Sixty-sixth Quarto Volume—January 1, 1919, to June 30, 1919

## AUTHORS

- Acworth, W. M., 573, 877  
Aishton, R. H., 1379  
Andrews, Howard, 347  
Anthony, C. C., 1105
- Bardwell, R. C., 1321  
Barr, William M., 1215  
Barth, Kurt C., 643, 1036  
Basford, George M., 1039  
Begien, R. N., 1309  
Beyer, O. S., Jr., 1313  
Bogg, Pete, 824  
Boublikoff, A. A., 1819  
Brazier, F. W., 1212, 1673  
Brennan, J. H., 500
- Campbell, Major E. D., 1709  
Cary, Robert J., 731  
Chambers, C. E., 1496  
Clegg, W. H., 1212  
Coleman, Frederick C., 843, 1139  
Cullen, George A., 943  
Cummins, Albert B., 1041  
Cunningham, Wm. J., 43  
Curran, Arthur, 750  
Cuyler, T. De Witt, 188, 1242
- Daly, M. A., 1037, 1251  
Denby, Charles, 252  
Dodd, S. T., 1157  
Dunn, Samuel O., 7, 53, 197, 436, 762
- Edge, Senator Walter E., 1682  
Elder, Jas., 1168  
Elliott, Howard, 455, 578  
Endsley, Louis E., 930  
Ernst, F. B., 934  
Erson, T., 878
- Farquhar, Percival, 1421  
Farrell, James A., 1090  
Fay, Charles S., 1807  
Fayant, Frank H., 775, 911  
Fisher, O. E., 604  
Fort, Gerrit, 316  
Freer, Guy M., 461  
Fristee, J. W., 345  
Fritch, L. C., 236  
Fuller, C. E., 1791
- Gaines, F. F., 1796  
Gary, Elbert H., 1190  
Gibbons, J. W., 1834  
Gibbs, A. W., 1663  
Gluck, H. A., 1212  
Goss, W. F. M., 854  
Goto, Baron, 1203  
Gray, Carl R., 1349
- Haas, Exum M., 1199  
Hall, U. K., 286  
Hammill, F. H., 1253
- Harding, H. McL., 582  
Hardy, J. W., 1309  
Hawley, Wm. E., 428  
Henry, Philip W., 1259  
Hines, Walker D., 244, 529, 848, 998, 1134, 1159, 1189, 1302, 1404  
Hodge, Col. Henry W., 1683  
Hoy, Sir William, 299  
Humphrey, A. L., 853  
Hurley, Edward N., 1089
- Joffray, L. J., 1255  
Johnson, Alba B., 156, 218, 293  
Johnson, Benjamin O., 1063  
Johnson, John H., 346  
Jones, Paul, 384
- Kahn, Otto H., 465  
Kent, Fred I., 1088  
Knickerbocker, E. J., 1808  
Kruttschnitt, Julius, 258
- Lamora, Julio, 1420  
Lane, Franklin K., 543  
Lane, F. W., 665, 706  
Lavis, F., 825, 892, 945  
Leigh, E. B., 879, 1248  
Leighton, M. O., 1806  
Lenmerich, Gustave E., 538, 587  
Lichty, C. A., 1386  
Lipetz, A. I., 1257, 1763  
Lisman, F. J., 831, 883, 1221
- McAdoo, William G., 139  
McAuliffe, Eugene, 1254  
McChord, C. C., 1528  
McManamy, Frank, 1165, 1256, 1701  
Middleton, P. Harvey, 579, 863, 1297, 1374, 1531  
Milner, B. B., 1766  
Mitchell, Charles E., 1107  
Monlevalde, Francisco de, 1424  
Montgomery, F. B., 59  
Moore, John, 1414  
Morse, Charles A., 207, 666  
Morton, E. M., 1839  
Munoz, M., 863
- Nay, Frank, 1535  
Nicholson, J. M., 1252  
Noonan, E. J., 698
- O'Kelly, T. J., 1104  
Osborn, Wm. Church, 1197
- Parmelee, Julius H., 27, 236  
Patterson, W. J., 1165  
Payne, J. L., 31, 1555  
Pearce, H. C., 285  
Peek, George N., 1091  
Plumb, Glenn E., 1137  
Poleman, Walter, 344
- Pomerene, Atlee, 729  
Post, George A., 1136  
Potter, W. B., 1157  
Powell, T. C., 904  
Pratt, E. E., 1089  
Prouty, Charles A., 36, 483, 1835  
Purdon, C. D., 237  
Pyle, L. R., 1249
- Randolph, O. C. F., 889  
Ray, H. E., 387  
Rea, Samuel, 458, 1147  
Redfield, William C., 1263  
Reeves, Cuthbert E., 556  
Reynolds, T. W., 1245  
Rhea, Frank, 1144  
Ripley, E. P., 1815  
Roberts, S. S., 955  
Robinson, Bird M., 1377  
Rodriguez, José S., 1420  
Roesch, F. P., 1316, 1762  
Roosevelt, Hon. Franklin D., 1682
- Sandrus, Charles L., 237  
Schwinn, F. S., 1188  
Shaver, A. G., 137  
Shipman, H. L., 495  
Smith, Cedric B., 1295†  
Smith, T. Duff, 1312  
Souby, J. M., 751  
Sparrow, W. W. K., 1296  
Sprague, Frank J., 1816  
Stoek, H. H., 1311  
Storey, W. B., 1249  
Stuart, J. G., 497
- Tatum, J. J., 773  
Thayer, Robert E., 1785  
Thelen, Max, 837  
Thom, Alfred P., 192, 258, 1360  
Therne, Clifford, 307, 1036  
Tollerton, W. J., 1699  
Towner, M. E., 287  
Townley, Calvert, 765  
Townsend, J. Fred, 1296  
Tyler, W. T., 1659, 1713
- Villard, Harold G., 52
- Warfield, S. Davies, 350, 459  
Waterman, J. H., 287  
Watters, R. J., 1169  
West, A. E., 911  
Wiested, H. K., 849  
Willard, Daniel, 452  
Williams, T. H., 1051  
Wilson, L. F., 1808  
Winant, Clinton D., 1116  
Woodard, W. E., 851  
Wyer, William, 1826
- Yamaguchi, K., 1262

## GENERAL INDEX

[Illustrated articles are indicated thus\*; Editorials thus†; Letters to Editor thus‡.]

- A**
- Abandoned Lines in 1918, 57\*, 225  
 Accident (See also Safety First)  
 Baltimore & Ohio, near Pittsburgh, 513, 882  
 Canadian Pacific at Bonheur, 168  
 Flaggling Rule, 1523†, 1528, 1541  
 France, Collision in, 1059  
 I. C. C., Bulletins Nos. 66 and 67, 547; No. 68, 991  
 Monthly Summaries: December, 368; January, 510; February, 906; March, 1066; April, 1317; May, 1812  
 Nashville Collision, Lesson of, 1133†  
 New York Central at South Byron, 175†  
 212\*, 477†, 491, 515, 574†, 1010  
 New York P. S. Commission's Investigation of Collision Problem, 574†, 1388, 1553, 1805†, 1816  
 "No Accident Weeks," 186, 411, 898, 1387, 1395, 1558, 1564, 1813  
 Pennsylvania at Sabula, 1227  
 Philadelphia & Reading at Fort Washington, 212, 1523†, 1528, 1541  
 Rear Collisions, Prevention of, 236†  
 Records for 1917 and 1918, 878†  
 Responsibility for Collisions, 180†  
 St. Louis-San Francisco near Marshfield, 251  
 Southern Pacific's Record, 605  
 Union Pacific, near Beloit, 216  
 Accounting (See also Railway Accounting Officers' Association; also Division of Accounting)  
 Back Pay, Reports on, 364, 601  
 Calculating Machines, 896\*, 1353\*, 1428  
 Corporate, 1535  
 Depreciation Rates, Adequate, 427†  
 Officers as Executives, 1397†  
 Shop Accounting, Machines for, 896\*  
 Statement of Accounts Between Director General and Railroad Companies as of December 31, 1918, 433  
 Store Department, 287  
 Acetylene Welding, 1331  
 Acoustic Properties of Convention Hall, 1575†  
 Adams Express Company: Claims Settled 60 Per Cent on Dollar, 1173  
 Additions and Betterments:  
 Appropriation (See Director General Hines)  
 Financing Improvements, 408, 598, 732  
 Railway Business Association's Address to Director General Hines, 293  
 Advances (See Finance)  
 Advertising:  
 Campaign to Promote Passenger Travel, 372, 858, 969, 977†, 1085, 1211  
 Engineering Advertisers' Association, 868  
 Exchange Transportation, 162  
 Africa, French Railway Expansion in, 326  
 A. G. A. Railway Light & Signal Company's New Devices, 662\*  
 Agreement (See Contracts)  
 Agricultural Section:  
 Conference in Memphis, 858, 941  
 Homeseekers' Bureau, 108, 364, 1085, 1229  
 Air Brake:  
 Automatic Straight, 277, 821†, 840  
 Cylinder Packing Set, 1475\*  
 Defect Card, 1168\*  
 Report of A. R. A. Committee, 1506\*, 1770  
 Air Brake Association: Annual Convention, 1155\*, 1212, 1341†  
 Airco Acetylene Generator, 1471\*  
 Air Compressors, Sullivan WB-3, 703\*  
 Air Consumption of Auxiliaries, 1165\*, 1341†  
 Air Drill (See Drill)  
 Air Dump Car, 745\*  
 Air Leaks, Front End, 1316  
 Air Pressure Gages and Testers, 1470\*  
 Airplane (See Aviation)  
 Air Reduction Sales Company: Acetylene Generator, 1471\*  
 Aishton, R. H.:  
 Exhibit Praised, 1626  
 President of A. R. A., 1576†, 1579, 1813\*  
 A la Carte (See Dining Cars)  
 Alaskan Railroad Progress, 543\*, 944, 979†, 1284, 1388  
 Allegheny Region:  
 Annual Report, 394  
 Conditions During February, 860; March, 1006  
 Roads Transferred, 105, 1383  
 Allied Machinery Company, 1287  
 Allocation of Standard Cars, 1110, 1161, 1273  
 Amalgamation (See American Railroad Association—Reorganization)  
 American Association of Engineers:  
 Engineering, a Profession or a Trade, 1081†, 1293†, 1295†  
 Hearing Before Board of Wages and Working Conditions, 965, 1081†  
 Officers Elected, 1225  
 Railroad Conference, 657, 699  
 Railroad Sections Formed, 1387  
 Salary Schedule, 370, 658, 963  
 American Association of Passenger Traffic Officers: Annual Convention, 298, 316  
 American Association of Railroad Ticket Agents: Annual Convention, 1443  
 American Automatic Hose Connector, 1477\*, 1576†, 1698  
 American Brake Shoe & Foundry Changes, 1567\*  
 American Bureau of Welding, 1068  
 American Car & Foundry Company:  
 Exhibit of Railway Artillery, 1685\*, 1709, 1799  
 Heater, Electric Rivet, 1779  
 Miniature Car, 173†  
 American Engineering Forces (See War, The)  
 American Institute of Consulting Engineers:  
 Officers Elected, 467  
 American Institute of Electrical Engineers: Railroad Electrification, 765\*  
 American Iron and Steel Institute: Rail Production in 1918, 1204  
 American Locomotive Company:  
 Annual Report, 565  
 Consolidation Type for Italian State Railways, 1219\*  
 Pennsylvania Lines, 2-10-2 Type, 249\*  
 Standard Types, 291\*, 389\*, 508\*, 575\*, 951\*, 1193\*  
 American Manufacturers' Export Association, 1090  
 American Passenger Traffic Association: Address of W. D. Hines, 244  
 American Railroad Association:  
 Aishton, R. H., President, 1576†, 1579, 1813\*  
 Competitive Bids Under Clayton Law, Objections to Rules for, 1009, 1209, 1280  
 Reorganization, 177†, 194, 535, 541, 621†, 659, 664†, 697, 1140, 1284, 1576†, 1579, 1813\*  
 Section I, Operating: Telegraph and Telephone Division's Annual Convention, 1542  
 Section II, Engineering, 664†, 697  
 Section III, Mechanical:  
 Acoustic Properties of Convention Hall, 1575†  
 Addresses by Convention Visitors, 1682\*  
 Air Brake Conditions, 1770  
 Aishton, R. H., Address of, 1576†, 1579  
 Atterbury, General, Message from, 1698  
 Barachar, Mayor, Address of, 1495\*  
 Campbell, Major, Address of, 1709  
 Chambers, Chairman, Address of, 1496\*  
 Chambers, Chairman, Retires, 1653†, 1674  
 Coal Weighing Devices, 1708  
 Committees Appointed, 1577  
 Discussing the Reports, 1623†, 1783†  
 Election of Officers, 1657, 1673, 1737  
 Enrollment Committee's Work, 1769  
 Executive Committee's Meeting, 1576†, 1579, 1624†  
 Exhibit of Railway Artillery, 1685\*, 1709, 1799  
 Exhibit of Supply Men (See Railway Supply Manufacturers' Association)  
 General Committee Meeting, 1786  
 General Committee, Report of, 1452†, 1499\*  
 Innovations Should Be Continued, 1784†  
 Labor Situation Not Discussed, 1656†  
 Master Car Builders' Association's History, 1496\*, 1673  
 Master Mechanics' Association's History, 1699  
 McManamy, Frank, Honored, 1658  
 McManamy, Frank, on Standardization, 1696†, 1701  
 Mechanical Officers to Report on Convention, 1161, 1237†, 1438, 1544  
 Organization, 535  
 Pennsylvania Train Service, 1786  
 Proceedings, 1495\*, 1583\*, 1623†, 1627\*, 1661\*, 1695†, 1699\*, 1735†, 1739\*, 1783†, 1787\*  
 Registration, 1460, 1515, 1607, 1648, 1681, 1697, 1716, 1799  
 Report of Admittance Committee, 1583\*  
 Report of Committee on Subjects, 1793  
 Report of General Committee, 1452†, 1499\*  
 Report on Amalgamation of Other Associations, 1765  
 Report on Brake Shoe and Brake Beam Equipment, 1491†, 1510\*  
 Report on Car Construction, 1640\*, 1656†  
 Report on Car Trucks, 1624†, 1644\*  
 Report on Car Wheels, 1575\*, 1590\*  
 Report on Couplers, 1603\*, 1623†  
 Report on Depreciation for Freight Cars, 1492†, 1585  
 Report on Design and Maintenance of Locomotive Boilers, 1753, 1787\*  
 Report on Design, Maintenance and Operation of Electric Rolling Stock, 1787\*  
 Report on Draft Gears, 1576†, 1605\*  
 Report on Fuel Economy and Smoke Prevention, 1739\*, 1783†  
 Report on Loading Rules, 1632\*  
 Report on Locomotive Headlights, 1735†, 1753\*  
 Report on Mechanical Stokers, 1705, 1735†  
 Report on Nominations, 1503\*  
 Report on Powdered Fuel, 1795\*  
 Report on Prices for Labor and Material, 1585\*
- American Railroad Association (Continued)  
 Report on Reception of Passenger Car Rules of Interchange, 1590\*  
 Report on Safety Appliances, 1627  
 Report on Scholarships, 1502\*  
 Report on Specifications and Tests for Materials (A. R. M. M.), 1747  
 Report on Specifications and Tests for Materials (M. C. B.), 1594\*  
 Report on Standard Blocking for Cradles of Car Dumping Machines, 159\*  
 Report on Standards and Recommended Practice (A. R. M. M.), 1705\*  
 Report on Standards and Recommended Practice (M. C. B.), 1503\*  
 Report on Superheater Locomotive, 1736†, 1759  
 Report on Tank Cars, 1656†, 1661\*  
 Report on Train Brake and Signal Equipment, 1506\*, 1695\*  
 Report on Train Lighting and Equipment, 1667\*  
 Report on Train Resistance and Tonnage Rating, 1793\*  
 Report on Welding Truck Side Frames, Bolsters and Arch Bars, 1599\*  
 Rules of Order, 535, 1666  
 Russian Mechanical Conventions, 1765  
 Secretary Hawthorn's Work, 1738†  
 Snow Fighting Equipment, 1708  
 Special Guests, 1612, 1674, 1716, 1799  
 Subjects for 1920 Convention, 1793  
 Tollerton, W. J., Address of, 1699, 1736†  
 Tollerton, W. J., Elected Chairman, 1576†, 1579, 1738†, 1813\*  
 Train Line Connectors Investigated, 1477\*, 1576†, 1698, 1727\*  
 Tyler, W. T., Address of, 1655, 1659, 1695†, 1713  
 Tyler, W. T., Vice-President, 1576†, 1579, 1813\*  
 Section VI, Purchasing and Distribution of Supplies, 1140, 1284  
 Signal Division:  
 Amalgamation with A. R. A., 621†, 659  
 Committee on Valuation Appointed, 685  
 Creosoting Wood Trunking, 643, 1036†  
 Future of, 622†  
 Meeting, March, 621†, 622†, 624\*  
 Registration, 621†, 645  
 Report on Contracts, 640\*  
 Report on D. C. Automatic Block Signaling, 635\*  
 Report on Mechanical Interlocking, 632\*  
 Report on Power Interlocking, 628\*  
 Report on Signaling Practice, 622†, 636\*  
 Report on Standard Designs, 639  
 Report on Wires and Cables, 642\*  
 Rest in Peace (?), 661  
 Stoltz, C. F., New Committee Chairman, 658\*  
 War Service of Members, 621†, 648\*  
 American Railway Engineering Society:  
 Address of President Morse, 663†, 666\*, 705†  
 Annual Dinner, 729\*  
 Committee Chairman, New, 690\*, 949  
 Committee Subjects for 1920, 949  
 Committee Work, 705\*, 795†, 948  
 Designs, Unified, 664†  
 History, 686\*  
 Hooley, Mr., at Convention, 665, 706  
 Members as Corporate Executives, 732  
 Members with Railroad Administration, 737  
 Nominations for Officers, 167  
 Officers Elected, 738\*  
 Pennsylvania Officers at Convention, 707  
 Proceedings, 663†, 666\*, 705†, 708\*, 795†, 797\*  
 Railroad Administration Approves Convention, 621†, 685  
 Registration, 663†, 691, 733, 820  
 Reorganization Under A. R. A., 664†, 697  
 Report on Ballast, 705†, 726\*  
 Report on Buildings, 718\*  
 Report on Conservation of Natural Resources, 683  
 Report on Economics of Railway Labor, 673\*  
 Report on Economics of Railway Location, 819  
 Report on Economics of Railway Operation, 795†, 816\*, 820  
 Report on Electricity, 722\*  
 Report on Iron and Steel Structures, 795†, 800\*  
 Report on Masonry, 796†, 797\*  
 Report on Records and Accounts, 663†, 669  
 Report on Roadway, 714\*  
 Report on Rules and Organization, 677\*  
 Report on Signals, 670\*  
 Report on Signs, Fences and Crossings, 684  
 Report on Stresses in Track, 713  
 Report on Ties, 706†, 724\*  
 Report on Track, 677\*  
 Report on Uniform General Contract Forms, 813\*  
 Report on Water Service, 795†, 801\*  
 Report on Wood Preservation, 708\*  
 Report on Wooden Bridges and Trestles, 860  
 Report on Yards and Terminals, 706†, 721\*  
 Service for Younger Men, 666\*  
 Sifer, Hiram J., Death of, 683\*

- American Railway Engineering Association (*Continued*):  
Specifications, Prompt Publication of, 795†  
War Service Record, 740
- American Railway Express Company:  
Miniature Car, 1737  
Strike of Employees, 1227
- American Railway Master Mechanics' Association:  
Annual Convention (See American Railroad Association)—Section 111  
Officers Appointed, 169
- American Red Cross:

## Railway Age

# EDITORIAL

Judge Robert S. Lovett, who has been director of the Division of Capital Expenditures of the McAdoo Railroad Administration, having resigned that office, is now to resume his duties as president of the Union Pacific.

### Judge Lovett for Competition

In giving up his duties for the administration, he discussed at some length the railroad situation, and far and away the most significant part of this discussion deals with the subject of competition. Judge Lovett was one of E. H. Harriman's right-hand men, and it will be recalled that the Harriman lines were dissolved under an order of the supreme court because their merger was in contravention of the Sherman law; in other words, because they had tended to stifle competition. His earlier training, therefore, must have acquainted Judge Lovett thoroughly with all that there was to be said in favor of the elimination of competition. He has now had a year of experience in railroad operation where competition has been completely eliminated; nevertheless, he is emphatic in expressing the opinion that much of the progress made in the science of railroading, much of the excellence of service which the public has received from the railroads, is due directly to competition. He is emphatic in the expression of the belief that competition should continue in the future, and he brushes aside as trivial the economies which are to be gained by the elimination of competition. This estimate of the savings under the Railroad Administration, made by the elimination of competition, bears out what most close students of the past year's railroad history believe. Judge Lovett's opinion, however, is based on knowledge which no outside student of railroad affairs has. It should carry very great weight in any discussion of Mr. McAdoo's proposal for a continuation of government operation for another five years.

On Tuesday, December 31, the Standing Committee of the Association of Railway Executives held a meeting at which S. Davies Warfield, president of the National Association of Owners of Railroad Securities, was present. The Railway Executives' Committee, as has been mentioned previously in

### Warfield Won't Come In

these columns, has worked out a tentative plan, laying down the fundamentals which it is believed Congress should consider in developing a solution of the railroad problem. In arriving at a plan upon which all could agree, it was necessary for each of the interests represented on the committee to make sacrifices. It was undoubtedly felt that the plan must be general enough in its terms to serve as a basis for constructive legislation and not as a ready-made structure. While this tentative plan has not been made public, some of its main features have been discussed publicly. Federal incorporation and federal regulation to the exclusion of State regulation, and the placing of responsibility upon some government office for the results of regulation, as well as giving to some body the authority to regulate, are fundamental to this plan. No matter how divergent the views of those who

have intelligently thought about this railroad problem have been as to details, these main principles have been almost universally accepted. It is a little hard to see how any thinking man can refuse to accept these principles, unless he adopt advocacy of government ownership; not so with Mr. Warfield, however. Although Samuel Untermyer, counsel for the Security Owners' Association, has come out as personally favoring government ownership, Mr. Warfield has not, so far as we know, done so; but, after the conference with the railway executives, he makes the statement that "we may say, however, that the fundamentals of our plan, now under consideration, differ materially from those of the plan of the executives' association." Mr. Warfield has been in close touch and cognizant of each step in the working out of the railway executives' plan. It would have seemed feasible to have co-operation, but apparently that is not to be. A fundamentally different plan is to be worked out by Mr. Warfield's association. If it is advocacy of government ownership, well and good; the issue can be squarely met. If it is an attempt to play upon local prejudices by a reiteration of States' rights theories, it will serve but to befog the issue and interject controversies where co-operation and unity are so vitally important.

Careful, discriminating and constructive work has been put into the production of the standard operating statistics forms which are described by Professor W. J. Cunningham in this issue. The forms are more useful and much more logical than those used by a large number of American roads heretofore. They are

### Standard Operating Statistics

in all probability more logical than the form of statistics in use on any railroad in the country. Their full value will neither be appreciated nor obtained by the very men who now have the best systems of operating statistics on their own roads. A man who has studied the figures reported monthly on a certain form for his 2,000 or 4,000 or 6,000 miles of road for 20 years will in all probability find it difficult if not entirely useless to try to get the same information as quickly and as accurately from the new standard form of statistics as from his own forms. This is no reflection on the Operating Statistics Section of the United States Railroad Administration. After an executive has followed for years the operations of his property through the variation in certain statistics—learned to see reflected in certain figures the approach of certain conditions even before these conditions are suspected by the operating officers on the ground, has hammered at this thing or that thing through an insistence on a better showing in a principal figure in his statistics, it would be absurd to expect that he could use a new tool as easily and as successfully. It is for the younger generation of railroad men and for railroad officers whose forms of statistics, handed down to them possibly from predecessors, have been clumsy and ill-devised, that the new forms will come as a great immediate benefit. As a side light on the magnitude of the task that the Railroad Administration undertook, it would be interesting to try to picture how large a pile of these

operating statistics would have to be gone through by the director general of 250,000 miles of railroad if he were personally to attempt to supervise or even to keep himself informed of the operation of the railroad system of which he is the head. On the other hand, an executive operating only 3,000 or 4,000 miles could use the statistics shown on Professor Cunningham's forms to great advantage, and without plunging himself helplessly into an unmanageable mass of figures.

## Railway Signaling Situation

**S**IGNAL INSTALLATIONS very generally proved their value in facilitating the enormous traffic in troops and war supplies which had to be moved. Operating officers are coming to realize more and more the value of short block sections—that is, automatic signals—for other purposes than preventing collisions. Every hour saved between terminals in running time means a decided saving in locomotives, cars and overtime. Some roads have practically eliminated the use of the "31" train order through the operation of their trains by signal indication. The advantage of the remote control of outlying switches by low voltage switch movements to prevent the stopping of heavy freight trains is becoming more and more apparent, and the number of installations of this character is increasing each year.

The signal departments have been greatly handicapped during the year by the loss of experienced men. A large number of the employees went into the army, while others quit to go with manufacturers of war supplies because the wages received were much higher than the railroads could hope to pay. As it takes about two years to develop a good maintainer, it is easy to see what the loss of experienced men means to a railroad. While General Order No. 27 and Supplements Nos. 4 and 8 increasing wages helped materially in holding the employees, a feeling of dissatisfaction was created because of the discrepancy existing between the wage scales of the two supplements. This feeling was further increased as Supplement No. 8 was applied on a majority of the roads, giving signal workmen less than men in other departments doing work of a less exacting nature. The application of either supplement meant that the men, in many instances, would receive more than their immediate superiors, and this is the condition which exists at the present time. A number of experienced signal officers have accordingly entered other fields of work or have taken positions in the ranks in order to benefit by the increased wages.

The entire wage situation has been demoralizing. Signal department officers have been placed in a bad light, because they could offer nothing but promises to their men. The morale of the men was badly affected because they saw those in other departments doing work that did not require the training necessary for the signal department getting considerably more money than they were. As a direct result, the men are inclined to view with suspicion the interpretations of the award made by their superior officers.

A development of importance in the signal field during the past year is the large number of employees who have joined a union. Perhaps 70 per cent of the signal repair and construction men in the country are now unionized and many of the large roads are solidly organized. On December 19 an organization of signal supervisory officers was formed at Chicago to act as a unit in connection with all matters affecting them. This has been another direct outgrowth of the wage situation as outlined above. It is not surprising that men in the signal departments have taken these steps since the Railroad Administration has placed a premium upon organization.

## Railway Construction in 1918

**T**HERE IS LITTLE about railway construction during 1918 that is comparable with that of previous years. The mileage of new lines built, 721, comprises such a combination of projects carried over from previous years and short mine, oil and lumber spurs undertaken as war measures since the advent of federal management that it bears no definite relation to the 979 miles of new main lines completed during 1917. The acid test of war necessity resulted in the postponement of more than one project, while the high prices and difficulties of securing deliveries of materials, especially rails, under war conditions, were also deterring influences. Therefore the mileage of new line completed cannot be taken as an index of the normal attitude toward new railway ventures.

The second track mileage of 1918 is constituted very nearly the same as the new line mileage. The longer stretches of second track completed comprise projects of a year's standing or longer, while the shorter sections consist of work undertaken this year under the established policy of the Railroad Administration to provide additional main tracks where light construction promised speedy completion and therefore early utilization in the relief of congested traffic.

Of far greater importance this year than either the new line or multiple track construction has been the terminal work, both freight and engine. In engine terminals especially, which proved so woefully inadequate a year ago, the number of complete new projects is particularly evident. Freight yard work in the main has involved the extension of existing terminals, usually following the line of established plans for future extensions, but in many cases involving provision for additional tracks where they could be best applied to relieve congestion. Wye connections and cut-offs affording communication between facilities of normally competing properties were also features of the season's work and these in most cases accomplished much in the relief of traffic while involving but limited expenditures.

Another phase of the additions and betterments program that must not be lost sight of is the renewed interest taken in water treatment—interest that took material form in the construction of a large number of water softening plants. This tendency is also a direct consequence of the engine troubles of a year ago that were brought to a pronounced crisis by the severe season. The important economies to be obtained from these plants, if efficiently operated, will go a long way toward further development in this line.

Taken as a whole, the season's progress on the terminal projects is probably a disappointment to most of those concerned. Possibly the program was too ambitious, or the estimates of material and labor available were more optimistic than they should have been. The necessity for a review of the improvement budget by a centralized body implied a volume of work that could not be completed without the lapse of considerable time. As a consequence, many of the projects were not authorized until late in the season, thus placing a premium on construction methods that would hasten completion as rapidly as possible. Slow delivery of materials also had a marked influence in delaying work. Particularly in yard work, progress was delayed by the lack of a sufficient amount of relayer rail: that is, owing to a delay in the rail renewal programs of the roads, the relayer rail was not available in adequate quantities.

Nearly all work undertaken during the last year was war work in the sense that the improvements undertaken would be of definite advantage in handling war traffic. As a consequence the bulk of the new work was concentrated in the East, particularly east of Pittsburgh. But as this territory is normally one of dense traffic, the possibilities are that nearly all of the improvements will be of definite, permanent value, with the roads restored to private operation.

## Railway Expenses Under Government Control

IF THERE WERE not such serious possibilities of disaster in government experimentation with privately owned property under a form of guarantee that recognizes only the physical property, it would be interesting to see Mr. McAdoo given an opportunity to make good on his predication that the economies incident to unification under government control would make possible a material reduction in rates, probably within a year, without any reduction of the high wage scales established this year. Of course, talk of a reduction in rates from the level established this year is very conservative as compared with the claims usually made by government ownership advocates, that the government could reduce rates and raise wages at the same time; but even so, if Mr. McAdoo has any facts to demonstrate the possibility of an early reduction in rates, it seems strange that they have not been made public.

While much has been made of the saving of \$4,000,000 in officers' salaries by charging them to the corporate accounts instead of to operating expenses, and of the \$25,000,000 reduction in traffic expenses, and while scattering figures have been given out of savings made here and there by rerouting of traffic, joint use of facilities, etc., they are insignificant as compared with the total increase in expenses and do not bulk very large as compared with the margin of uncertainty as to the amount of the wage increase. Wages have been increased so fast that no one apparently knows yet within \$100,000,000 to \$200,000,000 how much the increase in payroll will aggregate for the year. We know that in the nine months ending with September 30 the railroads had handled 2.1 per cent more tons of revenue freight one mile and 14.3 per cent more passengers one mile than they did in the corresponding period of 1917, at an increased operating expense of \$779,000,000; and while we know that the larger part of that amount represents wage increases, and some of it represents the increased cost of fuel and other supplies, we do not know how much of it represents the wage increase and therefore do not know whether government operation has been economical or extravagant aside from the question of wages.

We realize that the rate advance was in effect for only about half of the year, while much of the wage increase applied throughout the year, and we know that the increase in revenues on a yearly basis probably exceeds the amount of the wage increase for a full year; but we also know that some very large expenses will have to be incurred in the near future that were not incurred in 1918 because it was not possible during the war to keep up the proper amount of maintenance work. While maintenance expenses have been greater this year than last year, that fact is largely due to the higher wages and material costs and at least as far as maintenance of way and structures is concerned a considerably larger amount will have to be expended in the coming year to make up for work deferred during the period of government control.

While it was hardly to be expected that the economies incident to unification would show their full results in the first year, it is also probable that many economies made in the name of war necessity will not be possible hereafter. Coal operators are already exerting pressure to bring about the discontinuance of the coal zone system, shippers and state commissioners are already agitating for a relaxation of the pressure for heavy car loading, and if the Railroad Administration continues its present efforts to show that the government can give a better passenger service than was possible during the war it may find that the effect of the war was not entirely on the side of increased expenses.

It is rather futile to attempt to disagree with so courageous

an optimist as Mr. McAdoo, particularly in the face of the uncertainties of the coming year, but we do not hesitate to register an opinion that the forthcoming annual report of the Railroad Administration will be able to deduce a more favorable outlook from the 10 months' figures of 1918 earnings and expenses, which should be available by that time, than it will be possible to extract from the complete figures for the year.

## Central Control of Purchases

ALBA B. JOHNSON, president of the Baldwin Locomotive Works and of the Railway Business Association, in referring to the standard locomotives, said that "The workman who is responsible for the best workmanship should be entitled to the selection of his own tools." With cars and locomotives designed and purchased by central committees for all the railroads in the country the opposite is true, for here we have, in effect, a small body of men indiscriminately handing out to the vast army of railway workers cars and locomotives, and giving little consideration to whether or not they meet the local conditions. This standard equipment, with its appurtenances, is determined upon by a committee made up of representatives from different sections of the country. The experience of most of them is different from that of the others. Their operating conditions are different; they have preconceived ideas of how cars and locomotives should be designed and what should be used on them based on the experience they have had in their respective territories. In an endeavor to come to an agreement many compromises are made. This is particularly true of the appliances that go on the equipment. No one common standard can be agreed upon, with the result that four or five are listed as having given good service. One committeeman swears by one device, a second by another, and so on, and in an endeavor to come to an agreement a group selection is made.

This done, the committee on design is through with its work and the matter passes on to a central purchasing committee, which with the accepted list before it attempts to make the necessary purchases. Its business is to buy the equipment at the lowest possible price. The committee members are business men not as familiar with the merits of the design or the material they purchase as those who are to use it. They seek the lowest price and buy from the man who makes the most attractive offer. Not being sufficiently familiar with the service value of the apparatus under consideration they do not know when it is economy to pay more for a certain device than for another. The first cost of any article is by no means an indication of its relative value. The service it renders and the cost of maintenance should be very carefully considered. Some railway supply concerns get greater returns from the sale of repair parts than from the sale of the original device itself. They can afford to lower the price because of the profit in repair parts, and further, it would not be impossible to raise the price on these repair parts in order to make up for what was lost in the lower price of the original article. With purchases made in this way—what happens? The equipment is built and sent to the railroads regardless of whether the roads to which it is sent should happen to have any of the particular standard equipment appliances on their own equipment. This complicates not only the operation of the new equipment, but its maintenance. The men that handle it are not familiar with the particular appliances provided and the men repairing it must provide themselves with a new line of repair parts. The seller is far removed from the user. In doing business with a committee at Washington for all the railroads on a large scale there is not that personal touch that is common when the appliances are sold directly to the

railroads themselves. There is not that incentive to the equipment manufacturer to provide service with his products. Where the railroads buy individually and anything goes wrong with the article purchased, the local representative of the supply company is notified and gets on the job immediately. He has a particular interest in the service his device gives on that road, for he—not alone his company—is after a repeat order. Under centralized purchases the road communicates with Washington and after the usual red tape accompanying the administration of large bodies, the equipment manufacturer is notified and a representative having no direct personal interest in the matter is sent out to rectify the trouble.

Satisfactory results cannot be obtained by making purchases in this way. The service a device gives is far more important than its first cost when its ultimate value is considered. Centralized purchases, furthermore, tend to restrict development. When the number of appliances performing the same functions is limited for the sake of standardization, the manufacturers do not have the same incentive to improve their products or to introduce new designs, on account of the difficulty in getting them into service in sufficiently large numbers thoroughly to determine their service value. On the other hand, devices will sometimes be accepted and a relatively large number placed in service before the design has reached a satisfactory stage of development. The latter has been found particularly true in the case of at least one appliance that is being used on the standard locomotives.

Service and economy demand that "the workman who is responsible for the best workmanship should be entitled to the selection of his own tools." This cannot be attained through a central organization. It cannot be attained when the purchaser buys on a price basis alone. Those who are to use what is to be purchased should have the opportunity and should be capable of determining the kind and make of the article to be bought, and those that do the purchasing should only seek to get the best price obtainable.

## Maintenance of Way Progress in 1918

**M**AINTENANCE OF WAY WORK was subjected to very little constructive supervision by the Railroad Administration during the working season of 1918. There was some interference in the handling of labor, largely with respect to wages and methods of employing men, while with materials and supplies the activities of the government other than in the administration of priorities were limited almost entirely to standardizing the specifications and methods of purchasing ties. The work suffered early in the season from the lack of a clearly defined policy. Maintenance officers hesitated to go ahead with the work because they were not sure of their authority to proceed. They finally came to understand that they were to conduct the work along the usual lines, but no general policy was enunciated at any time during the year.

Responsibility for the failure to assume direct charge of maintenance of way work while other departments of the railroads were being subjected to such detailed supervision may be charged primarily to the delay in organizing a maintenance department under either the central or the regional authorities until late in August, when C. A. Morse, chief engineer of the Chicago, Rock Island & Pacific, was made assistant director of operation in charge of maintenance of way and structures. Maintenance of way or engineering assistants to the regional directors were appointed about the same time. Since their appointment these men, working individually and also collectively as a committee, have endeavored to expedite maintenance of way activities, but their efforts came too late in the season to exert a material influence on the condition of the roads at the close of the year. Most of their

time has also been directed to the construction rather than the maintenance activities of the Railroad Administration.

With the opening of the season in 1918 maintenance officers were confronted with the necessity of maintaining tracks and structures that had been suffering for several years from a lack of sufficient labor and material, while carrying an ever-increasing traffic. Rail renewals had been estimated by various authorities as being in arrears in amounts up to 10,000,000 tons. Tie renewals had also been inadequate, while many roads were struggling along with only skeleton forces. Work on the cantonments had also drawn large numbers of bridge carpenters from the service.

The labor situation is discussed at length in another article in this number, and attention is directed to the delay in obtaining action in the matter of wages, meantime tying the hands of the officers of the individual roads in the exercise of their own initiative in obtaining men. These measures may have been necessary to prevent a disastrous competition for labor, but in the absence of prompt centralized action it tended to hamper the organization of adequate forces during the early part of the season when the most effective work could be done. This deficiency in forces was estimated in July at from 30 to 50 per cent.

With regard to rails, the roads were even more unfortunate. Previous to the initiation of government operation the roads had contracted for about 2,000,000 tons of rails for delivery during 1918, but in allocating the supply of steel available for all national needs the War Industries Board found it impossible to allot manufacturing capacities to the production of rails in excess of about 25,000 tons per week, and it was not until November that this rate of production was appreciably increased. As a result deliveries of rails during the year aggregated only about 1,200,000 tons, or less than half of the normal consumption of rails in this country. As long as the production of rails was limited by the lack of manufacturing capacity there was no occasion for the Railroad Administration to place any additional orders, and since these difficulties have been removed the government has failed to take any further action.

With respect to ties, the efforts of the Railroad Administration, while probably holding down prices and preventing confusion and inequitable distribution, have resulted in decreasing the production materially. It is probable that more ties would have been made in this country during the past year if there had been no interference. Deliveries of other track and structural materials were restricted by the same influences that limited the production of rails, and the consequent shortage of materials culminated toward the end of the year in a centralized movement for conservation of all materials used in maintenance of way work. This was a matter of national necessity and secured the enthusiastic cooperation of railway officers and men, but after about two months of this campaign the end of the war removed the principal necessity for it on other considerations than economy. While this campaign undoubtedly saved much steel and iron, and gave the men a better appreciation of the value of the materials they used, there is no question but that the tracks and structures would have been in a better condition if these measures of economy had not been necessary.

It is a commonly accepted fact that the roads are in a depreciated state of maintenance at the present time, and that the condition is far inferior to what it was when the government took control. Just how much so cannot be expressed readily in figures, although it is now very important that this should be done, for when the government took over the roads it agreed to return them to their owners in as good physical condition as when taken, or to compensate them for the difference. The determination of this difference is now one of the most perplexing problems imposed upon the maintenance officers of the Railroad Administration and the corporate organizations of the railroads.

## Administration Purchasing Policy Inconsistent with Labor Policy

DIRECTOR GENERAL McADOO has been quite insistent that wages of railroad employees should not be decreased, but should be maintained permanently at the present high level. Business men generally, throughout the country, seem to be largely of the same opinion, except that, instead of stating that the present schedule should be maintained permanently, they suggest that it should not be reduced in any greater proportion than the cost of living. One branch of the Railroad Administration, however, is apparently not very greatly in sympathy with the director general's views, at least its actions do not indicate that it is. Word seems to have gone forth from the purchasing department, for instance, that purchases all along the line should be curtailed or discontinued until lower prices prevail.

As labor is a large factor in determining the prices for most of the materials that the railroads use, it would appear that the purchasing departments are doing their best to upset market conditions and indirectly force wages down, in accordance with the law of supply and demand. This action is exceedingly unfortunate. Railroad managers in times past have been severely criticised because when traffic and earnings fell off they curtailed their expenditures at the very time that they should have been improving their facilities, and getting the equipment into condition for renewed activity as soon as more prosperous conditions prevailed. Manifestly, the improvements could be made more cheaply under such conditions, because of the more plentiful supply of labor and material and the fact that the work would not interfere to any great extent with the comparatively light traffic. The railroad manager had the excuse that his finances would not permit him to make the expenditures. It would seem, however, that under present conditions, when the administration is urging every possible effort to be made looking toward the re-employment of "war workers" and returning soldiers, that Congress would be glad to add sufficiently to the Railroad Administration's revolving fund to make it possible to provide the additional facilities and equipment that will be greatly needed under heavy traffic conditions that are sure to come not many months hence.

Those men who are following the industrial situation most closely expect that for a period of from possibly three to six months there will be a necessary slowing up because of changing over to normal conditions. They predict, however, that thereafter business conditions will improve rapidly and that the country may expect a long-continued period of heavy business activity. Under these circumstances it is advisable, and even quite necessary, that those industries that can place extensive orders for equipment, either for repairs or improvements, should do so at this time, in order to tide over the temporary business depression. It is useless to look forward to lower prices, except possibly because of unsettled conditions for very brief periods, and it is exceedingly desirable that the government should guard against any flurries of this sort. It would seem that if the situation is handled properly the railroad corporations might be prevailed upon to cooperate in the buying movement even though they have not been shown much consideration since the establishment of federal control. Even if it is not possible for them to cooperate because of financial or other conditions, it must be remembered that there is a large amount of deferred maintenance to be taken up and also that there are many improvements that can be made that will pay for themselves within a very limited period, and which will justify considerable expenditures at this time even though there may be a considerable falling off of prices after the reconstruction period, which, however, will probably extend over a number of years.

A large amount of the present locomotive and car equip-

ment cannot be operated economically, and it will be good business to scrap it just as quickly as possible. It is true that, particularly in relation to locomotives, the older equipment has been placed in good repair; nevertheless it does not have sufficient capacity to handle the heavy train loads that are necessary in the interests of economical operation. A keen observer recently made the remark that a locomotive which was built 15 years ago was a liability because it could not haul heavy enough trains. On the other hand, many locomotives which are 10 years old could be rebuilt or fitted with capacity-increasing devices. The expense would be offset by the savings within a comparatively brief period, in some cases in as short a time as one year. Those roads that were carrying out extensive programs for rebuilding and strengthening car equipment in pre-war days profited richly by it under the conditions of heavy traffic that have existed during the past few years.

If high wages are to be maintained it will be necessary to reduce the cost of operation and to furnish the roads with the kind of equipment that can be used to the best advantage toward this end. If the Railroad Administration is really in earnest about maintaining the present wage scale, and we believe it is, then it should lend its help in making it practicable. The new director general has an opportunity to do a big constructive piece of work in this direction.

## A Year of Government Operation

A MOMENTOUS CHANGE in mental attitude among railroad men and the public has marked the 1918 year of railroad operation under the direction of the government Railroad Administration. This change of mental attitude is far more important as having an effect on the future than are the physical changes which have taken place, important as these are when viewed in detail. The fact that more miles of railroad have been torn up than have been built, the fact that in a period of greatest need of every additional railroad facility not over half of the freight car building capacity of the country has been used, and that, whereas the government's order for 100,000 freight cars is but little more than half of what the private corporations were wont to order each year in normal times, and that only about a tenth of the government's order has been delivered, the lasting importance of these things is small when compared to the change in point of view of the public and the two million men actually engaged in railroad operation.

The general public over the entire country for the first time in the history of the United States realizes that there is a railroad problem. For years the more intelligent and thoughtful people of the country contemptuously and with some warmth branded the cry of railroad difficulties as a cry of wolf. The less thoughtful mass of citizens did not bother their heads one way or the other about the railroads.

Analogous to this attitude was that of the greater number of railroad employees and a goodly part of the railroad officers. Dissatisfaction with railroad management both on the part of the public and of employees and officers was rife, but it was largely a dissatisfaction with details. Annoyances and petty injustices bulked large in the horizon of those who thought about railroads at all, and even with those whose businesses compelled them to come in daily or periodical but less frequent contact with railroad operation, it was the personal equation which defined and circumscribed the opinions held on railroad questions. Now everyone knows that there is a railroad problem, and notwithstanding the continued potency of the purely personal point of view of this problem, it is receiving a consideration based on an attempt, at least, to understand something more of it than an occasional personal contact with it would impart;

it is this that distinguishes the present situation from any other in the history of the country.

Personal grievances against the railroads, while they were operated by private owners, fell into well-defined ruts. The shipper who wanted a transportation service below cost, the traveler who demanded a service comparable to that on the finest excess fare trains whenever and wherever he traveled, the railroad officer who was everlastingly being handicapped and beaten down in his requests for authority to make expenditures, and the employee who compared his wages and conditions of employment with conditions in other lines of work, all experienced a general shaking up during the past year that brought the railroad problem more nearly into its proper perspective. The shipper experienced a service and rates that he had not dreamed possible in these free and politically governed United States, the traveler experienced annoyances—"dis-service," as Director General McAdoo so aptly terms it—and high rates that temporarily took the breath of complaint out of him; the railroad officer found that what he had considered a shortsighted restriction was in reality an incentive to better work; and the railroad employee alone was satisfied with a satisfaction which resulted only too often in his quitting his job. Self-analysis not being one of the besetting sins of the country, what has taken place, so far from having shaken the faith of the citizens in any of the above categories, has led to a more self-assertive discussion of the railroad problem than ever indulged in heretofore, and in this discussion lies potentiality of great good. The significance of the statistics reflecting railroad operation in the past year lies largely in the fact that they have attained conscious significance for the first time in the minds of the great majority of people in the country.

In Europe, the four years of war have left a complicated physical problem of railroad rehabilitation. In this country, while there is suspended animation in railroad extension and railroad betterment and actual deferment of necessary repairs and upkeep of facilities, there has been no widespread and serious deterioration of the physical property of railroads. There is a widespread and serious impairment of the working ability and team play of railroad men. Allowed to go on, this might well prove to be destructive. Convincing discovery that something is wrong is the first step toward the discovery of a remedy for this wrong.

Take, for instance, the problems that the Railroad Administration has tackled as set forth in the account published elsewhere of the work of the administration. Many of these things are unimportant in themselves, many others have been handled illogically or not entirely in a disinterested manner, but look at the advertising they have had. It has been worth more than all of the traffic department's expenditures on advertising put together.

The Railroad Administration engaged the services of some of the most able of railroad officers. It was free to draw upon, and did draw upon, the services of railroad executives whose best thought and genius was hardly purchasable for a money wage. With this as a groundwork, with the credit of the government behind it, with an overthrowing of the precedent of railroad officers in the handling of the wage problem and with power to increase rates to almost any extent, the United States Railroad Administration demonstrated that there was a railroad problem. The year, 1918, has outlined in broad, crude strokes of unmistakable vigor the difficulties which have beset the railroads and the public in its relation with the railroads in the past.

If, however, there was too little public interest taken in the railroad situation in the past, there has been a very intimate interest taken in railroad management by various groups of bankers. Not infrequently, this interest amounted virtually to banking control of railroad management. There

was keen competition until a few years ago between the three or four larger banking houses, which were known as houses of original issue, for the financing of the large railroad systems which sold issues of from ten to fifty million dollars of securities at one time. There was competition among the smaller banking houses to participate in the syndicates headed by the houses of original issue, and there was competition between the smaller houses to underwrite smaller issues of notes, equipment trust certificates, and other securities in amounts ranging from a million to five million dollars.

The bankers were represented on the boards of directors and the voice which they had in the selection of the management was often compelling. As long as railroad securities could find a ready market among individual investors and institutions, such as savings banks and life insurance companies, it was to the interest of the bankers to have the companies sell securities up to a limit of safety. During all this time the bankers appreciated the dangers of the course that government regulation was taking and stood with the railroad men in an attempt to change this course. When, however, it became evident that the united efforts of railroad men and bankers would prove of no avail, and when, furthermore, the market for railroad securities narrowed almost to the vanishing point, the bankers' point of view radically changed. It was argued that the logic and the justice of the situation demanded that the government, having through regulation forced the railroads into an impossible situation, should now assume responsibility; and the taking over of the roads by the President quite possibly met with the approval of many of the bankers and met with no serious opposition from any of them.

The attitude now of many bankers is that they are willing to consider railroad financing if the railroads have good security to offer, but that good banking forbids them to loan money to railroad companies, with the exception of a few of the stronger ones, under present conditions. There is a tendency to get out from under the railroad problem entirely. Private credit, the bankers say, financed the building of 260,000 miles of American railroad, but unwise, silly, demagogic regulation on the part of the federal government, and more especially of the states, has irreparably damaged this credit structure, and now probably the best thing to do is to have the government use the public credit to support the railroad securities now outstanding and to finance future needs. So runs the argument.

Private industry bids fair to offer a field for profitable banking for years to come in this country. Transportation facilities were necessarily a first consideration. With transportation facilities provided, private credit can be used profitably to establish innumerable new industries.

The bankers who heretofore profited, and at the same time performed a useful public service, from the transferring from the railroad companies to investors, savings banks and insurance companies the stocks and bonds issued by the road and conveying to the railroad company the proceeds of the sale less a commission, stand ready to step out and let the institutions holding the outstanding securities protect their own interests and the railroad managements do their future financing in any way they can find available.

The situation is not without elements of hopefulness. With public interest thoroughly aroused in the railroad situation, with some of the more objectionable features of banking domination of railroad managements in a fair way to be eliminated, with the more statesmanlike of the bankers working in a constructive way on the railroad problem, with the development of means for the distribution of securities among the small investors rather than among the savings banks and insurance companies, and with the hope of elimination of pernicious state regulation, the prospects for a satisfactory solution of the railroad problem are good.

# American Railway Forces in the Great War

Remarkable Story of Transportation Department of  
A. E. F. Made Public for First Time

By Samuel O. Dunn  
Editor of the *Railway Age*

THERE is nothing more romantic and striking in the entire history of war than the story of the raising and organization of the American army in the Great War, of the sending of 2,000,000 members of it to Europe and of its participation in a struggle carried on more than 3,500 miles from the nearest part of its own country. One of the most extraordinary chapters in this story must be devoted to the work done by the transportation department of the American army.

## Expeditionary Forces in France

A great deal of the attention of government officials and the public has justifiably and necessarily been devoted to the problem of providing shipping with which to move our troops and supplies for them from the United States to Europe. It has been tacitly assumed by many that, with the landing of the troops and supplies in France, the problem of military transportation would be solved. It has not been generally understood that the American forces have been situated mainly in eastern France, and that therefore when troops and supplies have reached Europe there has still remained the necessity of transporting them across France to the front for distances of 500 to 1,000 miles. Since the armistice was signed large parts of our troops have been moved from the general district in which they were stationed before up to the Rhine. Therefore, while the cessation of hostilities has reduced in some ways the demands upon our Transportation Corps, it has increased greatly the average distance that supplies must be moved, and therefore the distances over which our railway men must operate and our trains must be moved.

When the United States entered the war in April, 1917, the officers and employees of American railways knew extremely little—in fact, practically all of them knew next to nothing—about the way in which the railways of Europe were constructed, equipped and operated. Even as late as July, 1917, the transportation department was practically non-existent. One year later—in June, 1918—it had a personnel of 1,300 officers and 30,000 men, was operating through eleven French ports, and over an extensive system of railways and inland waterways. It was running exclusively American trains, the first train which was exclusively American in equipment and personnel having been run on July 1, 1918, from Gievre to Nevers, a distance of 83 miles.

When the armistice was signed, in November, 1918, the American Transportation Corps had a personnel of 1,970

officers and 53,136 enlisted men. In addition, 553 officers and 21,452 men were attached to it for duty, making a total assigned and attached personnel of 2,523 officers and 74,588 men. Of this number, 576 officers and 21,832 men were on duty in the zone of the advance, and 1,947 officers and 52,756 men in the Service of Supply. Of those on duty in the Service of Supply, 779 officers and 22,079 men were at work at the ports; 328 officers and 546 men in the headquarters' organization (at Tours), and the rest were concerned with train operation, car and locomotive erection, maintenance of way, and inland waterway transport.

On November 30 there were 37 American railway officers and 2,687 men engaged in operating trains for the French, while 126 officers and 2,530 men were engaged in maintenance of way work for the French. The total number of men engaged in operating American trains was 16,000, while 6,139 were working in American railway shops, and 3,927 were engaged in the maintenance of American trackage. These figures relate only to railway work which was being done in the rear of the advanced zone. The Transportation Corps was operating over 5,000 miles of line; was transferring traffic from ships to cars and barges at 30 ports, and was handling about 32,000 tons of freight and about 10,000 soldiers daily. American railway men, directed by American railway officers, were running through trains made up entirely of American locomotives and cars, and hauling exclusively American freight over three lines of communication from French ports to the American front for distances of 500 to 1,000 miles.

In considering the significance of the service rendered by our transportation forces in France, it must never be forgotten that our supplies and troops were moved over railways which already were being used to render two other kinds of service. First, the French railways over which operations were conducted had to continue to be used for moving their commercial freight and passenger business. Second, they had to continue to transport the military passenger and freight business of the French Government. The American transportation organization and traffic had to be superimposed upon and co-ordinated with those previously existing, and the French roads were regarded as badly congested before our forces arrived. This point must be emphasized before an adequate understanding of what has been done can be obtained.

It will be long before a full and adequate account will or can be given of all the things that have been achieved by our transportation forces in France, and the way that these things have been done. The almost impenetrable veil interposed until recently by the censorship between the army supply and transportation service and the American public has now been lifted. All the data are at present available to those who have time and opportunity to get them and capacity to assimilate them. The present difficulty about telling the story is that it is so big and is replete with such a vast number of important details, that nobody who has not been in touch throughout with all the developments can learn the entire story except by giving literally months to the task of mastering it. So, too, those who have been in touch throughout with the developments are restrained from

Samuel O. Dunn

telling them either by official considerations, or by the fact that they are too busy.

The writer has had opportunity to visit Tours, the headquarters of the American Service of Supplies, which includes the Transportation Corps. He is the first American press representative to visit the headquarters of the Transportation Corps since the signing of the armistice. He is, therefore, the first who has been officially given full access to all the sources of information as to what has been done, how it has been done, and the difficulties that have had to be overcome in doing it. The article which follows will, in consequence, give the first authorized and connected account of the work of the Transportation Corps. Necessarily, however, it will be incomplete. When the entire history is written it will fill a volume; and a most instructive and valuable volume it will be to those interested in the important subject of military railway transportation in its numerous phases.

### What Actually Has Been Done

Many things have been published about what the American railway men have done in France. Insofar as these have been correct they have been very fragmentary. In many cases they have been more astonishing than true. One yarn which has gained widespread currency and cre-

that negotiations were pending for turning its management entirely over to our Transportation Corps. Of course, these negotiations have now been terminated.

While, however, more use was made of the Paris-Orleans than any other road, our railway men were also using portions of the lines of the Etat (a government-owned railway which embraces the old Western and State railways), the

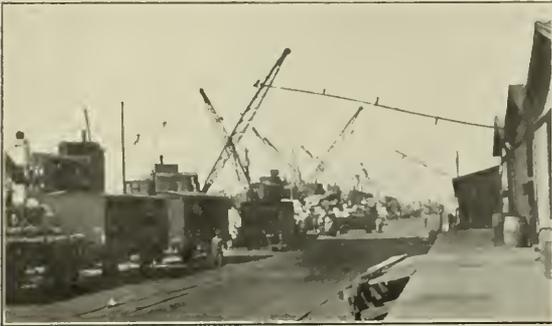

Steam Shovel and Train on Embankment Between Canal and River Loire; Nevers Cut-Off

Paris, Lyons & Mediterranean, the Est (Eastern) and the Midi (Southern). These are all the large railways in France except the Nord (Northern). A large part of the Nord was practically destroyed during the war, it being in the principal zone of hostilities, and 45 per cent of it having at one time been in the possession of the Germans. Furthermore, the available parts of it have been used by the British in handling their troops and supplies. It should be added that a portion of our troops and supplies have been handled by the French railroads with their own equipment and personnel. This was especially true during the early part of our participation in the war.

### Some of the New Facilities Provided

In order to make it possible to transfer from the ships to the railways all the vast quantities of supplies shipped from America to France for our army, it was necessary greatly to enlarge the transfer facilities at many of the important French ports. In order to enable the French railways to handle this vast additional traffic, it was necessary greatly to enlarge the facilities of the railways by building second, third and fourth tracks in some places; by building cut-offs in other places; by constructing numerous large yards and

Landing Freight at French Bassens, Bordeaux

dence is that our railway men have built, equipped and operated a new four-track railway clear across France. It can hardly be necessary to tell railway men that this report is without foundation. What our railway men have done is to take over the operation, and maintain and enlarge the facilities of existing French railways to the extent necessary, first, to move our own armies and supplies to the front, and, second, to enable the French army to continue to carry on its part of the struggle with unimpaired energy and effectiveness.

In some cases this has involved merely loaning the French railways American railway troops to operate the trains and maintain the rolling stock and tracks of French railways. In other cases it has involved the operation of American trains over the same lines as French trains, and the maintenance of the tracks and equipment by American railway soldiers. In other cases, it has meant the exclusive construction, maintenance and operation of yards, terminals and even entire parts of lines by our soldier railway men.

The principal ports of debarkation for American supplies have been those in the region of St. Nazaire and those in the region of Bordeaux, on the western coast of France. These groups of ports are served almost solely by the Paris-Orleans, one of the five large privately managed railways of France. The Americans were moving so large a part of the business passing over this road, and were so largely operating and maintaining it when the armistice was signed,

One of the Ten American Berths at Bassens

vast storehouses; by building shops to erect and maintain locomotives and cars, and by importing and putting in service large quantities of railway equipment and materials. Over 300 large construction projects (to be exact, 316) were undertaken for the Transportation Corps. The total number of miles of new trackage actually built was 937, and the number of cars shipped from the United States knocked down and erected in France up to December 12 was 15,068.

The number of locomotives from the United States put in service by our military forces in France was 1,105. Up to December 12 the complete record of the Transportation Corps with respect to the ordering, acquisition and erection of locomotives and cars was as follows:

No. ordered	Locomotives			Freight cars		
	From U. S.	Other sources	Total	From U. S.	Other sources	Total
.....	1,600	425	2,025	30,000	1,040	31,040
On sea	34	...	34	400	...	400
At port	139	...	139	747	...	747
At shop for erection	19	63	82	1,238	...	1,238
Erected today (Dec. 12)	8	...	8	80	...	80
Erected to date	1,105	336	1,441	15,068	988	16,056

**Amount of Traffic Handled**

The magnitude of the work which the Transportation Corps has done is indicated, although only partially indi-

**Gantry Cranes at American Bassens, Bordeaux**

ated, by the tonnage of supplies and the number of soldiers it has handled. Between June 1, 1917, and November 30, 1918, the total tonnage of supplies moved for the American Expeditionary Forces was 6,547,621 tons. What was accomplished is much better indicated by the increase in the tonnage handled per month and per day. In June, 1917, the tonnage handled was 24,524, or 817 tons per day, while in November, 1918, the tonnage handled was 920,972, or 30,699 tons per day.

The business handled was rapidly increasing when the armistice was signed, and in the first twelve days of December the tonnage unloaded at the ports averaged 31,926 tons daily. And this was less than one-third of what it was expected to handle daily when the American army in Europe had grown to 4,000,000 men. Plans had been made and were being carried out for providing a transportation capacity of 101,000 tons a day by June, 1919, if the war lasted until then.

In the eighteen months from June, 1917, to November, 1918, inclusive, the number of troops transported into France was 1,865,440, and the number of animals, 53,117. The number of troops handled by the Transportation Service in France is not, of course, the same as the number that arrived in Europe, since many American soldiers reached England, for example, who never got to France, but were returned home after the signing of the armistice.

It is hardly necessary to say that such stupendous things were not done by American railway officers and men in a foreign land and under wholly strange conditions without encountering tremendous difficulties which it required great imagination, foresight, patience, energy and administrative ability to overcome. Fortunately, the War Department called to its assistance just when they were needed several of the foremost railway men of the United States. It has been chiefly to their efforts that the wonderful record that has been made is due, and they have received the loyal and able support of the many railway officers and men who vol-

untarily left much more remunerative posts at home to enter a service abroad which required of them the hardest and most unremitting exertion; which separated them from their friends and families for months or years, and which afforded none of the excitement and was surrounded by none of the glamor of combatant military service.

**Some Difficulties of the Problem**

The problem presented to our transportation department was so difficult, partly because it was necessary to operate over railways whose facilities were not only inadequate but had been developed and operated in entirely different ways from the railways in the United States. Another thing which made it difficult was that there were no officers or men on American railways who had been trained before the war for military railway service, and that there were almost no officers in the regular army of the United States who knew anything about the operation of railways. In consequence, it was difficult for the army men to understand why railway organization and operation could not be made to fit their hard-and-fast military notions, and equally difficult for the railway men to understand many things which the army men demanded and insisted upon for more or less substantial military reasons.

It is an open secret that, owing to these conditions, there was much friction, at times, both between the French and American railway officers, and between the American army men and railway men. The organization of the transportation department, and its relations to other branches of the service, were, in consequence, changed repeatedly, the most important reorganization effected having been made as recently as November 12. In spite of all difficulties, however, the results attained have been far greater than the most optimistic would have believed possible a year and a half ago.

The development of our military transportation service has been carried on partly in the United States and partly in Europe. When it became necessary to send troops to the Mexican border, a transportation service was organized by the War Department, with Samuel M. Felton, president of

**General View, Nevers Cut-Off; Looking East Toward Loire Valley**

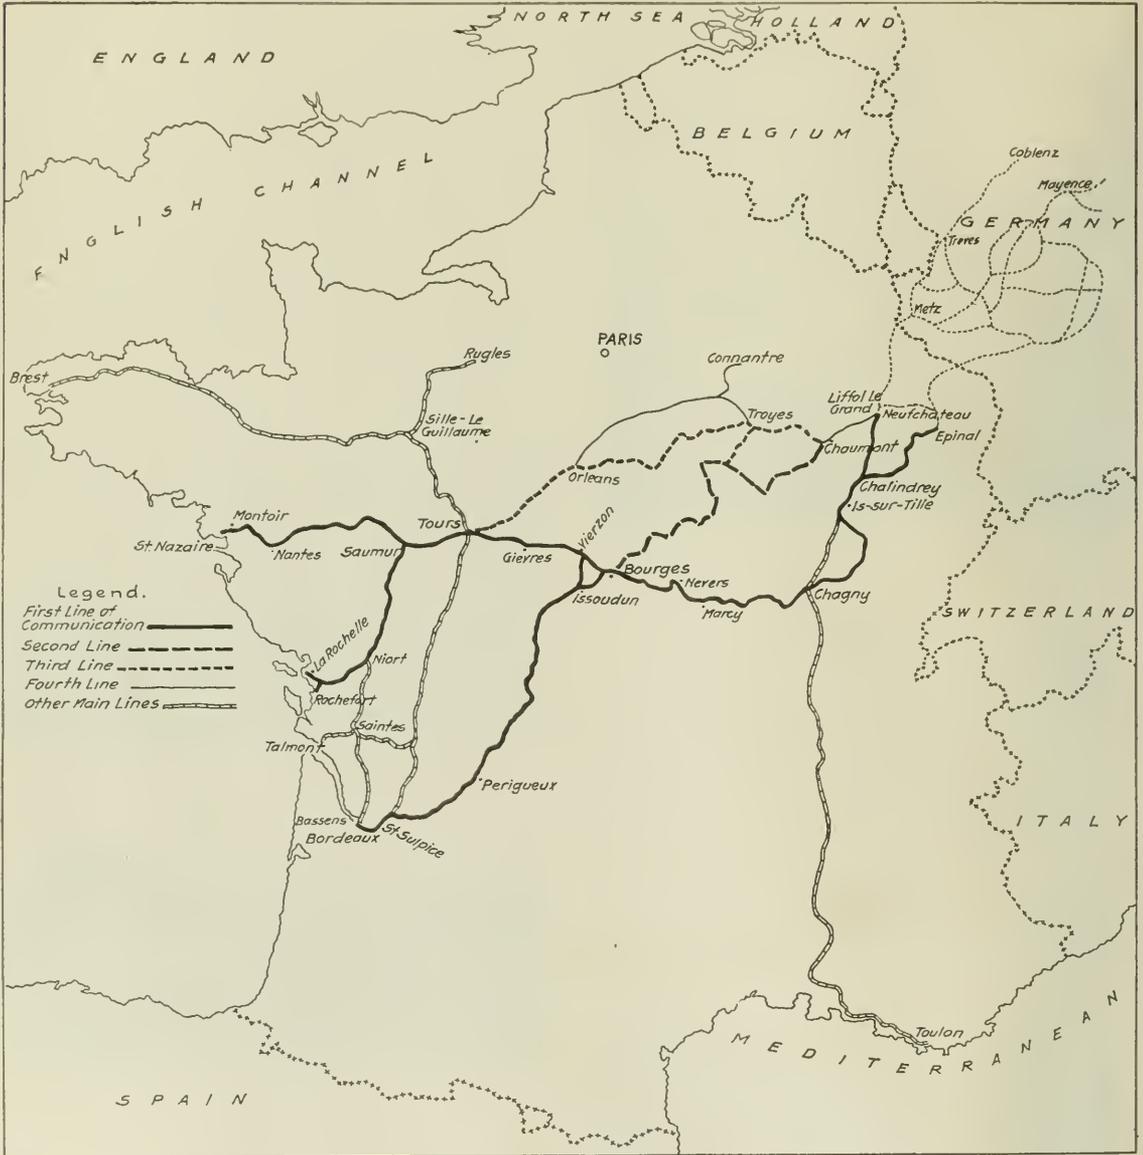

the Chicago Great Western Railway, as its head. On our entrance into the war in Europe this service was expanded, and Mr. Felton was made Director of Military Railways. On Mr. Felton and his staff were imposed the heavy duty and responsibility of providing from the United States the transportation supplies and men needed overseas.

In Europe there was organized, with W. W. Atterbury, vice-president in charge of operation of the Pennsylvania Railroad (now a brigadier general), at its head, a department which was called at one time the "Transportation Service," and more recently the "Transportation Corps." Its work has been to develop and manage the transportation

service in Europe. The present article is concerned almost solely with what has been done overseas. It would, however, be very incomplete if it did not note the fact that those who have been in the overseas service are unanimous in commending the energy and efficiency which Mr. Felton and his organization in the United States have shown in their

portation was to play in America's participation in the struggle when he had said to Secretary of War Baker, in accepting command of the American Expeditionary Forces: "The success of our armies is going to depend on how they are kept and supplied, i. e., upon transportation."

The commission sent to Europe to investigate the trans-

Lines of Communication, American Expeditionary Forces. Light Dotted Lines Show Advance into Germany

efforts to fill all the requisitions which have been made by the transportation department in Europe.

### Early Stages of the Work

The first step was taken toward organizing our transportation service overseas, when, in May, 1917, a commission was sent to Europe to investigate the situation from a transportation point of view. General Pershing had expressed his opinion of the importance of the part trans-

portation situation was composed of Col. William Barclay Parsons; Major (now Colonel) W. J. Wilgus, formerly vice-president of the New York Central; Capt. A. B. Barber, of the Corps of Engineers, U. S. Army; W. A. Garrett, formerly president of the Seaboard Air Line, and later vice-president of the Chicago Great Western, and F. de St. Phalle, of the Baldwin Locomotive Works. They were the first American soldiers to arrive in France, and reported to General Pershing in June.

Col. Parsons soon joined his regiment, Capt. Barber was assigned to general staff duty, Mr. Garrett returned to America, and soon Maj. Wilgus was left as the sole nucleus of the transportation service. He associated with him Capt. L. A. Jenny, formerly chief draughtsman of the New York Central, who had come with General Pershing. These two men, sitting on soap boxes, with packing cases as a desk, at 149 Boulevard Haussman, in Paris, drew up what became known as "Requisition No. 6." This set forth the amount and kinds of railway equipment, port equipment, tools and materials which were needed then; and it has been the basis of all requisitions made for the transportation service since that time.

### American Men, Equipment and Trains

Major Wilgus outlined the general policy with respect to military transportation which the conditions seemed to warrant. He set forth that the American army must prepare to operate its own trains, made up of its own locomotives and cars, and manned by its own men, from the seaports to the front, over the French railways under trackage rights.

The principle of trackage rights, which is so familiar in America, was entirely unknown in France, and at first the French railway officers did not know what Major Wilgus was talking about. They found it hard to understand how it was possible to operate two systems of transportation over the same tracks at the same time.

Major Wilgus favored the use in France of rolling stock built in America, and designed according to American practice with only such limitations as were imposed by the clearances and the strength of the bridges of the French railways, which generally were not sufficient to accommodate the larger types of American locomotives and freight cars. The type of locomotive favored by Major Wilgus and adopted for general transportation service was a Consolidation of 36,000 lb. tractive effort; while freight cars of 30 tons capacity were adopted. These big locomotives and cars—especially the latter—looked very large on the French railways, the average capacity of whose freight cars is about 15 tons. It was specified that all American locomotives and cars should be equipped with air brakes, which are unknown upon the freight equipment of French railways. The couplers were to be of the French type, in order that American and French cars might be handled in the same trains.

General Pershing took the view that the operation of our military railway service should be placed in charge of a man of large experience in the operation of commercial railways in the United States, and indicated to Secretary Baker his opinion that the ablest American railway man available should be secured. Apparently hearing nothing in response from Secretary Baker, General Pershing appointed Major Wilgus to his staff with the title of Director of Military Railways.

Meantime, Secretary Baker had secured the services of W. W. Atterbury and sent him to France, where he arrived in September, 1917. The situation presented an opportunity for serious embarrassment and friction. These were prevented by Mr. Atterbury and Major Wilgus. Finding the transportation plans well advanced, Mr. Atterbury offered to return to the United States. Since, however, he had been sent by Secretary Baker, it was agreed that he should be made Director General, and Major Wilgus, with the unselfishness and patriotism he has shown throughout, accepted appointment as Deputy Director General. In due course Mr. Atterbury was given the rank of brigadier general and Major Wilgus the rank of colonel.

### Fundamental Principles of Supply Service

In the early part of August, 1917, General Pershing established the principle that there must at all times be kept on

hand in France 90 days' supplies of all kinds for our troops. Forty-five days' supply must be available at base ports; 30 days' supply at intermediate storage points, and 15 days' supply at advance storage points, which were to be 50 or 60 miles from the front.

It was originally estimated that, on the average, there would have to be provided and transported 100 pounds of supplies daily for every American soldier in France. This included supplies of all kinds—munitions, clothing, coal, food-stuffs, etc.—and was based on the needs of soldiers of all kinds, combatant and non-combatant, from generals down to stevedores. It was on the basis of this estimate that the original plans of the transportation service were formulated. If, for example, there were 300,000 men in France it would be necessary to handle 15,000 (short) tons of freight daily for them. Experience showed that this estimate was much too large, and later ones were based on an average requirement of 50 lb. per day per man.

The actual consumption, after the army had become large, was about 40 lb. per man per day. The original estimate erred on the right side, however, and the error doubtless contributed toward the development of a supply service for our army which was so complete and adequate in all respects that it became one of the wonders of Europe. In addition to supplies bought in France, the tonnage for our army actually unloaded at the French ports on December 12 was almost 32,000 tons, or about 35 lb. per man.

Practically all supplies for American troops must be brought to Europe by water. Therefore, before any large movement of supplies could begin, it was necessary to select the ports through which it should be carried on. The selection of these ports must be made, not only with regard to their capacity for receiving and unloading deep draught vessels, but also with regard to the uses to which they were being put already and to the freight-carrying capacity of the railways serving them.

The northern French ports, such as those of Calais and Boulogne, and the railways serving them, were not available, principally because they were being used by the British for handling their troops and supplies. The port of Bordeaux presented great possibilities, because of its situation on the deep estuary of the Gironde river, but it had been heretofore used mainly for passenger business and lacked facilities for handling large quantities of freight.

The Mediterranean ports were not regarded as immediately available because ships attempting to enter the Mediterranean from the west were in great danger of submarine attacks near Gibraltar, and the Mediterranean itself was long infested with submarines.

The port most available for our service at first was St. Nazaire. It was possible to begin immediately, with the facilities in existence, handling through this port supplies for an army of 200,000 men. The first American line of communication was, therefore, originally opened from St. Nazaire to the front.

As time went on, and the number of Americans in France and the amount of supplies which had to be furnished them increased by leaps and bounds, it became necessary rapidly to increase the number of ports used and greatly to enlarge the facilities of many of them. Five entire groups of ports finally were used. These were as follows:

Channel Group.—Le Havre, Fecamp, Hornfleur, Rouen, Cherbourg, St. Malo, Granville.

Brest Group.—Brest, Lorient, St. Briec.

Loire River Group.—St. Nazaire, Montoir, Donges, Usine Brulee, Nantes, Les Sables d'Alone, La Pallice, Rochefort, La Rochelle, Ponnay-Charente, Marans.

Gironde River Group.—Bordeaux, Pauillac, Blazefort, St. Loubes, American Bassens, French Bassens, St. Sulpice, St. Pardon, Bayonne.

Mediterranean Group.—Marseilles, Toulon, Cete.

The submarine menace to the Mediterranean ports in due course was greatly reduced by the activity of the navies of the allied powers. Great improvements were made by our forces at St. Nazaire, but the most extensive port facilities constructed were those on the Gironde River estuary in the neighborhood of Bordeaux.

Several very important and interesting articles could be devoted solely to the great works constructed under the direction of the Transportation Department for the enlargement of the facilities of the French ports. The principal dock project was at American Bassens, near Bordeaux. The docks at this point consist of 10 berths of 410 ft. each, served by four tracks along the front of the docks. Electric gantry cranes are used for unloading cargoes from ships and placing the supplies on cars. Immediately back of the docks are classification yards and warehouses. There is at present a covered storage capacity of 121,984 sq. ft. and open storage capacity of 262,170 sq. ft. The project is also served by large receiving, classification and departure yards, and engine terminals are connected with the Paris-Bordeaux line of the Paris-Orleans Railway. Of the 38.6 miles of trackage planned 32.9 miles have been constructed, with complete engine facilities.

### American Lines of Communication

A "line of communication," in military parlance, is not, of course, a line of railway, but a route which is kept open to the rear of the army over which orders, intelligence and supplies of all kinds may be brought up. The general headquarters of our Expeditionary Forces have been located at Chaumont, in eastern France—a name which was jealously and successfully guarded until the armistice was signed. The headquarters of the "S. O. S."—Service of Supply—which includes the Transportation Corps, are located at Tours, about one-third of the distance from St. Nazaire and Bordeaux to Chaumont.

The first line of communication of our forces, as finally developed, ran from the St. Nazaire, or Loire River group of ports and the Bordeaux, or Gironde River group of ports, over the Paris-Orleans Railway to Bourges, and thence over the Paris, Lyons and Mediterranean Railway via Marcy, Allerey and Is-Sur-Tille to Liffol Le Grand. Under the plans originally adopted this line of communication was to be used exclusively until the tonnage handled exceeded 25,000 tons daily.

Then a second line of communication was to be opened, which was the same as the first to Bourges, from whence it passed through Etais, Larouge and Neufchateau to Liffol Le Grand. When these two lines of communication were handling a total of 40,000 tons daily, a third line was to be opened from Tours via Orleans and Troyes to Neufchateau.

When the first three lines of communication were handling 50,000 tons a day still a fourth line was to be opened from Brest on the western coast via Versailles, Paris, Connate and Bar Le Duc to Liffol Le Grand; from the Bordeaux Group of ports over a line of railways to Tours not used by the first line of communication, and from Toulon on the Mediterranean to a connection with the first line of communication at Tours. With these four lines of communication it would have been possible to have handled 101,000 tons daily, and the plans which were being carried out contemplated the full opening of all these lines by June, 1919.

As a matter of fact, a large majority of the supplies for our forces were being handled over the first and second lines of communication when the armistice was signed, although the two lines of communication which had not been fully developed were being used to a substantial extent.

The development of a line of communication involved a great deal more than the mere provision of port and railway facilities. As already indicated, General Pershing required base (or port) storage for 45 days' supplies, intermediate

storage for 30 days' supplies, and advance (or regulating) storage for 15 days' supplies. This made it necessary to construct vast storage warehouses, and railway yards for taking supplies in and out of them, along the various lines of communication.

### The Development of Storage Facilities

Base storage was provided at Montoir, St. Sulpice, St. Luce, Nantes, Donges, St. Pardon, St. Loubes, Miramas, Blaye Furt and Aigrefeuille. Intermediate storage was provided at Gievres, Montierchaume, and Nevers. Advance, or regulating, depots for general supplies, were provided at Is-Sur-Tille, Liffol Le Grand, and Tavaux. Ammunition depots were provided at Donges (near St. Nazaire), Mehun, Issoudin and Les Cors (all near Bourges) and St. Loubes (near Bordeaux).

The following data regarding the plans made for storage depots at certain places, and the extent to which they had been carried out, will give some idea of the magnitude of this part of the undertaking:

#### Port (or Base) Storage Projects

*Montoir (Near St. Nazaire).*—Projected to receive general cargo from a proposed pier. Plans called for receiving, classification, departure and storage yards, covered and open storage, locomotive terminal for watering, coaling and making light repairs.

Trackage planned for 230 miles, of which 125 was built when the armistice was signed.

Covered storage planned, 4,215,000 sq. ft., of which 1,786,000 sq. ft. was finished.

Open storage planned, 9,812,000 sq. ft., of which 6,926,000 sq. ft. had been provided with tracks.

All engine terminal facilities finished.

*St. Sulpice (In Bordeaux District).*—Plans called for 146 miles of track, of which 91 were completed. Plans called for 3,263,000 sq. ft. of covered storage, of which 2,762,000 were completed. Plans called for 6,864,000 sq. ft. of open storage, of which tracks had been laid for 3,140,000 sq. ft.

#### Intermediate Storage (30 Days)

*Gievres.*—This place was on the first line of communication, and handled traffic from St. Nazaire, Nantes and La Rochelle; in the later stages of the war it also handled traffic from Brest. Plans called for 264 miles of track, of which 132 were completed; 4,419,000 sq. ft. covered storage, of which 3,553,000 had been completed, and 10,387,000 sq. ft. of open storage, of which tracks had been laid for 6,000,000 sq. ft. Engine terminal facilities had been completed and in operation for some time.

*Montierchaume.*—The intermediate storage facilities at this point served the same purpose on the railway line from Bordeaux that the storage facilities at Gievres served on the line from St. Nazaire. The plans called for 225 miles of yard trackage, of which 49 miles were finished; 4,079,000 sq. ft. covered storage, of which 1,123,000 sq. ft. were finished, and 9,600,000 sq. ft. of open storage, of which very little was in service, because of the relatively small amount of trackage that had been built.

#### Advance, or Regulating Storage

*Is-Sur-Tille.*—Plans were made here in conjunction with the French, and provided for complete engine facilities, and 95 miles of receiving and classification yards, all of which were completed. The plans also called for 1,847,000 sq. ft. covered storage, of which 1,355,000 sq. ft. had been completed, and 5,110,000 sq. ft. open storage, of which 4,186,000 sq. ft. had been provided with yard tracks. Is-Sur-Tille was the regulating station for the first line of communication, and also for traffic coming up from the Mediterranean ports.

*Lifjof Le Grand.*—This place provided advance storage for the second, third and fourth lines of communication, and could serve as a supplemental station for Is-Sur-Fille. The plans called for complete engine terminal facilities, which were 80 per cent complete; 72 miles of track, of which 42 miles had been built; 407,900 sq. ft. open storage, all of which was completed, and 1,144,000 sq. ft. of open storage, of which 584,000 sq. ft. were available.

One cannot contemplate the vast storage facilities provided without having forcibly brought home to him the fact that the nature of all the traffic handled was very different from that of most of the traffic handled on our railways in the United States, and that, therefore, while many of the methods used in handling it might be similar to those used in the United States, many other methods must be used which were different from those with which our railway men at home are familiar.

A fundamental point which must always be borne in mind is that our Transportation Department served only one shipper—viz., the American Expeditionary Forces—and that it handled only one kind of freight for it—viz., freight for military purposes. In consequence, of course, the determination of the order in which the various kinds of commodities should be moved forward, and the points to which they should be moved, was entirely in the hands of the army men; and there was but one thing to do with commodities which the army did not immediately need, and that was to put them in storage.

### The Transportation of Supplies

Ships carrying supplies came partly direct from the United States, and partly from England. During the later months of the year all ships from the United States moved in convoys, protected by cruisers and destroyers. The ships in a convoy were always in danger of being scattered by a storm or other cause; and therefore they always had a predetermined point of rendezvous. When they reached the rendezvous point notice of their arrival there was sent by wireless to Brest, together with information as to their contents. Admiral Wilson of the American Navy who was located at Brest then got into touch with the army Service of Supply, and ascertained where the Service of Supply wished the ships to be unloaded—whether at St. Nazaire, Bordeaux or elsewhere.

All convoys were required to come in sight of Brest, and on the arrival of a convoy there it was instructed regarding the port to which it was to go. Communication between the Service of Supply and Admiral Wilson was handled by one code; and between Admiral Wilson and the ships at sea by a different code; and the codes were changed daily. Therefore the enemy had little opportunity of picking up information regarding the movements of ships.

The storage depots in the zone of the advance—in other words, in the neighborhood of actual hostilities—are called "regulating" stations, because their current conditions and needs really determine the entire handling of supplies from day to day and month to month. As already indicated, the advance stations must have on hand 15 days' supplies of every kind at all times. As fast as their supplies are consumed they make requisition on the intermediate storage points; which, in turn, when they fall below 30 days' supplies, make requisition on the base storage points.

The disposition of a cargo when it arrives in port is determined entirely by its character, and by the supply situation as disclosed by the requisitions which have been made from the various storage points, all information regarding these matters being centralized at the headquarters of the Service of Supply at Tours. It may be, for example, that a regulating depot is getting very short of foodstuffs of certain kinds, and that a convoy arrives bearing a large quantity of these foodstuffs. The Transportation Corps, in that case, probably will make up solid trainloads of foodstuffs at the port of

debarcation and run them through to the regulating station.

Or, it may be that certain intermediate stations have fallen below their quota of certain kinds of supplies. In that case, the transportation department will move these kinds of supplies directly to them as fast as the ships bring them in. Of course, in the normal course of events, supplies go from the ships into base storage, and thence to intermediate and advance storage; and the transfers are ordinarily made in large shipments; but the normal course of any kind of events often is interrupted.

It is hardly necessary to say that the system which was in use when the armistice was signed was a result of a long series of developments, beginning with the entrance of the United States into the war. It was, in fact, something intermediate between that which was used immediately after the United States entered the war and that which it was planned to have developed and in use in June, 1919, if the war lasted until then. The tonnage actually unloaded at the various ports in November, 1918, was as follows:

Port	Tonnage	Per cent of total
Brest	67,611	7.34
St. Nazaire	193,846	21.03
Nantes	77,637	8.43
Bordeaux	236,563	25.69
Bayonne	13,268	1.44
Havre	43,529	4.73
Rouen	34,179	3.71
Cherbourg	715	.08
Marseille	99,866	10.84
La Pallice	82,185	8.92
Rochefort	60,085	6.52
La Sable De Sou	11,488	1.25
Total	920,971	100.00

### The Classification of Supplies Handled

The tonnage unloaded at the ports in November was divided among the various classes of supplies as follows:

Supplies	Tonnage	Per cent of total
Coal	207,644	22.55
Forage	68,154	7.40
Foods	177,791	19.30
Clothing	9,451	1.03
Oil	23,629	2.51
Other quartermasters' supplies	63,657	6.91
Transportation materials	89,721	9.74
Motor transportation	50,096	5.44
Engineering supplies	75,272	8.17
Ordnance	64,195	6.97
Medical	10,973	1.19
Signal Corps	3,114	.34
Air Service	9,166	1.00
Gas Service	2,883	.31
Troop property	993	.11
Red Cross	3,765	.40
Y. M. C. A.	2,148	.23
Naval	1,780	.19
Steel billets	54,379	5.91
Miscellaneous	3,161	.34
Totals	920,971	100.00

"Ordnance" in the above classification embraces munitions of all kinds; and it is a striking fact that ordnance constituted less than 7 per cent of the supplies transported. Of course, however, a vast work of transportation was carried on in the United States in handling the fuel and raw materials which were used in the manufacture of the ordnance which ultimately formed so small a part of the supplies unloaded and transported in France.

The tonnage handled in November—about 921,000 tons—was about one-third the approximately 3,030,000 tons per month which it was planned to be handling in June, 1919, when it was assumed the United States would have an army of 4,000,000 men in France. The capacity of the Channel ports for handling American supplies was to be increased from 3,000 tons to 8,000 daily; that of the Brest group, from 2,500 tons to 13,000 tons daily; that of the Loire River group (St. Nazaire, etc.), from 15,600 to 36,500 tons daily, with an increase from 31 to 65 berths for ships; that of the Gironde River group (Bordeaux, etc.), from 9,700 to 28,100 tons daily, with an increase from 22 to 34 berths for ships; and that of the Mediterranean group (Toulon, etc.), from

4,200 tons to 15,000 tons daily, with an increase from 18 to 27 in the number of berths for ships. To summarize, the number of berths for American ships was to be increased from 74 to 150, and the tonnage capacity of the ports from 35,000 tons to 101,000 tons.

### New Railway Facilities Provided

It would, of course, have been impossible to have handled the enormous amount of traffic for the American armies in the first year of our participation in the war, much less that which it was planned to handle in future, without an enormous increase in the capacity of the French railways. In order to increase the capacity of the part of the lines used and to be used by our transportation service, a large amount of new equipment was provided, and some important construction projects were carried out. Reference already has been made to the equipment provided. The new construction done included multiple track lines, cut-offs, locomotive and car shops, yards, terminals, etc.

The most important construction project carried out was the Nevers cut-off. Nevers is the junction point of the lines of the Paris, Lyons & Mediterranean Railway from Bourges, Chagny, Cosne and Moulins, and the lines through the city were very much congested. The French wished the Americans to relieve the congestion by building a large yard to the northeast of the city. Instead, they decided to build a cut-off which would render it unnecessary for American trains to pass through the congested city at all. The cut-off saves 8.6 track miles of haul for American traffic. It is a double-track railroad 5.5 miles long. Its construction necessitated about 162,000 cu. yd. of excavation, the placing of about 428,000 cu. yd. of embankment, and the construction of 900 lineal ft. of bridging. The work was started on February 20, 1918, and the line was put into service on October 19.

Another important piece of construction work was the addition of two main tracks to those of the already double-track line from Bourges to Pont Vert. A glance at the map will show that the railways from St. Nazaire and Bordeaux, which were used by the Americans as their first line of communication, converge at Pont Vert, and the line from there to Bourges

Rails Ready to Lay; Nevers Yards Looking West

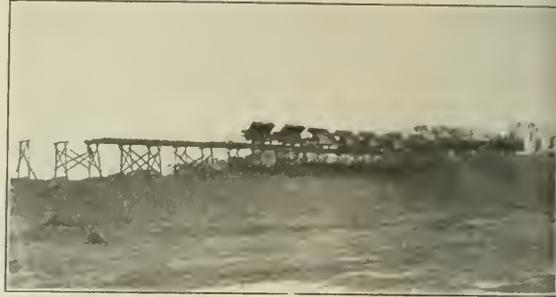

is the neck of the bottle. The additional two tracks built to enlarge this neck and relieve the congestion were 3.7 miles long.

Four main tracks were added to the two already running the five miles from St. Nazaire to Montoir, where as already shown, extensive base storage facilities were provided. Two new tracks—making four in all—were built from Montoir to Donges, which is an important ammunition storage point. From American Bassens (near Bordeaux), to the base storage plant at St. Sulpice, a distance of 6.5 miles, a third track was provided. A three-track line was provided through Nantes, where there had been only one line. Both the Etat (State) and Paris-Orleans Railway enter Nantes, but there had never

been a connection between them. The Americans built a wye connection from the Etat to the storage plant at St. Luce. They also built a wye connection between the lines entering Perigueaux to avoid unnecessary switching.

New engine terminals and yards had also to be provided at various places on the lines over which our trains operated, besides those at the storage points, which already have been mentioned. Saumur was the end of engine runs from Montoir on one line of railway and from La Rochelle and Rochefort on another. Facilities were provided here for handling 65 locomotives, including inspection, coaling, minor repairing, etc. Fifteen miles of yards were projected, of which 15 were finished.

Perigueaux was the end of the engine run from Bordeaux.

Cars Dumping off Trestle, Half-Mile West of Loire River; Nevers Cut-Off

The engine terminal plans here were the same as at Saumur. The plans had been 90 per cent carried out when the armistice was signed, and the terminal was in service.

The engine run eastward from Saumur was to Gievres, and the next run was to Marcy. The engine run eastward from Perigueaux was to Montierchaume. Complete engine facilities were planned for these points, and were practically complete. The American service was using French facilities at points farther along on the lines of communication, but it was planned to provide facilities for handling our locomotives at Etais, San Germain du Puy, Poincoin, Orleans, Troyes and Liffol Le Grand.

Besides providing facilities for taking care of both French and American equipment when it was in service, it was necessary for the American Transportation Department to provide shops for getting it ready to put into service after it was received in France. The erection of locomotives and cars from the United States and the repair of those of France and Belgium by our transportation forces were begun in December, 1917. From that time up to the middle of December, 1918, the shop troops erected 1,055 locomotives from the United States, 99 for the French, and inspected and overhauled 359 from Belgium. They had also repaired 1,423 French locomotives. Records for the same period showed that 14,302 cars from the United States and 975 from other sources were erected, and that 43,995 were repaired for the French.

### Locomotive Erection Shop at St. Nazaire

The large locomotive shop, where most of the work on locomotives is done, is at St. Nazaire. Locomotives for overseas shipment are erected and tested in the United States and then knocked down or partially knocked down for shipment. The knocked down locomotives are crated in sixteen boxes, the largest of which weighs 33,000 lb. The partially knocked down locomotives are complete except rods, cab, stack, piping and odd fittings.

Arrangements were made to rent ten locomotive emplacements in Shop No. 1 from the Societe Anonyme des Ateliers et Chantiers de la Loire, nine emplacements in Shop No. 2

from the Societe Anonyme des Chantiers et Ateliers de Saint Nazaire (Penhouet) and the necessary storage and shifting tracks, all the above being located on the Bassin de Penhouet at St. Nazaire.

The main storage tracks located at Shop No. 1 include 14,600 ft. of shifting and storage tracks and embrace 54,500 sq. ft. of locomotive box storage. At Shop No. 2 the yard includes only 2,080 ft. of track with no box storage, this yard being used principally for shifting.

The locomotive boxes are unloaded from the vessels by use of the French Titan cranes, loaded on flat cars and shifted to the locomotive box storage yard, unloaded by a

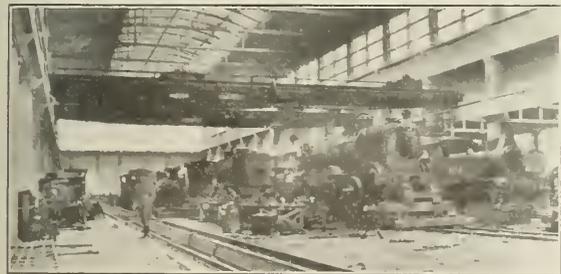

Locomotive Shops at Nevers

35-ton locomotive crane, and sorted out into complete locomotives, or held until the complete sixteen boxes are available. When sorted properly they are again loaded on flat cars, seven cars to a locomotive, and shifted either to Shop No. 1, close at hand, or Shop No. 2.

The locomotives under erection are handled in the French shops by two 100-ton electric cranes and are erected in proper sequence, that is, the drivers are placed, then the chassis, the boiler, etc., until the locomotive is completed and ready to be sent to Montoir engine facilities to be tested.

The first locomotive was turned out at St. Nazaire shops October 27, 1917. Since that time, up to and including December 12, 1918, 1,032 locomotives have been completed.

Repairing Locomotives at Nevers

This does not include 30 smaller type saddle tank locomotives completed at Rennes. The maximum daily output was obtained on September 6, when 14 locomotives were completed, this number consisting of seven partially erected type and seven knocked down type. The maximum weekly total was obtained during the week September 1 to 7, 1918, and was 69 locomotives. This number included 39 partially erected type and 29 knocked down type, and one saddle tank locomotive. The maximum monthly total was obtained in September, 1918, and was 215 locomotives, 77 partially erected, 137 knocked down, and one saddle tank.

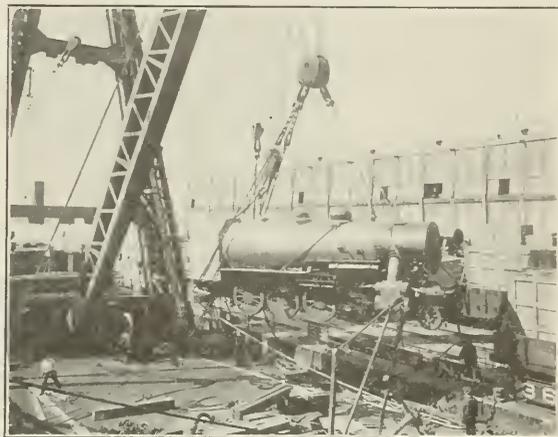

It is estimated that erecting shops No. 1 and No. 2 are capable of an output of 300 locomotives per month, 200

knocked down, and 100 partially erected. This capacity was never realized, due to the fact that the locomotives were not received from the States in sufficient numbers, or were held up in the ports.

When it was first proposed by the Transportation Department that locomotives should be shipped to Europe only partially knocked down, the Shipbuilding Board protested upon the ground that no ships were in existence which could stand up under the strain of such an immense concentrated load. But boats were found which would stand up; and as many as 12 to 15 partially knocked down locomotives, together with their tenders, have been shipped to Europe in a single ship. This method of shipment has saved time and labor on both sides of the Atlantic, but especially after the engines have arrived in Europe. Gantry cranes, which have been erected both at Bordeaux and St. Nazaire, have been used in transferring locomotives from the ships to the docks.

### Car Erecting Shops at La Rochelle

The large car erecting shops are at La Rochelle. These shops cover an approximate total area of 1,453,000 sq. ft. The buildings utilize an area of approximately 157,000 sq. ft. There are 34,325 ft., or about 6½ miles, of track, which include two sets of erecting tracks, four sets of un-

Hoisting Locomotive from Lighter to Ship

loading tracks, one locomotive and crane repair track and three tracks for painting.

An erecting set comprises six tracks spaced at 17 ft., 58 ft., 30 ft., 58 ft. and 17 ft. centers. The two outside tracks at each side are crane and unloading tracks. The two middle tracks are the erecting track and crane track. The erecting track is covered for its entire length of approximately 1,300 ft. and is divided into sections, according to the phases of construction, as follows: 200 ft., truck storage and erection; 450 ft., erecting and riveting; 180 ft., flooring; 300 ft. for side and end lining, and 220 ft. for roofing. The painting facilities consist of three tracks, each 1,000 ft. long, which were never covered as originally planned.

The 58 ft. intervals between tracks, at the first approach to the plant proper, are used for storage of car boxes, but further along the various buildings are placed in this space. The buildings included are the power house, offices, shop buildings, waste sheds, store houses, machine and blacksmith shops and quarters.

Car parts are received from the United States crated in 100-car lots. The crates are sorted and stored until the parts for a 100-car lot are on hand. Erection starts with the assembling of trucks, which are then moved along the track to

the erection position, where a frame, to which the outside fittings have been previously riveted, is placed on the trucks by two 15 ton locomotive cranes. The car then passes through the various phases of construction, each operation comprising a phase, being completed as nearly as possible at the same time, so that no delay occurs.

The first car was turned out at La Rochelle shop February 26, 1918. Since that time, up to and including December 11, 1918, 14,830 cars have been completed. The maximum daily output was obtained on September 26, 1918, when 150 cars were completed. The maximum weekly total was obtained during the week September 22 to 29, 1918, and was 700 cars. The maximum monthly total, obtained in September, 1918, was 2,370 cars. These totals include cars of all types, that is, flat, box, low and high side gondolas, refrigerator and Roger ballast cars.

Most of what has been said in the foregoing has related to the handling of supplies. This was, of course, very much the largest and most difficult service rendered by the Transportation Department. But the handling of troops was no small matter. About 70 per cent of our troops who came direct from the United States to France were disembarked at Brest, and taken over the Etat (State), Paris-Orleans, and Est (eastern) railways to the American front. But a clear majority of all our soldiers were not brought direct to France, but were transported from the United States to Great Britain in British ships, and thence forwarded to France. Large quantities of supplies were also shipped via this route, while other large quantities were obtained in Great Britain. This rendered it necessary to establish a branch of the Transportation Department in London; and this branch did a work of great importance.

Transportation Service Across Great Britain

Until February, 1918, there was no representation of the Transportation Corps in England, each supply officer arranging his own transportation.

Early in February the Army Transport Service established an office under the direction of Captain R. C. Stone, as acting superintendent. Captain Stone formerly represented J. H. W. Steel Company, at Galveston. Later in February, Captain, and now Major, Walter S. Franklin, formerly assistant general freight agent of the Pennsylvania Railroad, was sent from France to represent the Director General of Transportation in England, with an office in the British War Office under the Director of Movements, acting as liaison officer in connection with the movement of supplies and troops. Early in March, First Lieut. George R. Williams, formerly traffic manager of Chase & Company, Jacksonville, Florida, was placed in charge of the rail movement of supplies.

These three officers, with the addition of certain other officers at the ports, carried on the movement of troops and supplies until the arrival of Colonel M. C. Kennedy, Deputy Director General of Transportation, in May. Colonel Kennedy was formerly president of the Cumberland Valley Railroad. In July, First Lieut. Clarence T. Mackenson, Jr., formerly division freight agent of the Pennsylvania Railroad at Altoona, was assigned to duty in connection with the movement of troops.

The accompanying tables show the monthly movement of troops and of supplies through the various British ports. At the port of London two large sheds were used in Royal Albert dock and in addition to these sheds, vessels were loaded in the Thames, as well as at Batavier Wharf. Many of the ships were very small, but were the best obtainable under the circumstances. During the summer and fall there were, on an average, three or four ships loaded from the port of London per week.

The other principal freight port was Swansea, where a large shed was taken over, with additional open storage space

(b) Devonport.

in the immediate neighborhood; and other sheds were used as required. Certain other ports were used for particular cargoes that were assembled from points that were adjacent to these ports. Cardiff and Barry were used principally for coal, with deck loads of motor trucks, water carts, etc.

From the first part of August until the cessation of hostilities there were approximately 100 vessels employed exclusively in the transport of American supplies and coal from England to France. The vessels sailing from the port of London discharged at Havre and Rouen, and those from the Bristol Channel ports at the Western coast ports of France.

In the case of the freight movement, as soon as the Railway Transport Office ascertained to what port the freight should be forwarded, the embarkation officer at the port was notified to call forward the freight from the manufacturer and issue the necessary permission for the railways to accept the tonnage. The co-operation received from the various British officers controlling the railway movement, as well as the railway officials, has been excellent.

### Moving Troops from Britain to France

The main troop movement was through the Port of Liverpool, although a large number of troops were debarked at Glasgow, London and Southampton, also a number at Bristol Channel ports.

Three ports of embarkation were used from England to France, namely, Southampton, Folkestone and Dover. From these ports troops were carried to Cherbourg, Havre and Calais. With the exception of troops for training with the British or to be brigaded with the British, the entire movement was made through Southampton, the larger proportion being moved to Havre. Four American ships were placed in the cross-channel trade from Southampton to Havre to carry American troops. These vessels were pooled with the British ships in order to be used to the greatest possible advantage.

When a troop convoy left America for Great Britain, a cable giving the date of departure, and the number and character of troops on board each ship, was despatched by the War Department through the Navy to Admiral Sims, who delivered this information to the liaison officer at the British War Office, under whose direction the troops were distributed to American rest camps in England. What was known as a "Convoy notice" was issued by the War Office to the various parties interested, giving the distribution of the troops. Train times on the British railways were worked out in accordance with the various railway requirements, and the troops moved through under the direction of the British embarkation and railway officials. After arrival at the various American rest camps, the troops were called forward by the American embarkation officer at Southampton in as large

at Winchester. Later, a portion of the British camp at Southampton was turned over and then a camp at Romsey was constructed for the use of the Americans. Some smaller camps were later built in the immediate vicinity of Winchester and in the fall of 1918 the hutted camp at Codford was taken over. In the spring of 1918 a camp was erected at Knotty Ash, Liverpool, in order to relieve the congestion occurring at that point when a large convoy arrived. This camp was of great assistance in promptly unloading vessels and in reducing the large number of trains which had to be moved immediately on arrival of a convoy.

The capacity of the camps was as follows: Knotty Ash, Liverpool, 10,000; Winchester, 10,000; Standon, 3,000; Remsey, 7,000; Codford, 10,000; and Southampton, 5,000.

Convoys of troops arriving in England varied from 5,000 to 30,000 per day. During the months of June, July, August and September, 1918, an average of approximately 160,000 troops a month were debarked at various ports in England, moved through into the rest camps in England and again called forward and embarked for France. The movement of this large number of troops and accompanying baggage required very careful planning. The average stay of troops in England was only from three to four days. Often 60 to 80 special trains had to be run to handle a convoy of troops.

In addition to the transient troops there were in training in England approximately 20,000 American aviation troops, who required moving from point to point, and to whom supplies had constantly to be moved.

Too much praise cannot be given to the Director of Movements, British War Office, and the various railway and other officials acting under his direction, who actually arranged the details of the movement of American troops and supplies through England. There was never any complaint or suggestion which was brought to their attention that did not receive careful consideration, and in many instances they willingly changed their old-established methods when shown that by other methods a quicker movement or a saving could be made. Brigadier-General O. H. Delano-Osborne, Colonel B. Way, and Captain P. Eardley-Wilmot were largely responsible for the spirit of co-operation which prevailed throughout their entire department.

From the accompanying table giving the details regarding the debarkation of United States troops in Great Britain it will be noted that the total number of officers transported across Great Britain from May 18, 1917, to November 24, 1918, was 45,603; men, 974,297; nurses, 7,274. The increase in the movement after April, 1918, as disclosed by the figures, was extraordinary. Of the total of 1,027,174 officers, men and nurses transported across Great Britain in the 18 months covered, 822,059, or 80 per cent, were handled in the six months, May to October, inclusive.

numbers as the space that could be secured on the cross-channel transports would permit.

At Dover and Folkestone the rest camps were large enough to accommodate the number of troops moving through these ports, so that the troops were moved directly from the port of debarkation to the port of embarkation, and there embarked as fast as they could be accepted in France.

The first rest camp turned over to the American army was

### Army Transport Service

It will be seen from the foregoing that the Transportation Corps was not concerned solely with railway operation, but that it also had control of an extensive water service from Great Britain to France. Besides this, it conducted, during the later stages of the war, an important inland waterway service. The Director of the Army Transport Service, who was on the staff of the Director General of Transportation,

supervised the operation and maintenance of all port terminals under American control, the movement of ocean tonnage between the port terminals of the American Expeditionary Forces and England and other European countries; and also the operation of inland waterway transport routes under American control.

Quite an extensive inland waterway service was operated from Le Havre clear across France to the American front. The cargo of ships arriving at Le Havre was partly unloaded into barges there. The ships were then moved down to Rouen, a port with a shallower channel, where the rest of their cargo was unloaded into other barges. The barges were towed down the Seine river by tugs until the canal system was reached, after which they were towed by horses. It takes about six weeks to move freight in this way from Le Havre to Chaumont.

Needless to say, this route has been used chiefly for the transportation of coal and other commodities not requiring rapid movement. The size to which the traffic over this route had grown is indicated by the fact that in November 210 barges, carrying 295,467 tons of freight, were dispatched over it. Of this freight 206,282 tons were loaded at Le Havre, 87,281 at Rouen, and 1,354 tons at Paris.

### Problems of Organization

It is much easier now to present a statement of the things that have been done by our transportation forces in France than it is to give an adequate idea of the difficulties that have had to be overcome in accomplishing them. The difficulties encountered have been of many kinds, but probably the most formidable have been those of organization. The transportation department had to operate over foreign railways; it had to be fitted into, and to meet the requirements of the American army; and these two things caused many difficulties and some heart burnings.

### Relations with French Railways

The French system of handling railway rolling stock and trains differs sharply from American practice. In America the movement of all trains, passenger and freight, regular and extra, over a division, is subject to the centralized control of a train dispatcher, while control of the distribution of cars is centralized in the superintendent of transportation. In France, on the other hand, the movement of trains and distribution of cars are subject to the highly decentralized control of numerous chefs-de-gare. The French chef-de-gare system has been lucidly described by Lieut.-Col. Frederic A. Delano, Deputy Director General of Transportation, in a special report, which was published in the *Railway Age* for November 8, page 823.

As Col. Delano says, the chef-de-gare "is a good deal more than our station agent, even though the position of station agent or local agent in some of our large stations in America is not infrequently very important. Under French methods of operation, the chef-de-gare not only is in complete charge of all operations within the limits of his station, including distribution of cars and movement of trains, but a through train having arrived at the station may not pass out of it without his authority."

The American transportation department created a central car office to record, trace and control the movements of American cars in accordance with American practice. This office and its method of working were an object of much curiosity and interest to French railway men.

It was not possible similarly to solve the problem of train movement by the introduction of American practice. The American supply trains, and French trains manned by American railway soldiers, had to be run over the same tracks as French trains manned by French railway men.

The American practice of operating trains by means of train dispatching and the block system was incompatible

with the French practice of giving the chef-de-gare absolute authority over all trains within his territory, and of holding trains at one station until word had been telegraphed that trains on the same track had left the next station ahead. Since the chef-de-gare system was in possession, and since the French railway authorities would not set it aside or modify it, it was necessary for the American transportation department to conform to it. In consequence, it was necessary to give all American train service soldiers 30 days' training in French railway operating practice under the direction of French railway employees before they could be allowed to take trains out by themselves.

This was not the worst feature of the undiluted retention of the chef-de-gare system. As Col. Delano pointed out, it has placed a serious limitation upon the transportation capacity of the lines used at a time when increased capacity has been vitally needed. There have been negotiations between the American and French transportation officers looking to the adoption of a better system, but they have come to nothing.

When the war began the French War Department placed an official called the "Commissaire Militaire" in the office of each chef-de-gare to deal with and, indeed, direct him regarding transportation for military purposes. For a similar purpose the American transportation department created an officer unknown to railway practice in the United States—the "Railway Transport Officer." An officer having this title was placed in the office of each chef-de-gare on the principal American lines of communication, his principal task apparently being to prevent the French functionary from interfering unduly with the handling of American trains and freight cars. The term "Railway Transport Officer" was borrowed from the British, who give the title to many men dealing with the railways regarding military matters.

As Col. Delano pointed out, there are many single track lines in the United States which handle more trains with our despatching and block signal system than can be handled on double track lines in France under the chef-de-gare system. The need for increased capacity on the French railways used by our lines of communication was so great that it is probable if the war had continued much longer the American practice of operating trains with the despatching and the block systems would have had to be superimposed in some way upon the chef-de-gare system.

In justice to the chef-de-gare system, however, it must be said that, inefficient as it seems to the American railway mind, the French were operating many of the fastest trains in the world under it before the war, with a record for safety which put the record of American railways to shame.

### No Adequate Study of Military Transportation

The most difficult problem with which those concerned with the conducting of transportation for the American forces in France have had to struggle has been that of effecting satisfactory and efficient working relations between the railway transportation service in the rear of the advance zone and other branches of the American Expeditionary Forces. It has been clearly recognized ever since the American Civil War, and especially since the Franco-Prussian War, that railway transportation must play a part of great and growing importance in modern war.

The War Department of the United States has a War College which has been maintained for the study and theoretical solution of the problems that arise in warfare.

Apparently, however, it never occurred to anybody in authority in our army or War Department to give any attention to the subject of modern military transportation. The Great War had been in progress in Europe two and a half years when we entered it: the railways of the contraband countries had been organized and reorganized repeatedly to meet the various and changing military requirements imposed upon

hem; but if anybody in the War Department, or the regular army, or even in the army engineer corps, of the United States had carefully observed, reflected upon and drawn definite conclusions from what had been done with respect to transportation during the war in Europe, he has never let anybody know it.

Some years ago Brigadier-General (then Major) Connors, wrote a "Manual of Military Railways." General Connors, as a young man, was an employee of the Chicago and North Western at Clinton, Iowa, before he went to West Point Military Academy. He had always taken a keen and intelligent interest in railway operation. He had studied all that had

Locomotive Repair Shop at Nevers

been done in the operation of military railways up to the time this book was written. But he recognized more clearly than anybody else, perhaps, that his book was completely out of date within a few months after the Great War began; and yet, his book was the only authoritative thing our War Department had on the subject of the organization and operation of military railways.

That serious mistakes were made and friction resulted in dealing with the problem of military transportation after we entered the war is not, therefore, very surprising.

#### Early Organization Based Upon False Assumptions

When we entered the war our military authorities proceeded upon an assumption derived from the experience of the Civil War and the Franco-Prussian war—viz., that military railways were to be used solely for fighting purposes; that the operation of military railways was constantly an operation of movement, and that as fast as railways which had been used for military purposes were left behind the zone of actual hostilities, they would be turned back to purely civil operation. They, therefore, made the Transportation Department a branch of the Corps of Engineers, and organized the railway troops sent to Europe into engineer regiments, with regular army officers as Colonels.

If the basic assumption that military railways were to be used solely for fighting purposes had been correct this regimental organization might have served very well. General Pershing had not been long in Europe, however, when he became convinced that it was incorrect. As already indicated in July, 1917, he appointed Col. (then Major) Wilgus to his immediate staff as Director of Military Railways. Col. Wilgus and the other members of the original American railway commission to Europe had studied and reported to General Pershing upon the transportation organization and methods used by the British and French, especially the former; and in September, 1917, General Pershing cabled to America that the best experience showed that transportation should be handled by a separate corps officered by men thoroughly versed in the commercial operation of railways. The great

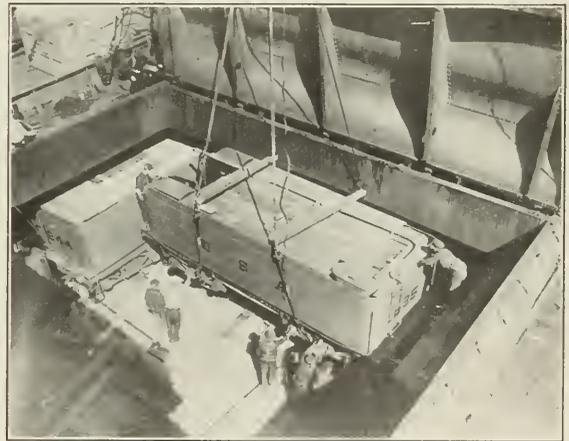

importance, under modern conditions, of military railways in handling supplies in the zone of the rear, as compared with their importance in aiding in carrying on hostilities in the zone of the advance, was being grasped by General Pershing.

When General Atterbury arrived in October he was made, as Col. Wilgus had been, a direct staff officer of General Pershing. The Transportation Department at that time had charge of all railway operation, and of all construction incidental to it; and it was still, theoretically, a part of the Engineer Corps. There were then nine American railway regiments in Europe, of which three had been assigned to the British, and one to the French. The members of these railway regiments were among the first American soldiers to arrive, there being only about 20,000 Americans in Europe, in July.

In the early fall a regular schedule for the movement of troops to Europe was worked out, which called for 1,200,000 men, of whom only 20,000 were to be railway troops. None of these additional railway troops had arrived in December, but they had begun to be sorely needed.

The situation with respect to the condition of freight cars had become very acute on the French railways. No cars from America were then being erected in France; and counting all cars, old and new, including those derived from Great Britain and Spain, the total cars that could be kept in service was declining. The condition of locomotives was remaining about stationary, but was far below the pre-war standard.

The French asked the Americans to furnish them 6,000 men about equally divided between locomotive repair and car repair workers. The 35th Engineer Regiment, which was then being organized for a car repair unit was expedited, and by taking from the cantonments in the United States all the suitable men that could be obtained there were secured about 500 more. Thus, by January, of the 6,000 men for which the French had asked, about 2,000 had been supplied. Mean-

Locomotive Tenders in Hold of Ship

time, none of the railway troops which had been asked for some months before had been received.

Under the defective draft system adopted in the United States no special provision was made for securing special men for the Transportation Department. Railway men were drafted into the ordinary army military units, and once they were in it was very hard to find them and get them out.

#### First Important Reorganization

Up to February, 1918, the Department of Transportation had under it railways, light railways, roads and inland water transportation, and the Director General of Transportation

was on the staff of the commander-in-chief. Then an important reorganization was effected. The Service of Supply was created, with a commanding general in charge. Within the Service of Supply was created a Service of Utilities, and this was divided into a Department of Construction and Forestry, and a Department of Transportation. All railway construction was taken from the Transportation Department and turned over to the Department of Construction and Forestry, leaving to the Transportation Department only the authority of designing the structures it wanted built.

### Army Transport Service Transferred

In April the Army Transport Service, which had always been a branch of the Quartermaster Department, had been transferred to the Transportation Department. This did not lighten the burden of the Transportation Department, in one way since the Army Transport Service had a deplorably insufficient and disorganized force of stevedores at the ports. It was a move in the right direction, however, because it put the entire transportation of supplies, from the time ships reached their rendezvous, under a single organization.

The Transportation Department then had four branches, those of operation, construction (design), army transport service (water) and business management (including accounting, treasury and similar functions).

The entire situation was then extremely unsatisfactory. There were at that time about 15,000 railway men in France, most of them engaged in ordinary railway operation. They were, however, all organized on a regimental basis. Now, a regiment, whether an engineer regiment of 1,500 men, or an infantry regiment of 3,000, will seldom fit into ordinary railway operation anywhere. In consequence, it was necessary to break up the regiments and assign the companies composing them where they were most needed. As *railway* workers, the men, the "non-coms" and the junior officers were subject to the orders of the *railway* men in direct charge of their work. As *soldiers*, on the other hand, they were subject to the control and discipline of their colonels and other *military* officers, who in many cases were in remote parts of the country. For a time there was not even in General Atterbury's office a personnel officer, who could centralize the handling of the personnel matters of the department from a military point of view. It is hardly necessary to say that, with the Transportation Department cut off from light railways, compelled to go to the Department of Construction and Forestry to get its construction work done, etc., the situation was unsatisfactory from its point of view.

Meantime, the establishment of an independent and permanent Transportation Corps, ranking with the other corps of the regular army, was mooted. In July the so-called "Service of Utilities" died. The "Transportation Department" was changed to the "Transportation Service," reporting direct to the Service of Supply; construction and forestry were made a branch of the Engineer Corps; and a special department of light railways and roads was established at general headquarters at Chaumont. At the same time a schedule for 4,000,000 American soldiers in France was worked out. The Transportation Department reported that this should include 150,000 railway men; but the general staff cut this estimate 20 per cent.

In April there were 270,000 American troops in France; and in June there were 1,300,000. Railway troops had not been arriving in anything approaching sufficient numbers, since it was estimated that 60,000 were needed for every 1,000,000 troops. In July and August alone, however, about 15,000 railway troops were received. This created much confusion. They could not be used immediately since, as already indicated, it takes about 30 days to teach each man enough about French operating rules and methods to put him in service; and it is impracticable to take out of the service enough of the men who were already in service to train them.

By September 15, however, enough men had been trained to enable the Transportation Department to begin operating through trains, yards and terminals from St. Nazaire to the advance zone at Is-Sur-Tille. Previously our railway men had been engaged in running American trains for shorter distances, and in helping the French operate trains, yards and terminals.

### Another Important Reorganization

Some time previously Major E. G. Bliss, an able, young regular army man and son of Gen. Tasker H. Bliss, was appointed personnel officer of the Transportation Service, with the title of Director of Military Railway Service. He and Capt. Baker worked out a plan for militarizing the railways in a way that would enable them better to perform their transportation function, and which at the same time would fit them better into the purely military organization. They proposed to create a "Transportation Corps" in the Service of Supply, in place of a mere "Transportation Service." They estimated that an organization to handle all American transportation when the Expeditionary Forces had increased to 4,000,000 should contain 6,669 officers and 187,150 enlisted men. This was to be distributed between 30 railway divisions, 15 grand divisions, and 30 ports. They opposed continuance of the regimental form of organization, and recommended distribution of the railway troops in companies which should be under the discipline and command of their railway superiors as to military as well as railway matters. This recommendation was approved in principle in September.

Soon after another important development occurred. Col. J. A. McCrea, formerly general manager of the Long Island Railroad, had been general manager of the Transportation Service. On October 1 he was made Deputy Director General of Transportation in the zone of the advance; and soon after General Pershing wired General Atterbury that he would expect him to be responsible for the efficient operation of the railways in the American lines of communication to the Rhine. Up to this time the Transportation Service (or Corps) had had jurisdiction only to the advance regulating storage stations at Is-Sur-Tille and Liffol Le Grand. An impenetrable veil had been drawn there, and all transportation in the zone of hostilities had been handled from general headquarters at Chaumont.

### The New Transportation Corps

The results of these various changes in organization were summarized in General Order No. 52, issued by Major General Harbord, commanding general of the Service of Supply, on November 12, and in General Order No. 35, issued by Brigadier-General Atterbury, Director General of Transportation on the same date. These orders well merit reading, and even study, as they crystallized the best thought of many of those who had given the most consideration to the subject of what the organization of a system of military railways operating under the conditions of modern war should be.

In General Order No. 52 General Harbord said in part:

1. Under instructions of Commander-in-Chief, American E. F., the Transportation Corps of the American E. F. will be re-organized by the Director General of Transportation.
2. The railway lines of communication of the American E. F. will be divided into grand divisions under the command of a general superintendent who will be assisted by an adjutant, a supply officer, a personnel adjutant, and such other administrative and technical staff as may be necessary. The general superintendent will act as commanding officer of all railway troops assigned to his grand division. His duties in this connection will be the same as those prescribed in army regulations for a regimental commander.
3. The railway grand divisions will be sub-divided into railway divisions, each division to be commanded by a division superintendent who will be directly responsible to the general superintendent of the railway grand division for the technical and the military efficiency of the troops under his command. The division superintendent will be assigned such technical and administrative staff as may be necessary by the general superintendent.
4. The large railroad shops located at Nevers, La Rochelle and St. Nazaire will be considered, so far as organization is concerned, as equivalent to a railway grand division. In each of these shops the superin-

end will be the commanding officer of all transportation corps troops and individuals assigned thereto, and will be assisted by an administrative staff as provided above for a general superintendent of a railway grand division, and such technical staff as may be necessary.

5. Each part will be considered as analogous to a railway grand division so far as organization is concerned. The general superintendent of the port will be the commanding officer of all transportation corps troops and individuals assigned thereto, and will be assisted by an administrative staff as provided above for a general superintendent of a railway grand division, and such technical staff as may be necessary.

6. All transportation corps troops engaged in the Inland Water Transport Service will form a military unit under the command of the Chief of Inland Water Transport Service. The duties of the Chief of Inland Water Transport Service will be the same as those prescribed for a general superintendent of a railway grand division. He will be assisted by an administrative staff as provided above for a general superintendent of a railway grand division, and such technical staff as may be necessary.

7. The transportation corps will consist of transportation corps com-

Pile Driver Over Loire River; Nevers Cut-Off

panies (railway) to be numbered serially, beginning with No. 1; transportation corps companies' stevedore to be numbered serially, beginning with No. 801, and a transportation corps at large. The companies will be assigned to station and duties by the director general of transportation in accordance with the needs of his service.

8. A transportation corps company (railway) will consist of the following:

Captain .....	1
1st Lieutenants .....	2
2nd Lieutenants .....	3
<hr/>	
Total commissioned .....	6
1st Sergeant .....	1
Sergeants 1st Class .....	4
Supply Sergeant .....	1
Mess Sergeant .....	1
Sergeants .....	11
Corporals .....	20
Cooks .....	5
Mechanics .....	7
Buglers .....	2
Privates 1st Class .....	66
Privates .....	132
<hr/>	
Total enlisted .....	250

9. A transportation corps company (stevedore) will consist of the following:

Captain .....	1
1st Lieutenant .....	1
2nd Lieutenant .....	1
<hr/>	
Total commissioned .....	3
1st Sergeant .....	1
Mess Sergeant .....	1
Supply Sergeant .....	1
Sergeants .....	6
Corporals .....	12
Cooks .....	5
Mechanics .....	5
Buglers .....	2
Privates 1st Class .....	72
Privates .....	145
<hr/>	
Total enlisted .....	250

10. A transportation corps at large is authorized to be composed of the following enlisted grades:

M. E. S. G. ....	400
M. E. J. G. ....	600
R. S. Maj. ....	20
B. S. Maj. ....	40
Sgts. 1st-cl. ....	840
Sergeants .....	800
Corporals .....	800
Cooks .....	50
Mechanics .....	100
Privates 1st-cl. ....	1000
Privates .....	1000

11. Officers not assigned to organizations will be considered as belonging to the transportation corps at large, and will be assigned to duties under the direction of the director general of transportation.

12. The present regiments and battalions, t. c., will be abolished, and their personnel will be organized into companies.

13. The enlisted men of regimental headquarters and battalion headquarters who cannot be provided for in the reorganization of the companies will be transferred to the transportation corps at large, and will be carried as headquarters detachments at their present stations.

As new regiments, battalions or other organizations arrive in France and are assigned to the transportation corps they will be transferred and reorganized as outlined herein upon request of the director general of transportation.

General Order No. 35, issued by General Atterbury, was in part as follows:

HEADQUARTERS ORGANIZATIONS

The operation and maintenance of all broad gage railroads under American control; the operation and maintenance of ocean terminals and docks and appurtenances thereto; the operation of inland waterway routes and appurtenances thereto and the erection and maintenance of floating equipment, motive power and rolling stock for the American Transportation Service will be under the direction of the director general transportation. The Director General Transportation will be assisted by the following staff:

- (a) Deputy Directors General Transportation (personal staff). Such number as may be necessary.
- (b) Deputy D. G. T. Railway Department of the Service of Supply.
- (c) Deputy D. G. T. Railway Department of the Zone of Advance.
- (d) Deputy D. G. T. with the French Ministry.
- (e) Deputy D. G. T. with the C. G. Base No. 3.
- (f) Director of Army Transport Service.
- (g) Engineer of Construction.
- (h) Business Manager.
- (i) Director Military Affairs.

Deputy Directors General Transportation (personal staff) will be the personal representatives of the Director General Transportation. The senior deputy at headquarters will act for the Director General Transportation in his absence.

The Deputy Director General Transportation for the Railway Department, S. O. S., will, under the direction of the D. G. T., supervise the operation and maintenance of all broad gage lines under American control between the port terminals and the zone of advance, including equipment and structures, and will perform such other duties as may be delegated by the D. G. T. The headquarters of the deputy director for the railway department, S. O. S., will be as stated in paragraph 2.

The General Manager for the Railway Department, S. O. S., will be responsible, subject to the supervision of the deputy director general transportation, S. O. S., for the performance of such duties connected with the actual operation and maintenance of the lines of railway, equipment and

Steam Shovel (2½ yd.) Loading Dump Cars; Nevers Cut-Off

structures referred to in paragraph-6, as may be assigned to him. He will be assisted by:

- (a) Assistant general managers.
- (b) General superintendent motive power.
- (c) General superintendent transportation.
- (d) General superintendent telegraph and telephone.
- (e) Engineer maintenance of way.
- (f) General superintendents.
- (g) Signal engineer.

The Deputy Director General Transportation, Zone of the Advance, will be charged with duties and have an organization of the S. O. S., and in addition an assistant deputy director general transportation for each American field army, whose duties will be outlined by the deputy director general transportation, zone of advance. His jurisdiction shall comprise such broad gage lines of railway as may be turned over to the transportation corps, American E. F., for operation and maintenance in the zone of the advance. The headquarters of the deputy director general transportation for the zone of the advance will be general headquarters, American E. F.

The Deputy Director General Transportation with the Ministre des Travaux Publics et des Transports will be stationed at Paris. He will represent the D. G. T., in the transaction of business between the transportation corps and the French ministry.

The Deputy Director General Transportation with the D. G. T., Base No. 3, will be stationed at London. He will perform such duties as representative of the D. G. T. as may be assigned to him.

The *Deputy Army Transport Service* will under the direction of the D. G. T. supervise the operation of all port terminals under American control, including the handling of ships and all floating plant and the transfer and delivery of supplies to the railway transportation service or to stores; the operation of inland water transport routes under American control; the movement of ocean tonnage between the port terminals of the American E. F. and England and other European countries; the distribution of shipping to the various ports of the A. E. F.; the maintenance of all port and inland waterway terminal facilities under American control, including survey equipment and such rolling stock and motive power as may be required to a port terminal operation. He will be assisted by the following staff:

- (a) Deputy director A. T. S.
- (b) Executive officer.
- (c) General inspector.
- (d) Chief of European service division.
- (e) Chief of inland water transport service.
- (f) Chief troop and cargo division.
- (g) Chief terminal facilities division.
- (h) Chief marine engineer.
- (i) Chief operation division.
- (j) Chief lighterage and harbor craft division.
- (k) General superintendents and superintendents at port.

The *Engineer of Construction* will be responsible for survey, design and inspection to insure construction according to specification of all new lines of railway (broad gage), terminals, docks, shops, buildings and other structures, connected with the transportation service of the American E. F.

The *Business Manager* will be responsible for the procurement of supplies for the transportation corps, American E. F.; for the keeping of accounts; for the compilation of all statistics affecting transportation, and for the duties pertinent thereto and incidental therewith.

The *Director of Military Affairs* will be responsible for the military organization of the transportation corps, American E. F., as a whole; for the procurement and assignment of personnel, and for the keeping of such records as may be required by military authority. He shall establish and maintain liaison on military questions with the general staff and with other staff departments, and is charged with the co-ordination of the various departments of the transportation corps on military matters.

#### TERRITORIAL BOUNDARIES

##### Geographical:

The line of demarcation between the railway department for the S. O. S., and the railway department for the zone of advance, will be established by agreement between the deputy directors general transportation for the respective zones, and may be changed from time to time to meet the needs of the service, subject to the approval of the director general transportation.

The line of demarcation between the port terminals and the contiguous railway grand divisions will be established by the director army transport service and the deputy director general transportation, S. O. S., and may be changed from time to time to meet the needs of the service, subject to the approval of the director general transportation. Nothing in this provision shall be construed as nullifying existing arrangements established pursuant to General Orders 31, Headquarters Transportation Service.

##### Railway Lines:

The railway lines in the zone of the S. O. S. will be divided into grand divisions as follows:

St. Nazaire and LaRochelle to Gievres.
Gievres to Issur-Tille.
Bordeaux to Vierzon and Bourges.
Brest to Tours.
Toulon and Marseilles to Chagny.
Tours to Sens and Cosne to Chatillon.

No designation of grand divisions will be made at this time for the zone of the advance, except that all lines radiating from Issur-Tille, north and east will be considered as one grand division.

##### Port Terminals:

The following designation of port terminals is hereby made.

Le Havre and Rouen.
Brest (group).
St. Nazaire.
Nantes (group).
La Pallice and Rochefort.
Bordeaux (group).
Marseilles (group).
London, England (group).

The organization of the transportation corps will be effected as prescribed in General Orders 52, Headquarters, S. O. S., by the commanding officers of the existing transportation corps regiments or the commanding officers stevedore troops, as the case may be, subject to the general supervision of the general superintendent of the railway grand division, port terminal, chief inland water transport service, or the superintendent of the shop, as the case may be, in which the troops are located. The companies thus organized will be reported to the general superintendents, and superintendents of shops and chief inland water transport service. Rosters will immediately be prepared of the individual companies and forwarded to these headquarters. The company will constitute the unit for administration and record.

The general superintendent of a railway grand division, port terminal, chief inland water transport service or superintendent of a shop, will upon the completion of the reorganization, become the actual commanding officer of all transportation corps troops stationed within the territorial limits of his jurisdiction. His staff will consist of an adjutant, to be chosen from the officers under his command and of no higher rank than major; a supply officer, of rank of captain, and a personnel adjutant, of rank of captain.

General superintendents of railway grand divisions, port terminals, and chief of inland water transport service and superintendents of shops may delegate at their discretion such administrative and technical duties as they see fit to subordinate officers. This delegation of authority cannot relieve

the general superintendent or chief of inland water transport service or superintendent of shop of his responsibility as commanding officer of all transportation corps troops under his jurisdiction.

Commissioned officers will not be assigned to railway grand divisions, port terminals, inland water transport service or shops according to a fixed table of organization, as far as possible each railway grand division will be provided with the necessary number of officers to carry on the technical and military functions of the particular railway grand division. This same rule will apply in the assignment of officers to port terminals, shops and inland water transport service. As far as possible these officers will be assigned to companies in accordance with tables of organization prescribed in G. O. 52, Hdqrs., S. O. S.

To create an "esprit de corps" and to simplify the designation of the transportation corps territorial commands, each railway grand division, port terminal, shop and inland water transport operation, will be given a designation "Grand Division, Transportation Corps." These numbers will be referred to only in the internal administration of the transportation corps. In all matters involving organization, equipment, administration and record, each transportation corps company will be considered as a separate unit of the army. In the same manner all individuals of the transportation corps at large will be considered as headquarters detachments of the particular territorial command in which they may be stationed.

#### DESIGNATION OF GRAND DIVISIONS

The present railway grand divisions, port terminals, shops and inland water transport operations will become:

##### Ports—

St. Nazaire .....	1st grand division, T. C.
Bordeaux (group) .....	2nd grand division, T. C.
London, England (group) .....	3rd grand division, T. C.
Le Havre and Rouen .....	4th grand division, T. C.
Brest (group) .....	5th grand division, T. C.
Marseilles (group) .....	6th grand division, T. C.
La Pallice and Rochefort .....	7th grand division, T. C.
Nantes (group) .....	11th grand division, T. C.

##### Inland Water Transport Service—

Seine river operation .....	12th grand division, T. C.
-----------------------------	----------------------------

##### Railways—

Zone of advance .....	13th grand division, T. C.
St. Nazaire and La Rochelle to Gievres .....	14th grand division, T. C.
Gievres to Issur-Tille .....	15th grand division, T. C.
Brest to Tours .....	16th grand division, T. C.
Bordeaux to Vierzon and Bourges .....	17th grand division, T. C.
Toulon and Marseilles to Chagny .....	18th grand division, T. C.
Tours to Sens and Cosne to Chatillon .....	20th grand division, T. C.

##### Shops—

Nevers .....	19th grand division, T. C.
La Rochelle .....	21st grand division, T. C.
St. Nazaire .....	22nd grand division, T. C.

Additional grand divisions, T. C., will be established as required upon recommendation to and with the approval of the director general transportation.

General superintendents of the above mentioned grand divisions will so far as railways are concerned, immediately assign units to railway divisions.

#### TITLES

The following titles will be adopted for the Railway Grand Division

Organization:	
General superintendent.	Superintendent telegraph and telephone.
Adjutant.	Engineer maintenance of way.
Personnel adjutant.	Accounting officer.
Supply officer.	General road foreman of engines.
Assistant general superintendent.	Troop movement officer.
Chief R. T. O.	Statistical officer.
Superintendent motive power.	

The following titles will be adopted for the Railway Division Organization:

Division superintendent.	Engine house foreman.
Adjutant.	Car repair foreman.
R. T. officer.	Foreman miscellaneous repairs.
Chief train despatcher.	Storekeeper.
Division operator.	Locomotive and air brake inspector.
Terminal superintendent.	Car inspector.
Engineer maintenance of way.	Trainmaster.
Signal supervisor.	Terminal trainmaster.
Track supervisor.	General yardmaster.
Master carpenter.	Yardmaster.
Master mechanic.	Road foreman of engines.

The following titles will be adopted for the Port Terminal Organization:

General superintendent.	Superintendent troop and cargo division
Assistant general superintendent.	Disposition officer.
Adjutant.	Chief stevedore.
Personnel adjutant.	Dock superintendent.
Supply officer.	Dock officer.
Executive officer.	Stevedore officer.
Finance officer.	Warehouse superintendent.
Statistical officer.	Warehouse officer.
Property officer.	Terminal trainmaster.
Gear keeper.	Yardmaster.
Supervisor of operation.	Superintendent port terminal facilities.
Marine intelligence officer.	Engineer inspection and maintenance.
Boarding officer.	Mechanical engineer.
Marine superintendent (lighterage and harbor craft).	Electrical engineer.
Port steward.	
Marine engineer.	

The following titles will be adopted for the Port Terminal Organization when such is subsidiary to a larger port:

- Superintendent.
- Adjutant.
- Executive officer.
- Finance officer.
- Statistical officer.
- Property officer.
- Gear keeper.
- Supervisor of operations.
- Marine intelligence officer.
- Boarding officer.
- Marine superintendent (lighterage and harbor craft).
- Port steward.
- Marine engineer.
- Superintendent troop and cargo division.

- Disposition officer.
- Chief stevedore.
- Dock superintendent.
- Dock officer.
- Stevedore officer.
- Warehouse superintendent.
- Warehouse officer.
- Terminal trainmaster.
- Yardmaster.
- Superintendent port terminal facilities.
- Engineer inspection and maintenance.
- Mechanical engineer.
- Electrical engineer.

GENERAL PROVISIONS

Nothing in this order will be interpreted as superseding provisions of former general orders of the transportation service on the question of responsibility of all commanding officers of transportation corps troops for the state of discipline, sanitation and military and professional efficiency, of the troops under their command; nor shall anything in this order be construed as superseding the existing authority and responsibility of section or other military commanders, as provided by law, army regulations, orders and bulletins.

In the event that a grand division, T. C., as provided for in Paragraph 24 of this order, is commanded by an officer who is not senior in rank, he will issue the necessary orders by direction of the general manager, or director of army transport service, as the case may be.

Under this organization the principal officers were as follows. Where more than two names are given in brackets for one office, the men named have successively held that office:

- Director General of Transportation..... Brig. Gen. W. W. Atterbury.
- Deputy Director General of Transportation..... Col. W. J. Wilgus.
- ..... Col. M. C. Kennedy.
- ..... Lt. Col. F. A. Delano.
- ..... Col. J. A. McCrae.
- ..... Col. G. T. Slade.
- ..... Col. H. C. Nutt.
- ..... Col. R. E. Wood.
- ..... Lt. Col. H. B. Moore.
- ..... Brig. Gen. Frank P. McCoy.
- ..... Col. H. C. Booz.
- ..... Col. H. M. Waite.
- ..... Lt. Col. A. W. Hudson.
- ..... Col. C. M. Bunting.
- ..... Lt. Col. I. A. Miller.
- ..... Col. F. Mears.
- ..... Col. H. H. Adams.
- ..... Col. F. G. Robbins.
- ..... Lt. Col. E. Stenger.
- ..... Lt. Col. Hinkle.
- ..... Major Alex. Woodruff.
- ..... Major Taylor.
- ..... Lt. Col. B. L. Bugg.
- ..... Major E. H. Shaughnessy.
- ..... Major Vandersluis.
- ..... Capt. R. C. Stone.
- ..... Major John A. McDonald.
- ..... Lt. Col. C. A. Stern.
- ..... Lt. Col. F. W. Green.
- ..... Lt. Col. G. T. Newbury.
- ..... Lt. Col. J. H. Elliott.
- ..... Major T. R. Ryan.
- ..... Major W. D. Wells.
- ..... Lt. Col. L. E. Lyon.
- ..... Lt. Col. G. S. Gaskill.
- ..... Lt. Col. George H. Vincett.
- ..... Major McDonnell.
- ..... Col. H. H. Maxfield.
- ..... Col. D. C. King.
- ..... Major Dilman.
- ..... Major E. R. McFarland.

Army Transport Service Staff

- Director General Army Transport Service..... Lt. Col. E. B. Cushing.
- Executive Officer..... Major O. D. Miller.
- Superintendent Troops and Cargo..... Lt. Col. Coates.
- Chief of Operations Division..... Lt. Col. Coates.
- Chief Inspector..... Major D. W. McCormick.
- Chief Marine Engineer..... Major George C. Cook.
- Chief of Terminal Ports Division..... Lt. Col. R. W. Stovel.
- Chief of Lighterage and Harbor Craft Div..... Lt. Com. H. W. Barstow.
- Chief Personnel Officer Trans. Corps..... Major C. A. Lohr.
- ..... Major E. G. Bliss.
- ..... Major E. G. Bliss.

Col. Wilgus is really senior deputy director general. Col. Kennedy, as already indicated, was located in London. The duties of Col. Slade (formerly vice-president of the Northern Pacific) correspond to those of a vice-president in charge of operation. Col. McCrae is deputy director general in the zone of advance. Lt. Col. Delano (formerly president of the Wabash and later of the Monon), who was the latest arrival among the higher officers, is located in Paris, and handles relations with the higher officers of the French railways. Col. Nutt (formerly general manager of the Salt Lake Route) is assistant to Col. McCrae in the zone of the advance.

It will be noted that this organization restricted the Transportation Corps to standard gage railways, ports and inland waterways. Light railways and motor transport were left in other branches of the service. It even continued the rule of confining the construction department of the Transportation Corps to the designing of the structures it needed, their ac-

tual construction being left in the hands of the construction and forestry branch of the Engineer Corps. Under this arrangement the construction plans of the Transportation Corps had first to be submitted to the Construction and Forestry branch, and if it approved them, to the French railway authorities.

Those approved by the French were then returned to the Construction and Forestry Department. This department did all construction work for the Expeditionary Forces on a priority schedule, and railway and port projects had to take their turn with it. It was thought desirable by the general staff to have all construction work for the army concentrated in a single department largely because labor for construction purposes was inadequate and it was believed that it would be most satisfactorily distributed among the different classes of projects if all construction work was in charge of a single department.

One of the interesting and important facts regarding the numerous railway storage and other structures which have been constructed by our forces in France is that they have been built without any agreements or contracts with the French as to their disposition after the war. It is assumed that the French will desire to acquire many of them, but on what basis they shall be paid for has never been determined. It may be said that the French should pay what they have cost. They are likely to take the position that many of the structures are not suited to their need in time of peace. Furthermore, it is going to be very difficult to determine what has been the actual cost of the work which has been done. It has been done by soldiers for soldiers' pay. In some cases the soldiers have been workmen experienced in the kind of work done; in most cases, by soldiers who were not experienced workmen, and many of whom did not relish the tasks they were required to perform. On what basis should the cost of such labor be computed? Again, the materials used were bought in America at high prices, and taken to Europe in ships owned or chartered by the United States Government. On what basis should the cost of these materials be computed?

The problem of determining on what basis the French should pay for the structures built by our soldiers, and for our locomotives and cars, if they decide to take them, is an extremely complicated and difficult one. Meantime, the French are engaged in preparing a bill for the use of their land, railways, and so on, by our forces; and whatever may be their true opinions, their railway representatives are endeavoring to make it clear that they do not even like our railway rolling stock. In the end, a large bill will be presented by each side to the other, and it will require long negotiations to reach a settlement.

Considering all the conditions, the American Transportation Corps has done a remarkable work in Europe, and it would have been possible to appreciate much better the energy and genius that were being devoted to its work if the war had gone on some months longer, and the large plans that had been made for conducting its work had been more fully carried out.

The writer is under obligations to several of the officers of the Transportation Corps for having put information at his disposal, and especially to General Atterbury, Col. Wilgus, Col. M. C. Kennedy, Lieut. Col. F. A. Delano, Major W. S. Franklin, Major E. G. Bliss, director of military affairs; and Capt. J. D. W. Melvin, historical officer of the Transportation Corps. Maj. Bliss is a West Point and regular army man, and Capt. Melvin until the war was a daily newspaper man, but both during their service in the Transportation Corps have acquired a broad knowledge of railway matters. The writer also acknowledges kind co-operation and assistance from Brigadier-General Conners, Chief of Staff to the Commanding General of the Service of Supply.

# Railway Supply Heads in War-Time Activities

Performed Important Service in Army, on Shipping Board  
and on War Industries Board

LIKE THE RAILROADS, railway supply companies contributed large numbers of men of all classes to the fighting forces and other direct war activities of the country. A host of these won marked distinction in various fields of patriotic endeavor, but because of lack of space it has been necessary to limit this article to a discussion of the direct war work performed by the presidents and chairmen of boards of railroad materials industries in the United States. The high quality of the services rendered by these men is typical of that which characterized the efforts of other members of the supply fraternity, in all branches of the industry.

The greatest number of railway supply executives who entered government service joined some division of the army, usually as commissioned officers. Our records show that at least 11 joined the military branch, seven served on the War Industries Board, three on the Emergency Fleet Corporation, and two with the American Red Cross.

Charles M. Schwab, chairman of the Bethlehem Steel Company and director general of shipping of the United States Shipping Board Emergency Fleet Corporation during the war, was one of the most prominent men before the public during the conflict. The results he achieved for the government are well known. Another of the most powerful officials in the country during the war was J. L. Repogle, president of the American Vanadium Company and chairman of the Wharton Steel Company, who was director of steel supply of the War Industries Board. With him rested the final decision as to the allocation of steel among the consuming industries of the country.

Another important officer of the Emergency Fleet Corporation was drawn from the ranks of the supply industry. Charles Piez, president of the Link Belt Company, Chicago, was made vice-president of the Fleet Corporation in the latter part of 1917, vice-president and general manager in August, 1918, and director general of shipping recently, to succeed Mr. Schwab. Another Chicago man, Edward F. Carry, president of the Haskell & Barker Car Company, served as director of operations of the United States Shipping Board from October, 1917, until July, 1918, when he was appointed chairman of the Port and Harbor Commission.

The large cantonment construction projects which were brought to completion in record time were built under the direction of a railway supply man. Warren R. Roberts, president of Roberts & Schaefer Company, Chicago, was placed in charge of the Construction Division of the army which did this work in the summer of 1917. He was promoted from major to lieutenant-colonel in May, 1918.

Samuel P. Bush, president of the Buckeye Steel Castings Company, Columbus, Ohio, was during the period of the war director of the Facilities Divisions, War Industries Board and chairman of the Division of Forgings, Guns, Small Arms and Small Arms Ammunition. J. Rogers Flannery, president of J. Rogers Flannery & Co., Pittsburgh, was chairman of the Committee on Railway Supplies of the War Industries Board. The secretary of the Committee on production of that board was J. M. Hansen, president of the Standard Steel Car Company, Pittsburgh.

The splendid work done by American railroad engineers in the construction of new lines in France is common knowledge, but it is not so generally known that a railway supply man assisted the director general of military railways, who was in charge of that work, throughout the period of the war.

E. N. Sanctuary, president of the Oxy-Acetylene Appliance Company, served in the office of S. M. Felton at Washington, when the latter was organizing railway engineering units for service abroad. Mr. Sanctuary was commissioned major in the Engineer Officers Reserve Corps.

J. M. Hopkins, chairman of the board of the Camel Company, Chicago, served as a member of the Priorities Committee of the War Industries Board at Washington, and in that capacity handled all export matters except those for Japan and for the allied governments having war missions.

Guy E. Tripp, chairman of the board of the Westinghouse Electric & Manufacturing Company, New York, was at first commissioned colonel in the production division of the Ordnance Department of the army, and was later promoted to the rank of brigadier-general and placed in control of the offices having charge of the production of ordnance material in their respective sections of the country. Other railway supply executives who served in the army include Cameron C. Smith, chairman of the Union Steel Casting Company, Pittsburgh, who was a major in the Ordnance Reserve Corps; W. K. Palmer, president of the W. K. Palmer Company, Kansas City, Mo., major in the Engineers Corps; E. A. Simmons, president of the Simmons-Boardman Publishing Company, regional constructing quartermaster, with the title of major; Lincoln Bush, consulting bridge engineer, New York, colonel in the Construction Division Quartermaster's Corps; Robert F. Carr, president of the Dearborn Chemical Company, Chicago, major, Department of Purchases, Storage and Traffic; W. W. Coleman, president of the Bucyrus Company, South Milwaukee, Wis., special representative in the office of the Chief of Ordnance, Washington, D. C.; and Warren Corning, president of Warren Corning & Co., Chicago, aide-de-camp to the chief of engineers of the United States Army, with the rank of captain.

Robert Patterson Lamont, president of the American Steel Foundries, Chicago, responded to the call of the government by assuming the duties of assistant chief in the Procurement Division of the Ordnance Department at Washington, with the rank of lieutenant-colonel. Later he was promoted to division chief of ordnance.

A. L. Humphrey, president of the Union Switch & Signal Company and vice-president and general manager of the Westinghouse Air Brake Company, Pittsburgh, served throughout the war as a member of the Labor Advisory Committee of the Council of National Defense. Alexander C. Brown, president of the Brown Hoisting Machinery Company, Cleveland, Ohio, was chief of the Locomotive Crane Section and assistant to the commissioner of finished products on the War Industries Board. Sheldon Carey, president of the Browning Company, Cleveland, was chairman of the committee of the War Industries Board which was charged with the responsibility for keeping up the production of locomotive cranes in this country early in the war.

Otis Cutler, chairman of the American Brake Shoe & Foundry Company, New York, served the American Red Cross at Washington as director of the Bureau of Insular Possessions. F. A. Poor, president of the P. & M. Company, Chicago, was also in the service of the Red Cross. W. W. Boyd, president of the Unit Construction Company, St. Louis, Mo., was with the Emergency Fleet Corporation during the war.

UNITED STATES

220,000

RAILROADS

## Nearly Quarter Million Men in Service

Reports from American Lines Indicate That Approximately 220,000 Employees Joined the Colors

CANADIAN

34,000

RAILROADS

APPROXIMATELY 220,000 railroad men, or 12 out of every 100 employed on the railroads in the United States, responded to their country's call for defenders in its time of need. Data recently received from 190 roads, representing a combined operated mileage of 186,488, or 67 per cent of the mileage of the country, show that 152,450 railroad officers and employees had left the service to join the colors. Assuming that the remaining lines of the United States contributed a proportionate number of men to the army and navy, over 74,000 additional honor men are accounted for. Reports received from roads representing 78 per cent of the country's mileage just one year ago indicated that nearly 71,000 railway men had joined the armed forces of the nation up to that time. Enlistments were much heavier in 1918, being twice the number for the first year of our participation in the war.

The railroads of Canada, which bore the burdens of war much longer than this country, also made enviable records, contributing approximately 34,000 men to the conflict. The Canadian Pacific system gave 9,661 to fight the cause of the Dominion and the Grand Trunk system has 4,846 stars on its service flag, 816 of which represent enlistments in the United States military and naval forces.

Some individual American lines were exceptionally heavy contributors to the nation's armed forces. The Pennsylvania system leads with a total of 24,487 in service at the conclusion of hostilities, or 15,468 more than at the end of the year 1917.

The New York Central system reported that 15,374 officers and employees had joined the army or navy during the war, as compared with a total of 7,143 who had enlisted up to the end of 1917. The Illinois Central system is third in rank with enlistments totalling 8,775, or 6,859 in excess of the number on the service flag a year ago. The Baltimore & Ohio system reports an honor roll of 5,731 as compared with 1,760 at the end of 1917.

Other roads which gave large numbers of employees to the colors are the Chicago & North Western, 5,386 men (1,573 in 1917); the Atchison, Topeka & Santa Fe, 5,383 men (3,000 in 1917); the Union Pacific system, 5,333 (2,008 a year ago); the Southern Pacific, west of El Paso, 5,142 (1,874 in 1917); the Chicago, Burlington & Quincy, 4,874 (1,486 in 1917); the Chicago, Milwaukee & St. Paul, 4,000 men (1,645 a year ago); the Rock Island system 3,838 (1,457 in 1917). The remaining lines with honor rolls containing more than three thousand names are as follows: the Erie, 3,576 (1,375 in 1917); the Northern Pacific, 3,543 (1,638 in 1917); the Boston & Maine, 3,284 (1,201 in 1917); the New York, New Haven & Hartford—including the Central New England—3,199 (1,446 in 1917), and the Philadelphia & Reading, 3,000 men (1,283 in 1917).

The following is a partial list of the roads and the number of their employees who entered military or naval service:

### AMERICAN LINES.

Name of railroad	Number of employees in military or naval service
Abilene & Southern	3
Ahnapee & Western	72
Alton & Southern	10
Alabama, Tennessee & Northern	37
Apalachicola Northern	45
Arizona Eastern	146
Atchison, Topeka & Santa Fe	5,383
Atlantic Coast Line (See Georgia & Florida.)	2,150
Augusta Southern	5,478
Baltimore & Ohio, Chicago Terminal	253
Bangor & Aroostook	154
Beaumont & Great Northern and Trinity Branch of M., K. & T. of Texas	47
Belt R. R. of Chicago	215
Bessemer & Lake Erie	418
Birmingham & Northwestern	10
Boston & Albany	558
Boston & Maine	3,284
Buffalo Creek	10
Buffalo, Rochester & Pittsburgh	850
Central Indiana	15
Central New England. (See N. Y., N. H. & H.)	750
Central of Georgia	720
Central of New Jersey	248
Central Vermont	16
Charlotte Harbor & Northern	2,470
Chesapeake & Ohio (east of Louisville)	312
Chesapeake & Ohio of Indiana	1,169
Chicago & Eastern Illinois	5,386
Chicago & North Western	174
Chicago & Western Indiana	4,874
Chicago, Burlington & Quincy	958
Chicago Great Western	356
Chicago Heights Terminal. (See Baltimore & Ohio Chicago Terminal.)	300
Chicago, Indianapolis & Louisville	4,000
Chicago Junction	29
Chicago, Milwaukee & St. Paul	3,838
Chicago, Ottawa & Peoria	1,127
Chicago, Rock Island & Pacific (including Chicago, Rock Island & Gulf)	150
Chicago, St. Paul, Minneapolis & Omaha	138
Chicago, Terre Haute & Southeastern	40
Cincinnati, Indianapolis & Western	1,986
Cincinnati, Lebanon & Northern	7
Cleveland, Cincinnati, Chicago & St. Louis	287
Clinton, Davenport & Muscatine	6
Colorado & Southern	30
Colorado, Wyoming & Eastern	50
Columbia, Newberry & Laurens	10
Copper River & Northwestern	1,253
Davenport, Rock Island & Northwestern	2,289
Delaware & Hudson	719
Delaware, Lackawanna & Western	206
Denver & Rio Grande	316
Detroit, Toledo & Ironton	11
Duluth & Iron Range	11
Duluth & Northern Minnesota	367
Duluth, Missabe & Northern	275
Duluth, South Shore & Atlantic and Mineral Range	9
Durham & Southern	10
East Broad Top Railroad & Coal Co.	5
East Carolina	1,026
Elgin, Joliet & Eastern	345
El Paso & Southwestern	5
El Paso Union Passenger Depot Co.	5
Erie	3,576
Evansville & Indianapolis	35
Fairchild & Northeastern	1
Flint River & Western	8

### A Bill to Render Justice to Contractors

REPRESENTATIVE S. HUBERT DENT, JR., of Alabama, on December 7 introduced a bill in Congress to provide relief where formal contracts have not been made in the manner required by law for contractors who have undertaken work for the government during the war emergency. The bill was referred to the Committee on Military Affairs and on December 19 was reported with an amendment back to the house, but has not yet been passed. The bill provides that Congress authorize the secretary of war to pay or discharge any agreements, expressed or implied, made in good faith by any officer or agent for the acquisition of land or materials when the agreement has been executed in whole or in part, or where expenditures have been made or obligations incurred in good faith. The bill protects the government against fraud and is not a bar to the recovery of money if the government has been defrauded.

The following letter has been sent out by the Symington Chicago Corporation, Symington Machine Corporation, Symington-Anderson Company, Symington Forge Corporation, and the 75 mm. Shell Association, American Fuse Manufacturers' Association, Committee on Boosters and Adapters:

1. On November 25, 1918, Comptroller Warwick ruled: "There are in the hands of contractors many informal papers, such as letters, purchase orders, procurement orders, etc. These papers generally are intended to be and are preliminary to the execution of contracts. *In themselves they place no obligation on the government.* The latter may be liable on a quantum meruit for the fair value of articles delivered and accepted, but it has no legal obligation for expenses incurred, value of incomplete work, material on hand or arranged for, etc., unless a contract in legal form has been made. Of course, it is understood a legal contract can not be made now for articles the government does not need, and this is true regardless of prior negotiations or understandings, written or oral."

2. The claims board and the district ordinance offices have ruled that the government will deal only with prime contractors. This means that, instead of checking the sub-contractors' claims in advance, the government wants the prime contractors to settle with the sub-contractors, and assume the risk that such settlement would later be approved by the government.

3. Only legislation by Congress can relieve the situation created by the comptroller's ruling.

4. If, as we believe, the government will ultimately have to check sub-contractors' claims before repaying to the prime contractors their disbursements on this account, why should not this government checking be done now, before the sub-contractors' material is stored and their cost records scattered?

We believe that pressure should be brought on the claims board to check sub-contractor's claims now.

5. In order to impress Congress and the country with the importance of immediate action if industrial disaster is to be averted, a meeting of prime and sub-contractors on government work will be held at the Hotel Cleveland, Cleveland, Ohio, on Friday, January 3, 1919, at 11 a. m., for the purpose of, (a) adopting a resolution requesting Congress to pass legislation at once legalizing payment on so-called informal contracts; (b) of urging on the claims board that claims of sub-contractors be checked and approved by government accountants immediately.

# Railway Revenues and Expenses in 1918

Record Breaking Revenue But Net Income Nearly \$250,000,000  
Under Government Guarantee

By Julius H. Parmelee  
Chief, Bureau of Railway Economics

TEN YEARS HENCE the railway historian will analyze the results of the year 1918 with a perspective born of full knowledge of intervening events. He will review the events of 1918 in their proper relationship to preceding and succeeding years. To those of us, however, who glance backward over the year as we cross the threshold into 1919, the task of interpreting its record of swift changes is doubly difficult; difficult both because 1918 was a year of unique and unprecedented happenings, and because we cannot yet see how it will be linked with the years that are ahead.

In particular, discussion of the financial results of 1918 is made difficult by appearance for the first time in American railway history of a governmental guarantee of net income. The injection of this and other accompanying factors into the situation leads to several results: for one thing it makes comparison with earlier periods of less significance, inasmuch as the year's net income is fixed and predictable months in advance of December 31; for another, it renders the aggregates of revenue and expense less susceptible to analysis, since the rates underlying railway revenues and the wages and prices underlying railway expenses have been subjected to such unnatural and sudden changes that the revenue and expense totals have temporarily ceased to serve as adequate standards of traffic and operation; still again, emphasis has shifted from conjecture regarding the amount of net income—for that is now fixed—to estimate of the amounts which the government will be called upon to turn over to railway corporations under its guarantee. Bearing in mind these difficulties and changes in emphasis, let us turn to the finances of the American railways, as set forth in their revenue and expense accounts for 1918, and interpret them as best we may in the light of existing information and potential developments.

Briefly stated, the year 1918 was one of record revenues and record expenses, but with net income lower than for any year since the fiscal year 1915, and nearly \$250,000,000 under the annual amount guaranteed by the Railroad Control Act of March 21, 1918.

Railway revenues and expenses for 1918 broke all records. Revenues approached the five billion-dollar mark, while expenses reached almost to four billions. Railway revenues had crossed the four-billion-dollar line for the first time in 1917; during 1918 they increased over \$800,000,000 above the 1917 total. Not only was the 1918 aggregate a record, but the increase of five-sixths of a billion dollars over the preceding year was the greatest single year's increase in the history of American railways. Similarly, operating expenses

surpassed all other years both in aggregate amount and in the amount of increase during the year. Railway expenses for 1918 amounted to nearly four billions, whereas in 1917 they had been \$2,854,000,000; the increase of one and an eighth billions over 1917, as in the case of revenues, was a record for the increase of a single year.

Normal taxes, exclusive of special war levies, increased to \$190,000,000 in 1918, also a record. This was about \$10,000,000 more than the normal taxes charged against railway income in 1917. The exact amount of war taxes paid by the railways in 1917 has not been reported by the Interstate Commerce Commission; the total was probably in the neighborhood of \$40,000,000; what will finally be charged against the railway income of 1918 depends on two factors not as yet fully determined, namely, the tax rate applicable under the war revenue bill now pending in Congress, and the extent to which railway companies are able to charge the special levies of 1917 and 1918 in the income accounts of those two years. The war taxes payable by the railways on their income for 1918 will be a charge against the railway corporations, while normal taxes are met by the United States Railroad Administration before arriving at the net income guaranteed to the roads.

The final resultant of the year's operations was that net income, the "standard return" as defined by the Railroad Control Act, declined from \$974,000,000 in 1917 to \$687,000,000 in 1918, a decrease of \$287,000,000, or thirty per cent. This \$687,000,000 is nearly \$250,000,000 less than the average net income of the same roads during the three-year test period, which formed the basis of the government's guarantee. In other words, the United States Railroad Administration will be called upon to make up a deficiency of that amount out of government funds.

The statistical data presented in the foregoing paragraphs are set forth in somewhat greater detail in Table I, which is a comparative income account of the railways of Class I, or so-called "million-dollar" roads, (including switching and terminal companies), for the years 1917 and 1918. The aggregates for 1918 are necessarily estimated in part, as only preliminary returns for November are available as this review is written, and only partial returns for December. The tax entry for 1917 is also estimated in part, owing to the fact already noted that the Interstate Commerce Commission has not yet reported the war taxes of that year.

TABLE I

Item	1918		1917		Increase or decrease	
	Amount	Per cent	Amount	Per cent	Amount	Per cent
Operating revenues.....	\$4,880,000,000		\$4,043,000,000		\$837,000,000	20.7
Operating expenses.....	3,975,000,000		2,854,000,000		1,121,000,000	39.3
Net revenue.....	905,000,000		1,189,000,000		d 284,000,000	d23.9
Taxes.....	190,000,000		180,000,000		10,000,000	5.6
Net rental balances....	Dr. 28,000,000		Dr. 35,000,000		7,000,000	20.0
Net operating income...	687,000,000		974,000,000		d 287,000,000	d29.5

d = Decrease.

Discussing first the year as a whole, the facts that press for attention are the great increase in revenues, the still greater increase in expenses, and the resultant decline of \$287,000,000 in net operating income. Revenues increased \$837,000,000; every month except January showing an increase over the corresponding month of 1917. Table II makes it clear that the monthly increases were accelerated

from January up to August and September, due largely to the speeding up of war traffic during the spring and summer months, while there was a slackening during the later months of the year. The general rate increases made effective in March and during June played their part, of course, in the increased revenues, especially during the last half of the year from July to December.

TABLE II

Month	Operating revenues (000 omitted)		
	1918	1917	Increase
January	\$285,084	\$300,841	d \$15,760
February	289,684	265,362	24,322
March	365,912	317,150	48,762
April	370,615	319,328	51,287
May	378,242	345,904	32,338
June	393,309	349,670	43,639
July	468,380	348,394	119,986
August	502,760	366,224	136,536
September	488,136	358,798	129,338
October	489,500	381,000	108,500
November	445,000	355,000	90,000
December	403,500	335,500	68,000
Twelve months	\$4,880,122	\$4,043,174	\$836,948

The principal rate increases of the year 1918 were the 25 per cent flat increase in freight rates made effective by the director general on June 25, and the general passenger rate increases of June 10. Passenger rates were increased to three cents a mile wherever they were below that figure, while an additional tariff of half a cent per mile was added to the passenger charge when the traveller carried a Pullman ticket. This extra tariff on Pullman travel was removed on December 1. On March 25, the Interstate Commerce Commission made effective in Official Classification Territory a large part of the increases not already allowed in the course of the Fifteen Per Cent Case; on June 22 the Commission granted a 10 per cent increase in express rates, the railroads' proportion of which increased in similar ratio. These principal increases, together with many minor adjustments and some changes in accessory charges, accounted for probably not less than \$600,000,000 of the total increase in revenues, amounting to \$837,000,000. The balance came from increase in traffic, which was relatively greater in the passenger than the freight service.

Passenger-miles increased approximately 15 per cent, a large part of this increase representing troop movements. In other words, what may be termed normal passenger travel remained almost stationary. Troop movements were especially heavy in the summer months, but grew less extensive during the later months of the year, both on account of the armistice of November 11 and on account of restriction of railway travel made necessary by the influenza epidemic. This last factor also affected normal travel, especially in October and November. December travel showed a number of vagaries; consolidated troop movements were heavy, and there was also a large movement of discharged soldiers returning home on their own account. These men received a reduced rate of two cents per mile, so that the revenue derived from their travel was not so great, relatively, as from other classes of passengers. Probably half a million discharged soldiers returned to their homes during December. Normal travel was also heavy in December. The increase in passenger travel during 1918, all classes combined, produced revenue well above \$100,000,000, possibly close to \$150,000,000.

Freight traffic, up to October, was only slightly greater than during the corresponding period of 1917. What increase may have occurred during the last two months of the year, together with the increases up to October, probably brought into the treasuries of the federal roads an amount approaching \$100,000,000.

Revenue from the carriage of mail showed a slight but consistent decline throughout the year, the total decrease approaching five millions. Express revenue increased nearly \$25,000,000.

Railway operating revenues for 1918 have been estimated

above at \$4,880,000,000. These were distributed among the several classes of service as follows:

Freight revenue	\$3,400,000,000
Passenger revenue	1,040,000,000
Mail	55,000,000
Express	130,000,000
All other	255,000,000
Total revenues	\$4,880,000,000

The increase in the various forms of railway revenue, reduced to the basis of percentages of increase over the year 1917, are shown by months in Chart I.

Operating expenses as a whole increased \$1,121,000,000 in 1918. In some respects this increase over the already heavy expense of 1917 stands out as the one significant feature of the year's operations. The rate of increase was nearly 40 per cent as compared with 1917, and 67 per cent as compared with 1916. The increase was due primarily to increased wages, secondarily to the higher cost of fuel and other supplies, and finally to the additional costs brought about by heavier traffic.

Wage increases accounted for considerably more than half of the total increase in expenses. Five general wage in-

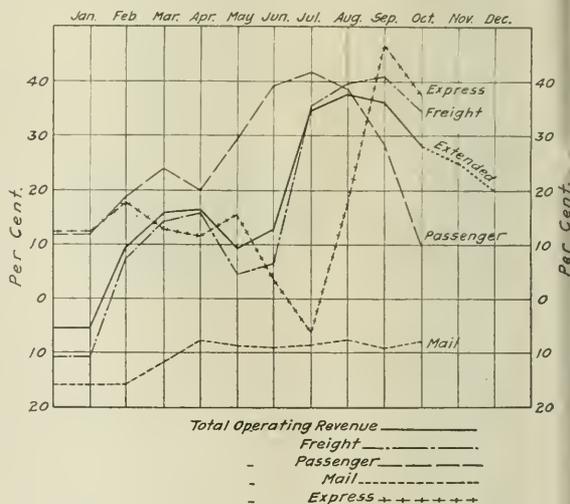

Chart I—Rate of Increase or Decrease of General Revenue Accounts by Months, 1918 Compared with 1917. Only Decrease Was for Mail

creases were granted by the director general of railroads during 1918, and there were many minor and local adjustments as well, virtually all of them in the upward direction. The principal increases, together with the annual amounts which they are roughly estimated to have added to the railway payroll, were as follows.

A general increase to all railway employees receiving less than \$250 per month was granted by General Order No. 27, promulgated May 25. This increase was retroactive to January first, and represented a payroll addition estimated from \$300,000,000 to \$350,000,000 per year. The second principal increase, also retroactive to January 1, was that to shopmen announced on July 25. This increase has been estimated at not less than \$125,000,000 per year. The third and fourth increases were made effective September first, and affected the wages of maintenance of way employees and of clerks, respectively. These two increases aggregated some \$150,000,000 per year. The fifth increase became effective October first and applied to telegraphers, towermen, block and telephone operators, etc. This increase amounted to \$30,000,000 or more per year. These principal increases, together with many smaller adjustments, accounted for a total

addition to the railway payroll variously estimated at from 600,000,000 to \$700,000,000.

Increased cost of fuel represented another considerable addition to operating expenses. Railway locomotives consumed some 650,000,000 tons of fuel in 1918. The average price paid by the roads was higher in 1918 than in 1917 by an amount not yet fully known. It may have been as great as fifty cents per ton, in which case the increased cost of fuel due to increase in unit prices would be about \$80,000,000.

Other supplies increased also in cost, some of the per cent increases ranging well above 100 per cent. The total

of ticket and other agencies, and other practicable economies under the conditions of unified operation. Maintenance expenditures increased over 50 per cent, maintenance of equipment increasing over 60 per cent and maintenance of way about 40 per cent. Transportation expenses were greater by 35 per cent.

The customary comparison of monthly expenditures with those of the preceding year offers but little interest in the case of the year 1918, because the retroactive features of the two largest increases in wages tend to overweight the expense accounts of some months and underweight those of other months. Chart II portrays the rate of increase over 1917 of the various classes of expense, by months, and shows very clearly how much out of line were certain of the months. Some of these variations from normal can be traced back definitely to one or more of the five principal wage increases. For example, the chart marks a sudden upward trend in all the expense accounts for June, the month in which the larger part of the back pay resulting from the general increase of May 25 was charged. The rate of increase approached more nearly to normal in July, but in August, September and Oc-

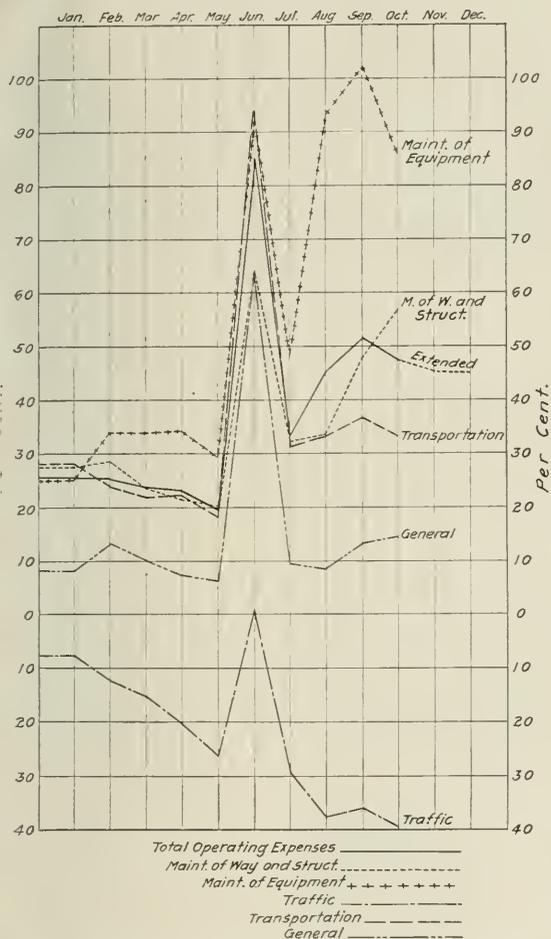

Chart II—Rate of Increase or Decrease of General Expense Accounts by Months, 1918 Compared with 1917. Only Decrease Was in Traffic Account

amount of such increases is not easily computable, but in the aggregate it represented a considerable item. Still another factor of increased operating expense, as in the case of revenue, was the increase in traffic.

The principal operating expense accounts were as follows:

Maintenance of way and structures.....	\$620,000,000
Maintenance of equipment .....	1,100,000,000
Traffic .....	50,000,000
Transportation .....	2,050,000,000
General and other .....	155,000,000
<b>Total expenses .....</b>	<b>\$3,975,000,000</b>

All these accounts except traffic showed heavy increases over 1917. Traffic expenditures fell off over 20 per cent, owing to the abolition of traffic solicitation, consolidation

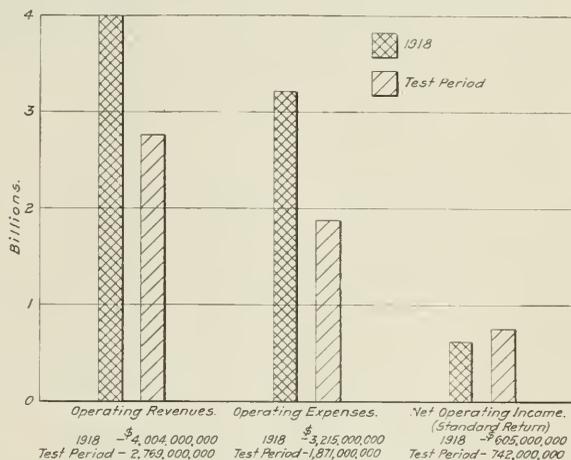

Chart III—Revenues, Expenses and Net Operating Income for Ten Months to October, 1918, Compared with Ten-Twelfths of Test Period

tober maintenance of equipment expenses show unusually large increases. Part of this abnormal showing grew out of the retroactive feature of the shopmen's increase of July 25. The general order making this increase effective provided that the July increase should be charged in the July accounts, while the increase for the six months from January to June should be brought into the accounts as soon as possible after August 1. Some roads did not succeed in computing and charging the back pay in full until September and even October. The maintenance of way increase of September 1 is clearly reflected in the jump in maintenance of way expenses, from a 33.5 per cent increase in August to a 47.5 per cent increase in September. The other wage increases cannot be so closely traced in the expense statements, either because they were scattered through the various accounts, as in the case of the clerks, or because they did not represent a relatively large addition to total expense, as was the case with the telegraphers.

Finally we come to the vitally significant item of net operating income, or standard return. This amounted in 1918 to \$687,000,000, which was a decline of \$287,000,000 from the results attained in 1917. The calendar year 1917 as a whole, however, showed better results than the average year of the three-year test period selected by Congress as the basis of its guarantee of net income. As a consequence the

deficiency which the director general's revolving fund will be called upon to make up is not the difference of \$287,000,000 between the results of 1918 and 1917, but rather the difference of about \$250,000,000 between 1918 and the annual average of the test period. I say "about \$250,000,000," since only a few of the compensation contracts have been signed as this is written, and there is some question as to what amounts will be guaranteed a number of the roads, although in many other cases the amount is, of course, virtually agreed upon even though the formal contract has not been completed.

To portray somewhat more clearly to the eye how the tremendous increase in expenses affected net operating income in 1918, Chart III has been drafted, showing for the first ten months of 1918 the total revenues, total expenses, and net operating income of roads of Class I, as compared with ten-twelfths of the test period average. Switching and terminal companies are not covered by this chart, and the results should not be compared in detail with the other charts and the tables, which do include such companies. The general results, however, are not affected by the exclusion. Revenues in 1918 far outstripped those of the test period, but as expenses increased in even greater ratio, net operating income shows a very appreciable decline.

If it has been difficult to analyze the results of 1918, even more difficult is it to offer predictions regarding 1919. So many uncertainties face the American railways on the threshold of a new year that even the most guarded prophecy might easily be upset overnight. Among the vital questions pressing for answer are these: Will unified operation and control continue through 1919? What traffic will be offered the railways? What will be the trend of wage and prices? Will the increased rates be maintained? And many others. If I were permitted a very cautious guess as to the possibilities for 1919, it would be that traffic will decrease but little, if at all, in the aggregate, although its composition and character will change considerably; that wages and prices will remain at or close to the high levels reached in 1918; finally, that the rate increases of 1918, being in effect from the very first of the year 1919, will bring net operating income back to or above the level of the government guarantee. One result that will almost certainly come out of this last factor will be a demand from the public for rate reductions. This point was recently touched upon by Director General McAdoo, when he predicted that the extension of unified control would make possible substantial reductions in both freight and passenger rates. However this may be, rates, prices, wages, and traffic will certainly react on each other, the final result being a matter that lies today on the lap of the gods.

## Engineering and Operating Problems of English Railways

SIR JOHN A. F. ASPINALL, general manager of the Lancashire & Yorkshire, has been chosen president of the Institution of Civil Engineers, and in his inaugural address, delivered before that body in London, on November 5, he made an interesting survey of some of the weighty problems now confronting the engineering profession in England.

More than 3,000 members of the institution have joined the fighting forces of the Empire, and 307 military orders and distinctions have already been conferred upon them; the number who have lost their lives is 291. Nearly one-half of the whole number—1,430—have been commissioned as officers of the Royal Engineers. The speaker mentioned with gratification the general recognition of the important service rendered in the war by the engineering profession—mathematicians, chemists, physicists, metallurgists and electricians—who are to be credited with rapid progress in de-

feating every hostile invention. The railways have not felt the deadening effect of government operation, as have other great industries, largely because the work has not been taken out of the hands of the men familiar with it.

The first problem considered by Sir John was that of the structure gage of British railways, there being 66 different loading gages applicable to 150 sections of lines; and the list of these must be studied when sending freight cars off from their home road. Progress in making larger freight cars is slow and at present almost impossible because of the limitations in width and height imposed at a thousand places. During the war English cars have been sent to France and have been run with facility, but French cars could not be run far in England. The speaker believed it possible to make great improvements in the structure gage without in any way altering the space between the two tracks of a double-track railway, which in most cases is six feet. He offered no specific remedy for this general problem but said that this and also the standardization of locomotives and cars ought to be actively undertaken; and "any change which may take place in the ownership of railways" ought to lead to an active policy; which probably would not cost more than a few days' war expenditure. The speaker had nothing definite to say concerning proposed amalgamations or state ownership, but alluded to the probable limitation of the number of designs of engines, if any change should be made. As to cars, running gear, brake gear, and some other details ought to be standardized without regard to whether more comprehensive plans can be agreed upon. Extended quotations are made from the recent address of Alba B. Johnson, at Chicago, on standardization.

Improved appliances for unloading coal at seaports, and for loading and unloading other heavy goods; the need of larger coal cars and the importance of abolishing private ownership of freight cars, and thus promoting standardization on the part of the railroads, are discussed at length; and the speaker then proceeded to discuss permanent way. Wooden sleepers (ties) are less plentiful than formerly, and are costing more; and it is suggested that when the steel mills of the kingdom are released from the burdens of war, they might be used to make the 300,000 tons of steel sleepers which could be used annually to replace the 4,500,000 wooden sleepers which need to be taken out each year. The speaker seems to hold that standard dimensions could be agreed upon for steel sleepers throughout the kingdom, and suggests that their use might become as extensive in England as it is today on the continent.

Another suggestion based on recent experience on the continent, is that light railways might be laid extensively in Britain for the development of agriculture; the hundreds of miles of 60-centimeter gage track which has been laid by the British army in France and Belgium might profitably be used in England. A committee of engineers and road surveyors, in combination with the Board of Agriculture, could decide where and how such railroads should be laid to be most useful.

Looking to the future and considering the probability of greatly lengthening freight trains, Sir John calls attention to the fact that wireless telephones will probably be available so that the engineman at the head of a train can communicate instantaneously with the runner of an engine at the rear of the same train, the two stopping or starting or setting the brakes at the same instant.

The future of electrical railway operation is discussed at length, with reference principally to recent experiences in America; and, observing that the railway demand for electric current will be far in excess of that for any other industry, the speaker thought that the generating stations ought to be owned by the railway companies. England must take into account the abilities of her competitors. Countries rich in waterpower can sell electric current at low prices; and Norway today is exporting current by cable to Denmark.

*Executive Committee of Canadian Railway War Board  
 Left to Right: Howard G. Kelley, president, Grand Trunk Railway; D. B. Hanna, president, Canadian Northern (Government) Railway; Lord Shaugnessy, chairman of the Canadian Railway War Board and chairman of the Canadian Pacific; A. H. Smith, formerly president of the New York Central, now regional director of the United States Railroad Administration, but still representing the American lines in Canada; E. W. Beatty, K. C., President, Canadian Pacific, and W. M. Neal, general secretary, Canadian Railway War Board.*

# The Confused Railway Situation in Canada

Present Form of Government Ownership Forced on Canada by  
 Circumstances; Whole Question Is Still to Be Settled

By J. L. Payne  
 Controller of Statistics, Ottawa, Canada

THE PRESENT SITUATION with respect to government ownership and operation of railways in Canada is the result of circumstances rather than the development of a definite policy. In so far as there was anything in the nature of a matured plan for the extension of the government system, which has been in existence for nearly fifty years, it had reference entirely to the Maritime Provinces; and the course of events in that direction will not be understood short of a clear grasp of the history of the Intercolonial. It was my privilege a year or two ago to set forth in the *Railway Age* (October 5, 1916, page 589), the essential facts with regard to that much discussed road, and it is therefore unnecessary at this time to do any more than epitomize those facts in their bearing on the position of matters today. There is sure to be confusion in the minds of readers if the historical aspect is omitted. It is fundamental, especially at this critical juncture in the discussion of railway policy in the United States and Canada.

J. L. Payne

Government did not start out in 1867 to give a demonstration of state ownership. That idea had no place whatever in the minds of those who built the Intercolonial. The principle, as against corporate control, was not even mooted. The Intercolonial, it must always be remembered, was constructed solely as an integral part of the bargain of confederation. The provinces down by the sea were reluctant to join with the upper provinces in a federal union, for a very good reason. They were cut off from central and western Canada by the closing of the St. Lawrence during the winter months. Their commercial interests were focussed in Boston and the eastern states. They were British in sentiment; but they were bound by ties of trade very closely to the United States. They felt themselves quite separated from Ontario and Quebec, and today, after the lapse of more than half a century, thousands of Nova Scotians still speak of the upper provinces as "Canada."

To win the people of Nova Scotia and New Brunswick over to the confederation idea it was necessary to offer them railway connection, and the Intercolonial was the result. The building of such a line was made a matter of specific contract in the British North American Act—the charter and constitution of the Dominion of Canada. It was to be the material link of political union, and out of that fact, without agreement on the point, grew up the idea that the road must never be regarded as a commercial undertaking. That is to say, it was tacitly understood that transportation tolls should be imposed solely for the purpose of meeting operating expenses. In practice, for reasons as to which there has been much debate, there were many years when it did not accomplish that much. Rightly or wrongly, the deficit of the Inter-

colonial were often attributed to political interference with the management. It is foreign to my purpose to discuss for one moment that phase of Intercolonial history, as it also is to write a syllable which could be construed as taking either side in the broad controversy over state ownership as a principle. I must be understood as being an entirely neutral recorder of the basic facts which have brought about the present railway situation in Canada, and nothing more.

Government began its railway enterprises with the Intercolonial, and was assumed to have ended with the building of the Prince Edward Island narrow gage line when that province entered the confederation in 1873. That was all the founders of the Dominion had in view. It was done as a matter of agreement based entirely on the necessities of the case.

The question of principle, apart from the original bargain, has no place in the official records. Other railways were built by private corporations; so that in 1903, when the Grand Trunk Pacific was projected, there were in New Brunswick and Nova Scotia 1,395 miles of line thus owned. This mileage attached to 26 separate roads, of which 9 were in Nova Scotia and 17 in New Brunswick. This will make it clear that the government had not dreamt of setting apart the Maritime Provinces as a field in which to exploit by monopoly the principle of state control. Not one of these lines paralleled the Intercolonial. They were all more or less in the nature of feeders to the government system. Almost without exception they connected with the Intercolonial. In time they came to be regarded as branch lines, although two or three of them could not properly be so classified. For the most part they served a local purpose. Few of them managed to make ends meet without a hard struggle. They constantly looked to the government road for assistance, chiefly in the way of equipment. The Intercolonial was the artery; they were the veins. In this situation there grew up an agitation for consolidation. It was believed that under such a re-casting a better service would be provided in the districts served, especially by the smaller roads, and that it would be a good thing in the long run for the government system itself.

The process of acquirement has been slow; but during the past 15 years lines have been taken over representing an aggregate of a little more than 500 miles, all in the province of New Brunswick. The basis of purchase was in essence the present value, which in some cases took the form of assuming outstanding liabilities. Under the circumstances it is quite impracticable to give either the cost to government or even a suggestion of how present value was appraised. The terms were a matter of arrangement between the government and the owners. This acquired mileage has not been added to the mileage of the Intercolonial as yet, the new properties being simply operated separately as before; and it would be altogether premature to say anything whatever about results. The bulk of the new mileage has been in possession of the government for but a short time, and as to the lines which have been operated for a number of years no change of importance is discernible in either gross or net earnings.

#### Extension of Government Ownership

The construction of the Grand Trunk Pacific, which was begun in 1905, marks a pivotal period in the extension of government ownership in Canada. That system was to begin at Moncton, in New Brunswick—practically at the Atlantic coast—and end at Prince Rupert on the Pacific. It will be remembered that the company was to build from Winnipeg to the Pacific coast, while the government undertook to build the eastern section, 1810 miles in length, officially designated the National Transcontinental. Without going into a considerable mass of details arising out of the bargain, let it suffice to say the construction of the Winnipeg-Moncton section was a mere variation of the form in which

the government was to aid the enterprise. The capital cost thus far has been \$170,000,000 in round figures, without including charges on account of deficits. The ultimate cost of the line, equipped for traffic up to capacity, is estimated at \$100,000 per mile. It is built up to a high standard; but runs for many hundreds of miles through an unproductive and quite undeveloped country. When the time came for the Grand Trunk Pacific to take over the National Transcontinental, thereby creating a new system from ocean to ocean, it was unable to do so. Financial difficulties barred the way. As that aspect of the situation as a whole will be taken up a little farther along, it is only necessary at this point to say that the government began the operation of the National Transcontinental in a tentative way in 1913. It has continued to do so. For the year 1917 the gross earnings were \$7,113,246, which fell short of meeting operating expenses, from which it is obvious the loss to the dominion treasury on interest account and deficits has been relatively large. This taking over of the National Transcontinental was the first long stride toward the creation of the largest railway system on this continent. Up to this time no effort has been made to throw all the mileage acquired into a single railway with both central control and centralized administration. Ownership and operation are both in government hands; but not under a common name nor a single central management. But I must not get ahead of the chronological order of events.

A year after the outbreak of war the financial difficulties of the Grand Trunk Pacific and the Canadian Northern reached an acute stage. The former had its parent, the Grand Trunk, to fall back upon, although government was joint guarantor of its bonds; but the latter stood alone. A royal commission was appointed in 1916 to consider "in a comprehensive way the conditions and necessities of railway development in Canada," and the famous Drayton-Acworth report\* was the immediate result. It is unnecessary for the purposes of this sketch of events to repeat any of the details of that significant finding. The taking over by government of the Grand Trunk, the Grand Trunk Pacific and the Canadian Northern was recommended. The setting up of a huge state system was held to be both unavoidable and expedient. Government had just given \$60,000,000 to the Canadian Northern and \$8,000,000 to the Grand Trunk Pacific to meet immediate and urgent needs. Thus far possession of only the Canadian Northern has been assumed. Bearing in mind that up to 1903 government had owned and operated only 1,788 miles of line, which represented no material change as against the early days of confederation, it is well to see what was the position of matters in 1918. This is the situation today:

GOVERNMENT MILEAGE	
Intercolonial .....	1,518
Prince Edward Island.....	275
National Transcontinental .....	1,810
Canadian Northern .....	9,405
Branch lines acquired.....	524
Total.....	13,532

Here was a big change. By a few swift strokes the government had altered the entire railway map of Canada. In doing so it had increased its capital liabilities on railway account from \$120,000,000 in 1910 to \$800,000,000 in 1918. If it had carried out the Drayton-Acworth recommendations to the full the final aggregate would not have been less than \$1,250,000,000 on 18,876 miles of lines. Of course, this has meant no more than a transfer of responsibility from corporate to public shoulders; but that does not modify the significance of the movement as a vital change in the Canadian railway situation.

\**Railway Age Gazette*, May 4, 1917, pages 953 and 957.

### The Public Attitude

As this is intended to be a mere statement of facts, free from the expression of personal opinion or comment, it is necessary to answer certain questions which must obviously arise in the minds of those who read. The public attitude, for example, is immediately suggested. The process by which such revolutionary changes were brought about may be expected to have its place in a frank history of events. The suspicion is unavoidable that all this must have been preceded by elaborate discussions in Parliament, in the press and on public platforms, of the underlying principle. Let it therefore be said at once that public judgment on these vast changes has neither been specifically sought nor positively declared. The matter in any of its aspects has not been an issue before the people. What has been done by the government has been the result of what was believed to be irresistible necessity. The National Transcontinental was built by the government and, although intended to be handed over to the Grand Trunk Pacific, was never taken off its hands. By reason of guarantees of bonds by the provinces and the Dominion, the taking over of the Canadian Northern was practically compulsory. The owners were at the end of their tether under war conditions, and the chief guarantors saw no avenue of escape from assuming a liability which already lay at their door. The definite grasping of these facts is essential to an understanding of the otherwise surprising statement that the Canadian public has to a large extent been both passive and silent. At all events, one would search the records of Parliament and the newspapers in vain to find anything which could be fairly recognized as a general discussion of the policy of government ownership as against the policy of corporate ownership. Nor has the government itself made any clear-cut announcement on the question.

Looking ahead, it might fairly be asked whether or not the government intends to give effect to the recommendations of the Drayton-Acworth report as respects the Grand Trunk and the Grand Trunk Pacific. I do not know, and it would be improper and impolitic to surmise. Nobody knows. The Grand Trunk in 1917 had net earnings of \$13,179,039, and showed a surplus of \$1,962,995 after meeting all its fixed charges. This is to be viewed, however, in the light of its obligations on account of the Grand Trunk Pacific. It is the guarantor of large responsibilities incurred by that road. The Grand Trunk Pacific itself had a shortage of \$205,000 as between gross earnings and operating expenses in 1917, to which should be added fully \$7,000,000 on account of fixed charges. The situation in this regard has not been materially changed since 1916, and at the end of that year Sir Henry Drayton and W. M. Acworth reported to the government as follows: "We estimate the present annual liability of the Grand Trunk in connection with the Grand Trunk Pacific system to be considerably over \$5,000,000 per annum, and after January, 1923, it will increase to over \$7,000,000. \* \* \* We recommend that the control both of the Grand Trunk Pacific and of the Grand Trunk be assumed by the people of Canada." A. H. Smith, in his minority report, recommended that the operation of the Grand Trunk Pacific be transferred to the Canadian Northern, which would admit of a considerable reduction in mileage; but, since the latter road has been definitely taken over by the government, it will be seen that this suggestion is now out of the question.

Neither the war nor the burdens arising therefrom can very well have any direct effect on the situation as presented in the foregoing paragraphs. What has been done was held to be unavoidable. It was regarded as the most prudent and promising way of meeting a liability which already lay at the door of the government by reason of the public guarantees outstanding. In other words, the choice exercised was believed to be the best for the defense of the dominion treasury. Whether or not the same force, proceeding from precisely

similar impulses, will lead to the early absorption of the Grand Trunk Pacific is a question which would seem to demand an early answer; but what that answer will be rests with the judgment of those who govern.

Inevitably, the aggressions of the government led to more or less general and sporadic talk, in the press and among men, on the comprehensive topic of nationalization. Having gone so far, it became a question for debate whether or not it would be both logical and expedient to go further—to the point of throwing all the railways of Canada into a common pool. There were factors on the surface which gave a suggestion of strength to such a bold scheme. The net earnings of all lines produced a balance on the credit side; while any combination which excluded the Canadian Pacific was more or less weak. Nevertheless, both the Drayton-Acworth report and the Smith report strongly urged the leaving of the Canadian Pacific alone. This created an obstacle. In so far as there was any discussion at all, either academic or constructive, it had its foundation very largely, if not wholly, in the situation created by the distressing finances of the Canadian Northern and the Grand Trunk Pacific. Probably some positiveness might have been given to these arguments, outside of the propaganda at Kitchener, Ont., but for the interest centered in the war. Be that as it may, the point I am trying to make is that nothing has happened in a definite way to show the trend of public judgment either for or against state ownership. The action of government was based on monetary considerations rather than an avowed principle, and there the whole matter rests at the present time.

### New Rates a Relief

Meanwhile, it may be said that the railways of Canada have had strong reasons for welcoming the relief which the new scale of rates has given them. That scale became effective on August 12, last, and, while it has given a fillip to gross earnings, it is much too early to speculate on the possible effect on net earnings. Much has happened to suggest that the additional inflow will be balanced by the additional outflow, for it is already clear that the McAdoo award to employees, plus the rising cost of supplies, has greatly added to operating expenses. It should be understood that the McAdoo ruling as to rates of wages found almost instant acceptance in Canada, and was a striking demonstration of the sympathetic relationship which prevails between the two countries as respects railways. On the other hand, there is just the shadow of a hope that the final balance for the fiscal year may be favorable; for the one outstanding benefit of the war, over against all the trials which it brought, was the development of efficiency in the operating departments. The movement of a greatly swollen volume of traffic in 1916 and 1917 had to be carried out with less equipment than was available in 1914 and 1915. Not only was there an actual decrease in the number of rolling stock units, but the loss of skilled labor from the shops made repairs slow and unsatisfactory. The introduction of female help was valuable, but it scarcely restored the conditions which existed prior to wholesale enlistments in the Canadian army. The operating officers made a virtue of necessity, however, and strove by every means to increase the average carload, train-load and so on. They were like the cheerful old liar who, when asked to explain how his dog had managed to climb a tree to escape from a pursuing bear, said: "He had to, the bar was crowdin' him so." In these heroic efforts to accomplish the seemingly impossible they had great assistance from the Railway War Board, whose work it was my pleasure to record a few months ago.

The collapse of the Germans and the ending of the war has brought the railways of Canada, in common with those of other countries, sharply up against the problems of peace.

It would be premature to make predictions. Nothing has yet happened to indicate the probable trend of events.

The nightmare of a possible reaction and great upheavals in trade is scarcely driven away by the hope that adjustments will swiftly take place; for the relationship between commerce and traffic is so intimate that the ups and downs of one always mean the rising or falling of the other.

The remembrance of what occurred in 1914 and the early part of 1915, when the paralyzing blow of war struck the railways, is a vivid part of the contemplations of peace. Nor can responsible officers find any comfort in the uncertain and unexpressed attitude of public or official judgment as to what may be done in the vital matter of nationalization, as to which I am as much in the dark as are they.

## Receiverships and Foreclosure Sales in 1918

The Government by Taking Over the Roads Suspended the Natural Economic Laws of Railroad Bankruptcy

SINCE THE LAW taking over the railroads specifically provides that without the permission of the director general of railroads the property of a railroad company used in transportation service shall not be attached by the courts, the receiverships established in 1918 were few and unim-

portant with the exception of the Denver & Rio Grande. In the case of that road the order of the court appointing a receiver was so worded as to put the question of whether or not a receiver should take charge of the property up to the director general of railroads. The other six roads are unim-

### RAILROADS IN THE HANDS OF RECEIVERS

Name of road	Mileage	Date of receivership	Bonds of old company	Stock of old company	Total old company securities

\* Discontinued.

† 20 miles of this road were sold at foreclosure, leaving 72 miles in hands of receivers.

‡ This property was sold at foreclosure in 1918, but it is still in the hands of receivers.

portant and form no part of the main line railroad mileage of the United States. The director general ruled that the receivership extended only to the free assets of the Denver & Rio Grande Railroad Company and did not pertain to the railroad itself. The receiver, therefore, took charge only of the free assets of the company not used in the transportation business and a federal manager was appointed for the Denver & Rio Grande in the same way as for a solvent company. It would seem proper, however, to include the mileage of the Denver & Rio Grande in our annual table since the company itself is bankrupt and the company owns the mileage shown in our table although temporarily a receiver is not in charge of this mileage.

The Colorado Midland not only went into the hands of a receiver but as mentioned elsewhere in the article on

RECEIVERSHIPS ESTABLISHED IN 1918

Name of company	Mileage	Funded debt outstanding	Stock outstanding
Colorado Midland	338	\$9,532,000	\$10,000,000
Denver & Rio Grande	2,610	121,802,000	\$7,779,800
Fort Smith, Subiaco & Eastern	14	400,000	150,000
Illinois Southern	140	3,398,000	5,000,000
Manistee & North Eastern	190	1,172,000	1,172,000
Michigan East & West	72	200,000	200,000
Ocella Southern	110	416,000	265,000
Waycross & Western	45	384,000	420,000
Totals	3,519	\$137,104,000	\$104,986,800

abandoned lines, a considerable part of it was actually abandoned and is to be torn up.

While there is nothing in the law taking over the railroads which specifically forbids a reorganization of a railroad property in bankruptcy there were no important foreclosure sales during the year. Even if a bankrupt company were to be reorganized the railroad which it owned could not be taken away from the federal manager. The short lines shown in our table are those that were sold under foreclosure but were not taken over by the government.

Of the roads still in the hands of receivers, the Missouri, Kansas & Texas, the Texas & Pacific, the Boston & Maine,

FORECLOSURE SALES IN 1918\*

Name of company	Mileage	Funded debt outstanding	Stock outstanding
Alabama, Tennessee & Northern	195	\$4,436,087	\$7,350,000
Cincinnati, Findlay & Fort Wayne	93	1,150,000	1,250,000

\* The receivership of the Pacific & Idaho Northern was ended June 21, 1918, without foreclosure proceedings.  
 † See large receivership table.

and the Toledo, St. Louis & Western are the most important.

A plan has been worked out for the reorganization of the Boston & Maine under which plan, published in the *Railway Age* of September 20, page 537, holders of guaranteed stock of leased lines are to accept stock in the new company which is to be formed. The fact that James H. Hustis, the receiver, had the confidence of the Railroad Administration as well as the various interests involved in the Boston & Maine reorganization aided materially in the working out of a sound plan of reorganization. Furthermore, since the plan needed the approval of the Railroad Administration before it could become effective this gave a leverage to bring all interests together that would otherwise have been lacking.

It must be remembered that not only in the Denver & Rio Grande case, but in the case of all the larger roads shown in our table of roads now in the hands of receivers the road itself

is being operated by a federal manager appointed by the director general and not by the receiver.

Had it not been for the government's taking over the roads and had no relief been afforded in the way of increased rates,

SUMMARY OF FORECLOSURE SALES IN 43 YEARS

Year	No. of roads	Miles	Bonds and stocks
1876	30	3,840	\$217,848,000
1877	54	3,875	198,984,000
1878	48	3,906	311,631,000
1879	65	4,909	243,288,000
1880	31	3,775	263,882,000
1881	29	2,617	137,923,000
1882	16	867	65,426,000
1883	18	1,354	47,100,000
1884	15	710	23,504,000
1885	22	3,156	278,394,000
1886	45	7,687	374,109,000
1887	31	5,478	328,181,000

# Progress Report on the Valuation Work

War Has Seriously Interfered With It, Both Retarding  
the Work and Increasing Its Cost

By Charles A. Prouty

Director, Division of Valuation, Interstate Commerce Commission

**T**HE WAR HAS SERIOUSLY interfered with the progress of our valuation work, having both retarded the work itself and increased its cost. The effect has been somewhat different upon different sections of that work.

*Engineering Section.*—The majority of our engineers were within the draft age, and many of them were included in the draft. An active demand for various kinds of engineering service was created by the war. All this made it difficult to obtain and retain competent engineers. It frequently happened that 25 per cent of our engineering force was changed in a single month. Since experience is of the essence of things in our work, this very much reduced the efficiency of our force and interfered with our progress.

Four years ago I estimated that our field work should be finished as of an average date, January 1, 1920. But for the war we should have been six months ahead of that program. As it is we are just about along with it. In the Southern and Pacific districts we have already disbanded several of our road and track parties and shall finish before the end of the year, even with our reduced force. In the Western district we shall complete our road and track work somewhat before January 1, while our structural and mechanical work will extend over into the following year. In the Central and Eastern districts our field work in all branches will extend slightly beyond January 1. On the whole, our field work will be completed just about as of an average date January 1, 1920, as predicted.

The effect in the engineering section has been more serious in the office than in the field for various reasons which need not be referred to. It had been estimated that our office work would be cleaned up in from a year to a year and six months after the completion of our field work. Owing to the delays of the war that estimate must be increased by about one year.

It is now estimated that engineering reports will be filed in Washington, upon all properties, in about three years from January 1 next. Here, again, we shall be somewhat ahead in some districts and somewhat behind in others.

*Accounting Section.*—The effect of the war during its continuance was perhaps more serious upon our accounting work than anywhere else. The number of accountants actually taken into military service was not great, but the activities of the war, both on the part of the government and in private enterprise, seemed to call for a great amount of accounting effort which very much increased the demand for accountants as well as the compensation paid. It was especially difficult to find accountants at the salaries which the commission

could offer who were competent to make reports. With the close of hostilities this difficulty is fast passing away and it is apprehended that we shall find it easily possible to conclude our accounting work within the time above indicated for the completion of engineering reports.

*Land Section.*—Most of our land appraisers were beyond the draft age and the war did not materially interfere with the prosecution of this branch of our work. While only about 150,000 miles of railway have actually been covered by our land appraisers in the field up to the present time, there will be no difficulty in bringing the work of that section to a completion along with that of our accountants and engineers.

In a word, we expect to complete our field work for the most part next year, and to finish the entire work within the two following years. This brings the valuation work to the point where reports of all sections upon all properties are filed with the commission in Washington. No estimate has ever yet been made as to the time which may be required to adjust the objections which carriers will make to these reports, but it is believed that after a little this will go forward rapidly.

C. A. Prouty

From the New York Tribune

And All He Asked for Was a Sword and a Gun

## A Year of Prosperity for Railway Labor

Federal Control and Industrial and Military Activity Have Introduced Marked Innovations in Past Practices

WITH THE SIGNING of the armistice on November 11 the word *finis* was placed on many formidable tasks which had been imposed on industry and commerce of this country. Of these, none has given greater concern than that of maintaining an adequate supply of labor. We still have today a labor problem of no mean proportions, but it is essentially different than that of the war period, although many of the perplexing difficulties yet to be overcome are in a sense an inheritance of the departing year. However, the indications are that the great problem of labor shortage will soon be no more, and it is now possible to review the trying times of the last twelve months as a book in which the last chapter has been written.

Three and a half years of war in Europe previous to our entrance into the conflict virtually stopped immigration, which for years was our chief source of common labor; the enormous growth of war industries created an unprecedented demand for men, and finally our own participation in the war led to the withdrawal of several million men for military duty and employment in government construction projects. So while there came to be an enormous shortage of help of all kinds, it was most severe in lines of industry or commerce requiring common labor, machinists and young men of military age. The railroads suffered in all branches of the service, but primarily in those employing men of the classes enumerated above. The problems of the various departments of railway service were essentially different and for that reason they are treated separately in this article. Nevertheless the underlying causes of difficulty were inter-related, and a number of influences were brought to bear which affected all departments to a greater or lesser extent. Federal interference, the wage advances, the attitude of the Railroad Administration toward organized labor, the employment of women, the activities of the Federal immigration bureau, all constitute interesting phases of the trying times from which we are just emerging and indicate the nature of the many and diversified factors which will play an important part in the

ultimate outcome of the no less difficult period into which we have but recently entered.

Going back to the first days of the past year, the plight of the railroads was indeed serious. The armed forces of the nation had already claimed about 70,000 men, the war industries had taken many more, and these factors had perfected their instrumentalities for recruiting and inducting additional forces at a rapid rate, with the further advantage over the railroads in the form of a much greater attractiveness of the service—the army and navy—through an appeal to patriotism and the industries through much higher wages. In addition, the draft was already removing certain classes of men.

Immigration, which has been the source of such a large proportion of track forces, had become a minus quantity, for whereas the average number of aliens entering this country annually during the years 1905 to 1914, inclusive, was 1,012,000, this number has since never exceeded 300,000, and was more than neutralized in later years by an even greater emigration. A further disquieting influence was that arising from an appreciation of the labor shortage by the men themselves, resulting in a marked spirit of unrest, characterized by unreasonable demands for increased wages and improved working conditions, and a marked tendency to jump from job to job in an effort to seek the Utopian position affording maximum pay and minimum work.

Efforts to overcome problems confronting all employers of labor in this country followed several diverting channels, which were actuated by a number of independent activities. Some of these were fruitful of excellent results, some were not. They may be classified as follows: The development of additional sources of supply, improved wage and employment conditions, the unification of labor solicitation tending to eliminate competition, and efforts to increase production.

### Immigration

Considerable speculation naturally occurred in regard to increasing the supply of labor from the outside, an idea

fathered by the fact that thousands of Asiatic workers have been passed through Canada on their way from the Orient to Europe, and plans were advanced even as early as the summer of 1917 by certain employers of labor in the West for the introduction of these Asiatics as temporary labor in this country. The United States Department of Labor refused absolutely to entertain this idea, which at no time progressed beyond the speculative stage. Whether it would have been wise to undertake this project in view of the political gunpowder it contained, is a question, but the fact remains that if a large number of these men had been employed here during the past year their removal from the labor market at the present time would now be serving effectively as a counterbalance for the present reduced demand for men.

Mexico was also suggested early in the year as a potential source of supply, but the operation of the literacy clause of the new immigration law served to exclude the peon. The Department of Labor for a long time turned a deaf ear to any suggestions for assistance even from this source, and for many months held up as a glittering possibility a plan for importing some 100,000 Porto Ricans, against whom no political objection could be raised because they were already classed as American citizens. Statistics are not available to show how many of these men actually reached this country, but they did not become an important factor in the solution of the labor difficulty.

Action was finally taken on the Mexican situation on June 20, when Secretary of Labor Wilson issued a department order temporarily removing the restrictions as to head tax, illiteracy and contract labor for Mexicans who would come to this country temporarily for work on farms, in mines or on railroads. However, the conditions imposed on the Mexican in waiving these restrictions were so severe as to offer little inducement for him to enter. Among other things his employer was required to withhold and deposit with the government 25 cents for each day of his sojourn in this country. Since this plan for obtaining immigrants proved impotent under these provisions they were finally removed in August, too late in the year to be of much avail.

That enlistments and the effect of the selective draft had made considerable inroads on the railroads is indicated by the fact that over 200,000 railway employees joined the colors. The Railroad Administration requested the War Department to grant relief from the operation of the draft law, in the form of instructions to the local draft boards to give deferred classifications to essential railway employees. This was not done, but following the passage of the second draft law calling for the registration of all male citizens between the ages of 18 and 45 inclusive who were not registered previously, instructions were issued to the railroads to request all essential employees to present industrial exemption claims when filling out questionnaires. This, however, came too late in the war to be of any effect.

### The Employment of Women

Another effort toward increasing the supply of labor was directed toward the employment of women to a larger extent in pursuits in which they had been used in the past, and also as substitutes for men in classes of work formerly done by men only. That these efforts have been accompanied by no little success is evidenced by an increase in the number of women employed from 60,000 in January, 1918, to about 100,000 in October. Of 81,000 employed on July 1, 61,000 were engaged in clerical work, at which they replaced many men and served greatly to relieve the situation in the clerical departments. The remaining 20,000 were employed in shops, scrap yards, coach yards, storehouses, etc. Some were also used on track work but as compared to the total number engaged the proportion in this work was small. Various obstacles were presented to their use for such work, among which were the need of better facilities for their com-

fort and their inability to do the heavier work. Finally in October, orders were issued in the Eastern and Central Western regions to discontinue the employment of women as track laborers, warehouse truckers, night watchmen and callers at train headquarters, the conclusion being that these forms of employment were unsuited to them both from the physical and social standpoints.

Boys have been used in increasing numbers in shops, offices, and on the track, following various plans for encouraging them to enter the service during summer vacations. College students, many of whom found railroad employment during their vacations, were also used in considerable numbers, but enlistments measurably reduced the possibilities of relief from that source during 1918. One interesting example of what was accomplished along this line, however, was the use of a special gang of University of Chicago students on track work on lines of the Burlington in Wyoming.

### The Federal Employment Service

One factor which has exerted a considerable influence on the solution of the labor problem was the United States Department of Labor through the agency of the United States Employment Service. This is a function of the labor bureau that had been designated originally to help immigrants find work, but which had gradually been expanded so that at the beginning of the year there were 100 branches or employment offices in operation throughout the United States. Special impetus given to this department of the labor bureau during 1918 led to its rapid expansion so that there were some 600 government labor agencies in operation by mid-summer.

In accordance with the policy pursued by the government for centralized control of many national activities suffering from inadequacy because of the war, the employment service undertook to centralize the employment and distribution of labor. On June 17, President Wilson issued a proclamation approving this plan and urging all employers engaged in war work to refrain from recruiting unskilled labor in any manner except through the government agencies. The plan provided that after August 1, all industries employing more than 100 men would be required to employ common labor exclusively through this service. Theoretically this was excellent. The competition for labor was keen. Various industries and localities were bidding against each other for the few men unemployed with the result that wages offered by the more profitable enterprises were assuming most unreasonable figures, while men were being shipped back and forth across the country from one labor center to another. To introduce order into this chaotic situation and supply men where most needed, a plan was introduced to take men from non-essential pursuits, thus giving the laborer one central agency for employment of all kinds. This was unquestionably an excellent plan, providing it could be carried out without any deceleration in the recruiting of labor during the transition period.

Skepticism as to the success of this plan was expressed early in the program by employers of common labor, including railroad men, because the first step announced by the federal service in the execution of its plan was to close all existing agencies or place them directly under government control through a formality known as "federalizing." It also became the policy of the service at once to frown upon the fee agency for the obvious reason that in the face of a most profound shortage of labor there could be no excuse for making a man pay for the privilege of getting a job.

The execution of the plan, however, was not as drastic as originally proposed as indicated by the orders issued by the Railroad Administration requiring the roads to comply with the wishes of the employment service. The private agencies were placed under government control, as were the agencies

of the individual railroads, but the roads were permitted to continue the solicitation of labor along their lines and at points where there were no agencies.

Matters did not move very smoothly, although there is a difference of opinion as to the reasons for the difficulties. Officers of the employment service hold that they did not receive the complete co-operation of the railroads, while the railroad officers, on the other hand, infer that the employment service was not organized to handle unskilled labor of the kind commonly employed by railroads. One suggested shortcoming was a lack of adequate supervision to insure that the man actually did ship out after he had been registered or assigned to a given job. Chief among the objections, especially in the early days of federal labor supervision, was that the employment service attendants usually lost interest in the railroad officer's request for men as soon as he stated the rate he was authorized to pay for his help, presumably because the recruiting of men for munition plants at much higher rates proved more congenial. Another source of difficulty was the inability of the employment service to control the activities of some of the great war industries in their strenuous campaigns for help.

Repeated reports of these difficulties to regional officers finally led to regional instructions to the effect that applications for men at the government agencies did not relieve the individual railroad officer from responsibility for the maintenance of an adequate force to conduct the work under his direction. This naturally led to a greater exercise of individual initiative in the procuring of men. Some railroads opened their own agencies in the labor centers, and although most of these were "federalized," a few were said to have made more or less use of the old private agencies. The federal service, however, has continued to be a potent factor in the recruiting of men and is still being called on to supply men for railroad work.

### Compensation

Adequate compensation for employees was one of the earliest subjects considered by the Railroad Administration. On January 4, the director general conferred with the officers of four railway brotherhoods with regard to demands made on the railroads before they were taken over by the government. As a result of this conference the director general announced a plan for the appointment of a committee to investigate the entire subject of wages and a committee thus appointed a short time later, consisting of Franklin K. Lane, secretary of the interior; C. P. McChord, member of the Interstate Commerce Commission; J. Harry Covington, chief justice of the Supreme Court of the District of Columbia; and William R. Willcox, of New York, held its first meeting on January 21. Other meetings followed almost daily for the purpose of hearing deputations representing all classes of railway employees until about March 1, when the committee commenced the preparation of its report which was made public in May. Under the provisions of this report all classes of employees were treated alike under a plan founded on two fundamental principles, (1) that the purpose of a wage advance was to afford the employee relief from the heavy increases in the cost of living since the first year of the European war, and (2), that the burden of this increased cost of living fell heaviest on the man with the smallest earnings. Accordingly it was recommended that an advance be granted the employees on a sliding scale of percentages, figured on the rates of pay in effect in December, 1915, these percentages ranging from a maximum of 43 per cent for the man receiving \$46 or less a month to nothing for the person receiving \$250 per month or more.

The recommendations of this report were made effective on May 25, by an order of the director general known as Order No. 27. This embodied two modifications of the original report tending to correct the inadequacy of its pro-

visions with respect to common laborers and shopmen, since the percentage of increase provided for in the report, over the wages in effect on December, 1915, were entirely inadequate to compete with the rates being paid these classes of employees by other industries. Accordingly the shop trades were awarded a minimum hourly rate of 55 cents, while laborers were given a minimum of 2½ cents per hour more than the rates in effect on December 31, 1917.

One of the effects of applying these advances by percentages over rates in effect December, 1915, was that the employee lost all advantage of any advances received in the intervening two years, unless there had been a clearly defined change of position. There was, however, one exception to this. Train service employees who had profited by the basic eight-hour day legislation of 1917, obtained advances clearly over and above the additional compensation resulting from the eight-hour day, since the order provided that the rates of increase in their pay should be determined from the average monthly compensation for the fiscal year of 1915 for each class of service, and that these percentages should then be applied to the mileage rates in existence at that time.

The wage award of Order No. 27, however, proved unsatisfactory to nearly all classes of employees and pleas for relief to the Railroad Board of Wages and Working Conditions, created by one clause of Order No. 27, were presented by many different groups of men. The hearings of these various complaints led to the promulgation of certain supplements to Order No. 27, providing special awards of wage increases for individual classes of employees. As each of these involved conditions peculiar to the several classes of employment they are treated under separate headings.

### Maintenance of Way Employees

In no department of railway service at the beginning of the past year was there as great disparity between the wages paid by the railroads and the outside interests as in the maintenance of way department. Supervisory officers had done their best during 1917 to improve working conditions and housing and feeding facilities, but it became apparent very soon in the spring of 1918 that no matter how great were the advances attained in these conditions it was impossible to hold men if there was an appreciable spread between the wages they were being paid and those which they could get elsewhere. Not only were the men afforded opportunities for doing common labor at considerably higher rates, but many of the brighter and more intelligent of them were being recruited for the semi-skilled trades of the war plants. The bridge and building carpenter forces too, had been subject to enormous inroads for some time because of the activities in cantonment, ship building, and munition works construction.

Government control of the railroads introduced a disturbing factor, since it made the individual roads uncertain as to their authority in granting wage advances to meet the competitive conditions. Although the wage commission was at work within less than a month after Mr. McAdoo assumed control of the railroads, it was confronted with such an enormous task that relief could not be expected in time to be of much benefit for the early days of the working season.

The first action taken on the part of the Administration was an attempt at temporary standardizations of track laborers' wages by the regional directors. Thus the director of the Western region issued an order on March 30, fixing the rate of wages for track laborers in the southwest and western territories at 25 cents and in the northwestern territory at 27½ cents, with the latter rate applying also to all terminals. When Order No. 27 finally appeared on May 25, it was found to be virtually impotent as far as the lower classes of labor were concerned. Consequently orders were issued by regional directors granting additional raises in rates to track forces. Orders were also issued calling atten-

tion to the need of making living and working conditions as attractive as possible.

These measures proved ineffective in keeping up the forces. Inquiries made of railway officers during the month of July indicated that the shortage in the track forces at that time was from 30 to 50 per cent of the estimated number required to complete the season's program. Conditions, however, were found to vary greatly since some roads had nearly the full complement while others had a totally inadequate force.

Hearings by the Board of Wages and Working Conditions on the status of employment in the maintenance of way department finally became the basis for Supplement No. 8 to Order No. 27 issued September 10 and made effective as of September 1. This superseded provisions of Order No. 27 insofar as it applied to the employees covered in the supplement and in place of the percentage increases provided in the order there were introduced specific advances for hourly, weekly and monthly rates of pay according to a carefully prepared classification of employees. For instance, track laborers were advanced 12 cents per hour over the rate in effect on January 1, 1918, with a minimum of 28 cents and a maximum of 40 cents. Track foremen were granted an advance of \$25 per month over the rates of January 1, with a minimum of \$100 a month, while assistant foremen were given 5 cents an hour more than the laborers.

Generally speaking, the provisions of Supplement No. 8 were satisfactory insofar as they concerned most of the laborers and craftsmen, but early interpretations of this supplement indicated that the foremen, especially in the case of bridge and building and water service groups, would in many cases receive less compensation than the men who worked for them. Later interpretations, taking into account the provisions for a basic eight-hour day, under which it was assumed that the new monthly rate was based on an eight-hour working day with provisions for overtime provided a reasonable spread over the compensation to the workmen in most cases.

No mention is made in Supplement No. 8, or any other supplement, of draftsmen or engineering assistants in the maintenance and construction departments, but some interpretations have classified these men either as clerks in Supplement No. 7, or as under a blanket provision of Supplement No. 8, so that in these cases the engineering assistants in the minor positions have been fairly well provided for. Engineers holding positions comparable to those of the lower division officers have not been covered in any way by Supplement No. 8, although most of the division officers have received recognition in the form of a supplemental regional order granting additional compensation. Thus, on August 1, roadmasters received an advance of \$25 per month over the rate in effect on January 1, 1918.

### The Mechanical Department

During 1917 the demands of munition plants for skilled mechanics had seriously depleted the ranks of the railroad shop men. At the beginning of 1918 there was a serious shortage of both skilled and unskilled workers. Director General McAdoo's promise to grant adequate wages was quite as effective in holding the men as any actual increase could have been and comparatively few mechanics left the service during the early part of the past year. The employees of the mechanical department were not satisfied with the increases awarded by the provision of General Order No. 27, and the disapproval of the findings of the commission was so strong that strikes took place in two shops. It was evident that the employees had expected to be awarded wages commensurate with those paid to mechanics in war industries. In hearings before the Board of Wages and Working Conditions the representatives of the shopmen's organization asked for a rate of 75 cents an hour. Supplement No. 4 to General Order No. 27 established minimum rates of 68

cents an hour for mechanics, boiler makers, blacksmiths, sheet metal workers, molders and first class electrical workers, 58 cents an hour for carmen and second class electrical workers, and 45 cents an hour for helpers. It provided also for foremen paid on an hourly basis a rate 5 cents higher than their respective craft and an increase of \$40 a month for foremen paid on a monthly basis, with a minimum of \$155 and a maximum of \$250. For the sake of uniformity all foremen were later placed on an hourly basis, the basic eight-hour day was established and the increases were made retroactive to January 1, 1918.

Other classes of labor in the shops were granted increased wages under the provisions of Supplement No. 7 issued September 5, 1918, the minimum rates established being \$110 per month for stationary engineers; \$90 a month for stationary firemen and power house oilers; 38 cents an hour for locomotive boiler washers; 33 cents an hour for power transfer and turntable operators; 31 cents an hour for shop, roundhouse and storehouse laborers, and 28 cents an hour for common labor. The rates specified in Supplement No. 7 were not retroactive but were effective September 1, 1918.

The increases in the wages resulting from the application of the new schedules have been variously estimated at from 40 to 60 per cent in the locomotive department and from 40 to 90 per cent in the car department, varying considerably, depending on the basis of payment previously in force. The supplements to General Order No. 27 made no provision for increases in the piece work prices, and this has resulted in the abolition of piece work in practically all shops. In general the mechanical department employees were well pleased with the wages awarded by Supplements 4 and 7. The migration of railroad shop employees to other industries practically ceased and many who had left railroad service returned to their former occupations.

Director General McAdoo stated that he expected every railroad employee, by faithful and efficient service, to justify the large increases of pay granted to them. However, the evidence at hand indicates that this result was not secured. The shopmen were given an opportunity to increase their earnings very materially, but instead of working steadily after the new rates went into effect, many of the men worked only enough days in each month to earn a small amount in excess of what they formerly received. The percentage of absentees in the shops was in some instances as high as 30 and to find 20 to 25 per cent "laying off" was not unusual.

While piece work systems were not abolished, the earnings under existing piece work rates were in most cases only slightly higher and in some cases even lower than the established minimum wage for mechanics. Consequently when the higher rates went into effect, there was no longer sufficient incentive for men to increase their production to a point where they would earn more than the guaranteed rate per hour. On the few roads where the rates earned on piece work were considerably higher than the present wages, the system is still in effect and the unit production has not fallen off appreciably, but where the incentive has been removed, the output has fallen very markedly.

Records of the average earnings on roads which had piece work systems before and since the wage increases went into effect are available. On one typical road these data showed that whereas the men earned an average of 45 cents an hour under the old piece work system, they were now earning 35 cents an hour, but were of course receiving the minimum rate of 58 cents an hour. On another road it was found that the output was but 60 per cent as much per man as formerly and 40 per cent as much work was being turned out per dollar as before. These are by no means extreme instances, as in some cases the records for whole shops show that the men's earnings have dropped to from 20 to 30 per cent of what they had been while the work was being done at piece rates. It is probably no exaggeration to say that in the shops

where piece work has been eliminated, the output per man has decreased 30 per cent and the labor cost of doing the work has increased 50 per cent.

The experience gained during the past year demonstrates plainly that increasing the hours worked does not increase the output in proportion. In general as much work was done in a ten-hour day as in a thirteen-hour day and the officers of one road stated that they expected to secure practically the same output with the shops running 48 hours a week that was obtained when the men were working 70 hours a week. It should be stated, however, that the eight-hour day has not been received with favor, particularly by the car men, and under this condition the normal production cannot be secured.

In considering the records of the shops, the fact must not be overlooked that supervising officers were working under unfavorable conditions. The foremen as a class were underpaid. Many had given up their positions to return to work at the trade and this tendency became even more marked after the issuance of General Order No. 27. Had the foremen been granted salaries commensurate with their responsibilities the labor situation would undoubtedly have been improved. The inadequate wages not only made it difficult to secure competent men for the supervising forces, but it also resulted in the foreman losing authority as, where the workers receive higher wages than the supervising forces, they feel that the foremen are their inferiors and obey instructions grudgingly, if at all. It was not until November 1 that the supervising forces were granted adequate wage increases. While the final wage scales for the foremen were in general quite satisfactory, they came too late. The most trying times had passed and the roads had lost the full production that might have been secured had the foremen been able to exercise complete authority in the management of the shops.

#### Special Supplements for Other Classes of Employees

Aside from the shop and maintenance of way employees, several other large groups of railway workers received special consideration in supplemental orders. Thus Supplement No. 7, referred to previously, also granted increases in pay to clerks in all departments, station employees and laborers in stations, storehouses and warehouses. In the case of employees paid by the month this supplement, in general, granted increases of \$25 per month over rates in effect on January 1, 1918, with minimums of \$87.50 for clerks, \$45 for boys under 18 years of age serving as messengers, office boys, etc., \$70 for janitors, elevator operators, watchmen, etc.

Supplement No. 10, dated November 16, announced increases to telegraphers, telephone operators, except switchboard operators, agent telegraphers, agent telephoners, towermen, levermen, tower and train directors, block operators and staff men. Under this supplement wages in effect January 1, 1918, were reduced to an hourly basis according to a formula given and to which an increase of 13 cents was added, with a minimum of 48 cents per hour. These advances were made effective as of October 1. On October 23 Supplement No. 11 was announced granting wage advances to non-telegrapher station agents. This was essentially an advance of \$25 per month with a minimum of \$95.

#### Train and Engine Service

The train and engine services were probably affected less by the labor shortage than any other class of employment. The reason for this is obvious; employment in these services is more attractive than in any other, so that outside employment did not offer sufficient inducements for men in the train or engine service to leave the railways, while most applicants for railway employment naturally preferred work in train and engine services to that in any other branch of the service.

Owing to the operation of seniority rules in both the train and engine services, any shortage of men would be manifested only in the positions at the bottom of the ladder. There were shortages in certain localities at different times in the ranks of firemen, brakemen and switchmen, but apparently the worst shortage occurred during the influenza epidemic of recent months. In the East, particularly in the New York district, some difficulty was experienced in keeping the switching forces at a working level, making it necessary to lower the standards in recruiting men. In the West some shortage of firemen and brakemen was experienced in the Northwest states, but practically no difficulty was experienced in the Southwest. This is explained primarily by differences in traffic which was depressed to a considerable measure in the Southwest by an adverse season. Train and engine service employees have received no wage awards other than that granted them by General Order No. 27, but representations have been made to the Board of Wage and Working Conditions concerning which no report has appeared to date.

#### The Accounting Department

Even in the past it has been customary in the accounting department of many of the larger railroads to employ women for some classes of work. The individual opinions of accounting officers differ greatly as to the extent to which they can be profitably employed instead of men. There are not a few accounting officers who express the opinion that in normal times it is better to employ men only in the general auditing offices as well as in freight offices. Others are of exactly opposite opinion and believe that women are better fitted for the greater part of the routine work of clerks in audit offices than are the classes of men who can be attracted by the comparatively low wage which has been paid. The result of the war and scarcity of men, especially those of the age employed in auditing offices, led to the substitution of girls for men even where the policy of the road or the opinion of the auditor was against such substitution. There was, however, comparatively little of drastic change in such employment of women to do men's work. Certainly, there was no such new experiment involved as was involved in the employment of women in shops, as track laborers, or in signal towers.

From such canvass of accounting officers as the *Railway Age* has made, opinion appears to be divided as to the desirability of continuing the employment of women where before the war men were employed. For instance, on one road it is pretty generally believed that the substitution of women and the extension of the use of computing machines and tabulating machines forced on the road by scarcity of men has resulted in demonstrating quite clearly the economy and feasibility of such a change. On another road, competing in the same labor market, the consensus of opinion appears to be that even where more extended use is made of calculating and tabulating machines, it is, under ordinary circumstances, more economical to employ boys to operate the machines than to have girl operators. Accounting officers in other parts of the country are similarly divided in opinion. The great majority would agree, however, that extension of the use of mechanical devices has tended toward greater efficiency in the audit office.

One objection to the use of women throughout the work of an auditor's office below the rank of chief clerk is that no chief clerks are being trained in the ranks. The question, of course, arises as to whether in time women may not rise from the ranks and qualify as chief clerks. Most auditors doubt this, but time only can prove it. It will be recalled that when girls first began to be employed extensively as stenographers in railroad offices, the cry of "Where are we going to get our next generation of railroad officers from, if none are being trained as stenographers?" was raised. The

question thus raised solved itself owing to the fact that it was still necessary for quite large classes of railroad officers to employ male stenographers if for no other reason than because of the necessity of traveling over the line at frequent intervals, and, furthermore, because of the fact that there were plenty of other ways for an embryo railroad officer to get a training in railroad work other than starting in as a stenographer. The objection to the employment of women in the accounting offices, however, has somewhat more force. It is quite feasible to employ women exclusively as clerks in nearly all branches of audit office work, and it is not so apparent that the future chief clerk and accounting officer can get the necessary training to fit him for his job in any other way than serving as a clerk.

Some roads after they began to employ women in the auditor's office more extensively, adopted a system of giving the clerks a rest, even if but for a few minutes, at frequent intervals during the day, the single rest period at lunch time being thought to be insufficient. Where a five or ten-minute rest period at intervals of two or three hours has been adopted, it is generally considered to work well and to increase rather than decrease the output of the clerks. This might, however, have been equally the case had it been tried out with men clerks in the way it is now being tried out with the girls.

#### Government Attitude Toward Labor

In no branch of the railroads has the effect of the government attitude toward labor been more clearly shown than in the mechanical department. One of the first significant changes was a marked increase in the number of men enrolled in labor organizations. Soon after the Railroad Administration announced that no distinction should be made between members and non-members of labor organizations, representatives of organized labor appeared at the shops where the mechanics had not already formed unions. As a result of the activities of the federation, there is probably not a shop in the country today in which a local lodge has not been formed. This movement has been furthered by the evident advantages of organized labor in enforcing its claims on the administration and by the widespread opinion among the workers that organized labor has been especially favored in the wage awards.

The removal of the power of determining wages from the officers of the individual roads has had an unfortunate effect on discipline, particularly in the shops and among train

service employees. The men became imbued with the belief that any favors they were to receive would be determined by the authorities at Washington and that the administration of discipline would likewise be governed by the central body. This has resulted in flagrant cases of insubordination. Men have refused to obey the orders of their supervisory officers, have denied their power to discharge them and whenever they were not satisfied with decisions in matters affecting wages or working conditions, have carried the matter to Washington in the form of complaints or grievances. In general the men have been inclined to give credit for all the benefits they have received to the Railroad Administration, but have placed all the blame for undesirable conditions on the local officers. The general detrimental effect of this situation on the morale of the workers can readily be appreciated.

Later in the year, the administration officers seem to have arrived at a realization that the men were not giving a fair day's work for a fair day's pay. Belated attempts were made to increase the production of the shops. The general supervisors of equipment visited a number of shops and by personal appeal endeavored to speed up the workers and restore discipline. These men have stated that the workers are not giving the government the output which they had given to the railroads under private control, regardless of the fact that wages have been increased and working conditions improved. In one case following an unpopular reduction in the working hours, the men deliberately cut the output more than 50 per cent. The equipment inspectors have also insisted that insubordination must cease, and that shopmen must obey their officers. This movement should result in better output in a short time under the present conditions.

Since the signing of the armistice labor conditions have undergone a rapid change. In the sections of the country where many war industries are located, there are now plenty of mechanics available. In other sections a slight shortage of skilled labor is reported. The working period in the shops has been reduced to eight hours per day and where it is found that a single shift will not give the required output, the second shift is to be organized. This arrangement has been put in force in order to give employment to the maximum possible number of men during the reconstruction period. With the decrease in the demand for skilled labor there has come a change in the attitude of the worker. The unit production probably reached the low point during the last months of the year and during the coming months there should be a marked improvement both in morale and output.

# The Standardizing of Operating Statistics

## Scope and Purposes of the Railroad Administration's New Plan for Uniformity in Statistical Reports

By Wm. J. Cunningham\*

Manager, Operating Statistics Section, U. S. Railroad Administration

WHEN THE operating statistics section of the United States Railroad Administration's Division of Operation was created in April, 1918, it was charged with three important tasks. The first was to devise a plan for the roads under federal control which would insure uniformity in the compilation and reporting of the statistics which deal with operating efficiency; the second was to prepare the report forms and to promulgate instructions making the standard methods and report forms effective; the third was to utilize, for the purposes of administrative control, the information made available by the new reports. The first two tasks have been practically accomplished. They related to the organization of ideas. The third task, which is one of operation, is in the early stages of development.

The methods and forms were promulgated under date of July 15, 1918, and were made effective with the reports for the month of August. At this date, it may be said that the operating statistics section, and its Advisory committee on operating statistics,† have, by standardizing operating statistics, brought about in that field what the Interstate Commerce Commission has accomplished in standardizing railroad accounting. It is now possible to make comparisons of the operating results of individual railroads, and of districts and regions, not only with respect to the financial features which are reflected in the monthly and annual report forms prescribed by the Interstate Commerce Commission, but also with respect to the important units of physical performance, as reported on the new standardized operating statistics forms. The qualifications and uncertainties heretofore due to variations in statistical practice, no longer attach to the interpretation of the statistics relating to train performance and to the utilization of locomotives and cars.

Everyone who has studied the statistics of physical performance of individual roads, or who has attempted to make comparisons as between roads, has found wide divergencies in statistical practice. Not only have there been noticeable differences in the several regions, but as between roads in the same territory there have been marked variations in methods and in bases which invalidated an unqualified comparison of units. Some roads have had well developed and scientific statistical systems; others have been content with little more

than the rather meagre statistical requirements of the Interstate Commerce Commission. The Commission has been interested primarily in the financial returns, and its requirements have touched but lightly on statistics of physical performance.

The policy of the operating statistics section in designing the new forms and setting the new requirements, has been to continue the best in current practice, and at the same time to avoid placing too great a burden on the larger number of roads which have not been so progressive in that respect. The aim has been to utilize all of the basic data heretofore called for by the annual reports of the Interstate Commerce Commission, and to superimpose upon that structure the additional information considered essential to a scientific exhibit of the more important phases of physical performance. The new plan is not complete. It is believed, however, that the initial requirements are scientifically comprehensive without being carried so far toward the ideal as to be impractical or unjustifiably burdensome.

While the new plan was made effective with the figures for August, 1918, it was not possible to obtain complete returns for the first two months. A large amount of correspondence and many conferences were necessary to insure a clear understanding on certain features which were new to many roads. The October returns, however, are fairly complete, and, beginning with that month, the Operating Statistics Section is attempting to fulfill its functions of utilizing the figures for purposes of administrative control.

### Purposes of Standard Forms

The purposes of the standard forms, as announced by Director of Operation Carl Gray's circular of July 15, 1918, are:

(a) To furnish the director general, the director, division of operation, and the regional directors with the basic data and the significant averages, ratios or unit costs which relate to or furnish indices of operating efficiency. Insofar as it is practicable the information on these forms will be utilized in supplying, through the operating statistics section of the division of operation, the statistical requirements of the several sections of the division of operation or of other divisions.

(b) To provide uniform bases, methods and forms which will insure uniformity in practice, and avoid any question as to comparability in so far as bases and methods are concerned.

While it may appear that the primary object of the new plan is to keep the central administration currently informed, and to furnish its officials and the regional directors with the data necessary to an intelligent supervision of operation, it is just as much the intention to give the local officials (the federal managers, general managers, and their subordinates) much information not heretofore universally available. The distribution of the monthly summaries, which show for each road and each region, the basic data and significant units, are designed to increase the interest of the local officials in operating efficiency by informing them not only as to their own results, but also as to those of other roads with which comparisons may fairly be made. It is realized that statistics are effective only to the extent that they are used, and that their use by the local officials should be more effective than

W. J. Cunningham

\*Professor of transportation, Harvard University, on leave of absence.  
†The committee met from time to time during April and May. It consisted of G. R. Martin, vice-president, Great Northern; J. G. Drew, vice-president, Missouri Pacific; H. W. MacKenzie, comptroller, Seaboard Air Line; J. J. Ekin, general auditor, Baltimore & Ohio, and W. C. Wishart, statistician, New York Central. The manager of the operating statistics section acted as chairman.

their use by the central or regional directors. The potential value of the figures lies in their successful application locally. Their value to the central or regional officials lies in their indication as to the extent and the effectiveness of the interest taken locally in improving the units of efficiency.

There is abundant evidence to support the belief that greater interest is now being taken in the figures, and that this added interest will yield substantial returns in increased attention to the details of operation which find their expression in the statistical units.

It is unnecessary to describe the plan in detail, as the forms are familiar to the majority of the readers of the *Railway Age*. The principal purpose of this article is to discuss a few of the fundamentally important principles and to explain why certain data are considered essential to a comprehensive statistical plan.

The first series of forms are numbered O. S. 1 to O. S. 7, inclusive, the prefix O. S. being the symbol assigned to the Operating Statistics Section. O. S. 1 relates to freight train performance; O. S. 2, to passenger train performance; O. S. 3, to locomotive performance; O. S. 4, to distribution of locomotive hours; O. S. 5, to freight car performance; O. S. 6, to locomotive and train costs, and O. S. 7, to the income account.

The more important features which are new to many roads appear in the reports giving the details of freight train performance, and the distribution of locomotive hours (Forms O. S. 1 and O. S. 4).

### Form O. S. 1, Freight Train Performance.

The freight service afforded the widest field for harmonizing differences in statistical practice and for setting scientific standards, as it has the greatest opportunities for statistical control.

The standard report of freight train performance gives the customary statistics pertaining to train miles, locomotive miles, and car miles. It is confined to "straight" freight service, and does not include mixed and special trains.

In addition to the statistics just mentioned, the form calls for the following data not heretofore universally compiled, viz:

Gross ton miles;  
Net ton miles (from the train reports);  
Rating ton miles;  
Train hours.

Gross ton miles are defined as the gross weight of the train (cars, contents and caboose) multiplied by the miles the train is moved. The figures are to be compiled from the conductor's train report. Gross ton miles represent the gross transportation product of train miles and locomotive miles. They are the product which may be credited to the operating department, and against which the direct expenses of train wages, fuel and other locomotive and train supplies may be charged. Subject to qualifications which will be referred to, gross ton miles are the best measure of train and locomotive efficiency. They represent the weight behind the drawbar and the distance which that weight is moved.

The computation of gross-ton miles has been common throughout the West and Southwest, but has not been as common throughout the South and East. An examination of the statistical reports of all railroads made by the operating statistics section last May indicated that they were computed either for the entire system or for parts of systems making up about 75 per cent of the road mileage of all Class 1 roads in the United States. The requirement that gross-ton miles be made a standard measure, therefore, introduced nothing new to the great majority of railroads. However, there have been differences in the methods used which made it difficult to compare the figures. Some roads adopted certain arbitraries, instead of making exact computations; others included only the slow, or tonnage freight trains; and others added in the weight of the locomotives, so as to afford a measure of traffic density for the purposes of maintenance of

way statistics. It is now required that gross-ton miles shall be computed from the actual gross weights as reported for each car in the train on the conductor's "wheel" report. The weight of the locomotive is not included, as it is not considered a part of the transportation product.

Net-ton miles are defined as the net weight of the freight (revenue and non-revenue) in the cars of the train, multiplied by the miles the train is run. These figures, as well as the gross-ton miles, are taken from the conductor's train report, and therefore correspond with the gross-ton miles. The net-ton miles thus derived represent the net-transportation product which should be credited to the operating department, but the figures should always be related to the gross-ton miles when an analysis of operating results is undertaken.

There is nothing new in net-ton miles as a measure of train efficiency. The novelty is in the method of compilation. Except in the few cases where the net-ton miles have been derived from the same source as the gross-ton miles, the net-ton miles compiled from waybills have been used for train efficiency statistics. For reasons which will be cited the waybill ton miles cannot satisfactorily answer the purposes of a scientific exhibit of freight-train performance, although they are valuable as a measure for obtaining the average revenue per ton mile and the average haul per ton. Ton-mile statistics have been required for many years by the Interstate Commerce Commission, and it has been the common practice for railroads to use these figures as a base for obtaining the train load and the car load.

Net-ton miles from the waybills are defective as a measure of train efficiency because they do not correspond to the actual production of the train miles and car miles of a given period, and because they are not available in time for current and effective use. Waybill ton miles for a given month are based on the waybills actually taken into account in that month. There is always a "lap-over" of ton miles which should have been credited to the performance of the previous month, and a shortage of ton miles actually produced in that month, but not taken into account until the following month. In theory, under normal conditions, the "lap-over" should balance the shortage, but in practice there is always a discrepancy, its degree depending upon local conditions. An interruption due to congestion, washouts, or snow blockades, may delay the billing on a substantial percentage of the freight, particularly if the trouble occurs during the latter part of the month. Consequently the train, locomotive, and car miles made in that month, and their operating expenses, will be charged against that month's performance, but a considerable amount of the transportation product is held up to go into the accounts of the next month.

Under governmental control the extent of this "lap-over" has increased because of the adoption of the universal interline waybill, which has resulted in a greater proportion of interline waybills. These are the waybills which are slow in being taken into account. Moreover, the "short-routing" of freight, the common use of paralleling lines, and of terminals and other accounting short cuts, which are authorized under unified control, add to the difficulties of giving each road and each month its proper credit for ton-mile production.

Finally there is the objection of delay in obtaining the information. Waybill ton miles are rarely available until well along in the second month. The waybill ton miles of January are usually not available until March 15. The information is then too old to be used effectively for operating control.

The computation of net-ton miles from the conductor's train reports is, in a measure, a duplication of the work of compiling similar information from the waybills; but it is believed that the additional expense is amply justified. Under the new plan the net production in ton miles is available on the 15th day of the following month, or one month earlier than the waybill ton miles. There can be now no question concerning the propriety of comparing the net with the gross ton miles, not with relating both units of product with the

rain miles, locomotive miles, train hours, and operating expenses of the particular period under review.

It may be possible later to utilize the net-ton miles, from "wheel" reports, for the purposes of the Interstate Commerce Commission, and thus avoid the duplication of effort. This proposal is now under consideration.

Rating-ton miles are defined as the potential production in

tio as low as 50 per cent may not imply criticism. It may actually represent a relatively good performance when consideration is given to the character of the traffic, unbalanced movement, or adverse weather conditions. The ratio in that case is not to be interpreted as an indication that the operating department was but 50 per cent efficient. It is proper, however, to compare that ratio with the same ratio of preceding months, and to make inquiries as to the reasons for changes. If it were permissible to have a varying base the ratio would not show the effect of changes in the relative proportion of fast freights, and would not show the effect of cold weather, requiring arbitrary reductions in tonnage ratings.

The principle adopted is that the general average for all freight trains shall be expressed in terms of summer rating for slow freights. It may not be proper to make absolute comparisons between the ratios of individual roads because of differences in traffic and operating characteristics, but it is

NOTES:  
(A) Miles of road—miles of first running track. Miles other main tracks—miles of second, third, fourth, or other multiple running tracks, not including yard tracks and sidings.  
(B) Fellow "Classification of train miles, locomotive miles, and car miles." Interstate Commerce Commission, July 1, 1914. Include electric locomotive miles, but exclude mixed, special, and motor car trains. Train miles—gross ton miles, both ordinary and light locomotive miles—gross ton miles—gross ton miles—gross ton miles. Where movement of traffic as a whole is not east and west, subdivide north for east and south for west, or combine north and south with west according to traffic movement.  
(C) Gross ton miles—sum of 2,000 lbs. loaded locomotive tender (coal, coke, and cabs) moved one mile; to be computed from conductor train reports. Net ton miles—potential gross ton miles for multiple mixed, special, and motor car trains.  
(D) Rating ton miles—the potential gross ton miles which would have been produced had all trains been loaded to 100 per cent of the slow freight main terminal tonnage rating, taking account of change in rating over sections of the line. When the potential tonnage is in the direction of the moving train it is expressed in number of cars an arbitrary tonnage rating should be used as the basis for Item 4.  
(E) Net ton miles—total of revenue and non-revenue freight tonnage to be computed from the conductor's train reports.  
(F) Train hours—also elapsed time of trains between the times of leaving initial terminals and time of arrival at final terminals, including delays on the road. May be taken from conductor train reports or from dispatcher's train sheets.

Form O. S. 1, Sheet 1

ross-ton miles based on the rated train load for each train run; in other words, the gross-ton miles which would have been produced if every train had been loaded to 100 per cent of the slow freight rating for normal weather conditions. The gross-ton miles show the actual production; the rating-ton miles, the potential production; the ratio of the former to the latter is an index of train loading efficiency.

The purpose of basing the potential on the summer slow freight rating for all classes of freight trains may not be thoroughly understood. The suggestion has been made that it is unfair to charge a superintendent with the slow freight rating for a preference freight or for a way freight, and that it is unfair to refuse him credit for necessary reductions in ratings because of abnormal weather conditions. The force of this suggestion is recognized, but the answer is that the 100 per cent base must be fixed. It is the "bench mark" from which the degree of variation in performance is to be measured. A movable base would defeat the purpose of the report. It is recognized that the ratio of actual to potential cannot be 100 per cent unless the ratings are too low. A ra-

Form O. S. 1, Sheet 2

proper to compare the ratio of any one road in any one period with its corresponding ratio in another period.

Train hours are defined as the aggregate elapsed time of trains between the times of leaving initial terminals and of arrival at final terminals, including delays on the road. A relatively small number of roads have taken cognizance of the importance of the time element in operating statistics, but it seldom is sufficiently emphasized. In these times, when maximum production is the desideratum, the product must be

measured by time as well as by volume per train unit. If an increase in the train load is accomplished at the sacrifice of a correspondingly greater reduction in train speed, the net result is a loss in ton miles per train hour. The unit "Ton miles per train hour" is obtained by dividing the total ton miles by the total train hours. Train efficiency may be increased (a) by increasing the train load without a corresponding reduction in train speed; (b) by increasing the train speed without a corresponding reduction in the train load; or (c) by increasing both the train load and the train speed. The effect of the changes in one or both factors is reflected in ton miles per train hour. The policy of the operating statistics section is to emphasize the importance of this unit in analyzing the net results of train operation. The prime importance of the time factor is recognized also on Form OS-5, in the unit "Ton miles per car day." The two elements—weight and speed—must be considered both separately and together. The units just described reflect their combined effect.

Attention is directed to the fact that all of the basic data, averages and percentages are shown separately by directions. The figures are reported as east, west and total, the instructions providing that in the cases where the movement of traffic as a whole is not eastward and westward, north should be substituted for east, and south for west, or north and south should be combined with east and west according to the traffic movement. This subdivision of the statistics is of the highest value in analyzing the results, inasmuch as it is possible to determine the effect of unbalanced traffic and of other operating or traffic features which are favorable in one direction and unfavorable in the opposite direction. It frequently happens that the total train load (both directions combined) will show no change, yet an analysis will develop the fact that a marked loss has occurred in one direction, this loss being neutralized by a corresponding gain in the opposite direction. Without the statistics by directions a loss in one direction would not be known and no credit would attach to the gain in the other direction.

Averages and Ratios—From the basic data on the first page of Form OS-1, the significant averages and ratios are derived and reported on page 2. The more important of these units have already been referred to in the discussion of the basic data.

Of first importance is "Net ton miles per train hour." This is the resultant of the average net train load and the average train speed in miles per hour. Since all of the items on the report call for a comparison with the previous year, and for the amount and percentage of increase or decrease, it is easy to measure the relative effect of changes in the components of any average.

**How Results Are Analyzed**

To illustrate, a specific case may be taken with the actual figures. The net ton miles per train hour show an increase from 4,877 to 5,216, or 6.9 per cent. This better performance was due to an increase in the net train load from 488 to 499, a gain of 2.3 per cent, and an increase in the train speed from 10.0 to 10.5 miles per hour, a gain of 5.0 per cent. Next in order, an examination may be made of the factors which influence the net train load. In the first place, it is noted that the ratio of locomotive miles to train miles shows a slight increase from 1.032 to 1.041, or 0.9 per cent. This indicates, probably, a slightly greater use of helpers or double-headers. Next, it is found that the net tons per loaded car mile increased from 22.5 tons to 24.2 tons, a gain of 7.6 per cent. The changes in these factors should have a favorable influence on the train load. On the other hand, it is noted that the per cent of loaded to total car miles—74.4 per cent last year, 71.2 per cent this year—shows a loss, a decrease, of 4.3 per cent, and that the per cent of net ton miles to gross ton miles fell from 47.0 per cent to

46.1 per cent, a loss of 1.9 per cent. These factors exert an unfavorable influence on the net train load. Finally, it is found that the per cent of gross ton miles to rating ton miles has changed in the right direction—76.5 per cent to 77.3 per cent, an increase of 1.3 per cent. These changes may be summarized:

FAVORABLE		Per cent
Car load increased .....		7.6
Per cent of rating hauled increased.....		1.3
UNFAVORABLE		
Per cent of loaded car miles decreased.....		4.3
Per cent of net to gross ton miles decreased.....		1.9
INCIDENTAL FACTORS		
Ratio of locomotive miles to train miles increased.....		0.9
Loaded car miles per train mile decreased.....		4.6
Empty car miles per train mile increased.....		11.6
Total car miles per train mile decreased.....		0.3
Gross ton miles per train mile increased.....		4.6
Rating ton miles per train miles increased.....		3.1
NET RESULT		
Net tons per train mile increased.....		2.3

The changes in each average or ratio may be analyzed by referring to the changes in the basic data. For example, what caused the loss in the per cent of net to gross ton miles? By referring to the basic data, it is found that both net ton miles and gross ton miles show an increase, but the increase in gross was 17.8 per cent, while the increase in net ton miles was 15.4 per cent. The cause of this is seen in the car mile statistics, where the empties show an increase of 26.4 per cent, while the loads show an increase of but 7.5 per cent. Since all of the statistics are shown separately by directions it is possible to trace the effect of changes in the relation of eastward to westward traffic. In this case, it is noted that the per cent of increase in gross ton miles is identical in each direction, viz., 17.8 per cent, but, in the case of net ton miles, the increase eastward was 16.8 per cent, while in the westward direction the increase was but 12.6 per cent. The loss, then, occurred in the westward movement. Looking again at the car miles, it is seen that the loads in the eastward direction increased 17.0 per cent, while westward they decreased 5.4 per cent. With the empties, the conditions are reversed. Eastward they show an increase of 22.4 per cent; westward the increase was 27.5 per cent.

These examples show the possibilities of analysis of each single factor and its effect on units of performance. The forms are designed to reflect all important items of information, and each form, while independent in its own field, is interrelated to a greater or lesser extent with the other forms applying to other phases of operation. In other words, the forms are designed to "tie in" to each other and together to furnish the complete exhibit.

**Form O. S. 2, Passenger Train Performance**

The degree of refinement attaching to the statistics of freight train performance is not justified in connection with the passenger service. The latter is not so susceptible of control. The trains must be run as scheduled, whether they are fully or but partly loaded. Consequently there is little to be gained by computing gross ton miles in passenger service. Instead of gross ton miles, Form OS-2 calls for passenger train car miles as a measure of performance. No additional accounting is required, since all of the basic data are required for the purposes of the annual report to the Interstate Commerce Commission.

**Form O. S. 3, Locomotive Performance**

Compared with the orthodox locomotive performance sheet, this report appears to be rather meagre in scope, but, in connection with the data reported on Forms OS-1 and 2, it fur-

shes the vital information for freight, passenger and switch service, in the following averages:

- Locomotive miles per locomotive day—
  - (a) Serviceable locomotives;
  - (b) Total locomotives;
- Per cent of serviceable to total locomotives;
- Gross ton miles per locomotive mile—freight;
- Passenger train car miles per locomotive mile—passenger;
- Pounds of coal per locomotive mile—freight, passenger and switch;
- Pounds of coal per 1,000 gross ton miles—freight.

Much of the information appearing on the average locomotive performance sheet, which the new form is designed to displace, appears on the reports of freight and passenger train performance, and of locomotive and train costs, (Forms S-1, 2 and 6), as well as on Form OS-4, next described.

Form O. S. 4, Number of Locomotives and Distribution of Locomotive Hours

This form has caused more additional work than any other report for the reason that, except on a very small number of roads, no data of the kind has heretofore been

A locomotive which is held out of service on account of needed repairs for a period in excess of 24 hours is classified as unserviceable. The hours of unserviceable locomotives are reported under three divisions:

- (a) Awaiting repairs;
- (b) Undergoing repairs;
- (c) Stored or awaiting sale (or other disposition).

Considerable difficulty has been experienced in obtaining complete reports compiled strictly in accordance with the requirements of the form. It was considered inadvisable to promulgate rules in detail which would specify exactly how the local officers should arrange to gather the basic data. The Administration believed that the better plan would be merely to indicate by the form and by the foot notes what is desired, and let each road proceed in its own way to gather and compile the statistics. The same principle applied to the other forms, and the results have been satisfactory except in the single case of distribution of locomotive hours. It may be necessary to promulgate instructions which will specify in minute detail the sources of information and the methods to be followed locally.

The importance of this information as to locomotive utilization justifies the cost and the trouble incident to its compilation. The statistics thus far available show some remarkable variations in the per cent of time locomotives are usefully employed, the per cent of time they are standing-by at terminals, and the per cent of time they are in the engine houses. The data will be extremely valuable to supervising and executive officers in passing upon the recommendations of the local officers for new power. The low per cent of time on the road will surprise many who have had little conception of what it really is. Many will be astonished, too, to note the extent of the stand-by losses at terminals. These statements, however, should not be interpreted as underestimating the difficulties which are inherent in increasing the per cent of time on the road, or in decreasing the idle time at terminals before starting or after completing the run. Nevertheless, it is maintained that effective remedial measures may not be applied intelligently without a knowledge of the facts. Or, to state it in slightly different form, it is only by the aid of complete statistics that the way will be pointed clearly to effective remedies. The statistics may, in certain cases, prove to be embarrassing to local officials, but they should have no difficulty in explaining an apparently poor showing in locomotive utilization, if local handicaps are insurmountable. On the other hand, the figures should furnish the local officials with the most effective argument to support their recommendations for additional and improved terminal and enginehouse facilities, where such are needed.

The publication of the summaries of these reports for individual roads and for regions will undoubtedly cause a greater interest to be taken in obtaining the maximum practicable utilization of freight motive power.

Form O. S. 5, Freight Car Performance

The purpose of this form is to indicate the degree of efficiency in freight car utilization. The basic data consist of the number of cars on line daily (divided to show separately those which are serviceable and those which are unserviceable); the total freight car miles—loaded, empty and total; and the total net ton miles—revenue and non-revenue combined. From these figures are derived the three factors which reflect the measure of car efficiency:

- (a) Net ton miles per loaded car mile;
- (b) Per cent of loaded to total car miles;
- (c) Car miles per car day.

The resultant of the three factors is as shown in the inclusive unit:

- (d) Net ton miles per car day.

A gain in any one factor or a loss in any one factor increases or decreases the net result. If, for example, the car-

NOTES.

1. Include all locomotives (steam and electric) on the road—owned, rented or leased, or acquired by U. S. Railroad Administration. Exclude leased locomotives in service on other roads.

2. Item 1, hours on road, represents the time in productive road and yard switching service. For locomotives on road service it should be taken from yardmen's time reports or dispatchers' train sheets, and based on hours from leaving time at initial terminal to arriving time at final terminal, including an enroute terminal to begin yard switching work and time it is released to final terminal.

3. Item 2, hours at terminals, represents time at terminals before and after the period of productive service, and hours of enginehouse time reported on road. For road service, it may be taken from dispatchers' train sheets and based on hours between times recorded in dispatchers' train sheets on yard switching locomotives. For yard switching, data to be taken from enginehouse and yard reports and based on hours between times locomotives are delivered to transportation terminal and time it is delivered to enginehouse for use.

4. Item 3, in enginehouses for light running repairs and other enginehouse work. (See Items 1 and 2.)

5. Item 4, locomotives under white load or stored, but in serviceable condition and available for service.

6. Item 5, up to date of awaiting orders of mechanical department for repairs when held more than 24 hours on that account.

7. Item 6, in shops or enginehouses undergoing repairs when held more than 24 hours on that account.

8. Item 7, locomotives unserviceable because stored while awaiting orders for sale, demolition, or other disposition.

9. Item 10, obtained by dividing the number of hours in Item 5 by the number of days in the month.

10. Item 11, obtained by dividing the number of hours in Item 5 by the number of hours in the month.

Form O. S. 4

It has been necessary, therefore, to set up new reports to meet the requirements. In effect it is necessary to account for every hour of every locomotive every day, and show for serviceable locomotives the aggregate hours and percentage of the total hours for each class of service:

- (a) On the road in productive service;
- (b) At terminals, standing-by, either before beginning or after completing the road run;
- (c) In enginehouses for attention of the mechanical department;
- (d) In enginehouses awaiting call from the transportation department.
- (e) Stored while in serviceable condition.

load is increased at the expense of the car miles per car day, or the per cent of loads, the net result may be a loss in net ton miles per car day, notwithstanding the greater car load. The net result may be improved by increasing one or more of the three factors, or by increasing one or two factors without causing a relatively greater decrease in the remaining factors. The tendency since the government assumed control of the railroads has been to increase the carload and to decrease the per cent of loads, the car miles per car day showing little change. During the early months of the year, the net result was a decrease in ton miles per car day, but in recent months the greater car load and the improvement in car movement has resulted in a net gain in ton mile productivity per car. It should be noted, however, that this unit does not reflect the collateral benefits to the shipping public by the better distribution of empty cars. The policy of the Administration has been to move the empties in train loads to the regions where they were needed for prospective loading, and while this has necessarily meant more empty car miles than were made prior to unified control, the amelioration of car shortage has meant less embarrassment to shippers.

#### Form O. S. 6, Locomotive and Train Costs

In this form an attempt is made to segregate what are commonly termed the "direct" or "out-of-pocket" expenses of train service, viz., locomotive repairs, enginehouse expenses, train enginemen, locomotive fuel, other locomotive supplies, trainmen, and train supplies and expenses. These expenses are shown separately for the freight and passenger services, and are related to the train miles, locomotive miles, gross ton miles (in freight service) and passenger train car miles (in passenger service), with average costs (a) per locomotive mile; (b) per train mile; (c) per 1,000 gross ton miles (freight); and (d) per 100 passenger car miles (passenger). There is nothing unusual in the form and it requires little additional accounting.

#### Form O. S. 7, Condensed Income Account and Operating Expenses by Primary Accounts

This is merely a reproduction of the condensed income account reported monthly to the Interstate Commerce Commission, and of the details of operating expenses by the primary accounts required by the annual report form of the commission.

#### Publication of Summaries

As already stated, the publication of the monthly summaries is still in the development stage. The August and September reports were too incomplete to permit summarizing. The October figures, however, are fairly complete, and summaries of the important figures on the reports of freight train operation, locomotive operation, distribution of locomotive hours, freight car performance, locomotive and train costs, and the income account, will be available before this article is printed. Hereafter they will appear regularly for each month at an earlier date. It is planned to have the summaries of physical performance distributed about the first of the second month, i. e., the summaries for December should appear about February 1. Those which show operating expenses should be available about two weeks later. The policy of the Administration is to give a general distribution of the summaries to the officers of the individual roads, as well as to the officers of the Administration, so that the information thus made available may have the widest field for usefulness.

The underlying theory of the new plan of standardized operating statistics is that the transportation department is charged with a given number of locomotive days and car days and is credited with its production in net ton miles.

The ton miles, in turn, are related to the expenditure in train miles, locomotive miles, and car miles, and the supplementary statistics throw light on the components of the train load and the car load, and the effect thereon of changes in ratios of net to gross ton miles, of loaded to total car miles, and of preference freights, or other lightly loaded trains, to total freight trains. The desiderata are that each locomotive and car shall be kept employed to its capacity and produce the maximum of ton miles with the minimum of train, locomotive, and car miles. The statistics are designed to show clearly the relation between the ton mile production and the time element in equipment utilization, and to indicate the relation between the actual and the potential train production.

The railroads in all sections of the country have cooperated cheerfully in making the new plan a success, and they are displaying an earnest effort to meet the requirements of the new forms. There is gratifying evidence that the adoption of the standard methods, and the more general distribution of summaries showing the operating results for all railroads, are doing much to increase the interest in operating statistics. The success of the new plan is to be measured by the use which is made locally of the reports of the individual roads, and the interest which is taken in the summaries. The results thus far are encouraging.

## Railway Supply Problems

CHAIRMAN A. L. HUMPHREY of the committee on government purchasing policies of the Railway Business Association, has issued an invitation to railway supply men who may have criticisms or suggestions for "strengthening the association attitude, work or methods," to meet with the committee at the Hotel La Salle, Chicago, at 11 a. m., January 8. This is the day before the annual convention of the Railway Business Association.

Mr. Humphrey states that "it is the earnest hope of the present officers of the association that the forthcoming convention will be regarded and remembered by everyone in the railway supply craft as a democratic clearinghouse, whose conclusions are representative of the whole industry.

"All of us know a great deal more now about selling goods under government control than we knew on January 1, 1918. Such control will continue for a period not yet determined. Regardless of the ultimate disposition of the roads, government control for the immediate future will be our environment. What, if any, are the practices which the whole industry can agree in thinking could be modified advantageously to manufacturers and not to the injury of the public?"

"Are conditions of bidding on contracts satisfactory? Are contractual terms fair? Has the adjustment from a commission to a salary selling basis been successfully accomplished and without increase in selling cost? Have design and specification preserved employment to makers of appliances or material formerly established in use? Is it reasonably easy to obtain trials for new or partly demonstrated devices? Do federal officers observe commercial ethics in such matters as adherence to contracts and avoidance of cancellations? Have you found in the Railroad Administration an attitude of respect for the integrity and general character of railway supply men as a commercial group? Has the pre-war improvement in remittances for goods continued under government control and can you suggest ways of overcoming present obstacles to more rapid accounting and the adoption and enforcement of a standard period for remittances? What other phases if any do you believe deserve consideration?"

"If you cannot be present, the committee will discuss a letter and, if so stipulated, hold its source confidential."

# Present Status of the Contract Negotiations

## Few Roads Have Executed Their Contracts With the Government. Difficulties With the Short Lines

EVER SINCE THE LAW was passed by Congress taking over the railroads for operation by the government during the period of the war and for 21 months thereafter negotiations have been carried on between the legal departments of the railroads and the Railroad Administration regard to the form of contract which was to be made between each company and the government. The Railway Executives Advisory Committee and the administration came to agreement upon the standard form of contract on September 5, 1918.

After the standard form was agreed upon, each road necessarily had to apply it to its individual case, and apparently the considerable modifications will have to be made in the standard form to fit specific cases. On the other hand, the contracts that have so far been signed do not vary greatly from the standard form. The lists of roads show only those contracts which are furthest advanced. The others are in various preliminary stages which it would be hard to classify. The compensation fixed in the contract is the rental which the government is to pay the corporations for the use of the roads, and from this compensation the corporations must pay their interest, corporation expenses and such dividends as they can pay.

NOTE.—The present status of the contracts does not necessarily indicate the order in which they will be signed.

### Short Lines

The Railroad Administration very early indicated that it did not care to be burdened with a large number of the so-called short-line railroads, and in spite of their protests announced its intention of relinquishing many of them from federal control, after they had received the same notices that were sent to other roads stating that they had been taken over by the government. This was partly because many of the smaller roads were not considered "needful or desirable" for the purposes of federal control, and partly because of the difficulty of reaching an agreement with the owners of the roads as to their compensation. On June 29 the Railroad Administration issued an order relinquishing nearly 2,000 small roads which were not considered needful or desirable, including some 1,400 plant facility roads as well as several hundred of the so-called short lines; but it had become apparent that many of the roads had been seriously affected by the fact of federal control whether any jurisdiction had been exercised over them or not, particularly by the uncertainty as to whether they had been taken over, and it was announced that "to preserve in every reasonable respect a status for the railroads so relinquished as favorable as that which they enjoyed during the three-year test period, great care will be taken to see that the railroads so relinquished are given fair divisions of joint rates, are insured a reasonable car supply—circumstances considered—and are protected against any undue disturbance in the routing of traffic."

The short lines had been particularly affected by the difficulty in making financial arrangements because of the uncertainty as to whether the government had taken them over and as to whether their earnings were to be guaranteed, and also by the diversion of their traffic in many instances to the trunk line railroads. They were also affected indirectly by the wage increases ordered by the director general and they

were not given the same advantages as to priority in materials and supplies that were accorded the railroads in the government system.

In order to secure a measure of protection a committee representing the short-line railroads entered into negotiations with representatives of the Railroad Administration for a contract which would make them certain guarantees, but without any provision for compensation by the government, and after two or three months of negotiations the director general offered the short lines a form of contract under which the roads were to be restored in a sense to federal control, but were not to be included in the government railroad system. An earlier form of contract offered by the Railroad Administration was rejected by the short line committee, but after some modifications had been made it was accepted by the committee of the American Short Line Railroad Association and recommended by it to the individual companies.

This contract, approved by Director General McAdoo on October 25, was published in the *Railway Age* of November 1, page 778, together with an account of the short-line situation. It provides that the roads are to remain under the management and direction of their owners, entitled to all revenues and responsible for all expenses, that joint rates

shall be divided on the basis in effect on January 1, 1918, and that such arrangements shall be made for the routing of competitive traffic as will guarantee to the short line the same amount of competitive traffic as was enjoyed for the average of three years ending December 31. The short lines were to have the benefit of the purchasing agencies of the director general and were to receive an equitable allotment of cars and motive power.

This form of co-operative contract, as it is called, has been signed by the director general in the case of the following railroads:

Cumberland & Manchester.  
Eastern Carolina.  
Georgia Northern.  
Peecos Valley Southern.  
Missouri & North Arkansas.  
South Georgia.  
Western Allegheny.  
Midland Railway.

No definite list of the railroads relinquished has ever been given out by the Railroad Administration, but a list has been made of 753 railroads operating 27,319 miles, or an average of 36 miles each, which have not been included among the roads operated by the Railroad Administration, and exclusive of the industrial or plant facility roads.

## Has Locomotive Standardization Been Justified?

Better Results Would Have Been Obtained Had the Roads Purchased Their Own Power

ONE OF THE MOST RADICAL innovations instituted by Director General McAdoo in his year's control of the railroads was that of establishing 12 standard designs of locomotives to be purchased for the railways under the jurisdiction of the Railroad Administration. This was done against the better judgment of a large majority of both railway men and locomotive equipment manufacturers and despite the fact that the President in his message to Congress said that, "Nothing will be altered or disturbed which it is not necessary to disturb." The proclaimed purpose for entering upon such a program was to provide new locomotives quickly, at as low a cost as possible, and to reduce to a proper minimum the classes of locomotives to be ordered for the railroads under government control. With the backing of but few friends, among them an officer of a locomotive building company and a railroad officer, the director general on February 13 requested S. M. Vauclain, vice-president of the Baldwin Locomotive Works, and chairman of the Committee on National Defense, one of the champions of standardization, to appoint a committee of locomotive builders to consider this problem and report within the week.

This was done and on February 19 this committee made its report to Mr. McAdoo, part of which was printed in the *Railway Age* of April 26, page 1085, in which it was stated that: "While it may be said, and truly so, that these standard designs could be rushed out quickly and the building of locomotives from them accomplished within a few months, if this is done, the factors just mentioned (providing the greatest interchangeability with existing equipment) cannot be taken into consideration within the limitations of time given and effort would have to be directed towards standardizing the details among these new types proposed without any reference to the standards now in use. This, in our opinion, would not be advisable, and we feel that the proper execution of such a series of standard designs cannot be carried out in time to permit the building of any of these locomotives for 1918 delivery. As the builders now have a

considerable amount of untaken capacity for this year we would respectfully suggest that if it is your desire that this year's full capacity (of the locomotive builders) be utilized, the railways be permitted to order for quick delivery, or until these standard designs can be properly worked out, such locomotives as they require exact duplicates of those now in service on their lines."

This part of the report passed unheeded and on February 22 a committee made up of railway mechanical officers, under H. T. Bentley, superintendent motive power of the Chicago & North Western, as chairman, met—not to consider the practicability of standardization—but to proceed with the work of preparing designs for the 12 different classes of locomotives that have since been ordered. The entire preparation of these designs was under the immediate direction of Henry Walters, chairman of the Atlantic Coast Line and the Louisville & Nashville, and special representative of the director general.

Early in April the work had progressed sufficiently for the preparation of tentative general specifications, which were sent out to the various roads with the request that they indicate the number of the different types they would care to have allotted to them. On April 30 an order for 1,025 of these locomotives was announced. During all this time sentiments were expressed by both railway men and equipment manufacturers against such an extreme policy, particularly while the nation was at war; these were published both in the columns of the *Railway Age* and the daily press.

If, by chance, the general plan of locomotive standardization was in any way practical for the railways in this country, the plan would have to be followed a large number of years in order to in any way justify it. This indicates that the director general had a firmly fixed idea that the railways would remain under the control of the government, if not permanently, for a considerable length of time. This thought was also made more evident by the manner in which the order for the first 1,025 locomotives was distributed be-

between the American Locomotive Company and the Baldwin Locomotive Works—so that each company would have some of each type to build and thus be prepared to meet future orders—which was done at a sacrifice of speed in production. Conditions as they exist today, however, indicate that complete government control will soon cease—regardless of the fact that the director general is so actively backing the five-year extension plan—and shows what a long chance the Railroad Administration took in its endeavor to institute such a radical program. The accredited aims which the director general sought in establishing these standards, namely, quickness of delivery and low first cost, have not been realized. In fact, the order for 1,025 locomotives announced April 30 and which was added to later, making a total of 1,430, has only been about half completed, even though the locomotives were specified for 1918 delivery. While comparable information can hardly be obtained regarding the first cost, it is apparent that had the suggestion of the builders' committee been followed and those roads needing locomotives most been permitted to order existing designs, the costs of manufacturing incidental to new designs would have been eliminated, much work saved and a greater output obtained. The standardization of locomotives as planned by the Railroad Administration was, therefore, not a war measure, but part of a definite plan to completely unify the railroads, and the speed of delivery which was so apparently necessary at the time was sacrificed in an attempt to work to that end.

Had the strongly recommended "liquid reserve" plan which involved one type of standard locomotive (Mikado) of design to meet general conditions, been followed and the roads been permitted to order locomotives of an existing design and construction to meet their particular needs, undoubtedly the output would have been greater, the first cost lower, and the director general would have had less difficulty in getting the railroads to pay for the locomotives built.

#### Railroads Hesitate to Pay for Standard Locomotives

When the locomotives were ordered a statement was made that they would be allotted upon completion to the various railroad systems where they were most needed and that they could be lettered "U. S." and remain the property of the government during its control of the roads. Thus at the beginning, the impression was general that the roads were to be provided with locomotives and that the statement of the number of each design needed to meet their requirements for new locomotives, which was requested when the tentative specifications were issued, was not a direct order on the government for them. In fact the roads were not permitted to place individual orders with the locomotive companies and were forced to take the standard locomotives if they were in need of new power. The Toledo & Ohio Central contested the right of the Railroad Administration to make it pay for the standard equipment and the matter is now in the courts. The roads cannot be blamed for not wanting to purchase standard locomotives and be obliged to operate them when the roads are returned to their owners, particularly when these locomotives are not as well adapted to the particular needs as the locomotives of the road's own design. Furthermore, all of the standard locomotives will be a constant source of expense to the roads on account of the new design detail parts which will have to be carried in stock.

#### Deliveries and Service

Up to the middle of December 368 light Mikado, 118 heavy Mikado, 72 eight-wheel switcher, 48 six-wheel switcher, 19 light Santa Fe and three heavy Mountain type standard locomotives, or a total of 628, had been delivered to the railroads. The Mikados and Switchers were the first to be delivered and on roads where they have been in service long enough to determine their performance to a fair degree, it has been found that in most cases they have given

good service. The chief criticism heard is that regarding the grates, grate rigging and front end arrangement. These details were made standard on all locomotives, regardless of where they were to go, and in many cases it has been found necessary to alter them to meet the local fuel conditions.

In the case of one road to which a number of the standard locomotives were sent, they were found to be inferior to the road's own locomotives of but slightly less tractive power, particularly in the amount of fuel used. This same road has had much trouble with the stoker equipment, which is of a different design from that used on the road's other locomotives. Engine failures have been caused on account of this, which have delayed traffic and necessitated the use of relief locomotives. The engines were held out of service waiting for repair parts with which to repair the stoker. If the road had had the privilege of specifying the equipment desired it would have ordered that with which its other locomotives were equipped and with which its engine crews were familiar and for which it had material in stock for repair parts.

On another road several standard locomotives were delivered almost before the road knew it was to receive them. They were delivered under their own steam and one arrived with the grates burned out. As all grates had to be changed, the engines had to be held out of service until the work was done. The rod packing used on these engines was of a different design from any used on that road, although other standard locomotives were equipped with packing that conformed to its standards. As no packing was sent with the engines, delays were caused until the road procured the proper packing for the engines. One of the engines met with an accident and as there were no spare parts and no drawings of the standard locomotive, a draftsman had to go out on the road to the engine and make a sketch of the parts needed for patterns and forgings to make repairs. This, of course, required holding the locomotive out of service for some time.

#### Repair Problems

As pointed out in our discussion of standard locomotives last spring, the problem of handling the repairs to these locomotives is no small matter, and taken in the aggregate, the extra cost for equipping shops for handling these locomotives—of an entirely new design—cannot be overlooked. It should, in fact, be added to the cost of the locomotives, as it is directly chargeable to the standardization plan. On the smaller lines this will be particularly noticeable. If standardization were to continue it would be from 10 to 15 years before any beneficial effects could be obtained from standard locomotives from a maintenance standpoint. Even after the government releases the control of the roads and the railroads have control over the purchase of locomotives, the tools, taps, dies, patterns, etc., will have to be carried in stock to maintain these standard locomotives. Thus, while the builder—if he builds nothing but standard locomotives during 1919—may find some advantages, the railroads will be at a disadvantage during the life of the engines. The disadvantage to the railroads is many times greater than the advantage that is to be gained by the builders. Moreover, locomotives should be designed from the standpoint of operation and not the convenience of the builder.

On one road in particular a complete set of patterns will have to be made for the standard locomotives assigned to it, as no part of the standard locomotives is common to that of its own locomotives. Grates were the first part to be considered, then the other details follow in order, pistons, cylinder heads, cylinders and parts, crossheads, driving boxes, shoes and wedges, ash pan castings, crown brasses, engine trucks, tender trucks and trailer truck brasses and boxes. The road manufactures all repair parts of grey iron and wrought iron and steel at its railway shops. Many fittings

are entirely different from those that have been used on that road for years, such as gage cocks, cylinder cocks, water gages, blower valves, angle and globe valves, lubricators, injectors and checks. There are twice the number of specialties on the standard engines as on the roads' standard locomotives, for which the vital repair parts have had to be ordered from the manufacturers. In addition to this, drawings for the locomotives will have to be purchased at a cost of between \$500 and \$600. As none of the locomotives have gone through the shops it is not possible to tell just what additional equipment will be needed there. Confusion will be caused the repairing forces due to the fact that they have an entirely new class of locomotive to handle to which they must accustom themselves. The material for repairs will have to be carefully watched as other locomotive equipment will not fit.

### Design of the Locomotives

As to the design of the locomotives themselves, the standardization committee is to be congratulated on the work it accomplished in the short space of time allotted it for the work. Strong efforts were made to produce a modern locomotive in every respect and from the reports thus far received of the few Mikados and Switchers that have been in service long enough so that an opinion can be formed of their performance, these have been found to be of fundamentally good design. After adjusting the draft appliances and the grates to suit the local conditions they have been found to be free steamers and to have ample boiler capacity.

In most cases the road men like them, although on some roads objections have been made to the cab arrangement. The kind of special devices that have been applied to them, where they were different from those used on the particular road operating them, has caused the greatest trouble. While it was the desire of the Railroad Administration to apply the same specialties to each standard design of locomotive, it would have been more logical to apply the accepted specialties in accordance with the wishes of the roads that were to use the locomotives.

Of course, as has been repeatedly pointed out, no standards can be made to meet all conditions and they must at best represent a compromise in design. The force of this was felt particularly on those roads which use anthracite coal as fuel. On one road in particular, which was provided with standard locomotives, provision had to be made for burning soft coal even though all the locomotives on that road were anthracite burners.

### The Present Situation

With about half of the first order of 1,430 standard locomotives to be completed and all of the second order of 600 to come, it would seem to be unnecessary for the Railroad Administration to place any further orders for standard locomotives, as by the time the present orders are completed the roads may be back in the hands of the private owners. Since, however, there is great need for new locomotives, it should allow each road to order such types and designs as are best suited to its particular needs. In fact, there is evidence that this is being considered by the Railroad Administration, for it is reported that five roads have been permitted to go into the market for locomotives of their own design; the Baltimore & Ohio and the Virginian for Mallet locomotives, the Philadelphia & Reading for locomotives having the Wooten type firebox, the Boston & Maine, as the standard designs do not meet its clearance limitations, and also the Kansas City Southern. Even though the Pennsylvania has been in need of locomotives, it has been permitted to build them to its own design. Undoubtedly more roads will seek to order locomotives to their own design as soon as some definite assurance is given as to when the government will relinquish its control of the roads.

## The French State Railways in the War Years

Harold G. Villard in The Economic World

AS IS GENERALLY KNOWN, the State Railways of France belong in the main to two systems, the one, commonly known as the Ancien Réseau (Old System), constructed many years ago, and the other, known as the Western Railroad System (Chemin de Fer de l'Ouest), acquired from its private owners two or three years before the war. Of these two systems the Ancien Réseau has not been directly affected by military operations, though its traffic has naturally been increased by the war conditions. Parts of the Chemin de Fer de l'Ouest, on the other hand, have at times been interfered with by the opposing armies, though at the same time the movement of freight and passengers has been greatly augmented by the proximity of the system to the chief fighting area. For many years before the war, the old system of state railroads was notorious both for the inefficiency of its service and for the inability to earn even the interest on the cost of its construction. Before the Western System passed into the hands of the government it had been a prosperous property; but after its purchase by the state its operating costs rose, and it became a burden upon the French government, instead of a financial aid, as had been prophesied by the advocates of the purchase.

It is of interest to know how these two state railroad systems of France have fared during the war years. In a recent number of *Le Monde Économique*, Paris, the operating results of the roads for 1916 are given, together with comparative figures for 1915. It appears that in 1916 the receipts of the old system amounted to \$16,267,125, a gain of \$2,015,186 over the 1915 receipts. The operating expenses for 1916 footed up \$16,379,673, an increase of \$2,390,829 over those of 1915. The operating deficit for 1916 was accordingly \$112,547, the coefficient of operating expense in 1916 being 100.69 per cent, as against 98.15 per cent in 1915. To the operating expense of 1916, however, must be added fixed charges of \$3,798,343, or \$60,119 more than in 1915. Hence the total deficit incurred in the system in 1916 was \$3,910,891—this deficit being \$435,562 greater than that for 1915. The deficit in both years, of course, had to be made good out of the French treasury, and added *pro tanto* to the burden of the French nation in its war period.

The financial situation of the Western System in the first two years of the war may be summed up as follows:

Receipts in 1916.....	\$59,624,904
Increase over 1915.....	10,479,492
Operating expenses in 1916.....	57,083,699
Increase over 1915.....	11,480,140
Net earnings from operation in 1916.....	2,541,205
Decrease from net earnings of 1915.....	1,600,648
Fixed charges in 1916.....	25,731,115
Increase over 1915.....	408,038
Deficit in 1916.....	23,189,910
Increase over 1915.....	1,408,686
Expense ratio in 1916 (per cent).....	97.74
Expense ratio in 1915 (per cent).....	92.79

It will be seen, therefore, that the combined deficit of the two state railway systems in 1916 amounted to over \$28,000,000. Of course, the operating conditions are abnormal.

The five great private railway systems have been similarly affected. But in 1916, when the expense ratio on the old system of the state was over 100 per cent and that on the western system nearly 96 per cent the average expense ratio on the five private railway systems was only 71.37 per cent. It varied from 64.7 per cent on the Paris-Lyons-Mediterranean railway to 82.25 per cent on the Nord railway. The most productive part of the last-named system is in the invaded districts of France, so that its operating expense ratio is abnormally high. *Le Monde Économique* concludes by saying that the above figures form a telling argument against state ownership and operation of railways.

# Opportunities for Railway Supply Exports

The Business Interests Must Have Co-operation of Both the Government and the Bankers

By Samuel O. Dunn  
Editor of the *Railway Age*

LONDON, ENGLAND, November 28, 1918

ONE OF THE THINGS I have been doing since I arrived in Great Britain has been to seek information which may throw light on the outlook for the sale of American railway equipment and supplies in foreign countries, both during the period of industrial reconstruction which we have entered, and following the actual period of reconstruction.

It is well known that until the Great War in Europe began the sales of American railway equipment and materials in foreign countries were quite small. The leading countries of Europe, and especially Great Britain and Germany, not only supplied their own needs, but sold most of the railway materials which were exported to other countries.

During the war, however, these countries became unable to meet their own requirements, much less those of other countries, also. In consequence, orders for locomotives, cars, and many specialties were poured upon America in a flood. Our own railways were not buying as largely as they normally had, and our manufacturers welcomed these orders, and filled them rapidly until our own country entered the war. Thus, a large export business in railway equipment and supplies was built up. These were years when the number of locomotives built in the United States for foreign railways was as great as the number built for American railways. The foreign buying of American made cars, railway specialties of many kinds and machine tools also was large.

How much of this business will our manufacturers be able to retain during the period of reconstruction, and also after the period of reconstruction? These are important questions for our manufacturers, for our railways, which will get whatever traffic our export business may afford, and for the American people in general, whose prosperity will depend in no small measure in the future upon our export business in manufactures.

In the short time I have been here, during which affairs in Great Britain, and indeed, throughout Europe, have been in a turmoil, I have got more impressions than detailed information. I feel sure, however, from what I have been

told on every side, that the impressions I have received would be merely deepened by the acquisition of more detailed information, and, therefore, I shall give the impressions now, hoping to supplement them later, if fortune is kind, with more actual information.

## Great Demand for Equipment Supplies

The most outstanding point of all is, that the railways of all the world now need vastly more equipment and materials of every kind than they ever did before. We all know that the railways of America need many thousands of locomotives, many hundreds of thousands of passenger and freight cars, many millions of tons of rail, and other materials and supplies in proportion. They need them, not merely for new construction and permanent improvements—although a vast amount of new construction and of permanent improvements is needed—but to make good the deterioration of tracks, structures and rolling stock which has occurred within recent years, and especially during the two years since the United States entered the war.

The situation is, of course, much more acute in other countries, and especially in those which have participated in the Great War since its commencement over four years ago. No foreign soldier has set foot on the soil of Great Britain, except as a prisoner; but it is hardly an exaggeration to say that the railways of that country are four years behind their requirements for locomotives, cars and work on the permanent way. They are so far behind, because since the beginning of the war they have practically acquired no new equipment and have kept their expenditures for maintenance at the minimum physically possible. The British railways build in their own shops most of their own locomotives and cars. During the war, their shops—which in many cases have been enlarged—have been devoted mainly to the manufacture of munitions.

The government has recognized in a very substantial way the deterioration which has been occurring by granting the railways in addition to the guaranteed return on their capital an allowance of 12½ per cent in excess of their ordinary

expenditures for maintenance, which has been put into special funds to be used after the termination of the war in making up deferred maintenance.

The conditions in the various parts of the British Empire—Canada, Australia, South Africa, New Zealand, etc.—which have not been in the zone of hostilities, as well as in the neutral countries of Europe, such as the Scandinavian countries, Spain, Holland, Switzerland, and so on, have been somewhat similar to those in Great Britain. The same thing may be said of the South American countries. The belligerent countries outside the immediate zone of hostilities have had to use all their resources of men and materials to carry on the war; and the neutral countries have had to see their railways deteriorate because they could not get materials to keep them up.

Far worst of all, of course, has been the case of the countries on whose soil hostilities actually have been conducted. Belgium, France, Italy, Russia, Roumania, and the Balkan countries have not only seen all their railways deteriorate, but they have seen large parts of them actually destroyed—tracks torn up, bridges blown up, cars burned, etc.

Prior to the war the aggregate amount of new railway construction going on in the world was great, and afforded a large market for equipment and materials of every kind. It is hardly necessary to say that all over the earth the war has practically stopped railway construction, and thereby stopped the development of new territories and new resources which railway construction always causes, and which, under modern conditions cannot occur without new railway construction.

Neither the market for railway equipment and materials which now exists, nor that which in the near future will exist, can be said to be as large in proportion as the need of the railways of the world for new equipment and supplies. It would require a fabulous amount of new capital to finance all the needs of the world's railways; and the world's supply of capital has been greatly depleted during the war, and it will take years to replenish it. But it cannot be replenished without a vast increase of production for the purpose of industrial reconstruction; and no such increase of production can occur until the railways are put into condition to handle the things produced. Therefore, the reconstruction of the railways will be one of the first things undertaken in every country whose statesmen and business men understand the present economic conditions and necessities; and this should mean that there will soon be the largest market for railway equipment and materials that ever was opened up.

#### America's Great Productive Capacity

The railway equipment and supply manufacturers of the United States—I use the term to include all that make anything used in construction, maintenance, or operation—have, of course, a vastly larger productive capacity than those of any other country—probably under present conditions larger than those of any other two, or even four countries. If as large a program of railroad reconstruction, improvement and new construction should be entered upon at once in the United States as the welfare of the country demands, our railway manufacturers probably would have their hands pretty full for some time filling domestic orders. But, in view of the existing confusion and uncertainty in our railway field it may be that our railways will not for some time place enough orders to use all the capacity of our railway manufacturers, and that they will be able to take a large amount of business from abroad.

That they can soon get a much larger business abroad than they ever have had seems highly probable, if they will go after it right, and can get the right kind of co-operation from our government.

In dealing with the export field, it would seem that our manufacturers should be very careful to think not merely

of the present and immediate future, but also of the distant future. If they do not, one result may be that the more business they get during the period of intense reconstruction, the less they will get after that period is ended.

#### Relations of United States and British Empire

The two greatest powers of the world now, in point of area, population, natural resources, and manufacturing activity, are the United States and the British Empire. In the long run our export trade in railway equipment and supplies and in everything else, is going to depend very largely upon the relations between the governments and peoples of these two countries. We can do more business, on the whole, with the British Empire than with any other country; and at the same time, the British undoubtedly will be, for years to come, our principal competitors for foreign trade. The way in which our competition with them is carried on will have a great influence upon the welfare not only of the peoples of our two countries, but upon the welfare of those of the entire world. Therefore, the governments of the two countries, each let us hope intelligently and fully representing the true interests of its own people, cannot too soon reach a clear understanding as to just how much and what kind of governmental stimulus and governmental restriction are to be applied to the business interests of the two nations in trading with each other and in competing for the trade of outside countries. The peoples of the two nations must not only trade with each other, but compete with each other; but their trade should be carried on in such a way as to promote the welfare of both, while their competition should be a friendly, open, honorable, sportsmanlike rivalry, and not be characterized to any degree by the dishonorable, underhanded, spy-ridden methods which were used by the Germans in pushing their foreign business before the war.

Now, as to the sale of American equipment and supplies to the railways within the British Empire, it would seem that the following will be about the situation: The efforts of the British government and British business men already are being energetically applied, and will be for some time thus applied, to filling their own plants with orders. Prior to the war, there long had been much unemployment in Great Britain. The British people live in fear that a return of extensive unemployment would result in a serious development of Bolshevism in these islands. Therefore, under the leadership of their government, they are going to try to provide employment for every person who wants it, and especially for their returning soldiers. This is going to be a herculean task, for their population is very large, and these islands are very small. They can only accomplish the task by developing manufactures of all kinds to the utmost, since manufactures can give employment to more people within a given area than any other line of industry. The manufacture of railway equipment and supplies is a branch of the iron and steel trade, and there has been during the war an immense increase of the capacity of the iron and steel plants of Great Britain. This increased capacity has been devoted principally to producing munitions. Besides the enlargement of private plants, the government itself had built several large plants at a cost of several hundreds of millions of dollars, some of which had hardly got fully into operation when the armistice was signed. Both the private and government munition plants must be, in so far as is practicable, converted to the uses of peace.

The government and the business men already are turning rapidly to the work, first of filling with orders for industrial products plants that are now in shape to make such products, and, second of converting to the uses of peace plants which as yet are adapted only to the service of war. The British railway companies, as already indicated, have large reserves which they can apply as soon as they can get the necessary labor out of munition works and the army to

building new cars and locomotives. The private manufacturers of locomotives and cars of Great Britain—ordinarily get about 90 per cent of their orders from railways outside of Great Britain—already are in the field for orders, and will begin largely to increase their output of railway supplies and equipment as soon as they can get their plants converted to peace purposes and get enough labor.

The chief railways for which equipment and supplies have in the past been made in Great Britain may be roughly divided into the following classes: First, the privately-owned railways; second, the state-owned railways of such colonies as those of Australia and South Africa; and third, railways of foreign countries which have been financed principally by English capital, such as several of those of Argentina. It seems pretty certain that the manufacturers of other countries, including those of the United States, will not stand a good chance of getting very much business from any of these railways until the manufacturers of Great Britain are busy and labor has as much employment as the manufacturers can give it.

However, the railways mentioned have a large mileage and large needs. In spite of the great expansion of the iron and steel trade, it does not seem probable it could within any reasonable time supply all the requirements of these railways. Therefore, it would appear that the time is not far distant when many railways within the British Empire, and railways outside the Empire which are controlled by British capital, will turn to America to buy equipment and supplies.

The prospect of soon developing a large export trade in railway equipment and supplies with the other countries which have been belligerents in this war seems much better than that of the prospect of soon developing such trade with the British Empire. The British and Americans ought to be able between them to get most of the business which formerly went to the Germans. Now, since the surplus capacity of our manufacturers in the United States is greater than that of the manufacturers of Great Britain, we should be able, it would seem, to get more of this business than they. In the neutral countries our manufacturers certainly stand as good, or a better, chance as the British.

#### Must Comply With Foreigners' Wishes

It already has been intimated that in seeking this business our manufacturers should think not merely of the present, but even more of the future, provided they wish to build up a permanent foreign market for their trades. One of the most important points to be considered is that European designs and methods of manufacture have differed widely from those of America. There are many people in the United States who believe that because, within recent years, our manufacturers have succeeded in selling to foreign railways large quantities of equipment and materials made according to American designs and standards, they will be able to continue to do so. Undoubtedly the familiarizing of foreign railway-officers with the actual service of American products will have this tendency. There are very many things, however, that the foreign railway officer wants made in accordance with his ideas, rather than in accordance with those of the American manufacturer. Now, during the period of reconstruction, while the demand for railway supplies will be so great, the American manufacturer may be able largely to succeed in forcing the foreigner to take what the American wants him to take; but if he does, he is likely to find that when the demand declines the foreigner will turn to some British or German manufacturer who will make him what he really wanted all the time, and the American export trade will have made a merely temporary customer instead of a permanent one.

One of the marked characteristics of railway equipment and materials manufactured in Europe, and of many other

things for that matter, is that it is more finished than American manufacture ordinarily is. The European not only wants his locomotive, for example, to work well, but he wants it to look well. Therefore, he hand-works and finishes and polishes every part of it, and then paints it with bright colors. Now, whether American manufacturers like it or not, they probably must recognize the fact that if they are to capture and hold foreign markets they must indulge the taste, not merely of the European, but also of the South American and many other people for this kind of thing.

The great objection of American manufacturers to meeting foreign demands as to design, finish, and so on, is that it interferes with the quantity production which appeals so strongly to America. Perhaps a compromise of some kind can be struck, but it seems highly probable that large American manufacturers, in order to get and hold foreign trade, will have to set aside parts of their plants, or even establish separate plants, in which special machinery will be used and specially trained workmen will be employed, to make things as the foreigners want them made. It goes without saying that this would increase the cost of production; and how costs of production in the different countries will compare after such questions as those of wages and the distribution of raw materials are settled under peace conditions is still a matter of conjecture.

#### Some Things We Can Sell Abroad

A very large number of bridges has been destroyed in all the countries in which actual hostilities have been carried on; and America should be able to replace many of these. American bridges have established a good reputation throughout the world; and it is not so necessary to construct them according to foreign ideas of good practice.

That countries throughout the world will go to the United States for rails seems certain. The American makers of track fastenings should be able to get a large business in Spain, Portugal, France, Italy, and other countries, but they must be willing to make them to metric dimensions, and to meet foreign specifications. There will be a large market in Europe and elsewhere for American-made springs; but I gain the impression that if American manufacturers are to hold a substantial business in Europe they must follow European practice, even if they have to provide separate plants for the purpose.

#### Success of American Machine Tools

One of the great successes in Europe during the war has been made by American machine tools. There is no question that in the making of machine tools America leads the world. "Imitation is the sincerest praise"; and there are two or three concerns in Great Britain which are giving American machine tools this high praise by copying them without saying anything about the fact that what they are making are copies. How American tool makers will be able to meet this unfair competition is conjectural. It would appear, however, in view of the wonderful results obtained with our machine tools during the war, that our manufacturers should be able to build up and hold an immense foreign trade, especially if they can eliminate unfair competition such as that mentioned.

#### Talk of Electrification of Railways

There is much talk of electrification of railways in Europe. This has been suggested as one means by which British railways might be able to enlarge their capacity and reduce their expenses without increasing their structure gages.

The most important project for electrification which is receiving serious consideration is on the state railways of Belgium. The railways of that country have lost a large share of their rolling stock and have been largely destroyed. Since they must be so largely rebuilt, it seems to have been

concluded by their management that in the long run the most economical and progressive thing that could be done would be to reconstruct them for electrical operation practically throughout. Apparently, the plan adopted would be that of erecting large power-houses near the coal fields. Indications are that there will be a large development of the manufacture of electrical machinery and apparatus in Great Britain, and sentiment evoked by the war probably would tend to give British manufacturers a prior claim upon business in Belgium; but American manufacturers surely would have a good chance to get some of the business.

There probably will be an extensive reconstruction of block signals on European railways and American makers of signal apparatus and supplies should stand a very good chance to get a large part of this business. It is well-known that the automatic signal system, whose operation involves the use of much less labor than the manual controlled system, has been developed almost entirely by American inventors and manufacturers; and it would appear that there should soon be a large foreign market for automatic signal apparatus and supplies.

Many years ago when Lord (then General) Kitchener desired to make his famous advance upon Khartoum to rescue General Gordon, he needed practically to build and equip an entire railway line within a very short time. He asked the British builders to furnish him quickly a number of locomotives and cars, and also some bridges. The British replied they could not fill the order within so short a time. He then applied to America, and our manufacturers started the locomotives, cars and bridges to him within 30 days. It was a great achievement. Unfortunately, those locomotives and cars were kept in service on the railways of Egypt for years afterward, alongside equipment built in England. Having been turned out so quickly, they inevitably presented a very poor appearance, and gave a rather poor service compared with the English-built equipment, with its excellent design, fine lines and perfect finish. The railway men in Egypt soon forgot the circumstances under which the American equipment was built, and, in consequence, it became a permanent obstacle to the sale of additional American locomotives and cars in Egypt.

The lesson suggested by this incident does not require elaboration. There undoubtedly will be a large demand for American locomotives and cars and for various specialties used upon them, during the period of reconstruction. But whether they will in future years be a good or a bad advertisement of American manufacturers will depend upon how they are built. There is no question that American builders can do work that satisfies the foreigner. For a few years before the United States entered the war our builders were engaged more or less in making equipment for railways in accordance with foreign design—for example, for the railways of India, some of the standard designs of which were copies—and the results were very satisfactory. After the United States entered the war, however, the American government took the view that this interfered with quantity production; that quantity production was the thing most needed; and since then locomotives for export have been built chiefly according to American standards. Now, undoubtedly, for the good both of the foreign railway and the American manufacturer, the former should be educated gradually to accept American standards; but until education has done its perfect work, it will probably be good business to let the foreigner have very largely what he wants.

#### Financing Railway Construction Abroad

One of the great countries in which extensive work of reconstruction will have to be done is Russia. Her railways are in deplorable condition, and she needs a vast additional mileage of railways to enable her to develop her great natural resources. Her situation and her standards of railway construction

seem to make her much the most promising market in Europe for American railway equipment and materials; but it is to be feared it will be some years before she will have the stable government and the financial conditions which will make her a safe customer with which to do business. In entering the Russian market, it will be very important to enter through Siberia and to work harmoniously with the Japanese, who have a great influence in the Orient.

It cannot be too strongly emphasized that in the promotion of foreign trade of all kinds the business men of America must have the cordial support and the intelligent and friendly co-operation of their government. They must also have the support and co-operation of their great banking interests. The great export trade of Germany and Great Britain in railway manufactures is largely owing to the fact that their financiers have invested capital in foreign railways and then used their influence to cause the railways in which they have made investments to buy their equipment and materials from the manufacturers of their home countries. Of course, American financiers cannot be expected to make large investments abroad unless they can be made to feel reasonably sure that their government, in case of need, will help to protect their investments. There are vast parts of the earth, especially in Eastern Europe, Asia—particularly in China—Africa and South America, where the construction of a large mileage of new railways is needed. If American capital builds railways in these parts of the world, these railways naturally will go to America for materials for their construction, and also for equipment and materials for their subsequent operation and maintenance. American manufacturers of railway equipment and materials doubtless in any event will get a large amount of foreign business for some years; but in the long run they probably must look to the construction of railways in foreign countries by American capital to afford them the largest part of their permanent market abroad.

Hundreds of tons of high explosives, including T. N. T., the property of the French and Italian governments, has been towed out to sea from South Amboy, N. J., and dumped overboard 35 miles from Scotland Neck lightship. This was done by order of the Railroad Administration, in order to get the dangerous stuff out of the hands of the railroads. Two hundred and twenty-eight carloads had been stored at Wilmington, Del., for some time, awaiting disposition, and the residents of that city had become nervous for fear of disaster. Some of the material was removed to interior points designated by the French government.

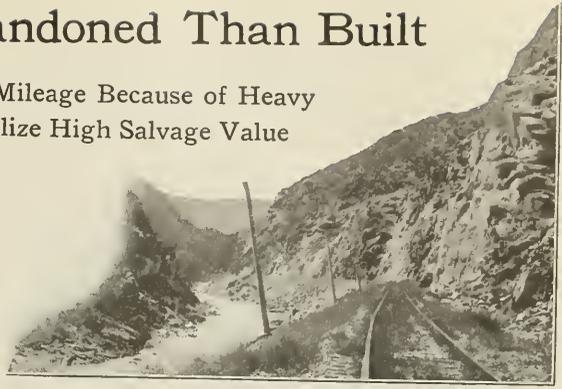

With the Czecho-Slovaks in Siberia

# More Railway Lines Abandoned Than Built

Operation Discontinued on Large Mileage Because of Heavy Expenses and Opportunity to Realize High Salvage Value

FOR THE SECOND TIME since the construction of the railway system of the United States was first undertaken in 1831, more miles of main lines have been abandoned a year than have been built. The only other year in which this condition existed was in 1917. In 1918, 445.83 miles of main lines were abandoned permanently and taken up, 2.68 miles additional were abandoned permanently but have not yet been taken up, and 224.37 miles were abandoned for operating purposes for the period of federal control owing to the consolidation of parallel lines. A total of 672.88 miles of main lines has therefore been abandoned for operating purposes during the year which has just closed. This is considerably in excess of the mileage of new lines built as indicated in another article. A total of 200.32 miles of main lines has also been abandoned in Canada, this mileage being confined to the Pacific Coast extensions of the Canadian Northern and the Grand Trunk Pacific in Western Alberta and British Columbia, where joint operation was instituted, in this way releasing considerable quantities of stock materials for military use on the French front.

A decrease in the mileage of railway lines in operation in the United States for two successive years does not necessarily indicate that this country is oversupplied with railways or that there are no further large areas needing transportation facilities. Rather, these statistics are a striking commentary on the conditions through which the railways of the United States have been passing in recent years. The fiscal policy of the state and national commissions to permit rates to be increased commensurate with the rising costs of operation have forced many of the smaller and weaker lines into bankruptcy. Obviously the first roads to go under have been those in sparsely settled areas or with light traffic. Under these conditions banks have been reluctant to advance the funds necessary for the reorganization and rehabilitation of these properties, and, being unable to operate at other than a loss, there has been no alternative for them except to suspend operations. Even under these conditions the state commissions have, in most instances, refused to permit the abandonment and taking up of the lines and it has been necessary for the owners to go into the courts to secure the necessary authority after proving their inability to operate successfully. The abandonment of these lines has received a decided impetus during the last two years. Costs of operation have risen rapidly on the small roads as well as on the larger systems. When the government took over the roads a year ago no distinction was made between the large and small lines in the President's proclamation. However, the Railroad Administration soon showed an unwillingness to assume financial responsibility for the operation of many of these smaller lines which were not essential to a unified national transportation system and a large number of them were turned back to their owners shortly before July 1. Facing increased costs of operation brought about by the war, supplemented by the wage advances granted the employees of the roads under federal control, confronted with the division of traffic to the government-operated lines, and with little or no relief through increased rates, the owners of many of these properties have abandoned hope and shown a disposition to dispose of the roads for what they could secure. Another condition leading to the abandonment of weak

roads has been the high prices which have prevailed for second hand materials. The shortage of railway supplies, and particularly of steel, raised the prices for many second hand materials to the point where they could be sold for considerably more than their cost new. In a number of instances this has resulted in the junk value of lines being greater than the amounts actually paid for them several years previous. Naturally, therefore, the owners of roads who were contemplating their abandonment in the near future have hastened to take advantage of these conditions to secure the highest possible return from their properties. The conclusion of the war, with the probable early return of the material market to a more nearly normal condition, will largely remove this latter incentive.

The statistics of lines abandoned this year also include a new factor. In working out the details of the policy of unified control of the railways of the United States as a single system the Railroad Administration has found it possible to co-ordinate the facilities of parallel lines in numerous instances. In some cases parallel single track lines have been converted for double track operation. In other cases one line has been abandoned and the traffic of both roads concentrated on the other line. This accounts for the 224.37 miles of lines reported as abandoned in the third column of the table accompanying this article.

Although it is in the far west that the greatest need for transportation facilities exists, it is in this same area that the largest mileage of lines has been abandoned.

The longest line on which operation was abandoned during the year was the Colorado Midland, extending from Divide, Colo., 194.20 miles to New Castle. Operation of this road ceased on August 1 and plans were made for its dismantling before winter, but the Colorado Utilities Commission prevented the track from being removed and the matter is now in the courts. The next longest road to be abandoned was the Las Vegas & Tonopah, 117 miles long, in Nevada.

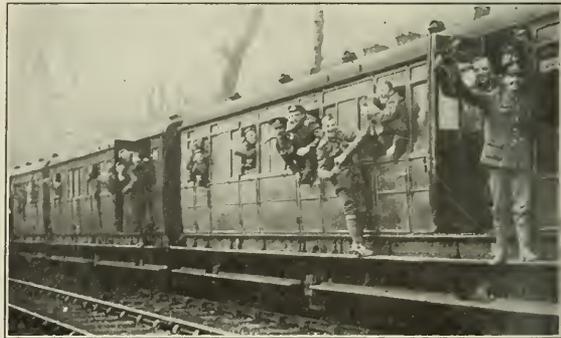

The longest line abandoned and taken up is the North Pole route, in Alaska, 90 miles, and the next longest line is the Wisconsin & Michigan, 52.8 miles.

In considering these roads which have been abandoned one should not lose sight of the fact that many other lines in operation in the United States are unremunerative, but, being parts of larger systems, which as a whole are solvent properties, they cannot be abandoned. Particularly in the mountainous states of the west, as in Colorado, many of the larger systems are handicapped by branch lines tapping mining regions of earlier days, but now largely abandoned or extending into areas for which there has never been a sufficient demand for railways to justify their construction permanently. If left to themselves such lines would be clearly insolvent and abandoned, but as parts of a larger

system they have constituted a drain on the earnings of the remunerative lines and the state commissions have in general refused to permit their abandonment. The time would now seem opportune to make a study of lines of this character in order to ascertain where they may be abandoned and to remove this drain on the railways before they are turned back to their owners.

# A Shipper's View of the Railroad Problem

Opposes Government Ownership or Operation. Suggests  
Larger Powers for Central Regulating Body

By F. B. Montgomery\*

COMPLYING with the *Railway Age's* request for an expression of my views regarding the disposition of the railroad problem, I will say at the outset that I am opposed to government ownership and government operation. I shall not enter into a discussion of the merits and deficiencies of railway nationalization further than to say that from my observation of federal control in this country nor my knowledge of government ownership as it has worked out in other lands, has convinced me that private operation is economic anachronism. In this connection it should be borne in mind that a shipper's interest in transportation means means and ends with service rendered; he will espouse any form of operation which, in his estimation, will produce maximum results with a minimum of expense. It is therefore significant that after eleven months of practical experience with government operation the leading shippers' organization unanimously adopted a resolution in its annual convention condemning both federal control and ownership and recommending the early return of the railways to their owners.

Assuming that the carriers revert to private operation, the question arises whether they should return to the conditions which obtained previous to the war or whether some modifications should be made in their organization and in the laws governing them. Opinions on this subject are diverse. My own ideas, which follow, are subject to change as I give the matter more intensive study, and I wish it to be understood that they represent my personal views only, and in no wise indicate those which may be taken by the company which I represent, or the National Industrial Traffic League, of which I am a member.

Competition between railroads is a desirable economic condition and should be re-established. The larger trunk lines, however, should have the right to purchase and consolidate adjacent and connecting short lines and roads which are not self-supporting—subject to the approval of the Interstate Commerce Commission. The carriers should be insured rates which will produce a liberal return on the use of their property with a surplus not exceeding four per cent annually. By a liberal return I do not mean reverses which will place badly managed, poorly located or over-equipped lines in the profit-producing class. Lack of insight and business ability should be penalized in the transportation field as it is in other industries. The practical effect of giving weak roads a generous return would be to allow excessive profits to the strong lines.

The Act to Regulate Commerce should be amended to give the Interstate Commerce Commission full authority over capital issues of every kind; plenary power to authorize and regulate the pooling of equipment of all kinds, the joint use of terminals and other facilities; control of maintenance work in every detail with authority to determine the extent of the work which shall be done and the expenditures which should be properly made therefor; the right to authorize or veto the construction of new lines, or the extension of old ones, after weighing their merits from the standpoint of public necessity and convenience; authority to order augmented or

reduced transportation service as the needs of the public may dictate.

The railways should retain the desirable features of unified operation brought about by government operation. Both passenger and freight train mileage should be reduced to a point not beyond the necessities and requirements of the public. There should be further consolidation and enlargement of freight trains when in the interest of economy and service. Through routing should be encouraged to reduce delays and congestion in break-up yards. Heavy loading of equipment is likewise an operating principle which has come to stay, but, it should not be observed to the extent of delaying the movement of shipments which should be handled expeditiously on account of commercial necessity. The joint ticket offices which have been established in the large cities of the country are undoubtedly a great convenience to the public and will probably be retained for that reason although they are of doubtful economy.

Those portions of the commerce act should remain unchanged which give the Interstate Commerce Commission the authority to suspend tariffs which place upon the carriers the responsibility of justifying rates of, and grant to shippers the right to route traffic. Much has been said about economical routing since the director general gave the carriers the right to deviate from the routing instructions of the shipper. It is my conviction that in times of peace the shipper is much better qualified to route traffic than the railroads. Because of his intimate knowledge of the location of the consignee with reference to alternate lines, and the character of the unloading facilities of each—if plant delivery cannot be made—he is better able to route in such a manner as to insure delivery with minimum detention at unloading platforms or in interchange yards. A recent experience of the company I represent illustrates the results which accrue from interference in routing by railroads. A heavy tractor was shipped to a point in Pennsylvania and routed over a line which had special facilities for unloading the machine at destination. The car was rerouted over another road with the consequence that it had to be switched back at destination to the line originally designated, before the tractor could be unloaded.

Another feature of government operation which has been widely proclaimed as conducive to economy and improved service is the unification of terminals. Although I do not condemn joint terminal operation and, in fact, recommend its adoption to the extent that the Interstate Commerce Commission may deem economical, it has not yet been thoroughly tried out. The best of theories do not always work out satisfactorily in practice. In making this remark I have the experience of my own company in mind. Under former conditions shipments from our Deering plant would pass through the Chicago terminal district within 24 to 48 hours. At the present time, with the terminals under one management, the best time for like movements is 72 hours.

Another idea which seems to be quite prevalent among both railroad officers and shippers is that the power to regulate railroads should be taken from the state commissions, leaving the Interstate Commerce Commission the only regulatory body in the country. It is my conviction that the territory served by our railways is too large to warrant such a concentration of authority. Innumerable matters of local

Mr. Montgomery is manager of the traffic department of the Internationalvester Company, Chicago, and chairman of the Committee on Carriage and Storage of the National Industrial Traffic League. He is also a member of a special committee of the N. I. T. League, created to study the railroad problem and to recommend remedial legislation.

concern and of no consequence to the remainder of the country can be better settled by a state body, thereby relieving the national commission of much detail which would have to be handled from a distance. It should also be borne in mind that the police power of the individual states gives them the authority to regulate traffic moving exclusively within their borders and this cannot be taken away from them without an amendment to our constitution. But such radical action is not, in my opinion, necessary. Through the Shreveport case which defined the relation of interstate to intrastate regulation, the Interstate Commerce Commission has all the authority over state rates that it needs.

## Dividend Changes

THE PRINCIPLE LAID DOWN in the President's proclamation taking over the roads, in so far as it applied to dividends, was the continuance of dividends at the regular rate where these dividends had previously been paid from surplus earnings. There is still some doubt and uncertainty, however, in regard to dividends, and the Baltimore & Ohio, Chicago, Milwaukee & St. Paul, and the Wabash are holding up their dividends, the first two pending a settlement of the contract with the government, and the Wabash pending a decision of the Administration.

The Baltimore & Ohio reduced its annual rate on the common stock in the second half of 1918 from 5 per cent, paid in 1917, to 4 per cent. Thus if the contract is signed with the government 4½ per cent total will be paid out in dividends for 1918.

The Buffalo, Rochester & Pittsburgh reduced its dividend rate, the rate in 1917 being 6 per cent; while 3 per cent was paid in the first half of 1918, only 2 per cent was paid

The Buffalo & Susquehanna paid 7 per cent on the common in 1917 and a 1¼ quarterly dividend on the common in the first quarter of 1918, but in the remaining three-quarters, "at the behest of the Railroad Administration," declared quarterly dividends of 1¼ per cent each, making a total for 1918 of 5½ per cent.

The Cripple Creek Central paid 6 per cent on its common stock in 1917 and 1½ per cent quarterly for the first two quarters of 1918, but passed the dividend in the third quarter, making 3 per cent paid in 1918, according to the latest advices.

The Union Pacific, in 1917, paid regular dividends on the common of 8 per cent and paid 3½ per cent extra dividends. In 1918, the stock was put on a regular 10 per cent dividend basis, although in the first quarter a regular dividend of 2 per cent was declared with a half per cent extra.

In the next and succeeding quarters the regular dividend was 2½ per cent. Thus, the stock paid 11½ per cent dividends in 1917 and 10 per cent in 1918. The Pittsburgh, Cincinnati, Chicago & St. Louis, a subsidiary of the Pennsylvania, reduced its annual dividend from 5 per cent, paid in 1917, to 4 per cent.

## Operations of the Great Western Railway of England

THE GREAT WESTERN of England is the largest railway in the United Kingdom, its operating mileage being greater by a thousand miles than that of the next largest British railway. The Great Western serves an extensive territory, west, northwest, and southwest of London, including

in the second half of the year; thus, the dividends paid in 1918 amounted to 5 per cent, but the stock is now on a 4 per cent basis.

The Alabama Great Southern in 1917 paid a regular dividend of 5 per cent and 2 per cent extra on the common, and a regular dividend of 6 per cent and 1 per cent extra on the preferred. In 1918, a semi-annual dividend of 3 per cent was declared on the common, for the first half year, and 3½ per cent on the preferred, and in August no dividend was declared on the common, and 3 per cent was declared on the preferred.

the important cities of Birmingham, Bristol, Plymouth, Cardiff, Birkenhead and Swansea. A statement recently issued from the Great Western statistical department makes available certain information regarding its operations during the last normal year preceding the war (1913), and the first four years of the war period, (1914, 1915, 1916 and 1917). From this statement the statistics in the table have been taken by the Bureau of Railway Economics, as being of general interest to students of the American railway problem, and also as throwing light on the relative operation of British railways under normal and war conditions.

NO DIVISION OF RAILROADING has been so radically modified by federal control as to organization and authority as the traffic department. The passing of competition proved the death knell of all solicitation of business. On the other hand, the rapidly rising costs of transportation during the war made increased revenues imperative, and these were secured not through the slow, cumbersome processes of the Interstate Commerce Commission and the state regulatory bodies, but promptly through a proclamation by the President. Under the authority conferred by the federal control act, the director general, acting for the President, initiated a freight rate advance of 25 per cent without hearings of any kind or referring the matter in any way to the interstate or state commissions. He knew that the railways needed more money and needed it immediately, so he proceeded to get it. At the same time that he increased freight rates he advanced passenger fares to three cents and authorized additional transportation charges for parlor and sleeping car passengers.

The original order, No. 28, provided that interstate rates should supersede state rates. As the result of strenuous protests by state commissions and others the intra-state freight rates were not cancelled but remained in force with the increase prescribed in the director general's order.

Realizing that General Order No. 28 was an emergency instrument and hence unavoidably imperfect, the director general created three territorial freight traffic committees and 25 district committees to iron out such inequalities and injustices as were contained in the order. He later authorized the appointment of representatives of the shipping public to membership on these bodies, so that no action would be taken without giving due consideration to the viewpoint of the railroad patron. This organization, under the director of the Division of Traffic of the Railroad Administration, practically replaced the Interstate Commerce Commission and the state commissions in rate regulation.

The same expeditious methods employed in securing increased revenues for the railroads were used to increase the returns of the American Railway Express Company. The operation of the company was taken over by the director general of railroads on November 18; two days later he issued General Order No. 56 announcing an advance in express rates, effective January 1, which is calculated to produce an increase in revenues of about \$24,000,000 annually.

Not only did the Railroad Administration advance its charges, but it saw to it that they were paid promptly. In General Order No. 25, which became effective on August 1, all transportation charges were put on a cash-on-delivery basis with the exception that credit is allowed under bond for 48 hours after sending a shipment, if prepaid, or after delivery at destination, if it be a collect consignment.

Through the unification of all the important lines in the country a more general introduction of uniform practices was obtained and railroad facilities and forces were more extensively pooled. Time tables and tickets were standardized, universal mileage scrip was introduced and interchangeable tickets were put on sale between certain large cities. Universal transit was established, *i. e.*, all existing tariffs which provided that outbound shipments from a transit point should pass over the road hauling the inbound were altered to permit movement over any line. Joint livestock agencies were created at the large western markets, and consolidated ticket offices have been opened in most of the large cities of the country.

From the standpoint of the shipper the very first general order was a serious invasion of his rights. It provided that the designation of routes by shippers was to be disregarded by railroads when speed and efficiency of transportation service may thus be promoted. While this action was prompted by the desire to remove all obstacles in the way of operating efficiency during the war, it deserves mention because it took from the shipper a prerogative which he long considered inviolable.

The importance of the traffic department as a railroad sales organization disappeared with the elimination of competition under government operation. Not only was all solicitation of traffic abolished, but all off-line traffic offices were closed. Although the Railroad Administration arranged that the informative work performed by these agencies should be taken over by resident lines, there has been considerable complaint on the part of shippers concerning the manner in which this service has been rendered since the change was made. The justice of their criticisms has been recognized by the director of the Division of Traffic and the regional directors who recently took steps to strengthen the traffic service departments of the railways. Exhaustive instructions issued by B. L. Winchell, Southern regional director, regarding traffic service work, were published in the *Railway Age* of December 13, page 1073. If these activities are carried on with the thoroughness suggested in Mr. Winchell's circular, it is doubtful whether the director general will be able to show any saving through the elimination of solicitation.

Other traffic activities discontinued under federal control were advertising and industrial development work. During the war when the rails were burdened with unprecedented tonnage it was not considered good policy to do anything which would tend to increase railroad traffic. It is understood that steps are now being taken to resume the stimulation of passenger traffic to some extent, and it is probable that the railroads will again take a leading part in the industrial expansion of the country. That the Railroad Administration

is planning to encourage passenger travel, which during the war was curtailed as far as possible, is further indicated by the recent restoration of a number of passenger trains which had been removed from service under federal control. In his report of the activities of the Railroad Administration during its first seven months of existence the director general stated that passenger service to the extent of 21,000,000 train miles a year had been eliminated in the territory west of Chicago and the Mississippi river, while in the eastern region the reduction in train mileage was equivalent to 26,420,000 per annum. Many of the trains annulled were superfluous, constituting duplications of service under competitive conditions. These will not be restored under government operation.

Although industrial development work was suspended during the war, the activities of the railroad agricultural departments were encouraged, as they were recognized as useful organizations in promoting a maximum yield of foodstuffs. To further strengthen the existing agricultural departments of the railways the director general created an Agricultural Section with headquarters at Washington and two agricultural committees, one for the North and West and the other for the Southeast, Texas and Oklahoma.

The director general's activities in the traffic field of transportation were not confined to emergency measures calculated to satisfy the demands of war conditions, but in some respects affected basic principles. Early in his term of office he ap-

pointed a special committee on uniform classification to formulate a report as to uniform rules, descriptions and weights with a view to completing that portion of the work. This body prepared Consolidated Classification No. 1, which has been the subject of hearings before the Interstate Commerce Commission at various cities throughout the country.

The director general has also proposed the standardization of class freight rates on a basis intended to eliminate the discriminations and inequalities resulting from differences between the rates of various States and between state and interstate rates and to bring about a greater degree of uniformity in those sections of the country where conditions of transportation, density of traffic and of population, etc., are similar. The plan, as submitted by the Railroad Administration to the Interstate Commerce Commission and the state railroad commissions, provides for a system of class rate scales, graded according to mileage, for adoption in all of the States except official classification territory, because the rates in that territory are already on a more uniform basis than in other sections of the country. Four scales are proposed, three of which are related to each other on a percentage basis. It is not probable that these scales will be made effective except after extended hearings before the various commissions. Nevertheless, some shippers have expressed the fear that the sole purpose of the plan is to effect a further increase in rates.

## One Year of Government Control of Railroads

### Radical Changes Possible Because of Autocratic Power Placed in Hands of Director General

**I**N THE ANNUAL REVIEW NUMBER of the *Railway Age* published a year ago, on January 4, 1918, there were recorded the first steps taken by Director General McAdoo toward co-ordinating the transportation facilities of the United States into a single system. We are now awaiting the appointment of a new director general of railroads, one of the most important of whose functions, it is believed in many quarters, will be to wind up the affairs of the Railroad Administration organized by Mr. McAdoo and to arrange for the restoration of the railroads to their owners at an early date.

Meanwhile Congress is beginning this week an inquiry into the railroad situation with a view to determining what ought to be the government's policy toward the railroads either now or permanently, an inquiry which will involve to a considerable extent the question as to how much of the policy adopted by Mr. McAdoo for a year during which the country was at war should be retained during times of peace. It seems to be generally accepted that if the railroads are returned to the management of their owners it will be under conditions differing greatly in many respects from those which formerly prevailed and that regardless of opinions as to the success of Mr. McAdoo's policy as a whole many lessons have been learned during the past year which will have permanent results.

A review of the manifestations of that policy and of what has been accomplished under it during the past year is, therefore, timely, but the various activities of the Railroad Administration have been so fully reported from week to week in our columns and a comprehensive official report prepared by the various departments and regional directors of the Railroad Administration is to be issued so soon that a detailed chronicle of events is hardly warranted at this time.

On June 17, after Director General McAdoo had been in charge of the railroads for over five months, he issued a

public statement declaring that the policy of the Railroad Administration has been informed and shaped by a desire to accomplish the following purposes, named in what he conceived to be the order of their importance:

#### The Policy of the Railroad Administration

First. The winning of the war, which includes the prompt movement of the men and material that the government requires. To this everything else must be subordinated.

Second. The service of the public, which is the purpose for which the railways were built and given the privileges accorded them. This implies the maintenance and improvement of the railroad properties so that adequate transportation facilities will be provided at the lowest cost, the object of the government being to furnish service rather than to make money.

Third. The promotion of a spirit of sympathy and a better understanding as between the administration of the railways and their 2,000,000 employees, as well as their 100,000,000 patrons, which latter class includes every individual in the nation, since transportation has become a prime and universal necessity of civilized existence.

Fourth. The application of sound economies, including:

(a) The elimination of superfluous expenditures.

(b) The payment of a fair and living wage for services rendered and a just and prompt compensation for injuries received.

(c) The purchase of material and equipment at the lowest prices consistent with a reasonable but not an excessive profit to the producer.

(d) The adoption of standardized equipment and the introduction of approved devices that will save life and labor.

(e) The routing of freight and passenger traffic with due regard to the fact that a straight line is the shortest distance between two points.

(f) The intensive employment of all equipment and a careful record and scientific study of the results obtained, with a view to determining the comparative efficiency secured.

While many students of transportation have formed a strong impression that Mr. McAdoo was also actuated by a desire to demonstrate that these purposes could be accomplished more successfully by the government than by private enterprise, it will be fair to endeavor to appraise the results of the year by the extent to which these objects have been attained, giving consideration to the fact that Mr. McAdoo undoubtedly had in mind a longer period than one year and that it could hardly be expected that the full results could be obtained in that period.

As the primary purpose of the government in taking over the railroads was to increase the efficiency of the trans-

portation system for the handling of the war traffic, the first question to be asked, in any analysis of the results of the year, naturally involves the volume of traffic handled. The statistics are available, in the monthly reports compiled by the Operating Statistics Section of the Division of Operation, for the 10 months ending with October, which nearly covers the period of war traffic this year, as the armistice was signed on November 11. For this period railroads operating 228,665 miles had handled a total of 365,855,394 net ton miles of freight (revenue and non-revenue), as compared with 358,977,441 in 10 months of 1917. This is an increase of 1.9 per cent. It is assumed that the real increase in traffic handled was somewhat greater than this figure indicates because one of the primary policies of the Railroad Administration has been to save ton miles by the rerouting of freight to avoid circuitous routes and cross-hauling, but the exact amount of this saving cannot be determined.

### Increased Expenses

This record-breaking traffic was handled, however, at record-breaking expense, largely on account of the increases in the wages of railroad employees, the bulk of which were made effective for the entire year, whereas the rate increase was in effect for only six months. There have also been large increases in the cost of fuel and other supplies, and while the proportion of the increase attributable to these items is not known, the total increase in operating expenses for the 10 months ending with October 31, for which statistics are available, was \$903,000,000, an increase of 38 per cent, as compared with an increase in revenues, caused principally by the increases in rates, of \$607,000,000, or 20 per cent. While a large number of economies have been effected, such as those resulting from the rerouting of traffic, the reduction of passenger train mileage, the joint use of facilities in many places, the discontinuance of traffic solicitation and the charging of many salaries and other general expenses to the corporate accounts rather than to operating expenses, their amount has been so small as compared with the increases in expenses in other directions that they became appreciable only when segregated, at least so far as this year's experience is concerned. While various statements have been given out by the Railroad Administration from time to time of the estimated savings resulting from these various economies, in one or more regions at a time, they have not been grouped in such a way as to give any very definite idea as to their aggregate. Regional Director A. H. Smith, in a report covering the operations of the Eastern region, on August 29, mentioned economies amounting to approximately \$36,000,000 a year. Doubtless more comprehensive figures will be shown in the forthcoming annual report of the Railroad Administration.

The report made by Mr. McAdoo to the President on September 3 included an estimate of \$23,566,633 for the saving effected by the closing of freight and passenger offices and curtailment of advertising, but these reductions in expenses were not in effect throughout the year, and the Interstate Commerce Commission statistics for 10 months show a decrease in traffic expenses of only \$12,000,000. The report of September 3 also mentioned a saving of \$4,000,000 in salaries of officers, but the 10 months' figures show an increase of \$12,000,000 in general expenses, which indicates that the saving in officers' salaries has been more than offset by the increase in the wages of clerks, and other general office expenses. The increase in operating expenses includes \$138,000,000 for maintenance of way and structures, \$333,000,000 for maintenance of way and equipment and \$426,000,000 for transportation, and while the maintenance of equipment account probably includes more work than was done during the corresponding period of 1917, it is certain that the amount of work performed on the maintenance of way and structures, on account of shortage

of labor and materials, was considerably less than in 1917.

What the expenses would have been if the railroads had remained under private management during the past year of course can never be determined.

The efficiency of transportation involves not only the volume of traffic handled, but the expedition with which it is moved and the promptness and regularity with which cars are supplied. While this can hardly be demonstrated statistically, it seems to be generally recognized that the classes of traffic regarded as essentials during the war period, which constituted the bulk of the traffic moved this year, have been given remarkably good service and a special expedited service has been furnished in the case of many especially important commodities, such as food supplies, oil, and other articles which have been consolidated and moved in solid trains via the routes best fitted to handle the traffic from the west to the seaports, avoiding delays at intermediate terminals. While the Railroad Administration discontinued the publication of the statistics of car surpluses and shortages which have been compiled since 1907 by the American Railway Association, the weekly and monthly reports of traffic conditions which it has issued have disclosed only occasional and local car shortages since the early months of the year and in recent weeks considerable surpluses have been reported in various sections, particularly in the case of coal cars, of which there were large shortages last year.

### Co-ordination of Government Departments

One of the most important ways in which the efficiency of the transportation service has been improved under the Railroad Administration, as far as the war traffic is concerned, has been the result of a closer co-ordination of the railroad service with the various other governmental war agencies and between our government and the representatives of the Allies. This was developed as the government gained organization experience after some unfortunate experiences in the earlier part of the war period, and the fact that the Railroad Administration was itself a government institution probably helped to promote harmonious relations. Better co-ordination of the government's traffic requirements was repeatedly urged by the Railroad's War Board last fall in order to prevent the confusion and congestion which resulted from the conflict of priority orders, but the War Board itself was not able to bring this about.

One of the first acts of the Railroad Administration after it had been organized was to appoint representatives of the Division of Traffic as traffic officers of the Food and Fuel Administrations, the War and Navy Departments, the War Industries Board and the War Trade Board. Thus, whereas priority orders had formerly been issued by 568 quartermasters in the War Department alone, the authority to issue such orders for the department was concentrated in the hands of the manager of inland traffic, and as the traffic officers of the various departments were able to work together, it was possible to carry out a general priority program without conflict and the prompt and preferred movement of war supplies was facilitated. It has come to be recognized that the congestion at the eastern seaports in 1916 and 1917 was caused by the unregulated shipment of export freight to a few ports regardless of the possibility of loading it into vessels, and it seemed impossible to increase the use of other ports because of lack of terminal facilities and because of the preference of the ships for certain ports, particularly New York.

This year the Railroad Administration perfected the permit system and the use of regulating embargoes to prevent the accumulation of freight at the ports, the government developed increased storage and handling facilities at numerous ports, the Shipping Board and the marine department of the Railroad Administration arranged for sailings from those ports and the Railroad Administration, after a study of traffic routing conducted by a special committee, ar-

ranged for the diversion of export freight to the ports where it could be handled, obtaining a much greater use of the southern and gulf ports. Later an exports control committee was formed to direct the routing of export freight and developed a zone system which greatly facilitated the regulation of this traffic.

The removal of the obstructive congestion which last winter almost paralyzed operations at some of the eastern terminals had a most vital bearing on the country's war efforts. So serious was the situation at one time that the late Lord Rhonda, food controller of England, sent a message to Washington saying that "unless America can increase the quantity of supplies I am unwilling to guarantee that the allied nations can hold out." Still later the representatives of the allied governments in Washington predicted disaster unless the shipment of food supplies was expedited and the centralized efforts of the Railroad Administration and its co-operation with other departments made it possible to meet the demands.

### Coal Traffic

Until recently the coal situation has been regarded as one of the most critical factors limiting the productiveness of America's war machine, and particularly during last winter it was the occasion of bitter controversies as to whether the responsibility for insufficient production belonged to the railroads, the coal operators, or the Fuel Administration. One of the most urgent recommendations of the Railroad's War Board was the adoption of a zone system to eliminate cross-hauling and reduce the distances over which coal should be transported. While the railroad committee had no power to put its recommendations into effect, the plan which it had worked out was taken as the basis of the plan later adopted by a joint committee of the Railroad and Fuel administrations which has been credited by the Fuel Administration with saving over 160,000,000 car miles. Co-operation between the two administrations and the coal producers and consumers also made it possible to maintain a heavy traffic in coal during the summer months when operating conditions were most favorable, and up to December 31 the railroads had handled 624,628 cars more of coal than they handled in 1917, with practically no increase in the number of cars.

This is simply one illustration of the things that were made possible by the co-operation engendered by the war. In former years railroads have tried to get consumers to buy and producers to ship coal during the months of favorable weather, without much success, because the producers could not ship without being assured of a market and consumers were reluctant to order in advance or had little storage capacity. This year advance ordering became a matter of self-preservation as well as a patriotic duty.

### Service of the Public

As to the second purpose mentioned by Mr. McAdoo in his statement, the service of the public in general, it must be admitted that the Railroad Administration during the past year has been less successful than in the handling of the war traffic, to which, of course, everything else was subordinated. Passenger service in particular has suffered in spite of many improvements effected in various ways in such matters as rearrangement of schedules, joint use of terminals, consolidated ticket offices and timetables and interchangeable tickets. Trains have been overcrowded and many privileges formerly accorded to the traveling public have been withdrawn. However, these conditions have been accepted cheerfully on the whole by the majority in the same way that various discomforts and inconveniences caused by the war in other ways have been accepted. There has been more complaint on the part of shippers regarding the loss of some of their privileges and because of the frequent disturbance of established conditions, while ship-

pers whose products were listed among the non-essentials have had little occasion to praise the service. Many representatives of the more essential industries have paid high tribute to the quality of the service accorded them.

As far as the maintenance and improvement of the railroad properties are concerned, the results have not been conspicuously successful because of the priority of other demands upon the supplies of labor and materials. Only 38 per cent of the authorizations for capital improvements had been expended up to November 1, and while special attention has been paid to the repair of cars and locomotives, rail and tie renewals have fallen behind. While the capital expenditures represent a greater sum of money than has been so expended in the past two or three years, the increased prices will offset the difference to a considerable extent. Deliveries of cars and locomotives have not fulfilled the expectations announced by the Railroad Administration when the orders were placed, but while some of the delay is doubtless attributable to the time consumed in the preparation of standard designs and under the new method of centralized purchasing the requirements of the railroads in the United States were allowed to give way to the requirements for equipment for use on our military lines abroad.

As to the promotion of a spirit of sympathy and a better understanding between the administration of the railways and their employees, opinions seem to differ widely. While Mr. McAdoo has made himself popular with the employees whose wages he has increased, the various wage orders have caused some dissatisfaction because of changes in the relations between the wages of various classes of employees, and there have been indications that the popularity of the director general has been somewhat at the expense of the discipline and of the respect for supervising officers because of the tendency on the part of employees to look to Washington. There have been also many reports of lack of courtesy on the part of employees which has been attributed by some observers to the lack of respect for local officers, but may be attributed in part to the general spirit of independence at a time when men were scarcer than jobs.

Any analysis of the results obtained this year in the direction of the application of economies, which Mr. McAdoo stated as his fourth purpose, would better await more complete reports which are soon to be made available. The various steps taken in this direction have been rather fully described in various issues of the *Railway Age*.

In all that it has accomplished the Railroad Administration has had an enormous advantage over private railroad corporations in the almost autocratic power placed in the hands of the director general by the federal control law and the ability to subordinate the question of expense. Whether or not such powers would be allowed to continue long during peace times, the director general was given sufficient authority to make rates commensurate with the expenses and was given in addition an appropriation from which he can draw if the rate increase for this year proves insufficient. He was not hampered by the difficulties of reconciling conflicting interests and he was able to disregard the various restrictions imposed by laws and commission orders on the railroads. The Sherman law did not apply to his operations, the right given the shippers to route their freight became non-existent, he was able to increase demurrage rates to a figure sufficient to penalize delays in loading and unloading cars, the tariff minimum weights no longer stood in the way of economical loading of cars, and neither competition nor the pressure of shippers, labor organizations or state commissions was allowed to interfere with sound railroad practices. Whether similar powers can, as a matter of practical politics, be conferred upon the railroads under other conditions and whether they could be made equally effective without a considerable degree of centralization, are questions that will doubtless be fully discussed in the near future.

# The Suspension of Commission Regulation

## Interstate Commerce Commission Divested of Most of Its Authority; State Bodies Ignored

ONE OF THE MOST interesting aspects of the railroad situation during the past year has been the practical absence of commission regulation. When affairs came to such a pass that the government realized the necessity of giving more consideration to the practical question of getting the utmost efficiency out of the transportation machine than to the question of preventing some railroads from earning too much money, the government demanded for itself a freer hand than it had allowed the railroad managers. This was justified both on the ground of efficiency and on the theory that the government need not regulate itself. When the federal control act was passed, very largely in the language which had been suggested to Congress by Mr. McAdoo's representative, it was found to contain a provision that the carriers while under federal control should remain subject to all laws and liabilities as common carriers "except in so far as may be inconsistent with the provisions of this act or any other act applicable to such federal control or with any order of the President."

As a result, while the organization of the Interstate Commerce Commission has been made useful in various ways by the Railroad Administration, and while it has been allowed to preserve the continuity of its records and, therefore, has been kept about as busy as before, the commission has been temporarily divested of most of the authority it formerly possessed.

The state commissions were not even mentioned in the federal control law and they have been almost as completely ignored by the Railroad Administration ever since. As far as railroads are concerned, the state commissions have hardly even been kept busy, except for their efforts to preserve their former prerogatives and to persuade Mr. McAdoo and his organization to accept their co-operation in some way that would give them a hand in the game.

The relation of the Interstate Commerce Commission to federal control has been very clearly set forth in the commission's annual report, of which an extensive abstract was published in the *Railway Age* of December 6. In the first stages of federal control individual commissioners and bureaus of the commission performed some useful services for the Railroad Administration, four commissioners took part in the negotiations with the railroad companies over the draft of the standard compensation contract, and the commission itself, under the terms of the law, has certified to the President the amount of the net operating income for the years 1915, 1916 and 1917, which is the basis for the compensation of the companies.

Another function of the commission in relation to the Railroad Administration has been advisory, the rendering of advice at the request of the director general in matters affecting the shipping and traveling public, such as the proposed consolidated freight classification and the advance in express rates. In both cases the commission was not asked to decide anything. The Railroad Administration assumed the responsibility but the commission was asked to give its judgment as to the effectiveness of the methods proposed to attain the desired object.

The authority which the commission has so long exercised in the regulation of rates was largely taken away from it by the provision in the federal control law authorizing the President to initiate rates and prohibiting their suspension, although the commission was authorized to enter upon a hearing and review presidential rates after they were in effect,

upon complaint. Under the broad powers thus conferred the director general was able to put into effect a 25 per cent increase in freight rates and an advance in passenger fares to 3 and 3½ cents a mile without even asking the commission's advice and upon less than the statutory 30 days' notice, and while the commission retained its jurisdiction over the rates of carriers not under federal control and over the joint rates between federal and non-federal roads, it has usually been prompt to accede to the requests of the Railroad Administration in such cases. While a large number of complaints have been filed with the commission attacking rates made by the Railroad Administration, the commission has decided only a few of them, which involve questions of relationships, rather than absolute reasonableness. In these cases the commission asserted its power to change the rates but it has not yet passed directly upon the 25 per cent increase in any case and numerous problems created by the somewhat arbitrary manner in which the increase was put into effect are still before it. Meanwhile numerous adjustments of rates of the kind which formerly were referred to the commission have been handled by joint committees, of railroad traffic officers and shippers, created by the Railroad Administration.

### State Commissions Not Consulted

The Interstate Commerce Commission has apparently appreciated the necessity for the exercise of autocratic powers by the Railroad Administration during war time, and whether or not it has approved everything that has been done, it has at least been able to maintain harmonious relations with the Railroad Administration; but the same thing cannot be said of the state commissions. The very fact that there are 47 of them made it difficult to deal with them on any effective basis of co-operation, and when the Railroad Administration early indicated its intention of handling the transportation situation as a national proposition, without taking time to consult with the state authorities or allowing itself to be interfered with by them, a state of strained relations soon became apparent, which was not improved by the tendency on the part of some railroad officers to make the most of their independence. The difficulty was increased by the fact that the provisions in the law are not so specific as to remove all doubt as to the respective jurisdiction of the states and the federal government. The law provided that nothing in the act should be construed "to amend, repeal, impair or affect the existing laws or powers of the several states, except wherein such laws, powers or regulations may affect the transportation of troops, war materials, government supplies or the issue of stocks and bonds." The state commissioners argued that this was intended to preserve state regulation in so far as it did not interfere "in any proximate and tangible way with the transportation of troops and munitions," and that this included authority over intrastate rates as an exercise of police powers. The Railroad Administration never specifically stated its interpretation of this language, but in practice it has initiated intrastate as well as interstate rates and has filed tariffs with the state commissions "for information only" and not in accordance with state statutory provisions.

In matters of service the Railroad Administration has acted apparently upon the assumption that its authority was complete, and while Mr. McAdoo has indicated a willingness to receive advice and suggestions from the state commission-

ers, and in many cases has adopted their recommendations in local matters, it was made clear to the state commissioners that the deciding power was at Washington, and that their recommendations would have more practical effect than their orders. This, however, was not the kind of recognition that the state commissioners wanted, and while many of them were jealous of their authority and resented being ignored, others were frankly puzzled as to how to comply with their local statutes. During the war most of the state commissions refrained from actively pressing the issue, but at the convention of the National Association of Railway and Utilities Commissioners in Washington after the armistice was signed the restraint was removed and resolutions were adopted asking recognition of the full and un-

impaired authority of the states, and declaring that "in any event it is the duty of each state commission to exercise and maintain its statutory authority to the extent which it may deem the public interest demands."

Mr. McAdoo yielded to the protests of the state commissioners, reinforced by a number of congressmen, particularly from the South, in one important instance. When General Order No. 28 was issued, providing for the general increase in rates, it was proposed to remove all conflict between state and interstate rates by first raising the state rates to the level of the interstate rates in the same territory before applying the 25 per cent increase. This would have resulted in some very large increases in some states, and Mr. McAdoo was finally persuaded to omit the first advance.

## Transportation Facilities of the A. E. F.

### Necessary to Build Vast Piers, Docks and Warehouses and Much Track, Rolling Stock and Other Facilities

**T**HE RAILWAY TROOPS recruited in this country under the direction of S. M. Felton, director general of military railways, and sent to France for work in connection with the transportation of the American Expeditionary Forces, up to November 30 aggregated 1,921 officers and 62,859 men actually attached to organized military units, in addition to a large number of officers and men sent from time to time as casuals.

While the complete story of the accomplishments of the railway engineers in France, as their contribution to the big job of winning the war, is yet to be told, we have secured some data which gives an idea of the extent of the transportation operations required to meet the needs of our army abroad. Before the armies could function in the field vast piers, docks and warehouses had to be built at the French ports assigned to the American forces, and railroads with the necessary rolling stock for the transportation of troops and supplies had to be either constructed or secured from the French. These operations involved the development of some 16 French ports from the English Channel to the Mediterranean, with such facilities as piers, unloading machinery, warehouses, and railroad yards and terminals, the repair, ex-

pansion and maintenance of the standard gage railroad lines assigned by the French, the construction of narrow-gage lines from the rail heads of the main lines to points near the trenches, and the provision of cars and locomotives, as well as the crews to operate them.

A total of 957 miles of standard gage railway track had been laid in France by the American railway engineers up to November 30. This comprises yards and sidings only, as, contrary to a rather widespread impression which has been allowed to spread because of the secrecy maintained during the war, the Americans built no new main line railroad in France, except for the 5.75 mile double track cut-off built to run trains around the city of Navarre, which was described in the *Railway Age* of December 6. As fast as they could supply the men and equipment the American railroad men undertook the operation of their own trains over several hundred miles of French railroads which had been assigned to their use, extending from the various ports toward the American front in the Toul sector, and they built their own yards, terminals and sidings, including terminal facilities for each engine district.

The transports supplying the American Expeditionary

S. M. Felton, Director General of Military Railways, and Commissioned Officers of His Staff. Front Row, Left to Right: Major W. W. Sullivan, Lt. Col. W. H. Holcombe, Col. J. M. Wright and S. M. Felton

Forces used 74 berths located at La Havre, Brest, St. Nazaire, Les Sables-d'Olonne, Nantes, La Pallice, Rocheport, Paullac, Bassens, Bayonne and Marseilles. New trackage had to be built in connection with the development of these ports, whose capacity was increased from 5,000 tons a day last January to 33,400 tons a day at the close of hostilities. From the ports the rail lines used by the Americans converge toward the front and in the vicinity of the trenches supplies were transported from the standard gage railheads over more or less temporary light railways of 60 cm. gage that were extended as the line advanced.

A total of 1,358 standard gage steam locomotives of the "Pershing" Consolidation type have been shipped to France for the use of the American Expeditionary Forces, and 65 additional engines of this kind have been shipped for the use of the French government. In addition, 332 locomotives of this kind were en route to France on November 30 or on docks in the United States awaiting shipment. Fifteen extra tenders for these engines have also been shipped. Thirty saddle tank switching locomotives are now in use by the American Expeditionary Forces. Ten gasoline locomotives of 150 h.p. each are in use in France, and six additional engines of this kind were en route.

Forty-five 36-inch gage steam locomotives are in use in France and one such engine was en route. One hundred and ninety-one steam locomotives of the 60 cm. gage are in use in France, and 30 of these engines were either en route or are on the docks in the United States awaiting shipment. Sixty-five 35 h.p. gasoline locomotives, 60 cm. gage, are in use in France, while 108 50-h.p. gasoline locomotives, 60 cm. gage, are in France, and one was en route. A total of 2,189 locomotives had been shipped to France either for the use of the American Expeditionary Forces or of our Allies.

The following standard gage freight cars have been delivered in France for the use of the American Expeditionary Forces: 4,459 box cars, ordinary; 3,350 box cars with cabs, 1,225 high-side gondolas with tarpaulins, 1,425 high-side gondolas without tarpaulins, 3,429 low-side gondolas, 1,700 flat cars, 675 tank cars, 950 refrigerator cars, 400 ballast cars, 150 six-yd. dump cars, 150 12-yd. dump cars, 100 16-yd. dump cars, two 100-ton freight cars, 796 motor cars, 352 hand cars, 108 push cars, total 19,271; 3,217 standard gage cars were either en route to France or on the docks in the United States awaiting shipment.

The following narrow gage cars have been delivered to the American Expeditionary Forces, or were en route thereto:

36-inch gage, 400 flat logging cars; 40 cm. gage, 500 dump cars, and 1,000 push cars; 60 cm. gage, 600 box cars delivered and 65 en route, 166 tank cars, 500 flat cars, 1,555 low-side gondolas, 230 one-yd. V-dump cars, with 64 additional en route. One hundred of the 1½ V-dumps have been delivered and 100 were on the way; 100 artillery trucks have been delivered and 100 additional were en route; 970 motor cars, 180 inspection cars, 300 hand cars and 990 push cars have also been delivered.

Shipments to France of locomotive cranes total 120, ranging in capacity from 7½ to 35 tons. Thirty-three five-ton gantry cranes and 15 10-ton gantry cranes were also shipped for the unloading of equipment at the ports of debarkation.

Two standard gage locomotive repair shops, each accommodating a road equipment of 1,500 locomotives have been constructed. One of these shops is situated at Nevers and the other at Melun. At La Pallice one standard gage erection shop with a capacity of 100 cars per day was completed. Twelve engine houses, each handling from 50 to 75 locomotives per day have been built.

A narrow gage locomotive repair shop accommodating 120 locomotives per month was constructed at Dijon, and an addition to this plant is being erected which will increase its capacity 50 per cent. There are two base and four field narrow gage engine houses which have also been built.

The following narrow gage track and track materials have been sent to France: 150 miles 40 cm. fabricated track, with 12-lb. rail; 490 miles of 60 cm. fabricated track, with 25-lb. rail; 435 miles, 25-lb. rail and fasteners.

#### Court Overrules Director General

In a suit brought by Robert McKay against the Erie Railroad Company to recover \$25,000 for personal injuries, Judge Vickery, of the Court of Common Pleas, Cleveland, Ohio, overruled a motion to have the Erie dismissed as a defendant and the director general substituted, in accordance with the order of the director general concerning the filing of personal injury claim suits. This motion was denied by the judge, who stated orally that he believed that under Section 10 of the Act of Congress of March 21, 1918, actions such as the one before him were properly brought against the carrier company. While this case was pending prior to the date of the director general's order, the tenor of the court's remarks did not indicate that his holding would have been different if the action had been brought since.

# The Motive Power and Rolling Stock Situation

Condition of Locomotives Much Improved During the Year;  
Car Conditions Are Less Favorable

**D**URING THE PAST YEAR, up to November 30, the records of the Railroad Administration show that the railroads of the United States have received 2,343 new locomotives, of which 1,364 were built on orders placed by the railroads prior to the institution of government operation, 546 were United States Railroad Administration standard types and 200 were Russian Decapod locomotives. An additional 105 Consolidation locomotives built for U. S. Army use overseas were placed in service during the latter part of 1917 and early in 1918. The last of these, however, was withdrawn from service to be sent overseas during the month of September.

The distribution among the various regions of the locomotives placed in service during the year is shown in Table I. It will be seen that there are to be delivered on orders already placed, 1,428 locomotives, 544 on orders placed prior to January 1, 1918, and 884 on orders for standard locomotives.

These locomotives have been placed in service on the lines where the need has been the greatest, irrespective of ownership. Table I shows that 91 new locomotives built for roads in the Southern, Central Western and South Western regions, on orders placed by the roads themselves in 1917, have been placed in service on roads in the Eastern, Allegheny and Pocahontas regions. In addition to the new locomotives, 22 old locomotives have also been transferred from roads in the south and west to those in the east, making a total of 113 locomotives now operating in regions other than those in

which the owning roads are located. There undoubtedly are some other locomotives which have been transferred between intraregional lines, but no complete data for these are available. The details of the interregional transfers are shown in Table II.

**No Immediate Shortage of Power**

Notwithstanding the fact that the number of locomotives actually built for the use of the railways in the United States during the past year and the four preceding years has materially fallen behind the 10-year average of 1907 to 1917 inclusive, and that there was an acute shortage of power apparent at the close of 1917, there is at the present time very little evidence of a lack of sufficient power to meet immediate requirements. This does not mean, however, that there is no need for new power. Old locomotives have been kept in service at a sacrifice in operating efficiency to preclude a repetition of conditions existing last winter. The number of locomotives built each year during the above mentioned 10-year period for domestic steam railroad use has averaged approximately 3,300. For the past five years, beginning with 1914, the railroads have fallen behind this figure by an average of about 1,300 locomotives each year, a decrease which can be accounted for only partially by the increase in tractive effort of the locomotives built during recent years.

There are, broadly, three factors to which the present fortunate situation must be attributed: (1) In general the power of the country is in much better condition now than at the beginning of any winter for several years past; (2) the application of economy and capacity increasing devices to existing equipment has increased the effectiveness for service of a large number of locomotives, and, (3) there are now retained in service many locomotives which, if new power were available, would, and could economically be scrapped.

**Power Now in Good Condition**

That the condition of power is much better than it was last year is evidenced by the fact that for several months past there have constantly been stored in serviceable condition from 800 to 1,000 locomotives, over half of them on the eastern roads, where extraordinary demands are most apt to arise. This improvement has been made possible by the increased working hours which have been in effect since last spring, the decrease in labor turnover during the latter part

country as a whole, the increase in output is more than accounted for by the increase in maintenance forces and the increase in working hours from the eight, nine and ten-hour days in effect in various parts of the country, to the 70-hour week which was in effect on many roads from March to November 25. During the period covered by the table it also will be seen that there has been a gradual increase in the number of locomotives being repaired for other lines, the maximum shown being 284 during the first week in November.

Since November 25, when working time was reduced from 70 hours a week to a nine-hour day basis, followed on December 9 by a further reduction to an eight-hour day, there has been a decrease in output which has been felt more particularly in running repairs. The eight-hour day necessitates the employment of three shifts at engine terminals, with a consequent increase in supervision, where two shifts have heretofore been the rule. At present, in most cases practically the same number of men who have constituted the two shifts must be redivided into three. It will, of course, be possible gradually to build up these forces to overcome the present shortage as demobilization progresses. The power has been put in such good condition during the past summer and fall that the reduction in back shop output following the reduced number of working hours on the whole need give little immediate concern.

**Old Power Modernized**

Since 1914, the conditions which have restricted the buying of new power have directed attention to the possibilities for increasing the capacity of a large number of existing locomotives by the application of economy and capacity increasing devices, most important of which are the superheater, mechanical stoker and brick arch. During the past four years not less than 10,000 old locomotives have been equipped with one or more of these devices. In some cases the conversion has made unnecessary the purchase of a new class of power to perform the service which these engines were becoming unsuitable for, but which they are now cap-

TABLE III--WEEKLY SUMMARY OF THE CONDITION OF POWER ON THE RAILROADS OPERATED BY THE UNITED STATES RAILROAD ADMINISTRATION

October 26.....	63,247	53,711	9,536	5,807	4,723	1,084	274	875	271,554	250,195	21,359	
November 9.....	63,269	53,357	9,912	5,791	4,636	1,155	284	878	276,837	253,066	23,771	
November 30.....	63,418	53,641	9,777	6,317	5,054	1,263	259	1,119	281,384	253,788	27,596	

of the year and the increase in the number of men employed on locomotive maintenance. Both of the latter are the result of the wage increases put into effect by the Railroad Administration.

What has been accomplished in increased shop output will be evident from an inspection of Table III, showing the condition of power for alternate weeks during a period of 18 weeks, for the months of August to November inclusive, which has been compiled from data collected by the equipment maintenance section of the Division of Operation of the Railroad Administration. For this period, which is practically one-third of the year, it is evident that the number of locomotives turned out of shops (including all engines out of service for repairs over 24 hours) is nearly 23 per cent greater than during the corresponding period of 1917, while the number of employees in the locomotive department has been approximately nine per cent to 11 per cent greater than the number in service last year. Taking the

able of performing satisfactorily. In such cases each converted locomotive has saved the purchase of a new one, while in others the saving in new locomotives has been in proportion to the increase in capacity effected by the change, which conservatively would be between 10 and 20 per cent. It is evident that these 10,000 converted locomotives have had a material influence in preventing an acute power shortage.

**Many Locomotives Should Be Scrapped**

While the use of obsolete locomotives, to scrap which authorization has been secured or is contemplated, may be effective in preventing an acute shortage of power, it can be justified only to meet an emergency. With such locomotives in service it cannot truly be said that there is no shortage of power. In the interest of economical operation it is now imperative that there be a heavy purchase of new power in order that the three or four years' accumulation of scrap power may be gotten off the lines.

The Car Situation

Although there has been some improvement in the percentage of bad order cars in the course of the year, it is doubtful if there has been any real improvement in the condition of freight cars such as noted in connection with locomotives.

In the first place the number of new cars delivered to the railroads during the past year was less than half the number which were placed in service during 1917, and is hardly large enough to take care of normal replacements. The extreme need of equipment during the past year has therefore led to the retaining in service of a large number of cars which should be and will be retired at the first opportunity. These cars, unlike old locomotives, cannot be kept in condition to remain in service without causing an undue pro-

The pooling of equipment has also tended to decrease the output of running repairs. It is a comparatively simple matter to supply material for the repairing of home line cars at outlying points where mill facilities are not available. Considerable delay is inevitable, however, where a very large percentage of the cars on the repair tracks belong to foreign lines, each requiring more or less special material.

The destruction of the incentive of the pieceworker following the failure to adjust the piecework wage differential to correspond to the increase in hourly rates, has had a much more marked effect in reducing the output in the car department than it has in the locomotive department.

The effect of these adverse conditions is not reflected in the percentage of bad order cars, which has been maintained

TABLE IV—WEEKLY REPORTS OF CAR CONDITIONS FOR ALL REGIONS

Week ending	Oct. 19	Oct. 26	Nov. 2	Nov. 9	Nov. 16	Nov. 23
Number of roads reporting	139	139	138	139	139	139
Total revenue cars	2,478,704	2,441,111	2,431,255	2,437,344	2,430,606	2,447,922
Bad order cars—1918	140,328	139,548	135,462	134,874	132,853	130,048
Bad order cars—1917	131,036	132,501	128,957	129,414	124,162	123,056
Heavy repairs—1918	82,459	82,078	79,559	79,198	77,966	78,941
Light repairs—1918	57,869	57,470	55,903	55,676	54,887	51,107
Percentage of bad order cars	5.7	5.7	5.6	5.6	5.5	5.3
Average number of bad order cars repaired per working day	86,486	83,279	83,728	83,469	82,274	82,805
Light repairs	9,332	8,871	8,578	8,797	8,173	8,209
Heavy repairs	77,154	74,408	74,750	74,672	74,101	74,596
Number of cars transferred to other shops	5,075	626	589	253	485	524
Number of employees—1918	140,021	138,703	158,959	142,500	141,540	143,169
Number of employees—1917	118,758	123,156	124,256	124,521	123,966	124,319
Number of cars damaged in trains	13,605	13,060	12,446	12,364	12,255	12,668
Cost of labor	\$126,630	\$121,275	\$90,464	\$123,463	\$128,925	\$135,887
Cost of material	\$154,708	\$151,476	\$170,532	\$162,818	\$179,972	\$182,005
Number of cars damaged in yards	5,264	4,868	5,267	5,275	5,159	5,242
Cost of labor	\$54,308	\$46,823	\$53,492	\$49,959	\$50,886	\$52,406
Cost of material	\$76,589	\$61,135	\$68,072	\$66,920	\$93,720	\$70,987
Cars held to be dismantled	5,584	7,211	6,920	6,823	6,646	6,640

portion of failures, and the need of retirement is therefore greater than in the case of motive power.

Those roads which had practically completed extensive reinforcement programs prior to our entrance into the war still have their equipment in excellent condition. Many roads, however, were only instituting such programs or had only partially carried them out before the pooling of equipment took the rolling stock out of the control of the owning

between five and six per cent, a figure approximately equal to the average for the country in 1917. An inspection of Table IV, however, shows that of the total number of bad order cars shown on the weekly statements of the maintenance of equipment section of the Division of Operation of the Railroad Administration for the six weeks ending November 23, from 58.7 per cent to 60.7 per cent are classed as needing heavy repairs. Of the corresponding daily output the number of heavy repairs has averaged a fraction above 10 per cent. It is evident, therefore, that there is an accumulation of cars needing heavy repairs, which eventually must be reckoned with. If this situation is to be improved some means should be taken to return the cars to the owning roads at the earliest possible opportunity, where in many cases material for reinforcing is already available, as in this way only can the greatest output be obtained for the labor expended.

Air brake conditions have been notably poor during the past year. This is due in part to a lack of proper facilities for testing and repairing brake equipment, to the necessity for employing many inexperienced men on this class of maintenance, and in part to a shortage of material.

TABLE V—PERCENTAGE OF BAD ORDER CARS BY REGIONS

Week	Oct. 19	Oct. 26	Nov. 2	Nov. 9	Nov. 16	Nov. 23
Eastern	6.3	6.4	6.2	6.3	6.1	6.1
Allegheny	7.1	7.1	7.1	7.0	6.7	6.4
Peachonts	5.9	6.9	5.8	5.6	5.6	5.1
Southern	4.4	4.8	4.5	4.7	4.8	4.4
Central Western	5.0	4.9	4.7	4.8	4.8	4.7
South Western	3.1	3.1	2.9	2.9	2.8	2.8
North Western	5.7	5.4	5.4	5.2	5.3	5.2
All regions	5.7	5.7	5.6	5.6	5.5	5.3

roads. In such cases there has been very little opportunity during the past year to continue the betterment program, the proportion of cars on home roads being so small as to very seriously slow up this work.

Bailey—First Station South of Nenana, Mile 407.

# The Supply Industry's Output of War Products

## How Manufacturers of Railway Materials Responded to Call for Military and Naval Equipment

MODERN WARFARE is a struggle of industries as well as of armies and navies. One of the things which made the German Empire so formidable a foe was the fact that it was the leading producer of guns, ammunition and other military supplies, for many years prior to the opening of hostilities in 1914. The United States and Canada, although industrial nations, had manufactured products useful to mankind in the pursuits of peace, and when involved in the conflict were forced to refit and remodel their shops and factories to supply war-time needs. How rapidly and how well this was done is common knowledge, but the extent to which railway supply companies participated in this work has not been given any appreciable publicity up to this time.

For the purpose of gathering a few facts concerning the part taken by the railroad supply industry in the manufacture of war supplies, the *Railway Age* recently sent inquiries to practically all companies which can be properly classed as belonging to that field. This information was not sought with the idea of setting out any particular manufacturers as worthy of greater distinction than others. In fact, approximately 25 per cent of those replying stated that they had continued to supply the railroads of this country exclusively throughout the war. In doing so they were performing a patriotic and highly important service, as adequate transportation is second only to the army and navy as an arm of warfare. The sole aim of the inquiry was to learn the degree in which some supply industries were transformed by the world upheaval and the various kinds of war materials they made.

The materials manufactured by railway supply companies include a great variety of war supplies. Among them were aeroplanes and accessories for airplane motors, 155 mm. howitzers, gun and ammunition carts, gun carriages, machine gun parts, shells, shell forgings, artillery hub bushings, drop bombs, steel mines and buoys, life boats and life boat parts, steel work for U. S. destroyers and merchant vessels, flanging and machine work on armored fighting tanks, trenching shovels, linings for steel helmets and engineer depot motor truck machine shops. A number of companies supplied materials and machinery for the shipbuilding yards, such as shipbuilding gantry locomotive cranes, railroad material, work locomotives, ship material and staybolts for marine tube boilers. One manufacturer produced roofing and waterproofing papers for cantonments; another shipped iron culvert pipe to France for use in the construction of military railways; a considerable number manufactured cars or locomotives, or parts thereof, for war service abroad.

Six railway supply companies reported that they had devoted 100 per cent of their plant capacity to war work; two stated that they were in the 98-per cent class; three rated their production at 95 per cent; one at 92 per cent; two at 90; two at 80, and the remainder at varying percentages below that figure. Some were unable to make any definite estimate of the proportion of their output which could be classed as war production.

The lack of uniformity in the replies received makes generalization difficult. In the belief that the information received concerning the individual companies will prove of interest, some of the facts divulged in response to our inquiries are presented.

### What Each Company Did

*The American Brake Shoe & Foundry Company* acquired five new plants primarily for war work at Erie, Pa. These cover an area of about eight acres. One plant was devoted

exclusively to war production and employed about 7,500 men. In one shop the company produced 155-mm. howitzers at the rate of 10 per day; in another shop 155-mm. high explosive shell bodies at the rate of about 3,000 per day, and in another 9.2-in. shell bodies at the rate of 1,300 a day.

*The American Castings Company, Birmingham, Ala.*, received one direct war contract which called for a large shipment of National lock joint cast iron culvert pipe to France for use in connection with the construction of military railroads.

*The American Flexible Bolt Company, Pittsburgh, Pa.*, increased its plant capacity considerably toward the end of 1917 to provide for an anticipated increase in the locomotive staybolt business. When this did not materialize because of war conditions the company contracted with the Emergency Fleet Corporation for its requirements of staybolts for marine tube type boilers. This work is still in progress, and the company expects to continue the manufacture of staybolts for marine boilers.

*The American Steel Foundries* produced shell forgings, ingots for shell forgings, castings for gun mounts and gun carriages, together with other Ordnance Department castings, and castings for submarines and battleships, davitt fittings, anchors and miscellaneous castings for the Emergency Fleet Corporation. Approximately 40 per cent of the company's steel casting capacity, 10 per cent of its structural plant capacity and 100 per cent of its forge plant, were used for war purposes. About 40 per cent of the total number of employees were engaged in war production. The company's forging shop at Indiana Harbor, Ind., was constructed primarily for war work. It consists of a main structure, 600 ft. by 175 ft., with an addition, 75 ft. by 500 ft. There is also a pump house in connection with this plant, 36 ft. by 300 ft. A number of additions have been made to the old plants of the American Steel Foundries during the past two years, but these were intended as permanent fixtures in the company's equipment and not solely as a means for increased war production.

In 1917 about 62 per cent of the locomotives built by the *Baldwin Locomotive Works* were for war service. During the first ten months of 1918 the proportion was 67 per cent. In addition to locomotives, the company built shells and gun carriages, although the relative output of these was small. As the result of war demands, the existing plants at Philadelphia, Pa., and Eddystone were enlarged. In Philadelphia an addition was built to the truck shop, and an eight-story reinforced concrete building was erected for shell work. New shops for shells and a large locomotive erecting shop were also constructed at Eddystone, Pa.

*The Barco Manufacturing Company, Chicago*, used most of its capacity for Railroad Administration work. About 15 per cent of its output, however, consisted of specialties for the Pershing engines manufactured for use on the military railways in France.

*The Berger Manufacturing Company, Canton, Ohio*, is another 100 per cent concern. Its output consisted of sheet metal products.

*The Buda Company, Harvey, Ill.*, manufacturer of trucks and tractors, was on a 60 per cent war basis.

*The L. S. Brach Supply Company, Newark, N. J.*, devoted 95 per cent of its plant capacity to war production. It manufactured telegraph and telephone instruments, antenna reels, radio sets, metal flagstaves, breast reels, projectors, compasses, etc.

The *Chicago Bridge & Iron Works, Chicago*, was on a 100 per cent war basis, 75 per cent of its output being ship material for the Emergency Fleet Corporation, 15 per cent powder plant work, 5 per cent steel tanks for the army and navy departments, and 5 per cent miscellaneous structures for plants engaged on war contracts.

The *Cleveland Twist Drill Company, Cleveland, Ohio*, devoted practically 98 per cent of its plant capacity to war work. It erected one new plant, which added about one-third to the total manufacturing floor space. Its production consisted of the company's regular line of drills, reamers, etc. The importance of a drill becomes evident when one considers that a 3-in. shrapnel shell contains 70 drilled holes, totalling 19¼ in. in depth. On a conservative estimate, a million shells of somewhat similar dimensions were the daily food of the European Mars. That means that 1,600,000 ft., or over 300 miles of drilled holes were shot away every 24 hours on the battle fronts of Europe.

The *Dominion Foundries & Steel, Ltd., Hamilton, Ont.*, reports that 80 per cent of its capacity was devoted to ordnance work and the balance to indirect war work. Cast steel slugs and shell forgings represented 80 per cent of the output previous to the signing of the armistice; miscellaneous work, including machining of shrapnel and 4.5-in. shells, constituted 5 per cent of the total production, ship castings and forgings 5 per cent, and the remainder, castings and forgings and rolled plate for railway cars, locomotives, etc. The company's plant is now from four to six times its pre-war size. The Dominion Foundries claims to be the originator of the direct conversion of shell scrap to shell forgings. It also claims a forging record of 1,846 9.2-in. shell forgings made on a single press in a 24-hour run. It also believes it holds the record for 6-in. shell forgings, i. e., 3,115 produced by a single press in a 24-hour run.

Among the war products manufactured by *A. Gilbert & Sons Brass Foundry Company, St. Louis, Mo.*, were artillery hub bushings and shells. Approximately 62 per cent of the tonnage of the company consisted of war materials.

The *Hale & Kilburn Corporation, Philadelphia*, used 80 per cent of its plant capacity and 95 per cent of its employees for war work. It manufactured drop bombs, machine gun parts, steel mines and buoys, truck bodies and limbers, repair cabinets, artillery trailers and steel work for U. S. destroyers and merchant vessels. An old plant with 700,000 ft. of floor space was devoted to war work and a new plant, 50 ft. by 200 ft., was constructed for the same purpose.

The *Hayes Tract Appliance Company, Richmond, Ind.*, furnished derrails to a number of navy yards, shipbuilding plants and cantonments, but the volume of this business was small. About 20 per cent of the capacity of the company during one month was used for an order of material for the American Expeditionary Forces in France.

*Heywood Brothers & Wakefield Company* devoted about 70 per cent of the capacity of its car seat plant, located at Wakefield, Mass., to the production of war materials. Here a great variety of articles were produced, among them field litters, navy deck chairs, ammunition truck linings, aeroplane chairs, camp stools, entrenching shovels and deck coverings for destroyers and patrol boats.

The *Independent Pneumatic Tool Company* was on a 100-per cent war basis. Its output of pneumatic tools was increased approximately 300 per cent over the production during peace times.

The *Keith Railway Equipment Company, Chicago*, devoted most of its manufacturing capacity to the production of car equipment for domestic use. It received an order for the government for 500 flat cars for service in France, but this order was later canceled because of the conclusion of hostilities.

The *Lackawanna Steel Company, Buffalo, N. Y.*, manufactured rolled steel shapes, rails, plates, structural material, bars, etc., for the use of the army and navy and other departments of the government. While no exact records are available, the company devoted its entire output to government work during a considerable portion of last year.

The *Laconia Car Company, Laconia, N. H.*, used about 25 per cent of its plant capacity and a like percentage of its men on war work. Its only war product was 75-mm. shell forgings.

The *Lakewood Engineering Company, Cleveland*, was practically on a 100-per cent war basis. It added two small plants during the war and increased the capacity of the Lakewood plant by the addition of four large buildings. Its output consisted of industrial cars and concrete mixers.

The *Lehon Company, Chicago*, was on a 90-per cent war basis. Its output included material for railroad cars built for service in France, roofing and waterproofing papers for cantonments, hospitals, etc.

The *Lima Locomotive Works, Lima, Ohio*, did not engage in any direct war work, except the production of locomotives for overseas use, detailed information concerning which is published elsewhere in this issue.

About 5 per cent of the output of the *Morden Frog & Crossing Works, Chicago*, was for overseas railroads and navy and cantonment yards in this country.

The *More-Jones Brass & Metal Company, St. Louis, Mo.*, produced brass, bronze and phosphor bronze castings used in connection with orders for the Navy, Ordnance Department and Shipping Board.

The *National Car Coupler Company, Attica, Ind.*, devoted about 95 per cent of its plant capacity to war production. About 80 per cent of the war output was tractor work and 5 per cent locomotive cranes.

The *Orton & Steinbrenner Company, Chicago*, rated its war output at 98 per cent. It produced locomotive cranes, shipbuilding gantry locomotive cranes, clamshell and orange-peel buckets, all but 2 per cent of which were contracted for by the War Department. The company constructed one temporary building, containing about 8,000 sq. ft. of floor space for war purposes. It doubled its peace-time output.

The *Parquesburg Iron Company, Parkesburg, Pa.*, devoted about 11.6 per cent of its capacity during 1918 to orders for the United States Navy and 14.4 per cent to contracts of the Emergency Fleet Corporation. The sole output of the company consisted of Parkesburg charcoal iron boiler tubes.

The *Pettibone Mulliken Company, Chicago*, manufactured frogs and switch material for railway construction in France. It estimates that about 20 per cent of its plant capacity was devoted to this work.

The *Pittsburgh Testing Laboratory* has been engaged in tirely in war work. This company is not a manufacturing concern, but rendered service to this country by testing materials and inspecting the workmanship of the products of industrial plants. This inspection was done not only for the United States government, but for the governments of the allied nations. The company's six-story laboratory and office building and equipment at Pittsburgh was turned over to the Bureau of Aircraft Production as a research laboratory. A new laboratory, having approximately 35,000 sq. ft. of floor space, was built to take its place and additional laboratories were installed at Detroit, Mich., and Birmingham, Ala., while the size of the New York branch was quadrupled.

The *H. K. Porter Company, Pittsburgh, Pa.*, produced locomotives for the army and navy in this country and abroad, and for the use of the allied nations, turning out marine engines and reversing engines for the use of the Emergency Fleet Corporation, and at the same time did all of the

flanging and a good deal of the machine work on the armor plate for 5,000 of our armored fighting tanks. The company was on a 92-per cent war basis.

The *St. Louis Car Company, St. Louis, Mo.*, devoted about 90 per cent of its plant capacity and a like percentage of its employees to war production. Its output included aeroplanes, gun and ammunition carts, engineer depot motor truck machine shops, life boat parts and freight cars for war service in France. A new steel shop, with 200,000 sq. ft. of floor space, was erected for war work.

The *T. H. Symington Company* did not utilize its plant at Rochester, N. Y., for war work, but did organize a new company which constructed a plant at Chicago for the

forging and machining of 75-mm. shrapnel and high explosive shells and of 75-mm. field guns and 155-mm. shells.

Approximately 50 per cent of the output of the *Western Wheeled Scraper Company, Aurora, Ill.* consisted of standard gage air dump cars for the construction and maintenance of military railways in France. In addition, the company produced small narrow gage cars for work near the front lines and practically every earth and stone handling tool that it manufactured for construction work on roads and railroads, including elevating graders, engine and horse-drawn road graders, wheeled scrapers, drag scrapers, grading plows, rock crushers, dump wagons and cars. The company was on a 95-per cent war basis.

## A Chronological History of Government Control

### Important Steps in the Development of the Organization and Policy of the Administration

**D**URING THE 12 MONTHS that have elapsed since the government assumed control of the railroads, the roads have undergone changes which have been unprecedented. The director general's small original staff has developed into a great central and regional organization with departmental heads at Washington. Many of the short line railroads originally taken over have been relinquished, corporate interests have been divorced from the operating organization, rates have been increased and wages have been raised. Traffic activities have been consolidated or discontinued; cars and locomotives built to standard designs have been introduced. There is not a single department that has not undergone radical changes. While the history of government control cannot be told in a few words, a concise list of the more important developments in the order of their occurrence should prove of interest. With that thought in mind, the list given below has been prepared:

December 26, 1917. President Wilson issues proclamation taking over the railroads and appointing William G. McAdoo director general of railroads.

December 27. Director General McAdoo issues first order and appoints as assistants Walker D. Hines and A. H. Smith.

December 28. Railroads pass into control of the government at 12 o'clock noon.

December 29. General order No. 1 issued, directing employees to continue in performance of regular duties.

December 31. The Railroads' War Board resigns. Government control for purposes of accounting begins at 12 o'clock midnight.

January 4, 1918. President Wilson addresses joint session of Congress on the railroad situation. Bill for control of the railroads introduced.

January 18. Eastern, Southern and Western regions created and A. H. Smith, C. H. Markham and R. H. Aishton appointed regional directors. Railroad wage commission created.

January 21. Demurrage rates increased. Railroad wage commission organized.

January 26. Judge John Barton Payne appointed general counsel.

January 29. Demurrage rules changed to take effect February 10.

February 2. Circular on additions and betterments sent to railroads.

February 4. Railroad control bill reported to the Senate. Director general outlines duties of regional directors.

February 6. Commission on Car Service and Bureau of Car Service of Interstate Commerce Commission merged and reorganized as Car Service Section, Division of Transportation. W. C. Kendall, manager.

February 9. Organization of director general's staff announced as follows: Assistant to director general, Walker D. Hines; general counsel, John Barton Payne; director Division of Transportation, C. R. Gray; director Division of Traffic, Edward Chambers; director Division of Finance and Purchases, John Skelton Williams; director Division of Labor, W. S. Carter; director Division of Public Service and Accounting, C. A. Prouty; manager locomotive section, Division of Operation, Frank McManamy. Inter-regional traffic committee appointed.

February 15. Embargo rules of Railroad Administration issued.

February 15. Marine section of Division of Transportation created.

February 19. Safety section, Division of Transportation organized with Hiram W. Belnap, manager.

February 21. General Order No. 8 issued, outlining duties of employees.

February 22. Committee on cars of the Council of National Defense delegated to investigate standards for freight cars.

February 22. Engineering committee delegated to review improvement work appointed with Francis Lee Stuart chairman.

February 22. Railroad control bill passed by the Senate.

February 28. Railroad control bill passed by the House of Representatives.

March 7. Organization of Division of Finance and Purchases with central and regional committees announced.

March 12. Division of Capital Expenditures created and R. S. Lovett appointed director.

March 16. General Order No. 11, on universal interline way billing issued.

March 18. Circular No. 10 issued directing that expenses of financial and corporate offices shall not be charged to operating expenses.

March 21. Railroad control bill approved by President Wilson.

March 22. Consolidation of ticket offices at Atlanta authorized.

March 22. Railway board of adjustment No. 1 created.

March 26. Section for protection of property, Division of Law, created. General Order No. 15, requiring industries to pay for and maintain industry tracks, issued.

- March 27. Railroad Administration asks prices on 100,000 freight cars.
- March 28. Regional traffic committees created.
- March 29. Specifications for standard freight cars announced. Director general authorized to exercise powers conferred on President Wilson by Congress. Inspection and tests section, Division of Transportation, created with C. B. Young as manager.
- March 30. Traffic soliciting discontinued. Salaries of corporate officers charged to corporate accounts, after April 1 by Circular No. 17.
- April 1. Freight car repair section, Division of Transportation, created with J. J. Tatum as manager.
- April 9. Railroad traffic activities to be consolidated or discontinued. Director general orders that suits against railroads must be brought in district where plaintiff resides or where cause of action arose.
- April 13. Coastwise steamship lines taken over.
- April 19. Tentative specifications for standard locomotives announced.
- May 1. Universal interline billing in effect. Fuel conservation section created and Eugene McAuliffe appointed manager.
- May 2. Distribution of orders for 100,000 standard freight cars and 1,025 standard locomotives announced.
- May 3. Committee on Mail Transportation appointed with Guy Adams as chairman.
- May 8. Report of the Railroad Wage Commission made public.
- May 18. Budget for improvements and extensions during 1918 given out.
- May 20. Freight charges placed on a cash basis by provision of General Order No. 25.
- May 23. Director General McAdoo announces that roads will be operated by federal managers.
- May 25. General advances in freight and passenger rates ordered. General Order No. 27 covering general wage advance issued. Theodore H. Price appointed actuary of the Railroad Administration.
- May 31. Troop movement section, Division of Transportation, created with George Hodges as manager.
- June 1. Allegheny and Pocahontas regions created; C. H. Markham and N. D. Maher appointed regional directors. B. L. Winchell becomes new director of Southern region. Board of Railroad Wages and Working Conditions organized.
- June 6. State commissioners ask suspension of the rate order.
- June 7. Organization of American Railway Express Company announced.
- June 11. Central Western and Southwestern regions formed; Hale Holden and B. F. Bush appointed regional directors.
- June 11. Operating statistics section of the Division of Operation created with W. J. Cunningham as manager.
- June 14. District directors for New England, and Ohio-Indiana districts appointed.
- June 21. Board of Adjustment No. 2 organized.
- June 22. Interstate express rates increased.
- June 29. Railroad Administration relinquished nearly 2,000 short line railroads.
- July 1. Announcement made that rates would be changed without authority of the Interstate Commerce Commission.
- July 1. Mechanical department, Division of Operation, organized with Frank McManamy in charge as assistant director, Division of Operation.
- July 3. Operating department of the Pullman Company taken over.
- July 4. First standard locomotive completed.
- July 10. Express and mail section of Traffic Division established with F. S. Holbrook as manager. Agricultural section established with J. L. Edwards, as manager.
- July 19. Section of insurance and fire protection organized with Charles N. Rambo as manager.
- July 22. Three general and 25 district freight traffic committees appointed.
- July 22. Short line railroad section formed with E. C. Niles as manager.
- July 24. Wages of mechanical department employees increased by Supplement No. 4 to General Order No. 27.
- August 30. Bureau of Suggestions and Complaints established under the direction of Theodore H. Price.
- August 30. Freight claim section created with John H. Howard as manager.
- August 20. Interchangeable mileage script on sale.
- September 1. Director General McAdoo orders railroad employees to abstain from political activities.
- September 1. Engineering and maintenance department of Division of Operation established; Charles A. Morse appointed assistant director, Division of Operation.
- September 3. Director general reports to President Wilson on first seven months of operation of the railroads.
- September 4. Director general approves standard compensation contract.
- September 5. Wages of agents, clerks and laborers increased by Supplement No. 7 and wages of maintenance department employees increased by Supplement No. 8 to General Order No. 27.
- September 6. Division of Inland Waterways created.
- October 22. First compensation contracts signed by Director General McAdoo.
- October 25. Short line contract approved by Director General McAdoo.
- October 25. Standard scale of class rates submitted to the Interstate Commerce Commission.
- November 16. Wages of telegraph and telephone operators increased by Supplement No. 10 to General Order No. 27.
- November 18. American Railway Express Company taken over.
- November 20. Express rates increased effective January 1.
- November 22. Director General McAdoo announces intention to retire.
- November 22. Members of Board of Adjustment No. 3 announced.
- December 2. President Wilson in address to Congress proposes to relinquish railroads.
- December 5. Judge Lovett resigns as director of the Division of Capital Expenditures.
- December 10. Theodore H. Price resigned as actuary of the Railroad Administration to take effect January 1.
- December 11. Director General McAdoo in letter to chairman of congressional committees, proposes five-year extension of federal control.
- December 20. Carl R. Gray, director, Division of Operation, resigned to take effect January 15, 1919.
- December 28. Supplement 13 to General Order 27 issued, making a further revision of the wage scales of telegraph operators and similar employees on the basis of a minimum of 48 cents per hour.
- January 1. Secret service branch of Claims and Property Protection section of the Division of Law terminated and Secret Service and Police Section of the Division of Operation created with W. J. Flynn as chief.

Transportation of mail to Chicago by airplane has been indefinitely postponed, this because of unsuitable machines or inexperienced aviators. The Post Office Department and the War Department seem to disagree as to the cause. One of the aviators in the mail service was killed on December 30 while making a trial flight, and two others have been injured.

# A Review of Railway Signaling for the Past Year

## Conditions Affecting the Work. New Block Signals Nearly All Automatic. Considerable Progress in Interlocking

AS IN OTHER BRANCHES of railroad work the signal department program has been carried on during the past year with the one essential purpose of helping to win the war. The appropriations during 1918 have been large, but the actual volume of work done has been somewhat less than that of previous years. The production and the actual installation of the materials have not kept pace with the plans authorized. The improvements of the 12 months, as represented in our tables, have cost something like seven millions of dollars, the expenditures in this department to November 1, as reported by the Railroad Administration, having amounted to \$5,965,544. The delays have been largely due to the priorities for war materials which greatly handicapped the production of signal supplies. The orders now on hand that will carry over into 1919 and the amount of new work in prospect indicate a favorable year for good business in the signal field. A large amount of maintenance work should be done throughout the country during the coming year and material for this class of work will be in demand. The total authorization for the signal departments for 1918, as recorded at Washington, amounted to \$16,601,166, or much more than double the amount mentioned above as expended in the first ten months; and most of these unexpended appropriations will, no doubt, be carried out as early as practicable in 1919.

The railroads have been handicapped in maintaining their signals by the large number of new employees. During the past year the railroads have shown a tendency to place orders earlier in the year to cover material for the following year's work. This is of direct benefit, as the construction program can be started earlier than would otherwise be the case.

Orders for signal material have been received almost entirely from the larger roads. Possibly only 5 to 10 per cent of all the material ordered has been for the use of electric lines. The average prices for signal material at present are approximately 5 per cent higher than those existing a year ago, while the cost of materials and labor entering into the manufacture of signal materials in the past year is approximately 10 to 20 per cent higher. With the material and labor markets remaining at their present level the prospects are that prices will show no decided decrease in the near future.

No important developments in new signaling devices or systems have taken place during the past year. In this connection it may be noted that some railroads which have heretofore regarded up-to-date signaling as unnecessary for their lines have found that under the necessity of obtaining maximum traffic capacity it is necessary to follow modern methods. With the heavy reconstruction period ahead and the prospect that the United States will serve as the storehouse for the world, the future appears bright from the signaling standpoint as the railroads will have to handle heavy traffic and this condition should be reflected in connection with signal construction programs.

During the past year several bad collisions have occurred with heavy loss of lives. These accidents again brought to the attention of railroad and government officers the necessity of preventing insofar as possible such occurrences in the future. In this connection the automatic train stop has

been receiving careful consideration of the officers whose duties it is to investigate and report on such devices. The Bureau of Safety of the Interstate Commerce Commission has strongly advocated the development of such a device as an adjunct to the present signal system for the prevention of collisions. A committee was to have been appointed by the Railroad Administration to make a thorough study of this

question, but no action has yet been taken, and it is doubtful whether such action will now be taken unless other collisions occur in which the loss of life is much greater than has occurred in the past. Should this happen, public opinion may force the passage of legislation requiring such safeguards and this legislation may prove more detrimental than if the railroads themselves had developed and applied the necessary safeguards.

A review of the statistics of block and interlocking signals construction during the past year and of the plants now in course of construction shows a total of 1,966 miles of road block signaled in the United States and Canada since January 1, 1918, or 843 miles less than the total recorded for the

calendar year 1917. It is very difficult to make exact comparisons of the total mileage of road worked under the space interval system because in numerous cases the new automatic signaling has taken the place of the manual block system, and some roads have not been careful to give the full facts in such cases. Nearly all of the new block signaling installed in 1918 is automatic and in the work now under construction (1,515 miles in the United States), and proposed for 1919 (1,438 miles), the non-automatic mileage is almost negligible.

In interlocking work the roads have not made the same progress as in 1917. The total number of plants completed or on which important changes have been made is 143, as compared with 187 the previous year. There are 135 plants now under construction as compared to 164 last year. The proposed new work for 1919, totaling 81 plants, is 27 less than the number proposed a year ago. The figures given under the column of proposed work are far from complete, as a number of the roads which contemplate extensive work are not yet ready to announce their programs. As was the case last year, the Interborough Rapid Transit Company, operating both elevated and subway lines, has expended several millions of dollars on interlocking and block signal work, and the work done or proposed by this company is

prominent in all three of the interlocking tables. The figures so far available, together with the data concerning work now under construction and in respect to plants for 1919 are shown in the accompanying tables.

The data from which the totals here presented are made up is given in the tables under nine heads, as follows:

- A—Automatic Block Signaling Completed in 1918.
- B—Automatic Block Signaling Under Construction.
- C—Automatic Block Signaling Proposed.
- D—Manual Block Signaling Completed in 1918.
- E—Manual Block Signaling Under Construction (none).
- F—Manual Block Signaling Proposed.
- G—Interlocking Completed in 1918.
- H—Interlocking Under Construction.
- I—Interlocking Proposed.

**Block Signaling Completed**

From the reports received the largest mileage of automatic block signals installed on a single road was on the Northern Pacific, which put in service 185 miles of single track and 48 miles of double track signaling, using 387 signals. Other roads installing a mileage of over 100 are the Illinois Central, which completed 191 miles of single track and 12 miles of double track signaling, with a total of 386 signals; the Great Northern, which installed 139 miles of single track and 11 miles of double track signals, with a total of 291 signals; the Los Angeles & Salt Lake, with 132

miles of single track signaling and a total of 224 signals; the Chicago, Burlington & Quincy, which completed two miles of single track and 129 miles of double track work, with a total of 399 signals, and the Chicago, Milwaukee & St. Paul, which installed 112 miles single track and 5 miles of double track automatics, using a total of 321 signals. Of this latter installation 112 miles were installed in the electrified territory in Montana, the signals consisting of the color light type, of which 284 were used.

The Interborough Rapid Transit Company, New York

City, installed 702 signals on its elevated and subway lines. These lines are of three general classes, namely, two track lines on which all trains stop at stations at frequent intervals, and on which, as a rule, there is no block signaling except at curves; four track lines on which the two inner tracks are used for express trains and are completely signaled, and three track lines, the middle track of which is in most cases signaled for the movement of trains in both directions. On these middle tracks the trains usually run toward the business district in the morning and in the opposite direction in

\*In tables A, B and C the column headed "double track" includes also the mileage of three-track and four-track lines. In these tables the name of the maker of signal apparatus, where it has been given, is shown in the last column: Federal; G. R. S. (General Railway Signal Company); Hall; Union (Union Switch & Signal Company).  
New York, New Haven & Hartford: The 69 semaphore signals have high power electric lights giving indications not only at night but also in the daytime.

the afternoon. Automatic train stops are used in connection with all automatic block signals on this road. Express tracks and middle tracks are equipped with automatic block signals at suitable intervals to allow the running of trains three blocks apart, under a headway of 90 seconds. Approaching the stations on express tracks automatic block signals with automatic train stops are placed very close together so as to constitute a system limiting the speed of trains.

In Canada very little automatic block signal work has been completed during the past year.

Block Signals Now Under Construction

Only three roads reporting have over 100 miles of automatic block signals under construction on December 31, 1918. The Atchison, Topeka & Santa Fe has under construction 172 miles of single track and 116 miles of double track signaling, on which 468 signals will be used. The

Illinois Central is installing 204 miles of single track and 9 miles of double track signals with a total of 362 signals. The Chicago, Milwaukee & St. Paul is installing 198 miles of single track and 12 miles of double track signals using a total of 298 signals. Of this mileage 198 miles of single track is in the electrified territory in Montana, where signals of the three position a. c. color light type are used.

The Chesapeake & Ohio has under construction 21 miles of single track and 12 miles of double track signaling, using 94 signals. In connection with this work automatic stops are being installed, including 57 ramps for automatic train control on 15 miles of the line (single track). The Interborough Rapid Transit will install 307 light signals on its lines in Manhattan and Brooklyn, including 7 miles of middle track to be signaled in both directions.

**Block Signaling Proposed**

Of the work proposed for 1919, six lines expect to install more than 100 miles of automatic block. The Northern Pacific proposes to install 360 signals on 213 miles of single track; the Kanawha & Michigan will install 150 miles of single track signals and 13 miles of double track automatic block using a total of 210 signals; the Chicago, Milwaukee & St. Paul will install 127 miles of single track and 17 miles of double track signals using 261 signals; the Cleveland, Cincinnati, Chicago & St. Louis will install 124 miles of

double track signaling using 200 signals; the Great Northern will install 17 miles of single track signals using 217 signals, and the Chesapeake & Ohio will install 98 miles of single

TABLE D—MANUAL BLOCK SIGNALING INSTALLED IN 1918

levers located at LaVergne, Ill., on the Chicago, Burlington & Quincy. The Illinois Central completed a plant with 53 working levers at Pullman Junction, Chicago, while the Central of Georgia placed in service an electric plant of 92 working levers at Macon. This, however, consisted of the reconstruction and enlargement of an existing plant.

Electro-pneumatic interlocking plants have been installed on four lines; a 25-lever plant on the Delaware, Lackawanna & Western, at Orange, N. J.; one of 18 levers on the Southern Pacific at San Francisco; Boston Elevated one of four levers, and the Interborough Rapid Transit installed no less than 35 plants with a total of 444 working levers. The

under construction, namely, the Boston Elevated, with one 37-lever and one 4-lever plant; the Baltimore & Ohio, with one 14 and one 30-lever plant; the Jacksonville (Fla.), Terminal, with one 122-lever plant; the Interborough Rapid Transit Company, with 8 plants ranging in size from 4 to 24 working levers, having a total of 94 working levers for all; the Pennsylvania, with one 83 and one 51-lever plant, at Philadelphia; the Philadelphia & Reading, with one push-button electro-pneumatic machine of 43 units, installed at Rutherford, Pa., yard, and the Richmond (Va.), Terminal, with one 40-lever plant.

The largest all-electric interlocking plant under construction is one of 74 working levers on the Brooklyn Rapid Transit at Coney Island Creek, protecting the terminal and drawbridge. The next largest is a 72-lever plant being installed at Rochester, N. Y., to replace a pneumatic plant on the New York Central.

The Atlantic Coast Line has one electro-mechanical plant under construction; the Chesapeake & Ohio has 7 electro-mechanical plants ranging in size from 12 to 38 working levers; the Jacksonville Terminal is installing one 48 working-lever electro-mechanical plant; the Big Four has one 16-lever plant; the New York, New Haven & Hartford one 30 and one 28-lever plant, while the Philadelphia & Reading is revising one plant which will have 67 working levers; the Pennsylvania is installing 10 electro-mechanical plants ranging in size from 7 to 47 working levers each. The eight interlocking plants on the Interborough covered by the items in Table H are located on six different lines, namely, Third Avenue elevated; Nostrand Avenue, Brooklyn; Eastern Parkway line; White Plains Road line; Webster Avenue line; additions on the Fourth and Lexington Avenue line.

Interlocking Proposed for 1919

Column 5 in Table I shows electro-pneumatic plants proposed on four roads. The Union Railroad (Pittsburgh, Pa.), will install two plants on the Clairton branch. The Norfolk & Western will install one 12 and one 10-lever electro-pneumatic plant. The Interborough Rapid Transit is contemplating installing 11 electro-pneumatic interlocking plants ranging in size from 3 to 32 working levers, totalling 118 in all at various points on the Lexington Avenue, East Parkway, Nostrand Avenue, White Plains Road and Webster Avenue lines. The New York, New Haven & Hartford is contemplating the installation of an electro-pneumatic push-button machine at a hump yard in Boston, 32 units.

The Philadelphia & Reading is contemplating installing two electro-mechanical machines, one of 35 and the other of 29 working levers. The Big Four is contemplating the installation of a 34-lever electro-mechanical machine, while the Baltimore & Ohio has under consideration the installation of a 37-working lever machine.

The largest all-electric machine contemplated for 1919 is one at Hayford, Ill., on the Belt Railway of Chicago, which is to have 168 working levers. The next largest electric machine is to be located at the East New York Terminal on the Brooklyn Rapid Transit line, at Tower 'B' and is to consist of 136 levers, while the third largest is contemplated at East Penn Junction, on the Philadelphia & Reading, 96 working levers.

The American Metric Association held its second annual meeting at Baltimore and Washington on December 27 and December 28. David A. Molitor, of Detroit, Mich., outlined his work for the C. E. Schmidt Company, tanners. He found that about 500 different commodities were being purchased for the use of this company and that they were recorded in many different units. By entering the weight or measure of everything in metric units marked economy was effected. The metric weights and measures were then used exclusively.

\*See note under Table G.

largest of these was a 44-lever plant located at 180th Street, on the White Plains Road line. The plants ranged in size from 44 down to three working levers.

Nineteen electro-mechanical plants were installed, ranging in size from 6 to 43 working levers. One push-button electro pneumatic machine was completed during the year on the New York, New Haven & Hartford at the Cedar Hill (New Haven), hump classification yard, 44 units. The Southern Pacific installed one six-lever low voltage electric plant operated by interlocked circuit controllers at Stockham, Ariz., while a low voltage layout was put in on the Oregon Short Line at Pocatello, Idaho.

Interlocking Under Construction

Column 5 in Table G includes electro-pneumatic plants and contains data from seven roads on which such work is

# Government Locomotive Orders Predominate in 1918

## Railroad Administration and Director General Military Railways Place Most of Year's Business

THE NUMBER OF LOCOMOTIVES reported as having been ordered during the 12 months of 1918 was 4,888, of which 2,802 were on domestic orders for companies in the United States and Canada, and 2,086 were on orders for shipments to other countries. These figures compare with a total in 1917 of 6,142, of which 2,704 were on domestic orders and 3,438 were for export, principally to the war zone in France.

The leading feature in the locomotive market during the past year, as in every other essential industry in the country, was, of course, the predominance of government orders. Of the 2,593 locomotives reported as having been ordered for service in the United States (that is, excluding the domestic orders for Canada), no less than 2,030 were included in the orders for standard locomotives placed by the United States Railroad Administration. Of the 209 locomotives ordered

in 1918, inclusive of the Canadian orders, as will be seen from Table II, was greater than last year but not as great as 1916. It was greater than the totals of domestic orders in 1914 and 1915, which were poor years. It was only about

Table II—Domestic Orders for Locomotives Since 1901

Year	Locomotives	Year	Locomotives
1901	4,340	1910	3,787
1902	4,665	1911	2,850
1903	3,283	1912	4,515
1904	2,538	1913	3,467
1905	6,265	1914	1,265
1906	5,642	1915	1,612
1907	3,482	1916	2,910
1908	1,182	1917	2,704
1909	3,350	1918	2,802

1,700 less than in 1912 and bears no comparison whatever to the big totals of 1905 and 1906. It is perhaps not necessary to refer in greater detail than this to the domestic figures, first, because there were so many foreign orders to bring up locomotive production, and, secondly, because the domestic situation is referred to in greater detail in another article on that subject elsewhere in this issue.

It is also interesting to observe that the orders for export were likewise not as great as in 1917. They bade fair to be much the same as those of that year, but the signing of the armistice put an end to the placing of further orders for the United States military railroads and resulted in cancellations of orders already placed, amounting to 1,500, in the latter part of November.

### A Review of the Year

The whole situation in the locomotive market this year has been one of great uncertainty. It is not necessary to refer in detail to the causes for this that resulted from the standard locomotive program, inasmuch as the whole standardization question is referred to at great length in an article elsewhere in this issue, entitled "Has Locomotive Standardization Been Justified?"

It is worth while to sketch briefly what has taken place in the locomotive building industry during the past year. First, it will be noted that during the early months of the

Table I—The Locomotive Orders in 1918

Domestic—		
United States Railroad Administration	2,030	
Other railroad orders	525	
Industrials, etc.	38	
Total United States	2,593	
Canadian railroads	209	
Total domestic		2,802
Foreign—		
Director General Military Railroads	1,404	
Other foreign	682	
Total foreign		2,086
Total of all orders		4,888

for roads in Canada 1915, or practically all, were ordered by the Canadian government for the Canadian Government Railways.

Of the total of 2,086 locomotives ordered for export, no less than 1,404 were on orders for the United States military railroads, this figure excluding those orders that were cancelled after the signing of the armistice. The remainder of the orders for export also included a considerable number of locomotives for foreign governments—South Africa, England, Chili, China, Italy, etc.

The number of locomotives ordered for domestic service

year some 200 locomotives were placed on order by various railroads themselves, as will be seen from the appended lists of orders. The first standard locomotive order was placed by the United States Railroad Administration in April after extended discussion and totaled 1,025 locomotives, 555 being given to the American Locomotive Company and 470 to the Baldwin Locomotive Works. In June this was supplemented by an order for 390 locomotives, 245 to the American Locomotive Company, 100 to the Baldwin Locomotive Works and 45 to the Lima Locomotive Works, the last company being given an additional order for 15 locomotives in July, bringing the total of all orders at that time to 1,430,

and locomotives placed to date by the Railroad Administration to 2,030. Of these orders there had been delivered to December 21, the latest date for which figures are available at this writing, 678 standard engines, including the 112 already referred to built by Baldwin, 33 from Lima and 543 from the American Locomotive Company. These details are given in one of the tables.

**The First Gun and the Eleven Hundredth Engine**

The Railroad Administration's standardization program has called for all kinds of adverse comment. It is only just to note here that it has been quite the opposite as far as the United States Military Railroad program is concerned. The department of which S. M. Felton has been the head, adopted standardization from the start, but it did not dally around for weeks and months as so many other of Mr. Baker's otherwise estimable departments did to reach that end. It adopted at the "first crack out of the box" a design that was being built at the Baldwin Locomotive Works for the British government, changed it to the extent principally of adding a superheater, managed to secure its first completed locomotive in 20 working days, and that design, with very minor changes, is still the one that is being produced at this writing, a year and one-half later. When the war ended with the signing of the armistice the American army in France had yet to receive its first American guns, its first tanks, its first airplanes. It was receiving, however, its eleven hundredth erected standard gage locomotive, and had received nearly a thousand more of smaller size.

**Production in 1918**

The total number of locomotives produced in 1918 was 6,475, including 3,668 on domestic orders and 2,807 on orders for the United States military railroads and for other railroads outside the United States and Canada. This total compares with a total of 5,446 in 1917, of which 2,585 were for

orders having been placed so that all three companies were working on the standard designs.

Late in July, however, the Baldwin Locomotive Works, after having under way about 100 of the standard locomotives, all light Mikados, was given an order for 500 of the so-called "Pershing" locomotives for the military railroads in France and ceased production on the Railroad Administration engines to devote its entire energy to the new order. This was soon supplemented by additional orders for 10 and 500, respectively, and again in September by two orders of 500 and 1,000 respectively. The signing of the armistice removed the need for the last 1,500, and they were accordingly cancelled about the middle of November. Baldwin's production continued on the 250 or so "Pershing" locomotives remaining on the July orders.

The American and Lima companies prior to this had received additional orders for 500 and 100 standard locomotives, respectively, from the Railroad Administration. Following the signing of the armistice these orders were also held up for a time—and that to the utter consternation of the whole railway supply field—but were soon reinstated and definite contracts signed, bringing the total of all the stand-

\* Includes Canadian output.

† Includes Canadian output and equipment built in railroad shops.

domestic service and 2,861 for export. In spite of the high rate of production which was attained at various times during the year the total was not as great as in the peak years of 1906 and 1907, when 6,952 and 7,362 locomotives were produced respectively.

**A Statement of Mr. Baruch's**

In Mr. Creel's Official Bulletin of November 2 there appeared a statement (reproduced in the *Railway Age* of November 8), authorized by B. M. Baruch, chairman of the War Industries Board, to the effect that the standard gage steam locomotive industry of the United States, operating under the direction of the War Industries Board, had increased its rate of production approximately 100 per cent in the preceding three months. During the last week of October the output of the three standard gage companies was 144 locomotives. From 1910 to August, 1918, the statement said, the largest number ever turned out in a single year was 3,776, which would represent an average weekly output of 72.6 loco-

motives. The statement, continuing, emphasized the fact that this increase in production was accomplished without expenditure to increase plant facilities or to enlarge the existing works, but was made possible by a redistribution of orders and concentration of the plants on particular types of locomotives.

The figures that are now available show, however, that Mr. Baruch's statement has not worked out as his publicity man had hoped. The production of steam locomotives was by no means doubled in 1918, and, in fact, the totals for this year, even inclusive of more than 600 little narrow gage gasoline locomotives, as well as other small equipment included in the *Railway Age's* reports, was but 1,000 larger than in 1917 and did not come within 4,000 of being double the figures for that year, nor within 2,000 of being double the domestic production alone in 1910, 1912 and 1913. A reference to Table IV in this article will bear out these last statements. With all due respect to the about to be deceased War Industries Board, it could not keep up with what Mr. Creel's Bureau could say about it.

The statement also continues to the effect that the "Pershing" locomotive, built on standard plans for the United States military railways is said to have been made the sole type of steam locomotive in use behind the American lines in France, and also to have been adopted by the British and French governments as the standard type for their armies

on the western front. It might be considered somewhat unkind to observe that the so-called "Pershing" locomotive was already in service on the British lines of communication even before we went into the war, or if one drew attention to the fact that there have been other designs of steam locomotives sent over for the American Expeditionary forces, and that American locomotive plants themselves have built engines to French designs for use behind the fronts. But enough has been said to show that, like much other Washington publicity, the statement of Mr. Baruch was far from the facts and should never have been published.

The Lists of Orders

The lists of orders appended are from official sources. They will, no doubt, suffer from a few omissions of small and less important orders, but will, nevertheless, show in a clear way the business that the locomotive plants have received during 1918. The *Railway Age* did not as usual send out letters to all the railroads this year, because it was able to obtain most of its data from the Railroad Administration, from the director general military railways, and from other government sources. The usual letters were sent to the builders, and the output figures were obtained directly from them. Lists from the builders, as well as the usual weekly reports, permitted the checking and amplification of the lists in the usual way.

## Freight Car Orders in 1918 Exceed 1917 Figures

The Amount of Business Now on Hand Insures a Big Year  
in 1919 from Production Standpoint

**B**ECAUSE OF THE 100,000 standard freight cars ordered by the United States Railroad Administration in 1918, of which, however, only about 12 per cent have been delivered to date, the orders for freight cars in 1918 for domestic service in the United States and Canada were considerably in excess of those of 1917. They were not, however, as great as those of 1916, were only half those of

orders in 1918, contains a resumé of the locomotive business of the United States during the year just past. Even with the chance of covering similar ground in this article, it is worth while to sketch briefly what has occurred in the freight car market during 1918.

As in the case of locomotives, the predominating feature during the past year, insofar as the orders for freight cars were concerned, was the great proportion the government purchases held to the total orders. Unlike 1917, there were few orders from governments of other countries. The government orders referred to were those placed by our own authorities, either the United States Railroad Administration or the Director General Military Railroads.

The year opened very auspiciously with prospects for

Table I—The Freight Car Orders in 1918

Domestic—

Director General Military Railroads.....	36,875
Other foreign.....	16,672
<b>Total foreign.....</b>	<b>53,547</b>
<b>Total of all orders.....</b>	<b>177,317</b>

1912, and did not compare at all with those of the big years 1905 and 1906.

The orders for freight cars in 1918 totaled 177,317, of which 123,770 were on domestic orders and 53,547 were on foreign orders, principally for the United States Military Railroads in France. The orders in 1917 totaled 131,558 (excluding the 30,500 Russian cars which were cancelled), of which 79,367 cars were for domestic service and 34,167 were for export, principally for France and the Military Railroads.

The passenger car orders this year were practically non-existent, war-time activities and presumably the omnipresent government desire for standardization not permitting the placing of such orders. The orders for passenger cars listed

Table II—The Passenger Car Orders of 1918

Domestic, United States and Canada.....	131
Foreign.....	26
<b>Total.....</b>	<b>157</b>

total only 157, including 131 for domestic service and 26 for export, as compared with 1,167 in 1917, of which 1,124 were for domestic service, 6 for the United States Government and 37 for export.

The article preceding this one, treating of the locomotive

heavy orders from the railroads, which were soon dispelled with the announcement that purchases for our own railroads would be centralized and placed by the Railroad Administration. It was not until April, however, that orders for 100,000 standard cars were placed, divided as follows:

25,000 40-ton double sheathed box.  
25,000 50-ton single sheathed box.  
20,000 50-ton composite gondola.  
5,000 70-ton low side gondola.  
25,000 55-ton hopper.

100,000

Quantity production on these orders was promised by the Railroad Administration for August, but was not reached until November, and up to December 21, the latest date for which figures are available at this writing, only 11,815 have been delivered.

The orders placed by the Director General Military Railroads totaled 36,875. The first orders this year were in February and totaled about 5,000. In July an order for 10,000 additional was divided among several builders, and

was shortly afterward supplemented by 20,000 more. In September an additional 40,000 cars were ordered, but immediately following the signing of the armistice this last 40,000 was cancelled before production had begun on them. One of the tables, giving a resumé of the orders on hand at the various car building plants of the country as

the production of other cars, and it cannot be said that the car building plants have been particularly rushed at any time.

The resumé of freight car orders on hand on November 1 shows a total of 235,614 cars, of which only 20,400 had been delivered, leaving a total of 215,214 still to be delivered, divided about evenly between foreign and domestic orders. This total represents nearly double as many cars as have on the average been produced annually for the past five years inclusive of 1918. Even with the elimination of such orders

\* Includes Canadian output.  
 † Includes Canadian output and equipment built in company shops.

of November 1, contains a column showing the status of the military orders on that date—that is, before any cancellations had taken place. From that column it will be seen that there were then outstanding orders for 85,834 cars. There had been shipped on these orders 2,575 cars, leaving 83,259 to be delivered. These figures are also to be shown as follows:

TOTAL OF ALL CARS ORDERED BY THE UNITED STATES MILITARY RAILROADS FROM THE TIME THE UNITED STATES ENTERED THE WAR TO NOVEMBER 1, 1918.

	Ordered	Shipped	Remaining to be shipped
Standard gage cars	98,069	19,395	78,674
Narrow Gage cars	8,579	3,994	4,585

Total of all military cars ordered, 106,648 23,389 82,359  
 Figures for standard gage cars include 6,000 sets box car metallics ordered by military railroads and 36 shuttle cars and 73 mortar cars ordered by the ordnance department.

These military cars have been an important factor in the year's business, but they have not been sufficient to impede

Standard Car Deliveries to December 21.

Atlantic Coast Line	50	50-ton Gondola	Am. Car & Fdy.

for the United States Military Railroads as have been cancelled since November 1, the indications for a big year from the production standpoint in 1919 are very favorable.

The largest single order remaining is, of course, that of 100,000 cars for the United States Railroad Administration. As of November 1, only 2,742 of these cars had been delivered.

A Resumé of the Freight Car Orders on Hand on November 1.

Electric Locomotive Headlights—Wayfarers along the line of the New York & Long Branch Railroad have recently been startled by headlights of certain night trains which throw rays of equal power to those of many naval searchlights. Older hands among them privately express some doubt as to the merit of the arrangement since for several years the practice on the well fenced railroads of the East has been to get away from the powerful oil reflectors of the early days of railroading. Some engine drivers say that the brilliant rays tend to confuse signal lamps which they and trackmen must observe. They admit that if a large white church or a man of war in holiday paint were to stray upon the track in front of a fast express, the glaring headlights might enable them to see it in time to stop unless they were making up time on a downgrade.—New York Times.

# Specialties for Standard Cars and Locomotives

Data Revised to Date and Arranged in Tabular Form for Ready Reference

THE SPECIALTIES applied to the standard cars and locomotives built for the Railroad Administration have been published in the *Railway Age* from time to time during the year. The first list was given in the June 14 issue, page 1448; and the second list on page 1540 of the June 21 issue; with an additional list on page 1586 of the June 28 issue. These lists gave in general the amounts of the various specialties ordered, and in order to give a better idea of the distribution of the use of these specialties among the various classes of equipment the accompanying tables have been compiled. A few minor changes were made

in the original lists showing the distribution of the orders, primarily on account of delivery.

The companies receiving orders for the specialties for the locomotives are shown in the table under the various specialty items and on which class of power these specialties are used. In case one specialty is used on all locomotives, such as the American Arch Company arch, it is so designated.

The table showing the specialties for the cars includes only those for the cars which have been built thus far, as information is not obtainable as to just which of the specialties will be applied to the other cars.

## Only a Small Addition to Main Track Mileage

Large Expenditures for Construction During 1918 Devoted  
Mostly to Terminal Facilities

**I**N TERMS OF MAIN TRACK completed and placed in service, railroad construction in the United States during 1918 amounted to less than at any time since the Civil War. Only 721.57 miles of new line was completed during the past year in the United States and only 135.08

years. This will be confirmed by an examination of the detail data which lists the amount of first track, second track, etc., completed during the past year, and gives also, under the heading of other important work under construction, the other projects of railroad work authorized,

Curves of Mileage Built in the United States and Canada Since 1893

miles in Canada. As shown by the diagram, these figures are far below those of any other year during the last 25. However, based on total expenditures authorized, railroad construction in the United States ranks well with recent

including in this the construction of main tracks on which work has not been completed. This list includes only projects costing \$100,000 or more, upon which work has been started, but excludes authorized work not yet started.

The amount of second track completed is larger than last year or any year since 1914, but is only about half the mileage completed in 1913. The total for multiple tracks in the United States includes third track, 76.95 miles, fourth, fifth and sixth tracks, 57.43 miles. In Canada only

Year	Miles	Year	Miles
1893	3,024	1906	5,623
1894	1,760	1907	5,212
1895	1,420	1908	3,214
1896	1,692	1909	3,748
1897	2,109	1910	4,122
1898	3,265	1911	3,066
1899	4,569	1912	2,997
1900	4,894	1913	3,071
1901	5,368	1914	1,532
1902	6,026	1915	933
1903	5,652	1916	1,098
1904	3,832	1917	979
1905	4,388	1918	721

4.28 miles of second track was completed, with no additions to other than first and second main tracks.

In the United States the new mileage of first main tracks includes 59.7 miles on the Atlantic Coast Line in Florida, 53 miles on the Government Railway in Alaska, and 48 miles on the Gulf, Mobile & Northern in Mississippi and Tennessee. Most of the mileage of new lines, however, is in short sections, and a considerable portion is in connection with the development of coal lands.

Second-track work includes 64.05 miles on the South-

ern; 60.77 on the Santa Fe Coast Line from Goffs to Cadiz, Cal.; some 63 miles in short stretches on the Great Northern, and 48½ miles similarly divided on the Atchison, Topeka & Santa Fe. In general, the new second track mileage is in short stretches, following the policy of the Railroad Administration to secure additional mileage of second track where it could be obtained with the least effort. This applies also to the additions to multiple main tracks.

In contrast with the greatly decreased activity in the construction of new lines, the roads authorized more than the usual amount of improvement work along existing lines. The congestion of last winter, particularly on the eastern roads, demonstrated forcefully the need for more facilities, particularly for the care of locomotives at terminals. As a result a record-breaking amount of work of this character was undertaken this year, as indicated by the fact that the Pennsylvania Railroad alone had under way over 200 projects involving expenditures of over \$100,000 each and ranging from that figure up to \$5,000,000.

While the necessity for so large an amount of such work is indicative of the starvation policy to which the roads have been subjected during recent years, it also demonstrates the gradual transition from the extensive to the intensive development of our transportation system. While relatively large areas in the far west are still without proper transportation facilities, it is to be expected that expenditures for railway work will, in the future, be diverted in increasingly large proportions to improvements along exist-

ing lines intended to modernize and to increase their capacities.

The inauguration of federal control introduced an element of uncertainty early in the year which greatly retarded the inauguration of new projects. Work was in general continued on those projects which were already under way, but the necessity of securing federal approval for new work seriously delayed its inauguration. Facing a labor shortage, many roads had planned to undertake their improvement program as early in the spring as weather conditions would permit, but the work of organizing the Division of Capital Expenditures so delayed the issuance of approvals that it was late in May before any considerable number of projects were authorized. Then the entrance of many roads with large budgets into the market for labor and materials further complicated the inauguration of the work which was approved. As a result, out of the total of \$1,199,426,026 of Additions and Betterments work, charge-

able to capital account which had been authorized up to November 1, less than one-half is now completed.

Owing to the lateness of the season at which this work was authorized, many expedients have been undertaken to secure its completion. A premium has been placed on short construction periods and every effort has been made to finish as much of the work as possible before winter. This has been particularly true of engine terminals which were so badly needed last winter.

While the uncertainty as to the disposition of the roads makes any prediction as to the outlook for construction activities during 1919 extremely hazardous, the large amount of work now under way and unfinished will, if carried to completion, provide a fairly busy year in itself. With the further improvements which must be made, the director general estimated recently that the roadway improvement work alone (excluding equipment) would aggregate \$550,000,000 next year.

## Railroad Construction in the United States in 1918

### Alabama & Vicksburg

Bridge over Big Black river, in Mississippi, cost \$174,000 completed.

### Alabama Great Southern

*Second Track:* Between Russell, Miss., and Toomsba, 8.8 miles.

*Other Important Work Under Construction:* Second track from Burstall, Ala., to Vance, 31.9 miles, 90 per cent completed; Warrior River Bridge at Eataw, Ala., cost \$237,475 completed.

### Alaska Railroad

*First Track:* Between Seward, Alaska, and Fairbanks, 53.00 miles.

*Other Important Work Under Construction:* Building in Alaska, from mile 224 to mile 265, 41 miles; mile 365 to mile 380, 15 miles standard gage, and from mile 414 to mile 456, 42 miles of narrow gage.

### Americus & Atlantic

*First Track:* Between Meta, Ga., and Methwens, 2.00 miles.

### Apache Railroad

*First Track:* Holbrook, Ariz., to Duke's Peak, 55.00 miles.

### Ashland, Odanah & Marengo

*First Track:* In Wisconsin, not specified, 5.00 miles.

### Atchison, Topeka & Santa Fe

*First Track:* Washington, Okla., to Cole, 3.28\* miles.

*Second Track:* La Junta, Colo., to Casa, 4.87 miles; Dodge City, Kans., to Wright, 7.64 miles; Dodge City to Scare, 4.46 miles; White to Augusta, 4.00 miles; Winfield to Arkansas City, 4.00 miles; Decatur, N. M., to Clorietta, 4.98 miles; Camden Junction, Mo., to Floyd, 2.57 miles; at Supton, Iowa, 1.52 miles; Albuquerque, N. M., to Hahn, 4.00 miles; Gallup, N. M., 3.1 miles; Western division, Kan., M. P., 344 to 352, 7.45 miles; total, 48.59 miles.

*Third Track:* Turner, Kan., to Holliday, 6.45 miles.

\*Change of line.

*Other Important Work Under Construction:* Illinois division, change in line, 0.28 miles, cost \$110,870, 30 per cent completed; second track mile posts, 418-422, Missouri division, 3.47 miles, cost \$551,551, 80 per cent completed. Unclaimed freight building at Topeka, Kan., cost \$310,825 completed; second track and change of line and grade, 11.82 miles, from Arkansas City, Kan., to Newkirk, Okla.; second track, from Eldorado, Kan., to Augusta, 9.9 miles, cost \$351,559, 16 per cent completed; second track, from Winfield, Kan., to Arkansas City, 12.3 miles, cost \$603,654, 19 per cent completed; extension of Bartlesville branch and terminals at Tulsa, Okla., cost \$815,000; new track and yard change at Hutchinson, Kan., cost \$143,518 completed; second track, 4.45 miles, at Dodge City, Kan., cost \$148,579, 50 per cent completed; engine terminal at Las Vegas, N. M., cost \$236,857, completed; reconstruction of bridge at Pinta, Ariz., cost \$157,022 completed; shop and station facilities at Gallup, N. M., cost \$616,066 completed; car shops and lumber shed at San Bernardino, Cal., cost \$402,975 completed; spur to U. S. cantonment at Camp Kearney, Cal., cost \$382,098 completed; new depot and track at San Bernardino, Cal., cost \$831,547 completed.

### Atchison, Topeka & Santa Fe Coast Lines

*Second Track:* Goffs, Cal., to Cadiz, 60.77 miles.

### Atlanta & West Point

*Second Track:* College Park, Ga., to Palmetto, 17 miles, completed.

### Atlantic Coast Line

*First Track:* Sebring, Fla., to Moore Haven, 59.70 miles.

*Other Important Work Under Construction:* James River bridge, Richmond, Va., cost \$231,117, 58 per cent completed; additional freight facilities, Richmond, Va., cost \$360,882, 50 per cent completed; new passenger station at Norfolk, Va., cost \$155,450, completed; single track, extension of Haines City branch 81 miles, between Sebring and Inmolkalee, Fla., cost \$1,000,000, 44 per cent completed.

### Baltimore & Ohio System

*First Track:* Penn Mary, Md., to Bear Creek, 4.80 miles; West Baltimore to Washington Road, 1.40 miles; North Dayton, O., connecting track between Wellston branch and main line; branch line at Great Cacapon, W. Va.; connection with Coal & Coke Ry., at Hampton, W. V.

*Second Track:* Evans, Pa.; Holloway, Ohio, to Flushing; Carlisle, Ohio, 11 miles; Defiance, Ohio, 1.30 miles.

*Third Track:* At Philadelphia, Pa., 0.60 miles.

*Fourth Track:* At Philadelphia, Pa., 0.60 miles.

*Other Important Work Under Construction:* Additions to Clearmont yard, Baltimore, Md., cost \$160,000, completed; Annapolis Junction, Md., to Admiral, tracks and other facilities for Camp Meade, cost \$408,120, completed; diversion of main lines through Cumberland, Md., cost \$225,000, 80 per cent completed; additional yard tracks at Keyser, W. Va., cost \$150,000, 80 per cent completed; rearrangement and standardization of fourth track line, from Bailey's to W. Baltimore, Md., cost \$200,000, 40 per cent completed; track to Camp Sherman, at Chillicothe, Ohio, cost \$191,692 completed; second track, 23.3 miles, from Milford Junction to La Paz Junction, Ohio, cost \$785,957, 85 per cent completed; second track, Storrs, Ohio, to Culloms, 2.20 miles, cost \$208,007, 44 per cent completed; reconstruction of bridges from Cook's Mill, Pa., to Sand Patch, cost \$191,200 completed; construction of bridge superstructures from Sand Patch to Collensville, cost \$104,500, 96 per cent completed; strengthening bridges from Uniontown, Pa., to Cheat Haven, cost \$325,380, 90 per cent completed; constructing bridge No. 315, at Etna, Pa., cost \$102,000; construction of Astor Bridge at Flemington, W. Va., cost \$478,900 completed; Baltimore, Md., construction of yard at Mt. Winans, cost \$700,000, 85 per cent completed; enlargement of Bay View yards, cost \$160,000, 70 per cent completed; heavy repair shops, Glenwood, Pa., cost \$1,732,605, 70 per cent completed; additions to round house at Brunswick, Md., cost \$125,000, 84 per cent completed; additions to round house at Grafton, W. Va., cost \$175,000, 78 per cent completed; erection of heavy repair shops at Cumberland, Md., cost \$1,216,000, 65 per cent completed; Thawing house at Curtis Bay, Baltimore, Md., cost \$100,000, completed; reconstruction of bridges from Cuba to Orient, Ohio, cost \$249,150, completed; engine terminal facilities at De Forest Junction, Ohio, cost \$146,280, 80 per cent completed; 12 additional stalls to round house at Garrett, Ind., cost \$155,000, completed; a new power plant at Garrett, Ind., completed; 8-stall engine house at Ivorydale, Ohio, cost \$130,637, 90 per cent completed; engine terminal improvements at Lorain, Ohio, cost \$101,790, 5 per cent completed; rebuilding bridge No. 3, at North Dayton, Ohio, cost \$407,832, completed; new receiving yard at North Dayton, Ohio, cost \$116,186, completed; engine house remodeling, at South Chicago, cost \$106,700, 5 per cent completed; extending engine house at Storrs, Ohio, cost \$100,000, 5 per cent completed; enlarging engine house at Stock Yards, Ohio, cost \$100,000, 91 per cent completed; freight house, office, etc., at Parkersburg, W. Va., cost \$268,013, completed; five additional stories on freight house at Allegheny, Pa., cost \$228,000 completed; transfer bridge pier 10, at Locust Point, Baltimore, Md., cost \$137,833, completed.

### Barton County & Santa Fe (A. T. & S. Fe.)

*First Track:* In Kansas not specified, 31.20 miles.

### Bay Point & Clayton

*Other Important Work Under Construction:* Extension to Bay Point, Cal., including overhead crossing over the Santa Fe and Southern Pacific, cost \$100,000, work not started but expected to be finished by June, 1919.

### Bessemer & Lake Erie

*First Track:* Deer Creek Junction, Pa., branch to new mines of Inland Steel Company, 1.60 miles.

*Second Track:* Henlein, Pa., to Kremis, 2.00 miles; Blacks Run to River Valley, 1.00 mile; total 3.00 miles.

*Other Important Work Under Construction:* Deer Creek Junction, Pa., branch to new mines of Inland Steel Co., 2.54 miles, cost \$410,000, 50 per cent completed; change of grade and alignment, Pardoe to Cool Spring, cost \$1,828,095, 45 per cent completed; Blacks Run to River Valley, Pa., double track bridge over Allegheny river, Pennsylvania Railroad and highways with approaches, cost \$2,149,112, 96 per cent completed; K. O. Junction, new yard tracks, cost \$378,711, completed; enlargement of yard and facilities

at Conneaut Harbor, O., cost \$209,316, completed; change of grade and alignment at Rural Ridge, Pa., cost \$290,000, 45 per cent completed; change of grade and alignment from Culmerville to bridge No. 7, Pa., cost \$1,617,778, 70 per cent completed; change of grade and alignment from Harrisville, Pa., to Grove City, Pa., cost \$896,000, 31 per cent completed (work held up, continuation undecided); change of grade and alignment at Hartstown, Pa., cost \$490,000, 91 per cent completed (work deferred); North Bessemer, Pa., new 400-ton coaling plant and tracks, cost \$160,000, 59 per cent completed.

### Black Mountain Railway

*First Track:* In North Carolina, not specified, 2.30 miles.

### Black Mountain Railroad

*Other Important Work Under Construction:* Grading completed on 8 miles and ready for track laying between Hulen, Ky., and head of Packets Creek.

### Boston & Albany

*Other Important Work Under Construction:* Reconstruction of draw-bridge over Chelsea river at Chelsea, Mass., cost \$280,300, 35 per cent completed; renewal of bridge over North Elm street and public square at Westfield, cost \$250,000, 6 per cent completed.

### Boston & Maine

*Second Track:* From North Chelmsford, Mass., to West Chelmsford, 2.25 miles.

*Third Track:* From Westminster, Mass., to South Ashburnham, 3.94 miles; Cummings, Me., to North Berwick, 5.64 miles.

*Other Important Work Under Construction:* Rebuilding bridge No. 180, at Zoar, Mass., cost \$215,000, 28 per cent completed; rebuilding bridge No. 154, at Greenfield, Mass., cost \$308,500, 60 per cent completed; rebuilding bridge No. 108, at Saco, Me., cost \$105,000, 15 per cent completed; improvements in yard and signals at Boston, Mass., cost \$148,812, nearing completion; engine house and yard facilities at Rotterdam, N. Y., cost \$643,000, 23 per cent completed; engine house and yard facilities at Lowell, Mass., cost \$1,000,000, 14 per cent completed; engine house facilities at East Deerfield, Mass., cost \$800,000, 40 per cent completed; rebuilding bridge No. 148, East Deerfield, cost \$274,000, completed; engine house and facilities, East Cambridge, cost \$171,000, nearing completion; additional yard facilities, Lawrence, cost \$100,000, completed.

### Buffalo Creek

*First Track:* At Buffalo, N. Y., 0.18 mile.

### Buffalo, Rochester & Pittsburgh

*Second Track:* In Pennsylvania, at Falls Creek, 0.18 mile; from Marion Center, Pa., 2.6 miles.

*Other Important Work Under Construction:* Shop terminal facilities, at East Salamanca, N. Y., cost \$706,500, completed; additional yard tracks at East Salamanca, cost \$133,245, completed; shop terminal facilities at Elk Run Junction, cost \$696,606, completed.

### Carolina & Northeastern

*First Track:* Rehoboth, N. C., to Lasker, 4.00 miles.

### Catasauqua & Fogelsville

*Other Important Work Under Construction:* At Guth, Pa. (Jordan Bridge), replacing viaduct with 3-span arch and filling at cost of \$150,000, 83 per cent completed.

### Central New England

*Second Track:* Highlands and Reynolds branch, N. Y.

*Other Important Work Under Construction:* Strengthening Poughkeepsie Bridge, Poughkeepsie, N. Y., cost \$370,000, completed.

### Central of New Jersey

*Third Track:* Between North Branch, N. J., and White House, 4.07 miles.

*Fourth Track:* Between North Branch, N. J., and White House, 4.07 miles.

*Other Important Work Under Construction:* Elimination of grade crossing, Westfield, N. J., cost \$303,157, 88 per cent completed; additional yard tracks, Newark, N. J., cost \$118,584, completed; Broad street terminal, Newark, N. J., cost \$632,663, completed; extra power house, Ashley, Pa., cost \$161,123, completed; new coal pier No. 18 at Jersey City, N. J., cost \$1,506,513 (1918 allowance \$800,000); storage yard, Fort Newark, Newark, N. J., cost \$227,003, 92 per cent completed; renewal bridge No. 1 at Phillipsburg, N. J., cost \$475,642, 17 per cent completed; coal thawing sheds, Jersey City, cost \$252,380, 7 per cent completed; additional yard tracks, Allentown, Pa., cost \$279,556, 53 per cent completed; extension of service plant, Jersey City, cost \$188,902, 90 per cent completed; extension fifth track, Bayonne, N. J., to Jersey City, cost \$111,591, 5 per cent completed; storage yard pier No. 18, Jersey City, cost \$828,686, 48 per cent completed (1918 allowance, \$500,000).

### Chartiers Southern

*First Track:* Clarksville, Pa., to near Jefferson, 3.50 miles.

*Other Important Work Under Construction:* Extension from Eighty-Four, Pa., to Marianna, 10.20 miles, work indefinitely postponed, cost \$1,385,000, 65 per cent completed; Champion to near Jefferson, 9 miles, cost \$1,912,840, 50 per cent completed; Crucible to Nemaquin mine, 5.50 miles, cost \$835,000, 10 per cent completed.

### Chesapeake & Ohio

*First Track:* Extension Big Coal branch from Seth, W. Va., to Whitesville, 13.3 miles, branch line up Big Elk Run of Coal river, 3.8 miles; Marsh Fork extension, Little Marsh, W. Va., to Hozy Creek, 6.5 miles; branch up

Pond Fork from Madison, W. Va., 11.6 miles; branch Man, W. Va., up Huff creek of Guyandot river, 2.7 miles.

*Second Track:* Harboursville, W. Va., to Clover Valley, 1.44 miles; Peeks Mill to Peach creek, W. Va., 3.38 miles; West Hamlin to Salt Rock, W. Va., 2.08 miles; Logan, W. Va., to Stollings, 1.1 miles; Bremo to Strathtmore, 3.00 miles.

*Other Important Work Under Construction:* Eight-stall addition to round-house, Fulton, Va., cost \$109,136, completed; renewal of bridge over Coal river with double track structure, St. Albans, W. Va., cost \$151,445, completed; third track from Big Sandy Junction to Russell, Ky., 11.3 miles, cost \$490,000, 4 per cent completed; renewal bridge No. 44 with double track structure, Clover Valley, W. Va., cost \$153,516; extension of line from Man to Gilbert, W. Va., 13.0 miles, cost \$850,053, 71 per cent completed; new additional westbound yard, Russell, Ky., cost \$819,618, 70 per cent completed; renewal bridge No. 66, Martha, W. Va., with double track structure, cost \$135,678, 50 per cent completed; water station at Silver Grove, Ky., cost \$131,000, 3 per cent completed; additional shop facilities, Huntington, W. Va., cost \$535,500, 50 per cent completed.

### Chicago & Alton

*Other Important Work Under Construction:* Track elevation, Rockwell to Kedzie avenues, Chicago, cost \$275,793, 85 per cent completed (work held up); yards and tracks, Carlinville, Ill., cost \$144,971, 62 per cent completed; freight terminal, Chicago, cost \$1,400,000 (work held up).

### Chicago & Eastern Illinois

*Second Track:* At Okaw, Ill., 0.33 mile; Jackson (Ind.) coal branch, 1.64 miles; total 1.97 miles.

### Chicago & Erie

*Other Important Work Under Construction:* Freight station and yard, Webster avenue, Chicago, cost \$232,681, completed; addition to yards, Marion, O., cost \$445,641, completed.

### Chicago & North Western

*Other Important Work Under Construction:* Ore docks and yards, Ashland, Wis., cost \$1,727,200, completed; elevator (6,000,000 bu.), South Chicago, Ill., cost \$4,583,348, completed; elevator (1,500,000 bu.) Council Bluffs, Ia., cost \$1,604,053, completed; extension of shop buildings, Chicago, cost \$721,054, completed; track elevation, Milwaukee, Wis., cost \$192,614, completed; addition to engine house, Nelson, Ill., cost \$182,000, completed; track elevation, Mayfair, Chicago, cost \$792,000, completed; reconstruction Des Plaines river bridge, Galena division, cost \$149,550, completed; Franklin-Orleans street viaduct, Chicago, cost \$709,340, completed; 20-stall addition to engine house, Fond du Lac, Wis., cost \$185,745, completed; Popsia mine spur, 3.77 miles, at Hudson, Wyo., cost \$139,020, completed.

### Chicago, Burlington & Quincy

*First Track:* Cut-off on old line at Orin Junction, Wyo., 1.16 miles.

*Second Track:* At Smithboro, Ill., 0.18 mile; at Beardstown, 1.64 miles; at Girard, 0.22 mile; Keyesport to Shattuck, 10.43 miles; Smithboro to Durley, 2.63 miles; at St. Joseph, Mo., 0.08 mile; Crawford, Neb., to Rutland, 5.95 miles; Ashland to Greenwood, 7.63 miles; Sheridan, Wyo., to Dietz, 3.70 miles; total 32.46 miles.

### Chicago, Indianapolis & Louisville

*Other Important Work Under Construction:* Midland, Ind., yard and engine terminal (1918 appropriation \$38,500), cost \$230,282, 16 per cent completed.

### Chicago, Milwaukee & St. Paul

*First Track:* Techy, Ill., to Bensenville, 3.7 miles.

*Second Track:* Techy, Ill., to Bensenville, 3.5 miles; Montevideo, Minn., to Milan, 5.6 miles; total 9.1 miles.

*Other Important Work Under Construction:* Track elevation, Milwaukee, Wis., cost \$2,083,444, completed; track depression, Minneapolis, cost \$1,365,261, completed; new station, Butte, Mont., cost \$272,945, completed; roundhouse, Sioux City, Ia., cost \$120,902, completed; electrification, Othello-Argo, cost \$8,990,741, to be completed by July, 1919; additions to shops, Dubuque, Ia., cost \$115,000, completed; engine terminal, Ottumwa Junction, Ia., cost \$772,300, completed; bridge over Missouri river, Chamberlain, S. Dak., cost \$210,200, completed.

### Chicago, Rock Island & Pacific

*Second Track:* Allerton, Ia., to Clio, 7.6 miles; Tindall, Mo., to Trenton, 4.3 miles; Topeka, Kan., to Bishop, 6 miles; Paxico, Kan., to McFarland, 3.90 miles.

*Other Important Work Under Construction:* Track elevation, Chicago, cost \$144,780, 87 per cent completed; second main track; engine terminal, Burr Oak, Ill., cost \$246,935, 60 per cent completed.

### Chicago Union Station

*First Track:* At Chicago, Ill., 0.70 mile.

### Chicago, St. Paul, Minneapolis & Omaha

*Other Important Work Under Construction:* Engine terminal, St. Paul, Minn., cost \$108,563, completed.

### Cincinnati, Indianapolis & Western

*Other Important Work Under Construction:* Coal branch from Dana, Ind., 5 miles, cost \$103,461, 90 per cent completed; track elevation, Indianapolis, Ind., cost \$100,000, 60 per cent completed; freight house and office building, Indianapolis, cost \$201,520, 90 per cent completed.

**Cincinnati, New Orleans & Texas Pacific**

*First Track:* In Tennessee, from M. P. 236.25 to 237.25, 2 miles.

*Second Track:* In Tennessee, M. P. 216.1 to 217.5, 1.40 miles; M. P. 215.3 to 215.4, 0.4 miles; M. P. 213.4 to 213.8, 0.40 miles; M. P. 229.2 to 230, 0.80 miles; M. P. 236.2 to 237.2, 1 mile; in Kentucky, from M. P. 124 to 132, and from M. P. 143.7 to 146.7, 9 miles; total 13 miles..

*Other Important Work Under Construction:* Reconstruction of Tennessee river bridge, Chattanooga, Tenn., cost \$268,175, completed; second track, Helenwood, Tenn., to Robbins, 6.00 miles, cost \$354,000; Huffman to Lancing, cost \$1,311,841.

**Cleveland, Cincinnati, Chicago & St. Louis**

*Second Track:* Union City, Ind., to Winchester, 9.00 miles; between Marion, Ohio, and Nelson, 33.00 miles; Ansonia to Union City, 9.00 miles; Columbus to Avenue, 4.60 miles; total 55.60 miles.

*Other Important Work Under Construction:* Additional yard facilities at Mattoon, Ill., cost \$115,000, grading completed; building 4.30 miles of first track near Zionsville, Ind., 10 per cent completed; building second track from Briar, Ind., to Beech Grove, 9 miles, 50 per cent completed, and from Augusta, Ind., to Whitestown, 11 miles, 10 per cent completed; separation of grades in Indianapolis, Ind., cost \$600,000, 75 per cent completed; new receiving yard at Brightwood, cost \$176,000, completed; additional yard facilities at Beech Grove, cost \$145,000, completed; rebuilding bridge No. 6 at Cleveland, Ohio, cost \$221,450, substructure completed, superstructure to be completed by March, 1919; separation of grades at four streets in Columbus, cost \$332,287, completed; additional yard facilities at Bellefontaine, cost \$270,000, and rearrangement of tracks, relocation of freight house and track connections at Bellefontaine, cost \$128,000, completed; additional yard facilities at Sharonville, cost \$545,000, to be completed by March, 1919; additional yard facilities at Columbus, cost \$263,000, grading completed; new engine terminal at Galion, cost \$219,000, and additional yard facilities at Galion, cost \$152,000, completed; extension of yard, Bellefontaine, O., cost \$135,000, completed; rearrangement of tracks at Galion, O., cost \$100,400, completed; engine terminal and yards at Ansonia, O., to cost \$184,800.

**Colorado Railroad**

*First Track:* M. P. 83 to Ingle side (Colo.) branch, 0.19 mile.

**Columbia & Nehalem River**

*First Track:* In Oregon, not specified, 1.00 mile.

**Cumberland Valley**

*Second Track:* Newville, Pa., to Oakville, 2.71 miles; Maugansville, Md., to Hagerstown, 1.93 miles; total 4.64 miles.

*Other Important Work Under Construction:* Extension of second track and revision of grade and alignment from Oakville, Pa., to Shippensburg, cost \$440,000, 35 per cent completed; additional yards at Cumbo, W. Va., to cost \$120,000, 65 per cent completed.

**Delaware & Hudson**

*First Track:* At Ninevah, N. Y., 0.24 mile.

*Second Track:* Windsor, N. Y., to Ninevah, 6.50 miles.

*Third Track:* Between Oneonta, N. Y., and Albany, 1.28 miles.

*Other Important Work Under Construction:* From Schenectady, N. Y., to Richmondville Summit, 12.45 miles main track, signals, bridges, etc., cost \$814,712, 45 per cent completed; \$450,000 of the appropriation was cancelled.

**Delaware, Lackawanna & Western**

*Other Important Work Under Construction:* Elimination of 26 grade crossings, Orange, N. J., cost \$2,173,165, 99 per cent completed; elimination of grade crossing and new passenger station, Madison, N. J., cost \$646,250, 98 per cent completed; grade crossing elimination, Passaic, N. J., cost \$197,631, 90 per cent completed; grade crossing elimination, East Buffalo, N. Y., cost \$284,776 completed; grade crossing elimination, Buffalo, N. Y., cost \$424,770, completed; engine terminal, Jersey City, N. J., cost \$148,174, completed; power plant, East Buffalo, cost \$284,646, completed; extension of piers No. 3 and No. 4, at Hoboken, N. J., cost \$146,835, 95 per cent completed; rebuilding power house, Hoboken, cost \$121,646, 35 per cent completed; additions to engine terminal Gravel Place, Pa., cost \$117,714, completed.

**Denver & Rio Grande**

*First Track:* Cokedale, Colo., to Bon Carbo, 7.19 miles; Hooper (Utah) branch to Kingsville and to Cox, 2.76 miles; total 9.95 miles.

*Other Important Work Under Construction:* Yard and engine terminal at Soldier Summit, Utah, cost \$850,000, 41 per cent completed; second track, Buttes, Colo.-Pueblo, cost \$103,435, 67 per cent completed.

**Detroit Terminal**

*Second Track:* In Michigan, at various points, 0.66 mile.

**Duluth & Iron Range**

*Other Important Work Under Construction:* Logging spur, 18 miles, from Wales, Minn., cost \$215,997, completed; repair shop, Two Harbors, Minn., cost \$192,854, completed.

**Duluth, Missabe & Northern**

*Other Important Work Under Construction:* Coal handling bridge, Duluth, Minn., cost \$239,570; steel and concrete ore dock, Duluth, cost \$3,839,714, 85 per cent completed; Missabe mine spur, cost \$177,399, completed; spur to Carson Lake and Fletcher mines, cost \$263,105, 95 per cent completed.

**El Paso & Southwestern**

*Other Important Work Under Construction:* Change of line, M. P. 117-144, Eastern division, cost \$514,063, completed.

**Erie**

*Other Important Work Under Construction:* New engine terminal, Croxton, N. J., cost \$875,695, completed; renewal of bridge No. 192.22, cost \$183,064, completed; coaling plant, Hornell, N. Y., cost \$255,000, completed; revision of engine terminal, East Buffalo, cost \$248,137, completed; elimination of grade crossing, Louisiana street, Buffalo, cost \$415,689, completed; engine terminal, Salamanca, N. Y., cost \$237,293, 90 per cent completed; elimination of grade crossings, Jamestown, N. Y., cost \$475,075, 40 per cent completed; engine terminal facilities, Brockwayville, Pa., cost \$142,445, 75 per cent completed; engine terminal, Avoca, Pa., cost \$260,000, 30 per cent completed; improved engine terminal, Ferrona, Pa., cost \$201,552, completed; engine terminal facilities, Meadville, Pa., cost \$415,081; classification yard, Girard, O., cost \$169,643, completed; elimination of grade crossing, P. R. R. and Liberty road, Girard, cost \$150,000, 20 per cent completed; improved freight handling facilities, Akron, O., cost \$241,061, 95 per cent completed; separation of grades, Youngstown, O., cost \$147,840, 70 per cent completed; enlarging the yard at Kenmore, O., cost \$113,583, completed; engine terminal facilities, Dayton, O., cost \$245,703, completed.

**Franklin & Abbeville**

*First Track:* Prevost Spur (La.), 3.00 miles.

**Galesburg, Rockford & Northern**

*Other Important Work Under Construction:* Building extension from Hoopole, Ill., to Geneseo, 16 miles, work includes two 100 ft. bridges, cost \$325,000, 5 per cent completed.

**Galveston, Harrisburg & San Antonio**

*First Track:* Rosenberg, Tex., to Damon Mound, 22.00 miles.

*Second Track:* Ysleta, Tex., to El Paso, 12.49 miles; San Antonio to Withers, 6.47 miles; total 18.96 miles.

*Other Important Work Under Construction:* Galveston (Tex.) Causeway, (G. H. & S. A. share), \$207,280, expected to be completed by June, 1920.

**Grand Trunk Western**

*Other Important Work Under Construction:* Yard extension, Nichols, Mich., cost \$406,000, to be completed June, 1919; car shops, Port Huron, cost \$473,000, completed.

**Great Northern**

*Second Track:* Long Lake, Minn., to Delano, 11.56 miles; Kandiyohi to Pennock, 11.02 miles; Campbell to Breckenridge, 15.31 miles; Cut Bank, Mont., to Blackfoot, 25.33 miles; total 63.22 miles.

*Third Track:* At Minneapolis, Minn., 4.26 miles.

*Fourth Track:* At Minneapolis, Minn., 4.25 miles.

*Other Important Work Under Construction:* Ward street bridge, Minot, N. D., cost \$135,391, 90 per cent completed; water supply, at Bowdoin, Mont., cost \$162,980, 97 per cent completed; engine house, etc., Wadsworth, cost \$276,675, completed; ore dock, Allouez, Wis., cost \$748,682, completed; freight house, team tracks, etc., St. Paul, cost \$1,832,771, 90 per cent completed; yard extension, Minot, N. D., cost \$125,000, completed; rebuilding snow sheds, Tye, Wash., to Scenic, cost \$170,000, completed; lining two tunnels, Butte division, cost \$185,000, 90 per cent completed; new material yard (Minneapolis Belt Line), Northtown, Minn., cost \$927,762, completed.

**Gulf & Ship Island**

*Other Important Work Under Construction:* Spur track extension 34.5 miles, Hovey, Miss., to Kiln, cost \$260,000, 80 per cent completed.

**Gulf, Colorado & Santa Fe**

*Second Track:* At Galveston, Texas, 2.00 miles.

*Other Important Work Under Construction:* Galveston Causeway (G. C. & S. F. share), \$305,151, 50 per cent completed; reconstruction of Gulf & Interstate Railway from Port Bolivar, Tex., to High Island, cost \$172,810, completed.

**Gulf, Florida & Alabama**

*First Track:* Pensacola, Fla., to Navy Yard, 5.08 miles.

**Gulf, Mobile & Northern**

*First Track:* McLain, Miss., to end of track, 30.00 miles; Middleton, Tenn., to Barrett's Divide, 18.00 miles; total 48.00 miles.

*Other Important Work Under Construction:* Extension of Blodgett branch, McLain, Miss., north, to be 31 miles long; total cost \$560,000, 92 per cent completed; extension of Middletown-Jackson line, to be 40 miles long, 80 per cent completed.

**Hocking Valley**

*Second Track:* Delaware, Ohio, to Marion, 6.90 miles; Marion to Walbridge, 6.00 miles; total 12.90 miles.

*Other Important Work Under Construction:* Passing track between Marion, Ohio, and Pemberville (to be absorbed later as second track), cost \$443,000, 70 per cent completed; additional yard tracks at Walbridge, O., cost \$394,740, and at Columbus, cost \$128,000, completed; grade crossing elimination at Columbus, cost \$224,331, completed; fuel and water stations at Walbridge, Carey, Columbus, Logan, and Nelsonville, O., cost \$367,659, completed; ten-stall engine house, turntable, shops and tracks at Nelsonville, O., cost \$120,000, completed.

**Houston & Texas Central**

*Other Important Work Under Construction:* 12-mile belt line around Dallas, Tex., cost \$834,500.

**Illinois Central**

*Second Track:* Belleville, Ill., to Wilderman, 2.8 miles.

*Third Track:* From Du Quoin, Ill., to Bois, 3 miles.

*Fifth Track:* Chicago, Twenty-second to Fortieth street, 5 miles, and Kensington to Riverdale, 4 miles

*Sixth Track:* Chicago, Twenty-second to Fortieth street, 5 miles, and Kensington to Riverdale, 4 miles.

*Other Important Work Under Construction:* Branch from Golconda, Ill., 6.5 miles, cost \$125,000, 40 per cent completed; Chicago, reconstruction of bridges from Sixty-third to Sixty-seventh streets, inclusive, cost \$537,000, 94 per cent completed, and Fifty-first to Sixtieth streets, inclusive, cost \$821,850, 50 per cent completed; raising tracks between Fifty-first and Sixty-seventh streets, cost \$426,800, to be completed by June, 1919; building suburban stations at Sixty-third, Sixty-fourth, Sixty-sixth and Sixty-seventh streets, cost \$302,270, completed; depot and office building Sixty-third street, cost \$878,000, completed; reconstruction St. Charles Air Line bridge, cost \$151,420, 80 per cent completed; classification yard, cost \$1,500,000; track elevation from Grand Crossing to Kingston, cost \$2,082,300, 31 per cent completed; engine terminal at Hawthorne, cost \$150,390, 75 per cent completed; four track bridge over Kankakee river, Kankakee, Ill., cost \$346,357, 71 per cent completed, and engine terminal, cost \$136,476, completed; engine terminal and additional yard tracks, Champaign, cost \$259,000, completed; additional yard tracks, Centralia, cost \$171,710, 85 per cent completed; water supply, Du Quoin, Ill., cost \$100,000, 10 per cent completed; engine terminal, Carbondale, cost \$300,000, completed; engine terminal and yard tracks, Mounds, cost \$458,000, 95 per cent completed; inbound freight house, East St. Louis, cost \$142,810, and engine terminal and additional yard tracks, East St. Louis, cost \$130,290, completed; engine terminal, Clinton, cost \$200,949, completed; engine terminal and yard at Amboy, cost \$316,170, completed; passenger station, Mattoon, cost \$107,715, and engine terminal, cost \$116,530, completed; renewal of bridges on system, cost \$1,715,340, to be completed by December, 1919; change in line and additional yard tracks, Stittton, Ky., cost \$128,300, completed; engine terminal at Paducah, Ky., cost \$265,000, completed; change of grade and line 13.5 miles from Princeton, Ky., to Dawson, cost \$802,000, 58 per cent completed; engine terminal, Fulton, Ky., cost \$190,000, completed; grade separation at East Junction, Memphis, Tenn., cost \$161,160, and additional trackage Nonconah yard, Memphis, cost \$328,920, nearing completion.

#### Indianapolis Union Railway

*Other Important Work Under Construction:* Elevation of Union tracks at Indianapolis, Ind., cost \$8,060,000, 25 per cent completed.

#### International & Great Northern

*Other Important Work Under Construction:* New shop buildings, San Antonio, Tex., cost \$229,163, completed.

#### Jacksonville Terminal Company

*Other Important Work Under Construction:* Reconstruction and enlargement of passenger and freight facilities at Jacksonville, Fla., about \$2,500,000, to be completed in 1919.

#### Kanawha & Michigan

*First Track:* Gauley Bridge, W. Va., to Belva, 5.60 miles.

*Other Important Work Under Construction:* Local freight station, Charlestown, W. Va., cost \$175,000, completed; storage yard, Dunbar, W. Va., cost \$100,000, 90 per cent completed; extension Hobson, O., to Meigs, 5.5 miles, cost \$431,725, 10 per cent completed; extension from West Charlestown, W. Va. to Dunbar, 3.90 miles, cost \$100,000, 25 per cent completed.

#### Kansas City Southern

*First Track:* Kansas City, Mo., 1.01 miles.

*Second Track:* Kansas City, Mo., 1.01 miles.

#### Kentucky & Indiana Terminal Railroad

*Other Important Work Under Construction:* Engine terminal, including 3.30 miles of terminal yard track at Louisville, Ky., cost \$350,000, completed, and concrete coaling station to cost \$100,000, 10 per cent completed.

#### Klamath Falls Municipal

*First Track:* Klamath Falls, Ore., to Dairy, 6.00 miles.

#### Lake Erie & Western

*Other Important Work Under Construction:* Roundhouse, Lima, O., cost \$250,000, 30 per cent completed.

#### Lake Erie, Franklin & Clarion

*First Track:* Reidsburg Junction, Pa., to Alsace, 3.00 miles.

#### Lake Superior & Ishpeming

*Other Important Work Under Construction:* Shops and engine terminal at Presque Isle, Marquette, Mich., to include 20-stall roundhouse and other structures also about four miles terminal tracks, cost \$430,000, 75 per cent completed.

#### Lancaster & Chester

*Other Important Work Under Construction:* Bridge renewal work on Catawba river in South Carolina, cost \$125,000, completed.

#### Lehigh & New England

*First Track:* Bethlehem, Pa., to Allentown, 3.00 miles.

#### Lehigh Valley

*Third Track:* Manchester, N. Y., to Farmington, 3.75 miles.

*Other Important Work Under Construction:* Renewal of bridges, No. 269, Athens, Pa., cost \$248,560; No. 407, Stafford, Pa., cost \$146,000; No. 386, Wadsworth, N. Y., cost \$266,000; No. 379a, Rochester Junction, N. Y., cost \$109,700, and No. 341b, Geneva Junction, N. Y., cost \$138,517; all completed; engine terminal and tracks, Ashmore, Pa., cost \$1,200,000, to be completed in January, 1919; new boiler house, Perth Amboy, N. J., cost \$196,164, completed; Hamburg Turnpike viaduct, Buffalo, N. Y., cost \$216,013, 83 per cent completed; Avenue R bridge, Newark, N. J., cost \$193,135, completed; engine terminal, East Buffalo, N. Y., cost \$688,710,

completed; Pitt Farm engine terminal, Buffalo, cost \$509,687, completed; engine terminal, Suspension Bridge, cost \$431,107, completed; engine terminal, Manchester, cost \$684,458, completed; new pier and bulkhead pier 44 East River, New York, cost \$142,010, completed; changes on piers D. H. and L. at Jersey City, N. J., cost \$230,360, completed.

#### Live Oak, Perry & Gulf

*First Track:* Encoufina (Fla.), river west 4.00 miles.

*Second Track:* Altav, Fla., to main line, 1.75 miles.

*Other Important Work Under Construction:* Extension from Encoufina (Fla.), river west 10 miles, of which 7 miles are under construction.

#### Long Island

*First Track:* At Bethpage Junction, N. Y., 0.02 mile.

*Second Track:* Floral Park, N. Y., to Garden City, 3.11 miles; Hempstead to Meadow Brook, 1.84 miles; Hicksville to Pinelawn, 6.45 miles; total 11.40 miles.

*Other Important Work Under Construction:* Yard changes, Long Island City, N. Y., cost \$140,930, completed; terminal facilities at Camp Upton, cost \$250,000, completed; improved engine house facilities, Long Island City, cost \$104,440, 70 per cent completed; improvements, including classification yard, Bay Ridge, cost \$262,227, 70 per cent completed; freight yard at Bushwick, cost \$247,230, 90 per cent completed; rearrangement and new station and track at Rockaway Park, cost \$127,892, completed.

#### Louisville & Nashville

*First Track:* Kildav, Ky., to Seagrove, 9.58 miles; Grays Knob to mouth of Turtle Creek, 2.70 miles.

*Other Important Work Under Construction:* Bulkheads and bank protection, Pascagoula, Miss., cost \$123,464, 82 per cent completed; second track 7.55 miles from Corbin, Ky., to Arkie, cost \$252,502, 40 per cent completed; terminal yard at De Courcy, Ky., cost \$1,356,471, completed; extension of yard at Montgomery, Ala., cost \$276,200, 44 per cent completed; yard facilities at Radnor, Tenn., cost \$2,170,067, 89 per cent completed; Lexington & Eastern branch from Blakely, Ky., 3.5 miles, cost \$150,000, 60 per cent completed, and from Hardin, Ky., 6.68 miles, \$230,000, 42 per cent completed; branches in Perry county, Ky., 7.91 miles, cost \$229,099, 75 per cent completed; Kentucky & Virginia, spur from Ewats, Ky., 6 miles, cost \$210,000, 36 per cent completed; reconstruction of coal wharf, Mobile, Ala., cost \$114,251, 78 per cent completed.

#### Madison, Illinois & St. Louis

*Other Important Work Under Construction:* Engine terminal in north end of Madison yard in Venice, Ill., cost \$140,000, 30 per cent completed.

#### Mahoning Coal Road

*Other Important Work Under Construction:* Coalberg, O., enlargement of yard, cost \$402,451 completed; additional car repair tracks, cost \$110,000, 10 per cent completed, and new engine terminal, cost \$675,000, 30 per cent completed; Hunrod avenue viaduct, Youngstown, O., cost \$310,285, 31 per cent completed.

#### Maine Central

*First Track:* Fairfield, Me., to Benton, 0.71 mile.

*Second Track:* Waterville, Me., to Clinton, 7.47 miles.

*Other Important Work Under Construction:* Shop improvements, Waterville, Me., cost \$247,625, completed; renewal of bridge, Gardner, cost \$120,000; terminal improvements at Mattawamkeag, cost \$145,000, to be completed by June, 1919.

#### Marion & Eastern

*First Track:* Pittsburg, Ill., eastward, 1.00 mile.

#### Miami Mineral Belt

*First Track:* Hackerville, Kan., to Jaxter Junction, 2.20 miles; Monarch to Naylor, 1.40 miles; total 3.60 miles.

#### Michigan Central

*Other Important Work Under Construction:* Engine terminal and yard, Niles, Mich., cost \$1,378,500, to be completed July, 1919; draw bridge, River Rouge, Detroit, Mich., cost \$541,000, to be completed July, 1920; boiler and tank shop, Jackson, Mich., cost \$355,000, to be completed March, 1919; steel car repair shop, West Detroit, Mich., cost \$210,000, completed; new roundhouse and facilities, Joliet, Ill., cost \$161,600, to be completed March, 1919.

#### Midland & Northwestern

*First Track:* Flory, Tex., to Seminole, 17.00 miles.

#### Minneapolis, St. Paul & Sault Ste. Marie

*Other Important Work Under Construction:* Concrete arch bridge, Frogner, Minn., cost \$133,800, 38 per cent completed.

#### Missouri, Kansas & Texas

*Other Important Work Under Construction:* Rearranging and enlarging yard and locomotive facilities at New Franklin, Mo., cost \$150,000, completed; building terminal and water supply at Appleton City, Mo., cost \$300,000, 20 per cent completed; building subway to carry Main street under tracks, Parsons, Kan., cost \$150,000, 65 per cent completed; rearranging and enlarging freight yard and building a reclamation plant at Parsons, cost \$350,000, completed; enlarging and rearranging locomotive facilities and yard at Fort Worth, Tex., cost \$300,000, 10 per cent completed; grade separation to eliminate street crossings, Dallas, Tex., cost \$360,342, 85 per cent completed.

#### Missouri Pacific

*Other Important Work Under Construction:* Track elevation, Omaha, Neb., cost \$198,500, completed.

#### Monongahela Railroad

*Second Track:* South Brownsville, Pa., to Luzerne, 4.61 miles.

*Other Important Work Under Construction:* Terminal improvements at

Brownsville, Pa., cost \$667,200, 32 per cent completed; additional yard tracks, Big Meadow Run, Pa., cost \$159,600, completed; second track from Big Meadow Run to Rush Run, cost \$120,000, 60 per cent completed, and from Masontown, Pa., to Antrim, cost \$171,000 to be completed March, 1919; shops at South Brownsville, Pa., cost \$105,000, 4 per cent completed; additional side tracks at Big Meadow Run, Pa., cost \$216,000, 45 per cent completed.

### Morgan's Louisiana & Texas

*Other Important Work Under Construction:* New machine shops, Algiers, La., cost \$152,800, completed.

### Morgantown & Wheeling

*First Track:* Between state line and Brave, Pa., 2.20 miles; between Blacks ville, W. Va., and state line, 1.50 miles; total 3.70 miles.

### Nashville, Chattanooga & St. Louis

*First Track:* Cravens, Tenn., to Altan Park; Coalmont, Tenn. to Tatesville.

*Other Important Work Under Construction:* Grade reduction, Chattanooga division, M. P., 76.84, cost \$272,740, nearing completion; engine terminal, Atlanta, Pa., cost \$206,796, 6 per cent completed; connecting track, Radnor, Tenn., 4.33 miles, cost \$963,177, 20 per cent completed; freight house and team tracks, Cleveland, O., cost \$129,544, completed; grade crossing elimination at Cleveland, O., to cost \$2,136,000, to be completed June, 1920; yard extension at Bellevue, O., cost \$133,787, completed.

### New York Central

*First Track:* At Grand Central Terminal, New York, 1.56 miles; extension of New Jersey Junction, West New York, N. J., 0.17 mile.

*Second Track:* Through Lyons, N. Y., yard, 1.03 miles

*Third Track:* Through Poughkeepsie, N. Y., 1.63 miles; Dunkirk, N. Y., 1.82 miles.

*Fourth Track:* Through Poughkeepsie, N. Y., 1.10 miles; Dunkirk, N. Y., 0.60 mile; Granton, N. J., to Little Ferry, 1.50 miles; Perry, Ohio, to Painesville, 6.42 miles.

*Other Important Work Under Construction:* Syracuse, N. Y., Solvay engine house, cost \$900,000, 2 per cent completed; new engine terminal, Watertown, N. Y., cost \$900,000, 15 per cent completed; additions and extensions to engine house at Clearfield, Pa., cost \$120,000, 85 per cent completed; additional eastbound yard at Minoa, N. Y., cost \$250,000, 28 per cent completed; third and fourth track, Syracuse Junction branch, Syracuse, N. Y., cost \$460,000, 44 per cent completed; engine house extension and alterations, Minoa, N. Y., cost \$204,000, 47 per cent completed; additions to engine house facilities at Cherry Tree, Pa., cost \$150,000, 75 per cent completed; extension of car repair shop, East Buffalo, N. Y., cost \$550,000, 3.1 per cent completed; engine house improvements, De Witt, N. Y., cost \$250,000, 40 per cent completed; engine terminal and yard tracks, Genesee Junction, N. Y., cost \$214,000, 16 per cent completed; freight repairs shop facilities, New Durham, N. J., cost \$200,000, 3 per cent completed; additional shop facilities, Avis, Pa., cost \$855,000, 12 per cent completed; addition to Massey street yard, Watertown, N. Y., cost \$120,000, 25 per cent completed; Piers K4 and K5, Weehawken, N. J., cost \$1,564,000, 3 per cent completed; reconstruction 149th street bridge, New York, cost \$284,700, 24 per cent completed; elimination of yard crossings at Duchess Junction, N. Y., cost \$424,813, completed; reconstruction of bridge No. 698C, at Rochester, N. Y., cost \$128,450, 17 per cent completed; elimination of grade crossing, Hertel avenue, Buffalo, N. Y., cost \$600,390, 71 per cent completed; new yard at West Albany, N. Y., cost \$546,107, 40 per cent completed; general improvements, Utica, N. Y., cost \$509,940, 15 per cent completed; yard extension, Little Ferry, N. J., cost \$313,535, 33 per cent completed; passenger station facilities, Poughkeepsie, N. Y., cost \$329,037, completed; express building, Buffalo, N. Y., cost \$742,318, 97.5 per cent completed; ice house and repair yard, Weehawken, N. J., cost \$397,192, 45 per cent completed; new freight house and team yard, West Lockport, N. Y., cost \$106,878, completed; new engine house facilities, Belle Isle, N. Y., cost \$784,153, 94 per cent completed; engine terminal and yard improvements, Gardenville, N. Y., cost \$2,264,800, 83 per cent completed; change of alignment, Tonawanda, N. Y., cost \$1,849,092, 14.5 per cent completed; improvements, Grand Central terminal, New York, cost \$3,701,530, 72 per cent completed; new trackage at Norwood, N. Y., cost \$151,000, work delayed; third and fourth track improvements at Dunkirk, N. Y., cost \$174,900, 96 per cent completed; terminal improvements, Erie and Wesleyville, cost \$221,847, 96 per cent completed; grade separation, Erie, Pa., cost \$139,985, 50 per cent completed; new west bound yard, Dock Junction, Pa., cost \$541,612, 70 per cent completed; new west bound freight main and yard tracks, Perry to Painesville, O., cost \$204,328, 71 per cent completed; water supply improvements at Nottingham, O., cost \$109,730, completed; extension to locomotive shops, Collinwood, O., cost \$350,000, 20 per cent; East One Hundred and Fifth street subway, Cleveland, O., cost \$125,243, completed; new freight terminal, Cleveland, O., to cost \$4,513,000, nearing completion; additions to Kinsman Road yard, Cleveland, O., cost \$140,000, 45 per cent completed; additions to yard, Marcy, O., cost \$100,000, 45 per cent completed; new yard, Rockford, O., cost \$960,885, 65 per cent completed; grade separation, Elyria, O., cost \$354,595, 30 per cent completed; new yard and engine terminal, Minerva, O., cost \$500,000, 45 per cent completed; engine terminal and additional yard facilities, River Rouge, Mich., cost \$173,896, completed; grade separation, Detroit, Mich., cost \$267,589, 85 per cent completed; Russell street freight house and team tracks, Detroit, Mich., cost \$341,442, completed; yard extension at Elkhart, Ind., cost \$279,000, 80 per cent completed.

### New York, New Haven & Hartford

*First Track:* Casanova N. Y., to connection with New York Connecting 0.08 mile.

*Second Track:* Casanova, N. Y., to New York Connecting 0.06 mile.

*Third Track:* Casanova, N. Y., to New York Connecting 0.08 mile; South Bay Junction, Mass., to Boston freight terminal, 0.50 mile; total 0.58 mile.

*Fourth Track:* Casanova, N. Y., to New York Connecting 0.06 mile; South Bay Junction, Mass., to Boston freight terminal, 0.50 mile; total 0.56 mile.

*Fifth Track:* Belle Dock Junction, Conn., to Quinnipiack, 1.00 mile.

*Sixth Track:* Belle Dock Junction, Conn., to Quinnipiack, 1.00 mile.

*Other Important Work Under Construction:* Strengthening bridge, Waterbury, Conn., cost \$118,171, completed; rebuilding bridge, Hartford, Conn., cost \$370,090, completed; Thames river bridge, New London, Conn., cost \$2,740,000, 84 per cent completed; rebuilding bridge, Mystic, Conn., cost \$211,131, 91 per cent completed; enlargement of South Boston cut for four tracks, Boston, Mass., cost \$972,000, 84 per cent completed; freight classification yard and engine facilities, Cedar Hill, Conn., cost \$2,349,200, 50 per cent completed; additional yard tracks, Waterbury, Conn., cost \$184,100, 86 per cent completed; extra classification yard, Midway, Conn., cost \$217,000, completed; freight terminal and classification yard, Boston, Mass., cost \$1,697,000, 11 per cent completed; classification yard and engine facilities, Pawtucket, R. I., cost \$1,403,780, 30 per cent completed; additional side tracks, Springfield, Mass., cost \$170,000, 80 per cent completed; connecting track from Highland branch yard to Nangatauck line, Waterbury, Conn., cost \$340,000, 7 per cent completed; additional yard tracks, Hartford, Conn., cost \$223,000, 5 per cent completed; passenger station, New Haven, Conn., cost \$1,434,713, 54 per cent completed; improvements at coaling plant pier No. 4, Boston, Mass., cost \$113,491, completed; engine house and terminal facilities, Danbury, Conn., cost \$204,895, completed; new and enlarged engine house facilities, Boston, Mass., cost \$762,822, completed; Cedar Hill engine terminal, New Haven, Conn., cost \$181,500, 24 per cent completed; engine facilities, South Worcester, Mass., cost \$157,240, 70 per cent completed; four coal towers, East Providence, R. I., cost \$184,636, completed.

### New York, Susquehanna & Western

*Other Important Work Under Construction:* Additional tracks and warming house, Undercliff, N. J., cost \$212,000 completed; additional engine terminal facilities, Little Ferry, N. J., cost \$101,623, completed.

### Norfolk & Portsmouth Belt

*First Track:* From connection with Virginian Railway in Virginia to Elizabeth River, 2.47 miles.

### Norfolk & Western

*First Track:* Putnam, Va., to end of line, 8.91 miles; in West Virginia, extensions of Western branch, 0.25 mile and of Alma branch 0.96 mile; total 10.12 miles.

*Other Important Work Under Construction:* Coal handling machinery pier No. 3, Lamberts Point, Va., cost \$400,000, 50 per cent completed; reinforced concrete viaduct, Lynchburg, Va., cost \$205,000, completed; freight station, Roanoke, Va., cost \$380,000, completed, and increased engine terminal and yard facilities, cost \$1,710,000, 10 per cent completed; additional tracks, Shenandoah, Va., cost \$154,000, completed; additional yard tracks, Hagerstown, Md., cost \$600,000, 3 per cent completed; third track from Pelton, Va., to Vicker, 2.80 miles, cost \$240,000, 58 per cent completed, coal and water station, Vicker, Va., cost \$140,000, 98 per cent completed; additional yard facilities, Bristol, Va., cost \$700,000, 88 per cent completed; additional storage tracks, Bannock, O., cost \$100,000, 70 per cent completed; station building, Camp Lee, Petersburg, Va., cost \$200,000, completed; freight station, Winston-Salem, N. C., cost \$167,000, completed.

### New York Connecting Railroad

*First Track:* Sunnyside Junction, N. Y., to Fresh Pond, 4.32 miles.

*Second Track:* Sunnyside Junction, N. Y., to Fresh Pond, 4.32 miles.

*Third Track:* North right of way line of N. Y., N. H. & H., to Woodside avenue, N. Y., 3.73 miles.

*Fourth Track:* North right of way line of N. Y., N. H. & H., to Woodside avenue, N. Y., 3.73 miles.

### Northern Pacific

*Second Track:* Jamestown, N. D., to Eldridge, 4.36 miles; Bozeman, Mont., to Logan, 32.38 miles.

*Third Track:* Billings, Mont., 1.07 miles.

*Fourth Track:* Billings, Mont., 1.16 miles.

*Other Important Work Under Construction:* Yellowstone division, construction dyke work and rip rap along Yellowstone river and similar work in Montana division; cost \$218,707, 95 per cent completed; second track from Jamestown, N. D., to Windsor, 12 miles, cost \$328,937, 77 per cent completed; second track, Laurel, Mont., to Park City, 7.47 miles, \$145,197, 44 per cent completed; Kission, Mont., to Livingston, 5.6 miles, cost \$118,486, 38 per cent completed; rehabilitating and improving to main line standards on Pasco, Sunnyside and other branches in Washington, cost \$359,361, completed.

### North Texas & Santa Fe

*First Track:* In Texas, not specified, 0.70 mile.

### Oregon Short Line

*First Track:* Menan, Idaho, to Annis, 2.72 miles; Keever to Thomas, 4.54 miles; Lincoln to Ammon, 3.58 miles; Garland, Utah, to Bear River City, 9.57 miles; Baker to Urban, 3.80 miles; total 24.21 miles.

*Other Important Work Under Construction:* Replacing 50-span pile trestle with steel spans and concrete piers and abutments at bridge 20-A, near Burley, Ida., cost \$200,996, nearing completion; Teton Valley branch, near Teton, Ida., to Brown Bear coal mines, construction 9.05 miles branch road, with 2.00 miles of siding, cost \$289,897, 15 per cent completed.

### Oregon-Washington Railroad & Navigation Company

*First Track:* Primo, Wash., to Vesta Creek, 3.21 miles. Between Pine Creek and Masonia, 2.32 miles.

*Second Track:* Hanlons, Wash., to Kamela, 2.30 miles.

*Other Important Work Under Construction:* New line from Pine Creek, to Masonia, Ida., 10.54 miles, cost \$380,000; work deferred, filling trestle, L-2, St. John Junction, Ore., cost \$119,088. Completed; grade revision through Sullivan Gulch, Portland, Ore., cost \$488,187, 95 per cent completed; change in line, Alto, Wash., 5,070 feet, cost \$177,018, 95 per cent completed; dredging and construction of wharf and warehouse, Seattle, Wash., cost \$354,080. Completed.

### Pennsylvania Railroad

*First Track:* Carubrook, Pa., southward 1.86 miles; Meadows Yard, N. J., 0.31 mile; connection with the Waverly Passaic branch, 0.46 mile; branch on the Meadows, 1.33 miles; at Princeton, N. J., 0.35 mile; at Trenton, 0.33 mile; West Morrisville, Pa., 0.08 mile; Petty Island branch, 2.22 miles; South Philadelphia, 1.06 miles; Manayunk, Pa., 0.63 mile; Coatsville branch, 2.03 miles; Unity branch extension, 2.42 miles; Turtle Creek branch extension, 1.78 miles; Ten-mile Run branch, 0.24 mile; Sixtieth street branch, Philadelphia, Pa., 4.51 miles; Girard Point to Essington, 6.51 miles; Essington to Chester, 1.48 miles; at Ridley river, 0.49 mile; at Darby river, 0.40 mile; at Stoney Creek yard, 0.35 mile; Camden N. J., 1.98 miles.

*Second Track:* Mt. Holly, Birmingham, N. J., 4.81 miles; second track and change of line, Brownsville Junction to Linn, Pa., 2.46 miles; change of line and grade and second track, Bullis Mill, N. Y., to Eldred, Pa., 7 miles; grade revision and second track, Corry, Pa., to Brownell, N. Y., 5.50 miles; Glyndon, Pa., to Spartausburg, 3.50 miles; Fifty-ninth street, Philadelphia, Pa., to Grays Ferry, 1.75 miles; at Peach Bottom, Md., 2.22 miles; at Meadows, N. J., 0.29 miles; at Princeton, N. J., 0.31 mile; at Trenton, 0.33 mile; at West Morrisville, Pa., yard, 1.90 miles; Petty Island branch 0.25 mile; Chelton avenue, Pa., 0.21 mile; at South Philadelphia, 1.06 miles; Manayunk, 0.63 mile; Saltsburg, 0.49 mile; Ten-mile Run branch, 0.38 mile; Sixtieth street, Philadelphia, 2.54 miles; Girard Point and Essington, 5.48 miles; Essington to Chester, 1.41 miles; South Chester branch, 0.04 mile; Marcus Hook, 0.34 mile.

*Third Track:* At Elkton, Md., 1.5 miles; Bayview yard, Md., 1.33 miles; Meadows yard, N. J., 0.26 miles.

*Fourth Track:* Newark, Del., to Elkton, Md., 2.53 miles; at Beacon Hill, Md., 1.74 miles; at Meadows Yard, N. J., 0.21 mile; Winans, Md., to S. Y. Tower; South Duquesne, Pa., to Drakesburg.

*Fifth Track:* Marcus Hook to Claymont, Pa.; at Philadelphia, 0.44 mile; at Torresdale, Pa., 0.20 mile; Parkersburg to Pomeroy, 1.10 miles.

*Sixth Track:* Edeely, Pa., to Tullytown, 0.73 miles; Philadelphia, Pa., 0.71 mile.

*Other Important Work Under Construction:* Car repair yard facilities, Greenville, N. J., cost \$256,770, completed; additional yard tracks, Sunnyside yard, Long Island City, cost \$458,598, 60 per cent completed; new yard tracks, Metuchen, N. J., cost \$145,324, 42 per cent completed; protecting center pier of Passaic river bridge, Newark, N. J., cost \$184,300, completed; changes at passenger station, New York, cost \$436,483, completed; facilities at U. S. Cantonment, Wrightstown, N. J., cost \$229,000, completed; Steelton, Pa., yard facilities, cost \$225,686, and freight station and car load delivery tracks, cost \$119,940, both completed; tank and caboose shop at Altoona, Pa., cost \$216,994, completed; extension to power plant, cost \$1,354,752, and extension to Juniata shop buildings at Altoona, Pa., cost \$748,750, under way; oil mixing and storing plant, South Altoona, Pa., cost \$184,267, completed; renewal of two bridges, Orrton Pa., cost \$373,716, completed; reconstruction of bridge No. 57-99, Reading, Pa., cost \$316,196, 65 per cent completed; side track, Bolivar, Pa., cost \$176,162, completed; rebuilding freight facilities, Conelersville, Pa., cost \$201,657, completed; additional classification tracks, Conelersville, Pa., cost \$176,645, completed; new engine facilities, Derry, Pa., cost \$124,705, 25 per cent completed; improved freight facilities, East Liberty, Pa., cost \$565,811, and at Greensburg, Pa., cost \$101,051, both completed; extension of yard tracks, Pitcairn, Pa., cost \$104,502, 50 per cent completed; engine and storehouse facilities, Pitcairn, Pa., cost \$100,018, completed; coaling station, Pitcairn, Pa., cost \$150,000, completed; improved engine facilities, Youngwood, Pa., cost \$323,262, 95 per cent completed; locomotive terminal facilities, West Brownsville Junction, Pa., cost \$245,913, 95 per cent completed; grade crossing elimination, Buffalo, N. Y., cost \$184,648, 73 per cent completed; additional freight facilities, Buffalo, N. Y., cost \$741,764, 85 per cent completed; ore dock facilities and track changes at Buffalo, N. Y., cost \$123,046, completed; grade crossing elimination, Mineral Springs road, Buffalo, cost \$283,237; Shocks Mills freight storage yard, Marietta, Pa., cost \$467,905, completed; change of line and grade, Larabee, Pa., cost \$192,171, 98 per cent completed; elevating existing main track and grading for second track at Brownell to Sherman, N. Y., cost \$312,036, 58 per cent completed; additional engine house facilities, South Oil City, Pa., cost \$126,385, 98 per cent completed; elimination of grade crossings and rearrangement of freight facilities, Erie, Pa., cost \$142,107, 90 per cent completed; engine house and facilities, Kane, Pa., cost \$194,084, 90 per cent completed; extension to engine house, additional ash pits, oil house, etc., Renovo, Pa., cost \$103,450, 85 per cent completed; bridge at Lewistown Junction, Pa., cost \$135,300, completed; bridge at Nanticoke river, Pa., cost \$114,000, completed; new receiving yard and shipping tracks, Farnhurst, Del., cost \$132,769, completed; extension of second track, from Harrington, Del. to Greenwood, cost \$376,755, 95 per cent completed; extension to engine house, Philadelphia, Pa., cost \$120,607, 80 per cent completed; relocating freight station and tracks at Roberts avenue and King street, Philadelphia, cost \$140,074, completed; storage yard, Twenty-second street and Margie street, Philadelphia, cost \$160,793, completed; replacing bridge at Kensington avenue, cost \$153,299, and at Second street, on main line, Philadelphia, cost \$126,113, both completed; new line, Saltsburg, Pa., to Turtle Creek branch, 8.4 miles, cost \$769,746, 60 per cent completed; removing 1,000 ft. of cover at west end of Radebaugh tunnel, cost \$518,231, 4 per cent completed; partial development of new classification yard at west end, Sharpsburg, Pa., cost \$1,431,876, 62 per cent completed; 10-mile branch to Waynesburg, Pa., cost \$402,884, 60 per cent completed; 10-mile branch to Pitt Gas Coal Co., at Besco, Pa., cost \$140,466, 60 per cent completed; engine house facilities, additional yard tracks and shop appurtenances, Blairsville, Pa., cost \$219,556, 65 per cent completed; removing old tunnel lining 200 ft. at Radebaugh, Pa., cost \$132,415, completed; new engine facilities, Gardenville, N. Y., cost \$1,023,106, 75 per cent completed; new bridge over Red Bank creek, Red Bank, Pa., cost \$234,400, 75 per cent completed; bridge over Clarion river, Parkers Landing, Pa., cost \$289,657, 73 per cent completed; bridge over East Sandy creek, East Sandy, Pa., cost \$226,820, 73 per cent completed; bridge over Mahoning creek, Mahoning, Pa., cost \$213,163, 75 per cent completed; replacing engine house,

extending machine shop and other repair facilities, Pitcairn, Pa., to cost \$310,000, 84 per cent completed; change of line and grade, Freeport, Pa., to Butler Junction, Pa., cost \$1,072,017, completed; additional engine house facilities at Shire Oaks, Pa., cost \$142,986, 70 per cent completed. Rebuilding bridge at Schuylkill river, Ridgewood, Pa., cost \$275,254, completed; rebuilding bridge at Schuylkill river, Orrton, Pa., cost \$246,947, completed; rebuilding bridge over Schuylkill river, Frick Lock, Pa., cost \$151,370, completed; Catesville, Pa., Pomeroy yard, cost \$98,755, 90 per cent completed; West Mainsville, Pa., east-bound receiving yard and westbound departure yard, cost \$71,714, completed; new bridge over Schuylkill river, Manayunk, Pa., cost \$845,623, completed; new bridge over Leverington avenue, Manayunk, Pa., cost \$135,790, 71 per cent completed; foundations, Sullivan Way, undergrade bridge, Trenton, N. J., cost \$154,857, 86 per cent completed; new engine house and shop facilities, Phillipsburg, N. J., cost \$138,141, 19 per cent completed; freight station and delivery tracks, Harrisburg, Pa., cost \$526,500, 78 per cent completed; revision and enlargement of yard at Meadows, N. J., cost \$1,224,560, 37 per cent completed; relocation work and passenger and freight station and yards, Princeton, N. J., cost \$433,557, 81 per cent completed; westbound receiving and classification yard and transfer facilities Waverly, N. J., cost \$1,507,210, 20 per cent completed; bridge over Avenue R, Newark, N. J., cost \$175,000, completed; covered pier and tracks, Greenville, N. J., cost \$688,171, completed; storage yard and track connections for U. S. Government and submarine hoist corporation, Newark, N. J., cost \$144,868, completed; developments between Passaic and Hackensack rivers, Meadow, N. J., cost \$290,306, completed; reconstruction of Baltimore & Potomac tunnels, Baltimore, Md., cost \$840,874, completed; coal pier and export pier, rearranging track, Baltimore, Md., cost \$541,191, completed; construction of new tracks at south end of Gunpowder river bridge, Maryland, to north end of Bayview yard, 19.5 miles, cost \$1,290,983, 15 per cent completed; extension No. 1 track 6.7 miles between Baltimore and Washington, cost \$456,845, 12 per cent completed; new pier and grain elevator, (Canton), Baltimore, Md., cost \$2,680,011, 30 per cent completed; new engine house and machine shop, etc., Greenwich, Pa., cost \$543,830, 14 per cent completed; South Chester bridge locomotive and car facilities at Thurlow, Pa., cost \$474,730, 1 per cent completed; two-track joint line, Broad street to Delaware avenue and Hoyt street, South Philadelphia, 2 miles, cost \$260,700, 4 per cent completed; South Chester branch closing gap in line 4 miles, track at Chester, Pa., cost \$382,386, 95 per cent completed; additional tracks and revision of Thurlow yard, Marcus Hook, Pa., and Thurlow, Pa., cost \$544,800, 5 per cent completed; new yard, Edge Moor, Del., cost \$2,222,000, 8 per cent completed; additional facilities at engine house, Wilmington, Del., cost \$585,355, 15 per cent completed; track elevation at South Philadelphia, Pa., Pennsylvania portion, cost \$4,231,316, 96 per cent completed, and Philadelphia, Baltimore & Washington portion cost \$753,467, 90 per cent completed; yard at West Philadelphia, cost \$2,147,448, 18 per cent completed; Sixtieth street branch, Fifty-eighth street to Junction with Chester and Philadelphia bridge, Philadelphia, 10 miles, cost \$1,594,602, 42 per cent completed; branch from Chester to Gerard Point, and connection with main line at Eddystone, between Chester and Philadelphia, Pa., cost \$3,091,703, 66 per cent completed; reconstruction of Pequa creek bridge, Pequa, Pa., cost \$184,319, 4 per cent completed; engine terminal at Perryville, Md., cost \$262,287, 1 per cent completed; elimination of grade crossing at Chestnut Hill bridge, Philadelphia, cost \$925,000, completed; extension to engine house, ash pits at Gray's Ferry yard, Philadelphia, cost \$107,990, 12 per cent completed; change of line and grade from Delaware avenue branch, Trenton to Cumberland street, Philadelphia, cost \$623,833, completed; overhead bridge at Trenton, N. J., cost \$148,855, completed; alterations to hog abattoir, Philadelphia, Pa., cost \$162,354, 90 per cent completed; electrification from West Philadelphia to Chestnut Hill, cost \$221,105, and electrification from Philadelphia to Paoia, cost \$1,843,875, completed.

### Pennsylvania—Western Lines

*First Track:* North Columbus, O., to Worthington,\* between Worthington and Lewis Center, 8.00 miles.

*Second Track:* Lewis Center, O., to Delaware 5.06 miles; at Bellaire 2.20 miles; Wardwell to Brietleville 11.60 miles; total 18.86 miles.

*Third Track:* Letonia, O., to Alliance Junction, 13.00 miles; Alliance, O., to Maximo, 6.20 miles, at Maximo, O.; at Canton, O.; Marsfield to Toledo Junction; Moravia, O., Lawrence Junction to Mahoning and H. F. Tower; Smithville to Millbrook, O.

*Fourth Track:* Alliance to Maximo, O., 6.20 miles; at Alliance, O., 3.00 miles; at Maximo, O.; at Canton, O.; Moravia, O.; Lawrence Junction to Mahoning and H. F. Tower.

*Other Important Work Under Construction:* Raising bridge No. 1 over Allegheny river, Pittsburgh, Pa., cost \$1,654,320, completed; coaling station, Yankee Crossing, O., cost \$110,701, completed; additional yard facilities, Stark, O., cost \$875,084, 90 per cent completed; new freight terminal, Chicago, cost \$4,457,775, completed; viaduct Polk and Taylor streets, Chicago, cost \$300,000, 95 per cent completed; track elevation from Stony Island to State Line, Chicago, cost \$3,519,180, 97 per cent completed; reconstructing bridge over Beaver river, Rochester, Pa., cost \$814,014, completed; receiving and storage track at Kinsman street yard, Cleveland, O., cost \$373,832, completed; track elevation, Cleveland, O., cost \$2,307,371, completed; second track, Bayard-Alliance, O., cost \$809,540, 90 per cent completed; second track grade revision and line change at Summitville, O., cost \$1,524,064, complete except track laying; yard and engine house, Mingo Junction, O., cost \$4,386,071, 50 per cent completed; low grade line from Kenwood to Rochester, Pa., cost \$1,647,288; additional yard facilities, Austinburg, O., cost \$108,450, completed; relocation main tracks, enlarging yard facilities and engine house facilities, Mosier yard, Ohio, cost \$3,492,000; engine house facilities, Wheatland, Pa., cost \$130,642, completed; second track, Burgoon to Tiffin, O., 11.20 miles, cost \$651,354, under way; track elevation, Columbus, O., cost \$136,752, completed; new engine house layout, Sandusky, O., cost \$208,280, completed; rearranging and enlarging yard, Sandusky-Bay Junction, Ohio, cost \$288,454, completed; rearranging yard facilities, South Akron, O., cost \$532,300, completed.

**Philadelphia & Reading**

*First Track:* In Pennsylvania, at various places, 1.00 mile.

*Second Track:* At Glenmoore, N. J., 1.50 miles; between Reading, Pa., and Harrisburg, 1.50 miles.

*Other Important Work Under Construction:* Concrete arch bridge over Schuylkill river, Philadelphia, Pa., cost \$915,374, 30 per cent completed; bridge work under way at Tulip and Emerald streets and Erie avenue yard, Philadelphia, cost \$309,196, undergrade crossing, Asylum Road, Trenton Junction, N. J., cost \$113,600, 52 per cent completed; additional track and replacing and extension of bridges, Trenton Junction, to Hopewell, cost \$539,645, 65 per cent completed; additional east and west bound tracks, Belle Meade to Manville, N. J., cost \$732,680, 72 per cent completed; additional tracks Eastwick to Darby Creek, Pa., cost \$211,986, 80 per cent completed; track work bridge work and drainage at Tulip and Emerald streets and Erie avenue yard, Philadelphia, Pa., cost \$623,969, 80 per cent completed; change in alignment and new yard from Lester to North Essington, Pa., cost \$187,420, completed; engine facilities, Sancon Creek, South Bethlehem, cost \$636,435, 75 per cent completed; east and west bound receiving yard and west bound classification yard, Rutherford, Pa., cost \$106,824, completed; east bound classification yard extension, Rutherford, Pa., cost \$196,512, 85 per cent completed; coaling station and sand house, Philadelphia, Pa., cost \$175,760, completed; engine terminal, Reading, Pa., cost \$264,150, 92 per cent completed; Erie avenue yard, Philadelphia, Pa., cost \$189,453, 72 per cent completed; engine house and machine shop, Philadelphia, Pa., cost \$339,517, 93 per cent completed; 12-stall engine house, Reading, Pa., cost \$226,426, 29 per cent completed; 13-stall engine house, Tulip street yard, Philadelphia, Pa., cost \$255,487, 64 per cent completed; additional east and west bound track, Robesonia, Pa., to Sheridan, Pa., and Robesonia to Womelsdorf, cost \$350,033, 15 per cent completed; replacing viaduct with arch and fill, McAuley, Pa., cost \$101,558, 10 per cent completed; east bound departure tracks, air testing plant, etc., at Rutherford, Pa., cost \$142,921, 20 per cent completed; engine terminal, South Bethlehem, cost \$626,525, 7 per cent completed; smoke elimination, boiler washing plant heating plant for engine house, Erie avenue yard, Philadelphia, Pa., cost \$109,987, 13 per cent completed; additional main track, Blandon, Pa., to Fleetwood, cost \$161,158, 18 per cent completed; new machine shop and engine house, Rutherford, Pa., cost \$288,468, 25 per cent completed; engine house facilities, Darby Creek, cost \$358,848, 16 per cent completed; extension fourth track, Wissahicken avenue to Falls bridge, Philadelphia, Pa., cost \$249,091, under way.

**Pittsburgh & Lake Erie**

*Other Important Work Under Construction:* Enlargement of terminal yard and building new facilities, Hazleton, O., cost \$2,201,588, 35 per cent completed; revision of main line, Lowellville to Struthers, O., cost \$520,889, 48 per cent completed; improvements at Groveton, Pa., including additional yard tracks, change of grade and alignment, signals and interlocker, coaling plant, water station, ash plant and sand house, cost \$430,000, 12 per cent completed; rebuilding coach and tender shop, McKees Rocks, Pa., cost \$253,787, completed; extension of east yard, McKees Rocks, cost \$631,000, 3 per cent completed; central warehouse, Pittsburgh, cost \$157,746, completed; replacing viaduct with embankment, Rankin, Pa., cost \$605,770, 28 per cent completed; Lynch classification yard, Port Vue, Pa., cost \$209,828, 70 per cent completed;

**Pittsburgh, Cincinnati, Chicago & St. Louis**

*First Track:* Indianapolis & Frankfort R. R., Frankfort, Ind., to Ben Davis, 42.10 miles.

*Second Track:* Alton to Glade Run, O., between Horatio, O., and Onward, Wheeling Junction, W. Va., to East Steubenville, 1.00 mile; Glenn's Run, W. Va., to Wheeling, 5.19 miles; Philadelphia, Ind., to Irvington, 9.08 miles; at Hawthorne Yard, Indianapolis, Ind., 1.77 miles; at Ben Davis, Ind., 0.31 mile; at Frankfort, Ind., 1.80 miles.

*Third Track:* Trimmer, Ind., to Poone, 6.34 miles.

*Other Important Work Under Construction:* New freight station and track layout, Kokomo, Ind., cost \$132,322, completed; new joint yard, additional main tracks and grade changes, Logansport, Ind., cost \$766,714, completed; track elevation Thirty-ninth street to Sixty-ninth street, Chicago, cost \$6,549,405, 45 per cent completed; second track, Wheeling Junction, W. Va., to East Steubenville, cost \$192,888; grading 74 per cent completed, and track laying 52 per cent completed; Chester, W. Va., to state line at Philipsburgh, Pa. (new Cumberland & Pittsburgh, Ry.), cost \$1,556,867, grading 92 per cent completed, bridge work 72 per cent completed; additional yard facilities, Pradford, O., cost \$434,122, completed; yard facilities and construction of joint yard with Pennsylvania, Western Lines, Columbus, O., cost \$1,097,992, work begun; improvements to engine house facilities, Columbus, O., cost \$364,499, 25 per cent completed; improved yard facilities, Dennison, O., cost \$1,663,690, to be completed by June, 1919; engine house and shop facilities, Chicago, cost \$490,866, completed; new yard, engine house and yard facilities, Jefferson, Ind., cost \$1,228,000, grading and masonry under way; new joint freight yard, east of Belt Railway at Indianapolis, Ind., cost \$1,669,352, 92 per cent completed; Indianapolis track elevation, South to Downey streets, cost \$347,951, completed; from Cruse to Noble streets, cost \$966,006; Ohio river bridge, Louisville, Ky., cost \$3,334,474, completed; track elevation, Delta to Stanley avenues, Cincinnati, O., cost \$427,211, completed; freight station facilities, Cincinnati, O. (Cincinnati, Lebanon & Northern Railway), cost \$301,782, grading 20 per cent completed; construction and rearranging track in east yard, Terre Haute, Ind., cost \$118,400, and improvements to shop facilities, cost \$143,045, completed; improvements to station and track facilities, Frankfort, Ind., cost \$189,427, completed; grade reduction passenger siding and track changes from Frankfort to Logansport, Ind., cost \$630,015, to be completed by July, 1919.

**Pittsburg & Shawmut**

*Other Important Work Under Construction:* Permanent lining of Coulter tunnel, Coulter, Pa., cost \$243,180, 19 per cent completed.

**Portland Terminal Company**

*Third Track:* At Portland, Me., 0.32 mile.

*Fourth Track:* At Portland, Me., 0.36 mile.

**Puget Sound & Cascade**

*First Track:* In Washington, not specified, 2.00 miles.

**Raritan River**

*Other Important Work Under Construction:* Engine terminal at South Amboy, N. J., cost \$200,000, 25 per cent completed.

**Richmond, Fredericksburg & Potomac**

*Other Important Work Under Construction:* Double track reinforced concrete bridge over James river, at Richmond, Va.; R. F. & P. proportion of cost, \$211,589, 74 per cent completed; track depression, Richmond, Va., cost \$323,080, 95 per cent completed.

**Rutland Railroad**

*Other Important Work Under Construction:* New shops, Rutland, Vt., cost \$277,700, completed.

**St. Joseph & Grand Island**

*Other Important Work Under Construction:* Reconstruction of bridge over Mississippi river, St. Joseph, Mo., cost \$1,174,056, 98 per cent completed.

**San Diego & Arizona**

*First Track:* Clover, Cal., to Jacumbo Siding, 25.28 miles.

**Sand Springs**

*First Track:* Between Tulsa, Okla., and Sand Springs, 3.00 miles.

**Southern Railway System**

*First Track:* From Central, S. C., to Tugalo river, 38.80\* miles; from Tugalo river, Ga., to Cornelia, 13.10\* miles; total 51.9\* miles.

*Second Track:* In North Carolina from M. P. 383.5 to 391.4, from M. P. 391.7 to M. P. 407.4, and from M. P. 409.9 to M. P. 416.6, 15.83 miles; from Blacksburg, S. C., to Gaffney, 6.17 miles; Gaffney to Cowpens, 7.83 miles; Cowpens to Mt. Zion, 5.05 miles; M. P. 485.6 to M. P. 487.3, 3.27 miles; Central, S. C., to Tugalo river, 19.40 miles; Tugalo river, Ga., to Cornelia, 6.50 miles; total, 64.05.

\*Replacing old line.

*Other Important Work Under Construction:* Additional main tracks building from Belmont to Bessemer City, N. C., cost \$865,402; Bessemer City to Blacksburg, S. C.; Gaffney to Cowpens, S. C., cost \$897,551; Cowpens to Mt. Zion, S. C., cost \$596,664; and from Greer, S. C., to Greenville, cost \$628,518; yard and engine terminal facilities, Selma, N. C., cost \$319,511, completed; new yard facilities, Monroe, Va., cost \$359,522, completed; new yard and engine terminal, Pomona, N. C., cost \$299,771, completed; yard and engine terminal, Hayne, S. C., cost \$437,097, 98 per cent completed; yard and engine terminal, Alexandria, Va., cost \$451,226, completed; Warrior river bridge, Barney, Ala., cost \$125,000, masonry completed; draw bridge at Congree river, cost \$117,000, 60 per cent completed; second hand steel bridge over Catawba river, cost \$176,000, completed; Toccoa, to Ayersville, Ga., North Broad river viaduct, Toccoa yard track, and 8 miles of additional track, to cost \$1,524,520, 97.3 per cent completed; viaduct at Birmingham, Ala., cost \$199,705, 80 per cent completed.

**Southern Pacific**

*First Track:* Between Colusa, Cal., and Hamilton, 12.81 miles; Hoover, Ore., to Idanha, 1.94 miles.

*Second Track:* Between Tucson, Ariz., and Stockham, 1.97 miles.

*Other Important Work Under Construction:* Enlarging and putting in concrete lining to the San Fernando tunnel (Cal.), cost \$187,263, 20 per cent completed; protection work for classification yard at Los Angeles, Cal., cost \$173,190, completed; constructing 28 miles of belt line, Calipatria, cost \$537,060, 40 per cent completed; building second track, Kern Junction, to Sivert, Cal., cost \$366,579, 1 per cent completed; second track from Cameron to Tehachapi, Cal., cost \$769,312, 2 per cent completed, and from Cameron to Mojave, 9 miles, cost \$272,070, 2 per cent completed; new terminal facilities, Bay Shore, Cal., cost \$861,762, 97 per cent completed; filling and grading at Sacramento, Cal., cost \$147,170, 2 per cent completed; new wharf facilities at Oakland Pier, \$437,300, 20 per cent completed; wood preserving works at Oakland, cost \$324,730, 3 per cent completed; dredging and bulkheading at West Alameda, cost \$14,320, 22 per cent completed; enlarging tunnels (3 to 12 inclusive) between Cisco, Cal., and Lakeview, cost \$106,360, 98 per cent completed; terminal facilities, Deming, N. M., cost \$263,191 and terminal facilities at Bowie, Ariz., cost \$223,393, both to be completed by March, 1919.

**Staten Island Rapid Transit Co.**

*Other Important Work Under Construction:* Track for new coal yard at Arlington, S. I., cost \$120,224, 83 per cent completed.

**Stouts Mountain & Hanceville**

*First Track:* Hanceville, Ala., to Stouts Mountain, 7.60 miles.

**Tampa Southern**

*First Track:* Orient, Fla., to Palmetto, 36.00 miles.

**Texas & Pacific**

*Other Important Work Under Construction:* Reconstruction of engine terminal, Texarkana, Texas, cost \$110,000, 40 per cent completed.

**Tidewater Southern**

*First Track:* Manteca, Cal., to South Manteca, 2.00 miles.

### Toledo & Ohio Central

*Other Important Work Under Construction:* Engine terminal, Columbus, Ohio, cost \$433,000, 74 per cent completed; shortening, enlarging and lining tunnel at Moxalala, Ohio, cost \$120,000, 28 per cent completed; from Pleasantville to Eckerts, Ohio, low grade line 10.5 miles, cost \$500,000, 80 per cent completed.

### Toledo, St. Louis & Western

*Other Important Work Under Construction:* Reconstruction of bridge over Wabash river, Silverwood, Ind., cost \$144,000, completed.

### Union Freight

*First Track:* At Boston, Mass., 0.17 miles.

### Union Pacific

*First Track:* Boulder, Colo., branch to coal mine, 2.17 miles; Hastings, Neb., through C. R. & Q., crossing, 0.10 miles; Winton, Wyo., branch to coal mines, 1.85 miles; total, 4.12 miles.

*Second Track:* In Wyoming, east end of Sherman tunnel to Hermosa, 1.25 miles.

*Other Important Work Under Construction:* Reconstructing substructure bridge No. 38, Waterloo, Neb., cost \$151,730, completed; lining tunnel with concrete, Aspen, Wyo., cost \$455,064, completed; reconstruction of James street viaduct at Kansas City, Kan., Union Pacific share, \$151,697, 1 per cent completed; second track, Manhattan to Junction City, Kan., 20.5 miles, cost \$931,942, 70 per cent completed; additions to roundhouse and tracks, Grand Island, Neb., cost \$128,226, completed; coal facilities, Grand Island, cost \$155,404, 98 per cent completed; passenger station, North Platte, Neb., cost \$175,640, completed; track changes in yard, Laramie, Wyo., cost \$177,216, 70 per cent completed; concrete snow sheds, Laramie, Wyo., to Ogden, Utah, cost \$959,163, 99 per cent completed; track changes in yard, Rawlins, Wyo., cost \$104,339, 98 per cent completed; engine terminal, Kansas City, Kan., cost \$238,180, 99 per cent completed; army camp facilities, Funston, Kan., cost \$136,695, 92 per cent completed; engine terminal, Ellis, Kan., cost \$378,658, 98 per cent completed; coach repair yard, Denver, Colo., cost \$107,600, 96 per cent completed; engine terminal, Marysville, Kan., cost \$275,733, 92 per cent completed; engine terminal, Hastings, Neb., cost \$253,139, completed; passenger station, Grand Island, Neb., cost \$152,050, completed; freight station, Salina, Kan., cost \$192,773, 80 per cent completed; coal station, Laramie, Wyo., cost \$101,991, 97 per cent completed; power house, Omaha, Neb., cost \$594,279, and machine shop extension, cost \$159,667, both completed; Winton branch, Wyoming, extension 4.38 miles, cost \$212,000, 91 per cent completed; engine terminal, Green River, Wyo., cost \$997,996, 5 per cent completed; engine terminal, Council Bluffs, Ia., cost \$1,688,501, 5 per cent completed; engine terminal, Junction City, Kan., cost \$1,220,034, 10 per cent completed; coal and ash handling facilities, Sidney, Neb., cost \$194,050, contract let; machine shop extensions, Omaha, Neb., cost \$546,571, contract let; machine shop, Cheyenne, Wyo., cost \$1,713,463, contract let.

### Union Railroad

*Other Important Work Under Construction:* Building 5 miles double track, branch line to Clairton, Pa., track to be laid in 1919.

### Virginian Railroad

*First Track:* Extension of Stone Coal branch, Laurel Fork, 2.34 miles; Piney Creek extension from Pemberton, W. Va., to Fireco, 7.40 miles; Upper Piney Creek branch, Fireco, W. Va., to Piney Fire Creek Coal Co., 2.40 miles; Beards Fork branch, 2.49 miles, Beards Fork.

*Second Track:* Q. M. Junction, Va., to Carolina Junction, 8.00 miles; in West Virginia, M. P. 366.4 to M. P. 371.5, 5.10 miles; total 13.10 miles.

*Other Important Work Under Construction:* Additions and improvements to coal pier, Sewalls Point, Va., cost \$703,317, 99 per cent completed.

### Western Maryland

*First Track:* Branch line (Somerset Coal Railway), Grays Junction, W. Va., to Bell; branch line, Fairmont, W. Va. (Fairmont, Helens River Railway).

*Second Track:* Security, Md., to Hagerstown; from Big Pool, Md., to Clear Springs, 5.65 miles.

*Other Important Work Under Construction:* Yard and engine terminal, Bowest, Pa. (Connellsville), cost \$315,000, 75 per cent completed; additional yard tracks, Hagerstown, Md., cost \$315,000, 15 per cent completed; passing siding from Cumberland, Md., to Big Pool, cost \$150,000, 30 per cent completed; second track, Clear Spring, Md., to Williamsport, cost \$605,000, 35 per cent completed; second track, Knobmount, W. Va., to Seymour, cost \$175,000, 15 per cent completed.

### Western Pacific

*Other Important Work Under Construction:* Replacing bridge No. 139.79 at American river, Sacramento, Cal., cost \$259,468, 99 per cent completed; replacing bridge No. 177.80 South Yuba river, Marysville, Cal., cost \$121,170, 75 per cent completed.

### Western & Atlantic

*Other Important Work Under Construction:* Engine terminal at Hills Park (Ga.) yard near Atlanta, cost \$360,000, 20 per cent completed.

### West Jersey & Sea Shore

*Other Important Work Under Construction:* Drawbridge at Racoon Creek, Bridgeport, N. J., cost \$177,562, 10 per cent completed; raising big timber creek bridge, Westville, N. J., cost \$106,533, completed; track elevation and elimination of grade crossings, Camden, N. J., cost \$358,462, 44 per cent completed, and elevating track Spruce to Everett streets, cost \$775,013, completed.

### Wheeling & Lake Erie

*Second Track:* Gambrius, Ohio, to Kemery, 2.71 miles; Harmon to Lonas, 1.33 miles; total 4.04 miles.

*Other Important Work Under Construction:* New yard and terminal facilities, Jewett, Ohio, cost \$100,000, 96 per cent completed; yard tracks, Canton, O., cost \$250,000, completed; new freight station, Canton, O., cost \$206,000, 98 per cent completed, except paving.

### Yazoo & Mississippi Valley

*Second Track:* Baton Rouge, La., to North Baton Rouge, 3.01 miles.

*Other Important Work Under Construction:* Second track from Marionette to Pritchard, Miss., 11.53 miles, cost \$275,900, 45 per cent completed; raising track in Cleveland district, 20 miles, cost \$381,890, completed; shop buildings, Baton Rouge, La., cost \$143,430, completed.

## Railroad Construction in Canada in 1918

### Canadian Northern

*First Track:* Glidden, Sask., westerly 21.60 miles; Moose Jaw (Sask.) terminals, 0.90 mile; Bonar, Alta., southwesterly 2.20 miles; total 24.70 miles.

### Canadian Pacific Western Lines

*Other Important Work Under Construction:* Building six-mile line from York, B. C., cost \$200,000, 60 per cent completed.

### Essex Terminal Railway

*First Track:* Ojibway, Ont., to Quarry of Amherstburgh, 9.20 miles.

### Grand Trunk Pacific

*First Track:* Duro, Sask., to Engen, 3.23 miles; Harfield to Yorath, 0.95 mile; total 4.18 miles

*Other Important Work Under Construction:* Coal mixing plant at Edson, Alta., cost \$120,000, 40 per cent completed; repairs and alterations to roundhouse at Rivers, Man., cost \$100,000, completed; extensions to roundhouses at Melville, Sask., Biggar and Edmonton, Alta., cost \$100,000, completed; Pine and Mule Creek diversion mile 91 to 94, provision of earth dump to make permanent line over these creek beds, cost \$450,000, 15 per cent completed.

### Intercolonial

*Other Important Work Under Construction:* Terminal facilities at Halifax, cost \$2,849,000, 90 per cent completed; additional train track extensions to freight sheds and track rearrangement at deepwater terminal, Halifax, cost \$130,000, 90 per cent completed.

### Pacific Great Eastern

*First Track:* In province of British Columbia, 30.00 miles.

### Sydney & Louisburg

*First Track:* Bridgeport, N. S., to New Man Staff, 1.00 mile.

### Toronto, Hamilton & Buffalo

*Second Track:* Stoney Creek, Ont., to Kinnear, 4.28 miles.

*Other Important Work Under Construction:* Sorting yard at Bridgebury, Ont., cost \$300,000, 60 per cent completed; replacing steel viaducts at Stoney Creek, Ont., cost \$130,000; at Hamilton, improvements under-way including extension of Kinnear freight yard and extension to shop buildings, cost \$128,200.

### Lake Huron & Northern Ontario

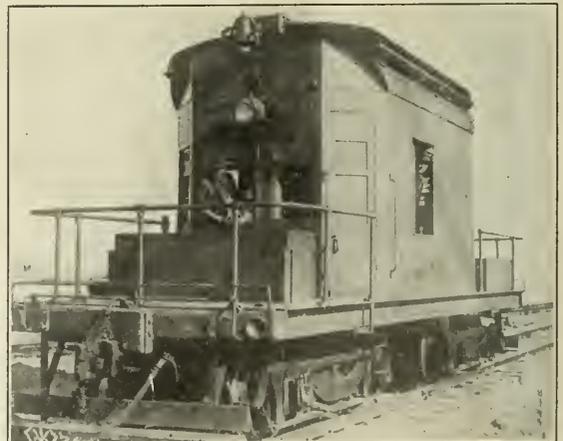

*First Track:* In the Province of Ontario, 66.00 miles.

## Railroad Construction in Mexico in 1918

### Tampico Panuco Valley

*First Track:* Panuco, Vera Cruz to Los Indios, 10.00 miles.

The Gas-Electric Locomotive Used at the Aberdeen, Md., Proving Grounds

# Doings of the United States Railroad Administration

## Telegraph Operators Receive Increase; Few Developments in Closing Week of 1918

WASHINGTON, D. C.

THE RAILROAD ADMINISTRATION has authorized the resumption of a limited amount of advertising of passenger service to begin soon after the first of the year. Such advertising has been almost completely discontinued during the war. It is proposed now to use advertising for new service and seasonal service such as that to Florida, the South and California. The advertising will be devoted principally to localities and will not be in the name of individual railroads, but as it will be used mainly in cities where there are consolidated ticket offices they will be referred to for information as to routes and schedules.

### Further Wage Increase for Telegraph Operators

Director General McAdoe has issued the following Supplement No. 13 to General Order No. 27, making a further revision of the wage scales of telegraph operators and similar employees on the basis of a minimum of 48 cents per hour:

Effective October 1, 1918, for positions held by telegraphers, telephone operators (except switchboard operators), agents, agent telegraphers, agent telephoners, towermen, levermen, tower and train directors, block operators and staffmen, the following rates of pay, rules for overtime, and working conditions upon railroads under federal control, are hereby ordered, superseding General Order No. 27, its Supplements Nos. 10 and 11, and in lieu thereof.

#### ARTICLE I.

(a) All employees herein specified shall be paid on the hourly basis except those provided for in Article IV.

(b) To determine the hourly basis for positions held by monthly paid employees, multiply by 12 the regular monthly rate in effect as of January 1, 1918, prior to the application of General Order No. 27 (exclusive of all compensation for extra services), divide by 306 (number of working days for the year), and apply provisions of Section (e) of this article.

(c) To determine the hourly rate for positions held by weekly paid employees, multiply by 52 the regular weekly rate in effect as of January 1, 1918, prior to the application of General Order No. 27 (exclusive of all compensation for extra services), divide by 306 (number of working days for the year), and apply provisions of Section (e) of this article.

(d) To determine the hourly rate for positions held by daily paid employees, multiply the daily rate in effect as of January 1, 1918, prior to the application of General Order No. 27 (exclusive of all compensation for extra services), by 365, divide the result by 306 (number of working days for the year), and apply provisions of Section (e) of this article.

(e) Employees who were on January 1, 1918, prior to the application of General Order No. 27, paid on a basis of 10 hours or more to constitute a day's work, shall receive one-eighth of the wages received for 10 hours on January 1, 1918, prior to the application of General Order No. 27, as their basic hourly rate; employees working less than 10 hours and over 8 hours shall receive one-eighth of the wages received for the number of hours recognized as a day's work.

(f) Where there are no regularly assigned or established daily hours, for the purpose of computing the hourly rate, daily hours shall be regarded as ten, one-eighth of which will be the hourly rate.

(g) In determining the hourly rate, fractions less than one-fourth of one cent shall be as one-fourth of one cent; over one-fourth and under one-half, as one-half cent; over one-half and under three-fourths, as three-fourths of one cent; over three-fourths, as one cent.

#### ARTICLE II.—RATES OF PAY.

For positions held by telegraphers, telephone operators, (except switchboard operators), agents (except as provided in Article IV.), agent telegraphers, agent telephoners, towermen, levermen, tower and train directors, block operators and staffmen, to the rates in effect on January 1, 1918, prior to the application of General Order No. 27, add 13 cents per hour and 2 cents per hour additional in lieu of vacations (applicable to all roads irrespective of present practice). Where this increase fails to establish a rate of 48 cents per hour, establish a minimum rate of 48 cents per hour.

#### ARTICLE III.—PRESERVATION OF RATES AND CLASSIFICATION.

(a) The minimum rates and all rates in excess thereof, as herein established, and higher rates which have been authorized since January 1, 1918, shall be preserved.

(b) The entering of employees in the positions occupied in the service or changing their classification or work shall not operate to establish a less favorable rate of pay or condition of employment than is herein established.

(c) Where existing pay roll classification does not conform to Article II, employees performing service in the classes specified therein, shall be classified in accordance therewith.

#### ARTICLE IV.—EXCEPTIONS.

The provisions of this order will not apply:

(a) To cases where salaries less than \$30 per month are paid to individuals for special service which only takes a portion of their time from outside employment or business.

(b) To agents whose compensation as of January 1, 1918, was upon a commission basis, or upon a combination of salary and commissions (not including express or outside commissions).

(c) To agents whose duties are supervisory and who do not perform routine office work, nor the small non-telegraph stations (except where they are now included in agreements), which, on account of the varying character and extent of their work and responsibilities, can not be intelligently treated as a class.

The federal manager on each railroad is hereby instructed to consider the individual cases of the smaller non-telegraph stations, or stations paid on a commission basis or on a combination of salary and commission, both as to compensation and working conditions, with committees of employees, and where agreement can be reached are authorized to put the same into effect.

In case of disagreement, either as to compensation or working conditions, or as to whether a station comes properly under the terms of this article, the exact points of such disagreement shall be reported to the Board of Railroad Wages and Working Conditions through the regional director for consideration and recommendation to me.

#### ARTICLE V.—HOURS OF SERVICE—OVERTIME AND CALLS.

(a) Eight consecutive hours, exclusive of the meal hour, shall constitute a day's work, except that where two or more shifts are worked, eight consecutive hours with no allowance for meals shall constitute a day's work.

(b) Overtime shall be computed at the rate of time and one-half time. Even hours shall be paid for at the end of each pay period; fractions thereof will be carried forward.

(c) When notified or called to work outside of established hours, employees will be paid a minimum allowance of two hours at overtime rate.

(d) Employees will not be required to suspend work during regular hours or to absorb overtime.

#### ARTICLE VI.—UNITED STATES MAIL.

When the carrying of United States Mail and Parcel Post by the employees herein specified becomes unduly burdensome or interferes with the proper operation of trains, they will be relieved from such work.

#### ARTICLE VII.—DISCIPLINE AND GRIEVANCES.

(a) An employee disciplined, or who considers himself unjustly treated, shall have a fair and impartial hearing, provided written request is presented to his immediate superior within five days of the date of the advice or discipline, and the hearing shall be granted within five days thereafter.

(b) A decision will be rendered within seven days after completion of hearing. If an appeal is taken, it must be filed with the next higher official and a copy furnished the official whose decision is appealed within five days after date of decision. The hearing and decision on the appeal shall be governed by the time limits of the preceding action.

(c) At the hearing, or on the appeal, the employees may be assisted by a committee of employees, or by one or more duly accredited representatives.

(d) The right of appeal by employees or representatives, in regular order of succession and in the manner prescribed, up to and inclusive of the highest official designated by the railroad to whom appeals may be made is hereby established.

(e) An employee on request will be given a letter stating the cause of discipline. A transcript of the evidence taken at the investigation or on the appeal will be furnished on request to the employee or representative.

(f) If the final decision decrees that charges against the employee were not sustained, the record shall be cleared of the charge; if suspended or dismissed the employee will be returned to former position and paid for all time lost.

(g) Committees of employees shall be granted leave of absence and free transportation for the adjustment of differences between the railroad and the employees.

(h) Where the time limits in discipline and grievance rules now in effect are more extensive, they may be preserved.

#### ARTICLE VIII.—RULES FOR APPLICATION OF THIS ORDER.

(a) The pay for female employees, for the same class of work, shall be the same as that of men, and their working conditions must be healthful and fitted to their needs. The laws enacted for the government of their employment must be observed.

(b) If the operation of this order creates either unreasonably low, or excessively high rates, for service, individual cases and circumstances considered, it will be the duty of the Board of Railroad Wages and Working Conditions to investigate, on complaint, and recommend equitable treatment therefor.

(c) Vacations with pay are abolished, effective January 1, 1919.

#### ARTICLE IX.—INTERPRETATION OF THIS ORDER.

The rates of pay and rules herein established shall be incorporated into existing agreements and into agreements which may be reached in the future, on the several railroads; and should differences arise between the management and the employees of any of the railroads as to such incorporation, intent or application of this order, such question of differences shall be referred through the director of the Division of Labor as prescribed in Supplements 6 and 6a to General Order No. 27 for decision, subject always to review by the director general.

Agreements or practices, except as changed by this order, remain in effect.

In a statement accompanying the order Director General McAdoe said:

"In reaching the conclusions upon which this order is

based, I have given special consideration to the problem presented of work on Sundays and holidays. I am in full sympathy, as every reasonable man must be, with the natural desire of the employees to be released from Sunday and holiday labor as far as possible. Not only are employees the better for such periods of rest and recreation, but they naturally prefer for that purpose Sundays and holidays, because all the habits of our people are so adjusted that rest and recreation are more feasible and satisfactory on those days than on other days.

"I am satisfied that in the past there has been a great deal of unnecessary work on Sundays and holidays, and that methods can and must be adopted to confine such work in the future to what is necessary. At the same time we must face the fact that the entire public expects the railroads to be operated on Sundays and holidays as well as on other days; hence it is impossible to adopt any plan which will eliminate Sunday and holiday labor.

"This order which I am promulgating will, in itself, go far toward eliminating Sunday and holiday work wherever practicable, and toward reducing such work where it cannot be eliminated to the fewest number of hours. This will result from the fact that hereafter all such work will be paid on an hourly basis instead of on a monthly basis, as has been true in the past to a considerable extent. Therefore, the employing officer will realize that he must pay additionally for every hour of Sunday and holiday work, and his anxiety to prevent unnecessary expense will be a strong inducement to eliminate unnecessary work on those days. I regard this as a great step forward, and I believe I am justified in expecting that it will bring about a marked reduction in Sunday and holiday work of an avoidable character.

"I propose to supplement this action by definite orders that a special study must be made for the purpose of eliminating Sunday and holiday work wherever practicable, and, where it cannot be eliminated, of minimizing it to the fewest number of hours. I believe the special effort which will consequently be made in this direction will, coupled with the strong inducement arising from the new basis of payment, bring about an early and substantial reform in this important matter.

"Employees who have heretofore had to work on Sundays and holidays will get through this order a direct compensation for that condition, by reason of the fact that their hourly rates of pay in the future will be, to a large extent, substantially increased, as from an examination of Article I, it will be seen that in determining the hourly wage a divisor of 306 days has been used, which will, in a large measure, compensate for punitive Sunday and holiday overtime.

"It has not been practicable to adopt a plan for paying a punitive overtime rate for time worked on Sundays and holidays. The object for such punitive allowances is to impose a penalty or punishment for the work to which the allowances attach. In the nature of things, it is unjustifiable to impose such punishment in respect of work which cannot be avoided. Such punitive allowance is not necessary to cause the elimination of such work, or its reduction to a minimum, because that result can and will be brought about by the adoption of the hourly rates and special instructions which will be issued to reduce Sunday and holiday work where practicable."

#### Successful Handling of Oil Traffic

W. E. McEwen, chairman of the transportation committee of the Western Petroleum Refiners' Association, has written a letter to Director General McAdoo, expressing appreciation of the "magnificent efforts made by the United States Railroad Administration during the war period to render a transportation service to the oil industry that would enable it to meet the demands made upon it by the United States

government, its allies and industries engaged in war work.

"It is perhaps safe to say," he said, "that no single industry was more important in the successful carrying on of the war than the oil industry, and in its early days it was realized that if the problems before us were to be met, the transportation question, involving the movement of petroleum and its products, required the closest attention. With this in mind, the oil industry appealed to the United States Railroad Administration for assistance in working out a plan by which the mileage on the tank cars might be doubled without any material increase in the tank car equipment, in order that the steel might be conserved for other important purposes.

"The appeal met with a hearty response and in the western district the regional directors appointed B. L. Swearingen as supervisor of oil traffic, with headquarters at Kansas City, to supervise the movement of oil traffic in the western district. The writer was appointed by the oil industry to co-operate with Mr. Swearingen and secure the assistance and help of the shippers.

"J. A. Middleton was assigned by the Railroad Administration at Washington to the oil division of the United States Fuel Administration, who in turn appointed O. M. Conley at Kansas City to also render assistance in meeting the emergency, Mr. Middleton afterward being succeeded by O. M. Conley at Washington, and F. B. McKay succeeding Mr. Conley.

"These joint offices were opened early in April when conditions were chaotic, and when a great many of the refineries in the mid-continent field in particular, were shut down or only partially operating on account of shortage of equipment. The refiners were requested to work as a unit and assist in consolidating the oil shipments into trainload lots, and this request was met with a hearty response. The Railroad Administration arranged to consolidate this freight, symbol it, and move it through to destination or breaking point in solid trainload lots.

"Without going into the details of the matter it suffices to say that within 30 days there was such an improvement that from that time on there was never a shortage of tank cars in the oil industry in the western field. There never was a demand made upon the western oil industry that it was not able to meet so far as transportation facilities were concerned. There never was a time that there was not at least a day and a half's loading of cars on hand. During the first 10 months of the year there was loaded from the mid-continent field 256,082 cars, compared with 200,603 cars for the same period of 1917, an increase of 55,479 cars, with practically no increase in the amount of equipment. From April 20 to November 30 inclusive, there was loaded from the mid-continent field a total of 3,585 solid trains of oil, containing 100,530 cars.

"In the month of January the mileage per car per day on tank cars of Western refiners was 26.16; in June 56.27, and in September 58.4, an increase of 100 per cent in the mileage performance.

"What was accomplished in the oil industry is one of the most concrete illustrations in the history of railroading of the economic gain by the co-operation between the shipping public and the railroads. These accomplishments were made possible by the whole-hearted co-operation, starting with the yard employees of the railroads, and on up the line, including the operating officials and car service section at Washington, railroad executive officials at Washington, and particular mention should be made of the magnificent co-operation rendered by the three western regional directors and their assistants. This coupled with the unselfish efforts of the refiners in lending their assistance in carrying out the systems adopted, made possible the meeting of all problems confronting the industry from a transportation standpoint in the western district.

"On July 1 the traffic department of this organization was asked to represent the tank car committee of the petroleum war service committee, in order to supervise in behalf of the shippers the entire tank car equipment of the industry, and while the industry as a whole regret the necessities that compel you to resign your position as director general of railroads, we want you to feel that we owe a debt of gratitude to you and appreciate to the utmost the magnificent assistance rendered, and it would be a source of keen regret were this economical method of handling freight to be dispensed with, as the systems devised enable the railroads to handle more freight with less equipment, saves congestion in terminals by reason of the trains moving through solid, and is of equal benefit to the shippers, the railroads, and the public at large.

"While the jurisdiction of the Kansas City office only extended to the territory west of the Mississippi river and Chicago, I also want to commend the eastern regional directors and their assistants for the hearty co-operation rendered in the movement of the very large tonnage that originated in this field that moved to the seaboard for export and to the large industrial institutions of the East in meeting the war problems."

#### To Retain Skilled Railroad Men

The mechanical department of the Division of Operation is taking steps to prevent the possible loss of trained shop employees to the railroad service as a result of any reduction in force which may seem necessary at particular points. If the men are not needed at one place arrangements will be made to locate them elsewhere, as it is believed that more men instead of less men will be needed in the next few weeks. Frank McManamy, assistant director of the Division of Operation, has addressed a letter to the regional directors stating that a number of cases have recently been brought to his attention where in the readjustment of shop forces skilled workmen have been laid off.

"Every trained railroad employee represents a certain definite investment," Mr. McManamy said, "therefore, when reorganizations make reductions in forces necessary, all reasonable efforts should be made to retain these men in railroad service. Before a reduction in force is made at any point, steps should be taken to ascertain if the men to be laid off can not be profitably used at some other point, either on that line or on some other line within your region, in which event transfer should be made and transportation provided.

"If the men cannot be profitably used in your region, this office should be advised, giving the number of skilled workmen to be released and their occupation, so that efforts may be made to place them elsewhere, thus retaining in railroad service, men who have been trained and are proficient in that line of work."

#### More Roads Transferred

Effective on December 26, according to Circular No. 68, the Pittsburgh & Lake Erie, the Monongahela, the Pittsburgh & West Virginia, and the West Side Belt Railroad were transferred from the Allegheny region to the Eastern region, and the Grand Rapids & Indiana Railroad was transferred from the Eastern region to the Allegheny region.

#### Secret Service and Police Section Created

Effective January 1, 1919, according to Circular No. 69, the secret service branch of the Claims and Property Protection section of the Division of Law is terminated, and instead thereof the Secret Service and Police section of the Division of Operation is created. W. J. Flynn is appointed chief of the Secret Service and Police section with office in Southern Railway building, Washington, reporting to the director, Division of Operation. The chief of the Secret Service and Police section will deal through the regional di-

rectors as to matters affecting the police service of the various railroads under the jurisdiction of the several regional directors.

#### Concurrence of R. R. Administration on Public Improvements No Longer Required

Director General McAdoo has issued Circular No. 44-A, cancelling Circular No. 44, dated July 29, which requested public authorities to secure the concurrence of the Railroad Administration where public improvements are contemplated for which a portion of the cost exceeding \$500 would be charged against a railroad under federal control.

#### Orders of Regional Directors

**E**XPENSES OF AMERICAN CHEMICAL SOCIETY.—Supplement 4 to Circular 136, Southwestern regional director, same as File 102-22A361 of Eastern regional director. (See *Railway Age*, December 27, page 1164.)

*Recognition of Federal Manager as Chief Operating Officer.*—Circular 148 of the Southwestern regional director, same as file 1500-96A360 of the Eastern regional director. (See *Railway Age*, December 27, page 1163.)

*Maintenance of Wires During Winter.*—Circular Letter No. 416 of the Southern regional director gives instructions similar to those issued in other regions for the maintenance of telegraph and telephone lines during the winter season. (See *Railway Age*, December 13, page 1078.)

*Removal of Coal and Water from Engines.*—The Eastern regional director, file No. 500-1-68A336 orders that when engines are moved dead to repair shops it is desired that coal and water be removed before shipment is made.

*Violations of Safety Appliance Laws.*—In Order 144 the Southwestern regional director states that numerous violations of safety appliance laws and of the director general's order No. 8 are being reported by traveling federal inspectors. He directs that immediate action be taken effectively to stop these violations; car and mechanical department heads should be given to understand that the federal laws and the orders of the director general must be observed.

*Insurance and Inspection of Elevators.*—In Order 145 the Southwestern regional director quotes a letter from the director of the Division of Finance and Purchases which states that an exception has been made to General Order 24 to provide that the insurance on all passenger and freight elevators in properties operated by the Railroad Administration be continued with the distinct understanding that the insurance carries an obligation on the part of the insuring companies to inspect the elevators with reasonable frequency.

*Routing Western Union Shipments.*—The Eastern regional director, file No. 600-4-95A320, states that in order to protect the Western Union Telegraph Company in its contractual rights of exchange transportation over many of the lines under federal control, it has been decided that an exception shall be made to the routing provisions of General Order No. 1, and that the Western Union Telegraph Company shall be given the right to route its shipments, and that such routing instructions shall be observed in the future handling of its traffic.

*Exchange Transportation Between Carriers of Local Card Passes.*—The Eastern regional director, file No. 2100-41A-343 announces that considerable local exchange transportation between carriers has been issued for account of officers and employees frequently traveling on a line of road other than the employing road, either on official business, or journeying between residence and place of business. There are no objections, and in fact it is desirable that such arrange-

ments shall be continued, subject to such local arrangements as to restrictions on trains, suburban zones, or otherwise, as may have heretofore existed.

*Disposition of Certain Kinds of Freight.*—In Supplement 1 to Circular 116, the Southwestern regional director states that the provision in General Order 34A, calling for the sale of shipments which have been on hand for 60 days after notice of arrival has been given consignees, is not intended to necessitate the holding of commodities of small value, such as sand, coal and low grade ore, the freight and demurrage charges on which may equal or exceed the sale value at the expiration of the two-month period. In some cases it will be found desirable for a road to take over the property for its own use and settle with the owner. In other cases a prompt sale will be advisable, or it will be necessary to unload the property in the best available space.

*Acceptance of Embargoed Freight.*—In Supplement 1 to Circular 58 the Central Western regional director calls attention to the large accumulation of export freight at Seattle, Wash., occasioned by the non-observance of embargoes. At present there are approximately 3,500 cars of export freight at Pacific ports. In addition, there are about 1,000 cars held back on the line from week to week awaiting opportunity to move into the terminal. There is also a vast amount of export freight unloaded on the ground and on the docks. To avoid a still larger accumulation and to permit the disposition of freight now on hand, embargo restrictions must be observed literally. This applies not only to Pacific ports, but to all points that are embargoed.

*Material Requirements.*—The Eastern regional director, file No. 3000-446, quotes as follows from a letter received under date of December 6 from the Central Advisory Purchasing Committee:

"Effective at once, it will not be necessary to file through this office, or with the Requirements Division, War Industries Board, any advice as to your requirements.

"The Commodity Section handling specific articles will remain as long as they can be of any service, and as the Central Advisory Purchasing Committee is represented on the most important of these Sections, information or assistance may be secured direct through the Section without handling through the Requirements Division.

"This phase of the work of the department has, therefore, ceased."

*Standardization of Corrugated Engine and Tender Hose.*—The Eastern regional director, file 500-1-67A339, announces that the Division of Railway Supplies of the War Service Committee of the Rubber Industry of the U. S. A. has recommended to the Railroad Administration that the sizes of corrugated engine and tender hose in conducting water from the tender to the boiler of locomotives be standardized, and that on and after a fixed date the following sizes, only, shall be made and supplied to railroads and railroad equipment companies:

2½ inches x 36 inches	3 inches x 48 inches
2½ inches x 42 inches	3 inches x 54 inches
2½ inches x 48 inches	3½ inches x 36 inches
3 inches x 36 inches	3½ inches x 42 inches
3 inches x 42 inches	3½ inches x 48 inches

*Free Transportation for Clergy.*—The Eastern regional director, file No. 2100-7A334, refers to instructions of December 4, with respect to half rates for clergy, members of religious orders and account charity.

Effective January 1, 1919, the director general desires that there shall be no change in the past practice of the various railroads with respect to the furnishing of passes to members of the clergy, Sisters of Charity, inmates and managers of charitable or eleemosynary institutions, or otherwise furnished for charitable account. While the general practice is expected to be on the basis of one-half rate as published by the Passenger Traffic Committee, federal and general managers are authorized to issue such passes of this character as it has been the custom for the lines in their charge to issue in the past.

*Uniform Method of Handling Hog Shipments.*—The

Southwestern and Central Western regional directors in Circulars 149 and 224, respectively, outline instructions regarding the establishment of uniform practice in handling hog shipments to market centers, quoted from a telegram from the Car Service Section. A standing embargo has been placed on all shipments of hogs to or through market centers and to regulate further movements and thereby avoid congestion and prevent loss. The Stabilization Committee of the Food Administration will determine the number of carloads which can be absorbed by each market daily. The terminal managers at each market center will allocate as between various roads the number of carloads of hogs which may be received daily, on the basis of past performance. The transportation officer of each line will allocate the car supply within his jurisdiction on the basis of orders received and the known ability of shippers to load and ship. The plan is now in effect at Chicago, East St. Louis, Sioux City, Milwaukee and South St. Paul.

*Inspection of Freight at Interchange Points.*—The Eastern regional director, file No. 600-96A337, announces that it is customary at most of the interchange points for each line to have inspectors for examination of freight make an inspection and record as to ventilation, refrigeration, etc., including loading, bracing, stability of packages and general condition of the freight. This was necessary for interline settlements. Under Railroad Administration operation this duplication can be reduced to save labor and avoid delays in moving traffic. As a general practice, therefore, the inspection and record at junction points between federal controlled railroads should be made only by the receiving railroad and by the carrier delivering shipment to consignee or to a line not under federal control.

As a rule, at present, this is already being done by joint car inspectors in the matter of open top cars. This order applies particularly to iceboxes, ventilators and other classes of inspection not heretofore so conducted. There will be local exceptions to this new practice, depending upon the line upon which the ice houses are located and other details, which the respective managers can develop at their several junction points.

*Employment of Discharged Soldiers.*—In confirmation of a telegram dated December 8, the Eastern regional director, file No. 1200-35-2A315, announces that the Railroad Administration will be allowed to send representatives to various camps, cantonments, etc., to secure such labor as will be available.

While such representatives will not be allowed to deal directly with soldiers to be discharged, or to make contracts or attempt to directly recruit labor within the camp, camp commanders will interpret these instructions in a very broad sense and in such a way as to facilitate, as much as possible, the efforts of the Railroad Administration to secure labor, the details to be worked out between the camp commanders and the representatives of the Railroad Administration; in other words, the properly accredited representatives of the Railroad Administration can go into the camps and, through the commanding officers, direct the men to vacant positions.

It is suggested that one man be designated for each camp to act as a medium between camp commanders and representatives of the various railroads; but if deemed advisable and the commandant will allow, this number may be increased. Possibly this may be best accomplished if each federal manager upon whose territory a camp may be located, shall station someone to keep in touch with the commanding officer at the camp, and list any men who wish to enter the railroad service, and their suitability for such employment, and report them to the federal manager and adjacent federal managers for employment, keeping a list to be compiled and submitted at the end of the month to this office.

# General News Department

"Canadian National Railways" is the title now used to designate all of the railways operated by the Canadian Government—the Inter-colonial, the National Transcontinental and the Canadian Northern.

The Union Station in Richmond, Va., just completed, on West Broad street, will be open for business on January 6, at noon. Trains of the Atlantic Coast Line run to this station. The Byrd street station is to be converted into a freight terminal for the Atlantic Coast Line.

Employees of the Pennsylvania Railroad furloughed for military service, up to November 1, numbered 24,712, and it is announced that every one of these who returns honorably discharged can have his former position or another equally good.

W. D. Beck, division superintendent of the Chicago & North Western, at Norfolk, Neb., has been appointed representative of the government in the hearings to be held at San Francisco on wages and working conditions of the employees of the railroad-owned steamship lines on the Pacific Coast.

The Fuel Administration has in preparation a compilation of all rules and regulations promulgated during the life of the administration. This will be brought down to date January 1, 1919, and will be issued as soon thereafter as possible. It will be a bound volume of perhaps 500 pages. All persons desirous of obtaining a copy of this should communicate at once with the Bureau of Education, Washington, D. C.

## Railroad Hearings Before Senate Committee

The hearing before the Senate committee on interstate commerce on the question of the disposition of the railroads was postponed from Thursday until Friday of this week. Mr. McAdoo was expected to be the first witness to outline

his views as to why the period of federal control should be extended for five years.

## Railway Business Association

The Annual dinner of this association will be held at Hotel La Salle, Chicago, on January 9. The speakers will be Harry H. Merrick, president of the Chicago Association of Commerce, and vice-president of the Central Trust Company of Illinois; H. H. Westinghouse, chairman of the Westinghouse Air Brake Company, who has just returned from Europe, and Samuel O. Dunn, editor of the *Railway Age*. Alba B. Johnson, president of the Baldwin Locomotive Works, and president of the association, will preside.

## Government Increases Pay

### of Commercial Telegraphers

The postmaster general on December 31 ordered increases of from 5 to 10 per cent in the wages of employees of the telegraph systems now in control of the department (the Western Union and the Postal). The increases amount to 5 per cent for employees who have been in service between six and eighteen months and 10 per cent for employees longer in service. The increases must advance no salary above \$200 monthly or above an additional \$35 monthly since January 1, 1918. Neither will the increases apply to premium earnings or to employees at nonfunctional offices. Those working on Sunday may accept regular pay scale or demand compensatory time during the following week, as they desire.

The department finds that revenue conditions at this time would not justify the increases now authorized unless, by a careful plan of elimination of waste incident to duplication and by effecting other economies which will not impair the efficiency of the service, the revenue conditions can be made to meet such increases. Believing that this can be done, the order for such increases is accordingly issued.

Czecho-Slovak Troop Train Stopped at the Monument Marking the Boundary Between Europe and Asia

## Traffic News

Coal loading for the week ended December 14 amounted to 222,301 cars, as compared with 183,898 in the corresponding week of 1917. The total increase in 1918 up to and including the week ending December 21 over the same period of 1917 was 624,628 cars.

The car service section of the Railroad Administration has cancelled its requirement that agents must observe the Food Administration's regulations regarding the loading of cars with food and feed commodities, but the continued co-operation of shippers is asked in the efforts of the railroads to keep up the loading of cars to their full capacity.

### Encouragement of Agriculture

The Railroad Administration has established a homeseekers' bureau, to furnish free information about opportunities for persons who wish to engage in farming, stock raising and kindred pursuits. J. L. Edwards, manager of the agricultural section of the Traffic Division, will have general charge of the work. J. F. Jarrell will be transferred from the Bureau of Suggestions and Complaints to be supervisor of the new bureau. Other members will be C. L. Seagraves, industrial commissioner of the Santa Fe, and W. W. Croxton, general passenger agent of the Atlanta, Birmingham & Atlantic. Standing committees of railroad agricultural agents will collate information by states. The homeseekers' bureau and the railroads will be in a position to give inquirers fresh data concerning the advantages offered by various localities and it is expected that returning soldiers will be aided in finding locations.

### Washington Christmas Traffic

Christmas passenger traffic through the Washington terminal this year was the largest in the history of the city, at least a third greater than a year ago, and because of the large number of war workers in the city temporarily, it will, no doubt, be many years before the railroads are called upon to handle anything like the same volume of traffic again. Passengers were induced by advertisements to buy their tickets and engage their accommodations well in advance. The make-up of extra trains was planned so that the work and confusion in the railroad yards was reduced to a minimum. While some trains were late, as a rule they were on time, and there was a noticeable lack of the confusion in the station that has been noted in the past.

Tickets sold in Washington for the period named numbered 111,369 and the revenue was \$731,998. The total number of persons arriving was 256,555; the total departing was 335,000; the number going through was 223,631; the number stopping off in Washington for the holidays was 32,924, and the net exodus from Washington proper was 78,445. Many of these were war workers who will probably not return. The number of pieces of baggage handled was 69,030, and the number

of parcels handled in the parcel room, 27,780, an increase of 50 per cent over a year ago. The number of meals served at the restaurant was one-third larger than a year ago.

To handle this large volume of traffic there were run out of Washington 2,055 sleeping cars and 3,905 passenger coaches, being an increase over a year ago of 686 sleeping cars and 869 coaches. The sleeping cars required 287,700 pillow slips, 493,200 towels, 369,900 sheets, and each sleeping car was equipped with six white coats for the porters, or a total of 12,330. Practically everyone who applied for sleeping car accommodations was accommodated. Extra baggage transfer forces were provided, and on Christmas day there was no delayed baggage left over in the station as has generally been the case.

The smoothness and lack of confusion with which the business was conducted this year is attributed to the fact that it was all directed by one authority which co-ordinated the work of all the departments of all the roads.

### The Traffic Club of New York

At the regular meeting of the Traffic Club of New York, held on December 30, the following resolutions were adopted:

Government ownership, management or operation of railroads is not conducive to economic efficiency, and private initiative, enterprise and responsibility in the creation, extension, improvement and operation of the American railroads should, as a matter of national policy, be fostered and preserved.

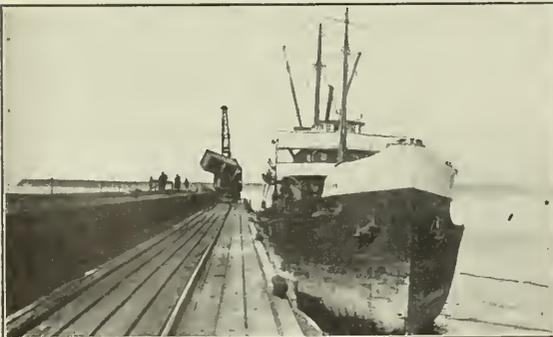

The extension of the present system of federal control for a period of five years, or any extension beyond the limitation now prescribed by law of one year and nine months after the proclamation of peace, is earnestly opposed as prejudicial to the public interest.

The recognized impracticability of continuing government operation of the railroads for twenty-one months after peace under the present law is a conclusive reason why the properties should be relinquished, and in view of the termination of hostilities it should be the policy of the Railroad Administration to restore the integrity of individual properties and prepare for their return to the respective owners.

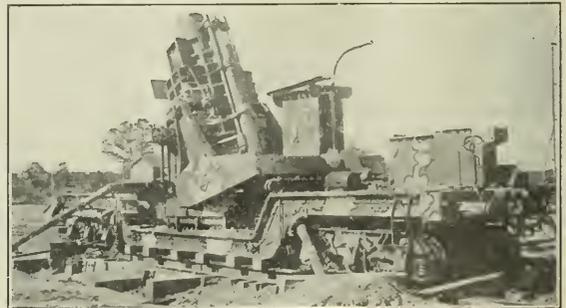

The principle of reasonable, responsible and adequate governmental regulation of transportation facilities is recognized and accepted, but such regulation should provide for the encouragement, protection and development of the railroads.

The Congress should promptly enact such revised legislation as will provide a uniform system of regulation in essential matters, safeguard the public interest, insure adequate revenue to provide for equitable treatment of all questions affecting wages and working conditions of employees and attract sufficient capital to maintain and develop transportation facilities which shall meet the necessities of the commercial, manufacturing and agricultural interests of the country.

Energetic efforts should be exerted to accomplish the early return of the transportation systems of the country to the control and management of their owners, and the enactment of suitable legislation for the protection of the shipping and traveling public, the carriers and their employees.

Unloading Freight from Panama, at Anchorage, Alaska.

Another of the Big Railroad Guns Recently Demonstrated at Aberdeen, Md.

## Commission and Court News

### State Commissions

The Public Service Commission of New Hampshire, in its annual report, just issued, asks why consolidation and unification of railroads cannot be carried out as well under private ownership as under the government. Rehearsing what are called strictly local questions, the commission asks: "Do farmers wish to have the statute requiring the railroads under certain conditions to maintain farm crossings annulled? Do the property owners wish to surrender their statutory right to call upon the railroads to pay for damages caused by fires from their locomotives? Does the state wish to be deprived of the right to require suitable train service to reasonably accommodate the public?"

### Court News

#### Stipulation for Notice of Loss

Cattle injured by exposure during the first part of their journey were unloaded at a way station, and the shipper, having there disposed of most of the animals, had the remainder transported under the original bill of lading to the destination named. The cattle were not injured in this latter carriage. The Circuit Court of Appeals, Eighth Circuit, holds that the 10-day period after unloading within which notice of loss was required to be given ran from the time of unloading at the way station, and transportation to the original destination did not extend the period. Any other ruling would open the door to discrimination. The requirement could not be waived. A telegram by the shipper to an officer of the railroad company, notifying him that the shipment would suffer injuries if precautions were not taken was not noticed within the provision; and oral notice of loss, given to an agent at the point where the animals were unloaded, although followed by investigation, was not sufficient.—*Olson v. C., B. & Q.*, 250 Fed. 372. Decided March 9, 1918.

#### Taking of Railroads for War Purposes—

##### Effect on Garnishment Proceedings

A garnishee summons was served on several garnishee railroad companies on January 29, 1918. Notice was thereafter given to the defendant, the Pennsylvania, as required by statute. Several of the garnishees had, when the summons was served, certain traffic balances in their hands belonging to the Pennsylvania. On motion to quash the proceedings it was urged that by virtue of the provision in the President's proclamation of December 26, 1917, the traffic balances were not garnishable. That provision is to the effect that, except with the prior written consent of the Director General, no attachment by mesne process or on execution shall be levied against the property used by any of the transportation systems taken under federal control in the conduct of their business as common carriers. It was admitted that no written consent of the general director had been obtained granting the levy of the garnishment. The plaintiff claimed however, first, that this particular clause of the proclamation is without warrant of law; second, that traffic balances are not included within the terms of said clause—in other words, that such traffic balances are not "property used by any of said transportation systems in the conduct of their business as common carriers." The federal district court for the District of Minnesota holds that under section 1 of the act of August 29, 1916, c. 418, empowering the President, in time of war, through the Secretary of State, to take possession and assume control of any system or systems of transportation, the clause was fully authorized and valid. What is implied in a statute is as much a part of it as what is expressed, and, when a power is conferred, everything necessary to carry it out and make it effectual will be implied. It is obvious that governmental control of railroads, to be effective, should be exclusive, and not subject to interference by private parties.

The plaintiffs' second contention was not sustained. Certainly cars, engines, coal machinery, would all be wholly within the terms used. Moneys coming in as traffic balances are simply earnings constituting a revolving fund, and form part of a working or liquid capital. Such a fund is just as necessary to the successful operation of a railroad as cars, engines, or coal. The liquid capital may be part of a wage fund today, part of a coal furnishing fund tomorrow, and part of a car rental fund the day after. The court will take judicial notice that no railroad system can be successfully operated without such a fund. The tying up of such a fund would clearly be detrimental to the successful operation of a railroad system, in the same way that the seizure of any other of its property would be. The traffic balances were therefore held within the scope of the President's proclamation, and therefore not subject to garnishment. *Dooley v. Pennsylvania*, 250 Fed. 142. Decided May 10, 1918.

#### The Federal Employees' Liability Act

The Utah Supreme Court holds that a railroad employee who helps to remove old discarded rails from the track is not engaged in interstate commerce within the act.—*Perez v. Union Pacific (Utah)* 173 Pac. 236. Decided May 23, 1918.

The New York Court of Appeals holds that one of a switch engine crew engaged in making up interstate trains, killed by an engine while going to work some eight minutes before beginning work, was engaged in interstate commerce when killed.—*Knowles v. New York, N. H. & H. R. (N. Y.)*, 119 N. E., 1023. Decided May 28, 1918.

The South Carolina Supreme Court holds that where a conductor, when injured, was engaged in switching a car to the siding to be sent to its home road outside the State, he and the railroad were engaged in interstate commerce.—*Paysson v. Seaboard Air Line (S. Car.)*, 96 S. E. 150. Decided May 3, 1918.

The South Carolina Supreme Court holds that if a car on which a repairer was working when he was killed was to be returned to state service after repairs, the state law fixed the rights and duties of the railroad and the repairer's administrator; if after repairs it was to be used in interstate commerce the federal act fixed these rights and duties.—*Cook v. Southern (S. Car.)*, 96 S. E. 148. Decided April 12, 1918.

The Illinois Supreme Court holds that a servant in switchyards operating a motor to carry switchmen back and forth, injured while hauling switchmen who had been looking after cars of coal moving within the state, but (because they belonged to the company) subject to reconsignment to points without the state, was not engaged in interstate commerce.—*Illinois Central v. Industrial Board (Ill.)*, 119 N. E., 920. Decided June 20, 1918.

The Kentucky Court of Appeals holds that a member of a section gang whose duty it was to repair and maintain the tracks, an instrument of interstate commerce, who left the place where he had been employed on the track under orders of the foreman to meet him at a certain station with a hand car, was employed in interstate commerce within the act.—*Williams v. Chesapeake & Ohio (Ky.)*, 204 S. W., 292. Decided June 21, 1918.

The Maryland Court of Appeals holds that a railroad employee, whose work consisted in taking care of a camp car used by bridge carpenters, and cooking meals for them, injured in a collision while engaged in cooking in the camp car placed on a side track, was engaged in interstate commerce within the act, the railroad being an interstate line, and the car traveling from place to place on the line as repairs were needed.—*P. B. & W. v. Smith (Md.)*, 103 Atl., 945. Decided February 27, 1918.

Where an empty car marked "shop" is being switched from the yards of one carrier, where it had stood for several days, to an interchange track for the purpose of returning it home for repairs, the switching being wholly within the state, the West Virginia Court of Appeals holds that an employee injured while engaged in the operation is not engaged in interstate commerce, though the car was forwarded promptly by its owner to its shop in another state for repair. The mere use of the word "shop" on a car is not equivalent to a designation for haulage in interstate traffic.—*Ewing v. Coal & Coke Ry. Co. (W. Va.)*, 96 S. E. 73. Decided May 7, 1918.

## Supply Trade News

Dwight P. Robinson & Co., Inc., constructing and consulting engineers, announce the opening of their offices at 61 Broadway, New York. This organization is prepared to construct, either from their own designs or from the designs of others, hydro-electric developments, steam power plants, transmission systems, industrial plants, housing developments and steel and reinforced concrete structures; to undertake the electrification of steam railways; to act as consulting engineers, and to make engineering and financial reports and appraisals.

H. W. Clarke, who until December 15 was connected with the advertising service department of the McGraw-Hill Company at Chicago, has been appointed manager of advertising for the Chicago Pneumatic Tool Company, Chicago. Prior to his connections with the McGraw-Hill publications he spent eight years with the Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa., part of the time as a member of the sales and publicity departments, and later as western publicity representative, with headquarters at Chicago.

### Philadelphia Branch for Walworth Manufacturing Company

Walworth Manufacturing Company, with general offices at Boston, and works at Boston and Kewanee, Illinois, with branches in New York, Chicago and Seattle, has recently purchased the business of Hunter & Dickson Company, at 241-247 Arch street, Philadelphia, Pa., and after the first of the year will operate it as one of its branches.

Hunter & Dickson Company was founded in 1881. The business began in one room and basement, about 25 by 25 feet, at the present location. Mr. Hunter and Mr. Dickson began their career as boys in the employ of Morris, Tasker & Company in the early sixties. In 1891, Mr. Dickson died, and the business was continued by Mr. Hunter, who later incorporated it in 1900 as Hunter & Dickson Company. In 1913, Mr. Hunter sold out his interest to C. J. Clark, who became president, with Samuel D. Hopkins, vice-president; C. M. Eaton, treasurer, and Robert Hoar, Jr., secretary. Their sales were about \$50,000 the first year, and the business has steadily progressed until of late years it has amounted to several million annually.

## Equipment and Supplies

### Locomotive Deliveries

Sixty-one locomotives were shipped to railroads under federal control during the week ending December 21 including 48 of the U. S. R. A. standard types, as follows:

Works	Road	Number	Type
American	N. Y. C.	3	USRA Mikado.
	Southern	10	USRA Santa Fe.
	C. & N. W.	6	Mikado.
	*Grand Trunk W.	16	USRA Mikado.
	Penn. L. W.	4	USRA 6-w. Switch.
	Seab. Air Line	4	USRA 6-w. Switch.
	Southern	2	USRA 8-w. Switch.
	Penn. L. W.	1	Santa Fe.
	Rutland	1	USRA 8-w. Switch.
	Total	47	
Lima	N. Y. C.	7	USRA Mikado.
	West. Pac.	1	USRA Mikado.
Baldwin	Ill. Cent.	2	Mikado.
	Penn. R. R.	2	Mikado.
	C. B. & O.	1	Mikado.
	A. T. & S. F.	1	Mikado.
	Total	7	
Grand total	61		

\*Three United States Railroad Administration Mikados constructed for the New York Central and six United States Railroad Administration Mikados constructed for the Grand Trunk West were sent to Buffalo and four United States Railroad Administration Santa Fe locomotives were shipped to Potomac Yards, Va., to be stored as parts of emergency pools.

## Financial and Construction

### Railway Financial News

PITTSBURGH, CINCINNATI, CHICAGO & ST. LOUIS.—This company has declared a semi-annual dividend of 2 per cent, making the dividend for the year 4 per cent, or 1 per cent less than in 1917.

WATAUGA & YADKIN RIVER.—The Oil City Trust Company, of Oil City, Pa., has purchased this road at receiver's sale for \$160,000. The road operates 29 miles of line between North Wilkesboro, N. C., and Darby.

PENNSYLVANIA COMPANY.—This company, which controls the Pennsylvania Lines West of Pittsburgh, has declared a semi-annual dividend of 1 per cent, making 6 per cent for the year, the same as in 1917.

MANISTEE & NORTH EASTERN.—The Michigan Trust Company, of Grand Rapids, has been appointed receiver for this road, operating 190 miles of line between Manistee and points in western and central Michigan.

ST. LOUIS-SAN FRANCISCO.—This company has sold to bankers \$10,598,000 prior lien mortgage 6s, series C, dated July 1, 1918, maturing 1928. The bonds are being offered at 96 and interest, to yield about 6.55 per cent.

BOSTON & MAINE.—George W. Anderson, former Interstate Commerce Commissioner, and now a judge of the United States Circuit Court, has been confirmed as one of the trustees of the Boston & Maine stock owned by the New Haven, but under the board's control. He will succeed the late Chief Justice Marcus P. Knowlton and will serve without pay. Judge Anderson, in accepting the position pointed out that usually a federal justice should not be permitted to be active in the administration of a railroad, but that in his case the circumstances are peculiar.

### Railway Construction

CISCO & NORTHWESTERN.—This company has been incorporated with a capital stock of \$500,000 to build a railroad between Cisco, Texas, and Graham, 70 miles. The incorporators are: R. O. Lee, G. D. Ward, C. H. Lee, N. W. Maxcill, J. H. Garner, G. C. Lingle, J. B. Elitch, B. S. Huey, T. R. McDaniels, D. E. Jones, F. E. Harell, J. R. Skinner, J. A. Lauderall, J. J. Butts, D. K. Scott, W. E. Spencer, William Reagan, E. B. Gude and A. J. Ward, all of Cisco.

PENNSYLVANIA RAILROAD, WESTERN LINES.—This road will build a freight house at Alliance, Ohio, which will be 40 ft. by 250 ft., of brick and timber construction, and to cost about \$35,000.

A contract has been let to G. A. Fuller, Cleveland, Ohio, for the construction at Denison avenue, Columbus, Ohio, of a 32-stall enginehouse, annex and office; car shop, oil house, power house, sand house, fan house, and service building. These buildings will be of reinforced concrete and brick construction, with concrete foundations.

At Ft. Wayne, Ind., the company has under construction and in contemplation a car repair building, store room and office building, machine shop, blacksmith shop, oil and paint storehouse, and firing-up shed.

### Trade Publications

DITCHING ON THE PENNSYLVANIA.—The Ball Engine Company, Erie, Pa., has just issued Bulletin S20, entitled "What the Erie Ditcher Is Doing for the Pennsylvania," which shows in an illustrated manner the variety of work which this equipment is doing on different divisions of this road. Figures of cost and operating conditions are included. This booklet also contains a discussion of the advantages of the Erie Ditcher in this class of work.

# Railway Officers

## Railroad Administration

### Central

**S. A. Bramlette** has been appointed representative of the Division of Labor of the Railroad Administration, effective December 16, with office at Washington, D. C. Mr. Bramlette will be assigned to conduct investigations and to represent the Division of Labor in other specific matters to which he may be assigned, affecting employees of the railroads under federal control.

### Federal and General Managers

The Manistique & Lake Superior has been added to the jurisdiction of **E. F. Blomeyer**, general manager of the Ann Arbor, with headquarters at Toledo, O.

**J. B. Parrish**, general superintendent of the Chesapeake & Ohio, has been appointed general manager of the Chesapeake & Ohio; the Ashland Coal & Iron; the Sandy Valley & Elkhorn, and the Long Fork Railroad, with office at Richmond, Va., vice **J. P. Stevens**, deceased.

### Operating

**George Geiger** has been appointed assistant superintendent of the Virginian Railroad, Norfolk Division, with headquarters at Victoria, Va.

**A. C. Reynolds**, car accountant of the New York, Ontario & Western, with office at Middletown, N. Y., has been appointed superintendent of car service, and the title of car accountant has been abolished.

**G. L. Hurley** has been appointed superintendent of the Alabama division of the Seaboard Air Line, with office at Savannah, Ga., vice **J. A. Streyer**, resigned.

**Roscoe Hooper** has been appointed superintendent of telegraph of all lines under the jurisdiction of **J. A. Edson**, federal manager, with headquarters at Kansas City, Mo., succeeding **R. L. Logan**, deceased.

**J. W. Deneen** will resume his duties as superintendent of the Cumberland division of the Baltimore & Ohio, Eastern Lines, vice acting superintendent **C. B. Gorsuch**, who will resume his position of relief superintendent.

The jurisdiction of **M. F. Dunn**, general safety agent of the Maine Central and the Portland Terminal, has been extended over the lines of the Bangor & Aroostook, and the Grand Trunk Lines in New England, with office at Portland, Me.

**C. F. Holbrook**, trainmaster on the Chicago, Milwaukee & St. Paul, at Portage, Wis., has been transferred to the Twin Cities Terminals division, with headquarters at Minneapolis, Minn., succeeding **J. E. Hills**, who has been promoted to assistant superintendent of the Chicago Terminals division, with office at Chicago, to succeed **A. J. Hasenbalg**, who has been transferred to Portage, Wis., as trainmaster on the LaCrosse division.

**E. P. Goodwin**, general inspector of transportation of the Chesapeake & Ohio, has been appointed assistant to the general manager of the Chesapeake & Ohio; the Ashland Coal & Iron; the Sandy Valley & Elkhorn, and the Long Fork Railroad, with office at Richmond, Va., and the office of general inspector of transportation has been discontinued; **E. L. Bock**, assistant general superintendent of the Chesapeake & Ohio, has been appointed general superintendent of the Western general division, with office at Huntington, W. Va., and **F. L. Poindexter**, fuel agent, has been appointed

assistant to the general superintendent of the Western general division and will continue in charge of fuel matters, with office at Huntington, W. Va. The position of fuel agent has been discontinued.

**John D. Beltz**, whose appointment as acting superintendent of the Baltimore & Ohio, with headquarters at Pittsburgh, Pa., has already been announced in these columns, was born on December 19, 1879, at Limaville, Ohio. He was educated in the schools at Alliance, Ohio, and later attended Curry College, Pittsburgh. In March, 1894, he began railway work with the Baltimore & Ohio, in the boiler shop. About 1896, Mr. Beltz entered the service of the Pennsylvania Railroad at Homestead as ticket agent and clerk. In 1898 he returned to the Baltimore & Ohio as a fireman, and from that position was appointed engine man. In 1912 he was appointed assistant road fireman of engines, and in 1913 was appointed assistant trainmaster. The following year he was promoted to trainmaster, and in 1917 was appointed assistant superintendent, which position he held until his recent appointment as acting superintendent as above noted.

### Financial, Legal and Accounting

**P. J. Hunt** has been appointed freight claim agent of the Los Angeles & Salt Lake, with headquarters at Los Angeles, Cal.

**Charles T. Vose** has been appointed supervisor of fire protection of the Maine Central, the Portland Terminal, the Bangor & Aroostook, and the Grand Trunk Lines in New England, with office at Portland, Me.

### Traffic

**Charles A. Lahey**, formerly assistant general freight agent of the Chicago, Milwaukee & St. Paul, and more recently assistant manager of inland traffic for the United States Food Administration, located at Washington and New York City, has returned to the St. Paul to become general freight agent of the lines east of the Missouri river, effective January 1. Mr. Lahey was called to Washington early last spring to assist the Food Administration in the handling of transportation problems, and during the last four months, while in New York, has been intimately associated with the handling of export grain and grain products. Starting from a clerical position with the St. Paul ten years ago, he has held various positions in the traffic department, and for the four years preceding his service with the Food Administration was in active charge of rate litigation before the Interstate Commerce Commission and state railroad commissions.

### Engineering and Rolling Stock

**Walter B. Harris**, supervisor of track of the Okolona district of the Mobile & Ohio, has been promoted to roadmaster of the St. Louis division, with office at Murphysboro, Ill.

**W. L. Robinson**, supervisor of fuel consumption of the Baltimore & Ohio, Western Lines, Dayton & Union, and the Dayton Union Railroad, has been appointed superintendent of fuel and locomotive performance, and his former position has been abolished.

The jurisdiction of **A. E. Owen**, chief engineer of the Central of New Jersey and the New York & Long Branch, has been extended over the Philadelphia & Reading Railroad, the Atlantic City Railroad, and the Port Reading Railroad, vice **S. T. Wagner**, resigned.

**Clark Dillenbeck**, engineer of bridges and buildings of the Baltimore & Ohio, with office at Philadelphia, Pa., has been appointed assistant chief engineer of the Philadelphia & Reading, the Central of New Jersey, the New York & Long Branch, the Atlantic City Railroad, and the Port Reading Railroad. **P. S. Baker** has been appointed engineer of bridges and buildings of the Philadelphia & Reading, the Atlantic

City Railroad, and the Port Reading Railroad, vice Clark Dillenbeck.

### Purchasing

C. H. Rothgery has been appointed storekeeper of the Baltimore & Ohio, Western Lines, with headquarters at Lorain, Ohio, vice W. H. Dean, transferred.

R. C. Harris, supervising engineer for the Pennsylvania Railroad, Western Lines, at Columbus, Ohio, has been appointed general storekeeper, with headquarters at Pittsburgh, Pa. C. W. Kinnear, assistant engineer of motive power at Toledo, Ohio, has been appointed assistant general storekeeper, with office at Pittsburgh.

## Corporate

### Executive, Financial, Legal and Accounting

Arthur H. Van Brunt, advisory counsel of the Pittsburgh & West Virginia and the West Side Belt, has been appointed general counsel of those companies, with office in New York, effective January 1, and the office of advisory counsel has been abolished.

The following appointments have been made on the Canadian National Railways (the new title adopted to include the Canadian Northern and the Canadian Government Railways): Gerard Ruel, counsel; A. J. Hills, assistant to the president; T. W. Ralph, assistant auditor of disbursements; H. G. Foreman, chief accountant; E. A. Kendree, assistant auditor of freight receipts; F. J. Gascoigne, assistant auditor of passenger receipts; W. L. Brown, assistant auditor of agencies, and H. G. Parker, auditor of freight overcharges. J. D. Morton, assistant comptroller of the Canadian Northern at Toronto, Ont., has been appointed general auditor of that road and the Canadian Government Railways; G. E. Friend, general auditor of the Canadian Northern at Winnipeg, Man., has been appointed comptroller of both roads; R. S. Gosset, auditor of disbursements of the Canadian Northern at Toronto, Ont., has been appointed to the same position also on the Canadian Government Railways, and H. G. Hanna, auditor of the Canadian Northern, has been appointed auditor of passenger receipts of the same road and the Canadian Government Railways. The jurisdiction of the following Canadian Northern officers has been extended over the Canadian Government Railways: W. F. Anderson, auditor of freight receipts, and A. C. Egan, auditor of agencies.

Samuel J. Hungerford, whose appointment as assistant vice-president of the Canadian Northern Railway System and the Canadian Government Railways, with headquarters at Toronto, Ont., has already been announced in these columns, was born on July 16, 1872, near Bedford, Que. He was educated in the common and high schools and began railway work in May, 1886, as a machinist apprentice on the South Eastern, and later served with its successor, the Canadian Pacific, at Farnham, Que. He was then machinist at various places in Quebec, Ontario and Vermont. From August, 1897, to February, 1903, he was consecutively charge-man, at Montreal; assistant foreman at Farnham, Que., locomotive foreman at Megantic, general foreman at McAdam Junction, N. B., and locomotive foreman at Cranbrook, B. C., on the Canadian Pacific. In February, 1903, he was appointed master mechanic on the Western division at Cal-

S. J. Hungerford

gary, Alta. The following January he became superintendent of locomotive shops at Winnipeg, Man., and four years later was appointed superintendent of shops at the same place. In March, 1910, he became superintendent of rolling stock of the Canadian Northern and the Duluth, Winnipeg & Pacific, at Winnipeg, Man., and in May, 1915, was transferred in the same capacity to the Canadian Northern at Toronto, Ont. On November 1, 1917, he was appointed general manager, eastern lines, of the Canadian Northern, at Toronto, which position he held at the time of his recent appointment as assistant vice-president, as above noted.

William A. Patton, assistant to the president of the Pennsylvania Railroad Company and president of the New York, Philadelphia & Norfolk, retired on December 31, 1918, from

W. A. Patton

active service, under the provisions of the pension plan; after a continuous service of 53 years and 11 months. Mr. Patton was born at Union Furnace, Pa., on October 21, 1849. He entered the service of the Pennsylvania Railroad in the office of the general superintendent, at Altoona, in January, 1865. In December, 1871, he was transferred to Philadelphia, and in August of the following year was appointed chief clerk in the office of A. J. Cassatt, then general manager. Mr. Cassatt, in 1882, temporarily withdrew from the railroad service and Mr. Patton went into the office of the president, and on February 10, 1897, he was appointed assistant to President Frank Thomson. Mr. Patton has retained the same position, in association with the three succeeding presidents, Cassatt, McRea and Rea. In the promotion and development of the New York, Philadelphia & Norfolk, now an important and prosperous link in the Pennsylvania System, Mr. Patton had a prominent part. On May 24, 1884, he was made vice-president of that road, and in June, 1899, became president. He remained not only president, but also the actual operating executive until the road was, for operating purposes, incorporated with the southern grand division of the Pennsylvania Railroad in 1917. He has been prominently identified with the agricultural and commercial development of the Maryland and Virginia peninsula and was also active in the promotion, construction and operation of the Norfolk & Portsmouth Belt Line Railroad. Mr. Patton has long been prominent in the affairs of the Young Men's Christian Association, and has been general chairman of the Pennsylvania Railroad Department, at Philadelphia, since August, 1899. He is also a member of the International Committee of Young Men's Christian Associations of North America. He is a director in 45 corporations of the Pennsylvania System.

### Operating

W. H. Bunney, general superintendent of the Montana, Wyoming & Southern, has been promoted to general manager, succeeding M. W. Maguire, resigned, and the office of general superintendent has been abolished.

## Obituary

C. H. Ewings, who resigned in July, 1917, as superintendent of freight transportation of the New York Central, died at his home in Tarrytown, N. Y., on December 27.

John J. Hackett, superintendent of terminals of the Cleveland, Cincinnati, Chicago & St. Louis, at Cincinnati, Ohio, died at his home in that city on December 11, aged 46 years.

## Railway Age

# EDITORIAL

According to that part of the annual report of the director general of railroads covering the Division of Operation, the locomotives ordered by the Railroad Administration "were built from standardized designs for various reasons, the principal of which are as follows: First. To reduce to a minimum the time required to prepare drawings, patterns, and dies, and thus enable deliveries to begin quicker than where separate drawings and patterns would have been necessary for each lot of locomotives allocated to a particular road. Second. To secure quantity deliveries. This method of construction has resulted in delivery being made at a quantity rate which could not have been approached had the locomotives been ordered to individual designs. Third. It has also provided a supply of equipment, the parts of which are largely interchangeable, which is available for use anywhere in the event of congestion. This removes the necessity of carrying a large stock of repair parts particular to the locomotive and avoids delay which results when repair parts must be ordered from some distant owning road." This all sounds very nice, but it does not at all agree with the facts presented in the article in the *Railway Age* of January 3, page 50. Moreover, nothing in the above reasons could possibly influence the *Railway Age* to modify the position taken in the above-mentioned article, which clearly proved that the standardization program was a most serious mistake.

### And These Are the Reasons!

The Brooklyn Rapid Transit is one of the largest street railway systems in the world. It has been a partner of New York City in building its share of the dual subway system. While some of the problems of operation are peculiar to this system and are peculiarly difficult, on the whole, it is representative of many of the best managed urban street railways. The fact that it has been so well managed in recent years and that it has had strong banking support, lays emphasis on the significance of the bankruptcy of the company. There was \$2,000,000 interest due on January 1, and it was decided that it would be better to put the company into the hands of a receiver at once, rather than to try to borrow this amount of money, with no prospects of immediate relief from the impossible situation of the company. The Brooklyn Rapid Transit has been far-sighted in its treatment of its employees; it has necessarily had to advance wages, and has done so in a generous spirit, but, notwithstanding this fact, has had a strike in recent months. Fuel and all materials used in the operation of a street railway have gone up in price from 25 to over 100 per cent.; the five-cent fare, with no charge for transfers, has remained rigidly in force. It might be supposed that, since the city was a partner with the Brooklyn Rapid Transit in the building of new subways, it would have done everything in its power to help the company. On the contrary, under the present administration the city has pursued what appears to be a consistent policy of nagging obstructionism towards the company. What the Brooklyn Rapid Transit and many other street railways need is a higher fare. Anyone who knows enough arithmetic to subtract one sum from another—expenses from earnings—can prove this fact for himself.

### Brooklyn Rapid Transit Receivership

There has been much complaint by railway suppliers because of the slow rate of pay on the part of the railroads since they have been taken over by the government. It was bad enough before in many cases, but is far worse under present conditions. Some of the railway supply companies are financially embarrassed because of this delay and relief should be granted promptly. One supply company states that where its specialties have been used for repairs or renewals in order to modernize equipment, its product has paid for itself in increased earnings long before the bills have been paid by the railroads. Investigation develops that this is by no means an unusual or isolated case. Government representatives are having much to say about the necessity for continued prosperity and the maintenance of high wage scales. How can these things continue if business is to be throttled for the want of funds to which it is rightly entitled? Is the government sufficiently interested in the prosperity of the country and the maintenance of high wage scales to right these wrongs for which it is responsible and which are inexcusable? Ought not the railway supply companies to unite and insist upon the universal use of the trade acceptance in dealing with the railways?

### A Poor Customer

Is No Middle Course Available?

### Is No Middle Course Available?

DIRECTOR GENERAL McADOO persists in contending that the only alternative policies available for dealing with the railroads are to return them at once to the competitive management of the companies, or to provide for a continuance of government operation for five years.

The objections to either of these policies are obvious, and repeatedly have been forcibly stated. What system would be tested under his five-year plan? This never has been made clear. Does he intend a test of the present policy of unified operation? It seems apparent to everybody except himself and a few others, that if the present policy of "unification" were continued five years the railways would be so "scrambled" and would establish such financial relations with the government, that they never could be returned to private management. But if his five-year plan should be adopted, would the result actually be a test of the present system? Some one else will succeed Mr. McAdoo as director general. Nobody knows what his successor's policy would be. Therefore, nobody knows of what policy we should have a test.

As to the immediate return of the railways to their owners without guarantees of net income, this would cause disaster to many companies. Some roads are earning more than their guaranteed net return, others much less. This is largely owing to the policy followed by the Railroad Administration during the last year. The ruin of numerous railway companies might cause a panic which would be disastrous to the entire nation.

However, it is not true that no course but the two mentioned is open. The country really is confronted with two railway problems. One is, what to do with the roads in the near future—say, for two years. The other is that of adopting a permanent policy of railway ownership, regulation and management. We must take some time to solve the latter problem. It can, however, be solved as well in two years

as in five. The immediately pressing question is, what policy shall be followed while a permanent solution is under consideration? The Railroad Administration itself has power to answer that question in a safe and rational way. First, the existing guarantees of net operating income can be, and ought to be, continued for perhaps two years—say, to January 1, 1921. Peace, apparently, will be signed within the next six months. The law provides for a continuance of government control not more than 21 months after the return of peace. Therefore, a continuance of the guarantees of net operating income until January 1, 1921, probably would cover a period not much shorter than the time until peace shall be signed, plus the 21 months specified by law. Morally and economically, is there any more reason why the government should pay the price fixed by it for wheat before the armistice was signed, than why it should continue for a reasonable time the guarantees to the railway companies?

If having been settled that the guarantees will be continued for two years, the railways, thus protected from financial disaster, could be returned to *operation* by the owning companies soon, and at the same time government *control* could be continued as long as the guarantees are continued. It seems constantly to be overlooked that there is a wide difference between government *control* and government *operation*. The law does not require government *operation*; it was adopted by the director general despite the fact that it was not apparently intended by Congress. The railway companies continued to operate the properties some months after government control was adopted, and the director general can restore them to operation by the companies at any time, without actual abandonment of government control.

Is early restoration of the railways to private operation desirable? It is evident that public sentiment is opposed to government ownership and operation, or to centralized management from Washington, whether by the government or a private monopoly. There is no reason to believe that public sentiment will change. Therefore, there is no reason to believe that the restoration of the roads to private operation would make a sound and satisfactory ultimate solution of the railway problem more difficult. Since it appears clear that the final solution ought not, and probably will not, involve centralized management from Washington, it would seem that the early restoration of the roads to private operation would make the final solution less rather than more difficult.

What would, or rather what ought to be the relations between government control and private operation if the former, together with the guarantees of net operating income, should be continued for two years? The directors and managers of the properties during this period would or should be allowed to exercise as to most matters the same initiative and authority they did before government operation was adopted. There would have to be some exceptions, but the return of the companies to private operation would solve some of the most perplexing problems now presented. For example, at present budgets for capital expenditures are first made by the federal managers, then submitted by them to the corporations, and finally passed upon by the administration at Washington. If the roads were returned to private operation the budgets would be made up by the companies themselves. Doubtless, while the government continued to guarantee net income they should continue to be passed upon by the administration at Washington. Doubtless while the final solution of the railway problem is in abeyance the government should prevent capital expenditures obviously having a purely competitive purpose; but, on the other hand, it should approve all expenditures intended to provide increased facilities where they are needed. As for expenditures for maintenance of way and maintenance of equipment, the government should not interfere with them insofar as they are intended to put the railways in good operating condition.

The director general in his statement before the Senate committee on Interstate Commerce last Friday mentioned specifically 17 "reforms which should be continued under peace conditions." Anybody familiar with railway conditions and the attitude of railway men, whether officers of the companies or of the Railroad Administration, who glances over this list of "reforms," will see at once that most of them ought to be and doubtless would be continued under private operation, if continuance of them were permitted. Among those which almost every railway man will agree should be continued are the following: "Maintenance of the permit system so as to control traffic at its source"; "maintenance of heavy loads for cars"; "unification of terminals"; "maintenance of the sailing date plan"; "consolidation of ticket offices"; "maintenance of the uniform freight classification"; "maintenance of common timetables between important points"; "maintenance of high demurrage rates and uniform rules"; "through way-billing of freight from point of origin to destination"; "simplification of the old practice of apportioning interline passenger revenue."

If government operation should be abandoned, and government control substituted for it, doubtless there should continue to be a director general with a small staff in Washington. It would seem there should be no difficulty in bringing about the co-operation between the various railway companies, under the supervision of the director general, which would be necessary to maintain these reforms. In fact, many of them were largely introduced under private operation, and many of the others the railway companies would have introduced but for federal laws requiring competition.

If the railways should be returned to private operation doubtless it should be understood that present wages and freight and passenger rates would be maintained while the guarantees of net operating income were maintained. What should ultimately be done about wages should be determined in accordance with future economic and industrial developments. If wages were maintained it probably would be necessary to maintain existing rates to protect the government from incurring a deficit. As for off-line agencies, the companies ought to be allowed and encouraged to restore them at least to the extent necessary to provide the shipping public with adequate service.

Two of the most important points to be considered are the effects which an attempt to continue the present system of operation, even for a short time, probably would have upon the morale of the railway organizations and upon the business of the country. An early restoration of the railways to private operation undoubtedly would have a beneficial effect upon morale. We believe it would also render it more easily practicable to proceed with the increased expenditures, both for maintenance and for improvements, which the economic welfare of the country imperatively demands shall be proceeded with. Once the companies were actually operating the properties again it should be possible for them to agree comparatively easily with the Railroad Administration as to what expenditures should be made for maintenance, and they probably would be much more disposed to use their resources in making needed improvements than if the entire management of the properties remained in the hands of the government.

Altogether aside from the differences which inevitably must arise between the government and the companies regarding matters of this kind, it is obvious that the organization of the Railroad Administration is rapidly going to pieces. Mr. McAdoo, Judge Lovett and Mr. Gray already have resigned. Most of the other high officers of the administration would like to see government operation discontinued soon because most of them hope and expect, when it is terminated, to return to the service of the companies. Most of them, it also should be added, are strongly opposed to the proposal to continue government operation for five years more.

It is not necessary in the interests of the railways, their employees or the public, as Mr. McAdoo tries to persuade us, either to return the roads at once to private operation on the pre-war basis or to hold them for five years. There is a middle course which can be adopted and which would be better for everybody concerned than either of the extreme policies which he contends are the only alternatives.

## Surplus Capacity Available For Foreign Trade

IN A PAPER read before the Reconstruction Conference, held under the auspices of the National Chamber of Commerce at Atlantic City the first week of December, James A. Farrell, president of the United States Steel Corporation, said: "The task before us today in respect to foreign trade expansion, is not so much to convince, as to advise and guide. Entrance into foreign trade is no longer a matter of choice with us. Everybody in these times is ready to concede the significance of the fact that the American industries presenting the most nearly unbroken record of prosperity and sustained labor employment are those which have been accustomed regularly to market overseas from 10 to 35 per cent of their products."

The applicability of Mr. Farrell's words to the railway supply field is at once evident. The supply field, to take his first point, after having supplied large numbers of cars and locomotives to our Allies and for our own forces overseas, has come to realize the value of foreign trade and to the belief Mr. Farrell mentions, that foreign trade is no longer a mere matter of choice.

One of the outstanding features in the business of supplying materials to the railroads has been the varying amount of business that has been done year by year over any extended period. It has been emphasized again and again in these columns and elsewhere, that the railroads of this country have had the habit, brought upon them of necessity, of buying in big quantities when business was good and prices were high and of doing quite the opposite when business in general was bad and prices were low. The railway supply field has been unfortunate in that it has not had a balance wheel, as it were, in foreign trade to tide it over from one period of prosperity to the next. It has not been fortunate enough to have that 10 to 35 per cent of production for export to which Mr. Farrell refers. A perusal of the figures for locomotive and car production given in last week's *Railway Age* on pages 83 and 87, respectively, will bear out this statement. For greater convenience these totals have been reduced to a percentage basis and the percentages are shown in the following table:

Year	PERCENTAGE OF EQUIPMENT BUILT FOR EXPORT	
	Locomotives	Freight cars
1905	11	3
1906	11	3
1907	11	3
1908	20	2
1909	10	3
1910	7	3
1911	11	4
1912	10	3
1913	10	3
1914	12	5
1915	40	19
1916	34	17
1917	53	21
1918	43	34

It will be seen from these figures that in but one year prior to the war did the locomotive production for export exceed even as low a percentage of total output as 14 per cent. That year was 1908 when the export percentage of 20 was attained only because of the small domestic output. In freight cars the smallness of the production for export is even more pronounced. Never until the war has output for foreign countries even gone higher than 5 per cent of the total production.

Our production of cars for export is, in other words, almost a new business for us, dating back only to 1915 when the demands of the war introduced a new element into our foreign trade.

The production of locomotives for export since 1915 has been a most important part of our total locomotive business, having reached in four successive years, 40, 34, 53 and 43 per cent, respectively. It may be an aside to note at this point that whether we should like to have it continue to attain such high percentages as were reached, particularly in 1917, is a question. It will be borne in mind that the 53 per cent foreign production reached in that year has generally been regarded since as a mistake due to sending locomotives to Russia while our own railroads were suffering from lack of motive power needed to help us "carry on" in our own part in the great struggle. The fondest lovers of export trade would not wish to have a thing of that kind happen again. They want export trade to help us in our domestic industry, not to take the place of it.

The locomotive producing capacity of this country is usually figured as being about 7,000 yearly, including both the building plants and the railroad shops in the United States and Canada. In 1906 a total production was attained of 6,952 locomotives and in 1907 of 7,362 locomotives. In no year since has the total production reached as high a figure as 5,500 with the exception of 1918, when a total production of 6,475 was attained, inclusive, however, of some 600 or more small gasoline locomotives for light railway service behind the lines. The fact that there exists a very large surplus capacity for export production in even our better years is evident.

The capacity for freight car production in the United States and Canada is generally conceded to be in the neighborhood of 350,000 cars annually. It is somewhat surprising to discover that in only one year in the last 30 at least, has the production exceeded even 250,000. The year in question was 1907 when 284,188 cars were built exclusive of the output of railroad shops, the figures for which were not then obtained. Judging by this and by the totals as a whole, given in last week's *Railway Age*, it is safe to say that the United States and Canada actually have a surplus productive capacity of no less than 100,000 to 200,000 cars annually which could be devoted to export business. In 1914, despite this fact, we sent abroad only about 15,000 cars. In 1918 we sent over only 42,941 cars, principally for war service. Even the latter total could be doubled in normal times without detriment to production for our own roads.

Emphasis has been placed again and again in the columns of this paper in recent months on the great markets for railway equipment that lie before us. We know that there is only one country besides ourselves that is in a position to export railway supplies and material to a world that has practically gone without railway material for over four solid years. That country is Great Britain and her car and locomotive plants will have such great demands upon them that they will be able to fill only a small part of them. Belgium, before the war a very large exporter of freight cars, will have to rebuild its car building plants and rehabilitate its own railways before it can again be an exporter—it will probably be an importer for many years instead. France, which lost four of its five locomotive plants in the Hun invasion, will be in a somewhat similar, though probably not so severe, position. Germany and Austria we can dismiss. The tag "Made in Germany" and disorganization due to revolution will guarantee that. In short, the markets and capacity are ours to as great an extent as we can use them.

That now is the time to make the most of all these facts is generally realized in the supply field.

For the time being apparently, there is but little prospect of new business from the Railroad Administration. The domestic railroads are out of the market for new equipment

until their future status is more settled. Supply men have long since given up hope that the government Railroad Administration would follow out the government's suggestion as expressed by the War Industries Board, to help over the readjustment period. Similarly—though for entirely different reasons—the military railroads are no longer purchasers. In short, the time has now come when the railway supply field is preparing to exploit new markets. It is fortunate in having substantial orders on hand to tide it over the transition period, if such it may be called, and fortunate in that the future prospects for both domestic business (once the domestic situation is adjusted) and foreign trade are exceedingly good.

The railway supply companies are well equipped for foreign trade. The American Locomotive Company, the Baldwin Locomotive Works, the American Car & Foundry Company, the Standard Steel Car Company, the Westinghouse and General Electric companies, the Westinghouse Air Brake Company, etc., already have large and well-organized export departments and will, no doubt, be able to make the most of the prospects available to them. It is unfortunate that so many other companies are not likewise well organized for export trade and that something has not as yet been done to take advantage of the new Webb law, permitting organization for foreign trade. As time goes on this matter will probably receive its due consideration, for it is impossible to believe that the American railway supply field is going to leave a single stone unturned to make the most of the new export business that is waiting for its usual aggressive attention.

## That Elusive Surplus

REGARDLESS OF THE EFFORTS of the advocates of permanent government operation of the railroads to minimize the importance of financial results, the American public is going to weigh this consideration fully in passing upon the work of the United States Railroad Administration and in acting on the plea that this plan be given a longer period in which to make good. The director general himself has not overlooked opportunities to emphasize this feature in the past. In the hearings before Congress when the railway control bill was under consideration last winter he indicated that the government stood to gain approximately \$100,000,000 a year from the start, as the net operating incomes of the roads in 1917 were approximately that much in excess of the average for the three-year period taken as a basis for fixing the proposed guaranteed compensation. In spite of this forecast we find at the end of the first year of government operation, that not only has this \$100,000,000 surplus not been gained, but another \$150,000,000 has disappeared with it, this being the estimated deficit from government operation during the year. In other words, the financial results have fallen \$250,000,000 short of the director general's own estimate, in spite of the large advances in rates made six months ago. In the face of these figures the savings resulting from the elimination of the "high salaries formerly paid railway officers," the consolidation of ticket offices, the elimination of outside agencies, etc., to which the Railroad Administration has repeatedly pointed with pride, appear insignificant.

Serious as this deficit of \$150,000,000 is, it does not tell the entire story. The government is pledged under the law to maintain the properties of the carriers under its direction to the standards existing at the time they were taken over. This it has not done. This failure in itself does not necessarily call for criticism, for it was advisable in the national interest to postpone much work which could safely be carried over in order to concentrate men and materials on those projects most essential to the winning of the war. The needed

expenditures which were not made for the maintenance of the properties during 1918 cannot be avoided, but are simply deferred. In other words, the Railroad Administration is now facing a large accumulation of deferred maintenance which will enter into the 1919 operating accounts, but which really should constitute a charge against 1918, and which should be added to the deficit of \$150,000,000 to give a true indication of the results for the year.

The conditions under which the roads have been operating during 1918 have made it necessary to retain in service much equipment which would normally have been retired and written off the books. Now that the crest of the traffic load has been passed and the demand for equipment has lessened it will be possible to retire many of the cars and locomotives which economical considerations would have released last year, but which were necessary to handle the business. The retirement of this equipment now will lead to a large operating charge.

In the maintenance of way field the situation is even more serious. It is possible to defer a certain class of maintenance work for a considerable period without serious trouble, but it is common experience that this work must be taken up and that it costs more to overcome the neglect later than to have done the work originally. Take the renewal of rails alone; only about 1,200,000 tons of new rails were laid in track in 1918, or over 1,000,000 tons less than normally. At the prevailing prices this alone involves an expenditure of perhaps \$75,000,000 for labor and the necessary auxiliary materials. Likewise there was a decrease in the number of ties renewed of approximately 50,000,000, equivalent to an expenditure of at least \$60,000,000. These are typical of a large amount of work incident to the repair and renewal of tracks, bridges and buildings which was deferred but which must be met.

It is true that the gross expenditures for the maintenance of equipment and for maintenance of way during 1918 were considerably in excess of those for preceding years, but this indicates not that more work was done but that it cost much more per unit of work. If the accumulated deficiencies in maintenance were evaluated and that sum added to the deficit already announced it would undoubtedly aggregate well over \$500,000,000 as the cost to the people of the United States for the first year of government operation, or \$1,500,000 for every day in the year, including Sundays and holidays.

## New Books

*American Engineers Behind the Battle Lines in France.* By Robert K. Tomlin, Jr. Size, 9 in. by 12 in. 91 pages. Bound in board. Sold by McGraw-Hill Book Company, 239 West 39th Street, New York. Price \$2.00.

In this book the Engineering News-Record has reproduced the series of articles which have recently appeared in its pages by Robert K. Tomlin, its former managing editor and the correspondent of the McGraw-Hill publications in France. Mr. Tomlin's articles cover a wide range of engineering subjects, including roadbuilding, water supply, topographical work, bridge and building construction, as well as the construction and operation of light and standard gage railways behind the lines. One of the early articles reproduced discusses the nature of the light railway, and another describes the activities of a railway engineer regiment, showing what a wide range of work such a regiment may be called upon to do. Two of the most interesting papers cover the use of the light railway behind the British front, showing not only what the light railway did on this front, but detailing the enormous amount of business it handled and how the railways were operated to carry this business.

## Letters to the Editor

### Are the Railroads Fair to the Public?

TO THE EDITOR:

I assume that you represent very fairly the opinion of a majority of the higher officials of the railroads in the United States, as well as of a majority of the bondholders and shareholders. Of the officials there are a few thousand, of the investors perhaps 400,000. Therefore, you speak for, possibly, half a million people. On the other hand, I look at railroad questions from the point of view of the public who use the railroads, so that I represent nearly a hundred million. And I would like to give you my opinion—which is, I think, the very general opinion—as to the present railroad situation.

First, let me say that I am opposed, and that I think the public as a whole is strongly opposed to government ownership of the railroads, for reasons too many to be stated in this letter. But I do think there is a strong public sentiment in favor of a better control of the railroads. Thoughtful people feel that the railroad officials and the investors who employ the officials are not quite honest in the attitude which inspires their conduct toward the public. They fail to recognize that common honesty requires them to give the public a fair return for the special privileges which the railroads receive, and also requires them to show the confidence in the public which they claim for the public.

Let me give you an instance of what I mean. If I have been a commuter on, let us say, the Lackawanna Railroad for twenty years, and some morning I leave my ticket at home, the company insists that I shall pay my fare to and from New York that day. Is this quite honest? The conductor knows me perfectly well, knows that I have a commutation ticket, knows that I have paid for my ride and am entitled to my ride. Yet it does not seem to be thought very exceptional. Suppose a great store like Altman's, which has to face competition, behaved in this way to customers who had actually paid for goods and to whom it had not delivered the goods, how long would it have any customers?

The company's only excuse for collecting from me money which I have already paid to them is to say that if they tried to treat a commuter fairly when he had forgotten his ticket, they would be constantly defrauded. That is just the excuse Germany gave for invading Belgium. Is there any such danger of fraud? In England, the commuter, or season-ticket holder as he is called there, receives from the company a ticket good for a month, three months, or a year. It is never punched, and on most days he does not show it at all; he simply says, "Season," and has no further trouble. Once or twice a month inspectors ask to see all season-tickets. And on such an occasion, if you have left your ticket at home, the inspector asks for your visiting card, which he turns in to the season-ticket department for verification. I once asked the head of one of the great English railroad systems if this method led to many frauds. He told me that his system spent \$500,000 per annum on inspectors, but that he did not think that the fares which passengers evaded amounted to \$50,000 a year. In another way the season-ticket holder's convenience is considered by the English railways. If he finds that, because he is taking a vacation, or is ill, he will not be traveling for a part of the period covered by his ticket, he mails it to the head office, to be kept there until he asks for it again, and when he does, the term covered by the ticket is correspondingly extended. In other words, the railways give full value to the passenger and do not attempt to take advantage of him on technicalities.

Is it not the duty of the railroad officials, and would it not

be their best policy, to get rid once for all of the idea that everybody in the United States who is not a railroad official is dishonest? Is not money wasted, and is not the public needlessly inconvenienced, by the elaborate precautions which are taken in order that no one shall ever get a ride he has not paid for? And is not the suspicious attitude of the railroad officials toward the public partly explained by the fact that these officials know that in the past the railroads have not been strictly honest in their treatment of the public? A large Pittsburgh steel manufacturer once told me that before legislation regulated interstate commerce, he could ship his product from Pittsburgh by an Ohio river boat to Cincinnati, then put it on a Pennsylvania Railroad train at Cincinnati and haul it through Pittsburgh to New York, and pay less freight for this absurd performance than if the same load had been originally given to the Pennsylvania Railroad at Pittsburgh for transportation to New York. Today no railroad official or shareholder would dare to defend such a dishonest policy in regard to rates.

Again, is it honest for a railroad to print in its bills of lading clauses which the courts have repeatedly declared to be absolutely void and without effect? Is it honest to print on excursion tickets stipulations as to the limitation of liability which have been condemned in the same way by the courts? In both instances there can be no purpose except to deceive ignorant people so that they will not claim their legal rights.

These points I have mentioned are only slight examples of the unfairness with which the people in general believe they are treated by the railroads. I could fill your whole paper with instances of the same kind. And this unfairness, which is clearly dishonest in view of all the railroads owe to the public, will influence the opinion of every citizen who asks himself how far government control should go.

Until railroad officials realize how wrong they have been, and realize the importance of their obligations to the public, they certainly will not change their policy. Mr. Harriman ran the Union Pacific as autocratically and as arbitrarily as the German "high command" ran the German army. The Kaiser and his generals never thought of the good of the German people as a whole, but only of the power and glory of the military leaders. The only way to govern a country properly, or to manage its railroads properly, is to serve all the people honestly.

It seems to me that the railroad officials should begin by trusting the people, and then proceed to show the people that the railroads themselves are trustworthy. You have great influence with the railroad officials, and you could do great good by exerting that influence in the direction I have tried to indicate. This is the right time to raise the whole question. The reason this country showed so fine a spirit in the war is that the American people knew that the position of the allies was moral and the position of the Germans immoral. We were perfectly sincere when we took that ground, and the result is that the moral sense of our people is keener than it was before the war. A good many public questions are going to be decided by the standard of morality, and if the policy of the railroads is morally unjustifiable the people will insist upon a change of policy. On the other hand, if the upper officials and the shareholders will put their house into good moral order, I am sure that the American people of course, a vastly larger productive capacity than those of will see that the railroads are treated by the government with all the honesty that the highest morality calls for.

A THINKING AMERICAN.

**German Railway Equipment for France.**—Press despatches state that M. Clavelle, the French Minister of Public Works, announced in the Chamber of Deputies of Paris on December 29, that France will receive 70,000 cars and 2,600 locomotives of the rolling stock which Germany must hand over to the Allies. Germany already has delivered 3,800 cars and 200 locomotives.

# McAdoo's Testimony Before Senate Committee

## Reviews Accomplishments in One Year of Federal Control and Urges Five-Year Test Under Peace Conditions

A REVIEW of the accomplishments of the United States Railroad Administration during the year just closed was presented by Director General McAdoo at the hearing before the Senate Committee on Interstate Commerce on January 3 in connection with his argument that the period of federal control should be extended for five years. Mr. McAdoo declared that even under the handicap of war conditions a sufficient showing has been made to indicate that the reforms accomplished are desirable as permanent measures and that the country is entitled to a more complete test of centralized management under government control.

An abstract of Mr. McAdoo's prepared statement follows:

### Railroad Conditions When Government Took Control

To review the results of the past year of federal control, it is helpful first to survey the railroad conditions that immediately preceded that control.

(1) For several years, railroads in seasons of heavy business had developed conditions of transportation stringency similar to the conditions of financial stringency that characterized our banking situation prior to the passage of the federal reserve act, but the periods of transportation stringency were even more frequent and more pronounced. It was impracticable for the scores of different railroad companies to depart from their competitive practices and join in a co-ordination of facilities and effort so as to meet the traffic demand made upon them and enable them to handle their "peak load" successfully. These competitive rivalries prevented any sort of central control of the traffic itself. Therefore it was impossible to stop the loading of traffic which could not be promptly disposed of at destination, or to encourage movement to destinations where the traffic could be promptly handled. To an important extent there was inadequacy of terminal facilities and a serious lack of co-ordination and use of those in existence. In the fall of 1916 the transportation stringency reached such a point that traffic was almost paralyzed through inability to dispose of it at destination. In the fall of 1917, despite strenuous efforts, and yet under a larger degree of co-ordination than had ever before been attempted, to prevent such a situation, a paralysis of the transportation situation again occurred. These conditions were most aggravated in the territory east of Chicago and St. Louis, and north of the Ohio and Potomac rivers, but the acute conditions in this territory reacted unfavorably on the transportation situation throughout the rest of the country, damming up the traffic on connecting lines and producing congestion and distress throughout the country.

Very serious conditions of car shortages existed both in the fall of 1916 and in the fall of 1917. In 1916 the situation became so critical that a special investigation was inaugurated by the Interstate Commerce Commission, with the result that under date of December 28, 1916, Commissioner McChord made a report in which he stated that "in some territories the railroads have furnished but a small part of the cars necessary for the transportation of staple articles of commerce, such as coal, grain, lumber, fruits and vegetables."

In its report of December 1, 1916, the Interstate Commerce Commission, after reviewing the car shortage situation in detail and telling of investigations into conditions at widely separated points, said:

"Substantially all told the same story of failure of transportation facilities and resulting embarrassment and losses.

It abundantly appeared that the movement of loaded cars was in the main and on the whole very slow. The time of movement of grain from Iowa points to Chicago was shown to be as low as 2 days and as high as 25 days, the greater part taking from 4 to 8 days. Serious delays to loaded cars in switching to points of unloading at large terminals and in passing through such terminals out to other cities, explained much of the failure in car service."

I need not recount the varying expedients adopted by the railroads under private control to bring order out of the railroad chaos, none of which was adequate or successful. The railroad executives of the country tried valiantly during 1917 to solve the problem. Most of them patriotically sought to find means of keeping the transportation system functioning. Competitive and private control, however, were unequal to the task.

(2) The great movement of traffic overseas without satisfactory co-ordination of rail and ocean transport, the heavy building operation in the way of construction of cantonments, shipbuilding plants, storage depots, munitions plants, etc., the transfer to war activities of the ships and tugs of the coastwise service, thereby throwing still another new burden on the railroads, the increasing and exacting movement of troops,—all these operated to accentuate difficulties and develop the grave weaknesses inherent in the unco-ordinated competitive activities of all the different railroad companies.

(3) These difficulties were further accentuated by inability to get promptly new locomotives which had been ordered (but which could not be delivered because much of the locomotive output was being devoted to our Allies) and to an entire absence of any locomotives in the reserves of the railroad companies.

Many lines had entirely inadequate facilities for repairing the locomotives they own. This was shown by the fact that up to December 14, the total number of locomotives sent to other line shops for repairs were 2,220. For instance, 423 locomotives of the Baltimore & Ohio were repaired in the shops of other lines, while B. & O. shops repaired only 24 locomotives belonging to other lines, leaving the net assistance received by the B. & O. 399 locomotives. Two hundred and one locomotives of the Pennsylvania Lines West were repaired in other line shops, while the shops of the Pennsylvania Lines West repaired only 55 locomotives belonging to other lines, leaving the net assistance received by the Pennsylvania Lines West, 146 locomotives. Thirty-six locomotives of the Central Railroad of New Jersey were repaired in other line shops, whereas they repaired no locomotives of other lines.

Prior to federal control the railroads had voluntarily transferred into the congested Eastern territory 107 engines from the West and South. The Railroad Administration, in addition, put into service in the East 130 locomotives constructed for lines in the West and South. In addition, the Railroad Administration relocated 215 locomotives already in the East. This ability to place locomotives promptly where they were most needed regardless of the interest of any particular line greatly assisted in bringing order out of chaos. Notwithstanding the tonnage handled during the year, which has been the heaviest ever known, there are now stored in good condition and ready for winter service 1,189 locomotives, while one year ago there was not a single serviceable locomotive in storage. This improved condition has been due largely to the co-ordination of shop work which

has resulted in an average increase of 20.93 per cent each week in the number of locomotives receiving classified repairs.

(4) The relations with labor were of the most unsatisfactory and threatening character. The cost of living had greatly increased. Insistent demands were urged by railroad labor for corresponding increase in wages. There was no method for an amicable adjustment of labor disputes. To a large extent there appeared to be a lack of confidence on the part of labor in the management of the railroad companies if not an actual hostility thereto. There was imminent prospect of the most serious strikes that had ever threatened the railroad situation.

(5) The financial situation of some of the railroad companies was precarious. The rapid increase in operating costs, due to increased prices of materials and supplies and the increased expense of operating under the conditions of transportation stringency, were threatening to impair the ability of many railroad companies to meet their interest and dividends, so that the railroad plight was a serious menace to the general financial situation. Even if railroad credit had been at its best instead of at its poorest, it would have been difficult at the time to raise funds for urgently needed capital expenditures because of the credit demand of the government and the high rates prevailing for money.

(6) The country was at war. Its industrial power was being turned into war channels. The volume of traffic to be transported for war purposes was steadily growing and promised to keep growing to a degree which could not be foreseen. The nation's success in the war was largely dependent upon the transportation machine functioning with an efficiency surpassing anything which had ever been known in the past. Yet all the factors were rapidly converging to produce a prolonged and serious transportation paralysis.

For these reasons the President took possession and control of the railroads on December 28, 1917. Simultaneously with his proclamation the country entered upon 10 weeks of the worst winter that had ever been known and transportation which before was slowing down in an alarming way was confronted with the danger of almost complete stoppage.

These were the conditions under which the United States Railroad Administration began its work.

#### Conditions Under Government Control

The principal railways and transportation systems of the country have now been under the control of the government for one year, a year marked by the participation of the United States in the greatest war in history, a year in which the railroads were required to carry a greater burden both of freight and of passenger traffic than ever before in their history, a year which began with terrific blizzards and an alarming coal shortage, a year in which enormous amounts of foodstuffs and other supplies had to be transported through the United States to the seaboard for shipment abroad, a year in which an army of millions of men had to be transported from their homes to camps and cantonments and then to the seaboard in order that they might take their places on the battlefields of France and Belgium. The year is now behind us. In the last few months there has been an entire absence of any transportation stringency, although the traffic carried was the heaviest of even this unprecedented year. The contrast between transportation conditions during the autumn just passed and the autumns of 1916 and 1917 is marked.

I shall recount some of the things that have been accomplished:

#### The Movement of Troops

From January 1, 1918, to November 10, 1918, a total of 6,496,150 troops were moved over the American railways, 4,038,918 having been transported on special trains. These movements required a total of 193,002 cars of all types, in-

cluding 167,232 coaches for draft and regular train movements. These troops were transported in comparative freedom from accident, due largely to the steadfast maintenance of a reasonable rate of speed.

#### Movement of Food to Europe

The food situation in the allied countries of Europe became extremely critical in February last, representations being made by Great Britain, France and Italy that unless the program of food deliveries promised by the Food Administration was kept pace with, Germany and her associates inevitably would win the war. While the facts could not be told at the time because of the possible effect on the morale of the nations fighting the Central Powers, it was nevertheless true that according to official word received from the Entente allies, the outcome of the war depended upon the ability of the American railways to transport sufficient supplies of foodstuffs to the Atlantic seaboard for shipment abroad. This problem was met. It was no time for half-way measures. The safety of the world hung in the balance. Empty box cars were rushed from all portions of the East, South, to the southwestern grain states. Conflicting traffic of all kinds was held up. Every facility of the Railroad Administration and of the railroads under its jurisdiction was thrown into the balance. Officials and employees worked day and night. The result was magnificent. By March 15 the vessel capacity of the Allies had been satisfied and there was available at North Atlantic ports an excess on wheels of 6,318 carloads of foodstuffs exclusive of grain on cars and in elevators.

Since that time there has never been any danger of the American railways failing to transport the necessary amount of food supplies for Europe. It perhaps is not too much to say that this was one of the turning points in the war.

#### Coal and Other Essential Supplies

Another critical situation which faced the railroads during the year just passed and was met, had to do with the coal supply. Constant predictions have been made that the railroads would not function sufficiently to transport enough coal to supply the Nation's needs; these predictions have not been realized. New England's demands have been met, and 28,153,317 tons, the largest tonnage of coal ever known, has been moved to the Lake Erie ports, and transported to the Northwest. In 1917 only 26,826,000 tons were moved over this route; in 1916 only 24,692,000 tons, and in 1915 only 21,507,000 tons. Some indication of the freight traffic problems facing the railroads in the year just passed may be gained from the fact that there was a net increase of 741,666 cars, or approximately 37,083,300 tons of bituminous coal loaded during the 10 months ending October 31, 1918, as compared with the same ten months in 1917.

At the same time special attention was being given to the movement of fruits, of cotton, of oil, of iron, and of the other principal products of the farms, the factories and the mines of America. Wherever necessary, special trains were utilized to transport these staple articles, and other methods were made available which resulted in fully meeting the situation.

#### Bureau for Suggestions and Complaints

In order to furnish the public a medium for communicating directly with the Railroad Administration concerning bad service the Bureau for Suggestions and Complaints was established with very helpful results. Many constructive criticisms have been received and acted on. A total of 1,328 commendations and 714 complaints of individual discourtesy or incompetence have been received during the 16 weeks since the formation of the bureau to December 24, 1918. The commendations have outnumbered the complaints almost two to one. This in itself is a tribute to the railroad employees of the Nation. Other letters have been received calling attention

to "organic" defects in railroad service. A sharp decrease in the number of complaints has marked the return of peace and the consequent improvement of service.

**Property Protection**

Promptly after the inauguration of federal control attention was directed toward minimizing the enormous drain upon railroad revenues as a result of loss as well as damage to freight and the activities of thieves. When this work was begun it was found that shipments of all kinds were being tampered with and stolen. While there are not available authentic statistics as to the volume of thefts from carriers in recent years, for 1914 carriers reported to the Interstate Commerce Commission a total of \$10,310,780.41 of thefts of merchandise from cars and terminals, including concealed and unlocated losses. The principal thefts have been of four classes:

- (1) Theft of merchandise from cars and terminals.
- (2) Theft of tools, machinery, appliances, brasses, etc.
- (3) Padded payrolls.
- (4) Embezzlements.

The following statistics reflect the activities as far as reported to the Railroad Administration of the police agencies of the carriers under the direction of the Railroad Administration from April 1, 1918, to December 1, 1918:

Arrests for thefts.....	10,530
Convicted .....	6,069
Pending .....	2,075
Employees arrested .....	3,241
Value of goods recovered.....	\$667,578.54
Number of sentences imposed of one year or over.....	1,095
Fines imposed .....	\$150,509.63

**Economies**

During the war period essential war necessities had to be met regardless of cost. In peace time, naturally, one of the chief aims of railroad operation should be the saving of money. But even though expense could not be made the first consideration during the war strict attention was given to this point and orders were issued to effect savings wherever possible without interfering with the war program. Many of the economies brought about, such as rerouting, common use of terminals, etc., will be reflected but slightly in the operating income accounts of the carriers for the year 1918. They will appear fully in the statements for the year 1919. Nevertheless reports so far received from five of the seven regions show that on a group of selected principal items, savings totaling \$85,576,424.71 have been effected in the period from December 31, 1917, to December 31, 1918. Reports from the two remaining regions are not yet available. The specific items which produced this saving include the unification of terminals and stations, the elimination of passenger service, also reductions in organizations and miscellaneous economies.

Equipment has been saved by the elimination of non-essential passenger trains, by the common use of freight cars, the common use of repair shops, the emergency use of the Pennsylvania Hudson river tubes for the movement of anthracite coal from the Jersey terminals to Long Island, a step which could not have been taken under private control; the introduction of the coal zone plan in co-operation with the Fuel Administration, which resulted in the saving of car miles and permitted the production and transportation of several million tons more coal than would otherwise have been possible; the utilization of the Cape Cod canal for the transportation of coal to New England, the operation of locomotives under steam from factories to the point of delivery instead of hauling them as dead freight in the past, the introduction of the "sailing day plan" for less than carload freight, the establishment of special organizations to handle refrigerator and tank cars and the elimination of circuitous routes.

**Unification of Terminals**

It having been shown that bad terminal conditions were proving a serious handicap to the necessary transportation business, terminal managers were appointed at the larger terminals with jurisdiction over the facilities of all lines. Successful efforts have been made to route freight so as to arrive at the specific terminal where it was to be disposed of. Interchange switching in terminals has been largely eliminated. The report on operations and the reports of the various regional directors will give in detail what has been accomplished in this respect.

**Solid Trains**

In order to meet the extraordinary war demand and rush food and other supplies through to destination, arrangements were made early in the year for the forwarding of consolidated trains of export freight, principally war supplies, of food, grain, munitions, etc. Under this arrangement a total of 5,090 special export trains have been handled from Western terminals, containing 124,198 cars of export freight, in the Eastern region, the trains being filled out with other freight to make the full train load as required. With the concurrence and co-operation of shippers, plans were made to put into effect in June for assembling livestock, fresh meat, live and dressed poultry and perishable freight, in solid trains, and forwarding them from Chicago, St. Louis, Cincinnati, Buffalo and other Western points, on specific days of the week, via roads best fitted to handle them, resulting in a reduction in the feeding requirements for livestock and in the number of fast freight trains required to handle. In the Eastern region the decrease in Chicago alone has been 11 trains per day, and the average cars per train of high class and perishable freight has been increased from 23 to 36. Grain, oil and cotton are being consolidated and forwarded in train-load lots from Western points, resulting in a large saving in labor, in switching, eliminating cross hauls and facilitating movements. In the Eastern region alone a total of 981 special oil trains have been run since June 1 containing a total of 25,034 cars.

**Elimination of Circuitous Routes**

One of the most wasteful practices in railroad operation in the past has been the use of circuitous routes in the handling of freight traffic, often for competitive reasons. General Order No. 1 directed that everything possible be done to alter this condition. In order to economize in rolling stock and motive power comprehensive studies were undertaken for the purpose of developing new routes which would not only be shorter but more economical and efficient. As a result, car, engine and train miles have been saved, and the shipping public has been benefited because more cars have been available and more expeditious movement of traffic has been secured. Shippers were not responsible for the former extensive use of circuitous and uneconomical routes, as this routing was largely influenced by the agents of the interested railroads. Shippers have gladly responded to what are now the combined efforts of all railroad representatives under federal control to influence the use of direct and economical routes, and consequently the original routing as specified by shippers is now, generally speaking, in accordance with the established routing instructions, and extensive diversions are unnecessary. Therefore the increase in efficiency cannot be measured by the car miles saved through diversions of freight in transit.

The savings in distance via many of the new routes is so great as to merit special mention. One from Los Angeles to Dallas and Fort Worth is over 500 miles shorter than the one formerly used; another, from the oil fields of Casper, Wyoming, to Montana and Washington state points, is 880 miles shorter; fruit from southern California to Ogden is hauled

201 miles less; and a new route between Kansas City and Galveston has been developed which is 289 miles shorter than the 1,121 miles previously traversed via one of the lines. The ore traffic moving from Minneapolis and Michigan mines to Lake Superior and Lake Michigan ports was rerouted with gratifying results. During the ore shipping season a total of 64,770 loaded and empty cars were rerouted with a saving of 3,577,464 car miles. A few other typical cases of shortening of routes follow:

Between	And	Long route	Miles	Short route	Miles	Saving in Miles
Duluth, Minn.	Chicago, Ill.	CB&Q-NP	606	Soo Line	465	141
Duluth, Minn.	Milwaukee, Wis.	CM&St.P-NP	499	Soo Line	376	123

Chicago, Ill.	Sioux City, Ia.	CB&O	615	IC	509	106

In a few instances it has been necessary to increase the length of hauls temporarily to avoid accumulations.

By rerouting, a total of 16,863,633 car miles has been saved in the Eastern and Northwestern regions alone.

### Better Operation

The operating results may be summarized briefly: The railroads during the first 10 months of federal control produced 1.9 per cent more ton miles with a decrease of 2.1 per cent in train miles and a decrease of 5.8 per cent in loaded car miles. The average train load increased from 655 tons to 682 tons, a gain of 4.1 per cent, and the average car load increased from 26.8 tons to 29.0 tons, a gain of 8.2 per cent. The increase in traffic in 1918 was accomplished by the use of approximately 3.4 per cent more freight cars and approximately 1.4 per cent more freight locomotives than in 1917. Compared with 1916, the 1918 increase in freight cars was 6.9 per cent and the increase in freight locomotives was 2.4 per cent.

It should be explained that the total ton miles handled are much less than they would have been in the past for a corresponding volume of traffic by reason of cutting out circuitous hauls. The general statement may be made that the actual transportation production is greater than is indicated by ton-mile statistics. In whatever degree the actual performance of moving tons from one place to another place as required is accomplished by moving the tonnage over shorter routes, to that degree the ton-mile statistics understate the real performance when they are compared with a period when the shorter routes were not used.

Probably it would not have been possible to meet the enormous demands made upon the transportation system during the past year without the utilization of the permit system, which prevents the loading of traffic in the absence of assurance that it can be disposed of at destination. This is a reform which under government control would succeed in peace times as well as in war times, and is one of the most important means of preventing transportation stringency or congestion. It means controlling the traffic at the source, in the public interest, instead of letting the traffic choke the public interest at destination.

Some of the means used to bring about the desired result were strictly war measures and probably could not or should not be utilized in time of peace. For instance, this is true with regard to the elimination of many passenger trains, al-

though passenger trains run merely for competitive reasons are often wasteful and do not give the needed service to the public.

The Exports Control Committee, which has played a vitally important part in the proper handling of supplies for overseas shipment, probably could not be operated under peace conditions, although under unified control an important adjustment of traffic to port capacity will be practicable, even under peace conditions.

### Reforms Which Should Be Continued Under Peace Conditions

Many of the changes in railroad operation inaugurated during the period of the last year should prove of permanent value and should continue if possible whatever form of control is decided upon for the railroads. Such reforms include:

1. The maintenance of the permit system so as to control the traffic at its source.
2. The maintenance of heavy loads for cars.
3. The pooling of repair shops.
4. The elimination of circuitous routes.
5. The unification of terminals.
6. The maintenance of the "sailing day plan."
7. The consolidation of ticket offices.
8. The utilization of universal mileage tickets.
9. The standardization of equipment.
10. The maintenance of the uniform freight classification introduced by the United States Railroad Administration.
11. The maintenance of common time tables between important points.
12. The maintenance of high demurrage rates and uniform rules.
13. The establishment of through waybilling freight from point of origin to destination.
14. Rendering unnecessary the rebilling by connecting or intermediate routes.
15. The elimination of the old practice of paying in mileage or per diem rental for the use of freight or passenger cars of one carrier by another.
16. The simplification of the old practice of apportioning interline passenger revenue.
17. The utilization of water routes for the relief of crowded rail lines.

### Wasteful Competition

Some of these reforms can be continued should the roads be returned to private operation; others cannot. Competition and self-interest dictate that when the roads are under private control, each carrier gets as much business as possible and keep it, regardless of the fact that the aggregate result may be wasteful and uneconomical. For instance, where two or more competing lines operate between two important cities the convenience of the public can best be served if alternating trains be operated at short intervals over the different roads. Competition, however, always results in each of the roads "bunching" their trains at the times when the demand for transportation is the heaviest. Competing lines can hardly be expected to route freight over the lines of competitors, even though these competing lines may have the shorter route and be able to handle this particular traffic more economically. Lines with advantageous terminal facilities cannot be expected under private control to place such facilities at the disposition of competitors operating under less favorable circumstances. One company will not forego loading and hauling traffic even though this seriously embarrasses the general situation, because its connections cannot conveniently receive and dispose of the traffic. Private carriers may not enforce rules which, although designed to bring about efficiency and economy, might drive business away from their lines. All the waste resulting from these prac-

tices and running into huge costs, is paid for by the public in the form of increased rates.

### Public Service Freight Bureaus

Under private control of railroads, and for competitive reasons, practically all railroads maintain so-called off-line agencies, the original function of which was solicitation of traffic. These off-line agencies were abandoned by the Railroad Administration for the reason that the competitive causes which gave rise to their establishment no longer existed. It was found, however, that in some measure these agencies had performed real service to the public and therefore the establishment of public service freight bureaus has been begun with a force trained to handle for shippers matters which were formerly handled by the off-line agencies.

### Labor and Wages

The participation of America in the European war with the consequent shortage in man power available in this country, and the increase in the cost of living has made the railroad labor problem a difficult one during the past year. However, the great bulk of railroad labor has demonstrated a fine spirit of patriotism and has co-operated heartily with the government. The labor troubles which were facing the railroads when they went under government control were practically all eliminated and with a few exceptions there has been quiet in the railroad labor world during the last 12 months.

In order to place railroad labor upon a living wage and provide fair working conditions, an investigation into labor conditions on the railroads was begun immediately after the carriers were taken by the government, with the result that many reforms in working conditions, decreases in the hours of labor and increases in the rates of pay have resulted. These investigations have been continued since the machinery was set up for the thorough investigation and hearing of all grievances and representations about wages and working conditions. This machinery generally has recognized the so-called "bi-partisan" principal of equal representation of employer and employee on boards. Decisions, however, have always been made by the director general since he is charged with that responsibility as the chief representative of the government.

The critical labor conditions are strikingly brought out in the report of the Railroad Wage Commission. This commission heard representatives of every class of employees, railroad officials and experts on the subject and examined hundreds of written statements and personal letters from employees. The requests presented to the commission for wage increases, if granted, would have involved an outlay of something over one billion dollars per year in excess of wages paid in 1917. In its report the commission, after reciting the various demands for wages made by railroad labor in 1916 and 1917, and reviewing increases given by the railroads under private control, said:

"But these advances were not in any way uniform, either as to employments, or as to amounts, or as to roads, so that one class of labor benefited much more than another on the same road, and as between roads there was the greatest divergence. The situation has been dealt with as pressure made necessary, and naturally those who, by organization or through force of competition, could exert most pressure fared best. Things came to a head just before the government took over the railroads. Another three months of private management and we would have seen much more extensive concessions in wages, or there would have followed an unfortunate series of labor disturbances. The government, therefore, has now to meet what would have come about in the natural course. Indeed, the patience of the men was only allayed after government intervention by the assurance that the matter of wages would be promptly taken up and that the

awarded increases would be retroactive as of January 1 of this year."

The commission also said: "It has been a somewhat popular impression that railroad employees were among the most highly paid workers, but figures gathered from the railroads dispose of this belief. Fifty-one per cent of all employees during December, 1917, received \$75 per month or less, and 80 per cent received \$100 per month or less. Even among the locomotive engineers, commonly spoken of as highly paid, a preponderating number receives less than \$170 per month, and this compensation they have obtained by the most compact and complete organization, handled with a full appreciation of all strategic values. Between the grades receiving from \$150 to \$250 per month there is included less than 5 per cent of all the employees (excluding officials), and these aggregate less than 60,000 men out of a grand total of 2,000,000.

Wage increases granted during the year are estimated to aggregate between \$600,000,000 and \$700,000,000 per annum, and in a large part were retroactive from January 1, 1918. These wages were fixed not upon the theory that the railroads, a permanent industry, should compete in prices paid labor with the transient war industries, many of which paid very high wages in order to attract labor. Rather the effort was made to find a just and equitable basis which would outlive the war and which would give a living wage and decent working conditions to every railroad employee. Efforts have been made to eliminate inequalities, and while this work has not been finished it has been chiefly done.

### Conditions of Employment

On February 21 General Order No. 8 was issued, containing among other things, the following: "No discrimination will be made in the employment, retention or conditions of employment of employees because of membership or non-membership in labor organizations." This has had the effect of many railroad employees joining labor unions who previously were not affiliated with them. At the same time, equal consideration has been shown employees who were not members of unions and individual employees have been heard on an equality with representatives of the unions. The principle of the eight-hour day was recognized early and strengthened whenever possible.

Special efforts have been made to better the working conditions of the women in railroad service and a special Woman's Section was established in the labor division to investigate conditions surrounding women so employed and apply remedies where unfavorable conditions were found to exist.

### Labor Shortage

The necessity for manning the American military railways in France with trained American railway men, and the induction into other branches of the Army and Navy through voluntary enlistments or through the draft, of many railroad employees, added to the difficulties throughout the year, since at no time in the history of the American railroads has there been a greater need for trained and skilled railway help than during the war period. This difficulty was greatly increased by the influenza epidemic during the last half of the year, which very seriously interfered with the operation of the railroads for several months.

### Expenditures for Capital Account

On February 2, 1918, all lines under federal control were directed to prepare and send in budgets of improvements immediately required to increase capacity and efficiency and to promote safety in operation. The budgets submitted in response to this called for expenditures chargeable to capital account—that is, exclusive of large sums chargeable to maintenance—amounting in the aggregate to \$1,329,000,000, which upon careful revision was reduced to \$975,000,000.

This amount has been increased from time to time by new and unforeseen requirements, and particularly by large orders for locomotives and freight cars, until the improvements definitely authorized to December 1, 1918, amounted to \$1,254,396,158. Of this amount \$551,925,525 is for additions and betterments; \$656,048,745 for equipment, and \$46,421,888 for construction of extensions, branches and other lines.

In planning improvements chargeable to capital account other than for war purposes, the rule adopted was that the first consideration should be *safety* in operations, and secondly, *increased capacity* where that was needed; and that any improvement not required for these purposes should be deferred until after the war unless exceptional circumstances should make it necessary earlier. Improvements designed to effect permanent economies have been left for the favoring times and conditions of peace, unless the economy was so great that substantially the entire cost could probably be saved during federal control. Much the largest item was for additional yard tracks, sidings, etc. The second largest item was for shop buildings, engine houses and appurtenances, and the third for additional main tracks, and by the large orders for equipment almost wholly for locomotives and freight cars.

In addition to the locomotives and freight cars under order by the railroad companies at the time the government assumed control additional orders were placed for 1,430 locomotives for 1918 delivery, at an estimated cost of \$78,193,200, of which 542 have been delivered by the builders; and also an order for 100,000 freight cars for 1918 delivery at an estimated cost of \$289,460,000, of which there has been completed and delivered to date 14,650 cars. An additional order for 600 locomotives for 1919 delivery has also been placed, involving an expenditure of approximately \$37,842,268. At the time these orders were placed it was supposed that the war might last much longer than the year 1918. Practically all of this equipment has been assigned to those railroads whose need for additional power and equipment appeared to be the greatest.

The cost of coal and practically all other supplies used by the railroads increased enormously during the year just passed, as compared with the cost during the year 1917. The increased cost of fuel for the first 10 months of the present year was \$140,000,000 over the cost for the same 10 months in 1917, and during the same period the cost of cross-ties and lumber increased approximately \$65,000,000. The added cost of coal to the railroads increased in spite of the fact that economy in the use of coal was exercised to such an extent that, for instance, on the Chicago & North Western during the month of October the number of pounds of coal per passenger locomotive mile was 110.9 this year, as compared with 124.3 last year, and the number of pounds of coal per passenger train car mile was 19.2, this as compared with 21.3 last year, and yet the cost of locomotive fuel per locomotive mile was 34.9 cents in October, 1918, as compared with 27.9 cents in October, 1917. On the Union Pacific, during the same month the number of pounds of coal per passenger locomotive mile this year was 115.6, as compared with 131.8 last year. On the same line, during the same month, the number of pounds of coal per passenger train car mile was 13.6 this year, as compared with 18.2 last year, and yet the cost of fuel per locomotive mile was 33.2 cents in October, 1918, as compared with 32.6 cents in October, 1917. On the Chesapeake & Ohio the number of pounds of coal per passenger locomotive mile during the same month was 142.6 this year, as compared with 136.1 last year. The number of pounds of coal per passenger train mile on the same road during the same month was 24.4 this year as compared with 24.9 last year, and yet the cost of fuel per locomotive mile was 35.3 cents in October, 1918, as compared with 29.8 cents in October, 1917.

### The Increase in Rates

The increases in wages and the greatly enhanced cost of coal, iron and steel and other supplies made necessary the increase of both passenger and freight rates. Flat percentage increases were necessary to obtain the required revenue, but continuing and successful efforts have been made since to eliminate inequalities naturally incident to the adoption of such a plan. These new rates did not go into effect until practically six months of federal control had passed, and therefore only approximately six months' benefits have been gained from them during the past year, whereas increased cost of labor, coal and other supplies has operated during the entire year. Economies in operation and in organization have resulted in enormous savings, but have not fully met the difference between the cost of operating the railroads and the income, for the reason stated. The benefit of these savings will not be fully realized until the operations for the year 1919 are completed.

### Increased Cost Necessary

The increases in cost of operation undoubtedly would have been equally operative had the roads remained under private control. If the private owners had operated the railroads during the past year they either would have had to increase the rates as the government did or they would have had to face an enormous deficit.

### Financial

From the reports of operations for 10 months, ending October 31, 1918, and with November and December estimated, the net operating income of the roads under federal control will be less by approximately \$136,000,000 than the standard return or annual rental which, under the law, the government pays for the use of the railroads. This deficiency is remarkably small in the circumstances, because the increases in freight and passenger rates were in effect for only a little more than six months of 1918, whereas increased wages and increased cost of fuel and all other railroad supplies were in effect for the entire 12 months. If the increases in freight and passenger rates had gone into effect January 1, 1918, or at the same time that the increased wages and cost of fuel and supplies went into effect, it is estimated that there would have been a substantial surplus for the year of at least \$100,000,000. It is to be expected, however, during the year 1919 the cost of material and supplies may be reduced, and it is also reasonable to expect that with improved operation under normal conditions, relieved of the intense pressure and excessive cost incident to the war necessity, and with a general improvement in operations and use of facilities and equipment that may be reasonably expected in peace time, many more economies can be effected. Since the object of the government should be at all times to operate the railroads not for profit, but at cost, and to render at the same time the best possible service, I confidently believe that it will be possible during the year 1919, or certainly at the end of the year 1919, to effect a considerable reduction in rates unless the traffic for 1919 should be much less than it was in the year 1918.

### Inland Waterways

Hundreds of millions of dollars have been expended by the nation, the states and citizens for the purpose of developing our inland waterways, and for the construction of canals. Thousands of miles of rivers, canals, lakes and bays are ready to assist in moving our products. These waterways, with the exception of the Great Lakes, are not being extensively used. With the assumption of my present task, I appointed a committee to make a prompt investigation and to suggest a definite plan for the additional use of internal waterways, for the economical and expeditious movement of the traffic of the country, so as to relieve or supplement

the railways under the conditions caused by the war. This was the beginning of a program which has been constantly pursued and while the greater urgency for raw materials in war work interfered with the construction of steamers and barges, 160 steel, wood and concrete vessels are now building and 50 steel and wooden craft have been purchased. The total appropriation for old and new floating equipment exceeds eleven and three-quarter millions.

The increased responsibilities of this country in the family of nations will demand greater commercial activity on our part. Transportation is a major problem, for, on account of the extensive area of our country we have a longer average haul to seaboard than other industrial commonwealths. It has seemed to me evident that by developing transportation on the waterways and co-ordinating and articulating them with a unified railway system, we shall bring about a correct solution of the rail-water controversy, which has been in progress for 50 years. This is possible with the railways under federal control. I doubt if any of our rivers or canals will become active factors of transportation if the railroads are turned back to private control. The old methods of railway competition with the waterways doubtless will be revived and the waterway experiment may not be able to survive that competition.

In furtherance of the plans for waterways transportation, a division of inland waterways with two sub-divisions was created: The Mississippi-Warrior and the New York and New Jersey Canal sections.

*Mississippi River.*—Service on the Mississippi was inaugurated September 28 with 34 vessels. Of these, 23 are leased and 11 were purchased. The service is developing satisfactorily and as tariffs for joint rates with the railroads have just been promulgated, the valley will be afforded traffic privileges not possible in the days of railroad competition. Six steel steamers or towboats, and 40 (2,000-ton) steel barges are under construction for this service. The capacity of the federal fleet between New Orleans and St. Louis will approximate a million tons annually.

*Warrior River.*—Nine steamers and 24 barges were purchased for Warrior River service. Six steamers and 20 barges are about to be constructed. This fleet will be capable of carrying 600,000 tons southbound and about 150,000 tons northbound. The federal improvements on the Warrior are complete as to six feet of water, and will shortly be completed as to eight feet navigable craft.

*New York Barge Canal.*—The congestion existing on the railroads in the early part of 1918, and the war emergency made it essential to prepare so far as possible for such use of this important waterway as might be necessary to assist the railroads, and although it was announced officially that the canal was completed, there was practically no private building of equipment for use on the canal, and many of the old boats were being diverted to other uses. During the season the Railroad Administration leased and operated upward of 200 barges and contracted for the construction of 51 steel and 21 concrete barges. Construction was delayed on account of the war requirements for steel. It turned out that the canal had only seven feet navigable depth at the opening and it was not until midsummer that all the boats could be loaded to full capacity for operation, and as the terminals and rail connections were unfinished, an economical operation was not possible. In fact 8½ feet of navigable depth was the maximum in the canal during the season. The rail congestion of last winter was relieved before the canal season opened. The suspension of imports, the decrease in road and industrial building and the deficiency in the grain crops of 1917, affected very seriously tonnages that under normal conditions are available for this waterway. In compliance with very urgent requests of the people of the state of New York a local packet freight service was installed between Troy and Buffalo. As suitable boats were not obtainable and

as the terminals were in some cases unfinished and in others inaccessible, it was apparent that the operation would not be profitable, and results justified this view. It is to be noted that although the enlarged canal was in operation all season, no activity was displayed on the part of individuals or corporations to build vessels. The Railroad Administration has repeatedly announced that it does not assume to control, nor does it in any way discourage, the operation of privately operated barges; nor does it fix the carrying rate for independent vessels. When the canal and its facilities are completed, and when modern vessels are available, it will be possible to ascertain the cost of transporting traffic on this waterway. The results obtained during this formative stage, with the unavoidably antiquated equipment, are not a criterion of what can be accomplished with a completed canal and modern equipment. The adjustment of shippers and their facilities to the use of the canal is also a matter of time, which could not progress rapidly with the conditions existing during the present season.

*Delaware & Raritan Canal.*—The Delaware & Raritan canal connecting the Delaware river with New York harbor from 1913 up to the present year suffered a steady decrease in business. In 1917, 272,734 tons of freight were moved. The limited draft of water and small lock structures prevented profitable transportation operation on this waterway. It became evident last spring that there would be a marked decrease in the use of the canal for transportation of coal, due to the fact that coal was to be shipped via other routes, but there was an unusual demand for transportation of miscellaneous freight between New York and Philadelphia by this route. The canal has for many years been under lease to the Pennsylvania Railroad and came under federal control as part of its transportation system. In July the New York-New Jersey canal section took charge of the floating power equipment of the Railroad Administration on the canal and December 1 the operation and maintenance of the canal was transferred to that section. The Railroad Administration also operated a fleet of packet freight ships during a part of the season. There are a number of private transportation agencies operating on this canal. In spite of the loss of coal tonnage, the total freight movement on the canal will slightly exceed 1917.

*Chesapeake & Ohio Canal.*—The Chesapeake & Ohio canal, connecting Chesapeake Bay with Pennsylvania and West Virginia coal fields, has been operated at a loss for several years. At the beginning of the season of 1918, it appeared that unless action was taken to support navigation on this canal, the increasing costs would cause it to cease, while the pressure of traffic at that time upon the railroads bringing coal to Washington and vicinity was so great as to make it very undesirable that they have the additional burden of transporting the coal previously carried by the canal. The Railroad Administration therefore for a time assumed the cost of canal tolls on coal, and later on made an arrangement with the only company operating boats on the canal, which insured the maintenance of the service, the Railroad Administration paying the actual cost of the service over and above the freight charges which were paid by the shipper at the same rate as for rail shipments. The Railroad Administration also furnished 10 new barges which were leased to the operating company.

*Ohio River.*—The Railroad Administration has established an office in Cincinnati, Ohio, for the purpose of co-operating with shippers and vessel owners and studying traffic conditions with shippers and vessel owners. In view of the fact that the projected locks and dams on the Ohio river between Pittsburgh and Cairo are not completed (the movement has not been finished even between Pittsburgh and Cincinnati) it does not seem a proper time to consider any new equipment for this route.

*Lake Keuka-New York.*—The service formerly operated

on this lake by the Lake Keuka Navigation Company had been discontinued, and in order to move the grape crop of 1918, the Division of Inland Waterways operated equipment of the Lake Keuka Navigation Company during the grape season.

*Intracoastal Waterways.*—The intracoastal waterway from Philadelphia to Beaufort, N. C., will be susceptible of greater commercial development. The projected improvement between Norfolk and Beaufort will not be completed for some time and it will require at least two years to modernize the Chesapeake & Delaware canal. The improvement ought to be authorized promptly and I hope that the Congress may grant the necessary appropriation and power to deal with the matter. The fleet operating along this route was commandeered to a considerable extent, during the war, but the vessels are being slowly returned to the owners. The fleet seems to be sufficient for normal conditions. The capacity can be considerably increased by the introduction of modern terminal methods. Ultimately, packet freight service on this route may be practicable.

### Coastwise Ships

The fleets of vessels of railroad ownership were augmented on April 13, 1918, by the taking over of the vessels of the Clyde, Mallory and Southern steamship companies and the Merchants and Miners' Transportation Company, comprising 64 passenger and cargo-carrying vessels, operating in coastwise service between various ports—Boston, Mass., to Galveston, Tex., inclusive. The operation of the vessels was at times seriously interfered with by German submarines. In supporting the war policy of the nation, the steamships under federal control were used in war work to the maximum extent. The properties of the Clyde, Mallory and Southern steamship companies and the Merchants and Miners' Transportation Company were relinquished from federal control on December 6 as they are no longer necessary to the war purpose.

### Cape Cod Canal

The Cape Cod canal was taken under federal control July 25, 1918, and it is earnestly hoped that it will be operated in the future by the government. Formation of shoals had reduced its navigable depth to 17 feet at mean low water when the government took control, but the Railroad Administration immediately provided \$250,000 for dredging, piling, bank protection work, etc., and on October 23 the canal was opened for vessels drawing 20 ft. 6 in. of water, and the dredging necessary to restore the original depth of 25 ft. is expected to be completed by February 15, 1919. In spite of the fact that the work on the canal has not been entirely completed there has been an increase of 56.4 per cent in the number of vessels handled and 114 per cent in the cargo tonnage transported through the canal in 1918 as compared with 1917.

### Standardization of Locomotives and Cars

Before government control, practically every important railroad had its own specifications for cars and engines. Practically all were different in details. Although the facts are not obtainable, it has been said that there were 2,023 different styles of freight cars and almost as many different styles of locomotives included in the equipment of American railroads prior to the war. Complete standardization of course is impossible but as rapidly as existing rolling stock and engines wear out, it ought to be practicable to replace them by standard types. During the period of federal control progress has been made. Some 12 standard types for freight cars have been agreed upon and it has also been decided that hereafter only 6 different types of locomotives of two weights each shall be purchased. The parts of these various locomotives and freight cars respectively are interchangeable.

The importance of this is forcibly illustrated by an instance where a leased locomotive was held out of service until over \$4,800 had accumulated, awaiting a part which would cost not to exceed \$30. Where peculiar conditions exist, however, and where special types of locomotives are necessary, permission has been given to depart from the standardized type of locomotive.

### Civilian Inconveniences

While such a great work was being performed, inconveniences to civilian travelers and some interferences with the transportation of ordinary freight in the United States were unavoidable. The war necessity came first; the civilian needs of America, second. With a limited supply of passenger and freight equipment available, and with a large proportion of this equipment needed for the movement of troops and war supplies, there were not sufficient cars and locomotives remaining fully to meet civilian needs; nor was there time, nor materials, nor labor to build them. This was explained to the country early in the year, and during the period of the war the people generally, when they realized the situation, patriotically accepted it and made sacrifices accordingly.

Whatever inconveniences have resulted are due entirely to war conditions and are in no way related to the fact that the railroads were under government control. Such inconveniences undoubtedly would have been greater under private control, for the supply of equipment was augmented by the ability of the government to shorten routes, to combine facilities, to pool equipment and motive power, and to introduce economies which the roads under private control could not, and would not, have introduced.

I desire to make this point as clear as possible, for it is necessary for the American people to understand the facts of the railroad situation, if this big problem is to be dealt with intelligently. Passenger equipment while crowded during the war, was crowded because much of the equipment had to be used in the transportation of troops; it was not crowded because the government had control of the railroads. As a matter of fact, many thousands of passenger train miles were saved by the ability of the government to achieve results which private owners of the roads could not or would not have achieved. During the period of federal control, every possible economy was exercised in order to save both passenger and freight equipment and make as many cars and locomotives as possible available for the war need first, and for the needs of the civilian population next.

### Serving the Public

While putting the paramount war needs of the nation first, nevertheless, every possible effort has been made by the railroads under federal control to serve the public adequately and furnish every possible facility for carrying on the ordinary passenger and freight business of the nation. The railroads are public servants and in time of peace the first consideration should be to furnish adequate service at the lowest possible cost. To keep in touch with the public during the period of federal control and see to it that their needs were given every possible consideration, the Division of Public Service and Accounting was established soon after the railroads were taken over and Charles A. Prouty was made director of the division. With this object in view, traffic committees were early established, upon which the public was given representation. While these committees have no authority to change rates, nevertheless, their advice and recommendations are most helpful. What the shipping public desires above everything is stability of rates and reliability and adequacy of service. In the past thousands of rate changes have been made each month, which were worse than unnecessary. While passenger and freight service was of necessity interfered with during the war, efforts have been made dur-

ing the past year to keep in touch with state railroad commissions and other local bodies to make certain that well-grounded and important complaints should receive prompt attention.

### The Future

I have given you a statement of the transportation conditions a year ago, of the transportation achievements under federal control during a year of war, and of the present situation. What remains to be considered is what permanent solution of the railroad problem should be adopted and what shall be the temporary form of railroad control pending a permanent solution. In December, 1917, there were about 180 separate operating railroad companies in the United States with operating revenues of \$1,000,000 or more per year each. Seventy-three of these companies had operating revenues of \$10,000,000 or more per year each. There were several hundred companies whose respective operating revenues were less than \$1,000,000 per year.

### Possible Solutions

Broadly speaking, there are three general permanent solutions of the railroad question. The first is to send the railroads back into the private control of the several hundred old companies. The second is to have outright government ownership and control of all the railroads. The third is to reconstruct the railroad map along logical lines so as to wipe out these hundreds of different railroad companies and substitute a comparatively few companies which under strict and close government control can be expected to combine the advantages of government control, including unified control of those things where it is needed with the advantages of the initiative of private management. I am not committed to any particular plan. I wish to lay before you certain reforms which I think are indispensable and without which any so-called solution of the railroad problem will be a mere disappointing makeshift.

I am frank to say I do not believe that these important reforms can possibly be accomplished if we are to have in the future several hundred different railroad companies as we have had in the past, or even a hundred or even fifty different railroad companies. I believe they can all be accomplished either through a comparatively few railroad companies or through single federal control. If the country prefers to continue in existence the hundreds of different railroad companies as in the past I believe it will be necessary for the country to abandon the hope of obtaining most of the fundamental reforms which I propose to point out.

### The Terminal Problem

One of the most difficult and important railroad problems in this country is the problem of terminal facilities. It probably means more to the producing and consuming public in the matter of delays, inconvenience and transportation burdens than any other phase of transportation. It is generally understood that the delays and excessive costs do not occur principally on account of insufficiency of facilities on the road, but on account of inadequate terminals and of the heavy terminal costs. It is not unnatural that this should be the case. It is a far simpler proposition to haul a train over a railroad than it is to break up that train in a terminal and distribute its cars to the connecting carriers. For one thing, it is easier to provide adequate track capacity on the railroad itself, most of which runs through the country, than it is to provide adequate track capacity in a terminal which is generally in the midst of a great city. But an even more important point is that when the train is being carried over the railroad between terminals it is being handled exclusively under one management and on a railroad which has been planned with unity of purpose. But the moment a train gets into a terminal where its cars must be separated and

delivered to connecting lines, then we have to deal with facilities which have not been planned with unity of purpose and which under private control are not operated under a single management. The ability of one company to get rid of the business depends upon what its connecting companies have provided in the way of terminal tracks and other terminal facilities, and upon the way in which those connecting companies carry on their operations. It is human nature that each company is much more interested in looking after its immediate exclusive interests, both in the facilities which it provides and in the way it operates them, than it is in building and operating its property so as to help its connections.

Generally speaking, the cities of this country and the railroad traffic that passes through them have wholly outgrown the railroad terminal facilities which were provided many years ago without any conception of the growth of the country's traffic. It is difficult to get the land to expand the terminals of any one railroad and each railroad company is jealously trying to prevent some other railroad from getting the advantage in new terminal facilities. Each railroad company wants to plan its new terminals so as to help its own business and so as not to help its rivals. It is true that at times under pressure of critical necessity some of the railroads at some cities try to combine a portion of their terminal plans into a joint terminal enterprise. But it takes years for the railroads to agree on any such matter, and the comprehensiveness of the particular plan is generally interfered with by the selfishness of some particularly powerful railroad which feels that it can preserve certain advantages by refusing to put into the joint plan certain facilities which ought to be put there in the public interest.

The effect is that when it comes to terminal properties we get a clear-cut conflict of interest between the public and any particular railroad company. The public wants terminal facilities comprehensively planned and carried out so as to promote the greatest convenience and economy for all concerned, but each railroad company is anxious to preserve any particular advantage which it already has and to increase that advantage when practicable. This clash of interests between the public and any particular railroad company and between the different railroad companies serving a particular terminal operates to produce deadlocks which to a large extent prevent terminals from being developed so as to meet the business necessities and so as to serve the public to the greatest advantage.

The condition exists, and is largely accounted for by the reasons above given, that the outstanding shortcomings in railroad transportation are inadequacies in terminal facilities. The great unnecessary burdens in the matter of inconvenience, delay and cost for which the producing and consuming public have to pay are largely due to these terminal conditions. There can be no successful solution of the railroad problem which does not provide a solution for these terminal difficulties. The greatest opportunity to reduce railroad costs for the future and to promote public convenience in transportation for the future will be found in the solution of these terminal problems.

### Cincinnati—An Example

A concrete illustration will help to emphasize the present difficulties. Cincinnati is an important gateway between the north and the south. Three important railroads—the Chesapeake & Ohio, the Louisville & Nashville, and the Cincinnati Southern—reach Cincinnati by crossing the Ohio river. Four other important railroads—the Big Four, the Baltimore & Ohio (including the old Cincinnati, Hamilton & Dayton), the Pennsylvania, and the Norfolk & Western—reach Cincinnati on the north bank of the Ohio river. The interchange of traffic between these lines at Cincinnati is enormous, and the general public has a vital interest in this interchange being accomplished with the least possible delay and

expense. Yet conditions are such that in times of heavy traffic Cincinnati is badly congested with freight, and the ability of all the railroads mentioned, not only with respect to handling traffic through Cincinnati, but with respect to handling other important traffic, is largely hampered by the inability to get rid of the traffic which must pass through Cincinnati.

Each of the three railroads approaching Cincinnati from the south has a bridge across the Ohio river. The Cincinnati Southern bridge and the Chesapeake & Ohio bridge are so light that they cannot accommodate the heavy locomotives which are used on those roads, so that there must be a delay and cost and congestion due to the necessity for changing engines south of the Ohio river on those two roads. The Louisville & Nashville has the use of a bridge which has only a single track and is therefore entirely too restricted in capacity to handle the traffic. The topographical conditions in Cincinnati are such as to make it exceedingly difficult to find suitable ground upon which to construct terminal facilities, and the densely populated area makes terminal facilities extremely costly. A considerable part of the important terminals in Cincinnati is subject to overflow in times of high water. To a very large extent the traffic which any one railroad brings into Cincinnati is traffic which must be moved beyond Cincinnati by some other railroad, so that more than one railroad generally has an interest in providing proper facilities for all the traffic moving through Cincinnati and all the railroads reaching there have a common interest in avoiding the congestion at Cincinnati which in the past has constituted one of the most serious traffic situations in the country. Yet each of the railroad companies has its separate facilities, and while there have been various particular arrangements of a joint character it still remains true that in all the years that have passed the railroad companies under private management have never been able to get together and put into effect any comprehensive plan which would result in terminal facilities equal to the situation. It seems fair to conclude from the failure of the railroad companies in the past to accomplish this result that they probably never will accomplish it in the future under corresponding methods of private management.

At the present time there are perhaps from 25 to 30 freight houses in and around Cincinnati which, generally speaking, have been provided primarily for the particular use of separate railroad companies and without any purpose of combining all the freight house facilities so as to serve the general public to the best advantage and at the least cost.

It is evident that in view of the common interest which the railroad companies have in the traffic passing through Cincinnati some comprehensive plan ought to be worked out. No railroad company can live to itself alone in a terminal like Cincinnati. No one important structure should be planned simply from the standpoint of a particular railroad company. The entire situation should be dealt with from the standpoint of the general public interest and the selfish interests of any particular railroad company ought to be subordinated to the general interest. Yet under private management there is no way whatever in which the public can properly assert and accomplish its needs and the result both in construction of facilities and in operation is left to the haphazard play of the conflicting ideas of seven or more separate railroad companies and plans of the utmost importance are subject at any time to be defeated by the disagreement of one or more of these companies.

It is estimated that there ought to be spent in the near future about \$45,000,000 in the rehabilitation of Cincinnati terminals so as to make them equal to modern public needs, with probably \$25,000,000 additional for passenger terminals. Practically every item of this large expenditure involves directly or indirectly the interests of two or more separate railroad companies. In fact, virtually the whole ex-

penditure has to be made in the common public interest and without making the interest of any one railroad company paramount as to any particular item. If this matter is left to be worked out by the separate railroad companies without any controlling public authority to shape up the whole situation for the benefit of the general public, there is no reason to believe that it ever will be successfully worked out. Certainly the railroad companies have had many years in which to work out the problem and they have never done so. If the problem is not adequately solved the result will be that a great burden of delay and inconvenience, uncertainty and cost will continue to rest upon the people of the United States simply because a thing which ought obviously to be done at Cincinnati in the public interest is not done and it will not be done because the power of government which ought to be exercised to promote the public interest is allowed to remain dormant and subordinate to the separate interests and to the disagreements of various privately managed railroad companies.

What is true of Cincinnati is true to a large extent of every important terminal in the country, particularly of Chicago and the terminals around New York harbor. In the aggregate these situations constitute a great burden and menace to rail transportation and a serious obstacle to convenience and certainty to the public in the performance of that transportation. These situations must be met if transportation in this country is to be performed at a reasonable cost and without the intolerable congestions and delays which have periodically arisen in the past.

Nor is there any just reason why railroad companies should fear that such a comprehensive development of terminals is going to interfere with any legitimate separate interests of the railroad companies in the event they shall eventually be turned back into the old form of private control. Any comprehensive plans of terminal improvement which are for the general public good will in the long run turn out to be advantageous to every separate legitimate railroad route in the country. No matter if the railroads do go back into the old form of private control with anywhere from 100 to 200 separate managements, it is inevitable that in the long run and perhaps as the result of long years of hardship upon the public, there must be some comprehensive legislative solution of these terminal problems in the general public interest. The railroads will not be injured, but on the contrary will be benefited, by a prompt public dealing with these matters.

As a simple illustration, it is evident that the fact that the Baltimore and Ohio passenger trains are now taken into the Pennsylvania passenger terminal in New York has not resulted in injuring the Baltimore & Ohio or in causing any injury to the Pennsylvania, of which it has any right to complain. The public has been enormously inconvenienced. If private control should return it is not to be anticipated that the public would again be subjected to the inconvenience and delay and expense incident to the Baltimore & Ohio going back to the use of its old and inconvenient passenger terminal at Communipaw, N. J.

#### Transportation Stringency Through Failure to Control Traffic

The situation exists in this country that the transportation needs of the people are national and interdependent, despite the fact that the railroads are local and independent. Practically every community in the country is dependent upon a national and not a local transportation service. It is not true of any community that it can depend wholly, or even principally, upon its local railroad to transport what it produces and what it consumes, because, directly or indirectly, what it produces must in some form go far beyond that railroad and what it consumes must in some form originate beyond that railroad.

Perhaps the greatest single difficulty is that under private management, with each company trying to prevent any traffic going to a rival, the amount of freight loaded has been dependent almost wholly upon the desire and opportunity of the consignor to load a shipment and get a bill of lading for it, without any regard whatever to the ability of the delivering railroad to dispose of the traffic at destination at that time, or of the ability of the consignee to receive the traffic, if delivered. The result has been the indiscriminate throwing into the stream of traffic of everything which consignors wished to throw into it, and this has led to the most acute congestion at or near destination, analogous to an "ice jam" or "log jam" in a river. This consequence has been injurious to the public as a whole, because it has reduced transportation capacity far below what it ought to be, has led to the greatest uncertainty and delay and consequent interruption and injury of business, with direct disadvantages to labor and to the producing and consuming public. It is apparent that this fundamental difficulty has not been effectively dealt with under diversified private management. It is difficult to see how any railroad company would be willing deliberately to prevent the loading of traffic on its own line, when it is able to handle that traffic, simply because eventually the traffic may be a source of embarrassment to some connecting line.

#### Met by Unified Control

These conditions have been substantially met under unified control by the routing and distribution of traffic over the available lines and by the establishment of the "permit system," whereby traffic involving potentialities of congestion is not allowed to be loaded, except upon showing that it can be delivered to and taken care of by the consignee at destination. During the autumn months of 1918, when traffic was at its heaviest, there was practically a complete absence of transportation stringency, which in the immediate preceding years had amounted almost to transportation paralysis. This condition was due largely to the "permit system." One of the essential reforms therefore is the adoption of some system to control traffic in the common interest.

As far as railroad tracks are concerned, the mileage of road tracks (as distinguished from terminal tracks) appears to be sufficient to take care, generally speaking, of a much larger tonnage than can be handled through the terminals. At times, however, particular railroads may become embarrassed by a surplus of traffic, even though it may be possible to care for the traffic at the terminal. Under unified control, in such conditions, the surplus traffic can be diverted to some other railroad reaching the same destination. Under private control this has not been possible. The company which was able to obtain the routing of the traffic has, generally speaking, not been willing, even though unable to handle the traffic successfully, to let it go to a rival railroad. The public ought to be provided with some system whereby unused railroad capacity may be used in the common interest in times of stress.

One of the most important classes of traffic is the export traffic and this ought to be greater than ever in the future. The transfer of such traffic at the seaport from the railroad car to the ship involves great possibilities for congestion and delay. Under the old form of private management a particular railroad company naturally wishes the traffic to go to its own port, and, even though that port may be momentarily seriously congested, is unwilling to turn that traffic to a rival line whose port may be free from congestion. Undoubtedly, an opportunity exists under unified control, even in peace time, to apportion the traffic among the ports and co-ordinate rail transportation with ocean transportation in such a way as greatly to relieve the strain which at times arises from the inability of the particular railroad company

to consider the interests of ports other than its own and to co-ordinate effectively with the ocean transportation. Whatever the solution of the railroad question a way ought to be found to control this matter in the public interest in times of emergency.

#### Motive Power and Cars

A further transportation factor of great importance is having adequate locomotives in good repair. In the past each railroad company has had its own locomotives and, generally speaking, has used them exclusively upon its own rails. If some of them were temporarily idle there was not generally any way of allowing them to be used temporarily by other railroads which were short of locomotives. In cases where there was no surplus of locomotives anywhere and where additional locomotives were far more needed, in the public interest, in some sections than in others, there was under private management no way under peace conditions of taking locomotives from the line where the public interest needed them least and putting them into service upon the line where the public interest needed them most. There was no way in which locomotives could be mobilized so that they can be used where they will do the public the most good. This, of course, has been accomplished under unified control and will be to an increasing extent.

The availability of locomotives depends upon their being in good repair and the ability to repair them depends upon the shop capacity. Under private control each railroad company has had its own shops. If those shops are taxed to their capacity, it is not, generally speaking, convenient to turn additional locomotives needing repair over to the shops of other railroad companies in order to receive the repairs. The result is that shops of some railroads may be partly or largely idle and shops on other railroads may be wholly unequal to the tasks confronting them. Yet, private management has never been able to work out any comprehensive and effective way for "matching up" the demand and supply of locomotive shop capacity. This important matter has been handled with great success under unified control and can be developed so as to be handled more systematically and successfully as time goes on.

#### Competition

Under private management there has also been an unnecessary use of locomotive power through duplication of train service for purely competitive reasons, whereas under unified control trains can be consolidated so as to release for useful service many locomotives which before had been used merely in transportation rivalries and without carrying loads to their full capacity. When each railroad company is intent upon the traffic which it can obtain for its own line, it is inevitable that the most carefully drawn rules will not be fully carried out and that there will be a temptation, frequently irresistible, for a railroad company to retain cars for its own purposes, when the public interest requires that those cars should be devoted to some other purpose. It is also true that the handling of empty cars, so as to get them in the quickest time to the place where they are most needed, cannot be handled as well under private control, because the transportation of the empty car gives the transporting railroad no revenue and hence it is not disposed to encourage any such transportation, except to the extent that it has had the benefit of the car when loaded and producing revenue. And yet, in many instances, in order to reach the place where it is most needed, the car ought to be hauled by a line which has enjoyed no revenue from the car when it last moved under load. The results of unified management show important advantages resulting from unified control of the car supply. Any permanent solution of the railroad question ought to give the public the advantage in times of stress of the mobilization of locomotives, and locomotive

repair shops, and of the handling of all equipment in the public interest including the emergency handling of empty equipment.

### Rates

In the matter of rates, an immense advantage resulting from unified control is that rates can be made only so high as may be necessary to protect the situation as a whole, through paying the total expenses and producing only a sufficient resulting operating income to represent a fair compensation for the property employed. But under separate management, there is the greatest diversity in the prosperity of the railroad companies. Some will prosper on very low rates and some will fail on very high rates. The result is either that rates must be maintained on an average basis which, while producing high profits for some railroads, will still leave other railroads in bankruptcy, or must be made sufficiently high to leave a margin of profit to the less prosperous, with consequently excessive profits to the most prosperous. The former course will result in the less prosperous roads being unable to perform their public service successfully. The latter course will result in the public being burdened with unnecessarily high rates. Under unified control rates which are sufficiently high on an average, to protect the general situation, will insure an adequate service on all roads and will, at the same time, protect the public against rates being made any higher than is necessary to meet the real necessities of the situation. I do not believe there can be any successful solution of the railroad problem which leaves in existence the great disparity in the results of the same rates to different railroad companies, because this will always cause question as to the propriety of any scale of rates and will keep the rate question in constant turmoil.

### Result

I believe that even under the handicaps of war conditions a sufficient showing has been made to indicate that all the reforms I have mentioned are desirable as permanent peace measures. Yet it is clear that the general public has not had an opportunity to appreciate this and to weigh the real value of what has been accomplished. There has not yet been an opportunity to give the public knowledge of the facts. In view of the far-reaching importance of any solution of the railroad question which may be adopted, the public is entitled to have, before the present federal control shall be terminated, a reasonably fair test under peace conditions of the advantages to be derived from these reforms.

When Congress comes to take the responsibility of making a final decision as to which is the best permanent solution of the railroad problem, one of the most important considerations to which it must give attention is the question as to which solution will involve the least financial burden for the future upon the American public. This being true it seems to me of the highest importance that Congress should have an opportunity to form an accurate idea as to the cost of unified control of railroad operations under peace conditions. In order to have an accurate idea on this subject Congress ought to have before it at least the operations of the year 1919 under federal control. Of course these figures cannot be ready until the spring of 1920. If Congress undertakes to make its permanent solution of this great problem prior to that time it will do so without any adequate comparison between the cost of railroad operation under diversified private control as in the past, and the cost of railroad operation under unified control during peace time. It is true that the figures for the year 1918 will be available in about two months, but these figures will represent the operations under war conditions when the railroad management was subjected to many difficulties which will not exist under peace conditions, and when a great deal of traffic had to be handled regardless of cost in order to meet the insistent

emergencies of war. It also happens that the year 1918 includes the operations of the most severe and costly winter that has ever been experienced in the life of the railroad business in this country, and the cost of clearing up the most serious congestion of traffic in the history of the railroads—a congestion existing at the time federal control was assumed. Therefore, unless a final solution of this problem is deferred until a reliable view of the economies which actually arise out of unified operation can be obtained, the result will be the adoption of a permanent solution in ignorance of one of the most important factors to be considered.

### Shipping and the Railroads

The glorious victory for democracy in which America has played such a noble and conspicuous part has given her a commanding position in world affairs. Our own material development makes it more than ever necessary that we shall have access upon just and fair terms to the markets of the world for the disposition of our surplus products. We cannot meet this situation unless we are prepared to go forward immediately. Opportunity does not wait for the laggard, whether that laggard be a nation or an individual. America must go forward immediately and organize her resources effectively for the purpose if she is to enjoy her share of the fruits of the keen and friendly rivalries in commerce in which she must engage with other nations.

Under the provisions of the United States shipping act, the great merchant marine we are constructing is to be under government control for a period of five years from the conclusion of the European war. If our splendid merchant fleet, built with the money of the people of the United States at a cost of more than one billion dollars, is to be used successfully in their interest, it must be operated in effective co-ordination with the great railroad systems of the United States. They must work together harmoniously and reciprocally. During this great period of world development involving the vital welfare of the American people, it seems to me peculiarly wise that the period of federal control of railroad transportation shall be made concurrent with that of government ship control. Then we shall have a great transportation system on land and sea furnishing the reliable, effective service which will protect the interests of the American people and carry them forward upon a career of prosperity and success unequalled in any previous period in their history.

### Conclusion

This is why I have urged that federal control be extended until January 1, 1924. It will be impossible to view the results of even one year of federal control under peace conditions until the spring of 1920, and it will then be too late for Congress to legislate before the end of the 21 months' period. Even if it were possible to accomplish legislation in the next 12 months it would be done without any opportunity whatever to form a reasonable idea as to the advantages of unity in the matters I have mentioned, under peace conditions.

Moreover, the operations under peace conditions with a tenure so short as the 21 months' period cannot possibly constitute a fair test. With such a rapidly approaching termination and with every officer and employee naturally speculating on his relations to the new management, whatever it may be, it will be impossible to secure the best results from the railroad organization and the nearer the termination approaches the more difficult will be the situation.

Indeed the difficulties with operation during the 21 months' period will be so serious that I do not see how the government can be fairly asked to encounter them. It will be asked to continue an operation deprived of all the elements which would help in making the operation a success, and I do not see how it can be seriously urged as the proper

course by any one except those who are anxious at all events to see the railroads restored to the control of numerous different companies just as in the past. It seems to me that any one who wishes a fair and dispassionate study made as to what is the best ultimate solution and as to the extent to which the reforms I have mentioned are in the interest of the American public, and as to the way in which those reforms can best be accomplished, if in the interest of the American public, must be anxious to have a reasonable period of federal control after the war under conditions calculated to make for tranquillity and single-mindedness upon the part of the federal railroad organization. I do not mean that this would be desired in order to accomplish government ownership, but it seems to me it would be desired in order to test the utility of various reforms in the direction of unification which can be accomplished without government ownership, but which cannot be accomplished as I view the situation through an unrestricted return to the old conditions of management through from 75 to 100 different important railroad companies, and several hundred smaller railroad companies.

The 21 months' period will be entirely too short to accomplish any effective results with respect to improvements, and especially the terminal improvements which are peculiarly needed. Indeed with such an early termination of federal control there will be almost a complete stoppage of improvement work except what is obviously needed for the most urgent necessities. The result will be that terminal reforms, which are badly needed in the public interest, and which already have been delayed many years, will be subjected to further indefinite delay. It will also be true that needed railroad construction and extensions will be practically at a standstill.

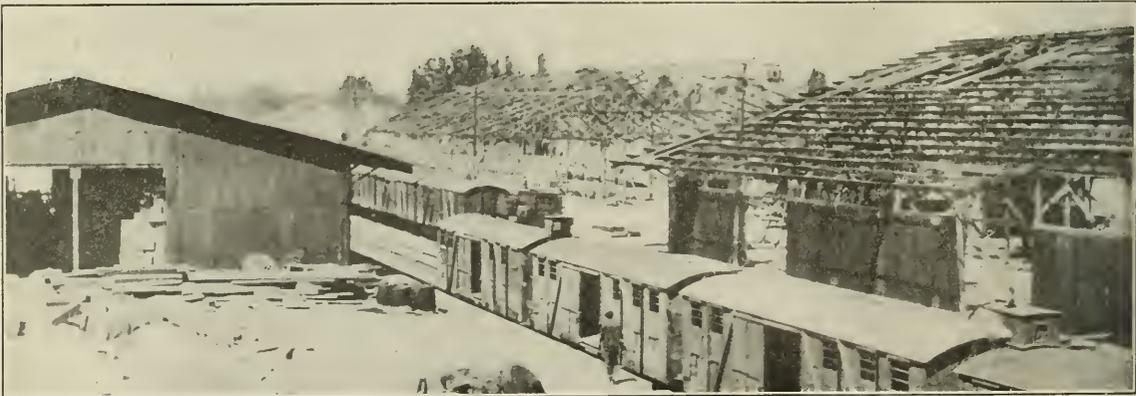

In the nature of things the concurrence of the railroad corporations cannot be expected in matters of improvements and extensions during the 21 months' period except as to things of the most urgent and obvious necessity and where there is no possibility of conflict with the selfish interest of the particular corporation. This is not surmise because the evidences of it are already appearing—notably in the case of locomotives where budgets were submitted by the corporations calling for their purchase and where even now many of the corporations are challenging the purchase of locomotives made for their account and within the limits of their requests. It is natural that each company will prefer to hold all other matters in abeyance in the hope that it can make its own plans in its own way at the end of federal control. This condition

will not exist, however, if a five-year extension shall be granted. During the early part of that extension comprehensive improvements can be carried forward in the public interest and the railroad companies will appreciate the impracticability of holding everything in abeyance for so long a period as five years. Of course as the five-year period nears its termination there would be a disposition on the part of the corporations to postpone matters which had not theretofore been entered upon, but by the time this condition would arise it is reasonable to expect that Congress would have been able to make a permanent solution of the whole problem in the light of an adequate experience with the present opportunities for unified control.

With the five-year extension, it will be practicable for Congress, say within two years from now, to enter upon a permanent solution of this question after Congress and the country shall have had before it the result of a complete year's experience of federal control under peace conditions, as well as a year's experience under war conditions. Congress, with that additional experience, will be able far better than it is at present to estimate at their real value the reforms which I have submitted to you as being fundamental and Congress can then determine whether those reforms are so important as to make it desirable to adopt some other method of railroad ownership and control than that of such a great number of different private companies as has been the case in the past.

#### Valuation

It must be remembered also that Congress has thought it important to provide for a valuation of railroad property and this valuation has been in progress for several years at large cost. I assume that it will be completed in the next two or three years. There is widespread conviction that no permanent solution whatever of the railroad problem can be made which does not put at rest the present insistent claims as to railroad overcapitalization. The question therefore arises whether Congress can satisfactorily deal with this matter in advance of the completion of the valuation which it has already prescribed, and whether Congress will wish to attempt a final solution of it before it can have the benefit of the valuation for which it has already appropriated such large amounts and to which it has attached so much importance. It is not possible, as I view the complexities of the problem, to effect any marked change in the form of railroad control that is not based upon a completed valuation of their properties.

# Executives Plan for the Future of Railways

## Government Regulation of Privately Operated Roads With Responsibility and Authority Vested in Federal Agencies

THE FOLLOWING PRINCIPLES, which should be incorporated in a plan providing for government regulation of railroads engaged in interstate commerce, were tentatively agreed to at conferences of the standing committee of Association of Railway Executives, at the Bellevue-Stratford Hotel, Philadelphia, December 11-15, 1918, and were presented to the Senate committee at Washington on Thursday of this week.

The fundamental and essential purpose to be accomplished is to furnish the public with safe, efficient and adequate transportation at the lowest cost consistent with such service, and with due regard to the just interests of the owners and employees, and also adequate to the nation's needs even in times of great national emergency or peril.

It should be realized that the commerce to be provided for, whether in peace or war, is not essentially, or in large part, local, but is in its most important and controlling aspect interstate and continental. Manifestly any system which is adopted should be adequate to deal with and supply local needs as well as to meet the larger purposes referred to, and consequently it is necessary to consider whether instrumentalities of commerce whose principal functions and importance are interstate and continental should in matters affecting their capacity to serve on equal terms the entire public, be subjected to many local authorities or to an authority representing all localities.

The interests of the whole people demand, that, in any plan or policy which is adopted, provision shall be made:

(a) For adequate service and facilities to meet not only the present requirements, but the growing and expanding needs of our population and of our domestic and foreign commerce.

(b) For new and additional construction when justified by public convenience and necessity and for the elimination and prevention of waste in unnecessary and injudicious construction.

(c) For the proper co-ordination of the carriers' lines, facilities and organizations and for the consolidation thereof under proper limitations whenever necessary in the public interest to meet and provide for the reasonable demands of our domestic and foreign commerce.

(d) For the prompt and orderly co-ordination of the lines, facilities and organizations of all carriers into a unified and continental system whenever required in the public interest, because of extraordinary national emergency or peril.

(e) For a rate structure which will provide sufficient revenues and create sufficient credit for these purposes.

### Principles Recommended

To this end, the following principles should be adopted:

1. Private ownership, management and operation of the American railways should, as a matter of national policy, be continued.

2. The power of regulation of the instrumentalities of interstate commerce, as to all things substantially affecting them, including all rates, state and interstate, should be exclusively in the hands of the national government; but these national functions should be administered through governmental machinery or agencies responsive to the needs of and convenient to the people of the several states to the extent and the manner hereinafter suggested. State commissions should not be interfered with by the federal act except so far as necessary to carry out the purposes herein mentioned.

3. The Interstate Commerce Commission, which has heretofore been the sole federal agency provided by law to deal with such matters should be relieved from its executive and administrative duties, except as to federal valuation and as to accounting, and should act as a quasi-judicial body clothed with authority to pass upon all questions concerning the reasonableness and adequacy of rates and concerning discriminations coming before it on complaint of any party interested, or referred to it as hereinafter provided.

### A Secretary of Transportation

4. A department of transportation should be created, the head of which should be known as the secretary of transportation. He should be a member of the President's cabinet and should be vested with the following powers and duties:

(a) To carefully observe the transportation needs and transportation facilities of the country, and, by suggestion and co-operation with the carriers, and, by recommendations from time to time to the Interstate Commerce Commission in respect to the necessity for rates and revenues adequate to provide and maintain the proper service and to create the credit required to meet the needs of the public for facilities, while at the same time protecting the just interests of employees, of owners, of shippers, and of the traveling public, to endeavor to insure the provision of adequate transportation facilities for the real transportation needs of each situation. He should be charged with the responsibility of recommending from time to time to the President such measures and policies as in his opinion would promote the interests of the public and the adequacy of the transportation service;

(b) If he find that a carrier is at any time so congested or otherwise unable to properly handle its traffic, he should have power to distribute such traffic over other lines and routes on such terms as between the several carriers as he may find to be just and reasonable under the circumstances, subject in respect to such terms to appeal to the Interstate Commerce Commission;

(c) If he find it to be practicable and in the public interest, he should have power, in the event of the failure of the interested carriers to agree, to require the use of the terminals of any carrier by another or other carriers on such terms as he may fix as reasonable and just, subject to the right of appeal of any interested carrier to the Interstate Commerce Commission;

(d) In cases of serious national emergency, he should have power to direct that, during the continuance of such emergency, the carriers should co-ordinate their facilities and operations and operate their properties as a unified national system on such terms as he may find to be just and reasonable in the public interest. Proper provision should be made for just compensation to any carrier injured thereby.

(e) If he find it necessary in order to provide adequately for the movement of traffic, he should have power to require any carrier to distribute its cars to other lines on such terms as he may deem just, subject as to such terms to an appeal to the Interstate Commerce Commission.

(f) He should have power to require any carrier to distribute its cars among its patrons in accordance with their needs and the public interest in the same manner and to the same extent as the Interstate Commerce Commission is now by law authorized to do.

5. No new or branch lines of railroad or large and ex-

pensive terminals should be constructed unless a certificate of public convenience and necessity is first obtained from the secretary of transportation.

6. The executive and administrative functions of the Interstate Commerce Commission, except as to accounting and as to federal valuation of railroad properties, should be transferred to the secretary of transportation.

7. The carriers should have the power to initiate rates, schedules of which should be filed with the Interstate Commerce Commission, with the secretary of transportation and with the state commissions of the states in which the rates are applicable and through which the carrier operates; and, if not suspended as hereinafter provided, such rates should become effective 30 days after the same have been so filed, unless a shorter period is in special cases authorized by the secretary of transportation.

It should be made the duty of the secretary of transportation promptly to consider the new rates so brought to his attention, and he shall either:

(a) Approve the same, giving his reasons for such approval, or,

(b) Permit the rates to go into effect without his specific approval or disapproval, or

(c) Disapprove the same, giving his reasons therefor.

In case he disapproves any rate or fails specifically to approve or disapprove it, he may suspend it for a period not exceeding 60 days and refer the same to the Interstate Commerce Commission for consideration and determination.

8. The statute itself should provide the rule of rate-making, and should require that rates be not only what has been called reasonable, but adequate and sufficient to enable the carriers to provide safe, adequate and sufficient service, to protect existing investment and to attract the new capital necessary in the public interest, and, to that end, the statute should, among other things, specifically provide that the level of rates must properly reflect the cost of wages and all other expenses incident to the furnishing of transportation.

9. Rates, whether approved or disapproved by the secretary of transportation, may by complaint be brought before the Interstate Commerce Commission for consideration, which should have power to pass upon the reasonableness and adequacy thereof, subject to the statutory rule in regard to rate-making, and, in any proceedings before it in respect to rates, the commission should give due consideration to any recommendations in respect thereto made to it by the secretary of transportation. Rates approved by the secretary of transportation should be presumed to be reasonable and proper until found otherwise by the commission.

10. In any proceedings before it in respect to rates the Interstate Commerce Commission should have the power to prescribe minimum as well as maximum rates and to determine the relation of rates and differentials whenever necessary or appropriate to establish or maintain a rate structure or a relation or differential found by it to be just and proper.

11. The statute should provide that existing rates, put into effect by the director general of railroads should be continued in effect until changed by the Interstate Commerce Commission as provided by law, or as provided in paragraph 7 hereof.

12. Any carrier should be given the right to complain of rates of another carrier in the same manner and to the same extent as a shipper.

13. The Interstate Commerce Commission, in order that matters within its jurisdiction may be dealt with more promptly and satisfactorily and with a fuller appreciation of all the circumstances and local conditions, should be directed to divide the United States into such number of regions as it may deem wise, and certify the number of regions and their boundaries to the President, who should appoint for each region a regional commission, which should be a board of primary jurisdiction, consisting of one member for each

of the states embraced therein. The regional commissions should have authority to hear and determine all complaints in respect of matters within the jurisdiction of the Interstate Commerce Commission arising in their respective regions and to make reports thereon to the Interstate Commerce Commission, such reports during a fixed period to be subject to exceptions by any of the parties, as in the case of reports by masters in chancery. If no exception is filed within the time limit and it is not otherwise ordered by the Interstate Commerce Commission, the orders and findings of the regional commissions should automatically go into effect. If there are exceptions, or the Interstate Commerce Commission considers the issues involved of sufficient importance to so order, a hearing should be had before it on such exceptions, or on the matters made subject to reconsideration by order of the commission, and the order of the commission should have the same effect as now provided by law in respect to its orders.

14. Express rates should be dealt with in the same manner as freight rates. Contracts between express companies and railroad companies for division of express earnings should not become effective until approved by the secretary of transportation.

15. Section ten of the Clayton act should be so modified as not unduly to hamper the proper transaction of business.

16. Existing laws should be so far modified as to authorize upon approval by the secretary of transportation as being in the public interest:

(a) Acquisition by a carrier engaged in interstate commerce of the properties, stocks or securities of another or other carriers; or consolidations and mergers of such carriers;

(b) Agreements between carriers engaged in interstate commerce in respect to rates and practices;

(c) The pooling of cars and other transportation facilities;

(d) The division of earnings in connection with the elimination of unnecessary train service.

All such agreements and arrangements should be filed with the Interstate Commerce Commission and with the commissions of the several states whose traffic is affected as well as with the secretary of transportation and be open to public inspection.

17. Continuity and regularity of transportation are absolutely essential to the public. Both the capital invested and the labor employed in transportation are therefore engaged in a business vitally affecting the public interest, and by engaging therein assume the implied obligation not unreasonably to impair or interrupt the movement of trains. Questions of wages and working conditions affecting individual railroads should be settled, if possible, by officers of the railroads and representatives of the employees. A board should be constituted, under the secretary of transportation, on which the employees, the employers, and the public, should have equal representation, with the duty and authority to investigate and report to the secretary of transportation on the merits of any controversy, which the parties are unable to adjust, arising in the railroad or other transportation service, either in regard to wages or in regard to conditions of service; and, pending such investigation and report and for a reasonable time thereafter, there should be no lockout by the carriers and no concerted action on the part of the employees which would have the effect of interfering with or interrupting the orderly movement of the United States mail or interstate or foreign commerce. The scale of wages and the expense incident to any change in the conditions of service recommended in the report of such board, if put into effect, should be accepted and recognized in the making of rates, as a legitimate expense of transportation.

18. Provision should be made for the funding by the United States of indebtedness of carriers to it growing out of federal control.

19. There should be in the federal government the exclusive governmental power to supervise and authorize the issue of securities by railroad carriers engaged in interstate or foreign commerce or by holding companies controlling any such carrier.

20. A system of federal incorporation should be adopted into which should be brought all railroad corporations engaged in interstate or foreign commerce. Such system should be compulsory and not elective. It should preserve to corporations reincorporating under it, not only all of their contract rights and other assets of all sorts, but also (except as to any feature contrary to an Act of Congress) their existing charter powers, and they should also possess the general powers conferred upon all corporations organized under the federal Act. The system of incorporation should provide a means of consolidation and merger for existing corporations engaged in interstate or foreign commerce, with the necessary power of condemnation; provided the secretary of transportation finds that such consolidation or merger is not contrary to the public interest and approves the same.

The committee of the Association of Executives consists of: Thomas DeWitt Cuyler, chairman; S. T. Bledsoe, general counsel, Atchison, Topeka & Santa Fe; W. R. Cole, president, Nashville, Chattanooga & St. Louis; A. J. Earling, chairman, Chicago, Milwaukee & St. Paul; Howard Elliott, president, Northern Pacific; S. M. Felton, president, Chicago Great Western; A. H. Harris, vice-president, New York Central; Charles Hayden, president, Chicago, Rock Island & Pacific; E. M. Hyzer, vice-president, Chicago & North Western; L. E. Johnson, president, Norfolk & Western; Howard G. Kelley, president, Detroit, Grand Haven & Milwaukee, Grand Trunk Western, and Atlantic & St. Lawrence; Julius Kruttschnitt, president, Southern Pacific; E. E. Loomis, president, Lehigh Valley; L. F. Loree, president, Delaware & Hudson; Wm. Church Osborn, president, Texas & Pacific; Chas. A. Peabody, president, Illinois Central; Samuel Rea, president, Pennsylvania; Bird M. Robinson, president, American Short Line Railroad Association; W. L. Ross, receiver, Toledo, St. Louis & Western; Henry Ruhlander, president and chairman, St. Louis-San Francisco; Frank Trumbull, president, Chesapeake & Ohio; F. D. Underwood, president, Erie; H. Walters, chairman, Atlantic Coast Line; and Daniel Willard, president, Baltimore & Ohio.

## I. C. C. Opposes Government Railroad operation

### For Return of Properties to Private Management After Reasonable Period of Readjustment or Preparation

**E**XPRESSING THE CONVICTION that with the adoption of appropriate provisions and safeguards for regulation under private ownership it would not be wise or best at this time to assume government ownership or operation of the railways of the country, the Interstate Commerce Commission, in a statement presented before the Senate Committee on Interstate Commerce on January 7 by Commissioner E. E. Clark, went on record as favoring a return of the railroads to private management after a reasonable period of readjustment or preparation and after reasonable notice of the date. The commission also outlined its recommendations for legislation to provide a broadened, extended and amplified governmental regulation, without which, it declared, no plan of private ownership should be considered. Commissioner Clark also read a dissenting statement by Commissioner Woolley favoring the extension of the period of federal control as recommended by Director General McAdoo.

Commissioner Clark's statement, which was adopted by the Commission in conference on December 21, follows:

#### Broad Policy Needed

It is unnecessary to dilate upon the vital importance of transportation to the country, its commerce and industries, or to picture the immensities of the transportation business and of the plant which it employs. The questions now presented should be considered in a spirit as big and broad as are the interests to be affected thereby. The legislation to be enacted in answer to those questions should be based upon a policy as broad as the territory to which it applies and the law in which our governmental policy is announced should be as big as the business to which it relates. Governmental regulation of corporations engaged as common carriers should reach the corporate activities wherever those activities may lawfully go in serving the public as interstate carriers. The responsibilities of operation under governmental regulation must be accepted by the carrier corporations and the

responsibilities that go with such regulation should be accepted in full by the government.

In our last annual report we said, with regard to the future of the railroads, that whatever line of policy is determined upon the fundamental aim or purpose should be to secure transportation systems that would be adequate for the nation's needs even in time of national stress or peril and that will furnish to the public safe, adequate and efficient transportation at the lowest cost consistent with that service, to that end there should be provision for the following:

#### Fundamentals of a Proper Transportation Policy

1. The prompt merger, without friction, of all the carriers' lines, facilities and organizations into a continental and unified system in time of stress or emergency. The thought underlying this is that, in the light of recent experiences, the President should be by law authorized in time of national stress or peril to assume possession, control and operation of the transportation systems of the country to such extent as may be necessary to serve and protect the general public safety and welfare. Such action was found to be essential about one year ago. It is hoped that such an emergency will not again arise, but it seems wise to provide for it if it should come, and that all cavil and controversy as to the lawful power to act should be, by statute, set at rest. The Franco-Prussian war led the British government to provide by law in 1871 a plan for taking over for governmental needs the railroads of Great Britain. It did not need or use that power until in connection with the World War which began in 1914. The further thought is that there may possibly arise a national stress or emergency, not the direct outgrowth of a war in which we are engaged, which would warrant and justify the exercise of such a power. If the power is provided by law it does not necessarily follow that it will be used, and it must be presumed that no President would exercise it except upon appropriate or proper occasion.

2. Merger within proper limits of the carriers' lines and

facilities in such part and to such extent as may be necessary in the general public interest to meet the reasonable demands of our domestic and foreign commerce. The thought underlying this is that it might become necessary or be found desirable in the general public interest to permit, encourage or require carriers within limits as to extent, territory and time to merge their lines and facilities or the operation thereof. The exercise of such a power would necessarily be an administrative function.

3. Limitation of railway construction to the necessities and convenience of the government and of the public and assuring construction to the point of these limitations. The thought underlying the first part of this suggestion is that in some instances, for speculative or competitive reasons, railroads have been built in excess of the reasonable demand and in excess of the necessities of the territory built into, as well as of its reasonably prospective traffic. A railroad once built ordinarily must be operated and permitted to earn a living. The public should not be burdened with the maintenance of two or more railroads when one would substantially answer every legitimate purpose. In this connection it would be desirable that in the exercise of its powers the Congress should say that no railroad shall be constructed or extended that is to engage or is engaged in interstate commerce unless, in addition to required authority from the state, a certificate of public convenience and necessity is secured from federal authority. The thought underlying the second part of this suggestion is that a railroad having been permitted, by public franchise and the powers that go with it, to build into a given territory, it should be required to properly serve and develop that territory. And in developed territory it is important to provide for the extension of short branch or spur lines or spur tracks to communities and industries that should be served and that can furnish sufficient traffic to justify such extension.

In some of the states the state officers are authorized to require such extensions, but in such cases they are necessarily primarily concerned with, if not confined to, a consideration of state traffic. Some of the states have not vested such authority in any state official. Ordinarily such extensions would be desired for the purpose of facilitating or making possible the transportation of interstate traffic. The desirability of uniformity is obvious. The exercise of federal authority should not depend upon whether or not the state has acted and should not be different as to the state that has legislated on the subject and the state that has not so legislated. It therefore seems desirable that the Congress should exercise its jurisdiction in this regard in a plenary way and that where such extensions are desired in connection with the movement of presently existing or prospective interstate traffic and the carrier is unwilling to construct them, it may, upon proper showing and after full hearing, be required to do so by the federal tribunal.

4. Development and encouragement of inland waterways and co-ordination of rail and water transportation systems. This means the co-ordination of rail and water transportation systems by establishment and maintenance of through routes between rail and water carriers and reasonable joint rates applicable thereto, divided upon reasonable bases, whenever and wherever such through routes will facilitate or economize in the movement of traffic and serve a real public interest. The law now prohibits a rail carrier from increasing a rate which has been reduced to meet water competition unless some justification for the increase can be shown other than the elimination of water competition. Where there is legitimate water competition and legitimate reason or occasion therefor, neither the railroads nor the water carriers should be permitted to reduce their competitive rates below a reasonable compensatory level for the purpose of stifling the competition. Rates that are on a level lower than is

reasonably compensatory are not a public benefit. If they cover all the traffic the carrier's bankruptcy and destruction are inevitable. If it has other traffic it is certain that it will endeavor from that other traffic to recoup its losses under the non-compensatory rates. A well-directed and proper co-ordination of rail and water transportation systems will of itself be an encouragement to the development of inland waterways.

We suggested five plans which we thought doubtless would be proposed for adoption as our future governmental policy and said that additional plans and modifications or combinations of those mentioned might be listed.

#### Government Ownership of Operation Not Wise

Much can be said on either side as to the relative advantages and disadvantages which accrue from or necessarily attend either government ownership and operation or private ownership and operation. It seems obvious that no plan of private ownership should be considered unless it be under a broadened, extended and amplified governmental regulation. Considering and weighing as best we can all of the arguments for and against the different plans, we are led to the conviction that with the adoption of appropriate provisions and safeguards for regulation under private ownership it would not be wise or best at the present time to assume government ownership or operation of the railways of the country.

The law provides that federal control shall not continue beyond 21 months after the promulgation of a treaty of peace. The wisdom of thus providing a reasonable period after the passing of the imperative necessities of our government in actual prosecution of warfare, within which to readjust or make preparations for readjustment of traffic conditions and to round out or prepare financial arrangements, is hardly open to question. Carriers' properties formerly composing a system are now under the jurisdiction of two or more regional directors or federal managers, the current of traffic has in some instances been materially changed, and financial complications exist. Comparatively few contracts for compensation have been perfected between the transportation companies and the government. Our expression in favor of return to private ownership and operation is therefore not to be understood as favoring a return of the properties in a precipitate way. A reasonable period of readjustment or preparation should be afforded and reasonable notice should be given that upon a given date the properties will be restored to their owners.

The experiences under federal control have still further demonstrated, as had previously been shown in proceedings before and reports of the commission, that there is necessarily a direct relationship between the wages paid to railroad employees and the rates which the carrier companies must and may charge. The largest item of expense in operation of a railroad is that of wages. Manifestly, from a social standpoint as well as from the standpoint of the nature of the employment, and because of the great importance to the public as well as to the railroads of loyal and devoted service on part of the employees, unaffected by excitement of wage controversies, and of uninterrupted operation of the carrier properties, the railroad employees should be adequately compensated. For the same reasons every reasonable provision should be made to insure proper compensation for the employees, a minimum of friction over questions of compensation or hours or conditions of service, and avoidance of interruption to the operation of the properties.

#### Suggestions for Legislation

In the event, therefore, of a continuance of the policy of private ownership and operation under governmental regulation, we think that the following matters, mentioned in our annual report, require legislative consideration, in connection

with which the following suggestions should be carefully weighed:

1. Revision of limitations upon united or co-operative activities among common carriers by rail and by water. Under the policy heretofore followed by our government all efforts to restrict the full play of competition between carriers have been frowned upon or prohibited. Obviously competition between carriers that is wasteful or unnecessarily expensive lays an added burden upon the rate-payers. Elimination of wasteful or unduly expensive competition in rates or service is desirable and under the exercise by the government of its power to regulate the service and the rates which the carriers may charge and to require an abatement of all unjustly discriminatory, unduly prejudicial or unduly preferential charges, regulations or practices, carriers might well be permitted and encouraged to co-ordinate their activities and merge or consolidate their lines to such an extent as is, after thorough investigation and full hearing, sanctioned by the regulating body. The rates should not be higher than the shipper may reasonably be required to pay and should not be lower than the carrier may reasonably be required to accept. The regulating tribunal should have authority to prescribe not only the maximum which the carrier may charge, but also the minimum. This power would restrain an individual carrier from furthering its own ends at the expense of others by unwise and unwarranted upsetting of reasonable rate adjustments. If the rates and charges are by regulation confined within the reasonably narrow limits between the maximum and minimum reasonable charges, no public interest can be injured by the carriers all maintaining charges within those limits. If, without unduly lowering or restricting the standard of service, economy in maintenance and operation can be secured by co-operative agreement or consolidation, under governmental supervision and approval, of two or more lines, the public is not injured, while the sum available for improvements and betterments of the carrier properties is augmented.

2. Emancipation of railway operation from financial dictation. It would serve no good purpose to recite the many instances in comparatively recent years in which, through financial deals for which it is difficult to find any word of excuse, railroad properties have been bankrupted or saddled with almost overwhelming burdens of indebtedness, which have not increased the amount or value of property devoted to the public service, have not improved the service rendered, and have on the whole had the effect of increasing the charges for service. There should be some way by which under the law these things could be prevented, or, if not prevented, by which the perpetrators could be required to adequately answer for their acts. A transportation line operating by virtue of a public grant, and upon which the industrial, commercial and social life of communities depends, should not be a football of speculation. The records in investigations made and reported upon by us in cases of financial wrecking of railroad companies suggest the advisability of extending the terms of the Clayton act with reference to common or interlocking directors so as to render them applicable to common carrier corporations, even when they are not competitors. Consideration of these questions and a corrective for the abuses referred to lead to:

3. Regulation of issues of securities. The advisability, desirability and propriety of public or governmental regulation of the issuance of securities by public service corporations is conceded generally by thinking and fair-minded men. A proper federal regulation of the issuance of securities by the corporations engaged in interstate transportation and supervision of the application of the proceeds therefrom would go far toward preventing the abuses referred to above. The commission is on record for several years past as favoring such supervision and regulation of the issuance of securities.

4. Establishment of a relationship between federal and state authority which will eliminate the twilight zone of jurisdiction and under which a harmonious rate structure and adequate service can be secured, state and interstate. If the government is to assume, as it should, all of the responsibilities that properly go with an amplified and broadened exercise of its regulatory powers and the regulation is to be adequate, the regulating body must have authority and powers which it has not heretofore had over questions of service and physical operation of the carriers. In this way only can an adequate service be secured and kept in harmony with a reasonable level of rates. The conflict of jurisdiction as between the federal government and the states could probably be resolved through harmonious co-operation if the federal tribunal could be authorized to co-operate with state authorities by utilizing their services in appropriate instances and to an appropriate extent.

5. Restrictions governing the treatment of competitive as compared with non-competitive traffic. This subject is necessarily linked with what has been said relative to revision of limitations upon united or co-operative activities among common carriers by rail or by water. If those limitations are appropriately broad there would seem to be no occasion for different charges, terminal or otherwise, as between so-called competitive and so-called non-competitive traffic, or for many of the old annoying and expensive restrictions surrounding milling and other services in transit.

6. The most efficient utilization of equipment and provision for distributing the burden of furnishing equipment on an equitable basis among the respective carriers. Under broad revision of limitations upon co-operative activities among carriers they could form equipment pools which would add efficiency in the standardization of construction and in the utilization of equipment. Under the extension of authority to the regulating tribunal to require adequate service, carriers that are disposed to shirk their duty could be required to provide themselves with the equipment necessary to the furnishing of an adequate service.

7. A more liberal use of terminal facilities in the interest of proper movement of commerce. Here again a broad revision of the limitations upon co-operative activities among the carriers would naturally bring a more liberal use of the existing terminal facilities and would undoubtedly bring about agreements between competing carriers under which existing terminal facilities would be opened to traffic which (is now and) heretofore has been excluded. If the regulating body is empowered to require adequate service, it could require the enlargement of terminals, if that action were necessary in the public interest, and could require that terminals be opened to traffic in so far as is reasonably and properly in the interests of the commerce of the locality. Where this power was exercised the regulating tribunal would, as a matter of course, determine the reasonable compensation to be paid to the owning carrier for use of its property by the carriers or traffic so using that property.

8. Limitations within which common carrier facilities and services may be furnished by shippers or receivers of freight. The carrier may provide facilities by ownership, lease or hire. If they are leased or hired on reasonable terms from those who are not shippers or receivers of freight, no public interest is affected by the arrangement. If the regulating body has power to require an adequate service it could determine what constitute proper facilities and the extent to which and the instances in which they shall be provided by the carrier. If the regulating body has power to require the most efficient utilization of equipment, it can determine the instances in which and the extent to which special equipment or facilities may properly be demanded of the carriers.

Transportation service and adequate service are demanded by the welfare, the industry, the commerce and the social life

of the whole people. Securing that class of service is more important than is the question of whether it shall be furnished at a slightly higher or a slightly lower charge. An adequate service cannot be provided except from adequate revenues and as a result of adequate expenditures for maintenance, improvement and expansion. Private capital cannot be induced to invest in railroad securities unless it can be reasonably assured of the security of the investment and an appropriate return thereon. It necessarily follows that the patrons of the transportation companies must pay rates that will yield revenues sufficient to justify rendering the quantity and character of service demanded. The charges should not be higher than those that will yield proper compensation for the service performed and appropriate return upon the property devoted to the public use. If through enlightened, broadened and wise regulation that proper balance between revenues, on the one hand, and returns to capital and expenditures in operation, maintenance and improvement, on the other hand, can be established, the public will be well served at reasonable charges, the employees of the transportation companies will be adequately compensated for their work, and the shippers and receivers will secure, at reasonable rates, an adequate service. It would seem to follow necessarily that the securities of the corporations would become stabilized and that when it becomes necessary to issue additional securities under governmental supervision, capital seeking investment would readily respond to the call.

#### Commissioner Woolley's Dissenting Statement

Commissioner Woolley said:

If the railroads under federal control are to be turned back to their owners, then I subscribe to the memorandum submitted by my colleagues, except wherein it says, "considering and weighing as best we can all of the arguments for and against different plans, we are led to the conviction that with the adoption of appropriate provisions and safeguards for regulation under private ownership, it would not be wise or best at this time to assume government ownership or operation of the railways of the country," with the following two additional recommendations:

(1) With power to supervise the issuance of railroad securities, to prescribe service regulations and to fix the minimum as well as the maximum transportation rates vested in the Interstate Commerce Commission, the commission should also be made the tribunal to which carriers and employees, organized and unorganized, would appeal for adjustment of any differences arising between them; also, it should have authority to investigate from time to time the living conditions of railroad workers, to insure regularity of employment and to fix a minimum wage. Congress should require the carriers, possibly by amending section 10 of the Clayton anti-trust act, to make all purchases of materials, supplies, etc., through competitive bids in the open market, and their correspondence and other documents bearing on transactions of this nature should be subject to inspection by representatives of the Interstate Commerce Commission. This body would then be in a position to act on full information in prescribing reasonable rates, in seeing that there is a fair return on capital invested and in adjusting labor disputes; labor itself would know that its rights were being protected even in cases where its demands might not be approved by the commission. If some such plan is not adopted by Congress, clerks and unorganized labor generally, having no effective means of protecting their rights, will inevitably be the first to suffer upon the least shrinkage of income after return of the roads to private control.

(2) The carriers should be required to set aside fixed portions of their gross annual incomes for depreciation, the percentage to be determined in each case by the Interstate Commerce Commission. This would insure uniformity of method in caring for the properties, and publication of the

percentage prescribed in each instance would safeguard the interests of the purchasers of their securities. Chairman Daniels and I are practically in accord on this point.

I believe the period of federal control should be extended, as recommended by Director General McAdoo, for a number of reasons, some of which are:

(1) With the government borrowing more than \$20,000,000,000 in a period of two years and with railroad securities, largely speaking, depressed or in a measure discredited, I fail to see where the money is coming from to insure to the United States an efficient and articulate growing transportation system, vitally necessary in the great period of reconstruction just beginning, if the roads are to be returned to their owners for operation. In spite of the clamor from several quarters against further federal control, the fact remains that following the statement of the director general that the roads may be given back at an early date if the period of federal control is not lengthened there came shrinkages in market quotations of many railroad stocks, in some instances as much as 20 per cent.

(2) Some of our great railroad systems have credit sufficient to raise in the open market the new money which will necessarily be required from time to time for the development of their properties. For instance, the Pennsylvania, the Burlington or the Santa Fe may find it possible to float bonds or notes, but I think it will not be seriously contended that a majority of the railroads now under federal control could do likewise. Especially would they find it difficult if so-called "banker management" should be definitely removed, as is in effect recommended by a majority of the commission. It is hardly possible that our great financial houses would under the circumstances be willing or able longer to market large issues of railroad stocks in order to secure additional funds.

(3) A real danger spot is the so-called "weak sisters." That many not already bankrupt might be thrown into the hands of receivers almost immediately upon return to private control is hardly debatable; that most of them are indispensable links in our national transportation system and should be improved and developed is generally admitted. The government is the only possible source of financial help for this class of roads.

(4) Our public utilities with approximately \$260,000,000 of bonds maturing in the next six months have been under a heavy strain for some time. If the financial waters should be seriously disturbed through the forcing of the weak members of the present federal control group into bankruptcy, many of these utilities would find it difficult to weather the storm.

(5) Probably for the first time in our history, all classes of railroad labor have received under federal control at least reasonable compensation. The rights of union and non-union workers have been alike considered, with the result that ample living wages have been granted. These workers demand that the recent increases be not withdrawn or reduced. Certain adjustments with a view to establishing proper relationships of wages for given classes of employment may be necessary, but, generally speaking, I think the workers in so demanding have a strong case.

(6) Though the present freight rate structure is undoubtedly the best that could have been devised under competitive conditions and the act to regulate commerce, long and ably administered by the Interstate Commerce Commission, I am firmly of the opinion that there is urgent need of a new system of rate making, and I see no hope of its being achieved except under federal control or with the government owning the railroads. The so-called rate blankets, grouping of communities, basing points, etc., outgrowth of competitive conditions, in my humble opinion make for favoritism and are highly uneconomic. In a word, the freight rate has been frequently used as a sort of protective tariff by means of which favored cities or communities have prospered at the

expense of others. The freight rate should be made, under proper classification, on the basis of a terminal charge plus straight mileage. We are coming to it some day, because it is the only just and logical plan, and I think the sooner it is perfected and adopted the better.

(7) I am aware that our year's trial of federal control has not been an unqualified success; but to my mind the good

accomplished far outweighs the shortcomings and is a promise of better things for the future.

(8) The proposal to return the railroads to private control, though widely discussed by railroad men, financiers and shippers, has not yet, so far as I am aware, been productive of any concrete plan which would carry the undertaking safely over the breakers obviously ahead.

## Should Government Operation Affect Signaling?

### Some of the Opportunities for Improvements Which Might Be Accomplished by Unified Control

By A. G. Shaver

Consulting Signal and Electrical Engineer, Chicago

"**I**S THE UNITED STATES RAILROAD ADMINISTRATION going to do anything which will affect railway signaling, and, if so, what can and what should it do?" This is a question which is frequently asked. With regard to the first part of this question, it is well known that the general increase in wages ordered by the director general of railroads applies to some members of the signal department as well as to other railway employees, but there is not yet in evidence any other act of the Railroad Administration which appears to change in particular the status of railway signaling from what it was before the government took over the railroads. It will be the purpose of this article to discuss some of the things which can and should be done.

#### Automatic Train Control

No one thing in the interest of safe train operation has received more attention in this country than has the problem of automatic train control. The Interstate Commerce Commission has made it the subject of investigation, and for years has persistently made recommendations concerning it in annual reports to Congress. Inventors and promoters of such devices, and there have been plenty of them, have struggled along with little encouragement from the railroads, spending their time and money and developing very creditable apparatus in some cases. They have hoped either that the federal government would make the use of automatic train control compulsory or that the railroads would eventually, of their own initiative, take up the proposition and make installations, much as has been done in the case of automatic block signaling. But such a millennium has not yet dawned for the inventor and the promoter, and the newspapers are still able from time to time to come out with big headlines telling of bad train accidents which possibly could have been avoided had there been in use at the time some adequate system of automatic train control.

With the railroads under federal supervision, the time has arrived when this problem should be worked out. It can be solved under the U. S. Railroad Administration to better advantage than it can by an individual or by any one railroad, or by even several railroads working together. Now that the war is over and resources, talent and all sorts of railroad operating conditions are available, this matter should not be further delayed.

#### Signal Standards

Splendid work has been done by the Railway Signal Association in the preparation of specifications and standards pertaining to railroad signaling, and these should be made effective on all railroads in so far as possible. These specifications and standards have been prepared usually with

the view that the greatest possible latitude would be allowed inventors and manufacturers so that competition and progress should not be stifled, and further that no section of the country should be handicapped by having to use methods and devices not suitable to local conditions and requirements of railway operation. Excepting to compel their use, it is doubtful if the Railroad Administration should take any action on specifications and standards for appliances other than through the Railway Signal Association, working with much the same objects in view as heretofore.

It has always been customary for each railroad to arrange its own practices, rules, standards, etc. While practices and rules have usually been the same in a general way for all railroads, yet in some cases they have been quite different in important essentials. There seems no good reason why signal indications and rules should not be uniformly the same for all railroads, due allowance being made for special situations and conditions.

#### Signal Department Organizations

Signal department organizations are much alike in that the head of the department usually has the title of signal engineer, the chief division officer is the signal supervisor and the man in charge of the maintenance work on a specified section is the signal maintainer. In other respects signal organizations may, and in some cases do, vary considerably. Under federal control it should be possible to rearrange and change the present organizations, as necessary, that greater efficiency and economy may be the result.

Railway signal engineers as a rule are competent. Possibly they are competent, in the positions which they hold, to a greater degree than is the case with any other class of railway officers. Some have been unable to manage their departments to advantage because of the lack of authority and the various restrictions surrounding their office. As a rule the signal engineer reports to the chief engineer. This seems to be a matter of custom. There is no real logical reason why this should be, since civil engineering and signal engineering are two distinct sciences, bearing little relation to each other, and it is also true that signaling on the railroads is largely an operating matter. The chief engineer is generally not skilled in either railway operation or railway signaling, and the duties pertaining strictly to his profession are numerous and exacting. Because of these facts, it is believed the railroads would get uniformly better results from their signal departments if the signal engineer reported directly to the operating head of the railroad.

The signal department of each well established railroad ordinarily comprises an engineering branch, a construction branch and a maintenance and operating branch. The en-

gingering for railway signaling could well become largely a regional function through which proper co-ordination and co-operation would result in greater efficiency and economy. Many railroads have heretofore, and some still do, let out their signal construction to contractors. On the larger railroads there is no good reason why such work should not all be done with the railroad's own forces. The contractor must make a profit and he must figure liberally for it. On those roads which have been adequately organized to do their own signal construction, experience has shown that the contractor's profit, and more in some cases, has been saved.

Signal construction is in itself something of a science, requiring time and expense to organize forces to function properly. Since some railroads do not have sufficient signals to keep construction gangs at work all the time, signal construction might also be subject to regional and even inter-regional supervision. Signaling for the various roads might be so planned that gangs could work in the south during the winter and in the north during the summer.

Two general practices exist regarding signal maintenance. On some railroads, excepting in the case of large interlockings and complicated signal situations, one man, known as a maintainer, is assigned to a definite section to do patrol duty and whatever work is necessary for the operation and upkeep of the signal system. On other railroads there is a maintainer with one or more helpers, all covering a prescribed territory but each having his particular work to do. The merits of these two practices should be determined and that one put into general use which is found to be the most satisfactory. The latter mentioned practice is the most expensive, but it affords a means for supplying men for maintenance positions through educating helpers for maintainer's duties.

There are interlockings where no conflicting train movements occur for periods of several hours each day. In these cases the routes required might be set up, the tower closed and the towerman excused from duty for such interval; or during such times the towerman might be detailed to maintainer's work. Considerable savings can be made in cases of this kind and in situations of a similar character.

#### Signal Accounting

High cost of labor and labor scarcity make it more necessary than ever heretofore that the exact cost of things be known. Nothing has handicapped signal engineers more than the inadequacy of signal accounting. Unless accurate cost data is available it is often impossible to tell if work should be done or, if something is being done, whether it is performed economically. Much good service from improved practices and devices is being lost because of ignorance of the cost of practices and devices already in use. Signal lighting is a good illustration. There is no doubt but that if the actual cost of the present oil lighting system for signals were known, in many situations it would be supplanted immediately by one of the better and more up-to-date systems available for this purpose.

While the Interstate Commerce Commission has dictated a system of cost keeping which the railroads must follow, yet as a basis for making comparisons and giving a true idea of signal costs it is insufficient in scope and detail. At the present time a statement by one railroad that its cost for a piece of signaling is a certain figure, does not mean much to another railroad unless details are given as to just what the figure includes. A basis for signal costkeeping should be devised and a system of accounting required such that all necessary information will be available for comparisons, the proper determination as to practices, the use of new devices, etc.

#### Combinations of Duties and Departments

A western railroad has a crossing alarm in a certain city, but there is no other signaling in the vicinity. The signal

maintainer is located over 100 miles away. Twice each month he has to inspect and repair the alarm. Would it not be better to let the telegraph lineman do this work, as he has his headquarters in the same city where the crossing alarm is located? There are many cases of similar character on various railroads where combinations of duties can be made, resulting in better service and a saving in time and money.

At the present time the use of electricity will be found on cars and engines, shop machinery, in lighting yards and stations, in throwing switches, in the telegraph and the telephone, railroad signals, etc., and this use is being rapidly extended. Supervision over all this will be found in several different departments, each working to a large extent independently of the other. The creation of a department of electricity on the railroads, to have general supervision over all matters pertaining to the use of electricity, is a real necessity. It would harmonize methods, make standards, combine duties of employees where advisable, reduce stocks, etc., all of which if properly done would mean as good or better service at less expense.

#### A Propaganda of Education

A program of education applied to signals may be considered as in two parts: the education of employees regarding signals that they may know how to interpret and act under them (operating department employees); and the education of employees to become skilled in the science of signaling (signal department employees). Some railroads have a very good system of educating enginemen and trainmen regarding signals and especially the more important, unusual and special cases, but many railroads depend almost entirely upon the book of rules and a periodical or occasional examination conducted by an already overworked trainmaster, the result being that few operating department employees know more than that *red* indicates stop, *yellow* caution and *green* clear. For safe, efficient train operation employees must have a better knowledge than these bare fundamentals of signaling, and they can get and retain all they need to know only from being taught by skilled instructors aided by models, pictures and other means now recognized as suitable for such purposes.

In addition to the insufficiency of skilled signal labor, the railroads are now confronted with the necessity for paying considerably higher wages. It is therefore, essential that this labor be as capable and as effective as possible. The important employee of the signal department is the signal maintainer. While the railroads have ordinarily been careful in the selection of these men, yet in the past low wages and scarcity of experienced labor have left them without much choice. As a result, if an investigation should be made at this time, it would probably be disclosed that many men in the service have little knowledge of signaling other than being able to mend broken bond wires and clean battery and trim lamps. Means should be provided to teach these men and to educate a reserve force for vacancies and new positions. Where the safe movement of trains depends upon signals, it is highly important to have signalmen who thoroughly understand their duties.

#### Analysis and Investigation

Railroads have never been especially strong in analyzing their problems. That is, they do not always go into them with the same thoroughness and application of needed remedies that most manufacturers and large private enterprises do. For example, few railroads, before installing additional tracks, have carefully analyzed their existing plant to determine if the rearrangement of existing facilities and the installation of signals would meet the requirements of the situation, and make the construction of additional tracks unnecessary. There is without doubt second main track in service at the present time, which never would have been installed had a careful study of conditions been made.

# The Work of the Division of Operation\*

## Congestion Eliminated, Facilities Pooled, Car Shortage Overcome, and Standards Adopted for Equipment

By William G. McAdoo  
Director General of Railroads.

THE DIVISION OF OPERATION, formerly known as the Division of Transportation, was established on February 9, 1918, and Carl R. Gray, an operating official of wide experience, was appointed director. This division, with the thorough and sympathetic co-operation of the various regional directors, federal managers, and operating officials and employees, has proved most effective in meeting the enormous problems facing the railroads, and their work has assisted enormously in keeping the transportation system of the country in a healthy condition.

In order to understand the operating problems presenting themselves with the inauguration of federal control, it will be necessary to recount some of the potent causes producing the serious conditions of congestion which resulted in the railroads being taken over by the federal government, and I will enumerate the steps which were taken to overcome them.

### Difficulties

1. Accumulation of export freight at North Atlantic terminals, which was reflecting itself immediately in an inability to successfully handle domestic freight. There was no co-ordination of rail and overseas transportation. The lack of co-ordination between rail lines and the overseas carriers was overcome by the creation of the Exports Control Committee referred to herein, and export freight was brought forward from the interior only when ocean shipping was available.

2. Shortage of motive power. As a result, engines had been kept in service under pressure of necessity which should have been thoroughly overhauled, and one of the immediate effects of the severe winter weather was to render engines of this class entirely unavailable.

3. Heavy building operations by different branches of the government, the contractors for which ordered materials forwarded far in advance of their ability to receive and unload. There was at one time over 5,000 carloads of piling alone for the Hog Island shipyard in excess of its ability to accept.

4. On account of the feverish demand for materials of all kinds manufacturers purchased raw materials from unusual markets in excessive quantities, with the frequent result that arrivals were badly bunched and unloading was slow and difficult.

5. The necessity for giving priority to shipments of government freight and the lack of a central control, even in a single department, to decide upon the degrees of importance in priority. This had resulted in many instances through the insistence of some energetic officer handling a single class of material in a preference movement being given to freight of minor relative importance.

6. The withdrawal for overseas service of Atlantic coastwise vessels, both of railroad and independent ownership, resulting in a call upon the rail carriers for the transportation of an enormous amount of tonnage which ordinarily moved by water.

Certain general conclusions can safely be drawn from a

year's experience of operation of the railroads as one unit. Given average weather conditions, and with the exception of the Pittsburgh gateway, which merits especial treatment, there is no question of the ability of the railroads to transport to destination all of the freight offering, either domestic or for overseas, provided there are facilities for prompt disposition and unloading at destination.

The controlling factor throughout our experience has not been in the road transportation, but at the ultimate destination, and any serious conditions of congestion obtaining on any of the trunk lines en route has been the reflex of the conditions at the terminals themselves. Practically all transportation in the United States has been based primarily upon the desires and necessities of the consignor rather than upon the abilities of the consignee to receive and digest the freight.

The winter conditions, beginning about December 1, 1917, and which were at their worst when federal control began, continued until well into March, and were the most severe known to railroad history, and continued for a longer period of time.

The congested area was, generally speaking, in the territory north of the Ohio and Potomac rivers and east of the Mississippi river and Chicago. Due to the causes above enumerated, as well as to the fact that the movement itself was of unusual volume, there was in this territory, when the railroads came under federal control, 62,247 carloads of freight which was being delayed short of its ultimate destination, in addition to which there were held by the lines at and west of St. Louis 31,421 carloads; at and west of Chicago, 24,836 carloads; at and south of the Ohio river gateways, 14,061 carloads; and at and south of the Potomac river gateways, 15,545 carloads. This congestion was practically cleared up May 1, 1918.

### Bituminous Coal

The most serious situation presented itself in the case of bituminous coal. This condition was the result of three factors:

1. An actual shortage of cars at the mines on account of the number delayed under load in the congested area and the limitations upon transportation due to the extraordinarily blizzard weather;

2. The lack of systematic distribution, which the Fuel Administration was arranging to provide; and

3. The dislocation of the New England supply, which was the result of the withdrawal of coastwise steamships, and which presented, on January 1, 1918, the most serious single situation.

The bituminous coal production for the preceding year had been the largest in the history of that industry. The severe weather conditions prevailing in January, 1918, resulted in a decreased production, almost entirely due to car supply, of 65,294 car loads. Immediate and drastic steps were taken to remedy this situation, and, notwithstanding the fact that the weather continued to be unduly severe throughout February and part of March, the railroads got on their feet, and in February produced an increase of 24,366 cars of coal over the preceding February, and for the suc-

\*Abstract of the chapter on operating results from the director general's forthcoming report to President Wilson.

ceeding months increases over the respective corresponding months of the preceding year were as follows:

	Cars
March	38,701
April	64,824
May	87,036
June	92,734
July	150,288
August	139,686
September	128,942
October	89,882

or a net increase for the 10 months of 741,666 cars, or approximately 37,083,300 tons.

New England's necessities have been fully met and the largest tonnage of coal ever known—28,153,317 tons—has been moved to the Lake Erie ports and transported to the northwest. A very considerable proportion of the credit for the increase in the coal production must be attributed to the operation of the zone plan, to which special reference is made hereafter.

### Food

Another serious condition arising early in the year was the threatened shortage of foodstuffs for the allies. A program had been arranged by the Food Administration, by which approximately 1,160,000 tons of food of all kinds per month was to be forwarded to the allies. Early in February the matter was brought earnestly to the attention of the Railroad Administration by the Council of National Defense, the Food Administration, and the representatives of the allies. Approximately 750,000 tons only had been forwarded in January, and at the then rate of progress only 500,000 tons would have been forwarded in February. The situation was represented to be of the utmost importance and was taken hold of with vigor. Empty box cars were moved in preference from all portions of the East and South into the western grain states, with the result that by March 15 the vessel capacity of the allies had been satisfied and there was available at North Atlantic ports an excess on wheels of 6,318 cars of foodstuffs, exclusive of grain on cars and in elevators. This situation has not at any time since presented any embarrassments and has been fully and satisfactorily met.

### Furnace Situation

The severe weather conditions and the resulting car shortages had produced a very serious situation with respect to the blast furnaces in the eastern territory. On January 12, 1918, out of a total of 169 furnaces 17 per cent were out of blast. This situation was accentuated during the month of January, until on February 1, 22 per cent were out of blast. This was given special consideration and a steady improvement was made until June 1. Since then the situation has been practically normal.

### Lease of Locomotives

At the beginning of federal control the Baldwin Locomotive Works and the American Locomotive Co.'s plants were occupied in the construction of locomotives for the Russian government, which, on account of the conditions prevailing in that country, it was impossible to deliver. Two hundred of these locomotives were partially constructed and practically all of the material was fabricated. These 200 locomotives were taken over by the War Department and leased to the Railroad Administration and are in service. They were constructed to a 5-ft. gage, as contrasted with our 4-ft., 8½-in. regulation. This difference was taken up by the use of wide tires, and these engines have been giving good service and came at a time when the need of additional motive power was very great.

A temporary lease of 135 light Consolidation locomotives was made with the War Department. These locomotives were for use in France and were returned and shipped overseas during the months of August and September.

Just prior to the inauguration of federal control the

Railroads' War Board had transferred to the eastern territory 92 engines from western and 15 engines from southern railroads. In addition, as they came from the manufacturers, 130 new locomotives, which had been constructed for southern, southwestern, northwestern, and central western railroads, were placed in service on eastern lines.

In addition to this transfer of power into the eastern region, there was a relocation of power inside of that region from one road to another, amounting to 215 locomotives.

### Transportation

While it is not possible in a report of reasonable length to epitomize in detail the action taken under unified control to simplify and economize methods of transportation, they can be briefly stated as coming under the following general heads:

*Unification of Terminals.*—This has been general throughout the country at both large and small stations, but has been of the greatest importance at the larger terminals, where terminal managers have been appointed with jurisdiction over the facilities of all lines. Where unnecessary mileage was not involved, a consistent effort has been made to route freight so as to arrive at the specific terminal where it was to be disposed of, and, so far as practicable, interchange switching in terminals has been eliminated.

In Chicago terminals it has been the practice under private control to reassign practically all coal after arrival. By co-operation with producers, 66 per cent of the coal arriving at Chicago, in August, was consigned direct to consumer from the mines, and crosshauling coal between terminal lines was greatly reduced through the same co-operation, whereby coal was used wherever possible upon the rails of the individual road over which it arrived.

Single track separately owned lines between Pueblo and Denver, 118.5 miles, and between Wells, Nev., and Winnemucca, Nev., 185 miles, have been utilized as double track.

The reports of the regional directors, which follow, will give in detail the information as to unification of terminals and facilities. However, the following are typical examples of what has been done:

The Southern Pacific, Atchison, Topeka & Santa Fe, and Western Pacific each maintained passenger ferry service between Oakland and San Francisco. Santa Fe and Western Pacific passenger trains have been brought into the Oakland Mole of the Southern Pacific. The latter railroad's ferry facilities were ample for the three lines, so it was possible to dispense with the ferry service of both the Santa Fe and the Western Pacific at an approximate saving of \$315,000 per annum.

All railroad marine facilities in New York harbor were consolidated under a marine manager, and have been used in common with very satisfactory results.

One hundred and seventeen coal-carrying barges and 18 tugs belonging to the Philadelphia & Reading, Lehigh Valley, New York, Ontario & Western, and Erie were pooled under a single management.

All passenger trains of the Baltimore & Ohio and through passenger trains of the Lehigh Valley were brought into the Pennsylvania railroad terminal in New York City.

*Short Hauling of Freight.*—Instructions were issued immediately upon the inauguration of federal control providing for the movement of freight by the shortest practicable route. This practice has been consistently followed, except where better grade conditions and less congestion were favorable factors on a somewhat longer line. Agencies were created whereby failure to observe the correct routing was detected and remedied.

It is impossible, of course, to estimate the total saving accomplished in this direction. An instance, however, is available in the case of the Northwestern region, where the correction of improper routing, within a period of five months,

on 34,941 car loads, resulted in a saving of 4,054,455 car miles.

**Solid Trains.**—The practice was inaugurated of creating solid trains for definite destinations by building up at Chicago, Minneapolis and St. Paul, St. Louis and Missouri river crossings, which resulted in a natural decrease in intermediate terminal switching and the expedition of essential government freight. This has been especially valuable in the transportation of export food of all kinds, meats, grain and grain products, and of munitions and steel for shipbuilding plants.

**Elimination of Nonessential Passenger Trains.**—The question of duplicate and unnecessary passenger train service has been given the most careful consideration, with the result that a number of trains have been discontinued which fell in one of these classes. Between the important terminals the remaining trains have been so spaced as actually to afford greater variety and extent of service than was possible heretofore where, through competitive conditions, the trains on the several lines practically duplicated each other. The saving per year in passenger train miles by regions is as follows:

Eastern .....	16,253,914
Allegheny .....	4,870,000
Southern .....	1,702,480
Northwestern .....	23,280,400
Central western .....	16,772,524
Southwestern .....	4,411,244

**Pittsburgh Gateway.**—The extraordinary development of industrial activities in and around Pittsburgh, and the enormous tonnage which is handled locally, makes it very difficult to use this gateway for trunk-line traffic, and this is especially true when the through and local business increases coincidentally, as is usually the case. Physical conditions, which embrace a narrow gorge and a large city, render the solution of this problem exceedingly difficult of local treatment.

It is my conviction that as soon as practicable the trunk-line railroads through Pittsburgh should be relieved by the construction of an entirely new line for freight purposes, connecting them east and west of Pittsburgh, but entirely avoiding the industrial area.

**Coal Zone Plan.**—The experience of the railroads under private ownership, especially with a demand for coal far in excess of the tonnage produced, was that shippers reached out into markets far beyond the territory in which their particular coal had normally been sold in previous years. The result was a very considerable waste of transportation, in that a much greater car mileage, reasonably estimated as running into millions of car miles, was necessary to supply the country with its normal coal requirements than would have been the case had shippers chosen to content themselves with normal markets.

To meet this situation the Railroad and Fuel Administrations jointly established what has come to be known as the bituminous coal zone plan of distribution. Under this plan the various bituminous coal mining districts east of the Rocky Mountains were separated and each assigned a definite territory wherein it could market its coal. It was further provided that coal from any district could be shipped to destinations beyond the zone allotted to that district only upon permit of the Fuel Administration, which was recognized by the Railroad Administration as constituting exemption from the railroad embargoes which were laid down to give force and effect to the zone plan. The coal-zoning plan, however, did not merely save car miles, and thus permit the production and transportation of several millions more tons of coal than would otherwise have been possible; it furnished, in addition, the means of utilizing coal produced in the plains states, which would not have otherwise been produced.

## Marine Department

The following matters have been handled:

1. General supervision of all water transportation under federal control on the Atlantic and Pacific Oceans, Gulf of Mexico, their tributaries, and also the Great Lakes.

The following special subjects have also been handled:

1. Protection of coal supply for the New England states.
2. Protection of pulp-wood supply to insure ample supply of news print paper.
3. Cape Cod canal.
4. Foreign coal supply for New England railroads under federal control.
5. Movement of potatoes from Maine.

This department has had direct supervision over the marine facilities of the Division of Operations.

The original withdrawals of ships from the coastwise service threw upon the railroads a wholly unusual and unexpected tonnage which, unfortunately, moved into and through the most congested areas. It was not possible to utilize privately owned steamship lines for this purpose, because, naturally, they were disposed to seek that class of tonnage which paid the highest rates, and which they could concentrate for a single port. Under federal control the tonnage which would most relieve the rail lines has been turned to the Coastwise Steamship Section.

In the operation of the Coastwise Steamship Section tonnage was diverted from the Southwest as well as from the entire South, and the supply of cotton for New England mills and of raw materials for eastern war industries was successfully accomplished through South Atlantic ports, at a time when rail gateways were partially closed. To relieve the northern trunk lines, seven cargo vessels were operated between Lake Michigan ports and Buffalo, handling a total for the season of navigation of 599,811 tons. The cessation of war activities has lightened the burden upon coastwise railroads to such an extent that the business can now easily be handled by the railroad-owned steamships and the rail lines.

All coastwise lines were operated from April 13, 1918, to September 1, 1918, by the Coastwise Steamship Advisory Committee. On September 1 all coastwise lines under federal control were combined under H. B. Walker, federal manager, with headquarters at New York, making possible the transfer of vessels from one service to another, regardless of ownership, enabling the greatly reduced fleet to effect prompt movement of all business. The operation of vessels was seriously interfered with by German submarine operations on the Atlantic coast, necessitating running without lights and making long detours to avoid submarines and mines.

### Movement of Potatoes from Maine

The potato shipping interests in Maine being apprehensive of shortage of transportation for the Maine potato crop during the coming winter, the Division of Operation was requested to organize equipment supply, train, and if necessary, vessel movement. Complete provision has been made, and there is no probability of weather or any other condition preventing prompt and efficient movement of this important food and seed crop. Estimate of total crop is 25,000 carloads.

### Mechanical Department

On February 9, 1918, Frank McManamy, chief inspector of locomotives for the Interstate Commerce Commission, was appointed manager of the Locomotive Repair Section, and authorized to co-ordinate the repair of locomotives. On July 1, 1918, he was promoted to assistant director in charge of the mechanical department and his jurisdiction extended to include car repairs, supervision of mechanical standards, and of tests of new devices. Later he was given jurisdiction over the enforcement of federal laws for the promotion of safety for employees.

*Methods Adopted for Improving Equipment.*—To utilize any of the large manufacturing plants for repairs would very seriously limit their effectiveness in the production of new locomotives, and on account of the competition of high wages paid by the shipbuilding plants and war industries generally there was a considerable shortage of skilled mechanical workers in railroad shops.

Immediate relief could only be secured by working a greater number of hours. On a large number of railroads there were in existence contracts with the mechanical crafts which limited the number of hours per day. The railway employees' department of the American Federation of Labor, which represented the mechanical crafts on such railroads, very patriotically met this situation and voluntarily agreed that they would, during the period of the war, waive their privileges in this respect. As a result of this, railroad shops on many of the important lines were placed on a basis of 70 hours per week, and the remainder on 60 hours per week, which was approximately an average increase of 20 per cent in shop hours. In June all shops were placed on the 60-hour-per-week basis, which continued until the signing of the armistice, when arrangements were made for readjusting the hours, which were reduced on November 25 to nine, and December 9 to eight hours per day.

*Co-ordination of Locomotive Repairs.*—A check of the repair shops indicated that their combined capacity was ample to take care of all of the locomotives if they were properly distributed. Plans were immediately perfected to send locomotives to the nearest available repair shop, regardless of ownership, and to distribute the work so that each shop could be worked to capacity. This arrangement in many instances actually reduced the distance which defective locomotives were ordinarily sent for repairs, and also reduced the time such locomotives were held out of service. Under this plan, since January 1, we have transferred 2,065 locomotives to the shops of other railroads under federal control, where they had been given heavy classified repairs; otherwise, these locomotives could not have been kept in service.

*Comparison of Motive-Power Conditions.*—Accurate comparison of motive-power conditions with one year ago is difficult, because of the varying methods of rendering reports prevalent on the different lines, the repairs on some roads being divided into three classes, while on the others they were divided into more than 150 classes. This has been standardized, and the reports of repairs and of the condition of locomotives are now rendered by all roads on the same basis. The improvement in the condition of locomotives is perhaps best indicated by the fact that, notwithstanding the tonnage handled during the year has been the heaviest ever known, there are now stored in good condition and ready for winter service, 1,189 locomotives, while one year ago there was not a single serviceable locomotive in storage. This improved condition is due to the co-ordination of shopwork.

*Condition of Freight Cars.*—The general condition of freight cars has also shown a substantial improvement since the organization of the mechanical department. The percentage of bad-order cars to revenue cars on line has decreased from 7 per cent in July to 5.3 per cent, which is a decrease of approximately 43,000 in the number of bad-order cars.

*Standardization of Equipment.*—The standardization of locomotives and cars is an ideal which has long been striven for by the various organizations of railroad officials, and much has been done by them to bring about this result. Complete accomplishment has never heretofore been possible because of an absence of authority to enforce standards which might be agreed upon. This has now been accomplished by the preparation and adoption of standard designs for different types of locomotives which are suitable for all classes of service and by standardization of freight and passenger equipment. This will increase production by eliminating de-

lay waiting for designs and patterns and will facilitate repairs and reduce the number of repair parts necessary to be carried in stock.

It is interesting to note that one of the large locomotive companies, working solely upon engines of individual design, turned out in a five-week period ending August 17, only 104 completed engines, while the same shops for the five weeks ending October 2 produced 163 engines of standardized design. It would not be safe to assume so great an increase in capacity as a regular thing, but that the standardization does very greatly increase the capacity of locomotive shops is unquestioned.

#### General Condition of Equipment and Terminal Facilities

One of the prime causes for the necessity of government control of railroads and one of the most serious conditions the Railroad Administration was called on to correct when assuming control, was the general bad condition of locomotives and cars.

It was impossible at the time the railroads were taken over to say to what extent the condition of locomotives and cars were responsible for the situation which existed, and as the Railroad Administration had at that time no mechanical department organized to check up shop practices and handling of equipment at terminals and advise relative to outlining plans for improvement, the Interstate Commerce Commission was asked to assist in obtaining accurate information relative to the general situation. The commission promptly placed at the disposal of the Railroad Administration the records and personnel of its Bureau of Locomotive Inspection and Bureau of Safety.

The records of these two bureaus contained much valuable data with respect to general conditions throughout the country and the inspection forces of the commission were assigned to various congested terminals, particularly throughout the East and Middle West, to investigate and make daily reports of the actual condition of locomotives and cars and train movements. These reports showed that in addition to the congestion caused by failure of shippers to unload cars promptly that a serious situation existed on account of the number of bad-order cars at various terminals and also on account of the general defective, run-down condition of motive power, which, together with overcrowded and inadequate shops and roundhouses, had resulted in trains being held at terminals on account of shortage of efficient motive power, and also seriously slowed up movement on the road, often to the extent of blocking several divisions.

The immediate remedy for these conditions was not so much the building of new locomotives and cars as the proper maintenance of locomotives and cars that were in service and more prompt movement of trains.

A survey of the situation indicated that shop facilities were sufficient if efficiently used; therefore, the task of nationalizing the railroad-shop facilities and assigning locomotives to shops where repairs could be made, regardless of ownership, was assigned to the chief inspector of the Bureau of Locomotive Inspection, who, in addition to his duties as chief inspector, was placed in charge of the mechanical department of the administration.

Prompt handling of locomotives was seriously hampered by the condition of roundhouses and the lack of facilities at many points to make running repairs to large modern locomotives. Roundhouses built 20 or more years ago for locomotives in service at that time were still being used to house locomotives more than twice the size for which they were designed. Repairs had to be made either out of doors or in open roundhouses with the temperature below zero. Steam pipes, injectors, air pumps, and even cylinders froze and burst, and in many cases locomotives were actually frozen to the track in roundhouses and could not be moved.

In spite of these conditions, under the plan organized by the mechanical department of the Railroad Administration with the assistance of the railroad officials and the co-operation of the employees in working increased hours regardless of working conditions, the situation immediately began to improve and that improvement has continued up to the present time. It is true that there were difficulties encountered on account of failure to appreciate the need of co-operation between officers and employees. This resulted in 123 instances in labor disputes which threatened to, or did temporarily, tie up certain terminals.

All of these were successfully handled, and following such adjustments there was a noticeable increase in the production of the shops and engine houses where such disputes occurred.

Only two methods for improving the general condition of equipment existed; namely, to increase the shop facilities and forces or to use more efficiently the facilities and forces which were available. Increasing the facilities and forces under war conditions was clearly impossible; this left as the only practical means of improving equipment conditions the adoption of some plan whereby existing facilities and forces could be made to produce greater results.

The average increase in locomotive-shop hours for the entire country amounted to about 16 per cent, and the effect became immediately apparent by the increased number of locomotives repaired per week in comparison with the most accurate records available for the corresponding week of the preceding year.

This increase in shop hours applied to roads where locomotives were in good condition and shop facilities ample, as well as to roads which were not so favorably situated, which enabled a comprehensive program of nationalization of railroad shop facilities over the entire country to be carried out, and locomotives from roads where shop facilities were not sufficient and motive power in bad condition to be sent to shops on other lines for repairs. This distribution of locomotives was so arranged as to reduce, in many instances, distance to the repair shops; therefore, the cost of transporting locomotives to the shops was no greater and all shops under this plan were kept working to their maximum capacity with a full force.

The plan of considering the condition of equipment as a whole and taking steps to improve it by, first, uniformly increasing shop hours on all railroads in the country and utilizing to their full capacity the facilities of all shops which could only be done under federal control is really what improved the condition of the locomotives and cars and enabled trains to be promptly moved from terminals with reasonable assurance that the locomotives would make a successful trip. The result of the policy of nationalizing railroad shop facilities made it possible to repair at other line shops 2,065 locomotives for railroads which lacked sufficient shop space and shop organization, thus improving the general situation without detriment to the railroads that furnished this help.

### Standardized Locomotives

In addition to the vigorous action which had been taken to improve the condition of existing equipment, the necessity of adding to the available stock was recognized and designs were worked out for standardized locomotives and orders placed for their construction.

The locomotives were built from standardized designs for various reasons, the principal of which are as follows:

First. To reduce to a minimum the time required to prepare drawings, patterns, and dies, and thus enable deliveries to begin quicker than where separate drawings and patterns would have been necessary for each lot of locomotives allocated to a particular road.

Second. To secure quantity deliveries.

This method of construction has resulted in delivery being made at a quantity rate which could not have been approached had the locomotives been ordered to individual designs. The increase in the rate at which standardized locomotives can be turned out is clearly shown by the following comparison of two of the principal shops of the American Locomotive Co. during a portion of July and August when the locomotives built were of individual design with a similar period in September and October when they were building standardized locomotives. During five weeks, beginning July 20, an average of 13½ locomotives per week were turned out at the Dunkirk plant, while during five weeks, beginning September 14, an average of 19½ locomotives per week were turned out at the same plant. For Schenectady, during the five-week period beginning July 20, an average of 8 locomotives per week were turned out, while for the corresponding period beginning September 14 an average of 13¾ locomotives were turned out. It will be seen that the increased production due to the standardized locomotives was about 50 per cent.

Third. It has also provided a supply of equipment, the parts of which are largely interchangeable, which is available for use anywhere in the event of congestion. This removes the necessity of carrying a large stock of repair parts peculiar to the locomotive and avoids delay which results when repair parts must be ordered from some distant owning road.

### Standardized Cars

The freight car situation was handled along the same lines as were the locomotives. In addition to the designs for freight cars, for which orders have been placed, designs have been prepared for all-steel box cars of 50 tons capacity, refrigerator cars of 30 tons capacity, general service gondola cars of 50 tons capacity, steel framed stock cars of 40 tons capacity, flat cars of 55 tons capacity, oil tank cars of 7,000 gal. capacity, oil tank cars of 8,000 gal. capacity, oil tank cars of 10,000 gal. capacity, acid tank cars of 7,000 gal. capacity, acid tank cars of 8,000 gal. capacity, and acid tank cars of 10,000 gal. capacity. While no cars have actually been built from these drawings, they are available at any time that the traffic needs show them to be desirable.

Complete plans and specifications of all steel baggage cars, in both of 60-foot and 70-foot lengths, have been prepared, and tentative plans prepared for 70-foot steel coaches, and for steel passenger and mail, passenger and baggage, passenger, baggage and mail cars.

### Standard Reports

In the meantime other work was being vigorously pushed to improve conditions and to facilitate keeping of records. First, a system of weekly equipment-condition reports from each railroad was installed, so that the condition of power might be reported and the administration kept informed and locomotives needing repairs assigned to the nearest available shop.

### Reclamation Work

To conserve material and avoid the possibility of usable material being sold as scrap, instructions were issued to the effect that proper facilities must be provided and every effort made to reclaim and make repairs to old material instead of using new, and under no circumstances was material to be scrapped until—

First. It was known positively that it could not be satisfactorily repaired, or

Second. That the cost of repairs would be prohibitive.

The total saving resulting from reclamation of scrap material can not be checked up at this time, but when this work is thoroughly developed and reclamation plants provided on all railroads it will amount in the aggregate to millions

of dollars annually in addition to relieving manufacturing establishments and permitting them to use their facilities for war material and with the signing of peace, material that will be needed in reconstruction work.

### Standard Practices

Standard practices have been established and circulars of instruction issued for mechanical work covering the following matter, which will result in more efficient and economical operation of locomotives and cars: Repairs and betterments to freight cars, painting freight cars, installing field ranges in cars, locomotive maintenance, care of journal boxes, inspection of ash pans and spark arresters, lubrication of locomotives, repairs to refrigerator cars, and super-heating of locomotives.

Rules have also been promulgated for the inspection and testing by the inspection forces of the railroad companies of all stationary boilers used, which will make it possible to save the insurance premiums now paid on such boilers.

Locomotives en route to or from other line shops and new locomotives being delivered by the builders were usually hauled dead in trains. Instructions were at once issued that wherever possible such locomotives should be moved under steam, hauling a train wherever practical. This order relieved the railroads from 500,000,000 ton-miles of transportation annually for material which not only should be self-propelling, but which should, in many instances, be hauling additional freight.

### Consolidation of Mechanical Terminal Facilities

Under private operation, at many points complete organizations for the maintenance of a comparatively small number of locomotives or cars were maintained side by side, which resulted in a duplication of work, heating plants, and supervising forces. Wherever a saving could be made without adversely affecting efficiency, such useless facilities were eliminated. Such consolidations have been made at 417 points and the annual saving effected thereby amounts to \$2,363,535.95. Additional consolidations are now under way.

In connection with this work extensive investigations were conducted covering shop and engine-house operation, resulting in changes and improvements which have materially increased the output. For example, at one large shop the output of locomotives receiving classified repairs increased over 50 per cent, and increases ranging from 10 to 25 per cent were secured in many shops. It was also possible by rearranging the method of handling work in engine houses to release hundreds of employees that were sorely needed in other departments, and the saving effected in engine-house operation by such reduction in force, while not obtainable for all railroads, on one railroad alone amounted to \$1,061,332.68 per annum.

It was also possible by rearranging methods of handling locomotives at terminals to secure greater efficiency from such locomotives, and thus overcome what otherwise would have been a shortage in motive power.

The condition of motive power on all lines under federal control has shown a gradual improvement, and the locomotives in service are in much better condition than they were one year ago, and on some lines, that last spring required extensive assistance from other line shops, the condition of power has shown such a marked improvement that they are now doing all of their own repair work, and, in addition, are repairing locomotives for other lines.

The tabulations furnished by the railroads show an average increase of 20.93 per cent each week in the number of locomotives receiving classified repairs during the period of increased shop hours.

In addition to the improved condition of power in service

there are now in white lead 1,021 locomotives in the various regions, divided as follows:

Region	Number
Allegheny	57
Central western	198
Eastern	480
Northwestern	147
Poconantas	1
Southern	39
Southwestern	99
Total	1,021

These locomotives have received classified repairs and are being held in reserve for winter service. There are also being placed in storage for service during the winter months 150 new standardized locomotives which were recently received from the locomotive builders. With the surplus power in reserve and the new power to be received from the builders to be distributed where it is most needed, there is no doubt but that all lines under federal control will be able to pass through the winter with a sufficient number of locomotives in serviceable condition successfully to handle all business offered.

### New Devices for Locomotives and Cars

On account of the vast number of new devices for use on locomotives and cars which were submitted, a comprehensive plan for handling this question was necessary. Detailed instructions were issued by circular establishing rules for the submission of such devices for the consideration of the Railroad Administration and a committee on appliances was created to conduct necessary investigations and to pass upon the value of all devices or appliances thus submitted. Up to date 692 such devices, which cover practically everything used in locomotive or car construction, have been submitted. One hundred and thirty-five of these have been examined, ten of which have been recommended for test under service conditions. These tests will proceed under the direction of the mechanical department, and a record will be kept of the results, so that the value of the devices in question may be correctly passed upon.

### Enforcement of Laws for the Promotion of Safety

As provided in General Order 8, it was the purpose to require compliance with all federal laws for the promotion of safety, but while under federal control it would manifestly be no punishment to impose fines; therefore other means must be provided. By General Order 46 this work was placed under the direction of the assistant director of the Division of Operation, in charge of the mechanical department.

Since the issuing of General Order 46, 108 reports of violations of the federal laws for the promotion of safety, totaling 682 separate counts, have been received from the Interstate Commerce Commission and referred to the mechanical department for correction. Although this work has not been completely organized, the Bureau of Safety and the Bureau of Locomotive Inspection of the Interstate Commerce Commission have advised that substantial improvements in practices have been noted at points where such violations have been handled.

### Education of Railroad Employees

It has long been recognized that the service rendered by railroad employees is capable of substantial improvement by proper training of employees along industrial lines, and many railroads have in existence plans for furnishing additional training for their employees.

The Railroad Administration is in sympathy with this work and plans are being considered for establishing a system of technical training for railroad employees in connection with the Board for Vocational Education. It is also believed that this work may be profitably extended to employees who have been injured in the service to an extent

that prevents them from following their usual vocation, but who with proper training may be fitted to fill other responsible positions.

### Organization

The work of the mechanical department, Division of Operation, has been conducted with a total force of approximately 60. Of these, 28 are considered as field men whose duties are to conduct investigations concerning shop practices and shop output and to furnish first-hand information relative to the efficiency of the work performed and the general condition of the equipment. They are also used to conduct investigations and handle disputes between shop men and railroad officials which have not reached the point where they should be referred to the Division of Labor.

The office force, in addition to handling ordinary correspondence, receives, checks and compares the reports showing the general condition of equipment, the assignment of locomotives to shops for repairs as well as the assignment of new locomotives received from the builders. It also includes the mechanical engineering staff, which checks up the designs for locomotives and cars, receives reports of failures of standardized locomotives, and corrects faulty construction. The mechanical engineering staff also acts as a clearing house for information concerning standard designs of locomotives and cars, distributes drawings and other data necessary to the proper standardization of equipment and keeps the practices up to the standard.

### Department of Engineering and Maintenance

C. A. Morse, assistant director of operation, in charge of engineering and maintenance, was appointed September 1, 1918, and his organization is engaged in compiling information reflecting the physical condition of the railroads under federal control as of date December 31, 1917, and in preparing for the compilation of similar information as to conditions at the end of each year, and at the end of federal control.

This work is being handled through a committee composed of the assistant director of operation, as chairman, with the engineering assistant of each regional director, and an organization has been built up in each region with the engineering assistant of such regional director as chairman, the committee to consist otherwise of the chief engineer or other officer handling maintenance on the various railroads in such region.

Forms are provided upon which each railroad will record essential features in connection with its maintenance, and this report is supplemented by regular inspection reports.

The department is also handling matters in connection with proper standardization of practices in the maintenance of roadway and structures, studying questions of improved appliances and such engineering problems as are directly connected with maintenance and operation.

### Car Service Section

The Car Service Section was the first of the agencies created in the Division of Operation. Its primary duty has been the relocation of freight cars upon the railroads throughout the country, and it has been the intimate point of contact between the Railroad Administration, on the one hand, and various branches of governmental activities, on the other.

The authority given to this section has necessarily been very broad, and with W. C. Kendall as manager there have been associated seven assistant managers, whose experience as transportation officers has covered practically all of the regions.

The Eastern Railroads Coal Car Pool, with headquarters at Pittsburgh, an inheritance from independent operation, has been continued under the jurisdiction of the Car Service

Section with very satisfactory results. A large part of the increased coal production referred to elsewhere in this report can be directly attributed to the operation of this pool.

The Car Service Section consists of a central organization at Washington, with a Refrigerator and Tank Car Branch at Chicago and an Eastern Railroads Coal Car Pool at Pittsburgh, also a branch at Seattle, Wash., organized originally to supervise car service in the lumber districts of the Pacific Northwest in the interests of government shipments. The central office staff embodies, geographically and otherwise, a car service and transportation experience sufficient to provide comparatively intimate knowledge of conditions likely to arise in any part of the country.

The function of the section is to provide an equitable distribution of the various classes of freight-car equipment, and so to regulate other transportation details as to meet daily emergencies and to maintain a proper balance between the government, the public, and the railroads during the period when extraordinary demands of all kinds have been laid upon the transportation machinery of the country.

To meet the exigencies of the war, primary importance has attached to the requirements of all government activities. Close contact has constantly been maintained with the War and Navy Departments, the Shipping Board, the War Industries Board, the War Trade Board, the Housing Commission, and the Food and Fuel Administrations as well as with the allies' traffic representatives. Through this contact the railroads have been thoroughly and promptly advised of all government needs, which have been met with the least possible disturbance to other industries. Like contact has also been maintained with the Canadian Railway War Board, and necessary car supply has thus been made available for the large volume of commerce between Canada and the United States.

*Car relocation.*—Under federal control freedom has been exercised in moving empty freight cars of various classes to meet requirements, regardless of their ownership. Within the year fully 850,000 such movements have been made. Practically 700,000 of these have been box cars and the remainder stock cars and flat and gondola cars specifically for lumber tonnage. This does not include the emergency movements of refrigerators or the continuous relocation of coal cars under continuing instructions as required to equalize the empty supply among the various mining districts in the eastern, Allegheny, and Pocahontas regions. Through these means a comparatively easy car situation has been maintained generally throughout the United States for months past.

Beginning June 15 a movement of empty box cars was directed to the grain-producing territory of the Western and Southwestern states, with the intent of establishing a supply sufficient to meet the requirements of the Food Administration. As a result, when the wheat crop was ready to move there were cars available in the territory involved in sufficient quantities to protect every requirement in better shape than ever before, and this supply was regulated by further movement with the northerly progression of the harvest.

To meet the situation in the Southeastern states a continuous movement of empty box cars is kept under way, mainly into the lumber-producing territory. This was maintained until about October 15 sufficiently to fully meet all government and commercial demands. It then appeared that inbound loaded movement into that territory would be sufficient for empty requirements. Shortly thereafter a surplus developed, an altogether unprecedented situation. This section has been materially assisted in car supply by the location there of various army encampments, the necessary movement of supplies thereto having made available box cars for outbound loading.

It is the conviction of those familiar with the subject that only by this liquid distribution of freight cars through cen-

tralized control has it been possible to meet all requirements with reasonable promptness.

*Campaign for advance movement.*—Beginning in April and continuously thereafter for some months the attention of traffic organizations and shippers generally was called to the advantages possible by shipping raw materials and supplies during the summer months and prior to the anticipated period of heavy traffic normally to be expected about September 15. Full and generous response was made. This not only relieved the heavy tension customarily experienced during the fall months, but will further relieve the railroads during the severe winter months. This will be of material advantage alike to the shipping public and the railroads.

In April special action was necessary in connection with the movement from the Pacific Northwest of aviation fir and spruce for the War Department, ship timbers for the Shipping Board, and other lumber and miscellaneous articles on government account, including railroads, as well as regular commercial business. These arrangements continued until November when the aviation program was discontinued. The record from April 21 to November 20 shows a total movement from this territory of approximately 150,000 cars of lumber, of which 12,700 were for the aviation program, 5,500 for the Shipping Board, 6,700 for other government activities, 11,000 railway material, and commercial more than 115,000. This reflects an average daily movement of 813 cars of lumber from this section.

The movement of live stock, which has been extremely heavy, has been handled with far less complaint than ever before. There was some difficulty for a short time in providing transportation for the western sheep because of the abnormally high market which induced everyone to ship stock at the same time, but the extent to which the railroads met the situation is shown by reports from the markets at Chicago, Kansas City, Omaha, St. Joseph, St. Louis, Sioux City, and St. Paul, where the receipts of sheep for the period August 3 to October 19 totaled 4,486,102 head, as compared with 2,902,981 for the corresponding period in 1917, or an increase of 54.53 per cent. The heaviest week's receipts were those of September 28 when the market report shows 587,014 arrivals.

*Coal and coke.*—One of the heaviest tasks for the railroads during the past year has been in providing necessary transportation for fuel. This has only been accomplished by effective co-operation between the Fuel Administration and the Railroad Administration. It has been necessary to adopt extraordinary measures, and these as a rule have been cheerfully met by shippers, whose rights were at times very considerably affected. Foremost among these measures was the joint action of the two administrations in zoning the distribution of bituminous coal.

The foundation of successful operation in the steel industry lies in an adequate supply of coke, by-product coal, and steam coal. Every effort had been made during the year to maintain adequate supply of these fuels at such plants, and it is a matter of record at the War Industries Board that practically all of the transportation needs of coke, by-product coal, and fuel coal for the steel industries have been promptly and adequately met.

A step of much importance was taken by the establishment of uniform rules for rating of coal mines by which car supply is directed. These were made effective as of October 10, 1918. Previously roads were using different methods and with varying interpretations. On the uniform basis which now obtains a more equitable distribution of cars as between districts, railroads, and mines is possible than heretofore.

A factor which has an important bearing on the question of coal-car supply is the extent to which this type of equipment is used in handling stone, sand, and gravel for con-

struction and road-building purposes, and curtailment of such noncoal use has been necessary. Cheerful co-operation and assistance has been received from all shippers thus adversely affected.

*Car conservation.*—Full credit is due the shipper for the patriotic way in which he has responded to requests for conservation of freight-car equipment by heavier loading. During the nine months January to September there was an increase per loaded car of 2.3 tons over the corresponding period for 1917. This has not been accomplished merely by the physical effort of loading more heavily. It has involved on the part of the shipping public not merely additional labor in loading into the car, but also changes in the size of packages, changes in the manner of constructing packages, and changes also in the manner of placing goods, particularly manufactured articles, within the packages. Thus, hogsheds used for the loading of tobacco have been reduced in size to permit double tiering, handles have been removed from baby carriages, grain cradles, and other agricultural implements, wagons, wheelbarrows, and other vehicles formerly shipped in large quantities set up, have been shipped knocked down. Shippers of barreled goods, such as oil, syrup, molasses, tanning extract, and the like, by using dunnage, are also making double tiering possible. In a general way the result sought by the carriers and shippers both has been "making one car do the work of two," but often greater conservation has been accomplished by the double and triple loading of small lots in one car.

*Sailing day plan for handling less-than-carload freight.*—An important feature of the activities of the Car Service Section is the development of the sailing day plan for handling less carload merchandise freight. During the past two or three years there has been an increasing tendency toward congestion at large centers and at transfer points, due to excessive accumulations of less carload freight. The sailing day plan has been inaugurated for the purpose of assembling less carload shipments to eliminate the necessity for transfer, thus insuring improved service and increased car efficiency. Regional committees have been appointed to supervise the concentration and consolidation of less carload freight from common points via one or more designated routes based on the volume of traffic and direct routing. At points common to several railroads subcommittees have been formed composed of representatives of railroads involved and in many cases including representatives of the chambers of commerce. Up to the present time this work has taken definite form at Baltimore, Boston, Milwaukee, Norfolk, Pittsburgh, Philadelphia, Roanoke, Trenton, and Wilmington, Del. As a specific instance of what can be accomplished, through cars of merchandise are now being loaded from Boston and other eastern points to San Francisco. It is expected that by January 1 next, sailing day plans will be effective at New York, Chicago, and St. Louis, with work in other sections progressing satisfactorily. While it is too early as yet to estimate results, present indications are that the handling of an average of 30 tons per day can be eliminated at each of the 400 transfer points now in operation throughout the United States. The feature of most importance is improvement in service, the expediting of freight, the reduction of loss and damage incident to rehandling, and the elimination of the necessity of embargoes.

*Embargoes and permits.*—The Car Service Section is responsible for supervision of the embargoes issued by railroads. Inasmuch as such supervision has never before been attempted by a central organization methods and practices have been allowed to develop naturally, and restrictions have been imposed only as a real necessity therefore appeared. The inevitable result is some lack of uniformity. An improvement in distribution was made early in the year, whereby the roads of the country were divided into 26 zones through which embargoes were simultaneously issued to each

road and forwarded to the Car Service Section. Formerly a railroad originating an embargo transmitted it to each of its connections and each connection, in turn, transmitted it to its connections, with a consequent piling up of duplications and delay. These zones have since been revised and reduced in number and further simplifications to conform more closely to regional lines are in prospect.

On January 1st, embargoes in eastern territory were more or less general in scope. As conditions improved and congestion was relieved, the necessity for general embargoes gradually ceased. At present no general embargoes are outstanding, practically all now in effect being local in character, and as a rule due to the condition at individual destinations. Embargoes are still in effect governing the handling of domestic and export freight to and through the North Atlantic ports and should be maintained in the interests of control of war and postwar conditions.

Because of the increasing activities of government departments and of the transportation conditions which prevailed last winter and early spring, individual railroads and various government organizations were attempting to authorize special movements of government and other important freight in violation of existing embargoes. This made necessary a uniform embargo and permit system in order to eliminate existing confusion.

This permit system proceeded upon two lines, one providing general and continuing exemption from embargoes for essential commodities, and the second providing special exemption from embargoes for individual shipments according as the needs of the individual consignee concerned and the public welfare might demand. To effect the general exemptions a list of standard exemptions to embargoes was issued under date of February 11, 1918. This gave, in the order of their importance, great freedom of movement to government freight, fuel, food, and essential commodities and was practicable and readily adopted by all roads where a complete embargo was not necessary. It avoided the necessity for issuing permits for individual movements to a very considerable degree.

Experience soon demonstrated, however, that general exemptions could not adequately meet public needs, and recourse was ultimately had to the plan of permitting special shipments. These permits were controlled and regulated very carefully, and the final tests as to whether or not they should be issued was the need of the destination community for the commodity and the ability of the consignee to accept and unload the goods without car delay. The needs of some government departments were met by authorizing the issue of necessary permits by a representative of the Railroad Administration assigned to the departments concerned. In other cases, particularly where the destination was for war reasons, one habitually congested without such traffic control, committees representing the administration were established to meet the situation. The Car Service Section furnished the medium for such control by permit when provision otherwise had not been made, and generally acted as a clearing house for and check upon all such traffic control representatives and committees.

The "permit system" has fully justified itself. Every effort has been made to utilize it without undue discrimination. To its successful operation is due in considerable measure the great improvement in movement which has been had during federal control.

Among other activities of the Car Service Section are those involving the arrangements for certain important movements as requested by the War and Navy and other government departments. This work developed with the ending of that of the priorities director, since which the Car Service Section has operated as liaison office between these government departments and the various railroads.

*Refrigerator-car department.*—The refrigerator department of the Car Service Section was organized with headquarters in Chicago July 1, 1918. Under this plan an abnormally heavy movement of perishable commodities has been handled in refrigerator cars with general satisfaction. Assurances have been received from perishable-freight associations and shippers, as well as private and railroad car owners, that the car supply this season as compared with the past seasons has been much more efficient and satisfactory. Serious shortages have been avoided, and the few minor shortages which have occurred have been local and of short duration. Co-operation has been readily extended by the private refrigerator lines, and this has permitted a free interchange of equipment and more general use of seasonal surpluses to meet demands in all territories.

*Tank car.*—A system of reports has been required from railroads respecting tank-car movements, the purpose being to develop within the organization of the individual road information indicating the number and causes of delays, together with the time involved. This has been salutary in effecting a much-needed improvement in the supply of equipment and the service. Large unit movements of tank-car shipments have been arranged, and without these tank-car requirements could not have been fully met. Apprehension by the oil division of the Fuel Administration that there would be a failure in tank-car supply has proved unfounded. Complaints of delayed movement have been greatly reduced in number. Average miles per tank-car per day show material increases.

*Car-record office.*—The car-record office of the Car Service Section, established on May 15 for the purpose of affording information to the various government departments relative to the location and movement of cars, has, from its inception to the present time, recorded movement of 1,026,000 cars, or an average of 5,700 daily, and has furnished information as required to the various departments, especially the War Department, which was interested in a far greater number of cars than any other department. Requests have been received and handled for special tracing covering the movement of about 16,000 cars. This office furnished a medium for tracing for all departments and has relieved individual railroads materially. The results of the work have been entirely satisfactory.

*Miscellaneous figures.*—Ninety thousand cars of grain have been moved under preferential orders given by the Food Administration. Six hundred and thirty thousand cars grain loaded during season (to date). Figures compiled and furnished various offices. Six thousand requests received for expedited placement and movement of cars, chiefly from War Department. Five hundred and sixty thousand cars moved to encampments, shipbuilding, and other points, requiring in many cases close supervision.

*Inspectors.*—A corps of experienced and competent inspectors is maintained. These men travel throughout the country and keep the section advised concerning such matters as utilization of available capacity of freight cars, the movement and distribution of empty freight equipment, the progress of special movements (as, for example, coal for the Northwest via the Lakes, coal for New England, etc.), delays to loaded cars account lost billing, embargoes, etc., the extent to which employees are kept informed regarding requirements for handling freight cars, etc. They are also used for the prompt development of facts in serious cases of complaint made by shippers. Much valuable information is obtained through their work.

*Auxiliary committees.*—In the development of the work of the Railroad Administration terminal managers have been placed at various transportation centers charged with responsibility and having authority for co-ordinating the terminals of the various lines in the interest of the public as a

whole. This has made possible the elimination of the large number of Car Service Section committees which were taken over with the railroads at the time federal control became effective and through which the commission on car service (the present Car Service Section) sought to bring about in part by agreement what the terminal managers now accomplish by direction.

**Safety**

The Safety Section was created February 19, 1918, with Hiram W. Belpap, formerly chief of the Bureau of Safety of the Interstate Commerce Commission, as manager. This section has been most effective in its work and in the creation of uniform practices for the enhancement of safety on the several railroads and has created organizations on those lines where none previously existed. The particular function of this section has been not only to emphasize and educate the employees in the matter of safety requirements provided for by existing laws, but to go much further than this and to locate unsafe practices of every character and point out the remedy.

The death of Mr. Belpap, which occurred on October 12, was a very great loss to the Railroad Administration, but the section has been continued under A. F. Duffy, assistant manager.

**Troop Movement**

The prompt, efficient, and safe movement of troops has been a first consideration throughout the period of federal control, and nothing has been permitted to interfere with it. From January 1 to the armistice there have been moved a total of 6,496,150 men, an average of 625,434 per month. The maximum was reached in July, when 1,147,013 men were moved.

Four outstanding points may be emphasized:

One million seven hundred and eighty-five thousand three hundred and forty-two drafted men were picked up at 4,500 separate points in larger or smaller units and moved on schedule to their training camps, in many cases upward of a day's journey, and in all cases, were fed in transit. The amount of detail involved in routing, scheduling, moving, and feeding these men can hardly be overestimated.

Four million thirty-eight thousand nine hundred and eighteen men in 9,109 special trains moved an average distance of 855 miles, unquestionably the largest long distance troop movement in history.

One million nine hundred and four thousand and fourteen men were brought into the crowded port terminals for embarkation overseas without interference with the heavy traffic of other kinds already being handled through these ports and in the territory adjacent thereto. During one period of 30 days more than 20 troop trains each day were brought into the port of New York.

During the period there were but 14 train accidents involving either death or injury of enlisted men.

The Troop Movement Section has had exclusive charge of this work since the beginning of federal control and, under a different designation, handled it for the railroads prior to that time.

The report of the section gives in detail the performance during the period of federal control and, for convenience, to cover the period of the war, the data has been expanded to include the period from May 1, 1917, to November 10, 1918.

A perfect understanding existed at all times with the general staff of the Army.

At the peak of the activities incident to the prosecution of the war it was necessary to provide for the daily movement to and from industrial plants and camps of 205,587 persons in each direction. To perform this work, 2,319 passenger-equipment cars were in daily use.

In September, 1918, this section was directed to undertake

the handling of such labor movements as were being made under the direction of the Employment Service of the Department of Labor.

Contact was established in each state and large industrial center with representatives of that department, and the work has been carried through successfully since that time. The demands made upon this section by it have not been great; our records show that we were obliged to take action in cases involving only 25,157 persons.

On October 28 this section was directed to undertake the handling of all passenger-equipment cars. In line with the policy of making use of cars of any initial to meet the situation, we have not hesitated to send into the heavy express districts in the East baggage and express cars of all ownerships to meet the requirements of the holiday traffic. This, of course, is a temporary measure inasmuch as no opportunity has hitherto existed for an analysis of the express traffic as a whole.

A study of this situation should undoubtedly be made, primarily to ascertain the normal and seasonal flow of the express traffic and the relationship between the roads handling other than local traffic. This study will be undertaken with a view to accurate knowledge upon which proper recommendation and action may be based in the future.

It will be noted that the creation of the army and sending approximately 2,000,000 men to ports of embarkation involved the transportation of upwards of 8,700,000 men. It

(a) Number handled in Pullman cars.....	2,671,074
(b) Number of men handled in coaches.....	6,043,508
(c) Percentage in Pullman cars.....	30.6
Accidents involving death or injury:	
(a) Number .....	16
(b) Number of men killed.....	39
(c) Number of men injured.....	335

is estimated that to demobilize these troops will involve the transportation of not less than 7,250,000. Methods for handling this to the best advantage are gradually being worked out in connection with the proper organizations of the general staff, and while the problems are new and cannot be dealt with upon any precedent it is not anticipated that any insurmountable difficulty will be encountered.

To accomplish the demobilization and to properly serve the express traffic a continuation of the policy of the common use of coaches and baggage and express cars must necessarily be continued until the occasion therefor is removed.

The work of this section has been performed by the following forces:

In the Washington office, three heads of departments and 27 clerks.

In the country at large six department general agents;

dividing the United States between them, 54 camp general agents and the necessary force of 60 clerks. In addition, there has been on each railroad an authorized official to whom all directions as to troop and other movements were transmitted and who made himself responsible for their proper carrying out. The number of these is 204. To deal with the draft there was placed in the office of the governor or adjutant general of each state a representative of the passenger department of some road serving the territory to deal with the innumerable questions relating to the movements of drafted men. The number of these is 49.

The work which has been performed by this section would have been impossible except for the continuous and cordial co-operation of the War Department and the Railroad Administration.

### Operating Statistics Section

This section was created May 6, 1918, and after careful consideration and report upon the subject had been made by a committee of executive and accounting officers selected from railroads in all sections of the country.

The plan for standardizing statistical practice became effective August 1, 1918. Except in two particulars—the computation of net ton-miles from the train reports and the distribution of locomotive-hours—there is no material departure from the practices already established on the majority of the railroad mileage, but it was made uniform throughout. The statistics are available within a reasonable time, considering the magnitude of the figures, and are compiled individually for all Class 1 railroads under federal control and separated into regions. Because the cost of materials and labor has been steadily climbing, comparisons of transportation costs, expressed in money, are valueless, but the comparisons of physical performance afforded by these statistics are most instructive and helpful to the operating officers.

The creation of the Operating Statistics Section on May 6, 1918, grew out of the recommendations of the committee on operating statistics appointed April 11, to report upon what should be done to furnish operating statistics, and to bring about a uniformity in statistical methods and reports.

The functions of this section are:

- (1) To decide upon operating statistical standards and to make them effective;
- (2) To act as a clearing house for the receipt of the standardized forms, and for the analysis of the operating results, as well as for the dissemination of the figures in detail and in summarized form;
- (3) To make such special analyses of the results of any particular road, groups of roads, or regions as may be required, and to report upon other specific subjects referred to it for special study.

The first object has been attained in that practical uniformity in operating statistical practice has been accomplished. Complete figures are now available for all Class 1 roads (those having operating revenue in excess of \$1,000,000 per year), under federal control, and the figures are compiled on uniform bases. The new plan has done for operating statistics what the classifications of the Interstate Commerce Commission have accomplished for railroad accounting. It is now possible to compare not only the accounting returns, but also the operating statistical returns of the individual roads without the qualifications and the uncertainties heretofore unavoidable because of variations in statistical practice. The aim of the new plan has been to continue the best in current practice without imposing undue hardship or unnecessary expense. While believed to be scientifically comprehensive, and to give the fundamentally important information, the new plan has not been carried so far toward the ideal as to be impractical or unjustifiably burdensome.

The force of the section has expanded gradually as its work has enlarged. At this date it numbers 21 employees.

It will undoubtedly be necessary to add to the force as the work of the section is further enlarged in making a more complete check of the reports and in compiling additional summaries. The effective utilization of the large amount of information for the purposes of administrative control, both centrally and locally, is still in the early stages of development.

As now being published, there are four sets of monthly statistical summaries, which show the following information for individual roads, districts, regions and total:

#### (1) FREIGHT-TRAIN PERFORMANCE (EXCLUDING MIXED AND SPECIAL TRAINS)

(Statistics in practically all items shown by directions and in comparison with the same period of previous year.)

- Average miles of road operated.
- Net ton-miles per mile of road per day.
- Net ton-miles per train-hour.
- Train speed in miles per hour.
- Net ton-miles per train-mile.
- Per cent of net ton-miles to gross ton-miles.
- Per cent of loaded to total car-miles.
- Net ton-miles per loaded car-mile.
- Gross ton-miles per train-mile.
- Per cent of gross ton-miles to rating ton-miles.
- Per cent of locomotive miles to train-miles.

All of the basic data from which the foregoing averages are derived are shown on pages 2 and 3 of the monthly summary.

#### (2) UTILIZATION OF FREIGHT EQUIPMENT (FREIGHT AND MIXED TRAINS)

Average number of locomotives, (a) serviceable; (b) un-serviceable; (c) total.

Average number of cars on line daily, (a) serviceable; (b) un-serviceable; (c) total.

Per cent of un-serviceable to total equipment, (a) locomotives; (b) freight cars.

Miles per locomotive-day, (a) serviceable locomotives; (b) total locomotives.

Net ton-miles per loaded car-mile.

Per cent loaded to total car-miles.

Car-miles per car-day.

Net ton-miles per car-day.

#### (3) NUMBER OF LOCOMOTIVES AND DISTRIBUTION OF LOCOMOTIVE HOURS

(Divided to show separately the data for freight, passenger, switch, other, and total.)

##### AVERAGE NUMBER OF LOCOMOTIVES ON LINE

Distribution of locomotive-hours, showing for each class of service the hours and per cent of total hours, (a) on road; (b) at terminals; (c) in engine houses; (d) stored; and (e) total.

#### (4) CONDENSED INCOME ACCOUNT

A monthly statement has been prepared since August, which shows for each Class 1 road and for each region the principal items of the income account—operating revenues, operating expenses, net operating revenues, net federal income, average "standard return," and per cent of "standard return" earned, both for the month and for the cumulative period of the calendar year.

##### ADDITIONAL SUMMARIES TO BE ISSUED

It is the intention, beginning with the month of November, to issue monthly summaries of "passenger-train performance" and "locomotive and train costs."

Effective with the returns for the month of December this section plans to begin the work of compiling monthly re-

ports showing the number of cars of less-carload freight, as well as statistics which show the average carload for certain selected commodities moving in carloads. These statistics have recently been compiled by the Association of Transportation and Car Accounting Officers for the Car Service Section of the Railroad Administration.

### Telegraph Section

The Telegraph Section was created July 1, 1918, and to this section has been assigned the work of co-ordinating the telegraph and telephone facilities of the railroads under federal control. A great deal has been accomplished in this direction, and the work is steadily progressing.

Consideration is being given to the relations between the railroads and the commercial telegraph companies now also under federal control, and, in conjunction with a committee appointed by the postmaster general, the subject of these relations is being thoroughly gone into.

Instructions have been issued providing for the use of symbols and a brevity code in composing telegrams, and study is being given to testing newly invented telegraph and telephone devices.

### Fuel Conservation Section

This section was created May 1, 1918, with Eugene McAuliffe as manager, and representatives who had had practical experience in the use of locomotive fuel, as well as in its production, were assigned to each region. There has been constant co-operation with the Fuel Administration, and a consistent effort has been made to improve the quality of coal purchased for locomotive use, as well as to instruct engineers in proper and economical firing. The cost of fuel to the railroads, now aggregating about \$473,000,000 annually, exclusive of road haul on users' rails, represents the largest single item of operating expense other than labor.

The marked improvement in the measure of supervision and supervising methods established and the specific attention given to the selection and inspection of coal at mines, as well as the economical use of same on locomotives and in stationary plants, has resulted in very material fuel savings on the several railroads, and the revised methods of distribution which have been worked out will result in economy in road hauls.

While deprived of the stimulus of war necessity, work in the Fuel Conservation Section will move along continuously broadening lines, the recent extraordinary increase in fuel costs rapidly bringing this angle of railroad-operating expense into such marked prominence as to warrant continual refinement in purchasing, operating, and maintenance methods; the question of determining the most economical grade of coal for use on the heavier type of locomotives, the best method of obtaining the maximum return in fuel economy for use of the locomotive superheater, the possibilities of the locomotive feed-water heater, and the determination of methods that will reduce the stand-by fuel losses of large locomotives present problems worthy of the most serious consideration.

### Exports Control Committee

Mention has been made elsewhere in this report of the lack of co-ordination between the rail lines and the vessels handling overseas traffic. The control of all shipping, both for the United States and for the allied governments reaching American ports, had been given to the Shipping Control Committee, of which P. A. S. Franklin is chairman.

On June 11, 1918, by agreement between the secretary of war, the secretary of the navy, and the director general of railroads, the Exports Control Committee was organized, with George D. Ogden, representing the Railroad Administration, as chairman; Maj. Gen. George W. Goethals, United

States Army, representing the War Department; Rear Admiral C. J. Peoples, representing the Navy Department; P. A. S. Franklin, representing the Shipping Control Committee; and D. W. Cooke, representing the allies.

The work of this committee has been intelligently and sympathetically directed, and there has been as a result of its activities a most satisfactory co-ordination between the rail and ocean lines. Freight for overseas from the interior has been allowed to come forward only on permits, and these permits were issued where there was a practical certainty, barring only the exigencies of the war, that ships would be promptly available.

### In General

It is not unnatural that with so fundamental a change, and with the large number of officers and men involved, there should have been some uneasiness and uncertainties arise, and we have not been without in the earlier period of federal control some evidences of demoralization in service as a result of these conditions, but the fact that there were so few is a most gratifying evidence of the patriotism and discipline of the officers and men in railroad service.

The Railroad Administration was organized in a period of unprecedented business, aggravated by weather conditions, which as to severity and duration have never been equaled.

The needs of a government at war involving the greatest variety of activities, many of them in localities heretofore relatively unimportant and with an insufficiency of facilities, had to be satisfied.

Fuel for industries and homes, as well as food for the domestic population and our Army abroad and of the allies, had to be provided concurrently with an unprecedented commercial and industrial activity.

The fact that this was done and that the railroads, emerging from the stress of weather conditions in March, were functioning normally by May 1, and have continued to do so, speaks for itself.

## Railroad Administration News

The net ton miles of revenue and non-revenue traffic handled by the railroads under federal control during the month of November increased  $1\frac{1}{2}$  per cent as compared with November, 1917, according to the monthly report of the Operating Statistics Section. The total train miles decreased 2.6 per cent and the net ton miles per train mile increased 4.1 per cent, while the net ton miles per mile of road per day increased from 5,180 in November, 1917, to 5,255 in November, 1918. The total freight car miles decreased 3.1 per cent and the average number of freight cars on line daily increased 3.1 per cent. The car miles per car day decreased 6 per cent from 26.6 to 25, while the net ton miles per car day decreased 1.6 per cent.

### Passenger Traffic in October

Railroads during the month of October handled a passenger traffic amounting to 3,194,955,151 passenger miles, a decrease of 10.7 per cent, according to the monthly report of the Operating Statistics Section. Decreases were shown in all the regions excepting the Allegheny and Pocahontas regions. For the 10 months ended October 31 the number of passengers carried one mile shows an increase of 10.8 per cent as compared with the corresponding period of 1917.

### Disposition of Empty Containers

The Claims and Property Protection Section has issued Circular No. 5, prescribing regulations governing the receipt of empty containers as described in classifications, and the disposition of such containers when astray.

# Boiler Efficiency Increased by New Type of Firebox

Eighteen Per Cent Greater Evaporation Per Pound of Coal Secured in Tests on C. M. & St. P.

THE CHICAGO, MILWAUKEE & ST. PAUL has recently completed a series of road tests of a locomotive equipped with a new type of firebox. The principal feature of the design consists of two water legs extending longitudinally from the throat of the boiler to the crown sheet. The trials were conducted with one locomotive so equipped and another of the same class with a firebox of the usual type. The results showed that the new design caused a noteworthy increase in the boiler efficiency with a corresponding decrease in the fuel consumption. The performance, as developed by the tests, is summarized in the table below. Locomotive 7142 had the ordinary type of boiler, while engine 7615 had the new type of firebox.

The boiler tests conducted at Coatesville in 1912 proved

firebox. The salient features of this design are the water legs in the firebox, known as Nicholson Thermic Syphons.

The syphon is formed from a single sheet rolled to shape and closed by welding along the front edge. The sides are set four inches apart and joined to the crown sheet, extending from a point about 18 in. from the front edge to about 6 in. from the rear. The front edge of the water leg is parallel to the tube sheet; from the back of the crown sheet it slopes downward toward the throat of the boiler. The cross section of the leg is increased at the lower edge to form a segment of a circle six inches in diameter, which joins a 6-in. tube extending into the lower portion of the tube sheet. The syphons thus form a support for the sectional brick arch. Fig. 1 shows the side elevation and plan of the firebox on which the

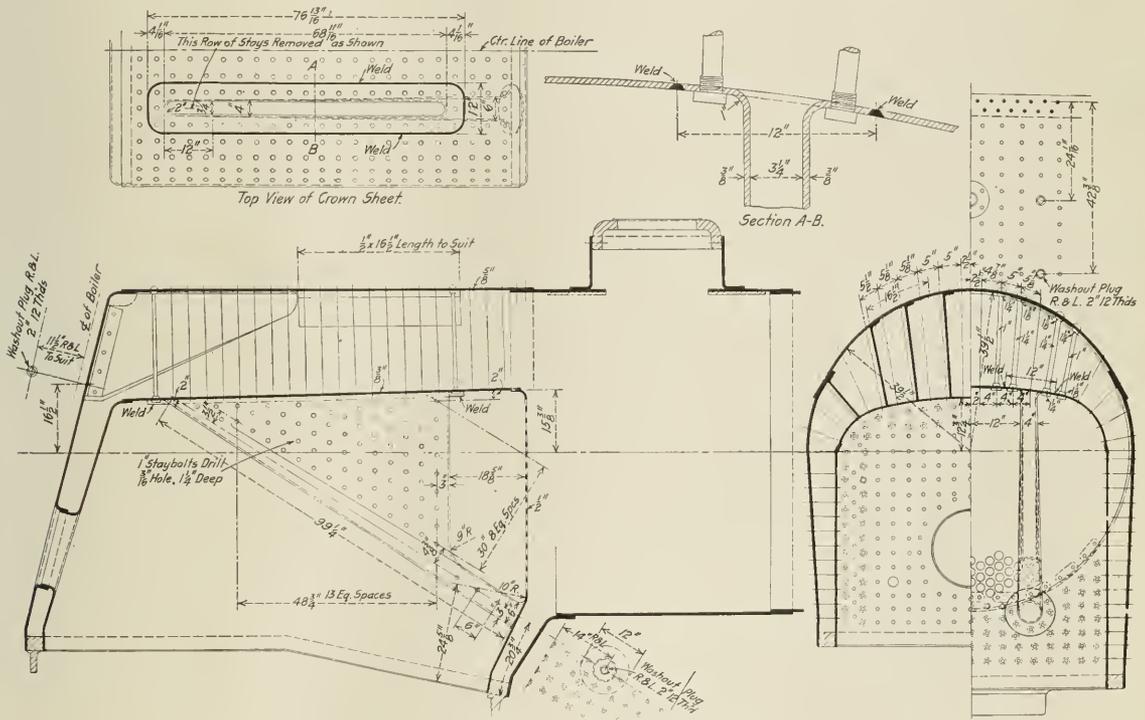

Fig. 1—Firebox of Chicago, Milwaukee & St. Paul Locomotive Equipped with Nicholson Thermic Syphons

conclusively that the water evaporated per square foot of heating surface in a locomotive boiler is much greater in the firebox than in the boiler tubes and flues. The maximum evaporation per square foot of tube heating surface is estimated at about 10 lb. per hr., while the corresponding figure for the firebox is 55 lb. per hr. Since these important facts have been demonstrated, the tendency in boiler design has been along the line of increased firebox heating surface. It is a difficult matter to secure more than a very limited increase in the area of the sheets in the usual design of firebox. To overcome this difficulty J. L. Nicholson of the Locomotive Firebox Company, Chicago, recently patented a new design of

tests were made, equipped with the syphons. Fig. 2 shows another method of installing thermic syphons in locomotive fireboxes. In this case, instead of flanging the neck of the syphon out and welding it into the throat sheet, a separate diaphragm plate is used, the syphon being formed with a separate neck and expanded into the diaphragm plate, also being riveted and welded as shown. This is for the purpose of giving more flexibility to the installation, and also to enable the manufacturers, by eliminating the flanged portion of the neck and making the neck long enough to fit extreme cases, to standardize forms and dies necessary for the manufacture of the syphons.

The locomotives tested were of the Consolidation type, using saturated steam and equipped with piston valves and Walschaert valve gear. They were alike in all respects except that the firebox of locomotive 7615 was equipped with

The engines were coaled at the chutes, no attempt being made to select the coal. The amount used was obtained by weighing the tender at the end of each run with all water emptied out of the tank. Sacked coal was used while at terminals and standing or switching on the road.

Samples were taken from the tender during each trip and were later analyzed. The average analysis was as follows:

GENERAL RESULTS OF TESTS

	Engine 7142	Engine 7615	Increase, Engine 7615, Per cent
Pounds coal fired per thousand gross ton miles, actual	124.36	93.64	24.7
Pounds coal fired per thousand gross ton miles, equated	124.36	86.63	30.3
Pounds coal fired per locomotive mile	271.9	218.9	19.4
Average tonnage hauled	2,190.0	2,340.0	6.8*
Pounds of water used per thousand gross ton miles	670.72	596.22	11.1
Pounds water evaporated per pound of coal fired	5.39	6.36	18.0*
Equivalent evaporation per pound of coal fired	6.54	7.74	18.3*
Equivalent evaporation per pound of dry coal	7.28	8.60	18.1*
Equivalent evaporation per pound of combustible	8.37	10.49	25.3*
Boiler efficiency	57.65	73.75	27.92*
Front-end temperature	625 deg. F.	550 deg. F.	13.6

\* Increase. Numerical quantities under engine 7142 considered as 100 per cent in the above.

ANALYSIS OF COAL AS FIRED

Eng. No.	Moisture	Volatile combustible	Fixed carbon	Ash	B. t. u. per pound coal
7615	10.00	35.02	38.75	16.23	10,184
7142	10.21	37.36	40.80	11.63	11,008

The coal consumption and rate of firing are shown in the following table:

Eng. No.	Test No.	COAL CONSUMPTION							
		3 Total lb. coal fired	4 Average lb. coal fired per hr.	5 Lb. coal fired per sq. ft. of grate	6 Lb. coal fired per 100-car mile	7 Lb. coal fired per locomotive mile	8 Lb. coal fired per gross 1-000 ton-miles		
7615	1-E	18,400	3,262	66.84	382.8	206.7	80.60		
	2-W	20,450	3,903	80.00	689.0	222.7	102.84		
	3-W	20,820	3,523	72.19	513.7	226.8	101.35		
	4-E	19,505	3,744	76.72	317.6	219.1	91.61		
	Ave.	19,794	3,599	73.75	440.6	218.9	93.64		
7142	1-W	29,450	4,558	93.40	486.0	320.8	162.12		
	2-E	22,100	4,300	88.11	483.9	248.3	108.22		
	3-W	25,855	4,568	93.60	638.1	281.6	141.51		
	4-E	20,930	4,120	84.42	461.1	235.1	94.10		
	Ave.	24,584	4,401	90.18	510.8	271.9	124.36		

From an operating standpoint the boiler performance of both locomotives was satisfactory, although it was noticeable

the Nicholson Thermic Syphons supporting the brick arch, while 7142 had the ordinary type of firebox with a brick arch supported on four 3-in. arch tubes. Both had recently received heavy repairs. The principal data for the two locomotives are given as follows:

LOCOMOTIVE DATA

	Engine 7615	Engine 7142
Cylinder diameter and stroke	23 in. by 30 in.	23 in. by 30 in.
Diameter of drivers	63 in.	63 in.
Tractive effort	42,800 lb.	42,800 lb.
Weight on drivers	190,400 lb.	189,200 lb.
Total weight of engine	216,900 lb.	215,700 lb.
Total weight of engine and tender	351,450 lb.	350,250 lb.
Boiler type	Straight radial stay	Straight radial stay
Boiler diameter, first course	75 3/4 in.	75 3/4 in.
Grate area	48.8 sq. ft.	48.8 sq. ft.
Tubes, number and outside diameter	414—2 in.	418—2 in.
Tube heating surface	3,143.0 sq. ft.	3,173.4 sq. ft.
Normal firebox heating surface	195.7 sq. ft.	195.7 sq. ft.
Heating surface added by arch tubes	.....	29.3 sq. ft.
Heating surface added by thermic syphons	53.0 sq. ft.	.....
Total firebox heating surface	248.7 sq. ft.	225.0 sq. ft.
Total heating surface	3,391.7 sq. ft.	3,398.4 sq. ft.
Total heating surface ÷ grate area	69.5	69.6
Firebox heating surface ÷ total heating surface, per cent	7.3	6.6
Firebox heating surface ÷ grate area	5.1	4.6

Test Condition and Methods

The test runs were conducted between Milwaukee and Portage, Wis. The distance westbound was 91.8 miles and eastbound 89.1 miles. There was no attempt to control the makeup of the test trains. The tonnage was limited to what the engines could handle on the ruling grade, and trains were run as extras with whatever cars were available. Two trips eastbound and two westbound were made with each locomotive, the same engine crew being used on all the tests. A road foreman of engines acted as cab observer and all other readings were taken by employees of the test department under the direction of G. P. Kempf, engineer of tests. Weather conditions were uniform throughout the tests. A summary of the tonnage and time consumed is given below.

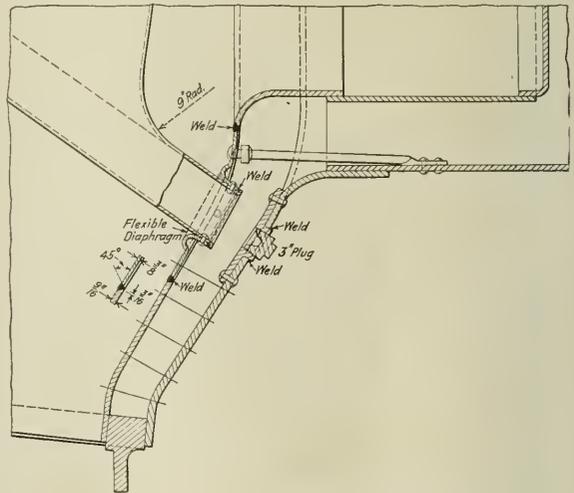

Fig. 2—An Improved Method of Applying the Thermic Syphon to the Throat

that the boiler of engine 7615 was more responsive to the demands made upon it than that of engine 7142. The tables below summarize the boiler performance.

BOILER PERFORMANCE—COAL AND APPARENT EVAPORATION

BOILER PERFORMANCE—EQUIV. EVAP. HORSE POWER AND EFFICIENCY  
Equivalent-evaporation—from and at 212 Deg. F. lb.

Eng. No.	Test No.	Per hour	Per hr. per sq. ft. of heat. surf.	Per lb. of coal as fired	Per lb. of dry coal	Per lb. of combustible	Boiler hp.	Boiler efficiency
7615	1-E	26,546	7.82	8.14	9.04	9.42	769.4	67.00
	2-W	28,615	8.43	7.34	8.14	10.22	826.5	73.63
	3-W	27,730	8.16	7.87	8.74	11.09	803.7	77.96
	4-E	28,682	8.45	7.66	8.51	10.77	831.3	77.26
	Ave.	27,858	8.21	7.74	8.60	10.49	807.4	73.75
7142	1-W	28,851	8.48	6.33	7.10	8.26	836.2	58.00
	2-E	29,781	8.76	6.93	7.35	8.95	863.2	61.35
	3-W	28,274	8.31	6.19	6.96	7.85	819.5	53.89
	4-E	28,353	8.34	6.88	7.59	8.56	821.8	58.10
	Ave.	28,803	8.47	6.54	7.28	8.37	834.8	57.65

It will be noted that the average boiler horsepower developed by locomotive 7615 was 807.4, as compared with 834.8 horsepower for engine 7142. This is to be accounted for by the fact that engine 7142 consumed 12.4 per cent more water per thousand gross ton miles. Neither of the locomotives was forced to the limit of the capacity of the boiler. Engine 7615 developed a maximum boiler horsepower of 1,015 on the grade from Milwaukee to Brookfield. This is at the rate of 35,000 lb. equivalent evaporation per hour, or 10.62 lb. per square foot of heating surface per hour.

During one round trip with each locomotive readings were taken of the vacuum in the front end, firebox and ashpan, and also of the temperature in the front end. The results are shown in the table below.

DRAFT AND FRONT END TEMPERATURE

Eng. Test No.	Test No.	Lb. coal fired per hour	Lb. coal fired per sq. ft. grate per hour	Draft—Inches of water			Front end Temp. Deg.
				Front end	Firebox	Ash pan	
7615	1-E	3,262	66.84	5.2	1.67	.27	520
	2-W	3,903	80.00	5.3	1.66	.29	536
	Ave.	3,582	73.42	5.25	1.66	.28	528
7142	1-W	4,558	93.40	5.3	1.56	.22	610
	2-E	4,300	88.11	5.0	1.27	.17	589
	Ave.	4,429	90.15	5.15	1.41	.195	599

Both locomotives had double exhaust nozzles with 3½-in. tips at the time these readings were taken. On the last round trip with engine 7615 the tips were enlarged to 3-11/16 in. diameter, which reduced the vacuum somewhat. The front end temperatures were obtained by means of a Hoskins pyrometer. It is thought that owing to an improper adjustment of the recorder the temperatures recorded for engine 7142 are too low.

No analysis was made of the front end gases, so it is impossible to tell exactly what changes in combustion conditions were brought about by the changes in the firebox. The reduction in the coal consumption, the increase in the evaporation and the marked absence of smoke indicates that the syphons tend to improve combustion conditions by breaking up the stream of gases and securing a better mixture of the combustible gases and the air.

In considering the increased boiler efficiency secured by the use of the Nicholson Thermic Syphons it should be noted that engine 7615 was working at a lower rate of evaporation than engine 7142 and also at a lower rate of combustion, which made a favorable condition for obtaining higher boiler efficiency. In this connection, however, it should not be overlooked that this was not due to operating conditions favoring engine 7615, as the average tonnage hauled by this locomotive was 6.8 per cent greater than that hauled by engine 7142. Making due allowance for the favorable evaporation and combustion rates, there remains a gain in economy which cannot be attributed entirely to the increased firebox heating surface. There is evidently a further saving due to the increase in the radiating surface in the firebox, to the more intimate mingling of the combustible gases with air in the firebox and to the more rapid circulation through the boiler. It is estimated that the rate of flow through the syphons is so fast that all the water in the boiler passes through them every five minutes.

Such rapid circulation will cause the water to remain at more nearly uniform temperature throughout the boiler. This should result in a decrease in the boiler troubles due to unequal expansion and contraction.

The cost of application of the Nicholson Thermic Syphons is low, and it is anticipated that the maintenance charges will be negligible compared with the savings effected. The syphon requires no more attention than any other part of the firebox and when properly applied is practically fool-proof and accident-proof. The first installation has been in service for four months and has given no trouble from mud or scale. The rapid circulation has kept the syphons clean and has apparently resulted in throwing the mud and scale into the back water leg, where it can easily be removed. Up to the present time there has been no evidence of scale in the syphons, and no leak or trouble of any nature has developed at the seams or stays. The Chicago, Milwaukee & St. Paul is now planning to install the syphons on several additional locomotives.

### Cleveland Station Ordinance Approved

THE PUBLIC SQUARE union station ordinance submitted to the people of Cleveland for ratification was passed in a special election on January 6 by a vote of about two to one. Under this ordinance the mayor is authorized to enter into a contract with the Cleveland Union Terminal Company which will provide for the construction of a union passenger station for all of the railroads and interurban lines entering the city.

The officers of this company are quoted as saying that work will be commenced on the project in the spring, the complete expenditure for which is estimated at \$50,000,000. It is said that all the railroads have agreed to co-operate in carrying out this plan.

All of the railroads entering Cleveland, with the exception of the Pennsylvania Lines, the New York Central and the Nickel Plate, occupy locations in the valley of the Cuyahoga river, a rather tortuous flat extending southeast from the lake just west of the business center of the city. The New York Central occupies tracks and terminals along the lake front, while the Nickel Plate has a parallel location from two to three miles back from the lake with terminals adjacent to the other roads in the river valley. The Pennsylvania Lines enter the city from the south and use the New York Central passenger station on the lake front, to which they have access by a line across the city about two miles east of the station.

The new union station project provides for a passenger station for all steam roads as well as for the numerous electric interurban routes which now occupy the city streets. The proposed site is centrally located to the south of the Cleveland public square at the top of the bluff overlooking the Cuyahoga valley. The bluff is connected with the bluff on the west side of the valley by a viaduct, 1,000 ft. long, just west of the proposed station. The plan provides for access to this terminal by all of the roads with but limited detours from existing lines with the exception of the New York Central, which would reach it over the tracks of the Nickel Plate. The project also includes extensive local freight terminal developments on a site close to the proposed passenger station.

The station project is backed by financial interests headed by O. P. Van Sweringen, of Cleveland, president of the New York, Chicago & St. Louis, who is also identified with the Cleveland & Youngstown Railroad, an interurban line, extending to the east, through the Shaker Heights and other real estate developments. One of the more recent activities of these interests has been the construction of the High Level Freight Terminal at Orange avenue and Broadway, used by

the New York Central, the approach line to this terminal being one link of the entrance to the proposed station.

One of the principal objections raised to this plan preceding the recent election was the fact that it nullifies the plan of the City of Cleveland undertaken as early as 1901 for a union passenger station on the lake front, to form part of a civic center or mall, around which the principal public buildings of the city were to be grouped. The people of the City of Cleveland had already committed themselves definitely to this plan through the purchase of land and the construction of a new court house, a city hall and other buildings, and in November, 1915, the city entered into a contract with several of the railroads for the definite prosecution of this plan, but nothing had been done other than the construction of the municipal buildings above mentioned.

### Freight Traffic Statistics for October

THE MONTHLY STATEMENT of freight traffic movement and car performance compiled by the Operating Statistics Section of the Railroad Administration is published for the month of October in a new form, based on data reported on the new standard forms. The figures continue to show an increasing volume of traffic handled. The net ton miles increased 3.5 per cent in October as compared with October, 1917, while for the 10 months ending October 31 the increase was 1.9 per cent. This increase was handled

with a decrease in train miles of 2.2 per cent for October and of 2.1 per cent for the 10 months. There was an increase in the average train and car loading and an increase for October in the car miles per car day, although for 10 months there was a decrease of 6 per cent in this item. The increase in empty car mileage continued, amounting to 14.3 per cent for October and 3.9 per cent for 10 months. The net ton miles per car day increased 2.7 per cent for October but decreased 1.4 per cent for the 10 months period. The new tables include a figure for percentage of unserviceable freight cars, 6 per cent for this year as compared with 5.6 per cent for last year for the month of October, while the percentage for 10 months is 5.7 per cent, the same as for 1917. A summary of the report by regions and districts is shown in the table.

The Railroad Administration has also given out a statement of train and locomotive performance in freight service, not including mixed and special trains, for the month of October, showing by individual roads the freight train miles, freight locomotive miles, freight car miles, gross ton miles, rating ton miles, net ton miles, train hours, net ton miles per train hour, train speed, net ton miles per train mile, per cent net ton miles to gross ton miles, per cent loaded car miles to total car miles, net ton miles per loaded car mile, gross ton miles per train mile, per cent gross ton miles to rating ton miles, per cent locomotive miles to train miles, average number of freight locomotives, locomotive miles per day, gross ton miles per locomotive mile, net ton miles per locomotive day, tons of coal consumed, and pounds of coal per locomotive mile and per 1,000 gross ton miles.

### Government Lumber to Be Sold

The War Department has created a special agency, with a director of sales, to dispose of vast quantities of timbers and other wood products which were on hand at various cantonments and building projects throughout the United States at the time the armistice was signed. The sudden ending of the war, when all this work for the government was under way, for a time threatened to create a serious disturbance in the market.

The director of sales will confer with committees representing industries affected by the disposal of different kinds of supplies, in order that business conditions may be disturbed as little as possible under the circumstances.

# Shall American Railways Be Prussianized?\*

Frank Discussion of Mr. McAdoo's Proposal With Practical Suggestions for Regulation of Roads

By Alba B. Johnson  
President, Baldwin Locomotive Works

IT IS MY ASPIRATION and hope to emulate the wisdom of that sagacious leader who served us so long and so well as President, my honored predecessor and loyal friend, Mr. Post. Some of my official colleagues have commended to me one of Mr. Post's customs, which was to supplement the addresses of distinguished guests at our dinners in New York by some remarks of his own by way of expressing in a special way sentiment or opinion in the railway supply guild. A part of what I might say would have particularly to do with the phases which have just been dealt with so vigorously and clearheadedly by this statesman in business. Other speakers are to follow, eminent travelers, lately home from Europe, and I am sensible of the obligation of a toastmaster to temper ambition with mercy; but in order to preserve the continuity of your thought I ask pardon for saying what I have to say, as briefly as I can, at this juncture.

There is only one time when the optimist looks more foolish than when he is predicting, and that is when his prediction has come out wrong. I am an incorrigible optimist, but a chastened prophet. Nevertheless, it is only veracious to report that for the present at least it is apparently not going to be necessary to repeat the sound money campaign of 1896 in order to prevent the adoption of government railway operation. Suppose you were to call for debate on the question, "Resolved, That American railways should be Prussianized." In their present frame of mind, I believe, a majority of Americans would take the negative. This is much more than merely turning the general unpopularity of a people against one of their particular institutions. There is a peculiarly Prussian and offensively Prussian thing about state railways. They typify the substitution of a government bureau for the individual citizen in performing a function which ought to be regulated, and which cannot be regulated when the government itself performs it. Prussian state railways are a chapter in despotism. Apparently our people generally are in no mood for trial of it here. This seems to apply to the proposed five-year trial. There have in the past been those who advocated trial marriages. The idea has encountered obstacles, one of which, I suspect, is the fear lest when, at the conclusion of the period nominated in the bond of union pro tem, the experimental pair issued forth from the connubial laboratory one of them might prove to have been damaged. There is, I think, some apprehension that even a five-year test might take some of the bloom off Miss Democracy, whom our boys have just been fighting and dying to preserve.

For practical men, therefore, the profitable object at this time upon which to expend thought and energy is the specific problem which must be solved in restoring the roads to individual operation.

Especially to those in our line of business, but in great degree to everybody, a problem of immediate urgency is that of railway improvements during the period while Congress is considering permanent railway legislation. Mr. McAdoo, in suggesting the five-year extension, says that the government cannot operate the roads under the present

Control Act, and particularly it cannot carry through a program of additions and betterments. It has seemed to us that if amendments to the Control Act could be drawn which would permit a reasonable annual program of improvements for five years an amendment could be drawn which would accomplish the same purpose annually for two years. One difficulty about additions and betterments under government control is the question of requiring corporations to pay for goods which they did not choose and at prices which they did not negotiate. That issue is now in the courts. Why is it necessary or desirable to await the long-drawn-out processes of litigation? Why cannot all concerned get together in a businesslike way and adjust the situation to a fair and practicable basis? This ought to be possible.

As to price, there has of course been no profiteering by railways. They carried a larger volume of traffic in 1916 and 1917 than previously, but could not and did not raise, as did manufacturers, merchants and labor, the price of what they had to sell. The director general raised rates, but the railroad corporations never had a penny of that; their present income is the standard return based on net income of three years ending 1917. Granted that the government ought to avoid possessing itself of any railway equipment whatever, and that therefore the corporations should be steadily augmenting their plant, the amount charged to them on account of this should be computed by making an appropriate deduction from the prices paid by the government and letting the government absorb the difference as part of the cost of the war.

It may well be asked whether with an enlarging plant the standard income guaranteed to the roads should remain unchanged. Probably the money for improvements would be borrowed from the government. Upon such borrowings interest must be paid. Where is it coming from? It ought to come from increased income made possible by the enlargement of plant. But such increased earnings accrue to the government. Some equitable adjustment is called for under which the proposed obligations to the government may be provided for not only as to interest but as to sinking fund. A part of this provision by the government may be termed cost of the war and a part cost of past regulation.

Design of equipment also complicates this branch of the subject. The standard rolling stock has not been eagerly welcomed by railway corporation officers. Quantity is also an issue and might remain one if an ambitious program were entered upon. He who pays, the railway officers think, should choose what he will buy, how much and when. Why not let the corporations initiate the improvements in budgets to be submitted to the director general for approval? Their obligation could be made plain to plan terminals, extra tracks and other fixed facilities on a basis of joint use and avoidance of duplication. This would be a step toward resumption of operation by the corporations; it would tend to mitigate a too rigid standardization in favor of consideration for local needs, and it would get us accustomed to a formal periodical survey ahead with provision for estimated needs.

Meantime what shall follow the present government control?

\* Presidential address at ninth annual dinner of the Railway Business Association, Hotel La Salle, Chicago, Thursday evening, January 9, 1919.

Shall what President Wilson calls the "new element of policy"—an affirmative purpose of transportation development—be passed to the Interstate Commerce Commission to be carried out, including the co-ordination of rates with expenses, or shall a new federal office be created to perform the affirmative function?

The Commission enjoys a peculiar prestige for honesty and freedom from influence. The very defect which is now seen to call for correction, namely, the past attitude maintained by the Commission as a defender of shippers and others as against the roads and nothing more, has given it the character of a popular champion. Castigation of financial practices in the cases of some roads has strengthened this sentiment.

Large numbers of shippers and shippers' bureaus have, through their traffic managers, for several years gone along with the Commission in defining what has been called scientific rate-making and in gradually bringing the actual rate fabric into harmony with such definition. This process has involved the relation of one rate to another, as affecting competitive conditions, the distribution of the burden of transportation cost fairly among the several commodities, the development of standard comparisons for measuring reasonableness of particular rates, and the evolution of precedent covering a number of other technical branches of the subject. Traffic managers are complaining that the United States Railroad Administration has rapidly and substantially undone much of this work. The director general in practice makes the rates and the Commission in practice has refrained from reviewing them except in case of discrimination.

War-time experience with division of the rate-making function between two departments of the government has thus complicated the acceptance of a plan under which such division would be perpetuated. Manufacturers and merchants generally, as a matter of judgment in the choice of men for constructive functions, would greet without enthusiasm or confidence the designation of the Interstate Commerce Commission by Congress as the agency to re-establish railway credit. They as shippers will no doubt take the view, as sometimes in the past in large-rate advance cases, that the paramount matter is sufficiency of facilities and service and extension of lines, and that the problems of scientific rate-making, however important in themselves, can only receive such consideration as is consistent with attaining that paramount purpose.

Executives of industrial and mercantile concerns, if they give their energies to this problem, will undoubtedly come to concur in recommending that a new federal officer charged with promoting transportation development shall have power to sanction rates initiated by carriers, subject to review by the Interstate Commerce Commission respecting discrimination, but on no account subject to reviews respecting the adequacy of revenue. The same shippers, on the other hand, will be sure to insist, and ought to insist, that in preserving this great and vital advantage learned from government control, of lodging in one place responsibility alike for adequacy of transportation and adequacy of rates, the development of symmetrical rate structures should proceed with as little interruption as may be.

The Chicago Association of Commerce is studying the larger phases of railroad legislation through a special committee, separate from the traffic department, which has a restricted scope. Why would it not be advantageous for that organization to suggest a similar method to other local bodies throughout the country and establish among them co-ordination of study and of public discussion? Valuable aid can be given to such a concert of shippers by the National Industrial Traffic League. What shippers most need is skilled service in accomplishing, with the least loss of advantages, the rehabilitation of railway credit. The prob-

lem upon which the shippers' traffic managers have a competence all their own is that of transferring jurisdiction over revenue adjustments from the Interstate Commerce Commission to another federal functionary and preserving rate relations in the process. The question is not why this cannot be done, but how it can be done.

Whether the new functionary should receive from the Interstate Commerce Commission advice growing out of its past work in that special field or whether he should have a rate bureau of his own, or whether he should share with the Commission the use of a federal bureau of railway economics, I do not undertake to suggest. Whatever the choice, he should have the last word except as to discriminations. To mean anything, the opinion of the shipping interests of the country must be formed by a process of conference in which there is participation both by traffic managers and by the heads of the enterprises and associations who employ them.

Close to the question of power over rates, as affecting revenue, is another question which is not going to be solved by whispering "Hush!" That is the problem of labor cost. Under any program which gave a federal officer responsibility for sanctioning railway budgets and the rates on which to carry them through, one item—the largest item—would be the pay-roll.

What real difference is there between the labor item and any other item so far as concerns the process of getting it sanctioned and the money provided? The government, which is going to permit the required rate schedule, would say to the railway company: "You may build that extension and not this; you may electrify between A and B, but not yet between B and C." Why should not the government say, "You may grant this demand of labor but not that"? It is a part of the budget. The public is going to pay and some representative of the public must consent or refuse or modify.

What representative? Some suggest a court. But no labor court would command the respect that our law courts command unless there were a statute framed for all men that the court shall apply to particular cases; and I apprehend you and I would be hard put to it if asked to draw, at the present time, statutory language setting forth a general rule for the treatment of labor. That is a long way off. But suppose you had a court. It would not be the regulator of the roads on the side of adequacy and growth. The fixing of wages and working conditions is an administrative function which cannot be performed except with responsibility in connection with revenue. The federal officer might have advisers. Mr. McAdoo had. But in the end it was Mr. McAdoo who decided and proclaimed payrolls. He happened to be the manager, because it was government operation. The analogy under private control is that the payroll should be initiated by the manager of the road, and that because of the public character of the enterprise an appeal could be made either by employees or by members of the rate-paying and service-seeking part of the public; then, finally, the whole public, through its government officer, after he had taken advice, would decide and proclaim.

The difference between payrolls and other expenses is that employees can threaten to interrupt service. Suppose Mr. McAdoo had been deciding and proclaiming reductions instead of advances. That attitude and conduct of organized labor toward methods of adjusting disputes will be determined by public opinion in the communities where the employees live and where their work is done. If public opinion in the United States has developed to the point of favoring adjustment through umpires such opinion will become known to Congress, and the result in legislation will correspond. If public opinion is not ready for adjustment through umpires then some other contrivance may be set up, but it will not be a solution. The only real solution is to couple power with

responsibility somewhere and abide by the action of the constituted authority.

A consideration follows this so inevitably that it ought not to have to be stated. The federal officer who determines transportation budgets, including payrolls, and finds the money, should be kept out of politics so far as is humanly possible.

By the same token, private management must be held to strict accountability. I can think of only two things worse for the United States in transportation than to have a Kaiser bureau. One would be private management operating without the restraint of government regulation. Abuses growing out of unrestricted private management we had for a long while. That sort of thing is no more wanted now by railway managers than by the public. The other thing in transportation that I would think worse for democratic America than a Kaiser bureau would be government operation. The Kaiser had at least a continuous tenure of office and a motive for considering the future prosperity of his country. The statesman does not know whether he is going to be re-elected or not. He takes no chances with any remote future. He wants to do something and do it now; and if he makes a mistake he is only one of a houseful, no man of whom we can hold responsible. You can't regulate him, because of course no commission that you could set up would criticise another department of the government. During the past year we have seen an example. The Railway Control Act gave the executive authority to raise the rates, subject to review by the Interstate Commerce Commission. You have noticed how heroically that body has resisted temptation to exercise any such power.

There seems to be in Congress some sentiment for the enactment of provisions which their advocates believe would be in the direction of stricter regulation, but which would actually have the effect of throwing regulation out of the window. There is talk of government directors of railway corporations. Just as surely as Congress puts one government representative on a railroad board we shall see the beginning of the end of regulation. You will never hold private management to accountability if there is a government man in there consenting to everything and a party to everything before it is done. You will never get a regulatory body to criticise an institution which is partly or wholly another department of the government.

Government directors on boards would mean government influence in the selection of managers and in the framing of policy. The American system is that a boy starts at the bottom and without political services or pull works his way upward through a career, perhaps to the top. Instead of that we would have politics.

Why are government directors proposed? Because government guarantee of interest or dividends is proposed. If the government owns railroad securities or guarantees them it will insert its tentacles into the management. But why is there talk of guarantee? Simply and solely because it is feared Congress will run away from its plain duty of providing revenue which will enable the roads to finance themselves independently. If we do not have responsible regulation and the government furnishes its credit the cost must either be assessed after all upon the users in rates or upon all the citizens in the tax levy. If we have responsible regulation we shall not need government guarantees and we shall escape government directors and the government hand on the management.

We in the United States are slow to make up our minds that an annoyance has attained to the stature of an evil and is worth ending. When we once resolve, however, that a problem is due for solution we move on its works with all arms and take it by storm. How many weary years we bore an antiquated banking and currency system! Yet the hour struck, and in a few months of a single year we established the strongest system in the world. The most hopeful sign

that the moment is at hand for a transportation solution is that the subject is on the lips of almost every man you meet. Congress has at last grappled seriously with it. The law-makers are entitled to the fullest co-operation of business men in working out a measure. Let business organizations and men of affairs in every State and community approach the subject with open minds, a spirit of team work, and a readiness to make sacrifice of time and energy, and our railways shall soon once again build up the cities and carry settlement and commerce into the forest and the inaccessible farm land, while they join every centre of American production and trade to the ships that shall carry the Stars and Stripes and American cargoes to the markets of the earth.

## Orders of Regional Directors

**UNIFORM METHOD OF HANDLING HOG SHIPMENTS.**—In Supplement 1 to Circular 224 the Central Western regional director quotes a letter from the Car Service Section containing additional information concerning the uniform method of handling hog shipments to market centers recently inaugurated. The letter is in part as follows:

Hog embargoes now prevail at Cincinnati, Indianapolis, Pittsburgh, St. Louis, Milwaukee, Sioux City, South St. Paul and Buffalo. The Food Administration states that the total hog receipts by cars on a single deck basis should be as follows per week of six working days:

Name of market	No. of cars	Name of Food Admin. chairman
Chicago	4,140	.....
Cleveland	400	W. L. Bryans.
Indianapolis	1,000	W. A. Cowan.
Pittsburgh	325	I. N. Burgess.
Nashville	200	F. L. Murray.
Buffalo	600	S. M. Boren.
Cincinnati	480	Fred C. Edmonds.
Louisville	175	W. D. Carrithers.
East St. Louis	1,000	H. R. Ray.
Peoria	240	.....
Evansville	48	J. F. Recknor.
Toledo	90	J. C. Dresser and W. W. Jones.
St. Joseph	1,000	Warren Nichols.
Omaha	1,200	E. H. Schroer.
Sioux City	600	Y. A. Hartman.
Kansas City	1,300	B. R. Bridgford.
Milwaukee	350	J. W. Holmes.
Cudahy, Wis.	480	.....

The terminal manager or any other designated representative of the Railroad Administration should confer with the chairmen of the sub-committees of the Stabilization Committee of the Food Administration mentioned above, concerning the division which should be made as between Saturday and other days of the week. Ordinarily the Saturday run should be less than on the other week days.

**Insurance on Stationary Boilers.**—In Circular 154 the Southwestern regional director points out that the railroads, under the instructions of General Order 24, did not renew insurance on stationary steam boilers. He advises that provision has been made for the inspection and testing of stationary steam boilers heretofore performed by the insurance companies, and rules and regulations have been issued by the Division of Operation, Mechanical Department, under Circular 11, for the information of each railroad.

**Taking up of Industrial or Other Sidetracks.**—The Eastern regional director, file 1800-4-7A390, has issued the following instructions: "Owing to the shortage of rail for new sidetracks, repair purposes, etc., it is understood that instructions have been in effect on some lines to take up industrial tracks or other side-tracks which have served the purpose for which they were constructed, and which are no longer needed, in order to provide material for such purposes. As the emergency which required such action no longer exists, it should be understood that it is not intended that any tracks should be taken up without the consent of the corporation in writing, except, of course, tracks which have been laid since federal control to serve some temporary need."

**Joint Superintendents of Telegraph.**—The Eastern regional

director, file 801-1A375, transmits the following instructions from the Division of Operation:

"I believe it desirable that the superintendents of telegraph of the different railroads, especially those who jointly represent the telegraph companies, be instructed that so far as concerns their handling of the telegraph lines owned, leased, or operated by the railroads they must not permit any instructions that they may receive from the officials of the telegraph companies to interfere with the instructions issued by representatives of the Railroad Administration. It is, of course, understood that if a superintendent of telegraph feels that a contract provision between the railroad and the telegraph company is being violated, it will be proper for him to call the matter to the attention of the railroad officer to whom he reports, after which he will be guided by the instructions of such officer."

*Freight Destroyed or Confiscated in Transit.*—The Eastern regional director, file 600-102A377, states that shippers and consignees of freight frequently suffer inconvenience due to the lack of information as to the whereabouts of their property when it is destroyed by wreck, fire or other casualty, or is confiscated by carrier. Please arrange a plan in such cases so that the operating department will immediately notify the freight claim agent, furnishing full waybill reference, name and address of shipper, consignee and a description of the freight destroyed or confiscated. Upon receipt of such advice in the claim office, arrangements should be made immediately to notify the shipper and consignee to enable them to make such arrangements as they see necessary under the circumstances, either by duplication of the shipment or otherwise.

*Inspection of Freight at Interchange Points.*—Circular 155 of the Southwestern regional director, similar to File No. 600-96A337 of the Eastern regional director, abstract of which appeared in the *Railway Age* of January 3, page 106.

*Exchange of Local Transportation.*—Supplement 15 to Circular 29 of Central Western regional director, similar to File No. 2100-41A-343 of Eastern regional director, published in *Railway Age* of January 3, page 105.

*Free Transportation for Railroad Y. M. C. A.*—In Supplement 13 to Circular 29 the Central Western regional director announces that the Division of Operation will issue transportation for the international traveling railroad secretaries of the Y. M. C. A. who may be assigned to territorial districts similar to that of the railroad regions. Railroads are also authorized to continue their past practice in the matter of issuing transportation for state or local secretaries.

*Transportation of Corporation Officers and Employees.*—In Supplement 14 to Circular 29 the Central Western regional director announces that railroads are authorized to issue 1919 annual or trip passes to corporate officers and employees over the railroads with which they are connected. The usual complimentary passes for wives and dependent members of families of such officers and employees may also be issued over the railroads with which they are connected. Annual passes for directors and such off-line annual or term passes as the officers and employees of the corporations may require, will be issued by the director of the Division of Operation. Off-line trip passes for corporate officers and employees will be requested of and secured by the federal manager.

## Doings of the United States Railroad Administration

### Director General McAdoo Has Left Washington for Three Months' Vacation in California

**D**IRECTOR GENERAL McADOO left Washington on Tuesday night for three months' vacation with his family at Santa Barbara, Cal., without having heard from President Wilson as to the appointment of his successor. He issued a statement saying he expected the President would designate his successor as director general of railroads within the next few days and that meanwhile he will continue to discharge the responsibilities of the office. Assistant Director General Walker D. Hines will be in immediate charge at Washington and Mr. McAdoo will continue to keep in touch with and direct the affairs of the Railroad Administration at long range. He was accompanied to California by Oscar A. Price, assistant to the director general. As to his future plans, Mr. McAdoo said he expected to take up his residence in New York City about the first of April and to resume the practice of law.

On Tuesday afternoon Mr. McAdoo called a special meeting of his railroad staff and, saying that he expected to be relieved of his office shortly, made a farewell speech, in which he expressed the highest appreciation of the work of his assistants during the year and their loyal support and co-operation. Walker D. Hines and John Skelton Williams spoke in reply.

It is believed in Washington that Congress will take no definite action at the present short session as to the disposition of the railroads, least of all in the direction of Mr. McAdoo's proposals for a five-year extension of federal control, and that as soon as this fact is made certain at the expiration of the present session, the President intends to issue a proclamation that he will restore the roads to their owners

after a reasonable period for readjustment. June 30 is suggested as the probable date, because this would conclude a six months' period and would be convenient for accounting purposes. On the other hand, Congress might intervene to prevent a relinquishment of the roads without a longer opportunity to work out a legislative plan.

Most of the members of the staff of the Railroad Administration seem to expect that its affairs will be wound up shortly. No action is being taken, pending the appointment of a new director general, to fill the vacancies in the staff caused by resignations. The Railroad Administration has definitely released to the Treasury Department the space which it had planned to occupy in the new Arlington Building, although it is looking for other quarters than the Interstate Commerce Building, in which its principal offices are now located.

#### Weekly Traffic Report

The movement of freight and passenger traffic for the week ended January 6 continued without interruption, according to the weekly report made public by Director General McAdoo. The returns of passenger travel since last week show a much greater increase than was ever anticipated. On account of the holiday season there was a slowing up in the movement of freight cars in some sections.

Following is a summary:

*Eastern Region.*—Labor troubles at the railroad piers and freight stations in the Greater New York district necessitated shutting off all New York freight on January 1; situation slightly improved. Export freight for Boston also shut off owing to labor troubles and lack of vessels. Trainload move-

WASHINGTON, D. C.

ment of export provisions from Western cities running about the same, averaging the last half of December 673 cars in 27 trains daily. High class passenger travel exceptionally good, as indicated by large number of extra Pullman cars required.

**Allegheny Region.**—Regular passenger travel continues very heavy, but has been generally handled in a satisfactory manner. Perishable freight traffic experiencing a let-up after the holidays. Box car loading has decreased, and it may be necessary to store some empty box cars. Production of bituminous coal continues light, and there is a surplus of empty coal equipment.

**Pocahontas Region.**—Passenger travel continues heavy. Effective January 1 the White Sulphur Springs and Hot Springs sleeping cars were extended through to New York, and the New Orleans sleeper similarly extended. On and after January 6 all Atlantic Coast Line trains will use the new Broad Street Station at Richmond, Va. General freight movement shows decrease, due in part to the holiday season. Slight increase in total coal and coke movement.

**Southern Region.**—Heavy passenger travel continues; passenger service being extended in various directions. Freight service has been normal, with the exception of accumulations on the New Orleans Public Belt Railroad, and accumulations of empty coal cars at Birmingham, both of which will be shortly relieved. General freight movement lighter than last week, but heavier than similar week of previous year.

**Northwestern Region.**—Movement of loaded freight cars shows quite a serious decrease as compared with same period last year, due principally to general slowing up of business account holiday season. Grain arrivals at primary markets at Chicago, Minneapolis, Milwaukee and Duluth, 12,800,000 bu., a decrease of 2,700,000 compared with previous week, but an increase of approximately 8,000,000 bu. over same period last year. Live stock loading shows some decrease under previous week, but was larger than last year. Crop conditions continue unusually satisfactory.

**Central Western Region.**—Business shows quite a decided falling off compared with last year, with large decreases in coal, as many of the mines are shut down on account of lack of orders. Train operations on the Santa Fe, Rock Island and Union Pacific interfered with by snow and low temperature in Colorado and Kansas. Passenger travel reports indicate that holiday travel was well handled, but on the whole the travel was a little less than during the same season last year. Travel to California is heavy.

**Southwestern Region.**—Freight traffic comparatively light. Steel people in this district anticipating a heavy demand. General impression prevails that export and import traffic will become heavy during latter part of February. Passenger travel is heavy, stimulated by holiday business. Unprecedented storms in Kansas, Oklahoma and Texas had their natural effect on train service, although the situation is rapidly improving.

**War Department.**—Freight on hand at New York shows increased accumulation by reason of unloading being seriously delayed account inefficient labor, holidays, and restrictions imposed by eight hour day. Transportation conditions throughout the entire country are, taking into consideration usual slowing up during the holidays, generally satisfactory.

**Advances to Railroads for the Year 1918**

The total sum advanced to December 31, 1918, by the United States Railroad Administration to all railroads and other transportation properties under government control, including loans made to railroad corporations for current needs and payments on account of compensation, advances made for operating requirements, and the payments made on account of the new standardized cars and locomotives aggregate, according to a statement issued by the director general, \$689,034,759.

In making these payments the director general drew on the \$500,000,000 revolving fund to the extent of \$453,454,-

810. The balance of the money thus advanced, amounting to \$235,579,949, was obtained from the surplus operating receipts of certain railroads and from receipts from the express companies.

The total amount deposited with the director general up to December 31, from the surplus receipts of all railroads and transportation companies under federal control amounted to \$270,524,961 which included \$46,916,416 received from express companies.

The only railroad properties which have made deposits with the director general of sums aggregating as much as \$1,000,000 in excess of the amounts returned to these depositing roads and the corporations by the director general, were the following:

Atch. Top. & Santa Fe.	\$12,600,000	Duluth, Missabe & N. W.	\$10,400,000
Elgin, Joliet & Eastern.	7,000,000	Louisville & Nashville.	5,510,000
Bessemer & Lake Erie.	4,000,000	Atlantic Coast Line.	3,800,000
Duluth & Iron Range.	3,400,000	Pullman Car Line.	2,800,000
Rich., Fdksbg. & Potomac	1,540,000	Atlantic S. S. Lines.	1,500,000
Pere Marquette.	1,145,000	Central of New Jersey.	1,250,000
Morgan's, Louisiana & T.	1,300,000	Nashville, Chat. & St. L.	1,000,000

The amounts advanced by the United States Railroad Administration to all transportation systems, making the above aggregate of \$689,034,759 up to December 31, 1918, are set forth in the following list:

Pennsylvania Railroad.	\$90,066,000	Central New England.	\$990,000
New York Central.	72,720,000	Ind. Harbor Belt.	920,000
N. Y., N. H. & H.	65,925,000	Texas & Pacific.	909,250
Baltimore & Ohio.	35,875,000	Pere Marquette.	855,000
Atlantic.	23,600,000	Ann Arbor.	801,800
Chi., Mil. & St. Paul.	22,532,000	Toledo & Ohio Central.	770,000
Illinois Central.	17,425,000	Monongahela.	750,000
Southern Pacific.	16,500,000	Portland R. R.	741,000
Union Pacific.	13,500,000	Wheeling & Lake Erie.	700,000
Southern Railroad.	11,706,650	Kans. City, Mex. & Orient	700,000
Chi., Bur. & Quincy.	10,650,000	Atlanta, Birm. & Atlantic	659,000
Chi., R. I. & Pacific.	9,700,000	Bangor & Aroostook.	643,000
Chi. Northwestern.	9,000,000	Fr. Western & Denver Cy.	619,000
Delaware & Hudson.	8,790,000	Gulf, Mobile & Northern.	600,000
Missouri Pacific.	8,400,000	Chi., Peoria & St. Louis.	600,000
Seaboard Air Line.	8,075,000	N. Y., Ontario & Western	575,000
Chesapeake & Ohio.	8,050,000	Pittsburgh & Shawmut.	528,500
Boston & Maine.	7,067,000	Lehigh & New England.	525,000
Great Northern.	6,800,000	Old Dominion S. S. Line	515,000
Philadelphia & Reading.	6,090,000	Chi. Junction.	500,000
St. Louis-San Francisco	6,020,000	Gulf, Colo. & Santa Fe.	500,000
Denver & Rio Grande.	6,000,000	Western Pacific.	430,000
Northern Pacific.	5,500,000	Kansas City Terminal.	400,000
Norfolk & Western.	5,250,000	Chi., Terre Haute & S. E.	387,913
Wabash.	4,645,000	Pittsburgh & West Va.	375,000
Mo., Kans. & Texas.	4,245,000	Chi., Ind. & West.	350,000
Mt. St. P. & S. Marie	4,159,000	Georgia R. R.	309,000
Buff., Roch. & Pittsburgh	4,000,000	Detroit, Toledo & Iron	300,150
Del., Lack. & Western.	4,000,000	Bklyn. East. Dist. Term.	300,000
Western Maryland.	3,558,000	Belt Ry. of Chicago.	290,000
Lehigh Valley.	3,500,000	Midland Valley.	270,000
Louisville & Nashville.	3,000,000	Trans-Miss. Terminal.	265,000
Hocking Valley.	2,890,000	Mo., Okla. & Gulf.	255,000
Chi., St. Paul, M. & O.	2,450,000	S. Antonio & Aransas Pass	250,000
Mpls. & St. Louis.	2,395,000	Pt. Dodge, D. Moines & So.	246,000
Maine Central.	2,130,000	Vicksburg & Shreveport.	242,000
Chicago & Alton.	2,060,000	Am. Refrigerator Tr. Co.	229,000
Chi., Indianapolis & L.	1,925,000	Chi. & Western Indiana.	215,000
Int. & Great Northern.	1,877,215	N. Y., Susque. & West.	200,000
Denver & Salt Lake.	1,718,460	Georgia Ship Island.	200,000
Chi., Great Western.	1,680,660	New Or. Tex. & Mexico	176,130
Grand Trunk.	1,621,000	Illinois Southern.	160,000
Kansas City Southern.	1,585,000	Mo. & N. Arkansas.	150,000
Term. R.R. Assn. of St. L.	1,545,000	Duluth, S. Shore & Atl.	150,000
Colo. & Southern.	1,485,000	Ocean Steamship Line.	150,000
Central of Georgia.	1,450,000	Portland Terminal.	150,000
Chi. & Eastern Ill.	1,449,000	Detroit & Toledo Shore L.	135,000
Virginian Ry.	1,300,000	Cumberland & Pa.	127,900
Cent. R.R. of N. Jersey.	1,250,000	Detroit, Bay City & West.	120,000
Pullman Company.	1,200,000	N. O. Great Northern.	120,000
Atlantic Coast Line.	1,200,000	Atlanta Terminal.	115,000
Los Angeles & Salt Lake	1,175,000	Winston-Salem S. Bound	112,000
Denver & Salt Lake.	1,118,460	Western Ry. of Ala.	110,000
Norfolk Southern.	1,058,000	Mississippi Central.	102,500
Florida East Coast.	1,050,000	Ulster & Delaware.	100,000
Central Vermont.	1,035,000	B. & O. Chi. Terminal.	100,000
Hudson & Manhattan.	1,012,000	Toledo Terminal.	100,000
N. Y., Chi. & St. Louis.	1,009,775		

Twenty-six roads receiving in each case less than \$100,000.	990,000
Advances to inland waterways and canals.	4,361,486
Payments on account of standardized engines and cars.	114,514,400
<b>Total</b>	<b>\$689,034,759</b>

Of the sums shown in the foregoing table the amounts advanced to the various systems during the month of December, 1918, were as follows:

N. Y., N. Haven & Hart.	\$15,475,000	Southern Pacific Lines.	\$4,000,000
N. Y. Central Lines.	12,850,000	Chicago & North Western	3,770,000
Pennsylvania R. R. Lines	12,600,000	Norfolk & Western.	2,750,000
Baltimore & Ohio.	11,800,000	Missouri Pacific.	2,750,000
Erie Railroad.	9,700,000	Seaboard Air Line.	2,465,000
Union Pacific Lines.	8,500,000	Hocking Valley.	2,392,000
Boston & Maine.	4,250,000	Minn., St. P. & S. M.	2,107,000
Chi., Burl. & Quincy.	4,100,000	Delaware & Hudson.	2,000,000
Great Northern.	4,000,000	Chi., Rock I. & Pacifco.	2,000,000

Philadelphia & Reading..	\$1,690,000	Chicago, P. & St. Louis..	\$400,000
Louisville & Nashville..	1,500,000	St. Louis S. Western..	400,000
Northern Pacific .....	1,500,000	Buff., Roch. & Pittsburgh	330,000
Del., Lack. & Western..	1,500,000	Atlan., Birm. & Atlantic	320,000
Int. & Great Northern..	1,470,000	Bryn. E. Dist. Terminal	300,000
Central R. R. of N. Jer.	1,250,000	Central Vermont .....	300,000
Illinois Central .....	1,200,000	K. C., Mex. & Orient..	300,000
Denver & Rio Grande..	1,200,000	Monongahela R. R.....	300,000
Western Maryland .....	1,185,000	Wabash R. R.....	300,000
Los Angeles & Salt Lake	1,175,000	Ft. Worth & Denver City	279,000
Southern Railway Lines.	1,164,000	Bangor & Aroostook....	270,000
Toledo Trunk .....	1,000,000	Missouri, Oda. & Gulf..	255,000
Chesapeake & Ohio.....	1,000,000	Gulf, Mobile & Northern	200,000
Chicago Great Western.	973,000	Gulf & Ship Island.....	200,000
Chicago & East Illinois.	912,000	N. Y., Susq. & Western	200,000
Chicago, Mil. & St. Paul	857,000	Ind. Harbor Belt.....	200,000
Maine Central .....	830,000	M. K. & T. Lines.....	250,000
Pere Marquette .....	775,000	Winston-Salem S. S. Lines	200,000
Toledo & Ohio Central..	770,000	Virginian Railway .....	200,000
Central New England..	690,000	Texas & Pacific.....	159,250
Kansas City Southern..	525,000	N. Y., Chicago & St. L.	155,000
Colo. & Southern.....	510,000	Missouri & North Ark.	150,000
Gulf, Colo. & Santa Fe.	500,000	Ocean Steam Ship Line.	150,000
Minneapolis & St. Louis	500,000	Denver & Salt Lake....	127,812
Rutland R. R. ....	475,000	Winston-Salem S. S. Bound	112,000
Term. R. R. Ass'n of St. L.	464,000	Norfolk Southern.....	110,000
Chicago & Alton.....	425,000	Mississippi Central .....	102,500
Kansas City Terminal..	400,000	Chic., St. P., M. & Oma.	100,000
Atlantic Coast Line.....	400,000	Detroit & Tol. Shore Line	100,000
Chicago, Ind. & Louisiv.	400,000	Det., Bay City & Western	100,000

Seventeen railroads receiving sums amounting in each case to less than \$100,000.....	768,375
Payments on account of standardized locomotives and cars.....	26,799,274

Total of advances to all railroads for the month of December, 1918, including payments made on account of new rolling stock for various companies, as shown above.....\$168,982,711

Total amount received during December from railroads on account of surplus earnings and including \$15,781,541 from express companies, was.....33,116,985

Excess of advances to railroads for the month of December, 1918, over and above amounts received as above for same period..\$135,865,726

All loans to railroad companies by the Director General have been made at the uniform rate of 6 per cent. per annum interest.

On December 30 and 31 the following railroads repaid to the United States Railroad Administration the following amounts with interest at 6 per cent., which had been formerly loaned them:

Chicago, Milwaukee & St. Paul.....	\$8,000,000
Chicago, Rock Island & Pacific.....	6,000,000
Baltimore & Ohio.....	5,450,000
Southern .....	2,170,000
St. Louis-San Francisco.....	1,710,000
Total .....	\$23,330,000

Including the amount of these loans thus collected, the total balance remaining in the revolving fund, plus the sum total of balances remaining on hand with the director general from the surplus receipts turned over by certain roads, aggregates the total sum of \$102,856,762.

The aggregate amount of loans made by the director general to railroads and other transportation companies, and still outstanding is \$171,606,073. This is exclusive of the amount advanced by the director general for the benefit of various roads on account of standardized equipment.

**Director General Asserts Authority Over State Rates**

Director General McAdoo has taken up the challenge made by various state railroad commissions of his authority to initiate rates applying to intrastate as well as to interstate traffic. This question was held in abeyance during the war, but was revived at the annual convention of the National Association of Railway and Utilities Commissioners held in Washington just after the armistice was signed. The director general has heretofore refrained from making a definite statement of his attitude toward the matter, but when his attention was called to the fact that several states have begun litigation, drawing in question the validity of rates initiated by him under the federal control act so far as they apply to intrastate traffic, he issued a statement saying he regretted that the issue should be raised and a contest precipitated between state and federal authority, but that he was acting under the law of Congress as the President's representative and could not subject himself, in that capacity, to the jurisdiction of courts or commissions beyond the provisions of the law.

Considering the purpose for which the statute was enacted, and the extent to which it would be defeated by a division of

authority, as well as the terms of the statute itself, there can, in his opinion, be no reasonable doubt that the intention is that during the period of federal control rates may be initiated to apply to both intrastate and interstate business, and that complaints of such rates are exclusively within the jurisdiction of the Interstate Commerce Commission, which can be relied upon to do justice to all interests. Any other construction of the statute might have been fatal to the prosecution of the war, and would now result in creating an indefensible discrimination between interstate transportation charges and state charges, and serious curtailment of the revenue which the Railroad Administration must have in order to perform the duties placed upon it by Congress.

The director general pointed to the fact that the correctness of this position seems to be conceded in many of the states where no question is made as to the power vested in the President to initiate rates applicable to intrastate business, and as to those rates being beyond the jurisdiction of the state authorities.

He expressed the hope that the states which have brought suits based upon the opposing contention may for the present at least hold them in abeyance. If such suits are pressed, he said, the government, although it desires to give the most respectful consideration to the views of the state authorities, has no alternative except to proceed upon the theory that the action of the President's representative in establishing rates is not within the jurisdiction of either state commissions or courts, and that orders prescribing rates instead of those which have been initiated, and injunctions forbidding the application of the initiated rates to state shipments cannot be observed as to railroads under federal control.

If the government is compelled to engage in a legal contest, he said, no other position can be taken, and there is no other course that will protect the general public interest.

Aside from the provisions of the statute which empower the President to initiate rates without distinction as to interstate and intrastate traffic, he said that he could not conceive that any state would be placed at a practical disadvantage, inasmuch as if any such rates are deemed unreasonable or unjust, the state itself, or the commission of the state, or any citizen of the state is free to file a complaint before the Interstate Commerce Commission and have it determined in the light of all of the facts. He reiterated that his concern is not because of any misgiving as to the power of the President under the federal control act, but because of his aversion to the United States government being forced into a contest with any of the states about these matters.

**Continued Heavy Car Loading Urged**

The Railroad Administration hopes to be able to continue the records for heavy car loading set this year in spite of the fact that it will not have the aid of the power of the Food Administration to force heavy loading of food commodities. The Car Service section recently issued Bulletin No. CS-86, canceling Bulletin No. 41; embodying the United States Food Administration's Rules and Regulations governing the loading of food and feed commodities. The bulletin adds:

"The heavier loading of freight cars, the campaign for which has had the valued aid and support of the several departments of the government, as well as the hearty co-operation of shippers, has been a very material factor in accomplishing the following: 1st—An increased car supply. 2nd—Lessened congestion on the railroads, particularly at terminal points. 3rd—Improved service made possible by such lessened congestion.

"If it be thought that the improved car supply which exists at the present time makes it less necessary to load cars to full capacity, it should be borne in mind that a return to the old practice of light loading would speedily bring about another car shortage and congestion, by reason of the increased number of cars used to carry a given tonnage. Numerous

shippers have volunteered the information that it is their purpose to continue to make the fullest use of equipment, maintaining records established during the war, regardless of tariff minima. They apparently realize the advantages gained, which will prevent useless waste and a return to transportation conditions which formerly prevailed.

"The Railroad Administration will continue its efforts to closely supervise the loading of all commodities, in order that demands for service may be promptly met, and we ask the continued co-operation of all shippers to this end. Reports of all instances of light loading of equipment will be made to the Car Service Section, as heretofore."

**The Export Situation**

According to the report of the Exports Control Committee for the week ended January 4, made public by Director General McAdoo, there was an accumulation of export freight on hand at north Atlantic, south Atlantic and Gulf ports, due to the slow acceptance of freight by ships on account of the inefficiency of labor during the holiday season and delays to shipping incident to bad weather. The movement of food-stuffs to be sent overseas and used in relief work continued unabated.

The total overseas movement since the signing of the armistice shows a steady increase. It was decided to temporarily suspend loading of all export freight covered by G. O. C. permits destined to Boston, New York and Philadelphia (exclusive of grain to Boston), effective as of the third instant, until further notice.

The total receipts and deliveries at north Atlantic ports for the week ended December 30, was as follows, in carloads:

	(In cars)	
	Received	Delivered
Export freight at North Atlantic ports, exclusive of U. S. government freight, bulk grain and coal....	7,543	5,418
U. S. government freight on railroad operated terminals .....	3,107	2,862
Total .....	10,650	8,280

showing an accumulation of 2,370 cars in addition to those reported last week and the week before.

The arrivals of carload export freight at North Atlantic ports (exclusive of bulk grain and coal) during the month of December totaled 50,896 cars, while deliveries were 45,174 cars, resulting in an increase in freight on hand, due to delays to ships on account of severe weather on the Atlantic, necessity for repairs after arrival, and the labor situation.

The total accumulation for all ports, including South Atlantic and Gulf, for week ended December 26, was:

	In cars	In to's
North Atlantic .....	2,502	67,360
South Atlantic .....	174	5,460
Gulf .....	520	24,040
Total .....	3,196	96,860

This emphasizes the necessity for a strict continuance of the permit system. The average daily delivery of cars of export freight at North Atlantic ports, April to December, 1918, inclusive, was as follows:

Port	April	May	June	July	Aug.	Sept.	Oct.	Nov.	Dec.
Boston .....	100	98	76	92	64	26	88	86	90
New York....	680	814	845	932	741	712	1,029	1,104	1,141
Philadelphia ..	105	184	123	128	154	147	150	252	166
Baltimore ...	124	122	140	156	105	109	113	161	151
Newport News	24	106	104	103	76	147	145	111	79
Norfolk .....	22	24	63	69	92	107	112	101	92
Total .....	1,055	1,348	1,351	1,480	1,232	1,248	1,647	1,815	1,719

The estimated tonnage of export freight (including U. S. government freight, but exclusive of bulk grain and coal), disposed of during the month of December, compared with December export tonnage of previous years, is as follows:

With December, 1913,	185.9 per cent increase
With December, 1914,	158.3 per cent increase
With December, 1915,	104.5 per cent increase
With December, 1916,	48.5 per cent increase
With December, 1917,	107.5 per cent increase

**Interpretation of Wage Order**

Director General McAdoo has issued the following interpretation No. 8 of General Order No. 27:

As there seems to have been a misunderstanding on some railroads as to the application of General Order No. 27, the said order is hereby interpreted to apply to all persons in the employment of the railroads earning less than \$250 per month in December, 1915. Where such persons have not been granted the increases provided for in General Order No. 27 such increases will be made applicable retroactive to January 1, 1918, and until superseded by supplements thereto.

**New York Central and Other Contracts Signed**

Director General McAdoo on January 2 signed the compensation contracts for the various roads comprised in the New York Central system, providing for annual payments as follows: New York Central Railroad, including Toledo & Ohio Central, Zanesville & Western, Kanawha & Michigan, and Kanawha & West Virginia, \$58,122,084.92; Cleveland, Cincinnati, Chicago & St. Louis and Muncie Belt, \$9,945,738.41; Pittsburgh & Lake Erie, \$8,980,219.40; Lake Erie & Western, \$1,548,541.69; Cincinnati Northern, \$317,628.01; Indiana Harbor Belt, \$296,053.57; Michigan Central and Chicago, Kalamazoo & Saginaw, \$8,105,727.04; Lake Erie & Eastern, \$127,081.06; Detroit Terminal, \$186,460.40.

Director General McAdoo, just before leaving for California, also signed the compensation contract of the Pennsylvania Railroad Eastern Lines, including the Baltimore & Sparrows Point, Cumberland Valley, New York, Philadelphia & Norfolk, Union Railway of Baltimore, Barnegat Railroad, Philadelphia & Beach Haven and Rosslyn Connecting. The annual compensation is \$53,603,427.

**Exchange Transportation**

Director General McAdoo has issued Supplement No. 2 to General Order No. 6, extending over the year 1919 the authority to renew contracts between carriers and newspaper publishers providing for an exchange of intrastate railroad transportation for advertising, providing that the rates charged by the publishers shall not exceed their usual commercial rates, that the value of the transportation shall be computed on the basis of normal tariff fare for one way tickets, and that transportation so used shall not be used upon any part of an interstate journey.

**Clover Leaf Allocation Suit Not Yet Decided**

The United States court at Toledo, in charge of the receivership of the Toledo, St. Louis & Western, has ordered the receiver of the road to accept 350 of the 1,250 standard freight cars allocated to it by the Railroad Administration, but has not yet rendered a final decision on the suit of the stockholders of the road for an injunction. The case was argued on December 30. The order to accept the 350 cars came after that date but was issued pending a final decision on the merits of the case.

**Collection of Miscellaneous Rents**

P. S. & A. Circular No. 57 provides that miscellaneous rents due to a corporation whose property is under federal control may be collected for it by the employees of the United States Railroad Administration, provided the arrangement is requested by the proper officer or officers of the corporation. In accounting for miscellaneous rents collected at the request of the corporation, the payment of which should be made to it monthly, a charge of 2½ per cent upon the gross collections should be retained by the federal treasurer as compensation for the labor and expense involved. Federal auditors shall account for the amounts retained out of such collections as miscellaneous income.

# Proposals for Disposition of the Railroads

## McAdoo Argues for Five Year Test—I. C. C. and Railroads Advocate Revision of Regulatory Policy

WASHINGTON, D. C.

**D**IRECTOR GENERAL McADOO's plan for a five years' longer test of government operation of the railroads received some hard knocks during the first week of the hearing before the Senate Committee on Interstate Commerce called to consider proposals for the disposition of the railroads. Mr. McAdoo's prepared statement, which is published elsewhere in this issue, elicited not a word of approval from any member of the committee for the five-year plan, although there was some appreciation of the accomplishments of the Railroad Administration during the past year.

He was followed on Tuesday by E. E. Clark, chairman of the legislative committee of the Interstate Commerce Commission, who presented a statement on behalf of the commission (Commissioner Woolley dissenting), favoring a return of the railroads to private ownership after a reasonable period of readjustment or preparation and after reasonable notice of the date. The commission not only expressed the conviction that "with the adoption of appropriate provisions and safeguards for regulation under private ownership," which it outlined, "it would not be wise or best at this time to assume government ownership or operation of the railways of the country," but it also opposed a return of the properties in a precipitate way and later, in reply to a question, Mr. Clark said Congress ought to withdraw from the President the power he has to return the roads back on an hour's notice, and that Congress ought to say when they shall be turned back. It is understood that a resolution to this effect will soon be introduced in the Senate. The commission's statement and Commissioner Woolley's dissenting opinion are also published elsewhere.

The respect with which the senators listened to such recommendations of the commission as the repeal of the prohibitions against consolidation of competing lines and against pooling, the limitation of unnecessary railway construction and the power to prescribe minimum rates, indicated a growing appreciation of some of the points which have been urged for several years by the railroads and of the difficulties which the railroads have experienced under a system of regulation designed to restrict rather than to encourage and develop. The committee members also manifested some satisfaction that the commission had not agreed with Mr. McAdoo's five-year plan. The commission was very respectful to Mr. McAdoo. Its statement did not even refer to his plan, nor did it express a word of criticism of the Railroad Administration. It merely expressed in unmistakable language the conviction that it would not be wise or best at this time to assume government operation or ownership of the railways. It was not until Senator Watson asked a direct question that Mr. Clark made any reference to the five-year plan, when he said that the commissioners, with the exception of its member who has had the least experience in matters pertaining to railroad regulation, do not think it is a wise plan, and that it would not be desirable to place full authority to run the railroads in the hands of one man.

Opposition to the five-year plan was again expressed by T. De Witt Cuyler, chairman of the Association of Railway Executives, who presented on Thursday a series of principles adopted by the executives of 92 per cent of the country's railway mileage, which they believe ought to form the foundation of the national legislation necessary for the readjustment of the railroads to peace conditions, including

provision for the continuance, under private operation, of a large part of the measures taken by the Railroad Administration during the war to co-ordinate and unify railway facilities. The statement of the plan as presented by Mr. Cuyler is printed elsewhere in this issue. He was to be followed by Alfred P. Thom, counsel for the Association of Railway Executives, with a legal argument, while Daniel Willard, Julius Kruttschnitt and S. T. Bledsoe were to present various aspects of the railroad situation.

### Mr. McAdoo Questioned by Committee

Director General McAdoo's argument apparently made little impression upon the committee. The questions put to Mr. McAdoo by Senators Cummins, Kellogg and Watson particularly indicated hostility to the idea of a further experiment of government operation and a belief that legislation to improve regulation and to make possible a continuance of some of the advantages of the co-ordination of railroad facilities effected during the past year would present a more satisfactory solution. These Senators and others laid particular emphasis upon the great increase in expenses and the deficit as a result of the year's operations. They also indicated a strong belief that the obstacles which Mr. McAdoo mentioned to successful operation by the government during the 21 months after the war would exist to an even greater extent during a five-year tenure.

Mr. McAdoo expressed a little more strongly than he has heretofore an opinion that a five-year test would lead rather to some plan of private operation under strict centralized control by the government, but persistently declined to consider the possibility of agreeing upon any permanent policy for dealing with the railroads before it will be necessary to relinquish them. Such proposals as a repeal of the anti-trust law and a removal of the various other legal restrictions on the railroads he characterized as merely "palliatives" or "poultices," declaring that what is needed is a comprehensive plan which will consider the entire situation. He would not subscribe to the opinion that a mere removal of restrictions would result in the proper degree of co-ordination, and expressed some doubt as to whether private corporations could be safely entrusted with the degree of freedom of action which he would give to the governmental authority in charge of railroad operations. He said the inability of the railroads to meet the situation in 1917 was due only partly to legal impediments. He was plainly irritated by the line of questions implying criticism of the increase in expenses, attributing them to the conditions created by the war and the necessity for increasing wages.

Mr. McAdoo declared that if the five-year plan is adopted the short lines, which were excluded this year as not being needful or desirable for war purposes, should be included, because the purpose would be to test the whole transportation problem.

Senator Cummins asked Mr. McAdoo whether he proposed to retain the power to nullify laws and to continue to curtail the authority of the Interstate Commerce Commission and state commissions. Mr. McAdoo replied that successful operation could not be obtained without concentration of authority, and that while it might be wise to modify the powers of the President in some details the full benefits of federal control could not be had without retaining them substantially. He declared that the manner in which the rate authority was exercised during the war was

not an indication of the methods to be followed under peace conditions.

Senator Cummins also asked whether the present rate of guarantee to the railroad companies should be continued. Mr. McAdoo said he thought that the country could afford to continue it for a test period. Senator Underwood expressed doubt as to whether the government could keep the railroads for a longer period without paying their value.

When Senator Cummins kept pressing the idea that a legislative solution could be obtained within a year if Congress is allowed time to study it, Mr. McAdoo said he could work out a plan in that time, but doubted whether 600 minds could meet on one. He thought that while the test was being carried on Congress could agree on a permanent plan which would be ready at the end of the period.

Several senators expressed apprehension of grave consequences if the railroads should be returned to their owners too precipitately, on the ground that state rate laws would automatically go into effect and their effect would crumble the interstate rate structure. Mr. McAdoo said he thought the various commissions would recognize the necessity of keeping rates high enough to meet the increased costs, and he scouted the idea that the return of the roads would mean bankruptcy, except in the case of the weaker roads. Senator Cummins said it would be "little less than a crime" to turn back the roads without giving them time to prepare for it. Mr. McAdoo said the roads could be returned in "infinitely better condition on March 1 than they were in March, 1917."

In opposing the idea of continuing government operation through the 21 months' period, Mr. McAdoo said it would be impossible to carry on a program of needed improvements because the corporations, not being particularly friendly to federal control, would not co-operate, but that if assured of a five-year period, and their credit strengthened by a government guarantee, they would realize the necessity of co-operating.

Senator Kellogg brought out the fact that the expenses of the Railroad Administration are not included in the operating expenses of the carriers as reported by the Interstate Commerce Commission. Mr. McAdoo promised to file a statement showing the amount. The senator also pointed out that the corporate expenses were not included in operating expenses in 1918, although they had been previously. Mr. McAdoo said that the operating ratio for several months had been increased by the inclusion of back pay and that for the months of July, August, September and October, since the rate increase, if the back pay is excluded, the operating ratio in 1918 was 67.4, as compared with 67.9 in 1917. He said the force of the central administration at Washington was about 1,100.

Senator Kellogg insisted that the five-year plan would constitute a test of only one system of operation, and would throw no light on other possible plans, while Mr. McAdoo pictured his idea of federal control as a form of protection thrown over the railroads while they were experimenting with various ideas that might later be continued under private management.

"But if Congress turns you down, you have no suggestion to make for legislation to provide proper regulation?" said Senator Watson.

"I have but one suggestion," replied Mr. McAdoo. "I want a test and I must reserve judgment as to a permanent plan until I get further light."

"Suppose the five-year test results in failure," said Senator McLean, "would that demonstrate the failure of government ownership?"

"The five-year test would show something conclusive," replied Mr. McAdoo. "I don't know what."

Senator Kellogg also questioned Mr. McAdoo on the subject of car supply, bringing out the fact that only a small percentage of the cars and locomotives ordered in 1918 were

delivered. Mr. McAdoo said that effective operation has practically enlarged the supply of cars and that there has been no shortage. Senator Kellogg then filed the following statement from the Interstate Commerce Commission records showing the number of cars and locomotives added and retired each year:

Year	Freight Cars		Locomotives	
	Added	Retired	Added	Retired
1908.....	17,156	70,776	3,227	1,140
1909.....	67,925	83,223	1,549	1,333

1915.....	2,664	1,385	10,228	11,787
1916.....	1,261	2,156	13,086	13,446

Senator Townsend paid a high tribute to Mr. McAdoo's management during the past year, but called attention to the fact that it is proposed to turn the operation of the roads for the future over to an unknown man. When Mr. McAdoo expressed confidence that the right kind of a man would be selected, the senator remarked that "we don't always get them," and said he thought there was no more of a presumption that the right kind of a director general would be chosen than that Congress could enact the right kind of legislation. In concluding his testimony, Mr. McAdoo summed up his argument as follows:

"My judgment is that the American people are entitled to a fair test of federal control under peace or normal conditions. We have spent large sums of money to win the war, and part of that money has been used to gain some experience in the unified operation of the railroads, an experience necessitated by the war and by the incompetency and inefficiency of private control under existing laws and conditions. I am not suggesting that anybody should be blamed because the laws are as they are or because competitive conditions under private control were as they were. I am speaking only of the inefficiencies and deficiencies of the system and not of individuals.

"We have expended a great deal of government money on improvements for the railroads and for equipment during the war period. We may have to carry for some time a part of the cost of these improvements and this equipment before we can liquidate this cost and secure repayment from the carriers.

"As I said in my testimony before this committee one year ago, I felt sure that the government would have to expend large sums of money for the improvement and betterment of railroad properties during the period of federal control and that I was sure that the government would have a better chance to secure the payment of its advances to the railroads while in possession of their properties than when out of possession. Having expended so much money on the railroads and having carried forward this experiment in unified operation to a point where I now think we can enter upon its last stages with obvious benefit to the public interest, it seems to me a pity to throw away all that we have gained and to attempt a hasty solution which may not be a permanent solution at all, but a mere makeshift, and which may injure the best interests of the American people irreparably at a time when we are facing a new world condition which demands that America shall be on the alert and not only look forward but go forward without hesitation or delay.

"It seems to me that it is our plain duty to preserve the mobilized energies and industries of America in the form of railroad control for a five-year period and use our unified railroads during the great time ahead of us and co-ordinate and synchronize their operation with our great merchant fleet, giving to all the ports on the Atlantic, Gulf and Pacific coasts adequate rail facilities to meet adequate shipping in those ports, so that the development of our country may be carried forward homogeneously and symmetrically and every part of our people be permitted to share in the great prosperity which is now opening up to us. If we control the railroads and the ships, we can develop all the ports advantageously, distribute the traffic of the country over all the facilities so as to avoid needless congestion and loss and have a unified system of rail transportation on land and ship transportation on the high seas that will bring a new and greater era of prosperity and happiness to the American people than they have ever before enjoyed."

Director General McAdoo has already found it necessary to revise the estimate presented in his statement before the committee that the deficit for 1918 would be about \$136,000,000. In a letter to Chairman Smith of the committee on January 7, he presented a new estimate that the operating income of the Class I railroads would fall short about \$196,000,000 of paying the standard return. He enclosed a letter from G. H. Parker, assistant to Mr. Hines, stating that the returns for the month of November have become available to a large extent, and they indicate that the operating income for November will be less by about \$28,000,000 than the amount estimated last week. This falling off, he said, is accounted for by a falling off in business resulting in a decrease in revenues to the extent of \$6,000,000 and by an increase in expenses due almost wholly to increased wages, including back pay, of \$28,000,000. Mr. McAdoo said in his letter that the fact that these estimates are necessarily subject to revision lends additional point to the statement that it is impossible to predict satisfactory conclusions upon the present necessarily incomplete results for even a single year of government control, especially under war conditions.

#### Commissioner Clark's Statement

Commissioner Clark began his statement by saying it had been adopted by the commission in conference on December 21 and represented the opinion of all the commissioners except Commissioner Woolley. No specific suggestion for legislation regarding wages and working conditions had been included because of the feeling that there was no justification for the commission to suggest that it would be more successful in dealing with the problem than the various agencies for mediation, conciliation and arbitration already provided for by law. It had not included any reference to the depreciation matter because it could see no occasion for legislation on the subject, as the commission now has the power to require carriers to set up depreciation funds. The whole question involves many complications as to what is a proper charge and the commission has directed a very careful inquiry into the entire subject. As to Commissioner Woolley's objection to blanket and group rates, Commissioner Clark pointed out that if the rates from various coal mines in a given district were not grouped, but were graded in accordance with distance, the entire advantage would go to the producer nearest to the consuming market who would make his price to the public only a shade under the price which the more distant mine could make with its higher freight rate, whereas the group system of rates gives equal opportunity to the producers and consumers. He also pointed out some objections to a mileage system of rates, saying that if grain rates were made on a mileage basis a point would be reached beyond which it would be impossible to ship grain.

Amplifying the suggestions made in the prepared statement, Commissioner Clark expressed the opinion that the

public interest would be served if the stronger roads were allowed to take in their weaker connections, receiving the benefit of the traffic turned over to the main line as an offset to the possible unprofitable operation of the branch line. He said he and his colleagues could see no possible harm from such absorption of smaller lines by the larger as long as the government may regulate the rates, and that it is a great deal easier to regulate one large, well-developed corporation than a number of poorly organized companies on the verge of bankruptcy. The idea of the commission is that sound public policy would permit the consolidation of even competing lines with the approval of proper public authority after an investigation.

Members of the committee asked many questions, which indicated sympathy with the attitude expressed by the commission. Senator Gore asked for its attitude regarding the right of the shipper to route his freight, to which Commissioner Clark replied that the present law undoubtedly invites uneconomical routing.

In reply to Senator Underwood, Commissioner Clark said that if the anti-trust law should be abolished and pooling permitted it would be necessary to provide for some regulation of service. Senator Underwood also asked how the commission could regulate the securities of corporations organized under state laws, and as to the commission's attitude toward federal incorporation. Mr. Clark said the commission has entertained no doubt of the power of Congress to regulate the issuance of securities because of the effect of the amount of capitalization upon interstate commerce, and that they thought the subject was controlled by the principle announced by the Supreme Court that when Congress speaks, state action must give way. The commission thought, therefore, that proper supervision of the issuance of securities and of the expenditure of money derived therefrom would be a purely regulatory function which it would be proper to give to the commission, and would be sufficient without going into the question of federal incorporation. In reply to Senator Underwood, Mr. Clark also expressed an opinion that it might be well to give the commission power to initiate rates, although its recommendation extended only to the power to prescribe a minimum rate. He said that the initiation of rates by the carriers was very satisfactory to some shippers but very unsatisfactory to others because the power of the shipper with a large tonnage is very great.

Commissioner Clark read into the record a statement showing the capitalization, earnings and percentages of return of the carriers from 1900 to 1916, as a reply to the statements that the credit of the railroads has been destroyed by niggardly regulation. The figures, he said, point to the fact that in the aggregate the increase in revenues has kept pace with increased investment, that the operating income has increased more than the mileage, and that the surplus of the roads has increased marvelously. He expressed the opinion that if the commission were given the power to regulate security issues and initiate rates and some supervision over operation and service, the unsatisfactory conditions would be largely relieved. He thought that if the commission should fix a reasonable level of rates they would be accepted, generally speaking, both by the railroads and by the public with much less litigation than results from the rates initiated by the carriers.

"Then all of the commissioners with the possible exception of Commissioner Woolley are against Mr. McAdoo's five-year plan?" said Senator Watson.

"We don't think it is a wise plan," replied Commissioner Clark.

"And all of the commissioners, with the possible exception of Commissioner Woolley, are opposed to government ownership?"

"Yes," replied Commissioner Clark, "except that one or two of my colleagues say that they would favor government ownership in preference to some plans that have been sug-

gested." "You agree that it would be unwise to cast the railroads back without legislation?" said Senator Watson.

"Yes, unqualifiedly," replied Mr. Clark.

"Are you in favor of the elimination of all competition?" asked Senator Watson.

Commissioner Clark replied that competition in service ought to be preserved, and that the commission had never thought of consolidating the New York Central and the Pennsylvania, for instance, but rather of the consolidation of the shorter and weaker lines into larger systems. He said he had never been able to see the benefits to be derived from the so-called regional system, but thought it would be better public policy if the railroads were to be consolidated into a comparatively few large systems which then ought to be required to develop their territory by the extension of new lines where necessary.

Senator Watson asked if the commission would favor the creation of a cabinet officer to run the railroads.

"We don't think that would be a desirable plan," replied Commissioner Clark. "One man can make up his mind more quickly than a commission, but several minds working together are more calculated to produce the right result."

"Do you think Congress ought to take five years to make up its mind?" asked Senator Pomerene.

"No," replied Commissioner Clark.

Continuing his testimony on the following day, Commissioner Clark went into detailed analysis of the earnings and expenses of the railroads in 1918, 1917 and the three-year test period, showing that the standard return for the test period for the 10 months including October was \$779,694,244, as compared with a net operating income for the corresponding period of 1918 of \$605,178,922. The standard return for the full year the commission had calculated at \$929,966,992. Mr. Clark said that while railroad conditions were abnormal in 1918 they were also abnormal in 1917, and he doubted if Congress could get any great amount of additional information by extending the period of experimental control for five years. Within one year he thought Congress could gather all the information necessary and enact the necessary legislation. He said that while the Railroad Administration had been able to do many things that could not be done by private management under the present laws, there had never been any demonstration of what private management could do under other laws and he remarked that there was some advantage to the Railroad Administration in having a revolving fund of \$500,000,000 "even if it didn't revolve."

Senator Pomerene asked if he saw any reason why the various administrative and legislative reforms could not be carried out even if the roads were turned back to their owners at an early date. The commissioner replied that the reforms could be made but their effect would be less. If the railroads were turned back they would be confronted by limitations of existing laws and be unable to do promptly many things that he was sure they would do if they were permitted. Without legislation, he said, they would be unable to continue many things which federal control has demonstrated to be advantageous, and it seemed to the commission most desirable that the legislation be enacted before the railroads are returned. He thought Congress ought to withdraw from the President the power he has to turn back the railroads on an hour's notice and that Congress ought to say when they shall be turned back. Congress could say that the period of federal control will terminate on a given date far enough ahead to allow legislation to be perfected and this would end the uncertainty.

When Commissioner Clark said that he had seen many a poor railroad turn into a good railroad after having been taken over by a large system, Senator Underwood asked what could be done in the case of an independent railroad that might be left in a precarious position because of the refusal

of a connecting line to take it over. Mr. Clark thought Congress ought to allow a wide discretion to the commission in such matters so that the commission might withhold its approval of any consolidation that would leave an independent property stranded.

Senator Cummins, who has a plan for government ownership of railroad property with private operation, under which the government would issue stock or bonds for the railroads paying, say, 4½ per cent, asked the commissioner if he had considered any way in which the capital charge of railroad operation could be reduced. Mr. Clark said he had not arrived at any conclusion that would enlighten the committee. The senator said that if all capitalization were on the basis of 4½ per cent, the public would be saved approximately \$250,000,000 a year by removing the necessity for paying a larger percentage on stock. Mr. Clark expressed no opinion on this point, but he agreed with Senator Cummins that private operation is more economical as far as operating expenses are concerned than government operation would be because of the larger incentive for saving, less probability of expenditures for the purpose of meeting the insistence of the residents of certain sections, and because private management is more likely to adopt new methods that will yield economies. Asked for his opinion as to whether the wages of employees should be reduced under private operation, Commissioner Clark said that, speaking generally, his view is that wages have not been advanced beyond a fair point, although perhaps some further adjustments ought to be made. Senator Cummins also asked where the director general gets his authority to set aside state rates, in view of the reservation to the states in the federal control act of police powers. Without answering this directly, Mr. Clark said he knew of no statutory authority for the director general to do anything except that contained in the federal control act and that the commission had always regarded the power to regulate rates as the exercise of police powers.

"Do you think the President ought to continue to have power to initiate rates?" asked Senator Cummins.

The commissioner replied that the only reason for giving him that power was that the government had assumed the payment of compensation to the railroads and ought to be able to earn it, but that he had always believed that the operation of the railroads for war purposes would have to result in the payment by the government of certain sums as part of its war expenses, which ought not to be charged to shippers.

Senator Pomerene introduced into the record some correspondence between Commissioner McChord and Francis H. Sisson, vice-president of the Guaranty Trust Company, in which the commissioner stated that the Interstate Commerce Commission had allowed the railroads in blanket rate cases from July 1, 1910, to July 1, 1917, increases in revenue amounting to \$350,000,000 a year.

Representatives of the National Association of Owners of Railroad Securities, the Investor's Protective League, the American Short Line Railroad Association, the National Association of Railway and Utilities Commissioners, and the shippers and the labor organizations were also in attendance at the hearing prepared to testify. How long the hearings are to continue has not been definitely decided. Chairman Smith of the committee, in announcing the hearings, said it was hoped to complete them by January 15, if possible, but Republican members of the committee are in favor of a thorough consideration of the question and legislation at an extra session after March 4.

Chairman Sims of the House Committee on Interstate Commerce on January 7 introduced a bill to carry out Mr. McAdoo's plan providing for an extension of federal control until January 1, 1924, and appropriating a further sum of \$500,000,000, which is to be made a part of the revolving fund.

# General News Department

A meeting of the standardization committee of the American Gear Manufacturers' Association will be held at the Hotel Statler, Buffalo, N. Y., January 13 and 14.

The National Farmers' Reconstruction Conference, at a meeting held in Washington on Wednesday of this week, adopted resolutions urging Congress to enact without delay legislation providing for Government ownership of railroads. The proposed five-year test was disapproved.

E. T. Owens, Private Company D, Thirty-seventh Engineers, with the American Expeditionary Forces in France, and formerly associate editor of the *Railway Age* and the *Railway Signal Engineer*, is now attached to headquarters and has been assigned the task of writing the regimental history.

Brigadier-General Henry W. Thornton, general manager of the Great Eastern Railway of England, and formerly general superintendent of the Long Island Railroad, has been gazetted Knight Commander of the Order of the British Empire. General Thornton became a British subject in 1916. He is a member of the Railway Executive Committee which, acting for the Government, has operated the railways of the United Kingdom during the war.

A strike of freight handlers at New York City last week, Thursday, depleted the forces at the freight stations by several thousand men; but most or all of the strikers returned to work on Tuesday, January 7, after having been out three or four days. Work was resumed on promise of early attention to the demands of the men by the Federal Railroad Wage Board. While the men were out embargoes were laid on non-perishable freight destined to the New York piers but not including freight to be unloaded from team tracks; and on some commodities the embargo was placed against Boston and Philadelphia freight as well as that destined to New York, the movement of export freight having been seriously affected.

## Railway Storekeepers' Association

### to Hold Business Meeting

The Railway Storekeepers' Association has decided to hold no convention this year but in its stead a business meeting at the Hotel Sherman, Chicago, on January 27, 28 and 29. Among the subjects to be considered at the meeting are, fundamental principles of railway storekeeping; unapplied material; labor and labor saving devices; scrap and scrap handling; the use, inspection and handling of lumber and cross ties; the conservation of materials and of cars, and the accounting for materials in the store's department.

## Nominees for American Railway

### Engineering Association Offices

The nominating committee of the American Railway Engineering Association has selected the following candidates for offices for the ensuing year: President, Earl Stimson, general superintendent maintenance of way and structures, B. & O., Baltimore, Md.; vice-president, J. A. Atwood, chief engineer, P. & L. E., Pittsburgh, Pa.; treasurer, Geo. H. Bremner, district engineer, Bureau of Valuation, I. C. C., Chicago; secretary, E. H. Fritch, Chicago. For directors, the committee nominates Hadley Baldwin, assistant chief engineer, C., C. & St. L., Cincinnati, Ohio; C. F. Loweth, chief engineer, C., M. & St. P., Chicago; J. C. Mock, signal-electrical engineer, M. C., Detroit, Mich.; Geo. A. Mountain, chief engineer, Canadian Railway Commission, Ottawa, Canada; J. A. Peabody, signal engineer, C. & N. W., Chicago; H. T. Porter, chief engineer, B. & L. E., Greenville, Pa.; E. B. Temple, engineering assistant to regional director, U. S. R. A., Philadelphia, Pa.; F. L. Thompson, chief

engineer, I. C., Chicago; F. E. Turneure, dean, College of Engineering University of Wisconsin, Madison, Wis. Five members of the nominating committee are named, as follows: J. R. W. Ambrose, chief engineer, Toronto Terminals Railway, Toronto, Canada; D. J. Brumley, chief engineer for corporation, Illinois Central Railroad Company, Chicago; Maurice Coburn, supervising engineer, Pennsylvania Lines, Indianapolis, Ind.; C. F. W. Felt, chief engineer, A., T. & S. F., Chicago; E. A. Hadley, engineering assistant to regional director, U. S. R. A., St. Louis, Mo.; H. E. Hale, group engineer, Presidents' Conference Committee, New York City; A. W. Newton, chief engineer for corporation, C., B. & Q., Chicago; G. I. Ray, chief engineer, D., L. & W., Hoboken, N. J.; Louis Yager, engineer maintenance of way, N. P., St. Paul, Minn.

## Additional Enlistment Records

Information concerning the number of railroad men who joined the armed forces of the nation was received from the following roads too late for publication in the annual statistical number of the *Railway Age*:

NUMBER OF MEN IN MILITARY OR NAVAL SERVICE			
Name of Road	Number	Name of Road	Number
Gulf, Colorado & Santa Fe....	881	Houston Belt and Terminal....	48
International & Great Northern (Fort Worth Division).....	93	Fort Worth Belt.....	7
St. Louis-San Francisco of Texas (including Fort Worth & Rio Grande) .....	44	Texas Midland .....	14
		Norfolk Southern .....	243
		Kinston-Carolina .....	5
		Carolina .....	1

## National Foreign Trade Council at Chicago

The annual meeting of the National Foreign Trade Council will take place at Chicago on April 24, 25 and 26. A large committee on arrangements has been formed to provide adequate accommodations and suitable entertainment for the delegates to the convention. John J. Arnold, vice-president of the First National Bank, Chicago, is chairman of the committee, and the other members include labor leaders, bankers and prominent industrial and commercial men. R. H. Aish-ton, Northwestern regional director at Chicago, is a member of this body.

## Railway Business Association

The Railway Business Association met at the Hotel La Salle, Chicago, Thursday, January 9, with morning and afternoon sessions and an evening dinner. Two hundred railway supply men were in attendance. In his opening address, Alba B. Johnson, of the Baldwin Locomotive Works, president of the association, emphasized the importance of association members leading in the discussion of the national railway problem and in shaping public opinion favorably to the ideas held by the Business Association. He urged the members to promote systematic study of the railway problem by local commercial associations. He thought the members more ready to recommend an extra session of Congress to consider legislation than to recommend a definite plan at the present time. He also discussed the relations of the association to government purchasing methods. The original purpose of the association to promote co-operation between the railways and the public is now enlarged to include relations between the railway buyer and seller. The policy of the association has been to consider individual grievances as outside the scope of the association, but general practices affecting the entire industry within its scope. An association can handle such matters which an individual could not. The committee on government purchasing policies and other standing committees presented reports and resolutions, which were adopted.

The association adopted resolutions opposing the arbitrary

had immediately used the fire extinguishers which were at hand in the car. The jury recommended that porters be regularly put through a fire drill.

### Railway Revenues and Expenses for October

Net operating income of the railways for October as reported by the Interstate Commerce Commission again showed a decrease, the total being \$87,106,126, as compared with \$102,700,478 in October, 1917; decrease \$15,594,352. While the operating revenues increased \$107,000,000, the increase in expenses was \$123,000,000, and the operating ratio for the month was 78.35, as compared with 67.98 in October, 1917. After having shown a decrease for the first six months of the year, net operating income had increased in July, August and September, under the influence of the higher freight and passenger rates that went into effect in June; but in October the expenses again overtook the increase in revenues. The operating income per mile for October was only \$384, as compared with \$428 for the month of October in the "test" years ending June 30, 1915, 1916 and 1917.

For the 10 months ending with October the net operating income was \$605,178,922, or \$228,000,000 less than that for the corresponding period of 1917. While the total operating revenues, \$4,032,234,144, were \$677,000,000, or 20 per cent greater than in 1917, the operating expenses, \$3,247,085,929, were \$903,000,000, or 38 per cent greater, and taxes were \$8,000,000 greater. The operating ratio was 80.53, as compared with 69.87. The freight revenues increased \$461,000,000; passenger revenues \$181,000,000, and express revenues \$15,000,000, while the mail revenues decreased \$5,000,000. Of the increase in expenses, \$138,000,000 was for maintenance of way and structures, \$333,000,000 for maintenance of equipment, \$426,000,000 for transportation and \$12,000,000 for general expenses. Traffic expenses decreased \$12,000,000. The figures for October are shown in the large table.

### Master Car Builders' Rules of Interchange Modified

The Master Car Builders' Association has recently issued Circular No. 25 announcing certain changes in the 1918 Code of Interchange Rules. A second paragraph has been added to rule 8, which specifies that when repairs are made to cars of private ownership equipped with a receptacle for cards, a copy of the billing repair card shall be inserted in the receptacle. A new rule, No. 23, has been formulated which provides for the periodical repacking of journal boxes. Rule 120, with some modifications, has been reinstated, effective January 1, 1919, to provide for the disposition of cars belonging to private car lines and railroads not under federal control which require extensive repairs for which the owners are responsible. The circular also contains two interpretations of Article II of the 1918 rules of interchange.

### New York Railroad Club Meeting

C. A. Morse, assistant director, engineering and maintenance department, Division of Operation of the U. S. Railroad Administration, will discuss the railroad question from an engineering and economic point of view at the regular meeting of the New York Railroad Club, which is to be held on Friday evening, January 17, at the Engineering Society's Building, New York.

### Master Mechanics' Association Appoints New Officers

At a meeting of the executive committee of the American Railway Master Mechanics' Association, held in Chicago on January 3, W. J. Tollerton, general mechanical superintendent of the Rock Island Lines, was appointed president of the association, to fill the vacancy caused by the resignation of F. H. Clark. C. F. Giles, superintendent of machinery of the Louisville & Nashville, was appointed first vice-president, and C. H. Hogan, assistant superintendent motive power, New York Central, was appointed second vice-president. The position of third vice-president was left vacant and will be filled by election at the time of the next annual meeting.

## Traffic News

A steel barge, designed for use on the Erie Canal, the first of 24 barges ordered by the United States Railroad Administration, was launched at the yard of the Ferguson Steel & Iron Company, Buffalo, N. Y., on January 4.

Coal loading for the week ended December 21 amounted to 211,177 cars, as compared with 216,967 during the corresponding week of 1917. The total increase for the year up to December 28 is estimated at 570,077 cars.

Bituminous coal production in the United States during the year just closed, as reported by the National Coal Association, amounted to 587,500,000 tons, an increase of approximately 36,000,000 tons, or nearly 7 per cent, over the production in 1917, which was in itself a record.

J. M. Belleville, general freight agent of the Pittsburgh Plate Glass Company, Pittsburgh, Pa., has been appointed a member of the Eastern Freight Traffic Committee as the representative of shippers, to succeed G. M. Freer. This committee's headquarters is in New York.

Reductions of 25 per cent or more are announced at New York in freight rates to ports in South America, Asia, Australia and Africa. To Para, Brazil, the rate quoted last week was \$22.50 a ton; to Buenos Aires, \$25 a ton; to points in Japan and China, \$45; Singapore, \$45; Manila, \$40.

Gen. W. W. Wotherspoon, superintendent of public works of the State of New York, in his annual report to the legislature, says that the federal government ought to discontinue its control of the New York State Canals, but he recommends that twelve months' notice be given before actually transferring the control back to the state.

J. W. McClymonds, vice-president and general manager of the Pacific Fruit Express Company, with headquarters at San Francisco, Cal., has resigned from that company to become general manager of the Federal Refrigerator Company, a new car icing concern which is a merger of a number of smaller companies, effective January 1.

The Iowa state railroad commissioners were granted an injunction recently restraining the American Railway Express Company from enforcing the express rates which were increased January 1. The express company is disregarding the injunction on the ground that it is not responsible for the rates as they were initiated by the director general; and furthermore it is declared that state authorities have no jurisdiction over transportation rates under the present scheme of government control. Similar injunctions have been secured by the railway commissions of South Dakota and Nebraska.

A. C. Johnson, chairman of the Western Freight Traffic Committee, Chicago, has issued Supplement 3 to reprint of Circular 3 containing explanatory rules in connection with the application of rates under General Order 28 of the director general: "Please refer to provision in Supplement 1 to reprint of Circular 3 for minimum carload charge and be advised that the minimum charge of \$15 should be applied to the movement of each unit of railroad equipment moving on its own wheels, but that in the case of the combination of separately published factors to make a through charge on such a shipment, the required minimum \$15 per unit is to be applied to the total charge made by such a combination and not to the separate factors."

R. D. Sangster, transportation commissioner of the Kansas City Chamber of Commerce, has written to C. A. Prouty respectfully suggesting and insistently urging that the Railroad Administration take prompt steps toward the re-establishment of foreign line offices to attend to diversions, the location of cars, the giving of passing reports and tracing, when necessary; as well as the proper quotation of rates, etc. The publication of a list designating representatives of initial lines to take care of foreign lines' interests is declared a

failure. It is suggested that consolidated off-line offices might be established, each to represent a certain region. It is desired that the offices of initial Kansas City lines be kept intact and be individually operated.

The sailing day plan for less than carload freight has proved, at Kansas City, very unsatisfactory, according to a complaint presented on behalf of the Kansas City Chamber of Commerce by R. D. Sangster, transportation commissioner of the Chamber. No objection is made to the movement of freight to common points by a single road, instead of accepting shipments over all of the roads every day, but the Chamber protests against the continuance, anywhere, of the rule for shipping freight to a given place on only two or three days a week. It is admitted that, to obtain fair tonnage, it may be proper sometimes to hold a car over for a single day, but the shippers demand that carriers receive the freight into the freight house every day. The protestants believe that Kansas City is discriminated against as compared with shipping points east of the Mississippi River where the sailing day plan is not in effect. It is claimed that peddling cars from Kansas City have been loaded so full that local conductors (at the larger stations) would not unload the freight and then the car would be set out and some of the freight delayed a whole day. This, it is claimed, has resulted in a great increase in the number of loss and damage claims. It is declared unreasonable to place so much emphasis on full car loading over routes where large numbers of empty cars are moving at all times, as for example, the westward movement in a grain producing territory.

### Lumber Manufacturers Open Traffic Bureau

The National Lumber Manufacturers' Association has opened a fully equipped traffic bureau in the Southern building, Washington, D. C. This bureau will interest itself in all traffic matters of a national character which affect the lumber industry. Frank Carnahan, for a number of years connected with the traffic departments of the Chicago, Rock Island & Pacific and the Chicago & Alton, is in charge of the bureau.

### Central Western Loading Records

Railroads in the Central Western region showed increases in grain and live stock traffic and a decrease in coal during December. These lines loaded 143,013 cars of grain as compared to 39,123 cars during the corresponding month of 1917, or an increase of 9.8 percent. There were loaded 100,145 cars of coal as compared with 132,819 loaded in December, 1917, or a decrease of 24.6 per cent. There was increase of 25.8 per cent in the number of cars of live stock loaded, the comparative figures for December, 1918 and 1917, being 61,170 cars and 48,622 cars respectively.

### Mississippi Valley Foreign Trade Convention

The Mississippi Valley Foreign Trade Convention will be held at New Orleans, La., on January 13 and 14. The primary purpose of this meeting is to promote the movement of foreign trade by way of the Gulf ports, the development of steamship lines and improvement of transportation facilities to and from the Mississippi Valley by way of the Gulf. The convention will give the producers and shippers of the Mississippi Valley an opportunity for concert of action and for co-operation in securing additional and cheaper channels of trade and wider foreign markets. It will be suggested to the convention that a Mississippi Valley Foreign Trade Development Bureau be organized for the promotion of foreign traffic through the Gulf ports. The speakers at the meeting will include Hon. Bainbridge Colby, of the United States Shipping Board; R. L. McKellar, secretary of the Exports Control Committee; M. J. Sanders, federal manager of the Mississippi-Warrior Waterways; John J. Arnold, vice-president of the First National Bank, Chicago; Harry H. Merrick, president of the Chicago Association of Commerce; James E. Smith, president of the Mississippi Valley Waterways Association; W. B. Thompson, president of the Dock Board, New Orleans, and Walter Parker, general manager of the New Orleans Association of Commerce.

## Supply Trade News

The French Government has conferred upon **Samuel M. Vauclain**, first vice-president of the Baldwin Locomotive Works, the title of Chevalier of the Legion of Honor.

**Ernest Baxter** has been appointed general sales manager of the Kansas City Bolt & Nut Company, with headquarters at Kansas City, Mo., succeeding **L. L. Middleton**, promoted.

**Edward F. Carry** has resigned as chairman of the Port Facilities Commission at Washington to return to his office at Chicago as president of the Haskell & Barker Car Company.

**Nelson T. Burns**, formerly inspector in the mechanical department of the New York Central at New York, has been appointed district salesman for the Vapor Car Heating Company, with headquarters at Chicago, succeeding **Roswell P. Cooley**.

**Cyrus J. Holland** has been appointed western representative of the Wine Railway Appliance Company, Toledo, Ohio, with offices at 730 Peoples Gas building, Chicago, succeeding the vice-president, **R. F. Tillman**, who has been assigned to other duties, with headquarters in Toledo.

**Nathaniel M. Rice** has been elected a vice-president of the Pierce Oil Corporation, in charge of lubrication, with headquarters at 420 Olive street, St. Louis, Mo. The managers

of the railroad lubricating, stationary engine lubricating and automobile lubricating departments will report to and receive instructions from Mr. Rice. Mr. Rice was formerly connected with the St. Louis-San Francisco, having occupied the position of purchasing agent, and later that of third vice-president. He was born December 28, 1863, at Rome City, Ind., received his early education in the public schools at that place, and in May, 1887, entered railway service as a brakeman on the Gulf, Colorado & Santa Fé. He served in various capacities in the transportation and store departments of the company, and on April 1, 1901, he was made assistant general storekeeper of the Atchison, Topeka & Santa Fé Coast Lines, which connection he held until April 1, 1903, when he became general storekeeper in full charge of material, fuel and stationery, serving the entire system. In November, 1913, he was appointed chief purchasing agent of the St. Louis-San Francisco, with headquarters at St. Louis, Mo., and in September, 1916, was elected third vice-president of the same road.

N. M. Rice

**Captain George A. Post, Jr.**, of the Ordnance Department, U. S. A., has received an honorable discharge from the military service and has returned to the service of the Standard Coupler Company, as assistant to the president, with headquarters at 30 Church street, New York.

The **Wellman-Seaver-Morgan Company**, of Cleveland, Ohio, has opened a San Francisco office at 415-417 Rialto building, in charge of **Norman S. Ross**, to handle business originating from California, Nevada, west of the 115th meridian; Lower California, and the counties of Josephine, Jackson and Klamath in Oregon.

**Thomas P. Orchard**, formerly production manager on the Browning machine gun tripods, with the New Britain Ma-

chine Co., New Britain, Conn., has joined the Service Engineering Company, planning and quantity production specialists, 25 Church street, New York, as sales engineer.

**V. I. Smart**, formerly professor of railway engineering and transportation, McGill University, and **J. A. Burnett**, formerly electrical engineer, Grand Trunk Railway System, are now associated as consulting engineers, with office at 821 New Birks building, Montreal. The lines handled will be civil, electrical and mechanical engineering.

**Horace N. Trumbull**, who has recently received his discharge from the Engineers Officers' Training School at Camp A. A. Humphreys, Va., has been appointed advertising manager of the Wellman-Seaver-Morgan Company, of Cleveland, Ohio. Before entering the service, Mr. Trumbull was advertising manager of the SKF Ball Bearing Company, of Hartford, Conn.

**Wm. T. Lane** has been appointed district sales manager of the Franklin Railway Supply Company, Inc., with offices at San Francisco, Cal. Mr. Lane has spent his entire business career in the railway supply field. For the past seven years he has constantly been in touch with locomotive development. On leaving college he went as an apprentice with the Franklin Portable Crane & Hoist Company. His next position was as draftsman for the Franklin Railway Supply Company, Inc., and then chief draftsman. In 1915, he was made mechanical engineer of this company, which position he held at the time of his new appointment.

**S. D. Rosenfeld** has been appointed district sales manager of the Franklin Railway Supply Company, Inc., with offices at Houston, Texas. Mr. Rosenfeld has had wide experiences in railroad work and has brought out several inventions that improved locomotive operation. He was born at Lincoln, Nebraska, and received his early education at that place. Upon leaving college he entered the service of the Chicago & North Western, serving in the machine shop and signal department, and then as fireman and engineer. In 1912, Mr. Rosenfeld resigned as locomotive engineer and entered the service of the Franklin Railway Supply Company as mechanical representative, which position he held at the time of his recent appointment.

**Fred C. J. Dell** has been elected secretary of the National Railway Appliance Company, effective December 24, 1918. Mr. Dell has acted in the capacity of secretary to the president of the company for the past two years, previous to which time he was connected with the American Electric Railway Manufacturers' Association as assistant to the secretary-treasurer. He held that position from March, 1911, to May, 1916, at which time he resigned to assume charge of the detail work of the exhibit committee for the 1916 convention of the American Electric Railway Association. In October, 1916, he was elected secretary of the American Electric Railway Manufacturers' Association, which position he still holds. He received his early training in the office of the vice-president and general manager's office of the Interborough Rapid Transit Company, where he was employed in a clerical capacity for a period of seven years.

The Consolidated Steel Corporation, formed recently to handle the export trade of several independent steel producers, has opened offices in the City Investing building at 165 Broadway, New York. **E. A. S. Clarke**, former head of the Lackawanna Steel Company, is president of the export concern. The other officers are **H. H. Barbour**, vice-president, formerly of the Lackawanna Steel Company; **W. Hesselman**, secretary and controller, and **A. Van Winkle**, treasurer. Mr. Hesselman was controller of the Lackawanna Company, and Mr. Van Winkle was secretary to Mr. Clarke when he was at the head of that concern. The traffic manager is **William Heyman**, formerly foreign freight agent for the Delaware, Lackawanna & Western Railroad. Eight of the independent steel companies are represented in the organization. They are the Bethlehem Steel Corporation, the Brier Hill Steel Company, the Lackawanna Steel Company, the Lukens Steel Company, the Midvale Steel and Ordnance Company, the Republic Iron & Steel Company, the Sharon Steel Hoop Company, the Trumbull Steel Company, the Whitaker-Glessner Company and the Youngstown Sheet & Tube Company. The board of directors of the new export company is made up from the heads of these companies

## Reorganization of Grip Nut Company

All of the Hibbard interests in the Grip Nut Company, Chicago, have been purchased by others and the company has been reorganized with the following officers: Francis H.

Hardy, chairman of the board of directors; William E. Sharp, president; Chester D. Tripp, vice-president; Herman A. Brassert, vice-president; Truman F. Miller, secretary and treasurer. The directors of the company include Messrs. Hardy, Sharp, Tripp, Brassert and Thomas G. Deering. H. E. Passmore, formerly with the mechanical department of the New York Central and later production manager of the Marble Cliffs Quarries Company, has been appointed sales representative of the Grip Nut

W. E. Sharp

Company. William E. Sharp, who has been elected president of the reorganized corporation, began his railway career as an apprentice in the car department of the Erie in April, 1889. In October, 1892, he was promoted to general foreman of the car and locomotive department of the same road, with headquarters at Chicago. He left the Erie in 1898, to become assistant superintendent of the Armour Car Lines. In April, 1901, he was promoted to superintendent of those lines. He resigned that position in 1911 to enter the railroad supply business as vice-president of the Grip Nut Company. He was elected president of the company in September, 1916, and became president of the reorganized corporation in November, 1918.

## Westinghouse to Build Electric Locomotives at Essington

Discussing the prospects for the year 1919 at the Essington, or South Philadelphia, Works of the Westinghouse Electric & Manufacturing Company, R. B. Mildon, assistant to the vice-president, recently made the following statement:

"We share the general opinion in the industrial field that business will slow down somewhat owing to the readjustment of the industries from a war to a peace basis; but by spring this phase should be over and then for the next few years we should have a period of prosperity.

"As far as the Westinghouse Works at Essington is concerned, we have enough orders on hand to keep us busy for the next year without considering new business which is now beginning to develop.

"We are at present making nothing here but ship propulsion machinery, but our plans contemplate bringing here all of our turbine and electric generator construction work that is now being handled at East Pittsburgh. Before we can accommodate this additional business, however, we shall have to build several new buildings, including an office building, a shop for making turbine blades, and an electric generator shop. Unless we are mistaken in our expectations, however, this new construction work should begin this spring.

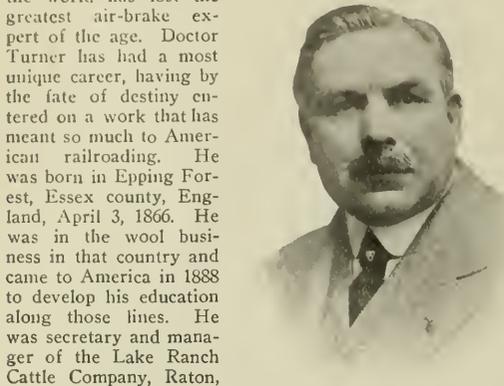

"Looking a little further ahead into the future it is probable that we shall in time erect a building for the construction of electric locomotives. The electric railroad situation is unquestionably very favorable and a large amount of electrification will be undertaken in the next ten years. We co-operate with the Baldwin Locomotive Works in the manufacture of electric locomotives and our location here, so close to the Baldwin plant, makes this the proper place to do our part of the work.

"In other words, we plan to build at Essington all of our large and important apparatus, and as the demand for this class of apparatus is certain to increase rapidly from year to year,

we expect to see our plant expand in the near future to many times its present size."

### Dr. Walter V. Turner

Dr. Walter Victor Turner, manager of engineering of the Westinghouse Air Brake Company, died at the Columbia Hospital, Wilksburg, Pa., Thursday morning, January 9. In the death of Doctor Turner the world has lost the greatest air-brake expert of the age. Doctor Turner has had a most unique career, having by the fate of destiny entered on a work that has meant so much to American railroading. He was born in Epping Forest, Essex county, England, April 3, 1866. He was in the wool business in that country and came to America in 1888 to develop his education along those lines. He was secretary and manager of the Lake Ranch Cattle Company, Raton, N. M., in 1893. In 1897 this company failed, and Doctor Turner entered the employ of the Atchison, Topeka & Santa Fe as a car repairer. In one month he was made gang foreman and three years later was made chief inspector. Having previously become interested in air-brake apparatus through a bad wreck that occurred in the vicinity of his home, he made a very careful study of its intricacies in his new position, and it was during the first year of his employ that he developed his first air-brake patent. He soon gained a reputation for proficiency in air brakes and was placed in charge of the air-brake instruction car on that road. From general air-brake instructor he was promoted to mechanical instructor for the entire system, during this time having taken out 22 patents, which were sold to the Westinghouse Air Brake Company.

Dr. Walter V. Turner

At the 1902 convention of the Air Brake Association, which was held in Pittsburgh, Doctor Turner was offered a position with the Westinghouse Air Brake Company, but refused. The offer was repeated again at the 1903 convention, and in November of that year arrangements were made between the Air Brake Company and the Santa Fe to loan Doctor Turner to the former. That arrangement was continuously in effect to the time of his death. In 1907 he was made mechanical engineer; in 1910, chief engineer; in 1915, assistant manager, and in 1916, manager of engineering. The first task of Doctor Turner with the Westinghouse company was to develop the K triple valve, of which there are now over 2,000,000 in use. By his untiring energy and ingenuity the art of braking trains has developed by leaps and bounds. He has been granted over 400 patents and a hundred or more are still pending. Among his latest inventions the improved empty and load brake and the electro-pneumatic brake stand out pre-eminently. These made possible an increase of 300 per cent in the capacity of the New York subways.

Doctor Turner was also an author, among the more important of his books being "Train Control—Its Development and Effect on Transportation Capacity," which was published in two volumes. He was awarded the Longstreth medal in 1911, and the Elliott-Cresson medal in 1912. He was a fellow of the Royal Society of Arts, England, and a member of the American Society of Mechanical Engineers, the American Electric Railway Association, Franklin Institute (Philadelphia), and the Pennsylvania State Chamber of Commerce. Doctor Turner's death was the result of complications, among them being enlargement of the heart and Bright's disease. He was injured two or three years ago in an automobile accident, to which he attributed his condition. He had been seriously ill since the middle of November. He leaves, besides his widow, a married son and daughter.

### Dr. Angus Sinclair

Angus Sinclair, D. E., founder and editor-in-chief of Railway and Locomotive Engineering, New York, died at his home in Millburn, N. J., on January 1, 1919, at the age of 78. Doctor Sinclair was born in Forfar, Scotland. He began his railroad career as a telegraph operator and later was a locomotive engineman on the Scottish Northeastern Railway. He attended evening high school and later for several years was employed in the Customs Department in Montrose, Scotland, and London, England. A love of adventure took him to sea and after some service as a marine engineer he again took up railroad work in America, first in the service of the Erie, and afterward in the West, where he ran a locomotive on the Burlington, Cedar Rapids & Northern. During this period he attended the chemistry classes of the Iowa State University, making a specialty of water analysis, and was appointed chemist of the railroad, combined with the duties of roundhouse foreman. It was during this period that he first gave serious consideration to the problem of fuel economy and smoke prevention on which he has since written extensively.

Dr. Angus Sinclair

In 1883 he joined the editorial staff of the American Machinist, a few years later became president of the publishing company. In 1887 the company, desiring to broaden its field, established the Locomotive Engineer, of which the late John A. Hill became editor. A few years later Doctor Sinclair and Mr. Hill bought this paper, now Railway and Locomotive Engineering, and since Mr. Hill's retirement from the partnership in 1897, Doctor Sinclair has been the sole proprietor and editor-in-chief. In 1908 the faculty of Purdue University, Lafayette, Ind., conferred upon Mr. Sinclair the honorary degree of Doctor of Engineering. About this time he was appointed special technical instructor in the mechanical department of the Erie Railroad.

Doctor Sinclair has also been closely identified with the work of nearly all of the leading engineering societies in America and with some in Europe. He was the senior officer, in point of continuous service, of the American Railway Master Mechanics' Association, having been treasurer since 1900. Previous to that time he had served as secretary from 1887 to 1896. He was also a member of the Master Car Builders' Association, the American Society of Mechanical Engineers, and was instrumental in the establishment of the Traveling Engineers' Association, which was organized in his office in 1892. He was a delegate to three International Railway Congresses, at Washington, D. C., St. Louis, Mo., and Berne, Switzerland.

Doctor Sinclair is the author of a number of works on railroad subjects, some of which have become text books, including Locomotive Running and Management, Combustion in Locomotive Fireboxes, Firing Locomotives, Railroad Man's Catechism, Twentieth Century Locomotives and History of the Development of the Locomotive Engine. His first published work, Locomotive Running and Management, was begun while he was running a locomotive and was made up entirely from personal observation. It has repeatedly been revised by the author and has passed through 26 editions, the last appearing in 1915. His work on Firing Locomotives has been translated into eight languages, including Chinese. In his long and varied career Dr. Sinclair has been a pioneer in the study and development of many practices pertaining to locomotive operation which have now become well established and his influence will long be felt in practical railroad operation.

# Railway Officers

## Railroad Administration

### Central

**A. F. Duffy**, assistant manager of the Safety Section, Division of Operation, of the Railroad Administration, has been appointed manager of the section, succeeding **H. W. Belnap**, deceased.

### Regional

**J. A. Lucey**, formerly trainmaster on the Minneapolis & St. Louis, has been appointed supervisor of freight loss and damage of the Northwestern region with headquarters at Chicago.

**James E. Weller**, formerly general western freight agent of the Pennsylvania Lines at Chicago, has been appointed resident traffic assistant for the Allegheny region, with headquarters at Chicago.

**T. W. Proctor**, assistant general freight agent of the Chicago, Milwaukee & St. Paul at Chicago, and chairman of the Sailing Day Plan Committee of the Northwestern region, has been appointed supervisor of merchandise service of that region with the same headquarters.

### Federal and General Managers

**E. F. Blomeyer**, general manager of the Ann Arbor, with headquarters at Toledo, Ohio, will also have jurisdiction over the Manistique & Lake Superior.

The authority of **George L. Peck**, federal manager, Pittsburgh, Pa., has been extended over the Grand Rapids & Indiana, which has been released from the jurisdiction of **E. D. Bronner**, federal manager.

### Operating

**J. J. McCullough** has been appointed superintendent of the Seattle (Wash.) terminals.

**Lawrence A. Downs**, general superintendent in charge of the northern lines of the Illinois Central, has been promoted to assistant general manager of that line, the Yazoo &

Mississippi Valley and the Chicago, Memphis & Gulf, with headquarters at Chicago, to succeed **A. E. Clift**, promoted. Mr. Downs was born at Greencastle, Ind., on May 9, 1872, and graduated from Purdue University in 1894. Early in 1895 he began railway work with the Vandalia Railroad and from March, 1896, to 1898, was in an engineering party on the Illinois Central. He then served as roadmaster from 1898 to March, 1907, on the Amboy, the Louisville, the Louisiana, the Springfield and the

Chicago divisions. In March, 1907, he was appointed assistant chief engineer maintenance of way, remaining in that position until December 6, 1910, when he was appointed superintendent of the Kentucky division. On November 1, 1915, he was promoted to general superintendent of all lines south of the Ohio river, with headquarters at New Orleans, La. On August 1, 1917, he was transferred to Chicago to become general superintendent of

the northern lines. He has continued in that position up to the time of his recent promotion.

**C. McDonough**, superintendent on the Great Northern at Everett, Wash., will also have supervision of Everett terminal.

**F. C. Dow**, superintendent of the Chicago, Milwaukee & St. Paul, is now in charge of the Milwaukee terminal, Tacoma, Wash.

**J. W. Allen**, superintendent of the Northern Pacific, will in future supervise the operation of Auburn and Tacoma (Wash.) terminals.

**J. W. Barrett** has been appointed trainmaster on the Salt Lake division of the Denver & Rio Grande, succeeding **J. W. Durkin**, resigned, effective January 1.

**Albert E. Clift**, assistant general manager of the Illinois Central, the Yazoo & Mississippi Valley and the Chicago, Memphis & Gulf, has been promoted to general manager,

A. E. Clift

with headquarters at Chicago, to succeed **T. J. Foley**, deceased. Mr. Clift was born at Urbana, Ill., on October 15, 1869, and entered railway service with the Illinois Central on December 5, 1888, as a brakeman. He was later a conductor on the same line and on the Cleveland, Cincinnati, Chicago & St. Louis. On February 19, 1893, he returned to the Illinois Central as engine foreman of the Campaign district. From March 7, 1893, to February 22, 1905, he was consecutively yardmaster, conductor on the

Chicago district, passenger conductor on the Chicago division, acting trainmaster of the Chicago district at Kankakee, Ill., and trainmaster of the Chicago division. On the latter date he was appointed superintendent of the Freeport division at Freeport, Ill., and on January 16, 1907, was transferred to the St. Louis division at Carbondale, Ill. On June 1, 1910, he was promoted to general superintendent of the southern lines with headquarters at New Orleans, La., and on November 10, 1912, was appointed general superintendent of the northern and western lines at Chicago. He was appointed general manager on August 1, 1917, to succeed Mr. Foley, who was then elected vice-president of operation. With the readjustment of railroad titles under government control Mr. Foley was made general manager and Mr. Clift assistant general manager. As general manager under the present organization, Mr. Clift takes over the duties formerly performed by Mr. Foley.

**M. W. Clement** has been relieved of his duties as superintendent of freight transportation and has been appointed acting superintendent of passenger transportation of the Pennsylvania Railroad, Eastern Lines; the West Jersey & Seashore; the New York, Philadelphia & Norfolk, and the Huntington & Broad Top Mountain Railroad, vice **D. C. Stewart**, furloughed.

**William Elmer**, superintendent of the Schuylkill division of the Pennsylvania Railroad, Eastern Lines, with office at Reading, Pa., has been appointed acting superintendent of the Philadelphia division vice **F. W. Smith, Jr.**, furloughed, and **C. D. Young**, formerly superintendent of motive power with office at Wilmington, Del., has been appointed acting superintendent of the Schuylkill division vice Mr. Elmer. Mr. Young resigned in November as superintendent of motive power to become a lieutenant-colonel in the transportation corps, engineers.

**J. J. Pelley**, general superintendent of southern lines of the Illinois Central and the Chicago, Memphis & Gulf, with

L. A. Downs

headquarters at New Orleans, La., has been transferred to Chicago as general superintendent of the northern lines of the Illinois Central, succeeding L. A. Downs, promoted to assistant general manager. J. M. Egan, superintendent at Fulton, Ky., has been promoted to succeed Mr. Pelley at New Orleans. J. W. Hevron, superintendent at Clinton, Ill., has been transferred to Fulton, Ky., to succeed Mr. Egan; C. W. Shaw, trainmaster at East St. Louis, Ill., has been promoted to superintendent at Clinton, succeeding Mr. Hevron; J. D. White, trainmaster at Carbondale, Ill., has been transferred to East St. Louis, succeeding Mr. Shaw, and E. D. Holcomb, chief clerk in the office of the general superintendent of transportation at Chicago, has been appointed trainmaster at Carbondale to succeed Mr. White.

### Financial, Legal and Accounting

L. C. McCutcheon has been appointed freight claim agent of the St. Louis-San Francisco, with jurisdiction over freight, loss and damage claims, with headquarters at Springfield, Mo. G. E. Whitelam having resigned, the office of superintendent of freight, loss and damage claims is abolished.

F. A. Winkler, acting federal treasurer of the Chicago, Milwaukee & Gary, with headquarters at Rockford, Ill., has been appointed federal auditor to succeed C. G. Nelson, who has resigned to go with the corporation. V. E. Nelson, disbursement clerk at Rockford, has been promoted to acting federal treasurer to succeed Mr. Winkler.

### Traffic

J. J. Cowan, chief clerk to the vice-president and general manager of the Pacific Fruit Express Co., with headquarters at San Francisco, Cal., has been appointed district agent with the same headquarters.

J. T. Conley, general freight agent of the Chicago, Milwaukee & St. Paul at Chicago, resigned effective January 1. He was succeeded by C. A. Lahey, whose appointment was announced in the *Railway Age* of January 3.

L. F. Vosburgh, passenger traffic manager of the New York Central lines east of Buffalo, has had his authority extended over the lines west of Buffalo, with headquarters at New York City; and J. W. Daly, passenger traffic manager of the lines west of Buffalo, has been appointed assistant passenger traffic manager, with headquarters at Chicago.

J. W. Graham, in addition to his duties as general freight agent of the Toledo, St. Louis & Western, has been appointed assistant general freight agent of the Wabash Railroad with office at Toledo, Ohio; C. E. Rose, assistant general passenger agent of the Toledo, St. Louis & Western, has also been appointed assistant general passenger agent of the Wabash Railroad, with office at Toledo, and D. E. Gilbert, division freight agent of the Wabash Railroad, with office at Toledo, will continue in charge of all Wabash matters on the Toledo and Peru divisions.

Robert L. Russell, whose appointment as freight traffic manager of the Philadelphia & Reading, with headquarters at Philadelphia, Pa., has already been announced in these columns, was born on July 19, 1867, at Jessup, Md., and was educated in the general schools. He began railway work in October, 1882, with the Baltimore & Ohio at Baltimore, Md. He subsequently served as a general clerk on the Long Island Railroad, and then as general clerk and later as chief clerk in the freight department of the Philadelphia & Reading. He then was appointed freight claim agent of the same road and three years later was promoted to assistant general freight agent. In 1909 he was appointed general freight agent and since July, 1918, served as assistant freight traffic manager until his recent appointment as freight traffic manager of the Philadelphia & Reading, the Central of New Jersey, the Baltimore & Ohio New York Terminals and associated lines.

### Engineering and Rolling Stock

H. Stringfellow has been appointed district engineer of the Southern Railroad and associated railroads, with office at Charlotte, N. C., and F. Furlow has been appointed engineer of surveys with office at Washington, D. C.

A. Yappen, district carpenter of the Chicago, Milwaukee & St. Paul at Chicago, has been appointed assistant engineer in charge of bridge maintenance, inspection and erection on lines east of Mobridge, S. D., with the same headquarters, succeeding C. N. Bainbridge, recently promoted to engineer of design.

N. Bell, formerly master mechanic of the Minnesota and Iowa divisions of the Illinois Central with headquarters at Waterloo, Iowa, who has just returned from military service, has been appointed to the same position, succeeding O. A. Garber, who has been transferred to Memphis, Tenn., succeeding W. H. Watkins, granted a leave of absence, effective January 1.

William Gemlo, master mechanic of the Minneapolis & St. Louis at Marshalltown, Iowa, has been promoted to superintendent of motive power and rolling stock with headquarters at Minneapolis, Minn., to succeed G. W. Seidel, recently resigned to become superintendent of motive power of the Chicago & Alton and the Chicago, Peoria & St. Louis, with headquarters at Bloomington, Ill.

### Purchasing

G. W. Alexander, storekeeper of the Central of Georgia, has been appointed general storekeeper, with headquarters at Macon, Ga.

J. H. Nichols has been appointed general storekeeper of the New York, Chicago & St. Louis with headquarters at Cleveland, Ohio.

E. A. Workman, storekeeper of the Baltimore & Ohio Eastern Lines, with office at Keyser, W. Va., has been appointed district storekeeper of the Maryland district, with headquarters at Camden station, Baltimore, Md., vice O. V. McQuilkin, deceased.

Charles W. Yeamans, assistant engineer of the Chicago & Western Indiana, has been appointed purchasing agent of that road and the Belt Railroad of Chicago, with headquarters at Dearborn station, Chicago, succeeding Rov Benson, transferred to other duties.

## Corporate

### Executive, Financial, Legal and Accounting

G. R. Martin, vice-president and controller of the Great Northern at St. Paul, Minn., has been elected also president of the Minnesota Transfer Railway Company.

C. G. Nelson, federal auditor of the Chicago, Milwaukee & Gary, with headquarters at Rockford, Ill., has been appointed auditor of the corporation with the same headquarters.

Eugene E. Fairweather has been appointed assistant counsel of the Canadian National Railways with office at Ottawa; Archibald J. Reid, K.C., and Reginald H. M. Temple, at Toronto, and H. F. Alward, general solicitor and claims agent of the Canadian Government Railway at Moncton, N. B., have been appointed general solicitors of the Canadian National Railways, all with offices at Montreal, Que.

## Obituary

M. P. Washburn, formerly chairman of the Southeastern Mississippi Valley Association, with office at Louisville, Ky., died in New York on January 4, at the age of 64.

THE LONDON IRON & STEEL EXCHANGE, LTD., has been formed, says the *Railway Gazette*, of London, by a group of some forty of the leading British firms engaged in the iron, steel and metal industries. It comes into being at an auspicious moment, when the whole tide of industrial activity is being turned from purposes of war to purposes of peace. The secretary's office is at 113, Queen Victoria street, E.C.4, and for the purposes of its business the London Iron & Steel Exchange, Ltd., has secured the great Pillar Hall of Cannon Street Hotel.

## Railway Age

# EDITORIAL

American railway supply manufacturers now have an exceptional opportunity to introduce their products into the markets of the world. The exhibit

**Why Not Invite Foreign Railway Men?** which the National Railway Appliances Association will present in Chicago during the week of March 17 will provide the first opportunity for the display of American railway materials since the conclusion of hostilities. Although this exhibit is limited to the materials used in the engineering, maintenance and signaling departments there is great opportunity for the exploitation of supplies of this character in the foreign fields. This condition would appear to justify the officers of the Appliances Association in extending a special invitation to railway officers in foreign countries to attend the exhibit. Although the time is short it will still permit men to come from Europe and South America if the exhibit is brought to their attention promptly. Such an invitation might well be issued jointly with the American Railway Engineering Association, which will hold its annual convention in the same city and at the same time. In fact no more constructive action could be taken in arranging the program for that week than to set aside an evening at which representatives of foreign railways could be invited to speak on the conditions and the needs of the railways in their countries.

Among the many activities of the *Railway Age* during the year just past has been the publication of numerous articles

**Announcing a New Department**

intended to encourage the interest of its readers in foreign trade in railway supplies. Emphasis has been placed in these articles on the great need for railway equipment and supplies brought about in many countries by the cessation of imports from the warring nations; and attention has been directed to the favorable position of our own supply industry as regards both making up these deferred demands and filling those that will result from future development as soon as financial and industrial conditions permit. Foreign trade to the rank and file of American manufacturers at least, up to within the past two months, has been more or less of a theoretical matter. Now that the demands of war are over, however, it has become a very practical one and is receiving the attention of every progressive concern that is in any way equipped to sell its goods in other lands. With the development from the theoretical to the practical interest that is being everywhere evidenced in foreign trade, the *Railway Age* this week advances to a new step. It will continue to publish important articles of general interest, but, in addition, it has also established a new section in the General News Section to be headed Foreign Railway News. It will be the purpose of this section to present to the readers of the *Railway Age* a brief summary of happenings on the railways of the world outside the United States, particular attention being paid to those developments of greatest interest to the American reader. The aim of the editors will be twofold (1) to help sustain and encourage the present interest in foreign lands and in foreign trade and (2) to give those practical points of information that will, to the greatest possible extent, help American firms in securing and carrying

on foreign trade. The information for the new section will be obtained from many and various sources, but it is the expectation that the greatest value will lie in the original items secured from the paper's correspondents in various countries the world over.

One reason why the railroads are unable to pay their bills promptly, thus causing much embarrassment to some of the supply companies and manufacturers, is because of the slowness of various departments of the government in paying the railroads for transportation. It appears that in many cases this is largely due to red tape and complicated checking methods which would not be tolerated for a minute in any up-to-date business establishment. The Railway Administration is asking for statements from different roads as to the amounts of the bills due and the departments of the government involved, with a view to improving the situation. The story that is going the rounds about an army officer delaying the mustering out of 200 men for five days in order that he might secure a certain rubber stamp may not be true, but without doubt it reflects more or less clearly a condition that really does exist in a much larger way and on an enormous scale. It is time that business men took a more active interest in government affairs, large and small.

**Government Slow Paying Bills**

The collision at South Byron will revive discussion of the automatic train stop. This tragedy once more impresses the lesson that making cars of steel does not cure all of our ills; that enginemen (with first-class reputations) get sleepy on express trains the same as on slow freights, and that the monitorship of the firemen constantly proves itself worthless; in short, that a force of 100 per cent enginemen, even for the few fastest trains, is an iridescent dream. There may be such men, but no superintendent has been able to classify and record them. The discussion of the automatic stop should now take a practical turn, for the Railroad Administration has appointed a strong committee on the subject (as noticed in our Washington news) with a view to the commencement of comprehensive tests. The collision occurred on January 12. The committee was announced on January 14. It is to be borne in mind that automatic stops will not work miracles. The collision record—Fort Washington, Pa., already has added 12 to South Byron's death list—calls for vigorous action in other directions, as is pointed out in a letter, printed in another column, commenting on the collision of last September at Birdsell, Nebr. Moreover, the public is looking to the Railroad Administration not only for a study of the subject—committees sometimes spend an interminable succession of months in their deliberations—but for a lucid and intelligible policy. The frankness which has characterized Mr. McAdoo's attitude toward the public in some directions has been conspicuously lacking in the matter of the prevention of collisions.

**The Prevention of Collisions**

## The Railway Business Association

THE CONVENTION of the Railway Business Association in Chicago last week was purely a business meeting. No guests not engaged in the railway equipment and supply business were invited to any of the sessions. The subjects discussed and passed upon were all subjects of interest and importance to the members of the association primarily to persons and concerns engaged in making and selling machinery and materials to railways. From this point of view the meeting was a decided success.

The association originally was organized chiefly to bring about closer relations between the railway supply concerns and their customers—the railways—and to help secure fairer and more constructive railway regulation. The adoption of government operation of railways, and certain policies initiated by the Railroad Administration, brought forcibly home to the railway supply people the fact that they had "troubles of their own." The main function and duty of the association have since become those of representing its members in an effort to reduce the number of the troubles they have in common, and of reducing the seriousness of the part of their common troubles which cannot be entirely eliminated.

The developments of the past year suggest the thought that the activities of the association might be, and probably ought to be, increased and intensified in several ways. Whether the railways remain in the hands of the government, or, as now seems probable, are soon returned to private management, the railway equipment and supply concerns will have in future—and, indeed, have now—many problems which they can solve better by organized than by merely individual study and action. They are both manufacturers and merchants; and all are dealing with the same class of customers. They pass together through the same periods of large orders and of small orders; they have similar problems regarding labor and materials; they have similar selling problems. Like concerns of every class, they include many that wish to do business on the highest plane of commercial and ethical principles, and some which are not wholly indisposed to do business on a low plane. Also, like every other class of concerns that makes or sells goods, they have many customers who wish to do business in accordance with sound commercial and ethical principles, and some customers who do not. They meet like difficulties in securing the testing and adoption of new devices, and in getting the devices they sell properly maintained and operated. Under prolonged or permanent government operation they would have not only the problem of getting the government to buy their goods on reasonable terms, but of keeping the government from engaging in competition with them, on the theory that it could make many kinds of equipment and devices cheaper than independent manufacturers would or could afford to sell them. Even under private management they will always have in more or less serious form the problem of convincing the railway managements that it is better for the railways to buy from independent manufacturers than to attempt to make their own equipment and supplies.

The foregoing suggests but a part of the problems which railway supply concerns have in common, and which it might profit them to attempt to solve largely by concerted investigation, discussion and action. The Railway Business Association is the organization by which the various necessary activities should be originated and sponsored. Under President Johnson's leadership it is moving in the right direction. There is reason to believe it could be developed into an organization which would put the entire railway equipment and supply industry on a higher commercial and ethical plane, broaden and improve its markets, and

increase its prosperity, while at the same time making the railway equipment and supply concerns of the United States an even more potent force than they have been in the past in improving the art of railroad transportation.

## Mr. Hines as Director General

THE RAILWAY OFFICERS and employees, the railway companies and the public deserve to be congratulated upon the appointment of Walker D. Hines as director general of railroads. In fact, we think everybody concerned deserves to be congratulated except Mr. Hines himself.

Mr. Hines accepted a place in Director General McAdoo's cabinet a year ago at a great personal sacrifice. He was one of the most successful lawyers in the country and one of the principal officers of one of the greatest railroad companies. To go to Washington and become assistant director general meant giving up his usual pursuits and accepting a position which would yield him a much smaller income and require of him work of a much harder and more exacting, and, perhaps, less congenial, kind. The policies which have been adopted by the Railroad Administration have been primarily those of Mr. McAdoo. Whatever may be thought as to the expediency or wisdom of those policies, nobody can question that they have been ably and energetically carried out; and to Mr. Hines must be attributed a large part of the ability and energy with which they have been carried out.

Mr. McAdoo has now left the ship. The reasons he has given for leaving it do not constitute a sufficient justification for his action. He devoted a year to destroying the old organizations of the railways and to building up a new unified organization to replace them. Just when the unsettlement and uncertainty in the railroad field were greatest, when the time for transition from a war to a peace basis had come, and there was the largest number of difficult problems pending ever known, he suddenly announced his resignation—and then recommended that his plan of unified government operation should be experimented with for five years more!

Obviously, Mr. McAdoo's retirement, in these circumstances, was found to leave a most difficult and embarrassing situation for his successor to deal with. Mr. Hines has not confided to us his feelings in regard to the matter, but we can hardly conceive that he has accepted the director-generalship because he really wanted it. Undoubtedly he has taken it because he has considered it his patriotic duty to do so.

Mr. Hines favors the five-year plan of government operation proposed by Mr. McAdoo. He made a powerful argument in favor of it before the Railway Committee of the Chamber of Commerce of the United States. His argument did not convince us, nor did it the chamber, but everybody who heard or has read it must admire the clarity and force with which it was made. Mr. Hines will show as director general the same public spirit and ability he has shown as Mr. McAdoo's assistant. Should the unexpected happen, and the five-year plan be adopted, he will probably give the railroads as good management as anybody could give them under this plan. We do not believe the man lives who could manage the railways successfully and satisfactorily during the proposed five-year test; but Mr. Hines doubtless could come as near it as anyone. If the expected does happen and Congress decides to turn the railways back to private operation in a comparatively short time, Mr. Hines, with his great knowledge of the railway situation in general, as well as of the existing relations between the government and the railway companies, can be relied upon to represent the interests of the government ably but fairly in connection with the transfer back to private operation.

For many reasons, some of which lie apparent and some of which do not, Mr. Hines' work as director general will be extremely hard and trying. Nobody knows this better than he does, which makes the credit he deserves for having accepted the position all the greater.

## The American Railroad Association

THE AMERICAN RAILWAY ASSOCIATION is to be reorganized under the above name, and there is to be amalgamated with it the American Railway Master Mechanics' Association, Association of Railway Telegraph Superintendents, Association of Transportation & Car Accounting Officers, Freight Claim Association, Master Car Builders' Association, Railway Signal Association, and Railway Storekeepers' Association. The *Railway Age* has advocated for a number of years a co-ordination of efforts between the American Railway Association and the other associations which would preserve the identity and initiative of the junior associations, but would promote co-operation, prevent overlapping of activities and give additional power to the recommendations of the junior associations. Except for the loss of name of the junior associations, this appears to be the underlying principle adopted in the formation of the new American Railroad Association. Besides the executive committee of this new association there are to be five sections, dealing with operating, engineering, mechanical, traffic and transportation questions. By transportation is meant such activities as were formerly handled by the Association of Transportation and Car Accounting Officers, per diem rules, etc. By operating is meant such activities as the transportation of explosives, operating rules, prevention of accidents at grade crossings, etc. It is expected that the new organization will be in full working order by March 1. The circular, making announcement of the organization of the new association, makes no mention of taking over the activities of the American Railway Engineering Association, which has preferred to retain its individuality, but it will be noted that one of the sections of the new association is devoted to engineering.

The organization of the new association provides specifically for home rule for the five separate sections. Each section is to formulate its own rules of procedure and its methods of selecting committees and members thereof, and each section elects its own chairman and vice-chairman. This means that there will be no interference with conventions and that the work of the associations can go on much as it has gone on before, except as to the change in name, and, in the case of the mechanical associations, the Master Car Builders and the Master Mechanics will be combined in one section. The recommendations of the different sections will be commendatory only, but during the period of federal control, the director general may make such recommendations mandatory. In the past, the junior associations have derived great benefit from the fact that scientists and others, not railroad officers, have been active members of the associations. It is very desirable that this practice should be continued, and the organization of the new association provides that any section, with the approval of the executive committee, may permit others than those that are representative members of the railroads to become affiliated members. These affiliated members may serve and vote in committees, and each section fixes the qualifications of affiliated membership for itself. This is obviously a wise, sound provision.

The junior associations are left with all the power that they had before, with home rule and freedom of action, but the nature of the American Railway Association has been radically changed. The officers of the association are not

elected by the members of the association, but by the executive committee from among its own membership. The Railroad Administration has 10 out of 19 members of the executive committee; three appointed by the director general and seven regional directors. The members of the association, not having the power to elect their officers, and having only a minority representation on the executive committee, are subordinate in the direction of the affairs of the association to the Railroad Administration. Since the regional directors are, however, all successful railroad men of the highest standing, this should not interfere with the association taking the lead in the development of the science of railroading. On the other hand, when the roads are returned to private operation, it should be a comparatively simple matter to change the organization and by-laws of the American Railroad Association so as to make it an organization embodying the principles for which the *Railway Age* has contended. All that would be necessary would be to make the entire membership of the executive committee a matter of selection by members of the association, and to give it the power to make recommendations of the various sections mandatory.

## Solving the Railroad Problem

IN ONE OF HIS WRITINGS Matthew Arnold referred to "the process of wandering between two worlds, one dead, the other powerless to be born." This process, he added, "helps nothing." The railroads are now wandering between two worlds. One undoubtedly is dead. Whether a new and better one will prove powerless to be born remains to be seen.

The railroad problem is the greatest of America's problems of reconstruction. In many respects the railroad situation is so bad that a mind at once thoughtful and timid would be tempted to conclude that the problem it presents cannot be satisfactorily solved within any reasonable time. But the very badness of the situation is its hopeful feature. It has become so bad that everybody at last sees that something really important and constructive must be done. Perhaps "cut of this nettle, danger, we pluck this flower, safety."

We have had experience within recent years with three systems of railroad operation. First, until April, 1917, we had operation subject to government regulation and to laws enforcing competition. Second, from April, 1917, to January 1, 1918, we had operation under the Railroads' War Board, which sought to manage the railways as a single system in spite of government regulation and of the laws to enforce competition, and without government guarantees of net income. During 1918 we had unified government operation, with net income of the companies guaranteed, and operation taken entirely out of their hands. Competition was abolished; and emulation in operating efficiency was discouraged by the requirement that all the parts of the railroad system should be worked primarily for the benefit of the whole and practically not at all to make showings for its many parts. No intelligent and thoughtful person could observe the effects which the methods used under these different systems have had upon the opinion of the various parts of the public, and study the operating and financial results which have accrued, without having his old views of the way in which the railways should be dealt with modified, and getting some new ideas as to the way in which the railway problem should be solved.

Foreign experience also throws light on our domestic problem. We do not know exactly how the government-operated railways of Germany have come through the war; but the available evidence indicates that they have not come through well. The railways of Great Britain, which have been privately operated under government control, have come through

very well. Much of the same thing may be said of those of France. Private initiative has beaten government bureaucracy in every crucial test.

The views of the *Railway Age* have undergone considerable modification, especially as a result of the experience of the United States with government operation during the last year. We did not believe from the start that unified operation subject to highly centralized direction from Washington would work well. We began saying so a year ago, and we continued to say so. In some respects the results obtained have been better than we anticipated; in others, worse. The problem before the statesmen and the people of the United States is to preserve in some way the parts of the present system which have done good and eliminate those which have done harm.

The problem should be looked at almost exclusively from the standpoint of the public. Nothing which is beneficial to the public can in the long run be harmful to any special class or interest. What are the principal ends which any sound solution of the railroad problem will attain for the public?

First, adequate transportation facilities and good service.

Second, fair wages and good working conditions for railway employees.

Third, the most economical operation which is consistent with the two things mentioned above.

Fourth, passenger and freight rates which will be as low as is consistent with all the foregoing, and which will also be equitable as between different shippers and communities.

Reason and experience demonstrate that the foregoing ends can be attained only through private ownership and operation, under conditions which will promote and encourage the full exercise of initiative and enterprise in the development and management of the railways. Private ownership and operation merely will not be sufficient. It is easily conceivable that some system of private ownership and operation might be adopted which would be superior in few or no respects to government ownership and operation. For example, it is very doubtful whether the ownership and operation of the railways by a single corporation would have many, if any, advantages over government ownership and operation. The wastes and evils resulting from the excessive competition which formerly prevailed were so great and glaring that they led many persons to decide that the operation of the railroads, even though private ownership was retained, should be turned over to a single monopoly, or to a very few companies, each having a monopoly in its own territory. After a year's experience with absolutely non-competitive operation and service, the sentiment of railway men and the public has crystallized in favor of the adoption of some system under which a measure, and an important measure, of competition will be restored. We think this view is sound. We believe the desire for a reasonable measure of competition in service is one of the principal elements causing the public to desire a return to private operation, and that the public would never be satisfied with any system which did not provide for a considerable amount of competition.

What are the principal conditions it is necessary to bring about in order to enable the railways, under private ownership and management to attain the ends which it is desirable, in the public interest, that they shall attain? Among the principal conditions which it is necessary to bring about are the following:

*First, reasonable competition in service and intense emulation in operating efficiency.*

This condition cannot be provided except by having in each of the large territorial divisions of the country two or more railways which render service in direct competition with each other and which operate under circumstances which render it practicable intelligently to compare their operating results. We had emulation in operating efficiency and com-

petition in service before government control was adopted. We never can have too much emulation; but competition in service formerly was excessive, and also very unequal, because of the widely differing strengths of the competitors. Too much competition causes wastes which ought to be, and can be, avoided, without impairing the service rendered.

*Second, co-operation and coordination in the operation of railways in the same territory, which, while not interfering with emulation and reasonable competition, will prevent the wastes caused by excessive competition.*

If such co-operation and coordination as are suggested are to be brought about some negative and some positive measures must be adopted. The anti-pooling clause of the Interstate Commerce Act, and the Sherman anti-trust law as it applies to railways must be repealed. Binding agreements regarding operation and service must be made or actual consolidations must be effected, under the supervision or actual mandate of public authorities by groups of railways operating in the same sections. In almost every territory there are several roads which are very unequal in physical condition, operating efficiency and financial strength. If the laws to enforce competition were withdrawn, would the various railway companies voluntarily make the agreements, or effect the consolidations needed to preserve needed competition, and at the same time eliminate wasteful competition? Perhaps they would; but that they might not is conceded by the chief executives of the railway companies.

The Association of Railway Executives has presented to the Senate committee on Interstate Commerce a plan for government regulation and control of private operation (*Railway Age*, January 10, page 131). This provides for transfer to a Secretary of Transportation of most of the executive and administrative functions of the Interstate Commerce Commission, the commission to be left "authority to pass upon all questions concerning the reasonableness and adequacy of rates and concerning discrimination." The Secretary of Transportation would be empowered, if the railways did not themselves make the necessary agreements regarding the handling and distribution of traffic, to transfer traffic from congested lines to other roads and to require such common use of equipment and terminals as was necessary. He would have authority to approve of the pooling of cars and other transportation facilities and the division of earnings in connection with the elimination of unnecessary train service, when proposed by the carriers, and to authorize consolidations and mergers when deemed by him to be in the public interest. Under the railway executives' plan, no public authority would have power to require consolidations and mergers. Doubtless, however, if this were authorized many of the weaker lines of the country would be absorbed by the strong roads in their territories. It would seem that the methods suggested by the railway executives would be sufficient to bring about the needed co-operation in railway operation, and to prevent the wastes of competition without eliminating needed competition. The Interstate Commerce Commission also recommends "mergers within proper limits of the carriers' lines and facilities in such part and to such extent as may be necessary in the general public interest."

*Third, prompt, impartial and expert determination of questions regarding the wages and working conditions of railway employees.*

The plan of the railway executives provides that a board should be constituted under the Secretary of Transportation to deal with such matters, on which the employees, the employers and the public should have equal representation, and that pending the investigations and reports of this board and for a reasonable time thereafter there should be no action by the carriers or the employees which would result in interference with transportation.

This is obviously a fair proposition. Whether, in view of

what occurred in the railway field within the two years before government control was adopted, the railway labor unions will concur in it, seems doubtful. Obviously, however, for the protection of employees, of employers and of the public, some method for settling labor disputes on the railways without lockouts or strikes must be provided by law.

*Fourth, the establishment of railway credit on a firm foundation.*

The re-establishment of the credit of the railway companies is the most important phase of the great problem with which railway owners, statesmen and public are grappling, and not enough consideration is being given to this phase of the matter. The country needs well rounded expansion and improvement of the facilities of all the existing railways, and construction of some new railways. It would be worse than useless, from the standpoint of public interest, to return the railways to private operation without legislation to insure that they would be able to raise new capital in proportion to the needs for facilities and service of the territories in which they severally operate. Private management can accomplish more for the public than government management with a given amount of capital, but even private initiative and enterprise cannot give the public good and adequate service unless it can raise the means for providing needed facilities.

The financial positions of the many existing railway companies vary widely. Some are strong enough to raise capital by selling their stock. This, of course, is the ideal method, but a company has to earn more money to pay satisfactory dividends on stock than to pay satisfactory interest on bonds. Some companies cannot sell stock, but can still sell at par bonds bearing a rate of interest reasonably measured by what industrial concerns have to pay. Many railway companies cannot raise new capital without paying excessive rates of interest on it, and many can hardly raise new capital at all.

Many persons have attempted to use the average net return earned by all the railways in the past to prove that they were making enough adequately to develop their facilities. We do not believe that the average return the railways as a whole were earning for several years before government control was adopted would have been sufficient to have caused adequate expansion of their facilities even if each of the companies had been getting the average, no more and no less. But, of course, some were getting much more than the average and some much less. The excess over the average which some were earning was not available for the use of those that were earning less than the average, and in consequence while some of the railways were constantly increasing and improving their facilities, others were practically standing still, and the transportation facilities of the country as a whole were not being developed and improved, as was necessary in the public interest, for the public interest demands increase and improvement of facilities in every territory and almost in every community.

The plan of the Association of Railway Executives, and also the suggestions made to Congress by the Interstate Commerce Commission (*Railway Age*, January 10, page 133) deal more or less indirectly with the problem of establishing railway credit. Both propose federal regulation of the issuance of railway securities. This is good as far as it goes. Both the Interstate Commerce Commission and the railway executives say that advances in wages should be recognized in fixing rates. The railway executives would transfer the power of suspending advances in rates from the Interstate Commerce Commission to the Secretary of Transportation, who should be required to act within thirty days, and rates should be referred to the Interstate Commerce Commission before going into effect only if the secretary suspended them. The railway executives also propose that the law shall provide the rule of rate-making, and "shall require that rates be not only

what has been called reasonable, but adequate and sufficient to enable the carriers to provide safe, adequate and sufficient service, to protect existing investments and to attract the new capital necessary in the public interest." They would also have the law provide that "existing rates which have been put into effect by the director general of railroads and are based in part upon increased wages should be continued in effect until changed by the Interstate Commerce Commission on complaint."

Important and desirable as all these provisions are, they do not seem to go to the heart of the matter. They would not insure that the average net return which the railways would be allowed to earn in future would be any less inadequate than the average which they were allowed to earn before government control was adopted. Neither their adoption, nor the adoption of the proposals which have been made regarding co-ordinated operation of the railways, would give any assurance that a large part of the railways would not continue to be unable to raise and invest the new capital which the public interest demands.

In other words, none of the plans which have been formally presented to Congress would solve the problem presented by the existence and operation of the so-called "strong" roads and "weak" roads side by side in every part of the country. Of course, if we could be sure that under the new legislation there would be a substantial absorption of the strong roads by the weak roads, the situation would present a different aspect. But no law should, and probably no law could, require this. The plan by the railway executives proposes to authorize the Secretary of Transportation to permit "division of earnings in connection with the elimination of unnecessary train service." It may be if the anti-pooling law were repealed the weak roads would profit by being paid by the strong roads to discontinue unnecessary service. It must be said, however, that the plans of the Interstate Commerce Commission and of the railway executives leave entirely to conjecture what methods, if any, would be adopted to solve the problem of the "weak and strong roads."

It has been largely owing to the need for solving this problem in order to secure a satisfactory and salutary solution of the larger railway problem, that the organization of regional holding companies to acquire stock of railways in whole territories has been proposed. It is doubtful, however, whether any such scheme can secure a friendly hearing now, because public sentiment apparently has crystallized in favor of the restoration of a considerable amount of competition. Another plan which has been suggested is that rates shall be so fixed that the railways as a whole shall be enabled to earn an average return on their property investment of, say, 6 or 7 per cent, that railways which, under this arrangement earn in excess of this amount shall be required to divide the excess with the government, and that the government shall loan the money thus secured by it at a very low rate of interest to the weak roads to enable them to build up their properties.

In our opinion, the best solution would be one under which the strong roads would absorb the weak roads in their territories with the result that competition would not be destroyed, but that the competition which occurred would be almost entirely between strong railway systems. It is probable, however, that if any such solution is ever reached it will have to come after the railways have been returned to private management. Meantime, more consideration should be given by railway corporate officers and public men to the question of what is to be done to protect and rehabilitate the weak roads, physically and financially, both before and after their return to private operation. Unless this problem is solved in some way there will be no solution of the general problem of re-establishing railway credit; and unless railway credit is firmly established no scheme of control, regulation or operation which may be adopted will satisfactorily solve the larger railway problem.

## Letters to the Editor

### Inefficient Clerks

DIVISIONVILLE.

TO THE EDITOR:

An auditor of one of the large middle west trunk lines in commenting upon the apparent lack of efficiency and organization in division offices complained of payrolls, reports, etc., being late on account of it. He seemed to attribute the cause for the apparent inefficiency mainly to inexperienced clerks and insufficient forces in the various offices. His diagnosis was partly correct, but if he took the time to study the real cause by visiting these offices he would find he was not at the correct conclusion.

The writer, who is employed in a division office and has been for several years, has noted with some apprehension just what the auditor refers to, but from his study and observation he concludes that the greatest cause for lack of efficiency and organization has been the dissatisfaction existing among the older and more experienced clerks on account of inequalities in wage awards and the interpretations placed upon them by the railroad officers. Many striking examples of these inequalities can be cited, but a few of them will show clearly just what the writer refers to. On this division the chief clerk is receiving a salary of approximately \$150 a month, while the chief dispatcher is now drawing approximately \$285; dispatchers \$265 and roundhouse foremen \$260. There may seem to be no comparison of the work performed by a chief clerk with these positions, but it will require as much talent, as much initiative, and as much experience to handle his position as the others. Not so very long ago one of the vice-presidents of this same railroad, in commenting upon the mishandling of a subject by a chief clerk, said that a chief clerk could do more to jeopardize the superintendent's position than any other man on a division, or words with that intent. It would seem then that the salary should be graded accordingly.

On this same division the division accountant is receiving approximately \$130 a month and is directly responsible for the entire accounting work. He has had years of experience and training, yet under one of the recent awards he is drawing practically the same amount of pay as a call boy working 12 hours a day (who receives practically \$125 a month). The chief timekeeper, handling and allowing all train and enginemen's time, receives \$112 a month, or a lower rate than the call boy. Other clerks in the office are receiving on an average \$100 a month—the assistant accountant, assistant timekeepers, stenographers, etc.—while unskilled laborers about roundhouses and coal-chutes, track-repairers, etc., are receiving as much, and in most cases more; some as high as \$108 a month.

The railroad clerk resents the implication that his work is of little importance or consequence in the operation of the railroad and he has come to the conclusion he is not appreciated. Therefore, he does not take the interest or pride in his work that he formerly did. Why should he exert himself, he reasons, when he can look about him everywhere and see such inequalities? As long as he can see common labor catered to by the management; and see that they secure increases in pay without exertion, initiative or responsibility, he is dissatisfied, and will remain so. His work suffers, for his ambition is demoralized by the knowledge that, if he were to resign, another man could be secured at the same rate. Just so long as these conditions are allowed to continue, then just so long will the clerical work suffer.

A RAILWAY CLERK.

## Responsibility for Collisions

CHICAGO.

TO THE EDITOR:

I have read with much interest your condensation of the Interstate Commerce Commission's report on the collision near Alliance, Neb., (*Railway Age*, December 6, page 1018), and also the very condensed expression of your own opinion in the case. It seems to me that there are several more things to be said. As between you and Mr. Borland; or between you and Borland on the one hand, and the Interstate Commerce Commission and Director C. R. Gray on the other, something ought to be done. The responsibility for killing people in collisions seems to be so scattered that it does not rest very heavily on the mind of any one. When are things going to be brought to a head?

The Bureau of Safety has made faithful reports of the conditions discovered in the cases of a good many bad collisions and is to be commended for performing the useful public duty of setting forth cold and disagreeable truths; but what is the commission going to do about it? The publication of a report with the name of Mr. Borland attached to it does not give the public any assurance that the nine commissioners—or even one of them—could be depended upon to back up the recommendations of the bureau chief if he were to go before Congress. Possibly the commission is quiet just now because of the overpowering presence of the Railroad Administration, sitting in the same building. The director general has walked right over the commission whenever he saw fit to do so, and provided he believed it necessary to cut some Gordian knot; but in the matter of slaughtering passengers he does not seem to recognize that there is any knot to be cut. The government report on the Alliance collision, like many other reports, gives little or no satisfactory information about the past records of the men (or officers) who were at fault. Why does not the Washington headquarters of the Railroad Administration let up on courtesy for a brief period and look to "safety first"? I mean safety of passengers. The Administration has evinced a disposition to quiz railroad officers and employees quite sharply in a good many directions; why not make a more extensive use of the quiz in this matter of safety?

For example, a truly illuminating quiz for the superintendent would include such points as the following:

What is your opinion of the engineman who was responsible for the last serious collision on your division? (This answer, if frank, frequently discloses acknowledged weaknesses.)

Was his punishment for former derelictions fair, adequate and consistent?

Do you feel free to administer discipline without fear of the grievance committee?

Assuming that your own knowledge and courage are up to the mark, how about your trainmasters? Do they do their work to your satisfaction? If not what is the cause? Are they paid good salaries? Have you a sufficient number of trainmasters? If not why do you not add to their number? How often does *every one* of your conductors and enginemen have opportunity for a full and free interview with a trainmaster—or with yourself? How many actual interviews of this kind could you report for the last three months?

Can you feel sure of the safety of your train operations without frequent and frank interviews?

What do you do with obstinate passenger enginemen?

How much money do you spend for surprise checking? Do you spend all that you think necessary or desirable? What does your general manager think about surprise checking? How often do you have a full and frank interview with him?

And a hundred others which will at once suggest themselves.

A. F. L.

# Labor Conditions During Federal Control

Abstract of Chapter from Director General McAdoo's Forthcoming Report to the President

THE DIVISION OF LABOR of the Railroad Administration was created on February 9, 1918. W. S. Carter, president of the Brotherhood of Locomotive Firemen and Enginemen, was appointed director. It has been the purpose of this division to create a better feeling between employees and officials of the railroads than existed previous to governmental control.

On January 18 General Order No. 5 was issued, creating a railroad wage commission and directing a general investigation of the compensation of persons in the railroad service. This commission devoted several months to the work, submitting recommendations to the director general on which General Order No. 27 was based.

General Order No. 8 was issued on February 21, and directed that safety appliance laws be observed, that excessive hours of service be avoided where possible and that matters of controversy arising under interpretations of existing wage agreements, and other matters not relating to wages and hours of service would take their usual course. This order also provided that "no discrimination will be made in the employment, retention, or conditions of employment of employees because of membership or non-membership in labor organizations."

Unquestionably these initial orders did much to bring about a better feeling on the part of those employees who believed they had not been treated justly in the past.

## Adjustment of Labor Controversies

One of the principal purposes of the creation of the Division of Labor was to provide means whereby the controversies that constantly arise between railroad officials and employees would be promptly and equitably adjusted. An inability to adjust these controversies under past practices resulted in strikes, threatened strikes, or a constant unrest among employees to the extent that the efficiency of the service had greatly diminished at the time that the roads were taken over.

It is but fair to say that neither the operating officials nor the employees were entirely to blame for so undesirable a situation. While on some roads there had never been a liberal policy toward employees of certain classes, a study of past relations will reveal the fact that not so many years ago the labor policy of a railroad was developed entirely by the operating officers. At that time, committees of employees, with the knowledge that their immediate operating officers had the authority to grant wage increases, revise wage agreements, and adjust personal grievances, entered into negotiations with their respective officials with an open mind, and with the belief that if evidence and argument could be presented that would prove their contentions, the operating officials of the road would at least grant some relief from the conditions of employment against which complaint was made.

It is alleged by employees that with a concentration of financial control of the railroads operating officials lost all authority over the labor policies upon the respective railroads. With the creation of "general managers' associations" covering a comparatively large territory, came "district movements" by employees for the adjustment of wage matters.

During the two or three years antedating federal control of the railroads an alarming situation was created, in that the employees' organizations as a whole and through federa-

tions, found themselves confronted with similar federations on the part of the railroads, the roads being represented by conference committees, and the conference committees being subordinate to "advisory committees." It was alleged by employees that these conference committees were not permitted to grant the demands of employees or even to make favorable compromises without the consent of the advisory committee. The advisory committee, it is alleged, was the agent of the great banking institutions that controlled the financial policy of all the railroads.

Arbitrations have been resorted to in later years with the result that employees reached the conclusion that an arbitration award depended entirely upon the frame of mind of the neutral arbitrator.

It may be truthfully said that at the time the railroads passed under federal control, because of these vexatious contentions, the morale of railway employees had sunk to a low degree. In many instances there was an entire absence of esprit de corps, so necessary for efficient operation.

With an intimate knowledge, on the part of the officers of the division, of the relations between the railroads and their employees during the past years, innovations were proposed, the practicabilities of which were first questioned by some officials and by some employees. It was suggested that at least for all classes of employees who were working under wage agreements, bipartisan boards be created for the purpose of adjusting any differences of opinion which might arise between the employee and the official, upon which there would be equal representation of the railroads and of the employees without the presence of any "neutral" or umpire. It was believed that when partisans were equally divided, and when they realized they were occupying judicial positions, they would abandon their partisanship and earnestly and efficiently exercise the function of a judge. In carrying out this plan three railway boards of adjustment have been created.

All controversies growing out of the interpretation or application of the provisions of wage schedules or agreements in effect, which were not promptly adjusted by the officials or employees on any of the individual railroads under federal control, and all personal grievances or controversies arising under interpretation of wage agreements and all other disputes arising between officials of a railroad and its employees were to be handled in the usual manner by the committees of the employees and the officials of the railroads up to the chief operating officer of the railroad (or some one officially designated by him). If, after this usual process, an amicable adjustment was not reached, then it became obligatory on both the part of the railroads and officials of employees' organizations to submit the matter in controversy to the railway board of adjustment having jurisdiction. Provisions were made for joint submission of facts and brief argument in each case submitted, and if it was deemed advisable, such railway board of adjustment could call for additional information, either oral or written, and when the matter had been entirely investigated a decision would be rendered by the board.

In the beginning fears were expressed that employees would protest against unfavorable decisions, to the extent that the purpose of the creation of the boards would be defeated. A knowledge of the loyalty of employees to their organizations, and a familiarity with the strict discipline enforced by these organizations in matters of agreement, led

those who had intimate knowledge of the situation to know that a decision thus reached would be faithfully observed by the employees.

Methods having been thus provided for classes of employees having agreements on a comparatively large number of railroads, there were yet perhaps a million employees for which no disposition had been made. For the purpose of providing prompt and proper methods of adjusting controversies affecting these employees, an assistant director of the Division of Labor was appointed, whose especial duty was to investigate all complaints, endeavor to bring about amicable adjustments, and practically perform for these employees the work accomplished by the railway boards of adjustment.

In the prosecution of this work, four representatives of the Division of Labor have been appointed, whose duties require them to be almost constantly in the field making personal investigations of matters referred to the Division of Labor by employees. In the selection of persons for the performance of this work regard was had for their past experience and ability in this or similar class of work, with the result that a large number of complaints have been investigated and adjusted.

#### "Closed Shop" v. "Non-Union Shop"

In many industries a contest has long existed between certain employers and unions of employees over rights of employees to become members of labor organizations, and over alleged discriminations against employees because of their connection therewith. It is claimed by employees, in many instances, that unless all employees in the class in the industry are members of the union, the employer discriminates against the employees who are members or else favors the employees who are not members.

In this contest, and for their own protection, employees have often demanded the "closed shop." On the other hand, certain employers have insisted on maintaining what they have called the "open shop." Theoretically, employers do not discriminate against any employee in the "closed shop" because it is alleged that any employee in the shop may become a member of the union. Theoretically, the employer does not discriminate against the union man in the open shop.

Many roads forbade the employment of employees who were members of certain organizations and had thus maintained non-union conditions, with the result that on a considerable portion of the railroads, for certain classes of employees, committees of employees had never functioned, and wage bargaining had been prevented.

Previous to the assumption of federal control, on these railroads and for these classes of employees, almost continuous dissensions had arisen, with the result that in many instances strikes had been precipitated, many of which were lost by the employees and non-union conditions prevailed. For the purpose of eliminating this constant conflict, which necessarily adversely affected the efficiency of the service, and because the government was now in control, Article V of General Order No. 8, issued under date of February 21, 1918, contained the following:

No discrimination will be made in the employment, retention, or conditions of employment of employees because of membership or non-membership in labor organizations.

The immediate result of the foregoing order was (1) the assertion on the part of representatives of the employees that they had never contended for a closed shop except as a protection to the members of the union, and that non-union employees would be assured the same rights and benefits and treatment under existing union wage agreements as were accorded to the union employees, and (2) the employees on the railroads where they had never been permitted to become members of the organizations were almost immediately organized into the unions.

## Standardization of Wages

With the development of trade unions in all industries came the demand for the same rate of wages for the same character of work, and the result has been that there is a constant and pressing demand on the part of employees for a standardization of wages.

On the other hand, each individual is of the opinion that so long as some other person is required to work, or is willing to work, at a less rate of wages, it produces a dangerous competitive situation wherein there is an incentive for the employer to dismiss the higher paid man and retain the lower paid man, and thus reduce labor cost. The demand for a standard wage and working day was made apparent at the hearings of the first federal wage commission, but it was not deemed expedient by that commission to attach much importance to this demand.

On the other hand, the wage commission was imbued with the humanitarian idea that the "increased cost of living" had fallen heaviest upon the lowest paid employees, and therefore the percentage of increase for the lower paid man should be greater than the percentage of increase for the higher paid man, and that this percentage should be based upon wages in effect in December, 1915.

It so happened that during the two years of 1916 and 1917 great progress had been made in the standardization of wages through negotiations of employees with railroad companies and consequently many differentials were eliminated. With the application of the graduated percentages of increases provided for in General Order No. 27, which order was based upon the recommendation of the first wage commission, all these differentials were re-established.

General Order No. 27 created a Board of Railroad Wages and Working Conditions. In the report of this board it will be shown that rapid advances toward standardization of wages of all railroad employees have been made, and but for the possible early return of the railroads to private control it could safely be said that the logical conclusion of the work of the present Board of Railroad Wages and Working Conditions would be standardized rates, standardized days, and other standardized conditions of employment for all employees on railroads under federal control.

#### The Eight-Hour Day

The demand for an eight-hour day has been pressed by employees in all industries. While on a considerable number of railroads some classes of employees had secured the eight-hour day through negotiations, perhaps in no industry of such importance had there been so little recognition by the employer of the eight-hour day as with the railroads.

Practically all of the representatives of employees that appeared before the first wage commission were earnest in their demands for the eight-hour day, but it did not appear to the first wage commission as being practicable during the war period. Nevertheless, in the issuance of General Order No. 27, provisions were made for the "basic eight-hour day," with a pro rata overtime rate.

This plan for an eight-hour day was but the foundation for the real eight-hour day, which it was proposed could be put in effect when the war was ended and our soldiers returned and were seeking employment and the supply of labor was sufficient to reduce the work of employees to an eight-hour period.

Through investigations by the present Board of Railroad Wages and Working Conditions supplementary orders have been issued that have made great advances toward an ultimate eight-hour day for all railroad employees. Where classes had through negotiations, and previous to federal control, secured the eight-hour day to a considerable extent, with time and one-half for overtime, such practice was extended to all employees in that class. Where classes have

not secured the eight-hour day with time and one-half for overtime, great advances have already been made by extending to them the eight-hour day with pro rata overtime for the ninth and tenth hour and time and one-half for all hours worked in excess thereof.

### Standard Working Rules

Because of the increased cost of living, increased wages were of far greater concern during the present year to employees than the standardization of working rules. Nevertheless, requests have been filed for standard working rules for several classes of employees to be applicable to all railroads under federal control. Where classes, through negotiations, had secured wage agreements, including rules, the demand was not so persistent, but for the great number of employees who had never been privileged to work under fixed regulations of employment the demand was urgent, with the result that in supplements to General Order No. 27 rules have been established providing for the administration of discipline and the maintenance of the seniority principle for more than a million employees.

Notwithstanding the fact that on a majority of railroads employees connected with the skilled shop trades have had agreements which included working regulations, recently these employees have presented a request for a standardization of working rules on all railroads under federal control.

### Employment of Women

The employment of women (and of children) has often been opposed in many industries by employees affiliated with labor organizations upon the theory that women may be more successfully exploited than men, and with the result that in many industries into which women are introduced as employees to any considerable extent the wages will not be increased and perhaps decreased, and that the working conditions will not be favorable.

A large number of women have always been employed by the railroads, but because of war conditions this number rapidly increased, and in many instances women were not paid the same wages as men. To assure the women employees of the railroads of not only fair treatment and wages, but suitable working conditions, the Women's Service Section was created on August 28, 1918. The work done by this section has been very thorough, considering the limited time in which it has been in operation, and a detailed report of its work is attached.

### Railway Board of Adjustment No. 1

Railway Board of Adjustment No. 1 was created by virtue of an agreement entered into March 22, 1918, between the regional directors and the chief executives of the four organizations representing engineers, firemen, conductors, trainmen, and yardmen.

As article 6 of the agreement refers to the "Commission of Eight" and transfers the jurisdiction which that body had previously had to the new board, it seems appropriate to embody here a statement explaining the origin and jurisdiction of the Commission of Eight.

When, in March, 1917, the committee of the Council of National Defense, at the request of the President, intervened in the controversy over the demand for an eight-hour day, it was agreed by the railways and the four organizations to accept whatever award the committee should make. The National Conference Committee of the railways represented over 150 railways, and practically each of these roads had elaborate and complex agreements in effect with two or more of the employees' organizations. There were, therefore, in all hundreds of individual contracts, each with its own peculiar provisions, to which the award had to be applied, and it was fully appreciated by each side that in this process innumerable controversies would inevitably develop. Imme-

diately upon the acceptance of the award the conference committee and the executives of the four organizations entered into a further agreement to create a standing commission of eight members, four to be chosen by the National Conference Committee and four by the brotherhoods, to pass upon the application of the award to the agreements on the individual roads.

The board was intentionally composed of an even number from each side, and a majority decision was to be binding. The commission met in May, 1917, and held sessions each month until March 22, 1918, on which date it was superseded by this board. By that date it had practically completed its work. In every instance the action of the commission on all matters before it was unanimous. The above review has been gone into because it is believed that the experience of this commission in being able to reach unanimous agreements had a very direct influence on the action of the regional directors and the heads of the brotherhoods in making their agreement to create another similarly constituted board with enlarged jurisdiction to supersede that commission.

It was recognized at the outset that mutual respect and confidence on the part of its members was a prime requisite for its successful functioning, and four of the members of the Commission of Eight were named for membership, the other four not being longer available because of press of other duties.

Starting with this advantage, the work of this board from the beginning has been marked by mutual understanding and good will and by the absence of friction or any appearance of biased partisanship. In the appended statement it will be seen that up to November 30, decisions had been rendered by the board in 292 cases, and between that date and this writing additional decisions have been rendered bringing the total up to 331. While in accordance with the agreement a majority vote is decisive, in every one of the decisions rendered the action of the board has been unanimous. While the agreement further provides that in the event of a deadlock the case may be referred up to the director general for a decision, no occasion has up to this time arisen to invoke this provision of the agreement.

Board of Adjustment No. 1 held its initial meeting at Washington, D. C., April 8, 1918. It organized by the selection of Charles P. Neill as chairman and L. E. Sheppard as vice-chairman for the ensuing calendar year. Later on Mr. Sheppard had to be withdrawn from the board to devote his time to duties at headquarters as senior vice-president of the Order of Railway Conductors, and W. M. Clark, another vice-president of that organization, was named in his place. F. A. Burgess of the Brotherhood of Locomotive Engineers, was chosen vice-chairman.

In pursuance of its adopted policy of rotating its chairmanship and vice-chairmanship, F. A. Burgess has been elected chairman and E. T. Whiter vice-chairman, for the term beginning January 1, 1919.

The board has been in session the greater part of each month, and at the beginning of its December session had disposed of 309 cases. In most of these cases hearings have been held at the request of one or the other party to the controversy, or of both, to permit of the presentation of oral testimony and argument. There is appended hereto a statement showing the number of cases on the docket of the board at the close of November and the disposition made of these cases.

Number of cases entered upon the docket under General Order No. 13	408
Number of cases in which decisions have been rendered	292
Number of cases disposed of locally	7
Number of cases withdrawn at hearings	7
Number of cases in which decisions were not rendered, account being taken of	9
without jurisdiction	2
Total number of cases disposed of	307
Number of cases on the docket as of November 30 and not yet disposed of	101
Number of cases for which hearings have been set for December session	51
Number of cases now ready for action of the board	2

Number of cases held up or covering which additional data has been requested.....	16
Number of cases on docket under General Order No. 27.....	21
Number of cases on which recommendations have been made.....	2
Number of cases held to determine jurisdiction.....	21

**Railway Board of Adjustment No. 2**

This board was established in accordance with the understanding reached in General Order No. 29, dated May 31, between the regional directors representing the railways which may have, or may hereafter have agreements with the International Association of Machinists, International Brotherhood of Boilermakers, Iron Ship Builders and Helpers of America, International Brotherhood of Blacksmiths and Helpers, Brotherhood of Railway Carmen of America, Amalgamated Sheet Metal Workers' International Alliance, and International Brotherhood of Electrical Workers, and the officers of those crafts.

Regular meetings of the board began on Tuesday, July 2, 1918, and have been held practically continuously from that date.

The board to date has had 147 controversies presented to it for adjustment and has rendered 128 decisions. The board has been obliged to hold up some of the cases pending decisions of the Board of Railroad Wages and Working Conditions, and others pending further information from the parties to the controversies.

In addition, the board has had considerable correspondence both with the railways and the crafts, endeavoring to guide them in the presentation of matters which would properly come before this board, there seemingly having been more or less misunderstanding on the part of both the railways and the crafts as to how the controversies should be properly submitted. At this date there seems to be a better understanding.

The decisions are based on the orders of the director general and agreements between the crafts and the railroads, and as almost every railroad had a different agreement it was necessary to make a careful collection and compilation of the agreements in force.

While much time has been expended in considering some of these controversies, it is felt that on the whole it was well spent, and, so far as the board is aware, its decisions, taken as a whole, have met with the approval of both the railroads and the crafts.

It is further felt that the creation of this board has had a stabilizing effect as between the railway employees and railway employees.

**Railway Board of Adjustment No. 3**

General Order No. 53 created Railway Board of Adjustment No. 3 under date of November 13, 1918. But one case has been submitted to the board, upon which no action has been taken (December 1, 1918) due to additional information being required.

**Women's Service Section**

This section was created August 28, with Miss Pauline Goldmark as manager, to "give consideration to conditions of employment of women on railroads under federal control."

In view of the growing importance of women in the railroad service and the diverse problems which follow their introduction in a new field of industry, it was deemed advisable to create this special agency. For the first time women were entering new occupations side by side with men, and it was important to determine whether such work was suited to their strength and aptitudes, or whether it was too heavy or performed under undesirable conditions. If this proved to be the case, then it would be necessary to discontinue their employment in certain occupations and to transfer them to other more suitable fields. Moreover, there was need of more careful provision of the comfort facilities which were often overlooked when women took the place of men. And finally,

it was important to insure observance of wage orders giving women the same rate of pay as men for the same class of work.

The first statistics of the number of women employed in the railroad service were collected as of January 1, April 1, July 1, and October 1, and showed the following increases:

NUMBER OF WOMEN EMPLOYED BY THE RAILROADS ACCORDING TO TERRITORY  
[First-class roads]

	January 1	April 1	July 1	October 1
Eastern territory .....	32,049	34,938	45,702	54,466
Southern territory .....	6,332	6,937	8,724	11,447
Western territory .....	22,174	23,979	27,944	35,383
Total .....	60,555	65,854	82,370	101,296

**Further classification according to occupations follows:**

NUMBER OF WOMEN EMPLOYED BY THE RAILROADS ACCORDING TO CHARACTER OF OCCUPATION  
[First-class roads]

SUMMARY OF EASTERN, SOUTHERN AND WESTERN TERRITORY, 1918

Classes of employees	Jan-uary 1	April 1	July 1	Octo-ber 1
1. Attendants .....	807	934	1,443	2,390
2. Bridge tenders .....	2	6	11	12
3. Car department .....	381	421	928	684
4. Clerical or semi-clerical.....	47,192	51,468	61,320	73,285
5. Clearing .....	3,492	3,666	4,652	5,555
6. Elevator operators .....	16	15	34	97
7. Messenger service .....	359	430	557	736
8. Personal service .....	2,187	2,300	2,480	2,796
9. Roundhouse work .....	354	397	923	1,365
10. Shopwork .....	1,392	1,443	3,178	5,091
11. Signal service .....	36	40	186	220
12. Station agent, assistants, agent-oper- aters .....	379	426	300	377
13. Supervisors of women employees...	52	52	78	113
14. Switch tenders and other yard work	10	18	17	50
15. Telegraph operators .....	1,538	1,693	2,158	2,396
16. Telephone operators (train orders, locking, etc.) .....	1,385	1,322	1,729	2,613
17. Track work .....	60	133	817	872
18. Train service .....	24	30	71	100
19. Warehouse and docks (includes trucking) .....	324	420	792	1,461
20. Watch women .....	204	232	293	518
21. Other service .....	361	408	423	565
Grand total .....	60,555	65,854	82,370	101,296

The variety of occupations is surprising. One of the railroads reports the employment of women in 99 different positions. The following list covers in general the occupations in which women are employed outside the clerical and semi-clerical and common labor:

- Turntable operators.
- Packers of journal boxes.
- Attendants in tool rooms and storerooms.
- Telegraphers and telephoners in block-signal work (including interlocking switches).
- Lever women in signal towers.
- Checkers in freight houses.
- Car clerks.
- Operators on bolt-threading machines.
- Operators on nut-tapping machines.
- Operators on car-bearing machines.
- Operators on turret lathes.
- Operators on angle-cock grinders.
- Hammer operators.
- Crane operators.
- Air-brake cleaners, repairs and testers.
- Electric welders.
- Oxy-acetylene cutters and welders.
- Core makers

**Organization of the Women's Service Section**

In order to get first-hand information as to actual conditions under which women were working, four field agents were appointed on the staff of the Women's Service Section (Miss Rose Yates, Massachusetts; Miss Edith R. Hall, New York; Miss Helen Ross, Missouri; and Miss Florence E. Clark, Indiana). The field agents are reporting on the exact character of labor required, the suitability of the work, and the environment, including dressing, wash room and toilet facilities. They are also determining whether state labor laws as to hours of work are being observed and whether the correct rates are being paid, insuring equal pay for equal work irrespective of sex. The Women's Service Section presents complaints and questions needing correction to the proper officials and in most instances has secured the necessary changes and adjustments on the presentation of the facts.

Data from Field Inspections

The number of field inspections made by the Women's Service Section amount to 407. This covers the employment of 3,590 women. Inspections have been made in 11 states and the District of Columbia. Practically all the occupations in which women are employed are herein included, so that the data secured in these inspections can be considered representative of general conditions of employment.

EMPLOYMENT OF 3,590 WOMEN ACCORDING TO CLASS AND HOURS OF WORK

	Total number women	Hours of work per week			
		48 or less	49 to 54	55 to 60	61 or more
Attendants	118	58	48	8	4
Car department	60	3	32	9	16
Clerical workers	2,140	2,023	76	30	11
Cleaners	411	207	57	20	127
Personal service	130	120	3	3	4
Roundhouse	141	68	6	0	67
Shopwork	335	18	148	161	8
Block operators	123	0	7	47	69
Track work	18	0	0	18	0
Warehouse and docks	84	2	30	50	2
Watch women	5	4	0	0	1
Other service	25	20	3	1	1
Total	3,590	2,523	410	347	310
Per cent	100	70.3	11.4	9.7	8.6

NUMBER OF WOMEN ACCORDING TO AGE AND NIGHT WORK

	Total number	Day work	Night work	Per cent
Number of women	3,590	3,267	323	8.99
Number of women under 21	963	914	49	5.08

The 323 women here enumerated as employed at night were not employed for overtime but on regular night shifts, beginning or ending between 6 P. M. and 6 A. M. For the most part these shifts ended at midnight, 12:30, 1:30, 2, 2:30, 3, 5:30, 7, 9, or 10 A. M. Block-signal operators, coach cleaners, and scrub women, as well as clerks in roundhouses, are predominately represented among these night workers.

NUMBER OF EMPLOYEES HAVING NO REGULAR WEEKLY DAY OF REST ACCORDING TO CLASSES OF WORK

	Number working 7 days week	Total number of employees	Per cent
Attendants	2	118	1.7
Car department	3	60	5.0
Clerical work	44	2,140	2.1
Cleaners	128	411	31.1
Personal service	71	130	54.6
Roundhouse work	57	141	40.4
Shopwork	...	335	...
Block operators (telegraph and telephone)	123	123	100.0
Track work	...	18	...
Warehouse and docks	1	84	1.2
Watch women	3	5	60.0
Other service	3	25	4.0
Total	433	3,590	12.1

This group of 433 women is scheduled to work 365 days a year. Classified according to hours of labor, they are distributed as follows:

NUMBER OF EMPLOYEES WORKING SEVEN DAYS A WEEK ACCORDING TO HOURS PER WEEK AND HOURS ON SUNDAY

Number of employees	Hours of work	
	Per week 54 hours and under	On Sunday 5½ to 6½
81	...	...
83	56	8
11	60	6
80	63	9
1	66½	9½
1	68	10½
158	70	10
2	77	11
1	80½	11½
15	84	12

In connection with these statistics, it should be said that the excessive length of hours has been brought to the attention of the officials and steps are being taken to reduce them.

Women Removed from Unsuitable Occupations

It became apparent several months ago that the employment of women in certain occupations was objectionable. Their use as section laborers, for instance, was judged by the director general to be unsuitable owing to the heavy work and to the surroundings, women and young girls being

employed in gangs with men along the tracks at long distances from any house or station.

Objection was also taken to the employment of women as truckers in depots and warehouses on account of the excessive physical exertion required. In view of the wages now paid it was believed possible to secure men and to transfer the women to some class of work suitable to their strength and with proper regard to their health. The railroads were accordingly asked by the director general to discontinue their employment both as section laborers and as truckers, September 27, 1918. Similarly, the work of calling train and engine crews was not approved for women (November 7, 1918).

Under these orders, on one railroad employing more than 2,000 women, 223 employed as laborers and 193 employed as truckers were transferred to other jobs or dismissed. Another railroad which in August employed 145 truckers has now entirely given up this form of work for women.

Improvement of Comfort Facilities

The sudden growth in the number of women employed has not always been accompanied by proper supervision for health and comfort. It has therefore proved necessary in many places to secure better equipment and improvement of conditions of employment. One special hardship has been the inaccessible location of toilets, sometimes entailing a long walk out of doors. These conditions have been remedied or are in process of being remedied, but there is no doubt that women are still suffering hardships of this kind for which there is no legitimate excuse.

Less serious from the point of view of health but still harmful is the failure to provide dressing and wash rooms. After working in a roundhouse or shop, in the yards, or even after cleaning coaches, a woman should be given a place where she can wash up and change her clothes before going home. The new practice of wearing uniforms, which should be encouraged as a safety measure for all positions except the clerical, makes it indispensable to provide these accommodations. There should be no evasion of the responsibilities of making proper provision for them if they are employed at all.

Steps Taken to Reduce Dangers of Night Work

Recently the Women's Service Section received inquiries whether women might be employed on night shifts as watch women. Owing to seniority rights among railroad employees, the last comers are given the most undesirable hours. The position was taken that older men who may be incapacitated for more active work should be employed on these shifts and the employment of women restricted to the daytime. Where women have been found working in isolated positions at night in roundhouses or telephone offices the moral hazards have made it necessary to secure their transfer, especially when girls are employed, to daytime shifts.

A serious situation was found in one special class of work, namely, block operating in signal towers. An investigation of 198 girls and women so employed shows the following:

EMPLOYMENT OF WOMEN AS BLOCK OPERATORS, ACCORDING TO AGE AND DAY AND NIGHT WORK

Number of women	Day work	Night work	Total
Under 21 years of age	15	51	66
Over 21 years of age	34	98	132
Total	49	149	198

\*Five girls 17 and 18 years of age included.

The hours of work run from 52½ per week to 70. One woman was employed 77 hours, but by far the greater number were on duty 63 hours. All work seven days a week, thus averaging 9 hours a day. In order to understand the full significance of these figures it should be explained that most of the operators work in lonely towers and stations at a distance from towns or houses. This is clearly not suitable

work for young women unless they are fully protected at all times. Objection has been made to the employment of girls under 21 as cleaners in the yards at night as involving moral hazards which would not be tolerated.

### Opinions Secured as to Women's Abilities in Various Occupations

The opinions of officials as to women's abilities in the various lines of work are important as indicating the future place of women in the railroad service. It appears that whenever women have been given proper instructions they have proved their value in practically all the clerical and semi-clerical occupations. Old prejudices are rapidly disappearing, and they are being recognized by many officials as a permanent addition to the labor force. Many superintendents and chief clerks report that they are careful and conscientious, as well as capable of obtaining a good grasp of the scope of the work.

In the shops, too, there is evidence that women have been equal to the new jobs, not only in processes requiring little skill, but in some of the trades calling for a high degree of intelligence and training. They are, for instance, doing electric welding, having advanced from flat work to welding of all kinds. They are also doing oxy-acetylene burning and welding. In one shop 20 welders are employed. The fact that some are earning the full mechanic's rate is proof of their proficiency.

They are also cleaning and repairing and testing air-brake equipment. In one shop three young women have full charge of all the triple-valve work in emergency repairs. They are giving satisfaction without the help of any man operator. This exceptional achievement is the result of careful training and the selection of the proper type of worker, as well as a real desire to develop women as a new source of labor. They have responded to this treatment, take pride in their work, and are doing it well. The shop foreman says that he would be willing to match the three girls in his shop against any three men in the country, and he considers the tester by all odds the most skilled on the division. Similar opinion was expressed by the superintendent of motive power, by whose order the experiment of placing women in charge of this shop was tried. The federal manager, too, commented favorably on their performance.

Another set of workers who have done well are the box packers. Of one group the master mechanic says that he considered their work entirely satisfactory. The car-shop foreman says that he considers their work just as reliable as that of any man; in fact, more carefully done. "They take more interest and are more impressed with the harm likely to result from neglect."

Regarding women as turntable operators, general satisfaction is expressed by the officials of several roads. One operator, for instance, is reported as keeping herself posted on the order in which the engines are scheduled to go out, and moving the table into readiness in advance of the signal. A foreman said of her that she was far superior to any man they had ever had, in being always on the job, alert to any emergency, and generally intelligent in her work. The district superintendent remarked that for the first time in the history of the road the engines were going out exactly on time.

With respect to common laborers, there is wide diversity of opinion depending upon the kind of women employed. In the lighter job of cleaning the tracks, sweeping cinders, and collecting scrap, many older women who are no longer vigorous have been employed, but admittedly only as a wartime expedient, as they cannot be depended on for long-continued effort. From many quarters there have been complaints of the unsatisfactory character of the work. This may in part be due to the lack of efficient supervision, the women often slacking on their jobs and wasting time.

In certain localities, foreign women of peasant type and

especially the colored women have succeeded in doing very heavy lifting and carrying. But on the whole it is true of the women laborers that their work involves too great muscular exertion. Work of this kind should undoubtedly be discontinued not only because, like trucking, it involves possible physical injury, but also because women are not in the long run able to measure up to the work and carry it on effectively. The same criticism is made of women as attendants in parcel rooms on account of the great amount of lifting required.

On the railroads, as elsewhere in industry, the women of the United States when the war began did not feel the obligation experienced in England to leave their wonted occupations and take the places of men. Though some women were undoubtedly influenced by the opportunity for patriotic service, the attraction for the most part lay in the high wages that were offered. About a year and a half ago, before the railroads were put under federal control, women were first engaged on account of the shortage of labor and also because they could be obtained for less pay than men. The wage orders of the Railroad Administration have put an end, however, to this undercutting of men's wages.

It may, in general, be said that a fine class of women have been secured. In most cases they have received wages higher than any previously earned by women except in positions of much responsibility or those requiring special skill. The women are eager to remain with the railroads, as they have shown by their anxiety to retain their positions and share in all the privileges of the service. They appreciate the recognition given by the government to the labor of women, especially the equality of wages assured to them.

### "No Accident Week"

THE FOREGOING is to be the watchword for railroad employees throughout the Southern region, says B. L.

Winchell, regional director, for the week beginning Sunday, January 19. During this period all officers and employees are urged to pledge themselves to try to prevent injury to their own persons or to their fellow employees. C. M. Anderson, regional supervisor of safety, has started this movement in emulation of a "no accident week," which was carried out on the lines of the Central of Georgia during the first week in December and which proved highly successful.

Every officer and employee is requested to make a pledge, in writing, to the effect that he is going to co-operate with the management and the general safety committee in making no accident week a success.

The Central of Georgia pledge consisted, in substance, of a promise "that we shall be exceedingly careful during the first seven days in December and will do our utmost, not to get hurt, or be the cause of any other persons being hurt." The total number of employees on that road is about 9,000, and, judging by past records, it might have been expected that, in a week, one or more employees would be killed and perhaps a score injured. In the week when the pledges were in force no person was killed, and the only injury was that of one man, in a shop, who in handling an adze cut his finger, and was off duty for one day. One trespasser was injured by being struck by a train at night; but the pledge had to do only with employees.

Each day during the week messages were sent out announcing that the record was clear up to the time of writing. Varied means were taken to keep up the interest of the men, in the effort to make a clear record. About 350 personal letters were written: by general officers to those in the lower grades; by subordinate officers to foremen and to individual employees, and by foremen to employees in various departments whose influence was believed to be specially valuable.

# Walker D. Hines, Director General of Railroads

Associated with McAdoo from Beginning of Government  
Control and in Sympathy With His Policies

**W**ALKER D. HINES, assistant director general of railroads, and formerly chairman and general counsel of the Atchison, Topeka & Santa Fe, has been appointed director general of railroads, succeeding W. G. McAdoo. The appointment, which was cabled by President Wilson, was announced by Mr. McAdoo at Los Angeles on January 11, and Mr. Hines entered upon the duties of his office immediately. The appointment was recommended to the President by Mr. McAdoo, and Mr. Hines announced that he intended to carry out the McAdoo policies. He will receive the same salary, \$25,000 a year, which he has received during the past year as assistant to Mr. McAdoo, and which was fixed for the directors of the departmental divisions in the Railroad Administration. One of Mr. Hines' first official acts was the appointment of W. T. Tyler, senior assistant director of the Division of Operation, as director of the Division of Operation, succeeding Carl R. Gray. The position of assistant director general will not be filled for the present.

In announcing Mr. Hines' appointment Mr. McAdoo said:

"Mr. Hines has been my assistant at Washington since the beginning of government control and has a thorough knowledge of the organization and administration of the railroads under federal control as well as of the fundamental problem involved in the railroad situation. His ability and experience admirably fit him for the great trust and responsibility with which the President has honored him. Aside from his obvious qualifications, Mr. Hines is in full sympathy with the policies which have guided the Railroad Administration and with the views of the President on the railroad question. I am sure that Mr. Hines will have the hearty support of the fine army of railroad officers and employees and I can ask nothing better for him than that they shall give him and the country the same loyal and effective service they rendered during my term as director general."

Mr. Hines issued a statement to the public as follows:

"From the first day of government control of the railroads I have been part of Mr. McAdoo's administration and it will be my purpose as director general to carry forward the policies he has so ably put into effect—fidelity to the public interest, a square deal for labor, with not only an ungrudging but a sincere and cordial recognition of its partnership in the railroad enterprise, and fair treatment for the owners of railroad property and for those with whom the railroads have business dealings.

"Until the signing of the armistice the government's first

railroad duty was to run the railroads to win the war, but now that the war is won, the government's railroad job is to render an adequate and convenient transportation service at reasonable cost. There can be no greater civic triumph in time of peace than the performance of a successful transportation service for the 100,000,000 producers, consumers and travelers in this country. To participate in the achievement of this great object I invite all the railroad officers and employees with whom I have had the great privilege of co-operating in their splendid war work.

"I am a profound believer in the virtue of mutual understanding. Most disputes come from the failure to understand the other fellow's legitimate needs and his legitimate difficulties. I shall do my best to understand the points of view of all the interests affected by the conduct of the railroads or charged with duties on the subject, and I shall also try, frankly and as clearly as I can, to get all those interests to understand the government's needs and the government's difficulties in conducting the railroad transportation service. I ask of all that they will meet me half way in this great work of trying to understand."

He also telegraphed to the regional directors to have placed on all bulletin boards the following statement to railroad officers and employees, to which was added a copy of Mr. McAdoo's statement and of his own statement to the public:

"The President has appointed me director general of railroads, effective at once. I wish my first official act as director general of railroads to be this statement to officers and employees:

"Having been part of Mr. McAdoo's organization from its first day, his policies are my policies and I intend to carry them out and to do so through the existing railroad organizations of the Railroad Administration.

"The responsibilities of the work cannot be exaggerated and there can be no success in it without your confidence and support.

"I shall gain and justify your confidence by prompt and fair treatment, but until you get a chance to know me and judge me by my works, I want you to take me on faith and from the very first day help me to give the government the best possible service and the people the best possible transportation. You and I have been fellow workers in the hard war work of the past year, and I ask you to join me in giving the public even in time of peace the valiant and faithful service that you gave so heartily in time of war."

Mr. Hines was born February 2, 1870, at Russellville,

© BY HARRIS E. WILSON, WASHINGTON FROM PHOTO WOODS-LOTT, N.Y.

W. D. Hines

Ky. He was graduated from Ogden College in 1888 with the degree of B. S. and from the University of Virginia in 1893 with the degree of L.L. B. He entered railway service in 1893 as assistant attorney of the Louisville & Nashville, which position he held until 1897, when he was appointed assistant chief attorney. From 1900 to 1904 he was first vice-president of the same road and from 1904 to 1906 he was a member of the law firm of Humphrey, Hines & Humphrey at Louisville. In 1907 he became a member of the law firm of Cravath, Henderson & de Gersdorff. In 1906 he was appointed general counsel of the Atchison, Topeka & Santa Fe and in 1908 became chairman of the executive committee of that road while continuing his private law practice, and he was later elected chairman of the board of directors of the same road. In connection with his law practice Mr. Hines represented numerous important clients in litigation before the Interstate Commerce Commission and the courts.

Mr. Hines served as acting director general for several weeks during the spring while Mr. McAdoo was away from Washington, and he was left in charge at Washington when

Mr. McAdoo went to California last week. He is in sympathy with Mr. McAdoo's ideas as to the disposition of the railroads and recently represented him in an address before the transportation conference called by the railroad committee of the Chamber of Commerce of the United States, urging a five-year extension of the period of federal control as the only practical alternative to a prompt return of the railroads to their owners. He feels very strongly that a continuance of the present plan of operation for a comparatively short period, such as 21 months, would be attended with such disadvantages that unless the time is extended the government should relinquish the railroads at a very early date, and he expects to testify to this effect at the hearing before the Senate Committee. As there is little probability that Congress will approve the five-year extension, it is believed in Washington that Mr. Hines' tenure of office will be short and that one of his principal duties will be to wind up the affairs of the Railroad Administration and arrange for the adjustment of the relations between the government and the railroad employees, unless some interim plan is worked out.

## Railroad Hearings Before Senate Committee

### Alfred P. Thom Begins Legal Argument Against Five-Year Extension of Federal Control

THE HEARING before the Senate Committee on Interstate Commerce on plans for the disposition of the railroads promises to become a protracted proceeding. The committee has thus far heard the views of former Director General McAdoo, the Interstate Commerce Commission, the Association of Railway Executives and a group of western shippers, and expects still to hear from more railway executives, representatives of the security owners, the national shippers' organization and the labor organization. It is understood that Congressional leaders base no hope of enacting any legislation on the subject at this session.

While the testimony introduced thus far and its reception by members of the committee indicates a general desire to bring about an improvement in the methods of railway regulation and a return to private management rather than an extension of government control, there are many differences of opinion as to the details and a general opposition to a return of the roads until a permanent plan can be worked out. Aside from the testimony already presented, something has become known of the attitude of some of the interests that are still to be heard.

S. Davies Warfield, president of the National Association of Railroad Security Owners, which has a definite plan for the return of the roads to their owners, has been working in co-operation with the executive committee of the National Industrial Traffic League, and has let it be known that both bodies are opposed to the ideas of federal incorporation and a secretary of transportation proposed by the railroad executives, but desire the return of the roads as soon as remedial legislation can be enacted and are in favor of a greater degree of co-operation on the part of the railroads than has heretofore been permitted by law. The state commissions are opposed to federal incorporation or a secretary of transportation and desire to retain their authority over intrastate rates and service, but are in accord with the proposals of the Interstate Commerce Commission for a plan for co-operation between state and interstate commissions. The officers of the train service brotherhoods, who are to appear on January 22, have not yet expressed themselves and the classes of em-

ployees included in the American Federation of Labor are taking a referendum vote on the question of government ownership.

#### Mr. Cuyler's Testimony

The plan proposed by the Association of Railway Executives, as published in last week's issue, was outlined by T. De Witt Cuyler, chairman of the association, on January 9. Mr. Cuyler also put in the record a copy of a message which he had sent to Walker D. Hines, assistant director general of railroads, on December 21, regarding the statement made by Mr. McAdoo to Mr. Cuyler and a number of financial men, on December 9, as to the possibility of the early return of the railroads, or, in lieu thereof, of extending the time of federal control for a period of five years. Mr. McAdoo's position had been laid before the standing committee of the executives, who came to the conclusion that the period of 21 months should furnish ample time for the consideration and adoption of any plan that might be a wise one for the railroads and the country, and urged upon the director general the importance of time to consider plans for the future, and that any return of the roads might be deferred until this opportunity has been afforded. The message said that the executives were hopeful that a constructive plan could be submitted either to the present Congress or to the sixty-sixth Congress, and meanwhile urged upon the director general the great disaster that, in their judgment, would ensue to the owners of the roads, the security holders and the public at large if the roads should be returned before time has been given to fully consider the problem.

Mr. Cuyler explained that the plan of the railroads was not a hard and fast plan and, therefore, was not in the form of a bill, but it represented the views of all the principal railroads, except the Southern Railway, which is not a member of the association, and also of the short line railroads, whose association has a representative on the committee. It had been approved at a meeting of the railway executives at Philadelphia on January 5.

Senator Smith asked why the railroads preferred to place the executive and administrative powers in the hands of a secretary of transportation rather than the Interstate Commerce Commission. Mr. Cuyler said this was because the commission was overburdened and because of the thought that a member of the cabinet would have the ear of the President and be in a position to represent to him the transportation conditions of the country. He also thought there would be less fear of political pressure upon a cabinet officer than upon a board. He had no criticism to make of the commission, but thought it could not act with sufficient promptness. The railroads did not propose to abolish the state commissions; their assistance was desired, and it was felt they should act in an advisory way to the regional commissions, but should have no power over rates, on the ground that rates are a matter of national concern. Senator Cummins thought the railroad plan was very similar to that under which the railroads are now operated. Mr. Cuyler said that while Mr. McAdoo now has the power to do everything, the railroads propose to leave the matter of operation in the hands of the railroads and divide the powers of regulation between the secretary of transportation and the Interstate Commerce Commission. Chairman Smith said he was very much in favor of the regional commission plan, but somewhat skeptical regarding a cabinet officer who would be changed every four years, and other Senators expressed a feeling that he would be a politician.

In reply to a question by Senator Townsend as to whether the railroads would maintain the present scale of wages, Mr. Cuyler said that he thought wages should be governed by the law of supply and demand, but he was not qualified to say whether the present wage scale is wisely and economically adjusted.

Mr. Cuyler thought that competition between railroads so that the railroad which gave the best service would get the business would have a greater effect in improving service than the enforcement of orders. He said he realized that this created the condition where some railroads might earn a high return while other roads could not earn enough, but that the best managed railroad ought to derive some reward for its efficiency. Senator Pomerene asked whether it was the impression of the railroads that the Interstate Commerce Commission had not been liberal enough. When Mr. Cuyler replied in the affirmative, the Senator asked how he explained the figures submitted by the commission showing a general increase in net income, dividends and surplus. Mr. Cuyler replied that the increase in earnings was not sufficient to provide for the enormous increase in capital requirements.

The rate situation, he said, was the key, and he thought that there would soon have to be even another increase in rates if the present scale of wages and costs of materials is maintained. Otherwise, there would be a deficit in 1919, and if the government continued to operate the railroads he did not believe rates would ever be reduced. He admitted that he was biased because of his strong feeling that the end of the republic would come if the government ever owned the railroads. Asked about the possibilities of economies as the result of unification, he said that Mr. Kruttschnitt would present that subject more in detail, but that the possible economies were surprisingly small as compared with total expenses.

Senator Underwood said that apparently all minds meet as to the necessity for regulating security issues, and he thought there would not be much objection to removing the prohibitions of the Sherman law and the anti-pooling law under proper regulation, but that if the rates are sufficient, that is all the railroads have the right to ask, and he suggested that it might be better to have the rates themselves initiated by the government under some sort of budget plan. Mr. Cuyler said he would not object to that if the railroads

were insured rates sufficient to meet the cost of operation and attract the necessary capital. Senator Cummins suggested that if the government is to practically guarantee a sufficient return on the capital it ought to get the capital at the lowest possible rate, as by issuing government bonds to pay for the railroads and leaving their operation in the hands of private corporations. Mr. Cuyler said he did not believe the American people would invest enough money to buy the railroads and then refrain from operating them, and that it would be difficult to organize private companies to operate the railroads for a limited return.

Mr. Cuyler declared that the railroads were never more efficient than in 1917 before they were taken over by the government, and that whatever collapse of transportation there was resulted from the fact that the laws would not allow the railroads to do what the government has done. Under the same laws, he said, the government would have broken down worse than the railroads did, and he thought the railroads might have done better than the government has done if they had been allowed to do the same thing.

Mr. Cuyler took exceptions to Mr. McAdoo's statement that the railroad companies have not co-operated with the government in the matter of capital expenditures. He said that practically the only exception was in the matter of the allocation of standard cars and locomotives. The government gave a huge car order without consulting the railroads, and then asked them to take and pay for cars and engines entirely unsuited to many railroads. For instance, the Pennsylvania Railroad was asked to take 1,000 55-ton coal cars, when its standard cars were 70 tons. The railroad would be handicapped for 20 years, he said, by uneconomical cars. Many of the railroads had placed orders for cars before the government order was placed, and now the war is over, only 14 per cent of the standard cars have been delivered, and most of the railroads have idle cars. Senator Townsend asked whether the standard car is economical.

"We don't think so," replied Mr. Cuyler.

"I understand that the Interstate Commerce Commission doesn't think so, either," said Senator Townsend.

Senator Smith asked if the railroads had considered the effect of a return of their property to private management in advance of remedial legislation.

"They have considered it very seriously," said Mr. Cuyler, "and fear that the effect would be very disastrous. The roads owe vast sums to the government, payable on demand, although it is not expected that the government would attempt to exercise its right. The government has taken over many of the securities of the roads as collateral; in the case of the New Haven, every dollar's worth of securities it owns. Railroads have received very little of their contract compensation yet from the government, and many of them need the money."

#### Commissioner Clark Recalled

Commissioner Clark of the Interstate Commerce Commission was recalled for further questioning on January 10, and some time was spent on the question as to whether the commission has delayed the decision of important cases. Commissioner Clark thought that criticism on this score was unjust, except possibly as regards the five per cent rate case, in which the commission covered a very wide range and spent a great deal of time. He said he had frequently read in the morning papers complaints by railroad executives of the delays by the commission and later in the day had listened to arguments of railroad counsel asking for further time to present their case. He referred to the director general's Order No. 28 as an example of the fact that when rates are changed in a hurry a great many revisions and corrections are required. He said the commission had been overburdened and had asked for additional members and the power to organize into divisions, particularly because of the valua-

tion work. Since the plan has been in effect conditions have been so abnormal that its effect has not been demonstrated. If the commission were charged with the duty of supervising capital issues a new division would probably be required. Mr. Clark said he had never favored the plan of regional commissions, which he thought would necessitate a somewhat formidable multiplication of machinery and records, besides defeating to some extent the purpose of securing uniformity. Also, he said, many important rate cases affect such a wide territory that they cannot be localized. He said there was not much conflict between the Interstate Commerce Commission and the state commissions, and he thought a very satisfactory plan of co-operation could be worked out if provided for by law.

In reply to a question by Senator Townsend, Commissioner Clark disagreed with Mr. McAdoo as to the standardization of equipment. He thought a greater degree of standardization than has existed was greatly to be desired, but that complete standardization would be very undesirable because locomotives suited to one railroad were not suited to others on account of differences in grades, bridges, etc. Box cars might well be standardized to a considerable extent. Asked whether government operation was essential to continue the heavier loading of cars, Mr. Clark said that in his judgment the heavier loading was largely due to the co-operation of shippers in their desire to help out the situation as well as the necessity created by the shortage of cars and also to the fact that heavier loading was required in the case of many commodities by the War Industries Board and the Food Administration, but that there has been a progressive tendency toward heavier loading for a long time, and that if it is the government's policy to favor heavy loading in the interest of economy all that is necessary is to let the railroads increase the minimum carload weights.

In connection with the discussion of the earnings and expenses under federal control, Senator Cummins asked Commissioner Clark if he had any information as to the amount of claims against the railroads pending and unpaid on November 1, the date of the latest available statistics on expenses. He said it had been reported to him many times that the Railroad Administration had pursued the policy of refusing to recognize or pay claims, or at least of making it difficult to reach any conclusion, and that if the claims had been paid the operating expenses would have shown a still greater increase. Mr. Clark said the commission had no information as to the amount but would undertake to get it.

Asked whether he considered the completion of the valuation essential before a railroad policy is determined, Commissioner Clark said he was not very sanguine as to when the work would be completed because of the possibility of protracted litigation in connection with the protests of the carriers.

Senator Lewis, a government ownership advocate, created some amusement by asking Commissioner Clark to what extent the opposition of the commissioners to an extension of government control had been influenced by the probability that such a plan would do away with the need for the commission.

"Such a consideration never entered into our deliberations," replied Commissioner Clark, adding that rate-making would probably need some regulation, no matter who made the rates. Senators Poindexter and Cummins replied to Senator Lewis' insinuation by expressing the opinion that the work of the commission would not be decreased even if government operation were continued.

### Shippers Want Powers of Director General Abridged

Without proposing any plan for the permanent settlement of the railroad question, Clifford Thorne, C. D. Chamberlin and F. B. Dow, representing a number of shippers'

associations, filed a statement with the committee on January 11, urging an amendment of the federal control law to eliminate some of the arbitrary powers possessed by the Railroad Administration by restoring the suspended powers of the Interstate Commerce Commission, striking out the clause which states that the orders of the President may supersede the common law and the statutes of the state and federal governments, and by inserting a provision requiring the director general to pay final judgments rendered against common carriers. The statement expressed the belief that it is not possible for Congress to determine the ultimate disposition of the railroads during the present session, but that Congress should immediately restore the full jurisdiction and powers of the courts and commissions over the common carriers. The statement continued in part as follows:

"During the war there may have been some necessity for the alleged subordination of the Supreme Court, state courts, Congress, state legislatures, and the Interstate Commerce Commission to the will of the one man who happens to be director general of railroads; but that emergency has now passed.

"We do not concede that such a subordination of the judicial and legislative branches to one man occupying an administrative or executive position is constitutional or was intended by Congress, and yet the fact remains that the director general has so interpreted the law in actual practice, and he is now proposing to do so in the future. Test cases are being carried to the Supreme Court, that will finally determine the validity of such orders, but that will consume many months. In the meantime we earnestly implore Congress to clarify the situation by making just a few changes in the phraseology of the railroad control law.

"During the past year we have not had 'government operation of railroads'; it might be described more accurately as a taste of 'railroad operation of the government.' We do not say this with the slightest spirit of hostility or ill-will. We simply state a fact. It is correct to say that the railroads have not had their wishes as to some phases of the contracts or the purchase of railway supplies, etc. But as to operation Mr. McAdoo has delegated practically the whole problem to a staff composed almost entirely of railroad men. Numerous sub-committees have been created in different cities all over the country to hear complaints from shippers about service or rates and to make recommendations to the Washington staff as to what should be done. Without one exception to our knowledge the majority of these committees are railroad men.

"The administration has rendered many orders that have been of great value. This has been especially true as to rates that would develop new business and as to orders that affect the movement of certain commodities in certain portions of the country. The administration has been prompt to make a large number of rate revisions that restored the rate relationships existing prior to June 25. On the other hand, many orders have been issued that are arbitrary and unjust, without granting any opportunity whatever to those concerned to have a hearing before a disinterested tribunal before the order became effective.

"At the present moment the Railroad Administration has under consideration several sweeping, revolutionary changes in rates that are serving as a constant menace to industry, and that will disturb existing rate relationships upon which business has been built up during the past generation.

"General Order No. 57, dated November 26, 1918, directs that claims for loss of bulk grain will be recognized only where there is evidence of negligence on the part of the carrier. This is in direct conflict with the common law, as established in the decisions of the courts of last resort in both state and Nation.

"General Order No. 18 attempts to prescribe the venue

or jurisdiction of the courts, both state and federal. In effect it repeals a part of an act of Congress, one of the provisions in the well-known Carmack Amendment to the interstate commerce act. This is true whenever the claimant does not reside within the jurisdiction of the court where the shipment originated. Some municipal and district courts have held this attempt of an administrator tribunal to repeal an act of Congress and to limit the jurisdiction of our courts, is invalid. But Judge Trieber of St. Louis, of the federal bench, has recently sustained the order.

"The Railroad Administration is now considering the advisability of initiating an entirely new set of class scale rates based solely on distance, which shall supplant existing class scales throughout three-fourths of the United States, disturbing, in a wholesale manner, rate relationships upon which business has been established. Commenting upon this, Chairman Daniels of the Interstate Commerce Commission has written to the director general a letter in which he states: 'The substitution of distance as a basis for the class rate scales in these territories would generally and materially alter the long-established relationship of rates to and from competing places.' When business has been so greatly disturbed and the future is so problematical, this is a most unfortunate time to hold over American industry threats of further revolutionary changes of this nature.

"The administration has to a large extent eliminated the tracing of cars by shippers as before the war, even though the shipper owns the car.

"The administration has recently proposed an increase in the charges for intra-plant switching ranging from 30 to 300 per cent in amount. All this is in addition to the 25 per cent ordered last June.

"Many other advances and changes of a similar character are under consideration. The administration has recently announced the policy of granting hearings. That is a step in the right direction; but it is utterly insufficient. If John Smith wants a thousand dollars that belongs to me, I want a hearing before some other person than John Smith, before he gets the thousand. During the next few months it is probably more important, ten times over, than at any time in the past, that the shippers of the country shall have an opportunity to be heard before a disinterested tribunal prior to the time when changes in rates, rules and regulations shall become effective.

"The essential purpose sought to be accomplished in placing the railroads under federal control was to secure adequate transportation under war conditions through unified operation, thus securing an elimination of conflicting operating regulations, to which the carriers were subject at the time. It is no doubt true that a continued improvement of service can be secured through a further development of the operating plans which have been commenced under federal control. Nothing we suggest here is intended to militate against that effort. What we seek to accomplish is merely such a change in the statute as will restore the full effectiveness of the act to regulate commerce and the common law between the shippers and the railroads, under normal conditions, now that the great war emergency has passed."

#### Commissioner Woolley Wants Mileage Rates

Commissioner Woolley appeared before the committee on January 13 to elaborate his previous statement as to why federal control of the railroads should be continued. He presented a prepared statement, consisting largely of quotations from opinions of the commission, to support his opinion that the present freight rate structure of the United States is "unscientific, illogical and laden with preferences" and that a sufficient time under normal conditions must be granted for testing a plan calculated to do exact justice to the whole people rather than to the shipper and the carrier

as classes of the people. He declared that the freight rate is not simply an academic question to be settled with the consent of shipper and carrier, but that it goes to the heart of our social and economic problems, that our commercial development has been dictated by the railroads, and that the effect has been taxation of small towns and rural communities without representation. He declared that only the consumer is interested primarily in the reasonableness of a rate, that the shipper's chief interest is in maintaining the proper relationship of his rates to those of his competitors, and that the carrier's interest under private ownership is in collecting all that the traffic will bear. After citing numerous instances of the evils which he considers result from the present rate system, particularly along the lines of the development of the larger cities and the powerful shippers to the detriment of the smaller communities and shippers, he urged that Congress direct the commission to make the necessary investigation and inaugurate a plan of rates based on a terminal charge based on cost at both the point of origin and the point of destination, plus a uniform line haul charge based on actual short line mileage.

This, he said, would soon produce a wholesome agitation and competition among inland as well as seaboard cities for the reduction of terminal costs. Mr. Woolley also filed as exhibits a table of market quotations of railroad stocks at the time of the beginning of the European War, our entrance into the war, the principal congestion on the eastern railroads in the fall of 1917, President Wilson's recent address to Congress and Mr. McAdoo's proposal of the five-year plan. This, he said, was for the purpose of showing the difficulty that would be experienced in financing the railroads if they are returned to private operation. He also filed a list of the railroads under federal control amounting to 194,026 miles of road owned and 240,719 miles of road operated, with outstanding capital stock amounting to \$6,713,790,760 and bonds amounting to \$8,833,409,980.

Senator Cummins on cross-examination led the witness through a technical discussion of rate-making problems which brought out clearly numerous difficulties in the way of establishing a uniform mileage scale of rates, most of which Commissioner Woolley met by suggesting that various factors which now cause discriminations in rates "would have to be taken into consideration." Mr. Woolley said that he had agreed with Mr. McAdoo regarding the plan for putting into effect scales of standard mileage rates on class traffic, which he said was a step in the direction of his own plan, but that the Interstate Commerce Commission shortly before the signing of the armistice had decided that conditions were too abnormal to make it an opportune time to enter upon the investigation of such a plan which the director general had proposed. Therefore, Mr. Woolley suggested that Congress ought to initiate such a policy. Senator Cummins pointed out that the plan of mileage rates would completely revolutionize the business of the country, and asked the witness if he realized how it would increase many rates for long distance traffic which are now made to meet competition on the same commodities which may be shipped to market over much shorter distances. He cited as an example the rates on butter from western points to the east as compared with the rates from New England. Commissioner Woolley said he would have the rates looked up.

Senator Smith asked if the rates over lines in sparsely settled territories would not have to be higher than those over lines with dense traffic because of the difference in cost. Commissioner Woolley got around this by suggesting that the terminal costs would be less in the more sparsely settled territory and that such conditions would have to be given consideration, but he thought the difference in cost for the straight line haul would be so slight that the mileage rates could be made about equal in all parts of the country. At any rate he thought if the government controlled the rail-

roads conditions could be equalized better than under operation by competing lines.

At the conclusion of Mr. Woolley's testimony Senator Cummins suggested that Director General Hines be called to testify because of Mr. Woolley's statement that the Railroad Administration proposed to put into effect a mileage system of freight rates. Chairman Smith stated that it had been arranged that Mr. Hines would appear later.

#### Mr. Thom Opposes Five-Year Plan

Alfred P. Thom, counsel for the Association of Railway Executives, began his argument before the committee on January 14, opposing the plan of a five-year extension of federal control. He first took occasion to reply to Mr. McAdoo's suggestion that there had been a lack of co-operation on the part of the railroad corporations, saying that if there has been any such lack except as to the matter of allocating the standard equipment, the executives had not been aware of it.

"I doubt," he said, "if there has ever been a more stupendous event in the history of commercial affairs than the taking over by the government of some fifteen or twenty billion dollars' worth of property from their owners to be operated by the government. And yet the record of these executives from April 11, 1917, when they were summoned to Washington by the government to co-ordinate the railroads into one harmonious system, has been one of patience, obedience and co-operation. You have seen no complaints and no agitation originating from these executives in the public press, and you at the Capitol have had no approach in any effort to throw one iota of difficulty in the way of successful management by the Railroad Administration. It is the universal consensus of opinion that, except as they were prevented by the obstacles of existing law, these executives did all that was humanly possible. During the whole time of the government's operation of the railroads there has been the same spirit of not pushing to the front any selfish purpose. We think, in no captious spirit, that we owe it to the interests we represent and to the public to express our objection to the proposal to extend the government's control for five years during a time of peace.

"Little has been said about the great danger to the companies from government control. The government has taken not merely our physical property. It is using the credit of these railroads. As a war purpose to accomplish the national ends during the period of great peril, we accepted that as necessary. We challenge the proposal that for five additional years it is necessary for the government to keep not only our property, but also absolute control of our credit; that it shall tell us what debts we must create, what we are to buy and what we are to pay, and that instead of our credit being subject to the control of the owners of the properties, that it be taken away and exercised entirely by government officials."

Mr. Thom then quoted from section 6 of the federal control law which appropriated the \$500,000,000 revolving fund with which to pay for cars, locomotives, terminals, etc., and which also provided that the President might call on any carrier to make any expenditures he might designate for war purposes or in the public interest.

"This enormous power," Mr. Thom said, "cannot be over-stated. It may be wisely and considerably exercised or it may be exercised harshly and ruinously. That depends on the sense of fairness and right of the man who exercises the power. We don't know who he will be. We have had one man for a year and now another has been appointed. We have no knowledge of the personality who may exercise this power in future. We do know that the tendency would be to use the credit of the carriers and to spare the credit of the government. The very moment the revolving fund becomes a disappearing quantity and the real financial prob-

lem presents itself to the Railroad Administration, that very moment there will be a temptation to use the credit of the carriers for the relief of the government credit.

"We have been charged with having some human nature," Mr. Thom said, "but I have not observed that there is any less human nature in the love of power than in the love of property. The human nature is not all on one side."

Mr. Thom then produced one of the recent monthly reports of the Division of Capital Expenditures, saying that there has been created as capital charge against the railroads by the Railroad Administration a total of \$1,254,000,000, of which \$477,000,000 had been expended to November 1. He said he did not mean to say that this should not have been done, but that it has involved the purchase of equipment and the making of additions and betterments at war prices which will at once become a disappearing asset.

"We are confronted," he said, "with the possibility that when we come back into possession of these properties two-thirds of that cost put upon us at the present basis of high prices will have disappeared. Now it is proposed not only to do that in time of war, but to repeat it in time of peace for five years."

Referring to the matter of equipment, Mr. Thom said that under the law cars and locomotives may be ordered and paid for either by the government from the revolving fund or on the credit of the carriers. The Senate committee in its report to Congress last spring on the proposed federal control act had stated that the purpose of the revolving fund was to enable the purchase of engines and cars and terminals to become the property of the government to be used wherever they were needed and that their disposition would have to be settled by post-war legislation and that such expenditures as for extensions to army camps, etc., should become the property of the various carriers. The Senate bill had confined the power to purchase equipment and terminals to the government account, but the House bill had added the power to make such purchases on the credit of the carriers, yet the House committee in its report had also stated that section 6 contemplated the direct ownership by the United States of equipment and perhaps of terminals, but not of tracks to camps, shipyards, etc. In spite of these statements, Mr. Thom said, it has been the policy of the administration to buy engines and cars and to make improvements at the expense and on the credit of the carriers and that this is the one point on which there has been a lack of co-operation.

"We have contended," he said, "that it was the purpose of Congress that the revolving fund should be used to pay, at least in part, for these cars, costing three times their normal value, or \$3,000 instead of \$1,000 each, and these locomotives, costing \$80,000 and worth \$29,000 to \$30,000. If we are required to pay, our indebtedness will have been increased by these amounts, and without active antagonism we have insisted that the fair interpretation of the law was that the government should bear part of this excess cost of equipment which has been bought and allocated to the carriers without consulting them. Some of the railroads thought that they were oversupplied with equipment and ought not to be saddled with any part of this expense. Was not that a fair attitude to present and insist upon? Other carriers insisted that the kind of equipment ordered by the Railroad Administration was not needed and not usable for their purposes because it did not conform to their standards and could not be economically operated for their character of traffic."

Senator Cummins asked whether there had been any indication since the war was ended of a continuation of the same policy. Mr. Thom replied that he thought the administration had recognized the difference between war and peace conditions in putting these expenditures on the railroads. Senator Smith asked if the railroads had not contemplated similar expenditures for equipment. Mr. Thom

said the railroads had contemplated an extensive program of additions and betterments without having reached any definite figure and that the Railroads' War Board was of the opinion that 100,000 freight cars should be purchased but that it had not gone so far as to say which railroads should pay for them. It had assumed that they would go to the railroads whose equipment was most deficient.

Senator Cummins also asked if the railroads could not claim a loss on the equipment on the ground that it represented war conditions, but, Mr. Thom said, the law provided that such expenditures could be ordered when required for war purposes or in the public interest and that the contracts offered to the railroads contained a provision that no loss could be claimed on the ground that the cost was greater than it would have been under other market conditions and that the actual cost should be taken as fair and reasonable. If the law should be amended to provide for a five-year extension, he said, there is no reason why the government could not continue to order the railroads to make whatever expenditures it saw fit and he thought that this attitude on the part of the government was not illogical even if it was a harsh thing to do and was not intended by the Congressional committees. He said if Congress said it was the duty of the railroads to purchase this equipment and pay for the additions and betterments, then the government might naturally take the position that the whole burden of the price should fall on the carriers. He would not say that the amount of the purchases or improvements was excessive, but that there is a latitude of business judgment as to when such things should be undertaken and the railroads could not contemplate without alarm a continuance of such a power for five years. He said he had not been critical of the Railroad Administration and had recognized the great ability shown in conducting the affairs of the railroads during the war but he did not believe it was necessary in time of peace to continue such enormous and possibly destructive powers.

After the armistice was signed, Mr. Thom said, the executives had brought to the attention of the Railroad Administration the desirability of cancelling as many orders and contracts as possible. He had discussed the matter with Judge Lovett and expressed the opinion that no more of the expenditures should be continued than were absolutely necessary. He said that Judge Lovett was receptive to this view and he thought the Railroad Administration had done everything possible to reduce the charge against the corporations but he did not know to what extent.

Senator Smith asked whether the equipment ordered was needed now. To which Mr. Thom replied that no one knows whether a period of idle cars is to be expected or how the needs for equipment will be affected by the diversion of traffic from one road to another. Senator Smith asked whether if the railroads are forced to assume the cost of these expenditures it will not be reflected in the rate structure.

"We don't know," replied Mr. Thom. "That is for another government body to determine, but we do know that every increase in rates antagonizes the shipping public and we can hardly look with unconcern on a policy that makes necessary additional increases in rates."

Senator Smith asked if the railroads had not given the administration a budget of needed expenditures which was the basis of the authorizations. Mr. Thom said they had but that they had not understood at that time that the government was going to depart from the policy of meeting many of the expenditures itself. He repeated that he was not complaining of any abuse of the power in the past but was pointing to its existence which it is proposed to continue under a director general whose personality is not known and under a director of capital expenditures not yet appointed. He said Judge Lovett had agreed with the railroads that after the armistice was signed all obligations should be cancelled that could be

and that there should be as few commitments against the companies as possible.

"Why did the railroads agree to waive any claim for loss on account of high prices?" asked Senator Cummins.

"What other course was open to us?" replied Mr. Thom. "We had to accept the contract offered us or go to the court of claims and we wouldn't reach a conclusion as to all of the 175 roads in a lifetime. Our position was not a strong one; the three-year average operating income was only a maximum and while we secured some concessions we had to accept many provisions in the contract which we didn't approve."

"Has not the position of the railroads been better than if the government had not taken them over?" asked Senator Underwood.

"I have always believed it was a wise thing for the President to take them over," replied Mr. Thom, "but I am against the extension of the same powers in time of peace."

Mr. Thom pointed out that one of the great elements of value to a carrier is its good will and that in five years this element, with its accompaniment of earning capacity, would be dislocated and destroyed. The organization of the railroads would largely be destroyed, also, he said, and he referred to a statement made by Julius Kruttschnitt before the committee last year that he would rather have his railroad returned without rails and with its organization intact than with rails and without organization. It would be impossible, he said, for the government to return at the end of the five-year period the same thing it took over and the debt to the government might be so great that the only way to pay it would be to let the government take over the property in liquidation. Mr. Thom also raised a question as to the constitutional power of the government to retain control of the railroads during times of peace on the basis of an annual rental fixed without relation to the value of the property. Congress could only exercise such a power under the commerce clause of the constitution, he said, and it cannot take over the property for the purposes of an experiment as to what kind of a regulation it intends to adopt at the end of the period.

As illustrating the danger of a too early return of the railroads, Mr. Thom cited the greatly increased operating ratio during the past year, resulting largely from the increased wages, and in spite of the increased rates established by the director general, and asked what reliance the railroads could have on the continuance of the increased rates. It had been strongly argued, he said, and has been decided by one state court that rates fixed by state laws would automatically go into effect on the termination of federal control. As to the interstate rates, he was not certain. Commissioner Clark, who was present, stated, however, that while the rates had been filed in the name of the United States Railroad Administration and W. G. McAdoo, director general, none of the rates were in conflict with any outstanding orders of the commission which could be invoked and that it was the definite view of the commission that if the railroads should be returned to private management the rates on file for roads now under federal control are the only ones on which the carriers could transact business and would continue in effect until changed in the regular course of procedure. Mr. Thom also said that to return the railroads to their owners without a period for readjustment and an opportunity for the enactment of permanent railroad legislation would create such difficult conditions that private management would be discredited and would be "so unjust as almost to be criminal" and he could not believe the administration would do such a thing, but, while he urged that the railroads should be retained under federal control until Congress has had an opportunity to legislate, he declared, in reply to a question by Senator Smith, that the railroad

companies would prefer an immediate return of the roads to a five-year extension of the present plan.

Mr. Thom continued his argument Thursday, discussing the need for improvements in railway regulation such as pro-

posed in the railroad plan by the resolution adopted by the committee in executive session Wednesday. It was decided to limit the various interests to appear before the committee to two spokesmen except in special circumstances.

# The American Railroad Association

## Reorganization of the American Railway Association Taking in Several Auxiliary Associations

THE DIRECTOR GENERAL of railroads on January 10, 1919, issued Circular 70 stating that during the period of federal control, and in order to provide a responsible channel through which the director general may obtain recommendations for the advancement of railroad practice, the American Railway Association has revised its articles of organization and by-laws and will change its name to the American Railroad Association.

The scope of the association has been enlarged and will cover the former activities of the: American Railway Association; American Railway Master Mechanics' Association; Association of Railway Telegraph Superintendents; Association of Transportation & Car Accounting Officers Freight Claim Association; Master Car Builders' Association; Railway Signal Association; and Railway Storekeepers' Association.

The new organization will consist of five sections, viz.: Section 1—Operating; Section 2—Engineering; Section 3—Mechanical; Section 4—Traffic, and Section 5—Transportation.

Railroads under federal control are members of the association, and are directed to be represented and participate in the activities of each section through their proper officers.

The articles of organization and the by-laws of the newly organized American Railroad Association are as follows:

The name of this organization is the "American Railroad Association."

Its object is the discussion and recommendation of methods for the scientific and economical construction, maintenance and operation of American railroads.

Its action shall be recommendatory and not be binding upon any member. During the period of federal control of the railroads recommendations requiring authoritative action shall be submitted to the director general. If approved by the director general, such recommendations will be either promulgated to the railroads by him, or by his direction, through the American Railroad Association.

Its membership consists of carriers which operate American steam railroads, but no carrier operating less than one hundred miles of road, including trackage rights, or which operates primarily as a plant facility shall be eligible for membership. Each carrier shall be entitled to exercise the right of one membership for each one thousand miles of road, or fraction thereof, operated by it, including trackage rights. The executive committee shall in all cases determine the qualifications for membership under these articles. The executive committee may admit to the association as associate members carriers which, in the judgment of the executive committee, are not eligible for membership.

Each membership is entitled to one vote, which vote shall be cast only by an official of the member voting. Associates shall not be entitled to vote, but otherwise shall have the same standing as members.

A carrier not under federal control may terminate its membership by formal withdrawal after the payment of assessments due; or, if a carrier not under federal control shall fail to pay its dues and assessments for two consecutive years its membership may be terminated by the executive committee.

Its officers consist of a president, a first vice-president, a second vice-president, a general secretary and treasurer. The president

and the vice-presidents must be officers of members of the association. The term of each of these officers is two years. During the period of federal control of railroads, representatives of the United States Railroad Administration will be eligible to serve as officers or members of committees of the association. A vacancy in any of the offices shall be filled by vote of the executive committee for the unexpired term. The committees for conducting the work of the association as an organization shall consist of an executive committee of nine elected members, including the president and the vice-presidents and three representatives named by the director general, in addition to the regional directors, a committee on nominations of five members and an advisory council consisting of the chairman and vice-chairman of each section.

It is the duty of the president to preside at all meetings of the association and to exercise a general supervision over the affairs of the association. He shall be *ex-officio* a member of all committees. In his absence the first vice-president, and in the absence of both, the second vice-president shall perform the duties of the president.

It is the duty of the general secretary to keep a full and complete record of the proceedings of each regular and special session, to notify members of the date and location of, and to provide printed copies of the proceedings of each session, and of each meeting of the several sections, to issue all circulars and to compile information for the use of the association and of the various sections thereof. He shall act as secretary of the executive committee, the committee on nominations and the advisory council. He shall either act as secretary of the sections and of the several committees thereof, or in connection with the chairman and vice-chairman of any section he may appoint a secretary thereof, and shall see that the minutes of the sessions of the sections and of the several committees are properly kept, and from time to time shall attend their sessions. He shall be the custodian of the library and of all records of the association, and under the direction of the president and executive committee shall authorize all disbursements on account thereof. He shall select an assistant general secretary and such other assistants as the business of the association may require, subject to the approval of the executive committee and shall perform such other duties as the association or the by-laws may prescribe.

The treasurer shall receive, disburse and account for all moneys received or expended, and shall deposit the funds of the association in such banks or places of deposit as may be approved by the executive committee. He shall make a semi-annual report of the finances in detail to the executive committee, for presentation to the association. He may, with the consent of the executive committee, select an assistant treasurer to act in his absence. During the period of federal control the director general will provide for the auditing of the accounts of the association.

These articles may not be amended except by a four-fifths vote of the members of the association present, and then only after such amendment has been proposed at one regular session for consideration at the next regular session.

### By-Laws

1. A regular session of the association will be held on the third Wednesday of November of each year at such place as the executive committee may determine. Special sessions shall be called by the President at the request of the executive committee, or on the written request of ten members. The executive committee may change the date of a regular session when in its judg-

ment the best interests of the association will be thereby conserved.

2. In addition to the executive committee, the committee on nominations and the advisory council, the organization includes the following sections :

- SECTION I—Operating.
- SECTION II—Engineering.
- SECTION III—Mechanical.
- SECTION IV—Traffic.
- SECTION V—Transportation.

Members may be represented in each section by their officers in charge of matters coming within the scope of the section.

Each section shall be presided over by a chairman and vice-chairman who shall be elected alternately every second year by the representatives of the members of the association in the section.

Each section shall arrange for the selection of a "general committee" to harmonize and co-ordinate the work of such section and for the proper transmission of recommendations of the section and such other committees as may be necessary to facilitate the handling of the matters with which the section is charged, subject to the approval of the executive committee. Any committee of any section may appoint such sub-committees as it may

association on alternate years as candidates for the committee on nominations. The names so offered shall be reported in accordance with the provisions of by-law 12.

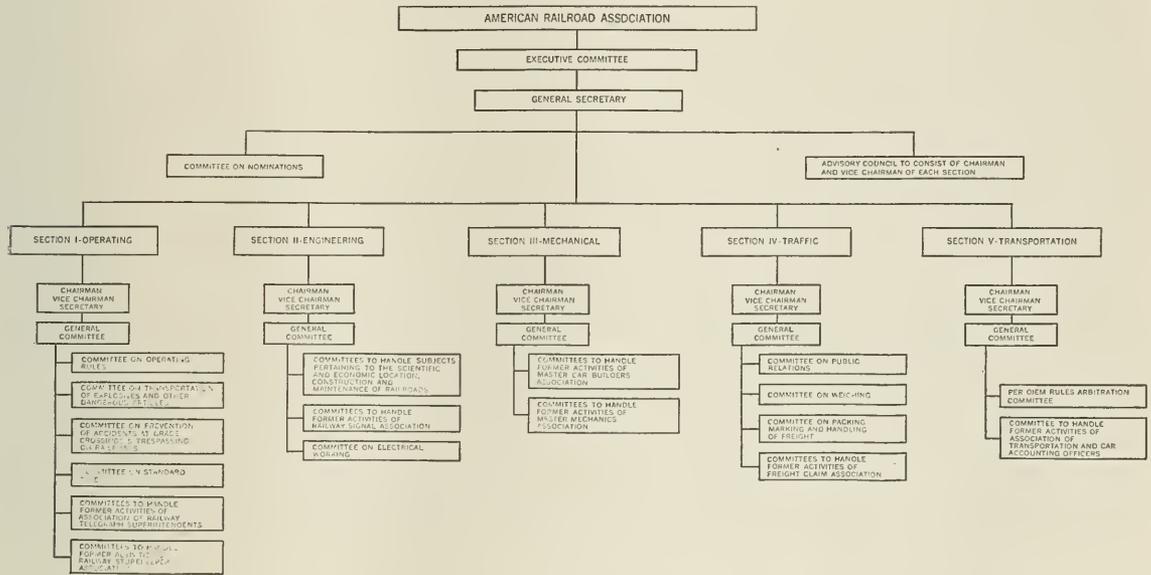

It shall make report at each regular session of the action it has taken and recommendations it may have to suggest on matters of importance to the association.

During the period of federal control it shall submit semi-annually to the director general a budget of the estimated expenses for conducting the affairs of the association during the succeeding period, with recommendation as to the methods to be employed to provide the necessary funds. Assessments may be levied only against railroads under federal control when approved by the director general.

Whenever the committee on nominations shall cease to have a quorum in its membership, the executive committee may make such appointments as may be necessary to fill the vacancies.

5. It is the duty of the committee on nominations to present at the regular session the names of nine persons as candidates for the executive committee.

6. It is the duty of section I—operating, to examine into and report upon questions affecting operating practices, train rules, rules for the operation of interlocking and block signals, rules for

Organization of the American Railroad Association

find desirable for the advancement of its work, subject to the approval of the "general committee."

The time and place of holding sessions of sections, the method of selecting committees and the members thereof, and of conducting its business shall be decided upon by the representatives of the members in each section, subject to the approval of the executive committee.

Any section may, with the approval of the executive committee, permit others than representatives of members to become affiliated members of such section and to serve and vote in committees. Qualifications for affiliated membership shall be fixed by each section.

3. Three members of the executive committee will be elected at each regular session, to serve for three years. Three members and two members of the committee on nominations will be elected at alternate sessions, each to serve for two years.

4. It is the duty of the executive committee to exercise general supervision over the affairs of the association; decide upon applications for membership and act as an advisory committee to the president.

It shall select every two years, a president, a first vice-president and a second vice-president from among its members. It shall select a general secretary and a treasurer. It shall offer the names of nine persons and of six persons at the regular sessions of the

detouring of trains, protection of grade crossings, practices affected by standard time, and details relative to the advancement of the efficiency of the telegraph and telephone departments of the railroad service.

7. It shall be the duty of section II—engineering, to take action toward the advancement of knowledge pertaining to the scientific and economic location, construction and maintenance of railroads.

8. It shall be the duty of section III—mechanical, to take action toward the advancement of knowledge concerning the principles of construction, maintenance and service of the rolling stock of railroads.

9. It shall be the duty of section IV—traffic, to consider and report upon questions affecting the relations of the operations of railroads and the public.

10. It shall be the duty of section V—transportation, to consider and report upon questions affecting the efficient utilization and interchange of equipment, the handling of railroad business mail and kindred subjects.

11. Any committee, except the executive committee and nominating committee, may, with the approval of the association on the recommendation of the executive committee, increase the committee by appointing a chairman, who need not be an officer of a railroad which is a member of the association.

12. Reports of standing committees and sections, except that of the executive committee, shall be formulated at least thirty days prior to the date of the session at which they will be considered by the association and copies forwarded to the members by the general secretary with the call for the meeting.

13. The chairman and vice-chairman of each section shall constitute the advisory council, which may be called upon by the president or the executive committee for consultation concerning the affairs of the association.

14. A person who becomes a member of a committee shall continue to perform the duties thereof so long as he is an official of a member of the association, whether the original member or another. A vacancy in a committee caused by resignation or disability shall be filled by the vote of its remaining members except as provided in by-law 4.

When a member of a committee shall be absent consecutively from three regularly called meetings of the committee his membership ceases *ipso facto*, and the committee shall act as in the case of a vacancy from any other cause.

15. Any officer of a member will be admitted to the sessions, and may join in the discussions or serve on the committees of the association.

16. Thirty members shall constitute a quorum for transaction of business, but a less number may adjourn from time to time.

17. Each membership will pay an annual fee of \$10, and such other sums as may be assessed by the executive committee for conducting the affairs of the association. Each associate shall pay annual dues of \$20, but will not be subject to assessments. Annual dues shall be payable on April 1. Assessments when made will be based upon the number of miles of road operated, leased or controlled by each member at the time the assessment shall be payable or on such other basis as may be decided upon from time to time by the executive committee.

18. A member will not be entitled to vote if in arrears to the association.

19. Each member has the privilege of voting for any three candidates for membership on the executive committee, and for any two (or three) candidates for membership on the committee on nominations. The three persons receiving the highest number of votes cast for membership on the executive committee and the two (or three) persons receiving the highest number of votes cast for membership on the committee on nominations, shall be declared elected. All such votes will be by ballot on forms prepared by the committee on nominations. A member may cast a ballot for any member of the association for membership on any committee.

20. A vote in the regular sessions of the association may be

taken *viva voce*, by rising, by roll-call or by ballot, in any of which only members shall participate.

Letter ballots may be ordered to be taken in such manner and under such conditions as the executive committee may from time to time direct.

21. In all ballots for members of committees at meetings of the association, the following form of voting shall be adhered to:

An envelope shall be provided on which there shall be a blank space for the name of the member, the name of the official voting and the number of votes which he casts. In these envelopes the ballots shall be placed by those voting them, and they shall then be presented to the general tellers.

When a ballot is to be taken, the president will announce the names of all required tellers. Three general tellers shall have charge of receiving and recording the ballots cast. When all ballots have been cast these tellers will announce that the polls are closed. They shall then deliver the ballots marked "For \_\_\_\_\_ committee" to two tellers for each committee to be voted for, and these tellers shall count and announce the vote for members of committees. In ballots taken at the sessions for any other than election purposes, the same form shall be adhered to as nearly as may be practical for the purpose.

When a ballot for membership in committees shall be announced as having eventuated in a tie vote, or be otherwise undecided, upon such announcement the final result shall be determined by the members present.

22. At all regular sessions of the association the regular order, unless otherwise directed by a majority of the members present, shall be as follows:

1. Announcement of members present.
2. Approval of minutes of previous meeting.
3. Reports of committees.
4. Unfinished business.
5. Miscellaneous business.

The election for members of committees, etc., shall be held immediately before the noon recess of the first day's meeting of the session, and be reported to the association after the recess.

23. The several officers of the association and members of committees shall serve for the periods designated in these articles or until their successors are elected and qualified. Any officer may resign by giving notice to the association through its president; any member of a committee may resign by giving notice to its chairman.

24. The proceedings of this association are governed by "Robert's Rules of Order," except as otherwise herein provided.

25. These by-laws may not be amended except by a two-thirds vote of the members present, and then only after such amendment has been proposed at one regular session for consideration at the next regular session.

# The Railroad Situation in Great Britain

Roads Made Remarkable War Record But Great Difficulties  
In Way of Return to Owners

By Samuel O. Dunn  
Editor of the *Railway Age*.

LONDON, England, December 20, 1918.

THE RAILWAY SYSTEMS of Great Britain and of the United States are the two most important systems in the world which have been built and developed, and which are still owned, entirely by private capital. The question what relations each of these railway systems shall in future bear to the state is now under discussion. The question as it affects the British railways has, since the war ended, been a subject of official consideration. A select committee on transport was created some months ago to report to Parliament on "what steps, if any, it is desirable to take to develop and improve the internal facilities for transport within the United Kingdom; to secure effective supervision and co-ordination, and to insure that developments and improvements shall be adequate and suitable to meet the national requirements." This committee made its second report on November 14. The committee was not composed of railway experts, and its recommendations are extremely indefinite; but in one respect, at least, the report is definite. This is, in giving high praise to the British railways for the way they have done their work during the war.

"The success that has attended the operation of the railways throughout the war, which has been superior to that witnessed in any of the other belligerent countries," says the report, "affords conclusive proof both of the adequacy of the arrangements which had been made in advance and of the capacity of those who have been concerned with their execution. There has been little dislocation, notwithstanding that, in addition to a very large government traffic, the volume of civilian traffic, both of passengers and goods, has been heavier than in pre-war days; that large numbers of the staffs have been inexperienced and that considerable demands have been made upon the railways for rolling stock and materials of all kinds for use with the armies abroad."

Nobody who is familiar with the facts will be disposed to question that the British railways deserve all the praise that the select committee bestows upon them. They have handled the situation extremely well. There is no doubt in my mind that, as the committee says, their success "has been superior to that witnessed in any other of the belligerent countries," not excepting the United States. Furthermore, the managers of the British railways assert—and I have found no one who disputes the assertion—that the railways have handled their work at least as well, if not better, than any other branch of the government.

The success of the British railways during the war must be credited almost entirely to private initiative, resourcefulness and ability; because, while the railways have been under government control from the beginning of the war, the actual operation has remained, as before, entirely in the hands of the owners and the managers and officers selected by them. As the select committee says in its report, "The war has considerably modified the position and methods of working of the railway companies though the changes in their organization and practice have been less than is generally supposed. The desire has been to get the work done with as little disturbance of the existing machinery as possible. As a result, the individual organizations of the railway companies have remained intact, and the boards of directors have continued to be responsible for their affairs. The changes which have

been introduced and the high efficiency which has been witnessed in the handling of the traffic by the railways during the war have been due far more to a patriotic determination on the part of all concerned to do their utmost to assist the country in a time of national emergency, regardless of corporate or personal interests, than to direct imposition by the government of its will upon the railway companies."

It is well known that when the United States entered the war its railways, under the direction of the Railroads' War Board, which was created by their own managers, made a voluntary effort to carry out a policy of co-ordinated working which would keep the roads out of the hands of the government and at the same time afford to the government and the public the maximum amount of useful service at the minimum practicable expense. Late in the year 1917 the government, deeming that the results secured under this voluntary system were not sufficient, set the Railroads' War Board and the railway companies aside and adopted a policy of government operation, with a government director general in charge. The director general kept most of the managers and officers in the service, but he adopted a policy of drastic unification of the organizations of operation and even of the physical properties. Why have the British railways succeeded in getting better results, on the whole, under the policy that has been followed in this country, than our railways have succeeded in getting under the policy—or, rather, the policies, for there have been two policies—that have been followed in the United States? It is not difficult to answer that question.

The war came very much more suddenly and unexpectedly to Great Britain than it did to the United States. I happened to be in this country in July, 1914, and sailed for the United States about the middle of that month. When I sailed there was not the slightest expectation—unless in the very highest official quarters—that Great Britain was going to be involved in war; but within three weeks the war had come, and, among other developments, the British railways had been taken under government control and were being operated pretty much as they have been since. The principal reason why this change in the position of the railways could be and was made so quickly is indicated in a single sentence in the select committee's report. "The government was not, and is not today, organized to carry on the administration of railway systems by means of the direct control of a government department. It had, instead, long prior to the war, established an organization to cope with just such a situation as subsequently arose, under which, while the supreme control of the system would be taken over by the state, the technical management would remain in the hands of the administrators who were responsible for its working in time of peace."

The legislation under which government control was adopted in Great Britain was passed in 1871, immediately after the Franco-Prussian war had demonstrated to Europe the important part railways must play in modern war. Exhaustive study had been made for years by government officials and railway officers jointly as to just how matters should be handled on the railways in case of war. As a result of this study, when war did come, every railway general manager had in his possession instructions as to just what he should do when the government should take control and mo-

bilization should begin; and it was largely owing to the character of these orders and the celerity and efficiency with which they were carried out, that Britain was able within a few days to land an army in France and take an important part in the conflict in its earliest stages.

The war had been going on in Europe two and a half years before the United States entered it. For many anxious months our government and people had known that we might be drawn into it. The warning voices of many experts—including that of the *Railway Age*—were raised repeatedly in calling attention to the fact that if we became involved our railways would have an important part to play, and that they were, financially, physically and in point of organization, unprepared for it. Our government paid no attention to these warnings. The first step actually taken to get our railways ready was when their chief executives met in Washington in April, 1917, four days after war was actually declared, and created the Railroads' War Board. This meeting was held on the suggestion of the Council of National Defense. That was all the government had to do with it.

Effective as it has been, the organization of the British railways for the war is, and always has been, very simple. The select committee, in its report, briefly describes it as follows: "The management of the railways taken over has been entrusted to a Railway Executive Committee, composed in the first instance of nine, and subsequently of twelve, general managers who were invited by the government to serve upon it. The president of the Board of Trade is *ex officio* chairman of the committee, but the work of the chair is in practice carried out by the acting chairman, who is one of the general managers serving upon the committee. During the war unification of management of the railways has thus been in operation, but it has not been accompanied by unification of the assets of the railway companies concerned."

The president of the Board of Trade, who is a government officer and a member of the cabinet, is Sir Albert Stanley. He is in private life head of the company which operates the London underground railway system, and received his early railway training in America. The acting chairman is Sir Herbert A. Walker, general manager of the London & Southwestern Railway. Each member of the committee has continued to perform his usual duties on his own railway, which correspond roughly to the duties performed by the president of an American railway under private management.

There was a similarity between the war organization of the British railways and that under which the railways of the United States worked when the Railroads' War Board was at their head. But there were some points of difference which were far more important than the points of resemblance. First, the British government from the start guaranteed to each company practically the same net return it earned in 1913, and the executive committee did not have to consider the financial effects of any thing it did upon any individual railway, or upon the railways as a whole. The United States government, while our railways were operating under the Railroads' War Board, did not guarantee the companies any return whatever. Second, the British Railway Executive Committee was not subject to any legislative restrictions regarding competition or any other matter, but exercised all the power of the government in pooling facilities and traffic, in reducing train service, in saying what traffic could be moved, and in what order of priority, and so on. On the other hand, under the Railroads' War Board, the railways of the United States were left subject by our government to all the old legislative prohibitions against trusts and pooling; were loaded down with traffic priority and preference orders issued independently by innumerable government departments and agents; and had no authority to refuse to handle freight as shippers routed it, or to refuse to take non-essential traffic which they could not handle.

Two other points, it is important to recall, are that the British railways had not been subjected for years to such a system of regulation as that which had made it impossible for the railways of the United States to keep their facilities reasonably adequate to the demands of business, and that they never experienced such terribly severe weather as that with which American railways had to contend during the last two months the Railroads' War Board was in charge and during January, 1918, the first month of government control.

In spite of the fact that they received little co-operation and no legal or financial support from the government, American railways under the Railroads' War Board for several months made a splendid record of increased efficiency in operation. They did not succeed, as the British railroads did, in handling the business without congestion and almost without delays; but they did succeed in handling a vastly increased business, both passenger and freight. When the government took them over it had the choice of adopting practically the same policy Great Britain had followed with such conspicuous success, or of entering upon an extensive programme of reorganization. It took the latter alternative. In order to accomplish complete unification of both the organizations and physical facilities, in which he strongly believed, Director General McAdoo put the railway companies, their directors, chairmen and presidents off the right-of-way, established a large overhead organization in Washington and placed federal managers in place of the presidents. Now the complete reorganization of the railways of Great Britain would be a much smaller and less difficult matter than the complete reorganization of the railways of the United States.

The British railways have less than 25,000 miles of line and 60,000 miles of track, while ours have over 250,000 miles of line and over 350,000 miles of track. Their railways represent an investment of \$5,000,000,000, while ours represent an investment of \$18,000,000,000. British railways earned before the war about \$600,000,000 a year, while ours earned over five times as much. Their railways employ about 700,000 persons, ours about 2,000,000. Theirs operate within a small area, ours within a vast area. Nevertheless, the British did not consider it expedient to attempt a complete reorganization of the railways.

The results of Mr. McAdoo's efforts to reorganize and operate the railways of the United States on an entirely new basis will be for some time a subject of animated discussion; but certain indisputable facts will stand out in this discussion. These will be, that under the Railroads' War Board there was a very large increase in the amount of traffic handled on United States railways; that under the British system there has been a very large increase in the traffic handled; that under government operation in the United States there has been but a small increase in the amount of business handled; and that, disregarding the factor of advances in wages, the increases of operating expenses under government operation in the United States have been relatively much greater than they were under the Railroads' War Board, or than they have been on the British railways under the Railway Executive Committee. Just what the Railroads' War Board would finally have been able to accomplish if the government of the United States had, after the British system guaranteed the net returns of our railway companies, left the Railroads' War Board in charge of their operation—without all the disruption of the organizations which government operation has involved—and used the power of government to help the railway managements instead of to break them down, is largely conjectural; but, after studying operating methods and results both in the United States and Great Britain, there is no doubt in my mind that it was a capital mistake to attempt, as Mr. McAdoo did, completely to reorganize our railways in the midst of a great emergency; nor any doubt that we shall be engaged in dearly paying for his mistake long after the war's end.

While the British railways have not gone through any such revolution as ours have during the last year they emerge from the war in an unsatisfactory and precarious condition. Nobody knows just what their earnings from all their traffic during the war at their regular passenger and freight rates would have been, since no account is kept of traffic handled for the government. Their expenses are known, however, and they have increased greatly. An accompanying table gives the expenses (in pounds) of eleven leading railway companies, doing about 90 per cent of the total business of the country, for the last two years before the war—1913 and 1914—and for the years 1915, 1916 and 1917.

employees demand that "all advances given as war increases be converted into permanent increases." It is estimated that if this should be done the change to a basis of eight hours' work a day and 48 hours' work a week would add about £25,000,000, or approximately \$125,000,000, a year to the wages now being paid. This would make the total wages paid annually about \$635,000,000, as compared with \$235,000,000 before the war. The increase in wages since the war began would be \$140,000,000 a year more than the total net earnings of the companies were before the war.

Even with the 50 per cent advance in passenger rates which has been in effect for two years the expenses of the railways,

TABLE I—OPERATING EXPENSES OF BRITISH RAILWAYS, 1913-17, INCLUSIVE

	1914		1915		1916		1917		Per-centage increase 1917 over 1913

London & South West-ern .....	3,476,379	4,080,475	4,449,624	4,941,500	5,620,504	6,262,880	679,004	2,144,125	61.7
London, Brighton & South Coast .....	2,174,196	2,471,039	2,693,048	2,913,531	3,206,548	3,206,548	293,017	1,032,352	47.5
Midland .....	9,416,981	10,188,550	10,441,179	11,196,243	12,514,685	13,184,442	1,318,442	3,097,704	32.9
North Eastern .....	7,220,784	8,008,277	8,234,718	8,916,228	9,816,228	10,000,244	1,084,016	2,779,460	38.5
South Eastern & Chatham .....	3,057,948	3,406,378	3,565,946	3,713,473	4,047,145	4,047,145	333,672	989,197	32.4
Total for 11 companies	£62,532,604	£68,856,603	£72,331,949	£78,765,614	£88,397,417	£93,631,803	£25,864,813		41.4
Total for England and Wales .....	67,965,211								
Total for Scotland...	8,001,344						£28,000,000		

It will be seen that on the average the expenses of these companies were £28,000,000, or 41.4 per cent, more in 1917 than in 1913. Nor does this tell the whole story. The "war bonuses" granted to railway employees are not included in these figures, and they were reported in May, 1917, to be running at the rate of £47,000,000 a year—roughly, \$235,000,000. New agreements made in September raise the "war wages" to £55,000,000 a year—roughly, \$275,000,000. It seems safe to estimate that, including the war wages, the cost of operating the railways of Great Britain is now \$400,000,000 a year more than it was in 1913. But in 1913 their net earnings were but \$260,000,000. Passenger rates have been advanced 50 per cent during the war, but freight rates have not been touched.

Even the foregoing does not indicate adequately the problem presented. It would appear that a further enormous addition is to be made soon to the cost of labor on British railways. In August, 1917, a strike was threatened by locomotive engineers and firemen. It was prevented by a promise from Sir Albert Stanley, the president of the Board of Trade, that within one month after the cessation of hostilities he would entertain a request from the employees for a shorter working day, and that the request would be given "immediate and sympathetic consideration" by the government. The employees were not slow to present their request after the signing of the armistice, and on December 6 a statement was issued by the government to the effect that: "(1) The principle of an eight-hour day for all members of the wages staff has been conceded, and is to come into operation February 1. (2) All existing conditions of service to remain unaltered pending the decision of a committee to be set up as soon as possible to review wages and other working conditions of service of railway men in Great Britain."

What is meant by the "principle of an eight-hour day" is not explained, but the programme of the National Union of Railwaymen is very definite on this point. It demands "that eight hours constitute a working day and 48 hours a working week." It will be noted that a committee is to be appointed to investigate all wages and working conditions. The em-

in the absence of an advance of freight rates, would undoubtedly be equal to, and would probably exceed, their total earnings from a commercial business equal to that which they had before the war. Whether all the so-called "war wages" will be left in effect, as demanded by the employees, has yet to be determined, but the general impression is that this is substantially what will be done. In that case it is easy to see that for the railways to be turned back to their owners without large advances in freight rates would mean instant ruin for all the companies.

It is felt that some remedy must be found for this situation; that this remedy must be one that will reduce expenses, and the words "standardization" and "unification" have been imported from the United States to accomplish the desired result. I have included a recent report on railway standardization in an earlier letter. The select committee on transport discusses "unification" in its report, and I quote from it at considerable length:

"Evidence has been given by members of the Railway Executive Committee to the effect that if a policy of unification of management, combined with a pooling of assets of the railway companies, were adopted it should be possible to give the public better service and facilities at less cost to the railway system.

"From a purely technical point of view, it appears, therefore, to be desirable that there should be a unification of ownership, not merely unification of management, of the main railway systems, because, while unification of management would undoubtedly be a great improvement upon pre-war conditions, and would assist materially to secure more efficient organization and management, it would not, without unification of ownership, permit of the use of the assets of the combined system to the best advantage nor allow of the provision of new and costly equipment without constantly giving rise to undesirable financial negotiations and difficulties. Whether the state or one large joint-stock concern owned the railways would be immaterial from this point of view; the essential conditions are that there should be single ownership and single management.

"The position of railway shareholders when the present arrangements with the government terminate, under which their pre-war earnings on the basis of the year 1913 are assured to them, will obviously be one of great uncertainty. Dividends on the old scale, assuming that wages remain at a level comparable with that now existing, and the volume of traffic returns to its pre-war dimensions, cannot be earned unless either rates are raised considerably or large economies are effected in working. The former course, notwithstanding that the raising of rates might be fully justified in the circumstances, would certainly be bitterly opposed and be detrimental to the general interests of the community. Large economies, on the other hand, can only be brought about by means of greatly improved methods of administration, and the introduction of labor-saving appliances on a considerable scale. So long as the railway companies remain as separate corporations it will be difficult to apply either method of securing economies to the fullest possible extent.

"There are also other circumstances which will make it difficult from the point of view of shareholders to return to the pre-war situation. War conditions of working, and the complete elimination of competition in the public interest, have in many cases revolutionized old-established practices and habits. Traffic has been encouraged to follow unaccustomed routes, the clienteles of individual companies have been disturbed, their ideas have been changed and the respective good wills of the various companies have consequently been altered. Difficulties such as these seem to require solution by some process of continued unification.

"The above considerations lead to the conclusion that the main railway systems of the United Kingdom should be brought under a unified ownership and managed as one system if the question of the improvement and development of the internal transport facilities is to be considered from the standpoint of efficiency and economy, and with due regard to the interests of the proprietors, the railway staffs and the general community. \* \* \*

"Your committee at this stage of its inquiry is unable to make recommendations as to the manner in which the railway system can be organized most advantageously from the point of view of the general interests of the community, or to advise as to the status and management of other transport agencies. Its conclusions upon the second of these questions must necessarily depend upon the view that may be taken as to the future position of the railways to which, as will be evident from what has been said previously, all other transport agencies must be looked upon as ancillary.

"It is, however, in a position to state the following preliminary conclusions which, though to some extent negative in character, may nevertheless be of assistance to Parliament upon which the responsibility of arriving at a decision must ultimately rest.

"Your committee considers:—

"(1) That the organization of the transport agencies of the country—and particularly of the railways—cannot be allowed to return to its pre-war position.

"(2) That the temporary arrangements for the control of railways and canals during the war would not be satisfactory as a permanent settlement.

"(3) That unification of the railway system is desirable under suitable safeguards, whether the ownership be in public or private hands.

"Any one of the following courses would be consistent with the conclusions stated in the preceding paragraph, but without further evidence your committee is not in a position to recommend which of these methods should be adopted in the first instance:

"(1) Further amalgamations of railway companies as a step towards unification.

"(2) Unification accompanied by private ownership and commercial management.

"(3) Unification by means of nationalization followed by:

"(a) Establishment of a Government department to manage the railways.

"(b) Constitution of a board of management not directly represented in Parliament.

"(c) Leasing of the system to one or more commercial companies."

It will be noted that the committee very carefully refrains from committing itself on the question whether the unification of ownership and management it favors should be accomplished by the government or by private capital. Furthermore, it gives no details as to how mere unification, whether under government or private ownership and management, is to be so accomplished as to effect such large economies as would be required in order to maintain both existing wages and existing freight rates. There is no doubt in my mind that by making the changes in their physical properties and operating methods necessary to enable them to handle freight traffic in larger carloads and trainloads and without transferring it at connections, the British railways could make large economies; but nobody but a complete ignoramus about railway economics could believe that, with all the standardizing and unifying they could possibly do they could effect economies great enough to enable them to make both ends meet, while charging existing freight rates and paying existing and prospective wages.

Some of the most competent students of railway matters in the country are opposed to the complete amalgamation of all the railways. They would prefer to see them divided into about ten systems, each having approximately 2,500 miles, each occupying a region by itself, and coming into competition with other roads only at terminals, and a few intermediate points, each having its own management, and all under some central control which would prevent excess of competition, and bring about a large measure of uniformity of physical construction and operating methods. Under this system, either the government or private companies might own the various railways, but if the state owned them, they would be leased to private companies for operation. The British belief in the value of private initiative, enterprise, ambition and emulation, is by no means dead; and I find that most business men and students of industrial and economic questions regard with dread the possibility of the government becoming the owner and actual manager of the railways.

On the other hand, organized labor, which is much more Socialistic here than in the United States, seems to favor government ownership, not only of the railways, but also of coal mines, steamships, land and many other things.

What the outcome with respect to the railways will be is conjectural. The prime minister, Mr. Lloyd-George, has said in one of his public addresses since the war closed, that the railways must in future be operated under the "inspiration and control of the state." That might mean almost anything. The Labor party is the only one which has definitely committed itself, and it favors government ownership.

Winston Churchill, Minister of Munitions in the Coalition government, in one of his electioneering speeches in the recent political campaign, said in reply to a question that the government had decided on the "nationalization" of the railways—which is the term ordinarily used in Great Britain for government purchase. There is already in existence a Royal Commission on Railways (in addition to the Select Committee on Transport), which was created in October, 1913, and which held some hearings before the war. There was an impression that the hearings of this commission would be resumed, and that a report from it would be awaited, but Mr. Churchill said he did not think the matter would be delayed until the Royal Commission had "wandered over the country making inquiries." He added that "railways in private

hands must be used for immediate direct profits, but it might pay the state to run railways at a loss to develop industries and agriculture."

It has been assumed that Mr. Churchill voiced the views of the Coalition government; and, as is well known, the Coalition government, in the recent elections, won an overwhelming majority in the House of Commons.

The crux of the problem is presented by the fact that the railways cannot be returned to their owners without either a reduction of wages, an advance of rates, or a continuance of the government guarantees. I have no doubt that were it not for this, they would be returned to private management. Probably the final outcome will be one of those compromises for which the British government and people are famous, and which will result, as one of my English friends predicts, in a policy under which "Government Control" will be painted on one side of the cars, and "Private Commercial Management" on the other. That out-and-out government ownership and management will be adopted I do not believe, and at the same time I am sure there will be no return to the old system of highly competitive management.

One thing may be stated with the utmost certainty, and this is, that up to the present time the government has got no farther with its plan for solving the railway problem than to the conclusion that it probably will be necessary to adopt nationalization. How nationalization will be adopted—whether by actual purchase or by perpetual guarantees to the companies; and how the roads shall be managed if they are nationalized; whether as a single unit or several units, whether by the government itself or by a company or companies under lease—these are things which are entirely unsettled in the mind of the government itself. Furthermore, it is by no means certain that if the government introduces a bill to provide for nationalization it will be found easy to get it adopted.

Important as the question of nationalization is, it was not much discussed in the political campaign, and, as already indicated, there is a strong undercurrent of sentiment against it which is sure to make itself felt in Parliament.

The operation of the British railways in this war has been one of the finest demonstrations ever afforded of the superiority of private over state management in a time of emergency. Likewise, the experience of the railways of the United States during the last year has exploded most of the old arguments that government management would be more efficient, economical and considerate of the public than private management. With experience in both countries confronting them, the advocates of government management will find it very hard to make out a plausible case for government management in time of war emergency, and much harder to make a case for it in accordance with the economic considerations which should be given the most weight in time of peace. It is true that under government control in both countries there have been enormous advances in wages, but government operation in the United States has utterly failed to realize the large economies which some predicted it would produce, and on the other hand has resulted in a vast increase of expenses only partly due to advances in wages, which has made necessary larger increases in rates, both passenger and freight rates, than the railway companies ever dreamed of asking for. If Great Britain adopts government ownership it will not be because either reason or experience has convinced the British people that it is desirable, but because they have a feeling that advances in freight rates sufficient to offset the increases of expenses would be impracticable under private ownership, and that it would be both immoral and illegal to return the railways to their owners in a bankrupt condition. If government ownership is adopted without an advance of freight rates the public will immediately be confronted, even if the advance of 50 per cent in passenger fares is not rescinded, with a deficit of not less than \$300,000,000 a year. Roughly

speaking, this would be equivalent to a deficit of \$1,500,000,000 on the railways of the United States. My estimate of a deficit of \$300,000,000 on the British railways is based upon the available official facts regarding traffic, earnings, wages, etc., both pre-war and during the war, and takes no account of the enormous capacity of government management for increasing expenses. If government operation in Great Britain should increase expenses other than wages as much in proportion as government operation did in the United States in 1918, or as it did on the Western Railway of France from 1908 onward, the deficit of the British roads under government ownership would soon be at least \$500,000,000 a year.

Personally, as a result of my study of the results of government operation almost throughout the world I have no doubt whatever that this would be the outcome. The British government has owned and operated the telegraph system of the country for many years; and it has always operated it at a heavy loss. If the railways incur a deficit it will have to be paid by the British taxpayers, and the amount of the deficit they will have to pay undoubtedly will be larger than the cost to the public of such an advance in freight rates as would be necessary to enable the railways to operate under private management at a profit.

Just how and why the necessity of paying the increased expenses of the railways in increased taxes will impose a smaller burden upon British commerce and industry than would the necessity of paying them in increased freight rates I am willing to leave to be elucidated by the brilliant Mr. Churchill. I have met him and heard him speak, and am sure he can come as near clearing up the mystery as anybody. Meantime I wish, in conclusion, to emphasize the fact which is patent to anybody who has visited this country while the subject has been under consideration, that if the British adopt government ownership it will not be because their economists, statesmen and business men believe in it on principle, but because they and the people generally have got into a way of thinking that an *impasse* has been reached which makes a continuance of private ownership almost impossible. It is a remarkable fact that government ownership of railways never has been adopted in any country as a result of a full of reasoned consideration and discussion of the question by the general public. Fortunately for the United States, no conditions exist in our country which any reasonable person can regard as making a return to private management impossible, or even impracticable, unless statesmanship has become extinct in America.

At Work on Light Railway Construction

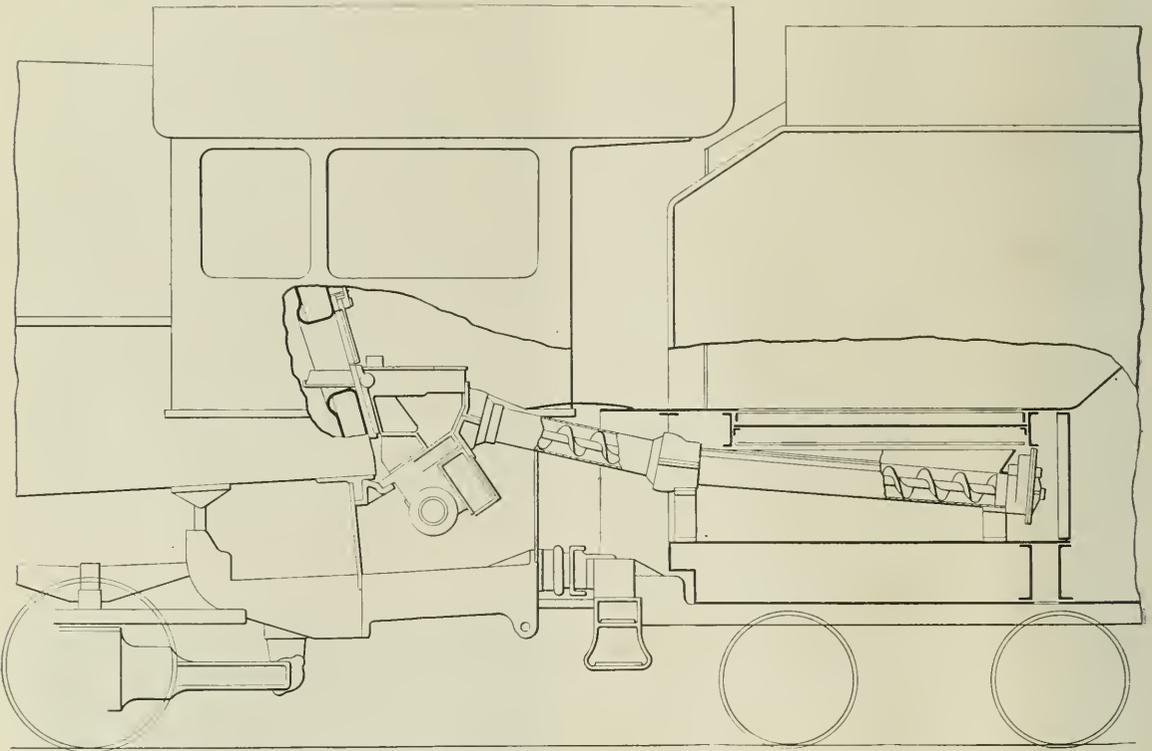

# New Locomotive Stoker Tested Out on Erie

Mechanical Distribution of Coal; Maintains Light Fire and Reduces Cinder and Stand-by Losses

A MECHANICAL STOKER, in which the entire distribution of the coal in the locomotive firebox is effected by mechanically operated shovels without the use of steam jets, has been developed by the Elvin Mechanical Stoker Company, New York. One of these stokers has been in road service on the Erie for the past three months with results which have demonstrated the feasibility of the method of distribution employed and which indicate an economy in the use of coal equal to, if not exceeding that obtainable by hand firing under favorable conditions. The locomotive equipment consists essentially of three parts: the stoker proper, the agitator and feed control on the tender and the screw conveyor between the engine and tender. The equip-

The distributing shovels are mounted on vertical shafts, the lower ends of which carry segmental bevel gears. These gears are driven by bevel segments carried on the upper ends of a pair of centrally pivoted drive arms, the lower ends of which carry steel rollers running in the grooves of a double-faced flat cam. The cam is driven by a worm gear from the main stoker shaft and revolves in a plane approximately parallel to the usual inclination of the backhead of the boiler. Each revolution of the cam completes a cycle of shovel operation; that is, one shovel moves around into the firebox and returns to remain idle while the other shovel performs the same movement.

Upon the cam is mounted a spur gear which, through a

Elevation Showing the Location of the Stoker Equipment on the Locomotive

ment is designed to handle the usual grade of prepared stoker coal.

The stoker proper is assembled in a complete unit which is mounted on the back boiler head and braced to the mud ring by cast brackets. The proportions of the machine and its location on the backhead are shown in one of the drawings. The one design is adapted to backheads of varying slopes by the insertion of filler blocks of suitable taper between the stoker and the boiler head. The stoker consists essentially of two distributing shovels operating through the fire door opening and an elevator for bringing the coal from the conveyor to the level of the shovels, with a suitable driving mechanism.

meshing gear of one-half its diameter, drives the elevator crank shaft. The elevator is thus raised and lowered twice during each revolution of the cam, once for each of the two shovels. The elevator, which moves up and down on an inclination parallel to the cam, has an approximately level top surface measuring 7 in. by 12 in. In its lowest position coal as it is delivered by the screw conveyor falls directly on the top of the elevator. As it moves up a long apron extending downward from its back side forms the front wall of a V-shaped pocket in which the coal accumulates until the elevator again returns to the lower end of its stroke. As the elevator is gear driven directly from the cam, its movement synchronizes perfectly with that of the shovels. The

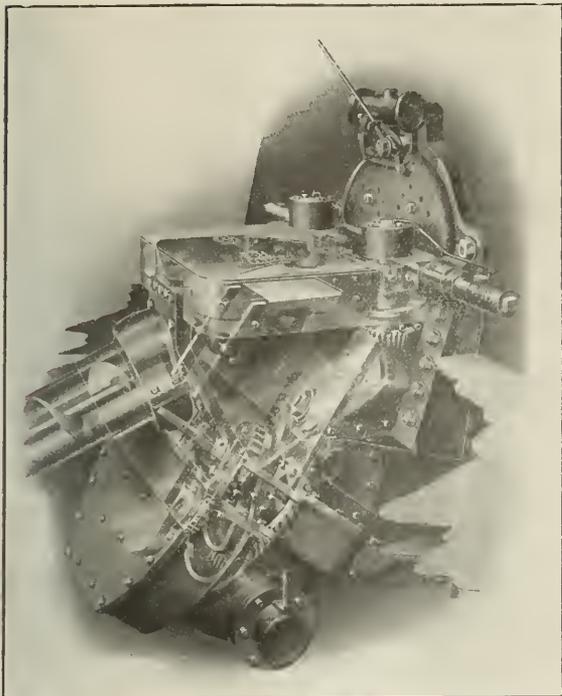

crank is set so that the elevator reaches the top of its stroke just as a shovel is swinging over it. A slight inclination of the top of the elevator compensates for the small amount of downward movement which has taken place before the shovel has moved completely across its top. One of the shovels thus picks up the pile of coal from the top of the elevator at each stroke and carries it forward into the firebox.

The upper part of the stoker casing forms a box-shaped chamber known as the shovel box, which is covered by hinged lids. The forward end of this box is open to the firebox and the shovels swing therein. The total height of

back is moving in an arc the effect is to spray the fuel throughout the remaining travel of the shovel, and that portion of the fuel held by the 1¼-in. vane is projected parallel to the backhead when the shovel comes to a stop.

The changes in the speed of the forward movement of the shovels have the effect of distributing the fuel uniformly over the entire grate area. The distribution is capable of variation, by changes in speed of the stoker engine; an increase in speed throws a greater amount of the fuel toward the front of the firebox, while a decrease fires heavier to the rear. Irrespective of the speed of the shovels, however, a portion of the fuel is always held by the shovels to fire the back corners of the box. In practice it is found that there is a certain speed which will give the proper distribution under normal conditions and the stoker should be operated at this speed, except when occasionally it may be advisable to fire heavier at the front or rear of the firebox. In practice the speed of firing is about 34 shovels per minute, or a cam speed of 17 r. p. m. The amount of fuel fired is independent of the shovel speed, and the distribution is not affected by the quantity.

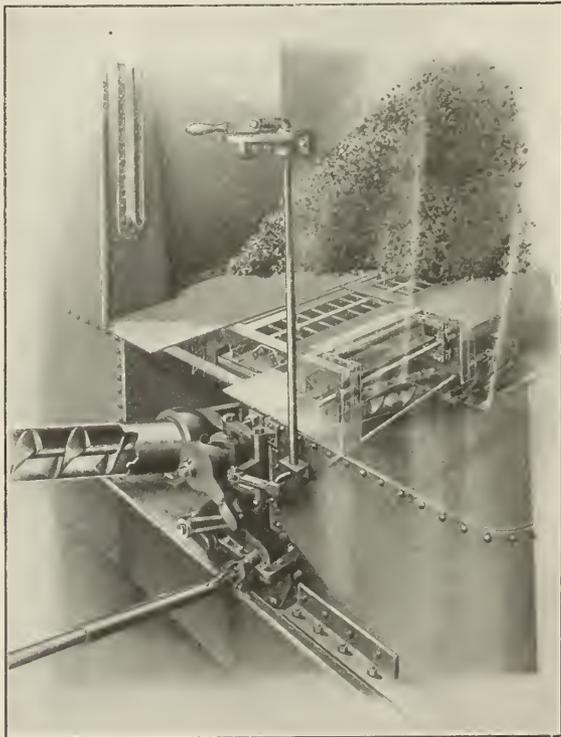

All working parts of the stoker, with two exceptions, are run on ball bearings in a dust-proof casing, and are in a constant bath of oil. The oil level is maintained at a point

Phantom View of the Elvin Stoker Attached to the Back Boiler Head

the box is 5½ inches over the cover. The stoker thus uses the lower 5½ inches of the firedoor opening and that part of the door opening above the stoker is closed by a butterfly door, which is used for inspection and hand firing if necessary.

The shovels are L-shaped, with a flat bottom and a back, the maximum height of which is 4½ in. This is reduced to a height of 1¼ in. around the end of the shovel, to permit a portion of the coal to be retained in the shovel until the end of the forward throw. As will be seen from one of the drawings the shovels are pivoted at either side of the fire door, and are swung through an arc of about 140 deg. The use of a cam drive has made possible the attainment of the speed variations required in the course of the forward swing of the shovel to accomplish the picking up and distribution of the fuel without shock and with constant uniformity. In action the shovel movement is uniformly accelerating until the charge of fuel has been picked up, or until the shovel has passed over the elevator; then the movement is rapidly accelerated until the shovel tip has entered the firebox when it is rapidly decelerated. During this deceleration the fuel slides forward on the shovel and off the end where the back is reduced in height and at a tangent to the back of the shovel; but as the

Phantom View of the Tender Equipment of the Elvin Stoker

above the main worm shaft and the oil is pumped to the highest bearings to return by gravity. The connecting rod driving the elevator being outside the stoker casing proper is provided with graphalloy bearings which require no oil and give long service without attention. The stoker is operated by a No. 3½ Dake reversing engine, which is rated at 7½ h. p. at 100 lb. pressure. The steam line to the stoker is provided with a regulating valve which is set for 25 lb. and is blocked for a maximum of 60 lb. The whole of the stoker mechanism is designed to withstand the maximum power of the engine without failure, and the engine

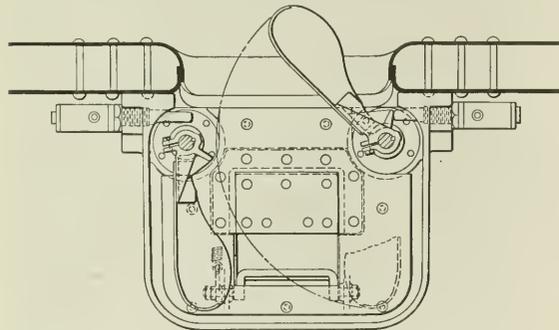

will stall before any part of the mechanism can be unduly stressed.

The conveyor extends from the stoker rearwardly under the coal space of the tank and is in two parts. It is supported rigidly upon the tank, and the portion between the engine and the tank is arranged to swivel to compensate for curvature and to telescope for varying lengths of coupling. The rear end of the conveyor screw is carried in a trough and between engine and tank it is carried in a pipe. The conveyor is driven from the rear through gearing enclosed in dust-proof casings. The drive is taken through worm gearing from the main stoker shaft, enclosed in the stoker casing and running in oil. A universal slip joint shaft transmits the power from the engine to the tender.

Under the floor of the tank and above the conveyor is the feeder which consists of an agitator, a deflector and a feeder plate. The agitator is a grating with a double row of 3 1/4 in. openings, and is operated from a rock shaft which also moves the feeder plate. The feeder plate is located under the deflector plate so that when operating full stoke the openings in the plate register fully with openings on either side of the deflector plate, first on one side and then on the other.

A simple mechanism on the rock shaft, which operates the agitator and feed plate, provides for varying the throw of the shaft and the size of the plate openings which register with the deflector plate openings, thus controlling the quantity of coal fed to the conveyor, which runs at constant speed. This device is controlled by a handle operating on a quadrant on the front of the tank, where it is readily accessible to the fireman. The range of feed varies from zero to the maximum, which is 12,000 lb. of coal an hour.

The conveyor is designed to carry the maximum coal feed when running one-third full. This makes the movement of the fuel easy as the action of gravity tends to roll the coal along ahead of the screw, and it reduces the danger of clogging to a minimum. The ease with which the coal is moved

Top View of the Stoker with the Cover Removed from the Shovel Box, Showing the Elevator at the Top of Its Stroke

may be tested by turning the engine over by hand, which can easily be done with the whole device under full load.

The stoker maintains a very thin fire over a greater part of the grate area, which gradually becomes heavier toward the front, rear and sides of the box, where the heaviest fire is needed. The thin character of the fire is clearly indicated by the fact that within a very few minutes after the throttle has been closed and the stoker stopped, the only fire still burning is around the outside of the firebox, while the central portion of the grate is dead. On starting the stoker, however, the thin charges of coal immediately ignite over the entire area of the grate and a uniformly hot fire is maintained as long as the stoker continues to operate. The rapid building up of the

fire and the steam pressure following the starting of the stoker has made possible a saving in standby losses, as little need be done, either to maintain the fire or the steam pressure during detention time on the road beyond the minimum necessary to start the train. A characteristic of the distribution of the coal which also tends toward economy is the projection of the lumps forward under the arch while the finest of the coal is retained in the shovels to be deposited in the back corners of the box furthest from the most violent action of the draft. Comparative freedom from large cinders is a noticeable feature of the operation of the locomotive equipped with this stoker.

Test Data

The Erie locomotive to which the Elvin stoker was applied is of the Santa Fe type with the following dimensions:

Size of cylinders.....	31 in. by 32 in.
Diameter of drivers.....	63 in.
Weight on drivers.....	337,400 lb.
Total weight of engine loaded.....	417,300 lb.
Total heating surface.....	3,660 sq. ft.
Superheating surface.....	1,389 sq. ft.
Total equivalent heating surface.....	7,743.5 sq. ft.
Tractive effort.....	28,000 lb.
Grate area.....	88 sq. ft.

A series of tests were made with this locomotive, employing a dynamometer car and accurate means for correctly determining the quantity of coal and water used. These tests were made on the Second district of the Meadville division between Meadville, Pa., and Kent, Ohio, during the month of November last, under prevailing temperatures of 32 deg. F. This division has a ruling grade both east and westbound of one per cent and is generally rolling in character with little to distinguish between the physical characteristics of the division east and westbound. A brief summary of the results of these tests is given in the table.

AVERAGE RESULTS OF ELVIN STOKER TESTS ON THE MEADVILLE DIVISION OF THE ERIE RAILROAD

Length of run, miles.....	89.3
Time on road, hr. min.....	9:50
Detentions, hr. min.....	3:57
Running time, decimal hr.....	5.88
Actual M's (1,000 lb.).....	4,243
Adjusted M's.....	5,133
Total actual M's (inc. eng. and ten.).....	4,816
Average drawbar pull, lb.....	24,362
Average speed, m.p.h.....	15.56
Average temp. superheated steam, deg. F.....	693
Million ft.-lb. of work.....	11,482
Total coal as fired, running time, lb.....	25,679
Coal as fired to do 11,482 million ft.-lb. work, lb.....	25,679
Equivalent evap. per lb. dry coal, running time, lb.....	8.60
Equivalent evap. per lb. dry coal, combustible, lb.....	9.59
B. t. u. per lb. of coal as fired.....	13,157

It was developed during the tests that practically perfect distribution of the fuel was obtained under all conditions. The fire was maintained at a uniform level without the necessity of using the rake or shaking the grates, notwithstanding the variable operating conditions met on this division. The engine arrived at terminals with approximately six to ten inches of fire on the grates, except a point immediately under the arch at the forward end of the firebox, where the fire was somewhat heavier.

No difficulties were encountered in cleaning the fire at terminals because of the comparative absence of clinker. The results of the tests indicate very favorable evaporation per pound of coal fired. Under ordinary circumstances locomotives of the Santa Fe type on this division require coaling and fire cleaning between terminals. During the tests, however, it was unnecessary on any of the trial trips to clean the fire on the road and the grates were operated only to relieve the accumulation of ashes. On two occasions it would have been easily possible to make a round trip without attention to the fire other than shaking the grates. This condition is in a measure attributed to the absence of moisture which is injected into the firebox with most of the other types of locomotive stokers now in use. The locomotive will handle tonnage trains over this division with the use of less than one tank of coal.

## Orders of Regional Directors

**WESTERN UNION TELEGRAPH FRANKS.**—The Eastern regional director, file 2100-33A400, advises that Western Union telegraph franks for 1918 have been extended to March 1, 1919, or until new franks are received.

**Free Transportation for Canadian Immigration Inspectors, etc.**—The Eastern regional director, file 2100-10A397, states that free transportation can be issued to Canadian government officers and representatives, such as immigration inspectors and other officers of the Immigration and Colonization Department, also traveling officers of their postal department, revenue collectors and others.

The Northwestern regional director has issued similar instructions in Supplement 38 to Circular 20.

**Free Telegraph Service for Express Company.**—The Eastern regional director, file 304-11A403, states that Judge Payne has ruled that where the telegraph lines are operated by the railroads the messages of the Express Company can properly be transmitted without charge, as provided in the contract.

Circular 158 of Southwestern regional director conveys the same information.

**Rulings—Free Transportation.**—The Eastern regional director, file 2100-26A408, states that requests for annual transportation for the year 1919 over short line railroads not under federal control should be made direct on such railroads. Individual railroads may continue the past practice of furnishing American representatives of European railway lines for the year 1919 with such trip transportation as may be required. Requests for annual transportation should be made direct upon the Director of Operation.

**Interest During Construction.**—The Eastern regional director, file 2700-A409, orders federal auditors to "include in their accounts from January 1, 1918, interest during construction on additions and betterments expenditures out of federal funds at the rate of six per cent per annum. Same to be charged to the account name of corporation, additions and betterments and credited on the federal books to the account, interest on unfunded securities and accounts. Interest to be figured at the end of each month on the balance for the preceding month, excluding therefrom interest on previous balances. Also to arrange for accruing depreciation at the rate of 4½ per cent per annum on the cost of equipment less salvage coming into service subsequent to December 31, 1917, including the equipment assigned by the United States Railroad Administration. Depreciation on other equipment in service taken over from the corporation December 31, 1917, should be accrued to conform to the test period rate and practices."

**Time Allowed for Lunch to Shopmen on Eight Hour Shifts.**—The Eastern regional director, file 1200-259A394, states that pending further action by the United States Railroad Administration, the following will govern except when more favorable conditions are provided for by agreements in force: Men employed in shops or roundhouses where three shifts are worked and who work one of the three shifts, will be allowed a lunch period of not to exceed 20 minutes, with pay. Those employed in shops or roundhouses or other places where less than three shifts are worked are to have a meal period of not to exceed one hour, without pay.

**Payment of Bills Due from the U. S. Government.**—The Eastern regional director, file 700-12A399, states that attention has been called to the failure on the part of the different departments of the United States government promptly to pay bills due to the railroads under federal control for transportation of men and property. Federal auditors of Class 1 roads are asked to immediately prepare reports, and send to C. A. Prouty, director, Division of Public Service and Accounting, Washington, D. C., which will show the amount due from the United States government for the transportation

of men and material (excluding mails) showing separately the amount due from each department of the government and the amount due on stated account separately from the sums not yet stated to the government.

The Southwestern regional director has issued a similar order, No. 146.

**Report on Condition of Addition and Betterment Work.**—The Eastern regional director, file 2700-A398, states that under date of December 10 he was advised by the director of the Division of Capital Expenditures that as to entirely new work not yet authorized he is proceeding upon the view that it is not expedient to grant authority therefor unless either (a) there is imperative necessity for the improvement, or (b) the corporation itself desires the improvement and is willing to finance it. The question arises as to whether the same consideration ought not to operate to cause the cancellation or postponement of any authorities already granted in cases where the work has not been started, or if started, is in such shape that it could be suspended without loss. Please advise me as to any projects which have been approved (but which are not started, or if started, can be stopped without loss) for which you believe there is no imperative necessity under existing conditions and give me recommendations as to whether or not the authority should be cancelled or the work postponed or stopped. If there are any cases in which you feel that the corporation desires work to proceed even though the Railroad Administration feels that the carrying out of the project can properly be deferred, please ascertain so far as possible the wishes of the corporate authorities.

**Passenger-Equipped Refrigerator Cars.**—In a circular dated January 9, the Northwestern regional director announces that when passenger-equipped refrigerator cars are located and disposition instructions regarding them are given by General Superintendent Mervin of the American Railway Express Company, further movement of the cars will be confined to passenger service. This is necessary on account of the serious shortage of express cars and the apparent inability to keep them out of the freight service when moving empty in freight trains.

**Location of Air Pumps on Locomotives.**—In Order 147, the Southwestern regional director announces that hereafter when air pumps are applied to locomotives care will be taken to locate them so as not to obstruct the vision of men on the locomotives. As locomotives receive class 1, 2, or 3 repairs, railroad officers in charge will see to it that pumps are properly located.

**Competition Between Railroads for the Services of Employees.**—In Order 148, the Southwestern regional director calls attention to a letter recently written by a vice-president of the American Railway Express Company to the director general, which states that 59 employees of the general accounting department of the express company in Chicago have been hired by various railroads, in none of which cases did the railroad officers ask permission of the express company in connection with the employment. In view of the relation of the American Railway Express Company to the Railroad Administration, it is desired that no employees of the express company be employed by railroads under federal control without first obtaining consent of the proper express officials.

**Vacations for Train Dispatchers and Yardmasters.**—Supplement 10 to Circular 28 of the Northwestern regional director amplifies previous instructions regarding time off and vacations for yardmasters and dispatchers. It is the intention that two days off per month be granted for the purpose of providing needed rest, and definite arrangements must be made to carry out this provision in the current month. Whenever due to extremely bad weather or any other emergency, the two days' relief is not granted during the month, extra pay will be allowed at pro-rata rates. It is not intended that train dispatchers be required to make trips over the line on their days off. Two weeks' vacation per annum with pay will

be allowed those officers who have served in that capacity continuously one year or more. On roads where more favorable vacation rules or practices are in effect they will be continued. This vacation provision is compulsory and must be provided at the convenience of the officer in charge.

*Heating of Troop Trains.*—In Circular 159 the Southwestern regional director calls attention to the large movement of returned troops, including sick and wounded, from ports to inland points. Recently a very slow movement of cars, especially of tourist and army hospital cars, has been noted. As a limited number of cars of this class is available, they should be moved as rapidly as possible. This can only be accomplished by their prompt movement empty to the points needed. Attention should also be given to the heating of passenger equipment. The director of the Division of Operation has emphasized that ample fuel should be supplied in all cases, that Baker heaters may be operated when steam is not being supplied at division or other points, but steam should be furnished while cars are in motion, continuously when possible. When deemed necessary by the commanding officers and railroad officers, trains may be made up with passenger equipment ahead of freight equipment. The regional director also calls attention to his Circular 110 and Orders 97 and 104, which contain detailed instructions regarding the heating of troop trains.

*Employment of Returned Soldiers.*—In a circular dated January 7, the Northwestern regional director quotes correspondence with the United States Employment Service which indicates that large numbers of applications for clerical positions are being received from returned soldiers and sailors. It is suggested to railroads in the Northwestern region that they call upon the Employment Service if in need of clerical help.

*Insurance and Inspection of Elevators.*—Circular 68, Northwestern regional director, similar to Order 145 of Southwestern regional director, abstract of which appeared in *Railway Age*, January 3, page 105.

*Insurance on Stationary Steam Boilers.*—Supplement 1 to Circular 68 of Northwestern regional director, similar to Circular 154 of Southwestern regional director, abstract of which appeared on page 158 of the *Railway Age* of January 10.

*Free Transportation for Custom Inspectors.*—In Supplement 7 to Order 109 of the Southwestern regional director and Supplement 37 to Circular 20 of the Northwestern regional director, it is announced that railroads will continue to furnish transportation to United States custom inspectors and employees for 1919.

*Western Union Franks for Corporate Officers.*—In Supplement 8 to Order 109 the Southwestern regional director quotes a telegram from the director of the Division of Operation advising that the Railroad Administration is not requesting Western Union telegraph franks for corporate officers. It is assumed that the latter will deal directly with the Western Union.

*Standardization of Time Table Changes.*—In Order 149 the Southwestern regional director outlines rules governing the issuance of advance notice of changes in passenger train schedules. All changes in the time of passenger trains are to be made on the first Sunday of each month. General passenger departments should be furnished the final proof of time cards not later than the second Monday preceding the date upon which the change becomes effective, so that ample time for the preparation of copy, printing of folders, and supplying agents and the public may be given. General changes on different divisions of the same road should be made effective on the same date.

*Freight Car Distribution.*—In Circular 70 the Northwestern regional director outlines new rules to cover the distribution of freight cars. Hereafter freight cars will be dis-

tributed between roads in the region as directed by the office of the regional director. The Car Service Section will issue orders covering movements between regions only which will be addressed to the regional directors and not to the individual roads. The Refrigerator and Tank Car Bureau of the Car Service Section, located at Chicago, will exercise the same jurisdiction as in the past and will issue distribution orders direct to railroads when necessary. District Manager Roth, Seattle, Wash., will continue to distribute cars locally in that territory. Orders covering the movement of cars between railroads in the Northwestern region will be issued from the regional director's office with the prefix "N. W. R. Car Order," followed by the number. Reports covering the movement of cars on orders will continue to be made daily by wire to the regional director's office quoting the proper reference as under the present instructions covering movements on Car Section Orders. No report will be made to the Car Service section with the exception that cars delivered to the Northwestern region roads through the Chicago gateway will be accepted on the authority of orders issued by the terminal manager at that point, and reports of receipts on such orders will continue to be made to him as well as to the regional director's office. In accordance with this program outstanding orders issued by the Car Service Section have been cancelled.

*Corporate Obligations of Terminal Companies.*—The Eastern regional director, file No. 601-A366, quotes a telegram dated December 24, 1918, as follows:

Referring to corporate obligations of terminal companies. In all cases where amounts equivalent to said obligations are collected from the using lines by federal treasurers of terminals as joint facility rents pursuant to operate agreements in effect prior federal control between tenant companies and terminal companies whose property is used solely for the benefit of the tenant companies and which amounts are charged by the using lines to their joint facility rents accounts. The federal treasurers of the terminals are authorized pending further instructions to advance from time to time including advances direct to fiscal agents or trustees. out of funds on hand to the terminal corporations direct or to fiscal agents or mortgage trustees as provisions of operating agreements may prescribe amounts necessary to meet said proper obligations on due dates, the specific receipts of the terminal corporations to be taken for all amounts so advanced including advances direct to fiscal agents or trustees.

Some idea of the scope of the work which is being done by the Alaskan Engineering Commission is conveyed by a report of the acting general storekeeper of the Anchorage division of the Alaska Railroad. On September 30, 1918, \$1,564,034 worth of material belonging to the commission was on hand and in addition there was in transit material valued at \$1,048,019.

# The Railroad Problem and Economics\*

“While We Are in the Business of Seeing That Justice Is Done in Europe, Why Not Use Some of It for Home Consumption?”

By Charles A. Morse†

Assistant Director in Charge of Engineering and Maintenance, Division of Operation.

WHAT SHALL BE the future status of the railroads of the United States? There seems to be a universal feeling that before they are returned to their owners there should be some changes in our laws that will permit them to take advantage of the experience of the government during its operation of the property as regards those things that showed a saving in operating expenses.

I feel that it is proper to give the New York Railroad Club some views from the point of view of the engineer and economist, and while I name them separately, they are in fact synonymous terms, for the function of the engineer has been defined as that of making one dollar do what has required two dollars to do heretofore. In other words, the employment of engineers is fundamentally for the purpose of studying a proposed or already completed installation, and so shaping it that its operation will be economical. In making such a study the engineer must familiarize himself with the details of operation. Naturally, in so doing he is constantly confronted with uneconomical methods and, in his effort to correct them, he discovers that customs, laws, agreements, lack of appreciation of common economic principles, or lack of credit are the cause of the lack of economy that exists.

We are now in the position of having been rudely awakened by the war conditions to realize that the transportation facilities of the country are what they have so often been called—but so little realized—the arteries through which must flow the life blood of the nation, and to appreciate that they must not be permitted to be clogged longer by unwise laws, improper regulation, antiquated agreements or customs that permit of discrimination in favor of individuals or corporations. The railroads are today owned by individuals, but operated for the benefit, not alone of the owners, but of the public at large, and in this operation three things are absolutely necessary in order to make a properly balanced equation—justice to the investors, justice to the public, and justice to the employee. Justice does not mean *favor*; it ceases to be justice when it favors any one of the three interested parties.

The public has seemed to feel that the railroads had money to burn, that all they had to do was to go down into their pockets and dig up the money with which to make any improvements that federal, state or municipal authorities might order. All of these necessitate the borrowing of money, with its necessary interest charges to be paid out of operating income, with a constant effort to reduce rates—or no appreciable increase granted in rates, notwithstanding a constant increase in cost of labor and material. The result is plain—there comes a time when, regardless of curtailment of upkeep, which should not have taken place, the earnings fail to pay expenses and interest on the bonds—and they fail.

When a railroad fails it is not permitted to shut up shop. Instead of this receivers are appointed. They go on operating at a loss and the property is finally sold. A heavy expense bill is paid out of the proceeds to cover the cost of the receivership. The stockholders get little or nothing. The bondholders have to take a scaling down of their securities.

A new company is formed that buys in the property for less than it would cost to reproduce it. They continue to operate it and after a cycle of years they get up against the same thing that the original company did,—fail, are sold out, securities are shrunk, new company formed, and so on as long as they are obliged to operate under laws such as we have today, and they are regulated as they have been in the past.

## Sherman Law Must Be Revised

Is this justice to the investor? Of course it is not! So our equation has failed, and we must correct, if possible, the cause of failure. There has been a law in force for many years that was passed originally to prevent monopoly. This law makes pooling between the railroads unlawful, and forces competition which is uneconomical and extremely expensive. The first thing that the government did when it took over the railroads was to disregard this law, and to pool both freight and passenger business with marked economy.

Before the railroads are returned to private ownership, this law should be revised so as to permit the same operation under private control as was found necessary and economical under governmental operation. Proper provision should be made in the new law to give the public protection from anything that would be against the public interests.

Regardless of which of the various methods may be finally adopted for handling the transportation of the country, it will be necessary to enlarge the duties of the Interstate Commerce Commission in order that it may function efficiently in carrying out the new laws, and in perfecting the various matters that must of necessity be either added to their duties or taken over by some additional organization. Among these are:

Control of capitalization.

Authorization and control of capital expenditures.

Control (probably through a subsidiary body) of wages and working conditions of employees.

Control of fixing of rates, with obligation that in so fixing they shall be such as will after taking care of operating expenses including depreciation and obsolescence, insure a fair return to the stockholder.

Authority to cause the standardization of appliances and methods to the extent that such standardization would cause a reduction in operating expenses.

Authority to study any or all properties with the view of ordering any improvement in their physical condition, such as improvements in grade or alignment, in terminals, bridges or other elements, as such study would indicate would make a reduction in operating expenses sufficient to more than pay interest on cost of improvement.

Authority to so distribute motive power and rolling stock as will tend to reduce the cost of operation.

This would mean that there should be attached to the Interstate Commerce Commission a complete organization such as is required by any large railroad today, except that care should be taken to secure for this organization men of national reputation acquired by actual experience in the various matters, and the compensation of the members of the commission and their assistants should be equal to that paid by the railroads for positions of similar responsibility.

The responsibilities of the commission under this arrangement would make their duties similar in many respects to that of the board of directors of an eighteen or twenty billion dollar railway corporation.

## Shipper Trying to Get More Than He Pays For

In connection with arranging for a proper organization to handle transportation, laws should be passed authorizing

\* From a paper read before the New York Railroad Club, January 16, 1919.

† Mr. Morse is also president of the American Railway Engineering Association.

the commission to do away with the routing of freight by the shipper. There is no question but that routing of freight by the shipper tends to stimulate better service. As with fixed rates, the only thing that the different railroads have to offer is *service*, and it is a question whether or not service can be kept up to a high standard without this stimulant, but it is an open question whether in the effort to give better service in many cases the cost has not been such that there was no profit in the business.

The abuse of control of routing is noticeable by the purchasing, engineering and maintenance departments. Large shippers of commodities that are used by the railroads themselves try to influence the purchase of their wares by threats to the effect that if they are not favored they will route their shipments via some other railroad. There are even cases where very large shippers of certain commodities form subsidiary manufacturing companies for the production of articles required by railroads and use the business of the parent concern to force the railroads to buy their side line goods regardless of quality or desirability of the goods themselves.

The purchasing agent and the chief engineer are being constantly importuned by the traffic department to use the product of different manufacturers in order to influence the shipment of their products over their railroad. This results too often in the purchase and use of inferior products by the railroad company.

There is no reason why the shipper should be interested in how or by what route his products are shipped. He pays for the transportation from one point to another, and if they are transported promptly he is getting all he pays for. What he is really trying to do when he insists on the routing is to get something more than he pays for. No shipper should be permitted to own cars, as by so doing they aim to secure discrimination in their favor, which the shippers not owning cars do not enjoy.

Expediting freight should also be limited to such expedition as will command an extra charge large enough to pay for the extra cost of such expediting over and above the cost of hauling ordinary freight. There is no business that has interfered with economy in operation as much as expedited freight. Some roads in the desire to get business have made practically all of their freight trains, except the local, expedited trains, with a consequence that low-tonnage trains are noticeable in their reports, and earnings are reduced accordingly.

### Contracts with Labor

While the subject of the future organization of the railroads is under consideration, attention should be given to existing contracts between labor organizations and the various railroads.

If the questions of compensation and working conditions are handled by a government board it would probably mean the cancellation of all present contracts, but if this is not done contracts should be revised with the idea of eliminating many features that have crept into these contracts due to the manner in which the contracts were secured in early days from weak roads, and by precedent they have spread to many large roads.

They were agreed to, evidently, by parties not familiar with operating economies or under pressure that they could not resist, and their existence has often prevented the consummation of operating economies. Among the subject referred to are: constructive mileage, agreements against double heading, agreements against turn-arounds, etc.

I have one place in mind where an engine district is 150 miles long; 100 miles of it is on a 0.30 per cent grade, and the west 50 miles is on an 0.80 per cent grade. Upon making the recommendation that the 100 miles be operated as one

engine district and that the 50-mile portion be operated as a turn-around with an engine heavy enough to haul the same train that was then used on the 0.30 per cent grade I was told that this could not be done owing to a clause in the train and engine men's contract prohibiting it, this notwithstanding the fact that the turn-around crew would be at home practically every night.

Contracts should not be made that tend to interfere with principles of economy and progress. We are bound to progress and to attempt to prevent it by agreements or contracts is like trying to stop a flood with a broom. Whatever additional work or expense is caused to employees by changes that tend to economy should be paid for, but the public should not be penalized and made to pay higher transportation rates through lack of knowledge of economic principles by parties making agreements.

Neither should economies be attempted at the expense of employees. The whole matter should be approached in a spirit of fairness to all, which means fair pay to employees fair returns to investors, and the lowest cost for transportation to the public that careful study and economical operation can produce.

### Motor Trucks vs. Branch Lines

The perfection of the motor truck and tractor, together with the universal use of the automobile, has introduced a new element into the transportation problem that should be taken into consideration at this time while studying the reorganization of the whole transportation question. Good roads are demanded for the use of the automobile, and a study should be made to see what additional expense would be necessary to so construct them that they would serve for the motor truck and tractor. Where, heretofore, development of the country for 50 miles on either side of a trunk line of railroad has required the construction of light branch lines, it is a question to be seriously considered whether this policy should be continued or whether good wagon roads should be constructed and the products of the farms and passenger travel should not be handled by motor trucks and automobiles to the main line.

Taken alone and considered as a unit, practically none of these small branch lines pay expenses, but as gatherers of freight and passengers to increase density of traffic on the trunk lines they are sources of profit. As, however, the traffic gathered by them is turned over to the main line with a deficit attached, which has to be overcome during main-line movement, before any profit is made, it would be a decided advantage if this traffic could be delivered to the trunk line by means of the motor truck, tractor and automobile, without this bill of expense attached.

If the good roads had to be constructed and operated for the freight alone, it is a question whether they could be built and operated as cheaply as the light branch railroad, but when we find that the good road is demanded for the use of the automobile and if it is found that the increase in cost to make it heavy enough for the truck, is not too great, and if we take into consideration the fact that the farmer and merchant must deliver their products on good roads to the branch line by truck, thus doing the same handling as if they delivered them to the main line, it looks as though there was a possibility that delivery to the main line, and avoidance of the construction of the branch line, would be economical.

Investigation of this subject may show the desirability, as good roads are completed, of the taking up of many branch line railroads and utilizing the abandoned road bed for improved motor road, thus decreasing the expense of maintenance and operation of our railroads and giving in its place a well located motor road. Such a change would call for increased facilities at stations along the main line for passengers and for handling freight, including storage, trackage, etc.,

but it would mean the concentration of supervision and labor, permitting better housing and living conditions for employees.

### Consolidation of Terminals

The terminals of the railroads should be consolidated and operated under one head, thus cutting out the necessity for much duplication of facilities, such as separate freight terminals, including supervisory and clerical organizations, switch engines, roundhouse and coaling stations, repair shops, and numerous other facilities that are now provided for each road.

The cost of operating terminals should be charged to freight originating or being distributed at that terminal, making the terminal self-supporting, rather than distributing this expense over the freight rates between terminals. It is a well known fact that intermediate lines like the Union Pacific make much greater earnings on the same rates than do the roads feeding them, due to the fact that the bulk of their traffic is collected and distributed by other lines, they receiving it in their terminal yards in train load lots. Much valuable land is occupied by railway terminals in the large cities that would be unnecessary if the terminals were consolidated.

Passenger terminals in large cities should be approached by trains below the surface, and electrically operated, permitting the ground level and above to be utilized for other business purposes, instead of laying waste a large area in the center of a city for passenger terminal use. This plan is well illustrated by the Grand Central Terminal layout in New York.

Freight should be shipped between large terminals by the route over which it can be handled most economically taking into account distance and grade line. The short, low-grade line should be developed to the fullest extent, and maintained at a proper standard to give the greatest operating economy. The same thing applies to through passenger business. If there are two short low-grade lines, one should be devoted to through freight and the other to through passenger business, for the more economical operation of each, other lines operating only local passenger trains.

### Branch Line Rates

I have referred to the fact that in most cases the rates received on branch lines do not pay expenses of operation, and that business originating on branches, reaches the main line with an expense bill attached to it. This should not be the case; rates on branch lines should be such that they pay the operating expenses and fixed charges of the branch.

Land values are fixed by distance from market and by transportation facilities available. There is no reason why the balance of the country should contribute to an increase in the value of farm land on branch lines by absorbing a portion of the transportation expenses of the products of lands located on these branch lines. What we should have is the cheapest long distance transportation possible, after giving fair returns on investment, paying fair wages to employees, and taking care of the upkeep of the property. If we can make rates on branch lines that will cause them to be self-supporting, and rates in terminals that will make them self-supporting, we can then reduce the main line rates, the long distance rates, to a figure that will move products for longer distances economically, and will distribute the expenses where they belong, and not be taxing the producer of farm products for the luxurious union passenger stations, the elevation of tracks, the electrification of terminals, the assessments for public improvements and high taxes of the large cities, or requiring him to contribute to the expense of moving the business on branch lines.

Our system of rate-making has grown up from competition, efforts to develop the country, and state laws or state railroad commission orders, made arbitrarily with no regard to the cost of production. If we are going to try at this time

to remodel our transportation methods these matters should be given serious consideration.

### Centralized Federal Regulation

Many advantages could be secured by nationalizing the railroads and operating them all under the direction of one central organization, sub-divided into zones as seem best suited to prevent too great a centralization. To carry out this plan would necessitate national charters for all railroads, thus bringing them directly under national regulation, and freeing them from regulation by the states.

It has been evident for some time that something would have to be done to do away with the confusion caused by so many states trying to regulate the same railroad. In some cases there are railroads that come under 12 to 15 state railway commissions, in addition to the Interstate Commerce Commission, and each state commission has different ideas, makes intrastate rates, tries to make its own standards and its own regulations, the result being absolute confusion, with no benefit to any one, and with added cost to all.

In order that the central governing body may be able to regulate and control local conditions, there should be an accredited representative of the central governing body located at each state capital, a resident of the state in which he is located, and recommended by the governor of that state. By means of this representative local conditions that require special treatment can be brought officially before the central governing board. The same protection will be then given to the states and at the same time the regulation can be coordinated and controlled by the central regulating organization.

### Need of Standardized Practices

By this method it would be possible to classify the railroads according to density of freight traffic and speed of passenger trains, and a standard type of construction and maintenance could be prescribed for each class, including weight of rail, size of ties and number per mile, depth of ballast under ties; frogs, switches, etc., to be used on each type of railroad.

We are ordering new rail today ranging all the way from 60-lb. per yard to 136-lb. per yard. Some roads are scrapping rails below 75-lb. per yard, which could be saved, re-rolled or straightened, and used on the roads now buying new 60, 65 and 70-lb. rail.

There are being ordered by the different railroads today 44 different sections of rail between the weights of 70-lb. and 136-lb. per yard. This means that the steel mills must have rolls for this great variety of shapes, and that rail joints must be made to fit all of this list of rail sections, and as there are more different spacings of drilling of rails than there are variations in rail section, each rolling of rail must be drilled to suit the whim of the individual road, and rail joints even for the same section of rail, must have a different drilling for the different roads that happen to use the same section of rail. This could be reduced from 44 sections to not over seven or eight sections, with a great saving.

The same variation exists as to details of frogs, switches and guard rails. The result is that manufacturers must have different dies and patterns for each railroad's requirements, and can only manufacture on orders, whereas if these matters were standardized, the manufacturer could go on with his work regardless of orders, thus stabilizing his working force, reducing his patterns and dies and reducing materially his stock of materials, thereby decreasing cost of manufacture, which means decrease in cost to the railroads and to the public.

Some roads are treating track and switch ties and some are not; some are using tie plates and some are not; some are using Bessemer rail joints and some open hearth oil quenched

joints; some are using wooden surface or pit cattle guards, while others are using steel surface guards in place of either of the others; some roads are treating timber for use in bridges and others are not; and so on indefinitely.

Now it stands to reason that there is a lack of economy on someone's part in this variation in practice. In many cases the road following the less economical method recognizes the economy in the other method, but cannot raise the money with which to follow what is known would give greater economy in the end.

There is an old saying that "The poor man's way is a poor way," and there is no place where it is more applicable than in railroad construction and maintenance.

About 20 years ago it was recognized by some of the leading maintenance engineers and officials of this country that something should be done in the way of studying and standardizing the different appliances and methods in connection with railway maintenance, and there was organized the American Railway Engineering Association. This association has been very active during these 20 years, having had large standing committees studying all phases of maintenance, and they have from time to time gotten out a manual of recommended practice both as to appliances and methods of maintenance, today recognized the world over as authority on American railway methods.

This was recognized by the United States Government during the war, when it had so much railway construction in this country in connection with camps, storage and shipping terminals and manufacturing plants, and in connection with the overseas forces, by purchasing from the Association over 2,700 copies of its manual of approved practice. Notwithstanding the work that has been done by this association, made up of the best practical maintenance engineers in this country, the railroads have not as a rule, adopted its recommendations, simply because it involved a change in their present standards and practices. This means that great economies that could be made for the country as a whole are not carried out, owing to the dislike of individual railroads to make a change; this notwithstanding the fact that the engineers of these same companies are among those recommending the better practice.

As standardizing of methods and materials means economy, and a lower cost of transportation, the national regulating body should have the authority to order standardization and should have advisory boards, to which such matters can be referred, and in whose recommendations they will have enough confidence to order them put into effect.

There should be such advisory boards made up of men of national reputation as experts on: Transportation, traffic, maintenance of equipment, maintenance of way and structures and engineering and economics. They should be appointed because of their experience and ability along these lines. During the past, experts have been employed by the Interstate Commerce Commission on traffic and on maintenance of equipment, but the other subjects which need careful study and consideration have not been represented. If the commission is to pass upon capital expenditures it needs advice on all of these subjects, in order to intelligently pass upon them.

#### Maintenance a Side Issue

For the year 1916, the expenditure for maintenance of way and structures on railroads reporting to the Interstate Commerce Commission amounted to \$408,500,000 out of a total operating expense of \$2,230,000,000 or 18 per cent.

It would seem as if the expenditure of this amount of money by the railroads should call for and demand its supervision by specially trained officials, and that it should cease to be a side issue in the organization of the railroads; yet it has, except in the case of a few of the larger railroads, been handled by men who never had any experience in maintenance until they were appointed division superintendents

and who have had to get their experience after such appointment, while busily employed with the various other duties of the position. The result is that the railroads and the public, who pay the bills, pay dearly for their education in maintenance.

In most cases maintenance is a side issue to the higher officials under whose authority it is done, with the result that it is handled by some clerk or assistant and does not get the attention that its importance warrants from the higher official.

It would seem that a class of work that requires nearly one-fifth of the total operating expenditures of the railroad is of enough importance to have some one at the head of it, who has the authority to handle the work in the most economical way, and that such official should be required to devote his whole attention to that work.

There is more opportunity to work out economies in maintenance of way and structures than in any other department today for the reason that, it has been so long treated as a side issue on so many railroads.

The railroads are recognized as semi-public institutions—in fact, practically as wholly public institutions—and it is agreed that transportation is the greatest factor in the prosperity of the country, and that the cost of transportation affects the cost of practically everything that we eat, wear or use. It is of prime importance, therefore, that transportation should be furnished as cheaply as will permit fair wages to employees of the transportation companies and of a fair return to the owners of the property.

#### Financing Capital Improvements

The construction of additional railroad facilities should be regulated by a board competent to pass upon the question of the necessity for the construction, and upon the type of construction, including grade line, curvature, weight of rail, strength of bridges, etc.

One of the uneconomical features in connection with railroad construction in this country has been the building of lines by promoters, who boldly claim that they can sell a line constructed with a one per cent grade line for as much money as if it was located with a 0.30 per cent grade. The result is cheaply built, poorly located, and uneconomically designed lines, later purchased and operated by some of the larger systems, with not business enough to warrant reconstruction and grade reduction, hence continual uneconomical operation.

There are many of the large trunk lines of railroad that have not reduced the grades or improved the alignment on their lines, either for lack of credit, or because the financial backing of the property did not understand enough about the economics of railroad operation to realize that such improvements would not only return interest on the cost of improvement but much more and assist in reducing cost of operation to a marked degree. The same applies to second track. We have much main line on important lines, which for economical operation should have a second, third or fourth track constructed.

There should be a board qualified to pass upon these matters, and it should pass upon all capital expenditures of railroads, exceeding some agreed minimum, and then should review and approve the sum of these minimum charges at the end of the fiscal year. They should have authority to make investigations on their own initiative as to whether or not, for economical operation, grades or alignment should be improved or second track or improved terminals constructed,—in fact, on the whole matter of capital expenditures that would produce reduced operating charges, and as the object of this is to insure the more economical operation and maintenance of the property, the government should *guarantee* all bonds issued to procure money with which to carry out any and all expenditures approved by this board.

It must be admitted that it is not *just* to permit the savings of the public to be lost through investment in a public utility whose rates are regulated by the government, and that it is but right that the government guarantee the payment of bonds sold to get money for improvements on these properties. This guarantee would mean that the credit of the railroads, large and small, would be stabilized, and that the railroads would be able to get money at from one to three per cent cheaper than they can get it without this guarantee, and that the public would get the benefit of this saving in reduced cost of transportation, and also by having their savings guaranteed. It might be feasible for these bonds to be handled by the Federal Reserve banks, or by a board attached to them, thus saving a large cost in brokers' fees, which are, in many cases of the poorer roads, very high, to say the least.

### The Financial Returns

The stock of the railroad companies should be permitted to earn a fair return, say 7 per cent average for all common stock. This would mean that the better located, improved and managed roads would earn over 7 per cent and other roads less than 7 per cent.

It is necessary to permit a fair margin of earnings for common stock to stimulate and recompense efficiency in operation. As the government now fixes the rates for transportation, it should fix the compensation of employees below the rank of division superintendent, equalizing them in accordance with local conditions on all railroads; and fixing the working conditions so as to prevent, as far as possible, competition between different railroads as to rates of pay and living conditions.

By the organization of a board of adjustment and equalization, this could be very readily handled, and it would prevent the time of superintendents and general managers, as well as other officials, being taken up with wage and working condition hearings, and permit them to devote their whole time to the economical and efficient operation of the property, and to meeting patrons of the roads and becoming acquainted with their needs.

### Ignorance as to Economics

Many important trunk lines of railroads in this country have not made the improvements in alinement and grade line that are possible, and on which the decreased cost of train operation and maintenance, that would be effected by such improvements would more than pay interest on the cost of making the improvements.

Lack of funds has been the cause of the failure to make these improvements in some cases, but in many of them it is a case of lack of *nerve*, due to the fact that the management does not know enough about economics of railway operation to realize the benefits, and they doubt the statements of those that do know, even in the face of the fact that neighboring roads that have made these improvements show earnings that are big returns on the investments that they have made in this class of improvements.

If we agree that the public is entitled to as cheap transportation as can be furnished, after giving a fair return on investment and paying fair wages to employees, all improvements to the railroads that will give reduced cost to transportation should be made; and the only way that this can be done is to have a board of engineers pass upon the question of improvements; on their recommendations the work should be ordered done, and the financing of the improvement should be by the sale of bonds guaranteed by the United States.

The same argument applies to motive power and rolling stock; whenever locomotives or cars have reached such a state of obsolescence that it is more economical to scrap them and buy modern equipment, there should be a means of doing this, and not let the cost of transportation be in-

creased through the lack of judgment or lack of means of local railroads to do the economical thing.

In connection with the proposition to have the United States guarantee the bonds for improvements to be made by the railroads that are approved by a central governing board, there comes up the question of the relation that these bonds would have to outstanding issues of bonds by the same company. There is not a railroad in the United States today that is not worth the amount of its bonded indebtedness at least, and as a whole they are worth their total capitalization.

A valuation is being made of the railroads as of June 30, 1914, and the valuation is estimated to be completed by the end of 1920, which would be practically at the end of the extreme date of federal control under the act of Congress taking over the railroads. The railroads of the country could not be duplicated today for 33 1/3 per cent more than in 1914, and the investigations so far made have convinced those making them that the valuation as of June 30, 1914, will, if a fair value is given on right of way—for the railroads as a whole—equal their capitalization on that date, so that if this is the case there would be no chances taken by the government if they guaranteed all railroad bonds.

### Replace Wastes as We Go Along

While the cost of federal valuation of the railroads has been very great, it has been the means of calling the attention of the railroads as well as the Interstate Commerce Commission to the question of depreciation and obsolescence and the necessity of providing for both in the rates charged for service, and it is to be hoped that in connection with new laws and rules that may result from the present agitation that depreciation rates will be established in connection with maintenance of way and structures, and that rates hereafter will be such as will take care of depreciation as well as operation, maintenance and upkeep.

The public has been feeding for the past ten years on the fat off the bowels of the railroads, and it had gotten down to the tissue, when the railroads were taken under federal control. No institution can live under these conditions, and provision should be made to replace all wastes as we go along and thus keep the railroads in a healthy condition.

There has been more or less discussion by those interested in reducing rates, regardless of fairness to investors, of what is termed the "unearned increment," the claim being made that the railroads should not be permitted to earn anything on increased value of right of way or of improvements placed on same, or on increased value due to location, or industrial conditions, disregarding the fact that the investments in railways are of private capital and that at the time they were made they were hazardous, and that money could only be secured by the offering of common stock as a bonus for the purchase of bonds, the value of the common stock, if any, coming from increased value of the property as business developed along its lines.

The lands through which the earlier railroads passed were of no value; the building of the railroad gave them a value, and at the same time gave a value to the land occupied by the railroads, and the development of the country gave an increase in business that increased the earning power of the railroad. The two grew together, and yet they would give the value so made to one of the parties and withhold it from the other, regardless of the fact that the parties from which they would withhold made the increase possible.

We hear a great deal about justice today, applied to the situation in Europe brought about by the world's war. The United States has placed itself in the attitude of the apostle of justice. We are all proud of the fact that it has done so, but while we are in the business of seeing that justice is done every one in Europe, why not use some of it for home consumption—in our treatment of public utilities, and the railroads are our greatest public utility.

## Thirty-four Passengers Killed in Collisions

**I**N A REAR collision of westbound passenger trains on the New York Central at South Byron, N. Y., seven miles east of Batavia and 43 miles east of Buffalo, on the morning of Sunday, January 12, between 3 and 4 o'clock, 22 passengers were killed and 20 or more injured. The leading train, the second section of No. 17, "The Wolverine," had been stopped for the purpose of having a helping engine attached at the head of the train. The following train, No. 11, the Southwestern Limited, came on at high speed and crushed the rear car, a sleeping car, completely; and the second car from the rear was buckled so that it stood almost on end for a moment and then fell on the rear car, crushing in its roof. The engineman of No. 11 said that his application of the brakes was followed by the parting of the coupling behind the tender so that the brakes on the cars had no effect in slackening the speed of the locomotive.

Both of these trains were made up of steel cars of the latest type. The line is equipped with the latest design of automatic block signals.

The engineman of No. 17 claimed that the block signals were clear; but the signal apparatus was found working properly after the collision, the first signal in the rear was found in the stop position and the second one in the caution position. A statement issued by the road says:

"The flagman of train No. 17 states that a red fusee which he had placed on the track was burning when No. 11 passed him and ran over the fusee and ran into No. 17.

"The engineer on train No. 11 states that the automatic signals were clear when he passed. He also states that he did not see the flagman of No. 17.

"The fireman on a freight engine which stood on an adja-

lights on No. 17 were both burning brightly, and the engineer of No. 11 is unable to give any reason why he did not see these marker lamps. He claims he was wide-awake, but also is unable to say why he did not see the flagman of No. 17 signaling him to stop or the burning fusee."

The statement of Fireman Brill, of train No. 11, is substantially the same as that of Engineman Friedley.

The evidence indicates that the flagman of the standing train had got back about 2,000 feet, and that the fusee placed by him was about 1,500 feet back. Torpedoes placed on the rail by the flagman are said to have been about 800 ft. back. The train had been standing about seven minutes.

Engineman Friedley said that he had slept on Friday night about 12½ hours, his time thenceforward having been spent as shown below:

- 1—Friday, January 10, 10 p. m., went to bed.
- 2—Saturday, January 11, 10:30 a. m., rose.
- 3—Saturday, January 11, 2:45 p. m., registered for train 28.
- 4—Saturday, January 11, 7:50 p. m., arrived at Syracuse, train 28.
- 5—Saturday, January 11, 9:50 p. m., registered for westbound train No. 11.
- 6—Sunday, January 12, 3:42 a. m., collision.

During the two hours spent at Syracuse, in the evening, Friedley ate his supper and was around the enginehouse.

Fireman Brill was off duty at Buffalo from 4 a. m. of the 10th until 3:15 p. m. of the 11th, after which time he was with Friedley.

It will be noted that Friedley had been out of bed about 17 hours, thus making the circumstances of this collision somewhat like those of that at Ivanhoe, Ind., on June 22, 1918, where Engineman Sargent, who was dozing in his cab at 4 a. m., reported that he had been out of bed since 5 a. m. of the day before.

### Fort Washington, Pa.

In a rear collision of passenger trains on the Philadelphia & Reading at Fort Washington, Pa., on the Bethlehem branch, five miles north of Jenkintown, and 16 miles north

Photograph from Underwood & Underwood, N. Y.

Wreck at South Byron, New York, January 12.

cent track says he saw the flagman of No. 17 go back and also saw him signal No. 11 to stop by swinging his red lantern.

"The towerman, who had a view of the scene, also testifies that he saw the flagman of No. 17 signaling No. 11 to stop by swinging his red lantern and setting the red fusee burning. The towerman likewise testifies that the automatic block signals were set against No. 11.

"The engineer on No. 11 had a clear view for a distance of two miles, and it was a cold, clear night. The rear red

of Philadelphia, on the night of January 13, twelve passengers were killed and twenty or more were injured. North-bound local passenger train No. 381, which had been stopped by an obstruction on the line ahead, was run into at the rear by express No. 319, and the rear car of the standing train was completely crushed.

There was an enclosed-disk automatic block signal a short distance in the rear of the standing train. It is claimed, on behalf of the engineman of Train No. 319, that this signal indicated clear.

# The Traffic Department of the U. S. R. A.

## Abstract of Chapter on Traffic From the Director General's Forthcoming Report to the President

**T**HE DIVISION OF TRAFFIC was established on February 9, 1918, with Edward Chambers as director. Since competition ceased with the assumption of federal control, the solicitation of traffic and special exploitation of passenger routes were discontinued, and the efforts of the soliciting forces of the railroads were directed in other channels. Consolidated offices have been opened in all of the larger cities, 98 in all. General freight information is also either furnished at the information bureaus or the inquirer directed to the proper department. The consolidated offices are in lieu of and more adequately serve the public than the total of 564 passenger offices which were in existence prior to federal control.

The effect of these consolidated offices has been a much better distribution of the traffic. Passengers finding that sleeping or parlor car space is not available via one route are able to select another without leaving the building. Regardless of what disposition may be finally made of the railroads these consolidated offices should unquestionably remain in existence to the lasting advantage and convenience of the traveling public. Further economies have resulted through the removal of "on-line" commercial freight offices from private to railroad property. In the seven months' period ended July 31, 1918, there was a total saving as a result of this policy of \$16,566,633. To this amount a substantial sum has since been added.

For the purpose of conserving transportation energy so that essential food, fuel, war supplies and freight of all kinds might be moved expeditiously and economically, it was decided to eliminate those passenger trains that gave a duplicate service and were run mainly for competitive reasons, and, after careful study, to eliminate a number of other trains where it could be done without too great inconvenience to the traveling public. That the comfort and convenience of the traveling public might be discommoded as little as possible, the policy of staggering trains between commercial centers was adopted. Considerable progress is still being made in reducing passenger train mileage, though the gradual return to normal conditions is resulting in the restoration of some trains.

### Consolidation of Terminals

Other reforms include the common use of terminals by railroads formerly in competition and using separate terminals. The most conspicuous example is the use of the Pennsylvania terminal in New York for through trains via the Baltimore & Ohio between Washington and New York. The same principle has been applied as rapidly as possible in the consolidation of freight terminals. The saving of switching costs that has resulted, and the greater rapidity with which cars have been handled and loaded and unloaded, is already apparent. In the changes made the prime purpose has been the convenience and service to the public. The necessary readjustments may have caused some temporary dislocation, but the ultimate results will be increased efficiency and capacity.

### Curtailment of Advertising

Time-tables have been simplified and abridged, extraneous and unnecessary matter has been eliminated, and the waste which previously existed in the distribution of time-tables entirely stopped. That unnecessary passenger travel might be restricted during the war both general and special adver-

tising were, to a very large extent, discontinued. The annual estimated saving from these two sources is \$7,000,000. During the coming year, because of the changed conditions and the possible necessity of creating passenger travel, general and particularly special advertising will to a large extent be resumed.

### Demurrage

In order to effect the prompt release of cars the national code of demurrage rules and regulations was modified and the charges increased to \$3 per car for each of the first four days, \$6 for each of the next three days, and \$10 for each succeeding day. A considerable increase in the supply of equipment was thereby made available.

### Shortening Freight Routes

In developing new routes which should be not only shorter but also more efficient and economical than those previously in use, material progress has been made, especially in the West, where the opportunities because of the longer average hauls are much greater than in the East. Not only have the carriers profited through the saving in car, train and engine miles, but the shipping public has benefited because of the fact that the speedier handling via shorter routes has made more empty cars available than would otherwise have been the case.

### Co-ordination with Other Governmental Departments

With the object of co-ordinating the railroad service more completely and harmoniously with the other war agencies of the government, representatives of the Division of Traffic, each bearing the title of manager inland traffic, were appointed to co-operate with and direct the traffic of the Food Administration, the Fuel Administration, Oil Division of Fuel Administration, the War and Navy departments, the War Industries Board, and the United States Shipping Board. As a result of their work, the prompt and, wherever necessary, preferred movement of war supplies for the United States and its Allies was made possible. Their complete and practical knowledge of the transportation systems of the country enabled them to direct shipments via the most efficient routes, thus speedily relieving the congestion that had previously existed, while at the same time, through a proper distribution of the traffic, they were able to arrange for its movement in solid and maximum trainloads. The managers of inland traffic, cordially assisted by the chiefs of the various activities together with the patriotic and practically unanimous co-operation of the shipping public, were able to increase the carload minimum on most of the commodities transported and, in many instances, bring about their double loading as well.

It would be difficult to say too much in praise of the services of these gentlemen, and of the very efficient manner in which each of them accomplished his difficult and delicate task.

### Passenger Service Matters

As a result of the draft law and high wages, the number of competent ticket sellers was greatly reduced, and several schools for the instruction of men and women as ticket clerks were established. Many women ticket sellers, at the same salaries paid men filling similar positions, are now in the service and are proving satisfactory and efficient.

Rates of approximately one cent a mile for soldiers and

sailors on furlough and of two cents for soldiers and sailors discharged from the service, the latter to cover their movement from point of demobilization to the points to which they are allowed travel expenses by the government have been made effective. During the war a low uniform fare was also established for workmen at all war industry plants to which special trains were run.

Because of the necessity for the further conservation of food and in order that the dining-cars might be utilized to maximum efficiency, the plan was adopted on October 1, of serving table d'hote luncheons and dinners at a uniform price of \$1, except upon a few limited trains where \$1.25 is charged for dinner. The saving effected in the way of food and the increased number of meals served justified the practice. As a permanent plan, however, the table d'hote system has not yet passed the experimental stage and some modification may be found desirable.

The removal of competition and unified operation has made possible the rearrangement of train schedules so as to permit of many additional connections at junction points, thereby making for greater public convenience. Considerable progress is still being made in this direction. The maintenance of passenger schedules thus giving "on-time" service has been greatly improved, and unnecessary duplicate and lightly patronized sleeping cars are still being eliminated.

Considerable progress has been made in the issuance of permanent tariffs carrying the advanced fares, in connection with which circuitous routes are being eliminated, and tariffs, rules and regulations standardized. The work is rapidly approaching completion. A standard basis of approximately 30 cents a mile has been adopted for the movement of special cars, such as mine rescue, hospital, public health, and fish distributing cars, which are operated by the federal government, the states, and the Red Cross. A basis of standard ticket forms for use on all federal controlled roads has been completely worked out and mileage scrip books, good on all carriers under government operation, are in effect. Standard baggage rules for the entire country have been adopted and put into operation.

#### General Order No. 28

In order to provide for the increase in wages allowed, the higher prices that were and are being paid for all materials and supplies, and the rising costs of operation generally, General Order No. 28 was issued, effective June 25, 1918, as to freight rates, and June 10, 1918, as to passenger fares and baggage charges, by means of which an average advance of 25 per cent was made in freight rates throughout the country, and passenger rates were raised to a minimum of 3 cents a mile where they were previously lower. Commutation fares were also advanced 10 per cent.

A rule requiring two adult tickets for a drawing room in a sleeping car and other economies have been adopted, so that the general traveling public may not be excluded from the use of Pullman space unnecessarily pre-empted.

The order carried a provision for a further charge of one-half cent a mile for transportation in standard sleeping cars and parlor cars and one-quarter cent in tourist sleeping cars. This increase has since been canceled, the war necessity which created it having ceased to exist.

These advances in rates, made only after a thorough investigation of the conditions as well as a careful estimate of the probable results, were designed to increase the net operating revenues by an amount about equal to the greater cost of operation, thereby leaving sufficient net operating income to insure the standard rate of return as fixed by law, without drawing upon the government's other sources of revenue.

Some criticism has been made of this order. It was only after the federal control act had been passed (March 21, 1918), that any steps could be taken to meet the constantly rising costs. It was a physical impossibility to secure the

advances by the substitution of new tariffs with corrected items in less than several years. Our efforts, therefore, were directed toward some plan which would quickly spread that increase as equitably and fairly as possible over the entire country. General Order No. 28 was the result, and experience has shown that it accomplished the end that had to be attained with the least possible disturbance of business conditions.

Sufficient time has not yet elapsed to judge of the final effect of these increases as related to the net operating income, but it is hoped that with the return to more nearly normal conditions reductions may gradually be made.

#### Freight Traffic Details

Three general freight traffic committees have been appointed with headquarters at New York City, Atlanta and Chicago. Under these are district freight traffic committees, to which either the carriers or shippers may propose changes and by which recommendations are made to the proper general committee. These committees are conveniently located at Boston, New York, Philadelphia, Buffalo, Pittsburgh, Detroit, Cincinnati, Chicago-Eastern, St. Louis-Eastern, Richmond, Louisville, Atlanta, Birmingham, Jacksonville, New Orleans-Southern, Chicago-Western, St. Louis-Western, New Orleans-Western, St. Paul, Kansas City, Dallas, Denver, Portland, and San Francisco. The Division of Traffic, co-operating with that of Public Service and Accounting, has instituted the innovation of having upon each of these various committees one or two members who have been selected with the approval of the Director of Public Service by the general business interests of the section. These shippers' members engage actively in the deliberations of their respective committees and have voice and authority equal to that of the individual railroad members in the reports and recommendations made. Among those who are familiar with the work done, the results accomplished are regarded as very satisfactory.

The adoption of "sailing days" has worked marked economy.

This plan has for its purpose: First, the allocation of all less than carload traffic destined to certain designated common points to those lines which form the shortest routes and afford the most efficient service; and, second, the movement from distributive centers to the smaller, or noncompetitive points, upon all lines under government control, upon specified and convenient days of the week. Its adoption, through the elimination of some, and heavier loading of others, has already resulted in the saving of thousands of cars besides furnishing better service, through the avoidance of transfers. Specific figures showing the total number of cars saved will be supplied in the reports of the regional directors.

For some time considerable uneasiness has existed in the cotton-producing sections of the country over the question of an increased allowance for the compression of cotton in transit. The compresses have contended they could not, under existing conditions, perform the service for the carriers, in such instances as the latter assumed the expense, without some increase in the amount allowed for compression out of the through rate. This difficulty, with the assistance of the War Industries Board, has been adjusted by increasing the former allowance from 50 to 100 per cent, at the same time increasing the minimum loading to 75 bales per car. The issue of through export bills of lading via all ports has been resumed to the great advantage as well as relief of cotton and all other shippers.

After many conferences and by mutual agreement with the interested shippers a circular has been issued as a supplement to the southern classification, which contains specifications of standard containers for fresh fruits and vegetables and loading rules governing the same. This will have the effect of greatly reducing the loss and damage in the handling

of these commodities. A standard package for boots and shoes has also been determined upon by agreement with the shippers.

The adjustment of divisions with the so-called "short lines," including the settlement of many intricate questions, is proceeding rapidly.

### Consolidated Freight Classification

At the present time there are in general use some three different freight classifications applying to interstate traffic, while many states have their own particular classifications applying to intrastate traffic. These various classifications contain some 15,000 items. The carload minima vary and they differ in other essential details. Great confusion in ratings and classifications and many overcharges and claims have been the result. To simplify this situation a consolidated classification was prepared upon which hearings throughout all sections of the country as well as at Washington have now been completed by the Interstate Commerce Commission.

The formal recommendation of the latter body has not been received, but it is our hope to place this consolidated classification in effect within a very short time.

### Modifications in Charges and Practices

Many modifications in charges and practices have been made by our freight rate department. With the assistance of the Department of Agriculture the freight charges on cattle feed moving into the drouth-stricken districts of the Northwest and Southwest have been reduced, and by means of emergency through rates the shipment of stock cattle from the latter section to the grass and range lands of the east and southeastern sections has been encouraged. At the request of the Food Administration a storage-in-transit privilege has been established on dressed meats, thereby enabling the packers lacking sufficient cold-storage facilities at their plants to keep their products moving without congestion or delay toward the Atlantic seaboard for overseas movement. Similar aid has been given on wheat flour substitutes to the end that the smaller dealers might carry a complete supply, thereby increasing the domestic consumption of such substitutes and releasing increased amounts of wheat and flour to our allies and our own army overseas. Other war measures were: The reduction in manganese ore rates from western mines to eastern furnaces to replace Brazilian ores impossible of procurement; the establishment of through rates on coal in territories where they were not heretofore effective to aid in the economical and efficient distribution of this very essential commodity; the installation of log rates in the spruce sections of the Northwest to facilitate the production of aeroplanes. Rates were also established upon castor beans for castor oil, necessary in the operation of aeroplanes. Many readjustments have also been made, the most noteworthy of which has been the establishment of a uniform scale of class rates for application within Oklahoma, by means of which the rates in that state were placed more nearly upon a parity with those existing in the state adjoining. This scale has proved entirely satisfactory to the Oklahoma railroad commission, as well as the shipping public.

### Simplification of Tariffs

A plan is well under way for the simplification and consolidation of freight tariffs which it is believed will not only save approximately \$2,000,000 per annum in the tariff printing bill of the railroads, but put the tariffs in a great deal better shape for use.

Under past practices there have been some so-called bureau tariffs containing the rates of all roads in a certain section, but to a large extent each railroad has continued to publish separately the rates between points on its lines or with its connections. This means that where two or more lines serve

the same points the publication of the rates is duplicated sometimes as many as 20 times. This has been very expensive and has also frequently resulted in rates or regulations applying over one line different from those over another. New tariff publishing bureaus have already been established at several important points, and freight tariff revision committees have been appointed.

### Agricultural Section

The Agricultural Section, with J. L. Edwards as manager, is in close and complete co-operation with the Department of Agriculture and the Food Administration. The chief efforts of the agricultural agents of the carriers have been directed toward aiding the campaigns undertaken everywhere for increased food production. For carrying on the work of the Agricultural Section the 48 states have been divided between two general committees, with special subcommittees, to the end that the agricultural departments of the railroads in each state and in the country at large may co-operate with each other and with the appropriate federal, state and county authorities, including also civic bodies, manufacturers of farm implements and fertilizers, local bankers and business men, that they may harmonize and co-ordinate their efforts.

The experimental or scientific part of the work is now left to the United States Department of Agriculture and the several states. The railroad agricultural agents' work is more along the lines of dealing with the transportation problems involved; encouraging the production of new or different farm products and increasing that of old; bettering their quality and preparation for market; aiding in finding markets; and bringing about improvements in farm methods as approved by competent authorities.

With the coming of peace and restoration of normal conditions, the movement of returning soldiers, industrial workers and others to the farms is expected to assume large proportions. The agricultural representatives of the railroads have co-operated in all sections in getting together the information necessary in the consideration of the plans proposed by the Department of the Interior for reclaiming land for returning soldiers. They have also prepared a great deal of information on the subject of farming opportunities along the several railroads that prompt and intelligent reply may be made to the many inquiries which are coming in from prospective farm settlers in this and foreign countries.

### The Express and Mail Situation

Early in the period of governmental operation of the railroads it became apparent that the activities of the several express companies should be co-ordinated with the various railroads under federal control. Each railroad had its separate contract with the express company operating over its line and the percentage of gross revenue which the railroads received from the express companies varied considerably. Other features of the contracts differed materially, some calling for routing of a proportionate amount of competitive traffic over certain railroads, and it was obvious that with the operation of the railroads under a single control, the discontinuance of needless trains of a competitive character and the reduction of train service to meet war conditions, the only way to treat the express situation was to make one uniform contract operative during federal control. Consolidation on the part of the express companies during this period also became essential, and after continued negotiations between the express companies and the director general an agreement was made, effective July 1, 1918, under which the several express companies formed a corporation known as the American Railway Express Company, for the purpose of carrying on the express transportation business upon the railroads under federal control, and also on certain non-federal controlled lines which were essential to round out the express transportation system in the United States.

Under this agreement the express company pays to the Railroad Administration 50 $\frac{1}{4}$  per cent of the gross revenue earned on the transportation of express matter as compensation for the rail transportation, this representing the average payment for the past three years to the individual railroads by the various express companies. Following this the express company pays its operating expenses, the balance being subject to a division between the express company and the Railroad Administration on a basis which makes it unnecessary to guarantee any definite amount of net earnings to the express company based upon the previous three years' average of those companies, some of which had made substantial net earnings, while others had shown a deficit. The agreement also has the effect of requiring the express companies to put forth their very best efforts and individual initiative, as their net returns are based upon the results of their successful operation.

The increased cost of labor, as well as of everything else which entered into the expense of conducting the express business, soon made it apparent that the 10 per cent advance in rates granted by the Interstate Commerce Commission, and effective upon July 15 last, was not great enough to cover actual operating expenses and allow the express company any net return. A further advance was therefore ordered to become effective January 1, 1919, which it is hoped will provide sufficient funds to cover the increased wages recommended by the Board of Railway Wages and Working Conditions, as well as permit of some net return to the express company.

Express traffic is now sent by the quickest route, circuitous routes having been eliminated; cars for handling express are used regardless of individual ownership, thus increasing the express car availability by several hundred cars. A sufficient number of new express cars have been ordered to provide for the needs of the railroads based upon their average requirements for the past five years, and it is expected that the express business in the near future will be placed upon a firm foundation with a stabilized organization, and with a premium for individual initiative coupled with a degree of federal control, all of which should work to the advantage of the patrons, the railroads, and the express company itself.

The Express and Mail Section, under the direction of F. S. Holbrook as manager, is also working in close co-operation with the Postal Department to the end that the mail service may be efficient and expeditious as possible.

#### Conclusion.

It should be borne clearly in mind that whatever inconvenience the traveling and shipping public have suffered during the past 12 months of governmental operation has been due to the absolute necessity of first devoting our transportation agencies to the vigorous and successful prosecution of the war. Only that part of the motive power and freight and passenger equipment remaining after our troops had been moved to cantonments or from cantonments overseas, and supplied with all the necessities of life and war, could be devoted to the commercial traffic of the country. The service rendered under such conditions cannot and ought not to be taken as the measure of what might be expected through federal control under normal conditions, or in a time of peace. As a matter of fact, our inconveniences were luxuries as compared with the situation which existed in England or on the Continent.

There remains a great deal of work which has been undertaken and is not yet completed, such as the unification of rules and practices covering the transportation of livestock; the preparation of a consolidated tariff governing the handling of perishable freight; the consolidation and modification of the demurrage, weighing and inspection bureaus in each of the three classification territories to the end that existing discriminations may be removed to the benefit of

both the shipper and the carrier and uniformity in practice and rulings established.

One of the most important and fast developing traffic questions relates to the efficient and proper handling of import and particularly export traffic. There is every indication that the efforts of the manufacturers and producers of the United States, with the assistance of our proposed merchant marine, will result in a much more successful invasion of foreign markets and a considerably greater volume of traffic than has heretofore sailed from our harbors. We are therefore giving immediate consideration to the rate situation, service between ports and producing points, unification of port practices and charges, and the elimination of undue competition between ports, with the thought in mind that each producing section shall have its proper standing and be given all the encouragement possible to develop the traffic.

Given the opportunity, it will be our aim to bring these and other important matters to a satisfactory conclusion.

## Report on Beloit (Kansas) Derailment

**W.** P. BORLAND, chief of the Bureau of Safety of the Interstate Commerce Commission, has issued a report (No. 132) on the Union Pacific, near Beloit, Kan., on January 15, 1918, which resulted in the death of four passengers and the injury of 22 passengers and three employees. It is attributed to a track failure at a bridge undergoing repairs, trains having been allowed to run at full speed when they should have been subject to a limit.

This is a single-track line laid with 60-lb. rails. The derailed train—locomotive and four cars of wooden construction—was running at about 20 or 25 miles an hour. The derailment occurred at the end of a timber trestle, the two coaches falling off the bridge and landing on their roofs in the bottom of the creek. Frozen ground had been excavated and a new bulkhead bent had been placed near the old one at the westerly embankment. Piles 17 in. in diameter had been driven in the new bulkhead, on which was placed a 12-in. cap carrying 16-in. pine blocks, which in turn supported a 7 $\frac{1}{2}$ -in. by 8-in. tie.

The track joint at the point of accident was weakened, the outer splice bar having been partially fractured for some time and part of the flange being missing. A rail badly flange-worn on the gage side also butted against one only slightly worn at this joint. The inner flange of the latter rail had also received injuries from spike wear. These conditions contributed to the weakening of the joint as the slightly worn rail received repeated blows from passing wheels. Both rails were fractured at distances of 28 in. and 45 $\frac{1}{2}$  in. from the joint, causing the derailment.

The accident was probably caused by the failure of the outer splice bar at the joint, followed by the fracture of the rails themselves. These ruptures were occasioned by an outward thrust. The testimony taken during the investigation showed that the rail was not spiked to the tie over the new bulkhead bent and no slow order was in effect. The report concludes with the statement that each of the elements of weakness which have been enumerated probably contributed toward the accident and that the failure of the track was due immediately to side thrusts on a weakened joint by a train which was going at customary speed, in the absence of a slow order restricting speed on a bridge which was undergoing repairs.

A meeting of the Railroad Administration committee on standards for cars and locomotives has been postponed from January 21 to February 18.

## Railroad Encounters Some Remarkable Sink Holes

Necessity for Adequate Contingent Allowances Is Demonstrated  
by Experience on Second Track Work

NO BETTER DEMONSTRATION of the justification of the proper consideration of hidden quantities in valuation work is to be obtained than the experience which the Cleveland, Cincinnati, Chicago & St. Louis has encountered during the past summer with some sink holes on the Cleveland-St. Louis line between Union City, Ind., and Ansonia, Ohio, in western Ohio, in connection with double track work now in progress between Winchester, Ind., and Ansonia. While the work is all relatively light in moderately rolling country, difficulty has been encountered in three places when widening and raising the embankments for second track across small depressions, the bottoms of which contain a deposit of peaty loam of varying depths. Deposits of this character are found rather extensively in parts of Ohio.

In some places the stratum of this material is so thin that it is practically all squeezed out from under the embankment with only a moderate settlement, but at the two points shown in the photographs the layer of soft material is so thick that the large quantities of material placed in the embankment thus far have not penetrated to the full depth of the soft stratum. In the case shown in Figs. 1 and 2 the length of the sink hole along the track is only 400 feet., but 9,000 cu. yd. of material has been dumped here in an attempt to widen

a 7-ft. embankment for second track. As shown in Fig. 1 the soft material has been forced up just outside the toe of the slope to a height equal to or greater than that of the embankment. Near the track this upheaval has been so violent as to break up the surface, exposing the interior of the soft mass, but some distance back from the track the sod remains in place although somewhat folded or wrinkled. The mass has also been pushed away from the track so that the right-of-way fence has been displaced a maximum distance of 50 ft. This is clearly shown in Fig. 2. Evidences of the disturbance of the ground surface may be detected as far as 175 ft. away from the track.

A minor disturbance was also noted on the side of the track opposite the new embankment, the right-of-way fence on that side being moved some 3 ft. However, the most serious disturbance at this place is the shifting of the old embankment away from the new one, so as to throw the operated track out of line. Just how much the track has been thrown is not known since it has been lined back from day to day. At the other places the operated track has not been seriously disturbed, and the old embankment seems to have reached a stable support.

Fig. 3 shows a larger upheaval found at another sink hole

of larger extent, this having a width at right angles to the track of at least 100 ft., while the disturbance extends back 300 ft. A highway crossing at about the middle of this soft area is indicated by the row of trees shown in the background. At the time that this photograph was taken, operations had been carried on only to the west of this highway crossing. The effect of this condition is shown in Fig. 4. The highway with the trees bordering it on each side has been pushed bodily eastward fully 10 ft.

This work was undertaken with some knowledge of the conditions to be encountered at these places. Borings taken during valuation surveys some time previous showed at least 38 ft. of filled material below the tracks although the apparent height of the embankment was only 7 ft. This has been verified since the work has started by driving a pile, although

the test was not carried far enough to ascertain the full depth of the peat. That there has been a gradual settlement of this operated track for years is apparent from the fact that there is an appreciable sag in the grade line across these two sink holes.

The material first deposited was a heavy clay from steam shovel excavation. Upon contact with the water contained in the sink holes, this material became semi-fluid and flowed laterally, its greater specific gravity raising the lighter peaty material with the effects described. Upon realizing this situation, the engineers decided to stop filling with earth and to use only cinders. This plan promises to be entirely successful. At the time of writing, the new track at the worst one of the sink holes is in operation and the disturbance has practically ceased at the others.

## Railway Business Association Meets in Chicago

Annual Meeting the Occasion for Discussion of Future of Transportation Industry—Constructive Resolutions Adopted

THE ANNUAL MEETING of the Railway Business Association was held at the Hotel La Salle, Chicago, on Thursday, January 9, as reported briefly on page 167 of the *Railway Age* of last week. Over 200 railway supply men were in attendance at the morning and afternoon sessions, while over 500 were present at the dinner in the evening. The attendance at all sessions was restricted to men in the railway supply industry. The attention of the meeting was largely devoted to the consideration of the changes which have been introduced in the purchase of railway supplies during the past year and to the further changes which will probably result from the early return of the roads to their owners. The constructive character of the meeting itself and of the work done by the committees during the past year is reflected in the strong set of resolutions which were adopted and which are published in full below.

The association has been reorganized during the past year to transfer a large part of the work from the president to several committees. These committees have been active in their respective fields during the past year.

In calling the meeting to order Alba B. Johnson (president of the Baldwin Locomotive Works, Philadelphia), president of the association, discussed the problems confronting the organization and the railway supply industry. The following is an abstract of his remarks:

### Mr. Johnson's Opening Address

Quite apart from the opinions which our association may announce touching purposes of legislation and provisions of law, it would seem desirable at this time to consider appropriate ways and means for winning public and political opinion to our way of thinking. Is it not obvious that our best chance of adjusting and conforming our ideas to the needs and the thoughts of the various interests and the various regions and of adapting their requirements to a consistency with our own is through the contact of our individual members with their fellow-citizens? Every accomplishment by our association in the past has been based upon an ascertainment of views in the communities and local discussion to show whether our own general aims could be co-ordinated with the special aims put forward by others. Can we hope to find for the present emergency a more serviceable method?

Taking a leaf from our own book, we would naturally turn to business organizations. Bodies that serve trades and bodies that serve cities both discuss transportation, but as

between the two the local commercial association has distinct advantages in this respect. It is miscellaneous, embracing manufacturers, merchants, and men in many lines of business, usually including professional men. Through this complex composition the thought of the organization is diffused among occupations generally. Most business men who are members of trade associations belong also to the organizations in their home cities. What we may hope to promote in city associations with which our members are affiliated is systematic study of the subject and local discussion of the results of such study.

Many organizations will be found committed to a policy of discussing national questions only through the National Chamber. The Railway Business Association itself follows that practice as to questions outside our special scope. Underlying such a self-imposed restriction is the idea of waiting for a National Chamber referendum and then letting organized business speak once for all with full force. Another method is feasible, however, when a referendum might take too long. The *Railway Age* for December 27, discussing ways and means for solidifying public opinion in favor of an extra session of Congress to pass remedial railway legislation, asks, "Might it not be a typically American, business-like and enterprising thing to do for business firms all over the country to write or telegraph the Chamber a full expression of their views on the railroad situation, and especially upon the necessity of calling an extra session of Congress?" Thus, says the *Age*, "the President of the Chamber would have available a mass of evidence which he might present to President Wilson on his return from Europe." Probably representations of constituent bodies rather than of individual business men, or in addition to them, would best befit the character of the Chamber as a federation of bodies accustomed to act on petitions from constituents. Doubtless most of them are ready to speak for an extra session and not ready to recommend provisions of law.

Let us counsel together now, if you will, upon the other major aspect of our activity as an association—the commercial relation of our members with the buyer. What prospect there is of additions and betterments in the coming months, what measures in connection therewith may deserve our consideration, and what practices under government control can be improved. Up to the time of government control the association had rigidly excluded from its scope any matters that arose out of commercial transactions. Our task was to

promote co-operation between the railways and the public. Of relations between the seller and the buyer we took no cognizance. Government control brought in a new buyer, the government itself, and without hesitation we introduced into our activity matters relating to purchasing policies. Where do you think this should lead us? If the roads are after a time to be privately managed, the future will consist of two periods—the remainder of the era of government control and the subsequent era of private control.

Take the first in its order. What is it fair for members to ask and what is it wise for officers to attempt in connection with government purchasing policies? If a member of this association received an order for goods and his competitor, another member, was disappointed, the Railway Business Association would be justified in regarding the outrage as outside of its peculiar province. Yet underlying that order there might be a general condition with which we could and ought to grapple. Suppose, for example, that the makers had been invited to submit to tests and the man who did not get the order was not given that opportunity; or suppose there were tests but the order was given to a maker who had not submitted to test. Certainly our association would deserve and receive the unanimous support of all of its members for pointing out an opportunity to improve that practice in the direction of fairness to all makers and of efficient administration for the public interest.

We may perhaps draw the line by saying that particular exercises of administrative judgment by the authorities would fall outside our scope, but general practices and conditions under which such particular acts are performed would be for us to discuss. The fact that some contract was cancelled would not concern the association. The fact that conditions and standards of administration were such or tending to become such as to encourage arbitrary and demoralizing cancellations would call for recommendations by the association.

An association as such can and does say things to the authorities which an individual business man could not say with the same impressiveness and which he might not be willing to say at all.

When government control shall be ended and our dealings are once more with corporation officials, what will then be the function of the association on the side of commercial policies? It is reasonable that our neighbors will expect us as a guild to make provision for the development and adoption of the highest standards of commercial ethics to be practiced by the seller in all his dealings with railways.

### Committee Reports

Verbal reports were presented by A. L. Humphrey (president, Union Switch & Signal Company, Pittsburgh, Pa.), chairman of the committee on Government Purchasing Policies; W. W. Salmon (president, General Railway Signal Company, Rochester, N. Y.), chairman of the committee on The Railways After the War, and H. H. Westinghouse (chairman, Westinghouse Air Brake Company, Pittsburgh, Pa.), chairman of the committee on Finance and Administration.

On the day preceding the meeting about 50 members of the association met with the committee on Government Purchasing Policies to discuss the problems which had arisen during the war. In presenting his report Mr. Humphrey referred to this conference and also described the work of his committee in conducting negotiations with the Central Purchasing Committee and others. He explained the policies governing the action of the committee in the conduct of its work and made suggestions regarding future procedure.

Mr. Salmon, in discussing the work of his committee, touched on the study which has been given to the future of the railways, particularly as it affects their relations with

the railway supply industry. He also read extracts from a number of letters written on this subject by members of the Railway Business Association.

Following the presentation of the reports of the committees resolutions were prepared and adopted as follows:

### Resolutions

*Contracts.*—If railroad contracts are to protect the government against declines in the cost of production such contracts should also protect the contractor against increases in the cost of production. Whatever the terms, both parties should adhere to contracts. Arbitrary cancellations of orders due to a falling or rising price market tend to demoralize standards of conduct and impair industrial stability.

*Contingent Fees.*—Abolition of contingent fees in compensating sales service is against the public interest as applied to railroad contracts. Compensation depending wholly or partly upon obtaining a contract has become established in this industry because it has been found to promote economy in selling cost. A change to a salary basis will tend to increase overhead and sooner or later show itself in higher prices. We urge upon the President of the United States that he make effective as applied to railroad contracts the policy attributed to him in the announcement of exemption for the War Department namely, that "the covenant to be inserted in all war supply contracts against the operation of contract brokers and other illegitimate business agents should not be used in such a way as to be harmful to long-established business customs or to curtail industry."

*Elimination of Wholesalers.*—It is injurious to the best interest of the roads and of the public for central purchasing agents to eliminate wholesalers, who in the past have performed a valuable service in handling and carrying supplies and in maintaining competition. The disappearance of numerous small dealers will in the long run mean the concentration of business in the hands of a few large concerns and consequently a tendency toward higher price levels.

*Mechanical Tests.*—It is essential to mechanical progress that the development of railway appliances not yet established in use should be at once resumed with vigor. Tests should be decentralized, so that the several roads may proceed independently as if under private control, and so that the federal managers in their discretion may admit makers of new appliances to eligibility in specifications.

*Remittances.*—Cordial acknowledgment is due the Railroad Administration for its good offices in bringing about the liquidation of many long over-due accounts for goods delivered to railways. It would be fortunate if one of the achievements of government control might be the installation of methods and conditions insuring prompter remittances. We urge the Railroad Administration to consider: (a) a study of accounting and vouchering as practiced by roads that pay their bills the most promptly and the recommendation of such methods to all of the roads; (b) a study of the problem of providing the several roads with funds out of current receipts with which to meet current bills; (c) the adoption of a standard period for payment, preferably the 30 days of general commerce.

*Prompt Remedial Legislation.*—If Congress at the present session does not enact remedial legislation providing for modified private control of railways, we favor the calling of an extra session for that purpose, and upon the enactment of such legislation the roads should be returned to their owners.

*Additions and Betterments.*—During the period of government control additions and betterments should proceed with vigor and foresightedness. Discretion should be permitted the railway corporations in determining the design and amount of facilities which they will acquire. The government should provide for corporate co-operation in projects

for terminals, way and structures so as to promote joint use and an avoidance of needless duplication. The government should make such allowance in terms of purchase that the corporations will not carry the whole burden of war prices while their income is based upon that of 1915-17. Government loans should be funded for such periods and at such rates of interest as will give each carrier reasonable opportunity to discharge all financial obligations to the government.

*Reference to the National Chamber.*—The President of the Railway Business Association is requested to transmit the resolutions, entitled "Prompt Remedial Legislation" and "Additions and Betterments"—(a) to the Chamber of Commerce of the United States with the recommendation that if the time is too short for a referendum these and similar expressions of constituent bodies be laid before President Wilson upon his return from Europe; (b) to members of the railway supply industry with the suggestion that they favor in business associations of their communities and trades adoption of similar expressions addressed to the President through the National Chamber.

*Independent Federal Corporations.*—While permitted to co-operate with one another so as to eliminate duplication of service and facilities and to secure the most efficient and economical use of routes, terminals and vehicles, and permitted under federal sanction to effect consolidations if essential, railroad properties should be operated by independent federal corporations as numerous as may be consistent with their financial strength and stability.

*Exclusive Federal Rate Regulation.*—We favor the adoption by Congress of a policy under which regulation of maximum and minimum rates of carriers engaged in interstate commerce would be federal only.

*A Secretary of Transportation.*—We favor the creation of a Secretary of Transportation to consider carriers' estimates of future expenditures, including labor costs; to exercise exclusive supervision over security issues, and to fix rates designed to yield a revenue sufficient for future operations and credit.

*Presentation to Congress and to Business Organizations.*—The president of the Railway Business Association is requested (a) to appear with such other representatives of the association as he may deem expedient before committees of Congress at the earliest practicable moment and testify in favor of the recommendations for legislation affecting railways which have been declared by this convention; (b) to transmit the resolutions of this convention dealing with governmental policy affecting railways to members of the railway supply industry with the suggestion that they bring the expressions before associations in their communities and trades and that through public meetings, through action by committees, or through interviews with officers or leaders in such organizations they endeavor to obtain constructive comments upon such resolutions for the information and guidance of our Association in further developing counsel for Congress.

#### New Officers

The committee on nominations suggested the following officers for the ensuing year. Its report was accepted and the following officers were unanimously elected: President, Alba B. Johnson, president Baldwin Locomotive Works, Philadelphia, Pa.; vice-presidents, J. C. Bradley, president Pratt & Letchworth Co., Buffalo, N. Y.; Robert F. Carr, president Dearborn Chemical Co., Chicago; A. L. Humphrey, president Union Switch & Signal Co., Pittsburgh, Pa.; G. W. Simmons, vice-president Simmons Hardware Co., St. Louis; W. W. Willitts, president Adams & Westlake Co., Chicago; W. W. Salmon, president General Railway Signal Company, Rochester, N. Y.; Knox Taylor, president Taylor-Wharton

Iron & Steel Company, High Bridge, N. J.; treasurer, M. S. Clayton, New York.

#### The Annual Dinner

The tenth annual dinner of the Association was held in the Hotel La Salle on Thursday evening, President Johnson presiding.

H. H. Merrick, of the Chicago Association of Commerce, was the first speaker, taking for his topic the reconstruction problem as it affects the railways. Mr. Merrick referred to the essential character of the transportation industry and advocated the prompt return of the roads to private operation, pointing out the dangers inherent to government ownership or operation. During the course of his remarks he read extracts from a letter written by Charles G. Dawes, president of the Central Trust Company, Chicago, to William G. McAdoo, suggesting a plan for control of the railways, of which the following is an abstract:

#### Mr. Dawes' Plan

A federal railroad board would be appointed by the president, with a proper cabinet officer as member *ex officio*. Through this agency, which it is assumed would be granted broad administrative powers, we would have the required governmental control. This board would determine the policy of the Railroad Administration and by its power to approve or disapprove would prevent unjust discrimination as between the public and the railroads, and as between the railroads themselves.

Profiting by the experience of the regional operation of the railroads under the present emergency, federal railroad corporations would be established at such places and in such number as conditions might require. These corporations would follow the usual form of corporations having capital stock; the amount of such capital stock being merely nominal, as such corporations would not, at least in the beginning, be concerned with railroad financing. The purpose of a regional railroad corporation would be to provide the necessary organization into which could be brought all of the railroad companies operating in any particular zone. As in the case of the federal reserve banks, the stock of these federal railroad corporations would be owned exclusively by the railroads, thus compelling participation by all of the railroads in a common organization. The directors of these federal corporations would be elected by the railroads composing the stockholder members, under such restrictions and regulations as would protect all interests involved and insure a non-political control, as is true of the federal reserve banks. To these federal railroad corporations would be given broad regulatory powers over all railroad activities. These corporations would have supervision over all phases of railroad operation, including the consolidation of terminals, ticket offices, railroad lines, if necessary, and all the other activities which affect the interests involved, and which need not be mentioned in this connection. In addition to the supervisory powers, in my opinion, the functions of these railroad corporations should include power to pass upon passenger and freight rates, with the right to initiate rates when deemed advisable, subject only to revision, approval or disapproval of the Federal Railroad Board, to prevent unjust discrimination. Also, to these federal railroad corporations all future issues of railroad securities could be referred, in much the same manner as has been done with the various capital issues committees during the past year.

The difficulty of co-ordinating federal and state control of railroads in the matter of rates and taxation appears to many to be insurmountable. A similar difficulty was apparent in the federal reserve system in connection with the admission of state banks and trust companies to membership in the federal reserve system. This has been largely overcome and,

at the present time, most of the large state banks and trust companies are members of the federal reserve system, generally with the expressed consent of the state authorities.

The strength of the federal reserve system lies in the ownership of the federal reserve banks by the member banks and the centralization of banking reserves. The strength of the new railroad administrative system would lie in the ownership of the federal railroad corporations by the railroads themselves, and the control of railroad operations by means of the power to protect railroad operations by means of the power to protect railroad revenues and control railroad expenditures.

H. H. Westinghouse, chairman, Westinghouse Air Brake Company, Pittsburgh, spoke briefly on his observations of British and French railway conditions gained on a recent trip to those countries. He dwelt particularly upon the difficulty

of the problems which confronted American railway men on their arrival in France, and the remarkable results which they had secured. He paid a high tribute to the work of our men overseas.

Samuel O. Dunn, editor of the *Railway Age*, also spoke on railway conditions in France, and particularly in England, dwelling especially on the part transportation played in the successful outcome of the war. He gave numerous statistics relative to the amount of traffic necessary to the maintenance of our forces and concluded with a discussion of the railway problem in Great Britain and the outlook for future government control in that country.

The dinner closed with an address by Alba B. Johnson on the question, "Shall the American Railway System Be Prussianized?" This paper was published in the *Railway Age* of last week, page 156.

## Doings of the United States Railroad Administration

### Director General Hines to Ask for Additional Appropriation to Aid in Financing Improvements

WASHINGTON, D. C.

**A**N ADDITIONAL APPROPRIATION, which may exceed \$500,000,000, is to be asked of Congress shortly by the Railroad Administration, according to an announcement by Director General Hines, to assist the railroad companies in financing capital expenditures which, for the year 1919, together with the unexpended balance of the budgets authorized for last year, are estimated to amount to \$1,627,000,000. While an investigation is now being made to ascertain how much of the improvements authorized by last year were planned because of war necessities and may be cancelled, it is not expected that this will greatly reduce the amount.

Director General Hines authorized the following: "The Railroad Administration has been charged by the federal control act with two functions which are entirely distinct and which it is very important shall not be confused. One of these functions is to render the public service through operation of the railroads, collecting of the revenues therefor, and paying the expenses and the rental due the railroad companies. The other of these functions is to require the necessary permanent improvements to be made, including purchases of new equipment, and to aid in financing these expenditures for new improvements in order that railroad companies may not be forced to offer large blocks of securities in the market under circumstances which would unsettle financial conditions and which would interfere with government financing. The carrying out of this second function may call for the temporary use of a great deal more government money than is needed for the carrying out of the first function.

"This second function was one of the controlling considerations for taking over the railroads. Very large expenditures were needed to equip them to perform their war work. Any efforts on the part of the railroad companies to borrow such sums would have resulted in the offering of such high interest rates as to interfere with the financing of the government. In many instances it would probably have been impracticable for railroad companies to raise the necessary funds at all. Consequently it was contemplated in the federal control act that the government would temporarily carry the expense of these improvements as far as might be necessary.

"The railroad companies themselves, before there had been any change in their managements, were asked at the beginning of February, 1918, to prepare and send in budgets of necessary improvements. As a result the companies recom-

mended improvements aggregating \$1,329,000,000. The Division of Capital Expenditures reduced these proposals to \$975,000,000, and they have been since expanded so that the total authorized to December 31, 1918, is \$1,277,000,000, of which it is estimated \$588,000,000 had been expended up to December 31 and \$689,000,000 remains to be expended.

"It is estimated that the minimum additional budgets for 1919 must be \$350,000,000. This represents a total of authorized capital expenditures which must be provided for, for the years 1918 and 1919, of \$1,627,000,000. While a substantial part of this total may not actually be expended during the calendar year 1919, it is apparent that it will be necessary during that year for the government and the railroad companies to provide, in the aggregate, a very large amount of money for these improvement purposes. If the government is to pursue the policy upon which it entered when the railroads were taken over, and is to provide temporarily the funds for such financing, except so far as they can be satisfactorily financed by the railroad companies, it is obvious that a substantial appropriation must be made. A careful analysis of the situation is on the point of being completed with a view to preparing an estimate for Congress for the necessary appropriation to meet this situation. While it is impossible at present to make an exact estimate of how large an additional appropriation will be needed, it is possible that it may exceed \$500,000,000. The moneys advanced by the government to the railroad companies to pay for improvements will be repaid with interest (so far 6 per cent has been the prevailing rate), so the making of an appropriation for such purposes does not mean that the government loses this money.

"It is important to avoid confusing this function of financing necessary railroad improvements with the entirely distinct function of the current operation of the railroads and the payment of the current rental to the railroad companies. The point to be emphasized at the moment is that the necessity for carrying out the government policy as to the function of financing permanent improvements is the reason which will require an early request for a large appropriation."

The loans to the companies will be made in the same way that similar advances have been made during the past year. That is, they will be secured by the deposit of collateral by the railroads and will be at the uniform rate of 6 per cent,

but whereas the loans already made are mostly demand loans this plan may be departed from. The War Finance Corporation has also made advances to railroads in one or two instances and some of the loans made by the Railroad Administration have been repaid.

At the time the appropriation is asked of Congress a statement will be presented of the disposition of the original appropriation of \$500,000,000, which, with any surplus earnings, was to constitute a revolving fund for the payment of the expenses of federal control and for other purposes, and from which advances had been made during 1918.

### W. T. Tyler Appointed Director of Operation

Director General Hines has announced the appointment of W. T. Tyler as director of the Division of Operation, effective on January 15, when the resignation of Carl R. Gray, previously announced, took effect. Mr. Tyler has been senior assistant director.

Mr. Tyler was born at Janesville, Wis., July 29, 1870. He entered railway service with the Wisconsin Central as messenger in June, 1883, and was later an operator and despatcher on the same road. In 1889 he was employed as a brakeman on the Milwaukee, Lake Shore & Western, now a part of the Chicago & North Western. In the two subsequent years he was brakeman and conductor on the Northern Pacific, and from 1891 to 1900, was consecutively yardmaster, trainmaster and superintendent on the Great Northern. He was appointed superintendent on the St. Louis, Iron Mountain & Southern in 1900, and from 1901 to 1906

was general superintendent. In the eight succeeding years he was successively general superintendent and general manager of the St. Louis & San Francisco. In 1915 he was appointed superintendent on the Northern Pacific, with headquarters at Pasco, Wash., and on February 1, 1917, he became general manager of the St. Louis Southwestern Lines. On May 15, 1917, he was elected first vice-president of the St. Louis Southwestern Lines. On November 1, 1917, he was made assistant to the vice-president, in charge of operation of the Northern Pacific. Mr. Tyler came to Washington as assistant to Mr. Gray on January 22, 1918, and was appointed senior assistant director on July 1, 1918.

### Accounting Circulars

P. S. & A. Circular No. 60 directs that the following data concerning overcharge claims adjusted in accounting department be forwarded to the Director of Public Service and Accounting immediately after the close of the accounts for the quarter ending December 31, 1918, and each quarter thereafter: Number of overcharge claims on hand at beginning of month, number presented by claimants during month, number on hand (unpaid) at end of month, and number on hand (unpaid) at end of month which were over 90 days old.

P. S. & A. Circular No. 61 gives instructions for the handling of freight charges on prepaid shipments to prevent their being collected both by the forwarding and receiving agents.

### The Export Situation

According to the report of the Exports Control Committee for the week ended January 11, there is a large accumulation of food supplies at all of the terminals at the port of New York. This is due mainly to the strike of harbor boatmen and dockmen. As a result of this disturbance, no shipments but overseas supplies for our troops were moved without interruption.

The increase in the overseas movement is still growing. The total receipts and deliveries at North Atlantic ports for the week ending January 7 was as follows (car loads):

	Received	Delivered
Export freight at North Atlantic ports, exclusive of U. S. Government freight, bulk grain and coal.....	8,589	6,234
U. S. Government freight on railroad terminals.....	3,446	3,524
Total .....	12,035	9,758

showing an accumulation of 2,277 cars during the week.

The total number of cars of freight on hand at North Atlantic ports (as of January 7) was 34,319; last week, 31,930, showing an increase of 2,389 cars.

In view of the unsettled labor conditions in New York harbor, the Allies are arranging to send a greater number of their vessels to South Atlantic and Gulf ports, and cargo will be directed to those ports accordingly.

In view of the changing conditions, the re-entry of steamship lines into commercial export business, and the desire of the steamship lines and exporters rapidly to fill the space released by the foreign governments, a conference was held January 3 with representatives of the allied governments, the Wheat Export Company and the various steamship interests at the port of New York for the purpose of devising ways and means whereby all of the export traffic could be expedited, particularly at New York.

There is a shortage of tonnage of the British and French at Boston, the French having no ships at Boston and quite an accumulation of freight. The British tonnage, as a whole, however, is ample to take care of the freight on hand. The French show a general shortage at North Atlantic and the Gulf ports.

### Automatic Train Control Committee Appointed

Director General Hines on January 14 announced the appointment, effective at once, of an automatic train control committee "to make a study of and report upon automatic train control devices now undergoing test upon various lines of railroad, or available for test, with their recommendations for installation, and for the practical test of any device now, or during their investigation, made available for that purpose, which they may consider practicable and reasonably conforming to the purposes to be accomplished." The report of the committee is to include recommendations "upon the requisites of automatic train control, and its conclusions upon the mechanical or economic features of such devices as the committee may find available for practical use." The committee will consist of C. A. Morse, assistant director, Division of Operation, in charge of engineering, as chairman; W. P. Borland, chief of the safety bureau of the Interstate Commerce Commission; C. E. Denney, assistant to the federal manager of the New York, Chicago & St. Louis; H. S. Balliet, signal engineer, electric division, New York Central; Henry Bartlett, chief mechanical engineer, Boston & Maine; J. H. Gumbes, general superintendent, Western Pennsylvania grand division of the Pennsylvania Railroad; and R. W. Bell, general superintendent of motive power of the Illinois Central. Mr. Morse has called the first meeting of the committee to be held in Washington on January 23. A committee for this purpose, it was announced, had been formulated and was ready for announcement last summer, with H. W. Belnap, manager of the Safety Section, as chairman, but after his death it became necessary to create a new committee on account of the

loss of his experience in the investigation of various automatic train control devices and of his services.

Freight Traffic Shows Decrease

In a brief item published in last week's issue, page 150, figures showing the freight traffic movement and car performance of the railroads under federal control, as reported by the Operating Statistics Section, for the 11 months ended November 30, 1918, were erroneously stated as those for the month of November. In November the net ton miles of revenue and non-revenue freight decreased 2.4 per cent, while the 11 months' period shows an increase of 1 1/2 per cent. Net ton miles per mile of road per day for the month averaged 5,181, as compared with 5,298 in November, 1917, while for the 11 months' period there was an increase. Total train miles in November decreased 7.3 per cent. Net ton miles per train mile increased 5.3 per cent. The percentage of empty car miles showed an increase of 8.6 per cent, while the total car mileage decreased 4.7 per cent. The percentage of unservicable freight cars on line was 5.6 as compared with 5.4 in November, 1917. The net ton miles per loaded car mile increased 8.4 per cent, while the car miles per car day decreased 4.7 per cent, and the net ton miles per car day decreased 2.4 per cent. The statistics by regions and districts for the 11 months ended November 30 are given in the table.

Payments Between Railroads and Pullman Car Lines Discontinued

P. S. & A. Circular No. 58, issued by the Division of Public Service and Accounting, provides that effective as of November 1, 1918, the Pullman car lines shall discontinue paying to the railroads under federal control any portion of the amounts received from passengers for accommodations furnished, as provided by the terms of contracts between the Pullman Company and railroad companies, provided, however, that any part of such amounts earned prior to January 1, 1918, and payable to the railroad company shall be settled as heretofore. The Pullman car lines shall also discontinue rendering bills against railroads under federal control for mileage of Pullman cars or electric or other lighting of Pullman cars. Railroads under federal control shall discontinue rendering bills against the Pullman car lines for any part of the costs incurred by them for heating, lighting, lubricating, or for ice or water furnished, or rental or other expenses covering terminal or yard facilities operated for the sole or joint benefit of the Pullman car lines. The cost of repairs made by railroads to the equipment of the Pullman car lines, the amount of which is chargeable to the Pullman car lines, shall be billed against that company as heretofore.

All unsettled audited bills covering items of the class enumerated herein shall, if correct, be paid. If any items of the class named have been settled subsequent to the effective date of this circular, such settlements shall stand.

Contracts Signed

The Railroad Administration, on January 9, signed a contract with the Atlantic Coast Line, including also the Washington & Vandemere and the Tampa Southern, providing for an annual payment of \$10,185,942; also a contract with the Galveston Wharf Company for \$526,069.

Gaines Chairman of Wage Board

F. F. Gaines has been elected chairman of the Board of Wages and Working Conditions, succeeding G. H. Sines, and A. O. Wharton has been elected vice-chairman, succeeding Mr. Gaines, in accordance with the plan of rotation in office every six months decided upon at the time of the organization of the board.

d Indicates decreases. a Less than one-tenth of one per cent. e Estimated. t Information incomplete.

# General News Department

Negroes may eat in dining cars on the Texas & Pacific, according to a bulletin which was recently issued. The bulletin says that negro passengers are to be allowed access to the dining cars after all the white passengers have been served.

The Dent bill to validate some 6,600 of the so-called "informal" contracts for war supplies for the United States government, entered into before November 12, 1918, was passed by the House of Representatives on January 9. It was estimated that these contracts would aggregate \$1,600,000,000.

The Interborough Rapid Transit Company, New York city, is now running trains through to Hunt's Point avenue on the Pelham Bay Park branch of the Lexington avenue subway, about 2½ miles east from 138th street. The eastern terminus is near the Hunt's Point station of the New York, New Haven & Hartford.

Telegraph wires and other wires on the Putnam division of the New York Central were put out of service, causing delay to a number of trains, on the night of January 14, by the theft of about 3,000 ft. of copper wire. The thieves worked between Dunwoodie, N. Y., and Ardsley, and, apparently, took several hours to do the job.

The governor of Vermont, Percival W. Clement, in his inaugural address, spoke in opposition to further federal interference with railroads, telephones and telegraphs. These public utilities contribute a large share of the revenue of the state of Vermont and the governor reminds the legislators that if the federal government should own these properties the change would cause a great reduction in the income of the state.

Federal ownership and operation of the leading railroad systems is provided for in a bill which has been introduced in Congress by Representative DeWalt of Pennsylvania. The bill provides for a federal department of railroads, headed by a cabinet officer, the creation of five railroad districts with five federal companies to acquire the controlling interest in the larger systems, a federal railroad board to be appointed by the President, and guaranteed government stock.

One million one hundred thousand dollars is the sum estimated by L. M. Garrison, receiver of the Brooklyn (N. Y.) Rapid Transit Company, as necessary to be raised to settle the claims for damages incident to the derailment on that road November 1, when more than 90 passengers were killed. The receiver, who has just taken charge of the property, says that the chief difficulty of the management is "lack of cash." He recommends also that ten millions be secured with which to buy 500 new steel passenger cars.

Locomotives in the Northwestern region for the week ended December 28, were 85.25 per cent efficient; that is to say, 8,002 engines, according to the reports, were serviceable out of 9,386, leaving a balance of 1,384 or 14.75 per cent out of service. Locomotives turned out of shops during the week numbered 483; 134 serviceable engines were in storage, and nine were repaired for other lines. The locomotive shops of the Northwestern region employed a total of 34,356 men who worked an average of 48.3 hours in that week.

Governor Alfred E. Smith, of New York, who took his seat on January 1, desires to reorganize the Public Service Commission of the State, for the first district (New York City) by reducing the number of commissioners from five to one; the one commissioner to have authority to regulate public service. A second commissioner would take the duty of supervising the completion of the subways, which are now under construction. A bill has been introduced in the legislature to carry out the proposed change. The single regula-

tive commissioner would appoint four deputies at \$7,500 a year. This sum is equal to half the salary of each of the present commissioners.

Development of airplane routes for the transportation of mail, which has been the subject of a study by the Post Office Department, will need an appropriation of \$3,000,000; this appears from a statement made last week before the Congressional Committee by Otto Praeger, assistant postmaster-general. Mr. Praeger said that during the last six months the expenses incident to the transportation of mail by airplanes between New York and Washington, six times a week, each way, had amounted to \$75,165; and the revenues in that time amounted to \$60,653.

The Fuel Administration announces that an owner of coal confiscated by a railroad between April 1 and October 10, 1918, is not deprived by any regulation of the Fuel Administration of any legal right which he may have to recover the purchasing agent's commission which he has paid or become obligated to pay on such confiscated coal; and, that the payment of such commission by a railroad on the settlement for coal confiscated during such period is not prohibited by any such regulation. This ruling supersedes all previous inconsistent interpretations.

The National Railways of Mexico, according to a report from Monterey, are being rehabilitated under plans which are making a fair degree of progress. All bridges on the main lines are now repaired and in use, and many of the stations have been rebuilt in a permanent manner. The roadbed is reported in fair condition. The number of locomotives in service is about 500, of which 100 belong to industries along the line and are used in the freight service of their owners. About 250 more locomotives are awaiting repairs, delay having been incurred in getting the repair parts from the United States. To handle even the minimum volume of traffic about 1,000 locomotives ought to be constantly in use, and the question of acquiring some new ones is now under consideration.

## Railroad Honor Men

To the lists, printed last week and the week before, of railroad employees who have served the country in the military or naval service during the war, the following items should be added:

Name of road	Number of men in military or naval service
Ann Arbor.....	171
Atlanta & West Point and the Western of Alabama.....	231
Atlanta, Birmingham & Atlantic.....	247
Colorado & Wyoming.....	47
Name of road	Number of men in military or naval service
Detroit, Bay City & Western.....	11
Detroit Toledo Shore Line.....	14
Fort Street (Detroit) Union Depot Railroad.....	10
Pere Marquette and Lake Michigan Car Ferry Association..	1,497

## Conferences With Shop Men at Washington

The Board of Railroad Wages and Working Conditions of the Railroad Administration has called a meeting of representatives of the federated shop crafts and representatives of the various railroad regions to take place at Washington on January 20, for the purpose of creating uniform rules and working conditions and establishing uniform practices in handling grievances on all railroads under federal control. The labor organizations will be represented by a committee composed of 36 men, including one chief executive officer for each of the crafts, with the acting president of the Railway Employees' Department of the American Federation of

Labor as chairman. The railroads will be represented by a committee of 36 men selected by the various regional directors. The two committees will continue in regular session from day to day until they are prepared to submit their conclusions. These will be subject to review by the Board of Railroad Wages and Working Conditions.

### Cripple Creek & Colorado Springs

In the table which was published in the January 3 issue of the *Railway Age*, showing mileage of railroad abandoned, there was included under the heading: "Lines Abandoned Permanently and Not Taken Up," 39 miles of the Cripple Creek & Colorado Springs, from Colorado Springs, Col., to Cameron. This piece of road was not being operated at the time our table was compiled, and an officer of the company wrote us that this piece of line had "suspended operation, disposition not certain." We have since learned that a bridge on this line was burned in May, 1918, and the lessee did not replace it, so that the line was not operated. It was incorrect to show the line as having been abandoned, and it is understood that the bridge is to be replaced shortly. The Cripple Creek & Colorado Springs leases the Colorado Springs & Cripple Creek District Railway, on which this piece of mileage is located.

### Decrease in Traffic Through Soo Canals

The total amount of freight moved through the canals at Sault Ste. Marie, Mich. and Ont., during 1918, amounted to 85,680,327 tons, or 4,133,571 (short) tons less than passed through these waterways in 1917. There was also a decrease of 3,349 passengers carried through the canals, or 9 per cent. The only commodity handled which showed an increase in tonnage was oil. In 1918, 334,134 tons of oil or 71,645 tons in excess of the amount carried in 1917, were transported through the canals. There were very heavy decreases in the tonnage of some commodities handled. The movement of wheat, for instance, was 34 per cent below that of 1917, while that of other grain was 54 per cent that of the previous year. Manufactured and pig iron showed a decrease of 62 per cent, stone 30 per cent, anthracite coal 14 per cent, lumber 15 per cent, copper 28 per cent and general merchandise 25 per cent.

### Labor Recruiting Conference

A conference will be held at the Railway Exchange building, Chicago, on January 20 and 21, to discuss ways and means of recruiting labor for railroads. Sanford H. E. Freund, director of the Clearance Division of the United States Employment Service, will preside. The meeting was called at the suggestion of Dr. P. L. Prentis, special representative of the United States Employment Service at Chicago. Among those who will speak are Mark L. Crawford, federal director of the United States Employment Service; C. A. Griswold, in charge of the labor employment service of the Chicago & North Western; M. G. Kibbe, local superintendent of the Railroad Division of the United States Employment Service at Chicago; James McDermott in charge of the employment of labor on the Chicago, Milwaukee & St. Paul; R. W. Nichols, labor agent on the Elgin, Joliet & Eastern, and W. W. Brown, central director of the United States Employment Service for Missouri. W. G. Bjerd, federal manager of the Chicago & Alton, is also expected to speak.

### Congestion at Seattle

At Seattle and other ports on Puget Sound the export freight waiting for vessels amounts to 5,780 carloads, according to a report in the Philadelphia Public Ledger. The Seattle Chamber of Commerce is investigating the situation, as the delay in forwarding the merchandise has piled up heavy insurance and other holding charges for which there can be no remuneration. Much valuable time has been lost, according to the Public Ledger, "in the kindergarten conducted by the railroad administration in transfusing sufficient foreign

trade knowledge into men accustomed only to bossing railroad switchmen and yardmasters to equip them as authorities in world commerce." It is hoped that before long "these men at least will have learned the names of the various bulk commodities moving across the Pacific. \* \* \* Working for new superiors, with policies to be built up out of nothing and with no predicate before them, these officials have feared to do and feared not to do." Ships have had to wait several days while the railroad men searched for the cars containing the freight for which they held contracts; but, says the report, transpacific rates have doubled and trebled within the last year, and the steamship lines have been quietly endeavoring to hand-pick the tonnage to move at the higher rate and to leave the low-rate merchandise that had been waiting for from ninety days to a year.

### Master Boilermakers' Association

The 1919 convention of the Master Boilermakers' Association will be held in Chicago May 26, 27, 28 and 29 at the Hotel Sherman. This will be the first convention since 1916, the association having suspended activities on account of the war. The subjects to be discussed at the convention, together with the committees, follow:

1. Proper method of threading radial stays and tapping the hole in the boiler for them.  
Is it necessary to give radial stays the same lead as the tap with which the holes were tapped?  
Committee: H. J. Raps, chairman, Andrew Hedberg, J. J. Keogh, J. B. Smith, T. J. Reddy.
2. Which is the better time for drilling tell-tale holes, before or after application of the bolts?  
Which is the better method for drilling in either case?  
What is the best style of drill for opening up tell-tale holes in old staybolts?  
Does it pay to use a high speed drill for this purpose?  
What is the best lubricant for the drill?  
Committee: L. R. Porter, chairman, A. N. Lucas, S. M. Carroll, Bernard Wulle, C. E. Erwin.
3. Effect of proper upkeep of ash pan and front end draft appliances on fuel economy.  
Method used in determining proper design for various classes of locomotives.  
Committee: George Austin, chairman, E. J. Nicholson, Fred Bayer, H. F. Weldin, George Hewitt.
4. What is the best method for scaling superheater flues in the boiler?  
What is the best method of rattling flues?  
What is the best method of handling flues in and out of the rattler?  
How many revolutions per minute should the rattler make for 2-in. and for 5 1/2-in. flues?  
Describe method for safe ending superheater flues.  
Committee: Frank Gray, chairman, W. J. Murphy, Andrew S. Green, John Harthill, J. J. Mansfield.
5. What is the best style grate for bituminous coal?  
Where should the dump grate be located, (a) in road engines, (b) in switch engines?  
What should be the percentage of opening in grates?  
What should be the percentage of draft opening in ash pans compared with area of grates?  
Committee: W. H. Laughridge, chairman, L. M. Stewart, T. P. Madden, C. P. Patrick, C. A. Nicholson.
6. What should be the minimum distance between the grates and the lower part of arch tubes for different classes of locomotives?  
What is the proper distance from the door sheet to the brick arch and from the crown sheet to the brick arch for the various classes of locomotives?  
Committee: C. L. Hempel, chairman, W. F. Fantom, A. E. Brown, E. W. Young, G. B. Usherwood.
7. What is the best method of bracing locomotive tenders? Describe method used.  
Committee: Thomas Lewis, chairman, E. J. Sweeney, J. J. Orr, J. P. Malley, J. T. Johnson.
8. Oxy-acetylene and electric welding.  
Committee: H. J. Wandberg, chairman, B. F. Sarver, L. M. Stewart, T. F. Powers, J. J. Davey.
9. What is the advantage of cutting off stay ends with oxy-acetylene over old method of nippers and chucks?  
Committee: W. S. Larason, chairman, John McGarrigal, J. B. Tynan, E. H. Hohenstein, A. E. Shaul.
10. General discussion.

### Chicago Union Station

Construction work on the new Union Station at Chicago is to be resumed immediately. Some contracts are about to be let on certain portions of the work and bids are being requested on other portions. The budgets for the work this year call for an expenditure of five or six million dollars by the Union Station Company and about \$3,000,000 by roads entering the Union Station on work incidental to the Union Station facilities. The program includes the depression of track between Van Buren and Twelfth streets to meet the grades outlined in the city ordinances, the rearrangement of tracks to permit the construction of viaduct foundations, the construction of the Harrison street viaduct, the east half of the Burlington freight house, the Polk street viaduct, the Canal street viaduct between Polk and Taylor streets, the

Taylor street viaduct, the elevation of Canal street between Taylor and Twelfth streets and the south half of the Twelfth street viaduct. Work will also be started on foundations for the head house, which are expected to be completed this year. There is some prospect of starting the work of elevating Canal street between Monroe and Jackson. Considerable work has already been completed on the Union Station facilities, most of which consists of the construction of sewers and conduits and the wrecking of buildings within the limits of the facilities. Approximately \$30,000,000 has already been spent in the purchase of property and for construction work already done. It is expected the work on the station will now be carried on to completion. It will furnish employment to several thousand men.

### Material Handling Machinery Manufacturers

At a meeting held at the Hotel McAlpin, New York, January 15 and 16, an organization was formed to be known as the Material Handling Machinery Manufacturers' Association. The object to be attained was that of bringing together the firms engaged in making machinery designed to handle all kinds of material, raw, fabricated or in packages. The list of members indicates the range of work covered.

James A. Shepard, president of the Shepard Electric Crane & Hoist Co., Montour Falls, N. Y., was appointed chairman of the meeting. A luncheon was served on January 16, at which the members were addressed by the Hon. William C. Redfield, Secretary of Commerce; Calvin Tompkins, former Commissioner of Docks, City of New York, and J. W. Frazier, of the U. S. Shipping Board.

After the luncheon, a Board of Governors was elected, consisting of the following:

C. M. Watson, Watson Elevator Co.  
William A. Clarke, Manning, Maxwell & Moore.  
R. W. Scott, Otis Elevator Co.  
F. W. Hall, Sprague Electric Works.  
Frederick Stadelman, Wellman, Seaver, Morgan Co.  
Lucian C. Brown, Elwell-Parker Electric Co.  
J. C. Walter, The Alvey-Ferguson Co.  
James A. Shepard, Shepard Electric Crane & Hoist Co.

The firms joining are:

The Alliance Machine Co., Alliance, Ohio.  
The Alvey-Ferguson Co., Cincinnati, Ohio.  
American Hoist & Derrick Co., St. Paul, Minn.  
Box & Co., Inc., Alfred, Philadelphia, Pa.  
Brown Portable Conveying Machinery Co., Chicago, Ill.  
Cleveland Crane & Engineering Co., Cleveland, Ohio.  
Clyde Iron Works.  
Elwell-Parker Electric Co., Cleveland, Ohio.  
Heyl-Patterson, Inc., Pittsburg, Pa.  
Heyward Co., New York.  
International Conveyor Corp., New York.  
Karry-Lode Industrial Truck Co., Long Island City, N. Y.  
Manning, Maxwell & Moore, New York.  
Shaw Electric Crane & Hoist Co., New York.  
Mead-Morrison Manufacturing Co., East Boston, Mass.  
New Jersey Foundry & Machine Co., New York.  
Ohio Locomotive Crane Co., Bucyrus, Ohio.  
Otis Elevator Co., New York.  
Charles A. Rohr, New York.  
Rowson, Drew & Clydesdale, Inc., New York.  
Shepard Electric Crane & Hoist Co., Montour Falls, N. Y.  
Sprague Electric Works, New York.  
Edward F. Terry, Manufacturing Co., New York.  
Watson Elevator Co., New York.  
Wellman, Seaver Morgan Co., Cleveland, Ohio.  
Whiting Foundry Equipment Co., Harvey, Ill.

### Sixth National Foreign Trade Convention

The National Foreign Trade Council will hold its Sixth National Foreign Trade Convention at the Congress Hotel, Chicago, on Thursday, Friday and Saturday, April 24, 25 and 26. The formal call will be issued shortly by the chairman of the council, James A. Farrell, president of the United States Steel Corporation.

In the past these conventions have drawn an increasingly large number of the prominent business men of the country, representing all forms of industry, commerce, finance and transportation. To these will now be added the representatives of labor. In this way the delegates are supplied with a broad view of the business situation, with specific information to meet their individual needs, and with advice and inspiration for the coming year.

The convention in April will deal with Foreign Trade as a Factor in Stabilizing American Industry—problems involving the conversion of war industries to the needs of peace; development of our foreign trade to provide employment for our soldiers, sailors, and war workers; and the formation of a definite policy dealing with the future of our new shipping.

## Traffic News

The terms of monthly commutation tickets, according to an announcement at Washington, must, after February 1, always begin and end with the calendar month.

The Transportation Club of Louisville, Ky., will hold its annual banquet on January 31. B. L. Winchell, Southern regional director, will be the guest of honor and will deliver an address.

The embargo on the delivery of freight to the Denver & Salt Lake, occasioned by a slide which closed the mouth of Tunnel No. 16 on that road about thirty days previously, was cancelled on January 14, when the line was again opened for traffic.

The Canadian Railway War Board has ordered embargoes on nearly all freight destined for Europe, because of congestion of freight at British and French ports. Exports from Canada to Europe have lately amounted to about 500,000 tons a month.

According to the Pittsburgh (Pa.) Post, 40 steel barges are to be built in that city, on contracts recently let by the government for operation on the Mississippi river between St. Louis and New Orleans. It is expected that work will be begun in the spring. The American Bridge Company has the contract for 25 barges and the Dravo Construction Company for 15.

The Canadian Railway War Board announces that freight cars of Canadian roads may now be allowed to go into the United States. During the pressure of the past year this use of Canadian cars has been forbidden. Arrangements have now been made with the United States Railroad Administration whereby Canadian cars will be promptly returned to their owners.

Proposals to divorce the meat packing companies from ownership of refrigerator or livestock cars, stock yards and other transportation and terminal facilities, as provided in bills now pending in Congress on the recommendations of the Federal Trade Commission were supported by the marketing committee of the American National Live Stock Association at hearings held in Washington last week before the House and Senate Committees on Interstate Commerce. It is proposed to require that these facilities be taken over by the Railroad Administration or by the railroad companies.

### National Industrial Traffic League

The spring meeting of the National Industrial Traffic League will be held at New Orleans on March 10, 11 and 12. The executive committee of the organization will convene on the first day and the remaining two days will be devoted to the program of the league as a whole. The demurrage rules which have been reconfirmed by the Committee on Car Demurrage and Storage of the League and the Special Committee on Relations of the American Railway Association will be presented for ratification.

### Uniform Rates for Storage of Freight

The non-federal railroads—or 177 of them—have issued a new storage tariff for freight—"Uniform storage tariff No. 1"—effective February 15, and have filed it with the Interstate Commerce Commission and 37 state commissions—a good example of economy in printing. This tariff is issued by J. E. Fairbanks, 75 Church street, New York (secretary of the American Railway Association) as agent for all of the roads, and was adopted by special permission of the Interstate Commerce Commission, without reference to present or past storage tariffs, for the purpose of establishing uniformity as between these small roads and those operated by the government, which latter also use the same rules. Forty-eight hours is the standard free time, after which the normal rate, each day, for the first five days, is two cents per 100 lb. (minimum charge 25 cents); after that three cents a day (minimum 50 cents).

## Commission and Court News

### Interstate Commerce Commission

The term of James S. Harlan, member of the Interstate Commerce Commission, who has held that office since 1906, expired on December 31, but the president has not sent to the Senate any nomination of a successor.

The Hocking Valley, the Kanawha & Michigan and the Kanawha & West Virginia have filed petitions for rehearing of the order of the commission in the standard time zone case to the end that the dividing line between the Eastern and Central time zones as fixed by the commission may be so modified as to place those lines of railroad within the Central time zone, or to enable them to operate under the Central standard time. A rehearing has been granted and will be held before Examiner John T. Money at Columbus, Ohio, on January 27. The Toledo Commerce Club has petitioned for a rehearing to the end that the city of Toledo, Ohio, which is located on the zone boundary line between the Eastern and Central zones, shall be considered as within United States standard Eastern time zone. Public hearing will be held before Examiner John T. Money at Toledo, on January 28.

### Personnel of Commissions

Captain George F. Daggett has been appointed chief of the Transit Bureau of the New York State Public Service Commission, first district, in place of J. P. H. DeWitt, resigned. The chief of the Transit Bureau supervises the operations of transportation lines in New York City, and his salary is \$6,000. Captain Daggett has been in military service for the past twelve months, but before that had been in the employ of the commission for about ten years.

### State Commissions

The New York State Public Service Commission, First District, in its annual report, presented this week to the legislature, says that during the past year the new track put in use on elevated and subway rapid transit lines in New York City aggregates 63 miles. The cost of these new lines aggregated \$103,000,000, not including the cost of cars; and it is anticipated that by the end of 1919 the total length of track in operation on these lines in the city will amount to 600 miles. Securities issued during 1918 by city transit lines and by gas companies in New York City, and authorized by the commission, amounted to \$64,220,500. Included in the lines of rapid transit now under construction, and to be completed in 1919 are two additional tunnels between Manhattan and Brooklyn—the Clark street tunnel, and the Whitehall-Montague street tunnel. The Clark street line will be operated by the Interborough Rapid Transit Company and the other by the Brooklyn Rapid Transit Company.

### Court News

Arguments were heard before the Supreme Court of the District of Columbia at Washington on January 4 on the application of the Kansas City Southern for a writ of mandamus to compel the Interstate Commerce Commission to take testimony regarding the present cost of condemnation and damage or of purchase in excess of original cost and the present value of lands belonging to the company.

### Bonds and Stock Certificates Not Baggage

The New York Appellate Division holds that a sleeping car company is not liable to a passenger for the loss of stocks and bonds contained in a handbag lost through its negligence, as they are not baggage.—*Jandorf v. Pullman Co.*, 171 N. Y. Supp. 321. Decided June 27, 1918.

## United States Supreme Court

### Courts Must Inquire Into

#### Reasonableness of City Fare Ordinance

The United States Supreme Court on January 13, by a vote of six to three, decided for the plaintiff in the case of the Detroit United Railway against the City of Detroit.

The case came up on appeal from the District Court for the Eastern District of Michigan, which had dismissed proceedings instituted by the railway company to restrain the enforcement of a city ordinance which sought to fix the rate of street car fares in Detroit. The ordinance was passed by the City Council after it had refused the company permission to increase its fares.

It was contended by the company that the rates sought to be established were confiscatory. The city authorities challenged this contention. The district court in dismissing the proceedings did not go into the merits of the case.

In the present decision, by Justice Day, the decree of the district court is reversed with costs, and a new trial is ordered. Justices Clarke, Holmes and Brandeis dissented.

The court holds that a public service corporation is entitled to a reasonable return on its investment and that the district court should have heard the case on its merits and decided whether the Detroit city ordinance would or would not enable the company to get a legal return on its investment. The company sought to increase its fares after the War Labor Board had raised the maximum wage rate for the company's employees from 40 to 48 cents an hour and had recommended an advance in fare to meet the increased operating expense due to the war. It was the contention of the company that the War Labor Board's award added about \$2,000,000 annually to its financial burdens and would prevent it from earning a fair return on its investment.

### Reed Amendment Sustained

In a suit brought against D. Hill, charged with taking a quart of liquor into West Virginia, the United States Supreme Court, on Monday, January 13, held valid the federal law, known as the Reed Amendment, forbidding the interstate transportation into "dry" states of any or all intoxicating liquor for beverage purposes, even when intended for personal use. This decision overrides the provisions of state statutes permitting limited amounts of liquor to be taken into a state for personal use. The case was remanded for a new trial. Justice McReynolds, in a dissenting opinion, concurred in by Justice Clark, declared the Reed amendment was not a regulation of interstate commerce, but a direct intermeddling with a state's affairs, and beyond federal power.

### Webb-Kenyon Law Sustained

To avoid penalties sought to be imposed upon it for illegally carrying intoxicating liquors from another state into Kansas, the Missouri Pacific asserted that as the provision of the federal Constitution exacting a two-thirds vote of each House to pass a bill over a veto means a two-thirds vote, not of a quorum of each House, but of all the members of the body, the Webb-Kenyon Act was never enacted into law, because after its veto by the President it received in the Senate only a two-thirds vote of the senators present (a quorum), which was less than two-thirds of all the members elected to and entitled to sit in that body.

The Supreme Court of the United States, by U. S. Chief Justice White, says, in part, that in consequence of the identity in principle between the rule applicable to amendments in the Constitution and that which controls in passing a bill over a veto, the rule of two-thirds of a quorum has been universally applied as to the two-thirds vote essential to pass a bill over a veto. In both cases the continued application of the rule was the result of no mere formal following of what had gone before, but came from conviction expressed, after deliberation, as to its correctness by many illustrious men. . . . In the absence of an express command to the contrary the two-thirds vote of the House required to pass a bill over a veto is the two-thirds of a quorum of the body as empowered to perform other legislative duties. Judgment against the appellant railroad was affirmed.—*Missouri, Pacific v. Kansas*. Decided January 7, 1919.

## Foreign Railway News

The Argentine Government has refused a request of the railway companies for authorization to institute an all-round increase of 10 per cent in tariffs.

The International Sleeping Car Company announced the inauguration on December 15 of sleeping car services from Paris to Strasbourg and from Paris to Metz, both leaving Paris at 8 p. m.

The Northern Railway of France recently issued a statement showing the systematic destruction of the tracks by the Germans, right up to the signing of the armistice, and pointing out that 1,731 bridges, 330 stations, practically the whole of the telegraph and telephone wires and the water supplies have been destroyed.

Recently published figures prepared by the Division of Statistics of the Bureau of Foreign and Domestic Commerce show that for the calendar year 1917, the United States exported locomotives to the number of 1,840, valued at \$31,072,336, railway cars to the value of \$25,745,007, and machine tools to the value of \$60,170,724.

The Roumanian Government is reported to have set aside a sum of \$1,000,000 for the construction of a railway line to connect the northern part of Moldavia and the north of Bessarabia. The new line will join Lipcani, Radantzki and Dangeni. Northern Moldavia possesses great natural resources which have been but little developed hitherto. During the war this district provisioned the whole of the Roumanian army. The government, it is stated, will do everything possible to hasten the completion of this new line.

The Military General Direction of Warsaw has given its assent to the commencement of the preliminary work for a new railway between Memel-Telschi-Schaulen, which, branching off from the Northern German station at Bajohren, will run as a standard gage railway and enclose the whole of the former government of Kovno. The preliminary work, towards which the town and district of Memel and the Eastern German Railway Company have subscribed 120,000 marks, has already proceeded as far as a survey of the line. It is not yet known whether the line will be private or state-owned.

### Structural Material Specifications for Latin America

Two more numbers of the Industrial Standards series now being issued by the Bureau of Foreign and Domestic Commerce are ready for delivery: No. 3, Standard Specifications for Open-Hearth Steel Girder and High Tee Rails, and No. 4, Standard Specifications for Low-Carbon Steel Splice Bars. These specifications are printed in Spanish and English, and are published to meet a demand from South American firms for information that will enable them to specify American structural materials. The text is that adopted by the American Society for Testing Materials, and is published in co-operation with the American Society of Civil Engineers and the Bureau of Standards, Department of Commerce. Copies can be purchased at 5 cents each from the Superintendent of Documents, Government Printing Office, Washington, D. C., or from any district or co-operative office of the Bureau of Foreign and Domestic Commerce.

### Allies to Take Over the Trans-Siberian

Announcement was made by the State Department Tuesday to the effect that an understanding has been reached in Tokio for joint allied control of the Chinese Eastern and Trans-Siberian Railroads.

Complete details regarding the understanding have not reached Washington and will not be obtainable until the Japanese Ambassador submits the text of the proposed plan.

The official announcement issued by Acting Secretary of State Pook said:

"The State Department has been advised that an understanding has been reached in Tokio regarding the proposed restoration of the efficiency of the Trans-Siberian Railway, including the

Chinese Eastern Railway, and that the proposed plan will be submitted to this government through the Japanese ambassador in Washington.

"In brief, the proposal is that there shall be an interallied committee under the presidency of a Russian, this committee to consist of one representative of each of the following nationalities: Russia, China, Japan, United States, Great Britain, France and Italy. Under this committee there will be established two boards—first, a technical board, on which Mr. Stevens will serve, and, second, a military board."

John F. Stevens has been serving as chairman of the Stevens Railway Commission of five members, all of whom, except Mr. Stevens, returned to this country some time ago, which was sent to Russia in 1917. Mr. Stevens has been serving in a supervisory capacity over the members of the Russian Railway Service Corps, composed of American engineers and railway men sent to Siberia to help rehabilitate the Russian railway system.

### The Present Position of German Rolling-Stock

In almost every direction, says an article in a recent issue of *Engineering* (London), Germany finds herself in a most serious plight, and the shortage and disrepair of rolling-stock is not the least important factor. Before the war Germany had about 700,000 freight cars and 30,000 locomotives. The number of the latter, as of the former, has certainly been increased during the war, through seizures in Belgium and France; but on the other hand some 4,000 locomotives may be looked upon as at least temporarily unavailable, being at present stranded in often remote occupied territory. As far as a portion of these 4,000 engines is concerned, it is doubtful whether they will ever return. Some 8,000 locomotives are badly in need of repair. Thus the 5,000 locomotives which have to be handed over, according to the terms of the armistice, represent about one-fourth of those available, and efficient. Apart from this there is some doubt as to whether or not the locomotives of the Alsace-Lorraine State railways are included in the above 5,000 engines. The proportion of increase and decrease as regards freight cars may be taken to be about the same as with the locomotives. The question then remains to what extent German works will be able to make good the compulsory surrender of these 5,000 engines, for of the purchase of locomotives from abroad there can be no question at present. The capacity of the German locomotive factories is at the present moment, with some reserve, put at 2,500 large locomotives per annum. This estimate, of course, is subject to sufficient raw materials and other necessities being available as well as a sufficiency of skilled and trained and willing labor. If it really were possible satisfactorily to overcome these and other difficulties, and also in other ways to return to an ordered state of affairs, and entirely to ensure and rely upon the large left-Rhine production of raw materials for the whole reconstruction period, it would take the German railways two or three years to recover from the blow which their defeat has entailed. During this considerable period German industry would be entirely debarred from export of full-size locomotives and confined to narrow-gage engines, of which it can supply some 1,500 in the year. The position is made additionally difficult, because Germany has to deliver up efficient locomotives, so that those which remain include all those more or less unfit for use. The repair of these, in addition to that of the 8,000 locomotives referred to above, will be very difficult to effect, but as the State railways are compelled to exercise the greatest economy these repairs will probably first be proceeded with.

It is being suggested in Germany that firms which have not formerly gone in for the building of locomotives, of which the majority have been engaged in war work, might with advantage take up the manufacture of locomotives, as the Allgemeine Elektrizitäts-Gesellschaft already has done.

As regards the building of freight cars the capacity of the German works during the last few months of the war has been put at 50,000 per annum. In case all necessary raw materials which are nearly all produced within the country, be made available and the industry not be handicapped by other adverse circumstances, the above-mentioned capacity might perhaps be increased by 50 per cent. Even then it will take Germany three years to replenish her stock of freight cars. In view of the eight hours movement it is deemed likely that the cost per ton of locomotive and car weight for some considerable time to come will remain at something like the present high figures.

# Equipment and Supplies

## Locomotive Deliveries

A total of 43 new locomotives were shipped to railroads under federal control during the week ending December 28, as follows:

Works	Road	Number	Type	Individual engine No.
American	*Grand Trunk	9	USRA Mikado	471-9
	*Southern	12	USRA Santa Fe	5229-40
	C. & N. W.	2	Mikado	2477, 2480
	Penna. L. W.	3	USRA 6w. Sw.	8935-37
	S. A. L.	2	USRA 6w. Sw.	1094-5
	C. Ind. & L.	5	USRA Mikado	550-4
	Total	33		
Lima	N. Y. C.	5	USRA Mikado	5183-87
Baldwin	Phila. & R.	1	Mallet	1814
	A. T. & S. Fe.	2	Mikado	3225-26
	Penna. R. R.	1	Mikado	2861
	Red River & G.	1	10w. Sw.	103
		5		
	Grand total	43		

\*Four U. S. R. A. Mikados constructed for the Grand Trunk were shipped to Buffalo, and five U. S. R. A. Mikados, constructed for the Grand Trunk, were shipped to Cleveland, and four U. S. R. A. Santa Fe, constructed for the Southern, were shipped to Potomac Yards, Va., to be stored as parts of emergency pools.

Locomotives were shipped to railroads under federal control during the week ended January 4 as follows:

Works	Road	No.	Type
American	Oregon Short Line	5	USRA Mikado
	*Southern	9	USRA Santa Fe
	*C. & N. W.	4	USRA Mikado
	Union Pacific	6	USRA 6 W. Sw.
	Seaboard Air Line	2	USRA 6 W. Sw.
		Total	26
Lima	N. Y. C.	4	USRA Mikado
Baldwin	C. B. & O.	2	Mikado
	Illinois Central	1	Mikado
	Atlantic Coast Line	1	Mikado
	Lehigh Valley	1	Pacific
	B. & O.	7	USRA Mikado
	Penn. R. R.	1	Mikado
		13	
	Grand total	43	

\*Nine U. S. R. A. Santa Fes constructed for the Southern, and three Mikados constructed for the Chicago & North Western were shipped to Potomac Yards, Va., to be stored as parts of an emergency pool.

## Locomotive Deliveries in December

The following is a statement of the number of locomotives shipped to railroads under federal control during December:

Works	For week Dec. 1 to 7			For week Dec. 8 to 14			For week Dec. 15 to 21			For week Dec. 22 to 28			For period Dec. 29 to 31			
	Road	No.	Type	Road	No.	Type	Road	No.	Type	Road	No.	Type	Road	No.	Type

									Grand total		252					

In addition to the above the American Locomotive Company shipped 28 miscellaneous domestic locomotives, and completed 10 foreign locomotives; and the Baldwin Locomotive Works shipped 1 miscellaneous domestic and completed 167 foreign locomotives.

## Cars Built in Railroad Shops

The Railroad Administration has issued the following statement of new cars constructed in railroad shops during the month ended November 30, 1918:

Class of Cars	Steel	Steel under-frame	Steel center sills	Wood	Total
Passenger:					
Dining observation	2	...	...	...	2
Passenger coach	1	...	...	...	1
Passenger baggage	1	...	...	...	1
Baggage	1	...	...	...	2
Milk	...	...	...	1	1
Total passenger equipment	5	...	...	2	7
Freight:					
Stock	...	...	...	70	70
Hopper	...	...	...	133	133
Gondola	46	...	...	23	69
Flat	...	...	...	3	3
Coke rack	8	...	...	6	14
Work cars	3	...	...	3	3
Caboose	30	...	...	5	35
Box	255	20	...	126	401
Total freight equipment	255	107	...	366	728
Total passenger and freight	255	112	...	368	735

## Freight Cars

THE INGERSOLL-RAND COMPANY, Phillipsburg, N. J., is inquiring for one all steel side dump car.

THE UNITED STATES NAVY DEPARTMENT, Washington, is inquiring for 4 all steel, 50-ton hopper cars, and 6 all metal push cars.

THE PENNSYLVANIA EQUIPMENT COMPANY, 1420 Chestnut street, Philadelphia, Pa., is in the market for 6 second-hand, 30 to 40-ton flat cars of good length.

THE PENNSYLVANIA EQUIPMENT COMPANY, 1420 Chestnut street, Philadelphia, Pa., is in the market for several second-hand, standard gage, hand operated, 30 or 40 ton capacity dump cars, with inverted V shape floor.

## Machinery and Tools

THE CHICAGO & ALTON has issued an inquiry for machine tools, the list including among others the following:

- One 16-in. Norton toolroom lathe.
- One 16-in. by 8-ft. portable geared head lathe.
- Two 24-in. heavy duty lathes
- Two 36-in. heavy duty lathes.
- Two 18-in. heavy duty lathes.
- One 18-in. crank slotter.
- Two 60-in. vertical drilling machines.
- One 5-in. forging machine.
- Two 32-in. crank shapers.
- One 100-in. heavy tire boring mill with two heads.
- One 36-in. vertical boring and turning mill.
- One 48-in. boring mill with two heads on cross-rail.
- One 48 by 36-in. by 10-ft. planer.
- One 42 by 36-in. by 16-ft. extra heavy frog and switch planer.
- One electric traveling crane and other items.

THE CHICAGO & NORTH WESTERN is expected to issue shortly an inquiry for machine tools.

## Supply Trade News

Ensign Irving Burrows has been released from service in the navy and will reopen the San Francisco (Cal.) office of the Blaw-knox Company within the next two weeks.

Edward D. Hillman, secretary and engineer of the National Railway Appliance Company for the past two years, resigned from that company January 1, and has accepted a position with the new Consolidated Steel Corporation, 165 Broadway, New York.

Joseph B. Weaver, vice-president and general manager of the Harlan & Hollingsworth Corporation, Wilmington, Del., has been appointed vice-president in charge of the manufacturing department of the Pullman Company with headquarters at Chicago.

Kenneth C. Gardner has been appointed assistant manager of sales for the Central district of the Pressed Steel Car Company, with headquarters at Pittsburgh, Pa., vice Henry P. Hoffstot, who has resigned to become president of the Koppel Industrial Car & Equipment Company.

A. A. Heller, treasurer and general manager of the International Oxygen Company, has given up his active managerial duties, and Eugene Schoen has been appointed general manager for the company. Mr. Hiller, as treasurer, continues in charge of the financial departments of the business.

To the list of specialties for standard cars and locomotives, published in the January 3 issue of the *Railway Age* on page 91, should be added the J-M Slip-Type expander ring for brake cylinders for all cars, locomotives and tenders. These rings are manufactured by the H. W. Johns-Manville Company, New York.

W. Jerry Stanton has resigned as sales manager of the Railway Improvement Company to become special representative of the National Railway Appliance Company, New York. Mr. Stanton was employed by the General Electric Company for a period covering 18 years in the testing, engineering and sales departments.

The Vanadium-Alloys Steel Company of Pittsburgh and Latrobe, Pa., maker of high speed and alloy tool steels, has leased commodious offices and warerooms at 566-568 West Randolph street, Chicago, where will be carried a large stock of "Red Cut Superior" high speed steel in all the standard sizes and shapes of bar stock, also treated bits for tool holders.

W. J. Austin, vice-president and general manager of the Austin Company, Cleveland, Ohio, sailed recently for a tour of France, Belgium, Italy and England. While the trip was undertaken primarily for the purpose of developing the export business of his company, Mr. Austin will study the reconstruction methods employed in those European countries with the expectation of collecting information which can be used to good advantage here. He will return about the middle of February.

Lieutenant T. W. Jenkins, U. S. N. R. F., has been appointed manager of railway sales of the American Rolling Mill Company, effective January 1. Previous to the entry of the United States into the European war, Mr. Jenkins was in charge of sales of castings and forgings for this company. When the war broke out he was given indefinite leave to re-enter the navy, from which he had resigned in 1913. Lieutenant Jenkins served as an engineering officer on the navy transports throughout the war. Upon cessation of hostilities he was relieved from active duty to return to the commercial field.

The Guaranty Trust Company of New York announces that in line with its policy to help develop American trade overseas, and to extend the financial facilities whereby American bankers, importers, exporters, and manufacturers may transact direct business with foreign countries, it is about to send two more repre-

sentatives abroad—one to the Scandinavian countries (Norway, Sweden and Denmark) and the other to Australasia (Australia and New Zealand). These representatives will be pleased to communicate with institutions and firms desiring to make new connections or to increase the business they already command in the above countries. Letters for business relating to Scandinavian countries should be addressed "attention of Mr. N. Falk," and for business relating to Australasia "attention of Captain Lionel Lehmaier."

W. C. Lincoln has been appointed engineer for the National Railway Appliance Company, New York, effective January 1. Mr. Lincoln was originally employed by the American Locomotive Company at Schenectady, leaving that company's service to enter Union University. After graduation and the completion of the General Electric Company's test course, he was assigned to special railway work by that company. Subsequently he took up and completed the engineering extension course, after which he was connected for some time with the consulting engineering department. Mr. Lincoln later entered the railway engineering department and in 1913 was transferred to the General Electric Company's Philadelphia district as commercial engineer, railway department, after which he entered the service of the Railway Improvement Company as electrical engineer.

Lloyd O. Stratton, who has been connected with the Oregon Short Line motor car department as a foreman at Pocatello, Idaho, has been appointed western manager for

L. O. Stratton

Mudge & Co. at San Francisco, Cal. Mr. Stratton was born at Guide Rock, Neb., on January 2, 1888, and was educated in the public and business schools at Grand Island, Neb. In August, 1911, he entered the service of the motor car department on the Union Pacific, with which road he remained until April, 1914, when he went to the Oregon Short Line as motor car foreman at Pocatello, Idaho. For the past seven years Mr. Stratton has been identified with the motor car industry and in

connection with his recent appointment as western manager for Mudge & Co. he will have charge of the sales and service departments for that company in the Pacific states with office in the Crocker building, San Francisco, Cal.

Capt. A. Fletcher Marsh of the Construction Division of the army has resumed his duties as secretary of the Marsh & Truman Lumber Company, Chicago. Captain Marsh received his commission almost simultaneously with the entrance of this country into the war and was employed to supervise lumber production and transportation in the interests of the army. During the first five months of his service he was stationed in the Atlantic states south of Washington, D. C., where he was employed on lumber production work. He was later transferred to New Orleans, La., and Birmingham, Ala., where he supervised the transportation of lumber to eastern points. Latterly he was located on the Pacific coast, where he engaged in similar work. Lieut. E. R. Ross of the artillery branch of the army, and Lieut. F. L. Bronez of the American flying forces, have also returned to their former positions with the Marsh & Truman Lumber Company. They are both members of the sales organization.

Charles H. Wilson, who has been in active military service in France as a lieutenant of engineers, has been honorably discharged from the army and has resumed his duties as representative of Fairbanks, Morse & Co. He was one of the survivors of the U. S. S. "Lincoln," which was sunk by

the Boche submarine U-90, 400 miles off Brest, France, while on return trip to the United States. During his service with the American Expeditionary Forces Lieut. Wilson, who was a reserve officer prior to the entry of this country in the world war, was attached to the British tank corps as mechanical officer and was later with the U. S. tank corps. On his return he was assigned for duty in the organization of tank corps units here, afterwards being on duty with engineer replacement troops. Prior to his entry into military service Mr. Wilson was located in Houston, Texas, as southwestern representative for Fairbanks, Morse & Co., with which company he has been associated for 14 years. He will now make his headquarters at the St. Louis office.

The Klaxon Company, manufacturer of the Klaxon horn, announces its entry into the railway intercommunication field. It has taken over the Stentor Electric Manufacturing Company, maker of loud speaking railway telephones, and in the future will manufacture and distribute the Stentor products through its industrial division with office in New York City. During the war all of the intercommunication apparatus manufactured by this company was required by the United States Government. To meet navy requirements for dependable means of communication under severe noise conditions, this company developed a transmitter and a receiver that have given satisfactory service even under gunfire. The Klaxon-Stentor loud speaking railway telephones are equipped with these improved transmitters and receivers. They transmit messages in so loud and clear a tone that they can be heard at a distance from the instrument. The railway train dispatcher who has one on his desk need not wear a head receiver. The Klaxon Company is extending its laboratory facilities for experimental and research work and has already put to work several engineers of wide experience in this field. It has engaged the services of one of the foremost authorities in telephony and sound reproduction in the United States and the inventor of the Stentor loud speaking telephones will devote all his time to development work on intercommunication apparatus. The Stentor apparatus was described in the *Railway Age Gazette* of July 31, 1914, page 214.

## Trade Publications

**PNEUMATIC HAMMER.**—A six-page folder describing in detail the construction and operation of the Barr pneumatic high speed hammer has been published by H. Edsill Barr, engineers, Erie, Pa.

**TURRET LATHES.**—The Gisholt Machine Company, Madison, Wis., has issued a 102-page catalogue, TLC-1, describing Gisholt turret lathes. It was the purpose in preparing this catalogue to show particularly what kinds of work these lathes will do. It contains over 100 illustrations, including a number of close-up views of the lathes actually at work, followed by 22 pages of line drawings showing parts which are successfully finished on Gisholt lathes; the time for finishing these parts is given under each drawing. A general description of the machine is also given, together with specifications and dimensions, and the last part of the book is devoted to standard tools for the lathes, boring bars, reamers, tool holders and chucks. The turret on carriage and gap lathes, as well as the motor driven lathes, are illustrated and described.

**CAR HEATING DEVICES.**—The Gold Car Heating & Lighting Company, New York, has issued circulars describing the construction and operation of car heating apparatus which the company has recently developed. These are a vapor valve, No. 1112, designed for application on the inside of the car; packless end valve No. 1126, with automatic drip in the valve itself; packless quick opening single and twin supply valves, Nos. 1140 and 1145, respectively, which open and close on a quarter turn; and pop valve No. 1137, a train line safety valve designed to prevent the blowing off of the steam hose in case of excess pressure, and also successfully used as a safety valve for hot water circulating systems. Circulars have also been issued describing other Gold devices, including a combination gasket tool No. 1077, for use in applying and removing coupler gaskets; a pressure regulator with a large steam capacity for long passenger trains, No. 1014; steam hose coupler No. 804-S, with oscillating gasket; and steam hose coupler gasket G-4, for use in steam hose couplers using non-oscillating gaskets.

# Railway Officers

## Railroad Administration

### Central

**Charles B. Eddy**, heretofore assistant general counsel to the United States Railroad Administration, has been appointed associate director of the Division of Finance.

**Theodore H. Price**, who resigned on January 1 as actuary of the Railroad Administration to return to his business in New York, has decided to retain his position with the Railroad Administration, but will devote less of his time to that work.

In the chart of the organization of the Railroad Administration published as a supplement with the issue of December 20, **J. A. Middleton** was erroneously included as manager inland traffic, oil division of the Fuel Administration. **O. M. Conley** succeeded Mr. Middleton in this office on October 1.

**T. C. Powell**, formerly vice-president of the Queen & Crescent and traffic vice-president of the Southern Railway, and, during the past year, manager of inland traffic, representing the Railroad Administration on the War Industries Board, has been appointed director of the Division of Capital Expenditures, succeeding **Judge R. S. Lovett**. Mr. Powell was also a member of the priorities committee of the War Industries Board.

### Federal and General Managers

The Gulf, Texas & Western has been added to the jurisdiction of **J. L. Lancaster**, federal manager, with headquarters at Dallas, Tex., effective January 10.

The Missouri, Oklahoma & Gulf has been placed under federal control and has been added to the jurisdiction of **L. Kramer**, federal manager, St. Louis, Mo.

**S. G. Strickland**, federal manager of the Chicago & North Western, with headquarters at Chicago, has had his jurisdiction extended to include the Sioux City Terminal Railroad.

**E. E. Calvin**, federal manager of the Union Pacific, the Oregon Short Line and the Los Angeles & Salt Lake has had his jurisdiction extended over the Gilmore & Pittsburg, with headquarters at Omaha, Neb.

### Operating

**J. M. Ward** has been appointed agent and superintendent of the Lawrenceville Branch Railroad, at Lawrenceville, Ga., vice **W. H. Cheney**, assigned to other service.

**C. H. Dyson** has been appointed fuel agent of the Baltimore & Ohio—Western Lines; the Dayton & Union Railroad, and the Dayton Union Railroad, with headquarters at Cincinnati, O.

**C. T. Mason**, assistant superintendent of the St. Louis-San Francisco, at Springfield, Mo., has been appointed assistant superintendent of the Willow Springs and Memphis subdivisions of the Ozark division, with headquarters at Thayer, Mo., vice **T. F. Gaines**, assigned to other duties.

**H. A. Shepard**, assistant superintendent of telegraph on the New York, New Haven & Hartford, at New Haven, Conn., has been appointed superintendent of telegraph of that road, the Central New England, the Wood River Branch Railroad, the New York Connecting Railroad, the Narragansett Pier Railroad and the Union Freight Railroad, vice **N. E. Smith**, deceased.

**W. E. Brooks**, general superintendent on the Missouri Pacific with headquarters at St. Louis, Mo., has been transferred to the Southern district of that road and the Memphis, Dallas & Gulf, with headquarters at Little Rock, Ark., succeeding **J. W. Dean**, deceased. **J. A. Somerville** has resigned as assistant manager of the Car Service Section at Washington and has returned to his former position as general

superintendent of transportation on the Missouri Pacific, the Memphis, Dallas & Gulf, the Arkansas Central, the Natchez & Southern and the Natchez & Louisiana, with headquarters at St. Louis, Mo., succeeding J. Cannon, who resumes his former position as general superintendent of the Eastern district of the Missouri Pacific, with headquarters at St. Louis, effective January 11.

### Traffic

The Southern Freight Traffic Committee, Atlanta, Ga., announces the appointment of F. L. Speiden as agent of the Louisville Traffic Bureau, effective January 8, succeeding M. P. Washburn, deceased.

J. H. Lyman, freight service agent of the Chicago Great Western at St. Joseph, Mo., has been appointed general agent, freight department, with headquarters at Minneapolis, Minn., succeeding R. W. Goodell, who resigned to engage in another business. F. H. Byers, general agent at Leavenworth, Kan., has been appointed freight service agent at St. Joseph, Mo., to succeed Mr. Lyman, effective January 1.

### Engineering and Rolling Stock

S. E. Shoup, assistant engineer of the Kansas City Southern, at Kansas City, Mo., has been appointed engineering assistant to the general manager.

J. C. Hill has been appointed division engineer of the St. Louis district of the Missouri, Kansas & Texas, with headquarters at Sedalia, Mo., succeeding B. E. Wilber, resigned.

J. B. Lamb, supervisor of the signal department on the Southern Railroad, at Washington, D. C., has been appointed signal and electrical engineer of the Southern Railroad Lines East, with headquarters at Charlotte, N. C., succeeding W. J. Eck, promoted.

George W. Dittmore, division car foreman of the Delaware & Hudson, at Carbondale, Pa., has been appointed master car builder of that road, the Greenwich & Johnsonville, the Wilkesbarre Connecting Railroad and the Schoharie Valley Railroad, with headquarters at Colonie, N. Y. The position of assistant master car builder has been abolished.

Clark Dillenbeck, who has been appointed assistant chief engineer of the Philadelphia & Reading, the Central of New Jersey, the New York & Long Branch, the Atlantic City Railroad and the Port Reading Railroad, with headquarters at Philadelphia, Pa., as has already been announced in these columns, was born on June 24, 1866, at Palatine Bridge, N. Y. He was educated in the public schools, later graduating from Canajoharie Academy and in 1888 he graduated as a civil engineer from Cornell University. Mr. Dillenbeck began railway work in May, 1890, as an assistant engineer on the Philadelphia & Reading, and has since served continuously with that road. In January, 1914, he was appointed engineer of bridges and buildings, and now becomes assistant chief engineer of the roads mentioned above.

F. E. King, district carpenter on the Northern division of the Chicago, Milwaukee & St. Paul, with headquarters at Minneapolis, Minn., has been transferred to Chicago, succeeding A. Yappen, promoted as noted in last week's issue. The authority of F. E. Rice, who has also been serving as district carpenter at Minneapolis, will be extended to cover the territory recently under the direction of Mr. King.

C. Dillenbeck

### Purchasing

N. C. Foss, purchasing agent of the Ann Arbor, has been appointed assistant purchasing agent of that road, the Pere Marquette, the Detroit & Toledo Shore Line, the Grand Trunk Western Lines, the Detroit & Mackinac, the Detroit, Bay City & Western, the Port Huron Southern, the Port Huron & Detroit, the Fort Street (Detroit) Union Depot Railroad, and the Lake Michigan Car Ferry Association. He will assist in the purchasing of coal, materials and supplies, and will have headquarters at Detroit, Mich. M. M. Drake has been appointed assistant purchasing agent of the above roads, in charge of stores, with office at Battle Creek, Mich.

### Corporate

#### Executive, Financial, Legal and Accounting

Carl R. Gray, whose resignation as director of the Division of Operation of the United States Railroad Administration became effective on January 15, has been re-elected to the railway positions from which he resigned upon assuming his duties at Washington. These include the presidency and chairmanship of the board of the Western Maryland Railway Company and the chairmanship of the Wheeling & Lake Erie. Mr. Gray was also re-elected a director of both of these companies.

A. J. Earling, chairman of the board of directors of the Chicago, Milwaukee & St. Paul, with headquarters at Chicago, has retired on account of ill health. His resignation took effect on November 1, when R. M. Calkins was elected president and took over his duties, but no public announcement of the fact was made until January 10. Mr. Earling is 71 years of age and has spent 52 years, his entire railroad career, with the St. Paul. During the 18 years which ended in September, 1917, Mr. Earling was president of the St. Paul and since that time has been chairman of the board. During his tenure of office as president the mileage of the road increased from 6,337 to 10,510. The road was likewise transformed from a midwestern to a trans-continental line through the construction of the Puget Sound extension. The electrification of a large portion of the trans-mountain section of this line constituted a daring venture in railroad construction. A photograph and an extended account of Mr. Earling's railway career were published in the *Railway Age Gazette* of September 21, 1917.

### Obituary

William Riley, formerly general roadmaster on the Chicago & Alton, the Chicago, Indiana & Southern and the Indiana Harbor Belt, died at Chicago on January 10, at the age of 71.

Henry C. Kline, division passenger agent of the Wabash at Chicago, died at his home in that city on January 11, following an illness of two months with influenza. Mr. Kline was 62 years of age and had been connected with the Wabash for 35 years.

John Atlee, division engineer of the Pennsylvania Railroad, with headquarters at West Philadelphia, Pa., fell from the platform of a train at the West Philadelphia Station and was instantly killed, on January 9. Mr. Atlee had been in the service of the Pennsylvania Railroad for 16 years and was 45 years old at the time of his death.

W. H. Higgins, signal engineer of the Central of New Jersey since 1901, with headquarters at Elizabeth, N. J., died on January 15 at his home in Jersey City, N. J., at the age of 61. Mr. Higgins began railway work when about 17 years old with the Pennsylvania Railroad in the telegraph department. He subsequently had charge of the electric lighting and interlocking on that road at Jersey City. In 1901 he went to the Central of New Jersey as signal engineer, which position he held at the time of his death. Mr. Higgins superintended the construction of block signals on practically the whole of the important passenger lines of the Central of New Jersey.

## Railway Age

# EDITORIAL

From time to time the Railroad Administration has made announcement of the "advances" which it has made to the

railroad companies. Many of these so-called advances are simply due or overdue rental. The Administration has the excuse that the contracts between the railroad companies and the

### Advances to Railroads versus Slow Pay

government have not, except in a comparatively few instances, been signed. But the government has used the railroads for over a year. They are the property of private corporations and justice demands that compensation be paid the owners currently for the use of their property. If the government were promptly to pay a rental of 90 per cent of the minimum amount that would be due under its own interpretation of the prospective contract with each road in accordance with the provisions of the railroad control act, it would be beyond peradventure on the safe side and the corporations would be in possession of a reasonable part of the money which is due them. The corporations could then in turn meet their obligations. As it is now the Wabash is holding up the payment of the dividend on its prior preferred "A" stock, and the Chicago, Milwaukee & St. Paul is deferring the dividend on both its preferred and common. If the so-called "advances" which the Administration talks about were fully analyzed, it would be found that in a great number of cases the Administration is far behind in its payments to the roads. This situation is analogous to that previously mentioned in these columns which is created by the fact that federal managers are not allowed sufficient sums to pay debts due for railroad supplies. It is all thoroughly bad business and works injustice to the supply companies that are creditors of the government and to the holders of securities of the companies.

In the Pacific Lumber case, reported elsewhere in this issue, the director general, through his counsel, at first contended that the Interstate Commerce Commission did not have jurisdiction under the federal control act to pass upon alleged discrimination in rates. By successive steps counsel for the Railroad

### Rate Discrimina- tion and the Administration

Administration, however, retired from this position and the Interstate Commerce Commission in its decision squarely rules against this earlier contention of the Railroad Administration. The commission apparently holds that whether the advance in rates alone may be considered as the rate initiated by the director general, or the entire rate including the rate advanced as well as the advance on this rate should be considered as the rate initiated by the director general, the commission still has the power to declare a rate unjust and unreasonable. It is a rather interesting point that the commission brings up as to whether the whole rate or the advance only is the rate initiated by the Railroad Administration. In this particular case the commission did not attempt to decide the question, but it might conceivably enter into other cases which the commission will be called upon to decide during the period of federal control. It is rather amusing to see the evident joy which the commission takes in brushing aside the contention of counsel for the Railroad Administration

that war conditions might justify rates which would otherwise be unreasonable. This plea was quite possibly entered before the signing of the armistice, but the decision of the commission was arrived at since that time, and there is quite evident a note of relief on the commission's part that such an argument is no longer valid. Notwithstanding this attitude, however, the commission in the Pacific Lumber case stands squarely on its right to reduce rates on roads under federal control when such rates are unjust because discriminatory.

The end of the war and of the responsibilities carried with it have enabled railroad officers, heretofore bound to their duties by patriotic considerations, to think of their own interests. The recent resignation of A. W. Thompson, federal manager of the Baltimore & Ohio, Eastern Lines, illustrates which

### Driving Brains Out of the Railroad Business

way the wind is blowing. Mr. Thompson, who is not yet 44 years of age, has been regarded as one of the ablest and most promising of the younger generation of railroad executives. Despite the fact that the railways constitute one of the most important instrumentalities of our economic fabric, and as such should be able to retain their best talent, Mr. Thompson evidently deemed his future in the steam transportation field too uncertain to warrant his remaining in it when a good opportunity in another business presented itself. As president of the Philadelphia Company, a corporation operating several public utilities and industrial properties in the Pittsburgh district, he will no longer have to fear the uncertainties presented by the present situation of the railways or the restrictions upon initiative and ambition imposed by government operation. Mr. Thompson is not alone in leaving the railways for industries which offer more stable conditions and the certainty of compensation more commensurate with ability and energy. For example, C. B. Seger, president of the Union Pacific system, has recently resigned to go to the United States Rubber Company, and D. W. Cooke, vice-president of the Erie, has gone with the Cunard Steamship Company. Other men it is important to keep on the railways are likely to follow their example unless the policy of experimentation with government operation, inaugurated during the war, is abandoned and the railroads are returned to their owners on a basis which will permit their successful operation. Although the Railroad Administration shows a large deficit for the first year of its activities, much has been said of the improvements that have been introduced through unification. On the other hand, too little has been said of the advantages the Railroad Administration has derived from the loyal service of railway officers who have been developed and trained under private management. While the railways can well afford to dispense with some duplications of facilities and service, they can lose their skilled and experienced officers only at a tremendous cost. It is obvious to any one familiar with existing conditions that the railway problem of this country must be settled, and settled soon, if the exodus of brains from the industry is not to assume dangerous proportions.

As briefly mentioned in last week's issue, announcement has been made that the Sixth National Foreign Trade Convention will be held at the Congress Hotel, Chicago, April 24, 25 and 26. The railway supply field has always been well represented at the Foreign Trade Conventions and it is not unreasonable to suppose that with the new interest in foreign trade that is being manifested by the industry and in view of the holding of the meeting in one of the big centers of the supply field—namely Chicago—there will be even a much greater attendance of supply men this year than usual.

### The Foreign Trade Convention

With these facts in mind, the *Railway Age* feels sure that it would not be out of order to suggest that the American business man's interest in the railways of other lands has now become great enough to permit of the holding of a special group session of the convention, devoted entirely to the export of railway supplies. Such a group session could cover a number of important and timely topics; including, for example, the present trend of railway development in foreign lands; the desirability of the investment of American capital in the railroads of South America, China, etc.; the prospects for trade in railway supplies in various countries the world over; and, by all means, a discussion of the practical difficulties to be surmounted and consideration of the best steps to follow to build up a lasting trade in railway supplies—including not only cars, locomotives, rails, etc., but also specialties and accessories. In view of the large number of railway supply men in Chicago and the interest in this subject manifested by the railway supply men in New York and other cities, a good attendance at such a group session would apparently be guaranteed. The question itself is so broad that it would seem to fit in with the broad ideas that characterize the conventions. The speakers should be readily obtainable and that such a group session would prove of lasting value seems beyond doubt. The secretary of the National Foreign Trade Council, O. K. Davis, 1 India Square, New York, has asked for suggestions. We feel sure that if a sufficient interest in the plan were shown by the many railway supply men who are in the habit of attending the Foreign Trade Conventions, it could easily be brought about.

## Save Fuel by Supervising Coaling Stations

THE POSSIBILITIES for saving fuel through careful supervision of coaling stations have in the past received but little consideration. The importance of this matter was strikingly brought out at a recent meeting of the Western Railway Club by J. G. Crawford, who presented data to show that if the plants were improperly operated as much as six per cent of the fuel might be wasted. To secure the best grade of fuel for locomotive service, as delivered on the tender, the coal loaded at the mine must be checked to insure that the lump and screenings are well mixed, and the metal bottoms of the coal pockets must be kept bright and each pocket must be completely emptied every few days. If these precautions are observed each engine will receive a fairly uniform grade of well cracked mine run coal. On the other hand, if the chute pockets are not cleaned thoroughly and systematically, the metal bottoms will become rusty, and coal will accumulate with the result that some engines will receive egg coal, others cracked mine run and still others screenings.

The fuel performance under the latter conditions will not be as good as if the engine had received a uniform grade of mine run coal. Tests conducted at the University of Illi-

nois show that two-inch lump coal is 98 per cent as efficient as mine run and that two-inch screenings are 90 per cent as efficient as mine run. It would make no difference whether the two-inch lump and two-inch screenings were obtained by screening mine run at the mine or whether they resulted through separation of mine run at the coaling station. Therefore under the first assumed condition the efficiency of the coaling station would be 100 per cent and under the second condition, assuming that the engines received one-half the time two-inch lump and the other half two-inch screenings, the efficiency would be only 94 per cent, or the average of 98 and 90 per cent.

The amount to be saved by closer supervision of coaling stations will not average six per cent, but nevertheless, on most roads, it will be found to be a very appreciable item. There are other conditions that make it advisable to give close attention to the coaling plants. There will be more delays to trains and more engine failures if some locomotives receive all lump coal and others all screenings, than if each engine receives a uniform grade. Furthermore, the gradual oxidation of accumulations of fine coal which have remained in the chutes undisturbed for some time may cause fires due to spontaneous combustion.

## Government Operation Kills Private Initiative

IN HIS PROCLAMATION of December 26, in which he announced his decision to take over the railroads, President Wilson stated that "investors in railway securities may rest assured that their rights and interests will be as scrupulously looked after by the government as they could be by directors of the several railway systems." When he appeared before Congress on January 4 he stated further that "nothing will be altered or disturbed which it is not necessary to disturb. We are serving the public interest and safeguarding the public safety, but we are also regardful of the interest of those by whom these great properties are owned."

The public and the owners of the railways took these statements at their face value. The President stated that he took the roads over solely as a war measure but many measures have been introduced which have borne no relation to the winning of the war and which have been promoted solely to demonstrate certain theories of railway operation held by those in control. Although the war has now been won and the purpose for which the roads have been taken over has been accomplished, new measures continue to be introduced, many of which are in evident conflict with the pledge of the President to protect the interests of the owners of the individual property. As an illustration, one road has made extensive investments in a timber treating plant to insure a supply of treated ties for its lines. Following the inauguration of government control, a large part of the output of this plant has been diverted to other lines, while the owning road has been forced to return largely to the use of untreated ties. Another road found the tie supply failing along its lines several years ago and after extended search developed a new source of supply remote from its then-existing lines. To protect itself it made a long-term contract with a large producer working in this region, built a treating plant located with reference to this source of supply and perfected an elaborate program. This road has recently been notified of the cancellation of its contract by the Central Purchasing Committee and has been advised that the ties produced in this region will be diverted to other roads. No attempt is made to deny the fact that the original road needs the ties, but the statement is made that other lines need them worse. When it is considered that the tremendous decrease

in tie production during the past year has been brought about largely by the ill-advised actions of the Central Purchasing Committee in its attempt to "reform" the tie producing industry and not entirely by the conditions inherent in the national situation, it is difficult to see how such steps are "regardful of the interest of those by whom these great properties are owned."

One of the features which has characterized the successful roads under private operation has been the courage and far-sightedness displayed in making large investments leading to ultimate economies. Having taken the risks incident to these investments, these roads are now denied the advantages accruing from them and are required to share these advantages with other roads which have incurred none of these risks. The only possible result of the continuance of such a policy will be to force the progressive roads to forego such productive improvements and to lower them to the level of the average. The suppression of initiative has been found to be a universal result of government ownership of public utilities elsewhere, and it is rapidly becoming evident in this country.

## The Employment of the Expert

THE HIGHER THE RATE of compensation for any given class of employees, the greater the incentive to curtail their employment. Thus with laborers paid double what they formerly received there is a greater demand for labor saving devices. Likewise the award of appreciable advances to supervisory and technical forces on the railroads naturally leads to speculation on the opportunities for curtailing the employment of these higher grade men. To be sure, there will be no tendency toward a return to the old days of railroading when the only supervision considered really necessary was that given by the "old man" himself who also assumed that he had a more intimate knowledge of the technical details of all branches of railway operation than any one else in the organization. There is little question that supervision on the roads should be increased rather than curtailed, and it is common knowledge that the employment of technical assistance on railroads is not nearly as extensive as in most industrial undertakings.

In the case of technical help, however, there is one legitimate means of reducing the size of the staff, namely the employment of the outside consulting expert at such times and for such periods as his services may be required for some special project. This suggestion may be applied to any one of a half a dozen or more different types of special railway employment. Of all classes of special experts employed by the railways the architect is probably the commonest and most frequently considered.

Few large passenger stations are developed without the aid of outside architects. On the other hand, even the smallest roads are organized to design the small roadway and station structures. Briefly, success in the large projects implies a happy combination of skill and imagination in architectural design with an intimate knowledge of the physical operating requirements of the railroad structure. Unless the architect in private practice specializes in railroad work or carries on a sufficient amount of it to become thoroughly conversant with railroad requirements, his designs will require too extensive revision by the railway officers to be entirely successful from either the utilitarian or the aesthetic standpoints. On the other hand, the small railroad can scarcely afford to employ an architect on its staff who has sufficient breadth of vision to handle the larger work. Even if the road should be able to pay an adequate salary to attract the man of ability, the paucity of the larger problems would have a tendency either to drive him to other

employment or to cramp his ability to cope with the occasional large project. Such a man would suffer a handicap also through the application of the old adage "familiarity breeds contempt." Being occupied most of the time with minor matters, his superiors will not accord him the necessary independence of action in preparing his designs and will be too inclined to drive rough shod through his plans, ordering changes here and there which may ruin the motif of his architectural treatment entirely.

However, while it is clear that most railroads will find it more profitable to retain the architect in private practice for the more important projects, it is necessary that the nucleus of the building design staff be maintained to conduct the current building work. It would be impracticable to carry on work of this nature with the aid of a firm of outside architects. Familiarity with general policy and intimate knowledge of the property and its needs are matters which enter largely in the preparation of designs for new structures or for remodeling old ones as well as in the successful superintendence of work while in progress. Furthermore, the architect must be in close contact with the maintenance forces in order that he may study the practical working out of the various building standards and be in a position to revise them intelligently with a knowledge of their actual performance.

The problem, therefore, seems to resolve itself into the retention of a staff to conduct the current work, while calling in outside assistance whenever the unusual or monumental structure is to be considered. The conditions on some roads may justify the arrangement for doing a larger part of the work by outside individuals than on others. Whatever the solution of the problem, one principle is established—there is no economy in eliminating the expert when his services are really required. Be he architect, hydraulic engineer or coal dock expert, if he is not employed on salary he must be retained on a fee.

## Will Another Advance in Rates Be Necessary?

MR. McADOO is no longer director general of railways. The effect of the things he said and did while he was director general will, however, long be felt by those who have succeeded to the responsibilities he has left and by the public. It is necessary that one of the last important things he said shall at this time be subjected to sharp scrutiny. Otherwise, the public may be seriously misled and other persons may be held responsible for the results of some very far-reaching things he did.

Testifying before the Senate Committee on Interstate Commerce, Mr. McAdoo expressed the opinion that if government operation were continued the railways, with the present freight and passenger rates, could earn a surplus over the return guaranteed to the companies of \$100,000,000 in 1919. He even indicated it should be possible to effect economies during the present year which would render it feasible and desirable to make some reduction in freight rates.

Early this week, however, it was implied in newspaper despatches from Washington that further advances of rates probably will be necessary if the government is to avoid incurring a railway deficit in 1919 even larger than that of 1918. Study of the statistics of railway earnings and expenses for the four months, August to November, inclusive, and consideration of some important new influences which are working, will demonstrate that the fear that either rates must be again advanced, or the taxpayers of the United States must pay a large railway deficit for the year 1919, is only too well founded.

The increase in total railway earnings in the four months August to November, inclusive, as compared with the same months of 1917, was \$457,000,000. This was almost wholly due to advances in rates. The increase in operating expenses in the same months was \$465,000,000. In consequence, in spite of the advances in rates, net earnings in these months were almost \$8,000,000 less than in the corresponding months of 1917. The way in which earnings and operating income declined during this period was very ominous. In August net earnings were \$144,000,000; in September, \$117,500,000; in October, \$106,000,000; and in November only \$76,000,000. Operating income is what is left of net earnings after the deduction of taxes and uncollectible revenues. In August operating income was \$128,000,000; in September, \$101,400,000; in October, \$89,500,000; and in November only \$57,000,000. It requires over \$80,000,000 a month to pay the returns guaranteed to the companies; in November, the last month for which statistics are available, operating income was \$23,000,000 less than this amount.

Since the armistice was signed and the war activities of the government have been in process of reduction, a rapid decline of both freight and passenger traffic, and therefore of gross earnings, has been occurring. In consequence, the figures for December may make a worse showing than those for November. It is true that large retroactive advances in wages were charged into the accounts in the months mentioned. But it must also be remembered that in October, November and December there was very little snow and cold weather, which was extremely favorable to economical operation. Furthermore, all the advances in wages granted in 1918 are not reflected in the statistics yet, and large advances in wages are still to be made to the train service employees, which will affect both the expenses and net earnings in 1919.

The facts are, then, that when Mr. McAdoo retired the expenses of the railways already had increased so much more in proportion than their earnings that they were not making enough to pay the guaranteees to the companies; that traffic, and, in consequence, gross earnings were rapidly declining; and that owing to things he had done, and which cannot now be undone, the ratio of expenses to earnings was still sharply rising. Theoretically, it should be possible to effect large economies either by reductions of wages or by increases of operating efficiency. Nobody believes, however, that wages will be reduced. They are still being increased. It ought to be practicable to effect economies by increasing the efficiency of labor, which, in many branches of the service, has declined almost beyond computation, and is now at a low ebb. This is especially the case in the mechanical department, the inefficiency in which is reflected in a startling manner in the enormous increases in expenditures for maintenance of equipment. It seems very doubtful, however, whether the efficiency of labor will or can be substantially increased under government operation.

It would appear, therefore, that the only practicable alternatives, if government operation is to be continued, are to advance rates or to impose a railway deficit of \$250,000,000 or more on the taxpaying public this year. Undoubtedly economies in operation would be effected if the railways were returned to operation by the companies, but nobody knows how soon these economies could be made or how large they would be, and therefore to return the railways to private operation without giving some kind of government guaranteees of net income, temporary or permanent, or first making a substantial advance of rates, would be ruinous to many companies and would subject the country to the perils of a great panic.

Mr. McAdoo has left to those who are now operating the railways, to the railway companies and to the public a heritage of problems and dangers of the most serious kind.

## Letters to the Editor

### Locomotive Fuel Consumption

WASHINGTON, D. C.

TO THE EDITOR:

May I call your attention to a typographical error in the article from my pen which you published in your Annual Review number of January 3, 1919, page 29, by means of which I was made to say that railway locomotives during 1918 consumed some 650,000,000 tons of coal. By some process known only to your compositor my statement that consumption of fuel had been 165,000,000 was metamorphosed into 650,000,000 tons.

JULIUS H. PARMELEE.

### To Prevent Rear Collisions

CHICAGO.

TO THE EDITOR:

The two rear collisions to passenger trains that resulted in numerous fatalities which occurred recently prompts me to suggest a simple safeguard which would tend to render such accidents avoidable. All operating officers know how difficult it is to have the flagging rules strictly observed and that rear collisions in many instances are primarily due to a violation of these important rules.

If a rear platform lamp, equipped with a 100 to 150-watt electric light, and having a radial lens of 60 deg. to 90 deg. radius were provided for the rear end of every passenger train, protection would be afforded which is now lacking.

The "tail lights" used on most roads are inferior and not of sufficient size to be seen for any distance. On curves the rear lights are scarcely visible for a distance of more than a few hundred feet. The red light suggested would be visible on tangents for miles, and on curves a distance sufficient to enable a following train to be stopped before a serious accident resulted. My own experience has demonstrated the utility of such a simple protection and with only reasonable flagging protection such a device would make the disastrous rear collisions rare.

L. C. FRITCH.

### Shipper Wants Better Treatment

CHICAGO.

TO THE EDITOR:

Now that the railroads have had their rates raised substantially, demurrage and switching rates have been raised, freight accounts placed on a strictly C. O. D. basis and many other conditions have been enforced that are favorable to the carriers, it is unfortunate that railways cannot, or will not, pay their own bills promptly.

Generally speaking, lines that formerly discounted, are taking extensive overtime on material accounts now, while lines that were slow under former management are now dreadfully delinquent. Little attempt on most lines is made to comply with terms of sale, though patrons are absolutely required to respect the new arrangement as respecting the payment of freight accounts. Then, too, little or no improvement has been noticed in the handling of freight claims; there is still the same old fencing, delays, needless correspondence, and none of the roads that we have encountered will pay interest on delayed claims as the director general recently ordered, unless forced to do so by the claimant, in accordance with Mr. McAdoo's order.

The public has stood very patiently for many changes, new procedure, etc., in the transportation field, but now feels that the time has arrived to show the public more consideration, as it is the good old public that, in the end, pays the bills. A SHIPPER.

increase granted the foremen in the locomotive and car departments was based on what their highest paid craftsmen would receive when working a full month, and was made sufficient to take care of any emergencies that may arise. If a foreman in the locomotive and car department, supervising men rated at 68 cents an hour is paid a flat monthly rate amounting to so much more than his craftsmen, why should not the signal foreman who is supervising crafts rated the same as those in shop work, receive an increase equivalent to that of the shop foreman with a fair percentage allowance made for the number of men over whom he has supervision?

### Wage Awards and Signal Department

ALTOONA, PA.

TO THE EDITOR:

Among the many irregularities brought about by the United States Railroad Administration's wage adjustment, perhaps none has wrought more injustice than that affecting the signal foremen. Signal department employees from the maintainers to the signal engineer have always been an underpaid class, considering the responsibilities resting upon them; but never before was there a time when the subordinate forces were rated higher than their immediate superiors. This, however, is one of the many inequalities that is being allowed to exist at the present time.

The gross injustice to the signal foremen, of the application of General Order No. 27 with its subsequent supplements, was evident soon after they became effective. In attempting to have the matter corrected, supervisors of signals, division engineers, superintendents, general superintendents, general managers, regional directors, wage boards and even the director-general were appealed to, but so far without any apparent result. At the present time signal foremen on one of the large roads in the Allegheny region are classed under Supplement No. 8 to General Order No. 27 and are paid a monthly salary (provided they work every day) of \$140.45. A signal maintainer, rated at 68 cents an hour, under Supplement 4 will receive \$182.24 for the month of January, 1919. A section maintainer also paid under Supplement No. 4 working in a minor supervisory capacity, with a five-cent differential over the maintainer though subordinate to the signal foreman, would receive \$13.20 more than the maintainer, or a total of \$195.44; making a monthly difference between the monthly earnings of the foreman and the section maintainer of \$54.99, in favor of the section maintainer. This shows the absurdity of the rates when applied to the three positions mentioned and when each person filling the position is employed the net specified number of working days in the month.

When called to work on Sundays and holidays, or for the ninth and tenth hours of the regular working day, the inconsistencies to which the signal foreman and his assistant are subjected is demonstrated by the following:

Signal foreman receives.....	\$0.688 per hour
Assistant foreman receives.....	0.641 per hour
Section maintainer receives.....	1.095 per hour
Maintainer receives .....	1.02 per hour

No person familiar with signal department work would say that the established rates of the maintainers or the section maintainers are excessive in the least, and any attempt to reduce such rates would be nothing short of a miserable travesty on justice, but how long will the Railroad Administration be able to hold signal department organizations together under such conditions? Many experienced men have already left their positions to take up other work. Others have forfeited their foremanships and taken places in the ranks, while others, conscious of their patriotic duty and willing to stand by the government in a crisis, have labored on in the hope that some of the many promises would eventually be fulfilled.

There has been much speculation as to what an adequate increase for the signal foremen should be, but, treating the matter from the standpoint of justice, there should be no difficulty in arriving at a satisfactory conclusion. The recent

A signal foreman stands to lose approximately \$1,000 simply because he happens to have sufficient ability to have been advanced above his fellows. If such injustice is to continue, the only thing remaining for the signal foremen is to petition the Railroad Administration for a place in the ranks and if this were permitted, it would be very difficult to fill the foremen's positions, because years of experience are necessary to develop a signal foreman; and as already stated, the existing rate would not justify the subordinate forces in making the change.

CHAS. L. SANDRUS.

### Speaking of Resignations

ST. LOUIS, MO.

TO THE EDITOR:

Your editorial entitled "Speaking of Resignations," in the issue of November 29, reminds me that the ancient Greeks and Romans, when they got the characters in a play in such a fix that they could not be extricated by mortal hands, had a "Deus ex Machina" or a sort of God, let down on the stage in a cage, who straightened them out. If you can find a "Deus ex Machina" for the railroads he could be more useful than the I. C. C. and forty-eight other disturbers.

C. D. PURDON,  
Consulting Engineer, St. Louis Southwestern.

[Representative Sims has introduced a bill to provide \$500,000,000 additional for the Revolving Fund. Maybe it's the "angel" that's needed for the show.]

New Lift Span Partially Completed with Temporary Lift Span Still in Place

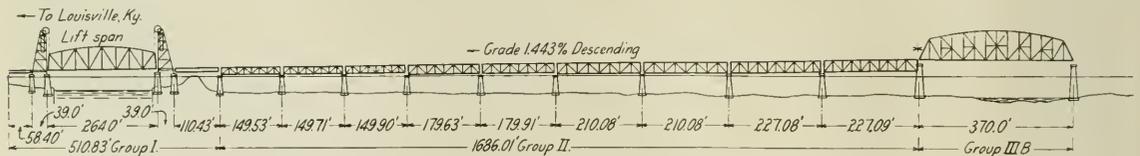

# The Reconstruction of a Notable Railroad Bridge

Ohio River Crossing at Louisville Now Contains Longest Simple Riveted Span in the World

THE RECONSTRUCTION of the Ohio river bridge of the Pennsylvania Lines at Louisville was the foremost railway bridge project under way during the past year. It was the greatest by reason of the length of the structure, which is almost a mile, because of its weight, which aggregates 23,500 tons of structural steel, and because it contains a record-breaking span of 643 ft. 10½ in., the longest simple, riveted truss span in the world. Considerable historic interest also is attached to this project because it marks the passing of a noted structure among American railway bridges, the Louisville bridge built by Albert Fink between 1867 and 1870. Through 47 years this old superstructure carried the increasing loads of railway traffic with but minor

swing span of 264 ft. over the Portland canal, with 23 deck spans varying from 50 ft. to 245 ft. 5 in. in length. The two through spans were of the sub-panel Warren type with cast-iron compression members and wrought-iron, eye-bar tension members. The trusses were duplex, there being two complete trusses on each side connected by struts and ties. The deck spans were all of the Fink type with material of the same character as that used in the through spans.

Subsequent to first construction certain changes were made. In 1891, the floor beams of the deck spans, which were of a unique cast-iron arch type, were reinforced by placing steel beams on either side of them. About 22 years ago the truss floor beams of the through spans were equipped

South Half of the Louisville Bridge

strengthening and when removed was in a remarkable state of preservation. But like most other railroad bridges built before the beginning of the new century, it proved inadequate for present loadings and had to be replaced by a new structure of greater carrying capacity and also providing double track. The new bridge, like the old one, is being built by the Louisville Bridge Company, a corporation controlled by the Pennsylvania Company through ownership of 98 per cent of the stock.

The old bridge, as built in 1870, consisted of two through channel spans of 400 and 370 ft., respectively, and a deck

with equalizers to effect a more uniform distribution of the load to each of the doubled trusses. In 1902, the drawspan was replaced by a through Pratt truss draw. The wooden stringers were also replaced by steel after 25 to 35 years of service. In 1900 instructions were issued limiting the weight of trains crossing the bridge to 3,300 lb. per lin. ft., with engine axle loads of not over 39,000 lb. The speed was also restricted to from 8 to 20 miles per hour, depending on the makeup of the train. The old substructure, of Bedford stone ashlar masonry on rock foundation, was so well preserved that it has been used to support the new steel with only such

modifications as were necessary to make it fit the new superstructure. The wrecking of the old structure disclosed the high grade of workmanship which had been applied in its

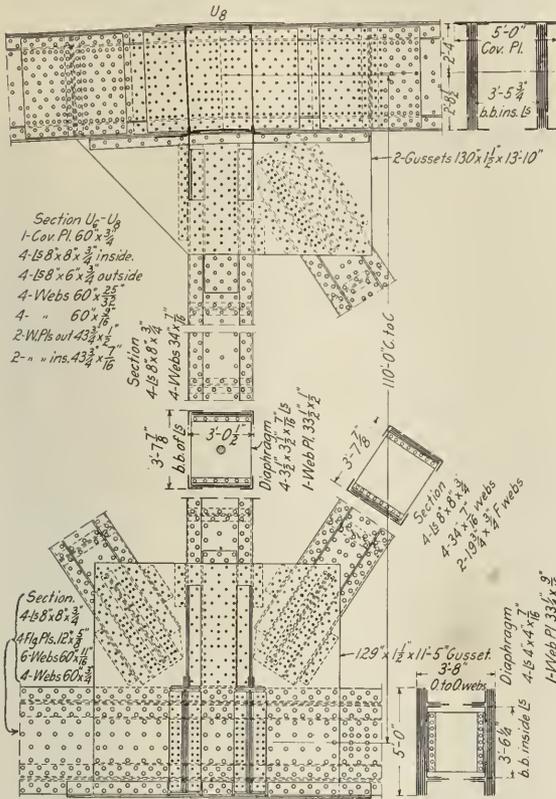

blance to that of the Ohio Connecting Railroad bridge of the Pennsylvania Lines across Brunot's island near Pittsburgh, which was rebuilt in 1914-15. Both of these bridges contain two through riveted channel spans of the Petit type, separated by a long series of riveted deck Warren type truss spans, and there is a marked similarity in the structural details. There is also an interesting coincidence in the fact that, until the completion of the record span of 644 ft. in the Louisville bridge, the 525-ft. span of the Brunot's island bridge was the longest riveted simple truss span in the United States. The similarity, however, ends there, since the manner of prosecuting the work in the two structures differed widely.

The Indiana Channel Span

As a record structure, a few of the principal dimensions of the 644-ft. span are of interest. It consists of 18 sub-panels of 35 ft. 9 1/4 in. The height of the trusses is 74 ft. at the portals and 110 ft. 6 in. at mid-span, measured center to center of chords. The trusses are 34 ft., center to center, and the total weight of the span is 6,209 tons.

The top chords and end posts are of a double-I section with top cover plates and having 60-in. webs and 60-in. cover plates. The gross sectional areas of the end posts and maximum top chord members are 562.43 sq. in. and 535.09 sq. in. respectively. The bottom chords are of a double-web type with maximum net and gross sections of 487.55 and 587.27 sq. in. respectively. The largest gusset plate, which is at panel point L-4, measures 129 in. by 1 1/2 in. by 13 ft. 10 in. The two webs of the bottom chord are tied together by diaphragms spaced 10 ft. to 12 ft. apart with single lacing of 6-in. by 1/2-in. bars attached to horizontal plates secured to the webs by means of 8-in. by 8-in. angles. The top chords and end posts are stiffened by diaphragms at intervals of 6 ft. to 9 ft. and the lower edges of the two webs are tied together by lacing bars and tie plates, except that the lacing bars are omitted in the top chords by providing that the spaces between the ends of the tie plates are not greater than three feet.

The floor system, following the design used on the Ohio Connecting Railroad bridge, consists of duplicate floor beams at each panel point, one each to support the stringers in the panel on either side. This makes the floor system at each panel a complete, independent unit, an arrangement that is especially convenient in erection. The end bearing detail of the span is of massive proportions; the bearing pin is 24 in. in diameter and the expansion bearing consists of eight segmental rollers having a diameter of 2 ft. 6 in. and a length of 4 ft. The span rests on a grillage 2 ft. 2 in. deep and 11 ft. long transverse of the piers, which in turn is sup-

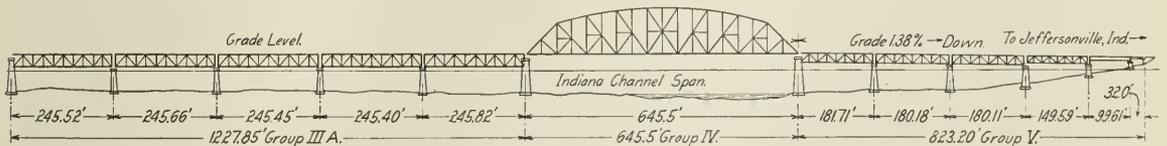

Typical Truss Details of the Indiana Channel Span

fabrication and erection, as demonstrated by the excellent behavior of the spans through their long service life.

The New Structure

The old superstructure has been replaced largely by spans of equivalent length on the old piers, except for several important modifications. The old 400-ft. Indiana channel span and the deck span adjacent to it on the south have been

North Half of the Louisville Bridge

replaced by a single span 643 ft. 10 1/2 in. long center to center of end bearings. Two of the deck truss spans at the north end of the bridge have been replaced by two deck girder spans of 32 ft. and 99 ft. 6 in. respectively. The old center pier drawspan has been replaced by a span of 264 ft., center to center of piers, operated as a vertical lift, while the necessity for flanking this by 39-ft. tower spans introduced a modification in the makeup of the spans immediately adjacent to the draw.

Except for the presence of the lift span, the new superstructure of the Louisville bridge bears a striking resem-

ported on a grillage covering the entire length of the pier and consisting of eight girders 3 ft. 9 in. deep. The material is high tension steel for main members of the trusses and floor system and medium steel for the gusset plates, bracing and minor details. The rivets are 7/8 in., 1 in. and 1 1/8 in. in diameter.

The details of the 370-ft. Kentucky channel span correspond very closely to those of the large span. One difference is noted in the fact that the end post occupies only one sub-panel and therefore has a much steeper slope. Some idea of the relative proportions of the new double-track bridge

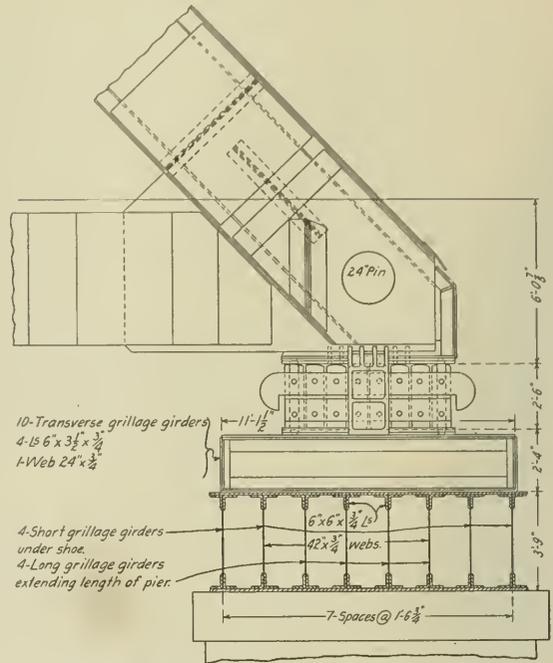

as compared to the single-track structure which it replaces is to be obtained by a comparison of the weights per foot of track of the new and old superstructure for this span, these being 12,272 lb. and 3,050 lb. respectively. The new 644-ft. span weighs 19,650 lb. per ft.

**The Lift Span**

The lift span is composed of through riveted trusses 260 ft. long, center to center of end bearings, and weighs about 1,320 tons. Towers flanking it on either end afford means for lifting the span a distance of 32.3 ft. to give a clear head-room of 79 ft. above the pool level of the canal. The operating details of this structure conform very closely to those used in the Pennsylvania Lines bridges over the Chicago and Calumet rivers at Chicago. The counterweight towers are 105 ft. high from the top of masonry to the center line of the 15-ft. sheaves from which the span and the counterweights are hung by sixteen 2½-in. wire ropes at each corner. The sheaves consist of seven cast-steel rim segments with special steel web members connecting them to cast-steel hubs which are bored for 24-in. diameter shafts. The counterweights are of concrete cast in structural steel frames. Compensation for the weight of the carrying cables is accomplished by means of cast-iron link chains swung between the bottoms of the concrete counterweights and points at mid-height on the towers.

Power is supplied for moving this span up and down by cables attached near the bottoms and tops of the towers and passing over sheaves at the ends of the top chords to drums on hoisting equipment in a house over the center of the span. The hoisting equipment consists of two 150-h.p., 220-volt, 3-phase, 60-cycle induction motors. There are three forms of control, one automatic by means of two solenoid brakes, and two manual through an electric brake and a hand brake. Duplicate control of the structure is provided since it may be operated from a cabin suspended inside of the trusses below the machinery house, and also from an interlocking tower located just south of the bridge which controls not only the movement of the trains that cross the bridge but also the throat of a yard located just south of the canal. Excessive vibration in bringing the structure to bearing on the bridge seat is avoided through the provision for pneumatic

The grade of the bridge between and including the two channel spans, a distance of 2,242 ft., is level, with approach grades of 1.38 and 1.443 per cent ascending from the north and south respectively. The 1.443 per cent grade ex-

Outlines of the End Bearing for the 644-Foot Span

tends across the lift span and was taken care of entirely in the attachment of the floor beams to the trusses, so that the bottom chords of the span could be level. There is a possibility that grade separation work in the city of Louisville

Falsework for the Erection of the Deck Truss Spans

buffers consisting essentially of cylindrical plungers passing into cylindrical tubes from which the delayed escape of the contained air through small orifices serves to bring the span to rest gradually.

to the north of this structure will require some future modification of the track grade at the south end of the bridges and as a means of facilitating a change of grade across the lift span, the rivet spacing of the connections of the floor

beams to the posts has been made uniform so that the beams may be readily moved up variable distances on the posts.

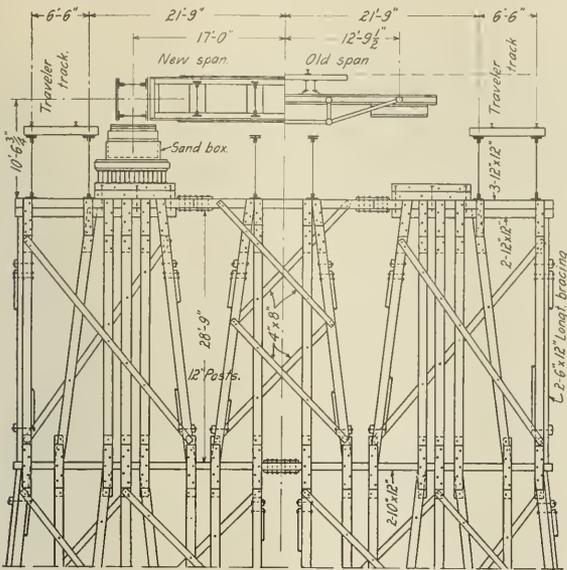

Erection

The erection of the bridge proceeded slowly because of the masonry changes that had to be carried on simultaneously with the placing of the new steel. The first work to be done

The old masonry was found to be in excellent condition and, although built for single track, the piers were found to be of adequate length to carry the new double-track structure after being provided with longitudinal steel grillages concreted into new copings. In the case of the piers supporting the old Fink trusses, the bridge seat was located just under the top chords so that in order to erect the new deck trusses it was necessary to cut down these piers to afford space for bearing shoes below the level of the new bottom chords, and since the piers had an appreciable end batter, the new pier tops at the lower level were considerably longer than at the old level. However, this change in the masonry proved to be a considerable obstacle to the work since the rate at which the old superstructure could be replaced by the new was controlled very largely by the speed at which the alterations to the masonry could be made.

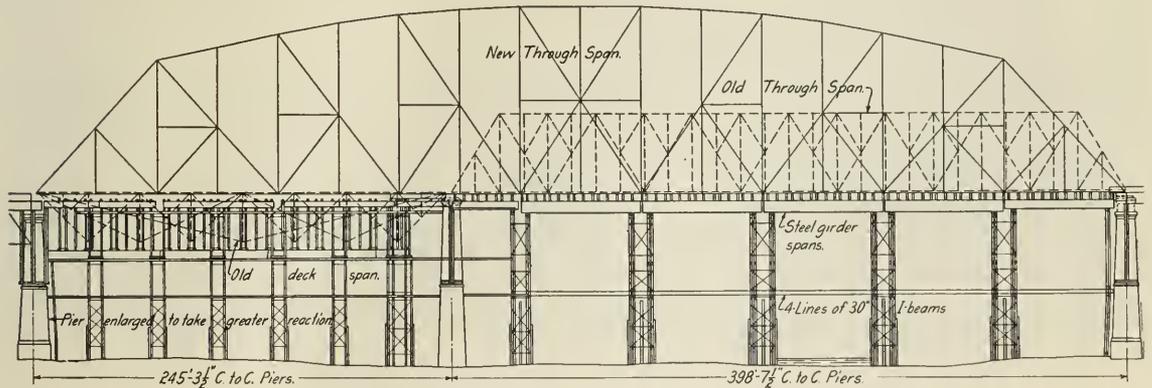

The falsework for the deck spans consisted of towers of frame posts resting on the rock bottom of the river and carrying plate girder spans below the level of the bottom chords of the new spans. On these, frame bents were erected to support the bridge floor and the old trusses at the level of the top chords. The old trusses were then taken down and the new ones erected, after which the floor system was replaced panel by panel. In the meantime the old piers were removed down to the new level and the grillages installed and concreted in place.

The erection of the Indiana channel span was by far the most formidable problem of the project, not only because of the great weight of 6,209 tons which had to be maintained on the falsework, but because of the very swift current that flows in the channel under this span. Some idea of the velocity of the water may be gained from the fact that there is a fall in the river of 23 ft. in one mile. Erection on falsework under these circumstances would have been an impossibility but for the fact that the depth of water is only from 8 to 10 ft., with a maximum of about 16 ft. The bottom is bare solid rock. The problem was complicated by the necessity for removing the intermediate pier carrying the south end of the old channel span and the need for strengthening the pier to carry the south end of the new span, since this pier now carries a far greater reaction than under the previous arrange-

Elevation of the Upper Half of a Bent in the Falsework Used Under the 644-Foot Span

was on Group 5, the deck spans between the Indiana channel and the north abutment; this was started June 1, 1916, and finished October 1, of the same year. The next section was Group 3A, the five deck spans between the two channel spans requiring from September 1 to December 15, 1916.

Elevation of the Falsework Under the 644-Foot Span

The 370-ft. through span was erected between April 25 and July 10, 1917. The remaining deck trusses were erected between May 10, 1917, and January 20, 1918. The erection of the superstructure of the group of spans centered about the lift span started on March 1, 1918, and was completed on September 10 of the same year, while the work on the great Indiana channel span was started on April 20, 1918, and is now practically complete.

ment. This was accomplished by inclosing it with a three-foot thickness of new stone masonry on all sides. The pier is 100 ft. high from top of footing to base of rail and the reinforcement entailed the use of 1,392 cu. yd. of masonry in the neatwork and 64 cu. yd. in the coping.

The reconstruction of this pier was accomplished by surrounding it with a rock crib to produce a pool of still water. A cofferdam was then built inside of this and worked down

through the loose rock to the bottom of the river, after which it was unwatered and the footing concreted.

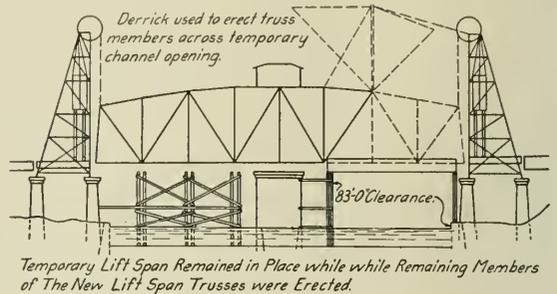

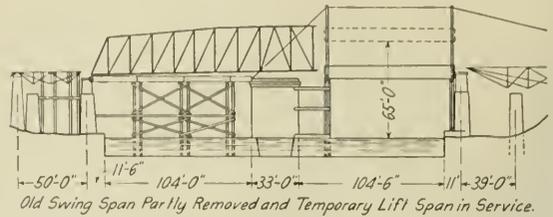

Work on the new masonry was facilitated by building a gallow's frame supported on the pier and spanning over the track with sufficient clearance to allow the passage of trains. This was equipped with two derrick booms which were used to handle the stones delivered on cars and set them into place in the pier. Material for concrete work was stored in a bin built on the bottom chord of the new deck span to the south, the material being chuted from cars spotted above. As the old deck span to the north was not placed on falsework during this operation it was necessary to support the end of this span over the pier by means of a 50-ft. girder placed crosswise under the end shoes of the old span and supported on frame bents at the two ends of the pier.

**Falsework for the Indiana Channel Span**

One of the drawings shows an elevation of the falsework used in erecting the 644-ft. span. It consists of a series of frame bent towers supporting deck plate girders. The portion of the falsework under the old span was complicated by the need of placing these girders low enough to clear the bottom of the old span so that the construction was similar to that used in erecting the deck spans. Under old channel span each falsework tower consisted of four bents containing 16 posts each. The most difficult part of the work was to place these posts in the swift current. To accomplish this a timber frame or box truss was designed to surround the entire lower story of the tower. It was built above water, suspending it from lines depending from a creeper traveler riding on the top chords of the old through truss span. This frame was held at a fixed distance out from the pier or the nearest tower previously erected by struts hinged at the ends so as not to interfere with an up-and-down motion of these box trusses. The trusses were fitted with four posts located at approximately the quarter points of each outside bent so that when the box trusses were lowered these four posts could be brought to bearing on the river bottom. With the frames

of these I-beams were cross-braced to form a horizontal truss.

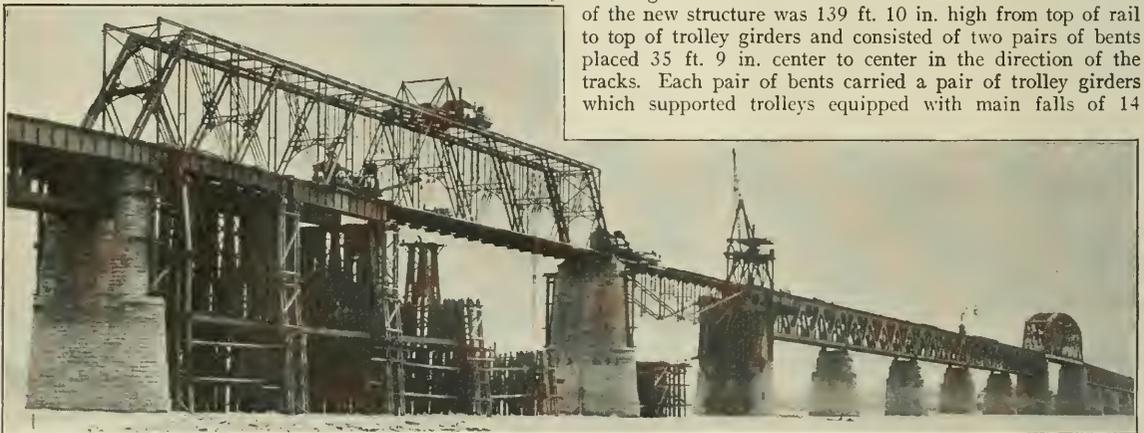

An elevation of the top section of the tower bents shows how the posts were grouped to support the various parts of the superimposed live and dead loads. Two girders in the center carried the track used for revenue traffic and for the delivery of new steel. On either side of these, grillages were provided to carry the sand boxes under panel points of the

**Method of Removing the Old Draw Span and Erecting the New Lift Span**

trusses, while on the outside pairs of girders were placed to support the traveler tracks.

The gallow's frame traveler which was used in the erection of the new structure was 139 ft. 10 in. high from top of rail to top of trolley girders and consisted of two pairs of bents placed 35 ft. 9 in. center to center in the direction of the tracks. Each pair of bents carried a pair of trolley girders which supported trolleys equipped with main falls of 14

**Erecting the Falsework Under the Old Indiana Channel Span**

thus supported, the rest of the posts for the tower were let down into place in succession between guides in this frame. Each post was fitted with a cast iron pyramidal shoe and brought to a solid bearing on the rock by subjecting it to several blows with a steam hammer.

No sway bracing was provided between the towers, but four lines of 30-in. I-beams at a level of 31 ft. above the bottom were spanned from tower to tower and made continuous between the piers to serve as sash bracing. The two inside lines

parts of 7/8-in. wire rope and auxiliary falls carrying a single sheave block. The hoisting engines were carried on trailers standing on the traveler track. The heaviest member erected with this traveler weighed 129 tons.

All parts of the old span were removed by a locomotive crane, the members being cut apart with an oxy-acetylene torch. The work was started at the south end, the old deck span being replaced by the new steel first. The new span was detailed to have a camber of 1 ft. 4 1/2 in. as erected (un-

der no stress), which reduced to a camber of 7.32 in. when under dead load after the span had been swung free of the falsework.

The deck spans were replaced under traffic, using a small tower traveler standing astride the operated track and supported on rails 19 ft.  $2\frac{3}{4}$  in. center to center. This was made of frame posts and floor beams taken from the old structure.

### Special Problem in the Lift Span

The replacement of the old swing span by the new lift span was a problem of no mean proportions since the work had to proceed with a minimum of interference with the operation of both rail and canal traffic. The solution was to place the south half of the old span on falsework and replace the north half by a temporary lift span consisting of a pair of 88-ft. girders raised and lowered by lines from galleys frames supported on bents adjacent to each side of the north draw opening. A minimum interference with the canal traffic required that the interval from the time that the swing span was rendered inoperative until the temporary lift span was ready for use should be as short as possible. This was accomplished as follows: The lift span was delivered on the bridge on two flat cars and was picked up by lines from the galleys frames so that the cars could be released. The portion of the old floor system under the temporary span was cut away from the trusses, most of it being lashed to the under side of temporary girders which were then lowered into a position to carry traffic. One hundred feet of the north ends of the old trusses was then cut away and removed so as not to obstruct the channel when the lift span was raised.

The temporary lift span was raised and lowered by means of hand crabs, the span was counterweighed by means of rails suspended from the falsework. The operation of opening and closing the span occupied about 20 min.

After the temporary lift span was installed the towers for the permanent lift were erected and the portion of the old span over the south channel and the pivot pier was replaced by the portion of the new span shown in full lines in the drawing. Navigation was then closed and the remaining members of the trusses were placed by the cantilever method, the temporary span being maintained operative between them. When the trusses were completed the traffic over the bridge was stopped and the temporary span removed and replaced by the permanent floor system, whereupon the bridge was restored to rail traffic after an interval of eight hours. The blockade of the canal traffic from the time that the truss members fouled the channel until the new lift span became operative was seven days, but as the river traffic was inconsequential the delay was of little concern.

The erection of the bridge, with the use of the operating track by work trains supplying material for the new structure and removing the material released from the old one, introduced possibilities of serious interference between the construction operations and the conduct of revenue traffic. This was overcome by adjusting train schedules to avoid the movement of revenue trains on the bridge during the work-day hours. Some of the trains were diverted to other bridges crossing the Ohio at Louisville; concentration of movements was also arranged at night and during the noon hour.

This bridge was designed and built under the direction of J. C. Bland, bridge engineer of the Pennsylvania Lines West. The Pennsylvania Steel Company, Pittsburgh, Pa., had the contract for the entire superstructure, the erection being under the direction of J. L. Poffenberger, engineer, and J. J. Kelley, general foreman. The masonry changes were made partly by the railroad and partly by separate contractors. The work on the substructure for the lift span, after being partly completed under an independent contract was taken over and completed by the Pennsylvania Steel Co.

## Labor Recruiting Conference at Chicago

A CONFERENCE ON WAGES and means of recruiting labor for railroads was held in the auditorium of the Insurance Exchange Building, Chicago, January 20 and 21. It was called by the Federal Employment Service for the purpose of developing, if possible, some means of co-operation between officers of the railroads and the Employment Service and was attended by some 25 railroad officers and representatives of various departments of the Federal Service. Sanford H. E. Freund, director of the clearance division, United States Employment Service, Washington, D. C., presided.

In their opening addresses Mr. Freund and Charles J. Boyd, general superintendent of the Illinois free employment offices, expressed the opinion that while there is a well defined labor surplus at the present time, there is every reason to believe that there will be a decided labor shortage within a very few months, particularly in common labor. The reasons given for this are the rapidity with which men released from the army and war industries have been placed in positions and the fact that this country is now short 2,000,000 men through the failure of immigration in recent years, since it has always been the immigrant who has afforded the supply of common labor in the past. Mr. Freund urged upon the railroad men the necessity for co-operating with the 750 government agencies. He said that competition between the federal bureaus and those maintained by the railroads would be harmful to both and would increase the labor turnover.

In speaking for the railroads, W. G. Beird, federal manager of the Chicago & Alton, admitted that the railroad situation was grave, particularly with respect to unskilled labor. A particularly unfortunate feature in connection with the unskilled labor is that it is less efficient than formerly, so that one of the most important problems is to restore it to its former efficiency. He said that after listening to considerable of the discussion it was his opinion that there was a missing link between the organizations of the Federal Employment Service and the railroads and as a means of securing this necessary connection he believed it should be the sense of the meeting to call upon the United States Railroad Administration to appoint a committee to confer with representatives of the Employment Service to formulate the necessary means of united action.

Representatives of a great many of the different state branches of the Federal Employment Service spoke of the success of their work, quoting figures as to the large number of men to whom they had given employment. They decried the failure of railroad officers to co-operate with them and assumed a rather critical attitude concerning the employment practices of the railroads. Exception was taken to this by Robert H. Ford valuation engineer, Chicago, Rock Island & Pacific, who reviewed the labor problem of the past few years in detail and called attention to the fact that the problem is not solely one of searching out the man without a job and putting him to work, but also of keeping him at work. This means that the working and living conditions must be favorable. Moreover, the floater must be prevented from traveling all over the country at the expense of the railroads. He gave as one reason why the federal service was unable to supply men properly during the past year, that they were too much concerned with supplying men for other employments at higher rates and cited instances of the intense competition of varied independent agencies of the Employment Service with each other. He also quoted from orders of the regional director of the Western region warning railroad officers that applications for men at the Federal Employment offices did not relieve the railroad man of

responsibility for an adequate supply of help to conduct his work properly. He made several recommendations for the improvement of the Employment Service so that it could secure the confidence of the railroads and therefore their co-operation.

The method of soliciting men must be simplified. Common labor is scared away by an excess of examination and red tape. The Employment Service must also accomplish a complete co-operation of all branches of its own organization. The transportation of men back and forth across the country must be stopped. The employment of common labor must be separated entirely from that of skilled labor. The state employment agencies should work for the necessary legislation to remove present abuses in employment and vagrancy. Some form of regional control of the railroad's part in employment activities should be provided.

In discussing the distribution and transportation of labor C. A. Griswold, Chicago & North Western, said that all agencies are imposed upon by persons who wish to obtain transportation to some distant point without expense. He suggested that the solution of this would be to apprehend a few men who have followed this practice and have them arrested and fined. Mr. Griswold was followed by H. E. Ballou of the Chicago, Burlington & Quincy employment agency. He related some of the details of the administration of the employment and distribution of men as carried out by the agency of the single railroad and contended that an objectionable multiplicity of details would obtain when a single agency was supplying men to all of the railroads in the tributary territory. At Chicago he estimated this would represent some 110 operating divisions.

The advisability of centralized supervision of central west territory was discussed by Mr. Freund and W. J. Towne, assistant general manager of the Chicago & North Western, who spoke in place of R. H. Aishton, director of the Northwestern region, whose name appeared on the program. Mr. Freund called attention to the fact that the Federal Employment Service had been organized as a war emergency and that it had been called upon immediately for assistance from all sources. One of the principal difficulties from which it suffered was the lack of any unified organization of labor on the part of the government war activities. Conflicting demands were received from various departments which were so urgent that it was necessary to deal with these various calls as they came without much attempt at co-ordination. Under these circumstances the employment service could not afford the railroads as much assistance as would be possible under a more highly developed organization. Under present circumstances he contended that these objections no longer exist.

Mr. Towne agreed that centralized control of labor distribution was desirable and favored a movement toward that end. Assuming that centralized supervision must come it is desirable to avoid its disadvantages. The system must be made sufficiently flexible to enable railroads to employ labor locally without any formality. The advantages of unification are a standardization of rules and practices and the elimination of duplicate effort. The principal disadvantage is a tendency for a large organization to become slow in operation. In closing he favored the formulation of some kind of a recommendation to the director general of railroads which would outline the course to be pursued.

This took definite form in a resolution presented by Mr. Ford, that it was the sense of the meeting that the director general of railroads, the regional directors and the director general of the United States Employment Service be urged to designate representatives fitted by training and experience, to act on a central committee to co-ordinate activities in recruiting and stabilizing labor to the end that unrestricted competition and duplication of facilities and effort be eliminated.

## Mr. Hines Addresses Passenger Men\*

MAN Y YEARS AGO a celebrated wit in Kentucky, in a speech to commercial travelers, said the commercial traveler was the "commercial evangelist," and it seems to me it could fairly be said that you gentlemen are the evangelists of the public service. It is you who have to spread the gospel of the proper sort of public service and who see that that gospel is lived up to. Since it is the cardinal point of my administration that we must serve the public in the best possible way, I turn to you for help. . . . Do not be disturbed by reports calculated to discredit the Railroad Administration. A prominent story published in some newspapers yesterday indicated that there was a serious conflict between the Interstate Commerce Commission and the director general over a question of jurisdiction. There is no foundation for that contention. The fact is that there has never been the slightest difference of opinion between the Interstate Commerce Commission and the director general as to their respective jurisdictions. There has been the most cordial and beneficial co-operation between the commission and the director general. We have found nothing but the most sympathetic understanding of our problems and the most earnest desire to co-operate with us in making a success in discharging the responsibilities which rest upon us. If railroad officers and employees are confronted day by day by such unfounded reports the tendency will be to impair the morale of the railroad organization, and that above all things is what I wish to avoid, and I wish to get your co-operation in avoiding it.

I, as director general, and all my associates in the central railroad administration, have a single-minded purpose, to serve the public to the best of our ability and to face the facts, whatever they may be; and give the public the benefit of those facts, and to secure at all times the understanding and the co-operation of every interest, whether public or private.

Whatever may be the future of the railroad problem every interest affected will be promoted by the continued maintenance of the best possible railroad system, rendering an adequate public service; we are to keep on giving the best public service and of finding ways of improving it. The war and its hardships are over, and the hardships from the standpoint of the passenger service were, of course, very serious. People did not have adequate space, there was no opportunity to give them adequate information in all cases, and in a great many ways they were subjected to serious inconvenience. We must now endeavor to re-establish the same convenient and comfortable form of passenger service which was available before, and we must do everything we can, within reason, to make that service more convenient and more comfortable than before. I have particularly in mind the point of providing adequate information for the public, the point of seeing that the public is treated with courtesy and the point of seeing that there are facilities adequate for comfortable travel; these are points of paramount importance. I hope that you will find it practicable to perform to an increasing degree the careful inspection of stations, passenger trains and dining cars, and do not forget the important point, whether or not trains are run on time.

Do not take as a necessity any unsatisfactory condition you may find. Don't assume that that condition has to be because of federal control of the railroads. View the matter from the standpoint that if the thing is unjustifiable on its merits a way ought to be found to correct it and that the government owes it to the people to correct it; and I want you without hesitation to use your initiative in these matters and to bring to the proper officers of our Railroad Administration the recommendations with the confident belief that they will be considered on their merits and with the most earnest desire to promote the public service.

\*Address at the annual convention of the American Passenger Traffic Association, at Washington, D. C., January 22; abridged.

# Doings of the United States Railroad Administration

## Director General Faced With Big Financial Problems; Complicated By Falling Off of Traffic

WASHINGTON, D. C.

AS AN INDICATION of the condition to be faced by the railroads if they are to be restored to their owners this year, preliminary estimates of earnings and expenses for 1919 which have been considered by Director General Hines and his staff, including the regional directors who spent most of last week in Washington, are said to forecast a deficit of approximately \$250,000,000 for the year. Mr. McAdoo in his testimony before the Senate committee on January 3, estimated that with the same volume of traffic as last year the railroads would earn a surplus in 1919 above the guaranteed rental of \$100,000,000, and on this he based a prediction that unless the volume of traffic should be reduced, rates might be decreased during the year, certainly by the end of the year. It is now recognized that there is no chance for any decrease in rates. Increases in payrolls far exceeding the estimates which had been made of the effect of the various wage increases ordered during the past year account for a large part of the difference in the estimates, as later figures have become available since Mr. McAdoo made his optimistic assertions just before his departure. An additional increase in pay for the members of the train service brotherhoods, which has been under consideration by the Board of Wages and Working Conditions and which, it is said, may run up to \$100,000,000 a year, is another factor which Mr. McAdoo may have overlooked. Mr. McAdoo estimated the previous wage increases at \$600,000,000 to \$700,000,000, but some of the wage orders had not then been in effect long enough to afford accurate figures as to their amount.

The Railroad Administration is not making its figures public, particularly in view of the uncertainty as to the volume of traffic to be expected, as business has been declining rapidly since the signing of the armistice. The fact that estimates showing a prospective deficit had been made and that the regional directors had recommended that it be met by a further increase in rates or by asking an appropriation of Congress, got into print, however, and elicited a prompt denial from Director General Hines that an increase in rates was being considered.

"There is no foundation," he said, "for the report that the Railroad Administration has given or is giving any consideration to any increase in the present basis of rates." As to the reports regarding the estimated deficit, he said: "The results of operations for the year will be largely dependent upon the volume of traffic. If the volume of traffic should be as large as last year, it is believed the operating income would be sufficient to pay the rental. As soon as any reasonably satisfactory conclusion as to the probable volume of traffic can be formed, the public and Congress will be given the best possible estimate of the prospects for 1919."

It is expected that he will give this estimate when he asks Congress for an additional appropriation for the revolving fund, which, as previously announced, is proposed primarily to enable the Railroad Administration to make advances to railroads for capital expenditures. Mr. Hines said the amount to be asked would probably exceed \$500,000,000. The unexpended balance of the capital expenditures authorized in 1918, plus an estimate of \$350,000,000 for 1919, would make a program for the year of \$1,039,000,000. How much of this would have to be advanced by the Railroad Administration would depend on how much of it is actually carried out and on how much of it could be financed by the railroad companies themselves. If the amount should be re-

duced or if the companies could take care of a large part of it or could take up some of the loans made to them last year from the revolving fund, a part of the original appropriation of \$500,000,000 might be made available for making up the operating deficit, which for 1918 probably considerably exceeds \$200,000,000, without taking into account a large amount of unpaid claims and whatever amount it is finally decided the government owes the railroads for deferred maintenance.

Mr. Hines has issued the following statement regarding the revolving fund:

"In view of the constant discussion of the railroad problem which naturally is now going on because of the pendency of the issue before the Congress, and since a great deal of stress is being laid upon the financial condition of the carriers under federal control, it should be helpful to comprehend some outstanding facts regarding the so-called 'revolving fund.'

"It is important to understand that the mere fact of taking over the railroads as going concerns involved the temporary absorption of about \$340,000,000 of the government's money, and that if the operation of the railroads for the year 1918 had not involved any loss whatever it would still be true that about \$350,000,000 of the revolving fund would be thus absorbed all during the period of federal control.

"On any given date a large amount of cash is in the hands of railroad conductors and railroad freight and ticket agents throughout the country. On the date the government took possession of the railroads this amount was about \$140,000,000. This was of course credited to the railroad corporations and in settlement with them for the first year the government has to pay that amount in addition to the rental. Of course, at the end of government control the railroad companies will pay back to the government whatever amount (probably the same or more) may then likewise be in the hands of conductors and agents.

"It is also true that approximately \$200,000,000 of working cash capital has to be kept on hand at all times in the hands of the federal treasuries of the United States Railroad Administration and in the hands of the Central Administration. Since the operating expenses average perhaps \$325,000,000 per month, this working cash capital of \$200,000,000 is relatively small. Nevertheless it absorbs for the time being that much of the resources of the Railroad Administration. At the end of federal control this cash will be released and will come back to the government; for the time being it is tied up in the conduct of the business in exactly the same way that the working cash capital is tied up in any other business.

"The result is that in making the first year's settlement with the railroad companies the Railroad Administration will have to use \$340,000,000 which in the last analysis must come out of the revolving fund and to that extent the use of the revolving fund represents no suggestion of loss, but purely an inevitable absorption of cash for the time being.

"It must also be remembered that it has been the policy of the government that the Railroad Administration shall finance temporarily a large part of the permanent improvements which have been made and which still must be made by the railroads during federal control. The amount required for these purposes promises to be several hundred million dollars, which likewise will ultimately be returned to the government. It is evident, therefore, that the absorption of the original \$500,000,000 appropriation and the

making of a very large additional appropriation will be needed for these essential purposes entirely apart from any question of losses which were incurred in operation during the war conditions which confronted the railroads in the first year of government control."

### T. C. Powell Director of Capital Expenditures

As briefly noted in last week's issue, Thomas Carr Powell, recently manager of inland traffic of the War Industries Board and formerly vice-president of the Cincinnati, New Orleans & Texas Pacific and Alabama Great Southern, has been appointed director of the Division of Capital Expenditures, succeeding Judge Robert S. Lovett. Mr. Powell is a man of wide railroad experience, and since the entrance of the United States into the European War has been engaged in important war work for the government. In November, 1917, he was detailed by the Southern Railway to assist Judge Lovett in the work in connection with the office of director of priority in transportation and on July 1, 1918, he was appointed by Mr. McAdoo as special representative of the Railroad Administration with the title of manager inland traffic of the War Industries Board. He was also a member of the priorities committee of the War Industries Board.

Mr. Powell was born September 5, 1865, at Cincinnati, Ohio, and since 1884 has been engaged in railroad service on lines connected with the Southern Railway System. Starting as mail clerk for the Cincinnati, New Orleans & Texas Pacific, he was consecutively rate clerk, chief rate clerk and chief clerk to traffic manager of the same road. On June 1, 1893, he was appointed assistant general freight agent of that road; on November 1, 1895, chief clerk to the general freight agent of the Southern Railway; on August 4, 1898, general freight agent of that road and the Northern Alabama; on July 1, 1899, assistant freight traffic manager of the same roads; on March 15, 1901, freight traffic manager, and on April 1, 1905, vice-president of the Southern Railway in charge of traffic. On August 1, 1907, he was also elected vice-president in charge of all departments of the Cincinnati, New Orleans & Texas Pacific and the Alabama Great Southern.

### Embargoes Under Regional Directors

The Car Service Section and the regional directors have been working out plans for a revision and regrouping of the zone embargo committees so that the issuance of embargoes will be placed to a greater extent under the jurisdiction of the regional directors, who believe that they will thus be able to eliminate the necessity for issuing embargoes in many cases. There are now 20 of the zone embargo committees and it is proposed to regroup the zones to correspond to regional lines, although there will be more than one zone in a region, reducing the number from 20 to about 15. There will be one at each regional headquarters, two for Canada and additional committees at Boston, Cincinnati, Seattle, Dallas, and possibly New Orleans and Wilmington. Under the new plan railroads will not issue embargoes without the

approval of the regional director, who may be able to take action to avoid the necessity.

### Contracts Signed

The director general has signed a compensation contract with the Great Northern providing for an annual rental of \$28,771,360.78. The contract also covers the following subsidiaries: Duluth & Superior Bridge, Duluth Terminal, Great Falls & Teton County, Great Northern Equipment Company, Great Northern Terminal, Minneapolis Belt, Minneapolis Western, Montana Eastern, Watertown & Sioux Falls. In addition co-operative contracts have been signed with the following short line railroads: LaCrosse & Southeastern, Coudersport & Port Allegany, Pittsburgh, Lisbon & Western, Kalamazoo, Lake Shore & Chicago, and Paris and Mount Pleasant.

About 30 contracts are now nearly ready for execution, but new action on them will have to be taken by the directors of the various companies because of the change in the name of the director general so that Mr. Hines can sign them, and it is expected that the bulk of the contracts with the railroads will be executed in the next 60 days.

### Max Thelen Director Division of Public Service

Effective on February 1, the existing Division of Public Service and Accounting, which has been under the jurisdiction of C. A. Prouty, will be reorganized into two divisions, the Division of Accounting and the Division of Public Service. Max Thelen, formerly chairman of the California Railroad Commission, and recently supervisor of contracts in the War Department and assistant to Major General Goethals, has been appointed director of the Division of Public Service; and Judge Prouty will continue as director of the Division of Accounting. Judge Prouty had desired to be relieved of some of the numerous duties devolving upon him and in order to continue his valuation work for the Interstate Commerce Commission, decided that it was necessary for him to give up some of his work for the Railroad Administration.

Mr. Thelen is a man of wide experience in dealing with the relationship between the public and the railroads. After serving as attorney for the Western Pacific from 1906 to 1911, he became attorney for the California Railroad Commission, serving in that capacity until 1915. In 1912 he became a member of the California Railroad Commission, and served as chairman of the commission from January, 1915, to June, 1918. In 1916 he was president of the National Association of Railroad Commissioners. Leaving the California Railroad Commission, he came to Washington in June, 1918, to engage in war work, and was appointed supervisor of contracts in the War Department and assistant to Major General George W. Goethals, director of Purchase, Storage and Traffic of the War Department.

The Bureau of Complaints and Suggestions, which has been operated under the direction of Theodore Price, actuary of the Railroad Administration, is to be transferred to the new Division of Public Service.

Thomas C. Powell

Max Thelen

### Board of Railroad Wages and Working Conditions

The Railroad Administration has made public the chapter from Mr. McAdoo's forthcoming report to the President for 1918 dealing with the work of the Board of Railroad Wages and Working Conditions. The report gives a brief outline of the functions of the board and a list of the supplements and interpretations to General Order No. 27, which have been issued based on its recommendations. In addition, the board now has before it four major investigations, as follows:

1. Wages and working conditions of engineers, firemen, conductors and trainmen in road and yard service.

2. Wages and working conditions of employees engaged on sleeping, dining and business cars.

3. Wages and working conditions of employees in the police department.

4. Wages and working conditions of employees of the American Railway Express Company.

Hearings in all of the above cases have been conducted, and the board is now considering the merits of the claims presented; and it is hoped it will reach a conclusion in the very near future. The report says:

"While very substantial increases in wages and greatly improved working conditions have been granted by recent wage orders, they have generally been less than men performing similar service for industrial concerns engaged in war work are receiving, which differentials are considered warranted on account of the permanency of employment on railroads, while the employment in other government activities was brought about by war conditions, and is more or less transitory. The object has been kept constantly in mind of creating a wage structure which in its essentials would survive the war period."

### Interstate Commerce Commission Decides Against Railroad Administration

The Interstate Commerce Commission has again overruled contentions advanced by counsel for the Railroad Administration in a case involving the relationship of rates increased by the director general's General Order No. 28, deciding that the rates on lumber and other forest products from Humboldt Bay points on the Northwestern Pacific north of Willits, Cal., to eastern points are unjust and unreasonable, in violation of section 10 of the federal control act, to the extent that they exceed the rates from California coast group points. The relation complained of existed and the evidence had been taken before the general increase in rates. Counsel for the administration at one time argued that under the federal control act there no longer exists any such ground of challenge to a rate as discrimination and that the commission was without power or jurisdiction to adjudicate the case. This position was subsequently modified and it was admitted that the commission had jurisdiction to determine the reasonableness of rates with reference to their relationship as well as to the measure of the rates, but it was then contended that the commission should take judicial notice of the abnormal condition of the lumber business during the war and that "the importance of rates and rate adjustments has disappeared to a very large extent for the period of the war," because no matter how high the freight rate the shipper did a profitable business.

Commissioner Aitchison in the decision says that "the more abnormal other conditions, the greater would seem to be the need for unswerving fidelity to the standards of justice and reasonableness in transportation charges" and the commission also took judicial notice that the war is at an end.

Because some newspapers featured this decision as indicating a conflict between the commission and the Railroad Administration, Director General Hines issued a statement saying in part:

"It is distinctly unfortunate that several newspapers, in reporting the decision in the Pacific Lumber Company case, have drawn the conclusion that there exists a controversy over the relative jurisdictions of the director general and the commission. It appears to be assumed in these stories that the director general has denied or sought to contest the right of the Interstate Commerce Commission to review rates initiated by him on behalf of the President. As a matter of fact, nothing could be further from the truth. The federal control act places such power of review specifically in the hands of the Interstate Commerce Commission, and the director general, time and time again, has recognized this authority by being represented before the commission by counsel who have argued as to the merits of contested rates.

"At no time since the government took possession and control of the railroads has there been the faintest suggestion of any conflict in jurisdiction between the commission and the director general. The most satisfactory understanding has existed as to the functions of each. At all times the director general has enjoyed the co-operation and assistance of the commission, and assurances to this effect have been most cordially given to the new director general. He is in entire accord with the statements which the commission has made in this case relative to the extent of its jurisdiction and there is no basis for assumption of any controversy on this subject." As indicative of his reliance on the commission the statement includes a letter sent by him to Chairman Daniels of the commission, on January 17, asking for suggestions and co-operation.

### Zone and Price Regulations on Bituminous Coal and Coke Lifted

Governmental restrictions on the prices of coke and all coal, except Pennsylvania anthracite, and the zone regulations covering the movement of these fuels by rail will be suspended on February 1, it was announced by the Fuel Administration. Restoration of both zone and price regulations will be immediately liable, should changing price, wage, labor, production, or other conditions demand it, the announcement said. It was estimated that when the President decided last May that the railroads should pay the government prices their fuel bill was increased by \$45,000,000.

The accumulation of stocks of bituminous coal sufficient to guarantee consumers a full winter's supply, is one of the basic reasons for the suspension of the regulations. On January 1 the average stocks of bituminous coal for the country were approximately sufficient for seven weeks' consumption and in the regions farthest from the mines 20 weeks' supply was on hand.

Zone regulations worked out by a joint committee of the railroad and fuel administrations were announced in March, 1918, dividing the country into 14 districts, and are credited with having saved the railroads 160,000,000 car miles, by eliminating cross hauls and allotting consumers to the nearest mines. The relation of this saving to the enormously increased production of coal in the United States is obvious. Under the spur of war demand production of bituminous coal in the United States in 1917 increased some 50,000,000 net tons over 1916, and there was a 12,000,000-ton increase in anthracite production. The railroads were required in 1917 to handle more than 60,000,000 tons of coal in excess of their 1916 load.

The Fuel Administration called special attention to the fact that the prices established under the provisions of the Lever act have been maximum prices, based on the cost of production, rather than on quality of coal, and that in the return to normal a different relation between prices in the several fields, based as in normal times on quality of coal, may fairly be expected to obtain.

Walker D. Hines, director general of railroads, has issued a statement denying that the Railroad Administration proposes to pursue a policy of so combining and using its purchasing bureau as to break down coal prices with the result of forcing a reduction in the existing rates of pay for mining labor. It is the policy, he says, to avoid at this time any undue concentration of its purchasing power of coal and to accomplish this purpose by permitting each road to purchase its own coal. It is further the policy to require that all bids made and accepted shall be based on the existing scale of wages; there can be no excuse, therefore, for the making of the claim that coal operators are forced to reduce wages by reason of the Railroad Administration accepting any prices which may hereafter be offered it for coal. It is already fully understood that the railroads are not to use the car supply as a means of affecting prices. The policy on the other points above referred to, is being clarified by the issuance of the following specific instructions to the purchasing agents of the roads:

1. The railroads must not violate existing contracts or cancel contracts where the quality of coal is in accordance with specifications, without special consideration by the Central Advisory Purchasing Committee of the reasons for cancelling.

2. The purchasing agent of each individual railroad shall buy the coal for that road under the supervision of the regional purchasing committee of his region. In all requests for bids, the following paragraph should be inserted:

"It is distinctly understood that all bids are to be based on existing rates of pay for all mine labor, and the price will be subject to readjustment in event existing rates of pay are changed."

On contracts awarded or orders placed, the following paragraph should be inserted:

"It is distinctly understood that the prices named herein are based on existing rates of pay for all mine labor and the prices will be subject to readjustment in event existing rates of pay are changed."

3. For coal which it is necessary to purchase for requirements prior to April 1, 1919, the purchasing agents of each railroad should request that bids be submitted. They shall not undertake to fix the price of the seller's acceptance or make offers therefor, and shall agree only upon a price that shall be contingent upon the pay-for-mine-labor clause in paragraph No. 2. No negotiations for contracts for coal for delivery after April 1, 1919, should be undertaken without first obtaining the approval of the regional purchasing committee.

### Conflict Between Authority of States and Director General

Railroad Administration officials do not seem to be worrying much about such action as that by the Ohio Public Utilities Commission which formally rejected the higher express rates initiated by order of Director General McAdoo on the ground that Ohio laws as to the filing of tariffs was not complied with. Mr. McAdoo recently issued a statement in which he made it clear that he was not going to be influenced by attempted state interference with his orders and it is stated that the increased express rates will continue to be collected in Ohio regardless of the action of the commission, just as they have been in a number of western states where the state authorities have refused to recognize the director general's authority over intrastate rates. The attitude of the Railroad Administration is that the law authorizes the President to initiate rates and makes no reference to state rate-making functions.

### Director General Asks Rate Committees to Expedite Rate Revisions

Walker D. Hines, director general of railroads, has sent the following telegram to B. Campbell, chairman of the Eastern Freight Traffic Committee, New York City; A. C. Johnson, chairman of the Western Freight Traffic Committee, Chicago, Ill., and N. B. Wright, chairman of the Southern Freight Traffic Committee, Atlanta, Ga.: "In taking up the duties of director general, I desire to express to your committee and the district committees my appreciation of your devotion to the work and intelligent effort on behalf of the Railroad Administration and my predecessor, and to ask your continued support. With the cessation of hostilities, it is both more practicable and more necessary

that the important rate matter, coming under your charge, should be disposed of promptly, and that the patrons of the roads should be able to secure a decision with the least delay, and I ask you to do all that is possible in this direction under the present conditions."

### Surplus Cars to Be Sent to Western Regions

Plans for the disposition of the large accumulation of surplus freight cars in the east, estimated to amount to 50,000 to 75,000, were arranged at a meeting in Washington last week of the assistant regional directors and the Car Service Section. In the east both box and coal cars have become a drug on the market. Surplus box cars suitable for grain will be sent to the western regions via Chicago, Peoria and St. Louis, to be stored until they are needed and then distributed to the railroads by the regional directors. Some difficulties which have been experienced because of the rejection of cars at the western gateways by inspectors on account of their condition were also ironed out at the meeting.

### Capital Expenditures for 1918

Total expenditures in connection with improvements and equipment chargeable to capital account for the calendar year 1918 amounted to \$573,334,119 for Class I roads, as compared with total authorizations amounting to \$1,218,969,505, according to a special statement compiled by the Division of Capital Expenditures. The figure for expenditures represents actual returns for eleven months and an estimate for December. The total includes \$265,931,052 for additions and betterments, \$289,388,544 for equipment, and \$18,014,523 for extensions. Of the equipment \$171,000,000 was on purchases by railroad companies and \$117,000,000 on purchases by the Railroad Administration, of which \$57,930,129 represents cash advanced on undelivered equipment. The total authorizations include \$16,522,002 for equipment unassigned and equipment assigned to terminal and switching companies.

### Operating Officers May Be Served in Suits

Director General Hines has issued General Order No. 50-a amending General Order No. 50, issued on October 28, providing that service of process in suits for claims for personal injury or for loss and damage may be made upon operating officials, operating for the director general of railroads, in the same way that service was heretofore made upon like operating officials. But the pleadings in such actions may on application be amended by substituting the director general of railroads for the carrier company as party defendant and dismissing the company therefrom. This will obviate the necessity for securing personal service upon the director general which has become of such frequent occurrence as to constitute something of a nuisance.

### Committee on Automatic Train Control Organized

The Committee on Automatic Train Control appointed by the Railroad Administration held its first meeting for organization at Washington on Thursday and, after deciding to appoint an executive secretary, discussed in a preliminary way the requisites which must be met by an automatic train control system. It reviewed the list of requirements drawn up by the American Railway Association in 1914. This subject will be considered further by the individual members of the committee and it is expected to promulgate a list of requirements after the next meeting on February 4.

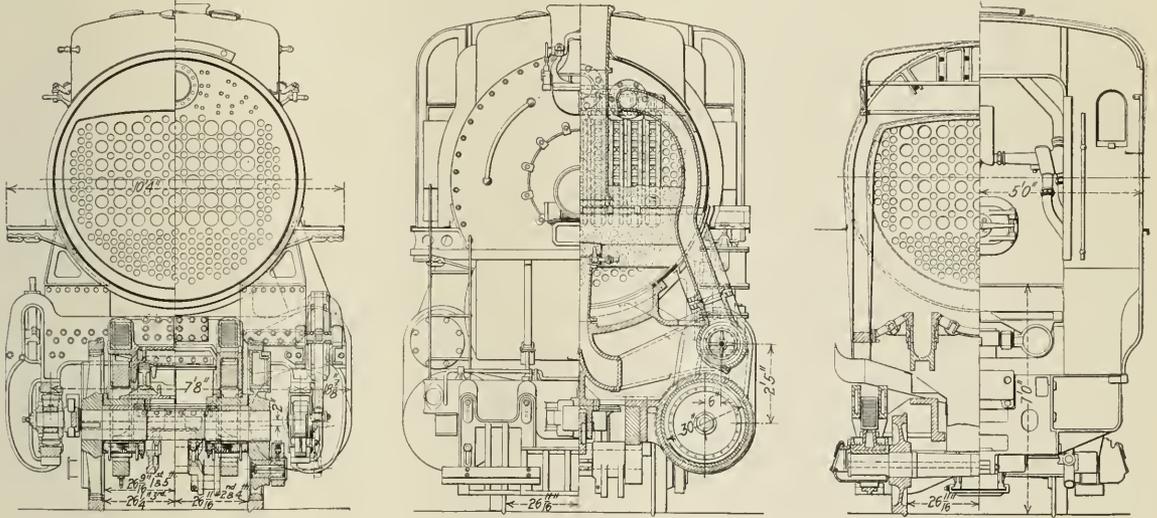

The St. Louis Chapter of the American Association of Engineers was installed at a banquet at the Planters Hotel, St. Louis, on the evening of January 18. About 150 members were enrolled.

# Heaviest 2-10-2 Type Built for Pennsylvania Lines

Design Permits Operation on 23 Deg. Curves; Pilot Meets Requirements for Road or Yard Service

THE PENNSYLVANIA LINES WEST of Pittsburgh have recently received from the American Locomotive Company several locomotives of the 2-10-2 type which are notable for two reasons. The total weight is greater than for any engines of this type previously built and yet they are able to operate on 23 deg. curves. Although these locomotives are extremely heavy they are in service on a division

the tractive effort obtainable with four driving axes. As the traffic conditions demanded heavier motive power, it was felt that the increase in tractive effort which would be secured with the Mikado type would be so slight that it was best to go to the use of five driving axes. This 2-10-2 type, which is known in the company's classification as the N-1-s was therefore designed. Orders have been placed with the

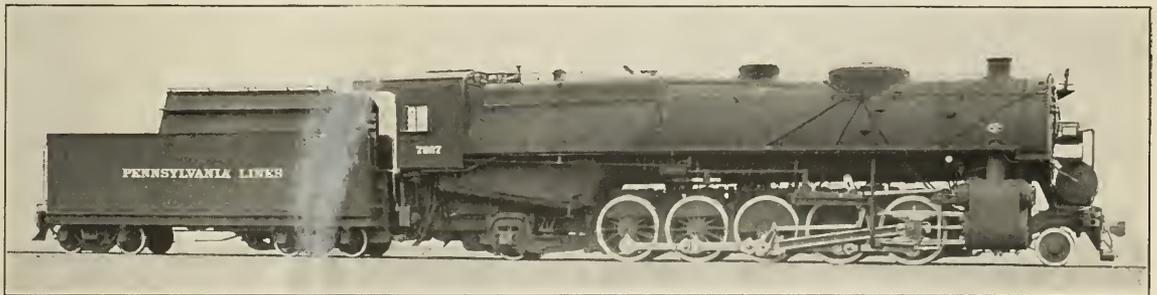

Sections of Pennsylvania Lines West 2-10-2 Type Locomotive

with low grades. All that have been received thus far are in use on the lines running from Conway Yard, near Pittsburgh, Pa., to Ashtabula, O., and Erie, Pa. The larger part of the traffic being handled is ore moving from Ashtabula to Conway, and coal from Conway to Ashtabula. The ruling grade on this line is 0.3 per cent and the engines are handling approximately 85 loaded ore cars, the rating being

American Locomotive Company for 35 of these locomotives and 25 of them are to be built at the Baldwin Locomotive Works.

Locomotives with five coupled pairs of driving wheels and a lateral motion driving box on the front axle cannot traverse curves sharper than 16 deg. In order to enable these engines to pass 23 deg. curves both the front and rear drivers

2-10-2 Type Locomotive for the Pennsylvania Lines West

7,100 adjusted tons, which amounts to about 6,000 actual tons.

The Consolidation type has long been the standard for freight service on the Pennsylvania Lines West of Pittsburgh. The recent designs developed practically the limit of

are fitted with the Woodward floating axle. The tires on these wheels are set  $53\frac{3}{8}$  in. apart and the main driving wheels have blind tires. In order to permit of coupling on sharp curves a pilot drawbar with a long shank is used and the pilot beam casting is cored out where the coupler enters

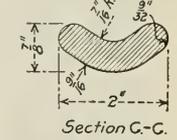

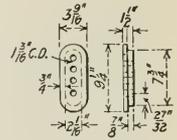

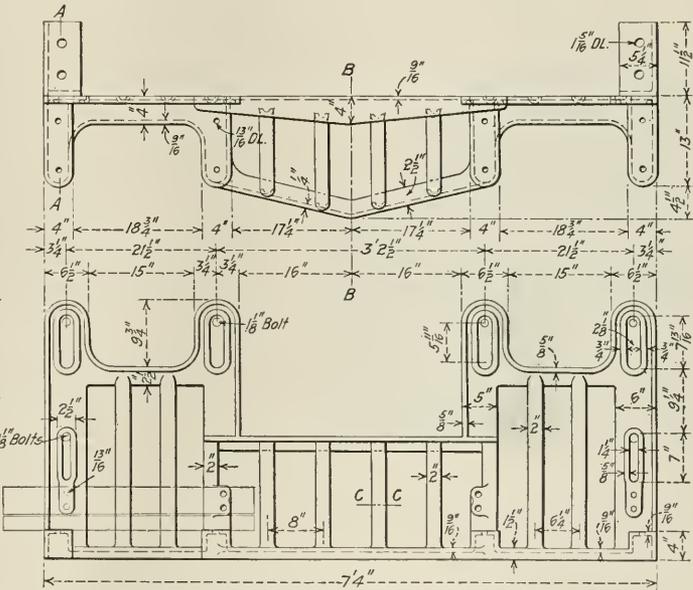

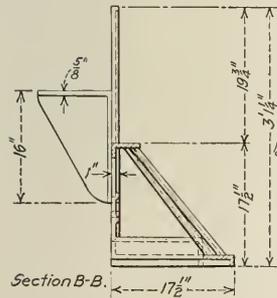

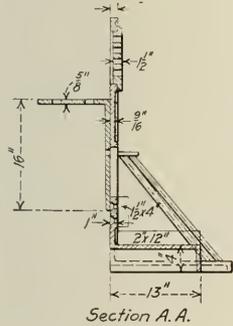

The principal dimensions and ratios of the locomotives are as follows:

General Data	
Gage	4 ft. 8 1/2 in.
Service	Freight
Fuel	Bit. coal
Tractive effort	80,942 lb.
Weight in working order	435,400 lb.
Weight on drivers	351,300 lb.
Weight on leading truck	23,100 lb.
Weight on trailing truck	61,000 lb.
Weight of engine and tender in working order	642,400 lb.
Wheel base, driving	22 ft. 2 in.
Wheel base, total	41 ft. 11 1/2 in.
Wheel base, engine and tender	82 ft. 7 1/4 in.

Ratios	
Weight on drivers ÷ tractive effort	4.34
Total weight ÷ tractive effort	5.38
Tractive effort × diam. drivers ÷ equivalent heating surface*	701.67
Equivalent heating surface* ÷ grate area	89.4
Firebox heating surface ÷ equivalent heating surface*	5.21
Weight on drivers ÷ equivalent heating surface*	49.1
Total weight ÷ equivalent heating surface*	60.9
Volume both cylinders	26.18 cu. ft.
Equivalent heating surface* ÷ vol. cylinders	273.1
Grate area ÷ vol. cylinders	3.06

Cylinders	
Kind	Simple
Diameter and stroke	30 in. by 32 in.

Valves	
Kind	Piston
Diameter	14 in.
Greatest travel	1 1/2 in.
Outside lap	1 1/8 in.

Cast Steel Pilot for Both Road and Yard Service

Inside clearance	1/8 in.
Lead in full gear	3/4 in.

Wheels	
Driving, diameter over tires	62 in.
Driving, thickness of tires	3 1/2 in.
Driving journals, main, diameter and length	12 1/2 in. by 15 in.
Driving journals, others, diameter and length	11 in. by 15 in.
Engine truck wheels, diameter	33 in.
Engine truck, journals	6 1/2 in. by 12 in.
Trailing truck wheels, diameter	36 in.
Trailing truck, journals	7 1/2 in. by 13 1/2 in.

Boiler	
Style	Conical Belpaire firebox
Working pressure	1205 lb. per sq. in.
Tubes, number and outside diameter	196, 2 1/2 in.
Flues, number and outside diameter	54, 5 1/2 in.
Tubes and flues, length	20 ft. 10 1/4 in.
Heating surface, tubes and flues	4,302 sq. ft.
Heating surface, firebox, including arch tubes	423 sq. ft.
Heating surface, total	4,725 sq. ft.

Superheater heating surface	1,618 sq. ft.
Equivalent heating surface*	7,152 sq. ft.
Grate area	80 sq. ft.
Center of boiler above rail	10 ft. 1 1/4 in.

Tender	
Tank	Rectangular water bottom
Frame	Cast steel
Weight	207,000 lb.
Wheels, diameter	33 in.
Journals, diameter and length	6 in. by 11 in.
Water capacity	10,000 gal.
Coal capacity	20 tons

\*Equivalent heating surface = total evaporative heating surface + 1.5 times the superheating surface.  
 †Designed to carry 250 lb. per sq. in. pressure.

### Report on Marshfield Collision

THE INTERSTATE COMMERCE COMMISSION has issued a report, dated November 27, and signed by W. P. Borland, chief of the Bureau of Safety, on the butting collision which occurred on the St. Louis-San Francisco near Marshfield, Mo., on September 17, resulting in the death of twelve passengers and three employees, and the injury of 35 passengers and five employees. Eastbound extra train No. 1260 carrying troops, collided with a westbound freight train, second No. 39. Responsibility for the collision rests

on the train dispatcher, and the engineman of No. 1260. The dispatcher issued an order giving the troop train the right to the road, but did not send a copy to the freight train. He asserted that he transmitted a copy by telephone to the operator at Conway, at 6:08 p. m.; but this operator showed that he was out of the office at that time, and he produced corroborative testimony from a man who had accompanied the operator from his house to the station, after supper, about 6:20 p. m. The engineman of the troop train asserted that automatic block signal 2126 was clear for him, but evidence of other witnesses satisfied the inspector that it was in the stop position.

The dispatcher had been in the service of this road only 25 days, but is said to have had several years' experience as an operator on other roads. The engineman had been a fireman since 1905 and an engineman since February, 1918.

## American Locomotives Needed for Chinese Railways

By Charles Denby

Special Assistant to Department of State, in Millard's Review

ONE OF THE URGENT NEEDS of China today is locomotives. The demands upon the railways have far exceeded the expectations of the builders. The locomotives bought in the first instance have proved too small, and it is now clearly realized by the technical advisers of China that they must standardize upon a type that will meet their needs for a long time to come. This question is being earnestly considered at the present time, and the problem arises for American consideration: Will the standardization be along the lines of American design or will it be made to conform to a European model to the detriment of American interests?

Of the 15 lines composing the system of Chinese Government railways only one was built by the Chinese themselves; it is financed by the Chinese government and is operated exclusively by Chinese. The funds for the construction and equipment of the various other railway lines of China were furnished by foreign capital of various nationalities, but not in a single instance has America so constructed and equipped

**An American Built Locomotive on a Heavy Grade at Nankow Pass on the Peking-Kalgan-Suiyuan**

any of these lines. As a result today the Continental (European) design of locomotive is predominant in China. On some of the lines, notably those under English and (hitherto) German influence, not a locomotive other than those built in accordance with the prevailing design common to the nation financing the railway was purchased or even considered, either for initial or subsequent equipment—at least up to the time of the outbreak of the war. Only in the case of the Chinese financed and operated railway have American builders been given a free hand, with the result that an American design was adopted and a thorough standardization of power effected on this line.

The latest statistics published by the Chinese Government railways (June 30, 1915) show that of a total of 6,600 kilometers (about 4,100 miles), including main and branch lines, industrial tracks, sidings, etc., the three principal trunk lines compose approximately 62 per cent of the total. One of these three lines is under English, one under Belgian and French and one under combined English and (hitherto) German influence. Out of a total of 638 locomotives in service

on all lines at that time only 15½ per cent were of American design and manufacture, and on the English, Belgian and French lines mentioned, which operated at that time 365 locomotives, or approximately 60 per cent of the total, only 8, or approximately 2.2 per cent, were of American design and manufacture.

Since the outbreak of the war but few locomotives have been purchased and placed in service in China, owing principally, perhaps, to a lack of available funds and to internal disorders in the country. As a result of this and of the constantly increasing traffic, the railways are now urgently in need of power. As is often evidenced in the case of new roads, this particular instance of China shows that traffic has increased far beyond the estimates that were made when the initial equipment for power was under consideration, with the result that in addition to the natural depreciation and abandonment of locomotives on account of age, those left in service are light and not of adequate power for the most part to handle the traffic of today.

In 1917, 24 additional heavy locomotives were placed in service, and in 1918, up to the present, 2 more have been erected and 4 are under process of assembly for the Government lines. Orders have been placed or are about consummated for the further addition of 56 locomotives—all for the urgently needed heavier power. Of this number 38 are to be built strictly in accordance with American design and all are from American builders. In addition to this number there are 2 on order and 21 being considered for private lines; these locomotives are to be of American design and standards.

The question of the standardization of power and rolling stock is just now being most earnestly considered by the Chinese government, but a considerable time may elapse before this scheme becomes an assured fact. One American builder has for the past seven years been anticipating the coming of this event, and since the standardization of power on the Peking-Kalgan line every locomotive sold into China by this builder, whether for government or privately owned railways, has been designed and furnished with this end in view.

Pending the adoption of a standardized power by the Chinese government the greater the number of modern American design locomotives that can be furnished to the railways here the greater will be the opportunity to obtain the adoption of a strictly American design as the standard of power for China. The benefit of this to American interests is incalculable and should not be lost sight of.

### Automobile Trucks in Iowa

The Highways Transport Committee of the State Council of National Defense, of the state of Iowa, reports that motor trucks are extensively used on the highways of that state in hauling livestock. In a report prepared for the purpose of showing the importance of having an extensive system of concrete highways in that state it is said that the livestock hauled to packing houses in Iowa—period of time not stated—has aggregated 225,600 head of hogs; 23,408 head of cattle, and 61,402 sheep. It is estimated that this amounts to 35,003 truck-loads, hauled an average distance of 35 miles; and that 6,250 railroad freight cars have thus been made available for other service. A considerable part of this livestock movement has been carried out by trucking companies which take freight and express from the cities to small-town merchants, and carry the livestock on the return trip. There are 61 such trucking companies. There are also in the state 187 trucks running on regular advertised schedules, hauling merchandise and farm products, but not taking part in the livestock traffic.

# Government Ownership From a British Point of View

## Nationalization Stifles Initiative, Adds to Administrative Costs and Discourages Inventiveness

From Engineering (London), December 13, 1918

THE ANNOUNCEMENT made last week by Mr. Churchill that the government had decided on the nationalization of the railways, renders it incumbent on engineers to exert such influence as they possess to prevent a repetition of the mistakes which have occurred on previous occasions when services hitherto administered by private companies have been taken over by the public. It unfortunately happens in the present instance that the possible advantages of nationalization lie on the surface, and are obvious to the meanest capacity, but it is all important for the future of the transportation problem that this "meanest capacity" shall not have the determining voice in the establishment of the new order of affairs. The dangers to be feared as a result of the suggested action are less patent, and are less likely to be generally appreciated, having relation to mind rather than to matter.

Orators have been eloquent in depicting public companies as caring for dividends merely, and nothing for the public. Nevertheless, in actual practice it has been the Post Office, and not the railway officials, which by their neglect and indifference have continued to provide themes for the pen and pencil of our modern satirists. The supercilious young lady who is occasionally found behind the counter of our postoffices, has had no counterpart in our railway services.

### Practice Disproves Theory

How is it that in this country every great service taken over by the public from private companies has failed to realize the anticipations of the advocates of the change? The telegraphs were purchased with assurances of the most prosperous and profitable future. But few years had elapsed, however, before it had to be admitted that these forecasts had been wholly falsified, and that the service was being run at a loss, although the companies, hampered by restrictions from which the nationalized undertaking was free, had been nevertheless worked at a profit. Much the same has happened with the telephones, and it has not been without interest to observe during the past few days in one column of a journal, violent complaints of the inefficiency of the nationalized telephone service, and in another column rosy anticipations of the economies and improvements to be effected by the nationalization of our railways. Still a third instance of how far realization has fallen short of anticipation is afforded by the Metropolitan Water Board.

The telephones, of course, were acquired at considerably below a fair valuation. No credit was given for the imponderables which, as we pointed out last week, often constitute so large a proportion of the value of a growing concern. Mere materials were alone assessed, and no allowance made for the capital necessarily expended in pioneering work and in building up the organization. In America materialism is less rampant than here, and the Interstate Commerce Commission has definitely laid it down that expenditure, even on an experiment or enterprise would prove unsuccessful, may be fairly taken into account in valuing an undertaking. If progress is to be made, novel schemes and devices must be adventured on, and of these a certain proportion are sure to prove failures; yet their cost remains, notwithstanding, a fair charge on the enterprise.

In the case of the Metropolitan Water Board, it has been freely asserted that the price paid was excessive, but, as a

matter of fact, the value of the mains alone was nearly equal to the full amount paid. To lay these mains in open country would have cost, under the most favorable conditions, not less than £10,000,000 (about \$50,000,000) and the cost of main laying in towns is, as is well known, at least three or four times as much. Hence, the value of the mains alone was nearly equivalent to the full purchase price. To repeat our question, how is it that, in all these several cases, there has been such a wide discrepancy between promise and performance?

### Administrative Charges Higher Under Public Control

Undoubtedly the main reason lies in the difference in the organization. The administrative charges tend to be much higher under the public than under the private control. This is, no doubt, contrary to anticipation, and some would assert, contrary to reason. Reason, however, is of itself but an indifferent guide to truth, and the late W. B. Bryan, chief engineer to the board, has stated that the administrative cost of the London Water Board exceeded the aggregate administrative costs of the eight companies which it replaced. According to a recent statement by Harold Cox, a similar result has followed the nationalization of the Swiss railways. He says that the administrative staff is larger than that of the five companies which were absorbed. The real cause of the inefficiency of the public services seems to lie in the fact that these increased administrative charges are all due to an increase in the clerical and statistical staffs, and to a reduction in the departments responsible for creative thought.

An interesting light on this matter is shown by a study of the terms on which the staff of the telephone company was taken over in 1911. Here the rule was laid down that any company official who, by showing initiative and imagination in the company's service, had secured a salary of over £700 (about \$3,500) per annum, was, ipso facto (save in special cases), disqualified for the government service. So far from "men of push and go" being required, it was to a large extent the men of "push" who had to "go."

### Initiative Stifled in Government Undertakings

In fact, the whole system of organization was changed. As described by a district superintendent a couple of years after the transfer, all initiative and independence of judgment was suppressed. He knew, he said, exactly where certain matters were going wrong, and how they could be remedied, but if he made any move whatever he would be straightway informed "that the matter did not concern his department." Again, small difficulties which, under the company's management, would be settled locally out of hand, had, under the new regime, to be referred to headquarters. The original memorandum received additions at each step of its stately progress from official to official up to the one man who alone had power to settle the affair, trivial though it might be. In many cases, moreover, the memorandum on reaching this official was returned along the same devious path for further data, and had again to retrace its steps to the departmental head before a final decision was taken. The net result was that, instead of the one man who understood the whole of the local conditions settling the matter in half an hour, hosts of officials had all to spend time on it, and weeks might elapse before the final settlement. Obviously, any such system as this must necessarily find em-

ployment for a vast army of clerks, so it is easy to see how the administrative costs are increased.

### Executives Swamped with Trifles

The evil of such a system does not end here, one of its consequences being that the head of the department, who ought to have ample leisure for the consideration of important matters of policy, has practically his whole time taken up with trivialities which, in any efficient organization, would have never reached him. In this connection, it may be noted that on certain of the great American railways, it has been the custom to relieve the vice-president of all routine work, so that he and his immediate staff may give the whole of their time to the consideration of new proposals for increasing the effectiveness of the service. In the public services there is nothing analogous to this, and, indeed, the powers even of the heads of departments are often extraordinarily, and indeed ludicrously, restricted.

To sum up, the traditional organization of our public services has been to discourage initiative and independent judgment on the part of subordinates, and greatly to restrict responsible action in the case of heads of departments. As one result, we have not in any public service "*la carriere ouverte aux talents*." Able young men, who later on should fill the higher administrative posts, get no opportunity as subordinates for the display of any but humdrum qualities, and are thus not sorted out from the general average. As one result, men competent to supervise the many new undertakings which had to be extemporized during the past five years, were found almost anywhere save in the civil services. Indeed, not the least debt of the nation to the railway companies is due to their work during the past years revealing the abilities of the numerous men which the state borrowed to control so many of our war services.

If the question of the nationalization of our railways is to come up for discussion, it is perhaps as well that it should come now, while the memory of this contrast between the results of company organization and public services organization is fresh in the public mind. It should make it easier to resist the attempt to establish a new organization molded on traditional lines, which all experience shows to have proved singularly unsatisfactory.

### Nationalization Unsuitable to a Democracy

No doubt the German state railways were managed with fair efficiency, even if the staff was mainly parasitic on English or American thought, but an organization which may be effective in an autocratic country is unsuitable to a democratic one. Commenting on this point some 18 months ago we observed that while the best public service in a democratic country had never, in the whole course of history, been as good as the best in an autocratic country, yet, nevertheless, there was reason to believe that the worst in a democratic country had never been quite so bad as the worst in an autocracy. Whether this view can still be maintained depends very much on whether the Bolshevik regime in Russia is to be regarded as autocratic or democratic. Our own view is in favor of the first alternative, but some of the most fervent of those who claim to be the apostles of democracy in this country seem ardent advocates of the contrary opinion.

### Standardization Versus Invention

Among the advantages claimed for the nationalization of an industry is that the reserve of stores will be greatly reduced by the greater standardization which becomes possible.

The theoretical benefit of such a change is obvious, but experience shows that it may, on occasion, be purchased somewhat dearly. In the case of the telegraphs, the extensive standardization of instruments effected on taking over these

undertakings from the companies, destroyed competing centers of thought, and the result was, to a large extent, stagnation. A leading American authority has stated that up till 1870 more than one-half of the important improvements effected in telegraphy originated in Britain, but that subsequently the Postoffice simply imported improvements ready-made from abroad. On the other hand, we continued as before to make the most important contribution to improvements in submarine telegraphy, which remained under private direction and control. An instructive example of the difference between public and private action in this regard is afforded by the history of long-distance telephony. The principle now in use originated as is well known with Oliver Heaviside, but our postal authorities refused to help him to practicalize his ideas. Some abortive experiments were made, it is true, but not under his direction or control, and the scheme was reported to be a failure. Some years later Mr. Heaviside's idea was taken up in America and most ably worked out by Professor Pupin, who in contrast to Mr. Heaviside received the most generous support and reward from the Western Union Telegraph Company, with the result that all difficulties were overcome and the scheme made a practical success. Pupinized cables have, moreover, solved the difficulties of submarine telephony. It will be noted that there are many more systems of state telephones than company-controlled systems, yet this great advance was secured by a company and not by a state service.

The sole chance of maintaining the efficiency of our railway services under state control would be that the essential features of the present organization should not be materially changed. Of course, the ill effects of a change would not be experienced at once any more than they were in the case of the Metropolitan Water Board. In fact, a few years after the transfer the chairman of that board made a grandiloquent speech, in which he enumerated the many improvements which he claimed were due to the board; all these, he said, had been made "without one penny cost to the public." As a matter of fact, up to that date the board was, to all intents and purposes, living on accumulated capital. Every work, whether completed or commenced up to that date, was, in fact, a company scheme worked out before the drastic reduction in the engineering staff. Later on, when really new works had to be undertaken, the weak spot became evident. The staff was inadequate and the few creative minds retained were overloaded with routine.

### Nationalization Means Loss of Creative Minds

With the transfer of the railways to the public, there will, undoubtedly, be a strong movement to reduce very largely the higher technical posts. Under mistaken ideas as to the all-importance of abolishing overlapping, independent centers of thought may be suppressed, with the result that our railways may become purely parasitic for ideas on company managed lines in other countries. It is of first importance that this tendency should be resisted, though even if former precedents be followed, the evil effects would not appear at the outset, any more than they did in the case of the Metropolitan Water Board. The best of the old officials—or some of them—would, no doubt, be retained, but if all initiative in subordinates is to be discouraged in accordance with the past traditions of our national services it will be impossible, as the present leading men die off or are superannuated, to replace them with men of equal caliber.

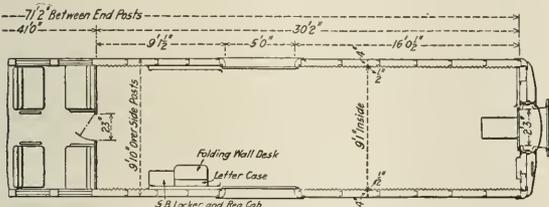

An investigation by the Interstate Commerce Commission of present methods of purchasing railroad ties, car material and crossing planks, and of the possibility of using substitutes for wood ties is proposed in a bill introduced in Congress by Representative Dyer, of Missouri.

# Standard Passenger Car Equipment

THE COMMITTEE ON STANDARDS for Locomotives and Cars of the Railroad Administration has approved the general arrangements for the passenger; passenger and baggage; passenger, baggage and mail, and passenger and mail cars, the floor plans of which are shown in the illustrations. No other drawings, nor the specifications have been drawn for this equipment because of the uncertainty as to whether any of these cars will be built. All the cars are 70 ft. in length and are of the same general design. The illustrations show the complete floor plan of the passenger car and half plans of the other cars, as the passenger end of all cars is the same. The designs for these cars will follow in a very general way that of the 70-ft. baggage car, which was published in the *Railway Age* of September 27, 1918, page 585.

The following is a list of the specialties recommended by the committee for the standard passenger carrying cars:

*Inside finish:* Water and fireproof, 1/4 in. mahogany window sills. Three star Agasote below wooden window sill and steel above.

Half Floor Arrangement of U. S. R. A. Passenger and Baggage Car.

*Ceiling:* Upper deck water and fireproof—three star Agasote 1/4 in. thick. Lower deck water and fireproof—Agasote 3/16 in. thick. Deck to be painted with slush paint. Ceiling to be painted light color enamel of approved shade.

*Ceiling decoration:* Single plain sap green color line on lower and upper deck. Line only varnished over to hold decoration.

*Window sash:* Brass sash complete with fixtures as shown on Baltimore & Ohio blueprint No. 10,745. All windows to be double sashed except toilet room windows. Sash to raise 18 in.

*Deck panels:* All swinging deck panels to be equipped with T. U. Company's Eclipse ratchet. No deck sash to be used, swinging panels only at ventilators.

*Window glass:* American polished plate 3/16 in. thick, except in saloons and lavatories, which are to be equipped with pressed prism design 0-1, with smooth surface outside.

*Door glass:* American polished plate 1/4 in. thick.

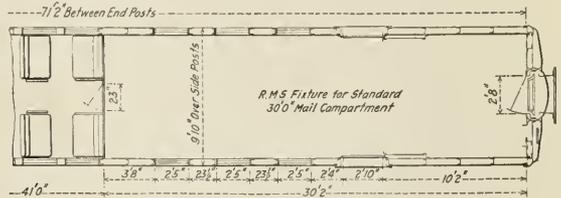

*Window shades:* Railway standard mercerized on inside, pantasote on outside. Width of curtain goods in windows not more than 1/4 in. less than distance between window casing. Color of shade to be selected.

*Heating system:* Chicago Car Heating Company's vapor system to be guaranteed by manufacturers to register an inside temperature of 70 deg. when the outside temperature is 20 deg. below zero. Holes through center sills for train line sufficiently large to prevent chafing of pipe due to expansion or contraction. Piping so applied as to give ample clearance between all body and truck parts when cars are rounding 170 ft. radius curve. Same to include extra heavy pipe for train line.

*Steam hose and couplings:* Steam hose to be 1 1/2 in. by 24 in. Couplings to be of the S-4 type.

*Steam pipe:* Train pipe 2 in. wrought iron. Pipe and fittings extra heavy. Piping inside of car 1 1/2 in. standard pipe.

*Foot rests or guards:* Pullman type, perforated steel.

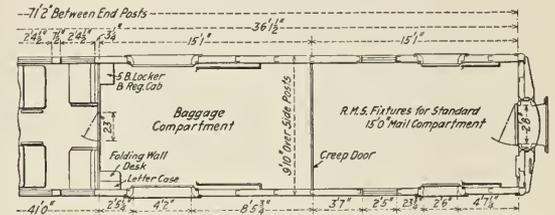

Half Floor Plan of U. S. R. A. Passenger and Mail Car

*Wrecking tools and cases:* Steel box fitted with No. 6 sledge, axe, saw, fire bucket, hack saw, six hack saw blades, cold chisel and steel bar, located to comply with state laws.

*Hardware:* To be of the Pullman type.

*Floor covering:* Floor covering to be of plastic material, thickness to meet linoleum 3/4 in. to the top of chanarch, and then an aisle strip of green or red linoleum laid so that the top will be on the level with the inlay and of suitable color to harmonize with the interior finish of the car, chanarch to be 22 B.W.G. gage galvanized. Brass strips to be placed on either side of the linoleum as shown on Baltimore & Ohio blueprint No. 31,189.

Half-Floor Arrangement of U. S. R. A. Passenger, Baggage and Mail Car

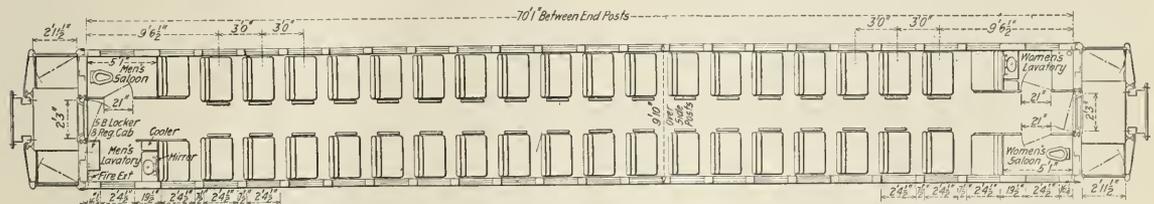

*Equipment:* One deck sash opener. One step box (Dunbar.)

*Basket racks:* Three-section continuous type.

*Coat and hat hooks:* In saloons and lavatories.

*Check holder:* Fitch.

*Platform and end of car:* Cast steel integral with body bolster as manufactured by Commonwealth Steel Company, or built-up type of approved design.

Floor Arrangement of the U. S. R. A. Standard 70-ft. Passenger Car

*Shade fixtures:* Rex, all-metal shade roller. Curtain Supply Company, ring type No. 88.

*Shade rolls:* Rex, all-metal shade roll.

*Seats:* Hale & Kilburn, walk-over type, high back, with head rest, steel ends, wooden arm rests, No. 197, or its equivalent.

*Seat covers:* Seat covering to be selected later.

*Ventilation:* Clerie story deck, eight per car. Utilities ventilator 100 per cent, Peerless 90 per cent, Garland Honeycomb 75 per cent.

*Water coolers:* White metal, North Pole sanitary drinking fountains with filter attachment, arranged suitably to design of car.

*Wash stands:* White metal. Plumbing under wash stands to be open with nickel fittings. Wash stands fitted with Adams & Westlake throw-over lever type of faucets and drain fixtures of Pullman standard.

*Water supply:* Pullman standard air pressure water system. Galvanized steel piping. Cold water only. Metal tank box insulated.

*Gates:* Each car to be equipped with safety gates, Pullman type, and permanently attached at each end of car.

*Steps:* Steps to be of steel with metal safety treads of abrasive material and have no nosing.

*Draft gear:* Miner friction class 5-A-P.

*Buffer device:* Miner friction, Class B-10, or equivalent.

*Diaphragm upper buffer:* Fowler upper buffer spring.

*Vestibule:* Wide type Pullman standard, with Imperial wide face plate.

*End doors:* Mahogany with finger guards.

*Diaphragms:* To be of steel. First choice Dunbar, Style C. Second choice, Pullman. Third choice, Rex.

*Vestibule curtains:* Pullman, first choice; Acme Automatic, second choice.

*Vestibule shield:* Pullman or Acme revolving type.

*Vestibule curtain, hook and handle:* Rex, first choice; Robertson Safety, second choice.

*Vestibule trimming:* Enameled body color.

*Vestibule grab handle:* All handholds, grabs, to be smooth wrought iron,  $\frac{3}{8}$  in.

*Trap doors and lifting device:* First choice to be T. U. Company's National high station platform type, arranged to open up after and outside of vestibule doors. Second choice, Edwards, and third choice, Pullman. *Air brakes:* The Universal, common standard, high-speed automatic brake equipment, schedule UC-18, shall be used without electric features and with type K-1 automatic slack adjuster placed on brake cylinder. J. M. expander ring. Ten pound spring type retaining valve and one conductor valve.

The air brake shall develop a nominal brake power of 90 per cent of the complete light weight of the car with 60 lb. cylinder pressure, and be capable of 150 per cent braking power in emergency.

All parts of truck and foundation brake gear to withstand stresses in accordance with M.C.B. standards;  $1\frac{1}{4}$  in. extra heavy brake pipe to be used. All pipe fittings except those regularly included in the air brake schedule shall be "Extra quality individually tested pipe fittings for railroad air brake service." All air pipe to be blown out before pipe is assembled.

*Hand brakes:* Miner or Western Railway Equipment, or Lindstrom improved.

*Braking and signal cord:* Signal cord,  $\frac{3}{4}$  in. steel cord, braided green. Conductor's cord,  $\frac{3}{4}$  in. steel cord, braided red, both applied along center of car upper deck supported.

*Painting:* U. S. Standard.

*Roof:* Steel. To be of material which has been thoroughly sand blasted, painted and sanded on the outside.

*Trucks:* Cast steel.

*Truck wheel base:* 11 ft.

*Center plates and center fins:* Cast steel separable, arranged for application to cone bolster locking center pin.

*Side bearings:* Frictionless rolled side bearings for six-wheel passenger trucks. Miner first choice, Perry second choice, Woods third choice.

*Equalizers:* Wrought iron.

*Wheels:* 36 in. rolled or forged steel.

*Pedestals:* Cast steel.

*Journal bores:* National Malleable Castings Company's pedestal type complete with lids for axles with 5 in. by 9 in. journals.

*Journal bearing keys:* To be drop forged M.C.B. dimensions suitable for axles with 5 in. by 9 in. journals.

*Brake shoe:* Diamond S.

*Floor insulation:* To be 1 in. quilted hair felt with paper on both sides.

*Insulation, super-structure:* Body insulation to be  $\frac{3}{4}$  in. quilted hair felt with paper on both sides applied to inner surface of the side walls and end sheeps.

*Saloon hoppers:* Dayton Company's Eckert No. 8 with porcelain hopper chute as manufactured by Dayton Manufacturing Company, or Pullman Standard (Duner). Hopper in women's lavatory to have double lid and men's lavatory to have single seat with horseshoe opening. Toilet paper holder, Pullman type, to be applied in each saloon.

*Designating signs:* Pullman style, to show location of each toilet. one illuminated sign to read "Men" in end of car where men's toilet is located. Sign to be placed inside of car on bulkhead. Same method to be used at ladies' end and sign to read "Women."

## Orders of Regional Directors

**I**NSURANCE COVERING PASSENGER AND FREIGHT ELEVATORS. Eastern regional director, file 1800-113A418. Same as orders noted on page 206 of *Railway Age*, January 17.

*Employees Accepting Positions on Other Railroads at Higher Salaries.*—Eastern regional director's file 1200-4-63A412, similar to Southwestern regional director's Order 148. See *Railway Age*, January 17, page 205.

*Back Pay to be Included in December Operating Expenses.*—The eastern regional director, file 401-7A419, orders that there be included in operating expenses for the month of December, 1918, any amounts of back pay provided for by General Order 27, or supplements thereof, which have not been included in operating expenses prior to that month. If pay rolls have not been prepared as accurate an estimate as possible should be made and included in December expenses.

*Endorsements on Administration Passes.*—The Eastern regional director, file 2100-29A432, states that it is understood that rubber stamp endorsements are being placed on Administration passes. There has been no authority for this and no endorsements or changes should be made on these passes without first securing the approval of the Director of Operation.

*Writing Material on Club Cars.*—The Eastern regional director, file 1600-83A433, requests that on such club cars, buffet-library cars, observation cars, etc., as are now in operation or may be restored in the future, a reasonable supply of writing material, together with pens and ink, be provided without charge to the public.

*Food Conservation Posters in Passenger Cars.*—The Eastern regional director, file 1500-80-1A429, states that on account of the necessity for exporting food to Europe, the Food Administration prefers to have its posters remain in passenger cars for the present.

*Discontinue Picking Up of Stored Coal.*—The Eastern regional director, file 301-3A426, advises that picking up of stored coal shall be discontinued immediately, except in cases of emergency.

*Location of Air Pumps on Locomotives.*—The Eastern regional director, file 500-73A424, states that when air pumps are applied to locomotives, care should be taken that they are so placed as not to obstruct the vision of men on the locomotives; as locomotives receive Class 1, 2 or 3 repairs the pumps should be properly located.

*Transportation of Corporation Officers and Employees.*—Supplement 9 to Order 109 of Southwestern regional director, similar to Supplement 14 to Circular 29 of Central Western regional director, abstract of which was published in the *Railway Age*, January 10, page 159.

*Fire and Casualty Insurance on Construction Work.*—The Eastern regional director, file 401-5A430, quotes from a letter received from Theodore H. Price, actuary to the Railroad Administration, as follows:

"I am writing to inform you that after careful consideration the Honorable John Barton Payne, general counsel to the Railroad Administration, has decided that inasmuch as the cost of fire and casualty insurance on construction work that is chargeable to capital account is properly to be considered as part of the cost of such work, such insurance should be provided in accordance with the practice of the railroads prior to governmental control. The premiums paid therefor are to be included in the accounting made and accepted for work of this character."

*Disregard of Shippers' Routes.*—The Eastern regional director, file 600-4-102A438, states that the Food Administration Grain Corporation complains that some railroads are not protecting the lowest rates on shipments which they forward un-routed, and which the railroads for efficiency reasons send via a route over which a higher rate applies, but in such cases are collecting the higher rate, and insisting that it will be necessary for the Grain Corporation to file reparation claims for refund. This is not in accordance with instructions of the regional director, file 3000-124, on the subject of Disregard of Shippers' Route, Article 4, of which reads as follows:

4. When traffic is forwarded by the railroads for efficiency reasons via a route to which a higher rate applies than over the route specified by shipper, the rate via shippers' route must not be exceeded as a charge for the movement over the substituted route.

*Elimination of Sunday and Holiday Work.*—The Eastern regional director, file 1200-2-29A420, reproduces a letter from the Director of Operations which is self-explanatory:

"If you have not already done so, won't you please immediately arrange for a thorough investigation and study to be made on the roads in your region with respect to the elimination of Sunday and holiday work, in order to carry out the desire of the director general as expressed in Supplement No. 13 to General Order No. 27.

"In order that the director general may know what progress is being made, and that his wishes in the matter are being fully met, I believe it advisable that you have your federal managers make reports from time to time indicating to what extent they have found it possible to either wholly eliminate or reduce to the minimum Sunday or holiday work."

*Interest During Construction.*—The Eastern regional director, file 2700A417 refers to file 2700A409, (*Railway Age*, January 17, page 205), regarding interest on construction expenditures and rates of depreciation accruals. That portion referring to depreciation on equipment coming into service subsequent to December 31, 1917, should be corrected to read as follows:

"Also arrange for accruing depreciation at the rate of 4½ per cent per annum on the book value or original cost of all equipment first placed in service subsequent to December 31, 1917, including equipment assigned by the United States Railroad Administration."

*Director General's Name on Stationery.*—The Eastern regional director, file 1500-1-3-8A431, orders that Director General Hines' name appear in place of Mr. McAdoo's on

any stationery which may be ordered in the future; correct by rubber stamp or other suitable means, such stationery as may be on hand, by substituting Director General Hines' name (Walker D. Hines) for that of Mr. McAdoo. It will not be necessary, however, to change any existing supply of tickets or tariffs.

**Rental Charge on Locomotives.**—In Order 150 the Southwestern regional director announces that the rate for the rental of locomotives to industries and small lines has been set at one-tenth cent per pound of tractive power per day with a minimum of \$30 per day, and that this rate of rental will apply in all cases of locomotives loaned to any such industries or small lines. Any engines rented which are covered by a contract entered into prior to the date of Order 126 of the Southwestern regional director, shall continue at the same rate of rental as provided in such an agreement.

**The Master Boilermakers' Association.**—The Eastern regional director, file 102-1-9A435, states that the Master Boilermakers' Association will hold its convention at the Hotel Sherman, Chicago, Illinois, May 26, 27, 28 and 29, 1919. As this organization has been recognized and encouraged by the railroads on account of its educational value, approval has been given for the holding of the convention. Please arrange for master boilermakers, boiler shop foremen, general boiler inspectors and others employed in a similar capacity to attend, as far as they can be spared without detriment to the service. Each road should follow its usual practice with respect to allowance of time and expenses and furnishing transportation for men who may properly be permitted to attend this convention.

**Assessments for Current Expenses of Associations.**—In Supplement 3 to Circular 136 the Southwestern regional director announces that no individual railroad under federal control should maintain and pay for more than four memberships in any one traffic club. He asks that statements be prepared showing the number of memberships which each road has in traffic clubs, giving the full name of each organization and its location. In case it is desired to take out additional memberships in traffic clubs where the number is less than the maximum of four, the approval of the regional director should be obtained.

**Railway Storekeepers' Association.**—The Eastern regional director, file 1500-11A413, quotes a letter received from H. B. Spencer, chairman, Central Advisory Purchasing Committee, as follows:

"A meeting of the Railway Storekeepers' Association will be held at the Hotel Sherman, Chicago, Ill., on January 27, 28 and 29, 1919. The status of the association has been approved by the director general, and this is the first meeting which has been held since the railroads were taken under federal control. In view of the important economies which it is confidently expected to effect through the re-organization of the stores department which has been undertaken, and the desirability of having all of those who are charged with the duty of procuring, handling and distributing the material obtain the benefit of personal discussion of the many questions involved, we would appreciate it if you will request your federal managers to arrange to have as many of their purchasing and stores department officers as possible in attendance at this meeting. It is believed that this will greatly assist in the introduction of uniform practices, which it is the desire to establish as speedily as possible."

**Passes for General Chairmen of Committees of Employees' Organizations.**—The Eastern regional director, file 2100-13A415, states that it has been decided that it will be the policy of the Railroad Administration to issue annual railroad transportation to the general chairmen of committees of employees' organizations, where the application is properly made and it can be shown that such chairman actually represents the class of employees he claims to represent. This will include also the granting of the necessary leave of absence in the usual manner during the incumbency of such chairman to enable him to carry on the business of his Association. It will be proper to honor requests of this character where annual transportation over the home road only is desired. Requests for off-line transportation should be forwarded to the Director of Operation.

**Railroad Business Mail.**—In Order 151 the Southwestern regional director announces that federal-controlled roads may carry as railroad business mail, without payment of postage, mail which relates to the business of other railroads under federal control, which is sent by and addressed to officers or employees of controlled lines. This mail should be handled with care, and if particular routing is indicated on the envelope it should be strictly observed. Only mail of special importance should be registered.

**Handling Labor Matters with Adjustment Boards.**—In Circular 69 the Northwestern regional director calls attention to paragraph 10 of the director-general's Orders 13, 29 and 53 which require certification of the chief operating officers of the railroads to all cases referred to the Boards of Adjustment Nos. 1, 2 and 3. The regional director states that the federal manager or general manager, when there is no federal manager, is the chief operating officer so far as concerns matters referred to boards of adjustment. However, the federal manager may delegate to his general manager or general managers, as he may consider advisable authority to certify such cases to these boards. When he does so, however, he must file with the Division of Labor the names of the officers to whom such authority has been delegated.

**Standard Form for Stationery.**—In Supplement 5 to Circular 6 the Northwestern regional director announces that it will not be necessary to discontinue the use of stationery containing the name of Mr. McAdoo as director general. Bills of lading and other printed forms will be valid and binding if executed by a duly authorized representative of the present director general, even though Mr. McAdoo's name should appear. It will, however, be proper to eliminate Mr. McAdoo's name from stocks of bills of lading and other contract forms of stationery on hand so as to leave the same reading: "United States Railroad Administration, Director General of Railroads, North & South Railroad." This should be done so far as reasonably practicable on all stationery on hand. This will apply to bills of lading (both bills furnished by the carriers and bills furnished by the shippers) but it is not to be construed as a positive requirement that all bills of lading accepted from shippers must have Mr. McAdoo's name eliminated therefrom. New stocks of all stationery, excepting time-tables, should employ the form: "United States Railroad Administration, Director General of Railroads, North and South Railroads." This will apply to bills of lading and other printed forms partaking of the nature of contracts, as well as to other stationery except time-tables. Working time-tables for employees should use the form "United States Railroad Administration, Walker D. Hines, Director General of Railroads, North & South Railroad." The Eastern regional director has issued a similar order, file 1500-1-3-8A441.

**Care of Sick and Wounded Soldiers.**—The Eastern regional director, file 1600-87A445, quotes George Hodges, Manager, Troop Movement Section, Washington, D. C., in regard to arrangements made by the war department for the care of sick and wounded soldiers at important transportation centers. As additional medical officers are assigned to this service, advice will be given to the railroads concerned.

"Surgeon general, War Department, has assigned medical officers to various important transportation centers, as Liaison Officers, in connection with transfer of sick and wounded soldiers.

"Co-operation of railroads is requested, and that office or desk space in main terminals be provided, advance information given, expected time arrival such trains, access thereto, information relative to breaking up trains at diverging points, advice relative to feeding arrangements, rendering every facility consistent and accepting helpful suggestions or assistance offered with a view to providing most satisfactory and comfortable handling of sick and wounded. Such officers have already been sent to Richmond, Baltimore, Washington, Salisbury, N. C.; Philadelphia, Chicago, Cincinnati and New York."

**Continuation of Memberships, Assessments, Dues, etc.**—The Eastern regional director, file 102A444, advises that

participation by carriers under federal control in the expense of memberships, assessments, dues, etc., in associations, organizations, etc., which were authorized for the year 1918, may be continued during the year 1919 on the same basis as heretofore authorized, such expense to be charged to operating expenses, provided if, in your opinion, any of these memberships, assessments, etc., should now be discontinued, that you bring the matter to my attention. As heretofore,

proper authority should be secured from this office before expenses of this nature are assumed, where such authority was not extended in 1918.

*Billing for Empty Tank Cars.*—The Eastern regional director, file 2000-28A442, announces that the office in charge of F. W. Boltz, supervisor oil traffic, has been abolished and hereafter disposition for empty tank cars on hand without billing will be furnished by the owners as heretofore.

## Railroad Hearings Before Senate Committee

### Julius Kruttschnitt Compares Government and Private Operation of Roads—Mr. Thom's Argument

WASHINGTON, D. C.

ARGUMENTS BY ALFRED P. THOM, counsel for the Association of Railway Executives, and a comparison of the results obtained under the direction of the Railroads' War Board, presented by Julius Kruttschnitt, chairman of the Southern Pacific Company, constituted the testimony before the Senate Committee on Interstate Commerce during the past week. Mr. Kruttschnitt was to be followed by representatives of the brotherhoods of train service employees. It is understood that the House Committee on Interstate Commerce will soon begin a similar hearing on the question of the disposition of the railroads. Mr. Kruttschnitt's statement was as follows:

Inasmuch as the railroads under private management stand charged with having broken down and failed to render the public service expected of them, and with being in deplorable condition, lacking both in equipment and terminals, at the end of 1917, when they passed into the hands of the government, I desire to place information before the committee that will test the correctness of these assertions, and to present additional facts that will convince them, I hope, of the ability of the owners of the properties to serve far more efficiently than they have ever been able to do in the past, if afforded the reasonable assistance that Congress alone can give. Profiting by experience acquired under both private and government operation, the carriers earnestly desire to provide a better system of operation by combining the initiative and beneficial features of competition inherent in private ownership with the benefits developed during the operation by the government unhampered by legal restrictions.

In denying that private operation failed or broke down, I respectfully ask permission to show wherein it did neither the one nor the other, and how with a plant provided by private owners it gave service that has never been equalled in the history of transportation, and that with legislation permitting practices heretofore prohibited it can and will, by combining the good and eliminating the bad features of both federal and private operation, give a service better than any that has ever been given in the past.

It has been frequently stated that the railroads of the country were in a very bad condition on January 1, 1918, when they were taken over by the government. In a despatch from Washington in the New York Sun of December 20, the director general is quoted as saying that existing rates were instituted to pay "the heavy cost of reviving the roads from the paralysis that seized them when the government took control," and also "they were admittedly run down and huge sums were necessary to get them into efficient operation," and in his statement before the Senate committee he says, "There was inadequacy of terminal facilities." "In the fall of 1917, despite strenuous efforts, and yet under a larger degree of co-ordination than had ever before been attempted, to prevent such a situation, a paralysis of the transportation situation again occurred."

The Interstate Commerce Commission's report of December 1, 1916, was quoted to show how bad transportation conditions were in that year. As a result of unified private control the commission's condemnation of 1916 is changed to commendation one year later.

In its report of December 1, 1917, the Interstate Commerce Commission says: "Equipment has been taken from sections where it was less needed to other sections, where military and commercial needs required more equipment than there was available, and such stupendous movements as those of the cantonment construction material and the troop transfers have been made without seriously interfering with the commercial business of the country. While conditions have been extraordinary and while traffic has not always moved as carriers and shippers would have had it moved, the essential needs of the country have to date been cared for."

The difficulties that could neither be escaped nor neutralized were well understood at the time to be impending demands for increased wages to put railroad labor on a parity with labor in other industries, and the necessity for financial help required by many of the railroads. Indeed, these were the reasons that the President gave to the members of the Railroads' War Board in person a few days before he issued his proclamation.

The latest statistics of government operation available to us when this memorandum was prepared covered the nine months ending September 30, 1918. This period began on January 1, 1918, which marked the end of nine months of unified private control and management and the beginning of nine months of government management.

The percentage of freight cars in shop or awaiting shopping was the same in both years.

The percentage of freight locomotives in shop or awaiting shopping was 13.8 in 1917 and 14.9 in 1918.

The director general claims to have stored, ready for winter service, 1,189 locomotives, while one year ago there was not one in storage.

At the close of 1917 there remained undelivered 3,400 locomotives and 33,000 freight cars ordered by the carriers, many of which were for the Eastern trunk lines, on which freight congestion was most severe. This shortage was not unexpected, because shortly after the declaration of war we were informed that the Council of National Defense found it necessary to direct builders to give precedence to locomotives for Great Britain, France and Russia; whereupon the Railroads' War Board considered appealing to the council to take account of the needs of our own roads, but the conclusion was reached that agencies conducting the war should not be embarrassed with our troubles, which we determined to surmount as best we could. We believed this was proper in the circumstances, although, as expected, it produced a shortage of locomotives at the end of 1917. The accumulation of 1,189 locomotives represents the deliveries during 1918 on

carriers' orders and on those of the United States Railroad Administration for 1,400 locomotives, only 126 of which, however, had been delivered up to the first of November. Had the severe weather conditions of 1917 replaced the mild weather of 1918 this reserve would have been impossible.

The terminal facilities, main and other main tracks were substantially the same, as there were few additions made in the first nine months of government control.

As of September 30 only 92, or less than one-tenth of 1 per cent, of the 100,000 federal cars had been delivered, and but 126 of the federal locomotives; so that it may be said without substantial inaccuracy that whatever transportation service has been rendered by the federal Railroad Administration has been rendered with facilities provided by private foresight and management, with equipment—counting both locomotives and cars—in better physical condition at the end of nine months of private unified control than at the end of

27.3, an increase of 6.2 per cent for the period; but for the month of December, 1917, at the end of nine months of private unified control, the average tons per car was 29.2 tons, and the corresponding figure for September, 1918, after nine months of government unified control, was but 29.7 tons.

The average train load in the two periods was 667 and 678 tons, respectively, an increase of 1.6 per cent, but as the increases in carload was 6.2 per cent a less number of loaded cars per train was hauled.

A press despatch in the New York Times of January 2, 1919, credits to the Railroad Administration an estimate of the operating expenses of 1918 at \$3,800,000,000, or \$1,000,000,000 more than 1917. This expenditure was made to increase efficiency; nevertheless roads that are alleged to have been run down at the end of nine months of unified private control show:

1. A larger volume of freight traffic handled in nine months under private than in the same period under government control.
2. The largest volume of freight traffic ever handled in any one month.
3. Loaded car mileage 7.5 per cent larger than under government control.
4. Greater number of loaded cars per train than under government control.
5. Miles run per locomotive per day 7.2 per cent higher than under government control.
6. Miles run per freight car per day 6.1 per cent higher than under government control.
7. The physical condition of freight locomotives better than under government control.
8. The condition of freight cars equally as good as under government control.

As weather conditions both at the end of 1917 and the beginning of 1918 were unusually severe, the comparison of the two nine-month periods is not unfair.

Whence it follows that increased efficiency under government control is, to say the least, not proven.

### Reforms Which Should Be Continued Under Peace Conditions

Mr. Kruttschnitt discussed the list of reforms mentioned in Mr. McAdoo's testimony as follows:

1. The maintenance of the permit system so as to control the traffic at its source.

Unquestionably of great benefit in preventing congestion, but cannot be continued without government authority. Shippers would not submit to dictation of carriers under normal conditions. During the war patriotism controlled them.

2. The maintenance of heavy loads for cars.

The railroads under private management have for years devoted a great deal of attention to this feature and the carload was increased very largely during unified control in the last nine months of 1917, being 29.2 tons in the ninth month of private control compared with 29.7 tons in the ninth month of government control.

3. The pooling of repair shops.

This was done to some extent under private control, and has been continued under federal control.

4. The elimination of circuitous routes, i. e., competitive routes.

This is synonymous with the suppression of competition and is impracticable under private control without special statutory authority. A mere suggestion to do this in 1917 prompted an immediate inquiry by the attorney general as to what was contemplated. The benefit of this practice, which deprives the shipper of choice of routes and competitive facilities and service, is very much exaggerated; the director general says that during a year of federal control 16,863,633 car miles have been saved in the Eastern and Northwestern

From the New York Tribune

### Not So Goldarned Easy As It Looked
