conditions, if 20 steel companies are persuaded to go after export business in Brazil, at least 20 men must be sent to that country. If 20 countries offer a field, at least 400 men must be sent abroad, and they will have to compete with one another. If 20 steel companies co-operate under the provisions of the Webb bill, one man can accomplish the result of 20. In the name of pure economy and self-defence we cannot safely pursue any other course. The same plan will permit the joint co-operative advertising of all members."

It has been suggested by an American consul that an association of American manufacturers of non-competing articles could profitably form an organization, dividing the expenses and being represented in Shanghai, Hankow and possibly other places in China. As a list of manufacturers upon which to form the basis he suggests the following: Railway locomotives, railway rolling stock, electrical supplies, flour-mill machinery, oil-mill machinery, coal-mining machinery, iron-mining machinery, motor cars, motor engines, structural steel material, heating plants, plumbing, arsenal equipment, rolling-mill machinery, cotton-mill machinery, and desiccated-egg mills.

The cost of maintaining offices in Hankow—the Pittsburgh of China—for such an association of manufacturers would be something like the following: Local manager, \$5,000; office rent, \$1,440; clerical and Chinese staff, \$4,000; other office expenditure, \$400. The total expense might be \$1,000 per month. An office could be run on less, but this is con-

sidered conservative for efficiency. The maintenance of an office in Shanghai would cost more. But even should the cost be double this amount, it will fall very lightly upon each individual member of the association of manufacturers.

There are many ways in which money might be lent with perfect safety to assist in developing Chinese industry and extending American sales. An association of manufacturers on the spot would be able to determine which would be safe and which would best develop the American export trade. The first year would not be profitable, but this association would build up a reputation for American interests and would receive many inquiries that at present do not reach American manufacturers or exporters.

We Cannot Sit by Placidity

One thing is certain: we cannot sit by placidly while our industrial strongholds are assaulted by the long-range guns of London, Paris and Berlin. The European international trader will "come back" after the war with a wallop which will be felt from Berlin to Peking, from London to Cairo, and from Paris to Timbuctoo. Every market between the Mexican border and the Land of Fire will be invaded. Well drilled emissaries speaking the languages of the countries to

which they are accredited will be sent to secure the highly remunerative engineering contracts of the Far East. The European will "dig in" for a throat-cutting trade war, armed with all the weapons developed by the German cartel, the French comptoir and the British monopoly in half a century of foreign trading. Unless America develops combinations of manufacturers of real fighting power, and is ready to invest money in the construction of railroads and other public utilities, it will be hard indeed to dislodge competitors so firmly entrenched.

Secretary William C. Redfield, of the Department of Commerce, summed up the situation when he said: "We have learned the lesson that our factories are so large that their output at full time is greater than America's markets can continuously and regularly absorb. We know now that if we run full time all the time, we must do it by reason of the orders we take from lands beyond the sea. To do less than that means homes in America in which the husbands are without work; it means factories that are shut down part of the time. And because the markets of the world are greater and steadier than the markets of any one country can be, and because we are strong, we are going to go out into the markets of the world and get our share."

Railroad Construction as Affected by the War

Review of the Situation and Discussion of Relative Importance of Different Classes of Work

ONE OF THE MOST IMPORTANT PROBLEMS which the railways of the country are facing now is the decision regarding the extent to which construction work shall be carried on during the war. There now exists a need for more improvement work than can possibly be completed under the existing conditions, and the problem resolves itself into the selection of that work which by its nature will bring the most immediate relief. This consists primarily in the amplification of existing facilities and the indications are that work of this character will be carried on to as great an extent as the supply of labor and materials will permit. While the construction of extensions and new lines can and doubtless will be curtailed it is probable that the total expenditures this year for railroad construction and improvement will exceed those of any recent year.

For the past three years new construction work has been relatively light, particularly with reference to new lines, terminals and other projects of an extensive character. This has resulted primarily from the uncertainty regarding the future of the railways and a lack of capital to carry on the work rather than from the fact that railway construction had outstripped the industrial development of the country. Also the labor shortage and the increased costs of both labor and materials since 1914 have contributed to this inactivity.

During 1917 the situation became acute and many of the roads found it impossible to complete their programs, even for improvements of a lesser nature. Work of all kinds was delayed through priority orders and the scarcity of labor and at the close of the year it was the common experience of roads in the territories where the conditions were especially adverse that a considerable proportion of the year's program of improvements was incomplete. In particular instances more than 50 per cent of the work planned for 1917 was not finished. With the additional traffic that the roads will be called upon to bear this year the situation is serious and demands special study in order that advantage may be taken of all opportunities to improve operating conditions and to provide the necessary facilities. Also for this same

reason special care should be exercised in grading, selecting and concentrating on the most essential work.

Under normal conditions railroad construction work may be divided into two general classes: *extensive* development or the building of new lines and extensions, and *intensive* development or the improvement of existing facilities. This last class may also be divided into (1) the amplification of existing facilities by the enlargement of yards and terminals, the building of additional tracks or shop facilities, the installation of signals, etc., and, (2) the construction of new passenger stations, grade separation projects and other work of similar character which add little or nothing to the capacity or economy of operation of a road. While the same general division may be made, in times such as the present, there should be the further division of projects into those essential and non-essential to the prosecution of the war.

Under normal conditions new lines or extensions are constructed to reach traffic centers already served by other roads or to open up new territory not yet provided with railway facilities. Under the present scheme of non-competitive operation of the railways there is no good business reason for building new lines to points where adequate service is already provided. On the other hand it has been demonstrated that railroad construction into new territories is essential to the development of the country. Eventually the work of building new lines or extensions into territory without railway facilities will have to be done. The postponement of such construction only adds to the burden to be borne after the war and the advantage gained by deferring the work, thus making the capital, money and labor it would require available for other purposes is only temporary. Under the existing conditions this temporary advantage should be considered in so far as new projects are concerned. It may also be advisable in some cases to discontinue construction projects of this character that are already under way. On the other hand the work may be so far advanced that it may be more economical to complete the work than to drop it and leave idle the investment made. As an example

of work of this character may be cited certain extensions now under construction by the Santa Fe in the Southwest.

Construction work of any character at the present time brings the builder in direct competition with the government for materials and labor needed in the prosecution of war work. It also requires money needed for the purposes of the government. However, in favor of much of the railway construction work should be weighed the importance of adequate transportation facilities to the industries and the country at large. This applies particularly to the intensive development of facilities in so far as these improvements will facilitate the operation of the roads and increase their capacity. This includes the amplification of yard and terminal facilities, additional signals, engine house facilities and similar work. The importance of work of this character to our economic, industrial and military welfare was demonstrated last winter more fully than ever before when the slowing up in the operation of the roads through the combination of inadequate yards and terminals to handle the unprecedented traffic and extreme weather conditions was reflected in the very general retardation of industrial activities and in delay in shipment of food and supplies to our army in France and to the Allies. Such work should without question be carried on to the greatest possible extent.

In contrast with this, much work such as the building of new passenger stations, the separation of grades and other projects of a similar character which may be entirely justifiable under normal conditions, must now be classed as non-essential. When at all possible the starting of new projects of this character should be avoided, although where such work is already under way and may have progressed to such a state that to abandon operation would be an economic waste it should be completed.

This suggests that the construction program for an individual road for this year should give preference to work that will provide increases to existing facilities, followed by the work now under way which may not be considered essential but which may be more costly to discontinue than to complete. Where new lines or extensions are included in the program the justification of their construction at present should lie in the extent to which they are essential to the economic welfare of the country as a whole and not in any advantage that might accrue to the particular road. In general all work of this character must be considered secondary in importance to that outlined by the government as essential to the operation of the roads as a single system.

This unified control brings in a new class of work to be done, for a particular road or roads may be ordered to build certain facilities which under normal conditions would not be justifiable. As an example, it may and will become advisable in many instances to provide interchange facilities or inter-line connections which may simplify the operation of the roads as a system for which there would be little or no occasion under individual operation. Railway construction work for the near future will consist largely of improvement to amplify existing facilities. Particular attention will be paid to increased facilities for the care of motive power and additional and lengthened passing tracks, more signals, and in fact all work which will facilitate and lessen the cost of the operation of the existing properties. That work already under way which in the full sense of the word must be classed as unessential, will be completed as indicated by the announcement that the grade separation project of the Indianapolis Union railway at Indianapolis, Ind., will be completed. Conversely the order of the director-general that certain grade separation projects in the city of Chicago should not be started is indicative of the trend concerning work of this character which has not been begun.

These conclusions are supported to a certain extent by the recent order of the director-general with reference to all railroad work involving charges to capital account.

Government Supervision of Improvements

As director of the recently created Division of Capital Expenditures of the Railroad Administration, R. S. Lovett will receive and pass upon the reports made by the railroads as to their budgets of necessary expenditures for improvements. It has been ordered that the following rules be observed for work involving charges to capital account:

First: In determining what additions and betterments, including equipment, and what road extensions should be treated as necessary, and what work already entered upon should be suspended, please be guided by the following general principles:

(a) From the financial standpoint it is highly important to avoid the necessity for raising any new capital which is not absolutely necessary for the protection and development of the required transportation facilities to meet the present and prospective needs of the country's business under war conditions. From the standpoint of the available supply of labor and material it is likewise highly important that this supply shall not be absorbed except for the necessary purposes mentioned in the preceding sentence.

(b) Please also bear in mind that it may frequently happen that projects which might be regarded as highly meritorious and necessary when viewed from the separate standpoint of a particular control of the railroads generally, and therefore when the facilities heretofore subject to the exclusive control of the separate companies are now available for common use, whenever such common use will promote the movement of traffic.

Second: The construction of new lines or branches or extensions of existing lines shall not be entered upon or contracted for without the director-general's approval.

Fourth: Work contracted for or actually commenced prior to January 1, 1918, and unfinished, may be continued until further order, except in so far as in the judgment of the carrier concerned it may be possible to discontinue or curtail it without substantial loss, in order to conform to the general principles outlined in paragraph First hereof.

Fifth: Other work which does not involve charges to capital account in excess of \$25,000 may be contracted for and commenced without approval of the director-general provided that:

(a) it conforms to the policy outlined in paragraph "First" hereof; that

(b) it also falls clearly within the policy of the particular carrier as that policy has been applied in practice during the two calendar years 1916 and 1917; and that

(c) a report giving a brief description of each project in particular company, may not be equally meritorious or necessary under existing conditions, when the government has possession involving not less than \$5,000 nor more than \$25,000 chargeable to capital account and showing also the amount chargeable to operating expenses, shall be made in duplicate to the director of the division of capital expenditures at Washington and the regional director for the district within ten days after the work shall be contracted for or commenced.

Sixth: No work involving a charge to capital account and in excess of \$25,000 shall be contracted for or commenced subsequent to January 1, 1918, unless

(a) it conforms to the policy outlined in paragraph "First" hereof, and unless

(b) it be authorized by the director-general.

Seventh: The director of the division of capital expenditures is authorized to prescribe such forms, require such reports and issue such regulations and instructions as may be necessary to carry out this Order.

In the eastern territory where the congestion was most severe last winter a committee of engineers consisting of Francis Lee Stuart, former chief engineer of the Baltimore & Ohio (chairman), A. C. Shand, chief engineer of the Pennsylvania Railroad, and H. A. Lane, chief engineer of the Baltimore & Ohio, has been appointed and attached to the regional directors' staff. The duties of this committee are to review the budgets submitted by the roads in this territory, separating the essential work from the unessential and grading the various projects in the order of their importance. The findings of this committee are submitted through the regional director to the director of the division of capital expenditures for final action.

Railroad Y. M. C. A. Building at Anchorage, Alaska

Remarkable Progress Being Made by R. R. Y. M. C. A.

Regular Program Not Only Extended and Intensified, But
Doing a Big Service in War Work

By John F. Moore

General Secretary, Railroad Department, International Committee of Young Men's Christian Association.

THE RAILROAD YOUNG MEN'S CHRISTIAN ASSOCIATION, in operation for less than half a century, now has 270 branches established on the railroads which control 80 per cent of the total mileage of North America.

These associations operate upon a co-operative basis. Railroad managements and employees meet in their rooms upon a common platform. As a rule railroad corporations make reasonable monthly appropriations toward maintaining the associations, such appropriations being supplemented by membership dues and other revenues from the men.

Not many years ago approximately 70 per cent of all moneys expended in the conduct of these associations came as contributions from railroad companies and the remainder from the membership. This percentage has steadily changed in recent years until last year, out of every dollar expended approximately 65 per cent came from the men and not to exceed 35 per cent from corporations.

New Buildings

During 1917 new buildings and extensive additions were numerous. Among the former were those at Wilcoe, W. Va.; Bellmead, Texas; Benwood, W. Va.; Youngwood, Pa.; Groveland, N. Y.; Newell, Pa.; Brewster, Ohio; Gillen, Mich.; Turcott, Canada; Urbana, Ill.; Corbin, Ky.; Sharonville, Ohio; Segundo, Colo.; and Sunrise, Wyoming.

During the year many buildings completed in other days became inadequate, because of the ever-increasing demands made upon them, necessitating large and important additions. Among such associations were: Douglas, Arizona; Pocatello, Ida.; Chicago Junction, O.; Shenandoah, Va.; Handley, W. Va.; Bridgeport, Ontario; Haselton, O.; Two Harbors, Minn.; Parsons, Kan.; Rochester, N. Y.; and Binghamton, N. Y.

The above are partial lists of buildings and additions definitely opened during 1917. In addition to these, new structures are already assured during 1918 and 1919 at Lexington, Ky.; Pine Valley and Cleveland, Ohio; Bellwood, Pa.; Brownsville Junction, Maine; Pen Argyl, Pa.; Knoxville, Tenn.; Channing, Mich.; Clifton Forge, Va.; Hulbert, Ark.; Lamberts Point, Va.; Glassport, Pa.; and Cane Fork, W. Va., while at Fort Worth, Texas, \$40,000 has been raised toward an association building without any corporation gifts thus far; and at Kansas City four lots valued at \$50,000 have been set aside by the Terminal Company as site for a railroad Association building.

This significant list of new buildings and enlargements either recently completed, now under construction, or definitely assured for the early future, indicates the degree in which the Railroad Association has by its work won the confidence of railroad administrations and railroad men alike. It is significant that, after being under close scrutiny for nearly half a century, appropriations from corporations and gifts from friends mounting into hundreds of thousands of dollars should be made for its extension.

In the early days the Railroad Association confined itself largely, though never exclusively, to men in train service, and this field continues to constitute its largest single field of operation. Nevertheless, with the years the scope of its endeavor has constantly been extended, until now its work is adapted to meet the requirements of all railroad men. In fact, it has within its membership thousands of men related to affiliated interests; as for example, express company and mail service employees.

In addition to opening new buildings, the work of the Railroad Department of the Young Men's Christian Asso-

ciation has within the past year been intensively developed along the following lines:

Street Car Employees

Street Railway Young Men's Christian Associations are now in successful operation in a number of cities, more especially in the South, and it is planned that after the war an experienced traveling secretary will be assigned to devote his entire time to the development of this interesting field.

A new association of this character was recently organized at Norfolk, Va., in a building leased for that purpose by the Virginia Railway & Power Company.

Colored Railroad Employees

An investigation was recently made by one of the colored secretaries of the International Committee into the condition of colored employees on a great railroad system. A detailed report was submitted, looking to further co-operation by this organization in the solution of this difficult problem.

A small building was opened during the year at Chicago Junction for the exclusive use of colored railroad employees, and several associations are now experimenting along this line.

Women Railroad Employees

The question of how to be of service to the women employees on railroads has been given consideration, and experiments have been made. A number of associations have made special membership rates for such employees and have established special privileges for them. For example, at Albany, N. Y., educational classes and practical talks are being conducted for young women studying railway telegraphy, while at Brewster, Ohio, an annex association build-

Opening of New Railroad Y. M. C. A. Building at Brewster, Ohio

ing has been erected for the exclusive use of women railway employees, the wife of the secretary of the Railroad Association acting as matron.

Boys of Railway Communities

It is increasingly recognized that many railroad associations, without impairment of service for railroad men, might render an inestimable contribution to the whole life of railway communities by relating themselves to the life of boys in railroad homes. It is clearly recognized that any work of this character needs to be conducted with the utmost caution, so as not to conflict with the rights and privileges of railroad men.

An experienced railroad secretary of the International Committee recently made a careful study of this question and his report made clear the fact that the Railroad Asso-

ciation has a rare opportunity, by helping the sons of railroad men, to assist in tiding them over the critical period of boyhood and ushering them safely into strong, useful manhood.

Sixty-one railroad associations now do work of this character, and no fewer than 22 of that number have on their employed force secretaries giving their entire time to this definite work.

Railroad Men in Other Lands

The work of the Railroad Association in America has attracted attention in other countries, with the result that similar related organizations are now in successful operation in India, Japan, Korea and Manchuria, while an experienced American secretary is in China studying the language, so as to be equipped to promote this movement among the railroads of the great eastern republic.

In a recent address to a group of men at the Bankers' Club

Railroad Y. M. C. A. Building at Chicago Junction for Colored Employees

in New York City, Major General Hibiki, of Japan, a member of the Railroad Committee of the National Council of Young Men's Christian Associations of that country, made the following statement:

"I bring greetings from the Japanese Railroad Young Men's Christian Associations to the secretaries and members of the American organization.

"Our Japanese Railroad Association was organized after studying your work in America 14 years ago. We have now more than 30,000 out of the 100,000 railroad workers in Japan as members of our Japanese Railroad Association, and our National Secretary, Mr. Masutomi, is with me in this country, studying your work and aiming to secure your co-operation in its further extension."

At Jamalpur, in India, the association furnishes an illustration of how a railway community may be served on an adequate scale. The building is furnished by the East Indian Railway and operated by the Young Men's Christian Association. How the life of the community—physical, mental, and moral—is stimulated, is indicated by the following quotation from a recent report of the secretary:

"The four football fields, cricket ground, golf course, rifle range, tennis courts, bowling green (lighted by electricity), swimming pool, reading room and library of 1,500 volumes are mostly in frequent use and perform a distinct social work in bringing together the members on terms of good fellowship. First-class bioscope shows are held every week in our fine Y. M. C. A. auditorium, and I am about to start a series of weekly or fortnightly popular lectures, generally illustrated, on various topics of interest, scientific and scenic. Y. M. C. A. socials and teas are occasionally held, and we have band con-

certs twice a month. Nearly all the Europeans of Jamalpur belong to the association, and we give some of its privileges to even the youngest Boy Scouts."

Conduct of Campaigns

In these stirring days when governments are emphasizing the value of campaigns as a safe and sane method for stimulating interest and securing results, the Railroad Department has continuously conducted, in all parts of Canada and the United States, thrift, safety first, temperance, first aid and health campaigns among railroad men and their families.

On one important system a campaign to encourage apprentice boys in railroad shops to clean living proved most beneficial. Carefully selected lecturers visited important shop centers, specially prepared literature was freely distributed, and scientific charts were exhibited, all with most satisfactory results.

Growth of Membership

Near the close of 1916 a ten-day national membership campaign resulted in securing over 38,000 new members for

spirit of the Rockies and secured more men than in the year preceding.

The Work in a Nutshell

The following brief summary of facts suggests the history and status of the Railroad Department of the Young Men's Christian Association:

First. The first railroad association was organized in Cleveland in 1872.

Second. At present there are 270 railroad associations in operation in Canada and the United States, and at least 15 additional new associations assured of organization during 1918.

Third. This organization has been extended until there are now railroad associations located in many parts of the world.

Fourth. The present membership is approximately 125,000. Annual dues vary from \$3 to \$10, depending upon location and advantages offered. Added charges are made for dormitory and other special privileges. Wherever equipment is adequate and buildings not overcrowded by members, privileges are open to all railroad men.

Fifth. Membership is open to all self-respecting railroad men, irrespective of creed, position, or nationality. Each local association is conducted by a committee of management, composed of men from the membership. As a rule, these committees have on them both local railroad officials and men from the rank and file.

The work of the railroad association is supervised in part by the International Railroad secretaries, who devote their entire time to this work and in part by supervising state railroad secretaries, who are definitely assigned to this specific task.

Seventh. More than 600 trained railroad secretaries devote their entire time to promoting the physical, mental, social, moral, and religious welfare of railway men. These secretaries have been carefully selected; some among them have had four years of preparatory technical training in association colleges, and nearly all take yearly special training at some one of the six summer schools conducted for railroad secretaries.

Eighth. The work of the railroad association is four-fold in character, social, physical, mental, and moral. To these ends it maintains reading rooms, libraries, educational classes, practical talks, baths, gymnasium, outdoor and indoor athletics, entertainments, socials, games, correspondence facilities, non-sectarian religious services (attendance optional), dormitories, restaurants, and lunch rooms, and also promotes campaigns along the line of first aid, safety first, thrift, temperance, health, etc.

Ninth. The 270 railroad associations already organized operate in a variety of types of buildings and with varying degrees of equipment, ranging from the splendid home of the association for New York Central and New Haven employees in New York City, to the cars set apart as a temporary and inadequate association plant at some needy railway terminal.

Tenth. Buildings operated by the railroad association are sometimes owned by that organization, sometimes owned jointly by railroad association and railroad corporation, and in still other instances, owned by the railroad company and leased or given to the association for operation.

Eleventh. The approximate value of property now owned by the Railroad Young Men's Christian Association exceeds \$4,000,000, while the value of property owned by railroad companies and leased or given to associations for operation is even larger.

Twelfth. In 1917 North American railroads appropriated toward the maintenance of railroad associations approximately \$350,000. In the same year receipts from membership fees exceeded \$400,000 while large additional sums

A Japanese Railroad Y. M. C. A. Secretary

the Railroad Young Men's Christian Association, although how far these men would renew memberships after the enthusiasm of the national campaign had passed was a question difficult to answer until submitted to test. The test has been made and most successfully met; a few instances will illustrate the manner in which railroad men have responded to the call for renewal.

At Jersey City the Railroad Association, which in 1916 secured 789 new members in ten days, secured 1,051 renewals and new members in ten days in 1917. At Clifton Forge, Va., where nearly 1,000 new members were secured a year ago, 1,100 new members were secured in a single day in November, 1917. At Louisville, Ky., three of the 678 new members secured in 1916 secured 672 new members themselves in the campaign of 1917.

The Pueblo, Colorado, association caught the conquering

were secured from use of special privileges such as dormitory, games, etc.

Effect of Government Control of Railroads

The question as to how far, if at all, government control may affect the future of the Railroad Young Men's Christian Association has arisen in some quarters. However, assurance has already been received from the government that the work of this organization will continue as heretofore and it is confidently believed that the status of the association will remain unimpaired, for the following, among many reasons:

First. The Interstate Commerce Commission has made definite allowance for expenditures by railroads for the organization, equipment, and conduct of Railroad Young Men's Christian Associations.

Second. In the history of railroad receiverships receivers have almost without exception continued association appropriations as necessary and legitimate items of expenditure.

Third. On the only government-owned railroad in the United States, that in Alaska, a Railroad Association has been conducting successful work, with an appropriation from the government toward its maintenance.

Fourth. A successful experience of more than 40 years has adequately demonstrated that the Railroad Young Men's Christian Association is not a thing apart from, but an integral and essential factor in, the successful operation of a railroad.

Fifth. The Railroad Association is the only organization of its character known, with international relationships; a trained personnel; a proven power of adaptation; a scientific and comprehensive program of work; and a practically unbroken record of striking accomplishments.

The religious basis and motive of the Young Men's Christian Association is the secret of the great strength of the organization; for, because of it, men of high gifts enter its secretarial service and it gives to the movement a cohesion and permanence that enables it to continue unshaken through the vicissitudes of the years.

War Work of R. R. Y. M. C. A.

The great world war brought to the Railroad Association new and unexpected responsibilities. It was called upon to enter new and vital fields and responded promptly.

The War Work Council of the Young Men's Christian Association organized a Bureau of Transportation, with special relation to soldiers and sailors in transit on land and sea. This bureau instinctively turned to the Railroad Association for leadership and co-operation.

When the first quota of the new National Army was summoned from home to cantonment, the railroads were called upon to undertake a difficult task and, in a manner challenging admiration, carried hundreds of thousands of these new soldiers with a minimum of friction and slight impairment of regular service.

When it was learned these embryo soldiers were to be moved, Railroad Associations promptly made arrangements to have their secretaries accompany them from their homes on their journey to khaki and camp, and on more than 800 trains representatives of Railroad Associations were at work. These secretaries passed through the trains, telling the boys about the camps to which they were assigned and also of the huts of the Young Men's Christian Association and the Knights of Columbus, reminding them also of the fine work of the Young Men's Hebrew Association. The men in each car were told that they would be made welcome by all these agencies that were working as one and that they would find in the association and other huts a friendly greeting and a sure cure for homesickness and blues.

The value of this service is indicated in hundreds of letters that have been sent to the International office in New

York City. One such letter, written by H. O. Williams, an International Railroad Secretary, who recently accompanied one of these trains, is typical of all:

It was like any one of the great number of selective draft troop trains that the Railroad Y. M. C. A. secretaries have accompanied to cantonments the past fall and winter. This one left Long Island City one bleak, raw, snowy winter morning with twelve cars well crowded with mothers' boys, many of whom were leaving home for the first time to meet the call of our government as soldiers of the American flag.

With two associates I went through the train, telling the boys about the value of the Army "Y" and how large an opportunity at Yaphank awaited them and of the benefits and blessings they would receive. After an informal talk of a few minutes in each of the dozen cars, I went back to the forward end of the train in order to have interviews with a number of these young men. Before the journey was ended I sat down and talked with twelve or fifteen of them. The first was a representative of the gas house gang and was already prepared to fight the Germans single-handed. He embraced me affectionately and was insistent that I should share the contents of a bottle he had with him. After a heated argument, I convinced him that it would be better if I did not share in his conviviality, and so he played the part alone. He promised, however, that this would be his last drink, no matter whether the government interfered with him or not.

In the second car I saw a young Jewish boy, possibly twenty-one or twenty-two years of age, sitting alone, his lip trembling, and the tears coursing down his cheeks. I sat down with him and he told me that he was a young musician, a pianist, and had been giving concerts in New York City. He was glad to be called to the colors and the only reason he hated to go was because he would have no opportunity to play the piano, or, as he said, to live with his music. When I assured him that he would find a piano in every Army Y. M. C. A. bungalow in the cantonments, his face brightened and he said, "It's all right if I can have my piano and an opportunity once in a while to touch it up a bit."

In another car, I noticed a fine, red-checked, bright-eyed, clear-faced young fellow sitting alone, and when I sat down with him he told me that he was the most prominent real estate man north of 110th street in the city of New York. He had made a large income for several years, had left his mother and sister in good circumstances, and was ready to do his part. He only hoped he would pass the final physical examination, but was a little worried for fear some slight heart trouble might cause his rejection after reaching camp. He had known something of the work of the Association in Harlem and appreciated its advantages and benefits.

A young fellow with whom I sat said, "I am going to send the folder you handed me to my parents, because it portrays the comprehensive work of the Association. I am a traveling man and have been on the road for the last seven or eight years, representing one of the largest linen houses in New York City. I have been a member of the Association for all that time and in many cities have taken advantage of the privileges offered. My parents live in San Francisco and I have often written them about the great blessings and benefits that have come to me through the Associations which I have visited in my territory. As soon as I reach camp and have an opportunity to tie up to one of the Associations there, I shall do so and do anything I am asked to help promote the work."

Another had been a policeman in the 22d Street District in this city; had already received his discharge from the army after six years of service; had served three years on the police force; and had just been enrolled in the selective draft. He knew the work of the New York City branches and was enthusiastic about its benefits and ready to co-operate in the camp.

With the exception of the first car there was no drinking on the train. The young fellows were resolute, determined, hope-

ful, and ready to do their part in winning this war for freedom and the perpetuation of Democracy.

Under the direction of the Bureau of Transportation, secretaries also accompany trains of uniformed men as they journey from camp to camp or from camp to port of embarkation, and conducts work at ports of embarkation, such as Hoboken and Newport News and at great transfer centers such as St. Louis and Chicago.

It does not require much exercise of imagination to recognize the value of service such as this to the sorely pressed railroads, to the men themselves in a difficult and trying hour of their lives, and to the country now at war. Many railroad officials have frankly expressed their cordial appreciation of the aid these secretaries have given in helping to keep men contented and busy during long hours in transit and so helping to reduce to a minimum that spirit of restlessness which, unemployed, might easily develop trouble, embarrassment, and delay.

Railroad Secretaries at the Front

The Railroad Association, alive, as ever, to its responsibility for railroad men here at home, has not only thus manifested its power of adaptation in the manner in which it has entered the field of service among men in transit here at home, but is also proving equal to a call made upon it by railroad engineers overseas.

Thousands of American railroad men are now at the front and the difficulty of working among these men, scattered, as in many instances they are, seemed for a time almost insuperable. Progress, however, is being made rapidly, as is indicated in the following letter recently received from France:

I am pleased to report that since January 1st there have been special and interesting developments in connection with our service for men engaged in railway construction and operation. Although several of these regiments are broken up into small units of one or two companies each, the Association is now working with approximately 75 per cent of the men in this branch of service in France and in another 30 or 40 days our work will be practically upon a 100 per cent basis in this matter.

For one regiment which is intact we have provided a splendid double hut, with full equipment. Our service to most of the other railway regiments is now being carried on in canvas buildings with demountable frames, so that we may move quickly as companies or regiments move.

We are also serving the engineer units attached to the larger commands. One of the railroad secretaries reaching here recently has been assigned to service with a railway regiment recruited from the west and now engaged in railroad operation in a most interesting section immediately back of the French lines.

Among the experienced railroad secretaries already selected for this service and now in France working among railroad men are the following: F. G. Smith, A. B. Adams, B. T. Stone, S. L. Thomas, W. J. Tubbs, E. Dow Bancroft, W. A. Cochran, C. C. Kent, R. R. Jenkins, E. F. Gailey, Roland Swift, Fred T. Harshaw, W. L. McKinley, George E. Burgess, Sydney Morse, C. B. Flaggs.

A letter from a railroad man at the front to W. N. Northcott, associate secretary of the Transportation Bureau of the War Work Council, illustrates the appreciation of what the Association is doing for men on or near the battle line:

The Thirteenth Engineers are doing some great work here behind the French lines and all of the boys have their heart and soul connected with the work. We are the only regiment of engineers attached to the French and we have sure picked up the French method of railroading very fast. Their method is very different, it is odd. The hook and eye couplers as we call it, which it is. We have one of the Chicago Y. M. C. A. secretaries with us now, and he is sure a live wire. He has not

been with us very long, but has made a great impression on the boys already and is sure to make a great success with us and we all look toward you to use your influence to keep him with us, as he is just the man we have wanted since the Y. M. C. A. has been with us in France. His name is R. R. Jenkins. He is from some railroad junction near Chicago, the name of which was changed to Willard. I just was visiting him in his room and he is a very pleasant man to talk to and seems well satisfied here with the boys. He has already proved his worth to his regiment.

In Conclusion

The Railroad Young Men's Christian Association is a great and growing organization, although it makes no idle claim to perfection. Those most familiar with its activities are most conscious of its occasional failures. Nevertheless, when its history and accomplishment are fairly judged, it stands out as the most successful organization of its character that the world has known.

Its failures have been due to the human equation, but although occasional men have not been equal to their great responsibility, the high purpose, the unselfish devotion, and the fine organization of the Railroad Association have ever carried it onward.

Less than fifty years ago a small group of railroad men met at Cleveland to organize the first Railroad Young Men's Christian Association. Today, within the life span of men who were active then, these associations have become located on practically all of the great railroads of North America while outposts are established in distant lands and on the islands of the sea.

Its membership grows constantly; its leadership increases in numbers, experience, and efficiency; its property holdings are considerable; its motive is unselfish; its sympathies are broad and practical; and in what has been accomplished already in these relatively few years there is abundant promise that the Association stands upon the threshold of larger opportunity and more striking achievement.

"To Make the World Safe for Democracy—This Thing Must Be Crushed"—President Wilson

The Future of the Federal Valuation Work

The Shortage of Engineers, Government Control and Decision Not to Report Final Value Introduce Uncertainties

ONE OF THE FIRST QUESTIONS which was raised when the government took over the railroads concerned the effect of this action on the federal valuation work. This question still continues to be raised and still remains unanswered. The future of the valuation work therefore remains a matter of conjecture, although certain tendencies are becoming evident. It is to be expected that a definite statement will soon be made by the Railroad Administration outlining its attitude towards this work.

The federal valuation work has now been in progress for five years, the bill providing for it having been signed on March 1, 1913. The remainder of that year was spent in organizing forces and preparing plans and it was early in 1914 before the government undertook field work actively. Since that time the roadway and track parties have inventoried over 150,000 miles of line, or 60 per cent of the mileage of the country. Approximately 53,000 miles of line was covered in the year ending September 30, 1917. Based on this progress the Interstate Commerce Commission estimated in its last annual report that the engineering forces should practically complete the field work during 1919 and should finish this and the office work during 1920. It was also stated that the work of the land and accounting sections should be completed at the same time.

Less progress has been made in completing the reports on individual properties. Tentative valuations have been served on several of the smaller carriers and hearings have been held on these reports but no final figures have been turned over to the commission by the Division of Valuation as its conclusions regarding the value of those properties or of any portions of them. In fact, it developed a year ago that the Division of Valuation now interprets the law as not requiring it to determine a final and complete valuation of any property but only to report to the Interstate Commerce Commission on the various elements of value. The announcement of this attitude which, in the opinion of the director as well as most railway men, does not comply with the intent of those who prepared the bill and supported its passage through Congress, has caused many railway men to lose interest in the work and to raise serious doubts regarding the value of the results which will be secured.

While railway men in general did not oppose the passage of the valuation law actively few of them received it with any degree of enthusiasm. With certain exceptions, the general feeling has prevailed that the results to be secured would not be commensurate with the heavy expenditure involved and that the main benefit to the roads would be the indirect one of quieting the harangue of the agitators regarding over-valuation. In spite of skepticism regarding the value of the work the roads have co-operated consistently in its prosecution, both in their individual capacities and through the Presidents' Conference Committee, which was organized to harmonize the conflicting ideas of the roads and to provide a common agency to represent the roads as a whole in negotiations with the government.

With the entrance of the United States into the war a year ago, a new question was raised regarding the valuation work—whether it should be classed as essential or non-essential to the winning of the war. The valuation work is requiring a large force of men, almost all of whom are technically-trained engineers and most of whom are of military age. The Division of Valuation employs over 1,500 men. The roads in the eastern group alone employ an equal num-

ber. On this basis over 5,000 engineers are now employed in valuation work by the government and by the roads.

This large force is engaged in valuation work at a time when there is an acute shortage of engineers throughout the country. The intricate science into which warfare has developed has created a heavy demand for engineers and they have been called into military service in larger numbers than in any previous conflict. Many railway organizations have been very seriously depleted in this way and in numerous instances valuation forces have been almost entirely wiped out by enlistment and conscription. In order to meet the demands of the government for men it has been necessary to transfer engineers from maintenance and construction, frequently to the serious detriment and delay of work under way. It was a common experience last year for work to be held up pending the completion of plans, delayed by a shortage of draftsmen, while on at least one western system contractors were delayed in many instances because of the inability of the engineers on the road to set the necessary stakes. Under such conditions it is not surprising that there has been a strong feeling that this work, which demands so many engineers, should be called off for the duration of the war in order that these men may be employed in the routine maintenance and improvement work which is so necessary to the operation of the railroads at the present time.

The feeling that the valuation work should be discontinued during the war has not risen solely because of the shortage of men, for there has been a further feeling that in view of the government's plea for economy in expenditures it was unwise to continue work for which the annual government expenditure is \$3,500,000, and for which the railways must spend probably \$5,000,000 more. The position now taken by certain officers of the Division of Valuation that the railways should not be concerned with the expense of this work as the government is now paying the railways' share of the cost through its guarantee of earnings is not a reply to this criticism for if the work is to be continued the money must be spent and if the government pays for it it must come out of the same treasury that is financing the war.

The feeling that the valuation work should be classed as non-essential prompted the introduction of a bill into Congress recently calling for the discontinuance of this work. It has also led the directors of the Philadelphia Bourse to adopt and forward to Washington vigorous resolutions asking that Congress repeal the law and requesting early action on the bill now before Congress.

With the taking over of the railways by the government on December 28, still another element was introduced into this problem. Regardless of the attitude of the Railroad Administration toward government ownership, the assumption of direct control of the operation of the roads by the director general has brought government ownership more directly before the people. For this reason some railway men who have been lukewarm regarding valuation work previously, now feel that a complete inventory of their properties will be important in the event that the government takes over the roads permanently. This has led to agitation in some quarters for the continuance of the work, at least to the point that the inventory of the physical property should be completed.

Up to the present time the administration and the Division of Valuation have announced no change in the program of work and it is being continued just as before government

control became a reality. The director general has appointed the director of the Division of Valuation as a member of his immediate staff, which may have no significance whatever, but which may also be taken to indicate a close affiliation between the Railway Administration and the valuation work

which will insure its continuance until completion. The question will undoubtedly come up for final decision before Congress when the appropriation for the coming year is passed upon this spring. In the mean time the division is proceeding with its authority to complete the work.

The Railway Supply Field—Prospects for 1918

Realization That Railroads Are Our Third Line of Defence in
Transportation Means Much to Manufacturers

THE RAILWAY SUPPLY FIELD enjoyed in the year ended December 31, 1917, one of the most prosperous in its history, as has been evidenced by the recently issued annual reports which have shown the greatest earnings, for many companies, for any year in their entire history. There is prospect of a large business the rest of 1918, although its profitability will depend on the price policy of the Railroad Administration.

Thus far this year the orders for cars and locomotives have been few, but the car and locomotive plants have been able to continue at work, under severe difficulties from the standpoint of labor and materials, it is true, on railway equipment orders placed many months ago or on guns, shells or other material for the government. Now there are soon about to be added to this business, large orders for cars and locomotives for the government, and conditions will be further improved by the priority that will be given to material for these orders for the very reason that they are on government work.

If there were nothing else in the situation that should lend optimism to the supply field there is the fact that at last the government has seen the urgent necessity of providing at once for the needs of our American railroad system.

This brings up the interesting question of what is likely further to develop along this line in the future.

"It has become perfectly evident to all observers," says an editorial in last week's *Coal Age*, "that the capacity of the nation for production of war material is enormously greater than its capacity for shipping it to Europe, and that we must at once not only balance this production, but slow it down in order to prevent such a choking of our eastern ports as may produce an impossible condition. The answer comes that if we are making too much war material we had better turn some of our activities into the manufacture of articles of peace. Immediately we run into the financial situation, which now seems to hamper seriously new undertakings."

"It would seem that the claim of the railroads that they need \$1,000,000,000 worth of improvements should at this juncture be considered. Here is one organization now devoted exclusively to the service of the community, which, being under the control of the Federal Government, can be financed directly by that government, and there would seem no reason why the production programs of war material should not be limited, and a certain amount of the energy now being expended in that direction turned at once toward the improvement of our transportation facilities."

No less important than munitions and supplies in this war is transportation at the front, behind the lines, on the sea or behind the seaboard at home. It is a very apt cartoon that recently appeared in some of the metropolitan newspapers showing a camel heavily laden with munitions of war essaying to go through a wall the entrance through which, representing the shipping, was only large enough to permit the passage of its head and neck. The same analogy might be well applied, although in a smaller measure, to the railroad situation

Railroad men recognized it years ago, but it has been only recently that the authorities at Washington have seen it. For months last year our car and locomotive plants were turning out cars and locomotives for Russia and France and for our own military forces in France, while engines that were urgently needed for our own railroads at home were held up until in the heart of winter it developed that for lack of boats we could not ship all the material that was ready, overseas, while the American railroads themselves were crippled for want of cars and motive power. This, we are all agreed, must not happen again. We must take no further chances with our railroads. Germany today is tremendously handi-

EARNINGS OF REPRESENTATIVE COMPANIES—1917 AND 1916

capped for lack of cars or locomotives. In fact, one French authority, who is quoted elsewhere in this issue, says that one of the best things the allied armies could do would be to destroy German locomotives, for they cannot be replaced. There is no reason why we should ever reach a serious condition such as that.

No one doubts that the first thing we must do, however is to do our utmost to provide material for the new ships. They are our first line of defence in transportation. The railways now being used behind the lines in France, by the soldiers of England, France and the United States make up the second line, while the railways here at home supply the third. All must be in first-class condition to guarantee a

steady stream of munitions, supplies and men to France. We can neglect none of them.

The supply field naturally wants to see the railways of this country kept in first class condition,—it is the railway supply business that our manufacturing companies are most familiar with and best equipped to handle. Presumably they will be guaranteed a continuation and possibly an extension of this part of their activities during the coming months.

There has been a very evident change in the railway supply field, a tendency towards diversification, and a very healthy broadening of interests. The average railway supply company not so many years ago specialized on railway supplies alone and perhaps on a single line of products. Today the fact is the reverse. On the one hand, some companies have expanded into other lines of endeavor, and several of the most successful companies have also added many other and rather dissimilar lines of railway specialties. On the other hand, there have been many outside companies, new to the field, who have realized the immense possibilities attendant upon the sale of supplies to railways.

We can omit guns, shells and other war material as special war-time factors, although a very large number of companies in the supply field are now engaged in their production. But we can notice that the Baldwin Locomotive Works, some time since, bought the Southwark Foundry & Machine Company to add to its line gasoline engines and similar products; that the American Car & Foundry Company has so diversified its work that now it is in a very advantageous position when it comes to handling an enormous order for shrapnel helmets; that the Locomotive Superheater Company is building up a large business in marine superheaters; that the Chicago Railway Equipment Company has so diversified its work that now 70 per cent of its business is in other than railway specialties. And last, but by no means least, there is the steel industry which at one time supplied over 40 per cent of its products to the railways and now supplies nearer 10 per cent. The peculiar buying methods of the railways, be it repeated, are not the only reason for such diversification, but they are a big reason, particularly since regulation tightened down too much to permit of the extent of progress and expansion that was necessary to the railway industry.

On the other hand, there are other companies which have taken on railways as additional customers. Among such companies can be instanced the Barrett Company, the Carborundum Company, the Norton Company, the H. W. Johns-Manville Company, a number of paint concerns, several belting manufacturers and an exceptionally large number of machine tool builders, all companies which have realized the immense possibilities of selling to an industry that purchases a billion dollars' worth of goods a year, but all of them companies whose industry was already diversified before they entered the railway supply field.

The pending Government orders for cars and locomotives will naturally have a tremendous influence in the railway supply field, as has been discussed previously in this paper. But they will by no means take up all the country's capacity for an extended period of time, nor will they change seriously the tendencies that are mentioned above.

Now what is the ultimate answer? What is going to be done when the orders for the government are completed and after the Kai-ser's defeat makes no longer necessary the continued manufacture of guns and shells? There are two answers: (1) A continued diversification to take care of the natural expansion that cannot be utilized by the demands for railway supplies at home. (2) Export trade. Both are necessary, one as much as the other. Diversification because it will help to produce economies. A foundry, a forge shop or a machine shop can be used for other things besides the manufacture of railway material, and particularly may it be so used to take up the slack in

railway demands. Export trade, because diversification alone will not suffice and because it, too, will help to take up the slack in domestic railway demands.

But there is far more to the export proposition than that, and any manufacturer must fully realize this condition before he can ever hope for a continued and successful export business. The point, in short, is that there will be a tremendous opportunity for American railway supply houses in export trade. For many years after the war there will be but two countries in the world which can hope to secure an

extensive export trade in railway supplies—England and the United States. The wise American railway supply manufacturer, or at least he who did not have a large business in foreign lands before the war, is already beginning to realize that there is a tremendous opportunity in export trade, that will help take up his increased capacity and will yield him profitable returns; and the wisest manufacturers among them all are those who are now making their plans and getting in the missionary work in favor of American equipment and American standards.

Double-End Electric Crane Independent of Road Rail or Trolley

Electric Equipment for Steam Railroads

Difficult Operating Problems Are Solved by Electric Trucks,
Electric Locomotives, and Electric Welding

LIKE ALL OTHERS in the steam railroad field, electrical men are extremely busy. The present crisis is affording them the opportunity to prove that much electrical equipment is prerequisite for efficient operation. The branches of the electrical field which are now demanding particular attention are shop power and light, handling of freight in terminals, heavy electric traction, and electric arc welding. Car lighting and headlights are subjects which are also demanding recognition. The incandescent lamp has become the standard for locomotive headlights and the greater number of railroads are replacing all other forms of light for coaches with electric light as rapidly as circumstances permit.

Shop Power and Light

The electric motor has long since proved to be the best sort of power for driving machine tools in the railroad shops. At present, repair shops and repairmen for the electric motor equipment are at a premium. This has led in a number of cases to the demand for portable motors to take the place of those in trouble until they can be repaired. These motors employ belts or flexible coupling drive and so far as developed are limited to 15 h. p.

It is generally accepted that anti-friction bearings are the best preventative for motor trouble and their use has simplified maintenance. Attention to lubrication twice a year will suffice to keep them in good condition.

The car repair shop shown in the illustration presents an example of working conditions which can be obtained with proper illumination. Much is being said, and in good cause, about lighting curtailment, but this should be applied to the shop with discretion. It has been shown in a number of cases that burning more light may actually effect a saving of coal. With good light the workman can perform a given piece of work in much less time than he could if the light were inadequate; the motor used to drive the tool which he is working with is used for a shorter period of time and the power consumption of the motor is relatively large as compared with that of the light.

Electric Trucks

The handling of freight in terminals has been the cause of more difficulty than has the shipping of freight over the road. The use of electric trucks has served greatly to reduce the congestion in terminals. A large eastern road reports it would be impossible to handle the transfers of

material in the terminal with hand-trucks, even though a sufficient number of trucks and men were available. The reason for this is that the greater amount of space required is not available.

Electric Traction

Those roads with electrified sections have a great advantage, for with electric locomotives as against steam locomotives, almost twice as many cars can be handled over a given amount of track. There are at present four new types of electric locomotives under construction; two of these are being built by the General Electric Company for the Chicago, Milwaukee & St. Paul and the New York Central. The other two are being built by the Westinghouse Electric & Manufacturing Company, for the Chicago, Milwaukee

A Well Lighted Shop

& St. Paul and the New York, New Haven & Hartford. These four locomotives were described in the *Railway Age*, March 22, 1918.

Some interesting information pertaining to maintenance and operating costs was contained in the last annual report of the Norfolk & Western. The average maintenance cost

—including repairs, retirements and depreciation—per 1000 ton-miles for steam locomotives was 32 cents, while that for electric locomotives was only 10 cents. The following statement was contained in the report pertaining to operating costs: "The cost of freight movement in the electric zone in the month of October, 1917, when the conditions were normal, was 26 per cent less than if steam power alone had been used."

Electric Arc Welding

Welding is now demanding more attention than any other branch of the electrical field. It is used effectively on steel and cast-iron, and experiments on other metals, such as bell metal, have proven that the use of arc welding is not limited to iron and steel. Its use on railroads is being steadily extended.

In the locomotive repair shop, arc-welding is used for

Worn Cross-head Guide Built Up by the Metal Electrode Process of Arc Welding

making almost every kind of repair. Broken locomotive frames are repaired quickly, and with little cost; cracked and broken cylinders are repaired without removing the cylinders from the locomotives; broken fireboxes are repaired; flue sheets are welded into boilers without the use

of rivets, and it has become quite common practice to weld the flues to the sheet at the fire-box end of the boilers. The cross-head guide illustrated was worn down until practically useless, and then built up by the metal electrode process. After it has been machined it will be put into service again. This practice is not limited to flat surfaces only but applies

Electric Trucks Can Operate In and Out of Box Cars

equally well to cylindrical forms, which are in need of bushing. Extensive tests have shown that it is possible to make a weld stronger than the original metal. This statement is true for cast-iron as well as for steel.

The savings made possible by the use of electric arc-welding are apparent to anyone who has seen it in use. The superintendent of a large eastern shop recently said that by the use of improved shop methods and electric arc-welding, they had been able to maintain total operating costs constant in spite of the tremendous increases in cost of labor and material.

Helping a Railroad Out of Its Difficulties

The Shifting of Motive Power From Road to Road

The Practice Leads to Many Difficulties, Some of Which May Be Overcome; Should Be Curtailed

THE PLAN OF TRANSFERRING LOCOMOTIVES from those roads having a surplus of power to those suffering seriously from traffic congestion and power shortage was first considered by the Railroads' War Board. Under the direction of that body, arrangements were made in December for the transfer of 100 locomotives from 20 railroads in the west to a number of eastern lines, the transfer to be carried out through the St. Louis and Chicago gateways. Since the control of the operation of the railroads has been taken over by the President, the application of the plan has been somewhat extended by Director General McAdoo, not without numerous difficulties, but in the main with success, when considered as an emergency measure.

At the present time there are more than 40 railroads in the United States using from one to 75 borrowed locomotives each, which are being paid for on the rental basis of \$50 a day. All of these locomotives, however, were not borrowed directly from other railroads. About 200 of them are either Consolidation type locomotives of the design built for our army in France or the Russian Decapod type, some 200 of which are reported as being converted to standard gage by the use of wide tires, and loaned to the railroads by the United States Government. There is also an increasing output of new locomotives delivered on domestic orders, all of which are being taken from the builders and placed in service wherever the greatest needs exist, irrespective of ownership. As announced early in February, this practice was to be followed for the entire output of the builders during January, February and March, amounting in all to about 700 locomotives. It is estimated that about 600 foreign engines from all sources were being operated on April 1.

Locomotives Do Best at Home

Much that has been said about this subject indicates very clearly that to the lay mind any locomotive is a good locomotive anywhere—just as good in California as in Maine. But to those who have directly to do with the operation and maintenance of locomotives they come to be considered almost as much a part of the fixed transportation plant as yards and roundhouses. Whole systems of repair practice and shop organization grow up around the types of locomotives and even details of construction which become more or less standardized on each railroad. Smokebox design and adjustment and grate design are influenced by the characteristics of the fuel in the districts in which locomotives regularly operate. If such locomotives are suddenly replaced by others developed under other conditions, neither the locomotives nor the organizations handling them fit and a considerable amount of adjustment of both is required.

The movement of traffic is of greater importance, however, than either convenience of operation or the greatest efficiency of maintenance. Under the conditions which have been faced by many of the railroads during the past winter it has been imperative that they secure all the motive power that could possibly be made available. In such a situation, on the principle that half a loaf is better than none, railroad men have been willing and even eager to secure locomotives of almost any type from any available source.

Unnecessary Confusion

As the situation stands at the present time, there is apparent a lack of co-ordination in the distribution of the borrowed locomotives which should be remedied. Indeed, the practice of transferring locomotives has now reached a point

where there is danger of its being carried to extremes. The railroads operating locomotives foreign to their own line, and hence most affected by the practice, are those in the eastern and southern sections of the country and a few in the southwest. Some of these railroads are operating a miscellaneous collection of one or two locomotives received from each of several other railroads. Conversely, locomotives of the loaning roads are being scattered one or two in a place, when they might better be kept together. There are cases where railroads are receiving foreign locomotives to make up their own shortage of power and are having their own new power scattered about on other railroads. It is possible that there are cases in which each one of these conditions may be justified, but the unhindered practice of such methods is laying the foundation for a tangle later on when the need for repair parts becomes urgent, which will not only be exceedingly annoying, but expensive as well.

Even under the best of conditions there are many difficulties incident to the transfer of locomotives to foreign lines. One of the difficulties is to secure proper material from the owning road with which to make essential running repairs. The most common instance of this is the failure to secure grates, a part of the locomotive very frequently requiring renewals. There are instances where locomotives have been held out of service for as much as 10 days by the borrowing road awaiting grate bars, which had to be secured from the owners. In one case, after the locomotive had been held for some time awaiting material, the defective grates were patched up and the locomotives sent back to the owning road. In another case, the borrowing road, in order to protect itself against such delays, ordered sufficient material from the owning road to seriously cripple the latter's store stock of this material.

All of these difficulties present themselves at the outset of the transfer and, as such transfers are only resorted to as emergency measures, will probably never be wholly eliminated during the comparatively short periods in which the locomotives remain away from home. If the borrowing road is using locomotives from several different railroads, instead of securing them all from one line, it is evident that the difficulties of the situation are multiplied. On the other hand, if the locomotives of the loaning road are scattered over a number of other lines, instead of being kept together on one road, the difficulty of providing the necessary stock for running repairs to protect the borrowing roads is materially increased.

In considering the transfer of locomotives from one railroad to another, the fact should not be overlooked that there is always a tendency for borrowed power to run down. This does not imply any lack of conscientious attention on the part of the officers or men of the borrowing road. It is due to the difficulty of securing needed repair parts and material which must come from the owner, and also to the fact that frequently such locomotives are not adapted to the regular routine methods of handling its own power in force on the borrowing road. In such a case it is a natural consequence that the more popular home locomotives and, therefore, those considered the best, can be kept in service longer with running repairs before requiring a trip to the back shop.

Clearance limitations should never be overlooked when transferring locomotives from one road to another. Some instances which have occurred during the past winter indicate that this important matter has not always received the attention it should. In one such case the clearance limita-

tions on the borrowing road were such that after receiving locomotives from another line, it was found impossible to operate them except in a restricted territory only 50 miles in length. In another similar case it was found that Russian locomotives would not clear a viaduct on the line of the railroad on which they were placed in service, this fact only being determined after the locomotives were placed in service.

Keep the Transfers Within Reasonable Limits

It is evident, therefore, that the practice of transferring locomotives should have rather narrow limitations. One of the first and most important considerations to make the plan successful is to keep the locomotives near the home road, preferably on a line directly connecting with the home road, and on a division directly adjoining the home road connection. If this practice were strictly followed, the difficulty of securing repair parts and necessary material for the maintenance of the locomotives would be very much reduced. Long delays incident to the transportation of the material long distances would be eliminated.

Every effort should be made to keep together the locomotives of each loaning railroad, and, on the other hand, to give each railroad borrowing locomotives, those from as few lending roads as the available number of locomotives which can be spared by the latter roads will permit. This will materially simplify the problem of furnishing and securing material for running repairs and will save what otherwise is more than likely to become a very confused situation; furthermore, it will conserve material stocks. It takes but a very small amount more of stock to protect ten or a dozen locomotives than it does to protect one or two. Obviously, therefore, if a railroad has 10 or 12 of its locomotives loaned, and these engines are in service on a half a dozen other railroads, the calls upon its store stock by the borrowing railroads for material to protect themselves will be much more burdensome than if all of these locomotives were in service on one line and one division.

Finally, one of the most important limitations which should be placed upon this practice is the length of time the locomotives remain away from the home roads. In an emergency the practice can only be adopted as a temporary expedient to effect an improved distribution of motive power until a more permanent equalization can be effected. Every effort should be bent to the end that the locomotives now being used on foreign lines be returned home at the earliest possible moment. With the contemplated control of the placing of orders for the various railroads, or of the distribution of new motive power, the need for the general shifting of motive power from one railroad to another should be past before the advent of another winter. Not unlike the more fixed facilities of the railroads, the locomotive performs its best service on its home system—even within the narrow limits of its own division and in the hands of its own crew. Unlike the car, which is at home anywhere, for best results the locomotive should be maintained as a permanent facility.

Provide Central Direction

In order that the least difficulty should arise from the maintenance and operation of the borrowed locomotives and later from the transfer of these locomotives back to the home roads, all of the details should be co-ordinated in the hands of a single agency. The agency best adapted to handle this situation and the one to which it most logically belongs, is the Locomotive Section of the Railway Administration. The information in the hands of the Manager of the Locomotive Section and his facilities for securing such additional information as may be required, are such that he should be in a position to give each factor entering into every case which presents itself its due weight. Each case may then be settled in its proper relation to all other cases now existing or which may arise. Only in this way may the confusion now evident gradually be eliminated and, what is of equal importance, may the locomotive be directed toward the home roads just as rapidly as conditions will permit.

Railroads Need Better Machine Tool Equipment

Must Not Postpone Ordering; Builders Offer Fairly
Good Deliveries In Most Cases

DURING THE YEARS immediately preceding the outbreak of the European war, the railroads of the United States spent approximately \$12,000,000 annually for shop machinery and tools. In the year 1914 there was a serious falling off in the net operating revenue of the roads, and as a result the expenditures were reduced wherever possible. Consequently only \$9,000,000 was spent for machinery and tools during 1915. Throughout the past two years there has been an unusually strong demand for machine tools for war work and the railroads have confined their purchases principally to tools which were urgently needed. Although no general statistics are available, it is safe to say that the expenditures for tools have been even smaller during the past two years than in 1915. With the great advance in prices, a given expenditure of course represents a much smaller amount of shop equipment. Taking this into account and considering also that the roads are handling far more traffic than ever before, it is quite evident that they are in need of a large number of machine tools at present.

Although there has been no reduction in the prices of machine tools, other changes have taken place which should not be overlooked when considering the advisability of making purchases. The past year has brought large wage increases to all classes of mechanics. While in 1915 the total

compensation paid by the roads to mechanics, helpers and apprentices was over \$90,000,000, for the present year it will probably be 40 per cent higher, or about \$125,000,000. There are but few methods that can be used to offset this increase. One that deserves attention is the use of improved machine tools to increase the output per man. Suppose only 2 per cent more output could be secured by providing better tools. Figuring interest and depreciation at the rate of 12 per cent annually this saving would justify the expenditure of more than \$20,000,000. All who are familiar with shop conditions will agree that with improved equipment much greater economies could be effected. Aside from the direct saving in labor there would be opportunities for increasing the efficiency of operation by reducing delays and making it possible to get more service from equipment.

During the past winter it was impossible to care for equipment properly at some points, due largely to the inadequacy of the roundhouse facilities. The machine tool equipment of engine terminals is usually made up of tools that have outlived their usefulness in the shop and should have been sent to the scrap pile instead of to the roundhouse, where minutes lost in doing machine work may result in costly delays.

The need of first-class tool equipment in roundhouses has been recognized for some time. One superintendent of mo-

tive power recently stated that he thought with the large locomotives now in use requiring frequent heavy work, every roundhouse should have a few pits equipped for handling heavy repairs in order that the heavy roundhouse jobs could be taken care of promptly. The necessity for keeping down the expenditures has prevented roads from buying the equipment they have required in the engine houses. Better facilities at these points will help to prevent such costly congestion as occurred last winter, and should certainly be provided.

Although the machine tools most urgently needed are those required for roundhouse work, many shops should have additions for their equipment, or replacements for obsolete tools. There are wide variations in the conditions on different roads. Some have followed a consistent policy of buying shop machinery regularly as additional rolling stock was secured. On other roads the repair facilities are not sufficient to take care of the equipment under the present conditions. It is, of course, advisable to have all locomotives repaired on the home road if possible. While it may not be feasible to build additional shops at this time, the capacity of existing shops is usually limited, not by the number of pits but by the machine facilities and in most cases a few tools, judiciously chosen, will make it possible to increase the output considerably.

The question of providing good repair facilities is of such importance that it should receive first consideration when ordering tools. Under the present conditions, however, the reclamation of materials offers such unusual opportunities for reducing expenses that it may be found advisable to include a considerable amount of machinery in the tool program for such work. As specific instances of equipment that is being reclaimed to good advantage at this time flues, rails and bar iron may be mentioned.

Granting that the roads need a great many machine tools at this time, the question of their ability to secure them naturally suggests itself. There seems to be a general opinion among railroad men that tools of all classes are hard to get and deliveries are very slow. While it is true that in the past there have been delays in securing tools, the situation has improved and reasonable deliveries are now being promised on practically all types of machines.

Before going into the subject more in detail, it may be well to give a short account of the work of the machine tool section of the War Industries Board. Although an advisory body without executive authority, the board has done much good in directing the manufacture and distribution of machine tools. A schedule of production was secured from every shop and from the data furnished it was determined whether the production of various machines was greater or less than the demand. This made it possible to commandeer tools with the minimum of inconvenience to private industries. The requirements of munition plants are being estimated and a reserve of tools set up for such work. Companies which formerly did not manufacture machine tools have been induced to enter the field, thus increasing the production of machines that were badly needed. By preventing speculation in machine tools the board has helped to keep the prices on a reasonable basis. While there has been some costly duplication of facilities, the production and the demand have been controlled as much as possible and the conditions are fast becoming normal.

The commandeering of tools for government work has not interfered with the delivery of tools to railroads to any great extent. Since the roads are now under government control they will probably be given preference in arranging for priority of orders. Some of the tools which the railroads use in large number can now be delivered from stock, and nearly all can be secured within six months from the date ordered. In fact the only classes of equipment on which deliveries are much slower than usual are the extremely heavy tools and special equipment of which small numbers are built.

Information received from the manufacturers of tools indicates that the conditions as regards deliveries are at the present time about as follows:

Good Deliveries in Most Cases

Lathes: A few of the smaller sizes can be delivered from from stock. On the larger sizes deliveries vary from two to seven months depending on the swing and length of bed. It is almost impossible to secure wheel lathes, as plants equipped to manufacture large tools are devoting all their time to working on government orders.

Turret lathes: All sizes and types can be furnished in from two to five months' time.

Boring mills: With the exception of the larger sizes used for tires and wheel centers, deliveries can be secured in from two to three months. The larger machines are not available at this time and probably cannot be secured for some time to come.

Planers: No class of equipment has been more in demand than large planers. The urgent need for these tools for war work has led to the introduction of a new type of machine which has a concrete base. The medium and smaller sizes can be secured in from four to twelve months, however.

Milling machines: Deliveries of the ordinary sizes of plain and universal milling machines can be made within six to twelve months, while for heavy milling machines the time is somewhat longer.

Shapers: Deliveries vary from four to eight months.

Drill presses: Sizes up to six feet can be secured in from three to eight months; on radial drill presses and on the other types the time required is even shorter.

Cylindrical and surface grinding machines: Small stocks of some sizes are on hand and other machines can be supplied in from two to eight months.

Portable tools: All types and sizes can be furnished within two months from the date ordered.

Electric welding equipment: Deliveries can be made in from one to three months.

Electric motors: All sizes required for driving machine tools can be furnished within two months.

Blacksmith and boiler shop equipment: Steam and power hammers can be supplied in from two to four months, forging machines in six months and bolt machinery in three to five months. Deliveries of punches and shears can be made within one month; flangers are available within four months.

Wood working machinery: Deliveries are practically normal, one to three months being required to fill orders depending on the type of machine wanted.

From the data given above it is evident that while some difficulty might be experienced in securing complete equipment for new shops owing to the great demand for certain types of machines, the ordinary requirements can be met with but little delay. Machine tool prices are stable and there is no longer any thought of postponing buying in anticipation of a possible decrease in prices. The railroads have everything to lose and nothing to gain if they restrict their orders for machine tools. With labor costs continually rising, they have every inducement for replacing the old equipment with modern machine tools. The roads must operate at the highest efficiency in order to handle the present enormous traffic. Better shop equipment will help them to realize that aim. Their purchases in the past three years have been entirely inadequate, but this year the roads should make up for it and should place larger orders for machine tools than during any previous year.

A BRIDGE TO CONNECT EUROPE WITH ASIA.—According to the *Vossische Zeitung* the Turkish government has introduced in the Chamber a bill asking for a credit for the examination of the question of the construction of a bridge or tunnel connecting Europe with Asia.

New York Is Urgently Recommended for a Free Port District.

Is the Supply Field Interested in "Free Ports"?

Apparently the Idea Will Have No Advantages for the
Manufacturers of Railway Materials

By E. S. Swazey

THE QUESTION OF THE DESIRABILITY for the United States of free ports—districts set outside of the jurisdiction of the customs into which foreign merchandise may be brought for storing, handling, manufacture and re-export—has been the subject of more or less discussion, particularly during the last few months. The United States Tariff Commission has conducted hearings in several cities for the purpose of finding out how useful these free ports would be in developing our foreign commerce; and legislation has been introduced in Congress providing for free ports.

The interest of railwaymen centers largely in the part that these free ports would play in the whole problem of port development, particularly at New York.

It is, however, not probable that free ports would prove of any special assistance to the manufacturer of railway equipment and supplies, for the reason that his raw materials are entirely domestic. They might, on the other hand, even prove to his disadvantage, by way of being of greater assistance to the foreign manufacturer of these products in facilitating his sales to, for example, the Latin American countries.

The free port problem is, nevertheless, one of fundamental interest to those whose attention is turning to foreign trade and one about which far too little is known as to its practical adaptability to existing and probable future conditions in this country. The very fact that the minds of the leaders in the railway supply field are turning to a discussion of the new problems of the day is the best reason why a discussion of the arguments for and against the free port should be of interest to railway supply men.

Definition

A free port has been defined as a district in or adjacent to a port, within which the customs authorities do not enter but confine their activities to guarding its boundaries and imposing the usual formalities and charges upon all goods which leave it for the interior. It is designed to counteract the restrictive effects of customs supervision and at the same time retain all the protective and revenue-producing features of the tariff system. It usually consists of a large district, isolated from the remainder of the port by natural or artificial barriers, equipped with wharves, warehouses, industrial loca-

tions and mechanical devices for the economical handling and transportation of merchandise. It is a district which all ships, irrespective of flag or cargo, may enter and depart from unmolested and where all sorts of activity in commerce and industry, including sorting, refining, grading, mixing, assembling, manufacturing and selling may be carried on without customs charges, supervision or formalities. The territory set aside as a free port is intended to be a great market and the center for the transshipment trade of the region.

The value of a free port district bears a direct relation to the extent of tariff restrictions existing in the country in which the district is located. Recent discussion of the desirability of free ports for the United States seems to have very largely omitted any detailed consideration of what part of our trade would be benefited by such an arrangement.

Hamburg Glibly Cited

The example of Hamburg is glibly cited to show the benefits that accrue from the establishing of a locality in which merchandise may be stored, handled, manufactured, or re-shipped without the inconvenience of customs regulation. The Hamburg free port has been undoubtedly successful, but Germany has a high protective tariff.

On the other hand, England, a free trade country, has in Liverpool and London, two of the greatest transshipping ports of the world, and handles successfully through her bonded warehouse system, dutiable commodities, such as tea and similar luxuries.

Between these two extremes lie the conditions existing in the United States—raw materials, very largely free of import duty, semi-finished and manufactured goods, more or less subject to a duty that is partly protective, and partly for the purpose of revenue.

Three Fundamental Conditions

Three other fundamental conditions must be borne in mind in a consideration of the problem, particularly if undue emphasis is not to be laid on the success of the European free ports:

First, the great bulk of the raw materials entering into our manufacturing are of domestic origin (this applies to our in-

creasing production for export as well as to production for our own needs and includes particularly railway materials) and that of those materials that are of foreign origin, a large part comes in free of duty;

Second, we are located geographically not only at considerable distance from the sources of important foreign raw materials, but we are also far from any foreign consuming markets with such concentrated purchasing power as exists in the foreign markets nearby Hamburg;

Third, our extensive coast line, though it has the one pre-dominating port of New York, has also a large number of smaller ports competing among themselves even now for a share in the free port privilege, which, if granted liberally—as it would have to be or not at all—would, by decentralization, lessen the benefits that might otherwise be gained by one large trade center.

The idea of making the United States less dependent on the European transshipment raw material markets, and even of setting up such marketing centers in this country to which other nations will come as we have gone to them, is now very vital. Possibly, with our enlarged merchant marine, greater financing power and increased prominence in foreign fields, we may be able to overcome the handicap of distance and the inertia of established trade channels, and obtain some of the results desired. How would the establishing of free ports assist in this development?

Free and Dutiable Merchandise

Tables I and II show the relations that exist between free and dutiable merchandise as grouped into six classifications for the last six years. The first three of these years (ending June 30) are pre-war. The first two years, 1912 and 1913, represent imports under the old Payne-Aldrich tariff. The figures for 1914 show clearly the effects of the new tariff, although industry can hardly be said to have adjusted itself to the new rates of duty. The effects of the war during the

assistance to the manufacturer preparing goods for export, note that dutiable crude materials and dutiable manufacture for further use in manufacturing, each run under the new tariff only between 4 per cent and 5 per cent of our total imports. Even with a remarkable development of our export trade, the part of these dutiable materials that would enter into our exports would be a very negligible quantity.

Free ports may, of course, be used for the handling of merchandise that is not subject to duty. A steamer bringing both dutiable and non-dutiable goods might use the facilities of a free port for both classes of goods. Any free port districts that would be developed would probably be very modern in equipment and as low in charges as existing facilities, so that the district might attract a merchandise movement con-

TABLE II—RATIO OF THE DUTIABLE IMPORTS IN EACH GROUP TO THE TOTAL OF ALL U. S. IMPORTS

| | Years Ending June 30 | | | | | |
|--|----------------------|------|------|------|------|------|
| | 1912 | 1913 | 1914 | 1915 | 1916 | 1917 |
| Crude materials for use in manufacture | 6.9 | 6.9 | 4.4 | 4.1 | 4.4 | 3.8 |
| Foodstuffs in crude condition and food animals | 3.0 | 1.8 | 2.4 | 1.6 | 1.5 | 1.7 |
| Foodstuffs partly or wholly manufactured | 10.9 | 10.1 | 10.1 | 14.0 | 12.5 | 11.4 |
| Manufactures for further use in manufacturing | 8.5 | 9.3 | 6.2 | 4.5 | 4.6 | 4.4 |
| Manufactures ready for consumption | 17.1 | 17.1 | 16.9 | 13.7 | 8.8 | 8.2 |
| Miscellaneous | 0.2 | 0.3 | 0.3 | 0.4 | 0.3 | 0.2 |
| Total | 46.6 | 45.5 | 40.5 | 38.3 | 32.1 | 30.5 |

siderably in excess of the amount of dutiable merchandise that would actually benefit by the absence of customs restrictions and which would not be a full measure of the use that would be made of the districts. But this suggests the more important problem of the proper development of the entire port and terminal facilities of our seacoast, irrespective of whether or not free ports are permitted. As a matter of practical operation, it would be very difficult to import the small proportion of actual free port merchandise in the relatively few vessels that would discharge in the free port districts.

A Free Port's Activities

The activities of a free port fall in two main categories, re-exporting merchandise largely in the form in which it is imported, and manufacturing for export products of which imported materials form a part. It would seem from the above figures that only a limited use would be made of free port facilities for manufacturing purposes, although inquiry may develop specific industries whose use of imported dutiable raw or partly manufactured materials in products for export would warrant their taking up manufacturing quarters in a free port zone. The re-export of foreign merchandise with

TABLE I—PERCENTAGE OF DUTIABLE MERCHANDISE IN EACH GROUP OF UNITED STATES IMPORTS

| | Years Ending June 30 | | | | | |
|--|----------------------|------|------|------|------|------|
| | 1912 | 1913 | 1914 | 1915 | 1916 | 1917 |
| Crude materials for use in manufacture | 20.6 | 19.8 | 13.2 | 11.9 | 10.2 | 9.1 |
| Foodstuffs in crude condition and food animals | 21.8 | 15.1 | 18.6 | 12.1 | 13.8 | 19.9 |
| Foodstuffs partly or wholly manufactured | 91.5 | 94.4 | 83.7 | 82.1 | 88.3 | 88.1 |
| Manufactures for further use in manufacturing | 47.8 | 48.3 | 37.1 | 31.8 | 28.4 | 24.3 |
| Manufactures ready for consumption | 78.4 | 76.2 | 71.6 | 68.2 | 61.4 | 57.5 |
| Miscellaneous | 26.01 | 34.1 | 35.2 | 35.3 | 34.6 | 37.3 |
| Total | 46.7 | 45.5 | 40.5 | 38.3 | 32.1 | 30.5 |

last three years are also to be borne in mind, though they do not materially alter the conclusions to be drawn.

Table I shows for each of the years the percentage of the imports in each of the groups of merchandise that is dutiable. "Foodstuffs partly or wholly manufactured" is the group in which the greatest percentage is dutiable, ranging from 94.4 per cent in 1913 to 82.1 per cent in 1915. The next group in point of proportion of dutiable merchandise is "manufactures ready for consumption." Of the "crude materials for use in manufacturing" group, which in total volume of trade as well as in point of free port interest is of most importance in this analysis, the percentage of dutiable imports was but 20.6 per cent and 19.8 per cent in 1912 and 1913, and under the new tariff dropped to 10.2 per cent and 9.1 per cent in 1916 and 1917.

Table II shows for each of the years the percentage of dutiable imports in each group to the total of the imports of all groups, both dutiable and free, in order to show the relative importance of the dutiable imports, to a small part of which a free port would cater, to our total import trade. Bearing in mind the argument that free ports would be of material

TABLE III—IMPORTS AND RE-EXPORTS FROM BONDED WAREHOUSES

| Year | Total Imports | Total Re-Exports | Ratio | |
|------|----------------|------------------|-----------------------|-----------------------------|
| | | | Re-Exports to Imports | Re-Exports to Total Imports |
| 1912 | \$1,653,64,934 | \$14,051,581 | 10.585 | 10.585 |
| 1913 | 1,813,098,234 | 17,377,791 | 12.14 | 12.14 |
| 1914 | 1,893,925,657 | 34,895,118 | 18.41 | 18.41 |
| 1915 | 1,674,169,740 | 54,110,875 | 32.32 | 32.32 |
| 1916 | 1,783,510 | 61,305,800 | 34.38 | 34.38 |
| 1917 | 659,55,185 | 63,036,795 | 9.57 | 9.57 |

* Not reported.

which a free port would apparently be most concerned, it then to be considered.

Table III gives an indication of what has been done under the existing bonded warehouse system. The percentage of total re-exports to imports is small, although the war has increased both the percentage and the actual amount. The portion of these re-exports representing merchandise dutiable when imported cannot be ascertained exactly. An indication is seen in the re-exports from bonded warehouses, which have been about 30 per cent of the re-exports. Or if we take the same proportion that is dutiable when imported, the amount

which would be available for free port handling has apparently been worth about \$20,000,000 in 1916 and 1917. The existence of free ports would facilitate this transshipment movement. Let us see what commodities would be favorably affected by such a plan.

The world's great commodity markets in London, Liverpool, Rotterdam, Hamburg and other European ports are those of raw materials such as rubber, cacao, coffee, cotton, silk, jute, and tea. Hope has been expressed that the United States would become the distributing center for one or more of these products—say rubber, coffee, and cacao—but free ports would hardly help in this development, since each of these commodities now enter free of duty, and except possibly for the formality of "entering," which would be necessary even in a free port for record purposes, and except for certain sampling, are not handicapped by customs regulations.

Easier Means to Secure Same Results

Even if these raw materials were dutiable, the difficulties of bonded warehouses and drawbacks could be more easily overcome than the more dominating factors in determining world markets of geographical location, established channels of trade, financing and insurance, and our own lack of world trading knowledge.

The most important of the commodities re-exported that are subject to import duty are: Antimony, chicle, jute manufactures, dried peas, precious stones and imitations of, cleaned rice, sugar, and leaf tobacco, of which the total value of the re-exports in 1916 was about \$10,000,000.

With free ports, the amount of dutiable commodities re-exported would, of course, be greater, and in considering the desirability of such districts, it is not entirely fair to measure their value by the experience recorded under customs conditions, which the ports would eliminate.

A list is given below of the most important raw and partly or wholly manufactured materials that are imported into the United States subject to duty in order to call them definitely to the attention of those who, under free port conditions, might import these products for re-export to other countries. Note the absence of railway materials.

| RAW MATERIALS | | |
|-------------------------------|------------------------|---------------------------|
| Almonds | Antimony | Breadstuffs |
| Apples and wine | Glycerin | Camphor—crude, natural |
| Chicle | Indigo—natural | Licorice root |
| Vanilla beans | Feathers | Fruits and nuts |
| Leaf | Olive oil | Precious stones (unset) |
| Flaxseed of insect | Spices | Sugar |
| Tobacco | Zinc | |
| PARTLY OR WHOLLY MANUFACTURED | | |
| Flour | Silk and woolen mfrs. | Laces, embroideries, etc. |
| Dyes, chemicals, drugs, etc. | Bristles | Furs—dressed and mfrs. |
| Earthen, stone, and chinaware | Cotton thread and yarn | |
| | Mfrs. of fibers | |
| | Brushes | |

What in general are the trade movements in which the United States could figure to any extent as a distributing center? Geographical location to ensure the shortest distance between producer and consumer is an important factor, although there are notable exceptions, such as the tea and rubber movement through England. Even granted the shorter distance, steamship lines or the tramp movement of ships must create new channels.

First, there is the possibility of the distribution of European products via the United States to Latin-America (particularly to the Caribbean and West Coast countries, as little movement to Brazil and the Argentine could be expected via New York), and the return movement of raw materials from Latin-America.

Second, there is similarly a possible trade channel via our Pacific ports between the Far East and the Latin-American countries.

Third, there is the exchange of European with Far Eastern products via this country, insofar as this might compete with the direct move via the Suez.

It would be very desirable to possess the controlling markets of raw materials, such as rubber, which this country does not produce, and particularly those that enter largely into our requirements. But as has been noted, these are for the most part free of duty, and would be benefited by free ports only to the extent to which these ports might assist in developing the desired new trade channels.

Raw materials which the country does produce and which are dutiable, such as rice, wheat and other breadstuffs, sugar, tobacco, and certain vegetable oils, would be directly benefited to the extent that the free port system would release the transshipper—agent, refinery, factory—from the burden of red tape and attendant expenses. Though, as Irving T. Bush has suggested, the simpler remedy here would lie more naturally in an overhauling of the present bonded warehouse and drawback systems.

Materials required in the manufacture of merchandise which we would be able to sell abroad would be advantageously handled through free ports where these materials are either not available in this country or are in insufficient quantity. To what an extent these would enter into our growing export trade in manufactured articles it is difficult to determine from data available—probably only in relatively small amounts.

The Danger in Free Ports

The transshipping of foreign manufactured articles to the possible detriment of our own manufacturers would seem to require most careful economic consideration. A free port would not, of course, do more than simplify a trade movement now fully possible. But it might prove to be a deciding factor in a competition between a United States and a foreign manufacturer in the sale of goods to a country in which the foreign seller did not have direct sales or shipping connections. To take a very possible case as an example—suppose that a group of European railway supply manufacturers, availing of the facilities of a United States free port, were to have in stock there a complete line of their products, any selection from which could be offered to a foreign buyer—say from the west coast of South America. (Goods in bonded warehouses, where this merchandise would now be stored, may only be removed intact in the lots in which it is entered.) The foreign manufacturer would then have an equal advantage with our manufacturer in point of quick delivery.

Free port legislation would apparently be of benefit only to a small part of our foreign trade, and that part certainly does not include railway supplies. Suppose, however, that those few who would be directly benefited were to make their case sufficiently strong to warrant the support of those who would have no real use for the facilities. The legislation might conceivably be passed on the basis that every encouragement, however slight, should be given to our foreign trade. What might be the working out of the plan?

Certain benefits do accrue to the immediate locality in which a free port is located—the manufacturing interests attract labor in addition to the necessary dock labor, and real estate values appreciate; the movement of ships and their cargoes, with attendant expenses, and the banking, insurance, and other trade features are at least of local benefit. If the number of free port districts is restricted, the competition for these districts on the part of local chambers of commerce would undoubtedly open the way for political preferment and dissatisfaction. If the number is not restricted—in view of the necessarily expensive customs guard around each district, this is hardly conceivable—the benefits that might be gained by one, two, or even three large ports would with a larger number be "spread so thin" that they would not be worth while.

New York stands out pre-eminently as a location for one of the ports, should it be proved that they are of advantage to the country as a whole. Criticism has been expressed of

the already congested condition of the port, but the fact nevertheless remains, that the port handling 50 per cent of the United States imports is the natural radiating point for steamship lines to and from the greater part of the world, and that the selection of any smaller port on the Atlantic would be an attempt to divert trade much further from its natural channels than we are already trying to do in our attempt to establish the United States as a transshipping country in competition with England and Germany. Proper port development would allow a free port district to be accommodated.

Possible Free Ports

In addition to New York, one district, if the tariff commission finally recommends the free port idea and Congress passes it, would probably be of advantage on the Pacific Coast, and another on the Gulf. Neither of them would be large; each would cater to a relatively small number of commodities.

Dock Commissioner Hurlburt of New York has remarked that the protectionists in Congress are against the free port idea because they think it will let materials in free of duty; the free traders are opposed to it because it presupposes the continuance of tariffs. In general, there is a very great lack of public understanding as to what free ports are intended to do, and how much they will be able to accomplish for the benefit of our foreign trade. Many have spoken in favor of the idea, some of them, it must be stated, without a very clear conception of the volume of our trade that would be affected. And certain importers whose raw materials are not subject to

duty and who would, therefore, be only directly benefited, have urged the ports apparently on the ground that some time their commodities might be made dutiable. A very few, among them Mr. Bush, have expressed disapproval of the idea instead of taking for granted the general and unconfirmed statement that "it would be a good thing for the country, and, therefore, I am in favor of it."

If most of our merchandise were subject to duty, free ports would probably be a good thing for the country, if under existing tariffs it can be proved that it would be of enough use to the country, it would to that extent still be a good thing. But the burden of proof does very definitely lie with those who would make use of the facilities. Unless the tariff commission has already done so, the next step would appear to be a thorough referendum among those who would be affected to determine how much the free ports could be used on the basis of present trade tendencies. This would seem to be more productive of tangible results than any number of hearings.

The hearings held this past winter in various cities were advantageous in that they represent a part in the necessary campaign of education as to the functions of a free port. Such a campaign should be carried on in any event. But the remarks at the New York hearing were very general indeed, seeming to lack entirely any concrete data as to who and what would be benefited. Until the tariff commission or some other body can give us more definite facts, let us not be so hasty in urging free port legislation as the great panacea with which to develop foreign trade.

Freight Operations Under the Railroads' War Board

Remarkable Seven Months' Record, Partly Neutralized by Intolerable Conditions in November

DURING THE NINE MONTHS April to December, 1917, the railroads of the United States moved 9.8 per cent more ton miles of revenue freight than during the corresponding period of 1916 with an increase of only 1.1 per cent in the average number of freight locomotives in service and of only 2.9 per cent in the number of freight cars. This period covers that part of the year after the United States declared war against Germany and corresponds closely with the period during which the railroads were operated under the general direction of the Railroads' War Board.

The war board was organized at a meeting in Washington on April 11. For the purpose of recording the results obtained from its campaign for increasing the efficiency of the American transportation system it inaugurated a series of monthly reports of freight operations containing information which formerly was not available except in annual statistics. These reports were compiled by the Bureau of Railway Economics and that for the month of December, with a combined summary for the nine months, has recently been issued, as noted in last week's issue.

The combined report for the nine months, which is reproduced herewith, is of special interest as an indication of the results accomplished by the roads under the direction of the War Board. It covers the operation of 227,651 miles of line, or about 98 per cent of the operated mileage of Class 1 roads.

The primary purpose of the Railroads' War Board was to increase the efficiency of the roads to enable them to handle the maximum of freight with the available facilities; and to accomplish this purpose it devoted its efforts largely to obtaining a heavier loading of cars, the maximum tonnage per train, the elimination of delays in loading and unloading of

cars, greater mileage per car and per locomotive per day and an increase in the available transportation capacity by proper attention to repairs of cars and locomotives.

During the nine months' period under its direction the railroads represented in the table handled 303,751,995,337 ton miles of revenue freight, which is more than the entire revenue traffic of all the roads for any preceding full year except the record year 1916. In the calendar year 1916 the total for the Class 1 roads was 362,154,291,397 and in the year ending June 30 it was 339,883,189,699, but the largest previous total was 301,398,752,108 in 1915. The freight earnings in the calendar year 1916 were 19.1 per cent greater than in 1915.

The table also shows how the increase was accomplished. The average tonnage per train was increased from 624 to 667, or 6.9 per cent and the tonnage per loaded car was increased from 25 to 27.3, or 9.2 per cent. The average mileage per locomotive per day was increased from 66.6 to 67.9, or 2 per cent, but the average miles per car per day decreased 1.8 per cent, from 27.3 to 26.5, so it is apparent that most of the net increase in efficiency resulted from the campaign in which the shippers co-operated for heavier loading of cars.

When examined in comparison with the earlier monthly reports the table also shows the effect of the increasing congestion of freight during the later months of the year in the eastern district which resulted from the confusion caused by indiscriminate use of preference orders and the concentration of export freight at a few North Atlantic ports. The decrease in miles per car per day for the nine-months period is the result entirely of the conditions on the eastern lines, where the reduction was 5.5 per cent. The southern lines

showed an increase of .9 per cent and the western lines of .3 per cent.

For the six months, April to October inclusive, the increase in revenue ton miles handled had been 14 per cent, and there had been an increase in miles per car per day of 2.2 per cent.

The average mileage per locomotive per day had also in-

creased by 17 per cent over April, 1916. In May the increase was 16.1 per cent, in June 23.2 per cent and in July 20.2 per cent. By August, however, the increase had fallen to 8.4 per cent, in September to 2.9 and in October it was 5.3. In November there was an increase of only 2.9 per cent and in December there was an actual decrease of 2.6 per cent. The reduction in the rate of increase is partly attributable to the

FREIGHT TRAFFIC OF STEAM RAILWAYS, NINE MONTHS, APRIL TO DECEMBER, INCLUSIVE; 227,651 MILES

d Decrease.

creased by 4 per cent. But the report for October and seven months showed decreases in the mileage per car and per locomotive. In both of these items the best record was shown in the month of May, when average mileage per locomotive per day reached 71.3 and the mileage per car per day was 29.6. In October the mileage per locomotive per day was as high as 69.8 but by December it had fallen off to 61.6. In December the mileage per car per day had fallen to 21.3 and in the eastern district to 16.7 as compared with 21 in December, 1916.

These figures illustrate how the remarkable record made during the first six months was to a considerable extent offset by the conditions of October and particularly of November and December.

In April the revenue ton miles moved showed an increase

fact that the figures for the later months are in comparison with the period of 1916 when traffic was increasing in volume.

COAL EXPORTATION AGREEMENT BETWEEN CENTRAL POWERS—According to an article published in the *Bohemia*, at Prague, it was agreed at a meeting held in Berlin between the German, Austrian, and Hungarian coal distribution officials, that for the months of March and April there shall be sent monthly to Austria a total of 572,500 tons of coal and coke from Silesia, and to Hungary 243,500 tons. In return, 275,000 tons of brown coal from the northwest Bohemian fields and 8,000 tons of hard coal from the Kladno and west Bohemian fields are to be sent to Germany.

Motive Power Conditions During the Past Winter

A Shortage of Locomotives Aggravated by Causes Mainly Produced by Weather Conditions

PROBABLY THE ONE THING to which the inability of the railroads to meet fully the extraordinary demands which have been placed upon them during the past winter has been attributed most commonly is a shortage of locomotives. There has been a shortage of motive power and undoubtedly this has been due partly to an actual shortage of locomotives. It is true, however, that much of the difficulty which has been attributed to a shortage of locomotives, has been due directly or indirectly to conditions which more locomotives could not have overcome.

A study of the orders for locomotives placed annually during the last decade indicates that there is an actual shortage of locomotives. A comparison of the number of locomotives ordered during the years 1909 to 1913, inclusive, with the growth of traffic and locomotive mileage performance during those years, indicates that the orders were about normal. The average orders placed during that period were for about 3,600 locomotives per year, while in 1914 orders were placed for but 1,265 locomotives, and in 1915 for 1,612 locomotives. An improvement was shown in 1916, when about 2,900 locomotives were ordered, but the number fell off again by about 200 locomotives in 1917.

While the number of locomotives ordered in 1914 and 1915 was very small, it was not an undue reduction when considered in comparison with the actual business handled during those years. But it left the railroads unprepared, for the sudden and rapid increase in traffic which began during the fiscal year 1916 and has continued ever since, and the exceedingly slow deliveries which have been the general rule since have given the roads little opportunity to catch up. Furthermore, the conditions are not fully indicated by a study of data applying to the country as a whole, owing to the fact that the extraordinary increase in the amount of traffic handled during the past year has not been uniformly distributed. In a large measure it has fallen upon the railroads in the eastern section of the country, all of whose facilities have been strained far beyond the extent indicated by general averages.

The motive power shortage which has been so acute during the past winter has been due, however, much more to causes decreasing the capacity of the locomotives actually available, than directly to a shortage of locomotives. The past winter was the second through which the railroads have been operating under extraordinary traffic conditions. While a few roads were able to enter the winter with their power in better shape than it was just prior to the preceding winter, in general there was a lack of a normal reserve in the average condition of the locomotives of the country. The effect of the exceedingly severe weather conditions would have been dire even with all the power in the best possible condition.

Effect of Severe Winter

In considering this matter, it should not be overlooked that winter conditions always affect the capacity and efficiency of motive power in two ways: First, by decreasing the tonnage rating during storms and cold snaps; second, by materially increasing the number of engine failures. Without considering the effect of snow, which may decrease the hauling capacity anywhere from zero to 100 per cent, the low temperatures prevailing in the eastern section of the country, and even in some sections of the south usually but slightly affected by winter conditions, required a reduction

of 25 per cent and upwards in maximum train loading. Ordinarily, the aggregate loss of capacity to the railroads in the greater part of the country is not large from this cause because the heavily reduced ratings are in effect for comparatively short periods and but a few times in the course of the winter. During the past winter, however, extremely low temperatures prevailed over practically all of the eastern section of the country, where traffic conditions were densest, for the greater part of two months and the snowstorms rapidly succeeding each other necessitated even greater reductions in trainloading. It is therefore evident that even though operation had otherwise been normal, the effect of the winter must have been an abnormally large loss in locomotive capacity.

Anyone who has followed the course of locomotive failures has observed the marked increase in their number during the winter months, even under average winter conditions. That engine failures should increase far beyond the normal winter average during the past winter was inevitable, even with all other factors affecting the condition of motive power remaining normal. But other factors were not normal. The capacity of locomotive terminals was decreased; for several months there has been an excessive turnover of firemen, resulting in a large number of inexperienced men being in service during the past winter, and the railroads have suffered their full share of the difficulties incident to any attempt to make steam from the kind of coal mined last winter.

While there may have been but little, if any, actual decrease in the number of men employed in the maintenance of locomotives during the winter, there has been a sufficient loss of experienced mechanics to materially slow up the operation of locomotive terminals. Added to this was the disorganizing effect of two months of continuous winter weather conditions, unprecedented both in the severity of the cold and in the quantity and frequency of the snowfall. Not only was the efficiency of labor greatly reduced, but it was practically impossible to maintain the usual number of men in service, especially on the exceedingly important, but disagreeable outside work around engine terminals.

The delays to the movement of power at engine terminals caused by these conditions resulted in the freezing up of many locomotives and increased the amount of running repairs required. While it is not impossible to operate locomotives without freeze-ups under the most severe weather conditions, even where they must frequently be stored outdoors in the winter, such a result can only be attained at the price of eternal vigilance on the part of engine terminal forces accustomed to such weather conditions. Where such conditions are not ordinarily experienced, however, and where more or less inexperienced labor is employed, an excessive number of locomotive freeze-ups, resulting in broken cylinders, burst brake pipes, etc., is inevitable.

These conditions all resulted in decreasing the amount and condition of the power available for the use of the transportation department. All of them directly affected the mechanical department or operations under its control. There were unusual operating conditions which had either a direct influence on the effectiveness of the locomotives while in service or indirectly produced similar results by hindering the proper maintenance of the power.

For a year or more there has been an excessive turnover of firemen as a consequence of which there are a large

number of comparatively inexperienced men in the engine service of many roads. At any time such a condition is a handicap and it was unusually so last winter. Low temperatures and snow always increase the difficulty of maintaining steam pressure and become a severe test of the skill of the most experienced firemen, and coal to the uniformly low quality available last winter does not help matters any. A slowing down of train movement, a loss of engine capacity and an increase of engine failures can only be the result of such a combination.

A regulation of the Fuel Administration requiring railroads to use coal on a pro rata basis from all mines which they served had a disturbing influence upon the quality and grades of coal which some of them were able to obtain. In one case this increased the number of mines from which the road received its coal by several hundred and resulted in a loss of control over the distribution of the several kinds of coal mined in the district.

The exceptionally high traffic density prevailing on the eastern railroads for the past year has resulted in the utilization of yard and terminal facilities practically to capacity. But little additional burden was necessary to cause congestion at these points, which immediately resulted in a general slowing up of the traffic movement. The additional burden was supplied by the weather conditions. Again, one of the effects was a loss of motive power. The congestion at terminals caused long delays to trains waiting to enter the yards. Indeed, it has not been an uncommon occurrence for crews to be caught by the 16-hour law almost within sight of the home terminal. Every hour of delay on the road means one less hour for the locomotive in the hands of the mechanical department for needed attention, as well as a probability of a considerable increase in the amount of work required to keep the locomotive in good condition. Furthermore, the long delays to locomotives caught in the storms, which followed each other in such rapid succession, resulted in very rapid deterioration. In fact, as one railroad man expressed it, the best way to operate a railroad under such conditions is "to put the locomotives in the roundhouse and lock the doors" until the storm has subsided.

Getting Ready for Next Winter

The foregoing paragraphs indicate that there were many contributing causes other than an actual shortage of locomotives to the shortage of motive power which has been so keenly felt during the past winter, and that practically all of them had their origin in the unprecedented severity of the winter. With the smooth running of locomotive terminals and regularity of road operating conditions following the winter weather there is evident a general catching up on running repairs and a marked improvement in motive power condition so far as the present and immediate future are concerned. Probably the greatest immediate need for motive power is in yard service to facilitate the clearing of terminals of the accumulation of cars encroaching upon their working capacity.

In order that the railroads may enter next winter with an adequate reserve of power, however, it is probable that not less than 60 per cent of the locomotives of the country will require general overhauling within the next seven months. This is an unusually large program and its accomplishment will necessitate extraordinary effort and the most effective use of every available facility for locomotive repairs.

Of the greatest value in meeting this demand for repairs will be more stable labor conditions. The best information available indicates that the number of men employed in the maintenance of locomotives is larger now than it was a year ago, which is a hopeful sign for future output. This, together with a decrease in labor turnover, due to a gradual stabilizing of the demand for labor in all industries, a gen-

eral realization on the part of men employed in railroad work of the importance to the country of the work they have in hand in their present positions, and the confidence that they will receive full justice which should be inspired by the Railroad Administration's handling of the whole wage problem, undoubtedly will have a very beneficial effect in increasing the general efficiency of locomotive shop operations. The working of longer hours already has had its effect in many shops and as the plan of working becomes more generally adopted a material increase in the aggregate output of the railroad shops of the country may be confidently expected.

Many railroads do not have adequate facilities for taking care of their requirements for power for general overhauling even under normal conditions, and under the extraordinary demands upon shop facilities obtaining in the present situation, they are finding it impossible to bring their power back to a condition in which there will be a normal reserve with which to face another winter. While it is doubtful if there is any railroad with what actually may be considered a surplus of shop capacity, there are a number of railroads with such relatively large shop capacity that in the present emergency they are fully justified in helping out those roads which are less fortunate. The railroads have already taken advantage of such possibilities and at the present time over 100 locomotives are being repaired in shops other than those of the owning roads. Until recently, however, this matter has been handled in a haphazard manner. It is now in the hands of the Manager of the Locomotive Section of the Railway Administration, under whom, as pointed out elsewhere in this issue, the fullest advantage will be taken of the country's aggregate shop capacity.

As was indicated at the beginning of this discussion, the acute shortage of motive power obtaining during the winter may be attributed perhaps as much to an unusual decrease in the effectiveness of the locomotives already available, brought about by conditions which could not altogether be overcome by the addition of new locomotives, as to an actual shortage in the number of locomotives. The importance of bending every effort to putting existing locomotives back into the best possible condition is therefore evident.

There are in service a large number of locomotives built before the general adoption of the superheater. Many of these locomotives are still of too great economic value, even under normal conditions, to be retired from service. The added capacity which may be obtained by the conversion of these locomotives should not be overlooked in an attempt to keep down expenditures or to expedite the turning of power through the shops. For the additional expenditure of money and labor required to make the conversion, as much additional hauling capacity could not be obtained in any other way.

There will be little difficulty in using all of the new locomotives the builders can turn out this year. The builders will probably be able to turn out between 3,500 and 4,000 locomotives for domestic use during the year 1918, a number considerably more than 1,000 in excess of the number built for home railroads last year. These locomotives, the distribution of which will more closely conform to the actual local requirements for new power than has ordinarily been possible, will add materially to next winter's reserve.

Indeed with the added relief which smoother working and better co-ordinated traffic arrangements have already offered, there is every reason to believe that the railroads will be in a far better position to meet the essential demands of the country next winter than they were last. Just what the weather will do to transportation, the country can only wait and see. It is a safe assumption, however, that it has few terrors which we have not already experienced.

Government Control of Railway Traffic Departments

Abandonment of Solicitation and Advertising Among the Changes Introduced by New Regime

GOVERNMENT CONTROL OF RAILWAYS has had, and probably will continue to have, more far-reaching effects on the traffic departments than in any other branch of the railroad organizations. The big outstanding fact brought out by the assumption of the control of the carriers by the government is the unification of the transportation system of the country for operating purposes. This, added to a condition of superabundant traffic resulting from war conditions, made the continuance of freight and passenger solicitation questionable. On the other hand, it has been the general consensus of opinion that traffic representatives who have devoted their lives to the solicitation of competitive business cannot be lightly considered. While the situation has reached the point where the director-general has ordered the discontinuance of solicitation, it is the understanding of those in close touch with the Railroad Administration that every effort will be made to take care of the soliciting forces in other railroad work.

It has been pointed out by many traffic men that the elimination of solicitation will not in any way alter the necessity for informative work on the part of the traffic departments. In other words, under any method of operation the public will demand certain information in regard to fares, rates, routes, classifications, service, etc. According to the latest information all outside traffic agencies throughout the country will be closed and the informative work done by them will be taken over by resident lines. For this purpose it will probably be necessary for the local lines to employ agents of outside offices to take care of business destined to the territory with which their work has made them familiar. In the passenger field it seems to be the intention of the Railroad Administration to centralize all city ticket offices, thereby saving the expense of maintaining separate offices in choice locations in the larger cities. Up to the present time ticket offices in both Washington, D. C., and Atlanta, Ga., have been combined.

An expected corollary of the order to discontinue solicitation was the order to stop advertising. Although the railroad administration has not specified what it means by "advertising," a literal interpretation of its order would mean the discontinuance of all efforts to increase passenger travel and freight traffic through the medium of publicity. While it is generally understood that this order will mean the end of campaigns to encourage pleasure tours to national parks, national monuments, summer and winter resorts, it is not interpreted as meaning the discontinuance of agricultural and industrial development work carried on for the purpose of creating new sources of freight traffic. It is pointed out that the agricultural work carried on by the railroads is particularly valuable at the present time to increase the food production of the country during the war. The fruitful efforts of the roads in this direction last year are pointed to with justifiable pride. One of the advantages which it is hoped will develop from the elimination of competition is further attention on the part of the railroads to the needs of all their patrons regardless of their size and importance. Under competitive conditions the railroads necessarily gave the best service to the large shippers and undoubtedly in many instances the small shippers at local points suffered.

One of the most radical changes ushered in by the new regime is the re-schedule of passenger service between the large cities of the country, with absolute disregard of former competitive conditions and with the one purpose in view of reducing passenger service to the minimum in order to save

fuel and locomotives for the movement of freight traffic. While the Railroad Administration has caused the removal of a large number of trains throughout the country, and particularly in the East, the first case of the revision of the schedules of all railroads operating between two large cities was the rearrangement of service between Chicago and St. Louis, effective March 17. The new plan resulted in a reduction from 15 daily trains between the two cities to 9, more evenly distributed throughout the day. The plan also provides that tickets between these two points are interchangeable, thereby enabling passengers to use other roads if the train they intended to take is overcrowded. While the Railroad Administration has made no definite announcement to that effect, it seems to be the general opinion that passenger tickets throughout the country will be made interchangeable. The director-general's staff is now working on the re-schedule of train service between other large points in the country, and in the course of time, no doubt, passenger service will be reduced to the minimum needs of the traveling public.

There is considerable speculation as to the future of the various territorial rate committees. In view of the further elimination of competition between roads, the logic of the situation would seem to demand a further extension of the work of these bodies rather than a curtailment of their work. There is some study of the possibilities of creating superior regional rate committees to take care of the larger questions affecting the three railroad regions of the country. These committees as well as the territorial committees will undoubtedly consist of railroad traffic officers of prominence who will have more real authority than the present committees and will hold sessions whenever necessary to consider the applications and complaints of the shippers and consignees in their jurisdictions. Under the present arrangement the negative vote of one road will nullify any action under consideration by a committee. Under the new plan all questions will be determined by majority vote. Under the new plans, if worked out, it is probable that joint tariffs will be issued in much greater numbers than in the past, and this will call for increased activity on the part of the committees. This view seems to be reaffirmed by the plans the Railroad Administration is understood to be preparing for the routing of freight. These plans, it is believed, include the working out of routes in the main avenues of traffic without regard to any principles except such physical facts as distance, grade, the condition of roadbed and rails, etc. This will mean that company lines will be ignored and the business which individual roads have spent years to build up will go over the roads which can handle it most economically.

All in all, the effects of government control on the personnel and methods of the traffic departments of the American railroads have been most profound, but we are still in the transition period with many problems yet unsolved. It is therefore only possible to outline what has been done up to this time and to indicate the probable developments of the future. The Railroad Administration is working out these problems carefully and deliberately with the greatest possible deference to the continued stability of traffic, relationships and the rights of railroad employees and officers who have spent their lives in competitive activity. For this work Director-General McAdoo has selected some of the foremost traffic executives of the country to assist him, and it is unlikely that he will take any steps that are ill-advised or unsound.

Corporate and Operating Organizations Separated

THE POLICY OF THE RAILROAD ADMINISTRATION, that the corporate and the operating functions of the railways are to be distinctly separated under federal control of the roads, the corporate functions to be under the control of the companies and paid for out of the compensation to be guaranteed by the government for the use of the properties, and the operating functions to be under the control of the director general and his organization and paid for out of operating revenues, was more definitely indicated than it has been heretofore by a general order and a circular issued by Director General McAdoo on March 28 and March 30. The general order provides that the president of each company shall be treated as the principal executive authority in all matters of operation and that the chairmen of boards of directors, or of committees of boards of directors, shall not exercise functions connected with the operation of the roads under federal control. The circular expresses the opinion that the government ought not to pay the salaries and expenses of officers whose services are not reasonably required for the operation of the roads.

This idea was expressed in a general way in Circular No. 10 issued on March 18, which provided that after April 1 expenses of offices, including salaries, devoted to financial affairs as distinguished from operation, might not be charged to operating expenses except as expressly authorized. This circular applied particularly to the financial offices in New York and elsewhere but it was understood as indicating the separation which was to be made between corporate and operating functions. It provided, however, that each carrier should present a statement showing the amount of such expense which it was claimed should fairly be chargeable to the government, with the reasons therefor.

General Order No. 16 and circular No. 17 are more explicit in indicating the policy to be followed although no order is made except as to chairmen of boards or of executive committees. It is stated that the entire subject is still under consideration and that the government may charge back against the corporate funds of the company any amounts charged to operating expenses after April 1 which it does not consider are properly chargeable to operation. The circular applies not only to financial officers but to traffic officers, counsel, and practically retired officers who have been continued on a salary in recognition of past services. Many of the railroad companies have already given consideration to these questions and it is understood that arrangements have already been made to transfer a considerable number of officers from the operating to the corporate accounts.

The order and the circular are as follows:

General Order No. 16

"In the organization of the various carriers, some doubt appears at times to exist as to the extent to which, if at all, the executive authority in operating matters is divided between the president of the company and the chairman of its board of directors, or of some committee thereof.

"For the purpose of simplification and definiteness it is ordered that the president of each company shall be treated by the United States Railroad Administration as the company's principal executive authority (subject to the director general), in all matters of operation under federal control and that chairmen of boards of directors, or of committees thereof, shall not exercise functions connected with the operation of the railroads under federal control."

Circular No. 17

"The director general is of opinion that the government ought not to pay the salaries and office and traveling expenses of officers whose services are not reasonably required

for the operation of the railroads. It is, of course, evident that in the past the railroad companies, in establishing and maintaining their staffs of officers, have provided not only for the actual necessities of operation, but in addition have provided (a) for financial and corporate functions beyond what is necessarily connected with operation—for example, functions calling for chairmen of boards of directors and of executive committees, etc.; (b) for other activities in which the company may be lawfully engaged, but whose operation is not to be conducted by the government; (c) for operating functions which were natural when railroads were operated under the competitive system, but which are unnecessary under existing conditions—for example, traffic functions connected with the obtaining of traffic rather than with the giving of adequate and convenient information and assistance to the public; (d) for officers who have practically retired from service and whose salaries have been continued because of their past services rather than because of their need for current operation; (e) for counsel whose services have not been needed for the conduct of ordinary operating activities of the company but who to a large extent, if not entirely, have devoted themselves to matters of a corporate character; (for example, many of whom are now devoting themselves to the problems in connection with the making of the contracts with the government for the use of the railroads).

"It will be necessary for the government to make a careful study to determine the extent to which operating expenses under government control should be relieved of charges for the salaries and office and traveling expenses of officers not necessary to carry on operating functions, and this circular is to give notice that this subject is and will be under consideration, and that in clear cases the government may charge back against the company any amounts charged into operating expenses on and after April 1, 1918, for the salaries and office and traveling expenses of officers who are not required to conduct railroad operations.

"This policy will not affect the positions of any officers whom the company itself may desire to continue to pay out of its own funds, but who are not necessary to railroad operations.

"It is the purpose of the government to carry out the above policy in a reasonable and considerate way and not to disturb unnecessarily the operating forces of the railroads. In general it is anticipated that the rank and file of railroad officers are needed for the conduct of the company's business and that practically all railroad employees, as distinguished from officers, can be continued in service even though the offices in which they now work may no longer be continued. It is believed that the readjustment of operating charges above suggested will be called for almost, if not entirely, with reference to general officers of the character illustrated by clauses a to e, whose functions are not necessarily connected with operation."

GERMAN FREIGHT ROBBERIES CONTINUE.—According to an official statement in the Prussian Diet concerning robberies on the State railways during 1917, merchandise to the value of \$14,250,000 had been stolen from freight trains and depots alone. The Minister of Public Works said that in 1914 only \$1,175,000 worth of freight was stolen. In 1916 the amount rose to \$4,450,000, and by the end of 1917 it had increased by more than 300 per cent over the preceding year. Within a certain period, which the Minister did not detail, 1,343 ordinary civilians and 2,622 railway employees, mostly "National Service" recruits were punished for theft. The authorities, says the London Daily Mail, found themselves powerless to check the carnival of robbery. They were compelled to regard it as a "war evil" which time alone would eradicate. Meantime they were forced to acknowledge that the security of freight entrusted to the State railways could not be guaranteed.

Large Expenditures Needed for Maintenance of Way

There Has Been a Marked Deficiency in the Outlay for Upkeep;
Rail Renewals Are Far in Arrears

IT IS A MATTER OF COMMON KNOWLEDGE among railroad men that the present condition of railway tracks and structures in the United States is not in conformity with established standards. In other words, there is an appreciable amount of what is known as deferred maintenance. This is apparent to any seasoned traveler who has noticed the deterioration in the riding qualities of the tracks, even on some of the highest grade main lines—lines which in the past enjoyed reputations for smooth riding and perfection of upkeep. Such purely qualitative comments are of value only as indicating a general tendency, but on the other hand any attempt at a quantitative analysis of anything so intangible as a condition of maintenance is beset with serious difficulties. It is possible to make a detailed inspection of a given piece of track and prepare a reasonably exact estimate of what would be necessary to restore it to standard condition, but a similar study of the conditions throughout the country covering all classes of property, including main lines, and terminals as well, would lead nowhere.

There are, however, a few indexes which may be applied to indicate the relative condition of railway structures and roadways today as compared to what it has been in the past, and of such indications probably the most important is to be obtained by a study of the amount of money spent from year to year for maintenance of way by the railroads of the country. For this purpose, a table is given below showing the expenditures for maintenance of way with the total operating revenues for the years 1913 to 1917 inclusive, and a column showing the per cent of maintenance of way expenses to operating revenues.

CLASS I ROADS

| Year | Operating revenues | Expenditures for maintenance of way | |
|-------|--------------------|-------------------------------------|--------------------------------|
| | | Amount | Per cent of operating revenues |
| 1912 | \$2,744,342,277 | \$348,470,704 | 12.7 |
| 1913 | 3,743,324,782 | 405,840,494 | 13.3 |
| 1914 | 2,969,898,838 | 403,682,593 | 13.6 |
| 1915 | 2,871,563,047 | 364,004,178 | 12.7 |
| 1916 | 3,381,945,764 | 404,554,315 | 12.0 |
| 1916* | 3,592,591,023 | 421,193,640 | 11.7 |
| 1917* | 4,041,914,239 | 444,458,855 | 11.0 |

*Calendar year, all others are for the fiscal year ending June 30.

Operating revenues are given here because of the relatively simple ratio they bear to the traffic carried by the tracks. From an examination of the table it is seen that the percentage relation of the maintenance of way expenditures to operating revenues has decreased from 13.6 per cent in 1914 to 11.0 per cent in 1917. Many of the items making up maintenance of way expenditures are independent of the volume of traffic, so that it is not to be expected that expenditures for maintenance will vary in direct proportion to the amount of traffic carried. Consequently, the decrease in relative proportion of maintenance expenditures from 13.6 per cent to 11.0 per cent, as noted above, is not in itself indicative of any deficiency in the expenditures, were it not for the unfortunate fact that the value of a dollar suffered a remarkable decrease during the period in question.

This is demonstrated in the diagram on which the gross operating revenues have been plotted in relation to the maintenance of way expenditures. Superficially this shows that the maintenance expenditures have increased and decreased relatively from year to year with the variation in the revenues, but to a somewhat less pronounced extent. However, this does not take into account the reduction in the purchasing power of the dollar expended, and to introduce this into

the comparison the three dotted lines have been added which show the reduction in the purchase value of the dollar in procuring three commodities typical of maintenance of way expenditures, namely: rails, track spikes and labor. These are expressed in percentages, taking the quantity that a dollar would purchase of each of these commodities in 1915 as 100 per cent. In the case of rails and track spikes the figures are based on the current quotations, while in the case

Relation of Maintenance of Way Expenditures to Operating Revenues with Indexes of the Decreasing Purchase Power of a Dollar

of labor the computations were based on the average hourly rates paid by a middle-western railroad for section laborers in typical rural communities.

These examples are given merely as indicating tendencies and it is not to be expected that these decreasing percentages may be applied directly to the expenditure for maintenance of way to determine the relative amount of effective work done in 1917 as compared to 1914. Nevertheless they give some indication of the decrease in the effectiveness of the expenditures made.

Rail Renewals

As rails form the all-important part of the track structure and as their purchase constitutes one of the large items of expense in maintenance of way, a study of rail purchases furnishes another insight into general maintenance conditions. However, a comparison of the rail renewals in any two years does not necessarily furnish a conclusive indication of the relative degree to which the tracks are being restored to standard condition, since a certain part of the tonnage has been purchased each year to be used in or as

an indirect result of newly constructed lines. Neither is it entirely safe to compare rail renewals from year to year with the traffic (operating revenues) or mileage because the increase in wheel loads, the use of heavier rail sections, and the change from Bessemer to open hearth rails, have without doubt produced some material modification in the relation of traffic to rail wear.

With these limitations in mind, attention is directed to the table given below which shows the tonnage of rails pur-

CONSUMPTION OF RAILS, TOTAL MILEAGE AND GROSS EARNINGS

| Year | Tonnage of rails used | Total mileage | Gross earnings | Gross earnings per ton of rails consumed |
|------|-----------------------|---------------|-----------------|--|
| 1893 | 1,119,470 | 221,863 | \$1,220,751,874 | 1,090 |
| 1894 | 1,008,516 | 229,795 | 1,073,361,797 | 1,064 |
| 1895 | 1,291,983 | 233,275 | 1,075,371,462 | 832 |
| 1896 | 1,056,675 | 239,140 | 1,150,169,376 | 1,088 |
| 1897 | 1,500,086 | 242,013 | 1,122,089,773 | 748 |
| 1898 | 1,679,538 | 245,333 | 1,247,325,621 | 742 |
| 1899 | 1,997,120 | 250,142 | 1,313,610,118 | 658 |
| 1900 | 2,075,511 | 258,784 | 1,487,044,814 | 734 |
| 1901 | 2,557,588 | 265,352 | 1,588,526,037 | 621 |
| 1902 | 2,943,789 | 274,195 | 1,726,380,267 | 586 |
| 1903 | 3,057,195 | 283,821 | 1,900,846,907 | 621 |
| 1904 | 1,906,237 | 297,073 | 1,975,174,091 | 1,036 |
| 1905 | 3,098,184 | 306,796 | 2,082,482,406 | 672 |
| 1906 | 3,654,794 | 317,083 | 2,325,765,167 | 636 |
| 1907 | 3,298,500 | 327,975 | 2,589,105,578 | 785 |
| 1908 | 1,726,224 | 333,645 | 2,440,638,832 | 1,413 |
| 1909 | 2,725,847 | 342,351 | 2,473,205,301 | 907 |
| 1910 | 3,290,712 | 351,766 | 2,812,141,575 | 854 |
| 1911 | 3,405,330 | 362,824 | 2,852,854,721 | 1,186 |
| 1912 | 2,885,222 | 371,237 | 2,906,415,869 | 1,007 |
| 1913 | 3,052,635 | 379,508 | 3,208,427,649 | 1,051 |
| 1914 | 1,792,986 | 387,208 | 3,127,729,588 | 1,744 |
| 1915 | 1,891,349 | 391,141 | 3,094,055,110 | 1,583 |
| 1916 | 2,340,468 | 394,944 | 3,623,252,371 | 1,549 |

chased by the railroads between 1893 and 1916 inclusive, in comparison with the total mileage of all tracks and the gross earnings. Considering the tonnage of rail purchases alone, it is seen that the rails purchased in 1914, 1915 and 1916 aggregated 6,024,803 tons, which is less by 1,717,980 tons than the tonnage purchased in any three consecutive years since 1902. The average for the three years 1914, 1915 and 1916 is only 2,008,268 tons as compared with an average of 2,837,055 tons for the years 1902 to 1913 inclusive. Assuming that this average represents a fulfillment of normal requirements and allowing for the 20 per cent increase in the mileage of tracks since 1907, the mid-year of this period, it is seen that rail renewals in 1914, 1915 and 1916 were deficient by 4,000,000 tons.

The chances are that the deficiency in rail renewals is really greater than this, as there is reason to believe that rail renewals from 1908 to 1913, during which railway finances were gradually approaching the condition to which they

were depressed in 1914, were curtailed at least in a measure from what good judgment would have indicated as requisite for adequate maintenance, if the money had been available. Some indication of this tendency may be had by studying the last column in the table, which shows the number of dollars of gross earnings per ton of rails purchased. It is seen that this amount ranged between \$586 and \$785 in all the years from 1897 to 1907 with the exception of the single year of 1904, while between 1908 and 1913 this same quantity averaged well above \$1,000 and was more than \$1,500 throughout 1914, 1915 and 1916. This shows that insofar as earnings were concerned, rails were purchased in larger proportion in earlier years, although it must be remembered that new mileage entered somewhat more largely into consideration during former years than it has more recently. However, in spite of these uncertainties the fact remains that on the most liberal basis the rail renewals at the present time are seriously in arrears without any consideration of 1917, for which statistics are not yet available.

General Conditions

Aside from any attempt at mathematical demonstration, the general deficiency in maintenance of way is manifested in various ways. With the growing scarcity and increased cost of labor, it is obvious that a large number of inexperienced and inefficient men have been employed in maintenance work, so that aside from the decreased value of a dollar in the purchase of hours of labor, there is no question but that the roads received less effective output for each hour of labor purchased. Shortage of materials and difficulty in securing delivery has also had some effect in slowing up work, although as a general rule the shortage of labor has been the most serious difficulty.

As a climax to the adverse conditions, the winter of 1917-1918 added not a little to the troubles of the men responsible for the condition of track. Going into the winter with the tracks in none too good condition to withstand low temperature conditions, the Middle West and the East experienced unusually severe winters. In some localities the severity of the storms and the prolonged low temperatures have not been equalled in a great many years, while added to all these adverse circumstances, most lines have been compelled to carry a traffic exceeding anything previously imposed. The fact that some of the lines have stood up as well as they have under the enormous traffic, in spite of the inadequate maintenance, is owing to the high standards of condition in which they had been kept previous to the present emergency. However, there is a definite limit to the time that the track may be neglected with safety and the penalty which must be paid as a result of this neglect, coupled with the burden of heavy traffic is now becoming manifest. There is only one cure for this condition—increased expenditures for maintenance of way.

Something New in Light Railway Cars

Can the Freight Car Situation Be Improved?

Many New Cars Will Be Built, But the Maintenance Problem Is Exceedingly Serious

THE RAILROADS OF THE UNITED STATES entered the year 1918 with the greatest number of unfilled car orders ever reported at that season. During the first months of the year the roads struggled with the worst weather conditions they had ever experienced. The movement of traffic was hindered by the severe storms and freight accumulated on the originating lines. As a result the shortage of cars is now even more acute than it was at the corresponding time last year. The excess of unfilled car orders over surplus cars on March 1 was 138,102, which is more than 8,000 greater than the shortage for the same date last year, and with the exception of three months, April, May and November, 1917, is the greatest net shortage on record. The demand for cars is not confined to any particular class of equipment but the shortage of box cars in the middle west is particularly serious as it threatens to result in the loss of large quantities of foodstuffs which are in such condition that they will spoil unless marketed at once.

For more than a year and a half the unfilled demands for cars have been in excess of the number of surplus cars. Though the need for additional facilities has been universally recognized the roads have not been able to secure the capital necessary to provide the equipment. Despite the fact that there was a shortage of cars throughout 1917, the number ordered during that year was less than for any previous year since 1906. The capacity and efficiency of the transportation system are of vital importance during the period of the war. The supply of cars has an important influence on the ability of the roads to handle the traffic that is offered to them. At present the supply of cars is not sufficient to meet the demand. What are the prospects for the future?

From present indications it seems likely that more new cars will be placed in service on the railroads of this country during the present year than they have received in any year since 1912. The Railroad Administration has announced that orders will soon be placed for 100,000 cars. The builders are now in a position to make prompt deliveries. They have comparatively few cars on order and while the material situation has caused some delay in deliveries during the past six months, the conditions at the present time are such that little difficulty should be experienced on account of inability to secure either wood or steel. Reports received from the railroads indicate that while some intend to keep the entire force of car men on repair work, the aggregate number of cars built in company shops will probably be as great in 1918 as it was in 1917. It seems reasonable to anticipate that 200,000 new freight cars can be supplied to the roads this year. This amount of new equipment will do much toward improving the situation as far as car shortage is concerned. However, unless additional tracks, motive power and terminal facilities are provided, an increase in the number of cars will do little to improve the operating conditions and in fact may make them worse.

Even though an exceptionally large number of new cars may be built the greater part of the business must be handled by the equipment now in service. For that reason the condition of the existing rolling stock is quite as important as the amount of new equipment that can be secured. The great increase in the ton miles per car during the last two years has made more than the usual amount of repairs necessary to keep the equipment in good condition. The track has deteriorated during the past year and the abnor-

mally bad condition has had its effect in increasing the wear and tear on rolling stock, besides causing an unusual amount of damage through derailments. There has been a widespread shortage of labor in the car department and the output has been still further reduced by the extreme cold weather. One road, for instance, reported that in a single month the shopmen at one of the large repair points spent over 9,000 ten-hour days shoveling snow and cleaning switches. The result has been that car repairs have of necessity been neglected.

The equipment is far from being in good condition. The draft gear and other parts which must be kept up if the cars are to remain in service are getting most of the attention. Doors and roofs are neglected to such an extent that it is difficult to get cars fit to load with high class commodities. One of the large eastern lines reported that in 30 days it had 200 truck failures due to such minor defects as nuts working off, cotter pins falling out and brake beams dropping. Care in the application of the parts would have prevented these costly failures. The repairs to air brakes are neglected to an extent that makes it necessary to use extra precautions on heavy grade lines. Such a condition should not be allowed to exist as it creates a possibility for serious accidents. Under the car service rules now in effect cars may stay off the tracks of the owning roads for long periods. As a result work which is usually done at regular intervals by the owner is neglected by the handling line because it cannot readily do it. It is seldom that a car is completely repainted except when on the home road. A great deal of steel equipment is now badly in need of painting and unless this is attended to promptly deterioration of the equipment is sure to be rapid.

The condition of equipment is not reflected by the percentage of cars in shop, which is practically the same as last year. For some time every effort has been put forth to move the traffic. The shippers have been willing to load any car that was placed on their tracks regardless of its condition and the railroads have accepted cars which formerly would not have been allowed to pass in interchange. These tendencies cannot go on indefinitely. Unless the equipment is maintained in good condition there will be a large increase in the losses in transit and if carried too far safety of operation will be sacrificed.

The repair work of the car department does not lend itself well to the application of machinery or improved methods, therefore, the question of car repair is largely a matter of securing the proper kind of laborers in sufficient numbers. The conditions vary widely in different sections of the country but on nearly every road there is now a marked shortage of car repairers. The wage increases on the railroads have not kept pace with the advances in other lines of work and in some places common laborers are paid practically the same rate as car repairers. In many sections the wages paid to laborers in the car department are far lower than in most industries. For instance in one southern district the rate for laborers in the car department was 22 cents an hour while the prevailing wage scale among industries and contractors was 30 cents. The result was that the railroad secured an inferior class of labor and was often unable to maintain a full force. To what extent the increases which will be authorized by the wage commission will improve the labor situation it is impossible to state. The working conditions in many car yards are far from ideal. Better

facilities would increase the production per man and make it easier to keep up the force.

Since the government assumed control of the roads the status of the M. C. B. rules of interchange has been radically changed. As it is really the government that does all the work and pays all the bills there is really no necessity for keeping a record of repairs, except as it may affect private car lines or the railroads of Canada and Mexico. It has been suggested that the labor involved in making bills for repairs and in settling the charges might be reduced by establishing regional billing departments. Some have favored even more radical measures and advocated that the rules be suspended for the period of the war. It seems, however, that this would be a step in the wrong direction. The M. C. B. code of interchange rules performs the important function of distributing the cost of equipment maintenance on an equitable basis between the roads.

Aside from this the enforcement of the rules insures that unsafe practices will not be adopted in the construction, repair or operation of cars. Those responsible for the operation of the roads cannot afford to do away with regulations which promote safety. If no record of repairs were kept it would be a difficult matter to insure that every one lived up to the provision of the M. C. B. code. There is no question that some of the rules might well be modified to take care of the changed conditions. For instance, Rule 120, as it now stands, provides that if the labor cost of making repairs to cars, for which the owner is responsible, exceeds a certain fixed amount, varying with the type of car, authority must be secured from the owner before the car is repaired. Under the present conditions no road would attempt to repair a car which would not be worth the labor and material spent upon it, and the work would be expedited if the handling line was not required to secure authority before proceeding with the repairs.

Many cars of weak construction have been given a new lease of life by reinforcement of members which could not meet the requirements of modern service. A great deal still remains to be done along this line. The work of reinforcing cars should be kept up as it offers an opportunity to in-

crease the serviceable equipment at a comparatively small cost. It is impracticable to attempt to reinforce cars except in the shops of the home road and unrestricted routing of cars will hamper the work. Although everything possible should be done toward strengthening cars, most roads will find this an inopportune time to attempt to carry out an ambitious program for the reinforcing of weak equipment. One large road in the middle west had planned to put steel underframes on about 1,000 cars. There was some delay in securing delivery and when the underframes were received the equipment was so scattered that very few cars of the classes that were to be reinforced could be found on the home lines. The records showed that there were 89 per cent of foreign cars on the road. As this is apt to increase rather than diminish, the betterment work will necessarily proceed but slowly.

The high percentage of foreign equipment on the lines promises to make the car repair problem increasingly difficult. The shop men are familiar with the equipment of the home road and on many classes of work their production when working on foreign cars will show a considerable decrease. The forces should be increased to bring the output up to the point where equipment with which the men are not familiar, as well as that owned by the roads on which they work, will be properly maintained. It is, of course, essential that all in the car department, as in all other departments, should realize that the roads are now a unit, and that there are no longer any foreign cars in the formerly accepted sense of the word.

Government control of the roads introduces new conditions in the car department. To meet these conditions successfully will require men who are resourceful and energetic, men who realize what the new order of things means and can act accordingly. Some are still clinging to the practices of former years and in making repairs are giving preference to cars belonging to the roads for which they work. This attitude must change. Every man in the car department must do his part to keep up the condition of all equipment regardless of ownership marks in order that every car may do its share toward producing the maximum of transportation efficiency.

British Infantry En Route for the Front Line

New Embargo Instructions and Car Service Bulletins

THE CAR SERVICE SECTION of the Railroad Administration has issued circular No. C. S. 1-A, a revision of circular No. C. S. 1, dated February 11, 1918, containing the following new instructions to be observed in the handling of embargoes. These instructions supplement and do not supersede those contained in General Order No. C. S. 17, dated January 15, 1918, which was issued by the Commission on Car Service.

1. Place embargo without delay against consignees who do not unload freight promptly upon arrival.

2. When other than an absolute embargo is placed:

(a) Exemptions must include as many of items in paragraph 6 as circumstances warrant.

(b) Such exemptions must be in the order listed.

(c) When necessary to place embargo varying from these provisions request, with supporting detail, must first be submitted to the Car Service Section for approval.

(d) Freight for export via ocean vessels or domestic freight for port cities and their outlying terminals shall be subject to the rules and regulations of the freight traffic committees having jurisdiction over such traffic, also subject to requirements with respect to export licenses as provided for in Car Service Section Circular No. C. S. 2 of February 15, 1918, or supplements thereto.

The committees already created are: Freight Traffic Committee, North Atlantic Ports, 141 Broadway, New York City; Southern Export Committee, Healy Building, Atlanta, Ga.

It is understood that permits for export traffic will be honored against all except general embargoes, or where specifically restricted: also that permits will not be issued for domestic traffic to port cities if such permits are in conflict with outstanding embargoes.

3. It should be understood that an embargo placed against carload freight includes less carload shipments which are ordinarily forwarded in carload lots.

4. Cars must not be loaded in violation of embargoes. When shippers disregard embargoes, agents must not issue bills of lading, and cars will be held at points of origin, subject to current demurrage charges, until released.

5. The instructions herein contained do not in any way authorize preference in car supply for freight exempted from embargoes.

6. Exempted commodities (code word in italics).

Embassy.—(a) Live stock, perishable.

Emblem.—(b) Coal, coke and charcoal; acids, alcohol, ammoniacal liquor, light oil (benzol and toluol), naphthalin, petroleum and its products; empty tank cars; empty metal, glass, or jacketed oil, acid, gas or ammonia containers.

Embank.—(c) Food, domestic (not export), for human consumption, including wheat, corn, oats, rye, barley, rice, cereal products, salt, canned goods, sugar, syrup, molasses, peanuts, vegetable oils and lard substitutes; feed, domestic (not export), for animals and poultry, not including hay and straw.

Embower.—(d) Materials consigned to the United States Government or its authorized agents or officers, including: The Public Printer; the Bureau of Engraving and Printing; the Post Office Department; the War Department (Army); the Navy Department, navy yards and naval stations; the marine corps; shipments consigned to or for account of the United States Shipping Board, Emergency Fleet Corporation; shipments to the American Red Cross; the Imperial Munitions Board of Canada.

*Note.—Shipments for the War Department, destined to points named in Section 1 of Order No. 2, issued by the Director of Inland Transportation, War Department, Feb-

ruary 18, 1918, will be handled in accordance with the terms of that order.

Embass.—(e) Railroad material and supplies (other than coal and coke) consigned to an officer of the purchasing road at a point on such road, materials and supplies for the maintenance and operation of Pullman cars, materials and supplies consigned to locomotive and car manufacturers for the construction and repair of locomotives and freight and passenger cars.

Embed.—(f) Printing paper and printing ink, empty ink drums.

Embolden.—(g) Acetate of lime, acetone, methyl acetone, chemical wood, ketone, carbide, carbon black, chrome, graphite, manganese, pyrites ores, copper, lead zinc, fertilizer, fertilizer materials, including agricultural lime, pulverized limestone phosphate rock, fuller's earth, liquid chlorine, alum, sulphate of iron and similar chemicals when to be used for purification of public water supply, and when consigned to municipal authorities, medicines, drugs, surgical instruments, surgical dressings, spraying materials, including arsenic (basis for insecticide), and implements for spraying, sulphur, tanners' extract, agricultural implements and farm machinery required for preparing the soil, binder twine, canning machinery, electrodes for smelting purposes, field and garden seeds, seed grain, nursery stock, food containers, laundry soap and soap powder, mine props, mine wagons, powder, and other materials and supplies necessary in the operation of coal mines, supplies for oil refineries, scrap and waste paper and other scrap stock for paper manufacture when consigned direct to paper mills or paper manufacturers, supplies for oil and natural gas wells, tin plate for manufacture of tin cans, wood pulp.

Distribution of Cars

The car service section has also issued the following bulletins regarding the distribution of cars:

"Please cancel any conflicting instructions, and effective at once discontinue the use of A. R. T. and D. S. D. refrigerator cars for packing house products. Deliver all A. R. T. and D. S. D. cars released west of Missouri river to D. & R. G. Deliver all such cars released east of the Missouri river to the Wabash and Missouri Pacific, except cars released on Texas lines, including M. K. & T. System and St. L. S. W. System, which will be delivered to the I. & G. N.

"Wabash, Missouri Pacific, and I. & G. N. railways will accept out of route all A. R. T. and D. S. D. cars via any junction point. Cars released by roads having no direct connection with these roads will route via direct lines, who will arrange for acceptance. Prompt movement is necessary to get these cars into Texas territory for the immediate protection of vegetables. We are advising railroads direct."

"The prospects are favorable for a large vegetable and fruit crop, and an unusually heavy movement of meat and dairy products. All available refrigerator, insulated and ventilated cars will be required for this loading, and it is therefore important that the use of these cars be confined strictly to the loading of commodities which require this class of equipment. Also that all such cars available be kept in constant service.

"Any railroad having at any time a surplus will report same to the Car Service Section, in order that such surplus may be directed to territory where assistance is necessary in order to move food-stuffs which otherwise cannot be taken care of."

"Reports from potato loading territory are to the effect that there is in general a sufficient supply of refrigerator cars to meet requirements. Please cancel all restrictions against the application of railroad owned cars for packing house product loading, except Great Northern, Northern Pacific, Soo Line and Illinois Central refrigerator cars.

which should continue to go to owners. This arrangement does not change instructions that Pacific Fruit Express cars move to Union Pacific, American Refrigerator Transit and D. S. D. cars to Mo. Pac. and I. & G. N., Union Refrigerator Transit cars in banana service (series 1000 to 1999) to Illinois Central and Mobile & Ohio, and other U. R. T. cars to Wisconsin roads. Please also arrange that S. F. R. D. cars shall go to the Santa Fe; that F. R. L. cars shall go to the Frisco, Mo. Pac. or I. & G. N. for Texas; and that F. G. E. cars be returned to A. C. L. and S. A. L. for fruit and vegetable loading in Florida."

Director General McAdoo Authorized to Represent President

PRESIDENT WILSON on April 1 issued a proclamation formally vesting in Director General W. G. McAdoo authority to make agreements with the railroad companies for the compensation for the use of their property during government control and otherwise to represent the President as provided for in the railroad control law approved on March 21. The proclamation authorizes Mr. McAdoo "either personally or through such divisions, agencies, or persons as he may appoint, and in his own name or in the name of such divisions, agencies or persons, or in the name of the President, to agree with the carriers, or any of them, or with any other person in interest, upon the amount of compensation to be paid pursuant to law, and to sign, seal and deliver in his own name, or in the name of the President, or in the name of the United States, such agreements as may be necessary and expedient with the several carriers or other persons in interest respecting compensation, or any other matter concerning which it may be necessary or expedient to deal, and to make any and all contracts, agreements, or obligations necessary or expedient, and to issue any and all orders which may in any way be found necessary and expedient in connection with the federal control of systems of transportation, railroads and inland waterways, as fully in all respects as the President is authorized to do, and generally to do and perform all and singular all acts and things and to exercise all and singular the powers and duties which in and by the said Act, or any other Act in relation to the subject hereof, the President is authorized to do and perform."

Negotiations are still in progress between the counsel for the railroad companies and the legal department of the Railroad Administration regarding a standard form of contract agreement for the compensation of the companies for the use of their property. A proposed form of contract was first drawn by John Barton Payne, general counsel; Nathan Matthews, assistant to the general counsel; and C. A. Prouty, director of the division of public service and accounting of the Railroad Administration, with the co-operation of a committee including Commissioners Hall, Meyer, Clark and Anderson of the Interstate Commerce Commission. This was placed before the railway counsel and they in turn drafted another proposed form which was submitted on March 23, through a sub-committee headed by Alfred P. Thom, counsel for the Railway Executives' Advisory Committee, and including A. H. Harris, of the New York Central; George Stuart Patterson, of the Pennsylvania; C. W. Bunn, of the Northern Pacific; S. T. Bledsoe, of the Atchafalaya, Topeka & Santa Fe, and Burton Hanson, of the Chicago, Milwaukee & St. Paul. A joint conference between the representatives of the Railroad Administration and the Interstate Commerce Commission committee and the railroad committee was held last Thursday to discuss details of the proposed contract and further conferences will be held.

Milton H. Smith, president of the Louisville & Nashville,

has denied a report that his company would not enter upon an agreement with the government but would appeal to the courts to fix its compensation. He said that a resolution authorizing an agreement upon the terms proposed by President Wilson had been prepared for presentation to the stockholders on April 3.

State Commissioner for Unqualified Support of McAdoo

AT A SPECIAL PATRIOTIC MEETING of the Pacific Railway Club at San Francisco, Cal., on February 14, the proceedings of which were briefly noted in the *Railway Age* of March 1, page 473, Edwin O. Edgerton, railroad commissioner of California, declared himself in favor of unqualified support of the United States Railroad Administration. He deplored the attitude of certain state commissioners who brought political influence to bear upon Congress in an effort to secure an amendment to the administration's railroad bill whereby the state commissions in every state might issue mandatory orders binding upon the director general as well as upon the railroads. He said that such a course would have immediately plunged the country back into the difficulties under which it was laboring when the government took over the railroads. "In such a great emergency as this," he said, "these regulatory laws do not accomplish their purpose and it would be a fatal error for Congress to inject into the law, or pass any measures that restrict the full power of the director general in running the railroads."

Mr. Edgerton was likewise opposed to giving the Interstate Commerce Commission the final voice in rates. He stated that government control would bring new problems which might require the fixing of new rates promptly and that to force upon the director general a hearing before making such changes would be fatal to effectiveness.

Explaining his own attitude as a state commissioner, he said: "If I see fit to express an opinion to the director general, I shall feel free to do so just as any railroad man should feel free to do. If he does not accept the advice I propose to line up with his decision. I propose to obey promptly any order that the director general may issue. I feel so strongly on that subject—that if the power of the state is retained, it is my judgment that it is the duty of the states to line up with the orders or suggestions of the director general. My conception is that the railroad problem is a national problem. I do not believe it is a state problem. The operations of railroads are so inter-connected, even in state movements, that they can be dealt with only as a national problem, and the whole authority should be centered in one place and under one man. . . . It would seem to me that one organization, one great system, under one control ought to be able to handle the huge job before it better than many separate organizations under many separate heads."

At the same meeting W. S. Palmer, president and general manager of the Northwestern Pacific, called upon all railroad men to get behind the director general and the government and work as they have never worked before to the end that the war may be won. He said there was no room at the present time for such labor-wasting laws as the full crew bill, and on this point said: "Why expend money uselessly to provide positions in the service when man power is needed elsewhere? As to the safety feature: I will only suggest that the annual wage of every extra brakeman employed under such law would equip at least two miles of track with automatic block signals; that the extra money paid under such regulation, since the first of such laws was enacted, would have equipped nearly every main trunk line in the United States with automatic block signals, and the additional safety gained over that secured by the employment of such men

would have been a thousandfold. Once installed, their value continued indefinitely, whereas, when the wage was paid, the service was ended."

He also stated that many branch lines in the United States should be abandoned in the interest of the conservation of cars, motive power and men. Highway motor car service, he stated, would suffice for these communities.

"Now that the stimulus of competition and the necessity for hunting traffic has been in a measure removed," he said, "the traffic people are in a position to exercise what has always been one of their chief functions. They form the intelligence department of the railroads. They come in contact with the public. They meet the shippers; they are in a position to educate them—to prove to them that transportation agencies are anxious to work with them and for them, and that they must drop the selfish motives which have underlain much of their reluctance to comply with regulations the enforcement of which would ultimately result to their own benefit. They must teach the doctrine of the greatest good to the greatest number. Shippers must show their patriotism by enabling the railroad men to double or quadruple the loaded mileage of their cars, to rapidly unload and load cars placed at their establishments to avoid concentration of their shipments in certain seasons."

Professor D. M. Folsom, chairman of the oil committee of the Federal Fuel Administration, addressed the club on the need for fuel conservation on the railroads. He pointed out that California had reached its maximum production of oil and that out of 8,000 oil wells in the state 2,000 were required to furnish fuel for railroads terminating in California.

Government-Owned Telephones in Tokyo Ten Years Behind Demands

GOVERNMENT OWNERSHIP of telephones is working out so far from well in Japan that at the present time there are 50 per cent more people waiting to have their telephone service put in than there are subscribers. The authorities hope to catch up with the demand by 1929—in not less than 10 years. In the meantime telephone brokers have bought up such telephones as are available, and any one who really must have a telephone in a hurry can obtain one for from \$375 to \$500. These facts are taken from the Japan Times and were forwarded for publication in Commerce Reports by Consul General George H. Scidmore at Yokohama. His extract follows:

The number of telephone instruments installed in Tokyo is 45,000. The number of persons who have applied for installations is now 60,000, and will continue to increase. An officer of the department of communications has stated that the authorities are of the opinion that it will be possible to satisfy everyone of these applicants within 10 years, not a very brief period. He was unable to give concrete plans of the government, since they are subject to revision in accordance with any change of conditions in the city. The government, however, is at least resolved to meet the demand within about 10 years.

In order to satisfy the demand for telephones it will be necessary to treble or quadruple the present number of new installations, which calls for great effort on the part of the authorities.

There are many reasons why the telephone system of Japan has so much trouble in meeting the demand. In providing for the expense consideration must be given to the time best suited for the flotation of loans. Thus it is impossible to obtain the capital at will, and work is postponed whenever the money market is hard. There is also the question of employees. Since the work involves the handling of delicate mechanism, experience and efficiency are necessary before the workmen can do the work satisfactorily. The shortage of hands naturally delays installation. The exchange apparatus used in Japan is imported, and being made for foreign operators, is rather too high or too wide for the Japanese telephone girls, so that its full working capacity can not be attained.

These conditions do not exist in other countries. There is no other city where there is such an accumulation of applications. Tokyo has only 2 telephones to 100 persons, whereas the city of Chicago maintains 20 to 100 population. Elsewhere there are no telephone dealers who make a profit on telephone transactions as in Japan.

The telephone is a government monopoly in Japan, and if the government transacted the business itself, these brokers would be unnecessary; but as it is they are necessary evil. The establishment of this brokerage market has brought telephones, like company stock, on the exchange. Like the stock-market price riggers, the telephone dealers attempt various manipulations to bolster the prices.

Tokyo is not the only place where such leaders are active, and they may be seen in all the large cities of the country, especially in Osaka, where prices even higher than in Tokyo are often quoted. Today a good call number costs more than 1,000 yen (\$498.50), while the minimum may be said to be about 750 to \$300 yen (\$374 to \$399).

UNCLE SAM—"Here's a SCRAP o' PAPER
He Won't Destroy in a Hurry"

SHORTEN THE WAR—The sooner the irresistible might of this great republic is organized and put into full action the sooner the war will end. Every dollar invested in government securities works to shorten the war, to save the lives of American soldiers and sailors. Buy Liberty Bonds.

General News Department

Angus D. McDonald, vice-president and comptroller, southern Pacific Company, has been temporarily detailed to Washington as acting treasurer for the Railroad Administration under immediate supervision of the director of finance and purchases.

Three thousand six hundred gardens, averaging one-half acre each in size, were cultivated on the Burlington road's right-of-way, last year; and the company has distributed posters urging employees and the public to utilize the idle land of the company for war gardens again this year.

Economy in Using Fuel Oil is recognized on the Southern Pacific, Pacific system, by a distinctive mark, on the locomotive, of each class, which makes the best showing on its division. This decoration consists of bright red paint on the circular number plate which is borne on the front of the boiler.

Medals, recognizing 25 years of acceptable service, are now worn, or at least possessed, by 3,887 employees of the Southern Railway. President Fairfax Harrison has just made the third annual distribution, giving medals to employees who have completed 25 years' service since the last preceding distribution.

The existing standard time zones have been recognized by the Interstate Commerce Commission. Under the Daylight Saving Law the commission was required to define the limits of the five zones in which should be used, respectively, the times of the 75th, 90th, 105th, 120th and 150th meridians; but there was not time, before the day on which the law went into effect, to do other than recognize the existing limits; and that has been done. The 150th meridian is the standard for all Alaska.

Herbert A. Meyer, assistant to F. K. Lane, Secretary of the Interior, who has had charge (at Washington) of affairs in connection with the construction of the government railroad in Alaska, has been commissioned as a captain in the aviation branch of the Signal Corps and assigned to active duty in the field. The duties performed by Mr. Meyer in the Interior Department will be handled by Assistant to the Secretary E. C. Bradley.

The Rock Island Lines report an excellent record for increased carloading in the year 1917 as the result of an educational campaign among shippers and railroad employees. The net increase per car in all commodities was 20.5 per cent for the year, as compared with 1916. The average load per car was 51,800 lb., compared with 43,000 lb. in 1916 and 43,000 lb. in 1915. This includes all commodities loaded on the Rock Island lines. The increase in the loading of flour was 14.6 per cent.

Holdings of Oil Laws must be reported by railroads, in accordance with a circular which has been issued by Director General W. G. McAdoo. This circular calls for information concerning lands, wells and operations in which railroads have any direct or indirect interest; the estimated quantity of crude oil that could be produced within one year from April 1, 1918; the number of wells in operation, estimated cost of additional development necessary to obtain greatest production, proportion of present production used by respondent for fuel purposes, and otherwise disposed of, and other details.

The Train Despatchers' Bulletin for March conveys the news that a rival association of train despatchers is being formed. The Train Despatchers' Association of America, of which the Bulletin is the organ, is devoted to the improvement of the service and has a constitution which forbids strikes. The rival association, spoken of as the Western Train Despatchers' Association, came to the notice of the editor of the Bulletin by means of a circular mailed from Spokane, Wash., and one of the objects of the movement is to teach despatchers to "take advantage of their industrial position and to build up and protect an impregnable organization; . . . and to

deal fairly and honestly with all employers who are willing to investigate and adjust difficulties."

Charles P. Neill, manager of the Bureau of Information, Southeastern Railways, and former United States Commissioner of Labor, has been appointed chief of the Industrial Service Section of the Signal Corps and W. Jett Lauck, of Washington, D. C., editor of the Labor Gazette, and former consulting statistician of the United States Commission on Industrial Relations, has been appointed as his assistant. This completes the War Department's program of creating in each important procuring bureau an organization for the development and maintenance of satisfactory relations between employers and employees engaged in production for the Army. The work of these sections is being carried on in close co-operation with the Department of Labor and is being co-ordinated through the office of the secretary of war with the labor administration.

Car Builders Confer in Washington

Car builders, who had submitted tentative prices on standard freight cars to be ordered by the government, were called into conference Wednesday afternoon by John Skelton Williams, director of finance and purchases, to discuss the tentative figures.

"You Have Chosen a Dangerous Place to Walk"

This is the heading on a card which the New York, New Haven & Hartford, through its trackmen and crossing watchmen, gives to people who walk on the tracks. The card tells of the dangers of the tracks and points out how easily a safer way may be found. About 40,000 cards have been given out.

Inspection and Test Section

The Director General has announced the creation of the Inspection and Test Section of the Division of Transportation, with C. B. Young, mechanical engineer of the Chicago, Burlington & Quincy, as manager, with office in the Southern Railway building, Washington, D. C. The manager of this section will have charge of the test and inspection of materials and work in connection with the construction of standard locomotives and cars.

Freight Car Repair Section

The Director General has announced the creation of the Freight Car Repair Section of the Division of Transportation with J. J. Tatum, superintendent of the freight car repair department of the Baltimore & Ohio, as manager, with office in the Southern Railway building, Washington, D. C. The manager of the section will supervise the condition of and repairs to freight and passenger cars in all existing railway shops and at outside shops.

Railroads Show Deficit for January

For the first time since the Interstate Commerce Commission began requiring the filing of monthly reports of earnings in 1907, the railroads of the United States showed a deficit after the payment of operating expenses and taxes for the month of January, according to a preliminary summary covering 172 roads issued by the commission on March 28. Returns were still to be received from 24 additional roads, but those reporting, covering 215,456 miles of line, show a deficit in the place of operating income of \$2,227,535, as compared with an income of \$67,279,639 in 1917. This report strikingly reflects the influence of the unprecedented weather experienced in January, particularly in the eastern section. Railway operating revenues amounted to \$270,231,812, as compared with \$283,000,000 in January, 1917, and railway operating expenses were \$257,868,006 as compared with \$203,000,000 in 1917. Tax accruals were \$14,551,790 as compared with \$13,000,000 in 1917. The revenues per mile were \$1,254, expenses per mile \$1,197, net revenue per mile \$57, tax accruals

per mile \$67, and the deficit per mile \$10. The regular sworn reports have not yet been rendered for the month of January as the printing of the forms was held in abeyance pending the enactment of the railroad law, which became effective on March 21.

Safety First on the Canadian Government Railways

J. E. Long, safety engineer of the Intercolonial Railway (including also the Prince Edward's Island) reports that during 1917 on those lines 1 passenger, 9 employees and 20 other persons were killed, and 13 passengers, 704 employees and 21 other persons were injured. There has been a steady decrease in casualties since the "safety-first" department was started in January, 1914. In 1913 the number of employees killed was 19, and taking the annual average of the last four years and comparing with what the record would have been if there had been no improvement over the record for 1913, it appears that the decrease in the number of employees killed is 50 per cent; employees injured, 19 per cent; passengers killed, 58 per cent, and passengers injured, 10 per cent. The record of trespassers killed shows, in this comparison, a decrease of only 2 per cent, while trespassers injured increased 40 per cent. This four-year record of the safety-first department covers a period of very heavy traffic—a movement greater than in any similar period in the history of the roads.

Railroad Associations Approved

The Committee on Mail Pay, of which Ralph Peters, president of the Long Island, is chairman, which has been conducting the campaign for the railroads for a more equitable system of railway mail compensation, has been authorized by the Railroad Administration to continue its work, for the balance of the year and until further order. This and other railroad associations had been given a temporary approval until April 30 pending a permanent decision, which has now been reached as to this committee. The entire question of railway mail pay is now before the Interstate Commerce Commission for decision and the committee has represented the railroads in presenting evidence to the commission.

The Bureau for the Safe Transportation of Explosives and other Dangerous Articles and the Railway Fire Protection Association have also been approved.

Railway Wage Adjustment Board

Announcement has been made of the personnel of Railway Board of Adjustment No. 1 created by the Railroad Administration to deal with controversies between the railroads and the organizations of train service employees growing out of the interpretation or application of the provisions of wage schedules or agreements. The board will consist of four representatives of the railroads and four officers of the brotherhoods, as follows: E. T. Whiter, assistant general manager of the Pennsylvania, Western Lines; J. G. Walber, secretary of the Bureau of Information of the Eastern Railroads; J. W. Higgins, executive secretary of the Association of Western Railroads; C. P. Neill, manager of the Bureau of Information of the Southeastern Railroads; L. E. Sheppard, vice-president, Order of Railway Conductors; F. A. Burgess, assistant grand chief, Brotherhood of Locomotive Engineers; Albert Phillips, vice-president, Brotherhood of Locomotive Firemen and Enginemen, and W. N. Doak, vice-president, Brotherhood of Railroad Trainmen. The board will hold a meeting at Washington on Monday to organize and will proceed immediately to consider a number of pending disputes.

Government Action Against Thieves

Director General McAdoo has announced that a section for the Protection of Railroad Property and property of shippers in transit has been established in the Division of Law to enforce rigorously the federal law against theft from cars, stations, sidings, and wharves, and to take all necessary measures in co-operation with carriers to prevent loss from this cause, which in past years has been enormous. Philip J. Doherty has been appointed manager of the section. Full co-operation with this section is required from all officers and employees of the rail-

roads, and secret service men employed by the roads are especially required to co-operate with this section, both in protecting and investigating thefts, making arrests, or prosecuting offenders, and railroad attorneys and all other officers are required to give all possible aid.

Anyone having knowledge of any such offence should report the same to the nearest railroad officer or to Mr. Doherty, in order that indictment of the guilty parties may be had under the federal law, which carries a maximum penalty of ten years' imprisonment.

Railroad officers and employees are reminded that all property being transported by the railroads is in the custody of the United States and that they owe an especial duty to guard and protect the same and to report promptly any person who tampers therewith; and the United States looks to the officers and employees to do their duty in this behalf.

Railway Regiments' Thanks for Tobacco

A number of letters have been received expressing the appreciation of the men in the railway regiments now in France for the tobacco which they have received as a result of the contributions to the Railway Regiments' Tobacco Fund, by railway supply companies in the United States. C. W. Kutz, colonel commanding the Thirteenth Engineers, writing on March 1 says: "Ever since December 21 when I acknowledged receipt of your letter, we have been on the lookout for the shipment of tobacco which you had made. Yesterday our patience was rewarded by the receipt of three cases of smoking tobacco, each containing 12 full cartons and 4 mixed cartons of Bull Durham—1,056 packages; and 16 full cartons and 4 mixed cartons of Lucky Strike—424 cans—the total shipment being 3,288 bags of Bull Durham and 1,272 cans of Lucky Strike. The tobacco will at once be distributed among the companies of the regiment in proportion to the strength of each and then issued to the men by the company commanders from time to time. The members of this regiment feel very fortunate in having such friends as the contributors to the 'Railway Regiments' Tobacco Fund,' and hope by their actions to fully justify the interest of their friends in the United States. . . ."

Major John A. Laird, commanding the 12th Engineers, writing on February 27, expresses similar hearty thanks for three cases received on February 26.

V. J. Jaeger, Co. F, 13th Engineers, writing on March 4, acknowledges receipt of the first consignment of "generosity" from the Railway Supply Companies' Fund. "Words fail to express our appreciation. The smokes are the answer to our difficulties and a solace to the ills engendered in dovetailing railroading with the military end of this war game. In the language of our French comrades we simply say 'Je vous remercie.'"

Col. W. P. Wooten, of the 14th Engineers, acknowledging receipt of three cases of tobacco sends thanks to the donors and says that the men's enjoyment of the gift has been very great.

War Finance Corporation

The report of the conferees on the administration bill establishing the War Finance Corporation with a capitalization of \$500,000,000 and empowered to issue \$3,000,000,000 of bonds to assist in the financing of war industries, including railroads, was submitted to the Senate and passed, on April 1, and was also passed by the House on April 2. As the Senate passed the bill it provided for the issuance of \$4,000,000,000 of bonds, while the House bill provided for only \$2,000,000,000. The conferees agreed on \$3,000,000,000 as a compromise.

The corporation is authorized to make advances for periods not exceeding five years to any bank, banker or trust company in the United States having outstanding loans to persons, firms, corporations or associations conducting an established and going business in the United States whose operations shall be necessary or contributory to the prosecution of the war, but no such advance shall exceed 75 per cent of the face value of the loan; also to banks which shall have rendered financial assistance to persons, firms or corporations. The advances are to be made upon the promissory note or notes of the banks secured by notes, bonds or other obligations which are the basis of the advance by the corporation, together with securities held as collateral for such obligations. The corporation is also authorized in exceptional cases to make advances directly to any person, firm or cor-

poration or association conducting an established and going business in the United States whose operation shall be necessary or contributory to the prosecution of the war, but only for the purpose of conducting such business and only when in the opinion of the board of directors of the corporation the person, firm, corporation or association is unable to obtain funds upon reasonable terms through banking channels or from the general public. Such advances shall be for periods not exceeding five years and in no case shall the aggregate amount exceed at any one time 12½ per cent of the authorized capital stock of the corporation, plus the aggregate amount of bonds of the corporation authorized to be outstanding at any one time. Such advance shall be secured by adequate security of such character as shall be prescribed by the board of directors, equal to (except in cases of an advance made to a railroad in the possession and control of the President for the purpose of making additions, betterments or road extensions to such railroad) at least 125 per cent of the amount advanced by the corporation.

The bill also provides for a Capital Issues Committee to investigate and determine whether it is compatible with the nation's interest that securities shall be issued by any person, firm, corporation or association in excess of \$100,000. The bill provides that this shall not be construed to authorize the committee to pass upon any securities issued by any railroad corporation, the property of which may be in control of the government.

Railway Business Association Meeting at Chicago

Through the courtesy of the Railroad Administration, the forthcoming conference at Washington between the purchasing authorities and the car specialty manufacturers will be fixed for a date which will give members of the Railway Business Association ample opportunity to attend the convention of the association at Chicago on April 8.

The car specialty conference will be held not earlier than Thursday, April 11. Director of Purchases Williams, when President Post laid the situation before him, promptly wired that he would endeavor to arrange the car specialty meeting so as to enable members to attend the convention and Chairman Spencer of the Central Advisory Committee on Purchases telegraphs "You can say that meeting will not be held before Thursday of next week."

Following is the program for the Railway Business Association convention, which will be held at the Hotel La Salle:

11 a. m. (Red Room).—President's address and report of general executive committee on future activities of the association.

2 p. m. (Luncheon, ball room).—Lewis E. Pierson, chairman of the Irving National Bank of New York and chairman of the American Trade Acceptance Council, on prompter remittances for railway purchases.

2 p. m. (Red room).—Frank Rhea, of the Department of Commerce on Foreign Trade; on Opportunities in Railway Supplies, and report of committee on resolutions.

6.30 p. m. (Dinner, ball room).—Speaker to be announced.

U. S. Chamber of Commerce Meets at Chicago

The United States Chamber of Commerce will hold its sixth annual meeting at the Auditorium, Chicago, on April 10, 11 and 12. Representatives of more than 1,000 commercial organizations with a combined membership in excess of 500,000 business executives are expected to gather to discuss the further part business is to play in the war. One of the four chief subjects to be considered is Railroads and Highway Transportation. This discussion will be held on Thursday and will be under the leadership of Harry A. Wheeler, chairman of the National Chamber's Committee on Railroads. Among the speakers on this topic are Alba B. Johnson, president of the Baldwin Locomotive Works, who will speak on Motive Power; John F. Wallace, chairman of the Chicago Railway Terminal Commission, who will discuss Terminals; E. F. Carry, director of operations for the United States Shipping Board and president of the Haskell & Barker Car Company, who will speak on the subject of Car Supply, and Roy D. Chapin, chairman of the Highway Transport Committee of the Council of National Defense and also prominent in the automobile world, who will present the Possibilities of Highway Transportation.

Traffic News

The railroads centering in Scranton, Pa., have agreed that their freight stations shall be closed at 5 p. m., instead of 6 p. m. as heretofore. The closing time on Saturdays will be 3 o'clock.

The Railroad Administration and members of Congress have been receiving numerous letters of protest from chambers of commerce and other representatives of shippers protesting against the proposal in Trunk line, Central Freight Association and Western Trunk Line territories, to impose charges ranging from \$3.50 to \$8.50 per day for trap-car service.

Representatives of southwestern lines serving oil-producing territory, representatives of oil interests and of the U. S. Fuel Administration held a conference at Chicago on April 2 to work out schedules for train-lot movements of fuel oil, gasoline and naphtha oil for naval and military use. The present demands on oil cars are in excess of the supply and the object of the meeting was to work out schedules which will conserve cars to the greatest possible extent.

Hearings before the House Committee on Interstate Commerce on the bill to make the fourth section of the interstate commerce law an absolute prohibition against charging higher rates for a longer haul than for the shorter haul over the same line in the same direction, were continued last week. H. C. Barlow, chairman of the executive committee and other representatives of the National Industrial Traffic League, testified in opposition to the proposed amendment.

United States Fuel Administrator Garfield has issued the formal orders instituting the zone system of distribution for bituminous coal. Twelve general orders, imposing upon the movement of coal the limitations arranged by the fuel administrator and the director general of railroads were issued. Each order covers a single consuming zone. The orders of the fuel administrator are supported by embargoes imposed by the director general of railroads on all coal movement except in accordance with the zone system plan.

R. G. Fagan, acting assistant superintendent of transportation of the Southern Pacific, reports that in 1917 his office had to deal with inquiries concerning more than 2,000 shipments of freight which went astray or were delayed because the marks on the goods were imperfect or had been lost. At the expense of much time and labor about 1,000 of these consignments were identified and delivered to their owners. There were 942 consignees who did not get their freight at all because the packages could not be identified.

The Food Administration has issued a circular urging shippers of eggs to load refrigerator cars to the maximum. The carload minimum is placed at 24,000 lbs. The Food Administration believes that this may be generally attained without increased breakage or without using a more expensive package. The Food Administration also calls attention to the fact that heavy production of perishables will create a strong demand for refrigerator cars, this year, denying that they will be so readily available as to allow extravagant use by any trades.

The round-trip excursion rate from Philadelphia to Atlantic City and other seashore resorts, used by many thousands of people in warm weather, has been advanced from \$1.00 to \$1.25, both by the Pennsylvania and the Philadelphia & Reading lines. It is said that the new rate includes the war tax of 8 per cent; which means that the railroad fare is \$1.16 and the tax 9 cents. It is expected that these tickets will be sold only on Sundays. Low-fare Sunday excursion trains have been suspended since January 6 as a part of the conservation of railroad men and locomotives for the movement of freight; but trains were run on Palm Sunday and on Easter.

At the annual meeting of the Traffic Club of Chicago on March 26, the following officers and directors were elected: President, Robert C. Ross, traffic manager, Joseph T. Ryerson & Son; first vice-president, E. R. Newman, assistant general freight agent of the Wabash; second vice-president,

Thomas J. Dixon, general manager, Arthur Dixon Transfer Company; third vice president, E. A. Stedman, vice-president, Wells, Fargo & Co.; secretary, C. B. Signer, agent, Delaware, Lackawanna & Western; treasurer, Willard E. Brown, western passenger agent, Florida East Coast; directors for two years: Chas. B. Hopper, general freight agent, Goodrich Transit Company; Murray N. Billings, assistant traffic manager, Illinois Steel Company; E. L. Dalton, traffic manager, Montgomery Ward & Co.; Albert G. Francis, railroad agent, Chicago Telephone Company.

Coal Production

The production of bituminous coal increased slightly during the week ended March 23, according to the bulletin of the United States Geological Survey. The total production, including lignite and coal made into coke, is estimated at 10,972,000 net tons. The average production per working day is estimated at 1,828,000 net tons, as compared with 1,729,000 during March, 1917. Bituminous coal shipments on 123 roads were 191,525 carloads. Anthracite shipments increased from 42,265 to 42,487 cars. The percentage of full time output lost on account of car shortage during the week ended March 16 was 22.9 per cent, as compared with 33.2 per cent lost from all causes.

Proposed Standard Fruit Crates

Eight standard crates for fruits and vegetables are described in a circular which has been issued by the Fruit & Vegetable Transportation Association of the South and East; and growers and shippers of fruits and vegetables are asked to see that their goods are put up in good shape to stand transportation. These proposed containers are described in great detail, so that any competent workman can make one of them exactly to standard. They are a lettuce crate, a lettuce crate, cleated; pineapple crate, cabbage "barrel" crate (Norfolk), cabbage "barrel" crate (Florida), and asparagus crate; standard bushel crate and standard bushel crate, cleated.

The Fruit & Vegetable Transportation Association of the South and East embraces in its membership all of the principal railroads carrying perishable freight from Florida and other southern states to northern cities, and also the Old Dominion Steamship Company. The chairman is H. C. Bixler, Pennsylvania Railroad, Broad street station, Philadelphia. In the circular he calls upon all interested to use sound containers, to select and pack their products with care and to mark each shipment plainly. The proposed standards have been decided upon in conference with all interests, including crate manufacturers and the United States Department of Agriculture.

No Sitting Up Nights to Fret

One thousand tons is the estimated daily weight of merchandise now being carried between New York and Philadelphia, 90 miles, by automobile trucks. Two new concerns have lately entered this field and it is said that about 150 large trucks are already in service. The rates are said to be about the same as those charged by the regular express companies, while in promptness and regularity the automobiles claim to be superior.

One concern, in a letter addressed to merchants, credits itself with the following merits:

"The most dependable and reliable trucking service between New York and Philadelphia. High-powered 5 ton Pierce-Arrow motor trucks, equipped with the latest windlasses.

"Trucks leave every day. You do not have to sit up nights fretting about merchandise being side-tracked in some freight yard.

"Our carefully trained drivers look after your interests, rather than our own convenience. By entrusting the delivery of your goods to us, regardless of size, shape or weight, you can do so with perfect confidence; and besides, you do not have to crate them, if you ship through us. Special monthly rate to manufacturers.

"Phone us, and our representative will call with valuable suggestions, and quote prices. Freight received before 5 p. m. will be delivered the following day (except in cases beyond our control)."

Further Curtailment of Advertising

The three regional directors of the Railroad Administration, A. H. Smith, R. H. Aishton and C. H. Markham, have each issued a circular directing the discontinuance of traffic solicitation. General orders directing the discontinuance of solicitation had been issued earlier in the year, but the following order was issued to avoid misunderstanding and to outline the policy more definitely:

"It is directed that immediately on receipt of this notice First: The solicitation of traffic, both freight and passenger, be eliminated.

Second: That men employed exclusively in solicitation be transferred, where needed, to other departments.

Third: It is suggested that the men employed exclusively in solicitation can be used to good advantage in the operating department in extending supervision to accelerate unloading of cars and movement of freight traffic."

Western Regional Director Aishton has also issued the following order to all lines within his jurisdiction.

"1. Discontinue the custom of exploiting train service pleasure or health resorts and the like until further notice.

2. Discontinue all forms of advertising such as pictures, calendars, wall maps, etc.

3. Confine newspaper and other advertising to giving of necessary information to the public.

4. Standardize all time-table folders and limit their distribution, to avoid waste.

5. Folders must be purely informative and contain no advertising of luxurious trains, claims of superior service or extraneous matter of any description."

Transportation of Food Stuffs

Since early in February the Railroad Administration has been making constant efforts to expedite the transportation of grain, livestock, and other food stuffs at the request of the Food Administration, and according to daily and weekly reports compiled in the office of the Division of Transportation, has shown some very large increases in the movement of these commodities, as compared with the corresponding period of the preceding year. Daily reports are received of the grain receipts at eleven primary markets in the western district—Chicago, Cincinnati, Detroit, Duluth, Indianapolis, Kansas City, Milwaukee, Minneapolis, Omaha, Peoria and St. Louis—of the grain in elevators at the primary markets, and of the grain loading by cars, and these are tabulated weekly and kept in comparative form for reference. From February 11 to March 23, 73,760,000 bushels of grain were received at the primary markets, as compared with 32,512,000 in the corresponding period of 1917, an increase of over 41,000,000 bushels. Special efforts were made to get the grain into the elevators for drying, as approximately 60 per cent of the crop was soft. The receipts of oats during the same period ranged from over 6 million to over 8 million bushels weekly, a total of 42,771,000, which was an increase of about 15,000 bushels, but the wheat receipts were only 8,821,000, a decrease of 18,242,000 bushels, the movement of wheat to market being slack at that time. The total grain receipts were 124,352,000 bushels, an increase of 37,767,000.

The report of grain in elevators at primary markets shows an increase in grain from 3,584,000 bushels on February 2 to 12,333,000 on March 23. These figures correspond approximately with the usual weekly receipts, showing that the grain had been moved out of the elevators for consumption and export. The oats in elevators had increased from 10,853,000 bushels to 14,130,000, showing that out of total receipts of 42,000,000 bushels only 4,000,000 had remained in the elevators. The wheat in elevators on March 23 amounted to 3,621,000 bushels as against 5,425,000 bushels on February 2, and the total grain in elevators was 30,084,000 bushels, as compared with 19,964,000 on February 2.

The total grain loaded in the period March 11 to March 23 in eastern, southern and western districts had averaged over 4,000 cars a day. From February 10 until March 23 a total of 37,456 cars of livestock, dressed beef and perishables were forwarded east from Chicago and from February 12 until March 23 a total of 10,806 cars were moved in special food trains from Chicago and East St. Louis to New York, Philadelphia and Boston for export.

Supply Trade News

United States Government Locomotives

Specifications have been prepared by the Railroad Administration for 8 types of locomotives:

- Light and heavy mountain types.
- Light and heavy Mikado types.
- Light and heavy Pacific types.
- Six-wheel and eight-wheel switching locomotives.

The director-general will determine the number of each type which will be ordered for use in the different regions. The proposed standard specifications for locomotives although still subject to slight revisions, were given to locomotive builders some time ago and they have submitted their prices, which are being carefully scrutinized and checked. If the costs for any item seem high, the reason for it will be ascertained, and if necessary the government will arrange to purchase certain materials for builders where it can do so more cheaply. A meeting was held at Washington on Monday with the manufacturers of locomotive specialties to consider informally the specialties to be used on the standard locomotives to be ordered. A similar meeting will be held shortly with the manufacturers of car specialties. Detailed prices on the cars have been received and will be checked before a decision is reached as to the number of each type to be ordered.

Henry A. Hawes, representative in the Chicago office of the P. & M. Company, has resigned to join the Railway Engineering Regiment, at Camp Grant, Ill.

The H. W. Johns-Manville Company advises that its office in Memphis, Tenn., has been removed to 804-5 Exchange building, at Madison avenue and Second street.

The Asbestos Protected Metal Company, Pittsburgh, announces the appointment of Herbert Longstaff as manager of its St. Louis office, located in the Boatman's Bank building.

Colonel Henry P. Bope has resigned his position as vice-president and general manager of sales of the Carnegie Steel Company, effective April 1, 1918. He has been succeeded by William G. Clyde.

Laura G. Edwards, for ten years connected with the advertising department of the National Tube Company, has resigned, effective April 1, to enter the service of the publicity department of the A. M. Hyers Company.

R. W. Hunt & Co., Limited, Montreal, have been commissioned by the Canadian Government to inspect 100,000 tons of rails which that government has ordered from the Dominion Iron & Steel Company for distribution among the four principal roads of Canada. This commission includes the special inspection which necessitates the sending of a corps of inspectors to the mill at Sidney, N. S.

The Pittsburgh Testing Laboratory has turned over its building and equipment at Seventh and Bedford avenues, Pittsburgh, to the United States Government for the duration of the war. From April 1 until about June 15 its offices will be in the B. F. Jones Law building, Fourth avenue and Ross street. After June 15 its offices and laboratories will be located at 612-620 Grant street, the buildings being remodelled and fully equipped for the company's special needs.

Fred H. Jones has been appointed resident manager for the General Railway Signal Company, in charge of eastern territory, with office at 30 Church St., New York, effective May 1. Mr. Jones has been connected with the General Railway Signal Company since the time of its organization in 1904. During this period, he has held a number of the important positions with the company including assistant resident manager of the Chicago office and resident manager of the San Francisco office.

The Chicago Railway Signal & Supply Company, Chicago, has increased the size of its plant at Carpentersville, Ill., by taking

over a number of shop buildings formerly used for other purposes. Where space has been available in these various buildings, modern machines have recently been installed. A power house and hydro-electric station generating power from the Fox river has recently been placed in service. These increased manufacturing facilities have been added with the view of producing a more extensive line of signal apparatus and supplies.

W. S. Bartholomew, president of the Locomotive Stoker Company, has been elected vice-president of the Westinghouse Air Brake Company in direct charge of the activities of the stoker company and to attend to such other duties as may be assigned to him. Mr. Bartholomew received his education in the public schools of Chicago and in the North-Western University. He entered business life with Geo. B. Carpenter & Co., leaving that company to enter the service of Adams & Westlake, in course of time becoming eastern manager. In 1903 he entered the service of the Westinghouse Air Brake Company as New England representative at Boston, Mass. He remained here until 1905 when he was made western manager of the same company at Chicago, Ill. He was transferred in 1913 to the Locomotive Stoker Company, being elected president, and ever since has actively directed the development of the Street stoker and its distribution to the railroads throughout the country. He still retains his office as president of the Locomotive Stoker Company.

H. D. Savage has been elected vice-president of the Locomotive Pulverized Fuel Company. He will also continue as vice-president of the American Arch Company.

Mr. Savage was born at Memphis, Tenn. He was educated in the public schools at Ashland, Ky., and at the Kenyon Military Academy. He started his business life with the Ashland Fire Brick Company in the manufacturing department serving in various capacities. Later he was appointed manager of sales and during his ten years in this position he made great strides towards putting the manufacture of high grade refractories on a scientific basis. He was largely instrumental in making Ashland the most modern brick

plant in the country at that time introducing many features making for uniformity of product and increased output. Together with the late E. S. Hitchens he organized the Refractory Manufacturers' Association of which he was elected the first president. This association includes in its membership practically all the manufacturers and users of refractory materials. Mr. Savage's work as sales manager gave him opportunity to thoroughly study the application of refractories to the metallurgical field and he enjoys a wide acquaintance in the metallurgical industry of this country. In 1914 he was elected vice-president of the American Arch Company in charge of manufacturing. In this position he organized the manufacturing department of this company so that close supervision by trained

W. S. Bartholomew

H. D. Savage

inspection is given the fire brick at the Arch company's plants. This resulted in higher grade brick and greater service life. In 1917 in addition to his duties as vice-president of the American Arch Company he was appointed manager of sales of the Locomotive Pulverized Fuel Company.

The firm of Waddell & Son, which has offices in Kansas City and New York, has lately become incorporated. The new firm of Waddell & Son, Inc., includes besides Dr. Waddell and N. Everett Waddell, their former assistant engineers, F. H. Frankland, Shortridge Hardesty, and L. C. Lashmet. These five constitute the board of directors, the officers being J. A. L. Waddell, president; N. Everett Waddell, vice-president, and L. C. Lashmet, secretary and treasurer. Mr. Frankland is managing engineer; Mr. Hardesty, designing engineer, and Mr. Lashmet, office engineer.

On account of the growth of the Interstate Iron & Steel Company of Chicago, it has been found necessary to enlarge its offices. Because space was not available in the First National Bank building, the company has leased the east half of the 14th floor of the Monroe building, 104 South Michigan avenue, Chicago. The sales department at the Grand Crossing plant, which was recently made a part of the Interstate Iron & Steel Company, will be combined with the general sales offices and will also be moved to the Monroe building. It is expected that the change will be completed by April 6.

W. O. Duntley, president of the Chicago Pneumatic Tool Company, Chicago, resigned, effective April 1. According to a statement issued by the company, Mr. Duntley tendered his resignation in order to secure more time to look after his private business and also to take a long needed rest after 22 years in active service with the corporation. He will retain his interest in the company and will also remain a director and a member of the executive committee, and will continue to assist in an advisory capacity. No successor to Mr. Duntley has been elected, but J. G. Osgood, first vice-president will act as president.

George W. Wildin has resigned as general manager of the New York, New Haven & Hartford Railroad to enter the employ of the Westinghouse Air Brake Company as general

manager of the Locomotive Stoker Company, with headquarters at Pittsburgh, Penn. He brings to his new position extensive railroad experience and a well rounded out mechanical and managerial career. Born at Decatur, Illinois, February 28, 1870, he studied at the city schools and was graduated from the Kansas State Agricultural College in June, 1892, with the degree of Bachelor of Science. He entered railway service shortly afterwards as mechanical draftsman in the Topeka shops of the Atchison,

G. W. Wildin

Topeka & Santa Fe. He subsequently became a machinist and a locomotive fireman on the Santa Fe and later an engineman on the Mexican Central. Leaving railway service he was for a time superintendent of the Aermotor Company, of Chicago. He soon returned to railway service however, as an engineman on the Chicago & Alton and then went to the Plant System, now a part of the Atlantic Coast Line, where he served successively as a machinist, locomotive and car inspector and as mechanical engineer. From April 1, 1901 to March 1, 1904 he was mechanical engineer for the Central Railroad of New Jersey. On March 1, 1904, he left that company to become assistant mechanical superintendent of the Erie, being promoted on April 1 of the same year to mechanical superintendent at Meadville. From January to

July, 1907 he served as assistant superintendent of motive power of the Lehigh Valley, and then left that road to accept the position as mechanical superintendent of the New Haven. In May, 1917 he was promoted to general mechanical superintendent, and in September of the same year was again promoted to the position of general manager. Mr. Wildin was president of the American Railway Master Mechanics' Association in 1910.

Price Fixing by War Industries Board Approved

The President has approved the recommendation of the price-fixing committee of the War Industries Board that the maximum prices heretofore fixed by the President upon the recommendation of the board upon ore, coke, steel and steel products, subject to revision on April 1, 1918, be continued in effect until July 1, 1918; from April 1 to July 1, however, the maximum price of basic pig iron be reduced from \$33 to \$32 per gross ton, and that the maximum price of scrap steel be reduced from \$30 to \$29 per gross ton. No new contracts calling for delivery of any of said commodities or articles on or after July 1, 1918, are to specify a price unless coupled with a clause making the price subject to a revision by any authorized United States government agency, so that all deliveries after that date shall be within the maximum price then in force, although ordered or contracted for in the meantime.

It is expected that all manufacturers and producers will observe the maximum prices now fixed.

Dr. Snowden Returns from Australia

Dr. Albert A. Snowden, an exporter with offices at 149 Broadway, New York, has just returned from a business trip to Australia where he established a branch of his railway supply business in charge, as manager, of Hon. H. C. Hoyle, formerly minister of railways for New South Wales. Mr. Hoyle will be remembered as the special commissioner on railways who represented the Australian Government in this country last autumn when he addressed the Railway Business Association and other commercial bodies. Dr. Snowden is desirous of securing agencies for Australia and New Zealand for railway supplies and materials. He represents the Simmons-Boardman publications there.

Dr. Snowden reports that Australia at the present time is very prosperous due to the enormous production of primary products such as wool, wheat, meat, etc. While there has been a lack of sufficient ships to carry the surplus of these goods to foreign markets the British Government takes the entire wheat and wool production paying for it in advance and this brings plenty of money into circulation. Australia's mining interests have also benefited greatly by the war time prices.

Shipments to Australia are being made though not without difficulties. The recent allotment to the Australian trade of a large number of sailing vessels and other slow moving craft which have been taken from the eastern Atlantic to bring wheat from Australia to the United States affords the opportunity of further shipments from the States.

The Australian railways are in very fair condition, says Dr. Snowden, but as everywhere else in the world, there has been considerable depreciation of roadbed and equipment, because the local manufacturer cannot begin to meet the requirements. Reports by Mr. Hoyle and Mr. Henderson, chief engineer of the Commonwealth Railways and of other Australian railway experts who have visited the United States have created great interest in American methods and goods, so that with the shortage of materials and the rising of American materials the outlook for export trade of American railway supplies is very encouraging.

Trade Publications

Motor Cars.—Murray & Co., Chicago, have issued an attractive 28-page booklet illustrating and describing the different types of motor cars made by this company. The booklet contains copies of advertisements which have appeared in technical papers recently, pointing out the advantages of this make of cars, and the names of a number of railroads using Murray cars.

Railway Officers

Executive, Financial, Legal and Accounting

William Morris Imbrie, Jr., has been elected treasurer of the Savannah & Atlanta, with office at Savannah, Ga., vice **Thomas Goodbody**.

S. T. Bledsoe, assistant general solicitor of the Atchison, Topeka & Santa Fe, has been appointed general counsel with office at Chicago, succeeding **Walker D. Hines**.

O. D. Dalton has been elected first vice-president of the Valdosta, Moultrie & Western, and **S. W. Jones** has been elected treasurer; both with headquarters at Valdosta, Ga.

L. R. Deevers, acting auditor of the Wheeling & Lake Erie, with headquarters at Cleveland, Ohio, was appointed auditor, with same headquarters, succeeding **C. H. Holmes**, resigned, effective April 1.

Operating

A. B. Woodward was appointed chief dispatcher of the Salt Lake division of the Denver & Rio Grande, with headquarters at Salt Lake City, Utah, succeeding **C. E. Leverich**, promoted, effective March 14.

L. E. Jones, secretary and treasurer of the Valdosta Moultrie & Western, with office at Valdosta, Ga., has been appointed general manager, with headquarters at Valdosta, succeeding **W. M. Legg**.

A. B. Scates, trainmaster of the Louisville & Nashville, with office at Paris, Tenn., has been appointed superintendent of the Memphis division, with headquarters at Memphis, vice **F. N. Fisher**, resigned.

L. A. David, assistant superintendent of the Missouri Pacific, with office at Atchison, Kan., has been appointed acting superintendent of the Southern Kansas division, with headquarters at Coffeyville, Kan.

W. L. Robinson, supervisor of fuel consumption, Baltimore & Ohio, has been assigned to accept a position in the operating department of the E. I. du Pont de Nemours Company, Wilmington, Del. Mr. Robinson is one of the best-informed men in railway fuel matters and is at the present time vice-president of the International Railway Fuel Association and the Smoke Prevention Association.

E. Flynn, division superintendent of the Chicago, Burlington & Quincy, at Chicago, has been promoted to general superintendent of the Nebraska district, with headquarters at Lincoln, Nebr., succeeding **A. G. Smart**, who was transferred to the Wyoming District, with headquarters at Alliance, Nebr., succeeding **E. E. Young**, who was appointed superintendent of the McCook division, with headquarters at McCook, Nebr., in place of **H. W. Maxwell**, who has been appointed superintendent of terminals at Kansas City, Mo., to succeed **J. P. Falk**, who was promoted to superintendent of the Chicago division, with headquarters at Chicago, succeeding Mr. Flynn. **N. C. Allen**, superintendent of the Casper division, with headquarters at Casper, Wyo., was transferred to the Omaha division, with headquarters at Omaha, Nebr., succeeding **J. H. Aydelott**, who takes Mr. Allen's place on the Casper division. The above changes were effective April 1.

Engineering and Rolling Stock

R. A. Winsor, engineer of tests and fuel inspector of the Chicago & Alton, with headquarters at Bloomington, Ill., resigned, effective April 1.

G. O. Hockett, master mechanic of the Chicago, Burlington & Quincy, with office at Sterling, Colo., has been appointed master mechanic, with office at Alliance, Neb., vice **J. G. Dole**, resigned, and **C. O. Davenport**, road foreman, with office at Alliance, has been appointed master mechanic, with office at Sterling, vice Mr. Hockett.

W. B. Stokes has been appointed master mechanic of the Wrightsville & Tennille, with headquarters at Tennille, Ga., vice **M. G. Brown**, resigned to enter the service of the Georgia, Florida & Alabama, with headquarters at Bainbridge, Ga.

H. P. Anderson, mechanical engineer of the Missouri Kansas & Texas of Texas, was appointed superintendent of motive power, with headquarters at Denison, Tex., succeeding **F. W. Taylor**, promoted to general manager, effective March 1.

E. C. Anderson, mechanical engineer of the Colorado & Southern, with headquarters at Denver, Colo., has been appointed assistant mechanical engineer of the Chicago, Burlington & Quincy, with office at Chicago. **H. E. Hines**, draftsman in the office of the mechanical engineer, of the Chicago, Burlington & Quincy, has been appointed mechanical engineer of the Colorado & Southern, succeeding Mr. Anderson. **G. G. Gilpin**, chief draftsman of the mechanical department of the Chicago, Burlington & Quincy, has resigned to accept service with another company.

Purchasing

W. F. Lamb has been appointed division storekeeper of the Southern Railway, with office at South Richmond, Va., vice **J. E. Angel**, promoted.

Railway Officers in Government Service

T. C. Powell, vice president of the Southern Railway at Cincinnati, has been appointed traffic representative of the War Industries Board at Washington.

Ralph Budd, executive vice-president of the Great Northern, St. Paul, Minn., has been appointed assistant to the regional director of western railroads in charge of capital expenditures, with headquarters at Chicago.

Charles Barham, general freight agent of the Nashville, Chattanooga & St. Louis, with headquarters at Nashville, Tenn., has been appointed regional director under the National Food Administration, with headquarters in Atlanta, Ga.

C. S. Albert, attorney for the Great Northern in Idaho and eastern Washington, with headquarters at Spokane, Wash., has been commissioned a major and assigned to the judge advocate's staff of the army. He will leave shortly for France.

D. L. Gray, assistant general traffic manager of the Erie has been appointed traffic representative of the Railroad Administration in co-operation with the Shipping Board, succeeding **J. F. Holden**, who has been assigned to special traffic work under **Edward Chambers**, director of traffic, of the Railroad Administration.

J. M. Herbert, president of the St. Louis Southwestern, has been appointed chairman of the inter-regional committee in charge of railroad operations at St. Louis and East St. Louis. He will issue such orders and instructions as will be necessary with the approval of the three regional directors of railroads, each of whom has lines under his jurisdiction entering St. Louis. **J. D. Watson**, assistant to the president of the St. Louis Southwestern has been designated by Mr. Herbert as his assistant and has relinquished his duties with the Cotton Belt in order to assume active charge of the new work.

Obituary

W. W. Cotton, counsel of the Oregon-Washington Railroad & Navigation Company, with office in Portland, Ore., died in Los Angeles, Cal., on March 13, at the age of 59.

Alexander Millar, who was secretary of the Union Pacific from 1888 to July 1917, died at his home in Plainfield, N. J., on March 31. He was born in Scotland and began railway work in 1872, as a stenographer with the Union Pacific. He subsequently served consecutively as bookkeeper, chief clerk in the controller's office and as assistant secretary. In 1888 he was appointed secretary of the Union Pacific; from October, 1893, to December, 1897, he was secretary and assistant controller and then served as secretary until July, 1917, when he resigned on account of ill health.

Contributors to the Financial Section

Frank A. Vanderlip

FRANK A. VANDERLIP is the originator of the War Savings Stamp idea, and has been in charge of the sale of Thrift Stamps and War Savings Stamps for the United States Government. The sale of these stamps has brought into the United States Treasury up to date more than \$75,000,000. Mr. Vanderlip's salary as director of this work has been \$1 a year. He is also president of the National City Bank of New York. He is the author of Chicago Street Railways, The American Commercial Invasion of Europe, Business and Education, and Political Problems of Europe. He was a reporter on the Chicago Tribune in 1889 and at one time was financial editor. He was editor of the Economist of Chicago from 1894 to 1897. From 1897 to 1901 he was Assistant Secretary of the Treasury. He has been president of the National City Bank since January 1900.

Leonor F. Loree

LEONOR F. LOREE is president of the Delaware & Hudson Company and chairman of the board of directors and chairman of the executive committee of the Kansas City Southern Railway. He was a close friend and valued adviser of the late E. H. Harriman, and a man of extraordinarily broad interests, both literary and financial. He combines both in his attitude toward other men and toward economic problems; a keen sense of humor with uncompromising fighting qualities, a combination rare to a degree. He is a graduate of Rutgers College, and began work as an assistant in an engineering corps on the Pennsylvania, and later was transitman on the topographical preliminary survey and location of the Mexican National Railway from the Rio Grande River to Saltillo, Mexico. He was president of the Baltimore & Ohio from 1901 to 1904.

Sir George Paish

SIR GEORGE PAISH is the author of *The British Railway Position*, *The Railways of Great Britain*, *The Railroads of the United States*, *Capital Investment in Other Lands*, and *Savings and The Social Welfare*. He was adviser to the chancellor of the exchequer and the British treasury on financing and economic questions in 1914 to 1915. In this connection, he came to America and helped in the adjustment of the crisis in the international money situation which had been brought about by the war. It is difficult to overrate the importance of his work at that time. From 1881 to 1888, he was secretary to the editor of the *Statist*. He was sub-editor of the *Statist* from 1888 to 1894, assistant editor from 1894 to 1900 and since 1900 has been joint editor. He is governor of the London School of Economics and was a member of the Departmental Committee of the Board of Trade on Railway Accounts and Statistics. He was knighted in 1912 in recognition of his work in connection with the revision of the accounts and statistics systems of British railways.

Albert Breton

ALBERT BRETON began his banking career in 1892 with the *Comptoir National d'Escompte* in Paris and was connected in various official capacities with their foreign branches in London, Calcutta and Bombay. He also has had business experience in Japan, China and Brazil. In 1905 he associated himself with American banking interests in New Orleans, and was up to 1916 first vice-president and a director of the Canal Bank and Trust Company. Mr. Breton has been active in the Louisiana Bankers Association, serving as its vice-president in 1908 and as president in 1909. During the three years previous to his connection with the Guaranty Trust Company, he made a special study of Central and South American banking business, and in 1913 organized the Banco Atlantida, which has branches in the principal commercial centers of Spanish Honduras, C. A. In February, 1916, Mr. Breton became associated with the Guaranty Trust Company of New York as special foreign representative, and in March of that year was made a vice-president.

ROBERTS WALKER is a lawyer, a member of the firm of White & Case of New York, a writer on dull subjects, which he treats with so much of imagination and wit as to make vividly alive the dullest of them. He graduated from Amherst in 1896 and took an LL.B. in Columbia Law School in 1899, and went to work for the law firm of Seward, Guthrie & Steele. He was made assistant to the general counsel of the Chicago, Rock Island & Pacific Railway and the St. Louis & San Francisco in 1904, and in January 1910 was made general counsel, chairman of the executive committee and president of the Rock Island Company. He became a member of White & Case in 1912. In the first rank of a profession that requires a prodigious amount of reading, Mr. Walker's acquaintance with other subjects is extraordinarily broad.

Roberts Walker

JOHN E. OLDHAM is a partner in the firm of Merrill, Oldham & Company of Boston, Mass. He has been in the investment business since his graduation from Amherst College in 1888. He has been active in connection with the Investment Bankers Association of America and at present is one of the vice-presidents. In this organization he has been for several years chairman of the Committee on Public Utilities and is at present chairman of the Committee on Railroad Securities. He is also a member of the sub-committee on capital issues—Federal Reserve District No. 1, Boston.

John E. Oldham

Contributors to the Financial Section

John R. Hall

JOHN R. HALL is manager of the bond department of Hallgarten & Company, one of the two or three larger progressive private banking houses which have been prominent in recent reorganizations of railroad companies. He is a graduate of Hotchkiss School and of Yale University (1902). He began work as a messenger in the First National Bank, New York; later got a clerical position in the Bankers Trust Company, and then became the secretary to Robert C. Pruyn, who was president of the National Commercial Bank of Albany. He was with Crawford, Patton & Cannon of New York, before going to Hallgarten & Company. Mr. Hall is a member of the Committee on Railroad Securities of the Investment Bankers Association of America and has taken an active interest in the work of this committee, especially in the proposals which the committee made suggesting that, at the time of the sale of an issue of bonds, a committee be formed for the protection of the bond holders' interest.

O. M. W. Sprague

O. M. W. SPRAGUE is the Edmund Cogswell Converse Professor of Banking and Finance at the Harvard Graduate School of Business and Finance. He is the author of *History of Crises Under the National Banking System*, and *Banking Reform in the United States*. He served as professor of economics at the Imperial University of Tokio, Japan, from 1905 to 1908. He took the degree of A.B. at Harvard in 1894, of A.M. in 1895 and of Ph.D. in 1897. From 1900 to 1904 he was an instructor in economics at Harvard and was then made an assistant professor. A year later he was made professor at the Imperial University of Tokio. A banker having personal interests involved would in all probability find it impossible to express his views as fully, as frankly and as fearlessly as Professor Sprague does about the much discussed War Finance Corporation.

FOREWORD

By Frank A. Vanderlip
President, National City Bank, New York

THE Railway Age, by reason of the able and thorough manner in which for many years it has covered the field of railway affairs, has made itself well-nigh indispensable to persons desiring to keep themselves well-informed upon the transportation industry. Its competent staff has dealt instructively with every phase of the railway business, including technical matters of special interest to operating officials, financial intelligence, economic problems and all of the numerous and intricate questions which have arisen out of the relations between the railways and the public.

In view of the responsible character of the publication and the ability with which its editorial policies have been directed, the announcement that it will broaden its field by adding to the regular departments which it has heretofore maintained a quarterly section devoted to general financial investment conditions, is a matter of public interest. Inasmuch as the railroads up to this time have supplied much the largest single class of securities appearing in the investment market, it is rather a natural departure for the Railway Age to extend its inquiries and comments to the fundamental conditions affecting investments.

The announcement says that the section "will be devoted to the science of the utilization of wealth as capital." There has never been a time when it was more important that the public should be impressed with the community value of capital than now. The waste of wealth going on at the present time is appalling. Enormous debts are being piled up, for the payment of which the good faith of the nations is sacredly pledged. Economic relations are being radically changed by the pressure of conditions which are themselves temporary, and there is evident danger of reaction when these conditions disappear. To meet this situation without disaster industry must be sustained after the war by large new investments in constructive work. There never is full employment for the industries except when such investments are being made. The almost complete absorption of surplus incomes by public loans during the period of the war will throw the country behind its normal development, and in order to recover this lost ground, as well as to provide immediate employment for the country's wage-earners, it will be important promptly to organize our resources to finance these new operations. That the wastes of war shall be made good, that the debts of the war shall be paid, that every man and woman wanting employment shall be able to find it, and that the efficiency and productivity of industry shall be so increased that wages may be sustained and the costs of living at the same time reduced—these are the aims to which we must unitedly set ourselves when the war is over.

There is need for all the agencies we can have to spread correct knowledge of the part which capital plays in community progress and of the patriotic service which it can render in times of peace as well as in times of war. I am sure that the Railway Age will do good work in its new field.

The Investment in American Railroads

What Has Happened and Is Happening to Invested Capital, and the Relations of the Railroads Thereto

By L. F. Loree

President Delaware & Hudson Company.

THE TOTAL WEALTH of the United States as of the year 1912, which was that of the latest official inventory, is stated by the bureau of census as amounting to \$187,739,071,090, and may be divided as follows:

| | | |
|---|------------------|-------------------|
| Real estate and improvements..... | \$71,801,428,367 | |
| Furniture, carriages, etc..... | 8,463,216,222 | |
| Clothing and personal ornaments..... | 4,295,008,593 | |
| | | \$84,559,653,182 |
| Wealth subject to regulation: | | |
| Railways..... | \$16,148,532,502 | |
| Street railways..... | 4,596,563,292 | |
| Telegraphs..... | 223,352,516 | |
| Telephones..... | 1,081,433,227 | |
| Pullman and private cars..... | 123,362,701 | |
| Shipping and canals..... | 1,491,117,193 | |
| Waterworks privately owned..... | 290,000,000 | |
| Light and power plants privately owned..... | 2,098,613,122 | |
| | | 26,052,874,553 |
| Wealth not subject to regulation: | | |
| Agricultural production— | | |
| Land..... | \$28,475,674,169 | |
| Buildings..... | 6,325,451,528 | |
| Products..... | 5,240,019,651 | |
| Implements and machinery..... | 1,368,224,548 | |
| Irrigation enterprises..... | 360,865,270 | |
| Live stock, including range stock..... | 6,238,388,985 | |
| | | 48,008,624,151 |
| Manufacturing and mining production— | | |
| Manufacturing plants..... | \$8,097,113,448 | |
| Manufacturing products..... | 14,693,866,489 | |
| Mining plants..... | 2,894,804,300 | |
| Mining products..... | 816,552,233 | |
| | | 26,501,336,470 |
| Gold and silver coin and bullion..... | 2,616,642,734 | |
| Total..... | | \$187,739,071,090 |

This accumulation of \$188,000,000,000 represents the total savings of the entire 300 years of settlement in this country. There is no official statement of the annual income. Estimates have been made by several authorities. From them it may be inferred that the total value of the national product and of all productive services in the year 1912 was in excess of \$35,000,000,000. It is startling to reflect that the accumulations of three centuries are no more than the income of five years of our present time, and reflection gives ample warning of the dangers inherent in income and inheritance taxes that strike directly at the productive capital fund.

The residence of man upon this earth has been estimated by the scientists at from 300,000 to 1,000,000 years. Evidences of civilization, whether in Greece, Egypt or Assyria, we are told, do not date back more than 10,000 years, so recent is this precious possession of the race. And what is of even greater importance, the slender hold we have upon it, seeing that in the 800 years of the "dark ages" we almost lost it. In the view of that experience we would do well in these parlous times to test out all our methods to eliminate any found menacing.

Industries Subject to Legislative Regulation

Roughly the investments of potential capital (by which I mean wealth productively employed) divide into three principal groups, of which one-fourth (actually 25.9 per cent) is invested in industries subject to the legislative regulation of prices or rates:

(A) Those devoted to agricultural production;

(B) Those devoted to manufacturing and mining; and,

(C) Those devoted to steam transportation, traction lines, electric light and power companies, gas companies, water companies, telegraph and telephone companies, express companies, etc.—a group loosely described as public utilities and distinguished by the fact that, unlike the others, which are left substantially to the control of their management, these

are regulated by an ever-increasing mass of legislation, federal and state, and as well by commissions, either federal or state, serving as deputy-legislatures or a deputy-congress.

At a time when capital invested in groups "A" and "B" is profitable to an unusual and amazing degree, capital invested in group "C" is embarrassed and too frequently threatened with destruction. A condition that involves in difficulties steam railways lying in Missouri, Kansas and Texas and, as well, in Maine, New Hampshire and Massachusetts, urban and interurban traction lines on the Pacific Coast and in New York, gas companies in Illinois and Maryland, water companies in Ohio and Pennsylvania, telephone companies in Ohio, Indiana and Illinois, and the United States Express Company, is too widespread and involves too great a variety of business experience and association to be the accident either of corporate management, character of the service, or geographical location. We must look for an explanation to the difference in circumstance; to the regulation of statute and commission. For more than a generation these public utilities, so-called, have been the subject of public attack and have been on the defensive. It is the legislature and the commission upon whom the responsibility is now clearly seen to rest and to whom we must look for a speedy solution of our problems unless we are to be involved in disaster.

The old quarrel pictured in fable between the parts of the body as to which was the most important need not be imported into this question to justify a discrimination among the three groups nor of the elements comprising them, for in the light of the world war, involving both the principles and the character of our government, the steam transportation facilities become for the moment of commanding importance. It was a maxim of the great Napoleon that "for one thought that a general gives to his enemy, he casts a thousand anxious glances to the rear," so important to the existence of an army and the conduct of war are the lines of communication. The steam railroads of this country constitute at this time its first line of communication. The army on the battle-front cannot be maintained there unless the railroads are strong and vigorous and work at their highest efficiency. If they fail the army fails, and he would be a bold man who would say that with its failure the government itself could be maintained. The responsibility is now with the legislatures and the commissions. Having grasped these utilities, they and they alone can determine whether these utilities are to be strangled or energized.

It is of the first importance to try to arrive at an exact appreciation of just what has happened and is happening, and the relation of the railroads thereto. Our railroads have been in private hands since their construction began now nearly ninety years ago, and though during late years the control over their affairs has been extreme, and the liberty of action of their officers has been tremendously curtailed, these officers are still held responsible and still feel responsible for their operation and its results. It would be a reflection upon their ability and responsibility if the railroads reflected any neglect or inadequacy of their own effort. Their vindication is that it is admitted on all sides that these instruments of transportation have steadily improved in their character and efficiency, and that whether we consider the capital involved per mile

of line open, cost of the movement per passenger or per ton of freight carried, or the declining ratio of the amount of capital involved to the unit of service rendered, their history is the envy of the civilized world.

At this moment the physical condition of these properties, the steam railroads, is better than at any time in their history. Their locomotives and cars are of the most advanced type, are well maintained and are ample for the present demands upon them. There is no occasion in my judgment for anxiety regarding either the permanent way or the equipment for the next eighteen months. The matter for anxiety, and anxiety of the gravest character, is the supply of labor, the freedom of management, the maintenance of working capital and the integrity of credit.*

The Labor Situation

The reduction of the working time of some labor from 12½ per cent to 25 per cent, the withdrawal of large numbers for service in the army, when there is suddenly additional demands to supply the wants of our own armed forces and the needs of our allies, places a great strain upon all productive enterprises and especially upon those requiring a high degree of skill and training, as do the railroads.

In something less than three generations there has been built up in the railroad service of this country a practice and a personnel that for efficiency and character stands without parallel in the world. Men entering the service are subjected at the outset to a careful physical examination; they receive systematic instruction and are held to a high state of discipline. In the main they are subject to be called upon for duty at all hours of the day and on all days of the year. They are under control not only as to the disposition of their time but as to their personal habits. They are engaged in a hazardous occupation. Having in mind the character of the force so assembled, it is of the highest importance that relatively the rate of wages paid and the conditions of employment should be such as to attract and retain in this service the pick of the industrial community.

Swift's picture of "Gulliver" reduced to immobility by the 10,000 threads by which he was fastened to the ground by the "Lilliputians" is not an exaggerated illustration of the condition to which the railroads have been reduced. Lloyd George, then Minister of Munitions of Great Britain, said to a trades union congress in December, 1915:

"The next direction in which trade unionists can help us is by suspending during the war again all practices and customs which have the effect of preventing men from turning out as much work as their skill and strength permit. I am going to speak about that very plainly later on. What I will tell you now is that the reports we get from our own offices, the Admiralty, the War Office and the Munitions Department, show that if we had a suspension during the war of these customs which keep down the output, we could increase it in some places by 30 per cent, in other places by 200 per cent. Between 30 and 200 per cent—well, you know that makes the difference between victory and defeat in the quantity which you turn out and place at the disposal of our armies."

The difference between victory and defeat—that, I take it, may in the end depend upon the relief which the railroads are able to get from labor union restrictions and legislative and commission restrictions, limiting output, piling up burdens, reducing resources, assailing credit.

Cash is to a business enterprise what blood is to the human body; without it life ends. Credit is to a business enterprise what virtue is to a woman; it is not sufficient that it be good; it must meet Cæsar's demand of his wife and be above suspicion.

The income account statements do not necessarily reflect the ability of the railroad to meet its cash obligations. The

term "cash," so concise and so innocent, may embrace not only free working capital but moneys definitely required for sinking fund and other payments. It is a condition misleading alike to the commissions, to the corporate executive and to the investor. The working capital "necessary for the safe and convenient conduct of the business" of a railroad may be taken roughly at 10 per cent of its annual gross earnings. The Bradstreet Company reports that during 1916 "lack of capital" was responsible for 4,995 failures, being 30.3 per cent of the total failures during that year. Few things have so seriously involved business enterprises as the failure to provide working capital in adequate amount. Among the railroads, when the business is organized and under way, important as this resource is and subject as it is to varying and serious encroachments, it can in the main be nourished only from current income. Under the laws of most of the states, additional securities may be issued only for the purpose of acquisition of property, the construction, completion, extension or improvement of facilities, the discharge of refunding of lawful obligations, or the reimbursement of moneys actually expended for the foregoing purposes. This fund of working capital, its integrity dependent solely upon surplus income, may be drawn upon extensively by the hazards of business, such as washouts, fires, earthquakes and other catastrophes, and just now is being seriously impaired by the great rise in the prices of materials and supplies and the delays in their receipt, requiring the carrying of increased quantities in stock. An amount equivalent to about one-half the working capital of the railroads has been so absorbed in the inventory, and this condition constitutes a real menace in the situation.

Railroad Credit

The provision of moneys for the use of a railroad through the exercise of its credit is limited to a very small number of means—the first mortgage bonds; junior mortgage securities; income and debenture bonds; equipment bonds; short term notes; preferred and common stock.

(a) The number of railroads upon which first mortgage bonds can now be issued can be counted upon the fingers, so that at this time the issue of this class of securities is negligible.

(b) Junior securities, whether foreclosable upon failure to pay interest thereon or lacking such provision, as in the case of incomes and debentures, may be issued only and to the extent that the railroad shows a rate of growth in its net profits commensurate with the additional capital so to be invested in its properties. Such bonds become speculative securities if the net profits become barely sufficient to pay the interest thereon. The ability to market securities of this character, if they can be marketed at all or upon reasonable terms, depends largely upon the net profits remaining after providing for the payment of interest upon them, and it is upon this margin of safety that investors determine whether any given security affords a safe medium for the investment of their funds. If the interest is twice earned, the security may be expected to sell generally so as to give an annual yield approximately 1 per cent higher than the first mortgage bonds. If earning not more than one and one-half times, then the rate must be considerably greater. Unless there be a substantial margin, they can be sold only at a great sacrifice in price and the payment of a correspondingly high rate, if salable at all, which depends upon varying conditions and circumstances.

(c) The principle of the equipment bond is identical with that of the purchase of furniture upon the "installment plan," and to the poorer companies involves similar hazards and hardships. Perhaps no one financial practice has so frequently involved the railroads in disaster as the free use of this method of credit. Under ordinary conditions moneys so obtained involve the payment of 20 per cent down and

*Government control temporarily may shelve the question of working capital and chance somewhat the technique of dealing with labor problems; but the fundamental principles which are the foundation from which railroad problems should be viewed are not changed by the war expedient of government control.

annual payments of 10 per cent of the remainder, as well as the payment of interest, so that the liquidation of the loan thus obtained imposes upon the railroads the obligation to pay it off at the very burdensome rate of 14 per cent a year. At the present time, with the very high cost of equipment, running in some cases 150 per cent in excess of that prior to the war, these instruments cannot be generally utilized.

(d) Short-term notes are temporary borrowings running usually from six months to three years, the cost of which increases with the increased length of duration. They are at the present time practically the only instrument of credit available to the railroads and are, in essence, a bankers' accommodation rather than an investors' lodgment.

(e) The margin of credit for preferred stock may be approximated by combining the interest and dividend charges and considering the ratio between these combined charges and the net earnings available for their payment. If the combined interest and preferred dividend requirements are earned one and one-half times, a fair basis of credit is established. If the net earnings are double the amount, the credit basis would be high.

(f) At a time when the public was not only invited but urged to put its money into railroad properties, the common stock was offered as an opportunity for speculative profit. If it be assumed that, as distinguished from this, some fixed dividend rate is to be looked for, then it is obvious that both such dividend rate and the margin of safety in respect to earnings for common stock would necessarily, by reason of the greater risk of capital, be greater than that for the preferred stock. How much can only be determined by experience and by a consideration of other opportunities for investment open to prospective purchasers.

(g) Any consideration of the subject of credit would be incomplete that, besides noting the payments of the principal of equipment trust notes, failed to call attention to the amortization of bond and preferred stock discount and expense; to sinking funds for the extinguishing of mortgage and other securities; and to the effect of the provision for these payments upon the cash situation of the railroads.

Competition for Investment Funds

The railroads seeking to attract a portion of the investment funds are not monopolies but competitive enterprises.

The rate of growth in their passenger business for the past ten years has not kept pace with that of the freight business; notwithstanding a heavy reduction in their rates of fare, due largely to the development of the automobile, the seating capacity of the pleasure automobiles today being greater than the aggregate seating capacity of all railroad and traction cars.

The parcel post has invaded the field of the express and merchandise movement. The law contemplating a handling here similar to that in European countries of maximum packages of 11½ lb. has been so construed by the postmaster-general as to promote shipments of 50 lb. and further increases are in contemplation.

Road competes against road, facility against facility, commodity against commodity, community against community, while some agencies, such as the shallow waterways, are maintained at public expense, not as legitimate means of transport, but for the sinister purpose of breaking down railroad rates through their subsidized activities.

In few fields of enterprise is competition keener or the hazard of investment more dependent upon competence of management.

The railroad once constructed must remain where it is, notwithstanding conditions that may reduce or totally dissipate its profits, while capital once invested in it is immovably fixed.

Additions to plant and enlargements of service may be arbitrarily required by lawful authority, while all the advantages of large business, improved methods and econom-

ical devices may be swept away by arbitrary though lawful reductions in rates.

The natural timidity of the investor in railroad securities is excited to a panic condition by two prime causes. He sees:

| | Per Cent. |
|--|-----------|
| the United States Government, through the Fuel Administrator, fixing the price of coke at an advance of..... | 216 |
| the United States Government, through the President, fixing the price of wheat at an advance of..... | 156 |
| the United States Government, through the President, fixing the price of bituminous coal at an advance of..... | 115 |
| the United States Government, through the President, fixing the price of pig iron at an advance of | 105 |
| and the United States Government, through the Interstate Commerce Commission, fixing the freight rates of the railroads at an advance of.... | 4 |

So much he feels for the prospects of the future return upon the investment.

He sees, also, the United States Government engaged in a valuation of the railroads; a valuation that sees no value in cash on hand, the lawful money of the United States; no value in material and supplies on hand; no value in terminal facilities if organized under joint corporate enterprises; in fact, a valuation radical in origin radically administered.

So much he feels for the prospects of the future value of the property upon which the investment is invited.

Capital Requirements

All moneys available for investment represent savings. It is fashionable in some quarters to decry the institution of property, but it is upon the institution of property that our industrial civilization rests. The important fact about capital is not its unequal distribution or that some possess it in great amounts, but rather that some have had the wish, the determination, the self-sacrifice to save and that they have been willing to put their savings to the general use.

The total of railway capital outstanding in the hands of the public is reported by the Interstate Commerce Commission to have been in 1915 in excess of \$16,000,000,000. The number of employees reported by the commission is close to 1,500,000, so that for each name on the payrolls of the railroads there is an approximate investment of \$10,000, and each additional name added thereto must be predicated upon the provision of an additional sum of \$10,000.

At the extremes of the list of those making investments stand the conservative and the speculative investor. Among the first are a large number (banks, insurance companies, trustees, executors, etc.) who by law are limited to securities meeting certain requirements, including usually, in the case of railroad bonds, the maintenance of minimum dividend payments upon stock for a series of years. A suspension of dividends would close this market and may lead to extensive selling. On the other hand, a forced recognition of the loss of all the equities from which speculative value rises would destroy the worth of the common stock, which constitutes that final margin of credit upon which all the other securities depend.

The Vital Need

Exaggerated statements are much in vogue as to the financial needs of the railroads. There is about \$200,000,000 of maturing securities falling due in each of the next three years. If necessary, these could be extended by legislative enactment.

I do not believe that under present conditions the railroads can obtain, need, should have or could use any very considerable sums of capital funds. Their activities should primarily be devoted to and definitely subordinated to the winning of the war, and that is true also of the public they serve.

For this purpose no considerable additions to their fixed plant or equipment are necessary. Were they able to pay for and disposed to make such additions, the country would not be warranted in now taking on such additional burdens. Certainly no more should be spent for such purposes than can be paid for through the use of short-term notes or provided from surplus earnings under a proper rate structure. Should the margin for increased movement be exhausted, then in this country, as among our allies, shipments should be resolutely and remorselessly restricted. We are at war, at war for

our very life, and the railroads must be accommodated to this condition, strengthened where strengthening is necessary, their use restricted where such restriction is necessary. At this time of war, "on the minute" service for pleasure and civil commerce is as much out of place as is wasteful living. What is vital is that the rate structure should be so fixed as to set at rest the fears of security holders, relieve the minds of the management of the fear of disaster, make the finances of the companies secure, their funds ample, their circumstances easy, their movements free.

World's Money Markets, Now and After the War

The Greatest Wisdom and Foresight Will Have to Be Exercised to Meet the Delicate Situation That War Has Brought About

By Sir George Paish

RARELY HAS THERE BEEN greater difficulty in coming to any definite conclusions as to the future course of the world's money markets, and were it not that the world's common interest was likely to induce, indeed to compel everyone to act with great consideration and with a quite unusual degree of wisdom, one would not be so hopeful about the future as the facts of the situation now justify. Actual experience of what has been accomplished during the present war fully warrants one in anticipating that any further difficulties will be safely overcome and that the world's credit system will emerge from the extraordinarily trying ordeal to which it has been subjected not only uninjured but greatly widened and strengthened. On every hand admiration is expressed for the wonderful manner in which money has been provided for war in all the belligerent countries and everyone now recognizes that such things would not have been possible but for the growth of banking and investment which had rendered the credit system prior to the war so powerful and so efficacious in supplying the world with the capital it needed for the development of its natural wealth and manufacturing power, as well as for the provision of the machinery of transportation and of distribution.

No more convincing testimony to the efficiency of the credit system in providing money for war is required than the fact that all the money needed to finance the colossal expenditures of this war has been supplied on the general comment that if so much money can be found for war then why not for improving the condition of the great mass of the people in all countries.

Certainly the credit system has attained a reputation in war which it will not be easy to live up to in peace, and it is partly because everyone now recognizes that bankers and investors in giving credit are able to create wealth that there is some uncertainty about the future. All the old landmarks and tide levels upon which bankers used to rely for guidance have been swept away by the great torrent of credit now sweeping over the world. It is obvious that the credit system of the past was merely a child in comparison with what it will be in future now that in the present emergency it has become fully grown.

When one considers how greatly credit has contributed to the expansion of the world's wealth in general and to the well-being of these countries in particular in which it was most highly developed before the war one realizes that after the war is over the well-being of the race will show a rate of progress never hitherto witnessed now that the possibilities of the credit system are so widely recognized:

that is, provided that the war is ended by a democratic, clean and good peace.

To appreciate the course of the money market not only during the war, but after the war is over, it is essential to take the experience that is now being gained by the public into account.

The experience gained of war in these days shows that with everyone co-operating and with everything possible being done to facilitate the creation of credit both nationally and internationally there is practically no limit to the amount of money that can be borrowed both from bankers and from the investing public.

Of course, it is essential that we should all realize that at the present time these vast credits are not adding to the permanent wealth of the world and that for the greater part they are pure inflation, forcing up the prices of commodities, wages and profits. Nevertheless, they are attaining the end in view, the stimulation of human effort to produce things needed in a great crisis and to enable war to be waged on a scale never hitherto regarded as possible. Nor can it be denied that if the object in view had been the creation instead of the destruction of wealth that the world's well-being could have been enhanced in a most remarkable manner by such a vast creation of credit.

And no one can doubt that the world having had such an object lesson in the possibilities of credit will seek to apply its advantages after the war to the production of wealth and that as a result of this wider knowledge and appreciation of the power and the value of credit, wealth will increase much more rapidly in the future when the war is over than it did in the past.

Future of Money Market

It is the situation thus created that renders any forecast of the future of the money market a matter of very great difficulty.

One thing, however, is clear—that there will be no lack of demand for banking and investment money in all countries, both for the purpose of pursuing the war and, when peace comes, carrying out the work of reconstruction. The proportions of the sum required that will be provided by bankers and investors respectively cannot yet be decided. That depends upon many considerations. Just now investors in Europe are disposed to think that the war has entered upon its last stages and that the economic pressure upon Germany and Austria will at last have the desired result and are rather more disposed to allow their money to accumulate in the hands of bankers until they can form

a clearer idea of how long the war is likely to last. The consequence of this is to bring about a plethora of banking money in London and to cause bankers to reduce the rates of discount and the government its rate for treasury bills. But already a greater attractiveness of government bonds in comparison with bankers' deposit rates and treasury bills is again causing investors to subscribe to the government loans more freely.

Fluctuations of this kind are, of course, inevitable and can be more or less ignored, the essential factors in the situation being the constant need of all the money that can be supplied both by bankers and investors in all parts of the world until the war is over.

After the War Conditions

In considering the post war situation, account must first be had of the position that the war will leave. First of all, we shall have the fact that the belligerent nations will be heavily indebted to the rest of the world for produce and foods supplied during the war, the payment of which they have been allowed to finance temporarily in the countries from which the things have been bought.

Of course, if the countries in which these temporary loans are incurred were to demand immediate payment of the money due to them a very awkward situation would arise. But they are likely to do nothing of the sort. In the past, these countries have obtained very valuable help from France and Great Britain in the shape of immense loans of permanent capital for the development of their resources and now that the situation is reversed they are likely to act with the same consideration as was shown to them, and to make no demand for payment which cannot be readily met.

What is likely to happen is that these countries which normally are borrowers and not lenders and need to import more goods than they can usually pay for by exports will, after the war is over, again begin to go ahead and will take payment of the loans they have made to other countries during the war in the goods they need for their development. In other words, they will gradually take back the capital which they have accumulated abroad during the war from their great sales of goods and produce and will not need to borrow from other lands until the money due to them is liquidated. In this way the balance of trade against the belligerent nations that has piled up during the war will be gradually adjusted until eventually the effect of the war entirely disappears and the world resumes business as usual.

The inevitable effect of this situation will be to maintain prosperity and the volume of business in the countries that are now greatly adding to their wealth and are in a position to ask for payment after the war for the produce and goods sold to the belligerents during the war. On the other hand, the need to repay these loans will compel the belligerent nations to become both economical and efficient in order to produce the goods they will require to export in order to redeem the debt they have incurred to other nations as speedily as possible.

Maintaining Present Prosperity

Possibly, but not probably, this temporary debt will be liquidated by sales of securities possessed by the warring countries whose holdings of foreign securities alone amount to some £7,000,000,000 (\$35,000,000,000). But inasmuch as the countries to whom the money is due will for the most part need it for new capital expenditures not much of the debt is likely to be liquidated in this manner.

But whatever view is taken it is obvious that the international financial situation after the war will be a very complicated, not to say a delicate one, and will need to be handled with the greatest wisdom and circumspection.

Indeed, the importance of adjusting the financial situation will not be inferior to that of finding a solution of the

economic situation. In Russia we see that food is plentiful in some parts of the country, while in other parts vast numbers of people are starving because they have not the means of purchasing the food they need. No very great difficulty would have been experienced in adjusting this situation had the rulers of Russia really wished to do so, had given a reasonable amount of thought and good will to the matter, and had applied themselves to adapting the country's financial machinery to its economic needs.

It is of supreme importance that a situation such as that now existing in Russia should not be allowed to arise in the world at large after the war, with consequences as appalling as, or even more appalling, that have been witnessed in Russia.

Already suggestions have been made to bring about an understanding between all the nations of the world for the purpose not only of mutual defense and protection against any aggressive country in future but also to deal with the grave economic situation likely to arise after the war when the peoples of the enemy countries will be prepared to bid for food and raw material at any price unless an arrangement has been already reached for distributing the world's supplies of the essentials of life equitably between the nations. And it is obvious that a similar understanding is demanded for dealing with the financial situation not merely for the purpose of dealing with the problems directly arising from the war but in order to provide the poorer nations of the world with the financial assistance they will urgently need in order to enable them to pay for the food and raw material they will want to preserve them from starvation.

AIN'T IT A GRAND AND GLORIOUS FEELING ?

Making Our Resources Available for War

The Duty and Responsibility of the Individual American for the Successful Prosecution of the War

By John E. Oldham

Merrill, Oldham & Company.

THE great responsibility which the United States assumed by its entrance into the war, while not fully appreciated at the outset, is becoming more generally recognized with the progress of events from day to day. That the government has enormous tasks before it the necessities of which must be stated in millions of men and billions of money is a fact of which the significance is not easily comprehended.

It is vaguely understood that the resources of the country must be mobilized, organized and regulated, and that this involves a change from a nation of individual effort to a nation preparing for a serious, if not a desperate struggle for its own preservation. It is not difficult to understand how the work which is to be done by the army and navy will contribute to winning the war and to understand the importance of the activities that support them in the way of supplies, ships and hospitals. It is, however, difficult to see and appreciate the extent to which these activities are dependent for their success on the everyday activities of the balance of the people.

It is obvious that activities directly connected with the war will require the combined efforts of an immense number of people, and every day sees a great number of persons in civil life leaving their former occupations and taking up posts in the service of the country; placing themselves behind the army and navy in various ways and becoming part of a great national organization. Yet, except as war activities occasionally reach out to the individual in the form of a suggestion by some regulating body as to conservation of coal or food, or an appeal for funds or supplies for hospitals or relief work, the average man or woman has a feeling of detachment and of bewilderment in the magnitude of events that are taking place, and of insignificance and helplessness in finding any definite way to be of service. Nevertheless, in spite of the fact that every individual cannot be directly associated with government activities or with great organizations which supplement the government, he can be a part of the machine which is to carry on the war. On his own initiative and without association with others he can give as much faithful service, and as much assistance, and bear as much responsibility as if he wore a uniform or received his orders directly from a superior in the government employ.

The part which individual service accomplishes is difficult to understand unless considered in relation to the whole situation. Considered in this way it should be evident that effective service at the front is made possible only by service behind the lines; and the most valuable service behind the lines consists in making the resources of the country available for war.

Every effort, therefore, which serves to make them available—whether it is an effort to produce or conserve—is a direct contribution to winning the war. To make resources available which otherwise might be lost through waste, extravagance, or imprudent use is the primary purpose of the nation-wide campaign for thrift and economy; for resources which are made available through savings are as valuable as those which result from increased production.

The importance of thrift and economy in effectively organizing the country for war becomes evident "if we think

of finance in terms of labor instead of in dollars," as suggested by Mr. Everett Morss, of Boston, in his pamphlet entitled "Patriotic Economy"; the term labor as used and defined by him being understood to mean "personal service, whether of brain or of brawn, of the forty million of us who are engaged in gainful occupations."

The resources of the country can be made available for war only by the use of labor, and it is therefore clear that labor which is employed to perform tasks which are not absolutely necessary, which benefit the individual only, or which might be deferred, cannot, at the same time, be at the disposal of the government.

While the amount which can be contributed by the efforts of any one individual when considered by itself may not appear to be of great importance to the situation, yet it must be recognized that the efforts of millions of people when combined and taken collectively become a tremendous force. Failure to recognize that these facts apply to the present situation would appear to account largely for the difference of opinion on the part of the advocates of "business as usual" in war times, and those who contend that economy and thrift are factors of the greatest importance in the prosecution of the war.

The following illustrations are presented with a view to showing what it means in a practical way to utilize the full resources of a community or nation, and with the hope that they may serve to bring about a better understanding of the valuable and helpful service which can be performed by those not engaged directly in war activities.

Let us assume a community with no purpose except existence from day to day, making it necessary only to provide food, shelter and clothing. Let us further assume that the labor required both for production and distribution prorated over the whole population accomplishes the desired results by all working four hours a day.

If one-half of the people of this community were willing to work eight hours a day, this would permit the other half to remain idle.

Again, let us assume that one-half of the people are willing to work eight hours a day and continue to have no thought beyond their day-to-day requirements, but that these requirements are extended to include some kind of pleasure or luxury which does not increase efficiency or add to the general welfare of the people as a whole. Further, that the services of one-half of the people for eight hours a day are necessary for this additional requirement. In this community we would have labor fully employed; eight hours of labor being required of one half of the people to provide the necessities and eight hours of labor being required of the other half to provide luxury and pleasure.

Now let us assume a community of more progressive people with aims beyond the immediate satisfaction of their daily necessities, denying themselves pleasures and luxuries, and unwilling that any part of the population should remain idle. We might again have one-half working eight hours a day to supply the physical necessities of the whole population, and the remaining half—instead of staying idle or instead of being employed in furnishing pleasure and luxuries—devoting its efforts to furnishing better living conditions, and means of increasing production which will

eventually save labor, and producing a variety of other things which will serve some useful purpose in the future. With increased productive capacity the necessities of living would be supplied with less effort in the future, thus requiring the efforts of a smaller part of the population; the number available for employment in doing things which add to the comfort and welfare of the whole community would be automatically increased; the cumulative efforts of that part of the population not required to furnish the necessities would be the surplus production or savings of the community put into a form which would represent permanent wealth.

In the Case of Emergency

Let us consider that a disaster of some kind threatens these communities and for protection it is necessary in each instance to make use of every available resource. In considering this matter let us assume for the purpose of illustration that an eight-hour day is the limit of the capacity of the individual for the most efficient service and, further, that the resources when made available are most efficiently used.

In the first illustration the hours of labor would be increased for the whole population from four to eight hours. In the second a day's labor would be required of one-half of the population which would otherwise be idle. In the third labor would be diverted from the requirements of pleasure and luxury, and in the fourth labor would be diverted from activities which for the most part are devoted to the increase of permanent wealth.

This broad classification of the employment of labor applies as well to communities whose activities are varied and complex as it does to those where the activities are more limited and simpler in character. The composite of the four illustrations above results in a situation which is not unlike the situation of this country to-day. There is need for mobilizing our entire resources, and if we exclude for the time being such important additions as would result from the elimination of waste and an increase in hours of labor, the extent to which the resources of the country are made available for the prosecution of the war will be measured by the extent that labor now devoted to purposes other than the necessities of everyday life is made available for use by the government.

A difference of opinion may well exist as to what constitutes the actual necessities, what amount of effort should go to furnish necessary recreation and pleasure which serve to maintain health and to further efficiency; what enterprises should be promoted and what should be postponed; whether the curtailment of the production of things which are not essential to carrying on the war should take place immediately or develop gradually. Whatever difficulties are presented by these considerations are difficulties which have to do with the application of the principle and do not involve the principle itself.

A Service Everyone Can Render

The conclusion is inevitable that it is possible for everyone to render the government a service of first importance not only by reducing his personal requirements to the necessities, but also by the frugal use of these necessities, in order that the labor of the country as far as possible may be devoted to industries connected with the war.

A further service is the transfer of the control of labor which is thus made available, for it cannot serve the purposes of the government until the right to its use has been relinquished by the individual and transferred to the government. This service is the help which is contributed through the payment of taxes and by the purchase of government bonds. It may be noted that the payment of taxes calls for the permanent surrender of the right to the use of

a given amount of labor without compensation and is compulsory, and not voluntary. The purchase of war loan bonds, on the other hand, is a voluntary act and consists of a temporary surrender of labor with compensation for its use; the right to this use to be restored at some future time.

This transfer to the government of the right to the use of labor involves a financial transaction and is usually accomplished by the use of banking facilities. As all financial transactions of large amounts are handled in this way it will suffice for the purpose of illustration to consider this method as covering all transactions. A practical application of the foregoing may be seen from the following illustration adapted to an income of \$5,000.

When we say that a man has an income of \$5,000, we mean that he will receive in the course of the year the right to use labor for such purposes as he may choose to the extent of that sum of money. He may find that one-half of this amount, or \$2,500, will be required for labor to provide his necessities.

Perhaps he will be required to turn over a further amount of \$200 worth of labor to the government in payment of his taxes. With \$1,300 of the balance he may purchase labor to provide him with luxuries and pleasures, and the balance of \$1,000, for which he had no immediate use, he may keep in the form of a deposit in his bank to be assigned temporarily to the use of the bank's customers; or he may decide to turn this amount over to a railroad or to a municipality by purchasing a \$1,000 railroad or city bond; thus lending to the railroad or the city the use of \$1,000 worth of labor which will probably be used for construction of a permanent nature and thus add to the wealth of the community.

Disposition of the Surplus

It will be seen that after providing for the labor which supplies his necessities and the labor which he is required to contribute for the support of the government, he has the disposal of \$1,300 worth of labor, which may be used for luxuries and pleasures, and \$1,000 worth of labor for which he has no immediate use. It is the labor which can be used for these purposes, which in this case amounts to \$2,300, that the individual can put at the disposal of the government, in one form or another, and if he can reduce his necessities this amount may be still further increased.

Assuming that this \$2,300 exists as a bank deposit and is to be placed at the disposal of the government, the transaction is accomplished by the purchase of government bonds. This is equivalent to a transaction which results in transferring to the government the right to check against the bank account and the consequent release of any claim upon labor which it carried with it. The amount in the bank account remains unchanged by the transfer. It will still be used for the employment of labor, but the labor will be used by the government for purposes connected with the war. As a matter of fact, in its final effect a purchaser of government bonds temporarily loans labor to the government and merely postpones until a later date the full use and enjoyment of that labor for his own purposes. It is obvious that money enters into the transaction merely to facilitate the transfer of the right to the use of the labor.

With these principles in mind it seems clear that the individual—even though he is not directly connected with war industries or activities which are primarily war activities—is, nevertheless, a most important and necessary part of the machinery for carrying on the war; and that the measure of his contribution to winning the war will be determined by the extent to which he conserves his resources and makes them available for the use of the government.

While great emphasis was placed upon the importance of everyone subscribing to our recent war loans to the extent of his ability, the fact should be kept in mind that these

subscriptions serve only as the agency for transferring labor resources from the individual to the government, and cannot be of real value unless they fulfill this purpose.

Subscriptions based on money borrowed from the banks make no transfer of this kind at the time of the subscription and consequently do not increase the resources of the government in any way unless and until the loans themselves are liquidated by accumulated savings. It follows that subscriptions which were made with the intention of liquidating the loans by selling the bonds, instead of by accumulated savings have not served directly, at least, a permanently useful purpose. These subscriptions have merely resulted in placing the government in a position to enter the market in competition for the existing labor supply, and this could have been accomplished as well by the government making arrangements to borrow from the banks without the intervention of the individual. The economic effect is the same, whether the government borrows directly or through the individual. In either case the demands for labor result in higher costs for labor and higher prices for the things into

which labor enters, thus correspondingly increasing the cost of carrying on the war.

At best, these increasing costs cannot be avoided entirely as the supply of labor during the war will be unequal to the demands of both the individual and the government, but they can be substantially minimized by the individual decreasing his demands for labor for his own purpose. When this is fully accomplished and not until then can it be said that the country is efficiently organized for war and that the business of war is the sole business of the country.

Vast as are the resources of this country they are not unlimited. They cannot be made to do double duty; they cannot supply the luxuries and comforts of living to which people are accustomed in times of peace and at the same time provide for the necessities of war. The responsibility of making these resources available for the purpose of the government rests on no individual or group of individuals. It is a responsibility which concerns the whole people and can be met only by personal sacrifice and self-denial on the part of each and every one.

Government Operation of Railroads: Legal Aspects

Owners' and Creditors' Rights Are Almost Wholly Subordinated to Expediencies of the Government

By Roberts Walker,
White and Case.

THE FIRST THOUGHT of the average lawyer is that there are no legal aspects to our present governmental control of railroads. The actual taking over was a matter of war necessity, not of constitutional prerogative. Built upon this undeterminable power, the superstructure may or may not bear some resemblance to the body of adjudicated and statutory rights with which lawyers are conversant. At any point the paramount Federal authority may change or ignore some rule of law, no matter how definitely established. And in so doing, the Federal power might nevertheless be functioning in accordance with what was best for the nation and the railroads alike.

It would be hazardous to forecast the future of our Federal commandeering. It has not proceeded far enough to develop settled principles. It is still largely in the phase of investigation and correlation. The direction of the entity has hardly begun; the vertebrae and ribs of the Government's transportation beast are not definitely located. The statutes and a few instances are all that we can examine.

Contemporary Statutes

The general appropriations act of July 1, 1916,¹ gave the Interstate Commerce Commission \$3,500,000 with which to continue valuation work and secure information as to "stocks, bonds and other securities," carrying forward this dubious task. The Newlands Commission was created² to investigate the carriers. The Council of National Defense was³ required to investigate the railroads, looking to their co-ordination for defense and commerce. All this legislation was passed eight months or more before the United States declared war.

Controlling Statutes

Inserted⁴ between provisions for a bridge at Fort Riley and for horses for the militia, is the following:

"The President, in time of war, is empowered, through the Secretary of War, to take possession and assume control of any system or systems of transportation, or any part thereof, and to utilize the same, to the exclusion, as far as may be necessary, of all other traffic thereon, for the transfer or transportation of troops, war material and equipment, or for such other purposes connected with the emergency as may be needful or desirable."

The mental picture evoked is the temporary, emergency use of a route of travel—railroad, steamship or highway—to carry troops or munitions from Waco to Galveston, or from Pittsburgh to New York. There is no suggestion that railroads off the usual routes of such movements will be taken. All "other" purposes are "purposes connected with the emergency."

The statute used three basic words:

Possession,
Control,
Utilize.

The President's proclamation of December 26, 1917, added a weighty fourth word, "operation," and directed that the

Possession,
Control,
Operation and
Utilization

should be exercised by the director general.

The only purported authority for the commandeering of railroads generally, as far as this proclamation discloses, is the quoted language from the two joint resolutions⁵ declaring a state of war with Germany and Austria-Hungary, wherein "all of the resources of the country are hereby pledged by the Congress of the United States." These words cannot be said to constitute a taking-over; they doubtless

¹39 Stat. 262, 281.

²Joint Res. July 20, 1916; 39 Stat. 387.

³Act of August 29, 1916; 39 Stat. 619, 645.

⁴39 Stat. 649.

⁵Of April 6 and December 7, 1917, respectively.

reflect the feelings of every right-minded citizen, but, viewed as a statute, they lack all requisite provisions respecting compensation, without which such an enactment is idle under our constitution. Thus the initial operation of railroads, in so far as not clearly for "purposes connected with the emergency," had no statutory warrant. Nor, it is hardly necessary to add, has it any constitutional foundation: the Congressional rights "to regulate commerce" and "to establish . . . post roads," even if pertinent, have not been invoked by Congress.

Such was the statutory situation on December 28, 1917, when the railroads were actually taken over.

These comments are made in no controversial spirit, but we should realize how far the executive took unto itself powers not wholly supported by legislation. From its practical side, it was better to commandeer the railroads "all or none." From the governmental view-point, the effective way, and the fairest method to each railroad, was to take them all.

It is plain that those in authority have themselves given some thought to these conditions. In the compensation statute,⁶ passed nearly three months after actual possession and operation had begun, there are patent efforts to correct the statutory situation by express ratification or acquiescence. "The President having in time of war taken over the possession, use, control and operation," are the first words of section 1. By section 9, the provisions of the act of August 29, 1916, "except as expressly modified and restricted by this act," are kept in full force and effect, "and the President in addition to the powers conferred by this act, shall have and is hereby given such other and further powers necessary or appropriate to give effect to the powers *herein* and *heretofore* conferred. The provisions of this act shall also apply to any carriers to which federal control may be hereafter extended."

Thus the statutory state of affairs, in somewhat back-handed and *nunc pro tunc* fashion, has been made nearly satisfactory. That to which Congress expressly submits may perhaps be deemed to be that which Congress expressly authorizes. And any constitutional objection is met at the threshold by the manifest effort to provide adequate compensation and due hearing as to its adequacy. Federal operation is in the saddle, under conditions which no one will or should attack. For the best prosecution of the war, this great experiment must be given most thorough trial. In a number of cases, the compensation formula would work injustice, but means are provided for special treatment of special cases. There is likely to be some friction as to what may properly be charged to expenses; a symptom of this is the attitude already announced regarding fiscal offices in metropolitan cities, off-line counsel, etc. It is only natural that the Government, being entitled to the net revenues, should seek to enhance them by forbidding questionable deductions from gross revenues. Whether it necessarily follows that proper expenses disallowed by the director may justly be saddled upon the railroad's compensation is a question awaiting settlement. It may well be that the federal authorities will discover that successful operations will not by themselves restore railroad securities to the favor of investors. If the government should contemplate public sales of railroad bonds, it must give heed to the marketwise features to which investors are now thoroughly wonted, and provide (in the same spirit with which it has handled the Liberty Loans) convenient paying offices, registration, "splitting" facilities, and all the rest. The modest cost of the average eastern fiscal agency of a southern or western railroad is ordinarily quite justified by its importance to the general standing and marketability of the securities.

These and other areas of irritation are, however, only the growing pains of a nation just attaining stature as a warrior.

⁶ Act of March 21, 1918.

The corporations are all kept alive. They are merely ousted, temporarily, from the possession of their properties. Counsel for the director general likens his possession to a "lessee interest." While not a totally correct picture, the analogy is close enough. Each carrier corporation has become a landlord. It trusts that it owns a reversionary interest, but is not certain. Considering the involuntary nature of the arrangement, the director general's estate is more like that of a receiver; but reasons appearing elsewhere will indicate why that analogy may be distasteful: it involves possible clash with receivers already existing, while the government must assert paramountcy.

At all events, the corporation is to receive a cash compensation, which its directors in proper cases may distribute to stockholders by way of dividends. Prudence will dictate what part, if any, of the compensation must be accumulated against the day when the carrier gets back its property. The policy exercised by the director as to additions and improvements, in a given case, may thus be reflected in the rate of the dividends distributed.

Rights of Bondholders

The intention of those in authority seems to be that the rights of bondholders shall not be affected. It is true that one great right—that of holding the mortgagor accountable under its covenants to repair and improve—has been swept aside. But the right to receive payment of interest and principal remains unaffected. So, also, *probably* does the right to foreclose in event of default. We say "probably." On the analogy of the lessee estate, there should be no difficulty in foreclosing and selling subject thereto. As a bare theoretical matter, that is. But as a practical matter, there may well be a distinction and a difference. The courts will give weight to the fact of the director's possession, and presumably to his wishes as to the form and manner of sale. There may be questions as to whether improvements, not paid for by the carrier but by the director, though clearly intended to be covered by the granting clauses of the mortgage, will pass under the sale. And, as foreclosure usually involves reorganization, the director will be a further party to be consulted as to the form and terms of new securities, and the application of their proceeds.

Effect on Receiverships

When the director general assumed possession, several railroads were in the hands of receivers. On its face, the judiciary had control of these railroads, to the exclusion, on the theory of concurrent jurisdiction, of the executive, because the judiciary had exercised its power earliest. No clash is likely, it would seem, to develop on this point. The judiciary will probably lay aside its technical position, and look at the matter from a national viewpoint, recognizing a paramount right in the executive in the stress of war.

A subservient attitude on the part of the courts would not, however, fully meet the equities of the occasion. Suits are in progress to enforce bonds or equipment trusts—real contract rights, acquired for value in good faith, which the government should be no less anxious to safeguard than are the courts, if the securities of railroads are to maintain and improve their investment position. These litigations will of necessity proceed and must some day reach the stage of decree. Perhaps the next development will be in the form of decree. Instead of the foreclosure and sale, the courts may decree the *reorganization*, providing what new securities shall issue and on what terms they shall be exchanged for the old ones. Such a decree would accomplish everything possible during possession by the director general, since a sale subject to his possession would be a rather fruitless proceeding, and the question of rehabilitation expenditure is in his hands rather than those of the reorganizers. The fear of not barring dissentient

bondholders unless a sale be had, should be largely abated: that which is adjudicated with the sanction of the federal authorities will hardly be attacked successfully if and, or when federal control shall have ceased.

Closer at hand is the question of the correct posture of the receiver himself, *vis-à-vis* the director general. Theoretically the receiver is an "indifferent person" through whom the court seeks to manage justly for all interests concerned; practically, he responds to the preponderant groups of securityholders who are seeking the court's aid. In either case, he represents a viewpoint athwart that of the director general, who is operating for the nation during a crisis. Receivers will therefore have to decide whether to become the operating subordinate of the director, or to remain the manager for court or creditors. Upon electing the latter, the receiver will be shorn of all operating duties and powers, for these the director must control, and will become the custodian of non-operating assets, some few other sticks and chattels, and possibly of the government compensation. The courts will probably be amenable to suggestions of this character.

The Case of "Denver"

The director general had assumed possession before the application for a receiver of the Denver & Rio Grande Railroad. The court proceedings then marched up the hill and down again.

A general creditor filed a bill for a receiver, and the railroad answered, confessing and consenting. A hearing on the appointment was ordered. At the hearing, the Equitable Trust Company, with its \$38,000,000 judgment on the Western Pacific guaranties, was present. The director was represented only by a letter from his counsel. The court order was prefaced with a paragraph recognizing the possession of the director general, and went on to appoint receivers in the customary manner. This did not suit the director, whose counsel wrote to the court stating it to be "necessary that a line be drawn between the federal control and the receivership; that is, that the receivership deal with the corpus and with the assets belonging to the road at the time of the effective date of the proclamation. That the operation . . . of the railroad as a going concern shall be under the direct charge of the director general and not in any way affected by the receivership." The counsel outlined the precise steps desired, and the court obediently entered a new order, pursuant to which one receiver resigned to become the director's operating agent, while the other receiver was relegated to a custodianship of non-operating assets and of government compensation.⁷

This brief history is expressive of the director's policy toward receiverships. While to the conventionally minded it would seem to ignore established rights of securityholders and creditors to the administration of their debtor's affairs by courts of equity, the necessity from the government's view-point of unified complete control will probably be accepted as entitled to the right of way over all usual considerations.

Rates

By the compensation act, the President "may initiate rates, fares, charges, classifications, regulations and practices," immune from suspension. The Interstate Commerce Commission may, however, hold hearings on such tariffs, upon complaint, and make and enforce orders respecting same; but the commission must give weight to any recommendation the President may transmit as to the need for this or that increase.

This is a great step toward equitable tariffs in this country. For years we have gone on adjudicating as between

one destination and another, or one producer and another. But the real problem has never been touched. There has been no disinterested manner in which rates could be fixed as between one commodity and another, no authority which could keep desirable water competition from being killed out, no power to eliminate many underlying principles sanctioned by long practice, but not invariably just or reasonable. The opportunity for scientific treatment of rates and practices has at last arrived, and the greatest good or evil to the shipping public will depend on the use made of these tremendous powers.

The 15 per cent increase granted by the commission about the middle of March, while welcome, is an illustration of what ought soon to be regarded as an antiquated and barbarous method of dealing with the rate fabric. A general 15 per cent raise cannot fail to intensify every existing disparity as between commodity and commodity, classification and classification. It is to be hoped that this will be the last rate increase of the "horizontal" variety.

General

He is wise who can, and bold who will, prophesy the course of events in railroad properties. Inspection of the present factors, however, indicate a few principles:

- (a) Each corporation is being preserved as such.
- (b) Securities are being recognized and not disturbed.
- (c) There is no talk, as yet, of conveyances or consolidations or mergers, of reincorporation, or of dissolution.
- (d) The regulative methods are built upon the existing scheme of things, and no upsets or sweeping changes are suggested.

These and other signs can be read to indicate that the properties will go back to their owners when the war emergency is passed. They are not symptomatic of government ownership, but merely of government rental and tenancy.

"THIS IS YOUR SECURITY"

⁷Not then provided by statute, the court's phrase was "all rights and powers which may be hereafter created in favor of said . . . Railroad . . . by Act of Congress or otherwise."

Banking Institutions to Finance Our Future Abroad

Establishing Foreign Branches Is Not as Effective as Forming Affiliations or Partnerships With Separate Banks

By Albert Breton,

Vice-President in Charge of the Foreign Department of The Guaranty Trust Company of New York.

TO CONTINUE TO HOLD the commercial and financial supremacy we have gained through the war, our merchants and manufacturers must become thoroughly and practically acquainted with the financial machinery for marketing and distributing their goods both at home and abroad.

One of the chief obstacles to the extensive development of our overseas commerce, in fact, has been a more or less general unfamiliarity on the part of our manufacturers with the means that our banks afford for the financing of this business. Another handicap to our progress in the lucrative fields abroad, which will be more important than ever when peace is established, has been the inability or disinclination of our exporters to grant the credit terms demanded by foreign reliable buyers. It is certain, for instance, that our exports to Latin America will not reach their peak until we extend as favorable terms as our competitors.

Bank credit bridges the gap between the raw material and the finished product—between production and distribution. There is no mystery and little complexity about financing foreign trade. The principles are the same as in domestic business. There are only the differences of language, differences of currencies, and the greater distances. A shipment of cotton from the United States to England will illustrate how the financing of exports is conducted under ordinary circumstances.

How Exports Are Financed

An importer in England desiring to purchase cotton in this country first goes to his bank in England and establishes a credit for a certain amount of money, which he estimates will be sufficient to cover the purchases he is about to make. He next instructs his agent in this country to purchase for him a certain amount of cotton and to draw sixty and ninety day drafts on the English bank where he has previously established his credit. These drafts are drawn in English currency, viz., pounds sterling. As a ninety day draft in pounds, shillings and pence, payable in London, would not be acceptable to the cotton grower in payment for his cotton, the American buyer arranges with one of the large banks in New York, New Orleans, Galveston, Savannah, or some of the larger cities to take these drafts and pay for them in United States currency, so the grower can immediately receive payment in money he can use. The buyer may make such arrangement with a local bank and the local bank may in turn make the arrangements with the larger bank, but this is a minor detail.

So far the transaction is simple, but now comes the phases which require expert knowledge, foresight and sound judgment. These sixty and ninety day drafts carry no interest and the sixty or ninety days begin only from the time such drafts are accepted by the manufacturer in England. Therefore, the bank purchasing such drafts must calculate the number of days it will be "out" the use of the money; that is, the time which will be required to send the drafts to England and have them accepted, in addition to the sixty or ninety days they must run after acceptance. This calculation is necessary not only to include a sufficient interest charge during the time the bank is "out" the money, but also for reimbursement of the principal itself. After the New

York bank has made these calculations, it is then in position to advise the cotton buyer, or the local bank, of the rate of exchange or the amount in United States currency it is prepared to pay for the draft drawn in foreign currency. The grower does not care anything about all this foreign figuring and calculation, as he simply sells his cotton at so much per pound, yet this process must all be gone through with and the machinery must be there or he could not get his money without great delays and unwarranted risks.

Larger Banks Have Better Facilities

The question is not infrequently asked, "Why could not the local country banks send the drafts direct to the English banks without making use of the large banks in New York, Chicago, New Orleans and other cities?"

There are many reasons why the local country banks are unable to do this, the principal reasons being the following:

The local banks have not sufficient capital and deposits to await the maturity of any considerable amount of drafts or even the time necessary to send them to Europe for acceptance, so that it is to their advantage to handle a greater amount and turn them over quickly at a moderate profit. Even the largest banks in the United States have not sufficient resources to hold all of these drafts until maturity. They sell, or discount them in Europe at every favorable opportunity, so they can be in position to take care of the constantly increasing demands on them.

These drafts are drawn by a great many people on a great many banks, and the credit and standing of the drawers, the drawees, and foreign banks must all be carefully looked into and watched, so that loss is not sustained through fraud or failure. This requires a credit department and extensive system of credit reports which a small bank could not support.

It requires the undivided attention of a highly trained expert to deal successfully in foreign exchange and a small or even a moderate size bank could not afford to pay for the services of such a man.

The larger the bank, the better facilities and the more economical in conducting the transactions, with resultant good to business generally. While a comparatively small number of banks deal directly with the European banks, there is hardly a bank in the United States which does not have transactions that are a direct result of exports or imports and the larger banks are the channels through which these transactions ultimately find their way to foreign countries and make it safe for the bankers of the country at large to finance shipments of products to foreign countries.

Necessity for Co-operation

Unless American bankers extend their foreign banking business our manufacturers, exporters and all those who are directly or indirectly allied with them will be seriously handicapped not only in promoting our foreign trade but also our domestic commerce, for the two latter are interdependent. But before foreign banking can be extended and before we can reach the object we wish to attain, many things must be done. Some of them are now being accomplished.

To extend our foreign banking we need, first of all, co-

operation. We must not attempt to extend our foreign banking by individual efforts. Our bankers must go abroad hand-in-hand, like brothers, like soldiers in a common cause, presenting a solidly united front, joining hands to build our foreign trade. Unfortunately the principles of democracy sometimes are opposed to co-operation. This government has been built on principles of decentralization, and this independence of powers and rights sometimes means antagonism to co-operation when it comes to foreign trade and international finance. Our Sherman anti-trust law, for instance, prohibits co-operation among manufacturers. It has been a criminal offense for manufacturers, producing a similar line of goods, to combine to sell their products in a foreign country, even though they do not agree to uphold prices, but simply desire to build up their business for their mutual benefit. The new Webb bill, however, provides very judiciously and patriotically that manufacturers may go abroad and work together in foreign commercial fields.

Merchant Navy Needed

Another thing that we need is a merchant marine second to none. We cannot have foreign banking without foreign trade, and foreign trade cannot be obtained without a merchant marine. We are building great fleets of ships, and, I believe, that the American merchant marine will be one of the most important benefits conferred upon us by the war. Strange to say, every calamity has some good result. The Spanish-American war, for instance, disclosed to us the need for the Panama canal when the Oregon had to go around Cape Horn. Our panic in 1907 showed the necessity for the Federal Reserve system, and by good fortune the Federal Reserve system had just been put into operation when this country was called upon to play such an important part in handling the finances of the Allies. Now this war has come, and this country is paying its very large part of the bill, but we are going to have a merchant marine, which will insure foreign trade, and consequently, foreign banking. The day the United States is rendered independent of foreign shipping by its merchant marine, as its accumulation of gold makes it independent today of foreign credit, we will have no difficulty in maintaining our place in the first rank among the great nations of the world.

American Leadership

I am firmly convinced that after the war we will play a prominent part in international banking and financing. We cannot expect our Allies to be able to pay on demand all the loans they owe to the United States. Our power arising therefrom will not be abused, but it certainly will entitle us to considerable influence in international conferences. Countries like Argentina, Brazil, China, and others will seek the co-operation of the United States, and will come to us because we will be in the best position to supply them with the things they may need commercially and financially. We will play, therefore, a very important part in foreign finance, and handle a large volume of foreign banking business. Instead of British, French, Belgian and German banking syndicates financing China exclusively, and instead of international industrial groups in China, composed only of Japanese, British, French, Swiss and German concerns, there will certainly be American participants. The British, French, Japanese and other foreign bankers will be glad to take us in as their partners. As it is our duty to help them today as our Allies, it will be our reward after the war to have them recognize our financial institutions as entitled to a prominent place in the world's finances.

There are opportunities for foreign banking in every country. There are many different ways in which business can be developed. One of them is the branch banking system which is very well developed in Great Britain, in Canada,

in France and in Italy. In Canada there are half a dozen leading banks which have branches all over the country. In England the big clearing house banks are established everywhere. They are daily increasing the number of their branches in every town, by absorbing local banks or by setting up new offices. In France there are three or four banks with branches all over that country.

Foreign Branches

The national bank act of the United States, however, does not permit a national bank to establish domestic branches, neither does the banking law of New York state permit a state bank to have branches in the state. But New York state banks or trust companies may establish foreign branches after obtaining the approval of the state banking department. National banks may establish foreign branches, too, with the approval of the Federal Reserve Board.

The branch bank system which has proved a great success in Great Britain, Canada, France, and Italy, so far as local business in those countries is concerned, has not proved so satisfactory when extended abroad. On the other hand, foreign trade banks with foreign branches have been quite successful.

The large British banks have very few foreign branches, although an erroneous impression to the contrary seems to exist here. Lloyds Bank has a branch in Paris, which is really a separate company, although it bears the same name. The London City and Midland Bank, the largest commercial bank in Great Britain today, has no foreign branch. The Bank of Montreal, and the Canadian Bank of Commerce have no foreign branches outside of the United States and Mexico. The Royal Bank of Canada has branches in the West Indies, and has specialized in certain territories under the protectorate of Great Britain and the United States. It is only lately that it has been going to other foreign countries, such as Venezuela, Costa Rica and Spain.

The French and Italian banks have few foreign branches, but all the big banks of these two countries have affiliated institutions. In other words, they work on the principle that the world is divided into different races, into different commercial sections, and that to handle business in different sections, like Latin-America, the Orient, and in the colonies, it is better to establish a bank specially fitted and organized to handle business in the countries pertaining to each of the foreign groups.

The American banker today is confronted with the problem of how to extend his foreign banking business. He can solve the problem by establishing his own foreign branches, or by establishing special banks in the different countries of the world, or by forming partnerships or affiliations with foreign local banks. Which of these methods is best? When it comes to management and handling of business I believe, as stated above, that each section of the world should be considered separately, according to its race, its laws, its customs, and its commerce.

There is the Mercantile Bank of the Americas, for example, which has been established to handle business principally in Latin-America, with branches in Paris, Genoa, and Barcelona. It has banks affiliated with it—not branches—which it controls in North Brazil, Venezuela, Ecuador, Peru, Nicaragua, and Colombia.

The Mercantile Bank of the Americas is composed of the Guaranty Trust Company, Brown Brothers, J. & W. Seligman and Company, the National Shawmut Bank of Boston, the Anglo and London, Paris National Bank of San Francisco, and the Hibernia Bank and Trust Company of New Orleans. Thus it is an association of banks controlling extensive foreign business, and I am inclined to think that this system is going to grow to a much larger extent as soon as the laws of the different states are amended so as to allow

different banks to work in co-operation and join their efforts to develop our foreign trade.

Neglected Possibilities

Our general lack of knowledge regarding foreign banking has been largely due to the fact that this is relatively a new country. Prior to the beginning of the great war we were occupied in developing our own business, our own resources, in building new factories, and in constructing new railroads. We were busy in the making of this wonderful commonwealth, which today has attained a pinnacle among the powers of the world. Therefore we may be excused to have overlooked the possibilities of foreign banking.

American bankers in general looked upon foreign banking as a special science having no points in common with domestic banking. They thought it required different business methods, and that it would require much study to understand them. Even today, outside of New York and some of the other big cities, most of the bankers think of foreign banking as something wonderful. Apparently they believe that unless they can speak Chinese, or Japanese, or some other strange language, they cannot tackle foreign banking. This, however, is not so. There is no wide difference between foreign banking and domestic banking. There are differences in laws, in customs, and there are differences in moneys; but fundamentally, the principles of foreign banking and domestic banking are the same.

Banking is a matter of receiving deposits, of extending credit, and of making loans and collecting them. There is no difference between making a collection on San Francisco and in making a collection on London. It amounts to the same thing. There is no difference between lending money on an ocean bill of lading covering cotton afloat to Liverpool, and in lending money on cotton warehoused in Memphis or Dallas or Savannah. It is simply a question of whom you are dealing with.

Functions of the Foreign Bank

What does a foreign bank do? It lends money, it extends credits, receives deposits, and makes advances on documents. There is no difference in handling a warehouse receipt, seeing that it is properly signed and endorsed, and in looking at an ocean bill of lading to see if it is properly drawn and endorsed. Up to 1914, when the Federal Reserve Act became effective, American banks loaned money, but they did not lend their credit. The Federal Reserve system has introduced and put into operation in this country the acceptance system used by foreign banks, which is nothing more or less than a loan of credit instead of a loan of money.

Requisites of Foreign Banking

To become familiar with foreign banking it is necessary to study only a comparatively few subjects.

First of all it is necessary to learn commercial geography. That is one of the things we have neglected. A clerk who comes into the foreign department of an American bank may know that Brazil is in South America, or that Buenos Aires is in Argentina, but it is almost certain that he will not know the names of smaller towns or the way to reach them.

Commercial Geography

A knowledge of geography is absolutely essential in handling collections. I have known of clerks sending collections on Merida, Yucatan, to Mexico City. It took two days for the collection to get to Mexico City from New Orleans, and two days to get back, and then it had to be sent direct to Merida. Collections on Para, which is in the northern part of Brazil, may be frequently sent to Rio de Janeiro simply

because Rio de Janeiro is the capital of Brazil. I remember one clerk sending a collection on Baranquilla, Colombia, to Medellin, Colombia. Baranquilla is about five days from New York by boat, and Medellin is away off in the interior, a two weeks' additional journey from Baranquilla.

These are only a few instances, but they illustrate details that are very important, because lack of knowledge or lack of attention to them means poor service to customers and loss of interest, as well as the possibility of ultimately being responsible for the amount of the collections so mishandled.

Knowledge of Languages Needed

Knowledge of modern languages is another essential factor in foreign banking. We have been neglecting modern languages. We are all interested today in South American countries, but very few of us know how to speak Spanish, or how to translate it. That is something we should learn to do as soon as possible. It is not necessary to know how to talk or to write Spanish like Cervantes, or, if we learn French, to write poetry like Moliere, but we should learn how to translate commercial letters, so that we may make entries in our books according to the contents of such letters.

Another requisite of successful foreign banking is a condensed knowledge of international law. We should know more about that subject, particularly about commercial law and local customs.

Dearth of Trained Men

We have enough capital, but not enough trained men. It is the lack of such men that is principally militating against our development in foreign countries. The chief reason for the slow penetration of our banks abroad is that we have so few men of experience to send abroad—men who can meet the people, men who are familiar with the language and customs of other lands, and who at the same time know our policies. There are plenty of men able thus to equip themselves, but they hesitate; they seem to think that foreign banking is very difficult, and that they are not fit for it. This attitude is a mistake. Learn the language of the country you intend to go to, and a few of the other things I have mentioned. Absorb the policy of our banks, study foreign markets and get somewhat familiar with their customs and regulations. Our representatives abroad must be educated to these essentials.

The Future

There will be enough foreign banking business for all of us, not only for New York banks but also for banks of Philadelphia, Boston, Chicago, San Francisco and other commercial centers. There will be plenty of business for all of us, and we can obtain reasonable returns without cutting rates and competing foolishly against one another. Our banks have to build new annexes abroad to help this country to keep its foreign trade, and to maintain its financial prestige in foreign countries.

The right thing to do is for them to get together, think together, and work together.

ANTICIPATING A TIMBER SHORTAGE IN ENGLAND, Mr. Thornton, the general manager and chief engineer of the Great Eastern Railway, arranged contracts for a supply of sleepers from the pine forests in the south of France, to be delivered on the quay of Bordeaux. Soon after the first ship-load was ready for transhipment to England the British Government authorities asked to have the timber transferred to them. They have been so pleased with the quality that they have asked the railway company to relinquish the whole of the contract in their favor, and this has been done, as the timber was for the armies in France.—*The Engineer*.

Co-ordination of All Transportation Facilities

Under Private Operation Competition Could Be Eliminated and a Federal System of All Transportation Be Effectuated

By John R. Hall,

Manager Bond Department, Hallgarten & Company.

That precipitation of many economic questions for immediate disposition is one of the most important and bewildering results of the struggle in which the nations of the world are involved. We have for many years been so content to see problems settled by the slow methods of evolution, by discussions gradually developing public opinion, or by the action of the forces of economic necessity, that it is exceedingly difficult for us to realize that we can no longer be satisfied with a hand-to-mouth policy in anything that is vital to our interests or with seeking solutions only when difficulties take an acute form. Instead we, ourselves, must courageously take the initial steps, particularly at this time, in coping with problems which if not wholly new are bound up with conditions in many respects quite different from those existing in pre-war times.

There is a hopeful belief among some that the happy day which sees the end of the world convulsion will witness the reestablishment of general pre-war conditions, but it is doubtful whether the fulfillment of such a hope is either desirable or possible. The generations to come, freer from traditions which control contemporary thought and action, will find it easier to complete readjustments than it will be for us of the present day to launch them. But if the fact can be made plain to this generation that the old order has changed, to an extent as yet unknown, just in so far will it be possible for the nation as a whole to retain the best that we have built up as a foundation for the future.

The treatment of the railroad situation in this article, as the most important single factor in our national business life, is necessarily broad in outline without attempt at detail. There are too many questions involved to permit more than drawing outlines of various phases and conditions which must be so adjusted and rearranged that the new order may be workable, efficient and economically sound.

A Permanent Change in Organization

The government in assuming control of railroad operations has taken a step which is likely to mark the beginning of a permanent change in railroad organization and operation, as well as in the plans for development of all transportation facilities within the United States. This step is particularly significant in that it involves in effect the substitution of a unified national system for a competitive system, and, by virtue of the substitution, adopts the principle of co-operation.

The Director-General in a statement before the Senate and House committee, shortly after his appointment, said: "It was evident that under the competitive system it was impossible to get the co-ordination which was necessary to the efficient conduct of the war." Acting on this belief Mr. McAdoo is reorganizing the operations of many competing railroads along lines adapted to their operation as a single unit.

Orders are being issued which are calculated to co-ordinate the use of all transportation facilities with little or no regard to the effect they may have on the position of individual companies. If sufficient time permits him to carry out his policies Mr. McAdoo will have reformed the operations of a great many separate corporations into a unified

co-ordinated system which for all practical purposes will constitute an absolute railroad monopoly.

It is the purpose of this paper to give expression to the belief that the preliminary steps taken by the government should be regarded as the groundwork of a new and permanent railroad institution. By extending and perfecting the work of the government a unified American railroad system can be created in conformity with the purposes and requirements of a progressive people who, while ridding themselves of a continuous quarrel which has been a menace to business and a reproach to our democratic polity, are determined to have a transportation system capable of serving the whole country in the most efficient manner possible.

There are numerous reasons which make it seem unwise to return to a system of competitive railroad units. Many of these have to do with weaknesses inherent in the system itself and cannot be eliminated except by abolishing it. The necessity for such an extraordinary measure will be more readily appreciated by an examination of a few of the disadvantages associated with competitive railroad operation.

The Waste of Competition

The wasteful expense of maintaining and operating a large number of separate corporations, all engaged in the same business, with complete executive, transportation, maintenance and traffic organizations, and fully equipped with tracks, terminals, cars, motive power, stations, offices, machine and repair shops and other facilities essential to the operation of each as a complete entity is inherent in the competitive system. The extravagant use of labor under such conditions is unavoidable. Capital required to finance the improvement and betterment of numerous separate railroads, which in too many cases are facilities duplicated for competitive purposes, does not produce benefits commensurate with the cost. The roads which are well equipped physically and financially attract the lost business and can be run more profitably than roads poorly equipped in these respects. Generally speaking and with due regard for exceptions, the high standards of service given the public can be kept up or bettered in the one case and the lower standards tend to remain stationary or are lowered until disaster comes in the other. Communities served by the poor roads, therefore, must suffer under the burden of unfair and unwarranted handicaps. Fast passenger and freight service, calling for the right of way and requiring the highest standards in roadbed and equipment on many lines, are wastefully duplicated between competing centers. The capacity of cars and motive power must be kept by each road largely in excess of traffic requirements. Losses due to the competitive demand for equipment, supplies and labor are inevitable. The development of vast stretches of rich territory is neglected to intensively overdevelop the facilities of districts where competition is keen.

While the foregoing items by no means cover the field, it is evident that many things which would be wasteful in a unified system must be done by competing lines as matters of self protection. In fact they are such vitally essential attributes of successful competition as to make any suggestion for their elimination untenable. Yet, to continue the

system is only to enlarge unnecessary capital costs, wastes and inefficiencies to a prohibitive degree.

Because there does not appear to be any practical way of harmonizing the conflicting interests of independently operated railroad companies composing a competitive system, and because it is so vitally important that transportation facilities be co-ordinated, the perpetuation of the system cannot be justified on the ground of economy, efficiency or public interest. In order, therefore, to obtain the benefits of a system better fitted to provide adequate facilities for handling the rapidly expanding business of the country it will be worth while to give attention to a form of organization which adopts the principle of co-operation as the base of its business structure.

Co-operation in Industry

For the past twenty-five years the principle of co-operation, alone or in combination with the control or elimination of competition, has been developed particularly in other countries to the advantage of many forms of industry. The soundness of this principle has been fully demonstrated. By recognizing it as a natural evolution of sane business practice and in establishing policies and regulatory and supervisory laws, both England and Germany have encouraged business men to expand their activities to all parts of the globe. In the United States our legislators in failing to take account of changing conditions have enacted laws which have discouraged co-operation and in general hampered business of all kinds and especially that of transportation. The war crisis has merely accelerated the coming of the time when it would be realized that the measures we have in force are, when judged by results, destructive and cannot be continued except to the detriment of the country.

The desirability of co-operation has for many years been appreciated by railroad men. They attempted to secure its full benefits by pooling and traffic agreements, mergers, control through stock ownership, and otherwise, and have only been prevented from doing so by the interposition of uneconomic laws upholding the theory of forced competition. If, in the effort to secure the maximum of efficiency and economy, railroad men had been left free to follow their own devices, they must ultimately have reached the goal towards which the government itself is now hastening. Whether or not financially profitable the procedure of the government is likely to be so far-reaching in its effects as to raise an issue which will be determined on considerations involving the feasibility and desirability of unification under private or government ownership, and in no way involving a return of competitive units to their owners. If this question can be calmly dealt with there is at present good reason to believe that the principle of private ownership will be upheld in this country.

The Present Opportunity for Combination

The opportunity of combining all the railroads, through the voluntary action of the owners, has never before seemed so possible and certainly could not have been accomplished under such favorable circumstances. The most difficult and costly part of the task, that of co-ordinating facilities, has been assumed by the government, and while this is being accomplished the owners are relieved of the danger of financial disaster and are guaranteed a return that may be regarded as fair.

In view of the probability that neither the government nor the people will consent to a return to the old form of competitive operation, and of the possibility that an opportunity will be offered for the formation of a unified system under private ownership, it is fitting to take note of some of the more obvious benefits which may be expected to accrue therefrom.

A unified system of railroads physically merged and or-

ganized under a federal charter, and operated by means of a central controlling body with regional direction and supervision, would make it possible to save a great part of the heavy expense involved in maintaining hundreds of separate organizations. Rates could be made and adjusted on a broad basis of practical business considerations instead of on a competitive theory. Vexing and conflicting laws of the states and the regulations of the many public service bodies affecting rates, labor, material and operations could be largely superseded by the powers of a single federal commission.

The use of parallel tracks as double tracks; the linking up of lines not now physically connected; the pooling of the use of terminals, stations, docks, warehouses, cars, locomotives, machinery, repair shops, floating equipment and many other facilities would greatly increase capacity and efficiency, reduce operating and maintenance expense, and save the cost of all forms of new construction of a competitive nature. Standardization of types of cars and locomotives and many other supplies could be introduced and competitive purchasing stopped.

The Traffic Department

The expense of traffic departments with the exception of the tariff bureau and the industrial department could be largely eliminated; the expense of competitive advertising could be cut off; circuitous routes now enjoying differentials would discontinue such business except for overflow traffic; unnecessary duplication of competitive service in all parts of the country could be stopped, and fast passenger and freight mileage materially reduced. Cars and locomotives could be used to greater advantage, and freight and passenger mileage reduced, which would tend to increase the carrying capacity of existing facilities without additional capital outlay and at greatly lowered cost. A better use of labor could be arranged and its waste largely diminished; and the expense of unnecessary duplications of auditing, reports to commissioners, intercompany records, inspection, supervision and many other similar items could be curtailed to a considerable extent.

A studied policy could be inaugurated for national up-building; many miles of road into new territories could be built on the savings made by eliminating competitive construction; central electric generating stations could be built and many miles of road electrified in congested traffic districts from the same savings; a comprehensive study of labor unrest could be made by experts and their findings used to enable railroad officials to deal with the subject intelligently; a broad educational policy could be adopted by establishing a system for the careful training of men for skilled labor and executive positions, thus providing a continuous supply of capable progressive young men to solve the problems of advancing times.

Extent of the Saving

Consolidation of weak with strong roads has in the past proved beneficial to both. Unification is, in principle, a general extension of this practice to all railroads and should result in like advantages.

The elaboration in detail of the foregoing and the addition of many items not included would only serve to emphasize the fact that under the competitive system railroads are compelled to carry many heavy burdens by reason of duplicated facilities and inability to use labor and equipment in the most effective manner. Losses sustained as a result of operating under a competitive system are pure wastes which should in large part be saved by unification.

While it would be quite impossible to definitely figure the money advantages of operating the railroad lines on a unified instead of a competitive basis, it seems safe to estimate that net earnings alone could be increased in due

course by hundreds of millions of dollars per annum, and capital expenditures curtailed almost immediately.

It should not take many years to sufficiently perfect the workings of a unified co-ordinated railroad system so as to make its net earnings from operation larger than any yet produced under the competitive system. However, to secure the full advantages of such a system will take probably ten to fifteen years. All that should be hoped for from the government's efforts is an indication of the efficiency that can be attained under normal conditions when it will be possible with private control to include both economy and efficiency in measuring success. Under present conditions efficiency in moving men and materials for war purposes is necessary above all other things, for the government cannot now sacrifice anything for the sake of economy.

Not a Railroad Problem Alone

It must not be assumed, as in the past, that the problems of transportation can be cleared up by solving the railroad problem alone. The railroads, waterways, highways, port and shipping facilities are all interdependent in important respects, and it is vital that none of them be dealt with except while giving full consideration to its relation with the others.

For the last half century the United States has been fully occupied in developing its own resources and internal trade, but the time has now come when, in dealing with the transportation problem, it is of considerable consequence that full weight be given to the bearing that the overseas commerce of this and foreign nations may have on it.

England and Germany by virtue of possession, or political or financial control, enjoy special privileges in most of the best markets of the world outside of this country. To their credit it must be said that the commercial power which they have attained has been won by a thoroughness of treatment and a wise forethought, based on sound business principles and exact knowledge, which we will do well to emulate. By control of these markets, and in other respects, England and Germany have commercial advantages over us which can only be overcome under the protection and encouragement of a constructive governmental policy and by our business men making better use of available resources and originating new means for successful competition. No satisfactory results, however, can be obtained without a government policy which will address itself to the solution of the transportation problem as a whole, based on broad consideration of internal development and world wide commerce.

Other Agencies of Transportation

The railroads, aside from being permitted to form a unified system, should, with the assistance of federal, state and municipal governments, be allowed to co-operate with the steamship companies in constructing, financing and operating floating equipment, warehouses and other port facilities, in order that traffic may be efficiently handled at low cost. The advisability of giving encouragement to the extension of export and import trade by making special rates on this business should be given careful consideration. A thorough study of the waterways of the country should be made by the joint action of the federal and state authorities to determine what water courses may be widened, deepened canalized or connected to the advantage of commerce and trade. Acting on the theory that it would not be wise to attempt to extend railways into every square mile of the country, federal and state authorities by joint action could greatly advance the interests of labor, commerce and wealth by acting on a studied plan to place a complete system of well built motor highways at the service of those whose interests would be promoted by being thus brought closer to the rail and water systems. Port facilities are unorganized and are

in great need of attention by the government in co-operation with those who can, from their experience, forecast the trend of foreign trade and its future requirements. Neglected ports should be built up and new ports developed to provide facilities for a more economical distribution of traffic arising from foreign trade. A careful study of the relation of a strong mercantile marine to our military and commercial needs is essential and should result in such government action as will encourage American shipowners and investors to regard this business with as much enthusiasm as accorded to it by the same classes of people in other progressive nations.

The consolidation of the railroads under a federal charter will, of course, necessitate the enactment of a complete new code of laws covering the ownership, operation and development of all rail and water transportation facilities in the United States. The purpose of the new laws being to insure for the people all of the advantages of unified railroad operation, without incurring any of the dangers of government ownership, they will have to provide for supervision and regulation by a government commission which will assist rather than hinder the development of the system. From commissions now in existence must be taken away the arbitrary power to modify rates; and, in fact, the adjustment of rate questions should be made as free from governmental interference as is consistent with the necessity of reserving to a regulatory body the power to handle effectively exceptional needs for rate adjustments.

Changes in Rates

Changes in conditions beyond the control of the managers of the roads would be sufficient cause for a change in rates; but savings effected through greater efficiency, or losses through lower efficiency, would result in benefit or detriment to the railroad stockholders. It is undoubtedly possible to make a fairly sharp distinction between items not under the entire control of the managers—which would notably include wages, cost of materials, maintenance, taxes and interest—and those which, depending upon increased or decreased efficiency, are under their control. Changes in the former would automatically cause an adjustment of rates, though in respect to certain items, such as wages and maintenance, standards should be set up below which the road could not go. As regards the latter, however, savings effected as a result of efficiency would not influence rates, but would go to swell the net income of the railroad corporation, although provision may wisely be made that there be a fair rate adjustment whenever earnings conservatively distributable to the stock of the corporation exceed a stated percentage per annum.

The savings, which will result under private operation of the roads as a unified system after they have left the hands of the government and have been relieved from giving priority to war transportation, will unquestionably be so large that it will be advisable to give the government a share in the profits of the carriers when they rise above a certain point; and it may even be wise to do the same in the case of the operatives.

Though difficult, it is undoubtedly possible to work out in detail a plan for the semi-automatic adjustment of rates, and thereby eliminate the danger of rate inflexibility. Substantial changes in wages, cost of materials, etc., effective for long periods, would cause automatically an adjustment of the rate structure, so that the payment of dividends in excess of the percentage possible under earnings obtained while the roads are under government control could only result from increased operating efficiency. With labor and stockholders sharing in the benefits accruing from operating economy the incentive for personal initiative, which is of course the main advantage of private ownership, would be maintained, while the public through the government would

get its share of the profits resulting from the unified system, in addition to having at its command a vastly superior service.

The government in dealing with the rate question should consider the wisdom of permitting the railroads to earn a surplus in excess of the amount required for dividends, to allow for the sinking fund mentioned below, and to pay for all or part of the many improvements which are wholly or partly non-productive and which might better remain uncanceled.

The plan for the exchange of stock of the various railroads for that of the federal corporation could perhaps be chiefly based on the earnings guaranteed by the government during its control. This would probably be more than fair to security holders as the system unquestionably cannot attain the highest degree of operating economy while the transportation of war materials is paramount, and consequently the roads must incur losses during war which would be saved for the stockholders during peace.

In taking over the railroads only the stock of the individual companies need be dealt with and its acquisition would be effected by exchanging the stock of the individual roads for that of the new federal railroad corporation. Stock of this company should be issued to an amount which would permit the conservative distribution of regular dividends at a rate sufficient to attract capital under most conditions when funds are needed for development. The eleven billion dollars of mortgage bonds and other funded debt would remain outstanding and unchanged as to secur-

ity, option being given to the holders to exchange them for bonds of the federal company bearing a slightly lower rate than the bonds refunded, but with redemption terms added to make the exchange desirable. A cumulative sinking fund of approximately nine million dollars per annum compounded at four per cent would discharge the present existing debt at the end of one hundred years. Were such a fund created and used first to retire the bonds of the federal company an incentive would be given to present bondholders to exchange their securities for those of the new company. All financing and refunding that could not be accomplished through the sale or exchange of stock of the federal company would be provided for by the issuance of bonds which would be the direct obligation of the federal company but secured only by a charge on its earnings.

The obstacles in the way of securing a workable and satisfactory transportation system by means of an attempt to coordinate the facilities of competitive units appear insurmountable.

The task of consolidating the railroads into a single system and of co-ordinating the operations of all the transportation facilities in the country is a great one. The easiest and most dangerous way to accomplish it is by accepting government ownership. The most difficult, but in every respect the most satisfactory way, is that which contemplates the retention of the policy of private ownership. Surely this country is not lacking in men in the government service, in business, and among labor groups who can and will rise to the occasion!

The War Finance Corporation

Inflation Can Be Prevented Only By Saving Drastic Enough to Offset
the Government's Extraordinary Demands

By O. M. W. Sprague.

Edmund Cogswell Converse Professor of Banking, Harvard University

THE WAR FINANCE CORPORATION to be established under the provisions of the measure which has been passing through Congress during the month of March is designed to meet four distinct financial requirements which have become increasingly evident with each month of the war. Large resources will be at the disposal of the organization—five hundred million dollars of government funds from the treasury as capital and at least three billion dollars to be secured through the sale of notes or short term bonds.

Whether all or only a part of these resources will be needed cannot now be determined. One of the functions of the corporation will presumably involve the employment of no large amount of money. The corporation is empowered to buy and sell liberty bonds, the object in view being the stabilization of their market price through the establishment of a broader market for them. In the exercise of this function no effort should be made to establish an artificial price for the bonds. The corporation will hardly be prepared to take indefinitely large offerings since the very fact of such offerings would indicate that the yield of the bonds was insufficient and that a stable price could only be found at a lower quotation. Owing to the fact that practically everybody with funds at his disposal has purchased the bonds, comparatively small sales have at times occasioned a considerable drop in market quotations. Handled with judgment, no large amount of money should be needed to prevent extreme declines due to temporary causes, declines which are apt to prove permanent as a result of the uneasiness which

they occasion in the minds of many inexperienced holders.

The second object of the measure is to conserve the available capital of the country for government use during the war by obstructing its employment for other purposes. Government war expenditure vastly exceeds the normal savings which have been available for investment during recent years. These savings are estimated at something like five billion dollars while the expenditure of the Government will apparently run between fifteen and twenty billion dollars. In these circumstances the drastic contraction of the employment of capital for other than war purposes is essential though it will not greatly lessen the absolute necessity for abnormal saving on the part of all classes of people.

The measure in its original form gave the directors of the corporation a veto power over all issues of capital in excess of one hundred thousand dollars other than those by states and municipalities. The grant of this great power was not regarded with favor by Congress. In its present form, only supervisory power has been granted, and this power has been lodged with a separate Capital Issues committee which may merely express its approval or disapproval of proposed security issues. It is to be hoped that the expression of opinion by this committee will be sufficient to prevent in large measure the use of capital for non-essential purposes. If such proves not to be the case, it will clearly be necessary to grant more drastic control over the situation.

The third object of the war finance measure is distinctly opposite in character. Patriotism stimulated by liberty loan

campaigns impels most people to devote all available funds to the purchase of government bonds. It has proved difficult, consequently, to refund maturing obligations of all classes of business corporations and to secure additional funds even by those engaged in war work. The War Finance Corporation will not tap resources which were not already available to the Government. Whatever funds it employs will by that amount reduce the funds which the Government will have at its disposal for other purposes. This is evidently true of the capital of the corporation since it is to come from the Treasury. It is no less true of the funds which the corporation will secure through the sale of its notes or bonds. Purchasers of the securities of the corporation will have less for the purchase of government bonds. The object of the arrangement is simply to provide machinery somewhat more effective than the treasury department through which both banks lending to war industries as well as those engaged directly in war work may secure needed funds.

Savings Banks

Finally the corporation is empowered to assist savings banks and building and loan associations quite regardless of whether they are employing funds in war work. These institutions are subjected to strain on account of the unfavorable effects upon them of the failure of the people up to the present time to provide from current savings the full amount of the funds which the Government is expending. The difference is made up to a moderate extent by the withdrawal from savings institutions of the savings of former years which have already been invested, and to an even greater extent by the expansion of credit on the part of the commercial banks and trust companies. The withdrawal of funds from savings banks, if one may judge from the experience of other countries, will perhaps not be sufficiently great to cause serious trouble. It is, however, desirable to make provision for a contingency of this nature. Consequently the War Finance Corporation is authorized to make advances for periods of a year to savings banks and trust companies, though at rates which properly are somewhat higher than the average rate of return on their investments.

Objection to the establishment of the War Finance Corporation has been raised on the ground that it may lead to inflation. Possibilities of inflation through the activities of the corporation are undoubtedly present, but this is not a valid objection to the measure. A condition of inflation is present whenever credit expands far more rapidly than the volume of trade. It has been going on since the beginning of the war, owing to the fact that the savings of the people are far less than the expenditures of the Government. It has, however, been a one-sided sort of inflation. We have had inflation through the commercial banks based upon commercial loans and loans on Liberty Bonds, and as a result of purchases of the bonds and government certificates of indebtedness by them. The effects of this inflation are seen in the rapid advance of prices. A moderate amount of inflation can continue almost indefinitely because the necessary slight adjustments which it involves can be made without much difficulty. Rapid inflation, on the other hand, threatens the complete disorganization of the entire industrial mechanism as was witnessed in Russia just before the revolution.

Uniformity in Expansion

How far it is possible to go on the road of inflation cannot be determined in advance, but it is clear that one-sided inflation will lead to collapse at an earlier date than somewhat more rapid inflation affecting all classes in the community. Owing to the fact that the federal reserve banks may only rediscount commercial paper and loans based on Liberty Bonds and government certificates, there has been a tendency for the banks to curtail accommodation for investment and refunding purposes. But the Government having

preempted the supply of available investment funds and having also resorted extensively to borrowings from the banks, both business corporations and savings institutions find themselves in a difficult situation.

Alternatives

The War Finance Corporation is simply a palliative for some of the consequences resulting from inflation. It provides an arrangement by which the Government will provide directly some of the funds which in ordinary circumstances would have been secured through private channels. The Government might have used a part of the proceeds of its sales of Liberty Bonds for this purpose. It would then have been necessary to float a somewhat larger amount of such bonds than will now be necessary, bonds of the finance corporation taking their place. The Liberty Bonds would have been available at the reserve banks for loans and might have been purchased by them. The situation is not fundamentally changed by giving the bonds of the finance corporation a similar quality. The extent of inflation will be measured by the extent to which the total expenditure of the Government exceeds current savings. There is but one remedy for inflation—the desirable but painful remedy of drastic economy on the part of all citizens to an amount which will approach, if not fully cover, the requirements of the Government for funds.

Some of the results of inadequate economy and the consequent resort to the financing of the war largely by inflation are familiar. Others are not as yet very generally perceived. The burden which will fall upon persons with stationary incomes if the war is largely financed by credit expansion is well understood. The rise of prices will seriously damage such people and also of course greatly increase the money cost of the war. It is not generally recognized, however, that inflation and the consequent rise of prices may have very serious consequences upon the solvency of many corporations and impose heavy burdens upon the holders of large classes of securities.

Difficulty of Making Adjustments

During the Civil War there was a comparatively small amount of outstanding securities—bonds and preferred stocks—having a fixed rate of return. Moreover, there was then no considerable number of concerns engaged in supplying commodities or services at a fixed or customary price, as is the case now with the bulk of public service corporations, and also of a considerable number of concerns producing goods sold at a standardized price. Nearly everyone except salaried people in former times could adjust himself to rising prices by advancing the price of his own product or services. If there should be a further advance in prices of, say, 100 per cent or even 50 per cent, the effect upon all those whose investments consist mainly of bonds and preferred stocks of every variety and also of common stock of public service corporations will be most serious. It would seem that this is a consequence of inflation which if brought home to the investment classes, and investment bankers, would induce them to set their face sternly against further inflation. An effective check, however, upon inflation cannot be found in piecemeal restrictions. The necessity for inflation can only be avoided by the adoption of measures which will induce universal economy on the part of all classes of citizens.

While the War Finance Corporation is necessary on account of the inflation which is taking place, there is a danger that by making the policy of inflation temporarily somewhat more feasible, its establishment may work against due economy. This danger can only be met by renewed efforts directed toward impressing upon the public the vital importance of a vastly greater curtailment of civilian consumption than has been generally adopted up to the present time.

Railway Age

INVESTMENT ECONOMIST SECTION

WILLIAM E. HOOPER,
Financial Editor

There are two signed articles in this issue of the Financial Section which deal directly with the Liberty Loan. Railroad

Understand What the Liberty Loan Is

men have been liberal subscribers to the first two Liberty Loans and will undoubtedly be liberal subscribers to the third one. It is right and it is something to be proud of that it is patriotism more than anything else which has led to previous Liberty Loan subscriptions and will lead to subscriptions for the present issue of United States bonds. Nevertheless, every man owes it to himself and to his family to make an effort at least to understand something about the nature of the investment which he makes when he buys Liberty Bonds. While, in a broad way, most of the articles in the Investment Economist section deal directly or indirectly with investment, there are two articles—the one by John E. Oldham, a Boston banker, and the other by Professor Sprague of Harvard University—that every railroad man who has bought or intends to buy Liberty Bonds—and that should mean every railroad man without exception—should read with care. Professor Sprague's article deals with the War Finance Corporation, which, like the War Savings Stamps, is a device in addition to the sale of Liberty Bonds which the Government is using to raise funds and credit to finance the war; but a correct understanding of the functions of this War Finance Corporation is of the greatest value in correctly understanding the part the Liberty Loan plays in financing the war. Mr. Oldham's clear, simple, illuminating exposition of the duty which each one of us owes to his country in the way of investment in Liberty Bonds should be read equally carefully by the trainman and by the railroad president. Lack of clear thinking about the right way and the wrong way to buy Liberty Bonds is just as possible in the executive offices as it is in the cab or caboose. The point which Mr. Oldham makes that unless you purchase your Liberty Bond out of your savings and hold it without borrowing against it, you are not helping your country, but rather aiding inflation—jacking up prices against yourself and everyone else—cannot be overemphasized, it is fundamental.

Secretary McAdoo has recommended, and presumably Congress will follow his recommendations, that the third Liberty

Terms of the Liberty Loan

Loan bear interest at $4\frac{1}{4}$ per cent and the bonds will not be convertible into any other issue of bonds made later. This is a lower rate of interest than that expected by many bankers and if it marks, as it possibly does, the limit beyond which the government interest rate will not go on bonds issued for this country, it compares with the limit fixed by the English government of 5 per cent. It is very desirable that the interest rate on Liberty Bonds should be kept as low as possible and still have them eagerly sought after both as investments and as expressions of patriotism. The higher the rate of interest fixed on Liberty Bonds, the more temptation there is for people who have money in the savings bank to draw it out to buy Liberty Bonds rather than to make fresh savings to purchase these bonds. The higher the interest rate on Liberty Bonds, the further downward will the sale of billions of these bonds drive the prices of all classes of fixed interest-bearing corporation securities, and also the prices of mortgages. Savings banks' funds are very largely

invested in fixed interest-bearing securities of corporations and in mortgages. A high rate of interest, therefore, would work a double hardship: it would tend to increase the amount of deposits withdrawn and to lower the margin of safety behind deposits. The fact that Secretary McAdoo believes that the combination of patriotism and credit, which is the warp and woof of the fabric of the sale of Liberty Bonds, is $4\frac{1}{4}$ per cent as compared with England's 5 per cent shows a courage and a belief in the American people that it is now up to them to justify. It will be remembered that the first Liberty Loan, that bearing interest at $3\frac{1}{2}$ per cent, is convertible into any later issue; the second Liberty Loan is convertible only into this, the third Liberty Loan. The second Liberty Loan bore interest at 4 per cent. There would appear to be an incentive, therefore, for holders of the second loan immediately to convert their bonds into the new $4\frac{1}{4}$ per cent bonds, unless, of course, there is something in the detailed enactment of the law which makes the 4 per cent bonds desirable for some specific reason as compared with the $4\frac{1}{4}$ per cent bonds. On the other hand, holders of $3\frac{1}{2}$ per cent bonds may well hesitate to exchange them for the $4\frac{1}{4}$ per cent bonds. If these $3\frac{1}{2}$'s are not exchanged, they carry the privilege of conversion into any later issue. If, therefore, a year from now, or two years from now, if the war unhappily lasts as long as that and conditions have changed so materially that it becomes necessary to issue a 5 per cent bond as the British government has done, then the holders of $3\frac{1}{2}$'s who have not exchanged can make the exchange into the 5's and will have lost only $\frac{3}{4}$ of 1 per cent interest for a year or two years and will gain $\frac{3}{4}$ of 1 per cent—the difference between the $4\frac{1}{4}$ and the 5 per cent that might be issued—for the full number of years which the new bonds will run.

The government has decided to advance to the New York, New Haven & Hartford the \$40,000,000 necessary to meet

A Forecast of the Government's Attitude

the short time notes which mature in April. This has been hailed as an indication that the Government intends to deal fairly with holders of railroad securities and also forecasts a fair attitude toward all investors in corporation securities. As a matter of fact, it is somewhat of a back-hand compliment to show pleased surprise that the government is going to play square. It could do nothing less than this. The banking resources and the investment resources of the country are being placed unreservedly at the disposal of the government in its efforts to finance the war. It is not a matter of surprise that the government should lend its aid in the New Haven situation—it is rather a matter of course. In England, all the financial machinery of the country was placed at the disposal of the government and the government has reciprocated by lending its help and advice wherever this was necessary to keep the machinery in good working order. Co-operation between Washington and Wall street will be a good thing for both. Washington should not accept with suspicion the whole-hearted aid which the financial interests of the whole country have tendered and, on the other hand, Wall street should not hail fair dealing on the part of the government as something to be surprised at.

It is to be hoped that the article by John R. Hall on a uniform transportation system, which is published in this issue of

A Unified System of

Transportation

the Investment Economist section, will draw forth extended discussion from bankers, railroad men, insurance company officers, and, above all, from federal and state legislators. There is hardly a paragraph of it that could not profitably be expanded and discussed pro and con. In one sense, Mr. Hall

discusses railroad matters from an outsider's point of view, but, on the other hand, he has had a far more varied experience with railroad affairs than the average officer, even one who has risen to an executive position because his experience has been with many different roads. He has had the responsibility of passing upon the question of whether or not his house should offer securities of various railroads to their customers, and he has been actively engaged in working out the reorganization plans of roads that have recently been in the hands of receivers or are now in receivers' hands. If some of his suggestions seem impractical to men who have spent their lifetime in railroad work, let us by all means have the reason why they are impractical set forth. If there are parts of his outline which seem vague or inconclusive to congressmen or newspaper editors, or students of the transportation problem of this country, let us have a full discussion of these points. As a starter, would it be possible to administer, even under the most highly perfected form of private management, such a huge industrial activity as the operation of 260,000 miles of railroad from one central point without the evils of red tape and formalism which would be a bar to progress and individual initiative?

A Confession of Faith
