Anchor Packing Company, The, Philadelphia, Pa.—Air pump and throttle packings; valve packings; sheet packings; Pahlow air valves. Represented by W. R. Haggart, J. P. Landreth, J. F. Edmonds and D. J. P. Murray. Spaces 373-375.

Ashton Valve Company, The, Boston, Mass.—Safety valves and gauges for locomotive and stationary boilers; single, duplex and triplex air gauges; dead weight gauge testers and standard test gauges; three speed air brake and wheel press recording gauges; portable boiler test pumps. Represented by A. C. Ashton, H. O. Fettinger, J. F. Gettrust and J. W. Motherwell. Space 518.

Association of Manufacturers of Chilled Car Wheels, Chicago, Ill.—One 33" 625 chilled iron wheel for 30-ton cars; one 33" 700 chilled iron wheel for 40-ton cars; one 33" 725 chilled iron wheel for 50-ton cars; one 33" 850 chilled iron wheel for 70-ton cars; one pair 850 lb. M. C. B. wheels for 70-ton cars, mounted on axle with flange increased 3/16 of an inch, as recommended by our association. Represented by George W. Lyndon and F. K. Viol. Spaces 633-635.

Atkins & Company, Inc., E. C., Indianapolis, Ind.—Atkins Kwik Kut metal cutting machines; No. 3 metal hand saw machine; Atkins AAA hack saw blades; circular metal cutting saws; hack saw frames; Atkins silver steel hand saws; metal saw

Arrangement of Exhibit Spaces at the Convention Hall End of the Pier

American Steam Gauge & Valve Manufacturing Company, Boston, Mass.—American improved locomotive steam, steam heat and duplex air brake gauges; muffled and open pop valves; American hydraulagraph; American trainagraph; American dead weight gauge tester and general locomotive and power plant appliances. Represented by P. H. Ryan, Charles C. Kilander and H. B. Nickerson. Space 374.

American Steel Foundries, Chicago, Ill.—Simplex clasp brake; Economy cast steel draft arm; Davis steel wheel; Ajax and Hercules brake beams; Simplex and American coupler pockets; Simplex coupler; Atlas safety guard and third point support; cast steel bolsters; Vulcan trucks. Represented by G. E. Scott, R. H. Ripley, G. F. Slaughter, J. W. Dalman, D. T. Harris, W. J. Lynch, Theo. Cook, T. H. Hopkirk, J. V. Bell, T. D. Kelley, F. B. Ernst, P. A. Martin and W. H. Graul. Space 193.

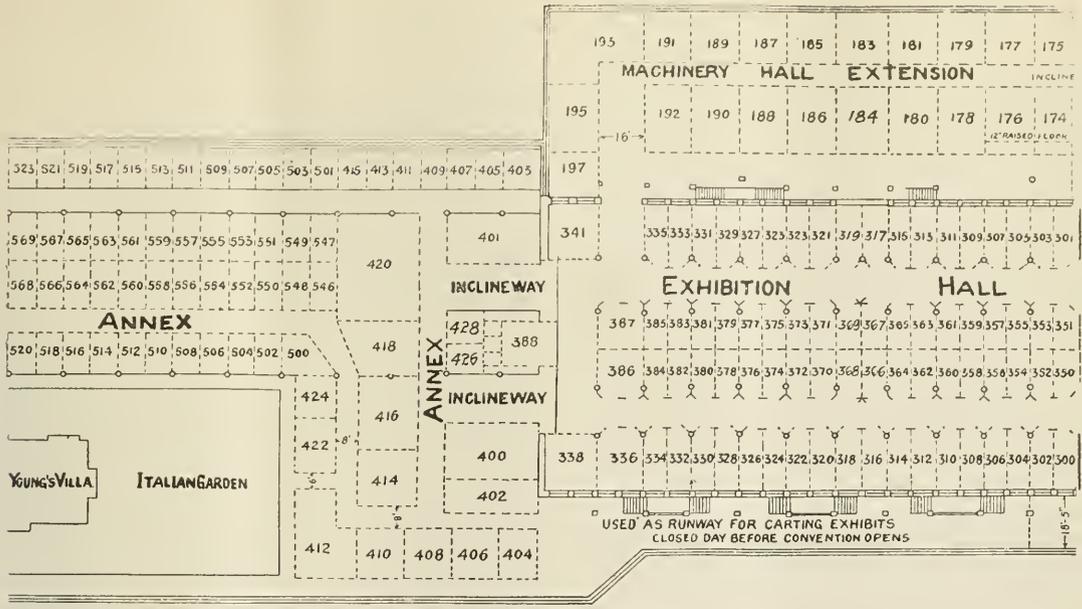

American Tool Works Company, The, Cincinnati, Ohio.—Lathes, shapers and radial drills. Represented by J. C. Hussey, H. W. Schatz and R. S. Alter. Spaces 105-107-109-111-113.

blades. Represented by T. H. Endicott, W. L. Timpone and T. A. Carroll. Space 174.

Atlantic Hand Brake Corporation, The, Buffalo, N. Y.—Rack showing the Atlantic hand brake attached to one end of a dynamometer and the other end is attached to the ordinary staff brake. Represented by Chas. E. B. Smith and Jno H. Weidemiller. Space 4, pier end.

Baker, R. & L., Company, Cleveland, Ohio—Type QTQ Baker electric industrial tractor; type DUQ Baker electric utility truck. Represented by George L. Weiss, Harry B. Grieg, J. Harry Killius and Nathaniel Platt. Space 36.

Barco Manufacturing Company, Chicago, Ill.—Barco flexible joints; engine tender connections; car steam heat connections; roundhouse blower connections; coach yard steam connections; smoke box blower fitting; Barco cross head and shoe. Represented by F. N. Bard, C. L. Mellor, Charles Thomas and F. H. Stiles. Space 607.

Arrangement of Exhibit Spaces in Exhibition Hall, Machinery Hall Extension and Part of the Annex

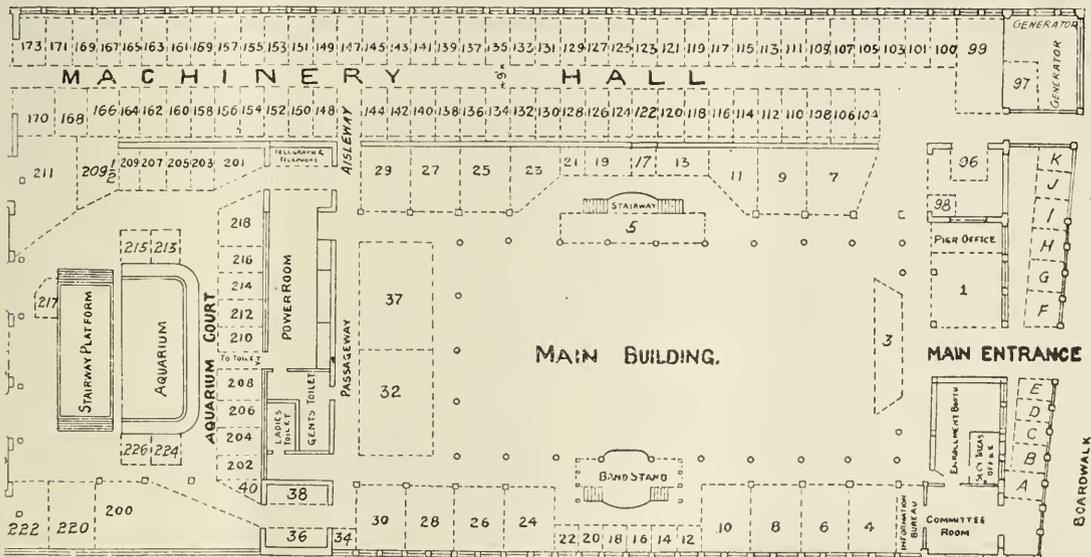

Barrett Co., The, New York, N. Y.—Everlastic fibrecote; front end engine paint; elastigum elastic adhesive cement; ever-jet elastic paint; carbosota grade one creosote oil; rubber roofings and sheathings. Represented by W. S. Babcock, K. C. Barth, C. T. Bilyea and W. J. Hickerson. Spaces 316-318.

Besly & Company, Charles H., Chicago, Ill.—Number 16 Besly wide face ring wheel grinder; Besly taps. Represented by Edward P. Welles, C. A. Knill and John F. Gurns. Spaces 140-142.

Bastian-Blessing Company, The, Chicago, Ill.—Rego welding and cutting apparatus. Represented by W. S. Hartsock, F. R. Goehler, H. H. Hirshon, W. H. Girdler and C. W. Davis. Space 3, Pier End.

Bettendorf Company, The, Bettendorf, Iowa.—Section of Bettendorf girder beam center sill; 40-ton capacity Bettendorf truck; 70-ton capacity semi-equalized truck; display of two types of Bettendorf and one U. S. R. A. truck, side frames, showing comparative weights on automatic scales; display of two types of Bettendorf and one U. S. R. A. truck, side frames, showing distortion after being subjected to comparative test loads. Represented by J. W. Bettendorf, J. H. Bendixen and C. J. W. Clasen. Space 200.

Beatty Machine & Manufacturing Company, Hammond, Ind.—New combination punch, angle shear, bar shear and coping machine; Hammond never slip portable floor crane. Represented by W. R. Beatty. Space 96.

Arrangement of Exhibit Spaces at the Boardwalk End of the Pier

- Bird-Archer Company, The, New York, N. Y.—The Bird-Archer polarized metallic boiler chemicals and introducing the Harter circulating plate for locomotive boilers. Represented by P. B. Bird, C. A. Bird, L. F. Wilson, J. A. McFarland, T. A. Peacock, W. E. Kudenour and W. W. Burden. Space 37.
- Blackall, Robert H., Pittsburgh, Pa.—Blackall ratchet brake lever, U. S. Government type; improved Lindstrom brake lever with back-off cap for vestibule passenger cars; improved Lindstrom brake lever—tunnel brake layout for application to inside and outside of blind end baggage cars; standard ratchet brake levers for passenger and freight equipment. Represented by Robert H. Blackall and E. Emery. Space 627.
- Blevney Machine Company, Greenfield, Mass.—Patent polishing and finishing machines; grinding machines; friction clutches. Represented by W. S. Howe and A. H. Behnke. Space 304.
- Boss Nut Company, Chicago, Ill.—Boss lock nuts. Represented by J. A. MacLean, J. W. Fogg and W. G. Willcoxson. Spaces 370-371.
- Bowser & Company, Inc., S. F., Fort Wayne, Ind.—Self-measuring oil and gasoline pumps; oil storage tanks and metering devices. Represented by E. M. Savercool, C. C. Fredericks and W. T. Simpson. Space 28.
- Bradford Draft Gear Co., New York, N. Y.—Draft gears. Represented by Horace Parker, Harry F. Lowman, H. C. Priebe, Charles F. McCuen, William A. McWhorter and Edward H. Barnes. Spaces 554-555.
- Brewster Company, Inc., William, New York, N. Y.—Bond bits; high speed twist drills, reamers and countersinks; high speed milling and gear cutters and hobs; etchograph electric marking machine; Bull Dog demagnetizer; electro lead burn. Represented by William Brewster, William E. McCabe and Frederic B. Squires. Space 213.
- Brosius, Edgar E., Pittsburgh, Pa.—Brosius automatic single hoist grab buckets; Brosius single hook grab buckets. Represented by Edgar E. Brosius and D. C. Schultz, Sr. Space 34.
- Buckeye Steel Castings Company, The, Columbus, Ohio.—Models of Major M. C. B. couplers, truck side frames, truck bolsters and Buckeye draft yokes. Represented by S. P. Bash, J. G. Bower, F. J. Cooledge, G. T. Johnson and J. C. Whitridge. Space 603.
- Buda Company, The, Chicago, Ill.—Buda-Ross model G. W. electric headlight. Represented by Mark A. Ross, H. P. Bayley and W. F. Davis. Space 550.
- Buffalo Brake Beam Company, New York, N. Y.—Brake beams and brake beam parts. Represented by S. A. Crone, E. C. Farlow, A. E. Crone, E. Strassburger, A. Gordon Jones and E. J. Kreiger. Space 552.
- Bullard Machine Tool Company, The, Bridgeport, Conn.—Bullard 54" Maxi-Mill; Bullard 36" vertical turret lathe; Bullard 8" Multi-Au-Matic. Represented by E. P. Bullard, S. H. Bullard, F. B. Smith, John W. Bray, John Beirne, J. H. Sharley, F. E. Hatch, Jr., F. S. Lincoln and C. H. Keller. Space 99.
- Byers Company, A. M., Pittsburgh, Pa.—Genuine wrought iron pipe. An exhibit board showing different kinds of pipe joints, welds, bends, signal pipe, pipe sizes, method of identification of Byers pipe. Also an exhibit of the materials employed and the different stages of manufacture of Byers pipe. Represented by W. W. Williams, T. L. Lewis, S. P. Broome and E. A. Small. Spaces 580-581.
- Cambria Steel Company, Philadelphia, Pa.—See Midvale Steel and Ordnance Company. Space 637.
- Camel Company, Chicago, Ill.—Top and bottom supported freight car door fixtures; burglar proof freight car door locking arrangements. Freight car door starter arrangements. Represented by P. M. Elliott, J. F. Comee, H. E. Creer and W. Han. Spaces 386-387.
- Carbic Manufacturing Company, Duluth, Minn.—Carbic cakes; portable acetylene lights and generators; oxy-acetylene welding and cutting equipment. Represented by D. C. Duncan, G. B. Van Buren, W. H. Norden and M. V. Crouse. Space 329.
- Carborundum Company, The, Niagara Falls, N. Y.—Reception booth. Represented by W. W. Sanderson, R. S. Marvin, H. P. Frost, C. C. Lathrop, C. C. Schumaker and J. W. Fraser. Spaces 548-549.
- Carnegie Steel Company, Pittsburgh, Pa.—Rolled steel wheels for freight car, passenger train car and engine truck service; locomotive piston blanks; gear blanks; electric tool steels; carbon steels; track bolts and spikes; railway cross ties; industrial wheels; crane track wheels; large sized rolled steel wheels for French Government Railroad. Represented by W. G. Clyde, John E. Woods, C. L. Wood, C. C. Cluff, R. B. Woodworth, T. W. Williams, N. B. Trist, J. B. Arnold, L. C. Bilher, H. W. Summers, Charles Orchard, J. C. Shields, Samuel Fray, Jr., and L. W. Conroy. Space 420.
- Chambers Valve Company, New York, N. Y.—Chambers locomotive throttle valve. Represented by Frank H. Clark. Space 188.
- Chase & Company, L. C., Boston, Mass.—Mohair plush upholstery for railroad coaches, steamships and automobiles; Leather-ovwe upholstery for railroad coaches. Represented by H. T. Wight and W. P. Underhill. Space 10.
- Chicago-Cleveland Car Roofing Company, Chicago, Ill.—Photographs of products. Represented by R. C. Dudley, T. N. Russell, J. E. Tesseyman, James L. Stark, T. H. Williams, R. C. Munro and K. M. Hamilton. Space 506.
- Chicago Pneumatic Tool Company, Chicago, Ill.—Boyer pneumatic riveting and chipping hammers; Little Giant air drills and grinders; Little Giant electric tools and grinders; Boyer staybolt riveters; Boyer holder-ons; Boyergrip riveting hammer attachment; improvements in design and construction of both electric and pneumatic tools; hammer rock drills. Represented by H. A. Jackson, W. P. Pressinger, W. H. Callan, H. D. Megary, H. L. Dean, C. B. Coates, T. J. Hudson, A. C. Andresen, Edw. Aplin, H. J. Kimman, H. E. Epley, E. H. Crossen, H. W. Clarke, L. C. Sprague, F. S. Sargent, A. M. Brown, R. F. Eissler, T. D. Slingman, Ross Watson, T. G. Smallwood, Nelson B. Gatch, W. H. White, H. W. Buker, George J. Sheppard, H. G. Barbee, C. W. Cross, A. E. Conrow and Norman S. Thulin. Space 621.
- Chicago Railway Equipment Company, Chicago, Ill.—Creco, Drexel and Diamond special brake beams; Creco, Drexel and Economy roller side bearings; Creco third point support and safety device; Creco four point support and safety device; Creco combination brake beam support and safety device. Represented by E. B. Leigh, C. Haines Williams, E. A. Lebean, R. J. Sheridan, F. T. De Long, G. N. Van Sweringen, E. G. Busse and R. H. Pilson. Space 639.
- Chicago Varnish Company, Chicago, Ill.—Reception booth. Represented by R. K. Buckman, S. M. Dolan and Edwin Besuden. Space 523.
- Cincinnati Bickford Tool Company, The, Cincinnati, Ohio.—One 5" motor driven plain radial drill; one 28" motor driven upright drill. Represented by H. M. Norris, J. G. Schmidt and L. Quackenbush. Spaces 164-166.
- Cincinnati Grinder Company, The, Cincinnati, Ohio.—One No. 2 12" x 36" Cincinnati manufacturing plain grinding machine, motor driven. Represented by Arthur C. Hoefinghoff and Walter F. Stegner. Space 162.
- Cincinnati Milling Machine Company, The, Cincinnati, Ohio.—No. 5 plain Cincinnati miller; No. 4 vertical Cincinnati miller; 24" automatic duplex miller; No. 1½ plain Cincinnati cutter grinder. Represented by George W. Binns, Millard H. Romaine and A. J. Baker. Spaces 164-168-170.
- Cincinnati Pulley Machinery Company, The, Cincinnati, Ohio.—Automatic drilling machines; Avery Sensitive drilling machines. Represented by L. B. Patterson, J. G. Hey, J. F. Mirrlees, L. H. Pratt and D. A. Patterson. Spaces 141-143.
- Clark Car Company, Pittsburgh, Pa.—Extension side dump car. Represented by H. E. Chilcoat. Space on track.
- Clark Tractor Company, Chicago, Ill.—Clark tractors for industrial and railway freight house and platform transportation and haulage. Represented by Robert A. Shiverick and Warren B. Eldred. Space 402.
- Clipper Belt Lacer Company, Grand Rapids, Mich.—Clipper belt lacers and belt hooks; twisted rawhide and "Fibro" waterproof pins. Represented by William F. Kall. Space 314.
- Commonwealth Steel Company, St. Louis, Mo.—Models of cast steel tender frame mounted on cast steel trucks; combination double body bolster and platform with cast steel end frame—vestibule end; combination double body bolster and platform with cast steel end frame—blind end; six-wheel passenger car truck with clasp brake; cast steel locomotive cradle with Delta trailer truck; cast steel locomotive cradle with KW trailer truck; cast steel pilot and bumper beam. Represented by Harry M. Pfleger, George E. Howard, B. V. H. Johnson, Charles S. Shallenberger, William P. Stout and William Sheehan. Spaces 386-387.

- Commonwealth Supply Company, Richmond, Va.—Lewis power reverse gear; Moss universal chuck; Gary-Moss expanding mandrel. Represented by Thomas J. Leahy and S. H. Lewis. Space 610.
- Consolidated Car-Heating Company, Albany, N. H.—Locomotive steam heat exhibit; Thermostat exhibit panel; door engine; electric cab heaters; air heaters; truss plank and panel electric heaters; switches; quick opening end valves. Represented by C. S. Hawley, W. S. Hammond, L. P. Hynes and G. E. Oakley. Space 530.
- Crane Company, Chicago, Ill.—Crane locomotive pop valves; blow-off valves; cab valves; Crane tilt steam traps; Crane railroad unions and union fittings; steel valves; Crane safety automatic stop and check valves; marine pop valves; blow-off valves for stationary boilers; Crane sta tite round house blower valves; Crane CC pressure regulators. Represented by F. D. Fenn, John B. Jordan and Fred W. Venton. Spaces 502-504.
- Crosby Steam Gate & Valve Company, Boston, Mass.—Locomotive pop safety valves, new high efficiency type; steam pressure gauges; chime whistles; globe and angle valves; blow-off valves—quick opening type; pressure recording gauges for wheel presses, continuous record. Represented by Edward C. Kenyon and J. J. McCormick. Space 632.
- Crucible Steel Company, Pittsburgh, Pa.—Reception booth.—Represented by F. Baskerville, W. D. Wintersmith, F. A. Lawler, W. K. Krepps and A. E. Jones. Space 382.
- Curtain Supply Company, The, Chicago, Ill.—Curtains with ring fixtures and Rex all metal rollers; ring curtain fixtures; Rex all metal rollers; vestibule curtain outfits with Rex opening shield, steel roller and release handle; Regal vestibule curtain release handle; Rex canvas diaphragms; steel diaphragms; upper buffer springs; Regal upper buffer spring. Represented by Ross F. Hayes, Thomas P. O'Brian and Ralph Brown. Space 638.
- Damascus Brake Beam Company, Cleveland, Ohio.—One channel beam for freight car; Anglerod beam for freight car; No. 1 Waycott special beam for passenger car; heavy 6-wheel Waycott special beam for passenger car; No. 2 Waycott beam for freight car; miscellaneous forgings; Brascott freight car ladder; No. 1 indestructible stake pocket; side door handle (square hole), side door handle (round hole). Represented by C. D. Jenks and C. E. Meyer. Space 619.
- Davis Boring Tool Company, St. Louis, Mo.—Davis expansion boring tools; Davis Expansion reamers. Represented by George Edward Gill and William Morgan. Space 4, Pier End.
- Davis Machine Tool Company, Inc., Rochester, N. Y.—Close coupled tool room lathe; "Liberty Lathe" designed for motor transport corps, U. S. A.; Davis cabinet lathe; 16" engine lathe; 16" shaper; No. 1 keyseater; No. 2 keyseater; 20" drill. Represented by John M. Fitzgerald and L. D. Farmer. Spaces 100-101-103.
- Dearborn Chemical Company, Chicago, Ill.—Showing method of Dearborn water treatment for prevention of scale formation, corrosion, pitting and foaming. Waters analyzed. Operators of analytical laboratories; NO-OX-ID rust preventive. Represented by Robert F. Carr, George R. Carr, J. D. Purcell, G. W. Spear, Edward C. Brown and E. M. Converse. Spaces 6-8.
- Detroit Graphite Company, Detroit, Mich.—Railway paint specialties. Represented by L. D. Mitchell, W. D. Waugh, H. U. Birdseye and J. J. Hogan. Space D.
- Detroit Lubricator Company, Detroit, Mich.—Locomotive lubricators; locomotive flange oilers; force feed oilers. Represented by A. D. Homard and A. G. Machesney. Space 640.
- Dickinson, Inc., Paul, Chicago, Ill.—Models, photographs and full size roundhouse ventilators, smoke jacks and small stove jacks. Represented by A. J. Filkin. Space 203.
- Dixon Crucible Company, Joseph, Jersey City, N. J.—Graphite lubricants; silica-graphite paint; belt dressings; engine front finish; brake cylinder lubricant; pipe joint compound; graphite crucibles; full line of pencils. Represented by Herman Price, J. J. Tucker, H. A. Nealley, Wm. Ernst, W. A. Housten, H. L. Hewson and L. H. Snyder. Space 24.
- Dixon Valve & Coupling Company, Philadelphia, Pa.—Hose couplings; hose clamps; throttle valves. Represented by C. W. Thomson. Space B.
- Draper Manufacturing Company, The, Port Huron, Mich.—Pneumatic flue welder; pneumatic superheater flue welder. Represented by Thos. Draper. Space 532.
- Dressel Railway Lamp Works, The, New York, N. Y.—Electric headlights; classification lamps; gauge lamps; lanterns. Represented by F. W. Dressel, F. W. L. Dressel, H. L. Hoskinson, B. P. Claiborne and J. C. Snyder. Space 362.
- Duff Manufacturing Company, The, Pittsburgh, Pa.—Lifting jacks. Represented by E. A. Johnson and C. A. Methfessel. Space 401.
- Dunbar Manufacturing Company, Chicago, Ill.—Vestibule diaphragms car window curtains and fixtures; weatherproof windows; Kass safety treads and step boxes; vestibule curtains and fixtures; steel doors and fixtures for passenger train equipment; Chanarh steel flooring; Gosso sanitary beds; folding tail gates; drawn steel mouldings; pressed steel shapes and steel stampings of all kinds. Represented by H. U. Morton, T. K. Dunbar, Wm. Wampler, G. H. Ord, H. B. Chamberlain, F. S. Harper and C. D. Morton. Space 609.
- Duntley-Dayton Company, Chicago, Ill.—Pneumatic tools, electric tools and Red Devil rivet cutters. Represented by W. O. Duntley, C. A. Duntley, G. A. Barden and A. G. Rice. Spaces 383-385.
- Du Pont Fabrikoid Company, Wilmington, Del.—Railway car seats; dining car seats; leather substitutes; a Cadillac roadster with entire surface covered with Craftsman Fabrikoid. Represented by C. L. Petze, C. H. Silkman, L. Kirkpatrick and A. H. Berwald. Space 404.
- Edgewater Steel Company, Pittsburgh, Pa.—Rolled steel wheels; locomotive and car wheel tires. Represented by W. V. D. Wright, M. R. Jackson, J. H. Baily and J. P. Rapp. Space 222.
- Edison Storage Battery Company, Orange, N. J.—Edison alkaline storage battery for railway train lighting, railway signaling; industrial trucks and tractors; commercial vehicle and delivery wagons; storage battery locomotives; mine lamps; meter testing; manhole lighting; ignition and lighting. Represented by W. F. Bauer, H. W. Stortz and E. T. Sawyer. Space 636.
- Edna Brass Manufacturing Company, The, Cincinnati, Ohio.—Locomotive injectors; lubricators; reflex water gauges; boiler check valves and coal sprinklers. Represented by B. I. Kaufmann, E. O. Corey, H. A. Glenn, R. B. Burgheim, J. E. Dillon and M. J. Mullen. Space 305.
- Edwards Company, Inc., The O. M., Syracuse, N. Y.—Window fixtures; metal extension platform trap doors; all metal sash balances; top, bottom and side weather stripping; metal stop casings and parting strips. Represented by O. M. Edwards, Sr., E. F. Chaffee, C. H. Rockwell, R. T. Axe, O. M. Edwards, Jr., and Harold Edwards. Spaces 527-529-531.
- Electric Arc Cutting & Welding Company, Newark, N. J.—Welders; hoods; electrode handles; electrodes. Represented by W. J. Murray. Space 373.
- Electric Controller & Manufacturing Company, The, Cleveland, Ohio.—Automatic controlling device for both direct current and alternating current motors. Represented by R. G. Widows, M. D. Goodman, H. K. Hardcastle and A. A. Piper. Space 300.
- Electric Railway Journal, New York, N. Y.—Copies of Electric Railway Journal and other McGraw-Hill publications, including the Electrical World, Engineering News-Record, Ingenieria Internacional, the Electric Railway Directory. Represented by H. W. Blake, C. A. Babtiste, H. H. Norris, J. J. Rockwell, C. W. Squier, C. T. Baldwin, F. H. Behrens, W. Buxman and Mason Britton. Space 7.
- Electric Service Supplies Company, Philadelphia, Pa.—Keystone turbo-generator; Keystone locomotive headlight switch; "Golden Glow" locomotive headlight. Represented by L. A. Darling, A. H. Englund, C. J. Mayer, J. R. McFarlin, E. E. Hedler, J. W. Porter and W. J. Bryan. Space 426.
- Electric Storage Battery Company, The, Philadelphia, Pa.—E. S. B. constant voltage axle light system in operation with "Chloride Accumulator." Storage batteries for industrial trucks and railway signal service. Represented by J. Lester Woodbridge, F. G. Beeten, T. L. Mount and H. E. Hunt. Space 624.

- Electro Dynamic Company, Bayonne, N. J.—One complete A. C. motor; 1 complete D. C. motor; 1 A. C. motor; 1 A. C. stator without windings; 2 compensators; 1 lamp regulator; 1 field or general regulator; 3 15" battery connectors; 3 48" battery connectors. Represented by D. B. Wilson, D. N. Balderston, L. Schofield, H. J. Lamb, H. J. Fuller, C. A. Mudge and E. Heitman. Space A.
- Elyin Mechanical Stoker Company, New York, N. Y.—Elyin locomotive stoker. Represented by Frank H. Clark. Space 188.
- Ellwell-Parker Electric Company, The, Cleveland, Ohio.—Electric storage battery industrial trucks; battery charging apparatus. Represented by Lucian C. Brown, George W. Brown, Fred B. Pink, Capt. Jarvis S. McCrea, Joseph M. Brown, Frank B. Ward, Fred B. Neely and Capt. Frank Kelly. Space 341.
- Enterprise Railway Equipment Company, Chicago, Ill.—Models of all types of load discharging cars including gondolas, hoppers, general service, ballast and grain; also safety devices used on United States Railroad Administration hopper and gondola cars. Represented by Argyle Campbell, Walter L. Gunnison and C. Dewey Humason. Spaces 582-583.
- Ewald Iron Company, Louisville, Ky.—Reception booth. Represented by Baylor Hlickman, G. O. Boomer, H. E. Pierce, E. V. Shackelford, S. F. Sullivan and R. F. Kilpatrick. Space 535.
- Fire-Gun Manufacturing Company, Inc., 115 Fourth Avenue, New York, N. Y.—No. 1 and No. 2 Fire-guns in brass and assorted colors. Represented by Dr. J. C. Gooch. Space 207.
- Flannery Bolt Company, Pittsburgh, Pa.—Tate flexible staybolts for water space; adjustable crown stays; flexible flush staybolts; flexible drilled (hollow) staybolts; F. B. C. solid flexible staybolt (new design); F. B. C. hollow flexible staybolt (new design); installation tools for the application of "Tate" and "F. B. C." staybolts; model of section locomotive boiler with complete installation—all types. Represented by J. Rogers Flannery, B. E. D. Stafford, George E. Howard, F. K. Landgraf, W. M. Wilson and E. I. Doods. Spaces 590-591.
- Flower Waste and Packing Company, Bayonne, N. J.—Journal box packing. Represented by F. J. Clair. Space 508.
- Ford Company, The J. B., Wyandotte, Mich.—Only samples of cleaning material, it being principally a reception booth. Represented by W. P. Scott, W. E. Ratz, George E. Gordon, George Lawrence, S. C. Tompkins, B. N. Goodell, W. H. Todd and Mr. Stiers. Space 521.
- Foster Company, The Walter H., New York, N. Y.—Improved bolt turning and threading machine equipped for radial, crown and side stays; turning and threading from forged blanks; N. E. W. spacing and punching machine—semi-automatic operated by compressed air. Represented by J. A. Eden, Jr., Walter H. Foster, H. L. Kenah and N. E. Woods. Spaces 127-129.
- Franklin Railway Supply Company, Inc., New York, N. Y.—Franklin automatic adjustable driving box wedge; Franklin automatic driving box lubricator; Franklin automatic fire door; Economy trucks; McLaughlin flexible conduits; Franklin ball joints. Represented by J. S. Coffin, S. G. Allen, H. F. Ball, W. H. Coyle, J. L. Randolph, C. W. F. Coffin, H. M. Evans, S. D. Rosenfelt, W. T. Lane, H. R. Stafford and B. S. Allen. Spaces 414-416-418-422-424.
- Frost Railway Supply Company, The, Detroit, Mich.—Harvey friction spring gears; "Interchange" draft castings; Detroit metal weather strips. Represented by Harry W. Frost, George A. Cooper and George L. Harvey. Space 560.
- Fuller Engineering Company, Allentown, Pa.—Locomotive equipped with apparatus to burn pulverized fuel. Represented by Walter D. Wood. Space on track.
- Galena-Signal Oil Company, Franklin, Pa.—Reception booth.—Represented by L. J. Drake, L. F. Jordan, J. E. Linahen, J. W. Bunn, W. O. Taylor, W. A. Trubee, E. G. Johnson, J. C. Tipton, E. Hawker, G. E. McVicar, B. H. Grundy, D. L. Eubank, S. S. Shields, Robert McVicar, E. V. Sedgwick, C. McNair, W. H. Foster, W. L. Trout, J. E. Hall, William Holmes, George L. Morton and T. J. Powell. Space 32.
- Garlock Packing Company, The, Palmyra, N. Y.—Special packings for railroad shops and roundhouses; for air pumps, throttles, compressors, accumulators, steam hammers, stationary engines and pumps. Represented by H. N. Winner, W. G. Cook, J. E. Hillerman, H. J. Ramshaw, Phil Arnold, C. F. Flood, E. O. Roby, Isaac McAllister and L. P. Duggan. Space 516.
- General Electric Company, Schenectady, N. Y.—Electric welding equipments; motors; industrial control; steam flow meters; turbo headlight sets; miscellaneous electrical equipments for steam roads. Actual demonstration of the electric welding equipment will be carried on throughout the Convention. Represented by W. J. Clark, Charles Fair, R. E. Woolley, C. A. Raymond, J. J. Liles, C. K. West, G. H. Gilbert, R. G. Standerwick, B. C. Tracy, R. E. Moore, C. H. Williams, H. W. Stewart, P. O. Noble, John Roberts, F. P. Jones, J. F. Myrick, F. S. Hartman, P. A. Dyer, W. L. Merrill, J. A. Seede, J. M. Hollister, J. W. Ham, C. Dorticco, D. B. Rushmore, B. S. Pero, John Eaton, R. S. Bennett, D. K. Frost, C. F. Lawrence and L. W. Shugg. Spaces 161 to 173.
- Gilbert & Barker Manufacturing Company, Springfield, Mass.—Oil storage systems; self-measuring pumps; storage tanks; power pumps; portable tanks. Represented by W. C. Halsey, J. E. Ham and Elmer M. Kling. Spaces 321-323.
- Gillespie & Company, A. W., Chicago, Ill.—Economy locomotive fire door; Henrikson journal bearing boring machine. Represented by A. W. Gillespie and J. S. Seeley. Space 365.
- Globe Seamless Steel Tubes Company, Chicago, Ill.—Boiler tubing. Represented by F. W. Renshaw, E. H. Bankard, Jr., F. J. O'Brien and W. H. V. Rosing. Spaces 526-528.
- Gold Car Heating & Lighting Company, New York, N. Y.—Vapor, combination pressure and vapor, pressure, hot water and electric car heating systems. Thermostatic control for all types of car heating systems and buildings; ventilators for railway cars; pressure regulators. Represented by Edward E. Gold, E. B. Wilson, A. B. Strange, F. R. Cooper, E. J. Ronan, W. H. Ivers, J. O. Brumbaugh, A. Sheldon, F. H. Smith, F. O. Bailey and G. E. A. Letourneau. Spaces 350-351-352-353.
- Gould Coupler Company, New York, N. Y.—Cast steel truck bolsters; malleable iron journal boxes; automatic slack adjusters; cast steel truck side frames; cast steel body bolsters; friction buffers; friction draft gears; cast steel pilot beams; electric car lighting equipment; storage batteries; freight, passenger and engine couplers; turbo-generators for locomotive headlight. Represented by Commodore Charles A. Gould, C. E. Rood, W. F. Richards, G. B. Young, P. H. Simpson, M. R. Shedd, W. H. Sauvage, G. R. Berger, W. F. Bouche, William Garstang and D. C. Davis. Spaces 209 $\frac{1}{2}$ -211.
- Gould & Eberhardt, Irvington, N. J.—Showing a 28" invincible type shaper, arranged with constant speed motor and selective type gear box, with automatic starter and dynamic brake control apparatus. Represented by H. Ezra Eberhardt and Charles L. Cameron. Space 187.
- Grand Rapids Grinding Machine Company, Grand Rapids, Mich.—Two motor-driven Grand Rapids drill grinders; 4 belt-driven Grand Rapids drill grinders; 1 No. 1 Universal grinder; 1 No. 2 cutter, reamer and drill grinder; 1 Grand Rapids casting grinder. Represented by S. Owen Livingston and J. DeKoning. Space 181.
- Graver Tank Works, William, Chicago, Ill.—Model Graver type "K" water softener; model Graver pressure filter; 110-gallon Graver underground gasoline storage unit; specimen heavy steel plate riveting and welding. Represented by W. R. Toppan and J. J. Felsecker. Space K.
- Greenfield Tap & Die Corporation, Greenfield, Mass.—Nutter & Barnes cutting off machines; "Wells" universal grinders; G. T. D. threading machines; Maxi staybolt top; taps and dies; screwplates; gauges; reamers. Represented by L. H. Taylor, W. A. Cook, F. W. Strecker and F. H. Hoffman. Spaces 308-310.
- Grip Nut Company, Chicago, Ill.—Grip nuts. Represented by W. E. Sharp, A. B. Chadwick, C. J. Wymer, Albert Roberts and H. E. Passmore. Space 175.
- Hale & Kilburn Corporation, Philadelphia, Pa.—Walkover car seats and reclining chairs; steel car interior finish; steel car doors; steel truss-plate car partition and flooring. Represented by H. C. Minor, A. F. Old, R. H. Pilsen, H. R. Rochester, J. R. Strain and P. J. Tucker. Spaces 408-410.
- Hammett, H. G., Troy, N. Y.—Staytite metallic packing for piston rods and valve stems; Trojan bell ringers; triple valve bushing rollers. Represented by H. G. Hammett, A. O. Van Dervort and E. C. Sawyer. Space 512.
- Hanna Locomotive Stoker Company, Cincinnati, Ohio.—Full-sized stoker—type H 1. Represented by W. T. Hanna, W. A. Austin and L. J. McConnell. Space 217.

- Haring, Ellsworth, New York, N. Y.—Park gate extra special superlative high speed steel and tool steels; Monel metal wires; fine brass; bronze and nickel wires; nickel sheets and specialties. Represented by Ellsworth Haring. Space 20.
- Harrington, Son & Co., Inc., Edwin, Philadelphia, Pa.—Peerless hoist; Harrington improved screw hoist; Peerless army type hoist; plain traveler, lower flange of I-beam; geared traveler, lower flange of I-beam. Represented by Roger Sherron, A. M. Harrington, W. J. Somers, James A. Slaughter, G. W. Schwager and M. W. Christian. Space 185.
- Hauck Manufacturing Company, Brooklyn, N. Y.—Portable heaters; storage battery repair outfits; thawing outfits; pre-heating burners; crude oil furnace burners; kerosene torches; melting furnaces; oil burners; pumping stations; weed burners; tire heaters; rivet forges. Represented by John D. Moore, G. A. Nelson, J. R. Jarvis, G. N. Broadhurst and Arthur E. Hauck. Space 320.
- Heald Machine Company, The, Worcester, Mass.—No. 61, cylinder grinding machine for use on air brake parts and valve motion units or parts which cannot be revolved when grinding; No. 71, internal grinding machine used on bushings, valves and small parts that can be revolved; No. 22, rotary surface grinding machine; magnetic chucks. Represented by Samuel M. Hershey, William Erickson, James H. Cafferty and S. T. Massey. Spaces 147-149.
- Heywood Bros. & Wakefield Company, Wakefield, Mass.—Samples of reed furniture; Perfektone reed music cabinets; nickel-plated seat mechanism which reverses automatically; samples of seats used on various railroads in the United States. Represented by E. C. Lang, Bertram Berry, Frank N. Grigg, C. A. Van Derveer and George E. Cornwall. Spaces 520-522-524.
- Hunt-Spiller Manufacturing Corporation, South Boston, Mass.—Air furnace gun iron castings. Represented by W. B. Leach, Gordon Dexter, J. G. Platt, A. B. Root, Jr., V. W. Ellet, J. M. Monroe, E. J. Fuller and C. L. Galloway. Spaces 562-563.
- Hutchins Car Roofing Company, Detroit, Mich.—Models all-steel flexible car roofs. Represented by D. W. Hawksworth, M. F. Ryan, F. M. Whyte, A. R. Wilson, C. F. Pape and W. D. Thompson. Space 525.
- Hyatt Roller Bearing Company, New York, N. Y.—Hyatt roller bearings as used in railway service cars, freight house trucks, baggage wagons, machine tools, line shafting, counter shafting; a large moving model of a Hyatt roller bearing; small railroad cars equipped with plain bearings and with Hyatt bearings to show comparison, and a lantern slide projectograph machine for illustrating the many uses of Hyatt roller bearings. Represented by D. Gleisen, P. C. Gunion, E. E. Eby, T. P. Cunningham, M. F. Lawrence and H. K. Porter. Space 9.
- Illinois Steel Company, Chicago, Ill.—Tie plates; track bolts; track spikes; screw spikes. Represented by Edwin S. Mills, John Brunner and J. B. Arnold. Space 420.
- Imperial Appliance Company, Chicago, Ill.—See Standard Railway Equipment Company. Space 428.
- Independent Pneumatic Tool Company, Chicago, Ill.—Piston air drills and reamers, non-reversible and reversible; pneumatic grinders; stay bolt drivers; hoists; pneumatic chipping hammers; pneumatic caulking hammers; pneumatic flue heading hammers; pneumatic light riveting hammers; pneumatic long-stroke riveting hammers; sand rammers; electric drills and grinders; pneumatic tool hose to hose couplings; close corner drills. Represented by R. S. Cooper, R. T. Scott, F. B. Hamerly, H. F. Finney, F. J. Passino, F. H. Charbono and A. L. Schuhl. Space 557.
- Industrial Truck Company, Holyoke, Mass.—Tractors, under-slung load carrying and elevating load carrying. Represented by Edwin F. Moody, S. L. Ayr and Theodore T. Ludlum. Space 1.
- Ingersoll-Rand Company, New York, N. Y.—Showing "Little David" type of pneumatic tools. Represented by George A. Gallinger, W. A. Johnson, D. A. Fulton, George S. Johnston, P. J. Christy, Charles Little, M. O'Connor, F. W. Gaw, R. H. Cunningham, L. W. Schnitzer and Robert F. McCreadie, Spaces 588-589.
- International Pulverized Fuel Corporation.—See Pulverized Fuel Equipment Corporation, 414-416-422-424.
- Iron City Products Company, Pittsburgh, Pa.—Rees double worm gear drive jacks. A number of different designs and sizes from 2 to 25 tons capacity with testing machine to demonstrate jacks under load. Represented by E. E. Arnold and C. A. Conklin. Space 618.
- Jefferson Union Company, Lexington, Mass.—Jefferson unions, flanges and malleable iron pipe fittings. Represented by Daniel T. Groff. Space 16.
- Jenkins Bros., New York, N. Y.—Jenkins valves, in brass, iron and cast steel; mechanical rubber goods including Jenarco and "96" sheet packing and gaskets, Jenkins discs; pump valves; compressed asbestos jointing; Selclo blow-off valves. Represented by Frank Martin and B. J. Neely. Spaces 558-559.
- Johns-Manville Company, H. W., New York, N. Y.—Air brake cylinder packing cups and expander rings and gaskets; slack adjusters; insulating materials; pipe coverings; hair felts; boiler lagging; roofings; packings; pump valves; insulating cements; high temperature cements; cellulite; ebony and asbestos wood; transite asbestos wood smoke jacks; asbestos paper and millboard; vitribestos; fire felt; fibre conduit; sheet fibre; metallic flexible conduit; tape; fire extinguishers; fuses; asbestos shingles; boiler wall coating; mastic; waterproofing materials; 85% magnesia and fire felt for locomotive boiler lagging; salamander insulator for steel passenger and postal cars; Keystone hair felt insulator for refrigerator cars. Represented by J. E. Meek, G. A. Nicol, J. C. Younglove, P. C. Jacobs, F. J. Horne, H. G. Newman, G. C. Christenson, J. H. Trent, C. E. Murphy and H. Flannagan. Spaces 570-571.
- Johnson Bronze Company, New Castle, Pa.—Babcock water gauge protector; bronze engine, and car brasses. Represented by P. J. Flaherty, G. P. Blackiston and F. H. Babcock. Space 373.
- Joliet Railway Supply Company, Chicago, Ill.—Huntoon brake beams; Huntoon truck bolsters; Joliet journal boxes; Peerless, Burry & Perry side bearings; Hartman center plates; Burnett reinforced box car end; Burnett angle cock holder; Burnett train pipe anchor; Rex emergency knuckle. Represented by J. H. Slawson, F. L. Siyver, C. A. Carscadin, J. E. Simons, R. W. Burnett and V. J. Burry. Space 611.
- Jones & Company, Inc., B. M., New York, N. Y.—Mushet high speed steels; extra best Titanic carbon tool steel; Taylor's best Yorkshire iron. Represented by W. H. White, Ray G. White, Fred J. Holden and B. C. Heacock. Space 208.
- Jones & Laughlin Steel Company, Pittsburgh, Pa.—Miscellaneous steel products. Represented by Roland Gerry, Robert Geddis, R. M. Kilgore, G. C. Fogwell, T. G. Roberts, G. B. Mitchell, E. A. France, R. T. Rowles, F. S. Slocum, J. P. Replinger and J. K. Barker. Spaces 409-411.
- Joyce-Cridland Company, The, Dayton, Ohio.—Jacks for every railway service; hydraulic, full automatic, geared ratchet and lever; 35-ton journal jack, control lowering; geared screw jack; pulling and pushing jacks. Represented by C. D. Derby, W. F. Bippus, C. W. Ripsch, W. I. Clock and A. S. Beattys. Space 605.
- Justice & Company, Philip S., Philadelphia, Pa.—Reception booth. Represented by Philip J. Mitchell. Space 509.
- Karry-Lode Industrial Truck Co., Inc., Long Island City, N. Y.—One model No. 1 all steel utility electric industrial truck; one model No. 2 all steel low platform warehouse electric industrial truck. Represented by Ernest Tarof, H. A. Spalding and J. M. Breitenbach. Spaces 317-319.
- Kaustine Company, Inc., Buffalo, N. Y.—Kaustine system toilet apparatus. Represented by D. A. Evans, F. B. Shalters and C. W. Kelly. Space 335.
- Keller Pneumatic Tool Company, Grand Haven, Mich.—Riveting, chipping, caulking, heading and scaling hammers; jam riveters; pneumatic tool safety devices; pneumatic drills; woodboring machines and grinders; sand, bench and floor rammers; holders-on; hammer holders-on; dolly bars; rivet sets; chisel blanks; hose couplings. Represented by W. H. Keller, J. G. Osgood, J. B. Corby, G. M. Kenyon, W. W. Shaw, J. C. Campbell, L. A. Zaring, C. Humphrey, J. E. Mills, H. C. Browne, E. E. Knox, A. M. Andresen, W. J. Devlin, H. I. Kahn, W. F. Delaney, W. H. Woody, F. S. Eggleston and Mr. Coates. Space 197.
- Kerite Insulated Wire & Cable Company, The, New York, N. Y.—Kerite insulated wires and cables. Represented by P. W. Miller, J. W. Young and J. A. Renton. Space 384.
- Kershaw Corporation, Newark, N. J.—Rapid railway mail and message exchange system. Full sized device used in tests conducted at Port Newark terminal, Pennsylvania R. R., Newark, N. J. Represented by Frank A. Bross and Henry Kershaw. Space 13.

- Kevoke Railway Equipment Company, Chicago, Ill.—Cast steel traction draft gear; keyed cast steel coupler yokes; keyless cast steel coupler yokes. Represented by R. J. Cook, E. Walters and George C. Murray. Space J.
- Keystone Drop Forge Works, Chester, Pa.—Standard and special drop forgings. Represented by Geo. H. Berlin and Wm. J. McDewitt. Space 368.
- Lands Machine Company, Waynesboro, Pa.—A 2" Lands double head bolt threading machine, motor driven; a 4" pipe threading and cutting machine, motor driven; a 2" stationary pipe die head; an 8" stationary pipe die head; a 2" automatic die head; Lands chaser grinder. Represented by C. N. Kirkpatrick, F. C. Deleher, J. W. Willis, E. E. Bohm and J. W. Frey. Spaces 131-133.
- Lansing Company, New York, N. Y.—One 3 wheel tractor and 3 trailers. Represented by E. L. Card, M. F. Christensen and W. B. Tourtelotte. Space 324.
- LeBlond Machine Tool Company, The R. K., Cincinnati, Ohio.—LeBlond lathes, milling machines and cutter grinders. Represented by Edwin D. Nichols and Wm. O. Strauss. Spaces 157-159.
- Lchon Company, The, Chicago, Ill.—Mule-hide plastic car roofing; burlap back car roofing; waterproof insulating fabric for refrigerator cars; saturated burlap; membrane for reinforcing the waterproofing of concrete in tunnels, subways, bridges; canvas for coach, caboose and engine cab roofing; waterproof insulating papers for refrigerator cars; composition roll roofings; waterproof sheathing papers and asphalt shingles for buildings. Represented by Tom Lchon and Chas. V. Eades. Space 18.
- Liberty Export & Import Corporation, New York, N. Y.—See Liberty Steel Products Company.
- Liberty Manufacturing Company, Pittsburgh, Pa.—Liberty type (air and water operated) arch tube cleaners; Lagonda type (air and water operated) arch tube cleaners. Turbine cleaners of every description to clean every type of boiler condenser or evaporator tubes. Represented by Henry A. Pastre. Space 98.
- Liberty Steel Products Company, Inc., New York, N. Y.—Davis solid trust freight and passenger brake beams; Liberty built-up brake beams; "Stefco" sectional steel buildings; Clark tractors; nuts, bolts and rivets. Represented by J. W. Weinfeld, N. O. Acby, R. P. Townsend, R. M. Smith, S. W. Midgley, J. M. Borrowdale, W. C. Schneider, J. H. Siebert, W. E. Fowler, W. S. Ottinger, C. W. Gridley, T. L. Lawry, E. L. Capehart, Frank Harrison and C. K. Drury. Space 618.
- Liberty Tool Company, The, Baltimore, Md.—Portable drilling presses; stay bolt heading attachment; dolly bar; rivet heating furnaces; portable torches. Represented by E. Oliver Grimes, Jr., E. S. Astin, Andrew B. Moore and Peter P. Beck. Space 213.
- Loco Light Company, The, Indianapolis, Ind.—Loco light generator in operation; headlight case. Represented by H. H. Tomlinson, C. C. Vossler and Fleming Brothers. Space 333.
- Locomotive Feed Water Heater Company, New York, N. Y.—Model locomotive feed water heater and full size boiler feed pump. Represented by George M. Basford, Earl A. Averill, Walter H. Lovekin, C. R. Fairchild, A. R. Frankhauser, C. R. Hardy and H. V. Jones. Space 416.
- Locomotive Firebox Company, Chicago, Ill.—Nicholson thermic siphon—its construction and application. Represented by John L. Nicholson, Chas. G. Hawley and Stuart Hawley. Space 332.
- Locomotive Lubricator Company, Chicago, Ill.—A 1919 model locomotive force feed lubricator, with diaphragm terminal check valve. Represented by O. H. Neal, C. W. Rudolph and W. J. Schlacks. Space 574.
- Locomotive Stoker Company, Pittsburgh, Pa.—Type "D" duplex stoker; type "D" slope sheet coal pusher. Represented by C. D. Barrett, W. S. Bartholomew, J. J. Byrne, O. B. Capps, D. T. Carlisle, W. G. Clark, D. F. Crawford, N. M. Lower, L. E. Osborne, C. F. Pennypacker, E. Prouty, E. Ryan, L. V. Stevens and A. N. Willis. Spaces 403-405-407.
- Locomotive Superheater Company, New York, N. Y.—Pyrometer for superheater locomotives; developments in construction of superheater units; stationary superheaters. Represented by Geo. L. Bourne, F. A. Schaff, R. M. Ostermann, G. E. Ryder, R. R. Porterfield, W. A. Buckbee, A. C. McLachlan, Geo. Fogg, H. B. Oatley, N. T. McKee, C. A. Brandt and Chas. H. True. Spaces 422-424.
- Lodge & Shipley Machine Tool Company, The, Cincinnati, Ohio.—One 16"x6" portable selective head lathe with belted motor drive in leg; one 24"x10" selective head manufacturing lathe with belted motor drive on head; taper attachment; connected compound and plain rests; multiple length and cross feed stops; four-way tool block; high duty tool block, pan, pump and tubing. Represented by J. Wallace Carrel, H. J. Breitenbach and J. E. Kordenbrook. Space 170.
- Long, Jr., Company, Chas. R., Louisville, Ky.—Samples of railway paints and paint films. Represented by Chas. R. Long, Jr., Harry Vissering, Guilford S. Turner, W. H. Heckman and Samuel W. Russell. Space 577.
- Lucas Machine Tool Company, Cleveland, Ohio.—No. 32 "Precision" horizontal boring, drilling and milling machine. Represented by W. L. Cheney and F. P. Sprague. Space 138.
- Ludlum Steel Company, Watervliet, N. Y.—Seminole unbreakable chisel steel; Mohawk extra high speed steel. Represented by P. A. E. Armstrong, S. T. Pearsons, C. J. Poore, James Cran and R. P. Devries. Space 334.
- Lunkenheimer Company, The, Cincinnati, Ohio.—Valves; lubricators; oiling devices; oil and grease cups; injectors. Represented by Howard J. Evans and Andrew Lauterbach. Spaces 309-311.
- McCabe Manufacturing Company, Lawrence, Mass.—Tube sheet for locomotive fire-box. Represented by Fred H. McCabe. Space 312.
- Macbeth-Evans Glass Company, Pittsburgh, Pa.—Gauge glass; lantern globes; chimneys, headlight; signal lenses; car lighting glass. Represented by Frank J. Lepreau. Space 364.
- McConway & Torley Company, The, Pittsburgh, Pa.—Pitt pivoted passenger coupler; new developments in coupler and yoke connections. Represented by Wm. McConway, Jr., Stephen C. Mason, I. H. Milliken, H. C. Buhoup and W. J. Regan. Spaces 501-503-505.
- McCord & Company, Chicago, Ill.—Journal boxes. Represented by Judson A. Lamon, L. A. Shepard and F. W. Craig. Space 629.
- MacLeod Company, The, Cincinnati, Ohio.—Oil fuel rivet forges; portable sand blasts for cleaning bridges and steel cars; file sharpening and cleaning machine; flue welding apparatus; portable oil burners. Represented by Walter MacLeod and A. H. Schmidt. Space 186.
- MacRae's Blue Book Company, Chicago, Ill.—MacRae's Blue Book. Represented by Alex Smith and L. R. Rollins. Space 22.
- Mahr Manufacturing Company, Minneapolis, Minn.—Mahr No. 1-C steel car repair torch outfit; No. 2 boiler shep torch; Mahr self-contained type torches; oil fuel rivet forges and safety automatic shut-off valves. Represented by J. A. Mahr, J. R. Matthews and R. B. Ecker. Space 538.
- Manning, Maxwell & Moore, Inc., New York.—Putnam gap lathe; Putnam slotter; Putnam planer; Putnam axle lathe; Putnam geared head lathe; National rivet header; National Heading machine; National hammer header; National bolt cutter; National tapper; Defiance rail drill; Defiance vertical drill; Defiance horizontal boring mill; Cincinnati crank planer; Cincinnati traverse head shaper; Cincinnati crank shaper; Woodward & Powell planer; Ashcroft steam and pressure gauges; Metropolitan injectors; Consolidated safety valves; Tabor indicators; Ashcroft paper tester; Ashcroft thickness gauge; Hancock inspirators; Hancock main steam valve; Hancock boiler check valve; Hancock hose strainer; Hancock cylinder cocks; Hancock oil cups; Hancock globe and angle valves; H. D. ejectors. Represented by A. J. Babcock, N. J. Derby, F. E. McKee, H. D. Carlton, P. M. Brotherhood, F. J. Baumis, J. Soule Smith, J. H. Bush, C. L. Brown, H. E. Lott, E. R. Frost, J. W. Spraggins, C. A. Spraggins, K. L. Ernst, Charles Harmon, Jr., James Briscoe, E. L. Fickett, Paul Dayton, Joseph Wainwright, B. T. Williston, W. H. Williston, F. J. Mawby, Thomas Stevens, P. G. Marsh, Jr., B. J. Mihans and H. Fenner. Spaces 104 to 136.
- Massachusetts Mohair Plush Company, Boston, Mass.—Mohair plushes for car seats. Represented by William W. Melcher. Space 631.

- Mead-Morrison Manufacturing Company, East Boston, Mass.—Mead-Morrison type "U" grab bucket for crane and derrick work; Mead-Morrison electric car puller. Represented by D. W. Coe, C. D. Bray, F. O. Klukics and R. C. Smith. Space 326.
- Metal & Thermit Corporation, New York, N. Y.—Thermit and appliances; sample welds; samples of carbonfree metals and alloys produced by the Thermit process; large sample weld on a 9' crankshaft; materials for demonstration pipe welding for the purpose of welding locomotive superheater units; sample of superheater unit so welded. Represented by F. W. Cohen, W. R. Hulbert, H. D. Kelley, H. S. Mann, E. B. Bloom, J. G. McCarty and W. Aldrich. Space 184.
- Midvale Steel and Ordnance Company, Philadelphia, Pa.—Twisted axles; bolster spring; rolled gear blanks; turbine bucket wheel; wheel center; and illustrations featuring wide range of products. Represented by J. C. C. Holding, L. B. Morris, L. R. Steur, E. Price, Jr., Frank Krouse, Joseph De Cray, Samuel Griffith, R. V. Sage, C. E. Keenan, F. W. Sager, H. E. Rowe, A. C. Howell, Stuart Hazlewood, J. C. Thomson, H. O. Williams, G. A. Richardson, J. K. Bayliss, Frank Huff, A. D. Wade, H. H. Neele, John Welsh, William Thornhill and Mr. McCarrigle. Space 637.
- Milburn Company, The Alexander, Baltimore, Md.—Milburn acetylene generators; cut-weld combination torch; cutting torch; Milburn equal pressure welding torch; portable carbide lights. Represented by A. F. Jenkins and C. R. Pollard. Space 4, Pier End.
- Miner, W. H., Chicago, Ill.—Friction draft gears; side bearings; safety hand brakes; refrigerator car door fasteners; drawbar yokes. Represented by W. H. Miner, A. L. Canavan, Bradley S. Johnson, J. R. Mitchell, J. F. O'Connor, W. E. Robertson, A. P. Withall and George A. Johnson. Spaces 584-585.
- Mudge & Company, Chicago, Ill.—Mudge peerless ventilator; Mudge Slater removable box front end; Mudge Salvit compound. Represented by Burton Mudge, Karl J. Eklund, George W. Bender, William B. Ross and Sherman C. Amstien. Space 201.
- Mutual Manifold Company, The, Baltimore, Md.—Way-bills; bills of lading; freight bills—triplicate and quadruplicate; telegraph blanks. Represented by Philip S. Carpenter. Space 376.
- Napier Saw Works, Springfield, Mass.—Metal band saw with hydraulic feed. Represented by G. W. Fleming. Space 228.
- Nathan Manufacturing Company, New York, N. Y.—Locomotive injectors; lubricators; boiler checks; water gauges; Klinger, Delco and fittings; check valves; steam valves; feed water strainer; boiler washers and testers; steam fire extinguishers; oil cups; gauge cocks; whistles; cylinder and drain cocks; globe and angle valves. Represented by Edward S. Toethe, Otto Best, J. G. Arn, J. F. Farrell, William Brumble, Harry Gettys, Richard Welsh and James Currie. Spaces 578-579.
- National Car Wheel Company, Pittsburgh, Pa.—Star special cast iron car wheels for freight and tender service, from 60,000 lbs. to 140,000 lbs. capacity. Represented by John Howard Yardley, H. E. McClumpha, E. H. Chapin, R. H. Tate, J. Francis Weisbrod, H. L. Garvin, D. C. Davis and A. H. Strickland. Spaces 572-573.
- National Lock Washer Company, The, Newark, N. J.—Models of car curtains; car curtain fixtures; window locks; sash balances; weather stripping; curtain rollers; national rib lock washers. Represented by C. H. Loutrel, F. B. Archibald, J. Howard Horn, R. L. Cairncross, A. T. Thompson and Daniel Hoyt. Space 541.
- National Malleable Castings Company, The, Cleveland, Ohio.—Couplers; journal boxes; miscellaneous car castings. Represented by S. L. Smith, O. W. Loomis, James S. Slater, L. S. Wright, J. J. Byers, T. W. Aishton, R. T. Hatch, Charles H. McCrea, E. O. Warner, Charles A. Bieder, H. L. Mausk, Benjamin Nields, Jr., J. V. Davison, Jr., W. E. Coffin, George V. Martin, H. T. Krakau, George R. Farrell and E. H. Schmidt. Spaces 613-615.
- National Railway Appliance Company, New York, N. Y.—Economy power saving meters; Johnson fare box—motor driven, in operation; Gog automatic drain valve; samples of flaxlinum; Garland ventilators; Anglo-American varnishes and enamels. Represented by B. A. Hegeman, Jr., Charles C. Castle, Harold A. Hegeman, Fred C. J. Dell, W. C. Lincoln, Frederick C. Dunham, J. Turner Martyn and Charles H. McCormick. Space 622.
- National Railway Devices Company, Chicago, Ill.—Shoemaker vertical firedoor. Represented by Jay G. Robinson, E. J. Gunnison and A. F. Linds. Space F.—G.
- National Tube Company, Pittsburgh, Pa.—Reception booth. Represented by George N. Riley, P. J. Conrath, J. T. Goodwin and J. W. Kelly. Spaces 546-547.
- Newton Machine Tool Works, Inc., Philadelphia, Pa.—Showing a 6" swivel head slotting machine; 26" blade bar type cold saw cutting-off machine; duplex keyseat milling and cotterling machine; locomotive radius link milling machines. Represented by N. P. Lloyd and R. G. Holmes. Spaces 117-119-121.
- New York Air Brake Company, The, New York, N. Y.—Reception booth. Represented by B. Pratt, C. E. Leach, S. T. Toby, N. W. Lyon, N. A. Campbell, William Owens and George Kliefges. Space 30.
- Niles Bement Pond Company, New York, N. Y.—Moving pictures of railroad machine tools in actual shop operation. Represented by George Mills, Charles Lyle, N. C. Walpole, D. H. Teas, B. S. Skinner, H. F. Welch and E. L. Leeds. Space 180.
- Norton, Incorporated, A. O., Boston, Mass.—High speed self-lowering lifting jacks. Represented by Arthur O. Norton, Harry A. Norton, Frank L. Gormley, Henry J. Wilson, George R. Law, Charles H. Smith, Jr., and F. B. Hartman. Space 551.
- Oakley Machine Tool Company, The, Cincinnati, Ohio.—One No. 2 Oakley grinder—power feed, motor driven; one No. 2 Oakley universal cutter and tool grinder. Represented by Abbot A. Thayer and Irwin Newsome. Space 115.
- Oesterlein Machine Company, The, Cincinnati, Ohio.—The "Ohio Tilted Rotary," which is a new continuous production, semi-automatic heavy duty milling machine, motor driven, which will be rigged up and turning out a different job each day of the Convention, showing both application and operation. Represented by Geo. M. Meyneke, Nick Baechle and Chas. D. Oesterlein. Space 145.
- Okadee Company, The, Chicago, Ill.—"Okadee" blow off valves; blower valves; roundhouse washout valves; tender hose couplers; reflex water gauges; water glass protectors; automatic drain valves; locomotive front end hinge. Represented by A. G. Hollingshead, Harry Vissering, Chas. R. Long, Jr., W. H. Heckman and G. S. Turner. Space 575.
- O'Malley-Bear Valve Company, Chicago, Ill.—Valves; multi-plate; globe; angle; check; "Y" body; all types locomotive valves; shut off and blow out valve, and new type gauge cocks. Represented by J. E. Brown, E. O'Malley, J. N. Gallagher, T. O'Malley and J. M. Pigott. Space 177.
- Oxweld Railroad Service Company, The, Chicago, Ill.—Reception booth. Represented by H. W. Jacobs, R. R. Browning, E. S. Richardson, J. P. Furbeck, William Leighton, George Thompson, C. B. Moore, M. C. Beymer, J. P. McWilliams, H. W. Schulze and G. M. Crownover. Space 5.
- Page Steel and Wire Company, New York, N. Y.—Armco iron electric welding wire; Armco iron oxy-acetylene welding wire and "Copperweld" copper clad steel wire. Represented by W. T. Kyle, C. A. McCune, G. A. Paff and E. C. Sattley. Space 307.
- Paige & Jones Chemical Company, Inc., New York City, N. Y.—Boiler feed water treatment. Represented by Fred O. Paige and H. N. Bennett. Space 363.
- Pantasote Company, New York, N. Y.—Pantasote curtain upholstery; Agasote headlining, roofs, wainscoting and flooring; Steelasote; Electroasote. Represented by John M. High, Wm. A. Lake and Wm. Anderson. Space 401.
- Parkesburg Iron Company, Parkesburg, Pa.—Model of flue sheet showing correct method of applying Parkesburg charcoal iron boiler tubes; small samples of Parkesburg charcoal iron boiler tubes for marine, locomotive and stationary boilers. Represented by H. A. Beale, Jr., George Thomas, 3rd, W. H. S. Bateman, R. J. Sheridan, G. W. Denyven, G. A. Cardwell, J. R. Wetherald, W. P. Canby and G. H. Woodroffe. Space 388.
- Paxton-Mitchell Company, Omaha, Neb.—Metallic packing. Represented by James L. Paxton, D. E. Murphy and R. C. Fielding. Space 533.
- Penn Iron & Steel Company, Creighton, Pa.—Reception booth. Represented by Henry F. Gilg and Chas. J. Nieman. Space 40.
- Penn Seaboard Steel Corporation, Philadelphia, Pa.—Reception booth. Represented by T. Burd Zell, Craig Adair, Paul W. Day and Wm. F. Baker. Space 608.

- Pilliod Company, The, New York, N. Y.—A quarter size running model Baker valve gear; standard parts for Baker valve gear; sentinel low water alarm. Represented by E. J. Barnett, J. J. Donovan, K. J. Eklund, F. E. Pilliod, K. V. Pilliod, J. D. Purdy and R. H. Weatherly. Space 191.
- Pocket List of Railroad Officials, The, New York, N. Y.—The Pocket List of Railroad Officials. Represented by J. Alexander Brown, Harold A. Brown and Charles L. Dinsmore. Space 7.
- Pratt & Lambert, Inc., Buffalo, N. Y.—Two steel car sections showing Vitralite railway enamel; one large rack of display panels showing standard shades of Vitralite railway enamel. Represented by J. F. Gowing, I. R. Mielke and E. L. Georger. Space 612.
- Pratt & Whitney, New York, N. Y.—See Niles-Bement-Pond Company, Space 180.
- Pressed Steel Car Company, New York, N. Y.—Reception booth with photographs. Represented by J. F. MacEulenty, N. S. Reeder, C. E. Postlethwaite, J. S. Turner, W. H. Wilkinson, J. H. Mitchell, H. H. Gilbert, K. C. Gardner, C. C. Clark, H. S. Hammond, Chas. A. Lindstrom, B. D. Lockwood, J. F. Streib and L. O. Cameron. Spaces 545-601.
- Pressed Steel Manufacturing Company, The, Chicago, Ill.—See Standard Railway Equipment Company, Space 428.
- Pulverized Fuel Equipment Corporation, New York, N. Y.—Model of powdered fuel burning locomotive; literature on pulverized fuel. Represented by H. D. Savage and M. C. M. Hatch. Spaces 414-416-422-424.
- Pyle-National Company, The, Chicago, Ill.—One type "K-2" 500-watt maximum capacity turbo-generator; one type "E-2" 500-watt normal capacity turbo-generator; one type "E" 1500-watt turbo-generator; one type "F" 2½ K. W. turbo-generator; one type "M" 3½ to 7 K. W. turbo-generator; one special 18" incandescent case and reflector fitted with No. 1450 lamp stand; one standard 18" incandescent case and reflector fitted with No. 1450 lamp stand; one model of the Young valve gear. Represented by R. C. Vilas, J. Will Johnson, Wm. Miller, R. C. Shaal, J. E. Kilker, O. W. Young, C. P. McGinnis, R. L. McIntosh, R. L. Kilker, Geo. E. Haas, J. L. Reese, A. R. Allen, E. M. Thomas, C. T. Tewkesbury and C. F. Owens. Spaces 602-604-606.
- Q and C Company, The, New York, N. Y.—Q & C piston rod packing; piston lubricator; car and engine replacers; skid shoes or track skates and Gilman-Brown emergency knuckles. Represented by E. R. Packer, C. F. Quincy, F. F. Kister, W. W. Hoyt, Edgar M. Smith, L. T. Burwell, J. V. Wescott and R. J. McComb. Space 510.
- Quigley Furnace Specialties Company, New York, N. Y.—Hyttempte, high temperature cement for bonding and repairing fire clay and silica brick furnace linings. Insulbrix. A cellular insulating refractory brick. Powdered coal apparatus for transporting, distributing and burning powdered coal and other fuels. Represented by W. S. Quigley and L. G. McPhcc. Space 302.
- Railway Devices Company, St. Louis, Mo.—"Western" angle cock holder; "Perfection" brake ratchet; "spiral" pipe clamps; "Iron Horse" or pedestal; "Sta-Rite" uncoupler and attachments. Represented by Louis A. Hoerr, Roland M. Hoerr and Sterling Campbell. Space 616.
- Railroad Herald, The, Atlanta, Ga.—Copies of The Railroad Herald. Represented by E. C. Laird. Space 376.
- Railway Materials Company, The, Chicago, Ill.—Steel back brake shoes. Represented by W. M. Simpson, I. B. Lesh, Geo. F. Allen and E. C. Folsom. Space 561.
- Railway Review, Chicago, Ill.—Copies of weekly publication. Represented by Willard A. Smith, Harold A. Smith, J. E. Gougeon, A. E. Hooven, C. L. Bates, L. H. Lozier, Robt. B. Armstrong and John Lammedec. Spaces 12-14.
- Railway Storage Battery Car Company, New York, N. Y.—Operating exhibit on tracks of Atlantic City and Shore Railroad of 50' steel combination passenger and baggage Edison Battery car, in service between Atlantic City and Ocean City. Represented by L. Klopman, F. N. Koziell and C. A. Wipf. Space 634 and on exhibition track.
- Reading Specialties Company, Reading, Pa.—Car replacers; skid shoes; rail benders; guard rail clamps; replacer clamps; street car replacers; portable derrails; rail braces. Represented by J. Turner Moore, M. G. Moore, B. J. Pnell, J. J. O'Connell, A. P. Haines, W. J. Zimmernan, W. H. Doherty, L. G. Schmitt and Chas. F. Ludstone. Space 620.
- Reliance Electric & Engineering Company, Cleveland, Ohio.—Reliance direct and alternating current motors; Bardons & Oliver cutting off machine. Represented by C. L. Collins, H. M. Hitchcock, A. M. MacCutecheon, A. W. Ray, H. J. Fisher, S. G. Boyd and R. Timmerman. Spaces 135-137-139.
- Republic Iron & Steel Company, Youngstown, Ohio.—Reception booth. Represented by H. L. Rowind, W. B. Topping, C. S. McKinley, W. H. Oliver, W. H. Hunter and Frank Phalen. Spaces 517-519.
- Rich Tool Company, Chicago, Ill.—High speed drills, reamers, forged rivet sets and chucks; milling cutters. Represented by W. B. Sullivan, F. H. Whiteside, C. M. Conner, T. H. Carlin, Jr. and J. L. Crowley. Space 303.
- Rivet Cutting Gun Company, Cincinnati, Ohio.—Flexible rivet cutting guns; flexible slag guns; rivet catchers. Represented by J. M. Crowe and L. K. DeBus. Space 513.
- Robinson Connector Company, The, New York, N. Y.—The Robinson automatic train pipe connector. Represented by A. R. Whaley and H. D. Cameron. Spaces 328-330.
- Robinson Exhaust Company, Boston, Mass.—Robinson exhaust nozzle. Represented by Gordon Dexter, Frederic Parker, J. G. Platt and V. W. Ellet. Spaces 564-565.
- Rogers Company, H. A., New York, N. Y.—Moncrieff's gauge glasses; tubular glasses; Perth brand—up to 200 pounds steam pressure; Unific brand—up to 400 pounds steam pressure; Beacon red; lubricator glasses; reflex gauge glasses; gauge glass strips; glass protector slides. Represented by Harry S. Griffith. Space 372.
- Rogers Journal Packing Company, Inc., Chicago, Ill.—Stecos journal packing; Paine toggle bolts and expansion shells. Represented by Charles A. Ely. Space 628.
- Rome Iron Mills, Inc., New York, N. Y.—Samples of Rome superior staybolt iron; Rome Perfection engine bolt iron; Rome hollow staybolt iron. Represented by B. A. Clements, Major Weston Jenkins and C. C. Osterhout. Spaces 414-416-422-424.
- Ryerson & Son, Joseph T., Chicago, Ill.—Ulster special solid staybolt iron; Ulster special seamless hollow iron; engine bolt iron; complete Ryerson flue shop equipment; complete Ryerson spring top equipment; flue cleaners; Ryerson friction saw for rail cutting. Represented by H. A. Gray, J. P. Moses, A. W. Willcuts, H. T. Bradley, E. W. Kavanagh and J. H. Craigie. Space 176.
- Safety Car Heating & Lighting Company, The, New York, N. Y.—Pintsch mantle light; car lighting electric generators; car lighting fixtures; Oxy-Pintsch metal cutting equipment; electric fans. Represented by W. L. Conwell, J. A. Dixon, A. C. Moore, W. L. Garland, George E. Hulse, L. Schepmoes, H. K. Williams, R. H. Harvey, J. H. Rodger, H. D. Donnell, V. S. Henry and J. S. Henry. Space Stairway Platform.
- Safety Nut & Bolt Company, The, Cleveland, Ohio.—The Stevenson safety nuts, bolts and washers, spring clips, U bolts, shackle bolts and turn-buckles. Represented by E. Ellis Clepper, R. D. Stevenson and W. W. Bonnell. Space 17.
- Sargent Company, Chicago, Ill.—Sargent safety water gauge; Ironclad water glass protector; Loedige quick acting blower valve; Remm gnage cock; Sargent automatic feed grease cup; Martin self-locking grease plug. Represented by George H. Sargent and George S. Garren. Space 600.
- Schaefer Equipment Company, Pittsburgh, Pa.—Schaefer truck lever connections; Schaefer detachable brake jaws; K. C. repair card holder. Represented by Frederic Schaefer, E. J. Searles, H. G. Doran and S. M. Hindman. Space 511.
- Schroeder Headlight & Generator Company, Evansville, Ind.—Turbo-generator for electric headlights; electric headlights; oil headlights; electric headlight accessories. Represented by W. A. Carson, F. W. Edmunds, J. Henry Schroeder, L. B. Jones, W. T. Manogue and A. J. Leonard. Spaces 367-369.
- Sellers & Company, Inc., William, Philadelphia, Pa.—Table exhibit of locomotive injectors and accessories pertaining thereto. Represented by Strickland L. Kneass, Charles T. Wilson, John D. McClintock, Edward L. Holljes and James R. New. Space 625.

- Shepard Electric Crane & Hoist Company, Montour Falls, N. Y.—Two electric hoists, one electric winch, and accessories. Represented by A. J. Barnes, R. H. McGredy, H. W. Gledhill and W. C. Briggs, District Manager of New York Territory. Space 215.
- Simmons-Boardman Publishing Company, New York, N. Y.—Copies of the Railway Age; Railway Mechanical Engineer; Railway Maintenance Engineer; Railway Electrical Engineer; Railway Signal Engineer; Locomotive Dictionary and Cyclopaedia. Car Builders' Dictionary and Cyclopaedia, and other railroad literature. Represented by E. A. Simmons, L. B. Sherman, Henry Lee, S. O. Dunn, R. V. Wright, C. R. Mills, F. S. Dinsmore, A. F. Stuebing, C. B. Peck, F. H. Thompson, C. N. Winter, F. C. Koch, H. H. Marsh, J. P. Risque, A. G. Oehler, J. M. Rutherford, R. H. Smith, J. G. Little, F. J. Fischler, C. W. Foss, F. W. Kraeger, H. L. Burghus, J. E. Anderson, S. B. Outwater, L. R. Wolff, N. H. Crossland, C. L. Fletcher, A. E. Ortinghaus and T. E. Crossman. Space 1.
- Simmons Hardware Company, St. Louis, Mo.—Electric welded ware; gray super-seated cylinder cock; shovels; scoops; hickory handles. Represented by J. B. Webb and H. W. Jacques. Space 331.
- Simonds Manufacturing Company, Fitchburg, Mass.—Metal cutting circular saws—both solid and inserted tooth; hack saw blades; files; car builders' saws; an inserted tooth metal saw with high speed steel teeth will be in operation, and a newly designed metal saw sharpening machine for keeping high speed steel teeth in perfect condition will be demonstrated. Represented by H. B. McDonald, R. D. Baldwin, B. F. Kelly and S. Patterson. Space 306.
- Smith Locomotive Adjustable Hub Plate Company, The, Chicago, Ill.—Locomotive driving wheels mounted on axle with both solid and sectional adjustable hub plates (lateral devices) therein; literature and catalogs. Represented by A. J. Sams and R. G. Long. Spaces 602 to 606.
- Smoke Jack Company, The, East Boston, Mass.—Standard mill type smoke jack, assembled; Standard mill type smoke jack, crated for shipment; model of mill type smoke jack; photographs of installations. Represented by Robert McKillop, Walter Richardson and Daniel W. Coe. Space 220.
- Southern Locomotive Valve Gear Company, Knoxville, Tenn.—Valve gear; Murden blow-off valve; Brown power reverse gear. Represented by W. S. Murrian and E. L. Chollman. Space 230.
- Southern Railway Supply & Equipment Company, St. Louis, Mo.—Saunders car stopper; Scarritt car seats. Represented by Laurance Boswell and Blake C. Howard. Spaces 313-315.
- Southern Wheel Company, St. Louis, Mo.—One pair of new M. C. B. design 33" No. 700 wheels on axle, the wheels having flanges  $\frac{3}{16}$ " thicker at base line than M. C. B. standard; one pair of Southern Wheel Company special No. 800 33" wheels on axle, the wheels having flanges  $\frac{3}{16}$ " thicker at base line than M. C. B. standard; one pair Southern Wheel Company special No. 800 wheels on axle, with flanges  $\frac{3}{16}$ " thicker at base line than M. C. B. standard, which have been in service for 17 months under 50-ton steel hopper coal car Atlantic Coast Line R. R. These wheels will be shown on track, with standard frog and guard rail to show guard rail clearance. Represented by Frank C. Turner, F. O. Bunnell, J. B. Spencer and Sam C. Watkins. Space 418.
- Southwark Foundry & Machine Company, Philadelphia, Pa.—Southwark Mason washer press; spring banding press; boiler tube welding machine. Represented by W. H. Harman, F. G. Schranz and G. Harry Case. Space 178.
- Speedograph Corporation, Newark, N. J.—Loco-Recorder, model K, speed, time and distance recording instrument for road engines; loco-recorder, model L, recording instrument for switch engines, showing idle and working time, in hours and minutes, the speed at any point or time and exact mileage covered. Represented by H. H. Smith, A. F. Wallbillich and R. A. Paterson. Space 630.
- Standard Asphalt and Refining Company, Chicago, Ill.—Sarco mineral rubber floor, refrigerator compound, fabric and No. 6 waterproofing; Sarco battery sealing compound; Sarco pipe coating. Represented by R. F. Trumbull. Space 381.
- Standard Car Truck Company, Chicago, Ill.—Trucks, models and specialties on pier; two cars on Mississippi Avenue track exhibit. Represented by J. C. Barber, J. T. Milner, Lee W. Barber, F. L. Barber and E. W. Webb. Spaces 190-192.
- Standard Coupler Company, New York, N. Y.—Friction draft gears. Represented by George A. Post, A. P. Dennis, E. H. Walker, R. D. Gallagher, Jr., and George A. Post, Jr. Space 500.
- Standard Railway Equipment Company, New York, N. Y.—National bottom supported car door fixtures; Murphy XLA flexible roof; Imperial type "B" release rigging; Imperial centering device; Carmer release rigging; steel end; Fowler upper buffer spring; carlines. Represented by W. P. Murphy, A. C. Murphy, G. T. Cooke, S. G. Rea and A. A. Frank. Space 428.
- Standard Stoker Company, Inc., New York, N. Y.—A working model of the Standard Stoker for locomotives will be shown in booth 4. In booth 338, there will be motion pictures showing the operation of a Standard stoker on a locomotive now in service; also pictures of our electric steel furnace at Erie, Pa., and the assembling of stokers in the machine shop. Represented by James A. Carey, F. H. Cunningham, Harvey L. Walker, Eugene duPont, Alexis I. duPont, Clarence E. Pratt, D. B. Fawcett, J. B. Liminger and W. C. Carter. Spaces 4 and 338.
- Stone Franklin Company, New York, N. Y.—Stone-Franklin single battery coach equipment operating with 23 cells Edison A-4H. Represented by Ralph G. Coburn, Charles E. Walker and Harry D. Rohman. Space 406.
- Strong-Kennard & Nutt Company, The, Cleveland, Ohio.—Safety devices in the form of clothing, surgical appliances, goggles, eye protectors and masks. Represented by B. W. Nutt, Thomas P. Scully, J. H. Hopper and F. B. Frank. Space 514.
- Swind Machinery Company, Philadelphia, Pa.—Bradford lathe; Gray's sheet metal cutter; Barnes drill; Willard lathe; Lealand-Gifford drill; Oesterlein grinder. Represented by L. H. Swind, J. E. Brandt, W. J. Powers and M. R. Carson. Space 97.
- Symington Company, The T. H., New York, N. Y.—Farlow draft attachments; Symington journal boxes; Symington flexible dust guards. Represented by T. H. Symington, C. J. Symington, J. F. Schureh, R. H. Gwaltney, T. C. deRosset, I. O. Wright, A. H. Weston, C. R. Naylor, W. G. Hoffman, Jr., and D. S. Barrows. Spaces 568-569.
- Talmage Manufacturing Company, The, Cleveland, Ohio.—American automatic connector; Cleveland low water alarm; Talmage hand brakes; steam chest and cylinder lubricating drifting valve; blow-off valves; diverting valves. Represented by J. G. Talmage, M. A. Barber, Frank M. Roly, J. Frank Walker and Alfred F. Letherer. Spaces 354-361.
- Trumbull Waste Manufacturing Company, Philadelphia, Pa.—Curled Tampico journal packing; cotton wiping waste. Represented by R. R. Bilter. Space H.
- Tuco Products Corporation, New York, N. Y.—Tuco products; flexolith flooring; national standard roofing; resisto insulation; Tucork insulation; national trap door; universal trap door; K-1 kicker lock; deck sash ratchets; Imperial car window screens; universal car window screens; Reliance sash balances; Perfection sash balances; preservative; metallic steel sheathing; Brown weatherstrips; Giessel sanitary water cooler; Berwick electric rivet heater. Represented by David W. Pyc, L. F. McNally, Frank N. Grigg, Garrett Burgert, W. J. Elliott and J. W. Coleman. Space C.
- Underwood Corporation, H. B., Philadelphia, Pa.—One portable cylinder boring bar; one portable cylinder boring bar attached to cylinder showing method; one circular planer tool; one heavy type rotary planer; one dome facing machine; one 8" crank pin truing machine set upon crank. Represented by D. C. Hitchner. Space 301.
- Union Connector Company, St. Louis, Mo.—Union connectors for passenger service and accessories; "Union Jack" truck. Represented by Charlton A. Alexander and L. D. Woodruff. Space 378.
- Union Draft Gear Company, Chicago, Ill.—Cardwell friction draft gear type G class II-A; Cardwell friction draft gear type G class II-A-compound. Represented by J. R. Cardwell, L. T. Cantfield, C. H. Tobias, H. Barnard, J. W. Hathaway, W. G. Krauter, J. E. Trelton and C. J. Gorman. Spaces 413-415.
- Union Metal Products Company, Chicago, Ill.—See Standard Railway Equipment Company. Space 428.
- Union Railway Equipment Company, The, Chicago, Ill.—Ureco metal roof; drop brake shaft; refrigerator brine tank valves; hand holes and tank supports; Ureco coupler centering device; uncoupling lever; Ureco pipe clamp. Represented by Wm. B. Hall, A. F. O'Connor and A. C. Lewis. Space E.
- Union Spring & Manufacturing Company, Pittsburgh, Pa.—Journal boxes. Represented by L. G. Woods, F. E. Schaeffer, J. W. Chandler and A. C. Woods. Space 553.

- United Engineering & Foundry Company, Pittsburgh, Pa.—Working model of steam hydraulic forging press and photographs of large shop installations. Represented by Arnold P. Park. Space 540.
- U. S. Light & Heat Corporation, Niagara Falls, N. Y.—Complete lighting; axle equipments; direct current arc welder converter; alternating current arc welding motor generator. Represented by W. L. Bliss, H. A. Matthews, R. H. Van Nest, R. Bauer and W. B. Turbayne. Spaces Welding at Pier End No. 2 and in Hall 325-327.
- United States Metallic Packing Company, The, Philadelphia, Pa.—Models of King metallic packing; Gollmar bell ringer; Leach pneumatic track sanders and Security knuckle and wrist pin. Represented by Elliott Curtiss, M. B. Brewster, J. S. Mace, R. R. Wells, J. T. Luscombe, J. E. Keefe, L. B. Miller and Harry E. Hyslop. Space 566.
- Unit Railway Car Company, Boston, Mass.—Steam driven unit car. Represented by H. C. Dodge, F. O. Stanley, B. J. Moses, W. J. Lavarre, J. F. Shimp, P. H. Gentzel, A. R. Crapo and H. Edwards. Space Track space Mississippi Avenue.
- Universal Car & Hose Coupler Company, Oklahoma City, Okla.—Automatic car and steam hose coupler. Represented by J. H. Funk, O. H. LeCompte, Joseph LeCompte and J. A. Houle. Space 38.
- Universal Draft Gear Attachment Company, Chicago, Ill.—Universal cast steel re-inforcing draft arms, coupler yokes and malleable draft lugs and plates. Represented by C. J. Nash and C. C. Kinsman. Space 515.
- Universal Equipment Company, The, Toledo, Ohio.—National Gregory automatic fire door. Represented by Frank I. Isbell. Space H.
- Vapor Car Heating Company, Inc., Chicago, Ill.—Passenger train car heating; vapor system of heating; steam pressure system of heating; combination steam and hot water heating system; car heating specialties; steam specialties; emergency stoves; ventilators. Represented by Egbert H. Gold, Joseph E. Buker, S. Higgins, E. A. Schreiber, B. A. Keeler, E. E. Smith, H. F. Lowman, R. P. Cooley, Wm. Damm, L. B. Rhodes, F. F. Coggin, F. A. Purdy, C. E. Lowell, N. F. Burns, and E. C. Post. Spaces 210-212-214-216-218.
- Vissering & Company, Harry, Chicago, Ill.—Viloco and Leach types locomotive sanders; Viloco fire door; forged steel draw bar yoke; steam compressor governors; Crescent metallic piston rod and valve stem packing; Viloco bell ringers. Represented by Harry Vissering, G. S. Turner and W. H. Heckman. Space 576.
- Walworth Manufacturing Company, Boston, Mass.—Walworth cast iron, malleable and steel pipe fittings, brass and iron body valves; Genuine Walworth Stillson wrenches; Parmelee wrench, Walco Hex wrench; "Boston" wrench and full line of tools, Kewance union and specialties. Represented by L. F. Hamilton, H. S. Patterson and H. T. Goodwin. Space 412.
- Warner & Swasey Co., The, Cleveland, Ohio.—One No. 2A universal hollow hexagon turret lathe with bar equipment and 5 H.P. General Electric motor; No. 3A ditto with chucking equipment and 10 H.P. Reliance motor. This machine to operate on piston valve followers using both "Stellite" and high speed steel cutters. Represented by L. K. Berry, E. R. Gardner, H. E. Witham, C. E. Neubert and Walter Loegler. Spaces 123-125.
- Watson-Stillman Company, The, New York, N. Y.—High speed ball bearing screw jack with automatic lowering device; Watson-Stillman hydraulic jacks; 250-ton crank pin press (hydraulic); Stauchian pipe bender (hydraulic); 15-ton telescopic hydro-pneumatic pit jack; hydro-pneumatic accumulator; four plunger motor driven pump; hydraulic leather packings. Represented by E. A. Stillman, G. D. Kershaw, H. D. Nitchie, W. B. Updegraff, F. T. West, C. Wessels, E. E. Radeck and E. B. Fleming. Spaces 151-153-155.
- Waugh Draft Gear Company, Chicago, Ill.—Waugh draft gear with auxiliary cushion; passenger car buffing device, type "H"; stub buffer for express and refrigerator cars; draft gear with side carrier plates adaptable for U. S. standards; Anderson friction draft gear, type "B"; Chaffee draw 3/4 bar centering devices. Represented by J. M. Waugh and S. T. Rowley. Spaces 537-539.
- Wayne Oil Tank and Pump Company, Fort Wayne, Ind.—One-barrel signal oil outfit; cross sectional view of two-barrel cylindrical tank (underground) and pump; two-barrel outfit with barrel cradle; cross section of two barrel cellar tank and pump; two long distance pumps; three long distance pumps. Represented by R. S. Bohn. Space 206.
- West Disinfecting Company, New York, N. Y.—Automatic deodorizing appliances; Coro Noleum disinfectant and cleaner; fumigators; insector machines and liquids for exterminating the insects; liquid soaps and dispensers; metal polish; paper towels and cabinets; portable steam sterilizer for sterilizing water coolers; stock car sprays. Represented by H. E. Daniels, C. P. Williams, W. L. Farry, J. A. Martinka, T. F. Kelly and Chas. Auerbach. Space 26.
- Western Machine Tool Works, Holland, Mich.—One six foot extra heavy duty plain radial drill. Represented by G. J. Bosch. Space 222.
- Western Railway Equipment Company, St. Louis, Mo.—"M. C. R." malleable journal welds; "Western" brake jaws; "Linstrom locomotive siphon; "Security" dust guards. Represented by Louis A. Hoerr, Roland M. Hoerr and Sterling Campbell. Space 616.
- Western Steel Car & Foundry Company, New York, N. Y.—See Pressed Steel Car Company. Spaces 545-661.
- Westinghouse Air Brake Company, Pittsburgh, Pa.—Reception booth. Represented by A. L. Humphrey, W. S. Bartholomew, G. W. Wildin, C. C. Farmer, E. A. Craig, J. R. Elliott, C. J. Olmstead, C. P. Cass, Robert Burgess, C. R. Elliott, John B. Wright, S. G. Down, F. H. Parke, F. V. Green, T. L. Burton, F. M. Nellis, F. H. Whitney, J. S. Y. Fralich and R. E. Adreon. Space 19 to 29.
- Westinghouse Electric & Manufacturing Company, Pittsburgh, Pa.—Arc welding motor-generator; small turbine generator unit; motor driven grinder; small portable drills; electric fans. Represented by J. C. McQuiston, J. C. Bair, J. Andrews, J. A. Albrecht, W. P. Cochran, C. M. Harris, F. O. Kirkpatrick, H. C. Mode, R. F. Moon, W. H. Patterson, Charles Rabbons, R. J. Ross, H. Stinemetz and E. W. Wise. Spaces 19 to 27.
- Wheel Truing Brake Shoe Company, Detroit, Mich.—Various forms of abrasive shoes designed for grinding car wheels and locomotive driver-wheels. Represented by J. M. Griffin and Perry Allen. Space 507.
- White American Locomotive Sander Company, Inc., Roanoke, Va.—Graham-White perfect shown in operation. Represented by John E. Graham, James Frantz and Oscar F. Ostby. Space 205.
- Whiting Foundry Equipment Company, Harvey, Ill.—Working models of type "R" electric crane trolley and Whiting electric screw-jack locomotive hoist; photos, drawings and catalogs of foundry equipment, cranes and railway equipment, such as coach hoists, turntable centers and tractors, transfer tables, car wheel foundries. Represented by R. H. Bourne, R. S. Hammond and G. W. Ristine. Space 179.
- Wilmarth & Morman Company, Grand Rapids, Mich.—New Yankee drill grinders; Wilmarth & Morman universal grinders and surface grinders. Represented by Joseph H. Hazley and B. C. Saunders. Space 183.
- Wilson Corporation, The, J. G., Norfolk, Va.—Rolling wood doors; rolling steel doors. Represented by P. S. Tremaine, P. H. Wilson, R. T. McKnew, L. H. Myrick, Geo. D. Dodge, H. H. Charles, E. A. Baker, E. Doscher and A. H. Dodge. Space 336.
- Wilson-Imperial Company, Newark, N. J.—Car cleaning methods and sundries specialties connected with the up-keep of passenger cars. Represented by J. MacNaull Wilson, Ellsworth Wilson, D. J. Giles and William McCandless. Spaces 202-204.
- Wilson Welder & Metals Company, Inc., New York, N. Y.—Wilson plastic-arc welder. Represented by J. O. Smith, R. S. Drummond and Claude Hartford. Spaces 224-226.
- Wine Railway Appliance Company, The, Toledo, Ohio.—Wine freight car ladders; side bearings; hopper door mechanism; ventilators. Represented by William E. Wine, William F. Cremane, Cyrus J. Holland, R. F. Tillman, J. L. Tillman and L. J. Tillman. Space 366.
- Wood Iron & Steel Company, Alan, Philadelphia, Pa.—Reception booth. Represented by L. G. W. Carpenter, W. W. Lukens and C. O. Hadley. Space 11.
- Woods & Company, Edwin S., Chicago, Ill.—Anti-friction side and center bearings for freight cars, passenger cars and locomotives. Represented by Albert G. Welch, H. M. Perry and A. A. Weigel. Space 617.
- Wyoming Shovel Works, The, Wyoming, Pa.—Veteran red edge locomotive scoops; red edge locomotive scoops. Represented by H. T. Potter and E. L. Ruby. Space 209.
- Yale & Towne Manufacturing Company, New York, N. Y.—Chain blocks; electric hoists; trolleys (I-beam) winches; portable floor cranes; locks and hardware. Represented by C. W. Beaver, A. L. Connor, J. F. Stoldt, H. R. Butler and W. C. Bigelow. Spaces 148-150.

F. C. KOCH J. P. RISQUE

Entered at the Post Office at New York, N. Y., as mail matter of the second class.

Subscriptions, including 52 regular weekly issues and special daily editions published from time to time in New York, or in places other than New York, payable in advance and postage free; United States and Mexico, \$5.00; Canada, \$6.00; Foreign Countries (excepting daily editions), \$8.00 (£-15s; Od.); single copies, 15 cents each. Subscription Agents for Great Britain and Egypt: The Dorland Agency, Ltd., 16 Regent Street, London, S. W. 1.

WE GUARANTEE that of this issue, 17,000 copies were printed; that of these 17,000 copies, 15,406 were mailed to regular paid subscribers to the Railway Age and the Railway Mechanical Engineer; 119 were mailed to advertisers, 300 were provided for counter and news companies' sales, new subscriptions, bound volumes, copies lost in the mail and office use; and 1,175 copies for distribution at Atlantic City.

THE RAILWAY AGE is a member of the Audit Bureau of Circulations (A. B. C.) and the Associated Business Papers. (A. B. P.)

The report of the Brake Shoe and Brake Beam Equipment Committee, which was presented during yesterday morning's session, was received without discussion, not because of any lack of interest in the subject, but because in a large measure the report is a forecast of what may be expected in the way of definite proposals for consideration next year. There is much in the report which is of great interest and will undoubtedly be carefully considered by the membership of the Mechanical Section. In general, the plan of procedure which the committee proposes to follow is to be highly commended. The five suggested steps in which subjects before the committee will be advanced to the point of consideration for advancement to the standards of the Section will offer ample opportunity for the formation of well digested and crystallized opinions on the part of the membership, so that better ballot action may be of a more intelligent nature than it has been some times in the past. One point mentioned in the report is worthy of especial attention. This is the effect of the change in the relative location of the center loop hanger opening of the brake head and the center line of the brake beam strut, raising the center of the hanger above the center of the strut. The result, under load, is an eccentrically loaded brake shoe, with a tendency for greater wear at the bottom than at the top. With the brakes released the brake heads will tend

to drag at the top, while hanging free at the bottom. The proposal that the standard and recommended practice sheets of the association show a method of laying out the brake head, rather than mere detailed dimensions of the finished heads, is an excellent one, as it should avoid all possible misunderstandings in the interpretation of the standard, whatever it may be in its finally adopted form. The suggestion of the committee that the judgment of a committee member may be of an opposite character in his official capacity from that exercised in the capacity of a representative member is open to question. If the members of a committee cannot support the recommendations to which they attach their signatures as committee members, when acting on the same propositions in the letter ballot, they have little right to expect the support of the association as a whole to the propositions which they propose that the association adopt for universal application.

Track exhibits this year are probably the most remarkable that have ever been seen at any convention during the history of the association. The exhibit of railroad equipment alone is unusually extensive and interesting, but in addition to the railroad equipment there are a number of heavy railroad mounts for the Army and Navy Ordnance that are not only noteworthy because of the natural interest attaching to equipment of this nature at the present time, but also because of the problems which had to be solved by the designers to provide for the extraordinary stresses to which equipment of this sort is subjected. It is of interest to note that in some cases this equipment differs very little from standard railroad practice. Two of the Army rifles, the seven-inch and the eight-inch, the mounts of which are of the well-car type, are carried on standard M. C. B. trucks, a 50-ton truck in one case and a 70-ton truck in the other. As a whole, this part of the exhibit is a remarkable demonstration of the adaptability of the manufacturers of railway equipment, who, in the time which has elapsed since the last convention in Atlantic City, have produced large quantities of ordnance and other munitions in addition to their regular products.

The *Railway Age* has referred in the past to the good work being done by the Latin-American Division of the Bureau of Foreign and Domestic Commerce in connection with its reports on railways and markets for railway supplies in various South American countries. It now desires also to express its appreciation of the work being done by another of the divisions of the bureau—namely, the Division of Statistics. That division for the past few months has been compiling detailed figures of exports of all kinds, classified by countries of destination, and has included the tabulation of export figures of railway supplies under the following heads: locomotives; cars; car wheels and axles, and railway track material. The figures in question have been reproduced in the foreign railway news column of the *Railway Age*, and, we believe, have served a real purpose, not only in stimulating interest in export trade, but in showing that this interest is proving a most practical one. The tabulation by countries of destination is especially valuable, as it enables the observer to see into what markets our trade is expanding and permits the drawing of

definite conclusions therefrom. The figures as compiled by the division for the year thus far are as follows:

Month	Locomotives		Freight Cars		Car Wheels and Axles	
	No.	Value	No.	Value	Value	
January ...	87	\$3,076,543			\$278,393	
February ..	85	2,584,269	583	\$957,128	541,630	
March ...	27	852,224			686,281	
April .....	55	2,193,168	1,005	1,913,728	946,304	

The increase in the exports of car wheels and axles in the four months is especially encouraging, although the exports of cars and locomotives are not very large. It should be borne in mind, however, that they represent in reality the beginning of our peace time export trade, and will no doubt increase from month to month as conditions generally improve. It is to be hoped that the bureau will keep up this work and thereby supply an indication of the increase in exports of railway supplies that is rightly to be expected.

## Depreciation of Freight Cars

THE PROLONGED and animated discussion of the report presented by the Committee on the Depreciation of Freight Cars shows that the members generally were greatly interested in the subject. The accurate determination of the average life of cars is extremely important because of the large amount of money involved in the settlement for destroyed cars. The committee is to be commended for its work in compiling statistics regarding the average life of wooden and steel equipment to be used as a basis for the rate to be applied under various conditions.

One point brought out very clearly in the course of the discussion was the impracticability of settling for cars on any but an average basis. The conflicting statistics regarding the life of steel cars shows the extent to which the type of construction, the weight of the car, the standard to which it is maintained and the service to which it is assigned affect the life and consequently the rate of depreciation. Obviously, the effect of these factors cannot be evaluated in fixing the settlement price and the average age at which the cars are dismantled furnishes the only satisfactory data on which to base the depreciation rate.

The limiting of depreciation to 50 per cent. of the value now probably strikes a bare average for all cars. Extensive studies have shown that the estimated service life based on the physical condition alone does not decrease more than 40 per cent. in actual service, but the older equipment, of course, must be retired, due to obsolescence, even though the individual parts of the car may be in good condition. If it were practical to make a separate classification for the older types of equipment, the maximum depreciation might be increased to an amount equal to 100 per cent. minus the scrap value.

Some road will, no doubt, question the advisability of applying the same rates of depreciation to the truck that are applied to the car body. Many roads make a practice of setting aside the trucks removed from cars which are dismantled and applying them under company service for less capacity equipment, such as stock cars. The long life of the truck and the high scrap value of the wheels and axles would seem to call for a rate of depreciation lower than that which is fixed for the car body.

The work of the committee during the past year furnishes an excellent foundation for the development of a thoroughly logical basis for settling for destroyed cars. The continuation of its investigation, particularly with regard to the life of steel cars and the establishment of a separate rate for rebuilt cars, promises to furnish data

that will eliminate many of the principal objections to the former rules covering this subject.

## Government's Debts to Railway Supply Companies

NO OTHER PEOPLE IN THE COUNTRY will be so glad to see the \$750,000,000 railroad appropriation bill passed by Congress as the railway supply people. The experience of the railway supply people with Government operation has been, in the main, a distinctly unpleasant one. They were at first confronted with what was regarded as a demand that they should, in dealing with the railways under Government control, pool their patents and forego the royalties upon them. Next, an attempt was made to force them to sell to the Government on a lower basis of profit than any other class of concerns that was doing business with the Government. Later they were presented with a ruling of the Attorney-General of the United States to the effect that every concern selling any kind of goods to the Government railways must insert in the contract a warranty—later modified—that no commission was or would be paid to any agent for having got the business.

But perhaps the thing which, under Government control, has caused the supply people more trouble than anything else has been the delay of the Government in paying its bills. When the railroad appropriation bill was killed by a filibuster at the last session of Congress, the Railroad Administration owed the railway equipment and supply concerns many millions of dollars. The passage of that bill would have enabled the Administration to meet its obligations. Its defeat rendered it impossible for the Railroad Administration to pay its debts. In consequence, for months the Government has owed the railway equipment and supply companies vast sums of money. In order to continue to carry on their business, the supply companies have been obliged to borrow large sums from the banks, on which they have had to pay interest. They had to do this borrowing because the Government did not pay them what it owed them, but on a large part of its indebtedness to them the Government has not paid interest. In consequence, the companies have had to strain their credit at the banks and to incur losses by paying interest on money which they should have received from the Government instead of being obliged to borrow it.

It is not the fault of the Railroad Administration that its debts to the railway supply companies have not been promptly paid, but it is the fault of the Government. Congress is a branch of the Government, and it was its failure to pass the needed legislation which left the Railroad Administration without adequate funds. Congress is now engaged in partially repeating its former performance. Director General Hines asked it at the present session to appropriate \$1,200,000,000 for the Railroad Administration. He estimated that this amount would be required to carry the administration through to the end of the present year. Without any investigation, Congress has cut the appropriation to \$750,000,000. This amount, it is understood, will be sufficient only to enable the administration to meet its existing obligations, and, as soon as they are settled, it will have to begin to go into debt again.

The Government has always borne the reputation of being a bad customer to do business with. The railway supply concerns can bear testimony that in its dealings with them during the last year and a half it has fully lived up to its reputation.

## Program For To-day

9.30 A. M. TO 1.30 P. M.

Discussion of Reports on:

Car Wheels .....	9.30 A. M. to 10.00 A. M.
Standard Blocking for Cradles of Car Dumping Machines.....	10.00 A. M. to 10.30 A. M.
Specifications and Tests for Materials (M. C. B.).....	10.30 A. M. to 11.30 A. M.
Welding Truck Side Frames, Bolsters and Arch Bars.....	11.00 A. M. to 11.30 A. M.
Couplers .....	11.30 A. M. to 12.00 M.
Draft Gear .....	12.00 M. to 12.30 P. M.
Questions proposed by Members....	12.30 P. M. to 1.30 P. M.

### ENTERTAINMENT.

10.30 A. M.—Band Concert, Entrance Hall, Million Dollar Pier, Royal Scotch Highlanders' Band.

3.30 P. M.—Orchestral Concert and Impromptu Dancing, Entrance Hall, Million Dollar Pier. Fry Philharmonic Orchestra. Tea will be served at 4.30 P. M. in Entrance Hall.

9.30 P. M.—Carnival Night, Special Features, Ball Room, Million Dollar Pier, Royal Scotch Highlanders' Band.

## Cornell Dinner

THE REGULAR ANNUAL dinner for Cornell men will be held on Friday evening, June 20, at the Traymore.

All Cornellians are requested to register with L. H. Lynder at the booth of the Joseph Dixon Crucible Co., Space 24 in the Main Building, before Friday noon.

## Railway Club Secretaries Meet

THE ANNUAL MEETING of the Society of Railway Club Secretaries is scheduled for 10 o'clock this morning in Room 192 of the Blenheim. Several questions of unusual concern to the railway clubs are to be taken up. The business session will be followed by a "round table" luncheon for the secretaries and their guests.

## Chicago Pneumatic Installs Railroad Department

THE CHICAGO PNEUMATIC TOOL COMPANY announced yesterday the appointment of L. C. Sprague as manager of the railroad department and C. W. Cross as assistant manager. These appointments are effective July 1. Mr. Sprague is at present district manager at New York and Mr. Cross has been acting as special railroad representative at Chicago.

## Pennsylvania Directors Visit Track Exhibit

THE BOARD OF DIRECTORS of the Pennsylvania Railroad, holding a meeting in Philadelphia yesterday, adjourned the meeting, and, accompanied by President Rea, came to Atlantic City, arriving at three o'clock in the afternoon for a visit of inspection of the Pennsylvania equipment on exhibition at the conventions this year. This includes the most powerful electric locomotive in the world, a new simple Mallet type locomotive and the road's class 11s Decapod. They also visited the

cars on Georgia Avenue. They returned to Philadelphia at five o'clock.

## Vice-President Parish Resigns

LE GRAND PARISII, who was elected vice-president of the Railway Supply Manufacturers' Association at the 1916 convention, has asked to be relieved from his position because of the pressure of other duties. Mr. Parish was looked upon as the logical candidate to succeed President Walker. His action means that it will be necessary to look elsewhere for the new president.

## Executive Committee, A. R. A.

THE MEETING of the Executive Committee of the American Railroad Association, reference to which was made in yesterday's daily, is scheduled to be held at the Marlborough-Blenheim at 11 o'clock this morning. It is expected that the work of the meeting will be finished early in the afternoon, and that the members of the committee will later pay a visit to the exhibit.

## Canadian National Railways in Market for Passenger Cars

THE TORONTO GLOBE of June 14 contains the following item: "Tenders on twenty mail cars and twenty first-class coaches are being asked for by the Canadian National Railways. If the order is placed it will constitute the largest rolling stock order placed by any railway since the outbreak of hostilities. At an estimated cost of \$20,000 per car the order is worth \$800,000."

## The Informal Dance Last Evening

THE INFORMAL RECEPTION and dance on the Million Dollar Steel Pier last night marked the formal commencement of the week's entertainment features. From 8 until 9 o'clock a band concert and reception were greatly enjoyed. The dance program was then commenced. This consisted of the fox trot, one step and the now called old-fashioned waltz. The Royal Scotch Highlanders' Band furnished the music. At 11 o'clock the pier orchestra succeeded the "Kilties" and played until midnight.

The evening's affair was well handled by the following gentlemen: L. B. Sherman, chairman; W. M. Wilson, N. C. Naylor, G. A. Nichol and W. M. Melcher.

## Meeting of Railway Car Manufacturers' Association

DR. W. F. M. Goss, president, and C. S. Sale, assistant to the president of the Railway Car Manufacturers' Association, are here, and will attend a meeting of the Association, which is to be held at the Marlborough-Blenheim at 1.30 P. M. to-day. The Association, as its name implies, is composed of the manufacturers of railway cars. It was organized in February, 1917, primarily to do research and other similar work in connection with the construction of the 100,000 standard freight cars ordered by the Railroad Administrator last year. About 48,000 of the cars have now been built, and

it is expected that all of them will be finished in September.

Dr. Goss was formerly dean of the Engineering College of the University of Illinois, and Mr. Sale was formerly in charge of the engineering experiment station of the same university. Some years ago Mr. Sale was an associate editor of the *Railway Age*.

## Delivery of Standard Equipment

THE RAILROAD ADMINISTRATION has compiled the following statement showing the delivery of its standard freight cars and locomotives to May 28:

Type	LOCOMOTIVES.		Total Tractive Power Pounds	Number Delivered May 28
	Tractive Power Pounds	Number Contracted for		
Light Mikado .....	54,600	655	35,763,000	533
Heavy Mikado .....	60,000	233	13,980,000	98
Light mountain .....	53,900	40	2,156,000	32
Heavy mountain .....	58,000	15	876,000	13
Light Pacific .....	40,700	43	1,750,000	33
Heavy Pacific .....	43,800	20	876,000	10
Light Santa Fe .....	69,400	94	6,524,000	75
Heavy Santa Fe .....	74,000	175	12,950,000	117
Light mallet .....	80,300	30	2,409,000	15
Heavy mallet .....	106,000	106	11,236,000	25
0-wheel switch .....	39,100	255	9,971,000	226
8-wheel switch .....	51,200	145	7,424,000	90
Reading consolidated .....	50,000	30	1,500,000	...
Undetermined types .....	.....	89	4,922,000	...
Total .....	58,200	1,930	112,331,000	1,257

Estimated date when deliveries will be completed, December 1, 1919.

### FREIGHT-TRAIN CARS.

Type	Number	Total Capacity Pounds	Number Delivered May 28
50-ton single-sheathed box .....	25,000	1,250,000	8,669
40-ton double-sheathed box .....	25,000	1,000,000	10,386
50-ton gondola .....	20,000	1,000,000	14,243
55-ton hopper .....	25,000	1,375,000	18,330
70 ton gondola .....	5,000	350,000	1,326
Total .....	100,000	4,975,000	52,954

Estimated date when deliveries of cars will be completed, October 1, 1919.

## Supplementary List of Exhibitors

THE FOLLOWING is in addition to the list of exhibitors published in the *Daily Railway Age* of June 18th, page 1479:

- Acar Manufacturing Company, New York, N. Y.—Acar signal device—blue flag. Represented by Chas. R. Powell. Space 376.
- Baldwin Locomotive Works, Philadelphia, Pa.—Gun mount on Pennsylvania track, off Boardwalk, four blocks from pier, with 14-inch naval rifle. Gun is 50-calibre, 65 feet long; weight of mount is 650,000 pounds; total length of mount, 110 feet. One caterpillar tractor mount, with 7-inch gun. Represented by Samuel M. Vauclair, C. A. Bourgeois, W. H. Leary, Lieut. A. H. Showalter, U. S. N.; John H. Kindel, U. S. N.; G. Greenough, A. H. Ehle, A. W. Hinger and Chas. W. Werst. Space P. R. R. track, west of pier, on Boardwalk.
- Cleveland Tractor Company, Cleveland, Ohio.—Industrial "Cletrac." "Crawler" tractor for heavy hauling over rough or soft footing. Represented by Walter A. Hall. Space on unloading platform on Boardwalk, opposite pier.
- Dale-Brewster Machine Company, New York, N. Y.—Western heavy duty, radial drill. Represented by Jas. J. Dale. Space 222.
- Davison Tool Manufacturing Corporation, New York, N. Y.—High-speed tool steel cast to form. Represented by Oscar F. Ostby. Space 205.
- Mercury Manufacturing Company, Chicago, Ill.—Industrial tractors—3 and 4-wheel machines. Represented by L. R. Duffield, J. S. Kunkle, C. H. Clair and K. A. Wood. Space on unloading platform, on Boardwalk opposite pier.
- Richardson Scale Company, Passaic, N. J.—Model of a car unloading device for emptying grain out of box cars and showing operation with grain. Represented by Henry Richardson. Space 38.
- Four Wheel Drive Auto Company, The, Clintonville, Wis.—U. S. Army standard ordnance truck, driven on all wheels. Truck in operation. Represented by R. M. Newbold. Space on track at Mississippi Avenue.

## Special Programs for Saturday and Monday Evenings

PRESIDENT WALKER, of the Railway Supply Manufacturers' Association, made an announcement at the convention yesterday morning, in behalf of the Committee on Arrangements, concerning two special meetings that are to be held on Saturday evening of this week and Monday evening of next week. On Saturday evening there will be a meeting in the Ballroom on the pier in appreciation of the services of the railroad men and railway supply men who have participated in war activities.

Secretary of Navy Daniels will speak on behalf of the Administration for both the War and Navy Departments. Colonel Henry W. Hodge, who was assistant chief engineer of the American Expeditionary Forces in France, will speak of the work of the railroad men. General W. W. Atterbury has been invited to be present and has not said "No." He wants to come and is trying to make his arrangements accordingly.

On Monday evening Major E. D. Campbell, of the Railway and Seacoast Section, Artillery Division, Ordnance Department, United States Navy, will make an address on heavy artillery. The address will be illustrated by moving pictures and will be given in the Hippodrome. Major Campbell has been detailed to make this address by the War Department. Following the address a representative of the Navy Department will show pictures illustrating the effects of the 14-in. guns.

President Walker also called attention to the fact that some of the large guns are on exhibition on the track on Georgia Avenue and ten cars of light and heavy army artillery are on Mississippi Avenue.

## Baldwin Locomotive Works Exhibits Improved Mounts for Heavy Guns

THROUGH AN OVERSIGHT the exhibit of the Baldwin Locomotive Works was not included in the list of exhibitors published in yesterday's issue. Two interesting gun mounts—a 7-inch caterpillar mount and a 14-inch railway mount—built for the United States Navy at the Eddystone plant, are among the track exhibits on Georgia Avenue.

The caterpillar mount is one of a number of this type which have been built for use on rough roads and soft soil. The actual bearing pressure under the treads is approximately 10 pounds per square inch. The mounts are transported in the field by means of tractors of 120-hp.

The railway mount represents an improvement over those built during the war which did such effective service abroad. When firing at high angles with these first mounts it was necessary to jack up the gun and transfer its weight to a specially designed foundation in order to absorb the shock and to provide room for the recoil. The mount now on exhibition, however, is so designed that the gun can be fired at angles up to 43 degrees without relieving the trucks of its weight. The trucks are four in number, each having five pairs of wheels, making a total of 40 wheels under the mount. The average load carried on each pair of wheels is approximately 15 tons.

This exhibit is shown through the courtesy of the Ordnance Department of the United States Navy and the Pennsylvania Railroad, and is in charge of naval officers and enlisted men, together with several Baldwin representatives. It is open for inspection, to all holders of official badges and official admission cards, between the hours of 10.00 A. M. and 4.00 P. M.

## American Railway Association, Section III, Mechanical

### First Session Included Address by Chairman Chambers and Presentation of Several Reports

**T**HE OPENING SESSION of the first annual convention of the American Railroad Association, Section III, Mechanical, was held in the Greek Temple on Young's Million Dollar Pier, Atlantic City, Wednesday, June 17, 1919.

The chairman, C. E. Chambers, mechanical assistant, Allegheny region, United States Railroad Administration, called the meeting to order at 9.50 o'clock. The Reverend Newton W. Cadwell, pastor of the Olivet Presbyterian Church, invoked the Divine Blessing.

The convention was welcomed to the city by Mayor Bacharach.

#### Address of the Mayor

I am not sure that you will agree with me that it is a mere matter of form for me to be here this morning to welcome you to this great playground of America, this great convention city of America, because you must surely realize that men and women who have been doing so much, not only during the period of war, but previous to the war—and I am sure that after you are out of government control you will do as much for the government in the future as you have in the past—you must surely realize that you are welcome, not only in Atlantic City, but in any city of this great country of ours.

We are glad to have you here, not alone because of the fact that you represent the wonderful and great industry that you do, not alone because of the fact that you have such a wonderful convention in our city—I understand one of the largest exhibits since the World's Fair—and not alone because you have such a large representation—we are pleased and proud and glad to have you here, for all of these reasons—but above all we are glad to have you here because we know that you represent true Americanism.

We, in our city, are proud of many things—we are proud of our magnificent boardwalk, 5 miles long, 100 feet wide, where a quarter of a million of people promenade at one time. We are proud of our magnificent streets, cleaner and better lighted we believe, than any other city in the country. Proud of the magnificent force of men who patrol our beach, and protect the lives of our five million bathers in a season. We are proud of our magnificent hotels, of our business establishments, but above all, in this city of ours, where there is no manufacturing industry, no munition plants, we are proud that there has never

been a drive for any patriotic purpose, or any purpose whatsoever, but what Atlantic City always has gone "over the top," and, in addition, my friends, over 3,500 of our best young manhood went forth to fight for your country and my country.

We did not wait for Congress to act, but from the day that the first soldier and sailor left this city, we took care of their dependents. We organized what we called the Liberty Club, in which the chair pusher on the boardwalk, the proprietor of a magnificent hotel, the street cleaner, the banker, were all members, and from the day that the first boy left our city to fight for this country, we took care of his dependents, not in a mean or miserly manner, but in a manner befitting the dependents of sailors and soldiers of the American Army and Navy. These boys are now returning, and as they left here with an easy conscience, we can meet them with an easy conscience.

There is one thing we have long been proud of—we have the finest and purest water in the country, and after July 1st we feel that the people will appreciate what fine water we have in Atlantic City.

In this city of ours we permit no flags except the Nation's flag, which represents something to be paraded on our streets, nor do we permit meetings of any sort unless they represent 100 per cent Americanism.

So we are pleased to have you here because we know that you represent true Americanism. You and I may not agree upon the question as to whether the government should or should not retain control of the railroads—I, for one, believe that the railroads should go back to the people that own them and who know how to properly run them. Now that the war is over, I feel that the practical men who have always been at the head of the railroads know more about running the railroads than the people at Washington know about running them.

I trust that your stay in our city will be a beneficial one, not alone to yourself and the members of your organization as individuals, not alone to you as an organization, not alone to the great industry which you represent, but to our country as a whole, and so, in behalf of the people of Atlantic City, I extend to you, and through you to all those who are in attendance at these conventions, a most cordial and hearty welcome to this great city of ours. I want to assure you that if the ladies present do not too seriously object, that to-night at least curfew

shall not ring. In behalf of the citizens of the city I present to you not only the key to our city, but the key to the hearts of the people of Atlantic City.

In behalf of the Association, Chairman Chambers thanked the Mayor for the kind welcome and then delivered his opening address.

## Address of Chairman, C. E. Chambers

**T**HE SELECTED as the presiding officer of so great an association is one of the highest honors that can come to a man in the mechanical profession, and as such, I extend to you a most hearty welcome to this first annual meeting of Section III—Mechanical, of the American Railroad Association, and what would have been under the old organization, the fifty-third annual convention of the Master Car Builders Association.

The unusually large attendance to-day indicates that we have not lost interest from the fact that the regular annual conventions were postponed in the years 1917 and 1918. Since our coming together in this city in June 1916, the great war in Europe, which at that time clouded our future, assumed greater strength, until on April 6th, 1917, we found ourselves forced into the World's greatest war, which was only terminated November 11th, 1918, after a loss of many of our brave boys, and resulting in almost complete disarrangement of our American commerce. Now that peace seems assured, let us trust and pray that none present to-day may live to see a re-occurrence of such a disgraceful and uncalled for waste of human life, and the world's necessities.

As the last President of the Master Car Builders' Association, I feel mindful that I should say something as to the organization and activities of that association.

The Master Car Builders' Association, in its beginning a voluntary organization, composed of Master Car Builders and foremen of railway car shops, was formally organized at Springfield, Massachusetts, Wednesday, May 15th, 1867, and held its first annual convention at Altoona, Pa., September 18th, 1867, at which time the date of the subsequent annual conventions was set for the second Wednesday of June each year. The subjects to be considered assumed proportions requiring more than one day's session, and later certain designated days in the month of June were selected for the annual conventions, which have obtained from that time up to the present date, with very few exceptions. At the meeting referred to, 41 master car builders were present, when a constitution and by-laws were adopted. Previous to this, and dating back as far as 1864, several informal meetings were held as follows:

The objects of the association were the advancement of knowledge concerning the construction, maintenance and service of railroad cars and parts thereof, by investigations through committees and discussions in convention; to provide an organization through which the members and the companies they represent, might agree upon such joint action as might be required to bring about uniformity and interchangeability in the parts of railroad cars, to improve their construction and to adjust the mutual interest growing out of their interchange and repair, but the action of the association was only of a recommendatory character, and was not binding upon any of its members, or the companies represented in it.

### Formation and Development of the M. C. B. Association

The reasons for the formation of such an organization may be stated as follows: Prior to the date of the organization, cars were confined almost, if not entirely, to the roads for which they were built and to which they belonged. The inconvenience of trans-shipping freight when carried long distances soon made it necessary to run cars over more roads than one, and as the demand for carrying freight further without breaking bulk increased, some improvement was necessary in order to carry it without unloading and as rapidly as possible. This brought into existence different express or fast freight lines which operated over two or more roads in different sections of the country. It was soon found that difficulties were constantly occurring in regard to the repairs of these cars, and that they were often delayed when far away from home by not having the right kind of materials on hand to replace broken parts. Some plan

had to be devised to obviate the evil, and as the Master Car Builder was deeply interested in the physical condition of the car, an organization of these men was effected to take care of the prompt repairs.

Up to the year 1882, the organization was wholly voluntary. It received no financial support whatever from the railroad companies which were the owners of the property intrusted to the care of the Master Car Builders, and the improvement of which was the chief subject of consideration and discussion at their meetings, the expenses of the organization being met by assessment on the individual members. Neither were the railroads directly represented in the association, excepting by such exertions in behalf of their employes as the Master Car Builder might choose to make, if he were a member. It was, therefore, thought that if the association was so organized that each railroad company could be represented by a vote in its deliberations proportionate to its interests, or in other words, to the number of cars it owned, and if the work which the association had done and should do was adequately explained and understood by the chief executive officers of the railroads of the country, that they would be inclined to co-operate with the association and assist in its work. An amendment was therefore introduced at the convention in June, 1881, the purpose of which was to create a new class of members, to be called "Representative Members" with the status and privileges indicated above and described in amendments to the constitution of the Master Car Builders' Association.

The proposed plan of reorganization of the association was submitted to the chief executive officers of the railroads of this country, Canada and Mexico, and received practically unanimous approval. At an adjourned meeting held at Niagara Falls, New York, on October 10, 11 and 12, 1882, the proposed reorganization was ratified and adopted.

The number of cars represented in the association is practically 3,000,000, the cars of Canadian and Mexican railways being included in the above enumeration. Its membership extends to England, France, Russia, India, Australia, Japan, China, Argentina, Chili, Brazil, Cuba and the Philippines, officials of railroads in those countries wishing to avail themselves of the information contained in its proceedings relating to the construction and operation of cars.

As a result of the reorganization in 1882, the scope of the work of the association developed and broadened very materially. Through the financial support furnished by the railroad companies, investigations and tests of practically every part of a car have been, and are constantly being carried on, to furnish equipment of the necessary strength and designs to meet the varying requirements of the traffic of the country.

### Standardization of Car Parts

The question of uniformity in the construction of cars whereby the parts of cars used by one railroad may be used in repairs of the cars of another road has been constantly before the association. As an indication of what has been accomplished in this direction, the following comparison of some of standard parts necessary to keep on hand for repairs at the date of reorganization (1882) and the present time is cited:

	1882	1918
Axles .....	56	5
Journal boxes .....	58	5
Couplers .....	26	2
Brake shoes .....	20	1
Brake heads .....	27	1

The parts enumerated above are only a few of those used in the repairs of cars, but if all were named, it would increase the list to enormous proportions. A condition similar to that indicated above exists wherever any considerable number of cars are interchanged between railroads.

Among the more important developments made by the asso-

ciation, may be mentioned the adoption in 1887 of the automatic coupler for cars, thus doing away with the link and pin coupler and the necessity for going between cars to couple them together. It may be said at the present time, it is the universal standard of all the steam railroads in the country. Another noted achievement was the adoption in 1888 of the automatic air brake as the standard of the association. To-day, every car in the country is equipped with this device. Following its adoption, a code of instructions for the proper operation of the air

ing car owners for the destruction or damage to their cars by other handling companies. (6) The compulsory use by car owners of detail standards of construction as brought about through the operation of the rules, so that when the association felt that certain standards of construction were necessary for the safe operation of cars, they would not be permitted to be interchanged without the use of these standards.

I might mention at this time that no country in the world has gone so far with standardization of railway equipment as have the United States, Canada and Mexico, particularly by reason of standard gage track, which permits of the interchangeability of cars throughout the entire area mentioned. I might cite as an instance Australia, with about seven railway systems and six different gages of track. At no interchange point can a car be interchanged from one railway system to the other, resulting in all freight being transferred at the end of each line.

In 1887, an Arbitration Committee was established for the settling of disputes arising under the rules between members of the association in reference to a correct understanding of the rules with reference to car maintenance and also as to correctness of charges. During this period, approximately 1,200 cases have been arbitrated.

The association promulgated rules for the loading of materials on open cars, thereby preventing the shifting of loads in transit and the consequent accidents. The safety appliances approved by the Interstate Commerce Commission were its standards, and their rules were distributed to the members. In 1903, as the result of serious accidents in the transportation of inflammable liquids, it became necessary for the association to regulate the construction of tank cars, and in that year the first specifications were issued, not only making immediately necessary requirements for cars then in existence, but prescribing much higher standards for cars to be built. As new uses for tank

C. E. Chambers  
Chairman, General Committee

brake has been prepared and generally distributed among railway employes.

The railroad car of to-day is simply a vehicle of transportation, no matter by what railroad it is owned, the object being to furnish a vehicle suitable for the lading, and transport that lading to destination as expeditiously as possible. The railroad car is subject to very severe handling in trains and certain defects naturally develop which need to be kept in repair.

**Rules Governing Interchange and Repairs**

To take care of this condition this association has formulated and maintains rules for the interchange of traffic in so far as they relate to the physical condition of the car, so that the traffic itself may not be delayed. By these rules of interchange, the immense movement of traffic between railroads is carried on with a minimum of delay due to the defective condition of the car. The efforts of the association through these interchange rules were: (1) To establish rules which will uniformly permit of the prompt interchange of traffic between the various railroads without undue delay to the shipment of the car, which might be brought about by a difference of opinion between the receiving and delivering line as to responsibility for the physical condition of the car or the method of loading on open top cars. (2) To provide, through allowances, as given in the rules, prices to be charged for materials, detail times for completing the various items of repairs and a uniform labor rate per hour for the work. (3) Uniformity in compiling charges as between car owners for the maintenance of the equipment of the country. (4) Fixed allowances to enable car owners to properly check bills for car repairs made against them by other handling companies. (5) To provide methods for reimburs-

W. J. Tollerton  
Vice-Chairman, General Committee

cars arose, the specifications have been modified to suit them, and since the establishment of the Bureau of Explosives this association and the bureau have closely co-operated in all matters relating to tank cars. The result has been to materially strengthen the rules relating to their construction and use. At the present time, such cars are provided not only for the transportation of the petroleum products, but also for food products, as well as poisonous liquids, such as liquefied gases.

## Amalgamation of Railway Mechanical Associations

About ten years ago it was suggested that the Master Car Builders' Association and the American Railway Master Mechanics' Association, consolidate under one organization to be called the American Railway Mechanical Association, or some suitable name. Committees on consolidation were appointed by each association and reports rendered in the negative. On one or two occasions since, the question was again brought up, with a similar result.

Early in the year 1918, after the railroads had been taken over by the United States Government, the Director General requested that the individual associations of railway officers be amalgamated into one body, the American Railway Association, made up of different sections, each section to carry on its respective part of the railway program, and having its Chairman, Vice-Chairman and General Committee continuing the same subject committees, holding their regular accustomed annual meetings or conventions and submitting their findings to the Executive Committee of the parent association for approval and placing into effect.

On May 2nd, 1918, a meeting was called by the president of the American Railway Association to comply with the request of the Director General that the several Associations be amalgamated to form one congress of Associations, inviting the attendance of the presidents of the different voluntary railway associations. It was decided to put the matter to a vote of the executive committees of the different bodies, resulting in a favorable vote for amalgamation by the American Railway Master Mechanics' Association, and the Master Car Builders' Association. What was formerly the American Railway Association was changed to the American Railroad Association, of which the American Railway Master Mechanics' Association and the Master Car Builders' Association were combined, and known as Section III—Mechanical, and as such we convene to-day at our first annual convention.

As the Master Car Builders' Association, the rules were recommendatory and not mandatory. As Section III—Mechanical of the American Railroad Association, the rules will be made mandatory, and the efforts of the committees handling the different subjects will, therefore, be much better recognized. In the past, much overlapping committee work has been done, by reason of the different bodies having individual committees to handle subjects that might in some day effect them, but under the present organization, this duplication of work should be minimized, for all subjects of a mechanical nature will be referred to Section III, and its findings will be final. You will, therefore, recognize how carefully a committee must consider a subject before making final submission, which means, without question, placing into effect.

## Prospects for Further Development

The membership should not in any way decrease, but on the contrary, should increase, for the reason that railroads can have as many members as they desire, there being no limit placed as to the number of associate members a railroad may wish to have represent them in the section, although on letter ballots affecting standards, votes will be on the basis of locomotives and cars owned, and ballots cash by representative members designated by the railroads.

There will be no dues paid by the members, for the reason that the railroad companies, through the American Railroad Association, by assessment, will pay the expenses of the section, but affiliated members will be charged a reasonable amount for the proceedings and literature furnished them throughout the year. It is, therefore, apparent that our interests should grow and the scope of activities be greatly broadened, and I predict that through such an arrangement, it will be so entirely satisfactory to the members of both the Master Car Builders' Association and the American Railway Master Mechanics' Association, that after the railroads have been turned back by the government to the corporate owners, no one will wish to return to the old methods of handling the matters pertaining to the locomotive and car departments.

I would also suggest for your serious and careful consideration that the Air Brake Association, American Railway Tool Foremen's Association, Chief Interchange Car Inspectors and Car Foremen's Association, International Railway Master Blacksmiths' Association, International Railway General Foremen's

Association, Master Boilermakers' Association, Master Car and Locomotive Painters' Association, American Railroad Master Timbers, Coppersmiths and Pipe Fitters' Association, Association of Railway Electrical Engineers, and the Travelling Engineers' Association be made a part of Section III—Mechanical, and the committees which in most instances have been overlapping, become committees in Section III—Mechanical. This, to my mind, would not only very much strengthen their efforts, but would also make it possible to immediately put into effect their accepted recommendations, for the reason that they would have the approval and backing of Section III—Mechanical, which is an identified part of the American Railroad Association.

The work of designing a standard box car was undertaken by the Master Car Builders' Association some years ago, and owing to the slow progress made, the matter was referred to a committee of presidents of the American Railway Association for further development. In due time, however, the matter was turned back to a committee of the Master Car Builders' Association for completion, and was just about completed when the railroads were taken over by the government. During the period of federal control, 100,000 standard freight cars of different capacities and types have been arranged for and partially built.

The Master Car Builders' Association should be credited with having done remarkably well under the old organization and arrangement. The ardor and enthusiasm of committees has been dampened many times by reason of failure to approve their recommendations after they had conscientiously spent much time on their work. They were not supported constructively by statements from negatively voting roads, as to the reason for their having so voted. It is suggested that, under the new organization, negatively voting roads should be obliged to sustain such a negative vote by a statement covering the reason therefor, together with constructive suggestions.

## Activities of Committees

It may not be amiss here to call attention to what seems to be a misconception on the part of some of the members of committees in writing their reports. They seem to have the opinion that what is required of them is to prepare a series of questions, which are sent to members, and that all the work which the committee can be expected to do thereafter is to report and tabulate the replies received in answer to those inquiries. In most cases, a report on any subject should involve much more work than this.

A committee report frequently relates to some subject which is imperfectly understood, or in which there is apparently a diversity of practice, the reason for which is not evident. In most cases, the list of questions formulated by a committee indicates that they are not giving the subjects sufficient study to know what information is really desired. The committee should give the subject such prior study as to develop clearly the points on which facts must be obtained before conclusions can be drawn. In most cases, it is a diversity of practice which, if possible, is to be reconciled. In such cases, the questions should include suggestions, which would develop the reasons for such diversity. Finally, when answers to these questions are received, the committee should be a little more than a tabulating machine. They should present to the association, in all cases, their conclusion, giving the reasons therefor, remembering that the association looks to the committee for guidance in taking necessary action.

I would ask you to carefully consider the individual papers which will be presented at this convention, for in them will be brought out many beneficial thoughts for our future service. I would direct your attention to the report of the Committee on Standards, and suggest not only that its present recommendations be carried out, but that standardization, so far as is practicable, be given serious consideration in the future, especially as applied to freight car equipment. The difficulty experienced in the operation of freight car equipment, when pooled, evidenced the necessity of closer co-operation in the design of common parts necessary in the repair and upkeep of the equipment. Many parts can be standardized without interference with the many requirements. We have reached the time when freight car equipment of given capacities should be considered of entirely interchangeable parts, which are subject to breakage, or wear and tear.

I would ask that you give serious consideration to the report of the Committee on Car Trucks, calling for the restencilling of freight car equipment in a manner which will take care of the long debated question of axle loading, not only increasing the possible load on much freight car equipment, but also taking care of the weaker constructed cars that should not now permit of the regular 10 per cent. overloading.

The report from the Committee on Train Brake and Signal Equipment should receive careful consideration, as there are many changes which can yet be made without interference, that will add greatly to the practicality of interchange movement.

There is no more important committee than the one handling Brake Shoe and Brake Beam Equipment. The adoption of a standard brake beam for freight car equipment is of vital concern to all railroads, and in the design, due consideration should be given to the existing equipment, and if possible, it should be made entirely interchangeable with the present type of truck. I would, therefore, ask your serious consideration of the recommendations of that committee before its acceptance or disapproval.

I would ask that you show your appreciation of the untiring efforts of the Arbitration Committee by adopting their recommendations. I do this knowing that few of the members realize the amount of time and energy devoted by this committee each year to the questions involved.

There is practically nothing recommended by the Committee on Prices for Labor and Material, by reason of the abnormal period passed through during war conditions, which necessitated changing prices, which it was thought could be best accomplished by the addition of an agreed percentage, rather than undertaking to make a complete revision of all prices. It now seems pertinent, however, that the entire subject should be reviewed and recommendations made at the 1920 convention, for a complete new set of prices.

I would ask your serious consideration of the report of the Committee on Depreciation of Freight Cars. The importance of this subject merits a free discussion. An adequate depreciation which does not provide a reserve, which added to the scrap value of the retired equipment, replaces the original cost, really means that we are consuming the capital investment. On the other hand, it must not pad the expense of operation as a means of providing concealed assets.

The large interchange of passenger car equipment during the past two years had made it necessary to recommend several changes in the passenger car rules of interchange, and I request that you make a careful study of the recommendations of that Committee.

The Committee on Standard Blocking for Cradles of Car Dumping Machines has made some helpful recommendations. A casual observation of our open top cars of the older type signifies the necessity for changes in this practice, and everything possible should be done to protect this equipment from the present abuses.

A number of recommendations have been made by the Committee on Specifications and Tests of Materials, and knowing the difficulty encountered by many of the railroads in obtaining personal knowledge and the exhaustive study made of the subject by the committee, I recommend the acceptance of their report.

The Committee on Welding Truck Sides, Bolsters, etc., was continued from 1918, and requested to make a further study of the art. An extensive report has been submitted as to reliable practices consistent with our service, and inasmuch as this is a subject of vital importance to all, I request your careful consideration before adoption or rejection.

I would direct your serious thought to the report of the Committee on Couplers, and ask your careful consideration of its

recommendations. There is no longer any question as to the practicability of the standard coupler, and the only thing involved is the expense brought about in the changes asked for.

I would direct your attention to the expiration of the time limit in which all cars are to be equipped with safety appliances, namely, September 1st, 1919. There are yet many thousands of cars in the United States and Canada not equipped, and after that date, no car will be allowed to be used until so equipped. This will mean that the carrying road will be required to make such application on whatever cars remain on its line before offering them in interchange.

By reason of the numerous commodities offered for shipment during the past two or three years, the Committee on Loading Rules has had considerable activity, and a number of recommendations have been made for your acceptance.

I would ask your careful consideration of the report of the Committee on Train Lighting and Equipment. Their report is an interesting one, and worthy of careful study. I would suggest that their recommendations be accepted, and the committee continued.

I would ask your hearty support to the Committee on Tank Cars. This has been probably one of the most active committees during the war period, by reason of the many new products presented for transportation, and the promptness of action required. Just now some perplexing problems are in progress that need the backing of the Mechanical Section and the Bureau of Explosives.

In calling your attention to the intruders on our members by the grim reaper, Death, I feel it pertinent to remind you of the remarks of President MacBain at the 1916 convention, calling attention to the long and faithful service of former Secretary Joseph W. Taylor, who at that time, had been with the association 26 years; during 17 of which he had been secretary. While his name is not included in the report of the past year, yet since our last convention in Atlantic City, he has left his labors on earth for his eternal reward. I make special mention of him, because of his long and continued service.

I would also call your attention to the passing on of Dr. Angus Sinclair, Editor of Locomotive Engineering, and a member of both the Master Car Builders' and American Railway Master Mechanics' Association, having served for more than 18 years as treasurer of the American Railway Master Mechanics' Association. Up to the time of his death, Dr. Sinclair was probably one of the most generally known mechanical men in the United States.

To the officers of the association, and especially the secretary and general secretary, I express my sincere thanks for the splendid assistance accorded me during my term of office. To our fellow workers, the Railway Supply Mens' Association, I extend thanks for their continued efforts in making our conventions what they are. To the Hotel Mens' Association, I also desire to extend thanks for their splendid part in arranging for the comforts of our members and families. In closing, I trust the sessions at this convention will be but a repetition of the past, and that great good may come from them to the public at large. The members of the association, I again thank for the privilege of serving during the past three years.

## Association Business

The minutes of the 1918 convention were adopted as printed.

The chairman announced that, as the Executive Committee had held several meetings during the period since the last convention and had matters well cleaned up, the usual session on the night prior to the opening of the convention was omitted.

## Report of General Committee

**A**S AUTHORIZED BY Articles VI of the Constitutions of the American Railway Master Mechanics' and Master Car Builders' Associations, the Executive Committees have during the past year taken action on several important questions. This action is outlined in this report of the General Committee and your approval is respectfully requested.

On January 28, 1918, the Director General of Railroads issued General Order No. 6, directing that "Carriers' operating reve-

nues shall not be expended for the payment of persons or agencies constituting associations of carriers, unless such association is approved in advanced by the Director General." The Master Car Builders' and American Railway Master Mechanics' Associations made application and received temporary approval for the use of the funds already on hand to pay the current expenses of the association until April 30, 1918. On April 26, 1918, the Director General approved, until further ordered, the

J. E. Fairbanks  
Secretary  
American Railroad Association

C. E. Fuller

Members of the General Committee in Charge of the Mechanical Section  
of the American Railroad Association

J. W. Small

T. H. Goodnow

A. Kearney

C. F. Giles

J. E. O'Brien

A. P. Prendergast

J. Coleman

H. R. Warnock

W. H. Winterrowd

Members of the General Committee in Charge of the Mechanical Section  
of the American Railroad Association

American Railway Master Mechanics' and the Master Car Builders' Associations and authorized making such assessments, and the carriers paying the same, as may be necessary for the current expenses of the association.

On January 10, 1919, the Director General of Railroads issued Circular No. 70: "To provide, during the period of Federal control, a responsible channel through which the Director General may obtain recommendations for the advancement of railroad practice." The scope of the American Railroad Association (formerly American Railway Association) has been enlarged and among other associations covers the former activities of the American Railway Master Mechanics' and Master Car Builders' Associations. Railroads under Federal control are members of the association (American Railroad Association) and are directed to be represented and participate in the activities of each section through their proper officers.

On May 2, 1918, a conference of presidents of voluntary railroad organizations was held at 75 Church Street, New York, at the call of Acting President Thompson, of the American Railway Association, to comply with the request of the Director General that the several associations be amalgamated to form one congress of associations.

On May 14, 1918, the Executive Committees of the American Railway Master Mechanics' and Master Car Builders' Associations held a joint conference at Chicago. A plan was outlined and was submitted to the joint conference of the several railroad organizations. Since that time the American Railway Association (Order No. 70) has been changed to the American Railroad Association and its scope enlarged so as to include, among other associations, The American Railway Master Mechanics' and Master Car Builders' Associations.

On November 19, 1918, the Executive Committee of the Master Car Builders' Association, at a conference held with Acting President Thompson, of the American Railway Association, agreed to accept the proposed method of organization for the American Railroad Association and to become a part of the Mechanical Section of that organization.

On December 5, 1918, a special committee composed of the presidents and representatives of the Executive Committees of the American Railway Master Mechanics' and Master Car Builders' Associations held a conference at 75 Church Street, New York, and prepared tentative Rules of Order to govern the Mechanical Section.

On February 1, 1919, a joint conference of the Executive Committees of The American Railway Master Mechanics' Association and the Master Car Builders' Association was held at 75 Church Street, and tentative Rules of Order for Section III—Mechanical, were approved and adopted, and a tentative General Committee to govern the section was elected.

The committees of the American Railway Master Mechanics' Association and the Master Car Builders' Association have been continued and will handle their work as they have in the past. No change in personnel, outline of work or procedure in handling reports has been made except that the secretary of the section will act as secretary of all committees.

The scope of the activities of the associations will be greatly enlarged, and in the future the Mechanical Section will handle exclusively all work pertaining to the mechanical design, maintenance and repair of railroad motive power and rolling stock.

All memberships in the American Railway Master Mechanics' and Master Car Builders' Associations are transferred to the Mechanical Section of the American Railroad Association. Representative members are appointed by their respective railroads, as in the past; all others on the membership lists will be termed affiliated or life members of the Mechanical Section.

At meeting of the General Committee for Section III—Mechanical, of the American Railroad Association held at the Traymore Hotel, Atlantic City, N. J., Monday, February 17, 1919, the following resolutions were passed:

*Resolved*, That all accounts accruing against the Master Car Builders' Association and the American Railway Master Mechanics' Association be requested to audit the books and accounts shall be paid out of the treasury, and be it further

*Resolved*, That the funds of the Master Car Builders' Association and the American Railway Master Mechanics' Association, on hand in its treasury as of February 28, 1919, shall be transferred to the Treasurer of the American Railroad Association, including all books, papers and accounts payable and accounts receivable, and be it further

*Resolved*, That the Auditing Committee of the Master Car

Builders' Association and the American Railway Master Mechanics' Association be requested to audit the books and accounts of the Secretary and Treasurer, as of midnight, February 28, 1919, for the purpose of closing the transactions of these associations and transferring all funds and accounts thereof to the Treasurer of the American Railroad Association as of the same date and hour, and be it further

*Resolved*, That the office furniture, fixtures, stationery, records, files, etc., as indicated in the inventory when submitted by the Auditing Committee as of February 28, 1919, shall be transferred to the American Railroad Association, and be it further

*Resolved*, That any securities which may be transferred to the Treasurer of the American Railroad Association are to be held by him as custodian and are only subject to the orders of the General Committee, and be it further

*Resolved*, That before the scholarship funds of the American Railway Master Mechanics' Association are transferred to the Treasurer of the American Railroad Association, a committee of three be appointed by the Chairman to take whatever steps may be necessary to protect the continuation of such fund.

The necessary details in connection with the transfer of activities, funds and securities of the American Railway Master Mechanics' Association and the Master Car Builders' Association have been consummated and the interests of the above named associations properly safeguarded.

The committee, in accordance with Section 2 (f) of the Rules or Order, offers the names of the following members as candidates for the Committee on Nominations:

F. W. Brazier, New York Central; Jos. Haincn, Southern; W. J. Robider, Canadian Pacific; J. Purcell, A. T. & S. F.; J. J. Hennessey, C. M. & St. P.; J. T. Wallis, Pennsylvania; D. R. MacBain, New York Central; H. T. Bentley, C. & N. W.; Willard Kells, Atlantic Coast Line, and A. C. Deverell, Great Northern.

### Secretary's Report

The report of the Secretary, which was appended to the report of the General Committee, showed the receipts of the Master Car Builders' Association from June 18, 1918, to March 21, 1919, to be \$33,224. The disbursements during the same period were \$22,720, leaving a balance of \$10,503. The receipts of the American Railway Master Mechanics' Association were \$10,085, and the expenses \$5,343, leaving a balance of \$4,741.

The membership statement submitted by the secretary showed the Master Car Builders' Association to have 1,029 members, and the American Railway Master Mechanics' Association 1,047 members. The memberships in both associations have been transferred to the American Railroad Association, and are classified as follows: Representative members, 442; affiliated members, 1,085; and life members, 108, making a total of 1,635 members. All those holding life membership in the Master Car Builders' Association, or honorary membership in the Master Mechanics Association, and all members who have served as president of either association, together with representative members who have been in good standing in either association for twenty years or more, have been designated as life members.

The report as read was accepted.

## Report of the Committee

### on Scholarships

THE COMMITTEE ON SCHOLARSHIPS, consisting of W. J. Tollerton, C. E. Fuller and H. R. Warnock, submitted a report in accordance with the resolution adopted by the General Committee. It was found that the scholarships at the Stevens Institute of Technology are perpetual, and the absolute property of the association, having been endowed from the entertainment fund left over from the convention of 1872, and the interest which accumulated on this fund until 1891. It was decided, by the General Committee, that the earnings on the bonds and securities of both associations, held in trust by the treasurer, should be prorated among the holders of the four scholarships at the Stevens Institute of Technology each year. Since 1903 Joseph T. Ryerson & Son have provided scholarships, which have been awarded by the American Railway Master Mechanics' Association, and the company has agreed to continue this arrangement with the Mechanical Section of the American Railroad Association.

The report is signed by C. E. Chambers (Chairman), United States Railroad Administration; W. J. Tollerton (Vice-Chairman), Chicago, Rock Island & Pacific; Frank McManamy,

United States Railroad Administration; C. B. Young, United States Railroad Administration; F. F. Gaines, United States Railroad Administration; T. H. Goodnow, Chicago & North Western; H. R. Warnock, Chicago, Milwaukee & St. Paul; J. E. O'Brien, Missouri Pacific; A. P. Prendergast, Texas & Pacific; J. W. Small, United States Railroad Administration; C. F.

Giles, Louisville & Nashville; C. E. Fuller, Union Pacific; I. S. Downing, Cincinnati, Cleveland, Chicago & St. Louis; Jno. S. Lentz, Lehigh Valley; Jno. R. Gould, Chesapeake & Ohio; A. Kearney, Norfolk & Western; M. K. Barnum, Baltimore & Ohio; Jas. Coleman, Grand Trunk, and W. H. Winterrowd, Canadian Pacific. This report was accepted as read.

## Report of Committee on Nominations

F. W. Brazier  
Chairman

and Tests Section, U. S. R. A., and F. F. Gaines, chairman, Board of Railroad Wages and Working Conditions, U. S. R.

AS the present General Committee is a tentative committee to serve only until this convention, the committee nominated a chairman and seven members for the General Committee to serve for two years, and a vice-chairman and seven members of the General Committee to serve for one year. This will provide that future nominations for the General Committee can be made for the regular two-year term in accordance with the Rules of Order. In addition, Frank McManamy, assistant director, Division of Operation, U. S. R. A., C. B. Young, manager, Inspection

A., are also members of the General Committee representing the Railroad Administration in accordance with Section 2 (b) of the Rules of Order.

The committee nominated the following to serve for two years:

For Chairman, W. J. Tollerton, G. M. S., Chicago, Rock Island & Pacific. For Members of the General Committee, J. T. Wallis, G. S. M. P., Pennsylvania; T. H. Goodnow, S. C. D., Chicago & North Western; W. H. Winterrowd, C. M. E., Canadian Pacific; C. H. Hogan, A. S. M. P., New York Central; J. E. O'Brien, M. S., Missouri Pacific; A. Kearney, S. M. P., Norfolk & Western, and C. F. Giles, S. M., Louisville & Nashville.

To serve for one year: For Vice-Chairman, Jas. Coleman, S. C. D., Grand Trunk. For Members of the General Committee, J. W. Small, Mech. Asst., Southern Region; Jno. S. Lentz, M. C. B., Lehigh Valley; H. R. Warnock, G. S. M. P., Chicago, Milwaukee & St. Paul; C. E. Fuller, S. M. P., Union Pacific; Samuel Lynn, M. C. B., Pittsburgh & Lake Erie; A. P. Prendergast, M. S., Texas & Pacific, and Jno. R. Gould, S. M. P., Chesapeake & Ohio.

The report is signed by F. W. Brazier (Chairman), New York Central; J. Hainen, Southern; W. J. Robider, Canadian Pacific; John Purcell, Atchison, Topeka & Santa Fe, and J. J. Hennessey, Chicago, Milwaukee & St. Paul.

This report was accepted.

## Report on Standards and Recommended Practice (M. C. B.)

AFTER CONSIDERATION of the present Standards and Recommended Practice of the Master Car Builders' Association, together with replies received to the Circular of Inquiry, sent to all members, the committee submits the following report:

JOURNAL BOX AND DETAILS. (STANDARD. Pages 472-476. Sheets M. C. B. 3, 6, 9, 12-C.)

A subscriber requests information as to whether the skeleton brass, as shown in Fig. 1, meets M. C. B. requirements. The committee is of the opinion that the journal bearing in question does not conform to standard M. C. B. construction.

LETTERING AND MARKING OF CARS. (STANDARD. Pages 611-616. Sheets M. C. B. 26, 26-A and 26-B.)

A member recommends a standard stencil including the wording, style and size of lettering, and location, for marking cars that have had journal boxes repacked, suggesting the words "Repacked 1-10-19" in 1-in. block letters and figures, located on the outside of the car as close as possible to the middle of the car, but not behind any doors.

The committee has referred this matter to the Arbitration Committee with the suggestion that the rule in question be revised to require this stencil to appear at diagonal right-hand corners of car and to recommend to the association that this stenciling should be shown on M. C. B. Sheets 26 and 26-A.

LETTERING AND MARKING OF CARS (STANDARD. Pages 611-616. Sheets M. C. B. 26, 26-A and 26-B.)

A member calls attention to the difficulty experienced by yard clerks and other similar employees in deciphering the numbers on stock cars at night, primarily due to the fact that the numbering and lettering of this type of car is ordinarily on a letter board located near the eves of the car, and suggests that a standard method be established for applying the marking on stock cars to overcome this difficulty. The committee believes the location indicated for house cars on M. C. B. Sheet No. 26 meets all the requirements.

The Western Weighing and Inspection Bureau calls attention to a variation in the size of figures used to indicate the light weight of cars, which light weight is a very important factor in arriving at correct freight charges on a large percent of car-

load freight. An analysis of the information furnished indicates that cases of improper size of letters and figures are the result of light weighing stations using the wrong-sized stencils, and

Fig. 1.—Skeleton Journal Box, Brass

the attention of the members is called to the fact that light weighing stations should be furnished with the correct size of stencils, so as to comply with M. C. B. standard lettering, as shown on Sheets Nos. 26, 26-A and 26-B, and that when stenciling the new light weight cars should be used to completely obliterate the old stenciling, and a good grade of paint used and applied in a strictly workmanlike manner.

PIPE UNIONS (STANDARD. Page 618.)

The standardization of pipe unions, both flat and ball joint types, as concerns the contour and interchangeability of parts, which was a matter of special investigation with the A. S. M. E. and A. R. M. M. Association, in accord with the action of the 1916 convention, and which was dormant during the war period, has again been taken up with those associations. Progress only, at this time, is reported.

SPECIFICATIONS FOR BOLTS AND NUTS (STANDARD. Pages 619-623.)

A member calls attention to the difference in the specified dimension of bar stock for rods and nuts between the association's specifications and commercial practice, and suggests that the specifications be revised to permit acceptable tolerances. The committee suggests the matter be carried over for further consideration and report.

STEAM AND AIR CONNECTIONS FOR PASSENGER CARS (RECOMMENDED PRACTICE. Pages 918. Sheet M. C. B. Q-1.)

Under instructions from the General Committee, the matter of steam heat hose couplers was to be investigated and a recommendation made to the United States Railroad Administration for a standard in so far as interchangeability and locking are concerned. The committee has canvassed the situation with the manufacturers and users of steam heat hose couplings, and owing to considerable variation in the type of locks on couplers as now in use and the fact that the openings do not properly register, the committee can, at this time, only report progress.

DEFINITIONS AND DESIGNATING LETTERS OF GENERAL SERVICE FREIGHT EQUIPMENT CARS. (RECOMMENDED PRACTICE. Pages 946-949.)

A member recommends separate designating letters for single-deck and double-deck stock cars. The committee concurs with the recommendation and suggests that the designation "S. M." for stock cars, be revised by eliminating the words "or double"; that a new designation be provided, "S. C." reading the same as designation "S. M.—Stock Cars" with the exception of substituting the words "convertible single or double deck" for words "single or double deck"; and that another new designation be provided, "S. F." substituting the words "fixed double deck" for the words "single or double deck."

STANDARD FRICTION DRAFT GEARS

The following was suggested by a member: "There are several makes of friction draft gears which will go into the prescribed space of  $12\frac{7}{8}$  by  $24\frac{3}{8}$  in., but some of these gears use a modified front stop which has a limiting stop in combination, which limiting stop encroaches upon the rectangular clearance, quoted above. By comparatively slight modifications in the casings of the various gears, however, and also in the travel, they could all be made to go into the same space, including the use of the limiting stop, and we would recommend that this matter be referred to the Draft Gear Committee to see if it can not be worked out." The committee has referred this to the Committee on Draft Gears.

MISCELLANEOUS

A member suggests that a limit should be placed on the welding and reclaiming of various parts, such as couplers, side frames, etc., and that the practice of welding should eliminate any possibility of relying on the judgment of one man as to whether or not the part in question would be serviceable after being thus repaired. The committee has referred this subject to the Committee on Welding Truck Side Frames, Bolsters and Arch Bars.

The report is signed by T. H. Goodnow (Chairman), Chicago & North Western; C. E. Fuller, Union Pacific; A. R. Ayers, New York, Chicago & St. Louis; O. C. Cromwell, Baltimore & Ohio; O. J. Parks, General American Tank Car Corporation; Willard Kells, Atlantic Coast Line; C. F. Thiele, Pennsylvania, and A. G. Trumbull, Erie.

After the reading of the printed report, Mr. Goodnow said:

Since the report was printed, a member of the association made a suggestion, which has been turned over to the committee, but on which no action has been taken, and I simply read it at this time as it can be included in the report if the association sees fit to act on it. It is as follows:

"I would suggest that the standard lettering on freight cars be reconsidered with a view to simplifying the same. The points I wish to bring out are the following:

"The present stenciling calls for the capacity in pounds and cubic feet, and it is generally understood that the cars can be loaded to 10 per cent. beyond the marked capacity. I believe the terms 'nominal capacity' and 'load limit' should be used in preference to avoid overloading the car axles, the maximum load limit being based on the difference between the light weight of car and the total weight as noted in column A of table on

axles in M. C. B. Rule No. 86. Likewise some standard should prevail covering the size of letters used in the lettering, showing the name of the railroad company. Reference to specialties, such as triple valves, coupler shanks, brake beams, etc., can be omitted.

"In order to reduce the number of stencils to a minimum, option should not prevail as to the use of two or three-inch letters for any of the legends, as one or the other size should be standard."

F. F. Gaines: Referring to the committee's report in regard to the steam heat coupler, the Committee on Standards of the United States Railroad Administration has spent considerable time on that subject during the past year, and it seems proper to suggest that the standards they have adopted be the M. C. B. standard, at least during the period of federal control, and should be incorporated in this report as it is finally submitted.

The Chairman conferred with the Administration, and that will be taken care of. Any papers and standards that they may have had will be included in the report of this committee. If there are no further remarks, we will take up the next paper.

George S. Goodwin (C. R. I. & P.): I would like to ask whether it is the intention of the Arbitration Committee to publish the stenciling for the repacking of boxes. This was covered on page four, and the suggestion was made there that the boxes be marked "Repacked 1-10-19" and referred to the Arbitration Committee. They made no mention of it in the report. These cars are being marked now with all kinds of stenciling, and I think some standard marking of cars should obtain.

Chairman: Does any member of the Arbitration Committee want to make any answer to that?

Mr. Goodnow: I understand that the Arbitration Committee did not include that in its report to the present convention; just why no action was taken on that I am unprepared to say.

Mr. Fuller: At the time of the meeting of the committee that report was not before the committee; therefore, no action was taken on it.

Chairman: It is my understanding that this will be incorporated in the writing of the Rules.

J. A. Donahy (A. C. & Y.): The lettering and marking of cars, where it speaks of "light weighing stations," should be "re-weighing stations."

Chairman: We will see that that is corrected.

Mr. Goodnow: I would like to ask regarding the action on the motion to adopt this report, whether or not it included the letter which I read. For the benefit of the Committee on Standards, I really think it should not include that. The Committee on Standards has been more the custodian of the historical records of the Association. It is not an investigating committee, and this carries with it certain changes in the M. C. C. standards which I don't think ought to be acted on this year, but rather that they be carried over.

Mr. Fuller: When I made that motion I did not intend to include anything other than the committee's report.

Chairman: Well, that will be the understanding. The letter, as I understand it, was simply a suggestion for consideration.

Mr. Goodnow: It was really a recommendation for a change in the present M. C. B. standards.

Mr. Fuller: I did not understand that was a part of the committee's report, but was something that came in afterwards. My motion was merely to carry the committee's report only.

Mr. Goodnow: I would like to say for the benefit of the Committee on Standards that it has been the practice in sending out the circular of inquiry by the Committee on Standards, for suggestions, to confine these suggestions to matters of recommended practice and standards. Frequently subjects are sent to the Committee on Standards, which really apply to the work of standing or special committees and these suggestions should go to those committees. As the Committee on Standards cannot meet, until very near convention time, it has no opportunity to investigate the suggestions made, and can only refer them to the special or standing committee, which is directly concerned with the suggestion made; very often these suggestions reach the Committee on Standards too late to go before the convention. Those members who have suggestions which properly fall within the province of the work of other committees, should send them to the chairman of the General Committee direct, or to the particular committee concerned, and thus get the suggestions before the committee where they will be acted on.

The Committee on Standards in its report this year, so far as standardization is concerned, offers very little, if anything, of importance, and it will greatly expedite the handling of suggestions, if, for example, any suggestions which properly apply to the Truck Committee, or any other committee, go direct to those committees, not to the Committee on Standards. I make that suggestion in conformity with the suggestion made by the chairman in his address regarding the work of committees.

C. E. Fuller: Are not the suggestions all sent to the secretary?

Mr. Goodnow: They have not been in the past.

Mr. Fuller: Sent to you?

Mr. Goodnow: Sent to me as chairman of the Committee on Standards and Recommended Practices.

Mr. Fuller: Then I make a motion that in the future all suggestions of that kind be sent to the secretary of the association, and that the secretary send them to the proper committee, if there is a committee appointed to handle the matter to which the suggestion refers, otherwise that it be handled by the General Committee.

W. E. Dunham (C. & N. W.): I understand, after having conferred with the Secretary, that that is the procedure which will be followed out in the new organization; that all matters of this kind go through the Secretary, or the General Committee.

Chairman: That is my understanding. Are there any further remarks on Mr. Fuller's motion?

The motion was seconded, put to vote and carried.

J. J. Tatum (U. S. R. A.): I would like to ask Mr. Goodnow a question in connection with the marking on stock cars. It seems to me that that matter was brought up by the yardmen, who have to read the marking on the stock cars for their protection. In other words, they wanted safety, they wanted their lives protected. Now, the committee says, that "Your committee believes the location indicated for house cars on M. C. B. Sheet No. 26 meets all the requirements." I would like to ask Mr. Goodnow if he has consulted the Safety Section or any of the safety sections of the various railroads, as to whether or not that location would give the yardmen the protection they need, or whether the committee has simply decided it from the establishment of the marking shown in our records.

Mr. Goodnow: I would say that the majority of the roads have already adopted the practice of putting a number board on stock cars, and if they comply with the present M. C. B. standards they must do that to get the number down to a certain height from the top of the rail. The only way in which you can do that is to put an additional number board on the car and put a number on it. I think a large number of the stock cars are being taken care of in that way, and that is the only way in which they can be taken care of, and it meets the safety requirements. It came up on our road, through the Safety Section and several years ago we adopted the practice of putting on an additional board which carries the number at the height required under that standard.

Mr. Tatum: I agree with what Mr. Goodnow says, as far as that goes, but as a matter of fact the yardmen have complained of the location of the marking as shown by the marking sheets issued by the M. C. B., and it seems to me that the Committee on Standards should know if the location designated by the sheet referred to will give them the protection they need. I believe that the Committee on Standards should interview the men in the yard, who are doing this work.

Mr. Goodnow: The Committee on Standards will be glad to take that action. There is only one location for a number on any car at the present time, and that is definitely established in the standard. It is at a height in range with the line of vision of the average individual. That standard was established at the suggestion of the American Railroad Association some years ago and was included in the present M. C. B. standards at the suggestion of that association. It is not the number at the top along the eaves of the car where the ordinary stock car is numbered at the present time. The standard location on box cars is the standard location for that number. It has not changed on any particular style of equipment—it must be the same on stock cars or box cars or any house cars.

Mr. Tatum: I still agree with Mr. Goodnow as to what he said, but I am not convinced that we have satisfied the men who have to read this marking. Suppose we had to change our entire marking, to some other method of marking, to give the men the proper protection. If there is a

possibility of loss of life, under the present method of marking, we should prevent that possibility by changing the system of marking, and I believe the Committee on Standards should consult the safety sections of the various railroads doing this work, in order to determine whether or not it is satisfactorily located, and to locate the marking in that position where the men will get the protection they need. I suggest that that part of the subject be referred back to the committee for consideration.

F. F. Gaines: I think perhaps we can satisfy the point that Mr. Tatum brings up without very much work. If the standard location is that which is now shown; if it can be made a safe place by putting up a number board, and it becomes the standard of the association, it necessarily also becomes imperative to use that location, and do away with the old eaves lettering.

Chairman: I believe the matter was looked into from all sides before a decision was reached, as to the best position for the number board over the rail in the case of stock cars, and in taking action on stock cars it was decided to make it standard with other cars as heretofore shown. This was done by the arrangement of a number board, which could be placed at the proper height from the ground, to agree with the position of the number as on box or house cars. There is no objection to the suggestion made by Mr. Tatum, that the Committee on Standards shall write to the different railroad safety committees to ask if they have any suggestions to offer in connection with the matter. I imagine you will have as many suggestions as there are railroads, but you will at least receive information on the subject, and to that extent I think it would be advisable.

John McMullen (Erie): Inasmuch as the question has been raised by Mr. Tatum, from a safety point of view, it might be well to put these number boards closer together, rather than to have them spread apart, as they generally are—have the number board and the name of the road closer together, so there will be no space in which a man can insert his hand to climb up on the truck and the car. Another question is whether or not the number board should be placed higher on a stock car than on a house car, for the reason that the number board is likely to get smeared through the slats of the car.

Mr. Goodnow: We will be glad to confer with the Safety Section, as Mr. Tatum suggests. I do not see how, in connection with what Mr. McMullen says, that the number board can be changed. The number on the car is now placed where a man of ordinary height will best see it, when he is reading the numbers on successive cars in a train, and I think the numbers on stock cars are sufficiently high from the floor of the car to be kept in good readable condition. However, if it is the desire of the convention that we make any special location for stock cars, we can go into the matter further, but I think the main thing to do is, as far as possible, to keep a standard location for numbers, and then our clerks and those who have to read the numbers on the cars, and often get them in a hurry, need not look all over the car, but can look at one place on the car and get the number. That is an important feature in keeping a standard location for the numbers on all cars where it can be maintained.

F. F. Gaines: In order to put the association on good ground. I move that the subject of lettering on stock cars be referred to the committee for further consideration, and in giving it further consideration, they confer with the Safety Section, so that every item in connection with the matter will be taken care of.

C. E. Fuller (U. P.): Mr. Tatum made a suggestion. I ask him if he has heard of any complaint in regard to the location of the number of the stock cars on the board, which is a standard of the association.

J. J. Tatum: The Safety Section of the U. S. R. A. brought the matter to my attention, and asked me to have the M. C. B. Association do something to locate the marking so that it would protect the men who have to read it. They have had various complaints from men all over the country, that their lives were in jeopardy many times in trying to read the marking on the cars. The communications which they referred to me were referred to the Arbitration Committee for action, and were forwarded by that committee to the Committee on Standards. We have heard their action on the subject, as indicated in the report,

but it is a question whether the standards committee decided for the Safety Section or the various safety committees of the different railroads, that that was a safe location. I know, and you do, too, that the man who does the work knows more about the work to be done than the man who does not do it.

Mr. Fuller: Do you know whether they were referring to the numbers just under the eaves, or the numbers on the board about the height of the average man's eye?

Mr. Tatum: The statement was made that the numbers had been located in various places on the car, that there was no standard location, and that they did not think that the locations had been approved by the various railroads or were satisfactory. They did not say that the M. C. B. location on the box car was satisfactory or not satisfactory, but it appeared to me, inasmuch as they took exception to the location of the numbers on the stock cars, that the Safety Section was the proper section to consult and to ascertain from them what the objections were. We must stay with the Safety Section for all time, and we must do everything to protect the lives of the men who are more or less penalized in doing the work; there is no better way to solve the problem than to make it absolutely satisfactory to them.

Mr. Fuller: Is not a great deal of the trouble due to the fact that a number of the railroads have not complied with the standards, and have introduced variations in the standards, which has brought about the trouble?

Mr. Tatum: That may be true, but is it not better for us to find out whether that is so? We do not now know which is right and which is wrong, and we should find out. If our marking is right, when placed in the location established by the M. C. B. Association, then let us say it is right and approved by the safety sections of the railroads, and insist on the marking being located at that place for the safety of the men who are involved.

Mr. Fuller: That is just the reason I raised the question, because Mr. Tatum's remarks did not indicate whether the standard marking was wrong or not. I will second Mr. Gaines' motion, that the committee take up the question with a view of determining whether the standard location is proper or not. There is no necessity of this committee investigating a thousand and one heights. It is a uniform height that we have got now that should be used. Apparently, it has not been used, and I will second Mr. Gaines' motion.

Mr. George Gibbs (P. T. & T.): Was not this marking originally settled on because of a recommendation from the Car Service Association? Mr. Hill was then chairman. I have a recollection that they sent a communication to us through the American Railroad Association, recommending the uniform placing of these markings and suggesting the position for them, and giving the reasons, I should say, ten years ago. I suggest that the same body that made that recommendation be brought into this.

Mr. Goodnow: Mr. Gibbs is correct in what he says. The standard marking of cars, so far as the operating feature of it is concerned, was handled in that way. It was handled by the Committee on Relations of the American Railroad Association, and included in the M. C. B. standards at their suggestion, and as a result of the adoption on the part of the Association by letter ballot.

Mr. Tatum: I believe the position taken by Mr. Gibbs is well taken and I think that the American Railway Association should be brought in as a committee that passed on that marking and recommended it.

I. S. Downing (C. C. C. & St. L.): It seems to me this matter should go to the Transportation Department of some section. It is not a mechanical matter. So far as the safety is concerned, or the putting of the board down low enough for a man to get hold of, they might take hold of the slats in the stock car; they might take hold of the door. I don't think we ought to handle it except to send it back to the committee, or that part of the section of the American Railway Association, that told us to locate it in that location.

Chairman: I think that a subject of that kind is strictly a mechanical subject, and should be referred to none but Section III. They naturally would have to confer with the people who were affected in making their report, but it is rightfully a mechanical question.

Mr. Goodnow: If the motion, as now before the association, prevails, I think it will take care of it, as it simply will get the approval of the Safety Section on the standard location. If we get that approval, then the whole matter is settled.

R. H. Kleine (P. R. R.): I was chairman of the committee that fixed the present location for height of lettering on the cars. It was done at the request of the American Railroad Association about ten years ago. The distance from the top of the rail to the bottom of the board is, as I recall the figures, 5 ft. 9 in. with a variation of 6 in. either way. That is about as low as you can get a board on a house car and still get your capacity marking and your lightweight markings, underneath the same, and it was entirely agreeable to the American Railroad Association at that time. I believe the complaints in regard to the location of the present lettering is on cars that are not stenciled in accordance with the present standards.

Chairman: I think the motion will properly take care of it. The motion was unanimously carried.

Mr. Goodnow: As there is only one item that should go to letter ballot as I see it now—and that is "Definitions and Designating Letters of General Service Freight Equipment Cars"—the matter of separating the double deck, single deck, and convertible deck stock car, that should be included in the motion, so that one item will go to letter ballot this year.

Chairman: If there are no objections, that will be included in the motion. So ordered.

## Committee on Train Brake and Signal Equipment

T. L. Burton  
Chairman

SINCE THE ANNUAL MEETING of the M. C. B. Association in June, 1918, nine subjects have been referred to the Train Brake and Signal Equipment Committee, on which the following report is submitted:

### PART I. AIR BRAKE MAINTENANCE

Acting under direction of the Executive Committee, the Train Brake and Signal Equipment Committee met in Buffalo on November 6th last, with the secretary, representatives of the Fuel Conservation Section, United States Railroad Administration, and the President of the Air Brake Association, for a discussion on the condition of freight brake equipment and means of improving it.

As a result of this meeting, Circular No. 20 on Air Brake Main-

tenance was issued by the Executive Committee and approved by the United States Railroad Administration.

### PART II. ADJUSTMENT OF BRAKE POWER OR TANK CARS

Under date of December 28, 1918, a communication was received from the secretary enclosing an exchange of correspondence and blue-prints with the Tank Car Committee and the American Car & Foundry Company, and a request from the Executive Committee to have the Train Brake and Signal Committee review the question of hand brake power for tank cars, which was done. The committee's recommendations have been issued to the members in Circular S-III No. 3.

### PART III. AIR BRAKE HOSE COUPLING PACKING RINGS AND GAGES

The committee's attention has been called to the fact that the recommended practice packing ring gage shown on Sheet Q-1 does not provide for tolerance dimensions of the flange of the air brake hose coupling packing ring shown on Sheet I8-A, and it has been suggested that this gage drawing should be revised to show minimum and maximum slots for the flange of the packing ring.

For years packing rings have been supplied in large quantities with less variation in flange thickness than can be detected with a

gage, and to make the change suggested would unnecessarily increase the chances for brake pipe leakage, therefore the committee does not concur in the suggestion; on the contrary it believes: (a) The gage shown on sheet Q-1 should be advanced to standard. The gage and packing ring to be drawn to larger scale and shown on the same sheet. (b) The packing ring drawing in the specifications should show nominal dimensions only, the tolerance dimensions to be provided for in the gage. (c) The packing ring specifications should include instructions on the use of the gage.

PART IV. BRAKE INSTALLATION

Attention has been called to the large number of loose brake cylinders, reservoirs and pipe clamps on freight cars, secured with bolts having single nuts. The committee's recommendations will,

racks, many of which are in use, be discontinued. It believes, however, that the use of the two racks should be made optional, and when a new rack is installed it should be the later type, and when the older racks require extensive repairs they should be converted. The proposed revised instructions on cleaning and testing triple valves, therefore, include drawings and operating instructions for both racks.

PART VII. STENCILING BRAKES

The Air Brake Association and the Northwest Air Brake Club recommend changing the stenciling for brake cylinders and triple valves when cleaned, lubricated, etc., so that but two lines will be required, one line to show the place, month, date and year of cleaning, and one line to show the initials of the road on which the work is done, the stencil to be applied to both sides of the

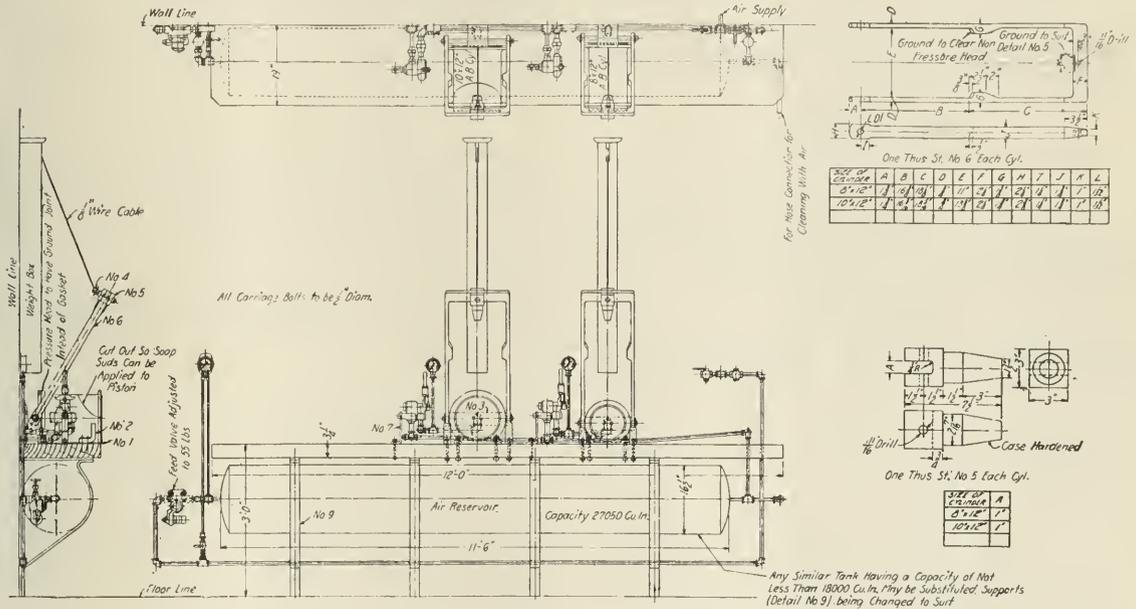

Fig. 1.—Brake Cylinder Packing Lever Test Rack

therefore, include a revision of Sheets 18 and 1 Q, to include double or lock nuts for such bolts.

PART V. CLEANING, LUBRICATING AND TESTING BRAKE CYLINDERS

It has been suggested that the brake cylinder piston and packing leather when removed should be taken to a shop conveniently located, where the leather should be cleaned by a man assigned to this work, and tested on a test rack. This method of cleaning and testing packing leathers is employed on several roads with most satisfactory results, and the committee believes the suggested method should be extended and ultimately made standard practice. Drawings for suitable test racks are, therefore, included in Exhibit C-1, to which suitable reference is made in the proposed instructions on annual repairs to freight brakes (Exhibit C).

PART VI. TRIPLE VALVE TEST RACK

Since the triple valve test rack, for which drawings are shown in existing instructions for cleaning and testing triple valves, was brought to the attention of the association, an improved test rack has been developed and is in extensive use on many roads. The committee also understands that many of the old racks have been converted to the later type, which can easily be done, and that any cleaned or repaired valve that will pass the prescribed test for the later rack will also pass the test prescribed for the older rack. The use of the former rack will, therefore, not conflict with the rules and instructions governing the cleaning and testing of triple valves.

While the committee recognizes the superiority of the later rack, it does not feel justified in recommending that the older

car or reservoir. The recommended form of stencil is concurred in, but the necessity for stenciling both sides of the reservoir or car is not conceded.

PART VIII. RETAINING VALVES FOR FREIGHT CARS

Attention has been called to the large number of different types and capacities of retaining valves required in order to make proper repairs to foreign cars, and it has been recommended making 15-30 and 25-50 lb. spring type retainers standard for all new cars built in the future, the 15-30 lb. valves to be used on cars under 80,000 lb. capacity, and the 25-50 lb. valves to be used on car of 80,000 lb. capacity and over, and that a suitable test be formulated for cleaned or repaired retaining valves.

The matter of testing retaining valves is provided for in the proposed revised instructions on the maintenance of freight brakes, but the committee is not in possession of information which would justify it in recommending standard capacity retaining valves for all freight cars offered in interchange, and doubts if such information can be had without making some road investigations, which the committee to date has not been able to make. It believes, however, the association would be justified in adopting, as recommended practice, two-pressure spring type retaining valves of such capacity as may be required by individual roads, leaving the question of standard capacity open for further consideration, and so recommends.

If this recommendation carries, and a standard capacity retainer of the two-pressure spring type should subsequently be adopted, any retainers of this type then in use can, if they should not be of the capacity adopted, be easily converted to standard by simply changing the springs, which can be done at a very

nominal cost. Meanwhile the weighted type and the single pressure spring type retainers will have been abandoned for new equipment, and, in many cases, for repairs, thus going a long way toward accomplishing the object sought, i. e., to reduce the number of valves carried in stock for repairs.

**PART IX. RULES AND INSTRUCTIONS ON THE MAINTENANCE OF FREIGHT BRAKES**

At the request of the General Committee, the standard instructions on the maintenance of freight brakes have been revised and divided into the following parts, as shown in Exhibits A, B, C and D.. (a) Test and repairs to brakes in terminal yards. (b) Test and repairs to brakes on shop or repair tracks with brake stencils in date. (c) Annual repairs to brakes with stencils out of date. (d) Cleaning, lubricating and testing triple valves.

**PART X. AIR BRAKE REPAIR TOOLS AND DEVICES**

Several roads have submitted drawings showing useful tools and devices for use in making air brake repairs to freight cars. The committee reviewed a number of drawings submitted, some of which are shown in Exhibit C-1.

**Recommendations**

The committee recommends submitting to letter ballot:

**FOR RECOMMENDED PRACTICE**

1. That Sheet Q be revised by adding a note reading: "Bolts securing brake cylinders, auxiliary reservoir and pipe clamps, to have double nuts or lock nuts." 2. The adoption of spring type duplex retaining valves for freight equipment cars.

**FOR STANDARD**

1. Advancing to standard the recommended practice gage shown on Sheet Q-1 for air brake hose coupling packing rings. The gage, and the hose coupling packing ring now shown on

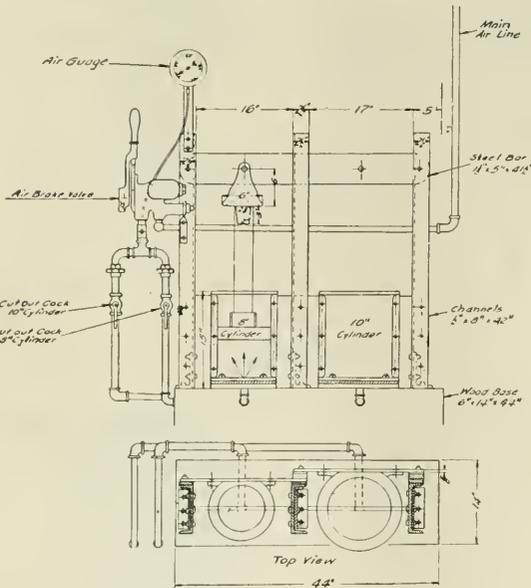

Fig. 2.—Brake Cylinder Packing Leather Test Rack

Sheet 18-A, to be shown on one (new) sheet. 2. That Sheet 18 be revised by adding a note to read: "Bolts securing brake cylinders, auxiliary reservoirs and pipe clamps to have double nuts or lock nuts." 3. Revised rules and instructions on the maintenance of freight brakes as shown in Exhibits A, B, C and D, voting separately on each exhibit.

The committee recommends that the following subjects be included in next year's work of this or a similar committee: 1. Revision of existing rules and instructions on the operation of train brake and signal equipment. 2. Cleaning and testing brake

cylinder packing leathers in a room or shop instead of under the car. 3. Capacity of standard retaining valves for freight cars. This subject to include such investigations as may be found necessary on the operation of retaining valves in grade service.

**Rules and Instructions Governing the Maintenance of Brake Equipment on Freight Cars**

**EXHIBIT A.—TEST AND REPAIRS TO BRAKES ON CARS IN TERMINAL YARDS**

1. Freight cars in terminal yards should have the air brakes tested as follows:

**INCOMING TRAINS**

2. Freight trains, on arrival at terminals where inspectors are stationed to make immediate brake inspection and repairs, shall have the slack stretched and shall be left with the brakes fully applied in service application. Inspection of brakes should be made as soon thereafter as practicable and any needed repairs made, or promptly mark for repair tracks any cars that cannot otherwise be repaired.

**OUTGOING TRAINS AND YARD TESTS**

3. While the train is being charged, make a visual inspection of retaining valves and retaining valve pipes, position of angle cocks and hose, and examine closely for leaks from the brake pipe and its connections, and make necessary repairs to reduce this leakage to a minimum when the brake system is charged to standard pressure.

4. When the brake is charged to standard pressure, make a 15-lb. service reduction, after which a second examination of the train should be made to determine: (a) Brake pipe leakage. (b) If triple valve will operate on service application. (c) Piston travel. (d) Brake cylinder leakage. (c) If the brakes release properly.

5. If, during this test, the brake pipe leakage, as indicated by the brake pipe gage, exceeds 8 lb. per minute, it should be reduced to 8 lb., preferably 5 lb., and if the piston travel is less than 6 in. or more than 8 in. it should be adjusted to 7 in. All defects found shall be repaired in the yards or the car sent to the shop or repair track for necessary attention.

6. In addition to the above terminal tests, at the last terminal inspection point prior to descending mountain grades, it must be known that a sufficient number of retaining valves are in good operating condition to control the train.

**EXHIBIT B.—TEST AND REPAIRS TO BRAKES ON CARS ON SHOP OR REPAIR TRACKS WITH STENCILS IN DATE**

1. All cars on shop and repair tracks (with stencils in date) should be connected to a yard air plant equipped with testing apparatus, and a dummy coupling attached to the hose on the

TYPE OF RETAINING VALVE	Position of Handle	Initial Cylinder Pressure	Combined leakage from the cylinder, retaining valve and pipe must not exceed that shown below	Number pounds leakage per minute
15 lb. Single Pressure Spring and Weighted Type	.....	10 lb.		7
15-30 lb. Double Pressure Weighted Type	.....	20 lb.		10
15-30 lb. Double Pressure Spring Type	.....	High 20 lb. Low 10 lb.		10 7
25-50 lb. Double Pressure Weighted Type	.....	40 lb.		14
25-50 lb. Double Pressure Spring Type	.....	High 40 lb. Low 15 lb.		14 9

opposite end of the car. The pipe, including angle cocks, cut-out cock and hose, to be tested under a pressure of not less than 70 lbs., using soapsuds for this test when weather conditions permit. All possible leakage should be eliminated. Any hose found porous or leaking around the fittings, or otherwise defective, and any cocks found leaking at the top of the key should be removed.

2. The brake cylinder must be tested for leakage with a gage attached to the retaining valve exhaust or triple valve exhaust port, and the triple valve tested with a specified testing device to determine whether it will apply and release properly in both service and emergency applications. If the triple valve fails to pass this test or the brake cylinder leakage exceeds 12 lb. per

minute, the entire brake equipment must be given the attention specified for cars requiring annual repairs when the stencil is out of date. If the triple valve and brake cylinder pass the prescribed test, the retaining valve and its pipe must be tested, and the combined leakage from the cylinder, retaining valve and retaining valve pipe must not be greater than is specified in the table on the preceding page.

3. When giving brakes this attention, see that the brake pipe is securely clamped, angle cocks in their proper position with suitable clearance (see M. C. B. Sheet 18), hose and couplings in good conditions, reservoirs and cylinders tight on their supports, the supports securely attached to car, and that piston travel is table on the preceding page.

**EXHIBIT C.—ANNUAL REPAIRS TO AIR BRAKES ON FREIGHT CARS**

Exhibit C follows closely the instructions for Lubricating and Inspection of Brake Cylinders as published on page 524 of the Proceedings of the Master Car Builders Association for 1918 with the following additions:

19. When the brake cylinder and triple valve are cleaned, the following additional work should be performed: Retaining valve cleaned by removing the cap, wiping or blowing out all dirt and seeing that the valve and its seat are in good condition, the retaining position exhaust port open and the valve proper well secured to the car in a vertical position; pipe clamps applied where missing, and tightened where loose, hose and angle cocks turned to their proper position. Pipe joints, hose, release valve, angle and cut-out cocks should be tested under a pressure of not less than 70 lb., using soapsuds for this test when weather conditions will permit. The retaining valve and its pipe must be tested and the combined leakage from the cylinder, retaining valve and retaining valve pipe must not be greater than is specified in the following table:

TYPE OF RETAINING VALVE	Position of Handle	Initial Cylinder Pressure	Combined leakage from the cylinder, retaining valve and pipe must not exceed that shown below, Number of pounds leakage per minute.
15 lb. Single Pressure Spring and Weighted Type.....	.....	10 lb.	5
15-30 lb. Double Pressure Weighted Type .....	.....	20 lb.	6
15-30 lb. Double Pressure Spring Type .....	High	20 lb.	6
25-50 lb. Double Pressure Weighted Type .....	Low	10 lb.	5
25-50 lb. Double Pressure Weighted Type .....	High	40 lb.	8
25-50 lb. Double Pressure Spring Type .....	Low	15 lb.	6

20. Stenciled dates on brake cylinders or auxiliaries should not be changed unless paragraphs 1 to 19, inclusive, have been complied with.

**NOTE.**—It has been found good practice, where conditions will permit, to install a brake cylinder packing leather test rack similar to Figs. 1 or 2, Exhibit C-7, in a suitable building close to where the brakes on cars receive attention. When such a rack is installed, the piston, when removed from the cylinder, should be taken to the rack and cleaned, lubricated and tested, in accordance with instructions for cleaning and testing these parts on cars. The expander ring should also be tested in a gage, and metal covers for protecting the leather from damage through handling should be provided.

Exhibit C-1 includes drawings of tools and test devices for use in testing and repairing air brake equipment on freight cars including a gage for brake cylinder leather expanders, protectors for brake cylinder packing leathers and brake testing devices.

Exhibit D covers the cleaning, lubricating and testing of triple valves and corresponds with the standard instructions on page 522 of the 1918 Proceedings of the Master Car Builders' Association with minor revisions and also the Triple Valve Tests and Instructions for Operating Triple Valve Test Racks shown on page 526. To this is added a section covering instructions for operating the No. 2 triple valve test rack.

The report is signed by T. L. Burton (Chairman), New York Central; B. P. Flory, New York, Ontario & Western; J. M. Henry, Pennsylvania; L. P. Streeter, Illinois Central; R. B. Rasbridge, Philadelphia & Reading; W. J. Hartman, Chicago, Rock Island & Pacific and G. H. Wood, Atchison, Topeka & Santa Fe.

T. L. Burton: There is one paragraph which does not appear in the report which the committee subsequently decided should appear and that is an acknowledgment of its indebtedness to the Air Brake Association, especially its president, Mr. Berry, for the hearty assistance and co-operation rendered the Train Brake and Signal Committee during

the current and previous years in the work which has been before that committee.

Mr. Hennessey: I move the report be accepted and referred to letter ballot.

Mr. Gaines: I would like to have the mover amend that motion, so that in printing the note on sheet 2, in the portion "double or lock nuts" the word "or" be omitted, and have it read "have lock nuts," that being the practice of the Railroad Administration at the present time.

Mr. Hennessey: I don't accept that amendment.

Mr. Fuller: We ought to have that made a little clearer. Do I understand, Mr. Gaines, that you do away with the practice of using a double nut or a single nut and a lock nut, and go to some so-called nut that takes the place of both—is that your idea?

Mr. Gaines: That is not our idea. The practice of using double nuts has been generally discontinued in preference to using a nut and a lock nut. That is what I wish to convey; instead of leaving it optional whether you were going to use double nuts or a nut and a lock nut, that you make the nut a lock nut mandatory as being the better practice.

Mr. Hennessey: If that is the idea, I will accept the motion that way.

Mr. Fuller: I don't understand that.

Mr. Gaines: Do you want to use two nuts or a nut and a lock nut? What is the better practice?

Mr. Fuller: What is your motion?

Mr. Gaines: My motion was to omit the double nut and just make it a nut and a lock nut.

Mr. Fuller: I don't think there is any particular objection to that, but it is rather revolutionary. I don't believe the time is ripe to put into a rule something that you can't do and won't do. I believe that the recommendation should say "a nut and a lock nut is preferable," but to prohibit the double nutting out in the woods is going so far that we won't be able to accomplish it to-day.

Mr. Gaines: In reply to Mr. Fuller, I don't think that if you were out in the woods, and had to put a double nut on, there is anything that will prohibit you doing it; but I think it is wrong to specify double nuts as being better than a nut and lock nut.

Mr. Fuller: What is the use making rules here that we know people will not obey. That is just our trouble. We make rules and go home and don't obey them, and won't do it.

Mr. Gaines: We don't make it mandatory by doing that, but you give the preference to the best practice. On new equipment I think we should start out with a nut and a lock nut.

Mr. Fuller: I am trying to make the rule consistent, and if I understand your motion, it makes the proper repairs a nut and a lock nut, and it is improper repairs if two nuts are used.

Mr. Burton: I believe that the committee can add a word or two that will make it entirely satisfactory to those who have participated in the discussion so far. Mr. Fuller has stated that they thought, that so far as getting results was concerned, either method would be satisfactory, probably the lock nut more desirable than the other; but we did not feel like going so far as to specify lock nuts instead of double nuts. My suggestion is that the last sentence on the proposed note be revised to read that the committee's recommendation will, therefore, include the revision of Sheets 18 to include double or lock nuts, preferably the latter.

Mr. Fuller: I will accept that.

Mr. Burton: I think the committee will do that without a motion.

Mr. Hennessey: I will accept that.

Mr. Goodnow: Before the motion is put, it seems to me they have omitted one item from their letter ballot which should be included, and that is the matter of stenciling referred to on the bottom of page 3, because that will mean a change in the present standards, and it should be recommended.

Mr. Burton: It is shown here as a part of the proposed revised instructions on the maintenance of freight brakes, of which that stenciling would be a part, and reference should perhaps have been made to the fact. I just noticed from reading the report of the Committee on Standards that this proposed stenciling seemed to agree with what they proposed, and if you adopt the standard practice on the automatic air brakes, you automatically adopt the form of stenciling.

H. W. Watkins (S. P.): There is nothing in this report that provides for the draining of reservoirs and the stenciling of them. We find that our reservoirs contain a considerable amount of water; condensation and corrosion get back into the valve and cause trouble, and I believe that the reservoirs should be drained out at the time the cylinder and the triple valve are cleaned, and so stenciled. I think this committee should include that in their report.

Mr. Burton: The condition referred to is largely a local one, and I doubt the necessity of providing specific instructions on draining auxiliary reservoirs on freight cars for the purpose of removing moisture and stenciling them to cover. You understand this is a freight car proposition exclusively. If that should be necessary, why then I would say that the thing to consider is putting the bleed cock in the bottom of the reservoir where it is drained every time it is used, but I think the protection afforded by having the relief valve at the top offsets any advantages of having the drain cock at the bottom.

Mr. Watkins: When we first put the automatic brakes on our equipment, there was a bleed cock put in for that very purpose, but it was abandoned, and a plug was put in, and that plug is never removed. The result is that water and condensation is carried around in these reservoirs for years, and there is corrosion. It is just as important to have your reservoirs cleaned as it is the cylinders for a perfect brake.

Mr. Burton: Why not request some committee to consider that in connection with this other work?

Chairman: That will have to come up after this first motion is disposed of. I will dispose of the first motion and then you can make your motion.

The motion was put and carried.

Mr. Watkins: I move that the question of draining and stenciling reservoirs be considered by the committee for next year.

Mr. Gaines: I second the motion.

The motion was then put to vote, and lost.

H. M. Curry (N. P.): I speak on this motion as the author of it. I think it is very essential this should be done if you leave off the stenciling end of it. I don't think we ought to leave the matter as it now stands, because we in the northern country have had considerable trouble with water in the air brake apparatus. I don't think we ought to let it rest this year.

Chairman: If I were in the northern country, or in the country where these things seemed necessary, and the head of a railroad, I would see that the proper instructions were issued, so that my men would take care of these particular things that gave us annoyance, and I believe that is the proper way to do.

Mr. Curry: This is one point that you apparently overlook. These cars may come from the South to the North, and we have encountered considerable trouble on that account.

Chairman: The first time they reach your rails they can be drained.

Mr. Curry: That is all right. When they reach our rails there is a whole lot of drainage; we find it necessary. You are putting the practical burden on the Northern Pacific and the Northern roads, of taking care of all the work to drain the cars that come to our country.

Chairman: I believe that that thing will adjust itself. There is some other section than the North that has to do a lot of things you don't have to do.

Mr. Fuller: I make the motion.

## Report on Brake Shoe and Brake Beam Equipment

B. B. Milner  
Chairman

THE COMMITTEE MET in Chicago on April 22, confronted by a rather peculiar situation. By letter ballot of 1917, the "No. 2 Brake Beam," shown on Sheet R of that year, had been adopted as recommended practice, but by a close margin. This "No. 2 Brake Beam" was not a complete beam, certain details having been omitted in order to save it from being lost as were its predecessors in the letter ballots of 1912, 1913, 1914 and 1916. In 1918, a completely detailed beam, built upon the results of the 1917 letter ballot, appeared among the M. C. B. Standard Sheets as the result of

special Executive Committee action suggested in connection with the car equipment built by the Railroad Administration, it being evidently thought that a beam supposedly used on the 100,000 administration cars would be fit for adoption and that such large initial use of a beam would be a favorable beginning for any standard.

On account of the generally unsatisfactory situation, which has obtained in connection with the committee's work, particularly with regard to the adoption of a standard No. 2 Beam, it was the opinion of the committee that the difficulties or objections which have beset its work and have operated to keep the committee from making the desired contribution to the advancement in the state of the art, should be reviewed for your information and for the benefit of the committee in planning for its future work.

In addressing itself to the brake beam and brake shoe problem of the country, the committee has not benefited by an adequate knowledge of the brake beam conditions of the country. It should appear impractical to divorce new equipment design from the maintenance of old as well as the maintenance of new, or to attempt to treat new and old equipment entirely indepen-

dently, one of the other. Yet that appears to have been virtually attempted. Without knowledge of the country's brake beam conditions, the committee has, in the past, submitted to you for adoption, a beam which, on account of lack of adequate clearance between the spring plank and wheels, could not be applied to, many thousands of cars. The committee is now, through the medium of a questionnaire, collecting from all the roads, brake

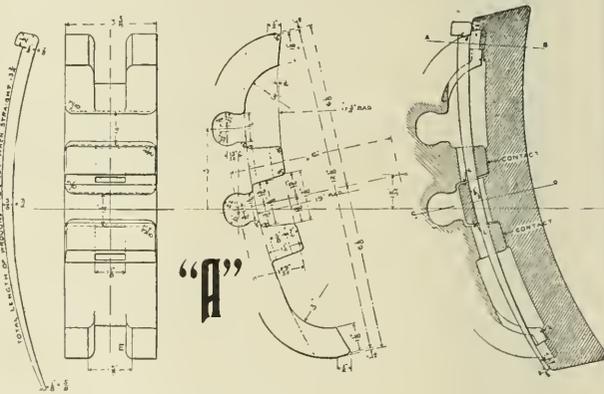

Fig. 1

beam information essential for passing judgment upon brake beam problems.

Large numbers of dimensions shown upon drawings submitted for adoption, and in some cases, adopted, have caused dissension with some, and, with others, confusion because of an attempted use or interpretation not clearly intended by the committee or specifically contemplated by some of the members in casting their letter ballots. For example, in the 1917 Proceedings, page 394, the statement is made that "The committee recommends a revision of the present face of contour shown on Sheet M. C. B. 17, including the contract of the shoe to the head in the revised contour of the head . . . it being understood that only the contour lines of the head, where the shoe is in

contact with the head, are under consideration," introductory to question 81, "Do you approve of the above recommendation?"

A comparison of the 1916 brake head drawing identified as A upon Fig. 1 of this report and the brake head drawing which action upon the above question gave place in the standards as shown by Fig. 2, will justify and reflect, very apparently, the cause for the dissension and confusion referred to, notwithstanding the following note which the 1917 Sheet 17 bore—"Dimensions affecting contour, lugs and slots only are standard. Other dimensions for information only." The present committee submits that such notes are very likely to be overlooked and that text in the report or explanations of the meaning of letter ballots qualifying the significance of information, particularly dimension information, on Standard and Recommended

rails to the center of the face of new shoes, were adopted in 1894, as follows: for inside hung beams, 13 in.; for outside hung beams, 14½ in.," but has never appeared upon any of the Standard or Recommended Practice Drawings.

Failure to exhibit this dimension upon the drawings has, it is believed, contributed to some further confusion which the 1917 letter ballot action unwittingly occasioned. Upon the brake head drawing A of 1913, 1914, 1915 and 1916 Standard Sheets, Fig. 1, the (unmarked) radial line drawn from the wheel center intersects the horizontal (unmarked) center line of the strut at a point which is the center of the center loop hanger opening. This same situation has obtained and has been generally used since before introduction to the Standard and Recommended Practice Sheets in 1907. Note, however, that upon

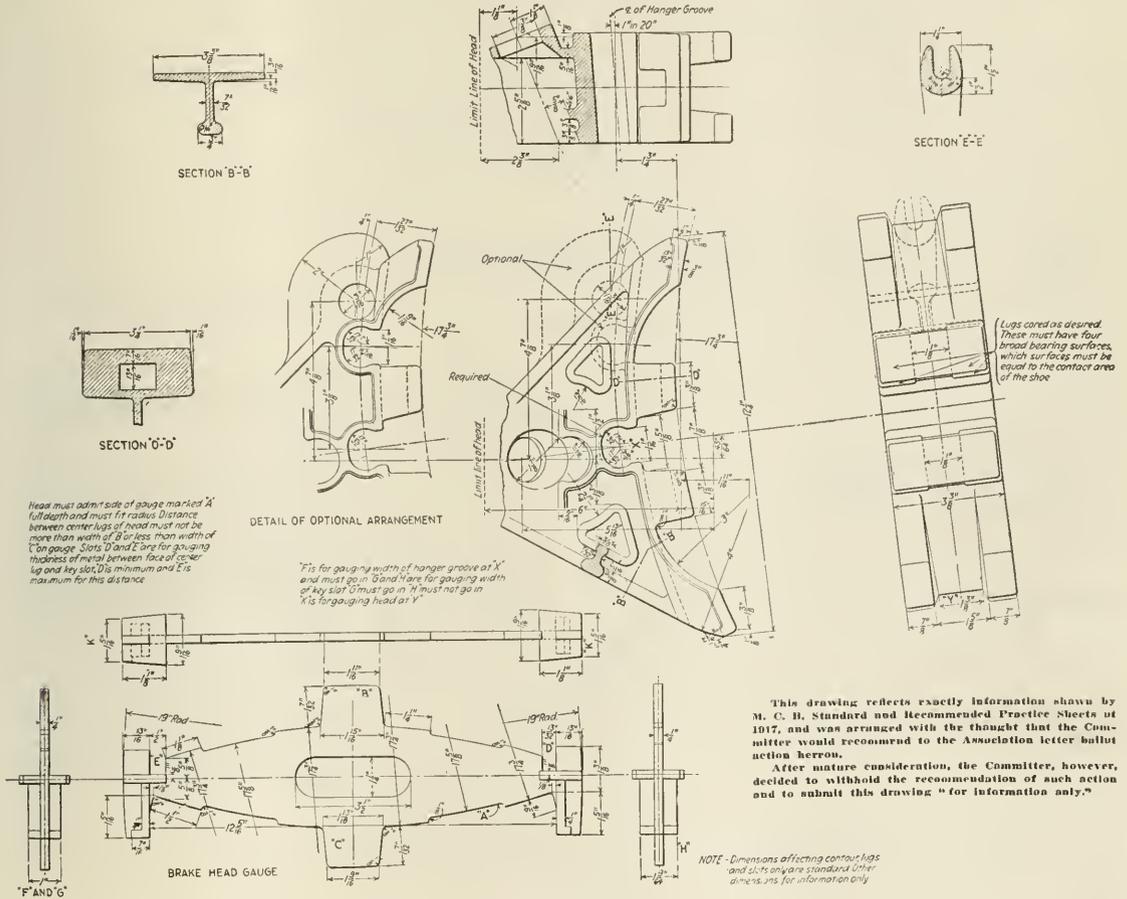

Fig. 2

Practice Sheets, is even more apt to confuse. All that was said on this matter in the body of the report of that year was ". . . the committee has strengthened the head design as well as the bearing surface of the head to the shoe and eliminated the 1/16-in. offset between the two center lugs of the head and the outside lugs where they engage the ends of the shoe." This very meagerly covers what the drawings reflect.

Again, while unauthorized dimensions or dimensions which had not specifically received formal approval, occasioned dissension and confusion through finding place upon Standard and Recommended Practice Sheets, it is suggested that the service has suffered because some dimensions which have been formally approved, have never appeared in the drawings. One, very important, has appeared each year for years in the text of the Standard and Recommended Practices as follows: "Standard heights of brake beams, when measured from the tops of the

what was adopted in 1917 (Fig. 2, this report), this radial line intersects the horizontal referred to, at a point much farther back and that the center of the center loop hanger opening remaining upon it (the radial line), is raised very significantly, although these facts were not referred to, much less explained, in the 1917 report or in the letter ballot circular of that year.

Such a situation would be positively obviated by adopting, either directly or indirectly, but clearly represented upon drawings, a process of laying out brake heads and brake beams such as the accompanying Fig. 3 presents. This one has been in most general use among manufacturers for years, being their interpretation of what found place in the Standard and Recommended Practices in 1907 and remained unchanged until 1917. The committee is on the point of soliciting from the representative members, statements of any reasons for not adopting the procedure which Fig. 3 would clearly fix, with any proposed

suggested plans, and hopes to recommend for adoption next year some such fundamental and basic procedure, the importance of which is reflected by Fig. 4, which presents a cut resulting from superimposing upon one of the many heads received upon the Administration cars in accordance with the plan of layout antedating 1917, the one head furnished in accordance with the 1917 18 layout.

The committee is not, and probably will not be, for some time, in position to recommend for adoption a "Standard Beam," that is, a beam having all of its detailed dimensions duly standardized, but plans to include in its reports, beams and parts thereof fully dimensioned for the benefit of any who may be concerned in such information, and to arrange for adoption next year, from the 1917 Standard and Recommended Prac-

enter upon the committee work independent of the operation of any such impending factors, contributing to the fullest their individual engineering judgment, skill, experience, etc., to the solution of the country's brake beam and brake shoe problems.

The committee plans to arrange adequate trial of the gages shown in this report and other gages which the committee's canvass of the representative members brings forth, and so ultimately recommend adopting the best of the lot.

The committee finds approximately four pages in the text of the Standard and Recommended Practices devoted to brake shoes and beams, all of which is or could be advantageously represented on Standard or Recommended Practice drawings, and contemplates recommending, with the adoption of New Standard and Recommended Practice drawings next year, that the association

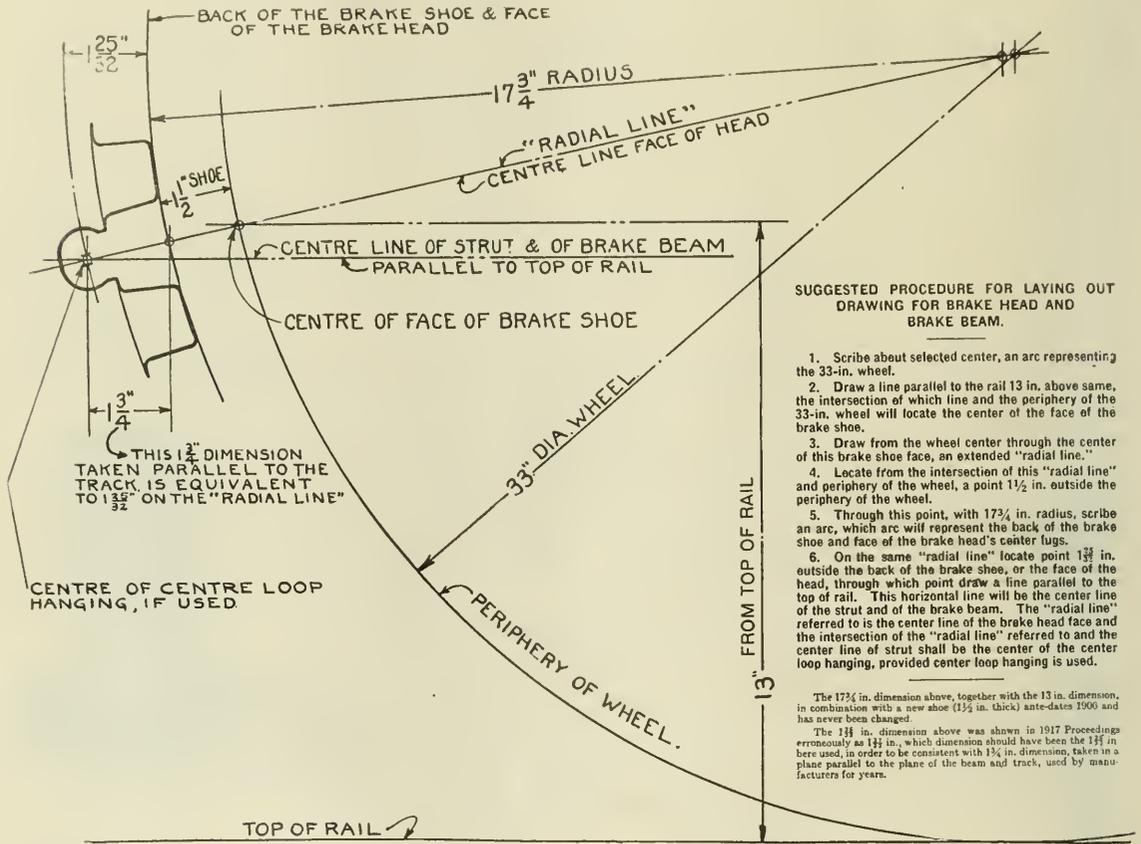

Fig. 3

tices and from whatever of the questions referred to in this report the committee may be able to decide and agree upon, drawings exhibiting those dimensions only which have had definite approval. The committee will then assume to recommend for formal adoption dimensions missing from the Standard and Recommended Practice Sheets, just as rapidly as the committee's judgment will support and warrant.

This committee has not, in the past, benefited by reason of much constructive criticism. In order to make progress, the committee should, at least, benefit by the reasons for a negative ballot, if definitely constructive criticism can not be furnished.

We have heard from time to time in the past of the representatives of some roads trying to force matters, others being on the defensive either on account of pending damage to them, or of simply a disinclination to change anything, and then, too, of the selfish influence of manufacturers' interests. It is the belief of the present committee, that each of its members should

approve eliminating from the Standard and Recommended Practice text all unnecessary duplication, reducing it to very little more than specifications for Brake Shoes and for Brake Beams.

The committee proposes to solicit from the exponents of various views on disputed questions, written argument sustaining their respective positions. During the current year, the matter of prescribing the process of laying out, upon the drawing board, a standard brake head and beam, previously referred to in the text and Fig. 3, will be so pursued, and the association may anticipate our recommending action on the matter next year. Another question which will, in all probability, be similarly handled, but later, is that of brake beam hanging arrangement. We anticipate it will be sometime before one hanging can be made standard to the exclusion of other arrangements. On these accounts, the committee plans to, just as far as possible, forecast, in its reports, the work which it sees ahead and to, just as soon as possible, indicate, subjects which are or will be in the way of being placed before the association for letter ballot action. Prin-

ciples or subjects may then occupy several consecutive stages in some such order as follows: (1) mention in report, (2) study, (3) approval of the principle involved, (4) suggestion or recommendation of trial, (5) Recommended Practice, under which it may be said that no mistake is made in applying the principle, and (6) Standard Practice, in which stage the principle should be used. maintenance practices should be in the direction of applying the principle or should at least be consistent therewith, and a new car is not a car without it.

The committee is of the opinion that its work and the work undertaken for it which has been reported in the Proceedings, should be classified and indexed so that any part of the history of the subject should be immediately available to any one interested therein. Such an index we propose to arrange as a part of our next year's report.

Likewise, the committee is considering the advisability of presenting next year a report on the "state of the art," both as regards brake beams and brake shoes, the latter being now suggested because of the following quoted from the 1917 report, page 155 of the Proceedings of that year: In its Circular of

Two other plates showed 12 different designs of brake heads which were applied to the order of 100,000 cars for the Railroad Administration.)

Considering the many things obviously wrong or subject to criticism in the Standard Sheets of 1918, particularly in view of the additions and changes represented therein which had never been before the committee, the fact that the Standard Sheets of 1917 were accepted by letter ballot, although by a very close vote the impossibility of the committee's being able to present a recommended decision on many of the disputed questions in the time available after its organization for this year's work, and prevalent criticism directed to the arrangement of the Standard Sheets and their illegibility on account of the smallness of the drawings and dimensions, the committee decided upon presenting a rearrangement of the 1917 sheets to larger scale.

Aside from the difficulties already referred to in this report, the committee will address itself to the following questions or suggestions, with the hope that upon some of them conclusive report may be made next year: The question of increasing the No. 2 Beam capacity from 12,000 to 15,000 lb., and the counter suggestion that a new beam, No. 2½, with a capacity of 15,000 lb., to be recognized among the Standards, comes from several members.

A member suggests that full recognition be given the top hanger opening.

Dimension and details upon compression and tension members.

A member suggests covering of various types and locations of third point suspension lug, and that the hole in this lug should be 1¼ in. for a ¾-in. pin, in lieu of the larger pin shown on the present strut drawing.

It is suggested that the strut should be dimensioned to show the minimum distance from the pin hole to the ends of the slot; that the chamber in the compression member should be "not less than ¾ in.," instead of 7⁄8 in. The strut and compression member fastening with key is objected to, together with the use of nuts on the ends of compression members, it being believed that these arrangements might be replaced by better ones.

Some believe that the vertical dimension between the centers of the loop hanger opening should be restored from 3½ in. to 3 in.; that the width of the center head lugs be reduced from 1⅝ in. to 1¼ in.; that the upper pot hook hanger hole should be 1¾ in. above the center line of the upper loop hanger opening, and that the cross section of metal in the pot hook hanger opening should be changed to a single ribbed style.

Some believe that the ¼-in. clearance back from the 17¼-in. radial line on the top and bottom head toes should be restored; that the width of opening in the brake head for the brake key should be shown as "not less than 5⁄8 in. instead of 13⁄16 in.; that the length of the face of the head lug shown precisely as 3¼ in. should be replaced by a minimum dimension, say 3 in., and that the head lug note reading "Lugs cored as desired. These must have four broad bearing surfaces, etc.," should be changed to "Lugs cored as desired. These must have four full bearing surfaces, etc."

A member suggests that the width at the base of the tie lug openings should be re-established from 1¾ in. to 1¼ in., and the head gage changed accordingly; that 5⁄32-in. radius should be added to the adjacent corners on the head gage; that the 1⁄8-in. radius at the bottom of the B and C head lug opening should be made 3⁄32 in. instead of 1⁄8 in., because, otherwise, the gage will not "bottom" in the head. It is further suggested that the brake beam outline and salient dimensions thereof should be inserted inside of the limiting outline drawing, together with interchange dimensions, that is, angle of strut, spacing between shoes, etc., and that the 19¼-in. maximum width of limiting outline opening should be extended to within 1⁄16 in. of the end of such opening.

A member suggests that the A and B openings of the brake shoe gage should be changed from 1¼ in. to 1⅜ in.; that the base of these openings should be a radius of 18⅜ in., in lieu of 19 in., and that strut markings should be changed from the rear to the front end of the strut, because of being, in that location, more easily seen.

It is also suggested that the "outside beam hanging 14½ in." should be eliminated; that

"Center of Brake Shoes 60 in.," should be changed to "center to center of face of brake heads 60 in. on the plane of the strut center," and that the center of the third point suspension should

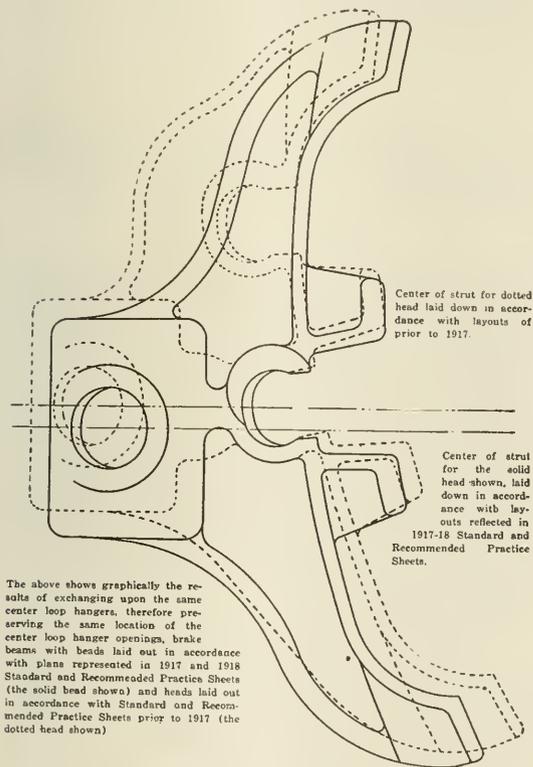

Fig. 4

Inquiry, the committee requested the members to furnish designs of steel back brake shoes which they were manufacturing and to advise if they were free from patents. The replies indicate that such forms of steel back brake shoes as are being manufactured by the members and which would be acceptable as Recommended Practice of the association are not free from patents, and probably will not be until 1919; that one of the members is using a steel back brake shoe of his own manufacture which is free from patents, but this design does not incorporate carrying the steel back reinforcement around the key lug. The committee therefore feels that until the above mentioned date it can not offer to the association as Recommended Practice any design of steel back brake shoe which would be free from infringing any valid existing patents."

(The committee submitted with the report several plates showing information incorporated in the standards from 1906 to 1916 and called attention to the successive changes.

be specified as 10 $\frac{1}{4}$  in. from the center of the face of the head.

The committee carefully considered the advisability of suggesting letter ballot action on the question of substitutes in Standards for present 1918 sheets 17, 17 A and 17 B of this report, but finally concluded that the 1918 sheets referred to might as well stand during the coming year, it being understood that the committee anticipates recommending replacement thereof by appropriate letter ballot action in 1920.

The report is signed by B. B. Milner, Chairman, New York Central; Prof. Chas. H. Benjamin, Purdue University; T. L. Burton, New York Central; C. B. Young, United States Railroad Administration; H. K. Fox, Chicago, Milwaukee & St. Paul; G. H. Gilman, Northern Pacific; T. J. Burns, Michigan Central, F. M. Waring, Pennsylvania.

E. B. Milner: The committee assumes to submit this report as a progress report, and requests an extension of time covering the next year, in which to consider and report to you if possible definitely upon many questions which this report indicates as requiring time for further study.

C. F. Giles: I move that the report be received and the committee continued to report at the next meeting.

The motion was carried.

The meeting then adjourned until 3 P. M.

### The Afternoon Session

The proceedings of the afternoon session which took up the consideration of reports of the Committees on Arbitration, Revision of Prices for Labor and Material, Depreciation for Freight Cars and Revision of Passenger Car Rules of Interchange will be published in to-morrow's issue.

## Apologies to the Camel Company

PRINT SHOP SURGERY amputated a line from the items included in the exhibit list statement made for the Camel Company yesterday. By this operation W. W. Darrow, A. B. Wegener, Arthur Allen and Belden D. Jones, of that company, were omitted from the names of those attending. The spaces of the company also were given incorrectly. The correct spaces are 534-536.

## Canadian Delegates Missed From Convention

THE DEADLOCK between the Canadian Railway War Board and Division No. 4, Railway Shopmen of America, has made it necessary for all of the mechanical officers on the Canadian roads to remain on their jobs. They will be greatly missed because they have been a most important factor in all of the conventions which have been held during recent years.

The following are the most important demands made by the employees' committee:

1. Increases in rates for helpers from 45 cents per hour to 70 cents; for the machinists, blacksmiths, carpenters and similar tradesmen, ranging from 53 to 68 cents per hour, to 85 cents.
2. Forty-four-hour week as compared with forty-eight hours now in vogue in round houses and operating yards and forty-seven hours in main shops.
3. Double time for overtime in place of time and one-half.
4. Thirty days' holiday with full pay each year.
5. Extended issuance of annual free transportation.

Upon some of the foregoing and on a number of minor points the board has already made concessions. The employees have been informed that an eight-hour day has been granted, with Saturday afternoon holiday, where that privilege is already enjoyed, and the payment

of punitive overtime for work performed on Saturday afternoon, where provided for in existing agreements.

Other points, however, are involved gravely affecting not only the solvency of Canadian railways, but the ability of Canadian business concerns to meet foreign competition. The board has declined to conclude negotiations or to give definite assurances except and until the same points in negotiation by the main branch of the same labor organization, constituting 90 per cent of its membership, with the United States Railroad Administration in Washington have been announced.

## The Track Exhibits

THE large number of track exhibits this year has required that practically every available track be occupied, and of necessity the exhibits are somewhat scattered. The following is a list of the exhibits and the tracks on which they will be found:

### Pennsylvania Cars

Three cars are being exhibited this year by the Pennsylvania Railroad, a 105-ton hopper car, a 110-ton gondola and a general utility express and baggage car. These cars are located south of the pier entrance, on Georgia Avenue, near the Boardwalk.

### The Locomotives

Three locomotives are on exhibit, one a powerful electric freight locomotive, built by the Pennsylvania Railroad and the Westinghouse Electric & Manufacturing Company, a simple Mallet locomotive, just completed at the Juniata shops of the Pennsylvania Railroad, and the class I is Decapod locomotive, the first of which was built by this road about two years ago. These three locomotives are located on track 5 of the Pennsylvania electric train station at Tennessee Avenue. Bus service between the hours of 2.30 and 4.30 P. M. will be maintained by the Westinghouse Company between the Boardwalk and the Tennessee avenue station for the benefit of those who wish to visit the locomotive exhibit. The busses will make frequent trips, starting from Arkansas Avenue at the Boardwalk, just in front of the pier entrance.

### The Army Ordnance Exhibit

The American Car & Foundry Company has on exhibit at Mississippi Avenue four heavy railway gun mounts. These are a 14-in. army rifle, a 7-in. rifle, a 12-in. mortar, an 8-in. rifle and an armored ammunition car for railway artillery.

In addition to the track exhibit, the American Car & Foundry Company also has a number of field artillery pieces, which are being exhibited near the Boardwalk, between the Marlborough-Blenheim and the Brighton hotels.

### A Four-Wheel Drive Automobile

The Four-Wheel Drive Auto Company, Clintonville, Wis., has on exhibit, on Mississippi Avenue, a three-ton truck with four-wheel drive, used by the Army for handling ammunition.

### Self-Propelled Cars

The storage battery cars, being exhibited by the Railway Storage Battery Car Company, and in operation between Atlantic City and Ocean City, leaves the Boardwalk on Virginia Avenue, at 10 A. M. and 3 P. M. daily. The round trip requires one hour and forty minutes.

The steam-driven car, exhibited by the Unit Railway Car Company, is located on Mississippi Avenue.

### The Naval Ordnance Exhibit

The Baldwin Locomotive Works is exhibiting, on the Georgia Avenue tracks, a 14-in. railway gun mount and a 7-in. caterpillar gun mount, built for the United States Navy.

## R. S. M. A. Nominations

THE Nomination Committee of the Railway Supply Manufacturers' Association has nominated as president W. S. Bartholomew, president of the Locomotive Stoker Company, and vice-president of the Westinghouse Air Brake Company. It has nominated as vice-president J. F. Schurch, of the T. H. Sington Company. Mr. Schurch has been located at Rochester, N. Y., but expects shortly to remove to Chicago.

 Yorke, T. H., M. M., O. W. R. R. & N., Haddon Hall.

THE EXTENT OF THE MOVING PICTURE INDUSTRY in the United States may be judged from the fact that about 300,000 kilowatt-hours of electric current are used daily merely for moving picture machines. The investment in the machine industry alone, devoted to moving picture machines, has been estimated at \$11,000,000. Probably 5000 machines are worn out annually, and the total amount of money absorbed by the industry may be estimated at about \$500,000,000 a year.—*Machinery.*

## Conventionalities

Oscar Haywood, of the Touzey Varnish Company, is accompanied to the convention by his mother, Mrs. A. W. Haywood.

G. E. Carson, district master car builder of the New York Central at Albany, is accompanied by Mrs. Carson this year. Their daughter, Virginia, was married on June 2d to M. Croissant, an attorney in Albany.

J. A. MacRae, mechanical engineer of the Minneapolis & St. Louis, is attending the convention, and from his appearance seems to have fully recovered from a serious operation last winter.

W. R. Haggert, vice-president; Samuel Bennett, Western representative of the Anchor Packing Company, are all accompanied by their wives to the convention this year. Mr. and Mrs. Haggert and Mr. and Mrs. Bennett live in Philadelphia and Mr. and Mrs. Landreth in Chicago.

Norman C. Naylor, of the Railway Steel Spring Company, who arrived from Chicago on the Special, Tuesday, will be joined here Saturday by his sister, Mrs. J. Larned Green, of New York, who will remain over Sunday. Mrs. Green has never attended the convention before.

C. C. Hall, master car builder of the Cuba Railway at Camaguey, Cuba, arrived last night and is stopping at the Francis Hotel. Mr. Hall brings the regrets of George E. Knight, superintendent motive power of the same road, who was unable to attend the conventions this year.

Mr. and Mrs. C. F. Massey, of Chicago, who have been attending the conventions of the signal associations for some years, already are here, and will stay for the signal convention, which will closely follow the mechanical convention. Mr. Massey is president of the C. F. Massey Company.

H. L. Irving and H. C. Delcher, inspectors of the Baltimore & Ohio test department at Baltimore, are at the Martinique. They have been specially delegated to report their impressions to the Test Bureau of the B. & O. on their return. Both admit that the convention will pass every known test to which it can be subjected.

John S. Lentz, master car builder of the Lehigh Valley, who has been treasurer of the Master Car Builders' Association for many years, says that his name was misspelled for the first time in his 40 years of attendance at the conventions in the registration list reported in yesterday's daily.

Among those who arrived on the special train from Chicago was W. J. Tollerton, vice-chairman of the Mechanical Section. Mr. Tollerton is stopping at the Marlborough-Blenheim, and has with him Mrs. Tollerton and his two children, Miss Frances Lee and Robert William.

Mr. and Mrs. Frank J. Lepreau and son, Frank, Jr., are this year attending their first mechanical convention. Mr. Lepreau, who is manager of railway sales of the Macbeth Evans Glass Company, Pittsburgh, has for years been identified with the Edison interests and is one of the old guard at the signal conventions. He will, of course, remain over to attend the semi-annual meeting of the Signal Division at the Breakers before returning.

Fred A. Meckert is attending the convention this year in the role of the new general manager of the Fort Pitt Spring & Manufacturing Company, Pittsburgh. Mr. Meckert was for years with the Standard Steel Works at Philadelphia, having severed that connection last March to accept his present position. He is stopping at the Shelburne.

W. P. Borland, chief of the Division of Safety of the Interstate Commerce Commission, with Mrs. Borland and a party of three, motored from Washington to Atlantic City on Tuesday to attend the convention. Mrs. Borland was so severely burned by the wind and hot sun that she was confined to her room yesterday, but will be out again today.

Captain George Hull Porter, who formerly was manager of the central district of the railroad department of the Western Electric Company, comes to the conventions this year as manager of the entire railroad department. Captain Porter was in the Signal Corps of the army during the war, and was assigned to special signal work on outpost wires.

Arthur Allen, vice-president of the Holden Company, of Montreal, Canada, is here for the convention. The Holden Company represents a number of important United States concerns in Canada, including the Camel Company, McCord & Company, the American Brake Shoe and Foundry Company, the Chicago Pneumatic Tool Company, the Pyle-National Company and the Bradford Draft Gear Company.

We regret to see our old friend, Walter B. Leach, walking with crutches, but Mr. Leach himself is very glad to be able to walk even with the aid of the crutches. On account of sickness there was a long period during the last two years when he was hardly able to get around at all. Recently, however, he has been getting better, and while he still walks with much difficulty, he hopes he is now on the road to recovery. Mr. and Mrs. Leach, who have been regular attendants at the conventions for years, arrived Monday.

The first man we saw after our early arrival in Atlantic City was John D. Hurley, president of the Independent Pneumatic Tool Company. According to custom of many years standing Mr. Hurley has a habit of getting on the ground early and making his plans for contributing to the success of the gathering. Mrs. Hurley is with him—at the Marlborough-Blenheim.

R. S. Cooper, vice-president of the company, and F. J. Passino, southeastern representative, are at the Traymore.

Major John L. Woods died in Pasadena, California, June 13. This simple announcement in the daily will be read with sincere regret by the many friends of Major Woods now in Atlantic City. Major Woods was a veteran of the Civil War. In business life he was connected in a managerial way with the Allen Paper Car Wheel Company, McKee, Fuller & Company (both corporations later on being merged into the Steel Tired Wheel Company, of New York), the Railway Steel Spring Company and the Buckeye Steel Casting Company. Major Woods leaves a widow, but no children. He was the father of the late Edwin S. Woods, president of Edwin S. Woods & Company.

Edwin B. Leigh, president of the Chicago Railway Equipment Company, arrived in Atlantic City on the opening day and registered at the Traymore. Mr. Leigh has recently been honored with the vice-presidency of the National Manufacturers' Association. C. Haines Will-

iams, vice president of "Creco," is also attending the conventions. Fred De Long and Arthur Wyman will probably not be able to be here this year. Mr. Leigh recently has written and published a pamphlet entitled "Value of Railway Plant Compared with That of Other Industry," which is an interesting contribution to the discussion of the relation of the railroad industry to general prosperity.

George E. Scott is returning to his duties as first vice-president of the American Steel Foundries. In July of 1917 he severed his business and home ties in Chicago, moved to Washington and entered actively in Red Cross service. He became assistant general manager of the American Red Cross and later its general manager. He literally worked day and night and his record of achievement is a splendid one. Now that he is again an American Steel Foundries man he is in Atlantic City, accompanied by his sister, Miss Cornelia Scott, who, by the way, has also been an earnest Red Cross worker in Washington since we entered the war.

One of the former attendants at the conventions who will be missed by many friends this year is Samuel T. Fulton. Mr. Fulton, who was vice-president of the Railway Steel Spring Company, became ill with pneumonia in the latter part of last March, at his home in New York, and died within a few days. Before going in the railway supply business Mr. Fulton was a railway man, his last railway position being assistant to the president of the Rock Island Lines. He was widely known, and nobody ever knew Sam Fulton who was not glad and proud to call him a friend.

Ethan I. Dodds motored down with his family from Central Valley, N. Y., to Atlantic City, arriving here at 3 p. m. Tuesday. He left his farm at Central Valley at 5 a. m. and made the run of 200 miles in 10 hours. At least 50 miles of the trip was through a fog and one hour was used to repair a puncture and eat lunch. Mr. Dodds is accompanied by his wife, his son, Ethan I., Jr., and his daughter, Miss Dorothy. Mr. Dodds' name, by the way, was misspelled in connection with the list of representatives of the Flannery Bolt Company in Wednesday's Daily.

Charles L. Humpton, manager of the tube mill and director of the Parkesburg Iron Company, Parkesburg, Pa., died at his home in Parkesburg on May 26 at the age of 48. Mr. Humpton was taken ill just a few days before and his trouble almost immediately developed into bronchial pneumonia. He served for many years with the Parkesburg Iron Company in various departments; for some time he was connected with the Philadelphia office, where he devoted his time to the railway trade. He was one of the old-timers at these conventions.

Frank McManamy, who has come to the conventions in past years as chief locomotive inspector of the Interstate Commerce Commission, has come this year as assistant director of the Division of Operation of the United States Railroad Administration in charge of the mechanical department. He is accompanied by Mrs. McManamy, and they arrived from their home in Washington, D. C., on Tuesday evening. To the broad view Mr. McManamy took of the desirability of holding the convention and exhibit in Atlantic City this year and of having as many mechanical officers as practicable attend, is very largely due to the great success of the convention and exhibit. Mr. McManamy expressed satisfaction yesterday both because of the size of the crowd attending the convention sessions and the magnitude and completeness of the display of railway equipment and machinery.

The first thing that Juan Romañach, locomotive superintendent of the Cuba Cane Sugar Corporation of Havana, inquired about on his arrival at the convention was, "Where's Hale?" Otis R. Hale, overdue, is superintendent of motive power of the United Railways of Havana. When last seen on Monday, Hale was reported as alive in New York. In addition to Romañach, Mr. Hale is sought by several manufacturers who have inquired for him.

Secretary John D. Conway, of the Railway Supply Manufacturers' Association, you must remember, came here long before the rest of us. He looked around Atlantic City in odd moments, and somewhere he glimpsed this placard; "TAKE A SKY TRIP OVER ATLANTIC CITY." Now, Secretary John is not a "flyer" by nature or choice. The stock market never did interest or excite him; in fact, on his travels he prefers the way freight to the "Century" and the "Broadway." But the

Secretary Conway About to Go Up in an Airplane

placard interested him, and he pondered over the vision of a real thrill in his young life. He thought of it day and night, and after he had made all arrangements for our coming and had figured out the last detail of making that splendid exhibit on the Steel Pier, he came to the conclusion that his life's work was practically ended—all but the thrill. He nearly decided definitely to give the pier and the exhibit the "once over" from above, but he might have changed his mind had he not, in an unguarded moment, told a friend of his intention. Well, the friend told the story to a friend, and soon several friends heard of the plan. Then it was all over, except the flight. Thursday, June 12, 1919, at 4 P. M., Secretary John and Lieut. Bob Shank, the hero of many hours in the air, made a beautiful "hop-off" from Aviation Field, Atlantic City, in the lieutenant's plane. Let Secretary John finish the story: "We made a beautiful start. I had no sense of leaving the ground. We ascended rapidly to a height of 3,000 feet and then flew over the city. It was a beautiful sight—an experience I will never forget. I felt perfectly safe from the very start, and enjoyed it more than I can tell you. Every man should go. It's the life."

## The Man Who Saw

### Don't Spit on the Matting

The Man was told that the matting on the floor in some of the booths has chameleon-like characteristics this year, due to the peculiar qualities of the coloring with which it is dyed.

Water spilled on the matting will transform it from the conventional grass green to black. Visitors, in deference to a sense of orderly color, should refrain from expectorating on the floor.

### Co-operation

To The Man Who Saw them it was evident that in some way The Four in the discussion were in some manner "out of luck."

"I counted every box—six of them—none of them contained the drills."

"Well, we're in bad all right. We had better wire home for drills, or else we don't demonstrate."

"Why, there are all kinds of drills here; let's see what we can do."

The Man followed them, interested in the results. A partly emptied box of assorted twist drills invited The Four into the booth of the drill exhibitor. They told their hard luck tale and were given the drills with the admonition, "You can use all you want, but be sure to tell them whose drills you are trying to burn up."

### The Light Cure

The master mechanic from Cuba complimented the electric headlight maker upon the substitution of incandescent lamp bulbs for the troublesome carbons. The headlight maker seemed pleased.

"But," added the Locomotive Man, "they have become so popular with the engineers that they will, on every possible occasion, remove the high-powered bulb from the headlight, place it in the cab, and put the smaller cab lamp in the headlight."

Overcome by curiosity, The Man asked the most natural question in the world:

"But how do you overcome this; can't you cure them of the habit?"

"Well," said the Locomotive Man, "it got so after awhile that we had to resort to extreme measures to prevent the over brilliant illumination of the comfortable cab at the expense of the front end. When we put in a new headlight bulb now, we seal the door with a car seal. If the engineer wants a new one he has to produce the old lamp and the seal."

### A Forecast

The Man was interested in the latest developments in the construction of what someone has termed "the real money earner on the railroad." He wondered, as he sought the booth of the maker of locomotives what shape the tendency of design would assume under the private control of railroads, which is considered imminent. What features of standardization would remain? What innovations would be conspicuous by their absence in future design?

The builder quickly dispelled any idea The Man might entertain as to their intention of perpetuating some of the mistakes which have resulted from the headlong plunge into standardization. He admitted that perhaps some of the lessons learned during the war would be profitable—but he couldn't think of them just then.

"Take limitations," said he. "Hundreds of standardized locomotives are operating on lines to-day deprived of steam dome space because they were ordered built to a minimum clearance established by a road to which, perhaps, was allotted a small number of the standard locomotives, after all. We shall correct that, and meantime we are urging those who are so afflicted, to reconstruct these domes and give their engines dry steam."

The Man saw that the builder meant business. And he suspected that the return of the roads would signal the repeal of regulations which, under the stress of apparent urgent necessity, had imposed unpractical ideas on the carriers.

### A Pow-wow on the Pier

The early bird in quest of the worm had nothing on The Man. He was abroad early, and a slowly rising fog revealed the outlines of the Pier, toward whose entrance he made his way with deliberation. Just as he had passed the first three or four exhibits he glanced up. Smoke apparently arose from a booth some distance down the aisle. Where there is smoke there must be fire, he thought, and the enjoyable ease of his stroll suddenly developed into a trot. As he ran his mind quickly framed him as a possible hero—perhaps he would shine in to-morrow's Daily as The Man Who Saw and quenched a threatening blaze on the pier! Visions of congratulations increased his speed.

Anticipation is truly the joy of life; by contrast, realization pales into cold and morbid insignificance. As The Man, somewhat shy of breath, arrived at the scene of his suspected blaze he gazed upon a comfortable smokefest of no mean proportions! There were those who sat, and those who stood. Most of them inhaled cigarettes, some puffed black cigars, and two or three contributed their bits with well seasoned pipes. But all smoked furiously as the argument waxed hot and the smoke cloud grew denser.

"Why, this is the best mechanical convention ever held," escaped through the cloud to the ears of The Man who leaned against a post and fumbled for a cigarette.

"Believe me," volunteered a member, lighting another stogey, "the Railroad Administration knew what it was doing when it encouraged this show."

"You're right," said Joe, "I have attended these conventions since Hector was a pup and nothing like this was ever pulled off before—possibly, never again. Why, I remember—"

Here he was intercepted by one of the listeners with a request for "a little tobacco." One who perceived the psychological chance assumed the floor. Respectful deference was accorded the "old timer," a superintendent of motive power, who delivered a lesson born of up-hill toil against odds and the observance of a lifetime of "conventions."

"Boys, listen to the voice of Nestor," he said. "Ten years ago I made the statement just made by Joe. I never thought that another convention would eclipse the one we saw that year—and look what has happened! Put away the pipes and let's get to work. Let's go out among these exhibits and study them. If you can't remember it all, write it down. Think of some of these things as possible solutions of your problems."

As the smoke subsided, The Man Saw. And he felt, as he quietly withdrew, that there *was* some fire behind that smoke after all; a fire of determination to make it pay; a fire of enthusiastic appreciation of the railway mechanical brains of a continent, and the far-sightedness of a nation of contributors to their welfare, stretched along the pier.

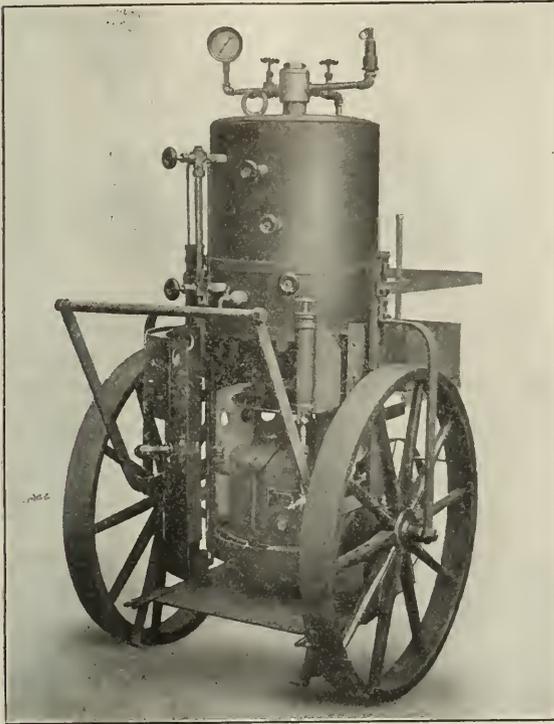

# New Devices Among the Exhibits

## A Portable Steam Sterilizer

**T**HE WEST DISINFECTING COMPANY, New York, is exhibiting an improved portable steam sterilizer which is intended for use in railroad yards for sterilizing water coolers used in passenger cars and stations. The sterilizer consists of a steam boiler, a fuel tank and burners and an air pump, all substantially secured in an

of each burner and is supported on an asbestos partition between the burners and the fuel tank.

The boiler, fuel tank and burners are encased in a Russia iron jacket lined with asbestos, which makes the danger of communicating the flames to surrounding objects extremely remote. This apparatus is equipped with adjustable safety valves, safety water gage, steam gage and other safety devices. The capacity is about 10 gallons and the working pressure from 15 to 50 lb. per square inch according to requirements. The device may readily be moved to any desired location without damage to the apparatus or danger to surrounding objects.

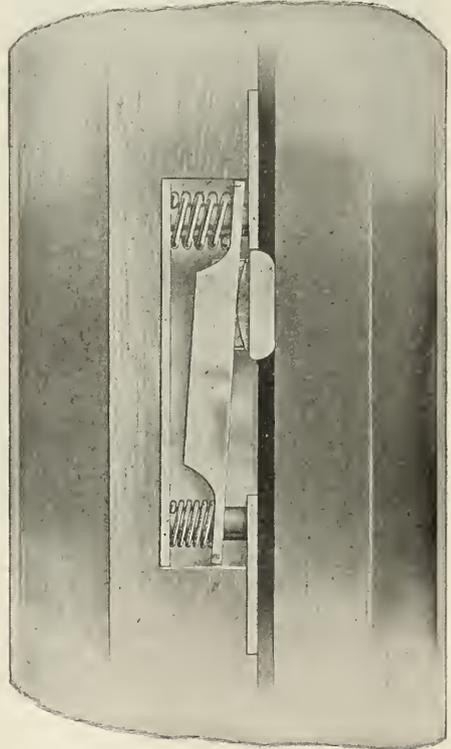

The Sterilizer Mounted Ready for Use

iron frame work mounted on heavy wooden wheels and using kerosene vaporized under air pressure as fuel.

The boiler shell is constructed of open hearth sheet steel having a tensile strength of 55,000 to 65,000 lb. per sq. in. It is 14 in. in diameter and 22 in. in height with convex top and concave bottom. The seams are lap joint, and after being securely riveted, and the various pipe connections inserted, the entire boiler shell is galvanized and thoroughly tested under a pressure of 200 lb. per sq. in. The fuel tank is of sheet steel, 12 in. in diameter and 9 in. high, with seams brazed or riveted. Both the boiler and fuel tank are provided with fusible plugs having a melting point of 300 deg. F. Three Giant burners, constructed of bronze, are provided and are especially adapted for use with kerosene. A brass screen in the central supply pipe of these burners reduces carbonization to a minimum and a clean-out hole is also provided. The burner tip can be removed for cleaning. A priming pan or cup fits around the supply pipe

## A Car Window That Will Not Drop

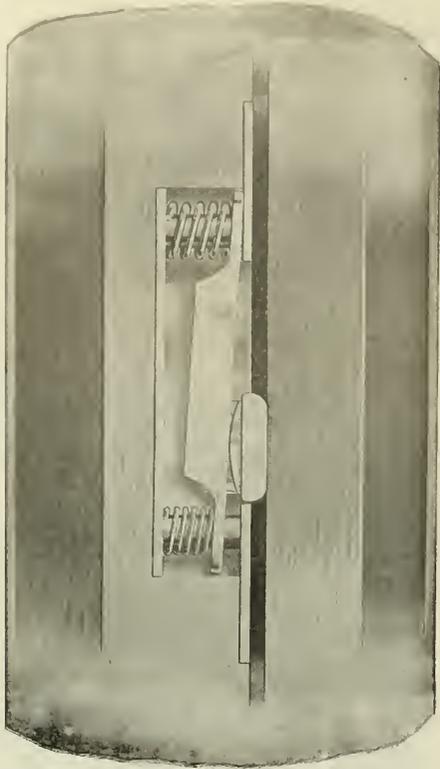

**A**BATEMENT OF THE NUISANCE of the car window which may suddenly and without warning drop on the hand or the arm of an unsuspecting passenger, is obtained by the device illustrated herewith, which will effectively retard the downward movement of the sash,

Shoe Automatically Slides to the Top in Lowering the Sash

thereby preventing damage to the sash frame, glass and sash lock. As indicated in the illustrations the springs are of different strengths. One photograph shows the device applied to a sash which is raised, and it will be noted that the heavy spring is at the top. In raising the sash the shoe compresses the weaker spring, allowing

the sash to be raised with comparative ease, at the same time preventing all rattle. In lowering the sash, the shoe automatically slides to the top and compresses the heavy spring, as is shown in the second illustration. This increased pressure gives sufficient friction to prevent the

Application of Compression Brake Device to Sash

sash from falling and at the same time holds the sash firmly against the outer stops when the window is closed.

If preferred, this device can be placed on the edge of the stop casing adjacent to the sash, in which case application is made with the heavy spring at the bottom. This attachment is known as the compression brake device No. A-151 and A-152, and is manufactured by the O. M. Edwards Company, Syracuse, N. Y.

## New Cleaning Materials for Railways

**T**HE WYANDOTTE METAL CLEANER is especially adapted to cleaning driving boxes and rods, brake rigging and other locomotive parts and is said to render metal surfaces chemically clean without pitting the metals or causing rust. It is further claimed that this is accomplished without creating any objectionable fumes and that by its use the amount of time devoted to cleaning is reduced to a noticeable degree. This material is manufactured by the J. B. Ford Company, Wyandotte, Mich., who have samples of it on exhibition.

For cleaning the interior of box and refrigerator cars and coaches, a material having sweetening and deodorizing as well as cleaning properties, has also been brought out by this company; the success of this material is said

to be due to the absence of soap greases, caustic and sal soda. The name of the compound is Wyandotte Sanitary Cleaner and Cleanser.

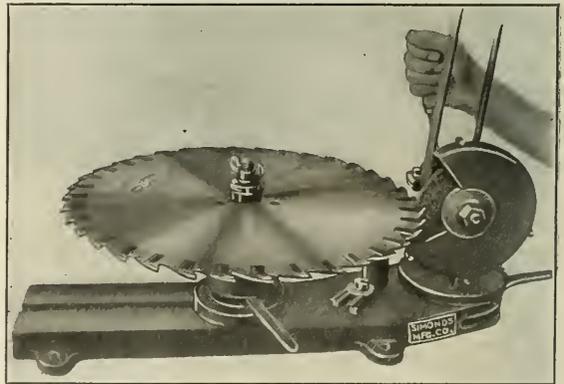

The cleaning of tile, marble, rubber and cork mats and all similar furnishings that are mopped or scrubbed, as well as floors, walls and woodwork in offices, shops, coaches and elsewhere is accomplished by a compound known as Wyandotte Detergent, another product of the above company.

## Styles in Car Lighting Fixtures

**S**EVERAL NEW TYPES of car lighting fixtures have been put on the market by the Safety Car Heating and Lighting Company, New York. The totally indirect type has succumbed and signs seem to point to the gradual elimination or refinement of the semi-indirect type, possibly due to the cost of maintaining light colored headlinings in perfect condition for light reflection. The brilliancy of the modern gas filled electric lamp has revived the bowl type of deck fixture and has also brought into vogue the enclosing bowl type. The illumination with both of the fixtures shown in the illustrations produces a soft, restful effect, and when fitted with gas filled lamps they provide ample light for all purposes.

## Inserted Tooth Metal Saw Grinder

**A** LIGHT, INEXPENSIVE MACHINE for quickly and accurately grinding the inserted teeth of metal saws is shown in the photograph. It is a self-contained, portable affair and may be screwed down on a bench and driven from the line shaft. The movement of the saw in the path of the grinding wheel is governed by the lever which is seen protruding from the base. Stops are provided for governing the "bite" of the wheel, and ad-

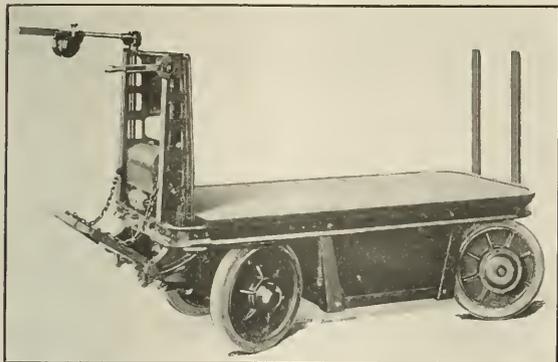

Grinder for Sharpening Inserted Teeth on Metal Saws

justment is furnished to neutralize the wear of the 5½-in. by ½-in. by ½-in. hole, 46-J vitrified Norton grinding wheel, which has a 45-deg. bevel. The teeth may be ground on the top by using a cup wheel and turning the wheel head at right angles to the position maintained in grinding the face of the teeth.

This handy little saw sharpener is at work in the booth of the Simonds Manufacturing Company, Fitchburg, Mass.

## Electric Trucks and Tractors

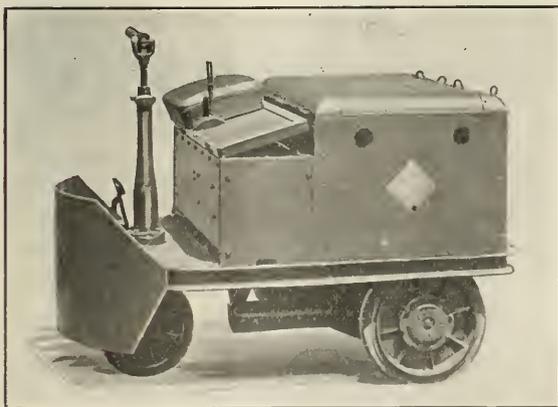

FOUR TYPES OF ELECTRIC TRUCKS and tractors have been developed and improved by the Elwell-Parker Electric Company, Cleveland, Ohio, particularly to meet the needs of the railroad field. The type EH truck is equipped with large wheels, high lift elevating platform and interlocked control mechanism. The drive wheels are 21½ in. in diameter with ¾-in. treads, and the trailing wheels are 15 in. in diameter with ¾-in. treads. The vertical motor is direct-connected to a single reduction worm and runs in a dust tight oil case. The brake is located between the motor and differential and

Truck Designed for Operation Over Rough Pavements and Soft Yards

is operated by one of the two foot pedals. The driving axle is of the full floating type.

The lifting mechanism is operated by a separate motor especially designed for a service differing from that of the heavier propelling motor. The motor is high off the floor away from the dirt and possibility of damage. This lifting motor may be started or stopped at the will of the operator at any point in the upward or downward travel of the platform, or it may be started and left to automatically stop when the load has reached its highest or lowest position. The upward travel of the

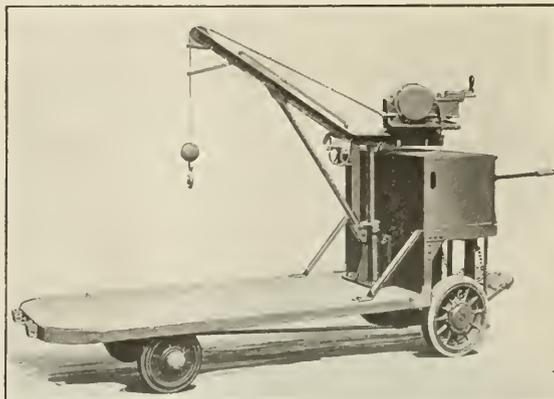

Three-Wheeled, Light Weight Tractor

platform may be set any lift up to 4½ in., assuring clearance for the separate tray on which the load is carried.

A special device protects the elevating mechanism in case the platform should catch under some immovable

object. The platform is three-point supported. It rests on vertical links when up and is steadied by guides on each side. A heavy, hot-riveted steel frame provides support for the equipment and protects it against abuse.

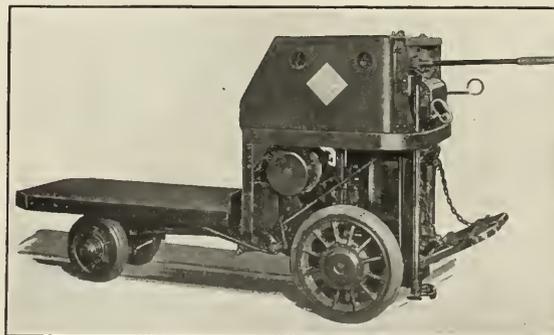

The type CC truck with a revolving crane has been designed for service where heavy castings are stored

Truck Equipped with Revolving Crane

beyond the reach of a traveling crane. The crane is electrically operated, has a capacity of 1,000 lbs. and a reach of 4 ft. It is used to load heavy pieces on the truck and transfer them to machine or forge shops for finishing. The truck has a carrying capacity of 3,500 lbs. and operates at a speed of 400 ft. per min.

The type IK truck with wheels 20 in. in diameter and battery located beneath the platform, so that all of the platform may be used for loading space, is especially designed for operation over poorly planked platforms,

Elevating Platform Truck

rough pavements or soft yards. The motor in this truck is large enough so that it cannot be injured by the battery, even though the motor is at a standstill, with the current full on. This makes fuses unnecessary and assures the climbing of inclines from yards to loading platforms. The capacity of the truck is 4,000 lb., and it operates at a speed of from 400 to 550 ft. per min.

The type TA tractor is a light weight, high torque, short turning tractor for operation where machines or construction restricts operating room. This tractor has three wheels and carries a battery of 50 per cent greater capacity than a standard truck. It cannot be operated unless the driver is on the seat, which automatically closes the circuit breaker connecting the controller to the bat-

tery. There is no fuse in the motor circuit as the motor will absorb all the current the battery can deliver.

The motor is direct connected through a single reduction worm on a full floating drive axle. The wheels are 20 in. in diameter with  $3\frac{1}{2}$ -in. treads, and may be fitted with chains for outside work. The operator sits on a cushioned seat and is protected by a stout dash in front. The tractor has a normal drawbar pull of 6 tons, and turns practically in its own length.

## Refrigerator Car Insulation

ONE OF THE MOST VITAL FEATURES in the construction of refrigerator cars is the use of an efficient insulating material. The H. W. Johns-Manville Company, New York, is showing the Keystone hair felt insulation, which was used in the construction of the

Keystone Hair Felt Insulation

refrigerator cars built in this country and sent to France for the purpose of transporting fresh meats to the American Expeditionary Forces. This hair felt insulation consists of a cushion of specially treated hair placed between two sheets of insulating paper and securely bound together at the edges and at several intermediate points, making an insulation one-half inch thick. The results in refrigerator efficiency obtained by the use of this hair felt insulation are said to be most satisfactory.

## Reinforced Flanges for Freight Car Wheels

IT IS CLAIMED that there are over 650,000 33-in. wheels of various weights with flanges thicker than the Master Car Builders' and Master Mechanics' standards in service in the United States today in both freight car and engine tender service.

The Southern Wheel Company, St. Louis, Mo., has on exhibit three pairs of wheels on axles, the wheels having flanges  $\frac{3}{16}$ -in. thicker at the base line than the present Master Car Builders' and Master Mechanics' standard flange. Wheels with the flange as described above have been recommended by the Association of manufacturers of Chilled Car Wheels. One pair of the above-mentioned wheels—the 800-lb. special wheel—has just been removed from service under a 50-ton steel, hopper bottom coal car on the Atlantic Coast Line Railroad and the wheels show practically no wear on either the front or back of the flange.

The three pairs of wheels mentioned above are shown on a standard section of track with a No. 4 frog and guard rail, with standard  $1\frac{3}{4}$ -in. guard rail clearance.

## Improvement in Journal Packing

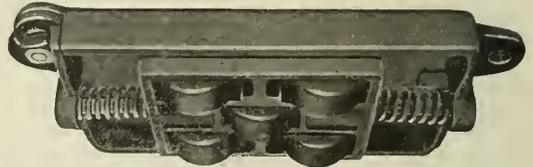

BECAUSE OF THE SCARCITY and high price of wool it has been necessary to find substitute materials for use in journal packing. The resiliency in journal packing was in the past derived almost entirely from the wool in the packing mixture, but with the great reduction in the proportion of wool waste, various fibrous and metallic substitutes have been used. The Rogers Journal Packing Company, Chicago, has improved and developed the old Rogers journal packing, under the trade names of Stecos and Fracar.

The Stecos packing for high speed service consists of 25 per cent. of wool waste with a mixture of cotton, pieces of sponge and steel shavings. The capillary action is provided chiefly by the cotton; the resiliency imparted by the wool, sponge and steel shavings makes a packing mixture that will resist the tendency to glaze over and remains in a resilient condition for a long period. The pieces of sponge, being highly absorbent, act as reservoirs of oil throughout the whole mass as it rests in the journal box.

A cheaper form of packing is the Fracar, which is composed of colored cotton waste, sponge and steel shavings, and is intended for use in freight service.

## Drexel Multiple Roller Side Bearing

IN THE ILLUSTRATION BELOW is shown a roller side bearing adapted for use under extremely heavy equipment. It is of the multiple interposed roller type, which provides large contact surfaces. Being of the inverted design, it does not become inoperative through accumulations of dirt, cinders, snow or ice. It is so

Inverted Multiple Roller Side Bearing

constructed that all parts are open to close inspection. This side bearing is made by the Chicago Railway Equipment Company, Chicago.

## Sand on Axle-Generator Belts

THE SAFETY CAR HEATING AND LIGHTING COMPANY, New York, has developed a device to prevent slipping of axle generator belts for trains operating in severe winter weather. This device operates by automatically depositing sand on the belt. A small motor is mounted on the frame of a small metal case located at some convenient place on the car. Geared to the armature shaft of the motor is a valve operating mechanism, whereby a valve is opened at predetermined intervals, releasing air under pressure from the air brake system. The velocity of this air passing through an injector carries a spray of sand onto the generator belt, counteracting any effects of ice on the pulleys. The sand is stored in the locker or some other suitable place and feeds through a pipe to the injector. The motor operating this device is connected directly to the lighting generator so that the sander is only in operation while the train is in motion. When the service of the sander is not required it is disconnected from the axle generator by a switch.

Director General Hines has issued a statement appealing to railway employees to give him their energetic co-operation in

### Mr. Hines' Appeal to Labor

trying to operate the railways more economically. It will be interesting to see whether Mr. Hines' appeal has any perceptible effect. Railway labor has received advances in its wages and concessions affecting its conditions of work since government control was adopted which are costing approximately a billion dollars a year. The government is incurring a deficit in operating the railways which is running at the rate of about three-quarters of a billion a year. If cordial and energetic co-operation could be brought about between railway managers and employees in devising and carrying out efficiency methods, probably a large part if not practically all of this deficit could be wiped out without any increase in the hours of work or a reduction of the wages of a single railway employee. The result would necessarily be a large reduction in the number of employees, because wages are so large a part of total railway expenses that without increases in efficiency having the direct effect of reducing the number of men employed, no large economies can be effected. It has seldom been possible on any individual railway and never possible on the railways as a whole to secure the good understanding and co-operation between the managements and the men necessary to obtain the greatest efficiency and economy. Thus far it has proved even more impracticable to secure this co-operation under government operation. Frankness requires us to express some skepticism as to whether Mr. Hines' appeal will do any good. The duty of railway employees, in view of the vast increases in wages they have received, is plain, but, unfortunately, the supposed rights of railway employees occupy a larger place in their thoughts than their duty. In this respect, of course, they are merely human; most people think and talk a great deal more about their rights than about their duties. As long, however, as both employees and employers in the various lines of industry constantly subordinate consideration of their duties to consideration of their rights, the difficulties in the way of securing the increases in industrial efficiency which are needed to further the best interests of all, will not be removed.

A syndicate of American bankers, headed by the National City Company of New York, have arranged to sell in this country \$25,000,000 of Swedish Government twenty-year six per cent bonds. The offering price of these bonds is 99½, which is approximately the same price at which the Norwegian Government six per cent bonds, sold in this country some time ago, are now dealt in on the open market. The Swedish loan is particularly interesting for a number of reasons. In the first place, prior to the war, Sweden bought railroad supplies both from Germany and from Great Britain, and was, moreover, a fairly large manufacturer of machinery and tools herself. The proceeds of the present loan are, presumably, to be used in the purchase of machinery and tools, textiles, and possibly some other goods in this country. It is understood that the machinery and tools include some railroad supplies. Another interesting point about the loan is

the indication which it gives of the change that has taken place since the signing of the armistice and the lifting of the restrictions on foreign exchange. At one time in 1917, a Swedish krona was worth a little over forty-seven cents in New York. The parity of American and Swedish money makes the krona worth a little over twenty-six cents. At present, the krona is selling in New York at about twenty-six cents, and before the offering of the loan, was selling at about twenty-five cents. In the four months ended April 30, 1919, exports from the United States to Sweden amounted to over \$38,000,000, while our imports from Sweden were between \$2,000,000 and \$3,000,000. The large premium at which kronars were selling in this country in 1917 and 1918, was due, not to an excess of Swedish imports into the United States over United States exports to Sweden, but to the fact that England and other of our allies were importing heavily from Sweden and settlement for these transactions was being made through New York at a time when the exchange rate of the pound sterling in New York was "pegged," that is, fixed arbitrarily. The large premium on the krona in New York was the reflection of the relations between our allies and the Scandinavian countries, and even during the war, Sweden was an importer from the United States rather than an exporter to this country. The ability and willingness of this country to place credit at the disposal of Sweden marks a definite stage in the progress of gaining a market for American goods in that country.

Mr. Borland's report on the Fort Washington collision of January 13, noticed on another page, brings out the fact

### The Fort Washington Collision

that there were failures at five points; nothing new or surprising, perhaps, yet a fact to be noted, lest we concentrate too fully on the main point, the mistake or neglect of the engineman. The second point is the failure of the monitorship of the fireman. This weakness is so nearly universal that there is, perhaps, no occasion for discussing it; though in this case the fact that the engineman and the fireman were in separate cabs adds significance to the point. The third point is the engineman's defective record. It is not for a distant critic to say that a better man should have been on this engine; circumstances may have afforded various reasons for having this man there; but the fact remains that when a superintendent sets out to have his best trains manned by the best men he has undertaken to sustain his road's reputation at a vital point, and is bound to give reasons for any condition lower than perfection. The fourth failure was in the weakness of the brake power. This cannot be called a major feature, for all space-interval and flagging rules provide for a margin of safety; but this was one point in the aggregate of reasons why the railroad, in this case, did not reach 100 per cent safety and save the fourteen lives. The fifth point was the negligence of the flagman. It is no different from a hundred other cases, except that the evidence in this case is peculiarly strong, clear and understandable. On this point Commissioner McChord has given us a two-page excursus (which we print following the notice of the official report) which operating officers may do well to paste in their scrap-books. He does not present any facts that they did not

know before, but his Bureau of Safety has given him a telling array of citations, which give "body" to his dissertation and which will be useful to refresh one's memory when going to the confessional or in any quiet night season. If any reader is so busy as to be deterred by the length of this essay on flagging he will do well to turn to the fourth paragraph from the end, about "the human tendency toward minimum effort"—toward what some people call laziness.

Nine investment bankers out of ten will tell you that when it comes to investments, the American people have no imagination. In Indiana one of the standard investments is gravel road bonds. Why? Not because it is a particularly sound investment, but because the investor can go out and see his security, or at least a gravel road similar to the one which his investment will help to pay for. If the American public is really devoid of imagination in regard to investments, the task of establishing a great American export business is nearly hopeless. The United States Investor, in a recent issue, tells of a contract which France is to place in this country for 100,000 cattle which we secured in competition with the Argentine, simply because this country was able to finance the purchase; in other words, extend credit to France, whereas the Argentine was not able to do so. American bankers, except a very few, know nothing about foreign investments. The few, however, who are working on this problem of financing American exports have at their command the resources of some of the largest financial institutions in the United States. It ought to be possible for these bankers to arouse the imagination of the general public. Recently there have been two very interesting advertising campaigns carried on in the East, based on the expectation of arousing the romantic imagination of comparatively wealthy people. One was a series of advertisements illustrating the various phases of pearl fishing. The other was a campaign carried on by a firm selling furs, the advertisements illustrating the life of the fur trapper in the far north. Englishmen with their supposedly less imaginative perception will buy shares in a diamond mine in South Africa, a rubber plantation in Brazil, and an oil well in Mexico. Would it not be worth while for the banking interests which are forming great combinations to aid American exporters to make an attempt through a campaign of advertising, to help the American people visualize the romance of foreign investment?

One more evidence that, in many of our everyday affairs, war conditions have passed, is found in the renewal of complaints of the whistle nuisance.

#### Abuse of the Locomotive Whistle

The problem of making all enginemen reasonably careful in the prevention of noise—whether by whistles, or bells, or pop valves or by just plain banging of cars—is one small burden from which the careful superintendent is never free; but for the past year or two people who rightfully might complain have held their peace. The following press despatch from Macon, Georgia, serves as a reminder that the problem is still a live one:

MACON, Ga.—Being an alderman in the city of Macon at the present time, lacks a whole lot of being the sincere it is imagined. People living in the vicinity of the various railroad lines have combined to stop the blowing of whistles during the night. The matter comes before the city council regularly each week, but so far, the kickers have failed to get results. Petitions failing to have their effect, new tactics have been adopted and now each night the aldermen are roused from their slumbers in the dead of night by telephone, some stranger calmly informing the alderman that "the whistles are blowing."

The despatch may be somewhat colored, but its elements

are true to life. This note is not being written with the idea of reforming all of the enginemen, or even of telling them their duty; but to cite a praiseworthy rule on the noise nuisance, that of the Pennsylvania Railroad, which is printed in another column. To make the practice as praiseworthy as the rule, however, it is necessary to pay constant attention to those clauses which we have printed in italics. All of the principal roads have a rule on this subject; how many trainmasters find themselves able successfully to enforce those italicized features? Rule 468 seems to refer to noises which are considered objectionable, not by the railroad, but by the citizens, those of reasonable minds and those of the other kind. Mr. Statler, the hotel-keeper, professes to be able always to admit that complainers are right; can it be done in this matter? How long does it take to teach the average engineman to use the whistle "judiciously"? What percentage of the whistle signals on your road are no louder and not a second longer than is actually necessary?

### Interstate Commerce Commission and Adequate Railway Revenues

ASSUMING THAT THE RAILWAYS are to be returned to private operation, the heart of the railroad problem is the question of how the companies are to be assured net operating income adequate, first, to enable them to pay returns on their outstanding obligations and refund them as they become due, and second, to raise sufficient new capital to improve and enlarge their facilities enough to handle the commerce of the country.

The new legislation may work fairly successfully, though defective in other respects, if it deals clearly, wisely and effectively with this question. However perfect it may be in other respects, if it does not deal clearly, wisely and effectively with this question, it will be a failure, because under it private operation will be a failure.

Before government operation was adopted regulation had proved a failure because it had denied to the railways the opportunity to earn adequate returns. This is denied in some quarters. It is denied in a recent public statement by Commissioner McChord of the Interstate Commerce Commission. He points out that net operating income in the three years 1915-1917, which immediately preceded the adoption of government control, was the largest in amount ever earned in three consecutive years. This proves nothing as to the wisdom and success of the old policy of regulation.

The most pertinent and convincing evidence regarding the success or failure of the old policy of regulation, is afforded by the facts as to the tendency of railway development under it. Before the state legislatures and commissions and the Interstate Commerce Commission began to make reductions and prevent advances in rates regardless of advancing operating costs, the mileage of new railways built in the country annually was about 5,000 miles. Since 1907 new construction has never equalled 5,000 miles in any year, and in the last three years before the United States entered the war, it was only 3,563 miles, an average of less than 1,200 miles a year. There were corresponding declines in the other facilities provided.

This downward tendency of the provision of new facilities was of course reflected in the statistics regarding new investment. The investment made in road and equipment in 1910 was \$778,000,000 and in 1911 \$808,000,000. In 1911 the Interstate Commerce Commission rendered its decision in the first rate advance case, refusing to grant the carriers the advances for which they asked. In the next year—1912—the investment made was \$680,000,000; in 1913, \$478,000,000; in 1914, \$584,000,000; in 1915, \$311,000,000 and in 1916, \$268,000,000. In every year from 1911 to 1916, ex-

cept 1914, there was a decline in investment; and in 1916 the investment made was less than one-third what it was five years before.

Why was there this decline in investment? The average percentage of net operating income on cost of road and equipment earned in each year from 1910 to 1915, inclusive, as reported by the Commission, was as follows: 1910, 5.73 per cent; 1911, 4.87 per cent; 1912, 4.62 per cent; 1913, 5.12 per cent; 1914, 4.19 per cent; 1915, 4.09 per cent. The average return in the five years ending with 1905, according to the Commission, was 4.97 per cent; in the five years ending with 1910, 5.41 per cent; and in the five years ending with 1915, 4.56 per cent. The percentage of return earned in 1915 was the smallest in any year since 1899. The tendency of net operating income under government regulation down to and including the fiscal year ended on June 30, 1915, explains the decline of investment.

But, it is said, in the three years 1915-17 the railways earned the largest operating income they ever earned in any three years. What was that due to? In the fall of 1915 the railways began to feel the effects of the tremendous increase of industrial activity in this country which had been caused by the war in Europe, and in the year ended on June 30, 1916, there was an increase of 24 per cent in freight traffic, and of 21 per cent in freight earnings. No such increases in volume of traffic and in earnings ever occurred before, or probably ever will again. The traffic and earnings in the calendar year 1916 were larger still. In the calendar year 1917, they showed a still further increase, although because of large increases in expenses there was a decline in net operating income.

The foregoing facts show that under ordinary business conditions in the United States in the five years up to and including the fiscal year 1915 the policy of regulation followed resulted in a steady decline of the percentage of income earned by the railways. This crippled the companies in raising new capital. Then suddenly, owing to abnormal conditions created by the war, there was a tremendous increase in traffic and earnings, and in consequence a large increase in net operating income. The policy of regulation had nothing to do with this increase in traffic, or the large increase in operating income which it caused. If normal conditions had continued the percentage earned probably would have continued to decline.

Railways officers and investors know this. Therefore railway men and investors judge of the effects which the old policy of regulation would produce in future, not by the abnormal results caused by abnormal conditions in 1916 and 1917, but by the normal results produced by normal conditions and regulation in the years preceding 1916. They know that just before this abnormal increase in traffic came, more miles of railways were in the hands of receivers than ever before. They know this affords a better measure than the earnings of 1916 and 1917 of the fairness and wisdom of the old policy of regulation.

But this is not the whole story. The enormous increase of business came so quickly that for a time it was impossible for the increase in railway expenses to keep up with it. But in 1917 the expenses again began to grow faster than the earnings. This was especially true as to the railways in eastern territory. They asked for an advance of 15 per cent in freight rates early in 1917, but were given only half of it. Finally in December, 1917, when it had become clear that a large advance in rates would be necessary if increased expenses were to be offset, the Interstate Commerce Commission side-stepped the acute problem presented by sending a special report to Congress in which it said, in effect, that it could not grant the advance in rates which were needed to keep the railway companies solvent. Within a month government control was adopted. A few weeks afterward the Commission granted another advance of about 7½ per cent in the

freight rates of the eastern railways; and before we had had six months of government control freight rates throughout the country were still further advanced 25 per cent, and passenger rates 50 per cent.

To one who knows this record it is futile to say that the railway companies need have no fear of future regulation by the Interstate Commerce Commission. They have the best of grounds for fearing any legislation which would leave almost entirely in the hands of the state commissions and the Interstate Commission the determination of what measure shall be applied in deciding what the railways shall be allowed to earn.

There are available certain other methods which may be adopted. Congress may fix by law the percentage of return the railways shall be allowed to earn, and on what basis. It may specifically instruct the Commission to so fix rates as to make net operating income sufficient to enable the railways adequately to develop their facilities. It may delegate the determination of what return they shall be allowed to earn to some other governmental body. The Esch-Pomerene bill is fatally defective because it leaves the determination of this question to the Commission without in any way indicating that rates, as a matter of public policy, must be made adequate.

## Are the Roads Being Over-Maintained?

THE RAILROAD ADMINISTRATION appears to have suddenly become obsessed with the fear that it is over-maintaining the railways and that heroic measures must be adopted to prevent this. An order was issued by the Director General on May 27, instructing Federal managers to so hold down maintenance of way expenditures that the ratio of these expenditures to the operating revenues for June would not exceed the average yearly ratio during the three-year test period. This drastic order must have presupposed that the ratio of maintenance expenditures to operating revenues during the test period is a fair measure of what present expenditures should be. Any such assumption would be grossly erroneous. That the Railroad Administration has since realized this is indicated by the fact that the order has since been annulled, at least for June.

The obligation of the government to the railway companies with respect to the maintenance of their properties is set forth in the standard contract, by the terms of which the director general is required so to maintain each property that it will be "returned to the companies at the end of Federal control in substantially as good repair as it was on January 1, 1917," provided that an annual expenditure for such purpose equal to that of the test period, equated for changes in costs of labor and materials, shall be considered as full compliance with this obligation. The fear of the Railroad Administration that the government will exceed its obligation in this respect is in direct contrast with the anxiety on the part of most railway men that the government will leave them with a large accumulation of deferred maintenance at the termination of the period of federal control, settlement for which will be made only after extended controversy, if at all.

According to the figures on which this order was based, maintenance of way expenditures consumed 15.3 per cent of the operating revenues for the first three months of 1919, as compared with 11.1 per cent for the same months of the test period, and 12 per cent for the entire test period. Rather than indicating excessive maintenance, these figures reflect the radical changes in conditions during the last four years which make these ratios valueless for comparative purposes. All costs of operation have risen greatly during this interval, those for the first three months of 1919 being 85 per cent greater than for the same period of 1916, while earnings

increased only 38 per cent. It is this failure of earnings to keep pace with expenditures that has brought the operating ratio up to 91.5 per cent, as compared with 72.4 per cent three years ago, and has reduced the operating income from \$214,000,000 in the first quarter of 1916 to \$45,977,752 in 1919. No further data should be necessary to demonstrate the undesirability of attempting to apply pre-war relations between earnings and any part of expenses to present conditions. With the ratio of all operating expenses to earnings increased from about 70 per cent in the test period to over 90 per cent at present, to suggest that one large item of expense shall be made to bear the same ratio to earnings that it did in the test period borders on the absurd.

The director general stated in his order that the ratio for the calendar year 1918 was 13.3 per cent, as compared with 12 per cent for the test period, thus intimating that the roads were over-maintained during 1918. That this is purely a paper comparison which is not supported by the physical facts is best indicated by a comparison of the tie and rail renewals of last year, with those of the test period, these being the only two materials the 1918 replacements of which have been tabulated and made public. The rail renewals failed by 250,000 tons, or approximately 20 per cent, to reach the test period average of 1,350,000 tons, while tie renewals failed by 17,000,000, or 18 per cent, to meet the test period standard. Other important units of maintenance renewals are equally in arrears. It is therefore difficult to see how the Railroad Administration can justify its apparent position that the roads are being over-maintained.

The order was also ill-advised because it applied alike to the road which started its work early and had a large part of its season's program completed and to the road which was only starting. It was issued at a time when the best progress could be made and before the call of the harvest field depleted the forces. Its drastic nature is indicated by the fact that it would have required the laying off of as many as three to four thousand men on each of several Middle-Western roads.

It is unfortunate that the order was issued, and it is to be hoped it will not be renewed since maintenance of way expenditures should be determined by physical needs and facts and not by statistical ratios which are meaningless unless considered with reference to physical facts.

## New Books

*Efficient Railway Operation.* By Henry S. Haines. 709 pages. The Macmillan Company, New York.

It is peculiarly difficult to get a true perspective in discussing the efficiency of American railroad methods. Louis D. Brandeis, when he was counsel for the Interstate Commerce Commission, raised a widespread but rather superficial discussion of the railroad question by asserting that a million dollars a day was being lost through inefficiency in railroad operation. A traveler who meets with a discourteous ticket seller or a grumpy conductor makes a mental comparison between the railroad business and the hotel business, forgetting that it is ten times easier to change a hotel clerk or to correct his errors, than in the case of a conductor. A shipper whose freight goes astray, possibly because of poor marking, compares the efficiency of the railroads to that of the large drygoods company and gives the railroad a very low rating. But these are unweighed averages, all of them. A careful and scientific investigation into the efficiency of American railroads has seldom been made even on a limited scale.

Government operation of railroads has afforded a helpful contrast by which the general public has been able to judge of the efficiency of railroad operation in America, at least

in many of its aspects, under private operation. Colonel Haines, however, studies the question from the point of view of the scientific student. He examines the factors which go to make up the business of transportation by railroad; he examines these in the light of history, in the light of comparisons with other countries and with other businesses and from the ideal standpoint—that is, in the light of what could be hoped for in the solution of the problems that they present. The work is undertaken in a strictly critical spirit; but at the same time it is the spirit of a friend, not an outsider, for the author has a full knowledge of the problems involved.

Colonel Haines is a veteran of the veterans, having served in both the mechanical and the engineering departments away back before the civil war. He was superintendent of the Charleston & Savannah through that war, and was the chief operating officer of the Plant System for 15 years ending with 1895. He had a wide acquaintance, and was president of the American Railway Association for nine years, 1887-96. This practical experience is reflected throughout the book in a wealth of detail, sometimes contained in the text itself; sometimes in the invaluable appendices. From this point of view the book may be regarded as both a text book and a reference work of incalculable value to railroad men. It would be hard to say whether the ambitious train master or the general manager would gain most from its possession and study. To the younger men it answers, for the period which it covers, as a very useful historical sketch.

The scope of the book is very broad. After a brief but fascinating history of transportation from the dawn of history, the author describes in some detail the modern developments of motive power, of rolling stock, of substructure and superstructure of roadway, traffic, transportation and what he calls operation. By traffic, Colonel Haines means service, which includes safety, speed, car supply, etc. "Transportation" is self-explanatory, but by operation he means real control of operation, including both transportation and what he calls traffic.

The chapters on operation are possibly the most interesting in the book. They will be appreciated by the general reader as well as by railroad men. After all, it would be useless to show that American engineering skill and American ingenuity had devised the best tools for transportation of which we have any knowledge, if it could not be shown also that American genius for organization had so utilized these tools as to get from them a large measure of their potential efficiency. In this chapter on operation, Colonel Haines critically examines American railroad organization and the methods used for control of the organization, and sums up his conclusions in this regard as follows:

"The exercise of executive control of a high order requires a combination of knowledge and experience with natural ability, a sense of justice and honesty of purpose. These qualifications have been eminently conspicuous in the men who have brought our railroad system into the state of efficiency by which our national resources have been marvelously developed and our prosperity augmented; and, furthermore, by which railway operation elsewhere has largely profited. It is not to be expected of our railroad managements that they have attained the highest possible stage of efficiency, nor is this claimed for them, for the field for investigation in railway operation is continually broadening, as in other fields for research. General practice will always lag behind the pioneers in every art. In this respect, it will be difficult to prove that our railway managements compare unfavorably with those in other countries or with the directors in other fields of production or distribution at home or abroad."

So broad is the scope of the book that it is out of the

question to discuss any but a very few of the points which the author covers. There are many points on which practical railroad men, as well as other competent critics in the railroad field might disagree with the author. For instance, while most railroad men would agree that questions of policy should be left to the board of directors, how far this should apply in regard to "terms and conditions of employment" is a question about which there is no settled agreement. Colonel Haines would relieve operating officers entirely of such matters; but our Central Railroad Administration at Washington, which undertook to relieve the federal managers entirely of just this responsibility has not yet demonstrated its success. Whether many American boards of directors are able, ready and willing to do any better may be seriously questioned.

It is a rare thing to find a practical man who can write really well about the art, profession or business in which he has proved himself an expert. This rare combination, however, is found in the author of "Efficient Railway Operation." The writing is both polished and scholarly. It shows no signs of old age. It has a leisurely tone that is quite unusual in present-day writing on technical and professional subjects. The book, however, is not technical, except, of course, in the statistical tables in the appendices. Any well-educated layman can understand and appreciate the discussion not only of the history of the development of the railroads but of the operation of the roads and the engineering features which have gone to make this development possible. The book is, therefore, thoroughly well worth reading consecutively.

It is also a valuable reference work. The index is comprehensive and very carefully made. This is said with a full knowledge of how extremely rare it is to find a comprehensive index for even a short treatise.

A bibliography, so-called, is included, but apparently what is meant is a list of books which the author consulted, for certainly no attempt is made to give a complete list of even the most important books that have been published in the last 10 or 15 years on railroad subjects.

Colonel Haines has spent on this work a period of three or four years which, at his age, he might have claimed as a well earned leisure; but the literary and historical workshop seems to be his natural element—and this is a condition for the existence of which all students of railroad history will have occasion to be grateful. To foreign readers the book may be of somewhat less absorbing interest than to the American, because of its wealth of details which they will perhaps be likely to skip over; but in no other place can they find such a rich collection of facts combined with lucid and rational comment.

The book is not free from errors; in such an extensive and laborious undertaking no author could expect to attain perfection except by referring every chapter to a committee of specialists. The development of the electric train staff is credited (page 393) to the General Electric Company instead of to Tyer, Thompson and the engineers of the Union Switch & Signal Company. A foot note on page 394 gives the erroneous impression that yellow is the night color indication (in fixed signals) for "proceed" on the Pennsylvania Railroad. The distance from New York to Chicago, over the Pennsylvania Lines (page 588) is given as 870 miles, some 36 miles less than is shown in the time-tables. However, these errors are but as the small dust of the balance in a great mass of facts in which the reader gains interesting information on every page.

It is hard to conceive of anyone reading Colonel Haines' book with an open mind and a clear understanding who can fail to agree with the author that in this field of railroad operation Americans have made a brilliant record of efficiency; that American railway operation is in the highest degree efficient operation.

## Letters to the Editor

### The Selection of Local Officers

FORT WORTH, TEX.

TO THE EDITOR:

Since government control of railways became effective there have been many statements in the press about the lack of discipline, non-observance of rules and general inefficiency of railroad men, especially in train, engine and shop service. The truth of most of these allegations is evident to all who are not entirely blind to plain facts.

The writer recently re-read an article by E. H. Heath, published in the *Railway Age* of November 16, 1917. The author is a very close observer and a good judge of human nature, and he hits the "bull's-eye" in almost every paragraph. The general manager of today is rather dull of comprehension if he is not studying evident facts and their causes. Mr. Heath points out the principal reason for unrest and loose discipline, but his statement should be amplified by the following addition: "Some local officials vie with each other to find ways and means to violate the contracts that exist between the brotherhoods and the railroads."

There has been a great change in railroading in the past 10 years and local officials who would have been a success 15 years ago may be failures today.

My early training began under a superintendent who had served in the ranks as a civil engineer and he fairly had the itch to learn the practical side of train movement as well as all other branches that go to make transportation successful. This man climbed from the position of superintendent of a subdivision to general manager of the greatest railroad in the country, and this was done by the force of his ability in about seven years. The next best superintendent I worked for was in the West and he was taken from the freight department. If all the other local officials I have worked for in the past 30 years were put into these two men's shoes, they would rattle like peas in a gourd.

Chief clerks generally make better local officers than dispatchers for the simple reason that they are better "mixers" and are in a position to hear all transportation problems debated. Mr. Heath states, "Efficiency comes through persistent instructions by an efficient field staff, explaining the why as well as the how." Many local officers apparently think that efficiency is in the atmosphere and we absorb it as we do air. Efficiency in the rank and file of railroad employees is simply a result of good management. If the general manager does not know whether the general superintendent, superintendent and trainmaster know the factors of successful transportation, how can he be successful?

The braking problem on railroads gives the best illustration of the effects produced by the "I don't knows." A prominent air brake man wrote me some time ago, "We have tried for 30 years to have the trains handled smoothly." I admitted it was a fact, but added that we had been trying all that time to use devices which we did not properly understand, and had failed to notice that the devices could not do in actual service what they did in the instruction car.

Engine crews are the only employees on a railroad who receive a progressive examination. They are literally surrounded with inefficiency, neglect, incompetency and theory. Despite this mass formation and attack on all sides, they are expected to deliver 100 per cent efficiency. The engineers have the experience and others have the theory.

This letter is not written to direct attention to the important fact that local officials must be trained, trained and for modern ideas.

AN OBSERVER.

# Flagging and Its Relation To Railroad Accidents.

## Review of American Experiences with the Flagging Rule; Things Needed to Improve the Practice

By C. C. McChord

Interstate Commerce Commissioner

THE REPORT of the Interstate Commerce Commission upon a rear-end collision which occurred on the Philadelphia & Reading Railroad near Fort Washington, Pa., on January 13, 1919, has recently been issued. The collision was between two passenger trains originating at Philadelphia; it occurred about 15 miles north of that city. One of these trains, a local consisting of 8 wooden coaches, left Philadelphia at 5:30 p. m. and was stopped and delayed just south of Fort Washington on account of a preceding freight train blocking the track. The following train, known as the Scranton Express, left Philadelphia at 6 o'clock. The engineman of this train stated that an automatic block signal located about 4,000 feet south of the point of accident indicated clear, and he proceeded past this signal with undiminished speed; under the circumstances, however, this signal should have been in the caution position. Approaching the point of accident, his view of the track ahead was obstructed by an overhead highway crossing with bridge abutments close to the track, also a railroad bridge over the Philadelphia & Reading track, together with sharp curves and trees located along the right of way.

The flagman of the preceding train had gone back some 1,500 feet for the purpose of protecting his train, but on account of the local circumstances, the engineman of the Scranton Express was unable to see him in time to bring his train to a stop before colliding with the preceding train.

The colliding locomotive telescoped in the rear coach of the local train for a distance of about 45 feet, entirely demolishing that car. Thirteen passengers and one employee were killed and twenty-two passengers were injured.

A thorough investigation and extensive tests of the signal system at this point were made by the employees of the railroad company as well as by representatives of the Interstate Commerce Commission. This investigation disclosed no condition which could have caused a false indication of the signal, and the conclusion was reached that the engineman either misread or overlooked the caution signal indication.

A contributing cause of the accident was the failure of the flagman of the local train to go back far enough to insure full protection to his train. The investigation disclosed that the flagman went back a distance of approximately 1,500 feet from the rear end of his train and he was within the range of vision of the engineman of the approaching train for an additional distance of about 750 feet. As the results of this accident show, sufficient distance was not provided to enable the engineman of the express train running at full speed to bring his train to a stop before reaching the point of collision. Tests made subsequent to the accident with a similar train confirm the conclusion that the flagman was not in position to warn the engineman of the approaching train of danger in time to enable him to prevent the collision.

The rule of the Philadelphia & Reading Railroad Company prescribing the flagman's duties in a case of this character provides that when a train stops or is delayed under circumstances in which it may be overtaken by another train, the flagman must go back immediately with stop signals a sufficient distance to insure full protection. According to evidence in this case a period of at least 15 minutes elapsed between the time the local train stopped and the time the express train approached. It is clear, therefore, that the flagman had ample time to have continued

back far enough to insure full protection to his train.

The flagging rule on the Philadelphia & Reading Railroad is similar to the rule in effect on practically all railroads in the country. Some roads have elaborated upon this rule to the extent of specifying minimum distances which are considered to provide adequate flagging protection. But experience has shown that on account of the widely varying factors affecting flagging protection, such as speed and weight of different trains, weather conditions, grade and curvature of track, it is impracticable from an operating standpoint to make this rule specific and absolute in its requirements. It is, therefore, a practical necessity to rely to a very considerable extent upon the experience, discretion and judgment of a flagman for the proper protection of his train under the local circumstances and operating conditions existing in each case. This is true not only with respect to the interpretation of the requirements of a rule when applied to any particular location, but also to the judgment of the man as to what constitutes adequate protection under any given circumstances.

It is a universally recognized principle or requirement where automatic block signals are in use that the signal system must not be relied upon entirely for protection; the fact that train movements are protected by automatic block signals does not alter the requirements of the flagging rule. Under the circumstances in the Fort Washington wreck, if the engineman of the express train had properly observed the caution indication of the automatic block signal involved, he would, no doubt, have been able to bring his train to a stop after seeing the flagman in time to prevent the accident. But the flagging rule contemplates that adequate protection shall be furnished in a case of this character, even though the engineman, as in this case, overlooks or for any reason fails to heed the signal indications. Had the flagman gone back as far as the available time permitted in this case or at least the maximum distance required for bringing a train running at full speed to a stop, he would have been able to warn the engineman of the presence of the preceding train in time to prevent the collision, notwithstanding the failure of the engineman to heed the signal indication. The flagman had had nearly 15 years' railroad experience and his service record was good. He exercised poor judgment in this case, and no doubt relied upon the automatic signals.

The Interstate Commerce Commission has been conducting investigations of serious railroad accidents for the past eight years. Since July 1, 1911, a total of 567 accidents have been investigated, of which 358 were collisions, and in 111 of these collisions flagmen were involved to a greater or less degree. Of the 358 collisions, 139 were rear-end collisions, and in this class of accidents there were 76 in which flagmen were involved. Of the total of 111 collisions in which flagmen were involved, 57 occurred on lines operated by the block system, while 54 occurred on lines where no block system was in use.

The records disclose case after case in which flagmen neglected or failed fully to carry out the requirements of the rules. In some instances it has developed that experienced men have grown careless and have acted in a perfunctory manner, apparently without realizing their responsibility.

There are also a large number of instances in which the flagman exercised poor judgment, due either to failure properly to realize what was required of him in a particular

case, or to lack of experience and sufficient instruction by experienced railroad men. Many instances may also be cited showing lack of proper supervision of men when entering railroad employment, or when assigned to trains as flagmen.

Another condition which has been found to exist is the fact that conductors too seldom give their flagmen specific instructions with reference to proper protection of their trains. In a large number of cases conductors have apparently taken it for granted that flagmen with comparatively little experience know what is required of them and can be depended upon properly to perform their duties. In many cases a suggestion from the conductor or a few words of instruction as to what was expected of the flagman would probably have prevented serious accidents.

One of the most disquieting features of the record of accidents in which flagmen were involved is the fact that a considerable percentage, and some of the most serious accidents which have been investigated, occurred on lines equipped with modern automatic block signals. The fact should be recognized that lines equipped with such signals carry the densest and fastest traffic in the country and perhaps in the world. It is a fact that frequently fast trains are run at such brief intervals that when a train is unexpectedly stopped or delayed, there is not time for a flagman to get back far enough to provide adequate protection for his train.

### A Compendium of Flagrant Cases

An examination of the records of accident investigations suggests the following general classification of accidents resulting from the lack of proper flag protection.

1. *Carelessness and failure to realize responsibility of the position of flagman by experienced men.* Accidents wherein experienced flagmen fail properly to perform their duty are surprisingly common. In a recent case of this character, a train had been standing 25 minutes on the main line without protection; the flagman had visited various saloons during the preceding night and was in no condition to work. This man had had more than 7 years' experience as a trainman. In another rear-end collision, a passenger train had stopped at a flag station on account of low steam. The flagman went back and in about 20 minutes returned to the train to obtain a fusee on account of his lanterns beginning to burn low and also to see how much longer the train would be delayed. He had started back the second time, but had gone only 2 or 3 car lengths beyond the rear of his train when the following train passed him. At no time did he have any torpedoes with him, and he was unable to light the fusee as there was no cap on it. This flagman was a man of nine years' experience in train service.

In another case a train stopped with rear-end about half a mile outside of yard limits; the engineman whistled out a flagman, and the conductor told the flagman they would be there about two hours, but did not give him specific instructions to flag, as he was qualified and he considered him to be trustworthy. The flagman said he did not know the location of the yard limit board and thought his train was within yard limits, so he remained in the caboose reading and writing. Train stopped at the usual point and he said he had never gone back to flag in the month he had been running over this part of the road. Train had been standing one and one-quarter hours at the time of accident. Flagman had had eight years' experience of which four was as a flagman.

2. *Inexperienced and incompetent men.* In a rear-end collision between two passenger trains, resulting in the death of 14 persons and the injury of 200 persons, the collision occurred at night. The flagman did not go back a sufficient distance, and did not use either fuses or torpedoes, although he had both with him. The flagman entered the service of the company 24 days before the accident, had no previous railroad experience, and had not been examined on the rules.

In another case the flagman of a work train was given verbal instructions to go to the next station on a preceding

train and hold all trains in the opposite direction until his own train arrived. The evidence indicates that when a passenger train approached from the opposite direction he did not unfurl his flag and the signal he gave was such that the engineman of the passenger train took it for a wave of the hand or a salute, acknowledging it with two short blasts of the whistle and resuming full speed. No torpedoes were used, although the flagging rule required their use in all cases. The flagman had been in railroad service a total of only four months and had never been instructed, examined or qualified as a flagman.

In another case of this character, the flagman at fault had been employed on this road less than one week, but had had some previous railroad experience. He was assigned to duty as a flagman by the trainmaster's clerk; the only question asked was whether or not he had a watch. No instructions were issued to him, and he received none from his conductor during the trip. He stated that he went out without any knowledge of the operating rules and did not even have a time table; and that he paid only half a dollar for his watch.

In another case the investigation developed that men were employed for train service by a trainmaster's clerk who had never been examined on the rules. The examination given was very perfunctory and consisted merely of filling in answers to questions contained in a printed form which was supposed to be checked over by the clerk and supplemented by such explanations or instructions as he might give.

These and many similar cases point clearly to the menace of employing incompetent and careless men in responsible positions, and emphasize the need for the most rigid enforcement of rules and for frequent inspection and test by officers in order that they may know absolutely that rules necessary for the safe operation of trains are understood and obeyed.

3. *Poor judgment on the part of experienced flagmen.* The Fort Washington accident described above is an example of this class. In another case, a rear-end collision occurred on a six-degree curve, 550 feet from the point of curvature. From that point, there was 150 feet of tangent, 475 feet of 2-degree curve, and 1471 feet of tangent. The grade was descending for several miles, averaging about one-half per cent. The accident occurred during the day time, in clear weather. The flagman went back a distance of 30 car lengths, which brought him to the tangent 1,471 feet in length, and there put down two torpedoes. He then walked back and forth between the torpedoes and his train, being about 24 car lengths from his train when the following train passed him. According to the evidence, the engineman could not see the flagman until within about 8 car lengths of him, though his fireman and head brakeman could have seen the man a distance of 60 or 75 car lengths. The head brakeman called attention to the flagman, and the engineman made a partial application of the air brakes when about 12 or 15 car lengths from the flagman. The speed of the train at the time of collision was very low, the weight of the 85-car train contributing materially to the damage. The flagman had had more than a year's experience and had a good record.

Accidents due to errors of judgment on the part of responsible employees cannot be entirely eliminated; the most that can be expected is to reduce their occurrence to a minimum by care taken in employing men for train service and by educating them to the responsibilities and duties of their position; also by making the rules as definite and specific as practicable.

4. *Lack of definite instructions or misunderstanding of instructions.* In one case of this character the conductor sent the flagman forward to assist in switching in place of an inexperienced head brakeman; he told the head brakeman to look out for a following passenger train but received no acknowledgment from him. The head brakeman said he had not been instructed to flag the passenger train and thought the reason no attempt was made to protect was because the conductor had time on that train. Head

brakeman had been in the service less than four months.

In another case the conductor of a work train sent a flagman to a station with verbal instructions to hold all trains until his train arrived, but the flagman understood that he was to hold all but first class trains. He failed to hold a passenger train, and a collision resulted. This flagman had never been instructed or examined on the rules, although he had been in the service of the railroad company 9 months. He had had some previous railroad experience.

Accidents due to the misunderstanding or misinterpretation of flagging instructions in connection with work train operation are common. Such cases occur because instructions are given verbally and without sufficient care to know that they are properly understood. Many roads require by rule that flagging instructions be given in writing and make it the flagman's duty to show his written instructions to the enginemen of trains flagged. This rule should be universal and should be strictly observed.

5. *Dense traffic or trains operated so close together as not to allow necessary time for flagman to go back a sufficient distance to provide full protection.* There have been a considerable number of disastrous accidents in which this was a contributing cause. In one case several years ago four sections of a fast freight train were being run at high speed in a dense fog at intervals of only about 5 minutes apart. The engineman of the third section decided that in view of the weather conditions it would be unsafe to attempt to go to the next station, 4.4 miles distant, in 10 minutes and clear an opposing passenger train. He therefore slowed down in order to take siding. As the flagman opened the caboose door on his way out to protect, he heard the fourth section approaching and called to the conductor to jump, but the latter did not have time to do so. The last open telegraph office was 5.6 miles distant, and the fourth section travelled that distance at an average speed of 48 miles an hour and intended going to the station beyond to clear the passenger train. The third section had been running at a lower rate of speed, and this, coupled with a minute or two lost when making the stop at the siding, enabled the fourth section to overtake the third section. There have been recent examples of accidents of this character, attended by much more serious results. In one of them, the first train stopped at 3.13 a. m. in a dense fog on account of an interlocking signal being in the stop position. The signal was cleared and the flagman called in, but when endeavoring to start, the engine stalled. The flagman again started back, but had gone only one or two car lengths when he heard the following train approaching. In the meantime, the engineman had started the train and it had traveled 6 or 7 car lengths before it was struck, at 3.18 a. m. The accident was due either to the engineman missing the automatic signal indications entirely or to his misreading them on account of high speed and dense fog. In another accident, a train stopped at 3.55 a. m. and the flagman started back, seeing the approaching train after he had gone but a few car lengths. When he saw that the engineman of the following train was disregarding the automatic signal indications, he began to run toward that train and was back about 700 feet when it passed him, colliding with his own train at 3.57 a. m. The accident was due to the engineman being asleep, but could probably have been prevented had the flagman had time enough to go back a proper distance and put down torpedoes, which he had with him.

In view of the evidence furnished by the accident investigations which have been conducted by the Interstate Commerce Commission, it is apparent that the safety of railway travel may be greatly enhanced by more careful attention to the requirements of proper flagging. This is a matter that should receive the constant attention of railway operating officers, by the promulgation of definite and easily understood rules, as well as by adequate measures to insure that the rules are understood and obeyed. The position of flagman should be made a preferred job, and should be invested

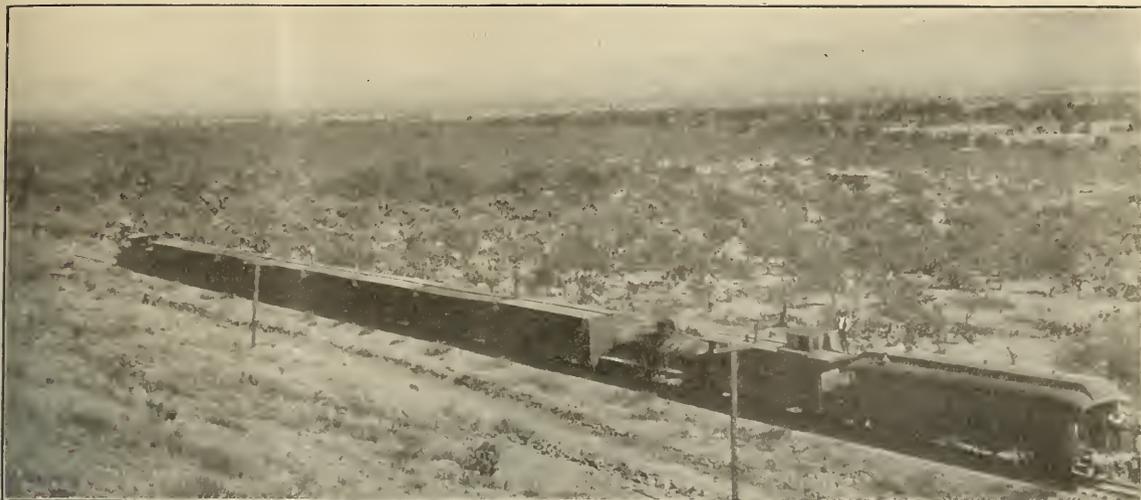

with more importance and dignity than is at present the case. Extraordinary precaution should be taken to insure that only competent men having a keen sense of their responsibilities, are given this position. In addition, special measures should be taken to see that flagmen are fully instructed in the performance of their duties, and that constant supervision over all details of their employment is given.

In connection with this important matter full consideration must be given to the human tendency toward minimum effort. Individuals are naturally indolent; they do not wish to exert themselves unnecessarily, and they are aroused only when ease is more unbearable than action. Men rarely do the best of which they are capable. They grow to the smallest dimensions of their job and then stop. No more effort is expended to perform a task than is required to produce a satisfactory result, and what is "satisfactory" is usually a variable quantity. There being no standard, the result obtained is generally far below the individual's capacity. It requires severe effort on the part of an individual to maintain his highest level of efficiency, and effort is a strain that he is loth to make. Consequently, he is contented with efforts that produce fair results.

Applying the fact of this well-known human tendency to the subject of flagging, the necessity for constant supervision and admonition, even with men of the highest grade, is apparent. Take a conscientious man of good intelligence, having a full sense of the responsibility imposed upon him, and at the outset he will exercise extraordinary care, and make a tremendous effort to do his job well. Then, as he becomes more familiar with the details of his task, the human tendency to do things in the simplest way, in a way requiring the least expenditure of energy, causes his efforts to relax, perhaps at first gradually and imperceptibly, until he is finally acting much below the level of efficiency demanded by the safety of his train. To counteract this tendency requires constant and intelligent effort on the part of railway operating officers. They should be especially vigilant in this regard, bearing always in mind that they themselves are subject to the same psychological propensity as are their subordinates. It is highly essential for them to know that men of the proper calibre are placed in these positions in the first instance.

On many roads flagmen of passenger trains are prohibited by rule from riding on the rear of an observation or private car. Such a prohibition is not in the direction of safety, and wherever the rule exists it should be rescinded. A seat should be reserved exclusively for the flagman just inside the rear door looking out. It should be made compulsory for a flagman to ride in the rear end of the last car of the train, as that, or on the rear platform, is the only place where he can ride and properly protect his train.

Occasionally accidents occur due to the existence of dangerous operating practices which have grown up with the full knowledge of responsible officials and which they have failed to take steps to correct. When such conditions exist, they are usually found in and around yards, interlocking plants and other points where train movements are more or less congested. In connection with one such accident, the superintendent stated that in his opinion it was a safe practice for transfer trains to use the main track within yard limits on the time of a first-class train, provided the crew of the transfer train were told by someone that the first-class train was late. Such operation is in violation of all rules provided for the safeguarding of train movements, and when responsible officials are acquainted with and acquiesce in the continuance of such practices, accidents are bound to occur. Not only that, but the effect on the employees under their jurisdiction is detrimental to a proper performance of their duties, for slackness and inattention by officials to violations of the rules on the part of employees will be reflected in their daily work and can only result in the occurrence of those accidents which it should be the duty of all officials to prevent to the best of their ability.

## A Trip Over the Railway Lines of Mexico

Construction and Operation Under Difficulties. Private  
Trains to Secure Better Service

By P. Harvey Middleton

Executive Assistant, Railway Business Association

### PART II.\* PRIVATE LINES AND PROPOSED EXTENSIONS

THE TENACITY, enterprise and foresight of Harriman resulted in the construction a few years ago of the Southern Pacific of Mexico, which owns approximately 1,000 miles of line in some of the most beautiful country on this continent. This line is the result of the consolidation into a single system in Mexico of the lines controlled by the Southern Pacific system of the United States. The Mexican concession dates from 1905, and carried a subvention of \$10,058 U. S. currency per mile. This company has virtually absorbed what was hitherto called the Cananea, Yaqui River & Pacific, which had constructed lines from Nogales and Naco on the Pacific-Arizona border to Cananea, a copper-producing center in the state of Sonora, and down the west coast of Mexico on the Gulf of California from the port of Guaymas to Mazatlan, continuing to Tepic, from which point it is eventually to go to Guadalajara and Mexico City.

The company suffered considerably between 1910 and 1913, the traffic loss for this period being estimated at \$3,000,000, and the cost of maintaining the property during the same period was \$510,000 in excess of the revenue collected. The road in its progress southward crosses the wealthy regions of the Mayo and Yaqui rivers, which produce the best garbanza (chick peas) in the world. It passes Navajoa, the center for this product, and then touches San Blas, in the state of Sinaloa, where it connects with the Kansas City, Mexico and Orient. At Manzanillo it connects with the National Railways of Mexico.

The Southern Pacific of Mexico runs triweekly trains from Nogales to Naco via Cananea, 120 miles, but the property of the railroad in this section has greatly deteriorated, owing to the fact that it has been compelled on several occasions to withdraw all trains and practically abandon the roadbed. All

the bridges have been destroyed, and all rolling stock, roadbed, terminals and buildings will have to be renewed at an early date. At one point on this line, between San Blas and Culiacan, H. J. Temple, the general superintendent, rebuilt a bridge nine times. Every time the bandits destroyed it, Temple rebuilt it. A pile driver outfit was maintained at the bridge all the time, and in one month the bridge was rebuilt five times. As will be seen in the photographs reproduced in this article, the Southern Pacific of Mexico is compelled to operate armored cars on all trains.

A glance at the map published in the *Railway Age* of May 30 will show the small portion of the route between Tepic and Guadalajara which is still to be completed. The intervening distance is only a few miles, but it is in the difficult Sierra Madre country, requiring a number of tunnels—one of them nearly three miles in length—and much heavy grading. Representatives of the Southern Pacific are now in the field arranging for the early completion of the line. When this is done the Southern Pacific will have a direct connection between its great system in the United States and the entire west coast of Mexico—a region immensely wealthy in agricultural and mineral products.

#### Difficulties of Construction

The difficulties which will have to be overcome by the American engineers in completing this short stretch between Tepic and Guadalajara are graphically illustrated by the description of the survey made under exactly similar circumstances of the Cañon de Tamasopo on the Mexican Central by Max E. Schmidt, an American engineer. This cañon is 18 miles long, with perpendicular cliffs many hundred feet high on both sides.

When the first surveys were made, the cañon was devoid of roads or trails. The sun hardly ever penetrated the rockbed where the engineers

\*The first article will be found in the *Railway Age* for May 30, page 1297.

camped, and where a sudden rain in a few hours might create a torrent that would fill the bottom of the cañon from side to side many feet deep, and carry away every vestige of the camp outfit and survey. At night, the noise of the rocks becoming detached from the cliffs above and falling into the cañon made sleep a succession of nightmares. When the actual location was made it was found that, in order to obtain proper grades, the road would have to intersect the cliffs at about half their heights. Difficulties then began in earnest. On many days not over 100 feet could be staked. All camp comforts had to be abandoned, and night would find the engineers camping on the cliffs, near the last stake, swinging their hammocks over rocks and precariously securing what little rest they could. The roadbed as now finished is nearly all carved out of the solid rock. The total track curvature is 12,248 degrees, and in the aggregate only about one-fifth of the distance is on tangents.

### Another American Line

A gigantic monument to the pluck and resourcefulness of American engineers is the Kansas City, Mexico & Orient, running from Kansas City to the Bay of Topolobampo on the Pacific Coast of Mexico, a total of 1,451 miles. It was promoted by Arthur E. Stilwell, who carried large parties of prospective stockholders from the western states, and in this way sold enough stock to carry on the construction work. The company was incorporated in 1900 under the laws of Kansas. Two sections are still under construction—one between Alpine, Texas, and the Rio Grande, 81 miles, and the other

A Gun Made in the Railway Machine Shop at Monclova, Mexico

between Sanchez, in the state of Chihuahua, and Los Hornillos, in Sinaloa, 198 miles.

This line also taps large agricultural and mining districts, it being estimated that there are about 500 mines and prospects on the line, as well as important haciendas producing sugar, cattle, grain, timber and fruit. Owing to bandit activities, service is at present irregular on the stretch of line from the Rio Grande to Sanchez, 287 miles.

The construction of this line is all first class, rails of 75 lb. weight, ties of California redwood, tarred, bridges well piled and provided with safe approaches and abutments. On the first hundred kilometers of the line, starting from the Pacific terminus at Topolobampo, there is but one bridge of any importance, namely, that crossing the Fuerte river, comprising three truss spans, each measuring 300 ft. in length. Several smaller bridges are from 15 to 50 ft. in length. On the second division, from Chihuahua east, however, when the Sierra is reached, the country becomes difficult to negotiate. In this long section tunnelling has been both expensive and difficult, the longest of the excavations being 1,520 ft., while there are two others which measure 810 ft. East of Chihuahua there is a bridge across the Chuviscar river near Aldama consisting of 10 spans of 50 ft. deck girders on concrete piers and abutments. Further on, crossing the Conchos river, there is a

steel girder bridge which is comprised of 17 spans of 50 ft. deck girders.

The length of the main line in Mexico, from the Rio Grande to Topolobampo, is 633 miles, which distance includes a portion of the Chihuahua & Pacific Railway, from Tabalaopa to Minaca, 120 miles, operated under lease. The terminus of the line at the bay of Topolobampo is a magnificent port, completely mountain-locked, measuring about seven square miles in area, with a depth over the bar at the entrance at low tide of about 22 ft.

### Privately Operated Trains

A large part of the freight in northern Mexico is today handled in privately operated trains, of which there are about 30 in service. American mining companies have agreed to

The Southern Pacific of Mexico Protects Its Trains With a Gondola Car Cut With Slits for Rifles

rebuild a part of the destroyed cars on condition that such cars are to be used exclusively by them for a period of two years, after which they revert to the regular equipment of the service. From the American border to San Luis Potosi, 475 miles, on the government railways, shippers are dependent on private trains for quick service, freight being delivered in about ten days, at rates 50 per cent higher than the regular government rate. As freight is not received on private trains in less than carload lots, shippers of smaller quantities who require regular quick service must ship by express or pay

One of the Locomotives Left on the San Jorges Bay & Eastern After the Rebels Had Stripped That Road

insurance. There are special express trains leaving Nuevo Laredo on the Rio Grande for Mexican points twice a week.

An effort is being made at the present time to bring about an agreement with the United States Railroad Administration for the through billing of freight from points in the United States and Mexico, and for the regular interchange of cars. Through billing has been discontinued since 1915. American owned freight cars are, however, going across the border into Mexico under bond furnished by the shipper, and bond is released as soon as the car is returned to the United States. There are at present about 500 American owned freight cars in shops and in service in Mexico.

### Extension of Lines

When I left Mexico City on May 7 the extra session of the Mexican Congress had completed its organization, and was starting to work on the big questions which it is now compelled to deal with. One of the most important of these is the extension of the railroads of the country, as recommended by President Carranza, and the purchase by the government of all or a majority of the stock of the United Railways of Yucatan. This company was incorporated under the laws of Mexico in 1902, and is a system formed through the consolidation of lines formerly independent and then owned by benequen (hemp) planters of the peninsula of Yucatan.

A Big Fill on the Mexican National Railway

There are four divisions—the Northern, between Merida, the capital of Yucatan, and Progreso, its seaport, and between Merida and Izamal, all standard gage; the Eastern, between Merida and Valladolid, with two branches, all narrow gage; the Western, connecting Merida with Campeche, capital of the state of the same name, and two branches, all narrow gage; and the Southern, between Merida and Peto, with one branch, narrow gage.

Since 1914 the Yucatan railways have been operated by the local government of the state of Yucatan. The share capital is 23,000,000 pesos (\$16,500,000), in addition to which there

The Other Extreme of Transportation in Mexico

is an issue of \$4,125,000 first mortgage 5 per cent redeemable gold bonds issued in London. At the time of my visit to Yucatan on May 12 there were 500 miles of railway operating on schedule time. Track was in good condition, but rolling stock was badly in need of repair.

Three new lines are proposed for Yucatan. The first would link the Yucatan system with the territory of Quintana Roo, running through Peto, Yucatan, Bacalar and Santa Cruz. Surveys for this line were made under the rule of Porfirio Diaz. The second extension, also proposed by Diaz, would connect Santa Lucrecia, in Vera Cruz, to Campeche, connect-

ing with the National Railway of Tehuantepec across the isthmus. The third proposed line will run from some point on the Southern Pacific, between Magdalena and Hermosillo, to Ensenada, the capital of Lower California. The completion of these lines will enable troops to be transported by rail from any part of the country to Lower California without entering the United States.

The American Smelting & Refining Company is also planning the construction of a new line to be operated in connection with its extensive mines and smelters in the states of Chihuahua and Durango, and will expend some \$5,000,000.

### Smaller American Lines

Another American owned line is the Mexican Northern, with offices at 82 Beaver Street, New York, which has a total track of 78 miles and runs from Escalon, in Chihuahua, to Sierra Mojada, connecting that region with the Mexican Central. This line is now under the control of the Mexican government. The Mexico Northwestern Railway, incorporated in 1909 under the laws of Canada, with offices at 115 Broadway, New York, was formed for the purpose of providing northern Mexico with railroad facilities. It has 476 miles, and is still privately operated. It owns the following lines: The Chihuahua & Pacific (incorporated in 1897 in

Bridge Across Rio Grande Between Pedras Negras and Eagle Pass

New Jersey), the Sierra Madre & Pacific, a lumber line, and the Rio Grande Sierra Madre & Pacific, which owned several lines in Sonora and Chihuahua—all rich in agricultural, mineral and forestry resources.

The Parral & Durango Railway was incorporated in Colorado in 1898, and runs from Minas Nuevas Chihuahua, to Paraje Seco, Durango, 59 miles, with a short branch line to Parral. The head offices of this line are at Pittsburgh. The Potosi & Rio Verde, narrow gage, is another American enterprise, with offices at 82 Beaver Street, New York. This runs from San Luis Potosi to Ahuacatal, 38 miles, and is at present under the control of the Mexican government.

### Building a Tropical Railroad

It was a Kansas City man, Dennis W. Hedrick, who built the bridges on a line which crosses more rivers and streams than any other railway on the North American continent. This was the Vera Cruz & Pacific line, completed in 1903, and now part of the Mexican government railways, extending from Vera Cruz to Santa Lucrecia, a station on the National Tehuantepec, midway between the Gulf of Mexico and the Pacific. The distance was only 242 miles, but the road crosses six large rivers and numerous streams, which necessi-

tated the building of 300 steel bridges. The largest of these crosses the Papaloapan river at El Hule, the superstructure consisting of five spans, each 170 ft. in length, a draw span of 225 ft. and two steel approaches of 245 ft. each, making a total length of nearly one-third of a mile, and consuming 1,250 tons of steel.

### Curiosities of Mexican Railroading

There are a number of reasons, other than those relating to natural obstacles, which make railroad building in Mexico expensive. The peculiarities of the Mexican peon is one of these. During the construction of a line in the south thousands of wheelbarrows which were imported for grading purposes had to be thrown away because the peons would not use them unless permitted to take the wheels off and carry the bodies on their backs.

Government requirements for the construction of new railroads have also in the past caused large unnecessary expenditures. When I was traveling on the Mexican Railway from Mexico City to Vera Cruz on May 8 I was informed that the cost of the road had averaged \$136,000 per mile—probably the most expensive railroad in the world—and that while only 264 miles long it had taken 20 years to build the road. A

Bridge Across Balsas River, Mexico

little inquiry soon cleared up the mystery. The government in granting the concession had insisted that the railroad be constructed from both terminals simultaneously. Notwithstanding the vehement protests of the English contractors, they were compelled to transport rails, parts of locomotives and other machinery on mule-back or carts over 250 miles inland, over rugged mountains, some of them over 8,000 ft. high, and then the track had to be laid backwards to meet the section which was working up from the coast.

### Some Statistics

That the freight and passenger traffic of Mexico is growing, despite bandit and rebel activities, is evidenced by the statistics of transportation of commodities on the railways under government control—representing only about 8,000 miles—for the year ended June 30, 1918. Here are the figures, in metric tons: Forestry products, 393,968 tons; agricultural products, 1,236,719 tons; animals and animal products, 216,443 tons; inorganic products, such as lime, cement, asphalt, coal and coke, oil, minerals, etc., 1,935,105 tons; general merchandise, 372,475 tons. For a country containing a population of only 14,000,000, of which about 10,000,000 are Indians and half-breeds living under the most extreme primitive conditions, a country which, moreover, has been torn up by nine years of revolutions, these figures are remarkable.

## Engineering Council Committee on Compensation for Engineers

THE RAILROAD SECTION of Engineering Council's committee on classification and compensation of engineers has submitted a preliminary report of its activities from which the following abstract will be found of interest to engineers employed by railroads. This section of the committee is composed of Francis Lee Stuart, consulting engineer, New York City, chairman; Frank H. Clark, consulting engineer, New York City and Bion J. Arnold, consulting engineer, Chicago. The work of this committee to date has consisted essentially of the preparation of a questionnaire to be submitted to the chief engineers of railroads, to gather information on compensation being paid to engineers in railway service and opinions on the adequacy of such compensation. It was proposed to have this transmitted through the agency of the Railroad Administration, but Director General Hines did not concur to this view and in consequence the questionnaire has been sent only to members of the "founder societies."

The work of the committee has been divided as follows:

- A. Determining the classes of engineering positions.
- B. Collecting data in regard to compensation now paid for each class.
- C. Determining an equitable rate of compensation for each class.

The committee has adopted a simple general classification containing eight groups which it is believed will be generally applicable to all organizations of engineers.

1. Chief administrative officer having full charge of organization, including determination of policy.
2. Head of major subdivision in responsible charge of large unit.
3. Head of intermediate subdivision in responsible charge.
4. Head of minor subdivision.
5. On general duty under direction but requiring special education and special training and the use of initiative and originality.
6. On subordinate duty requiring special education or training, but not requiring special originality.
7. On subordinate duty not requiring special education, training nor originality.
8. On special duty of responsible character requiring particular qualifications and initiative.

In supplementary remarks issued by the entire committee on classification of Engineering Council considerable information is submitted showing the decreased purchasing power of the dollar and the embarrassing position of the salaried man when compared with wage workers whose compensation has been largely increased by collective bargaining. This statement is concluded by the following:

"The committee believes, therefore, that in adopting standards for the compensation of workers in all technical fields due consideration must be given to the great increase in the cost of living which has taken place. The dollar of salary must be considered with regard to what it will purchase today and is likely to purchase next year, and not with regard to the value of the dollar 10 or 15 years ago. This increase in compensation is necessary not merely as a matter of justice to the engineer, but in order that engineering work may be maintained on the plane that it must be to secure economical and efficient work. Not only the leaders but the rank and file of technical workers often have it in their power largely to affect the cost of the work in their charge by the quality of the effort they exert. There is no economy in paying such men at rates inadequate for their support, for this leaves their minds burdened with anxieties, when they should be free to give their best efforts to the work in hand. Moreover, such a rate automatically tends to drive the abler men into other occupations and to leave in charge of the work only those of less ability, who are unable to make a change."

# Corporate Accounting During Federal Control\*

Responsibility Rests on the Corporation Accounting Officers to  
See that Proper Accounting Is Had With the Administration

By Frank Nay

Vice President and Comptroller, Chicago, Rock Island & Pacific

THE UNITED STATES GOVERNMENT took possession of the railroads of the United States under proclamation of President Woodrow Wilson, at 12 o'clock noon, on December 28, 1917, but for the purposes of accounting, the possession dated from 12 o'clock midnight on December 31, 1917.

Under general orders Nos. 1 and 2, the railroad accounting officers handled both corporate and federal accounts; in fact, at that time they had no knowledge as to the difference between a corporate account and a federal account. They continued, for several months, to perform their duties exactly as prior to federal control. January 1 being the beginning of the calendar year and of the fiscal year established by the Interstate Commerce Commission, was the most propitious day on which to inaugurate the period of federal control. Naturally the accounts for the year 1917 separated themselves from the accounts for the year 1918, barring certain overlapping items which will be considered later.

## Corporate and Federal Accounts

For some months there was indecision as to whether or not it was necessary to make a complete separation of the accounts, such as has since been decided upon. The undersigned was asked by an official of the United States Railroad Administration if he could fairly and impartially keep the accounts of the road which he represented, for the corporation and for the director general, and give a square deal to both. The answer was in the affirmative, and reference was made to the many joint agencies of various kinds existing all over the United States, filled by men who have for years been serving two or more railroad companies, and have been giving each railroad company served, a square deal. However, further consideration of the matter led the Administration officials to the conclusion that it was desirable and necessary to have not only a complete separation of the accounts between the corporate accounts and those of the Administration, but that they should be administered by separate accounting forces, in charge of separate accounting officers; or, to put it another way, the Administration desired to have their accounts kept by men who were 100 per cent Administration, and who had no official connection with the corporations. With this in mind, General Order No. 17 was issued, under date of April 3, 1918. This order provided for a complete separation of the accounts of the corporation from those of the director general, and required that they be written in separate sets of books. This was done, and when the work was completed, the corporate books were turned over to the corporation, and it was then necessary for the corporation to have an accounting officer who would take charge of the corporate books, as the accounting officers of the Administration were prohibited from keeping them further without special permission from the Administration.

## Corporate Accounting Departments Organized

About July 1, 1918, the separation of the sheep from the goats began. At that time federal managers were appointed for the various railroads, complete federal organizations were established and the federal officers were required to sever all

connections with the railroad corporations, as officers, directors, or otherwise. That action obliged the corporations to create organizations entirely separate and distinct from the federal organizations. One of the first essentials of the separate corporations was adequate provision for corporate accounting, because it was extremely important that the accounts of the corporation should be given proper attention. As illustrating how the corporate executives felt, I quote the following from a letter dated October 26, 1918, from Mr. Samuel Rea, president of the Pennsylvania, addressed to a number of presidents of other large railroad companies, in connection with the proposed formation of a corporate railway accounting officers' association:

"You will appreciate that the contract is in large part an accounting matter. It lays down the general basis and principles of the relation with the government, but the details for carrying it out will devolve largely upon the accounting officers."

I imagine very few corporate accounting officers at first had any grasp upon the conditions and situations which confronted them. I confess to you that when I was appointed corporate accounting officer, or rather, retained in that position, because no change was made in my title and no change in my duties, except the separation of accounts relieved me from the detail of the operating accounts,—I said to my assistant, something like the following: "Joe, I believe you and I can handle the corporate accounts for the Rock Island; there will not be very many journal vouchers, and we may have to get a clerk or two to work on the subsidiary accounts and check the lap-overs, but you and I can do the general work without any difficulty at all; in fact, I rather welcome the idea of getting a chance to make some entries on the books again; it has been so many years since I actually took my pen in hand to make entries on ledgers."

Today I have in my corporate accounting office for the Rock Island, 34 clerks; they are all kept busy and many of them are working overtime. By actual count we record just as many journal vouchers on our books as prior to federal control. Up to this time I have not personally made any entries on the books and it looks as if I would not be able to do so during federal control; in fact, I give you my word that I have never worked harder in my life than during the last year, and I may add, I have never had less to show for hard work.

In taking up this corporate accounting work, we had an entirely new proposition. None of us had had experience with a similar accounting situation, and we had to blaze the trail. We were also confronted with the difficulty of obtaining adequate and competent help. The very cream of the young railroad men of our country had eagerly offered the supreme sacrifice to help win the war, and there was a great shortage in railroad accountants.

## Compilation of Standard Return

One of the first things to which the attention of the corporate accounting officer was applied, was the compilation of data to demonstrate prior to the signing of the contract covering federal control, whether or not the average net railway operating income as reported to the Interstate Commerce Commission for the three years ended June 30, 1917, was the true income for that period. It is assumed that when the

\*From an address before the Association of Railway Accounting Officers, New York, June 11, 1919.

President issued his proclamation and when Congress passed the Act of March 21, 1918, fixing as the compensation for the use of the railways, the average annual net railway operating income for the three years ended June 30, 1917, the actual net income as nearly as might be ascertained without completely re-working all of the detailed figures, was intended. In the case of carriers where that net figure was over-stated, due to the omission of some charge or to an excessive credit, which would be adjusted in a subsequent period, unless adjustments are made, such carriers would receive a rental in excess of the amount intended by the President and by Congress. In the case of a carrier whose net income as stated to the Interstate Commerce Commission for the period named, was less than the actual figure, due to items similar to those hereinbefore mentioned, such a carrier would be underpaid unless proper adjustment was made. As the Interstate Commerce Commission was required to certify to the President, the average net railway operating income for the three years ended June 30, 1917, it would seem natural that the Interstate Commerce Commission would make an effort to locate the relatively important items which should be adjusted and thus produce a net figure which would more nearly represent the actual net railway operating income than the one which was reported to the commission.

It should be said right here that when the statement is made that the net operating income reported to the commission, is not the actual, the impression must not be created that any intentional omissions or errors were made or that the net figure that was stated was intentionally greater or less than the actual, but owing to the large volume of items entering into the net operating income of the carrier during the year, or during the three year period, and the complications in connection therewith, it is a practical impossibility to state the net income of the carrier on an actual basis within the time prescribed for rendering the reports.

Along in the summer of 1918, the Interstate Commerce Commission became aware that certain carriers had included in their accounts, subsequent to June 30, 1917, certain Adamson law payments, which accrued prior to June 30, 1917, and should have been charged against the expenses of the three year period ended June 30, 1917. Further, they were aware of the fact that under the income or war tax law of October, 1917, the carriers could not possibly have included the taxes under that law which accrued during the first six months of the year 1917, in the accounts for that period. The very fact that the law was not enacted until more than three months after the close of the period, precludes the possibility of including the figures within the period. Therefore, the Interstate Commerce Commission sent out a communication to the chief accounting officers of the various carriers, requesting them to modify their previous reports of the net railway operating income for the three years ended June 30, 1917, by deducting therefrom such omitted Adamson law payments as had accrued within that period, and also by deducting therefrom one-half of the war taxes under the Act of October, 1917, for the year 1917. This action was commendable and in harmony with the spirit to determine a figure for the net railway operating income for the three years ended June 30, 1917, which should be as nearly as practicable the actual figure for that period. The carriers responded with the corrections requested, and then later, certain carriers called to the attention of the Interstate Commerce Commission items which were erroneously included as a charge against the net income of the test period, and to revenue which was erroneously omitted from that of the test period; the adjustments requested would have the effect of increasing the net railway operating income for the test period. However, the Interstate Commerce Commission declined to make any further adjustments unless it could be shown that the accounting rules of the Interstate Commerce Commission had been violated. The Interstate Commerce Commission initiated the

move to decrease the net railway operating income by deducting therefrom the two items mentioned, the omitted Adamson law payments and the one-half of the 1917 war taxes, neither of which constituted a violation of the accounting rules of the Interstate Commerce Commission, but the commission has so far declined to make adjustment of similar items subsequently brought to their attention.

### Lap Overs

Under General Order No. 17, certain items affecting the income accounts of the corporations prior to midnight of December 31, 1917, were classed as lap-overs. On the expense side, these lap-overs were very clearly defined by General Order No. 17, and accounting bulletins and circulars. They referred to all payments by the director general for expenses which were incurred prior to January 1, 1918, which if they had been paid prior to federal control, would have been charged to operating expenses or income account of the corporation prior to such control. In other words, the lap-over expense items were allocated according to the date on which the service was performed or the liability incurred.

The general orders and circulars of the Administration provided that such lap-overs would be paid by the Administration, and charged against the railroad corporations, and that the railroad corporations would simultaneously credit the Administration on the corporate books. This was an entirely equitable method of handling these lap-overs as the Administration had taken over the cash on hand January 1, 1918, and had collected all operating funds accruing to the corporations on and after that date; in fact, the Administration collected all moneys, whether operating or corporate, that accrued to the corporations for several months after the beginning of federal control, and naturally, it was incumbent upon the Administration to pay the liabilities of the corporations.

On the revenue side, however, the lap-overs have not been clearly and equitably defined. In General Order No. 17 it was provided that the Administration would continue to revenue the freight, passenger and other traffic in the same manner that the corporation had accounted for such revenue, taking into the Administration treasury, the revenue that would have accrued to the corporation in the months during federal control. As to passenger service, the revenue on which is accrued largely on a forwarded basis the corporations are credited with more than their proper proportion of the revenue on lap-over passenger traffic. The average journey per passenger is shown in the reports of the Interstate Commerce Commission to be anywhere from 20 miles to 100 miles in the different sections of the United States, and therefore, on the average, because of the short journeys and because passengers do not become congested at terminal points, like freight, the method of determining passenger lap-overs as prescribed in General Order No. 17 does not miss the mark very far, but as heretofore stated, it is not exact, and is on more or less of a hit-or-miss basis. However, neither the revenues of the corporations nor the revenues of the Administration would be seriously affected by the application of General Order No. 17 to the passenger business, assuming that exactly the same method of ticketing passengers and of accounting for passenger revenue will prevail at the end of federal control as at the beginning of federal control.

As to the freight traffic, the method proposed in General Order No. 17 of revenueing freight at the beginning, during and at the end of Federal control, in accordance with the practices of the carrier prior to federal control would cause certain carriers or corporations to suffer heavy losses in their revenues, and the U. S. Railroad Administration to have the advantage of similar gains. At the time that the railroads were taken over by the Administration, freight was interrupted en route and congested at many terminal points. This was due to the increased movement of traffic on account of trans-

portation for the War and Navy departments and by orders given to expedite the movement of certain classes of traffic, which resulted in the delay and congestion of other classes of traffic. In fact, at December 31, 1917, there was an unusual congestion and freight was delayed en route to a much greater extent than in the ordinary course of business, and the accrued earnings on such freight delayed en route, amounted to many millions of dollars. In the case of the few railroads which accrue their freight revenues on the "forwarded" basis, that is to say, those which put into their revenue and income account the earnings when the freight starts on its journey, these congestions would have no effect, but the large majority of roads which accrue their revenue on a "received" basis, that is to say, those which credit their revenue or income account when the freight arrives at destination and the transportation service is complete and the contract fulfilled, would suffer a very large loss of revenue under the provisions of General Order No. 17. Of course, the losses to the corporations would be minimized if the congestion at the close of federal control should be as great as at the beginning of federal control,—a condition which is scarcely possible because at the close of federal control, under peace conditions, there will not be the enormous volume of traffic and priority orders that caused the congestion and delay which existed at the beginning of federal control. However, as to lap-overs, that order was framed on an unsound accounting basis, and provided a hit-or-miss division of the freight revenue between prior or corporation account, and the accounts of the federal Administration. This condition was later modified by the contract, see Section 4, paragraph (b), and by accounting circular No. 53 of December 2, 1918.

The accounting circular No. 53 is still on a hit-or-miss basis, although it does provide for an adjustment of certain delayed carload shipments on which the service was completed prior to federal control but the accounting delayed until during federal control. However, accounting circular No. 53 does not take care of the large number of shipments,—carload and less than carload,—that were delayed in transit on which the service had not been completed at December 31, 1917. Take for example a carload shipment moving from Chicago to Baltimore, which reached Pittsburgh in December, 1917, and lay there until, say January 10, 1918, when it moved out to destination, the settlement being made on the "received" basis. The lines west of Pittsburgh included in their operating expenses, the cost of transporting that shipment from Chicago to Pittsburgh, but never have, and according to the present attitude of the Railroad Administration, never will receive a dollar for such transportation. An offset will result at the end of federal control if a similar car is en route from Chicago to Baltimore, reaches Pittsburgh just prior to the end of federal control and lays there until after the end of federal control, and then moves to destination after federal control, the revenue being taken into the accounts of the corporation after federal control. If a sufficient number of such cars move just prior to the end of federal control, to produce the same lap-over revenue as that produced by delayed cars which moved just prior to the beginning of federal control, there would be an offset, but considering the congestion that existed at the time the railroads were taken over, and that probably there will be no congestion at the end of federal control, it is inconceivable that there will be anything like the number of such cars en route at the end of federal control as at the beginning of federal control. It has been urged that to make a separation of the accounts between the carriers, would require additional clerical expense, and of course, it is true that to prepare an account accurately requires more clerical work than to guess at it. It is my judgment that the railroads as a whole will lose millions of dollars because of the failure to separate the freight revenues at the beginning and at the end of federal control on the

basis of the service performed; that is to say, take the case of the shipment Chicago to Baltimore, hereinbefore referred to; the revenue from Chicago to Pittsburgh should have been credited to the corporation because the expense of that haul was charged to the corporation, and only the revenue from Pittsburgh to Baltimore should have been credited to the federal Administration because the Administration paid the expense of that haul. The increase of 25 per cent in freight rates would require that 80 per cent of the freight that was delayed en route at December 31, 1917, should be delayed en route at the end of federal control; that is to say, where there were 100,000 lap-over cars from certain points to certain points delayed in transit at certain points at December 31, 1917, there should be 80,000 lap-over cars from the same points to the same points, delayed in transit at the same points, at the end of federal control in order to give the corporation an erroneous credit which would offset the erroneous credit given the Railroad Administration at the beginning of federal control. If there should be less than 80 per cent of such cars delayed in transit at the end of federal control, the corporation loses revenue; if there should be more, it will gain revenue, but such methods are unbusinesslike and are not good accounting methods. I daresay that the accounting between the U. S. Railroad Administration and the War department, Navy department, or any other department of the same government, is not conducted on a basis as loose as that.

Of course, as to the less than carload shipments, the average haul is shorter, the amount of money involved is smaller, and the expense of separation is greater. The majority of the less than carload shipments of freight are handled on the "received" basis, while the passenger business is handled on the "forwarded" basis. The less than carload business might be ignored and any loss to the corporation thereon be considered as an offset against the gain in the passenger business. In those two cases, the amount of revenue involved would be comparatively small, and although it is unbusinesslike not to make any attempt at a separation on the basis of service performed, yet accountants must be practical, and where the expense is liable to be more than the amount involved in a separation of accounts between the railroad and the government during the time of war, there would be no serious objection to waiving the strict accounting practices in such cases. However, the expense of apportioning the revenue on carload shipments substantially in accordance with the service performed, would not be seriously burdensome and where millions of dollars are involved, good accounting and businesslike methods should not be sacrificed.

Another question regarding these lap-overs relates to the proper accounts to be charged and credited by the corporation after the amounts have been determined. A bulletin was put out by the Committee on General Accounts of this association, stating that Alexander Wylie, chief examiner of accounts, of the Interstate Commerce Commission, had ruled that these lap-over expenses and lap-over revenues should be charged and credited to the income accounts of the carriers, while a large number of railroad accounting officers maintain that they should be charged and credited to the profit and loss accounts of the carriers. The theory on which the instructions to charge and credit the income account is that if the corporation had been operating the properties, these items would have been taken into the income account under the head of operating expenses, operating revenues, etc. In other words, the decision is based on an "if" statement, but the "if" goes the wrong way. The corporations are not operating their properties and have not operating expenses, operating revenues, etc., in which to include those items. Furthermore, the corporation's income account is based on the average net railway operating income for the test period, which theoretically is complete and represents the

complete income for those three years including the lap-overs from the beginning of the period and excluding the lap-overs at the end of the period. An average of three complete years makes the complete income account so far as the operating accounts included in the standard return are concerned. Hence, any lap-overs added to the income account or deducted therefrom, cause a mis-statement of the income of the corporation.

Another reason for requiring such items to be debited and credited to the income account of the corporation, was to offset the corresponding debit or credit to the income account of the Administration, so that when the two accounts were put together, these lap-over debits to expenses and credits to revenues would disappear in the consolidated account, offsetting each other. However, I have learned recently that it is the intention of the Administration, and I want to express my commendation of their proposed practice, not to charge and credit these items to the Administration income account, but to set up reserve accounts which will take care of similar items that will be charged and credited to the Administration after federal control. It is evident, of course, that at the end of federal control there will be lap-overs in expenses which must be charged back to the federal Administration, and lap-overs in revenues which must be credited back to the Administration. If these items are put into the income account of the Administration currently, it will be necessary for the lap-overs to be put into the income account of the Administration a long time after the close of federal control, which might prove very embarrassing to the Administration because they will run into millions of dollars. It seems to me to be very wise, good business and sound accounting for the Administration to charge and credit these lap-over items to a reserve account against which they will charge and credit similar items after the end of federal control.

#### Corporate Transactions

Certain debits and credits are made to the corporations by the United States Railroad Administration under the head of "Corporate Transactions." These debits and credits represent payments or receipts by the federal officers which are chargeable or creditable to accounts outside of these comprised in the standard return. Such debits and credits should be carefully examined by the accounting officers to determine whether or not they are properly chargeable or creditable to the corporations, and the principle to govern is whether or not the item is properly chargeable or creditable to an account which is not embraced in the standard return.

#### Verification of Accounts

One of the principal duties in connection with corporate accounting is to check the debits and credits made against the corporation by the U. S. Railroad Administration, to determine the accuracy of the lap-overs, the charges for additions and betterments, the charges against corporate transactions, and in fact, all debits and credits made against or in favor of the corporation, in order to see that the corporation's revenues and income are properly protected so far as its accounts with the Administration are concerned. Of course, this does not mean that the corporate accounting officer is to neglect in any way whatever his usual functions with regard to strictly corporate transactions which are not handled by the Administration, but this section of the paper is to lay emphasis on the necessity of checking the accounts with the federal administration. Not only should the items which are charged and credited to the corporation be thoroughly audited and their accuracy completely determined, but the accounts of the federal books should be examined with a view of determining whether or not omissions have occurred, which would affect the accounts with the U. S. Railroad Administration.

As to the lap-over items, the principal work will be in the

freight and passenger departments, and that work diminishes as time goes on, because naturally there would be more lap-overs in January, 1918, than in any subsequent month, and so on until the present time, the lap-over items are very small. However, as most of the railroad corporations did not get their corporate accounting departments on a working basis until the latter part of 1918, it is probable that the work of checking the lap-over debits and credits and the accounts to determine whether omissions have occurred, has not been completed to date by very many carriers. For this purpose, first-class accountants should be employees. Any lack of ability on the part of the accountants checking the accounts with the government may result in heavy losses in revenues to the corporation. It is much better to defer the work to some later day than to employ inferior accountants for that kind of work.

#### Co-operation of Corporate and Federal Accounting Officers

Throughout this paper, reference has been made to the protection of the revenues of the corporation. This has been done for the reason that the subject assigned to me was "Corporate Accounting during Federal control." The accounts between the U. S. Railroad Administration and the corporations involve hundreds of millions of dollars resulting from transactions which must be recorded on the federal books. Hence, the federal accounting officer is interested in protecting the revenues of the corporations to the extent of seeing that all his accounts with the corporation are recorded with the greatest degree of accuracy. From my personal knowledge of the honesty and fair dealing of the railroad accounting officers of the United States, both federal and corporate, I know that during federal control the federal accounting officers have been diligent and faithful in their efforts to record all transactions with the corporations, with the greatest degree of accuracy and thus to render substantial assistance in protecting the revenues of the corporation. If any federal accounting officer has intentionally deprived the corporation of revenues to which he believed it was justly entitled, whether through erroneous debits or through omission of proper credits, then such accounting officer is unworthy of his profession and is unworthy of membership in this great association, but I will not believe that such an one exists.

#### Director of Accounts—U. S. Railroad Administration

While in this paper I have criticised a few of the accounting provisions of the Administration, it is not intended to create the impression that I think the Administration has a weak accounting department. On the contrary, I think it has a strong accounting department, administered in its details by men of recognized accounting ability. It would be a miracle if all of the accounting provisions of the Administration were beyond criticism. I also want to pay a tribute to Director C. A. Prouty at the head of the Division of Accounts of the U. S. Railroad Administration, in his administration of that department. The magnitude of his duties prevents him from giving attention to details, but the policy of his administration has been broad and fair-minded.

#### Conclusion

Many other things could be said with reference to corporate accounting during federal control; this paper has attempted to touch simply a few of the high spots as they appeared to the writer. It would be an insult to the intelligence of the many experienced accounting officers if I should attempt to go into the details and try to touch upon every phase of this subject during federal control. If my paper has resulted in suggesting chains of thought which may be of benefit to the corporations and to the U. S. Railroad Administration, the effort has been amply repaid.

# Doings of the United States Railroad Administration

With a Reduced Appropriation the Administration Is Making Every Effort to Hold Down Expenses and Increase Traffic

WASHINGTON, D. C.

**D**IRECTOR GENERAL HINES returned to his office on Monday after a speaking and inspection trip to Boston, Denver, Chicago, Omaha, St. Louis and Birmingham. He will also speak before the Philadelphia Chamber of Commerce on Friday and before the New England Bankers' Association at Boston on Saturday. Mr. Hines has stated that he is exceedingly anxious to come into contact with the people of the country as far as it is in his power to do so and to get them to understand the policies which he and his associates are trying to carry out in the Railroad Administration, as well as to seek every practical opportunity to get the point of view of the people as to what the Railroad Administration should do. He is also presenting his views and suggestions as to a permanent solution of the railroad problem and in his speeches takes occasion to explain why he is not yet prepared to decide on a rate increase. In one recent address he said he had had the rather unique experience of having various shippers come to him urging that rates ought to be increased. This he attributed to the fact that "there has been such a striking object lesson that railroad prices have increased to a much greater proportion than the rates have been increased, and therefore that the railroad operations are not likely to be self-sustaining in business with no increase in rates."

## Appropriation Is Reduced

The principal effect of the reduction of the Railroad Administration appropriation from \$1,200,000,000 to \$750,000,000 apparently will be in the direction of making it necessary for the Railroad Administration to continue, although to a less extent, the policy forced upon it during the time it has been waiting for an appropriation, of postponing some of its disbursements as long as possible. The estimate of its requirements did not represent contingencies but amounts already expended, contracted for, or to which it stood committed and practically none of the items can be reduced. As soon as the money is made available it will be possible to pay off the certificates of indebtedness, of which \$234,000,000 were outstanding on May 31, and to make additional deferred payments on rental and equipment which were not represented by certificates. Meanwhile its working capital will be somewhat increased and a considerable part of the payments on equipment will not become due until later, by which time it is hoped that they will be financed by an equipment trust, and also pressure will be brought to bear on the corporations to pay what they owe to the government for additions and betterments. The financial situation of the Railroad Administration will then depend largely on the amount of any additional operating deficits and on how fast the corporations are able to finance their indebtedness. The administration officers feel some relief because of the suggestion held out by the House committee that an additional appropriation may be had later and presumably it will follow familiar methods of adjusting its disbursements to its cash on hand until it becomes necessary to ask for more.

From June 2 to July 1, according to an estimate prepared some time ago, the requirements of the railroad companies amount to \$190,850,271. Of this \$113,000,000 was for corporate requirements, \$51,000,000 for maturities, \$23,000,000 for capital expenditures and \$2,962,000 for equipment other than standard.

## Contracts Executed

The Railroad Administration has executed a compensation contract with the Illinois Central providing for an an-

nual payment of \$16,540,717 and one with the Yazoo & Mississippi Valley for \$3,862,317; also one with the Bennettville & Cheraw for \$29,077. Short line co-operative contracts have been executed with the Boyne City, Gaylord & Alpena; Virginia & Truckee; Tennessee, Alabama & Georgia; Wilmington, Brunswick & Southern and the Loranger, Louisiana & North Eastern.

The War Finance Corporation has made a loan to the Wabash of \$68,000 and to the Seaboard Air Line of \$110,000 on the security of certificates of indebtedness issued by the director general of railroads.

## Improvement in Traffic Noted

In the Central Western Region there was an increase in the loading of grain, for the week ended June 9, amounting to 64 per cent over the same week of last year; live stock loadings increased 34 per cent in the same region. Grain loadings in the Northwestern region showed an increase of 100 per cent over last year, while grain products, livestock and miscellaneous freight also showed increases. Passenger travel is on the increase in nearly all the regions and indications are that it will continue to improve.

Reports from the Southwestern region continue to show increases, both in freight loadings and earnings, the increases amounting to 11.1 per cent for the past week. Both the local loading and the cars received from connections show increases. Cotton is moving more freely in this region and with promises of additional steamers for Gulf ports, an increased shipment is expected in an effort to reduce the large surplus on hand.

A summary follows:

*Eastern Region.*—Reports from nearly all sections still show the general movement of freight and coal traffic to be sub-normal. The blast furnace situation remains about the same, and while the ore movement on the lake is increasing, it is not up to last year's figures. Passenger traffic continues good, and the travel on Decoration Day was extremely heavy, some stations showing largest receipts in history of their companies.

*Allegheny Region.*—Heavy orders for refrigerator cars have been received through Chicago and Potomac Yards, and special attention is being given to the handling of this equipment. Some slight improvement is noted in the blast furnace situation in Pittsburgh district. The demand for box cars continues heavy, and we are just able to meet requirements.

*Pocahontas Region.*—Coal dumped at tidewater for the week showed an increase of 50 per cent over the preceding week, although still showing considerable decrease under last year's dumping.

*Southern Region.*—The cotton movement seems to be increasing throughout the region. The recent fall in prices handicapped planters to the extent that their activities were embarrassed and their purchasing power reduced to the minimum. The recent sharp advance in price, however, has enabled them to recoup their losses, dispose of much of their cotton which they have been holding, and consequently they are in better financial condition, and have again become an element of large purchasing power in the Southern region.

*Northwestern Region.*—Reports a gradual improvement in the general movement of traffic, particularly merchandise and eastbound tonnage. The loading for the week, how-

ever, showed a decrease of 8,468 cars, consisting principally of coal, coke, lumber and ore. There is a continued improvement in the Pacific Coast Lumber situation. The oil traffic from Wyoming fields continues to show an abnormal increase and the facilities for handling same were taxed to the utmost. The movement of ore for the week shows a decrease of about 15 per cent under corresponding week of last year, but the output of the independent companies is improving and the indications are that the production of ore will be normal in a short time. The movement of freight east-bound is about the same as last year, but the westbound movement is lighter, due chiefly to absence of shipbuilding material and munitions, which moved in large quantities last year, also lighter exports through Puget Sound ports. Passenger business continues to show an increase over last year, particularly pleasure travel. The recent warm weather has greatly stimulated resort and vacation travel, and many requests are being received for reservations.

**Central Western Region.**—During the week 93,914 cars of all freight were loaded in this region, which was 4 per cent less than the same week of last year. Passenger travel in general continues to be heavier than last year, particularly to Colorado and locally within the state, on account of the inauguration of summary tourist rates. There is also an especially heavy movement at the present time between Kansas City and the new Texas oil fields. Notwithstanding the heavy outbound travel from Southern California, it is reported that the number of people there seems as great as ever, and that hotels and apartment houses are still crowded and unable to accommodate all applicants. Indications are that as soon as means of transportation are available, a large number of foreigners will leave Southern California for their native countries.

**Southwestern Region.**—Crops in general are in need of warm weather and sunshine, as the rainfall throughout the Southwestern region, especially during the last two weeks of May, caused considerable damage to cotton, wheat, corn and alfalfa hay. Regular passenger travel, both local and through, continues above normal with adequate equipment provided to handle same. The movement of farm hands to harvest fields during the present month will be an item of considerable importance.

**Railroad Administration Paying Little Extra Compensation**

Up to June 1 claims for extra compensation had been allowed amounting to \$3,709,887 and an estimate of \$1,500,000 has been used, in figuring the total standard return at \$940,000,000, as a reserve to take care of additions to compensation which may yet be allowed, although the claims pending amounted to \$26,285,000. The total claims filed amounted to about \$69,000,000. The federal control law of March 21, 1918, provides in section 1 that "If the President shall find that the condition of any carrier was during all or a substantial portion of the period of three years ended June 30, 1917, because of non-operation, receivership, or where recent expenditures for additions or improvements or equipment were not fully reflected in the operating railway income of said three years or a substantial portion thereof, or because of any undeveloped or abnormal conditions, so exceptional as to make the basis of earning hereinabove provided for plainly inequitable as a fair measure of just compensation, then the President may make with the carrier such agreement for such amount as just compensation as under the circumstances of the particular case he shall find just."

It is also provided that claims not adjusted may be submitted to boards of referees appointed by the Interstate Commerce Commission. Following is a statement of the disposition of the various claims for extra compensation up to June 1:

STATEMENT SHOWING NAMES OF RAILROAD COMPANIES WHICH HAVE FILED CLAIMS FOR COMPENSATION IN ADDITION TO STANDARD RETURN AND DISPOSITION THEREOF

Recapitulation of claims allowed to June 1, 1919, in excess of standard return.

Baltimore & Ohio	\$2,136,932.60
Chicago, Milwaukee & St. Paul	440,073.98
Carolina, Clinchfield & Ohio	173,798.41
Northwestern Pacific	172,479.50
Missouri & North Arkansas	161,230.00
Kansas City, Mexico & Orient	140,926.61

\*Baltimore & Ohio allowance includes \$1,724,800 allowed for Toledo & Cincinnati Division, which had no separate standard return, for the reason that during the test period it formed a part of the lines of the Cincinnati, Hamilton & Dayton and made no separate report to the Interstate Commerce Commission.

Georgia & Florida R. R. (including Augusta Southern)	116,000.00
Western Pacific	86,229.76
St. Louis Southwestern	67,303.78
Cumberland & Pennsylvania	19,885.50
New York, Susquehanna & Western	19,007.00
Wrightsville & Tennille	16,531.20
Salina Northern	15,000.00
Van Buren Bridge Co.	11,126.47
Louisville & Wadley	2,819.57
Trinity & Brazos Valley (lump sum)	100,000.00
Gulf, Texas & Western (lump sum)	29,734.80
<b>Total</b>	<b>\$3,709,887.09</b>

Claims denied to June 1, 1919:

New York Central	\$5,339,941.20
Chicago, Rock Island & Pacific	5,193,045.34
St. Louis-San Francisco	4,971,520.70
Missouri Pacific	4,383,736.12
Wabash	2,731,368.00
New York, New Haven & Hartford	2,000,000.00
Great Northern	1,426,320.00
Eric Railroad	1,397,577.91
Minneapolis & St. Louis	1,073,680.75

**Director General Appeals for Efficiency and Economy**

Walker D. Hines, director general of railroads, has sent the following letter to all officers and employees of railroads under federal control:

"The increased payroll cost, due to improved wages and working conditions, and the increased cost of material and supplies, are now resulting, in connection with the falling off in business, in the United States Railroad Administration incurring heavy deficits in railroad operations.

"For the first four months of this year, these deficits, after deducting the rental due the railroad company, were about \$250,000,000 or at the rate of \$62,500,000 per month. This critical condition makes it imperative not only that costs shall not increase but also that every effort be made to help the government through every reasonable effort to economize and realize greater efficiency.

"These deficits, so far as they cannot be eliminated through greater economies and through increased business, will eventually have to be offset by increased transportation rates which all should endeavor to avoid.

"I ask every officer and every employee to redouble his efforts to do efficient work, to economize in the use of railroad materials, fuel and other supplies, and to use great care not to injure equipment, tools, office furniture or injure property being transported by the railroad and for which payment must be made if injury occurs, and further than this, to try to encourage others to do the same. Please remember that if you should fail in any of these respects to do what you reasonably could and ought to do you would impose unnecessary cost upon the government. This is true because it is the government which has to bear the loss if there is one or which will receive the profit if any is earned.

"Do not wait for the other fellow to begin this improvement, but begin yourself. Do not decline to help because some other fellow is not helping; turn in and help, and keep on setting the other fellow a good example. You are interested in the great movement for the improvement of the condition of the individual worker. You can aid in that great movement, through efficiency and saving in reducing the cost of railroad operation, because thereby you help to keep down transportation rates, and thereby you help to keep down the cost of living. An increase in rates will give occasion for an increase in prices of what the public consumes and that will mean a new cycle of increasing still further the cost of living. It is to the interest of every man, woman and child in this country that this shall be avoided just as far as possible.

"The government, during federal operation of the railroads, as a result of its nation-wide control, has been able to do much to promote justice to railroad employees through making proper increases in their wages and proper improvement in their working conditions. In the nature of things the result cannot be equally satisfactory to all, involving 2,000,000 employees, because it is not possible in this vast undertaking to satisfy equally every one or even every class of these employees. If any employee feels he has a ground for such dissatisfaction he ought to remember the remarkable strides that have been taken by the government in the last 12 months in the recognition of the just rights of railroad employees, and compare the situation today with what it was in December, 1917, before federal control began. It has been a

source of satisfaction to me to aid in this great work. Will you not, in turn, do justice to the government and help sustain my work, as director general, and also justify what has been done for you, by doing all that you can reasonably do to save the government money and to increase the efficiency of your work?

"I sincerely want your assistance in demonstrating that the railroads may be operated successfully even though the wages of its employees have been materially increased."

**Report on Fort Washington Collision**

THE INTERSTATE COMMERCE COMMISSION has issued a report, dated April 10, signed W. P. Borland, chief of the Bureau of Safety, on the rear collision on the Philadelphia & Reading near Fort Washington, Pa., January 13, 1919, which resulted in the death of 14 persons and in the injury of 22.

This collision was reported in the *Railway Age* of January 17, page 212, the accident having happened in the same week with that at South Byron, N. Y.; also in the monthly record printed in the *Railway Age* of February 28, page 510.

While the principal cause was the failure of the engineer of train 319 to observe the adverse indication of a distant automatic block signal, the report brings out other elements. The signals are enclosed disks, and the distant signal is not controlled by the position of the home signal; it is controlled directly by the track circuits of the two block sections in advance. The engine had two cabs, the engineer's cab being located ahead of the firebox and about the center of the locomotive. The colliding train, No. 319, was running at moderate speed, but the engine, weighing 98 tons, penetrated the wooden passenger car at the rear of the standing train about 45 feet. None of the cars in either train were derailed.

A test of the brakes on train 319 developed that the engine had no brakes on the engine truck, and that the piston travel on the tender was too great, so that the brake apparatus of the engine and tender, as a whole, was weak.

The flagman went back only about 1,500 ft. and there stood from 3 to 5 minutes before the approach of the following train; by going a short distance farther he would have made his signal visible beyond the abutment of an overhead bridge.

The report recounts very careful inspection of the signal apparatus, leading to the conclusion that the possibility of any abnormal condition existing in the distant signal, which would be necessary to justify the engineer's claim that he saw a clear signal, is exceedingly remote. The engineer declared that about six weeks prior to this collision he had found this distant signal clear when the next succeeding home signal was at stop; but from testimony of the signal maintainer it appears that the distant signal, in indicating clear, was in proper position, and that the wrong position of the home signal was due to local circuit trouble in the clearing relay. Though the home signal indicated stop, the section was in fact clear.

The engineer at fault is 39 years old; was employed as fireman in 1907 and promoted to engineer in 1913. In February, 1918, on account of unsatisfactory service he was put back to firing; and was restored to the position of engineer twelve days later. Since then two other adverse items appear on his discipline record. The flagman is 35 years old, and had been in the service 13 years; was a freight train conductor for one year.

Fifty miles in 26 minutes, 23.2 seconds is the latest speed record reported in an automobile race. This record was made at Sheepshead Bay, New York City, on June 14, by Ralph De Palma. It is equal to 113.7 miles an hour.

# Convention of the Telegraph Superintendents

## Mailgram Service, Wire Crossings and Pole Line Construction Among Important Subjects Considered

THE TELEGRAPH AND TELEPHONE division of "Section 1—Operating," of the American Railroad Association, held its first annual meeting at the La Salle Hotel, Chicago, June 11, 12 and 13. This division of the A. R. A. was formerly the Association of Railway Telegraph Superintendents and this was the thirty-seventh meeting of the former association. M. H. Clapp, manager of the Telegraph section of the United States Railroad Administration and chairman of the division, presided, and the total registration was about 180. The chairman said that although the reorganization was intended to be only for the duration of the Railroad Administration he felt that it was for the best interests of the members that the amalgamation be permanent. He said that reports presented were to be divided into two groups consisting of those ready for final adoption and those of a preliminary nature. He made a plea for co-operation in and between different departments, railroad companies and commercial companies.

R. H. Aishton, regional director the Northwestern region, United States Railroad Administration, made a short address Thursday morning. He referred to the wonderful progress that had been made by the association in the past. In 1908 the only telephone circuit for train despatching in use was one 45 miles long on the Chicago, Burlington & Quincy, while at the present time there are 13,440 miles of such circuits. He was a great believer in association work and favored amalgamation with the American Railroad Association; the railroads will of necessity have to look to somebody to keep them from being foolish after their return to private operation. No railroad would be foolish enough to go against recommendations of such a body as the American Railroad Association. What is accomplished by the association will in the course of the next four or five years come very close to being railroad law. If the roads go back to private operation at the end of the year it will be under changed and better conditions and greater progress will be made during the next few years than ever before.

A banquet was given for the members of the association on Thursday evening at the La Salle Hotel under the auspices of the Railroad Telegraph and Telephone Appliance Association. The speakers were E. E. Nash (C. & N. W.); C. Selden (B. & O.); G. A. Cellar (Pennsylvania Lines West), and H. Hulatt (Grand Trunk).

### Committee Reports

Sub-Committee A.—Maintenance and Construction of Pole Lines of committee No. 1—Construction and Maintenance, Outside Plant, presented a preliminary draft of pole line specifications including 15 of the proposed 16 sections but in general without the official drawings and without certain appendices yet to be decided upon. A plan for pole line specifications involving complete independence of any other organization or company was presented at the meeting held in Chicago last December. It was decided, however, to develop through joint action if possible uniform specifications satisfactory to both railroad and telegraph interests and this report was made upon this basis. The specifications provide for three grades of line according to the character of circuits carried, viz., special trunk lines, trunk lines, and non-trunk lines. Trunk lines are described as all pole lines carrying trunk and other important circuits; special trunk lines are defined as special pole lines connecting important centers. Non-trunk lines are all other pole lines.

The specifications also divide the country into four pole-line districts determined by the severity of the climatic conditions which are designated as extra heavy, heavy, medium and light, respectively. The various grades of the lines to be built under these specifications are to be fitted to climatic conditions. The committee asked approval of the plans submitted and for further instructions.

E. C. Keenan, general superintendent telegraph, New York Central, pointed out the advisability of the committee establishing a set of specifications based on engineering principles and offered an amendment to the original motion to the effect that the committee should continue along lines consistent with principles heretofore adopted by the Association of Railway Telegraph Superintendents. He proposed changes in certain tables.

William Bennett (C. & N. W.) felt that it was unnecessary for the committee to follow engineering principles in pole line construction as strictly as for other items of railroad construction; railroads could operate temporarily notwithstanding failure of pole lines.

E. A. Chenery, general superintendent telegraph Southwestern region, United States Railroad Administration, stated that under the present specification a mile of 41 Class B 22-ft. chestnut poles carrying 40 wires would cost \$1,355 which is considered a pretty good pole line, compared to practice 10 or 20 years ago when 30 to 35 poles per mile was common practice. Comparing these figures with the proposed specifications for pole lines in extra heavy districts, the cost would be \$1,327 to \$2,419, the lower figure being for non-trunk lines. A mile of pole line in extra heavy districts would cost from \$1,951 to \$2,419 or from 41 to 80 per cent more than the same line built under present specifications. Every railroad has some mileage so important that a 50 per cent increase in the cost of construction is not justified. The report was accepted by the association as a progress report.

### Wire Crossings

The report of sub-committee B,—Wire Crossings, Committee No. 1 Construction and Maintenance, Outside Plant, contained recommendations covering wire lines crossing over railways. Dr. M. G. Lloyd of the Bureau of Standards requested the association to criticize the Bureau of Standards' proposed revision covering such crossings. This revision was considered at committee meetings and the sub-committee conferred with Edwin B. Katte, representing the Committee on Electric Working of the A. R. A. and the Committee on Electricity of the American Railway Engineering Association, who concurred in the recommendations of the sub-committee as presented here. In the proposed revision the Bureau of Standards wished to have the rules governing signal line crossings over railways based upon engineering principles with proper assumed loading so as to be consistent with other sections of the Safety Code. While the proposed revision as shown by the first draft is generally based upon scientific principles it contains some articles which in the opinion of the committee were not consistent with good railroad engineering practice and changes were proposed. After the Bureau of Standards finally issues its revision it is the purpose of the sub-committee to get up detailed specifications for wire crossings over railroads as well as parallels or conflicts between signal lines and power lines. The association instructed the committee to proceed

along the lines on which it was working with the understanding that it follow the engineering practice of the Bureau of Standards.

### Underground Construction and Transpositions

Sub Committee C,—Underground Construction, Committee No. 1, Construction and maintenance, Outside Plant, reported on a revision of the draft of the specifications which appeared in the proceedings of the meeting held in Chicago last December. The specifications presented at this meeting prescribed the general requirements for underground conduit construction for telegraph, telephone and other low voltage signal cables on railroad right-of-way. The specifications covered conduit construction, general specifications, high and low tension ducts in the same trench, location and clearances, manholes and handholes, and material. The report was adopted as recommended practice.

Sub-Committee D. Transportations, Committee No. 1, Construction and Maintenance, Outside Plant, submitted complete specifications for locating and installing transpositions in telephone circuits. The specifications were accompanied by numerous transposition diagrams for standard auxiliary and unit sections showing non-phantom, horizontal phantom and vertical phantom transpositions. The specifications cover the creating of both physical and phantom telephone circuits and provide a method for transposing these circuits so as to reduce inductive disturbances from neighboring circuits. These specifications follow those of the American Telephone & Telegraph Company and the Western Union Telegraph Company. It is the intention of the sub-committee during the coming year to prepare specifications for the line materials which are referred to in these specifications.

The question was asked whether the telegraph wires should be placed above or below telephone circuits and as to where the ticker circuits and signal circuits should be placed on the pole line. In answer the chairman of the sub-committee said there was no preferred position as regards the telegraph and telephone circuit but that the ticker circuit should be on an end pin on the top cross arm in order to be as far removed from inductive disturbances as possible. When signal circuits were carried on the same pole line with the telephone and telegraph circuits the signal circuits should be on the lower cross arm.

### Report on Office Wiring and Equipment

Committee No. 2, Construction and Maintenance, Inside Plant, submitted a preliminary draft of specifications for the installation of telegraph and telephone equipment in railroad offices. The report was accepted as a progress report.

### Reports on Electrolysis and Lighting Protection

Committee No. 3—Protection Against Electrolysis, presented a report which consisted of a general discussion of electrolysis as affecting telegraph and telephone conductor cables, its nature, causes and remedies with descriptions of instruments for making electrolytic tests and instructions concerning the use of such instruments. Certain specific maintenance instructions were also given. The report was accepted as recommended practice.

Committee No. 4 submitted a report on Protection Against Lightning and Against Electric Light and Power Circuits in the form of a preliminary draft of specifications for such protection. The committee felt that it was necessary to differentiate between wires owned by railroad companies and those not owned. During the discussion some members felt that the railroad companies should specify the protection to be used on all lines entering railroad company buildings irrespective of whether they were owned by the company or not. Others felt that specifications should not be carried that far as the larger telegraph and telephone companies

have their own specifications which may be presumed to be safe. Some felt that hazard to life had been given secondary consideration and property hazard first. The report was accepted as showing work accomplished to date.

Committee No. 5—Telegraph and Telephone Development, presented a report upon a number of recent improvements which was accepted as information.

### Messages and Mailgrams

Committee No. 6—Message Traffic, reported in part as follows: "Assuming that many communications have been offered for transmission by wire which would have served their purpose equally well if handled by mail, we are confronted with the proposition of establishing a dividing line between message traffic and mail traffic."

The committee recommended that the railroads generally be asked to instruct all persons originating telegrams and correspondence to offer for transmission by wire only communications which require attention prior to the time such attention would be given if forwarded by mail or where the transmission by wire will mean a considerable money saving. A mailgram service could be established to advantage on practically all railroads. "Mailgrams" should be placed in a pouch in the telegraph office and, immediately before the departure of train, a special messenger should be sent to the train with the pouch, delivering it to the train baggageman. At destination a telegraph office messenger meets the train and takes the pouch to the telegraph office, from which point the messages are delivered the same as telegrams. On some railroads special forms of envelopes, or envelopes specially stamped, are kept open in the telegraph office until immediately before the departure of a train on which such telegrams can be carried as mail.

The rest of the report discussed censoring, filing time, adequate address, use of symbols and codes. These items were referred back to the committee for further consideration.

### Regulations Governing Telegraph

#### and Telephone Division

The regulations as drawn up by the Committee of Direction for the Telegraph and Telephone division Section 1, Operating, were presented to the meeting and they were adopted. The regulations provide:

1. Representatives of members shall be those actively connected in official or supervisory capacities with railroad telegraph or telephone service, who have general charge of such service over an entire railroad or grand division of a railroad consisting of two or more transportation divisions. A reasonable number of such other employees in supervisory capacities as may, from time to time be presented by the railroads for reasons special to themselves, or as may be called by the Telegraph and Telephone division for special duties may be designated as temporary representatives of members.

2. The Committee of Direction consists of eleven representatives of members within the division, including the chairman and the first and second vice-chairman of the division, the two past chairmen of the division last holding office, and six representatives of members; and a committee on Nominations of five members to be elected annually by the division.

The Committee of Direction shall conduct the business of the division and fix the number of and appoint the members of committees. For the present there shall be the following:

Committee No. 1—Construction and Maintenance—Outside Plant.  
Committee No. 2—Construction and Maintenance—Inside Plant.  
Committee No. 3—Protection Against Electrolysis.  
Committee No. 4—Protection Against Lightning or Electric Light and Power Circuits.  
Committee No. 5—Telegraph and Telephone Development.  
Committee No. 6—Message Traffic.  
Committee No. 7—Filing.

3. Regular meetings of the Committee of Direction shall

be held quarterly, and regular meetings of the division in March and September. The September meeting shall be the annual session. Special meetings may be held at the call of the Committee of Direction.

4. The Committee of Direction shall offer the names of ten representatives of members, not officers of the division, as candidates for the committee on nominations.

5. Defines duties of the Committee on Nominations.

6. Officers shall be elected at the annual meeting. The chairman, the first and second vice-chairman and members of the Committee of Direction and the Committee on Nominations shall be elected by printed ballot each year, the candidates receiving the majority of the votes cast shall be declared elected and shall hold office for one year or until their successors shall be elected.

7. The right to hold office, vote and attend executive sessions shall be vested in representatives of members only.

### Election of Officers

Martin H. Clapp, manager Telegraph section United States Railroad Administration, was elected chairman; J. F. Caskey, superintendent telegraphs, Lehigh Valley, first vice-chairman; H. Hulatt, manager of telegraphs, Grand Trunk Railway System, second vice-chairman. The secretary of the telegraph section is J. E. Fairbanks, 75 Church street, New York. The members elected on the Committee of Direction were: G. A. Cellar, superintendent telegraph, Pennsylvania Lines West; E. A. Chenery, general superintendent telegraph on Southwestern region, United States Railroad Administration; W. H. Hall, superintendent of telegraph, Missouri, Kansas & Texas Lines of Texas; C. S. Rhoads, superintendent telegraph, Cleveland, Cincinnati, Chicago & St. Louis; L. S. Wells, superintendent of telegraph and electricity, Long Island Railroad, and F. T. Wilber, superintendent of telegraph, Illinois Central. In addition E. C. Keenan, general superintendent of telegraph and telephone, Eastern region, United States Railroad Administration, and William Bennett, superintendent of telegraph, Chicago & Northwestern.

### The Appliance Association Elects Officers

The Railway Telegraph and Telephone Appliance Association at its annual meeting at Chicago on June 12, re-elected the following officers: A. D. Walters, New York Telephone Company, New York, (chairman); G. A. Graber, Kerite Insulated Wire & Cable Company, Chicago, vice-chairman; G. A. Nelson, Waterbury Battery Company, New York, secretary-treasurer. The executive committee of the association also remains unchanged.

### Orders of Regional Directors

**F**REIGHT CAR DISTRIBUTION.—The regional director, Eastern Region, by a circular, dated June 12, issues revised instructions for sending freight cars towards home. System cars will be confined to local loading to the fullest extent practicable and will not be furnished for off-line loading if other suitable equipment is available. In filling orders for off-line loading, special effort should be made to furnish equipment for loading to or in the direction of: (a) the car owner; (b) the Regional territory in which car is home; (c) to an intermediate connection in the direction of car owner or Regional territory in which car is home; (d) locally in the direction of car owner or Regional territory in which car is home. In furnishing empty cars on Inter-Regional or Regional orders, care will be exercised to furnish to fullest extent possible cars owned by: (a) the receiving road or roads; (b) the receiving Regional territory in which car is home.

**Superheaters.**—A. T. Hardin, regional director, Eastern Region, by circular 500-1-97A728A promulgates for the information of federal managers the order of the director of the Division of Capital Expenditures relative to the application of superheaters to locomotives. The order says: "Consideration by the Mechanical Section of the Division of Operation develops that these superheaters will not pay for the cost of application, irrespective of the cost of the material, if the engine is not actually in service by October 1, 1919. It is of course expected that business judgment will be exercised in installing the superheater even after that date, but unless the corporations are willing to stand the operating charge as well as the capital charge for applying superheaters after October 1, 1919, the program should cease as of that date."

**New Locomotives Moved Free.**—The regional director, Eastern Region, by circular 500-1-106-A783, advises that no freight charges are to be assessed on any class of new locomotives moving from the works of the builders to the purchasing roads, whether under their own steam or dead in trains.

**Label Holders for Express Cars.**—The regional director, Eastern Region, by circular 500-104A784, recommends that all cars used in express service be fitted with two holders, one on each side, for the labels used by the express company. A standard label, six inches by nine inches has been adopted, and the circular shows a drawing of a metal holder suitable for this size label. It can be made of sheet metal or of cast iron. The holder should be near enough to the door to permit of being reached by a person standing inside, and with the center of the holder about six feet above the rail.

**Per Diem Settlement.**—Supplement 4 to Circular 78 of the Northwestern regional director amplifies instructions contained in Supplement 3 to Circular 78 (*Railway Age*, page 1202, May 16) regarding per diem settlements with non-federal controlled roads. A similar order has also been issued by the Southwestern regional director.

**Shipments of Nut and Bean Oil.**—Order 212 of the Southwestern regional director states that shipments of nut and bean oils are being made in barrels and other wooden containers which are not of sufficient strength to prevent leakage and instructs all concerned to apply rules making it permissible to decline freight unless shipped in containers of sufficient strength to afford reasonable protection.

**Movement of Oil and Tank Cars.**—Order 211 of the Southwestern regional director amends Circular 72 issued on April 9, 1918, by Regional Director R. H. Aishton to all western railroads in that roads in the Southwestern Region may symbol, report and handle as trainload 20 or more cars of oil for one destination instead of the 25 cars stipulated as the minimum for the movement of oil in train lots in the original order. All trains may be filled out with other traffic when practicable and where it can be done without unreasonable delay. In any case where the engine rating is less than the tonnage of 20 cars of oil, then the full engine rating of oil tonnage will be considered a trainload of oil.

**Routing Instructions for Eastbound Carload Freight.**—Routing Circular 103A—Chicago, superseding Routing Circulars 101, 102, 103 and 104, issued by J. E. Weller, resident traffic assistant, Allegheny Region, Chicago, outlines routing instructions for eastbound carload freight including fresh meat, live-stock, perishables, grain, grain products and dead freight originating in Chicago districts and west, when destined to the Allegheny or neutral territory. These routing instructions are not to apply when in conflict with current embargoes.

**Atlantic City Convention.**—Hale Holden, regional director of the Central Western Region, in a letter dated June 6, to federal and general managers of Central Western railroads, issues similar instructions to those contained in Circu-

lar 131-75A731A of the Eastern regional director (*Railway Age*, June 13, page 1438).

**Notifying Consignee of Arrival of Freight.**—Supplement 1 to Circular 74 of the Northwestern regional director states that freight waybills do not ordinarily show the street address of consignee and that notice of freight arrivals, where street address is not shown, should be given by sealed letters rather than by postal cards in cities where mail is delivered by carriers because of the fact that postal card notices which do not show street addresses are not delivered, whereas sealed letters without street addresses are delivered when the city directory shows the location of person addressed.

**Forage Consigned to Army Camps.**—The Northwestern regional director, file 73-1-83, amends orders issued in a circular dated February 14, (*Railway Age*, February 21, page 444), relative to the weighing of shipments of forage consigned to army camps. The Southwestern regional director issues similar amendments in Supplement 1 to Order 165.

**Cotton Shipments to Southern Points.**—Circular 221 of the Southwestern regional director outlines instructions issued by the regional director of the Southern Region relative to the shipment of cotton originating at points west of Chattanooga, Tenn., Birmingham and Montgomery, Ala., and Pensacola, Fla., and destined to Jacksonville, Fla., Brunswick, Ga., Savannah, Ga., Charleston, S. C., Wilmington, N. C., proper or for export through these points unless shipments are covered by transportation orders issued by the Inland Traffic Service or by permits issued by the Southern Export Committee, Atlanta, Ga., and requests that cotton restricted by this circular be refused for shipment unless covered by the proper authority.

**Flexible Staybolts.**—Northwestern Regional Purchasing Committee Bulletin 146 states that the American Locomotive Company has completed the installation of equipment necessary for the manufacture of flexible staybolts and will prepare to furnish them upon order.

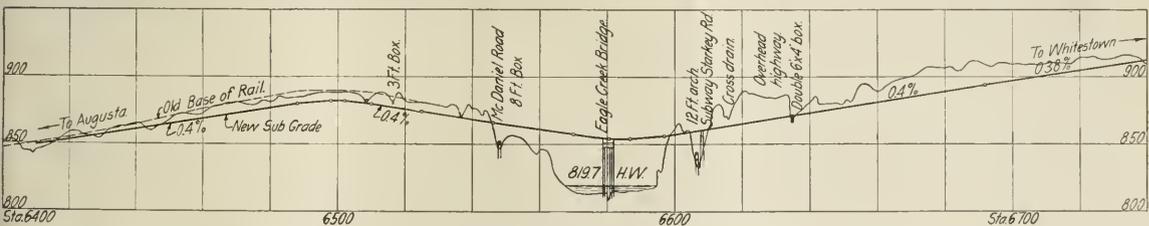

## Big Four Increases Capacity At Congested Points

### Builds 87 Miles of Second Track and Reduces Grades to Handle More Traffic During War Period

**A**N INCREASE IN TRAFFIC density on the Cleveland, Cincinnati, Chicago & St. Louis during the war period made it necessary to provide additional facilities, particularly second main tracks. As a consequence the construction of 87 miles of second track was undertaken during 1917 and 1918, nearly all of which is now in service. The largest part of this is on the Cleveland-St. Louis line, the backbone on the Big Four system. Later, work was also undertaken on the Chicago-Cincinnati line and on a short stretch at Columbus, Ohio, in connection with terminal improvements at that place. Considerable improvement in grade was undertaken in connection with the second track work, but, as explained later, the conditions did not warrant a complete change in ruling gradients on any of the

Marion, Ohio to Cleveland 101.5 miles. Of this last stretch the 21 miles between Marion and Galion consists of the parallel, single-track lines of the Big Four and the Erie which are operated as joint double track. The 284 miles of line between Cleveland and Indianapolis is operated as two engine districts; one of 141 miles from Cleveland to Bellefontaine and one of 143 miles from Bellefontaine to Indianapolis. The ruling grade in both districts is 0.8 per cent in both directions. The present improvements include 18.6 miles of second track between Ansonia, Ohio and Winchester, Indiana, and 44.6 miles between Gretna, Ohio and Marion, work on which has been in progress since the latter part of 1917.

All of this work is being conducted in conformity with a

Profile of the Zionsville Cut-Off North of Indianapolis

engine districts. In only one case was it found necessary to make a deviation from the existing alignment.

#### The Cleveland-Indianapolis Line

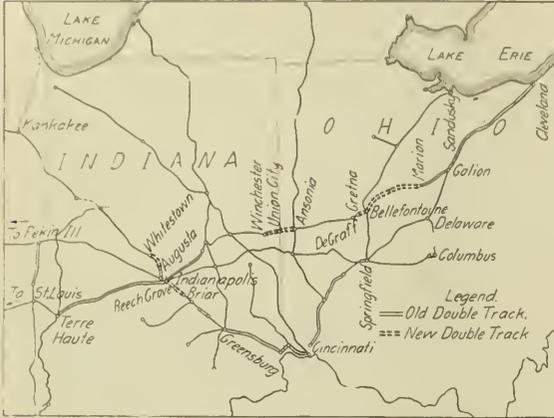

All of the improvement work on the Cleveland-St. Louis line is east of Indianapolis. This is the busiest section of the road. The traffic amounts to about six passenger and seven scheduled freight trains each way daily, in addition to extras. During 1916 the gross tonnage handled amounted to 8,782,000 ton miles per mile of road while the train movements aggregated 6,800 freight and 5,700 passenger train miles per mile of road. Previous to the inception of the present project double track had been in operation on this line between Indianapolis and Taft 32.9 miles, and from

program for reducing the ruling grade in both directions to 0.3 per cent, with the exception of that portion of the line crossing a summit about four miles east of Bellefontaine where the track reaches an elevation of about 1350 ft. above sea level, one of the highest points in the state of Ohio. The two approaches to this summit cover practically the entire distance of 25 miles from DeGraff, at elevation 1000, to Ridgeway, at elevation 1060, and entails the use of 0.8 per cent grades which could not be eliminated on the present location, without an objectionable increase in distance. It would be possible to build a line several miles to the north of the present location which would largely avoid this summit, but such a line would miss the city of Bellefontaine and involve the abandonment of the engine and freight ter-

minal facilities at that place to which the railway company has been committed. This solution also would not have afforded the immediate relief to the congested line which it was possible to obtain by second tracking on the existing location, since this plan adopted afforded opportunities to

new eastward yard and the extension of the existing "B N" yard east of Bellefontaine, each of which comprises a simple grid of tracks having car capacities of 86 to 102 each.

The work between Marion and Gretna was relatively light, consisting in the main of the widening of existing embankments and cuts. The cuts were taken out with teams and the lighter fills were made with material from the cuts and from borrow pits. The heavier fills were made with material handled by train from steam shovel cuts. One of these was in the eastward yard which required 195,600 cu. yd. of excavation, 33,000 cu. yd. of which was used for filling in the yard and the rest in the completion of main line embankments. After the completion of the excavation in the yard this shovel was moved to a borrow pit near Mt. Victory for the completion of the embankments between Marion and Ridgeway. In laying out the second track work, existing passing tracks were incorporated where this was possible, but new 100-car passing tracks were installed at intervals of about 10 miles. The work between Gretna

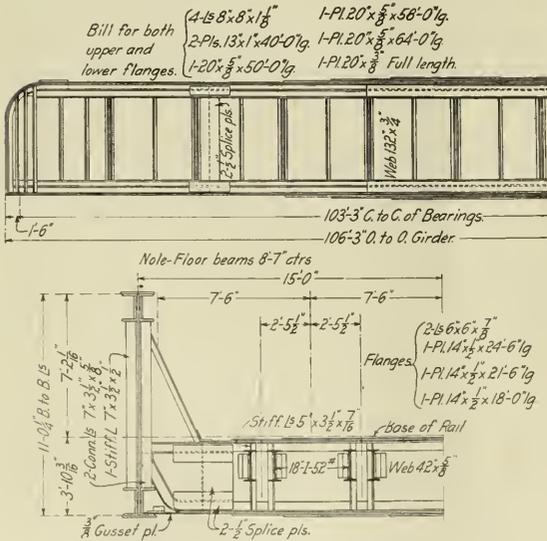

Map of a Part of the Big Four Showing Location of New Double Track

throw sections of the new track into operation as fast as completed. As a consequence it was concluded to double track the 21 miles from Ridgeway to Gretna without change of grade, except that the  $2\frac{1}{2}$  miles of 0.8 per cent grade east from the Bellefontaine yard to the top of the hill was reduced to 0.5 per cent against eastbound traffic. As a result of this arrangement the Bellefontaine hill still imposes a 0.5 per cent grade against eastbound traffic and an 0.8 per

Progress View on Bridge Construction at Columbus

Details of Heavy Girder Span Used at Columbus

cent grade against westbound traffic in the engine district between Bellefontaine and Cleveland, and it imposes an 0.8 per cent grade against eastbound traffic between Indianapolis and Bellefontaine.

In addition to second track work and grade changes the improvements in this section included the construction of a

and Ridgeway was finished in November, 1918, except for the extension of the "B N" yard, while the work from Marion to Ridgeway was started in July, 1918, and is now practically completed.

From Winchester to Ansonia the double-track work consisted partially in the widening of the existing embankments and cuts and partially in raising the grade through sags to reduce the gradient. Of this work which amounted to 500,000 cu. yd. in embankment, the heavier portion is between Union City and Ansonia. The improvement also includes the construction of a small enginehouse, coal dock, cinder pit and water tank at Ansonia to take the place of existing facilities at Union City.

The largest single feature of the earth work on this section is an embankment 10,000 ft. long containing 190,000 cu. yd. with a maximum raise above the old track of 17 ft. To build this it was necessary to place the operated track in a temporary position a maximum of 24 ft. to one side of the old center line at the old grade on a new shoulder which eventually formed a part of the higher embankment. With this temporary track in operation, the embankment was completed to the new grade line on the opposite side for as great a width as was possible without interfering with the

operated track. After this had been done, a track was laid and put in service on the new embankment which was then widened to the standard width. The shoulder for the temporary track and the first portion of the high embankment were made with teams from borrow pits along side having a maximum depth of 15 ft. A steam shovel was also used

filling without effecting much progress in the completion of the work. This difficulty was finally overcome by discontinuing the use of a heavy clay filling in favor of cinders, which, being much lighter and not being subject to the flowing which took place in the clay, did not disturb the equilibrium of the subsurface materials to any great extent. A more complete account of the experience with these sink holes was published in the *Railway Age* of January 17, 1919, page 217. All of the grading on the Cleveland divi-

Contractors Plant at the Eagle Creek Bridge

Building a Drainage Diversion Ditch Alongside the Eagle Creek Embankment

in this pit to supply material for completing this embankment after the track had been installed on the top and for widening embankments at other points in the section. All filling handled by the shovel was hauled in standard-gage equipment over the operated track. The bridge work on this section was of minor importance, the only structure of any size being an existing undercrossing used by an electric line. This had to be largely reconstructed to provide for the second track and a raise of seven feet in the grade line. Aside from the extension of the abutments and the raising of the grade, the single-track, deck girder span was replaced by a reinforced concrete slab.

sion was done by the Walsh Construction Company, Davenport, Iowa.

**Heavy Work Near Indianapolis**

By far the heaviest and most interesting feature of all the improvement work undertaken by the Big Four is the double track work between Augusta and Whitestown, a short distance north of Indianapolis. This improvement covers 10.2 miles of which 4.5 miles is on a new location known as the Zionsville cut-off. This constitutes an extension of sec-

One of the points of chief interest attached to this section of the work arose from difficulties encountered with sink holes. At several places east of Union City, the bottoms

The Embankment in the Eagle Creek Bottoms

of depressions traversed by the railroad are underlaid with a stratum of peaty loam of varying thicknesses. In three locations this was so thick that the weight of the newly imposed embankment squeezed it out along each side and pronounced and protracted settlements occurred, accompanied by extensive upheavals of the adjacent ground surface. As a consequence large quantities of material were placed in the

ond track on the Indianapolis-Chicago line which had previously extended from Indianapolis to Augusta, a distance of 10.8 miles. It also affords a considerable improvement in grade and alinement. The old line has grades of 0.78 per cent southbound and 0.67 per cent northbound, whereas the new line has maximum grades of 0.4 per cent in each direction conforming to the adopted ruling grade between

Indianapolis and Kankakee, Ill. The maximum rate of curvature on the old line is 2 deg. 37 min. with a total central angle of 75 deg. 56 min. whereas the new line now has a maximum rate of curvature of 0 deg. 30 min. with a total central angle of 34 deg. 50 min. The saving in distance on the new line is important, amounting to 2,500 ft. or nearly one-half mile. A total of 586,000 cu. yd. of earth work in excavation is involved.

On the basis of its physical features this project is naturally divided into four sections. At the south end is 3.2 miles of second-track work on the old alignment, the most important feature of which is an 11,530 ft. grade reduction involving a depression below the existing grade to a depth of 8 ft. and requiring the removal of 189,000 cu. yd. of material. This total includes a 2,000-ft. continuation of this cut on to the south end of the cut-off. The cut-off embraces two essential features, an embankment a mile long and 40 ft. high across the Eagle Creek valley containing 478,000 cu. yd. and a cut 2½ miles long containing 397,000 cu. yd. The remainder of the work including 2,300 ft. of the cut-off

in the north cut moving without interference entails a carefully planned and extensive track layout as indicated by the use of 7 miles of temporary track in the 4½ miles of cut-off.

One noteworthy feature of this work is the special pains taken to obtain adequate drainage as well as freedom from washing of the cut and embankment slopes. Cuts were given a sub-grade width of 10 ft. from the center line of track plus a minimum of 5 ft. for a ditch, this ditch being increased 0.1 ft. in width for each 100-ft. of distance in the direction of drainage. The contractor was required to finish the cut in perfect slope while surface ditches of adequate proportions were provided wherever conditions demanded. In the long cut, the first 2,500 ft. from the lower end is drained by side ditches carried to a catch basin 500 ft. from the lower end where a depression in the ground line made it possible to install a line of 24-in. pipe leading down a transverse gully. At a point 2,600 ft. from the lower end of the cut the ground surface comes practically to grade for a distance of 150 ft. where a double 6-ft. by 4-ft. box culvert

Steam Shovel in the Big Cut Near Zionsville

and the north section of second track work consists of light fills with only two slight changes of grade in the second-track portion.

The lowering of the grade south of Eagle Creek is being accomplished by making a preliminary cut along the east side to the final grade without disturbing the existing track. This could be done readily for a considerable portion of the distance without any excavation beyond the finished cut line because the cut had to be made of sufficient width to accommodate a passing track on the east side. After turning trains over a temporary track at grade in this portion of the cut, the old track will be abandoned and the rest of the cut taken out.

This cut and the long cut north of Eagle Creek are being taken out with 70-C Bucyrus shovels, the material being handled by standard-gage equipment into the Eagle Creek embankment and some minor fills by dumping from trestles. Two shovels are being operated in the north cut and one in the south cut, each being served by two trains of 12-yd. Western air dump cars. The complete equipment includes seven six-wheel switch engines and 100 cars. To keep the four trains

was installed to carry the drainage of a creek that crosses the line. By depressing the bed of this creek for a distance of 200-ft. downstream, it was possible to use it as the out-fall for water draining into the cut north of this point, as well as for a surface ditch extending for nearly the entire length of the cut along the east side and a channel diversion ditch one half mile long on the west side. These surface ditches were made with teams before the cut proper was started, the material being wasted on the site of the cut so that it could be picked up by the shovels in taking out the cut.

The structures formed an important feature of this project, chief among them being the Eagle Creek bridge which is located about centrally in the long embankment. This is a reinforced concrete arch structure of the filled-spandrel type consisting of five semicircular arches—three central openings of 45 ft. with one at each end of 39 ft. The total length of the bridge is 273 ft. with a maximum height of 62½ ft. from base of rail to bottom of footing. It requires the placing of 6,200 cu. yd. of concrete and 112,000 lb. of reinforcing steel. Pile foundations were used.

# Railway Developments in Foreign Countries

## Authority Asked for the Construction of 1500 Miles of New Railroad in Mexico; Other Notes

### American Railway Manufacturers May Be Under Handicap in China

(From our Special Correspondent in China)

While there is considerable feeling of disappointment that America has not been able to "put over" a reorganization of affairs in the Far East, Chinese are not disposed to blame either America or Mr. Wilson. But they do point out that unless something very pointed is done, American interests are completely in eclipse. The peace settlement clearly recognizes the "sphere of influence" in China. It intensifies the competition between British and Japanese, with the French-Belgian interests holding a position of balance of power. Under these conditions, since there is no American "sphere of influence" or room in which one can be set up, American manufacturers are relegated to a position of permanent handicap. For a year or two, until Europe gets back to a peace basis, there is likely to be a small market for materials which are urgently needed, in which Americans may bid with some hope of success. But after that, the "home" dealer, it is thought to be beyond question, will always have the preference.

\* \* \*

The Peking Hankow has ordered 10 Prairie Type locomotives from the Baldwin shops and 10 more from the Lima works. Tientsin Pukow tenders are delayed pending a discovery of means of payment.

\* \* \*

The Ministry of Communications has received advices concerning the arbitration of the Shanghai-Nanking Railway net profits case, to the effect that one of its contentions has been sustained, one decided adversely, and one reserved for further taking of evidence. Due principally to the favorable rates of exchange for interest payments, this line found itself with a surplus for the year in 1916. The ministry contended, however, that deficits from previous years should be met before profits could be divided with bondholders. This is the contention which is sustained. It also contended that interest upon land purchases, although in excess of the amount provided in the contract, should be deducted as expenses, before a declaration of profit. This has been denied. Its third contention was that its regular depreciation charges are a proper charge to expense before declaration of profit, and this point is still under consideration. The immediate result of this decision, so far as it goes, is to release \$1,250,000 held in the treasury pending the award. This line is sorely in need of locomotives. Because of overwork, its expense for locomotive repairs increased in 1918 over 50 per cent above 1917, and loaded wagons were constantly being left standing for want of power. Whether the necessities of the government for ready money will permit the use of this sum now in the treasury for the purchase of the needed power remains to be seen.

\* \* \*

The Lung-Hai management has cancelled certain inquiries for bridge steel entered with an American firm just prior to the armistice. The explanation is that the line is now required to make such purchases "at home" (Belgium).

\* \* \*

The nearest official admission of approaching bankruptcy which any organ of the government has made was contained in the recent report of a conference between a representative of the Ministry of Communications and rep-

resentatives of the stockholders of the late Chekiang and Kiangsu Provincial railways. The Chekiang and the Kiangsu Provincial railways represent two of the many attempts made about ten years ago to build Chinese railways with local capital. The officials and gentry of these two provinces undertook to build a line from Shanghai to Ningpo. This route was already under contract to the British and Chinese Corporation, but yielding to this local pressure the Manchu government secured a release from the British. Some six or seven years of painful progress, quarrels among stockholders, and exhaustion of funds brought a realization that a foreign loan and foreign management was necessary. The government, now the Republic, therefore took over the line, agreeing to refund the shares with its own bonds and cash. The two lines have now been consolidated, practically rebuilt, and are operated by the Shanghai Nanking administration. But the shareholders object to receiving their interest in depreciated bank notes, and demand certain cash payments which were promised in installments. The latter the ministry representative professed to be impossible at the present and soundly scolded the provincials for expecting anything besides depreciated bank notes "when the ministry had millions of them which it can not dispose of."

\* \* \*

The Tientsin Pukow has now given notice of refusal to accept payment of freights or fares in anything but silver or its equivalent. This line has as managing director a brother of Hsu Shih Chang, president of the Republic. The other Chinese managed lines are still accepting the notes for payment of fares.

\* \* \*

The situation is very tense over reports from the Peace Conference in Paris. It has been rendered more so perhaps by the very evident tampering with telegraphs and cables along the China coast. For two weeks Peking has been practically out of communication with the outside world, except over the Japanese wireless. At the same time reports in the Japanese papers seemed to be baiting Chinese into some act of violence. At the same time that assurances were extended that Japan had succeeded to everything it claimed in Shantung, a Japanese paper published in Chinese in Peking contained a circumstantial account of the assassination of President Wilson. The result was that on the following day students of government schools formed a procession and marched to the legation quarter with banners expressing disappointment and anger with Chinese officials, who are held responsible in the public mind for "selling China." The delegation was peaceable until upon arriving at the home of Tsao Ju-lin, Minister of Communications, it found gates barred and the minister refusing to appear. The procession was immediately transformed into a mob, which broke down the gates, rushed the guards, and made a search of the house, breaking everything in its way. The minister made his escape, but his father was badly beaten in the hope of provoking Tsao to appear from his supposed hiding place. Chang Chung-hsiang, minister to Japan, who signed with Tsao many of the treaties and agreements which are objected to, was found in the house in conference with a Japanese. The latter was quickly passed outside without violence, but Chang was beaten and kicked into insensibility, and is now in the Japanese hospital. Tsao and Lu Cheng Yu, who also has

been implicated in the recent railway deals, took refuge in the Japanese Legation.

### Carranza's Railroad Program

#### Calls for 1,500 Miles of New Line

It is an ambitious program of government railroad building which President Venustiano Carranza has mapped out. In his recommendations to Congress authority is asked for the construction of more than 1,500 miles of new railway. It is expected that the recommendations will be favorably acted upon by Congress. It is significant that all of the proposed new lines cover practically the same routes that were designated in concessions that were held by American and British interests at the time their plans were upset by the beginning of the revolutionary period nearly nine years ago. The most important perhaps of the proposed new roads is that which is to run from a connection with the United Railways of Yucatan at Campeche, about 450 miles. The concession for the construction of this proposed line was owned by a syndicate of British investors at the time President Porfirio Diaz was forced to vacate the chair of chief executive. The route is through a remote part of Mexico that is said to be capable of wonderful agricultural development. The region is also rich in mahogany and other valuable timber. President Carranza's plan also embraces the construction of a railroad from Peto, state of Yucatan, to Chan Santa Cruz, in the territory of Quintana Roo, a distance of about 300 miles, including proposed branch lines. This proposed road would penetrate what was formerly the heart of the hostile Maya Indian country. The line would be of important military value, it is asserted. Another new line, the construction of which is recommended by President Carranza, has for its purpose the connecting of Ensenada, on the Pacific side of Lower California, with the Nogales-Guaymas branch of the Southern Pacific of Mexico, at a point a short distance north of Hermosillo. The building of branch lines is also contemplated. This proposed road would closely parallel the international border between Mexico and the United States and traverse a part of the rich Imperial Valley. It would also serve as a valuable factor in the movement of troops in time of troubles along that part of the border.

It is not questioned that the Mexican government may be able to assemble men and materials sufficient to carry out these railroad construction projects, but it is not understood where the equipment for operating the proposed lines is coming from. It is well known that the present railroad systems of the country are so short of equipment that traffic is far below normal. The new road which the government has constructed between Durango and a point on the old Mexican Central near Zacatecas is not being operated to any appreciable extent because of the lack of cars and engines. The same is true of the new line which the government recently finished between Cuatro Ciénegas and Sierra Mojado.

At this time a large force of men are employed on the construction of the railroad which the government is building between Durango and the Pacific port of Mazatlan. From an engineering standpoint this is one of the most difficult pieces of railroad ever attempted in Mexico. It involves the crossing of the Sierra Madres at an altitude of nearly 8,000 ft. and an almost precipitous descent to the sea-level of the coastal region. The late Collis P. Huntington, who built the old Mexican International from Eagle Pass, Texas, to Durango, had corps of engineers in the field constantly for several years endeavoring to find a feasible route over the mountains for the proposed extension to Mazatlan and none was found.

According to the report of engineers who have made an investigation of the physical condition of the National Tehuantepec, the expenditure of not less than \$15,000,000

gold will be required to place that line in shape to properly handle trans-isthmian traffic. This road was operated for many years by the British contracting firm, S. Westman Pearson & Son, Ltd., of which the present Lord Cowdray is the head. The firm had the road leased for a period of 51 years from the National government, but on account of pressure that the Carranza administration brought against the lessees, the lease was given up and the line turned back to the government some months ago.

The Pan-American which runs from Piacho, on the National Tehuantepec line, to Suchiate, 284 miles, is also bad off physically. This line was constructed by David Thompson, former American ambassador to Mexico, and associates. They disposed of the property to the Mexican government during the latter days of the Diaz administration at a profit of many millions of dollars, according to report current at the time. The Pan-American was to have been a link in a through trunk railroad that was to have continued on down through the countries of Central and South America. Just across the river from Suiache is Ayutla, Guatemala. The original plan was to extend the railroad system of Guatemala to a connection with the Pan-American, but this has not as yet been done. The coastal region traversed by the Pan-American is capable of producing big yields of various kinds of crops. Large areas of land in the territory along both the National Tehuantepec and the Pan-American are owned by Americans but on account of disturbed conditions that have prevailed for several years most of these properties have long been abandoned.

The Mexican Southern Railroad occupies an unique position in the government affairs of Mexico. Although the line is owned by the government it has been in control of the revolutionists under General Felix Diaz for several years. Little is known here as to its physical condition. It is said to be giving very good passenger and freight service between points on its line in the state of Oaxaca.

The government recently ordered that construction of the branch line that is to run from Allende, situated on the Eagle Pass-Torreón division of the National Railways of Mexico, to Las Vacas, 75 miles, be resumed. From an international standpoint this is a very important piece of work for the reason that Las Vacas is situated just opposite Del Rio, Texas, and it is purposed to connect there with the branch line of the Kansas City, Mexico & Orient that is to be constructed south from San Angelo. The National Railways of Mexico and the Kansas City, Mexico & Orient entered into a contract several years ago to jointly build a bridge across the Rio Grande at Las Vacas-Del Rio. The accomplishment of this project will mean the opening of a new international railroad gateway between the two countries.

### American Rivalry in Steel

#### Discussed in British Parliament

In the British Parliament on May 26 Lieutenant Colonel Sir F. Hall asked Sir Auckland Geddes, minister of national service and reconstruction, whether America was now able to import steel into Great Britain at a price which enabled manufacturers in the United States to undersell British manufactured steel by £4 10s a ton and upwards, after allowing for freight and all other costs; and, if so, what practical steps had been taken by the government to meet the position thus arising. In reply Mr. Geddes said: "I understand that American steel manufacturers are quoting prices for delivery in the United Kingdom lower than those quoted by British manufacturers (though, not so far as I am aware, to the extent suggested). As regards the second part of the question, his Majesty's government is) not prepared at present to impose any restrictions upon the importation of iron and steel, in view of the demand in the country."

Sir F. Hall interposed: "Is the right honorable gentleman aware that the difference of price is upward of £9 10s and that the government has undertaken to protect the interests of this country? Are they going to do anything or are they not?"

"Under the provisional trade policy that is being followed," Sir A. Geddes replied, "the interests of this country are being protected to the best ability of the government, and the matter is not so simple as the honorable gentleman appears to imagine. There is a very great demand for iron and steel in this country, which at present the producers of this country are unable to meet."

"Is not iron being produced at places which are much nearer the United States, and does it seem reasonable that Americans should be able to send this produce to this country at £9 13/4s per ton lower to the detriment of the manufacturers in this country?" asked Sir F. Hall.

"I do not know whether it is reasonable or not, but it is a fact that they are producing iron and steel at the present moment cheaper," was the answer, "and it is also a fact that our export still demands a large amount of iron and steel to be worked up in things to be exported."

**President-Elect of Brazil to Visit United States**

Dr. Epitacio Pessoa, who was elected president of Brazil on April 13 while he was in Paris serving as president of the Brazilian delegation to the Peace Conference, is to visit the United States on his way back to his country and is expected in New York on June 20. Dr. Pessoa is one of the first presidents of Brazil to be elected from a northern state, the presidents as a rule having hitherto been of the more populous and further developed southern regions. He is a comparatively young man. After taking his degree with honors in one of the leading law schools of Brazil, he became public prosecutor in the state of Pernambuco, where he revealed striking legal and oratorical abilities. He came rapidly to the front with the proclamation of the republic in 1889 and his reputation as a jurist won for him the position of professor of law in the faculty of the University of Pernambuco. At only 26 years of age, he was elected deputy to Congress and became one of its leading figures.

Before he was 33 years of age, President Campos Salles invited him to be minister of justice and public instruction in his cabinet, where he rendered brilliant service. Later, he occupied the position of attorney general for the republic and became a judge of the highest judicial body of Brazil, where, in the execution of his duties, he was noted for his firmness and impartiality. At the time he was appointed president of the Brazilian Mission to the Peace Conference, he was serving as senator from the state of Parahyba.

**Train Connection with Southeastern Europe**

Mr. Chaveille, the French minister of public works, presided recently over a meeting of diplomatic and technical representatives of Great Britain, Belgium, Switzerland, Italy, Serbia, Roumania, and Greece, called to consider under what conditions a train service could be established with the southeast of Europe to replace the former Orient express, writes Trade Commissioner Eliot G. Mears at Athens.

The proposed line will pass through the Simplon Tunnel, Milan, Venice, Trieste, Agram, and Belgrade. Ultimately the line will be prolonged to Bucharest and Constantinople, where a connection will be established with the Bagdad railway. A branch will go to Odessa. The project of building a suspension bridge to connect the two shores of the Bosphorus was also considered. This bridge would serve as a line of communication with Asia.

Train service with the Balkans will probably be established very soon, although no definite date has been set.

According to a plan announced in London, two trains will meet at Milan, one from Calais and one from Bordeaux. From there a single train will proceed to Brod, where a second division will be made with one part of the train going direct to Constantinople through Bucharest, while the other part will run direct to Odessa.

**Exports of Railway Track Material in April**

Exports of rails amounting to 60,463 tons valued at \$3,416,590 showed an increase over March but did not reach as high totals as in January or February. Exports during April of railroad spikes amounting to \$413,292 and of switches, frogs, etc., amounting to \$1,063,437 were, on the other hand, considerably greater than for any of the preceding months of the year. The figures in detail as compiled by the Division of Statistics of the Bureau of Foreign and Domestic Commerce were as follows:

Countries	Railroad spikes		Rails of steel		Switches, frogs, splice bars, etc.
	Pounds	Dollars	Tons	Dollars	Dollars
Belgium			3,802	197,098	21,116
Denmark			200	13,163	1,007
France	4,746,100	267,761	15,153	859,483	645,152
Italy					33,750
Norway	3,254	183	40	2,598	203
Portugal					725
Spain			646	32,755	19,734

Philippine Islands			777	54,822	3,157
British West Africa	16,800	1,244			
British South Africa			100	6,417	
Egypt			264	13,295	1,008
Total	7,799,630	413,292	60,463	3,416,590	1,063,437

**Exports of Locomotives in April**

The exports of locomotives from the United States in April, totaling 55 and having a value of \$2,193,168 were more than double those of March but not as great as in January or February.

The detailed figures as compiled by the Division of Statistics of the Bureau of Foreign and Domestic Commerce are as follows:

Countries	Steam locomotives	
	Number	Dollars
France	8	379,600
Italy	10	575,000
Canada	5	49,100
Cuba	12	364,889
Brazil	1	10,950
Colombia	3	85,085
China	5	260,000
Japanese China	8	457,986
Japan	3	10,564
Total	55	2,193,168

### Tokyo Considering Building a Subway

The city of Tokyo, Japan, is considering the building of a subway to help relieve its serious transportation problem. But in the meantime, and in order to receive immediate relief, the mayor of the city has recommended to the city council the purchase of 200 additional street cars.

### Railroad Affairs in Congress

CONGRESSIONAL CONSIDERATION of the general railroad problem has been somewhat delayed by the precedence given by the Senate and House committees to other matters in an effort to clear the decks, but Chairman Esch of the House committee now hopes to begin hearings either next week or the following week, depending on the time required by the water power bill, which will probably continue for about two months, and at which the director general and the Interstate Commerce Commission will probably be given the first opportunity to testify. The passage of the deficiency appropriation bill for the Railroad Administration has not been responsible for any delay because it was handled by the appropriations committees and not by the interstate commerce committees, but both the House and Senate committees have given some time to the problem of getting the wire systems returned, while the House committee has been concerned with the farmers' demands for the repeal of the daylight saving law and the Senate committee desired to do a little tinkering with the railroad laws before tackling the big question. Senator Cummins, who is in charge of general railroad matters, was ambitious to get through his bill to restore the Interstate Commerce Commission's power to suspend rates and other Senators took advantage of the opportunity to dispose of another question that has been disturbing them by tacking on an amendment requiring the director general to pay out of the railroad rental judgments based on claims that accrued before federal control. Many of such claims had been held up because it was not considered the duty of the government to pay them and many railroads were unable to pay them or took advantage of the fact that their property could not be attached while under federal control.

Some of the Senate committee members are also sympathetic toward the bills to amend the fourth section to require a strict enforcement of the long and short haul rule and hearings were held before the committee last week on Senator Poindexter's bill. Some of the Senators who had got their views on the question principally from the representatives of the inter-mountain country who have been most in evidence during the previous discussions on this subject, had their eyes opened when the first testimony was presented at this hearing by prominent representatives of a large number of shippers who vigorously opposed the bill and showed that its passage would not only not accomplish the desired object but would disrupt the rate structure in practically all parts of the country.

The Cummins bill, if it becomes a law, would leave the director general no more power to put rates into effect than that formerly possessed by the railroads. He may continue to initiate rates, but must file a fifteenth section application with the commission for permission to file a tariff increasing a rate, until January 1, 1920, when this provision of the law expires, and the commission may suspend his rates if it sees fit. Heretofore the Railroad Administration, while it has frequently consulted the commission, has merely filed its rates and set the effective rate, regardless of the former statutory 30 days' notice in many cases. The commission could review them later on complaint, and it has made several minor changes without any attempt to disturb the general 25 per cent advance, but meanwhile the rates were in effect. As to intrastate rates, the director general is still supreme, on the

theory, as stated by Senator Cummins, that it would be intolerable to have the federal administrator subject to the interference of 40 states. Efforts were made by several Senators to restore the former authority of the states, but it was recognized in the debate that the purpose was to give them an opportunity to reduce the rates increased by the Railroad Administration and that even if they did not do so affirmatively the state statutory rates might be put into effect. Senators Sheppard of Texas and McKellar of Tennessee introduced amendments to restore the state authority but were voted down after Senator Cummins had stated that it might be possible for the states, if given the authority, to reduce the federal income by \$200,000,000. Senator Trammell of Florida, however, secured the adoption of an amendment providing that no intrastate rate shall be increased until at least 30 days' notice has been given to the shippers of the state and a hearing granted. Another amendment provides that in computing the time allowed for presenting claims or bringing suit for reparation or loss or damage, the period of federal control prior to the passage of this bill shall be excluded.

The principal provision of the bill is as follows:

That during the period of federal control the right to initiate or change rates, fares, charges, classifications, regulations and practices exercised by the carriers now under federal control, prior to the 29th day of December, 1917, shall hereafter be exercised by the President, or by the director general of railroads, but such right as to interstate commerce shall be exercised under all the limitations and conditions which were imposed upon said right by the act to regulate commerce, approved February 4, 1887, as amended; and the Interstate Commerce Commission shall have as full and complete authority and jurisdiction to set aside, change, modify, suspend or otherwise review all such rates, fares, charges, classifications and regulations directly affecting interstate commerce as though the government had not assumed the possession and control of said transportation systems. To that end the said act to regulate commerce, as amended, is hereby declared to be in full force and effect with respect to rates, fares, charges, classifications, practices and regulations, anything in the act approved March 21, 1918, to the contrary notwithstanding. The procedure before the Interstate Commerce Commission shall be the same as formerly, except that the President or the director general of railroads shall stand in the stead of the carriers, and all notices theretofore required to be given to or served upon carriers shall be given to or served on said director general. All orders or findings of the commission shall bind the director general to the same extent as they formerly bound the carriers.

While this would make it slightly more difficult to put into effect a general advance in rates there is a belief that it offers a sharing of responsibility between the director general and the Interstate Commerce Commission that might not be unwelcome to both parties.

Senator Pomerene especially took occasion during the debate to criticize many of the rate and other orders issued by the director general. He said in effect that as a railroad man Mr. McAdoo was a wonderful secretary of the treasury. He also pointed out that whereas Mr. McAdoo had claimed a saving of \$6,000,000 last year on the salaries of executives, an examination of the director general's payroll indicated that there had not been much saving in the long run. He said that 72 men on the staff of the director general receive salaries aggregating \$1,398,100, or an average of \$19,418, which he compared with the \$15,000 received by the chief justice of the United States.

Several Senators said they were more interested in getting the railroads back to their owners than in the bill before them and expressed an opinion that the question of rate jurisdiction could well wait to be considered in connection with the proposed general legislation, but they were willing to support the bill. In reply to a question as to when such legislation could be expected, Senator Cummins expressed confidence that it could be worked out before the end of the year.

H. C. Barlow, representing the Chicago Association of Commerce, the National Industrial Traffic League, the Illinois Manufacturers' Association and the Illinois Traffic League, in testifying on the Poindexter bill said that those for whom he appeared are opposed to a rigid application of the long and short haul rule and that the act as it now reads is conducive to the greatest good to the greatest number. The commission should continue to have the broadest discretionary power because each case presents a different aspect. He said that if the railroads were prohibited from meeting the

water rates the intermediate points would not get the benefit anyway and he pointed out that the rates on sugar from San Francisco to Chicago are less than those to Kansas City because the western sugar industry could not reach the Chicago market in competition with Cuba by New York and New Orleans if the rates were higher. In such a case, he said, Chicago would be dependent on one source of sugar supply.

J. C. Lincoln, representing the Merchants' Association of New York and the National League of Commission Merchants, said the question involved is that of the railroads competing with water carriers and that the possibility of an all-water service from New York to the Pacific coast causes keen competition which the railroads have to meet if they wish to participate in the traffic. If not allowed to participate their ability to conduct their other business would be impaired and he thought the eastern shippers were entitled to the benefit of both rail and water facilities.

W. H. Chandler, who appeared for the Boston Chamber of Commerce and several New England industrial organizations, pointed out that a rigid long and short haul rule would encourage an increase in the water rates and would require the rail carriers to increase their non-competitive rates to make up for the loss of the other business. He also said that enforcement of a rigid long and short haul rule would mean either a very material advance in rates in the southeastern territory or a reduction of all rates to the level of the Mem-

phis and Mobile rates and that such a change would put New England out of market.

Senators Poindexter, Cummins and Pomerene kept referring to the argument that the present adjustment penalizes the intermediate points for the benefit of those enjoying water competition, while the witnesses asserted that their only penalty was by comparison with localities better situated.

J. A. Morgan, representing Texas shippers, and E. J. Rich, representing New England shippers, also opposed the bill.

E. E. Clark of the Interstate Commerce Commission testified on June 17, opposing the bill. He said he could not see how any public good could result from it while it would uproot rate structures representing years of development. He said the commission had done its best in applying the law but had felt it necessary to prevent undue disturbance of business relationships and had narrowed its policy in regard to meeting water competition from one of recognizing potential competition to recognizing only actual and active water competition as a justification for fourth section relief. He thought the commission should have power to establish minimum rates and to have control over the rates of water carriers and that possibly it would be well to lay down some rule to govern the commission in its application of the fourth section.

The representatives of the intermountain section were to be given their innings on Thursday.

## New York Commission on the Collision Problem

### Mechanical Automatic Stop Discussed and the Inventors Give Full Descriptions of Their Devices

THE NEW YORK Public Service Commission, Second District, held a hearing on the collision problem in New York City on Wednesday, June 18. The hearing was conducted by the full commission, Charles B. Hill (chairman), Frank Irvine, John A. Barhite, Thomas F. Fennell and J. A. Kellogg; with C. R. Vanneman, chief of the Division of Steam Railroads. Among those attending the hearing, many of them invited by the Commission, were F. P. Patenall, signal engineer of the Baltimore & Ohio; Frank Rhea, engineer, New York City; W. Y. Scott, signal engineer of the Boston & Maine; J. D. Bourne, superintendent, Boston & Maine; J. E. Sague, former member of the Public Service Commission; Frank J. Sprague, of the Sprague Safety Control and Signal Corporation, New York; D. H. Schwyer of the Schwyer Electric & Mfg. Co., Easton, Pa.; J. F. Webb, Jr., International Signal Company, New York; C. E. Doyle, "M-V All Weather" train control system; C. G. Riddick, locomotive engineman; Thomas E. Ryan, representing locomotive firemen; and other enginemen.

Messrs. Sprague, Schwyer and Webb spoke in advocacy of their respective systems and the locomotive men outlined the necessary elements of safety as viewed from their standpoint; while Messrs. Sague and Rhea appeared as independents, not favoring any railroad, any device or inventor or anything but the public interest.

The first speaker was Mr. Patenall. He suggested a closer alliance between the railroads and the inventors and said this was being done at present through the Automatic Train Control Committee of the Railroad Administration. He briefly outlined some of the systems of train control that have been tested. It has taken approximately 30 years to develop the present system of automatic visual block signals and it will be necessary to have patience in the development of train control apparatus.

Mr. Scott told of the practice with automatic block signals

on the Boston & Maine where each signal goes to the stop position before it is reached by the train which sets it; that is to say, the signal is set 200 ft. beyond the entrance to the block section; and the engineman, seeing it move, knows that it is in working order and will indicate stop behind his train.

Mr. Bourne told of his experience with surprise tests. He said that the Boston & Maine conducted large numbers of these tests which, he felt, were instrumental in securing proper observance of signal indications; personally he felt that an automatic train control would be a desirable adjunct.

Mr. Sague believed that safety of operation could be improved by using a full block overlap which would make it necessary for an engineman to run by two stop signals before colliding with a train ahead. At the time the full block overlap was discussed by the commission, some years ago, the members were divided on this question, as some felt it would have a tendency to make the engineman less vigilant in the observance of signals. He suggested the physical examination of enginemen who had reached a certain age; the further development of the present signal systems, and the use of surprise tests to improve discipline. It was a question in his mind whether generally speaking, a man of 60 odd years should be allowed to run high speed trains. Mr. Patenall raised an objection to the use of a full block overlap; it does not tell the engineman the truth as to actual conditions ahead. Mr. Sague favored automatic speed recorders on locomotives. He spoke of the high record for safety made by English railroads, where the flagman and the perplexities of the flagging rule, as experienced in this country, are unknown, and suggested that American roads ought to heed this lesson from British practice.

Mr. Webb described his mechanical automatic stop as it was tested over a period of two years on the New York, New Haven & Hartford. This apparatus was described in the *Railway Age Gazette* of April 13, 1917, page

789, and copies of this description were handed to the commissioners. Referring to electrical devices, with no mechanical contact, Mr. Webb said that there should be no unseemly rivalry; there would be room for several companies in this field; no one manufacturer can supply all the requirements of all the railroads. He claimed the advantage, for the mechanical device, that no further demonstration was needed. His two years' test had demonstrated the integrity of his apparatus. It had functioned properly in all weathers, through two winters, with never a failure; not even failures on the safe side (which cause unnecessary stops). His is the only machine that has been tested which operates at every signaling point, both when the road is clear and when it is not. The air valve is opened directly by the vertical member, when it comes in contact with the ramp on the roadway, requiring no intermediate apparatus. In addition to the apparatus that was tested, Mr. Webb has also a mechanical speed control device depending upon centrifugal force and the force of gravity.

He estimated the cost of equipping one engine and one signaling point at \$500 and was sure that he could provide satisfactory apparatus at a lower price than Mr. Schweyer, while Mr. Schweyer had named figures lower than those quoted by Mr. Sprague. The apparatus can be maintained by an ordinary mechanic; no special talent required; and repairs and renewals are not costly.

Asked about the results of his tests as throwing light on the effect of an automatic stop on the mind of the engineer, Mr. Webb believed that it was good rather than bad; the experience with automatic stops on the Interborough lines in New York City and on the Chicago & Eastern Illinois has shown that the enginemen are more vigilant, not less so. His company has already invested money amounting into six figures, but the conservative attitude of the railroads and the delays incident to the war have halted progress.

Mr. Schweyer described his induction apparatus which is now being tried on the Colebrookdale branch of the Philadelphia & Reading extending from Pottstown, Pa., to Barco. This apparatus was tried last year and was described in the *Railway Age* and, with illustrations, in the *Railway Signal Engineer*, but a new and more extensive installation is now being made for the inspection of the Committee of the United States Railroad Administration.

The induction apparatus is the only practicable automatic stop, because of the difficulty with clearances if mechanical devices are used. Induction is the only means of meeting climatic conditions. The air mechanism, as well as the electric circuits, must be normally closed so that a leak in the main reservoir will cause an application of the brakes. Audible indications may or may not be given in the cab. Audible signals at the roadside are not practicable in the present state of the art, as they must be designed on the open circuit principle. The air brake mechanism must be such that by merely turning a valve the application may be made either service, or emergency, and the service application must be of a predetermined amount, to be decided by the railroad company.

The public should demand that a start be made, even if money has to be spent lavishly in making tests. Millions of dollars have been spent on experiments in this field by private parties, and if a definite policy is not soon decided upon there will be little encouragement for further activities by inventors.

After the government committee has made its inspection (about July 7), Mr. Schweyer invites everybody else to come to Pottstown and see his apparatus. This can be observed in the baggage car; visitors need not ride on the engine. Mr. Sprague told of the experiments which he has been making during the past five years, and outlined what he held to be the wise policy to be pursued by the state and the rail-

roads. His device, which has met successfully the criticisms of the most conservative signal engineers, is still in the laboratory stage, but the United States Railroad Administration has asked him to prepare for an installation as soon as he is ready to do so.

Thomas E. Ryan, speaking in behalf of the Brotherhood of Firemen and Enginemen of New York State, called for the abolition of surprise tests, which he declared to be grossly unfair. He said that he expected the Director General of Railroads to issue an order forbidding such tests. Mr. Ryan answered numerous questions put to him by the commissioners. He and other spokesmen for the locomotive men protested against relaxation or suspension of the flagging rule (which had been suggested by another speaker). The firemen and enginemen want the flagging made more thorough and complete, both within and without yard limits.

Mr. Rhea gave in condensed form his views of the whole collision problem. He said, in substance: "There is a decided public sentiment in favor of requiring installation of devices for prevention of rear and butting collisions. This opinion is held by many representative business men, who doubtless have but vague ideas of the probable large cost of installation, the heavy continuing expense for maintenance and operation and the probable restriction of traffic capacity of the railroad; but the time has arrived for determining the real possibilities and limitations of automatic train control. The development of automatic train control can be properly done only by completely equipping given railroads of considerable length and operating automatic train control under actual service conditions. On account of the probable great cost the expense can best be borne and probably can only be provided as a matter of public expense instead of being borne directly by the railroads equipped. There must be entire unity of action by all interested parties, particularly by the regulating Public Service authorities.

"Methods of train direction can be divided into two generic classes: (1) Manual direction, including ordinary telegraph despatching, central controlled staff operation for single lines and lock and block for multiple track lines; (2) automatic direction, in which I include the so-called audible and cab signal systems as well as the usual automatic visual fixed signals.

"All classes of train direction and automatic train control must be considered as between single track lines with traffic in both directions and multiple track lines with traffic in one direction only on assigned tracks. To permit of the most desirable arrangement of single track automatic train control it is highly desirable, if not actually necessary, for the train control to be both 'cautionary' and 'stop.' For multiple track lines with traffic in one direction only on assigned tracks, while 'cautionary' control might be desirable, this is not a necessity particularly, as full protection can be provided by a complete overlap, although this arrangement may substantially restrict the traffic capacity of the line.

"There are at least two and probably three or four typical arrangements of automatic train control which can be installed as workable systems. The best ultimate system of automatic train control would be obtained by appropriating the best features of several suggested arrangements and combining these. The more simple problem of multiple track installation should first be attempted, to get the benefit of this experience for the more difficult problem of single track train control. It is highly desirable that all parts of all systems be standardized as far as practicable. If the best results are to be obtained, it is absolutely necessary that there be entire unity of requisites for the same classes of roads by all public regulating authorities. It is highly desirable that there shall be only one set of standards and requisites for the entire United States.

"To attain the best results the situation warrants tem-

porarily commandeering the best qualified men in the United States to carry out test installations; the number of thoroughly qualified men at present is limited. If overlapping of patents prevents the adoption of the best system the good of the public service warrants the commandeering of such patents as may be necessary for carrying out the best composite installations. Some railways are better adapted for trials than others and the situation warrants the commandeering of such railways, if necessary.

"With approval rather than criticism of past policy I feel warranted in making the statement that the installation of improved systems of train direction in the past has been equally a matter of expediting the movement of traffic as well as the safeguarding of the traffic. In fact the installations in many instances has been made on the basis of expediting the move-

ment of traffic as one of the best means of safeguarding it. In all probability installations of automatic train control will somewhat restrict the traffic capacity of the railroads so equipped.

"The cost of installation and expense of maintenance and operation no doubt will be very considerable, especially when taken into consideration with the possible restriction of traffic capacity, but in my opinion no definite conclusion can be arrived at until actual working results of automatic train control are available. Therefore, I believe unity of action by all Public Service regulating authorities is necessary and that the cost of installation and the extra expense of maintenance, operation and indirect expense, if any, of restriction of traffic, is properly a charge which should be borne by government appropriation."

## Canadian Railway Progress During 1917-1918

Forty-Four Per Cent. of the Mileage of the Dominion Is Now  
in the Hands of the Government

By J. L. Payne

Comptroller of Statistics, Department of Railways and Canals, Ottawa, Canada

THE RAILWAYS OF CANADA had gross earnings of \$332,777,937 for the fiscal year ended June 30, 1918, which was in the nature of a high level record. This total was \$19,284,988 better than that of the preceding year, and, to make such an encouraging feature more striking, it was \$89,694,398 above the showing for 1914—the year prior to the outbreak of war. The latter increment alone was greater than the aggregate of gross earnings no farther back than 1902. In fact, everything on the side of receipts was most satisfactory. Per mile of line, they reached \$8,493, which represented a gain of \$442 over 1917. Freight traffic swelled in volume and yielded a higher average per ton and per ton per mile. While the number of passengers carried showed a slight decrease, passenger train revenue and the average receipts per passenger per mile were above the results for the year before. All the conditions on the inflow side suggested growth and prosperity.

It would be very agreeable to stop there and ignore the other side of the account. The facts growing out of the positive side of railway finances in 1918 would make a gratifying and inspiring story, and it is always pleasant to be the bearer of good tidings; but the truth must be told. Despite the buoyancy of business and the expansion of revenues, the railways of the Dominion had rather a hard year. Operating expenses not only ate up the extra income, but made serious inroads on normal net earnings. Since all the operations of railroading find a focus in the running of trains, the results for 1918 may be summarized quite conveniently and illuminatingly in this vital statement. That whereas earnings per train mile increased for the year by 12.1 per cent, operating expenses per train mile increased by 29.5 per cent. In other words, while receipts grew by \$19,284,988, operating expenses grew by \$51,233,446. The railways were practically poorer by that difference. Net operating revenue fell from \$87,880,842 in 1917 to \$56,264,714 in 1918. Thus, while receipts gave encouragement, outgo brought despair.

The situation in Canada in 1918 will be better understood on further analysis. Out of 68 reporting units, 30 did not make one hand wash the other as between gross earnings and operating cost. Three more fell below superficial solvency when taxes had been paid. After deducting further fixed charges there were only 24 survivors, and of these six were

able to declare dividends. The aggregate of dividends was \$37,403,499, and of that the Canadian Pacific paid \$36,278,672. These facts put the whole case in a nutshell.

The railways, of course, saw the finish coming. It would perhaps be more in accordance with actual experience to say they felt it coming. They applied for relief in the only way relief was practicable—by being allowed to charge higher tolls. Resistance at once came from all quarters. Some of it was broad and general, in the sense that it was contended all passenger and freight rates were as high as they should be allowed to go; but the chief pressure was against the prosperous Canadian Pacific being permitted to better its earning power. The Railway Commission answered to the logic of stern and indubitable facts by granting increases equal to about 40 per cent all round, but, sheared the Canadian Pacific of any direct share therein by providing that all net earnings of that road created by the new rates should go into the Dominion treasury. The higher tolls went into effect in August, 1918, and will be reflected in the operating results for 1919.

In what particulars did operating expenses increase in 1918? On the surface, it would appear that all accounts were affected; but on further examination it is made clear that the chief difference between 1918 and 1917 was in the cost of labor and materials. The railways actually employed about 3,000 fewer persons, and yet the salaries and wages bill for the year was higher by \$22,648,766. Cost of materials made up in large measure the balance of the increase in operating expenses. If the figures attaching to the eight divisions of accounts be put side by side they practically tell their own story:

	1917	1918
Way and structures.....	\$41,154,193.11	\$51,614,857.71
Equipment .....	46,371,178.39	57,304,234.84
Traffic .....	6,236,810.91	6,342,393.99
Transportation—rail line.....	114,327,343.71	145,107,396.15
Transportation—water line.....	3,271,892.62	1,552,958.83
Miscellaneous operations .....	3,962,543.94	4,443,665.75
General expenses .....	7,584,881.55	7,597,985.10
Transportation for investment—Cr.....	18,207.15	8,056.58
Total .....	\$222,890,637.08	\$273,955,435.79

I have not taken up the space to show the percentage of each division in its relationship to the total; but the figures in that regard are surprisingly alike for the two years. That

is to say, the cost of maintenance of way and structures in 1917, for example, was 18.46 per cent of total operating expenses, and in 1918 it was 18.84. Maintenance of equipment showed 20.80 as against 20.92. To keep up those percentages, owing to the higher cost of labor and materials, meant a larger outlay in 1918, as compared with 1917, by \$21,393,721. This condition ran down through the whole list, and it very clearly and emphatically shows that the railways had to meet the higher cost of living created by the war in precisely the same degree as had individuals. If food, clothing and so on, cost railway employees more money, that additional cost had to be provided by the employers; and it was reflected quite directly in operating expenses.

It may be worth while to pause right here and interject a thought or two about this cost of living, which we see very clearly concerns the railways in a vital way. During the American civil war, and until 1866, the prices of all commodities went steadily upward to a very high level—in some respects almost as high as at present. Then they receded. The whole duration of rise and fall was not above twelve years. In fact, by 1870 the recession was very marked. The upward flight began with abnormal conditions, among which the low ratio of specie to total currency was an outstanding fact. The rise of prices from which we are now suffering began in 1896, and ran concurrently with a remarkable period of trade expansion and prosperity world-wide in scope. It was first demonstrated in the higher cost of food, and this led, quite naturally, to demands for better wages. In 1865 there was scarcely a trace of organization on the part of labor; in 1896 there was a vast change in that regard. The fattening of the pay envelope increased the power to bear the rising burden of food cost, which, we must see, was not attacking the problem at its base, but at its apex. Had a courageous and determined effort then been made to check the upward movement of food prices we should probably have a different situation today; for we must definitely recognize the basic character of food prices in relation to all prices. Higher wages to meet the higher cost of living was a process so much to the taste of the food profiteers, whose vast and powerful organizations had full control of supply, that from that time onward they persistently took advantage of it.

Higher wages quick logically and unavoidably meant the higher cost of all products into which labor entered. Thus was begun, with steadily increasing momentum, that process of reciprocal leverage by which the cost of one thing raised the cost of another. It has brought us to our present distressing position. The conditions being fundamentally different, there is scarcely any ground for the hope that the experience of 1862-1870 will be repeated. In my humble judgment, after most painstaking study of the whole problem, not only will prices be maintained, but they may be further advanced. The law of supply and demand cannot possibly be identified as the controlling factor in what has occurred, particularly during the past three years. What we have seen has been the easy triumph of organization over unorganization—the strong in that respect winning against the weak. On one hand, tremendous forces have been behind the exploitation of the world's needs for food, without regard to the adequacy of supply; on the other, consumers have not made the slightest attempt at co-operation and therefore have not offered resistance. In short, no matter from what angle our bitter experiences may be viewed, the whole trouble may be quite clearly traced to this lack of resistance. Hence, if a remedy for high prices is to be found it must have its foundation in some effective form of opposition. Market prices are made by human beings and not by the force of automatic and inexorable laws.

Can this resistance be asserted? To reply in the negative is to admit the loss of the war by the Allies. If the struggle was in behalf of democracy, and victory has come to those

who fought for that lofty principle, then the judgment of the majority must prevail. The winners are sane and sagacious. They can do anything for the common good if they are agreed about it and in earnest. Since food prices are clearly recognizable as forming the basis of all prices, then the course of action suggested is to proceed in a firm and comprehensive way to stabilize them. This should be done on the just ground of cost plus a fair profit. The cost of producing a pound of butter or a dozen of eggs can be ascertained with greater accuracy than can the cost of moving freight by a railway. We have seen freight rates fixed by law for a generation past, without any reference to the alleged law of supply and demand, and the producer of transportation is not in any essentially different position from the producer of food. What has been deemed just for one surely cannot be unjust for the other. If this is not done, then we must be prepared to see the operating expenses of railways rise with the upward movement of everything else.

The whole process by which the cost of food is first crystallized into the cost of labor, and then by reaction into the cost of everything which labor needs—moving upward at one end and then at the other in response to changing gravity—can only be arrested by taking control of the fundamental factor. That factor is food. It is now yielding what many regard as a high and more or less unearned profit to producers; yet prices will unquestionably continue to ascend unless steps are taken to interpose the thing now lacking—resistance.

From this digression, if it can be so regarded at a time like this when the responsiveness of railways to general conditions should be clearly recognized, we must get back to the presentation of further statistical facts regarding the year 1918. It has been said that traffic was buoyant. It was actually the best in the history of Canadian railway operations. Tons of freight rose from 121,916,272 to 127,543,687. For this higher volume of business the average receipts per ton per mile amounted to .736 cent, as compared with .690 in 1917 and of \$1.789 per ton, as against \$1.765 for the year preceding. The average trainload was raised from 436 to 457 tons, and in this betterment lies one of the brightest features in the story of 1918. It was by such means the strain of financial conditions was in some degree met. Tonnage per mile of road expanded from 3,159 to 3,281.

It must be borne in mind that Canada still has a considerable mileage of undeveloped line. The total operating mileage in 1918 was 38,879, which was 247 miles ahead of 1917. Since the outbreak of war in 1914 the addition to mileage has been 8,084. This would seem to indicate considerable activity in construction; but, as a matter of fact, it merely represents the completion of mileage which was under way when Germany invaded Belgium. Not a single new project has been undertaken since 1914, and at this juncture it does not seem probable that much railway building will be done in the near future. There are two difficulties in the way—high cost, and the uncertainty of subsidy aid by government. Practically all railways in Canada, with the exception of some of those which are owned in the United States, have been given substantial subventions. This policy of stimulating the increase of transportation facilities, in which the people heartily concurred, is alleged to have carried the Dominion beyond its immediate capacity to assimilate; but, apart from that consideration, the burden of debt arising out of Canada's conspicuous part in the war may call for rigid economy during the next decade at least.

Leaving aside all further references to merely statistical data, this brief sketch in relation to the year 1918 would not be complete without some allusion to the altered conditions under which 1919 was begun. On July 1, 1918, government assumed full possession of the Canadian Northern

System, thereby adding 9,479 miles to the 4,334 operated by the state at that time. Since then the Grand Trunk Pacific, with 1,794 miles of line, has passed into the hands of a receiver, and the Minister of Railways holds the assignment. To this might be added 1,000 miles owned by the Grand Trunk Pacific Branch Lines Company; so that, actually and prospectively, it might be assumed that government ownership has been applied to a system aggregating nearly 17,000 miles, or approximately 44 per cent of the total mileage of the Dominion.

This will appear on the surface like a very sweeping and significant change, and so it is; but due regard must be had to the facts of the case if a misunderstanding is to be avoided. This has come about wholly because of financial conditions. The Canadian Northern had fallen into difficulties just before the war, and with the outbreak of hostilities was unable to carry on its financing. Government was the guarantor of about 75 per cent of its total obligations, and because of that important fact deemed it expedient to take over the road. Although a decision has not been reached with regard to the Grand Trunk Pacific, the situation as respects guarantees is practically the same. The acting Prime Minister, speaking recently in Parliament on the railway situation, implied that it might also be necessary to absorb the Grand Trunk. In that event more than half of all the mileage in Canada would be brought under government ownership. Up to a few years ago the Dominion merely operated the two lines of railway, representing about 1,800 miles, which had been built as an integral part of the bargain of confederation.

It is no part of my purpose to write a single syllable either for or against the principle of government ownership. It is solely my intention to present in the briefest possible form, without comment, the facts of the case for the information of American readers. Let it therefore be clearly understood that the present situation in Canada was brought about by circumstances of a purely monetary character. Government might be regarded as having no choice in the matter. Be that as it may, the point to keep definitely in view is that the far-reaching changes of 1918 and the current year came about without a direct decision being reached by either government or the people on the underlying principle. Nobody may say at this moment that the judgment of either

the Administration or the voters of Canada has been declared in favor of or against state ownership of railways as distinct from corporate ownership. Whatever may happen in that regard in the future, scarcely a single aspect of the whole matter has been presented as a clear-cut issue. Certainly neither what has been done or may be done has as yet come before the people at large as a question of public versus private control of railways.

## The Military Railway\*

**R**APID TRANSPORTATION to the front, both of food and munitions, was made largely over narrow-gage military railways, thousands of miles of which were furnished by this company for use in France by the French Government from the beginning of hostilities, and also by the United States Government for the American Expeditionary Forces after our entrance into the war.

The French track was ordered mostly in sections 5 metres long, or approximately 16 ft. 4 in. and in 60 centimetre gage, which is slightly less than 2 ft. The weight of the French rail was approximately 20 lb. to the yard of single rail and the American 25 lb. to the yd. Eight pressed steel ties were riveted to the 5-metre lengths of French track, while American practice bolted the ties to the rail so that it could be packed knocked down to save shipping space. Although most of the track was in 5-metre lengths, many longer and shorter sections were used, all, however, in multiples of  $2\frac{1}{2}$  metre, accurately sawed so as to insure absolute fit of intermediate sections when shell fire necessitated replacement. Vast quantities of curved track were also specified as well as innumerable switches and turnouts. After the track was unloaded at the French port it was shipped over standard gage railroads to points close to the war zone. Here it was either stacked up according to length of sections to await requisitions from the Engineer Corps, or sent at once to the front. The necessary splice bars and bolts accompanied the track, so that the Engineer Corps were able to lay it quickly ready for use.

The "Stars and Stripes," the official newspaper of the American Expeditionary Forces, published in France, in a recent issue devotes much space pertaining to the contests which were held by the engineers in laying narrow gage track which had been shipped overseas unassembled to save shipping space. Remarkable results in distance of track laid per day were obtained by these contests, always friendly. Teams were composed of 12 men each, working in pairs. Six men bolted the ties to the rails, while the other six men, acting as helpers, supplied the necessary ties, splice bars, clips and bolts as fast as needed.

One contest started by two rival teams began at 7 o'clock in the morning and ran all day without let-up, in spite of raw winds and drizzling rains. One of the teams had not tasted defeat in track laying since it arrived in France 15 months earlier. But it had a strong rival this day.

"With the first defeat seemingly inevitable they became desperate. As the time for the finish grew shorter the two teams were neck and neck, but at the close they were the winners in a grandstand finish that equalled any uphill fight ever staged on the Polo Grounds in New York in ante-bellum days."

They had laid 280 sections, or about 4,572 feet of track, while their rivals were a close second with 279 sections, losing out by just one section, or approximately 161.3 feet. Officers had promised a feast for the winners, but the race was so close both teams were invited to the celebration that night in the mess hall.

Breaking-Up Shells at a German Manufacturing Plant

# General News Department

The Artesian Belt Railroad, connecting Macedonia and Christine, Tex., a distance of  $4\frac{1}{4}$  miles, was sold at auction on June 3, for \$150,000, to Harry Landa and associates, who will continue operation. They plan to make improvements in the near future.

Seven employees of the Kanawha & Michigan at Hobson, Ohio, have been arrested by railroad detectives, following the investigation of thefts of thousands of dollars worth of merchandise from freight cars in the yards at Hobson. The reports say that one of the men has signed a confession implicating the other six.

The shopmen of the Norfolk & Western of whom, according to the newspapers, a large number have been on a short strike, agreed with officers of the United States Railroad Administration on June 13 to go back to work this week Monday. Their chief grievance was the alleged unfair discharge of certain men. In the negotiations the shopmen were represented by officers of the American Federation of Labor.

Three hundred shop employees of the Southern Railways at Alexandria, Va., went out on strike on June 17 by way of protest against what they term the delay in passing on the proposed uniform rules and working conditions and also the general demand of the shop employees for an advance in wages which have both been before the Board of Wages and Working Conditions for some time. The strike was unauthorized and the men were persuaded to return to work later in the day.

Governor Frank O. Lowden of Illinois, and State Director of Finance Omar Wright have been exonerated of charges made by W. H. Malone, a member of the State Board of Equalization, of tampering with the State Board of Equalization over its assessment of the Pullman Car Company, in the original draft of the report of the legislative committee appointed to investigate the charges. Mr. Malone charged that the governor and Mr. Wright threatened to abolish the board if the Pullman company assessment was not reduced.

The Voluntary Relief Department of the Pennsylvania Lines West of Pittsburgh for the 18 months ending December 31, 1918, reports total receipts of \$1,942,551 and total disbursements \$1,834,449. During this 18 months there has been paid \$252,866 for expenses of the relief department out of the railroad treasury. The number of death and disablement benefits paid during the 18 months was 32,444, of which 182 were deaths due to accidents and 12,928 disablements due to accidents. The total membership of the Department on December 31, 1918, was 52,780.

The use of heavy guns on railroad cars is engaging the attention of officers of the War department at Washington in connection with their studies of the defenses of the Chesapeake bay district. Coast artillery officers are now conferring with railroad officers regarding the practicability of constructing permanent spurs from the main lines to the coast around Chesapeake bay. The vicinity of Roanoke, Va., is also being studied in connection with its importance to the defense of the National Capital. Several heavy howitzers and rifles mounted on cars already are available, other units are under construction and still others will be brought back from France.

Fines aggregating \$8,000 were recently imposed upon three railroad companies, namely, the Michigan Central, the Grand Trunk and the Wabash, by Judge Arthur J. Tuttle, in the federal court at Detroit, Mich. The Michigan Central was fined \$6,700 for violation of the law requiring that cattle be taken from cars seasonably for watering and feeding. This

line covered violations from 1911 to about 1914 and the amount represented part of a large number of suits, approximately 475, commenced at Detroit and also at Buffalo, N. Y. The Grand Trunk was fined for not having air brakes properly repaired and for not having sufficient grab irons on cars; and the Wabash company was fined for the same offense.

The triennial convention of the Brotherhood of Locomotive Firemen & Enginemen opened at Denver, Colo., on June 9 with approximately 900 delegates present and will continue in session for approximately a month, during which the average attendance is expected to be approximately 2,500. Among the questions which it is understood will be discussed by delegates to the convention are those of federal control of the railroads, the attitude of the Brotherhood toward a solution of the railway problem, and the matter of wages of railroad firemen and engineers. Among the first resolutions adopted by the Brotherhood were ones endorsing the League of Nations and requesting the release from prison of Eugene V. Debs and Thomas J. Mooney.

Safety-first campaigns will be begun in both the Central Western and the North Western regions on June 22, and will continue through June 28—seven days. The government operated railroads in these two regions aggregate about 104,000 miles of line, or about two-fifths of the mileage of the country. The campaigns will be under the direction of H. A. Adams, in the Central, and H. J. Bell in the North Western region. The two campaigns will concern approximately 550,000 railroad men. The men in these regions operate roughly 700,000 freight cars, 21,000 locomotives and 17,000 passenger cars, or 30 per cent of the total railway equipment of the United States. So far as practicable personal appeals will be made to every employee to equal or better the records made in similar campaigns in other regions.

## Eight Miles of Belting

The B. F. Goodrich Rubber Company, Akron, Ohio, recently shipped to the Pennsylvania Railroad, 44,254 ft. of rubber belting for use in its new grain elevator at Camden (Baltimore). This shipment included 32-in. and 38-in. widths for belting, and 36-in., 42-in. and 48-in. for use in conveyors. The capacity of one of the 48-in. horizontal carriers is 35,000 bushels an hour. It is expected that at this elevator 2,000,000 bushels of grain can be loaded daily.

## The Trouble Begins

Today (June 20) is the last day for shipping whisky by railroad, according to a Cincinnati paper, which says that a notice to that effect has been sent to distillers and wholesalers by the United States Railroad Administration. It is said that more than a third of outbound shipments from Louisville are whisky; for the last week freight houses have been packed with liquor. "All whisky going out now must have freight prepaid so that railroads will not be the loser if the goods arrive at their destination after the curtain falls, July 1."

## The International Fuel Association

The report of discussion of F. H. Hammill's paper on fuel economy appearing in the article on the Eleventh Annual Convention of the International Railway Fuel Association as given on page 1254 of the *Railway Age* of May 23 referred to a statement by A. D'Heur of the Southern Pacific. This is incorrect as the speaker was Thomas Ahern, division superintendent of the Coast division, Southern Pacific. The division fuel oil meetings there referred to are attended by em-

ployees from all departments, as they can be spared. Engineers and firemen attending these meetings are selected because they have the best fuel records, as shown by performance sheets.

**Spruce Forest Railroads to Be Sold**

The Spruce Production Corporation announces at Portland, Ore., that the extensive forests bought by the government last year with a view to supplying lumber for airplanes, together with the railroads built to get at this lumber, will be soon advertised for sale. The timber area amounts to hundreds of square miles, and the length of completed railroad is more than 75 miles. About half of this railroad is on the Olympic peninsula in Clallam county, Washington, and grading has been done on many miles of short spurs. There are also long pieces of railroad in Oregon.

**Winnipeg Strike**

With the arrest of 10 of Winnipeg's general strike leaders on June 17 on charges of making seditious statements, the situation at Winnipeg is less tense, and it is expected that the difficulties between employees and metal trade workers, in whose support the general strike was called, will soon be adjusted. The "labor temple," from which the strike has been conducted, was raided by the police and considerable literature confiscated.

Members of the Winnipeg lodges of the firemen's and brakemen's brotherhoods have voted to join in a sympathetic strike unless certain demands of the local unions are met. The executive officers of both brotherhoods immediately declared that the action of the Winnipeg locals was unauthorized and that union men would be used to replace the "illegal strikers." The railroad brotherhoods acting as mediators did not accomplish any definite results. Train service in and out of Winnipeg has been maintained, and with the exception of a few suburban trains the service has not been curtailed in any manner during the strike.

**James Peak Tunnel Proposed**

Mayor Dewey C. Bailey, Denver, Colo., has recently made a proposal to the Denver Civic & Commercial Association to create a six million dollar corporation to complete the tunnel under James Peak for the Denver & Salt Lake independent of state aid. In making his proposal Mayor Bailey promised city aid in promoting the new company and proposed to ask the citizens of Denver to vote bonds to build the tunnel.

The Colorado legislature at its last session authorized the appointment of a special commission to prepare plans for submission to the voters of a bond issue to complete the tunnel. Mayor Bailey's proposal was based on the supposition that the southern part of the state would not support a plan to vote bonds by the state to build this tunnel for the Moffat road, whereas Denver is directly interested in this project because of the great business which otherwise would be diverted to Wyoming, Omaha, Neb., and Salt Lake, Utah. President W. D. Hodges of the Denver Civic & Commercial Association, promised to back the campaign, which will probably start about September 1.

**The Franco-American Tongue**

A correspondent in France sends us the following extract from an Anglicized report, received from a French superintendent, replying to correspondence about carelessness or neglect on the part of a certain engineman. Superintendents and others who do not feel themselves 100 per cent proficient in correspondence may perhaps learn a point or two from this translator. The incident referred to was the derailment of a tender, the engineman of Engine 1242, coupled to the rear of Engine 1579, putting on steam at the wrong moment and derailing the tender of 1579, as they were entering a side track.

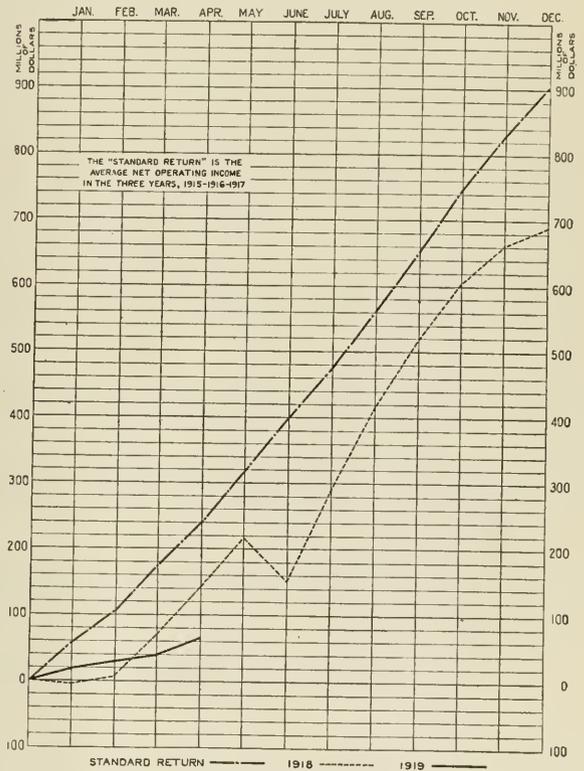

"In reference to the correspondence exchanged—your note No. 580 DM.—concerning the derailing of the machine USA 1242, on the heart of switch 328 . . . according to the

investigation to which we proceeded, it follows that the engineman of the machine 1242, which was joined to machine 1579, had opened his regulator just as he was about to engage the center of the crossing. This operation, causing pressure of the first machine, uplifted slightly the front axle of the machine 1242 and enabled it, thanks to a curve of 280 mm. (eleven inches!) diameter to take the tangent and to engage itself in the groove preceding the frog.

"As we have no regulation whatever, in case of a double draw-gear, forbidding the engineman of the second engine to open his regulator, when the operation is necessary, the responsibility of the engineman, at machine 1242, cannot be looked for. . . ."

**Net Operating Income**

The chart made by the Bureau of Railway Economics shows the net operating income of the Class I Roads in 1919, compared with the average in the test period (1915-1916-17)

**Net Operating Income, Cumulated by Months, 1918 and 1919 Compared with Standard Return, Class I Railways of United States**

on which government rental is based. The table gives the figures on which the chart is based.

Month	Average net operating income (standard return) in 3-year test period		Net operating income earned in 1919		Deficit in 1919	
	By months	Cumulative	By months	Cumulative	By months	Cumulative
Jan. . .	\$56,613,000	\$56,613,000	\$18,783,702	.....	\$37,830,000	.....
Feb. . .	47,934,000	104,547,000	10,106,268	\$28,889,970	37,828,000	\$75,658,000
March. .	68,251,000	172,798,000	10,842,608	39,660,778	57,409,000	133,067,000
April. .	67,289,000	240,087,000	26,115,214	65,916,807	41,174,000	174,241,000
May. . .	77,385,000	317,472,000	.....	.....	.....	.....
June. . .	82,550,000	400,022,000	.....	.....	.....	.....
July. . .	75,341,000	475,363,000	.....	.....	.....	.....
August. .	86,860,000	562,223,000	.....	.....	.....	.....
Sept. . .	91,273,000	653,496,000	.....	.....	.....	.....
Oct. . .	94,333,000	747,829,000	.....	.....	.....	.....
Nov. . .	83,536,000	831,365,000	.....	.....	.....	.....
Dec. . .	73,282,000	904,647,000	.....	.....	.....	.....

REVENUES AND EXPENSES OF RAILWAYS

MONTH OF APRIL, 1919—CONTINUED FROM LAST WEEK

Table with columns: Name of road, Average mileage operated during period, Freight, Passenger, Operating revenues, Total revenues, Way and equipment, Maintenance of equipment, Operating expenses, Traffic, Transportation, General, Total, Operating ratio, Net from operation, Railway tax accruals, Operating income (or decr.) last year, Increase (or decr.) last year.

REVENUES AND EXPENSES OF RAILWAYS

MONTH OF APRIL, 1919—CONCLUDED

Table with columns: Name of road, Average mileage operated during period, Freight, Passenger, Operating revenues, Total, Maintenance of way and equipment, Traffic, Trans- portation, General, Total, Operating ratio, Net railway accruals, Railway operating accruals, Operating (on debit or credit last year), Increase (on debit or credit last year).

FOUR MONTHS OF CALENDAR YEAR, 1919

Table with columns: Name of road, Average mileage operated during period, Freight, Passenger, Operating revenues, Total, Maintenance of way and equipment, Traffic, Trans- portation, General, Total, Operating ratio, Net railway accruals, Railway operating accruals, Operating (on debit or credit last year), Increase (on debit or credit last year).

REVENUES AND EXPENSES OF RAILWAYS

FOUR MONTHS OF CALENDAR YEAR, 1919—(CONTINUED)

Table with columns: Name of road, Average mileage operated during period, Freight, Passenger, Total operating revenues, Maintenance of way and structures, Equipment, Operating expenses (Traffic, Trans-portion, Total), Operating ratio, Net from railway operation, Railway operating income (or loss), and Increase comp. with last year.

REVENUES AND EXPENSES OF RAILWAYS

FOUR MONTHS OF CALENDAR YEAR, 1919—CONTINUED

Table with columns: Name of road, Average mileage operated during period, Freight, Passenger, Total operating revenues (inc. misc.), Maintenance of way and structures, Equipment, Traffic, Trans-shipment, General, Operating ratio, Net railway operation, Railway tax accruals, Operating income (or loss), Increase (or decrease) comp. with last year.

### Atlantic Crossed in 16 Hours, 12 Minutes

The flight across the Atlantic, by way of the Azores by the United States Navy biplane in command of Lieut. Commander A. C. Read on May 26 and 27, was followed on June 14 and 15 by a flight from St. John's, Newfoundland, to Clifden, Ireland, 1,960 miles, in 16 hours, 12 minutes, without a stop. This flight was made by Captain John Alcock, and Lieutenant Arthur W. Brown of the British Royal Air Force, flying in a Vickers-Vimy biplane. They left the Newfoundland coast about noon on Saturday, and arrived at Clifden, near Galway, at 8:40 a. m., Greenwich time, on Sunday. This flight wins a prize of \$50,000 offered by the London Daily Mail several years ago.

### Safety First in Southwestern Region

The campaign to reduce accidents to employees in the Southwestern region during the month of May, 1919, reduced the number of these accidents 56 per cent from the records for the same month last year. During the month of the campaign there was a total of 646 accidents to employees as compared with 1,475 during the corresponding period last year. During the three months' period January to March, 1919, inclusive, an average of one employee per month was killed to every 9,715 in service, while during the month of May the number was reduced to one employee killed to every 24,983 in service. During the same three months' period one employee out of every 153 was injured, while during the month of May one employee was injured to every 273 in service.

### To Eliminate the Noise Nuisance

Among the rules prescribed by American railroads for the guidance of enginemen, and other trainmen, in performing their work with the least practicable offense to adjacent residents, that of the Pittsburgh division of the Pennsylvania Railroad is one of the most comprehensive. It is embraced in Sections 464 and 468 of the working time-table and is reprinted below. The italics are the editor's; a brief comment on the rule will be found in the editorial columns.

#### PENNSYLVANIA RAILROAD, PITTSBURGH DIVISION

"464. Enginemen will use the whistle *judiciously* where required by rule or law, but all *unnecessary* long and loud blasts must be eliminated in order to minimize the annoyance to and complaints from the residents along our right-of-way.

"When handling trains in or about borough limits, except in approaching grade crossings, the bell must be rung when proper to have it serve the purpose instead of using the whistle.

"Boroughs have very generally passed ordinances prohibiting all unnecessary noises and smoke, a violation of which involves a fine and imprisonment of person at fault.

"468. In order to avoid complaint of *what may be considered* unnecessary noise in connection with the movement of trains and shifting of cars, it is desired that *all employees* give this matter special attention. The engine whistle must not be used except as provided by rule or special instruction, or when necessary to prevent an accident, and when so used it *must not be sounded any louder than actually necessary*. Engines should not be permitted to blow off steam except when testing safety valves. When shifting cars at stations and elsewhere, care must be exercised to eliminate all unnecessary and avoidable noise."

### New York Electrical Society

Edwin B. Katte, chief engineer of electric traction of the New York Central, has been elected president of the New York Electrical Society. Mr. Katte is a graduate of Sibley College, Cornell University, with the degree of M.E. in 1893, and with the degree of M.M.E. in 1894. He began railroad work on the New York Central & Hudson River in 1896. In 1903 he was appointed electrical engineer, which carries with it the secretaryship of the electric traction commission. In 1906 he was appointed chief engineer of electric traction of the New York Central & Hudson River. He is a past vice-president of the American Society of Mechanical Engineers.

## Traffic News

Edward L. Hamilton has been appointed general agent for the American Railway Express Company at Chicago to succeed William Gourlay, who has been appointed manager of the London, Eng., branch of the American Express Company.

Representatives of the railroads and electric lines centering in Toledo, Ohio, expect to transport 60,000 or 75,000 persons on the occasion of the Willard-Dempsey fight at Toledo on July 4. Parking space for approximately 600 sleeping cars has been provided.

Traffic through the canals at Sault Ste. Marie, Michigan and Ontario for the month of May, 1919, shows a substantial decrease eastbound; a total of 7,895,542 tons of freight as compared with 9,200,843 tons in May of last year. The total tonnage westbound was 2,670,784 tons; last year it was 2,203,202 tons.

The record of overseas traffic for the week ended June 11, showed 10,146,408 bushels of grain in the elevators at North Atlantic Ports, the excess for the week of deliveries over receipts being 1,459,809 bushels. South Atlantic and Gulf Ports report on June 7, 4,788,751 bushels of grain in elevators distributed as follows: New Orleans, 2,511,880 bushels; Galveston, 2,276,871 bushels; Port Arthur, empty; Texas City, empty.

A comparison of freight car loadings on the lines of the Northwestern region for the month of May, 1919, with the corresponding period last year shows a decrease of 53,962 cars, 640,698 cars being loaded during 1919 as compared with 694,660 in 1918. A comparison of grain loading for the same period shows an increase in 1919 of 12,755 cars, while bituminous coal loaded at mines during the same period show a decrease of 13,078 cars.

R. D. Williams has been appointed traffic manager of the California Fruit Exchange, Sacramento, Cal., to succeed Henry Cole, who becomes traffic manager of the California Fruit Growers' Exchange at Los Angeles, Cal. Mr. Williams was formerly connected with the traffic department of the Erie railroad at San Francisco, Cal. In April, 1918, he organized the traffic department for the housing division of the Shipping Board, completing that work in May of this year.

The agricultural departments of the railroads of the South-eastern States are praised warmly by J. J. Brown, Commissioner of Agriculture of Georgia, in his annual report. Their extension work is carried on by "some of the ablest and best informed men of Georgia," who give their entire time to the furtherance of agriculture. These men, being thoroughly conversant with up-to-date agricultural methods and the most modern means of marketing and transportation, are rendering valuable service. The commissioner also commends the hearty co-operation of the railroads with his department in moving promptly all shipments of products directed through the State's market bureau division.

Howard H. Hays, manager of the Bureau of Service National Parks and Monuments, a sub-committee working under the direction of the Western Passenger Traffic Committee for the advertisement of America's national parks and monuments, has bought the Yellowstone Park Camping Company and assumed the position of general manager of that company with office at Livingston, Mont. Mr. Hays was formerly manager with the Union Pacific-Chicago & North Western department of tours and was the organizer as well as the manager of the Bureau of Service National Parks and Monuments. Prior to his connection with the railroads he was general tourist agent of the "Wylie Way," the pioneer Yellowstone Park camping company.

## Equipment and Supplies

### Locomotive Deliveries, Week Ended May 31

Locomotives were shipped to railroads under federal control during the week ended May 31 as follows:

Works	Road	Number	Type
American	A. C. L.	2	USRA Pacific
	P. L. W.	3	USRA Santa Fe
	C. C. C. & St. L.	3	USRA 8-w. Sw.
		8	
Baldwin	A. T. & S. F.	2	Pacific
	L. H. B.	6	USRA 8-w. Sw.
	Southern	3	USRA Mount.
	B. & O.	4	USRA 6-w. Sw.
	S. P.	6	Santa Fe
	A. T. & S. F.	1	Mountain
	C. B. & Q.	2	Santa Fe
	C. B. & Q.	1	Mikado
	U. P.	1	Santa Fe
	N. & W.	1	Mallet
	G. N.	2	8-w. Sw.
	T. & P.	1	Santa Fe
	T. & P.	2	Pacific
	P. & R.	1	Mallet
		33	
Total		41	

### Locomotive Deliveries Week Ended June 6

The following locomotives were shipped to roads under Federal control during the week ended June 6:

Works	Road	Number	Type
American	N. & W.	20	USRA Mallet
	P. L. W.	2	USRA 6-w. Sw.
	Wash. Ter.	3	USRA 6-w. Sw.
		25	
Baldwin	C. C. & O.	1	Mallet
	Sou. Pac.	5	Santa Fe
	T. & P.	3	Santa Fe
	C. B. & Q.	1	Santa Fe
	U. P.	1	Santa Fe
	L. H. B.	6	USRA 8-w. Sw.
	N. & W.	1	Mallet
Southern	1	USRA Mount.	
		19	
Total		44	

## Freight Cars

THE PENNSYLVANIA EQUIPMENT COMPANY, Philadelphia, Pa., is in the market for 100 second-hand all steel tank cars, 8,000-gal. capacity, without heater coils; also 100 of 10,000-gal. capacity.

THE PENNSYLVANIA EQUIPMENT COMPANY, 1420 Chestnut street, Philadelphia, is in the market for several second-hand steel self-clearing hopper bottom coal cars; one 40-ft. box car with automobile end doors, and one gondola car with drop ends.

THE CANADIAN NATIONAL, Toronto, Ont., has sent inquiries to Canadian car builders for the construction of 20 steel postal cars and 20 steel first-class coaches. The postal cars are to comply with the latest Canadian Railway Mail Service department specifications and also those of the United States Railway Mail Service and will be 73 ft. 6 in. in length. George E. Smart, general master car builder, is receiving the bids.

## Iron and Steel

THE BELGIAN GOVERNMENT has ordered 8,000 tons of rails from the Algoma Steel Corporation.

THE CANADIAN GOVERNMENT has ordered 10,000 tons of rails from the Algoma Steel Corporation.

## Signaling

THE NEW YORK CENTRAL has ordered from the Federal Signal Company, Albany, N. Y., a 68-lever style "A" mechanical interlocking for Port Byron, N. Y.

## Supply Trade News

The Judson Freight Forwarding Company, Chicago, Ill., will open its new office, 202 Wells Fargo building, 204 Camp street, New Orleans, La., with O. E. Duggan, general agent, in charge.

The Niles-Bement-Pond Company, Pittsburgh, Pa., has removed its office from the Frick building to 425 Seventh avenue. This company will keep a stock of Pratt & Whitney small tools at the new office and store.

Major John L. Wood, formerly connected with the Buckeye Steel Castings Company, Chicago, and interested in several railway supply companies including Edwin S. Woods & Co., Chicago, died on June 13, at Pasadena, California, after a protracted illness.

The Railway Audit & Inspection Company of Philadelphia, Pa., has opened an office in Boston, Mass., for the purpose of having representation in the New England territory. H. G. Hathaway has been appointed office manager and C. J. Logan will continue a special representative in this territory as heretofore.

Edwin T. Jackman, formerly of E. S. Jackman & Co., Chicago, has returned from Sheffield, England, where he has been investigating methods in connection with tool and alloy steels. On July 1 he will become manager of the Boston, Mass., office of the Firth-Sterling Steel Company, McKeesport, Pa.

The Betson Plastic Fire Brick Company has been incorporated under the name of the **Betson Plastic Fire Brick Company, Inc.**, with headquarters at Rome, N. Y. Frank J. Jewell is president and secretary, and Nelson Adams, vice-president and treasurer. The company manufactures plastic fire brick for boiler furnace linings and baffle walls and "Hi-Heat" cement for use in boiler rooms.

A company, known as the **Cummins-Blair Company**, a subsidiary organization which will be affiliated with the C. R. Cummins Company has recently been formed. This company will specialize in reinforced concrete and brick building construction and reinforced concrete bridges and arch culverts. N. F. Blair is president, C. R. Cummins, vice-president and W. A. Beaumont, treasurer. The headquarters will be at Cleveland, Ohio.

Colonel R. T. Lamont, president of the American Steel Foundries, Chicago, has been awarded the distinguished service medal for "exceptionally meritorious service as assistant to the chief of the procurement division, later as chief of the procurement division and as a member of the claims board of the ordnance department," and for "rendering material assistance to the nation's industry in adjusting equitably outstanding contracts in full justice to employers and employees alike."

The **Central Steel Company**, Massillon, Ohio, has opened new offices in Detroit, in the Book Building, 35-37 Washington boulevard, rooms 948-9-50. Arthur Schaeffer, former assistant director of sales at the home office, Massillon, has been appointed district manager of sales, with Frank Gibbons as his assistant. Mr. Gibbons, who has just joined the organization, has been associated with the Carbon Steel Company for five or six years. He spent a great part of this time in the Carbon Company's Pittsburgh plant, and for the last several months he has been district sales manager of its Detroit office.

The **Carter Bloxonend Flooring Company**, Kansas City, Mo., has been formed to take over the manufacturing and selling interests in Bloxonend Flooring formerly held by the C. J. Carter Lumber Company, Kansas City, Mo., the Doniphan Lumber Company, Kensett, Ark., and the Marsh & Truman Lumber Company, Chicago, Ill. The Kansas City

office will be under the direction of C. J. Carter, president, and Mabry Mellier, vice-president, will have charge of sales. The sales office in the McCormick Bldg., Chicago, will be in charge of M. G. Truman as vice-president, who will also have charge of the railroad sales to those roads with principal operating offices east of the Mississippi river. The Builders' Material Supply Company, New York, will continue as sales agents for the new company in the New York district for all other than railroad business. The manufacturing plant of the company will be located at Kensett, Ark.

J. M. Woodruff, manager of the advertising and paving departments of the Standard Asphalt & Refining Company, Chicago, a subsidiary of the Cities Service Company, New York, has resigned to become general manager of the Southern Asphalt Association, with headquarters at Atlanta, Ga. In this capacity he will have charge of the publicity of this association which was organized for the purpose of supplying information to public officers and taxpayers concerning the advantages of asphalt for paving roads and streets. From 1909 to 1913, Mr. Woodruff was manager of the paving department and in charge of advertising for the Standard Asphalt & Rubber Company, and the following four years he was southern representative of the Warren Brothers Company, Boston, Mass., bitulithic paving contractors, with headquarters at Richmond, Va.

The S. F. Bowser Company, Ltd., Toronto, Ont., which has for a number of years been manufacturing and selling Bowser gasoline and oil pumps, tanks and storage systems under the control of the parent company, S. F. Bowser & Co., Inc., Fort Wayne, Ind., has been re-organized under the Canadian laws to operate as a strictly Canadian firm. H. C. Christie, who has been for some time past connected with the Canadian factory of the S. F. Bowser Company, recently as sales manager, has been elected manager, with E. E. Cummings as factory manager. For a number of years, nearly the entire Canadian trade of the S. F. Bowser Company has been supplied from the Toronto factory, but this company has been under the direction of the home office at Fort Wayne. Through the present re-organization, the Canadian factory is to be operated and controlled as a separate institution. The officers are S. F. Bowser, president; S. V. Bechtel, vice-president; H. J. Grosvenor, secretary, and W. G. Zahrt, treasurer.

### Railway & Industrial Engineers, Inc.

The Railway & Industrial Engineers, Incorporated, with offices at 25 Broad street, New York, recently organized by J. E. Muhlfeld and V. Z. Caracristi, as announced in the *Railway Age* of May 23, page 1288, announces that it has associated with it an experienced, competent and reliable staff of experts thoroughly familiar with domestic and foreign methods and practices, and offers to bankers, corporations and others its services in a representative, advisory, consulting or administrative capacity as follows:

Organization, management and operation of railroad, public utility, industrial and manufacturing enterprises.

Examination of proposed capital and consequential expenditures for facilities or equipment to ascertain whether they are justified and will improve conditions, increase revenues or reduce costs of operation and maintenance.

Assistance in connection with plans for financing projected improvements and extensions.

Review or preparation of plans, specifications and estimates of costs of contemplated new construction work, or enlargements of existing facilities.

Rehabilitation and modernization of unprofitable undertakings, including, if desired, their temporary management and operation until satisfactory results are obtained.

Advisory or consulting engineers to insure that expenditures are made in a manner that will produce maximum economic results and reflect the greatest return to the proprietors, and provide the best security to the owners.

Advisors and conferees in labor problems and in the preparation of rules and regulations governing compensation and working conditions.

Preparing, passing upon or approving inventories, valuations and appraisals of properties and equipment.

Consulting engineers for exporters and importers and their foreign representatives, to co-ordinate specifications, prices and purchases for the best interest of each.

Reporting on inventions, new methods and processes, and assistance in the development of those having practical merit and commercial value.

J. E. Muhlfeld, who has been in transportation work for about 25 years, has, during the past ten years, been engaged in the habilitation of roadway, terminals, shops and equipment on various railways, and more particularly in the design and development of the Mallet and other types of large steam locomotives in combination with the utilization of low-grade fuels for the purpose of increasing the average train load and reducing the costs of operation and maintenance on railroads in the United States, Canada and Brazil. He was born at Peru, Ind., on September 18, 1872, and studied mechanical engineering at Purdue University; he served as machinist, and then as locomotive fireman and engineer on the Wabash Railroad and later successively as enginehouse foreman and general foreman on the same road; master mechanic at Port Huron and Montreal, on the Grand Trunk; superintendent of machinery and rolling stock on the Canadian Government Railways; superintendent of motive power on the Baltimore & Ohio, and vice-president and general manager of the Kansas City Southern. During the past five years he has been located in New York and has specialized in railway and other valuation and improvement work and in the development of methods and appliances for the modernization of locomotives and central power stations for the purpose of reducing investment and fuel costs, utilizing waste heat, eliminating arduous labor, and increasing capacity.

V. Z. Caracristi has been engaged in railway and industrial work for the past 20 years, having specialized in locomotive, car and shop design and construction. He served as shop engineer and maintenance supervisor for the Richmond plant of the American Locomotive Company, and in the inauguration and installation of a uniform system of maintenance and shop betterment he was general maintenance supervisor for all of the plants of the same company. He associated on the design and construction of the Washington, D. C., terminal and station, and later served as assistant to general superintendent of motive power of the Baltimore & Ohio, in charge of shop additions, construction and equipment, and general betterment of the design and construction of locomotives and cars, which included the design and construction of the first Mallet type locomotive. He was then engaged in carrying out improvements of the Brewster shops of the Wheeling & Lake Erie, and the Watervliet shops, and Carbondale mechanical terminal of the

J. E. Muhlfeld

V. Z. Caracristi

Delaware & Hudson Company; in charge of the layout, design and equipment of extensions to the Lima Locomotive Works, and various additions to plants and power houses of the American Locomotive Company. For the past six years he has been engaged in consulting work for various bankers on financial reports and suggesting improvements in industrial operating methods for controlled corporations. During this time he was engaged in development and commercial work on means and methods of burning coal in suspension, which work he will continue.

**American Brake Shoe & Foundry Changes**

William G. Pearce has retired as president of the American Brake Shoe & Foundry Company to become chairman of the executive committee, and Joseph B. Terbell, vice-president, has been elected

W. G. Pearce

president to succeed Mr. Pearce, effective July 1. Randolph Ortman, who has been president for one of the company's subsidiaries, has been elected a director, succeeding the late Joseph D. Gallagher. Col. James B. Curtis, of Baldwin & Curtis, has been elected general counsel of the American Brake Shoe & Foundry Company also, succeeding Mr. Gallagher.

William G. Pearce, chairman of the executive committee of the American Brake Shoe & Foundry Company, was born at Marietta, Ohio, on June 11, 1859. He entered railway service in August, 1877, as a clerk in the office of the controller of the Missouri, Kansas & Texas, at Sedalia, Mo. He was later promoted to bookkeeper and chief clerk in the same office, and in August, 1879, left that road to take a clerical position in the auditing department of the Northern Pacific. He was successively promoted to assistant express auditor, assistant auditor of disbursements and auditor of disbursements in the same department, and in February, 1890, was appointed general purchasing agent. From May, 1892, to September, 1896, he was assistant general manager of the same road, and when the Northern Pacific was re-organized on the latter date, he was transferred to Tacoma, Wash., as assistant general superintendent. From August, 1900, to July 1, 1901, he was assistant to the president of the Northern Pacific, the Seattle & International, and the Washington & Columbia River, at the same time being general manager of the Seattle & International. From July, 1901, to March, 1902, he was general manager of the Northern Pacific, leaving railway service at the end of that time to become second vice-president of the Griffin Wheel Company. On June 5, 1905, he was also made general manager of this company, with headquarters at Chicago. He left the Griffin Wheel Company on November 22, 1910, to become vice-president of the Ameri-

J. B. Terbell

can Brake Shoe & Foundry Company, and in May, 1916, was elected president, with headquarters at New York.

J. B. Terbell, the new president, was born at Corning, N. Y., in February, 1863, and was educated at Hamilton College, graduating in the class of 1884 with the degree of A. B. After leaving college he served with the Fall Brook Railway, now the Pennsylvania division of the New York Central, with headquarters at Corning, N. Y., and later was vice-president of the Corning Iron Works. In 1897, he became president of the Corning Brake Shoe Company, and in 1902, was elected vice-president of the American Brake Shoe & Foundry Company, with headquarters at Chicago, in charge of the company's western business. In 1915, Mr. Terbell came to the New York office in connection with munition contracts for the British Government, and on July 1, succeeds Mr. Pearce as president.

**Trade Publications**

**SPECIFICATIONS FOR MANGANESE CROSSINGS.**—The Balkwill Manganese Crossing Company, Cleveland, Ohio, has just issued specifications for its articulated cast manganese crossings accompanied by standard detailed drawings for crossings at various angles, for heavy and medium duty and for three-hole and two-hole drilling.

**CEMENT GUN WORK.**—The Cement Gun Construction Company, Chicago, has issued Gunnite Book No. 6, containing 24 pages illustrative of the structures which have been treated with the Cement Gun process for the application of a coating of gunite to produce wall, roof and floor surfaces or to protect structural steel against corrosion.

**EYE SHIELDS.**—The Chicago Eye Shield Company, Chicago, has issued a new catalogue describing various types of goggles, respirators and protective shields for chippers and foundry workers. Interesting data are included on the spectrum of the welding arc and the absorption of ultra-violet rays by the special Essentialite lenses which this company uses in welders' goggles.

**Financial and Construction**

**Railway Financial News**

**ARTESIAN BELT.**—This road was sold at auction on June 3 for \$150,000 to Harry Landa, J. E. Jarrett and W. R. Wiseman, officers of the Commonwealth Bank and Trust Company of San Antonio, and their associates, who were the only bidders for the property. The Artesian Belt has a length of line of 46 miles and has been in the hands of receivers since April 25, 1917.

**Railway Construction**

**PENNSYLVANIA LINES WEST OF PITTSBURGH.**—This road will build a group of repair shops at Stark, Ohio, consisting of a locomotive erecting shop, heavy and light machine shops, tank shop, flue shop, wheel and pipe shop, blacksmith shop, firing-up shed, storehouse, office building, rest house and shed for the storage of miscellaneous material. A portion of these buildings are already under contract, and bids have been requested or will be requested in the near future on the remainder. The buildings, with the exception of the rest house, office building and storehouse, which are of brick and timber construction, and the firing-up shed, which is of reinforced concrete construction, will be of steel frame and brick exterior wall construction and carried on concrete foundations.

# ANNUAL REPORTS

## The New York Central Railroad Company—Annual Report

To the Stockholders of

THE NEW YORK CENTRAL RAILROAD COMPANY:

The Board of Directors herewith submits its report for the year ended December 31, 1918, with statements showing the income account for the year and the financial condition of the company.

The operation and maintenance of the company's road were conducted under Federal control during the year 1918. The mileage covered is as follows:

	Miles
Main line and branches owned.....	3,699.14
Leased lines.....	1,920.40
Lines operated under trackage rights.....	456.25
Total road operated.....	6,075.79

The construction of a joint terminal of the Putnam Branch at Sedgwick Avenue, New York, in accordance with an agreement with the Interborough Rapid Transit Company, whereby the Putnam bridge over the Harlem River was surrendered for use in connection with the extension of the elevated system up Jerome Avenue, decreased the length of the Putnam Division by 23/100ths of a mile.

The Cardiff Branch, Reddick to Cardiff, Illinois, 3.49 miles, was abandoned.

To correct an error in the 1917 report, 11/100ths of a mile has been added to the main line mileage in the State of Illinois.

These changes produce a net decrease in operated mileage of 3.61 miles. There was no change in the capital stock of the company during the year. Since the date of the annual meeting on January 23, 1918, the number of stockholders has grown 1,591, the total number at the end of the year being 28,694, of whom 28,395 are in the United States, and 298 abroad. The par value held by those here is \$247,543,855, and by those abroad \$2,053,500, the average holdings being 87 and 69 shares respectively. In 1913 the numbers reported were 22,270 here, and 2,772 abroad, the general average holding being, approximately, 100 shares, while now it is 87 shares.

The changes in the funded debt of the company are shown in the following statement:

Amount as reported on December 31, 1917, was..... \$711,883,086.19

Included therein were the following securities which had been reacquired or held pending their sale, and (with the exception of certain of them with a par value of \$730,000) had been pledged for the company's notes:

N. Y. C. & H. R. R. Co. refunding and improvement mortgage 4 1/2% bonds.....	\$20,000,000.00
N. Y. C. R. R. Equipment Trust certificates of 1917.....	1,218,000.00
N. Y. C. & H. R. R. Co.—Lake Shore collateral gold bonds.....	10,000.00
R. W. & O. R. R. Co. 1st consolidation bonds.....	2,000.00
	21,230,000.00

leaving the total funded debt actually outstanding at the beginning of 1918..... \$690,653,086.19

Retired during the year:

R. W. & O. Terminal 1st mortgage 5% bonds matured and paid..... \$375,000.00

Payments falling due during the year on the company's liability for certificates issued under equipment trust agreement as follows:

N. Y. C. Lines Trust of 1907, installment due November, 1918.....	1,492,884.74
Boston & Albany Trust of 1912, installment due October, 1918.....	500,000.00

a total decrease of..... 2,367,884.74

leaving the funded debt actually outstanding December 31, 1918..... \$688,285,201.45

New York Central Railroad Equipment Trust certificates of 1917 to an aggregate amount of \$6,648,000 were issued during 1918, but as all of them were concurrently acquired by the company, there is no change in the funded debt in this connection.

As was pointed out in the last annual report, the President of the United States took possession and assumed control of the railroad property of your company on December 28, 1917. By the terms of the President's proclamation the possession, control, operation, and utilization of the transportation systems were vested in a Director General; and it was stated that, until the Director General should otherwise determine, his powers would be exercised through the boards of directors, officers, and employees of the systems taken over. The Director General appointed Regional Directors under whom the railroads of the several districts were unified as to control and operation. Subsequently, Federal Managers and other federal officers were appointed and required to report through the Federal Managers to the Regional Directors and the Director General.

As of December 27, 1918, the company, jointly with The Toledo and Ohio Central Railway Company, The Zanesville and Western Railway Company, The Kanawha and Michigan Railway Company and the Kanawha and West Virginia Railroad Company, executed an agreement with the Director General of Railroads providing for the operation, during Federal control, of the roads of the parties to the agreement by the Director General of Railroads for an annual total standard compensation of \$58,122,084.92, divided as follows:

The New York Central Railroad Company.....	\$55,802,630.50
The Toledo and Ohio Central Railway Company.....	1,086,650.87
The Zanesville and Western Railway Company (deficit).....	107,598.45
The Kanawha and Michigan Railway Company.....	1,295,141.37
Kanawha and West Virginia Railroad Company.....	45,260.63
	\$58,122,084.92

Under the agreement, all salaries and expenditures incurred by the company, during Federal control, for purposes which relate to the existence and maintenance of the corporation, are required to be borne by the corporation, out of its compensation and other income.

Immediately upon his taking office, the Director General of Railroads appointed as Regional Director in charge of the Eastern District Mr. A. H. Smith, then President of The New York Central Railroad Company. This district, at that time included practically all the railroad lines north of the

Ohio and Potomac rivers and east of the Indiana-Illinois state line. Mr. Smith assumed the duties of the Regional Director's office, which involve dealing with a complicated traffic situation and the co-ordinating of the lines for war purposes, as an addition to his obligations as President of the company.

Early in 1918, the Director General decided that officers in charge of Federal operation should not continue their positions with the corporation, except in special cases and where permission was given. Thereupon, Mr. Smith resigned his office as President, effective May 31st, and Mr. William K. Vanderbilt, Jr., was elected in his stead. Later in the year the following general executive officers also resigned in order that they might continue in the service of the United States Railroad Administration:

Mr. A. T. Hardin, Vice-President; Mr. C. F. Daly, Vice-President; Mr. P. E. Crowley, Vice-President, and Mr. H. M. Biscoe, Vice-President.

A separate corporate organization has been formed to conduct the affairs of the company under instructions from the President and the Board of Directors, and to take all appropriate and necessary corporate action to carry out the obligations assumed by it under the agreement. Through this organization, the personnel of which is shown on the first page of this report, expenditures for additions and betterments to the property, and for the maintenance of road and equipment under federal management, are investigated and verified and supervision is exercised for the protection of the company's interests, both as to the property transferred under the Federal Control Act, and that remaining with the corporation.

### SUMMARY OF FINANCIAL OPERATIONS AFFECTING INCOME

Year ended December 31, 1918

COMPENSATION ACCRUED FOR THE POSSESSION, USE AND CONTROL OF THE PROPERTY OF THIS COMPANY AND ITS LEASED LINES..	\$55,802,630.50

Sundry deferred debits and adjustments.....	69,254.43

454,054.65

BALANCE TO CREDIT OF PROFIT AND LOSS DECEMBER 31, 1918..... \$80,943,297.90

The amount of standard compensation, \$55,802,630.50, accrued under federal control for the possession and use of the company's property, and its leased and operated lines, was based upon the average annual railway operating income for the three years ended June 30, 1917.

As required by the Federal Control Act, this amount was certified by the Interstate Commerce Commission as agreeing with the income reported to it, subject, however, to such changes and corrections as the Commission might hereafter determine and certify to be requisite.

There were delivered in 1918, 1 electric locomotive, 139 steam locomotives, 20 steel baggage and mail cars, 71 steel passenger coaches, 2 steel dining cars, and 105 steel baggage cars, which were provided for under the New

York Central Railroad Equipment Trust of 1917 as authorized by the Board of Directors on October 19, 1916. On account of the prevailing unsatisfactory market conditions for the sale of the equipment trust certificates, and in order to procure the equipment as needed, the company has purchased at par and accrued interest \$6,648,000 of the certificates, of which \$4,187,000 were pledged as security for short-term loans and \$2,461,000 carried in the treasury of the company.

The Director General of Railroads allotted to the company 4,500 freight cars, estimated to cost \$13,201,000, and 120 locomotives, estimated to cost \$6,192,955; a total of approximately \$19,393,955. Of this equipment, 2,556 freight cars and 114 locomotives were delivered during the year.

The Director General also allotted to the company, as Lessee of the Boston and Albany Railroad, 10 locomotives, estimated to cost \$622,770, for use on that road.

These allotments were accepted by the company and the equipment is being constructed under contracts between the Director General and the builders, and the financing of the cost thereof is being arranged between the Director General and the company.

The changes in the property investment account for the year were as follows:

Additions and betterments—Road Expenditures by the Federal Manager..... \$11,432,818.09 Expenditures by the corporation..... 126,860.84 Less sale of land by corporation and miscellaneous credits..... 63,522.96 \$11,559,678.93	\$11,496,155.97
Additions and betterments—Equipment Expenditures by the Federal Manager, less equipment retired and transferred..... \$2,933,531.70 Equipment assigned to the N. Y. C. R. R. by the United States Railroad Administration..... 13,002,056.00 Expenditures by the corporation..... 8,511,006.80 Total addition to road and equipment accounts..... \$35,942,750.47 Improvements on leased railway property Expenditures by the Federal Manager..... \$4,783,284.40 Less miscellaneous credits by the corporation..... 11,911.68 4,771,372.72 Improvements on miscellaneous physical property Expenditures by the Federal Manager..... \$18,541.61 Expenditures by the corporation..... 52,293.74 \$70,835.35 Less credits by the corporation..... 50,000.00 20,835.35	\$40,734,958.54
The net increase in property investment accounts during the year being.....	
Pending the execution of the agreement with the Director General of	

Railroads and the settlement of accounts thereunder, the company borrowed from him \$20,000,000 for which it gave its 6 per cent demand notes. Of the notes so given \$13,500,000 were secured by collateral, the balance, \$6,500,000, being unsecured.

In the operation of the Pension Department, 107 employees were retired and placed upon the pension roll. Of these retirements, 43 were authorized because of the attainment of seventy years of age, and 64 because of total and permanent physical disability; 165 pensioners died during 1918, and at the close of the year 1,469 retired employees were carried upon the pension rolls. The average monthly pension allowance of these is \$26.34, and the total amount paid in pension allowances during the year was \$471,075.11, which was paid by and charged to the operating expenses of the United States Railroad Administration, as provided in the agreement with the Director General of Railroads.

The following changes took place in the Board of Directors during the year:

Resigned: March 13, 1918.....	Robert S. Lovett
April 10, 1918.....	Marvin Hughitt
May 31, 1918.....	Alfred H. Smith
Sept. 18, 1918.....	Frank J. Jerome
Sept. 18, 1918.....	Leonard J. Hackney
Elected: Sept. 18, 1918.....	Charles T. Lewis
Sept. 18, 1918.....	Charles B. Seger
Sept. 18, 1918.....	Edward S. Harkness
Nov. 13, 1918.....	Samuel Mather
Re-elected: Dec. 11, 1918.....	Frank J. Jerome

The Board records, with regret, the death on August 10, 1918, of Mr. William H. Newman, a Director of this Company, and who was President of the New York Central and Hudson River Railroad Company from June 3, 1901, to February 1, 1909.

The Board also records, with regret, the death of two other of its members, Mr. Charles T. Lewis, on September 29th, and Mr. Horace B. Andrews, on December 1st, 1918.

Appreciative acknowledgment is made to all officers and employees of their loyal and efficient co-operation and service.

For the Board of Directors,  
 WILLIAM K. VANDERBILT, JR.,  
 President.

**The Cleveland, Cincinnati, Chicago and St. Louis Railway Company—Thirtieth Annual Report**

To the Stockholders of THE CLEVELAND, CINCINNATI, CHICAGO AND ST. LOUIS RAILWAY COMPANY: The Board of Directors herewith submits its report for the year ended December 31, 1918, with statements showing the results for the year and the financial condition of the company.

The operation and maintenance of the company's road were conducted under federal control during the year 1918. The mileage embraced in the operation of the road is as follows:

Main line and branches owned.....	1,693.03
Proprietary lines.....	126.09
Leased lines.....	204.43
Operated under contract.....	201.37
Trackage rights.....	170.85

Total road operated (as shown in detail on another page)..... 2,395.77

As compared with mileage operated in 1917, there was an increase in mileage of leased lines of 2.01 miles account of the Mt. Glead Street Line Railroad, which heretofore had been reported as separately operated, and an increase of trackage rights of 6.85 miles over the Toledo Terminal Railroad between Stanley and Gould, Ohio, making an increase of 8.86 in mileage operated during 1918.

There was no change in capital stock during the year, the amounts authorized and issued to December 31, 1918, being as follows:

Preferred stock authorized.....	\$10,000,000.00
Common stock authorized.....	50,000,000.00
<b>Total stock authorized.....</b>	<b>\$60,000,000.00</b>
Preferred stock issued.....	\$10,000,000.00
Common stock issued.....	47,056,300.00
<b>Total stock issued.....</b>	<b>\$57,056,300.00</b>

Balance common stock authorized but not issued December 31, 1918..... \$2,943,700.00

The funded debt unamortized outstanding December 31, 1917, was \$99,231,284.62. It has been decreased during the year as follows:

Big Four Railway equipment trust certificates payable June 1, 1918.....	\$373,000.00
Big Four Railway equipment trust certificates payable July 1, 1918.....	115,000.00
Pro rata New York Central Lines equipment trust certificates payable November 1, 1918.....	246,689.81
C. I. St. L. & C. Ry. Co. general first mortgage bonds retired.....	76,000.00
C. I. St. L. & C. Ry. Co. first consolidated mortgage bonds retired.....	11,000.00
Central Gain Elevator Co. bonds retired.....	26,000.00
C. & St. L. Ry. Co. (St. Louis Division) first collateral trust mortgage bonds purchased for sinking fund.....	22,000.00
<b>Total funded debt outstanding December 31, 1918.....</b>	<b>\$98,361,594.81</b>

The Big Four Railway Equipment Trust of 1917, established by agreement dated June 1, 1917, provides for a total issue of \$2,370,000 equipment trust certificates. The original agreement provided for an interest rate of 5 per cent per annum, but under date of December 31, 1918, by supplemental agreement, the interest rate was increased to 6 per cent per annum. Under the provisions of the Trust 20 locomotives and 30 passenger cars were delivered during the year.

The Big Four Railway Equipment Trust certificates issued during the year amounted to \$465,000. On account of the prevailing unsatisfactory market conditions for the sale of equipment trust certificates, and in order to procure equipment as needed, the company, through the medium of short-term loans, purchased at par and accrued interest these certificates, using \$317,000 of them as collateral, pending more favorable conditions for their sale. There is therefore no change in the funded debt in this connection.

As was pointed out in the last annual report, the President of the United States took possession and assumed control of the railroad property of your company on December 28, 1917. By the terms of the President's proclamation the possession, control, operation, and utilization of the transportation systems were vested in a Director General; and it was stated that, until the Director General should otherwise determine, his powers would be exercised through the boards of directors, officers, and employees of the systems taken over. The Director General appointed regional directors under whom the railroads of the several districts were unified as to control and operation. Subsequently, Federal Managers and other Federal officers were appointed and required to report through the Federal Managers to the Regional Director and the Director General. On December 27, 1918, the company, jointly with The Muncie Belt Railway Company, executed an agreement with the Director General of Railroads providing for the operation, during federal control, of the roads of the parties to the agreement by the Director General of Railroads for an annual total standard compensation of \$9,945,738.41, divided as follows: The Cleveland, Cincinnati, Chicago and St. Louis Ry. Co..... \$9,938,597.23 The Muncie Belt Railway Company..... 7,141.18

Total..... \$9,945,738.41 Under the agreement, all salaries and expenditures incurred by the company, during federal control, for purposes which relate to the existence and maintenance of the corporation, are required to be borne by the corporation out of its compensation and other income. Immediately upon his taking office, the Director General of Railroads appointed as Regional Director in charge of the Eastern District, Mr. Alfred H. Smith, then President of this company. This District at that time

included practically all the railroad lines in the district north of the Ohio and Potomac Rivers and east of the Indiana-Illinois state line. Mr. Smith assumed the duties of the Regional Director's office, which involved dealing with a complicated traffic situation and the co-ordinating of the lines for war purposes, as an addition to his obligations as President of this company.

Early in 1918, the Director General decided that officers in charge of federal operation should not continue their positions with the corporation, except in special cases and where permission was given. Thereupon, Mr. Smith resigned his office as President, effective May 31st, and Mr. William K. Vanderbilt, Jr., was elected in his stead. Later in the year Mr. Abraham T. Hardin, Vice-President, and Mr. Harry A. Worcester, Vice-President and General Manager also resigned in order that they might continue in the service of the United States Railroad Administration.

A separate corporate organization has been formed to conduct the affairs of the company under instructions from the President and the Board of Directors, and to take all appropriate and necessary corporate action to carry out the obligations assumed by it under the agreement. Through this organization, the personnel of which is shown on the first page of this report, expenditures for additions and betterments to the property, and for the maintenance of road and equipment under federal management, are investigated and verified and supervision is exercised for the protection of the company's interests, both as to the property transferred under the Federal Control Act, and that remaining with the corporation. Pending the execution of the agreement with the Director General of Railroads and the settlement of accounts thereunder, the company borrowed \$5,300,000, of which \$4,300,000 were obtained from the Director General of Railroads and the Secretary of the Treasury, for which the company gave \$2,500,000 of 6 per cent demand notes secured by collateral and \$1,800,000 unsecured. For the balance of \$1,000,000, an unsecured 6 per cent demand note was given by the company to The New York Central Railroad Company, endorsed by that company and sold by it to the Director General of Railroads.

**SUMMARY OF FINANCIAL OPERATIONS AFFECTING INCOME**  
Year ended December 31, 1918

Compensation accrued for the possession, use and control of the property of this company and its leased lines.....	\$9,938,597.23

Adjustment of sundry accounts (net).....	58,350.48
	863,781.03

BALANCE TO CREDIT OF PROFIT AND LOSS  
DECEMBER 31, 1918..... \$11,325,609.16

The amount of standard compensation, \$9,938,597.23, accrued under federal control for the possession and use of the company's property, and its leased and operated lines, was based upon the average annual railroad operating income for the three years ended June 30, 1917. As required by the Federal Control Act, this amount was certified by the Interstate Commerce Commission as agreeing with the income reported to it, subject, however, to such changes and corrections as the Commission might hereafter determine and certify to be requisite.

The Director General of Railroads allotted to the company 2,000 freight cars, estimated to cost \$5,736,000, and 35 locomotives, estimated to cost \$1,780,000, a total of approximately \$7,516,000. Of this equipment 1,246 freight cars and 25 locomotives were delivered during the year. These allotments were accepted by the company and the equipment is being constructed under contracts between the Director General and the builders and the financing of the cost thereof is being arranged between the Director General and the company.

The changes in the road and equipment accounts for the year were as follows:

Additions and betterments—Road	
Expenditures by the Federal Manager.....	\$4,088,370.76
Expenditures by the corporation.....	52,283.58
	\$4,140,654.34
Additions and betterments—Equipment	
Equipment assigned to the C. C. C. & St. L. Ry. by the United States Railroad Administration.....	\$4,875,074.00
Expenditures by the Federal Manager less equipment retired and transferred.....	78,483.15
Expenditures by the corporation.....	1,344,469.35
	6,298,026.50
Improvements on leased railway property	
Expenditures by the Federal Manager.....	\$229,458.28
Expenditures by the corporation.....	1,774.85
	231,233.13
Total (as shown in detail on other pages)	\$10,669,913.97

In the operation of the Pension Department 32 employees were retired and placed upon the pension roll; of these retirements 18 were authorized because of the attainment of seventy years of age, and 14 because of total and permanent physical disability; 39 pensioners died during 1918, and at the close of the year 313 retired employees were carried upon the pension rolls. The average monthly pension allowance of these is \$23.06, and the total amount paid in pension allowances during the year was \$86,471.77, which was paid by and charged to the operating expenses of the United States Railroad Administration as provided in the agreement with the Director General of Railroads.

The following change took place in the Board of Directors during the year:

Resigned: March 13, 1918.....	Robert S. Lovett
May 31, 1918.....	Alfred H. Smith
May 31, 1918.....	Harry A. Worcester
September 18, 1918.....	Frank J. Jerome
September 18, 1918.....	Leonard J. Hackney
Elected: September 18, 1918.....	Charles T. Lewis
September 18, 1918.....	Charles B. Seger
September 18, 1918.....	Edward S. Harkness
September 18, 1918.....	Horace E. Andrews
October 30, 1918.....	Samuel Mather
Re-elected: December 11, 1918.....	Leonard J. Hackney

The Board records, with regret, the death on August 10, 1918, of Mr. William H. Newman, a Director of the Company, and who was President of the Company from January 31, 1905, to February 1, 1909.

The Board also records, with regret, the deaths of two other of its members, Mr. Charles T. Lewis, on September 29th, and Mr. Horace E. Andrews, on December 1st, 1918.

Appreciative acknowledgement is made to all officers and employees of their loyal and efficient co-operation and service.

For the Board of Directors,  
WILLIAM K. VANDERBILT, JR., President.

The Michigan Central Railroad Company—Seventy-Third Annual Report

To the Stockholders of

THE MICHIGAN CENTRAL RAILROAD COMPANY:  
The Board of Directors herewith submits its report for the year ended December 31, 1918, with statements showing the results for the year and the financial condition of the company.  
The operation and maintenance of the company's road were conducted under federal control during the year 1918, the mileage covered being as follows:

Main line and branches owned	Miles	1,182.84
Leased lines		71
Lines operated under trackage rights		578.16
		100.06

Total road operated (as shown in detail on another page) 1,861.77  
There was no change in capital stock during the year, the amount authorized being \$18,738,000 and actually outstanding \$18,736,400. The funded debt outstanding on December 31, 1917, was \$52,738,843.79. It has been decreased during the year by payment of principal of installments on account of equipment trust certificates as follows:  
Trust of 1907, due November, 1918 (N. Y. C. Lines) \$260,425.45  
Trust of 1915, due October, 1918 (M. C. R. R.) 300,000.00  
Total funded debt outstanding December 31, 1918 \$52,178,418.34

Of the \$8,000,000 refunding and improvement mortgage bonds authorized in 1917 there were issued during the year \$6,171,000, but as all of them, pending their sale, are held by the company and pledged as collateral for short term loans there was no change in the funded debt in this connection.

Michigan Central Railroad Equipment Trust certificates of 1917 issued during the year amounted to \$3,848,000. On account of the prevailing unsatisfactory market conditions for the sale of equipment trust certificates, and in order to procure equipment as needed, the company, through the medium of short-term loans, purchased at par and accrued interest these certificates, pledging \$3,658,000 of them as collateral, and receiving more favorable conditions for their sale. There is therefore no change in the funded debt in this connection.

SUMMARY OF FINANCIAL OPERATIONS AFFECTING INCOME

Compensation accrued for the possession, use and control of the property of this company and its leased lines	December 31, 1918	\$8,052,127.48

Adjustment of overaccrued prior to December 31, 1917, of mail revenue	18,672.17	532,180.50
BALANCE TO CREDIT OF PROFIT AND LOSS, DECEMBER 31, 1918		\$18,448,755.41

As was pointed out in the last annual report, the President of the United States took possession and assumed control of the railroad property of your company on December 28, 1917, by the terms of the President's proclamation the possession, control, operation and utilization of the transportation systems were vested in a Director General; and it was stated that until the Director General should otherwise determine, his powers would be exercised through the boards of directors, officers, and regional directors under whom the railroads of the several districts were unified as to control and operation.

Subsequently, Federal Managers and other Federal Officers were appointed and required to report through the Federal Managers to the Regional Director and the Director General.

As of December 27, 1918, the company, jointly with the Chicago, Kalamazoo & Saginaw Railway Company, executed an agreement with the Director General of Railroads providing for the operation, during federal control, of the roads of the parties to the agreement by the Director General of Railroads for an annual total standard compensation of \$8,105,727.04, divided as follows:

The Michigan Central Railroad Company	\$8,052,127.48
Chicago, Kalamazoo & Saginaw Railway Company	53,599.56
	\$8,105,727.04

Under the agreement, all salaries and expenditures incurred by the company, during federal control, for purposes which relate to the existence and maintenance of the corporation are required to be borne by the corporation out of its compensation and other income.

Immediately upon his taking office, the Director General of Railroads appointed as Regional Director in charge of the Eastern District, Mr. Alfred L. Smith, then President of this Company. This District at that time included practically all the railroad lines in the district north of the Ohio and Potomac Rivers and east of the Indiana-Illinois State Line. Mr. Smith assumed the duties of the Regional Director's office, which involved dealing with a complicated traffic situation and the co-ordinating of the lines for war purposes, as an addition to his obligations as President of this company.

Early in 1918 the Director General decided that officers in charge of federal operations should not continue their positions with the corporation, except in special cases and where permission was given. Thereupon, Mr. K. Vanderbilt, Jr., was elected in his stead. Later in the year the following general executive officers also resigned in order that they might continue in the service of the United States Railroad Administration: Mr. Abraham T. Hearn, Vice-President; Mr. Charles F. Daly, Vice-President, and Mr. Edmond D. Bronner, Vice-President and General Manager.

A separate corporate organization has been formed to conduct the affairs of the company under instructions from the President and the Board of Directors, and to take all appropriate and necessary corporate action to carry out the obligations assumed by it under the agreement. Through this organization, the personnel of which is shown on the first page of this report, expenditures for additions and betterments to the property, and for the maintenance of road and equipment under federal management, are of the company's interests, both as to the property transferred under the Federal Control Act, and that remaining with the corporation.

The amount of standard compensation, \$8,052,127.48, accrued under federal control for the possession and use of the company's property and its operating income for the three years ended June 30, 1917, as required by the Federal Control Act, this amount was certified by the Interstate Commerce Commission as agreeing with the income reported to it, subject, however, to such changes and corrections as the Commission might hereafter determine and certify to be requisite.

Pending the execution of the agreement with the Director General of Railroads and the settlement of accounts thereunder, the company borrowed \$7,950,000, of which \$4,000,000 were obtained from the Director General of Railroads and the Secretary of the Treasury on 6% demand notes secured by collateral, and \$3,950,000 from The New York Central by it to the Director General of Railroads.

The Michigan Central Railroad Equipment Trust of 1917, established by agreement dated March 1, 1917, provides for a total issue of \$9,000,000 equipment trust certificates. The original agreement provided for an interest rate of 4 1/2% per annum. Under date of December 31, 1918, by supplemental agreement, the interest rate was increased to 6% per annum. Under the provisions of the trust 3,470 freight train cars were delivered in 1918.

The Director General of Railroads allotted to the company 2,000 freight cars, estimated to cost \$5,747,000, and 30 locomotives, estimated to cost \$1,512,600, a total of approximately \$7,259,600. These allotments were accepted by the company and of this equipment 827 freight train cars and 20 locomotives were delivered during the year.

This equipment is being constructed under contracts between the Director General and the builders and the financing of the cost thereof is being arranged between the Director General and the company. The changes in the road and equipment accounts for the year were as follows:

Additions and betterments—Road		
Expenditures by the Federal Manager	\$2,066,319.88	
Expenditures by the corporation	1,533.80	\$2,067,853.68

Additions and betterments—Equipment		
Equipment assigned to the M. C. R. R. by the U. S. R. R. Administration	\$3,302,419.00	
Expenditures by the Federal Manager less equipment retired and transferred	118,830.12	
Expenditures by the corporation	5,119,481.66	8,540,730.78

improvements on leased railroad property			
Expenditures by the Federal Manager.....	\$162,187.13		
Less miscellaneous credits by the corporation	725.87	161,461.26	

Total (as shown in detail on other pages) ..... \$10,770,045.72

In the operation of the Pension Department, 24 employees were retired and placed upon the pension roll; of these retirements 5 were authorized because of the attainment of seventy years of age, and 19 because of total and permanent physical disability. 29 pensioners died during 1918, and at the close of the year 288 retired employees were carried upon the pension rolls. The average monthly pension allowance of these is \$23.82, and the total amount paid in pension allowances during the year was \$82,635.68, which was paid by and charged to the operating expenses of the United States Railroad Administration as provided in the agreement with the Director General of Railroads.

The following changes took place in the Board of Directors during the year:

Resigned: April 10, 1918.....	Robert S. Lovett
April 10, 1918.....	Marvin Hughtitt
May 31, 1918.....	Alfred H. Smith
Elected: September 18, 1918.....	Charles B. Seger
September 18, 1918.....	Edward S. Harkness
October 16, 1918.....	Samuel Mather
October 16, 1918.....	Henry Russell

The Board records with regret, the death on August 10, 1918, of Mr. William H. Newman, a Director of the company and who was President of the company from January 31, 1905, to February 1, 1909.

The Board also records, with regret, the death on December 1, 1918, of Mr. Horace E. Andrews, a Director of the company.

Appreciative acknowledgment is made to all officers and employes of their loyal and efficient co-operation and services.

For the Board of Directors,  
WILLIAM K. VANDERBILT, Jr.,  
President.

APPENDIX

INCLUDED AS INFORMATION FROM REPORTS SUPPLIED BY FEDERAL AUDITOR REPORT OF OPERATIONS OF THE MICHIGAN CENTRAL RAILROAD BY UNITED STATES RAILROAD ADMINISTRATION FOR YEAR 1918 AS REPORTED TO THE INTERSTATE COMMERCE COMMISSION

## Railway Officers

### Railroad Administration

#### Operating

O. J. Nelson, trainmaster on the Chicago, Burlington & Quincy, with headquarters at Alliance, Neb., has been promoted to assistant superintendent with headquarters at Greybull, Wyo., to succeed C. C. Holtorf, who has been transferred to the Wymore (Neb.) division.

Newman Kline, division superintendent on the Northern Pacific, with headquarters at Minneapolis, Minn., has been promoted to general superintendent with headquarters at St. Paul, Minn., to succeed C. L. Nichols, whose promotion to assistant general manager was noticed in the *Railway Age* of June 6 (page 1450).

#### Traffic

R. N. Golden, general agent of the Chicago, Milwaukee & St. Paul, at Cincinnati, Ohio, has resigned to become general agent of the Shippers & Manufacturers Export Corporation, Marquette, Bldg., Chicago.

D. G. Gray, freight traffic manager of the Baltimore & Ohio, Eastern lines, and assistant freight traffic manager of the Western Maryland, with headquarters at Baltimore, Md., has been appointed assistant traffic manager of the Baltimore & Ohio, Western lines, with headquarters at Chicago, Ill.

#### Engineering and Rolling Stock

Herman F. Noyes, traveling engineer of the Maine Central, has been appointed superintendent of fuel economy of that road and the Portland Terminal, with office at Portland, Maine.

Albert M. Traugott, whose appointment as acting chief engineer of the Virginian Railroad, with headquarters at Norfolk, Va., was announced in the *Railway Age* of May 9 (page 1184) was born on July 31, 1882, at Rochester, N. Y. He was educated at Purdue University and during his summer vacations worked as a chainman with the Buffalo, Rochester & Pittsburgh, and later as a rodman on the Delaware, Lackawanna & Western. In February, 1903, he entered the service of the Virginian Railroad and has served successively as rodman, draftsman, instrumentman, resident engineer on construction work and later as locating engineer on preliminary surveys. In February, 1913, he was appointed resident engineer of the Norfolk division, and one year later became division engineer of the third and Deep-water divisions, which position he held until his recent appointment as acting chief engineer, as above noted.

Charles J. Scudder has been appointed superintendent of shops of the Delaware, Lackawanna & Western, with headquarters at Scranton, Pa., vice Joseph Grieser, assigned to other duties.

H. G. Clark, who was chief engineer of the Chicago, Rock Island & Pacific prior to the return of C. A. Morse, as noted in the *Railway Age* of June 13, page 1450, has been appointed

assistant to the federal manager, succeeding H. M. Sloane, who has resigned to become assistant to the president of the Chicago, Milwaukee & St. Paul.

#### Purchasing

R. R. Jackson has been appointed division storekeeper of the Pittsburgh division of the Baltimore & Ohio, Eastern Lines, with headquarters at Glenwood, Pa., vice T. C. Hopkins, assigned to other duties.

### Corporate

#### Executive, Financial, Legal and Accounting

A. H. Barnes, auditor of the Kansas City Southern has been appointed in addition assistant secretary succeeding J. M. Souby, solicitor and assistant secretary. Mr. Souby retains his position as solicitor.

#### Traffic

R. W. Long, division freight agent on the Grand Trunk, with office at Hamilton, Ont., has been transferred to Toronto, vice L. Macdonald, promoted; R. J. S. Weatherston, division freight agent at Ottawa, has been transferred to Hamilton, vice Mr. Long, and E. J. Hilliard, commercial agent at Buffalo, N. Y., has been appointed division freight agent, with office at Ottawa, Ont., vice Mr. Weatherston, transferred.

### Obituary

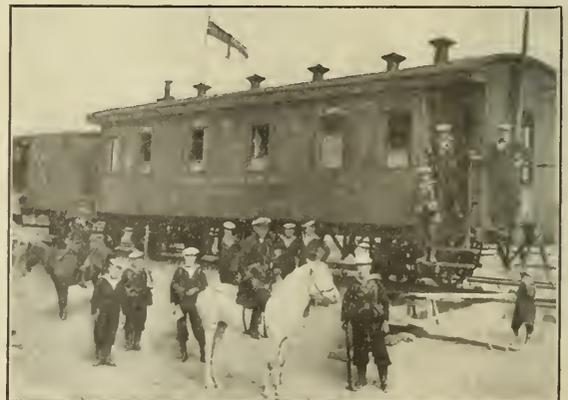

Carl Remington, assistant secretary of the Chesapeake & Ohio Railway Company and the Hocking Valley Railway Company, with office at New York, died in that city on June 6. Up to January, 1918, Mr. Remington was secretary of these roads, and for about a year he had been out of active service on account of ill health.

Joseph C. Thompson, formerly district passenger agent of the Northern Pacific with headquarters at Chicago and recently connected with the Chicago Consolidated Ticket Offices, died at Chicago on June 10. Mr. Thompson was also president of the Tri-State Passenger Agents' Association prior to government control and was a brother of E. Thompson, secretary of the Western Passenger Traffic Committee.

The new shops of the Canadian National at Leasee, near Toronto, were opened for business this week. Construction work is practically completed. The plant consists of a roundhouse, powerhouse, administration building, locomotive repair shop and car repair shop.

THE RAILWAY AGE is a member of the Audit Bureau of Circulations (A. B. C.) and the Associated Business Papers. (A. B. P.)

It is a remarkable fact that even though the Wheel Committee has been reporting for many years, hardly a convention passes without some concrete suggestion for securing increased service from car wheels. In 1917

### The Wheel Committee's Report

the re-design of the 675-lb. wheel practically eliminated the cracking of the plate, which had proved so troublesome with the older design. This year the strength of the tread seems to have received special attention, as the committee is considering a change in the location of the limit of wear groove on wrought-steel wheels, and recommends the adoption of a gage to fix the allowable limit of wear for wheels with hollow treads. Undoubtedly a definite condemning limit should be fixed and the gage proposed should meet all requirements. As a measure of protection against arbitrary scrapping, it should prove valuable, and will no doubt be adopted by the association. The suggestion contained in the committee's report that the 625-lb. and 725-lb. wheels may be re-designed is an indication of the excellent service secured from the arch plate design. It has been reported that of forty thousand 700-lb. arch plate wheels in service, only two have been found with cracks in the plates. Probably the most

serious trouble experienced with the present standards is the breakage of 625-lb. wheels under refrigerator cars. The high brake shoe pressures and high speeds combine to make the service conditions unusually severe. While it must be admitted that the merits of the 1917 design cannot be definitely determined as yet, the performance which has been secured thus far is very gratifying. In view of the apparent resistance to breakage under temperature stresses exhibited by the arch plate wheel, the next problem to which the committee should give attention is the re-design of the 625-lb. wheel, with special regard for the requirements of refrigerator car service.

It is unfortunate that with the fine attendance at the sessions of the convention this year, probably not half of

### The Acoustic Properties of Convention Hall

those in the room are able to follow closely the reading of papers and the discussion following. The acoustic properties of the hall are exceedingly poor, a fact which the large attendance, necessitating the use of the entire floor space, accentuates. It is noticeable that most of the discussion comes from those well toward the front. Is this due to the fact that those deeply interested in the affairs of the section are grouped in a comparatively small section of the hall, or is it because those farther away are unable to follow the course of the proceedings sufficiently closely to take part intelligently? In either case, the result is the same and is detrimental to sustained interest in the meetings. Many of the younger members and attendants receive an unfortunate impression of the value of attendance at the conventions, due to this situation. It would seem to be highly desirable that some experiments be made to determine whether it is not possible and practicable to improve acoustic conditions.

On March 1 the aggregate surplus of freight cars in the United States and Canada amounted to 473,080, a greater surplus than has ever before been recorded. During March and April the surplus was reduced and now, little more than three months later, the roads are facing a severe shortage of one class of equipment at least, namely, box cars. The representatives of the car departments of the Western roads who are attending the convention have expressed great concern over the problem of furnishing cars to care for the wheat crop this season. The yield will unquestionably be greater than ever before, and the demand for cars will be augmented by the present circumstances. There is little incentive to hold the grain for an advance in price. Consequently the farmers will attempt to dispose of it as quickly as possible. Furthermore, the elevator capacity is not adequate to take care of the crop, and it will be necessary to market a large percentage of it to prevent deterioration. The abnormal demand for cars comes at a time when the roads are not well prepared to meet it. The percentage of equipment in suitable condition for grain service is unusually low, due in part to the small amount of new equipment purchased in the last two years. Less than one-half of the Administration's order of 100,000 cars has been built to date. About 5,000 box cars are stored at the car builders' plants awaiting disposition, but even if these cars are used they will care for but a very small portion of the crop and it will be necessary for the roads to make every effort to repair the maximum number of cars in time to transport the grain traffic.

### The Grain Car Situation

## Comparative Draft Gear Data

THE REPORT OF THE COMMITTEE ON Draft Gear, which was presented at Thursday's session, calls attention to the drop gear investigations which are being conducted by the Inspection and Test Section of the Railroad Administration. Reference has already been made to these investigations in an article in the May 2, issue of the *Railway Age*, describing these methods of testing the gears under practically service conditions, which have been developed by the Inspection and Test Section and are being applied at the draft gear test plant of the T. H. Symington Company at Rochester, N. Y. The subject of draft gears, is one of importance and one involving many considerations.

The committee brings out clearly in its report limitations of the various methods of testing. It is evident that no one of the methods provides data on which a definite conclusion may be reached as to the relative value of different gears in service. The ideal draft gear, from the standpoint of its characteristics, new, is not necessarily the best gear when considered from the standpoint of the service to be obtained from it over a period of years. The question of life, the change of characteristics during the life and the cost of maintaining the gear in a reasonably perfect condition are factors which are of equal weight with the characteristics of the new gear. It is evident that the only reasonable basis of comparison, considering these factors, involves the accumulation of a large amount of service data which can only be accomplished after the lapse of years of service. The work of the Inspection and Test Section will be of great value in arriving at conclusions on one phase of the subject and it is fortunate that through the co-operation of the committee of the mechanical section, the data will be available to that committee. The committee, however, will still have much work to do in the accumulation of service data involving the question of life and repairs.

## The Automatic Train Line Connector

THE MECHANICAL SECTION has taken up the automatic train pipe connector as a subject for consideration. The question was brought up during Thursday's session and referred to the general committee by vote of the members in attendance, with the result that a special committee will probably be appointed to take it up, or it will be referred to one of the standing committees.

The automatic train pipe connector is not a new device. The first connectors were placed in service about eighteen years ago and many different devices have received trials since then. While not all of these have proved successful, the eighteen years' development has demonstrated the desirability of continuing the development so that the manifest disadvantages of the manual couplings may be eliminated. There are several connectors at the present time which seem to be working successfully and the outstanding facts in connection with the service of all of these devices are the increased life of hose and the reduction in train line leakage. The advantages from the standpoint of safety are self-evident.

There seems no insurmountable difficulty in developing devices of this kind to meet the essential mechanical requirements.

The greatest difficulty in the universal use of connectors is the question of interchange. This problem for the connector is practically the same as that which had to be solved in the development of the automatic coupler to the present universal interchangeable standard. To secure the benefits of more than local or isolated installations on special service equipment which is not offered

in interchange, all automatic train pipe connectors must operate interchangeably. To expect the immediate or hasty development of a standard type to meet this requirement is unreasonable, as the form of a perfected mechanical device can only be arrived at by first allowing designers the widest latitude in the development of their various ideas. It would be unfortunate, however, if this fact were used as an argument against the widest possible application of the various devices which are now or may be developed, because it is only through such development that the advantages of safety and economy offered by a universally interchangeable automatic connector may ultimately be obtained.

When the investigation of the connector problem has become sufficiently extensive so that well-supported opinions may take form as to the essential requirements of such a device the problem of interchangeability may be considered. Until that time has arrived lack of interchangeability should not be a deterrent on the development of connector devices. In its present stage the question is one of a fair field and may the best man win.

## Opportunity of the American Railroad Association

IN their addresses before the mechanical convention yesterday, Mr. Aishton, Mr. Tyler and others touched upon the part the new American Railroad Association can play in bringing about unity of action by the railroads after Government control has ceased, and the Railroad Administration has gone out of existence.

This is a point of the utmost importance. Many of the serious troubles of the railways before Government control was adopted, were due to their failure to work together. In fact, they did not in all things work together as they should have even when the Railroad War Board was in charge of their operation, and this was one of the things which made Government control practically unavoidable.

While, on the whole, Government operation has not been a success, it has brought about some important improvements in operation which could not have been effected without centralized control, and which cannot be perpetuated without some form of centralized control provided by the railroads themselves.

The new American Railroad Association affords the best, and indeed, the only agency in sight, for effecting the co-ordinated working under private control which will be necessary if the best results are to be obtained.

Fortunately, the difficulties in the way of co-operation between the railroads regarding operation will be much less formidable in the future than they have been in the past, since it appears certain that the Sherman anti-trust law and the anti-pooling law, as they apply to railways, will be repealed at the present session of Congress. These laws in the past rendered it very difficult for the railways to adopt and enforce among themselves the measures necessary to secure the co-operation and co-ordination of operation which all recognized as desirable.

The new American Railroad Association is fortunate that it is going to begin its career with R. H. Aishton as its president. No railway manager in the country unites in himself better than Mr. Aishton does the qualities of energy, courage, tact, thorough knowledge of the "railroad game," which are needed in order to give the association a good start in the right direction. Upon the way the new American Railroad Association performs its enlarged functions will largely depend the future of the railways of the United States.

## Program For To-day

9.30 A. M. TO 1.30 P. M.

Discussion of Reports on:

Safety Appliances .....	9.30 A. M. to 9.45 A. M.
Loading Rules.....	9.45 A. M. to 10.15 A. M.
Car Construction .....	10.15 A. M. to 10.45 A. M.
Car Trucks .....	10.45 A. M. to 11.30 A. M.
Train Lighting and Equipment....	11.30 A. M. to 12.00 M.
Tank Cars .....	12.00 M. to 12.30 P. M.
Questions Proposed by Members..	12.30 P. M. to 1.30 P. M.

### ENTERTAINMENT

10.30 A. M.—Orchestral Concert at Entrance Hall, Million Dollar Pier. Fry Philharmonic Orchestra.

3.30 P. M.—Band Concert and Impromptu Dancing, Entrance Hall, Million Dollar Pier. Royal Scotch Highlanders' Band. Tea will be served at 4.30 P. M. in Entrance Hall.

9.30 P. M.—Grand Ball, Ball Room, Million Dollar Pier. Royal Scotch Highlanders' Band.

## Badges Must Be Worn!

THE DOOR COMMITTEE of the Entertainment Committee again wishes to emphasize the importance of the wearing of badges at all times. The Door Committee is an important unit; it has difficult problems to solve and rather hard situations to adjust. It should be given real, not half-hearted, help.

## Daily Distribution

FOR MANY YEARS it has been the policy to put the *Daily Railway Age* in the hands of those attending the convention as early as possible. In most of the hotels the *Daily* will be found on a table at the entrance to the dining rooms, while at others they will be found on the hotel registration desk.

## Big Guns in Action

IN CONNECTION with the program to be given on the pier on Sunday evening, at 8.15, there will be shown a series of motion pictures illustrating large naval guns in action in France. These pictures will be exhibited by the United States Navy and a naval officer will be present to explain them.

## Carnival Night

It was carnival night at the Million Dollar Pier last night. The three thousand convention people who attended the entertainment voted unanimously that it was "some big night to-night" and it was.

Those who went were fortunate and by the same token those who failed to attend now regret it.

The fun commenced in the ball room at about 9 o'clock when the Royal Scotch Highlanders started a program of sixteen dances. During the dances members of the Entertainment Committee distributed vari-colored paper hats and caps, confetti, ticklers and so forth.

The management of the evening's entertainment was in the hands of the following: W. K. Krepps, general

chairman; R. J. Himmelright, chairman; Ellsworth Haring, L. O. Cameron, H. E. Passmore, G. A. Nicol, R. H. Gwaltney and J. E. C. Holding.

## Air Brake Meeting

The Executive Committees of the Air Brake Association and the Air Brake Appliance Association will hold a joint meeting at 10 o'clock Friday morning at the Marlborough-Blenheim.

## Chairman Chambers

### Appoints Committees

CHAIRMAN CHAMBERS has appointed the following Committee on Subjects for the American Railway Association, Section III, Mechanical; M. K. Barnum, C. E. Fuller, D. R. MacBain, T. H. Goodnow and J. C. Fritts.

Messrs. W. E. Dunham, B. P. Flory and R. L. Kleine have been appointed on the Committee on Resolutions and Correspondence.

## Committee on Obituaries

CHAIRMAN CHAMBERS named the following Committee on Obituaries at the Wednesday afternoon session: On J. L. Greatsinger, F. W. Brazier; on Henry Hardie, C. F. Giles; on C. D. Porter, A. W. Gibbs; on R. E. Smith, Willard Kells; on C. W. VanBuren, W. H. Winterrowd; on R. A. Billingham, F. W. Gaines; on D. M. Perrine, J. T. Wallis; on Dr. Angus Sinclair, C. E. Chambers; and on J. W. Heintzelman, Geo. McCormick.

## Lost and Found

FOUND—Badge No. 2290. Call at the office of the *Daily Railway Age*.

LOST—By Miss E. D. Knapp, Iroquois, Hotel, Atlantic City, R. S. M. A. badge; also bar pin and silk handkerchief (colored).

LOST—Dark brown sable scarf during the informal dance Wednesday evening. It was left on one of the chairs immediately in front of the Galena Signal Oil Company exhibit. Please return to Mrs. C. F. Massey, care *Railway Age* office, at the entrance of the pier.

## Railway Club Secretaries

THE SOCIETY of Railway Club Secretaries held a brief meeting yesterday morning, Mr. A. J. Merrill, of Atlanta, chairman, presiding, and adjourned to meet again at 10 o'clock this morning in room 192 of the Blenheim.

Later, with several invited guests, the members had a "round table" luncheon at the Blenheim. This is an innovation in the society's work. It proved of so much pleasure and profit to all concerned that it will be a permanent feature of the annual meetings.

## The Man Who Saw

The "old timer's" emotion was only exceeded by his admiration as he surveyed the latest greyhound of the rails, the monster Mallet locomotive in the exhibit of the Pennsylvania Railroad, near the Atlantic City station. The Man, observing his interest, came nearer and ventured to ask him what he thought of it.

"It is wonderful, sonny," said Andrew Chambers. "I have watched them grow for 50 years. In 1868 I started running for the Pennsylvania Railroad, and held the job without an accident for 44 years. Since 1873 I have had the honor of pulling seven different presidents of the Pennsylvania Railroad and three Presidents of the United States. I have never missed a mechanical convention, and this is the finest one I ever saw. I handled one engine—the 937—from 1873 to 1912. Yes, it is wonderful. I am through now; let the younger boys have a chance."

### Running Orders for the Boss

"What I would like to know is, who's supposed to be running this job here, anyway?"

The irate, sputtering master car builder bounced out of his office and bumped into The Man who waited patiently outside for an "interview" and nearly knocked him down.

"Last night I told the worst stenographer I ever saw that she wouldn't do, and I was sorry to be compelled to seek another in her place.

"Why, she even leaves the "i" out of railroad. Deprive her of her trusty eraser and she would cease to function altogether!

"Now comes an important person who calls herself the Secretary of the Amalgamated Association of Secretaries to inform me that she has reviewed the case and finds that Miss Smith has done nothing whatever to merit dismissal.

"She furthermore stated that she has decided to recommend that Miss Smith remain on the job. If Miss Smith goes, she says the whole works goes."

Now, what do you think of that?

### U. S. Presidents and Machine Tools

"Do you realize," said a mechanical engineer, "the quality of some of the talent employed on this floor?"

The "talent" referred to, scattered here and there among the exhibits in the machine tool section, was surrounded by interested groups from 48 States, watching this year's innovations in drilling, boring, planing, grinding and other operations. The turning of wheels everywhere evidenced the machine tool builders' ingenious perfection of devices that meant "more miles for less money."

"Do you see that fellow with the gray suit and glasses?"

"Yes," said The Man. "Who is he?"

"Well, he is the publicity manager for the tool concern in whose booth he is standing. A few years ago, right on this same pier, this unassuming fellow, who was the personal press representative for a presidential candidate, closed a campaign that helped to elect a President of the United States. The man standing on his right is the 'daddy' of motion on the pier. He was the first man to exhibit a tool doing business at the convention, and he

put up a sign which read, 'Look what's coming off here! That was 13 years ago—to-day they are all moving.'

"That is talent," said The Man, in appreciation of the press agent; and "that was initiative," said the mechanical engineer, as a tribute to the pioneer exhibitor of operating tools.

### The Shipper Speaks

The Shipper and the Labor Delegate had casually noted each other's presence in the lobby and The Man had been watching them both. Feeling that each other had something to "get off of his chest," The Man timidly approached the Delegate to get some "views."

"Wages won't come down; if they change, they'll go up. Attempts at 'slave driving' will be promptly squelched."

The Shipper, anxious to hear any discussion participated in by the well-known Delegate, moved nearer to the conversation. For the benefit of the Shipper, the Delegate repeated his threat, whose intended effect brought this immediate response:

"Gentlemen, pardon me. I could not help overhearing your conversation. Evidently you men represent the interests of the workman. I am a shipper of a thousand tons of merchandise a month. I acknowledge our obligation to the men whom you represent. As proof of my sincerity you are invited to visit my plant. Come and talk to my men. You will find that our workmen have all they demand—and a little more. But I want to tell you that the forty-five men who are soldiering on the thirty-man job at the P. & X. shops right in this town, have something to do with the rate that I pay to send my stuff to you.

"You both use my product. You are paying more for my goods than you would pay if you were more concerned over an honest analysis of the condition that I mentioned, than in the indulgence of defiant generalities. Think it over!"

The Man looked at the Delegate as the Shipper withdrew. "Well, what do you say?" said The Man. "To hell with him," said the Delegate.

### The Crepe Hanger

"Oh, I've tried that darn thing—put it on three locomotives—we didn't get anywhere with it."

In hanging this little bit of crepe on the door of the supplyman, the visitor complimented his own alleged abilities in his remark. He seemed to have stamped himself as a duly qualified member of an ever-present minority of weak sisters who usually only half-heartedly encourage the development of new devices to which the transportation world to-day owes its very existence.

"I wonder," thought The Man, eyeing the retreating crepe hanger with suspicion, "if that fellow *really* tried it to get the results. I wonder if he thought of the supplyman's contribution of confidence, courage and money in the gradual perfection of the device which was already commencing to exceed its promises on other lines?"

The Man's thoughts took him back to the early days of the superheater and brick arch. He remembered the army of "conscientious" objectors, the coldness of whose feet was only exceeded by the chilliness of their reception of those who persisted day and night in their efforts to save coal and increase the train load. And hope for the ultimate salvation of the crepe hanger lies in the supplyman's refusal to attend the funeral.

# A. R. A. Executive Committee at the Convention

R. H. Aishton Elected President of the Big Organization and

W. T. Tyler, First Vice-President

THE FIRST MEETING of the Executive Committee of the reorganized American Railroad Association, which was held in Atlantic City yesterday, proved to be one of the most interesting and important events that have ever been associated with the mechanical conventions. All the members of the Executive Committee were present except Charles A. Prouty, director of the Division of Accounting of the Railroad Administration; E. E. Calvin, federal manager of the Union Pacific, and H. G. Kelley, president of the Grand Trunk Railway. The most important work done at the meeting was the election of officers, which resulted as follows:

President, R. H. Aishton, regional director, North Western Region.

First vice-president, W. T. Tyler, director of the Division of Operation, United States Railroad Administration.

Second vice-president, E. H. Coapman, federal manager of the Southern Railroad.

General secretary and treasurer, J. E. Fairbanks, who was re-elected.

Assistant general secretary and assistant treasurer, H. J. Foster.

It was decided to hold the first annual meeting of the reorganized association in Chicago, on the third Wednesday in January. C. W. Crawford was elected chairman of the General Committee on Transportation, which will constitute Section 5.

After the meeting of the committee adjourned all of its members proceeded in a body to the Million Dollar Pier, where the Mechanical Section of the association was in session. C. E. Chambers, president of the Mechanical Section of the association, who was presiding, invited the visitors to the platform and introduced the new president of the association, Mr. Aishton, who delivered a short address, which was received with much enthusiasm. In the course of his remarks, Mr. Aishton said:

## Mr. Aishton's Remarks

"I was just elected president of the American Railroad Association. I do not know why, or did not know until I got on this magnificent pier, and some fellow told me they elected me president so that I could make a speech for them at your convention. That is not much of a reason why a man should be elected as president of such an important institution as the American Railroad Association, and, furthermore, I could hardly qualify on those grounds, because I am not a very great success as a speech maker.

"I have been connected with the American Railway Association—now the American Railroad Association—for a great many years, and I have been on the Executive Committee for a long while, and I want to tell you gentlemen that a visit to your convention here has certainly broadened us out, because I know all the history of the American Railroad Association, and we never had a meeting in a Greek temple on the Million Dollar Pier, and at no place where we went did we ever get a badge that entitled us to the many things that this badge of your association entitles us to. (Laughter and applause.)

"It goes without saying that the Executive Committee is glad to be with you. Government control of railroads, as you know, is almost universally condemned by

the public, but if the public could be here with us today, and could see what a magnificent meeting you folks are having, I think they would say that government control, at least, has given you the largest and I think one of the most enthusiastic meetings you have ever had in your associations. (Applause.) You also have here a wonderful exhibit of railway equipment and devices for which the manufacturers deserve unstinted credit and praise.

"We have been going through strenuous times. We have been through the greatest war in history. It is true that we only went in in 1917, but previous to that, for two or three years, we had given all the assistance we could to the Allies in an indirect way through our transportation machine, and I think it is the general verdict of everybody in Washington, at least of the real people in the United States, that if there was one class of men in the United States who met successfully the burden that was put upon them, it was the railroad men.

"We are going through strange times, times when all our past precedents and ways of doing things are in the discard. No man can tell what the future has in store for us or where we are going. The President of the United States has announced very definitely that the roads are going back to their owners on January 1st next. I do not think there is a dissenting voice on that proposition, either from Congress, the people of the United States, from the Administration or from the railroad men.

"But we are going to be up against one of the greatest constructive periods we have ever gone through. I am one of those who do not believe that in the future the selfish conditions which have prevailed in the past are going to prevail in the railroad business or any other business of this country in future. I believe the time has come when all men must work together, and I firmly believe that the welding together of all these railroad interests, the welding together of your Master Car Builders' Association, and your American Railway Master Mechanics' Association, and all these various associations, into one big force, is going to be to the advantage of all of us.

"What has held the railroads together during the last 18 months? It has been the Railroad Administration—it has been the central authority that said what ought to be done, and how to do it, that has held us together. We have made mistakes in the Railroad Administration, lots of them—who has not?—they made mistakes in all the Allied countries—they are free to admit that they made many mistakes in the conduct of the war—but, on the whole, if it had not been for the centralized control of the Railroad Administration, I doubt if we could have gotten through the job as well as we did. In fact, I know we could not have done so.

"What is going to happen? The Administration is going to let go control the first of January, and we will be placed upon our own resources—that is what they say, and most of us hope that it is true.

"In my opinion, the action you people have taken in joining hands in one great big functioning machine is what is going to hold us together, and the people will look to your organization to co-ordinate this whole railroad system into one great big system, in so far as methods of doing things are concerned, and I firmly be-

lieve that the day has come when individual idiosyncrasies, and all that kind of thing, which in the end cost considerable money when applied to railroads, and which in the end the public has got to pay for, will disappear, and I believe that the American Railroad Association, with you gentlemen as the directing force of that Association, putting it up to the Association to make effective your recommendations regarding the things that you as a collective body believe to be right, is going to be the main thing that is going to tie this railroad system together, and make a smooth working machine of it, when the central direction, as represented in the Railroad Administration lets go.

"Now, for the members of the Executive Committee—they are all very modest, and I am afraid they will not speak for themselves, and they want me to speak for them. All I have to say is that the Executive Committee of the American Railroad Association will stand with you on any reasonable proposition. If you have something bothering you, and you want to have it straightened out, call on us and we will send some one down here to take it up with you, or I will come myself, if I can, as I spend most of my time traveling about the country, and, if possible, I would be glad to come.

"You are here to work out the practical problems connected with the operation of the railroads. Who knows the mechanical end of the railroads, if you gentlemen do not? I have been a railroad president for three or four years and all of these gentlemen on the platform are railroad presidents, and pass as 'wise guys,' but when it comes down to finding out something you know who they go to.

"I want you to know that we are all traveling together, and that we must work out this problem together. There is no one man who is going to do it, but it is the hundreds and thousands of men who are thinking about these things that are being brought up in your Association, and who finally crystallize them into something definite that finally produce something that is of inestimable value, in the line of progress, who are going to bring about the results which are so much to be desired.

"I would like to state to your entire convention that, from the sample I have seen so far of it, it is very fine. I have had two free rides in a rolling chair on the Boardwalk because I have this badge, something that never happened to me before in Atlantic City (laughter), and all I can say, in conclusion, is that if there is anything that the Executive Committee of the American Railroad Association can do to assist you, call upon us and we will be glad to help you." (Applause.)

#### Remarks of Mr. Tyler

The chairman then introduced W. T. Tyler, who in turn presented to the convention J. E. Fairbanks, general secretary of the American Railroad Association; Mr. Bush, Regional Director of the Southwestern Region; Mr. Powell, Director of the Division of Capital Expenditures; Mr. Jackson, Federal Manager of the Chicago & Eastern Illinois, and G. L. Peck, Federal Manager of the Pennsylvania Lines West of Pittsburgh.

Mr. Tyler said in part:

"I cannot add anything to what Mr. Aishton has said, except to say if these two rides which he has had are the first two free rides he has ever had, he has one still coming to him. (Laughter.)

"I do want to say that I think while the work of the Railroad Administration and the work of the railroads under the Administration has been most remarkable in a great many ways, one of the most remarkable results has been in the matter of organization. When the railroads were taken over in January, 1918, the Railroad

Administration was entirely without any landmarks, without any precedents, without any light at all on the matter of procedure. The Director General had to reach out largely in the dark, and gather together an organization. I presume that he had advice on the subject, although most of the additions that were made to the organization after I became connected with it, which was in the second week of its life, seemed to be almost entirely without suggestion. The Director General might call his staff together, but, as a rule, either he or some member of his staff recommended a man and it went through.

"There was gathered together at Washington an organization that worked in absolute and complete harmony, and is doing so up to this time. There has never been, so far as I know, a discordant note in that central organization. I think that thing itself is most remarkable. Now, that condition prevailed naturally, you might say, during the period of the war as the result of the patriotism of the members, but it continued after the signing of the armistice in just exactly the same degree as it did before, and it continues and goes along, even when the minds of the individual members very naturally are largely turning to the return of the railroads.

"That organization, as I have said, is functioning today perfectly, and in this meeting here we see the same signs of perfect success in working out a complete organization of the railroads of the United States, to take the place of the U. S. Railroad Administration when it shall cease to exist by act of the President. So that I think, not only from what the railroads did toward winning the war—and when I say the railroads I mean, of course, railroad men—but from what is now being done by the rank and file of these various organizations to promote an organization that will go on and keep up what has already been accomplished, we are going to get results that could not have been accomplished in any other way, and results well worthy of all that we have all done in the past eighteen months, for first, the Government, and second, the railroads.

"I am hopeful that before the roads are finally turned back there will be, as Mr. Aishton has said, a complete organization of all the functions of the operation of these railroads in one smooth, working body."

#### Mr. Markham Speaks

In introducing C. H. Markham, the Chairman, Mr. Chambers, said: "While there were no doubt many difficulties attending the work under the Railroad Administration, I presume almost everyone found some pleasure in the work—I know that was true in my case—for if it had not been for the creation of the U. S. Railroad Administration, I might have lived my lifetime and never been associated with one man, to know whom it has been a great pleasure to me, and I will ask Mr. Markham, Regional Director of the Allegheny Region, to say something."

"I am very glad," said Mr. Markham, "to have had the opportunity of appearing before the organization that in its work is doing as much for the railroads of the country as any that I know of. I am particularly glad of the opportunity that is given me to testify to my own appreciation of having had the privilege of being associated in the work of the Regional organization of the Allegheny Region, with your esteemed Chairman, Mr. Chambers. To be associated with Mr. Chambers is not only a privilege but a great pleasure."

#### Remarks by Mr. Powell

Mr. Powell, when called upon, said: "I am in a most unfortunate position, because while I have the title of Director of the Division of Capital Expenditures, my

constant effort is to keep down expenditures. We had hoped that Congress would be willing and liberal enough to give us the money that we required for the operation of the railroads, but they became cautious and cut down the appropriation bills, including the Army and Navy appropriation bills, and when they came to the appropriation for the Railroad Administration, they landed on us with both feet, and cut off a greater proportion of our appropriation than in any other bill, and because of this you will see that I really have not much to say."

#### Regional Director Winchell Introduced

Mr. Winchell, the southern regional director, said in part:

"I want to comment a little upon what Mr. Tyler said about the Director General reaching out in the dark, and not knowing what he was doing. That is not quite so in my case, because he did not send for me until he knew what he wanted, and that was the first of June. (Laughter.) This thing of being a Regional Director may be more or less hard for you to understand, because it was hard for us to understand. I think it was Samuel Butler, who said a great many years ago, that life is a good deal like playing a violin solo in public without knowing anything about the violin, but learning the instrument as you went along. That is very much like what the position of being Regional Director has been, but it has been the most interesting work that I have ever done in my life, and I am sure it has been so to a great many others.

"We have had broad opportunities, doubtless many opportunities we have not risen to, but anything we did accomplish could not have been done without the splendid support that has been given us by everybody, and no support has been more valuable than that which came from the members of your organization. Before I sit down I want to testify to the accuracy of the remarks which were being made by a very talented speaker as we came into the room, on the subject of cleaning air brakes. I want to tell you there is no discriminatory practice in that matter, for I started out from Atlanta not long ago with bright new lettering, stating the date I had been cleaned up, the day before, and I got to Louisville with the brake acting badly, and found it was dry and full of sand." (Laughter.)

#### Regional Director Maher Speaks

Mr. Maher, regional director of the Pocahontas Region, said:

"I am reminded at this meeting that when I was on a railroad once I heard a man say that an engine was the only thing that earned money on a railroad. This section of the American Railroad Association I regard as a vital section. I think your work is probably as important, if not more important, than that of the other sections; unless we have the locomotives and cars in good shape, the railroad cannot be operated. I am very much in sympathy with the statement of Mr. Aishton and Mr. Tyler that the amalgamation of this association with the American Railroad Association is going to be one of the greatest helps to the whole railroad situation that we have in this country."

Mr. Stone, Federal Manager of the Erie; Mr. Gorman, Federal Manager of the Rock Island, and others also spoke briefly. Mr. Gorman paid a high compliment to Mr. Tollerton, mechanical superintendent of his lines.

The members of the Executive Committee of the American Railroad Association constitutes the largest body of the higher operating officials of the railways who have ever attended the mechanical conventions in one group. They had been expected at the convention hall

some time before they arrived, and the hall was crowded and many persons were standing. In proceeding to the hall, the distinguished visitors passed through parts of the pier containing a large part of the exhibits. Most of them had never seen a mechanical exhibit at Atlantic City before, and they expressed great astonishment and satisfaction because of its magnitude and completeness.

A few of the executives left for their homes yesterday, but most of them remained over for the purpose of taking advantage of the opportunity of making a more thorough inspection of the exhibit.

#### Some Facts About the Members of the Committee

Some details regarding the personnel of the Executive Committee of the American Railroad Association may be of interest.

Mr. Aishton, the new president of the association, is regional director of the North Western Region, and was formerly president of the Chicago & Northwestern Railroad. When the Railroad Administration was originally organized, all the railroads west of the Mississippi River were comprised in the Western Region, of which Mr. Aishton was director. Some years ago he was first vice-president of the American Railway Association, and was in line to be elected president but declined the office because at that time W. A. Gardner, then president of the North Western, was in bad health, and Mr. Aishton, who was then vice-president of the road, felt that his railroad required his undivided attention. He is one of the biggest, ablest and most public spirited railroad men in the United States, and withal a man with a personality so attractive that he is one of the most popular railroad men in the country.

William T. Tyler, the director of operations of the Railroad Administration, and the new first vice-president of the American Railroad Association, is a thoroughly experienced railroad operating man, who has served on various railroads, including the Great Northern, the St. Louis & Iron Mountain, the St. Louis-San Francisco, the St. Louis-Southwestern and the Northern Pacific. He was general manager of the Frisco, vice-president of the Cotton Belt, and assistant to the vice-president of the Northern Pacific. He was occupying the last-named position when the Railroad Administration was organized and C. R. Gray was appointed director of operation. Mr. Gray immediately wired, asking Mr. Tyler, who had served under him on the Frisco, to become his senior assistant. Mr. Tyler served as senior assistant director of the Division of Operations until Mr. Gray retired, late in 1918, when Mr. Tyler was appointed to succeed him. No railroad man in the country has worked harder than Mr. Tyler during the last year and a half. The strain imposed by the long hours he has had to keep in his office in Washington has been tremendous, but his rugged constitution has enabled him to stand up under it. Personally, Mr. Tyler is one of the most congenial and approachable of men, and all of his friends know that promotion to his present position as the head of the operating department of the railroads of the United States, while it has made him busier, has made him no less democratic and approachable than he always has been.

T. C. Powell, director of the Division of Capital Expenditures, was connected with the Southern Railway System for many years, having become vice-president of this road in 1905. Mr. Powell did much important work for the Government in important positions in Washington during the war. He succeeded Judge R. S. Lovett as head of the Division of Capital Expenditures, when Judge Lovett retired after the signing of the armistice.

A. T. Hardin, regional director of the Eastern Region, was formerly vice-president in charge of operation of the New York Central. He was made assistant regional director of the Eastern Region and succeeded A. H. Smith as regional director when the latter retired a short time ago.

C. H. Markham was president of the Illinois Central when Government control of railroads was adopted. He was first appointed regional director of the Southern Region, and later was appointed regional director of the Allegheny Region when the latter region was created.

N. D. Maher, regional director of the Pocahontas Region, was president of the Norfolk & Western when Government control was adopted and served as federal manager of that road until the Pocahontas Region was created.

B. F. Brush, regional director of the Southwestern Region, was president of the Missouri Pacific before Government control was adopted and later was federal manager of that road.

Hale Holden, regional director of the Central Western Region, was formerly president of the Chicago, Burlington & Quincy. He was chairman of the Railroad Presidents' Conference which, in 1916, carried on the negotiations with President Wilson in the eight-hour controversy with the train service employees. He was a member of the Railroads' War Board, which supervised the operation of the railroads for the railway companies in 1917.

B. L. Winchell, regional director of the Southern Region, was formerly president of the Rock Island, and later the Frisco. He was traffic director of the Union Pacific when he was appointed regional director of the South.

W. J. Jackson, federal manager of the Chicago & Eastern Illinois, was formerly president and later receiver of that road. He was long chairman of the Committee on Relations of Railway Operation to Legislation.

E. H. Coapman, federal manager of the Southern, was vice-president in charge of operation of that road when Government control was adopted.

H. E. Byram, federal manager of the Chicago, Milwaukee & St. Paul, was federal manager of that road, and J. M. Hannaford, federal manager of the Northern

Pacific, was president of that road, before they were appointed federal managers. G. L. Peck, federal manager of the Pennsylvania Lines West, was vice-president in charge of operation of those properties. J. E. Gorman was president of the Rock Island Lines before he was appointed their federal manager. A. J. Stone, federal manager of the Erie, was vice-president in charge of operation of that road.

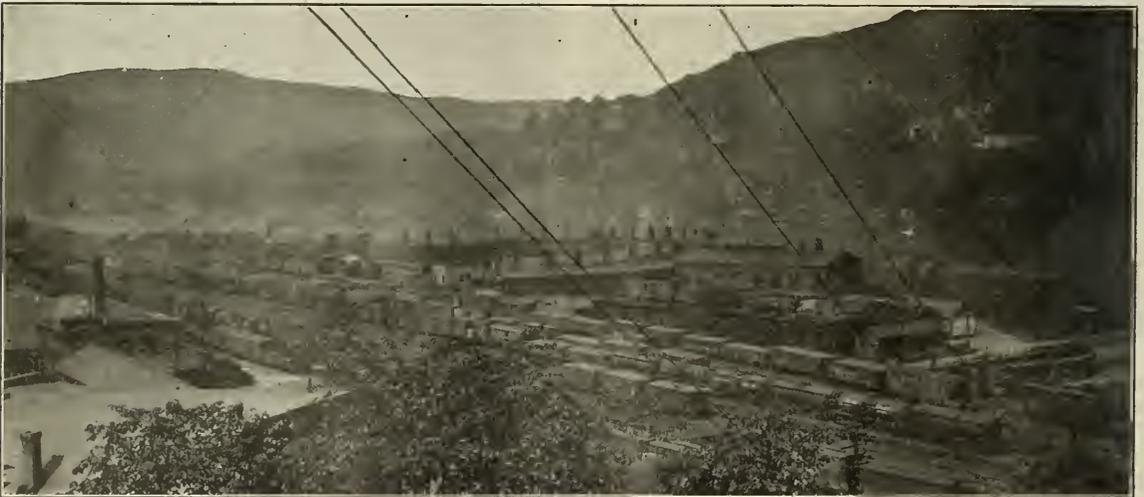

Mr. Pairbanks, general secretary of the American Railroad Association, stated yesterday that its headquarters in Chicago will be as large as those in New York. They will be located in the Manhattan Building. The activities of the mechanical, engineering, traffic and transportation sections will be carried on from Chicago, and the general secretary will have an office there. The general secretary will also have an office in New York. The treasurer will be located there, and the activities of the operating, telegraph and telephone, signal and transportation and purchase and stores section will be carried on from New York.

### The Cure of the Model Hater

"How do you do, Mr. X. What do you think of the convention this year?" The Man who saw turned his head to hear the reply.

"Why, hello, Dick. It's the best I ever saw. I'll take off my hat to the far-sighted crowd who brought these splendid exhibits here. And, Dick, I'm going to make a confession. For years, as you know, I have declined to look at the models you have so patiently dragged around for my benefit—and other fellows like me. Models, to me, have always been a bore, but now I am cured. I have spent four straight hours looking at models and nothing else, and I'll say frankly, that I wish I had more time."

The Man thought of unconverted others of his type who, safely fortified in their private offices, politely declined to give the "once over" to carefully constructed models which were made for their sole education and brought to their very doors. Truly, the "greatest convention" is a converter as well as an educator.

## American Railway Association, Section III, Mechanical

### Report of the Proceedings of the Wednesday Afternoon and the Thursday Sessions

The Wednesday afternoon session was called to order by Chairman Chambers at 3:15 o'clock.

#### The Report of the Arbitration Committee

J. J. Hennessey  
Chairman

Loading Rules, Specifications, etc., and all printed forms issued in connection with the interchange, repairing, billing, defect carding, etc., be changed to conform therewith, i. e., be designated as "A. R. A." instead of "M. C. B."

#### Changes in the Rules of Interchange Recommended by the Committee

##### Rule 9

The committee recommends the following addition to Rule 9:

Journal Boxes:	{ "Length of journal. Date previously repacked or "No date."
Periodical repacking, per Rule 66.	

This information will be required if the recommendation for repacking journal boxes under Rule 66 is approved.

##### Rule 12

The committee recommends that the fourth paragraph of this rule be amended to read as follows: "Joint evidence must be

obtained within 90 days after first receipt of car home and said joint evidence shall not be valid unless used within 16 months from date of issue."

We feel there should be a time limit within which joint evidence must be used. As there is a twelve-month limit upon the rendering of bills, there should be some additional time allowed the car owner to make use of joint evidence.

##### Rule 17

The committee recommends the following interpretation of Section B of this rule, to be included in the revised rules: "Q.—Are special steels, or alloy steels, considered to be the equivalent of and permissible in substitution for malleable or gray iron A. R. A. standards A.—Yes."

The committee recommends that the following interpretation of paragraph (e), as shown on page 31 of the 1916 Rules of Interchange, be reinstated and shown in the Rules when revised for 1919. "Q.—When substitution of different makes of M. C. B. metal brake beams necessitates changes in brake hangers or connections, is the company making the repairs liable to the car owner for wrong repairs on account of these hangers, etc., being different from that standard to the car? A.—The association has no standard method of hanging beams, and until such a method is adopted the standard to the car must be maintained." The committee feels that this interpretation is necessary to properly protect the car owner.

##### Rule 32

The committee recommends that Rule 32 be rewritten as follows: (Delivering Company Responsible.)—"Dome covers or safety valves missing from tank cars. Material missing from cars due to handling on unloading machines. Removing or cutting out parts of car to facilitate loading or unloading. Known theft of parts of car occurring on handling line.

"Damage to any car (including cars on ferries or floats) if caused by: (a) Derailment. (b) Cornering. (c) Sideswiping. (d) Collision or impact other than that occurring in regular switching. (e) Handling of cars with broken or missing couplers, or couplers out of place. (f) Colliding with or shoving over bumping post or other fixed obstruction. (g) Shifting of

loads from other cars. (h) Overloading. (i) Explosion. (j) Collapsing buildings or other structures on right-of-way. (k) Unconcealed fire damage. (l) Flood. (m) Storm where car is derailed or destroyed. (n) Failure to close hopper or drop doors before moving car."

These changes are intended to better cover those causes of damage which should be considered as unfair usage and more clearly outline such causes and the loss of certain parts of cars which it is felt are properly a handling line responsibility, and to eliminate the indefinite term "wreck."

#### Rule 33

The committee recommends that the first paragraph of this rule be rewritten to read as follows: "Owners will be responsible for the expense of repairs to safety appliances where not involved with other delivering line damage, except damage to running boards on tank cars when sideswiped or cornered."

#### Rule 58

The committee recommends that Rule 58 be reinstated to read as follows: "Delivering company responsible when cars are offered in interchange with missing brake cylinders, reservoirs, triple valves, pressure-retaining valves, cut-out cocks, angle cocks or air hose, each or all complete." Also that reference to Rule 58 be added to Rule 43 as an exception.

#### Rule 66

The committee recommends that Rule 23, as printed in Circular No. 25, issued January 1, 1919, be incorporated in the Rules of Interchange as Rule 66, and amended to read as follows: "Owners responsible.)—Periodical repacking of journal boxes, regardless of the responsibility of delivering company for change of wheels, journal boxes or journal bearings. No charge shall be made for repacking unless all boxes are repacked. No charge shall be made if the repacking is done within nine months from date stenciled on car. If car bears no stenciling, showing date of previous repacking, all journal boxes may be repacked, if necessary, and charged for.

"(a) All journal boxes shall be repacked with properly prepared packing (new or renovated) at least once every twelve months, at which time all packing will be removed from the boxes and the boxes cleaned; dust guards to be renewed when wheels are changed.

"(b) The date and place (railroad and station) where the work is done must be stenciled on the car body near the body bolster at diagonal corners in 1-in. figures and letters, using the same station initial that is used for air-brake stencil.

"(c) This work to be done as far as possible when cars are on repair track undergoing heavy repairs. When on repair track for heavy repairs, cars which have not had boxes repacked within nine months will have all boxes repacked and the record stenciled on the car as above.

"(d) This does not contemplate any change in the intermediate packing of boxes when it is necessary to do so. No change should be made in the stenciling unless all boxes are repacked."

#### Rule 88

The committee recommends that Rule 88 be rewritten to read as follows: "In order that repairs of owners' defects may be expedited as fully as possible, foreign or private line cars may be repaired by the handling line by using material from their own stock instead of ordering material from car owner, as prescribed by Rule 122, in which event the repairing line must issue its defect card for the labor only of correcting such improper repairs, and defect card should be so marked.

"In case of delivering line defects, defect card shall be issued for both labor and material for correcting the improper repairs."

#### Rule 90

The committee recommends the elimination of the last exception in this rule, reading "except in cases covered by Rule 88."

#### Rule 94

The committee recommends that the third paragraph of this rule be changed to read as follows: "If the owner elects to dismantle the body or trucks, or both, charge may be made for such material as would have been required for the repairs covered by the defect card, but such charges to be confined to the

actual material stated on card and items of labor for straightening or repairing material returned to store stock. No other labor shall be charged in such cases except in so far as labor is already included in the A. R. A. prices for material."

#### Rule 95

In reference to a recommendation that this rule be changed to include missing brake beams and other brake details, as formerly covered, the committee recommends the rule remain as at present for the reason that in case of bills for defective or missing brake beams, the average credits allowed under Rule 101 are high enough to offset the value of occasional missing beams, and the billing is thereby greatly simplified. Furthermore, the condition of the missing beam cannot be ascertained and is no doubt frequently defective.

#### Rule 101

The committee recommends that the following items be inserted in Rule 101 to provide for the charge for the periodical repacking of journal boxes as per Rule 66: "Journal Boxes, periodical repacking of, per car, net:

149-a.	For journals 7 in. long and over, but not 8 in. ....	\$1.75
149-b.	For journals 8 in. long and over, but not 9 in. ....	2.10
149-c.	For journals 9 in. long and over, but not 10 in. ....	2.35
149-d.	For journals 10 in. long and over, but not 11 in. ....	2.50
149-e.	For journals 11 in. long and over. ....	2.80"

#### Rule 108

The committee recommends that Rule 108 be rewritten to read as follows: "No labor to be charged for the inspection of cars, testing or adjusting brakes, adjusting angle cocks, tightening unions or spreading cotters; sill steps, ladder treads or hand-holds, tightening or straightening on car.

"No material or labor to be charged for the following items of repairs: 1. Air-hose gaskets, applied, except with hose complete, applied. 2. Brake pins or key bolts, applied. 3. Brake ratchet wheel keys, applied. 4. Brake-shaft rings, applied. 5. Brake-shoe keys, applied. 6. Carrier iron, Bettendorf type, when turned over, no charge for adjustment. 7. Coupler release clevises, clevis links or chains, clevis pins or bolts, applied. 8. Lag screws, applied, except when used to complete other items of repairs not herein listed. 9. Nuts or lag screws, tightened. 10. Nuts,  $\frac{3}{4}$  in. or less, applied, except when used in renewal of bolts. 11. Nut locks, or lock nuts, applied. 12. Release-valve rods, repaired or applied. 13. Straightening brake shafts and uncoupling levers when not removed from car. 14. Spring cotters and split keys, applied. 15. Staples, applied. 16. Wood screws, applied, except when used in renewal of running board. 17. Washers, applied, except when used in renewal of bolts.

"No charge to be made for the material or labor of lubrication, except as provided in Rule 66."

#### Rule 120

The committee recommends that the fifth item under Paragraph "B," "Repair Limits for Labor," be corrected to read as follows: "All steel and steel underframe cars, excepting steel or steel underframe flat cars."

The report is signed by J. J. Hennessey (Chairman), Chicago, Milwaukee & St. Paul; P. F. Smith, Pennsylvania Lines; James Coleman, Grand Trunk; F. W. Brazier, New York Central; T. H. Goodnow, Chicago & North Western; J. J. Tatum, United States Railroad Administration, and George Laughlin, Armour Car Line.

#### Discussion

After the reading of the report, the Secretary made the following statement: At a meeting of the Arbitration Committee, held last night, the committee decided to recommend the following changes in Rule 36:

"To be permitted only on cars loaded with perishable or fragile freight and on tank cars containing dangerous articles as per 1. C. C. regulations."

Also, that the following be added to the last paragraph of the same section:

"Commodity cards required on tank cars may be pasted, glued, or otherwise secured."

Also, that the second sentence in second paragraph of Section 3 of this rule, be changed to read as follows:

"Placards and certificates on empty cars, except inflammable and commodity placards on tank cars, must be removed."  
Reason: Apparent conflict between above M. C. B. rule and

paragraph 1712 of I. C. C. regulations relative to use of commodity cards on tank cars containing dangerous articles.  
On motion the report was accepted as read.

## Report on Prices for Labor and Material

P. F. Smith, Jr.  
Chairman

THE COMMITTEE after the 1915 M. C. B. convention took up the work of analyzing the prices for labor and material (as outlined by the Committee on Compensation for Freight Car Repairs in their report to the 1915 convention) as instructed by the association. For the 1916 convention the report presented gave a general outline of the method being followed in carrying on the work, and included a list of items for Rules 101, 107, 108, 111, 116 and Passenger Car Rules to be added and changed. This report was adopted and the revised 1916 M. C. B. rules included the changes in items and prices as suggested.

For the 1917 convention the report presented covered all items for labor and material for freight and passenger car repairs, and specified that during the coming year the studies of the committee would include the direct and overhead charge for yard repair work as compared with shop track work; center, intermediate and side sill renewals; tank car repair studies; items per Rule 111; also giving further consideration to material prices and making recommendations for alterations in such prices as might be found necessary. This report was adopted, subject to the modifications which the Price Committee had in mind and that were reported upon at the meeting held in Chicago, but the items for labor and material as reported on

were not introduced in the M. C. B. Rules of Interchange, and the proceedings do not give any reasons therefor; further, the Price Committee was not informed or given any instructions how to proceed in the future.

For the 1918 meeting the report presented, due to abnormal conditions existing at that time, was to the effect that the items for labor and materials, as printed in the 1917 revised M. C. B. rules, should stand, but the percentage to be added should be increased to 50 per cent. On this report apparently no action was taken, as the proceedings make no mention of such a report, further; price details were taken care of by the Arbitration Committee.

In view of the above, the committee asks for further instructions. If it is desired to continue this committee, we suggest that the work left unfinished in our 1917 report be continued, and the entire price schedule be revised to date and submitted to the 1920 convention. We further recommend in the revision of time allowances that time basis be used and the hours divided on the decimal plan in multiples of tenths.

The report is signed by P. F. Smith, Jr. (Chairman), Pennsylvania Lines; G. E. Carson, New York Central; J. E. Mehan, Chicago, Milwaukee & St. Paul; Ira Everett, Lehigh Valley; Willard Kells, Atlantic Coast Line; E. S. Way, General American Tank Car Corporation; H. L. Osman, Morris & Co.; G. F. Laughlin, Armour Car Lines, and A. E. Smith, Union Tank Line.

### Discussion

In the last year and a half the prices of both labor and material were continually shifting, but your committee has considerable data on time studies that were made for the various items in the rules, so that we can now go ahead if the Association so desires.

A motion to accept the report was carried.

## Report on Depreciation for Freight Cars

IN ORDER THAT the committee's conclusions might be based on representative factors as to average life and residue values, Circular No. 35 was issued requesting data on equipment dismantled during a period of three years ending December 31, 1917. This period was taken because it represented normal conditions more nearly than those existing during 1918. This information was requested by classes in three groups—wooden cars, wooden cars with steel underframes and cars of all-steel construction.

Replies were received from 55 railroads and 7 private lines, representing the ownership of 2,023,783 cars and covering 106,010 cars dismantled during the three-year period, a summary of which is shown below:

### CARS WORN OUT AND DISMANTLED.

(Cars retired in connection with rebuilding are not included.)

ALL WOOD CARS.			
Class of Cars.	No. of Cars.	Average Life of Cars in Years.	Scrap Value.
Box	47,672	22.3	12.2
Stock	5,201	20.1	12.1
Flat	6,800	22.3	17.1
Gondola	24,630	18.0	14.7
Hopper	16,082	20.3	14.4
Refrigerator	4,591	21.7	12.3
Tank	81	24.6	31.5
Weighted Average	105,057	20.9	13.5
ALL STEEL CARS.			
Class of Cars.	No. of Cars.	Average Life of Cars in Years.	Scrap Value.
Gondola	817	13	11.7
Hopper	136	14.7	17.2
Weighted Average	953	13.1	12

The information furnished regarding wood cars with steel

underframes was very limited and not representative of average conditions, and the committee did not feel justified in using it.

The average life of railroad owned wooden refrigerator cars dismantled was 17.1 years and of private line wooden refrigerator cars dismantled 21.9 years, making the average life for all wooden refrigerator cars dismantled 19.4 years. However, the average life of railroad owned wooden refrigerator cars is very largely affected by two lines reporting the dismantling of a large number of cars of an average life of only 15 years, which is much lower than the general average for all railroad owned wooden refrigerator cars, and by excluding these two lots of cars the results are as follows:

Railroad owned wooden refrigerator cars dismantled...21.3 years  
Private line owned wooden refrigerator cars dismantled...21.9 years  
Average life for wooden refrigerator cars dismantled...21.7 years

which your committee feels should be taken as the average life of wooden refrigerator cars and which has been shown in the table.

In order that the information would be obtained on a uniform basis, the committee asked that the scrap value be expressed in the percent of the M. C. B. price of the car, as shown in Rule No. 112 in the 1918 M. C. B. Rules, using the 1918 price for scrap.

From the information secured we obtained a weighted average percentage of scrap of the M. C. B. value new, on all wooden cars, of 13.5 per cent. It is the opinion of the committee that ¾ cent per pound is more nearly representative of the average current market price for scrap than ½ cent per pound as quoted in the present M. C. B. Rules, which would increase the weighted average percentage from 13.5 per cent to 20.25 per cent.

In settling for destroyed cars, recognition should be given of the fact that the car has a value to the owner above that of the actual value of the scrap to the line destroying the car, and further, that there is considerable serviceable material on which the line destroying the car can obtain the secondhand instead of the scrap value. If 20.25 per cent represents the value of the scrap to the line destroying the car, the committee does not feel justified, in the absence of any other figures, in recommending any change in the provision of Rule No. 112 which provides that in no case shall the depreciation exceed 60 per cent of the value now.

The weighted average life of all classes of wooden cars was found to be 20.9 years, as indicated in the above table. We have no information as to the average life of cars of steel underframe or all-steel construction, in the absence of which we would suggest, that on such cars, other than gondola or hopper cars, the same rate of depreciation be used as on wooden cars, until such time as experience may warrant a different rate.

The weighted average life of all classes of open top steel cars was found to be 13.1 years, but on account of the committee having knowledge that the cars reported as being dismantled during the period did not represent the present standard for this type of car we are inclined to believe that the information does not represent the average life of this class of equipment and, pending the time when experience will warrant a revision, the committee recommends considering 17½ years as the average life for open top steel cars. Based on the average life as indicated in the above table for wooden gondola cars, the committee suggests that wooden and steel underframe gondolas and hopper cars, for the purpose of depreciation, be included with similar cars of all-steel construction.

Opinions were requested as to whether depreciation should be applied on air brake values at the same rate as for car bodies and, on a car-owned basis, the majority of the replies favored depreciating both 8-in. and 10-in. air brakes at the same rate as the car body, which is recommended by the committee. The majority of replies to the question about depreciation of trucks, considered on a car-owned basis, favored having the trucks carry their own rate of depreciation and having that rate less for all-metal trucks than for composite trucks. However, the committee finds that the rate of depreciation of car bodies should be reduced to 3 per cent and 3½ per cent, according to construction, and we do not feel that a rate less than 3 per cent for trucks is justified; therefore we recommend that the trucks be depreciated at the same rate as the car body to which they belong.

In view of the information at hand, the committee submits the following recommendations for the depreciation of freight cars:

#### STRAIGHT DEPRECIATION BASIS.

Items.	1918 Rules of Interchange. Per Cent.	Proposed Rate. Per Cent.
Wooden car bodies, except gondolas and hoppers.	5.5	3
Wooden car bodies, gondolas and hoppers.	5.5	3.5
Wooden car bodies with steel underframes, except gondolas and hoppers with steel underframes.	4.5	3
Wooden car bodies, gondolas and hoppers.	4.5	3.5
Steel underframe flat cars.	5	3
All-steel car bodies or those with steel underframes and steel superstructure frames, except gondolas and hoppers.	4	3
All-steel car bodies or those with steel underframes and steel superstructure frames, gondolas or hoppers.	4	3.5
Tanks for non-corrosive material.	4	3
Tanks for corrosive material.	5	3.5
Air brakes.	None	Same rate as car body.
Trucks	Same rate as car body.	Same rate as car body.

The age of the car body shall govern in figuring depreciation on air brakes and trucks.

The depreciation rate for the class of car shall govern in figuring depreciation on such betterments as are listed in Rule 112 and shall be figured from date of application.

In its study of the subject of depreciation your committee was confronted with the question of rebuilt cars, and believes that this should be referred to a committee for consideration, and suggests this committee, if appointed, be requested to take up the part of Rule 112 which provides that in no case shall the depreciation exceed 60 per cent of the value now.

The report is signed by M. K. Barnum (Chairman), Baltimore & Ohio Railroad; J. Hainen, Southern; L. K. Silcox, Chicago, Milwaukee & St. Paul; A. E. Calkins, New York Central, and H. L. Osman, Morris & Co.

## Discussion

C. E. Fuller (U. P.): I think this committee should be either continued or another committee appointed to take up the question of rebuilt cars. That subject is very pertinent and one we ought to have settled. There is quite a diversity of opinion as to the value of a rebuilt car, especially the refrigerator cars, and now, with steel underframes and the betterments and improvements on the car, they place that car in a class by itself. I think the subject should be thoroughly considered and a report given on it by this committee.

Chairman: If there is no objection, that will be included in the motion—that the report be accepted and the committee requested to continue the investigation in accordance with the recommendation of Mr. Fuller.

F. F. Gaines (U. S. R. A.): I would like to hear from some member of the committee as to what ground they justify the limitation of 60 per cent and that the scrap value lies between 12 and 13.5 per cent. If you leave 40 per cent there which you cannot get back, you are penalizing somebody; the owner of the car, in other words, can only get 60 per cent value of the car up to its 20 year life. I do not understand why the figure of 60 per cent is the dividing line, and have never understood it.

R. L. Kleinc (Penna. Lines): I think the average life of 20 years for wooden cars seems to be right, and what would be expected, although during the early portion of this life, wooden cars were not subjected to the severe strains of being hauled with steel cars and in heavier trains.

No steel or steel underframe cars have been retired on the Pennsylvania Railroad on account of being worn out, and the first of these cars was built in 1898. The life of a steel or steel underframe car will naturally be longer than that of a wooden car, since during the first ten years of the life of such a car the total cost of repairs, aside from running repairs, would be about \$100. After the tenth year, and until it is 25 years old, the car will require normally, barring accidents, in turn a new floor, possibly new side sheets, and another floor, which may carry the car until it is 32 years old. Around that time the cost of maintenance per year will be much higher, as it will not have the initial ten years' low maintenance cost of a new car, and then it becomes a question of whether to maintain such a car or build a new one. This would be decided by taking into consideration the yearly costs of maintaining the old car and the cost of building a new car, including the interest on investment and the depreciation.

With the value of scrap in a car representing the per cent of the original cost of a new car, the limit of depreciation in per cent should be the difference between 100 per cent and the per cent representing the value of the scrap, both figured in normal times, and if the price of either scrap or new car should materially change, the percentage could be adjusted accordingly, although they generally run hand in hand. That is, if the cost of the car new is materially increased, the value of scrap generally increases correspondingly. Under all conditions the total value of the car (100 per cent) should be made up of the limit of depreciation in per cent, plus the value of scrap in per cent. The value of scrap recovered from destroyed and badly damaged cars is not worth more than the scrap rate net to the handling line, as there is a very small percentage of this material that can be used in repairs.

Since January 1, 1918, the Pennsylvania Railroad Company reclaimed, at the request of the regional director, all serviceable parts from destroyed foreign cars, recorded and tabulated them, and submitted lists to the car owners for instructions as to what items they desired shipped home. Very few items were desired, and these were mainly truck sides and truck bolsters of the latest design, and the majority offered no more than scrap rates, plus the expenses of handling.

The conclusions are: 1. The yearly rate of depreciation for badly damaged cars or maximum allowable depreciation should be such that neither the owner nor the handling line would make money in settlement for destroyed cars.

2. On account of the different retirement programs and rates of depreciation used by various roads, a definite life should be established for wooden, steel underframe, and all-steel and tank cars, or at least a definite time at which depreciation should cease as a basis for settlement of cars destroyed: 20 years for wooden cars and 27 years for steel cars.

3. The limit of depreciation should be a percentage based on the value of new cars (normal times) to the value of scrap

(normal times) obtained from the car at time of destruction: 20 per cent scrap value, and 80 per cent limit of depreciation.

4. The rate of depreciation should be the number of years established for the life of the car divided into the limit of depreciation: 4 per cent for wooden cars, and 3 per cent for steel cars.

5. Provision should be made for return of trucks at the option of the destroying line.

6. Rate of depreciation should be the same for trucks and air brakes as for body of car.

7. The M. C. B. values now have been increased 55 per cent in the last two years, and the arbitrary values of betterments were increased 100 per cent without any of the depreciation rates being changed and the long standing practice of depreciating betterments from the original date the car was built was superseded by depreciating from the date applied, which makes it difficult for the handling line to estimate depreciated values of such cars. Unless arbitrary values are reduced, the maximum allowable depreciation should be increased, in order that the remaining depreciation may represent only the value of the scrap in the car.

8. If the low yearly depreciation rates, as recommended, be adopted, it would prohibit roads from settling for many damaged foreign cars, on account of the high settlement price, would result in more old wooden equipment being maintained instead of getting this weak equipment retired and might result in additional building of wooden equipment. There are thousands of old wooden cars, especially of low capacity, which will not stand up under ordinary service, and are a danger to themselves, to other equipment, to the roadbed and to life, and when such cars fail to the point of destruction, they generally cause considerable expense to the handling line by damaging other cars and the roadbed.

Furthermore, the corporations set up a yearly depreciation for the cars, and the depreciation which the Association set ought to more nearly approximate what the corporation has already in its accounts.

Mr. Gaines: I think that this convention will take a big step backward to put in that old method of depreciation on equipment. The only way you can get at it rationally is to take 100 per cent, minus your scrap and divide by the life of the car for your yearly depreciation, and I think if we adopt this report as a whole, we are taking a step backward.

Chairman: I have had some experience with these items, and I never did agree to it in my own mind. The depreciation has never been right, and there is no reason at all for the wide gap between the Rule 120 basis and 112, and I favor a little more latitude than 120, so that there will not be any incentive for a man to destroy a good car if he happens to damage it, and finds he can pay for it more cheaply than for the repairing; but there should be a basis so that at the time when a car was dismantled there would be an established figure that can be represented in dollars and cents. I think we could and should establish it before we drop this subject, or recommend rather some basis that seems sensible and will bear argument.

Mr. Giles: It appears to me that some further consideration should be given to establishing a different basis for figuring the depreciation of trucks, especially steel trucks under modern equipment, than that which is used in arriving at the depreciated value of the body of the car. The trucks do not depreciate as rapidly as the body of the car does, either in steel or wood, and I have always been in favor of establishing a different basis for the trucks.

Mr. Goodnow: It is not brought out in this report at all just what consideration was given the present value of cars. The Arbitration Committee is accepting as the basis of settlement the book value of the car purchased since 1914. Prior to that time the cars go on the arbitrary values as established in the M. C. B. rules. That took care of the war conditions which prevailed, but in the settlement for cars built in the years just prior to 1914 and cars which may have been contracted for and delivered in 1914, and for the cars that have been bought under the present prices, there is no difference, as an earning unit to your company. There were cars built in 1912, 1913, and 1914 that will go along for years and be just as good as a car built since 1914. They represent only about one-third of the value of the car that has been built since that time; so that if this is to be analyzed right, there must be some basis of settlement or of cost set up to take care of the depreciated value. I don't know

if the committee gave any consideration to that in their recommendations.

Mr. Calkins: The committee had that subject in mind, but according to the instructions it had, it did not consider it was to go into anything other than the rate of depreciation.

Mr. Goodnow: You mentioned just prior to that that you depreciated on the M. C. B. prices.

Mr. Calkins: That was in determining the value of scrap, as compared to the value of the car. We did not get any of those new values because all the cars dismantled were of the type that came under the old arbitrary value established by the Association.

Mr. Goodnow: I don't think the rate of depreciation is half as important as setting up proper values, because what we would actually lose, whether it is three or five per cent, in depreciation, does not represent the value of cars to your company today under present prices, although they may have been bought just prior to 1914. This matter of reconciling the M. C. B. depreciation and that set up by the various companies on their books was attempted about two years ago, and at that time the depreciation as carried by the companies varied so much that it was impossible to reconcile it at all. It ran from one-half of one per cent up to 3 per cent or more, so that at that time there was no common depreciation, as between the companies, on the equipment.

Mr. Kleine: It would be a simple matter to cover Mr. Goodnow's point in regard to the various prices paid for cars during recent years. You could establish a basis for normal times, and as the cars increased in price in following years, you could use that as a base and add a percentage. But the rate of depreciation, and the total depreciation of the car, is the thing that should be established as a fixed basis. We have had enough experience with the wooden cars to know what that is, and I think the committee brought that out very nicely. It is about 20 years; that is our experience also, but I think the committee is wrong in stating 60 per cent. If 80 per cent were used to represent the depreciated value of the car and the 20 per cent remaining in the car the scrap value, it would be approximately correct.

Mr. Calkins: We did not set the 60 per cent limit. We had this 20 and 80 per cent figure in our mind, too, but we thought the thing ought to be carried over, as we suggest there, to the committee, who will go on with this work another year. The last paragraph says: "And suggests this committee, if appointed, be requested to take up the part of Rule 112 which provides that in no case shall the depreciation exceed 60 per cent of the value new." We did not change the present practice.

Mr. Tatam: I was wondering how these figures are arrived at. We place the average life of wooden cars at 22 and 23 years. The average life of a wooden gondola is 18 years; steel is placed at 13 years. In considering the repairs to steel cars when repairs or rebuilding is necessary, you are required to renew the floor sheets and the side hopper sheets possibly. The side sheets of the car are fairly good, yet 50 per cent of the life is gone. In repairing a wooden gondola car, if you are required to renew the floor and side hopper planks, the planks may all be there and intact, and for the reason that they do not depreciate by deterioration they are worth as much in the rebuilding of that car as if they were new. It is well seasoned, hardened and in good condition, and as the car is rebuilt with the new floor and side planks, as it may be, or end sills, these old side planks applied to the rebuilt wooden gondola car are just as good as if new. It would not be so with the steel car, because if you apply a new steel floor to the steel car, or perhaps new sills, the side plates of that steel car have depreciated 50 per cent or probably 75 per cent, and maybe it would not justify the rebuilding of that car, or scrapping it, and building a new body, as it would the wooden car. By that method you are able to increase the life of the wooden car, if you don't consider the rebuilding along with the scrapping of the car, while with the steel car you shorten the life. If we take a steel car and compare the cost of rebuilding it or repairing it, you might find it just as cheap to build an entire new steel body, as it would be to repair the old steel body. There have been some test cases made where there was only \$50 difference between the building of a new steel body and the repairing of an old steel body. It is very expensive to get the car down so that you can apply new parts and build it up, while you can use the oxy-acetylene or other methods, and cut the steel down, put it in the scrap and use the money you save in cutting out the rivets to

apply to the new body, and practically get an entire new body for what you pay for the repair or rebuilding of the old body. Has the committee considered the cars having had new bodies built, and the old bodies scrapped? If you continue the trucks, draft gears and air brakes, and simply build a new body, you can add considerable life to a steel car, just as much as you can to a wooden car by renewing the defective parts.

Mr. Hennessey: The committee is up against a very hard proposition when it attempts to get the average depreciation of a wooden car or a steel car. You may build a wooden car, and use material in that car that will depreciate to a very small per cent. I may build from the same drawings a car practically out of sap. It will depreciate twice as fast as a car that is built out of good material. I have inspected some 100,000 gondola cars that in 8 years are practically fit for the scrap heap; I have inspected other cars that have the same cubical capacity, but instead of having been built 38,000 lb. in weight when new, a good car was built about 45,000 lb. That car had the great factor of safety, and depreciation was very small in per cent, as compared to the car that was practically a tin pan. The same is true with the wooden cars.

Mr. McBain: The committee should consider an arbitrary point of depreciation at some point above the actual scrap values. It should take into consideration the maintenance of that car in the service, depending on the maintenance policy of the owner. Any car that is maintained in serviceable condition, so as to pass interchange and carry the load to destination, certainly must have a value somewhere in excess of the actual scrap in the car. I urge that the committee consider that point before it reaches a final conclusion.

Mr. Gaines: I would like to amend the motion that is now before the house to this extent: That the report of the committee be accepted, but in publishing this report we substitute for the method of depreciation, the plan of using 100 per cent, minus the scrap value divided by the life of the yearly depreciation.

Mr. Kleine: I second that amendment.

Mr. Calkins: I don't quite get that point. Do I understand then if you have a \$1000 car, and it runs 5 years, and is destroyed, and is worth \$200, that you have got to account for \$800 in depreciation in the five-year period? What is to be the life of it that you use for that divisor?

Mr. Gaines: The estimated life is 15 or 20 years, whatever you adopt.

Mr. Kleine: That simply substitutes the depreciated rate, or to establish the depreciated rate, we take 100 per cent, subtract the scrap value, divide the life into that and get the rate of depreciation, whereas in my suggestion I had set a definite life.

Mr. Tatum: I understand Mr. Gaines' motion is that the committee or the Association fix the life of the car. For example, say that they have established a life of 20 years or 30 years, or whatever it may be, if a car costs \$1000 and the scrap value is \$200, and they divide the \$800 remaining above the scrap value into the age of the car, that would be its depreciated value per annum.

Mr. Gaines: I would say it is my intention that we take for the present, until we get different figures, the estimated life given in this report and use that as the basis to work on.

Mr. Calkins: When a car reaches the estimated life, it is worth nothing but scrap value, according to the process of reasoning used. There is always some value in a car above its scrap value, if it is used as a unit of equipment, and is in condition to be so used. At the end of 17.5 years a steel car is worth \$200 as scrap value, according to this report. I still believe there is more value in the car than its scrap value at that time.

Mr. Tatum: Is it Mr. Gaines' intention to accept the figures of 13 years as the life of the steel car?

Mr. Gaines: I had in mind 17.5 years. We should accept these figures as the best we have obtainable at the present time, with the understanding that the committee will give further attention to the subject and report at a later time. You can extend the life of a car, or cut it down, but you must make an arbitrary life, and my suggestion is that we accept the committee's report this year as to the life.

Mr. Goodnow: I understand the motion which was first made to receive the report of this committee, and that the committee should be continued, to give further study to the subject, particularly with reference to rebuilt cars. Representing a company which owns and operates cars, I am not ready, without

a chance to give further study to this subject, to vote one way or the other on such a motion, and I think, without establishing some rule as to how your scrap values and similar matters are to be arrived at, we never would settle for a car. I do not think this convention is in any shape to act on a motion now, and I think we had better go along for another year with what we have at the present time.

Mr. Gaines: The committee has worked out the scrap value and it has given averages. The proposed amendment is superior to the old methods of the 60 per cent limit, and has some rational basis at the bottom of it, which the other has not, and we must adopt some rule for handling the business this year.

Mr. Goodnow: If you can arrive at some standard of value for cars, you are right, but in the absence of that, I believe a car built in 1913 will earn as much money as one built in 1915, and there is a wide line of settlement on the original values of these cars.

Mr. Fuller: Do you mean you would accept 14 years as the life of a steel car?

Mr. Gaines: That part of the report does not agree with my experience, but I am willing to ride with that part of the report.

Mr. Fuller: It does not seem right to put the period of life of a steel car, gondola or hopper, at 14 years, when the figures show that the life is 17 years as an average. Every one knows that if the steel car is taken care of it has many more years of life than 14 or 17 years.

Mr. Tatum: Some of the railroad companies are tearing down and settling for a car which was in bad condition, rather than to rebuild a car.

Suppose the car is 17 years old, and it has been maintained in fairly good, serviceable condition. It goes on a road and it is damaged, and the managers of the road say—"We will settle for this car, we will not repair it. There is \$200 worth of scrap in it, it will cost us \$300 to repair it. By settling for it we will save \$100, and we will settle for it." I do not think that is good and I am sure that is what will happen if Mr. Gaines' motion prevails.

Mr. Goodnow: Under Mr. Gaines's motion the scrap value is the only thing to be considered, and it reflects back to the value of the car as it is established under an arbitrary figure, and as it is represented in value on the books of the company.

R. L. Kleine: The present rates of depreciation are too high. Mr. Gaines wants to extend the life of the car to a longer period—instead of 60 per cent of the value of the car he wants to extend it to 80 per cent, or 100 per cent less the scrap value. That means anywhere between 15 and 20 per cent. The committee has found that the life of the average wooden car, torn down as worn out, is about 20 years. We have data on wooden cars, but in connection with the steel cars, we have not any such data. We have steel cars built in 1898, which are now 20 years old, but we have not torn down a single one of these cars on account of being worn out.

If we establish 20 years as the life for the wooden car, as recommended by the committee, and run the depreciation to 80 per cent of the value of the car, that will give 4 per cent a year depreciation. In the case of the steel car, we do not know what it is, and no matter how much investigation is made, we have to wait until the end of the normal life of the car to determine it. We will have to estimate it for the present.

J. H. Milton (Rock Island): Suppose a car has been running 15 years. Do I understand that we will depreciate that car on a 20-year basis, notwithstanding the fact that we may have practically rebuilt the car, and spent \$700 or \$800 on the car, reinforced it in every way, and added years of life to it? It seems to me when that amount of money is spent on a car we change the life of the car and in my opinion it should be considered as a new piece of equipment.

L. K. Silcox (C. M. & St. P.): I want to point out one of the conditions prevailing today. We settle on a car basis, according to the cheapest method, we either fix the car up to stand the pull, or settle with the owner, and our experience has been that we have a vast majority of steel cars on our hands for which we have settled. The committee has reported a less rate of depreciation than that which was formerly used, and I think it is on the right track. We had to use figures based on information which was furnished.

The evidence which has been submitted with respect to the steel cars does not cover a long enough experience, and shows cars taken out of the service which have a short life naturally.

There are cars running in the Illinois territory which have eight years of service, and that is the normal condition in the coal traffic in that section, whereas if you take the same cars out in Colorado, where the conditions are not so severe, the same type of car might run 15 years, and yet be in good shape. The point I want to make is this—that we are settling for cars today which are in good shape, because it is the cheapest way to do it. A lot of these cars could be continued in service if there was a less rate of depreciation prevailing.

E. S. Way (Gen. American Tank Car Corp'n): I do not think it is wise to take any hasty action on the amended motion before us. I wish to offer another amendment, that the subject be referred back to the committee for further consideration, and that the committee give weight to the value of a tank car, as well as the scrap value, and allow for the maintenance of the car.

Mr. Calkins: Under the present rate of depreciation, which I think is too high, a car at the rate of 5.5 per cent depreciation reaches the 40 per cent limit in 10¾ year; at the 4.5 per cent rate of depreciation, it reaches the 40 per cent limit in 13.3 years; at the 5 per cent rate of depreciation, it reaches the 40 per cent limit in 12 years, and at the 4 per cent rate of depreciation, it reaches the 40 per cent limit in 15 years. I believe the work of the committee should go further, and take up the question and determine the facts regarding the rebuilt car.

Mr. Milton: Take a steel car that costs \$1500 when you bought it, and it is depreciated down to \$500. We repair it and use \$1000 worth of good material with \$500 of partly worn-out material; it has only 3 or 4 years more life. Is it policy to do this? It would appear to be better to tear it down and build a new one.

Mr. Way: Perhaps it will clear up the situation if an amendment is made to the effect that, instead of accepting the rate of depreciation as worked out by the committee based on the data compiled, to let the present rate of depreciation stand, and refer the matter back to the committee for continued consideration as to the actual point of depreciation. I make that as an amendment to the motion.

The Chairman: It is not within our province to settle the rate of the value of the car under the present operation. The corporate interests value the car, and any rate change, one way or the other, can only be done with their consent. I would suggest that you keep that in mind when we undertake to make any change this year, and I want to say, that as chairman, that it is not my intention to allow any of these motions to be passed, if it is in my power to have them withdrawn.

In the first place, this matter will have to be referred to letter ballot to change any method of value of a scrapped car. We have always had two methods of depreciation, and the reason we have had these two methods, is because one covered a worn-out car, and the other covered a destroyed car, and we had the two methods to prevent the very thing Mr. Sillcox told us about—that many cars have been destroyed because they could be paid for more cheaply than they could be repaired.

I hope that some one will make a motion to take the place of these amendments, so that a proper vote can be taken with regard to the matter. We had better go on, in my opinion, as we are, for another year, and let the committee put further study to the subject.

It is wrong to think of limiting the life of a steel car to 17 years. I would say that 25 years is the life of a steel car, on the average. I think that 20 or 22 years is the life of a wooden car. Thirteen years is not anywhere nearly long enough for the life of a steel car, unless it has been abused and practically thrown away. I do not want to see anything passed that is wrong, and we had better accept what we have until we get something better, rather than adopt something we have not the authority to do.

Mr. Fuller: I approve of everything you have said, Mr. Chairman. I cannot afford, and I do not think there is anybody in this room who can afford, to vote on the period of 15 or 17 years as the life for a steel car. If Mr. Hennessey is the man who made this motion, I will ask him to withdraw it.

Mr. Hennessey: My only motion was to receive the report of the committee and open it for discussion. I have no motion before the house. Mr. Gaines has a motion pending.

Mr. Gaines: I will withdraw my motion.

Mr. Goodnow: As I seconded Mr. Way's amendment, I do not understand that it has anything in view except to change the rate of depreciation which is arbitrarily established by the M. C. B. rules. It does not change the time allowed for de-

preciation, but simply changes the rate from 5.3 to 4.3 per cent. That is perfectly safe. The only reason the question of the value of cars was brought up here was on account of the change attempted to be made in the rate, and if you make that change you must take into consideration the value of the cars. Mr. Way's amendment does not take into consideration the value of the cars at all, but simply takes into consideration the rate of depreciation.

Mr. Gaines: I move that the report of the committee be received, and that the committee be continued for another year to take up all these questions which we have discussed; that we maintain the old rule which we have for the ensuing year, pending another report from the committee at next year's convention.

C. E. Spoor (B. & S.): I want to say that for the past month or two I have been making an inspection of the equipment on our roads, and I found that we could repair the cars at our home shops at less than \$200 in two instances, and from these facts I do not believe the steel car equipment should be put below 20 years. I think it should be extended longer. I believe the committee should be continued.

F. W. Brazier (N. Y. C. Lines): We have had some steel cars on our lines that have gone to pieces in less than 12 years. It makes a big difference what service the cars are in. I ask Mr. Kleine what service the cars are in that have been on his road for 20 years—in coal service?

Mr. Kleine: Yes, the cars go to tidewater daily.

Mr. Brazier: I believe the best car ever built, with steel underframe, will not survive the coal business.

Mr. Sillcox: One of the difficulties the committee was confronted with, and one of the matters which made it so confusing for the committee to arrive at a conclusion, was the fact that we labored with the question of depreciation without giving due consideration to the question of rebuilding. You cannot consider one without the other, because one takes in the question of repairs and of maintenance, and I think now that the opportunity has been given to give consideration to the rebuilding feature that the committee can work with a great deal more freedom. The fact remains that there has not been enough experience had with the steel car to date in order to arrive at definite conclusions. It is a question of type of construction employed, whether of wood or steel, which enters into this question, and we must solve that feature before we can solve the general question.

There are classes of steel cars in service today not as good as wooden cars. There were a lot of general service cars built in 1912 to sell and not to give long service.

Chairman: The first steel cars operated on the Central Railroad of New Jersey were bought in 1901. These cars are still in service, with the original sides, most of them; new bottoms and hoppers in most cases, and they are good for eight or ten years more.

Mr. Fuller: I would like to make a motion that the committee's report be received, so far as the 3 per cent depreciation is concerned, and that the report then be returned to the committee for further consideration.

Prof. W. F. M. Goss: Before the question is put, I would like to say that we all fully understand that the depreciation which is discussed by the committee is really a depreciation of investment, not of a car, and I make that distinction because there are other uses of depreciation which we sometimes wish to employ, which would lead us to a different result from that which is reached by the committee. You are trying to determine the diminished value of your investment, of your car, and hence you credit your scrap values, but suppose I wish to determine the rate at which new cars are to be built, because of the losses through depreciation, then there is no scrap value that I can take into account, and I must work upon the basis of cars put out of service from depreciation, that is, through the using up of their life tenure.

The point I wish to make is, that in fixing the value for depreciation, as the committee has recommended, and as is contemplated by this motion, we are depreciating investment, and not cars.

The motion, that the committee's report be received so far as the 3 per cent depreciation is concerned, and that the report be returned to the committee for further consideration, was put to vote and unanimously carried.

## Revision of Passenger Car Rules of Interchange

H. H. Harvey  
Chairman

**T**HE COMMITTEE on the Revision of Passenger Car Rules submits the following changes for consideration:

Sections A, B and C should be changed to conform with whatever changes the Arbitration Committee makes in Article 11 of the freight car rules.

Add a Section "D" to read as follows: "It will no longer be necessary to apportion among interested carriers the expense of heating, lighting, cleaning, etc., of passenger train equipment employed in through service over railroads under Federal control. A fair proportion of the expense should be charged

against any non-Federal road which participates in the through service."

"NOTE. Under Section 'D,' items per Rules 6 'C' and 'D,' 9 and 10, also other expenses chargeable to I. C. C. Account 402—Train Supplies and Expenses, shall not be billed for as between roads under Federal control, nor shall owners be billed for items mentioned in Rule 7 'C' when such items are chargeable to Account 402.

"Any Federal controlled road incurring any expense as above in connection with through service in which a non-Federal controlled road participates will bill direct against the latter for its fair proportion of expense. Any non-Federal controlled road incurring expense in connection with items mentioned in Rule 7 'C' will bill direct against car owner."

RULE 7. If the Wheel Committee makes provision for a change in Item 4, paragraph F (tread worn hollow), this rule should be changed to comply with their report.

RULE 8. If Freight Car Rule 32 is changed by the Arbitration Committee, paragraph "A" should be changed to correspond.

Add a paragraph at the end of Section "F" to read as follows: "The above provisions shall govern any loss or increase of service metal on account of the mate wheel, even if same is

not defective, if both wheels are turned off to correspond."

RULE 9. Make the third line of paragraph "C" read "Mantles, tips, burners, domes, globes." Add a paragraph "E" to read as follows: "Illuminating oils, water and ice are not a line expense. Coal, wood and charcoal are not a line expense unless used as specified in paragraph 'B' for cars in line service. (See note below.)" Make paragraph (4) read as follows: "Coal, wood, charcoal, water and ice. (Such items furnished private or business cars shall be charged against the car owner.)"

RULE 13. The labor rate referred to in answer to the question in the interpretation should be changed to 68 cents, instead of 58 cents.

RULE 17. Omit the words "Not in line service" in the first line.

RULE 19. Add a sentence immediately after the third line to read as follows: "Original record of repairs and billing information shall be prepared as required in the freight car rules."

RULE 20. If the percentages in the freight car rules are changed, those mentioned in this rule should be changed to correspond.

RULE 21. Labor on repairs (Item 20) should be changed from 58 cents to 68 cents per hour.

RULE 22. Make a third note on page 204 to read as follows: "Material not listed above, but listed in Rule 101 of the freight car rules (if same as that used on freight cars), shall be charged at prices shown in Rule 101. All other material to be charged at net store department cost, except material ordered from car owner, which shall be handled in accordance with Rule 122 of the freight car rules."

The report is signed by H. H. Harvey (Chairman), Chicago, Burlington & Quincy; C. J. Nelson, Chicago & Northwestern; W. R. McMunn, New York Central; J. E. Mehan, Chicago, Milwaukee & St. Paul; T. J. Boring, Pennsylvania, and C. J. Forrester, Grand Trunk.

### Discussion

A motion that the report be adopted was carried. The meeting then adjourned to 9.30 o'clock Thursday morning.

## The Thursday Morning Session

The Thursday morning session was called to order at 9.40 by Chairman Chambers. It immediately proceeded to a consideration of committee reports.

## Report of Committee on Car Wheels

W. C. A. Henry  
Chairman

**C**ERTAIN RECOMMENDATIONS have been made by manufacturers of wrought-steel wheels and referred to this committee. Among them is one, that the 38-in. diameter wrought-steel wheel be eliminated from our standards, it being stated that the number of wheels of this diameter manufactured is small and that in many cases the 36-in. wheel could be used. The committee does not have sufficient information to justify making definite recommendations at this time, but arrangements will be made to obtain this information, meanwhile the use of the 38-in. wheel should be discouraged.

It has been recommended that the limit of wear groove for wrought-steel wheels be located  $\frac{1}{2}$  in. from the inside of the rim of the wheel instead of  $\frac{3}{4}$  in. as at present, it being that the

thickness of metal would be sufficient to afford the necessary strength. Other questions than the strength of the wheel are involved, namely, maintenance of draw bar height, truck clearance, and effectiveness of brakes with increased range in diameter of wheels. The committee, therefore, requests that the members give this subject consideration in order to reply to a circular of inquiry that will be sent out.

The question has been raised as to whether the standard wheel circumference measure, sheet M. C. B.-16B, should have the points indicating the normal circumference of the 33-in. and 36-in. wheels located on the tape when laid out flat, or whether a correction should be made for the tape thickness; there being a difference of  $\frac{2}{10}$  in., or more than one tape size, depending upon which way the tape is laid off. In playing out the wheel circumference measure, due correction should be made for the tape thickness and in order that absolute uniformity may be obtained the Executive Committee has decided that the association obtain standard rings of 33-in. and 36-in. diameter; these rings to be certified by the Bureau of Standards and used in cases of dispute to check wheel tapes. The committee was instructed to prepare a design and mounting for these rings and they are submitted herewith (exhibit A).

The specifications for wrought-steel wheels permit a variation of five tape sizes under and nine tape sizes over the size called for. It is felt desirable to provide for these additional tape

sizes for 33-in., 36-in. and 38-in. wheels by adding to the spaces now provided for taping cast-iron wheels. The continuous markings on the upper side of the tape would then be used for mating worn wheels. Exhibit B shows the recommendations of the committee as to how this could be carried out.

The following note should be inserted on sheet M. C. B.-16B: The linear dimensions shown represent measurements of the actual circumference of the wheel and not the straight length of the

pass the M. C. B. test the first letter of the initials of the purchasing road be chipped off with the idea of stopping the practice claimed to exist to a certain extent of roads purchasing rejected wheels. It is felt that action of this sort is desirable, but that the letter C in the legend M. C. B. be chipped off for the reason that, being located on the outside of the wheel it can be more readily seen than if a letter on the inside, where the purchaser's name is placed, were chipped off. Furthermore, wheels not coming up to

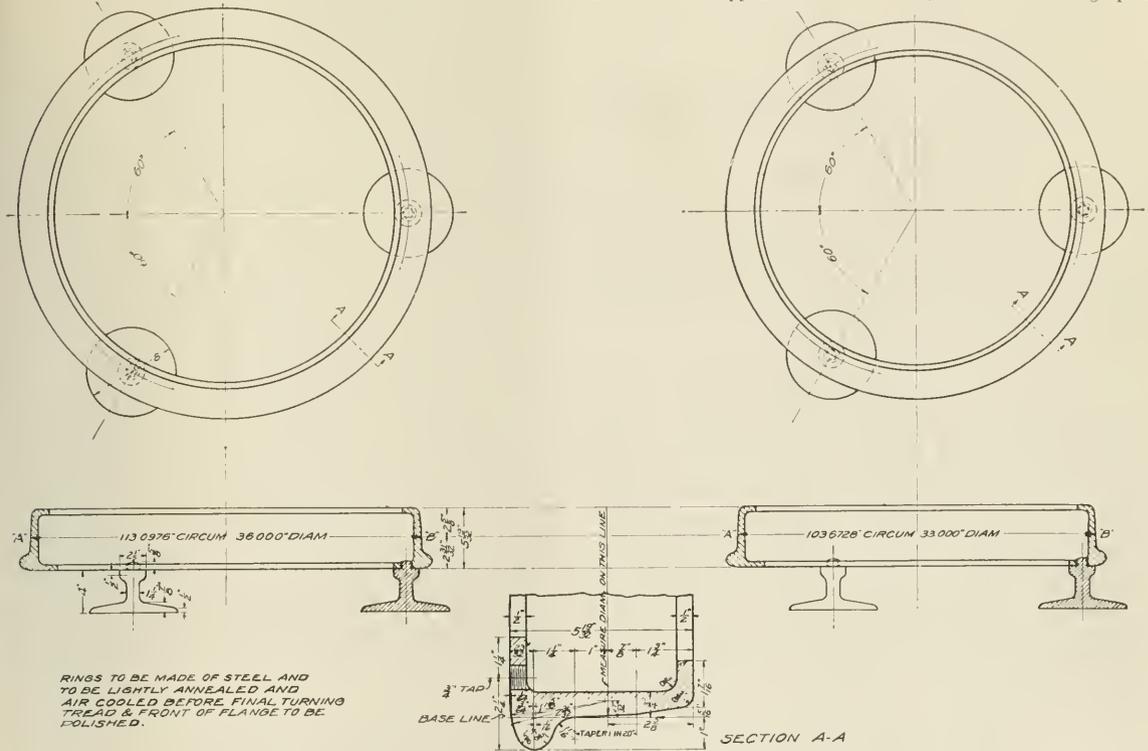

Exhibit A.—Wheel Circumference Measure Test Rings for 33-in. and 36-in. Wheels

tape. Graduations are to be spaced  $\frac{1}{8}$  in. apart with the tape laid flat, and the space between lines 157 and 158 on the upper side of the tape is to coincide with the space representing tape size No. 3 for the 33-in. diameter cast-iron wheels.

Rule 76 of the Rules of Interchange reads as follows: "Tread worn hollow; if the tread is worn sufficiently, hollow to render the flange or rim liable to breakage." It is the opinion of the committee that the meaning of this rule is not clear and subject to

M. C. B. requirements cannot be considered M. C. B. wheels. The committee, therefore, recommends that the following clause be added to the specifications for cast-iron wheels under the heading "Rejection," paragraph 16: (d) In all cases where wheels are rejected the letter C must be chipped out of the legend M. C. B. on the outside face of each wheel. It is further recommended by the committee that a rule be inserted in the Rules of Interchange prohibiting acceptance, in interchange of a car,

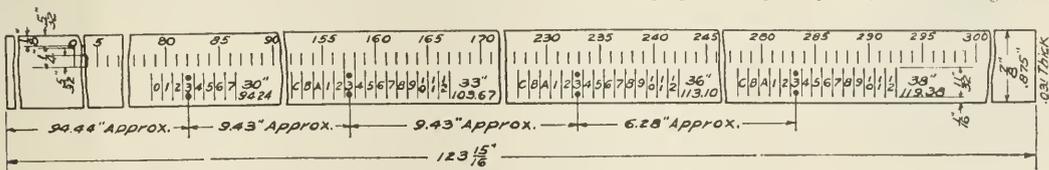

Exhibit B.—Additional Spaces to be Added to Standard Wheel Circumference Measure Tape for Taping Wrought Steel Wheels

wide variation in actual application; it having been found that many wheels are being withdrawn on account of tread wear without the wear being sufficient to injure the wheel. The committee recommends that a gage, as shown in exhibit C, be used in determining whether or not a wheel should be condemned on account of tread worn hollow; a wheel not to be condemned on this account unless the projection on the underside of the gage does not come in contact with the tread of the wheel.

It has been recommended that a clause be inserted in our specifications, requiring that in case of cast-iron wheels failing to

any of the wheels of which have the letter C chipped out of the legend M. C. B.

The Association of Manufacturers of Chilled Car Wheels advises that all information thus far available indicates the superiority of the arch design of plate adopted in 1917, for the 700 and 850 lb. wheels over what has been considered our standard design of plate. It is our feeling, however, that another year should be allowed to elapse in order to accumulate more information before considering the re-design of the 625 and 725 lb. wheels.

The report is signed by W. C. A. Henry (Chairman), Pennsylvania Lines; E. J. Brennan, Chicago, Milwaukee & St. Paul; W. H. Winterrowd, Canadian Pacific; J. A. Pilcher, Norfolk

Discussion

At the conclusion of the report, Mr. Henry said: The committee would like to supplement its report by recommending that we submit to letter ballot the following items:

1. The standard rings referred to in our report as exhibit A;
- 2, the modified wheel circumference measure referred to in our report as exhibit B;
- 3, the gage for determining tread wear referred to in our report as exhibit C;
- 4, the modification of the wheel specifications to require the letter C to be chipped from condemned wheels;
- 5, provide in the Rules of Interchange to prohibit accepting cars, any wheel of which has had the letter C chipped off.

A motion that the report be accepted and opened for discussion, and the questions suggested submitted to letter ballot was carried.

Mr. Gaines: Referring to the recommendation of the commit-

tee, relative to chipping off the letter "C." While I believe that is a good thing to do, I wonder if you won't throw a lot of work on our interchange inspectors to examine every wheel and see whether they have the "C" on them or not. I would like to hear from the committee whether they think they can carry that out or not. The principle is good.

Mr. Henry: It was not thought that that will place very much of a burden on the inspector. The wheels are supposed to be carefully looked after in interchange, and the fact that these letters are large and on the outside plate, should not place any appreciable amount of work on the inspectors.

Mr. Brazier: The idea is all right, but I would like to know how the inspector, with four or five inches of snow or ice on the wheels, will be able to see it. The inspector condemning the wheels having the "C" cut out is all right, but there may be some unprincipled people that will buy them and use them over again, and the idea of the committee is to overcome this by having the inspectors reject them. I can see how that would work in the summer, but it will be rather difficult in the winter, with snow and ice on the wheels.

Mr. Tollerton: I would like to ask the chairman of the committee, if he has any guarantee that the inspector will chip the "C" off the wheel. I think they will have car repairers do it, so that might involve the question of expense.

Mr. Henry: It was the idea that the letter "C" would be chipped from the wheels at the place of manufacture. Some roads now require one of the initials of their legend to be chipped off wheels which are manufactured for them, and which fail to pass the test. The removal of that letter should be done at the point of manufacture of the wheel and nowhere else.

Mr. Goodnow: I have just one question about the two items that go to letter ballot. Will that not be too late to get in the Rules of Interchange? The results of letter ballots are not generally known at the time the rules are printed in interchange. The items that go in the rules are usually passed by the vote of the floor here, rather than by letter ballot, so as to get them in time.

Chairman: The Secretary informs me that they will be in all right, that our letter ballot goes out earlier than formerly. It will be included. If there are no other questions, we will declare the subject closed.

Standard Blocking for Cradles of Car Dumping Machines

J. McMullen  
Chairman

THE COMMITTEE appointed to make recommendations covering standard blocking for cradles of car dumping machines has found by observation of the operation of the machines equipped with the present M. C. B. blocking that cars receive more or less damage while passing through the machines. The railroad mechanical department, with the co-operation of the heads of various industries in the coal and ore district, after experimenting with several types of blocking, developed what we consider the most suitable blocking for protecting the various types of cars now being handled on the car dumper.

This blocking consists of vertical posts covered with horizontal planking. This arrangement furnishes the greatest possible bearing surface for the side of the car, which is one of the most important requirements. The proposed blocking can be renewed at less expense than the old style, as it is only necessary to renew the planking at the places where it wears out, while with the present M. C. B. blocking it is necessary, in some cases, to renew the heavy vertical posts when they become worn.

Provision is made to take care of projecting grabirons, ladders

and the ends of winding bars by omitting a part of the 3-in. planking at the B end and near the center of the cradle wall. The planking is also omitted between the first and second posts at the A end of the machine so that short cars may be handled nearer the center of the cradle, this to be accomplished by spotting the car with the side ladder between the two posts. The long cars are to be spotted with the ladder outside of the end post. This post is to be faced with 3-in. timber to make the face flush with the planking. Railroads operating cars having the top side angle projecting beyond the face of the car side may cut a horizontal recess 6 in. wide and 3 in. deep in the face of the blocking at the point of contact with the angle.

The matter of applying a metal plate to the face of the posts above the planking to prevent wear of the facing on the posts is left optional with the company operating the machine. All fastenings, such as bolts, lags, spikes, etc., shall have heads flush or below the face of the blocking. The distance from the center of the track to the face of the planking should be made 5 ft. 9 in. (where possible) when the cradle is in the normal position. A guide plate should be located as shown on the drawing at the B end of the cradle to prevent damage to the blocking by cars having sides bulged too wide to clear.

The planking directly under the clamps should not extend more than 6 ft. 7 in. above the top of the rail in order that the clamp may drop low enough to engage the top of low side cars. The spacing of the vertical posts will have to be governed to some extent by the construction of the cradle, but they should not be spaced further apart than 3 ft. centers where possible, with the exception of the first two at the A end, which should be spaced not less than 2 ft. 6 in. between the posts, as shown on the drawing. The bottom ends of the posts should be tapered

close to this lay-out. It will wear out in a short time, so that you will have to renew it anyhow.

Mr. Rink The present installation is a large square block, setting lengthwise, with a heavy angle iron frame, and we would have to make some changes to the frame before we could apply two thicknesses of material.

Mr. McMullen. I think that perhaps your blocking is heavy enough there, so that you could reduce the posts sufficiently to compensate for the horizontal planking that would be applied on the face of the posts.

A motion that the report be submitted to letter ballot for recommended practice was carried.

## Specifications and Tests for Materials (M. C. B.)

F. M. Waring  
Chairman

THE COMMITTEE SUBMITS its report covering the subjects which were reviewed during the past year and recommends that changes be made in the several specifications, as shown under the respective exhibits. All references to page numbers relate to the 1918 Proceedings.

### Exhibit A

1. The following revision to supersede the present Specifications for Galvanized Sheets for Passenger and Freight Equipment Cars, page 1042, as Standard.

### Specifications for Galvanized Sheets for Passenger and Freight Equipment Cars.

(Standard)

1. **Scope.**—These specifications cover galvanized steel and iron sheets for use on passenger and freight equipment cars.

#### I. MANUFACTURE.

2. **Process.**—(a) The sheet material may be either open-hearth mild steel, or puddled iron made wholly from pig iron.

(b) All sheets shall be thoroughly cleaned and then galvanized with a coating of not less than 1.5 oz. of zinc per square foot.

#### II. PHYSICAL PROPERTIES AND TESTS.

3. **Bend Tests.**—(a) A test specimen shall stand bending double on itself around a mandrel, the diameter of which is equal to twice the thickness of the specimen, and straighten, without cracking or flaking of the coating on either side of the specimen.

(b) A test specimen shall bend twice in the same direction, first around a mandrel the diameter of which is equal to fifteen times the thickness of the specimen, and straighten, and then bend flat on itself and straighten, without cracking of the base material.

(c) Sheets of Gage No. 26 and less in thickness shall double-seam without cracking of the sheet or coating.

4. **Test Specimens.**—Specimens eight inches in length by two inches in width shall be cut from the center of a sheet selected at random from each lot of 1,000 sheets or fraction thereof, for test purposes.

#### III. PERMISSIBLE VARIATIONS IN WEIGHT.

5. **Permissible Variations.**—The weight of the finished sheets shall not vary more than 2½ per cent either way from that shown in Table 1.

TABLE 1.  
WEIGHT OF GALVANIZED SHEETS.

United States Standard Gage Number.	Weight Per Square Foot, Oz.
16	42.5
17	38.5
18	34.5
19	30.5
20	26.5
21	24.5
22	22.5
23	20.5
24	18.5
25	16.5
26	14.5
27	13.5
28	12.5
29	11.5
30	10.5

#### IV. WORKMANSHIP AND FINISH.

6. **Workmanship.**—The sheets shall conform to the gage and size ordered.

7. **Finish.**—The finished sheets shall be properly galvanized, be free from blackened and acid spots and surface defects.

#### V. MARKING.

8. **Marking.**—The finished sheets shall, when ready for shipment, be properly marked with the name or brand of the manufacturer and a lot number for identification.

#### VI. INSPECTION AND REJECTION.

9. **Inspection.**—(Same as paragraph 7 of 1918 specifications.)  
10. **Rejection.**—(a) Sheets represented by samples which fail to conform to the requirements of these specifications will be rejected.

(b) Sheets which, subsequent to tests and inspection at the mills or elsewhere and their acceptance, show black spots, inferior galvanizing, improper trimming or other defects will be rejected and shall be replaced by the manufacturer.

11. **Rehearing.**—Samples tested in accordance with Section 9 (b), which represent rejected material, shall be preserved for two weeks from the date of the test report. In case of dissatisfaction with results of tests, the manufacturer may make claim for a rehearing within that time.

### Exhibit B.

2. The following revision to supersede the present Specifications for Miscellaneous Steel Castings for Passenger and Freight Equipment Cars (Recommended Practice), Specifications for Cast-Steel Truck Sides (Recommended Practice) and Specifications for Cast-Steel Bolsters (Recommended Practice), pages 1029, 499 and 502, respectively.

### Specifications for Annealed Carbon Steel Castings for Passenger and Freight Equipment Cars.

(Recommended Practice)

1. **Scope.**—These specifications cover all steel castings for passenger and freight equipment cars, including couplers, truck bolsters, truck side frames, yokes and miscellaneous castings.

#### I. MANUFACTURE.

2. **Process.**—The steel may be made by the open-hearth, crucible or electric process.

3. **Heat Treatment.**—Castings shall be allowed to become cold. They shall then be uniformly reheated to the proper temperature to refine the grain and allowed to cool uniformly and slowly. If, in the opinion of the purchaser or his representative, a casting is not properly annealed, he may at his option require the casting to be re-annealed.

#### II. CHEMICAL PROPERTIES AND TESTS.

4. **Chemical Composition.**—The steel shall conform to the following requirements as to chemical composition:

Carbon	0.20-0.37 per cent.
Manganese	not over 0.75 per cent.
Phosphorus	not over 0.05 per cent.
Sulphur	not over 0.05 per cent.

5. **Ladle Analyses.**—An analysis of each melt of steel shall be made by the manufacturer to determine the percentage of carbon, manganese, phosphorus and sulphur. This analysis shall be made from drillings taken at least ¼ in. beneath the surface of a test ingot obtained during the pouring of the melt. The chemical composition thus determined shall be reported to the purchaser or his representative, and shall conform to the requirements specified in Section 4.

6. **Check Analyses.**—A check analysis may be made by the purchaser from the broken tension test specimen or from a

finished casting representing each melt. The chemical composition thus determined shall conform to the requirements specified in Section 4. Drillings for analysis shall be taken not less than 1/4 in. beneath the surface of the casting.

III. PHYSICAL PROPERTIES AND TESTS.

7. Tension Tests.—(a) The steel shall conform to the following minimum requirements as to tensile properties:

Tensile strength, lb. per sq. in.....	65,000	
Elastic limit, lb. per sq. in.....	0.4 Tensile Strength	
Yield point, lb. per sq. in.....	0.45 Tensile Strength	
Elongation in 2 in., per cent.....	1,600,000	
Reduction of area, per cent.....		Not under 22 per cent.
	Tensile Strength	
	35	

(b) Either the elastic limit or the yield point, but not both, shall be determined. The elastic limit shall be determined by an extensometer and the yield point by the drop of the beam of the testing machine.

(c) The yield point, or the elastic limit, shall be determined at a cross-head speed not to exceed 1/8 in. per minute, and tensile strength at a speed not exceeding 1 1/2 in. per minute.

8. Alternative Tests to Destruction.—In the case of orders including only castings not exceeding 150 lb. in weight, a test to destruction on one casting for each 100 castings or smaller lot may be substituted for the tension tests. This test shall show the material to be ductile, free from injurious defects, and suitable for the purpose intended.

Radius not less than 1/8"

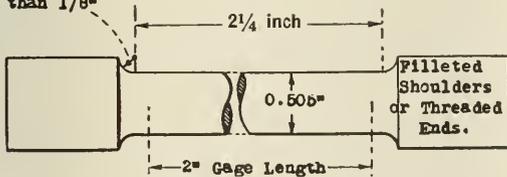

Fig. 1.—Exhibit B, Paragraph 8

9. Test Specimens.—(a) Tension test specimens shall conform to the dimensions shown in Fig 1. The ends shall be not less than 7/8 in. in diameter and of a length and form to fit the holders of the test machine in such a manner that the load will be axial.

(b) An adequate number of test coupons shall be cast with and attached to castings, weighing over 150 lb., from each melt when presented for inspection. If the design of the casting is such that the test coupons cannot be attached, the test bars shall be cast in runners outside of the casting, but attached to it to represent each melt. The location of the test coupons or bars, as well as the method of casting such coupons or bars, shall be subject to mutual agreement by the inspector and manufacturer. In the case of any orders for castings weighing under 150 lb., the physical properties as required in Section 7 may be determined from an extra or spare test bar cast with and attached to some other casting from the same melt.

(c) When sufficient coupons have not been cast, a test specimen may be cut from a finished casting at a location mutually agreed upon by the inspector and manufacturer.

10. Annealing Lugs.—For the purpose of determining the quality of annealing, at least two and not more than four annealing lugs shall be cast on all castings 150 lb. and over, and on such castings less than 150 lb. as required by the purchaser. The location of the annealing lugs shall be agreed on by the inspector and the manufacturer. The standard annealing lug shall be 1 in. in height and 1 in. in width by 5/8 in. in thickness where it joins the casting. The inspector may remove one-half and the manufacturer one-half of the number of annealing lugs.

11. Grouping Melts.—(a) After 15 consecutive melts, which may contain any or all classes of castings covered by these specifications on one or more orders, have been tested and accepted, the manufacturer may group the succeeding melts in lots of five melts each, but each lot not to exceed 40 tons; the entire group to be accepted if the test specimen selected from the lot fulfills the chemical and physical requirements herein specified. If this test fails, a rehearing will be granted on the

melt that the failed bar represents, and the other four melts of the group shall be tested individually.

(b) In case of small orders for bolsters, truck sides, draft arms, yokes or castings weighing over 150 lb., where the size of order and the available pattern and foundry equipment are such that not more than five castings can be cast in any one melt, the physical properties as required in Section 7 may be determined from an extra or spare test coupon cast with and attached to some other casting from the same melt.

(c) If there is a period of more than six months between shipments of the class of castings covered by these specifications, then each melt shall be tested individually until 15 consecutive melts have been accepted, after which the melts may again be grouped as in paragraph (a).

(d) If one or more melts are rejected each succeeding melt shall be tested individually until 15 consecutive melts have been accepted, after which melts may again be grouped as in paragraph (a).

12. Number of Tests.—(a) One tension test shall be made from each melt, except as provided in Section II (a).

(b) If any test specimen shows defective machining or develops flaws, it may be discarded and another specimen substituted.

(c) If the percentage of elongation of any tension test specimen is less than that specified in Section 7 (a) and any part of the fracture is more than 3/4 in. from the center of the gage length, as indicated by scribe scratches marked on the specimen before testing, a retest shall be allowed.

IV. PERMISSIBLE VARIATIONS.

13. Dimensions.—The dimensions shall conform to the permissible variations shown on the drawings.

14. Weight.—The normal weight of the castings of any one design shall be determined from the actual weight of at least 50 castings weighed at one time. The weight of individual castings shall not vary more than 5 per cent over or 3 per cent under the normal average weight so obtained. The gross weight of the entire order of castings to be not more than 2 1/2 per cent over the normal average weight multiplied by the number of castings in the order. The gross weight as specified herein shall apply only on large orders of castings from machine patterns.

V. WORKMANSHIP AND FINISH.

15. Workmanship.—All castings shall substantially conform to the size and shape shown on standard drawings, and shall be made in a workmanlike manner.

16. Patterns.—When patterns are furnished by the purchaser, the manufacturer shall make sure that the allowance for shrinkage in these patterns agrees with his own practice, and castings shall be rejected which do not conform closely to dimensions on prints, or if distorted by improperly matched flasks, undue rapping or any other defect caused by molding. Special attention should be given to properly rounding all fillets and corners shown on drawings. Where surfaces are to be machined, the castings shall have the proper allowance for finish. Under no circumstances shall manufacturer change purchaser's patterns, without written permission from the purchaser.

17. Finish.—(a) The castings shall be free from all injurious defects. Castings shall not be painted before inspection. Castings rusted to any extent, or covered with any material to hide defects, shall be rejected.

(b) Any casting found with blow holes, cracks, low spots or thin sections filled with cement or like material will be rejected and shall not be further considered. Welding will not be permitted unless authorized by the inspector and then only when the defects are cleaned to solid metal and only at locations where the defects will not in any way be detrimental to the strength of the casting.

VI. MARKING.

18. Marking.—The manufacturer's name or identification mark and the specified pattern number shall be cast on all castings. In addition, the month and year when made shall be cast on all bolsters, truck sides and similar castings. The location and size of numbers shall be agreed upon by the manufacturer and the inspector. In accordance with the standard practice of the individual foundry, to identify individual castings, a serial number may be cast or the melt number may

be stamped on bolsters, truck sides and similar castings as agreed upon by the manufacturer and the inspector.

VII. INSPECTION AND REJECTION.

19. **Inspection.**—The inspector representing the purchaser shall have free entry, at all times while work on the contract of the purchaser is being performed, to all parts of the manufacturer's works which concern the manufacture of castings ordered. The manufacturer shall afford the inspector, free of cost, all reasonable facilities to satisfy him that the castings are being furnished in accordance with these specifications. All tests (except check analyses) and inspection shall be made at the place of manufacture prior to shipment, unless otherwise specified.

20. **Rejection.**—(a) Unless otherwise specified, any rejection based on tests made in accordance with Section 6 shall be reported within five working days from the receipt of samples.

(b) Castings which show injurious defects subsequent to their acceptance at the manufacturer's works will be rejected, and the manufacturer shall be notified.

21. **Rehearing.**—Samples tested in accordance with Section 6, which represent rejected castings, shall be preserved for two weeks from the date of test report. In case of dissatisfaction with the results of the tests, the manufacturer may make claim for a rehearing within that time.

Exhibit C.

3. The following revision to supersede the present Specifications for Rivet Steel and Rivets for Passenger and Freight Equipment Cars (Standard), page 1038:

Specifications for Rivet Steel and Rivets for Passenger and Freight Equipment Cars.

(Standard.)

1. **Scope.**—These specifications cover steel bars for the manufacture of rivets and finished steel rivets for passenger and freight equipment cars.

I. MANUFACTURE.

2. **Process.**—The steel shall be made by the open-hearth process.

II. CHEMICAL PROPERTIES AND TESTS.

3. **Chemical Composition.**—The steel shall conform to the following requirements as to chemical composition:

Carbon .....	percentage optional.	}
Manganese .....	percentage optional.	
Phosphorus .....	not over 0.04 per cent.	
Sulphur .....	not over 0.05 per cent.	

4. **Ladle Analyses.**—An analysis of each melt of steel shall be made by the manufacturer to determine the percentages of carbon, manganese, phosphorus and sulphur. This analysis shall be made from a test ingot taken during the pouring of the melt. The chemical composition thus determined shall be reported to the purchaser or his representative, and shall conform to the requirements specified in Section 3.

5. **Check Analyses.**—An analysis may be made by the purchaser from finished bars or rivets representing each melt. The chemical composition thus determined shall conform to the requirements specified in Section 3.

III. PHYSICAL PROPERTIES AND TESTS.

A.—Requirements for Bars.

6. **Tension Tests.**—The bars shall conform to the following requirements as to tensile properties:

Tensile strength, lb. per sq. in.....	45,000—60,000
Elongation in 8 in., min. per cent.....	1,500,000
	—————
	Tensile Strength
	but need not exceed 30 per cent.

7. **Bend Tests.**—The test specimen shall bend cold through 180 degrees flat on itself without cracking on the outside of the bent portion.

B.—Requirements for Rivets.

8. **Bend Tests.**—The rivet shank shall bend cold through 180 degrees flat on itself, as shown in Fig. 1, without cracking on the outside of the bent portion.

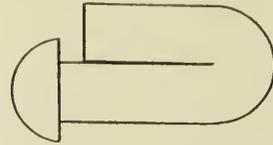

Fig. 1.—Rivet Shank Bent Cold

9. **Flattening Tests.**—Rivet heads shall be flattened sideways, when cold, to a thickness of one-third, and when at a driving heat to a thickness of one-fourth the original diameter of the shank without splitting.

10. **Test Specimens.**—(a) **Bars.**—Tension and bent test specimens shall be of the full section of bars as rolled.

(b) **Rivets.**—Bend and flattening test specimens shall be of the full section of rivets as manufactured.

(c) When accurate account of the material has been kept and the melts can be identified, only one set of specimens for each diameter in each melt shall be taken from either the bars or the finished rivets.

11. **Number of Tests.**—(a) **Bars.**—One tension and one bend test shall be made from each lot of 200 bars, or from each diameter in any one melt, each of which shall conform to the requirements specified.

(b) **Rivets.**—One bend and one flattening test shall be made from each lot of 100 kegs of each diameter or from each diameter in any one melt, each of which shall conform to the requirements specified.

(c) If any test specimen from the bar or rivets originally selected to represent a lot of bars or rivets contain surface defects not visible before testing, but visible after testing, or if a tension test specimen breaks outside the middle third of the gage length, one retest shall be allowed.

IV. PERMISSIBLE VARIATIONS IN GAGE.

12. **Permissible Variations.**—The bars shall conform to the M. C. B. standard limit gages.

13. **Dimensions of Rivet Heads.**—(Same as paragraph 19 of 1918 specifications.)

V. WORKMANSHIP AND FINISH.

14. **Workmanship.**—The finished base shall be circular within 0.01 in., and the rivets shall be concentric, true to form and shall be made in a workmanlike manner.

15. **Finish.**—The finished bars and rivets shall be free from injurious defects and shall have a workmanlike finish.

VI. MARKING.

16. **Marking.**—(a) **Bars.**—Rivet bars shall, when ready for shipment, be properly separated and marked with the name or brand of the manufacturer and the melt or lot number for identification.

(b) **Rivets.**—Kegs of finished rivets shall, when ready for shipment, be properly marked with the name or brand of the manufacturer, diameter of rivets and the melt or lot number for identification.

(c) **SAMPLES.**—The melt or lot number shall be legibly stamped on each test specimen representing a lot of bars. Samples representing a lot of rivets shall be marked in a manner that will not impair their value for test purposes.

VII. INSPECTION AND REJECTION.

17. **Inspection.**—The inspector representing the purchaser shall have free entry, at all times while work on the contract of the purchaser is being performed, to all parts of the manufacturer's works which concern the manufacture of the bars or rivets ordered. The manufacturer shall afford the inspector, free of cost, all reasonable facilities to satisfy him that the bars or rivets are being furnished in accordance with these specifications. All tests (except check analyses) and inspection shall be made at the place of manufacture prior to shipment, unless otherwise

specified, and shall be so conducted as not to interfere unnecessarily with the operation of the works.

18. **Rejection.**—(a) Unless otherwise specified, any rejection based on tests made in accordance with Section 5 shall be reported within five working days from the receipt of samples. (b) Bars or rivets which show injurious defects subsequent to their acceptance at the manufacturer's works will be rejected, and the manufacturer shall be notified.

19. **Rehearing.**—Samples tested in accordance with Section 5, which represent rejected bars or rivets, shall be preserved for two weeks from the date of the test report. In case of dissatisfaction with the results of the tests, the manufacturer may make claim for a rehearing within that time.

**Exhibit D.**

4. The following revision to supersede Specifications for Black Paint (Recommended Practice), page 1058:

**Specifications for Black Paint.**

(Recommended Practice.)

1. **Scope.**—These specifications cover carbon black semi-paste to be used as a protective paint for M. C. B. equipment cars.

**I. CHEMICAL PROPERTIES AND TESTS.**

2. **Chemical Composition.**—(a) **PASTE.**—The paste shall conform to the following requirements:

Pigment .....	43 to 47 per cent by weight.
Linseed oil .....	53 to 57 per cent by weight.

(b) **PIGMENT.**—The pigment shall conform to the following requirements:

* Lamplack or carbon black.....	not less than 30 per cent.
Red lead .....	not less than 8 per cent.
China clay or other approved inert pigment .....	not more than 62 per cent.
Oxide of iron, if present.....	not over 15 per cent., and may be substituted for an equal amount of lamplack.

\* The lamplack shall be of a good quality and of such a character as to produce the standard shade. Ground coal, etc., will not be considered.

(The last paragraph under (b) together with paragraph (c) and article 3 to remain the same as in the 1918 specification.)

**II. PHYSICAL PROPERTIES AND TESTS.**

4. **Shade.**—(Same as in 1918 specifications.)

5. **Fineness.**—The pigment shall be ground so fine that it will not show any appreciable settling in the barrel, and, when a sample of the paste is washed on a 350-mesh sieve with a suitable solvent, at least 97 per cent of the pigment shall pass through the sieve. There shall be no visibly coarse particles in the residue on the 350-mesh sieve and shall pass through a 200-mesh sieve.

6. **Sampling.**—A sample of the paste shall be taken at random from any barrel, can or package in each shipment, at destination.

7. **Place of Making Tests.**—The purchaser may make the tests to govern the acceptance or rejection of the material in his own laboratory or elsewhere. Such tests shall be made at the expense of the purchaser.

**III. PERMISSABLE VARIATIONS.**

8. **Weight.**—As quotations are made by the pound on the basis of the paint weighing not over 10.5 lb. per gallon, all paint received which weighs more than 10.5 lb. per gallon, but not over 11.5 lb. per gallon, will be accepted at the weight of 10.5 lb. per gallon, the excess weight being at the expense of the manufacturer.

(Sections IV., and V., remain the same as in the 1918 specifications.)

**Exhibit E.**

5. The following revision to supersede Specifications for Malleable Castings for Passenger and Freight Equipment Cars (Recommended Practice), page 1027:

**Specifications for Malleable Iron Castings.**

(Recommended Practice.)

1. **Scope.**—These specifications cover all malleable iron castings for freight and passenger equipment cars.

**I. MANUFACTURE.**

2. **Process.**—The castings shall be made by either the air furnace, open-hearth, or electric furnace process.

**II. PHYSICAL PROPERTIES AND TESTS.**

3. **Tension Tests.**—The tension test specimens shall conform to the following minimum requirements as to tensile properties:

Tensile strength, lb. per sq. in.....	45,000
Elongation in 2 in., per cent.....	7.5

4. **Annealing Tests.**—(a) All castings, if of sufficient size, shall have cast thereon test lugs of a size proportional to the thickness of the casting, but not exceeding 5/8 in. by 3/4 in. cross-section. On castings which are 24 in. or over in length, a test lug shall be cast near each end. These test lugs shall be attached to the casting at such a point that they will not interfere with the assembling of the castings, and may be broken off by the inspector.

(b) If the purchaser or his representative so desires, a casting may be tested to destruction. Such a casting shall show good, tough malleable iron.

5. **Test Specimens.**—(a) Tension test specimens shall be of the form and dimensions shown in Fig. 1. Specimens in which the mean diameter at the smallest section is less than 1 1/32 in. will not be accepted for test.

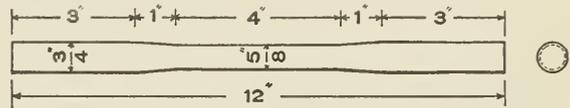

Fig. 1.—Exhibit E, Paragraph 5

(b) A set of three tension test specimens shall be cast from each melt, without chills, using heavy risers of sufficient height to secure sound bars. The specimens shall be suitably marked for identification with the melt. Each set of specimens so cast shall be placed in an oven containing castings to be annealed.

6. **Number of Tests.**—(a) After annealing, three tension test specimens shall be selected by the inspector as representing castings in the oven from which these specimens are taken.

(b) If the first specimen conforms to the specified requirements, or if, in case of failure of the first specimen, the second and third specimens conform to the requirements, the castings in that oven shall be accepted, except that castings will not be accepted if the test lugs show that they have not been properly annealed. If either the second or third specimens fail to conform to the requirements, the entire contents of that oven shall be rejected.

7. **Re-Annealing.**—Any castings that have shown insufficient annealing may be re-annealed, but not more than once. If the remaining test lugs, or castings broken as specimens, show the castings to be thoroughly annealed, they shall be accepted; if not, they shall be finally rejected.

**III. WORKMANSHIP AND FINISH.**

8. **Workmanship.**—The castings shall conform substantially to the patterns or drawings furnished by the purchaser, and also to gages which may be specified in any individual cases. The castings shall be made in a workmanlike manner. A variation of 1/8 in. per ft. will be permitted.

9. **Finish.**—The castings shall be free from injurious defects.

**IV. MARKING.**

10. **Marking.**—The manufacturer's identification mark and the pattern numbers assigned by the purchaser shall be cast on all castings of sufficient size. Markings shall be applied at such a point that they will not interfere with the service of the castings.

(Section V., remains the same as in the 1918 specifications.)

The report is signed by F. M. Waring (Chairman), Pennsylvania; J. R. Onderdonk, Baltimore & Ohio; J. J. Burch, Norfolk & Western; I. S. Downing, Cleveland, Cincinnati, Chicago & St. Louis; Frank Zelny, Chicago, Burlington & Quincy; A. H. Fetters, Union Pacific; H. B. MacFarland, Atchison, Topeka & Santa Fe; H. G. Burnham, Northern Pacific; H. E. Smith, United States Railroad Administration, and J. C. Ramage, Southern.

**Discussion**

After presenting the report Mr. Waring said: In addition the committee wishes to offer an amendment to the report,

which is not covered in the printed circular; this amendment to cover a modification of the specifications for steel axles, standard, page 483 of the 1918 Proceedings, Section 7; from the tests omit the letter "a" at the beginning of first paragraph and omit the entire paragraph "B." Paragraph "B" covers the selection of the test sample for chemical analysis and requires that a six-in. piece shall be cut off the axle and the test analysis be taken from this six in. piece. The majority of the purchasers seem to be making their inspection and tests, by drilling directly from the end of the axle, instead of cutting off a six-in. test piece.

The committee felt it would be well to substitute that method of taking the chemical analysis sample. The chemical analysis clause would then read as follows: "An analysis shall be made by the purchaser from one axle representing each melt. The chemical composition thus determined shall conform to the requirements specified in Section 2. The drilling for this analysis shall be taken, with a five-in. drill, from one end of the test axle at any point midway between the center and surface."

A motion to amend the report by including the modification to the Specifications for Steel Axles was carried, and Mr. Waring then read exhibit "B" of the printed report.

Mr. Waring: This recommendation was made as a result of a meeting of the committee held in Chicago in April, at which time it was decided that the advance that had been made in the art of making steel castings was sufficient to justify us in recommending to the association a complete revision of the steel castings specifications, raising the physical properties from a test strength of 60,000 to 65,000 lb. per sq. in., and making a complete revision of the remainder of the specifications to cover certain details of inspections and tests.

Chairman: Mr. Waring, may I ask you if in each instance where you have made these changes that you give for the benefit of the members the reason that brought about the changes.

Mr. Waring: Our specifications for steel castings are rather old, and they are in accordance with what has been used for a great number of years. They do not recognize the fact that a great improvement has been made in the quality of steel castings, and we found that the castings we were actually getting showed physical properties greatly in excess of those required by the specifications. At the same time it was recognized that the grade of steel called for by the specifications might be entirely satisfactory in certain miscellaneous castings, which were not subjected to any great stress, or did not form part of any important structure, but in considering castings, such as truck sides and bolsters, many felt that since the design of these parts were required to stand stresses as high as 12,500 lb. per sq. in., and in some cases greater, that it would be well to provide designs with specifications covering material which would be amply safe for such stresses. I have to make some explanation as I go along, because the committee's action was not unanimous, and we will get down to something a little bit different at the end.

Subsequent to a meeting, at which nine members were present, and all of them voting in favor of the specifications, there was apparently a change of opinion among certain members, thinking that this recommendation for a complete revision of the specifications and increase in physical properties was perhaps a little bit too radical to present to the convention at this time. As a result of conversation among some of the members of the committee, it was suggested that the committee's report on steel castings specifications be offered at this time simply as a part of the report, and not to go to letter ballot. On that proposition the committee was divided, two being opposed, desiring that the specifications should be submitted as they stand, or withdrawn completely, and the remainder of the committee in favor of sending them as information only. I do not have any unanimous recommendation from my committee in regard to the specifications. It seems to me there are two things we can do: one of them taking the majority vote of the committee to present these specifications as information only as part of the report, but not to go to letter ballot for recommended practice; and the other that the specifications be withdrawn and referred back to the

committee for further action. I would move that the revised specifications for steel castings, as presented in exhibit B of this report, be included in the report of the committee as information only.

H. G. MacFarland (A. T. & S. F.): I voted against that proposition of having it for information only. I really could not see what is to be gained by the presentation of the specifications after deliberation on the part of the committee for two years for information only. We have prepared a specification that meets very satisfactorily the requirements furnished by the steel companies except for a small percentage of rejections, and we think they will be very satisfactory, showing a tensile strength of 65,000 lb., a reduction of area of 35 per cent and a minimum ductility of 22 per cent. Those most essential requirements can easily be met and will provide a steel exceptionally satisfactory. I would much prefer that this go to letter ballot and be determined by the association, rather than left for information only, or if the association feels that it does not want a letter ballot, return it to the committee until we have a unanimous opinion. We did have a unanimous opinion at one time and I do not see any good reason why we should not continue with the same unanimity that we had expressed at one meeting.

Mr. Gaines: I would like to ask the chairman of the committee, what is the attitude of the steel makers themselves in regard to the question.

Mr. Waring: We have heard from six steel makers, and from the chairman of the sub-committee representing them, and they have stated to us that they would agree to the tensile strength of 65,000 lb. per sq. in. as the least limit of tensile strength, but they felt that the ductility requirements as expressed in these specifications, were very difficult for them to meet; they thought they were too high and that it would result in the rejection of from 8 to 10 per cent of their product. That is the main feature of the statement. Three members of the committee seemed to think that there might be a great deal in what the steel makers had to say, and for that reason they wished to change their views a little.

Mr. Kiesel: I fully agree with what Mr. MacFarland says. I am speaking now from the design standpoint. We allow a stress of 16,000 lb. per sq. in. in side frames and bolsters. Steel that is made in accordance with the old specifications, under the lower limit, is not to stand that stress; therefore, we ought to have better steel, or we will have to increase the weight of the bolsters and side frames at least 25 and maybe 50 per cent. We absolutely have to have better steel. We get better steel now, and there is no reason why we should not make a specification in conformity with the steel we now get, and eliminate any that comes down near the lower limit, which would not be safe to use in bolsters and side frames, and possibly also couplers.

Mr. Tatum: I agree with Mr. Kiesel. We are having frequent failures all over this country with our cast steel bolsters and cast steel side frames. Our trains are delayed; we are not able to get the traffic over the country because we haven't steel in our cast steel bolsters and side frames that will meet the requirements. I don't think that we should add metal over what is reasonable for a cast steel side frame, or a bolster, in order to get the bolster or side frame to hold up under load. I believe that this matter should be referred to the railroads, and that they be given an opportunity to vote their opinion by letter ballot, and not offer it only to the convention or to the railroads at large as information. I think it would be well for the committee to know the sentiment of the railroads throughout the country. They have men in their employment who have studied the necessity of steel and its requirements, and they should be given opportunity to express their views to the committee.

Mr. Cromwell (B. & O.): I am quite sure that it would be no hardship upon the steel manufacturers if these specifications were adopted. The railroad with which I am connected has no trouble whatever in obtaining steel castings to meet these requirements. It is absolutely essential to have a better grade of steel in cast steel side frames and cast steel bolsters. As Mr. Kiesel remarked, we will have to make the castings heavier if we hold to our present specifications. The failure of cast steel side frames and bolsters is quite a serious matter, and the matter relative to the welding of these parts has been before this committee a number of times. If we had had a steel of higher quality in those frames, those parts would not be annoying you

at this time. I hope the convention here will submit the specifications to letter ballot.

Mr. Fuller: I think it would be a mistake to ignore this committee's report and simply accept it as information. Everything that has been said here so far tends to the opinion that the specifications are not unduly high. To relieve the embarrassment of the chairman of this committee, as he evidently made that motion under more or less compulsion, I would like to ask him if he will withdraw his motion so that we can put a motion before the house without wasting a lot of time, and accept the report and submit it to letter ballot.

A. W. Gibbs (Penna. Lines): I would like to ask the chairman of the committee what is the practice on which these figures are based—are these figures the upper limits of the possibilities of the steel casting, or have you allowed a good margin even as it is over the common ones?

Mr. Waring: According to the results of a large number of tests in possession of the members of the committee, these minimum figures given in the specifications are quite low, and could be easily met. Of a series of 3,000 tests, there was only one which would have been rejected under this specification.

Mr. Fuller: I do not think there is any reason why this specification cannot be met by the steel makers, and it is up to this Association to get out a specification that will meet our requirements, and if we put that specification through, I doubt if we will have any trouble in obtaining a steel that will meet it. As I understand it, there is not very much opposition to it. The tensile strength is a little high, but not enough to interfere with the general acceptance of the specification, and I would like to see the Association go on record as accepting the report.

Chairman: Mr. Waring, have you made up your mind to withdraw the motion?

Mr. Waring: As that motion represented the latest majority vote of the members of the committee, I think we ought to let it go through to a vote, and either sustain it or vote it down. I do not feel justified in withdrawing it.

The motion that this report be referred to the association as information only was then put and lost by unanimous vote.

F. F. Gaines: I move that the report be received and submitted to letter ballot in its entirety.

B. B. Milner (N. Y. C. Lines): There is one question I would like to ask. This specification covers miscellaneous castings, side frames and bolsters. We are quite concerned about the material going into the side frames and bolsters, but I am wondering what the committee would say on the question of having a separate specification for miscellaneous casting.

Mr. Waring: We thought it would be better to have one specification covering all grades of casting, since the properties specified were not particularly high, and are being met in the case of the miscellaneous castings, practically in all cases.

Mr. Milner: The committee considered that carefully, and decided unanimously that all steel castings should be covered under one specification?

Mr. Waring: Yes.

Mr. Tatum: It is not only the side frame and bolster which put the cars on the shop track, but it is the center plate and the side bearing as well, so let us have a good casting properly made for all our parts.

The motion that the report be received and submitted to letter ballot in its entirety was then put to vote and carried.

## Welding Truck Side Frames, Bolsters and Arch Bars

W. O. Thompson  
Chairman

THE COMMITTEE MADE A REPORT to the 1918 convention; however, it was omitted from the proceedings and the committee was requested to continue its researches and report again this year.

The Committee on Standards also referred to this committee the following from I. S. Downing, general master car builder, C. C. C. & St. L., which was received in reply to the Circular of Inquiry from the Committee on Standards: "It is our opinion that a limit should be placed on the welding and reclaiming of various parts, such as couplers, side frames, etc., inas-

much as at the present time there is nothing definite as to what extent broken or cracked couplers, side frames, and the like, can be welded and placed back in service. This practice would eliminate any possibility of relying on the judgment of one man as to whether or not the part in question would be serviceable after being repaired."

Prior to the 1918 Convention the committee conducted static tests at the Bettendorf Company's plant, Bettendorf, Iowa, and at the American Steel Foundries' plant, Alliance, Ohio, on cast steel truck side frames and cast steel bolsters, some of which had been autogenously welded, whereas others were tested with cracks not welded. The results were variable; some of the frames and bolsters which had been welded failed at a point other than where the weld was located and in other cases the failure was through the weld. It also developed that some of the welds proved to be of inferior quality upon examination of the fracture.

The fact that so many cast steel side frames and cast steel bolsters are failing in the tension members is conclusive evidence of weakness in design and the welding of the fractures will not add to the strength but is likely to introduce a condition of fur-

ther weakness by improper workmanship and change in the structure of the metal. It is, therefore, necessary to confine autogenous welding within specified limits on structures subject to alternating stresses and prescribe definite instructions to govern such welding.

The necessity for a greater factor of safety in the design of cast steel truck side frames and steel bolsters has been recognized by the association in the adoption of specifications including chemical properties, of load tests and limiting weights for cast steel truck side frames, as well as specifications including definite designs, limiting weights, chemical analysis and physical tests of the steel for both pressed steel and cast steel bolsters; and the United States Railroad Administration adopted definite designs of cast steel truck frames and bolsters based on those specifications and also prescribed that when renewals are necessary on existing cars side frames and bolsters in accordance with these standards be used.

It is, therefore, desirable from the standpoint of economy and safety to retire cast steel truck sides and bolsters not conforming to these specifications, as rapidly as they show signs of failure; however, it is realized that this would entail a large expenditure of money and, therefore, the committee believes that as an expedient autogenous welding should be permitted on these members within well defined limits and regulations.

Other metal car parts subject to compression only or to compression and low tension stresses may be welded. Worn surfaces of any nature and on any parts may be built up, provided that the material remaining in parts subject to high tension, such as hangers, etc., before welding, is equal to at least 80 per cent of the original section area, and in parts such as bolster guides, column castings, center plate rings, etc., the material remaining must be equal to 60 per cent of the original section area.

Broken coupler bodies, knuckles, locks, lifters and throwers should not be welded for the reason that reinforcing of the fractures cannot be permitted on account of interfering with the proper operation of the parts. Worn coupler bodies, knuckles, locks and throwers may be built up to the original sections, dressed and checked with proper gages to insure interchangeability and proper operation.

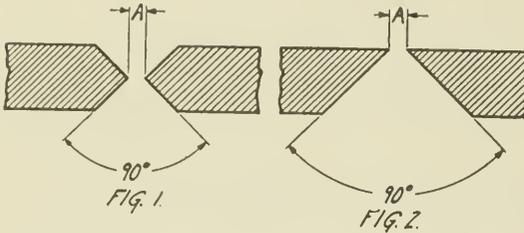

In order to determine what results would be obtained with blacksmith welding of wrought iron arch bars, four full sized pieces of 5 in. by 1¼ in. arch bar material were welded by com-

petent blacksmiths and these were tested (pull test) full size in comparison with four other bars which had not been welded. The following results were obtained:

	Lb. Per Sq. In. Ultimate Strength	Elongation Per Cent in Eight Inches
Welded bar.....	34,170	5
Welded bar.....	29,580	3
Welded bar.....	37,200	7
Welded bar.....	35,140	9
Unwelded bar.....	46,270	33
Unwelded bar.....	45,250	33
Unwelded bar.....	46,360	36
Unwelded bar.....	46,260	31

The average tensile strength shown by the unwelded bars was 46,000 lb. and the strength of the welded bars varies from 64 per cent to 81 per cent of this average, with very low elongation in eight inches. The general average of the strength of the welded bars gives 74 per cent of the average of the unwelded material. No attempt was made by the smith shop to produce a special weld but the material was handled as would be done for any ordinary welding of this character and the figures

A SHOULD BE SLIGHTLY GREATER THAN DIAMETER OF PENCIL

WHEN PIECE IS SUBJECT TO HIGH TENSION B MUST BE MORE THAN 1 1/2 T

probably represent what may be expected under ordinary conditions.

It is a simple process to form and drill arch bars and as the failure of this important member of truck construction is a serious matter, the committee is not justified in approving any process of welding which will decrease the strength of the original bar.

The committee, therefore, recommends the following:

**Autogenous Welding, Limits and Regulations**

I. General.—In welding, either by the use of gas or electricity, care and good judgment on the part of the operator are of prime importance. The operator's ability as to the desired proficiency should be certified by the mechanical officers in charge or by an instructor qualified by experience in general railroad welding with the method involved.

The metal added is liable to be porous and relatively brittle. The heat at the surfaces welded affects other sections near the weld, tending to reduce strength and toughness.

The following general rules must, therefore, be carefully observed:

II. Welding cracks or fractures will not be permitted on the following: Axles, arch bars, car wheels or tires, track equalizers, spring or bolster hangers, brake staffs, brake wheels, coupler bodies, knuckles, knuckle pins, locks, lifters and throwers.

Parts made of alloy steel or heat treated carbon steel. Top chord angles of open top all steel cars if the fracture is located at a point between bolsters more than five feet from the center of either body bolster.

III. Building up worn surfaces will be permissible on the following:

Parts subject to compression only.

\*Spring or bolster hangers, holes in levers.

†Center plates, truck sides, bolsters and column castings.

Journal boxes, coupler bodies, knuckles, locks, lifters and throwers. After building up to the original section, the same must be dressed and then checked with proper gages to insure interchangeability and proper operation.

Flat spots on rolled steel wheels and tires if thickness of tread is 1 in. or more above limit of wear groove.

\* Provided that the material remaining in the part is equal to at least 80 per cent of the original section.

† Provided that the material remaining in the part is equal to 60 per cent of the original section.

IV. Welding cracks or fractures will be permitted on the following:

Parts subject to compression only and general car parts not subject to high tension strains except as otherwise prohibited.

Car and roof sheets.

\*Cast steel truck sides.

\*Pressed and structural steel truck sides, bolsters and transoms.

\*Cast steel bolsters.

Draft castings.

\*Brake beams.

\*Case steel coupler yokes.

Car sills, posts, braces, stakes, carlines, side plates and end plates.

\* Welding is permitted only when the area of the crack is less than 2.5, or 40 per cent, of the total area through the section at the point of fracture, but it is not permissible to weld any crack located within 6 in. of an old weld.

**Regulations for Welding**

V. (a) All parts marked (\*) in Section IV, except truck transoms, must not be welded unless removed from the car or truck. Truck transoms may be welded in place by removing the truck from under the car body.

(b) The edges of pieces for welding must be prepared as shown in Figs. 1 and 2. If both sides of the fractured member can be worked upon, the fracture should be prepared as per Fig. 1, and where only one side of the fractured member is accessible, Fig. 2 should be followed. The entire crack should be burned or chipped out far enough back so that there will be no portion of the crack in the metal. Failure to do this permits the check or crack to work its way across the metal to the farther side, due to the constant vibration, even after the weld has been made. A hole may be drilled at the end of the crack or check or chipped or burned towards the hole. The surfaces where new material is to be deposited must be clean and bright and reasonably smooth and, therefore, if the surfaces are prepared by the burning process the surfaces must be finished by chipping before welding.

(c) The portion of the part adjacent to the fracture should be heated before the welding is begun. In welding, the operator should begin to weld at the point farthest away from the outside edge and work the weld towards the edge. All efforts must be made to prevent oxidization, and to accomplish this the work should be placed at an angle that will allow the blowing out of all slag or impurities in the fused metal. Giving the torch a rotary movement will assist in their removal.

(d) The new material must be deposited to the form shown in Figs. 3 or 4 in order to properly reinforce the weld, and B should be somewhat greater than T. For the important items marked (\*) and (†) in Section IV, as well as for car sills, posts, braces, stakes, carlines, side plates and end plates, B must be at least 1 1/2 times T.

(e) The parts marked (\*) in Sections III and IV, with the exception of truck transoms welded in place, must be carefully annealed by uniformly heating to approximately 1,400 or 1,500 degrees F. and allowed to cool slowly in the atmosphere.

(f) Worn surfaces permitted to be built up to the original section by depositing of new metal thereon must first be made clean,

bright and fairly smooth, and after the metal is deposited must be dressed to the required dimensions and gaged where necessary.

(g) When truck side frames and bolsters are welded the weld must be made smooth and the following record legibly stamped on the weld by at least 3/8-in. steel stencils, in the following form:

(Mo.—Day—Yr.) o—oo—oo	(Railroad) A. B. C.
XY	X
(Shop Abbreviation Mark)	(Welder's Identification Number or Mark)

VI. It is also recommended that reference be made in the Rules of Interchange to the effect that autogenous welding, by either gas or electric process, when performed must be strictly in accordance with these limits and regulations. The present price in the Rules of Interchange, Rule 107, Item 432, will not properly compensate the party performing the welding according to these regulations, and should be revised. A penalty should also be prescribed in the Rules of Interchange providing for the erection of any car on which a truck side frame or truck bolster is welded, after the adoption of these regulations, when not conforming to same.

The report is signed by W. O. Thompson (Chairman), New York Central; G. W. Rink, Central Railroad of New Jersey; J. T. Walls, Pennsylvania; J. J. Hennessey, Chicago, Milwaukee & St. Paul; A. M. McGill, Lehigh Valley; R. W. Schulze, St. Louis-San Francisco; Willard Kells, Atlantic Coast Line; J. R. Gould, Chesapeake & Ohio; E. H. Sweeley, Long Island and C. F. Giles, Louisville & Nashville.

During the reading of the report Mr. Thompson said: Your committee would like to have the paragraph in the middle of page 4, reading: "Flat spots on rolled steel wheels and tires, if thickness of tread is 1 in. or more above limit of wear groove," eliminated from the report, because after giving the matter further consideration we do not believe it is good practice to have that inserted.

Discussion

At the conclusion of the report Mr. Thompson said: There was a part of the report which was not printed, and that is that the thanks of this Association are due to The Bettendorf Company, The American Steel Foundries, and the Pennsylvania Railroad for placing all of their appliances at our disposal and for the considerable time and amount of money that was spent in the long extended experiments made with regard to welding.

Mr. Fuller: The committee's report has one recommendation that is all right, but I think you all ought to understand it. The last paragraph of the report reads as follows:

"A penalty should also be prescribed in the Rules of Interchange providing for the rejection of any car on which a truck side frame or truck bolster is welded, after the adoption of these regulations, when not conforming to same."

That should be carefully considered, as I presume there are hundreds and thousands of cars with the truck side frame or truck bolster welded, that have been welded for years, and are in use, and this paragraph may be the means of rejecting quite a number of cars.

Mr. Gaines: Mr. Fuller is right in this matter, and rather than make that penalty operative immediately, it would be better to set a future date, when the matter will become effective, so that we can gradually eliminate these cars. I would like to ask why the committee desires to cut out the recommendation relative to flat spots on rolled steel wheels and tires, if thickness of tread is 1 in. or more above limit of wear groove.

Mr. Thompson: They do not stick and you have a flat wheel, which is a great deal worse than what you had before.

A. W. Gibbs: I would like to ask, in connection with Section IV, on page 4, why it is stated "Welding cracks or fractures will be permitted on the following: 'Parts subject to compression only and general car parts not subject to high tension strains except as otherwise prohibited.'"

Why is the welding of bolsters and truck frames confined to the compression members only?

Mr. Thompson: It is hard to define what the tension and compression is in truck sides and bolsters. There are times when they are in tension and other times when they are in compression. It would be hard for anyone to say what are

the tension members and what are the compression members in these two parts.

W. J. Tullerton (Rock Island): In welding these flat spots on rolled steel wheels and tires, did you use the electric process as well, and did you have the same difficulty with the welds giving out when you used the electric weld? It is a well-known fact, that you cannot use the acetylene process for this purpose, as well as the electric process, for the reason that the acetylene calls for pre-heating, which the electric process does not. I think it is a mistake to condemn the welding up of flat spots on rolled steel wheels and steel tired wheels, until we know the reasons.

Mr. Thompson: Both processes were tried, and we could see no difference between the two in the result.

John A. Pilcher (N. & W.): I wish to point out in Paragraph 4, the first statement, as follows:

"The fact that so many cast steel side frames and cast steel bolsters are failing in the tension members is conclusive evidence of weakness in design, and the welding of the fractures will not add to the strength, but is likely to introduce a condition of further weakness by improper workmanship and change in the structure of the metal."

There are exceptions to that, because the stresses in the side frames can be very much increased by improper spring capacity; that is, any roughness in the track transmitted to the spring causes stresses to be set up which are indefinite, so there is a possibility of improper spring design affecting the breakage of the side frames, irrespective of the weakness of the casting. I want to take exception to that particular paragraph, because the spring must be properly designed to take care of the load, to avoid the breakage of the side frames.

There is another thing to which I desire to call attention. Under heading III—"Building up worn surfaces will be permissible on the following:" I notice they do not mention the building up of collars on axles. This is a source of great saving, and where the collars are built up simply to prevent their excessive lateral movement, it will not materially affect the strength of the axle, because the stresses are immaterial at that point. I wonder if that feature cannot be introduced—the building up of collars on axles.

Mr. Thompson: The committee did not consider the question of the building up of axles, but it is a question if that would not be in the same category as the steel-tired wheels would be. That is something, as I said before, that we did not look into.

The fact that so many cast steel side frames and cast steel bolsters are failing in tension members is conclusive evidence of weakness of design. When you consider the way the side frames are breaking down and the results we are experiencing from their breaking down, I do not believe that you could arrive at any other conclusion. Conditions have changed greatly since these truck side frames and bolsters were designed. The roads are carrying heavier loads and the service is more severe, all tending to the conclusion that the side frames were not designed for the service they are giving at the present time.

Mr. Gaines: I hope before the report of the committee is printed they will include the building up of collars on axles, as it will save many axles that now have to be thrown out. As to the building up of tires, I believe if you used the electric arc and the weld is made properly, that it can be done, and before we turn that proposition down finally it should be tested out further, because you can save money by welding up spots in the wheels by that process.

John McMullen (Erie): We have had a good deal of experience in electric welding flat spots on wheels. We have welded cast steel wheels and rolled steel wheels, and used them under our passenger cars, where we could see them and follow them up, and the results obtained have been very satisfactory. If the flat spot is properly cleaned off and cut in around the edges, and the weld is then made, rather than to apply it right on top, I do not think we will have any trouble with the electric welding process.

We have built up the collars and reclaimed a great many axles. The price of axles to-day is such that I think we are justified in building up these collars. We have reclaimed many

couplers, and I think if there is a slight crack down the back wall of the coupler it can be satisfactorily welded and reclaimed.

Mr. Tatum: Referring to paragraph four on page two, I am inclined to agree with the statement of the report. There are a number of side frames used on the trucks of various railroads in which the design is not proper, causing a number of them to fail. Another cause for the failure of truck frames is that they are not made of proper metal. As Mr. Pilcher says, because of weak springs the frames do get punishment. The truck frame receives more punishment than if you had a spring doing good work, but that makes no difference, in view of the committee's report that we had in service truck frames which show evidence of weakness in design.

The idea of building up the collar of the journal is very desirable. A great number of axles have been reclaimed by building up the collar of the axle, and I believe the committee should give that very thorough consideration.

Slid flat steel wheels and steel tired wheels have been successfully reclaimed when the work of building up the flat spot has been properly done.

I cannot agree with the reclaiming of the couplers.

J. G. Dickson (Oregon Elec. Ry.): Were the side frames tested, as mentioned in paragraph three, annealed for the welding, or were they welded without annealing them?

Mr. Thompson: They were experimented on, annealed and not annealed. We tried out every scheme we could think of.

Mr. Dickson: The Oregon Electric Railroad has been successful in welding flat spots by the electric process. We found the best material to use in filling in was cuttings from steel tired wheels. We had difficulty when we used other metal, but when using that metal we had good success, and I would not like to see this Association go on record against welding flat spots.

Mr. Thompson: The opposition to the recommendation of the committee, with regard to the matter of not welding the flat spots, has only been on the part of men who are operating suburban service, or electric railway service, which is a comparatively light and easy, but let us hear from some of the members who are running 120,000 lb. or 140,000 lb. capacity coal cars, and heavy trains.

C. E. Fuller (U. P.): We have been and are welding flat spots on steel wheels, and steel tires, with successful results. We would not think of removing a pair of wheels, or removing a tire, from service today because of a flat spot. We would use the electric weld, and if the work is properly done there is no question about its being a success. We have never welded any flat spots on wheels with the oxy-acetylene process.

We are reclaiming axles with worn collars. It would be a waste of material to throw axles away because the collars are worn  $\frac{1}{8}$  or  $\frac{3}{16}$ , or even  $\frac{1}{4}$  in. This committee should embody these items in its report, and should change the last paragraph on page 7 regarding the penalty, so that it will not compel us to take out of service side frames that have been welded and are giving good service.

The trouble is that some of it has been done in an improper manner. We have had lots of trouble from bad welding, but we have got to a point where we feel that we can weld safely, and I know of truck frames today that have been in service five or six years, and they are giving good service. I do not believe that anybody would ask to take them out of service because they had been welded.

The welding of some of the side frames has been done without regard to the service the truck frame is to perform—there have been too many tension members of improper design and bad steel that have been welded, and they have caused lots of trouble.

F. W. Brazier: The way I understand the recommendation of the committee is that in the future, any welding that is done must conform to the methods prescribed after a certain date. The date must also be attached, showing when the welding is done. If you get a car in the future with this date on it, and the welding is not done in conformity with the recommendations prescribed by the committee, you have the right to reject the car and that is the important point.

Frank McManamy (U. S. R. A.): The committee has rendered an excellent report, and while there may be some points not fully covered, there is so much good in the report that the

committee should be congratulated on it. In the paragraph Mr. Fuller refers to, I believe his interpretation may be due to a comma, which is misplaced. The clause reads: "A penalty should also be prescribed in the Rules of Interchange providing for the rejection of any car on which a truck side frame or truck bolster is welded, after the adoption of these regulations, when not conforming to same." The trouble comes with the comma after the word "welded."

The object was to provide a penalty in the case of welding that is done after the adoption of these regulations, taken in connection with the date at the bottom of page six, and then I believe that the report of the committee will not be subject to the objection raised by Mr. Fuller. Autogeneous welding is one of the most useful processes we have now in railroad work, but it has come near being discredited, due to the inefficiency of the operator.

We have been attempting to do things by means of autogeneous welding which we ought not to do, and I think in the interest of safety as well as economy, that considerable of that work might be reduced, and the rest of it more carefully supervised, particularly with respect to the efficiency of the operator.

Mr. Fuller: I am glad to have had pointed out my misinterpretation or misunderstanding of the paragraph referred to. I have no objection to the rule if it applies to welding after the date set.

(At this point, Mr. Tatum called attention to errors regarding truck equalizers and top short angle, which should be top chord angle.)

Mr. Fuller: I would like to make a motion that the report of the committee be adopted, leaving in the building up of flat spots on wheels. I would like to see the word "electric" used in connection with welding, and also request the committee to put into the report a section relating to the building up of collars on axles.

H. C. Oviatt (New Haven): I would like to get straightened out on the question whether the committee experienced any trouble in building up flat spots where the thickness of tread was more than one in. above the limit of wear groove.

Mr. Thompson: The allowable limit of running the tire would be about one in. It was not considered good practice to try to weld a truck member, when it is weak, if it is under one in. thick.

H. C. Oviatt: As I read this, it says this is permissible when the thickness of the tread is one in. or more above the limit of wear groove.

Mr. Thompson: We considered anything below one in. was not worth it anyway.

H. C. Oviatt: Was there any experiment made with tires more than one in.?

Mr. Thompson: A great many, both by the electric and acetylene processes.

H. C. Oviatt: They were satisfactory?

Mr. Thompson: No, they were not satisfactory; that's the reason we backed up on it.

Mr. Kleine: This committee has been continued from year to year, and it has finally presented a report which I think we can all go along with. There are requests for certain additions to the report, but rather than adopt them on the floor or read them into the report of the committee, it would be better to continue the committee for another year, and let it look into the proposition of welding collars on axles, welding flat spots on wheels, and also the welding of couplers. I amend Mr. Fuller's motion that the report of the committee be accepted as read by the chairman and referred to letter ballot, and the committee continued to report on the items which were brought out in the discussion.

Mr. Gaines: Before that motion is put I would like to have the vote on Mr. Fuller's original motion. The building up of flat spots is not an experiment; it has been going on for years. It is common practice and good practice, and as long as we can reclaim a whole lot of material, let those that want to do it do so.

Mr. Kleine: This would in no way stop any road from continuing its present practice, but I don't believe that the Association should recognize it as an accepted practice until the committee has had an opportunity to go into it further. I would refer the members to the report of Mr. Miller on Autogenous

Welding, that appears in the 1918 *American Engineer*, which absolutely condemns the practice. That was a very carefully considered report, and, therefore, I don't think we should take any precipitate action.

Mr. Gibbs: I would like to ask the chairman of this committee, referring to paragraph four of page four, would it be a very difficult job to introduce into this report drawings of typical side frames and bolsters, and indicate the parts that should not be welded. I think that would clear up the ambiguity. You have a pretty clear idea of the parts that should not be welded; would it be much trouble to do that?

Mr. Thompson: That is a very good suggestion, Mr. Gibbs. It would not be much trouble at all.

Mr. Fuller: Do I understand that the amendment carries with it the two suggestions that I made? My motion was to reinstate the paragraph covering the welding up of flat spots and also adding to the report the building up of collars on axles. Does your motion include those, or not?

Mr. Kleine: My motion eliminates those two items, and simply defers them for further investigation for the committee to report upon next year.

Mr. Sillcox: One thing to consider is the number of cars which are going to be tied up in this country on roads which are isolated and have to move equipment, where you have to weld the arch bars and the truck side frames. Some roads weld these frames and paint them. We had a train wrecked the other day that was one of the worst disasters we faced this year, and the train had passed four inspection points. The truck frame had been welded and thoroughly painted and the best inspector in the world could never have detected that condition. We can't get arch bars to points way out in the mountains on a 12,000 mile railroad, unless we tie the car up for two or three weeks. The question of whether we would render a bill for a welded arch bar should be brought up, or some explanation should be given how this would be included in the rules and applied. If the committee is to carry on its work it should be prepared next year to tell us how that would be controlled.

Mr. Tatum: I don't quite understand Mr. Sillcox. I would like to ask him if he thinks we should continue welding side frames and arch bars, or whether we should discontinue it.

Mr. Sillcox: I don't say that the universal practice is good, but there are cases where you have to weld the arch bar. If you have the car in a big shop, where you can put a new arch

bar in, that is the thing to do; but if you have a car 200 or 300 miles away from a point where you can obtain the proper arch bar? You have to keep the car moving somehow, and you are going to tie up a world of cars this way if you have to tie up to put in new arch bars.

Mr. Tatum: It would be far better to tie up a car than to allow it to go out on the railroad and tie up many more cars and destroy the property of the railroad, and tie up the traffic.

Mr. Gaines: I would like to ask Mr. Thompson if the committee's report bars the welding of arch bars in a blacksmith fire. We are talking of two things, the welding by autogenous process is one, but it does not say the arch bar must not be welded in an open blacksmith fire in the old way.

Mr. Thompson: Perhaps we don't say that, but that is what we meant; it should not be welded at all.

Mr. Fuller: This Association should go on record as absolutely prohibiting the welding of an arch bar, either in a blacksmith shop or any other place.

The Chairman: Any further remarks? If not, the amendment is before you. Will you please state your amendment again, Mr. Kleine?

Mr. Kleine: That the report of the committee, as read by the chairman, be adopted, and submitted to letter ballot for adoption as recommended practice, and the committee continue to consider the question of welding of collars on axles, the welding of flat spots on wheels, and the welding of couplers.

Mr. Tatum: Do I understand that motion to intend to stop the building up of solid flat wheels during the period that this investigation is going to be made?

Chairman: No.

Mr. Kleine: You can use your own option about that in the meantime; simply not recognizing it as recommended practice.

Mr. Fuller: Evidently there is some confusion here. I asked Mr. Kleine, who seconded my motion, whether or not that left out, as the chairman read, on page 4, the paragraph "Flat spots on rolled steel wheels and tires, if thickness of tread is 1 in. or more above limit of wear groove." Now, Mr. Kleine says: "The report as it stands." To make this clear, I think the members should have both motions, and my motion was to reinstate this item and also add into the report the building up of collars on axles.

The amendment was put to vote and carried.

## The Report of the Committee on Couplers

R. L. Kleine  
Chairman

WITH THE ADOPTION, last year, of the details, such as contour line, design of 6 in. by 8 in. shank, etc., for the M. C. B. Standard *D* coupler, the duty assigned to the committee to present to the association a one standard coupler has been completed. To realize the benefits of this work it is essential that the coupler be placed into general use as soon as practicable. The design has passed the experimental stage and the coupler manufacturers are in a position to furnish the coupler in any quantities desired.

To accomplish the universal use of the standard coupler, the committee recom-

mends the following program: (A) Make it mandatory that all new cars built after a certain date be equipped with the M. C. B. Standard *D* coupler with 6 in. by 8 in. shank. (B) Make it mandatory that after the present stock of 5 in. by 7 in. couplers is used all future renewals will be made with the M. C. B. Standard coupler with 5 in. by 7 in. shank.

NOTE.—On existing cars equipped with 5 in. by 5 in. shank couplers, the present type of coupler should be maintained except where cars are

changed in the draft arrangement when provision should be made for applying either the 5 in. by 7 in. or the 6 in. by 8 in. shank M. C. B. Standard *D* Coupler. It is impracticable to apply the standard type *D* coupler to the 5 in. by 5 in. shank.

In order to carry out this program the committee recommends the following changes in the M. C. B. Rules of Interchange for Freight Cars: (A) Add the following paragraphs to Rule No. 3:

I. Cars built after June 1, 1920, will not be accepted in interchange unless equipped with 6 in. by 8 in. shank M. C. B. Standard *D* couplers.

II. Existing cars, equipped with 5 in. by 7 in. shank couplers of the present types, when requiring coupler renewals, shall have 5 in. by 7 in. shank M. C. B. Standard *D* couplers applied. This rule to be effective when present stock of new and second-hand 5 in. by 7 in. shank couplers has become exhausted.

III. Existing cars equipped with 5 in. by 7 in. shank couplers shall have the existing type of couplers maintained in repairs. Where changes are made in the design of the draft arrangement, provision should be made for the application of either the 5 in. by 7 in. or 6 in. by 8 in. shank M. C. B. Standard coupler.

### Uncoupling Attachments—Revision of Standard

The General Committee instructed the Coupler Committee under date of February 25, 1919, to consider revising the standards for the uncoupling arrangements shown in the Master Car Builders' Association Standards, Sheet 19-B, with a view of providing a standard in accordance with Paragraph (m) of Rule 3 of the 1918 Code of Interchange Rules and with the United States Railroad Administration's standard.

Rule 3 (m) reads as follows: Cars built after January 1,

1919, must be equipped with coupler operating lever connected direct with coupler lock or locklift without the use of links, clevises or chains. The United States Railroad Administration Standard reads: Coupler operating device to be of the top operating type without the use of clevises, links and pins; that is, to be direct connected to the locking-block. Apparatus to be in accordance with condition drawings. United States Railroad Administration, Division of Operation, Mechanical Department Circular No. 8 reads: Coupler operating device to be of type directly connected to coupler knuckle lock without use of clevis, link, chain or pin and to be interchangeable with operating device on United States standard cars where possible. United States Safety Appliance Standards provide for uncoupling levers to be either single or double, and of any efficient design with prescribed dimensions for various types of uncoupling levers including those which employ clevises and link, and provide penalties for uncoupling levers not conforming to the detailed specifications.

The M. C. B. Standard *D* coupler makes provision for both top and bottom operation, the latter being necessary for cars with low height of floors from rail and where it is desirable to keep all portions of the uncoupling arrangement below floor line.

The object of changing the standard is to provide an uncoupling lever that is entirely connected to the locking-block or locking-block lifter and avoid the defects existing in levers which employ clevises, chains, pins and cotters. On account of the United States Safety Appliance Standards providing certain specifications for the various types of uncoupling levers used, it is necessary to retain these specifications in the standards. It is also desirable to retain the bottom connection for certain cars that require it. The types of uncoupling levers directly connected to the locking-block or locking-block lifter are covered by letters patent which, under the rules, prevent adoption of any specific design. It is, therefore, the suggestion of your committee to provide for the uncoupling rigging directly connected to the locking-block or locking-block lifter by making the following changes in the standards: 12. (A) Plate M. C. B. 23-A. Eliminate the uncoupling attachments (links, clevises, pins and cotters) shown on this plate. (B) Plate M. C. B. 19-B. Add a heading over the cuts, reading: "For Existing Cars Only." Add the following to the right of the cuts: "For New Cars and Application of New Design Uncoupling Levers to Existing Cars." Coupler operating device must be of a type directly connected to the coupler knuckle locking-block or locking-block lifter without the use of clevises, links, chain or pin and must conform to the detailed specifications prescribed in the United States Safety Appliance Standards. (C) M. C. B. Proceedings, 1918, Page 607, Heading: Change Recommended Practice to Standard.

On Page 607, eliminate the paragraph at the bottom of the page relating to chain connection. Page 608, eliminate the last sentence in the first paragraph reading: Details of uncoupling rod chain are shown on sheet M. C. B. 23-A. Page 608, add a new paragraph after the second paragraph at the top of the page, reading: In 1919 the standard for uncoupling levers for new freight cars and application of new design uncoupling levers to existing freight cars specified that the coupler operating device must be of a type directly connected to the coupler knuckle locking-block or locking-block lifter without the use of clevises, links, chain or pin and must conform to the detail specifications prescribed in the United States Safety Appliance Standards.

(D) 1918 Proceedings, Page 553. Add a paragraph after the second paragraph at the top of the page, reading: In 1919 the Standard for Uncoupling Levers for new freight cars and the application of the new design uncoupling levers to existing freight cars specified that the couple operating device must be of a type directly connected to the coupler knuckle locking-block or locking-block lifter without the use of clevises, links, chain or pin.

(E) M. C. B. Proceedings 1918, Plate B, Safety Appliance Standards for uncoupling levers, following Page 574: Add the same notes as provided for Plate M. C. B. 19-B and covered in foregoing paragraph (B).

In conclusion the committee recommends submitting to letter ballot the following: Coupler operating device for new freight cars and the application of new design coupler operating device to existing freight cars must be of a type directly connected to

the coupler knuckle locking-block or locking-block lifter without the use of clevises, links, chain or pin and must conform to the detailed specifications prescribed in the United States Safety Appliance Standards.

The report is signed by R. L. Kleine (Chairman), Pennsylvania; F. W. Brazier, New York Central; F. H. Stark, Montour; E. J. Brennan, Chicago, Milwaukee & St. Paul; J. W. Small, Atlantic Coast Line, and J. A. Pilcher, Norfolk & Western.

Mr. Kleine: You will note that we don't specify any given date, for the reason we desire to give the railroads an opportunity to use up their present stock of couplers, either new or second-hand. I have an inquiry from one of the members in regard to the specification for uncoupling levers. It is understood that the recommendation for uncoupling levers simply relates to the connection of the uncoupling lever to the locking block, or locking block lifter, and does not take in any other part of the uncoupling lever.

(Mr. Tollerton occupies the Chair, during absence of Mr. Chambers.)

Mr. Tatum: Mr. Chairman, I note the recommendation at the conclusion, "your committee recommends submitting to letter ballot the following: 'coupler operating device for new freight cars and application of new design coupler operating device to existing freight cars must be of type directly connected to coupler knuckle block or locking block lifter without use of clevises, etc.'" I thought that if the committee gave consideration to requiring that the standard that it has recommended be adopted on cars receiving a change in the device, why not extend it a little further, and say, "when new operating devices on the existing cars are manufactured, that they be made to conform with the new standard." Why should we perpetuate the old device.

Mr. Kleine: This is a matter of interchange, interchange could not control the manufacture, but they can control the application.

Mr. Tatum: The idea that I want to bring out is that a number of the railroads are manufacturing the old device, perpetuating the old existing trouble. In manufacturing the old device the railroads manufacturing it are making themselves liable to frequent penalties because the device is not always found operating, and I believe the sooner we understand the conditions and get away from the old device and put in a device that will prevent these violations of the safety appliance law, the better off our railroads will be, and the more our men will be protected.

Mr. Brazier: It would seem to me after all the arguments that have been made in years gone by and with the reports of the Interstate Commerce Commission inspectors showing violations—there have been more penalties attached to the system of the old method of chain clevises, and if you keep amount of it very carefully, you will find you are spending thousands of dollars a month in maintenance. The average road that is spending money on equipment today should put in the new uncoupling device in the reclamation work as well as in the new care.

Mr. Gaines: I agree with all that has been said about incorporating something of that kind, but I don't think you can put it in that paragraph because this is an interchange.

Mr. Kleine: I may explain that the report covers two devices; one, the interchange, and the other the recommended practice. In the recommended practice, your recommended practice would read this way: "Coupler operating device for new freight cars and application of new design coupler operating device to existing freight cars." It is covered right there.

Mr. Gaines: There are two distinct things we have here: one is a recommendation of letter ballot relative to the couplers; then, if I understand it, the committee also makes a number of recommendations for recommended practice in addition to that. I move that the matter be accepted and referred to letter ballot, both questions.

Mr. Tatum: I don't quite understand how this is going to be referred to letter ballot. Is it going to be referred by letter ballot for the roads to vote whether or not the manufacture of new uncoupling operating devices for old cars in existence is to be in accordance with the new recommended practice?

Mr. Kleine: Inasmuch as this is a change in the standards, it should first be approved by letter ballot, and then the change made in the Interchange Rules.

The motion was then put to vote and carried.

incorporated from a suitable framework with provision for applying different draft gears. The weights may be varied up to 300,000 lb. as found desirable. It was the purpose of the Draft Gear Committee to use this machine in tests conducted by it, but on account of the war, the machine has not been built.

On June 7, 1918, C. B. Young, Manager, Inspection and Test Section, Division of Operation, United States Railroad Administration, advised it is the desire and intention of that section to make an extensive test of draft gears to determine what a draft gear should be, and also the value of the draft gears now on the market measured by the ideal standard, and invited suggestions and recommendations of the Draft Gear Committee, draft gear manufacturers and railroad officers. The committee acted upon this invitation and placed at the disposal of the government all the data and tests that had been collected, as well as their views in connection with the tests to be conducted. After outlining their plan of procedure, the Inspection and Test Section of the United States Railroad Administration conducted tests of draft gears on the static and drop test machines, for the purpose of calibrating the gears used in the cars at the Symington testing plant, which were started April 10, 1919, and to which the committee has been invited.

In order to avoid duplication of work and entailed expense, this committee has suspended making any tests of draft gears, but will work in close harmony with the United States Railroad Administration, Inspection and Test Section, and thus have available the results of these tests.

The report was signed by R. L. Kleine (Chairman), Pennsylvania; Prof. L. E. Endsley, University of Pittsburgh; W. E. Dunham, Chicago & North Western; J. R. Onderdonk, Baltimore & Ohio; A. R. Kipp, Minneapolis, St. Paul & Sault Ste. Marie; G. W. Rink, Central of New Jersey; J. C. Fritts, Delaware, Lackawanna & Western; R. D. Smith, Boston & Albany; A. M. Darlow, Buffalo & Susquehanna, and H. C. May, Chicago, Indianapolis & Louisville.

### Discussion

Mr. Kleine: I may say, subsequent to describing the testing machine at the Rochester plant, that this description is prior to the time that the U. S. R. Assn. test section took up the work. It has added considerable to the machine which brings it up to date. Mr. Kadel, who is the engineer in charge of the tests at Rochester, is here, and I believe we should hear from him on the progress of these tests.

A motion to accept the report was carried.

Mr. Kadel: In taking up the work of testing draft gears for the Railroad Administration, we have given consideration to all of the methods of testing that are in vogue, and in assembling cars for testing, we put them through all of the recognized tests that might show any results, and in our tests, at this time, we have 16 different types of draft gears. These will, undoubtedly, be added to as there are several more being considered, and I think the total would be about 20 when we complete the program. The gears were first assembled at Baltimore, and were given their static tests, a 9,000 lb. drop test on solid anvils. On Mr. Onderdonk's gear-testing machine the gears have been carefully calibrated to see just what results they show there, and we have made destruction tests in testing the gear under the 9,000 lb. drop test. We know just what it takes now to first start destruction of any gear under that test. The gears were then taken to Rochester and are now being carried through tests in the Rochester plant of the Symington Company, and at that plant we are recording the exact striking velocity, the exact impact velocity, and when I say exact velocity it means the velocity at the instant of impact, which is somewhat different from the average velocity over a long length of track.

We get the exact amount that the draft gear closes. We are taking each type of gear, first running two tests with one of each type on each of the two cars that are there; then we take the gear out of the striking car, and put in a solid buffer of 24 sq. in. area, and we run a test with another gear in the struck car. In the standing car we get some additional new action on the draft gears, whether there be one or two gears. We get the exact amount that these draft gears close at different speeds, and we get a different measure of cushioning value. When we say cushioning value, we do not mean absorption, because a spring draft gear, whatever its capacity, has just as much a cushioning

action as a traction gear that may absorb all of the shock. They are two entirely different things. But we are also getting the absorption, because the absorption is a very important feature. The absorption spells absence or presence of what we call recoil, your kick-back in cars, and we are getting the cushioning value and the effect of recoil also in impact tests. We are able to tell you just what the gears do as they close, and how long it takes them to close, how far the cars travel while they are closed, how long it takes them to open—that is, what period of time, and how far the cars travel while they are opening. We tell you how much the striking car was decreased in speed by the closing of the gear and how much it was decreased by the opening of the gear. We tell you on the struck car how much its speed was affected by the closing and how much by the following release of the gear. There is one class of tests that properly should precede all of these that we have not been able to even begin, and that is the tests on pulling, the tests that are really road tests of draft gears, and should properly precede all other tests in the determination of an ideal draft gear. Draft gears, first of all, must hold cars together, they must enable us to handle cars in trains, and then, after they do that, we must get just as much cushion value and absorption value as we can get to keep destructive loads off the sills.

Briefly, that is the work going on at Rochester. The Draft Gear Committee is taking an active part in that work and have a representative there at all of the tests. Mr. Slaughter of the Pennsylvania Railroad has been named by the committee to attend all of these tests, and is in constant attendance there. The Symington Co.'s plant has always been a valuable testing plant for draft gears. The original plant of the Symington Company had means for measuring a draft gear closure, the distance the cars traveled, and a seismograph on each gear. There has been added to that a double drum, alongside of the track, setting on a base on the ground. That track is stationary with respect to the ground. The struck car is, what we term the B car, ordinarily the standing car, and it has means by which a pencil on the car draws a line on the drum. The other car drops down an incline, and as it approaches the first of these two drums it picks up a pencil there and draws a line on that drum, at the same time that the B car is drawing its line on the other drum. The two drums are running on a common shaft at exactly the same speed, and we have a very simple and very accurate means for marking the cars, so that we can time them together, both lengthways to the drum. When this pencil is used we can time them exactly around the drum, so that we know at any point around the drum just exactly where the two pencils stood, and from the two drums working on the same shaft at the same speed, we know exactly what each car was doing at any instant. We can trace the whole path and the whole action of the two cars all during that impact. There is only one way to really measure the path of the travel of any body. If it is a resilient body we would have to take the record from the center of the mass and we would have to apply the force to the center of the mass, but unfortunately we cannot do that. We could approach it, but we can never obtain it absolutely. So we are always going to have some resilience, some elastic yield in the car body, and that makes trouble for us, but we get mighty good records in spite of that.

We found that if you take a draft gear and test it under the 9,000 lb. drop, for example, we get practically an unyielding testing device. We have a base that we take for granted is unyielding, and then we have a weight that is pretty nearly unyielding also, and we drop it on there. If a gear has any tendency to chatter as it goes in you would not hear the chattering, and would not see it. The weight will prevent your discovering the chatter, but if you have the yielding car the little yield of the car striking is just enough to leave a chatter as it goes in. It is a little different thing from what any of us in the work there anticipated because we did not appreciate that that little yield alone might allow the chatter that the solid weight won't decrease and won't detect. I think that gives a description of the test plant.

G. H. Wood (A. T. & S. F.): I understand the report of this committee is merely a report of its investigations. There is no recommendation or anything of that sort in it, and the committee is to continue their investigations along the lines of

draft gear. It is a standing committee. The gentleman said there have been no tests made to determine the pulling strength on couplers, and as that is where we have the greater part of our coupler failures, or draft gear failures I would like to suggest that if it is possible to make any tests that will determine the pulling strength in the draft gear and the draw bars that the committee try and determine the relative strength between the coupler, draft gear and knuckle parts, so that any failure that may occur will occur throughout the knuckle, knuckle pins, or those parts that can be reapplied readily, because if the knuckle and draw bar is made strong enough, and it seems to be the general opinion that it ought to be made stronger, we are simply going to pull the draft gear out of the car. We are never going to stop breaking couplers and draft gears, and things of that kind, but the committee is trying to evolve some means of reducing the failures and the shocks due to slack action. In doing this they might evolve a draw bar and knuckle parts that will give us knuckle failures instead of draft gear and draw bar failures.

Mr. Kleine: The present M. C. B. standard "D" coupler is designed to fail through the knuckle hub. It is recognized that that is the portion of the coupler which is most easily renewed. Following that up, the draft attachment should, of course, be stronger than the knuckle hub. The test for the knuckle hub now is 175,000 lb.—within the elastic limit of the cast steel—therefore, your attachment should be stronger than that, and, so far as the attachment of the draft stops to the sills are concerned, it is rather a simple matter. So far as the draft gear itself is concerned, there isn't so much trouble on the road from the failure of the draft gear as it is from the failure of the draft gear that results from the failure to properly function, and Mr. Cadell's explanation in making these road tests was simply to ascertain how a draft gear should function in order to ascertain how a draft gear should function in order to take care of the proper starting and stopping of trains.

Mr. Gaines: I was present at some of these preliminary tests at Rochester, and have seen the apparatus, and understand it to a certain extent. I think they have apparatus up there that is going to give us very definite and very fine information on draft gears when they get the whole series completed.

A motion that the report of the committee be accepted and the committee continue its work was carried.

Pennsylvania General Utility Express and Baggage Car

## P. R. R. General Utility Express and Baggage Car

Capacity of 70,000 lb. Obtained in Design Meeting Requirements of Universal Passenger Service.

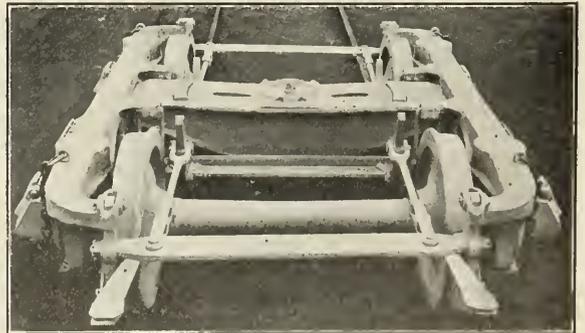

FROM AN ECONOMIC STANDPOINT one of the most interesting track exhibits this year is the Pennsylvania class B-50 general utility express and baggage car, which will be found on the Georgia Avenue tracks near the boardwalk. This car was designed primarily to handle the traffic now generally moved on the Pennsylvania in 50-ton express box cars of the X-25 class.

keeping with the character of the traffic it is primarily intended to handle, the greater range of usefulness has been effected by providing two doors of suitable width of opening on each side, end doors of standard width for

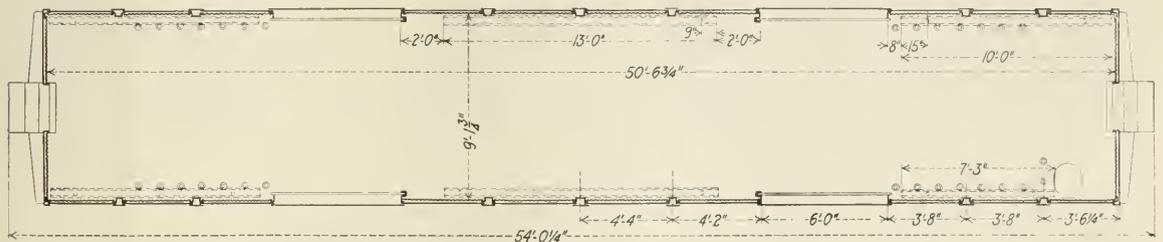

Semi-Passenger Truck for the General Utility Express Car

The design has been modified, however, to make it available for baggage, mail storage and parcels post service, as well as for some classes of perishable shipments. But while it may be pooled with other passenger equipment and moved freely in passenger service, it is much

End View of the Truck

communicating between cars in passenger service, steam heat and electric lights, and a suitable ventilating system which may be operated from the outside when the

Floor Plan of the Pennsylvania General Utility Express and Baggage Car

lighter, can be built for considerably less money, and has a much greater load capacity than standard passenger equipment. Furthermore, with the addition of running boards and ladders it will meet the requirements of the Interstate Commerce Commission for freight service.

While retaining a weight and first cost which are in

car is moving under seal. A modified design of freight truck has been used in order to make the riding qualities of the car suitable for high speed passenger service and the car is equipped with the Westinghouse UC brakes generally used on Pennsylvania Railroad passenger equipment.

The car has a length over butting faces of 54 ft. 1/4 in., is 9 ft. 1 1/8 in. wide over the eaves and has a maximum height above the rail of 13 ft. 4 5/8 in. Inside, the car is

which the load is transferred to the center construction at the ends of the car and at two intermediate points between the truck centers. The center sills are 15-in., 40-lb. channels and the side sills 6-in. by 4-in. by 1/2-in. angles.

The Interior of the Car

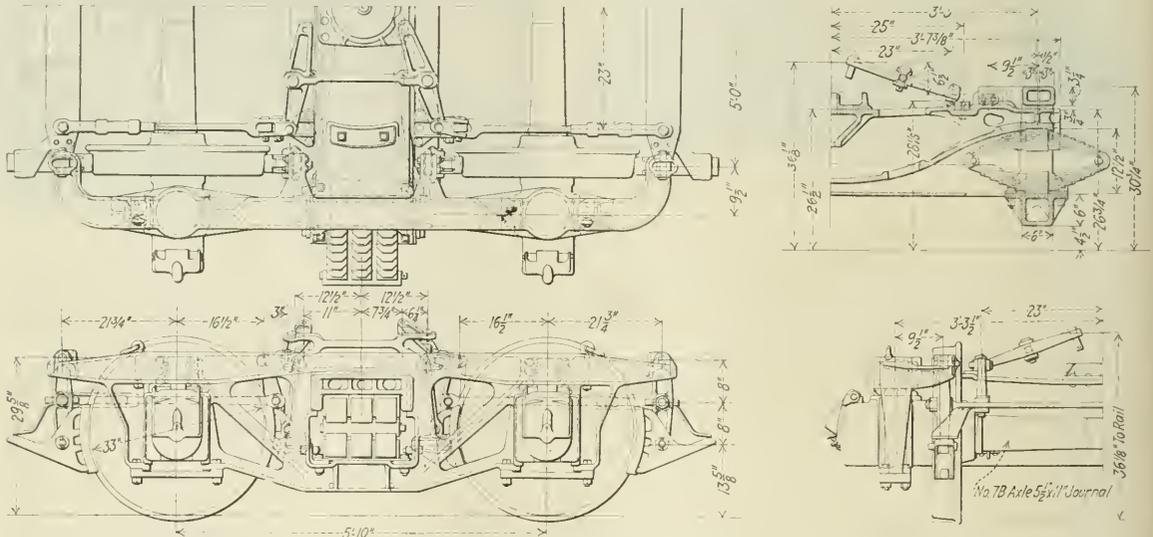

50 ft. 6 3/4 in. long, 9 ft. 1 3/4 in. wide and 10 ft. high at the center of the car. The trucks are 36 ft. from center to center and have a wheel base of 5 ft. 10 in. The car has a weight (estimated) of 72,000 lb., which gives it a

The Body Construction

The frame of the car body consists of corner posts of 3 1/2-in. by 3 1/2-in. by 1/2-in. angle section, end and side door posts of 4-in., 7.25-lb. channels and pressed steel intermediate side posts of U-section, flanged and riveted to the inside of the 1/8-in. side sheets. The channel openings on the outside of the posts are closed by butt strips eight inches wide and the edges of adjoining side sheets are riveted between the butt strips and the post flanges. The top member of the side frame is a 4-in., 10.3-lb. Z-bar, the outside flange of which extends down over the top of the side sheet. A belt rail of 2 1/2-in. by 2-in. by 1/4-in. angles is fitted between the side posts and riveted to the side sheets on a line 4 ft. 3 3/8-in. above the floor.

The car is fitted with the A. R. A. steel box car roof, which is carried on U-section carlines and is attached at the sides to the vertical flange of the Z-bar side plates and at the ends to a pressed steel connection angle flanged over the top of the end sheet, the contour of the vertical flange of which is shaped to suit the slope of the roof.

The car has a double floor, the lower course of which is of 1 3/4-in. yellow pine laid transversely and secured to the top of the side sills and the top center sill cover plate by 3/8-in. carriage bolts with countersunk heads and riveted ends. The sub-floor is surfaced with 3/4-in. maple flooring laid longitudinally. Drain troughs of 3/16-in. steel are let into the floor along the sides of the car, except at the door openings. Two drains open through the floor of the car from each of these troughs.

General Arrangement of the Truck

loading capacity of about 70,000 lb., limited by the requirement that the maximum for the total load be about 140,000 lb., or 35,000 lb. per axle.

Underframe

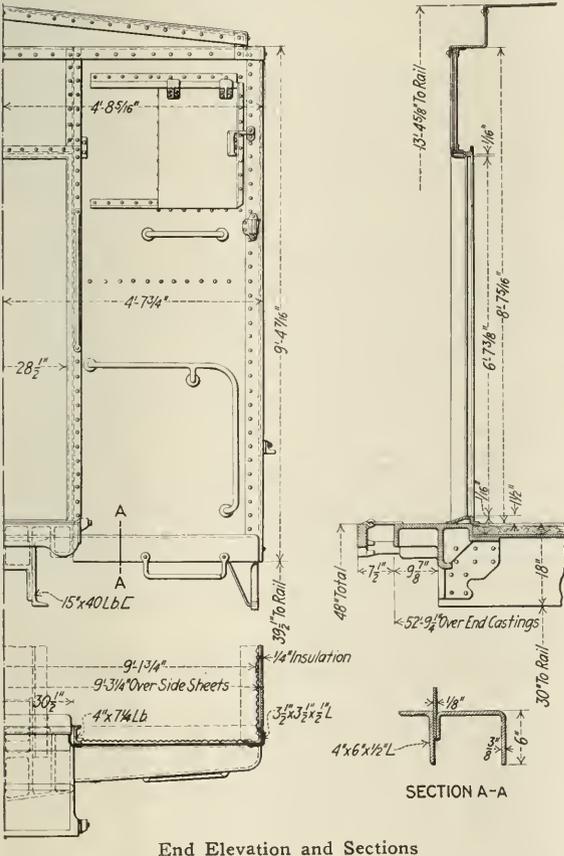

The car is built on the Pennsylvania standard steel passenger car underframe, which is of the center construction type with center sills of uniform section, in

The sides, ends and roof of the car are insulated. The side and end insulation is composed of eight layers of asbestos paper, covered on each side with burlap and applied to the inside of the sheets with freight car color in a semi-paste form. Corrugated iron lining is applied inside the insulation and is held in place at the top by 2 1/2-in. by 2 1/2-in. by 1/4-in. angles riveted to the web of the side plates, 1 1/2-in. by 1 1/2-in. by 3/16-in. angles fast-

ened to the floor with No. 12 wood screws and a special double angle of pressed steel fitted over and riveted to the horizontal flange of the belt rail. The roof is insulated with ground cork applied to the sheets with paint.

There are two doors on each side of the car and the center of each door opening is 13 ft. 9 3/8 in. from the end of the car. The door openings are 6 ft. 0 in. wide, which is the same as for doors on standard baggage cars. The end door openings are 2 ft. 5 1/2 in. wide. To meet the requirements of express service all doors are fitted with locks on the outside, and to suit the requirements of baggage service, are also provided with auxiliary locks which cannot be operated from the outside. In order to facilitate cleaning, the side door guards are made of one-inch wrought iron pipe.

Ventilator openings are placed in the car body, one in each end and two in each side, near the corners. These openings are 15 in. wide by 27 in. high and are framed by 2-in. by 2-in. by 3/16-in. angles, riveted to the inside of the sheets, to which the ventilator frame is attached. The ventilator itself is made up of horizontal slats placed one inch apart and inclined downward and outward. A

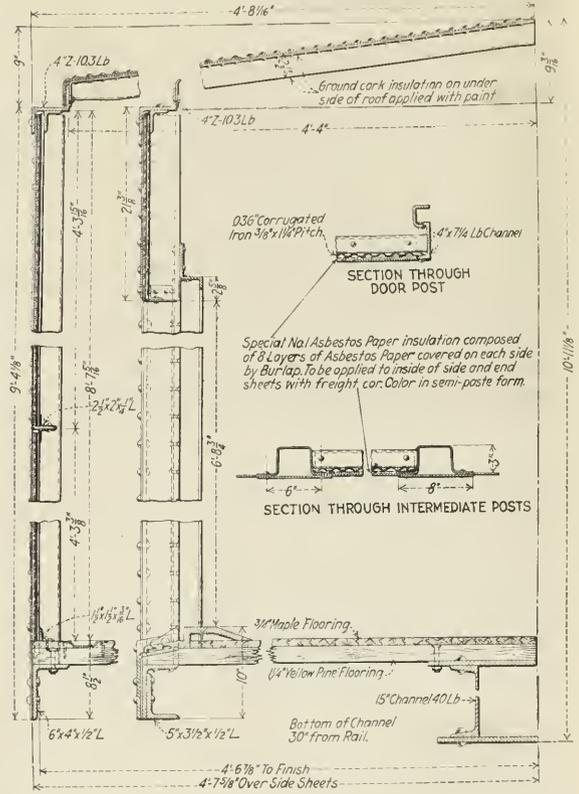

End Elevation and Sections

heavy galvanized wire screen is placed outside of the ventilator slats and welded to the frame at the top and sides, with a 3/8-in. opening at the bottom for draining. The ventilators are closed by sliding steel doors placed on the outside of the car.

The trucks are basically of freight car design, differing principally from freight car practice in the use of pedestals, and provision for the insertion of coiled springs between the truck side frames and the top of the journal

boxes. The truck side frames are unit steel castings, the members of which are disposed in truss form. The top or compression members and the bottom members under the spring seats are of box section with coil spring pockets above the journal boxes. The two frames are connected by a flat spring plank secured to each frame by four bolts, and the load is delivered to the side frames by a cast steel bolster resting on three-unit, full elliptic springs. The wheels are 33 in. in diameter, mounted on

Details of the Car Body Construction

passenger car axles with 5 1/2-in. by 11-in. journals, running in passenger car journal boxes. The trucks are equipped with clasp brakes and have a weight complete of 12,000 lb. each.

Five electric lights, supplied from an axle generator and storage batteries, are located along the center line of the roof of the car close to the ceiling, in order that they may be out of the way when the car is used in express or mail storage service. The car is fitted with standard steam heat equipment, with radiators along the side of the car protected by screens and a dry hopper is provided for messenger or crew service.

This car, in point of lading capacity, comes approximately half-way between a 50-ton freight car and a standard steel baggage car, a gain of approximately 30,000 lb. in capacity being obtained over that possible in the latter. In point of cost the car also comes approximately in the middle of the range between a steel box car and the standard baggage car. A wide range of usefulness is thus provided at a cost representing a substantial saving over the amount which would be required to produce standard passenger equipment.

## Special Guests

- Adan, John C., Superv. of Equipment, U. S. R. R. AD, Grand Atlantic.
- Agnew, S. H., M. M., River Terminal, St. Charles.
- Alexander, Verne M., Purch. Agt., C. & Alton, Ambassador.

MONEL METAL is an alloy of 60 per cent nickel, 38 per cent copper and a small amount of manganese or aluminum. It is tough and ductile and can readily be machined, cast, forged, annealed, rolled, soldered, brazed and welded. Monel metal is sold in rods, sheets, tubes or in cast form. It is used for parts requiring great strength, hardness and incorrodibility, such as pump liners, valve seats, bolts, studs, shaft nuts and caps, nails, screws, chains, etc.—*Machinery*.

BEEHIVE OVENS.—The continued existence of the wasteful beehive coke oven, said Secretary of Commerce Redfield recently, ought to be an offense against accepted business standards, just as higher business standards, will some day think it an economic offense to allow black smoke to escape from a chimney for lack of careful firing.

## Conventionalities

Mrs. Michael Quinn and sister, Miss Carroll, of Port Jervis, N. Y., are attending the convention with Mr. Quinn, who is general foreman car repairs of the lines East, Erie Railroad.

Juan Etenderson, General Locomotive Inspector, United Railways of Havana, and Juan Romaniach, Superintendent of Locomotives and Cars, Cuba Cane Sugar Corporation, Havana, Cuba

Did you ever see a broader grin than that on the face of Walter Johnson? There must be a reason and—we have it! Walter has been made assistant manager of the pneumatic tool sales of the Ingersoll-Rand Company.

F. W. Sargent, chief engineer of the American Brake Shoe & Foundry Company, was in action early. He has been in the ring at these conventions for more years than he will tell, but he still has the punch and the smile.

H. S. Irving and H. C. Delcher, Inspectors, Test Department Baltimore & Ohio Railroad

Ben Elliott, master car builder of the United Railways of Havana, Havana, Cuba, arrived Thursday with Mrs.

Elliott. They are registered at the Strand. Neither can vouch for Hale, reported overdue in yesterday's *Daily*.

George Musgrave is introducing his son, Howard G. Musgrave, who has recently been released from the Naval Aviation Corps. Mr. Howard Musgrave is joining his father in the service of the Star Brass Manufacturing Company.

E. E. Griest, formerly master mechanic of the Pennsylvania Lines at Fort Wayne, Indiana, and now assistant general superintendent of the Chicago Railway Equipment Company, is attending the conventions. He is quartered at the Traymore.

Frank Morrison, of the Mason Regulator Company, who has been prominent in past years in R. S. M. A. Committee work, has brought with him this year his daughter, Miss Lavinia. This is Miss Morrison's first visit to these meetings.

Frank De Wolff, assistant locomotive superintendent, Cuban Central Railway at Sagua La Grandé, Cuba, who is stopping with friends here, wishes to deny the fact that Sagua is not on a railroad. He states that it is on a good railroad and that the custom of the country is his—"my house is at your disposal."

Thomas L. Mount, who, for seventeen years, has attended these meetings as a representative of the Consolidated Railway Electric Lighting & Equipment Company, has, since May, been attached to the Electric Storage Battery Company, of Philadelphia. Mr. Mount is one of the pioneers in electric lighting for railway coaches.

Twenty-four hours late but still smiling, Colonel Savage, vice-president of the Pulverized Fuel Equipment Corporation, and party "blew in" to the Traymore Wednesday evening. It is whispered that "Old Maude," the Colonel's "benzine buggy" balked somewhere up the road when she found she was to travel all the way from New York to Atlantic City on pulverized fuel.

J. Snowden Bell, who has been a regular attendant at the conventions for many years, will be unable to attend this year. Several weeks ago he fell on the postoffice steps in Pittsburgh, Pa., breaking his leg near the hip. He is still confined to the Western Pennsylvania Hospital in Pittsburgh, but is getting along very well and expects to be moved to his home within a short time.

Burton Mudge, president of Mudge & Company, was an early arrival at the convention. Mrs. Mudge accompanied him but Burton, Jr., who has also been a consistent "conventioner," was forced to stay home to ponder

C. C. Hall, Master Car Builder, Cuba Railroad, Camaguey, Cuba

over college examinations. He expects, however, to arrive later in the week. Father and son Mudge are becoming a formidable golf team, and while no challenges have been issued, accompanying golf bags show preparedness to defend a good golfing reputation.

Compelled to remain at home on account of the illness of his wife, William O. Duntley, president of the Duntley-Dayton Company, regrets his inability to attend the conventions this year. He had made all arrange-

Left to right—Mrs. W. W. Lemen and Miss Catherine Lemen, wife and daughter of W. W. Lemen, Superintendent of Motive Power, of the Denver & Rio Grande. Dan Cunningham, Assistant Superintendent of Motive Power, D. & R. G., and R. H. Dyer, Supervisor of Car Repairs, U. S. R. A., Washington, D. C.

ments to be here. Vice-president Crawford A. Duntley, a son, will arrive Saturday. George Bardon, manager of the Philadelphia territory, is here, but this year Mrs. Bardon could not attend.

L. W. Schmitzer, of the Ingersoll-Rand Company, is attending the convention in a new capacity this year. He has just been made manager of the pneumatic tool department of that company at Chicago.

Chas. W. Allen, formerly with the motive power department of the Philadelphia and Reading and who later entered the supply field with L. J. Bordo, died at Reading, Pa., June 11th. Mr. Allen was the son of Geo. S. Allen, retired, who was master mechanic of the Philadelphia & Reading at Tamaqua, Pa.

Karl J. Eklund, who has attended all the conventions since 1910, is here this year with Mudge & Company, of which company he is general manager. He was formerly

use of his general utility industrial truck and delivered a large volume of material to the booths each day.

Frank T. Hyndman, who is now living at Cleveland, and who was associated with the Procurement Division of the War Department during the war, motored to Atlantic City with Mrs. Hyndman. He expects to remain here over Saturday and will then return to Cleveland, going back by a northern route which will carry him through New York and northern Ohio.

Fred S. Wilcoxon, a long-time convention attender, will be missed this year by his many friends. He is unable to attend this convention on account of his duties with the Fuel Conservation Section of the Northwestern Regional Director's Office. He has attended each year since 1910, having been connected with the Service Department of the Pilliod Company in the Western territory.

The Chicago, Milwaukee & St. Paul delegation this year includes two eastern railroad men who since the last convention have followed Horace Greeley's advice. They are H. R. Warnock and E. J. Brennan, who left the Western Maryland and the Baltimore & Ohio about two years ago. Contrary to the general belief Mr. Warnock and Mr. Brennan say they are not worrying about a surplus of locomotives and cars on the Milwaukee after July 1.

Nothing but an extremely important appointment could keep Robert F. Carr, president of the Deerborn Chemical Company away from the conventions. Unfortunately, the date of the convention this year conflicts with the commencement exercises at the University of Illinois. Mr. Carr is president of the board of trustees of that university which this year, will graduate more than 600 students. His duties in this connection make it absolutely necessary for him to be in Champaign.

R. S. Mounce, General Foreman Car Repairs, Erie, and J. T. Munroe, Shop Superintendent, Erie

associated with the Pilliod Company and is still representing its interests. Mudge & Company being western representatives for the Pilliod Company.

J. H. Gimpel, a supervisor of car repairs for the railroad Administration, with headquarters at Denver, Col., is accompanied by his wife and his oldest daughter, Bertha. It is hard to believe that Mrs. Gimpel is the mother of nine daughters. Mr. Gimpel reports that the crop conditions in the West are splendid and that the roads are rapidly getting their car equipment into shape to take care of the heavy traffic which will soon be upon them.

J. H. Killius, of the Baker R. & I. Company, gave a splendid account of himself on the Million Dollar Pier last week. When the congestion of express and parcel-post packages became acute he generously offered the

P. Balkoff, Assistant Chief, and (Right) S. Gourbonoff, Chief Inspector, Russian Mission of Ways and Communications

Mr. and Mrs. D. C. Noble are again at the Marlborough-Blenheim. Mr. Noble, who is president of the Pittsburgh Spring and Steel Company, has been attending these conventions for upwards of thirty years. It is only natural that he takes considerable pleasure in the

ever-growing success of the meetings, since for many years he was very active in the management, having at one period been treasurer of the Railway Supply Manufacturers' Association.

J. E. Mechling, superintendent of motive power of the St. Louis system of the Pennsylvania Lines West, with headquarters at Indianapolis, Ind., brings the regrets of W. C. Arp, former superintendent of motive power of the same lines, for his inability to attend the convention for the first time in years. Mr. Arp's host of friends will be sorry to learn of his indisposition and inability to be here this year. Mr. Mechling is accompanied by Mrs. Mechling and Miss Lois, their daughter.

It is good to see J. C. Currie on the pier. His railroad friends have missed him during recent months because of the fact that he retired from the Nathan Manufacturing Company sometime ago. The pull of the conventions, however, was too strong for him to resist, and he is attending as a guest of the Nathan Company. Mr. Currie has always taken an extremely active part in the affairs of the Railway Supply Manufacturers' Association and

**Sam Andrews, Mechanical Engineer, Seaboard Air Line**

was chairman of the Finance Committee of that organization at the 1916 convention.

William Owens, representative of the New York Air Brake Company at Buffalo, is at the Chalfonte. Mr. and Mrs. Owens have been attendants at these conventions for years and their many friends will learn with regret of Mrs. Owens' death about two months ago. Mr. Owens holds the distinction of being one of the engineers who took the Black Diamond over her maiden trip in May, 1897, his run being from Sayre to Buffalo. He has been with the New York Air Brake Company continuously since January, 1900, except for two years (1910-1912), when he was general air brake fuel inspector on the Lehigh Valley. He is also one of the charter members of the Traveling Engineers' Association and has attended its convention for twenty-five years.

Frank W. Furry, president of the Ohio Injector Company, who had been attending the conventions for years, died at his home in Chicago recently. It had been Mr. Furry's custom for a long time to come to Atlantic City on the Special from Chicago, and he followed the pleasant practice of providing himself with some fine California cherries which he passed around on the train.

William S. Furry, his son, who was associated with him in business and who has now succeeded him as presi-

**Andrew Chambers, Veteran Engineer, Pennsylvania Railroad**

dent of the company, continued his father's custom on this year's Special, and the crowd received its cherries as usual. The elder Mr. Furry had many friends among those who attended the conventions, who have greatly regretted to hear of his death.

Mr. and Mrs. W. T. Tyler, accompanied by their nieces, Misses Lucile and Veronica Ermatinger, arrived Wednesday evening, and are at the Marlborough-Blenheim. Mr. Tyler is director of operations of the Railroad Administration. The Misses Ermatinger are daughters of George A. Ermatinger, brother of Mrs. Tyler, who is connected with the mechanical department of the Railroad Administration, and who already was here at the convention. Mr. and Mrs. Tyler and their party paid their first visit to the exhibit on Wednesday evening, and were interested spectators. They probably will remain at least until Saturday, as Mr. Tyler is very anxious to give the exhibit a thorough inspection. The Tylers' only son, Harold, entered the United States Navy as a lieutenant when this country became involved in the war, and is now on the ship Mongolia, which is said to have made more trips carrying American troops and to have brought more troops home than any other ship. Mr. Tyler was greatly impressed by the attendance at the convention and by the magnitude and importance of the exhibit, and he is a good judge of anything pertaining to railroads, as he has been in the business ever since his youth, and rose from the ranks through all the grades of the operating department.

# New Devices Among the Exhibits

## Red Devil Pneumatic Rivet Cutter

THE RED DEVIL RIVET CUTTER shown by the Duntley-Dayton Company is a pneumatic tool designed solely to cut and back out rivets. The principle is simple—that of a plunger in a long barrel, driven by compressed air, striking a blow on the chisel head. It

The "Red Devil" at Work

will cut cold  $1\frac{1}{4}$ -in. rivets in an average of ten seconds, and 1-in. rivets are cut in from three to five blows.

The operation of the cutter is simple and requires no special skill. Three men are necessary to operate the tool. The operator takes the left side handle with his left hand and rocks the valve handle with his right. Another man holds the right side handle, while the third man holds the chisel on the rivet. Turning the valve handle up opens the air port, which instantly permits the

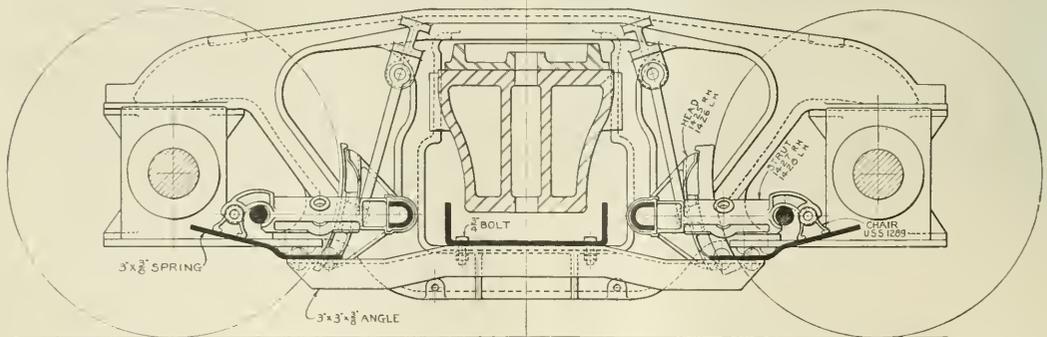

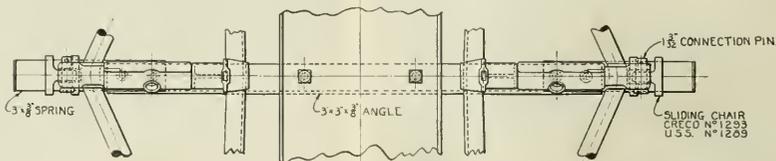

full force of the air to act on the plunger, driving it down the barrel and striking the chisel head. The valve handle is then thrown down to exhaust, and the plunger returns to the head of the tool ready for the next blow.

The force of the blow is entirely under control of the operator, and when the rivet is nearly off a light blow can be struck so that the rivets will not be thrown about with possible injury to persons nearby.

The valve head and nose piece are attached to the barrel by being forced on under 50,000-lb. pressure. With its 11-lb. chisel the Red Devil rivet cutter weighs 65 lb. It will give fairly good results with air pressure as low as 40 lb., and it will cut from 12 to 15 times as many rivets as can be cut in the same time by hand. The Duntley-Dayton Company, 1416 Michigan Avenue, Chicago, are sole distributors for the Rice Manufacturing Company, of Indianapolis, who manufacture the tool.

## A Recent Development in Brake Beam Supports

THE CHICAGO RAILWAY EQUIPMENT COMPANY, CHICAGO, is exhibiting at the convention a recent modification of the Creco brake beam support, which was applied to all the tenders on the Railroad Administration standard locomotives. The flexible spring in this design is used only under the chair at the end of the strut. This flexible element furnishes an adjustable support and is riveted to the end of a 3-in. by 3-in. by  $\frac{3}{8}$ -in. angle extending under the spring plank, which provides the maximum of safety in case the brake beam drops. This arrangement retains all the features of the former designs of the Creco third and fourth point supports, and is particularly applicable where a combination of long wheel base and heavy brake beam service is found.

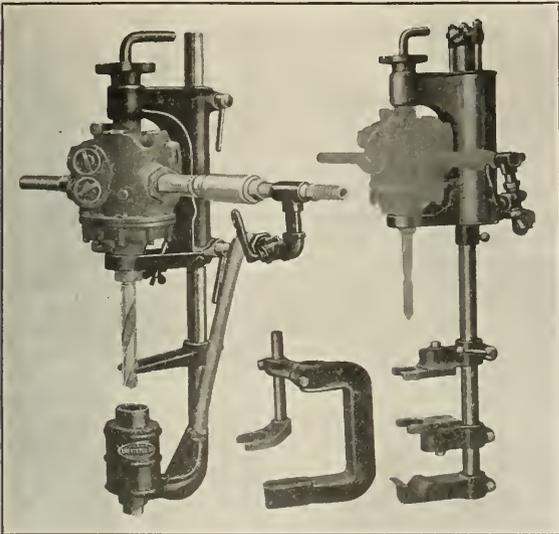

Latest Design of Creco Brake Beam Support

## Labor Saving Shop Tools

THE LIBERTY TOOL COMPANY, Baltimore, Md., is showing a number of new devices designed to effect time and labor saving in shop work.

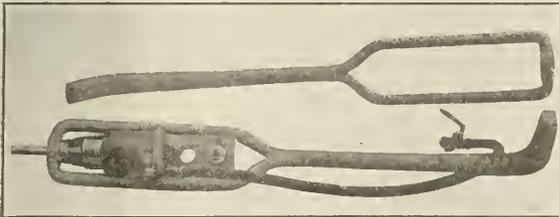

### Portable Drill Presses

A portable drill press, designed to fit any make or shape of air drill having a vertical motor, is especially adapted for drilling and countersinking flange and plate

Portable Drill Presses with Crowfoot (center) for Double Cylinder Press (right)

work, such as firedoors, flue sheets and door sheets. This device has a 2 3/4-in. pneumatic feed end and is equipped with a sliding head taking any work from 1/2 in. to 14 in.

Holding-on or "Dolly" Bar

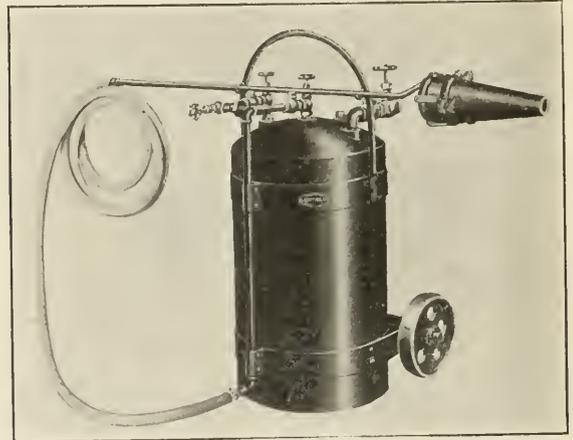

thick. It will drill holes from 1/2 to 1 5/16 in. and countersink up to 2 in. in diameter.

A double cylinder portable drill press with a crowfoot attachment is designed for any class of work and fits any of the pneumatic drills commonly used. It is equipped with a sliding head and a sliding table, has an 8 in. pneumatic feed and will drill holes up to 1 5/16 in. and countersink to 2 in. in diameter. It can be used as a radial drill press up to 18 in. in diameter of hole circle and the sliding head can be adjusted to take work up to 14 in. in thickness.

### Rivet Heating Furnace

A portable rivet heating furnace using oil as fuel is designed so that the point of the rivet may be heated to any desired temperature, while the head is heated only

to a cherry red or sufficient to readily conform to the work in the riveting operation. The top of this furnace is pierced with holes, through which the rivets are inserted, so that the point of the rivet is in the flame, while

Portable Heating Torch

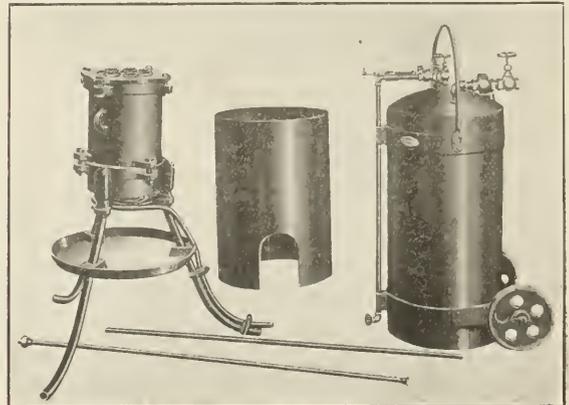

the rivet head rests on the outside or top of the furnace. The intensity and uniformity of heat may be regulated by means of a control valve.

### Portable Heating Torch

This apparatus consists of a fuel tank, a hose and a burner. The torch has one line of hose leading from the tank to the burner, which makes it convenient to handle in close places. This torch will heat to any desired temperature and may be used in the open air with excellent results.

### Holding-On Bar

This holding-on or dolly bar has a pneumatic clamping device secured in a rectangular frame which is part of the bar itself. The bar can be placed in position quickly and the recessed end tightly clamped over the rivet. It may be readily applied in close quarters and is especially designed for use in locomotive flue sheet riveting and

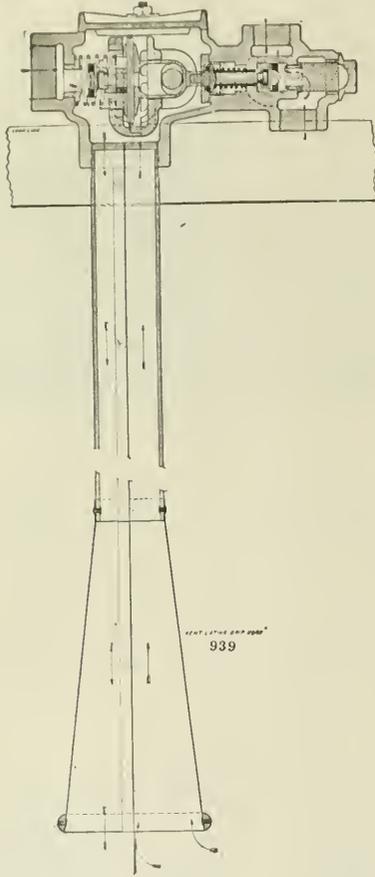

Rivet Heating Furnace

repair work. This company is showing a heading attachment for a riveting hammer, designed to rivet stay bolts and stay rods or countersink rivets and also a portable drill press for a close corner motor.

## Combination Pressure and Vapor Valve

PREVIOUS TO THE INTRODUCTION of the vapor systems most of the car heating arrangements were of the direct or pressure type, the radiation of which was sufficient for severe winter weather. Many roads have increased the piping in older cars from time to time in order to provide sufficient radiation for vapor heat. This was an expensive proposition, but by the introduction of the combination pressure and vapor valve shown in the illustration, to cars already equipped with the pres-

Sectional View of Combination Pressure and Vapor Valve

sure system, the advantages of the vapor system are obtained without additional radiation, and in addition the pressure system is available for the severest conditions. By the use of this valve, vapor can be used entirely on a car or pressure can be used entirely, or pressure can be used on the cold windy side of the car and vapor on the other.

It is stated that in the heating of cold trains in terminals pressure can be turned into the system, and the cars can be heated in much less time than with vapor, after which the vapor can be used. The installation of this valve on old equipment is said to be inexpensive and on new equipment the cost of its installation is claimed to be materially reduced because less radiation is required. This combination valve is said to weigh less than the ordinary vapor valve and the weight of the pipe and necessary fittings used in conjunction with

it is claimed to be one-third to one-half less than that required by the ordinary vapor system. The complete valve is of packless design, non-adjustable and so constructed that by the operation of the lever handle, either pressure or vapor is obtained in the system.

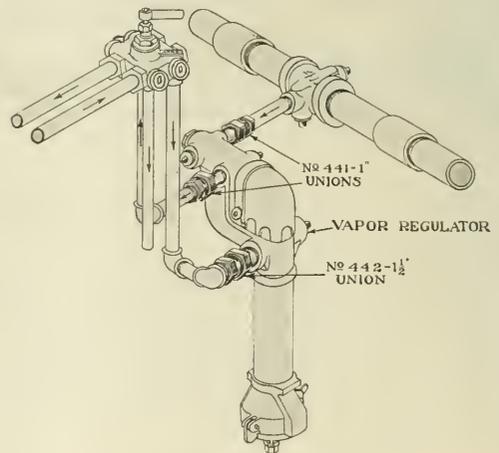

This system comprises a combination of vapor valve and steam trap arrangement for application inside of the car away from the danger of freezing. The diaphragm is located in the cradle, which is moved forward by a cam when the handle is set for vapor. In this position the expansion of the diaphragm is forward and the valve operates as a vapor valve. When the handle is set for pressure the cradle containing the diaphragm is moved backward. In this position the expansion of the diaphragm is set to the rear, or in the reverse direction to that when set for vapor; therefore, the vapor operating mechanism is held stationary in the open position and the valve operates as a steam trap.

This valve, which is the product of the Gold Car Heating and Lighting Company, New York, is known as its No. 1170, and embraces the use of a diaphragm that is identical with the one used in its vapor valve No. 1112, and its steam trap No. 1165. It is constructed in two separate and distinct sections or diaphragms joined together as a unit, each section separately containing a volatile liquid. This construction increases the flexibility and power of the diaphragm and also doubles its life. Should one section fail, the remaining section will operate the valve until replacement can be made, thus avoiding shutting off the steam from that side of the car.

The disk holders both on the vapor valve and the trap end are of the quick removable type, the rear portion being slotted. In case of necessary removal they can be slipped off their respective spindles and be readily replaced. The two plugs, one on either side of the vapor chamber, give access to one disk holder and the cover of the diaphragm chamber gives access to the other.

## Special Metal Union Connection

THE VAPOR CAR HEATING COMPANY, INC., of Chicago, is showing a Vapor regulator with a special metal joint type of union used in order easily to make repairs and renewal of parts of Vapor regulators. The 1-in. size is used in the feed and delivery pipes near the

Regulator Connected with the Special Unions

top of the regulator, and is so made that there is ample clearance for the union nuts when both are used on the

same side of the regulator. The 1½-in. size is used for the bottom or return connections. The male end of the union (made of wrought iron) screws in the regulator casting, and the female end (made of brass) is used on the end of the pipe.

When a regulator is removed the male end of the union remains in the regulator and the female end of the union remains on the pipes, so that a duplicate regulator equipped with the male end of the union can be applied in place of a defective regulator very quickly and conveniently. This avoids the inconvenient and slow method of making repairs or renewal of parts to a Vapor regulator when it is attached to the pipes underneath the car.

### Bottom Supported Car Door

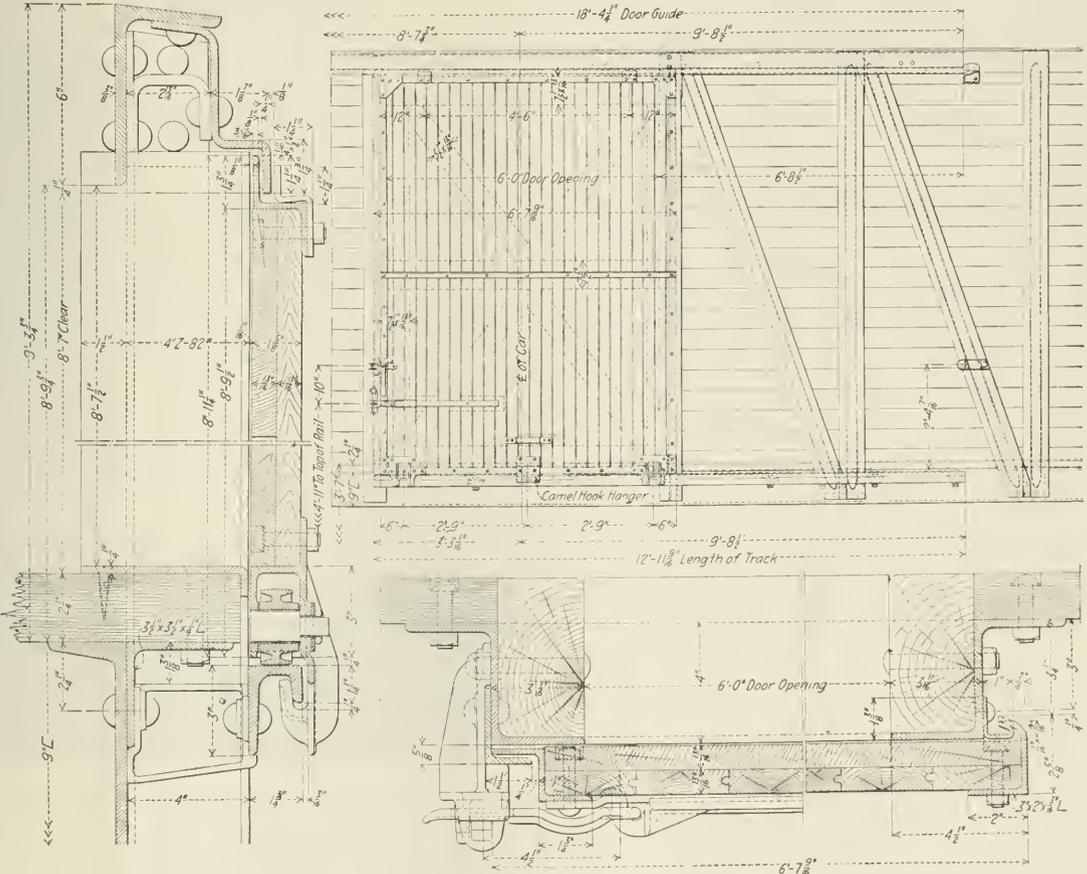

**A** BOX CAR DOOR OF NEW DESIGN which has been applied to cars built for the Railroad Administration is being exhibited by the Camel Company, Chicago. This door, which is known as the No. 50, is applicable to either single or double sheathed cars. The illustration shows the arrangement of the door as applied to the single sheathed standard cars. It has a steel frame made of

bottom and run on a continuous track of specially designed section. The hangers are of the double supported type, permitting of replacement of the wearing parts. A hook hanger between the rollers keeps the bottom end of the door from moving outward.

The door is made spark and weather-tight at the front door post by extending the flange of the Z-bar on the frame between the Z-bar and angle on the post, and at the rear post by a post strip which overlaps the angle on the frame when the door is closed. A burglar proof locking arrangement is used and a door starter of the eccentric type is located above the hasp. The design of the No. 50 door as applied to double sheathed cars is generally similar to the one illustrated, but there are numerous changes in the details.

### Spring Journal Box Packing

**T**HE UNIVERSAL PACKING & SERVICE COMPANY, CHICAGO, is exhibiting in the booth of the Anchor Packing Company a journal box which has been in service for ten months under a locomotive tender, without any new material being added or the waste in

Camel No. 50. Door Applied to Single Sheathed Standard Cars

angles and two bars braced by gusset sheets at the four corners. The door guide, which is of ¼-in. pressed steel reinforced the side plate and fits between the Z-bars at the top of the frame. The rollers are mounted at the

bottom of the door. The packing used in this box is of a new type known as Spring Journal Box Packing. It is composed of thread stock cotton waste, with mechanically inserted coiled wire springs, to give it resilience.

Plain cotton waste is a good conveyor of oil, because of its high capillary properties, but lacks resilience. Wool waste has more resilience than cotton waste, but lacks the capillary properties of the cotton. In Spring Journal Box Packing cotton waste, with its high capillary qualities, is given a resilience much greater than that of plain wool by means of the inserted springs. The packing is made with either brass or steel springs, as may be specified. The springs are made of No. 18 gage wire, with a lineal pitch of  $\frac{3}{8}$  in., 2 in. long and 1 in. in diameter.

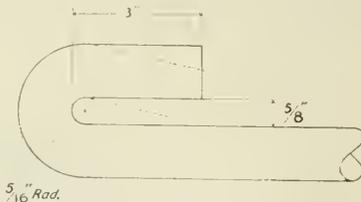

During the past twelve months a series of tests has been conducted which, it is claimed, has demonstrated that spring packing will produce entirely successful lubrication, requiring 20 per cent less weight of dry packing in the initial packing of the boxes, as compared with the amount necessary if packing without springs is used. This packing does not have to be picked up in the journal box with a packing iron at frequent intervals, nor is it necessary to add to the original amount of waste. Due to its looseness, or openness of structure, spring packing does not glaze over the surface which is in contact with the journal.

The springs are of an open pitch, so that when laid on the side they will have a spring action as well as when on end. The boxes should be packed in the same manner as with ordinary waste, except that it is unnecessary to pack them as tight, due to the fact that the springs will keep this packing against the journal, whereas in the case of plain waste there must be tight packing in order to get this result. Spring packing can be reclaimed by the same methods used with the ordinary packing when it has become dirty.

## Detachable Drop Forged Brake Rod Jaw

THE SCHAEFER EQUIPMENT COMPANY, Pittsburgh, Pa., which manufactures the Schaefer truck lever connection, has developed and is showing at its booth, a drop-forged detachable type of brake rod jaw of improved design and increased strength as compared to the common welded-on type of jaw.

This jaw is made from open hearth low-carbon bar steel, and is so constructed that it is very easily attached

Proportions of the Bend in the Brake Rod

and is securely held to the rod by means of double locking prongs. In the event of a change in the length of brake rods, these prongs may easily be folded back and reattached without danger of damage to the brake jaw. It is of the same relatively light construction that characterizes the Schaefer design of brake lever connectors and is so proportioned that it will develop the full strength of any given size rod. At the booth may be seen several samples applicable to freight car equipment, which have been pulled to various loads, one of these having been subjected to a tension load of 32,200 lb., at which load the  $\frac{7}{8}$ -in. diameter steel rod broke, the frac-

ture occurring at a considerable distance from the point of attachment.

The advantages of the mechanical structure, as embodied in the design displayed, over other types of jaws

The Jaw with Locking Prongs Open

are that the bent over portion of the rod engages a solid portion of the jaw structure; the rod entering the jaw in a straight line with the hole, the locking prongs engaging the brake rod proper practically opposite that portion of

The Jaw Attached to the Brake Rod

the rod which locks the front end; and the jaws has been designed so that it can be produced in a drop forging operation with corresponding increase in strength and decrease in weight.

## A Flexible Car Roof for Repairs

A NEW DEVELOPMENT in the repairing of car roofs is the application of a new all-steel flexible roof to the old carlines. This method has been developed by the Hutchins Car Roofing Company, Detroit, Mich.

In the past it has been necessary to use a special steel carline when applying a new steel flexible roof and the old carlines were usually scrapped; this waste of material is now eliminated and the labor cost of applying a new roof is reduced to a minimum. When applying a flexible roof in this manner the old roofing boards are removed, leaving the old carlines of wood or steel in place and the new all-steel flexible roof is applied direct to the old

The Flexible Roof Applied to the Old Carlines

carlines. These steel flexible roofs are made of 16, 18 or 20 gage sheet steel. This thickness is about three times that of the ordinary outside or inside metal roof, and because of the thickness of the weatherproofing steel sheets, together with the fact that no roofing boards are required, this method of repairing car roofs offers great possibilities in facility in repairing and economy in cost of material and labor.

THE RAILWAY AGE is a member of the Audit Bureau of Circulations (A. B. C.) and the Associated Business Papers. (A. B. P.)

The prediction has been made that the discussion of the reports at the convention will gradually grow less and less because under the better methods of organization which are being planned for the making up and working of the various committees, the reports will be so thorough and complete that there will be little need of very much general discussion. It is extremely doubtful whether this prediction will prove correct or that it would be desirable. It is true that there is a great deal of useless discussion that can be eliminated if the members generally study their reports carefully in advance. The great value of the conventions, however, is in having a large number of capable men from all sections of the country to criticise any statements that may be made or to suggest improvements or modifications in the findings of different committees. It may even be desirable for the General Committee deliberately to plan to insure having several of the best posted men in the country on each particular subject present to discuss each report. Some of the general engineering societies and two or three of the railroad clubs have got excellent results by specifically inviting different men well in advance of the time of meeting to discuss certain points in the reports which these men are particularly well fitted to talk on. The more thorough and complete the reports are, the greater the importance and value of having such expert discussion. This means that special and intelligent effort must be made to develop it.

## Discussing the Reports

No action taken by the Master Car Builders' Association in recent years is so far-reaching in its effects as the adoption of the type *D* coupler. The development work was a matter with which the committee was principally concerned, but the maintenance of the coupler is of interest to all car men. For that reason it is to be hoped that every one attending the conventions will avail himself of the opportunity to visit the exhibit prepared by the Coupler Committee in co-operation with the coupler manufacturers. The exhibit of gages to insure interchangeability of parts is an indication of the care that is taken by the makers to secure satisfactory operation. The railroads must do their part to obviate trouble, and one of the best ways of attaining this end is to see that the construction and operation of the coupler is thoroughly understood. The descriptive circular distributed at the convention has been prepared with great care and merits the widest possible distribution.

## The Coupler Exhibit

Several of the railway supply manufacturers have stated that this is the most businesslike convention that has ever been held, and they hope that the high standard which has been set will be maintained and even raised still higher in the years to come.

## A Businesslike Convention

Various reasons are given for this change in spirit, such as its being part of the after-effect of the war, which is noticed generally, or the fact that there has been no convention for three years. Still others say it is because of the larger and more general attendance of railroad men, a very large number of whom come from long distances and who are at the meetings for the first time. Then, too, there are those who say that the most important factor is the suggestion that was made to the regional directors that the various representatives from each road be asked to report back to their managements in writing on the important and practical things that were drawn to their attention at the convention. Whether any one of these factors is more important than the other it is, of course, impossible to say. One thing is certain, the railroad men generally are making the most of their opportunity to get practical suggestions and the railway supply manufacturers feel that they have been mightily well repaid for the effort that they have made to bring their exhibits to Atlantic City. It may not be amiss to suggest that it is not too soon for the heads of the railway and railway supply associations to get together and, after analyzing the situation thoroughly, to start to prepare for the next convention along such lines as will insure continuing and further developing the businesslike spirit which has so thoroughly entered into the convention this year.

## Increase Facilities for Car Repairs

THE SHORTAGE OF CAR REPAIR FACILITIES on American railroads was very strikingly brought out by the unusual conditions which existed during the war. The heavy traffic which the railroads were compelled to handle taxed the capacity of the rolling stock to the utmost and made it necessary to use every car which could turn a wheel. This resulted in serious deterioration of rolling stock, which bad order reports did not reflect. Figures compiled by the Mechanical Section of the Railroad Administration during the latter part of 1918, while they

showed a very good percentage of bad order cars and also indicated that the daily accumulation of bad orders was about balanced by the daily output of repairs, showed a much higher ratio of bad order cars shopped for heavy repairs than the ratio of the output of heavy repairs to the total number of cars repaired. Of course, this was in a measure due to conditions other than a lack of shop facilities, such for instance, as shortage of labor and the necessity for an early return of the cars to service; in the main, however, it could have been prevented had the railroads been provided with adequate car shop facilities.

Steel cars have now been in service for about twenty years and the extent of their use has been growing continually during that time. Adequate facilities to make heavy repairs to these cars, however, have not been provided and the time has now come when large numbers of them have reached the age where these facilities are badly needed. Many of the eastern roads and some of those in the southeast have provided shops equipped especially for handling steel car work. The western roads, however, have not anticipated their requirements and are seriously short of steel car repair facilities. With the lessons taught by the war fresh before them, it should be the duty of mechanical department officers carefully to consider and formulate plans for shop facilities which will be adequate to meet their requirements. The present situation with respect to capital expenditures will not continue indefinitely and it is well for the roads to have their programs laid out, ready to put into action when conditions change so that capital may be provided.

### Limiting Loads for Freight Cars

THE COMPREHENSIVE STUDY of the factors affecting the permissible capacity of freight cars is a piece of work for which the Committee on Car Trucks deserves to be commended. While the proposed methods of marking cars are a radical departure from the former practice, they are more logical, and the change should be welcomed by both shippers and railroad employees. The last paragraph of Interchange Rule 3-d, which was to be effective October 1, 1920, would have made it necessary to reduce the allowable loads for cars having axles of less capacity than required by the sum of the light weight and the marked capacity. If the committee's recommendations are adopted the maximum axle capacity will be made the basis for increases as well as decreases in the permissible loads.

The capacity of some of the equipment now in service will be appreciably changed by the new rules. The allowable load on cars of 60,000 lb. capacity will in general be decreased, while on the heavier equipment and notably on the 80,000 lb. capacity cars there will be an increase (assuming that the car bodies are considered strong enough to carry the extra weight). The load limits established for cars with non-M. C. B. standard axles should result in such axles being retired rapidly. Statistics regarding the number of cars that will be affected were furnished by only one road, but this probably represents a large proportion of the total equipment. Whatever the results, the committee's action seems fully justified considering the time that has elapsed since the adoption of the M. C. B. standard axles.

The new method of determining the allowable load may have an appreciable effect on the design of cars. In the past the desire to reduce the deadweight carried has been the only incentive for designing light cars. The proposed rules will give light cars a double advantage:

not only will the deadweight be less, but the maximum load will be increased as well. Of course, the stresses in the car will increase as the load increases and no very great reduction in weight will be feasible. The problem is to balance the saving in transportation expense against the cost of repairs. If the proportion of paying load can be increased by lighter construction, such design may prove economical, even though it results in higher maintenance costs for the equipment.

### Important Effect of

### A. R. A. Meeting Here

ONE OF THE ILLUSIONS which many railway executives and operating officers have cherished for years has been that the mechanical conventions were largely junkets. Few of them have appreciated the large amount of important work done at the conventions and the great educational value of the exhibit of equipment and supplies made in connection with them.

Because this misunderstanding has prevailed so widely, the visit of the executive committee of the American Railroad Association to the pier on Thursday was of very great importance. By the reorganization of the American Railroad Association the mechanical associations have lost their independence and in consequence, to a large extent, the future of the conventions and of the exhibit depends upon the attitude that would be assumed in future by the operating executives.

The comments made by members of the executive committee who were here—comments made both in public and in private—make certain that most or all of them have gone away from Atlantic City with a realization of the fact that the conventions and the exhibit constitute a great educational institution, which contributes more than can be estimated to broadening the vision and increasing the efficiency of the officers of the mechanical departments of the railways. It is a fact that in years long past there was conduct at the conventions which would not have borne close scrutiny. The conventions have suffered ever since from a taint acquired at that time. But for many years there have been no cleaner and more wholesome gatherings than the mechanical conventions.

There never was a doubt that the mechanical conventions would be continued to be held, but there has been talk at times of taking them some place where the exhibit could not be held. This would have been a serious mistake, since from an educational point of view the exhibit is fully as valuable as the convention sessions. The visit of the members of the executive committee to the pier this week cannot fail to have the effect of making the operating executives, generally, regard in a very favorable way the sessions which are held here and the exhibit which is made, and the more operating executives that attend the conventions, the more favorable their impression of the value of the sessions and the exhibit will become.

Since the mechanical associations have been merged into a section of the American Railroad Association it would seem that there is good reason why the executive committee of the A. R. A. should in future meet once a year where the mechanical convention is held and look over the exhibit. The enterprise of the railway supply manufacturers deserves this recognition, and it would be very beneficial to the railways for the higher operating officers to keep in touch with the progress being constantly made by the supply companies in the design and manufacture of equipment and supplies.

## Program for Today and Tomorrow

Saturday, June 21, 1919

9.30 A. M. to 12.00 M.

Discussion of Report on Train Lighting and Equipment  
 Consideration of Rules of Order.. 9.30 A. M. to 10.00 A. M.  
 Election of Officers, General Committee and Nominating Committee—Presentation of Badges to retiring Officers, Etc. .... 10.00 A. M. to 12.00 M.

### ENTERTAINMENT

10.30 A. M.—Band Concert at Entrance Hall, Million Dollar Pier. Royal Scotch Highlanders' Band.

8.30 P. M.—A special program has been prepared in appreciation of the railway and railway supply men who went into the service during the war. The speakers will be Franklin D. Roosevelt, Assistant Secretary of the Navy; Brigadier-General W. W. Atterbury, Col. Henry W. Hodge, and Senator Walter E. Edge, New Jersey's war governor.

Sunday, June 22, 1919

3.30 P. M.—Sacred Concert. Music Rooms of Marlborough-Blenheim. Fry Philharmonic Orchestra.

## Pictures from the Front

ON SUNDAY EVENING, at 8.15, an entertainment will be given on the pier. The program includes the presentation of an interesting series of motion pictures, representing large naval guns in action in France. These pictures will be exhibited by the United States Navy, and a naval officer will be present to explain them.

## Lost and Found

LOST—Badge No. 2425, issued to W. S. Clock. If found, please leave at the *Railway Age* booth.

LOST—Lady's badge No. 4334, lost last night on pier. Mrs. H. E. Graham, Room 1306, Hotel Traymore.

LOST—On dance floor, Thursday night, badge No. 4209. Mrs. J. E. Gierney, L. & A. Railway, Room 35, Hotel Sterling.

LOST—R. S. M. A. badge No. 2425 by Mr. Clock, Joyce-Cridland Company, Strand Hotel.

LOST—Bar pin, gold, three inches long, with square blue stone. E. D. Knapp, Iroquois Hotel.

LOST—R. S. M. A. badge No. 3226. Please return to the office of the Enrollment Committee or any member.

LOST—R. S. M. A. badge No. 5349. Return to Enrollment Committee.

## Railway Artillery

THE CONVENTION ATTENDANTS have a real treat before them in a special feature which was arranged for too late to go on the official program but which will precede the informal dance on Monday evening. Major E. D. Campbell, of the Railway and Seacoast Section, Artillery Division, Ordnance Department, United States Navy, has been assigned by the Navy Department to deliver an illustrated lecture on Railway Artillery. Readers of the *Railway Age* have followed with much interest the development and use of railway artillery during the war and will undoubtedly appreciate the importance of this announcement. The lecture will be given in the Hippodrome at 9.00 P. M. Following it a representative of the Navy Department will show pictures illustrating the effect of the 14-in. guns on the other side.

## Traveling Engineers' Meeting

THE EXECUTIVE COMMITTEE of the Traveling Engineers' Supply Men's Association will hold a meeting in the Green Room of the Marlborough-Blenheim at one o'clock Saturday.

## The Grand Ball

IT IS GENERALLY CONCEDED that the social events of the week have been delightful affairs, but it must be admitted that last night's event on the Million Dollar Steel Pier eclipsed all previous social functions. It was the convention grand ball. Fully three thousand conventionites were in attendance.

At 10 o'clock the grand march was started. It was headed by the officers and members of the executive committee of Mechanical Section III, American Railroad Association, and their ladies. The ball room of the pier certainly never presented a more beautiful sight. At the conclusion of the march the Royal Scotch Highlanders' band began a twenty-dance program. The pleasure was continued until long after midnight.

William M. Wilson, Chairman, was ably assisted in the management of the evening's entertainment by the following: G. A. Nichol, R. J. Himmelright, J. C. C. Holding, J. L. Paxton, L. O. Cameron, N. C. Naylor, Ellsworth Haring and H. E. Passmore.

## R. S. M. A. Annual Meetings

THE DISTRICT MEETINGS of the Railway Supply Manufacturers' Association will be held from 9 A. M. to 10.30 A. M. this morning in the Executive Committee Room, which is next to the Enrollment Booth.

It will be necessary for the third district (Pennsylvania) to elect two men to the Executive Committee for three years; for the fifth district (Illinois, Wisconsin, Iowa and Minnesota) to elect one member for three years, and for the sixth district (Delaware, Maryland, District of Columbia, Virginia, West Virginia, North Carolina, South Carolina, Georgia, Florida, Alabama, Mississippi, Kentucky and Tennessee) to elect one member for three years. A special election is also necessary for the fourth district (Ohio, Indiana and Michigan) to elect a member to serve one year to fill the unexpired term of J. F. Schurch, who has moved out of the district.

The annual meeting of the Railway Supply Manufacturers' Association, itself, will be held at 11 o'clock this morning in the Hippodrome. It will be necessary to elect a president and a vice-president. The nominating committee on Wednesday nominated W. S. Bartholomew as president and J. F. Schurch as vice-president. Mr. Bartholomew found that it would be impossible for him to accept the nomination. Following the receipt of a letter to this effect, it was necessary to hurriedly circulate a petition in order that another nomination be posted, in accordance with the requirements of the Constitution and By-Laws, before six o'clock last night. George R. Carr, who is a member of the Executive Committee representing the Fifth District and who is a vice-president of the Dearborn Chemical Company, was nominated.

Just before six o'clock last evening a petition placing George Hull Porter, of the Western Electric Company, in nomination for the office of vice-president of the Railway Supply Manufacturers' Association, was posted

on the bulletin board on the Million Dollar Pier. Mr. Porter will therefore be Mr. Schurcl's opponent for the office of vice president at the election to-day.

## Important Special Program for This Evening

COMPLETE DETAILS concerning the special program this evening were not available when the official program was published. The nature of the meeting is so important that the Railway Supply Manufacturers' Association, which has the program in charge, is desirous of giving the information concerning the program as widespread publicity as possible. A great many of the railway men and railway supply men were called into the service during the war; many of them in uniform and many to help in looking after the necessary work behind the lines on this side. It is quite appropriate, therefore, that recognition of this service should take the form of a patriotic program in appreciation of the work done by these men.

The committee in charge has been fortunate in securing as speakers Franklin D. Roosevelt, Assistant Secretary of the Navy, who will speak for the administration on behalf of the War and Navy Departments; Colonel Henry W. Hodge, who was Assistant Chief Engineer of the American Expeditionary Forces and who will tell of the achievements of the railway men in France, and Senator Walter E. Edge, who was Governor of New Jersey during the war. It is expected that Brig. General W. W. Atterbury, who did such splendid work as Director General of Transportation of the American Expeditionary Forces under General Pershing, will deliver an address.

## R. H. Aishton Praises the Exhibit

THE MOST ENTHUSIASTIC man on the pier yesterday regarding the exhibit of equipment and supplies made by the railway supply manufacturers this year was R. H. Aishton, regional director of the Northwestern region and new president of the American Railroad Association. Mr. Aishton, accompanied by General Secretary Fairbanks, of the A. R. A., arrived on the pier early yesterday morning and was shown through the exhibit by E. H. Walker, president of the Railway Supply Manufacturers' Association. He and Mr. Fairbanks saw the entire exhibit as thoroughly as could be done in a half day. After he had finished his tour of inspection Mr. Aishton said:

"I confess that before coming here I had no adequate idea of the magnitude, completeness and importance of this exhibit. The railway supply manufacturers of the United States deserve the greatest credit for having made such an exhibit, especially under present conditions and in view of the fact that for two years they have had nowhere near a normal business. It is a fine expression of their optimism as well as their enterprise.

"The railway executives of the country have not appreciated the value and importance of the exhibit in past years because most of them have not seen it. Its educational value, especially to mechanical officers, could hardly be exaggerated. I cannot imagine anything which would do more to increase the railway mechanical officers' efficiency than to come and spend six or seven days thoroughly studying the equipment and devices being shown, their uses and methods of operations. Furthermore, it would be of great value to the railways to have

their purchasing agents come here and thoroughly inspect the exhibit. I am extremely glad to have had opportunity to see this one and I hope to see more of them in the future."

Mr. Aishton was accompanied to Atlantic City by Mrs. Aishton and they stayed until yesterday afternoon, when they started on their return homeward to Chicago.

## Railway Club Secretaries Meet

ONLY TWO ORGANIZATIONS enrolled in the Society of Railway Club Secretaries were not represented at the adjourned annual meeting of the society Friday morning, at the Blenheim. The session lasted several hours with A. J. Merrill, of Atlanta, presiding. While much of the time was taken up with an interchange of experiences as to practices and methods in handling club work, several subjects of special interest to executive officers and club members were discussed.

It was agreed that in view of the suspension of activities during the war period and the condition of the treasury it would not be necessary to ask the clubs to contribute the usual assessment this year. In addition to economizing in running expenses the society invested in a Third Liberty Loan bond and hopes to be able to hold it in reserve until its payment becomes due.

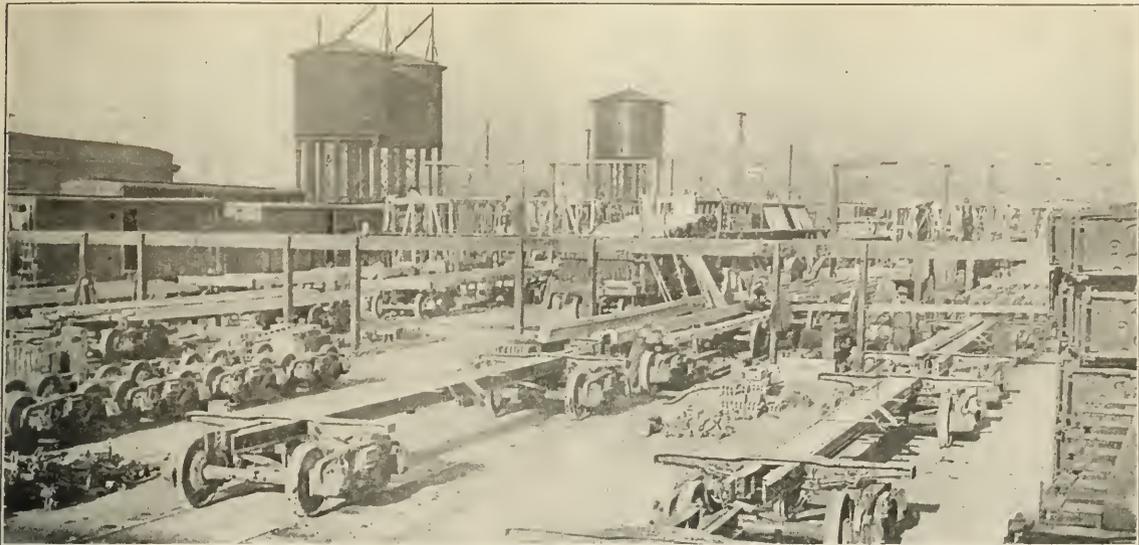

Vice-President Wood, of the Pacific Railway Club, after conferring with the secretaries, and having attended their luncheon, stated that he was much impressed by the earnestness and activity shown, and on his return home would recommend that his club become a member of the society.

The possibility of the western club resuming its membership was the subject of an encouraging report. It was decided that future annual meetings in connection with the Mechanical Section of the American Railroad Association shall be held on the first Saturday of the convention period, preceded on the previous Friday by a "Round Table Luncheon," each secretary to arrange for the attendance as a guest of the society of the highest ranking officer of his club present at the convention.

In connection with a referred subject from the New York and Central Clubs, an adverse decision was reached as to whether it would be advantageous for railroad clubs to identify themselves with the activities of the National Engineering Council organized in Chicago. The reason was that as railroad clubs have not a large representation of the engineering profession in their membership and the various engineering societies being actively identified with the work contemplated by the promoters of the council, it would be an undesirable duplication of membership for the railroad clubs to unite with it.

In considering conditions incident for two years to the attitude and policy of the postoffice department with respect to the postal privileges of the clubs in mailing Official Proceedings, it was agreed to recommend to the executive committees that as the clubs have a combined membership of 8,000 or more, they should unite in petitioning the Postmaster-General to reopen the matter, and give it his personal consideration. It is believed that if this can be accomplished, the question can be presented in a manner calculated to secure more favorable consideration. After electing the following officers for the ensuing year, the society adjourned subject to call:

Chairman, A. J. Merrill, Atlanta, Ga.; Vice-Chairman, W. E. Cade, Jr., Boston; Secretary-Treasurer, Harry D. Wright, New York City.

## American Railroad Association, Section III, Mechanical

### Report of Proceedings for Friday; Convention Hall Crowded; Lively Discussion

**T**HE FRIDAY MORNING session of the American Railroad Association, Section III, Mechanical, was called to order by Chairman Chambers at 9.40 o'clock.

The chairman stated that the Committee on Safety Appliances had submitted a written report, because it was not possible to have it printed in time for the convention.

### Report of the Standing Committee on Safety Appliances

**N**O REPORT WAS PRINTED by the Committee on Safety Appliances, because it was not possible to get the information together to draft such a report. The information, however, reached the chairman on June 16 and the attached report has been compiled for your consideration. It will be noted that this includes the total number of cars owned in each region, the total number equipped with safety appliances, those remaining to be equipped, and the percentage remaining to be equipped as per cars owned. The totals of all regions are also shown, from which it will be noted that there are still 89,645 cars to be equipped, or 3.8 per cent of the equipment owned. This should receive vigorous action from all roads until such cars are so equipped.

The report is signed by C. E. Chambers (Chairman), U. S. R. A.; D. R. MacBain, New York Central; C. E. Fuller, Union Pacific; C. B. Young, U. S. R. A.; H. Bartlett, Boston & Maine; E. A. Sweeley, Seaboard Air Line; H. T. Bently, Chicago & North Western.

**Discussion**

Mr. Brazier: It is very clear that the law defines that after September 1, 1919, no cars shall be received in interchange unless so equipped. You have had plenty of notice, and I would like to give you a few facts on the road which I represent. I thought that under government control all cars were home wherever they were, and I have treated them as such, but I find this is not a fact. The New York Central has equipped, in the last two years, between 500 and 600 foreign cars with safety appliances, and less than 10 cars of the New York Central have been equipped on the foreign lines. Our cars are somewhere in this country, and we would be pleased to have you put safety appliances on them so we can live up to the law. Under Federal control no cars are to be received after September 1, 1919, unless they are equipped with safety appliances. That means you must hold the cars on your lines and equip them before they are offered in interchange.

Mr. Tollerton: What Mr. Brazier has said is true. However, it seems from this report that the number of cars still unequipped with safety appliances is very small. We have all had a vast number of foreign cars on our lines during the past year and a half. There is an effort now being made to get the cars home. Our line has provided special material for equipping cars with safety appliances and I think many of the other railroads have provided the same thing. If the rule is provided that before September 1st these cars on foreign lines must be equipped with safety appliances, it will leave the individual lines with a lot of material they cannot use.

As the number of cars still unequipped is so small, I believe it will put an unnecessary burden on the railroads to insist on the observance of September 1st as the date when cars shall be refused in interchange if they are not equipped with the safety appliances.

The time should be extended, to give time for these cars to get home, so that the individual lines can equip them with the material they have on hand. I offer a resolution at this convention, that we go on record as asking the Interstate Commerce Commission to extend the time for the applica-

tion of the safety appliances until January 1, 1921, instead of September 1st of this year.

Chairman: I will put the original motion made by Mr. Fuller to accept this report before we take further action.

The motion was put to vote and carried.

Mr. Brazier: I will second the resolution made by Mr. Tollerton. The material Mr. Tollerton speaks of is standard, and the roads are equipping the cars with this standard material. We do not care about the safety appliances put on our equipment as long as they comply with the Federal laws.

I think it is in the hands of the government to say whether they will extend the time, or insist on our having the equipment provided with the safety appliances by September 1, 1919. I would like to see all the cars equipped. The equipment is standard to our cars and will be in the nature of repair work in the future.

C. E. Fuller (U. P.): If we could get the cars home we would do the work. There never was a time so opportune, nor a power so strong, as exists today that can get the cars home. I would like to see something go on the record to the effect that the movement of foreign cars to the home line shall be put into operation immediately. We received some cars recently that had not been on our line in 12 years. They were not equipped with safety appliances, or very much of anything else when they got home. I think that if this Association would go on record as asking the director general of railroads to make some rule—although there is a rule now in force to that effect—to have the cars returned home, and have this made absolutely effective, this question can be handled very easily and expeditiously.

T. H. Goodnow (C. & N. W.): In connection with the motion made by Mr. Tollerton, I was going to say that all railroads have undertaken to equip a great many cars in the last 18 months, which it was never anticipated would be equipped. We had a retiring schedule lined up, with several thousand cars on that schedule, which, had it not been for the conditions caused by the war, would have been retired by this time. They were old, light capacity cars, but instead of retiring them we withdrew the schedule and have been repairing the cars, so that in a way accounts for a number of cars in the country at the present time that remain unequipped.

So that there will be as little interference as possible in the interchange of cars when the law becomes effective, it will be necessary to see that the interchange inspectors are educated. While the United States standards are alike, their manner of application has not been the same on account of the construction of cars, and if inspectors are not educated, undoubtedly there will be cars rejected or refused that should be accepted, and others accepted that possibly should not be.

Mr. Gaines: I think this a very opportune time to request the Railroad Administration to make it imperative to send them home. While there is a rule out to send foreign cars home as rapidly as possible, it could be made imperative to send such cars home as are not equipped with safety appliances, and I think if that were done the majority of roads can get the cars home in time to put the safety appliances on in the near future. I don't know whether they could do it all by September 1 or not, but they could do a great many of them.

Mr. McManamy: So that we won't misunderstand the attitude of the Railroad Administration, I will say that rules are in existence for sending foreign cars home as needed for general repairs, or for betterments. I don't think there is anyone in this convention that would seriously ask the Railroad Administration to send empty cars long distances home to have ladders, handholds, hand brakes, or standard running boards, put on them. We have to consider the empty car mileage in that connection, and if we send cars four or five hundred or a thousand miles, for the application of such minor appliances, the actual cost of movement of the empty car will be several times the cost of the repairs. The Railroad Administration is trying to use judgment in the matter of sending cars home for repairs of any kind, realizing all the time that as a general proposition, heavy repairs or the application of betterments, can be better and more satisfactorily performed on the home line.

That is the principle that the Railroad Administration is fol-

lowing. But I am quite sure that this convention would not want to go on record as asking for cars to be sent home for the application, for instance, of the additional sill steps required by the law, or for the application of additional ladders or for the standardization of hand brakes. Where the safety appliances required mean practically the rebuilding of the car, every road has it in its own hands to have a car sent home by applying for it. If a request from any road is made to the Railroad Administration that such cars be sent home for extensive repairs or the application of betterments, orders are issued through the Car Service Section to send the car home, and you get them as fast as may be necessary—as fast as you can handle them.

We have had to regulate the sending of cars home because some roads were being buried in bad order cars, which other roads were sending home without request. Those things have to be handled in a broad way. We have at present, if I recall correctly, about 89,000 cars that are not yet equipped with U. S. safety appliance standards. During the last year we have equipped about 11,000. The time is not long, and in many instances the work is not very heavy, but there is not a railroad shop in the country that cannot put the standard safety appliances on any car just about as cheaply as they can be applied at home, with the exception of changing the superstructure of the car to give necessary end ladder clearance. The other things can be standardized much more quickly, and just as satisfactorily by any line and at any shop, as they can at home, and we will save a great deal of extra empty car mileage in that way.

It may be possible that it will be found desirable to ask the Interstate Commerce Commission for an extension of time, but we must remember that the Commission has been frequently asked for extensions of time on this matter, and I think we will all agree that it has been very fair and even liberal in the granting of such extensions when the need for them could be shown. I think this convention should take some action which would expedite the application of Federal safety appliance standards wherever the car happens to be.

I think we will find this: A large proportion of these 89,000 cars that remain yet to be equipped are special service cars, outfit cars, and other cars that are not largely used in interstate traffic, and if we take those away from the total, it will reduce the number to be equipped at foreign shops very materially. I simply want to lay before the convention the situation as we see it at Washington. We are sending home cars on request, not otherwise, except where cars are offered to the owning line at interchange point, when all empty cars must be accepted.

But I don't believe the convention wants to go on record as asking for excessive empty car mileage to get these cars home, when most of them can be just as well equipped at any other shop.

Chairman: I am thoroughly in accord with what Mr. McManamy has said. It would cost five times as much to get some cars home as it would cost to equip them. One thing I think is really important: Each mechanical department man on a railroad knows the attitude of his corporate interests as to what cars are to be maintained. I know that quite a number of cars remain on foreign lines today that are not equipped because they are of the oldest type, and in all probability they don't expect to maintain the cars. I favor a resolution from this convention that each road, so far as possible, learn the location of such cars and notify that road that it is not intending to maintain them. In that way, they would prevent any further money being spent. I would like to see an extension asked, for the end ladder clearance. They are cars that will be maintained for many years, and you might be able to get some extension to that particular portion of the requirements.

Mr. Fuller: I want to correct a misunderstanding. It was not my thought to move cars light, but to load them to home line. I full appreciate the fact that there are a lot of cars in this country that will not be equipped, and also appreciate that there are a lot of outfit cars in this list. If the real list of the cars that are to be maintained was under consideration, or given, it would reduce that number considerably. I don't see any reason why the Central Railroad of New Jersey, if it has a modern car belonging to a Western road, could not just as well load that car to the West as to load some other car.

Chairman: I think that all roads are so instructed at the present time, and should make it a point to load a foreign

car. But most of these cars are cars that cannot be loaded until something is done to them.

Mr. McManamy: I think W. P. Borland, the Chief of the Bureau of Safety, is in the audience somewhere, and I suggest that he be asked to explain to the convention just what the provisions are with respect to reconstructing cars to give them the desired end ladder clearance. I think that provision is covered in the Federal orders as they now stand, but he is more familiar with that than I am.

W. P. Borland: The motion made by Mr. Tollerton is one that the Commission will not look on very favorably. The Commission has already extended the time for the equipping of these cars on four different occasions, and I am sure they will not favor any further extension of time.

It seems to me that a great proportion of these cars that are still to be equipped are cars that naturally would be retired from service, and as to those that are still to remain in service, I cannot see any reason why they should not be equipped wherever they are found just as easily as sending them home.

I noticed in the list which was read two roads which in 1915 reported they had no cars to equip. One of them has reported here that they have 3.1 per cent and the other one another percentage which I cannot recall. When some of the roads were asking the Commission for further extension of time, those two roads stated that they wanted no further extension of time, because they were fully equipped.

I cannot see any particular reason—with the Railroad Administration able to get these cars fixed wherever they may be found—for another extension of time. The material is standard and can be used at any time and anywhere, and I cannot see that there is any hardship placed on the roads.

Chairman: There is some special provision in regard to the end ladder clearance, is there not?

Mr. Borland: Yes, but I cannot recall that. I cannot state it specifically without the order before me.

H. W. Watkins (So. P.): I favor Mr. Tollerton's motion for an extension of time, because I think it is necessary. It has been stated here that only 11,000 cars were done during the past year. How are we expected to do 89,000 cars in two months? Let us have the time that is asked for, and I believe by that time the railroads will be in a better position, and will have the job completed.

J. J. Tatum (U. S. R. A.): The safety appliance parts that we have in stock on the various railroads of this country to apply to cars belonging to the individual roads are United States standard Safety dimensions and meet the requirements of the law. If they did not meet these requirements, you would not apply them to the cars. For that reason they are suitable to apply to the cars of any railroad, and will meet the requirements of the law if properly applied. I see no reason why we should send a good order car home to have safety appliances applied to it. If you have safety appliances on your railroad, apply them to your own cars, apply them to your neighbors' cars, let your neighbors apply their safety appliances to your cars and we will get the safety appliances applied promptly.

As to the number of cars being equipped with safety appliances during the Federal control, we must all bear in mind that the men of our individual railroads were beyond the sea, applying safety appliances to the Germans. They did it well, and now that a great many of them are back with us and more coming, we can apply safety appliances to our cars very quickly.

Mr. McManamy said that we had equipped 11,000 cars during Federal control. Probably this figure slipped him in some way or another, but as a matter of fact, we applied 29,788—almost three times that number.

F. F. Gaines (U. S. R. R. A.): It would seem from what has been said here this morning, that it is a very easy matter to apply safety appliances anywhere at any time. It may be on some roads, and on some cars, but my experience as far as the end ladder clearance goes, it is not anything of the kind. On a great many of the cars it means new draft timbers, new end sills, and a lot of other things. It can not be done cheaply. If the end ladder clearance was excepted from all the other things, we could get busy with it without any trouble—we could put on the grab irons, and ladders, and all the other things that are required, but it will be a very difficult matter to apply the end ladder clearance, as far as the coupler is concerned, on old cars cheaply.

Mr. Tatum: I do not think we can tear down the cars and rebuild them to get the end ladder clearance to meet the requirements of the law as promptly as we would like to do, but by changing the coupler and using the long head coupler, we can put in the end ladder clearance almost in the same time that we are applying the ladders and grab irons. I do not believe we can do all this work by September 1, but we can facilitate the application of the appliances and get a greater number of cars equipped in a shorter time than we have been able to do in the past.

Mr. McManamy: I want to thank Mr. Tatum for correcting my figures. Roughly speaking, the provision for end ladder clearance in the requirements of the law, is that where cars have 10 in. or more clearance, they may be operated during the life of the car. Where they have less than that, they are supposed to be in a dangerous condition and the repairs should be made.

Mr. Tatum is correct when he says that in practically all cases, or in many cases, that the end ladder clearance is given by applying a coupler with a special head, so that with the provision which is now contained in the law, making exceptions of cars with more than 10 inches end ladder clearance. I do not believe that phase of the question is as serious as it appears.

Mr. Borland: I am quite sure that Mr. McManamy is correct on that. I will have the order in a few minutes and will let you know exactly how it reads.

I. S. Downing (C., C., C. & St. L.): Our great difficulty has been in getting the cars to the repair tracks. We had equipped a large number of foreign cars with safety appliances. The trouble is that at the large terminals, where you can equip them, the car comes to you loaded. It is loaded to an intermediate point, when it is unloaded, and reloaded again, so that the inspectors do not get at them and they go on through.

To get them to the repair tracks, I believe some kind of a general car could be used, to the effect that if the car is found without the safety appliance, and is loaded, it should be shipped, when it is unloaded, to the nearest shop in order that the appliances may be applied.

The ladders and end holds are near the proper location on a great many of the cars, so that unless the inspectors stop to measure them, they do not know that they do not comply with the law, and they are passed along. In order to get these cars to the shop, when they are received loaded, and the safety appliances must be applied to the car, we must indicate on the car in some manner that when it is unloaded it must go to the nearest shop for having the appliances applied, regardless of the road it is on.

We get long lists from other roads, telling us that certain classes of cars are not equipped. The inspectors have so much to look after and so many reports to make that they pay but little attention to these lists of numbers. About two weeks ago, I thought I would, at some special men in our large terminals for a test, and I put these men at Indianapolis, Cincinnati, St. Louis and Cleveland, and we did not find a Big Four car in any of these yards not equipped. We found several foreign cars not equipped, but they were loaded cars, loaded off our line. We had no right to pull them to some other shop, but I do believe that a very simple card could be gotten up that we could apply to the car, to the effect when the car is not equipped with the safety appliances that when it is unloaded it should be sent to the nearest shop to have the safety appliances applied.

Mr. Gaines: The main objection to the present status of the proposition is the end ladder clearance, and I feel that we could very justly ask the Interstate Commerce Commission to give us an extension of time on that one item. I would, therefore, move that this convention make that request to the Interstate Commerce Commission as an amendment to the motion now pending before the house.

J. S. Naery (C. I. & L.): Most of the cars we have to-day running over the country are cars that only need the replacement of the coupler. If we had the material to make this change, we could equip the cars. I have no doubt there are many other roads in the same condition. We started out to equip our wooden cars with the long draft arms, but you all know that previous to the war everybody wanted this material and it could not be furnished. We use the long shank couplers, but could not get them, and when the extension came along, it

gave us the privilege of running the cars. Today we cannot get the long shank couplers, and that is one condition which should be looked into in regard to the end ladder clearance. I put the appliances on individual cars, including the coupler, and if there is anything that can be done to help the situation in regard to this end ladder clearance it should be done.

E. T. Millar (B. & M.): I was very much impressed by what Mr. Brazier said regarding the number of cars that his road had equipped. Some two years ago I appointed myself a committee of one to do what I could to accomplish the end in view and get all our cars equipped. I presume the figures read, as far as the Boston & Maine is concerned, were correct—one-tenth of one per cent. Before coming to the convention I cleaned up all the matter I had on my desk, and I found that we had a total of 28 cars to equip, four of which would come under Form RE 2.

In the last month we equipped 64 foreign cars on the Boston & Maine, and I have so reported to the mechanical head. I also advised him that a proper billing statement would be sent through the Accounting Department, and sent a copy of that to our Accounting Department. I have had a number of inquiries from different mechanical men regarding their cars, and to the best of my ability I have run them down, and shopped them. In many instances I have found that their cars were equipped, and that, through some error in reporting, they had not been checked off on their books. I found that is true also as far as the Boston & Maine cars are concerned. I next checked up our own cars. I found there had been errors made and cars were not reported, or the reports had been lost, as all the reports were handled through the U. S. R. R. mail.

I agree with Mr. Fuller in regard to loading cars in the direction of the home road. I thoroughly believe in that. I sent out three tracing letters on a car which was passing over our lines. The car was owned away down in the South. It was loaded in the Middle West, and destined to a point about as far East as cars run. I know positively that where that car is to be unloaded it is utterly impossible for those people to equip it.

#### MOTION WITHDRAWN

At this point the original motion was withdrawn by Mr. Tolerton in favor of the amendment which covered only a request for an extension on the end ladder clearance. This motion was put to a vote and unanimously carried.

Mr. Borland: If you will permit me to proceed a little out of order now. I was unable to quote this exactly, and I did not want to say anything until I was sure I was exactly right. With respect to the steel and steel underframe cars, the roads have a definite extension, in which to provide for any change in these end ladders on these cars until the safety appliances are renewed. I suppose you all understand that.

Now, with respect to paragraph D, the carriers are not required to make a change to secure additional end ladder clearance on a car, that has more than 10 in. end ladder clearance within 30 in. of side of car, until the car is shopped for work amounting to practically rebuilding body of car, at which time they must be made to comply with the standards prescribed in the order. That cuts you down to paragraph E, which refers to cars which have less than 10 in. end ladder clearance. Those are the only ones that you need bother about to any great extent. Paragraph E refers to cars with less than 10 in. end ladder clearance, which must be changed at once. The original order gives five years, and as you know, there has been four different extensions on that, or three since the original order was passed, and as I said before, I don't believe the Commission will look very favorably upon any request for further extension of time, and it don't seem to me it is required.

Mr. Harvey: I would like to ask whether the 10 in. clearance refers to all cars, or simply the cars built prior to July 1, 1911? My understanding was that on cars built after July 1, 1911, it was necessary to have the 12 in. clearance.

Mr. Borland: That is true. It refers to cars built prior to July 1, 1911.

Mr. Harvey: When that law went into effect there was a great many cars under contract. Some of the cars were delivered, say, June 30th, and the 10 in. clearance was permissible. Cars delivered July 1, have to be changed, according to my understanding. That accounts for about half of our cars that are not equipped.

## Report of the Standing Committee on Loading Rules

J. J. Furch  
Chairman

THE COMMITTEE RECEIVED SOME CORRESPONDENCE FROM C. R. Gray, director, Division of Operation, United States Railroad Administration, instructing that the Code of Loading Rules be rearranged so that all instructions relating to each class of lading would be fully covered under the specific heading referring to such lading, thereby eliminating as far as practicable all cross references. The rearranging of the Code of Loading Rules will now meet these requirements. The general rules comes first in the code and are intended as a guide to the shipper in securing lading on the car, which is not specifically or definitely covered. Following this appear in their order the specific rules covering the manner of securing on cars the more common class of lading. The rules covering any specific lading referred to in the code, may, if desired, be obtained from the secretary, in pamphlet form, thereby eliminating in many cases the unnecessary expense of buying the complete Code of Loading Rules.

In addition to rearranging the rules, the committee reproduced all cuts to a larger scale and made the lettering and figures uniform in size and more legible. After the loading rules were put in their final shape, they were submitted to and approved by the Assistant Director of Operation, United States Railroad Administration, and the Executive Committee of the M. C. B. Association.

The committee has received a number of recommendations and suggestions from the Regional Directors, the Car Service Section of United States Railroad Administration, and others, relative to new rules to cover lading not taken care of in the present Code of Loading Rules and changes in the present rules. The suggestions in the main have reference to the conservation of the car supply by increasing the load carried per car and revising the present rules to bring them up to approved practices.

On account of the apparent necessity that immediate action be taken, the committee prepared several new rules and revised others, sending them to the Executive Committee for approval. The new rules, and the rules which have been revised and issued as supplements to the 1917 Code of Loading Rules by the Executive Committee, are as follows: Supplement Circular No. 6, issued July 15, 1918, includes a modification of Rules 17, 56, 57 and 59 and the following new rules: Rule 88, Manner of Loading Metal Plates in Gondola Cars; Rule 112C, Manner of Loading Wrought-Iron Pipe 12 in. or Less, on Flat Cars; Rule 117B, Manner of Securing Concrete Culvert Pipe Loaded on Flat Cars, and Rule 135, Manner of Loading Metal Sheets in Box Cars.

Supplement Circular No. 11 issued July 25, 1918, contains a modification of Rule 121-B, 1917 Loading Rules, Loading of Gasoline Tractor Engines.

These modifications and additions were incorporated in the rules as revised for 1918.

### Proposed Changes in the Loading Rules.

The committee recommends the following changes in and additions to the present (1918) Code of Loading Rules:

#### WIDE PLATES LOADED DIAGONALLY ON GONDOLA CARS

*Page 89, Paragraph 513.*—Change marginal note to "Plates loaded diagonally on gondola cars having wooden side boards."

*Page 89, Paragraph 513.*—Change second sentence to read "The plates must be placed on the car so that the center of gravity of the load (center line of plates) will be in the longitudinal

center line of the car, if necessary filler pieces may be placed between post and side boards to accomplish this"

*Page 89, Paragraph 513.*—Change sentence beginning "When used, the size of bearing-pieces is optional," to read "When used, the size of bearing-pieces is optional, but they must be located opposite each post and longitudinal shifting of the plates prevented by either stop blocks spiked to side and floor of the car or by horizontal tie rods across car."

#### ROUND PLATES, FLAT OR FLANGED

*Page 90, Paragraph 513.*—Change the last sentence "blocks securely spiked each edge of the plates" to read "To prevent longitudinal shifting, stop blocks 6 in. by 8 in. must be either bolted to the floor of the car or secured by cleats spiked to the sides and floor of the car."

*Page 90, Paragraph 514.*—Revise as follows: "Gondola cars loaded with plates or other material on the floor of the car may have plates that are too wide for the car, loaded on top of the car sides when the height of the sides does not exceed three feet (See Fig. 38-D.) Such superimposed plates must be supported by posts, one set of posts for each length of lading with a minimum of three sets of posts for each tier of plates. Side motion to be prevented by not less than two clamps consisting of a clamping-piece secured through the side boards of the car by an angle rod, the vertical leg passing through the clamping-piece and the horizontal leg through the side board of the car. Longitudinal motion to be prevented by struts against the end of the lading and spiked or bolted to the side of the car."

*Page 102, Paragraph 527.*—Revise to read "When bearing-pieces are on the car floor they must be over the car bolster or between bolsters. When one or both bearing-pieces are located on top of the car sides, they may be placed within twelve inches of either side of the center line of the car bolsters.

*Page 120, Paragraph 555.*—Revise to read as follows: "Material loaded on gondola cars with drop ends or on flat cars, as shown in Figs. 55 and 56, must have one hardwood bearing-piece not less than 10 in. by 10 in. for loads up to 65,000 lb. per bearing-piece and not less than 12 in. by 12 in. for loads exceeding 65,000 lb. per bearing-piece (see paragraph 507 for light loads), secured to the floor of each car with 7/8 in. bolts."

*Paragraph 555-A.*—When the lading consists of I-beams or similar material lying flat, and the load is 40,000 lb. or more per bearing-piece, or where there is danger of the flanges cutting into the bearing-piece, the webs must be supported by web-pieces or the lading must be placed on pivoted bolsters. (See Fig. 42.)

*Paragraph 555-B.* In placing lading on cars the following general requirements should be followed. (a) Make the width of the load as great as possible consistent with side clearance; (b) the longest pieces must be placed at the bottom of the load and, when possible, near the center of the pile; (c) When the lading consists of different kinds of material such as I-beams and angles, spacing blocks not less than 2 in. by 8 in. in section placed over and in line with the bearing-pieces may be used between the various kinds of material to properly align and stabilize the load. (See Fig. 42); (d) All structural material should be interlaced as far as practicable to prevent independent side motion; (e) The various tiers of the lading must be moved close together. Where space is left between tiers it must be filled up with upright spacers located at the bearing-pieces and binders so as to make a compact load when the binders are drawn tight. These spacing pieces must be secured at the top against falling out; (f) Height of the load is to be measured from the top of the bearing-piece to the top of the load; (g) Loads are limited to six feet in height and 180,000 lb. on the two bearing-pieces.

*Paragraph 555-C.* A clamp consisting of a hardwood top clamping-piece 6 in. by 8 in. in section and two vertical rods 1 1/4 in. in diameter placed close to the load and passing through the clamping-piece, the bearing-piece and the floor of the car shall be applied at each bearing-piece as shown in

Fig. 42. Each end of the clamping-piece shall have a 1/2 in. bolt with a suitable washer under the head and a nut to prevent the clamping-piece from splitting. If the load is 24 in. in height or over, braces 4 in. by 6 in. for loads up to 5 ft. in height and 6 in. by 8 in. for loads 5 ft. and not over 6 ft. in height must be added as shown in Fig. 46. The batter of the brace should be as great as possible. The clamping-piece at the top of the load should just clear the load when braces are used.

Paragraph 555-D. Binders consisting of two vertical hardwood pieces of timber 6 in. by 8 in. in section with 1/2 in. bolts and a suitable washer under the head and a nut in each end to prevent splitting, drawn together by means of two 1 1/4 in. rods, one on top and one below the load, shall be applied to all loads as follows: Loads up to 4 ft. in height, one binder located midway between bearing pieces. Loads 4 ft. and up to 5 ft. in height, two binders, one adjacent to each bearing-piece (either side) and 6 in. from it. Loads 5 ft. and not over 6 ft. in height, three binders, one adjacent to each bearing-piece and one midway between bearing-pieces.

Page 120, Paragraph 556.—The following notes should be added.

NOTE 1.—The side clearance given in paragraph 556 for a triple load relates to a load on three cars with the bearing-pieces located on the first and third cars and the center car acting as an idler.

NOTE 2.—A twin load supported on bearing-pieces on the first and second cars with the overhanging load over the third car, either with or without sliding-pieces on the third car, should be treated as a twin load for side clearance. The overhang governs the width of the load according to the tables under paragraph 554. The clearance required on each side of the overhang is one-half the difference between the width given in the table and ten feet.

Paragraph 558.—Change the reference to Fig. 47 in the second line of this rule to read: Fig. 48.

**BEARING-PIECES TO BE PROVIDED WITH VERTICAL RODS AND CLAMPING-PIECES**

Paragraph 559. Revised to read: "The bearing-pieces only are to be provided with vertical rods and clamping-pieces. When the bearing-piece is located on top sides of gondola cars it must be secured by cross braces and diagonal struts, as shown in Figs. 49, 50 and 54, to prevent breaking down of the sides of the car when going around curves. When the load, measured from top of bearing-piece to top of load, exceeds 24 in. in height the bracing for the clamping-piece on top of the load must be as shown in Fig. 46."

**CENTER-POSTS AND BEARING-PIECE CROSS BRACES MAY BE OMITTED**

Paragraph 560. Revised to read: "For twin load of plates, structural bars and shapes carried on two bearing-pieces not less than 8 in. by 10 in. in section (with or without sliding-pieces) located on top sides of car, the center post and bearing-piece cross braces may be omitted if the total weight of lading does not exceed 20,000 lb. or 10,000 lb. per bearing-piece.

**Rule Governing Loading of Automobiles, Trucks and Trailers on Freight Cars**

1300. Cars must be carefully examined, all defects remedied, and must be properly cambered.

1301. Cars should be in such condition that the trucks can curve freely. The maximum side-bearing clearance for loaded cars must not be more than 3/16 in. per side-bearing for loads less than 10 ft. high from top of rail, and must not exceed 3/16 in. per side-bearing for loads 10 ft. high or over from top of rail.

1302. All single cars must be so loaded that one hand brake is accessible and operative. There must be a clearance of at least six inches between the brake wheel and the lading, this clearance to extend the width of the car.

1303. The lading must be so placed on the car that there will not be more weight on one side of the car than on the other.

1304. The height and width of lading must be governed by the clearance limits of the roads over which the lading is to pass.

1305. All clamping-pieces, bearing-pieces, braces and

blocks must be sound, straight-grained lumber (hardwood preferred) and free from knots that materially impair their strength, or may be rolled or built up steel sections of equal strength. Decking or staging may be of lumber or steel construction.

1306. All trucks measuring more than 14 ft. over all should be loaded on open top railway freight cars, wherever

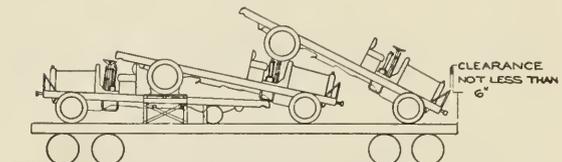

Fig. 99.—Tilting Method of Loading Three or More Automobile Trucks on Open Top Freight Cars

possible. Load freight cars as nearly as possible to capacity, using such of the methods given in the following specifications as will obtain the most economical results.

1307. Never load one vehicle, only, on a freight car, when it is possible to avoid it. Two trucks each 22 ft. long can be

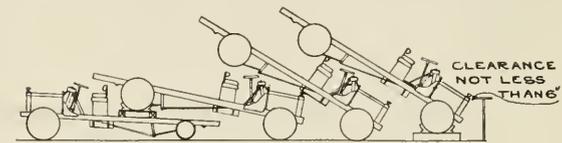

Fig. 99a.—Tilting Method of Loading Four or Five Automobile Trucks on Open Top Freight Car

loaded on 35 ft. freight car by tilting one of the trucks. Three trucks each 22 ft. long can be loaded on 40 ft. car by tilting two trucks. Four trucks each 22 ft. long can be loaded on a 45 ft. car by tilting three trucks. See Figs. 99, 99-A and 99-B. (When tilting, the wheels of either end of the vehicle may rest on the floor of the car, the other end raised.)

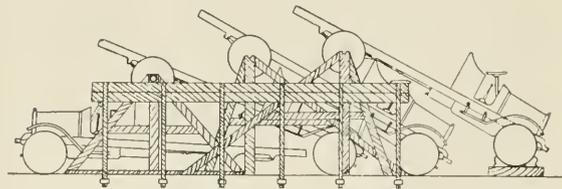

Fig. 99b.—Tilting Method of Loading Four or Five Automobile Trucks on Open Top Freight Car

1308. Where three trucks are to be loaded on a freight car which is long enough to hold two on the floor, back to back, the third truck can be loaded on top of the other two. This is done by fastening cross beams on the frames of each of the other two lower trucks with J- or U-bolts. Upon these

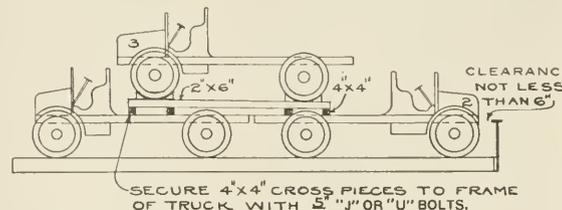

Fig. 99c.—Manner of Loading One Auto Truck on the Frames of the Two Trucks Loaded on the Floor of the Car

beams is mounted a board which will support the wheels of the third truck and the blocks that hold it. See Fig. 99-C.

1309. Where the over-all length of trucks being loaded is slightly greater than the length of the freight car, safe loading can be made by removing the front or rear wheels of

V-block (see Fig. 100-M, for detail construction).

1319. (a) Where wheel blocks are used without incut heel, the back of the block must be extended so as to form an extended heel not less than 2 in. from a vertical line drawn from the back edge of the top of the block, or the block must be backed up with 2 in. by 4 in. blocks securely nailed to the floor of the car. (b) When solid axle blocks are used, they must be made from wood shown in Groups 2, 3 or 4 of paragraph 1313. (C) When the horse or truss method is used for floor loading the wood for construction must conform to paragraphs 1330, 1331 or 1332.

1320. Blocks must be one inch wider than the tire. Curved grooved blocks must be made so as to conform to the contour of the tire. For five ton trucks or heavier, increase the width of the block one inch and use one additional nail.

SIZE OF BLOCKS WITH INCUT OR EXTENDED HEELS

For tires to 30 in. in diameter.....	6 in. high by 10 in. long
For tires to 32 in. in diameter.....	7 in. high by 11 in. long
For tires to 34 in. in diameter.....	8 in. high by 12 in. long
For tires to 36 in. in diameter.....	9 in. high by 13 in. long
For tires to 40 in. in diameter.....	10 in. high by 14 in. long

Where wheel blocks are used without incut or extended heel, add 2 in. to the above lengths.

1321. For tires seven inches wide or wider, use plain curved blocks. (See Fig. 100-A, Blocks No. 5 and No. 6.)

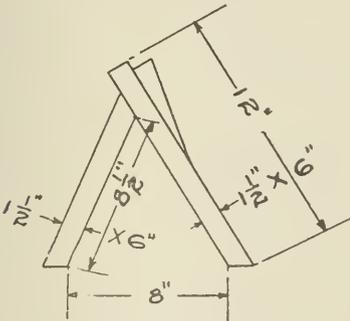

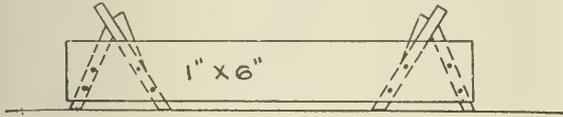

Fig 100m.—These are Minimum Dimensions. The Spread of the Block Must Not Exceed 90 deg.

1322. (a) When using the three-piece A-block or a straight faced solid block, a grooved or triangular shaped block should be fastened to the top so as to bring the resistance to the highest point of the block. (See Fig. 100-A, Blocks No. 7 and No. 9.) (B) In lieu of the foregoing, blocks as per Fig. 100-N may be used.

Loading Instructions for Automobiles, Trucks and Trailers

1323. (a) In raising vehicles for tilting or double-decking, the tackle should be secured by means of a hook or loop fastened to the side or end posts of the car. The tackle should not be fastened to the ridge pole or carlines.

(b) When a vehicle is loaded on the floor, chock all four wheels, using two wheel blocks to each tread, or solid axle blocks, or secure the front axle by two horses or truss blocks and tie the rear wheels securely to the floor, as per paragraphs 1324, 1325 or 1326.

(c) If a solid axle block is used, a 2 in. by 4 in., 24 in. long must be securely nailed to the block and to the floor of the car with not less than six 20-penny nails (cement-coated preferred). This 2 in. by 4 in. may be omitted in connection with the front axle blocks. A solid block 8 in. high must have a 14 in. base, and for higher blocks the base must be in proportion to the increase in height.

(d) If the horse or truss method is used, paragraph 1349 governs the manner of securing it to the floor of the car.

(e) If a solid block is employed, use not less than three 20-penny nails (cement-coated preferred) at the back and one 10-penny nail (cement-coated preferred) on the outer side. If side strips are used, the 10-penny nail on the outside may be omitted.

(f) If a three-piece A-block is employed, use not less than three 20-penny nails (cement-coated preferred) at back and two on the end next to the tire, one on each side.

(g) With all solid grooved blocks having incut or extended heel made from Groups 2, 3 or 4 and when loading vehicles weighing 3,000 lb. or less, side strips are unnecessary.

(h) A-type blocks must be constructed so that the bottom board projects sufficiently far to the rear to act as a heel block.

(i) When loading, emergency brakes should be set.

(j) The distance between any two vehicles at the nearest points loaded on a freight car must not be less than 2 in. horizontally and 4 in. vertically.

1324. Each wheel must be tied to the floor with a strap and

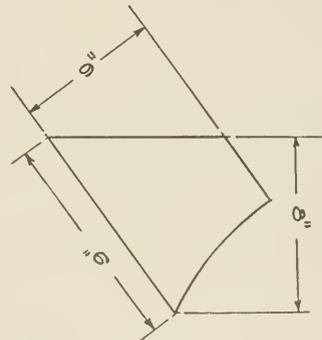

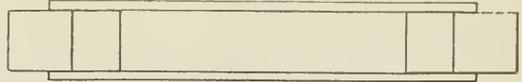

Fig. 100n

each strap must have an ultimate tensile strength equal to one-fourth the weight of the vehicle, for which purpose rope is recommended. (See Fig. 100.) The following table may be used for estimating the size of manilla or hemp rope to be used.

1/2 in. diameter.....	2,450 lb. ultimate tensile strength
5/8 in. diameter.....	4,000 lb. ultimate tensile strength
3/4 in. diameter.....	4,900 lb. ultimate tensile strength
7/8 in. diameter.....	5,900 lb. ultimate tensile strength
1 in. diameter.....	7,900 lb. ultimate tensile strength
1 1/8 in. diameter.....	8,200 lb. ultimate tensile strength

(Sisal rope possesses 25 per cent less strength than manilla or hemp rope.)

1325. If rope is used for tying down vehicles which have a varnish finish, the rope should be wrapped with burlap or cotton cloth around that portion coming in contact with the spoke and felloe.

1326. (a) A metal clip or wood block should be used to fasten the ends of the rope to the car floor. The metal clip should be stamped to fit the rope and should be so made that two nails pass through the clip and rope, and two nails through the wings of the clip. The wood blocks should be not less than 2 in. by 4 in. by 6 in. grooved to fit over and pinch the rope. Clips or wood blocks should be spiked down over each end of the

rope as close to the wheel as practical. (See Fig. 100 for cut of metal rope clip.)

(b) To apply the rope to the wheel. If a spoke wheel—nail one end to the floor with one 10-penny nail (cement-coated preferred), then secure the clip or block to this end of the rope close to the wheel, cross the rope around the spoke, stretch the other end out and secure it with a 10-penny nail (cement-coated preferred) at the extreme end, after which apply a block or clip to the rope, drawing it down and making it taut. If a wire

diameter of knots in the center half of any side shall not exceed one-quarter the width of that side. No knot on the vertical side shall be within one-quarter of the width of that side from the upper and lower edges.

1330. The principal woods used for double-decking and tilting devices and for cross bracing are grouped as follows:

GROUP No. 1		
White Pine	Chestnut	Noble Fir
Norway Pine	Butternut	Magnolia
Aspen	Redwood	Buckeye
Spruce	Cucumber	White Fir
Western Yellow Pine	Sugar Pine	Cedar
Cottonwood	Cypress	Alpine Fir
Yellow Poplar	Basswood	Lodgepole Pine
Balsam Fir	Willow	
GROUP No. 2		
Ash	Oak	Southern Yellow Pine
Hemlock	Maple	Blackberry
Elm	Beech	Douglas Fir
Red Gum	Virginia and North Carolina Pine	Black Gum
Sycamore	Tupelo	Birch
Larch		

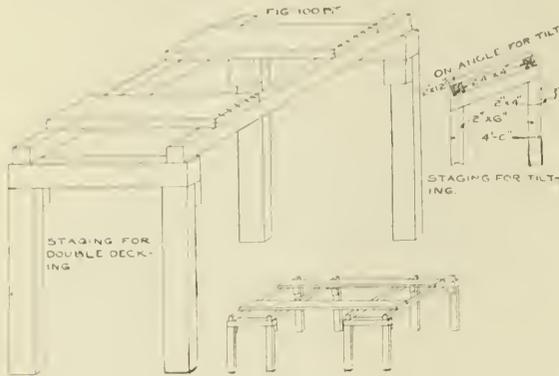

Fig. 100b.—Staging for Double Decking and Tilting

wheel—pass the rope over the felloe and fasten on the inside and outside as above. If a solid wheel—the rope may be passed over the hub. (c) If canvas or burlap straps are used, they must be fastened to the floor with blocks of not less than 1 in. by 4 in. lumber, not less than 6 in. long. The strap must be given one turn around each block and the blocks nailed to the floor with not less than 12-penny nails (cement-coated preferred). A metal stamping, not less than one 1/32 in. in thickness with 1/4 in. radius, may be used in lieu of a wooden block in securing the burlap to the floor of the car.

NAILS

1327. Nails (cement coated preferred) must be as follows: Not less than 20-penny nails for wheel blocks (except the side nail in a solid block which should be a 10-penny nail), 20-penny nails in the heel blocks and 10-penny nails in the side strips and through the rope and rope clips. Where wood blocks are used for tying down the rope 20-penny nails (cement-coated preferred) must be used.

TILTING AND DOUBLE-DECKING

1328. Lumber to be used in construction of horses must be sound (free from decay and dot) and uniform in thickness

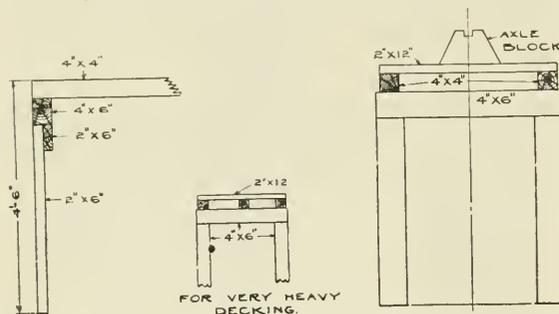

Fig. 100c.—Staging for Double Decking

and width. The supporting braces must be free from knots greater than one-fourth the width of the face of the board, and cross bracing must be free from knots greater than one-third of the width of the boards. No knots shall be permitted that interfere with the nailing.

1329. Lumber to be used for beams in staging shall be of high class structural material free from rot, loose or rotten knots and dot. When the beams are cut to size the aggregate

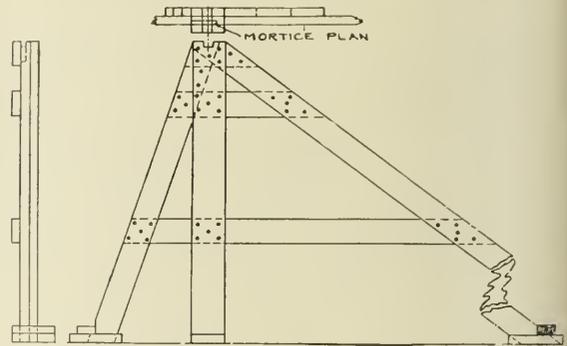

Fig. 100d.—Double Decking Horse with Mortise Head

1335. When two or more vehicles are tilted on the same freight car, the horses used for tilting are exactly the same as the horses for double-decking. Where only one vehicle is tilted, the horse has to take the strain alone, both forward and backward, and the construction differs accordingly.

1336. The outside legs of this horse are each of equal length and are braced at the bottom by a piece of 2 in. by 4 in. material spanning the entire length of the horse, properly beveled to fit the inward slope and nailed securely to the foot before the horse is placed in position. This foot brace is then nailed to the floor of the freight car. The horse is otherwise braced the same as the double-decking. (See Fig. 100-D.)

1337. The truss or horse method is the one recommended. It is adaptable to any size or kind of vehicle. The horse required for vehicles up to 3,000 lb. in weight, consists of two legs to the floor and an arm to the wall of the freight car. Four horses are required for double-decking and two for tilting vehicles, one for each wheel or axle raised. (See paragraph 1305 which governs.)

1338. The horse required for vehicles over 3,000 lb. weight, consists of three legs to the floor and an arm to the wall. In the lighter horse the lumber used for the legs consists of 2 in. by 6 in. material. Where three legs are used, this size is sufficient for weights up to 5,000 lb. For increased weights increase the size of the lumber; for instance, a truck weighing 10,000 lb. would have a central leg not less than 4 in. by 8 in. (See Figs. 100-H and 100-I.) (See paragraph 1305 which governs.)

1339. The horses for automobiles and light trucks are made approximately 6 ft. high, one leg 6 1/2 ft. long and the other

10 ft. long. For larger vehicles, the legs are proportionately longer. The long legs of the front and rear horses on each side overlap each other and are nailed together after being put in place. It is unnecessary to remove the wheel where the hub caps are strong enough to take the weight of the vehicle. The horses must be reinforced by cross pieces of 2 in. by 6 in. material at the top and 1 in. by 6 in. material in the middle. (See paragraph 1305 which governs.)

1340. Another style of horse which may be used for vehicles weighing not more than 2,600 lb. net, consists of one leg to the floor 4 in. by 4 in. and three arms 2 in. by 6 in. by 36 in. to the

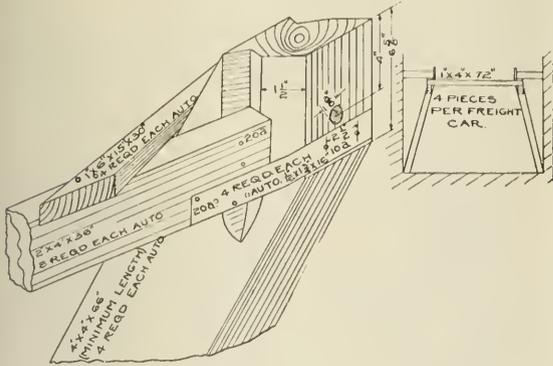

Fig. 100g.

wall. If the leg to the floor is made of 4 in. by 6 in. and the leg and arms are secured by steel straps or stampings, vehicles not exceeding 3,200 lb. net, may be loaded by this method. (See paragraph 1305 which governs.)

1341. The arms support the upright leg horizontally and are fastened to the car wall at the belt rail. One end of each arm rests in a notch or offset which has been made in the head of the upright and is fastened with 20-penny nails

is used to fasten the upright leg to the car floor. See paragraph 1305 which governs.)

1344. The two rear horses and the two front horses, respectively, are fastened together laterally, with a timber 1 in. by 4 in. by 72 in. (See paragraph 1305 which governs.)

1345. The foot of each upright must be braced fore and aft with blocks 2 in. by 4 in. by 6 in. (See paragraph 1305 which governs.)

1346. The horizontal arms are further braced by steel strapping and by nailing to them a board of 2 in. by 6 in. back of the upright support. (See paragraph 1305 which governs.)

1347. Another adaption of the same system for automobiles not over 2,600 lb., is as follows: An upright support 4 in. by 4 in. by 66 in. (minimum length) mortised to take a specially constructed head (see Fig. 100-G). This head receives the end of two arms which take the longitudinal strains and one arm which takes the lateral strains. The arms are all made from material 2 in. by 4 in. and are reinforced on the car wall with heel blocks and at the head with steel strapping. (See paragraph 1305 which governs.)

1348. A further reinforcement consist of a brace of 2 in. by 4 in. lumber from a block fastened to the upright immediately below the head to the floor, at an angle of about 45 deg. This brace is reinforced at the floor with a heel block not less than 2 in. by 4 in. by 6 in. (See paragraph 1305 which governs.)

1349. It is best to fasten the legs of the horses to the car

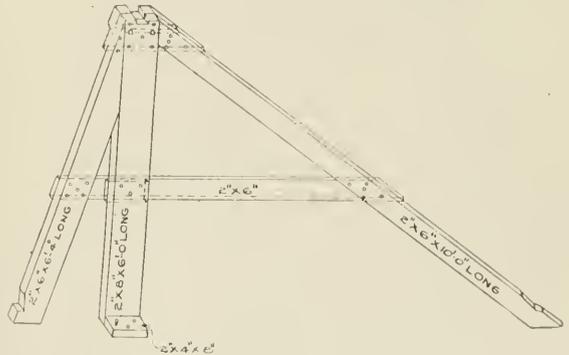

Fig. 100i.—Double Decking Horse With 3 Leg Eutting

floor by using an angular metal stamping 8 in. long and the width of the supporting members, but if these are found difficult to obtain a wooden foot lock may be used consisting of two pieces of 2 in. by 4 in. material nailed one on each side of the foot with a third piece across fitting into a notch made in the foot to receive it. (See Fig. 100-D.) (See paragraph 1305 which governs.)

1350. The 2 in. by 4 in. blocks on both sides of the foot should be beveled to accommodate themselves to the slant of the horse so as to make a snug fit. The inside block should be nailed to the foot before it is placed in the freight car. (See paragraph 1305 which governs.)

1351. There are several methods of construction which have been approved and which may be used in accordance with the necessities or requirements made by the special construction of individual vehicles, as follows:

HORSE HEAD CONSTRUCTION

The quickest and cheapest method of construction is to form the head of the horse by bringing together the two pieces forming the legs so that they abut. This head should be notched to receive the hub or axle, and cross braces nailed and bolted on with 3/8 in. bolts through the top brace and legs. Where the vehicle is loaded on its hubs the top of the head should be twice the width of the hub. (See Fig. 100-E.) (See paragraph 1305 which governs.)

1352. The heavier vehicles require the addition of a third leg to the horse. The horse may then be constructed in any one of three ways, depending upon the weight or construction of the vehicle to be loaded.

(a) A center leg with two side legs abutting, cross braces nailed and bolted with two 3/8 in. bolts through the top braces and side legs. (See Fig. 100-I.)

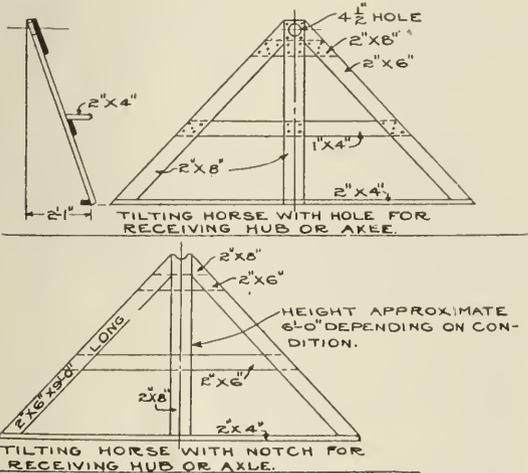

Fig. 100e.

(cement-coated preferred.) If the arm comes above or below the belt rail a runner of 2 in. by 6 in. lumber must be nailed along the side of the box car and the arms nailed to this runner. (See paragraph 1305 which governs.)

1342. At the end of each arm resting against the freight car wall must be placed a heel block not less than 2 in. by 6 in. by 8 in. (See paragraph 1305 which governs.)

1343. The third arm should be placed from the head of the upright upwards and outward to the car wall and fastened in place with a heel block, secured so as to prevent any upward movement of the horse. This arm is not necessary if a steel strap or stamping 8 in. long and the width of the upright member

(b) Side legs abutting at the top. The center leg fastened to the head thus formed, the whole cross braced, nailed and bolted

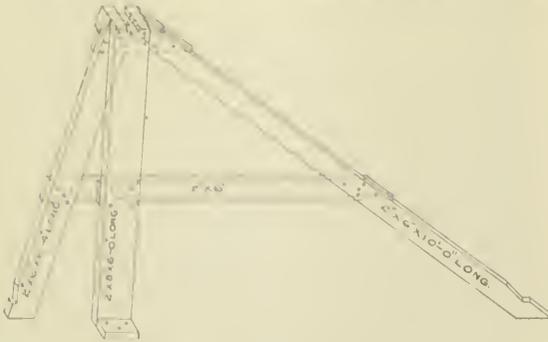

Fig. 100h.—Double Decking Horse With Side Leg Butting

with two  $\frac{3}{8}$  in. bolts through the top brace, side legs and center leg. (See Fig. 100-H.)

(c) Side legs mortised at the top, the center leg fastened to the

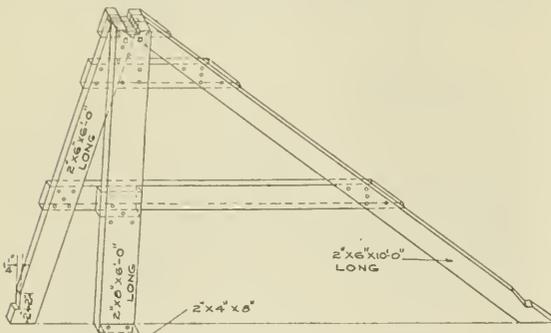

Fig. 100f.—Double Decking Horse With Mortised Head

head thus formed. The whole cross braced, nailed and bolted with two  $\frac{3}{8}$  in. bolts through the top brace, side legs and center leg. (See Fig. 100-F.)

1353. Another form of head construction may be used

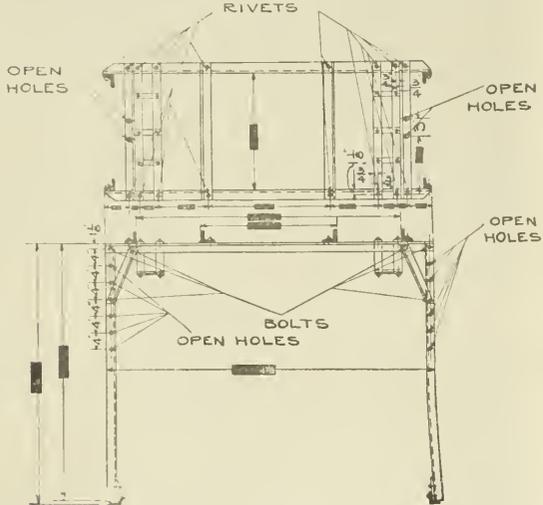

Fig. 100j.—Steel Decking for Use in Tilting or Double Decking Automobiles and Trucks

wherever desired; namely: A higher horse with "all-around head" having an opening to receive the hub or axle as shown in Fig. 100-E. (See paragraph 1305 which governs.)

1354. The lateral strains are taken on an arm made of not less than 2 in. by 4 in. material fastened horizontally between the horse and the wall of the freight car. (See Fig. 100-E.) The arm is supported at each end on a block 2 in. by 4 in. by 6 in. and fastened down with steel strapping. To hold the vehicle securely in the horse and to prevent any bounce or upward movement, steel traps are passed over the hubs or axles, crossed and nailed securely to the horse. A piece of two-ply 10-oz. burlap is placed under the strap to prevent chafing. (See paragraph 1305 which governs.)

1355. When steel decking, as shown in Figs. 100-J and 100-K, is used, the following precautions should be taken: (a) Lock nuts should be used on all bolts. (b) Axles of automobiles, trucks or trailers should be fastened securely so the fastening will not come off if the tires deflate. (c) Angle A should be kept wrapped to avoid tire chafing. (d) All floor angles should be nailed through all holes and at the front and rear end of the

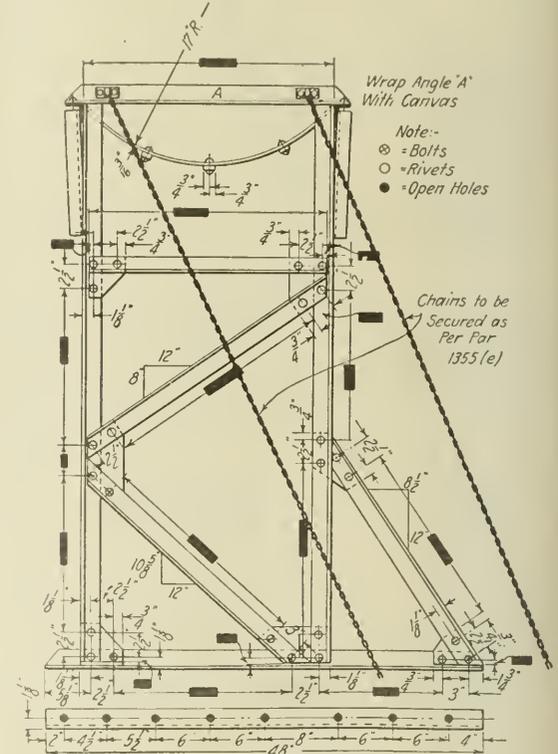

Fig. 100k.—End View of 100j

angle with not less than 20-penny nails, the top  $\frac{1}{2}$  in. of the nail to be bent over. (e) Two chains with plates securely attached in direction as shown should be used to tie each leg of the deck with a downward tendency and be securely fastened to the bracing of the car side which must be heavier than 2 in. by 4 in. and the anchor must not be more than  $2\frac{1}{2}$  ft. from the car floor. These chains should not be fastened to the car floor except in exceptional circumstances and then should be reinforced with 18 in. pieces of 2 in. by 6 in. securely nailed to the car floor over the plates. On flat cars fasten chains to side sills. (See Fig. 100-K.)

(f) The toes of the deck should be set toward the center of the vehicle supported. This applies to half decks or tilted loads as well. The chains for decks of tilted loads should preferably be used one in each direction.

1356. In lieu of the above methods of loading, automobiles may be loaded on their side as per Fig. 100-O.

PATENTS

1357. Of the methods of double-decking or superimposing automobiles, trucks and trailers, the staging system described

in paragraph 1334 is the only system not covered by patents and, therefore, the other systems specified cannot be used without purchase or proper authority from the patentee or his agent. The incut heel block shown in Fig. 100-A is also patented and subject to the same conditions. (See paragraph 1305 which permits the use of other constructions of equal strength.)

The committee recommends that, in view of the increased cost of the Loading Rules, these proposed changes and additions, if approved, be printed in the form of a supplement to the

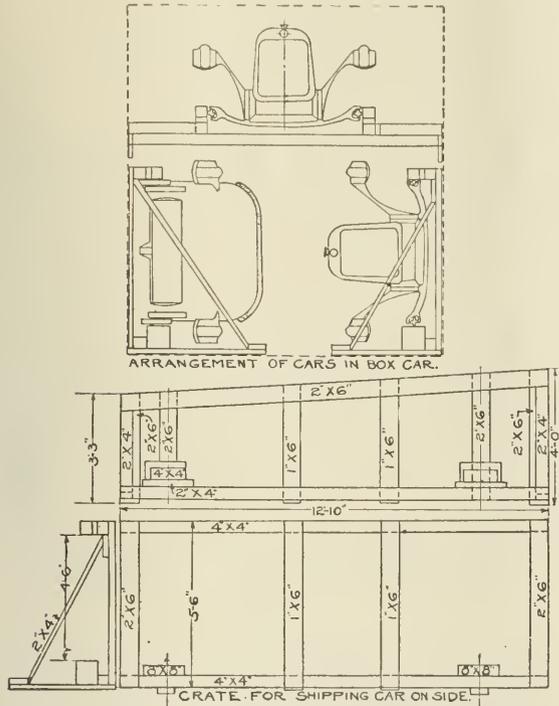

Fig. 100a.—Manner of Securing Automobiles in Box Cars When Loaded on the Sides

rules rather than revising the entire code, and that when the present stock of complete Loading Rules is exhausted the secretary be authorized to incorporate this supplement in any reprint made.

The report is signed by J. J. Burch (Chairman), Norfolk & Western; A. B. Corinth, Atlantic Coast Line; R. L. Kleine, Pennsylvania; H. H. Harvey, Chicago, Burlington & Quincy; C. N. Swanson, Atchison, Topeka & Santa Fe; E. J. Robertson, Minneapolis, St. Paul & Sault Ste. Marie; J. E. Mehan, Chicago, Milwaukee & St. Paul, and Samuel Lynn, Pittsburgh & Lake Erie.

Before presenting the report of the Committee on Loading Rules, Mr. Burch said:

Since the printing of the Loading Rules, your committee has found it desirable to make some slight changes and additions in the report which they would like to have included in the report.

**Discussion**

Mr. Burch: The first sentence of paragraph 1306 will be cut out. The committee thinks it advisable to add a note to paragraph 1324, as follows:

Note: Any mechanical device for holding down the wheels equally efficient to that specified will be accepted as an alternative arrangement.

Mr. Gaines: May I interrupt one moment? Inasmuch as this report has been distributed, I think it is unnecessary to read all these details. I think it would be much better to call attention to what changes have been made, and answer any questions that may be asked from the floor on the subject. We are taking up a long time on this detail work.

Mr. Burch: I was reading that on account of the change, which reads as follows: The committee has decided to

change paragraph 1340, the third line "2 x 6," to read "2 x 4 x 36," and the fourth line—

Mr. Milner: Can the speaker try to make himself heard back here, please?

Mr. Barnes: I would like to amend the motion, and in view of the fact we have all had the paper, and ample chance to read it, I move that the paper as prepared be accepted, and referred to letter ballot.

Mr. Burch: You haven't heard the paper as prepared. There are some slight changes which have been made in the report since the printed copy went out. Paragraph 1340, the third line, should read: "4 in. and 3 arms 2 x 4 in.," instead of "2 x 6 in.," and the fourth line, after the word "and," "the arms 2 in. x 6 in. x 26 in. and." That is to clarify the paragraph.

Paragraph 1341, at the end of the sentence, line 4, add "See Fig. 100G."

Paragraph 1346, line 2, change "2 x 6" to read "1 x 6 x 15 x 30 in." That is to make the paragraph conform to the cut.

Because of an accident which we had on the Pennsylvania with some steel loading we would like to ask that paragraphs 555, 555A, 555B, 555C and 555D be approved by the convention, so that the rules can be made effective at once. I think that is very necessary because these rules are now followed by some other steel shippers. I overlooked stating that I would like to add a sentence to the paragraph referring to spacing blocks, making the composite spacing blocks an alternative method, and the committee will prepare cuts showing the block to be used and will follow up the subject of blocks during the coming year and make a report at the next convention.

C. M. Swanson (A. T. & S. F.): Being a member of the Loading Rules Committee, I know of the untiring effort of our chairman for the last two years in changing the rules into sections, for different commodities. We have had meetings all over the country with manufacturers of steel, tubes, automobiles, concrete pipe, and lumber dealers, and I do not believe that at any time there has been such hearty co-operation between the carriers and the manufacturers as there is at the present time. I feel that the work that the chairman and the committee have done has been the means of bringing together in closer co-operation the interests of the carrier and the manufacturer. The great majority of the suggestions are made by the manufacturers owing to their large experience in handling their special commodity. I also find that the manufacturers are not supplied sufficiently with the loading rules. The Loading Rules are not distributed to the men who actually should have them.

Mr. Gaines: The committee on Loading Rules has done a very fine job in segregating these rules. About a year ago I was delegated by the Director of the Southern Region to go down on the west coast of Florida and settle a three-cornered fight between the Emergency Fleet Corporation, a timber contractor and some of the railroads, regarding loading piles for Hog Island. I thought I knew something about the Loading Rules, but when I came to go into the details of it I found that I did not know anywhere near as much as I thought; then I stepped down and tried to study them out. I found that Rule 101 tells you to look at Rule 3, and when you look at Rule 3 that tells you to look at Rule 48, and then I wondered what a car inspector out on the job ever could tell about it. I think this report will go a great way toward simplifying the work for the people doing the loading, and the man loading piles, or loading concrete pipe, or any other commodity, can look at the rules covering that commodity instead of referring back from one rule to another rule, dealing with something else.

A motion that the recommendation of the committee, in regard to the special circular being issued, be adopted, was carried.

Mr. Snyder: I want to add one suggestion: The rule calling for the spacing block is given in the front of the book, but is not repeated in the steel loading rules. It should be added to that pamphlet when that is prepared.

Secretary: That has been done. It is in every pamphlet.

Mr. Fuller: Mr. Chairman, I move you that the Rules be received and submitted to letter ballot, with the exception of that part that has already been passed on.

The Chairman: What about the spacing block suggestion? Mr. Fuller: I think that is all right. I think it should be included in all the rules.

The Chairman: They want to go back to the composite spacing block.

Mr. Fuller I haven't anything to say about that.  
 Mr. Lynn I move that the use of the composite block, as recommended, be continued for another year, so that the committee can get sufficient data to determine just what it

should do next year. I would make that as an amendment to Mr. Fuller's motion.

The amendment was put to vote and carried, and then the original motion was voted on and carried.

## Report of Committee on Car Construction

W. F. Keisel, Jr.  
 Chairman

**I**N THE PAST YEAR, the subjects referred to the Committee on Car Construction were: First: The revision of Rule 22 of the 1917 Code of Rules of Interchange; and, second: Suggested provision for side door openings 10 ft. wide in all box cars, the side door proper to be 6 ft. wide, with a removable door post, and an auxiliary door 4 ft. wide.

M. C. B. Circular of Inquiry, No. 19, was sent out to all members, asking for suggestions and recommendations for changes in Rule 22 of the Code of Interchange, and the replies thereto were carefully considered by the committee, based on

which the following rule has been formulated, and is offered herewith as a substitute for present Rule 22.

### For Cars Having Wooden Sills

Rule 22: Draft timbers must not be spliced. Longitudinal sills must not be spliced between or over cross-bearers. Longitudinal

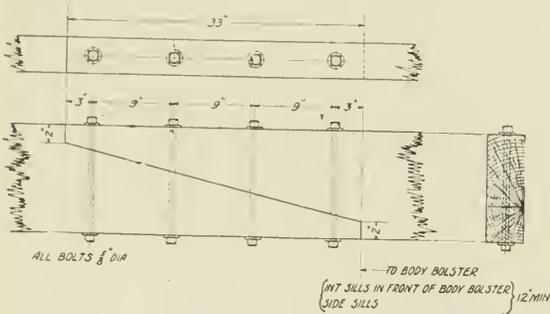

Fig. 10

sills (intermediate or side sills) may be spliced at both ends, on either side of the body bolster. The nearest part of the

splice must not be less than 12 inches from the edge of the body bolster. Intermediate sills, spliced between the the body bolster and cross-bearer, must be reinforced as per Figs. 11 or 11-A. Intermediate sills, spliced between the bolster and the end of the car, and side sills, spliced on either side of the bolster, must be in accordance with Figs. 10 or 10-A.

When splicing or renewing any longitudinal sill, the reinforcement shall be applied to all existing non-reinforced splices, in all sills except side sills. If the old splice is a four-bolt splice, it shall be reinforced in accordance with Figs. 11 or 11-A. If the old splice is a three-bolt splice, the reinforcement shall be applied in accordance with Fig. 15.

Center sills shall be spliced only between the body bolster and cross-tie timber. The nearest part of the splice must not be

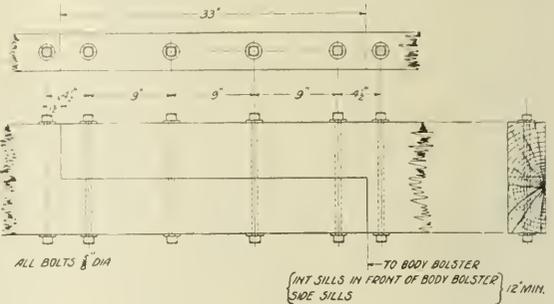

Fig. 10a

less than 24 in. from the edge of the body bolster. Center sill splices shall be in accordance with Fig. 11. The diameter of horizontal or vertical splice bolts shall be 5/8 in.

### For Cars Having Steel Center Sill Splices Located at Least Seven Inches from the Face of the Bolster

Adjacent sills may be spliced. All splices shall be of the butt-joint type, reinforced on both sides by plates not over 24 in. in length, and not less than twice the length of the protruding end when the projection is less than 12 in. The reinforcing plates shall be at least as thick as the web of the sill. The splice plate on the flange side of the sill shall be U-shaped, to include flanges, while the plate on the opposite side shall cover the web only. Rivets to be placed as shown in Figs. 12 and 12-A. Where autogenous welding is available, the sills may be welded after rivet-

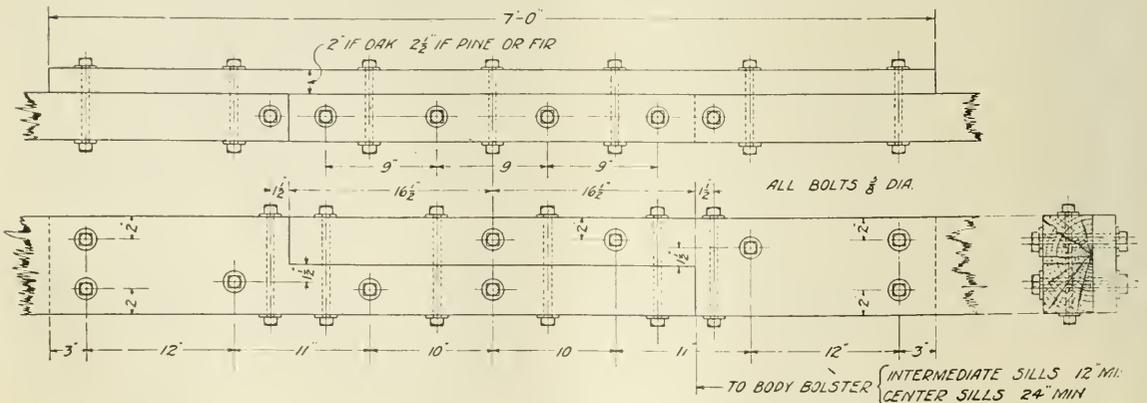

Fig. 11

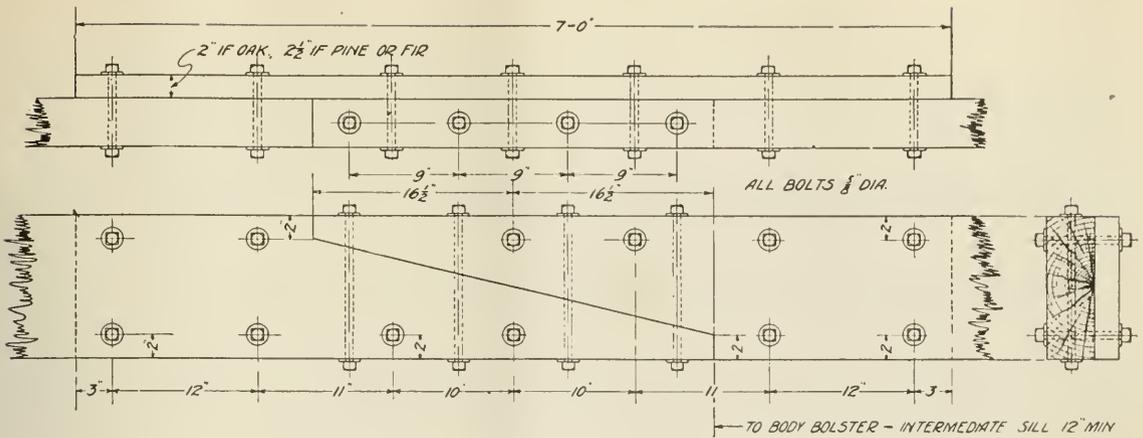

Fig. 11a

ing the U-shaped plate on the flange side, omitting the flat plate on the web side.

**For Cars Having Steel Center Sill Splices Located Between the Body Bolster and End Sill, and Less Than Eight Inches from the Face of the Bolster**

All splices shall be of the butt-joint type, with the addition of

30 in., as shown in Figs. 13 or 13-A. The rivets shall be spaced as shown.

**Side Sill Splices**

All splices must be of the butt-joint type, reinforced on both sides by plates 14 in. long. The reinforcing plates shall be at least as thick as the web of the sill. The splice plate on the

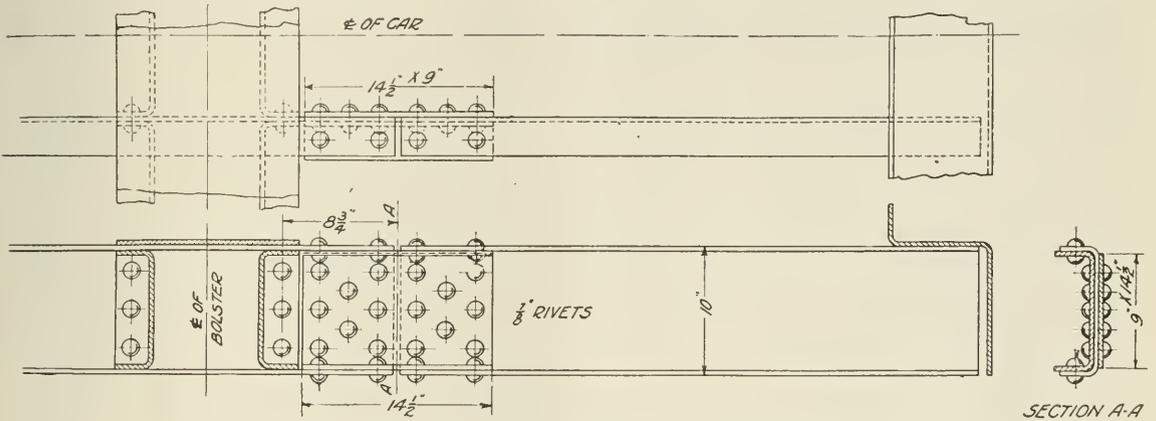

Fig. 12.—Steel Center Sill Splice in Front of Bolster

a cover plate. The splice plates shall be at least as thick as the web of the sill. They may be located on either side of the sill, extending forward and back of the center line of the bolster

flange side of the sill shall cover the web only, while the plate on the opposite side shall be flanged over the bottom leg of the side sill, and riveted to it, as shown in Fig. 14. The splice may

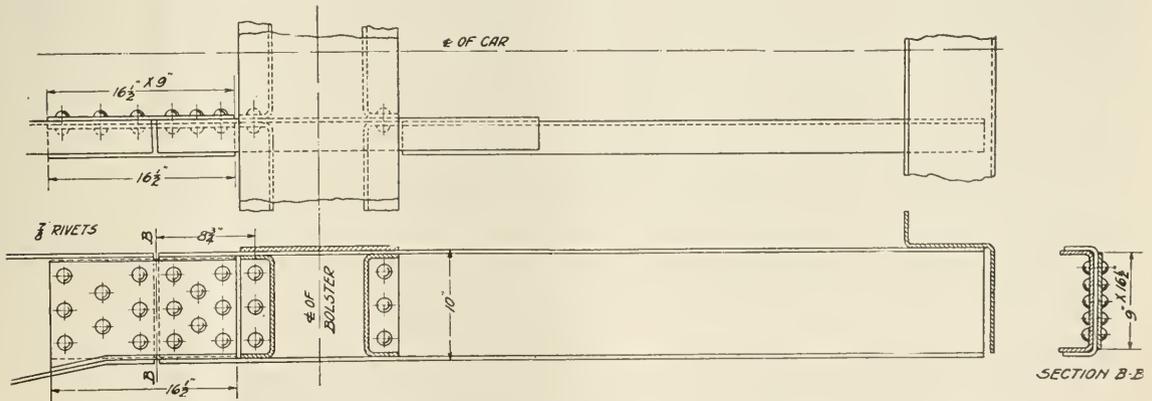

Fig. 12a.—Steel Center Sill Splice Back of Bolster

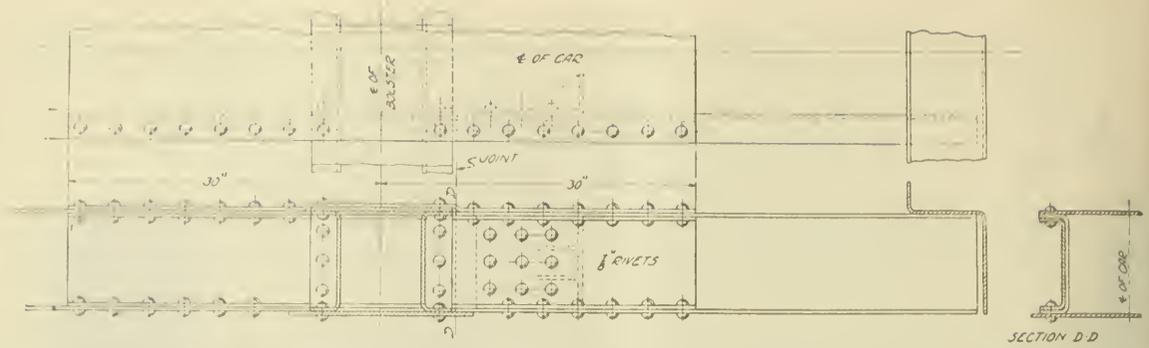

Fig. 13.—Steel Center Sill Splice (Outside), Less Than 8 Inches From Face of Body Bolster

be located on either side of the body bolster. The rivets shall be spaced as shown.

Side sills may also be welded by the autogenous process, mak-

The traffic manager of the General Motors Corporation suggests the following for box car side doors: "It has long been my contention that a 6-ft. wide side door, with a movable post,

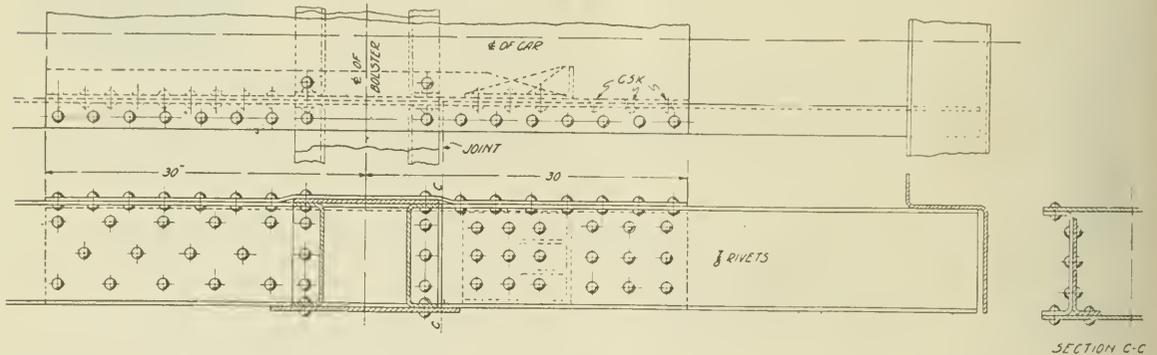

Fig. 13a.—Steel Center Sill Splice (Inside), Less Than 8 Inches From Face of Body Bolster

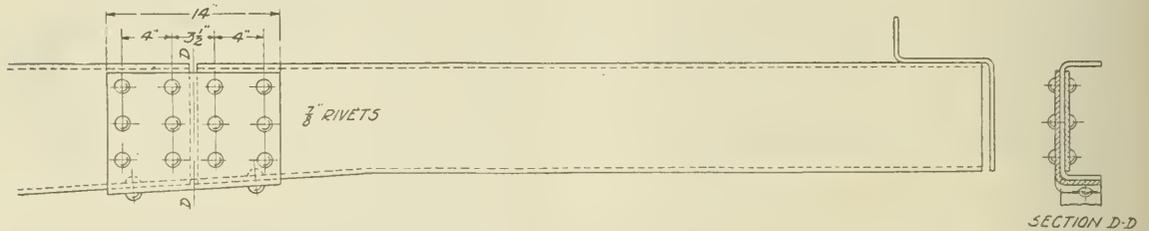

Fig. 14.—Side Sill Splice

ing the thickness of the metal through the weld one and one-half times the thickness of the metal in the sill, in which case the reinforcing plates and rivets shown in Fig. 14 may be omitted.

and a 4-ft. extension beyond, is the proper kind of a door to be used on either 36-ft., 40-ft. or 50-ft. cars. This kind of a door enables everyone to use a box car. In other words, with only

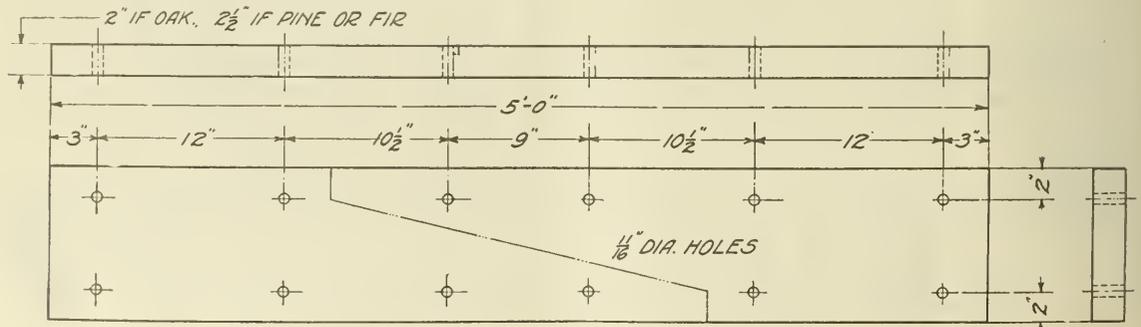

Fig. 15.—Center and Intermediate Sill Three-Bolt Splice Reinforcement

a 6-ft. door it confines the use of this box car to certain commodities, and certain other commodities, such as light and bulky articles, are excluded from the use of these cars, as it is impossible to get a light and bulky commodity in anything less than an 8 ft. wide side door—10 ft. wide preferred. If all box cars in future were equipped with the kind of a door above described, it would mean that on a car coming into our factory, loaded with any kind of commodity, when this car was unloaded we could immediately use this car for loading automobiles or trucks, by removing the post and taking advantage of the 4-ft. additional extension. This, you will note, gives a load to the car in both directions, and means that there will be practically no empty movement of a box car in any direction, as it could be used for all classes and kinds of commodities from merchandise to grain."

The point raised in the above is a matter of policy, for adoption or rejection by the management of the railroads. It, however, raises the question of providing a satisfactory design of door openings, wider than 6 ft., as a basis of construction. Special automobile cars with side door openings varying in width from 8 to 12 ft., and some with end doors 8 ft. and more in width, are in existence. If so directed, the committee will take up the task of providing such side door design.

The report is signed by W. F. Kessel, Jr. (Chairman), Pennsylvania; A. A. Ayers, New York, Chicago & St. Louis; C. E. Fuller, Union Pacific; E. G. Chenoweth, Chicago, Rock Island & Pacific; I. C. Fritts, Delaware, Lackawanna & Western; C. L. Meister, Atlantic Coast Line, and H. T. Bentley, Chicago & North Western.

After presenting the report Mr. Kiesel read the following communication from the committee.

To the Members:

Under date of June 9, 1919, your secretary, V. R. Hawthorne, sent us the following copy of communication from F. C. Ferry, master mechanic, L. H. & St. L., dated April 5, 1919:

"I am in receipt of your Circular No. S-111-No. 2, requesting suggestions as to subjects for committee investigation during the year from June, 1919, to June, 1920, reports to be submitted to the 1920 annual convention.

"Question: 'Why is it that refrigerator cars cannot be so arranged as to prevent salt water dripping on the rails, etc.; lack of such an arrangement causes untold thousands of dollars of damage every year.'

"Rule 3, Paragraph F, Rules of Interchange, Master Car Builders' Association, provides that cars lacking such an arrangement mentioned in above question, shall not be accepted in interchange after October 1, 1920. This rule has been promulgated from year to year, but has been rendered null and void and of no effect by reason of postponement of the effective date. Why not put an end to this evil and have done with it?"

The Secretary stated that he was instructed to refer this matter to the Committee on Car Construction, to investigate and report at the convention in connection with their regular report; also to consider and advise as to observations of the use of open tanks.

Your committee has made an investigation of the status of the question of salt water drippings from refrigerator cars to date.

In 1898 a committee consisting of Messrs. S. Higgins and A. M. Waitt made a report on "Rust From Salt Water Drippings." This committee presented two methods of equipping refrigerator cars without much expense, and submitted two drawings, the object being to lead the salt water to the center of the track, instead of permitting it to drop at or near the rails.

In 1910 the following rules were adopted:

1. All salt water drippings should be retained in the ice tanks and drained off only at icing stations.
2. The total capacity of drain openings should not exceed the capacity of traps, and the capacity of both drains and traps should be sufficient to release all drippings within the time limit of icing the train.
3. The mechanism adopted for handling drain valves should be simple and positive, and so designed as to insure closing the valves before hatch plugs can be returned to their places.
4. Salt water drippings should be conducted from ice tanks through the drain valves above described and thence to the outside of cars through the regular traps and drain pipes.

In the interchange rules, Rule 3, paragraph F, reads as follows: "After October 1, 1920, no car carrying products which require for their refrigeration the use of salt with ice, and which are equipped with brine tanks will be accepted in interchange,

unless provided with suitable device for retaining brine between icing stations."

We also find records that some of the members of this association have made independent investigations.

In January, 1905, C. A. Schroyer, superintendent car department, C. & N. W., wrote to important railroads operating dressed beef refrigerators, in order to ascertain the results of following the M. C. B. Recommended Practice of 1898. To the best of our knowledge he did not receive any very encouraging replies, and the consensus of opinion seemed to be that it is not feasible or desirable to consider the application of tanks for the retention of the brine. This referred only to such cars as were equipped with so-called "ice baskets," for we find that some milk cars and also some meat cars have been equipped with brine tanks, somewhat of the nature of those recommended by the M. C. B. Committee in 1910. An arrangement of this kind is shown on plate A, attached hereto. The brine tanks there shown have a pipe arrangement so installed that the upper part of the tanks can be emptied at terminals by opening certain valves, and when these valves are closed the pipe openings are at a sufficiently higher level to retain all of the brine plus the water from the ice meltage; should, however, there be too much water collect, there is a possibility for this water to overflow.

There has not been sufficient time to ascertain from all railroads how many cars they have equipped with brine tanks, but our preliminary investigation indicates that there are very few cars so equipped, and that the bulk of the refrigerator cars are equipped with so-called ice baskets, in which the ice is loaded, and all of the drippings pass out through traps to the track. On some cars there is a trough leading these drippings toward the center of the track and on other cars the traps are directly under the car side, where the drippings escape the rail. When meat is loaded in these cars it is the custom to add salt to the ice.

Although the question of guarding against damage from brine has been raised periodically, there has been little specific evidence produced to show the seriousness of the effect therefrom.

We should first determine whether this is sufficiently serious to justify making radical changes in present practice.

Explicit detail information should be obtained from the Maintenance of Way Section concerning the extent of damage, traceable to brine from refrigerator cars, that has been done to bridges, tracks and other maintenance of way structures; also whether any attempt has been made to protect these structures and with what success.

While this information is being collected, your committee will get in touch with Mr. Ferry in order to ascertain the details of damage to permanent structures on which he based his observations.

Respectfully submitted,

COMMITTEE ON CAR CONSTRUCTION.

## Discussion

Mr. Gaines: Referring to the diagonal splice shown on page 3. There is an alternate splice on the next page, and if I am not mistaken, the committee made a report to this association several years ago, showing tests made on the two forms of splice. There was no question whatever at that time that the splice shown on page four was much the stronger form of splice, and it is much the cheaper to put in a car when you are splicing sills. As it stands, I think that we ought to discard that old diagonal ship splice that you have on the first page.

Mr. Lentz: I recall the tests made in the shops at that time, and the results were as stated by Mr. Gaines.

Mr. Gaines: In addition, I am going to make a motion that in publishing this report we do away with that diagonal splice. It is expensive, is hard to make, and is not strong. I move that we eliminate it.

Mr. Goodnow: At the time that investigation was made the splice shown on page 4, as a lugging proposition, was the best, but the other splice, the ship splice, as Mr. Gaines referred to as a load carrying proposition for inner sills, was considered at that time to be a better splice than the buck splice.

Mr. Gaines: If you had that splice made accurately, possibly that might be true; but the average carpenter is not matching a diagonal ship splice, and I doubt that as a load carrying proposition, as a lugging proposition, as a pulling proposition, or in any other respect, it is as strong as the straight splice.

Mr. Keisel: We do not have this splice, shown in Fig. 10, for center sills, which take buffing action. They are used in intermediate sills, where they are under bending action, and that type of sill makes a stronger sill with that type of splice than the butt splice for bending. The report says: "Intermediate sills spliced between bolster and end of car, and side sill, spliced on either side of bolster, must be in accordance with Figs. 10 or 10-A." Therefore, it is not a buffing resistance that we get, but a bending resistance.

Mr. Gaines: I am willing to admit that, theoretically, for loading, the diagonal ship splice may be the stronger, but under practical conditions, in the car yard, you are not getting anything like what you think you are getting in theory, and you can get a straight butt splice which will be as strong, and stronger, practically, than the other. I am in favor of eliminating the diagonal splice.

Mr. Keisel: You can have either one. It reads "must be in accordance with Figs. 10 or 10-A." You can make it either diagonal or butt.

I. S. Downing (C. C. & St. L.): Some years ago two splice tests were made on the C. B. & Q. at Peoria, Ill., and Mr. Young had charge of the tests. That test showed that in no manner was the ship splice as strong as the butt, in any of the tests which we made.

John McMullen (Eric): I wonder if Mr. Gaines took into consideration that if we splice a 14 in. side sill and cut it in the center, making the butt splice, if we are going to have as good a sill, to carry the load as we would have with the ship lap splice. I think it would be a mistake to make the butt splice on all sills, because in the 14 in. sill you have 2 in. on the bottom, and that would leave 12 inches of sill, otherwise you will cut it in two and only have 7 inches.

Mr. Gaines: In the ship lap splice you have only 50 per cent when you cut it down, and I think Mr. Young answered the question as to the strength. I do not believe that one car repairer out of ten can make a perfect ship lap splice.

H. H. Harvey (C. B. & Q.): I am very much in favor of the butt splice, but this committee's recommendation is on Rules of Interchange, and you have both forms of splice. You will have to leave the report as it is and mention both kinds.

H. M. Curry (N. P.): Mr. Harvey brought out a question which came to my mind: If the recommendations formerly made were in favor of the butt splice, why was the other adopted? Some of the real old-time car men might give us some advice on that subject.

J. J. Hennessey (C. M. & St. P.): When the butt splice was first adopted it was altogether, as stated by Mr. Young, on the center sill, and leaving it optional to use either splice

on the side or intermediate sill. That was the first report we made to the association, and I believe the report of the committee to-day, to leave it optional, is a correct report.

I would not advocate the use of ship lap splices in center sill construction, but there are conditions and times when it is easier to apply a ship lap splice, especially between the body bolster and end sills on intermediate and side sills, than it is to apply the butt lap splice.

F. W. Brazier (N. Y. C. Lines): I agree with what Mr. Hennessey says. On the other hand, it is optional, and you can use either one you like. When the first ship lap splices were put into the rules it was because we had car men who were mechanics, and to-day we have not got them, and we put something easy in the rules, so that the mechanics can work it out. You can use it if you want to. The ship lap splice, as the report leaves it, is optional.

Mr. Gaines: It has been determined by actual test that the ship lap splice is not as good nor as strong as the butt splice, and to make it requires a better grade of mechanics than we have to-day. In view of the present state of the art, we should eliminate the ship lap splice from our rules, and take the one that can be made.

Chairman: How would you cover that in interchange?

Mr. Gaines: I would not bar that out in interchange.

Chairman: How do you know when it is made? A man might make a splice tomorrow and you would not know whether it was made a year ago, or six months ago.

Mr. Gaines: I would put in the straight butt splice as recommended practice to get rid of the ship lap splice. I have seen ship lap splices that did not meet within an inch.

Mr. Hennessey: If you put the butt splice in, and it does not meet within an inch, you do not know what you have then. The report leaves the matter as optional, and you must be careful not to get things into the interchange rules which will cause a turmoil for years to come. It will be impossible for an inspector in the yard to say when the sill was spliced, if you pass it along on your own road, and leave it there for years.

Mr. Gaines: As my motion was not seconded, I will withdraw that, and make another motion. The recommendation of the committee on page two says "must be in accordance with Figs. 10 or 10-A," and I now make the motion that that portion of the report be amended to read "must be in accordance with Figs. 10 or 10-A, but the latter preferred."

This motion was put to vote, and carried.

A motion that the report be accepted and go to letter ballot, and that the committee be continued to investigate the question of salt tanks was then made and carried.

## The Report of the Committee on Car Trucks

J. T. Wallis  
Chairman

UNDER DATE OF FEBRUARY 10, 1919, the secretary of the M. C. B. Association, at the request of the Car Service Section of the United States Railroad Administration, referred to the Committee on Car Trucks correspondence on the subject of marking freight equipment cars to show the load limit and requested the committee to make a report to be submitted to the Car Service Section.

This correspondence covered two points, viz.: First: Failure of axle in service due to being overloaded in accordance with the marked capacity on the cars, particularly the 60,000 lb. capacity cars.

Second: Difficulty and confusion in determining the allowable loading that may be placed on the car from the weight markings

stenciled on the cars as well as from the provisions of the M. C. B. Rules of Interchange governing the amount of load that may be carried.

The axle complication dates back to 1896, when it was found that the axles used at that time were too light to carry the load and axles of proper dimensions were designed. These axles, as subsequently modified and adopted as a standard of the association, have given satisfactory service without failure when purchased in accordance with the specifications. However, the condemning limits of the lighter design of axles, of 40,000 and 60,000 lb. capacity, were carried along in the interchange rules and in only the more recent years condemning limits were added for the M. C. B. standard axle. No penalty in repairs was provided for substituting a Non-M. C. B. standard for an M. C. B. standard axle until recently and the failure to have in stock M. C. B. standard axles resulted in axles of the same journal diameters, but different diameters at the wheel seats and the center of the axles, being under the same car. After the Rules of Interchange provided condemning limits at the wheel seat for both M. C. B. and Non-M. C. B. standard axles of the same capacity, some roads resorted to the practice of turning down the wheel seats of M. C. B. standard axles below the minimum limit and used such axles as Non-M. C. B. standard, thus prolonging the life of Non-M. C. B. standard axles and defeating the object

of having all cars in service equipped with standard M. C. B. axles. In some cases these axles with M. C. B. standard journal and center dimensions, but wheel seats below the minimum limit, were improperly applied in repairs to cars equipped with standard M. C. B. axles, causing justified complaints from the car owners. Furthermore, odd sized axles were introduced and applied to cars marked 50,000 and 70,000 lb. capacity.

Cars have been marked with varying capacities as follows: 40,000, 45,000, 50,000, 60,000, 65,000, 70,000, 80,000, 85,000, 90,000, 100,000, 105,000, 110,000, 115,000, 130,000 and 140,000 lb. capacity, notwithstanding that we have but five M. C. B. standard sizes of axles as follows:

M. C. B. Standard Axle	Journal Size	Nominal Capacity (Load)	Total Weight (Car and Load on Rail)
A	3 3/4 in. by 7 in.	40,000 lb.	66,000 lb.
B	2 1/4 in. by 8 in.	60,000 lb.	95,000 lb.
C	5 in. by 9 in.	80,000 lb.	132,000 lb.
D	5 1/2 in. by 10 in.	100,000 lb.	161,000 lb.
E	6 in. by 11 in.	140,000 lb.	210,000 lb.

Note.—The above table is based on four-wheel truck cars (four axles per car). The loads for six-wheel truck cars (six axles per car) would be 50 per cent greater than given in the table.

The various markings can be attributed to the following: (A) Heavy light weight of body (as in the case of refrigerator cars) plus nominal capacity, including 10 per cent excess lading, exceeding the nominal car capacity for the axles used. (B) Low light weight of body (as in the case of flat and open top cars) plus nominal capacity, including 10 per cent excess lading, being less than the safe load the axles will carry. (C) Some cars being marked with capacity markings disregarding the safe load the axles will carry. (D) Other cars marked with "Load Limit" weight in order to obtain the maximum paying load on the car based upon the safe load for which the axle was designed.

This has caused general confusion and it, therefore, seems evident that some standard method of marking cars with weight markings should be adopted, which from a safety standpoint must be based on the safe allowable load on the axle used under the car and should be stenciled on the car, indicating the total weight of the car and lading as resting on the rails. This would indicate to scale agents, when cars are weighed, whether the car is overloaded or not without making any calculations; however, it would be necessary for them to record the light weights as at present in order to obtain the weight of the lading for billing purposes, which makes necessary the stenciling of the light weight on the car. The maximum load weight, difference between total weight and light weight, should also be shown as the maximum limit weight of lading which shippers can load on the car. These markings should, in the opinion of the committee, be:

MAX LOAD ..... 000 000 Lb.  
 LIGHT WT ..... 00 000 Lb.      New 3—19  
 TOTAL WT ..... 000 000 Lb.

Max Load to include lading, as well as ice, brine or packing or blocking material used in connection with transporting the load shipped on the car. It is the difference between the total weight given in M. C. B. Interchange Rule 86 and the light weight of the car. This is the absolute maximum that can be placed on the car and no percentage for overload is allowed.

Light Wt to be the weight of the empty car resting on the rails.

**Exhibit A**

TOTAL WEIGHT LIMITS BASED ON SAFE ALLOWABLE LOAD ON AXLES (FOUR AXLES PER CAR).

Normal Capacity of Car	M. C. B. Standard	Permissible Weight of Car and Lading	Journal Diameter.		Wheel Seat Diameter.		Center Diameter.	
			New.	Worn	New.	Worn	New.	Worn
140,000	M. C. B.	210,000	6	5 1/4	7 3/8	7 3/4	6 1/2	6 1/2*
100,000	M. C. B.	161,000	5 1/2	5	7	6 3/4	5 7/8	5 7/8*
80,000	M. C. B.	132,000	5	4 1/2	6 1/2	6 1/4	5 3/8	5 3/8*
70,000	Non-standard	105,000	4 1/2	4	5 1/2	5 1/4	4 3/8	4 3/8*
60,000	Non-standard	95,000	4 1/4	3 3/4	5 1/4	5 1/2	4 3/4	4 3/4†
	M. C. B.	78,000	4	3 3/4	5	5	4 1/2	4 1/2*
50,000	Non-standard	66,000	4	3 1/2	5	4 3/4	4 1/4	4 1/4*
	M. C. B.	66,000	3 3/4	3 1/4	5 1/2	5 1/4	4 3/4	4 3/4†
40,000	Non-standard	56,000	3 1/2	3 1/4	5	4 3/4	4 1/4	4 1/4*
	M. C. B.	56,000	3 1/4	3	4 3/4	4 1/2	4 1/4	4 1/4*

Note.—The Rules of Interchange provide that M. C. B. standard axles of 80,000 lb. capacity and over (marked \*) may have a limit at the center of the axle 1/8 in. lower than the standard axle when new, and that the 60,000 and 40,000 lb. capacity M. C. B. standard axles (marked †) may have a limit at the center of the axle 1/8 in. lower than the standard when new. The committee is of the opinion that all new axles should be strictly in accordance with the standards, and the allowances now provided in the rules should only apply to existing axles under the equipment.

Total Wt to be the sum of the Max Load that can be placed on the car and the Light Wt of the empty car. This total weight is shown for each size of M. C. B. standard axle under M. C. B. Interchange Rule 86.

Note.—The total weight given in the M. C. B. Rule of Interchange 86 is based on the safe load for four axles, of the respective capacities, shown on M. C. B. Standard Sheet 15, plus the weight of the wheels and axles.

These markings involve a safe predetermined value for all axles now used under the cars and the committee has placed safe load limits on the Non-M. C. B. standard axles, figured on the same basis as the M. C. B. standard axles as shown in Exhibit A.

It will be noted that the carrying load for the Non-M. C. B. standard axles of the lighter capacity cars, 60,000 lb. capacity and less, are considerably reduced over the nominal capacity plus the usual 10 per cent. This mainly affects the house cars, as there are few open top cars of these low capacities and house cars very rarely carry loads up to their nominal capacity. On the other hand, it permits cars of 80,000 lb. capacity and over, which comprise the modern equipment, to carry loads up to the axle limit, which will increase the paying loads handled in these cars.

In the past, objections have been raised to permitting certain cars to be loaded to their axle carrying capacity on account of the truck or body details or both not having been designed with a factor of safety sufficient to permit them to be loaded beyond their nominal capacity. To provide for this contingency, the committee suggests that the owner of such cars be permitted, on authority of the Car Construction Committee, to mark down the Total Wt of the particular series of cars to the proper figure and place after such figure the size of axle with which the car is equipped, for example: A 100,000 lb. capacity

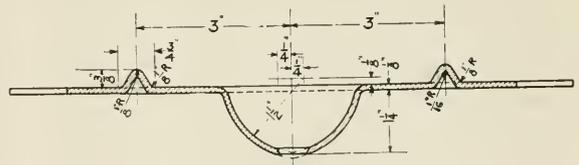

Exhibit B, M. C. B. Sheet 31

coal car can only safely carry 110,000 lb. of lading. The light weight of the car is 38,000 lb. The car should be marked as follows:

MAX LOAD ..... 110 000 Lb.  
 LIGHT WT ..... 38 000 Lb.      New 3—19  
 TOTAL WT ..... 148 000 Lb. 5 1/2 in. by 10 in. M. C. B. Std. Axle.

The only time the axle stenciling will be placed after the Total Wt is when the total weight is less than the prescribed allowable axle load.

With the proposed markings it is understood that when the light weight of the car is changed for any reason the maximum lading in pounds will also be changed. The total weight only changes when the type of Non-M. C. B. standard axle is changed to M. C. B. standard. The proposed markings involve changes in the M. C. B. Rules of Interchange and the committee will formulate these changes for submission to the Arbitration Committee when the plan is agreed upon.

With the adoption of the Max Load and Total Wt markings the nominal capacity marking is unnecessary. The new markings will require three lines for stenciling under the initials and number of the car and, as the distance from the center of the coupler to the bottom of the numerals in the number is fixed within certain limits, it leaves no space in which to stencil the cubical capacity of the car. The committee is of the opinion that the cubical capacity should be placed among the other dimension markings of the car, preferably under the inside dimensions. The committee was not unmindful of the fact that the Transportation, Traffic and Car Service Sections are vitally interested in any changes in the markings of weights, cubical capacity, etc., on freight cars and, therefore, the secretary arranged for a joint conference between this committee and the committees representing these sections. The representatives fully concurred in the report of this committee and considered the proposed mark-

ings essential and adequate. It was pointed out that the adoption of these markings will necessitate revisions in the tariffs.

### Norfolk & Western Special Axle 5 $\frac{1}{4}$ in. by 9 in.

The Norfolk & Western desired to have its special 5 $\frac{1}{4}$  in. by 9 in. journal axle included in the table with Non-M. C. B. standard axles, claiming that this axle is good for a total weight of 152,000 lb., the dimensions of the axle now being as follows: Journal, 5 $\frac{1}{4}$  in. by 9 in., dust guard seat, 6 $\frac{3}{8}$  in. diameter, wheel seat, 6 $\frac{1}{2}$  in. diameter, center of axle, 5 $\frac{5}{8}$  in. diameter, with 6 ft. 4 in. center to center of journals. Inasmuch as the wheel seat on this axle is the same as on the 5 in. by 9 in. axle, although other dimensions are greater, the committee cannot assign a greater load to this axle than the standard 5 in. by 9 in. axle.

### Remuneration for Light Weighing Cars

The question has been raised whether the present remuneration as given in the Rules of Interchange for light weighing cars is sufficient to reimburse the road performing the work. The committee has carefully checked this matter and finds that the present prices in the Rule of Interchange are adequate.

### Spring Plates—M. C. B. Sheets 31 and 31-A

C. B. Young, Manager, Inspection and Test Section of the United States Railroad Administration, calls attention to the height of the boss on the spring plate shown on M. C. B. Sheet 31 not being clearly defined, as well as differing from the height of the boss shown on M. C. B. Sheet 31-A. The committee concurs in the suggestion that the drawings should be clarified and recommends that the height of the boss be made  $\frac{3}{8}$  in. in the clear, the dimensions in the detailed views changed to accord with this dimension, and an enlarged view added to the section showing the recess for the bolt heads in the spring caps, showing the detail of the boss as per Exhibit B. In addition to the above the committee recommends that a note be added that the bolt must be riveted over the nut.

### Five Inch by Nine Inch Passenger Journal Box—Dust Guard Well

The secretary referred correspondence originating with the T. H. Symington Company to this committee, advising that the dust guard well on the 5 in. by 9 in. passenger journal box differs in dimensions from the dust guard well for the 5 in. by 9 in. freight journal box, and that this difference interferes with the interchanging of pattern parts. In 1916 changes in the dust guard well for the 5 in. by 9 in. freight journal box were adopted by letter ballot, but corresponding changes were not made in the 5 in. by 9 in. passenger journal box, and they should be the same.

### Recommendations

The committee recommends: That the following be submitted to letter ballot for adoption as Standard:

1. Marking cars with Max Load, Light Wt and Total Wt as per paragraph 7 of this report.
2. Marking the cubical capacity under the inside dimensions as per paragraph 13 of this report.

That the secretary be instructed to make the necessary changes:

3. In the spring plates shown on M. C. B. Sheets 31 and 31-A to accord with Exhibit B of this report and that a note be added reading "Rivet bolt over nut."
4. In the dust guard well of the 5 in. by 9 in. passenger journal box shown on M. C. B. Sheet 8-A to conform to the dust guard well for the 5 in. by 9 in. freight journal box shown on M. C. B. Sheet 8.

The report is signed by J. T. Wallis (Chairman), Pennsylvania; E. W. Pratt, Chicago & North Western; James Coleman, Grand Trunk; J. J. Tatum, United States Railroad Administration; Major E. C. Schmidt, New York District Ordnance Office; W. J. Robider, Canadian Pacific; J. McMullen, Erie; A. R. Ayers, New York, Chicago & St. Louis; E. G. Chenoweth, Chicago, Rock Island & Pacific; J. J. Maginn, Cincinnati Northern, and B. B. Milner, New York Central.

### Discussion

H. H. Harvey (C. B. & Q.): In page four, paragraph 10, sixth line, where it refers to the question of marking down the

present cars, I would like to ask the committee what they have in mind with regard to the owner of the car applying to the Committee on Car Construction for permission to do so.

Mr. Ayres: That is only as a general check, as there is a standing committee on car construction.

Mr. Harvey: It seems to me, especially as the roads will probably go back to private management, that the owner will be the party who is the better judge as to whether the car is strong enough to carry the marked capacity than anyone else. He knows the equipment, the time it was constructed, and knows how it has been kept up. I approve the report as a whole, but do not see the necessity for that particular recommendation.

Mr. Gaines: I have heard a great deal of criticism in the last two or three years of a lot of old equipment to the effect that the present condition of the car is not strong enough to carry the loading that would be given under this new maximum loading rule. There should be a clearing house of this association to determine whether such cars are justified in carrying the loads as marked before they are checked up by some committee. It is proper for some association like this to see whether they are strong enough to carry the loads, instead of allowing them to go around the country because the owners would like to have them do so.

Mr. Harvey: It is not a question of the trucks; it is largely a question of body construction. A 100,000-lb. capacity car will carry 92,000 lb. of freight in certain commodities, but if you load it with bulk grain it may not carry it safely. The body of the car is not heavy enough to carry it. The new cars will carry 86,000 lb., and you ask the older cars to carry 6,000 lb. more than the new cars. For this reason the owner ought to have the right to mark down his car, if he so wishes, without referring the matter to the Committee on Car Construction.

T. J. Burns (M. C.): There is a matter which is more important than that, and has to do with the first recommendation on page seven. You are providing a remedy that will not be operative for years to come. We know how long it took us to get the safety appliances on the cars, and we have an idea how long it will take us to have the cars properly stenciled, and in the meantime, while the stencils are being put on the cars, they are going around overloaded. We have a great deal of trouble with 60,000-lb. capacity cars, and few roads are observing Rule 86 as it was intended it should be observed.

Since I came to the convention, I received a letter from our general manager and chief operating officer, which, in part, reads:

"I am surprised at the general application of this order (Rule 86). No two railroads in the country appear to be applying the instructions alike: This is a confusing operating arrangement and also has a strong tendency to bring about discord among various shippers." Further on, he recommends that the matter be brought before this convention, to see if the members of the association have any suggestion to make to straighten out the matter. I do not know exactly how the committee can handle it, but there should be some court that will have the necessary authority to make the people observe this rule in the true spirit.

J. J. Hennessey (C. M. & St. P.): Without attempting to criticize the report of the committee, there is one thing I want to call to the attention of the association. You equip a car with a 60,000-lb. or 80,000-lb. standard M. C. B. axle, and so mark it. I receive that car in a short time, after you have so stenciled it, with the proper size axle under the car to carry the load according to the stencil, but I apply a non-M. C. B. 60,000-lb. axle, that is turned down in the wheel seat. Will you hold that car up in interchange? You cannot get anything into the rules and make it binding, unless you run the danger of holding up cars interchange, and I do not believe you want to do that. This subject should be handled very carefully indeed, because these interchanges of axles will be made.

J. A. Pilcher (N. & W.): The report of the committee, paragraph 15, refers to the application of the Norfolk & Western, in regard to an additional non-standard axle, in which the committee refuses to accede to the request to put this additional non-M. C. B. axle in their list, and I wish to bring before the Association the full significance of this ruling to the railway company.

The axles in question have been in service since 1899, so far as size of the journal is concerned. At that time the wheel

seat, which is the critical point referred to by the committee, was  $6\frac{3}{8}$  in. Several years later the wheel seat for this axle was increased to  $6\frac{1}{2}$  in.

In paragraph 15, the committee brings out the point that the  $6\frac{1}{2}$ -in. wheel seat is the standard diameter of the 5 in. by 9 in. axle. That is true, but the rules of interchange and the table in Exhibit A, allow the wheel seat of a 5 in. by 9 in. axle to be made as low as  $6\frac{1}{4}$  in.

In paragraph one, on page one, they speak of the failures being due to overloading. The question of failure from overloading is largely a question of experience, in so far that all of our stresses in shapes or structures, have been determined upon someone's experience. In all the twenty years' service of these axles, there has never been a single report of an axle breaking in the wheel seat, even though a large number of them were originally  $6\frac{3}{8}$  in.

I wish to ask that this additional non-standard M. C. B. axle be put in this list, in accordance with the letter to the committee, with one modification. We stated in the letter that we desire 152,000 lb. as the load. We would like to modify that and use 148,000 lb., as that will take care of the real carrying capacity of the cars—110,000 lb. in most cases—and allow, at the same time, throwing the axle stresses well within the limits as established in the standard M. C. B. axles.

I wish to illustrate that by referring to the variations of weight and comparing this axle with the standard M. C. B. 5-in. by 9-in. axle and the standard M. C. B.  $5\frac{1}{2}$ -in. by 10-in. axle. I will make the first comparison with the  $5\frac{1}{2}$ -in. by 10-in. axle. The decrease in weight is 8 per cent of the decrease in the strength of the axle at the wheel seat is 10.7 per cent. That looks as if it was below the standard axle, but you have further to take into consideration that the distance from the center of the bar to the center of the rail, measured in a horizontal line, is reduced one-half inch, which is equivalent to a 5.5 per cent reduction; so if we add the  $5\frac{1}{2}$  per cent to the 8 per cent, we have practically 13 per cent reduction in stresses and 10.7 per cent in reduction of the strength of the axle at that point. It is, therefore, well within the limit at the wheel seat.

Comparing it again with the  $5\frac{1}{4}$ -in. by 9-in. axle, using the 148,000 lb. and 132,000 lb., the lengths there are identical. The increase in lading is 12.1 per cent. The increase in the strength of the axle at the wheel seat is 12.5 per cent. As a matter of safety and strength, it meets all the requirements of the M. C. B. axle.

I therefore move that this non-standard M. C. B. axle be placed in the list with the others.

As to the operation of the rule, it is significant to the company that they have now in service, so far as we know, something over 14,000 open-top coal cars, so constructed. None of these cars have been built since 1909, so that you will see we started to be good 10 years ago. By cutting down the capacity of these cars on an average of 10 tons, that would be equivalent to a destruction of 2,800 50,000-lb. cars, the value of which, if you put it on a liberal basis, would be something like \$7,000,000. If we should estimate the carrying capacity of the cars on the basis of mileage of the cars during the year 1916, of which we have a record, and allowing only half the mileage to be the loaded mileage, it would reduce the capacity something over 1,000,000,000 ton-miles.

R. L. Kleine (Penna. Lines): The present chaotic condition of the markings of cars and the amount of loaded carrying capacity has brought about a recommendation on the part of the U. S. R. R. A. Car Service Section to get a uniform marking, in order to obtain the maximum loaded carrying capacity on the cars, and as well to overcome the trouble that has been experienced with broken axles in service. The matter was referred to the Car Truck Committee to solve the proposition.

We well know that the M. C. B. standard axle has been abused in that it has been turned down below the safe limits set for the particular axle, and I do not think we can justify Mr. Hennessey's statement that, due to expediency, we have disregarded the safe loading on the axle and turned it down below the safe limits, and ask to continue such practice.

The committee has taken all of these details into consideration, and formulated the safe loads on the standard axles, as well as figuring the non-standard axles by the same formula as the standard axle was figured, and in cars now in service,

we do not think that the standard axle will have to be marked down to the figures presented by the committee.

The committee has had a joint conference with the Car Service Section, and also with the Traffic Section, and they have unanimously agreed to the markings as recommended by the committee.

In regard to submitting to the car construction committee such questions as marking down the cars below the carrying capacity, the thought, there, was that the controversies might arise where a car has been marked in accordance with the standard axle under the car, and the car shows weakness in service. When such occasion arises there will be a controversy between the road on which the car failed and the car owner, and it was thought best that such controversies should be submitted to the car construction committee.

In regard to the Norfolk & Western axle, the committee carefully considered the subject. This is a special axle of the same length as the 5-in. by 9-in. axle. They have larger diameters as to journal, also center of axle, but their wheel seat is exactly the same dimensions as the M. C. B. 5-in. by 9-in. axle—in other words,  $6\frac{1}{2}$  in. Mr. Pilcher did not allow for any turning down of the wheel seat in service, where they changed the wheels under any such cars. The figures given by Mr. Pilcher are entirely correct, in accordance with the formula, that if the axle has a wheel seat of  $6\frac{1}{2}$  in. it is good for a load of 148,000 lb., but if the wheel seat is turned down to  $6\frac{3}{8}$  in. it is good for a load of 140,000 lb., and if turned down to  $6\frac{1}{4}$  in., which is the minimum limit for the 5-in. by 9-in. axle, it is good for 132,000 lb. Axles, under the N. & W. cars referred to, have wheel seats turned down to  $6\frac{3}{8}$  in. and  $6\frac{1}{4}$  in., and therefore, the committee could not consistently accept the recommendation of Mr. Pilcher.

For many years we have talked about the overloading of our refrigerator cars, considering the size of the journal that was under the car and the capacity marking on the car. Now, we all agree that the refrigerator marking was not correct considering the diameter of the axle under the car. After a while we found a lot of our cars weak and we began to apply steel underframes, steel centers and steel ends, and other improvements and added to their weight. Finally we found that our box cars had the journals overloaded with the marked capacity they were supposed to carry, considering the 10 per cent added.

Mr. Pilcher brings out the dimensions of his axle. He says it is strong. The  $5\frac{1}{2}$  in. by 10 in. axle was established because its dimensions were found necessary in order to carry the load that the car was supposed to carry, that it was placed under. He has not made any mention as to what the load would represent on the journal, or the journal bearing, that would increase the heating of his 5 in. by 9 in. journal over the  $5\frac{1}{2}$  in. by 10 in. journal. He probably didn't break the axle at the wheel seat, but probably broke the journal off because it was frequently hot.

Chairman: I would like to ask Mr. Pilcher whether any record has ever been kept of loose wheels.

Mr. Pilcher: We have loose wheels, but I am sure there are no more loose wheels in connection with this construction than any other construction we have. The loose wheel construction is not a question of the particular size of that axle fit. It is a very serious matter to cut out such a large hauling capacity in the country at this time, and the cost of replacement is so very great.

I would like, therefore, if I could get a second to my motion, so that the matter could come up for a vote, if nothing else, to see if we cannot stave off this enormous expense.

Mr. Kleine brought out the point of the turning down of the axles. Penalize us when you find them turned down, and don't penalize those that are not turned down.

There has been no indication whatever of any unexpected or any unusual heating that would bring about the breaking of these axles in the journal. We have had broken axles, due to hot boxes, but I cannot say that any one of them was this particular axle.

Mr. Gaines: I would like to ask the Secretary when the  $5\frac{1}{2}$  by 10 axle was first made the standard of the Association.

Secretary: That was in 1899, Mr. Gaines. In 1901 the diameter of the wheel seat was changed from  $6\frac{3}{8}$  to 7 in.

H. W. Coddington (N. & W.): It is my duty to make a report on all of these failures wherever they occur, and it is our experience that we have more broken journals in the boxes in

the journal bearing on the 5½-in. by 10-in. journals than we have in the 5¼-in. by 9-in. It is very seldom that we ever have a 5¼-in. by 9-in. axle failing in the journal bearing section.

Mr. Tatum: I would like to know if there is any comparative records kept or is this simply surmise? Have we a comparative record of the number of hot boxes we have on a 5-in. by 9-in. journal carrying 100,000 lb. capacity load, with other cars equipped with the 5½-in. by 10-in. journal, to measure up the difference existing on that railroad? If you have one I would like to know what it is.

Mr. Coddington: I was speaking about journal failures, not hot boxes. I understood Mr. Tatum took the point that way. I have a record of that. The motion to permit the use of the 5¼-in. by 9-in. journal was put and lost.

A motion that the report of the committee be received and the recommendations referred to ballot was carried.

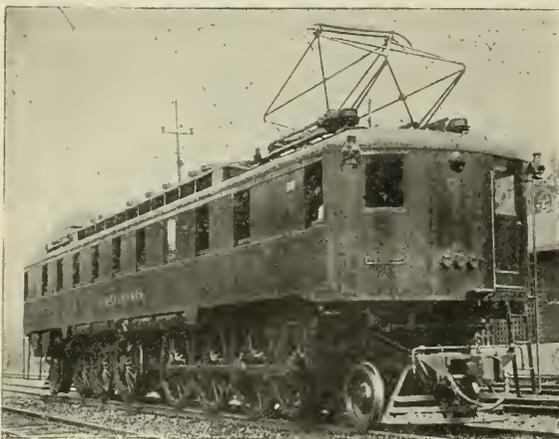

Mr. Ayers: I don't know that this requires any action by the convention, but it is a matter to which Mr. Barnes refers, and I would like to speak a little on it. It will possibly involve other and similar questions. That is, the matter of getting this rule about the maximum load followed out. It will not be taken care of at all by changing our Rules of Interchange, because the trouble goes a good deal farther back than the inspector. The trouble originates with the shipper, and I don't know just how the question can be handled. It is probably one for the Executive Committee, but the matter will have to be controlled before it gets to the Mechanical Section people, it seems to me.

## Report of Committee on Tank Cars

The report of the Committee on Tank Cars was presented by Mr. Gibbs, and a lengthy discussion ensued. This discussion will be published in the next issue of the Daily, next Monday morning.

## Moving Tonnage in Large Units

THE ABILITY TO INCREASE TRACK CAPACITY for the rapid expedition of heavy freight trains is fast becoming a difficult problem, owing to the tremendous increase in train tonnages to be moved as a unit. In other words, the problem before many steam railroad operators is how to increase the physical capacity of a

Pennsylvania FF1 250-Ton Electric Locomotive

certain heavy tonnage division without prohibitive expense. At the same time, after such an expenditure in correcting alignment, grade reductions and other operating difficulties, there still remains the problem of oper-

ation, namely hauling without delay the tonnage offered for transit.

With the introduction of the large FF1 250-ton locomotive of the Pennsylvania Railroad, on exhibit at the Pennsylvania Electric Station, Tennessee Ave., there dawns a new era in the possibility of moving heavy tonnage in large units over steep grades. The locomotive has a maximum accelerating horsepower of 7600, with a sustained horsepower capacity of 4800 for one hour. With two of these engines a 6300 ton train can be handled up long grades at constant speed; for instance on a 25-mile 1 per cent grade, such a train could be moved at 20.6 miles an hour.

The Pennsylvania FF1 locomotive was built within existing operating limits, including the maximum starting draw-bar pull which average freight cars will permit; the maximum tractive effort consistent with the wheel arrangement used; the maximum weight on drivers; the maximum horsepower per unit weight, and the maximum speed considered desirable for contemplated operation.

### Important A. R. A. Committee to Meet Here

**T**HE COMMITTEE ON GRADE CROSSINGS, Protection and Trespassing of the American Railroad Association will hold a meeting at the Marlborough-Blenheim Hotel on Monday. The committee is composed of the following railroad officers: Col. A. J. McCrea, chairman; C. L. Bardo, general manager, New York, New Haven & Hartford; J. Q. Van Winkle, general superintendent, Central Indiana Railroad; D. H. Beatty, superintendent of safety, Southern Railroad; W. J. Towne, assistant general manager, Chicago & Northwestern; J. H. Dyer, general manager, Southern Pacific Company; T. S. Stevens, signal engineer, Atchison, Topeka & Santa Fe; F. L. Thompson, chief engineer, Illinois Central, and C. H. Tillett, acting signal engineer, Grand Trunk.

#### "Look Me Up"

"I want to register a kick," said the tired car inspector, buttonholing The Man Who Saw.

"I got here at 10.00 A. M. this morning. At 10.02½ A. M. Dan Gitem, of the Fit-em-all Equipment Company, had my pedigree and a promise to bring my wife, and lunch with him at noon.

"Look me up," says I.

"Where are you at?" says I.

"Booth 4076."

"All right, Dan, we'll be there with our hair in a braid."

"Well, it's nearly one o'clock now and me and Mary here have been trudging all over the place to find booth 4076. We went through 2,000 of them and got tired—can you take us there direct?"

The Man, having qualified as a puzzle expert in the postoffice department, felt that he had acquired a sufficient knowledge of the intricate lay out of booths on the Pier to guide them safely to Dan Gitem's lair, and they started off.

"Why," said the Inspector, "doesn't somebody hand out a map so a fellow can find his way around? It might be a good idea to divide the whole exhibit floor into sections A, B, C, etc., and list the numbers as A1, B1, etc.,—anybody who could read could get there then."

"Perhaps," suggested The Man, "there may be 'method in their madness.' The object of the arrangements here is to assure the spectator that he won't miss anything. For this reason the exhibit spaces are laid out in such a manner that no matter what booth he starts out for, he is automatically sidetracked along by-paths which contain things he really shouldn't miss. From there, it is but a willing step farther to the next—and although he gradually gets away from his objective, in the long run he wins. He wins a liberal education."

"Well, well," said the Inspector, "I had a hunch that there was a purpose behind it—let's hurry, I'm hungry."

## Conventionalities

James E. Tierney, master mechanic of the Louisiana & Arkansas at Stamps, Ark., is here with Mrs. Tierney and the future master mechanic of the L. & A., Master Stanley Tierney.

Mr. and Mrs. Burton W. Mudge are attending the conventions as usual. Their son, Burton, Jr., was unable to come with them, as he is taking some important examinations in school, but he expects to come later.

B. L. Winchell, regional director of the Southern region, was accompanied to Atlantic City by Mrs. Winchell. They stayed here until yesterday and then went to New York to visit Mr. Winchell's mother, who is now 83 years old.

D. H. Kinter, General Foreman Car Department, Monongahela Railroad; Mrs. Kinter and Miss Grace Kinter

D. J. Champion, President of the Champion Rivet Co., is here as usual. We say "as usual" because while Mr. Champion can not lay claim to the "long distance" record, that having almost been conceded to Frank Edmunds, he has been coming a long time.

Left to Right—R. J. Leslie, Draftsman, Car Department, P. R. R.; C. Geisking, General Foreman P. R. R., and G. T. Baker, General Car Inspector, P. R. R.

W. H. Keller, president and general manager of the Keller Pneumatic Tool Company, Grand Haven, Mich., arrived Thursday from New York, bringing with him export orders for Keller tools approximating a quarter million dollars. Mr. Keller reports business brisk with his company. An enlargement of the Keller factory to nearly double its present capacity is planned for the near future.

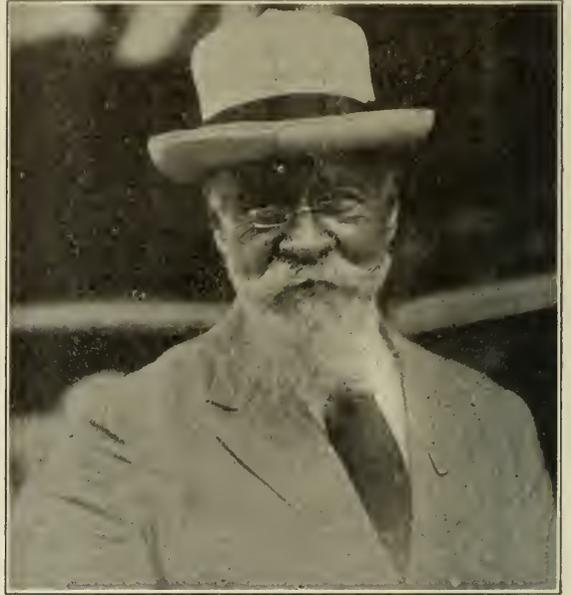

E. G. Jackson, president and general manager of the International Equipment Company, Montreal, representing in his territory the American Steel Foundries, Keyoke Railway Equipment Company, National Malleable Castings Company and Edwin S. Woods & Company, is at the Traymore.

So far as we are able to ascertain, the only Canadian railway officer at the convention is W. A. Booth, of Montreal, successor to James Powell as chief draftsman of the Grand Trunk and also as secretary of the Canadian Railway Club. Labor conditions have prevented our Canadian friends from coming to Atlantic City this year.

F. J. Foley came to the conventions this year as general sales agent of the Railway Steel Spring Company, having been appointed to that position recently, following the

G. Villard, Manager American Railroad of Porto Rico, San Juan, P. R.

M. N. Groten, First Assistant Engineer, Russian Commission on Ways and Communication

Mr. and Mrs. E. W. Pratt, who have been attending the conventions for years, arrived on Thursday, a little later than usual. Some months ago Mr. Pratt, who is assistant general superintendent of motive power of the Chicago & Northwestern, secured leave of absence for six months and has since been enjoying himself. He took leave of absence merely to get a good rest and we expect to see him back on the job in the railway business one of these days.

death of S. T. Fulton, vice-president in charge of sales. Mr. Foley is a sales agent who thoroughly knows the products he is selling, as he was until his recent promotion general superintendent of the plants of the company. He was accompanied to Atlantic City by C. K. Shreve, assistant secretary of the company.

Executive Committee, American Railroad Association

Left to Right—B. F. Bush, Regional Director, Southwestern Region; Hale Holden, Regional Director, Central Western Region; B. L. Winchell, Regional Director, Southern Region; W. T. Tyler, Director of Division of Operation, U. S. Railroad Administration; J. E. Fairbanks, General Secretary, American Railroad Association; R. H. Aishton, Regional Director, Northwestern Region and President, American Railroad Association; C. H. Markham, Regional Director, Allegheny Region; G. L. Peck, Federal Manager, Pennsylvania Lines West; N. D. Maher, Regional Director, Pocahontas Region; T. C. Powell, Director of Division of Capital Expenditures; A. J. Stone, Federal Manager, Erie; H. E. Byram, Federal Manager, Chicago, Milwaukee & St. Paul; J. M. Hannaford, Federal Manager, Northern Pacific; E. H. Coapman, Federal Manager, Southern Railway; A. T. Hardin, Regional Director, Eastern Region; J. E. Gorman, Federal Manager, Rock Island; W. J. Jackson, Federal Manager, Chicago & Eastern Illinois.

A lapse of three years defines sharply how much these meetings partake of the spirit of family reunions. Men and women are here to whom the convention has been a definite part of their lives annually. The Ashton family represents this type in a high degree. Mrs. Emma C. Ashton, the wife of Henry G. Ashton, has attended these

W. G. Phelps, Purchasing Agent, Pennsylvania Lines West

meetings for more than forty years. Her son, A. C. Ashton, who has married since the last convention, brings his wife.

E. S. Wortham plays a good game of golf. He is a member of the Glen View Club, Chicago. When we were in Atlantic City in 1916 he played in the M. C. B. and M. M. golf tournament. He made a fine score, but failed

Left to Right—George C. Weight, General Car Inspector, P. R. R.; F. S. Kent, General Car Inspector, P. R. R.; Captain C. R. McKinsey, Captain Engineers (ex-Master Mechanic, Washington Terminal); Captain J. M. Rank, Staff of Director General, Military Railways; Charles E. Boyer, General Car Inspector, P. R. R., and Frank E. Taylor, General Car Inspector, P. R. R.

to win a prize. The reason was that the handicap committee, knowing that Mr. Wortham was suffering with a case of poison ivy, made him a "scratch" man. Mr. Wortham, Frank L. Norton and George L. L. Davis, all of the Scullin Steel Company, are guests of the Marlborough-Blenheim.

The name of James M. Hopkins should be added to the list of "farmers" we mentioned in the daily the other day. And, by the way, he is no longer president of the Camel Company, Percy M. Elliott having succeeded him. "Farmer" Jim motors occasionally from his country estate near Libertyville, Ill., to Chicago, where he assumes his duties of chairman of the board of the Camel Company. After a fine record of attendance at the conventions Mr. Hopkins remains at home this year.

How children are trained up in the way they should go finds an example in the Bullard Machine Tool Company. Edward C. Bullard, grandson of the founder, is assisting demonstrators at the pier exhibit. He is a graduate of Sheffield School at Yale, and enlisted in the army and was assigned to the Ordnance Department, where he did active duty. On being released from the government service he began the routine shop education in the Bullard plants. This means a three-year term of apprenticeship, which includes work in all departments.

J. E. Erwin, a 20-year member of the A. R. M. M. A., probably has the unique distinction of representing a railroad at the convention owned by an orphans' home and so far as known, the only one in the world. Mr. Erwin is master mechanic of the Sand Springs Railway and hails from Sand Springs, Okla. This railroad has a history. Charles Page went to Oklahoma about 12 years ago a poor man. His youth had been beset with hardships and deprivation because of the necessity of providing for a mother with a large family, and he firmly resolved that if the time ever came he would in some way lighten the burden of widowed mothers and orphans. In a short time he acquired undeveloped "Indiana country" and struck it rich in oil. He built the railroad with no prospect of immediate, paying business and then built the business on the railroad. It is today both steam and electrically operated and is the smallest, large railroad in the mid-west, both from a passenger and freight earning basis. He subsequently built the Sand Springs Home, a widows' and orphans' colony, where widows are given an opportunity to help themselves and where orphans are given the advantages of a home and a good education.

This home provides for nearly 600 children and 70 widows, and includes a cannery, greenhouses, dairy, hospital, cold storage and ice plant, manual training school and other educational institutions. The Home owns the railroad and other business concerns established by Mr. Page and all are dividend payers.

Those who have met W. E. Dunham, assistant to the general superintendent of motive power and car department of the Chicago & North Western, only during working hours and know only his serious characteristics will not suspect that there is a recognized humorist in the Dunham family. His friends at the convention, however, will not be surprised to learn that Mr. Dunham's son, who is a sophomore at Cornell University, has been elected to the staff of *The Widore*, the humorous periodical published by the undergraduates.

C. H. Hogan, assistant superintendent of motive power of the New York Central at Albany, N. Y., was given badge No. 999 when he registered on Friday. This was not intentional but it is quite significant because of the reputation which he made as an engineer on the New York Central's Empire State express on the famous engine numbered "999."

To the old guard at the convention the Crane Company's booth without Frank Fenn looks almost as strange as a performance of "Hamlet" without the Prince of Denmark. For many years he has been a regular attendant at the Atlantic City conventions, but at present he is taking a much needed rest on his farm at Chillicothe, Illinois.

Major John R. Jackson, since his discharge from the army Ordnance Corps, has joined the staff of the chief mechanical engineer, Division of Operation of the Railroad Administration, and is attending the convention as a special guest this week. Major Jackson was formerly assistant engineer of tests of the Santa Fe, leaving that position in the fall of 1917 to enter the Ordnance Department of the army. Out of a total of 18 months in the service he was with the A. E. F. in France for a year. During his service abroad he was liaison officer on the Anglo-American Tank Commission, which was formed to design and construct heavy battle tanks for the joint use of the British and American armies. After five months' service in this position he went with the Engineering Division in the office of the chief ordnance officer, investigating the performance of tanks with the First Army

Col. John T. Dickinson, widely known as secretary of the World's Columbian Commission at Chicago and who nineteen years ago pioneered the introduction of the axle light system of electric car lighting which is now in universal use on all first-class passenger and Pullman cars, is registered at Haddon Hall with Mrs. Dickinson.

C. E. Slayton, Master Mechanic, Union Pacific, Marysville, Kansas, and Mrs. Slayton

He is now living in Washington, D. C. and is attending the conventions after a lapse of six years.

"Dave Pye," who has been coming to these conventions for many years, was introduced last night to a young lady who is attending this convention for the first time. After being introduced she said, "I don't like nicknames, what is your real name?" Somehow that reminds us of "Jack High." Pye and High are business

W. P. Borland, Chief of the Bureau of Safety, Interstate Commerce Commission and a Group of His Inspectors  
Left to Right—I. P. Kelley, W. F. Wagar, H. M. Burtch, J. E. Jones, W. P. Borland, Joseph Bromley, D. Garman and H. M. Priest

in the Argonne offensive, during the month of October, 1918. This was one of the real fighting jobs of the Ordnance Department and involved the reclamation in the field of tanks put out of service in action. At the signing of the armistice he was with the Second Army at Toul in connection with the motorization of artillery. Mr. Jackson says that it is some job to get back to this country even after assignment for return has been made. In his case it took six months.

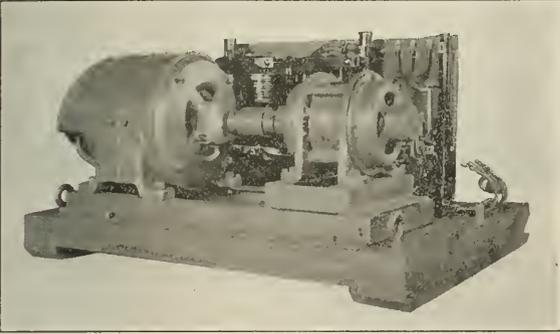

crories and occasionally find themselves resting in the same hotel lobby. On such an occasion recently at the Waldorf, a boy with a falsetto voice came up the hall paging "Mr. High," and closely followed by another boy equipped with a basso-profunda voice paging "Mr. Pye." And so they went up and down the hallways and lobby—"High, Pye, Pye, High." much to the amusement of the guests. Our relator doesn't tell whether either Pye or High answered the call.

# New Devices Among the Exhibits

## Welding Sets

**T**HE TYPE WD-9 WELDING EQUIPMENT made by the General Electric Company includes a constant energy self-excited generator to be driven by belt, electric motor, or engine. When belt driven by engines the speed should be 1200 r. p. m. or 1500 r. p. m.

The constant-energy self-excited generator is designed to embody all the characteristics demanded by arc welding service. There is no external ballast resistance or

Self Exciting Welding Generator Direct-Connected to an Alternating Current Motor

separate excitation from any external source. Neither a separate circuit nor direct-connected exciter is used. Since the machine provides its own excitation, the voltage characteristics are such that throughout the proper working range of the arc the energy delivered is practically constant. The voltage and current follow the momentary variation in the arc conditions practically instantaneously, and consequently the lag between change in arc conditions and resulting corrective change in electrical conditions is reduced to a minimum. This lag is a possible source of trouble in welding with self-regulating welding equipments when the automatic feature is embodied in the revolving apparatus or mounted on the control panel.

The generator is so wound as to give a no load or striking voltage of 60 volts which, when the arc is struck, automatically decreases to the voltage required by the arc. This is from 18 volts to 20 volts for the average operator and general work. A long arc is generally considered undesirable. Skilled operators are able to hold a very short arc with a voltage as low as 16 volts, but 20 volts is the average rating of the generator. By adjusting the dial switch on the panel, the current may be varied from a maximum of 200 amperes to a minimum of 75 amperes in 25 ampere steps.

The standard motor generator sets are assembled complete with the panel on a structural steel base so the entire equipment may be picked up by a crane and handled as a unit, or if desired can be mounted on truck.

The connections are simple, the motor leads being brought out at one end and welding leads at the other. Mounted on the control panel are the motor starter and the generator field rheostat, voltmeter, and series field dial switch.

Belt driven generators are mounted on standard sliding bases, and the control panel is arranged for separate mounting.

## Balancer Set

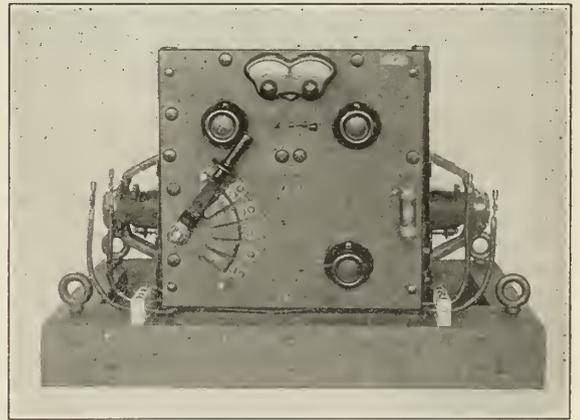

The constant energy arc welding set of the balancer type is a novel type of arc welding equipment which combines electrical characteristics for the arc with high efficiency and light weight. The characteristics have been determined by a series of practical tests under commercial operating conditions and by oscillograph curves.

This set is built for operation on 110 to 125 volt direct-current supply circuits. The two armatures are mounted on one shaft and connected in series across the 125 volt circuit. One terminal of the welding circuit is taken from the connection between the two armatures and the other from the positive line. By this means each of the machines supplies part of the welding current, and consequently the size and weight of the machines are minimized. The design of the fields and their connections is such that the set delivers the voltage required directly to the arc without the use of resistors.

The welding control panel for the balancer set consists of a slate base 24 inches square, which is mounted on 24-inch pipe supports for portable work and on 64-inch pipe supports for stationary work.

The equipment consists of: a meter and voltmeter inclosed in a common case, dial switch, motor and generator field rheostats, starting equipment, and reactor. The ammeter indicates current in the welding circuit and the voltmeter is so connected, that by means of a double-throw switch, either the line of voltage or the welding voltage can be read.

The dial switch is connected to taps in the series field of the generator, the field being connected to oppose the main field. This feature provides the current control by

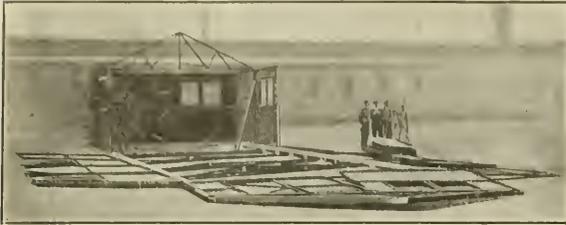

Balancer Type Welding Outfit

which six approximately equal steps are obtained between 50 amperes and 150 amperes. If intermediate current values are required, they can be obtained by means of the generator field rheostat. A small reactor is used to steady the arc and current, both on starting and during the period of welding.

Arc welding is always done on metal which is grounded. Since successful operation requires that the positive terminal be connected to the work the supply circuit should be arranged so that it can be safely grounded on the positive side.

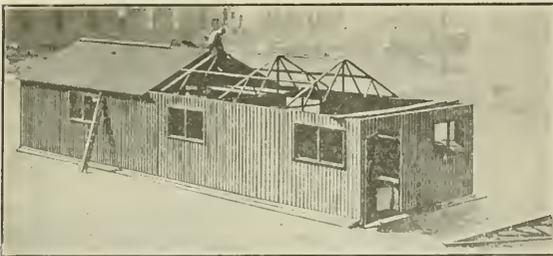

## An Easily Erected Steel Building

**I**N THE APPLICATION of the fabricated idea to the erection of buildings, startling strides have been made during the past year because of the necessity in many industries for strong and durable fireproof buildings which could be erected without the inconvenience of

Starting Erection of Stefcu Standardized Sectional Steel Building

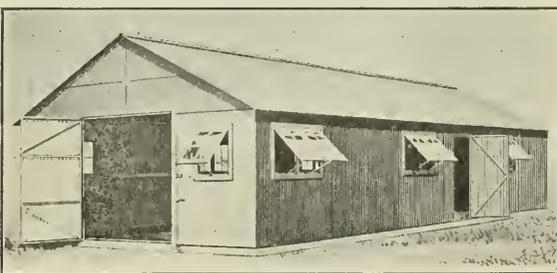

delays and disappointments incidental to the activities of architects, contractors, and skilled labor. A recent development in this type of standardized steel units for building purposes is shown in the photographs. In designing this type of building the engineers had in mind the fact that some of the early constructions along these lines had limitations because of lack of strength. The

Erection of Sectional Steel Building Nearing Completion

design illustrated is said to be strong enough to stand any of the strains to which an industrial building can be put, and it is further stated that these buildings are strong enough to carry a line of shafting on the trusses without any pillars, trusses or supports.

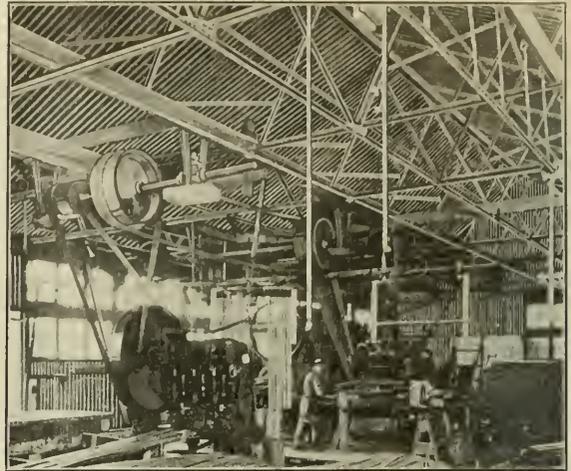

Practically any combination of window lighting effects can be obtained so that they can be adapted to a varied

Building Completed

line of purposes for manufacturing or for storage. It is claimed that these buildings are so simple to erect that common labor without any supervision, except that of a man who can read simple directions can erect them in a

comparatively short time. They can be supplied in any length or width, it being related that one installation has been furnished which was only 80 ft. short of a mile.

These Buildings Are Designed For Heavy Service

The construction described is known as the Stefcu structural steel building, manufactured by the Liberty Steel Products Company, New York, who are exhibiting several types of them at the convention.

## Trunnion Type Coupler and Yoke Connection

**A** NEW TRUNNION TYPE of coupler and yoke connection which eliminates the tail pin, the functions of which are performed by trunnions cast integrally with the coupler, is exhibited by The McConway & Torley Company, Pittsburgh, Pa. The trunnions are of generous proportions and provide, in addition to great strength, an extra large bearing surface for pulling. The yoke contains a single bearing block which, while readily moved, is normally held securely in place. This feature, in combination with the design of the coupler shank, provides for the application or for the removal of the coupler from the car independently of the yoke.

This trunnion type of connection is also shown in modified form, the coupler and yoke being cast separately but interlocking, in a manner requiring no tail pin, blocks or other details to form the connection, the device consisting simply of a coupler and a yoke.

## Collapsible Stake Pockets

**T**HE DAMASCUS BRAKE BEAM COMPANY, Cleveland, Ohio, is showing for the first time a novel form of collapsible stake pocket for application to the inside of gondola cars. It consists of three links of wrought iron chain of the proper dimensions to hold standard sized stakes. When the stake is removed, the chain hangs slack and will not become damaged or distorted, as is often the case with rigid stake pockets on gondola cars. Another new type of stake pocket exhibited by this company is designed for application to flat cars. It has corrugations which prevent vibration and shocks from loosening the wooden stake, thereby preventing the stake from working out and insuring against loss or damage to the lading.

WE GUARANTEE that of this issue, 17,100 copies were printed; that of these 17,100 copies, 15,406 were mailed to regular paid subscribers to the Railway Age and the Railway Mechanical Engineer; 119 were mailed to advertisers, 300 were provided for courier and news companies' sales, new subscriptions, bound volumes, copies lost in the mail and office use; and 1,275 copies for distribution at Atlantic City.

THE RAILWAY AGE is a member of the Audit Bureau of Circulations (A. B. C.) and the Associated Business Papers. (A. B. P.)

To preside over a large convention meeting is not an easy task even under the most favorable circumstances. At

## An Executive in the Chair

the sessions held last week, the difficulty was increased by the poor acoustic properties of the auditorium, and the retiring chairman is to be congratulated on the way in which he handled the situation. Chairman Chambers demonstrated that he possesses in a marked degree the qualities that go to make up a good presiding officer. He showed his familiarity with parliamentary law and, regardless of the complexity of the situation resulting from motions, amendments and protracted discussion, never became confused. He was impartial in his attitude and encouraged full and free discussion, but held the meetings in hand at all times and was decisive, though never arbitrary, when decisions were required. Among the factors that contributed to the success of the meetings, Mr. Chambers' work as presiding officer deserves recognition.

## "Post Graduate Courses" for Officers

IN HIS ADDRESS before the Mechanical Section yesterday, W. T. Tyler referred to the annual convention and exhibit as a "post-graduate course in railroading" for those attending. This is a very good description of the purpose which the convention and exhibit serve. The time never comes when any professional man can safely consider his education in his special line finished. The moment he begins to consider it finished and to act accordingly, he begins to retrograde, for in every line of professional activity new discoveries and developments constantly are occurring, and no man can keep up with them who does not make unflagging efforts to do so.

All this applies without qualification to the technical men of railroads. The important developments in their field do not all take place in the railroads. Many of the most important of them occur in the laboratories, the manufacturing plants and the offices of railway supply concerns. From them proceed a very large part of all the improvements in railway equipment and devices. No railway man can visit the laboratories and factories of all the equipment and supply concerns. On the other hand, every railway man, by participating in the annual meetings of the Mechanical Section, and carefully inspecting the exhibits made in connection with them, can do a great deal toward keeping abreast of all the important developments in his field, both those which originate on the railroads and those which originate with the equipment and supply companies. It would be an excellent thing if Mr. Tyler's suggestion that the spring meeting of the American Railroad Association be held at a time and place when and where the operating executives of the railroads could visit the exhibit should be adopted. The operating executives need "post-graduate courses" as well as the mechanical officers.

## An Innovation in Locomotive Design

ABOUT TWO AND A HALF YEARS ago the Pennsylvania Railroad built a Decapod locomotive, in the design of which the principle of the short maximum cut-off was first incorporated in a simple locomotive. The design was a development from the class L1s Mikado type, which was exhibited at the 1914 conventions, the boiler being essentially the same so far as proportions and capacity are concerned, with the notable exception that the working pressure was raised from 205 lb. to 250 lb.

By increasing the size of the cylinders and increasing the steam lap of the valve, the maximum possible cut-off was reduced from about 85 per cent to 50 per cent, thereby materially reducing the steam consumption of the engine when working at slow speeds. Advantage of the decreased steam consumption was taken to increase the tractive effort, which was increased about 40 per cent over that of the Mikado. The simple Mallet locomotive is the next step in the application of this principle.

A comparison of the characteristics of the compound with the simple locomotive show a decided advantage in the speed to which the maximum tractive effort may be maintained before the capacity of the boiler is exceeded. This is, obviously, due to the expansive working of the steam. The simple engine with short maximum cut-off possesses essentially the same characteristics in this respect as the compound locomotive, and it is this fact which gives promise of providing sufficient boiler capacity to take care of two sets of simple cylinders. The compound engine differs, however, from the short cut-off simple engine in that the full expansion takes place in a single cylinder with the disadvantage of smaller temperature differences in the cylinder walls. But with superheated steam this advantage is largely discounted.

This design, however, involves another feature which is decidedly to the disadvantage of the simple engine. This is the stresses to which the running gear is subjected. With a cut-off between 85 and 90 per cent of the full stroke the maximum pressure at any point in the stroke is comparative uniform and is very little higher than the mean effective pressure, on which the tractive effort depends. With the short cut-off, however, the maximum pressure is much higher. On a rough estimate, the maximum pressure with the long cut-off is about 17 per cent higher than the mean effective pressure, while with 50 per cent cut-off it will

probably be more than 60 per cent higher. There is no difficulty in designing the parts to provide adequate strength, but increased difficulties of maintenance may be expected. The driving box, with its crown type of bearing, is not well adapted to take heavy thrusts, a fact which already has resulted in increased maintenance of main boxes on large power. The added thrusts which must be resisted with the 50 per cent cut-off will increase the difficulties of keeping these boxes in good condition. There is no inherent objection to the short cut-off from the strength standpoint, but to provide ample strength the weight of frames, rods and pins must be increased.

There is nothing on which to base a prediction as to the ultimate success of the idea; it must rest upon a careful weighing of the advantage as demonstrated in service with the above-mentioned disadvantages. Applied to the Mallet locomotive, however, as a substitute for compounding, it does not possess the advantages which might be expected when compared with the usual type of simple locomotive.

## The Tank Car Situation

THE REMARKS OF COL. B. W. DUNN during Friday's session on the seriousness of the danger and economic loss in connection with the transportation of gasoline in tank cars, placed before the Mechanical Section a matter which should receive the very serious thought of the members. The bottom discharge valve is the greatest source of trouble and is most in need of attention. The solution of this safety valve and dome cap questions offer less difficulty. The inadequacy and unsatisfactory nature of the type of valve generally used at present was clearly indicated in the report of the Tank Car Committee and in the individual discussion of the bottom outlet valve by Chairman Gibbs. The principal point of difference between the committee and Colonel Dunn seems to be in their respective attitudes toward the proper methods of improving the situation. Mr. Gibbs' remarks, tacitly at least, recognize the bottom outlet valve as a necessary adjunct of these cars, but strongly recommends its improvement. Colonel Dunn points out that, since 20 years have elapsed without the development of a satisfactory device, it is unreasonable to expect any better results from future attempts at improvement.

For cars handling volatile liquids exclusively there seems to be no good reason why the bottom outlet should not be eliminated, as these liquids can very readily and satisfactorily be unloaded through the dome by several methods and the equipment required for top unloading is not of such a nature that its installation can be considered burdensome when the advantages of the elimination of the bottom valve in decreased danger and loss of lading is considered. There may be some difficulty in top unloading of some of the viscous products commonly handled in tank cars, which would make the elimination of the bottom valve burdensome to those having to do with such products. The matter, however, is one which must be determined on the broad grounds of country wide economy and safety and it will probably be impossible to arrive at a final solution which adequately considers the matter of safety and freedom from loss of volatile products, that will be entirely satisfactory to shippers of other products. It would be better to provide special equipment to meet the requirements of such cases than to perpetuate present conditions as they effect the vastly greater volume of traffic in highly inflammable volatile products. Such a solution of the problem is not impracticable when it is considered that the greater part

of the tank car equipment of the country is privately owned and built for use in one class of traffic and that the volume of traffic in products which cannot readily be handled in a car designed for volatile products are comparatively of very small volume.

## Training for Car Department Men

IN THE COURSE OF HIS ADDRESS at Saturday's meeting, F. W. Brazier gave some interesting data concerning the relative expenditures for labor and material in the car department. He quoted statistics which showed that wages formed approximately 60 per cent of the total expenditure for the maintenance of cars. This fact is of peculiar significance, coming, as it does, at the end of a four days' session devoted to discussions of the problems of the car department. During these meetings committee reports were presented dealing with questions involving various phases of operation, design, the technical aspect of equipment maintenance and the efficiency of materials and devices. During the entire session not a single report was presented which dealt in any way with labor matters; in other words, the attention of the committee has been devoted entirely to methods of saving a part of the 40 per cent spent for material, while the 60 per cent spent for labor has been ignored.

The natural inference that would be drawn from this fact is that labor conditions are entirely satisfactory and there is no opportunity for improvement. Such an idea would be promptly dispelled by reading the discussion of the report of the Committee on Car Construction. In the course of this discussion there were repeated references to the inability to secure good workmanship from the present day car repairers and the butt splice for car sills was adopted in preference to the ship lap splice, partly at least because the butt splice is easier to make.

Is it not time for the members of the mechanical associations to abandon their attitude of indifference toward the problems connected with the efficiency of labor? The by-laws of the Master Car Builders' Association prohibited the discussion of rates of wages or hours of labor. Even granting that the consideration of these particular questions by the Mechanical Section might be unwise, it is, nevertheless, a fact that the training of men to increase their efficiency is a subject which demands attention and to which no valid objection could be offered. The need for systematic training is proved when the master car builders agree that formerly the car department employees were competent mechanics, but now it is necessary to "put something easy in the rules so that the mechanics can work it out."

It is doubtful whether there is a road in this country that has a system of training car men that is satisfactory under present conditions. A consistent quality of developing the personnel of the car department is needed to reduce the labor turnover, to train skilled mechanics and to provide capable executives in the future. At the present time some roads are preparing comprehensive instructions for the guidance of car repairers. Such a policy, in conjunction with an apprentice course, should bring about a marked betterment in labor conditions.

The results of the methods developed to improve the labor situation might well be considered in a topical discussion at next year's convention. There is some question whether the Mechanical Section will confine itself to technical problems or whether it will broaden its activities to embrace all matters concerning the mechanical department. The decision which the officers and members come to will be watched with interest.

## Program For Today

9.30 A. M. TO 1.30 P. M.

Address of Vice-Chairman.....	9.30 A. M. to 10.30 A. M.
Action of Minutes of 1918 Annual Meeting (M. M.) .....	10.30 A. M. to 10.35 A. M.
Reports of Secretary and Treasurer (M. M.) .....	10.35 A. M. to 10.50 A. M.
Discussion of Reports on: Standards Recommended Practice (M. M.)..	10.50 A. M. to 11.20 A. M.
Mechanical Stokers .....	11.20 A. M. to 11.50 A. M.
Individual Paper on "Standardization," by Mr. Frank McManamy...	11.50 A. M. to 12.30 P. M.
Questions Proposed by Members....	12.30 P. M. to 1.30 P. M.
10.30 A. M.—Band Concert. Entrance Hall, Million Dollar Pier. Royal Scotch Highlanders' Band.	
3.30 P. M.—Orchestral Concert and Impromptu Dancing. Entrance Hall, Million Dollar Pier. Fry Philharmonic Orchestra. Tea will be served at 4.30 P. M., in Entrance Hall.	
9.00 P. M.—Major E. D. Campbell, Railway and Seacoast Section, Artillery Division, Ordnance Department, United States Navy, will make an address in the Hippodrome on "Railway Artillery." There will be an Informal Dance in the Ball Room, Million Dollar Pier. Royal Scotch Highlanders' Band.	

### W. T. Tyler to Speak Monday

**W.** T. TYLER, DIRECTOR OF OPERATION of the Railroad Administration, will deliver another brief address before the Convention on Monday morning.

### Meeting of General Committee

**T**HERE WILL BE a meeting of the new General Committee of Section III—Mechanical, American Railroad Association, at 4.00 P. M. on Monday, at the Marlborough-Blenheim. Members of the retiring Executive Committee are also invited to attend.

### The Lecture Tonight

**T**HE LECTURE ON RAILWAY ARTILLERY, which is to be delivered in the Hippodrome at 8.30 tonight by Major E. D. Campbell, Railway and Seacoast Section, Artillery Division, Ordnance Department, United States Army, should provide interesting entertainment from the popular as well as the engineering standpoint. Major Campbell was with the Ordnance Department throughout the war, following the development and progress of railway artillery from the very beginning, and is therefore specially well fitted to speak on this subject. The lecture will be accompanied by descriptive moving pictures and lantern slides.

### Don't Fail to See the Big Guns

**T**HE EXHIBIT of the Baldwin Locomotive Works, which is located on Georgia Avenue, three blocks below the pier, is of unusual interest. Through the courtesy of the United States Navy, two gun mounts are exhibited—one a railway mount carrying a 14-inch gun and the other a caterpillar mount carrying a 7-inch gun. The big gun is manipulated at 11.00 A. M. and 3 P. M. The 14-inch mount represents an

improvement over a number which were built during the war, and were used in action in France. The mounts were constructed by the Baldwin Locomotive Works and the guns by the Midvale Steel and Ordnance Company.

### Lost and Found

**LOST**—Lady's badge No. 5105. If found, please return to the *Railway Age* booth.

**LOST**—Plain gold lingerie pin, between Hotel Traymore and Dixon booth on pier. Finder will kindly return to F. W. Cohen, Metal and Thermit Corporation.

**LOST**—Gold mesh purse by Miss Louise Guldman. If found, please return to Royal Palace.

**LOST**—Badge No. 2591. If found, please return to *Railway Age* booth.

**LOST**—A diamond and platinum bar pin on Saturday evening by Miss Raster, at the enrollment booth.

**LOST**—Two return tickets to Baltimore by A. F. Jenkins, Ambassador Hotel, Room 926.

**LOST**—Railroad badge No. 238. Please return to J. H. Milton, of the Chicago, Rock Island & Pacific.

**FOUND**—Five-point star and circle enameled pin. Apply to Secretary Conway, Million Dollar Pier.

**LOST**—R. S. M. A. badge No. 3165. Return to enrollment booth.

**FOUND**—Lady's blue stone pin, set in filagree silver. Apply to Secretary Conway.

**LOST**—Badge No. 2747. If found, please call at the *Railway Age* booth.

### McBarmma Golf

#### Tournament and Dinner

**T**HE ANNUAL TOURNAMENT AND DINNER of the McBarmma Golf Club were held at the Seaview Club on Saturday. N. M. Garland won the championship medal with low gross of 84. He also won the Sargent Luck cup with a selected score of 77. C. F. Street won the club handicap cup with a net score of 82. Other winners in the tournament were:

Class A, first, A. H. Sisson; second, C. L. Bardo and H. A. Gillis tied.

Class B, first, F. H. Clark, George Bishop and C. F. Street tied, and Mr. Street won in the play-off; second, W. O. Wood.

Class C, first, J. T. Carroll; second, D. R. MacBain. Guest prizes, first, H. C. Manchester; second, Alfred Calkins.

The following officers were elected: President, C. L. Bardo; vice president, E. W. Van Houten; secretary-treasurer, C. F. Street; directors, B. F. Flory and W. L. Conwell.

The following new members were elected: J. H. Young, E. H. Walker, H. C. Manchester and Samuel O. Dunn.

### Election of Mechanical Section Officers

**T**HE ELECTION OF OFFICERS for the American Railroad Association, Section III, Mechanical, was held on Saturday morning.

W. J. Tollerton, general mechanical superintendent, Chicago, Rock Island & Pacific, was elected chairman, and James Coleman, superintendent car department, Grand Trunk Railway, vice-chairman. These officers will serve for the next two years.

For members of the General Committee, term expiring June, 1921: C. F. Giles, Louisville & Nashville; T. H. Goodnow, Chicago & Northwestern; J. T. Wallis, Pennsylvania Lines; W. H. Winterrowd, Canadian Pacific; term expiring June, 1920: C. E. Fuller, Union Pacific; John R. Gould, Chesapeake & Ohio; John S. Lentz, Lehigh Valley; Samuel Lynn, Pittsburgh & Lake Erie, A. P. Prendergast, Texas & Pacific, St. Louis, Southwestern, International & Great Northern; J. W. Small, mechanical assistant to the regional director, Atlanta, Ga.; H. R. Warnock, Chicago, Milwaukee & St. Paul.

For members of the Committee on Nominations: F. W. Brazier, New York Central Lines; H. T. Bentley, Chicago & Northwestern; J. T. Willis, Pennsylvania Lines; D. R. MacBain, New York Central Lines, and J. J. Hennessey, Chicago, Milwaukee & St. Paul.

## Industrial Car Manufacturers' Institute

**T**HE INDUSTRIAL CAR MANUFACTURERS' INSTITUTE had its regular monthly meeting on last Friday at the Marlborough-Blenheim. The Institute is a new organization of manufacturers of the lighter type cars used for industrial purposes. While the organization is a comparatively new one, it is quite progressive. At the present time there are 22 manufacturers in its membership. The objects of the Institute are to bring about co-operation of business methods and the standardization of equipment; special attention is also being given to welfare work and to the improvement of labor conditions.

Colonel James Milliken of the Corps of Engineers, was elected president of the Institute and assumed charge on May 1. It will be recalled that Colonel Milliken, who has been a member of both the M. C. B. and the M. M. Associations for a number of years, was, prior to the taking up of war duties at Washington, superintendent of motive power of the Pennsylvania Railroad at Wilmington, Del. Soon after the outbreak of the war he was called to Washington as mechanical aide to the director general of military railways, where he had charge of the design, purchase and production of the mechanical appliances for use by the American Expeditionary Forces. In the summer of 1918 he was commissioned a Colonel of Engineers and placed in direct charge of the design, purchase and production of all railway equipment, appliances and supplies. This position he occupied until he received his discharge the latter part of April, 1919.

## Frank McManamy Honored

**A**S A TRIBUTE to Frank McManamy, assistant director, Division of Operation, his associates gave him a banquet in the Forest Room of the Marlborough-Blenheim on Saturday night. He was presented with one of only fifty-six Webb C. Ball watches, which passed the test of the United States Government Bureau of Standards. Inscribed in the back of the case are these words: "Presented to Frank McManamy, assistant director, Division of Operation, U. S. R. R. A., by his associates, in memory of his services rendered in connection with the winning of the world war. June 21, 1919."

The guests included Mr. and Mrs. Frank McManamy, W. T. Tyler, director of operation, and Mrs. Tyler; George N. DeGuire, general supervisor of equipment; Fred P. Pfahler, chief mechanical engineer, and Mrs.

Pfahler; J. J. Tatum, general supervisor car repairs, and the Misses Lucille and Veronica Ermatinger, nieces of Mrs. Tyler, as well as the following supervisors and assistant supervisors of equipment, several of whom were accompanied by their wives: J. G. Adair, Harvey Boltwood, J. Frank Brady, Mr. and Mrs. R. Campbell, Mr. and Mrs. J. H. Cooper, G. E. Dougherty, Mr. and Mrs. George Dugdale, George Ermatinger, Mr. and Mrs. Hiram K. Green, Mr. and Mrs. John Kane, Mr. and Mrs. William Martin, G. B. Moir, Mr. and Mrs. C. R. Woods and Mr. and Mrs. C. Woodworth and daughter.

## R. S. M. A. Annual Meeting

**A**LARGER NUMBER of members than usual attended the annual meeting of the Railway Supply Manufacturers' Association in the Hippodrome on the Million Dollar Pier Saturday morning at 11 o'clock. All attendance records are nowadays being broken and it was therefore not surprising that the gathering Saturday morning was a large one.

President E. H. Walker occupied the chair. Although he reported verbally for the Executive Committee his statement of the activities of the association since the last convention in 1916 was very complete, and was listened to with interest and approval. The present convention and exhibit was, he said, by far the best and largest ever held. Keen interest was aroused when he told of the visit of seventeen of a total of twenty members of the Executive Committee of the American Railroad Association to the meeting of Section III, Mechanical A. R. A., on the pier Friday and of the interest of these men in the splendid exhibit of railway appliances. Mr. Walker did not use the word, but he plainly conveyed the idea of a great "awakening" among the railroad executives of the entire country in connection with the Atlantic City activities this year.

In the way of routine business the association passed a resolution increasing the amount to be retained in the association treasury from \$5,000 to \$10,000. It was also resolved that hereafter the fifth association district be composed of the State of Illinois alone and that the other States heretofore included in the fifth district be added to the seventh district.

District elections for the Executive Committee were reported as follows:

Third—W. H. S. Bateman, Champion Rivet Company, Philadelphia, Pa. (Mr. Bateman also represents the Parkersburg Iron Company), and John M. Gillespie, Lockhart Iron and Steel Company, Pittsburgh, Pa.

Fourth—Charles D. Jenks, Damascus Brake Beam Company, Cleveland, Ohio.

Fifth—L. S. Wright, National Malleable Castings Company, Chicago.

Sixth—Col. George L. Morton, Galena-Signal Oil Company, Atlanta, Ga.

The duties of the new members of the executive committee become effective September 1, 1919.

The election of officers for the coming year resulted as follows:

President, George R. Carr, vice-president of the Dearborn Chemical Company, Chicago.

Vice-President, J. F. Schurch, vice-president T. H. Symington Company, Chicago.

Mr. Carr, the newly-elected president, was compelled to leave on an important business trip to San Francisco just after the meeting.

# W. T. Tyler Addresses Mechanical Convention

## Director of Operation of Railroad Administration Praises Sessions and Exhibit as "Post Graduate Railroad Course"

W. T. TYLER, DIRECTOR OF OPERATION of the United States Railroad Administration, attended the session of the Mechanical Convention on the Pier, Saturday morning and delivered a brief, but interesting address. In the course of his remarks he referred to the achievements of the railroads in helping win the war; praised the work done by the mechanical officers and paid high tribute to the educational value of the exhibit on the Pier. He declared he would use his influence to get the American Railroad Association to hold its spring meeting in Atlantic City next year to enable the operating executives attending it to see the exhibit.

Mr. Tyler was introduced by C. E. Chambers, Chairman of the Mechanical section. He said in part:

I am here this morning as director of the Division of Operation of the Railroad Administration. The other day I called as a member of the Executive Committee of the Railway Association. I am not here with a speech or an address.

I presume a great many were too busy to keep up with all of the war activities of the railroads, and it may be of interest to you to know how many times the railroads actually won the war. That was, at times, a daily occurrence, and other times it did not occur more than two or three times a week; but whenever any fellow had anything he wanted done by the railroads, the outcome of the war depended on the railroads being able to do that one thing. Seriously, I am of the opinion that the railroads of this country did as much to win the war as any other agency. The war produced three or four millions of soldiers in this country in an incredibly short time. That same thing applies to railroad soldiers. It was necessary for almost every man in the service, especially the officers, to entirely change his methods and readjust himself to an entirely new situation.

There were many misgivings about the mechanical preparedness of the railroads to meet the demands of the war. Unfortunately, the railroads did come into the thing in bad condition, because they were laboring under the disadvantage of inadequate rates for several years, and matters had reached a point where many of the railroads were practically bankrupt. There was unpreparedness in the number and condition of locomotives and cars. There had been the most remarkable increase of business during the year 1916 and the first half of 1917, and locomotives and cars were run to their utmost. There was not the time, the labor, nor the facilities, and there was not the money with which to repair them.

Many predicted that it would not be possible for the railroads to meet the burden that would be thrown upon them. But the situation did straighten itself out, and the only way in which it could have happened was through the soldierly qualities of the members of the mechanical organizations. They simply got together and met that situation.

### War Achievements of the Railroads

C. R. Gray, in an address at St. Louis recently, touched briefly on one of the special features of our work that stands out in my mind. On February 8, 1918, three Cabinet officers, supported by Mr. Hoover, Dr. Garfield and Mr. Hurlley, walked into Mr. Gray's office and laid on his desk a cablegram to the President of the United States, signed by the Premiers of England, France and Italy, serving notice upon him that unless the United States im-

mediately brought its food program for the Allied armies up to par and kept it there, the Allied armies would have to discontinue fighting and withdraw from the field.

It was a notice, putting upon this country the whole burden, the whole responsibility for winning the war, and characteristic of the great American game called "passing the buck," it was brought over to the Railroad Administration with a brief speech from each of the gentlemen present, each one assuring Mr. Gray that his department of the government was ready to meet the situation and it was up to the Railroad Administration to bring the foodstuffs down to tidewater and they would take it across.

Drastic measures were taken immediately to meet the situation. Mr. Hoover said "it is out there"—he said it covered the country—but he could not say just where it was.

Dr. Garfield assured us that the coal was already mined, and the miners were waiting to put it into the cars if we furnished the cars.

Mr. Hurlley assured us that the ships were all on the ocean, and that they would be in port whenever we had food there.

An order was issued taking equipment away from the Eastern section of the country, regardless of the freight offering for movement. Cars were taken out of the industries empty, when the shippers had the freight piled up on their platforms ready to put into the cars. In about two weeks Mr. Gray was able to send a letter to the French High Commission, and to Sir Cunniffs Guthrie, the British representative in charge of the purchases for the Allies, and to each of the gentlemen who had visited him that morning, that the principal ports of commerce were at that time practically blocked with food supplies in cars waiting for ships, and while he would very much regret to do so, unless relief were offered at once, he would find it necessary to issue an embargo. From that moment on the shoe was on the other foot all the time. The movement of food supplies into the ports had to be regulated to meet the arrival of ships which could transport the food overseas.

Right along, almost every few days, we had some delegation come to see us who stated that their industry would perish if not supplied with cars. I recall that a great many cars had to be taken out of the Southeast, where the big bulk of fertilizer is manufactured. We had a call in a few days from members of the Association of Manufacturers of Fertilizer, with a representative from the Department of Agriculture. They assured Mr. Gray unless cars were furnished immediately, and in preference, for the movement of fertilizers, that there would be no crops in this country in the Fall of 1918, that a great majority of the farmers of the country depended upon fertilizer for their crops, and that at that time they were so far behind in its movement that it would be almost impossible to catch up and meet the situation, but that if we would turn over to the fertilizer industry the exclusive use of the cars and railroad facilities for the period of about thirty days, they might possibly save the situation.

Then came Mr. Hoover again to say that about 90 per cent of the total corn crop of the United States for the previous season was still unmoved—it was largely

on the farms—that about 80 per cent of that total was soft corn, and that it would germinate in the month of March and be a total loss. It was not cured, and unless it could be moved in the drying elevators and cured, and gotten out of the way, it would be a total loss, and we would starve to death, because all of our wheat had to go to the armies abroad. That situation did, in fact, exist, but it was met. By that time the overseas food situation had been met, and we were able then to turn the cars into the movement of corn.

In about six weeks there was more corn moved to primary markets, dried and moved out to its ultimate destination than had ever been moved in six months in the United States before. I do not know how it was accomplished—it was accomplished by the men on the job, that's all; they were told what was necessary to be done, and did it.

Following that came the men who built silos. They explained that for about two years they had not been able to carry on the work of building and distributing silos throughout the country, and that there had been a tremendous loss the year before in foodstuffs as the result of not having silos to take care of the corn crop, which was destroyed in the field, and there was greater danger last year than ever before of that happening again, and unless they could be furnished with cars we would all starve to death.

Then came the tin can manufacturers. They said even if we were at that time to give them absolute preference to the use of the railroad facilities of this country, in the movement of tin to their plants, and the movement of the manufactured product out to the distributing centers, they would not be able to meet the situation. They said they were so many hundreds of millions of cans behind, it was impossible to meet the situation, and a great deal of food would go to waste because of their not having cans in which to preserve it, and we would starve to death. That thing followed right along. Every fellow came in with his particular product and proved to us, unless he was given preference, the whole thing would go to smash.

Now, you men out on the job, met that situation, and as I say, you saved the country every time you did it. Each and every situation that I have mentioned, and many more which the railroads had to meet, they did meet. In doing so, I feel that we produced as good soldiers in the railroad operation as were produced in the Army. Speaking once again for the mechanical organization, as I saw it from Washington, while the Army produced wonderful soldiers, and the Navy produced wonderful sailors, our organization was absolutely amphibious—we worked above or below water, and it did not make any difference.

#### Praise for the Convention and Exhibit

Now, just a word about the Convention, and our experience here this time. I do not know of any department of the service that has labored under greater disadvantages than the mechanical men. The building of a roundhouse comes only after you have supplied the wants of all of the other departments on a railroad. You are expected to get along out-of-doors; you are expected to get along in any kind of weather, and if you do not do it, you are simply inefficient, that's all. This is my first experience at one of these mechanical exhibits, and I want to say here and now, and say it for publication, that I regard the mechanical exhibit here as a post-graduate course for mechanical officers that is not available in any other way. The doctor, for instance, takes his post-graduate course every year or two, in order to keep up with the times. You gentlemen have great need for the

same post-graduate course, frequently, and nowhere else is it available as it is right here on this Pier, and I am going to use my personal effort as a member of the Executive Committee of the American Railroad Association, to bring the spring meeting of that Association here to Atlantic City while you are in session. (Applause.) I think it will be just as helpful to the Executive officers of the railroads of this country, as it will be to you, and it will give them an entirely new conception of what you accomplish here, and of the opportunities that are put into your hands for, as I say, getting a post-graduate course in mechanics.

I think it will be helpful to you, in that it will enable you to demonstrate to the executives and the chief operating officials of the road what you can do if you are given up-to-date machinery and up-to-date tools; in fact, as you all know, there is a great difference between going on with what you have been able to utilize in order to keep your machinery in operation, and in going on with what is up to date and what really meets your need in handling the heavier power, and heavier cars, and heavier traffic which moves over the road.

I think a great deal of good will come from the visit of the Regional Directors and members of the Executive Committee of the American Railroad Association to this convention and the exhibit. If I had realized the importance of it a little earlier, I would have endeavored to have had the spring meeting at this time to cover two or three days, so as to have had them all here for several days; but some of them had important engagements and they hurried away after finishing the work in one day. Two or three of the gentlemen have remained over, and every one has voiced himself as anxious to come back, and as having an entirely new conception of these meetings and of this railway supply exhibit.

Now, I want to say in that connection, that as the result of the variety of interests of the different railroads and of business competition, it has been difficult in the past for you gentlemen to get over some of the things that you have recommended, to secure approval of many of the standards that you have recommended, and that you have seen the need of. The life of the United States Railroad Administration, we are told, is limited now to the close of this year, and I want to ask, therefore, that while the opportunity is ripe, you bring as many of these things to the attention of the Railroad Administration as you can, through Mr. McManamy, and let us work them out at this time, and get them into effect, and perhaps they will last after the roads go back to the individual owners. I pledge you my own personal assistance in this matter, and I want you to think seriously of taking advantage of the opportunity that we have. We can perhaps accomplish some things now that you gentlemen have had in your minds for a long time, but could not get all of the interests together on. Now, while we have that opportunity, let us go along with it. I will help you.

#### Plans for 1920 Air Brake Convention

THE AIR BRAKE ASSOCIATION and the Air Brake Appliance Association held a joint meeting in the Marlborough-Blenheim on Friday, F. J. Barry presiding. Plans were formulated for the exhibits in connection with the next convention, which has been set for May 5, 6 and 7, 1920. Chicago was chosen as the place of meeting. Twenty-two new applications for membership in the Appliance Association were acted on and arrangements were made for the assignment of exhibit space.

Chicago & Alton Engine Terminal at Bloomington, Ill.

## American Railroad Association, Section III, Mechanical

Proceedings for Saturday Morning, Including the Tank Car Report  
which was Presented Friday.

THE SATURDAY MORNING SESSION of the American Railroad Association, Section III, Mechanical, was called to order at 9.40, Chairman Chambers presiding. The session on Saturday was an innovation, as compared to previous conventions,

but there was a large attendance and the arrangement proved satisfactory. The report of the Committee on Tank Cars, which was presented on Friday, was not published in Saturday morning's *Daily* and follows herewith:

### Report of the Committee on Tank Cars

WITH THE WAR CAME the necessity for the transportation of various products, among them toxic liquids for filling shells, not previously handled in tank cars. The Class III car was adapted to this service by the modification of certain details, such as omitting all openings in the shell, making the dome capacity about one per cent, special arrangement for closing the dome opening, etc. Another demand was for tank cars for carrying compressed liquefied gases, notably chlorine. The specification for Class V car, with welded tanks, adopted by the association in 1917, with some modifications of details, met the situation very well.

Some difficulties were experienced in welding anchorages to the tanks. This was remedied by avoiding the use of anchorages having great length of welded contact with the shell.

The seams of these tanks were hammer welded throughout, using water gas as the heating medium. With steel of a proper quality there seems to be no difficulty in securing thoroughly sound welds and containers which are bottle tight. The American Society for Testing Materials has prepared a specification for "Plates for Forge Welding," which meets the views of those engaged in producing welded containers. If this specification is adopted by the A. S. T. M. this year, the committee recommends that it be substituted for the specification of the A. S. T. M. for Boiler Plate Steel, Fire Box Quality, now prescribed by the Tank Car Specifications for tanks of Class V cars. To insure getting satisfactory material under this latter specification it has been necessary for the users to make certain restrictions within its limits.

**Suspensions of Requirements.**—As stated in the committee's report last year, the necessity of keeping in service every car capable of safely handling liquid products made it advisable to suspend until July 1, 1919, the requirements of flange quality steel for Class III tanks, and until January 1, 1920, the hydraulic retests of tanks of Classes I, II, III, IV and V cars. As the conditions which led to these suspensions have passed, your committee has recommended to the Executive Committee that no

further extensions of these requirements be granted and that circulars be issued to inform all interested accordingly.

The Notes of Section 2 (a), Material, Class III Specification, and Section 23, Tests of Tanks, Classes I, II, III, IV and V Specifications, covering these suspensions should be omitted.

The notes to Section 2 (a), Material, Class III Specification, portant matters, the committee has been able to make but little progress during the past year with the experimental work in connection with the safety valve. For use in connection with these tests better springs than are ordinarily used in these valves have been purchased but even these do not entirely comply with the specifications.

It is very evident that for certain products it will be necessary to provide a safety valve in which corrosion is guarded against by the use of non-corrosive material in both the housing seat and the bearing face of the valve proper.

The committee has made some experiments in electrically welding the non-corrosive metal to the iron parts, but the results so far have not been satisfactory. Further work will be done in this direction.

It is not certain that an absolutely tight valve can be secured which will at the same time retain the valuable feature of the present design, viz., very free discharge in case of necessity. A considerable amount of information has been accumulated concerning the behavior of safety valves under pressure, and the committee hopes to be able to push the work to a conclusion during the coming year.

**Safety Valve Collar, Fig. 10-A.**—Complaint has been made that with the rivet circle of  $5\frac{1}{8}$ -in. radius the hub of the collar interferes with the rivet set. The size of this collar is limited by its location on the dome head, and the committee does not believe that there will be any question of safe construction if the radius of the rivet circle and the radius of the outside of the collar are left to the car builder, and therefore recommends that these dimensions be omitted from Fig. 10-A.

**Bottom Discharge Valve.**—Complaints continue to be re-

ceived, notably from the Bureau of Explosives, concerning the unsatisfactoriness of the bottom discharge valves now used. The question was discussed in the committees' report for 1917 and it is to be regretted that little or no progress has been made in the improvement of this feature. Reliance against leakage seems to be really placed on the cap of the discharge pipe instead of on the valve and although the regulations prescribed by the Interstate Commerce Commission require that cars shall be loaded with the caps off, it is apparently the general practice for loading to be done with the caps on, primarily for the reason that the valves are not tight, and the only way to prevent leakage during the process of loading is to rely upon the cap. The breaking of the cap in derailments and from other causes frequently results in the partial or entire loss of the contents of the tank, and too often in fires.

The committee does not feel that it would be proper for it to undertake the design of this part and then recommend it as a standard, and trusts that a design may be developed by the tank car builders or users which will be enough better than the present ones to warrant its adoption. The committee believes that the present conditions of the tank car traffic require some form of bottom outlet.

**Riveting.**—Criticisms have been received that tanks with

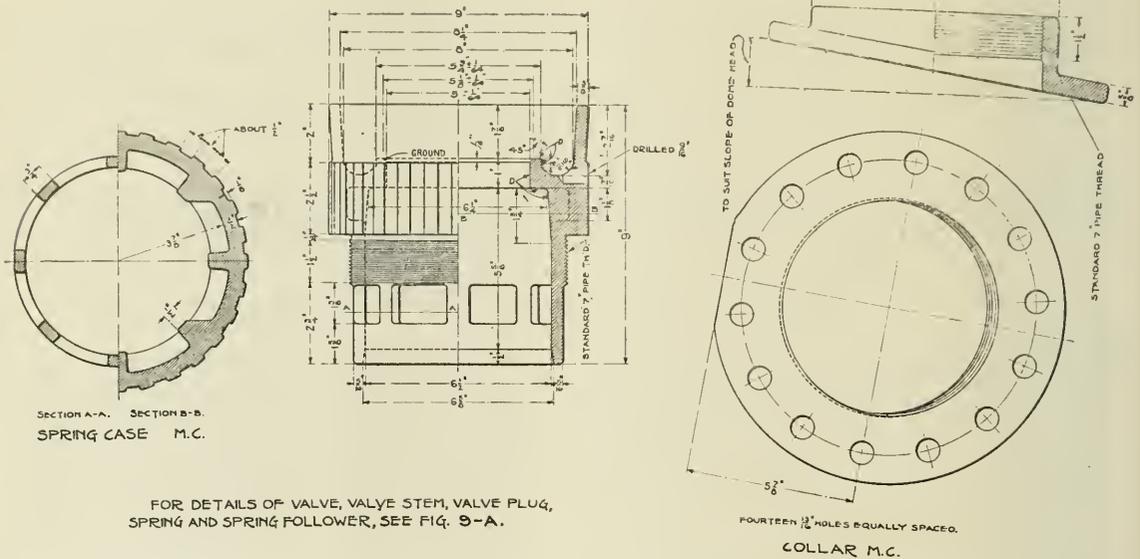

**Calking.**—Attention has been called to the injury of the shell of the tank by the use of chisel-pointed calking tools, and the committee recommends that a new sentence be added at the end of Section 4, Calking, Specifications for Classes III and IV Cars, reading,

"Split calking shall not be permitted."

**Application of Running-Board Brackets on Tanks Covered with Jackets.**—It is recommended that in paragraph "Manner of Application of Safety Appliances" the sentence, "The running-board brackets must be attached preferably to the underframe, or to metal pads attached to the shell proper," be changed to read: "Running-board brackets must be attached to the underframe."

**Application of Dome Platform Brackets to Tank Cars Covered with Jackets.**—It is recommended that in the paragraph "Manner of Application of Safety Appliances," the words "on the outside of the jacket" be omitted from the third sentence, so that it will read, "Dome platform brackets must be attached to suitable bands."

**Inspection.**—Section 25 of Specifications for Classes I and II cars has a note which seems to conflict with Interchange Rule 3 (c) and the committee now recommends that it be omitted from the two specifications.

FOR DETAILS OF VALVE, VALVE STEM, VALVE PLUG, SPRING AND SPRING FOLLOWER, SEE FIG. 9-A.

Revised 1918: Spring seat and opening for valve to be dressed. Tolerance limits fixed for certain dimensions of valve seat. Thickness of bottom of spring case changed from 3/8 in. to 5-16 in. Form of inside ribs of spring case changed.

Fig. 10a.—Details of 5-in. Standard Safety Valve, Applied to Dome

5/8-in. rivets, particularly those tanks having 7/16-in bottom plates, 9/16-in. shell plates, and 1/2-in. heads, have given trouble from leakage because of the small size of the rivet head. While the committee believes that such cases are due rather to bad workmanship than to any mistake in the size and spacing of the rivets, it has made a canvass of the car builders and finds that a number of them, considering the fact that the circumferential seams have a surplus of strength, prefer the use of the 3/4-in rivet with sheets 5/16-in. thick and over, and show that with a spacing of 2 3/4 in. they can still maintain the required 70 per cent strength of seam. In the head seams it is undesirable to use different sizes and spacing of rivet holes where the different thicknesses of bottom and shell sheets are joined to the head.

The committee recommends that for Classes III and IV cars the use of 3/4-in. rivets with 2 3/4-in. spacing be permitted with 5/16-in. plates. The committee is not prepared to recommend a wider spacing.

Section 3 (b). Riveting, amended in this respect, would read:

Thickness of Plate.	Diameter of Rivet.	Longitudinal Pitch.	Back Pitch.
5/16 in.	3/8 in.	2 1/2 to 2 3/4 in.	1 1/2 to 1 3/4 in.
3/8 in.	1/2 in.	See Note.	See Note.

\* Note.—For longitudinal seams with 3/4-in. rivets, 2 3/4-in. longitudinal pitch is necessary to insure 70 per cent strength of seam.

**Boards for Attaching Placards Prescribed by the Interstate Commerce Commission.**—It is recommended that a new section be inserted in the Specifications for Classes III, IV and V Cars, reading: "18-A. Cars shall be equipped with suitable boards for attaching placards prescribed by the Interstate Commerce Commission. These boards shall be of sufficient size to permit placards to be applied with the opposite points of the diamond in vertical and horizontal positions respectively."

Some minor corrections which were overlooked in the 1918 Revision should be made as follows:

**Method of Testing Safety Valve in Place on Car.**—In the Table of Scale Readings, 25-lb. setting the minimum scale reading should be 430 and the maximum 550, the same as shown in Fig. 13. The reference to tolerance should be changed to agree with the 3-lb. tolerance for the 25-lb. setting, as follows: "The minimum and maximum scale readings are the limits within which the valve must open when being tested to come within the tolerance of 1 lb. for the 12-lb. setting and 3 lb. for the 25-lb. setting, above or below the normal pressure per square inch at which the valve is supposed to open."

United States Railroad Administration Tank Cars.— Under date of February 7, 1919, the secretary, by direction of the

Executive Committee, referred to the Tank Car Committee the suggestion that they go over the plans and specifications for the United States Railroad Administration Tank Cars (Oil Cars, 7000, 8000, and 10,000 gal. capacity, and Acid Cars of same capacities), and consider the advisability of adopting them as standards of the Master Car Builders' Association, report to be made at the coming convention.

This involves two questions: 1. As to the wisdom of adopting any particular tank car designs as M. C. B. Standards. 2. Whether from all standpoints the government tank car designs meet the requirements of the tank car traffic better than others now being followed. In deciding these questions the interests of the railroads, the tank car owners, and the car builders must be considered.

The committee believes that as long as the requirements of the Master Car Builders' Standard Specifications covering the essential features of tank car construction are complied with it would be unwise to restrict the builders and users to certain standard designs, as the many commodities of widely different characteristics, weights and values transported in such cars require for their safe and economic handling various modifications in detail design.

The Railroad Administration designs were prepared to meet the M. C. B. Specifications, and this committee passed them in conference with the Railroad Administration. The tank car equipment of the country, in which the railroad ownership is comparatively small, must also be assumed to comply with the M. C. B. requirements, as it is moving in interchange. Specifications and prints have been furnished by the Railroad Administration for its cars, but the time available is entirely too short to permit the proper comparison and consideration of them and of the plans and the specifications for other designs of cars which must be gone over to answer the second question.

The committee will be glad to have further instructions in this matter.

The report is signed by: A. W. Gibbs (Chairman), Pennsylvania; C. E. Chambers, United States Railroad Administration; Wm. Schlafge, Erie; Samuel Lynn, Pittsburgh & Lake Erie; John Purcell, Atchison, Topeka & Santa Fe; O. J. Parks, General American Tank Car Corporation and A. E. Smith, Union Tank Line.

### Discussion

Mr. Gibbs: On page seven recommendations are made to suspend the requirements, and among those you will remember that during the course of the war we recommended the allowance to use tank steel instead of the specification boiler steel. A great many cars have been built according to those specifications, and a number of railroads and some builders have material to build cars which are on order. I would like to withdraw that part of the specification to suspend entirely until July 1, 1919, the requirement of flange quality of steel for Class III tanks, but have left it to the Executive Committee to fix a date after our committee can get all the facts.

There is a paragraph on bottom discharge valves, which I need not read, because I have a separate paper, and Colonel Dunn will also speak on that subject.

In regard to riveting, your committee is in doubt as to how much of this is based on poor workmanship, and how much is real necessity. We recommend that it be permissible to increase the size of rivets from  $\frac{5}{8}$  in. to  $\frac{3}{4}$  in.

At the time the report on Hand Brake Power was written the Executive Committee had not adopted rules for any practice on tank cars. Since this was written they have done so, and the Committee on Train Brakes has issued a diagram and circular. We recommend that this be made part of the report.

## The Bottom Outlet Valve on Tank Cars

### Individual Discussion by A. W. Gibbs

THE following discussion is to be understood as an expression of personal views, and does not of necessity express those of the members of the Tank Car Committee.

The bottom discharge valve on tank cars antedates the formation of the committee in 1903. Its use was due to its manifest convenience in discharging the contents of such cars without the aid of any auxiliary machinery. In detail, it consists in nearly every case of a miter valve, fitting into a conical seat. The valve is guided by either a pin passing through a hole in a bridge below the seat, or wings fitting a cylindrical hole forming the discharge passage below the seat. The material may be either steel or cast or malleable iron, the seat usually being cast or malleable iron. In practically all cases the valve discharges into a vertical cast iron pipe having a flange riveted to the shell of the tank. The seat for the valve is machined in this pipe casting. At its bottom end the pipe is ordinarily closed by a screw cap with internal threads corresponding to those of the union of the pipe leading to the storage tank.

The valve is as a rule operated by a vertical rod socketed and pinned to the valve and extending up into the dome where it is guided by a suitable bracket. This bracket also serves as a support for a lifting cam or some form of nut engaging a threaded portion of the rod. Where the lifting cam is used a spring below the bracket engages a collar on the rod and is supposed to keep the valve firmly on its seat. Other variants of this arrangement have been used, such as a yoke and nut immediately above the yoke, but not, so far as we are advised, combined with the yoke and spring. While this arrangement has possible advantages, it has also the disadvantage that the whole assembly is submerged and very inaccessible in the event that anything goes wrong.

There has been a great deal of complaint of the whole bottom discharge arrangement, and it is probably the main source of leakage of tank cars. The Tank Car Committee is in receipt of numerous complaints from the Bureau of Ex-

plosives, relating to cases where tank cars have lost all or a part of their contents by leakage at the bottom discharge valve. The indication is that shippers rely mainly on the bottom cap to prevent leakage. Complaints from other sources have supplemented those from the bureau. A number of bad cases have been due to water leaking past the valve into the discharge pipe and subsequently freezing and bursting the discharge pipe and unseating the valve. Still others have resulted from the exposed end of the discharge pipe being struck and broken, unseating the valve at the same time. The modern anchorages almost insure against the cases where the discharge pipe is broken by the tank shifting.

The question naturally arises, why should there be any difficulty in securing a thoroughly tight valve where the pressure is so very low—usually only that due to the static height of the liquid? At first thought it seems to be the simplest kind of a mechanical problem. This may be the reason why no serious attention appears to have been given to making a radical improvement. It is difficult to see where there has been any betterment in this feature of the car during the life of the Tank Car Committee.

In seeking for the causes of leakage we suggest the following possibilities: 1. Corrosion of the valve or seat. 2. Lodgment of dirt or trash on the valve seat. 3. Cocking of the valve from insufficient guide or from improper fitting of the lifting socket. 4. Displacement of the valve from surging action of the liquid contents of the tank. 5. Change of shape of the tank due to the weight of the lading causing lateral spreading with resulting decrease of vertical height.

The first of these sources of leakage is easily remedied by the use of non-corrosive material in the valve and its seat. As the seat is usually formed in the top end of the discharge pipe it will be desirable to roll or pean a ring of non-corrosive material into a proper seating in an undercut groove in the pipe, so as to reduce to a minimum the amount of stealable material. The same care would have to be taken in pre-

paring the valve itself. In this connection it should be mentioned that the seats must be adapted to the nature of the products handled.

It may be desirable to so arrange the valve and its guide and the valve seat that the whole assembly can be readily removed from below. This will insure better workmanship in refitting, as the work can be done under very much more satisfactory conditions than with the present arrangement where the men have to go into the tanks. In the case of cars carrying inflammables the tanks have to be steamed out before the men can enter. Such an arrangement would probably require a larger discharge pipe, which does not seem to be particularly objectionable.

The lodgment of dirt or trash on the valve seat probably occurs during the drainage of the last portion of the contents of the tank. The only practical remedy that we can suggest is care at the loading rack, passing the contents through a proper screen.

I believe there is a great chance of improvement by the use of some form of rotating valve in which the valve and seat are always in contact, the liquid contents discharging through ports which register when in the open position. The main disadvantage of this arrangement is the size of the opening required to provide the necessary area of discharge ports. I believe that the rate of discharge, especially during the latter stages, can be much increased by the use of proper overhead shields which will prevent the access of air through eddy action of the outflowing liquid.

Cocking of the valve is believed to be a potent cause of leakage. It should be borne in mind that a conical seated valve fits its seat only when the axes coincide; any but right sections of such a valve are ellipses. Spherical seats are free from this objection, but are so much more difficult to maintain that they are not to be recommended. The causes of cocking are many, such as rigidly pinning the valve to the operating rod, poor workmanship in providing proper guides above or below. I believe that an overhead cylindrical guide, such as that of the cup-shaped valve used in the old-time cross-head feed pump, has great possibilities.

The displacement of the operating rod by the surging of the liquid contents of the tank is offered as a possible source of valve leakage. With some of the large tanks having much less than the required percentage of dome capacity, which in consequence must not be loaded shell full, the rod is continually subject to this action, especially with viscid liquids. Enclosure of the rod in a protecting pipe would guard against this action.

Deformation of the tank from the weight of the contents is known to occur. We have some data concerning the flattening which occurs at the loading rack, but none as to that which occurs in transit due to uneven track. Where the valve is cam operated with spring take up it is not quite clear that this action should cause the valve to chatter on its seat.

Finally, there is the failure to properly close the existing valves, for which we have no remedy to suggest other than to make the open and closed position of the opening handle so plain as to be reasonably foolproof.

The Chief Inspector of the Bureau of Explosives has suggested that the Tank Car Committee design a proper outlet valve arrangement, but we have felt that it is not advisable for the committee to devise such an arrangement and then push its adoption. We believe that there is ample talent among the engineers of the car building and car operating companies to provide adequate devices if they will give this feature the same attention that has been given to the improvement of the general construction of the tank car.

### Discussion

Mr. Gibbs: Our committee has been in constant receipt of complaints from the Bureau of Explosives of loss due to continued leaking at the bottom discharge valve. The designers have made little or no progress over a long period of time, and this report is written with the hope that those who are designing cars will submit designs which give some promise of being tight.

Colonel Dunn is present and I would suggest that he be given the privilege of the floor, to tell us just how bad the trouble is.

Chairman: I will be very glad for the convention to have Colonel Dunn address us.

### Colonel Dunn Speaks

I am very glad for an opportunity to talk to you gentlemen on the subject of tank cars. You all know that the Interstate Commerce Commission has issued regulations intended to safeguard the transportation of explosives and other dangerous articles; that a part of those regulations has been to prescribe the specifications governing the manufacture or shipping and the containers for dangerous articles. A single exception to that practice was made in the case of tank cars. When these regulations were promulgated, this Association through its tank car committee had charge of prescribing specifications for tank cars, and it was thought best to leave the matter in the hands of that committee.

There are three things about the tank car which are weak. They are the bottom discharge valve, the safety valve and the dome cover. The people who are responsible for designing and constructing the tank car, to make it an efficient shipping container, have borne for about 20 years a responsibility of getting these parts of the tank car right.

The most destructive article, from the railway standpoint, that we have to transport to-day, is gasoline. Some years ago, when the Bureau of Explosives was organized, every one thought it was dynamite and similar explosives. Let me read you a few figures that come from our reports.

In the period of 1910 to 1917 the number of people killed on the railroads in the transportation of dangerous articles of all kinds, not including explosives, was 97—78 of those people, or over 80 per cent, were killed by gasoline; 901 people were injured; 607 of them, or 67 per cent, were injured by gasoline. Only four people were killed by explosives, gasoline being nineteen times as dangerous from that standpoint. Thirty-four people were injured, gasoline being eighteen times as dangerous as explosives. The property loss in those eight years was \$3,500,000. Gasoline caused \$1,600,000, or 46 per cent. The property loss from explosives, omitting the Black Tom explosion, which was a war outrage and not a transportation accident, was \$135,000; to \$1,600,000 for gasoline, or gasoline was twelve times as destructive from the standpoint of money as explosives of all kinds.

During 1918 the tank car carrying inflammable liquids, acids and corrosive materials, killed 22 people, injured 56, and caused a money loss of \$977,000, or about 1-23 of all the freight losses on the railroad.

The tank car accidents in 1918 summarize as follows: 49 were due to derailment, which killed 12, injured 13, and caused a money loss of \$651,000; 37 collisions, killing 2, injuring 9 and causing a loss of \$199,000. There were 59 leakages not caused by derailment or collisions, which killed 8, injured 34 and caused a loss of \$126,000.

In 1918, if our tank cars had not had bottom valves, we would have saved the lives of 3 people, the injuries of 11 and money loss of \$245,000. That does not include very large losses as a result of evaporation from both the bottom valve and the safety valve.

F. J. T. Stewart, Superintendent of the Bureau of Surveys, New York Board of Fire Underwriters, and President of the National Fire Protection Association, in answer to my questions, says: "I first familiarized myself with the present provisions for emptying such car tanks. I am impressed with the objectionable features of the outlet valve, located at the bottom of the tank and having a discharge pipe extending some distance below. This arrangement is a serious violation of a fundamental safeguard which the National Board of Fire Underwriters have stood for for many years. I refer to the prohibition against gravity pressure upon such a valve, which experience has shown is exceedingly difficult to keep tight. On the tank car the danger of derangement of this valve is infinitely greater than in the case of a fixed storage system. The valve being located in the bottom of the tank is affected by the slightest amount of sediment. Water, due to condensation, is also likely to accumulate at this point and freeze in cold weather. The projection of the outlet pipe below the valve offers an additional opportunity for derangement of the valve by being struck in case the car leaves the track. Serious fires have resulted

from this bottom valve, causing losses not only to the tank cars and their contents, but also to adjacent properties."

An extract from a report of one of the inspectors of the Bureau of Explosives indicates the general impression produced upon the mind of a disinterested man who has spent all his life traveling over railroad lines, where very large numbers of tank cars move.

"Aside from the fact that this tank car should not have been in transportation service, because of being in bad order and not complying with the M. C. B. Rules, and the various violations committed by the agent in waybilling the shipment, the contents would not have been lost if the tank had not been equipped with an outlet pipe at the bottom, which broke off when the tank shifted on the frame. The outlet pipe on tank cars is responsible for 95 per cent of the leakage of contents of tank cars, due to the fact that the outlet valve and the fittings on the outlet pipe cannot be made leak proof. In the winter, water will get in the outlet pipe and cause it to freeze and burst and the ice in the pipe will unseat the outlet valve. The only reason that I can see for having tank cars equipped with outlet valves and outlet pipes is for convenience in unloading and that can as well be done from the dome and a five-in. tapered plug can be substituted for the outlet valve."

Similar reports show that that is the general opinion of representatives of the Bureau of Explosives.

In England they do not allow bottom valves in any tank wagon which carries an inflammable liquid. They do not allow the most dangerous inflammable liquids to go into tank wagons at all, and gasoline is one of them.

Another extract from a report of one of our inspectors assigned to tank car work, who has just returned from a trip through the oil region in Oklahoma and Texas, follows:

Of leaky outlet valves, he says:

"This condition was observed on May 9th at Forth Worth, 14th at Burkburnett, 27th at Sapulpa, 28th at Kieffer, and the 29th at Shamrock. Tanks involved were owned by Anderson and Gustafson, General American Tank Car Corporation, Inland Refining Co., M. R. Travis Co., Oklahoma Petroleum Co., Keith Tank Line and Pelican Oil Refining Co.

In addition there must be many which do not show valve trouble because of the practice of using lime in the outlet valve caps. While this has proved to be the best method of insuring against leakage from the cap, it is depended upon too much by those who do not leave the cap off while loading. On several cars on which I saw the caps removed, leakage came from the outlet valves in streams, showing that the cars had been loaded with the caps on and the responsibility of the valve transferred to the cap by the use of lime. Efforts to reduce the leakage by manipulation of the valve rod failed and transfer was necessary.

At isolated tracks, where there is difficulty in securing empty cars, the temptation is strong to try to hold the load with the valve cap if another car is not available.

At Sapulpa, on May 28th, I saw a car loaded with gasoline and bearing on each side a label,

*DO NOT REMOVE  
BOTTOM OUTLET VALVE*

We will not be responsible for  
any loss entailed in unloading  
from the bottom.

*UNLOAD FROM DOME*

I think our 20 years' experience in waiting for a satisfactory bottom discharge valve, is about as much time as we ought to wait. My remedy is to do away with it entirely. This suggestion is radical from the standpoint of the owners of these tank cars, and for the shippers who use them. I am not making it with the idea that it will be adopted at once, or that all of these sacrifices that it would entail would be brought at once upon the owners of tank cars. I have asked a number of the larger shippers to give me some data as to what it will mean to them if this bottom valve is taken off, but I have not yet received their replies.

I believe that most large shippers are prepared at their large plants to unload through the dome. If a shipper is large enough to get gasoline in tank car lots, he ought to be large enough to get an equipment to unload through the dome.

The safety valve is second in importance to the bottom discharge valve. It was put on, as you know, to avoid the danger of a rupture of the tank in case of accidents involving fire. I will read what Inspector Grant found in regard to safety valves down in the oil region:

"In the usual trouble from blowing safety valves it was noticed that the temperature raised and interior pressure developed from exposure of the tanks to the sun. I went up on a number of cars where the leakage of gas from valves was heavy and the hissing noise could be heard from the ground at a considerable distance. There were a number with a quiet escape of gas evident only from a wavy appearance in the air about the valves and a very strong odor.

"At Sand Springs, in the shop of the General American Tank Car Corporation, on May 30th, I had Superintendent Eakins conduct some tests with new safety valves of Trumbull make as well as their own. No amount of adjustment or regrinding could make them tight, and they blew under test at practically all pressures up to the popping point.

"At Argentine, May 31st, at the works of Thomas Track Appliance Company, I found that they were machining a wider valve seat than called for in M. C. B. specifications. I arranged to have two complete valves machine to exact dimensions for testing at the shop of the Sinclair Refinery on June 3rd. These tests were conducted in the presence of Master Car Builder Beasley, Shop Superintendent Osborn and Inspector J. M. Scott. It was found impossible to get the valve tight, and the trouble showed itself due to a side lift. I do not believe that the present type of valve will ever prove satisfactory.

"The bottom outlet is not necessary in transportation, and without the development of a type to reduce or prevent the rapidly increasing cases of leakage it seems to me that it would be best to eliminate bottom valves."

He found that they could not make a new valve work in accordance with the specifications. We haven't yet had any big disaster in the storage yards in the oil region, but I am living in trepidation that from day to day I am going to hear from one. What does it mean to shippers to have that constant escape from this loose safety valve? A great many of them get to destination with shortage of contents. The railroads are asked to pay for a great deal of it, and the shippers themselves have to pay the major portion.

It is by no means uncommon to hear of a tank car losing 10 per cent of its products while en route. That is a tremendous tax upon the resources of the country and is due in a large measure to the fact that safety valves on tank cars do not hold; they leak almost from zero pressure.

Most of the dome covers are secured by a screw thread. It is a very large and heavy piece. Many of the men who should secure it after loading a car do not secure it properly, and many of them injured the thread. They are not vapor tight or even water tight. In attempting to screw them down, the gaskets underneath have been punched and injured; the holes that have been drilled to prevent opening the domes under pressure have taken up part of the thread, and the result is that wherever you get a high vapor tension product in a tank car today, you are liable to have the vapor, escaping from under the dome cover.

The design, assembled from the interior, which was submitted by the Union Tank Line sometime ago, and I understand approved by your committee, is a very much better one than the screw design that we are using. A large number of accidents have occurred as a result of men attempting to unscrew the dome cover, when there was interior pressure in the car. The usual result is for them to unscrew it until only one or two threads remain, and then the pressure in the car does the rest of it, blowing up the dome cover and a column of liquid with it. The hinged bolts, or the design assembled from the inside, would make it impossible for that accident to occur.

I hope that the owners of tank cars, those who construct them, those who are responsible for their use, will give serious consideration to the troubles that I have detailed and that they will meet us in the right spirit and devise some reasonable way to at least better the condition.

Mr. Gibbs: Before Colonel Dunn leaves the stand, will he tell us whether that great loss through the valves, particularly safety valves, is on cars which are jacketed? We prescribe a special car for handling these casing head gasolines, and my observation is that they are comparatively small in number.

Colonel Dunn: This is from the ordinary tank car. The regulations permitted shipment in an ordinary tank car of casing head gasolines, when they reduce the vapor tension down to 10 lb. All of these shippers claim that they do reduce the vapor tension down to that point; but experience shows that when the sun beats down on one of these tank cars long enough, you will get a vapor pressure that is sufficient to give this trouble, even where it is not a prohibited article. I have heard of very little trouble from those insulated tank cars.

Mr. Harding: I represent a private ownership. We have a number of tank cars that carry explosive products. Colonel Dunn's remarks are very interesting and instructive. I wish he could be a little more helpful in reference to that discharge nozzle. We have followed very carefully the Tank Car Committee's recommendations in past years. In addition to a discharge nozzle there are also two pipes entering into all our tank cars; for instance, through the bottom, for coils. It is necessary to take care of crystallized products, as they must also be removed. Our greatest losses are through the heating coils. The pipes extend from the bottom down each side of the discharge nozzle, and a man swinging himself under the car, grasping that pipe to help himself through, has, at times, broken off the pipe. It is necessary to have a valve on that, and at times that valve has been opened, causing loss.

We find that there are very few people receiving our commodities that are equipped to blow out or syphon or pump out our products. Our dome covers are of cast steel; they are hinged, and are held in place with swiving bolts. We ship the highest grade ammonia, and I cannot recall an instance in the past 19 years that we have had losses from leaking dome covers. I don't believe that this convention should put it up to the builders of tank cars, or the operators of tank cars, to find out the best means. I believe it remains for the Tank Car Committee to tell tank car users what to use, just the same as you are telling all other people what to do, and properly so.

Chairman: Evidently you don't think we would have any controversy if the Tank Car Committee did all of these things.

Mr. Harding: Yes, but the controversy would have the authority back of it at any time.

Chairman: It would have to be approved by the Tank Car Committee. I am sure we are very thankful to Colonel Dunn for his talk to us. He is always helpful, no matter where or when.

Now, the Report of the Committee is before you gentlemen. It has really only one specific request, and that is that the paragraph about the time limit of the use of flanged steel, whether it should be left to the Executive Committee for action after further investigation and developments.

A motion that the report be accepted and that matter be referred to the Executive Committee for action was carried.

The convention then adjourned until 9:30 o'clock Saturday morning.

## Saturday Morning Session

The Saturday morning session was called to order by Chairman Chambers at 9.40. The Secretary read the proposed Rules of Order for the Mechanical Section and then said:

### Rules of Order

The Rules of Order as read corresponded with those printed in the *Railway Age* of March 7, 1919, page 535, with the exception of the paragraphs printed below.—EDITOR.

(c) Any person having such knowledge of science or practical experience in matters pertaining to the construction of motive power or rolling stock as would be of special value to the section may be admitted by the General Committee as an affiliated member on being recommended by three representative members. Affiliated members shall be entitled to all the privileges of representative members excepting that of voting on matters submitted to written or printed ballots and being elected to office in the section and may serve on committees on appointment by the General Committee, in addition to the regularly elected members of such committee.

Such membership shall continue until written resignation is received by the secretary or the membership is terminated by the General Committee or by the members becoming engaged in business which, in the judgment of the General Committee, would impair his usefulness to the section or discriminate against others similarly engaged. Affiliated members shall not be subject to dues or assessments.

(d) Representative members who have been in good standing twenty years, or members who have served as President of the Master Car Builders' or American Railway Master Mechanics' Associations or chairman of the section become life members.

(e) Those persons, active or representative members, who have been in good standing in either the Master Car Builders' Association or the American Railway Master Mechanics' Association for twenty years, or members who have served as president of either association or as chairman of the section become life members. Those now carried by the Master Car Builders' Association as life members or by the American Railway Master Mechanics' Association as honorary members will be continued as life members of Section Three—Mechanical.

8. (b) In all ballots for chairman, vice-chairman, members of General Committee and Committee on Nominations at the meetings of the section, the following form of voting shall be adhered to: An envelope shall be provided on which there shall be a blank space for the name of the railroad, and the name of the official voting; smaller envelopes shall be provided on which shall be printed the words "For Officers," "For Members General Committee," "For Members Committee on Nominations," and otherwise unmarked. In these envelopes the ballots shall be placed by those voting them and they shall then be placed within the larger envelope and presented to the general tellers. When a ballot is to be taken the chairman will announce the names of all required tellers. Three general tellers shall have charge of receiving and recording the ballots cast. When all ballots have been cast these tellers will announce that the polls are closed. They shall then remove the smaller envelopes, count and announce the vote for officers and shall deliver the envelopes marked "For General Committee" to two tellers, who shall count and announce to the general tellers the vote for General Committee and those marked "For Committee on Nominations" to two tellers who shall count and announce to the general tellers the vote for the Committee on Nominations.

(d) When a ballot for officers or membership on committees shall be announced as having eventuated in a tie vote, or be otherwise undecided, upon such announcement the final result shall be determined by the majority of the members present.

9. (a) Unless otherwise provided herein, a vote in the session of the section may be taken  *viva voce* , by arising, or by written or printed ballot. In a vote taken by written or printed ballot only representative members and representatives of the United States Railroad Administration shall participate. Letter ballots may be ordered to be taken in such manner and under such conditions as the section may by resolution from time to time or the General Committee may direct.

(b) Votes on letter ballot on all measures affecting the interests of the railroads represented, which a majority of the Association decide, shall be determined on the basis of cars and locomotives owned, or which are in use or process of purchase by the railroad. Votes on car standards shall be on the basis of one vote for each 1,000 cars and on locomotive standards on basis of one vote for each 100 locomotives. The ballot shall be cast by the representative member in the section designated by the federal manager or executive officer of the member of the Association.

(c) Printed ballots for use in the election of officers, members of the General Committee and the Committee on Nominations, to be of the form as prepared by the Committee on Nominations.

(d) Printed ballots for use in letter ballots to be of the form as prepared by the General Committee.

*A motion that the Rules of Order, as read by the Secretary, be received and adopted, was put to vote and carried.*

## Report on Train Lighting and Equipment

J. R. Sloan  
Chairman

THE COMMITTEE HAS CONFINED its efforts this year to developing a proposed standard basis for the rating of car lighting axle generators and a method of testing to determine this rating. Some consideration was given to the subject of a proposed general specification for axle generator car lighting equipment, but it was found impracticable to give sufficient study to the subject to submit a report.

There is not, at the present time, any method of rating axle generators, or of testing them to ascertain their rating, that has been accepted by any society or association. The various manufacturers have their own basis of rating and some few of the railroads cover the subject in their specifications, but there is no generally accepted method. In order that when quotations are received from axle generator manufacturers the purchaser may compare them on an equal footing, it appears essential that there be an officially recognized method of rating and of testing to determine the rating.

The current carrying capacity of any electrical apparatus, including axle generators, is dependent upon the ultimate temperature attained by the insulation. The materials used as insulators have been divided by the American Institute of Electrical Engineers into three classes: Class A, Class B and Class C. Class A insulation consists of cotton, silk, paper and similar materials, when so treated or impregnated as to increase the thermal limit, or when permanently immersed in oil; also enameled wire. Class B insulation consists of mica, asbestos and other materials capable of resisting high temperatures, in which any Class "A" material or binder is used for structural purposes only and may be destroyed without impairing the insulating or mechanical qualities of the insulation. Class C insulation consists of fireproof and refractory materials, such as pure mica, porcelain, quartz, etc.

The maximum temperatures to which these various types of insulation may be continuously subjected have been determined by the A. I. E. E. to be as follows:

Class of Material.	Maximum Temperature to Which the Material May Be Subjected.	Maximum Temperature Rise.
* Class A .....	105 Deg. C.	65 Deg. C.
Class B .....	125 Deg. C.	85 Deg. C.
Class C .....	No limits specified.	.....

\* For cotton, silk, paper and similar materials, when neither impregnated nor immersed in oil, the highest temperature and temperature rises shall be 10 deg. C. below the limits fixed for Class "A" insulation.

It is further provided that the above temperatures are based on a standard ambient temperature of 40 deg. C., and that when the temperatures are determined by thermometer readings, 15 deg. C. shall be added to the highest temperature observed. This correction shall apply to insulated windings, but no correction is required for commutators, while the correction for bare copper solenoids, etc., is 5 deg. C. Class A insulation is now generally used in axle generators, except on commutators where Class B is used.

The test to determine the rating will necessarily be made in the shop, where the conditions of operation are quite different from what they will be in actual service.

With a constant field current, the e. m. f. of any generator is directly proportional (within limits) to the speed, and with constant speed it is directly proportional (also within limits) to the field current. As satisfactory illumination and lamp life are dependent on an approximately constant voltage, it is obvious that the generator voltage should be maintained between as narrow limits as the range of charging voltage of the battery will permit. Also to maintain the voltage within these

limits, it is apparent that the field strength must vary approximately inversely as the train speed, and therefore the maximum field current will be at the minimum train speed.

As the heating of the generator is due principally to the energy dissipated in the fields and armature, the maximum heating must occur at a speed of the armature that will generate sufficient voltage to make the generator carry the current, and as the maximum temperature is limited, the object of a capacity test or heat run is to ascertain the maximum current that can be carried without exceeding this temperature limit, and this heat run must necessarily be made at the minimum r. p. m. that will generate the rated voltage and current.

In service, the following conditions occur, all of which tend to affect the temperature, as compared with operation on the stand: 1. The commutator's hand-hole covers must be in place, tending to increase the temperature, as the heated air enclosed in the generator cannot escape, while on the stand test they are customarily removed. 2. Due to the movement of the train, the axle generator is subjected to a very effective air wash, tending to decrease the temperature. 3. The intermittent character of the load, due to the train speed falling below the "cutting-in" speed on account of slow-downs and stops will tend to decrease the temperature. 4. The ambient temperature will rarely attain a value of 40 deg. C., and when it does, only for a comparatively short time. 5. The time at which the load on the axle generator is likely to be greatest during the day is the time at which the ambient

Generator with Thermometers Applied to Bearings

temperature is likely to be least, and vice versa. What the railroad car lighting engineer desires to know is what the capacity of the axle generator will be in service and not what it may give on a stand test.

### A Series of Tests

The committee has, therefore, conducted a series of tests with a view of determining: 1. The rating of an axle generator. 2. A method of testing to determine this rating. 3. If possible, the relation between the capacity as found on the stand test as compared to the capacity in actual service.

These tests are as follows: 1. Stand test for five hours to attain maximum temperature. 2. Stand test for five hours at manufacturer's rated full load. 3. Road test with generators forced to carry manufacturer's rated full load. 4. Road test operating normally. 5. Stand test under same conditions as No. 3. 6. Stand test under same conditions as No. 4.

The apparatus used in making these tests was as follows: A standard make of body-suspended axle generator, rated at 40 volts and 41 amperes net output. A standard make of car lighting battery, rated at 150 ampere hours' capacity, having a normal charging rate of 30 amperes. The number of cells

was varied as conditions of load and temperature rendered necessary. Weston portable ammeters and voltmeters. Es-terline recording ammeters and voltmeters. Resistance and mercury thermometers. The instruments were calibrated by comparison with laboratory standards and actual readings obtained were corrected accordingly. The axle generator equipment with the thermometers in place is shown in the photograph

To make the road tests the generators and battery were applied to Pennsylvania steel coach 1893, and the car was placed in service on train No. 12, operated between Pitt-

Nos. 12, 13, 15 and 16 were selected as being the most representative of the conditions and as conforming most nearly to the normal schedule of the train. On these tests, temperature readings were taken at 30 minute intervals and immediately before and after stops.

Following these road tests, the entire equipment was removed from the car and set up for operation in the shop, where road tests Nos. 12, 13, 15 and 16 were duplicated as closely as possible with regard to load, number and duration of stops and average speed. It should be noted that the speed in the shop tests was not the actual speed as obtained on the

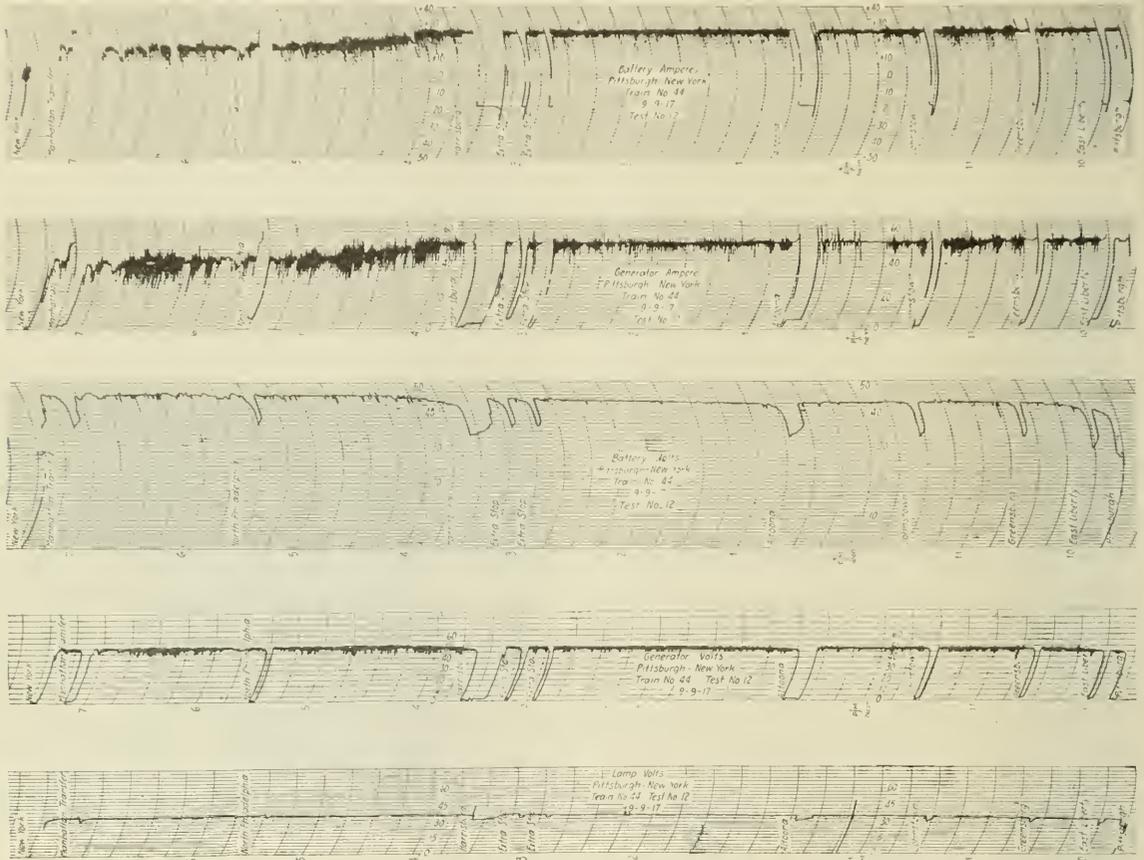

Plate No. 5.—Test No. 12.—Electrical Values—Normal Operation—45 "Load Side" Volts. Train No. 14.

burgh and Philadelphia. The results obtained on this run did not prove satisfactory, on account of the cooling due to the frequent stops of train No. 12 between Pittsburgh and Harrisburg, while between Harrisburg and Philadelphia the run was covered at high speed with few stops, with the result that the temperature of the generator was still rising at the end of the run.

The car was, therefore, transferred to train No. 44, operating between Pittsburgh and New York, and on this run a number of tests were made. Train No. 44 has a faster schedule and less stops than train No. 12, and it was noted that the temperatures attained on the run made on train No. 44 were higher than the temperatures attained on train No. 12. This indicated that the intermittent load obtained on No. 12, due to the frequent stops, more than compensated for the increase in field current at the lower speed.

Considerable difficulty was encountered in obtaining concordant data on these runs, due to the fact that in some of them the control was hand operated and also to other factors over which we had no control. The results obtained from runs

road, but the average speed obtained by calculation on the basis of distance and running time between stops.

The data accumulated on these tests are shown on the following plates:

PLATE.	TEST.	DATA.	DESCRIPTION.
1	S-1	Electrical Values....	Run five hours at 43.5 load side volts and constant current value to attain maximum allowable temperature.
2	S-1	Temperatures .....	Run five hours at manufacturer's rating 43.5 load side volts, 41 net amperes constant load.
3	SS-1	Electrical Values....	Road test, normal operation, 45 load side volts.
4	SS-1	Temperatures .....	Duplicate of test No. 12 on Stand.
5	12	Electrical Values....	Road test, constant load 41 amperes net, 45 load side volts.
6	12	Temperatures .....	Duplicate of test No. 13 on Stand.
7	12-A	Electrical Values....	Road test, constant load 41 amperes net, 43.5 load side volts.
8	12-A	Temperatures .....	Duplicate of test No. 13 on Stand.

22	S-1 SS 13 13-B 15 15-A	Temperatures .....	Comparison.

\* NOTE.—The electrical data for tests 15 and 15-A were lost and cannot, therefore, be submitted.  
[Due to lack of space the charts accompanying the report are not all reproduced.—EDITOR.]

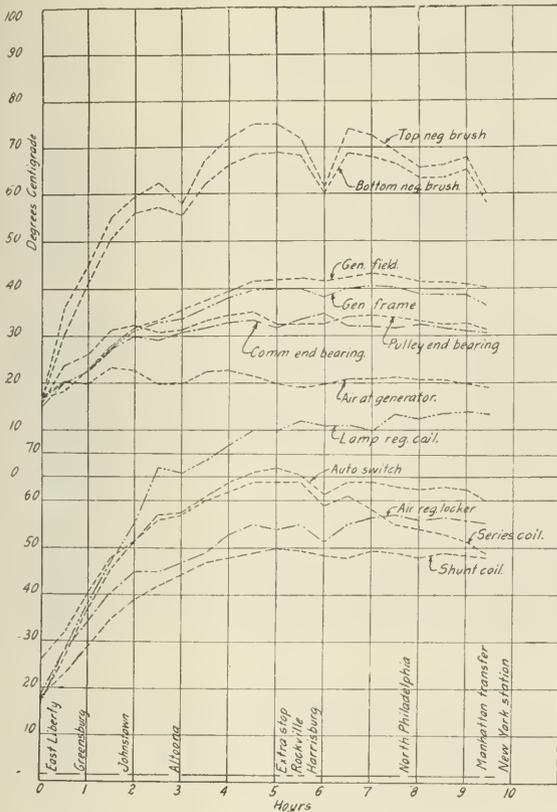

Plate No. 6.—Test No. 12. Temperatures—Normal Operation, 45 "Load Side" Volts. Train No. 44

On Plate No. 21, considering the curves for tests 12 and 12-A after the sixth hour, when the temperature of the fields had attained practically constant values, it will be noted that the rise in temperature (generator operating in normal manner at 45 load side volts) is 21.3 and 30.7 degrees, respectively, the difference in rise being 9.4 deg. C. Considering the curves for tests 16 and 16-A, also after the sixth hour, the rise in temperature of the fields (generator operating in normal manner at 43.5 load side volts) is 22.85 and 30.46 degrees, respectively, the difference in rise being 7.6 deg. C.

On Plate No. 22, considering the curves for tests 13 and 13-B after the sixth hour, when the temperature of the fields had attained practically constant values, it will be noted that the rise in temperature (generator operating at a forced output of 41 net amperes at 45 load side volts) is 23.6 and 33.2 degrees Centigrade, the difference in rise being 9.8 degrees C. Considering the curves for tests 15 and 15-A, also after the sixth hour, the rise in temperature of the fields (generator operating at a forced output of 41 net amperes at 43.5 load side

volts) is 26.1 and 29.9 degrees Centigrade, respectively, the difference in rise being 3.8 degrees.

The difference in rise in the above tests, which, so far as electrical values were concerned, were as near identical as possible, is accounted for by the different conditions of heat radiation on stand and road. The rise in temperature of the field, as shown in curves for stand test SS-1, is 25.5 deg. C. at the end of five hours. This rise is greater than the rise under road conditions as found in tests 12, 16 and 13, and only slightly less than was found in test 15. Also the difference in rise between corresponding stand and road tests is 7.6 deg. for normal operation and 3.8 deg. for forced load operation.

When it is considered that in making what is called the normal operating tests the tests were intentionally started on a battery that was only about one-quarter charged, and that the output of the generator was, therefore, greater than it usually would be in regular service, and also taking into account that the tests were run in very warm summer weather, it is believed that 5 deg. C. can easily be allowed for the difference in operating conditions on road and stand.

The generator was rated by the manufacturer at 41 amperes

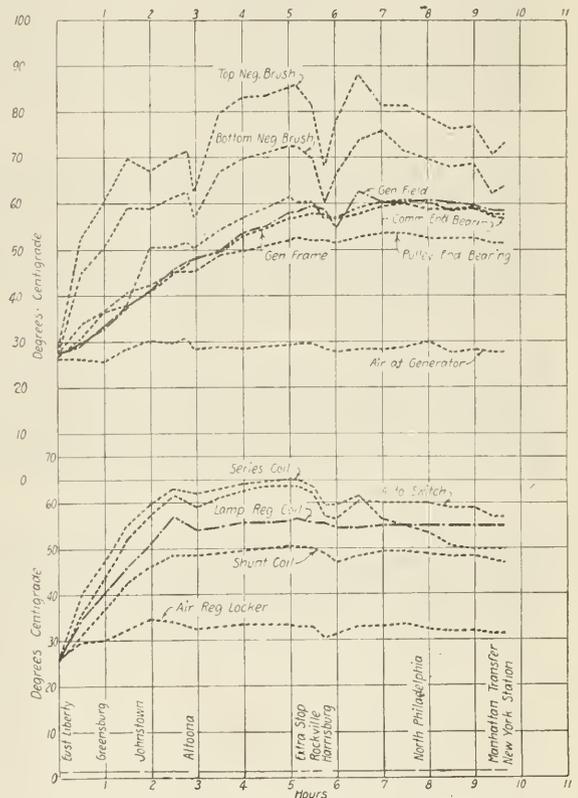

Plate No. 8.—Test No. 12-A. Bench Test Duplicating Test No. 12 on Train No. 44. Temperatures—Normal Operation—45 "Load Side" Volts

net output, so tests were run to determine its actual output. It was inconvenient to obtain the temperature of the field, but it will be noted in the other tests that the field and armature temperatures very closely approximate each other. From these tests, test S-1 was selected as being nearest the condition desired, *i. e.*, a rise of temperature of 65 deg. C. This test was run at 58 net amperes and the actual rise in temperature of the armature, the hottest part of the generator, was 67.5 deg. C.

The ambient temperature of an axle generator in actual service is rarely over 90 deg. F. or 32 deg. C., except in cer-

tain limited sections of country where it may attain a temperature of 100 deg. F. or 38 deg. C

The committee would, therefore, recommend the following:

1. That the method of testing to determine the rating of an axle generator be as follows: (a) That the generator, together with the generator and lamp regulator, if used, shall be connected in a normal manner to dead load resistance in the battery and lamp circuit, and (b) Shall be operated continuously for five hours, with commutator hand-hole covers removed, at the minimum r. p. m. that will generate rated

erator which shall show the following: (a) Manufacturer's name (b) Type number. (c) Nominal voltage of generator (40 volts for 30-volt system and 80 volts for a 60-volt system). (d) Rating in amperes as above determined. (e) Minimum speed in r. p. m. at which generator will deliver rated volts and amperes.

5. That the above recommendation be submitted to letter ballot as Recommended Practice.

The final meeting of the committee was attended by representatives of all the axle generator manufacturers in this

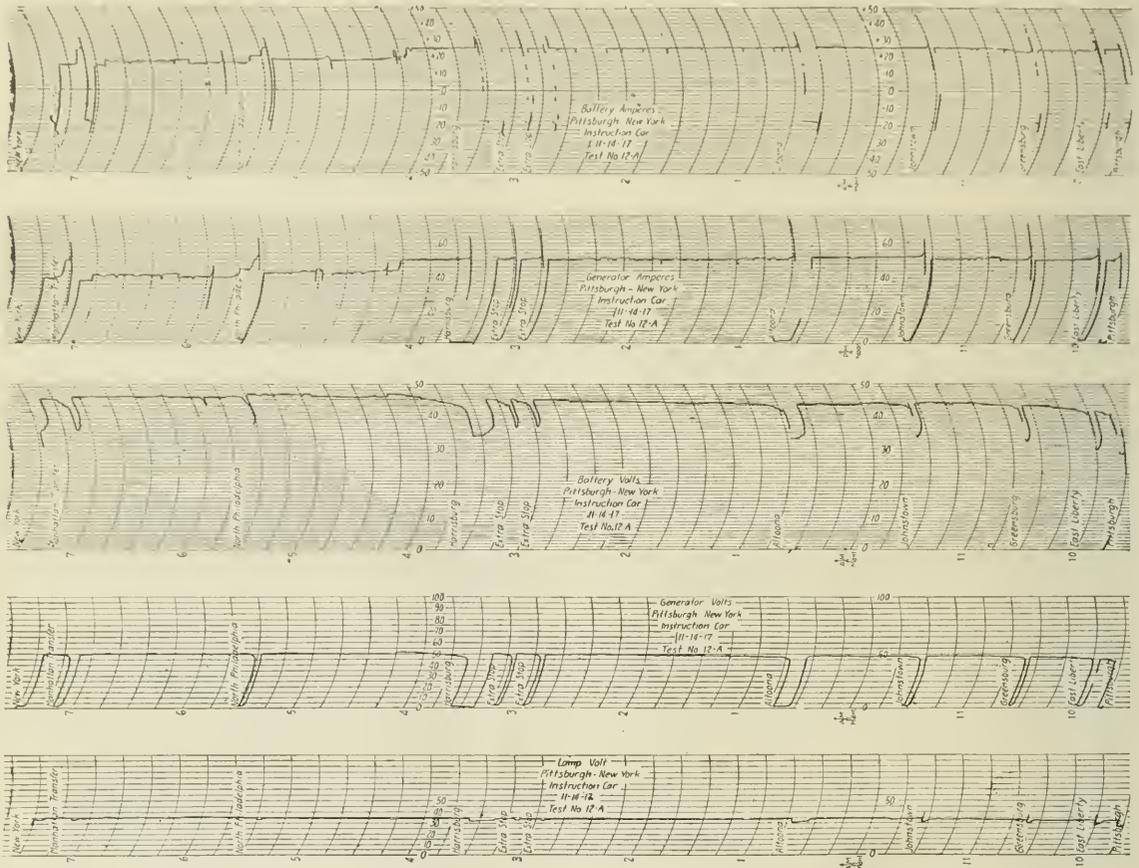

Plate No. 7.—Test No. 12-A.—Bench Test Duplicating Test No. 12 on Train No. 44. Electrical Values—Normal Operation—45 "Load Side" Volts.

volts at the load side of the generator regulator and carry the current, and that (c) The net current output shall be the armature current less all current consumed in the generator fields, generator regulator, and lamp regulator, if used.

2. That the rating of an axle generator be based upon the following: (a) The rating of an axle generator, when connected and operated as above, shall be the maximum net current that the generator will carry without exceeding the following values:

	Maximum Observable Temperature.	Maximum Observable Rise in Temperature.
Any part of generator or regulators, except commutator, brushes, brush rigging and bare copper solenoids . . . . .	110 Deg. C.	70 Deg. C.
Commutator, brushes, brush rigging and bare copper solenoids . . . . .	130 Deg. C.	90 Deg. C.

3. That the rating test shall be made at or above 15 deg. C. ambient temperature.

4. That a badge plate be securely attached to each axle gen-

erator but one, and the above recommendations were unanimously approved by the representatives attending.

A method of rating axle generators is one of the essential portions of an axle generator specification. The committee, while it realizes that it is impossible to draw a complete detailed specification that would be applicable to all types of axle generator equipment as now commercially manufactured, nevertheless believes that there are a number of essential characteristics that are common to all types of axle generators and which would be included in complete specifications. The committee, therefore, recommends that it be instructed to investigate this matter with a view to drawing up a partial specification which will include the features common to all axle generator equipment.

The report is signed by J. R. Sloane (Chairman), Pennsylvania; C. H. Quinn, Norfolk & Western; D. J. Cartwright, Lehigh Valley; E. W. Jansen, Illinois Central; E. Wanamaker, Chicago, Rock Island & Pacific; A. McGary, New York Central, and L. S. Billau, Baltimore & Ohio.

Discussion

Mr. Sloane: Referring to paragraph three on page five, my attention is called to the fact that for trains using a slipping belt, the field strength does not vary inversely with the train's

brush rigging and bare copper solenoids, the maximum temperature rise prescribed in these specification is 75 deg. C. The maximum allowable increase in bearing temperature is 50 deg. C.

Current output, according to paragraph (c), at the top of page 12, is "the armature current less all current consumed in the generator fields, generator regulator and lamp regulator, if used." The rating of current which the N. Y. C. Lines has been using is the serviceable current, that is the current measured at a point nearest the lamps and the batteries. The paragraph referred to might be made to cover that by including some additional relays or automatic switch solenoids which might be a part of the testing equipment. The service test prescribed is paragraph (b) on this same page is for some five hours under regular conditions of load and speed. Under the specifications referred to the

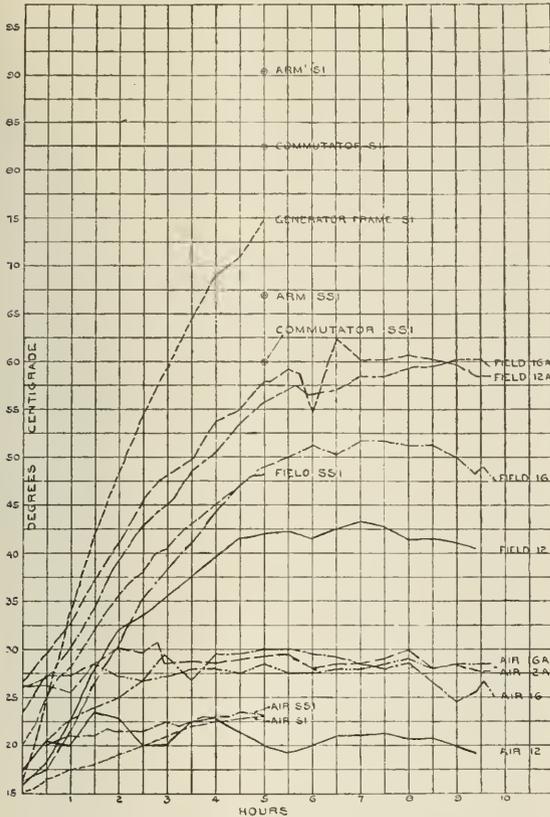

Plate No. 21. Comparison of Temperatures for Tests S-1, SS-1, 12, 12-A, 16 and 16-A

speed. But if you substitute here the words "armature speed" for the words "train speed" it is practically correct. In the table on page 12, paragraph 2-A, there should be inserted after the words "copper solenoids" the words "resistance units and carbon piles," so it will read "any part of generator or regulator except commutator, brushes, brush rigging, bare copper solenoids, resistance units and carbon piles," shall have a maximum observable temperature, etc."

Mr. Gaines: I move the report be received and the recommendation of the committee be referred to letter ballot, and that the recommendation of the committee relative to further investigation be carried out.

J. H. Davis (B. & O.): The only criticism that I had of the report was in paragraph 3, page 5, to which Mr. Sloane referred in reading the paper.

B. B. Milner (N. Y. C. Line): This report is a very commendable piece of work on the part of the committee. The method of basing the rating of the generators and the method of testing to determine that rating, as reported by the committee, represents pioneer work. As the committee states in its report, it has never been passed on by any society or association.

The N. Y. C. Lines have in operation some 2,800 axle light equipments which were purchased under, and meet, a specification somewhat more severe than that suggested by the committee in its recommendations on page 12. The temperature rise suggested by the committee as shown on that page is 90 deg. C. As applied to commutators, brushes,

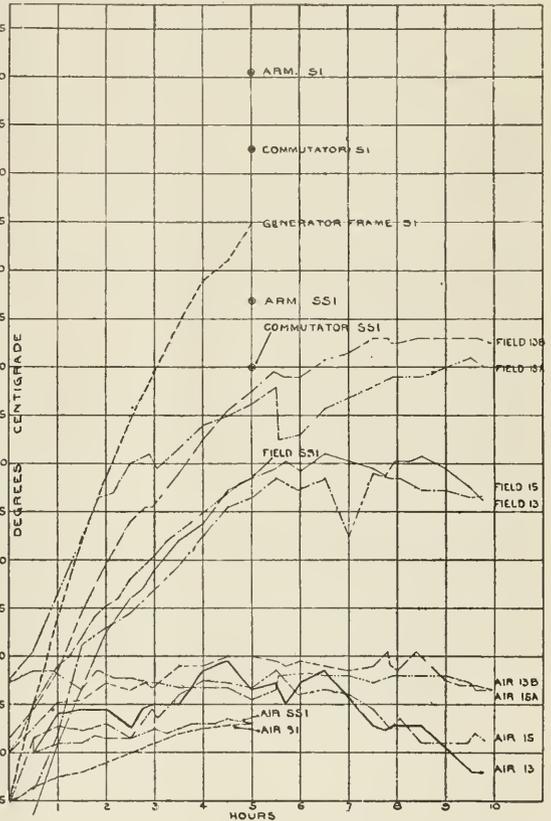

Plate No. 22.—Comparison of Temperatures for Tests S-1, SS-1, 13, 13-B, 15 and 15-A

fifth hour of that period of testing is replaced by 15-minute tests with increase in speed and load set up to cover unusual conditions under which the generators may be called to operate.

Mr. Sloane: In regard to Mr. Milner's remarks about I-C, the net current is specified as the armature current less all current consumed in the generator field, generator regulator, and lamp regulator, if used. That means that what current is put down as net current is what is available for use. We had a fully attended meeting of the committee and representatives of the axle generator companies, and this question of the N. Y. C. specifications was brought up. The committee decided that it could be omitted; that it did not consider that the service which an axle generator underwent was so severe that it had to put an additional test on it. I have received the following communication:

"In the replies from New York Central Lines roads to M. C.

B. Circular No. 29, dated January 1, 1919—Circular of Inquiry of the Committee on Standards and Recommended Practice—is included the following from E. S. Downing, G. M. C. B., C. C. C. & St. L., Indianapolis, Ind.:

"There are different ideas and systems of applying generator pulleys to axles of passenger equipment cars. Some roads use

"(c) The hub of the axle pulley shall have a uniform internal diameter of  $7\frac{1}{2}$  in., the length of the hub shall be  $6\frac{1}{2}$  in.

"(d) The face of the axle pulley shall be not less than 9 in. if flangeless, and not less than 8 in. if flanged.

"(e) The diameter of the axle pulley shall be as large as the construction of the car will permit, preferably 21 in. or 17 in.

"The recommendations were No. 88 in the letter ballot and were adopted, 1817 voting 'yes'; 154 voting 'no' and 'necessary to choice', 1314.

"These recommendations specify that a 'straight' seat shall be provided for the axle pulley but do not say by what means this end shall be attained. They do intimate that a special bushing is preferred, and this implies that a standard M. C. B. axle is used, as, if a special axle were used, the bushing would be unnecessary. They specify how the pulley bushing will be secured, its essential dimensions and also the essential dimensions of the pulley itself. It did not seem possible to prepare a 'standard' in the shape of a dimensioned drawing.

"If you feel that our committee can go further in the matter, please outline clearly what you would propose."

The stand of the committee is that the action desired has already been taken, and is recommended practice of the Association.

W. E. Dunham, (C. & N. W.): It would have more force with the members of the Association if the opinion of the Committee on Train Lighting was expressed a little more dis-

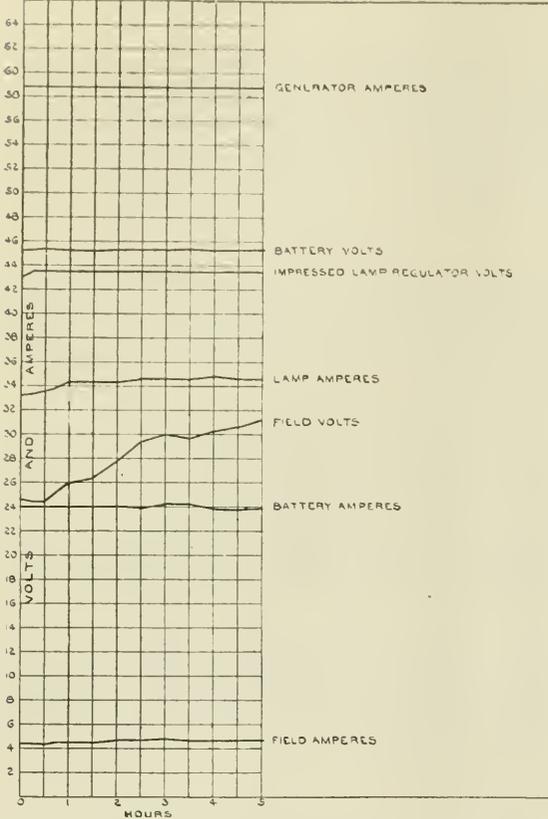

Plate No. 1. Test S-1.—Heat Run: Electrical Values—Load: Dead Resistance, 43.5 "Load Side Volts," 58 Net Amperes; Speed 16 M. P. H., 333 R. P. M. of Armature

special axles for the generator pulley, and it would be our recommendation that such pulleys be designed to conform to standard M. C. B. axles and avoid having special designed axles to accommodate the axle pulley."

(b) "Extract from Minutes of Meeting of the Committee on Standards and Recommended Practice, held in office of the Secretary at Chicago, Tuesday, March 18, 1919.

"It was decided that the subject of generator pulleys for axles of passenger equipment cars, mentioned in letter dated February 13, 1919, from E. Chamberlin, Secretary of Equipment Clearing House, New York City, be referred to the Committee on Train Lighting and Equipment."

I answered that letter to the Secretary of the Committee on Standards. I will quote in part:

"The Committee on Train Lighting and Equipment covered this subject as fully as it could be done, considering conditions as they exist, when they submitted the following recommendations in their report to the 1917 Convention.

"6. Axle Pulleys and Bushing.

"(a) A straight pulley seat shall be provided for the axle pulley.

"(b) If a bushing be used, it shall preferably be secured to the axle independently of the pulley, and shall have an external diameter throughout its length of  $7\frac{1}{2}$  in., and be not less than  $8\frac{1}{2}$  in. long.

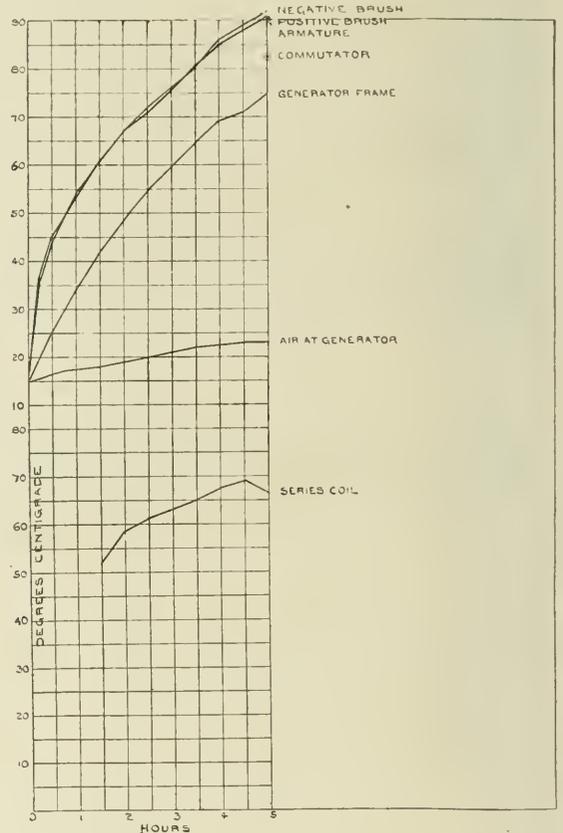

Plate No. 2.—Tests S-1.—Heat Run: Temperatures—Load: Dead Resistance, 43.5 "Load Side" Volts, 58 Net Amperes; Speed 16 M. P. H., 333 R. P. M. of Armature.

tinctly in recommended practices and standards. An axle shown in the recommended practices has a straight seat, and it is the appearance of that axle in the proceedings which leads a great many to continue to use it. I would like to see the action of

the Convention such that the straight sided axle will be eliminated entirely from the records.

Mr. Milner: I support the elimination of the special axle, or what appears to be a special axle, from the records of the Association. The N. Y. C. lines, are eliminating its use, and using only M. C. B. standard axles to which bushings are applied. If paragraph C, at the top of page 12, were amended in accordance with Mr. Sloane's remarks, it would be entirely clear.

Mr. Gaines: If we want to eliminate the special axle and adopt the standard axle in connection with car lighting, that is a subject of recommended practice and letter ballot. I would, therefore, add to the motion that the question of eliminating the special axle, and the adoption of the standard M. C. B. axle in connection with car lighting, be referred to letter ballot.

Mr. Sloane: We did not have a special axle. We say if you use it, make it thus and so, so that when you get your pulley bushing on it will conform to the same bushing as the M. C. B. axle, and be interchangeable.

Mr. Davis: I was chairman of the Train Lighting and Equipment Committee in 1917, and we made a special effort to steer clear of special axles, and I don't think you will find a thing in any of the reports of the committee which requires a special axle. If the Committee on Standards should see fit to eliminate the special axle shown, there certainly will be no objection on the part of the Car Lighting Committee.

B. B. Milner (N. Y. C. Lines): I believe that the interests of the Association and the interests of the railroads are somewhat broader than as stated by Mr. Sloane, and it seemed to me that some action should be taken in connection with the elimination of the special axle. As a matter of information, I would like to ask Mr. Sloane how many cars are carrying these special axles.

Mr. Sloane: The committee cannot state how many roads or how many cars are using special axles. We considered that the axle was out of our province, and what we considered our duty was to report on the conditions whereby we could make the pulleys interchangeable.

C. B. Keisel (Penn. Lines): It seems to me that the axle has nothing to do with this. The committee stated that it made the pulleys interchangeable so that you could use either the standard axle or the special axles, as you pleased.

*Mr. Gaines' motion, with the addition, regarding the special axle and adoption of the M. C. B. axle was then put to vote and carried.*

## Election and Other Business

F. F. Gaines: While the Secretary is busy with the tellers, I want to offer him a bouquet as I think it is due him. I do not think we have ever had a convention where things have been so conveniently arranged. Every morning we get the papers in a nice envelope, and everything we are to have for the day is right before us.

The Chairman: A great many improvements could be made in this room. We changed the arrangement this morning because of the bad conditions of the speaker's rostrum when it was at the other side of the room. If anyone talked from the back of the hall his voice struck the big girder and died at that point. The arrangement this morning was the old arrangement before the extension was built. I think we have a right to request at least, of the pier owners, that during the sessions some of this noise be eliminated. They started to rebuild out there the other day about the time we started our prayer, and there is no necessity for it at all. We have a right to stop these things, and I think by requesting it we will get that improvement. This Convention has grown with great rapidity in the last fourteen years, and these things need revision.

Mr. Cromwell: I don't think cutting windows on the side is quite the thing. The first day of the Convention I sat near the window there and there was a little too much ventilation. I had to move toward the center where I found it too hot. I think what we need is a passenger car deck above here to let this hot air out.

Here the Secretary read the report of the election which resulted in the election of W. J. Tollerton as Chairman of Section III, Mechanical, and of other officers. The results are given in full on another page of this issue:

Chairman: You have heard the result of the election and with

that goes the immediate placing of the new officers. I take great pleasure in introducing to you Mr. Tollerton, the Chairman of Section III, Mechanical, for the next two years.

Mr. Tollerton: Mr. Chairman, and members of Section III, Mechanical: I want to say how much I appreciate your selecting me to preside over this section for the next two years, and I shall endeavor in every way possible to handle the work as successfully as it has been handled by my predecessors.

Mr. Tollerton then took the chair and requested Mr. Brazier, of the New York Central Lines, to make a few remarks on the history of the M. C. B. Association, which after over 50 years of existence, is now merged with the consolidated association.

## Mr. Brazier Speaks of M. C. B. Assn.

I have prepared a paper touching on the history of the Master Car Builders' Association, but, after listening to the very able and masterly address of Mr. Chambers, who covered the ground so accurately, there was little more I could say. It is a great privilege for me, one of the oldest members in the Association, to be called on to read this paper:

The Master Car Builders' Association has been in existence as an organization for fifty-two years. The Association had its origin in informal meetings which were held by car men of the New York Central Railroad for three years prior to the formation of the Association. It is a privilege briefly to call attention to the long list of honored members of the Master Car Builders' Association, to the efficient work it has done, to its rules of interchange which have made possible the operation and interchange of equipment and to its standard and recommended practices which have been generally adopted by the railroads of the country. The decisions of its Arbitration Committee have been binding on its members, with a force equal to the decisions of our courts.

In years gone by when most railroads had their Master Car Builders, the Car Department was considered to be an important one. Looking back over the history of the Association and the foundation on which it was built and realizing that in the past few years there has been a tendency on the part of some railroads to consolidate the departments, it is regrettable to note that the prominence of the Master Car Builder has disappeared. Those in charge of the equipment departments, in many cases, are known under a different title.

Our government practically adopted its standards for safety appliances, which, to my mind, was a great compliment to our association. There has been altogether too little attention paid to this important department in recent years. You will find, if the car department is properly managed, and the equipment maintained and improved to the proper standard for present day operating conditions, that the expenditures for labor and material of the car department will be in excess of those of the motive power department.

It might be interesting for you to know the total of payrolls and material disbursed for the year 1918 in both the car and locomotive departments of the New York Central Railroad, Lines East:—

	Labor	Material	Total
Car Department	\$12,861,877.44	\$9,787,350.90	\$22,649,228.34
Locomotive Department	12,109,132.74	5,778,196.30	17,887,329.04
Total	\$24,971,010.18	\$15,565,547.20	\$40,536,557.38

In the last two years and particularly since we have been under Federal control, investigations have shown the importance of the car department in connection with the upkeep of equipment. I believe there is a brighter future for competent car men than there was prior to the period of Federal control.

Like the Constitution of the United States of America, adopted by the forefathers of our country, you can add to it by amendments, but the foundation stands forever. So with the Constitution of the M. C. B. Association; it can be added to or called by any other name, yet the principles stand forever.

There have been twenty-nine presidents of our Association of whom twelve have gone to their reward, nine have retired from railroad service and only eight are in active service to-day. In the list of officers and members of this association there are at the present time but five in active railroad service who have been members for twenty-five years or more: W. K. Carr, chief car inspector, Norfolk & Western; Past President J. J.

Hennessey, master car builder, C. M. & St. P., and E. J. Doyle, master car builder, M. K. & T.

Next on our list is a man whom we all honor and respect. He has been a member of this association for forty years; has served one railroad of this country for over half a century; has filled with honor the position of president of our association; I refer to the dean of the association, our treasurer, J. S. Lentz, master car builder of the Lehigh Valley, and your humble servant completes the number of five.

## Badge Presented to Mr. Chambers

Mr. Brazier: Mr. Chambers, I have been selected by the officers and members of the Master Car Builders' Association to present you with the Past President's badge of that association. I trust, sir, you will wear this with pride and when you look back over the work which our association has accomplished in the interest of the railroads of the country that it may bring pleasant recollections to your mind as to the part which you have taken in the work. You have filled the chair and administered the duties of the President of our Association with honor and credit to yourself and to the Association, and when you look upon this badge it will reflect the esteem and confidence of your associates.

I also have the pleasure, Mr. Chambers, of presenting you with the Past Chairman's badge of the A. R. A. You were elected as President of the Master Car Builders' Association in 1917 and in the changes made in our standing, which now places us under the American Railroad Association, you have had the distinction and honor of being our first chairman—in fact, you will be, without doubt, referred to as our war chairman, as you have carried us through this period. This badge is presented to you by the officers and members of the Mechanical Section and I trust, sir, that it may serve to convey to you the appreciation of your associates for the creditable manner in which you have conducted the affairs of the Mechanical Section.

## Mr. Chambers' Response

No event in my life will carry with it a more beautiful recollection of the past than the favors conferred upon me as being the last president, or any president for that matter, of the Master Car Builders' Association, and Chairman of Section III, Mechanical. Three years ago, when I was elected to this office, I took it not unmindful of my predecessors; also realizing to the fullest extent my inability to fill the office as it had been filled in the past. However, with your most hearty cooperation, I have done the best I could, and I trust that I have in a measure given satisfaction. I can only say in retiring that I want to offer my heartfelt thanks, not only to the members of the association, but to the secretary, and to the members of the General Committee and Executive Committee, who have unstintingly and without a dissenting vote, favored everything that I wished to put through or get before you. I could not ask in my future ever to have any better support than I have had in the past. Thank you, gentlemen.

Mr. Hennessey: I move that there be a vote of thanks extended to the retiring Chairman, Mr. Chambers, for the courtesies that all the members have received during his three years as President of the Master Car Builders' Association, and one year as Chairman of Section III, Mechanical.

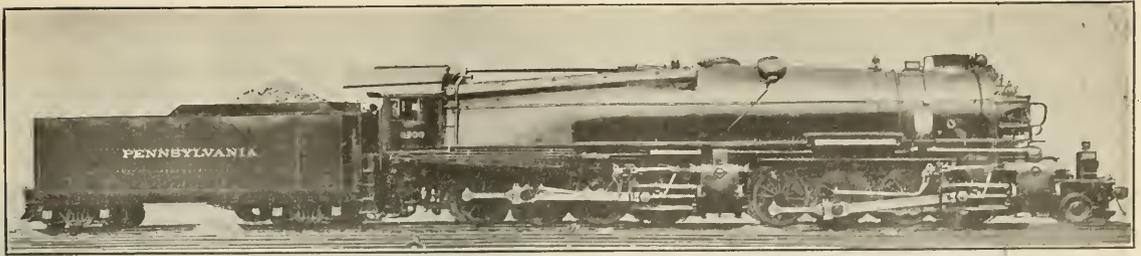

This motion was seconded and unanimously carried.

The meeting then adjourned.

## Special Guests

Anderson, Allan R., M. K. & T., New England.  
 Anderson, J. B., C. C. to Asst. A. M., Penn., Runnymede.

## Simple Mallet Locomotive with Short Maximum Cut-off

Pennsylvania Engine Has Unusual Boiler Design; Longest Port Opening Is 50 Per Cent of Stroke

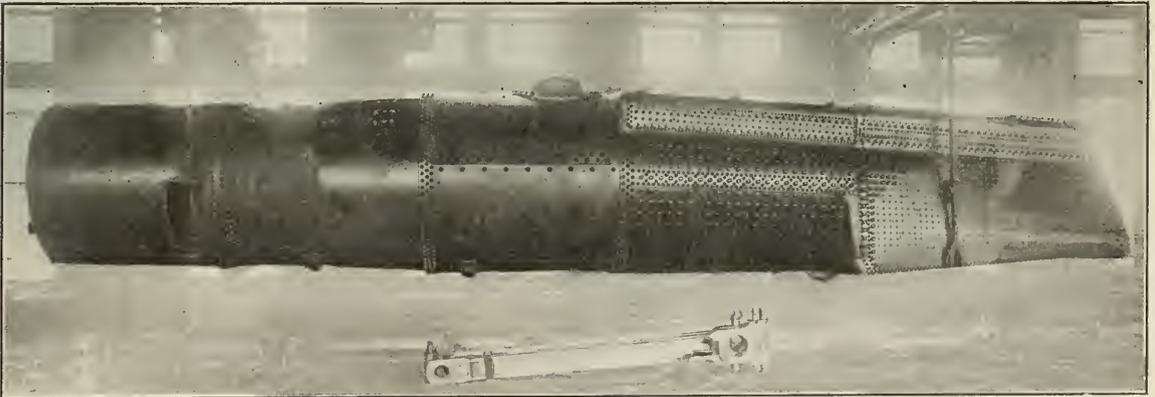

ONE OF THE MOST INTERESTING FEATURES of the track exhibit this year is the simple Mallet type locomotive, Class HC1s, which has just been completed at its Juniata shops by the Pennsylvania Railroad. This locomotive, together with the Pennsylvania Class IIs Decapod and the Class FF1 electric locomotive, is on exhibition at the Pennsylvania Station, at Tennessee Avenue, just off of Atlantic Avenue.

Many unique features are incorporated in the design of this locomotive. Like the Pennsylvania Decapods of the IIs class, the first of which was built in December, 1916, and one of which is also included in the track exhibit, the Mallet locomotive has cylinders designed to produce the maximum tractive effort at a cut-off of 50 per cent. The boiler, with a total equivalent heating surface of 11,360 sq. ft., a grate area of 112 sq. ft., and a barrel combustion chamber 11 ft. 7 $\frac{3}{4}$  in. long, is,

30 $\frac{1}{2}$  in. in diameter by 32 in. stroke and limited to a maximum cut-off of 50 per cent, driving wheels 62 in. in diameter and a boiler pressure of 205 lb., it is estimated that the maximum tractive effort, based on driver weight, will be about 135,000 lb.

### The Boiler

The boiler is of unusual interest both from the standpoint of design and of the methods employed in the construction of some of its details. It may be considered as in three parts, each involving a different type of construction: the two barrel courses, the combustion chamber course and the firebox. The barrel courses are formed of 1 5/16 in. plate. The first course is conical, with a minimum outside diameter at the front end of 96 in. The second course is straight, with an outside diameter of 110 in. This course contains the shoulders

The Boiler

as a whole, of unusual proportions and incorporates a number of details of construction the fabrication of which involved a high degree of skill and ingenuity.

The locomotive is designed on the basis of driving axle loads of 65,000 lb. to 68,000 lb. at the rail, the eight pairs of drivers thus giving a total adhesive weight of 520,000 lb. to 544,000 lb. The weight of the locomotive in working order is 555,000 lb. to 580,000 lb., while in working order the engine and tender have a total weight of 774,000 lb. to 800,000 lb. In all cases the weights are estimated. With two sets of simple cylinders, each

for the Belpaire roof connection and, as shown in one of the illustrations, is rolled in one piece, the corners being formed in one operation on the flanging press after the sheet is rolled. The combustion chamber course is made up of four parts: a tapering throat sheet of  $\frac{3}{4}$ -in. material, two side connection sheets of the same thickness and a Belpaire roof sheet 7/16-in. thick.

Two of the illustrations show how the throat sheet is formed. After it has been rolled the rear end is heated locally and then broken down to form the mudring connection; the Juniata boiler shop is equipped with a 700-

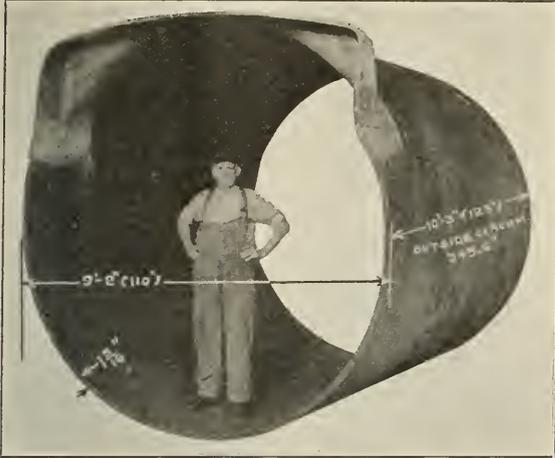

the combustion chamber flange was formed in a third operation.

When completed, the two sides of the channel, which extend completely around the mouth of the combustion chamber, are  $4\frac{1}{4}$  in. apart; the channel has a depth of 5 in. at the top and 14 in. on the bottom center line.

The firebox is built up of separate crown and side sheets, and the combustion chamber of a crown and a half barrel sheet. The adjoining edges of these sheets are butted and electric welded after the firebox is assembled.

The firebox has a length of 14 ft. and the combustion

The Second Barrel Course; Belaire Shoulders Pressed in One Operation

chamber extends forward into the boiler 11 ft.  $7\frac{11}{16}$  in. from the throat sheet. The tubes and flues are 19 ft. long. There are 137  $2\frac{1}{4}$ -in. tubes and 284  $3\frac{1}{4}$ -in. flues, the latter containing the elements of the type E superheater with which the engine is equipped.

The type E superheater has three vertical headers, one central saturated steam header and two superheater steam headers, one on either side of the smokebox. Each header connection serves a cluster of from two to five units, depending upon the arrangement of the flues. Each unit consists of two loops, each of which occupies one of the  $3\frac{1}{4}$ -in. flues.

The boiler is fitted with three 5-in. Coale safety valves and is fed by two non-lifting injectors, one a No. 16  $7/10$  Sellers, and the other a No. 17 Nathan Simplex. It is also provided with a Sentinel low water alarm. The engine is fired by a Duplex stoker and is also fitted with a Franklin power grate shaker.

The extreme length of the crown sheet makes the question of water level variations due to changes in grade one of great importance. This is particularly true on ascending grades, where the upward slope towards the front of the crown sheet augments the effect of the inclination of the locomotive. Under these conditions the water level at the backhead, as registered in the ordinary gage glass, is no criterion of the condition at the front end of the combustion chamber; in fact, the water level at the backhead may be above the top of the gage glass. Provision has been made in two ways for determining directly the water level at the front of the crown sheet.

Instead of being connected directly into the backhead of the boiler the gage cocks are each connected to a  $\frac{3}{8}$ -in. copper pipe, and the three pipes lead into the

boiler through the wrapper sheet near the front end of the combustion chamber, terminating at points respectively 4 in.,  $7\frac{1}{2}$  in., and 11 in. above the front end of the crown sheet. These pipes are carried back over the top of the boiler to a point just inside the cab in a  $3\frac{1}{2}$ -in. extra strong wrought iron pipe, opening into the boiler through a special flanged connection and closed at the rear end by a ground joint cap, on the face of which is located the gage cock fixture. Steam for cab auxiliaries is taken from a turret casting let into the wrought iron pipe just outside the cab.

A further check on the water level is obtained by an ingenious device which gives a visible indication of the level of the water at the center of oscillation of the water in the boiler; that is, at the point where the height of the water with relation to the crown sheet does not change with variations in the slope of the locomotive. This point is located about 16 in. ahead of the rear tube sheet.

The operating element of this device consists of a longitudinal arm pivoted in a bracket attached to the shell of the boiler, one end of which carries a float and the other a counterweight balanced so that in water at a temperature corresponding to 205 lb. pressure the float is one-half submerged. The float arm has a downward projecting lever which is connected to the indicator on the backhead by a rod of watertight steel tubing, the weight of which is practically equal to the weight of the water displaced. The indicator consists of two flat springs on the end of this rod, the ends of which bear lightly on the inside of heavy glass windows in a horizontal casing opening into the backhead of the boiler. A disk valve carried near the end of the rod and seating against the inside face of the indicator casing closes automatically in case of failure of either of the indicator glasses. The casing is provided with steam and drain pipes, the former for the purpose of breaking the seal of the disk valve and starting the device after the

The Firebox and Combustion Chamber Connection Sheet

valve has for any reason been closed. The range of this indicator is the same as that of the gage cocks.

#### Steam Distribution

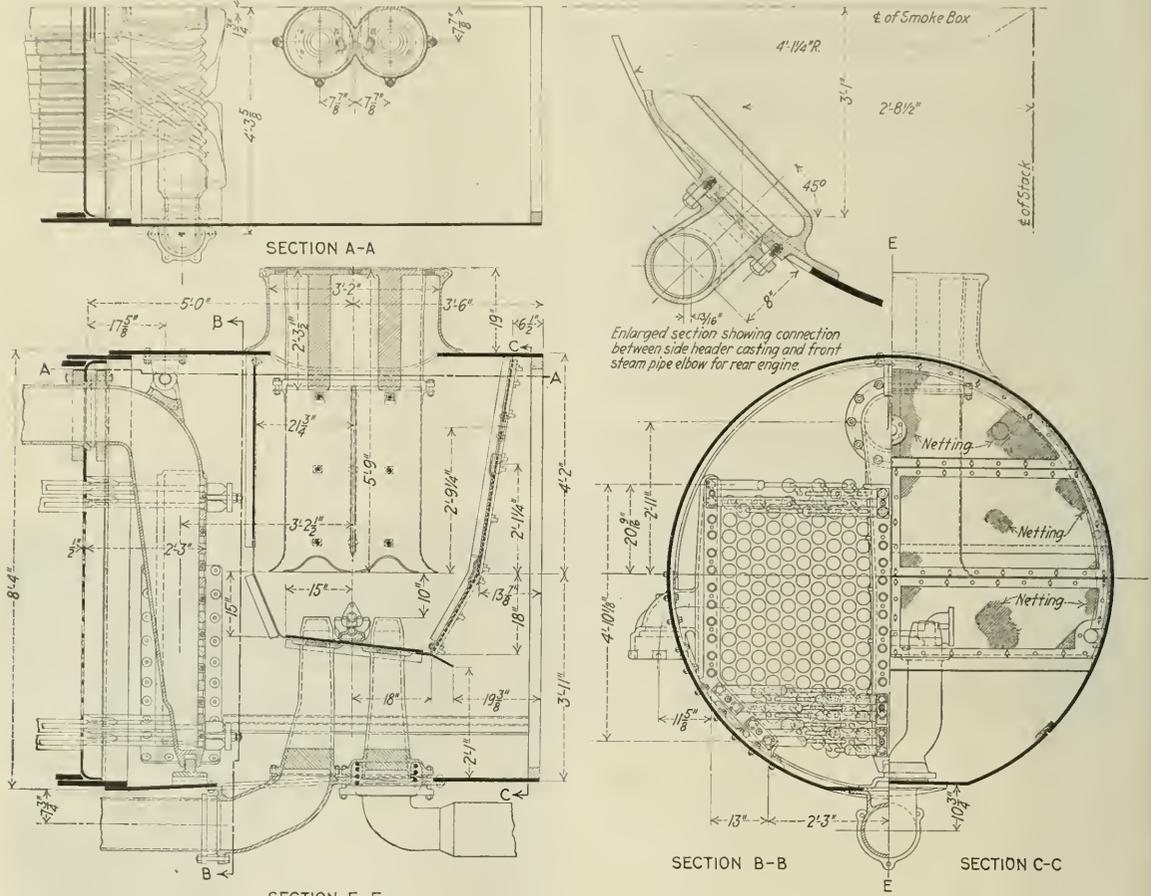

Contrary to the usual practice in Mallet locomotive design, this engine is driven by two sets of simple cylinders, a relation between boiler capacity and cylinder power roughly equivalent to that obtaining in compound locomotives being obtained by the use of a 50 per cent

maximum cut-off. This scheme, first tried on the Hs Class Decapod locomotives, was developed in order to eliminate the range of cut-offs in simple cylinders within which the water rate is excessive. As experience has demonstrated that little advantage is obtained by reducing cut-offs below about 25 per cent, it will be evident that at the range of speeds from starting to that corresponding to 25 per cent cut-off, this locomotive works in the most economical range of cut-offs and has a decided advantage in point of steam consumption over a simple locomotive, on which the cut-off varies from 90 to 25 per cent.

With the exception of the 2-in. steam lap employed to

permit steam pressure to accumulate in the cylinders sufficiently to move the engine and open the main port. Under running conditions the relation of their size to the main ports and the time element is so small that they have no appreciable effect upon the steam distribution.

The arrangement of the steam pipes is shown in one of the drawings. Two connections lead through the smokebox from each of the superheater steam headers. The lower of these openings terminates in an elbow, a pipe from which leads directly back along the shell of the boiler to an elbow connection with the rear unit steam chest, where a slip joint is provided. The upper connection terminates in a ball joint, from which a short

Front End Arrangement of the Pennsylvania Simple Mallet Locomotive

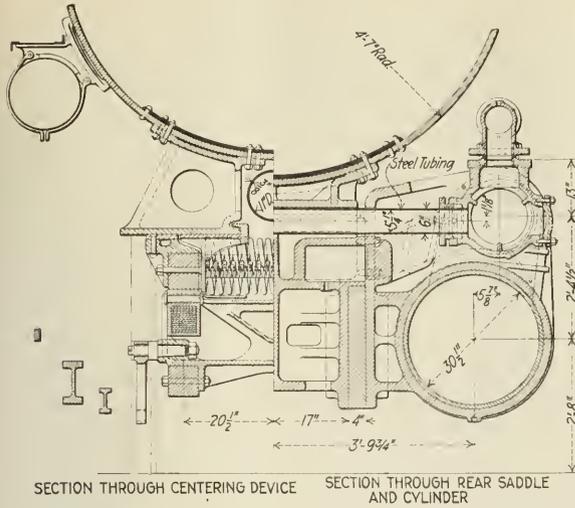

limit the maximum cut-off to 50 per cent, the arrangement of the valve gear does not differ essentially from the usual Pennsylvania practice. The long steam lap necessitates, however, the use of some auxiliary method of admitting steam to the cylinders when the locomotive is standing, in order that it may be started from any position of the crank pins. This condition is met by the use of an auxiliary port opening 1/8 in. wide by 1 1/2 in. long, cut through the valve chamber bushing and opening into a recess cored in the inside edges of each valve chamber steam port. The auxiliary ports are so placed that their steam lap is 1/4 in., and they serve merely to

vertical pipe leads down to a ball joint elbow casing; from this casing a pipe leads forward to the front unit valve chamber connection, which is also a ball joint.

The steam pipes are 6 in. in diameter, and in order to fully utilize the combined opening of the pipes and the superheater elements on both sides of the locomotive, the valve chambers of each unit are connected by a cross pipe 5 1/4 in. in diameter.

The exhaust pipes for the two units terminate in separate exhaust stands, each of which in turn terminates in a double nozzle. This arrangement is clearly shown on the front end drawing. The openings of the tips are

$4\frac{1}{2}$  in. in diameter and the center lines are located at the corners of a square measuring  $15\frac{1}{2}$  in. on a side.

The Front Unit Centering Device and a Cross Section Through the Rear Cylinders

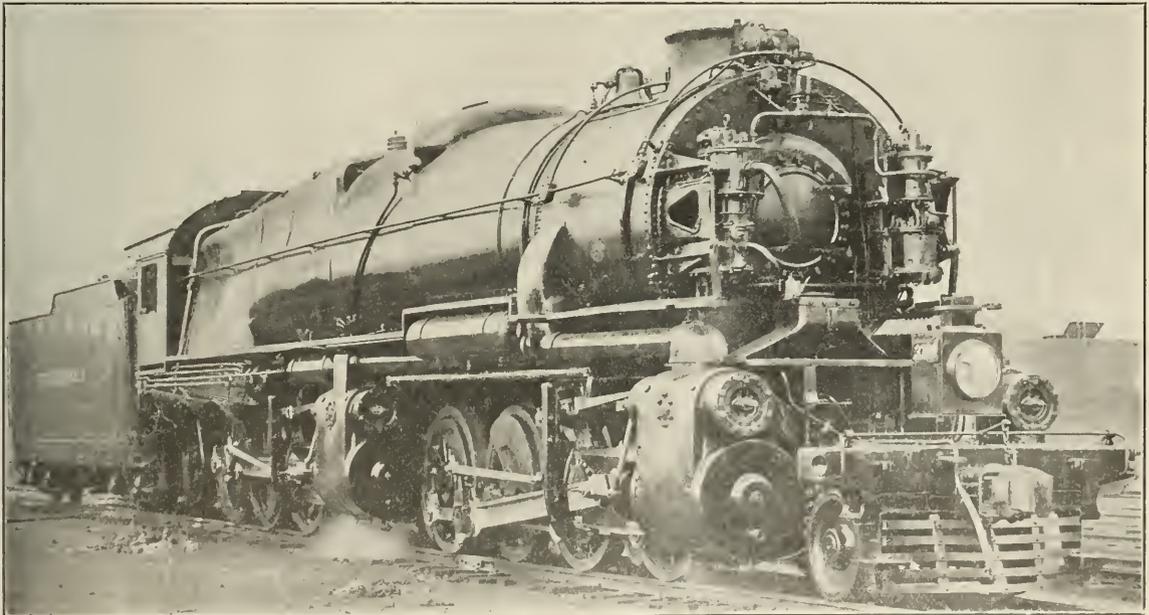

Each tip discharges into a separate stack passage having a minimum diameter of 15 in. The four stacks are cast

obtaining a satisfactory ratio of stack diameter to length, with one stack passage. The arrangement described was therefore adopted in order that a more satisfactory ratio of length to diameter might be obtained.

Another interesting feature of this locomotive is the power reverse gear. This is a hydro-pneumatic device, the cylinder of which is made up of two sections, one 16 in., and the other 12 in., in diameter. The cylinder contains a piston of the differential type, the full area of the 16-in. face of which is subjected to liquid pressure. The differential area between the 16-in. and the 12-in. head of the piston is always open to air pressure drawn from the brake system. The outside face of the 12-in. head is not under pressure.

The operation is controlled entirely on the hydraulic side by the admission of liquid to the operating cylinder to move the piston forward and by the release of air pressure from the surface of the liquid supply, carried in a reservoir in the cab, to move the piston backward. The backward movement is caused by the air pressure on the differential area of the piston, which forces the liquid from the cylinder back into the reservoir through a check valve in the control valve. The function of the control valve is to perform these operations only, and it occupies its central, or lap, position at all times except while the piston is actually moving. The position of the gear is shown by a sliding indicator at the side of the control valve. The gear is fitted with a steam connection for use when air is not available.

The purpose in the design of this device was to eliminate the constant tendency of the piston to move against the air cushion in pneumatic gears not provided with a

Front End View of the Pennsylvania Simple Mallet Locomotive

integral and are contained in a circular shell 3 ft. 2 in. in diameter conforming to usual lines so far as appearance is concerned. The inside stack extends down to the center line of the boiler, 10 in. above the nozzle tips.

Owing to the area of stack passage required for the four simple cylinders, no opportunity was afforded for

mechanical lock, hence the substitution of an inelastic operating medium for steam or air.

The Cylinders and Frames

The cylinders are cast separate from the saddles, and are all interchangeable. Between the cylinders and each

of the saddle connections passes a slab section front frame rail 28-in. deep and 4 in. wide. The front cylinders are lubricated by a two-feed Locomotive Lubricating Company's force feed lubricator and the rear cylinders by a hydrostatic lubricator in the cab.

The articulating joint tongue is cast integral with the rear engine cylinder saddle, and fits between the jaws of the articulating casting bolted between the rear ends of the front engine frames. These jaws are spaced to allow one inch vertical clearance. The tongue is 10-in. deep, bored out to a diameter of  $13\frac{1}{2}$  in. to receive the ball joint articulating pin connection.

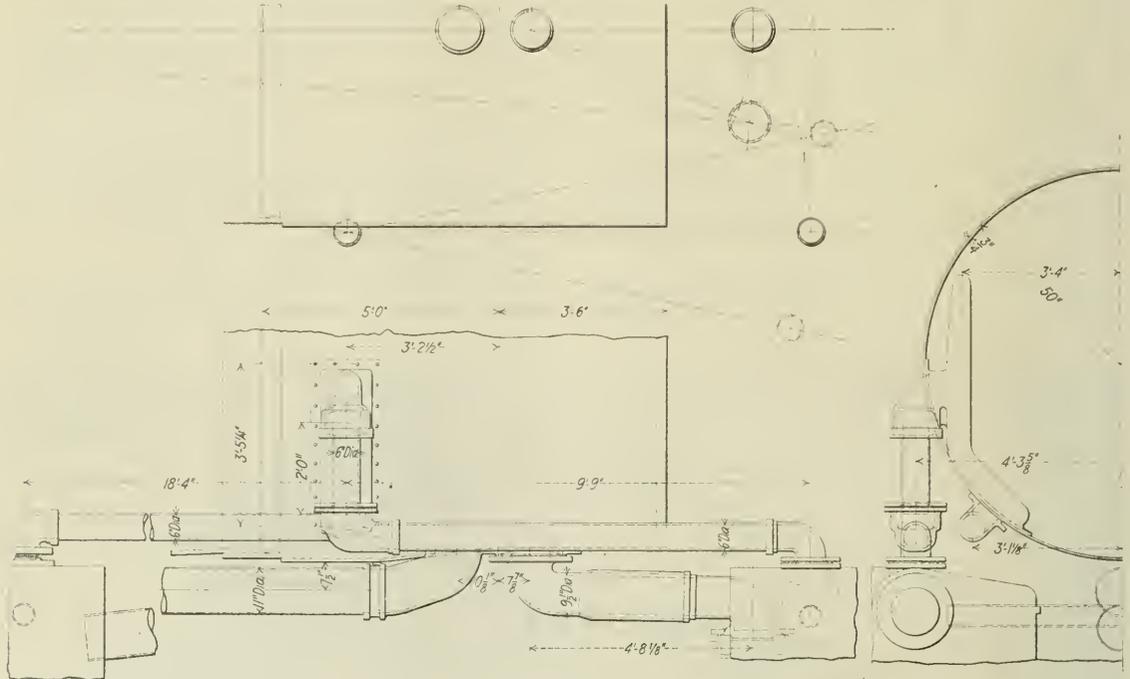

The centering device for the front engine is shown in one of the illustrations. This consists of a group of three triple coil springs placed between follower castings which seat against the inside faces of the top frame rails.

on the Hs class, on which it was first tried, and the first of these engines has been in operation, either on the test plant or in road-service for more than two years.

### The Running Gear

The design of the running gear details is characterized by a high degree of refinement in the distribution of metal to secure the lightest possible weight for allowable maximum stresses. Hollow sections are employed for the axles, crank pins and piston rods, a practice which has become well established on the Pennsylvania, and the main and side rods are of deep I-section with thin webs.

The locomotive is designed to traverse curves with a minimum radius of 400 ft. and has actually been moved around a curve of 395 ft. radius. The tires on two pairs

The Outside Steam Pipe Arrangement

These are cast with flanges which engage the inside of the saddle castings, so that the springs are compressed by the movement of one or the other of the followers as the engine swings out of alignment with the boiler.

The frames, in detail, are similar in design to those used on the class Hs Decapod locomotives. The top rails are  $7\frac{1}{2}$ -in. deep and 7 in. wide, the section being thickened on the inside over the pedestals to a width of  $9\frac{1}{2}$ -in. The lower rails are  $6\frac{1}{4}$ -in. thick over the binders and frame braces are attached.

The driving boxes are of straightforward design and are the same as those used on the Decapod locomotives. One point in connection with the design is especially worthy of note. In order to secure a bearing 16-in. long the box has been extended inside the frames so that its center line is one inch inside of the center line of the frames and spring rigging. The eccentricity of journal loading thus effected has shown no undesirable concentration of wear at the outside ends of the boxes or axles

of drivers on each engine are flangeless. On the rear engine these are placed on the second and third pairs. On the front engine they are placed on the second and fourth pairs, thus relieving the tendency to cramp the rear wheels of the front unit and the front wheels of the rear unit in traversing curves.

The equalization of the two engines has been arranged to produce in effect a three-point suspension of the locomotive as a whole. On the front unit the equalization of all four drivers is continuous on each side and the two sides are cross-equalized with the engine trucks. The load on the frames of this unit is thus free to distribute itself over three fixed points of support, *i. e.*, the engine truck equalizer, fulcrum under the cylinder saddle and the rear spring hanger connection on each frame. The drivers on each side of the rear unit are also equalized continuously, but are not cross equalized, and so form two separate system, equivalent to two points of support of the locomotive as a whole, while the third point is provided by the front unit.

### The Brake Rigging

Instead of dividing the brake rigging into separate systems on each side of the two units with an operating cylinder for each, the wheel base of each unit has been divided transversely into two systems of two pairs of wheels each. The space between the frames is too small to permit the location of the two cylinders side by side, and this arrangement of the brake rigging facilitates placing them at different points on the center line of the engine. On the front engine the cylinders are attached respectively to the frame braces back of the first and third pairs of driving wheels, which gives them practically identical positions in relation to their foundation gears.

On the rear engine the fact that the firebox extends forward over the third pair of drivers made it necessary to place the cylinder for the third and fourth pairs of wheels on the cross brace back of the second drivers. This required the placing of the brake lever fulcrum shaft for the rear half of the engine in front of the second pedestal jaws, from which the pull rods are carried back over the second brake bearer, above which they are broken in a horizontal pin joint and supported by a swing link hanger from the brake hanger bracket.

Two pull rod connections are provided on each cylinder lever fulcrum shaft, which are attached to equalizers, one end of each of which is attached to the forward brake beam and the other to a cross equalizer. From the center of the cross equalizer a pull rod leads to the center of the rear brake beam.

The brakes are operated by the Westinghouse E-T equipment and four 16-in. by 12-in. cylinders. Air is supplied by two 8½-in. cross compound pumps carried on the front end of the smokebox. The location and method of attachment are clearly shown in one of the photographs.

The principal dimensions and data are as follows:

#### General Data

Gage	4 ft. 8½ in.
Service	Freight
Fuel	Bituminous coal
Tractive effort (estimated)	135,000 lb.
Weight in working order (estimated)	575,000 lb.
Weight on drivers (estimated)	540,000 lb.
Weight on leading truck (estimated)	35,000 lb.
Weight of engine and tender in working order (estimated)	794,000 lb.
Wheel base, driving	17 ft. 1½ in.
Wheel base, total	54 ft. 8½ in.
Wheel base, engine and tender	97 ft. 3¾ in.

#### Ratios

Weight on drivers ÷ tractive effort	4.0
Total weight ÷ tractive effort	4.3
Tractive effort × diam. drivers ÷ equivalent heating surface*	736.81
Equivalent heating surface* ÷ grate area	101.41
Firebox heating surface ÷ equivalent heating surface* per cent	4.7
Weight on drivers ÷ equivalent heating surface*	47.5
Total weight ÷ equivalent heating surface*	50.6
Volume equivalent cylinders with 90 per cent maximum cut-off	43.6 cu. ft.
Equivalent heating surface* ÷ vol. cylinders	260.0
Grate area ÷ vol. cylinders	2.6

#### Cylinders

Kind	Simple (two sets)
Diameter and stroke	30½ in. by 32 in.

#### Valves

Kind	Piston
Diameter	12 in.
Greatest travel	.6 in.
Outside lap	.2 in.
Inside lap	¼ in.
Maximum cut-off	50 per cent

#### Wheels

Driving, diameter over tires	62 in.
Driving journals, main, diameter and length	12 in. by 16 in.
Driving journals, others, diameter and length	11 in. by 16 in.
Engine truck wheels, diameter	33 in.
Engine truck, journals	6½ in. by 12 in.

#### Boiler

Style	Belpaire
Working pressure	205 lb. per sq. in.
Outside diameter of first ring	.96 in.
Firebox, length and width	168 in. by 96 in.
Firebox plates, thickness tube and combustion chamber connection, ¼ in.; door, ¾ in.; others, ½ in.	

Firebox, water space	5 in.
Tubes, number and outside diameter	137—2¼ in.
Flues, number and outside diameter	284—3¼ in.
Tubes and flues, length	19 ft.
Heating surface, tubes and flues	6,125 sq. ft.
Heating surface, firebox	531 sq. ft.
Heating surface, total	6,656 sq. ft.
Superheater heating surface	3,136 sq. ft.
Equivalent heating surface*	11,360 sq. ft.
Grate area	112 sq. ft.

#### Tender

Frame	Rolled and cast steel
Weight	219,000 lb.
Wheels, diameter	.33 in.
Journals, diameter and length	6½ in. by 12 in.
Water capacity	13,000 gal.
Coal capacity	14 tons

\* Equivalent heating surface = total evaporative heating surface + 1.5 times the superheating surface.

# Addresses by Distinguished Convention Visitors

Assistant Secretary of Navy Roosevelt, Senator Edge and Col. Hodge Tell  
of American Achievements in War

ADDRESSES BY ASSISTANT SECRETARY OF THE NAVY, Franklin D. Roosevelt, United States Senator W. E. Edge, of New Jersey, and Col. Henry W. Hodge, of the American Expeditionary Forces, were delivered to a large crowd of interested convention visitors on the Pier on Saturday night.

Secretary of the Navy Daniels had promised to come, but was prevented by important duties, and Assistant Secretary Roosevelt consented to come in his place. Senator Edge, who was governing New Jersey during most of the time the country was at war, lives in Atlantic City. Colonel Hodge was connected with the engineering work of the American army in France, and for a time was in the transportation department under General Atterbury.

Arrangements for the meeting were made by the Entertainment Committee of the Railway Supply Manufacturers' Association, and E. H. Walker, president of the association, presided and introduced the speakers.

In opening the meeting, Chairman Walker said: It is three years since we have met in convention, and during that time we have seen a world remade. We have seen nations regenerated into serious, glorious manhood. We have seen this nation changed from indifference into passionate devotion. We have seen cynicism changed to patriotism; luxurious self-indulgence transformed into a fine abnegation; individual character exalted by a common cause.

When this nation decided that it could no longer be neutral between right and wrong, and there was a call to arms, two hundred thousand men went from the railroad ranks into the uniformed ranks, and as many more from the railway supply manufacturers' mills, foundries and desks.

To these men we meet to do honor; but not only to them, but you also, who served in civilian clothes, and in dungarees back of the lines, because this war was not won alone by burnt powder and shot and shell.

## Address of Hon. Franklin D. Roosevelt

Secretary Roosevelt said, in part:

Unfortunately, from the point of view of a good many people in the naval service, the primary purpose for which a navy had been thought to be created, of going out and fighting an enemy, was defeated because no enemy would come out to fight us. And so our task fell to fighting an invisible enemy. Our task fell along the same lines as your tasks fell—to throw ourselves heart and soul into the great game of winning the war where the enemy was; that is to say, on the soil of Belgium and France and Italy.

We, with you, were merely one link in that great chain that brought about the ultimate victory, because that chain started in the factory town in this country. It started on the farm, and the first link in the chain of transportation was composed partly of the material which existed, of the steel rails, the locomotives and the cars; but it existed far more in the personnel that made possible the operation of those material things. It was through the co-operation of the individual, not so much of a few people at the top in the railroads, in the Navy, and over in France, but in the individuals who made up the great mass of the servants of the Nation; who made the locomotives run, and the car wheels go round; who made the ships cross the ocean, and who protected them

across the ocean; who took the supplies and the troops off in France, and then another railroad organization took them up to the fighting front. That was the chain that made it possible for the men in the trenches to do their part.

I think it is fair to say that in handling the work of the supply department of the Navy we earned the good will of the men that we did business with, because we met them, or at least tried to meet them, on the level. The first principle which I presented two months before the outbreak of the war was this: We were going to increase the purchases for the Navy Department many hundredfold, and I saw signs at that time of other branches of the government trying to go out and do something new with new tools. And I said "No." In the purchase of our supplies, I believed it to be the right principle that we should take the men who know about supplies to assist us, and go to them first. In other words, we did not try to ask watchmakers to give us 14-inch shells; neither did we ask people who turn out armor plate to make chronometers for us.

So far as possible, the Navy tried to develop existing plants. That system proved its wisdom, and the result is that, so far as I know, the Navy happens to be one of the few departments of the government that is not under serious investigation at the present time. I think the country, as time goes on, will begin to recognize the magnificent spirit of service of the quarter million of men who went into the uniform from the railroads, and probably an equal number of men who went into the uniform from the railway supply organizations all over the country—a total of probably half a million men, who were trained in the work that you have been trained in. That half million men, plus the Navy, were responsible for getting the munitions and supplies to the troops from away back home, up, yes, to the Rhine. We appreciate it in Washington. I do not need to tell you that.

## Address of Senator Walter E. Edge

Senator Edge said in part: I think it is a magnificent tribute for you men and women to come to this hall tonight and spend an hour in consideration of those who have been associated with you in business, who offered their services to their country in the time of war. We could not all go abroad. We should not have all gone abroad. There were many responsibilities here, and it was a wonderful inspiration to see the way the men and women of New Jersey—and that simply typifies the sentiment of every State in the Union—met the obligation, and the way they were ready and determined to do their full part as members of the home army.

We must appreciate right now that we are facing the greatest problems this country has ever faced; problems that must be solved by sound, careful and mature judgment, and without sensation or too much visionary thought, and adherence to too many ideals in trying to reach the solution of these problems. I do not propose to discuss any of these problems, particularly the position of our country in the League of Nations. I do not want America to evade any responsibility. As we all know, she was a very potent factor in winning the war, but at the same time we must not evade any responsibilities in endeavoring to maintain the position she so dearly bought.

But with all that, I feel that this country can be stronger and better able to meet this great new and broadened responsibility, now that we occupy practically a position at the head of the council table of all the nations of the world. Under these circumstances, we can be stronger and better equipped to meet and help solve these problems by maintaining, at least, the sovereignty that has made us great, and although I want to see this country do its full part in any League of Nations or any other combination of nations, which will help to maintain peace, yet I do not want to see her as a minority stockholder in any international corporation.

We must forget everything but the duty we owe to protect the Flag, and back up the four million boys who went into the service, and now that we are trying to solve the problems before us, I propose to stand for the principles which actuated us in our part in the war, in order that the sacrifices we have made will not be in vain.

We have decided in the Commerce Committee, of which I am a member, that we will spend \$25,000,000, in

Senator Walter E. Edge

order that we may build a merchant marine, and some of us are trying to decide what we are going to do with it after it is built. I want to see a splendid merchant marine, carrying the American flag on all the seven seas. I want to see the men now employed in shipyards continue in that industry, and do not want to scrap the terribly costly equipment put in during war times on the Atlantic Coast.

But I want to go a little further, and find out if we are to be paid by the European countries for the manufactured products, the engines and tenders and machinery which we sent to France, and also to other countries. We can get the merchant marine readily, and we can get orders by the thousands, but we cannot get paid for them under present conditions. I want this country to prepare now, in times of peace, as in times of war, so that we can finance our credits and buy securities abroad, and bring them back here, and use their credit against our credit, so that they can pay us for the commodities and products that we send abroad. We desire that the government will co-operate and back your business with

the credit of the country in a way that will enable you to push your business ahead, with the understanding that the government will back you in securing your payment for the business which you secure abroad.

There is a great difference between the government running your business and the government giving you the moral and financial backing—and with the backing

Colonel Henry W. Hodge

of the American government, with its almost inexhaustible resources, we can go ahead and expand our business in all parts of the world, and that is the basis on which some of us are working.

#### Address of Colonel Henry W. Hodge

[Chairman Walker, in introducing Colonel Hodge, said: The transportation department of the American Expeditionary Force achieved marvels. Many things which the French and British war chiefs claimed were impossible were accomplished sometimes so easily as to intimate magic. Colonel Hodge was in France even before General Atterbury, and was with the General after he arrived. He was then made the Manager of Roads, and finally Assistant Chief Engineer of the American Expeditionary Force in France; he traveled over 28,000 miles in his automobile, back and forth, from Dunkirk to the border of Switzerland, and up and down the Coast, with all of what that means to the observant man, with the trained eye. He is going to tell up some of the things our boys did over there, and some of the things he helped do himself.]

I do not think that we have a true perspective of what has been going on in France—we do not know the size of the job. We all know we had two million men in France, and we thought that the most of these two million men were in the front line trenches. They were not. There were never more than 435,000 men at the front, out of two million men, and that is about the usual percentage in any army; in other words, in the Army you have four men back of the lines supporting every man in the line. But do not think that the rest of them, the one million six hundred thousand, were not fighting—they

were fighting, by doing work that the men in the front lines could not do.

At one time we had over 100,000 men doing engineering work, building railroads, docks, telegraph and telephone systems, building the biggest storage yard the world has ever known, building locomotive roundhouses, automobiles, refrigerator plants—the latter, the biggest on the face of the earth—and all these things being provided for the maintenance of our two million men whom we had in France, and we did the work pretty well.

We had the greatest transportation problem the world has ever faced. Our Allies did not have any problem such as we had. The British occupied the ports of Havre and Calais, and the average haul from England to their front lines was about 75 miles. The French had their supplies immediately behind the lines all the time; they had their shops and all their equipment behind their lines, and their haul was not more than 35 or 40 miles. We had to haul our stuff half way across the United States and 3,000 miles across the sea, and land it in France; and perhaps you think when it was landed in France all our fellows had to do was to fall on it and eat it. No, it was not as easy as that. We then had 600 miles to transport it, and we did transport it that distance.

When we got in France, we Americans were as green as green could be about the transportation problem. We did not know how much material we had to transport. They sent several of us up to the British and French headquarters to find out what their transportation problem was, and we discovered that the British were hauling 50 lb. per man per day and the French were hauling 47 lb. per man per day. That means everything, food, munitions, equipment, fodder, and everything else that is required by an army. That does not seem much to you, perhaps, but when the Armistice was signed we were handling 53,000 tons of freight every day from our own ships. We were unloading every day 20 ocean steamships—literally every day, weekdays, Saturdays, Sundays and holidays.

Our great problem when we arrived in France was to find out how we were going to do that. When we got there the British were occupying the two main ports on the Channel. They really had possession of all the available ports, and when we asked the French and British if there were any of the ports that we could use, they did not seem to be able to give us any reliable information.

#### Building a Port

The first thing we did was in August, 1917, when there was no American Army in France. That was to select a site for our first port. We picked out the port at Bassenes, near Bordeaux, and when I was there for the first time, in August, 1917, it was a slimy mud bank, with a large swamp behind it. We took it as the best place where we could build a port because we had deep water up to the very front of the location, a good piling bottom. We found we had nothing to start with, and we asked General Pershing if we could borrow material from the French, and he said: "We came to help the French, and not have the French help us. You must get your materials elsewhere." We cabled to the United States, and we got big lumber from Oregon and Florida, and we got pile drivers and cranes from the United States, and we got generators to generate electricity to run the trains, and American operators to operate the trains and we started in with about 13,000 men. Inside of 10 months we turned a swamp into docks for 10 ocean-going ships, and handled 25 tons of freight per day every day.

Then we started on other ports, and after we got these ports, we had to take care of the stuff that came in. You

may think we had a supply of common labor in France. I went across on a ship with two engineering regiments, and on the way over these 5,000 men were constantly talking about the men who were to do the labor on the job they were going to be the brains for. One of the officers said: "Is there much labor in France?" My reply was: "Not that I know of, but there are 5,000 good laborers aboard this ship." He replied, "We are not expected to do the labor, we are the brains of this organization, and someone else is going to do the labor."

The first job I was assigned to was at Bassenes. As I came across the swamp I saw the Colonel of the regiment, and the 2,500 men stretched out in a line, hip deep in mud, shoveling up the mud on to the bank; he waved his hand to the long, hard-working set of men and said—"behold the fate of a college graduate." As we got further down the line he stopped opposite a nice-looking boy, perhaps 20 or 24 years old. He said, "You see that boy with the long handled shovel—his father is one of the richest men in San Francisco. He wanted a commission and could have had it, but he did not wait for it, and joined as a private." He then said to the boy, "Walter, how is it?" The boy wiped the perspiration off from his forehead and said, "Colonel, I passed three examinations to get this job."

#### Building Yards the Next Step

That was the class of laboring people our railroads had there. After we got through the building of the railroads, we went to build yards. We had freight coming in at the rate of 50,000 tons a day, and we had to build yards to accommodate that freight. We laid out our first yard in the center of France, 8 miles long and 4 miles wide, and we had 125 miles of ladder tracks, and between the ladder tracks we had warehouses. The General came to me in August, 1918, and said, "Hodge, can you write a cablegram to be sent to the United States, describing the character of storehouses that you will require?"

I then wrote the following: "We want storehouses fifty feet wide, 11 feet high, at the eaves, built of wood or iron frame. Length immediate required 25 miles." That was the cablegram for the first order of warehouses, and we got it. That is the style we went into. We did it on grand scales.

When we first took that yard drawing up to the Army headquarters, they said, "We never would think of using a yard like that. We don't need it. We are here to fight a war, not build warehouses." But before the armistice was signed, we had six yards like that.

After we got the yards built, we had to commence building roads, to get stuff up to the front. Perhaps you might think we could take our stuff up to the front on railroads. We could not. We took it up to within about 15 or 16 miles of the front, then we took it the rest of the way by motor trucks, and the War Department says we had 16,000 trucks. Perhaps that is so. We did, but we didn't think so, we never saw them. They were great roads, not roads like the ordinary country roads. They were 80 feet wide and had rock on them three or four feet deep, because we had to get a good bottom in that muddy country; and we re-surfaced them all the time, the motor trucks wearing about 3½ in. of rock off every month. We had to employ about 36,000 men in keeping those roads in order, but that was not enough, we could not keep the roads up.

Well, our road work commenced in the Chateau Thierry drive. We were told this drive was coming and were told to carry rock, a total of 40 or 50 thousand tons, to build roads. That doesn't seem much to you because you could go to the telephone any day in our big

cities and call up a few quarries and they would furnish you all you wanted, but you must remember that in France we had nobody to telephone to, and if we needed the rock we had to dig it out and crush it and carry it ourselves.

So we opened 42 quarries, one up on top of a hill up on the Marne. It was 240 feet above where the trench was; it had never been opened. "It was good stone," the French said, "but rather expensive to get it down." And they did not think we could do it; they stood in open-eyed wonder when we hauled two big 45-ton Marion steam shovels up the hill, for we hauled them with beef, man-power, and block and tackles. Then we did not have any ordinary drills, we had only 8 in. well drills, so we drilled holes and loaded them with TNT and ordered the men off into the next county until we fired, and what did not land in the next county we picked up. There was six or eight thousand tons after we fired those shots. Then we tumbled it into the crushers on top of the hill and brought it down to our cars at the bottom of the hill, and within five days after we started that work we were getting five or six hundreds tons a day, and there wasn't another quarry in France getting fifty tons out.

### The Bridge Work

Just one thing as to the bridge work we did. The bridges were generally very simple, but most of the work in the Argonne fight was pontoon work, and we didn't have an American pontoon over there.

We Americans did wonders. You people at home did wonders. You sent us all the ammunition and clothing and many other things, but you don't want to ever accept as true the statement that an eminent late statesman used to make that a million men could rise to arms over night. A million men could rise to arms, but they are not an army, they are not equipped with lots of the things we need, but could not make in time for use in this war.

To begin with, we did not have any artillery in France. I was taken up by one of the Army officers in that statement. He sent me a list of 57 guns we had. Well, what is 57 guns? We did not have any aeroplanes to speak of. We had a lot being assembled but they were not on the front. The gas masks and helmets we fought with were almost entirely British, and so also were a lot of supplies. We had to get them from our Allies, and they furnished them to us.

Among other things we did not have any pontoon boats; we had to cross the rivers, and the Chief Engineer said: "Now, you are in charge of the bridges. It is up to you to know where things are and to get them." And I did get them, because I found out the Germans had come to the Marne with the greatest pontoon equipment the world has ever seen. They had come with 183 boats, better than the U. S. Army had ever seen.

Somebody said, how do you know they had 183 boats. I know it, because after they had been shelled for three weeks, they had the experience and we had the boats and we needed them. We took a gang of men up along the Marne and pulled those boats out of the bottom of the Marne mostly, filled with dead Boche and holes. We did not care about the dead Boche, but we did worry about the holes. And we had some trouble patching up those holes and making timber structures, but we got them fixed up, made them sound, and used them to chase the Germans in their own boats. And when we got one of the bridges up I saw some of the boys were very busy at a certain spot, near the end of the bridge. I went and looked to see what they were doing, and found they were placing a sign, and it said: "Made in Germany but erected by the U. S. Engineers."

If anybody asks you who won the war, and there is any question about it, it was not General Pershing; it was not the general staff; and not the officers; it was nobody in the world but those same dead boys in olive drab that won the war. And it was a job well done. But we don't want to give way to the feeling that we did it all. We want to be a little bit careful not to give way to the American feeling that we are the whole thing.

When we look carefully at the war, we, the Americans, only fought two campaigns. We fought the Chateau Thierry campaign from Soissons to Rheims, which is a distance of 27 miles, and took us two months. Then we moved to Argonne and we fought from Verdun to Vincennes, a distance of 50 miles, and it took us two months. Therefore, we were fighting on a front of eighty miles, for a total of four months, and our total losses were about 80,000 killed, and total casualties 300,000 men. That is a lot of good American boys, and we are sorry they are lost, but when we compare that with our allies, who fought 4½ years, on a front of 450 miles, and had total casualties of nearly 7 million men—then you can't look them square in the eye and say we did it all.

The meeting was preceded by a dinner given by President Walker, of the Supply Manufacturers' Association, at the Shelburne, in honor of the visitors. Those present were Mr. Walker, Assistant Secretary Roosevelt, Ralph Coburn, who was a college classmate of Mr. Roosevelt; Senator Edge, Colonel Hodge, C. E. Chambers, W. J. Tollerton, E. Hoover, E. H. Bankard, J. E. Fairbanks and Samuel O. Dunn.

## The Army Ordnance Exhibit

THROUGH THE COURTESY OF THE ORDNANCE DEPARTMENT of the United States Army, the American Car & Foundry Company has a group of three ordnance exhibits, one of which is on the pier and the others outside. The outside exhibit consists of four heavy artillery pieces on railway mounts and an ammunition car, which are on the Mississippi Avenue tracks, and an exhibit of field artillery trucks and artillery repair trucks, which are parked near the Boardwalk, just north of the Marlborough-Blenheim. An exhibit of shells is located on the pier.

The four heavy artillery pieces in the track exhibit are a 14-in. rifle, a 7-in. rifle, a 12-in. mortar and an 8-in. rifle. The 14-in. rifle is mounted on a heavy built-up frame of deep girder section, which is carried on two eight-wheel trucks. This rifle can be elevated to any angle up to 45 deg., and has a full traverse of 360 degs., with a range of 20 miles. The mount, ready for service with the gun in position, has a total weight of 436,700 lb. The eight-wheel trucks are completely equalized on each side with semi-elliptic springs over each journal box. The axles have 6-in. by 11-in. M. C. B. journals. The truck frames extend out beyond the ends of the gun mount, and are of such a height that the coupler and draft gear are mounted on the ends of the frames.

This mount is essentially for coast defense work, although its mobility makes it available for use in the field. The gun is not traversed when on the trucks. A base ring with a conical roller path is carried on a separate car, and is set on a foundation in the ground when the gun is to be put into action. The car is run over this ring with the center of the car over the center of the ring. The mount is then jacked up, the trucks removed, and the mount let down on the base ring. The gun may also be fired from the trucks, but at a reduced elevation of 22 deg. This mount is the only one of its type which has so far been built.

The seven and eight-inch rifles and the 12-in. mortar are all carried on mounts of the well type, and the two rifle cars are carried on trucks of standard railway type. The rifles are both mounted on barbette carriages, having a full circular traverse. The 7 in. rifle has a range of elevations from minus five to plus fifteen degrees, and the unit complete weighs 160,000 lb. at the

In one of the illustrations is shown the method of bracing the car when the gun is in service. To place the piece in action the mount is freed from the trucks by means of jacks which form an integral part of the car body, which are lowered by means of these jacks to rest on cross-ties placed on the rails. Outriggers, pivoted to the car body and carried against the side of the car

Railway Mount with 7 Inch Army Rifle

rail. It is carried on standard 50-ton trucks. These outfits were designed for coast defense purposes and were used as protection against submarines. The 8-in. rifle has a range of elevations from horizontal to 42 deg. and weighs 174,000 lb. on the truck. The trucks of the 8-in. rifle are the standard 70-ton truck.

when not in use, are swung and braced against suitable foundations, arranged as the angle of traverse requires. It is said that a trained crew can place these pieces in action in about 20 minutes.

The 12-in. mortar mounts are carried on six-wheel trucks, fully equalized, the frames of which are of

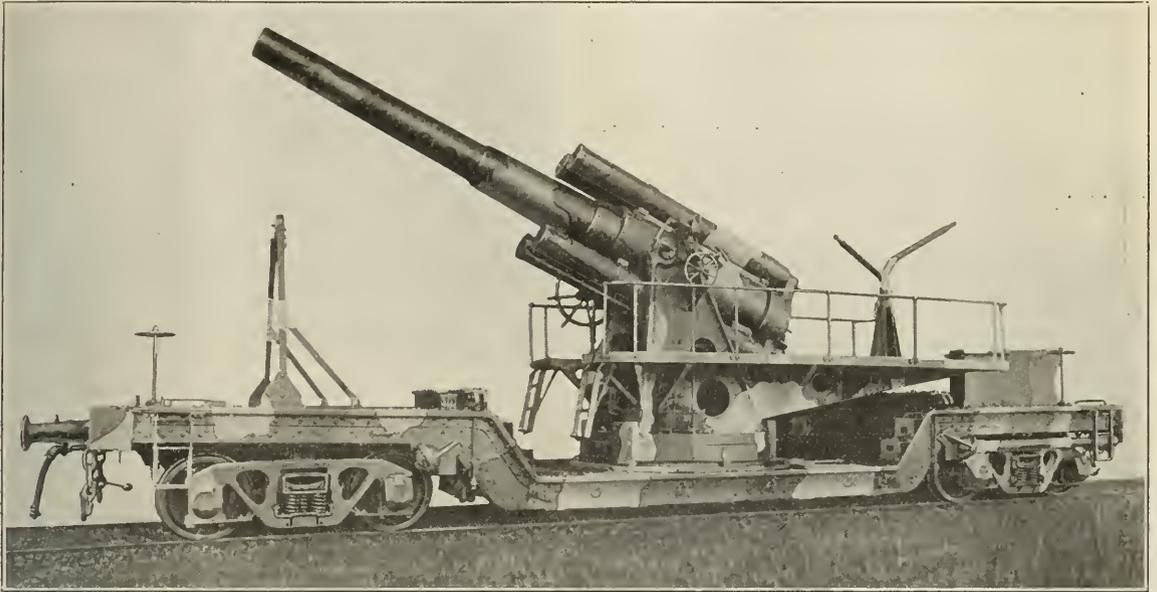

Railway Mount with 14 Inch Army Rifle for Seacoast Defense

special built-up construction. The mortars have a complete circular traverse and a maximum elevation of 65 deg. The mount with the gun ready for service has a total weight of 180,000 lb. This is essentially a field piece and is intended principally for destroying deep underground fortifications.

The 8-in. rifle and the 12-in. mortar mounts are

Car & Foundry Company for the French Government. The interior is equipped with ammunition racks and a longitudinal trolley hoist. Doors in the end of the car permit the hoist beams to be extended outside the car for the purpose of serving ammunition to the gun.

The field artillery exhibit includes a caisson limber and carriage limber for a 77-mm. field piece, a powder

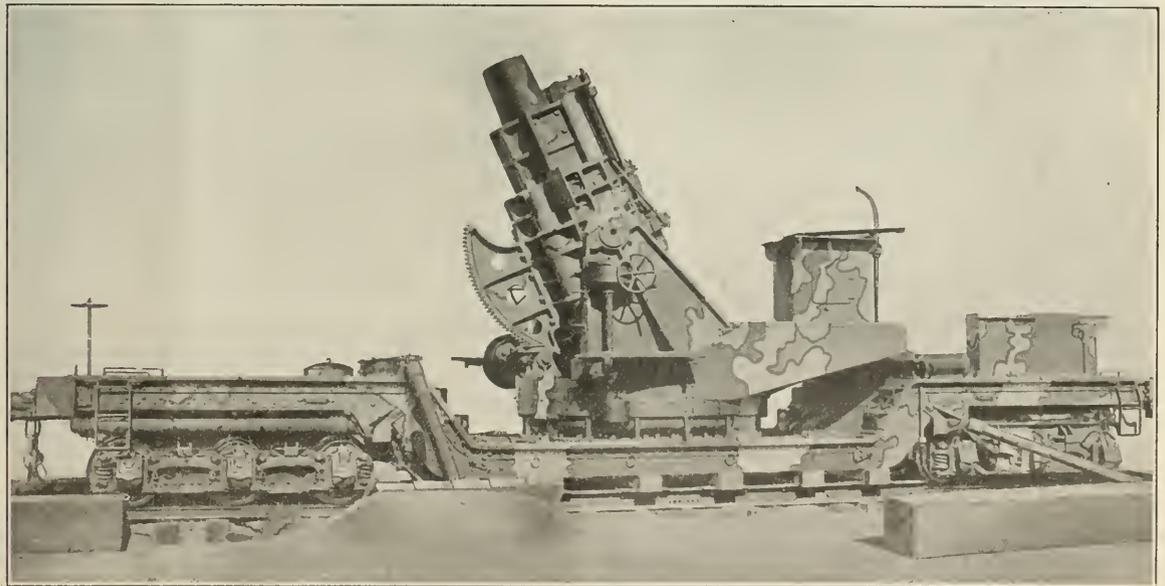

Railway Mount with 8 Inch Army Rifle in Position Ready for Firing

equipped with the French type of screw coupling and buffers.

The armored ammunition car is designed for railway artillery equipment and has a capacity of 66,000 lb. In the design of the body and the underframe structure, this car follows closely the box cars built by the American

and store wagon, forge and store limbers, a 4.7-in. gun and gun caisson, and a 75-mm. field gun and tractor. A number of artillery repair trucks are also included in the exhibit. With the exception of the 75-mm. field gun and tractor, these units were all built by the American Car & Foundry Company.

Railway Mount with 12 Inch Seacoast Type Mortar

## Conventionalities

J. R. Sloan, chairman of the committee on train lighting and equipment, says that Altoona, Pa., is no place for white serge.

Among the workers in the supply ranks the belief is growing that E. A. Le Beau, of "Creco," is very properly named Earnest.

R. J. Fisher, traveling salesman for the Bass Foundry & Machine Company, received the congratulations of his friends Friday upon the seventieth anniversary of his birth.

Many will know what we mean when we say that it is understood that Clark Moore, vice-president of the Safety Car Heating & Lighting Company, is writing several volumes, entitled "Life on the Pacific Coast."

Friends of W. A. Hall will be interested to learn that he left Yale & Towne to enter the navy in March, 1917. He was only recently released from service and has joined the Cleveland Tractor Company's organization as manager of industrial sales, at Cleveland, Ohio.

H. S. Fentress, Gen. Car Insp., Norfolk & Southern.

W. M. Lalor, president of the W. M. Lalor Company, Chicago, is attending the conventions this year as railway sales representative of the Zapon Leather Cloth Company. This is Mr. Lalor's sixteenth convention, he having been connected with the electric car lighting interests for a number of years.

The Editor found this memorandum on his desk a few minutes after the dailies were delivered on Saturday morning: "My name is Harry D. Vought and not Harry D. Wright, as reported in the account of the Railway Club Secretary's meeting in Saturday's *Age*. Bang that proofreader!"

To the list of members and guests who have taken trips in aeroplanes over Atlantic City during the conventions may be added the names of Mr. and Mrs. Harry Vissering and James A. MacLean. Latest report says that President Jackson, of the Chicago Pneumatic Tool Company, is to take, or has already taken, a "flyer" in the latest sport.

Many railroad and supply men are expressing their feeling in the loss by death of Secretary Joseph W. Taylor, of the M. C. B. and M. M. Associations. The passing away of Mr. Taylor, suddenly and unexpectedly, in the midst of his activities meant a loss which time will hardly repay.

L. C. Fitzgerald, Shop Supt., Erie; G. N. Waddy, General Car Foreman, Erie Lines West

E. R. Viberg, mechanical engineer of the Canadian Car & Foundry Company, Montreal, missed the 916 convention because of being sent to France in connection with war supplies. He was at one time located at Camp Audrie, to assist in the erection of Belgian cars, and while there heard the incessant booming of artillery.

J. P. Yergy, General Foreman, West Philadelphia Shops, P. R. R.; H. J. Yergy, General Car Inspector, Northwest System, P. R. R., and Mrs. J. P. Yergy.

Never before have there been so many new faces seen at the convention. T. A. Foque, mechanical superintendent of the Minneapolis, St. Paul & Sault Ste. Marie, is attending his first convention. When one looks back at the remarkable work that he did as secretary and later as president of the old Northwest Railway Club, it is hard to believe that he could have kept away from the Atlantic City conventions as long as he did.

The limit of space on the pier worked severe hardship upon one firm which shipped a carload of material here but were unable to get space. The Computing-Tabulating-Recording Company, of New York, would have made a most interesting display of machines used by the accounting departments and illus-

trative of the advantages their use may give in tabulating details in the mechanical department records. Harry S. Evans is representing the company here.

Captain R. de Heidenstam, of the Gas Accumulator Company, Stockholm, Sweden, has recently arrived in this country and is attending the convention. His com-

J. T. Mallard, Master Mechanic, Norfolk Southern.

pany represents the Dalen patents, covering gas lighting of railway signals, grade crossings, buoys, etc., and he is in this country studying American conditions. Captain de Heidenstam expects to remain another two months and is making his headquarters at the offices of the American Gas Accumulator Company, Elizabeth, N. J. The captain expects that a very large portion of supplies of all kinds bought from Germany or through German export houses prior to the war, will in the future be ordered from the United States and England.

Frank W. Edmunds, of the Schroeder Headlight family, had to return home last Friday to function as president of the School Board at West Nyack, N. Y., at the graduating exercises. Mr. Edmunds has taken a personal interest in educational matters in his neighborhood and has been responsible for many school improvements. During his absence, his co-workers have

vention service flag record—a star for each year, count them—still going strong.” Mr. Edmunds returned yesterday.

Alas and alack! There will be no golf tournament this year. Many will be disappointed. Have you heard

THE GOLFER'S PRAYER

O Lord, I pray Thee for a drive  
Of such a length that I,  
In telling of it afterward,  
Shall have no cause to lie.

And this will amuse some of us:  
There was an old duffer who stood  
For a slice, as he aimed at a wood;  
But by some twist or crook  
He came through with a hook,  
And the little pill left him for good.

Left to Right: George Thomson, Master Car Builder, N. Y. C.; I. W. Senger, Master Car Builder; N. Y. C.; E. H. Trottnow, Assistant General Foreman, N. Y. C.

The Fuel Conservation Section of the Railroad Administration is represented at the convention by three regional fuel supervisors, all of whom have been presidents of the Traveling Engineers' Association or the International Railway Fuel Association. They are: F. P.

Left to Right: H. F. Grewe, Master Mechanic, P. W. & B.; C. B. Keiser, S. M. P., P. R. R.; O. S. Jackson, S. M. P., C. T. H. & S. E.; C. Bowerson, M. M., Toledo & Ohio Central; F. K. Moses, M. M., B. & O. Chicago Terminal; C. M. Hitch, M. C. B., B. & O.; E. H. Mattingley, General Car Foreman, B. & O.; J. S. Naery, M. C. B., C. I. & L.; J. F. Holzemer, Purchasing Agent, Toledo & Ohio Central

hung his "convention service" flag in the Schroeder booth, on which are thirty-seven stars and the following words: "The old war horse, 'Pop' Edmunds. Con-

Roesch, of the Northwestern region; L. R. Pyle, of the Central Western region, and B. J. Feney, of the Southern region.

# New Devices Among the Exhibits

## New Machine Tools and Shop Devices

COMPARATIVELY FEW NEW TOOLS or shop devices for railroad use were placed on the market during the war. The builders were kept busy making their standard machines or in devising equipment for the manufacture of war supplies and munitions. That the designers were not unmindful of the demands after the war is evidenced by the number of new designs which have been placed on the market during the past few months. A large proportion of the new tools and shop equipment suitable for use by railways was fully described in the June number of the *Railway Mechanical Engineer*, subscribers to which are receiving copies of the *Daily*. We shall therefore in this article attempt only to briefly call attention to the new machine tools and shop equipment devices that are exhibited on the Pier and which were described in the special Shop Equipment Number of the *Railway Mechanical Engineer* in June.

### High Power Multiple Spindle Drill

An interesting example of drills of this type is being exhibited by the Defiance Machine Works Company of Defiance, Ohio. A description of it will be found on page 358 of the June *Railway Mechanical Engineer*. It is a heavy service production tool, especially intended for use in locomotive and railroad shops and will be found useful whether the work involves heavy gang drilling or heavy jig drilling. On jig work the compactness of the machine enables one operator to keep a number of spindles—either singly or in groups—in operation, and as a result, the operator is kept constantly reloading the jigs. One of these drills is in the exhibit of Manning, Maxwell & Moore.

### The Ohio Tilted Rotary Milling Machine

That there is apparently no limit to which the designer will go in the search for the practical application of every possible principle which will influence the efficiency of machine tool production is strikingly illustrated in the tilted rotary milling machine which is on display in the booth of the Osterlein Machine Company, Cincinnati, Ohio. As implied by its name, the table on this machine revolves, carrying the work to the cutting position; during the cutting operation the finished work is removed on the opposite side of the table, and the new work is set up. The cutter may be held in a fixed position and the table rotated continuously by automatic feed for continuous milling, or the cutter may be reciprocated radially in combination with an intermittent motion of the table, controlled by an indexing mechanism which provides for from two to 72 divisions. The table revolves rapidly between divisions in order to reduce the idle time, and by feeding the cutter radially over the surface of the work the loss of time between milling surfaces is avoided on such jobs as cannot be compactly spaced. Other advantages in the design of this machine include the avoidance of non-productive time of cutter approach. The cutter travels the shortest possible distance. Two or more simple fixtures may be used instead of one large fixture, and the machine is practical when applied to small quantity lots. This machine was described in the June *Railway Mechanical Engineer*, page 360.

## The Multi-Au-Matic

Friends of the quantity producer, the Bullard Multi-automatic, manufactured by the Bullard Machine Tool Company, Bridgeport, Conn., will be interested in noting the refinements and changes which have been made in the 1919 model of this machine. The new model is shown in operation on the pier. A detail description of it will be found on page 394 of the June issue of the *Railway Mechanical Engineer*.

### Internal Grinders for the Locomotive Shop

In repairing valve motion levers, parallel rods, and various similar parts where the holes in the rods or in the bushings are worn oblong or rough, or the holes in the levers have become distorted, the use of the internal grinder commends itself. Those who have benefitted by their recognition of the cylindrical grinders' place in the locomotive shop will be interested in the machine displayed by the Heald Machine Company of Worcester, Mass. It was described on page 362 of the June issue of the *Railway Mechanical Engineer*. It combines several noteworthy features, among which may be mentioned a large crosswise adjustment for the work, large vertical adjustment of the knee, multiple speeds for the rotation of the head, quick change gear boxes for speeds and feeds, and micrometer readings throughout.

### Belt Type Finishing and Buffing Machines

These machines embody the principle of a two-belt system employing an abrasive cloth belt running at high speed over a heavy corrugated leather cushion belt. Without mechanical holding devices or power feed attachment the work is held by hand, and produces a finished product of a superior nature. Equipped with a holding device and the power feed attachment, the machine is automatic in its operation, and thus production is limited only by the ability of the operator to handle the work. They are being exhibited by the Blevney Machine Company, Greenfield, Mass., and were described on page 345 of the June *Railway Mechanical Engineer*.

### Automatic Screw Cutting Die Head

The thread chasers on the new Landis automatic screw cutting die head may be easily and quickly removed for grinding or changing, as they are supported on the face of the head. The head is opened automatically by retarding the forward motion of the carriage, is closed by hand, and is locked by the operating handle which contains a latch having a tongue milled on the lower end. This tongue is milled off center, which permits roughing and finishing cuts; to adjust the head for either merely requires a half-inch turn of the latch to a suitable graduation. It will be found among the other products in the exhibit of the Landis Machine Company of Waynesboro, Pa. It was described in the June *Railway Mechanical Engineer*, page 372.

### Constant Speed Motor Drive for Shaper

A "selective type" gear box, with steel case-hardened gears, which may be used with a constant speed motor drive or a single pulley belt drive giving the same changes of speed as are ordinarily obtained with the

cone pulley drive, has been designed by Gould & Eberhardt, Newark, N. J., and is being exhibited mounted on one of their 28-in. Invincible shapers. By the use of this device it is unnecessary to stop the machine in changing speed except when changing from single gear to back gear, or vice-versa. The application of this device was recently described in the *Railway Mechanical Engineer* for June.

#### Combination Punch and Shear

The combination punch and shear exhibited by the Beatty Machine & Manufacturing Company, Hammond, Ind., is especially designed for steel car repair work, and combines some interesting features, noteworthy among which is the provision for three different sizes of punches which can set up simultaneously and be operated independently of each other. One end of the machine is built as a guillotine frame of semi-steel and supports and operates three different types of shears: one for flat work, one for different sizes of round bars, and another for angle irons. The extreme right end of the machine contains a set of coping tools. Seven sets of tools, each set ready for instant use, constitutes the working range of this interesting combination. The machine was described in the *June Railway Mechanical Engineer*, page 396.

#### Motor Driven Double Holder Drill Grinder

Those who seek "more holes for less money" should be interested in the motor driven double holder drill grinders which have been brought to the convention by the Grand Rapids Machine Company, Grand Rapids, Mich. One of its style C-6-A grinders, which was described in the *June Railway Mechanical Engineer*, is on display with several models of other types. The C-6-A grinders combines a small minimum capacity convenient in handling small drills with the necessary capacity for large drills. The small holder will accommodate drills from No. 52 to  $\frac{3}{4}$ -in., while the larger one will handle drills up to 4 in. or more. The larger holders grind the large drills wet and use a coarse wheel. The small drills are ground dry on a fine grain wheel. The rotation of the wheel of this machine is downward from the point of the drill, which not only obviates a tendency for the drill to lift from the holder, but throws all grit downward, resulting in safety for the operator's eyes.

#### A Valveless Air Drill and New Shipping Hammer

Because of the elimination of the delicate valve mechanism, the valveless air drill which is being exhibited by the Keller Pneumatic Tool Company of Grand Haven, Mich., is exceptionally light and compact. Economical air consumption is claimed for it, and it is stated that it will stand up under severe service. These machines are built in the non-reversible or reversible types, including a reversible wood boring machine and a reversible grinder.

The company is also exhibiting the new type of pneumatic chipping hammer, which it calls the Sure-Lox, a name derived from the manner of locking the handle to the cylinder, which eliminates the old-style clamp bolt. The new handle of the Sure-Lox hammer is locked directly to the cylinder in a rigid manner by means of a key which is inserted in the cylinder and engages one of a series of slots in the handle. The key is securely held in place and the entire lock arrangement is covered by a neat spring clip. An extra long striking end is provided on the piston and these hammers are furnished with either open or closed handle styles in 10 sizes, ranging from  $1\frac{1}{4}$  to a 41-in. stroke. These devices were fully de-

scribed in the *June Railway Mechanical Engineer*, page 363.

#### Jacks for Unwheeling Coaches

A contribution to the efficiency and cleanliness of the coach repair track is made in the production of the new Whiting coach jacks which were described on page 392 of the *June Railway Mechanical Engineer*, and which are shown in actual operation at the convention by the Whiting Foundry & Equipment Company, Harvey, Ill. The upright members of the jacks are spaced a fixed distance apart laterally. One pair of jacks mounted upon trucks which provide for adjusting the spacing longitudinally for different lengths of cars. Heavy steps or knees on the jacks travel between the jaws of the cast steel columns or posts and are controlled by a revolving screw. Provision is made for raising each step to the sill of the car independently; then all four jacks can, by throwing a clutch, be controlled as a unit.

#### Carbide Lamp and Welding Torches

New 5,000 candle power carbide lamps, with 12 hours capacity on 8 lbs. of carbide—a cost of approximately 3 cents an hour—are being exhibited by the Alexander Milburn Company of Baltimore, Md. One of the interesting features of this new lamp is the carbide container, which being made up as a series of pockets will accommodate the safe loading of carbide and no more. This construction also facilitates disposition of the residue. The container is simply withdrawn and the edge tapped lightly to dump the contents.

The same company is exhibiting its new oxy-acetylene torches. One is the "Cut Weld" combination torch, which is an all-purpose torch with interchangeable tips that can be used for cutting or welding as the case requires. Its type J or "quick-weld" is an equal pressure oxy-acetylene torch for welding. In this torch the gases are mixed in the tip. The torch head and tips have a flat seat which insures a perfect fit at all times, a new tip fitting the old torch without difficulty. It is stated that the equal pressure feature holds the oxygen and acetylene at equal pressure, making a softer flame, preventing flash-back and danger of oxidation of the metal. These devices were described in the *June Railway Mechanical Engineer*.

#### Davidsonized Cast Tool Steel

Seekers for the ultimate in production for machine tools who have tested and tried all makes of tool steels will doubtless be interested in Oscar F. Ostby & Company's line of cast tool steel which is being shown on the pier. A comprehensive review of the history of the production of this rather remarkable product was published on page 371 of the *June Railway Mechanical Engineer*. In the exhibit mentioned are samples of reamers, various types of milling cutters, counter-sinks, etc., which were cast in an electric furnace so nearly finished and ready for work that all that is required is hardening and grinding the cutting edges. The cutting possibilities of this steel are no less remarkable than the process of its manufacture.

#### High Speed Ball Bearing Screw Jacks

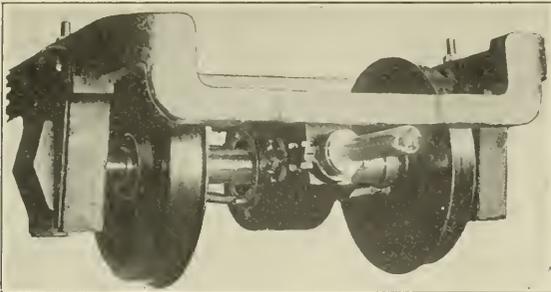

Three sizes of the 75-ton jack and three sizes of the 50-ton capacity are described on page 343 of the *Railway Mechanical Engineer* for June. These jacks, manufactured by the Duff Manufacturing Company of Pittsburgh, Pa., are on exhibition and are specially recommended for handling all railway equipment. The load is raised with the use of a solid steel bar in the lever socket, using it like a pump handle. The load being

raised on each downward stroke. A positive clutch holds the load for the return stroke of the handle. Regardless of the speed with which the jack may be descending, the lowering handle may be stopped with absolute safety to within a thousandth part of an inch of any desired point. It is stated that so little effort is required to lower the load that the 75-ton jack can be operated by a boy with ease.

## Spring Drive for Electric

### Axle Generators

THE SAFETY CAR HEATING AND LIGHTING CO., New York, is showing a new method of drive for car lighting generators, using a principle entirely new and unique in its application. Power is transmitted from the revolving car axle through springs connected to gear mechanism mounted on the truck, but free from the axle. Two split collars are bolted to the axle between the wheels, one at each end. Attached to each of these collars are three coil springs paralleling the axle and connected to the split drum. This drum surrounds the axle about midway between the wheels, but is of such internal diameter as to give several inches clearance between the axle and the drum. A flexible shaft running at right angles to the axle is geared at one end to the drum and

Spring Gear Driving Mechanism Mounted on Axle

at the other end to the armature shaft of the generator, the generator being mounted on the car body. The drum and gears are mounted in a two-part housing, split horizontally and bolted together; the upper part is securely fastened to the truck frame.

The generator being mounted in a fixed position on the car and connected to the axle drive by a shaft, necessitates providing for the variable relations between the car body and the axle when the car is traveling on a curved track. Compensation must also be made for side thrust through the truck equalizer springs and the variable pressure on the bolster springs. This is accomplished through the springs connecting the car axle with the geared drum. These springs not only give great flexibility in operation, but also provide wide latitude in assembling at the shops or on the road.

In case of flat wheels or other defects to wheels or axle, provision is made for quickly changing wheels and axle without changing any parts of the generator drive, thereby avoiding the necessity of carrying extra parts with each new axle. The same equipment can be applied to either straight or tapered axle without change, which is, of course, a great advantage.

The device is simple and compact and devoid of those

intricacies which the operator and inspector usually condemn.

## A Truck for Car Jacks

A CONVENIENT MEANS of supporting and moving car jacks about the shop or yard is being exhibited by the Union Connector Company, St. Louis, Mo. The device consists of a heavy block, on top of which the jack is mounted and to which is attached a lever handle

The Union Jack Truck

and a pair of wheels, as shown in the illustrations. When not used, the handle of the jack is raised and the block rests directly on the ground. When the jack is to be moved the handle is lowered, carrying the wheels down

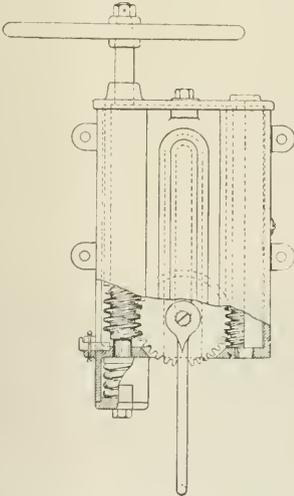

The Truck Ready to Move

with it and raising the block off the ground. The handle is locked in the moving position by a link, which engages a lug on the front of the block. When the jack is in use the block forms a solid foundation for the jack.

## Worm Driven Hand Brake

THE DRAWING SHOWS A HAND BRAKE which has just been developed and is being exhibited by the Atlantic Hand Brake Corporation, Buffalo, N. Y. The brake is worm driven and connects directly to the end of the push rod without the interposition of levers. The device consists of a short shaft, at the top of which the handwheel is placed. On this shaft is a long worm, which meshes with a gear and the gear in turn meshes with a stationary worm segment placed parallel to and on the opposite side of the casing from the driving shaft. The movement of the driving shaft causes the gear to climb the worm rack, carrying with it a clevis link, to which the brake chain is fastened.

As the leverage at the handwheel is high, special means must be employed to prevent the application of

The Atlantic Worm-Driven Hand Brake

excessive force to the brake chain. The lower end of the shaft rests on a plate, which in turn rests upon a coil spring in a pocket below the body of the device. This spring is designed to close under 12,000 lb. As the brake is applied, the shaft gradually compresses the spring, until it goes solid. This brings the end of the worm into engagement with a lug inserted in the casing, which prevents further movement.

No ratchet or other locking device is required, as the gear will not back off. However, it is only necessary to give the handwheel a spin to release it. In applying, a spin of the wheel quickly takes up the slack and the full force may be applied with one hand.

The leverage of the worm is such that the brake chain is connected directly to the end of the push rod without the interposition of intermediate leverage.

## Supplementary Exhibit List

- Broschart Threadless Pipe Coupling Company, Trenton, Mo.—Train line coupling for temporary repairs. Represented by J. L. Broschart. Space H.
- Cleveland Osborn Manufacturing Company, Cleveland, Ohio.—The Edlund railroad and mill broom. Represented by Jos. L. Sullivan, T. A. Unsworth and William P. Carroll. Space H.
- General Welding & Equipment Company, Boston, Mass.—Oxy-acetylene welding and cutting equipments. Represented by Thomas F. Stoddard. Space 537-538.
- Southern Economy Device Company, Shreveport, La.—International adjustable lateral plate and International removable driving box. Represented by H. McDougal. Space 38.

## A New Use for Fabrikoid

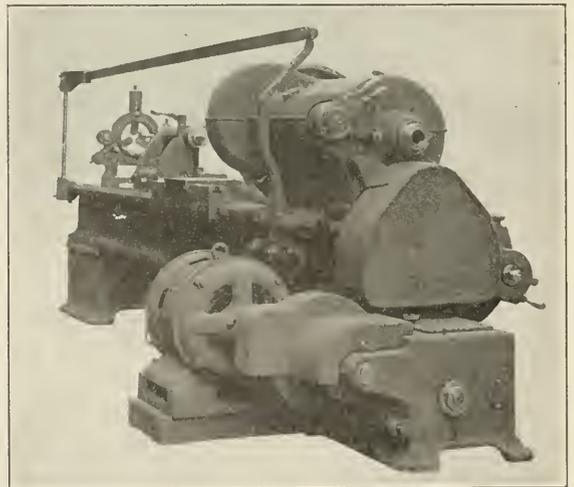

ONE OF THE EXHIBITS of the DuPont Fabrikoid Company, Wilmington, Del., is a Cadillac automobile. The body of which is completely finished with Fabrikoid in place of the usual enamel finish. This is the first trial which has been made in the use of Fabrikoid as an exterior finish where it is exposed to the weather. The body of the automobile was prepared for the Fabrikoid by the application of a coat of shellac. The Fabrikoid is then applied with cement. The entire exterior of the car body is covered in this way, including the top and the fenders.

The automobile on exhibit is the first one to which Fabrikoid has been applied and it has now been driven 15,000 miles, with the finish showing every evidence of a high degree of durability. So far as the test has been conducted the material has been unaffected by weather conditions or by the heat of the radiator and engine hood. A number of other automobiles have since been and are being finished with this material.

## A Lathe with a Low Motor Mounting

A DISTINCT AND NOVEL ADVANCE in lathes of the type illustrated is characterized by the low mounting of the motor on a standard motor frame, upon which a large or a small motor may be placed to suit the nature of the work on any given size machine. A pulley may be applied and the motor disconnected so that independent or group driving is at the option of the user.

The use of the silent chain in the head effects a smoothness of operation which makes the drive practically noise-

Twenty-Four-Inch Motor Driven Bradford Lathe

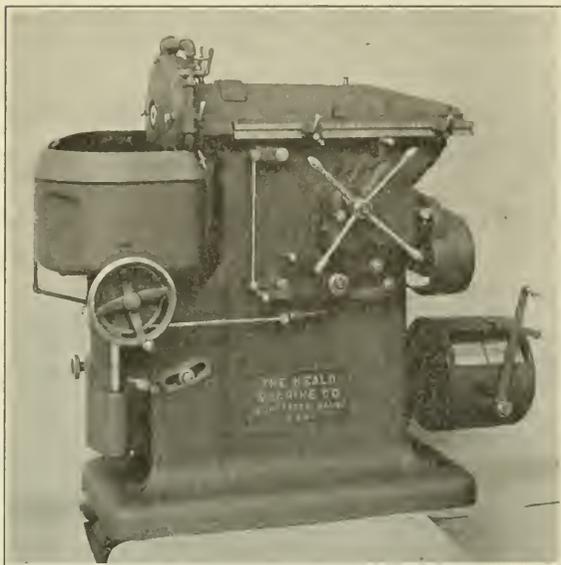

less and the spindle chatterless. Gear shifts in the selective driving gears in the speed box can only be effected after momentarily changing the drive through the shifter pole. In this gear shift no abuse of the mating gears is possible and speed changes are instantly made without noise or conflict. The back gear lever on the head not only engages the direct and back gear drives, but it is so arranged that in its central or disengaged position it effects a quick stoppage of the spindle by automatically applying through a direct friction brake. It is possible

to pull the work around by hand to inspect it with the friction brake applied.

The motor is used for driving purposes only and provision is made through simple mechanical means in the lathe itself for starting, stopping, reversing, speed changing and brake stopping. A 24-in. lathe of the type herein described, manufactured by the Bradford Machine Tool Company, Cincinnati, Ohio, is being displayed by the Swind Machinery Company, Philadelphia.

## Rotary Surface Grinding Machine

**T**HE ROTARY SURFACE GRINDING MACHINE shown in the illustration is built in two sizes, 8 in. and 12 in. regular equipment for both of which includes magnetic chucks. Prominent features incorporated in its design include the wheel slide which is a massive casting having a flat and "V" way which assures alinement. The wheel spindle is large and is mounted in a plain adjust-

Front View of 12-in. Rotary Surface Grinding Machine

able bronze bearing in the rear; it is lubricated through a large sight feed oiler. Automatic and hand feed for the wheel slide has been provided for by an automatic box and a pilot wheel which may be disengaged whenever the automatic feed is being used.

The main speed box which is situated on the rear of the machine furnishes power to the wheel slide by a three-stop cone and three speeds to the chuck through a bank of gears. The speeds of wheel slide and chuck are independent of each other allowing for a large latitude as regards speeds and feeds. The speeds to the chuck are controlled by a pull rod on the front of the machine.

The chuck spindle is driven by spiral gears, one of which is mounted directly on the spindle. The chuck bracket is adjustable to allow for the grinding of concave and convex surfaces up to an angle of 10 deg. The chuck feed is controlled by a hand wheel and vertical screw through a nut on the spindle sleeve. The chuck spindle is mounted on the ball bearings, while the vertical screw has a ball thrust bearing allowing vertical adjustment of the chuck. These machines are also equipped with an automatic vertical adjustment to the chuck which will feed from 0.0005 in. to 0.003 in. at each end of the wheel traverse.

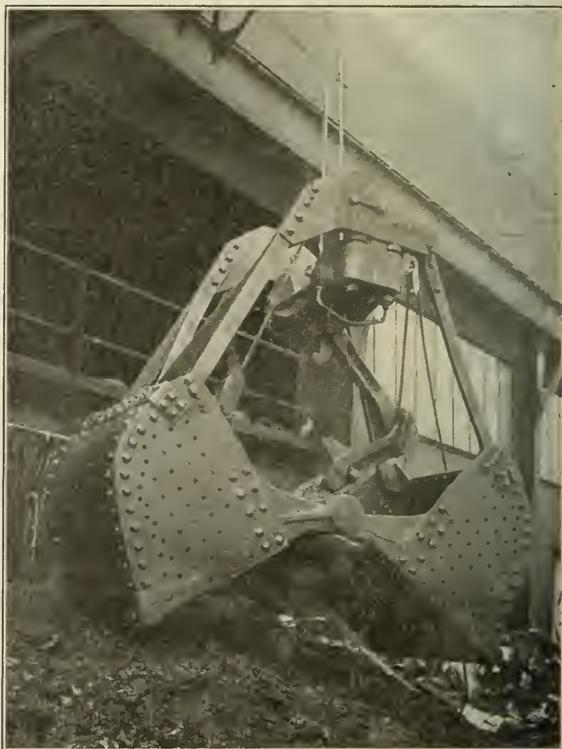

The water equipment includes a pump, tank, water-guard and connections, while a swivel joint in the distributing nozzle enables the operator to direct the flow of the water to any desired point.

The machine is self-contained, requiring but a single belt from the main line shaft or motor. Motor driven machines can be furnished if desired, the motor being placed where it is most convenient.

One of these rotary surface grinding machines is upon exhibition in the booth of its manufacturers, the Heald Machine Company, Worcester, Mass., who are also exhibiting a line of other types of grinding machines, one of which the Heald internal grinder, was illustrated and described in the June issue of the Railway Mechanical Engineer.

## Single Hoist Grab Buckets

**T**HE AUTOMATIC SINGLE HOIST GRAB BUCKET illustrated is recommended for use in the cinder pit; it will be noted that it is built without projecting parts which might catch on the sides of the pit. This bucket requires only a single drum hoist to handle it and is much faster in its operation than a two-line bucket because the operator has only one controller to handle. This grab bucket is automatic in operation, dumping at a fixed height controlled by a tripping hanger permanently attached to the hoist of the crane.

Brosius Automatic Single Hoist Grab Bucket

A special design of this particular type of bucket for use in ash pit service has been put out by Edgar E. Brosius, Pittsburgh, Pa., a specialist in the manufacture of grab buckets for ash handling plants; it has a capacity of 1½ cubic yards and is 3 ft. ½ in. wide, allowing a clearance between the walls of 4 ft. pit.

Subscription Agents for Great Britain and Egypt: The Dorland Agency, Ltd., 16 Regent Street, London, S. W. 1.

WE GUARANTEE that of this issue, 17,000 copies were printed; that of these 17,000 copies, 15,406 were mailed to regular paid subscribers to the Railway Age and the Railway Mechanical Engineer; 119 were mailed to advertisers, 300 were provided for counter and news companies' sales, new subscriptions, bound volumes, copies lost in the mail and office use, and 1,173 copies for distribution at Atlantic City.

THE RAILWAY AGE is a member of the Audit Bureau of Circulations (A. B. C.) and the Associated Business Papers. (A. B. P.)

A great deal of time is lost in the convention meetings by the reading of the reports in detail. This is, of course,

**Stop  
Reading  
the Reports!**

necessary where the reports are sent out late and do not reach the members until just as they are leaving for Atlantic City. This year, however, the most of the reports were

sent out several weeks in advance of the meetings and the members should have had plenty of time to read and digest those in which they were particularly interested. Indeed, many of the reports are so carefully prepared and go into such technical detail that it is hardly safe to attempt to discuss them unless they have been studied carefully in advance. While it may not be advisable to take such a radical step this year, some measure should be adopted to insure that the reports will be read only in abstract at the conventions next year. Secretary Hawthorne made a remarkable record this year in getting the reports out early and his staff is now so organized that it is safe to predict that even better results will be obtained next year. If this prediction is correct there is no reason why time should be wasted next year in reading the reports in full. It is an extremely difficult matter to get committee chairmen or the authors of individual papers to realize the importance or necessity of taking only a few minutes to place their reports before the convention. To check against this, the chairman should prepare their abstracts in advance and submit them to the General Committee to pass upon; or it might be advisable to have Secretary Hawthorne's office prepare such abstracts and submit them to the committee chairmen for approval. In this way prompt transaction of business would be insured and there would be more

time available for discussion—and discussion from a practical and educational standpoint is one of the most important parts of the convention.

Too often committee work is more or less of a joke. Members of a committee are likely to place the entire responsibility of doing the work on the chairman, and sometimes the chairman finds it easier to rely upon his own organization to do the greater part of the work in compiling and preparing the report because of the difficulty of arranging for meetings of the committee. Secretary Hawthorne is helping to overcome the latter difficulty by arranging through his office for the meetings of the committees at the convenience of the chairmen, but taking the details of calling the members together off their hands. It is understood that a Committee on Committees has been appointed whose duty it will be carefully to study the make-up of each committee and see that it is composed of the kind of men who are specially well fitted to work on it. An example of how a committee should do its work is afforded by the present Train Brake and Signal Equipment Committee. Its meetings are noted for the fact that ordinarily 100 per cent of its members are present. All of the men on the committee are experts on the subject, and it is not unusual for them to sit in conference for more than a day; indeed, one conference lasted several days, and all of the members worked hard and heartily during that time. With committees managed and made up in this way there is still another factor to be desired, and that is that the individual roads back up their representatives on committees and express a real pride in having them give the best that is in them to the committee work. The Pennsylvania Railroad has always insisted that its representatives on a committee make good, regardless of whether they were chairmen or members. More than this, it has placed its resources behind these men in the way of making special investigations or tests for the benefit of the committee. Other roads should adopt the same policy.

**An  
Ideal  
Committee**

## Mr. Tyler's Tribute to the Railway Supply Men

MR. TYLER PAID A DESERVED TRIBUTE to railway supply men in his address to the Mechanical Section yesterday, which is published elsewhere in this issue. He said the fact that more progress has been made in the United States than in any other country in the development of railroad equipment is due largely to the railway equipment and supply manufacturers.

We believe it is not generally known that the railway equipment and supply manufacturers occupy a much more important place in the transportation industry of the United States than of any other country. In most other leading countries a large part, or even most, of the equipment and materials used by the railways is made in their own shops. For example, the British railways built most of their own locomotives and cars. There are big builders of locomotives and cars in Great Britain, but they get 90 per cent of their business from foreign countries. In this country, on the other hand, the railways buy almost all of their equipment and supplies from manufacturers.

The technical officers of the railways have invented many of the most important specialties and materials used. They have suggested improvements in many of those which have originated with the supply companies. They have designed a large part of the locomotives and cars which have been built. On the other side, the supply companies have bought and put on the market

many of the things which railway officers have invented and have co-operated with the railway officers in perfecting their designs, while, of course, they have made most of the devices and equipment which the railway officers have designed.

It has been chiefly this co-operation between the officers of the railways on the one side and the supply concerns on the other that has promoted the technical development of our railroads and enabled them to haul a ton of freight one mile cheaper than any other railways, while paying the highest wages paid by any railways.

While there has been this co-operation between the officers of the railways on the one side and the equipment and supply companies on the other, they have always had the relationship of buyer and seller. They, in consequence, have regarded themselves as being engaged in separate industries. As a matter of fact, however, in a broad way, the railroad business and the railway supply business are one big industry. It is not always even true that the railroad is the buyer and the supply company the seller since the supply companies are large shippers and in the relationship of carrier and shipper it is the railroad that is the seller and the supply company the buyer.

To say just how much the technical development of the railroads has been due to railway officers and how much to railway supply men would be impossible. But in view of the superior efficiency with which our railroads are operated, it may be safely said that the railway and railway supply men of the United States have both done their work better than those engaged in similar lines of work in any other country.

## Locomotive Standardization

**I**N HIS ADDRESS at Monday's session Frank McManamy very ably presented the arguments for standardization. The great strides which have been made in industrial developments in this country have been made in an atmosphere of individual initiative which is the expression of the principle of freedom on which all our national institutions are founded. According to this principle, organizations as well as individuals should have the fullest possible latitude in the development of their own policies and ideas, only being restrained where it can be proved that the national interest demands the imposition of restraint.

The burden of proof, therefore, must lie with the exponents of general standardization. This has been done in the case of cars, which are universally offered in interchange, the question of standards therefore becoming a matter of general concern. On the other hand, while in special cases they may be used on foreign lines, locomotives are essentially a fixed part of the transportation machine, functioning to the greatest advantage when retained within the limits of the owning road, and to even better advantage when they are used exclusively on the home division. The fact that the extraordinary transportation conditions which were brought about by the war have made it expedient to transfer locomotives from one railroad to another does not alter this principle. Even the building up of permanent joint terminals in which locomotives of several roads are handled and dispatched by a common organization does not materially affect the situation, because these are largely turning points and the greater part of the actual repair work is cared for at terminals on the home road.

Standardization of locomotives has been adopted quite generally by individual railroads and where sufficient latitude is allowed in the working out and application of improvements, this is a highly desirable policy. But it

is not safe to draw general conclusions from the facts in particular cases, and standardization should not be regarded as a principle, but as an expedient for the attainment of certain ends. These ends are uniformity of shop practice and tools, the reduction of the variety of repair parts and hence the number which must be carried in stock, and the reduction of first cost.

As it has been adopted by individual railroad systems, the first two of these ends have in a measure been attained. To apply a single set of standards to the nation, however, will add nothing to the benefits which are being derived from the standardization programs of individual roads.

These programs make possible uniformity in shops practically under normal conditions and reduce the material carrying charges as far as they can practically be reduced.

In fact, general standardization would be a backward step, so far as the attainment of these benefits is concerned, for a period of 15 or 20 years. The standard locomotives already built have added to the number of classes and non-interchangeable details, now too large in many cases, which the more progressive railroads are endeavoring to reduce. To offset the disadvantage of this long transition period there must be assurance of large benefits in the end in addition to those now already assured from the measure of standardization which has developed naturally under private ownership and operation.

Of the advantages claimed for standardization the only one which offers reasonable hope of fulfillment is that of reduced first cost, which may be secured through economies in construction made possible by quantity production. This, however, is not large, owing to the comparatively small number of engines to be built of a single standard type and is a question of minor importance as compared with the question of the preservation of individual initiative and incentive in the development and improvement of motive power. It is not difficult to form an opinion of the effect on the state of motive power development 20 years hence, if the actual application and working out of new ideas and improvements must pass through the hands of a central organization for approval or rejection by a comparison of the motive power of 20 years ago with that of today. And yet 15 or 20 years must elapse before a general standardization program will have become effective.

The statement that standardization does not mean stagnation is true within certain limits where it has naturally developed and has taken a form expressive of the ideas of close knit organizations. In few cases have standards been so rigidly maintained that improvements were not very readily incorporated, not only in new designs, but in the old power. The attempt to maintain universal standards of necessity must greatly increase the difficulty of securing the adoption of improvements to prevent a rapid growth of local changes which would soon destroy the standards. The inflexibility and unwieldiness of such a central organization will effectively kill the incentive to continue the rapid pace which developments of the past twenty years have taken.

There is still much to be done before the locomotive is sufficiently perfected to attempt to maintain fixed designs. Take the question of fuel economy which is only just beginning to receive serious attention in this country. It involves the consideration of many problems of boiler and firebox design. The present high cost of fuel and the necessity for conserving the nation's fuel resources demand the utmost freedom in the development of improvements and in themselves are a sufficient reason for not adopting a program of national standardization.

## Program For To-day

9.30 A. M. TO 1.30 P. M.

Discussion of Reports on: Fuel Economy and Smoke Prevention Specifications and Tests Materials (M. M.) .....	9.30 A. M. to 10.00 A. M.
Design and Maintenance of Locomotive Boilers .....	10.00 A. M. to 10.30 A. M.
Locomotive Headlights .....	10.30 A. M. to 11.00 A. M.
Superheater Locomotives .....	11.00 A. M. to 11.30 A. M.
Individual Paper on Carbonization in Valve Chambers and Cylinders of Superheated Steam Locomotives; Its Cause, Effect on Lubrication and Maintenance, and Proper Measures to Overcome Same, by F. P. Roesch.....	11.30 A. M. to 12.00 A. M.
Amalgamation of other Mechanical Associations with Section III—Mechanical of the American Railroad Association .....	12.00 A. M. to 12.30 P. M.
Questions Proposed by Members...	12.30 P. M. to 1.00 P. M.
	1.00 P. M. to 1.30 P. M.

### ENTERTAINMENT

10.30 A. M.—Orchestral Concert. Entrance Hall, Million Dollar Pier. Fry Philharmonic Orchestra.

3.30 P. M.—Band Concert and Impromptu Dancing. Entrance Hall, Million Dollar Pier. Royal Scotch Highlanders' Band. Tea will be served at 4.30 P. M. in Entrance Hall.

9.30 P. M.—Mardi Gras Dance. Ball Room, Million Dollar Pier. Royal Scotch Highlanders' Band.

## The Mardi Gras To-night

THE BALL ROOM on the Million Dollar Pier will be the scene to-night of a merry affair. It will be termed a Mardi Gras dance and will be in its nature somewhat similar to the carnival dance of last Thursday night. The Highlanders' band will furnish the music for a twenty dance program and during the intermission the members of the Entertainment Committee will distribute paper caps, streamers, horns, squakers, confetti, etc. Fun will then reign supreme till long after midnight.

## Lost and Found

LOST—Badge No. 4187 by Mrs. S. F. Armstrong and Badge No. 184 by George Akans. If found, please return to *Railway Age* booth.

LOST—R. S. M. A. Badge No. 2312 by J. N. Gallagher of the O'Malley-Bear Valve Company. Finder please leave at the *Railway Age* booth.

FOUND—Badge No. 5349. Apply to Secretary Conway's office.

LOST—Parasol, blue with Roman border, tan stick with fork handle. Return to E. W. Winchester, Logan Hotel, or Secretary Conway's office.

FOUND—Small fur neckpiece. Call at Secretary Conway's office.

## Yesterday's Entertainment

THE ENTERTAINMENT FEATURES of yesterday and last night were greatly enjoyed. In the morning a band concert was given in the ball room of the Pier, and in the afternoon an orchestral concert received a generous attendance. The afternoon affair was followed by an informal dance during which tea was served.

In the evening the announced informal ball was thoroughly enjoyed, and there was a large attendance,

although many convention people attended an added attraction in the Hippodrome. Sixteen dances composed the evening's program. The committee in charge consisted of Langley Ingraham, Chairman, assisted by J. L. Paxton, H. E. Passmore, J. C. C. Holding, Ellsworth Haring, F. T. Connor and R. J. Himmelright.

## A Big Convention

REGISTRATION BOOK NO. 4, which will be issued to-day, will show some astonishing attendance figures. We have talked about the year 1911 as a record-breaker. It was and has continued to hold this distinction until this year. Book No. 4 will show a total attendance of 5,771. It is safe to say this morning that over 6,000 people have attended the conventions up to this time. The comparative figures between 1916 (up to Sunday evening) and 1919 (up to Monday noon) are as follows:

Members .....	1916	1919
Special guests .....	628	630
Railroad ladies .....	511	1,795
Supply ladies .....	417	600
Supply men .....	30	450
Foreign guests .....	1,453	2,246
	.....	50
Total .....	3,315	5,771

The figure for the "members" needs some explanation. In former years many members registered for both the M. M. and the M. C. B. conventions and were counted twice. This, of course, is not being done this year.

## American Society for Testing Materials

THE TWENTY-SECOND ANNUAL MEETING of the American Society for Testing Materials will be held at the Hotel Traymore, beginning today and closing Friday, June 27. The program for today's sessions is as follows:

### FIRST SESSION, 10 A. M.

- Minutes of twenty-first annual meeting.
- Annual report of Executive Committee.
- Report of Committee E-6, on Papers and Publications.
- Report of Committee D-3, on Method of Sampling and Analysis of Coal.
- Report of Committee E-4, on Magnification Scales for Micrographs.
- Announcement of election of officers.
- Miscellaneous business.
- M. O. Leighton, chairman of the National Service Committee of the Engineering Council, will address the meeting on the activities of that committee.

### SECOND SESSION, 3 P. M. ON PRESERVATIVE COATINGS, LUBRICANTS AND CONTAINERS.

- Report of Committee D-1, on Preservative Coatings for Structural Materials.
- Paint, a Plastic Material and Not a Viscous Liquid.
- Report of Committee D-2, on Lubricants.
- A Viscosimeter for Gasolene.
- Report of Committee D-10, on Shipping Containers. Motion pictures will be presented showing certain activities of the United States Forest Products Laboratory, Madison, Wis.

### THIRD SESSION, 8 P. M., PRESIDENTIAL ADDRESS AND MEMORIAL SESSION.

- Annual address by the President, Guillian H. Clamer, on the subject of Standardization.
- Memorial session in honor of Dr. Edgar Marburg, late secretary-treasurer of the society.

President Walker, of the R. S. M. A., has extended the full privileges of the Million Dollar Pier to the members of the American Society for Testing Materials during the remainder of the convention of the American Railroad Association, Section III, Mechanical. The badges of the members of the Testing Material Society will admit them to the Pier at any time.

## Train Line Connector to be Investigated by Mechanical Section

**D**URING LAST THURSDAY'S SESSION the subject of automatic train pipe connectors was brought up, under the head of Questions Proposed by the Members, by C. E. Fuller, superintendent motive power and machinery, Union Pacific. The discussion, which follows, was referred to in an editorial which appeared in the June 20 issue of the *Daily Railway Age*:

Mr. Fuller: Sooner or later we may be confronted with automatic steam and air hose couplings. I have noticed one on the pier. I do not remember whose it is, but it looked pretty good to me, and I think this association ought to study the subject, because I am sure we are going to be confronted with an automatic coupler sooner or later and we ought to anticipate it.

Wm. H. Mussey (Long Island): We have had a good many years' experience with automatic connectors and I think we ought to consider very carefully before we go into it. We have come to the conclusion that the straight automatic connector has so many difficulties involved in it that it involves the coupler question.

F. W. Brazier (New York Central): We have a train on one of our divisions running between Highbridge and Yonkers, a short distance, which has been equipped for about eighteen years with automatic connectors, but train has been kept going on the run back and forth without being broken up and they have been very successful. We are using one manufactured by the Westinghouse Company. This question was very much debated by this association a few years ago. We had committee reports on the subject, but the movement has died down. There is a movement on foot now to make tests, and go into it deeper, and it would be a good idea if this matter were referred to the Train Brake and Signal Equipment Committee. There are a number of different designs, and on the Lines West, Mr. Thompson can tell you they are testing out some on his trains.

W. O. Thompson (N. Y. Central Lines): We are trying out some of these connections on the lines West of Buffalo, but we are not in a position now to give any definite information, for the reason that we have put the equipment on our suburban trains and there is no cutting apart and switching or anything of that kind with those trains. We have now changed the couplers on some branch line trains that will be cut apart and switched around and perhaps that will give us a chance to give you a little more information later.

J. J. Tatum (U. S. R. A.): We have been working with connectors. All of us have realized for a number of years that the connector is going to come into use some day, and I believe we ought to get into position by having a committee follow up the development of the connectors so we will know more about them when they are developed than we know about the draft gear. You would be surprised to know how little we know about draft gears. It would be a good move by the association to have a committee follow up the development of the connector so that when it is complete and ready for use, they will be able to tell us something about it that we can bank on.

J. McMullen (Erie): We have a suburban train equipped with an automatic connector. I happened to be at Jersey City a few days ago when I was coming down here and I noticed this train come in on the platform while I was there and it seemed to be working very nicely. There was a car connected on the end of this train that was not equipped. This was done by the use of a dummy which they have in connection with the connector that we are using, and gives satisfaction.

Mr. Mussey: I didn't want to be understood as saying that the automatic connector did not have a lot of very good features, but the difficulty on one of the points Mr. McMullen has just brought out is the question of coupling other cars, and the attachment of the coupling is so closely allied to the couplers that it is really almost a part of the coupler, or should be, and the subject might be sent to a sub-committee of the Coupler Committee.

Mr. Fuller: We have been using automatic connectors for a long time. I had an experience in 1902 and 1903 on the Alton, with varied results. There is no question but that we have got to come to it and this association should be in touch with anything that is being done.

The Chairman: These men who have remarked that they have some in service on their trains that are never broken up must realize that there is absolutely no advantage in an automatic coupler if that is the service you are going to put it in. The argument has always been that the absolute need for them, if there is one, is for use in suburban trains, where you are breaking your trains up and slamming them together. I suggest if anybody is going to use automatic connectors that they put them in service where the trains are broken up and not where the benefits of the automatic coupler cannot be fully realized. The real test is in the suburban service, where you have a great deal of crossover conditions and conditions which are severe, but actual working conditions, as a rule.

On motion, the subject was referred to the General Committee, to be assigned to a new committee or to one of the standing committees.

## Message From General Atterbury

**I**T WAS EXPECTED that General Atterbury would be present to take part in the "Recognition Program" last Saturday evening. President Walker of the R. S. M. A. received the following telegram from him on Saturday morning:

"I am deeply grateful for the cordial invitation extended to me verbally by yourself and also in the telegram of Mr. Chambers and Mr. Tollerton to be present at the session of the American Railroad Association, Mechanical Section.

"It would be a great privilege and pleasure to me to participate in the affair of this evening were it not that other arrangements previously made preclude my being in Atlantic City for the occasion.

"I note that you call it a night of recognition and appreciation of the service rendered by A. R. A. members during the war.

"So far as this concerns the railroad men who served in France, I can speak with authority regarding their accomplishments, and my message to you is that you can go the limit in commending them. I rank their work with the most distinguished performed in France.

"A large percentage of the railroad men who went to France were well beyond the age at which military service might reasonably have been expected, many gave up very remunerative positions, home ties and all those comforts and conveniences that are so foreign to army life, all to answer the call of their country and to serve in such capacity as they could be used with benefit to the cause. I think that if the facts were analyzed it would be found that of all agencies that contributed over and above what might be termed the reasonable call of duty the railroad profession stands out pre-eminently. I am proud not only of the sum total of achievement of the railroad men in France, but also of every man who had the opportunity of serving there." W. W. ATTERBURY.

## American Railroad Association, Section III, Mechanical

Proceedings Include Addresses by W. T. Tyler, Chairman Tollerton  
and Frank McManamy

**T**HE FIFTH DAY of the first annual convention of the American Railroad Association, Section III, Mechanical, began with a morning session on Monday, June 23, 1919. The meeting was called to order at 9:45

o'clock by Mr. Tollerton, the newly elected chairman, who asked that the past presidents in the audience and also Mr. McManamy, assistant director, mechanical department of the U. S. R. A., take seats on the platform.

### Address of Vice-Chairman, W. J. Tollerton

**I**HAVE LISTENED to so many excellent addresses since the opening of the convention and the ease with which they were delivered and it would seem that any one should be able to make a public address merely by close observation as to how it was done. However, I am inclined to think that making addresses in public is like the great game of golf, you may be one of a gallery that is following a professional golfer and watching the ease and accuracy with which each shot is made, it seems not to be difficult at all, but when we try it ourselves we generally dub our shots. Therefore, I trust that if my drives are short and I am occasionally in the bunkers the convention will bear with me for I assure you if given strokes enough I will get over the course somehow.

The American Railway Master Mechanics Association is just closing its 51st year and as I had the honor of serving you as President until its consolidation into Mechanical Section No. III. I will therefore address you as Past President of your association.

In addressing you today as President of the American Railway Master Mechanics' Association, I thoroughly appreciate the honor conferred upon me and the privilege of appearing before you in a capacity which has in the past been so ably filled. It is therefore with an especial pleasure that I extend to the members and distinguished guests, a sincere welcome with the hope that this meeting shall be truly beneficial. I am certain that none of us will leave this beautiful city and its charming hospitality with other than the most pleasant recollections.

During these eventful years of change and progress, we have witnessed the growth of a co-operative spirit among nations and national institutions, the far-reaching effects of which, will not be fully appreciated for some time to come. In the railroad field some of these tendencies are already evident. The amalgamation of various organizations is in line with the general trend and will lead undoubtedly to a broader opportunity for useful

effort, and a more complete development of the inherent possibilities, than could be expected from the organizations acting independently.

Most of us will view with considerable regret the passing of our old association. In fact had it not been for this sentiment in favor of retaining the identity of the American Railway Master Mechanics' Association, it is probable that a combination of the different organizations would have been effected a number of years ago. While at that time the advantages of a more complete co-operation were realized, there was no urgent incentive to the formation of an amalgamated association. Today, however, we are confronted with problems, the solution of which will indeed necessitate our combined efforts, and in the wise consideration of these matters, we will have increased opportunities together with a graver responsibility than has been ours during the preceding years.

It is only necessary to glance through the published proceedings of the Master Mechanics' Association to realize that there has been a consistent growth right from the beginning, and also that in the various lines of investigation under way, there still remain great possibilities for future endeavor. It would require altogether too much time to attempt anything in the nature of a complete review of the work accomplished by this association during the past fifty-one years. I feel, however, that on this occasion it will not be entirely out of place to mention briefly some of the more important results secured. This is the only true measure of our success and consequently a summary of these results seem to be a logical topic for incorporation in my address as last president of your association.

#### History of the Master Mechanics' Association

It may appear to some of the members, that a synopsis of this association's efforts is not entirely necessary inasmuch as the modern American locomotive of today might be considered

in itself as a complete embodiment of our work and efforts during the past years. The difference between this machine just prior to the organization of the Railway Master Mechanics' Association and as it stands today, constitutes a vivid fact, infinitely more impressive than any written account. This is the concrete evidence of our labors as members of the old association and in the progress of its development during years to come, the locomotive will still remain as a true representation of our work in the amalgamated organization. It may be of interest, however, to outline a brief historical record of the Master Mechanics' Association, with an indication of some of the results accomplished.

The American Railway Master Mechanics' Association is today just closing its fifty-first year of existence. On June 10, 1868, six railroad master mechanics met at Dayton, Ohio, to plan this great organization. Another meeting was held at Cleveland just fifty-one years ago tomorrow, and was attended by twenty master mechanics, who issued invitations to the first annual meeting held at Cleveland, September 30th and October 1 of the same year. This time there was a more general attendance and the work of the association was formally started.

It was the purpose of these earnest men that annual meetings be held and appropriate committees be appointed to gather from all parts of the country ideas, practices, and the experience of manufacturers and mechanics, then after digesting them thoroughly, to present full and complete reports to the association. In this manner a valuable fund of information has been accumulated for the professional guidance and benefit of railway officials. During the first annual conventions reports on such subjects as Boilers and Boiler Material, Steel Tires, Wheels and Axles, Cylinder and Stuffing Box Packing, Boiler Incrustations, Safety Valves, Material for Flues and Standard Nuts, were presented and discussed.

### Development of Standards

Of the greatest value has been the work of the association committees in preparing and recommending various standards and practices, which have been adopted by action of the association assembled in convention, or by a letter ballot of all the members. The first recommended standard was for screw threads, and was adopted at the convention of 1870. Some of the more important standards that have been adopted are for axles, wheels, safety appliances, screw threads, bolts and bolt heads, tires, wheel mounting pressures, formulae for main and side rods, specifications for axles, boiler and fire box steel castings, cast-iron wheels, cast-iron cylinders and cylinder parts, steel forgings, packing rings, safety valves, steam chests, superheater castings, superheater pipes, boiler and arch tubes, solid and forged steel wheels and valve bushings.

In addition to the above association Standards, the following are some of the more important Recommended Practices that have been adopted:—Rules for the testing and inspection of locomotive boilers; rules for the inspection and testing of locomotives and tenders, air brake and train air signal instructions, photometering of headlights; rules for determining stresses in locomotive boilers; rules for boiler washing; fastenings for tires of steel wheels; standardization of tinware, various gauges and specifications for lumber, wrought iron bars, bronze bearings, steel forgings and castings, cast-iron wheels, engine bolt iron, air brake hose, journal bearings, lap welded and seamless boiler tubes, rivet steel and rivets, staybolt iron and welded pipe.

The above constitutes a brief synopsis of the most important work carried on by this association since its organization. It does not, however, give any indication of the tremendous amount of labor and investigation necessary on the part of the various committee members before the recommended standards, practices and specifications, were finally adopted. Eminent railway mechanics held diverse opinions regarding important details of locomotive construction, regarding the proper proportion of various parts; the strongest and simplest method of building and bracing locomotive boilers to insure them against explosion; the most efficient form and construction of fire boxes to develop the value of the different kinds and qualities of fuel; the relative value of iron and steel plate for boilers, and especially of copper, iron and steel for fire boxes and flues; the relative safety and economy of iron and steel axles, crank pins and truck wheels; the cause and prevention of boiler explosions; and a multitude of kindred topics, embracing a wide range.

In view of the various conflicting opinions held by the members upon these important subjects, a careful and systematic investigation by the different committees has been necessary in order to harmonize and develop a set of Standards and Recommended Practices that would represent the best composite opinion of the entire organization. These discussions and investigations have also had the very excellent effect of awakening and directing attention to the subjects under consideration. It is doubtful if any railroad man can listen to discussions upon matters of vital bearing upon his daily occupation, without having his attention quickened and awakened. He may not always take part in these discussions, nevertheless when he goes home he will see and look for things he never saw or thought of before.

At the convention of 1891, it was decided to incorporate under the laws of the State of New York, as owing to its steady increase in membership and influence, it was felt that the association should be in a position to exercise a legal control over its finances and to make and execute contracts and do all other acts that an association of this kind may do to maintain and perpetuate its existence. Incorporation was effected July 23, 1891.

### Association Establishes Scholarships

At the fifth annual convention, held in Boston during the year 1872, there was a surplus of three thousand dollars. By an unanimous vote of the subscribers (merchants and manufacturers of Boston) this money was turned over to the association to be placed in the hands of three trustees, chosen by the association, to be used for the benefit of the association in such manner as the trustees might direct. There were many discussions as to the proper use for this fund, among which was the project of erecting a building for the association. However, the fund was finally invested in government bonds until the year 1891, when with accrued interest it amounted to \$6,898.13. A committee was then appointed to find a suitable use for this money and recommended that \$5,000.00 of the amount be invested in four scholarships at Stevens Institute of Technology.

In 1903, Jos. T. Ryerson & Son of Chicago provided a scholarship in any institution and assigned the filling of this scholarship to the association. This scholarship provided for \$500.00 a year. In 1915 this was changed to two scholarships of \$300.00 per year each. These scholarships have been filled every year since first established. They are available to the sons of members and under certain conditions as provided by the constitution to the sons of other railroad employes. Successful candidates are required to take the mechanical engineering course. No more worthy use of money than this can be conceived and it is to be earnestly hoped that there may soon be many more such scholarships under the supervision of the association.

In 1904 the constitution was amended to provide for representative membership on the basis of locomotives owned and operated. Since that date relations between railroad corporations and the association have been very close. Prior to 1904 the membership was entirely voluntary, the members all paying their own dues, but of late years the railroads have manifested great interest in the association, appointing representative members and paying their dues, no doubt feeling that the expenditure was fully justified by the results achieved.

As we look over the activities of the American Railway Master Mechanics' Association during the past 50 years, we cannot fail to be impressed by the work which it has accomplished. Its entire history is a record of splendid achievements in the improvement of the steam locomotive on American railroads. It is the duty of the members of this association to see that the work which has been so ably carried on under its direction is prosecuted just as earnestly under the new organization which has been formed.

### Benefits to be Derived from Amalgamation

I am convinced that the amalgamation of the American Railway Master Mechanics' Association with the American Railroad Association offers even better opportunities than formerly existed for carrying on this work, and that it comes at a time that is very opportune to permit us to secure the greatest measure of co-operation. The period of stress through which we have just past demonstrated conclusively the necessity for efficient motive power and adequate facilities for maintaining it to a high standard while in service. Much of our work in

the past has been hampered by lack of funds to carry on improvements. When the re-adjustment of the transportation situation now under way is accomplished there is reason to hope that the financial return which the roads receive will be more nearly adequate and will permit of making improvements in motive power which have long been recognized as necessary to the economical operation of the roads.

The cost of fuel and to some extent, the cost of wages per ton mile are largely determined by the type of motive power and the condition in which it is maintained. These items form such a large proportion of the total cost of conducting transportation, that in the last analysis the extension of our railroad systems depends upon the ingenuity of mechanical men in devising means for reducing the cost of transportation. There are still fertile sections of this country remaining undeveloped owing to the lack of railroad facilities. As the population increases we shall need the additional production obtainable from this territory. The present tendency, however, is toward a decrease in railroad mileage. In fact during the past two years the mileage of railroads abandoned has exceeded the mileage built. Nothing will be more effective in overcoming this tendency toward a reduction in railroad mileage than the general development of improved facilities for the economical handling of light traffic.

### Many Engineering Problems Requiring Solution

There is great need for the continued study of motive power from an engineering standpoint. Further investigation is required to determine the best proportions for locomotive boilers and draft appliances. There are many devices now on the market and no doubt many others will later become available, with the object of bringing about a reduction in the cost of locomotive operation. These should be studied and every assistance given toward their further development. The design of machinery for large locomotives is a problem well worthy of our most careful attention. It is also of importance to determine possible economies by the addition of improvements to existing motive power and the advisability of such alterations based on the type and service life of the equipment.

The development of roundhouses has not kept pace with the increase in size and weight of locomotives. The length of time locomotives are held out of service is in many cases unreasonably long. There is a splendid opportunity for increasing the service secured from locomotives, by improving terminal facilities and mechanical men should give the matter careful study.

Many of the technical problems pressing for solution cannot be properly investigated without a complete equipment of testing and laboratory apparatus. Few roads are able to undertake the expense of such work alone and as the benefits are shared by all, the establishment of a joint laboratory for test and research work seems a logical method for furthering such investigations. I believe this association should go on record as recommending a central testing bureau and that an earnest effort should be made to bring such an institution into existence at the earliest possible date.

## Mr. McManamy Speaks on Standardization

**A**MONG THE CHANGES which the war brought about in the industrial life of the nation there are perhaps none that are more far-reaching in their effect than the general movement towards standardization, not only in railroad equipment, but in all branches of industry.

Because of the necessity of placing each plant engaged in producing articles which were necessary to the successful conduct of the war upon a basis which would insure maximum output, standardization was made compulsory in many lines, and the War Industries Board, through its numerous sections, standardized literally thousands of articles. In so far as some of these were concerned, as for example hardware, hand tools, pneumatic tools, electrical apparatus, etc., the process of standardization was in effect a process of elimination, and because of the comparatively short life of many of these articles in use, some of them may not leave very much impression on our industrial life.

Among the changes in railroad methods that which has perhaps been most commented upon and probably least understood is the standardization of equipment, which was started by Director General McAdoo very early in the life of the United

As we examine the progressive steps whereby the locomotive has advanced from the early crude conception to its present state of comparative perfection, it becomes very evident that in this marvellous growth the locomotive builders have exerted a most decided influence. In fact it would be difficult to exaggerate the importance of what has been accomplished by their engineering ability, not only in the development of locomotive appliances, the perfection of design and proportioning of parts, but also in the adaption of locomotive construction to a great variety of severe operating conditions and the working out of original ideas, frequently at heavy expense. In this connection it is only fitting to say a few words in behalf of the manufacturers of railroad supplies, who by their initiative and energy in the development of new devices have contributed so much to the progress of railroads in this country.

To the Railway Supply Men's Association we owe a debt of gratitude. They have brought together for our inspection what is beyond doubt the most complete display of railway appliances ever exhibited. I desire to urge upon all of you to devote your spare time to the examination of these exhibits, and to bear in mind that the use of more efficient labor saving machinery is probably the only means at our disposal to bring about a reduction in operating costs. The increased wages which employes are now receiving has changed the economic aspect of the shop situation. In view of these altered conditions it has become more vitally important than ever to see that our men are provided with modern tools and facilities. There are no doubt a considerable number of the members, having under their jurisdiction shops filled with machine tools built sometime during the nineteenth century. Practically all of this machinery is operated at a loss and in numerous cases at a very great loss. Many of us have realized for years the necessity for replacing and adding to our equipment of shop machinery, but owing to the ever-increasing burden of expense and financial difficulties under which the roads struggle, it became almost impossible to secure a sufficient appropriation to put the shops on a truly efficient basis. It seems to me that these matters are worthy of our consideration and as members of the combined organization we should have a better opportunity than ever to formulate a definite policy of shop improvement.

In closing I wish to express an appreciation of the work done by the committee members and officers during the preceding year. I am sure that the new organization will receive the benefit of your continued activity together with that loyalty and earnest endeavor which has accomplished so much throughout the life of the Master Mechanics' Association. It is my sincere desire that the members and their families shall secure from this meeting the greatest possible instruction and pleasure with a safe and enjoyable trip home.

### Minutes Approved

*A motion to approve the minutes of the 1918 meeting as published and transmitted to members was put to vote and unanimously carried.*

States Railroad Administration, and its relation to production, maintenance and operation of equipment.

In the standardization of rolling stock, where each unit has a prospective life of twenty-five years or more, this standardization could not be accomplished by elimination and required, therefore, the preparation of plans and specifications, with the single object of building locomotives and cars which would have, so far as possible, those parts subject to frequent renewals because of wear, interchangeable on as many classes as possible.

By some, standardization has apparently been construed to mean the preparation of a standard design for equipment which must meet the demands of all classes of service in every section of the country, which of course would be impracticable because it would hamper improvement and retard development.

As a matter of fact, however, nothing of this kind was even remotely considered in connection with the program of standardization of equipment. The fact that the standardization program was entrusted to a committee composed of some of the ablest superintendents of motive power and mechanical engineers in the railroad business, who for years have been active

in the work of this association, together with the engineers and designers from the locomotive builders, should have been a sufficient guarantee that nothing radical or impracticable could come from the deliberations of such a committee.

An effective transportation machine is just as vital to the welfare of the nation in time of peace as it is in time of war. Quantity production, standard parts and efficient performance are just as necessary to efficient industrial progress now as they were one or two years ago.

An attempt to agree on a single standard for locomotives or cars, without regard to the character of the service performed, would of course be impracticable and such a plan must of necessity be a failure. Standardization of certain dimensions and appliances common to all locomotives and the preparation of designs for a number of standard types of locomotives using appliances common to all and which are as far as practicable interchangeable, is an entirely different proposition and is intended to bring about a condition which has been striven for by railroad men during the century of locomotive development which has just passed.

While it has been generally agreed that cars may be standardized, it has been frequently pointed out that the differences in operating conditions, such as grades, character of fuel used, and nature of traffic would make a single standard design of locomotive impracticable. This is entirely true and such a thing was not attempted, but it is equally true that a locomotive that is designed to haul a certain train at a pre-determined speed on a 2 per cent grade will perform that service equally well whether the grade be in the Alleghenies or in the Rockies, and while standardizing the design of locomotives does in a measure prevent some of the various designers from giving undue preference to their individual ideas, experience with the standardized designs has indicated that so far we have lost little or nothing of value thereby.

This, and other associations of railroad mechanical men have been built up almost entirely on the principle of standardization. It will be interesting perhaps to those who have not closely followed the work of this association in its early days to refer to the proceedings of a meeting of this association, held at Adrian, Mich., September 19, 1866, under the name of "Car Masters" at which time the following resolution was adopted:

"Whereas, It is very desirable, in view of our extensive interchange of cars of our various compromise lines that we adopt some uniform plan of building for future use, and

"Whereas, It is found impossible to agree as to a uniform truck, some preferring wood, and some iron, therefore

"Resolved, That we recommend to the Red and White Lines, that they, through the Presidents and Superintendents of the different roads, authorize N. H. Marsh, of the Cleveland, Plainville & Ashtabua Railroad, and Joseph Jones of the New York Central Railroad, to each build a sample car of such style as in their judgment they may think best, and after such cars are built, and approved by the Presidents and Superintendents of our connecting lines, we recommend that such cars be our pattern cars, and that all roads running in connection conform in all the details to the pattern cars, thereby saving all our companies expense and delay in running and repairs. We would also recommend that in the building of the different styles that the axles and brasses and other parts that it is possible to make so, be precisely uniform, also that Mr. Marsh and Mr. Jones each furnish to each road, patterns for the use of each road, at the expense of the road that receives them.

"We also would recommend that, in view of the constant increase of the cars in the various lines in connection with us, that the Presidents and Superintendents have this matter acted upon immediately in order to meet the wants of roads now building cars. Adopted."

It will be noted in this resolution that they had the same disagreements relative to the use of wood or metal for the different parts of the car that we have today. It will also be noted that the purpose of standardization, as pointed out in this resolution was to save "All our companies much expense and delay in running and repairs."

It will be noted that "Pattern Cars" were to be built which corresponds largely with the method of the Administration in having sample cars built by each of the builders and inspected before they were allowed to proceed with their regular orders and that patterns for the use of each road was to be furnished

at the expense of the road which receives them, which corresponds in a great measure with the plan followed by the Administration in furnishing drawings of the U. S. Standardized cars and locomotives.

As a matter of fact, however, the real foundation for standard cars was laid long before the date of this meeting in the adoption of a standard gage of track to avoid expense and delay incident to the transfer of lading from one car to another at the terminus of each railroad, because of the difference in gage of track which prevented cars from being sent through to the destination of the shipment.

Although the standardization of gage of track was pretty well established it remained for the emergency created by the Civil War to bring about the practice of sending cars through to the destination of their lading regardless of ownership.

If the practice of standardization needed any justification the illustration provided by the larger railroad systems, such as the New York Central or the Harriman lines, in immediately proceeding to standardize the equipment of their entire line and extending its standards as their lines are extended, either by construction or purchase, would surely be sufficient, and it has always been difficult to explain why parallel lines operating through the same section of the country over approximately the same grades and handling the same kind of traffic should each have their different designs of equipment.

Changes in operating conditions are constantly emphasizing the need for standardization both in locomotives and cars. Freight cars have for many years been interchanged under the rules of the Master Car Builders' Association, and we are all familiar with the delay to equipment and the added expense of making repairs, including the necessity of carrying numberless parts in stock to provide material for repairs to other line cars which is made necessary by the different types of construction which are now in general use.

It is unlikely that locomotives will ever be as freely interchanged as cars, but at the present time locomotives are rendering an increased amount of service on the railroads of other than owning lines, and the indications now are that during the coming fall and winter this will be further increased, therefore the need for standardization of locomotives is becoming almost as great as for freight cars.

On March 1, 1918, 33 railroads were using 522 domestic locomotives belonging to other lines, and in addition 135 locomotives originally constructed for the use of our army in France, popularly known as Pershing locomotives, were in service on railroads under Federal control. Although the Pershing locomotives have long since been converted back to French standards and shipped overseas, there are at the present time 422 other line locomotives on 51 railroads under Federal control and in addition 200 locomotives originally constructed for the Russian Government, which have been modified for use on American railroads.

Another need for standardization of equipment which has been created by the Railroad Administration is the work which has been done in the way of consolidation of terminals and locomotive dispatching and car repair facilities. The consolidation of locomotive dispatching stations alone has effected the elimination of 820 engine houses and engine house organizations; therefore, many locomotives which were formerly cared for in the engine houses operated by the owning lines are now being handled at a joint terminal.

### Nationalization of Railroad Shops

What has been termed the "Nationalization of Railroad Shops" has resulted in 3,493 locomotives receiving repairs in other line shops during the period from January 1, 1918, to June 1, 1919. The handling of these locomotives, both in engine houses and at shops, has necessitated additional material for the particular locomotive, and has frequently caused extended and expensive delays because the material was not in stock at the point where it was needed.

An illustration of this is a case where a Mallet locomotive leased to another line was held out of service for repairs until rental amounting to \$4,800 had accumulated, while waiting for a repair part which cost less than \$30 to manufacture. In another instance, a leased locomotive was held out of service while rental amounting to \$1,680 accumulated while waiting for tires and another while \$1,375 accrued while waiting for a piston and rod. Numerous other illustrations of this kind can be given

which amply justify a greater degree of standardization than has formerly existed.

The illustrations given, of delay and expenditure caused by waiting for parts for repairs, are not intended as a criticism of operating methods but rather as a criticism of any failure to use standard parts where they may reasonably be used.

### Standard Locomotives and Production

Considering standardization from the standpoint of production it is only necessary to refer to what the builders have done with standard designs as compared with individual designs to see how very much production can be increased.

In this connection, it is interesting to note that one of the large locomotive companies were able to produce 163 locomotives of standardized design in a five weeks' period, while they were able to complete but 104 locomotives of individual design during a similar period, and this experience is typical.

The experience of another locomotive builder during a year's trial proved conclusively that they could produce at least 30 per cent more tonnage of standardized locomotives than miscellaneous locomotives of similar weights requiring separate specifications and a separate set of standards and gages.

Standardization means, therefore, tremendous economies not alone to the builder, but to the purchaser, and for this reason if for no other, the efforts of this association to standardize equipment should be encouraged.

In computing the cost of a locomotive it is of course necessary to include the cost of the design and the making of drawings, patterns, dies and formers. Therefore it will be clearly seen that this expense is multiplied by the number of different designs which are built. Because of this, and the reduced work in the drawing room and in the preparation of bills of material, as well as the reduction in other overhead expenses the cost of standardized locomotives is reduced.

### Standards and Maintenance

Standard locomotives and standard cars will reflect superior maintenance and will show a reduction in time at terminals, also a reduction in the time in shop. Parts standard to such equipment can be manufactured in quantity well in advance of the shopping. Men engaged in repairing equipment, because of their familiarity with them, will achieve greater speed than where each vehicle presents new problems in each part.

Striking illustration of this is found in the cases where locomotives were sent to other line shops for repairs, and hundreds of instances have occurred where the time lost by the locomotive due to sending to the owning lines for some minor part or making patterns and manufacturing it has cost more than the entire repair bill.

The Committee on Standardization of locomotives working jointly with representatives of the manufacturers brought about standardization of the dimensions of numerous specialties. These specialties need not be of the same type or purchased from the same manufacturer; in fact they may be of widely different design yet their dimensions were standardized so as to be perfectly interchangeable. This is true of injectors, lubricators, safety valves, power reverse gears and many other highly specialized productions.

The point has been raised that locomotives built to standardized designs will not be uniform with the present standards, therefore, will increase the number of spare parts necessary to be carried in stock. This in some cases will no doubt be true, but as a matter of fact there is no more difference between the locomotives built to standard design, the working parts of which are largely interchangeable with other locomotives, than there is difference between two road classes of locomotives on the same railroad. For instance, there are 66 different items, or 10 per cent, of the total which are standard for all of the 12 standard types of locomotives. There are 110 different items, or 16 per cent of the total which are standard to 9 or more of the 12 standard types of locomotives and there are 165 different items which is 25 per cent of the total number that are standard to 6 or more of the standard types of locomotives.

The importance of this will be more fully realized when we consider the fact that few roads will probably ever require locomotives of all of the 12 standard types. A comparison of the cost of locomotive repairs on various railroads will indicate conclusively that railroads which have developed and which

maintain definite well selected standards are experiencing decreasing maintenance cost.

### 1297 Items Standardized

The work of standardization covered a total of 1297 items, therefore, I shall not attempt to outline all of them but on the locomotives the following are some that will be recognized as facilitating maintenance without in any way decreasing operating efficiency.

All boilers and boiler seams are of the same general design, and in nine classes boilers are of the conical extended wagon top type.

Superheaters of similar arrangement are applied to all, the top header type being used, although the number and length of units varies with the type of locomotive.

Flues and tubes were so worked out that four flue lengths, viz: 15 ft. 0 in., 19 ft. 0 in., 20 ft. 6 in. and 24 ft. 0 in., filled all requirements. All superheater flues are 5½ in. diameter and all fire tubes on road locomotives 2¼ in., and on all switching locomotives 2 in.

The standardization of firebox dimensions permits the interchange of boiler and ash pan details. Without any sacrifice of grate area it has been easily possible to make the firebox lengths the same on five and three classes respectively, and to care for all classes with widths of 66¼ in., 84¼ in. and 96¼ in. Similarly it was found possible to make the grate surface and grate arrangements uniform on three classes with an area of 76.3 sq. ft. each, and two classes with an area of 66.7 sq. ft. each.

Unnumerable details are susceptible to standardization. Thus, the dome caps, safety valve fittings, injector check and pipe support, hand rail posts, longitudinal and radial staying, tube and flue end styles, smoke box and other details are interchangeable on all classes of locomotives. Mud ring corners, staying in throat sheet, superheater damper arrangement and smoke stacks are interchangeable for all road classes.

Cylinders are of similar, general design with only differences in dimensions and proportions imposed by the work to be developed. Fourteen inch piston valves are used on all road classes, except the light Mallet. All steam chest and cylinder glands are of similar design.

The diameter of drivers are worked out to give the best proportions for each type within the limitation of the design. Wheel centers and tires are largely interchangeable and three classes of road engines are each provided with 57 in. and 63 in. diameter driving wheels.

In main journals only four sizes were found necessary, viz: 9 in. by 12 in., 10 in. by 12 in., 11 in. by 13 in. and 12 in. by 13 in., and for driving wheels other than main, 9 in. by 12 in., 10 in. by 13 in. and 11 in. by 13 in. journals only are necessary. In addition, other than main axles on some heavy classes are used for main axles on other classes. The same is true of driving boxes and their parts, crown brasses, cellars, etc.

Trailing trucks are interchangeable on all road locomotives except the heavy Mallet and the tires, wheel centers, axles, journal brasses and details are similarly interchangeable.

All leading truck wheels and axles are interchangeable as are brasses, boxes and cellars.

One crosshead pattern serves eight classes of locomotives and other details, shoes, piston rods, etc., are used on two or more classes.

In the design there was borne in mind the entry of better or improved parts at some future time. To illustrate this I desire to point out that the frames of all locomotives have been slotted so that automatic driving box wedges may be applied in the future without the necessity for any machine work on the frames. Three designs of tenders with water capacity of 8,000, 10,000 and 12,000 gallons respectively, satisfactorily meet the requirements of all classes of service.

On the cars, it was possible to standardize numerous items; for example, three trucks with capacities of 40,000 lb., 50,000 lb., and 70,000 lb., respectively, may be used for a total of seventeen classes of cars, so that three patterns each of bolsters and truck side frames, and three lots each of brake levers and brake connections only are required.

Roofs are interchangeable. The dimensions of draft gear pockets are uniform and couplers, coupler yokes, uncoupling mechanism and many details are interchangeable on all classes of cars.

In the design and construction of the cars built on Administra-

tion order the standards of the M. C. B. Association were found of incalculable help, and they were closely adhered to. For example M. C. B. sizes of lumber were used throughout the cars, and wherever possible other items which the M. C. B. Association has made standard were used.

The winter of 1917 and 1918 exploded the theory that in order to render efficient service locomotives must be specially designed for the road on which they were to be operated. When it was necessary to bring western locomotives east, which was done to the extent of several hundred, it was found that these locomotives rendered excellent service and the only interference was due to the difficulty in getting repair parts and getting employes familiar with their repair and operation, all of which would have been avoided by even a moderate degree of standardization.

Standardization of locomotives and cars will reduce the time at terminals and in shops by reducing delays caused by manufacturing material for repairs, because of not having suitable materials in stock. It will provide locomotives that will be familiar to engineers and repairmen so that no loss of efficiency will result in transferring locomotives from one division or from one railroad to another as traffic conditions require.

It will reduce the quantity and consequently the cost of material necessary to be carried in stock at various terminals in addition to the reduction in delay. The reduction in expenses will be found to be substantial and this is confirmed by the cost figures of those railroads which have to the greatest degree standardized their designs and practices.

In the item of material alone, there would be an estimated saving of 50 per cent in the cost of the spare parts necessary to carry in stock and this saving can still further increased. The cost of carrying \$100 worth of material is not less than \$5 per annum for carrying charges only, but the carrying charges only, but the carrying charges are really only a small part of the total cost. In addition to the cost of carrying material, there must be included the expense due to deterioration and obsolescence. I have been furnished the figures of a well-officered road covering a period of ten years, which shows that these total figures are almost 18 per cent.

It should also be borne in mind that the interest on the investment, as well as the annual charges to depreciation, must be charged to operation, and this figure on an average railroad, assumes important proportions. Thus, an increase of \$5,000 in the cost of a locomotive means an annual charge to interest and depreciation of approximately \$450, or say \$1.25 per day, and this amount accrues irrespective of the service rendered or the productivity of the investment.

Standardization does not mean stagnation. This is evidenced not alone by the railroads which have extensively adopted this principle on their own line, but by companies which manufacture specialties used in railroad work. No one will accuse the air brake companies of having failed to keep abreast of the times, and yet their product is standardized to a very high degree. The same is true of a great many other specialty manufacturers, which, by the establishment of, and a strict adherence to definite, well selected standards, have built up businesses which are more than nation wide.

Surely no one will say that the adoption of standard dimensions for axles, journal boxes and contained parts, complers or safety appliances as referred to in the annual address of the President of this Association has had the effect of reducing the carrying capacity or the types of cars which may be built.

As the need for axles with increased carrying capacity became apparent, the need has been met. The American eight-wheel locomotive gave way to the Atlantic type and the ten-wheel passenger locomotive to the Pacific, and when train weights continued, the natural development was the Mountain, so with standards, as the need for additional ones arise, it can be met, without destroying the principle of standardization.

In this connection it is interesting to note the instructions issued by the Direction General of Railroads, when the original committees on the standardization of locomotives and cars were assembled. The instructions which were issued to the Locomotive Committee were to work up specifications for 12 types of locomotives with particular consideration given to creating standards of parts subject to wear and frequent replacement, so that these may, as far as economy and efficiency would permit, be made standard for as many types as possible, and permit the entry of better and improved parts in the future.

Similar instructions were issued to the committee having in charge the preparation of the designs for freight cars. They were charged that plans and specifications should comprise the most improved and modern designs of cars, not only as to structural strength, but having in mind the important questions of:

(a) Original cost.

(b) Maintenance cost for road service, and to be such as to permit the entry of improved or better designs than those described in the plans and specifications.

They were also instructed to provide for the interchangeability of parts, such as standard truck, applicable to various classes of cars, with the same weight carrying capacity, with a view to reducing the material stocks necessary to be carried at repair points throughout the country.

All of these things have been accomplished. It has been shown that it is possible to build locomotives covering practically the entire range, in weight, size, type and service, using to a very great extent standardized parts and dimensions without the introduction of any designs or parts whose reliability had not been demonstrated by extensive service. As a result, 12 classes of locomotives have been designed and built, with a great many parts standard to all of the classes of locomotives and with details interchangeable not only with locomotives of the same class, but with other classes.

The same thing has been true of the cars. Seventeen different classes of cars, including box, stock, gondola, hopper, refrigerator and tank cars have been designed of varying sizes, capacity and kind of construction, and yet it has been possible to not only build these cars so that three kinds of trucks only were necessary, but also to realize a very high standard of car construction. Where standards are adopted under suitable safeguards, and where those not only engaged in the production, but also those who are responsible for the maintenance and operation, have their wishes considered, superior results may be expected.

The success of a transportation company is not reflected by the number of patterns they own, by the sheets of tracings they possess, nor by the number of types of locomotives and cars on their equipment list, but rather by the service they obtain from their facilities and the promptness with which they are able to move the business offered.

The measures of operation is the use which may be had from a locomotive or car. If, by reason of reduction in time at terminals or time at shop, we can add 1 per cent to the time available for service, we have in effect added one locomotive or car to each 100. An addition of this kind adds nothing to capital, costs nothing for repairs and carries no charges for depreciation.

In carrying out this policy of standardization the Railroad Administration has simply followed not only the policy, but the practices which have long been advocated by this Association, the difference being that the Railroad Administration has a greater measure of authority to make its rules effective and it is a notable fact that most of the objections to the standards established comes from those roads which have shown the greatest disregard of M. C. B. standards.

This Association has originated most of the standards now in general use on American railroads, but has frequently required assistance in making them effective. No better organization exists to continue on behalf of the railroads the work of standardization in the future and if assistance is needed to make the rules of this Association effective it is to be hoped that in the final settlement of the railroad problem such means will be provided.

It would be a serious loss to the railroads of the country if the co-ordination of the work of standardization and the spirit of co-operation in the application of such standards which has been fostered during the period of Federal control should be permitted to decrease in any degree and it will be a distinct loss to the railroads, particularly to the mechanical departments, if in the final arrangement some way is not provided to hold all that we have gained and to continue the work of standardization for the promotion of both safety and efficiency in a co-operative way between the Federal government and the railroads as represented by this Association.

In this huge constructive work some mistakes were made, but the sum total constitutes the greatest step in standardization that has ever been taken by the railroads of America, and the standardization committee is to be congratulated on its work.

Critics may magnify minor but irritating defects, and may

minimize the vast benefits to be derived from a reasonable program of standardization intelligently carried out, but in spite of all this, I venture the prediction that among the many progressive methods initiated or fostered by the United States

Railroad Administration which will be perpetuated and improved upon, none will last longer, be of more benefit, or give more satisfaction to the railroad men of the country than the program of standardization of rolling stock.

## Report of Standards and Recommended Practice (A. R. M. M.)

W. E. Dunham  
Chairman

**A**FTER CONSIDERATION of the present Standards and Recommended Practice of the American Railway Master Mechanics' Association, together with replies received to the Circular of Inquiry, sent to all members, the committee submits the following report:

**SPECIFICATIONS FOR SOLID WROUGHT CARBON STEEL WHEELS (STANDARD, Pages 239-242, Sheet M. M. 24).**

Attention is called to the fact that the specifications for solid wrought carbon steel engine truck wheels in Section II, Paragraph 7-(1), limit the inner hub projection

to  $3\frac{1}{16}$  in. as a maximum from the line AB, thus making the actual projection from the rim face  $1\frac{1}{32}$  in., and that sheet M. M. 24 shows these figures also. Information is submitted which indicates that by far the larger proportion of the railroads specify this projection as  $1\frac{1}{16}$  in. and greater, while

some few railroads specify it smaller. It is suggested that the wording of this paragraph be changed to read "shall not be less than  $3\frac{1}{16}$  in." instead of "shall not exceed  $3\frac{1}{16}$  in." The committee concurs in the suggestion.

**PIPE UNIONS (STANDARD, Pages 332, Sheet M. M. 19).**

The standardization of pipe unions, both flat and ball joint types, as concerns the contour and interchangeability of parts, which was a matter of special investigation with the A. S. M. E. and M. C. B. Associations, in accord with the action of the 1916 convention, and which was dormant during the war period, has again been taken up with those associations. Progress only, at this time, is reported.

The report is signed by W. E. Dunham (Chairman), Chicago & North Western; M. H. Haig, Atchison, Topeka & Santa Fe; A. G. Trumbull, Erie; A. R. Ayres, New York, Chicago & St. Louis; G. S. Goodwin, Chicago, Rock Island & Pacific; R. L. Ettenger, Southern, and B. B. Milner, New York Central.

### Discussion

Mr. Dunham: I move that the first item, "Specifications for Solid Wrought Carbon Steel Wheels" be referred to letter ballot for a change in the standard.

Mr. Gaines: I second the motion.  
The motion was carried.

## Report of Committee on Mechanical Stokers

**T**HE COMMITTEE ON MECHANICAL STOKERS has been reporting to this association since the convention of 1913. It has now become extremely difficult to compile any additional data that might be received with interest and appreciation by the members of the association. During the last two years, the railroads have done very little research or experimental work. Consequently, there has been practically no information established relative to the performance of locomotive stokers in service such as is obtained from specially conducted tests.

This two-year's war period, from a manufacturer's standpoint, however, has been extremely active, and there have been a large number of stokers applied. Inquiry was made of the different stoker manufacturers as to the number of stokers they had actually applied which were in service as of January 1, 1919. The following table indicates the number of different representative stokers then in service and the type of engines to which they have been applied:

Kind of Stoker	Mallet	Mikado	Santa Fe	Centipede	12-Wheel	Decapod	Consolidation	Mt. Type and Mohawk	Pacific	Total
Street	424	638	380	4	14	22	1	37		1,522
Duplex	240	804	195			53	1	1		1,294
Standard	120	338	36		33		21	162	21	731
Hanna	70	6	73		16			4		169
Elvin			1							1
<b>Total</b>	<b>854</b>	<b>1,786</b>	<b>685</b>	<b>4</b>	<b>63</b>	<b>53</b>	<b>44</b>	<b>170</b>	<b>58</b>	<b>3,717</b>

There was a total of 3,717 stokers of the above types in service January 1, 1919. The stoker report of 1917 shows a total of 1,611 stokers (exclusive of Crawford) in service as of April 1, 1917. There have been placed in service 2,106 stokers between April 1, 1917, and January 1, 1919, which indicates the rapid rate at which locomotive stokers are being applied. The types of locomotives to which the stokers are largely being applied are the Mallet, Mikado and Santa Fe, which represent the locomotives of large capacity. The question as to the size of locomotives upon which stoker installations are justifiable is one that is frequently referred to and is yet unsettled. It is the opinion

of the committee that the conditions surrounding individual conditions are so variable that no fixed rule can be recommended for guidance in this connection.

Suggestions have been made involving certain limits in the weight and tractive effort of locomotives, the character of fuel used and the rate at which it must be fired. Limitations on the basis of weight and tractive effort of locomotives may be feasible where the locomotives operate under uniformly heavy conditions, but even then there are certain local and physical conditions to be considered that prevent any general recommendation being laid down even on such a basis as this. Locomotives operating in districts where the demand for maximum power is intermittent and for short duration could not be considered on the same basis as locomotives of the same weight and capacity operating where the maximum power is demanded for extended periods. The character of fuel available for firing may also be considered one of the controlling factors in consideration of the application of locomotive stokers to comparatively small engines. In view of these governing factors, the committee does not feel justified in attempting to suggest a ruling which might be followed in the consideration of this phase of the subject, as it is believed that this question will have to be settled based upon the surrounding conditions under which the locomotive is required to operate.

There were some questions of general interest in connection with stoker operations concerning which it was thought well to secure an expression from the roads using mechanical stokers. These questions were sent out to such roads and replies to this inquiry have been received from thirty-two roads; these thirty-two roads represent a total of 1,777 of the stokers now in service. Inquiry was made relative to the kind and character of fuel used, and it is noticed that on all of the roads bituminous fuel is used; the fuel reported varies in heat units from 9,212 B.t.u. to 14,520 B.t.u.

In answer to the inquiry as to whether the same size exhaust nozzles are used on stoker-fired locomotives as employed on hand-fired locomotives, it seems that the general practice is to use the same size exhaust nozzle, although a few roads vary from this general practice. Three roads report smaller nozzles on the stoker-fired locomotives, ranging from  $\frac{1}{8}$  in. to  $\frac{1}{4}$  in.

smaller in diameter. Two roads report that they are using nozzles from  $\frac{1}{8}$  in. to  $\frac{1}{4}$  in. larger in diameter than are employed on their hand-fired locomotives.

The consensus of opinion is that the stoker-fired locomotives burn more fuel than the hand-fired. Where percentages of difference have been expressed they range from 10 to 41 per cent in favor of hand-firing. This difference, however, is expressed in terms of coal as fired and does not recognize the advantages that have been gained by improvement in the performance of the locomotive resulting in uniform steam pressure and more active and uniform performance over the division. These increases in fuel consumption may, in some instances, be considered as the price of firing locomotives of capacity beyond the range of successful hand-firing.

In referring to the continuous performance of stokers over a division, the record indicates that in the majority of cases the stokers are doing about 100 per cent of the firing of the locomotive.

The failures occurring on the stoker equipment are the same old offenders and are classified as "failure of stoker parts," "foreign matter in fuel" and "wet coal." The record tabulated from the information received as to the percentage of failures that may be classified under these three headings is quite interesting in the variety it presented. On some roads the highest percentage of failures is due to broken stoker parts; on others, foreign matter in the fuel seems to be the chief offender, while on others the question of wet coal is apparently causing the most concern and delays to stoker-fired locomotives.

An effort was made to obtain information relative to the cost of stoker maintenance upon a thousand-mile basis. Very few roads keep such a record, and those that have reported on this item, when grouped together, show a very wide range of costs. One road with 92 stokers in service reports a cost of \$1.77 per thousand miles, while another road with 54 stokers in service shows a cost of \$40.00 per thousand miles. These are the maximum and minimum cost figures presented and indicate the extent of the variation in cost, and if closely analyzed it would no doubt be found that local conditions were possibly largely responsible for the variation.

In the circular of inquiry sent to the users of mechanical stokers, suggestions relating to features of mechanical stokers to which attention should be directed by the manufacturers were solicited, and it might be well to incorporate some of these suggestions in this record. A simpler and more accessible lubricating system has been suggested by several roads. Provision for the better handling of wet coal comes as a suggestion from roads that are experiencing trouble in this respect. Recommendations for more accessible conveyor screws are presented, which might be considered in conjunction with one road which suggests that the stoker be constructed so that it will be less susceptible to failure when foreign material gets into the stoker mechanism with the coal. Provision for overcoming the loss of fuel from the conveyor system may well be considered by the manufacturers as this feature has been suggested as a stoker deficiency. Improvement in the arrangement for the positive adjustments of conveyor adjusting plates is recommended, and it has also been suggested that consideration be given to the design of a system of conveyance of the fuel from the tender to the fire box that will provide against pulverizing the fuel in conveyance. Better protection from dust for the bearings and gears of the stokers is referred to as desirable.

In the report of 1917, additional reference was made to the Elvin stoker then undergoing development on the Erie. This stoker has passed through its experimental stage and it is understood that it is now in condition to be presented as a commercial proposition. The committee has learned that the Elvin stoker now in operation on the Erie is giving very satisfactory service, and that it embodies several individual features which may mean greater economy in mechanical firing. The opinion has been expressed by disinterested parties who have come in contact with this type of stoker and have seen it in operation that, while it may not have reached its final stage of development, there are, nevertheless, marked possibilities in a stoker of this type.

The committee wishes to recognize the unceasing efforts and activity of the stoker manufacturers in the development of their respective devices, and is of the opinion that with continued effort in the light of service experience, a more perfect stoker

may be developed in which objectionable features, such as those outlined in this report, will have been eliminated.

The report is signed by A. Kearney (Chairman), Norfolk & Western; M. A. Kinney, Hocking Valley; J. R. Gould, Chesapeake & Ohio; J. T. Carroll, Baltimore & Ohio; J. W. Cyr, Chicago, Burlington & Quincy; A. J. Fries, New York Central, and L. B. Jones, Pennsylvania.

## Discussion

Mr. Gaines: When we were working out the administration engines, we heard a great deal of discussion on the stoker, and the thing that struck me most forcibly in that discussion was the question of its lack of economy over hand firing. The discussion seemed to hinge on the point that the stoker, while necessary on heavy power to get the maximum results, was not as economical as hand firing. I have seen the exhibit that is here this year of a stoker that approximates hand firing in principle, and I think it is a very valuable principle and new. Should we have a coal crusher on our engines and carry that unnecessary weight around, or should some method be procured for curing the fuel before we put it on the tank? Carrying this crusher around on our engines is an unnecessary burden, and I think we should go into the feature of purchasing the fuel before it is put on the tank.

Mr. Dunham: The preparation of the coal has always been a very serious detail in the successful operation of mechanical stokers. I believe that the committee can do no better in the coming year than to gather information concerning the cost of preparing coal off the engine as compared to the cost of preparing it on the engine, taking into account the necessary equipment both off and on the engine, and the results obtained in the fire. *I, therefore, move that that be considered very seriously, and if necessary, referred to the general committee for action.*

Mr. McBain: I second the motion.

J. A. Pilcher: In the preparation of coal on my road, which has a large number of stoker engines, they provided, in their new types of coaling plants, a method by which the coal is separated as it passes into the storage bin. It goes over the screen in such a manner that coal suitable for the stokers is stored in one part of the plant, and that suitable for hand firing in another, with the further arrangement that in case there is an over supply of the lump coal for hand firing, that can be passed back through the crusher and into the bins for the stoker firing. That seems to be a very simple solution, although it makes quite an elaborate plant. It would appear to be the best method to have one breaker at the terminal instead of a large number on the tenders.

H. T. Bentley (C. & N. W.): We have just been considering a rather heavy locomotive to be fired with either oil or lignite, and I had a meeting with the locomotive builders yesterday to see how they could handle this particular type of engine. No one seemed to have had any experience with burning lignite coal with a stoker. Are there any members who have successfully burned lignite coal such as Wyoming lignite, and, if so, what kind of stoker was used for that purpose? It is a very serious situation with us. We have large fields of lignite in sight and we would like to get some kind of stoker that would handle it as satisfactory as it does the bituminous coal.

Mr. Fuller: We are handling Wyoming lignite or semi-lignite coal with a stoker; the fuel is prepared for and put on the tender, and with another class we have the crusher on the engine. We have two grades of lignite coal or semi-lignite. The Hanna coal is best, not crushed too fine but about the size of a walnut. It does deteriorate and it does interfere with the stoker operation, in wet weather, when very fine coal becomes thoroughly saturated with water, but I don't think, Mr. Bentley, you will have any trouble either with the Street or Duplex stokers. I presume other stokers are just as good for burning a semi-lignite coal or any Wyoming coal if the stoker is properly handled. We have been very successful with both makes of stokers. We have had some trouble at the start with the Hanna. It was felt that Hanna coal could not properly be prepared at the mine, but we prepare all our coal at the mines with the exception of that for engines that are equipped with a crusher.

Mr. Chambers: I note one item in this report speaking of percentage, increased percentage of consumption of coal with stoker as compared with hand firing. That was no surprise. A new device never starts out with its best effort. There is

much to be learned in the manipulation of a stoker, and the easy part of the job would incline a fireman to waste coal. While I have never had any direct supervision of a stoker engine in operation, I think that a man who would practically starve his fire at all times would have you a lot of coal, because you are taking no chance whatever if you get a little behind. It is very easy to increase the operation and your fire is covered all over at one time. It is not like the hand firing which might develop holes and make your engine go back materially in steam. I am not in favor of the system of automatically sifting your coal out as it goes into the bins. To get proper results you have got to prepare the coal either at one bin or in as many bins as necessary for the system and deliver it to the engines and to the bins in a prepared state.

Mr. Gaines: I think that the committee ought to develop whether or not it is feasible to have the coal producers run the coal over a screen and give you such portion of the screenings as you need for firing. I think that is going to be one answer. If the committee will take it up with the producers, they will find in many parts of this country that the producers would be very glad indeed to take out the lump that is too big to go into the stoker and prepare the fuel without any cost whatever.

Mr. Barnum (B. & O.): To derive any benefit of the figures on increased cost for fuel we should have, to go with that, the increase in the work done. One of the principal advantages realized by the roads using stokers is the increased tonnage hauled by the steam locomotive as compared with the tonnage that can be hauled by that locomotive when hand fired. One of the most important things for this committee during the next year is to give us something definite in the way of increased work performed with the stoker as compared with the hand-fired engine.

Mr. Fuller: There is no doubt but that a large percentage of the locomotives that were equipped with crushers were equipped because of the inability to use these engines in any territory on their railroad due to lack of having crushers at their coaling stations and their inability to get the coal crushed at the mines. After the crusher becomes a universal equipment there is no doubt but what the engines can run without a crusher on them. Mr. Gaines spoke about having the mines prepare the coal. We have our own mines and we prepare our own coal. Some years ago slack was a drug on the market and they threw it away, but when we got stokers there was more demand for slack than anything else. If you depend on the mines to crush your coal, those of us who have to store coal would want to store crushed coal. The loss in deterioration would be so great that I don't believe you would want to do it; and if you did store lump coal and did not have a crusher you could not crush your coal. I believe from our experience that we have to put crushers in our coaling stations and crush coal when we want. If you don't have a crusher on the engine, then you will be up against it.

Mr. Gaines: Perhaps I did not make clear the preparation of fuel. At the mines in Alabama they are very glad to screen the coal, run it over a three-inch mesh screen and give you the screenings and take the lumps out, and when that has been done it is all ready for the stokers. The next thing to be considered is storing the screened coal. It is surprising how little that deteriorates. I have had experience for four or five years with storing the nut coal to take us through the winter season. About Christmas time it is almost impossible to get fuel for your locomotives unless you store it in the summer, the demand for domestic fuel is so great and the depreciation is certainly very, very small. I would say that it is less than 5 per cent from tests we have made.

W. J. Bohan (N. P.): The question of whether we should store coal in prepared form for delivery to the locomotive or whether we should load reasonably prepared coal on the engine and there crush it for the firebox is one that should be approached with extreme care. The subject is very apt to be looked at from the viewpoint of local conditions instead of looking at it as a machine that would have to be used to take care of coal over a very wide area. We are approaching a period when lignite coal will necessarily be used on locomotives and we should creep before we walk. We are too prone to take broad jumps without making preparation. We can't afford at present to equip the coaling stations necessary. We have lots of territory west of the Mississippi river where a highly developed coaling station would be a failure. We lose sight of the fact that there are thousands of miles of outlying territory and very few miles

of the territory where the operation is intense, and where, perhaps, specially prepared coal would solve the problem. All we need at the coaling station is a clean, dry coal. We have to burn the coal, both lump and slack and poor and good, and the thing we should do at the present time is to develop the stoker that we have started out with to its highest possibilities, before attempting to install highly developed and expensively operated coaling stations.

Mr. Kinney (Hocking Valley): This committee does not desire to convey the impression that the stoker is not an economical machine on the locomotive. We have attempted to make it plain that in all cases where the stoker is applied it is where the range of successful hand firing has passed and you are applying the stoker for the benefits that will come from it, and these benefits are derived in other directions. We would very much decry any thought that this meeting would have, or individuals here that are considering or are operating stokers, that the stoker is not an economical proposition. As to the preparation of fuel. The stokers come on your line perhaps one one or two engines. You are not prepared to put in an expensive plant. These devices and methods that have been placed in use on the locomotives are in their infancy, and possibly, as time will tell, a makeshift in the development of the stoker. This committee will be very glad to have the co-operation of all users of stokers.

F. P. Roesch: In regard to the preparation of coal for the use of stokers, you will recall, the original stoker that was put out used prepared coal, and there are more of this type of stoker in use at the present time than of any other type. We met with considerable difficulty, due to the fact that all locomotives on all railroads using this stoker were not equipped with the stoker. The result was that it was necessary to carry two kinds of coal, having a two-compartment shute. The coal for the Street stoker is prepared at the mines, either by means of crushing or screening. I have known of instances of railroads equipped with this type of stoker where the coal is prepared at the mines and a mistake was made in the billing of the coal, the result being that the division using the hand fired locomotives received the prepared stoker coal and the divisions having the stoker fired engines had the lump coal. You may say that such a mistake as that is inexcusable, but such mistakes do occur. We know that this fine screened coal is not the best coal for hand firing. We also know from tests made at the University of Illinois and on various railroads that lump coal, screened lump coal, is not the best coal for firing. We will get the better results through the use of a mine-run coal, in view of the fact that it is not probable that any railroad will be operated with all stoker fired engines; it would be well to give the matter of taking the crusher off the engines very serious considerations before any recommendations are made in that direction. It costs a little more to crush coal; there is a great loss of crushed coal in transit, there is a great loss at the chutes, and it will not store due to the fact that it is more liable to spontaneous combustion.

I do not know whether the Alabama coal that Mr. Gaines speaks of fires in that way. All of these things must be taken into consideration before we make any recommendation toward the elimination of the crusher on the engine.

In the handling of lignite, the quality of the coal makes absolutely no difference; it is simply a question of capacity, and the stoker as now developed is of a sufficient capacity to successfully fire the largest locomotives that we have.

So far as the economy of the stoker is concerned, when compared with hand firing, if we take into consideration the fact that the stoker in itself has never burned a pound of coal, we can see that the lack of economy is not due to the stoker as a machine, but to the man who is operating it. If we educate the man to handle the stoker in the way we have educated them to handle the scoop, we will get exactly the same results, or possibly better results, from the stoker in pounds of coal per thousand gross ton miles that we get from the scoop.

Mr. William Schlafge (Erie): We have, on the Erie, approximately about one hundred and fifty stoker-equipped locomotives. It would be expecting rather too much if you did not have trouble with the stokers as they are not entirely out of the experimental stage. We usually experience trouble with any new device that is put on a locomotive. We have had troubles with air pumps and the injectors and without an exception you will have trouble where a new device is put on a locomotive. Such troubles the designer cannot foresee and service conditions

only can produce them. The stoker makers have worked out an efficient stoker, so far as the delivery of the coal to the firebox is concerned. They, undoubtedly, will work out the problem of an economical stoker and in my opinion it will be just as economical as intelligent hand firing.

We have our coal prepared at the mines. We did have some trouble, but that was due to the conditions of the period that we went through. We can now get our coal prepared in any way we may specify. While there is no data, I am very much of the opinion that there is no economy in making a coal breaker of every locomotive equipped with a stoker.

The committee recommended that in breakdowns there should be a weak link provided somewhere in a convenient location and I think this is a good recommendation. Our troubles today are the breakdowns mostly due to foreign matter getting in the machinery. We have one engine equipped with the Elvin stoker, which is very satisfactory. When foreign matter gets into the machinery the engine stops, but it is only a small matter to remove the obstruction and start the engine.

We ran a test sometime ago, as I remember it about two years ago, on the Kent division, and later on ran a test on the Meadville division. We are conducting further tests now. I believe we will be in a position to give the committee some valuable information for its next report.

Mr. Gaines: I believe that a scheme can be worked out at large coaling plants whereby you could screen the coal as it goes over the chutes into the tenders, taking the lump coal out for hand firing the engines, and using the slack for the stoker. The committee should look into that, and see if something of that kind could not be worked out at the coaling plants to properly prepare the coal for the stoker and also the lump coal for hand firing.

Chairman: The motion before the house is that the report be received and the committee continue with special instructions to investigate the preparation of coal.

*(The motion was put to vote and duly carried.)*

## Automatic Coal Weighing Devices

Mr. Barnum: I made some inquiries about the automatic coal-weighing devices for locomotive tenders and started with the locomotive builders, but was unable to find that any of the principal locomotive builders had built any tenders with any coal-weighing devices. The only record that I was able to find of such devices being tested was a case on the D. L. & W.

H. C. Manchester (D. L. & W.): We did test out for about a year a coal-weighing device which was invented by L. A. Watres, the same gentleman that invented, the National graphite lubricator. It consisted of a separate coal container, built so as to fit inside of the coal space in the tank. It was set on a scale arranged underneath the coal container, and supported by the tank frame; a gage which was located upon the left leg of the tank in view of the engineer and fireman, showed in actual pounds, how many pounds of coal were in the container at all times. The experiment was very much handicapped at first in getting the proper gage, but after a time that was quite satisfactorily taken care of. There was some difficulty with the dust and particles of coal getting around the device and the mechanism of the device underneath, and we were never able to quite satisfactorily solve that difficulty so as to get satisfactory results from the apparatus. Therefore, we abandoned the test after a number of months, and have done nothing further with it. That is about all I can say, and that is about as far as we have gone with it.

## Snow Fighting Equipment

C. E. Fuller (U. P.): I really know very little about snow fighting equipment. Of course, we have to fight snow in our line. Our experience is that it requires different kinds of plows to some extent to successfully fight snow. The trouble with the rotary plows is that there have been too many people who have attempted to buck snow with the rotary plow, which you cannot do. If you endeavor to do it, the rotary plow will soon be put out of commission, because it will not handle snow in a snow bank, unless you have sufficient power behind it to keep the plow fed up with the snow. The capacity of the plow is controlled by the wheel.

In the winter 1916-17—I think it was in that year—we fought snow for about five months constantly over the Rocky Mountains, and it was a fight day and night. The snow would blow from the up mountain and collect on our tracks just as fast as we could take it out. We got up a plow built new from the ground up. It is a bucking plow, a plow that it is necessary to get a speed up of twenty-five or thirty miles an hour, with three or four engines, depending upon their size, to shove it through the drifts. After we had worked with the rotaries and fought the battle until pretty nearly everybody was down and out, the home manufactured plow was put into commission and kept the road open the balance of the winter. The plow was christened the Fuller plow, I don't know why, but we built the plow and we had a great many of them. Our transportation people can't speak high enough of them, after they learned that they would stay on the track, and there wasn't any danger in operating them. They are scattered all over our railroad now. There is just one feature of this plow that has made it a success, and that is the nose of the plow. It digs down in place of digging up. Most of the plows, the push plows, will mount the rail in hard snow or other conditions. The greater the load, the more this plow hangs to the rail.

Mr. Bentley: Dan Cunningham, of the Denver & Rio Grande, suggested to me that a paper on snow-fighting apparatus would be entirely proper, and I think it is a very good subject, if the Committee on Subjects will permit of that being given consideration. I think there are a number of us who would like to get some information about snow fighting. We are fighting all the time during the winter months and sometimes we have derailments that are caused, the superintendents say, by the type of plow we use and the type of car we use behind the plow. It is a real live subject, for the Northern roads particularly, and I move you, that we have a paper on snow-fighting apparatus.

Mr. Fuller: Last April, I believe it was April, we had a tremendous storm in Kansas, wet snow and very heavy. We had one of these plows going over a part of the Kansas division. Telegraph poles were all on the track, wires and everything else, and there was a passenger train stalled on the main line. They opened the switches at each end so that if anything was coming which they did not know about, they would be protected. The snow plow came along. It saw nothing, it found the telegraph poles, and finally it landed into a box car and cut it to pieces and went through another one; while it damaged the plow, nobody was hurt and the plow was not off the track. We have only had one derailment of this snow plow, and that was on a branch line due to the ball of the rail being broken for about two feet; the plow went off the track and did a lot of damage, with two engines behind it. Two men were killed and two were injured. But it is our opinion that if the rail had been sound the plow would have gone through this drift as it had been going for several days under the same conditions, without any trouble.

Dan Cunningham: One of the reasons that I suggested this subject is that the snow-fighting equipment receives so little attention that it is something like the Arkansas Traveler—"When it is raining we can't fix the roof, and when it isn't raining we don't need it." Recently I was connected with a road that had to fight snow for eight or nine months a year. It was in an elevation of about 11,600 feet and had 28 miles of 4 per cent grade, so we really know what the snow game is. Some snow is better handled with flangers of different kinds, and others with the appliance that Mr. Fuller has just mentioned, and others with the rotaries. The rotary game is somewhat complicated, because there are so many things about a rotary plow that will give out.

Mr. Gaines: Mr. Chairman, I am going to suggest that the Secretary get in touch with Mr. Fuller and procure the drawings of his plow that he has described this morning and attach them as part of the minutes of this meeting.

Mr. Fuller: This plow is not patented. It is one of our own design and everybody is welcome to it.

Mr. Barnum: I second Mr. Bentley's motion,  
*(The motion on being put to vote was carried.)*

The Chairman: There seems to be another motion before us—the incorporation of the drawings of the Union Pacific plow with this report, if that motion has a second.

Mr. Bentley: I second that motion.  
*(The motion was put to vote and carried.)*

# A Remarkable Exhibit of Railway Artillery

Conventionites Accorded a Rare Privilege Through Courtesy  
of the Government and the Manufacturers.

THERE ARE TWO EXHIBITS of railway artillery at the conventions this year. One of these, The American Car & Foundry exhibit, which is made possible through the courtesy of the Ordnance Department of the United States Army, was described and illustrated in the *Daily Railway Age* of June 23d, page 1685. The other one, that of the Baldwin Locomotive Works, which consists of a 7-in. caterpillar gun mount and a 14-in. railway gun mount, built for the United States Navy, was described in the *Daily Railway Age* of June 19th, page 1494. The first of the 14-in. naval guns that were placed on railway mounts which were built by the Baldwin Locomotive Works, are familiar to the readers of the *Railway Age*, descriptions having been published in the *Railway Age* of November 1, 1918, page 767; November 15, 1918, page 875; and November 29, 1918, page 967.

In connection with the American Car & Foundry Company's War Activities Exhibits and through the courtesy of the Ordnance Department of the United States Army, Major E. D. Campbell, Railway and Sea-coast Section, Artillery Division, Ordnance Department, United States Army, gave an illustrated lecture last evening on "Railway Artillery." The *Railway Age* owes an apology to Major Campbell for having announced in an earlier issue that he was connected with the Navy Department. Extracts from Major Campbell's address follow:

## Major Campbell's Address

The popular idea of railway artillery is that it is a development of the recent war. As a matter of fact, it is almost as old as the railroads. It is important to remember that, so far as we can find any record, it had its beginning as early as the Civil War and was used by both the Confederate and Union forces at that time. Thus, railway artillery is doubtless an American invention. The development since the beginning of the world war has been so rapid as to make previous efforts seem of small consequence.

During the campaign against Richmond the Union forces used a piece of artillery which created great havoc among the Confederate gunners. This was a 13-in. mortar weighing 17,000 lb., mounted on a reinforced flat car having eight wheels. During the period from 1863 to 1912, while the idea of mounting guns on trucks had not been discarded, only crude railway mounts of an experimental nature were produced. France and Germany, according to record, appear to be the only countries actually working with railway artillery during these years. In 1912 the Schneider Company, a French manufacturer, produced a 200 mm. 8 in. howitzer railway mount, which was quite a step forward in the design of railway artillery. This mount possessed some of the features which were used in the design of railway artillery during the late war.

America manufactured some railway mounts during the year 1912 for use in the Panama Canal Zone. The cannon mounted on the cars were small, being 4.7 in. howitzers. During this period the main idea for the development of railway artillery in the minds of the designers was its obvious use for coast defense work. However, during the present war, the use of this artillery has been confined to field operations entirely, necessity of its use for coast defense not having developed.

## DESIGN PROBLEMS

*Transportation Problems.*—Transportation of railway mounts involves a problem of design that requires the closest consideration of weight, clearances, and the type of track used. You will appreciate that in handling mounts weighing 600,000 lb. and upward, a system of trucks must be utilized that combines perfect equalization and flexibility. Trucks have been designed which have 4, 6, 8, 10 and 12 wheels each. Conditions of road beds in France have limited all axle loads to 17 metric tons each, and this limitation has been followed in the design of equipment intended for foreign service. Trucks to meet these requirements have units, with short wheel-base, connected by span bolsters.

Railway clearances present limitations to the design of all heavy railway artillery that are ever present to handicap the engineer. It is absolutely necessary to give careful consideration to this point in order to transport your mount over any line that an emergency calls for. To keep within this clearance, it is necessary to swing the larger guns out of balance in order to keep the trunnions sufficiently low and at the same time get proper elevation of the gun. In fact, on some mounts where this is not done, an excavation between the rails is required in order to take care of the recoil of the gun at high elevations. These conditions impose extra work and complications which, you will appreciate, enter into the production of railway mounts, but which, none the less, must be met and overcome.

The Ordnance Department has made an extensive study of railway clearances covering both European and American railroads. A map has also been prepared of the coastal lines, the main transcontinental lines and a few central, north and south lines.

Regardless of the care and patience exercised by the Ordnance Department, in designing railway mounts, that could safely be transported over American and French railroads, most of the roads seem to have the opinion that these features have been entirely overlooked in the design. Some peculiar incidents have occurred in the shipment of railway artillery, as, for instance, one prominent Eastern railroad held up a railway mount on its way to the Coast with the information that it would not meet their clearances. Yet two other mounts of exactly the same type had been shipped over the same road without a murmur.

*Carriage Problems.*—In designing a railway gun carriage one of the big problems involved is to transmit the force due to firing to the earth with the least number and complication of parts. Many different methods of accomplishing this result have been developed, of which the American railway mounts, to be described, are typical examples.

The main features entering into a railway mount design are the recoil system, traversing mechanism, elevating mechanism, and the means of securing stability when firing. These four elements are common to both field and railway artillery, but certain limitations are imposed in railway mounts which bother the designer. The type of railway carriage to be designed fixes, to a large extent, the four features just mentioned. Likewise the converse is true, namely, that these features govern the type of carriage to be designed. Many other elements enter into the design, but once the above are fixed, a

definite type of carriage necessarily follows this decision. Consequently, in designing railway artillery, as is the case of any high-class machinery design, definite uses or special work to which the railway artillery unit is to be used must be given first consideration.

#### AMERICAN TYPES

The two desirable features in the design of railway artillery, namely, that of having an artillery piece which can be quickly emplaced in a battery and that of having a piece so designed as to permit the gun to elevate to any angle up to 42 degrees and to be traversed around the entire azimuth, have been met with in the 8-in. mount in a highly satisfactory and efficient manner. This mount is the only one of its kind in existence, and perhaps represents the highest type of railway artillery. When in firing position this railway mount is supported by a firing platform consisting of four 8-in. H beams, on top of which are placed six cross-ties. The H beams are simply laid on the railroad ties with no spiking, neither do the oak cross-ties require any fastening to the H beams. This emplacement can be laid in position in 15 minutes by a common crew and of course can be removed in less time. When firing at right angles to the track, the side outriggers of the mount are used. When firing railway mounts the trucks are relieved from the shock of recoil.

The gun carriage, known as the 8-inch Barbette Carriage Model of 1918, is mounted on a base ring which is bolted to the car underframe. Traverse is secured by means of a racer which rolls on a roller path formed by machining the top surface of the base ring. The rollers, of which there are 24, are forged steel, 4 inches in diameter, spaced equi-distant by means of a distance ring. Motion is imparted to the carriage by means of a hand wheel which moves a pinion whose teeth mesh into a circular rack secured to the base ring. A system of gears transmit the hand power at the wheel so that one man is able to traverse the carriage with ease. The gun can be elevated from zero degree to 42 degrees by means of an elevating rack secured to the cradle and turned by worm which is rotated by means of gears and hand wheel.

The car part of this railway mount consists of a structural steel drop type of under frame supported by two 4-wheel 70-ton trucks of the Pennsylvania standard 70-ton type. The underframe of the car is a daring departure from accepted car practice in that the center portion drops abruptly. It is recognized that this weakens the car in its resistance to buffing shocks, but in railway artillery this does not present a serious disadvantage. The car is 40 feet 6 inches between end sills, which are 15-inch channels. Both the center and side sills are the box girder type of construction continuous between end sills. Each has top and bottom cover plates and a 1/2-inch plate covers the entire under frame. Seven cross-ties are interposed between the body bolsters. The body bolsters are of single web construction, having top and bottom cover plates. The underframe is of structural steel construction throughout except the special transoms which take the side outriggers and special transoms for the jacking mechanism.

As an auxiliary feature it is possible to transport this car on 60 cm. gage track by means of special narrow gage trucks, which take the place of the four-wheel standard gauge trucks. It is necessary, however, to remove the gun from the cradle in order to bring the center of gravity sufficiently low to prevent overturning. This railway mount weighs approximately 180,000 lb., which load is carried on two 4-wheel standard gage trucks or four 6-wheel narrow gage trucks. The gun

used in this mount is known as the 8-inch Seacoast Gun Model 1888, considerable numbers of which were withdrawn from the seacoast fortifications for use as railway artillery. It has a maximum elevation of 42 deg., with a corresponding range of 21,000 yards. For field use it fires a 200-lb. projectile with 65 lb. of powder.

#### 7-Inch Gun Railway Mounts

Some 7-inch 45-caliber guns were secured from the navy and mounted on the same type of car for operation along our coast as protection against submarine attacks. This car embodies the same outrigger and float idea for securing stability, but is somewhat different in the underframe construction, the main difference being the installation of hydraulic jacks in place of the screw jacks used on the 8-inch railway mount. This mount does not use any emplacement or firing platform, but is simply lowered so that the cross ties rest on the rails. It weighs 171,000 lb. The trucks are 4-wheel Pennsylvania standard, two of which weigh 21,000 lb. The gun is 45 calibers in length, the range is 17,000 yards, with 15 deg. elevation. The projectile weighs 165 lb., using a powder charge of 58 lb.

#### 12-Inch Mortar Railway Mount

This same type of car is also used for mounting 12-inch mortars except that six-wheel standard trucks are used in place of the 4-wheel standard 70-ton trucks. The carriage for the 12-inch mortar has all the advantages of the 8-inch barbette carriages, but is substantially different in design. This difference is in the recoil system, which utilizes a hydraulic cylinder using piston buffer for recoil with an air pressure arrangement for counter recoil. The air is compressed by the recoil of the piece, thus utilizing a portion of the energy of recoil. Six-wheel trucks are used under the 12-inch mortar railway mount in place of 4-wheel standard gage trucks. These 6-wheel trucks are unique in their design since the wheel base and center plate heights are the same as the 4-wheel trucks. As a matter of fact the 6-wheel trucks can be interchanged with the 4-wheel trucks.

#### 14-Inch, Model E, Railway Mount

During the year 1915 a design was started for a railway mount of sufficient capacity to mount the 14-inch Army gun, which would have all around fire, and which could be adapted for seacoast defense. For seacoast work all guns must have at least 180 deg. traverse, and must be easily operated, since the objective is always a moving target. This mount was designed for seacoast work primarily and requires a special emplacement, consisting of a base ring carried on a flat car accompanying the mount. This base ring is inserted in the track and is provided with a roller path on its top surface on which the gun carriage is traversed after the trucks are withdrawn. The method of maneuvering this mount is to first emplace the base ring on any part of the track desired, then running the mount over this emplacement. When it is in the exact position the entire car body is jacked and the trucks withdrawn. It is then lowered in position on the base ring, the rear end resting on an annular support. The trucks used under this mount are of 8 wheels whose diameter is 31 in. The journals are M. C. B. 6 inches by 11 inches. The trucks are the rigid side frame type, with cast steel bolster and transoms. The weight of this mount is 436,700 lb. The two trucks weigh 56,000 lb.

The gun is a 14-inch Army gun, 40 calibers in length. It has a range of 32,000 yards at 30 deg. elevation. The projectile weighs 1200 lb. and utilizes a powder charge of 360 lb.

The railway artillery which I have just described is on exhibition during this week. The mounts are so designed that they can be used either in the field or for seacoast work.

### American 12-Inch Sliding Railway Mount

The American 12-inch sliding railway mount weighs 600,000 lb., mounting a 12-inch 50-caliber gun. It is similar to the French A'Glissement or sliding type, in that it has no recoil mechanism or traversing mechanism. The entire mount is 105 ft. long. Each truck weighs approximately 20,000 lb. This load is distributed over 32 wheels, giving approximately 18 tons per axle. The mount can negotiate curves as sharp as 16 degrees and has been moved at the rate of 45 miles per hour. The gun on this particular mount is one of the most powerful in existence, being 12 inches in caliber, 50 calibers in length, and having a muzzle velocity of 3200 foot seconds. The range of this gun is approximately 45,000 yards. The projectile weighs 700 lb. and uses a powder charge of 305 lb.

### 16-Inch Howitzer

In the case of the 7-in. and 8-in. guns and 12-in. Mortar, the firing platform is so simple that only a few minutes are required to put it in position. By actual test one of these mounts has been brought up to position, firing platform and outriggers placed, five rounds fired, platform and outriggers replaced on car, and the mount gotten under way, in 37 minutes.

In the case of the large guns and howitzers considerable time and labor are required to prepare the mounts for emplacement. This is a serious matter in the case of large mounts when used in the field for various reasons; one being, that the enemy is likely to observe the work of preparing the emplacement by means of aeroplane observers after which it would only be a question of a few hours until the enemy could drop a large shell which would obliterate that part of the landscape. Another reason is that in case of sudden advancement of the enemy, sufficient time is not allowed for withdrawal of the railway mount, due to the fact that so much time is consumed in preparing it for transportation, thus inviting its destruction or capture by the enemy. Hence, any railway mount which can be brought into battery and withdrawn in the course of a few minutes, has a distinct advantage over the other types.

The 16-in. howitzer overcomes the above disadvantages and is perhaps the very latest type of railway artillery. This mount carries the huge 16-in. howitzer, which is probably the most powerful howitzer mounted on a railway mount. This howitzer can be fired directly from the trucks on standard gage track. The shock of recoil is taken care of through the recoil mechanism and in moving the car backward along the track on its own trucks. Two 12-wheel trucks with specially designed truck frames and spring arrangement are used so that the recoil shock is comfortably transmitted through a system of equalizer springs to the rails. Ordinary rock-ballasted track of 80-pound standard rail is used, and after repeated firings, the test track shows absolutely no distortion.

The spring arrangement on these trucks is worthy of interest, inasmuch as both semi-elliptic and volute springs are used. The semi-elliptic springs are of sufficient strength to withstand the firing load. The volute springs, which are interposed between the semi-elliptic springs and equalizer beams, are designed to take the carrying load only. Thus on firing the gun the volute springs go solid and the shock of recoil is transmitted to the semi-elliptic springs. The truck is the locomotive type

using inside journals with 6½-in. x 12-in. journals. An immense combination bolster and transom casting connects the locomotive type of side frames so that the load at the center is uniformly distributed along the side frames. These trucks are equipped with both hand and airbrakes, which, of course, are of special design.

### Other Railway Mounts

The Ordnance Department has four other types of railway mounts in existence. These include a French type, known as the 305 millimeter Schneider Railway Mount, which is very similar to the American 12-inch Sliding Railway Mount, and is operated from a curved track or cpi. The 12-inch French Batignolles railway mount is another French type using the Army 12-inch gun. It is equipped with the hydro-pneumatic system of recoil. The mount is fired from a firing platform which is carried on a ground platform car. The other two railway mounts in existence are the 12-inch Howitzer and the 16-inch Howitzer Model E. Both are adaptable for seacoast defense since they have all around fire.

It is perhaps wondered how it is possible to negotiate curves with some of the railway mounts having 8, 10 and 12-wheel trucks. Contrary to what might be expected, every truck and mount is subjected to a test requiring that it negotiate a 17-degree curve. The ability to round curves is secured by means of extra pedestal clearance on the inner sets of wheels and the changes in wheel gages on the same set of wheels. It is only necessary to do this on trucks with more than eight wheels each. It has been found in practice that these two methods give all the flexibility required.

It is necessary in the design of railway artillery to so detail the construction that both the French State standard screw couplers and buffers and the American M. C. B. couplers and draft gears could be applied in the field. All the mounts sent abroad, of course, were equipped with the French standard. When these mounts were returned, the French couplers were taken off and the M. C. B. equipment installed. Although the French do not use any airbrakes on their railroad artillery, the Ordnance Department received instructions from General Pershing to equip all railway artillery with both hand and air brakes. The application of air and hand brakes to the trucks is an exceedingly difficult task. No standard locomotive or car brake arrangement could be utilized. The loads of course are static loads and after considerable experimental and development a brake power of 40 per cent was adopted. In most all cases this entailed the use of two airbrake arrangements utilizing two cylinders with other auxiliary equipment. On all trucks except four and six-wheel trucks, all the air brake apparatus is contained in the trucks. It was exceedingly difficult to so design the trucks and air brake arrangement to secure this feature, of having the brake arrangement self contained in the trucks.

It was early found out that the secret of safe running of heavy artillery was keeping the axle loads down to 17 metric tons. This necessitated the use of many wheels and axles on the extraordinarily heavy mounts and the question of clearance and negotiating railway curves immediately came up.

### Armament Train

The organization of railway artillery is made up of regiments, battalions and batteries. A battery consists of four pieces of railway artillery, together with armament train cars. A battalion consists of three batteries and a regiment of two battalions. The armament train cars include ammunition, supply, spare parts, fire control and repair cars. The ammunition car is a steel car

with a wood lining equipped with ammunition racks for storing ammunition. A trolley hoist arrangement is also provided in this ammunition car for transporting the ammunition to the platform of the gun car. This trolley I beam hoist can be projected through the end door of car so that ammunition has a continuous run on to the gun car platform. The construction of the ammunition car is somewhat similar to the 30-ton box cars supplied for use in France by the Director-General of Military Railways. This car has a steel roof, very similar to the construction of passenger car roofs and built up plate and angle earline sufficiently strong to support 16-inch shells weighing 2400 lb. The underframe of the car as well as the entire construction meets the M. C. B. requirements and the Interstate Commerce Commission rulings.

A fire control car is somewhat similar to an ammunition car except it has wooden roof and wooden sheathing. The supply car is a low gondola car with no distinctive features.

The repair car is of exactly the same construction as the fire control car with the interior equipped with machine shop, carpenter shop and blacksmith shop. Great care was exercised in procuring the equipment for this repair car, so that a complete outfit of tools sufficient for all repairs in the field, except those occasioned by direct hit, could be made. The machine shop part of this car has a lathe, shaper, radial drill, grinder, work bench and complete outfit of tools, gages, micrometers, etc. The machine tools are motor driven, current for which is furnished by 5 k. w. gas electric set.

### Camouflage

All railway mounts for use abroad were camouflaged by the Ordnance Department with the Ordnance five-color contrast system of camouflage. To the uninitiated it will appear that no preconceived arrangement of colors is used in painting this railway artillery. As a matter of fact, the colors and their arrangement on the mount is scientific, and will effectually conceal the piece from aeroplane observation. Shadows cast by any object on the ground are very distinct from a height, and it is necessary to conceal the outline of the shadows as well as the outline of the mount itself. For this reason railway artillery units are hidden under camouflage screens or canopies which are so constructed that no distinct shadows are apparent.

It is interesting to note here that the invention and use of microphones locate the position of heavy artillery by sound. At the time of the signing of the armistice the Americans had enormous quantities of these planted on the western front. I am told that 400 German guns were located and put out of commission by this system. It is doubtful, however, if the use of the microphones will do away with camouflage. The use of the microphone is only possible after sounds have been produced. Unless the artillery is camouflaged it could be located and destroyed before a shot was fired.

### Future Types of Artillery

A forecast of the future types of railway and field artillery is worthy of our attention in the light of all the experience gained during the war. In spite of the popular appeal to the imagination, and the widespread conception of long range artillery as an instrument of war, it is the shorter range artillery which wins battles. I have only to call your attention to the effectiveness of the French 75's at Verdun to illustrate the vital necessity of having armies equipped with a plenty of mobile field artillery. By field artillery we of course mean the 3 in.,

4.7 in., 5 in. and 6 in., 155 mm guns and the smaller caliber howitzers.

Long range artillery has certain tactical uses in the field, but is very rarely used to fire on men. These tactical uses prepare the way for an offensive operation by destroying railway centers, ammunition dumps, observation towers, bridges and fortified works. It may also be desirable to destroy and interrupt traffic on the lines of communication. A few well-placed shots will accomplish any one of the above objects and then that day's work is done. But the field artillery never ceases to operate in all kinds of fighting. This war has proven the great advantage of having all artillery mobile and capable of being moved swiftly over any kind of road or terrain where there are no roads.

The Ordnance Department early recognized this necessity and produced field pieces on caterpillar mounts. The light ones are capable of moving 15 miles per hour over any road or field, while the heavier howitzers can travel at the rate of 3 miles per hour.

Our forecast, then, of the field artillery of the future will include the light field artillery all mounted on caterpillar mounts or drawn by tractors, and the heavy howitzers and guns on railway mounts.

For seacoast defense, which is an entirely different problem, we have the navy as our first line of defense. It is obvious that no enemy can reach us from the sea unless they first defeat or elude the navy. Granting this accomplished, the next move of any enemy would be to capture our seaports or effect a landing on some suitable point along our coast. Our seacoast fortifications are admittedly the finest in the world. The great extent of our coast line, however, makes it physically impossible to fortify every vulnerable point. Our railway mounts will constitute a mobile seacoast defense, supplementing our permanent fortifications. It is desirable that the entire coast line be divided into zones and batteries of railway artillery assigned to each zone, so that sufficient units could be concentrated at any point attacked. Railroads running parallel to the coast should be extended so that their tracks will cover any strategic points and all places where an enemy might land an expedition.

### Closing Remarks

At this point a most dramatic scene was enacted. Major Campbell removed his coat and spoke as follows:

I have received my discharge as an officer in the United States Army, and so remove my coat preparatory to making a few remarks tributary to an officer of exceptional merit serving in the regular army. I am now talking to you as a civilian. Do you know that only 38 per cent of the officers of the regular establishment got to France during the war? Only those men who were associated with these officers know the bitter disappointment these regular army men felt in being forcibly detained in this country. It is hoped that these officers received just recognition for their invaluable work on this side. These men were held here for the simple reason that they were practically the only ones in this country competent to handle the designs and problems of supplying the troops with the necessary equipment. Some of them have received the Distinguished Service Medal. One of the recipients of this decoration was a former chief of the engineering division of the Ordnance Department. This officer, to my personal knowledge, worked day and night, Sundays and holidays, and was a constant source of inspiration to all who worked for him, not only on account of his tireless energy, but for his exceptional ability as an engineer, executive and organizer. I refer to Colonel Jas. B. Dillard. Too much praise cannot be given Colonel Dillard for the

stimulus he inspired in the manufacturers of ordnance material, which resulted in their noble and patriotic response.

I wish also to pay tribute to the manufacturers who so willingly co-operated with the Ordnance Department in all branches of its work. Among these is the American Car and Foundry Company. This concern absolutely placed its entire resources at the disposal of the Ordnance Department. Why, at the inception, in April, 1917, of the first project of railway artillery, the 8-inch mount, one of which is now on exhibition, this company submitted a bid which was 50 per cent below their competitors, with a promised delivery in one-third less time. In spite of this, the first mount was shipped in half the time promised.

In artillery vehicles such as you have seen on exhi-

bition here they reached at their peak of production a total of 277 vehicles per day, with spare parts aggregating the equivalent of 32 vehicles; thus their production can be stated to have reached 309 complete artillery vehicles per day. Previous to this the best output accomplished in the same kind of equipment was one vehicle per day.

We all know that one of the principal causes of Germany's request for an armistice was the splendid production of war materials in America. This production was only reached by the untiring work and co-operation of manufacturers, railroads, War Department and laborer. As one of the American generals remarked, had the war lasted three months longer the infantry would have to be put on horseback to keep up with the railway artillery.

## "Railroad Break-Down" Not Due to Railroad Men

"Too Much Government Interference Caused It," Says W. T. Tyler—Praise for Enterprise of Railway Supply Concerns

**W**. T. TYLER, director of the Division of Operation of the Railroad Administration, delivered a very interesting address at the Convention yesterday. In the course of his remarks, Mr. Tyler said:

### Public Interest in the Railroad Problem

I presume we have all attended the circus "just to take the children," so that I am glad your chairman has explained my reason for staying over in Atlantic City—it has not at all been a hardship, in fact, I tried to have him defer this talk until Wednesday, but he insisted on my coming over this morning. (Laughter).

I presume that the interest of the public to-day is about equally divided between the League of Nations and the railroad problem. I do not know but that we hear the railroad problem discussed among active business men more than we do the League of Nations. They do not expect to have much voice in settling the question of the League of Nations, but they do hope eventually to have a part in on the settlement of the railroad problem, and its settlement touches us all more nearly and the need for it is more immediately pressing, so I believe we can consider the railroad problem in this country at the moment the most important subject of thought and discussion. I believe we can rest assured that the President will carry out his expressed intention to return the roads to their owners at the close of this calendar year. A great deal of concern has been expressed, and is being expressed from day to day, lest this does not afford time for Congress to prepare and pass the necessary enabling legislation. My own opinion is that six months will serve every purpose that would be served by five years. We are not getting from the present method of operation any helpful experience, unless it be the lesson of what not to do. Public operation of privately owned railroads will not work, it is not practicable, and I think practically everyone who is interested and has given the matter study, is satisfied of that fact. I believe the situation is best expressed by the apt remarks of a member of the Senate Committee on Interstate Commerce that it is like trying to teach a man to play the violin by having him practice on the piano. If Congress was given five years in which to take action, very naturally it would defer action until the last six months, because the situation is constantly changing, and it would be a miracle if at any time Congress could enact a law that would serve

indefinitely and that would not require changes and modifications as experience taught the need of them, so that one time is as good as another. And the immediate solution is to pass at this time the best legislation Congress can, and then as we operate under it change it as experience shows the need of changing. My own opinion is that the Congress cannot do better than to face about and look to the first year of the war for its guidance as to what should be done for the railroads, and to meet the needs of transportation of this country.

### How the Railroads "Broke Down"

We hear a great deal about the railroads, especially of the East, breaking down at that time. I want to say to the railroad men all over this country that the railroads owe no apology for their breakdown or for their failure absolutely and completely to meet the transportation requirements during the first year of the war and before government control was adopted. They broke down in the same sense that the cathedrals of France broke down under artillery fire. With German guns playing on them for days at a time they did break down. The railroads broke down, especially in the Eastern section, where the war activities were greatest because of the multitude of government agencies exercising priority authority, each demanding that the freight for its particular department be moved in preference, and even to the extent of passing out to the railroads the individual car numbers of thousands of cars to be picked out of this great mass of blockaded traffic and brought in.

It was absolutely impossible to meet such a situation. For a long time the railroads had suffered from inadequate rates, and from all manner of hampering regulation. These things together constitute the reason why the railroads were not able to meet transportation needs during the first year of the war. Under government operation they were able to do it because the government agency placed in charge of the railroads was able to exercise absolute control regardless of all the other government agencies that hammered away day after day for their little part in control of the railroads.

### What the Railroad Administration Did

The first thing that the Railroad Administration did was to lock the door on these various governmental agencies and say to the War Department "you tell us

what you want moved and we will move it in our own way. You will get what you ask for and you will get it promptly." Really the very first thing that the Railroad Administration did, however, was to set aside and disregard all the restrictive laws and regulations that had been enacted by both the State and the Federal Government. It was early recognized as impossible to meet the transportation needs of the Government and at the same time follow its regulations, and the regulations of the States fortunately the man placed in charge, Mr. McAdoo, being himself familiar with the government methods and at the same time a man of extraordinary strength, wholly fearless and utterly disregarding of criticism, did apply the strong hand and defeat every effort at interference. He said to not only the central organization at Washington, but passed the word out to the railroads, "you know the transportation game, you know what you ought to do, go ahead and do it and I will stand behind you." That was all that was needed. The only thing needed was to have someone between us and outside interference and the railroads resumed their functions.

Now, it would have been impossible for any central organization or any number of men, no matter how well selected, to have themselves operated all the railroads, brought method and order out of chaos, without this cessation of interference by so many governmental agencies. So I say I think that Congress can do no better than to look back upon the first year of the war and the first four months of Government control to find the solution. If what was done during the first four months of Government control was necessary to enable the railroads to function, similar treatment is necessary now to enable them to go on and meet the requirements of transportation in this country in time of peace and to meet the expansion in business that we are sure to have and that we see coming at this time I should say that the first need is responsible centralized control. That is something that we have never had until we had Government operation. We have had scattered control, but never responsible control; we have had centralized control, but never responsible control. The Interstate Commerce Commission has been much abused, but I do not feel that the criticism is entirely deserved, because the Commission has never been charged with the responsibility for results. It has named a maximum rate after long investigation, and after several roads had become bankrupt, but it never was responsible for the effect of that rate upon earnings. If the railroads went bankrupt under it, the operating officers were considered responsible, and not the officers of the Government who named the rate. So when I say responsible central control, I mean a central body that will have absolute control of the rates and will also be responsible for those rates furnishing adequate returns to enable the railroads not only to meet the transportation needs of the moment, but to improve and build up their properties so as to be prepared at all times to meet just exactly what we met during the war, the maximum of requirements in the way of transportation service.

There should be at the same time a repeal of a great many of the restrictive laws, and the enactment of others in their place, because I think it would be entirely wrong and a most serious mistake for the railroads to be handed back to their owners without regulation of their operation. It is needed, and there will be no satisfactory solution without it.

If I were asked to name the most important benefit accruing from Federal control, I would say that away up at the top of the list stands the methods that have been

worked out for dealing with labor. I think it would be a most serious mistake if the corporations in taking back their properties should not work out of the existing boards and agencies for handling labor matters a permanent method, something along the same line, for adjusting labor disputes.

### Dealing With the Labor Problem

I have no very clearly defined idea as to just what form the plan should take, but I do want to say that a most serious mistake will be made unless this is provided for, and some definite plan worked out. I think it highly desirable that the officers represented in this meeting give the matter serious thought and consideration. There has been, of course, much complaint about interference of the central administration with discipline, but I believe any one who will stop to consider what the situation would have been if each railroad had been obliged to deal with its labor problems in its own way, will agree that the methods adopted, regardless of whether they are as complete and as perfect as they should be or not, were necessary and did absolutely save the day.

Now, I want to speak just a moment about the convention and its relation to the exhibits. I said on Saturday to the Master Carbuilders that I regarded this supply exhibit as offering to the railroad mechanical officers a post-graduate course in their profession not available in any other way, and I want to repeat that to you gentlemen now, and to say to you that you will not at all have justified this meeting and your trip here if you do not see every exhibit on the Pier.

### Praise for Railway Supply Concerns

The railroad supply man, to my mind, is entitled to a very large measure of credit, for the progress of railroading that has been made in this country, and I want to say furthermore he has accomplished that progress largely against opposition. He has not been met halfway, he has not had the encouragement he should have had, nor the help. I think it is the duty of every railroad officer here to go through the exhibits and not only listen attentively to the demonstrator but to give him your suggestions. He is entitled to that, and out of all that he gets unquestionably some will be valuable to him. I do not think there is any question that we have made greater progress in this country in the development of the art of railroad transportation than has been made in any other country on the face of the globe, and as I say, it is largely due to the supply man. It has not been a work of philanthropy, at all, it has been a business proposition, but it has been the result of foresight.

I know of a number of railroads in this country that encourage initiative and inventive genius, but a great many of them tie a string to it. If you produce something of value, the fact that you are on the payroll of that company gives it the right to use it without paying you for it. I think this policy is wrong. I think it has proceeded from an entirely wrong viewpoint, and if it were not for the supply man who stands ready to take whatever the inventor can work out and pay him for it, we would not have had this progress. The supply man may recognize that the appliance is not perfect and is even of doubtful value, but he always realizes that no other action will stimulate the interest, not only of that man, but of others in the same line of work, to use the inventive genius they have and to go along improving, and the supply man has prospered, not at all beyond his due, because he, after all, has carried the financial burden, and he realizes that a very large number of the appliances that he invests his money in must fail, but he keeps right along, trying again, buying something today.

perfecting it and discarding it to-morrow when he sees something that is a little better. For these reasons they are entitled to all you and I can do to help them along in that direction, to justify what they are trying to do, and so I say to you my own idea about the convention is that even if you find it necessary to stay here and transact your business after the exhibit closes, such a course would be preferable to neglecting one single booth on this pier.

I was introduced here to-day as the Director of the Division of Operation. When you meet next year there will perhaps not be a director of the Division of Operation. I hope at that time I may be asked to come down here again simply as one of yourselves to meet with you, listen to your discussions and avail myself, as I have on this occasion and as I propose to do during the next couple of days, of what there is to learn from the railroad supply exhibits.

## Meeting of Railway Electrical Engineers

THE SEMI-ANNUAL CONVENTION of the Association of Railway Electrical Engineers was held at the Hotel Dennis on Monday, June 23. The opening session was called to order at 10 A. M. by President J. E. Gardner, of the Chicago, Burlington & Quincy.

Jos. A. Andreuceti, secretary and treasurer of the association, presented a brief report in which the excellent financial condition of the association was shown. Mr. Andreuceti explained that it had not been the thought to provide an extensive program for this meeting, but that it was intended to provoke discussion to assist the members of the several committees in presenting more comprehensive reports at the annual convention in the fall.

Although the meeting was held ostensibly for the purpose of hearing the progress reports of the committees, one report was presented in completed form. At the annual convention last October the Committee on Electric Headlights was instructed to make a more extensive study of this subject and present its findings at the June meeting. The subject is a particularly live one at this time and the report was presented to a large and appreciative audience.

In substance the report is based upon facts brought out by a questionnaire sent to a number of roads some time ago to obtain information as to their practices. Although there is apparently a decided lack of uniformity in the headlight practice on the different roads there was sufficient information gathered from the questionnaire to enable the committee to prepare an interesting and instructive report. All phases of the headlight question were considered, including the conduit runs, wiring, switches, lamps, receptacles, etc. The committee was highly complimented on the excellent report it had prepared, although it was very evident from the lengthy discussion which followed that the time has not yet arrived when electric headlight equipment can be permanently standardized. The practice has changed so rapidly in headlight equipment that it has been exceedingly difficult to fix upon definite and permanent standards. There is every reason to believe that many other developments will take place before all of the different parts of this apparatus can be permanently standardized. In fact, it is exceedingly doubtful if it would be possible to standardize all equipment so that all roads would use the same standards. Nevertheless, the report of the committee is full of important recommendations which will

serve as an excellent basis for present practice, and as such, it was accepted by the association. It was, however, referred back to the committee again for its further consideration in order that any new developments might be included when the report will be again presented at the annual meeting of the association in October.

In view of the fact that the report embodies an excellent resumé of electric headlight practice at the present time it has been accepted as such by the Mechanical Section of the American Railroad Association and will be presented in its entirety at the meeting of this association on June 24.

The first report presented at the afternoon session was the progress report of the Electric Headlight Handbook Committee. It is the thought of this committee to prepare a handbook similar in all respects to the Car Lighting Handbook which was compiled last year and which so satisfactorily filled the requirements in the maintenance of car lighting apparatus. Special emphasis was placed upon the importance of preparing the headlight handbook, so as to include complete information concerning the theoretical operation of the various equipments.

The work of the Committee on Illumination was assigned to three sub-committees, namely, Sub-committee "A," car illumination; Sub-committee "B," on shop illumination, and lighting, etc. and Sub-committee "C," on lamp specifications. In answer to the question as to what might be expected in the way of increased efficiency of lamps, L. S. Billau, of the B. & O., seemed to be of the opinion that there was little to be expected in the way of reducing current consumption by increased efficiency of lighting units, as the tendency at the present is toward increased use of lamps with a corresponding increase of current.

E. Lunn, of the Pullman Company thought that some attention should be given to the artistic design of the lighting fixtures and that this question was at present under consideration by the Pullman Company.

In the matter of lamps for use on extension cords in shops, the practice of using carbon filament lamps, while desirable in view of its more rugged construction, will probably be eventually supplanted by tungsten lamps, due to the difficulty of securing a good grade of carbon lamps. It was suggested by J. L. Minick, of the Pennsylvania Railroad, that auto transformers might be used on 110-volt circuits, and by this means reduce the voltage on the lamps to 32 volts. Tungsten lamps of much larger filament can be used with the corresponding rugged construction. The more general opinion of the members, however, was that the matter should be taken up with the lamp manufacturers, with the idea of getting them to develop a tungsten lamp that would be sufficiently rugged to withstand use on extension cords.

The Committee on Electric Arc Welding in its progress report expressed the intention of going into the matter of arc welding in a most thorough manner, insofar as the matter is applicable to the repair of locomotive parts and in the numerous other fields on the railroad where welding can be carried on to advantage.

E. Wanamaker, of the Rock Island Lines, read the report of the Committee on Electrification. The committee expressed its desire to secure from as many of the members as possible all the information on this subject that is available. There is undoubtedly an increasing interest being taken by railroad managements in electrification projects, and it is information along this line that the committee wishes to be in a position to supply those roads that are logically interested in electric traction.

L. S. Billau read the report of the Committee on Train Lighting Equipment and Practice. This report covered

a number of temperature rating specifications with reference to axle generators. These specifications represent the first steps in the standardizing of the ratings of axle generator equipment and it is hoped that future specifications may be extended to include all parts of axle generator apparatus which may be properly assigned specified ratings.

The Committee on Compiling Costs for maintenance of Head Light Equipment expressed its intention of seeking the assistance of the various roads as to their present methods of keeping cost records for maintenance.

## Conventionalities

H. J. Small, well-known railroad man, now a resident of San Francisco, could not attend the convention this year on account of illness.

J. E. O'Hearne, formerly with the mechanical department of the Chicago & Alton, was recently seriously injured in a street car accident in Denver, Colo.

It is a matter of regret to many that W. L. Kellogg, formerly of the Pere Marquette, is ill and will not be here this year. Mr. Kellogg lives in Denver, Colo.

M. Kokawi, resident inspector of the Imperial Government Railways of Japan, with headquarters in New York, arrived Saturday and expressed his amazement at the first convention he has ever attended.

F. I. Marriott, chief draftsman of the Chesapeake & Ohio is known as the human calculator. It is said that he can "figger" the number of tubes in a boiler from the width of the running board.

The many friends of Mrs. Stanley Midgley will note her presence this year after an absence of some six years. Prior to that time her record of ten consecutive conventions is a good one.

Many friends of Mr. and Mrs. J. F. Dunn will be pleased to hear of them. They are in California with their daughter, Miss Edna Dunn, and are visiting another daughter, Marganeret, whose husband is in army service in San Francisco.

Probably the oldest guest at the conventions is the mother of F. B. Ward, of the Elwell-Parker Electric Company. Mrs. Ward has recently celebrated the ninetieth anniversary of her birth. She is enjoying the conventions each day on the pier.

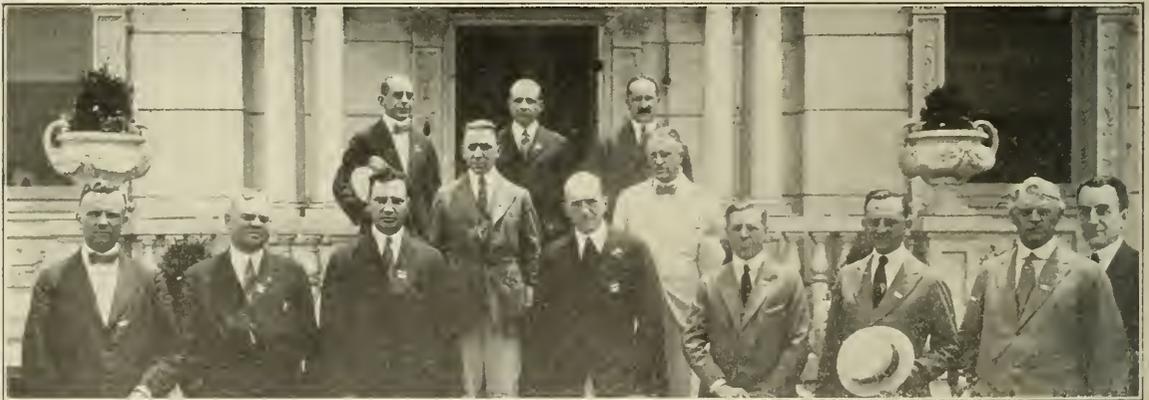

"Big Dan," Assistant Superintendent of Motive Power of the Denver & Rio Grande, in introducing his little brother, Frank Cunningham, of the Standard Stoker Company, says, "We're triplets. He's one of them; I'm the other two."

Alfred B. Carhart, vice-president of the Crosby Steam Gage and Valve Company, of Boston, came here to drown his sorrows in the Atlantic and incidentally to look over the convention. Mr. Carhart's disconsolate frame of mind was caused by the outcome of the Yale-Princeton baseball game which he attended yesterday. Princeton "blew up" in the fifth inning.

W. T. Tyler, Director of Operation, U. S. R. A., and Mrs. Tyler

Miss Irene M. Dunne, who was the soloist of the sacred concert given in the Exchange of the Marlborough-Blenheim Sunday afternoon, is a young soprano of remarkable promise. She completed her last year at the Chicago Musical College just before coming here. She sang with the Marlborough-Blenheim Orchestra Sunday afternoon,

Enrollment Committee

Top Row, Left to Right: Harry Jéques, F. H. Smith, William S. Edgar. Second Row: F. V. McGinness, J. A. Stevens. Bottom Row: S. Inglis Leslie, George A. Barden, L. D. Mitchell, G. H. Gayetty (Chairman), S. H. Campbell, Joseph E. Brown, George W. Denyven, Gilbert E. Ryder.

Donald R. MacBain, of the New York Central Lines West comes to the convention this year as assistant general manager instead of superintendent of motive power, having been promoted a short time ago. Mr. MacBain had been superintendent of motive power nine years.

and everybody enjoyed her singing greatly. Miss Dunne's home is at Madison, Ind. She is a friend of Mr. and Mrs. L. E. Jones and Fritz Ernest, of the American Steel Foundries, and has been visiting them while in Atlantic City.

Mr. and Mrs. E. P. Welles are accompanied this year by their son, Edward, who paid the convention the compliment of preferring to come here from Yale, where he is a student, to going to the boat races. Mr. Welles is president of C. H. Besly & Company, of Chicago.

J. F. Graham, superintendent of motive power of the Southern Pacific, could not be present on account of illness. Mr. Graham has had an attack of influenza, but is recovering. Mr. and Mrs. Graham, well known to conventionites, are residents of Portland, Oregon.

Mention was made in Mondal's issue of the *Railway Age*, regarding the celebration of "Bob" Fisher's seventieth birthday." This statement was somewhat incorrect. Mr. Fisher is celebrating, but not his birthday. He will be 74 years old this fall and will then retire from service with the Bass Foundry & Machine Company, after 55 years' service.

Nelson B. Gatch, of the Chicago Pneumatic Tool Company, received a promotion during the convention. He was yesterday named as manager of sales of the New York district. Mr. Gatch was a captain in the air service and, upon receiving his discharge in February, joined the forces of the Chicago Pneumatic Tool Company as district manager in the Minneapolis territory. He later on held the same position in Chicago.

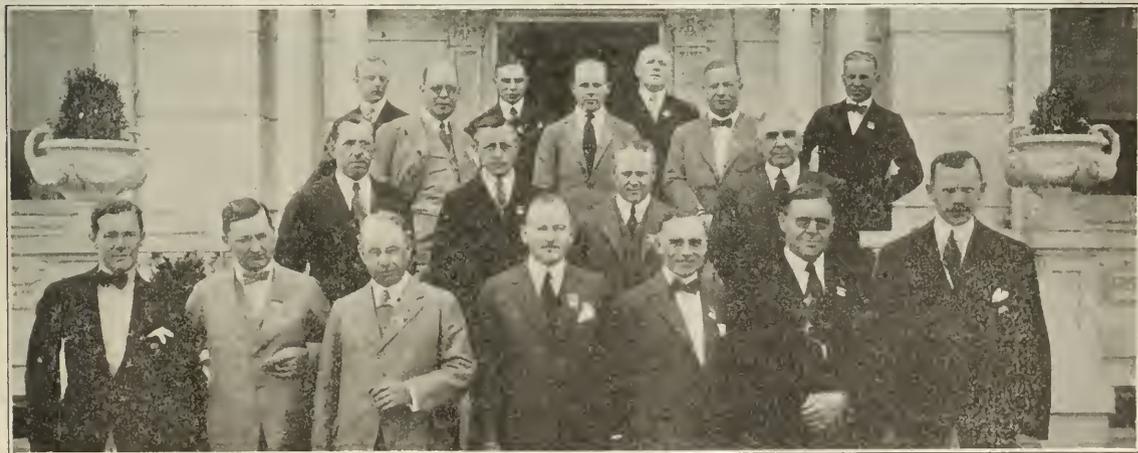

J. H. Young, senior assistant director of operations of the Railroad Administration, accompanied by Mrs. Young and their daughter, Miss Jeannette, are visitors at the convention. Before the adoption of Government control Mr. Young was president of the Norfolk Southern. He became federal manager of the Norfolk Southern and later also of the Virginian, which position he held before he was promoted to his present office.

When Major Leonard J. Hibbard appeared this year on the Pier he received as cordial a welcome as any man could possibly be given. And well he might. Enlisting in the French aviation service early in 1916 he flew during five months of that year. In 1917 he joined the American forces and was assigned to the first division as first lieutenant. In May of 1918 he was promoted to the captaincy of Company C, First Regular Engineers. While brigaded with the British forces in November of 1918 he was wounded, and again received wounds at Cantigny, at St. Mihiel and in the Argonne. Major Hibbard's wounds consisted of two broken legs, a machine gun bullet through the wrist and minor injuries. For nine years Major Hibbard served on the Entertainment Committee of these conventions.

Center, Mrs. W. T. Tyler, wife of the Director of Operation, U. S. R. A., and her two nieces, Misses Veronica and Lucile Ermatinger

William K. Krepps, of the Crucible Steel Company of America, who was chairman of the Entertainment Committee one year and a member of this committee for six conventions, received a telegram yesterday from President-elect Carr, of the R. S. M. A., appointing him chairman of the Entertainment Committee for the 1920 conventions.

## The Man Who Saw

### The Efficient Switchman

The air brake man had just returned from a tour of the perturbed realm of Don Venustiano Carranza.

"You know," said he to The Man Who Saw, and the supply man who said he was sitting up nights studying Spanish, "I learned how the Mexicans un-couple air brake hose down there. They pull out a knife and cut the hose in two—its quicker, and they don't understand the hose coupler anyway."

"They do that here," said the M. C. B. from Kansas. "The only difference is that we don't use a knife."

### A Tribute From Darktown

Superintendent of motive power, master mechanics, other locomotive men and the convention attendants in general are not the only ones who have visited and paid tribute to the Pennsylvania Railroad's latest masterpiece—the monster simple Mallet locomotive illustrated and described in the *Daily Railway Age* for Monday, the 23rd.

A delegation from Darktown was in attendance the other day and the Man Who Saw heard this little compliment from one of the colored admirers, "My, my, dat sho' am some injun. Hook her on to Atlantic City and she'll pull her right on up to Philadelphia."

### One Millionth of an Inch

It may be new to many to learn that seasoning—air seasoning from two to five years—is necessary before steel is in a fit condition to be used in the construction of certain machines and tools. To prove the truth of his statement to The Man Who Saw, the fine tool manufacturer produced a Hoke precision gage and explained that it is the most precise instrument ever produced by the hand of man. It is accurate to one millionth of an inch—count 'em. And he said one millionth is just as easy to measure as one thousandth. All you have to do is to catch a sunbeam and measure your work by it to prove it.

That is how it came about that seasoned steel—the time and air seasoned article that is steady and settled in its ways—must be used in the construction of certain instruments.

### Signs of the Times

One of his friends who has cultivated Cuban, Mexican and South American railroad men to a considerable extent, called The Man's attention to the significance of the fact that among the visitors here this year are two well known Cuban locomotive men, one of whom is in charge of 110 locomotives; two master car builders of Cuban railroads; two locomotive superintendents of important Cuban lines; a native general manager of Porto Rico's railroad system, and a distinguished Mexican who represents in the United States the purchasing interests of the National Railways of Mexico.

"Two of the Cubans," said the friend, "were amazed at what they saw at this, their first convention. They said that they took a chance on coming here in spite of the report that it would cost them \$40 a day. "Why," added the friend, "doesn't somebody start something that

will induce a representative showing here from Latin America every year? Why not arrange for their reception?"

The Man remembered a large recent purchase made by a man on this list and learned that after the order was concluded, two vertical turret lathes were added as a result of the visitor's attendance at the convention.

"Yes, why not?" said The Man.

It seemed that the arrival of the Latin Americans shadowed events which might be worth encouraging.

### The New Mail Car

Rumors in Poseyville had it that the Poseyville & Northwestern Railroad had ordered a mail car. As a consequence the usual daily committee of prominent citizens who considered it their sacred duty to see that the wheezy little train arrived safely, was considerably increased.

Finally she arrived and was given a reception and a write-up in the *Daily Taddle-Tale*.

"Well," said the well-known motive power accountant, who was telling the story to The Man Who Saw, "Everything seemed clear about the new car except the strange hook across one of the doors.

"What is that hook for?" inquired the druggist.

"It's to keep the door shut," ventured the grocer.

"You're both wrong," asserted the editor of the *Taddle-Tale*, "that's the mail hook. It grabs the mail as the train rushes past a station."

"Well, Andy," said the grocer, "don't you send any more eggs by parcel post."

### The Builder of Men

The mechanical engineer from the southwest turned the pages of a railway mechanical engineering paper with unconcealed affection.

"I have a fine drafting room," said he. "Whenever I hire a new man for my department my instructions to him include the following:

"We are buying your time which is eight hours a day. In return therefore, we give you eight dollars—a dollar an hour. The money we pay is real money; its value doesn't fluctuate. It is never discounted and represents full value. In return for this money we expect eight dollars worth of your time, which is eight hours a day of conscientious concentration on our work. We no more expect you to discount the value of these hours than you would have us deduct from your pay check.

"When the work slackens, instead of killing your own time at a dollar an hour and perhaps the time of another high-priced man as well, I want you to go to the book shelf and get a bound volume of a railway mechanical engineering paper and dig something out of it, which, from your observations around here, you think would benefit us by its adoption. I don't care what it is, just so its worth having or doing. If you have the time I would appreciate your writing it up, setting it forth as a recommendation or an argument for our consideration."

"How does your system work? Has it increased the interest—tell me about your results," asked The Man Who Saw that his informant was a psychologist as well as an engineer.

"Well," said the thinker, "it worked well for my showing and it helped the boys. Two of them recently left me to do really big things on their own hook. The P. & Q. is after another one and I am afraid I shall lose him, as I can't very well see how he can turn it down."

# New Devices Among the Exhibits

## Pyrometer for Locomotive Service

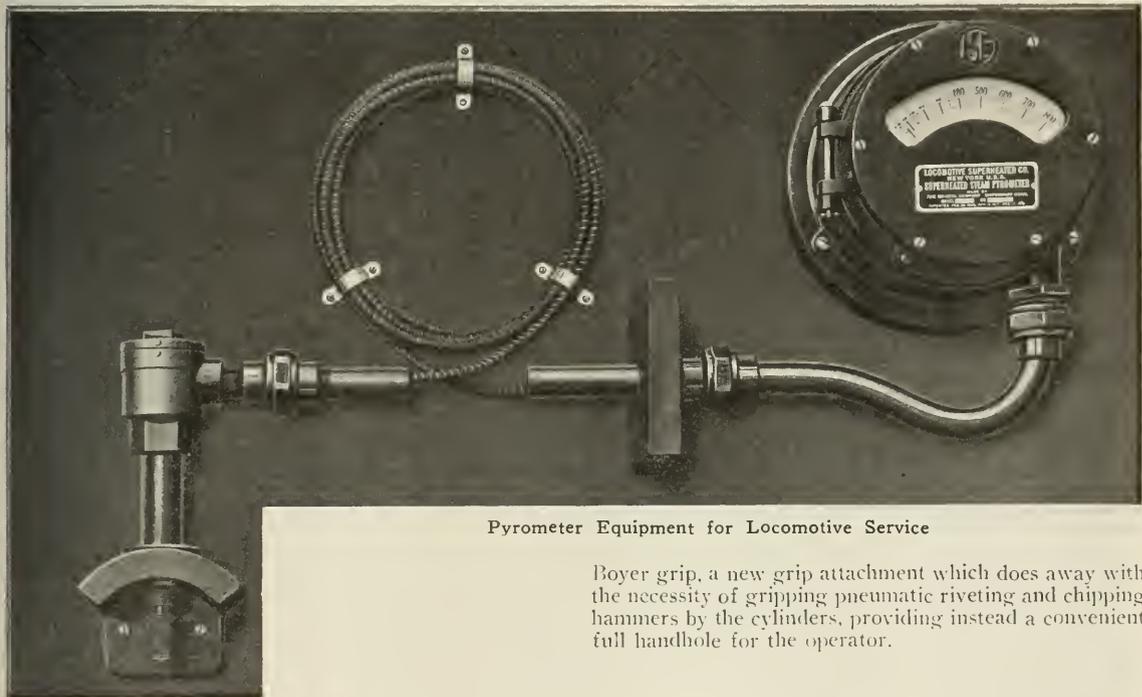

**T**HE LOCOMOTIVE SUPERHEATER COMPANY, New York, is showing its model 496 pyrometer equipment which is of the electrical type. This instrument makes use of the thermo-couple principle, by means of which an electric current proportionate to the difference in temperature between the hot and cold junctures of the couple is generated.

The indicator itself contains a millivolt-meter actuated by the current generated at the thermo-couple and moves a pointer on the dial indicating the actual temperature of the steam. The pyrometer equipment for each locomotive consists of three parts; a steam fixture (containing the hot junction of the thermo-couple), which screws into the steam pipe or steam chest of the engine; an indicator, which is placed in the cab, and a cable connecting the fixture to the indicator. The cold junction of the variations in the atmospheric temperature are au-

This apparatus provides a constant check on the performance of the engine. If the water is too high in the boiler or the fire is not properly kept, or if any other condition affecting the steaming qualities of locomotives should arise, it is at once indicated by the pyrometer.

## Advances in Air Drill Design

**T**HE Little Giant air drills displayed this year by the Chicago Pneumatic Tool Company, Chicago, contain several new features of interest to users of pneumatic tools. One of the important recent developments is a new form of toggle and piston construction, including a replaceable crank-pin bearing and a one-piece connecting rod by means of which all joints, eye holes and toggle nuts are eliminated. The company is also displaying a new corner drill made in both reversible and non-reversible types. Another innovation is the

Pyrometer Equipment for Locomotive Service

Boyer grip, a new grip attachment which does away with the necessity of gripping pneumatic riveting and chipping hammers by the cylinders, providing instead a convenient full handhole for the operator.

## Universal Air Hose Coupling

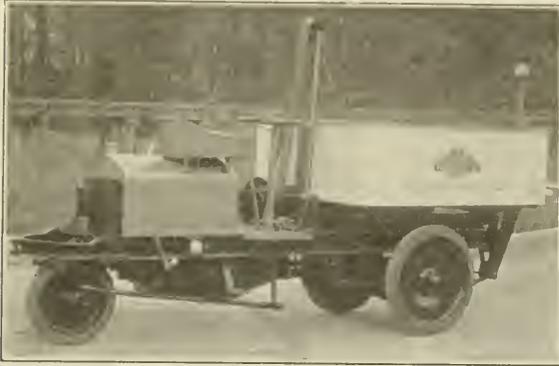

**T**HE INDEPENDENT PNEUMATIC TOOL Co., Chicago, is exhibiting an improved universal hose coupling. The coupling ends are absolutely interchangeable; consequently all confusion in ordering is eliminated and only the size required need be specified. Once connected the coupling cannot open when not intended, yet it can be uncoupled instantly by a pull on the sliding sleeves. The gasket cannot blow out, as it is protected from the flow of air by a protruding seat and the tapered back holds it securely in place.

tomatically compensated for. The hot junction of the thermo-couple is directly exposed to the flow of superheated steam and the slightest variation in the steam temperature immediately affects the current generated, showing this change instantaneously upon the dial in the cab.

The entire equipment has been completely adapted to locomotive conditions and has been found valuable in checking operating and maintenance conditions, as well as proving a substantial aid in making adjustments and drafting locomotives.

## The Clark Trutractor

ONE OF THE LATEST DEVELOPMENTS in industrial tractors is the Clark Trutractor, exhibited by the Liberty Steel Products Company of Chicago, who are the exclusive representatives for the railroad trade. The general design of this vehicle indicates a powerful and, at the same time, a flexible machine. It is constructed in a most substantial manner with a steel frame

Clark Trutractor with Dump Body

carried on two driving and one trailing wheel. The load carrying body is of sheet steel substantially braced with angle iron. The engine is mounted on the rear end of the frame. It is a four-cylinder 25 horsepower automobile type, with a differential gear acting on the forward axle, and will furnish sufficient power to propel the vehicle over rough roads or floors with a maximum tractive effort and enables it to haul heavy loads easily. The driver's seat is located directly over the engine hood.

Its carrying capacity is  $1\frac{1}{2}$  tons and with the dump body and its ability to make sharp turns, due to the wheel arrangement, it has proved very useful in congested places, such as foundry yards or shops, for the carrying

chine, with a one-yard dump body, are 125 in. by 46 in., and the truck wheel base is 84 in. The tractor will develop a speed ranging from one-quarter mile an hour to 15 miles an hour. In a recent test this machine was driven a distance of 143 miles over country roads in a single day and it has given remarkable service in shifting loaded freight cars without any injury to its structure. The clearance above floor level is  $9\frac{1}{2}$  in., which enables it to move over rough foundry floors, factory yards or bad roads, and because of its low center of gravity it can be successfully used under almost any conditions.

The steering gear acting on the single trailing wheel and the driving mechanism are substantially that of the

The Dump Body in Operation

automobile. The axles are equipped with frictionless bearings and the wheels with rubber tires. The load carrying end is supported on semi-elliptic springs, which enable the machine to travel over rough roads with no undue strain on the body or machinery.

The Trutractor Used for Hauling

in of sand or other material and the removal from the foundry of castings or refuse. The Trutractor is furnished either with the plain load carrier body without any dumping facilities, or with the dump body.

A clevis is provided at the rear end of the frame so that other trucks may be attached and the tractor used in a hauling capacity. The over-all dimensions of this ma-

The steering gear acting on the single turning wheel consumption of three gallons of gasoline a day, and because of its unusually strong construction it should prove a most efficient and economical tractor for industrial purposes. The Trutractor is demonstrated each day, on the pier beside Convention Hall, between the hours of one and three o'clock.

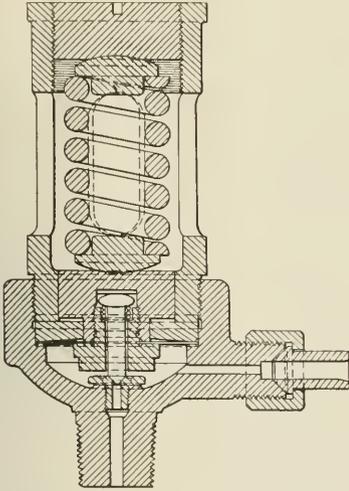

## Lubrication of Valves and Cylinders

IN 1911, THE EVOLUTION of the force feed lubricator for cylinders and valves of locomotives had progressed so little beyond the experimental stage that the Master Mechanics' Association's committee, which had been appointed to report on the comparative progress of lubrication of locomotive cylinders, summed up its findings in favor of the hydrostatic lubricator as against the early

system which is used in the force feed lubricator made by the Locomotive Lubricator Company, Chicago. The lubricator is mounted on a vertical flat plate, which is bolted to the head of the valve chest. The mounting of the apparatus is illustrated in one of the drawings; it will be seen that the mechanism is well out of harm's way, is easily accessible for filling and attention, and the installation as a whole presents an impression of compactness. The secret of the pump's efficiency lies in the variable control of its drive.

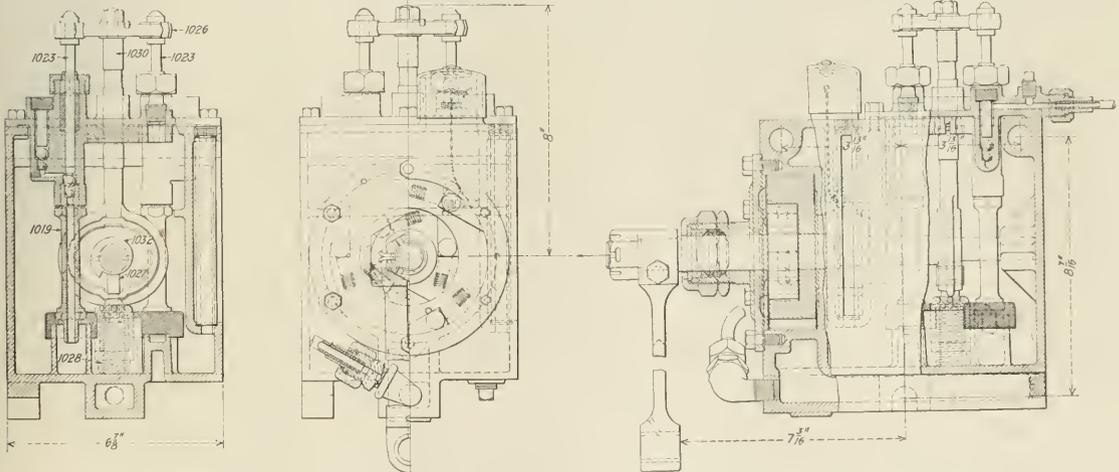

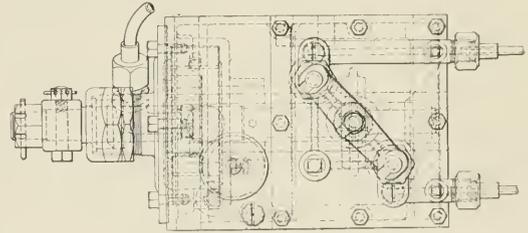

The pumping arm is driven from an extension on the combination lever of the valve gear. The distance between the radius rod connection and the center of the pump drive connection equals the distance between the valve stem connection and the radius rod connection, which insures a movement of the lubricator lever at all different cut-offs equal to the valve travel. The length of the lubricator lever, together with the valve travel, determines the amount of oil that is delivered into the steam at every revolution of the drivers. The formula by which the length of the lubricator lever is determined includes the valve travel at the normal running cut-off, multiplied by a constant of 2,500, divided by the diameter of the cylinder times the length of the piston stroke. This results in the injection of oil into the steam in proportion to the area of the cylinder walls to be lubricated.

In the 1919 model oil is delivered into the steam at

Diaphragm Terminal Check Valve

systems of mechanically forcing the oil to the valves and cylinders. The committee made the statement that "the accurate regulation of the amount of oil delivered to the valves and cylinders under the varying conditions of

1919 Model, Locomotive Force Feed Lubricator

service performance by the locomotive at different speeds and points of cut-off" was only achieved by the hydrostatic lubricator.

Interesting evidence of what has been accomplished in eight years in the development of force feed lubrication, which successfully overcomes the objection cited above is afforded in the following description of the Schlack's

every revolution of the drivers through the action of one pump in each oil pipe line, details of which are shown in one of the drawings. The wedge cam No. 1032 presses the stroke shaft 1030 and its bearing 1027 downward until it passes the lowest point on the cam, after which the spring 1028 carries the stroke shaft 1030 up quickly. The two plungers, 1023, one for each oil pipe

line, are connected to the stroke shaft 1030 by means of the cross head 1026 and on the quick upward stroke of the plunger, oil from the reservoir is sucked through pipe 1019 into the plunger chamber and forced out into the oil pipe by the successive downward movement of the pump plungers.

The lower end of the suction pipe is considerably below the top of the oil well and is covered by a very fine screen, which laps the upper part of the well about half an inch. Any light foreign matter in the oil will float on top; that which is heavier sinks to the bottom. The clean oil goes directly through the small meshed, so-called umbrella; should the screened umbrella be stopped up, it will pass between the larger diameter of the umbrella and the well, the combination of which makes extremely rare the chances of any foreign matter entering and affecting the pumping system.

The cam 1032 is revolved by means of a lever connecting through a friction ratchet. The pump mechanism is so designed that it delivers practically the same amount of oil at 140 degrees of temperature that it does at 265 degrees. Steam is delivered to the lubricator through a copper pipe tapped from the fountain and running under the lagging and against the boiler. The drain from the lubricator can be passed either directly into the exhaust channel in the locomotive saddle or to the air pump exhaust pipe.

When the locomotive is standing in the roundhouse, with very little radiation affecting the temperature of the lubricator, the steam in the lubricator heating chamber is under less than 2 pound pressure, keeping the oil at a temperature of less than 200 degrees. When the engine is running and the radiation of the lubricator reservoir is increased, the back pressure in the cylinder exhaust channel increases the pressure of the steam in the lubricator heating chamber, thus automatically increasing the temperature of the heating medium when re-

## Trap Door Plate

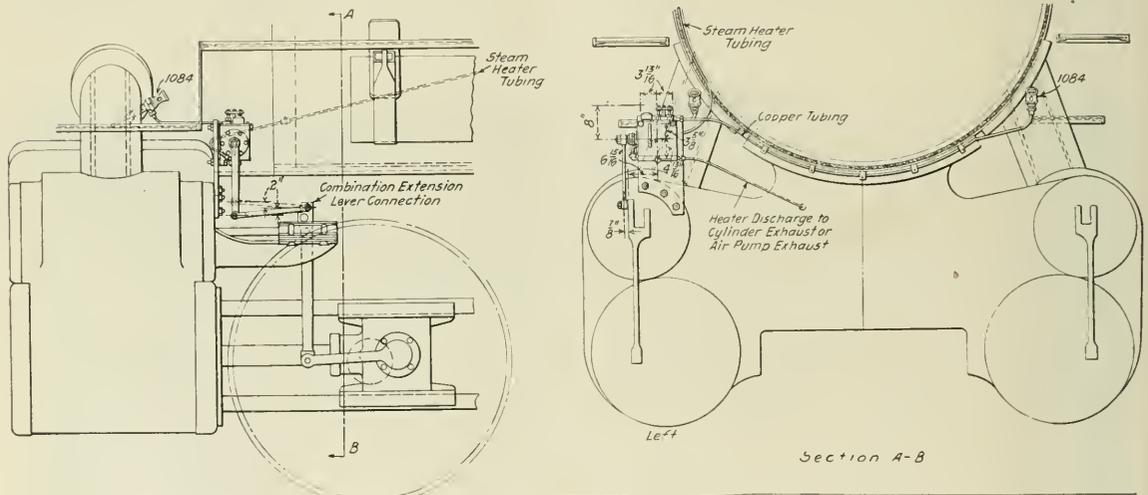

A TRAP DOOR PLATE which combines features of unusual interest is being shown in space C on the porch at the left of the main entrance to the pier. It is a new idea, which dispenses with much of the weight of older types of trap doors and is said to overcome the sticking tendencies of the latter.

The trap door plate is made of one-piece steel, No. 10 gage, with reinforcing ribs pressed in it on the under side, and turned over the edges, providing maximum strength and rigidity with minimum weight. Its weight is claimed to be approximately two-thirds that of other designs for the same area and rigidity.

The threshold is of one-piece steel beaded tread, securely riveted to the outside edge of the trap door plate and sufficiently strong to preclude possibility of buckling, through the pinching action of the buffer wings on the train when rounding curves.

The construction of the trap door plate makes it ideally adapted for the application of composition to replace rubber matting. Expanded metal is welded to the plate to provide the proper bond. Rib depressions permit material to work in under expanded metal, increasing the bonding action.

The lifting device proper consists of a specially designed spring and adjusting plug and worm. The spring is  $\frac{1}{4}$  in. by 1 in. cross section high carbon spring steel, carefully tempered, wound helically, with coils approximately  $\frac{1}{4}$  in. apart. This provides a winding action, also a very low fibre stress, and, therefore, long life, with the least possibility of breaking in service, and upon release of the trap door insures its rising with a slow, smooth action, thus eliminating customary banging. For a spring of this type a very fine adjustment is required. This is obtained by means of an adjusting plug and worm arrangement. The spring is anchored in a slot in the

Typical Application of the Schlack's System of Locomotive Force Feed Lubrication

quired. The diaphragm terminal check valve indicated by 1084 in the drawing of the front view of the application is connected with the steam pipe and maintains a constant oil pipe pressure, irrespective of the fluctuating steam pipe pressure, so that for every drop that the pump injects into the steam pipe, an equal size drop is simultaneously injected into the steam.

plug, which has gear teeth hobbled in it, and which meshes with the adjusting worm seated in the bracket. By turning the worm and thereby the plug a fine initial tension is placed upon the spring, this tension depending upon the size and weight of the trap door. With this arrangement any required adjustment, no matter how fine, is obtainable. Permanent adjustment is secured by means of a

locking washer which fits over the square shank of the worm and is locked on by means of a cotter pin. The lifting device is encased in a pressed steel housing of No. 13 gage material and consists of few parts of simple construction. The entire device is fitted directly to the trap door plate itself, thus facilitating repairs, whenever necessary.

This trap door is exhibited by the Tuco Products Corporation, New York.

### Automatic Drifting Valve

THE LEWIS VALVE COMPANY, New York City, is exhibiting a mechanically operated automatic drifting valve. This valve is connected to the valve gear as shown in Fig. 1. In its operation when the locomotive is running, link 3, Fig. 1, swings lever 4 to alternately open the compressed air governor valves 1 and 2, Fig. 2. When valve 1 is open compressed air is supplied from the air reservoir through pipe 6 to the compressed

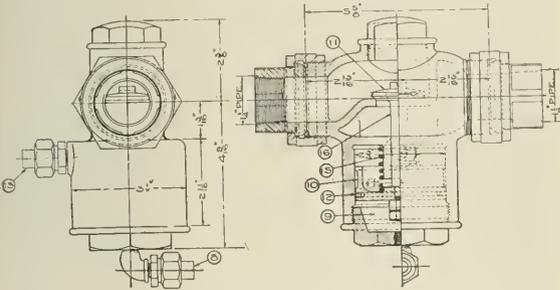

Fig. 3—Steam Governor

air governor chamber 7, Fig. 2. When valve 1 closes, valve 2 opens, and the compressed air in chamber 7 expands into pipe 8 leading to the steam governor. When the locomotive is running above a predetermined speed

compressed air will be intermittently supplied in sufficient volume to the steam governor cylinder 9, Fig. 3, to raise piston 10 and valve 11 and retain valve 11 open

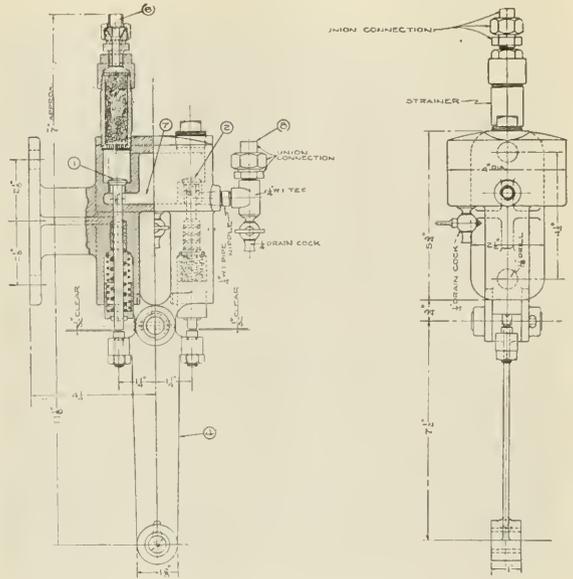

Fig. 2.—Compressed Air Governor

for the passage of steam from the boiler through pipe 14, Fig. 1, to the locomotive cylinders.

When coming to a stop valves 1 and 2 will not open rapidly enough to supply compressed air in sufficient volume to retain valve 11 open and the compressed air in pipe 8 and cylinder 9 will escape through the steam governor packing ring 12 and pipe 13 to the atmosphere. Valve 11 will be seated by spring 15 together with the

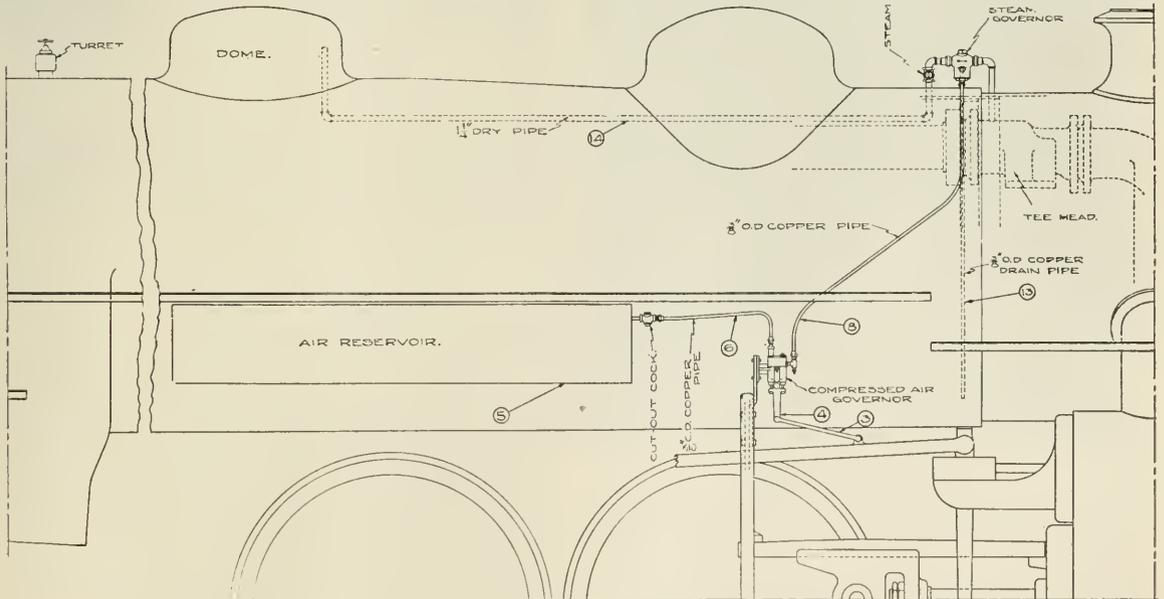

Fig. 1—Application of the Lewis Automatic Drifting Valve

action of the steam on the upper end of the valve stem 16 and the supply of steam to the locomotive cylinders will be cut off a short interval before the locomotive comes to a stop, and the locomotive will stop with no steam remaining in its cylinders.

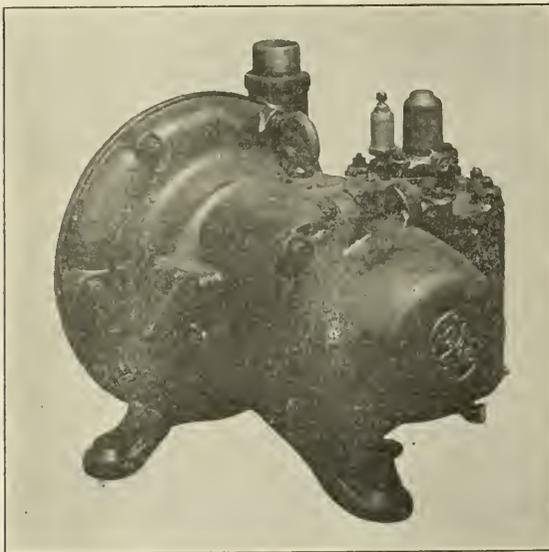

The packing used on the valve stems of the compressed air governor contains a permanent lubricant and oil holes are also provided on lever 4, Fig. 2. No other lubrication is necessary.

Locomotives equipped with this drifting valve are in service between Richmond, Va., and Washington, D. C., on the Richmond-Washington Line, the Richmond, Fredericksburg & Potomac and the Washington Southern Railroad.

## Turbine Headlight Set for Steam Locomotives

**T**O MEET THE REQUIREMENTS of steam locomotive headlight service, the General Electric Company, Schenectady, N. Y., has placed on the market a turbine generator set known as type CY-32B, especially designed to supply power for the headlight and cab lights. This set consists of a single stage Curtis turbine direct-connected to a compound wound generator governed on the steam end by a self-contained pressure regulating valve, and controlled electrically by a stationary magnetic brake coil and rotating copper disk which maintains practically constant voltage under different loads.

The machine is made in two sizes, 175 watt, 6½ volt, and 500 watt, 33 volt, for operation on boiler pressures varying between 125 and 225 lb. per sq. in. It is com-

Turbine and Generator Complete Ready  
for Mounting

posed essentially of one metal casting equipped with three substantial feet. This casting embodies the generator frame, regulating brake coil chamber and turbine casting. The generator shield carries one of the ball bearings and the brush holders, and the exhaust head carries the other ball bearing.

The rotating part is composed of a shaft upon which is mounted the armature and bucket wheel, and to the bucket wheel is riveted a copper disk by means of which

the load regulation is obtained. Cast integral with the main frame is a steam separator upon which is mounted the pressure reducing valve and pop relief valve.

The steam pressure at the turbine is maintained constant by the action of a hollow valve, steam working against the pressure of a spring, the section of the stem immediately below the ports being tapered. The tension of the spring is adjusted by the addition of thin washers, so that when the boiler pressure does not exceed 125 lb. the stem remains in its lowest position and no throttling of the steam takes place. When the boiler pressure exceeds 125 lbs. the stem is forced up and the tapered portion throttles the steam flowing out. The upward movement of this stem at all boiler pressures above 125 lb. is just sufficient to maintain constant steam pressure at the ports in the valve bushing.

The magnetic brake has no moving parts except the copper disk which is riveted to the bucket wheel and rotates in the air gap around the pole faces. The brake winding consists of a series and a shunt coil so proportioned that at full load the series coil neutralizes the magnetic effect of the shunt coil. Consequently no drag is produced on the rotating copper disk. When either the headlight or cab lamps are turned off, thereby reducing the current through the series winding, the field set up by the shunt winding is not entirely neutralized by the series field and produces eddy currents in the copper disk which results in a sufficient drag to hold down the speed of the rotor, thereby preventing over-voltage. The machine will run at its highest speed, 3,600 r. p. m., at full load, and any other condition produces a lower speed, unless an open circuit occurs between the brushes and brake windings. In this case, of course, no voltage is generated and the speed increases to approximately 5,000 r. p. m., a speed which the machine is made to withstand, however. This braking effect prevents burnt-out generator coils, for if an overload or short circuit occurs, the flux from the series coil overbalances the flux of the shunt coil, thereby producing a drag on the copper disk which is proportional to the amount of the overload. While the full-speed current of the machine is 15.2 amperes, and the speed 3,600 r. p. m., the short circuit current is about 12.8 amperes and the short circuit speed approximately 800 r. p. m. This form of governing is, therefore, not only simple, but it is also of value as a protection against burned-out windings. There are no moving regulator parts to become worn.

Railroad standards have been followed in the mechanical design. Only two sizes of cap screws and one size of nut are used, both sizes of cap screws being hexagon headed and slotted, so that if necessary the machine may be completely disassembled with the aid of an ordinary wrench and screw driver.

## Storage Battery Cars

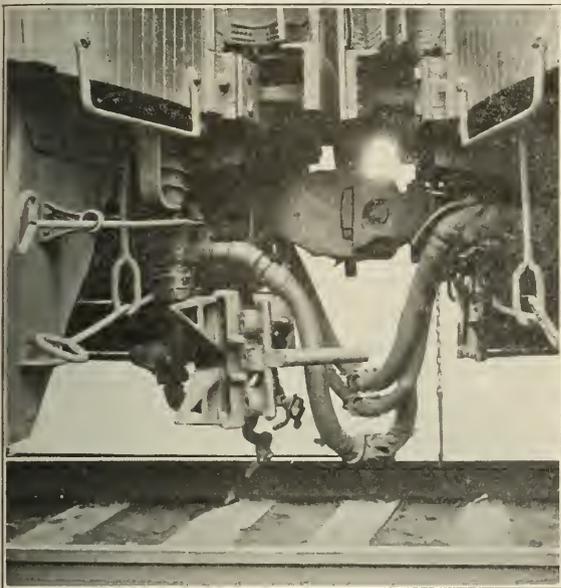

**S**TORAGE BATTERY CARS constructed according to M. C. B. standards and having the car body and its appliances of steel with the exception of doors and inside fittings, are exhibited and demonstrated by the Railway Storage Battery Car Company, New York. Motive power is supplied to the wheels through gears by four 250-volt direct current motors, and current is supplied by these motors by Edison storage batteries. These cars were described in detail in the April 19, 1919, issue of the *Railway Age*. One of these cars is making exhibition runs between Atlantic City and Ocean City, leaving Virginia avenue and the boardwalk at 10.00 A. M. and 3.00 P. M. The running time is 50 minutes for the round trip.

## The Union Automatic Train Line Connector

**A**N AUTOMATIC CONNECTOR for steam, signal and air brake train lines has been developed by the Union Connector Company, St. Louis, Mo., and is on exhibition. This connector is of the side port type, the gaskets registering in a plane making an angle of about one in seven with the center line of the car.

The connector is attached to any standard drawbar without welding or removing the couplers, by the use of attachments designed to meet the requirements of each application. Where the conditions permit, however, a lug may be welded to the drawbar to carry the connector. When new couplers are to be fitted with the equipment the lugs may be cast integral with the couplers. No

come together the gaskets are registered and the connector springs compressed  $2\frac{1}{2}$  in. each, thus holding the heads locked together. Before coupling, the springs are designed to hold the connectors in a fairly rigid posi-

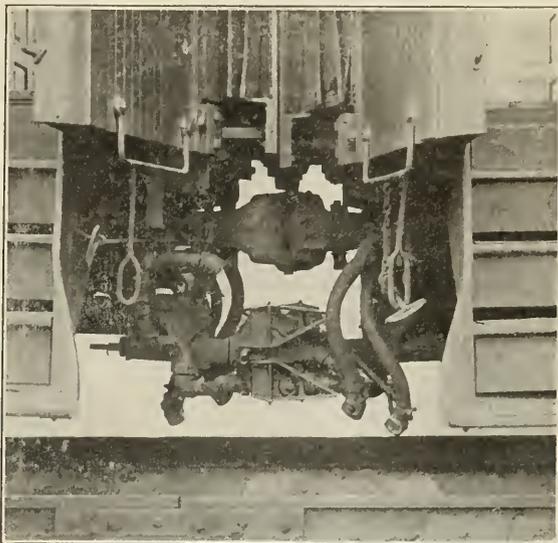

The Coupler Disconnected and Swung Aside for Interchange with Unequipped Cars

change in the air or signal hose need be made, as hose of standard length are attached to the connector by means of the standard hose couplings. This takes care of the interchange feature without the use of special dummy couplings, as it is only necessary to uncouple the hose from the connector to prepare for interchange with unequipped cars. The steam hose is ordinarily replaced with a flexible pipe connection leading to the connector. This pipe is screwed into a specially designed three-way end valve with two outlets, in one of which the standard steam hose may be screwed for interchanging with unequipped cars.

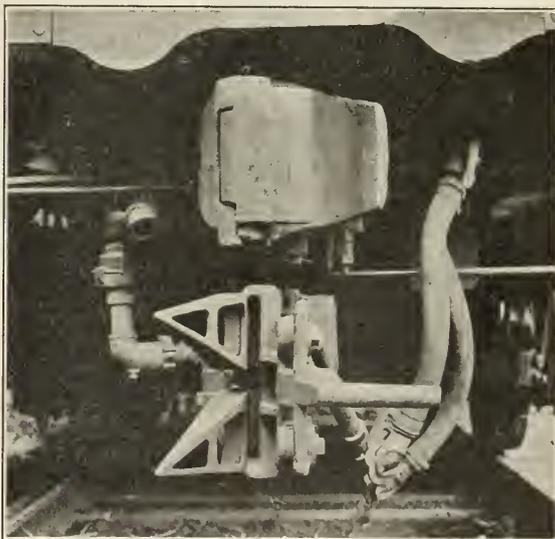

The connector has a gathering range of 11 in., both horizontally and vertically, which is about two inches more than the range of the car couplers. In registering horizontally the vertical tongue is gathered inside the points of the horns on the opposite head. Vertically, any variation in height is taken care of by the horizontally protruding pin, which is gathered between the upper and lower horns.

The connector is located with the center line of the brake pipe port about  $17\frac{1}{2}$  in. below the coupler, with the center of the gasket extending  $2\frac{1}{2}$  in. out from the inside face of the coupler knuckle. As two connectors

Union Automatic Train Line Connectors Coupled

tion, but when coupled the two connectors as a unit have universal freedom of movement, unhampered by the spring pressure. The side registering feature permits the use of light springs, the coupled compression of which amounts to only 250 lb. When interchanged with

End View of the Coupler

unequipped cars the connector is swung to one side, as shown in one of the illustrations, and locked.

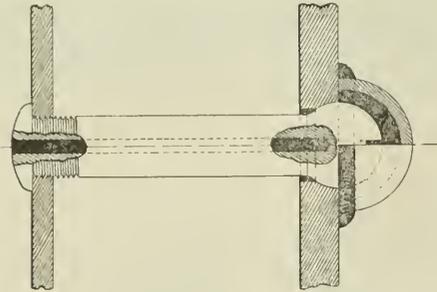

When coupled, the steam gaskets do not come in contact with each other, but remain loose in the heads. When steam pressure is admitted to the train line the steam forces the gaskets to close tightly against each

other. They are said to remain steam tight until condensation accumulates in the coupling, when it drains automatically without the escape of steam. The slight angle at which the gaskets register is designed to prevent any tendency for the gaskets to shear.

This connector has been developed as the result of a long period of service trials under a variety of conditions in which special attention has been given to the design of a device which will meet in a practical manner the requirements of interchange during the period when such connectors must frequently be used with unequipped cars.

## New Designs of Flexible Staybolts

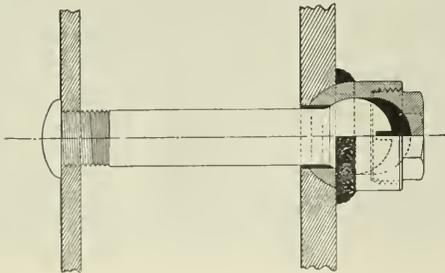

SEVERAL NEW DESIGNS of flexible staybolts, made feasible by the development of autogenous welding, are being exhibited by the Flannery Bolt Company, Pittsburgh, Pa. Electric welding is used to secure the caps and sleeves of flexible staybolts to the outer sheet for the purpose of doing away with the threaded sleeves and the tapping of the outer sheet, and in order to overcome

Hollow Flexible Bolt with Solid Cap

occasional troubles resulting from the leakage of sleeve threads. It also eliminates the uncertainties of the tooling operation in tapping the outer sheet to obtain perfectly tight installations of the sleeves in all instances.

The F. B. C. universal type of flexible staybolt contains a universal sleeves with inserted plug and gasket, that rests on a counterbored seat made in the outer plate at an angle corresponding with that of the staybolt. The round head Tate bolt has its bearing inside the sleeve,

Application of Universal Staybolt Sleeve

with sufficient clearance between the cap and the bolt head to obtain the necessary longitudinal movement under firebox expansion. The universal sleeve, when located on its counterbored seat on the plate surface, is held up tightly to the plate, and is then electric welded to the outer plate surface. Welding seals the connection tightly,

thus providing a reinforcement that adds strength to the plate section where the sleeve is applied. The bolt is then inserted through the sleeve and screwed into the firebox sheet until the round head takes its bearing in the sleeve. It is then riveted up and the plug and gasket are inserted in the sleeve.

The F. B. C. plain type of flexible staybolt is made in two designs. One design provides for seating the round head Tate bolt directly on the outer surface of the wrapper sheet, in a counterbored bearing. A one-piece cap is placed over the bolt head with ample clearance to allow for bolt movement, and is then welded to the outer plate. The closed cap used in this design necessarily demands a hollow staybolt and a drilled hollow Tate bolt is provided with a telltale hole extending from the riveted end of the staybolt to a point just beyond the round head, so that if a fracture should occur at any portion of the bolt beyond the round head it could be detected, provided it reached the telltale hole. The holes are cleaned out before inspections and tests. This design is very simple and no doubt will be found useful in certain types of firebox boilers. For locomotive boilers at the present time there is no ruling for inspection and test for a flexible bolt of this kind.

The other design provides for the use of a cylindrical housing with plug and gasket, welded onto the outer plate surface, covering the Tate staybolt, which is applied to the plate in the same manner as for the one-piece closed cap, thus allowing for the use of a solid bolt, and the removal of the plug in the housing for the periodical inspection and test of the staybolt.

At the Flannery Bolt Company's exhibit several models of the F. B. C. flexible staybolts are exhibited, showing the welded sections and separate parts, as well as the drilled Tate bolts, which can be used in the regular Tate flexible staybolt assemblages whenever it is thought advantageous.

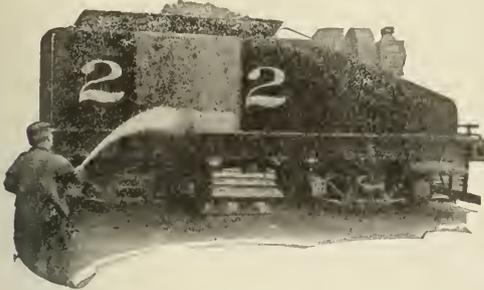

## Hvid Oil Burning Engine

THE HVID TYPE OIL BURNING ENGINE is being exhibited by Manning, Maxwell & Moore, Inc., New York. This engine operates with any liquid fuel and the fuel is not compressed before being fed to the engine. The small engines of this type are said to develop about 12 brake hp. hours per gallon of fuel oil and the larger engines 16 brake hp. hours per gallon. The small engines are started by cranking, while the larger ones are equipped with auxiliary air or engine starters. The fuel oil is completely burned so that there is no trouble with a carbon deposit; the exhaust is clean because of the high temperature in the cylinder at the time of combustion.

Briefly, the operation of the engine is as follows: During the suction stroke of the piston air is admitted to the cylinder through an intake valve. Simultaneously liquid fuel for one charge is admitted into the fuel cup by gravity flow. A small amount of air also enters the fuel cup, which is always open into the cylinder through small holes in the fuel cup. On the compression stroke of the piston the air in the cylinder is compressed to such a degree that it is heated to the point of ignition of the fuel, which is thus vaporized and ignited, creating a partial explosion in the fuel cup. The fuel is thus heated and then atomized through holes in the fuel cup into the cylinder, where it is completely burned. The pressure generated forces the piston through a power stroke. On the following exhaust stroke the piston expels the burned gases through the exhaust valve and the cycle is repeated.

## Removing Old Paint

REMOVING THE OLD PAINT from steel passenger and freight cars, locomotive tanks, structural steel, trucks, underframes, locomotive jackets, etc., is often as much of a problem as the repainting job itself; while methods of quick applications of new coats of paint have been brought to a high point of efficiency, the

Removing Old Paint with Solvit Compound

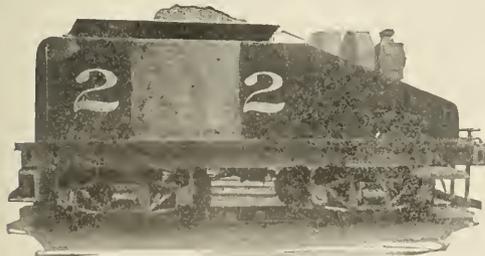

various procedures incident to the removal of old paint have offered room for improvement.

A new paint dissolving solution called Solvit has been recently brought out by Mudge & Co., Chicago. It is said to be non-inflammable, easily applied to flat surfaces and being of the proper consistency, will adhere easily to any vertical surface. One of the greatest difficulties

Before Applying Solvit Compound

met with in the use of many paint removers is the tendency of the remover to dry within a short time after it has been applied; it is necessary constantly to spray such removers with water. This of course means additional time, labor and expense. Solvit will remain moist for from 10 to 24 hours, and when once applied further attention is unnecessary until the paint is in condition so that it can readily be scraped or washed off. After being applied it is allowed to remain from one-half to six or

Immediately After Applying Solvit Compound

seven hours, depending entirely on the thickness of the paint to be removed. After it has thoroughly penetrated the paint, the latter may be easily removed by using hose

and water or a scraper knife, leaving a clean surface for refinishing.

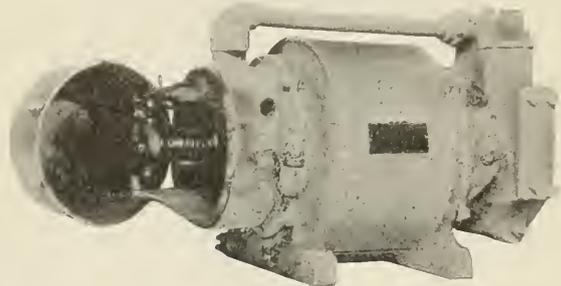

This compound is recommended for use on metal objects only, with the exception of brass and aluminum. It is not recommended for the removal of paint and varnish from wooden surfaces. The liquid can also be used for cleaning and renovating interior walls, hoppers, dining car kitchens, etc.

The photographs show one of the methods of the application of Solvit in removing the paint from a switch engine tender. The liquid may be applied with a brush, but for the purpose of speed and economy the method shown in the second illustration is recommended.

## Alternating Current

### Headlight Generator

THE GOULD COUPLER COMPANY, New York, is placing on the market a new 500-watt, 32-volt turbo-generator for locomotive headlights. The generator is designed on an entirely different principle from any of the headlight equipments that have heretofore been marketed. It is an alternating current device and combines a number of advantages that are inherent with this type

The Open Cover Shows the Absence of Brushes and Commutator

of machine. There are no rotating wires, no commutator, no brush holders or brushes. The rotating element revolves in ball bearings.

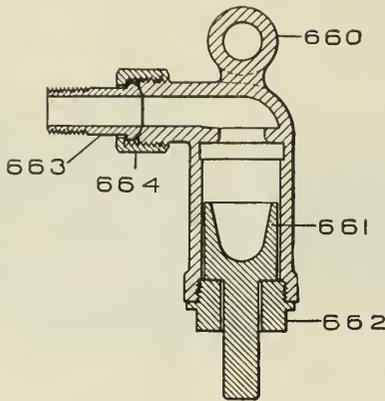

More electric headlight trouble and headlight failures can be attributed to commutator and brush trouble than to any other source, and in view of the fact that there are a great number of locomotives which must soon be equipped with electric headlights, the generator should receive most critical attention.

## Pivoted Type D Passenger Coupler

THE MCONWAY AND TORLEY COMPANY, Pittsburgh, Pa., is showing an adaptation of the new standard D coupler with pivoted head for use on passenger cars. The coupler head and shank are separate members and are connected in pivotal fashion by means of a 2 $\frac{3}{4}$  inch pin. In the shank are mounted devices, simple, compact and readily accessible, for centering the shank on the car and for holding the coupler head normally in alignment with the shank. The coupler head and all contained parts are "standard D," the rear portion of the head being designed properly to co-operate with the shank and centering device, the whole forming an equipment having the flexibility recognized as being so essential for passenger car service and providing for the use of standard D parts.

## Sellers Injector Indicator

THE USUAL FORM of "tell-tale" for non-lifting injectors warns the engineer by discharging a jet of steam into the cab when the injector blows back. The indicator illustrated herewith, and which is exhibited by William Sellers & Co., Inc., not only performs the function of tell tale without discharge of steam into the cab, but, in addition, advises the engineer if the injector is wasting water at the overflow and enables the operator to adjust the feed valve to the actual maximum or minimum capacities of the injectors. Its action depends upon the well-known principle that when feeding without waste there is always a partial vacuum within the overflow chamber of an injector of the gravity overflow type. This vacuum is utilized to raise the loosely fitting piston to its upper seat, causing the projecting plug to disappear from view. If, for any cause, the injector starts to waste, the vacuum within the overflow chamber is broken, the piston drops to the lower end of its stroke and exposes the projecting plug. The operator is thus warned and will partially close the lazy cock, stopping the waste.

Injector Indicator

If there is an interruption of the water or steam supply, and the injector "flies off," the piston will instantly drop to its lower seat, preventing outflow of steam; the engineer will be again warned of the danger.

A further advantage of this form of indicator is that it enables the engineer or fireman to obtain the actual minimum capacity and adjust the feed to the varying needs of the boiler. Most operators do not regulate the water supply closely, fearing that the injector may break off without warning, or waste at the overflow. The indicator is so sensitive to conditions in the overflow chamber that the exact minimum can be obtained by regulating the lazy cock until the end of the piston appears, due to the loss of the vacuum in the overflow chamber; a very slight opening of the lazy cock will cause the piston to rise and the exact minimum is obtained, with resulting economy of fuel.

Further, the application of the indicator will reduce the tendency of the engineer to close the heater valve, which prevents the injector from restarting automatically, so that this form of indicator materially increases the safety of the boiler feeding system. The Sellers indicator makes the non-lifting injector as safe and certain to operate by night or day as an open overflow lifting injector.

It is said to be applicable to the Sellers, Nathan WF,

Nathan Simplex, Chicago, and other forms of non-lifting injectors using an overflow chamber containing the combining tube and closed against the atmosphere by a gravity overflow valve.

## Chrobaltic High Speed Cutters

MILLING MACHINE CUTTERS cast from high speed steel are one of the new products developed to meet war-time demands, which are being exhibited at the convention. The demand for high speed steel for munitions work taxed the available supply of tungsten, and to meet the emergency the Chrobaltic Tool Company, Chicago, developed a high speed alloy steel made without tungsten, known as Chrobaltic alloy. This new product not only makes the use of tungsten unnecessary, but also saves material and high priced labor, as it can be cast into the most intricate shapes.

Chrobaltic alloy has been used in the manufacture of milling cutters, blanking, drawing and forming dies and hot and cold trimmers. It offers remarkable resistance to abrasion and is therefore particularly adapted for gages and similar instruments. The cutter or tool is cast to practically the finished form, leaving from  $\frac{1}{16}$  in. to  $\frac{1}{8}$  in. for finish, and the tools are machined to within a narrow tolerance before heat treating. Final finish, however, is attained by grinding as in the case of regular high speed steel cutters. These new high speed steel castings have the appearance of good smooth forgings. They are practically non-rusting and acid-resisting, and their grain is uniform and dense. The heat resisting qualities of the new alloy are high and it does not scale in the fire, thus adapting it to milling cutters having very thin cutting edges. The cast tools are furnished in the finished state ready for use, or they are supplied in annealed form to the customer who machines them to accurate dimensions and hardens them for use. They may be hardened in oil or air, and the process of annealing and rehardening may be repeated many times without losing any of the properties of the steel.

Annealing is effected by heating to 1,832 deg. F. in closed muffle furnaces and allowing the part to cool slowly. However, very rapid annealing may be effected by heating slowly to 1,202 deg. F. in a muffle furnace or in a blacksmith's fire, allowing the temperature to fall there to a black heat, and afterward cooling naturally in still air or quenching in boiling water. After annealing, the casting should show about 38 scleroscope hardness. It can then be machined at the rate of 25 to 30 lineal ft. per minute.

To harden Chrobaltic cutters, they should be heated slowly in a hardening muffle furnace to 1,832 deg. F. to 1,877 deg. F. and held at this heat until the tools are thoroughly soaked. The heat is then allowed to drop about 20 to 50 deg., at which heat the cutter is withdrawn and quenched in oil. Good results may also be obtained by allowing the cutter to cool in still air until the red disappears and is invisible in the shade, then quenching in oil. The slight drop in temperature while the tool is still in the hardening furnace is important. On very large milling cutters, a blast or air current may be used to accelerate cooling before quenched in oil.

In comparing the cutting and wearing qualities of Chrobaltic alloy with those of tungsten high speed steel, there is practically no difference where the ordinary temperatures in service are involved, but in abrasive service, as in the machining of phosphor bronze, white metals, etc., as much as ten times the wear is obtainable from Chrobaltic cast cutters.

## Type E Locomotive Feedwater Heater

**A**LTHOUGH THE TYPE *E* HEATER of the Locomotive Feed Water Heater Company, New York, has been in service over two years it has never before been seen at the convention. A half-size model is being shown embodying the corrugated agitator feature that is responsible for results beyond what was even hoped for.

This type is a development of the double tube or corrugated film type that was shown at the last convention. It was found that a higher heat transfer could be obtained by agitation of the water in the tubes. Metal agitator strips were therefore introduced in  $\frac{3}{4}$ -in. brass tubes. The tubes are four feet or more in length between tube sheets and are arranged in groups so that the water makes the passage of four different lengths of tubes in going through the heater, giving it a travel of over 16 feet in the tubes.

Within each tube is a spirally corrugated agitator made of this brass stripping. These agitators have stops at one end which overlap and interlock and prevent the agitator from turning in the tube. The water in passing through the tube and around the agitator is constantly impinging against the inner surface of the tube. This results not only in the high transfer of heat for a given area, but also scours the inside of the tube and keeps it clean.

Heavy cast iron headers are bolted to the tube plates and are arranged with partitions which cause the water to flow through the four passages in succession. These headers are easily removable for inspection. One of the

Sectional View of the Type E Heater

tube plates is larger than the other and is arranged to be secured to the end of the cast iron body which encloses the whole nest of tubes. The smaller tube sheet is allowed to move freely in a longitudinal direction within the body and thus provides for the difference between the expansion of the brass tubes and the cast iron shell. This end of the shell is enclosed by a casing to prevent the escape of the exhaust steam around the floating header.

Feet for securing the heater to the locomotive frames are formed on the body and elbows are provided for connection with the pipes leading from the exhaust passages in the cylinder. A drain is provided at the bottom of the shell for clearing away the condensed steam. It will be noticed that there is a baffle plate at the top of the nest of tubes to prevent the impinging of the steam directly on the tubes, and a tube nest guard is placed at the bottom to prevent damage to the tubes when the nest may be removed for any purpose.

Inlet and outlet water connections are provided at one end of the heater, the arrangement being for a flanged pipe connection to allow the removal of the header without disturbing the pipe lines. A thick coating of asbestos lagging is placed around the body of the heater and this is covered with a sheet steel jacket.

A point of special interest in this heater is the form of joint used for the connection of the tubes and the tube sheets. This joint includes a groove in the tube sheet about midway between the two faces, and as the brass tube is rolled the metal is forced into this groove. Experience has shown that by employing this construction a leaky tube at its connection with the tube sheet is practically unknown.

A drain is provided at the inlet end of the heater which, when opened, will remove the water, not only from the heater but also from the pipe leading to the pump and the connection as far as the check valve at the boiler. Thus by opening the drain on the end of the heater all of the line between the pump and the boiler check valve is easily drained.

Connections are provided to receive the exhaust steam pipe from the boiler feed pump and also from the air pumps at the back of the elbows on the top of the heater body.

This design of heater has been developed after three years' practical experience in locomotive service and is the result of a most careful study of roundhouse and shop conditions as well as regular road service.

A boiler feed pump designed especially for this work, has been developed by the assistance of the Westinghouse Air Brake Company. This pump has operated under the most difficult conditions with a slip of not over four per cent and a steam consumption of not over 70 lb. per water horsepower at any point of the range of capacity. The pump will consume less than two per cent of the capacity of the boiler and the amount to be deducted from the theoretical saving of the feedwater heater is less than two per cent.

Between 65,000 and 70,000 lb., or from 7,800 to 8,400 gallons of water an hour can be handled by this pump at its maximum rate. A normal continued rate of 50,000 lb. or 6,000 gallons an hour is maintained with quiet action.

The steam end is essentially the standard  $9\frac{1}{2}$ -in. locomotive air compressor of the Westinghouse Air Brake Company. All standard  $9\frac{1}{2}$ -in. air pump parts for the steam end are used in the water pump. On the water end the effort made was to develop a rugged construction with every part easily accessible for inspection and of the simplest and strongest design.

Valve chambers containing the suction and discharge valves are located on either side of the water cylinder in order to get ample volume for the free passage of the water and at the same time keep the pump within clearance limits for attachment to the side of the locomotive. The valves are located in groups of five, each side containing two sets, one for suction valves and one for discharge valves. Each set of five valves is arranged in a separate removable deck which is held in place by a center bolt. The stops for the suction valves are part of the upper or discharge deck and the stops for the discharge valves are attached to the valve chamber cover.

By using this large number of valves in each deck it is possible to get the desired area of opening with a very small lift of the valve, which gives high efficiency and also results in greatly reduced maintenance cost. With the low lift the valves do not pound themselves and their seats, or start leaking nearly as soon as would valves of larger size. Bronze valves and valve seats are used

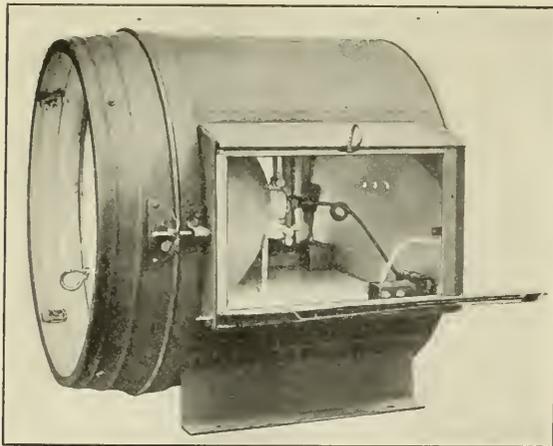

and over each is a light bronze spring insuring quick and positive action to each valve.

An accepted standard water packing is used on the water piston and the construction at this point is extremely simple. It incorporates a follower plate which carries an adjusting screw in the center for following down the packing, if necessary. Experience has shown that very little attention is required at this point. The packing should need renewing only at the shopping of the engine.

This pump has a fire hose connection at the bottom of the air chamber. Suitable provision is made for a careful draining of all parts of the pump in case the locomotive is to be laid up dead in cold weather.

## Electric Headlight and Generator

THE SCHROEDER HEADLIGHT AND GENERATOR COMPANY, Evansville, Ind., has improved its equipment by the addition of several devices. Automatic disconnecting switches have been applied to the headlight so that the reflector and other internal parts in the head-

Headlight with Side Open, Showing Disconnecting Switches

light case may be removed without the necessity of disconnecting any wires. Another improvement in the headlight makes the interior of the headlight easily removable and at the same time holds it firmly in position under all conditions of vibration to which headlights are subjected.

A piston valve, operated by the governor which controls the flow of steam and the speed of the turbine, has been added. The makers claim that this valve has done away entirely with the sticking of the valve caused by deposits of lime or other foreign substances common to localities where the water is bad.

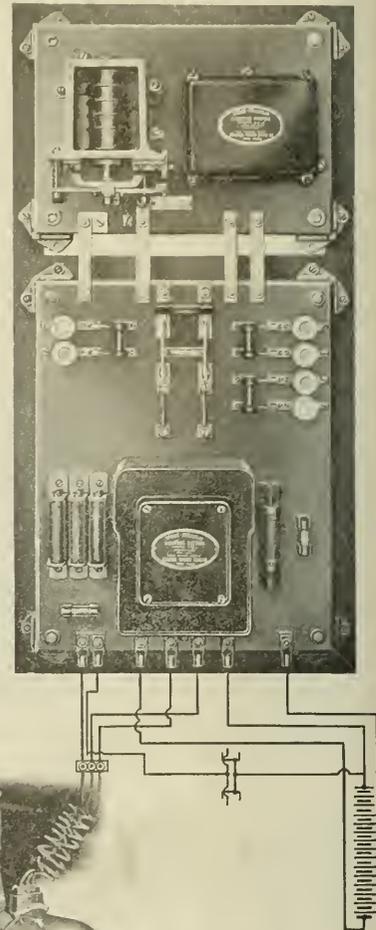

## Car Lighting Equipment

THE STONE FRANKLIN COMPANY, New York, has introduced a single battery system of car lighting, the operation of which is based on principles never before applied to car lighting equipment. It has been discovered that with constant output from the generator there is a certain relation between voltage and current delivered to the battery when gassing commences. When the charge reaches the gassing point the rate of charge is automatically reduced. In this way excessive gassing

is prevented and the amount of flushing required is greatly reduced.

Lamp voltage regulation is obtained in the same manner as with the two battery system, except that the regulating voltage is obtained from the one battery.

Four devices control the operation of the equipment. These are the constant watt generator output by speed control, the auto triplex switch, the reducer switch and a relay. The sequence of operations is quite simple. When the speed of the train is sufficient to bring the generator voltage up to the proper value the auto triplex switch connects the generator with the battery. Five contact fingers on this switch, without any adjustable springs, interpose properly proportioned lamp resistance for any supply voltage, and finally connect to the posi-

Panel, Generator and Connections

tive lighting circuit, a battery potential equal to the lamp voltage potential which is used for lamp voltage regulation.

As the battery approaches the gassing point the voltage rises and the current falls off. When gassing commences the relative values of voltage and current are such as to cause the reducer switch to operate. This switch shunts

out a part of the generator current through a resistance thereby reducing the rate of charge of the battery. It also prepares the relay to operate at a predetermined battery voltage. After reduced the charge rate has been continued for a period of time, the relay disconnects the generator by opening the triplex switch when the battery voltage has increased to a certain predetermined value.

A change of adjustment of the reducer switch makes it possible to use either lead-acid or alkaline batteries with the same equipment. If two batteries are wanted for dining car or private car service they may be taken care of by the addition of a change-over switch.

## Babcock Water Gage Protector

THE JOHNSON BRONZE COMPANY, New Castle, Pa., is exhibiting an improved design of the Babcock water gage protector, which is intended to improve materially the visibility of the water gage glass for observation with either natural or artificial light. The protector possesses all of the features formerly incorpor-

Babcock Water Gage Protector with a Slot in the Casing to Illuminate the Interior

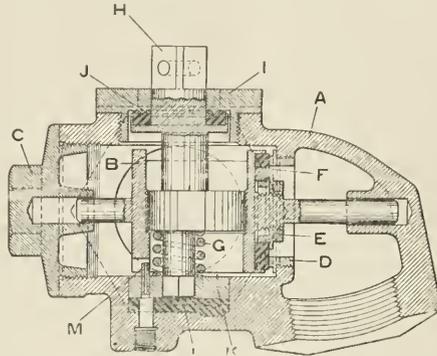

ated in the design, which include the heavy cast bronze body, the double observation glasses, each of  $\frac{3}{16}$ -in. glass plate, and the outlet for steam, hot water and broken glass in the event of a broken gage glass.

The new feature consists of a narrow slot in the front of the protector, which, by admitting the light, either natural or artificial as the case may be, illuminates the gage glass in such a way as to clearly show the water level to the engineer and fireman on opposite sides of

the cab. The photograph shows the front of the protector with the slot for admitting light in the casting behind the front window.

## Packless Steam Heat End Valve

IN RELIEVING THE CONDENSATION at the rear end of passenger train heating lines, the general practice has been to open the end valve slightly. This, however, has not proved satisfactory, and many different devices have been designed to take care of this drip automatically. All of these have been arranged to drain through the hose and have frequently caused freezing and decay of the hose. The Gold Car Heating & Lighting Company, New York, has recently developed a new end valve known as No. 1126, in which the drip is automatically re-

Section Through the Center of Valve

lieved through the valve itself, thus eliminating the continual dripping through the hose. The valve is also of a packless design and will not leak around the stem.

In the sectional view of the valve it will be seen that it is of the piston type, similar to existing Gold end valves. A composition disk *F*, insuring a tight valve when it is closed, is mounted on the face of the piston. A composition disk *L* is located in the base of the valve and is held stationary in its position. The seat *K* is of metal and rotates against the composition disk *L*. The metal seat *K* also has a sliding motion on the base of spindle *H*, so that the pressure from spring *G* will force it to a positive contact with the composition disk *L*, thus insuring a positive seat. A hole in the seat *K* and the disk *L* is so located that when the valve is closed (Piston *B* being forced to the right by the cam on spindle *H*) the seat *K* will rotate to a position so that the holes are in line, thus allowing condensation to drip out. The spring *G* presses the spindle *H* upward firmly against the bonnet. With the disk *J* at this point a leak is practically impossible, thus doing away with the packing at this point.

A quarter turn fully opens or closes the valve, and it cannot be jarred from its set position by the vibration of the train, or be unseated by the steam pressure. The valve is substantially built, the body being of iron and the cam and spindle of brass cast in one piece. The spindle is short and of large diameter and should keep in perfect alinement for a long period. The distance from center of the train pipe to the top of the spindle is  $2\frac{3}{4}$  in., and it will clear any adjacent apparatus.

The area of the passage in the valve is so large that it offers less resistance to the flow of steam than the train line itself. The seats of the valve are renewable and can be replaced without disconnecting any piping. In addi-

tion to relieving the hose of the effects of the continual drip incident to the condensation passing through the hose coupling, it is also a protection to the trainmen when incoupling the hose, as the opening between the train line and the hose is tightly closed when the valve is shut.

## Valve Gear for Standard Locomotives

**I**N SPITE OF THE ARMY of conscientious objectors to the so-called "monkey motion"—a term once sarcastically applied to all types of outside valve gears—and strong predictions from some "old timers" that "they would scrape it off on the corners of box cars as they pass," eccentrics and links seemed to disappear almost over night. In their places appeared the comparatively simple, accessible and more trustworthy steam distributing mechanism, deriving its motion from the crank pin and the crosshead. Evidence of continued thought and consideration for the betterment of the Baker valve gear in contending with the regularly increasing demands made upon it, is contained in the announcement by its manufacturers, the Pilliod Company, New York, of recent changes in its construction to comply with the requirements of the United States Government standard locomotives. For passenger engines, cast steel frames, vanadium cast steel bell cranks and drop forged reverse yokes, radius bars, connecting rods and other minor parts will henceforth be standard. On freight and switch engines all frames will be of cast steel. All principal gear parts will be of vanadium steel except the radius bar, which will be drop forged.

More than 800 of the Railroad Administration standard locomotives have been equipped with this valve gear.

## Four-Wheel Drive Auto Truck

**T**HROUGH THE COURTESY of the War Department the Four-Wheel Drive Auto Company, Clintonville, Wis., is exhibiting a three-ton, four-wheel driven truck, which is one of over 17,000 of these trucks used by the Allies and the United States Army during the war.

Four-Wheel Drive Ammunition Truck

The artillery repair trucks which are included in the exhibit of U. S. Army ordnance, are also of the same type.

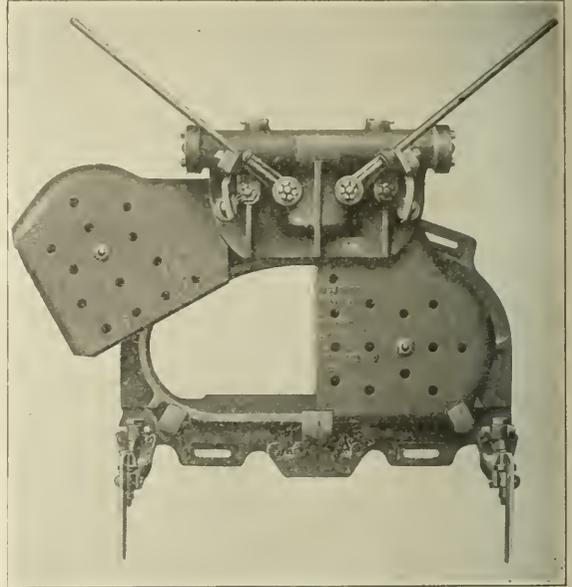

The feature of this truck is its high tractive power,

made possible by the utilization of all four wheels for driving the truck. To effect uniform traction on all wheels the weight of the truck is also equally distributed and the same size tires are used all around. This truck is readily adapted to run on railway track by the substitution of flanged steel tires for the solid rubber tires ordinarily used. No change in gage is necessary in making this conversion.

Such an application has already been made on the Northwestern Pacific, where one of these trucks is handling two 40,000-lb. dump cars and two 60,000-lb. flat cars on a 1.2 per cent grade. This installation indicates the adaptability of the truck to railway contractors' work.

## Double Butterfly Firedoor

**A** DOUBLE DOOR that provides for the independent operation of each fire door has been developed by the Franklin Railway Supply Company, New York, and is known as the Franklin double No. 6 type. This door is used on openings from 20 in. to 36 in.; the latter is the widest so far made. Its use cuts down by one-half the

Double Butterfly Door for Wide Fire Door Openings

amount of air entering the firebox opening, as it is used only when the opening of one side will admit a coal scoop.

The single operating cylinder contains two pistons that work in opposite directions, each operating one door by means of a link connection. The construction of the pistons and port valves and foot levers is the same as in the single operating Franklin No. 8 door, one for the right hand and the other for left hand operation. This does away with the use of the gear in automatic operation. While this type of door still retains a gear, it is for hand operation only. The door is also arranged so that it can be opened by hand so as to uncover the entire opening to permit passing grate bars through the door frame. This arrangement of door is now being applied in place of the horizontal or vertical double doors to engines having a wide fire box and a large fire door opening.

Entered at the Post Office at New York, N. Y., as mail matter of the second class.

Subscriptions, including 52 regular weekly issues and special daily editions published from time to time in New York, or in places other than New York, payable in advance and postage free; United States and Mexico, \$5.00; Canada, \$6.00; Foreign Countries (excepting daily editions), \$8.00 (£.15s; 0d.); single copies, 15 cents each. Subscription Agents for Great Britain and Egypt: The Dorland Agency, Ltd., 16 Regent Street, London, S. W. 1.

WE GUARANTEE that of this issue, 16,825 copies were printed; that of these 16,825 copies, 15,406 were mailed to regular paid subscribers to the Railway Age and the Railway Mechanical Engineer; 119 were mailed to advertisers, 300 were provided for counter and news companies' sales, new subscriptions, bound volumes, copies lost in the mail and office use, and 1,000 copies for distribution at Atlantic City.

THE RAILWAY AGE is a member of the Audit Bureau of Circulations (A. B. C.) and the Associated Business Papers. (A. B. P.)

The convention which will close to-day will be unanimously voted the most successful mechanical convention ever held. It may have a great influence upon the efficiency of American railroads in future. Railroad expenses at present are extremely high chiefly owing to increases in the wages of labor and the prices of fuel and materials. If greater economy of operation is to be secured, it must be done chiefly by using less labor, fuel and materials to move a given amount of traffic. Greater efficiency in the use of labor, fuel and materials can be obtained only by the employment of better operating methods and better machinery and equipment. The better methods of operation must be worked out principally by railway officers.

## The Most Successful Convention

The better machinery and equipment must be provided by the railways and the railway supply companies jointly. Never was so much equipment and machinery adapted to saving labor and materials on railways shown at one time and in one place as has been shown on the Pier at Atlantic City within the last two weeks; and never was such equipment and machinery examined by so many railway operating and mechanical officers in so short a time. Equipment and machinery to save labor cannot be provided by the railways in sufficient quantities to accomplish the maximum practicable results unless they have available the money which must be spent in order to buy it; and they cannot get enough money unless their rates are made reasonable and their earnings adequate. There are strong indications, however, that after the carriers are returned to private operation they will be regulated in a more liberal and intelligent manner than they have been in the past; and if they are, railway officers, realizing bet-

ter than they ever did before, both the imperative need for better methods and machinery, and the fact that better machinery is available if they can only buy it, will introduce an era of increasing efficiency in operation that will surpass any known in the past. The interest, the optimism and the enthusiasm shown by both railway men and railway supply men or this convention is a good omen as to the future of both the railway and the railway supply industries.

## The Electric Headlight Situation

THE REPORT OF THE COMMITTEE on electric headlights of the Association of Railway Electrical Engineers which was presented before the semi-annual convention of the association on Monday, and which was again read before the meeting of the Mechanical Section of the American Railroad Association on Tuesday deals with a subject which is a particularly live one at the present time because of the large number of locomotives that are being equipped with headlights. The first presentation of the report provoked a great deal of discussion and brought out many and diverse opinions as to just what should be considered as standard practices in the various parts of the equipment. While the work of the committee indicates that it obtained information from a large number of roads as to the practices that are being used, it is plainly evident that the time is not yet ripe to bring about a complete standardization of locomotive electric headlights, is not probable or advisable. There will eventually be standard practices adopted in some of the roads will all agree on the same methods of installing the wiring, conduit, switches, turbo-generators, etc. Unquestionably the several roads will retain their own practices to a large extent. Although methods of installation cannot be generally agreed upon there are certain parts of the electric headlight which can be made standard, such as the capacity of the generators, voltage of the lamps, kind of wire to be used, as well as lamp fixtures. These parts can readily be made standard on all roads and have already been made so to a large extent. The actual necessity for standardization of methods of installation is not a paramount issue, however, since locomotives are seldom used on any other than their own lines and the equipment adopted by any one line will not conflict in any way with the practices of the other lines.

The report as submitted by the committee should not be considered as a final attempt at standardization, but rather as an outline which represents the main features of present practice on a number of the largest roads and something which may be changed from time to time as necessity seems to dictate.

## Economics of Stoker-Fired Locomotives

THE REPORT OF THE COMMITTEE on Locomotive Stokers showed that while great progress has been made in applying stokers to locomotives, little or no work has been done during the past two years with a view to determining the results secured or the net effect of stokers on the cost of conducting transportation. The report contained several suggestions regarding matters in connection with mechanical stokers which required further study. The cost of stoker maintenance as reported by the roads using them, showed wide variations. In view of the difficulty experienced in operating stokers with certain kinds of coal it might be well to keep a separate record of the cost of maintaining the crusher in order to

determine whether the cost of maintenance could be reduced by eliminating this feature and preparing the coal at the chutes. The method of operating stokers to secure the maximum fuel economy was mentioned in the course of the discussion, and while it is not certain that it has any marked influence some consideration should be given to the matter.

The committee stated that the size of a locomotive is not the controlling factor in determining the advisability of applying a stoker. Any data that could be furnished to enable the roads to judge the advisability of equipping a given type of locomotive with a stoker would prove extremely valuable and it is to be hoped that the committee will carry on investigations with this object in view.

The economics of the operation of stoker-fired locomotives are so important that tests should be arranged to determine the most economical methods under various conditions. Stoker-fired locomotives can be worked at higher rates of combustion than hand-fired engines and as a rule the increased evaporation secured is utilized to haul heavier tonnage, although it might be used to increase the speed of the train. As the rate of combustion increases the efficiency decreases, but the heavier tonnage hauled reduces the cost of wages on the ton-mile basis an amount which is generally assumed to more than compensate for the increase in the cost of fuel. The maximum economy of operation cannot be secured unless it is definitely known whether the combined cost of fuel and wages per ton-mile decreases constantly with the increase in tonnage up to the point where the locomotive is loaded to the limit of the available tractive effort. It is to be hoped that the next report of the committee will include cost data bearing on this question.

## Pyrometers for Superheater Locomotives

IN DISCUSSING THE REPORT of the Committee on Superheater Locomotives one of the speakers urged the use of pyrometers to check the temperature of the steam and characterized the device as quite as necessary as the steam gage. There is no doubt that an increase in the efficiency of locomotives could be secured by the use of pyrometers and the fact is realized by motive power officers. It remains to be seen whether the device will be generally adopted or whether a long campaign of education will be required before it is recognized as a necessary adjunct to the superheater. The railroads are generally slow to adopt anything that adds to the cost of maintenance even though the increase is justified by the results obtained. It goes without saying that the pyrometers will require some attention, although the instrument now being offered for this purpose is very rugged and specially adapted for the purpose.

In considering the advisability of equipping superheater locomotives with pyrometers one important advantage secured by their use should not be overlooked. The pyrometer serves as a check on the operation of the locomotive and discloses conditions that could otherwise be determined only by very careful inspection. Mechanical department officers realize that due to hidden defects or improper operation the full benefit of the superheater is often not secured. The expense of examining locomotives every trip to determine whether draft appliances are in good condition, superheater flues clean and superheater unit joints tight would be prohibitive. The pyrometer will immediately show up any of these defects which reduce the degree of superheat. Furthermore, the improper methods of operation would be brought to the attention

of the enginemen by the decrease in the degree of superheat and they would be enabled to correct such practices. In short, the pyrometer would lighten the work of the inspectors and locomotive supervisors and would be of great value in insuring proper maintenance and operation. The railroads spend large amounts in order that they may occasionally check the condition of the equipment. It should certainly prove advantageous to maintain such a device as the superheater pyrometer, which would disclose many important defects affecting the efficiency of the locomotive as soon as they occur.

## Constructive Suggestions for the Mechanical Section

IN THE ADDRESS of W. J. Tollerton, printed in yesterday's issue, numerous subjects were mentioned to which the Mechanical Section might well devote its attention. Among the most important of these are two which have been touched on before, but should be taken up with renewed interest because under the present organization there is a better opportunity for dealing with them than has existed before. One of these is the question of engine terminals; the other the establishment of a co-operative research bureau.

It is 15 years since the Master Mechanics' Association had a comprehensive report or paper dealing with the design or operation of round houses. The conditions have changed greatly since then, and as stated by Mr. Tollerton the development of the locomotive has outstripped the improvements in the terminals. The need for improved facilities was very evident during the winters of 1917 and 1918, when great difficulty was experienced in caring for power at the terminals. Since the introduction of the report prepared by the Operating Statistics Section showing the distribution of locomotive time it has become apparent that even under normal conditions motive power is delayed unreasonably long at many roundhouses. By comparison with the cost of locomotives the investment in terminals is small and efficient roundhouses, cinder pits and coal chutes will bring large returns in the increased efficiency of the motive power. Under the circumstances the question of terminal design and management should be an excellent subject for a committee report and since engineering as well as mechanical problems are involved the engineering Section of the American Railroad Association might be invited to co-operate in the preparation of a paper on these subjects.

Mr. Tollerton advocated the establishment of a co-operative research bureau, and the applause which greeted his remarks showed that the members were in sympathy with the project. Some of the investigations that should be undertaken by such a bureau were outlined in the chairman's address. The need is apparent, and if a practical working plan can be drawn up the American Railroad Association could probably be induced to provide the funds for carrying on the work. There is no reason why this should not be started without delay, as some of the universities having facilities for such work have in the past expressed their willingness to conduct investigations in co-operation with the railroads. The failure to establish a co-operative laboratory has been largely due to a lack of funds, but if the financial assistance of the parent association can be secured, the Mechanical Section will have an opportunity for carrying on research that should point the way to improved practices that will effect marked economies in operation.

## Program For Today

9.00 A. M. TO 1.30 P. M.

Discussing of Reports on:	
Design, Maintenance and Operation of Electric Rolling Stock.....	9.30 A. M. to 10.00 A. M.
Individual Paper on "The Use of Bronze for Valve Snap Rings and Piston Surfaces, and Bull Rings in Large Cylinders, to Prevent Rapid Wear and Cutting of Cylinders and Valve Bushings".....	10.00 A. M. to 10.30 A. M.
By Mr. C. E. Fuller.	
Discussion of Reports on:	
Train Resistance and Tonnage Rating .....	10.30 A. M. to 10.45 A. M.
Subjects .....	10.45 A. M. to 11.15 A. M.
Powdered Fuel.....	11.15 A. M. to 11.25 A. M.
Resolutions, Correspondence, Etc...	11.25 A. M. to 11.35 A. M.
Auditing .....	11.35 A. M. to 11.40 A. M.
Unfinished Business .....	11.40 A. M. to 11.45 A. M.
Questions Proposed by Members...	11.45 A. M. to 12.30 P. M.
Closing Exercises .....	12.30 P. M. to 1.00 P. M.

## Transportation Committee—Attention!

**M**EMBERS OF THE TRANSPORTATION COMMITTEE are requested to meet in front of Mr. Young's house on the Pier at 12 o'clock to-day to have a group photograph taken.

## Section V, Transportation, Meeting

**I**N THE PARK AVENUE ROOM of the Marlborough-Blenheim Hotel this morning at 10 o'clock, there will be held a meeting of Section V, Transportation, American Railroad Association.

## President of A. R. A.

### Congratulates Chairman Tollerton

**W.** J. TOLLERTON on Monday received the following telegram from R. H. Aishton, the newly elected president of the American Railroad Association: "My sincere congratulations on your election as chairman of the Mechanical Section of the American Railroad Association."

## Presentation of Badge to E. H. Walker

**A**T THE MEETING of the Railway Supply Manufacturers' Association on Saturday, the presentation of the past president's badge to E. H. Walker was overlooked. The general committee of Section III, Mechanical, has extended an invitation to the Supply Manufacturers' Association to attend the Wednesday session near the close of the convention and the presentation ceremony will take place at that meeting.

## Lost and Found

**FOUND**—R. S. M. A. badge, number 2775. Apply at Enrollment Committee office.

**LOST**—Badge No. 4026. Return to *Railway Age* booth.

**LOST**—A gold watch this morning on pier. Return to J. D. Conway's office if found.

**LOST**—Lace filet collar on pier this morning by Mrs. W. F. Robinson, Room 553, Dennis. Return to J. D. Conway.

**LOST**—Following badges in Secretary's office: 2775, 3679, 3922, 4209, 4334.

H. S. Wall, mechanical superintendent of the Santa Fe Coast Lines, lost a five-eighth carat diamond on the Pier. Finder will please return to *Railway Age* booth.

## E. H. Bankard, Jr., on the Executive Committee

**E.** H. BANKARD, JR., who has made such an excellent record this year as chairman of the Entertainment Committee, was elected yesterday a member of the Executive Committee of the Railway Supply Manufacturers' Association. The vacancy which he was elected to fill occurred because George R. Carr, on being elected president of the association, had to resign his membership on the Executive Committee.

## Push Repair Work on Cars

**F.** RANK McMANAMY, the assistant director of the Division of Operation, on June 20, sent the following letter to the regional directors:

"Confirming the understanding reached at our conference yesterday, arrangements should be made at once to condition freight cars to handle prospective traffic:

"1. Car repair forces should be put on full time at all points where a reduction in hours has been made.

"2. Car repairers who have been furloughed should be returned to service in all cases where they can be used to advantage. Such increases should be made at principle shops and at points where the work can be most economically performed.

"3. Where additional work is needed and penalty overtime can be saved thereby a second shift may be organized at shops where the facilities are such that it can be profitably employed.

"4. Special attention should be given to grain cars, coal cars and refrigerators cars in the sections where such cars are most needed, so that the possibility of a shortage may be averted."

## A Remarkable Miniature Car

**T**HERE IS ONE CONVENTION EXHIBIT which is attracting a great deal of attention which is not designed as an advertisement for any manufactured product. Through the courtesy of the American Railway Express Company there is exhibited in booth 18 a model of a 50-ft. standard refrigerator express car built to one-eighth scale. The model was constructed by the American Car & Foundry Company. The underframe is of steel girder construction, the rivet heads in the model being hardly larger than the head of a tack. The body is of wood and is equipped with siphon ice bunkers with operative hatch covers and plugs. The inside is fitted with floor racks and the walls are insulated. The doors are fitted with a cam operated locking device and a miniature seal pin. The United States safety appliances have been applied to the car. Space will not permit of a description of all the details included in the model. It has all-metal trucks, hand brakes and brake rigging, air brake, signal and steam heat lines, couplers and safety chains and even a card holder on the side. The model will well repay inspection on account of its educational value and also as an example of high grade workmanship.

## Secretary Hawthorne

**I**N THESE DAYS OF PERSONAL ACHIEVEMENT, when individual accomplishment cannot be hidden by a modest personality, the work of Secretary Hawthorne, of Section III, Mechanical, American Railroad Association, shines in no reflected light; and it is both the privilege and the pleasure of the *Daily* to call attention to his record of efficiency both before and during the convention.

Under the direction of Mr. Hawthorne the work of the secretary's office has been thoroughly reorganized in order to meet the new conditions involved in becoming a part of the American Railroad Association. This has been done with energy and tact and with a vision of the future possibilities of a larger mechanical association.

Mr. Hawthorne was born November 27, 1886, at Oleona, Pa. He received a common school and high school education and graduated from the Elmira Free Academy, Elmira, N. Y., June, 1905. He entered the service of the Pennsylvania Railroad at the Elmira shop as painter, in June, 1905, and was transferred to Baltimore as a car builder in the passenger car shop, November, 1905. While at Baltimore shop he was assigned to work in M. C. B. billing department. He was transferred to the M. C. B. clearing house, Williamsport, Pa., in June, 1910, and was transferred to the Pennsylvania Railroad M. C. B. clearing house at Altoona, Pa., June, 1914. While at Altoona he served on the M. C. B. shop Committee of the Pennsylvania Railroad and also the special investigating committee of the American Railroad Association. He was serving on this latter committee at the time of the death of Secretary Joseph W. Taylor.

## The New Chairman

**W**HEN A MAN STARTS WORK as a machinist apprentice, rises to the position of master mechanic at the age of 26 and is made general mechanical superintendent of a road of 8,000 miles at 42 it is safe to say that he possesses unusual qualifications for railroad work. This in brief is the story of the career of W. J. Tollerton, who was elected chairman of the Mechanical Section of the American Railroad Association on Saturday. Mr. Tollerton might well be chosen as a typical representative of the higher officers of the railroads of this country. A tireless worker, he has risen to the position he now occupies by his ability and the force of his personality;

Mr. Tollerton was born in 1870 at St. Paul, Minn., and was educated in the public and high schools. He entered railroad service as a machinist apprentice with the St. Paul & Duluth, now part of the Northern Pacific, and subsequently became a fireman on the Chicago, St. Paul, Minneapolis & Omaha, since which he has been consecutively from 1890 to 1896 foremen and afterwards general foreman of the Union Pacific; from 1896 to 1903 master mechanic of the Utah Division, Oregon Short Line; from 1903 to July, 1906, master mechanic of the Idaho, Utah and Montana Divisions of the same road, with headquarters at Pocatello, Idaho; from July, 1906, to April, 1907, superintendent of motive power of the Chicago, Rock Island & Pacific in charge of lines west of the Mississippi river at Topeka, Kan.; from April, 1907, to May, 1912, assistant general superintendent of motive power of the Rock Island Lines at Chicago, Ill.; May, 1912, to January 1, 1913, mechanical superintendent, and from January 1, 1913, to date, general mechanical superintendent of the same lines.

The high esteem in which Mr. Tollerton is held was evidenced by the statement of J. E. Gorman, federal man-

ager of the Rock Island, before the convention a few days ago, that he replied implicitly on Mr. Tollerton. It is characteristic of the new chairman to devote his energy without stint to whatever he undertakes and those who know him feel assured that under his direction the Mechanical Section will live up to the best traditions of the old associations.

## The American Society for Testing Materials

**T**HE PROGRAM for the first day's sessions of the American Society for Testing Materials was published in yesterday's issue of the *Daily Railway Age*. The program for the remaining sessions is as follows:

### FOURTH SESSION, WEDNESDAY, JUNE 25, 10 A. M., ON STEEL AND WROUGHT IRON

Report of Committee A-1, on Steel.  
Report of Committee A-2, on Wrought Iron.  
Deep Etching of Rails and Forgings.  
Modern High Speed Steel.  
Some Fatigue Tests of Nickel Steel and Chrome-Nickel Steel.

### WEDNESDAY AFTERNOON, JUNE 25

#### Committee Meetings

### FIFTH SESSION, WEDNESDAY, JUNE 25, 8 P. M., ON CORROSION AND MAGNETIC ANALYSIS

Report of Committee A-5, on Corrosion of Iron and Steel.  
The Influence of Very Low Percentages of Copper in Retarding the Corrosion of Steel.  
Topical Discussion on "Magnetic Analysis."  
This discussion will be formally introduced by several speakers under a number of titles.

### SIXTH SESSION, THURSDAY, JUNE 26, 10 A. M., ON TESTING AND APPARATUS; RUBBER PRODUCTS AND TEXTILES

Report of Committee E-1, on Methods of Testing.  
A Wire Testing Extensometer.  
A Machine for Measuring Hardness of Thin Metal Sheets.  
A Fatigue Testing Machine.  
The Single Blow Notched Bar Impact Test as used in the American Industry.  
Report of Committee D-11, on Rubber Products.  
Steam Hose for Car Heating.  
Report of Committee D-13, on Textile Material.

### THURSDAY AFTERNOON, JUNE 26

#### Golf Tournament

### SEVENTH SESSION, THURSDAY, JUNE 26, 8 P. M., ON MALLEABLE IRON AND NON-FERROUS METALS

Report of Committee A-7, on Malleable Castings.  
Some Physical Constants of Malleable Cast Iron.  
Report of Committee B-1, on Copper Wire.  
Report of Committee B-2, on Non-Ferrous Metals and Alloys.  
The Behavior of Wrought Manganese Bronze Exposed to Corrosion while under Tensile Stress.  
Some Tests of Light Aluminium Casting Alloys: The Effect of Heat Treatment.

### EIGHTH SESSION, FRIDAY, JUNE 27, 10 A. M., ON CERAMICS, LIME AND ROAD MATERIALS

Report of Committee C-3, on Brick.  
Report of Committee C-6, on Drain Tile.  
Report of Committee C-8, on Refractories.  
Preventable Defects in Refractory Brick.  
Report of Committee C-7, on Lime.  
Report of Committee I-4, on Road Materials.  
An Apparatus for Determination of the Breaking Point of Pitches.

### NINTH SESSION, FRIDAY, JUNE 27, 3 P. M., ON CONCRETE AND GYPSUM

Report of Committee C-2, on Reinforced Concrete.  
Report of Committee C-4, on Clay and Cement Sewer Pipe.  
Report of Committee C-11, on Gypsum.  
Proportioning of Pit-Run Gravel for Concrete.  
Theoretical Studies of the Surface Area Method of Proportioning as Applied to Concrete.

Modulus of Elasticity of Concrete.  
Relation between the Methods of Curing Standard Concrete Specimens and their Compressive Strength at 28 Days.

### TENTH SESSION, FRIDAY, JUNE 27, 8 P. M., JOINT SESSION WITH AMERICAN CONCRETE INSTITUTE ON CEMENT AND CONCRETE

Report of A.S.T.M. Committee C-1, on Cement.  
Report of A.S.T.M. Committee C-9, on Concrete and Concrete Aggregates.  
Report of A.C.I. Committee on Fireproofing.  
A.C.I. Paper: Later Fire Tests of Concrete Columns.  
A.C.I. Paper: The Strainagraph and its Application to Concrete Ships.  
A.S.T.M. Paper: Effect of Fineness of Cement.  
A.S.T.M. Paper: Cements Producing Quick-Hardening Concrete.  
MISCELLANEOUS BUSINESS.

President Walker, of the R. S. M. A., has extended the privileges of the Million Dollar Pier to the members of the American Society for Testing Materials, whose badges will admit them to the exhibits until the close of the Mechanical Section Convention, at one o'clock this afternoon.

## American Railroad Association, Section III, Mechanical

### Fuel Economy, Maintenance of Boilers and Superheating Among Subjects Considered Tuesday

The convention was called to order by Chairman Tollerton on Tuesday morning, June 24, at 9.45 o'clock, and immediately

took up the reports of committees, the first being that on Fuel Economy and Smoke Prevention.

### Report on Fuel Economy and Smoke Prevention

W. Schlafge  
Chairman

THE COMMITTEE HAS heretofore aimed to deal with the methods of firing and the means to be adopted for developing the required supervision, rather than with the details in design and maintenance which are subjects that more properly fall within the scope of other committee assignments. The situation immediately preceding the report of 1918 was so extraordinary and the need for economy so pressing, that a departure was made from the earlier policy and some consideration given the more general features attending the purchase, transportation and use of railroad fuel. This situation has been

practically relieved so that now the importance of the subject arises from its influence upon operating expenses which have reached a point where they are absorbing the gross rail revenues for many roads.

There has been a steady increase in the total fuel cost to the railroads, chiefly caused by two factors—increased cost of production and increased consumption due to the natural expansion of traffic. The accompanying curve No. 1 exhibits the trend of total cost for the past nineteen years for which there are available figures. Comparison with curve No. 2 shows that while the trend of prices at the mines has been steadily upward, the increased total cost is chiefly due to increased consumption.

The increase was reasonably uniform for the ten year period ending with 1909 and subsequently it was more gradual. On a basis of the general trend of increase for the previous few years, a reasonable estimate of cost would have placed the total

for the year 1917 at about \$265,000,000, but the total actually amounted to \$401,297,300.00, an increase of 55.9 per cent over the preceding year.

The official statistics for 1918 will undoubtedly disclose a total even greater, although there will be a substantial decrease in 1919 due to the greatly reduced tonnage handled and to the influence of a generally organized effort to promote economies in every possible manner. But the total will still be a vast sum, and since it represents approximately 14 per cent of the total operating expense it has assumed a greater importance than ever.

In view of the situation this committee is of the opinion that its report for this year may be profitably devoted to some consideration of the application of its previous recommendations and to methods for economy in the use of fuel for other than locomotive purposes.

In one of its earlier reports your committee provoked some criticism because of its suggestion that railroad fuel should be purchased to specification, but the past few years have furnished convincing evidence that this procedure is highly important if reasonable economies are to be effected. The advantage lies not so much in the purchase of fuel having the higher B. t. u. values as in the opportunity for selecting coal that can be economically burned under the peculiar conditions prevailing in locomotive service. A specification which limits the percentage of easily removable non-combustible produces economies in fuel, labor and transportation and involves no economic losses.

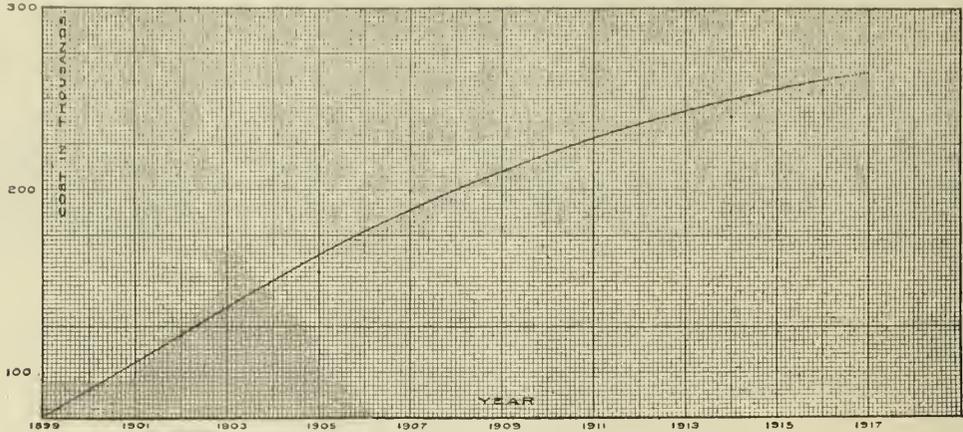

Action should be taken at no distant date to determine the most favorable conditions under which economical combustion may be obtained with various grades of fuel so that plant design and equipment may be made to utilize available supplies to the best advantage. Such an investigation would naturally include the difficult and varied circumstances attending locomotive service.

In the opinion of the committee public interest will ultimately require the exercise of reasonable efficiency in the use of fuel, which prompts a brief consideration of the conditions of purchase. Specifications should include the characteristics of the available supply with particular reference to the percentage of

ash present, to its clinker forming qualities, and to its liability to spontaneous combustion. The size demanded for best results is also important and should be specified by the road supervision which should be familiar with requirements for the most satisfactory combustion conditions. It should be observed also that where these conditions cannot be obtained with one grade of coal, analysis will frequently develop that a suitable mixture may be secured with another grade. The character of the ash content exercises a great influence upon the combustion condi-

not generally applicable since they were made with Illinois coal from a single mine with one locomotive. It is not impossible that other coals with a locomotive having different stoker, grate, fire box or front end conditions might develop a different ratio, but the figures are useful in demonstrating the importance of the subject and emphasizing the necessity for ascertaining the conditions applicable to the different coals on each railroad.

The foregoing observations are made for the purpose of emphasizing recommendations of your committee made in earlier

Curve No. 1.—Total Locomotive Fuel Cost

tions since, under certain circumstances, the free burning of the combustible material is prevented and clinker formed over the grate surface, thus interfering with combustion by cutting off the air supply and not infrequently preventing proper operation of the grates to keep the fuel bed open.

There is also a common source of waste through clinkering coal. The ash constituents producing these conditions are not only visible and mechanically separable, but may be intimately mixed with the combustible elements and, therefore, disclosed only by chemical analysis.

Reference has been made to the importance of properly grading the sizes of coal to insure the greatest efficiency. It is generally understood that existing locomotive operating conditions prohibit the use of slack, but not that different grades of lump coal have different evaporation values. This has recently been demonstrated at the University of Illinois in a series of tests with a modern Mikado type locomotive, the results of which are indicated below.

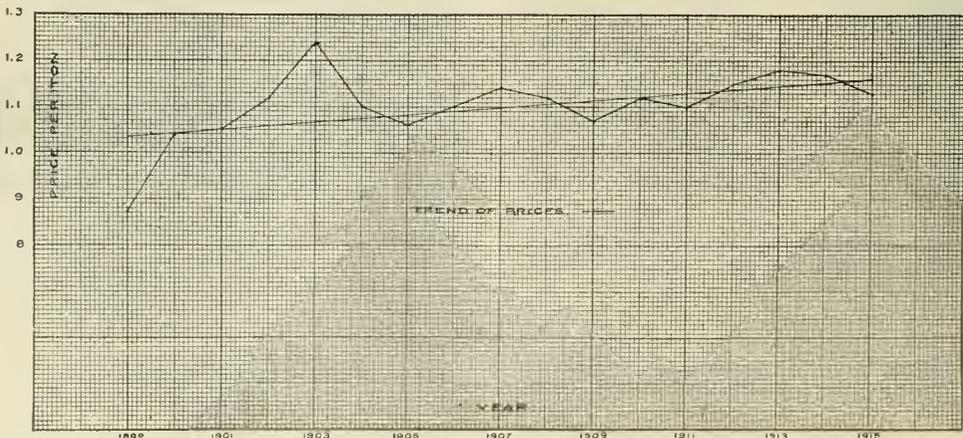

It should be said concerning these results that they are probably

reports concerning the desirability of creating an organized fuel department which should embrace the services of a chemist and an inspection corps whose attention could be devoted to those problems involving research and experiment and whose co-operation with the purchasing department would insure selection of

EQUIVALENT EVAPORATION PER LB. DRY COAL

Size of Coal	Medium Rate Tests	High Rate Tests
3-in. by 6-in. egg.....	10.21	9.09
Mine run .....	10.12	8.66
3-in. lump .....	9.95	8.32
2-in. by 3-in. nut.....	9.90	9.11
2-in. screenings .....	9.25	7.43
1½-in. screenings .....	8.47	7.06

those coals promising the greatest service value. Where the purchases are relatively small, a joint arrangement might be effected whereby the cost of this work could be distributed among several consumers. It is believed that the fuel Administration and Fuel Conservation Section have fully demonstrated the advantages of

Curve No. 2.—Price of Coal at the Mines

systematic inspection and analysis and a reasonable exercise of control over the supply. The benefits which have thus been received should be made permanent.

It may be well to describe a system in effect for some time on a large railroad, which has proven satisfactory and which has resulted in co-ordinating the various agencies responsible for the purchase and use of fuel. A chart of the organization appears in Fig. 1, and its functions are briefly described as follows:

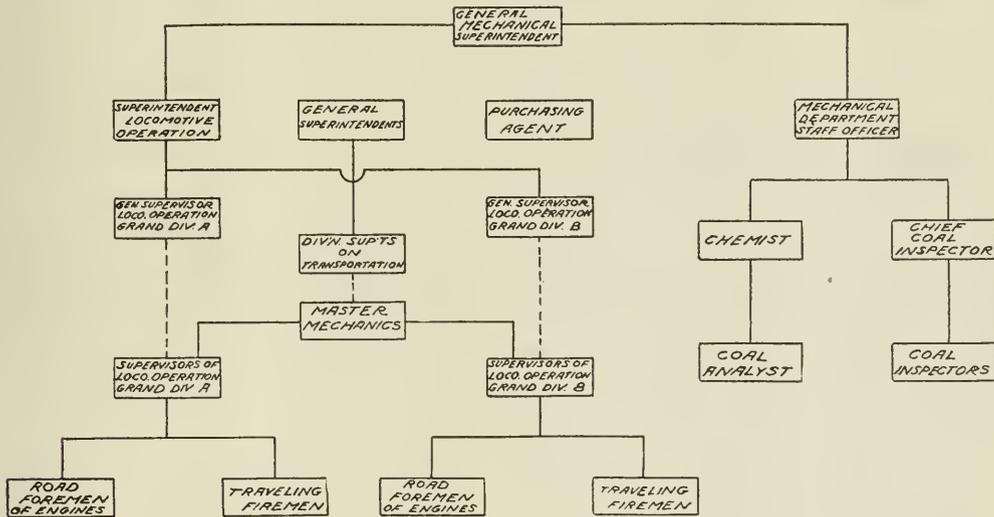

The chemist and coal inspectors report to a staff officer of the Mechanical Department who is responsible for co-ordinating the laboratory and inspection work with that of the road supervision and the purchasing department. In this manner a proper analysis of the varying conditions is insured and a check maintained upon shop maintenance and upon fuel distribution by the operating department.

Whenever purchase from a new mine is proposed analysis is made of a representative mine sample. From this analysis the general availability of the coal is determined and, if satisfactory, road tests are conducted to determine the service characteristics. As a rule the chemical analysis and physical inspection at the mine are sufficient to justify conclusions, but final acceptance requires favorable report by the road supervision. For the following regular shipments, samples from cars at des-

Another feature of importance is the distribution of equipment to suit unloading conditions. The cost of unloading is now a large item and it constitutes a part of the total fuel charge. The field inspection force should be required to maintain a check upon these details and upon the scale and manifest weights to detect discrepancies, and to insure loading of equipment to the prescribed limit.

If the information collected by the inspection force is to be of value it must be promptly transmitted to headquarters, consequently, a daily report should be required covering all the features of inspection so that prompt steps may be taken in connection with any conditions requiring correction. One of the inspectors, designated as the chief, is held responsible for the work of the others and is expected to be informed on the technical features of the work so that the department will be assured of information concerning developments in the entire field of investigation concerning fuels, combustion and other related subjects.

Such an organization requires a high order of ability, but the cost involved is readily justified in view of the possibilities for economy presented. While varying circumstances will affect the number of men required in such a force, it is believed that, in general, a thoroughly satisfactory inspection service for a large

NOTE: DOTTED LINES INDICATE DIVIDED JURISDICTION

Fig. 1.—Fuel Department Organization for a Trunk Line Railroad

tinuation are taken from time to time. These analyses are then compared with that of the original mine sample in order to determine whether the quality remains uniform. The inspector taking these samples effects contact between the road supervision and headquarters, interviews the road supervisors, investigates engine failures caused by poor coal to insure observance of the schedule provisions and to see that the quality of the shipments is up to the standard; he checks manifests to insure proper distribution and the coal dock records to see that the right grade of fuel is used for the specified service. The other field inspectors are assigned to specific territories and live at a point central to them.

The duties of the field inspection force comprises not only the preparation and sizing at the mines, but should include all features affecting efficiency, cost of transportation and handling, such as inspection of the empty cars for foreign matter, particularly sandstone, cinders, gravel and similar materials likely to be mixed with the coal and dumped into the pockets. Experience has demonstrated that a quarter of a ton of such refuse is frequently found in empty cars consigned to the mines. The inspection should also cover defects in equipment and all conditions affecting the loading, unloading or loss of lading in transit frequently overlooked in routine car inspection.

road should involve an expense not exceeding one-tenth of one per cent of the fuel cost.

The problem involved in the inspection, distribution and utilization of fuel is one in which each division of the operating department has some responsibility, and it is, therefore, advisable that the chief operating official should be fully informed as to the requirements, procedures and accomplishments of this branch of the organization. In the opinion of some, the head of the fuel department should report directly to the chief operating official, but, in view of the wide divergence of opinion on the subject, the committee is not yet prepared to make such a recommendation because it is thought that co-operation between the various operating branches will produce the required results, especially since fuel is now the second largest item of operating expense and, therefore, of prime importance to the transportation department.

The limitations upon a report of this kind do not permit further discussion of the features of inspection and we will now consider the locomotive and the influence of maintenance upon fuel consumption.

Since a knowledge of the nature of heat losses in locomotive service is essential to a proper appreciation of the possibilities for economy, it is desirable that brief reference be made to the

avenues through which heat is wastefully dissipated, which are as follows: 1. Steam leaks in fire box, superheater, front end or to the atmosphere. 2. Grate, cinder pit and stack losses. 3. Escaping steam through safety valves, unnecessary operation of auxiliaries, such as headlight generator, air pump, etc. 4. Unconsumed volatile matter usually denoted by excessive smoke. 5. Heat losses in escaping gases. 6. Radiation. These items are largely influenced by factors independent of operation and maintenance, but it is with the latter that we are now chiefly concerned and to which attention is directed.

Recent observation indicates that steam leaks are not receiving the attention demanded by the extent of losses involved. One remedy for this situation lies in a proper inspection of locomotives while under steam in advance of each boiler washing, this inspection to be followed by a check inspection after the locomotive is ready for service. This practice would insure reasonable freedom from leaks because excessive leakage rarely develops in the intervals between two boiler washing periods.

Large losses are sustained through faulty superheater maintenance. Pressure tests should be regularly applied to superheater units and steam pipe joints in order that defects may be located and corrected. Recent inspection on one railroad developed that out of 15 locomotives in service 11 had leaking superheater joints. This condition can virtually be eliminated through the observance of standard methods for the maintenance of units. This should include proper assembly with the required bands and supports in the tubes. Observation on several railroads shows that this feature is being neglected with the result that vibration opens the header joints, causing bad leaks in the smoke box and, frequently, costly damage to adjacent parts.

Faulty combustion, represented by unconsumed hydrocarbons and high combustible in the ash, is most frequently occasioned by improper air supply. For a given furnace and fuel, the excess air is fixed within comparatively small limits. An increase in the air supply reduces efficiency because of the loss in heating the excess, while on the other hand a decrease below the required percentage produces less complete combustion. Coals having low percentages of volatile matter require less excess air for nearly complete combustion than those having higher percentages of volatile. This not infrequently accounts for better results with one grade of fuel than with another.

In locomotive service the air supply is controlled by front end, flue, grate and ash pan conditions, which often do not receive proper attention from the designers. Many modern locomotives have grates with insufficient air-inlet openings, or with openings that readily become clogged, thus increasing the resistance to air flow. Attempts are frequently made to overcome this condition by adjusting front ends or reducing the diameter of the exhaust nozzle.

Many of the older engines are still equipped with ash pans having insufficient air openings, a defect readily detected with a U-tube draft gage. There should be no indication of vacuum in the ash pan.

It is highly important that the flues and tubes be free from obstructions which not only interfere with the air supply to the fire box, but reduce tube evaporating efficiency and superheater economy. The Fuel Conservation Section has recently pointed out that the fuel loss through drop in superheat with half the tubes stopped up may reach 24 per cent. In order that thorough and efficient cleaning may be assured, standard apparatus and methods should be established and suitable records maintained. The maximum interval in mileage or time between cleanings consistent with the requirements for different classes of power and service should be determined and flues thoroughly cleaned within these limits. Periodical checks by the supervising officers are required to insure proper work and continuous records.

Radiation losses have heretofore received little attention from writers on locomotive fuel economy and even less from those responsible for locomotive design and maintenance, as a casual inspection of any locomotive will disclose. It is estimated that the radiation from each square foot of surface carrying 200-lb. perature wastes 1000 lb. of coal per year. This loss increases rapidly with decreasing temperatures, certain weather conditions and rapid circulation produced by moving locomotives. The average locomotive has approximately 100 sq. ft. of such exposed boiler and pipe surface, easily representing an annual loss of \$150 to \$200. This can be substantially reduced if cylinder heads,

steam pipes and fire box surfaces are properly insulated. For this purpose it is recommended that magnesia-asbestos or hair felt be used and that it be not less than 1½ in. in thickness except for small pipes where ¾ in. is sufficient.

Fire boxes may be covered by removable sections where access to staybolts is required. These practices, once somewhat general, have been neglected because of the maintenance problems introduced with modern power.

A common source of loss of power and combustion efficiency arises from frequent unnecessary changes in the dimensions or adjustment of front end appliances. Standards suited to local conditions for each class of locomotive should be determined and maintained, and periodically checked by the inspection force. The common practice with respect to a poor steaming locomotive, for which the cause is not readily discernible, is to alter some of the front end details, whereas, proper investigation usually discloses a leak in some of the joints, frequently between the front and the ring or around the outside steam pipe joints. As an overdrafted locomotive produces air, spark and back pressure losses, the importance of maintaining standard front end details may be understood.

In its last report the committee briefly covered those features of maintenance that contribute largely to power and fuel losses, but the work of the Fuel Conservation Section has demonstrated that two other appliances are exerting an appreciable influence upon locomotive fuel losses, the power reverse gear and the pneumatic sander. There are some power reverse gears in use that, not being positive, permit "creeping" while the locomotive is in operation, thus increasing the cut-off and decreasing efficiency. It is recommended that all such gears be modified so as to permanently correct this defect and that particular attention be paid to the maintenance of valves and packing to insure proper operating conditions.

The losses occasioned by poor sand and defective or inoperative sanding appliances are greater than commonly supposed and arise chiefly through failure at critical points, necessitating stopping, taking slack and doubling hills. The committee recommends the adoption of suitable specifications governing the purchase of locomotive sand which, by establishing reasonable limits for silicon content, will insure a suitable quality. To make the material effective, the sand pipes should be firmly held over the rail by substantial clamps not less than ½ in. by 2 in. in section, attached to the extreme lower end of the pipes. With the adoption of these provisions the prescribed daily or trip inspections should insure the desired sanding efficiency.

Previous discussion has been confined to the influence of the locomotive and its details of construction, maintenance and operation upon fuel consumption, but it may be well to mention the fact that car equipment also exerts a large influence upon the problem. While any defect contributing to increased resistance produces a corresponding increase in the fuel required, perhaps the most general features are defective brakes and air leakage caused by defective hose and gaskets. The leakage limits for freight trains established by many railroads should be generally adopted and consistently maintained. The committee recommends that they be given official recognition and incorporated in the air brake rules now the standard practice of the section.

While the opportunity for the greatest savings occurs on the road, there is an aggregate annual loss now amounting to millions arising from locomotive fuel consumption that is occasioned through the limitations imposed by service conditions. The fact is that irregular demands upon the locomotive render side track and terminal economies of the highest importance.

A large part of the terminal losses arises from maintaining locomotives under steam when not required for early service and from unnecessary cleaning or removal of fires. Where locomotives are not likely to be required for service within twenty hours, as frequently occurs on Sundays or holidays, or under special conditions arising from variations in operation incident to reduced business, fires should be drawn. Under all circumstances grates and stacks should be covered to prevent the cooling effect of air circulation through the fire box and flues. This suggests the frequent waste observed through faulty methods of firing up, resulting in the loss of green coal through the grates either because they are defective or the openings are large enough to permit the green coal to fall through. Observation of recently prevailing methods discloses that enough coal is fre-

quently wasted in this manner to haul 1000 tons one mile on the average railroad. Grates should be covered with shavings or wood before coal is applied, which will not only minimize the loss mentioned, but reduce the quantity of coal otherwise required in kindling fires.

Side track losses arise from excessive draft which should be regulated by means of the fire door. Another factor in this connection is the influence of the superheater damper which is frequently tied open, a practice that should be discouraged because of its influence upon maintenance as well as upon fuel consumption.

Cinder pit operation offers much greater opportunity for fuel economy than is generally recognized. Recent investigation developed that the combustible content of locomotive cinders at certain terminals averaged 35 per cent by weight. In other words, every car of cinders contained more than a third of a car of coal. It is at present impossible to avoid large losses here, but they may be minimized through the co-operation of engineers, firemen, hostlers and ash-pit foremen by careful firing before engines reach the pit avoiding the application of green coal immediately before fires are cleaned.

This suggests the service that competent supervision may render on the ash pit in cleaning fires promptly, moving locomotives as soon as ready, in careful cleaning of fires to properly remove ash and clinker without waste of fuel, in preventing the excessive use of the air pump and steam blower and in maintaining co-operation with the roundhouse in order that no fire shall be dumped unnecessarily and no fire cleaned that will require subsequent dumping. The ash pit foreman should be provided with a copy of the monthly boiler list and see that fires are dumped as the engines pass over the pit.

The coal pocket foreman should be furnished with a schedule of coal required by locomotives in each class of service and should be charged with the responsibility for observance of the schedule. The Fuel Conservation Section estimates that at least 100,000 tons of coal, unnecessarily carried on engine tenders, is being transported 100 miles every day at a total expense for fuel alone equivalent to 1000 tons per day. The schedule should also indicate the kind of coal required for different classes of locomotives and assignments so that the better grades may be employed in the heaviest service.

The extent of the possible terminal losses suggests the desirability of an accounting system that will distinguish between the fuel consumption of locomotives in the hands of the mechanical and the transportation departments. Such records would readily disclose uneconomical practices and permit their prompt correction. The road performance should be compared with predetermined figures based on an estimate and trial under average conditions.

While the responsibility for fuel conservation rests in a large measure upon the mechanical department, there are features of operation affecting the problem that are under the immediate control of associated departments whose interest is essential to many economies that are possible only through improved efficiency in daily routine. This includes prompt dispatching of locomotives and trains, proper adjustment of tonnage, proper make-up of trains, prompt completion of station work and the elimination of delays in the movement of ash pit and coal cars.

Maintenance of way and signal department officers can also render effective service in the cause of fuel economy by eliminating, as far as possible, the necessity for stopping or reducing the speed of trains because of prolonged slow orders, the unnecessarily prolonged display of caution flags or inoperative signals. This department is also directly responsible for lighting and pumping-plant operation and should eliminate fuel losses through radiation from exposed surfaces and the steam leaks that are frequently characteristic of these isolated plants.

Locomotive fuel constitutes about 88 per cent of the total railroad consumption, and, therefore, offers the greatest opportunity for conservation and economy, but the remaining 12 per cent represents the very substantial sum of \$45,000,000 on the 1918 basis, an amount approximating half the total fuel cost for locomotives ten years ago. Of this total the largest percentage is represented by power plant consumption to which the remainder of the paper will be devoted.

Questions of relative economy in the purchase of power or its generation in privately owned plants are important, but do not fall within the scope of a paper which deals with the problems of

operation rather than design, and consideration will, therefore, be given to those details susceptible of correction in existing plants.

The inefficiency in the ordinary railroad stationary boiler plant arises from equipment, maintenance and operation. Large losses are frequently encountered because of insufficient or inefficient equipment. Investigation has developed frequent instances of low rates of evaporation in very inefficient plants caused by an attempt to force boilers above their normal capacity. This is a frequent accompaniment of the discarded locomotive boiler which is always uneconomical for stationary purposes. In one instance of recent occurrence, a locomotive boiler in stationary service, consuming seven tons of coal per day, was replaced by a return tubular boiler which effected a saving of three tons per day under the same service conditions.

Many stationary boilers are not provided with dampers in the uptake, and yet draft regulation should be obtained with dampers and the draft should be varied to suit the rate of combustion, which is proportional to the load. Maximum efficiency is attained when the proper draft for given rates of combustion under given condition is established by suitable tests. The influence of proper draft regulation is plainly indicated by the curve marked Exhibit A from which it will be observed that under the conditions represented, damper regulation effected an average saving of 9½ per cent.

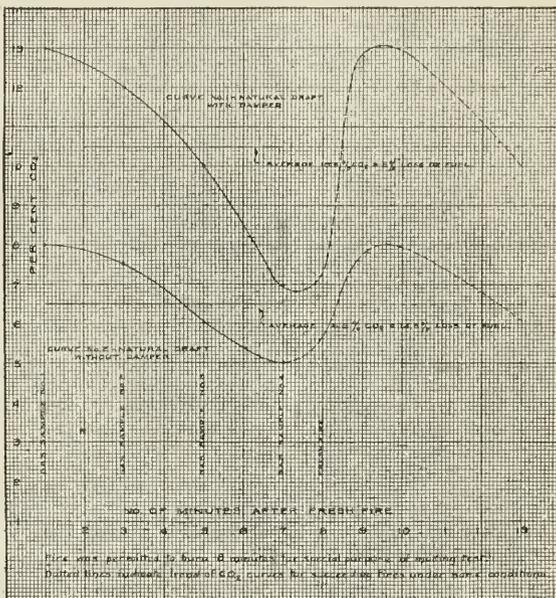

Exhibit A.—Variation of Percentage of CO<sub>2</sub> in Flue Gas Stationary Plant

Feed water heaters are not economically employed and yet the conditions prevailing in practically all railroad power plants will permit their use for eight months in the year. When it is considered that under average conditions an increase of 11 degrees F. in the temperature of feed water effects a saving of about one per cent in fuel consumption, the loss from free exhaust steam is plainly evident. There is no more immediate and effective means of economy than through feed-water heating.

One other prime factor in power-plant economy lies in the disposition of exhaust steam other than for feed-water heating purposes. This feature would not be lost to view if the engine portion of the plant were considered, the auxiliary and mechanical power a by-product. Under average conditions the heat consumption of stationary engines does not exceed 15 per cent of the total heat generated, the difference being represented by the heat of the exhaust. In practically all railroad shops, therefore, the heating requirements should be satisfied with exhaust steam, and in large plants the condensate should be returned through a suitable vacuum system. The outside purchase of

power and the use of high pressure steam for heating purposes is an unwarranted extravagance.

Experience has convinced the committee that the largest losses usually encountered in the operation of stationary boilers on railroads are included under the following headings, which are enumerated in the order of frequency and importance. 1. Leaky settings and stack connections. 2. Poor firing. 3. Radiation from uncovered surfaces. 4. Dirty flues.

Leaky settings produce excess air in the combustion space, although this may arise from other causes. The importance of this common source of inefficiency will be understood from the fact that boiler efficiency falls off in almost direct proportion to the percentage of excess air, and this not infrequently produces a loss of 40 per cent. Brickwork settings are sure to develop cracks in addition to which the porous character of the brick permits air infiltration. All exposed brick settings should at least receive a coat of a good plaster sealing compound; a 1/2-in. covering of magnesia-asbestos cement, followed by the sealing compound, is even better. Frequent leaks are found around stack connections, plates, dampers and doors, all of which influence the draft and reduce boiler efficiency. These parts require occasional inspection to insure a high order of maintenance.

Poor firing includes too thick or too thin a fuel bed, accumulation of clinkers, too frequent shaking, uneven distribution, permitting holes to develop, improper manipulation or neglect of dampers and carelessness in fire cleaning. Correction of these faults is a matter of analysis, education and supervision. It should be observed, however, that the economies of the best equipment may be lost in poor boiler room practice.

Radiation losses are usually considerable and nearly always neglected. At 100-lb. steam pressure and 70 degrees F. atmospheric temperature, the loss in radiation amounts to 718 lb. of coal per sq. ft. of uninsulated surface per year. It is, unfortunately, common practice to burden railroad shop boiler plants with a multitude of accessories usually involving large heating loads. It is certainly economy to centralize steam production, but economical steam distribution is a matter too frequently left to the division plumber or the shop pipe foreman, who may be masters of the technique of their trade, but to whom lost B. t. u.'s are of no particular interest. The surest evidence of this statement lies in the appearance of bare ground in winter over the average buried steam pipe. Plain, unprotected, asbestos covering on an underground steam pipe may be expected to become a surface condenser of large capacity. The committee recommends the adoption of specifications for pipe coverings suitable for superheated and saturated steam and hot water, and also for water-proof underground coverings for low pressure lines.

Clean flues and boilers are a matter of standard practice and organization. In plants having no engineer, the responsibility for cleaning flues and washing boilers at the prescribed intervals should be placed upon one of the firemen, and he should be followed up by the general supervision.

Auxiliaries are frequently neglected, especially in the smaller and older plants. Blowing rod packing, excessive water-pump slippage and leaking steam-pipe joints are all too commonly in evidence where it is unnecessary to maintain a suitable relation between input and output. The losses outside the plant are also much greater than usually supposed, particularly in compressed air lines. It is estimated that the cost of air, compressed in a modern plant, approximates 10 cents for each 1000 cubic feet of free air used, and yet the waste in many plants is enormous. Reasonable economy requires that a periodical inspection of air losses shall be conducted and leaks in pipe lines, valves and hose promptly repaired. Once each week is not too frequent for inspection in the average shop.

Preparation of systematic records is essential to every well operated plant. The possibilities should be developed through suitable experiments, and standards once established should be checked with the daily operation. Such records should be made to correspond with the available equipment, and, for smaller plants, may be very simple. The results for a general division of a railroad may be tabulated and a rating established which will stimulate competition. For this purpose plants having the same general facilities should be grouped by classes in order that the ratings may be comparable. The attached forms, A and B, are offered as a simple basis for rating plant maintenance.

Stationary power-plant operation may be reduced to a reasonably exact basis and the best results are attained when the equip-

ment is planned for the required service. Results may then be obtained upon a basis corresponding with reasonable exactness to a predetermined production cost, but the variables in the operation must be worked out to produce maximum economy for various rates of output. These are problems requiring skill and experience, and should be entrusted only to qualified engineers. The committee repeats its recommendations of last year that mechanical stationary power plants be placed under the responsible supervision of one man, whose time on the larger systems can profitably be devoted to the problems and economies in steam generation and utilization.

In conclusion, the committee recognizes that without any attempt at research or experiment, it has been necessary to sacrifice originality of subject matter. But if many of the things mentioned have long been familiar to mechanical department officers, perhaps their present existence is the best of reasons for their consideration at this time. It is reasonable to assume that neither the cost of mine production nor that of transportation will be appreciably lower in the immediate future, so that economy in consumption assumes an importance relatively greater than ever before. But, it may be asked, what shall be done to realize the economies admittedly so necessary. The answer is

**"FORM A"**

**RANK OF POWER PLANTS**

Rank determined from the standpoint of Fuel Economy. Size of plants not considered.

Rank based upon consideration of the following:

1. Combustion efficiency.
  2. Condition of plant, including air-tight boiler settings; dampers and damper operators; grates; scale; soot; engine-room equipment; steam and air leaks and pipe insulation throughout shop facilities.
  3. Interest of local forces in plant and effort to follow recommendations for operation and improvement.
  4. General appearance (with due consideration of conditions).
  5. Need of general overhauling.
  6. Quality of fuel furnished.
  7. Efficiency of firemen.
- (Master Mechanics will report by mail improvements made from time to time which will affect standing of plants they supervise.)

**KEY TO RANK**

A—Excellent	.....91 per cent to 100 per cent.
B—Good	.....71 per cent to 90 per cent.
C—Medium	.....51 per cent to 70 per cent.
D—Fair	.....26 per cent to 50 per cent.
E—Poor	.....0 per cent to 25 per cent.

that the first requisite is full knowledge as to the extent to which wasteful practices prevail, which should be determined by careful survey. Remedial measures will frequently involve mechanical equipment requiring appropriations, but the chief problem is one of efficient operation and effective supervision. The results depend upon maintaining an enthusiastic interest on the part of those responsible for the use of fuel and the

elimination of wasteful practices. And the interest and enthusiasm must begin at the top and permeate the entire operating organization if the maximum efficiency is to be attained. The great difficulty, on a railroad, lies in the tendency to relaxed effort, because of the routine involved, but this is a subject demanding sustained and interested support from the chief operating officer to the fireman and the roundhouse man.

The report is signed by Wm. Schlafge (Chairman), Erie; W. H. Flynn, Michigan Central; Robert Quayle, Chicago & North Western; D. J. Redding, Pittsburgh & Lake Erie, and W. J. Tollerton, Chicago, Rock Island & Pacific.

### Discussion.

Mr. Schlafge: We have received, too late to be embodied in the report, a suggestion made by a member of the Fuel Conservation Board, and we desire to offer the following:

"Since the advance copies of the report have been distributed, it has been suggested to the committee that there may be possibilities for fuel economy, in stoker-fired locomotives, through screening out a portion of the slack.

"There can be little doubt that the rate of evaporation would be improved if this was done, but the net efficiency would obviously depend upon the mine cost of the fuel so prepared. The committee suggests that the subject is sufficiently promising to justify investigation by the railroads having stoker equipment, in order that immediate advantage be taken of any economies that can be realized in this manner.

"Attention is directed to a typographical error appearing in Curve No. 1 of the report, the ordinates of which should be expressed in millions instead of thousands."

Mr. Woodbridge (Supt. Fuel Conservation, U. S. R. R. A.): I feel that the members of this association should take home the lesson that Mr. Tyler gave us yesterday, relative particularly to new devices. I was very sorry that the subject of weighing the coal on a tender was passed over so hurriedly. There is no question whatever but that accurate records of the consumption on individual engines will result in greater fuel conservation than any other one thing. Everyone knows that the experiments that have been performed in the last few months of counting scoops of coal, or estimating the coal placed on tenders, unsatisfactory as they are, have produced a rivalry among engine crews that has resulted in a tremendous economy in fuel. I sat in this convention in 1906 and 1907 when H. H. Vaughan pleaded with you to put superheaters on your locomotives, and most of the things he said fell on barren ground. Five years after that Russia had six per cent of her locomotives equipped with superheating apparatus, and you had six-tenths of one per cent equipped. A proper weighing device on the tender to tell what coal was being used would result in fully as great a reduction in the fuel consumption as the superheater, and I commend that thought to your very serious consideration.

I want to read a paragraph in this paper here, and to commend it to you: "The greatly increasing coal consumption and the present growing importance of conserving this indispensable factor in our economic life prompts your committee to say that in its opinion action should be taken at no distant date to determine the most favorable conditions under which economical combustion may be obtained with various grades of fuel so that plant design and equipment may be made to utilize available supplies to the best advantage." And just following this, "In the opinion of the committee public interests will ultimately require the exercise of reasonable efficiency in the use of fuel, which prompts a brief consideration of the conditions of purchase."

It seems to me there is a slight inconsistency in two paragraphs, and it is a mighty important matter. I also want to read these two paragraphs: "The problem involved in the inspection, distribution and utilization of fuel is one in which each division of the operating department has some responsibility, and it is, therefore, advisable that the chief operating official should be fully informed as to the requirements, procedures, and accomplishments of this branch of the organization. In the opinion of some recognized authorities, notably the chief of the Fuel Conservation Section, the head of the fuel department should report directly to the chief operating official, but in view of the wide divergence of opinion on the subject, your committee is not yet prepared to make such a recommendation, because it is thought that co-operation between the various operating branches will produce the required results.

There is no question about that, but you can't get that co-operation unless you have, as is stated in the report, the results dependent on maintaining an enthusiastic interest on the part of those responsible for the use of fuel and the elimination of wasteful practices. The transportation department can waste more coal than all the firemen in this country can save, and you must have co-operation. The interest and enthusiasm must begin at the top. You cannot get the co-operation that you must have unless you have at the head of the organization some one connected with the chief operating officer who is willing to assist you in checking the other fellows—maintenance of way men, for example, slow orders and so on.

Mr. Bentley: Some question was raised about the sandpipes not being in line with the rails. One of our men squared the ends of the sandpipe and put a square clamp on so that it is impossible for the pipe to turn. The covering of the outside steampipe is something that has given us a lot of concern, but I believe we have finally arrived at a solution of the difficulty. We are putting a shoulder on the casting that goes into the smokebox, putting a collar around the steam pipe about eight inches below that and covering the intermediate space with a sheet iron covering, which apparently is an air-tight proposition.

D. J. Redding, (P. & L. E.): One item in the report which perhaps does not receive enough consideration is the matter of sanding equipment. I know of some tests conducted some time ago to find out what sanding locomotives meant, and all of the standard makes of sanders were tested. We found as much as 500 per cent. difference in the amount of air required, as between one sander and another, to put sand on the rails.

We also found that no one was paying particular attention to sanding and its cost, and the cost of the operating mechanism to handle the sand. The sand, at least on that railroad, cost more than the oil for locomotives, and the oil was given a lot of expert attention.

W. J. Bohan (N. P.): Approximately one-third of the coal consumption of the country is credited to the railroads. We are apt to confine our coal conservation too much to our locomotives, and do little or nothing towards coal conservation in our stationary plants. Probably one of the most wasteful things we have is the ordinary round-house plants, with condenser systems, consisting of the blower outfits used in roundhouses and inefficient transmissions for operation of our shop tools. Little or no attention is given to what might be done in purchasing power from outside concerns.

Railroad people might well give consideration to the acquiring of accurate data on their power plants, to determine at what rates they could afford to buy current. Some recent investigations showed that from 30 to 50 per cent. can be saved in some instances, in the purchase of current at proper power rates. The public utility man has not recognized the possibility of securing this business to a very great extent, and it is time that we started an educational programme with him so that he will.

I would like to ask if the committee has considered that one part of its work is to look into this very important matter of the purchase of power and the shutting down of the local steam plant.

B. J. Feeny, (Supv. Fuel Conservation Sec. U. S. R. A.): Some reference was made to the difference in opinion as to who was to handle the coal on the railroads. If you have any difference of opinion as to who will be responsible for it, you do not understand how big a problem it is. If the fuel used on the railroads in this country in 1918, was put in fifty-ton cars and moved at the rate of sixty miles an hour, it would require twenty days and twenty nights for that amount of fuel to pass you, and when put in the storage yard, it would be necessary to have a yard one hundred miles long with two hundred and eighty-eight tracks and this coal is costing the railroads approximately \$1,500,000 a day.

There should not be much difference of opinion as to who should handle the fuel problem. Some one should be responsible for the handling of fuel on the railroads, because we know that there is a great waste of fuel.

You would get more results out of the use of weighing apparatus, if there is such a thing, than you do out of the use of superheaters. It is, maybe, we are not getting the full results from the super-heater, but this is due to neglect.

Faulty workmanship on locomotives is responsible for a large amount of waste. If you will go home and took down ten in-

dividual smokestacks you will see what faulty work is being done in the shops of the railroads.

On some stacks I have seen table plates that you could put your hand through, and these locomotives were inspected every day. We inspect the netting for fire protection, but that is as far as we go unless there is a loose nut or bolt that can be plainly seen.

The Russian locomotive came to us and there was a diversity of opinion as to the front ends. These locomotives had as many changes made in them as the number of railroads they were put on. One railroad changed the grates of these locomotives, put on a standard nozzle and made the best records in fuel consumption of any engines on that division.

We have learned from the Russian locomotive front ends that when the gasses reach the end of the flue they are not restricted, but pass right through the stack. On a great many of our older locomotives in this country we have the draft sheet set so close to the flue sheet that the gasses and cinders strike this plate so hard as to cause them to rebound and pass back through other flues. This is responsible for the hot fire doors we have heard so much about.

There is too great a variation in the grates on the different locomotives. One railroad will operate its locomotives with 25 per cent of air opening grates, and another railroad in the same vicinity using the same coal will use a grate with 50 per cent opening.

On a great many of the locomotives there is fifty lineal feet of exposed steam heat pipe from the source in the cab to the rear end of the tender and we run this equipment through zero weather and wonder why the train-line freezes up. If we will give the same attention to the fuel on locomotive tenders that we give to the lubricating oil on locomotives we will make progress.

On one railroad in the southern region a man was put on for the purpose of saving fuel and in looking over the record. I find that that road saved \$116,000 the first three months of 1919 as compared with the first three months of 1918.

L. P. Streeter (I. C.): Reference is made to the importance of reducing the permissible air leakage limits for freight trains. That matter was recognized by the Fuel Administration last year, and it requested the Air Brake Association to write rules that would eliminate or reduce that leakage. A committee was appointed, of which I was chairman, and the result was the issuance of Fuel Conservation Circular No. 13, over the signature of Eugene McAuliffe, and a marked improvement followed. I have noticed, however, a lapse in the efforts made on the part of the men since the armistice was signed. Possibly they thought that it was not so important to continue the strict observance of these rules as it was during the war.

It is important that every one of us should make the effort to keep that circular before all concerned.

Leslie R. Pyle (Supervisor of Fuel Conservation): You gentlemen think probably that the Fuel Conservation Section is doing a lot of talking, but I want to say a few things, and they are things connected with the mechanical equipment, either in the locomotive or stationary plant.

In the last year I have had hundreds of meetings in the Central and Western regions, and I have made a number of inspections. I see things that lead me to believe that there is no real heart interest in fuel economy. The railroad companies in the last five months of 1918 and the first six months of this year saved nearly \$10,000,000 in fuel, a saving on practically all railroads, but we cannot stop with what we have done.

All of the work you gentlemen have done with the assistance of your force, and the transportation people as well, show the new conditions that exist today. A master mechanic said to me a few days ago: "Mr. Pyle, after you have seen what we have done, you might give us some credit for it." It is not the credit we are looking for, but to save the dollars and cents of the railroad company, and when we are wasting fuel to-day to the extent of hundreds of dollars' worth around our terminals, there is no use in talking of what we have done. What is needed to-day in order to continue savings, and increase them, is for the people who are responsible for these conditions to take the proper interest in them and see that the saving is made. When I can go to a terminal and casually discover eight or ten places where steam is being wasted, and fuel wasted, it shows that the conditions are not what they should be.

I can go to any number of roundhouses and find leaky steam lines with the blowers covered with burlap to cover up the leaks. I can find air compressors that are compressing no air, but are running, and some one around the shop will see this, but nothing is done about it.

I have read the minutes of fuel meetings where the road foreman will get up and say there is nothing left to do at a terminal to save fuel, and the superintendent will say that he could not save ten dollars worth a month on his division. What he says indicates that in his mind there is no necessity for further effort to conserve fuel.

Every one should feel that it is his duty to save fuel. When you go back into the roundhouse see if there are not a number of these things that require attention. Sometimes when I talk to the foremen about steam and air leaks they say they cannot get the men to fix them. You cannot expect any man working for you to do any more than you do, and if you see burlap tied around a steam pipe to prevent a leak, or to lessen a leak, and you do nothing to have that difficulty remedied, you cannot expect the men to take any interest in it.

You can bring about fuel economy and get your men to take the proper interest in that subject, by setting them the example and seeing that these things are properly cared for.

The last two pages of the report contain diagrams giving the results of rating of power plants, showing the attempts made to bring about the efficient operation of stationary plants. This association recommends standard practices, and while this report does not recommend the standardizing of this practice of rating power plants, yet I would like to recommend that this rating be standardized on all railroads, because this system has worked a wonderful change in the power plants on the railroad on which it was developed. Before this system went into effect, due to the apparent lack of interest on the part of the company, one of the power plants was rated at 68 per cent, the best mechanical plant on the railroad. In the last report that plant is rated at 91 per cent. It would not have been 91 per cent had it not been for this report going out to the superintendent, showing that there was room for improvement in the operation of a plant. If it had not been for this system of rating the terminal probably would still be 68 per cent. When you point out an evil to a man who is responsible for it, he will give his attention to overcoming it. All that we need is to have a regular inspection, and not simply say that the fuel is being wasted, but do something to prevent that waste.

C. A. Bingeman (P. & R.): We have given the matter of fuel conservation some careful consideration on the Philadelphia & Reading, both from the standpoint of the locomotives and of the stationary power plants. It is not only a matter of seeing the things that require attention and co-operation on the part of all parties concerned, but it is a matter of a certain amount of money investment, in many cases, in order to achieve fuel conservation in these plants. Many of the old plants have grown up from year to year under the old practice of using locomotive boilers for stationary service at roundhouses, which practice everybody knows is wasteful in fuel. They do not have the proper size of chimneys, in many cases, no proper regulators, in some cases no damper provisions whatever and no gages so that the firemen may know just what his combustion conditions are at any time. We have found cases where grates were not properly proportioned. All of this can be cured with little expense, after the conditions are determined by making tests with suitable appliances.

A great amount of fuel can be saved at all of these plants if the management will give co-operation, from a financial standpoint, to the motive power department which has charge of these various plants and will give attention to its recommendations.

T. A. Barton (D. L. & W.): I have had a great deal of experience in sanding locomotives, and I find that, in a great many cases, there is not enough attention paid to the quality of the sand put on the locomotives. In many cases you will find the sand pipes, sand traps and sanding apparatus all hammered to pieces, and it is due to no other cause than the material put in the sandbox.

Robert Collett (Fuel Cons. Sec., U. S. R. R. A.): This very valuable report marks a very decided step in fuel conservation generally. It is a big thing for the motive power men and the mechanical organization represented by this association, which is the mouthpiece of the people who use the fuel. After all, it is

the mechanical department that uses the fuel, and the thing which is a big text is the paragraph "that the chief problem is one of efficient operation and effective supervision, and the results depend upon maintaining enthusiastic interest." It is not so much a question of who has the organization. Obviously the department that has the organization takes with it the responsibility, and I have never found any lack of willingness to assume that responsibility. If such attention be given to these recommendations, as they are picked out as applying to the individual road, results will surely follow that will be gratifying to any managing officer. In fact, they are now obtaining those results. It is only a comparatively short time since they have, on a great many roads, specialized on fuel to a large extent. Service, of course, has had to be first all the time. You must be careful about what suggestions you make, because the average operating officer is going to at least give some consideration to the things you say. I just recall an engine that I rode two days ago, it was a regular engine, and it looked like a jewelry ship in the interior, and the substance of what I said to the crew when I got off was that you are doing a good job operating this engine, it is a pleasure to ride with you and I want you to tell your master mechanic or your road foreman of engines that I said so, if you want to." Incidentally I told his federal manager the first time I saw him.

Sometimes we ride engines that are not so good. I rode an engine the other day on one of the most important trains in the Eastern region, and it does the railroad no injustice to call attention to it and say that we found a condition that was not quite so good as they should have it. The next day we had a meeting and there were about fifty or sixty men there. I did not call the meeting; I was invited to it, and I said to the chief fuel supervisor, "I want to tell you that this railroad has provided a very thorough organization that has the full support of the general operating officer as well as the chief mechanical officer and every other officer on the road." I told him what the performance had been the day before when I rode the engine for forty-five minutes, and I asked what fuel they

burned. They told me, and it checked very closely with my estimate.

I wanted to tell you this little story, as this was a regular engine, manned by a regular crew. We checked the work back, the mechanical officer and myself, for fifteen days at both ends of the road, and there was not a thing recorded on that engine by the engineer to show that it was wasting fuel until the night I went in, and then he said it was burning too much coal and that "the reverse gear creeps."

What the men that come here and talk on this paper want, what the chief operating officers of the railroads want is to get their money out of the things that they put on. We can get money to put all these things on the engines, but what is the use of putting all of them on if he was going to have a seventy-five per cent waste just because the man was not doing the job properly, and the man he had to supervise him was not supervising him.

J. Dickson (S. P. & S. Ry.): We have derived as much benefit from the monthly fuel meeting of each division as from any other thing that we have tried. Our fuel meeting is held on the first Tuesday or the first Monday, depending upon the division. The assistant general manager is the chairman of the fuel meeting. The superintendent of the division, the yardmaster, the chief dispatcher and all the other officers who are in charge of departments are at that meeting. We also encourage engineers, firemen, conductors, yardmen and any one we can interest in the meeting to come. We discuss the different complaints we have against each other. Instead of talking about the transportation department among ourselves, we air it at the meetings, and I have found the transportation department always ready to make improvements that help in fuel conservation. I believe that that monthly meeting is one of the best things that any railroad can institute. We have unearthed a number of things which cause fuel leaks that I don't believe we could have gotten to the bottom of otherwise.

*A motion that the committee be continued and that it should broaden its investigation to cover stationary plants was carried.*

## Report on Specifications and Tests for Materials (A. R. M. M.)

THE COMMITTEE SUBMITS its report covering the different subjects which were reviewed during the past year and recommends that changes be made in several specifications, as shown under the respective exhibits. All references to page numbers relate to the 1916 proceedings.

### Exhibit A. Specifications for Lap-welded and Seamless Steel Boiler Tubes for Locomotives

(RECOMMENDED PRACTICE, PAGE 552)

1. *Scope.*—These specifications cover lap-welded and seamless steel boiler tubes, boiler flues, superheated pipes, safe ends and arch tubes.

#### I. MANUFACTURE

2. *Process.*—The steel shall be made by the open-hearth process.

#### II. CHEMICAL PROPERTIES AND TESTS

3. *Chemical Composition.*—The steel shall conform to the following requirements as to chemical composition:

Carbon	0.08—0.18	per cent.
Manganese	0.30—0.60	per cent.
Phosphorus	not over 0.04	per cent.
Sulphur	not over 0.045	per cent.

4. *Check Analyses.*—(a) Analyses of two tubes in each lot of 250 or less, and of 2,000 ft. or less of safe-end material may be made by the purchaser. The chemical composition thus determined shall conform to the requirements specified in Section 3. Drillings for analyses shall be taken from several points around each tube. (b) If the analysis of only one tube does not conform to the requirements specified, analyses of two additional tubes from the same lot shall be made, each of which shall conform to the requirements specified in Section 3.

#### III. PHYSICAL PROPERTIES AND TESTS

5. *Flange Tests.*—(a) For all tubes 6 in. or under in diameter and having a thickness less than 9 per cent of the outside diameter, a test specimen shall have a flange turned over at right angles to the body of the tube without showing cracks or flaws.

This flange, as measured from the outside diameter of the tube, shall not be less than 15 per cent of the outside diameter, but the flange shall in no case exceed 1/2 in. in width. (b) In making the flange test, it is recommended that the flaring tool and die block shown in Fig. 1 be used.

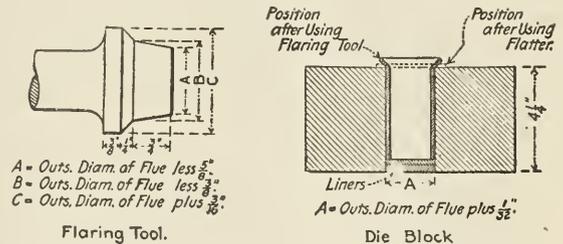

Fig. 1.—Flaring Tool and Die Block for Flange Tests

6. *Flattening Test.*—(a) For all tubes, except small tubes and superheater pipes, on which the flange test is not required, a test specimen 3 in. in length shall stand flattening between parallel plates until the distance between the plates is not over three times the wall thickness, without showing cracks or flaws. For lap-welded tubes, care shall be taken that the weld is not located at the point of maximum bend. (b) For small tubes and superheater pipes on which the flange test is not required, a test specimen 3 in. in length shall stand flattening between parallel plates until the distance between the plates is not over four times the wall thickness, without showing cracks or flaws.

7. *Crush Tests.*—(a) For all tubes except superheater pipes, a test specimen 2 1/2 in. in length shall stand crushing longitudinally until the outside folds are in contact, without showing cracks or flaws. (b) For superheater pipes, a test specimen 2 1/2 in. in length shall stand crushing longitudinally to 1 1/4 in., without showing cracks or flaws.

8. *Hydrostatic Test.*—Tubes under 5 in. in diameter shall stand an internal hydrostatic pressure of 1000 lb. per sq. in., and tubes 5 in. or over in diameter shall stand an internal hydrostatic pressure of 800 lb. per sq. in.; provided that the fiber stress does not exceed 16,000 lb. per sq. in., in which case the test pressure shall be determined by the following formula:

$$P = \frac{32,000 t}{D}$$

in which *P* = the pressure in pounds per square inch, *t* = the thickness of wall in inches, and *D* = the inside diameter of tube in inches. Lap-welded tubes shall be struck near both ends, while under the test pressure, with a 2-lb. steel hand hammer or the equivalent.

9. *Test Specimens.* (a) Test specimens shall consist of sections cut from tubes, selected by the inspector representing the purchaser, from the lot offered for shipment. They shall be smooth on the ends and free from burrs. (b) All specimens shall be tested cold.

10. *Number of Tests.*—One of each of the physical tests specified shall be made from each of two tubes in each lot of 250 or less, or each 2000 ft. or less of safe-end material. Each tube shall be subjected to the hydrostatic test.

11. *Retests.*—If the results of the physical tests of only one tube from any lot do not conform to the requirements specified in Sections 5, 6 or 7, retests of two additional tubes from the same lot shall be made, each of which shall conform to the requirements specified.

IV. STANDARD WEIGHTS

12. *Standard Weights.*—The standard weights for tubes of various outside diameters and thicknesses are as indicated in Table 1.

13. *Permissible Variations.*—The weight of the tubes shall not vary more than five per cent from that specified in Table 1.

V. WORKMANSHIP AND FINISH

14. *Workmanship.*—(a) The finished tubes shall be circular within 0.02 in., and the mean outside diameter shall not vary more than 0.015 in. from the size ordered. (b) The thickness at any point shall not vary more than one gage above or below that specified. In the case of boiler tubes which are expanded and swaged, the thickness of the expanded end may be 1½ gages

VI. MARKING

16. *Marking.*—The name or brand of the manufacturer, the material from which it is made, and the pressure in pounds at which it was tested, shall be legibly stenciled on each tube.

VII. INSPECTION AND REJECTION

17. *Rejection.*—(a) Unless otherwise specified, any rejection based on tests made in accordance with Section 4 shall be reported within five working days from the receipt of samples. (b) Tubes when inserted in the boiler shall stand expanding and beading without showing cracks and flaws, or opening at the weld. Superheater pipes when properly manipulated shall stand all forging, welding and bending operations necessary for application without developing defects. Tubes or superheater pipes which fail in any of the above operations will be rejected and the manufacturer shall be notified.

Exhibit B. Specifications for Lap-welded Charcoal-iron Boiler Tubes for Locomotives

(RECOMMENDED PRACTICE, PAGE 552)

1. *Scope.*—These specifications cover lap-welded charcoal-iron boiler tubes, boiler flues, safe ends and arch tubes for locomotives.

I. MANUFACTURE

2. *Process.*—The tube shall be made from knobbled, hammered charcoal iron.

II. PHYSICAL PROPERTIES AND TESTS

3. *Bend Tests.* (a) *Quench-bend.*—Strips ½ in. in width by 6 in. in length, planed lengthwise from tubes, when heated to a cherry red and quenched at once in water the temperature of which is 80 degrees F., shall bend in opposite directions at each end, as shown in Fig. 1, without showing cracks or flaws. (b) *Nick-bend.*—Strips ½ in. in width by 6 in. in length, planed lengthwise from tubes, when nicked and broken by light blows, shall show a wholly fibrous fracture.

Fig. 1

4. *Expansion Test.*—A test specimen 12 in. in length shall be heated for a length of 5 in. to a bright cherry red (1200 to 1400 degrees F.), placed in a vertical position, and a smooth tapered

TABLE 1—STANDARD WEIGHTS

LAP-WELDED AND SEAMLESS STEEL BOILER TUBES FOR LOCOMOTIVES  
(Including Safe Ends, Arch Tubes and Large Boiler Tubes.)

Thickness, Birmingham Wire Gage.		Weight, lb. per ft. of Length. Outside Diameter, In.

9	0.148	.....	.....	.....	.....	.....	.....	.....	1.741	1.939	2.038	2.137	

lighter, and of the swaged end two gages heavier than the thickness specified. (c) The length shall not be less, but may be 0.125 in. more than that ordered.

15. *Finish.*—The finished tubes shall be free from injurious defects and distortion, and shall have a workmanlike finish.

steel pin at blue heat (600 to 800 degrees F.), forced into the end of the tube by pressure or by light blows of a 10-lb. hammer. Under this test the tube shall expand to 1½ times its original diameter without splitting or cracking. The pin shall be of tool steel and shall have a taper of 1½ in. per ft. of length.

5. *Crush Test*.—A test specimen 2½ in. in length shall stand crushing longitudinally to a height of 1¼ in. without splitting in either direction and without cracking or opening at the weld.

6. *Hydrostatic Test*.—Tubes under 5 in. in diameter shall stand an internal hydrostatic pressure of 1000 lb. per sq. in., and tubes 5 in. or over in diameter shall stand an internal hydrostatic pressure of 800 lb. per sq. in., provided that the fiber stress does not exceed 16,000 lb. per sq. in., in which case the test pressure shall be determined by the following formula:

$$P = \frac{32,000 t}{D}$$

in which P = the pressure in pounds per square inch, t = the thickness of wall in inches, and D = the inside diameter of the tube in inches. Lap-welded tubes shall be struck near both ends, while under the pressure, with a 2-lb. steel hand hammer, or the equivalent.

7. *Etch Test*.—In case of doubt as to the quality of material, the following test shall be made to detect the presence of steel. A cross-section of tube shall be turned or ground to a perfectly true surface, polished free from dirt or cracks, and etched until the soft parts are sufficiently dissolved for the iron tube to show a decided ridged surface, with the weld very distinct, while a steel tube would show a homogeneous surface.

8. *Test Specimens*.—(a) Test specimens shall consist of sections cut from tubes, selected by the inspector representing the purchaser, from the lot offered for shipment. They shall be smooth on the ends and free from burrs. (b) All specimens, except as specified in Section 4, shall be tested cold.

9. *Number of Tests*.—One of each of the physical tests specified shall be made from each of two tubes in each lot of 250 or less. Each tube shall be subjected to the hydrostatic test.

10. *Retests*.—If the results of the physical tests of only one tube from any lot do not conform to the requirements specified in Sections 3, 4 or 5, retests of two additional tubes from the same lot shall be made, each of which shall conform to the requirements specified.

III. STANDARD WEIGHTS

11. *Standard Weights*.—The standard weights for tubes of various outside diameters and thicknesses are as indicated in Table 1.

IV. WORKMANSHIP AND FINISH

12. *Workmanship*.—(a) Finished tubes 3½ in. or under in outside diameter shall be circular within 0.02 in. and the mean outside diameter shall not vary more than 0.015 in. from the size ordered. For tubes over 3½ in. in diameter, these variations shall not exceed 0.5 per cent of the outside diameter. (b) The thickness at any point shall not vary more than one gage above or one gage below that specified. In the case of boiler tubes which are expanded and swaged, the thickness of the expanded end may be 1½ gages lighter and of the swaged end two gages

which fail in this manner shall be rejected and the manufacturer shall be notified.

Exhibit C. Specifications for Air-brake Hose Gaskets

(RECOMMENDED PRACTICE, PAGE 591)

(This specification is the same as that adopted by the M. C. B. Association and revised in 1918. See *Railway Age* for June 21, 1918, page 1490.)

Exhibit D. Specifications for Tank and Underframe Rivet Steel and Rivets

(RECOMMENDED PRACTICE, PAGE 604)

(Same as Specifications for Rivet Steel and Rivets for Passenger and Freight Equipment Cars. See report of Committee on Specifications and Tests for Materials, M. C. B.)

Exhibit E. Specifications for Locomotive Rivet Steel and Rivets

(RECOMMENDED PRACTICE, PAGE 609)

1. *Scope*.—These specifications cover steel bars for the manufacture of rivets and finished steel rivets for locomotive boilers.

I. MANUFACTURE

2. *Process*.—The steel shall be made by the open-hearth process.

II. CHEMICAL PROPERTIES AND TESTS

3. *Chemical Composition*.—The steel shall conform to the following requirements as to chemical composition:

Manganese	.....	0.30 to 0.50 per cent.
Phosphorus	.....	not over 0.04 per cent.
Sulphur	.....	not over 0.045 per cent.

4. *Ladle Analyses*.—An analysis of each melt of steel shall be made by the manufacturer to determine the percentage of carbon, manganese, phosphorus and sulphur. This analysis shall be made from a test ingot taken during the pouring of the melt. The chemical composition thus determined shall be reported to the purchaser or his representative, and shall conform to the requirements specified in Section 3.

5. *Check Analyses*.—An analysis may be made by the purchaser from finished bars or rivets representing each melt. The chemical composition thus determined shall conform to the requirements specified in Section 3.

III. PHYSICAL PROPERTIES AND TESTS

A.—Requirements for Bars

6. *Tension Tests*.—(a) The bars shall conform to the following requirements as to tensile properties:

Tensile strength, lb. per sq. in.	.....	45,000-55,000
Yield point, min. lb. per sq. in.	.....	0.5 tens. str.
Elongation in 8 in. min. per cent.	.....	{ 1,500,000 Tens. str. }
		but need not exceed 30 per cent.

TABLE 1—STANDARD WEIGHTS

LAP-WELDED CHARCOAL-IRON BOILER TUBES FOR LOCOMOTIVES (Including Boiler Flues, Arch Tubes and Safe Ends)

Thickness Birmingham Wire Gage.	Weight, lb. per Ft. of Length.													
	Outside Diameter, In.													
No.	In.	1¼	2	2½	2½	3	3½	4	4½	5	5¼	5½	5½	6
13	0.095	1.65	1.90	2.14	2.39	2.63	2.87	3.11	3.35	3.59	3.83	4.07	4.31	4.55
12	0.109	1.87	2.16	2.44	2.73	3.02	3.30	3.58	3.86	4.14	4.42	4.70	4.98	5.26

7	0.180	.....	.....	.....	4.37	5.31	6.25	7.20	8.14	9.08	10.02	10.96	11.90	12.84

heavier than the thickness specified. (c) The length shall not be less, but may be 0.125 in. more than that ordered.

13. *Finish*.—The finished tubes shall be free from injurious defects and distortion, and shall have a workmanlike finish.

V. MARKING

14. *Marking*.—The name or brand of the manufacturer, the words "knobbed charcoal," and the pressure in pounds at which it was tested, shall be legibly stenciled on each tube.

VI. INSPECTION AND REJECTION

15. *Rejection*.—Tubes when inserted in the boiler shall stand expanding and beading without splitting or breaking. Tubes

(b) The yield point shall be determined by the drop of the beam of the testing machine.

7. *Bend Tests*.—(a) *Cold-bend*.—The test specimen shall bend cold through 180 deg. flat on itself without cracking on the outside of the bent portion. (b) *Quench-bend*.—The test specimen when heated to a light cherry red as seen in the dark (not less than 1200 degrees F.), and quenched at once in water, the temperature of which is between 80 degrees and 90 degrees F., shall bend through 180 deg. flat on itself without cracking on the outside of the bent portion.

B.—Requirements for Rivets

8. *Tension Tests*.—The rivets, when tested, shall conform to

the requirements as to tensile properties specified in Section 6 (a), except that the elongation shall be measured on a gage length not less than four times the diameter of the rivet.

9. *Bend Tests*—(a) *Cold bend*.—The rivet shank shall bend cold through 180 deg. flat on itself, as shown in Fig. 1, without cracking on the outside of the bent portion. (b) *Quench-bend*.—The rivet shank, when heated to a light cherry red as seen in the dark (not less than 1200 degrees F.), and quenched at once in water, the temperature of which is between 80 degrees and 90 degrees F., shall bend through 180 deg. flat on itself without cracking on the outside of the bent portion.

10. *Flattening Test*.—Rivet heads shall be flattened sideways, when cold, to a thickness of one-third and when at a driving heat to a thickness of one fourth the original thickness of the shank, without splitting.

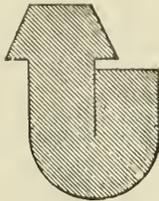

Fig. 1

11. *Test Specimens*.—(a) *Bars*.—Tension and bend test specimens shall be of the full section of bars as rolled. (b) *Rivets*.—Tension, bend and flattening test specimens shall be of the full section of rivets as manufactured. (c) When accurate account of the material has been kept and the melts can be identified, only one set of specimens for each diameter in each melt shall be taken from either the bars or the finished rivets. (d) If rivet bars or rivets have been cold-worked, the test specimens shall be heated to a drawing heat and allowed to cool in air before testing.

12. *Number of Tests*.—(a) *Bars*.—Two tension, two cold-bend and two quench-bend tests shall be made from each lot of 200 bars, or from each diameter in any one melt, each of which shall conform to the requirements specified. (b) *Rivets*.—One tension test (when specified), one cold-bend, one quench-bend and one flattening test shall be made from each lot of 50 kegs of each diameter or from each diameter in any one melt, each of which shall conform to the requirements specified. (c) If any test specimen from the bar or rivets originally selected to represent a lot of bars or rivets contains surface defects not visible before testing, but visible after testing, or if the percentage of elongation of any tension test specimen is less than that specified in Section 6 (a), and any part of the fracture is outside the middle third of the gage length, as indicated by scribe scratches marked on the specimen before testing, a retest shall be allowed.

IV. PERMISSIBLE VARIATIONS IN GAGE

13. *Permissible Variations*.—The gage of each bar shall not vary more than 0.01 in. from that specified.

V. WORKMANSHIP AND FINISH

14. *Workmanship*.—The finished bars shall be circular within 0.01 in., and the rivets shall be concentric, true to form and shall be made in a workmanlike manner.

15. *Finish*.—The finished bars and rivets shall be free from injurious defects and shall have a workmanlike finish.

VI. MARKING

16. *Marking*.—(a) *Bars*.—Rivet bars shall, when ready for shipment, be properly separated and marked with the name or brand of the manufacturer and the melt or lot number for identification. (b) *Rivets*.—Kegs of finished rivets shall, when ready for shipment, be properly marked with the name or brand of the manufacturer, diameter of rivets and the melt or lot number for identification. (c) *Samples*.—The melt or lot number shall be legibly stamped on each test specimen representing a lot of bars. Samples representing a lot of rivets shall be marked in a manner that will not impair their value for test purposes.

VII. INSPECTION AND REJECTION

17. *Rejection*.—(a) Unless otherwise specified, any rejection based on tests made in accordance with Section 5 shall be re-

ported within five working days from the receipt of samples, (b) Bars or rivets which show injurious defects subsequent to their acceptance at the manufacturer's works will be rejected, and the manufacturer shall be notified.

Exhibit F. Specifications for Steel Blooms, Billets and Slabs for Carbon Steel Forgings

(RECOMMENDED PRACTICE, PAGE 562)

6. That the determination of segregation, as specified in Section 8 (b), shall be omitted for "Class C" material, and the letter C removed from the last sentence in the paragraph.

Exhibit G. Specifications for Solid Wrought Carbon Steel Wheels

(RECOMMENDED PRACTICE, PAGE 543.)

7. SEC. 8.—Add to this paragraph, following the title "Brand-ing," the letter a and add as paragraph (b), the following: "(b) When so specified, the purchaser's name and serial number shall be obliterated from all rejected wheels, in the presence of the inspector."

Exhibit H. Specifications for Annealed Carbon Steel Castings for Locomotives

(RECOMMENDED PRACTICE, PAGE 569.)

1. *Scope*.—These specifications cover all steel castings for locomotives and tenders, including tender truck bolsters, truck side frames, locomotive frames and driving wheel centers, as well as miscellaneous castings, classified as follows: Class A—Steel for locomotive frame. Class B.—Steel for all other castings, except as otherwise specified on individual orders.

I. MANUFACTURE

2. *Process*.—The steel may be made by the open hearth, crucible or electric process.

3. *Heat Treatment*.—Castings shall be allowed to become cold. They shall then be uniformly reheated to the proper temperature to refine the grain and allowed to cool uniformly and slowly. If, in the opinion of the purchaser or his representative, casting is not properly annealed, he may at his option require the casting to be re-annealed.

II. CHEMICAL PROPERTIES AND TESTS

4. *Chemical Composition*.—The steel shall conform to the following requirements as to chemical composition:

	Class A.	Class B.
Carbon .....	0.25—0.45	0.20—0.37
Manganese .....	not over 0.75	0.75
Phosphorus .....	not over 0.05	0.05
Sulphur .....	not over 0.05	0.05

5. *Ladle Analyses*.—An analysis of each melt of steel shall be made by the manufacturer to determine the percentage of carbon, manganese, phosphorus and sulphur. This analysis shall be made from drillings taken at least 1/4 in. beneath the surface of a test ingot obtained during the pouring of the melt. The chemical composition thus determined shall be reported to the purchaser or his representatives and shall conform to the requirements specified in Section 4.

6. *Check Analyses*.—An analysis may be made by the purchaser from the broken tension test specimen or from a finished casting representing each melt. The chemical composition thus determined shall conform to the requirements specified in Section 4. Drillings for analysis shall be taken not less than 1/4 in. beneath the surface of the casting.

II. PHYSICAL PROPERTIES AND TESTS

7. *Tension Tests*.—(a) The steel shall conform to the following minimum requirements as to tensile properties:

	Class A.	Class B.
Tensile strength, lb. per sq. in.	75,000	65,000
Elastic limit, lb. per sq. in.	0.4 Tens. Str.	0.4 Tens. Str.
Yield point, lb. per sq. in.	0.45 Tens. Str.	0.45 Tens. Str.
Elongation in 2 in. per cent.	1,600,000 Not under	1,600,000 Not under
Tens. Str. 18 per cent.		Tens. Str. 22 per cent.
Reduction of area, per cent.	30	35

(b) Either the elastic limit or the yield point, but not both, shall be determined. The elastic limit shall be determined by an extensometer and the yield point by the drop of the beam of the test machine.

(c) The yield point, or the elastic limit, shall be determined at a cross-head speed not to exceed 1/8 in. per minute, and tensile strength at a speed not to exceed 1 1/2 in. per minute.

8. *Alternative Tests to Destruction.*—In the case of orders including only castings not exceeding 150 lb. in weight, the test to destruction of one casting from each 100 castings or smaller lot may be substituted for the tension tests. This test shall show the material to be ductile, free from injurious defects, and suitable for the purpose intended.

9. *Test Specimens.*—(a) Tension test specimens shall conform to dimensions shown in Fig. 1, the ends shall not be less than  $\frac{7}{8}$  in. in diameter and of a length and form to fit the holders of the test machine in such a manner that the load will be axial.

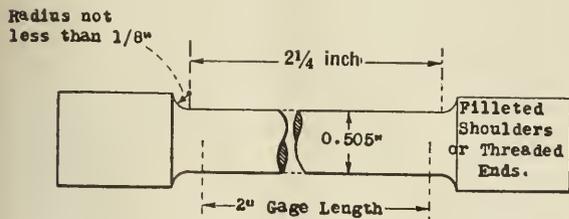

Fig. 1.—Test Specimen

(b) If the test specimen shows defective machining or develops flaws, it may be discarded and another specimen substituted.

(c) A sufficient number of test coupons, from which the required test specimen may be prepared, shall be cast attached to each end of each locomotive frame, to each locomotive cylinder, to each wheel center and to miscellaneous castings weighing over 150 lb. These test coupons shall remain attached to the castings throughout the annealing and until the castings are presented for inspection. If the design of the casting is such that the test coupon cannot be attached, they shall be cast in runners outside of the casting, but attached to it, to represent each melt. The location of the test coupons, as well as the method of casting such coupons, shall be subject to mutual agreement by the inspector and the manufacturer. In the case of any orders for casting weighing under 150 lbs., the physical properties as required in Section 7, may be determined by an extra or spare test bar cast with and attached to some other casting from the same melt.

(d) When sufficient coupons have not been cast, a test specimen may be cut from a finished casting at a location mutually agreed upon by the inspector and the manufacturer.

10. *Annealing Lugs.*—For the purpose of determining the quality of annealing at least two and not more than four annealing lugs shall be cast on all castings 150 lb. and over and on such castings less than 150 lb. as required by the purchaser. The location of the annealing lugs shall be agreed upon by the inspector and the manufacturer. The standard annealing lug shall be 1 in. in height and 1 in. in width and  $\frac{3}{8}$  in. in thickness where it joins the casting. The inspector may remove one-half and the manufacturer one-half of the number of annealing lugs.

11. *Number of Tests.*—(a) *General Requirements.* (1) One tensile test shall be made from each end of each locomotive frame and both tests shall meet the requirements of the specifications. One tensile test may be made from each wheel center and each locomotive cylinder casting, but at least one of each kind of such castings in each melt shall be tested. For miscellaneous castings from melts which do not include frames, wheel centers or cylinders, one tensile test shall be made from each melt. (2) If the percentage of elongation of any tension test specimen is less than that specified in Section 7 and any part of the fracture is more than  $\frac{3}{4}$  in. from the center of the gage length, as indicated by scribe scratches marked on the specimen before casting, a retest shall be allowed. (3) If the results of the physical test of any test lot do not conform to the requirements specified, the manufacturer may re-anneal such lots, but not more than twice, and re-test shall be made as specified in Section 7. (4) No part of this specification shall operate to cause any one tensile test to apply to more than 40 tons of castings as offered for inspection.

(b) *Special Requirements for Miscellaneous Castings.*—(1) After 15 consecutive melts, which may contain any or all classes of castings (except frames, wheel centers and cylinders) covered by these specifications on one or more orders, have been tested and accepted in accordance with the above requirements, the

manufacturer may group the succeeding melts in lots of five melts each; the entire group to be accepted if the test specimen selected from the lot fulfills the chemical and physical requirements herein specified. If this test fails, a rehearing will be granted on the melt that the failed bar represents, and the other four melts of the group shall be tested individually. (2) If there is a period of more than six months between shipments of the class of castings covered by these specifications, then each melt shall be tested individually until 15 consecutive melts have been accepted, after which the melts may again be grouped as in paragraph (a). (3) If one or more melts are rejected, each succeeding melt shall be tested individually until 15 consecutive melts have been accepted, after which melts may again be grouped as in paragraph (a). (4) In case of small orders for bolsters, truck sides, draft arms, yokes or castings weighing over 150 lb. where the size of the order and the available pattern and foundry equipment are such that not more than five castings can be cast in any one melt, the physical properties, as required in Section 7, will be determined from an extra or spare test coupon cast with and attached to some other casting of the same melt.

(The sections on Permissible Variations, Workmanship and Finish, Marking and Inspection and Rejection follow the wording of the corresponding sections in the M. C. B. Specifications for Annealed Carbon Steel Castings for Passenger and Freight Equipment Cars. See Report of M. C. B. Committee on Specifications and Tests for Materials.)

The report is signed by F. M. Waring (Chairman), Pennsylvania; J. C. Ramage, Southern; J. R. Onderdonk, Baltimore & Ohio; A. H. Feters, Union Pacific; Frank Zeleny, Chicago, Burlington & Quincy; H. B. MacFarland, Atchison, Topeka & Santa Fe; Prof. L. S. Randolph, Virginia Polytechnic Institute; H. E. Smith, Chief Materials Inspector, United States Railroad Administrator.

### Discussion

Mr. Waring: In addition, the committee wishes to make the addition of an Exhibit I to modify specifications for steel axles for locomotive tenders, standard page 229 of the 1917-18 proceedings. In Section 8 omit the letter A at the beginning of first paragraph. Omit the entire paragraph B. Change Section 5, check analysis, to read as follows: "An analysis shall be made by the purchaser from one axle representing each melt. The chemical composition thus determined shall conform to the requirements specified in Section 2. The drillings for this analysis shall be taken with a  $\frac{5}{8}$  in. drill from one end of the test axle at any point midway between the center and the surface." The reason for that is that the present specifications require that a 6 in. piece shall be cut off the test axle, and the most general method of drilling for check analysis is to take the drillings directly from the end of test axle. The committee saw no objection to making that substitution in the specification. *I would move that the report of the committee be accepted and go to letter ballot.*

T. L. Burton (N. Y. C.): I would like to call attention to the detail of nominal and tolerance dimensions for air-brake hose gaskets. The dimensions as here shown do not coincide throughout with the sections in recommended practice gage for hose coupling gaskets. This gage was voted a few days ago and submitted to letter ballot for advancement to standard. There seems also to have been some division of responsibilities of the committees on specifications and tests for materials and the train brake and signal committee in reference to this matter of gaskets, hose-coupling gages and so forth. In view of this the last mentioned committee submitted the matter to the General Committee to know whether the train committee was going to handle the question of dimensions for the parts mentioned, as they had done heretofore, or whether they were to be handled by the committee on specifications and tests materials. The decision was that the question of air-brake hose couplings, gaskets for air-brake hose couplings and gages for the two were to be treated as air-brake details, and all dimensions pertaining thereto were to be handled by the air-brake committee. The committee on specifications and tests of materials would deal only with the physical and chemical properties of those parts. As a result of that lack of understanding in the past you have had certain standard dimensions adopted on the recommendations of the committee on specifications for test materials for gaskets and certain dimensions for a gasket gage which

you also adopted on the recommendation of another committee, and the two did not coincide. I call this to your attention because of your having adopted conflicting recommendations in the past.

W. E. Dunham: Under the circumstances as explained by Mr. Burton, I move that the dimensions both original and limiting of the gage and of the gasket as recommended by the train-brake and signal committee be substituted in these specifications.

Mr. Burton: If you will carry out the recommendation that you adopted in connection with the train brake and signal committee's report, it will automatically do what has been suggested. The committee recommended that the matter of tolerance dimensions for the hose coupling packing rings be provided for in the gage rather than in the gasket the thought being that if you put a minimum and maximum gage, and specify that a ring should enter one side of the gage and should not enter the other, it would automatically take care of the tolerance dimensions. The committee also recommended that the specifications for the gasket include a drawing for the gage and instructions on its use. That being the case, it seems to me the matter might be cleared up by simply eliminating the tolerance dimensions in this report of the gaskets and substituting the one for the gage.

Mr. Waring: The reason these specifications do contain tolerances was that the members of the Specification Commit-

tee found that the actual gaskets that we were getting could not be checked with the gage which the Train Brake Committee had recommended. We made a thorough investigation of this gasket question, and came to the conclusion that since these tolerances were not satisfactory that it was up to us to make a set of tolerances, and that it would be desirable to have them in the specifications. That was done about a year ago. Since then I understand that the Train Brake Committee has made some changes in that gage and the tolerances. I think it would be desirable to have a joint action between these two committees, so that we could have the same understanding of the subject. In order to clear up this situation, perhaps Mr. Burton's motion to the effect that the tolerances should be removed from this specification is the one that should prevail.

The Chairman: Do you make that as an amendment, Mr. Waring? There is a motion before the convention.

Mr. Burton: I don't think the motion that was made conflicts at all with anything that was said. The motion, as I understood it, was that the gage and these dimensions be substituted for the dimensions shown in this report for the packing ring itself.

The Chairman: That is in accordance with your understanding?

Mr. Dunham: Yes, sir.

*(The motion was put to a vote and carried.)*

## Design and Maintenance of Locomotive Boilers

UNDER DATE of February 8, 1919, the committee issued Circular L, containing six questions. Up to March 20 only 19 roads responded, and from their reports we derive the following general conclusions:

None of the 19 roads reports introducing any new or special designs of locomotive boilers during the last two years.

Nine roads out of the 19 use electric welding in fire boxes for patches, partial side sheets, cracks and fire door patches.

Eight report no electric welding at all, and two report the use of oxy-acetylene. Only three roads report making a common practice of using electric welding as a substitute for riveted seams in the firebox and only to a limited extent in repair work. One road uses riveted seams strengthened by electric welding. In some cases seams between the crown sheet and side sheets are welded the full length without rivets, and also fire door hole flanges, without giving any further trouble. One road reports that all cross seams, and, to some extent, the fire door sheets, are either electric or acetylene welded. Mud ring corners are being successfully repaired by cutting off 18 in. each way and welding in a new corner, but the report does not specify whether this operation is done by the electric or acetylene process.

One road reports what it claims to be a successful method of reclaiming enlarged staybolt holes, by tapping out from 2 in. to 3 in diameter and screwing in plugs the same thickness as the sheet, with both the plug and the sheet chamfered off  $\frac{1}{8}$  in. and the electric weld built up in the gutter thus formed, with a slight mound for strength. Cracks between staybolt holes are repaired by cutting out the crack to a 45 degree bevel on each side  $\frac{3}{16}$  in. apart, and building in the electric weld.

One road furnishes a sketch of a sectional flue expander with the parts which, in the standard expander, would have a bearing against the bead of the flue ground off. This is to be used on flues which are electric welded in the back sheet when they show leakage, the idea being to knock the scale off on the water side next to the sheet and prevent overheating and cracking, and at the same time avoid crowding the bead of the flue against the weld and breaking it. Grinding the expander off in this way does not impair its efficiency for roundhouse work on flues which have not been welded. Some large superheater flue expanders have been changed also, and the road claims that up to date this seems to be the most efficient tool for keeping scale away from the ferrule on the water side. This road finds it necessary to work the flues which have been welded in the sheet about every 60 days, and in bad water districts oftener. A discussion of this process of removing scale and its effect upon welded flues is invited.

One road reports electric welding smoke box studs, the inference being that the studs are butt welded to the ring to save drilling and tapping. Another road electric welds arch brick studs in a similar manner.

The most approved methods of performing the various welding operations were included in last year's report and need not be repeated here. It may also be remembered that among the roads reporting last year, 25 per cent used electric welding for entire new fire boxes, which does not agree perfectly nor conflict radically with the fact that none of the roads reporting this year mention such a practice, although one road uses oxy-acetylene welding in place of riveted seams, except in the mud ring, for all new fireboxes.

Of the 19 roads responding to Circular L, only 10 have had experience with combustion chambers, and all that have had them any length of time report favorably on account of improved combustion and less trouble with leaky flues. If there has been any notable change in locomotive boiler practice during the past year, it has been the re-introduction of the combustion chamber. These range all the way from the D-shaped tube sheet up to a combustion chamber reported on the new Pennsylvania Mallet as 10 ft. in length.

One member advises his view of the combustion chamber is that its main function is not so much to increase the firebox surface as it is to shorten the tubes and give increased length of flamework, to allow combustion to be more nearly completed before it is extinguished by admission to the tubes. Combustion once completed, it is immaterial whether the heat be absorbed by the firebox or by the tubes, and the more heat extracted by the firebox, the less will be the evaporation of the tubes.

The introduction of large combustion chambers naturally brings up the question of bridge walls between the combustion chamber and the firebox proper; possibly also the desirability of some form of discharge for the bank of sparks carried over the bridge. While the committee has received no data on bridge walls, we have no doubt that a discussion will develop this feature.

A member has suggested as worthy of consideration the best method of determining the water level in the extremely long boilers of to-day. This refers particularly to the long boilers on Mallet engines, which operate over heavy humps and dips.

In reply to Question 5, 11 roads have experienced trouble from cracks in boilers where the guide and waist sheet angle is fastened to the boiler shell. To overcome this, six roads have removed the rivets or studs, leaving a loose bearing. One road uses two small waist sheets instead of the one-piece design, which they find permits greater flexibility, and one road is experimenting with flexible braces between the guide yoke

and the boiler, but these have not been on the road long enough to produce results. One important road continues to rivet the angle or tee to the boiler with a  $\frac{3}{4}$ -in. liner inside of the boiler, which distributes the strain over a greater area with successful results. Another important road uses studs in some engines and rivets in others, but finds that the counterbalance has some effect in causing cracks at that point.

In reply to the sixth question, 13 of the 19 roads have no government engines, while the remaining six have nothing to say except one reference to the two water glasses and water column, which is believed by some to be superfluous.

Referring again to innovations in locomotive design—the attention of the committee has been directed to detail descriptions and reports of the performance of a locomotive equipped with a new type of firebox on the Chicago, Milwaukee & St. Paul, known as the "Nicholson Thermic Syphon." (See *Railway Age*, issue of January 10, 1919, page 151.) According to published test data, the engine equipped with these syphons appears to have produced some very economical results.

The report is signed by C. E. Fuller (Chairman), Union Pacific; A. W. Gibbs, Pennsylvania; D. R. MacBain, New York Central; M. K. Barnum, Baltimore & Ohio Railroad; C. B. Young, Inspection and Test Section, United States Railroad Administration, and J. Snowden Bell.

### Discussion

Mr. Fuller: Since this report was made one or two members have suggested the advisability of a committee being appointed to go into the combustion chamber feature and its application.

Mr. Gaines: The combustion chamber question is one worthy of a committee. I have been making a study of that one particular feature of engine construction for a number of years. We have had little, if any, authentic data brought before the association. I have prepared, but I am not going to inflict it on the association at this time, a little data, and with your kind

permission I am going to leave it with the secretary and let him include it in the proceedings.

(Mr. Gaines' paper will appear in to-morrow's *Daily*.)

Mr. Bentley: Is the welding of two-in. flues in Locomotives operating in bad water districts a good proposition? At one time we welded the flues in a large number of boilers and the flue sheets cracked and we had all sorts of trouble. Our people used to say that in good water there is no necessity for any flue welding because the flues do not leak, but in bad water you get in other complications because the flues leak and the flue sheets crack.

The Chairman: We are welding the small tubes in about 40 to 50 locomotives a month—that is about one-half of what we turn out of our shops. The only reason we don't weld more is because we haven't enough welders. We would weld them all if we had machines enough. We are rapidly getting in the machines. We have been welding flues—small flues I am talking about now—because for years we have welded all our superheaters, and we have any number of cases on record where a locomotive leaves the shop and returns after performing from 55,000 to 70,000 miles without having a boilermaker in the firebox, and if you can keep the boilermakers out of the firebox you keep down your flue troubles. I don't want to get into a discussion of how flues should be welded, but there is only one method of properly welding tubes. Tubes should be prepared the same as you did when you handled them by a boilermaker, namely, the copper gasket. The electric welding arc is the only thing that you can properly weld a small tube with and not preheat it. With the aid of the copper gasket, if any difficulty should be experienced with the flue while in service, you can go to it with your prosser expander, just the same as you could before.

Mr. Pickard (D., L. & W.): *I move you that the report be received and the committee continued, and the subject of combustion chambers be referred to the same committee.*

*(The motion was seconded and upon being put to vote was carried.)*

## Report of Committee on Locomotive Headlights

H. T. Bentley  
Chairman

HERETOFORE, REPORTS of the Headlight Committee have been in the nature of results obtained by tests of electric headlights and at the time they were made and conclusions reached, most railroad men, especially in thickly congested territory, and where high-powered lights had not been tried, were satisfied that such a device was a menace to the safe operation of a busy railroad and should not be used. Now that the electric headlight is with us to stay, it may be in order to refresh our memories, to give a brief history of its evolution, and after that,

see what is still further needed to make the apparatus as reliable as any other part of the locomotive.

The first arc light was operated in the early eighties by an oscillating engine, which later was changed into a turbine for furnishing the power and this method, with modifications and improvements, is still in use. Objections to the arc light were many, among them being the necessity for continually changing carbons, the tremendous heat generated, the unreliability and variety in the intensity and direction of illumination and the burning out of carbon holders and other parts of the apparatus. There was no way of dimming or softening the light, and on account of its brilliancy it was very objectionable at stations or when passing trains on double track, etc. As an advertising medium and on single-track roads, particularly in the West, it was fairly successful except for failures, some of which are mentioned above.

After much experimentation it was decided in 1915 to substitute the incandescent carbon filament lamp for the arc light and a remarkable improvement in cost and operation was shown, the light being steady, uniform and more reliable. It was also possible to have a smaller lamp in the same headlight casing, so that by use of a switch it could be used when the larger lamp was objectionable at stations or on double track. On account of the lack of efficiency in the carbon lamp it was necessary to use a comparatively large generator with an accompanying high steam consumption and trouble was still experienced with the governor, and bearings had to be frequently lubricated or the machine was out of commission.

Improvements in electric lamp construction gave us the tungsten filament with its increased efficiency, so that for the same amount of current, very much greater illumination was furnished, but the frailty of this filament caused considerable trouble and failures. The lamp manufacturers later furnished a type of lamp with a short, stiff filament that was very rugged and thus the annoyance of failures from this cause was overcome. The greater efficiency of the lamps enabled a very much smaller unit, with decreased steam consumption to be used, and at about this time the lubricating devices were improved so that instead of having to oil the bearings about every eight hours they would run for several months without attention.

A dimming device was later designed, so that instead of using two lamps, one of which had to be out of focus, the 250-watt lamp in focus could be used for road work or through the medium of a resistance of 3.12 ohms could be reduced by the movement of a switch so that it was not objectionable to an engineman opposing it. The difficulty of properly focusing the lamp was taken care of by a device which enabled this to be done quickly and properly.

In the earlier recommendations of the A. R. M. M. Association committee, a 6-volt system was suggested, but on account of train-lighting systems being 32 volts, this voltage is now generally used for headlighting equipment and on

several roads, suburban coaches are lighted from the headlight equipment. To take care of this work a 2½ or 3 k. w. machine is used.

Towards the end of 1915 experiments were made with storage batteries to furnish current for the headlight. This equipment gave good results except for lamp trouble, which difficulty was later overcome, but its first cost was so high and the length of time consumed charging batteries so great, where facilities were provided for that purpose, that its use was abandoned.

The headlight reflector, silver plated, give considerable trouble with tarnishing, and a glass reflector that can be readily kept clean is very desirable. Several makers have put such reflectors on the market.

Acetylene gas was tried for headlights on a number of roads, some using a generator apparatus on the engine while others used acetylene stored in tanks. With the former practice serious accidents occurred, due to men with open torches cleaning out the spent carbide before all of the gas had been dissipated, while the storage tanks required considerable work to replace them when discharged. The light furnished was of good quality, but due to breakage of piping, clogging of burners, and the troubles mentioned above, the use of acetylene for headlight purposes was discontinued.

The amount of light necessary on a switch engine must be considered not only from the engineer's requirements but also from the switchman's safety standpoint. Complaints are continually being made by the former that the light is not bright enough and from the latter that it is too strong, but by using a 40-watt lamp in a clean reflector, ample light is furnished to comply with the 300-ft. requirement of the law and not be objectionable to the switchmen.

There appears to be a demand in some quarters for an enclosed type of switch of more rugged construction and conveniently located within reach of the engineer, as complaints are made that the single-pole double-throw switch as generally used is not very satisfactory.

Failures frequently occur from broken steam pipes, broken field lead, excessive voltage, ground brush holders, loose connections, worn bearings and excessive valve travel, but the manufacturers and repair men are making much progress in the correction of these difficulties and we soon will have the headlight equipment as free from troubles as any properly designed machine.

Through the courtesy of the Association of Railway Electrical Engineers, the committee has been furnished with their report on this subject, and with their permission it is presented by us. We believe it gives a great deal of technical information from men well qualified to handle the subject, so that by a thorough discussion of this we will be in very much better position to know what is the best practice and be governed accordingly.

The report is signed by H. T. Bentley (Chairman), Chicago & North Western; D. F. Crawford, Locomotive Stoker Co.; C. H. Rae, Louisville & Nashville; F. A. Torrey, Chicago, Burlington & Quincy; M. K. Barnum, Baltimore & Ohio Railroad; Henry Bartlett, Boston & Maine; W. H. Flynn, Michigan Central; W. O. Moody, Illinois Central, and A. R. Ayers, New York, Chicago & St. Louis.

### Exhibit A

#### Report of Committee on Electric Headlights A. R. E. E.

The committee, in submitting the following recommendations for standard practice for conduiting and wiring locomotive headlight equipment, has in mind the necessity of installing a conduit system that will insure good service and one that can readily be removed and applied with a minimum amount of labor, recognizing the fact that the installation is not permanent, as the engine may have to be stripped at any time to allow for repairs to the boiler, cab or other parts of the locomotive. It has, therefore, been the object of the committee to arrange the conduit plan so that the conduits could be removed with the wiring intact and placed in suitable racks ready to be reapplied to the engine when the engine repairs have been completed. Inasmuch as the installation of the conduit on the engine is usually the last thing to be done, the factor of time is an important element to be considered. The more simple the system of wiring and less complicated the conduit plan, the more readily

can the men who maintain and install it do their work. The item of expense is one that enters largely in the re-application of the conduit and wiring as well as the first cost of installation, and the committee has tried to keep in mind the practicability of the installation from the maintainers' point of view.

### Equipment

It is recommended that an incandescent electric headlight be adopted with a 500-watt turbo generator, capable of developing 32 volts with full load on at a steam pressure of 125 pounds, the governor to regulate the speed of the turbine properly between steam ranges of 125 to 200 pounds.

It is recommended that manufacturers of electric headlight equipment adopt a universal standard size of ball bearing which will be interchangeable and can be purchased on the open market. (No. 305 recommended.)

Owing to the transfer of motive power to foreign territory, the method of mounting the turbo generator should be standardized to facilitate interchanging of equipment. It is recommended that the spacing of bolt holes for mounting the turbo generators be the same on all makes of equipment, and that the thickness of the legs of the turbo generator be standard so that a standard size stud bolt can be used.

#### Installation of Turbo Generator—Location of Turbo Generator

The turbo generator shall be located on the top of the boiler as near the cab as practicable, with the dynamo end toward the side of the boiler equipped with the conduit system (preferably the left or fireman's side of the locomotive). Where locomotive conditions will not permit the location of the generator set at this point, it is recommended that the turbo generator be located on the left side and longitudinally with the boiler, the turbine end toward the locomotive cab and in a position not to obstruct the vision of the fireman. Under no condition should the exhaust pipe of the turbine be attached in any way to the cab. Where it is necessary to place the equipment forward of the center or at the front end of the locomotive, a ¾-in. extra heavy pipe should be run under the lagging next to the boiler for the steam supply (this to prevent steam condensation or freezing of this pipe in severe weather). It is recommended that the turbo generator be secured to the boiler with ⅝-in. stud bolts.

#### Piping for Steam Connections, Etc.

The steam connection shall be not less than ½-in. extra heavy pipe carried from the fountain in the cab to the turbine in such a manner that the line will drain from the throttle valve to the turbine. Where the pipe can not be drained direct to the turbine, the low point in the line should be inside the cab and a drain pipe placed with a suitable valve conveniently located so that the engineer can open and drain the steam line when the turbine is not running (this to prevent the pipe freezing). Where the steam line is brought through the cab, a clearance of at least ½ in. should be maintained around the pipe so that any movement of the cab will not break the pipe connections. Where the pipe passes through the cab, the hole shall be closed with a weather-proof cover that will allow for a free movement of the pipe.

It is recommended that two valves be used in the steam supply pipe, the one at the manifold or source of steam supply and the other to be within easy reach of the engineer. Where this valve can not be so placed, an extension handle should be used—removed from the hot steam pipe so there will be no danger of the engineer burning himself in turning the valve on or off.

#### Conduit and Wiring

**Locomotive Wiring.**—The conduit system and wiring for the electric headlight equipment on the locomotive boiler shall utilize the hand rail where possible. The wires from the turbo generator set shall run to the cab and to the front end of the locomotive in the hand-rail conduit (preferably on the left or fireman's side). This hand rail shall be of standard galvanized electric-conduit of not less than 1 in. inside diameter.

The conduit shall be supported and secured to the boiler by special hand-rail columns, provided with a detachable part

or cap to facilitate the removal of the hand-rail conduit as a unit intact. This conduit shall in no case be less than 4 in. above the engine jacket and shall have at least 2½ in. clearance over all pipes on the engine boiler. A suitable weather-proof box with a terminal block or disconnecting device should be located on the front of the cab where the wire enters, so that the wires may be readily disconnected. The connection between the hand-rail conduit and the junction box shall be a non-rigid connection (¼-in. flexible steel conduit with suitable fittings recommended). A suitable weather-proof fitting or terminal box shall be placed at the end of the hand-rail conduit with non-rigid connections between the classification lamps and the headlight case. This flexible connection shall be of sufficient length to permit the opening of the door on the front of the boiler without necessitating the removal of the headlight case. All conduits should be supported in a manner that will give at least 2 in. clearance above the boiler and in no case shall the flexible conduit rest on the smoke box. (This being unprotected with lagging, is the hottest place on the locomotive boiler.) The connection between the terminal box and the classification lamp should be so arranged that it can be easily disconnected either at the terminal box or at the lamp.

**Cab Conduit.**—The wiring in the cab shall preferably be installed in ½-in. rigid steel conduit so applied that it may be removed intact (approved electrical fittings to be used throughout), and where conditions permit of such location, the conduit fittings for drop cords to gage lights should be

pole, double-throw switch, a common wire terminal, resistance unit and Edison plug cut-out, all mounted on the same base, and placed on the side of the cab within easy reach of the engineer. The wires from the terminal box at the front of the cab to the distribution center may be run in flexible conduit, loom, or can be taped and cleated, but in no case shall it be a fixed part of the conduit system for the cab light circuits.

Open wiring for the cab lights (properly installed) is acceptable. See proposed conduit plans, Fig. F—Road Engines, Fig. G—Switch Engines.

**Switch Board Panels**

**Road Engines.**—The switchboard for road engines shall consist of a single-pole, double-throw switch, one resistance unit, a common wire terminal and one single branch, two-plug Edison cut-out, all mounted on the same base. The cab switch should be so connected that when the blade of the switch is in the forward position full voltage is impressed on the headlight lamp and when in the opposite position the dimming resistance is cut in the headlight circuit. (See wiring diagram Fig. F2.) One side of the classification and cab light circuits should be fused with 10-ampere Edison fuse plugs. Fusing of the main headlight circuit is not recommended.

**Switch Engines.**—The switch board for engines in switching or back-up service having front and rear headlights, shall consist of a special single-pole, double-throw switch,

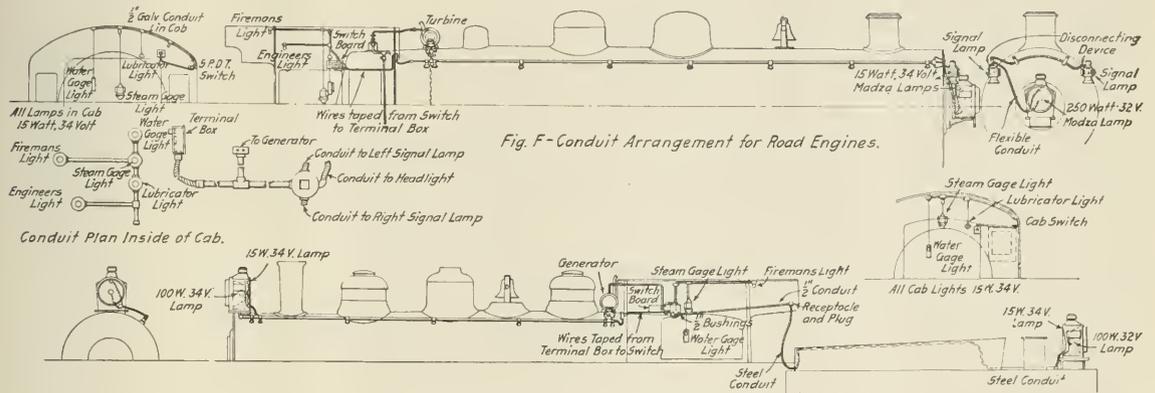

Fig. F—Conduit Arrangement for Road Engines.

Fig. G—Conduit Arrangement for Switch Engines.

**Conduit Arrangements for Road and Switch Engines**

placed on the ceiling of the cab in front of and not directly over the boiler in order that they may be readily accessible. A detachable fitting should be provided for the water glass, lubricator, air and steam gage lights, to facilitate the renewal or repairs to drop cords in case of trouble; (it is advisable to fuse each of these individual drops; armored cord or flexible steel conduit has not been satisfactory and is not recommended). No. 16 or No. 18 cotton-covered lamp cord drawn through a ¾-in. flexible asbestos tubing has proven the best for this service. Where this tubing is used the gage lamps and conduit fitting should be provided with a cover bushing or fitting having a ½-in. opening with a cupped recess, that will allow the tubing to pass through and form a knot so that the strain is taken on the tubing and not on the wire. This is formed in the tubing by turning in the ends on the cord.

Where the gage lights do not come directly under the fittings, some provision should be made to loop back and secure the drop cord so that it does not come in contact with hot steam pipes or the head of the boiler.

The conduit system in the cab should not be rigidly attached to the distributing center, neither should the conduit placed on the ceiling of the cab be rigidly connected to the conduit placed on the sides of the cab (the motion of the cab having a tendency to break the fittings or loosen the conduit). The distribution center shall consist of a single

common wire terminal and single-branch, two-plug Edison cut-out, mounted on the same base. (A four-position switch is recommended, wired as follows): Off Position—Blade at center. First Position—Forward, front headlight full voltage. Second Position—Forward, both headlights full voltage. First Position—Reverse or back, rear headlight full voltage. Second Position—Reverse or back, both headlight full voltage.

Where desired to dim headlights, the standard resistance unit can be cut in series with the center contact at the switch blade, with a separate 10-ampere snap switch (or preferably a toggle switch) to short circuit and cut out this unit when not used. When desired to dim one or both of the headlights, this switch should be open or off and to impress full voltage on the lamps the switch should be in the normal position, which is on or closed, the headlight circuit not to be fused. (See wiring diagram, Fig. G 2.) The 100-watt headlamps should be placed forward of the focal position in the reflector, so as to spread and not to throw a beam of light. It is recommended that a dimming resistance which will reduce the voltage of the headlight lamp approximately one-half be used. (A standard 3.12-ohm resistance unit 8-ampere capacity be used with 250-watt, 32-volt headlight lamp to comply with the Interstate Commerce Commission ruling in this connection.) Wiring for signal lamps on engines in switching service is not recommended.

**Connection Between Engine and Tender.**—Where a headlight is placed on the engine tender, a detachable, approved locking type of connector with flexible steel conduit connection should be made between the engine tender and the

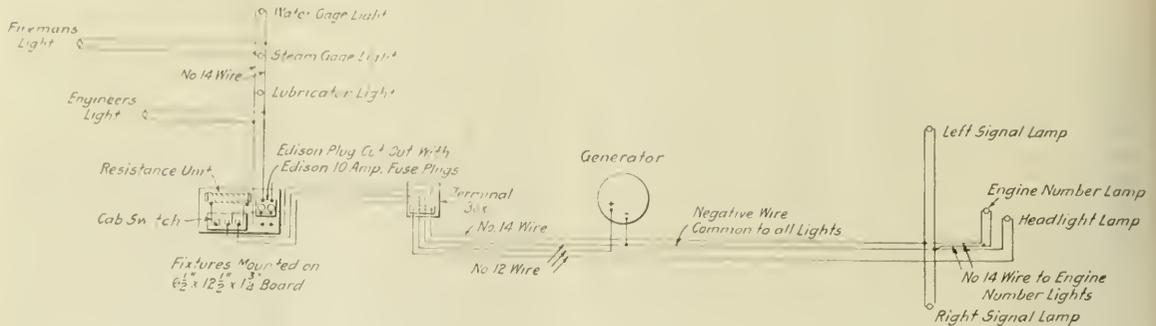

Fig. F 2.—Wiring Diagram for Road Engines

cab. (It is recommended that this connection be made between the roof of the cab and the top of the tender, leaving slack in the flexible conduit to allow for the swing of the tender. This conduit to be carried back far enough to keep clear of the gangway. The location of the connector and conduit under the step of the cab is not recommended on account of steam and water conditions.)

**Control of Classification Lamps.**—A key socket should be used in each classification lamp to require the enginemen to

mended that a 250-watt G-30-32 volt concentrated filament lamp be used for headlights on road engines. It is recommended that a 100-watt G-25-32 volt concentrated filament lamp be used on switch or back-up service engines.

**Discussion**

Mr. Bentley: I would like to ask that the privilege of the floor be given to E. W. Jansen, electrical engineer of the Illinois Central, chairman of the headlight committee, but before we

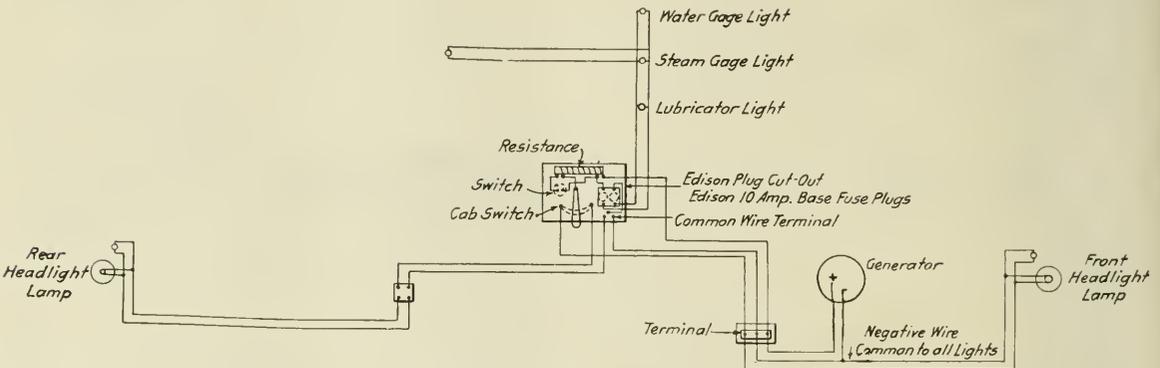

Fig. G 2.—Wiring Diagram for Switch Engines

go to the lamp to light it, thus insuring that the lamps are burning. A switch in the cab for controlling these lamps is not recommended. The connections to the classification lamps should be made at the conduit junction box or at the lamp, which will readily permit of their removal, the connection to be weather-proof and not a part of the lamp supporting bracket.

**Type of Wire**

The wire from the generator to the cab switch and to the headlight lamp should be No. 12 AWG. The wire for cab lights, classification lamp or engine-number lights may be No. 14 AWG. The use of standard rubber covered and slow-burning weather-proof wire has not proven satisfactory for resisting heat, moisture, oil and mechanical strains under conditions existing in locomotive service. A wire, therefore, with insulation that will not deteriorate nor adhere to the conduit at a temperature of less than 225 degrees F., and which will not be affected by oil, water or mechanical strains, peculiar to locomotive service conditions within a period of five years, is recommended. Where stranded wire is used, lug terminals should be provided or the ends of wires soldered.

call on him I would like to make a few remarks. The report says: "The turbo generator shall be located on top of the boiler as near the cab as practicable, with the dynamo end towards the side of the boiler equipped with the conduit system (preferably the left or fireman's side of the locomotive)." We had a large number of locomotives equipped with the generator located just ahead of the cab, and during the cold weather the condensation from the exhaust pipe was so bad that it frosted the windows, and we designed an exhaust head which took care of that condensation and made it generally satisfactory. I don't see why the manufacturers could not get up a very simple exhaust head and attach it to their electric generators so that everybody could have the benefit of that device, when the generator is located just ahead of the cab. Where it is located on the smokebox, as you will notice it on some of them, I don't think the necessity for such an exhaust head is quite as apparent.

Referring to the piping for the steam connections, we have had quite a number of cases where the steam pipe connections to the turbo-generator have broken off and a suggestion has been made that a flexible connection be made at that point so as to overcome that difficulty.

Under the heading of "Switch Engines," it is suggested that

the 100-watt headlight lamp should be placed forward of the focal position in the reflector, so as to spread and not to throw a beam of light. As I understand it, the recommendation is that instead of having a 25-watt lamp, as this committee recommends, in focus, the A. R. E. E. committee recommended a 100-watt lamp out of focus, so that instead of having a beam of light, the light is diffused, making it less objectionable for the switchman. I don't believe that we ought to use a resistance on a switch engine with the 25-watt lamp, and without a resistance there is absolutely no difficulty in complying with the requirements of the law, perfectly satisfactory to the engineer and also safe for the switchman to operate.

Under "control of classification lamps," the Electric Committee recommended that a key socket should be used in each classification lamp to require the engineman to go to the lamp to light it, thus insuring that the lamps are burning. The original installation on most railroads was to have a switch in the cab by which the blizzard lamps could be operated. The light could be turned on and off at will, but with the very large engines, the blizzard lamps being located directly in front of the smokebox, some objection has been raised that the engineer cannot tell whether his classification markers are burning or not, and therefore, for the purpose of knowing that the lights are burning, it is recommended that the key socket be used. I don't know that there is any objection to that. It is certainly very desirable to know that when you turn a switch your lamps are burning, and if you can't see it from the back of the engine, I presume the next best thing is to go up ahead and have a key socket and know that the lamp is there and burning. One case was brought to my attention where the man turned the switch on and started out, and did not have any light because somebody had taken the lamp out of his classification markers.

Discussing the question of lamps, it is stated that a 100-watt concentrated filament lamp should be used on switch or back-up service engines. I have been talking to a member of the electrical associations, and he says that "backing-up" engines means switch engines, that is, yard engines. Where an engine is in back-up service in road service, of course, a 250-watt lamp would have to be used, just the same as it would have to be used at the head end.

In closing, I want to say that the headlight lamp manufacturers and headlight manufacturers themselves are deserving of a tremendous lot of credit for the co-operation and assistance they have given the railroads in working out a hundred and one difficulties that we had to contend with.

The Chairman: You have heard the report of the committee. *A motion that it be received and opened for discussion will be in order.*

*(The motion was made and carried.)*

E. W. Jansen ((I. C.): In regard to the location of turbo-generators and, in fact, a good many of the recommendations of the committee, the Electrical Engineers' Association sent a questionnaire to twenty-one of the leading roads which we knew had had electric headlights in service for a great many years. A great deal of our report is from a tabulation of the majority replies of those different roads as to what they thought the best practice or the practice they were using. The installation of the turbo-generator on the left-hand side was voted by a majority of the roads as being the best place on heavy power. Where the turbo-generator is located at the front end of the engine it entails considerable steam piping and quite a loss, and located near the cab on the left-hand side it was away from the water pumps on the right-hand side. On the larger engine you cannot locate it just on top of the boiler in front of the cab for the reason that there is no space at that point, so it was located on the left-hand side, where the fireman could maintain both the steam and electric ends in case of trouble. By having the conduit on the left-hand side, on locomotives with the headlight on the smokebox, particularly with the door opening on the left-hand side, it did not necessitate cables and flexible connections going across the front of the boiler.

As regards the 100-watt lamp, that type lamp was recommended mostly on account of the government requirements specifying 250-watt lamps being used for road engines and 100 for switch engines. On some tests that were made with the 100-watt lamp it was found easy to see a man on the track on a dark night with dark clothes a distance of 300 ft., but with the 50 and 25-

watt lamps you could not see anything under operating conditions as we find them, especially with the reflector all clouded up and out of condition and dirty.

We don't think the 100-watt lamp is altogether satisfactory; in fact, the average switchman complains of the 25-watt lamp, and I think the special effort of the manufacturers should be to develop reflectors that will prevent the strong light and glare of the 100-watt lamp, or the stronger sizes, and to have the rays so arranged that they will be reflected down on the step particularly. Most switchmen complain that they look at the light and then can't see the step. By having a small deflector in front of the lamp and a proper reflector you could do away with that glare and throw the light down where it is needed. But I doubt, with the 25-watt lamp, with poor headlights where the mirror is not clean and smoke in the yard, if you will be able to see anywhere near 300 ft.

As regards the wiring of cabs, there was a great deal of discussion as to whether to place the wiring in a conduit or to use open wiring, but a great many complaints are received on the last government engines. One road says that after the first six months or year they had to re-wire the cabs. But I think that is a matter of application. If the conduit is properly applied in the cab, placed where it is accessible, and the conduit leading down the side of the cab is not originally carelessly placed, and the conduit on the roof, I don't think there will be any trouble with conduit cab wiring.

The question also came up of having steel flexible covered drop cord. There are probably some makes of this cord with proper fittings that can be made up without any trouble, but the roads have tried this out and had lots of trouble. They are using ordinary lamp cord drawn through asbestos tubing, wiring the ends together. This tubing takes the strains off the connectors both on the rosette on the wall of the cab and in the socket at the lamp. We have recommended that a rosette or the fitting at the ceiling where this cord and gage light is attached to the conduit system be such that if we had to change a length, or that the cord broke or became grounded or any trouble developed, the lubricator feed lights would go out and we could just take that one cord and put in another and take the cord to the shop and repair it.

The question came up also about fusing circuits, but we did not believe in fusing the main headlight circuit, but we do know that the other lights are liable to be put out by their circuit, and for that reason we placed no fuse on the headlight circuit, because you can keep running with the use of lanterns; the main thing is to keep your headlight going and not have an engine collision.

A. G. Trumbull (Erie): There are two paragraphs of the report that have been somewhat interesting to me. One is the suggestion that the brackets for the application of the units be standardized. The application of electric headlight equipment is proceeding with considerable rapidity and in the natural order of events as prescribed by the Association's standard can only be adopted after 1921. It seems to me that this is of sufficient importance to receive consideration and be available for adoption by the railroads at an earlier date, and I suggest that that possibly might be accomplished through the medium of the General Committee.

It is also proposed, and of course, applies to the electrical association, but I observe the committee recommends that a book of instruction on the maintenance of electric headlight equipment be compiled for guidance in headlight maintenance. I have always believed that the Master Mechanics' Association or the Mechanical Section of the A. R. A., as it now is, should take the lead in adopting standard practices of maintenance. That is a very important thing, and it seems to me that the association should take such steps as are necessary to bring that formally before the convention next year in order that we may have a standard practice with respect to locomotive headlight equipment.

Mr. Jansen: I will say that the Association of Electrical Engineers has practically concluded a book for standard maintenance and installation. We intend to print it and give it to all our members, and we also intend to furnish the chairman of the Headlight Committee of the A. R. A. with a copy of it. It goes into the question from both the maintenance and the installation standpoint. In regard to classification lights going to the front, we felt it very important that the fireman or en-

gineer go right to the lamp and open it to know his light is burning.

On the Illinois Central we have had a key socket in these classification lamps. We use our standard classification lamp, cutting a 5/8 in. slot in the side about 1 in. deep, and make up an angle brass fitting to which we attach a 3/8 in. socket with the key up and make a groove for that and run the loop right up through that, with the proper fitting, and merely open up the top a little and drop the angle fitting in the slot. If the light should fail or the whole equipment fail, we just open the top and lift this out, let it hang and light the oil. I think that there should either be a key socket on the classification light or else a switch such as the Pennsylvania is using in the headlight, so that the man has to go to the front end and know the lights are burning. I also want to say there is a lot of room for developing of heavier fittings. The standard fittings are not heavy enough.

D. G. Redding (P. & L. E.): I would like to ask if the committee has done anything or whether it feels it is within its province, to put out rules for the operation of lights along the road. We made some observations recently and could not find there were any fixed rules that seemed to be consistent for all roads as to the dimming of lamps, methods of operating them when meeting approaching trains and similar matters.

Mr. Jansen: I think you will find the A. R. A. rules cover that very specifically. We had that up on our road and found, I believe, that you had to blanket the light. In regard to lights on switching engines, I think you will have to have a 100-watt lamp, at least, or something larger than the 25-watt lamp, to reach the 300-ft. ruling, and if you have that you almost have to have a dimmer. It doesn't cost much more, and you will need it in the event you should let that switch engine go out on the road. That is the reason we put that in. It is there for use in emergency if ever required.

Mr. Barnum: The chairman of the committee calls attention to the importance of going to the glass reflector. The probable reason for this is the rapid deterioration of the silvered copper reflector. The value of the new silvered reflector of the standard 18-in. dimension is somewhere around three to four times the average. The reader of the paper called attention to the manufacturers endeavoring to manufacture an 18-in. glass reflector. I don't consider that the 18-in. reflector law is one of the Medes and Persians. I think the first thing we should do is to find out what glass reflector will comply with the law.

Tests that I have recently had the opportunity of making indicate that a 16-in. glass reflector of proper design will fulfill the requirements. The glass reflector, of course, has a constant reflecting value; it also has other values due to the refraction of glass and dispersion values, and the more shallow the lens the better headlight you get. The lens errors creep into the lighting of your right-of-way, and I would suggest that the committee's work include, during the coming year, carefully looking into the proper size of a glass reflector headlight, not only the contour and specifications for the glass, but the mounting of the glass and the best ventilation of the cage.

I think there are possibilities of doing a great deal toward ventilating a glass reflector to reduce breakage due to heat and using the high candle power lamp to a minimum. There is also a great deal that can be done in the more careful selection of metal in the construction of headlights, because we know that since we have eliminated the oil lamp from the headlight and gotten away from the use of kerosene corrosion is very rapid. I believe that on some of the locomotives we have been receiving lately deterioration has already set in so rapidly that probably cages will have to be renewed within a year. Cast iron affords a remedy for this trouble. I believe that a cast-iron headlight can be made that will last almost indefinitely, and that the headlight can be made dust-proof to such an extent that the reflecting values will be almost constant. I would like to recommend that that be considered in the next year's action of the committee.

I would also like to call attention to the remark made in connection with classification lamps. There is a little bit to be said in connection with the engineer going out to see whether his classification lamps are burning and a little to be said against it, on the basis of safety. Perhaps the classification lamps could be so located that they would be visible from the cab and could

be turned on by a snap switch and not necessitate the engineer going out front.

Mr. Woodbridge: I would like to suggest, too, if some of these committees have not already done so, that they recommend the most suitable location for the generator on the boiler. Placing it out on the smoke box requires an additional 30 or 40 ft. of pipe which should be insulated. I also would like to recommend that the members of this association consider very carefully the location of the gages and also the eliminating of the lighting in cabs. It is a very general practice to keep the dynamos running all the time, and that is very wasteful.

W. J. Bohan (N. P.): Mr. Chairmann, in regard to classification lamps, it seems to me the trouble could be overcome by putting the two lamps in series with the third lamp in the cab, so that the engineer would have a warning in case the classification lamps were not burning.

E. W. Jansen (I. C.): For such a scheme, you must have two lights in series, using 15-volt lamps. This would require you to carry a special lamp, which is not advisable, as in renewing lamps you are liable to place a 15-volt lamp in some other part of the engine, causing it to burn out, or a 32-volt lamp would burn only dimly if used in the series socket.

Another thing should be considered—all road engines should have a white light at the top of the center of the tank, to be used when taking the engine through the yard. We should consider wiring the tender the same as for switch engines, put a lamp at the top of it at the back, and instead of using a ladder, making it an ordinary fixture, with a standard white lens, set with a slot to throw light down on the track on the engineer's side, so that he can know if the light is burning. We cannot get the light high enough to see over the coal pile without interfering with the water spout, or having it broken off. Only two sizes of lamps should be carried on an engine: a 25-watt lamp for main headlight and a 15-watt lamp for all other locations.

B. P. Flory (N. Y. O. & W.): We are using a separate conduit for the wiring, using standard electrical fittings, and so far have had no trouble. The illustration of road engines shows the location of the headlight on the door of the smokebox, and on switch engines on the top of the smokebox. I have noticed that a number of roads have the headlight casting on top of the smokebox, some on the door, and some above the door of the smoke-box. The question has been brought up on our road that the use of a flexible conduit should be done away with, as far as possible, and it is a question whether the headlights should be located on top of the smokebox or just above the door.

H. T. Bentley (C. & N. W.): The cast-iron headlight is practically indestructible, but due to some difficulties in the foundry, we have not been successful in the manufacture of it. We hope that some manufacturer will make a cast-iron headlight which can be produced in a satisfactory manner.

In regard to Mr. Trumbull's question about the standard spacing, I think you will find that the manufacturers are getting to a common basis for a standard bolt spacing for the headlight generator, and if any man desires to apply a new headlight he will have to conform to the standards agreed upon by the manufacturers of headlights for the standard locomotives.

W. J. Bohan (N. P.): We have used the cast iron headlight on our switching engines, and we have had no trouble in obtaining them.

H. M. Curry (N. P.): I agree with what Mr. Bentley says, about a fireman coming to the front end to turn on the lights, to a limited degree only. We have used electric headlights on the Northern Pacific a great many years, and to my knowledge there has been no such instance as that which he reports that has ever occurred on our line. We have used them many years. If an engineer gets an order to carry a signal, perhaps in the winter time, it is a real job for the engineer or fireman to get up on to the front end of the locomotive and turn on these lights. Our men have not been subjected to that necessity. I mention this because we are endeavoring to adopt labor saving devices. I believe that this is a necessary move, and in the right direction.

*A motion that the committee be continued and enlarge the scope of the investigations which they are to carry on.*

*The motion was put to vote and carried.*

## Report of Committee on Superheater Locomotives

**T**HE COMMITTEE SUBMITS the following report on superheated locomotives:

### Superheating Existing Locomotives

The superheat schedule was somewhat delayed during the past few years, due to the shortage of labor and material caused by the war. Of the railroads reporting, practically all are going to the piston valve when superheating, either by changing to piston valve cylinders or applying a piston valve steam chest. One railroad, in superheating cross-compound locomotives, retained the slide valve on the low pressure side, using a double ported slide valve. Those reporting as retaining slide valves used bronze valves. In applying new cylinders new modern valve gears were applied to the locomotives. Considerable trouble was experienced in using the piston valve steam chest due to leaks and rapid wear. These defects have been overcome in the later designs. When superheat valve stem packing is used the life of the packing is about the same as that of a saturated locomotive.

### Lubrication of Superheated Locomotives

On the railroads using slide valves no change was made in the oiling or lubricating devices when bronze valves were used, but where the original cast-iron valves were used some trouble with cutting the seats was experienced. The application of an additional system of graphite lubrication stopped the trouble.

The hydrostatic lubricator is still the standard for all locomotives and results from its use are satisfactory in most cases. A number of the railroads have taken up force feed lubrication, using a plunger type of lubricator. As this practice of lubrication is very recent and data as to the performance limited, the committee does not feel justified in making any recommendation, but it is the opinion of the railroads using them that the force feed lubricator when in good condition will distribute the oil more economically, positively and regularly than the hydrostatic lubricator. It has the advantage of being outside the cab and requiring no special attention of the engineman, as the feeds are set and the lubricator stops feeding when the locomotive stops. Sufficient information is not at hand to judge as to the life of packing rings and bushings; it is the opinion of the committee that the life will be increased, but is unable to say to what extent.

Cylinder feeds are not extensively used and the committee is of the opinion that they are unnecessary and should be discontinued, as it is doubtful if any benefits are derived from their use.

The use of superheat valve oil is recommended by the majority of railroads reporting, but a large percentage use the ordinary valve oil and claim satisfactory results. Carbonization is caused by the manner of operation.

Considerable trouble has been experienced with cylinder and valve packing. Much of this trouble has been overcome by changing the design of the rings, which, in most cases, consisted of going from a ring, with a square cross-section, to a narrow-faced ring, by using a better grade of material, and by admitting steam to the cylinders while drifting. It is the opinion of the committee that two cylinder packing rings are ample for good service.

The majority of railroads report satisfactory results from a 50 per cent lead, 50 per cent copper mixture for piston rod packing. Very good results have been obtained from 74 per cent lead, 20 per cent copper and 6 per cent nickel, and 80 per cent lead and 20 per cent antimony, especially when equipped with a hard grease piston rod lubricator, which adds greatly to the life of the softer packing. Some railroads are using tandem piston rod packing, but it is the opinion of the committee that single packing will give satisfactory results.

When automatic or manually operated drifting valves, or drifting throttles are not used, instructions have been issued to enginemen to drift with what is called a cracked throttle. It is essential that steam be supplied to the cylinders while drifting. Drifting valves are not essential, but desirable, especially in a mountainous country, as the steam can be supplied by cracking the throttle. Automatic drifting valves of a good design are valuable as they eliminate the human element in furnishing steam for drifting.

A number of roads are using a manually operated drifting throttle, others are using and experimenting with automatic valves of different makes. Fifty per cent of the roads reporting do not use steam chest relief valves, and 50 per cent do when engines are not equipped with drifting valves or vacuum breakers. It is the opinion of the committee that relief valves should be used on large power if not equipped with drifting valves or vacuum breakers. It is the opinion of the committee that a properly designed drifting valve will eliminate carbon deposit, aid in lubrication, and increase the life of packing.

### Maintenance

The superheater units have failed mostly at the rear return bend, the welded type giving the most trouble. The application of cast steel return bends has reduced this trouble. Some failures have occurred at the front end under the ball joint. This failure is due mainly to cinder wear, as the unit lies in the path of the cinders drawn through the tubes at a high velocity. To protect against this wear, a shield of thin steel is spot welded to the unit. Failures at this point are repaired by cutting off the worn part and welding on a new piece. No particular difference has been noted in the cinder wear of a stoker fired and hand fired locomotive. The abrasive effect of the cinders varies greatly with different coals.

The tools used to repair and maintain the units are those recommended by the Locomotive Superheater Company. When units are removed, the joints should be reground and individually tested before being replaced, and collectively after being replaced. A periodical test might be desirable, but the committee feels that it is not essential.

The majority of railroads purchase the header bolts. One uses .988 per cent carbon steel heated to between 1,400 and 1,500 degrees F. and plunged into an oil bath, then reheated and allowed to cool naturally. Another specifies that the material shall have a tensile strength of 90,000 lb. per sq. in., elastic limit not less than 65,000 per sq. in., and an elongation in 2 in. not less than 18 per cent. The metal should have the following chemical properties: carbon, .45 to .60 per cent, manganese, not over .70 per cent, sulphur not over .05 per cent, phosphorus not over .05 per cent. Some use a high grade iron without any heat treatment.

The investigation shows that in most cases a limit percentage of weight for the scrapping of superheater flues has not been established. Some give the limit percentage as from 10 per cent to 25 per cent reduction. Some give flues the hammer test. Superheater flues are reclaimed by welding up pits and holes worn in by steam leaks. It is a good practice to weld the large superheater flues to the back flue sheet. Good results have been obtained from it, and the committee recommends this practice.

All boiler tubes should be blown out each time the fire is drawn and, at least, at each washout period all tubes should be cleaned thoroughly from end to end, and all accumulations removed; special attention should be given to the superheater flues. The flues should be blown with a ¼ in. or ⅜ in. pipe and 100 lb. of air.

The method employed in testing the packing for leaks around the outside steam pipes where they enter the smoke box is by applying a lighted torch to all surface joints while the blower is on. Much trouble is experienced in keeping these joints tight. Different kinds of packings have been used with varied results. Cement and ground magnesia have been used with some success. A mixture of ground magnesia and asphaltum applied while hot gives promise of better results; this is due to the heat keeping the mixture in a semi-plastic state. The design as used on the United States standard locomotives gives promise of a high efficiency.

Most railroads have issued through bulletins or personally by the road foreman, instructions not to carry over two gages of water; this, of course, depends on the water conditions of the locality in which the locomotive is operating. The use of a pyrometer will show the men the low temperature of the steam resulting from carrying high water; it will also show the effect the position of the throttle and reverse lever has on the superheat obtained. The majority of the roads prefer a wide open

throttle with as short a cut off as possible under the operating conditions. Some roads claim better results by using a longer cut-off and a lighter throttle, claiming better superheat.

Light, frequent and regular firing proves to be the best practice, and produces the best degree of superheat, but it is essential that at all times the flues be kept clean. The method of firing depends on the quality of fuel used.

The report is signed by W. J. Tollerton (Chairman) Chicago, Rock Island & Pacific; H. W. Coddington, Norfolk & Western; C. H. Hogan, New York Central; R. W. Bell, Illinois Central; W. C. A. Henry, Pennsylvania Lines; T. Roope, Chicago, Burlington & Quincy; E. W. Pratt, Chicago & Northwestern, and G. M. Basford.

### Discussion

F. F. Gaines (U. S. R. A.): The question of whether it is advisable to apply superheaters to new engines or existing engines is no longer pertinent. The question of whether a locomotive under consideration for the application of a superheater is to be kept in service a sufficient length of time to realize a saving over the cost of installing the superheater, is one that must be given some consideration. Further, consideration should be given, in the selection of classes of locomotive to receive the superheater equipment, as to which class performs the more important service and will pay the largest return on the investment.

Considering the superheater as a standard part of the locomotive, the superheater committee would be a great service to the organization and to the railroads as a whole if it would devote its efforts to the development of standard methods of operation, maintenance and repairs. In making recommendations along these lines careful canvass should be made in a way to bring out practices in force on a majority of the railroads.

The information available indicates that the present report, which makes recommendations for the benefit of approximately 250 railroads is compiled in the returns received from thirty railroads.

To comment specifically on a few items in the report, your attention is first called to the following paragraph:

"On the railroads using slide valves a change was made in the oiling or lubricating devices when bronze valves were used, but where the original cast iron valve was used some trouble was experienced with cutting the seats and the application of an additional system of graphite lubrication stopped the trouble."

The inference to be drawn from this statements is that the operation of slide valve locomotives is a general practice and successfully accomplished without difficulty where bronze valves are used, and where cast iron valves are used the difficulty in lubricating slide valve locomotives is easily overcome by the introduction of an additional system of graphite lubrication. Out of the 35,000 locomotives operating with superheaters on the North American continent an estimate of ten would be ample to cover the number of these locomotives that are using superheated steam with slide valves. With this fact in mind, it is difficult to understand why the committee makes a statement which can be construed to recommend the use of superheated steam with slide valve locomotives. The use of superheated steam with slide valves is a dead subject in view of the facilities at hand for applying piston valves. Where benefits are to be obtained in the way of increased tractive power by increasing cylinder diameter, it is economical to apply new cylinders with piston valves, and where no advantages are to be obtained from this source piston valve chests are available in order to obtain piston valves which unquestionably give satisfactory results with superheated steam.

"The hydrostatic lubricator is still the standard for all locomotives and the results are satisfactory in most cases."

The above statement is rather broad, and it is to be believed that some railroads that are obtaining satisfactory results with forced feed lubricators will have difficulty in qualifying under the standard of hydrostatic lubricators for all locomotives.

"Cylinder feeds are not extensively used and your committee is of the opinion that they are unnecessary and should be discontinued, as it is doubtful if any benefits are derived from their use."

This recommendation is substantiated by the statement

that out of 30 reports received, 17 report cylinder feeds as not essential, 11 as essential and 2 gave no report.

There is of course diversity of opinion as to the benefit resulting from the admission of oil to the cylinders. However, the majority just cited was so small and the percentage of the total roads represented in the report is so small that the direct recommendations that cylinder feeds be discontinued should meet with considerable objection. On the assumption that cylinder feeds are of doubtful benefit, it would seem preferable for the committee to give the safest practice the benefit of the doubt. Certainly, the admission of oil to the cylinders cannot in any way detract from better lubricating conditions, or destroy lubrication; consequently the use of cylinder feeds cannot be of negative value as far as the lubrication of the surfaces in contact is concerned, and, therefore, the uncertainty must be in favor of the cylinder feeds rather than against them. Further, there are many railroads in the country that have found the use of cylinder feeds beneficial in overcoming lubrication troubles.

"The use of superheat valve oil is recommended by the majority of railroads reporting, but a large percentage use the ordinary valve oil and claim satisfactory results from same."

This is a mere statement of facts and does not make any definite recommendation. However, the situation with reference to valve oil is similar to that which applies to the use of cylinder feed, and here, as in the case of cylinder feeds, the committee should give the favored practice the benefit of the doubt. By recommending the best that is obtainable the committee obviates the responsibility for failure. If an inferior quality of oil is used, the user assumes the responsibility and cannot use the reports of the Superheater Committee as a support for trouble that may follow the use of an inferior grade of oil.

"When units are removed the joints should be reground and individually tested before being replaced and collectively after being replaced. A periodical test might be desirable, but the committee feels that it is not essential."

If periodical tests will pay for themselves in reduction in engine failures due to leaky superheater units, they are certainly to be desired and to almost be considered essential.

"The majority of railroads purchased the header bolts. One used .998 per cent carbon steel heated to between 1400 deg. and 1500 deg. and plunged into an oil bath, then reheated and allowed to cool naturally. Another specifies that the material shall have a tensile strength of 90,000 lb. per sq. in., elastic limit not less than 65,000 lb. per sq. in. and elongation in two inches not less than .18 per cent. The metal should have the following chemical properties: Carbon .45 to .60 per cent, manganese not over 0.70 per cent, sulphur not over 0.05 per cent, phosphorus not over 0.05 per cent. Some use a high grade iron without any heat treatment."

A stronger recommendation for bolts would be that based on the elastic limits and ultimate strength rather than to attempt to cover the bolt material by a detailed chemical analysis and definite temperatures for heat treating. It is almost impossible to obtain various lots of steel which will run absolutely uniform to chemical analysis, and varying chemical analyses require different heat treatment limits in order to obtain the desired elastic limits and ultimate strength. The above recipe for heat treatment is not complete even for the chemical analysis of the material shown, inasmuch as the temperature of the reheat is not given, nor is the process of cooling after the reheat covered.

The subject of maintenance is only just touched upon in the committee's report. It might be thought by some that the information given covers the subject completely. Much benefit would be derived from a complete study and report on this subject.

There are many other comments which could be made in connection with the report of the Superheater Committee, but the above covers a few points which are of most importance.

Prof. L. E. Endsley (University of Pittsburgh): It is seventeen years since we started testing, at Purdue, on superheating locomotives, and there are a good many representatives of roads here today that did not have the superheater at that time.

There is one thing in this paper that I want to say a word about, and that is the pyrometer for use on superheated locomotives. I think that is the greatest forward step made by the superheater people in the last decade on superheater locomotives, and you men who have been interested in superheater locomotives, and have studied the problem, are much interested in

that subject. If the pyrometer is the success which I understand it is, it will be the greatest thing to show the efficiency of your engines that you can put on them. I have always wanted to see just such a thing—it is almost as necessary, in my opinion, as the gage on the engine itself.

I had a great deal of trouble in attempting to measure the temperature of superheated steam by thermometers, and it is a job which, even after you get it done, you do not know whether you have it right, but I believe the pyrometer is the thing to-day to be installed on the engine to give the engineman an idea of what his superheater is doing. He will get a much better efficiency out of the engine by the use of that instrument.

I am sorry to see also that some men are still adhering to a common grade of lubricating oil. We tested that matter out at Purdue, and I know, without a doubt, you will get better results if you use a better grade of oil. Those who are using the better grade of oil will not want to go back to the poorer grade, and to those who are using the poorer grade of oil I would recommend that you use the better grade of oil.

Chairman: I have been chairman of the superheater committee for a number of years. I hope, with the elevation to my new position, I may be relieved as chairman of the Superheater committee, but I wish to say that I find this—it is a difficult matter to get information that is of interest on his one single subject. The superheater is an accomplished fact—one hundred per cent of the standard government locomotives were equipped with the superheater. Almost that percentage of new locomotives were being equipped with a superheater before the government standard was issued.

On your home roads you are equipping as many locomotives with superheaters as your facilities will permit, and there is no question that the equipment justifies the amount spent. Therefore I think it is fair to say that the superheater, as an economical feature of locomotive construction, is a fact, and it is hardly necessary for further investigation to be made as to what it has accomplished. It would like to suggest, if the committee is continued, that it go into the investigation of other economies brought about in firebox construction in the past few years. There is on the pier an exhibit of a decided improvement in firebox design, which I think is well worth investigation. I refer to the Nicholson siphon. On the railroad that the tests have been made on, the performance of it is remarkable.

H. R. Warnock (C. M. & St. P.): About one year ago we equipped the first engine with two of the Nicholson thermit siphons. This was a Consolidation engine, with 23 in by 30 in cylinders. This class of engine was always considered over-cylindered, and for that reason it was relegated to yard work or short run work. On this test the engine was matched up against a sister engine of the same class and dimensions and put in as near the same condition as possible. The test showed an increase of boiler efficiency of 28 per cent, with an added increase of firebox heating surface of 53 sq. ft. There was 30 per cent decrease in fuel consumption per 1000 gross ton miles, with an average increase of 7 per cent in tonnage.

I might add, as a matter of information, that this test was run on a one-hundred-mile division in road service; the ruling grade was seventeen miles long and was from .5 to .7 per cent, so that it gave the crew a real test on what they could do with the new application. During this run there was no trouble in furnishing all the steam that was necessary. We thought that was quite a performance, in the absence of any figures.

The results were so gratifying that we have since equipped a Mallet with three siphons, also a Pacific type passenger engine which has a superheater, with two siphons, and later a long, narrow firebox, on a Ten-wheel engine, with one siphon. We have not the figures as yet on these latter tests, as they are being run now, but everything indicates that there will be a very good performance. The question has arisen as to the maintenance cost, and I would say that we have not had any maintenance cost in connection with those trials. There has been no indication of broken bolts in the siphon, nor have we had any trouble with leaky seams where the flanges are welded to the sheet. The water condition is not bad in this district, but there is a tendency for the formation of lime in the water. After about one year's service, the siphon is practically as clean as when put in, indicating that the rapidity with which the water travels will take care of incrustation and things of that kind.

Mr. Redding: I would like to ask one question. This paper speaks of a satisfactory drift valve. Is there such a thing?

Mr. Gaines: In the case of engines which have slide valves, I advise you to throw the valves away, and do not equip any more engines with them, whether they have bronze or graphite lubricators.

B. H. Gray (Gulf, Mobile & Nor.): In answering the question about the drift valve, the company I represent has been using the drift valve known as the McVoy type for about two years, and they are very satisfactory. We have not had any carbonization to speak of, and use the ordinary cylinder oil. It is such an improvement, that we have equipped all of our superheated engines with that device.

W. H. Codrington (N. & W.): We have the McVoy valve and discarded it. It is operated by a vacuum in the cylinder, and depends on the vacuum produced in the cylinder for its operation. It is the vacuum that we want to get rid of, and we do not want to wait for the vacuum to be set up in the cylinder before the valve operates.

Mr. Curry: I presume Mr. Gaines refers to road engines, particularly.

Mr. Gaines: Yes, not the yard engines.

A. G. Trumbull (Erie): I have been considering Mr. Warnock's statement regarding the economy realized from the application of the device which he was discussing, and the figures are so startling that I would like to inquire if he has any data as to the ratios; that is, the evaporation per pound of fuel that the locomotive had under the application of this particular device. It seems to me that if it is such an important matter we ought not to let this occasion pass without getting all the information on it that is available.

Mr. Warnock: The entire test was published some time ago in the *Railway Age* and the *Railway Review*, and I will be glad to send Mr. Trumbull a copy of that matter. I will say, however, that there was no test made of the efficiency of the engine, before and after this particular test to which I have referred. The engine was tested against a sister engine in the same class, put in as near the same condition as it was possible to do.

William Schlafge (Erie): Going back to Professor Endley's remarks on the subject of the pyrometer and its great value in the superheater locomotive, I may say that I am with him thoroughly on that proposition. I think it is as necessary as the steam gage on the locomotive, and you will find that the Committee on Fuel Economy recommended that appliance very strongly in its first report. At that time the system was too delicate, but it has been improved on since, and we are getting ready to put them on our equipment.

H. T. Flanagan (C. & O.): I would like to know if the representatives of some of the other roads have made experiments with the shields to protect the necks of the superheaters because of their liability to be cut away by the sparks. We have very little trouble with leaky joints, or with any other part of the equipment, but we are having a considerable amount of trouble from the necks of heaters cutting in two, and having to be renewed on that account. I trust you will also help us to find out what system the roads are using most economically for grinding the joints of the superheaters. Are the roads using the forty-five degree angle on the header and ball joints on pipes, or have some gone to the ball joint on both? We have tried some of them, but it is more expensive to maintain, as the contour has to be exactly right.

F. P. Roesch (U. S. R. R. A.): Before I became connected with the Conservation Section we had considerable experience through the cutting of the small superheater units at the neck, due to the cinder action. We protected that by means of a shield, which relieved the situation materially.

We must admit that this cutting action is due to the abrasive action of the cinders passing through, and the more rapidly the cinders pass through, the greater will be the abrasive action. In pursuing some investigations, we found the conditions to be as stated in the fourth paragraph of the last page of this report: that the air leaks around the outside steam pipe entering the front ends were the most prolific cause of steam failures, and also the most prolific cause for bushing the nozzle. This, in turn, gave greater rapidity to the draft action and resulted in more cutting.

In the report of the committee it makes certain recommendations as to measures to prevent these air leaks. In traveling over the Northwest region I found that in a number of the so-called remedies the trouble is we are moving along the lines of least resistance, and trying to get something for nothing.

and we cannot get it. The putty and other dope you put in will only last for a short time. In making some dynamometer tests on the Milwaukee road, in order to determine this feature, we had the pipe packed at one end of a ninety-mile division, and the packing was entirely gone before we got to the other end of the division.

The Milwaukee, however, has developed a permanent solution. After packing the gland around the pipe they weld on 10-gage sheet iron, the outer circumference being welded to the smoke arch and the inner circumference to the steam pipe. We believe that will make a good job.

As an illustration of the effect produced through the air leaks which resulted in the friction of nozzles; after we had this pipe welded up we again opened the nozzle with a resulting decrease in fuel consumption equated on the drawbar

pull of 14.2, 17.2 and up to 21 per cent., and also an increase in the efficiency of the engine line in the same ratio due to the decrease in back pressure.

Mr. Trumbull: In view of the fact that the matter of drift valves has entered the discussion, I would like to say that so far as we are concerned we believe in them, because we believe that the results of their use, in respect to improved lubrication, justify their application. If there are any members here who are sufficiently interested we will be very glad to place them in possession of information which we believe will be of interest in connection with the drift valve, and to show that it will do the work for which it is intended.

*A motion that the report be received, the committee continued, and the scope of its investigation broadened to include firebox economy was put to vote and carried.*

## Carbonization in Valve Chambers and Cylinders of Superheated Steam Locomotives

By F. P. Roesch, Supervisor, Fuel Conservation Section, United States Railroad Administration, Northwestern Region.

WHEN I SUGGESTED the above subject to the Committee on Subjects, I thought it a good way to learn something more of a proposition in which I have always been deeply interested, and one which I felt was beyond me to solve. The committee, however, assigned the subject to me for an individual paper.

I shall refer first to the so-called carbonization or deposits of foreign matter in valve chambers, passages, etc., usually called carbonized oil. As a matter of fact this term is a misnomer, as shown by an analysis made by Dr. P. H. Conradson, Chief Chemist, Galena Signal Oil Company, (p. 169, March, 19, 1912, Proceedings of the Western Railway Club, and May, 1915, Proceedings of the Cincinnati Railway Club), the composition of four samples being as follows:

1st Sample.  
13.35 per cent. thick oil.  
2.60 per cent. oily, gummy matter.  
57.15 per cent. carbonaceous combustible matter (coal and coke matter).  
26.90 per cent. red ash, principally iron oxide, silicious matter.  
After removing the oil and oily matter, the deposit was non-magnetic, indicating practical freedom from metallic iron.

2d Sample.  
24.25 per cent. thick oil.  
0.80 per cent. oily, gummy matter.  
48.78 per cent. iron metal wearings.  
8.18 per cent. iron oxides and silicious matter.  
17.87 per cent. carbonaceous combustible matter.  
After extracting the oil and oily matter, the deposit was very strongly magnetic, containing a large amount of metallic iron.

3rd Sample.  
6.45 per cent. oil and oily matter.  
35.70 per cent. coky, carbonaceous combustible matter.  
57.28 per cent. metallic iron, iron oxides and silicious matter.  
Mineral matter strongly magnetic from metallic iron wearings.

4th Sample.  
4.2 per cent. oil and oily matter.  
41.0 per cent. metal wearings, iron oxides, silicious matter.  
54.0 per cent. coky, carbonaceous matter.  
Mineral matter strongly magnetic.

From the above it will be seen that oil or oil products form but a small percentage of the whole, and the analysis also points directly to the cause, namely, smoke box gases drawn into the cylinders through the nozzle and there mixed with the oil adhering to the various ports, passages and surfaces not swept by either the valves or pistons in their movements. This combination, through the high temperatures obtaining at the moment the throttle is closed, together with practically the entire absence of steam, bakes on the surfaces above referred to almost in the form of an enamel. Again quoting Dr. Conradson: The above clearly illustrates the advisability of preventing smoke-stack gases, with their inherent dirt, dust, grit, etc., to be drawn into the cylinders while the engines are drifting. As seen from the analyses, a comparatively small amount of oil binds together a large amount of mineral matter, forming a sticky deposit which bakes on the metal much harder with superheated steam, especially high superheat, than would be the case with ordinary wet or saturated steam."

### Effect on Lubrication and Maintenance

Oil is introduced into valve chambers and cylinders in order to separate the rubbing surfaces with a film of lubri-

cant. The oils now furnished will admirably perform this function, regardless of temperature, under proper conditions, but this film of oil is infinitesimal in thickness, therefore when the throttle is closed and the locomotive so manipulated as to allow the entrance of smoke box gases, with their constituent properties of coal, coke, soot and cinders, these small particles will work their way between the pistons and cylinder walls, separating them to a degree far beyond the thickness of the oil film, so that effective lubrication, even though the quantity of oil introduced be materially increased, is practically destroyed, as the film of oil cannot fill the grooves or ridges in the rings and cylinders. Or again, this foreign matter may combine with the oil, forming an abrasive compound, causing wear of bushings, bull rings and packing rings, and thus accounting for the metallic iron, etc., found by Dr. Conradson. In fact, our investigation indicates that increasing the supply of oil beyond that required for effective lubrication simply aggravates instead of reducing the trouble.

The piston in the engine's cylinder cleans the walls of the cylinder of all the excess oil and drives out through the ports, exhaust passages and the nozzle what oil does not cling to the piston head and cylinder heads, to be carbonized at the first entrance of oxygen from the air; whereas the cylinder walls that need the lubrication for the next revolution do not have any unless the oil is injected into the steam the very next revolution.

As the lubrication is affected, so is the maintenance. Wear on valve rings and chambers, cylinder packing rings and cylinders is proportionately increased. Not only is wear through abrasion increased, but, through lack of lubrication, cylinder packing rings become overheated, resulting in their collapse, or breakage. Again, these so-called carbon deposits affect maintenance in other ways, as, for instance, cases have been observed where the deposits built up on piston and cylinder heads so as to take up practically all the clearance, in some cases knocking out cylinder heads, damaging cylinders, studs, etc., in others partially or wholly shearing rod bolts, etc.

Were the increased maintenance costs the only direct loss it might not be so serious, but, in addition to this, the deposits built up in the packing ring grooves, causing the rings to stick, producing valve and cylinder blows which materially impair the efficiency of the locomotive and result in proportionate increases in fuel and water consumption. Furthermore, cases have been observed where the exhaust passages were so constricted, due to the heavy deposits of this material, as to retard the exhaust sufficiently to greatly increase the back pressure.

### A Possible Solution

In checking over the various measures adopted by different railroads to overcome the troubles mentioned above, we find a marked lack of unanimity. This is not surprising, however, when the conditions under which each operates is taken under consideration, and it is only by comparing and analyz-

ing the results obtained by the different methods that some plan can be formulated applicable to and meeting practically all conditions. Some roads block shut, or entirely remove, the steam chest relief valves, retaining the by-pass. Others block shut the by-pass and maintain the relief valve. Others again dispense with both by-pass and relief valves, while other roads maintain both. Some use a drifting throttle, some a so-called drifting valve, and others again use nothing. Some use special metal, some common grey iron, some use plain snap rings, some grooved and perforated snap rings, some segmental rings, etc. Some use a special oil, some the same as with saturated steam. Some advocate a reduction in the fatty constituents in the oil, others an increase. Some advocate the use of the hydrostatic lubricator, others favor forced feed.

Analyzing the possible effects of the various measures adopted :

### The Steam Chest Relief Valve

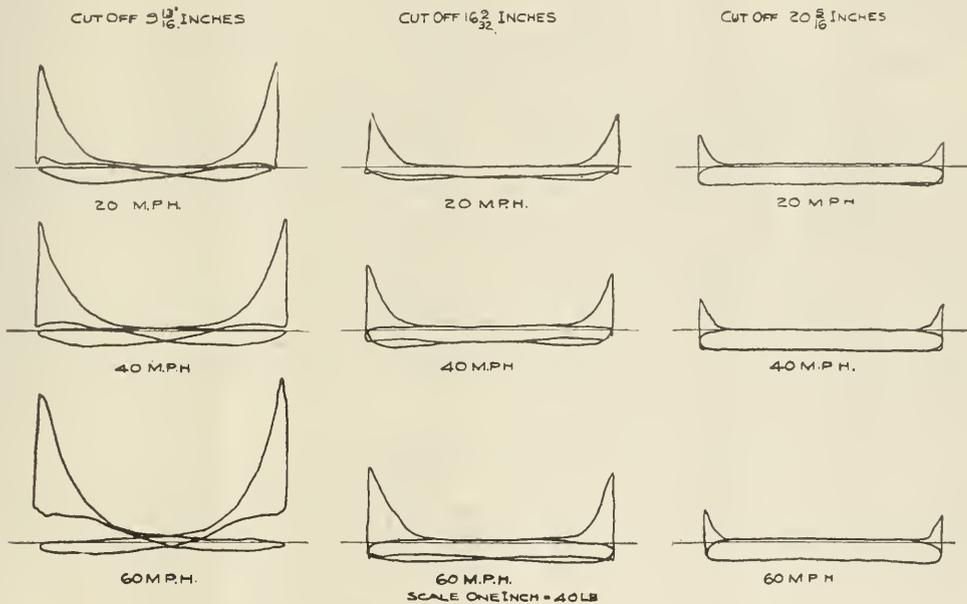

This is a heritage handed down from the saturated steam engine. It had its place at that time and as a safety feature with certain modifications can no doubt be fittingly used on modern power. Blocking it shut or removing it entirely will certainly prevent the admission of air to the valve chamber through this source when the throttle is closed on a moving locomotive; but in this case the question arises, which is preferable in the cylinder, clean air from the outside, or smoke box gases? Inquiry seems to indicate that these valves were removed from steam locomotives, not so much to prevent carbonization, but to overcome cylinder failures which were attributed to the stresses set up by the cooling effect of air so introduced. It may be said in passing that some years ago these

the adherence of the deposit, would not, however, be otherwise serious were it not for the presence of the smoke box gases in the cylinder, which are due solely to the vacuum created. The elimination of the by-pass valve, either by blocking or removal, can have but one effect, namely, increasing the degree of vacuum, which vacuum must and will be filled from some source, either through the open relief valve, if in use, or in its absence through the nozzle, or through the admission of steam from the boiler.

### The Drifting Throttle

On roads where no drifting occurs to speak of, i. e., comparatively level roads, the use of the drifting throttle, so called, will undoubtedly prevent the admission of smoke box gases to the cylinders regardless of the presence or absence of either or both steam chest relief and cylinder by-pass valves, provided, the engineer does not forget. Here, however, is the danger—human fallibility. If the engineer fails to leave his throttle slightly cracked when coming to a stop, or when tipping the summit of a grade, the damage is done even though the throttle be left closed for but a few revolutions. Each succeeding oversight adds its mite to the deposit, thus accounting for the deposits where the drifting throttle is presumably always used. As stated above, on comparatively level roads the drifting throttle can be used to advantage if men will at all times comply with instructions, but where necessary to make long drifts other means must be provided, as the drifting throttle is not always practicable, the grade, tonnage, brakes, etc., governing.

The above explains why some roads find it to their advantage to block by-pass valves, while others maintain them presumably operative. In the absence of both by-pass and relief valves much higher compression and greater vacuum will obtain than

Drifting Cards Taken with No By-pass or Relief Valves on Engine

valves were removed from some locomotives using saturated steam, presumably to reduce maintenance costs, and it may also be well to here remark that in this case the same deposits were in evidence on cylinder and piston heads.

### By-Pass Valves

The function of this valve is to reduce the vacuum and compression created in the cylinder of the moving locomotive employing piston valves, when the locomotive is drifting, especially at high speeds. In this particular discussion we are not so much concerned with the compression as the vacuum, as the only material effect due to compression, in so far as the so-called carbonization is concerned, is to increase the temperature of the air being compressed, which, while it undoubtedly adds to

by their use, and in the case the vacuum can only be relieved through the nozzle.

In order to make this clear drifting cards are shown below. The difference in the vacuum and compression at various speeds and cut-off should be noted. These cards also indicate another factor in the proposition, namely, if it were desired to entirely overcome cylinder vacuum under such conditions it would be necessary to proportion the by-pass valves to conform to cylinder volumes. As this is mechanically impractical, however, the problem must be considered with a view to finding relief under existing conditions.

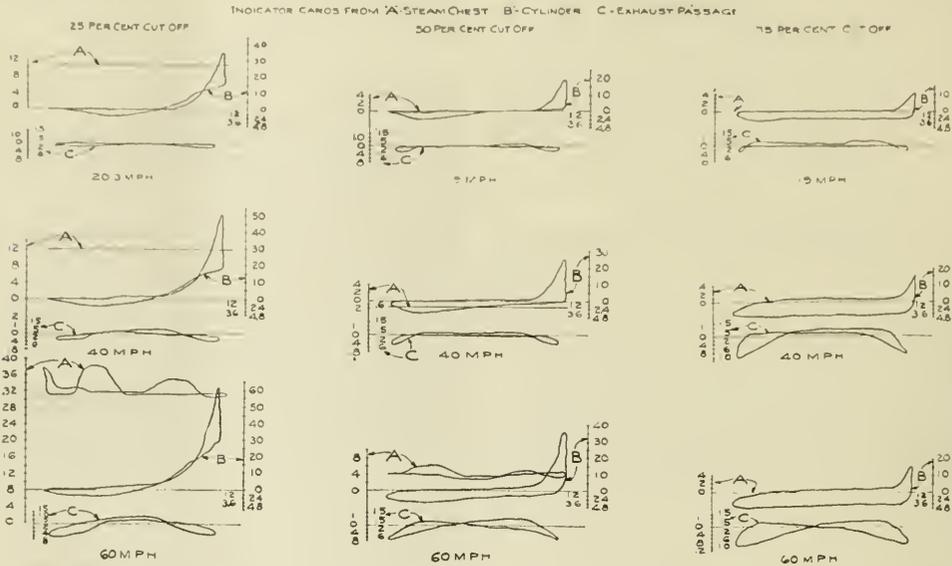

### Drifting Valves

Under this head can be classed all devices used to admit steam to the steam chest and cylinders through pipes, etc., i. e., not

through the main throttle as with a drifting throttle. It is through failure to properly coordinate or take into consideration the relative movements of valve and piston that so many devices have been discarded as unsatisfactory.

The average engineer drifts his engine with the lever well hooked up, i. e., in a short cut-off. Following the movements

is 90.54 cu. ft. A locomotive with cylinders 25 in. by 30 in., drivers 63 in. in diameter, has a piston displacement equal to 8.5 cu. ft. per cylinder. Assuming this locomotive to be drifting at the rate of 30 miles per hour it would take 90.44 cu. ft. of steam per second to keep the cylinders filled at this speed; therefore, it would appear that a 2 in. pipe would more than

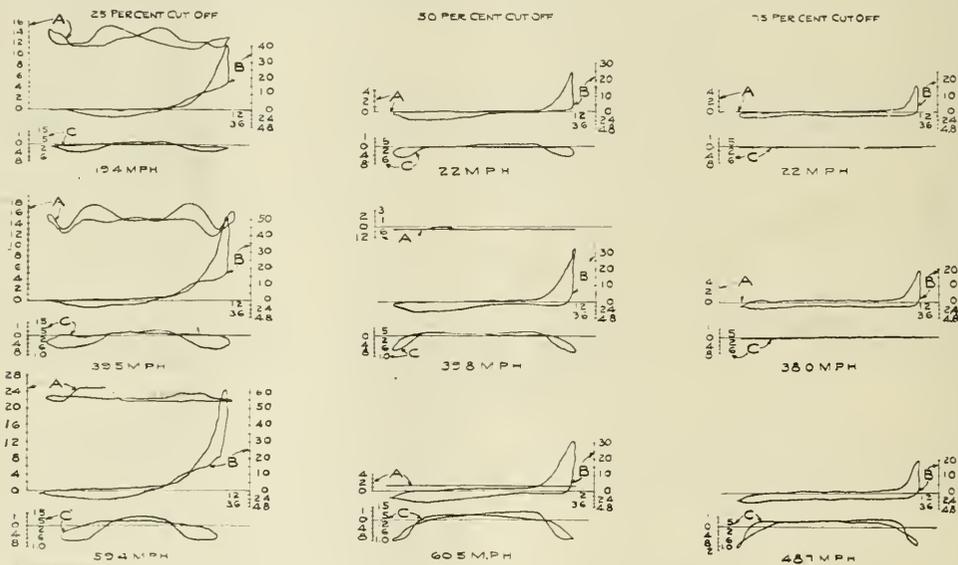

Drifting Cards Taken Without the Drifting Valve, By-pass Valve Blocked Shut

of the valve and piston and beginning the cycle with the initial port opening as the piston is beginning its stroke, the piston is moving back (assuming it starts from the front center), while the valve moves forward (inside admission) to complete the port opening. Continuing the cycle the valve now begins to

meet the requirements under the above conditions, viz.: keep both cylinders filled with steam above atmospheric pressure.

The above would be correct did the steam ports open directly to the boiler so there would be no drop in pressure between the boiler and the cylinders, or if the intervals between port open-

Drifting Cards Taken Without the Drifting Valve, By-pass Valve Open

travel back, closing the port when the piston has traveled a distance proportionate to the cut-off.

Assume that steam is being admitted to the valve chamber through a pipe of 2 in. inside diameter. The flow of steam through a 2-in. pipe at 200 lb. absolute pressure is 9 lb. per second (Napier's formula). Its volume at 40 lb. absolute pressure

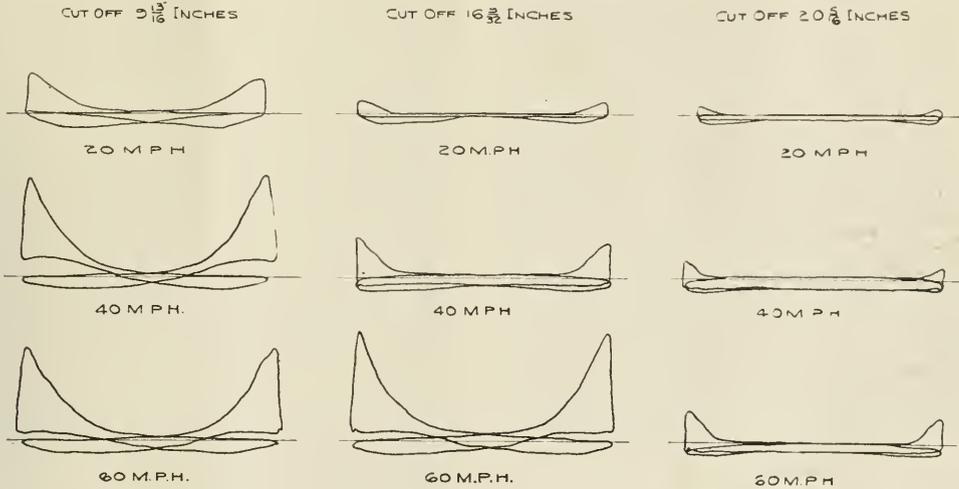

ings were so far apart as to allow the steam to bank up to boiler pressure. But as this is not the case and as the steam must decrease in pressure as the increase in volume into which it expands, and as the cylinders are continually drawing on this supply it follows, as shown by tests, that a 2-in. pipe extending from the cab to the steam chests will not maintain a pressure to

exceed 20-lb. gage or 35-lb. absolute in the valve chambers on a locomotive of the above dimensions, drifting at 30 miles per hour.

As the initial pressure in the cylinders cannot rise above the steam chest pressure, the pressure at cut-off will not exceed 35-lb. absolute; therefore, if the lever is carried at 30 per cent. stroke, the steam must again expand to three times its original volume before the piston begins its return stroke, and therefore its final pressure would not exceed 11.6 lb. providing no steam escaped at the moment the port opened to exhaust. As the pressure under such circumstances was

hold good in so far as the drifting throttle is concerned, except that through use of the drifting throttle a higher initial pressure may be obtained, resulting in a correspondingly higher terminal pressure. The only trouble is, as previously stated, in the fallibility of the human agent and also the fact that the total opening of a circular valve (throttle) is very indefinite where gauged by the position of the throttle lever.

If the correctness of the above theories is established, the remedy appears obvious, namely, prevent by automatic means as far as possible the intake of smoke box gases or neu-

Drifting Cards Taken With By-pass and Relief Valves Attached to Engine

slightly above atmospheric at the point of exhaust port opening, however, the excess pressure passed out through the nozzle until the point of equalization was reached; on the further movement of the piston the steam continued to expand with a corresponding drop in pressure to a point well below atmosphere. As no more steam is being admitted, equalization can only take place through the admission of air, and as the only opening to atmospheric pressure is by way of the nozzle, equalization will take place through this source, the inrushing air carrying with it the front end gases with all their fouling constituents. A glance at the indicator cards showing a sustained steam chest pressure of 25 lb. will clearly verify this statement.

Here, then, apparently is where and when the trouble starts. As the cylinder pressure is less than atmospheric, air will flow in through the nozzle and the open exhaust port until the pressures equalize, the combined steam, air and smoke box gases being then expelled by the piston on its return stroke. However, as the valve, valve chamber and ports are at their highest temperature and exposed to the first inrush of the incoming gases, it follows that all carbonaceous matter in these gases coming into contact with any of the above surfaces will adhere, or, in other words, be baked on. This theory appears to satisfactorily account for the greater deposits obtaining in the exhaust cavity of the valve as well as the exhaust ports and passages. Superimposing the drifting cards taken with and without by-pass and relief valves may help to clarify the proposition.

The above hypothesis, if based on correct premises, would

neutralize their evil effects by diluting with steam. To accomplish this it would appear that we should turn to such devices as we already have at hand, viz.: the steam chest relief and the by-pass valve. While the former is not exactly necessary, yet its use under proper conditions presents no great difficulty and as a safety feature it has a distinct place. The use of the by-pass, however, is practically essential in that it will go far toward preventing the formation of a vacuum in the cylinders if properly maintained, and under right treatment its maintenance cost is negligible.

The last and most important requirement is the neutralization of such gases as might be drawn in through the nozzle through improper handling of the locomotive. This can only be accomplished by admission of a jet of steam to both the receiving and exhaust end of the valve, so that when the conditions obtain as mentioned previously, the steam jet so admitted will mingle with the front end gases before these gases have an opportunity to deposit their constituent matter, and so neutralize their effects, it being universally conceded that carbonization of oil, or even the deposits of the so-called carbon, will not take place in the presence of steam.

**Discussion**

After presenting the paper, Mr. Roesch said: Doctor Conradson made an experiment to show that with valve oil heated to 1,000 deg., when he admitted air alone, he got an explosion. When he mixed a little steam with the air nothing happened.

*A motion that the paper be received and included in the minutes of the convention was put to vote and carried.*

**Amalgamation of Other Associations with Section III—Mechanical**

Mr. Thompson presented the following report: Your committee on this subject was appointed too late to obtain any definite results in the short time intervening between their appointment and the convention, and, at this time, can only report progress. However, considerable preliminary work has been done, several meetings have been held with some of the

different organizations and we would recommend that your committee be continued or a new committee be appointed to continue the work.

The report is signed by W. A. Thompson (chairman), New York Central; T. L. Burton, New York Central; E. W. Pratt, Chicago & North Western; J. E. Fairbanks, American Railroad

Association, and V. R. Hawthorne, American Railroad Association.

A motion that the report be received and the committee continued was carried.

# Drawbar Pull-Speed-Cut-off Calibration as an Adjunct to Efficient Locomotive and Train Operation

By B. B. Milner

Engineer of Motive Power, New York Central

IT IS A FACT RECOGNIZED upon most divisions that with the same engine and the same train, some enginemen are able to handle trains over ruling grades or other difficult places to satisfactorily move trains, while others generally fail to do so. The successful men are unable to very clearly state how the successful performance is accomplished, while the unsuccessful men cannot explain any reason for failure, although they make every effort possible. A study of the factors of operation in the hands of enginemen and subject to their manipulation develops the fact that there cannot be very much in throttle manipulation. Some may run with a full throttle, some with a partially closed throttle, but the crucial test of performance upon the tight places usually occurs at speeds so low that the difference between a full throttle and partial throttle with which some men may operate, under these conditions, is nil. The only other factor which an engineman can manipulate is the selection of his cut-off, that is, the position of the reverse lever, and it should be at once appreciated that the cut-off selection or the position of the reverse lever is a very important factor because it affects directly the drawbar pull developed. It should be rather apparent that there is, for each speed, a cut-off at which the drawbar pull developed will be a maximum and that the drawbar pull developed for any other cut-off, either longer or shorter, will be less than that developed by the cut-offs which should be used under conditions, where the maximum drawbar pull is necessary.

To the end that not only the maximum drawbar pull developed at various speeds might be ascertained, but also the cut-offs—reverse lever position—which must be used at the various speeds, in order to develop this maximum drawbar pull, a series of dynamometer car tests have been run in the following fashion: The engine under test was coupled immediately ahead of the dynamometer car, then between the dynamometer car and the train, a second engine; the engine under test being run at a selected fixed cut-off, while the engine next to the train and back of the dynamometer car was used for regulating speed. A series of tests with one engine was begun by placing the reverse lever of the forward engine under test in the first notch forward, and moving the train from rest at slowly increasing speed—the second engine regulating the speed by setting of brakes or by assisting as necessary—until the speed attained was such as to cause the engine under test to fail for steam at, say 15, 18 or 20 miles per hour, dependent upon the boiler capacity. Bear in mind that during this test the reverse lever of the first engine under test was allowed to remain in the full forward notch. During this test, the dynamometer car has been writing an accurate record of the drawbar pulls developed throughout the range of speeds attained, from zero to the highest speed at which the locomotive under test failed for steam.

After this test, the train was stopped and similar test was run on the first engine, with a somewhat shorter cut-off. In this case, the drawbar pull developed at the start will be lower than at the start of the previous test, and the decrease in drawbar pull with the gradual increase in speed, will be somewhat less than in the previous case, a point being reached in speed at which the shorter cut-off will develop the same drawbar pull as the previous longer cut-off, and, then at higher speeds, the drawbar pull developed by the shorter cut-off will be the greater. This test, like the preceding one, is continued until the engine again fails for steam, which, of course, will occur at a higher speed than attained in the previous test, because of the cut-off having been somewhat shorter.

The same program of procedure is represented for succeeding shorter cut-offs, until by means of the dynamometer car, there is obtained a record of the drawbar pulls developed at all speeds from zero up to that at which the boiler failed to supply

the necessary steam. By assembling the data thus obtained, we have not only a record and knowledge of the maximum drawbar pulls, which the locomotive under test will develop at any speed, but we also have a knowledge of the precise cut-off which must be used at those speeds, in order to develop the maximum drawbar pull referred to.

By means of the tests referred to above, a Mikado type engine, cylinders 25 by 32 in., driver diameter 63 in., carrying a steam pressure of 180 lb., was found to develop the greatest drawbar pull with the reverse lever in notch 1, or full cut-off, from start up to a speed of 9 miles per hour; with reverse lever notch 2, or slightly shortened cut-off, at speeds from 9 to 10½ miles per hour; in reverse lever notch 3, or slightly further shortened cut-off at speeds from 10½ to 11½ miles per hour, with reverse lever in notch 4, or with cut-off further slightly shortened, at speeds from 11½ to 13 miles per hour, etc. With a Consolidation type engine, cylinders 23 by 32 in., driver diameter 63 in., and steam pressure 200 lb., maximum drawbar pulls were found to be developed with the reverse lever in notch 1, or in the full forward position, from start to 9 miles per hour. At speeds from 9 to 11 miles per hour, the maximum drawbar pull was developed with the reverse lever in notch 2, or with slightly reduced cut-off; from 11½ to 14 miles per hour with the reverse lever in notch 3; from 14 to 15½ miles per hour with the reverse lever in notch 4, etc.

With a second Consolidation type engine with cylinders 25 by 30 in., driving wheels 57 in., and steam pressure of 180 lb., the maximum drawbar pull was found to be developed with the reverse lever in notch 1, or full forward position from start to 8 miles per hour; from 8 to 10 miles per hour with reverse

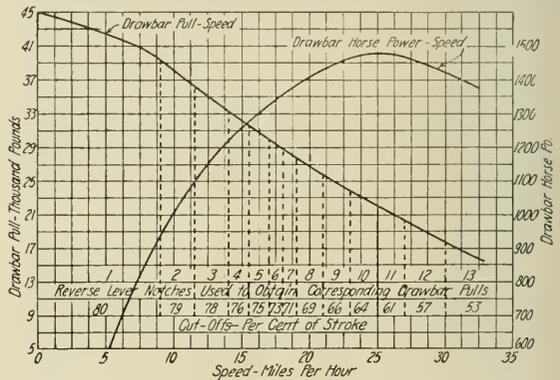

Fig. 1

lever in notch 2; from 10 to 12½ miles per hour in notch 3; from 12½ to 13 miles per hour in notch 4, etc.

It may appear at first thought that the above cut-offs are so great as to draw heavily on the capacity of the boiler for steam, but as a matter of fact, the boiler capacity, at these low speeds, namely below 15 miles per hour, should be no factor whatever in the selection of cut-off, because at such speeds, the horsepower developed by the locomotive is very much lower than that for which the boiler will supply easily the necessary steam. Maximum horsepower for average sized Mikado engines or large Consolidation engines, will be found to run from 2,000 to 2,500 h. p., these horsepowers being obtained at speeds from 22 to 28 miles per hour. For these same engines, the horsepower developed at 15 miles per hour is very much less than these referred to and the maximum for which the boilers will supply the necessary steam. These horsepowers will be further reduced

as the speed drops below 15 miles per hour, to say, 12, 10 or 8 miles per hour.

The chart herewith shown as Fig. 1 shows graphically for a Consolidation engine, the relations existing between drawbar pull and horsepower output through a range of speeds up to a little more than 30 miles per hour. It will be noted that the maximum horsepower, amounting to 1,480, was developed at a speed of 25 miles per hour from which maximum point this horsepower drops off rapidly as the speed is decreased. During the course of this fall, the margin of boiler capacity is constantly increasing.

It was found that by working locomotives at properly selected cut-offs with reverse levers in the proper positions, better time could be made up grades and between stations and that the locomotives could handle more tonnage; due, of course, to the use of the cut-offs necessary to develop the maximum drawbar pulls whenever required. On momentum grades or short heavy grades following a trackage where speed may be used in assisting trains over the grade or in any movements requiring prompt acceleration, considerable and noticeable improvement in locomotive performance can be obtained by using the cut-offs (reverse lever positions) which tests have shown to be required for maximum drawbar pull development. On long, heavy, or non-momentum grades, by working engines at the cut-offs required at the different speeds, faster moves between stations have been obtained with some increases in tonnage.

The advantages to be derived from making use of the precise cut-offs which must be used at various speeds in the development of maximum drawbar pulls, is illustrated by the accompanying chart, identified as Fig. 2, upon which is shown a graph-

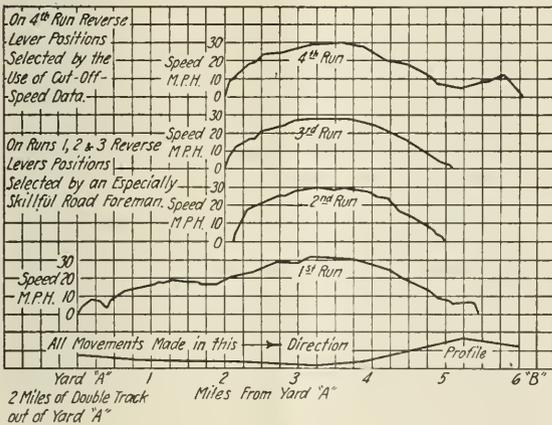

Fig. 2

ical exhibit of the speeds attained with an overloaded tonnage train moving from A toward B, over a profile slightly descending for a little over 3 miles and then rising to a summit 1/4 mile west of the fifth mile, this grade being the principal grade on a division and governing its tonnage by a wide margin. All of the four runs covered were made upon the same day with the same train overloaded to 15 per cent more than the regular slow freight tonnage. The first run was begun well down in the yard at "A," so that the end of double track two miles from the start, the train was going at 18 miles per hour. This speed was accelerated to a maximum of a little over 31, then decelerated over the summit, which was satisfactorily negotiated. The man was in charge of an especially skillful road foreman, selected on that account, who was instructed to take out of the engine all there was in her.

After having passed the summit the train was backed into the clear at the end of the double track from which the start for the second run was made, this being necessary in order to make the results of the tests practical since, of course, some trains must make their start from a stop at this point. The same road foreman was again in charge of the engine and did his best; however, the train stalled, as the chart shows, some distance from the summit.

After this second run, the same train was then again backed to the end of the double track for the third run. The same road

foreman ran the engine on this run and was exceedingly confident of being able to negotiate the grade, having had the benefit of the experience upon the two preceding trips, but as the chart indicates, was unable to do so. After this third run, the train was again returned to the starting point at the end of the double track for the fourth run, during which the position of the reverse lever was dictated from the dynamometer car speed indicator and a chart showing the reverse lever positions necessary for the development of the maximum drawbar pulls at various speeds. It will be noted that the grade was satisfactorily negotiated at a minimum speed of 5 miles per hour.

Graphic chart (Fig. 3), shows the general relations existing between the speeds and the drawbar pulls developed by the use of the various constant cut-offs as represented by reverse lever notches, numbered 1, 2, 3, etc., consecutively from the most forward or longest cut-off reverse lever position. This chart

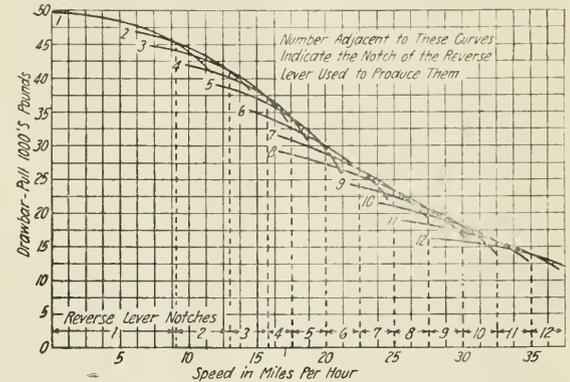

Fig. 3

indicates that the initial drawbar pull at zero speed, or when starting, decreases with decreases in the cut-off used; that is, a longer cut-off will develop a higher initial drawbar pull, whereas a shorter cut-off will develop a correspondingly lower initial drawbar pull. This chart also indicates that at successively higher speeds, successively shorter cut-offs develop maximum drawbar pulls, or in other words, for any speed there exists a definite cut-off at which the drawbar pulls will be maximum and that during operation at this particular speed, the selection of any other than the "maximum drawbar pull cut-off" either higher or lower, will develop a lesser drawbar pull.

It becomes, therefore, apparent that some knowledge of the precise cut-offs or reverse lever positions, which, at various speeds, will result in the development of the desired maximum drawbar pull, must obtain and be used, if the maximum results, which can, and with reason, may be currently expected, are to be obtained.

For the dissemination of this information to enginemen, cards which may be folded to convenient vest pocket size, as represented upon Figs. 4 and 5, are submitted. That portion of those cards headed "Statement showing reverse lever notches and cut-offs at which maximum drawbar pulls are developed" is addressed to the question of maximum drawbar pulls and operating covered thus far, these maximum drawbar pulls and operating conditions which will produce them being of paramount importance in the determination of tonnage ratings. The determination of such ratings may be viewed in the light of being in reply to the question: "Having given a locomotive and grade and alignment conditions, what maximum tonnage can be handled?" The second question consistently follows, namely: "Having determined the tonnage rating, what movement may the given locomotive be expected to make therewith?" under condition which require the maximum expected performance.

To the latter question the other portion of the suggested cards referred to is addressed. For individual runs between all points thereon, the time called for under Columns A, B, C and D, thereof, providing respectively for the moving time required in passing from one point to passing the next following point; from passing one point to pulling in the clear at the next following point; from standing in the clear at one point to passing the next succeeding point, and from standing in the clear

at one point to pulling in and clearing at the next point, should be filled out by those qualified to determine the performance which may be expected under conditions which particularly require the best. It is not submitted that the "moving time" which dispatchers have a right to expect from full tonnage trains shall be at all times met, but that this "moving time" may reasonably be expected, as the situations which confront dispatchers occasionally may demand. This "moving time" information should be equitably developed and placed in the hands of dispatchers, train-masters, engineers, conductors, road foremen, master mechanics and others who are concerned in tonnage train performance.

As indicating rather definitely the probability of finding some general need among road foremen for information bearing upon the cut-offs obtaining upon the engines in their charge, for various positions of the reverse lever, and also for information as to what the position of the reverse lever should be used at various speeds in order to obtain the maximum results, the following tabular statements of such information filled in for each notch on a well established type of locomotive familiar to each of several road foremen involved, are shown. The columns of these statements headed "Cut-off Per Cent" and "Used at Speeds From-To," were filled in by 18 road foremen, very full explanations having been made to them prior to their filling in this information and during the time it was being filled in. The answers given by the first group are shown below:

FIRST GROUP OF ROAD FOREMEN NOS. 1 TO 6.

Reverse Lever Notch	(1)		(2)		(3)		(4)		(5)		(6)

From the above attention is especially called to the following abstract therefrom:

Road Foreman.	Road Foreman.			Road Foreman.	Road Foreman.		
	A.	B.	C.		A.	B.	C.
1	95	72	10	3	90	60	
2	92	50	10	7	100	0	
3	90	60	12	4	80	25	
4	87	40	13	5	80	27	
5	85	20	14	4	93	70	
6	83	50	15	5	93	40	
7	80	20	16	3	80	27	
8	75	55	17	5	93	70	
9	72	25	18	5	97	20	

A.—Reverse lever notches recommended for a period of 10 miles per hour.  
 B.—Cut-off said to be obtained in the first reverse lever notch.  
 C.—Cut-off said to be obtained in the ninth reverse lever notch.

Note that for a speed of 10 miles per hour, the judgment of these road foremen on the proper position of the reverse lever, under the conditions specified, varies from the third to the seventh notches, whereas, upon the engine in question, for this speed the first notch should be used when the development of the maximum drawbar pull is required.

This drawbar pull-speed-cut-off calibration data is needed, can be used especially with stoker fired engines advantageously, and can be obtained without a dynamometer car, as follows: An engine under test can be given a string of cars, about 25 per cent above the engine's rated capacity, on a selected section of track, the grade of which should be as nearly uniform as possible. An assisting engine should be coupled on the rear of the train for the regulation of the speed, while the engine at the head of the train should be run under constant cut-off conditions. A trial in the longest cut-off, at about two miles per hour, will locate immediately that portion of the train which the first engine will haul at that speed, this to be ascertained by observation of the slack between that portion of the train hauled by the leading engine under test and that portion of the train which is pushed by the engine which from the rear regulates the speed.

That portion of the train which the leading engine is thus found to be able to just handle can be reduced by about one car, and that portion of the train to the rear thereof cut off, leaving the engine under test at the head of the train coupled to a section thereof slightly less than it can just handle. Then, between

two selected and marked points, 100 or 200 yards apart, the engine under test can be run at selected, fixed cut-offs and the difference precisely noted in the time required for the movement of the train between the two selected and marked points referred to. The differences in the drawbar pull developed by the locomotive under test, when being run at various fixed cut-offs, will be reflected immediately in the amount of time required for covering the marked distances. Any road foreman should be able to conduct such trials.

A motion that the paper be received and included in the proceedings was carried.

## Railroad Mechanical Conventions in Russia\*

By A. Lipetz,  
 Chief of the Russian

Mission of Ways of Communication.

YOU MAY BE INTERESTED in knowing something about the conventions of the Russian Master Mechanics' and Master Car Builders' Associations, which we call Conventions of the Motive Power and Rolling Stock Mechanical Engineers of the Russian Railroads.

The first convention of this kind took place, if my recollection is correct, in 1884. From that time on we held meetings almost every year. Our last convention, the twenty-ninth, took place in August, 1913, before the European war started.

I was very much pleased with the opportunity of attending the present convention because as a member of the Executive Committee of the last Russian convention, I am desirous of knowing what features of the Mechanical Section of the American Railroad Conventions it will be advisable to introduce into the Russian Association of Motive Power and Rolling Stock Mechanical Engineers.

Your association and our Russian association have much in common. While your association was busy with the standardization of details, our association from the beginning also started on standardization of rolling stock. The result is that all freight cars in Russia have been for over thirty years practically of a standard type; we had, before the war, about 500,000 of the so-called "normal" box cars of 22 tons capacity, about 80,000 "normal" flat cars, some standard gondola cars and standard tank cars, but very few cars of special design. These latter include milk cars, combined flat and rectangular tank cars, cars for special purposes belonging to private owners, which we call the "abnormal" cars. This enabled our railroads to adopt a general pooling system for car traffic where all cars are considered as general railroad property and are pooled over the entire railroad system. Every railroad is entitled to the use of as many "normal" box cars and as many "normal" flat car as it owns; if, therefore, one railroad delivers a certain number of cars to another road, the receiving road is obligated to deliver to the first road at the same point and on the same date, from midnight to midnight, an equal number of cars. The mechanical inspection and repairs take place wherever the cars happen to be at the particular time and the cost is charged to the railroad which owns the cars, at a certain schedule of rates. There can be no question of not having an axle, a wheel or another car part at any point as all cars are alike, and even cars of different types, as box cars, flat cars, gondola cars and tank cars have the same axles, wheels, couplers, buffers, brake parts, etc.

\*Mr. Lipetz, at the invitation of Chairman Tollerston, made this address at the meeting of the Mechanical Section on Tuesday morning. By unanimous vote it was ordered that the address be incorporated in the association proceedings.

The locomotive standardization was taken up at the convention together with the Rolling Stock Committee, of the Railroad Administration in Petrograd, which practically means a "standardization committee." It was continuously, as the new traffic conditions required new types of engines. In 1876 there was established by law a standard railroad structure clearance diagram and a rolling stock clearance diagram, and in 1893 there was built the first standard freight locomotive—the so-called "normal" slow freight engine. In 1914, just before the war, there were 7,376 locomotives of this type, or 32.5 per cent of the total number of locomotives. In 1904 we started to design a fast freight engine and in 1914 there were 1300 or 5.7 per cent of this type. Then there were 600 slow heavy freight locomotives and in 1915 we designed and had built in the United States 1,075 Decapods, the standard fast heavy freight engine.

At almost every convention of our association a paper was presented by a committee about the results obtained from the service and performance of a standard type locomotive, usually the last, based on the data which could be obtained from different railroads.

It would be difficult for me to enumerate all the papers presented at our convention—I want to tell you only that every new question which came up, or every new device of some importance, was entrusted to a committee or to an individual for study and report. We started to investigate the superheating of steam in locomotives as early as 1898 and have made very extensive road tests with locomotives of different types with and without superheaters and the results were submitted to the convention; we have gone through very thoroughly the questions of tonnage rating, estimates of locomotive capacity and the investigation of the most economical design and operation of locomotives, etc.

But our conventions did not have the practical spirit, which I see here. Our railway supply industry is not so large and extensive as the American is, and our manufacturers never cared to exhibit their products. Therefore, we had to get acquainted with the new designs by visiting different railroads and shops. This developed the practice of changing the place of our conventions, choosing every year another place, usually one with large shops. This was also done with the purpose of giving to every road an opportunity for all their officials to attend the meetings of our conventions, as usually the long distance prevented them from attending every convention.

Comparing now our conventions with the present American Railroad Association, Section III, Mechanical Convention, I must state with pleasure that this convention is remarkable because of the extent of the knowledge which one can gather at the meetings, from papers, reports and discussions together with the practical information he receives at the exhibits. Here, in a week, he gets more than he can obtain in a year on his own road. By exchange of his practical knowledge with the other man's information he keeps himself on the level of the up-to-date mechanical science of railroading and absorbs sufficient information and inspiration to carry him over to the next convention. It is really—as Mr. W. T. Tyler said the other day—a "Post Graduate Course" for railroad men.

As a member of the Executive Committee of the Russian Conventions of Motive Power and Rolling Stock Mechanical Engineers, I want to convey to you the greetings and the best wishes of our association and to assure you that the honor which has been conferred upon me by including me into the membership of the best American Master Mechanics' Association will enable me to be more useful to my country in the expected reconstruction of our railroads.

## The Enrollment Committee

EXCEPT THOSE who are intimately acquainted with the detail work over at the Enrollment Booth, few realize what a really big and oft-times thankless job it is. Registrants too often furnish inaccurate or incomplete information, such as giving the wrong hotel, room number or no hotel at all and then a correction has to be made in the official list. This one item alone runs into considerable extra work.

Again, someone sends an unknown secretary for a badge. Then it is that the committee must necessarily refuse to issue the badge, although the claimant may be of the highest character. It is obviously necessary that badges be issued to known parties and to no others, and when such a stand is taken by the committee it is only "playing the game according to the rules" and doing what is best for all interests.

Then there are the lost badges. No lost badge can be replaced, but in case of such accident, the owner is given a card which carries the privileges of the convention.

The getting out of the official list of enrollment is in itself an enterprising piece of publishing. Following the actual registration the registrant's number, name, title, business connection, hotel and room number must be transferred onto blanks prepared for the purpose in advance, they must be sorted as to classification, arranged by consecutive number and also alphabetized for cross reference. On certain days the registration is very heavy and it is necessary for the committee to buckle down to rapid detail work in order to get copy off by the last messenger to Philadelphia. The print shop works all night in order to print, bind and deliver 2,000 copies in Atlantic City by 6.30 A. M. each morning.

Added to all this work there always arise emergencies that have to be dealt with swiftly and accurately. One of those emergencies this year came because of the unexpectedly large attendance. The committee had arranged for a large number of badges, but before the end of the fourth day many of the classes of badges had been exhausted and cards had to be resorted to, which again drew on the diplomatic reserve of the committee in giving explanations.

President Walker in commenting upon the work of the Enrollment Committee says, "It has been this year an unusually trying task which the committee has handled with ability and tact and Mr. Gayetty, chairman, has voluntarily taken the responsibility and load from my shoulders in a very splendid way." The committee is certainly entitled to the gratitude of all attendants.

## Baldwin Offices Abroad

WALLACE R. LEE is here from Philadelphia and reports that his company, the Baldwin Locomotive Works, will open a branch in Buenos Ayres in September under his direction. A Baldwin branch is also scheduled to open in Madrid, Spain, in July and will be in charge of H. P. Austin, a nephew of William L. Austin, until recently chairman of the board of directors of the Baldwin Locomotive Works.

Col. C. H. Crawford, recently discharged from service with the United States Government at the Eddystone munition plant will sail for Rio de Janeiro in August, where he will inaugurate the Brazilian branch for the same company.

Mr. Lee owes his appointment to the Argentina branch to his successful conduct of the West Indies office at Havana, Cuba, which under his direction grew into importance and favor.

# A Topical Discussion of Air Brake Conditions

## Spirited Exchange of Experiences by the East and the West; More Attention to Maintenance Needed

**D**URING THE SESSION of the convention held on Thursday of last week, the subject of air-brake conditions was taken up for discussion under the head of Questions Proposed by the Members. The universally unsatisfactory conditions of air-brake equipment was clearly developed during the long discussion which the subject provoked. An abstract of the discussion follows:

F. W. Brazier: I would like to call attention to the importance of the maintenance of the levers of air brakes. You would be surprised to read the Air Brake Association Proceedings in Chicago held last month. If you read Mr. Tatum's address, made before the Central Railroad Club in March and the discussion there, and see and know what you do know of the condition of air brakes on freight trains. At one time, up to February of this year we had 800 men in the car department of the New York Central doing nothing but maintaining air brakes. This included the men in the shops. That is an alarming situation, gentlemen, a payroll of \$80,000 to \$90,000 a month. Since the business dropped off we dropped off some of these men, but I am free to say that there is very little attention paid by some railroads to the condition of air brakes, and there is too much pnciling of tests made—the work is not done properly. I hope when you get home that you will take up with your officials the question of having men enough to maintain this important part of the equipment, that is, the condition of the brakes. Many operating officials think that inspection is a nuisance, but you must take time to properly repair and inspect, and get the brakes in first-class condition. This is one of the things that I can impress on every man that has charge of a car department throughout this country. The work we are trying to do and the work that you ought to be doing, if you are not, is the maintaining of the air brakes on the freight equipment.

C. E. Fuller (U. P.): I endorse what Mr. Brazier said. Cars come out to the West, where we have to go over mountains, and we have to stop trains on account of the brakes being practically out of date, retaining valves will not hold the pressure, and we cannot run the trains over the mountains. They do not need the retaining valves here in the East, but any one that goes out West and sees the condition of brakes and retainers will agree that we have got to get relief from the Eastern roads. We are hauling about 75 per cent foreign cars. We need the retainers on going over the mountains and we have to delay the loads for the purpose of cleaning them.

The Chairman: I was talking to a man the other day on an Eastern road about handling trains with air brakes. Of course, they only have hills, but there are some mighty stiff grades, and he said that those Western cars were so covered up with dust that it was impossible to handle them down grades, that they did not do any work on their cars out there—they don't need to.

Mr. Fuller: I agree with you fully. We just received some cars home within the last few days that were built in 1915 and 1916. I don't think they would hold anything. They have never been repaired. They send them home for us to repair them.

D. S. Watkins (S. P.): I am glad that Mr. Fuller and Mr. Brazier have brought up this question. I tried to get this body to include the draining of reservoirs in the report on Train Brake and Signal Equipment. A test of 251 cars was conducted in Los Angeles and in the case of 21 of them they had from one-half a cupful to a gallon and a half of water in the reservoir. Ninety-five per cent of them probably were foreign cars. The retainers are never touched. I do not believe that you people here in the East realize what the retainer is there for. You put it on the car and when you paint the car daub up the exhaust port so they are perfectly useless. If it is not too late, and if it is in order, I would like to have my motion of yesterday reconsidered.

The Chairman: Every train that goes over the Jersey Central has the retainers used at some point on the Lehigh or Susquehanna division. We are probably more interested in retainers

on the Jersey Central than eight-tenths of the roads in the United States, but it is a common complaint over there about the inattention to retainers on other people's cars.

P. P. Bartholomey (Great Nor.): We have found the same trouble on our road, and I would like to ask whether or not the kind of branch tee connection used in the train pipe has been noticed. I have found quite a number of cars with just a plain union tee that permits the water, if any gets in the train line, to go straight down into the branch pipe, and after the dust collector is filled there is no other place for it to go.

Mr. Watkins: Some of the cars were equipped with a tee; some were equipped with dust collectors, and the dust collectors were filled solid so you had to take a hammer and chisel to get the dust out.

C. F. Giles (L. & N.): Every one present remembers that we received instructions from the Federal Administration some time last fall to make a record and make a monthly report of the triple valves cleaned and other attention given to cars on repair tracks, and to the air brake equipment. Every man present who has been carrying out these instructions ought to know just exactly what he is doing. It was suggested in that order that if we succeed in handling ten per cent that would take care of the air brake situation in good shape. We have exceeded that every month since that order came in. Last month we reached twelve per cent of the equipment handled on our line.

J. J. Tatum: Mr. Fuller says we have no grades in the East. We have some mountains to contend with, and inasmuch as I am somewhat acquainted with the other end of the country now, I believe we match up pretty well. If all of us did some work to get the air brakes in shape and put them in the condition the rules of this Association call for we will have good brakes, but we cannot do so by leaving the work to the other fellow.

I have some information that probably will surprise some of you. There were 175 cars tested at three different points as to air brake condition. The results were as follows:

*Air Brakes*—The number of cars with serviceable brakes, 135 out of 175; number of cars with non-serviceable brakes, 40 out of 175; number of cars cleaned within 12 months, 141; number of cars not cleaned within 12 months, 34; number of cars with train line leaks, 5 lb. per minute, or less, 60; number of cars, leaking more than 5 lb. per minute, 110.

*Cylinder Leakage*—Number of cars leaking 5 lb. per minute or less, 33; number of cars leaking more than 5 lb. per minute, 109.

*Retaining Valves*—Number of cars with serviceable retaining valves, 115; number of cars with non-serviceable retaining valves, 35.

*Hand Brakes*—Number of cars with operative hand brakes, 169; number of cars with hand brakes inoperative, 4.

*Travel of Piston*—Number of cars with travel of piston eight inches or less, 121; number of cars more than eight in. piston travel, 40.

The recapitulation of these figures is as follows:

Average train line leakage—5.5 lb. per min.

Average of cylinder leakage—16.5 lb. per min.

Train line test not taken on five cars on account of defects.

Cylinder tests not taken on 33 cars on account of defects.

Retaining valve test not taken on 25 cars on account of defects.

Piston travel tests not taken on 14 cars on account of defects.

That is more or less representative of the condition of the air brake equipment of this country. The air brakes were put under those cars at a very considerable cost to the railroads, and they surely should be maintained in serviceable condition, for the reason they were applied so that the locomotive engineer could properly control his train.

It is not the fault of this association that these conditions exist. The association is giving you information that will enable you to put the brakes under your cars in good condition. The difficulty is that we have not complied with the requirements of these instructions. That is no reflection on the association; it is a reflection on the individual railroad.

The fact has been stated that the Railroad Administration has suggested that the record be kept of the number of cars on which air brakes were cared for. The idea of that record is to inform the official responsible for the condition of these brakes whether or not they were taking care of a sufficient number of the equipment to maintain the air brakes in proper condition.

We find in various investigations that some of our car men say that the superintendents will not permit them to hold the trains. As a result of my investigations I believe that the car men do not always state their case fairly to the official who is responsible for these conditions, because I believe if the seriousness of the condition were made clear, the operating officer would give the car man opportunity to hold the cars and properly repair the brakes.

J. N. Milton (Rock Island): I was in Kansas a few days ago, and I find that the Western Lines are using to-day about 70 or 75 per cent of foreign equipment, and the equipment comes to our yards and our large terminals such as Chicago, Memphis or Kansas City, so rapidly that we cannot tie the cars up to give attention to the brakes in the proper manner without blocking the terminal. A railroad can handle just so much equipment, and the roads are compelled to let these cars go through as they are turned over to them in interchange.

J. J. Tatum: In regard to the blocking of terminals, I believe the existing conditions would almost bring that about, but if each railroad had performed the work it should have performed, we would not have had these conditions and our railroads would be open.

G. H. Wood (A. T. & S. F.): The members of the association have no dearth of instruction or information as to how to keep the brakes up. Mr. Tatum intimated that we had been talking about the thing too much and not doing it. That is the fact. Mr. Milton says we have not time to give the air brakes attention when the cars come to us. I do not know of a superintendent on any railroad who would tell you to run your train out without sufficient brakes, in order to control its safety. The superintendents want the trains controlled safely, and the reason we do not get the brakes fixed up is because we do not go to it and do it. I have seen hundreds of cars standing around in the yards, and standing there for days, and nobody looks at them as far as the brakes are concerned, and no provision is made that will compel them to do it. When we send the brakes out in improper condition, there is more delay on the road due to trouble with the brakes than would be required to put the brakes in proper order.

I want to appeal to the members to go at the thing along the lines we have laid down, and use the instructions and use them where you can use them. If the regional directors will check up the number of cars reported as cleaned, oiled and tested, on the railroads in their territory, they would find out that all over this country we are cleaning two or three times as many cars as there are in the country, and we are not doing a good job, simply because we do not take the time to do the job right. If the job is being done poorly, that is not the fault of the man doing the work, but our fault, because we do not insist upon its being done properly. At some points where brake work is done there is nobody directly in charge of the work. The only way to keep them in the best possible condition is to put them in that condition when we first clean them, and we will find by doing this that we will get much more satisfactory results.

### Cast Steel Chain

The beginning of the world war found chain makers quite as unprepared as all other industries. The Government called for production of anchor chain and the answer from makers of forged chain indicated that the required amount could not be produced. Chain makers cannot learn their trade in a day. Then the new idea insisted on recognition. Chain had never been cast, but necessity met the emergency. Cast steel molders produced a chain stronger than the forged chain, cast in any desired length and in any size. Perhaps no more significant instance can be found of the far-reaching influence of the war. Forged iron chain, that for so long had held supremacy, almost in a day finds a rival which may be its master.

## Conventionalities

"Big Dan" Cunningham's daughter, Miss Margaret, arrived here with her mother and sister, Dorothy, Sunday evening from Salt Lake City, and will remain until the end of the convention.

H. W. Ridgeway, Superintendent of Motive Power, Colorado & Southern, and Mrs. Ridgeway.

B. J. Coffman, acting mechanical engineer of the Richmond & Potomac, is attending his first convention. It is also his first visit to Atlantic City and he is enjoying every minute of it.

R. H. Dyer, Supervisor of Car Repairs, U. S. R. A.

This is the first convention George W. Wilden has attended as a railway supply man. He came to the last convention as superintendent of motive power of the New Haven. He is here this year as general manager of the Westinghouse Air Brake Company.

Mr. Michel, of A. Eugene Michel and Staff, advertising engineers, is here but is conspicuous by his absence from the pier, not that he hasn't the necessary headgear and overalls, but that he might the better serve his clients, he has been sticking pretty close to his temporary office in the Alanae Hotel.

Country Club at Chicago. D. E. Sawyer, who recently went with the Pollak Steel Company, long has been

C. F. Giles, Superintendent of Motive Power, L. & N., and Mrs. Giles

known as one of the best golf players in the country. A team of a dozen players could be organized from

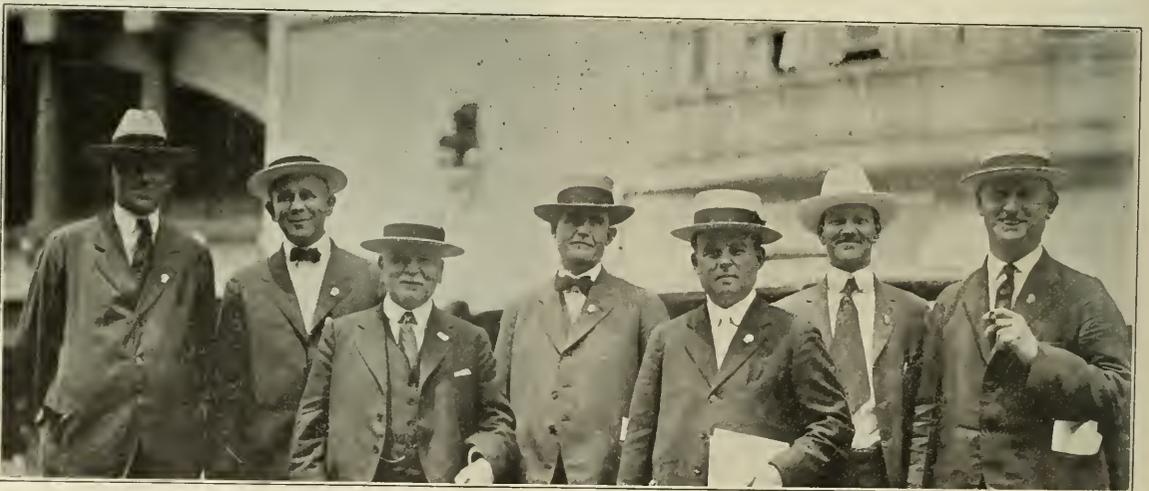

John Wintersteen, Cornwall Railroad, and Edward Clark, General Mechanical Foreman, Cornwall Railroad

It is probable that among the convention visitors could be found men and women with almost every form of accomplishment; and there are not a few men among them who have won fame in the game of golf. For instance, R. C. Vilas, president of the Pyle National Company, is now champion of the Exmoor Club, at Chicago. Robert Gwaltney, of the Symington Company, has been champion of New Jersey. Clayton Ingraham, president of the National Waste Company, is a fine player, and recently gave Max Marston a hard contest in a tournament, being beaten only one down by Marston. E. Hoover Bankard, of the Globe Seamless Tube Company, who is chairman of the Entertainment Committee this year, is a splendid player, and long has been chairman of the Green Committee of the Midlothian

A. L. Humphrey, W. S. Bartholomew, and George W. Wildin; the Latter Attending His First Convention as a Railway Supply Man

among the attendants at the convention which would give any other team of amateurs in the country mighty hard competition.

Left to Right. C. S. Patton, Supt. Motive Power, S. A. L.; J. W. Sasser, Supt. Motive Power, Norfolk Southern; Thomas Murcott, of Murcott & Campbell; C. H. Terrell, Assistant Supt. Motive Power, C. & O.; W. S. Butler, Master Mechanic, C. & O.; S. B. Andrews, Mechanical Engineer, S. A. L.; E. A. Murray, Master Mechanic, C. & O.

To get a free ride in an aeroplane, and in addition receive a taxicab ride and \$525 for taking it, would indicate that the man getting them was a business man as well as a sportsman. George Christianson, of the Johns-Manville Company, did it. Some of the other representa-

(Left) Willard Kells, General Superintendent of Motive Power, Atlantic Coast Line, and William Owens of the New York Air Brake Company

tives of the same company offered to bet him \$50 to \$25 that he would not take an air trip. This started the conversation. Mr. Christianson took the aeroplane ride yes-

R. E. Mercur, Traffic Manager Westmoreland Coal Co., and his son, Henry.

terday, went in a taxicab to and from the place of ascension, all at the expense of his associates, and was \$525 to the good at the expense of nine of them when he came down.

How's this for Friday, the thirteenth and persistency? R. D. Stevenson, president of the Safety Nut and Bolt Company, Cleveland, Ohio, left for Atlantic City in his machine at 4.30 P. M., Friday the thirteenth of June. His entire exhibit was loaded in the rear of the tonneau. After proceeding a half dozen blocks he turned into a street which had recently been paved with asphalt and was oily and slippery. A horse and wagon appeared from an alley and a street car running alongside of them closed the gap, preventing further progress. In applying the brakes the car slid sideways and crushed the right side

James Tierney, Master Mechanic, Louisiana & Arkansas, Mrs. Tierney and a future Master Mechanic, Stanley Tierney.

against the wagon; then the street car hit and crushed the left side of the car. After untangling the machine from the mix-up, he found the engine still running smoothly and the front axles in line—so he started again. When about 20 miles out of Cleveland the emergency brake, which had been set too tight in the beginning, burnt up and it was necessary to call in the assistance of a neighboring farm boy, who rushed a pail of water to the machine. After adjusting the brakes he proceeded, reaching Pittsburgh at 2.30 A. M. Saturday. Here ended his troubles as the balance of the trip to Atlantic City was without further troubles.

Guests at Dinner Given in Honor of Frank McManamy on Saturday Evening

P. C. Cady, well known in electric headlight circles, was seen in the Traymore dining room yesterday with

says that he didn't have the courage to send them back, so he ate them all and the waiter took him for a vegetarian.

Señor Juan M. Clark, formerly administrator of Central Pervseverancia, one of the seventeen properties of the Cuba Cane Sugar Corporation, located in the Province of Santa Clara, Cuba, is the latest arrival of distinguished visitors from the "Pearl of the Antilles." Mr. Clark represents the corporation, which is said to be the largest producer of sugar in the world. It owns more

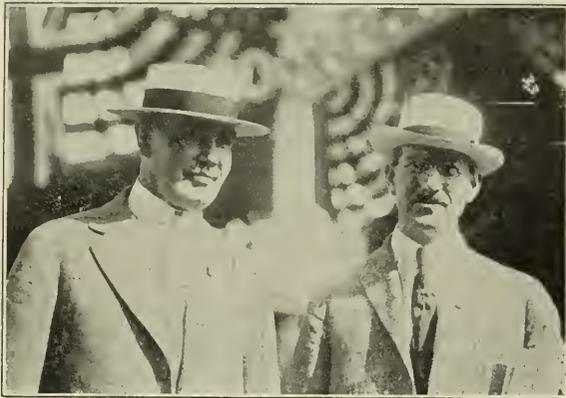

C. M. Dally, Machinist, C. R. R. of N. J.; H. L. Sandhas, General Inspector, C. R. R. of N. J.

Andre Rhue, Engineer, Schneider et Cie. Creusot Works, Paris, France.

put on a sketch that broke all encore records and made a decided hit. N. A. Campbell, with the New York Air Brake Company for over twenty years, much better known as "Sandy" or "Scotty," is an artist at telling Scotch stories. His friends say that he never has had

a "chestnut" in his "reservoir" and that he is in great demand as a story teller. George W. Denyven, of the Parkesburg Iron Company, Rome Iron Mills and the Pollak Steel Company, is also a dialect story teller and plays the bagpipe. He has been at all of the conventions for nine years and takes an active part in the

(Left) C. B. Keiser, Superintendent Motive Power, P. R. R., and (Right) J. L. Cunningham, Superintendent Motive Power, P. R. R.

show, this year serving as a member of the Enrollment Committee. "Deny" says he can play grand opera on the bagpipe, but the best we have ever heard is "Cock of the North" and "How Dry I Am." As a result of the sketch put on at the N. E. R. R. Club, they were offered flattering terms to go on the stage, due to the fact that it is reported Harry Lauder is about to retire.

**"Multum in Parvo"**

"Lunch?"

"Bowl?"

"Well, good-bye."

Five words, and yet there is the whole story told about a friend of ours and yours—a prominent member of Section III, Mechanical, American Railroad Association; an ex-president of the M. C. B. or the M. M. Association, we will not say which. The gentleman is not given to the use of many words; he never was and never will be. And yet the sympathetic sign of approval or the rather stern sign of disapproval, always unmistakably noted in his eyes or in the nod of his head plainly indicate the trend of his thought to the listener.

Samuel Lynn, Master Car Builder, P. & L. E., and Karl Berg, Mechanical Engineer, P. & L. E.

**The Visitors From Latin America**

Left to Right: Ben Elliot, Master Car Builder, United Railways of Havana; Frank De Wolf, Locomotive Superintendent, Cuban Central Railway; O. R. Hale, Locomotive Superintendent, United Railways of Havana; Juan Henderson, General Inspector of Locomotives, United Railways of Havana, and Juan Romañach, Locomotive Superintendent of the Cuba Cane Sugar Corporation—all of Havana.

**More Latin-American Visitors**

Left to Right: "Albertico" Gou, Santiago Estevez, general manager, Cardenas American Sugar Co., Cardenas; Juan M. Clark, Cuba Cane Sugar Corporation, Havana; Alberto Gou, administrator Central Lequeitio; Lequeitio Santiago Estevez, Jr., of the University of Pennsylvania

Well, one day a long-time friend from a distant city called. He was greeted with a hearty handshake and inasmuch as the hour of the day was about luncheon time our railroad friend looked into the eyes of the visitor in a kindly way and simply said:

Admiral C. W. Dyson, U. S. N., and Mrs. Dyson

"Lunch?"

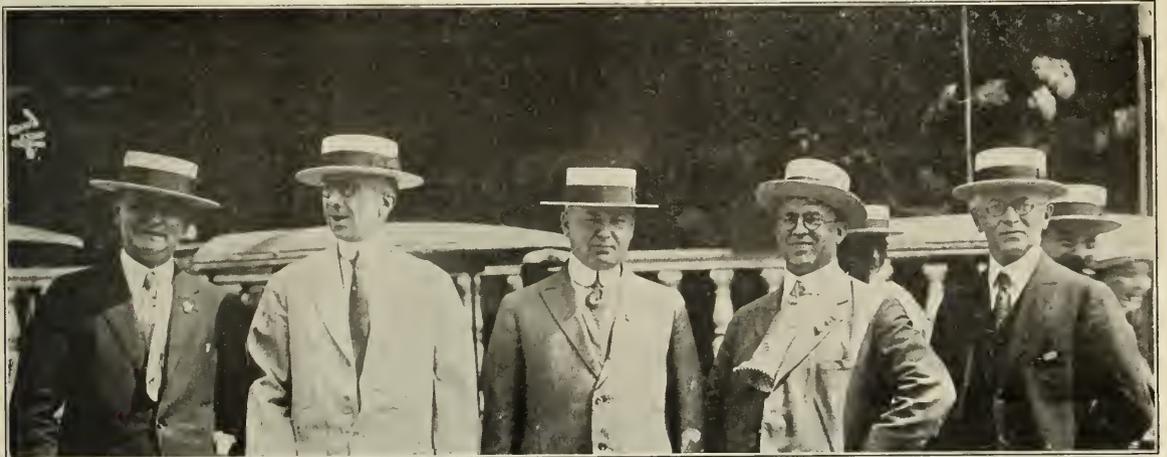

The man from out of town thanked the gentleman for the invitation and the two men proceeded to a club where an attractive luncheon was served. Of course, the guest chose for the meal the appetizing things he desired and the host simply smiled in an approving way to the waiter. So the order was duplicated. During the meal the guest did quite all of the talking we are informed, but he was at all times listened to in a friendly and interestedly manner. As they rose from the table the host said simply:

"Bowl?"

"Why, yes, I'd like to," said the guest. So they went to a nearby bowling alley and enoyed two frames of the game. As the two men left the place the guest thanked his host for a most pleasant luncheon and said he must be on his way. A hearty hand shake followed as our railroad friend said simply:

"Good-bye."

A temporary illness in New York prevented the early arrival at Atlantic City of George W. Lyndon, president of the Association of Manufacturers of Chilled Car Wheels. Mr. Lyndon, however, was on hand shortly after the opening exercises and will remain until the close.

Left to Right: F. S. Gallagher, Assistant Engineer of Rolling Stock, N. Y. C.; T. J. Burns, Supt. Rolling Stock, M. C.; W. H. Flynn, Supt. Motive Power, M. C.; G. E. Parks, Mechanical Engineer, M. C., and D. F. Jennings, of Guilford S. Wood Co.

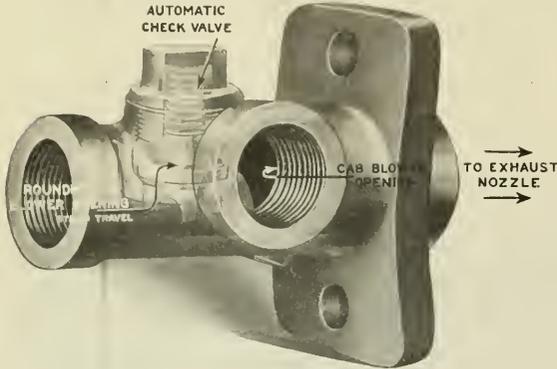

Left to Right: William Schlafge, General Mechanical Superintendent, Erie; Miss Carroll, sister of Mrs. Quinn; M. Quinn, General Foreman Car Repairs, Erie Lines, East; Mrs. Quinn; F. M. Graff, Superintendent Apprentices and Production, Erie; Stanley Bullard, Bullard Machine Tool Co.; A. G. Trumbull, Assistant General Mechanical Superintendent, Erie

# New Devices Among the Exhibits

## Automatic Smokebox Blower Fitting

**L**EAKLESS, PLUGLESS, THREADLESS, automatic in action, and always ready, are some of the claims made for the automatic smokebox blower fitting, which is so plainly illustrated in the photograph that it requires but slight description.

Cap screws secure the flange or body of the fitting to the smokebox, inside of which no nuts or bolts are re-

Automatic Smoke Box Blower Fitting

quired. All that is required in the attaching of the roundhouse steam hose is to screw it on and turn on the steam; the check valve is raised by the steam in its passage to the smokebox. When steam is up and the roundhouse pipe is disconnected, the blower valve in the cab furnishes the balance of the draft necessary and the check valve prevents leakage of steam to the atmosphere. This device, which is applied to all United States Standard locomotives is known as the Barco automatic smoke-

Barco 3-V Feed Water Connection

box blower fitting and is made by the Barco Manufacturing Company, Chicago.

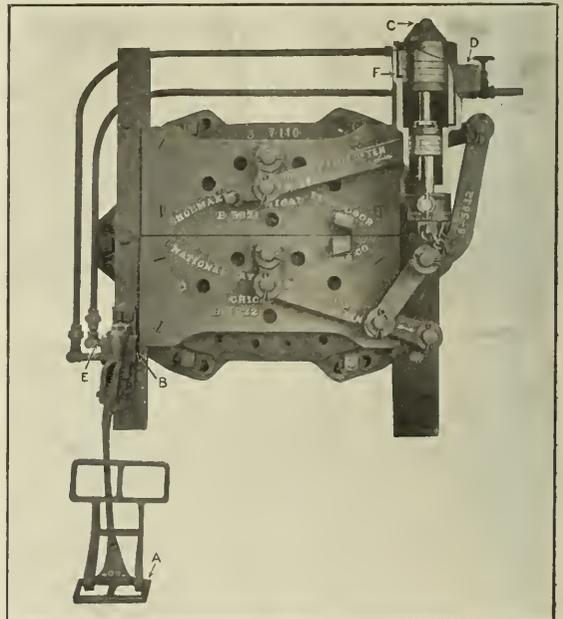

The Barco 3-V type engine tender connection which has been used for some time for air and steam lines, is now being used for water connections as well. The illus-

tration below shows a typical application. For this purpose  $2\frac{1}{2}$ -in. joints and  $2\frac{1}{2}$ -in. extra heavy pipe are used. One of the important advantages of the arrangement is its reliability. There is no possibility of a loose lining obstructing the flow of water, the connection cannot collapse, and if "blowing back" is necessary there is no danger that it will burst or be blown off. In addition to the increase reliability it is claimed that a reduction in the cost of maintenance is secured by the use of the Barco water connection.

## A Vertical Automatic Fire Door

**T**HE NATIONAL RAILWAY DEVICES COMPANY, Chicago, is exhibiting the Shoemaker vertical automatic fire door as applied to the United States Railroad Administration locomotives. This door is of the balanced type and is pneumatically operated, both in the opening and closing movement.

The short leverage required to move the doors and the short piston travel necessary to operate the levers are distinctive features. In the opening operation of this door the pedal *A* is pressed downward, thus lifting a foot valve which closes the exhaust port *B*, admitting

The Shoemaker Door In Closed Position

air through the foot valve and the admission valve *C* to the top side of the large piston, which forces both the pistons downward. The check valve *D* admits a constant air reservoir pressure into the cylinder between the two pistons, and at the same time as the downward movement reduces the volume between them, a proportionately greater pressure is built up, which near the completion

of the stroke balances with the reservoir pressure and brings the door to the open position without shock.

To close the door the pedal *A* is released, thus setting the foot valve which blocks the air at *E*. Port *B* opens, permitting the free escape of air through port *F*, forcing the pistons upward because of the greater pressure underneath. When port *F* is closed by the large piston an air cushion is formed in the top of the cylinder, and as this is relieved through a small hole in the plunger of the admission valve, the door closes without slamming. The doors can be cracked by means of the pawl at the lower end of the air cylinder.

This company is also showing a Shoemaker fire door of the vertical automatic twin type, designed for application to locomotives having wide fire door openings, such as those used in the anthracite regions. The design of this door permits the exposing of one-half of the door opening, while the other half remains closed, thus admitting less air into the firebox and at the same time providing ample opening for convenient firing.

### Chemical Specialties for Railroad Use

**W**ITHIN THE PAST YEAR the Dearborn Chemical Company, Chicago, has brought out a compound for rust prevention known as No-Ox-Id. This product is said to keep metal surfaces in perfect condition when exposed to the elements for months. It is used extensively by the War Department to protect guns, machinery, airplanes and munitions from rust. The illustration shows the condition of two pieces of metal,

Comparative Corrosion of Metal Protected by No-Ox-Id and by Oil

one coated with No-Ox-Id and the other covered with oil, after exposure to the weather. The part covered with No-Ox-Id was not rusted, while the other piece was badly corroded in spite of the coating of oil. No-Ox-Id has been adopted by manufacturers of steel products of every kind and, in view of the great need for a thoroughly efficient rust preventive, in railroad work, it is anticipated that it will find a wide field of application.

Dearboline is another article of interest to railway men and is intended for use in cleaning metals. It is adapted for washing steel cars and for general metal washing purposes and is economical and effective for cleaning locomotives and car trucks of accumulated dirt.

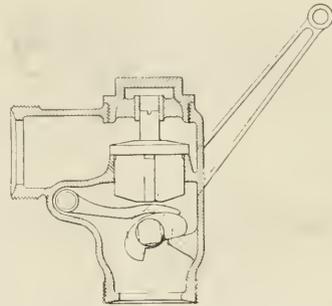

Dearboline is free from acid or other corrosive substances, and does not harm painted or varnished surfaces. It is extensively used to remove grease, cutting compounds, oils, iron filings, and other foreign substances, from iron or steel articles during the manufac-

turing process. Other new products of the Dearborn Chemical Company are cutting, quenching and drawing oils, and Kleen-Kleen, a cleansing preparation which has many uses.

### Drifting Valve

**A** SAFE, QUICK-OPENING DRIFTING VALVE, easily operated by hand or by an extension rod, even under the highest boiler pressure, is being exhibited by William Sellers & Co., Inc., Philadelphia, Pa.

It is intended to be used in open or closed positions only. The special feature is the cam cast solid with the stem operating a latch, and which by compound leverage raises a loosely fitting winged check. It is a type of

Sectional View of Drifting Valve

valve which remains tight in service, is easily accessible and can be reground or the valve replaced without removing from the pipes.

The older form of quick-opening drifting valve consisted of a pilot and main valve placed on a horizontal step; this form was always difficult to keep steam tight; the present form by its simplicity and the special design of steam check, eliminates all the objections to the quick-opening hand operating drifting valve.

### Electric Rivet Heater

**T**HE BERWICK ELECTRIC RIVET HEATER is an inductive type of furnace. It consists of a primary coil to suit characteristics of the alternating current supply and a very heavy secondary coil of only one turn; this secondary is divided at one end into four electrodes.

The electrodes of the heater are opened and closed by foot pedals, and pedal connections are used with compression springs. The primary coil is so constructed that a free air circulation keeps the windings cool.

Rivet heating is done by inserting the cold rivet lengthwise between the electrodes and then closing the line switch, which is very conveniently located at the left side of the heater where the operator has control of the heating at all times, thereby saving unnecessary fuel loss and burned rivets.

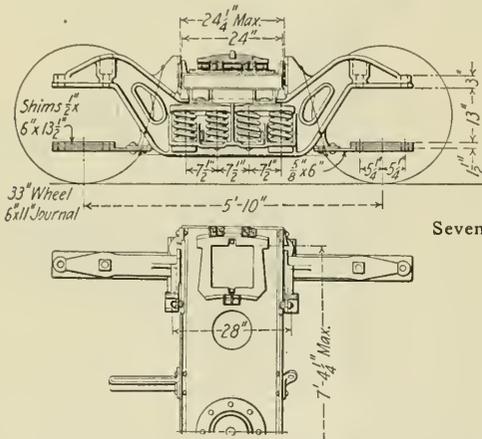

This heater is built in four sizes to heat rivets, ¼ in. by 2 in. up to 1½ in. by 10 in. It is claimed that the current consumption is 20 kilowatt hours per 100 lb. of rivets.

It embodies the feature of being portable, simple to operate, makes no smoke or fumes, and is economical.

The heater is made by the American Car and Foundry Company.

## Barber 70-Ton Truck

A TRUCK OF 70 TONS CAPACITY in which the load is carried entirely on the side bearings has been developed by the Standard Car Truck Company, Chicago, and is being exhibited on the pier. This type of construction delivers the load from the body bolster directly over the center of each side frame and materially reduces stresses in the truck bolster. In the design which is being exhibited the side bearings are spaced 6 ft. 6 in. from center to center. Each side bearing has twelve rollers 2 in. in diameter and  $3\frac{1}{4}$  in. long, located radially about the center pin. The base of the roller casing is bolted to the truck bolster. The center section, when assembled, locks the rollers in place and the top of the casing is curved to

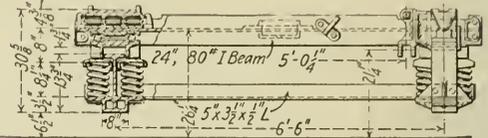

Seventy-ton Truck Which Carries the Load Entirely on the Side Bearings

or jam, thus eliminating a trouble usually found in all pneumatic hoists. Hoists of this type are being manufactured in capacities ranging from one-half to three tons.

## Increased Flexibility in Engine and Tender Pipe Connections

THE FRANKLIN RAILWAY SUPPLY COMPANY, New York, is exhibiting an application of the McLaughlin joints for engine and tender pipe connections which is made up of three double joints instead of the usual arrangement of two double and one single joint. The latter arrangement has proved satisfactory on small-

er locomotives, but on account of the rigidity of the connections it has been necessary to use an additional sleeve for heavy power. The new arrangement relieves the pipe connection of torsions of strains.

## Small Tool Equipment

THE WILLIAM BREWSTER COMPANY, 30 Church Street, New York, is exhibiting what is known as Bell-Mouth sockets and sleeves for drills. These tools are standard sockets and sleeves with a bell mouth or annular recess at the open end. This recess protects the taper tool seat no matter how badly the outside edge of the sleeve or socket is battered. This device overcomes the troubles so frequently encountered with a drill or reamer which is used in a socket that has been so battered that the tool seat is irregular and causes the tool to wobble. With the use of the Bell Mouth socket this cannot occur as the taper seat is protected by the bell mouth, and the life of both the socket and the tool itself is greatly prolonged.

## De-Magnetizer

The Bulldog De-Magnetizer is a device designed for the purpose of de-magnetizing such tools as milling cutters, files, micrometers, etc., which, due to magnetism, collect small particles of metal which adhere to the cutting edges and lower the efficiency of the tool. The device consists of a de-magnetizer in a rectangular container with a flexible connection that may be readily attached to any lighting fixture.

The machine is ready to connect to 110 volts or 220 volts, 60-cycle, single phase, alternating current circuit, or may be furnished to connect to other frequencies and voltages. If direct current only is available, a D-C to A-C rotary converter can be used. There are no moving parts—therefore, no repairs. This device absolutely eliminates all magnetism instantly and the power consumed is approximately the same as used in burning an ordinary light bulb.

This company is also showing the Etchograph, which is an electric marking apparatus for use in marking tools,

allow the bearing to adjust itself to the irregularities of the track. The center pin extends through the bolster but no load is carried at this point, the pin serving only to pivot the truck and to move it.

Each end of the bolster rests on lateral rollers which seat in a casting fitting into the spring caps and bridging the compression member of the truck side frame. Eight M. C. B. Class B springs are used arranged in two nests of four each. If desired, six springs of greater capacity can also be used. The spring plank consists of two 5 in. by  $3\frac{1}{2}$  in. by  $\frac{1}{2}$  in. angles. The side frames are of cast steel, the compression member being lowered to pass under the bolster. This truck has been in service for some time and a car equipped with it is being exhibited at Mississippi Avenue.

## Pneumatically Operated Cable Hoist

AMONG THE DEVICES EXHIBITED by the Independent Pneumatic Tool Company, Chicago, is a one-ton pneumatic hoist which is equipped with a motor similar to that used in corner drills. The main features of the hoist are the worm drive and automatic stop arrangement, which prevents jamming of the cables at any point. The worm drive is designed to suspend the load indefinitely. The reversing mechanism has a cam attached to a parallel shaft, which engages a geared tooth rack, shifting the position of the eccentric, and thereby giving the operator absolute control of the load at all times. It is equipped with roller bearings throughout, which, in addition to the oil splash design, reduces friction to a minimum. When in operation it is impossible for the cable to work out of the grooves and cross

micrometers, gages, etc., and is valuable because of its flexibility and the ease and speed with which it may be used. The only wearing part is the point of the pencil which may be replaced with ordinary copper wire. This device may be connected to a lighting fixture, and it uses power only when it is etching.

The Brewster Company also show the vertical drilling and counter sinking devices manufactured by the Liberty Tool Company, of Baltimore, Md., which were described in the daily *Railway Age* on June 20.

## Oil Handling Apparatus

**I**N CONNECTION with the discussion as to the advisability of eliminating the bottom outlet valve from tank cars it is interesting to note that there is being exhibited at the convention, equipment developed as the result of a careful survey and analysis of the conditions covered in the paper by A. W. Gibbs and the discussion on that subject. S. F. Bowser & Co., Fort Wayne, Ind., have developed equipment for unloading and measuring the contents of tank cars without opening the bottom outlet valve. To accomplish this a special suction connection of the rigid or non-rigid type is inserted in the manhole of the tank car to be emptied. This pipe is carried to a direct connected, motor driven pump, of a type adapted to the liquid or liquids to be handled. An automatic self-measuring and self-regulating control gives a record of the contents removed accurate to one-half of one per cent and also controls the operation of the pump.

The same equipment can be used for the distribution of oil to the point where it is used or to containers in which it is shipped, in any predetermined quantity. The advantages over the present methods secured by the use of this equipment consist in the elimination of the possibility of spillage and leakage and the saving of time and labor. It insures the safe and rapid transfer of the entire contents of the tank car to the permanent storage without the necessity for constant attendance, and is so designed as to be practically foolproof in its operation.

## Murphy Solidsteel Plate Roof

**I**N AN ENDEAVOR to provide a design adapted to present conditions, the Standard Railway Equipment Company, Chicago, has developed a new type of roof known as the Murphy Solidsteel roof. This roof makes the steel superstructure a solid unit and not only protects the lading, but also serves as a cover plate for the superstructure. Weaving on a riveted joint very soon loosens rivets or crystallizes and breaks the metal, so that in steel car construction in order to obtain the best efficiency it is necessary to eliminate weaving. In this class of equipment the solid steel rigid roof ties the top securely and makes the entire body of the car act in unison to prevent weaving and a consequent enlargement of bolt holes and distortion of the wooden lining.

The Murphy Solidsteel roof has outside carlines formed by upstanding flanges on the roof sheets in combination with a seam cap secured together with horizontal rivets, both heads of which are outside the car, so that a loose or bad rivet cannot cause a leak. The outside edge of the roof is riveted to the side plate in such a manner that both heads are outside of the car, and no leaks can be caused by loose rivets. The outside carlines give the maximum inside clearance for lading. On double sheathed cars with wooden sides and ends it is impossible to prevent a certain amount of weaving due to the shrinkage of the lumber; therefore a flexible

roof was necessary on that type of equipment. But on the modern steel underframe, steel frame box car, with underframe, ends and sides securely riveted together, a roof which will add to the strength of the entire structure is felt to be necessary.

## A High Heat Resisting Brick

**A** SPECIALLY PREPARED cellular insulating refractory brick for furnaces and other structures which is made in standard firebrick sizes and other special shapes, and whose weight is said to be about one-half of the ordinary firebrick, is the latest product of the Quigley Furnace Specialties Company, New York. This material, called Insulbrix, is shown in its booth. It is stated that insulbrix has a low thermo conductivity, one inch of insulbrix being equal to six to ten times the same thickness of fire or red brick. It is also said to have high heat resisting qualities, the fusing point being 2,900 deg. F. without showing shrinkage at as high a temperature as 1,800 deg. F. This material, it is said, will withstand a crushing strength of over 425 lbs. to the square inch.

The Quigley Company is also exhibiting a new and specially designed controller for the close regulation of fuel feed from furnace bins to individual burners in furnaces. By turning a handwheel the fuel feed may be adjusted for any range of control between minimum and maximum capacity. The feed screw is driven at constant speed, but the adjustment of the feed to the burner is accomplished by means of a diaphragm or pair of shutters closing around the screw, giving an adjustable opening leading to the discharge head.

## Tuco North Pole Sanitary Drinking Fountain

**T**HE TUCO PRODUCTS CORPORATION, NEW YORK, is exhibiting a sanitary drinking fountain, the construction and operation of which involves a number of interesting features. The fountain proper consists of three parts, a filter, a storage tank for filtered water and an ice compartment, in the bottom of which is placed a shallow, enclosed cooling pan, through which the water flows from the storage tank to the faucet. The water supply is drawn from the air pressure water system, first passing through a filter stone into the storage tank. The water is drawn from the faucet directly from the cooling tank, which holds about three cups. The ice compartment which is located below the storage tank, where it is readily accessible, is insulated to prevent undue thawing of the ice.

Provision is made for convenient and thorough cleaning of all parts of the cooler. By the removal of five clamps the filter casing may be removed and the stone taken out by unscrewing the pipe connection, with which it is attached to the fixed end of the filter case. It is then easily and thoroughly cleaned by steam or submersion in hot water. An opening is provided on the front of the storage tank near the bottom, which is closed by a plug. Removal of this plug permits the interior of the tank to be cleaned by the insertion of a steam nozzle. To drain the system a cock is opened in the bottom of the cooling tank, which permits the water in the storage tank to flow directly into the ice chamber and thence out through the drain. The drain from the ice chamber is closed by a tubular plug, the opening into which is located several inches above the bottom of the chamber. The removal of this plug allows the ice chamber to be drained.

These filters have been in service for several years in a large number of coaches on several railway systems. The service has demonstrated that the cooler is sanitary. The ice and drinking water are not in contact, and the filter removes all sediment which may pass to it from the compressed air storage system. The insulated ice tank has effected a saving of 50 to 60 per cent as compared with the ordinary type of water cooler. This saving was demonstrated in tests in comparison with both sleeping cars and ordinary day coaches, and it reduces the amount of labor required to keep the filter in operation because icing is less frequent. It also prevents the waste of water as the rate of flow is such that only one glass of water will flow freely at one time. It is also safer to keep in operation than the ordinary water coolers because filling does not require the use of ladders and buckets or hose, on top of the car.

The cooler equipment, complete, is enclosed in a compartment which opens on the inside of the car with the ice tank located at a convenient height for filling.

### National Car Door

ONE OF THE DEVICES exhibited on the pier which has been developed since the last convention is the National car door. This door is supported directly on the underframe on rollers of large diameter, mounted in brackets which do away with the track. This method of support was adopted to place the weight of the door at the point where the distortion of the frame would be a minimum. The rollers themselves are designed to prevent freezing up with snow or ice and can be loosened by a slight jar in case they clog. The bottom of the bracket is opened, permitting any foreign matter to fall through. The door being supported at the bottom brings the handle close to the line of support and prevents binding or cocking.

The top interlocking feature is so arranged that snow and ice cannot accumulate and prevent free movement of the door; with the front and back interlocking connection to the door post it forms a weather and spark-proof construction. By the use of beveled rollers in the brackets the door when shut is kept tight against the car. Flat rollers and a lug on the brackets keep the door away from the car when open, preventing binding and injury to the sheathing and insuring easy operation. This door is built by the Union Metal Products Company, Chicago, and has been specified for application to the entire 25,000 double sheathed box cars ordered by the United States Railroad Administration.

### Moncrieff's Reflex Gage Glass

PRIOR TO THE WAR a large number of reflex water gage glasses were imported from Germany and this glass was considered the most satisfactory for the purpose. Since the supply of German glass has been cut off many inferior glasses have been thrown upon the market which have indirectly injured the reputation of the Klinger type gage. During the war a process was developed by John Moncrieff, Ltd., Perth, Scotland, manufacturers of tubular gage glasses, for the manufacture of a specially toughened reflex gage glass. The glasses are not moulded, but are cut from a special quality of plate glass and toughened. They are said to withstand a steam pressure of 350 lb. or more, and have withstood the severest acceptance tests. The British Ad-

miralty tests glasses of this kind by dropping a six-ounce ball from a height of seven feet on the glass, which is supported at the ends. It has been tested in the same manner with an eight-ounce hard wood ball, without injuring or fracturing the glass. The Moncrieff reflex gage glasses are distributed in the United States by H. A. Rogers Company, New York.

### Single Hoist Grab Bucket

THE DESCRIPTION of the automatic single hoist grab bucket, exhibited by Edgar E. Brosius, Pittsburgh, Pa., which appeared on page 1694 of the June 23d issue of the *Daily Railway Age*, was accompanied by an illustration showing a single hook grab bucket instead of an automatic single hoist grab bucket. The single hook bucket operates on a one-drum crane and can be taken off in the same manner as a sling chain. The automatic single hoist grab bucket differs from the one which was illustrated in that it is on the machine permanently, with the sheave block attached to the hinge frame and the rope extending up directly to the hoist drum. This type of bucket dumps automatically from a predetermined height.

### Pulverized Coal Locomotive

#### on Mississippi Avenue

ON THE MISSISSIPPI AVENUE TRACK, near Pacific Avenue, is a Lehigh Valley 10-wheel locomotive, which has just been equipped for burning pulverized coal, by the Fuller Engineering Company, Allentown, Pa. This locomotive arrived at Atlantic City too late to be exhibited during the first week of the convention, but is now ready for inspection.

The locomotive has a Wooten type boiler, and the equipment is designed to handle either all anthracite or all bituminous coal, or a 50 per cent mixture of both. The engine is being kept under steam in order to demonstrate the equipment in actual operation.

### A New Departure in

#### Sheet Metal Cutting

A MACHINE WHICH ALLOWS the cutting of a sheet of metal into practically any desired shape, leaving every portion of the material in its former flat condition, is being exhibited by the Swind Machinery Company, of Philadelphia, Pa. It is known as Gray's sheet metal cutter and is manufactured by the W. J. Savage Company, Inc., Knoxville, Tenn.

The process of cutting takes out a clean kerf much the same as a jig saw does in wood, the stock being guided in any direction at the will of the operator. The metal is automatically advanced to the cutter in a manner which resembles the feeding of the cloth to the needle of a sewing machine. The use of this machine is said to eliminate the necessity of straightening out material, which after being cut with the usual methods invariably tends to curl or buckle.

This machine at present is being made in four sizes and will cut metal up to and including  $\frac{5}{8}$  in. in thickness; it is specially useful in cutting out lagging plates, liners and templates.

WE GUARANTEE that of this issue, 15,925 copies were printed; that of these 15,925 copies, 15,406 were mailed to regular paid subscribers to the Railway Age and the Railway Mechanical Engineer; 119 were mailed to advertisers, 300 were provided for counter and news companies' sales, new subscriptions, bound volumes, copies lost in the mail and office use, and 100 copies for distribution at Atlantic City.

THE RAILWAY AGE is a member of the Audit Bureau of Circulations (A. B. C.) and the Associated Business Papers. (A. B. P.)

The method of regulating cut-off with variations in speed in such a manner as to develop the maximum capacity of the locomotive, proposed in the individual paper by B. B. Milner, represents an important step toward the realization of the highest efficiency in the operation of locomotives. The object, as stated by Mr. Milner, is to increase the tonnage hauled or the speed developed. An incidental advantage which would probably be secured by setting up standards for road performance is improvement in the general condition of the motive power. The establishment of a standard running time for trains under fixed conditions presupposes that all engines of the same class can develop the same power. That this is not true under present conditions is shown by the aversion which enginemen express for certain individual locomotives that do not perform nearly as well as the average engines of the same class. Variation in the performance may be caused by the steam generated being abnormally low, due to defects of the boiler or draft appliances, or to lack of skill or energy on the part of the fireman. The condition of the machinery also influences the performance of the locomotive if it affects the steam consumption per unit of work. As an indication of the extent to which these defects may reduce the efficiency of the engine it is of interest to note the results of tests reported at the last Fuel Association convention. These investigations showed that a locomotive with valves out of square but no more than is found in ordinary practice, used from 8 to 21 per cent more coal per ton-mile

than it did when the valves were properly set. If a standard performance was set up, failure to meet the requirements would lead to an investigation of the condition of such locomotives leading to higher maintenance standards. Thus the method proposed by Mr. Milner might bring about important savings in both wages and fuel.

The small number of men who have participated in the discussion has been very noticeable at the convention.

### Where Are the Younger Members?

A few of the past officers of the associations have spoken on practically every subject presented, and others have discussed matters in which they were particularly interested, but very few of the younger members have been heard on the floor during the meetings. Surely the rising generation is not devoid of ideas, but it seems to be extremely timid. It might be well for the officers and the older members to make a special effort to get young men to take an active part in the affairs of the Mechanic 1 Section. There are at present many prominent members of the old associations who are represented on several committees. The majority of these men hold high positions and are extremely busy, so that necessarily they cannot give personal attention to committee work, and as a result it is delegated to their subordinates. The experience of attending committee meetings and doing the work on their own initiative would be of value to the younger officers who will be the future superintendents of motive power, and all involved should benefit if the amount of overlap in the committees of the Mechanical Section was reduced.

During the discussion on the report of the Committee on Fuel Economy and Smoke Prevention in Tuesday's ses-

### Equipment for Terminal Brake Tests

sion the importance of properly maintaining air brake equipment in order that the loss of fuel due to air leakage may be reduced to a minimum was brought out by several speakers and reference was made to the desirability of adhering strictly to the train line leakage limit of five to eight pounds advocated in Fuel Conservation Circular No. 13. Adherence to this circular is not only important from the standpoint of fuel economy and of the expense entailed by excessive train line leakage, but from the standpoint of safety as well. Strict adherence to this rule, however, in making terminal tests not infrequently results in the necessity for a large amount of switching in cutting out cars which cannot be made to meet the requirements without a visit to the repair tracks. It is evident, therefore, that the use of the road locomotive to charge the brakes for these tests results in the use of considerable fuel as well as in extensive terminal delays and overtime for the crews, and they also increase boiler maintenance. These delays and the entailed expense can be eliminated by the installation of terminal equipment for charging the train lines during the test, the necessary switching being performed by yard engines instead of by the road locomotives. Where such plants have been installed the saving effected has in some cases been found to offset the original cost of the installation within a year. Furthermore, they will undoubtedly tend to increase the effectiveness of the terminal tests. With a road locomotive attached to the train the incentive is very great to slight the test where conditions are bad, rather than to subject the train to

the excessive delay which would be required to cut out or make repairs necessary to bring the leakage within the limits.

## Painting Steel Cars

THERE IS ONE PHASE of the maintenance of equipment that is badly neglected; that is the painting of steel cars. Much more attention can be given to the protection of both the bodies and underframes than is now being done, with big returns in added life for the cost of the material and labor used. Many difficulties are in the way of adequately protecting the interior of open top cars, owing to the abrasive action of the lading which these cars handle. This condition, however, is no excuse for neglecting the exterior and does not even justify failure to give attention to the interior as opportunity presents itself. The cost of paint application by spraying is small and the deterioration of the unprotected steel takes years off the life of the car. War conditions have been responsible for the cutting of many corners in maintenance, and the attention once given to painting has been one of the things which has suffered seriously on that account. Bad practice, once started, is very easily perpetuated and on that account special care should now be exercised to see that better conditions are restored.

The economic phase of this subject was clearly brought out in a study made several years ago by M. K. Barnum and reported in the *Railway Age Gazette* of March 3, 1916. The investigation developed that \$30 or \$35 spent for enough additional paint to preserve the protective coat might be expected to increase the life of the car by as much as a third of its life. Furthermore, the actual cost of painting was found usually to be greater where the cars are most infrequently repainted.

This matter was also investigated by a committee of the Master Car Builders' Association in its report to the convention in 1908, which emphasized the necessity for taking proper care of the exterior of the cars. This fact would indicate that there is no lack of appreciation of the value of paint on the part of car department officers, but their recommendations have failed to receive the approval of the managements, probably because no immediately apparent ill effects followed the practice of inadequately protecting the steel. Failure to have recommendations in this matter accepted immediately is no reason why continued effort should not be made to have it understood by the managements in its proper light and it is the duty of car department officers to make every possible effort to present it in such a way that the ultimate return for the money expended in better protection may be so evident that the necessary approval of proper practice will be forthcoming.

## Innovations Which Should be Continued

THE FIRST ANNUAL CONVENTION of the Mechanical Section of the American Railroad Association has broken all records of previous conventions of the Master Car Builders' and American Railway Master Mechanics Associations in attendance, in the extent and character of the exhibits, and in the interest which has been taken, both in the proceedings and the exhibits. The Convention Hall has been filled at practically every session.

A number of innovations have been introduced this year. The entire membership of the executive committee of the American Railroad Association, including some of the foremost railway executives of the country

attended the convention and inspected the exhibits. W. L. Tyler, director of the Division of Operation of the United States Railroad Administration, addressed sessions of the convention during both weeks. The chief of the Russian Mission of Ways of Communication gave the Mechanical Section a very interesting talk on the nature of the similar organizations in Russia. A record has been kept of those in attendance at each session.

These innovations have all added greatly to the attendance and interest in the convention and have been a means of real inspiration to the members. They are innovations this year, but why should they not be considered as precedents to be followed next year and at succeeding conventions? The practice of collecting registration cards at each session is a good one and should be kept up. If the members are once induced to attend the sessions consistently they may in time acquire an interest in the affairs of the Section which will make the association of greater value to them and they will become an asset to the association.

The mechanical departments of the railroads have never been accorded the recognition which their importance justifies. This has been due largely to a lack of understanding and appreciation of the scope of the work of the departments. The visit of the railway executives at this year's convention has done much to correct erroneous impressions as to the value of the work which the mechanical associations have been doing, and a visit to the exhibits alone is sufficient to inspire a high appreciation of the great variety and scope of the problems with which the mechanical departments have to deal. But what is of even greater importance is the inspiration which the interest manifested by these men in the Mechanical Section has been to the members and the higher respect and feeling of greater responsibility which they will feel individually toward the association. The practice of inviting such men to attend the sessions is a good one and should be followed up consistently.

The world war has broadened the interests of people in every civilized nation in affairs outside their own countries. It would be an excellent idea if representative foreign railway men can be induced to appear before the Mechanical Section at each year's convention to deliver short messages on the problems of other countries. The result could not help but be broadening.

The large attendance this year places a great responsibility upon the officers of the Mechanical Section to see that everything possible is done to retain and increase the interest of the members in its affairs. It is a notable fact that in spite of the large attendance, participation in the discussions was largely limited to a small group of the older and better known members. The value of the association to the members is measured largely by what they put into it and every possible effort should be made to induce the younger and newer members to enter into the discussions. The value of the discussions can also be increased if those who take part know how to do so most effectively. It is difficult to retain interest and follow the proceedings when, for instance, a member near the front of the hall faces the chairman, with his back to the rest of the audience. Could not printed instructions be issued, giving briefly the essentials of effectively addressing the convention, in order that what is said may be heard by those in the hall?

A bigger hall is needed to accommodate the Section if the present large attendance is to be kept up and increased and more suitable arrangements in several respects should be made.

The officers of the section who have been responsible for the arrangements this year are to be congratulated.

lated on the excellent results which they have secured. A large measure of this success is due especially to Secretary Hawthorne for the work he has done in the securing of almost complete advance distribution of the reports and papers this year. The convenience of the members in attendance has been greatly facilitated by the method in which the advance copies have been distributed at each session. The distribution of the papers for each session enclosed in an envelope not only avoids waste, but saves the members considerable annoyance in not having to hunt through a complete list of the papers for the whole convention, to locate each report as it comes up. The success of any association depends to a large extent upon the secretary and the way in which the affairs of the office have been conducted this year is sufficient indication that the association is in good hands.

The exhibits this year have been of exceptional value and the only return the members of the Railway Supply Manufacturers' Association receive for the trouble and expense entailed in assembling them is the interest which is manifested in them. A general feeling of satisfaction has been evidenced in this respect. No railroad man in attendance can return home without having secured much information which is of immediate or future value to him, if he has taken advantage of the opportunity which the exhibits offer. The practice which has been followed this year of calling for reports on the exhibits visited should be continued, if for no other reason than because it requires the visitor to review and analyze what he has seen.

## Rolling Stock Conditions in Belgium

By Robert E. Thayer.

(European Editor of the *Railway Age*.)

BRUSSELS, June 2, 1919.

**I**F THE MECHANICAL MEN of the railways in the United States are at all discouraged with regard to the condition of the equipment on their roads they need only come to Belgium to find out what "bad conditions" really are. There are no figures here showing "percentage in bad order." If there were it would be very nearly a 100 per cent record with probably 25 per cent running. Locomotives are being run on the "crack" trains—to use a pre-war term—which would give the boilermaker a very satisfactory shower-bath when he entered the fire-box. In America we speak of crown bolts "weeping." The word "crying" would apply much better here to-day, and the tears would be crocodile tears at that, with every appearance of a miniature rainstorm. And yet both the engineer and fireman referred to the engine as a "bonne locomotive." In other words, the equipment situation in Belgium is beyond description. One must see to adequately appreciate what the conditions are. It is a wonder men can work under such conditions.

At the beginning of the war the Belgian State Railways had in the neighborhood of 4,500 locomotives, 10,000 passenger cars and 94,000 freight cars—perhaps "wagons" is better after all, they are so small. To-day they have 4,000 locomotives, of which 1,615 were "picked" from German equipment under the terms of the armistice and the rest are what the Germans left behind and what France returned out of the 2,000 sent her at the time of the German invasion in 1914. Needless to say, the condition of the locomotives remaining in Belgium and those returned from France is deplorable—and furthermore there are practically no facilities for repairing them. Those left in the country by the Germans

were not only badly in need of maintenance, but quantities were left with fires burning freely and no water in the boiler! The word "picked" in reference to the German locomotives is used advisedly, for out of the first 2,110 locomotives sent from Germany under the terms of the armistice only 350 were accepted as being in fit condition to run.

The same thing is true of the condition of both the passenger and freight cars. As against nearly 10,000 passenger cars in 1914, the Belgian State Railways have only 5,500 and only 74,500 freight cars as against 94,000 in the same year. The passenger cars now running on Belgian rails were also "picked," for out of 3,530 offered last Christmas day only 1,844 were accepted and out of 60,087 freight cars only 34,134 were accepted. As in the case of the locomotives both the passenger and freight cars left by the Germans and those returned from France were in an extremely bad state of repair. The passenger cars the Germans left behind were willfully damaged in a most shameful manner. The glass windows were broken, the upholstery was ripped from the seats, the air brakes were put out of commission, electric lighting fixtures were ruined, etc., etc., ad infinitum.

To still further complicate matters the repair shops were robbed of their machines and all belting was taken as fast as the Germans were through working the shops. That is to say, the shops in the western part of the country were absolutely denuded of all shop machinery and tools, while the shops in the east, which the Germans had to use up to the time of their evacuation, suffered in proportion to the time the Germans had for their departure from the country. The shop at Ghent has only recently been re-equipped with nondescript tools gathered up here and there as they could be found and spared and will be ready for business about the middle of June.

The fact that the German equipment used by the Belgians is entirely different from their own equipment—the 1,615 German locomotives were of a great many different designs—makes it impossible to keep them all in running condition for lack of repair parts. Many of the locomotives were furnished without any drawings for them. This has added further complication to the situation.

Such is the condition of the Belgian rolling stock and it presents a most distressing problem to the railway men here. The same wanton destruction was applied to the roadway. Bridges of no military value were destroyed very completely. The signal system, while not completely destroyed, was made so unfit for Belgian use that it will all have to be reconstructed. The spirit of the railway men here with all their reconstruction tasks ahead of them is wonderful. It is hard to account for it. Perhaps they are so glad to be rid of the Germans, after four long years of their domination, that they are happy to get their country back regardless of what shape it is in. The manner in which they are attacking the problems ahead of them is characteristic of the manner in which they resisted the invasion of the Boche in the early days of August, 1914.

## Mardi Gras Dance

The feature of Tuesday evening's entertainment on the pier was the beautiful sight presented after the dancers had donned their vari-colored hats and caps and the streamers and inexpensive souvenirs had been distributed. Certain it is that the Mardi Gras dance of the 1920 convention was a great success. The entire entertainment committee was in charge.

## General Committee Meeting

THE GENERAL COMMITTEE of the American Railroad Association, Section III, Mechanical, held a meeting on Monday afternoon and after reorganizing, took up several important matters. Chairman Tollerton of the section, is chairman of the General Committee.

It was decided to send the various questions referred to letter ballot to the members one at a time, rather than to combine them all into one bulky communication. This will insure closer attention on the part of the members and will also make it possible to decide first upon those questions which will affect the M. C. B. rules of interchange. It was also decided that any member voting in the negative should give the reasons therefore, thus assisting the committee in charge of that particular subject in developing a satisfactory report for the following year.

The secretary was instructed to prepare a bound booklet containing biographical sketches of the past presidents, together with their present addresses.

A Committee on Committees was appointed, whose duty it will be to study carefully the make-up of the different committees and see that the men best fitted to discuss the different subjects are placed on the committees. This committee consists of T. H. Goodnow, J. S. Lentz, J. E. O'Brien, C. F. Giles and J. T. Wallis.

The General Committee approved of the election to membership in the association of the following gentlemen:

Name	Title and Road	Address
Barthlemy, P. P.	Asst. Gen. Car Fore., Great Northern.	
Beaghen Thomas, Jr.	Representative, The Texas Co., New York City.	
Beyer, F. A.	Supt. Shops, St. Louis-San Francisco, Springfield, Mo.

## Extra Convention Service on Pennsylvania Railroad

THE PENNSYLVANIA RAILROAD, in order to handle the unprecedentedly large crowd attending the convention, arranged for extra service from Atlantic City over its lines Wednesday.

The train left at two o'clock and connected with the Broadway Limited, which left North Philadelphia at 4.40, had ample accommodations and it was arranged that the Broadway Limited should run in two sections if necessary in order to handle the crowd desiring to go to Chicago and other western points.

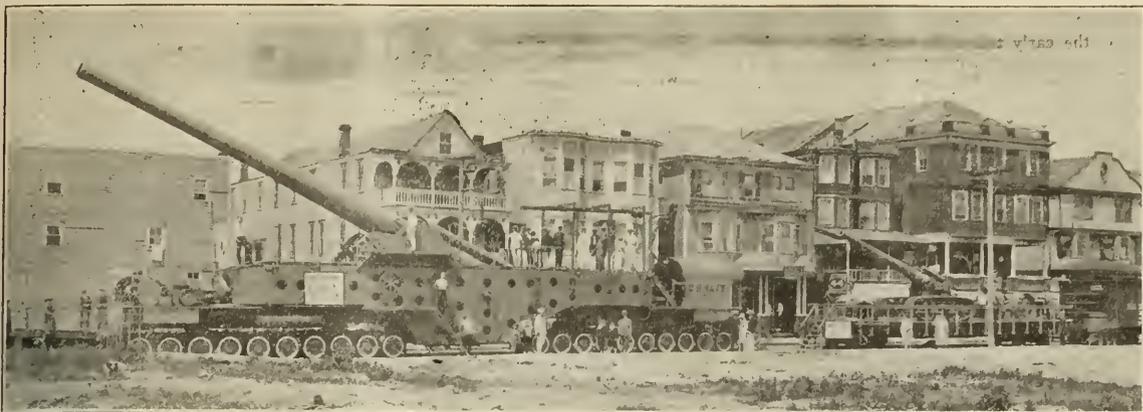

At 4.45 P. M. another train ran from Atlantic City in two sections and connected with the Manhattan Limited at North Philadelphia at 8 P. M. The Manhattan Limited also ran in two sections.

The 2.30 train for New York ran in three sections and the three sections contained 20 parlor cars and sleeping cars used as parlor cars. This was the first time that this train was ever run in more than two sections.

At 8.45 P. M. a train left Atlantic City containing through sleepers to Pittsburgh and this train was provided with enough cars to accommodate those desiring to use them.

Heretofore it was necessary to telephone to Philadelphia for sleeping car service. On this occasion, however, arrangements were made to provide extra cars for those leaving Atlantic City and space on them was bought direct from the consolidated city ticket office at Pacific and South Carolina avenues, in Atlantic City.

The Pennsylvania Railroad found it no easy matter to provide service for the convention visitors for two reasons. The first was that the attendance at the convention was unprecedentedly large. The second was that the railroads, owing to war conditions, are short of sleeping and parlor car equipment. Not only have the normal numbers of parlor and sleeping cars not been built in recent years but about 100 parlor cars have been converted into coaches for handling military business. However, the special arrangements which were made enabled the Pennsylvania Railroad to handle the convention crowds better than they had ever been handled before.

## American Railroad Association, Section III, Mechanical

### Proceedings of the Closing Session of a Remarkably Successful Convention

The closing session of the first annual convention of the American Railroad Association, Section III—Mechanical, was called to order at 9.40 o'clock on Wednesday morning, June 25, 1919.

### Design, Maintenance and Operation of Electric Rolling Stock

C. H. Quereau  
Chairman

THIS COMMITTEE SUBMITTED a report on the Heating of Passenger Trains Drawn by Electric Locomotives, an abstract of which is given below.

Under modern conditions and in states where there are laws which prohibit the use of fires in individual passenger cars, it is evident the successful electric operation of the through passenger trains over the usual steam railroad division, or for any distance approximating this, would be impracticable unless the locomotive can furnish sufficient steam to satisfactorily heat the train. A study of the problem was begun in 1902. This disclosed

at once that there were almost no precedents to guide the investigators, either as to the design of the heating plant or the amount of steam required for heating purposes. The design of the present heating boilers has been, therefore, necessarily largely a matter of slow development. It seems appropriate that a brief sketch of the steps in this evolution should be given.

In the eleven years from 1902 to 1913 there were nine designs of boilers built and tested, four of them using electricity as the source of heat and five fuel oil. The electric boilers did not prove satisfactory for the reasons given in each case, while the oil-fired type was finally developed to a point where it has been quite generally adopted.

#### OIL-FIRED BOILER No. 1, 1902

During the years 1902 and 1903 a flash boiler was designed having a nominal capacity of 1,000 lb. of steam per hour, using kerosene as a fuel, having 650 ft. of 2½-in. water tubes in series. Its development was discontinued because the accumulation of carbon on the tubes made the boiler inefficient, and trouble was experienced because of back drafts.

#### OIL-FIRED BOILER No. 2, 1904

In 1904 and 1905 tests and experiments were made with a semi-flash type of boiler with a nominal capacity of 1,000 lb. of steam per hour. Vaporized kerosene was used as fuel to prevent the accumulation of soot, and a forced draft was applied to the stack to overcome the back draft. The steel water tubes were ½-in. extra strong seamless, and they were electrically welded to form two sections in multiple. Electrically driven pumps having ball valves were used, one for kerosene and another for water, each being controlled by a thermostat. This boiler design was abandoned because of the irregular action of the thermostats, the splitting of the tubes and the unreliability of the pumps.

#### ELECTRICALLY HEATED BOILERS

From 1906 to 1913 four designs of electrically heated boilers were built. In two of these the water was heated by passing through metal tubes carrying a current of electricity. The other two were essentially upright boilers with electric heating units inside the tubes. All four designs proved costly to maintain and were finally abandoned.

#### OIL-FIRED BOILER No. 3, 1910

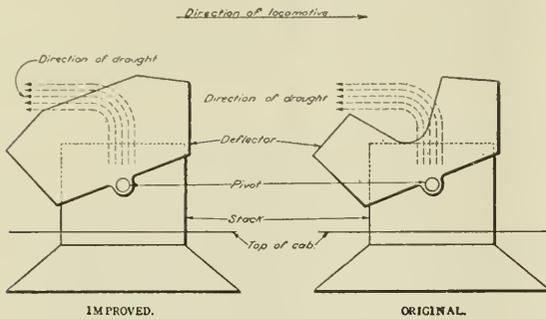

In 1910 the development of the oil-fired boiler was taken up again, with the result that finally this type has been perfected to a point where it is being used on most of the electric locomotives in the United States requiring steam heat. This oil-fired boiler consisted essentially of an upright boiler 22 in. in diameter, 16 in. high, having 856 copper tubes ½ in. in diameter, with ¾-in. bridges in the tube sheets, a heating surface of 123.5 sq. ft., a working pressure of 80 lb. and a capacity of 400 lb. of steam per hour. This was not sufficient in cold weather to heat satisfactorily more than four-car suburban trains. As a number of these trains had seven and eight cars, it was imperative that the boiler capacity be increased at once.

The important changes made to increase the steam output to 800 lb. per hour were as follows: An automatic bonnet on the top of the stack, which decidedly improved the draft; increasing the steam supply to the burner, thus atomizing the oil more thoroughly and increasing the amount of oil burned; withdrawing the burner from the fire box till it projected just inside the door, resulting in a stronger induced draft into the fire box, producing more perfect combustion.

During the early trials of the boiler the fact was noted that more steam was produced when the engine was standing still, or moving slowly, than when train speed was attained, smoke frequently coming from the fire box when the engine was making speed, particularly when passing under overhead bridges. The conclusion was reached that at speed and under bridges a horizontal air blanket over the stack prevented the free escape of the gases of combustion. This difficulty was overcome by the development of the automatic stack deflector, or bonnet, shown in Fig. 1. This device is operated by the air pressure developed by the movement of the engine, or may be thrown conveniently by hand. Its use increased the boiler capacity from 15 to 20 per cent by creating a partial vacuum at the top of the stack. The original form was open at the sides. Its efficiency was perceptibly decreased by strong side winds. The improved form remedies this defect.

**OIL-FIRED BOILER No. 4, 1911**

As soon as the fact was determined that the capacity of Oil-fired Boiler No. 3 could not be increased beyond 800 lb. of steam per hour, it became evident that it would not satisfactorily heat trains consisting of more than eight cars, and in 1911 plans were drawn and an experimental boiler of greater capacity built, differing from its predecessor only in size. This was 26½ in. in diameter, 30 in. high, having 1,180 copper flues ½ in. in diam-

**Fig. 1.—Stack Deflector or Bonnet**

eter, a working pressure of 100 lb., 266 sq. ft. of heating surface and a steam capacity of 1,680 lb. of steam per hour. This boiler was used in a series of tests to determine not only the effect of increased heating surfaces, but the steam capacity necessary for through passenger trains.

**OIL-FIRED BOILER No. 5, 1912**

As a result of these tests a still larger boiler was designed in 1912 and applied to twenty-nine electric locomotives. These boilers were 39 in. in diameter, had 1,380 copper flues 30 in. long and ½ in. in diameter, 436 sq. ft. of heating surface, a working pressure of 110 lb. and a capacity of 2,220 lb. of steam per hour.

Though based on the designs of Oil-fired Boilers Nos. 3 and 4, there were several radical changes, the most important being the use of a water leg 18 in. deep and 2½ in. wide; increasing the bridges between the tubes to ¾ in.; the substitution of a forced draft in the fire box with a closed door for the natural draft used previously, and the use of two expansion joints of the bellows type in the boiler shell. A cross-section of this boiler is shown in Fig. 2 and a diagrammatic arrangement of the whole boiler plant, including the water and oil storage tanks and piping in Fig. 3.

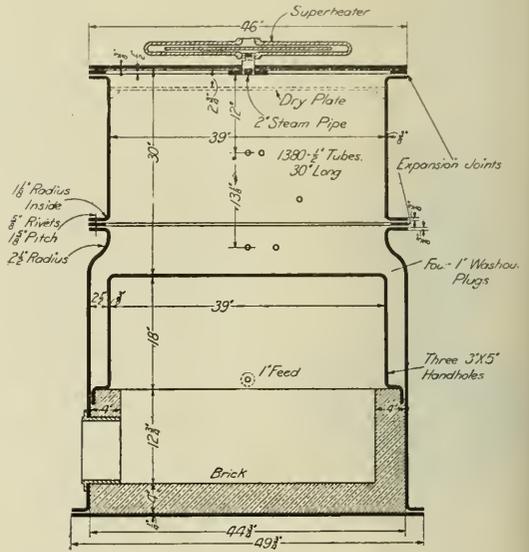

Complete with oil and water storage tanks and piping, but without fuel oil or water, the heater equipment weighs 5,850 lb. and occupies a circular floor space somewhat less than five feet in diameter for the boiler and about the same for the storage tanks. Under service conditions these boilers evaporate something over 5 lb. of water per square foot of heating surface and something over 6 lb. of water per pound of oil, though in carefully conducted tests the evaporation per pound of oil has frequently been over 10 lb.

The fuel-oil burner used is shown in Fig. 4. This is very

simple, very easily cleaned and adapted to eastern fuel oil, which has a paraffine base, or kerosene. It is worth noticing that the lower section of the burner, which carries the steam or air for atomizing the oil, projects beyond the oil orifice, forming a lip or shelf on which the excess oil may flow and still be atomized. Where it is more economical to use the heavy western oils having an asphalt base, it has been found necessary to leave off the lip, because of the liability of oil accumulating at that point and interfering with the steam jet, as shown by the experience of the Chicago, Milwaukee & St. Paul. Their burner is shown in Fig. 5. Only when the boiler is started is air from the main air reservoir turned into the stack blower to insure a draft and onto the burner to atomize the fuel oil. As soon as there is a steam pressure approximating 50 lb. a three-way cock is used to substitute steam for compressed air. With cold water in the boiler it requires only four minutes to develop a steam pressure of 10 lb. and ten minutes from starting the fire a steam pressure of 110 lb. is obtained.

Carefully checked recent tests have shown that the raising of the breeching, or smoke box, above the top flue sheet from its original height of 1½ in. to 10½ in. has resulted in increasing the steam capacity of these boilers 23.2 per cent. This is undoubtedly due to the fact that there is now a free exit for the gases from the outer tubes, which in effect increases the heating surface of the boiler, the products of combustion passing through these outer tubes having previously been choked by the limited area through which the gases from these flues could escape.

Particular attention is called to the fact that there is a superheater in connection with the boilers, as shown in Fig. 2.

**Fig. 2.—Cross-Section of Boiler**

It is possible to obtain any reasonable degree of superheat required. Good practice indicates that about 15 degrees F. is desirable, as a high superheat damages the steam hose and gaskets. Tests show that when the steam is somewhat superheated it requires less steam per car per hour to satisfactorily heat it.

The type of boiler just described as Oil Fuel Boiler No. 5 is standard for the electric passenger locomotives on the New York Central, where their capacity is rated at 2,200 lb. of steam per hour; on the Chicago, Milwaukee & St. Paul, where it is rated as 2,600 lb. of steam per hour; on the New York, New Haven & Hartford, where the maximum capacity is given as 2,700 lb. and an average of 2,200 lb. per hour. It has been adopted for the electrified zone of the Canadian Northern Railway, where the heating plant is installed in a separate car, or trailer, instead of on the locomotive. Each of the railroads reports satisfactory results from these boilers. In each case the cars are heated from a steam header at terminals before the engines are attached or are delivered, properly heated, by the steam locomotives to the

electric engines. On the Chicago, Milwaukee & St. Paul the outside temperature is occasionally 40 degrees F. below zero, and their heating plant "appears to fully meet the requirements for the heating of the trains in the coldest weather." The New York, New Haven & Hartford reports that "in normal winter

there are no data as to the amount of steam needed to satisfactorily heat passenger cars which can be generally applied. The results are usually given in pounds of steam per car per hour for various outside temperatures, without detailed information as to car dimensions, construction, ventilation or heating system. Under

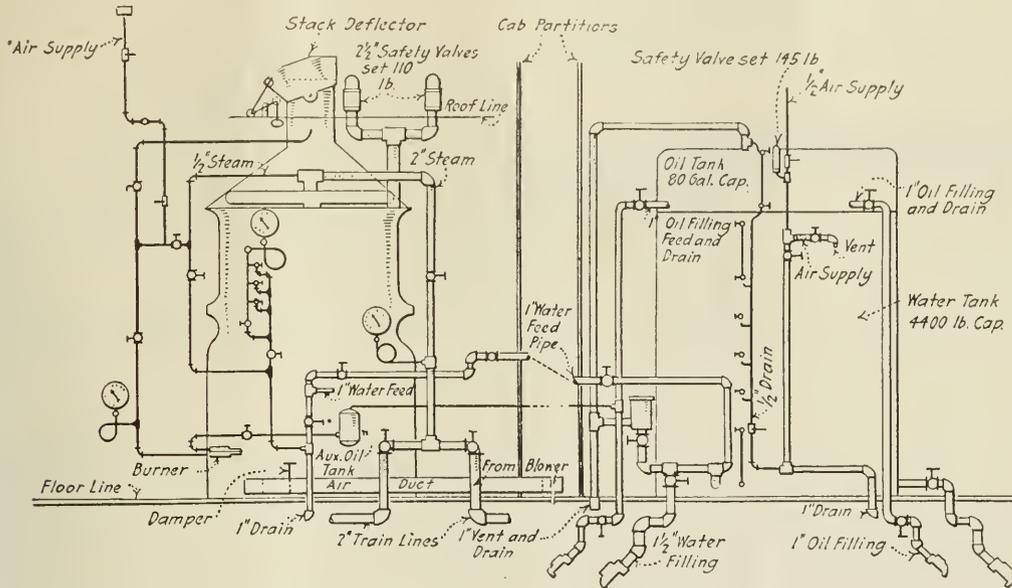

Fig. 3.—Assembly Diagram of Oil Fired Boiler

weather, with trains of nine cars or less, only one boiler is used, but with colder weather and longer trains we find it better to use two boilers, one from each locomotive."

It is evident that the heating plant should be designed to develop the amount of steam required by the most severe conditions, and that there are a number of conditions which influence the requirements. Among others are the following: The temperature of the outside air; the severity and direction of the prevailing winds; the number of cars in the train; the amount of radiating surface of the steam pipes; the cubical contents of the

these circumstances the records are of no practical value except locally. These remarks apply to the following records:

A. & B. Ry.—Steel cars; running test:

DATE.	OUTSIDE TEMPERATURE.	LB. STEAM PER CAR PER HOUR.
January 8, 1910.....	22 Degrees F.	161
February 7, 1910.....	5 Degrees F.	257
February 7, 1910.....	6 Degrees F.	267
February 7, 1910.....	6 Degrees F.	291
February 7, 1910.....	18 Degrees F.	203
February 7, 1910.....	18.5 Degrees F.	55.2

} train line orly.

C. & D. Ry.—Wooden, 53-ft. suburban cars, single sash; running test:

DATE.	OUTSIDE TEMPERATURE.	LB. STEAM PER CAR PER HOUR.
January, 1912.....	41 Degrees F.	95
January, 1912.....	35 Degrees F.	114
January, 1912.....	37 Degrees F.	90
January, 1912.....	32 Degrees F.	85
January, 1912.....	36 Degrees F.	90
January, 1912.....	25 Degrees F.	122
January, 1912.....	23 Degrees F.	133
January, 1912.....	23 Degrees F.	129
February, 1913.....	28 Degrees F.	147

} steel coaches  
} double sash.

E. & F. Ry.—Yard tests. British thermal units per car per hour per degree Fahrenheit; difference between temperatures inside and outside car:

January, 1916..Pullman car, indirect steam heat.....	980 B. t. u.
January, 1916..Steel coach, direct steam, automatic control....	1,450 B. t. u.
January, 1916..Wooden coach, direct steam, hand control....	1,530 B. t. u.
January, 1916..Wooden coach, direct steam, automatic control..	890 B. t. u.

"With outside temperatures between 20 and 32 degrees F. each car takes about 200 lb. of steam per hour, and with an outside temperature of 0 degrees F. the consumption of steam per car per hour approximates 225 to 250 lb."

So far as the committee is informed, no practical steam boiler has yet been developed which uses electricity as a source of heat. Assuming that such a heating plant is available, there are certain facts which should be borne in mind. The cost of electricity to produce a given amount of steam is from six to ten times that of fuel oil, omitting the item of fixed charges in the cost of current. The ratio depends on the relative cost of fuels. If the peak load for propulsion and heating current come at the same time, during the Christmas holidays, for in-

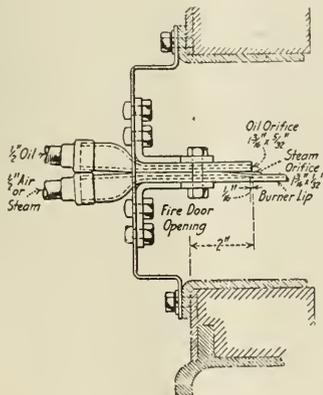

Fig. 4.—Burner for Paraffine Base Oils

cars; the ventilating system used in the cars; the presence or absence of double sash; the materials of which the cars are built, whether wood or steel, for instance; the efficiency of the heat insulation, especially in the case of steel cars, including, particularly, the steam line under and between the cars and the steam control on the cars, whether hand or automatic.

As far as the committee has been able to determine there

stance, it will be necessary to increase the power station and substation capacity, not only increasing the capital invested, but incurring additional fixed charges, which continue during the whole year, though the additional apparatus is required for only a few months during the heating season. Estimates made a few years ago showed that electrically generated steam would cost about \$45,000 a year more than from oil-fired boilers, the number of locomotives involved being less than 35, not including fixed

charges in the cost of current. If fixed charges are included, there would be in this case a saving of over \$100,000 a season in favor of oil as a source of heat.

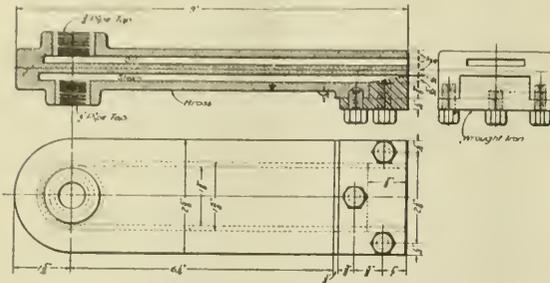

Fig. 5.—Burner for Asphalt Base Oils

There is undoubtedly an element of danger of fire in the use of fuel oil or kerosene. This was greater in the earlier designs of heating plants, when the oil was under air pressure, than with later designs, which feed the oil by gravity. Care in design, construction and operation has shown the hazard is small.

The experience with the electric steam boilers has been so very limited there are practically no facts on which to base an opinion as to the liability of fire and personal injury in their use. That there is an element of danger there can be no doubt. There are, however, certain conditions, such as long tunnels,

undertaken as an improvement was a new design of the heating-boiler. The undesirable features of our present boiler were maintenance costs and insufficient capacity. We have had much trouble in heating our through trains (which consist of ten cars, frequently), when the outside temperature gets much below zero.

### Exhibit A OIL-FIRED BOILER, 1918, CHICAGO, MILWAUKEE & ST. PAUL

After some preliminary tests or observations, it was decided that we needed a boiler of nearly twice the capacity of those in use at present. To this end was designed a vertical fire-tube boiler, as shown in Fig. 6. This boiler is 72 in. inside diameter, is of the submerged flue type, and contains 468 1½-in. flues 36 in. long. With this boiler we have a total heating surface of 624 sq. ft., a grate area of 21.8, which gives a ratio of heating surface of grate area of 28.6. This design of boiler has a light weight of approximately 10,500 lb., and with two gages of water, the weight becomes about 15,500 lb.

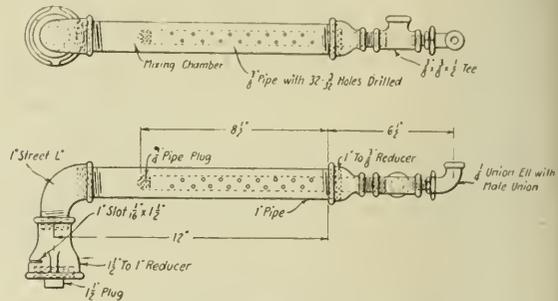

Fig. 7.—Details of Oil Burner

An experimental boiler was built in the summer of 1918, and mounted for testing. We were trying for a boiler that would produce 4,000 lb. of steam per hour, and, it being impossible to get this much with natural draft, we resorted to forced draft. The fire box is lined throughout with brick, excepting the flue-sheet. Air was forced through the door by a motor-driven blower. Quite a number of tests were run throughout a period of several months, the main object being to determine the maximum capacity, as well as the proper drafting arrangement. Two burners were used, made up as shown in Fig. 7, with a slot sawed in each to give a range of about one-half the fire box-in each case. It is noted that this burner consists of ordinary pipe fittings, and is an adaptation of what is in use on the Southern Pacific. We have tried several other types of burners, but find this one to be the most satisfactory for our purpose. These burners are set to project 12½ in. from the inside of fire-door frame. This just clears the inside of the fire-door frame.

Following are some data giving the maximum results we were able to obtain:

Following are some data giving the maximum results we were able to obtain:

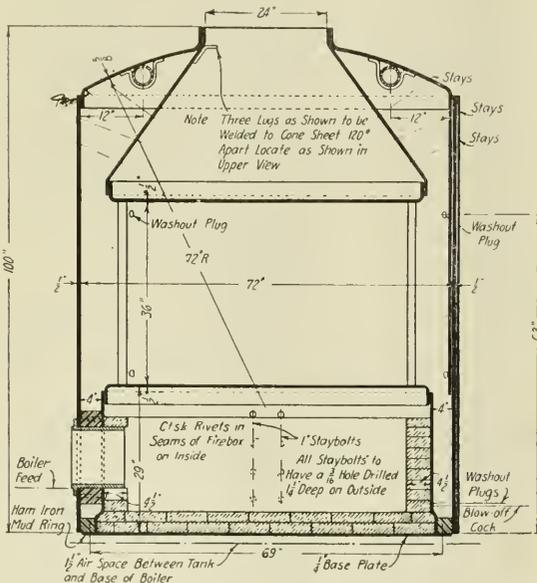

Fig. 6.—Vertical Fire Tube Boiler Used on C., M. & St P.

which make the electrically heated steam boiler very desirable and in all probability will result in a successful design.

The report is signed by C. H. Quereau (Chairman), New York Central; G. C. Bishop, Long Island; J. H. Davis, Baltimore & Ohio; Geo. McCormick, Southern Pacific; H. R. Warnock, Chicago, Milwaukee & St. Paul; W. L. Bean, New York, New

In getting these results, we find that it is desirable to have the oil pressure and the steam atomizing pressure about 40 lb. each. It is necessary that the steam atomizing pressure does not exceed the oil pressure, else the steam backs up in the oil line, causing saponification, and consequently interrupting the flame. These boilers are intended to be operated at a working pressure of 110 lb. gage, and the fuel is atomized by an air jet when beginning the fire, but on reaching a pressure of about 40 lb., the turning of a three-way cock cuts out the air and introduces steam as an atomizing agent.

The amount of air delivered for the above maximum capacity was found to be 2,650 cu. ft. per minute against a static pressure of 2 in. of water at the blower outlet. It is expected that our normal requirements will rarely ever exceed 1,800 cu. ft. of air per minute against a static pressure of possibly 1½ in. of water.

This test being conducted in the open air and with a fairly still atmosphere, we had no trouble in regulating the proper amount of air to produce a smokeless combustion. During the test the auxiliaries were driven by steam from the boiler. These

auxiliaries will consist of the feed-water pump, oil pump and atomizers. The calculated consumption of these auxiliaries, when driving the boiler at maximum capacity, is 800 lb. per hour, which would leave a net amount of 3,200 lb. actual for train line. This amount is thought to be more than sufficient for weather 40 degrees below zero if all connections are tight. An assembly diagram is shown in Fig. 8. Generally speaking, we believe we have ample capacity without too careful firing.

**Discussion**

W. J. Bohan (N. P.): I would like to ask Mr. Warnock what it costs him to develop the boiler horsepower of that boiler, what he figures it will cost and about what your average heating per train mile is per annum?

Mr. Warnock: I don't think we have that data at hand. We probably have it in our report some place, but I don't have it with me.

*A motion to receive the report and incorporate it in the proceedings was carried.*

**Use of Bronze for Valve Snap Rings and Piston Surfaces, and Bull Rings in Large Cylinders**

By C. E. Fuller  
Superintendent Motive Power, Union Pacific

UNDOUBTEDLY ONE of the most difficult and perplexing problems relating to locomotive operation is the proper and economical maintenance of pistons and cylinder walls, valves and bushings—those parts which, by their proper relation of sizes, and constantly varying relative positions, govern the correct and economical use of the steam which the boiler has generated. In this region may all too frequently be located the greatest wastes on the entire locomotive.

Since the introduction of modern outside valve gears has eliminated much of the old-time faulty and lame valve setting, the losses within the cylinder have easily taken first place. At no other point on the locomotive can the losses become so great, or so quickly aggravated, due to rapid cutting and wear; nor has the introduction of superheated steam, with increasing size of cylinders, tended to ameliorate conditions. Cylinder working temperatures, which have so direct a bearing on the rate of wear, have increased tremendously in the last ten years.

The extensive operation of cylinder bushings on modern power indicates the enormous increase in cylinder barrel wear and a desire to save cylinders, which otherwise would soon wear thin. Extended piston rods to carry the weight of the pistons in large cylinders are a compromise, and there appears a trend toward their abandonment. A decrease in the unit pressure between the piston and the cylinder walls can only be attained at the expense of increased reciprocating weight and dynamic augment. Cylinder and valve lubrication under increased superheat temperatures is surrounded by many difficulties. With these facts in mind, the mechanical department of the Union Pacific began experiments in 1913 with bronze valve snap rings, and in 1915 with bronze surfaces for pistons. No originality is claimed in this connection, as perhaps many of those present have experimented more or less along similar lines, but the results obtained are worthy of some consideration.

**Bronze Valve Snap Rings**

Two formulas have been used:

COMPOSITION A:		COMPOSITION B:	
Copper .....	82.96 per cent	Copper .....	80.80 per cent
Tin .....	14.66 per cent	Tin .....	5.83 per cent
Phosphor .....	.118 per cent	Phosphor .....	.10 per cent
Lead .....	none	Zinc .....	4.54 per cent
Impurities .....	2.26 per cent	Lead .....	6.58 per cent
		Impurities .....	2.15 per cent
Total .....	100 per cent	Total .....	100 per cent

Either composition gave good wearing qualities, but composition A has decided advantages in elasticity. We believe, however, that there is room for further improvement in the composition of the most suitable alloy for this purpose.

Valve rings are of the usual L-section for 15-in. piston valves of cast iron, working in gun-iron bushings. Information collected in 1915, or previous to the recent rise in wage rates and material, relative to comparative mileage and cost of cast-iron

and bronze valve rings may be of interest, showing that against 117 cast-iron rings, making 216,495 engine miles, there were 45 bronze rings, making 381,337 engine miles—an increase in mileage in favor of the bronze ring of 358 per cent.

The average cost per one thousand engine miles was:

Bronze ring .....	8.73 cents
Cast-iron ring .....	20.0 cents

or an increase of 129 per cent for the cast-iron ring. This test covered a period of thirteen and one-half months, during which no valve gages were removed where bronze rings were used.

A Pacific type engine was equipped with bronze rings—composition "A," April 13, 1916: The rings were removed, worn out, on March 22, 1918, with a mileage of 145,285.

**Piston Surfaces**

In August, 1915, a Consolidation type engine with 22-in. cylinders was equipped with two cast-iron pistons having a bronze bull ring poured on while the pistons were at about 1,500 degrees F.—afterwards machined to size, including ring grooves which were fitted with gun-metal rings. This test was in contemplation of the use of bronze for surfacing 29½-in. diameter cast-steel Z-type pistons, designed for use on a proposed 2-10-2 type locomotive, which was then under consideration for the 60-ft. grades between Ogden and Evanston. If possible, it was desired to escape the necessity for using an extended rod on a large diameter cylinder. It was known that at least a year would intervene before a decision was necessary.

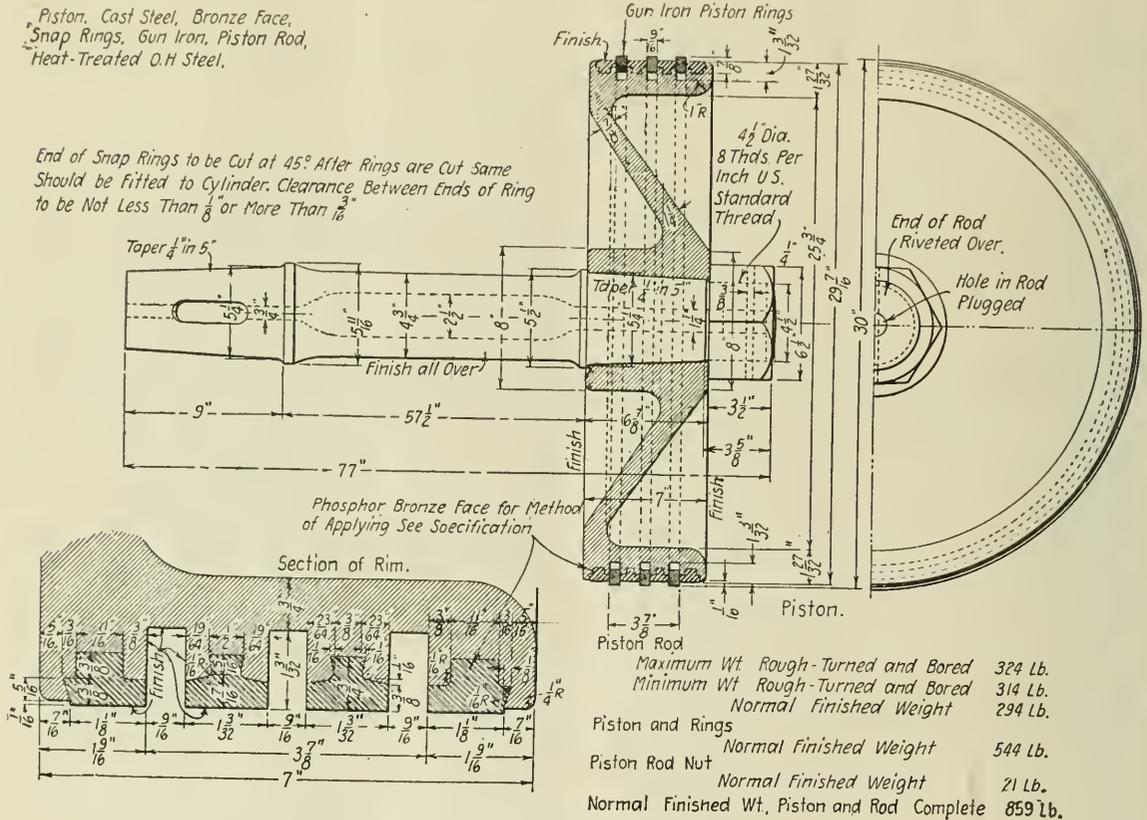

Frequent reports from this engine indicated that these pistons were performing quite satisfactorily, the rate of wear on pistons and cylinder walls being much below the average with cast-iron pistons. The bronze adhered to the piston head without fracture. In June, 1916, this engine was shopped, both pistons being reappplied without any work being done on them, mileage, 40,000. In March, 1918, this engine had a cracked cylinder necessitating shopping. The pistons, still in fair shape, were reappplied to another engine, after having made 120,000 miles, and up to December 31st last had made an additional 19,000 miles, and, to the best of my knowledge, are still in service. The success of this experiment led us to adopt the bronze face without hesitation for the new design 29½-in. pistons for the 2-10-2 type engines, and drawings were accordingly prepared. Upon being forwarded to the builders we received an immediate complaint that the design was impracticable from a manufacturing standpoint, as it was considered impossible to pour a bronze ring on a cast-steel head, on account of the different shrinkage coefficients. To this we replied by getting four steel castings from the same pattern, successfully pouring and machining them—sending photographs of the finished pistons to the builder as evidence, then putting the pistons in stock for the anticipated locomotives.

The builders had no difficulty in following the design, and ten engines arrived, equipped with the bronze-faced cast steel pistons, in the fall of 1917, and were placed in hard mountain service, where drafting is necessary for sixty miles, with little let up. After being in service six months the bronze had worn down to the cast steel lip at the edges of the piston, between  $\frac{1}{32}$  in. and  $\frac{1}{16}$  in. Pistons were then reversed, and gave four or five months' additional service. Since then, from time to time, this cast steel lip has been turned back slightly, exposing additional bronze surface, and at the end of nineteen months, several of these pistons are still in service, not having reached the limit of wear with their original bronze surface. The piston centers, however, are all intact and apparently capable of indefinite service. These pistons have made over 60,000 miles in most difficult service, and no cylinders have been rebored; in fact, showing remarkably little wear. Incidentally, the use of bronze permitted the adoption of a very light design of

which usually takes place mainly on the bottom half of the head—are now treated as follows: The pistons are preheated in a brick furnace over a charcoal fire to a temperature of 900 to 1,000 degrees F., without removing the rod. A small hole is then made through the sheet asbestos on top of the furnace over the piston, to permit the welding operator to work—the piston being turned from time to time by means of the rod as the work progresses. A thin layer of bronze is first welded over the worn surfaces between and adjacent to the ring grooves for approximately one-half of the circumference of the head, then built up to the desired height, including finish, after which the furnace is closed and the fire is allowed to die out and cool over night. The piston is then machined, the grooves squared up, and is ready for service, being applied with the bronze shoe to the bottom of the cylinder. Tobin bronze welding rods are used—about 8 lb. average, per 26-in. piston

Piston, Cast Steel, Bronze Face,  
Snap Rings, Gun Iron, Piston Rod,  
Heat-Treated O.H. Steel.

End of Snap Rings to be Cut at 45° After Rings are Cut Same  
Should be Fitted to Cylinder. Clearance Between Ends of Ring  
to be Not Less Than  $\frac{3}{8}$ " or More Than  $\frac{1}{16}$ "

29 1/2-inch Cast Steel Piston with Bronze Face

piston, which, though 29 1/2-in. diameter, weighs only 544 lb. complete, without the piston rod.

The drawing indicates the detail application of the bronze in dovetail grooves for the purpose of preventing individual sections from leaving their place in case they become detached from the main mass of bronze.

The composition of the bronze on these pistons is as follows:

Copper	86 to 89 per cent
Phosphor—Tin	4 to 6 per cent
Tin	4 to 6 per cent

**Oxwelding Bronze Surfaces on Cast-Iron Piston Heads**

This practice is of more recent origin, having been in vogue about six months. It is purely a reclamation process, but indications to date are very favorable. Cast-iron piston heads, which, heretofore, have been scrapped on account of wear—

It is contemplated from our previous experience with the fully bronzed circumference, and particularly in view of the fact that most of the wear is at the bottom of the cylinder, that these reclaimed pistons will not only show a considerable increased mileage, but will also show a material saving in cylinder-barrel wear, thus increasing the mileage between reborings.

A 26-in. worn cast-iron piston can be treated in accordance with the above process for approximately \$9.35, while replacements with a new piston of the same design would cost \$27.86. This results in a saving of \$18.51—besides resulting in really a better piston than the original on account of decreasing the tendency toward wearing the barrel of the cylinder. Up to date about 50 pistons have been thus reclaimed and put into service, and there has not been a single failure reported.

By the use of bronze for valve snap rings and for piston surfaces, we have been able to materially reduce the rate of

wear and increase the life of the cylinder and valve bushings, as well as the pistons, and keep locomotives longer in service with a maximum of power due to tight and properly fitting parts.

### Discussion.

J. Chidly (N. Y. C.): I ask Mr. Fuller how many engines he has equipped with the snap ring packing in the valves. I see that he has had the installation since 1913.

Mr. Fuller: I should say there are pretty close to 200 engines equipped, and they are mostly heavy Pacifics and Mikados.

Mr. Chidley: Do you intend putting the bronze rings in the cylinder packing?

Mr. Fuller: We have thought of it. I believe we tried it, but we have not been able to get a ring deep enough. A bronze ring in the cylinder will have to be pretty nearly  $1\frac{1}{8}$  in. or  $1\frac{1}{4}$  in. deep.

Mr. Chidley: You figure on snap rings?

Mr. Fuller: Yes, but we find it pretty hard to get over the solid head. In the case of a built up head you will have no trouble, but you will have to make your rings much deeper with any kind of cast iron.

B. P. Flory (N. Y., O. & W.): I would like to ask if in the tests of the valve snap rings the cast iron rings were the ordinary cast iron or whether they were gun iron.

Mr. Fuller: They were ordinary cast iron at first, but later on were of gun iron.

Mr. Bentley: The use of bronze rings for piston heads is not new. About thirty or forty years ago we used them, and found them rather satisfactory on cylinders that were very soft. They wore very much longer than the ordinary mild steel rings that we used in the rest of the cylinders. One thing that impresses me very much is the reclamation of worn parts by the Oxweld process. We are not having any particular difficulty. We have been using common cast iron recently and the reports from the master mechanics indicate that we are getting very good results, but we are still having some trouble with cylinder packing rings, although we have increased our average mileage from 12,000 miles per set of rings to over 41,000 miles. There is an opportunity for the reclamation of material that is now finding its way into the scrap, and I think with the one-piece piston head that is shown in the diagram here the building up of that piston head after it becomes worn will be of very great assistance to us in keeping the locomotive in service.

R. J. Mead: I would like to know if any of the members are using a built-up type of piston in the super-heated engine. We have used them, and came to grief, and I would like to know if you are having any success?

Mr. Bentley: That is our standard practice. We have about one thousand engines using superheated steam, that have built-up pistons.

Mr. Bohan: I would like to ask the gentlemen if they have tried reclamation with cast iron instead of bronze?

Mr. Fuller: Yes, we have tried it. We had difficulty in welding cast iron and keeping it sufficiently soft to do the work. I have no doubt, from the results that we are obtaining, in welding cylinders with cast iron, and in which we are getting a metal that is practically of the same consistency as the original casting, that a good operator will be able to weld cast iron to cast iron piston heads successfully, but we have not been able to do it yet. We had trouble to get the bronze to adhere and not have it too hard and break off.

I want to call attention to the depth of grooves in our piston heads. The grooves are  $1\frac{3}{32}$  deep, and the packing rings are  $\frac{7}{8}$  in. deep. We found that a large percentage of our trouble is due to too many applications of packing; that the packing could not get below the grooves, or, in other words, the piston was riding on the packing. One of the important things in any piston is to have plenty of clearance, and I would not oppose going to a still deeper groove.

Mr. Bohan: The matter of depth of grooves on piston heads is one that has to be very carefully considered on account of the possibility of getting them so deep that the corners will break out on this particular grooved cast iron head.

Chairman: The depth of grooves in the piston heads should have sufficient limits to take care of the new ring applied in the head just before it reaches its full wear limit.

*A motion to receive the report and incorporate it in the proceedings was carried.*

## Committee on Train

### Resistance and Tonnage Rating

O. P. Reese  
Chairman

THE COMMITTEE REPORTED that on account of the conditions existing during the last year there have been no new developments with reference to train resistance and tonnage rating upon which the committee could take action.

The committee consists of O. P. Reese (Chairman), Pennsylvania Lines; H. C. Manchester, Delaware, Lackawanna & Western; C. E. Chambers, United States Railroad Administration; J. H. Manning, Delaware & Hudson; Frank Zelency, Chicago, Burlington & Quincy; Major E. C. Schmidt, University of Illinois, and Jos. Chidley, New York Central.

## Report of the Committee on Subjects

THE COMMITTEE SUBMITS the following suggestions for the consideration of the General Committee in preparing the program for the 1920 Convention:

I.—That the present standing and special committees be continued.

II.—That the following subjects be assigned to committees as recommended.

1.—Investigation of the proper number of crossies to be used on hopper coal cars. It is recommended that this subject be referred to the Committee on Car Construction.

2.—The proper fibre stress to be employed in the design of helical springs for different diameters of steel wire from  $\frac{1}{2}$  in. to  $1\frac{1}{2}$  in. diameter. The ordinary spring table calls for 80,000 lb. throughout for all sizes, but it is well known that this is not the manufacturers' practice, and in fact in many cases it is im-

possible to obtain a proper spring with the smaller sizes of wire. It is recommended that this subject be referred to the Committee on Tests and Specifications for materials.

3.—That consideration be given to adopting the standard half tape sizes for cast iron and rough rolled steel wheels.

4.—That in the manufacture of steel wheels the wheels be machined to exact diameters. It is recommended that these two subjects be referred to the Committee on Car Wheels.

5.—Repairs to superheater units. It is recommended that this subject be referred to the Committee on Superheater Locomotives.

6.—The desirability of more water and steam space above the crown sheet. It is recommended that this subject be referred to the Committee on Design and Maintenance of Locomotive Boilers.

7.—Equated tonnage ratings. It is recommended that this subject be referred to the Committee on Train Resistance and Tonnage Rating.

8.—Auxiliary or safety connection between engine and tender. It is recommended that this subject be referred to the Committee on Standards.

9.—Design for coal space of locomotive tenders to allow the coal to flow within easy reach of the fireman, and to permit it to practically all feed into the hoppers of locomotive stokers. It is recommended that this subject be referred to the Committee on Mechanical Stokers.

10.—Specifications for tank hose. It is recommended that this subject be referred to the Committee on Specifications.

11.—Water glass fittings and mountings. It is recommended that this subject be referred to the Committee on Design and Maintenance of Locomotive Boilers.

12.—Standard practice for beading tools for boiler tubes or flues. It is recommended that this subject be referred to the Committee on Design and Maintenance of Locomotive Boilers.

13.—Proper location of blow-off cocks in locomotive boilers. It is recommended that this subject be referred to the Committee on Design and Maintenance of Locomotive Boilers.

III.—That the following subjects be assigned to special committees:

1.—Feed water heaters for locomotives.

2.—Modernization of stationary boiler plants.

3.—The comparative merits of hydrostatic and force feed lubrication for locomotive cylinders and steam chests and best method of application.

4.—Front end netting and netting door and other draft appliances.

5.—The study of ash pit and coal chute operation including organization and supervision. Roundhouse operations as a whole.

6.—Modernization of existing old locomotives.

7.—Automatic hose connectors for freight and passenger equipment.

8.—Standard method of packing journal boxes on freight cars.

IV.—That the following subject be assigned to a member as a subject for an individual paper.

A study of locomotive operation from the point of view of a large investment.

The report is signed by M. K. Barnum (Chairman), Baltimore & Ohio; C. E. Fuller, Union Pacific; D. R. MacBain, New York Central; T. H. Goodnow, Chicago & Northwestern, and J. C. Fritts, Lackawanna & Western.

### Discussion

M. K. Barnum (B. & O.): You will have the printed report of the committee in your hands, and I will read only the additional subjects which have been suggested since this report was printed.

Additional subjects presented are: Electric Arc Welding in Railroad Repair Shops; Scheduling and Routing Systems for Locomotive Repair Shops; Combustion Chambers for Locomotive Boilers; Results as to Fuel Economy; Difficulties in Maintenance, and other points of interest; Economical Diameters of Piston Valves of Superheated Locomotives, with Recommendations for Standard Practice in connection with Various Cylinder Diameters.

The committee recommends that these subjects be referred to a special committee.

The next subject is Modernizing Freight Equipment.

The committee recommends that this be referred to the Committee on Car Construction.

The next subject is: "What Shape of Exhaust Nozzle Will Cause the Highest Vacuum and Least Back Pressure in Cylinders?"

The committee recommends that this subject be referred to a special committee in connection with "Front End Netting and Netting Door and other Draft Appliances" that was mentioned in the printed report.

Because of the suggestions made by your chairman in his open-

ing address, the committee also wishes to recommend the following subjects:

"Designs with Complete Lay-Outs for Roundhouses of Various

The committee suggests that this could be treated in connection with subject No. 5, "Study of Ash Pit and Coal Chute Operation, Including Organization and Supervision. Roundhouse Operations as a whole."

If that suggestion does not meet with the approval of the chairman it will be subject to his revision as a member of the General Committee which will pass on all of these subjects.

Repair Shop Lay-Outs for both Passenger and Freight Car Repair Shops; also Lay-Outs for Freight Car Repair Tracks, including a study of results obtained and advantages gained by inclosing the Repair Tracks under roof.

The committee recommends that this subject be treated by a special committee.

Power Plants for both Roundhouse Terminals and Repair Shops and suitable Stokers for such Power Plants.

The committee suggests that this be treated in subject No. 2, "Modernization of Stationary Boiler Plants."

Ash Pit Lay-Outs for both Dry and Water Pits.

The committee suggests that this be treated in connection with subject No. 5, together with the lay-out for round houses and a study of the Ash Pit and Coal Chute operations.

Adequate Lighting of Engine Terminals for Night Work.

It is suggested that this be handled by a special committee.

Mr. Goodnow: I would move that the report be received and referred to the General Committee for such modifications as they may find desirable or necessary to adapt it to the programme arranged for the next convention.

C. F. Giles: I expect that the motion made by Mr. Goodnow would be the proper course to pursue in handling this report, but I would like to call attention to the fact that sometime ago it was stated that we would probably endeavor to handle the work at the next convention within one week instead of extending it over two weeks, and therefore the subjects to be handled next year should be given most careful consideration, and we should reduce them to the lowest possible number, in my opinion.

Mr. Barnum: I think there is a question as to whether the subjects that have been presented could be handled satisfactorily within one week. In checking over the list, I find there will be about forty-five committees, even with the combinations that have been suggested, and that is one reason why it seems advisable to pass the matter up to the General Committee for such modification as they may deem necessary when they are deciding upon the final programme for next year's convention. It is believed by the Committee on Subjects that all of these subjects suggested are important and should be considered.

Chairman: I believe that it is opportune at this time for the chair to say a word, inasmuch as the question of how the convention will be held next year has been brought up; whether it will be held within one week or spread over two weeks, as has been our practice for years.

I think all of the members appreciate the brief time that we have had at our disposal at this convention to inspect the exhibits; in fact, it was suggested by some of the members that we hold the convention, that is the exhibits, over until to-morrow evening, to give every one an opportunity to see them. That was not practicable this year, as many of the exhibitors have made their plans for leaving to-day. I am, however, very much impressed with the idea, and it is my intention to suggest something of that kind for consideration at the first meeting of the General Committee. I had the assurance that the question of how the convention would be held next year would be left entirely to the decision of the General Committee, and I want to say, for the information of the members, that as chairman of that General Committee it is my intention to make no change in our method of holding these conventions and I hope we get the entire support of the General Committee in that position. It would be most unfair, gentlemen, to all of these exhibitors who have gone to the expense and trouble to put on this vast display for the information and education of the railroad men of this country, to limit the time of this convention to such a short period that everyone would not have the opportunity of seeing what is on the pier and learning all that can possibly be learned, which is a very considerable amount.

Mr. Goodnow's motion was then put to vote and carried.

## Report of the Committee on Powdered Fuel

C. H. Hogan  
Chairman

AT THE TIME OF THE LAST REPORT of the committee in 1916 there were several experimental installations for burning powdered fuel on locomotives in the United States, but the increasing demands for transportation, due to the great war, and finally the entrance of this country into the conflict, made the setting aside of even a single locomotive for such experimental purposes an impossibility. Accordingly all locomotives that had been equipped for the burning of powdered fuel were stripped of the special appliances intended for that purpose and returned to their regular

service. For this reason the committee asks to be relieved from making even a report of progress at this time.

The general principles involved in the burning of powdered fuel were set forth in our last report when the experiments were progressing so satisfactorily that they seemed about to spell success. That the principles were correct has been demonstrated and it remained to work out the practical details to meet the varying requirements that locomotive service demanded, as has been done for stationary plants. But this sudden stoppage of the work, immediately after the presentation of our last report, leaves matters almost exactly as they were at that time.

It is probable that, as soon as the affairs of the railroads are settled and normal conditions have been resumed, the experiments with and development of the devices for burning powdered fuel will be taken up again. With conditions as they are, the committee is asking to be relieved from the necessity of making a report at this time and to be continued pending the resumption of the experimental work which they were appointed to watch and lay before the association.

The report is signed by C. H. Hogan (Chairman), New York Central; E. W. Pratt, Chicago & North Western; Thomas Roope, Chicago, Burlington & Quincy; J. H. Manning, Delaware & Hudson; Charles James, Erie; G. L. Fowler and O. S. Beyer, University of Illinois.

### Discussion

W. D. Woods (Fuller Engineering Co.): In the report of the committee there was no mention of the possibilities which might be obtainable in switching service from pulverized coal. I want to mention that there has been a switching locomotive in continuous service for some 18 months successfully using pulverized coal. It is at Fullerton, Pa. and there has been no difficulty with the locomotive at any time. The only cost of maintenance has been for one brick arch. Economies of about 40 per cent of the coal as fired over what was obtained with hand firing have been secured. There is a Lehigh Valley locomotive equipped with practically the same apparatus on exhibition here.

S. S. Riegel (D., L. & W.): I would like to ask the members if they have had any information concerning experiments on the colloidal mixture of powdered fuel and crude oil. I understand that for nearly a year experiments of that nature have been conducted with a mixture of powdered fuel and crude oil of any desired richness which justify the hope of success, and I would like to put the matter before the association for the purpose of finding out any information that might have been derived. It seems to me that if this plan of using powdered fuel can be worked out, there is a great field for its application in industrial plants, furnaces and perhaps locomotives.

C. H. Hogan (N. Y. C.): I think it would be a difficult matter to feed a mixture of powdered fuel and oil. Possibly if there are any locomotives so equipped in this country those in charge can explain.

Mr. Wood: I happened to be present at some tests in April, May and June, 1918, of colloidal oil on the U. S. S. Gem, where colloidal oil in combination with 30 per cent. of pulverized coal mixed with 60 per cent of ordinary navy fuel oil was burned in the regulation oil burners very successfully. The tests demonstrated it could be burned with the regular equipment then used on the boats for the navy oil, the object of the test being at that time to conserve the oil supply on account of the scarcity of tank steamers.

(A motion was made that the discussion be closed, the committee continued, and the questions raised further looked into for next year's report.)

W. J. Bohan (Nor. Pac.): Before closing that discussion, I would like to add to the motion that this committee give more attention to the cost of producing steam. The Fuel Association made a careful inquiry all over the United States on the cost of producing power by means of powdered coal, without a single answer giving the information on this important subject. There has been a good deal of enthusiasm about burning powdered coal, and there has been too much academic discussion on it. The railroads are interested in paying dividends and we want to know what it is going to cost to produce power with powdered coal. I know of one instance indirectly where powdered coal did not compare favorably with ordinary mechanical stoking on the large stationary plants. In order that the investigation be complete and satisfactory to the man who is going to spend money for his railroad, it is necessary that we know approximately where we are going to arrive. There, probably, will be little difficulty in the successful burning of powdered coal. That does not mean that the coal must be pulverized to the extent that some of its supporters recommend. It may be possible to develop the pulverizing of coal to such an extent that we can get practically the same results at much less expense. The art of burning powdered coal is a progressive one, and we should not take a broad jump on this any more than we should on any other important subject, without laying a more firm foundation. There may be some proofs that two hundred mesh coal is the best form in which to burn this fuel, but everyone does not believe that. We should commence to investigate generally on this subject. The question of burning powdered coal is not one that was originally considered for burning slack coal, but its greatest field probably is the burning of the lower grades of coal. It may not be generally known, but there is enough locomotive coal in the State of Montana to operate the five railroads that run in that vicinity for five thousand years. There is plenty of it up that way, and powdering may be the way to burn it, and if that is the way to burn it we would like to have the facts to substantiate it. In continuing this committee I would suggest that they spend a good deal more time in determining this fact than has been spent by past committees. This committee should co-operate with the Fuel Association Committee.

Mr. Chambers: With the consent of the seconder, I will include the comparative costs in this motion.

*The motion was then put to vote and carried.*

### Resolutions

Mr. Dunham then read a report on "Resolution, Correspondence, Auditing, etc.," as follows: "Whereas, the Railway Supply Men's Association have gathered together, for our benefit, the largest and most comprehensive exhibit of railway machinery and appliances ever collected at one time, have carried out such an acceptable program of entertainment for the members of the Section with their friends and families, and, without any confusion, have enrolled the largest attendance of any mechanical convention, and

"Whereas, The Atlantic City Hotel Men's Association, on short notice, have in their usual manner provided so acceptably for our welfare and comfort, and

"Whereas, The United States Railroad Administration has done so much to insure the success of this convention, and

"Whereas, The Executive Committee of the American Railroad Association have indicated their fullest approval of the

work of the section in convention, together with enthusiastic inspiration for future work, and

"Whereas, The meetings have been so ably planned and guided by the officers and the Secretary, be it

"Resolved, That the appreciation of Section III—Mechanical of the American Railroad Association be extended to the Railway Supply Men's Association, the Atlantic Hotel Men's Association, the United States Railroad Administration, the Executive Committee of the American Railroad Association and the Secretary and retiring officers of the section."

Signed, W. E. Dunham, B. P. Flory, H. L. Kleine, Committee. *A motion that the resolution be adopted was carried.*

Mr. Barnum: I would like to offer a resolution as follows: "That Mechanical Section Number III of American Railroad Association recognizes the need of a research bureau to investigate questions of mechanical practice, which should have the co-operation of all the railroads, and urges the appointment, by the chairman, of a committee of eight to study the question and report at the next convention."

*This motion was put to vote and carried.*

Chairman: I appoint on that committee C. B. Young, of the Railroad Administration, Chairman, and the following gentlemen from the various regions: Howard Ingersoll, Eastern; C. E. Chambers, Allegheny; W. J. Small, Southern; A. Kearney, South-eastern; H. T. Bentley, Northwestern; C. E. Fuller, Central Western; and J. E. O'Brien, Southwestern. I would suggest that the secretary notify these gentlemen of their selection, and also mail to them a copy of the resolution just passed.

## Unfinished Business.

Mr. Chambers: A great many of our older members, no doubt, will notice the absence of J. Snowden Bell, who has been a regular attendant for a great many years. Since coming to Atlantic City I had a letter from his daughter advising me that he had been in the Western Pennsylvania Hospital, at Pittsburgh, since May 25th, because of injuries received from a fall and while he is getting along satisfactorily he wished that the convention might be notified as to the reason for his absence.

Chairman: As Mr. J. Snowden Bell has been a valued member of this association for many years, I believe it would be entirely proper for this association to send to him an expression of their sympathy, with a wish for his early recovery.

*A motion to do so was carried.*

C. E. Chambers then took the chair and introduced Scott H. Blewett.

Mr. Blewett: Mr. President, the members of the Mechanical Section are your friends, and that you are the presiding officer of this association is testimony of their appreciation of your abilities to lead men. Not all decorations are given for deeds of courage performed in the time of personal danger. Peace has its victory as well as war, and for such the medals are as honorable as the Congressional Medal, the Victoria Cross or the Croix de Guerre. This association, for your intelligent, earnest, faithful leadership, deems you worthy of wearing its distinguished service medal, and has graced me with the privilege of placing on your breast its president's rosette, evidencing to the eyes of the world their esteem of you. You will keep it with your treasures, and when you look upon it the faces of companions and the voices of dear friends will come up out of the past, looking and speaking confidence and respect.

Mr. Tollerton: After the many years that I have been attending these conventions and have listened to the presentation of the badges to the past presidents of both associations by our good friend Mr. Scott Blewett, and the beautiful way in which he presented them, it seems hard, indeed, to find words to properly reply. I prize very much the token that he has just pinned on my coat, and will endeavor to keep it for all time. In closing the last session of the American Railway Master Mechanics' Association, and as your last president, I want to wish to all the members and their families a prosperous and happy future. I thank you.

The chairman then introduced Roy V. Wright, Managing Editor of the *Railway Age*.

Mr. Wright: I suppose very few of us recognize the tremendous amount of work that is involved in getting up an exhibition such as we have out on the pier. People who have visited our great expositions say that nowhere is there a finer exhibit of mechanical contrivances than we have on this pier,

and all of it is gotten up for just eight days. The Railroad Supply Manufacturers' Association is at work all year getting it in shape. Many of their members have to give a great deal of time to the job. It is tedious; it is hard work. And within the last three years they have had another mighty difficult problem. They did not know whether you were going to have a convention in 1917 until at the last minute it had to be called off. It was not until the armistice was signed last November that they knew that there was a possibility of having a convention this year, and yet we have here one of the greatest exhibits that has ever been made. I want to take this opportunity, in behalf of the Railway Supply Manufacturers' Association, in acknowledging to Mr. Walker, the president, our appreciation of the fine piece of work that he has done. I have been rather fortunate in being close to him in recent months. I know something of the problems he has had to contend with and some of the troubles he has had. We owe him a great debt of gratitude. Mr. Walker, in behalf of the Railway Supply Manufacturers' Association, I take great pleasure in giving you this badge, which I hope you will honor greatly, because it represents to you our feelings—feelings of the very kindest—for the splendid work that you have done this past year. We hope that you will prize this badge all the days that you live, and that they may be long.

Mr. Walker: The custom of presenting to the president of the Railway Supply Manufacturers' Association a past president's badge, must be the result of an inspiration in past years for the association to pin a badge on itself, because that is what you are doing. The president does not make the exhibit. The members make the exhibit; the committees make the exhibit, and perhaps you pick out the titular head and pin a decoration on him to gratify your own sense of appreciation for what you have done with your own efforts. There is no one knows better than I and the past presidents of our association how much the president has to depend on the committees, and how much the committees make for the success of the conventions. Your exhibit committee works days and nights in the preparation for the exhibition. Your enrollment committee, a difficult committee, which stands at the door and guards it, is your insurance that the proper people come in and the improper people do not. And they have been most efficient this year. Your transportation committee up and down the Boardwalk, a lonesome job, leaning up against the rail waiting until somebody comes along and asks for a chair—can you imagine a more inspiring way to spend the time at Atlantic City? And yet we ask men to do that, and unless they do it and do it right, your convention would not be a success. Your entertainment committee begins planning with the Committee on Arrangements six months before the exhibition opens, planning the entertainment that will fit in, that will attract the greatest number, that will keep the greatest number together the longest time, because one of the values of this convention is the association of man with man—your fellows that you do not see through the year but meet at the convention—you exchange ideas with them; you get new thoughts in connection with your business as well as with running a railroad.

I wonder if a large percentage realize what it means when I tell you that the value of the exhibit on this pier is approximately \$4,000,000; that it costs the exhibitors, talking now with gross figures, approximately \$750,000—three-quarters of a million of dollars—to put this exhibit on and take it away safely. The railroads pay the bill, every cent of it. But if the railroads use the exhibits, take advantage of the exhibits, they save, through the exhibitors, several times that amount, running well into the millions, so that if the exhibits are used, instead of an expense item for the railroads to meet, they become an economy. This year we have witnessed, I think, one of the greatest uses of the exhibits that we have had in years. I am not now talking about the size of the exhibits or the attendance at the convention; I am talking about the number of men, the number of people, in the booths getting information.

I have been president for three years. I heard for the last three years: "You will never have another convention." We not only heard it once, but we have heard it a hundred times. It certainly has affected me very deeply, the number of people that have expressed personally their appreciation for the work that has been done, and I have received that expression as I am receiving this—as an expression of appreciation for the men

who have held my hands up and helped me represent them seemingly satisfactorily.

E. S. Barnum: I have a little testimonial which the association desires to present to our past president, Mr. Clark. I wish to say to Mr. Clark that while he was elected president of the Master Mechanics' Association at the last meeting held in Chicago, it was not properly considered a convention, but it was an official meeting of the association and Mr. Clark was for the first part of the year the president of the Railway Master Mechanics' Association. For reasons which seemed good to him, he thought it advisable to resign the position, and yet the General Committee, in considering the work of the year, unanimously voted that because of the great value of Mr. Clark's work to the Association during the many years which he has been a member, and also for the work which he did during the first part of this year, they wish to present him with a badge showing their appreciation of that work.

Mr. Clark, it is with regret that the members of the Association have heard of your resignation from the presidency, and it is with still further regret that we railroad men have heard of your leaving the active work of the railroad business. We hope that possibly that may not be for good, but in any case we wish you the very best of success in whatever walk of life you may take up, and I trust that you will wear this badge as a testimonial of the appreciation of your fellow-members of the American Railway Master Mechanics' Association. I wish to convey to you the heartfelt appreciation of the members of the association for your good work and our best wishes for your future success.

F. H. Clark: If I had been on the General Committee at the time that this question of presenting me a badge came up, I should have tried to persuade the members that I was not entitled to the badge. I have, as Mr. Barnum has said, done more or less work for the association, but it has been gladly done. I have enjoyed it, and I do not think I am entitled to anything for it. As for the presidency of this Association, which I occupied for a period of six months or so, I think that is sufficient recompense in itself. I consider it a good deal of an honor to be the president of this Association. I do, however, appreciate the token which Mr. Barnum has presented to me.

I want to assure you all I shall always keep it and preserve it and try to remember, as I know I shall, the pleasant associations formed as a member of this Association and the various activities connected with that work.

Mr. Chambers: I want to say that with all of Mr. Clark's modesty about not being deserving of the badge, or something to that effect, he was an invaluable associate at the time he served as president, during the work which came up in connection with the change which was made from the Master Carbuilders' Association and the American Railway Master Mechanics' Association to the American Railroad Association, Section III, Mechanical. Had he been at the general meeting when this matter of presenting him with a badge came up, I would have seen that he was gotten out of the room before the vote was taken.

Before turning the chair over to your chairman, I want to take this opportunity to thank you all for your splendid cooperation, not only during my three years' occupancy of the presidency and chairmanship of the organization, but also at this convention. It has been very agreeable to all of us to hear the favorable remarks made about the convention from the start to finish, and the exhibits as well; there has never been a time when they were equalled. I have heard a great many times during the past two years that the conventions were dead, and we would never again see a big convention like those we witnessed here for several years. We are glad to know that at this convention we have had the largest attendance at the meetings and the largest exhibit that we have ever had.

Chairman Tollerton: You probably notice how easy I slip out of one job into another. I am sure that the assistance which I will receive from all the members of the association will make my task a very pleasant one.

I hope that we may be able to meet here twelve months from now, assuming, of course, that the next meeting will be at Atlantic City. That is entirely an assumption on the part of the Chairman, because it is a matter that the General Committee will have to settle.

## Combustion Chambers

By F. F. Gaines

Chairman, Board of Railway Wages and Working Conditions, U. S. R. R. Adm.

**A**CAREFUL ANALYSIS of any locomotive boiler test reveals the fact that the firebox is the factor that limits both the boiler capacity and efficiency. In other words, boiler capacity and efficiency are limited by the amount of heat that can be liberated within the firebox, rather than by the amount of heat that can be absorbed by the heating surfaces.

When burning high volatile bituminous coal, more than 50 per cent of the heat generated is liberated by the burning of the combustible gases above the fuel bed, and in order to burn

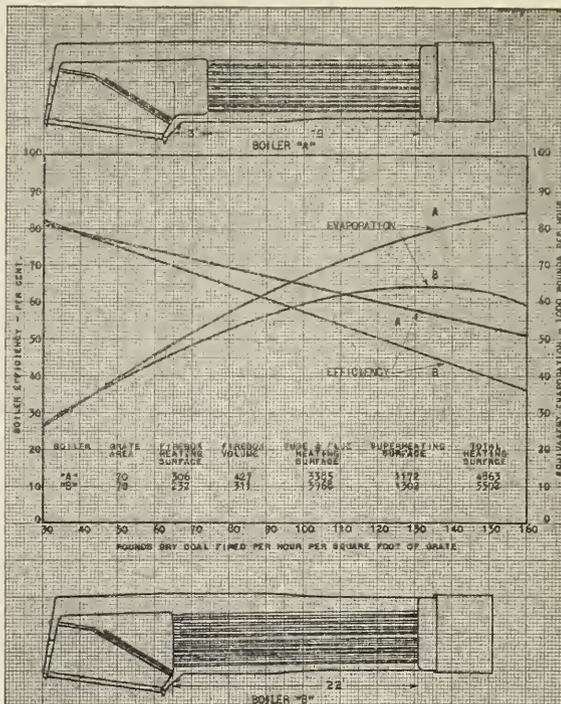

Fig. 1

these gases, it is necessary to have ample combustion chamber space or firebox volume.

The ratio of firebox volume to grate area has never received any careful or scientific investigation, but the value of firebox and combustion chamber volume is being demonstrated by the everyday operation of some 6,000 locomotives equipped with combustion chambers and is borne out by a few authentic tests.

The curves of Fig. 1 show the efficiency and capacity developed during tests of two Pacific engines equipped with boilers that were identical in every respect, except that one had a 36-inch combustion chamber and 19-foot flues, while the other had the ordinary firebox with 22-foot flues, the data as to the grate area and heating surfaces being shown in Fig. 1.

It will be noted that at low rates of combustion the capacity and efficiency developed by the two boilers are almost identical, but as the rate of combustion increased, the capacity and efficiency of the combustion chamber boiler showed a marked increase over that of the non-combustion chamber boiler, and while the non-combustion chamber boiler reached its maximum capacity at a rate of 130 pounds of coal per square foot of grate per hour, the capacity of the combustion chamber boiler continued to increase up to and beyond the rate of combustion of 160 pounds of coal per hour. At a rate of combustion of 120 pounds of coal per hour, the combustion chamber boiler showed an increase in efficiency and capacity of about 20 per

cent greater than that of the non-combustion chamber boiler, while at the maximum rate shown, the difference was more than 40 per cent.

The combustion chamber firebox had a volume of 427 cubic feet, or a ratio of firebox volume to grate area of 6.

The non-combustion chamber firebox had 311 cubic feet or a ratio of volume to grate area of 4.4.

At a rate of combustion of 120 pounds of coal per square foot of grate per hour, the combustion chamber boiler gave an equivalent evaporation of 75,000 pounds per hour, which is equal to 2174 boiler horse power.

Assuming that half of the heat was generated in the fuel bed and half above the fuel bed, we would have 1087 boiler horse power generated by the burning of combustible gases in a firebox volume of 427 cubic feet, or a generation of one boiler horse power per .4 cubic foot of firebox volume. At

Gaines combustion chamber. This boiler had 307 square feet of firebox heating surface, 3539 feet of flue and tube heating surface, and 886 square feet of superheating surface, or a total of 4732 square feet with a grate area of 70 square feet and a firebox volume of 430 cubic feet. While burning oil under test at a rate of 4,000 pounds per hour, this boiler developed 2,000 boiler horse power, or 4.6 boiler horse power per cubic foot of firebox volume with an over-all efficiency of 85 per cent, which approximates the theoretical limit.

There is but little data available on combustion chamber tests in oil burning service, but that quoted is sufficient to give an idea of the value of combustion chambers in such service.

There are in use some 6,000 locomotives equipped with combustion chambers, of which 1425 are the U. S. Government standards and 460 are of the Gaines type. These combustion chambers range in length from 18 in. to 11 ft. and are used in conjunction with flues varying in length from 9 ft. to 25 ft. It is evident from these figures that there has been no logical method of procedure followed in proportioning combustion chamber and flue lengths, and there is room for a lot of scientific investigation to determine the correct ratios between firebox volume and grate area, and between firebox heating surface and flue heating surface. It is also desirable to arrive at some correct understanding as to the value of firebox heating surfaces and flue heating surfaces and the arrangement and location of heating surfaces, such as will give the maximum evaporation and efficiency per unit of surface.

Extensive tests have been carried out by the Bureau of Mines at its Pittsburgh laboratories in trying to determine the ratio of furnace volume to grate area for the different kinds of coal used in stationary service. These tests show that in order to reduce the heat loss due to unburned gases to 2 per cent, it was necessary to have the ratio of furnace volume to grate area about 13 to 1 when burning Illinois coal at a rate of combustion of 60 pounds with a 25 per cent excess of air. Under the same conditions, Pittsburgh run-of-mine coal required a surface volume of ten times the grate area, while Pocahontas low volatile coal required a volume five times the grate area. These tests are not strictly comparable to locomotive practice for the reason that in the latter much higher rates of combustion prevail, and the excess air supply is generally lower than that mentioned.

Under these conditions it might be necessary to have a higher ratio of volume to grate area than those required in stationary service, in order to secure approximately perfect combustion of the gases.

Fig. 3 shows a Mallet firebox with a grate area of 80 square

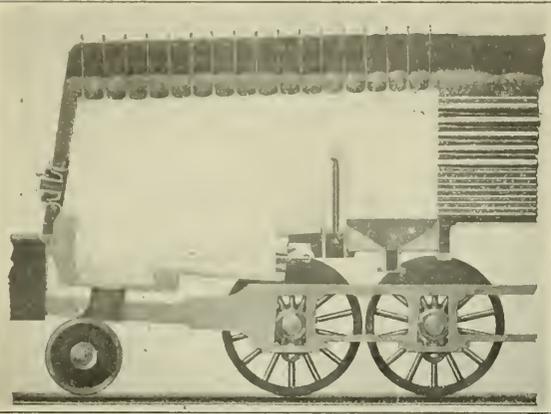

Fig. 2—Normal Grate Area = 70 sq. ft. Firebox Heating Surface = 307 sq. ft. Length of Combustion Chamber = 3' 6", Firebox Volume = 430 cu. ft. Flue Length = 18". Flue Heating Surface = 3539 sq. ft. Superheater Surface = 886 sq. ft. Total Heating Surface = 4732 sq. ft.

the same rate of combustion, the non-combustion chamber boiler evaporated 63,000 pounds per hour and developed 1826 boiler horse power.

Assuming that the combustion conditions in the fuel bed were the same in both cases, we have 1826—1086=740 boiler horse power developed by the burning of combustible gases above the fuel bed of the non-combustion chamber boiler, which is equivalent to one boiler horse power per .42 cubic foot of firebox volume.

It will be seen from these figures that the increase in capacity and efficiency was in almost direct proportion to the increase in firebox volume. Of course, it goes without saying that there is a limit to the firebox volume needed for approximately perfect combustion, and when this limit is exceeded the capacity developed per cubic foot of volume will begin to fall off.

Increasing the firebox volume by the use of combustion chambers can only be accomplished by reducing the flue lengths and sacrificing flue heating surface, but it is a well-known fact that the additional firebox heating surface so gained has a much higher value per unit of area than the discarded flue heating surface, and while accurate tests are necessary to develop the absolute values of the different heating surfaces, the fact remains that boiler capacity and efficiency depend more upon efficient combustion than upon mere area and extent of heating surface.

The over-all boiler efficiency of the combustion chamber boiler referred to above varied from 82 to 51 per cent, and the furnace efficiency ranged between 97 and 66 per cent, while the heating surface efficiency ranged from 97 to 93 per cent.

Firebox volume is as essential in oil burning service as in bituminous coal burning, for in the former all of the heat is liberated by burning fuel in suspension. Fig. 2 shows an oil burning firebox of a Santa Fe type engine equipped with a

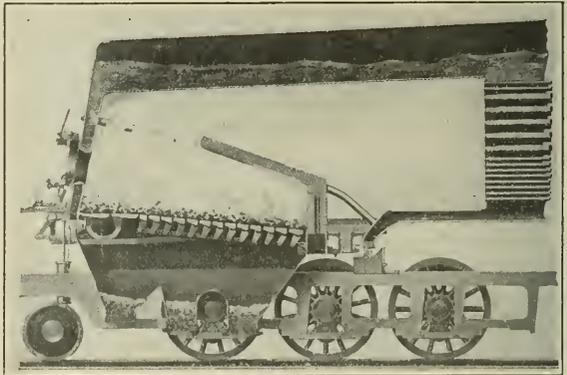

Fig. 3—Grate Area = 80 sq. ft. Firebox Heating Surface = 407 sq. ft. Firebox Volume = 570 cu. ft. Combustion Chamber Length = 7 ft. Length of Flameway from Center of Fuel Bed to Flue Sheet = 18 ft.

feet, 407 square feet of firebox heating surface, firebox volume of 570 cubic feet and a flameway 18 feet in length from center of fuel bed to flue sheet. In this firebox, the ratio of volume to grate area is about 7 and this probably represents the maximum at this time, with the exception of a locomotive now building which with a firebox volume of 860 cubic feet and a grate

area of 112 square feet, has a ratio of volume to grate area of 7.7.

If the tests on the stationary furnace referred to can be used as a criterion, it is apparent that our best designs of modern fireboxes are still shy in flame-way and volume and that there is much room for investigation and improvement in this direction.

Future developments and improvements in the art of burning coal in the locomotive firebox will probably depend to a large extent upon the changes made in the design and proportions of the firebox itself, and it is in this direction that we must look for innovations that will successfully meet the constantly increasing demand for boiler capacity and efficiency.

As an indication of this, we might mention that while the oil burning locomotive referred to developed 4.6 boiler horse power per cubic foot of firebox volume, and the coal burner developed 2½ boiler horse power per cubic foot of firebox volume, stationary power plants are being designed and built for burning coal in suspension with furnaces of such size that the desired boiler capacity can be developed at a rate of ½ boiler horse power per cubic foot of furnace volume.

No mention has been made of the effect that the introduction of combustion chambers has upon boiler maintenance; but it is a well-known fact that short flues give less trouble and fewer failures than long flues, and that moving the back flue sheet forward and away from the zone of high temperatures in the firebox materially reduces trouble due to flue leaks and failures.

Viewed from any angle, the combustion chamber firebox is apparently superior to that of the non-combustion chamber type; but there is a woeful lack of correct and authentic information concerning this most important subject, due to the fact that such knowledge can only come through a correct interpretation of experimental facts.

## Appreciation from the Ordnance Department

MAJOR E. D. CAMPBELL, Railway and Seacoast Section, Artillery Division, Ordnance Department United States Army, who made the address on "Railroad Artillery" on Monday evening, received the following communication from C. C. Williams, Major General of the United States Army, Chief of Ordnance, conveying appreciation to the manufacturers and railroad representatives at Atlantic City:

"I am glad to have this opportunity to express the thanks and appreciation of the Ordnance Department for the noble efforts of the manufacturers and railroad representatives here assembled which resulted in the splendid production of ordnance material.

"Your assistance was not only invaluable in manufacturing ordnance, but your hearty co-operation in design, research and development of all kinds of equipment was of inestimable value.

"It is due largely to the high purpose and patriotic efforts of the manufacturers such as the American Car and Foundry Company and the railroads that a surprisingly quick end came to the great war."

## Purchasing Officers Visit Convention

WHEN R. H. AISHTON, the newly elected president of the American Railroad Association visited Atlantic City last week, he was so impressed by the exhibits that he wired H. B. Spencer, director of the Division of Purchases, U. S. R. R. Administration, suggesting that he ask the purchasing officers within reasonable distance of Atlantic City to arrange to visit the exhibits. Mr. Spencer made this suggestion to the regional directors and through them to the federal managers. The result was that a very large number of the purchasing officers visited the convention before its close.

## Conventionalities

President Carr, of the Railway Supply Manufacturers' Association, has asked John C. Kuhns, manager railroad sales, the Burden Iron Company, Chicago, to take the chairmanship of the Transportation Committee for next year. Mr. Kuhns has accepted.

Secretary George B. McGinty, of the Interstate Commerce Commission, who has been attending the convention, became ill after he arrived and was confined to his room for a while. He is feeling much better now and has been attending the sessions of the convention and inspecting the exhibits.

In the photograph of Franklin Hess, son of George F. Hess, mechanical superintendent, Kansas City Southern, accompanied by Ellsworth L. Mills, of the Air Reduction Sales Company, which appeared in the *Daily* for Wednesday, June 25, a typographical error was responsible for the writing of the company's title as American Reduction Sales Company. It should have read Air Reduction Sales Company.

Mr. and Mrs. Harry W. Frost have had as their guests, since they have been at the convention, their son, Harry, Jr., and their son-in-law and daughter, Mr. and Mrs. Webb C. Artz. Mr. and Mrs. Artz live in Philadelphia. During the war Mr. Artz was in the motor transport service of the army. Harry, Jr., is a lieutenant in the navy, having recently received announcement of his promotion to first lieutenant, and is stationed at present at the Brooklyn Navy Yard.

An H. B. O.

With a party of 4,  
Strove motoring hither

Till She ran no more.

Said H. B. O.

When he left Flushing,

"Did not expect to do much pushing."

Oh! H. B. O.

You sure should know,

That trip would have been neater,

Behind a superheater.

Colonel C. H. Crawford, who has been attending the convention, will leave on July 1 for Rio de Janeiro, Brazil, where he will go as manager for the Baldwin Locomotive Works. The Baldwin works are establishing over a dozen branches in foreign countries, and the manager will go supplied with a complete library of catalogues and books regarding equipment and supplies produced in the United States, whether those of the Baldwin or other companies. Col. Crawford formerly was assistant to the president of the Nashville, Chattanooga & St. Louis. During the war he was in the Engineer Corps, and was to have gone to Europe to assist Samuel M. Vauclain, now president of the Baldwin Works, in carrying out this country's extensive program of tank production. Col. Crawford was actually on the Adriatic in New York harbor ready to sail, when the armistice was signed.

The losses by fire in the United States and Canada during the month of May, as compiled from the records of *The Journal of Commerce*, aggregated \$16,516,300, as compared with \$2,545,900 in May, last year.

## The Man Who Saw

### "Louder, Please!"

"Say," said the locomotive man from the Mormon capitol, "do you know what that meeting in the Convention Hall reminds me of?"

"What?" said The Man Who Saw, who was sure that the big westerner had a "good one."

"It reminds me of the delegation of boilermakers who 'waited on' the superintendent of a road. They were courteously received and stated their case for more pay, shorter hours, etc.

"The superintendent regretfully detailed his reasons for not being able to raise their pay and finished his address in 4½ hours flat.

"Just as he finished, the chairman of the delegation put his hand to his ear and said, 'how much did he say we got?'"

### "Comers"

"Never run a one-man show."

The mechanical engineer of a prominent eastern road was explaining his record of success in response to the questions of The Man Who Saw.

"Train two of your best men for your own job. Put the ability of one against the other. When you are away, entrust the duties of your office to the one who seems to be able to assume them with the least swelling of the head.

"Encourage them all to add to their study of details by absorbing some of the bigger things. Try to create in them an interest in what the road is doing—whenever you can send them out on the line.

"Have them meet the other men from other departments when possible, so that the interest in their work will be tempered with a familiarity with the real object we all seek to attain—to safely haul as much as we can, as economically as possible."

### Get Acquainted

The Man Who Saw 15 unexpected Latin-American visitors here this year begs to call attention to the significance of this event. Evidence of the importance of the Latin-American field for railway supplies is furnished in the announcement by a prominent locomotive works of the opening of Argentinian and Brazilian branches in addition to extended activities in Europe, Asia, Australia and Africa.

The Man Who Saw finds a slowly awakening interest among railway supply men in this development. Here and there he finds a manufacturer with vision who has studied or is quietly investigating South American possibilities on his own initiative. And he does not wish to urge the expenditure of a heavy appropriation which has so often accompanied the ill-advised excursion of a well-meaning but innocent explorer of the Latin-American mart. Rather he would suggest discussion and action which might lead to the attendance of as many influential officers of Latin-American railroads, sugar mills and other enterprises as can be induced to attend the next mechanical convention.

Why not tackle this problem now? The Man believes

that a sincere effort in this direction will not fail to bring forth fruits, of which, perhaps some day, we may well be proud.

### The Trackless Train

The Man Who Saw feels that attention should be directed to the fact that the "greatest convention" is marked by the introduction of a new era of transportation in and around the factory and machine shop.

The setting up of exhibits from one end of the Pier to the other, owes their rapid completion to the new development—the "trackless train."

Man savers, time savers, money savers—these miniature motor trucks are said to be displacing the old hand truck about as fast as they can be manufactured. The popular type propelled by an electric motor which derives its power from a storage battery can be seen handling formerly impossible loads in modern shops. Some haul three or four trailers and negotiate crowded aisles and sharp corners with perfect ease.

Internal combustion tractors of the small type on the caterpillar or "tank" principle are likewise coming to the front and are making good out of doors; some of them equipped with a belt pulley find themselves trusty guardians of the power breakdown where they are able to slip in next to a disabled machine and furnish emergency power.

The Man Who Saw believes that the advice of one of his friends, an enthusiast on this subject, is well worth reading: "If you are thinking of putting these tractors into your works, analyze your problem from all angles; balance the desirability of the use of electricity vs. gasoline, visit a big plant and see what they are doing with it, then study the different types which are offered and choose for your needs."

### Umbrellas and Soft Plugs

He had Asia's number. He could tell what province a Korean came from by the shade of blue on his shirt. He had watched them build and trade and his admiration of the Mongolians' methods was unqualified. There were, however, some phases of their reasoning which he could not explain and the pioneer of American machinery in the Far East proceeded to illustrate.

The Man Who Saw drew nearer to get the slant on the Asiatic from one who seemed to know.

"We were walking on one of the principal streets of Seoul accompanied by an Englishman and an enterprising Jap. It was the hour for trade. Push carts, bundles and junk of various descriptions seemed bound in a common direction. Among the throng appeared a picturesque old Korean and he carried two home-made umbrellas.

"But, I say, why does he carry two?" inquired the Briton.

"You ask him," said I to the Jap.

"The Jap blocked the path of the tradesman, asked his question and returned to make his report.

"He says," said the Jap, "that he carries two so that in case he loses one he will still have the other."

\* \* \* \* \*

"Two years elapsed and I found myself in the company of the same enterprising Jap. He had come to inspect a shipment of locomotives for his company and was quite insistent.

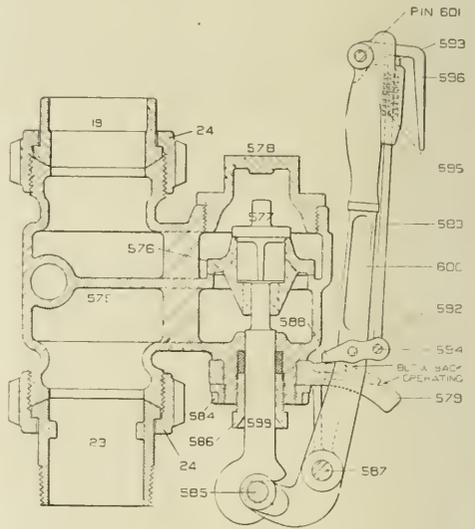

"But the specifications only call for one soft plug in the crown sheet," I protested.

"Ah, yes, I know," said the Jap, "but you remember the Korean and his two umbrellas? We must have the two plugs—if one goes bad we have the other one to go good."

### Balanced Lever Starting Valve for Non-Lifting Injectors

A LEVER STARTING VALVE, which will remain tight in service as long as needed, is being shown by William Sellers & Co., Inc., Philadelphia, Pa. It is known as style VC. It is radically different from the older forms in which the pilot and main valves are connected to and operated by a horizontal stem and with which it is difficult to maintain the valves in alignment.

The "VC" style has a main body with a supplemental steam receiving chamber containing two loosely guided flat seated checks, raised serially by a vertical stem. The valve is reseating, self-grinding and remains tight under the severe service to which valves of this type are subjected. It has a further advantage of safety, because the valves cannot be jammed open. As the steam pressure is always on top and the lift is vertical, the tendency is naturally to return to their seats. For this reason it is necessary that a latching device be provided

Balanced Lever Starting Valve

for holding the valve in operating position; this consists of the usual form of notched quadrant and tripping device for the latch. An initial notch is placed in the quadrant so that the valve may be held partially open, permitting the required amount of steam to warm the water in the tank during the cold weather. When the valve is placed outside of the cab a special notched hand pull is provided, which not only locks the valve wide open in operating position, but also permits eight positions of the valve when used as a heater, so that any required amount of steam can be blown back into the tank.

The present is a period of general unrest in all industries and strata of society. There is an almost universal clamor

### The Awakening of the Technical Societies

for new and changed standards to meet the conditions arising out of the war. This is as true of technical societies as elsewhere. It is particularly true of the older established engineering societies which, because of their large membership and their prominence, have been prone to move slowly and for this reason have become prominent targets for criticism. Recognizing this unrest, the American Society of Civil Engineers created a Development committee early last fall, with broad powers, to study the activities of the society. The other national societies of mechanical, electrical and mining engineers appointed similar committees soon after and all of them have been actively at work for several months. Two of these committees (the civil and mechanical) presented progress reports before the annual meetings of their respective societies last week. The report of the committee of the American Society of Civil Engineers is abstracted briefly elsewhere in this issue. A careful study of the tentative recommendations of this committee will show the comprehensive manner in which it is proposed to revise the society's activities in order that it may interest itself more directly in matters not purely technical or what may be termed welfare work for its members. The report presented to the mechanical society was equally progressive and equally well received. It is to be hoped that the membership at large of these societies may receive the reports with sympathetic attitude, realizing that the problem is theirs to solve and also realizing that they must be willing to render service to the society if they are to expect service from it.

The low-voltage switch machine is being slowly popularized, but it would seem to be deserving of more general favor.

### Low Voltage Switch Machines

It is in many situations the only practicable and satisfactory device by which a man can move a switch which is situated a long distance from his station, because the ordinary high-voltage dynamo is too costly; and the slowness of the low-voltage apparatus is tolerable because speed of operation is not essential. The use of low-voltage machines at the ends of certain passing sidings has enabled some roads to expedite the movement of trains very materially, and to reduce costs. The desire to operate switches beyond ordinary interlocking limits has led to the development of the low-voltage machine to a highly satisfactory degree. It is operated on 20 volts by a set of primary or secondary batteries, and it gives an indication to the operator as to the position of the switch point. These movements will operate a switch, switch lock, pipe connected derail and detector bar in approximately 35 seconds, while a signal will clear in about 15 seconds. One road has estimated that with the use of these movements the time saved to a train entering a siding will average seven minutes by doing away with the stop necessary to allow trainmen to set the switch by hand. Another road used such machines at switches that could not be seen from the point of operation and where large expenditures would otherwise

have been necessary for additional interlocking plants. Their use in connection with power-operated train order signals located at blind sidings and controlled by an operator at a station train-order office a mile or more away also greatly facilitates train movements and cuts down expenses. The use of the low voltage movements at such points is one method worthy of the careful consideration of managements wishing to decrease the running time of trains and lower the operating costs; a study of conditions surrounding their installation at certain places can well be undertaken at the present time in order that work may be started as soon as conditions warrant.

The railroad superintendent who removes the public's grievances before the public has formulated them comes pretty near

being an ideal officer, at least in one element. In the nature of the case, however, acts of that kind are not likely to come prominently before the public, and they remain unknown; so, there-

fore, we call the reader's attention particularly to that paragraph in the notice, on another page, of the abatement of the whistle nuisance at Tyrone, on the Middle Division of the Pennsylvania Railroad, which says that no complaints of loud whistling had been heard from residents of Tyrone. This bit of news is rather unusual, even novel; we recall nothing of the kind elsewhere. The New York Central formerly had a rule, on the busiest parts of its main line, under which flagmen of trains on the passenger tracks were never called in; and that, of course, abated the whistle nuisance in a very positive way; but if flagmen must go out, and must be called in, an electric circuit, with bells on fixed posts, as at Tyrone, is the ideal means of communication; simple and cheap. Former Commissioner J. E. Sague, speaking before the State Public Service Commission in New York city last week, again reminded us that our British cousins know how to handle a dense passenger traffic without flagging; but, judging by the present rate of progress the adoption of that refinement by our railroads is still far in the future; and the Tyrone experiment might well be considered for adoption at many other places. Reference was made in this column, last week, to the excellent rule, on another division of the Pennsylvania, which has been prescribed for the guidance of trainmen in affording decent treatment to the ears of the people, sick or well, who reside near the railroad; but, as to the noise nuisance, it is no more than right to say that the true way to cut off this dog's tail is to apply the axe directly behind the animal's ears. To put our rules in the best possible language is an important element of good railroading, as is constantly evidenced when clumsily worded rules cause annoyance and friction; but the foolish idea that good rules make good practice still seems to persist in some minds; it is a vigorous weed that has to be killed every Spring—or oftener. Our busiest railroads now have telephones strung along the line at very frequent intervals; and this facility is so inexpensive, comparatively, that many other roads must soon see the wisdom of providing it. With a communicating wire available at every telegraph pole, the continued free use of locomotive whistles is little less than barbarous.

Like the adoption of a national budget system as a basis for making appropriations, the creation of a national department

### Merely a Business Proposition

of public works embracing all engineering and architectural activities of the government is of such obvious advantage as to appear to require no argument. Yet we have been content to go on from year to year with these activities divided among several bureaus and departments, each ambitious to build up a large organization and without any pretense of coordinating its work with that of the other engineering branches. Thus, building construction is now handled by the Treasury department and river and harbor improvements by the War department; the Coast and Geodetic Survey and the Bureau of Standards are subordinated to the Department of Commerce, while the Bureau of Public Roads comes under the Department of Agriculture. Such a diversification of control necessarily results in much waste of money and energy which would not be tolerated in a business concern and should not be in national affairs. Engineers and business men in general throughout the country have long recognized the extravagance of this policy, or rather lack of policy, but as it is primarily a problem of engineering organization, agitation for its correction has rested primarily on engineers. They have agitated more or less actively and continuously for the correction of this situation for years. This agitation came to a head at a conference of representatives of engineering societies held in Chicago last April when delegates from over 75 organizations with a combined membership of over 100,000 engineers decided to inaugurate an intensive campaign for the concentration of these activities under one department. This has already borne fruit in the preparation of a bill to create a Department of Public Works which will be introduced in Congress in a few days. This bill should receive the active support not only of engineers but of all citizens interested in the economical, business-like conduct of governmental construction activities which run into the hundreds of millions of dollars expenditures annually. The only opposition which has so far manifested itself is that of the Engineers' Corps of the Army which is one of the principal engineering organizations in the present system, whose activities will be revised and placed upon a commercial basis in the proposed plan.

The question of wire crossings over the tracks is a subject of considerable importance to the railroads from the standpoint of safety. Various associations and others interested in such matters have made extended investigations and studies which have been productive of

### Wire Crossings Over Railways

what they believe to be adequate specifications for the construction and maintenance of such crossings. Some time ago the Bureau of Standards prepared and proposed a revision of a previous recommendation covering signal lines crossing over railways which provides for a distinction between crossings over "important" and "unimportant" railways. Such a distinction is contrary to the 1913 specifications of the Association of Railway Telegraph Superintendents, now the Telegraph and Telephone division, section 1, operation, of the American Railroad Association, which insists that there is no such a thing as an "unimportant" railway, or part thereof, insofar as wire crossings are concerned. It may be inferred by some that there are industry tracks, warehouse tracks, logging roads, spurs, etc., that are "unimportant." Such is the attitude of the Bureau of Standards. As a matter of fact, it is on such lines that the greatest danger frequently prevails. Industry tracks, warehouse tracks and passing tracks are almost always located in the towns along the road and it is at these points where wire crossings are more likely to occur. Trainmen have more occasion to ride the tops of cars while passing through towns

than in traveling between them. Curvature, grades, and obstructions to view on account of buildings enter more largely into the problem at these points than on main lines. Another question which should be considered in a study of this matter relates to wire crossings of small line companies such as farmer lines. It is said that there are three such crossings to every one of larger line companies and that as a rule the crossings of the latter are installed and maintained in a safe manner; while as much cannot be said of the small line companies because of a lack of adequate facilities to do proper work on the wires. Several state commissions have advocated legislation which would force most wire crossings to go underneath the tracks, and thus entirely eliminate the hazard attending these crossings.

In his recent testimony before the House appropriations committee Mr. Hines indicated that deficiencies in maintenance of way and structures could be

### The Penalty for Deferred Maintenance

compensated for in considerable measure by an excess in the condition of equipment over that of January 1, 1918. Nothing was said as to the unit of measure to be applied in thus balancing maintenance of equipment against maintenance of way and structures, but owing to marked changes in values almost any unit that could be proposed would present serious objections. Whatever the unit, there is one phase of this plan of balancing over-maintenance against under-maintenance that cannot be readily measured. Maintenance deferred cannot be restored in the future for the same outlay as would have sufficed if undertaken in season. For instance, recent measures to reduce maintenance of way activities have been instrumental in curtailing the season's painting program. Not only will the postponement of this work entail the expenditure of a much greater amount of effort when the work is eventually done, in cleaning off rust and blistered paint, but it will result in a deterioration of the structures that cannot be restored by any process short of renewal. It is to be admitted that this is probably an extreme case. Nevertheless, the same principle applies to nearly all items of maintenance work and surely ought to receive proper recognition when the government undertakes to compensate the roads for inadequacies in maintenance expenditures.

The last decade has seen a marked increase in the use of motor vehicles for passenger and freight traffic on public

### Highways and Railways

highways with promise of even greater development in the near future. The resulting density and speed of highway travel have led to radical changes in the physical requirements of the public roads. Where steep grades and sharp curvature were formerly objected to as sources of discomfort, they are now considered positive obstructions to traffic and on all important routes of travel the demand for improvements in grade and alinement are most insistent. This condition has become manifest to railway men wherever a grade crossing elimination problem brings railway and highway officers together. Flat skew bridges are now often demanded where detoured square crossings would formerly have sufficed and long approach grades are now specified where short dips would have served in the past. This condition has an important bearing on the distribution of the cost of such work. It has been recognized for no little time that the public, as sponsor for the highway, should bear a fair share of the expense, but now that these costs are tending to increase rapidly because of the refinements in highway design, it is but justice that the increased costs should be borne by the public which benefits by the improvements.

## A Useful Study of the Collision Problem

THE HEARING before the New York State Public Service Commission on the prevention of collisions, reported in our last issue, brought out many interesting statements of fact and opinion; and the full proceedings, when printed, will afford profitable reading and should mark progress. By this we do not mean that any one said much that was new; but it is a good thing to have the issues crystallized. Mr. Rhea, with his well-known frankness, set forth some of the fundamentals with a succinctness that might well be imitated in many quarters. Mr. Sprague, from his intensive studies, presents certain points of the problem in incisive terms. Extracts from his remarks will be found on another page of this issue. Messrs. Schwyer and Webb spoke with sanity and force, showing that they are not mere dreamers or promoters, but practical engineers. Mr. Sprague's gentle reminder that the old stagers do not know it all, and Mr. Patenall's call for more business-like co-operation between the railroads and the unorthodox inventors, both deserve attention.

A State Commission must recognize all interests, and it was proper to listen to the enginemen and firemen; but the spokesmen for these had nothing constructive to offer. Their urgent demand for more thorough protection of trains by flagging is logical enough, but they seem to forget that the diseases of the flagging system are incurable.

These commissioners may or may not have an important duty in connection with the settlement of the collision problem. The problem surely has to do very directly with the police power and therefore comes within the authority of the State of New York, although at the same time it is a national problem, demanding settlement on such lines of uniformity and conservatism as to insure the best progress, and the least waste, throughout the whole country. The New York commissioners have set forth, in their report on the South Byron collision, some very practical ideas; and if, by promptly propounding a very sound and practicable plan, they should forestall the slow-moving Washington authorities, their ideas would at least deserve careful attention. Just now they could not order the installation of apparatus on any important road without the consent of the United States Railroad Administration; but that condition will soon be changed.

It is fair to assume that Mr. Rhea sees straight when he says that public sentiment demands that the automatic stop problem be brought to a more definite issue. Why should the railroads of America longer delay the settlement of the question? Can discipline be further improved? Look at the more recent startling collisions. Mount Union (Feb. 27, 1917); Ivanhoe (June 22, 1918) and South Byron (Jan. 12, 1919) afford significant evidence that the further improvement of our methods of discipline is an exceedingly complicated problem. Those who say that the case is hopeless cannot be answered. In each of these cases the engineman had not had enough sleep, and the fireman was of no value as a monitor. Regulating enginemen's sleep appears to be an impossible task. The monitorship of the fireman has never been of any proved value. Where trains are not more than three minutes apart, the benefit from the flagman's function is very uncertain, and this degree of frequency of trains is now common on all of the principal roads.

Automatic stops have been used on the Boston Elevated for twenty years and their value as a disciplinary element has been well proved. The Chicago & Eastern Illinois has been using a stop on both passenger trains and freight trains for three or four years. The Great Western of England has 100 engines equipped with automatic stops and has been using cab signals for 12 years. With these several bodies of evidence before us can it not be said that some, at least, of the unsettled questions have been settled? The United States Railroad Administration began examining the question of

prevention of collisions after the Nashville wreck in July, 1918; but the investigating committee was not appointed for six months thereafter, and has not yet made a report. The New York State Public Service Commission has been six months considering what to do about South Byron. What good reasons can be given for these delays? A very competent experienced and conservative signal engineer, who has studied this subject for many years, remarked recently that the minds of the people (railroad officers included) seem to work in a cycle; we have serious collisions which an automatic stop would have prevented, and everybody feels the need of such a device and the call for it is definitely voiced; and then there is a period when no very bad collision occurs and "everybody seems more or less contented with things as they are." This view of the case is old, and would scarcely be worthy to be quoted at this time, except that it comes from a railroad officer peculiarly well qualified to take a correct view; and it was spoken after he had had very good opportunity to know the feelings of the directors of his own road. It is the directors of the railroads to whom falls the duty of finally dealing with this problem.

## Railway Rates and Cost of Living

A THEORY regarding the effect of railway rates upon the cost of living has been enunciated by persons in high positions, which requires discussion. Commissioner Woolley of the Interstate Commerce Commission has presented it in a recent address as an argument, as we understand it, why rates should not be advanced at all, at least for some time. The theory referred to is that an advance in freight rates results in an increase in the cost of living which exceeds the advance in rates, and may even be three or four times as large. This is attributed to the alleged fact that when freight rates are advanced, business concerns use the advance in rates as an excuse for advancing their prices much more than enough to cover the increase in rates.

If this argument were sound, it would be conclusive against advances in rates at any time, and especially at a time when the cost of living is so high as at present. But with all due respect to the eminent government officials who have made it, the *Railway Age* challenges its correctness and asserts that it cannot be successfully defended either on economic principles or by the concrete evidence of experience.

Why should an advance in freight rates have a different and greater effect upon prices to the consumer than an advance in any other kind of cost entering into the production and marketing of a commodity? To the manufacturer and merchant freight rates are merely one of their costs of doing business, like wages, prices of raw materials, cost of advertising, etc., and, considering the matter from a purely abstract point of view, there does not seem to be any more reason why it should be assumed that an advance in freight rates would result in a disproportionate increase of prices to the consumer than would an increase in wages, or taxes, or selling costs.

But it is not necessary to consider the question merely in the abstract. Freight rates actually have not produced any such effects. There were vast increases in the cost of living before any of the recent large advances in freight rates occurred. A little over a year ago the Railroad Wage Commission made an investigation of the increase in the cost of living and estimated that between December, 1915, and December, 1917, it had been about 45 per cent. During this period there had been no material advance in freight rates. On the contrary, the average rate per ton per mile was lower in 1917 than it was in 1915. It is a poor rule that does not work both ways in economics as well as in other matters. If an advance in freight rates would have such an important effect upon the cost of living, as is claimed, why did not the stationary position of railway rates

during this period keep down the cost of living? Mr. Woolley has indicated that freight rates ought to be "pegged" in future to prevent an increase in the cost of living. But they were very effectively pegged by the regulating authorities during the two years mentioned, and meantime the cost of living increased 45 per cent.

What has occurred since freight rates were advanced? The advance in eastern territory in 1918 was approximately 35 per cent and in the rest of the country 25 per cent. On the theory that any advance in freight rates results in a relatively much larger increase in the cost of living, it would appear that the increase in the cost of living, since these advances in rates were made, should have been much larger than it was before. If no advance in rates is accompanied by an advance of 45 per cent in the cost of living then it would appear that an advance in rates of 25 to 35 per cent should, on this theory, have resulted in an increase in the cost of living of at least 50 to 100 per cent; but really it has been much less than it was before.

Both reason and experience refute the argument that an advance in freight rates has any effects upon the cost of living which differ in kind or degree from the effects produced by an increase in any of the other costs of doing business. Freight rates are a factor in determining the prices at which goods are finally sold to the consumers and, therefore, affect the cost of living. But the same thing is true of every other element of industrial and commercial costs. Nobody would contend that the farmer, the manufacturer and the merchant should not advance their prices when an advance in prices is necessary in order to enable them, as classes, to offset increases in their expenses of doing business. There is no more ground for keeping down railway rates when an advance in rates is needed to cover advances in the cost of rendering the service of transportation, than there is for not advancing the prices of commodities when advances in them are needed to cover increases in the cost of producing and marketing them.

One most important point which seems to be overlooked by those who oppose advances in freight rates because of the supposed effect upon the cost of living is that if rates are not advanced and the government continues to guarantee the returns of the railroads, as Mr. Woolley suggests, taxes must be collected from the public in order to pay railroad deficits caused by the failure to advance the rates. Now, the effect which an increase in taxes produces is not exactly the same upon all classes of people as the effect of an advance in railway rates. The relative effects are influenced by the differences in the incidence of the taxes and railway rates. But, in the long run, a half billion dollars in taxes levied to pay a railroad deficit of that amount imposes as much of a burden upon the consuming public as would an advance in rates of a half billion dollars made to prevent the deficit from being incurred. Most taxes, like most freight rates, are finally passed along to the consumer. Furthermore, when all the cost of rendering transportation service is covered by the rates charged for it, the railways are almost certain to be more efficiently and economically operated than when the rates are made such that a deficit is incurred and the loss is recouped by taxation. One reason why government managed business almost always are extravagantly managed is that the managers know if they do not make them earn enough to pay expenses, the deficit can and will be defrayed from the public treasury.

Perhaps Director-General Hines is right in taking the position that an advance in rates should not be made until normal conditions have been restored and the amount of the advance which must be made, in order to cover all costs, including capital charges, can be accurately ascertained. But to talk about permanently keeping railway rates too low to cover the total cost of rendering the transportation service, as a means of holding down the cost of living, is, we submit, to talk economic nonsense.

## Letters to the Editor

### Reply of Corps of Engineers, U. S. A., to Proposed Dept. of Public Works

WASHINGTON, D. C.

TO THE EDITOR:

The long expected response of the Corps of Engineers, U. S. A., to the activities of the engineers, architects and constructors of the country looking toward the establishment of a National Department of Public Works has been made. It is in the form of a bill designated S. 1376, 66th Congress, 1st Session, introduced into the Senate on June 5, 1919, by Senator Ransdell, of Louisiana. It may be inferred that this senator is not prepared to father the measure for the customary legend at the head of the bill contains the additional words "by request" after Senator Ransdell's name.

The bill is 35 pages long and contains 29 sections. It proposes to create an "Auxiliary Engineer Corps" in the United States Army for duty on works of public improvement—a non-combative corps of engineers which shall be "under the command and direction of the Chief of Engineers, U. S. A. . . . Its personnel shall be assigned by the chief of engineers to duties under his charge; specifically on river and harbor improvements, inland waterways, locks and canals, fortifications, embankments, levees, dykes, breakwaters, piers, and in the supervision and in the construction of national highways and bridges, and to any other public work that shall be now or hereafter assigned to the chief of engineers under the War Department. This organization shall also perform the duty of guarding and protecting all national public works."

Whether or not the foregoing language places the construction of national highways and bridges under the chief of engineers and thereby increases the authority of the engineer corps beyond that now conferred upon it, is a question for the lawyers to determine. It may be observed, however, that, even if such authority is not specifically conferred, the language creates an "open sesame" and one is reminded of the ancient legend concerning the camel who received permission to place his nose in the tent. The bill is too long and comprehensive to be reviewed adequately here, but those who read it will have no question that it is the first step in the attempt, of which many of us have been aware, to militarize the public works functions of the federal government.

The Engineers, Architects and Constructors Conference on National Public Works took action at the recent Chicago meeting directly opposite in spirit and purport to that proposed under S. 1376. Therefore the officers of this federation are in duty bound to oppose this bill. In order that the engineers, architects and constructors of the country may be informed concerning the first steps taken in opposition the letter to Wesley L. Jones, chairman of the senate committee on commerce, to which the bill has been referred, is reproduced below.

"On June 5, Senator Ransdell introduced into the Senate, 'by request' a bill to create an auxiliary engineer corps in the United States army for duty on works of public improvement. It is numbered S. 1376 and has been referred to the committee on commerce.

"I have the honor to be chairman of a federation of societies with an aggregate membership of 105,000 engineers, architects and constructors. This federation, which is known as the 'Engineers', Architects' and Constructors' Conference on National Public Works,' is opposed to the provisions of the bill above named, and at its convention in Chicago, April 23 to 25, adopted a program contrary thereto in all respects.

"On behalf of the federation aforesaid, I respectfully request that when the committee on commerce designates S. 1376 for hear-

ing, said federation be given an opportunity to prepare and present its views.

"For more than 40 years, the engineers, architects and constructors of the United States have almost unanimously been advocating the consolidation of the engineering and construction work of the government into a department of public works. The United States stands practically alone among the great and small nations of the world in that it has no such department. The matter has been considered and acted upon from time to time by various engineering societies throughout the country but all efforts have heretofore been futile for two reasons: (a) the engineers, architects and constructors of the country have given local and sporadic rather than united and continuous support; (b) the corps of engineers of the United States army has always been able to defeat any proposal that has thus far been advanced to Congress. The engineers, architects and constructors of the country are now united and they propose to present to Congress in the near future a well considered plan for a Department of Public Works that will correct the present chaos in our national construction matters and achieve economy and efficiency.

"I will not burden you now with a detailed statement of the reasons which, after more than 40 years of mature consideration by well balanced men, prompt the forthcoming recommendations. With respect to S. 1376, we shall in due time endeavor to substantiate our belief that there is no more sure, certain and insidious way of accomplishing militarism in the United States than through the militarization of our public works. Heretofore, this militarization has extended principally to the rivers and harbors operations with results that have repeatedly been characterized in a way not at all favorable to the corps of engineers. The bill S. 1376 extends army control to public roads, bridges and any other public work that be now or hereafter assigned. This bill is merely a part of a very ambitious plan to place the army in the saddle over all engineering operations of the government.

"The genesis of S. 1376 is well known. You will find attached hereto a sample of propaganda circulated among the civilian force of the corps of engineers through the district office in New Orleans. It is hardly necessary to remind one as familiar with official army procedure as yourself that no civilian attached to the corps of engineers would be so venturesome as to distribute this amazing circular without 'knowledge and consent' of headquarters at Washington.

"It is a very long way from the war department to the capitol if one goes *via* New Orleans. The engineers, architects and constructors of the country are coming to the doors of Congress very soon, with a respectful petition which will be the result of 40 years of the best engineering thought. But in so doing, we shall remember the fundamental engineering axiom that a straight line is the shortest distance between two points."

Reference in the foregoing letter to organized propaganda will be made clear by the following abstract of the circular sent out from the district office of the engineer corps at New Orleans:

"Strictly Personal.—The purpose of this letter is to enlist all chief clerks in the U. S. engineer service in a 'push' to shove a bill through Congress for mobilizing an auxiliary engineer corps. A bill for this purpose was recently placed in the hands of Senator Joseph E. Ransdell with a view to having it introduced by request at the coming session of Congress. This bill provides for a complete organization from top to bottom—non-combative with a military status and under the direction of the chief of engineers, U. S. army, with the rank he now has—major-general—and the division engineers with the rank of brig.-general, and the district engineers with the rank of colonel; with provision for ranks for assistants below the district engineer. The corps is to be mobilized from the experienced men of all classes in the office and field now in the service. Its duties are as now—construction, care of maintenance of public works, and national highways and bridges to be added. Let us talk about national good roads; absolutely necessary for the welfare and prosperity of the nation.

"It provides for a three-year practical training period for all who enter the service and who have had no previous engineer experience before a man can get into the permanent corps, unless he qualifies for a commission before that time.

"It provides graded pay in the various classes of the personnel and also longevity pay of 5 per cent increase for every 3 years service, for eight three-year periods; besides the opportunity, if qualifications justify it, for promotion from class to class with higher pay in such class. It provides also for an efficiency board that shall pass upon the qualifications of the personnel—so that justice is done to all men; with reference to duties performed and rank and compensation, which any member of the corps is justly entitled to.

"It is essential to watch progress at Washington. Essential to have the bill introduced in the coming session, and essential to keep it going till passed.

"When you hear that the bill is introduced call on your congressman or senator for printed copy.

"Talk for such legislation—be enthusiastic over it—get your business friends to write letters requesting the passage of the bill. Keep at it and don't let it rest. It will take time to get the bill through.

"It may be necessary to keep a man in Washington under pay to 'mark time' and keep a sharp lookout. All the engineering districts, I feel sure, will rally to the necessary financial assistance."

M. O. LEIGHTON,

Chairman, National Service Committee, Engineering Council.

## "Excess Earnings" and Better Transportation

NEW ORLEANS.

TO THE EDITOR:

It would be trite to say that probably the most serious and important problem confronting the people of the United States today is that regarding the future of the transportation lines; and there have been about as many plans put forward for solving it as there have been patented car couplers.

The greatest difficulty that has presented itself with regard to proper regulation of the railroads in the future seems to be how to make an adjustment of rates as between the strong and the weak lines, which will not allow the strong too great compensation and the weak too little.

A number of plans have been suggested to overcome this difficulty, but none seems to be practicable or a proper remedy for the situation. Some of the plans propose to fix a reasonable return as a maximum that should be accorded to any transportation line for its efforts, anything that might be earned in excess of that amount to revert to the government. Another plan—that of the labor organizations—is that the excess should go to the employees or be divided between the government and employees. None of these plans would make for the greatest effort and efficiency in operation.

It seems to the writer that a proper solution would be for the excess to revert to the line which had earned it—not to be paid out in dividends to stockholders, but to be put back into the individual property which had demonstrated efficiency of operation in order to make that operation even more efficient, and to provide greater facilities to the patrons of that individual road who had furnished the business from which this excess had been derived, and who had thereby contributed this excess.

It should be the duty of some governmental agency, in combination with the railroad executives, to see that this money was spent in a way that would inure to the public benefit through increased facilities and better and safer transportation.

It has seemed to the writer that the government originally approached railroad regulation from the wrong angle. At the time it undertook to regulate the railroads many of them were newly built through sparsely settled regions, and if, instead of giving the principal attention to the regulation of rates, they had encouraged the carriers to charge rates reasonable but sufficiently high to show good returns, and then required a fair amount of those returns to be put back into the property for better facilities and conveniences for the public, much better results would have been obtained, not only for the public in general but for the carriers, than through simply reducing rates to a starvation basis.

Transportation as sold by railroads varies in value like any other commodity. Buyers of transportation can afford to pay a better price for good quality than for an inferior grade.

It is very doubtful if, under the most favorable conditions, even the most efficiently operated road will obtain any excessive amount beyond a fair return on its investment for many years to come, but such a plan as described above might be adopted for a period of, say, 5 to 10 years, and if condi-

tions so improve within that period as to make earnings in excess of a fair return on investment too large to be expended on a given property, it is reasonable to assume that the condition of the weaker lines would be likewise improved, making practicable a reduction in rates, thereby resulting in further benefits to shippers and the consuming public.

CHARLES S. FAY,

General Freight Agent, Southern Pacific Lines in Louisiana.

## Water Treatment and Anti-Foaming Compound

CHICAGO, Ill.

TO THE EDITOR:

The description given by Mr. Koyl of the water treatment system in use on the Great Northern (*Railway Age*, April 25, 1919, page 1053) is most instructive and the problem as touched upon is of such tremendous importance as to warrant the most extensive and serious discussion. In his summary of the results obtained it seems a little disappointing that Mr. Koyl has not gone into the details of costs. It is evident that the results would justify very considerable expense, but, of course, there is a limit beyond which even the list of benefits recited would not justify the expenditures made necessary. This limit is very evidently the balance between the cost of boiler maintenance and the interest, maintenance and depreciation of the equipment installed for water treatment.

Mr. Koyl states that foaming has not been abolished, but he seems to convey the impression that the present foaming tendencies are only those due to the small amount of calcium carbonate left in the water after treatment. This is not believed to be quite a satisfactory impression under which to close the subject. On the contrary, it seems logical to assume that the sodium salts added and left in the solution by the treatment will actually tend to increase the foaming condition.

This is the experience of nearly every railroad which has installed the wayside treating system described by Mr. Koyl, and there is no good reason to deny or overlook this condition, because the benefits gained from water treatment seem so great as to make it a good and economical practice to acknowledge the foaming tendency and meet it with the consistent and conservative use of anti-foaming placed on the engines.

Curiously enough, there seems to be a decided tendency on the part of water engineers to avoid discussion of this detail, and yet nearly every railroad in the West, using treated water, is also using anti-foaming compound, and rightly so. It makes no difference whether the foaming tendency is natural or artificially created, the argument for its cure is simple and effective, since it is based on dollars and cents, and is not open to difference of opinion.

The use of treated water makes it unnecessary to wash boilers frequently, so far as getting rid of sludge is concerned. Under average conditions, with treated water the boilers could be run much farther without danger of mud burning than they could with the raw water usually available in the same districts, but, unfortunately, after the installation of the treating plants, the boilers must be washed for a new reason—to rid them of the concentration of foaming salts resulting from the treatment.

If, therefore, the foaming tendency can be obviated by increasing the surface tension through the conservative use of anti-foaming compound, we have for comparison the cost of a boiler washout as \$4, while the compound used for an additional round trip costs from 40 cents to 80 cents. The sharper engine; the reduction in engine lay-over hours; the proportional obviation of evils resulting from strains of un-

equal temperatures in cooling and washing and firing up, are all in favor of the use of anti-foaming compound. The above being assumed as facts—and they are—every consideration of the cost of wayside treatment must carry the admission that compounds must still be used on the line and their cost must be added.

Mr. Koyl quotes a letter from the general master mechanic of the central district of his railroad, in which there appears the statement that the boilers are actually being washed every round trip. A later statement by Mr. Koyl is to the effect that the boiler washing in the treated water districts is about half what it was. It is assumed that in those districts not covered by the general master mechanic's letter the boiler washing has been remarkably reduced and probably by the use of anti-foaming compound placed on the engines.

Pitting and grooving not having been abolished, Mr. Koyl states that this is not due to chemical action of the water. It is probable that every operator of motive power west of the Mississippi river would be interested in discovering what does cause this pitting and grooving and how it can be proved that it is not at least partially a result of chemical action. It would also be interesting to know whether it was decreased or increased by the installation of the water treatment.

L. F. WILSON,

Vice-President, The Bird-Archer Company, Chicago.

## A Ticket Agent's Reminiscences

KANSAS CITY, Mo.

TO THE EDITOR:

I have read with much interest Mr. Cullen's address on the ticket salesman as printed in your issue of April 11, and it takes me back to the old days, the early eighties, when the ticket agent was a salesman of the first rank. Railroads at that time recognized this salesmanship. And not only your own road; connecting lines offered the agent a bonus in the way of commissions. Many an old-timer will recall going out into the country and soliciting passenger business for his road. Many a time the writer, when he had aroused sufficient interest to get them to come into town to start on the trip would explain the routes and rates, and then take the passengers to his home and have his wife entertain them until train time, to keep competitors away.

How different it is now! I went recently to a "modern" ticket office. There were about forty customers, and only ten men to wait on them. I waited 32 minutes before I could get attention; 30 people were waiting on an average 32 minutes; and yet the United States Railroad Administration calls this economy!

Three years ago you could telephone and a ticket would be sent to you by a courteous messenger. The ticket agents, not only in the larger cities but in the smaller towns as well, vied with each other in securing business. Now, you wait to buy a ticket, you wait for belated trains and you take an upper, if you are lucky enough to get one. There is, however, one redeeming feature in this—it makes old men young, in that they have learned to climb down from an upper without disturbing the porter.

In the old days, the dining car conductor would ask you if your meals were satisfactory. Now, you take what you can get, and if it isn't satisfactory, you can leave it. In the old days, the train conductor was proud of his train, and would remark to his friends, "We will reach your town on time," or if they were a few minutes late, he would apologize for it and explain the reason. Now, they are indifferent. The whole service has gone to H— along with individual initiative.

E. J. KNICKERBOCKER.

# Army Supply Bases Useful Adjuncts to Railroads

The Facilities Made Necessary by the War Were Planned  
to Meet Peace Time Conditions

INCLUDED IN AN ENGINEERING PROGRAM, involving the expenditure of more than \$1,200,000,000, embracing 581 major projects, located in 547 different and widely separated localities, handled by the construction division of the Army during the 18 months that this country was at war, was a comprehensive scheme for the development of port and terminal facilities sufficient for the storage and transshipment of supplies for the expeditionary forces. The plans provided for the construction of port terminals at Boston, Mass.; at Brooklyn, N. Y.; Port Newark, N. J.; Philadelphia, Pa.; Norfolk, Va.; Charleston, S. C., and New Orleans, La., and for interior warehouses at Chicago; Columbus, Ohio; Jefferson, Ind.; Pittsburgh, Pa.; New Cumberland, Pa.; Schenectady, N. Y., and St. Louis, Mo.

Each of the 14 layouts was planned and built as a complete project in itself and each one is a part of a co-ordinated plan designed to relieve the congestion of transportation facilities

In taking up the studies of the amount of space required at the port terminals and for the proper handling of freight in the interior, the amount of tonnage that had to be shipped abroad each month was first ascertained. From this was deducted the amount of space required at the ports to accommodate this volume of freight, the number of cars to be handled daily and the size of the yards necessary to handle these cars. In other words, the terminals were planned as a complete whole to meet certain definite conditions, with allowances for increased demands. They were built on vacant land, with room for expansion and with adequate space for yards and docks. In all, a total area of about 1,200 acres was required at the seaboard for the seven port terminals.

Generally speaking, two types each of port terminals and interior warehouses were built. In addition to the railroad facilities, the port terminals consist of one-story buildings

Administration Building, Main Building, Wharf Shed, Boston Terminal

resulting from the convergence of overseas freight at the seaboard, largely at New York; to permit continuous operation of manufacturing plants in the interior; to ensure maximum utilization of cars and permit the diversion of freight from one port to another to meet the changing conditions.

The storage areas provided in the port terminals supply the reservoirs to care for the material received at the seaboard during the lapses that are bound to occur in the schedules of ships. They are necessary not only because of the fact that a ship cannot arrive, discharge its cargo, load and depart on a rigidly fixed schedule, but also because of the irregularity in the arrival of shipments from the interior. The storage areas or interior warehouses at the sources of supply permit the manufacturing plants in the interior to work at all times to their maximum capacity by providing the outlet for the finished products without excessive storage space at the plants. In connection with the port terminals they give the opportunity for loading the materials in car load and train load lots, permitting the maximum use of cars, helping largely to overcome the necessity for using cars for storehouse purposes. To ensure flexibility in the system and to permit the diversion of freight from one port to another as occasion demands, traffic routes from each of the interior warehouses to all of the port terminals were definitely worked out prior to the final decision as to locations.

for one type and multi-story for the other, the same general division of type holding for the interior warehouses.

## The Port Terminals

Port Newark terminal is a typical example of the one-story type port terminal. It is located on the Jersey marshes about three miles from the city of Newark. It fronts on a ship canal extending from Newark Bay and has a direct rail connection with the Central Railroad of New Jersey.

The storage plant consists of nine warehouses and two open sheds, all of the buildings being 161 ft. wide and 1,150 ft. long. The warehouses furnish a storage area of 1,750,000 sq. ft. and the sheds 300,000 sq. ft. All of the buildings were placed at right angles to the waterfront, where a dock 3,300 ft. long and 80 ft. wide is provided.

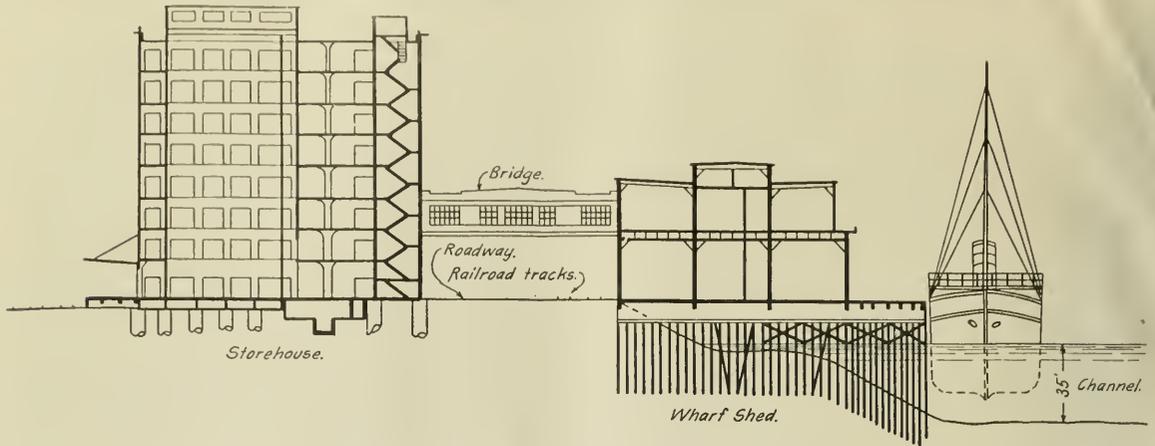

Each of the sheds and warehouses is provided with roadways on one side and with track facilities on the other. The arrangement of the roadways and tracks in reference to the buildings is shown on the general plan. It will be noted that the buildings are parallel to each other and separated by alternate roadways and railroad tracks. The warehouses are provided with platforms 18 ft. wide on both the track and roadway sides. At the open shed a platform also 18 ft. wide is provided on the track side. The roadways are 70 ft. wide and the tracks serving the platforms are spaced on 14

ft. centers with a distance from adjoining platforms to the center line of near track of 6 ft.

The warehouses are entirely on pile foundations and are all one story high with plank floor, 6-in. terra cotta block walls and mill construction roof, except one, which has brick

face of the many difficulties arising from weather conditions.

One of the multi-story type port terminals was built at Boston, Mass. This plant includes the army supply base and two navy structures with their supplemental docks and wharfs, the whole comprising a project costing approxi-

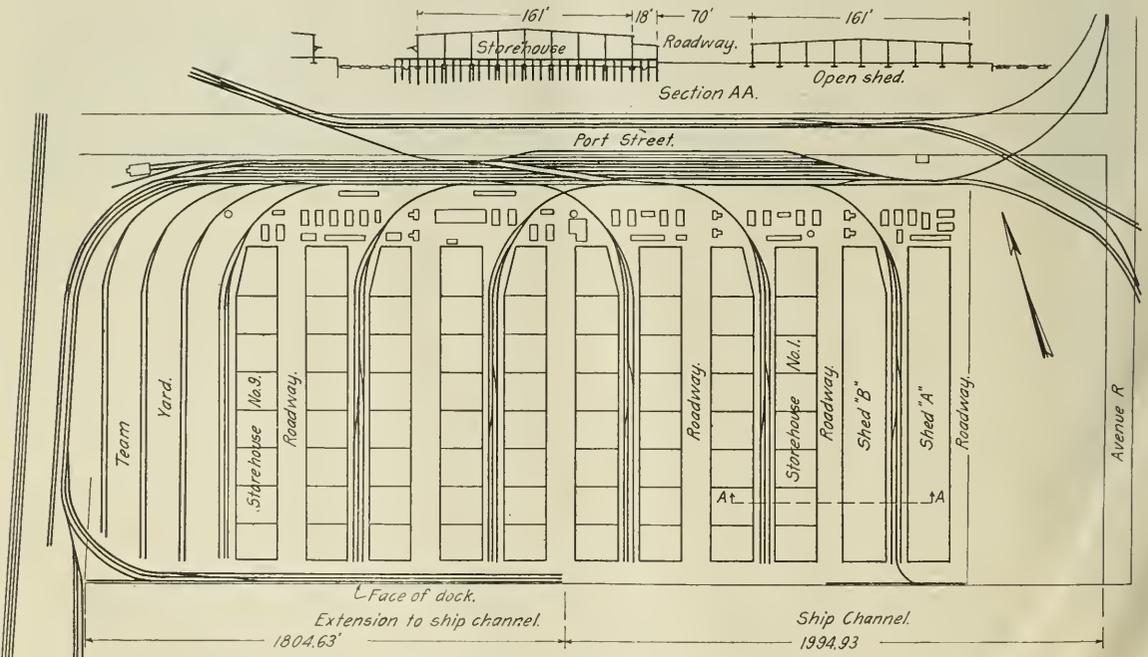

Cross Section Through Boston Storehouse and Wharf Shed

walls. This was carried up over a part of its length to provide space for office use.

The construction involved 800,000 cu. yd. of hydraulic fill, 600,000 piles in the foundations, 28,000,000 ft. B. M. of lumber, 3,500,000 bricks, 400,000 sq. ft. of terra cotta and

mately \$28,000,000, and covering 37 acres of land and 20 acres of water. The main building is an eight-story reinforced concrete warehouse of flat slab construction, with the first floor designed to carry 500 lb. per sq. ft. and the upper floors 300 lb. per sq. ft. and having an area of 126 ft. by

General Plan of the Newark Terminal

approximately 15 miles of railway tracks. During the construction, which was completed within three months, more than 10,000 men were employed at one time and 67 pile drivers and other equipment in proportion were used simultaneously in order to complete the project promptly in the

1,638 ft. The exterior is finished concrete. The first concrete was poured on May 14, 1918, and the last on October 3 of the same year. There are 4,000 lineal feet of wharfs and 2,860,700 sq. ft. of storage space in the eight-story building and the adjacent pier shed. A railroad supporting yard has

been built providing  $11\frac{1}{2}$  miles of single track, with a capacity for 722 cars and a terminal yard with  $6\frac{1}{2}$  miles of track, giving a total of permanent track of approximately 18 miles.

The project includes the main building 126 ft. by 1,638 ft. 8 stories high, the power house and coal crusher, 80 ft. by 85 ft. by 78 ft. high, the main building wharf shed 2 stories high, 100 ft. by 1,638 ft., and the navy pier sheds,

A View of the Interior Warehouse at Chicago

two 3-story buildings, each 100 ft. by 924 ft., a one-story and basement electric sub-station, 86 ft. by 52 ft., a 3-story and basement administration building, 122 ft. by 88 ft., designed for three additional stories, the west open wharf, 120 ft. by 1,100 ft., and the east open wharf, 72 ft. by 580 ft.

The principal items in the construction of this project include 2,500,000 cu. yd. of dredging, 13,000 tons of reinforcing steel, 300 tons of structural steel, 7 miles of sewer and water pipes laid, 30,000 wood piles, 6,650 lb. Raymond concrete piles, 240,000 cu. yds. of concrete, 5,700,000 sq. ft. of forms built and erected, 30 miles of temporary and permanent tracks and 265,000 sq. ft. of windows set and glazed. In carrying out this project 720 cars of material were received and unloaded. This plant fronts for its entire length

The sections through the pier sheds and the storehouse and wharf shed show the provisions made for the convenient handling of stored material. Bridges are provided at both the upper floors of the pier sheds and between the second floors of the wharf shed and the storehouse.

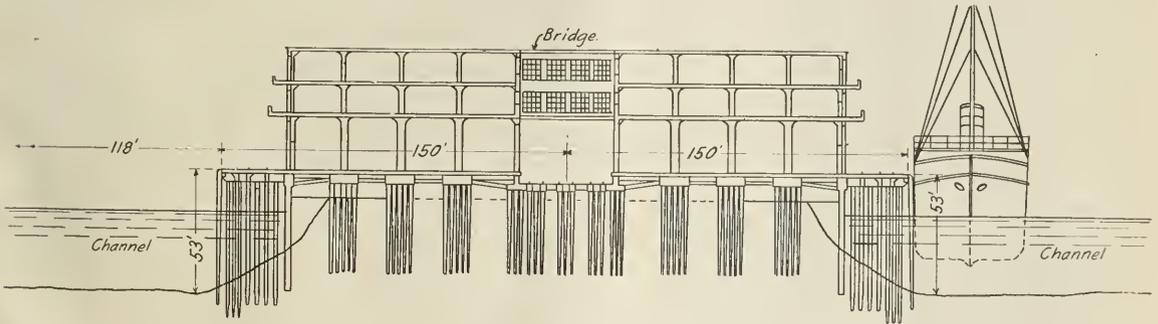

The Interior Warehouses

The storage warehouse at Columbus, Ohio, including nine warehouses supplying a total floor area of 2,000,000 sq. ft. on a site, including 300 acres of land, is an example of the one-story type of interior warehouses. The warehouses are 160 ft. wide and 1,540 ft. long, and are all one story high except one, which provides office space on the second floor of 2,200 sq. ft. One building is the open type shed with frame roof and timber floor, the remaining eight being constructed

View of the Tracks, Main Building, Wharf Sheds and the Connecting Bridges, Boston Terminal

with tile exterior walls, 16 ft. high, on concrete foundations, with roofs of mill type construction and concrete floors. These buildings are each divided by brick firewalls into 11 sections. The track sides of the buildings are provided with

Cross Section of the Pier Shed

on a channel leading from the main ship canal in Boston harbor with a second channel back of the pier shed. The general layout map shows its location in reference to the water facilities and the supporting yard facilities, the yard having direct rail connection with the New York, New Haven & Hartford Railroad.

From north to south the service tracks include three tracks serving the storehouse on the north, two tracks between the storehouse and the wharf shed, and two tracks south of the wharf shed extending the full length of the pier. These are so arranged to permit freight to be unloaded simultaneously direct from the cars to ships, into the pier shed or wharf shed, or into the warehouse for storage or classification, from which it can later be moved to the piers by means of elevators and storage battery trucks.

covered unloading platforms 12 ft. wide, running the full length. A classification and storage yard of 500 cars capacity and of 12 miles of tracks is provided, allowing 100 cars per day to be unloaded. Four and a half miles of concrete roads have been constructed as well as a complete sewer and water system. Electric power is provided for the operation of tiering machines and battery-charging equipment, the batteries being for the tractors, which are used to facilitate the operation of the plant.

The second type of interior warehouse is of multi-story reinforced concrete fireproof construction throughout. The St. Louis warehouse, a reinforced concrete skeleton structure veneered with brick, is an example of this type. It is designed in flat slab construction for a live load of 500 lb. per sq. ft., and is 100 ft. wide and 600 ft. long. The center section is

7 stories, including basement, and end sections are six stories.

The plans for these facilities were developed under the direction of Francis Lee Stuart as chairman of a sub-committee appointed by the War Industries Board. The construction was by the construction division of the Army.

### Abatement of the Whistle Nuisance

AT TYRONE, PA., on the Middle Division of the Pennsylvania Railroad, conductors of passenger trains who have to call in a flagman do it by means of an electric bell which is fixed on a post several hundred feet back of the train and is controlled by a push button on the station platform. This simple arrangement for reducing the disturbance to the neighborhood by the noise of the locomotive whistle was put into effect on June 4, and it does away with a large amount of whistling, as most of the passenger trains stopping at Tyrone have large quantities of baggage and mail to discharge or to take on. The station at this place is situated on a curve, and a high bank on the inner side of the curve interferes with easy communication between the standing train and any flagman who may be back the regulation distance, or even a shorter distance. There has been considerable inconvenience by reason of flagmen not hearing the engine whistle, particularly when the sound of the whistle was partly drowned by the noise of a moving freight train. There are four main tracks on this part of the road.

Bells are provided only for the passenger tracks. Each bell circuit is arranged to ring two bells, one a short distance from the standing train and one farther back; and for each circuit there are two push buttons so as to make it easy for the conductor to reach one or the other without loss of time.

The conductor, in sounding the bell, gives the regulation number of sounds, as prescribed by rules 14d and 14e. It has been found that there is in every case a saving of some seconds of time as compared with having first to inform the engineman and then have the signal given by the whistle.

The whistling of the large number of trains that stop at Tyrone in the course of every 24 hours, must, of course, have been something of an annoyance to the people of Tyrone; but the officer of the road who gives us this information says that, so far as he knows, no protest had been made.

The bells are located as follows: westbound, track No. 3, at the east end of the platform and at 600 ft. farther east; for eastbound trains, track No. 2, at the west end of the platform and 600 ft. farther west. The platforms are about 1,000 ft. long. For a train of that length the farthest bell is only 600 ft. from the rear car; but the bell is loud enough to be heard a good distance, and the flagman can go as far as necessary to afford full protection to his train.

### Train Accidents in May

THE FOLLOWING is a list of the most notable train accidents that occurred on the railways of the United States in the month of May, 1919:

COLLISIONS						
Date	Road	Place	Kind of accident	Kind of train	Kil'd	Inj'd
3.	Northern Pacific	Forsythe	xc	P. & F.	0	2
DERAILMENTS						
Date	Road	Place	Cause of derailment	Kind of train	Kil'd	Inj'd
2.	Seaboard A. L.	Wadesboro	malice	P.	2	8
8.	Balt. & Ohio	Pittsburgh	d. switch	F.	1	0
11.	Wabash	Moulton, Ia.	h. rail	F.	3	2
12.	Central of N. J.	Jersey City	unx	P.	1	2
21.	N. Y. N. H. & H. W.	Mystic	h. rail	P.	0	2
21.	Mo. K. & Tex.	Alvarado	d. track	P.	0	4
23.	Texas & Pacific	Gordon	cow	P.	0	4
25.	Penn.	E. Palestine	boiler	F.	2	1
28.	Texas & Pacific	Marshall	ms	P.	0	16
30.	Balt. & Ohio	Greenfield, O.	unx	P.	1	4
OTHER ACCIDENTS						
Date	Road	Place	Cause of accident	Kind of train	Kil'd	Inj'd
13.	Seaboard A. L.	Method, N. C.	boiler	F.	3	0

The trains in collision at Forsythe, Mont., on the 3rd, about 1 a. m., were eastbound passenger No. 4 and a switching freight train, on a side track. The passenger train ran over a misplaced switch and into the switching engine, damaging both engines, two baggage cars and four freight cars. Two employees were injured. The yard train was switching on the main track without having protected against the passenger train, which was behind time.

The train derailed on the Seaboard Air Line at Wadesboro, N. C., on the 2d, was southbound passenger No. 13. The locomotive was overturned, and the engineman and fireman were killed. Six passengers and 2 trainmen were injured. The derailment was caused by a malicious obstruction.

The train derailed at Greenfield Avenue, Pittsburgh, Pa., on the 8th, was a westbound freight. The locomotive ran off the track at a defective switch and was overturned. T. W. Barrett, trainmaster of the Pittsburgh district, standing on the tender, was pinned under the wreck and was killed.

The train derailed near Moulton, Iowa, on the 11th, was through freight No. 95. One trainman and two trespassers were killed, and two trespassers were injured. The derailment was caused by a broken rail.

The train derailed on the 12th at Jersey City, N. J., was a local eastbound passenger. The locomotive was overturned, and four passenger cars were thrown off the rails. The engineman was killed and two other employees were injured. The train was nearing the terminal train shed, and was running at moderate speed.

The train derailed at West Mystic, Conn., on the 21st, was west bound passenger No. 5. The four leading cars in the train filled with mail and express matter were thrown off the track by a broken rail and fell down a bank. Two trainmen were slightly injured. The rail had been weakened by a transverse fissure.

The train derailed near Alvarado, Tex., on the 21st, was northbound passenger No. 28. Three passengers were slightly injured. The derailment was due to soft track, caused by very heavy rains.

The train derailed at Gordon, Tex., on the 23rd, was the westbound Sunshine Special. Three passengers and one trainman were injured. The train was thrown off the track by striking a cow.

The train derailed on the Pennsylvania Railroad near East Palestine, Ohio, on the 25th, was a westbound through freight. The locomotive, a new one, belonging to the Chi-

Abbreviations and marks used in Accident List:  
 rc. Rear collision—bc, Butting collision—xc, Other collisions—b, Broken—d, Defective—unf, Unforeseen obstruction—unx, Unexp. plained—derail, Open derailing switch—ms, Misplaced switch—acc. etc., Accidental obstruction—malice, Malicious obstruction of track, etc.—boiler, Explosion of locomotive on road—fire, Cars burned while running—P. or Pass., Passenger train—F. or Ft., Freight train (including engine engines, work trains, etc.)—Asterisk, Wreck wholly or partly destroyed by fire—Dagger, One or more passengers killed.

cago, Burlington & Quincy, was wrecked by the explosion of its boiler, and two men were killed, the engineman of the train and a messenger for the Baldwin Locomotive Works. The fireman was seriously injured. Five cars were knocked off the track. The explosion was due to low water.

The train derailed near Marshall, Tex., on the morning of the 28th, was westbound passenger No. 25. The locomotive was derailed and overturned at a misplaced switch. The fireman and 17 passengers were injured.

The train derailed at Greenfield, Ohio, on the 30th, was westbound passenger No. 3. Four coaches were ditched. These cars were occupied by soldiers returning home to Arizona and New Mexico; one soldier was killed and four were injured.

The train involved in the accident at Method, N. C., on the 13th, was southbound freight No. 89. The locomotive, a new Mallet, was wrecked by the explosion of the boiler, and the engineman, fireman and one brakeman were killed. No cars were derailed.

*Electric Car Accidents.*—Of accidents to electric cars reported in the newspapers as occurring in the month of May, the only one thus far noted in which there was a fatality is that at Noblesville, Ind., on the night of the 24th, when a runaway car was derailed in the business part of the city, killing one person and injuring 23, and wrecking ten automobiles.

*Canada.*—Westbound passenger train No. 3, of the Wabash Railroad, was derailed by the falling of a brakebeam near Cayuga, Ont., on the 8th, and the engineman and fireman were killed. Forty passengers were slightly injured. A derailment on the Grand Trunk near Paris Junction, on the 22nd, resulted in the destruction by fire of ten cars containing oil, gasoline, coke and other merchandise.

## Country-Wide Safety-First

**A.** F. DUFFY, manager of the Safety Section, Division of Operation, United States Railroad Administration, has issued a bulletin giving in brief form the results of the "no-accident month" campaign in the Southwestern Region. Full reports are not yet in, but "splendid results have been shown." The Pyeatt Lines record a reduction of 71 per cent; the Edson Lines, 70 per cent; the Whitehead Lines, 64 per cent, and the Johnson Lines, 67 per cent. The first three lines mentioned above, so far, are the only ones that have placed expert and experienced inspectors in the field.

This was for the month of May. For the first three months of the year there were marked reductions in deaths and injuries to employees. Interesting information is given in the bulletin concerning other Regions. One small road in the Northwestern Region, in the month of March, reported none killed and none injured, as compared with four killed and 31 injured in March of last year. The Central of Georgia reports that the Candler Silver Trophy has been awarded to the Macon Division, which, under the supervision of Superintendent M. B. Smith, worked 665,139 man-hours during the first three months of 1919, with four injuries reportable. The Columbus shops, under Master Mechanic E. G. Gross, worked, during the three months, 333,452 man-hours, with no injuries reportable.

One large road in the Allegheny Region, in its report for April makes prominent the fact that 46 per cent of all bodily injuries and 37.5 per cent of all fatalities were those of persons who had been in the service less than one year. In the shops more than one-half of all injuries were sustained by men in the service less than one year, and the three men killed were all new employees. The proper education of new men is a serious duty. Another road shows that a large

number of personal injuries happened to men in places not properly provided with artificial light. Keeping reflectors clean and having the upper part of the walls of shops properly whitened at all times, are important elements of safety. Keeping windows clean usually increases natural light 25 per cent.

Mr. Duffy calls attention to the fact that the Safety Section has been endorsed by the votes of the Grand Lodges of all the railroad brotherhoods.

A tabular statement showing totals in each of the seven regions shows on class I railroads for the month of March, 2,072 meetings of safety committees at which the aggregate attendance was 32,249. The record shows that at each of these meetings some officers or employees who ought to have attended were absent, and the aggregate absences for the month of March were 5,530, or about one-seventh of the total membership. About 100 safety rallies were held, at which were present 19,268 employees. The total number of employees killed on these roads in the month of March was 169, as compared with 264 in March, 1918.

## The Reorganization of the American Railroad Association

**A**T A MEETING of the Executive Committee of the reorganized American Railroad Association, which was held in Atlantic City on Thursday of last week, the following officers for the ensuing year were elected:

President, R. H. Aishton, regional director, Northwestern Region.

R. H. Aishton  
President, American Railroad Association

First vice-president, W. T. Tyler, director of the Division of Operation, United States Railroad Administration.

Second vice-president, E. H. Coapman, federal manager Southern Railroad.

General secretary and treasurer, J. E. Fairbanks.

Assistant general secretary and assistant treasurer, H. J. Forster.

General Secretary Fairbanks will in future have headquarters in both New York and Chicago. The offices of the association in Chicago will be located in the Manhattan Building. Activities of the mechanical, engineering, traffic and transportation sections will be carried on from Chicago. The treasurer will be located in New York and activities of the operating, telegraph and telephone, signal, transportation and purchases and stores sections will be carried on from New York.

The Executive Committee now comprises 20 members, including the directors of operation, of accounting and of capital expenditures of the Railroad Administration, the seven

## Orders of the Regional Directors

**S**TANDARD STEAM HOSE COUPLING.—Order 213 of the Southwestern regional director states that an investigation of complaints received has developed the fact that some railroads were using a steam hose coupling of an entirely different type from that prescribed by the Master Car Builders' Association. A committee on standards has made an exhaustive investigation of steam hose couplings and it has been agreed that the standard steam hose coupling shall have M. C. B. contour and bore and a common standard gasket. The angle of the coupler shall be 20 deg. and the

W. T. Tyler,  
First Vice-President, American Railroad Association

E. H. Coapman,  
Second Vice-President, American Railroad Association

regional directors and the federal managers of seven individual roads. The meeting of the Executive Committee in Atlantic City was fully reported in the *Railway Age Daily*, edition of Friday, June 20, page 1579.

Great quantities of perishable freight were delayed at inbound freight stations in New York City this week because of a strike of the teamsters, employed by the wholesale dealers and jobbers in fruit and fresh vegetables, said to number 3,700 men. As we go to press the merchants appear to be making no concession to the strikers, having employed some new men, and having made arrangements for police protection to prevent interference with their wagons and trucks. On Monday the number of carloads of produce waiting at the piers of the Erie Railroad, to be delivered to consignees, was reported as 35 of green fruit, 52 of melons, 64 of oranges and 1 of apples. At the Pennsylvania piers there were 35 cars of peaches, 5 of melons, 42 of cucumbers, 39 of tomatoes, 123 of potatoes, 12 of onions and 31 cars of miscellaneous vegetables. The Old Dominion Steamship Company, at its docks on the North river had 10,000 barrels of potatoes, 3,800 barrels of cucumbers, 1,100 barrels of cabbages, 550 crates of onions, 100 barrels of squash and 5,000 packages of beans. Very large losses by deterioration of the fruit and vegetables are sure to be sustained, and on Wednesday some of the merchants estimated the total as \$1,000,000.

locking arrangement shall be similar to the type S-4 coupler, gasket to be made of composition and to be of the fixed type. The standard must be adhered to by all railroads under federal control where it is necessary to buy new couplings.

**Sampling Grain in Transit.**—Circular 220 of the Southwestern regional director quotes a recommendation of the Grain Dealers' National Association that grain doors of cars should have, at the top, boards not more than 6 in. wide, so that inspectors may inspect without destroying an unnecessary quantity of lumber.

**Public Improvements; Special Assessments.**—Circular 223 of the Southwestern regional director quotes the announcement of the Director General issued on June 2, relative to the method of handling public improvements or special assessments against railroads involving charges against capital account. This order supersedes all previous circulars and orders in this region concerning special improvement assessments and other charges against capital account based on public improvements under either special or general law.

The War Finance Corporation has announced the following new loans to railroad companies: Missouri, Kansas & Texas, \$976,000; Pennsylvania, \$12,260,000; Lehigh Valley, \$800,000; Illinois Central, \$1,500,000; Wabash, \$92,800; Erie, \$800,000; Seaboard Air Line, \$135,000; Chicago & Alton, \$80,000.

# Executive Suggests Relieving I. C. C. of Power\*

E. P. Ripley, President of the Santa Fe, Favors Appointment of  
a New Body to Control Railways

ONE OF THE MANY PROBLEMS that is troubling the American public today is service. There is trouble with service everywhere; there is trouble with service in the shop, in the factory, in the trades, in the club. The trouble everywhere is that there is practically no service, or that service is inefficient; that it is not half what it used to be. I think the real trouble is that there is no master. I think the work done under a master is always the best work. It is not derogatory to anybody to have a master. Every one interested in the accomplishments of any concern, whatever may be the business of such concern, is responsible to some one as a master. Everybody must account to somebody for his actions. Today we seem to have gotten away from that, to such an extent that every one is a law unto himself. To this extent we are Bolshevists, and are imitating Russia. It is this disorganization which accounts for the lack of service and the actual lack of production.

It is a matter of common knowledge that the railroads of this country were taken over by the United States Government on the first of January, 1918. There may or there may not have been good reasons for this. West of Chicago there was no good reason for doing so; there had been no failure on the part of the railroads to do their work and things were going on as well as always. East of Chicago there may have been good reason because of the tremendous—fictitious—impetus given to business by the war throughout the country generally. At the same time it was an open question whether, if the railroads had been allowed to throw aside all laws and had been permitted to do what the Administration did in throwing the laws of the country into the discard, and do things they had prohibited us from doing, the results would not have been equally satisfactory. It is not for me to say what the results have been so far as service to the public is concerned; that is something they may judge for themselves. Every one has had experience and can judge for himself. At all events it seems to have been borne in upon the Administration and upon Congress that the experiment of government operation has not been an unmitigated success.

I noticed that the bulletin board downstairs says "What shall we do with the Railroads?" I find it a good deal easier to criticize plans that have been suggested than to offer plans of my own. Almost everybody in Congress and I think almost everybody out of Congress has an idea as to the plan which should be operative. They all admit that the present condition can not go on any longer, but the plans for a solution range from the plan of Mr. Plumb, in behalf of the employees, who has a suggestion that the government buy the railroads and form a directorate of which the employees should be in the majority, to the plan of Mr. Warfield, representing the security holders, who practically does not want any limitations put on the earnings.

I do not think that Congress will ever pass any law which does not provide for some kind of regulation, there being apparently a fixed idea in the minds of some people that a curb must be put on the "rapacity" of the railroads. What opportunity the railroads have had to demonstrate the possession of this quality I am unable to remember. I can not remember when we were not very strictly limited in our income and more or less affected by law in our outfit.

The plan of Mr. Cummins provides for a small guaranty—he says from 4 per cent to 4½ per cent on the value. He is indefinite as to how he defines value. Presumably it is the

valuation now going on under the auspices of the Interstate Commerce Commission, which is based primarily so far on the prices of 1914. It is a well known fact that the prices of 1914 are at least 40 per cent below those of today, and that 4½ per cent today is equivalent to about 2¼ per cent in the former purchasing power of money, so that with the short valuation and short income it does not leave very much for the widows, orphans, insurance companies, etc., who hold the securities, and bought them when a 4½ per cent return meant 4½ per cent.

The plan of Mr. Warfield also provides, not in fact although in theory, for a guaranty of earnings; that is, the Interstate Commerce Commission shall be in full charge of rates and practically everything, including wages; that the country shall be divided into regional groups, and that the rates in those groups shall be so fixed as to bring about a certain amount of revenue within those groups. This is a very devious and complicated method. I do not believe there is any possible way of providing a set of rates which will bring about such results without doing away with all uniformity and without bringing about the very discrimination which it is the desire of the country to avoid. I do not believe it is possible to make a series of rates to bring about a given result which will not result in somebody either getting too much money or too little, as the case may be. It will vary also from year to year. It seems to me the plan is objectionable in that regard. It is also objectionable in my mind because it still allows a control of railroads by the states that have heretofore bedeviled the situation in their own interests. If states like Texas, which undertakes to say "Texas for the Texans" and to build a Chinese wall so that no one else can do business there, can do this sort of thing it seems as though there ought to be some national body which could intervene. The same spirit has taken possession of some other states, but notably Texas.

Still a third plan, one which is presented by Congressman Esch of Wisconsin and Senator Pomerene of Ohio. This bill attempts to restore the railroads on the 1st of January next to their owners, but without any recommendations other than that it provides for a large extension of the powers of the Interstate Commerce Commission, and practically makes them the court of last resort. It provides that the Interstate Commerce Commission shall take care of all facilities, distribution of power, cars, etc.—practically take the management of the railroads out of the hands of the owners, but does not make them responsible for anything. In other words, it gives absolute power to that body without any responsibility whatever. Of course, the owners will not look with much equanimity upon that kind of a proposition. It is doubtful whether the owners of any property would like to see it taken away from them and transferred absolutely into the hands of any political body, and it is particularly objectionable, I think, because of the character of the Interstate Commerce Commission. And here I am going to say something that perhaps will not be altogether agreeable to everybody present and which possibly may result in a good deal of criticism so far as I am concerned. But I have arrived at a time of life when it is immaterial what anybody thinks about it and what anybody says about it, and if they desire to criticize they are quite welcome to do so.

The Interstate Commerce Commission has been in existence about 32 years and during that time has had many able members. It has also had many not so able and many who

\*Address by E. P. Ripley before the City Club, Chicago, June 12, 1919.

were appointed because of political activities, or had made the railroad business their objective in the way of criticism. It is a singular thing, however, that in all of its 32 years of existence, it has never had as a member either a railroad man, or a business man, or a shipper, or a farmer. There was appointed on it a railroad conductor who had no previous knowledge of the railroad business except as a conductor. He has made one of the best commissioners they have had because he has done as well as he could with the education that he had. There are other members who have been partially educated at our expense. They were absolutely without experience. Many of them have learned that there are two sides to a question and have proved valuable to the Commission. There are still some others who have not seen the light. They are still standing in the way of compromise, or a fair way out of this muddle. It is only ten days ago that one of the members of the Commission said he did not think any remedial measures were necessary; the roads were earning as much money now as ever before, and all that was necessary was to return them to their owners without any legislation. This ignores absolutely the fact that the dollar is worth only about sixty cents, and we have to pay our bills on the basis of the depreciated dollar. It also ignores the fact that there is some five hundred or six hundred millions more of investment upon which interest must be earned.

In the Western Advance case of 1910 I testified for the Western Lines that of all the disbursements of a railway company more than half the total goes into labor. I showed that in the current year the wages of Santa Fe employees had been increased about \$2,000,000 and that further advances of \$2,500,000 were in prospect. I made the argument that to meet such outlays it was absolutely necessary that we have more money. Like testimony was given by witnesses for the Eastern Lines. Nevertheless, the United States Government, through the Interstate Commerce Commission, refused to give us a dollar.

It has seemed to me just now, when presumably every member of Congress admits something ought to be done, whatever is done should be in the direction of rather more intelligent regulation for the railroads. We do not care, as middlemen, it does not make any difference to us, what wages are, if we can pass it on—if we do as merchants do, charge our customers enough so as to recoup us for what the government says we must pay, we can stand it. We are exactly in the same position as you merchants are.

We shall probably be obliged to take over the railroads not later than January 1st next, but we can not take them back under the conditions as they have existed heretofore. With the Interstate Commerce Commission regulations there must accompany more responsibility for the payment of our bills, which have been enormously increased by concessions to labor. It is a bad situation and I would be glad if anyone could show me a way out of it. It is much easier to criticize the plans of others than to make new plans for others to criticize, and the question is often asked me what I would do if I could do just as I liked. That is always embarrassing because I do not know to what length I would go if I could do as I liked. But it has seemed to me that while the Interstate Commerce Commission ought to be in charge of regulation it ought to be shorn of its functions of prosecutor, judge and jury. It ought not to be permitted to prosecute an individual railroad for some infraction of the law and at the same time pass on the guilt of such railroad and fix the penalty. It is a dangerous thing to do. There ought to be somebody to whom appeal may be had. My thought has been that while the Interstate Commerce Commission should perhaps exist as heretofore there ought to be a body of three or five people, appointed by the President and acting for the people of the United States, holding almost the same rank as judges of the Supreme Court, and receiving salaries that would make it an object for the best class of men, who should have abso-

lute legal power over anything presented either by the railroads, or by the Commission, and to whom decisions of the Commission could be appealed either by shipper, or by railroad. A body like that ought to be appointed for at least ten years—15 years would be better in my opinion—and ought to be independent of politics and ought to be the final body to protect the American people from any injury that might be done by the railroads, and the railroads from the injury that has been done them heretofore and which may be done to them again by ill-considered partisan legislation. I have made no effort to introduce a plan of that kind except by correspondence with my friends and people in Washington, but hope that something of that sort can be done. I am sick and tired of perpetual lawsuits. We have been at law with the people of the United States for the last thirty years, it has not resulted in anything but bad feeling and there is no occasion for it and for its existence.

## Mr. Sprague's Automatic- Stop Proposals\*

THE PROPER FUNCTION of the automatic train control system is to control the train only when the engineer has failed to perform his required duties. The sense of responsibility for safety of their trains which is almost universally felt by enginemen is not always effective, with present safeguards, to prevent collisions. As I said when I was called to testify at the investigation of the South Byron collision, there has been a two years' attempt to introduce automatic train control on the New York Central. After a very considerable development the matter was called to the attention of the president of the road and he ordered a thorough investigation. This investigation was conducted in a perfunctory sort of fashion over a period of several months and was accompanied by two proposals to co-operatively equip the Hudson Division from Croton to Rensselaer.

Subsequently, by further direction of the president, the matter was referred to an expert committee, which was enlarged, by my request, so as to represent the entire New York Central Lines, this comprising the chief signal engineers of the four principal divisions, the chief mechanical engineer, the general superintendent of telegraph and the assistant terminal manager, aided, of course, by their experts.

This committee spent several months in their investigation, during which, in reply to many criticisms, constructive developments were made in the system; also new proposals were considered, covering shorter sections of line and reduced equipment of such character as would fully test the character and sufficiency of this system of train control, without involving too great capital risk.

A unanimous report was made endorsing a trial; but on the entrance of the United States into the world war, negotiations were suspended. Although I have seen this report I have never had a copy of it . . . . .

\* \* \*

Engineers and firemen are subject to the same frailties, weaknesses and accidents as others, and cannot control weather or other conditions external to their cabs. Momentary inattention, varying degrees of color blindness or defects in color sense, temporary or serious illness from whatever cause, fatigue due to long hours of service or to domestic demands, sleepiness induced by a torpid liver, the use of alcohol, the rhythmic action of the locomotive or the pressure of the wind may make the engineer momentarily oblivious to warnings. An unexpected happening in the cab, the break-

\*Extracts from a statement by Frank J. Sprague before the New York State Public Service Commission, Second District, at New York City, June 18, 1919. (See *Railway Age*, June 20, page 1553.) Mr. Sprague is the inventor of multiple-unit train control and other important elements of the art of electric railroad operation.

ing of a water gage, distraction by the fireman or a transient cab passenger, a blow from a passing obstruction, the clouding and frosting of windows, inclement weather, with driving rain, hail, snow or fog, and drifting smoke from passing trains add equal dangers. Curvature of road and uncertainty as to headlands along the route, the glare of an approaching headlight, the possible obscuring of signals from other causes, the dimming or failure of signal lights, the clogging of signal blades in winter storms, or a momentary hiatus or aberration of mind,—all increase the possibility of failure of response to a correctly initiated or given signal, and emphasize the necessity of supplementing the sense of sight by those of hearing and touch.

\* \* \*

How has the demand for the development of the automatic train control been met by the railroads? Often, although happily not always, by skepticism, disbelief and even narrow-minded opposition, at much of which I am not surprised and with a good deal of which I am in entire sympathy. I had some experience with one particular road, whose general manager and signal officer could never find an hour to inspect my system although one of its vice-presidents stated that if a system could be devised to increase safety of operation he believed, and would so advise his directors, that it must in law be adopted. And I may be pardoned if I take exception to the conclusion expressed, although I am not one of those who responded to a grandiloquent advertisement, issued after a series of disasters, offering the munificent prize of \$10,000 to that inventor who would produce a satisfactory system of automatic train control. Those familiar with this development are aware of the great cost of such work, running in individual instances to hundreds of thousands of dollars. My own company and I, despite all the technical resources at our command, my own experience of 37 years in several epochal developments connected with the electric art and the association of men skilled in signaling and braking, have spent not only several years of effort but over \$350,000 in cash.

Personally, I have not been satisfied to limit myself to "automatic stops." It has seemed to me that something much more was necessary, and that something was to marry together the wayside signal system of the road and the braking equipment of the train in such fashion that there should be repeated directly into the cab certain signals, depending upon the same track and train conditions as initiate the action of the wayside signals; and that in response thereto there should be established in [the approach to] every signal block the potentiality of both service and emergency braking, with the absolute minimum of interference with the normal judgment and action of an engineer.

It must be admitted that the development of an automatic train control system to meet all conditions is no mean problem, and the opinion has been expressed that it would perhaps be best done by the railroads themselves, working, I assume, through their signal engineers and brake experts. To this point of view I wish to take exception, one which is no reflection upon the individual capacity or ability of the men referred to. Something more is needed than they can give, both in the matter of time and of constructive knowledge. The employees on a road are well occupied in maintaining in operative condition apparatus designed, built and installed by equipment companies, each especially familiar with, and naturally prejudiced in favor of, its particular devices. Something beside the criticism which railway operatives can give is essential, and that is an outside point of view, a constructive agency well equipped, technically and financially, with concentration of thought and aim undiverted by daily operative duties, which, selecting and clarifying the essentials which must characterize a system having common application, shall have the advantage of the critical constructive comment of those who must eventually use and depend upon the apparatus.

It is this combination of private amply-backed initiation, using not only the known facts with regard to signaling and braking but other knowledge in the industrial art, and close co-operation with the railways for a common end, which is needed; and if this latter is accorded, the financial backing will be forthcoming, and an eminently satisfactory result will obtain.

In my automatic train control equipment the electrical circuits are the acme of simplicity, compared to the circuits of signal systems; the track equipment is simpler and more reliable than the motor-operated wayside signal, although dependent upon the same initiating causes; the air equipment is similar to and in many respects simpler than the standard braking equipment; and in the end I believe that each and every part of it will be at least equally fool-proof.

## Contaminating a Water Supply by Storage Coal

A RECENT EXAMPLE of water supply contamination occurring at a small middle western engine terminal, emphasizes conspicuously an unexpected source of pollution possible in railroad water supply. The water at this point is drawn from two shallow, gravel type wells approximately 45 ft. deep and 400 ft. apart, and is pumped by vertical centrifugal pumps run by electric motors. The usual delivery rate varies between 125 and 200 gal. per minute per well, and the consumption averages 200,000 gal. per day. The wells are located about 1,000 ft. from the roundhouse. The yard is built mostly on a sand fill with a comparatively small amount of cinder ballast. The terminal is situated in a small river bottom, with the surrounding country fairly level, drainage facilities being poor.

In the early summer of 1918, in view of a prospective coal shortage, this terminal was designated as one of the points for storing a surplus coal supply. The coal was of the bituminous type common to certain middle western districts, and was unloaded in piles of approximately 400 tons. The maximum storage of about 30,000 tons was reached in December, the piles covering ground adjacent to yard tracks and between and beyond the locations of the wells.

Early in January it was noted that trouble was being reported with engine boilers, leaky flues and cracked staybolts developing to a considerable extent beyond what would be warranted by ordinary circumstances. Flues removed showed a very hard scale accumulation not in keeping with the usual conditions and pitting was noticeable. Samples of the water supply were forwarded to the chemist about the middle of January. The original quality of the water was not extremely bad, having tested 15 grains per gallon of scaling matter present, mostly calcium and magnesium carbonates. However, results of analyses of these new samples developed the fact that a considerable change had taken place, the carbonates having been reduced to 8 grains and the total hardness increased to 25 with an increase also in the sodium chloride content, this water being one which would form a very hard flint-like scale.

An investigation was started at once to ascertain the source of contamination. Samples of water were furnished regularly from both wells, and these showed not only a variation between each other, but also a fluctuation of total solids of between 20 and 60 grains per gallon. Samples from wells in the vicinity showed similar contamination within a radius of one-quarter mile, but in wells beyond there had been no change. This indicated strongly that local drainage was the conveyor of the pollution with the storage coal piles as the possible source, this being the only changed condition from previous years.

Samples of coal from the storage piles were sent to the

laboratory, together with samples from cars fresh from the mines. When part of these samples were digested in water at the laboratory, water drawn from the storage coal showed that the carbonates were entirely eliminated, leaving residual acidity and a strong increase in hardness. The fresh coal had but little effect upon the water even after 30 days' leaching. This indicates that the weathering had oxidized the iron pyrites in the stored coal with the subsequent liberation of the sulphuric anhydride, which was changed to sulphuric acid or incrusting sulphates and carried away by drainage or soaked into the ground.

Government analyses of coal from the mines have shown from 2.86 to 5 per cent sulphur. Check analyses of the coal from storage piles tested but 1.45 per cent sulphur, indicating that some possible 200 tons of sulphur, or around 160,000 lb. of sulphate compounds had been leached out of the coal to be carried away by drainage, either surface or sub-surface.

As a measure of relief the coal was cleaned up between the wells and also removed from a radius of 300 feet. This helped and the wells are now gradually returning to normal, although one appears to be more in the channel of the underground flow from the coal pile drainage and consistently shows a poorer quality than the other. It is still noted that after heavy rains the hardness of both wells increases considerably and from 3 to 10 days are required before a decrease is noticeable. It will undoubtedly be some time before the trouble is entirely removed, as white discoloration remains on the ground around coal piles similar to alkali deposits on the western plains.

As a means of permanent relief for locomotive boiler troubles, a complete water treating plant is contemplated at this point, as this will also give economical returns with the normal quality of the water. As a temporary expedient, predetermined amounts of soda ash are added directly to the engine boilers when they are washed, and also in tenders when they are filled.

This incident emphasizes the fact that local water conditions and drainage, including porosity of soil, should be given careful consideration in the storing of coal.

## Big Four Increases Capacity at Congested Points\*

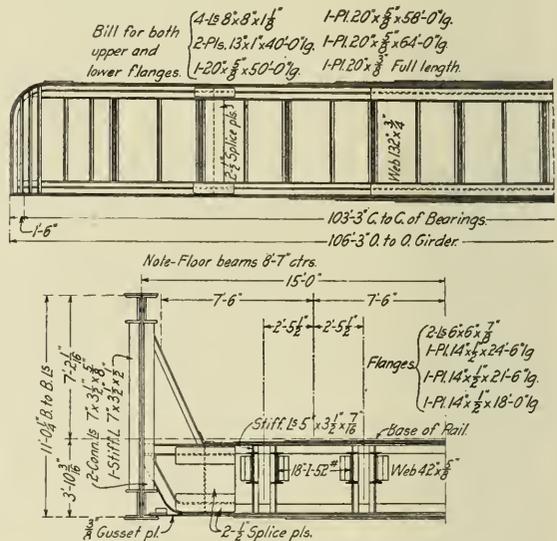

THE structures formed an important feature of the Zionsville project, chief among them being the Eagle Creek bridge which is located about centrally in the long embankment. This is a reinforced concrete arch structure of the filled-spandrel type consisting of five semicircular arches—three central openings of 45 ft. with one at each end of 39 ft. The total length of the bridge is 273 ft. with a maximum height of 62½ ft. from base of rail to bottom of footing. It requires the placing of 6,200 cu. yd. of concrete and 112,000 lb. of reinforcing steel. Pile foundations were used.

The construction of this bridge followed modern practice in concrete work, handling material from cars to storage and from storage to the hoppers over the concrete mixer with a clam shell bucket and derrick, while using towers and spouting for transporting the concrete. Three fourths of a mile of temporary track was required to haul the material to the site of the bridge. Bulk cement was used, being delivered in open top cars covered with tarpaulin and unloaded with a clam shell bucket into a storage shed of 12 cars capacity. The filling and emptying of this shed by means of the bucket was facilitated by having the roof made with removable sections.

Other structures included two highway under crossings, a number of over crossings and several culverts. One of the undercrossings is on a skew of 29 deg. 9 min., necessitat-

ing an excessively long span in order to obtain the 24-ft. clear width at right angles to the highway. The superstructure of this consists of two through girders connected by a floor of 20-in. Bethlehem I-beams covered with concrete. Just south of the long cut is an embankment 500 ft. long and 30 ft. deep occupied by a reinforced concrete flat-top undercrossing 13 ft. 10 in. high and 24 ft. wide for a highway and a 12-ft. arch for a creek. As most of the overcrossings will be of concrete construction, it has been necessary to install temporary timber overcrossings at a number of places in the course of progress on the excavation of the cuts. The contractor for the grading on this project is the Dunn, McCarthy Company of Chicago. The construction of the heavy masonry work was let to the A. J. Yawger Company of Indianapolis.

Another double-track project in the vicinity of Indianapolis is the provision of second track between Briar and Beech Grove a distance of about five miles, double track having previously been completed in the five miles between Indianapolis and Beech Grove. The reason for this improvement, like that between Augusta and Whitestown, is the necessity

Details of Heavy Girder Span Used at Columbus

for a stretch of double track next to a large terminal. There is a large yard at Beech Grove, the work is all light involving embankments aggregating 50,000 cu. yd. and cuts of 25,000 cu. yd. The project is entirely complete except for the laying of track which has been delayed on account of the inability to secure rail.

At Columbus, terminal facilities are being improved by the construction of a yard at Avenue, about four miles southwest of the city, in connection with provision for double track throughout the terminal district. The present project covers the second tracking of 4½ miles on the line toward Springfield and the construction of a part of the Avenue yard which eventually will be the main terminal for the Big Four at Columbus. An important feature of this work is the reconstruction of two bridges about one fourth mile apart, one over the Scioto river and the other over Olentangy creek. In making these renewals the grade was raised 2 ft. 4 in. at the Scioto river bridge and 0.9 ft. at the other structure.

Of special interest in connection with these structures is the use of long heavy through girder spans, one of 106 ft. 3 in. and three of 95 ft. 9 in. for the first named bridge and

\*An illustrated article was published last week on this subject.

three 104 ft. 3 in. spans at the second bridge. The bridges are designed for E-70 loading, New York Central Lines specifications, so that with a double-track, through-girder span 106 ft. long, the construction becomes exceedingly heavy, the steel in this one span weighing 250 tons. As the old span arrangement was not maintained throughout in the reconstruction, the work included considerable substructure work beside that of extending the piers for second track. The second track work here entailed 11,900 cu. yd. of cut and 47,500 cu. yd. of fill while the yard work, to the extent to which it is being constructed at the present, involves a cut containing 71,000 cu. yd.

All of the improvement work on the Cleveland, Cincinnati, Chicago & St. Louis has been conducted under the general direction of C. A. Paquette, chief engineer, Cincinnati, Ohio. The work on the Indianapolis-Cleveland line and at Columbus has been under the direction of W. C. Kegner, district engineer at Galion, Ohio, and W. S. Burnett, district engineer at Springfield, Ohio, (during the illness of Mr. Kegner). The work at Indianapolis has been under the direction of A. M. Turner, district engineer, Indianapolis, Ind. Resident engineers on this work are W. T. Taylor, Zionsville, Ind., T. E. Earle, Union City, Ohio, and F. N. Johnson, Bellefontaine, Ohio.

## Russia as a Field for American Railway Genius

### Foreign Assistance Necessary in Rehabilitation and Extension of Transportation Facilities

By A. A. Boublikoff\*  
President, Atchinsk-Minoussinsk Railroad

THE FUNDAMENTAL CAUSE of Russia's economic weakness was the retarded development of her railway system. This was among the primary causes, if not the only cause, of her complete political, military and economic collapse.

From the very beginning of her railroad construction, the development of the Russian railroad system was constantly behind the increase of the country's productiveness. If we plot the curve of the increase of railroad mileage in Russia, together with the curve of the traffic density for the period of time from 1874, when the necessary statistical data first became available, until 1904, a remarkable phenomenon would become apparent; namely, the two curves will be almost mathematically parallel. Even war-times and bad crops failed to produce serious and lasting fluctuations in the curve of traffic density.

Let the aggregate mileage of Russian railroads in 1874 be 1. Then the mileage in 1884, 1894 and 1904 will be 1.5, 2 and 3, respectively. The traffic density, however, would also increase 1.5, 2 and 3 times for the respective years. It follows that the sum total of traffic carried by the railroads, the amount of ton-miles, increased directly as the square of the growth of the roads, or 2.25, 4 and 9 times for the respective years. Consequently it may be asserted categorically that during the 30 years from 1874 to 1904 the productivity of Russia was steadily and energetically eclipsing the growth of the railroads.

The Russo-Japanese war and the first Russian revolution caused in 1906 a respectively sharp downward turn in the curve of traffic density, but the effect of even these tremendous events was nowise lasting and as early as 1907-1908 the previously stated relation between the curve of mileage and of traffic density prevailed again. In the years following, up to the outbreak of the great European war, the curve of traffic density soared even high above that of mileage.

On the eve of the great war the average traffic density on the Russian roads, two-thirds of which are single-tracked, reached 1,200,000 ton-miles per mile. Russia had no rivals so far as the work done on each individual track is concerned. If a railroad, as a mechanism, had no limit of power and if furthermore, there was no limit of economically profitable loading,† the facts stated above would have insured the Russian railroads the largest income in the world.

In reality a large number of Russian railroads exceeded the limit of profitable loading, so that further increase in tonnage carried, instead of increasing the net profit, brought about, on the contrary, an enormous growth of costs and losses of operation. Moreover, a sharp divergence between the demand for freight traffic and the available means for meeting this demand became prominent. The freight capacity of many lines became utterly exhausted at length. As a result, it became practically necessary to renounce the principle of shortest distances‡ and to use on a large scale the so-called "circuits," *i. e.*, roundabout routes for shipments to avoid congested sections. The additional mileage necessary in this way, as against the shortest distance method, often amounts to as much as 400 versts (about 267 miles) and more. It not infrequently happened, however, that all possible circuitous routes were also completely clogged. In such an event, freight traffic for many routes would practically come to a standstill. The railroads, instead of stimulating the productive forces of the country, would instead become a drag on its economic development.

The war further revealed the fatal weakness of the Russian railroads. Not only did they prove unable to handle the volume of freight traffic swollen by military needs, thus causing a lasting economic crisis, but they also fell down in their share in the military defense of the country.

#### Weakness of the Railroad System

It is hardly necessary to demonstrate elaborately the essential and intimate connection between the destinies of the

†Most of the Russian single-track railroads have a theoretical road capacity of 20-21 pairs of trains per 24 hours. Not a few lines actually despatch this number of trains part of the time, so their yearly average reaches 17-18 pairs of trains per 24 hours. In individual cases Russian railroads develop a truly enormous road capacity. Thus, for instance, 7,000,000 tons of freight in addition to a lively passenger traffic passed over the single-track railroad running across the Daniepr bridge in Ekaterinlav. This meant the passage of 96 trains a day on one track! The Kharkov-Penza line was at one time so congested that for the construction of the second track it was necessary to rely upon horse carts for the supply of rails and ties. Experience has taught, however, that so intense a use of road capacity is accompanied by an incredible decrease in the speed of freight movement. Thus, for example, on some sections in the Donetz region the average speed at times fell to 6 versts (4 miles) per hour and lower, as against the general average on the Russian lines of 11 versts (about 7 miles) per hour. This naturally leads to a big increase in cost of operation. It sometimes happens that an addition to the tonnage earned by a railroad decreases rather than increases the net profit. It has been found that the limit of profitable loading for a single-track railroad in Russia is 12-13 pairs of trains, which is also the number normal for American railroads.

‡It is noteworthy that in 1888, when the Russian Government undertook to regulate freight rates, one of the first steps taken was to introduce this principle and forbid competitive transportation along circuitous routes. This was also one of the first measures adopted by Mr. McAdoo's administration.

\*Mr. Boublikoff is also a director of the Central Caucasus Railroad, and vice-president of the Yuroveta Home and Foreign Trade Company, Inc., New York. He was formerly a member of the Russian Duma.

Russian railroads and the general trend of state policy in Russia. From times immemorial a police state (Polizei-Staat) has been the ideal of Russian statesmanship. The heavy arm of the state power has been laid on every manifestation of the life of the people. To this is due, it may be said in passing, the fierce reaction against state authority sweeping Russia at present.

Naturally a vast phase of economic activity, such as railroad construction, could not but come under the controlling power of state authorities. From the start railroads were constructed in Russia either by the direct order of the government or with its active financial assistance. The system of guaranteeing a net return on capital invested in private railroads—usually  $4\frac{1}{2}$  or 5 per cent on both bonds and stocks—was applied extensively. However, in view of the facts that enormous funds were usually misappropriated during the construction and that the amount of traffic was very small in the beginning, the newly built lines produced no net revenue at all and almost the whole burden of paying the interest on the "private" capital invested fell on the state treasurer. The result was that in Russia the control of the railroads was simultaneously vested in two agencies: the Ministry of Ways of Communication and the Ministry of Finances. The whole history of the railroads in Russia bears the imprints of the ceaseless struggle between these two institutions. Except during a few brief intervals, the Ministry of Finances, systematically and persistently championed private railroad construction, while the Ministry of Ways of Communication with equal zeal advocated state ownership of railroads.

The practical outcome of this conflict was an extraordinary systematic obstruction of railroad construction, without precedent in the history of any country, and extreme fortuitousness in the choice of lines to be built. Despite the energy of the entrepreneurs, their influence with politicians, their extensive and unscrupulous methods of bribery and "promissory" notes, the realization of projects of new railroads were delayed for decades, while, at the same time, railroads of doubtful utility would suddenly be started simply because the Ministry of Finances chanced to find means to finance the enterprise.

As a result, the Russian railroad scheme lacks system. Many accidental circumstances during construction caused transit distances to be longer than required by actual topographical conditions. Consequently, freight travels many unnecessary miles. For example, the distance between Odessa and Kiev, two very important centers, is 480 versts (320 miles) as the crow flies, whereas the railroad connection is 612 versts (408 miles), an excess mileage amounting to 28 per cent.\*

Most of the through trunk lines are made up of separate feeders widely differing in their transversal sections. Many active trunk lines consist of sections with grades of .6, .8, 1.0 and 1.1 per cent. Since Russian locomotives are chiefly of one type this necessitates constant reforming of trains which means an enormous increase in the cost of operation. It often happens that while a new line is being constructed, the capacity of an old line which is to forward freight from the new road is not sufficiently increased, thus rendering the full utilization of the new line impossible. Especially backward was the development of junctions. Generally speaking the Russian railroads have never been a unified mechanism, with co-ordinate parts.

Completely clogged railroad sections adjacent to lines with ample unutilized traffic capacity were an everyday occurrence. The formation in the stations of enormous stores of grain during the realization of the crop was a regular event every

year. The accumulation of mined products was prevented by artificially adjusting the output of the mines and mills to the capacity of railroads, by so-called "plans of transportation." All these circumstances taken together caused periodical financial crises in the Russian railroad business and constantly tended to lower the profits of the owners of the roads.

Russia is the exact opposite of those countries which have more railroads than their economic development requires. As new lines are constructed in such countries the average traffic density of the railway system as a whole falls. Such, for instance, is the case of Argentina. Russia is, therefore, a vast field for intensive railway construction. There is not the slightest danger that Russia will be provided in the near future with a railroad mileage unwarranted by the productivity of the land and that the railroad business in Russia will thus become unprofitable.

#### Extent of Future Railway Construction

Here are the facts from which a notion may be derived of the amount of work to be undertaken for the purpose of providing Russia with the system of railways she needs.

As has already been mentioned, Russian railroads developed accidentally, by fits and starts. In view of this circumstance, it was repeatedly proposed to draw up an inventory, so to speak, of the railroad needs throughout the country and to elaborate a detailed "Plan for the Development of the Russian Railway Net." . . . Only as late as 1916, however, was there finally formed a special inter-departmental commission, which drew up a detailed plan for railroad construction after the war. It also projected a list of lines, whose capacity to yield profit was beyond question and whose necessity for the state was incontestable. The list of these "first-class" lines included 35,000 versts (23,333 miles) of railroad.

These projected lines, almost without exception, were intended to meet the internal transportation needs of the country and did not solve the problem of opening up new and independent avenues of communication with the world markets. In the meantime the war and especially the Brest-Litovsk treaty have clearly shown that the sea outlets which Russia has at her disposal at present are not only insufficient commercially, but also fail to safeguard her freedom of political action. Thus, the creation of new outlets, more or less secure against German military and political aggression, has become a matter of vital importance. The following lines will meet this newly arisen need: the Caucasus-Persia, terminating at Bender-Abbas; the Turkestan-India, via Afghanistan; the Central Siberia-Peking, via Mongolia; the Amur Railway-City of Nikolayevsk-on-Amur, and two or three lines in the north of European Russia, terminating at Archangel and on the Murman coast. (The latter were included in the program because of their importance for the development of the exploitation of Russia's northern forests.)

Most of these lines were not covered by the official construction plans. They form an aggregate of 10,000 versts (6,667 miles) which must be added to the 35,000 versts (23,333 miles) of the governmental program.

Thus, Russia's immediate crying need for new railroads amounts to a mileage of approximately 30,000 miles. But among the projected railroads which in the above-mentioned plan were set aside as secondary in value and profitability, are a great many lines which, under conditions different from those now obtaining in Russia, would certainly be classed with the lines whose construction was recognized a matter of urgent national necessity and soundest investment. The mileage of such railroads amounts to approximately 16,000 miles.

It is clear that Russia alone, in her present state of complete financial collapse, will not be able to achieve this colossal task without the assistance of Allied capital and

\*The greatest Russian freight railroad east of Yekaterinoslav running to the Donetz Basin and carrying as many as 7,000,000 tons per mile a year, has in one section an unnecessary mileage of 20 per cent. In addition it has three entirely unnecessary gradients many hundreds of meters high.

Allied energy. Leaving aside the political conditions necessary for the work of this capital in Russia, it must be pointed out that the Allied nations, which in consequence of the war will have a number of domestic problems to solve, could only undertake such a vast investment of their treasure if Russia's reconstruction is considered in the light of its political significance and its magnificent economic potentialities. In this connection, it appears to be a generally accepted truth that universal peace and the prosperity of the peoples of the world demand the creation of a powerful Russian state which would be able to resist the economic and political aggression of Germany. Thus, from this standpoint, the necessity for Allied co-operation in rehabilitating Russia apparently needs no demonstration.

The economic possibility of this co-operation is still largely a debatable matter. The essential natural resources of European Russia fall into four groups: (1) Forests in the north, (2) peat in the northern and central sections, (3) anthracite in the Donetz basin, (4) mineral oil (naphtha) in the Caucasus and partly on the northern littoral of the Caspian Sea. If we further take into consideration that the deposits of bituminous coal in European Russia are altogether negligible, and that equally small are the deposits of rich iron ores in the Donetz basin, while on the European side of the Urals there is but one truly enormous bed of iron ores (the Komarov bed); we shall come to the conclusion that European Russia does not possess the necessary natural resources for such a broad, purely "American," economic development as will assure Russia's economic power and independence from Germany. With respect to its natural wealth, especially as regards that part of it which still lies hidden and unexploited, European Russia can by no means compare to a country like the United States, for instance.

The sources of the economic power of Russia, as a whole, must be sought not in its European portion, but in Siberia and central Asia. It is here that the potentialities of economic development are truly boundless. The country has practically inexhaustible deposits of mineral fuel of the highest qualities and possesses vast layers of gold and other precious minerals. It is stocked with rich metal ores to an extent exceeding all the other countries of the world. There are vast forests, endless stretches of most fertile alluvial soils (loess), which, when properly irrigated, would supply the whole world with cotton, and boundless meadows fit for the most intensive breeding of cattle. Siberia is that part of Russia in which the foundation for her economic strength can and must be laid.

#### An Assured Market for American Industry

The world war has given a powerful impetus to American industry. The number of new factories and mills called into being in the United States by the needs of the war is enormous. When the war is over many of them will die a natural death, but a great many of them will have to be only slightly reorganized to continue their work along peace lines. The natural tendency of American industry to maintain the war level of exports, if not to increase them, will meet with a systematic and persistent resistance on the part of both present foes and friends, especially of those of them who are able not only to meet their internal demand but also to offer their goods on the world market, *i. e.*, those who while seeking to develop their national industry have the necessary means thereof.

The only truly accessible market for the products of American industry are those countries which are unable to meet their own internal needs and in which the development of internal productivity is hindered by insurmountable financial difficulties. Only such countries can be truly willing buyers of the products of American industry. America will merely have to finance the buying needs of these countries.

The largest of these countries is Russia. Her need for

the products of American industry is enormous. The size of this market, especially in Siberia, is so large that it will easily absorb a considerable part of American exports. It only remains to finance this consumption capacity. The best and soundest method of financing would be for America to take over various industrial concessions in Russia, especially railroad, forest and land concessions, which would be an excellent security for the capital loaned by America to the Russian consumer to enable him to buy the products of American industry.

Thus, in this matter, the interests of America and Russia are in complete harmony. America needs the Russian market for her capital and for the products of her industry fully as much as Russia stands in need of the products of American industry and of American capital for the development of her natural resources. Co-operation in this field can and will be obtained.

#### America's Political Interest

##### in Russian Railroad Construction

There is, however, one circumstance, called into being by the war, which makes the achievement of this co-operation a matter of especially urgent necessity for America. . . . In the course of decades, the business of managing the industry of transportation by rail evolved a great group of prominent railway men who combine an immense amount of energy, knowledge and practical skill with wide financial and business connections. At present, a high sentiment of patriotism compels all these men to keep at their posts during the war. But when the war will be over there will be nothing to force them to act in the capacity of state officials in the business they had created and owned. Very many of them, and the best workers at that, are constitutionally, so to speak, incapable of adjusting themselves to the new situation, for the psychology of an owner differs too widely from that of a state official. Consequently it is permissible to expect that upon the expiration of the twenty-first month after the war there will arise a violent political struggle around the question of whether state or private ownership of the railroads should prevail. There is no doubt but that in this struggle all the best railroad experts will not be in favor of the historically inevitable transition of the railroads from private to state ownership.

This struggle cannot fail to arouse a violent commotion in the whole economic life of the United States,\* a commotion which, judging from the example of other countries, can only be avoided by draining off, so to speak, the energy of these railroad experts and directing into channels, in other countries, of work the men are accustomed to. In this respect, America's undertaking to provide Russia with the railways she needs is of the highest internal value for the United States. If the industrial capital and energy, now engaged in the railroad business within the United States, will find a natural outlet in similar work in Russia, especially in Siberia, the problem of America's transition to State owned railroads may lose most if not all of its acuteness.

American leadership in Russian railroad construction will have highly beneficial consequences in many other respects. American capital will find a sound investment, American industry a reliable consumer, and America, as a body politic, will have a mighty buffer State against German or any other aggression in the East.

All these considerations taken together dictate the necessity of organizing, at the earliest possible moment, Russian-American co-operation in the field of Russian railroad con-

\*That this will happen just so is best shown by the example of Russia, where the power of the government was so overwhelming that even experiments such as the introduction of liquor monopoly were accepted without a murmur. But even in Russia the taking over of the railroads by the government was accompanied by a struggle which agitated the whole society. In France and Italy the struggle around the railroad problem may be compared, for its intensity, perhaps only to the struggle against clericalism.

struction. The first step in this direction, it seems to us, would be the organization of something like an association of American railroad leaders, which should immediately commence to study Russia's needs for new railways, needs which, unfortunately, are entirely unknown here. This body should also elaborate the conditions on which American capitalists would be willing to invest their funds in Russia and draw up a program of financial and technical action. An individual person would hardly be equal to such a task. Without it the attempt of American railroad men to start work in Russia would, no doubt, meet with serious obstacles and unnecessary disappointments, and the work itself would not assume the dimensions corresponding to the magnitude of the problem.

The slightest delay in the work of the preliminary study of the problem will undoubtedly lead to results hardly desirable for America. As a matter of fact, Russia's need of individual railway lines was highly imperative even before the war, and, no doubt, as soon as order is restored in Russia her government will take all the necessary measures to inaugurate, at the earliest possible time, the construction of those most urgently necessary and, consequently, most profitable railways. Russia in that case will have the choice of many newly developed money markets. Some of them, for instance the Scandinavian market, have already become interested in Russian railroad construction. At the first signs of order in Russia they will make haste to take possession of the selected and partly investigated lines. Therefore, if America proves tardy, she may have to content herself with the less necessary and, consequently, less profitable lines.

We may have here a repetition of the recent story of the Russian banks; the absence of resolute action on the part of America resulted in that two banks (the Azov-Don and the Yunker Bank) are already in German hands, while the Siberian Bank is in the hands of English capitalists. It is more than probable that a similar fate will befall all the remaining Russian banks.\*

This circumstance represents the greatest menace to all future American industrial work in Russia. It is particularly a menace to American action in the field of railroad construction.

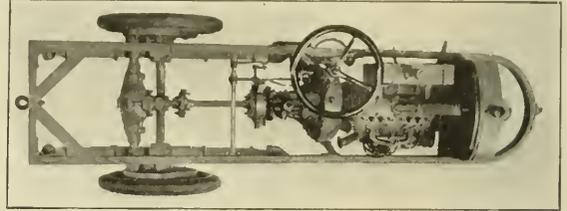

As a matter of fact, the majority holdings of the stock of the private railroad companies existing at present in Russia are in the hands of the banks. If the Germans are going to own the Russian banks, they will also, at the same stroke, become the owners of the now existing private railroads. It is a matter of common knowledge that the construction of new railway lines generally increases the revenue yielded by the old lines. Consequently, when, in compliance with the demands of international economic politics, the United States will begin to construct new railway lines in Russia, it may happen, if the Americans are not prompt enough, that they may have to work in the interest of the German capital owning the present Russian railroad system. This consideration is an additional argument in favor of recognizing as soon as possible the inevitability of Russian-American co-operation in Russian railway construction and of taking immediately the various preliminary steps and measures in this direction.

**The War Finance Corporation** has announced a loan of \$392,000 to the Alabama Great Southern and one of \$194,350 to the Cincinnati, New Orleans & Texas Pacific, both on the security of certificates of indebtedness issued by the Director General of Railroads.

\*When the Bolsheviki, having discovered by experience what an incredible confusion their celebrated nationalization of the banks had introduced into the economic life of the country, unananimously decided to denationalize them, Count von Mirbach decidedly forbade them to do so. He did not conceal his motives: all Russian banks were not bought up yet by Germans!

## A Gas Driven Industrial Truck

A RECENT DEVELOPMENT in industrial haulage is the use of gas driven vehicles modeled after the cars for street service, but adapted to indoor as well as outdoor use and designed for both direct haulage and tractor service. One example of this type of equipment, which has been in general service for some time, and is now being subjected to experimental use in several railroad freight houses, is of particular interest because of several characteristics which are such as to point towards some rather marked departures in the development of industrial truck service. Incidentally, the truck has several features of design that are in themselves unusual. For instance, it has three wheels rather than four

Chassis of the Tractor-truck

and is run backward, that is, with the two drive wheels ahead and the steering wheel in the rear.

The general make-up of the frame, power plant and transmission follow closely the standard layout of modern gas motor vehicles. This is illustrated by the photograph showing a top view of the machine with the body and hood removed. The engine is of 25-hp., four-cycle, four-cylinder ( $3\frac{1}{8}$  in. by  $4\frac{1}{2}$  in.) type with a multiple disk, dry plate clutch, a selective type transmission with three speeds forward and one-speed reverse, and an internal-gear drive axle. The machine is equipped with cast steel wheels ordinarily provided with rubber tires, but which may be fitted with steel tractor rims so that the car may be used on rough ground.

The machine may be had with a plain platform, a fixed

The Truck in Tractor Service

rectangular box, a dumping box or a side dumping hopper, depending upon the service in which it is to be used. The fixed box body is commonly supplied where the car is used in tractor service with the idea of loading this box with whatever weight is necessary to obtain tractive power to meet the needs of the traffic in which it is to be used. A better idea of this is obtained from the fact that the weight of the car empty is 2,050 lb. while the capacity load which is placed directly over the driving wheels is 3,000 lb. The cars are said to run at speeds varying from  $\frac{1}{4}$  mile to 15 miles an hour, giving great latitude in adapting the machine to various classes of service. For instance, the trucks have been used as the motive power for moving or spotting freight cars on

industrial side tracks. The practice of running the car with the driving wheels forward is said to be of considerable advantage in climbing inclines. Another feature to which attention is called is a three-gallon capacity welded gasoline tank, this capacity being enough for the operation of the car in ordinary service for an entire working day without recharging.

The small turning radius of 72 in. is of particular advantage in handling the car in close quarters. Other dimensions of the truck are: length over all 112 in., width 42 in., wheel base 72 in., tread 35½ in. This car is known as the Clark Tractor, and is manufactured by the Clark Tractor Company, Chicago.

# Doings of the United States Railroad Administration

## The Operating Statistics Section Reports Show That Economies Are Being Made in Train and Locomotive Service

WASHINGTON, D. C.

THE Fuel Conservation Section has issued a bulletin on locomotive fuel performance for January, February and March, 1919, as compared with the same period of the previous year, which shows an estimated saving in coal consumption by using less coal per 1,000 gross ton miles, or per car mile, amounting to \$11,263,774. This is based on incomplete returns covering 76 per cent of the total mileage. In determining the estimated total saving for all roads in a region it has been assumed that the average per cent of saving for the whole region is the same as the average per cent for the roads in that region for which complete information is available. The grand total saving for all regions has been taken as the sum of the regional totals. In freight train service the estimated saving for all roads is \$7,773,170. The saving on the roads for which information is available was 12.3 per cent. In passenger service the saving is estimated at \$3,530,604, or 12½ per cent. The average cost of coal per ton shows increases in the various regions, as follows: Eastern region, from \$3.48 to \$3.92; Allegheny region, from \$2.92 to \$3.00; Pocahontas region, from \$2.55 to \$2.67; Southern region, for \$2.82 to \$3.40; Northwestern region, from \$3.58 to \$3.91; Central Western region, from \$3.07 to \$3.55; Southwestern region, from \$3.13 to \$4.14; Grand total, all regions, from \$3.16 to \$3.57.

The total tons of coal consumed in the three months amounted to 26,191,000 as compared with 30,943,000 in the corresponding period of 1918, and the total cost of coal was \$93,503,000 as compared with \$97,541,000. In freight service the pounds of coal per 1,000 gross ton miles averaged 220 as compared with 243.7 in the corresponding period of 1918. This is a decrease of 9.7 per cent. In passenger train service the pounds of coal per passenger train car mile averaged 20 as compared with 22½ last year, a decrease of 11.1 per cent.

### Operations of Federally Operated Roads for April

The Operating Statistics Section has published complete figures for April and four months ending April 30 for all the large railroads in federal operation. 231,691 miles of road are included out of a total of 239,997 actually federally operated, comprising 96 per cent of the mileage and 98 per cent of the revenues.

	Month of April		Increase or decrease	
	1919	1918	Amount	Per cent
Operating revenues .....	\$384,739,685	\$365,540,408	\$19,199,277	5.3
Operating expenses .....	339,229,299	276,446,983	62,782,316	22.7
Net operating revenues .....	45,510,386	89,093,425	d43,583,039	....
Taxes, rents, etc. ....	18,195,988	17,691,325	504,663	....
Net federal income .....	27,314,398	71,402,100	d44,087,702	....
Operating ratio .....	88.2	75.6	12.6	....

Note: d—Decrease.

One-twelfth of the annual rental due the companies covered by the report amounts to \$74,017,136, so that the net loss to the government for the month was \$46,702,738 for

these properties. The loss from operation of all properties federally operated during the month was approximately \$58,000,000.

In making further comparisons with 1918, it should also be borne in mind that the increased wages for April, 1918, were not charged into operating expenses until subsequent months.

The results for the four months ended April 30, were as follows:

	Four months ended April 30		Increase or decrease	
	1919	1918	Amount	Per cent
Operating revenues .....	\$1,494,695,291	\$1,294,322,364	\$200,372,927	15.5
Operating expenses .....	1,355,661,499	1,078,979,007	276,682,492	25.6
Net operating revenues .....	139,033,792	215,343,357	d76,309,565	....
Taxes, rents, etc. ....	65,837,406	65,765,103	72,303	....
Net federal income .....	73,196,386	149,578,254	d76,381,868	....
4/12 of annual rental .....	296,068,544	296,068,544	....	....
Operating loss .....	222,872,158	146,490,290	76,381,868	....
Operating ratio .....	90.7	83.4	7.3	....

### FREIGHT TRAFFIC MOVEMENT

	Four months ended April 30		Increase or decrease	
	1919	1918	Amount	Per cent
Net ton miles (thousands) .....	113,692,228	133,056,686	d19,364,458	d14.6
Loaded car miles (thousands) .....	4,076,985	4,634,874	d557,889	d12.0
Total car miles (thousands) .....	6,044,944	6,616,732	d571,788	d 8.6
Freight train miles (thousands) .....	175,921	208,854	d 32,933	d15.8
Car load (tons) .....	27.9	28.7	d 0.8	d 2.8
Per cent loaded to total car miles .....	67.4	70.0	d 2.6	d 3.7
Train load (tons) .....	646	637	9	1.4

d—Decrease.

### Excursion Travel Not to Interfere With Troop Movement

As a result of correspondence with the Secretary of War regarding the demands upon railroad equipment caused by the very large return movement of troops during June and July, Director General Hines has ordered a notice posted in all railroad station waiting rooms stating that during June and July the return movement of our soldiers from overseas will be at its height and that during the last week of June and the first week of July passenger equipment must be provided at the Atlantic ports for the transportation of several hundred thousand soldiers. It is stated that it is the paramount duty of the Railroad Administration to provide adequate facilities for the safe, prompt and comfortable return of these men to their homes and that every effort will be made to perform this duty with the minimum of inconvenience to those who travel for business or pleasure, but until the troops have been moved, coaches and sleeping cars will be crowded and temporary discomforts will result. The Secretary of War in a letter to Mr. Hines asked that the use of equipment for recreation purposes might be limited to an absolute minimum. He said: "The splendid co-operation received from the railroads, both in the prompt despatch of the troops overseas and to date in handling the return move-

ment is greatly appreciated by the War Department and the magnitude of this undertaking is the admiration of all."

Mr. Hines in reply said that every provision will be made for providing the necessary equipment and that the co-operation received from the railroads in connection with the overseas and return movements will be continued.

**Division of Accounting Collects Maintenance Data**

The Division of Accounting has issued its Accounting Circular No. 101 calling for the information required for the purpose of ascertaining facts incident to maintenance, repair, renewal, retirement and depreciation of roadway and structures and the expenditures and charges therefor required to meet the provisions of section 5, relating to upkeep, of the standard agreement between the director general and the companies and for the purpose of recording upon the operating books of the federal administration the necessary accounting data in connection with upkeep. The federal auditors are directed to take immediate steps to prepare, record and report the data called for on six forms included in the circular, which has been in course of preparation for several months. It takes the place of Circular No. 28 issued by the Division of Operation in March, which was suspended because it involved such a burden of clerical work on the roads and because the furnishing of the information then called for would involve a duplication of the work which was to be called for by the accounting department. The circular issued by the Division of Operation was expected not only to provide the data necessary to ascertain whether the contract obligation as to upkeep was being complied with, but also to set the maintenance program for 1919. The latter question, however, has become involved in complications and has required further instructions.

A considerable portion of the data required by the accounting circular has been or will be reported to the Interstate Commerce Commission, and this will form the basis so far as applicable of the returns required by the circular. Five copies of each report are to be made, one for the director of accounting, one for the director of operation, two to be sent to the regional director, one of which is to be sent by him to the proper officer of the corporation, and one for the federal manager. Federal auditors are also directed to discontinue the use of all maintenance of way and structures operating reserve accounts which may have been created by charges to operating expenses subsequent to December 31, 1917. Reserves of this kind arising out of charges prior to January 1, 1918, are not authorized and must not be shown on federal books.

Form 1 of the reports required is an analysis of maintenance of way and structures expenses designed to show the comparison between the test and federal control periods.

Form 2 is a comparison of labor costs for the two periods for the purpose of obtaining the factors for equating the cost of labor.

Form 3 is for the comparative cost of selected items of maintenance materials designed for the purpose of obtaining the factors for equating the net material charges.

Form 4, a comparison of maintenance of way and structures expenses, is designed to show the total expenses for each year and for the entire test period, the average for such period, the equated average expenses for the test period, the total expenses for one year of federal control and the increase or decrease in maintenance expenses for the year as compared with equated average expenses for the test period.

Form 5 covers maintenance of way and structures expenses on account of fire damage, maintenance of additional property taken over and improvements during federal control and a final summary designed to show by comparison of costs, in case the property has been improved through maintenance, the increase in maintenance expenses, and in case the prop-

erty has not been maintained to normal standard, the decrease in maintenance expenses.

Form 6, operating statistics, is to secure data which may indicate the comparative use of the railroad during the test and federal control periods.

**Cost of Train and Locomotive Service**

The total cost of train service, including locomotive service, shows a steady decrease as compared with preceding months, although increases as compared with last year, according to the monthly reports compiled by the Operating Statistics Section. For the month of April it was 112.7 cents per 1,000 gross ton miles, as compared with 119.5 in March and 126.5 in February. The cost of locomotive service per locomotive mile in April was 115.2 cents, as compared with 98.5 cents in April, 1918; 119.2 cents in March, 1919, and 120.7 cents in February. The cost of train service per train mile was 162.2 cents, as compared with 141.7 in April, 1918, 167.5 cents in March, 1919, and 169.3 cents in February, 1919. The increase in the cost of locomotive service in March this year over March last year was 17 per cent, and the increase in the cost of train service was 14.5 per cent. All items of cost show increases as compared with last year. The figures are reported by roads and by regions. The combined averages for all regions with the comparative figures for last year and March and February of this year, are as follows:

	April, 1919	April, 1918	
Cost of locomotive service per locomotive mile.....	115.2	98.5	
Locomotive repairs .....	39.4	30.6	
Enginehouse expenses .....	9.6	6.8	
Train enginemmen .....	18.9	18.1	
Locomotive fuel .....	43.6	40.2	
Other locomotive supplies.....	3.7	2.8	
Cost of train service per train mile.....	162.2	141.7	
Locomotive repairs .....	55.5	43.0	
Enginehouse expenses } .....			
Locomotive fuel .....	49.4	46.2	
Other locomotive supplies.....	4.2	3.3	
Train enginemmen .....	21.4	20.8	
Trainmen .....	25.3	23.9	
Train supplies and expenses .....	6.4	4.5	
	April, 1919	March, 1919	February, 1919
Cost of train service per 1,000 gross ton miles	112.7	119.5	126.5
Locomotive repairs .....	38.6	40.8	43.1
Enginehouse expenses } .....			
Locomotive fuel .....	34.3	37.5	40.3
Other locomotive supplies .....	2.9	3.1	3.4
Enginemmen and trainmen.....	32.4	33.5	34.8
Train supplies and expenses.....	4.4	4.6	4.8

**Contracts Executed**

The Railroad Administration has executed co-operative short line contracts with the Midland & North Western and the Miami Mineral Belt railroads.

**Accounting Circular No. 99**

Under the present instructions net ton-miles are being computed from conductors' wheel reports, while the same information is also being compiled from waybills covering revenue and company freight.

This causes a duplication of work, which seems to be unnecessary, and it has been decided that satisfactory net-revenue ton-mile figures can be obtained in the following manner:

(1) Compile from the waybills or other accounting documents the net ton-miles for nonrevenue freight (company material).

(2) From the total net ton-miles, as determined from the conductor's wheel reports, deduct the nonrevenue net ton-miles ascertained as directed in paragraph 1, thus producing the net-revenue ton-miles.

Effective as to all ton-mile statistics prepared for June, 1919, and thereafter, all federally operated lines are to discontinue the compilation of net ton-miles from way-bills and adopt the method prescribed above, except in cases where special statistics required by any state should render it impossible.

It is recognized that the same relation between ton-miles and revenue may not exist under this plan, as resulted from the former practice of securing this data from waybills. It is stated, however, that tests have demonstrated that the result is sufficiently accurate for all practical purposes.

### Weekly Traffic Report

According to a report on traffic conditions for the week ended June 16, the volume of both freight and passenger business throughout the country shows an improvement, although for the country as a whole it is still considerably below normal. The shipment of grain is on the increase, but there is ample railroad equipment to handle the traffic.

The loading of grain in the Northwestern region has been exceedingly heavy, almost double the movement for the same period last year. Grain loading in the Central Western region showed an increase of 54 per cent as compared with the same period last year. Since the opening of navigation, 23,700,000 bushels of grain have been moved from the head of the lakes to Buffalo, and the Food Administration expects to move 150,000,000 bushels by this water route.

The total revenue freight handled in the Central Western region during the week amounted to 169,215 cars, which is a decrease of 6 per cent as compared with the same week a year ago but an increase of 19,017 cars over the preceding week. Passenger travel in this region has been so heavy that it was necessary to rearrange a great many schedules, establishing additional sleeping car routes as well as increasing the train service.

The recent advance of about \$15 or \$20 a bale in the price of cotton has stimulated the movement of that product in the Southwestern region. Harvest in the northern part of Texas is under way and wheat will begin to move from that territory within the next few days.

The movement of coal to the lakes is heavy, the total tonnage dumped into vessels to June 1 being one million tons in excess of the same period last year. The formation of the American Coal Exporters' Association and the Association's arrangement with the Shipping Board for definite allocation of ships is expected to stimulate the export business.

### Demurrage Rates Reduced

In response to the pressure brought to bear by a committee of the National Industrial Traffic League, Director General Hines has issued supplement 2 to General Order No. 7 reducing demurrage charges from the rates established by Director General McAdoo early last year. Representatives of the American Railroad Association also recommended a reduction and Mr. Hines' action was taken after consideration of reports submitted to him by the divisions of public service, traffic and operation. The rates established last year are \$3 per day for each of the first four days after the expiration of free time, \$6 per day for each of the next three days, and \$10 per day for each succeeding day. The new rates, which become effective on July 20, will be \$2 per day for each of the first four days after free time and \$5 per day for each day thereafter, which is approximately the basis in effect in 1917. The supplement also provides that the "average agreement," under which credits are allowed for unloading in less than the free time, will also be applied to cars held for loading, but the loading and unloading agreements will be kept separate. The average plan originally applied to both loading and unloading, but was changed on the ground that shippers naturally loaded their cars out as rapidly as possible and should not therefore be allowed credits which would enable them to waste time in unloading. On the other hand, some industries unload promptly, but waste car time by ordering cars in advance so as to have a supply always on hand for loading. The two averages are to be kept separate so that each class of car use will stand by itself.

In announcing the reduction in rates, Mr. Hines pointed out that demurrage charges are not imposed for the purpose of obtaining revenue, but to promote the punctual loading and unloading of equipment, and also that in view of the diminished purchasing power of the dollar and the increasing demand for equipment, it was doubtful whether the reduced rates would be sufficient to accomplish the desired purpose. He referred to the heavy movement of traffic expected within the next few months and announced that if the results were not successful he would feel impelled to increase the demurrage charges.

### Imposing Sentence

UNITED STATES Judge Buffington in imposing sentence at Pittsburgh recently on certain railroad employees said:

The jury has found you guilty of stealing and having in possession goods stolen from an interstate shipment of freight. You were in a trusted position—the railroad service. You had been exempted from service on the other side of the seas; while other young men were risking their lives you were working at the railroad in the public service in the time of war. You have been generously treated by the Government in the way of wages. You had the esteem and respect of the people about you. You had a father who had carefully reared you; you had a wife and children. And it is a very painful thing for the court to have to pass sentence on you, but these are the things that courts cannot avoid. When a man comes up for sentence before the court there are three things to be considered; first, the man himself; he has already probably suffered enough and learned a lesson, but there are the interests of the public to be considered. These railroad thefts have grown to an extent during the time the government has had charge of them that have run up into the millions and millions of money. Now the money to pay for these goods that have been stolen has to be raised by other people—Liberty Bonds—those are the people who in the end have to make good those losses.

Then, my young friend, there is the interest of those who are engaged in the railroad business as well as yourself. All these things have to be borne in mind.

We have had in this District—in this circuit which is composed of New Jersey and Delaware and Pennsylvania—widespread evidence of this thing going on on all the railroads. We have had lots and lots of people who were taking, not as these goods of yours were, for your own family, but actually stopping the cars and taking quantities of copper and merchandise, not for their own personal use but for sale, making a business of stealing for profit and sale. Down in New Jersey we have had conductors, trainmen, in positions where others were influenced by their actions and their example, sentenced to five years imprisonment in the penitentiary. This has caused men to stop and think. Out here we have taken a milder course, but the thing goes on and it is quite evident that in order to save men from themselves the time has come when there must be more severe sentences imposed, and I can say to you for the judges that such heavier sentences will be imposed from this time, if this stealing continues.

I have taken all these matters into consideration, my young friend, because the court feels kindly towards you, kindly towards your wife, kindly towards your children, kindly towards your father; but the court has a solemn duty. I have taken into consideration the fact that these articles were not taken by you for the purpose of a trade and making money, and you were not in a position where your example would possibly lead other men. I am going to impose as light a sentence as I feel I can under the circumstances. I want to say to you, my young friend, that you made a serious mistake. Sometimes the mistakes that we make are the best things that ever happened to us; and this will be to you, if you learn

a lesson from the mistake. You will find in the penitentiary men who will drag you down, and you will find men there who will help build you up. You can build up your manhood. You can come back to where you lived; your friends are there and your family is there, and you can build up your manhood again, and you will do so. When you come back I want you to come and see me and talk it over as many another man has. I want you to take it like a man and make the best of it.

And I want to say to you on behalf of the judges here that the lightness of this sentence in your case is not to be taken as an example of what will come hereafter. I am following with you the lenient course that has been pursued here, but the judges, all of us feel, after consulting together, that the word should go out that hereafter those who come into the court charged and found guilty with offenses of this kind on the railroads will be dealt with more in the lines of what has had the effect of stopping things down in New Jersey, since that leniency has not resulted in stopping this epidemic of railroad crimes.

### Checking Percentages By Chart

By William Wyer

Statistician, United States Railroad Administration,  
Operating Statistics Section

STATISTICS MUST BE REDUCED to significant percentages in order to attain their maximum value. This principle is generously illustrated in the summaries of the Operating Statistics Section of the Railroad Administration.

Such a large use of percentages, of course, means a great deal of office routine in the preparation of the summaries. As far as the Operating Statistics Section is concerned, however, much of this routine is limited to checking. Only percentages in the totals for districts and regions actually have to be computed, as figures for the individual roads are already computed on the O. S. forms. Not only percentages, but all figures derived from basic data must be checked before they are entered on the summaries, and this constitutes a large part of the work of preparation.

The chart has proved a great aid and time-saver, not only as an absolute check on percentages computed in a certain way, but also as an indirect check on all figures affecting the percentages in question. The chart applies to the following general case:

Suppose that one basic figure is divided by another basic figure to obtain an average. Suppose, further, that both basic figures are given for two consecutive months or years. The average will then be computed for these two periods, and there will, of course, be percentages of increase or decrease applying to both of the basic figures and to the average. The set of related figures numbers nine, as shown in the following illustration:

Item	A. B. X. RAILROAD		December, 1917	Per cent change
	December, 1918	December, 1917		
1. Net ton miles.....	124,337,000	108,808,000	14.3	
2. Train miles.....	307,000	278,000	10.4	
3. Net ton miles per train mile (1 ÷ 2)	405	392	3.3	

Referring to the chart, and following the instructions thereon, its application as a check on the above figures may be readily seen.

Starting at the center (or origin) where the heavy lines cross, move straight to the right (along the horizontal axis) 14.3 spaces, thence straight up (parallel to the vertical axis) 10.4 spaces. The point arrived at is about seven-tenths of the distance from the diagonal line marked zero to the diagonal line marked five, and is below the zero line. The percent of change in the train load should, therefore, be an increase of about 3.5 per cent.

This simple operation not only checks the three computed percentages, but is also a close indirect check on the two computed figures for net ton miles per train mile. The operation of the chart can be mastered with a very little practice; and by interpolation to tenths between the diagonal lines, the reading on the chart will never vary more than two-tenths of one per cent from the correct calculated figure. A very slight mistake in any one of the four computed figures on which the final percentage depends will change this final figure more than two-tenths of one per cent. Any variation of more than two-tenths of one per cent is at once investigated. Errors of a smaller magnitude than this are negligible.

Additional sets of figures which the chart may be used to check are:

- a—Net ton miles.  
b—Loaded freight car miles.  
c—Net ton miles per loaded car mile (or car load).
- a—Loaded freight car miles.  
b—Total freight car miles.  
c—Per cent loaded to total car miles.
- a—Total freight car miles.  
h—Total average number of freight cars on line daily.  
c—Car miles per car day.
- a—Net ton miles.  
b—Total number of freight cars on line daily.  
c—Net ton miles per car day.

These are merely illustrations chosen from the monthly summary O. S. 5, of freight traffic movement and car performance. The application of the chart is, of course, much more general.

In constructing the chart, all the diagonal lines representing fixed values of *P*, the final percentage, start at a limiting point where both of the first two percentages are minus 100. This is natural; for, if both the basic factors on which the average depends decrease 100 per cent (that is, become zero), no computation is possible of the average or its percentage of change, which are thus made "indeterminate."

Another point on each diagonal line is fixed by the fact that these lines cross the heavy horizontal line at equal intervals. Thus the diagonal line along which *P* is always an increase of 25 per cent, crosses the horizontal axis 25 spaces to the right of the center. The logic of this may be seen if we consider that with no change in train miles, for example, the train load will follow fluctuations in net ton miles exactly. Or, mathematically, if *P*<sub>2</sub> (per cent change in train miles) is zero, we can only move backward or forward on the horizontal axis; and if the train load is to vary exactly with changes in net ton miles, the diagonal line with value 30 must cross this axis at value 30, and so on.

It should also be noted that when the two basic figures show identical increases or decreases, the chart will give a reading on the zero line. This is simply another way of saying that when net ton miles and train miles increase in the same proportion, the train load is stationary.

The proof that the lines joining the limiting point to the points on the horizontal axis are straight lines is purely mathematical, and is given below.

$$\begin{aligned} \text{Let } a &= 1917 \text{ ton miles} \\ b &= 1918 \text{ ton miles} \\ c &= 1917 \text{ train miles} \\ d &= 1918 \text{ train miles} \end{aligned}$$

$$\text{Then per cent increase in ton miles} = P_1 = \frac{b - a}{a} \times 100 \dots (1)$$

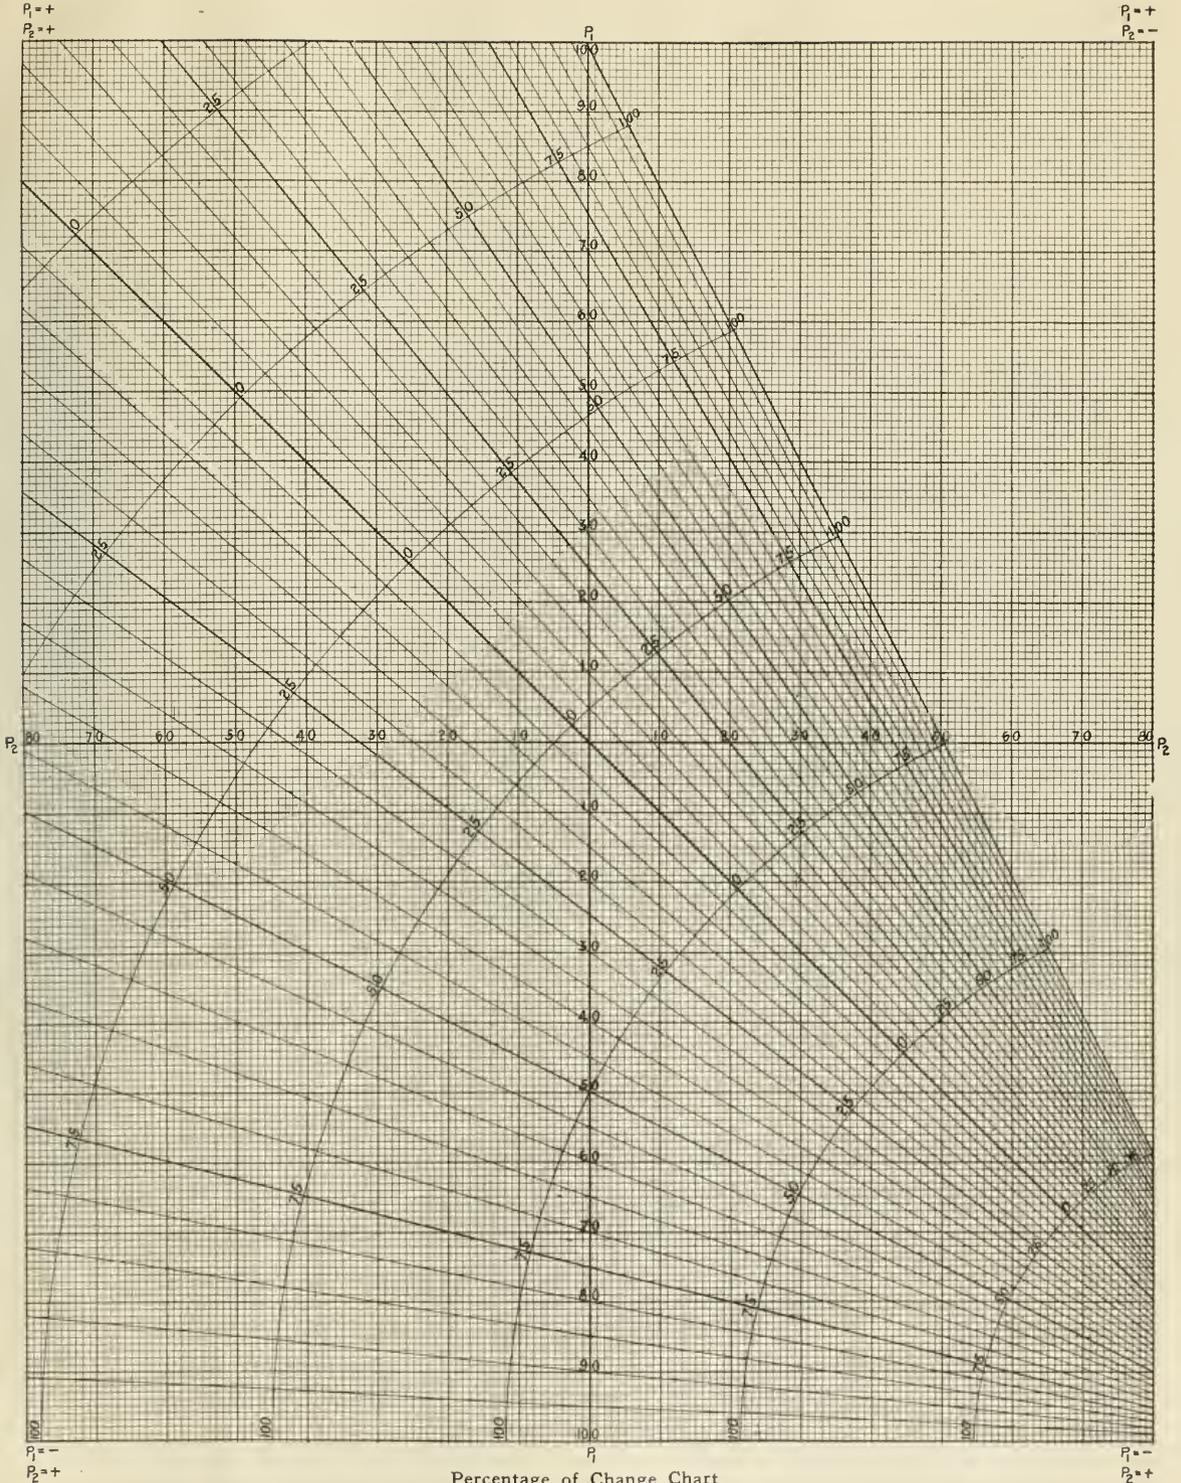

$$\text{and per cent increase in train miles} = P_2 = \frac{d - c}{c} \times 100 \dots (2)$$

$$1917 \text{ ton miles per train mile} = \frac{a}{c}$$

$$1918 \text{ ton miles per train mile} = \frac{b}{d}$$

$$\text{and per cent increase in ton miles per train mile} = P = \frac{\frac{b - a}{d} \frac{c}{a}}{\frac{c}{a}} \times 100 \dots (3)$$

$$= \frac{1}{d} \times \frac{bc - ad}{a} \times 100 \dots (4)$$

Percentage of Change Chart

Where comparative figures are given for two years and one item is divided by a second to obtain a derived unit, and where the percentage of increase or decrease of the first and second item are known, the percentage of increase or decrease of the third, or derived unit, can be read from the chart. Read the percentage of increase of the first item ( $P_1$ ) from the center of the chart along the vertical axis, and from this point move parallel with the horizontal axis to the left the amount of the percentage increase of the second item ( $P_2$ ). The point found related to the diagonal lines will show the percentage increase of the third or derived unit ( $P$ ). Increases for  $P_1$  are measured up, and decreases down. Increases for  $P_2$  are measured to the right, decreases to the left. All points to the right or above the diagonal zero line give plus values for  $P$ . All points below or to the left of this line give minus values for  $P$ .

Subtracting (2) from (1)

$$P_1 - P_2 = \frac{b-a}{a} \times 100 = \frac{d-c}{c} \times 100 \dots (5)$$

$$= \frac{100}{c} \times \frac{bc-ad}{a} \dots (6)$$

Substituting (4) in (6)

$$P_1 - P_2 = P \frac{d}{c} \dots (7)$$

$$P = (P_1 - P_2) \frac{c}{d} \dots (8)$$

From (2)

$$P_2 = \frac{d-c}{c} \times 100$$

$$= 100 \frac{d}{c} - 100 \dots (9)$$

Whence

$$d = \frac{100}{\frac{P_2 + 100}{100}} \dots (10)$$

Substituting (10) in (8)

$$P = \frac{(P_1 - P_2) 100}{\frac{P_2 + 100}{100}} \dots (11)$$

This is an equation in three variables. In order to plot it, one variable must, of course, be made constant, and this is what has been done by assuming various values for *P*. With *P* constant, the equation is of the first degree, and therefore represents a family of straight lines.

To determine the location of these lines,—

Let *P* = 0 and —100

Equation (11) may be written:

$$P_1 = \frac{P(P_2 + 100) + 100 P_2}{100} \dots (12)$$

If *P* = 0, *P*<sub>1</sub> = *P*<sub>2</sub> ..... (13)

If *P* = —100, *P*<sub>1</sub> = —100 ..... (14)

Solving equations (13) and (14), we find that the lines *P* = 0 and *P* = —100 intersect at the point (*P*<sub>1</sub> = —100, *P*<sub>2</sub> = —100). By substituting other values for *P*, it will be found that all the lines pass through this point.

If *P*<sub>2</sub> = 0, we get from equation (12) that *P*<sub>1</sub> = *P*.

This determines the intersection of every line with the horizontal axis.

Equation (11) therefore represents a family of straight lines, all passing through the point (—100, —100), and intersecting the horizontal axis at distances from the origin proportional to the constant value assumed as noted above for *P*.

## American Society of Civil Engineers Convention

THE AMERICAN SOCIETY of Civil Engineers held its forty-ninth annual convention at St. Paul and Minneapolis on June 17-20 with headquarters at the Radisson hotel, Minneapolis. Approximately 200 members were in attendance. Tuesday was devoted to the business of the association, the principal feature of interest being the presentation of a tentative report of the Committee on Development, the discussion of which consumed all of the afternoon session.

The committee tentatively recommended that while the society should continue to pursue the objects for which it was formed—the advancement of engineering knowledge and practice and the maintenance of a high professional standard among its members—the time has now come when it should adopt the principle of becoming an active national force in economic, industrial and civic affairs. To this end the committee recommended that a comprehensive organization be formed embracing: (1) The local affiliation of the branches of the national technical societies and the local technical

societies, (2) A state council composed of representatives from the local affiliations, and (3) A national council consisting of representatives of the national technical societies and of the state councils or state group organizations in lieu thereof. The object of this council shall be to increase the usefulness of the engineering profession, and to bring about greater co-operation and to advance the welfare of engineers.

Dealing with the internal relations of the society, the committee recommended that every member of the society be a member of a local association; that there be created in each geographical district of the society an organization consisting of representatives of the local associations in that district; that the representatives of each district on the Board of Direction and the Nominating committee of the society be elected by ballot by the corporate members resident in the district; that there be an annual conference of representatives from the local associations for the purpose of discussing the welfare of the society and its members; that the Board of Direction refer for recommendation each application for membership to the local association in whose jurisdiction the applicant resides; that it be the duty of the local association to provide for the welfare of the younger members of the profession by (a) reasonable representation on the active committees; (b) encouraging their discussion of the general problems of the society; (c) arranging excursions to works of engineering interest; (d) promoting social intercourse between them and the older members; that a personal service bureau be maintained by each local affiliation, organized to co-operate in connection with a central service bureau to be maintained by the national council.

With reference to technical activities the committee recommended that local associations should hold not less than four stated meetings per year and should encourage joint meetings with kindred societies; that the fortnightly meetings of the parent society be discontinued; that the semi-annual meetings of the parent society be supplemented by the addition of a spring and a fall meeting to be held in different parts of the country; and that a more systematic and comprehensive system of securing papers be developed. The creation of special sections was disapproved and the suggestion was made that such work be done by strong committees. It was also recommended that a book of recommended practices and standards be compiled.

Treating on the relation of the engineer to public affairs, it was recommended that a short code of ethics of broad scope, general character and positive rather than negative injunction be prepared; that a standing committee be created to consider questions of educational policy and to co-operate in carrying out such policies; that the society in co-operation with the other founder societies prepare a standard form of bill for the licensing or registration of engineers; that the national council maintain an agency in Washington, D. C., or elsewhere for the purpose of keeping advised of federal legislation and departmental rulings and regulations involving questions of engineering; and it was recommended that the creation of a national department of public works be supported.

The report was received favorably by the society and aroused active and extended discussion. The Board of Direction of the society has authorized another meeting of the committee to be held in the early fall at which an effort will be made to complete a final report for presentation at the annual meeting in January.

The remainder of the week was spent in visits to points of scenic and engineering interest in the vicinity of Minneapolis and St. Paul. On Friday the party left by special train for Duluth and the Missabe iron range where Saturday was spent in a tour of the range, returning to Duluth late Saturday evening.

## A Department of Public Works

SENATOR JONES of Washington and Representative Reavis of Nebraska have introduced bills in Congress to create a Department of Public Works in which will be concentrated all the engineering and architectural activities of the government. It is proposed to change the name of the Department of the Interior to the Department of Public Works, to transfer to this department engineering activities now handled by other departments and to transfer from the Department of the Interior all functions not directly concerned with construction, engineering, and scientific matters. Present bureau organizations with their personnel are to be kept intact.

The activities not now included in the Department of the Interior which it is proposed to include in the Department of Public Works are the Supervising Architect's office, now subordinate to the Department of the Treasury; the Construction division of the United States Army; River and Harbor Improvements, the Mississippi River Commission and the California Debris Commission, now subordinate to the Department of War; the Coast and Geodetic Survey and the Bureau of Standards, now included in the Department of Commerce; and the Bureau of Public Roads and the Forest Service, now subordinate to the Department of Agriculture.

Among the activities to be transferred to other departments are the Patent Office, which is to go to the Department of Commerce; the Bureau of Pensions to the Treasury Department; the Bureau of Education to the Department of Labor; the Bureau of Indian Affairs and the Board of Indian Commissioners to the Department of Labor; St. Elizabeth's Hospital and the Freedman's Hospital to the Public Health Service of the Treasury Department and Columbia Institution for the Deaf and Howard University to the Bureau of Education, Department of Labor.

The bill provides that the secretary of the Department of Public Works shall, by training and experience, be qualified to administer the affairs of the department and to evaluate the technical principles and operation involved in the work thereof. Provision is made for four assistant secretaries to be appointed by the President with compensation of \$7,500 each per annum and to have administrative jurisdiction respectively over engineering design and construction, architectural work and construction, scientific work and surveys, and land and legal matters.

The bill provides further that the engineering officers of the United States Army detailed to non-military duties in the Construction division of the United States Army, River and Harbor Improvements, the Mississippi River Commission and the California Debris Commission shall be detailed by the Secretary of War to like duties under the Department of Public Works for such period not exceeding two years as the Secretary of Public Works may find necessary to make the gradual transfer of these improvements to civil administration without detriment to the public interest.

The corps of engineers of the United States Army has expressed its opposition to this bill by arrangement for the introduction of a bill to create an "Auxiliary Engineering Corps" in the United States Army for duty on works of public improvement—a non-combatative corps of engineers which shall be "under the command and direction of the Chief of Engineers, U. S. A. Its personnel shall be assigned by the Chief of Engineers to duties under his charge; specifically on river and harbor improvements, inland waterways, locks and canals, fortifications, embankments, levees, dykes, breakwaters, piers, and in the supervision and in the construction of national highways and bridges, and to any other public work that shall be now or hereafter assigned to the Chief of Engineers under the War Department. This organization shall also perform the duty of guarding and protecting all national public works."

The bill to create the Department of Public Works is the

result of a conference of representatives of over 75 engineering societies in Chicago in April representing an aggregate membership of over 100,000 engineers. It has the backing of Engineering Council and the engineering societies of the United States in an effort to co-ordinate the extensive engineering and construction activities of the United States government which are now widely scattered in different departments with little or no attempt at co-ordination.

## Railway Affairs in Congress

WASHINGTON, D. C.

CONSIDERATION of general railroad legislation was begun by the Senate committee on interstate commerce on Tuesday in executive session but the meeting was devoted mainly to an informal discussion of the course of procedure to be followed. It was decided to appoint a subcommittee of five members, headed by Chairman Cummins, to draft a tentative bill and report back to the full committee. The committee was to meet again on Thursday to consider the Poindexter fourth section bill on which hearings were concluded on June 19.

Chairman Esch of the House committee on interstate and foreign commerce now expects to begin hearings on the general railroad question about July 7.

Hearings before the House committee on Tuesday, Wednesday and Thursday of this week on the Cummins bill, S. 641, intended to restore the complete jurisdiction of the Interstate Commerce Commission over interstate rates, brought out a number of points which were overlooked by the Senate when it passed the bill without having held any hearings on it. E. E. Clark of the Interstate Commerce Commission, the first witness, indicated that the commission is not especially keen for being authorized to suspend rates initiated by the director general during the remaining period of federal control, and thereby sharing with the Railroad Administration the responsibility for the general advance in rates now generally believed to be forthcoming. Alfred P. Thom, representing the railroads, said the question of policy was one for the Railroad Administration to discuss. C. E. Elmquist, representing the state commissions, was sure the shippers wanted the former jurisdiction over rates of both the Interstate Commerce Commission and the state commissions restored. Director General Hines did not oppose giving the federal commission power to suspend his rates but did object to being made subject to 48 states. Both he and Mr. Thom expressed much greater concern over the provision of the act requiring the director general to pay final judgments for causes arising before federal control, out of the railroads' rentals.

Commissioner Clark informed the committee that the commission was not the proponent of the bill, and that while it understood there was considerable demand for it, it "had not felt the urgent necessity for legislation of this sort at this time." The commission, therefore, had nothing to say as to the question of policy but merely wished to point out several ambiguities in the language which Mr. Clark said amounted almost to fatal defects.

"The financial results of federal operation," he said, "have not been as satisfactory or as successful as we all might have wished, but the railroads were taken over as a war measure and we have not doubted for some time that the government would be obliged in the end to charge off a substantial deficit as a war cost. The responsibility heretofore has rested with the President. The commission has had no jurisdiction except to review his rates on complaint and the shippers have generally refrained from attacking the rates fixed by the director general, but that condition is gradually being changed. A continually increasing number of complaints is being filed, although they mainly involve questions of relationship. The enactment of this measure would give

a sort of divided responsibility. It would require the President to ask the permission of the commission before he could file any tariff carrying an increased rate, no matter how trivial. The commission does not shrink from any responsibility but some of us thought that suggestion ought to be made."

Regarding the defects in the bill, Mr. Clark said that as he interpreted its language it did not mean what the Senate committee said it was intended to mean, that it would preserve the authority of the director general over intrastate rates. It provides that the director general shall have the only right to initiate rates possessed by the carriers before federal control but shall be subject to all the limitations of the interstate commerce act and, therefore, Mr. Clark thought the jurisdiction over intrastate rates would revert to the states, while another section of the bill puts another limitation on the power to increase state rates by requiring 30 days' notice. He thought this provision was not sufficiently definite as to how the notice should be given.

The shippers, Mr. Clark said, seem to favor the restoration of the commission's power to suspend rates initiated by the director general, but the bill would also subject him to the limitation in the amended fifteenth section of the act, which requires the permission of the commission before a tariff increasing a rate can be filed and he thought Congress would hardly like to limit the director general in that way. He also pointed to other defects in the language.

The amendment to require the director general to pay out of the railroads' rental final judgments based on causes before federal control Mr. Clark said, he personally considered sound, because a man ought not to be kept out of his money merely because the government has control of the railroad property.

Alfred P. Thom, counsel for the Association of Railway Executives, said the question of policy is one for the Railroad Administration to discuss but he pointed out that the passage of the bill would result in a divided responsibility for the results of federal control. The railroad companies, however, are very much interested, he said, in the provision regarding the payment of judgments and in that suspending the statute of limitations as to claims to exclude the period of federal control. He said that the question of judgments does not involve merely the question of personal injury or freight loss and damage claims, but that the field includes the large contracts made by the director general for improvements to the property or for materials and supplies to replace those taken over. Under the federal control act, he said, the carriers may be sued for the acts of the director general for which they are not responsible and the corollary is a right to levy on their property. Therefore he suggested an amendment to provide that no process shall be levied on any property of a carrier for causes during federal control where the director general is liable, as between himself and the carrier. He also declared that the provision for payment of judgments out of the compensation due the companies is in direct contravention of the terms of the standard compensation contracts, which include a limitation as to what may be deducted from the rentals and he suggested an amendment to provide that deductions shall be made to pay judgments "except as otherwise provided in the standard contract."

Charles E. Elmquist, president of the National Association of Railway and Utilities Commissioners, said that before the bill is passed the peace treaty will be signed and, therefore, it should be considered in the light of normal peace conditions. The shippers demand the right to have an investigation and determination of the reasonableness of rates before they become effective and the bill should be passed as soon as possible to restore rights which the shippers had gained after years of struggle. There are indications, he said, that we are again facing a large increase in rates, possibly 25 to 30 per cent, and if that is so, it is especially important that the

shippers should have the right to be heard before they become effective. He admitted that there might be some embarrassment to the director general in requiring him to ask the Interstate Commerce Commission's permission before filing an increased rate, but the protection required by shippers should have paramount consideration and any increases in rates during the expiring period of federal control should follow the former procedure and be filed with the fifteenth section board of the commission for a full report before the rates are made effective. He was particularly interested in preserving the authority of the state commissioners. The bill provides that a hearing shall be given, but does not say before what body. Mr. Elmquist suggested that it be amended to provide that no change or increase in intrastate rates be made without the approval of the proper state tribunals conformable to the laws of the several states. He argued that the state authorities realize the great increase in railroad expenses and thought there would be no difficulty because of their failure to act promptly, but when Representative Denison suggested that a state commission might consider it preferable for the federal government to bear a deficit rather than to impose a hardship on the shippers of the state, Mr. Elmquist said that the commission could deal with the question of discrimination under the Shreveport decision. If the jurisdiction is not restored, he said, there should be an amendment providing for review or suspension of intrastate rates initiated by the director general, by the Interstate Commerce Commission. Representative Winslow referred to the case of the Maine Central, which he said with an increase in traffic had an increase in expenses much greater than its increase in revenue and asked what the government should do for a road facing receivership by reason of such a condition. Mr. Elmquist said he was not prepared to say now what should be done in such a case.

Mr. Elmquist said that discipline and morale had suffered under federal control and he thought the railroads would be able to control their expenses by greater efficiency.

Director General Hines said he would discuss the bill on the assumption that it is the disposition of Congress to give the Interstate Commerce Commission power to suspend rates initiated by the President and that the relations of the Railroad Administration with the Interstate Commerce Commission are so close and cordial that the change would have little, if any, direct significance. It would not embarrass the Railroad Administration or change its procedure in any practical way. Mr. Hines said in an informal way the commission has been very helpful in giving advice on important rate matters and he felt that the Railroad Administration now should not undertake any important change in the rate structure without its advice. He pointed out, however, that because of the feeling that rates should not be decided entirely by railroad men, C. A. Prouty, a former interstate commerce commissioner, had been appointed in charge of the Division of Public Service and that its concurrence was required on all rates proposed by the Division of Traffic. In case of a disagreement, the matter was submitted to the director general. Later Max Thelen had been appointed director of the Division of Public Service and his concurrence is required. Moreover, the representation of shippers on the various local traffic committees has been increased so that they are evenly balanced between shippers and railroad men. The bill, however, goes beyond what is needed to accomplish the desired purpose, Mr. Hines said, because it apparently abolishes the machinery contemplated by the federal control act by which intrastate rates initiated by the director general are filed with the Interstate Commerce Commission. If this plan is abolished, the procedure for initiating intrastate rates would be relegated to the former procedure under the various state laws, under some of which the railroads had no power to initiate rates. Unless this was the purpose of Congress, he thought the entire situation could be met by a simple amend-

ment of the federal control act to provide that any rate initiated by the President in accordance with its provisions might be suspended by the Interstate Commerce Commission for a specified time pending an investigation. He pointed out that the bill in its present form would make the President subject to the fifteenth section amendment of August, 1917, requiring the permission of the commission before a tariff containing an increased rate can be filed, and would also subject him to the amendment of 1910, by which all increases in rates made after that date were presumed to be prima facie unreasonable and the burden of the proof was put on the carrier. The Senate bill, Mr. Hines said, would re-enact that presumption against any increase by the President, although that presumption is no longer reasonable in view of the diminished purchasing power of the dollar. He thought there was no great difference of opinion as to the intrastate rates, but that the question is important because the United States government has assumed responsibility for the railroad situation. The question of railroad revenues, therefore, becomes one of national policy. This represents an emergency situation of very great seriousness because the railroads will not remain under federal control for a very considerable time and if the government is left helpless as to intrastate rates because of the different conclusions of different states in no way responsible for the general policy, it will be impossible to carry out the conception of the federal control act. Mr. Elmquist's suggestion that the Interstate Commerce Commission control led the situation by its power over discriminations, he dismissed as impracticable, because, he said, if the government is to establish a rate structure which will protect the situation it must be in a position to act promptly and it would take many months to thresh out the question of discrimination in the way suggested by Mr. Elmquist.

As to the provision for the payment of judgments, Mr. Hines pointed out that the provision of the bill as to causes arising since federal control is unnecessary, because it is now the settled policy of the Railroad Administration to pay such judgments regularly and without question, but as to causes arising before federal control, the government should not be subjected to the burden of assuming the debts of the railroads without question. While the bill provides that such judgments shall be paid from the money owing to the railroads, Mr. Hines pointed out that this offered no protection to the government because nearly every railroad owes the government more for capital expenditures than the government owes it and the power of the government to deduct from the railroads' compensation is limited by the provisions of the standard contract. Therefore, if the government uses what it can deduct to pay judgments, it diminishes by that amount what it could deduct for the debts of the railroads to the government. This would leave it to get its money back in the best way it can. Moreover, he thought the only reason for such a provision arose from a very few instances of confusion or delay during the early period of federal control, because he was not aware of a single case now where a judgment against a railroad company remains unpaid because of inability to attach its property. Some railroads are insolvent but, generally speaking, it is incorrect to assume that the judgment creditor is without recourse because most companies have assets not under the control of the federal government which may be located and attached. The Railroad Administration will give every reasonable assistance to the creditor in locating such assets.

Mr. Hines also pointed out that the Senate bill omits the words "or with any order of the President" in the provision of the federal control act that carriers shall be subject to all laws and liabilities as common carriers except such as may be inconsistent with the provision of the act or with any order of the President. He said that within the scope and purpose of the federal control act it is necessary that the President shall have the right to make reasonable orders which are

necessary in connection with the policy of unification. In spite of many technical obligations on the individual railroads, and that if these words are eliminated all sorts of things done reasonably in connection with the unification would be brought into question. He thought most of the dissatisfaction against such orders grew out of the necessity for emergency action during the early part of the period of federal control and that the causes of discontent have now been generally eliminated.

Hearings on the fourth section bill were concluded on June 19 after a large number of witnesses had been heard for and against the bill. Most of those in favor of it were the representatives of the intermountain section.

## Receiving the German Railway Equipment

THE IMPORTANCE of the provision of the armistice calling for the delivery of 5,000 locomotives, and 150,000 freight cars to the Allied armies is best realized when it is understood that today a large share of the railway equipment in use on the railways of Belgium and northern France is of German origin. Some of the better fast passenger trains are equipped with German cars and still have the German signs and instructions in them. From the American point of view the further interesting fact is that Americans were assigned to the work of receiving a share of this equipment, of inspecting it and of putting it in condition for service.

By the terms of the armistice, Germany was ordered to deliver 5,000 locomotives, and 150,000 cars not including 19,021 cars needed to make up the quota of the railways of Al-

"U. S. Official" Photo

The Americans Who Received the Equipment and the Germans Who Handed It Over

sace-Lorraine which had to be "handed over together with their pre-war material and personnel."

The actual work of receiving the equipment was put in the hands of two Interallied Commissions for the Reception of German Railway material, one at Brussels consisting of a British, a French and a Belgian delegate and the other at Metz consisting of a French officer, Lieutenant Colonel Bachellery, and an American, Major N. F. Brown, was formerly an assistant engineer in the construction department of the Pennsylvania Railroad who was selected by Brigadier General W. W. Atterbury, Director General of Transportation of the A. E. F. to head the American section.

The locomotives to be delivered were originally divided into

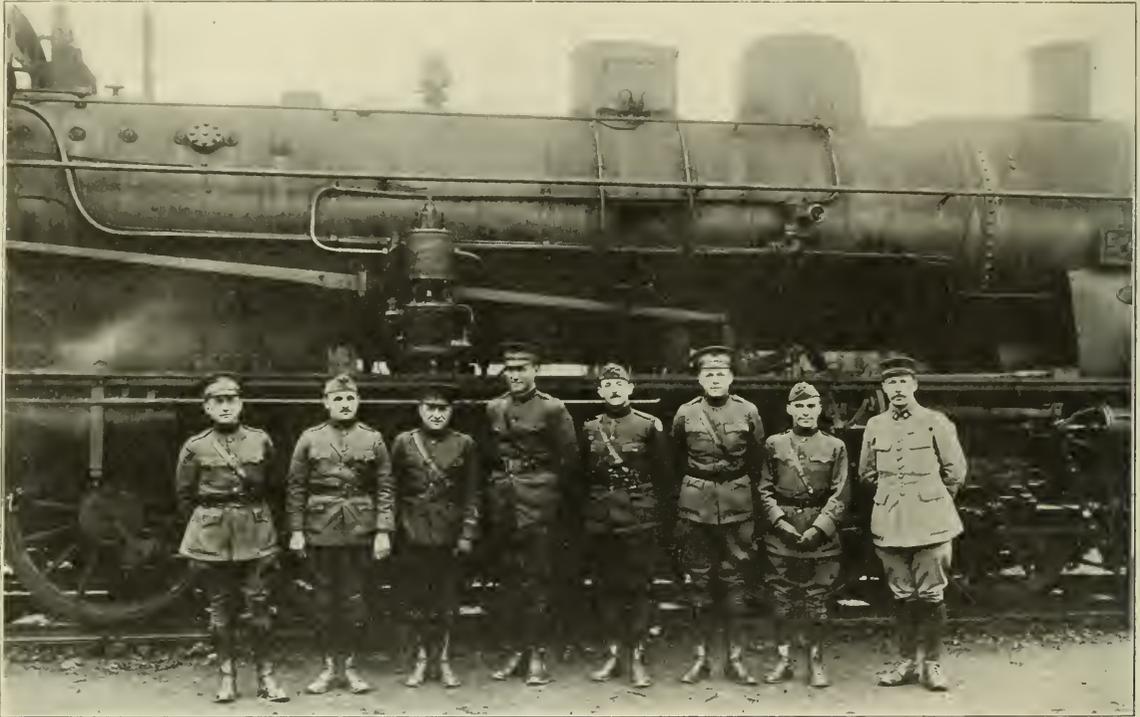

three categories based on hauling capacity, but later this was changed to include five categories, based on classes and types as follows: 1,000 capable of hauling a train of 900 tons minimum on a one per cent grade; 1,000 able to haul 800 to 900 tons on a similar grade; 1,500 and 1,200 able to haul 650 to 750 tons, and 300 able to haul from 650 to 700 tons. In each case the number acceptable in each series of Belgian, French and German locomotive was specified as well as the proportion of engines that might be supplied without separate tenders. The cars were similarly divided into eight classes as follows: 70,000 gondolas; 20,000 flat; 10,200 miscellaneous; 1,000 tank; 35,500 box; 2,500 freight baggage; 10,000 passenger and 800 passenger baggage cars.

Of the total number of locomotives, half were to be delivered to each commission—the commission at Brussels receiving 1,300 for the British army, 600 for the Belgian and 600 for the French. The 2,500 delivered to the Metz com-

mission destroyed and captured, made an immediate restitution to France imperative. Looked at in the broadest way the toll taken from Germany in cars and engines was, in the main, a replacement proposition, although of course, coming at such a time, the depriving her of this material had a retarding effect on a remobilization of her armies in case of an attempted renewal of hostilities.

The two commissions worked through a number of sub-commissions which handled the administrative work at the receiving stations—the Metz Commission having five French sub-commissions and two American, the latter being later combined to form a third.

One of the two American sub-commissions worked at Conflans. The other was at Audun Le Roman for a time and then moved its headquarters to Petange, in Luxembourg and when the two combined in January, moved the headquarters to Moselweiss near Coblenz.

The American Section of the Commission. From Left to Right: Major N. F. Brown; Major A. W. Byron, Assistant General Superintendent of Motive Power, A. E. F.; Captain V. Godshall; Captain W. G. Knight; Captain F. J. Snow; Lieutenant W. Smith; Lieutenant S. R. Harper; Adjutant Louis Loth

mission were to be divided 500 for the A. E. F. and 2,000 for the French.

The Metz commission was originally supposed to receive 34,000 cars, which number was subsequently increased to approximately 40,000.

In the case of the locomotives delivered to the American Army the title was not to pass direct to the A. E. F., but the latter was to be given the use of the locomotives until such time as agreed upon. Great Britain had lost many of her imported locomotives in Flanders, also at Gouzecourt following the counter attack after the battle of Cambria in November, 1917. Belgium had lost heavily in engines during the invasion of her territory. Germany had also contrived to keep cars belonging to France in her country prior to the beginning of the war, and these, with what she subsequently

It is interesting to note that the Americans rejected more of the locomotives delivered to them than they accepted. Of a total of 8,383 cars inspected, the Americans accepted 6,717 and rejected 1,666; but of the 225 locomotives the Americans inspected, only 82 were accepted and 143 were rejected.

Each locomotive was to be delivered in good order with shovel, lanterns, hose, etc., and provision was made for the delivery of spare parts for repairs. An interesting story could be made of the details of inspecting and repairing the locomotives and cars for service, etc., but space does not permit.

It is not right, however, to omit some reference to the German personnel that was sent with the equipment. Each engine was delivered by two agents—the engineman and fire-

man. These agents not only delivered the locomotives to the receiving stations, but moved them to the interior of France to their ultimate destination. They were retained in the service of the French as long as considered necessary to take care of the traffic pending the re-establishment of normal conditions. The agents furnished to accompany locomotives destined to the American Army, remained with their engines until they delivered them to their ultimate destination, but were not retained in the American service, but were returned to Germany to bring over other locomotives.

During their stay within the Allied lines they were furnished protection, and guaranteed shelter and food at their expense. Their salaries, which were on the basis of those paid to them while in civil life, were charged to the service using them.

To insure their proper treatment and protection every agent was furnished with a passport printed in three languages.

### Standard Contracts Executed

THE Railroad Administration and the railroad companies up to June 23 had executed 83 standard compensation contracts providing for an annual compensation of \$560,299,623 and three contracts providing for a lump sum payment of \$129,734. The contracts cover 51 of the Class I roads and in many cases they include a number of subsidiaries. The total compensation covered by contracts compares with an estimate of \$940,000,000 for all the roads under federal control. Most of the contracts with the larger roads which have not been signed are held up because of differences regarding the allocation of equipment or the matter of special compensation. The Railroad Administration has declined to sign a contract with a company until it has accepted the equipment allotted to it and many companies have not yet signed because they have claims pending for special compen-

The Personnel of the Inter-Allied Commission for the Reception of German Railroad Material at Metz. The Locomotive Is One of Engines Accepted and Has Already Received Its New U. S. A. Number

These passports were countersigned by the president of the sub-commission receiving and forwarding the locomotive. In addition to these passports each engineer was furnished with a travel order showing the station to which he was to move and the station to which he was to return after delivering his locomotive to the American service.

The *Railway Age* is indebted for the foregoing information to Major Norman Brown who since leaving the service, has become an assistant engineer (corporate) of the Pennsylvania Railroad and to Captain V. Godshall, formerly special agent of the accounting department of the Pennsylvania Railroad and since leaving military service, accountant in the corporate engineer's office of the Pennsylvania Railroad.

Reduction of damage to package freight is now the subject, on the Atchison Topeka & Santa Fe, of a campaign, conducted by special committee; and this committee gathers freight-house employees and gives them lectures. At Chicago it was shown that the loss and damage to freight shipments ten years ago amounted to 2 per cent of the gross freight revenues and by a campaign then carried on was reduced to 0.66 of 1 per cent; while in the past few years the percentage has steadily increased and at the present time is 2.12 per cent of the gross freight revenues. A comparison of the loss in freight during the first four months of 1919 with the same period of last year showed an excess of \$350,000.

in addition to the standard return. The list of compensation contracts executed, which is in addition to a number of co-operative short line contracts which include no compensation is as follows:

## Preventing Deterioration by the Proper Use of Paint

By J. W. Gibbons

General Foreman Locomotive Painter, Atchison, Topeka & Santa Fe

ONE OF THE MOST FERTILE fields for saving in the railroad industry has been practically ignored by the officers of the roads; that is the preservation of the property by painting. This statement is not made in a spirit of criticism for the same mistake has been made by the public in general. Railroad officers have disregarded the savings that could be effected by giving more attention to painting, not because they are indifferent to promoting economy, but because their training and education have been along other lines. Professor H. H. King of Kansas State Agricultural College has made a study of this particular question and recently stated that the lack of paint protection causes a greater annual loss through deterioration than the aggregate fire loss for the same period. The truth of this statement cannot be questioned, yet the prevention of a property loss by protection against fire receives much more attention than the prevention of deterioration by painting. The railroads employ men especially trained in fire protection methods to travel over the line constantly watching conditions and suggesting improvements. In every shop and terminal there is a fire chief whose word is law in all things pertaining to his department. Why not give the foreman in charge of the paint department some voice in the protection of equipment, since the lack of protective measures is causing a greater loss than fire?

Some will say that the railroads of this country expend hundreds of thousands of dollars each year for paint protection. However, careful observation will disclose the fact that painting is generally done because of the ornamental effect, the prevention of loss through deterioration being given secondary consideration or entirely disregarded. These two objects should not be separated. One should be incidental to the other, but preservation should be the controlling factor.

It is easy to find examples of the use of paint to secure ornamental effects while no thought is given to the preservation of material by its use. Not long ago while riding on the observation platform the conversation turned to the subject of the protection by painting, and I was able to point out object after object that was corroding for want of such attention. One striking example was found in the general store building which was a frame structure with a shingle roof. The entire building was well painted in attractive colors, the roof being a bright red, but the outside sheds made of corrugated iron were badly corroded having never

been painted. There was paint enough on the shingle roof where it was of no value to have covered all the corrugated iron buildings.

What is the remedy for the condition that prevails? It is not because of ignorance that such practices exist on railroads, but rather because those who realize the trouble have not the authority to correct it, due to the division of authority. The Master Car and Locomotive Painters' Association has made experiments which prove conclusively that heat treated or processed linseed oil will give greater protection against moisture and the action of sulphuric and other acids commonly found in railroad operation than raw linseed oil. This was publicly demonstrated at the convention of the association and the results have been confirmed by independent investigation. Nevertheless, the standard paint vehicle is still raw linseed oil, the reason being that the chemist cannot analyze or determine the purity of the heat treated or processed linseed oil. The objection is raised that under

these conditions there is an opportunity for the substitution of cheap materials. Why not disregard the composition so long as the paint mixed with processed linseed oil gives the best protection?

Similar conditions exist in regard to varnish. Chemists cannot determine the exact nature of the oil used in the manufacture of varnish, but this, the most expensive material used in the railroad paint department, is commonly purchased upon service tests and the reputation of the manufacturer for maintaining quality. Even this last is not necessary for a competent master painter can determine in a very short time the quality of paint or varnish by the film test. The proper means for correcting the great loss by deterioration is to give the master painters the recognition they deserve. The railroads hire painters but seldom take their advice. If this were done deterioration could be minimized without spending any more money for paint materials than has been done in the past.

## Prouty Proposes Plan for Adequate Revenues

Revenue Situation at the Base of the Whole Problem. Roads Should Be Returned on December 31

**C**HARLES A. PROUTY, former member of the Interstate Commerce Commission and now Director of the Division of Accounting of the Railroad Administration, who some time ago advocated a continuation of the experiment of government operation of railroads, has recently addressed a letter to a number of Congressmen and railroad men, declaring that the railroads should be returned to their owners on December 31 but that the government should retain a certain degree of control for another year while the financial relations between the railroads and the government are being adjusted. He estimated that the deficit for this year, if the first three months be taken as an index, will be \$500,000,000 to \$800,000,000. He also suggests some ideas for the future regulation of the carriers, in part as follows:

"The problem is to devise some method by which under private ownership rates shall be established which will yield to the carriers a sufficient revenue without imposing upon the public an unjust burden. Moreover, that plan must be such as can be adapted to the present exigency. As a contribution to the general discussion the following suggestions are made:

### I. The Making of Rates

"Rates to be fixed by the Interstate Commerce Commission. Such rates to be absolute, with no right upon the part of the carrier to vary up or down.

"State rates to be fixed by the I. C. C. in collaboration with the state commission, or perhaps by the state commission, with the right of appeal to the I. C. C.

"The I. C. C. shall have power to fix divisions and also to approve agreements for the routing of traffic and the division of earnings from competitive traffic, but not until after full hearing upon notice to all interested parties, including the general public.

"The right to initiate rates, supervised as it is by the I. C. C., has been for the last five years of no advantage to the carrier. No advance in rates has been made which could not have been secured by an application to the Commission for a change in the rate.

"The right to reduce the rate without leave of the commission has not benefited the public, but has in the main proved a sort of vicious discrimination and disorganization.

"It is said that the commission could not make the rail-

way rates of this country; and it could not with its present organization. With a proper organization it could make and publish those rates at a tithe of the expense under which the carriers now rest in that behalf. Still further, the rates so established would gradually assume a much more coherent, consistent, and permanent shape than they now have, to the immense advantage of the shipping public. As director of accounting I have charge of overcharge claims, and am satisfied that nineteen-twentieths of the undercharges and overcharges which so vex the shipper and which are so troublesome to the carrier, result from the complexities of our rate structures and the manner of the publication of our tariffs. All this might readily be removed if the commission itself made and published the rate.

"While the intrastate rate presents many difficulties in the solution, they are not at all insuperable. If some plan of actual co-operation can be put into effect they will disappear.

"The commission should have power to fix the divisions of a joint rate when the carriers themselves do not agree, thereby justly distributing the charge for the entire service among those carriers which participate in that service.

"In many cases competition might well be restrained with advantage to the carrier and without detriment to the public. To this end carriers should be permitted to enter into arrangements for the routing and division of traffic, or for the division of the earnings from competitive traffic. Such arrangements should only be permitted with the approval of the commission and upon conditions fixed by it.

### II. The Basis for Such Rates

"The railroads should be self-supporting. To this end Congress should instruct the I. C. C. to establish such reasonable rates as will yield a fair return upon the value for rate-making purposes which it establishes.

"The amount of this return ought not to be prescribed. In the nature of things it cannot be the same upon the value of all carriers. To establish rates which would yield a given return (say, 6 per cent) upon the value of the most unfortunate carrier, would exact from the public too high transportation charges, while upon the other hand, to maintain rates so low as to yield only an adequate return upon the value of the most fortunate carrier would be extremely

unjust to its less favored competitors. The rates should produce an adequate return upon the average value affected by them.

"The value upon which this return should be allowed is that value which the commission is now fixing under the valuation act of 1913. Until now it has wisely refused to place a value upon any property until it could know from the facts before it what the result would be of applying the methods and principles adopted by it to the railroads of the entire country. Within the next two and one-half years it should have named the rate-making value of every considerable railroad property in the United States.

### III. Disposal of Net Income from Operation

"Congress should provide that no carrier shall pay to its security holders out of its net operating income in any year more than a certain per cent upon the rate-making value fixed by the commission. The balance of its earnings should be distributed in the manner to be determined by Congress.

"All carriers in a given section must charge substantially the same rate. In the first place, many, and perhaps most, of these rates are directly or indirectly competitive and a carrier charging a higher rate would lose the business. But, in addition to that, there is a relation between communities within a given section which requires that a uniform scale of rates be maintained if serious discrimination is to be avoided. This means, of course, that one railroad will make a much larger net income than another, and perhaps the most difficult part of this whole problem is to find some way in which the weak road can be sustained without undue profit to the strong road.

"This can in a measure be accomplished by permitting the strong road to retain a sufficient amount to pay a fair return upon its value and by disposing of the balance in such a way as to encourage the carrier to secure the highest possible efficiency in operation and at the same time fairly protect the interest of the public. My own thought has been that this would be best accomplished under the following plan:

"The carrier should be allowed to pay to the owners of its securities which represent its carrier property, say, six per cent upon its rate-making value as determined by the commission. A few years ago this might have been too much; today less would be hardly fair. This would probably enable the carrier in the immediate future whose property was represented half by bonds and half by stock to pay a dividend upon its stock of at least 7 per cent.

"What remained over and above this in any year should be used for three purposes:

"(a) A certain amount, probably 2 per cent or 3 per cent upon the rate-making value, should be invested in the property itself, but upon condition that the amount of this investment shall not be made the basis of a claim for additional rates. There is in every railroad property, if the experience of the past be an index to the future, an invisible loss and a functional depreciation which cannot be taken care of in any other way. A reasonable rate should provide for this, just as much as for an adequate return to security holders.

"(b) In some way a guarantee must be provided for the payment of future interest and dividends. There will of necessity be lean years and fat years and the one should be made to offset the other. Rates cannot properly be varied every time the business increases or declines with a corresponding effect upon net returns. This guarantee fund should not be invested in the property, but should be held in the form of some quick asset.

"(c) Any balance remaining should be divided between the railway and the public, the public taking more as the amount increases; as, for example, the first 2 per cent to be divided equally, the next 3 per cent one to the carrier and

two to the government, any additional amount one to the carrier and four to the government.

"Anything accumulated from this source by the government might be devoted in some form to the assistance of the weaker roads.

"Assuming that this scheme might be a workable one if the roads were once more in the possession of their owners, what steps should be taken to restore them and put in effect this plan?

"1. Government operation should continue as it is until January 1. Within that time the commission will be able to judge something of the future and to determine what changes, if any, in rates may be necessary.

"2. December 31, 1919, existing contracts should terminate and the properties be returned to the operation of their owners. The government should guarantee for one year a return equal to 75 per cent of the contract compensation in all cases where the contracts have been executed, and the carrier should be required to pay over to the government in all such cases 75 per cent of any excess which it may make over and above the contract compensation. If there is no contract there should be no guarantee and no payment.

"3. The government should retain for one year from January 1 a certain measure of control for certain purposes.

"Settlements must be made with the carriers, and to that end the government must have the right to call upon them for certain assistance and information.

"In restoring these properties there will be many adjustments as to the use of terminals, the joint use of equipment, etc., as to which the government must have power to act to avoid inconvenience to the public and due equity between the carriers.

"If the government is to guarantee a net income in any amount, it must have a certain supervisory power over the expenditures for maintenance of way and equipment.

"I also feel that it will be found necessary during this first year, while the financial status of these carriers is becoming re-established, so to speak, for the government to assist in the financing of improvements, including the purchase of equipment. This, however, ought not to involve any loss upon the part of the government.

"These suggestions do not profess to cover all the legislation which ought to be enacted at the present time. There is no mention of the supervision of securities, which certainly must be undertaken in some way by the federal government.

"Nothing is said as to control by the government of construction, maintenance and operation. While carriers should be left as free as possible in these respects, there are instances when the safety and convenience of the public must be protected. I have always myself believed that these matters could be best dealt with through some executive branch rather than by the commission.

"Another important subject not referred to is the consolidation of railroad properties. Today our railroads are, under government operation, consolidated into a single system, and the public is dissatisfied because there is no competition. To the extent that consolidation is permitted under private ownership, competition and the benefits of competition must disappear. There are, however, undoubtedly many instances where combination would result in economy of operation without injury to the service. Something should probably be done in this direction.

"Only the revenue situation, which really lies at the base of the whole problem, is covered here. The government must establish the rate, that is, the measure of compensation, while the private individual must furnish the service. Whether our system of transportation can be satisfactorily developed upon that theory is extremely doubtful, but it seems likely that some plan of the sort suggested will come as near meeting the difficulty as any."

# General News Department

**Brigadier General W. W. Atterbury**, vice-president of the Pennsylvania Railroad, is now doctor of laws, that degree having been conferred upon him by the University of Pennsylvania.

**Repeal of the daylight saving law**, effective with the setting back of the clocks in October, has now been voted by both the House and the Senate and the bills are now in conference.

**An appropriation of \$2,500,000** for carrying on the railroad valuation being made by the Interstate Commerce Commission is provided in the sundry civil bill as passed by the House of Representatives.

**The Veteran Employees' Association** of the Middle Division of the Pennsylvania Railroad held its 23rd annual meeting and banquet at Harrisburg on June 19. J. C. Johnson, superintendent of the division, was elected president of the association for the ensuing year.

**The American Association of Freight Agents**, at a meeting held at Cleveland, Ohio, on June 17 and 18 authorized the executive committee of the Association to make application to the American Railroad Association for membership in that organization as a division of the Operating Section.

**The Railway Mail Association** at its 24th annual convention at St. Louis, Mo., June 17, 18, 19 and 20 discussed as paramount issues the establishment of a pension system whereby civil service employees of the government could be retired on a pension of \$50 a month after 30 years service and the authorization of a Board of Appeal for postal employees.

**The American Train Dispatchers' Association** held its annual convention at Chicago on June 17, 18, 19 and 20. Among those who addressed the delegates were James Davis, member of the War Industries Board, W. S. Stone, president of the Brotherhood of Locomotive Engineers, and A. B. Garretson, president of the Order of Railroad Conductors.

**The Traffic Bureau** of the New Orleans Association of Commerce has requested the Director General to have the headquarters of the New Orleans & Great Northern returned to New Orleans from Hattiesburg, Miss., in order that New Orleans merchants may have a greater opportunity to meet the requirements of the road in the matter of supplies.

**The Brotherhood of Railway Express Employees** held its first annual convention, opened at Chicago on June 23. Addison Bollinger, supreme president of the organization, urged the election of a committee to go to Washington to apply for a further increase in wages and also recommend the adoption by the brotherhood of a demand for a uniform wage scale in cities of the same size.

"**Hunting Jack Rabbits with a Locomotive**" is the title of an interesting pamphlet recently issued by George Bradshaw, supervisor of safety of the Pere Marquette and other Michigan railroads. He shows the similarity of action between jack-rabbits, on the plains of western Canada, who race in front of trains, and trainmen and yard men who act in a similar manner while at work, to the detriment of the safety first movement.

**The Brotherhood of Locomotive Firemen and Engineers** is holding its convention at Denver, Colo. Among those who have addressed the convention is Director General Walker D. Hines; also W. S. Stone, president of the Brotherhood of Locomotive Engineers, and other labor organization heads. J. F. McNamee, editor of the Brotherhood magazine was endorsed for a position on the Interstate Commerce Com-

mission. An appropriation was voted to the Commercial Telegraphers' Union of America to sustain the members of that organization during the present strike.

## The Trans-Siberian Railway

The President has agreed to advance \$5,000,000, as the share of the United States in a fund of \$20,000,000 contributed equally by Great Britain, France, Japan and the United States, for the relief of the Trans-Siberian Railway.

## Five Years Wandering in the Wilderness

Pacific Electric box car 2586, which left the builders, American Car & Foundry Company, St. Louis, Mo., December, 1913, arrived on home rails (first appearance) May 18, 1919. It had made seventeen trips between the Middle West and Eastern States, three between Atlantic and Pacific ports, one trip between Colorado and Eastern states and two trips between Eastern states and Texas. On one road it stayed 108 days; another it visited nine times in one month. This is the last to arrive of ninety box cars bought in 1913.—Pacific Electric Magazine.

## Improved Claim-Department Record

In fulfilling a promise made to shippers during the war that every effort would be made to dispose of outstanding claims as fast as competent help could be secured, the number of unsettled claims on hand in the Claim Departments of class 1 railroads in the Northwestern region has steadily decreased due to the re-employment of experienced clerks who have returned from service in the army and navy. The number of unsettled claims on hand February of this year totaled 150,019, which was decreased in March to 136,145, in April to 124,792 and in May to 113,443.

## Automobiles on Crossings

During the first four months of the calendar year the records of the Southern Pacific show that of the 151 grade crossing accidents involving automobiles, 20 were cases where automobiles stalled on the crossing and were struck by trains; 68 automobiles attempted to cross in front of trains, 36 ran into the side of trains, 16 ran into and broke down crossing gates lowered to protect them, one skidded into the side of a car, one ran down and injured a crossing flagman, four ran into signal posts, and five accidents were unclassified. Nine deaths and 45 injuries resulted. This information, accompanied by a statement of what the railroads are doing to avoid crossing accidents, has been sent to the press by the Southern Pacific News Bureau.

## Railway Executives

A. H. Harris, vice-president of the New York Central Lines, has retired from the standing committee of the Association of Railway Executives, and A. H. Smith, president of the New York Central, has been elected in his place. At a meeting held June 19 questions of accounting under the railroad contract were discussed. J. A. Taylor, chairman of the railroad corporate accounting conference, and G. A. Harwood, chairman of the Association of Railroad Corporate Engineers, were present by invitation. A conference was also held with a committee representing the American Short Line Railroad Association. The Short Line Committee was composed of Bird M. Robinson, chairman, and Ben B. Cain, L. S. Cass, F. J. Lisman, W. B. Dobson, H. B. Stewart and C. W. Pidcock.

REVENUES AND EXPENSES OF RAILWAYS

FOUR MONTHS OF CALENDAR YEAR, 1919—CONCLUDED

Name of road.	Average mileage during period.	Operating revenues.			Maintenance of way and structures.		Operating expenses.			General.	Total.	Operating ratio.	Net from railway operation.	Railway tax accruals.	Operating income (or loss).	Increase comp. with last year.

### Wires to Be Returned to Owners

Both Houses of Congress have passed bills for the return of the telegraph and telephone lines of the country to their owners. The Senate acted first and its bill provides that existing rates shall be continued for a period of 90 days and that the return shall be "forthwith" upon the approval of the act by the President. The House bill would extend the existing rates for six months and provides that the return shall be within 30 days, and so timed as to complete a full calendar month for accounting purposes. The conferees have adopted the House plan for the date of the return, but adopted a provision that telephone rates shall remain effective for four months unless sooner changed by State authority.

### Winnipeg Strike

After much rioting and the declaration of martial law, conditions at Winnipeg are again quiet and the soldiers called to police the city have been withdrawn. Rioting began on June 21, thousands of strikers being engaged. Conflicts ensued with the provincial police and one man was killed and many injured.

The strike of a number of firemen, switchmen and engineers in sympathy with the general strike badly crippled freight yard service at Winnipeg last week although passenger service was maintained without serious interruption. The places of these men were rapidly filled, however, and the sympathetic strike, insofar as the railway workers are concerned, lost much of its force.

### A New Federation?\*

"The trend of thought today in labor organization seems to favor government ownership and operation of the railroads. I am not so sure this attitude is the correct one, as it was never intended by the founders of this government that it should be paternalistic. I believe that the government should give the workers the full opportunity of using the complete machinery of labor organizations in accomplishing a desired end, and rather than, to, through some idealistic notion, hold out as bait things that are known to be impossible. Through the unhampered use of these organizations, men will be able to see to it that equitable rates of wages are paid, sanitary and healthy working conditions obtained, that the eight-hour day should prevail, and such other conditions be made that the worker, whether on a railroad or wherever he may be, has the proper and necessary opportunities for rest and recreation. Not all these things are feasible under government administration. Simply having a desire for a certain condition or wanting it is not sufficient to obtain it. You must formulate some plan for your betterment, and then you must put that plan into effect. Just what such a plan may be, is not within my province to point out. Behooves you to "keep a clear track" of the many palliatives that are now being offered and promised, none of which are guaranteed, even under government administration. All that you attain and obtain must be brought about by your own and the combined efforts of your fellow workers, and with the co-operation of those only who have the interest of the worker at heart, and not those or those things now brought forward to blind issues in order that a select few may benefit by political preferment because of having trotted out some will-of-the-wisp.

Railroad managers and operators in the years gone by have taken advantage of the vast store of knowledge possessed by the members of the four big railroad brotherhoods and sought their co-operation for the benefit of both parties and much was accomplished by this co-operation. Greater efficiency can be obtained and better conditions and pay-rates can be effected if all railroad employees' organizations will work hand in hand along these lines. For some time back, our committees have been meeting with a great deal of opposition in Washington; just what or who may be back of all this underecurrent of opposition I am unable to say.

but this I do know, that the time has come when we should get together the various units or organizations in railroad service now outside of the American Federation of Labor and bring about a federation strictly for railroad men, and I was authorized by my convention to go about arranging for a meeting of the chief executives or representatives of these various organizations. I have interviewed the representatives of a dozen different organizations, all of whom have expressed their desire to attend such a conference, and I have, therefore, called this meeting in Washington at the Continental Hotel for Monday, June 30.

### Efficient Airplane Mail Service

Second Assistant Postmaster General Otto Praeger reports that 58 consecutive trips of 325 miles each have been made by airplanes between Chicago and Cleveland without delays, without forced landings and without engine trouble of any sort. These flights have been made in weather which a short time ago would have been regarded prohibitive. Each day, each way, the "ships" carried 400 pounds of letter mail. As letters range from 40 to 45 to the pound, this means that 16,000 were transported on each trip.

Notwithstanding the inclement weather, the postal planes maintained an average speed of 98.5 miles an hour. On one occasion, when a squall prevailed throughout the Lake region, and was so severe as to paralyze shipping in Chicago harbor, the mail plane reached Chicago on time and made a perfect landing.

Twelve L. W. F. De Haviland planes are in the Cleveland service, four being stationed at each terminal and four at Bryan.

Henceforth, the mail planes will leave Chicago for the east at 2:30 p. m. It was found that 151 business concerns sent special messengers to the railroad stations each day (12:30 p. m.) to catch the two fast mail trains to the Atlantic seaboard. The 2:30 airplane service is expected thus to save much time. Mr. Praeger says that satisfactory operation of the air mail between Cleveland and Chicago has been the means of relieving rail congestion, and one distributing car each way each day has been cut from that division. Experiments are now being carried on looking toward the delivery and taking aboard of mail bags while the airplane is in flight. Another interesting development is the construction of fireproof walls between the mail compartment and the engine and the compartment and the gas tank.

As a result of protests registered at Washington by dealers and by the Minnesota Railroad & Warehouse Commission, proposed increases of 30 cents a ton in the freight rate on Illinois coal shipped to Minnesota points have been submitted by the Railroad Administration to the Interstate Commerce Commission for advice.

One of General Haller's Polish Army Trains on Its Way Through Germany

\*Extract from address delivered by President of the Order of Railroad Station Agents E. M. Morton at the American Train Dispatchers' Convention, Chicago, June 18, 1919.

## Traffic News

L. D. Knowles, division freight agent of the Missouri Pacific at Kansas City, Mo., has resigned to become traffic manager of the H. & H. Refining Company at Kansas City.

H. D. Driscoll, secretary-manager of the Waco (Tex.) Chamber of Commerce for the past three years, has resigned to become manager of the Oklahoma Traffic Association at Oklahoma City, Okla.

D. R. Lincoln has resigned as chairman of the Kansas City, Mo., District Freight Traffic Committee and has been succeeded by J. R. Koontz, a member of the committee. F. J. Shubert has been appointed a member of the committee to succeed Mr. Koontz.

### National Industrial Traffic League

The National Industrial Traffic League held a special meeting at Milwaukee, Wis., on June 11, 12 and 13, at which committee reports, held over from the New Orleans meeting of the league last March, were disposed of. The reports of the executive committee stated that since the New Orleans meeting the special committee and the executive committee had endorsed the recommendations submitted by President Freer with respect to railroad legislation. S. Davies Warfield, president of the National Association of Owners of Railroad Securities, and Max Thelen, director of the Division of Public Service, United States Railroad Administration, spoke at the dinner on the second night of the meeting. Mr. Warfield expounded his plan for solving the railroad problem and Mr. Thelen spoke on the Railroad Administration's side of matters interesting to members of the league.

The recommendations relative to remedial legislation oppose the extension of the period of government operation, but counsel due regard to the interests of the public, including investors in railroad securities. Pending the return of the railroads to corporate control it is recommended that section 10 of the Act of March 21, 1918, be amended to provide that during the continuance of government operation, present rates shall remain in effect until changed by the Interstate Commerce Commission. After return to corporate operation jurisdiction over rates, to be the same as prior to March 21, 1918. For the future the recommendations include repeal of anti-trust and anti-pooling legislation, as affecting railroads, and the encouragement of co-operative activities among common carriers. If pooling of traffic is permitted it should be under the approval of the Commission. The shipper should not be deprived of the right to route his freight. The Commission should have authority to prescribe minimum rates to regulate the issuance of railroad securities, including supervision of the expenditures of the proceeds to require extensions and additional facilities and to exercise general supervision over service, operation and maintenance. It should co-operate with State Commissions, and it should control interchange of traffic between rail and water carriers, establish joint routes and rates and the divisions of rates.

The League does not favor continuance of the law of August 9, 1917, which requires that tariffs be approved by the Commission before filing. Rates should be initiated by the carriers, subject to a suspension, as under Sec. 15; but the Commission should prescribe publicity by the carrier of contemplated rate changes, and provide for conference between the carriers and the interested public before tariffs are filed.

The League earnestly insists that federal regulation of common carriers be vested in the Interstate Commerce Commission exclusively, does not advocate regional commissions, believing that the Commission now has ample power to establish branch offices. As to intra-state commerce, no legislation is recommended; it is believed that, with the clarifying of the situation as the result of the Shreveport and other cases, the Interstate Commerce Commission can work out plans under which conflicts between federal and state regulation will largely disappear.

## Commission and Court News

### Interstate Commerce Commission

The commission has denied petitions of the director general of railroads and the Atchison, Topeka & Santa Fe for a rehearing in connection with its standard time zone investigation.

### Perishable Freight Investigation

The Commission, at the request of the director general of railroads, has ordered an investigation concerning the charges and regulations contained in Perishable Freight Tariff No. 1 prepared by the Railroad Administration, which are intended to supersede, with a few exceptions, those in all other general tariffs. It is desired that this new tariff shall be filed to become effective as soon as possible and the director general, in accordance with a provision in the federal control act, has requested the commission to advise him whether it is desirable that its provisions should become effective or in what respect they should be modified. The tariff contains many changes in rules and regulations and many increases in accessorial charges. A proof copy of the proposed tariff has been the subject of extended conferences between officers of the Railroad Administration and representatives of the shippers. The commission announces a series of hearings before Attorney Examiner Marshall at the following places: Los Angeles, July 7; Portland (Ore.), July 16; Denver, July 23; Chicago, July 30; New York, September 2; Atlanta, September 11, and New Orleans, September 18.

### State Commissions

The Public Service Commission of Pennsylvania, considering an application for a decision on switching charges at Towanda, announces that the case cannot be considered; the Supreme Court of the United States having ruled that the authority of the director general of railroads, acting for the federal government, is supreme in rate-making, the commission is without authority.

### United States Supreme Court

#### Original B. L. Not Superseded By Subsequent Bills

The Supreme Court of the United States holds that the terms of the bill of lading given by the initial carrier are binding upon the shipper and all connecting carriers, and cannot be waived by subsequent bills of lading.

Leatherwood made, in 1913, a shipment of horses from Watrous, N. M., to Waco, Tex., over four connecting railroads. The initial carrier's through bill of lading barred any action for damages unless begun within six months. When the horses reached the Texas & Pacific and the M., K. & T., each insisted that the shipper accept and sign a new bill of lading, and he did so. In 1915 he brought suit in a Texas State Court for injury to the horses while in transit on the lines of those two companies. The bills of lading issued by them did not contain the provision requiring suit to be brought within six months; but the carriers set up as a defense the provision to that effect in the original bill of lading. The state courts ruled that the carriers could not rely on that provision. The Supreme Court of the United States takes a contrary view.

Under the Carmack Amendment to the interstate commerce act the parties to a bill of lading cannot waive its terms, nor can the carrier by its conduct give the shipper a right to ignore them. A different view would antagonize the plain policy of the act and open the door to the very abuses at which it was aimed. The receipt given by the initial carrier embodies the contract for transportation from point of origin to destination; and its terms are binding

upon the shipper and all connecting carriers. *Texas & Pac. v. Leatherwood*. Decided June 9, 1919.

**Written Notice of Claim for Loss**

The Supreme Court of the United States calls attention to the enlargement of the definition of the term "transportation" by the Hepburn Amendment to the interstate commerce law, in connection with the necessity of written claim for loss or damage.

The plaintiffs delivered to the Toledo, St. Louis & Western at East St. Louis, a car of horses for transportation under a Limited Liability Livestock bill of lading via the Erie to themselves at Suffern, N. Y. At Suffern the car was placed on track opposite a cattle chute and left in charge of plaintiffs for unloading. They were about to lead out four horses when other cars were pushed against it and injured the animals. No written claim was made for the loss or damage as provided in the bill of lading; and when sued the railroad defended upon that ground. The plaintiffs maintained that transportation had ended when the accident occurred and consequently no written claim was necessary. The state courts of New York accepted that view. But the United States Supreme Court granted the railroad's request for an instructed verdict in its behalf. The clause requiring presentation of a written claim is clearly valid and controlling. In *C. C. v. St. L. v. Dettlebach*, 239 U. S. 588, the court said that Congress had recognized the duty of carriers to perform a variety of services that, according to the theory of the common law, were separable from the carrier's service as carrier. In the present case, if the railroad's employees had been doing the unloading there could be no doubt that transportation was still in progress; and giving charge of the removal to the plaintiffs, as agreed, was not enough to end the interstate movement. The animals were in the car; no adequate time for unloading had elapsed. The railroad had not fully performed the services incident to final delivery imposed by law. These included the furnishing of fair opportunity and proper facilities for safe unloading although the shippers had contracted to do the work of actual removal. Written notice of claim was therefore necessary. *Erie v. Shuart*. Decided June 9, 1919.

F. W. Burton, assistant manager of the Minneapolis Traffic Association, has been appointed manager of the Traffic Bureau of the Rochester (N. Y.) Chamber of Commerce, succeeding D. P. Chindblom.

A report of business conditions in the Northwestern region for week ending June 14, show that a total of 154,018 cars were loaded on lines, as compared with 163,859 cars loaded during the same period in 1918.

While this shows a decrease of 9,841 cars compared with 1918, there was an increase of 18,920 compared with the first week of June, this year. There was practically a 100 per cent increase in grain and grain products loaded, an increase in livestock and an increase of practically 2,000 cars in miscellaneous loading.

A very heavy ore movement is anticipated for the balance of the season. There is also a heavy movement of automobiles and manufactured articles, and a decided improvement in the shipment of cement and other building materials. The export situation at Puget Sound ports is in a very satisfactory condition, 661 cars being delivered to boats last week. Crop conditions generally are favorable except in the Western portion of North Dakota and portions of Montana where rain is needed.

A summary of passenger train performance in the Northwestern region for the month of May, as compared with the same period last year shows a marked improvement. Of a total of 9,595 trains operated during May this year, 8,608, or 89.71 per cent, were on time, whereas in 1918 of a total of 9,605, 7,974, 83.02 per cent were on time. A marked improvement is noted in the trains received from connections, the percentage of those on time increasing from 83.68 per cent in 1918 to 92.48 per cent in 1919.

**Equipment and Supplies**

**Locomotive Deliveries**

New locomotives were shipped to railroads under federal control during the week ended June 1 as follows:

**Locomotives**

THE PENNSYLVANIA EQUIPMENT COMPANY, 1420 Chestnut street, Philadelphia, Pa., is in the market for a 36-in. gage climax locomotive, a 20 or 22-ton class A or a 25 to 35-ton class B.

**Freight Cars**

THE WISCONSIN & NORTHERN, Appleton, Wis., is inquiring for inspection cars.

O. B. CINTAS, Havana, Cuba, has ordered 40 cane cars from the American Car & Foundry Company, Chicago.

THE A. J. YAWGER COMPANY, Indianapolis, Ind., is inquiring for one 40 ft. 50-ton steel underframe flat car.

THE AMERICAN RAILWAY EQUIPMENT COMPANY, Philadelphia, Pa., is inquiring for 25, 50-ton steel underframe flat cars.

THE PROVIDENCE GAS COMPANY, Providence, R. I., is inquiring for one all-steel hopper car and one all-steel gondola car.

C. H. HUGHES & COMPANY, Altoona, Pa., has ordered 50 mine cars from the American Car & Foundry Company, Chicago.

THE NORTHWESTERN IRON COMPANY, Milwaukee, Wis., is inquiring for 3 steel underframes for 80,000-lb. capacity flat cars.

THE CARROLLTON COAL COMPANY, St. Benedict, Pa., has ordered 330 mine car trucks from the American Car & Foundry Company, Chicago.

THE AMERICAN METAL COMPANY, New York, has ordered two 5,200-gal. tank cars from the American Car & Foundry Company, Chicago.

THE ISLAND CREEK COAL COMPANY, Huntington, W. Va., has ordered 350 mine cars from the American Car & Foundry Company, Chicago.

THE NEWPORT NEWS SHIP BUILDING & DRY DOCK COMPANY, Newport News, Va., is inquiring for one 40 ft. 240,000 lb. capacity flat car.

THE AMERICAN TRADING COMPANY, Havana, Cuba, has ordered 30, 30-ton all-steel cane cars from the American Car & Foundry Company, Chicago.

THE POND CREEK COAL COMPANY, Huntington, W. Va., has ordered 250 composite mine cars from the American Car & Foundry Company, Chicago.

## Signaling

THE CHESAPEAKE & OHIO has ordered from the Federal Signal Company, Albany, N. Y., an electro mechanical interlocking machine, 28 and 8 levers, for installation at Prince, W. Va.

THE CHICAGO, BURLINGTON & QUINCY has ordered from the Federal Signal Company, Albany, N. Y., a 96-lever, type "4" electric interlocking and other material for installation at Hawthorne, Ill. The control will be Federal type "4" with direct current for operation and alternating current for indication.

## Railway Construction

DENVER & RIO GRANDE.—Immediate resumption of work on the extensive improvements at Soldier Summit, Utah, has been ordered by the United States Railroad Administration. About 40 or 50 freight train crews have their headquarters at Soldier Summit. The improvements include a station building, a hotel, 26 miles of yard tracks and several shop buildings.

THE TOYAH VALLEY SULPHUR COMPANY, NEW ORLEANS, LA.—This firm plans to build a railroad approximately 15 miles long from its mines near Orla, Texas, to its property in Culberson county. Contracts for the work have not been let and it is not certain when construction will begin. M. J. Epley, president of the Toyah Valley Sulphur Company, will be president of the railroad company.

THE SOUTHERN RAILWAY has given a contract to M. M. Elkins, Macon, Ga., for building a bridge at Gaffney, S. C. The bridge and retaining wall approach will be of reinforced concrete construction. The structure will consist of three spans, one of which will be 35 ft. long and the other two 26 ft. long. The cost of the work will be about \$30,000. The bridge near Spencer, N. C., over the Yadkin river, at mile post 330.8 to consist of four single track deck riveted steel spans about 160 ft. long designed for Cooper's E-60 loading. Repairs will be made to portions of the existing masonry. The estimated cost for the entire work is about \$170,000. The American Bridge Company has the contract for fabricating and erecting the superstructure.

## Supply Trade News

The Ball Engine Company, Erie, Pa., builder of Erie Ditchers, is putting up an addition to its erecting shops, 175 x 125 ft.

F. G. Echols, for many years general manager of the small tools department of Pratt & Whitney Company of Hartford, Conn., has accepted a position as vice-president of the Greenfield Tap & Die Corporation, of Greenfield, Mass.

Mudge & Company, Chicago, will open a district office July 1 in the Railway Exchange building, St. Louis, Mo., in charge of Sherman C. Amsden, assistant to president, who has been promoted to district manager of the Southwestern territory.

Samuel F. Joor, consulting engineer of Chicago, has joined the American Steam Conveyor Corporation, Chicago, in a capacity of sales engineer. Mr. Joor has had wide experience in the conveyor field, at one time being western manager and sales engineer of the Jeffrey Manufacturing Company, previously being with the Link Belt Company.

The Blaw-Knox Company, which recently sold its plant at Wheatland, Pa., will concentrate its entire manufacturing activities at its plant at Hoboken, Pa., which is being greatly enlarged. The complete plant at Hoboken occupies a site covering 50 acres and will employ about 1,200 men. Further developments at this plant include the purchase of 15 acres for the construction of working men's homes.

Following the return of Fred A. Poor, president of The P. & M. Company, Chicago, from a six weeks' trip abroad, announcement has been made of the organization of The P. & M. Company (England), Ltd., with offices at 31 Budge Row, London, E. C. This company has acquired license under patents held by L. P. Winby & Company, of London, and Gillespie Partners, Ltd., of London, as well as under all the foreign patents held by The P. & M. Company of Chicago. L. P. Winby, formerly of L. P. Winby & Company, Queen Anne's Chambers, Westminster, London, S. W., will be the managing director of The P. & M. Company (England), Ltd. The other directors are: F. C. Winby and Fred A. Poor.

At the initiative of the American Concrete Pipe Association, a joint committee has been organized for the study of

"U. S. Official" Photo

Roundhouse Personnel, R. T. O. Camp de Grasse, St. Pierre des Corps, Intre et Loire, France

specifications for concrete culvert pipe. The committee is to be composed of one representative from each of six associations which were invited to participate. All of these societies have appointed members except the American Society of Civil Engineers, which is still to be heard from. Members of the committee appointed thus far include **Paul Kircher**, sales engineer, Massey Concrete Products Company, Chicago, representing the American Concrete Pipe Association; **T. R. Agg**, Iowa, State College, Ames, Iowa, representing the American Association of Highway Officials; **F. L. Thompson**, chief engineer, Illinois Central, Chicago, representing the American Railway Engineering Association; **B. S. Pease**, American Steel & Wire Company, Chicago, representing the American Concrete Institute; **A. T. Shelley**, assistant engineer, sewer construction department, city of Philadelphia, representing the American Society for Testing Materials. The first meeting of this committee will be held at Atlantic City on June 27.

### Aftermath of Government Contracts

The Director of Munitions reports that the total claims against the government on cancelled war contracts, settled and unsettled, will amount to \$700,000,000. If these 24,199 contracts had been carried on and completed, the cost to the government would have been \$6,000,000,000. The actual amount awarded thus far by reason of termination or curtailment is \$152,000,000. Vast stores of material had been accumulated under rapidly accelerated efficiency of production in anticipation of continuation of the war. In machinery, there were 500 manufacturing plants in the United States which were working for the various War Department bureaus. To stimulate production, the War Department had largely provided the funds with which machinery had been purchased and additions constructed, so that on the cessation of hostilities, the War Department had to take over the surplus commodities and the plant facilities and equipment that assumption of war work had entailed. To flood the market at this time with the commodities held by the government contractors, and the machinery with which they had been manufactured, would have upset industrial conditions; so that a director of sales was created, with a corps of expert assistants; and all material was classified, and sections to attend to its disposition created. The selling of surplus war materials is now going on. Sales are made for cash, at auction, to highest bidder; or on sealed proposals, at current market price; or by negotiation under competitive conditions. —*The Bache Review.*

### Trade Publications

**VANE RELAYS.**—The Union Switch & Signal Company, Swissvale, Pa., has issued bulletin No. 92, describing in great detail the company's single and double element vane relays. The different types are described, with illustrations, to the extent of a dozen pages, together with an explanation of the theory of the operation of the relays.

**FORCE PUMPS.**—The Humphreys Manufacturing Company, Mansfield, Ohio, has issued the first of a series of bulletins illustrating and describing its new types of pumps. These bulletins are 7½ in. by 10½ in. in size and are punched for standard ring or post binders. They contain essential data and dimensions of the different types of pumps described.

**COAL STORAGE.**—The International Conveyor Corporation, New York City, has issued a 16-page booklet describing the Stuart system of ground storage and pointing out its adaptations in railway work. The book contains detailed descriptions of the coal handling layout at the East Buffalo, N. Y., terminal of the Erie, the government fuel storage and distributing yard at Washington, D. C. and Baltimore & Ohio installations for the handling of coal and bulk materials respectively at Baltimore. The booklet is well illustrated and well gotten up and gives a comprehensive idea of the possibilities of this form of ground storage and reclaiming as applied to a variety of railway problems.

## Railway Financial News

**BALTIMORE & OHIO.**—A syndicate composed of Kuhn, Loeb & Co., Speyer & Co., and the National City Company, has purchased \$35,000,000 Baltimore & Ohio ten-year 6 per cent secured gold bonds. The issue will be offered for public subscription at 96½ and accrued interest, to yield investors approximately 6½ per cent if the bonds are held until they mature, on July 1, 1929. The bonds are secured by the deposit and pledge of \$6,000,000 par value Reading Company first preferred stock, \$14,000,000 par value Reading Company second preferred, and \$9,200,000 common stock, as well as \$15,000,000 Baltimore & Ohio Railroad Company refunding and general mortgage 6 per cent bonds, series B, due Dec. 1, 1995. These securities have an estimated market value of \$45,000,000, and it is understood that a 25 per cent margin is to be maintained. The bonds were sold by the company to enable it to meet all its maturing obligations, and will not materially increase the railroad's annual fixed charges.

The maturing obligations which will be taken up are \$22,500,000 notes and bank loans which were extended from February, 1918, to July 1, 1919. These include \$4,000,000 bank loans, \$10,500,000 6 per cent notes, issued in June, 1918, for retiring \$7,500,000 one-year 5 per cent notes, \$3,000,000 bank loans, extended for four months from Sept. 30, 1918, and \$8,000,000 notes issued in January, 1918, which were due last July but were extended.

Following a meeting of the Baltimore & Ohio directors on Wednesday, President Daniel Willard said the company had reached an agreement with the government on the question of compensation for the lease of the carrier's properties during the period of federal control, and that a contract had been executed calling for the payment each year by the government of \$30,031,009. He also said the company's other income each year amounts to about \$3,300,000, making the approximate annual income \$33,331,009. This after the deduction of \$22,063,000 fixed charges and corporate expenses, would leave a balance of \$11,268,009 available for federal income taxes, reserves, dividends, and so forth.

At its meeting, the directors determined to set aside part of the income to be devoted to capital expenditures so that the company's credit would not have to be extended further under present conditions. Because of the adoption of this policy, it was decided temporarily to suspend dividend payments on the common stock. The usual semi-annual dividend of 2 per cent was declared on the preferred stock to holders of record July 19. This payment will be made September 2, provided the company receives funds from the government by that time.

**BOSTON & MAINE.**—Minority stockholders have filed a bill in equity in the Massachusetts Supreme Court against this company attacking the validity of outstanding loans of the road and its leased lines amounting to \$13,000,000, which the legislature of 1915 authorized the company to pay. It is claimed that the act is unconstitutional, in that the legislature exercised both executive and judicial powers, and also that it deprives persons of property without trial by jury.

**CANADIAN PACIFIC.**—The Hon. William J. Shaughnessy has been elected a director to succeed the Hon. James Dunsmuir, resigned.

**CHICAGO, INDIANAPOLIS & LOUISVILLE.**—This company has applied to the Public Utilities Commission of Illinois for an order authorizing the issue of additional first and general mortgage bonds to the amount of \$867,198.

**PEORIA & EASTERN.**—W. A. Carnegie Ewen, New York, has been elected chairman of the protective committee for the 4 per cent income mortgage bondholders, to succeed John F. Wallace, resigned.

**TERMINAL RAILROAD ASSOCIATION OF ST. LOUIS.**—An application has been filed with the Missouri Public Service Commission for permission to issue \$1,000,000 4 per cent bonds, payable in 1953.

## Railway Officers

### Railroad Administration

#### Regional

**R. D. Starbuck**, assistant to federal manager of the New York Central, has been appointed assistant regional director of the Eastern Region, with headquarters at New York.

#### Federal and General Managers

**S. E. Burkhead**, assistant general manager of the International & Great Northern, with headquarters at Houston, Texas, has resigned to enter business in Houston.

**J. R. Hackett**, general agent of the Georgia Northern, has been appointed general manager, with headquarters at Moultrie, Ga., succeeding **F. R. Pidcock**, who resigned as general manager, but will retain his position as vice-president of the road. **J. D. Weston, Jr.**, of Albany, will succeed Mr. Hackett as general agent.

#### Operating

**A. B. McNaughton**, superintendent of the Grand Trunk Lines in New England, with his staff, has moved from Island Pond, Vt., to Portland, Me.

**L. L. Oliver**, trainmaster of the eastern division of the Texas & Pacific, with headquarters at Marshall, Texas, has resigned and will return to his former position in the dispatcher's office.

#### Financial, Legal and Accounting

**F. Markoe Rivinus** has been appointed general solicitor of the Norfolk & Western with headquarters at Roanoke, Va., to succeed **Theodore W. Reath**, who has resigned to accept service with the Norfolk & Western Railway Company.

#### Traffic

**B. N. Austin**, assistant traffic manager (passenger) of the Baltimore & Ohio, western lines, has been appointed general passenger agent, with headquarters at Chicago, Ill.

**W. F. Conner**, district passenger representative of the Pennsylvania Lines West, with headquarters at Pittsburgh, Pa., has been promoted to assistant general passenger agent, with office at Chicago, succeeding **C. L. Kimball**, who retired from active duty after 51 years of continuous active service. **A. H. Shaw**, assistant to general passenger agent, has been appointed assistant general passenger agent, with office at Pittsburgh. **S. L. Shank** has been appointed district passenger representative, with office at Pittsburgh, succeeding Mr. Connor, and **A. B. Ritchie** has been appointed traveling passenger representative, with office at Pittsburgh, succeeding Mr. Shank.

#### Engineering and Rolling Stock

**F. S. Kelly**, master mechanic of the Louisiana division of the Texas & Pacific, with headquarters at Gouldsboro, La., has been transferred to Marshall, Texas, succeeding **R. E. Roe**, resigned.

**Sidney U. Rhymer**, whose appointment as signal engineer and superintendent of telegraph of the Chicago & Alton, the Chicago, Peoria & St. Louis, the Peoria & Pekin Union and the Peoria Railway Terminal, with headquarters at Bloomington, Ill., was announced in the *Railway Age* of June 6 (page 1,450), was born on December 20, 1876, at Union Grove, Ill. He began railway service in June, 1896, as a section laborer on the Chicago & North Western near Fulton, Ill., and on March 1, 1901, he was promoted to section foreman at Union Grove. On October 15, 1905, he entered the signal department of the same road as battery man at Fulton, in which capacity he remained until February,

1907, when he was promoted to signal maintainer with headquarters at Stanwood, Ia. In 1910 he was appointed signal supervisor of the Northern and Southern divisions of the Chicago & Alton with headquarters at Bloomington, Ill., and on January 1, 1913, he was promoted to general signal inspector with jurisdiction over the entire line in which position he acted as assistant to the signal engineer until his recent promotion.

#### Purchasing

**Albert C. Mann**, purchasing agent of the Illinois Central with headquarters in Chicago, has resigned to become vice-president of the American International Steel Corporation with headquarters in New York.

### Corporate

#### Executive, Financial, Legal and Accounting

**H. P. Hughes** has been appointed auditor and general freight and passenger agent of the United Verde & Pacific Railway and the Verde Tunnel & Smelter Railroad Company, with headquarters at Clarkdale, Ariz., in place of **W. H. Archdeacon**, resigned.

#### Operating

**J. McMillan**, general manager of the Pacific Electric Railway Company, retires from active service July 1, after 45 years of service with the Southern Pacific lines and the Pacific Electric. The vacant position will not be filled.

**U. E. Gillen**, vice-president of the Grand Trunk Railway of Canada, with headquarters at Montreal, Que., has been appointed general manager of the Toronto Terminals Railway Company, with headquarters at Toronto, Ont., vice **J. W. Leonard**, deceased.

#### Engineering and Rolling Stock

**C. C. Johnson**, roadmaster at Campbellton, N. B., of the Canadian National Railways, has been transferred in the same capacity to the Mulgrave sub-division, with headquarters at New Glasgow, N. S., succeeding **H. I. Gray**, who has been transferred to the Bridgewater division of the Halifax & Southwestern. **William Sidwell** has been appointed roadmaster of the Dartmouth sub-division, with headquarters at Dartmouth, N. S., vice **James Myers**.

### Obituary

**Charles Carney**, formerly supervisor on the Illinois Central, with headquarters at La Salle, Ill., died at his home in Chicago on June 21, at the age of 64 years.
