The bureau for the safe transportation of explosives and other dangerous articles, 30 Vesey street, New York City, has issued the annual report of Colonel B. W. Dunn, chief inspector. The enormous and abnormal movement of explosives by railroads during the past year has been carried on with remarkable freedom from disaster. The military program of the government for the year 1918 called for the production of about two billion pounds of explosives for military use, and for two hundred tons a day of poisonous liquids and gases. For most of the year, up to November 11, shipments amounted to more than two thousand carloads a day, so that it is estimated that during the busy months the railroads of the country had at all times not less than 50,000 cars in transit, on government business, and bearing the explosive placard. This was in addition to the average of 5,000 cars in transit to meet normal commercial demands. Only eleven

accidents of all kinds occurred in the transportation of explosives during the year. One life was lost and four persons were injured; total property loss, \$33,238. The fatal accident occurred in Canada. This excellent record was due primarily to the general use of standard, approved packages and standard methods of loading, blocking and placing the packages in cars. Losses in transportation of other dangerous and semi-dangerous articles, including the explosives (just mentioned), amounted in the year to \$1,642,730; persons killed, 18, and injured, 106. Sixteen of the deaths are recorded in connection with fires arising in the transportation of gasoline.

The total number of boxes of high explosives condemned as unsafe for transportation was 2,971, as compared with 2,291 in the preceding year. The total number of cases of black powder condemned was 194 as compared with 397 in 1917. Total number of inspections, 10,734.

MEETINGS AND CONVENTIONS

The following list gives names of secretaries, dates of next or regular meetings and places of meetings:

- AIR BRAKE ASSOCIATION.—F. M. Nellis, 165 Broadway, New York City. Next convention, May 6-8, 1919, Chicago.
- AMERICAN ASSOCIATION OF DEMURRAGE OFFICERS.—F. A. Pontious, Supervisor of Demurrage and Storage, C. & N. W. Ry., Chicago.
- AMERICAN ASSOCIATION OF DINING CAR SUPERINTENDENTS.—E. H. Thayer, St. Louis-San Francisco R. R., St. Louis, Mo.
- AMERICAN ASSOCIATION OF FREIGHT AGENTS.—R. O. Wells, Illinois Central, Chicago.
- AMERICAN ASSOCIATION OF GENERAL BAGGAGE AGENTS.—J. E. Quick, Port Huron, Mich.
- AMERICAN ASSOCIATION OF PASSENGER TRAFFIC OFFICERS.—W. C. Hope, C. R. R. of N. J., 143 Liberty St., New York.
- AMERICAN ASSOCIATION OF RAILROAD SUPERINTENDENTS.—J. Rothschild, Union Station, St. Louis, Mo.
- AMERICAN ELECTRIC RAILWAY ASSOCIATION.—E. B. Burritt, 8 W. 40th St., New York. Next annual meeting, March 14, 1919, Waldorf-Astoria Hotel, New York.
- AMERICAN ELECTRIC RAILWAY MANUFACTURERS' ASSOCIATION.—F. C. J. Dell, 50 E. 42nd St., New York.
- AMERICAN RAILROAD MASTER TRINNERS, COFFERSMITHS' AND PIPE FITTERS' ASSOCIATION.—Otto E. Schlinck, 485 W. 5th St., Peru, Ind.
- AMERICAN RAILROAD ASSOCIATION.—J. E. Fairbanks, 75 Church St., New York.—
  - Operating Section (including former activities of Association of Railway Telegraph Superintendents and Railway Storekeepers' Association).
  - Engineering Section (including former activities of Railway Signal Association).
  - Mechanical Section (including former activities of Master Car Builders' and Master Mechanics' Association).
  - Traffic Section (including former activities of Freight Claim Association).
  - Transportation Section (including former activities of Association of Transportation and Car Accounting Officers).
- AMERICAN RAILWAY BRIDGE AND BUILDING ASSOCIATION.—C. A. Lichty, C. & N. W. Ry., 319 N. Waller Ave., Austin Station, Chicago. Next convention, October 21-23, 1919, Cleveland, O.
- AMERICAN RAILWAY ENGINEERING ASSOCIATION.—E. H. Fritch, 910 Michigan Ave., Chicago. Next convention, March 18-20, 1919, Chicago.
- AMERICAN RAILWAY MASTER MECHANICS' ASSOCIATION (see American Railroad Section, Mechanical Section).—Acting Secretary, V. B. Hawthorne, 735 Transportation Bldg., Chicago. Next annual convention, June 23-25, 1919, Atlantic City, N. J.
- AMERICAN RAILWAY PERISHABLE FREIGHT ASSOCIATION.—E. F. McPike, 135 E. 11th Place, Chicago. Regular meetings, 2d Wednesday in March and September.
- AMERICAN RAILWAY TOOL FOREMEN'S ASSOCIATION.—R. D. Fletcher, 6202 Greenwood Ave., Chicago.
- AMERICAN SOCIETY FOR TESTING MATERIALS.—C. L. Warwick, University of Pennsylvania, Philadelphia, Pa. Next meeting, June, 1919, Atlantic City, N. J.
- AMERICAN SOCIETY OF CIVIL ENGINEERS.—Charles W. Hunt, 220 W. 57th St., New York. Regular meetings, 1st and 3d Wednesday in month, except July and August, 220 W. 57th St., New York.
- AMERICAN SOCIETY OF MECHANICAL ENGINEERS.—Calvin W. Rice, 29 W. 39th St., New York.
- AMERICAN SHORT LINE RAILROAD ASSOCIATION.—T. F. Whittelsey, 708 Union Trust Bldg., Washington, D. C.
- AMERICAN WOOD PRESERVERS' ASSOCIATION.—F. J. Angier, B. & O., Mt. Royal Sta., Baltimore, Md.
- ASSOCIATION OF MANUFACTURERS OF CHILLED CAR WHEELS.—George W. Lyndon, 1214 McCormick Bldg., Chicago. Semi-annual meeting with Master Car Builders' Association.
- ASSOCIATION OF RAILWAY CLAIM AGENTS.—Willis H. Failing, C. R. R. of N. J., Jersey City, N. J.
- ASSOCIATION OF RAILWAY ELECTRICAL ENGINEERS.—Jos. A. Andreucetti, C. & N. W., Room 411, C. & N. W. Sta., Chicago. Next meeting, October, 1919, Chicago.
- ASSOCIATION OF RAILWAY TELEGRAPH SUPERINTENDENTS (see American Railroad Association, Operating Section).—W. L. Connelly, N. Y. C. R. R., Gibson, Ind.
- ASSOCIATION OF TRANSPORTATION AND CAR ACCOUNTING OFFICERS (see American Railroad Association, Transportation Section).—G. P. Conard, 75 Church St., New York.
- BRIDGE AND BUILDING SUPPLY MEN'S ASSOCIATION.—M. J. Trees, Chicago Bridge & Iron Company, Chicago. Next annual convention, October 21-23, 1919, Cleveland, O.
- CANADIAN RAILWAY CLUB.—James Powell, 46 Aberdeen Ave., St. Lambert (near Montreal), Que. Next meeting, 2d Tuesday in May, 1919, Windsor Hotel, Montreal, Que.
- CAR FOREMEN'S ASSOCIATION OF CHICAGO.—Aaron Kline, 841 Lawler Ave., Chicago. Regular meetings, 2d Monday in month, except June, July and August, New Morrison Hotel, Chicago.
- CENTRAL RAILWAY CLUB.—Harry D. Vought, 95 Liberty St., New York. Regular meetings, 2d Thursday in November, and 2d Friday in January, March, May and September, Hotel Statler, Buffalo, N. Y.

## Traffic News

**CHIEF INTERCHANGE CAR INSPECTORS AND CAR FOREMEN'S ASSOCIATION.**—W. R. McMurh, New York Central, New York.

**CHIEF INTERCHANGE CAR INSPECTORS AND CAR FOREMEN'S SUPPLY MEN'S ASSOCIATION.**—D. B. Wright, Lehigh Company, 45th and Oakley Sts., Chicago.

**EASTERN RAILROAD ASSOCIATION.**—J. F. Stuart, Washington, D. C. Next annual meeting, May 8, 1919, Railroad Club, New York.

**FREIGHT CLAIM ASSOCIATION (See American Railroad Association, Traffic Section).**—Lewis Fitch, R. F. & P., Richmond, Va.

**GENERAL SUPERINTENDENTS' ASSOCIATION OF CHICAGO.**—A. M. Hunter, 321 Grand Central Bldg., Chicago. Regular meetings, Wednesday preceding 3d Friday in month, Room 856, Insurance Exchange Bldg., Chicago.

**INTERNATIONAL RAILROAD MASTER BLACKSMITHS' ASSOCIATION.**—A. L. Woodworth, B. & O., Lima, O.

**INTERNATIONAL RAILWAY FUEL ASSOCIATION.**—J. G. Crawford, 702 E. 51st St., Chicago. Next meeting, May 19-22, 1919, Hotel Sherman, Chicago.

**INTERNATIONAL RAILWAY GENERAL FOREMEN'S ASSOCIATION.**—Wm. Hall, 1061 W. Wabasha Ave., Winona, Minn.

**MAINTENANCE OF WAY AND MASTER PAINTERS' ASSOCIATION.**—F. W. Hager, 1323 Hurley Ave., Ft. Worth, Tex. Next annual convention, October 21-23, 1919, St. Louis, Mo.

**MASTER HOILER MAKERS' ASSOCIATION.**—Harry D. Vought, 95 Liberty St., New York. Next meeting, May 26-29, 1919, Hotel Sherman, Chicago.

**MASTER CAR AND LOCOMOTIVE PAINTERS' ASSOCIATION OF THE UNITED STATES AND CANADA.**—A. P. Dane, B. & M., Reading, Mass. Next meeting, September, 1919, Chicago.

**MASTER CAR BUILDERS' ASSOCIATION (See American Railroad Association, Mechanical Section).**—Acting Secretary, V. R. Hawthorne, 746 Transportation Bldg., Chicago. Next annual meeting, June 18-21, Atlantic City, N. J.

**NATIONAL ASSOCIATION OF RAILWAY AND UTILITIES' COMMISSIONERS.**—James B. Walker, 49 Lafayette St., New York. Next annual convention, October 14, 1919, Indianapolis, Ind.

**NATIONAL FOREIGN TRADE COUNCIL.**—O. K. Davis, 1 Hanover Square, New York. Next convention, April 24-26, Congress Hotel, Chicago.

**NATIONAL LIGHTING APPLIANCE ASSOCIATION.**—C. W. Kelly, Kelly-Derby Co., Peoples Gas Bldg., Chicago. Next meeting, March 17-20, 1919, inclusive, Chicago.

**NEW ENGLAND RAILROAD CLUB.**—W. E. Cade, Jr., 683 Atlantic Ave., Boston, Mass. Regular meetings, 2d Tuesday in month, excepting months of June, July, August and September.

**NEW YORK RAILROAD CLUB.**—Harry D. Vought, 95 Liberty St., New York. Regular meetings, 3d Friday in month, except June, July and August, 29 W. 39th St., New York.

**NIAGARA FRONTIER CAR MEN'S ASSOCIATION.**—George A. J. Hochgrebe, 623 Brisbane Bldg., Buffalo, N. Y. Regular meetings, 3d Tuesday in each month, Tenjost Hall, Buffalo, N. Y.

**PACIFIC RAILWAY CLUB.**—W. S. Wollner, 64 Pine St., San Francisco, Cal.

**RAILWAY ACCOUNTING OFFICERS' ASSOCIATION.**—E. R. Woodson, 1116 Woodward Bldg., Washington, D. C. Next annual meeting, June 11, 1919, Hotel Commodore, New York.

**RAILWAY BUSINESS ASSOCIATION.**—Frank W. Noxon, 30 Church St., New York.

**RAILWAY CLUB OF PITTSBURGH.**—J. D. Conway, 515 Grandview Ave., Pittsburgh, Pa. Regular meetings, 4th Thursday in month except June, July and August, Colonial Annex Hotel, Pittsburgh, Pa.

**RAILWAY DEVELOPMENT ASSOCIATION.**—D. C. Welty, Missouri Pacific R. R., St. Louis, Mo.

**RAILWAY ELECTRIC SUPPLY MANUFACTURERS' ASSOCIATION.**—J. Scribner, General Electric Co., Chicago. Annual meeting with Association of Railway Electrical Engineers.

**RAILWAY EQUIPMENT MANUFACTURERS' ASSOCIATION.**—D. L. Eubank, Galena Signal Oil Company, Richmond, Va. Next annual meeting, September, 1919, Hotel Sherman, Chicago.

**RAILWAY FIRE PROTECTION ASSOCIATION.**—G. L. Hall, St. Louis-San Francisco Ry., St. Louis, Mo.

**RAILWAY REAL ESTATE ASSOCIATION.**—James P. Nelson, President, C. & O., Richmond, Va.

**RAILWAY SIGNAL ASSOCIATION (See American Railroad Association, Engineering Section).**—H. S. Ballist, Ass't Terminal Manager, Grand Central Terminal, New York. Stated meeting, on Monday, before 3d Tuesday in March, Chicago.

**RAILWAY STOREKEEPERS' ASSOCIATION.**—J. P. Murphy, N. Y. C. R. R., Box C, Colerwood, Ohio.

**RAILWAY SUPPLY MANUFACTURERS' ASSOCIATION.**—J. D. Conway, 1841 Oliver Bldg., Pittsburgh, Pa. Next annual meeting, June 18-25, 1919, Atlantic City, N. J.

**RAILWAY TELEGRAPH AND TELEPHONE APPLIANCE ASSOCIATION.**—G. A. Nelson, Waterbury Battery Co., 30 Church St., New York.

**ROADMASTERS' AND MAINTENANCE OF WAY ASSOCIATION.**—P. J. McAndrews, C. & N. W. Ry., Sterling, Ill. Next annual convention, September 16-18, 1919, Chicago.

**ST. LOUIS RAILWAY CLUB.**—B. W. Fraenthal, Union Station, St. Louis, Mo. Regular meetings, 2d Friday in month, except June, July and August.

**SIGNAL APPLIANCE ASSOCIATION.**—F. W. Edmunds, West Nyack, Rockland County, New York.

**SOCIETY OF RAILWAY FINANCIAL OFFICERS.**—L. W. Cox, 1217 Commercial Trust Bldg., Philadelphia, Pa.

**SOUTHERN AND SOUTHWESTERN RAILWAY CLUB.**—A. J. Merrill, P. O. Box 1265, Atlanta, Ga. Regular meetings, 3d Thursday in January, March, May, July, September and November, Piedmont Hotel, Atlanta.

**SOUTHERN ASSOCIATION OF CAR SERVICE OFFICERS.**—E. W. Sandwich, West-ern Ry. of Ala., Atlanta, Ga.

**SUPPLY ASSOCIATION OF AMERICAN RAILWAY TOOL FOREMEN'S ASSOCIATION.**—C. N. Thulin, Duff Manufacturing Company, 935 Peoples Gas Bldg., Chicago.

**TRACK SUPPLY ASSOCIATION.**—W. C. Kidd, Ramapo Iron Works, Hillburn, N. Y. Next annual convention, September 16-18, 1919, Auditorium Hotel, Chicago.

**TRAIN DESPATCHERS' ASSOCIATION OF AMERICA.**—J. P. Finar, A. T. & S. Fe Ry., Niles, Cal.

**TRAVELING ENGINEERS' ASSOCIATION.**—W. O. Thompson, N. Y. C. R. R., Cleveland, O. Next annual meeting, September, 1919, Hotel Sherman, Chicago.

**WESTERN ASSOCIATION OF SHORT LINE RAILROADS.**—Clarence M. Oddie, Mills Bldg., San Francisco.

**WESTERN RAILWAY CLUB.**—A. F. Steubing, 750 Transportation Bldg., Chicago. Regular meetings 3d Monday in month, except June, July and August.

**WESTERN SOCIETY OF ENGINEERS.**—Edgar S. Nethercut, 1735 Monadnock Block, Chicago. Regular meetings, 1st Monday in month, except July and August.

Grain loading this year, up to February 8, amounted to 137,202 cars, as compared with 117,563 for the corresponding period of 1918.

According to newspaper reports the grain growers in Idaho, Oregon and Washington have organized an "Inland Empire Shippers' League," and have filed with the Interstate Commerce Commission a protest against the 25 per cent increase in freight rates on grain and grain products made last June by the Railroad Administration.

J. E. Weller, Chicago resident traffic assistant for the Allegheny region, has issued a supplement to routing circular 103 stating that effective March 1, the provisions of this circular will apply to shipments of copper, lead and zinc. Exception "C" on the first page of the original circular is canceled. These rules are not to apply when in conflict with current embargoes.

The State Public Utilities Commission of Illinois has issued a citation against the Chicago, Milwaukee & St. Paul to appear before the commission at Chicago on March 11, to show cause why the work of elevating and reconstructing tracks in Chicago should not be completed at an early date. Work on the elevating of the St. Paul tracks was postponed approximately two years ago due to the high cost of labor and of material.

The Minnesota State Railroad & Warehouse Commission has filed protests on behalf of Minnesota shippers against the proposed reconsignment charges on grain and hay. Adoption of the reconsignment tariff has been recommended to the Interstate Commerce Commission, following recent hearings. The State Board charges that the assessment of a reconsignment charge of \$2 on grain and hay held for state inspection is unjust because this inspection is required by state law and therefore should not be the basis of a special charge by the railroads. It was also pointed out that authorization of such charges will mean that cars now inspected by the state at outside points would be forwarded for inspection in terminals which would become so congested as a result that the railroads would oppose the rule. The recommendation for authorization of a \$5 charge in cases where a commission merchant, after a car is placed on a team track, gives an order for it to a purchaser who will unload the car is also believed to be unjust. The state officers maintain that this is not a reconsignment but simply a delivery order requiring no service from the railroad.

### National Industrial Traffic League

The program for the spring meeting of the National Industrial Traffic League to be held at Hotel Grunewald, New Orleans, La., March 11 and 12, has been announced in Circular 107 of the league. The principal subjects to be discussed are: Report by the President on the recent Rivers and Harbors congress. Report of the Executive Committee on (1) recommendations to congress with respect to the railroad situation; (2) proposed uniform telegraphic code; (3) proposed mileage scales; (4) sailing day plan; (5) passing reports on l. c. l. freight; (6) restoration of commercial offices of the railroads; (7) uniform hour for opening and closing freight houses; (8) re-establishing shipper's right to route freight.

Reports of committees on car demurrage and storage; on transportation instrumentalities; on bills of lading; on proposed packing rules for express shipments and on tracing express shipments; and on rate construction and tariffs. Reports of baggage committee and freight claims committee. Reports of special claims committees on concealed loss and damage; on grain; on packinghouse products; on coal and coke; on ore and on fruit and vegetables. Report of weighing committee on (1) charge for testing industrial track sales; (2) moisture tolerance on coal and coke; (3) claims for loss of coal; (4) action of Railroad Administration with respect to national code of weighing rules. Report of classification committee. Report of special committee on railway leases and sidetrack agreements.

## Foreign Railway News

Advices to the State Department state that the allied railway representatives were called to an informal conference in Vladivostok on February 25, all the seven countries being represented, Mr. Stevens and Mr. Smith representing the United States and the American Ambassador to Japan, Mr. Morris, also had been invited to the conference.

Gen. Horvath attended as the representative of the Chinese Eastern Railway.

In England it is customary for the strong labor organizations to run candidates for Parliament. In the recent election the National Union of Railway Men ran such candidates for Parliament in 24 constituencies, of which those at Derby, Wakefield, Middlesboro, Newcastle (West), Manchester (Ardwick) and Cardiff (East) were "official" candidates. Two only were elected, viz., at Derby, where J. H. Thomas was not officially opposed, and at Kettering, where the contest was "three cornered." The Railway Clerks' Association ran 5 candidates, and the Society of Locomotive Enginemen and Firemen one without success.

During the London Tube Strike the Government Carried Thousands of War Office Clerks in Military Motor Trucks

### Free Admission of Railway Supplies Into Mexico

A cablegram of February 21 from the American Consulate General in Mexico announces that a presidential decree in effect from February 20 permits the importation of the following railway supplies into Mexico free of duty for a period of six months: Switch points, iron and steel ties, turntables, iron and steel rails, frogs, and tie plates. The duties thereby remitted amount to 0.03 peso per kilo gross weight, or \$0.68 per 100 lb.

### Modifications in British Railway Supply Restrictions

The British Board of Trade Journal of February 20 announced additional relaxations in the British export restrictions. The following articles are transferred to list C and may therefore be exported freely to American countries: Boiler tubes, iron and steel tubes, railway locomotives and their component parts.

The Minister of Munitions has suspended, as from February 7, until further notice, the Railway Material (Second-hand) Order, 1916, except in so far as relates to freight cars of all types. Dealings in second-hand railway locomotives, rails, chairs, fishplates, fastenings, signal apparatus, ties and the like may now take place without a permit; but second-

hand wagons of all types are still war material within the terms of Regulation 30a of the Defence of the Realm Regulations.

### Central Uruguay Railway Not to Change Hands

According to press reports, which are not, however, official, the contemplated purchase of the properties of the Central Uruguay Railway Company by the Uruguayan government will not be carried out, says Consul William Dawson at Montevideo, Uruguay, writing under date of December 9. It is stated, he says, that the price demanded was considered too high.

Little or nothing has been heard of this projected change of ownership during the past months, he continues. The purchase of the Central Uruguay lines by the government was under serious consideration as a means of stabilizing exchange. The system comprises 987 miles of track, or about 63 per cent of the total mileage of the country. The purchase price mentioned at the time was 60,000,000 pesos (\$62,040,000).

### British Government Asks Rail Control

Press despatches from London dated February 28 say that the government's transport bill introduced in Parliament will give the Minister of Transport complete control over every conceivable form of land transport.

The bill provides that complete management of the railways of the United Kingdom is to be conducted by the state for two years, partly to enable the government to make the railways pay dividends and partly to facilitate the movement of men and material during reconstruction.

Complete power is given to the minister to settle rates and charges, salaries and wages and conditions of employment and to make any alterations in policy and accounts that he may deem desirable.

The minister is authorized to purchase by agreement or by compulsion, in whole or in part, any railway, light railway, street car company, canal, inland waterway or harbor and dock undertaking.

The Trans-Balkan Route Through Otranto and Valona, Proposed by Italian Engineers, Would Reduce the Distance Between Rome and Constantinople from 1905 to 1260 Miles and Permit a 48-Hour Journey.

### Brazil Railway in French Control

Financial reorganization of the Brazil Railway Company, in receivership since 1914, has been completed except for some minor details with regard to subsidiary lines, according to the New York Tribune. The discharge of W. Cameron Forbes, of Boston, as receiver of the property, is expected to be ordered by the court within the next month.

French interests, representing the bondholders of the road, are now in control and new officers have already been elected, consisting of Louis Wibratte, of Paris, president; A. Roudy, of Brazil, vice-president and general manager, and Emil Petit, of Paris, secretary.

New money to the amount of approximately \$4,000,000 has been raised by a syndicate of French bankers, in accordance with the terms of the reorganization plan, which, in brief, called for the issue of 21,000,000 francs of new prior lien bonds. More than two years have been required in working out the reorganization, the progress of which was greatly hampered by difficulties arising out of the war.

Important English interests which held a large amount of the securities of the company when it went into receiver's hands at the outbreak of the war have retained possession of their equity in the property and have joined hands with the French in bringing about the successful reorganization.

Since the beginning of the war the Brazilian system has been starved so far as obtaining new rolling stock and other equipment was concerned, so that in order to put the property in first class operating condition large expenditures would have to be made. It is estimated that 200 new locomotives are needed, as well as thousands of freight cars. At the same time a large tonnage of steel rails is needed.

### Railroad Notes from China

Special Correspondence from Peking (Delayed)

The organization of the through traffic bureau as a part of the Ministry of Communications was effected during September. The bureau consists of four sections, general affairs, domestic through traffic arrangements, foreign through traffic arrangements, and the clearing house. The appointment as head of the bureau of Kuan Keng Lin, who is also director of the railway department of the ministry, serves to make clear that it is the intention of the ministry to take a more active part in the management of the railways than has hitherto been the case. This point is accentuated by the further fact that C. S. Liu (a graduate of the University of Pennsylvania) who is now chief of the traffic division in the ministry, has been placed in charge of the general affairs section of the bureau. Chinese also head the two arrangements sections. But the clearing house has been placed in charge of J. E. Foley, the veteran traffic manager of the Peking-Mukden line. Mr. Foley began his railway life in the clearing house in Dublin in 1876. He has been in China some 20 years. For 16 years prior to joining the Peking-Mukden staff he served with the Australian railways, except for one year, 1894, spent on the Pennsylvania Lines. As director of the clearing house Mr. Foley will be responsible for the devising of methods of control of car interchange, inspection, and interline repairs. It is apparent therefore that the ministry has an aggressive policy of unification of the various lines which it expects to have worked out along practical lines. The accounting work of the clearing house has been placed in charge of another foreigner, J. Lockhart, who up to October 1, had charge of the same matters on the Peking-Mukden line. Mr. Lockhart began railway work with the Caledonian Railway in station service in 1896. After working up through the clerical ranks of the Western division superintendent's office, he came to China in 1909 as revenue audit clerk of the Peking-Mukden line. He was given particular charge of through traffic audit when that service began in 1913. The nature of these appointments has given rise to a very definite impression that the Chinese government expects to take from now on a very marked control of her railways, and will make use of the technical ability which will make such control adequate.

#### FURTHER DETAILS CONCERNING JAPAN'S CONCESSIONS IN CHINA

Report was made in these columns several weeks ago that work was to be resumed upon the Lung Hai line from Suchowfu to Haichow, with the remark that where the funds were to come from was a mystery, for it was known that the syndicate which has this concession had allowed its funds to be used by Yuan Shi Kai to further his monarchical ambitions. The mystery is now cleared up. The funds are to come from Japan and be furnished by the group who have been purveying to the Chinese government throughout the past year. The line, however, will not be continued to Haichow, but to Kaomi, near

Tsingtau. If this line is built it will divert the bulk of the traffic now delivered to the Tientsin Pukow destined to Pukow. The haul to Tsingtau will be of about the same length as that to Pukow and the harbor at Tsingtau is much superior. This project, taken in connection with the extension of the Shantung Railway to Shunte, indicates a very definite plan to gather as much of the traffic of northern interior China for shipment through Tsingtau as it is possible to get. The commercial interests of Tientsin and Shanghai are immediately threatened, and the disposition of Tsingtau and the Shantung Railway at the peace conference is raised to paramount importance. The peace of the Far East will probably hinge upon the decision made on that question. The Japanese who at first were not satisfied with the extension to Shunte, preferring either Taokow or Chentingfu, have apparently been satisfied. It is said that certain privileges for civil courts under Japanese authority in Shantung have been granted in connection with the railway concession, and it is possible that this is the price.

Another line is also granted to the Japanese group, according to report. This will consist of an extension of the Ssuningkai-Chengchiatun line through Jehol to Peking. Roughly this line will parallel the Peking-Mukden line. But it will be located on the opposite side of a mountain range difficult of passage, and so will compete with it only for business originating beyond Mukden destined to Peking, and vice versa. Publication of the terms of these concessions has aroused no little feeling, and it is said to have caused the resignation of Yeh Kung Cho, vice-minister of communications, who was charged with making the terms public. Others give a similar interpretation to his resignation by saying that Japanese influence caused his downfall because he was thought to be susceptible to American influence.

\* \* \*

The Tientsin-Pukow Railway has been interrupted much of late by bandit activities in Shantung. Still further south the line was cut for some days by order of the military governor of Nanking, who refused to allow northern troops to pass through his territory.

\* \* \*

The shortage of cars on the Tientsin-Pukow has placed Shanghai and the government railways running out of that point at the mercy of Japanese coal dealers. These in turn have to wait upon shipping space. As a result those railways will probably have to pay between \$16 and \$17 per ton for fuel during the coming year.

\* \* \*

The soldier menace on Chinese Government Railways continues. During the past few weeks the Tientsin-Pukow has been broken again. This road, in an effort to minimize trouble from soldiers, changed the time of its through express between Peking and Hankow so as to pass the infested district in the night. This has resulted in an improvement. But some days ago at an intermediate terminal, two officers left a soldier guard with the engine while they went into the town for a leisurely breakfast, returning after they had delayed the train one hour.

\* \* \*

From October 21 to 29, inclusive, occurred the Third Conference of the Standing Committee on the Unification of Railway Accounts and Statistics. This committee is composed of the chief accountants of the several lines, and accounting officers of the Ministry of Communications. Its sessions dealt principally with questions of practice under the still new uniform classification of accounts. All accountants having doubts as to correct practice refer such cases to this committee for discussion. Similarly, exceptions to practices upon the lines taken by the auditors from the ministry are brought up for discussion. Decisions taken by the committee are passed to the ministry for approval, after which they become binding rules. Beyond these routine questions, a start was made toward the promulgation of uniform station accounts and forms. At present there are two distinct varieties followed upon the lines using English as the foreign language, and another upon the so-called French lines. Upon the French lines there are no traveling auditors, reliance being placed upon daily reports. A chief station accountant from the head office makes surprise examinations of such stations as come under suspicion. It is proposed under the new system to put more of the accounting work upon the stations and to increase the force of traveling auditors. The monthly system of reports will then be followed.

Equipment and Supplies

Locomotives

GILLESPIE BROTHERS & Co., 11 Broadway, New York, are inquiring for one or two second-hand, standard gage locomotives, weighing from 90 to 100 tons. Letters should be addressed to Miss M. Moody, of the West India department.

Locomotive Deliveries

The following locomotives were shipped during the week ended February 22:

Works	Road	Number	Type
American	C. B. & O.	3	USRA St. F.
	Penn. L. W.	1	Santa Fe.
	Chic. Great Western	2	Mountain.
	Eric R. R.	1	USRA 6W, Sw. St. F.
Lima	L. & N.	8	
Baldwin	L. & N.	17	USRA Mikado.
	B. & O.	5	USRA Mikado.
	Penn. R. R.	1	Mikado.
	Ill. Cent.	2	Mikado.
	Phil. & Read	1	Mallet.
	Lehigh Vall.	1	Pacific.
	Atch., Top. & St. Fe.	1	Mikado.
Phil. & Read	1	Consol.	
Grand total		37	

Freight Cars

The J. G. WHITE Co., New York, is inquiring for 20 tank cars.

The E. I. DU PONT DE NEMOURS & Co. is inquiring for 15 cars.

ANDERSON, MEYER & Co., New York, are inquiring for 100 high-side gondola cars for export to China.

Car Deliveries

New standard cars were accepted during the week ended February 15 as follows:

Road	Number	Type	Manufacturer	Total accepted for given roads
A. C. L.	97	40 T. D. S. Box	Am. Car & Fdy. Co.	413
A. C. L.	131	40 T. D. S. Box	Am. Car & Fdy. Co.	131

Total	944			

The Railroad Administration has given out the statement in the table in the opposite column showing the delivery of U. S. R. A. standard cars as of February 1.

Machinery and Engineering Supplies  
Held by War Department

The War Department authorizes the following statement from the office of the director of purchase and storage:

The stock of machinery and engineering supplies on hand as of February 1 is shown by a summary compiled by the statistical division of the office of the director of purchase and storage. The report includes stock on hand at inland storage and at ports, and gives the estimated value of the supplies as follows:

Article	Quantity	Estimated value
<b>Locomotives, standard gage:</b>		
Set up, complete	12	\$456,000
Knocked down, complete	120	4,167,000
Knocked down, incomplete	20	740,000
Spare parts	891.9	44,387
125 horsepower gas	6	123,000
<b>Locomotives, narrow gage:</b>		
60 C. M. steam	26	292,500
60 C. M., 50 horsepower, gas		7,150
<b>Cars, standard gage:</b>		
Box (complete)	250	650,000
Low gondola (complete)	150	323,850
Flat artillery (complete)	454	306,450
Tank (complete)	150	480,000
Ballasts (complete)	152	454,024
Refrigerator (complete)	100	350,000
Push (complete)		3,920
Box (incomplete)	300	690,000
L. S. gondola (incomplete)	200	400,000
Tank (incomplete)	100	290,000
Repair parts (incomplete)	578	37,570
Flat cars	350	196,000
<b>Cars, narrow gage:</b>		
Artillery trucks (complete)	100	48,300
Box (complete)	65	76,050
Dump (complete)	219	28,032
<b>Truck materials and fastenings:</b>		
Rails (80 pounds, 67½ pounds, 50 pounds, 35 pounds and 25 pounds)	65,426.38	3,729,304
Spikes, bolts	1,027.2	87,312
Angle and splice bars	1,167.74	50,446
Turnouts and switches	2,639.56	131,978
Angle plates, ties, stands, guard rails	221.3	11,065
Track material, narrow gage rail and fit	13,144	657,200

Supply Trade News

The Dearborn Chemical Company, Chicago, announces the opening of offices in the Commerce Trust building, Kansas City, Mo. E. M. Massen and W. H. Fairlamb will make their headquarters at that office.

The Chicago Pneumatic Tool Company announces the removal of its Cleveland district office from room 813 to room 406 Engineers building, effective March 1. Roos Watson is district manager at this office.

The bill validating informal war contracts, many of which were held by companies engaged in the railway supply field, which has been pending before Congress for several weeks, was signed by the President on March 3.

Wilson W. Butler, whose appointment as president of the Canadian Car & Foundry Company, Ltd., the Canadian Steel Foundries, Ltd., and the Pratt & Letchworth Company, Ltd.,

W. W. Butler

Canada, was announced in the *Railway Age* of February 21 (page 473), was born at Danville, Ohio, on December 9, 1862, and received his early education in the Danville Select School. Mr. Butler began his business career with the John Shillito Company, at Cincinnati, Ohio, and later was appointed western manager of the Sterlingworth Railroad Supply Company, at Chicago. Subsequent to his appointment as president of the Canadian Car & Foundry Company, Mr. Butler served as western sales agent of the

American Car & Foundry Company, at Chicago; second vice-president and director of the Simplex Railway Appliance Company, at New York; second vice-president and director of the American Steel Foundries, at New York; in 1901, as vice-president and director of the Simplex Railway Appliance Company, he established the manufacturing plant of that company in Montreal, Que. He was also vice-president and director of the Dominion Steel Car Company, near Montreal, where the first steel car manufactured in Canada was built. Mr. Butler was instrumental in the organization of the Canadian Car & Foundry Company, Ltd., composed of the Dominion Car & Foundry Company, the Canada Car Company and the Rhodes Curry Company. Since shortly after the beginning of the war, the plants of the companies of which Mr. Butler is president have been engaged in the production of steel, and the forging and machining of shells, for the American, British and Russian governments. Mr. Butler succeeds Senator N. Curry, who has retired from the presidency of the companies, and now holds the position of chairman of the board of directors.

O. E. Berggren has been appointed northwestern representative of the A G A Railway Light & Signal Company, vice H. E. Gifford, resigned. Mr. Berggren's headquarters are at 857 Peoples Gas building, Chicago.

Frank G. Wallace, vice-president of the Canadian Locomotive Company, has been elected president to succeed the late Dr. J. J. Harty, who died in London on February 23. J. L. Whiting succeeds Mr. Wallace as vice-president.

H. H. Morgan, who has been connected with the Chicago office of Robert W. Hunt & Co., for 15 years as head of the cement department and physical laboratory, has been trans-

ferred to the Pittsburgh office as assistant to D. W. McNaugher, who is the Pittsburgh partner of this company.

**Millard F. Cox**, assistant superintendent of machinery of the Louisville & Nashville, at Louisville, Ky., has become associated with the Louisville Fire Brick Works, Inc., of Louisville, as vice-president and consulting engineer.

**W. S. Moore**, formerly with the Cleveland Frog & Crossing Company, Cleveland, Ohio, has been appointed assistant to the president and general manager of the Greenville Gravel Company, with headquarters at Greenville, Ohio.

The Kalamazoo Railway Supply Company, Kalamazoo, Mich., has recently let a contract for the erection of an addition to its plant at Kalamazoo. The building will be of brick, 50 ft. by 135 ft., with a saw tooth roof, and will cost approximately \$10,000.

**Malcolm L. Maclean**, formerly manager of sales, miscellaneous department, of the American Steel Foundries, with headquarters at Chicago, and until recently a major in the infantry, has been appointed manager of sales of the Duquesne Steel Foundry Company, at Pittsburgh, Pa.

The controlling interest of the Carroll Foundry & Machine Company, Bucyrus, Ohio, manufacturers of locomotive cranes, has been purchased by Cleveland interests, and a temporary organization has been perfected which will be taken over later when the company is reorganized.

The Universal Car Seal & Appliance Company, Lyon Block, Albany, N. Y., has recently been reorganized and has changed its name to the Universal Seal Corporation. It has moved its offices and manufacturing headquarters to 270-276 Hudson avenue, Albany, N. Y. The new officers are as follows: C. R. Martineau, president; Gardner C. Leonard, vice-president; Edward J. Fitzsimmons, Jr., treasurer; Wm. C. Martineau, secretary.

The Deeming-Endsley Company has been organized with headquarters in the Transportation Building, Chicago, with Horace F. Endsley, president; Herbert Deeming, vice-president and general manager; H. M. Barney, secretary and treasurer. The board of directors is composed of Horace F. Endsley, Herbert Deeming, D. D. Glass, H. M. Barney, O. P. Morrison, A. L. Knowles and Eugene Landers. The new company will handle the Morrison Switch-Point Hold-Down and other railroad devices. Mr. Deeming was born in England on April 16, 1880, and began his business career as a stenographer and clerk in the general passenger department of the Fremont, Elkhorn & Missouri Valley at Omaha, Neb., in October, 1897. From July, 1899, to September he was with the American Express Company at Omaha, and from the latter month until January, 1900, he was employed in the general superintendent's office of the Fremont, Elkhorn & Missouri Valley. He was then promoted to secretary to the general freight agent of the same road, and in July, 1902, went to Chicago, where he was employed in the auditor's office of the Chicago & Western Indiana. In January, 1903, he was promoted to a position in the office of the president and general manager. From July, 1903, to February, 1916, he was secretary of the General Managers' Association, at Chicago, and from November, 1907, to February, 1916, was also secretary of the Association of Western Railways. In March, 1916, he became assistant director of the Railway Educational Bureau at Omaha, Neb., and seven months later he became associated with the H. E.

H. Deeming

Reisman Advertising Company. Later he became associated with Mudge & Company as sales manager, which position he held for nearly two years until the Deeming-Endsley Company was incorporated.

**C. W. Johnson** has been appointed assistant manager of works of the Westinghouse Electric & Manufacturing Company. After graduating from Ohio State University, Mr. Johnson entered the employ of the Steel Motor Company of Johnstown, Pa. A year later he became associated with the Bullock Electric Company, of Cincinnati, Ohio, and in 1904 was made superintendent of Allis-Chalmers-Bullock, Ltd., of Montreal, Can. In 1907 he entered the employ of the Westinghouse company, being appointed chief inspector of works, in which capacity he served until his recent appointment.

### Interstate Iron and Steel Company

The annual report of the Interstate Iron & Steel Company, Chicago, for the year ending December 31, 1918, shows net earnings of \$490,338.45 after the deduction of \$60,590.83 for the dividend paid on preferred stock, the adjustment in respect of 1917 federal taxes, ample provision for depreciation, appropriations for the preferred stock sinking fund and the paying of all operating expenses, taxes and sick charges. These net earnings are approximately half of the net earnings reported for the year ending December 31, 1917.

The company's balance sheet for the last fiscal year is as follows:

ASSETS	
Land, buildings, plant, machinery, furniture and good-will...	\$6,032,587.24
Current assets .....	4,669,753.06
Deferred charges: Insurance, interest, etc.....	8,662.07
	\$10,711,002.37
LIABILITIES	
Capital liabilities:	
Preferred stock—7 per cent cumulative, issued and outstanding .....	\$860,200.00
Common stock—authorized and issued.....	4,000,000.00
First mortgage 6 per cent serial sinking fund bonds, issued and outstanding .....	2,017,800.00
Current liabilities .....	1,742,887.26
Reserves .....	454,578.15
Surplus .....	1,635,536.96
	\$10,711,002.37

### American Locomotive Company

#### Shows Increased Earnings

The gross business of the American Locomotive Company for the six months ending December 31, 1918, according to a semi-annual statement of operations to the stockholders by Andrew Fletcher, president of the company, amounted to \$59,480,026 as compared with \$35,959,126 for the same period of the previous year. This large increase was due to the new high records of production made at the larger plants of the company, together with the addition of the production of the Richmond and Montreal plants which, in the six months of 1917, were being reorganized and converted from munitions to locomotive manufacture. The remainder of the report follows:

"The profits for the six months were \$8,244,352 before deductions for taxes in comparison with \$6,010,009 for the six months' period ending December 31, 1917, an increase of \$2,234,343. The percentage of profit to gross was 13.9 per cent as compared with 16.7 for the same period of 1917. A large proportion of the locomotive production was for the United States Railroad Administration, and was sold on a smaller margin of profit than was obtained for the output of the 1917 period.

"There has been reserved for United States income and excess profit taxes and Canadian income taxes \$3,148,884, which amount is \$1,108,126 in excess of the allowance for the similar period of the previous year. After deduction of taxes an available balance of \$5,095,468 net profits remained.

"During the six months two quarterly dividends, each of 1¼ per cent., were paid on the preferred stock and two quarterly dividends, each of 1¼ per cent, were paid on the common stock. A reserve of \$1,000,000 out of the net profits has been set aside for additions and betterments, continuing the policy of the management to improve the physical con-

ditions and for balancing the productive efficiency of the various plants, and the remaining surplus of \$2,595,468 for the six months period was carried to the general surplus account, making such account as of December 31, 1918—\$20,423,975.

"The value of stock materials on hand as of December 31, 1918, has been written down to the present day market prices.

"The amount of inventories of materials and supplies on hand and work in progress December 31, 1918, was \$21,432,377, as compared with \$25,411,834 on June 30, 1918.

"The net current assets of the company on December 31, 1918, were \$29,652,742.

"Shortly after the signing of the armistice orders were received from the government to suspend work on a contract received in October for 190 trench locomotives for military service in France, the contract price for which was \$1,873,400. Negotiations are now under way to effect an adjustment of same. The company should not sustain any loss in the settlement. On November 1, 1918, the company received from the United States Railroad Administration a contract for 500 standardized locomotives, which are now in process of construction.

"The unfilled orders on December 31, 1918, amounted to \$54,517,373, and since that date approximately \$4,200,000 of orders have been received for Canada, South Africa and Argentine Republic. We anticipate in the near future a moderate amount of additional foreign buying, but the prospect for domestic orders is very poor. The Pittsburgh plant will be closed at the completion of its schedule the latter part of March. The company has sufficient business to operate the other plants at a reduced rate of production until about June 30, 1919.

"It is vitally important to the prosperity of the locomotive industry and all industries connected with the building and equipment of railways, that a prompt and definite settlement be made of the questions before Congress of the disposition and financing of the railroads of this country; such settlement will aid materially in the readjustment of general business from a war to a peace basis."

CONDENSED INCOME ACCOUNT OF THE AMERICAN LOCOMOTIVE COMPANY AND ITS SUBSIDIARIES FOR THE SIX MONTHS ENDED DECEMBER 31, 1918, AS COMPARED WITH THE SIX MONTHS ENDED DECEMBER 31, 1917

	Six months to December 31, 1918	Six months to December 31, 1917	Increase
Gross earnings	\$59,480,026	\$35,959,126	\$23,520,900
Mfg., maint. and adm. expenses and depreciation	50,986,284	29,851,294	21,134,990
Interest charges	\$8,493,742	\$6,107,832	\$2,385,910
	249,390	97,823	151,567
Net profit	\$8,244,352	\$6,010,009	\$2,234,343
Reserve for U. S. and Can. taxes on profits	3,148,884	2,040,758	1,108,126
Profit available	\$5,095,468	\$3,969,251	\$1,126,217
Dividends on pref. for six months	875,000	875,000	.....
Dividends on com. for six months	625,000	625,000	.....
	\$3,595,468	\$2,469,251	\$1,126,217
Reserve for additions and betterments	1,000,000	.....	1,000,000
Surplus profit	\$2,595,468	\$2,469,251	\$126,217

## Trade Publications

OSGOOD RAILROAD DITCHER.—The Osgood Company, Marion, Ohio, has issued an eight page leaflet describing the Osgood No. 18 railroad ditcher manufactured by that company. The information is presented in the form of a descriptive article illustrated with half tones and line drawings.

SWITCH-POINT HOLD DOWN.—The Deeming-Endsley Company, Chicago, has issued a 12-page folder describing the results secured with a device manufactured by that company for safeguarding switches against the tendency for the switch points to "cock up." It is illustrated with photographs of actual installations.

THE INSLEY IDEA.—The Insley Manufacturing Company has just issued the first number of a bi-monthly publication to appear under the above name. It consists of eight illustrated pages, 9 in. by 12 in., and is devoted to descriptions and expositions of construction work of interest to contractors, industrial plants and others that are prospective users of Insley equipment.

## Financial and Construction

### Railway Financial News

CHICAGO, ST. PAUL, MINNEAPOLIS & OMAHA.—Hornblower & Weeks and William Salomon & Co. are offering \$6,070,000 consolidated mortgage 6 per cent bonds, due June 1, 1930, at 106½ and interest, to yield 5¼ per cent. These bonds will be secured by a first mortgage on about 1,589 miles of line, and by a second mortgage on about 80 miles additional, total of about 1,669 miles, on which the mortgage debt averages \$17-150 per mile.

MISSOURI PACIFIC.—Matthew C. Brush, president of the American International Shipbuilding Corporation, and John G. Lonsdale, president of the St. Louis National Bank of Commerce, have been elected directors of this company.

NEW YORK CENTRAL.—The Railroad Administration, through John Skelton Williams, director of finance, has authorized the New York Central lines to accept the bid of the Bankers Trust Company for \$17,500,000 equipment trust certificates. President Vanderbilt, of the New York Central lines, announced on Tuesday that the director general of railroads had authorized the acceptance of bids made by the Bankers Trust Company, the Union Trust Company of Pittsburgh, and Hallgarten & Co., on approximately a 6 per cent basis, for equipment trust certificates, as follows: \$7,410,000, principal amount, New York Central Railroad equipment trust of 1917, 4½ per cent certificates; \$7,800,000, principal amount, Michigan Central Railroad equipment trust of 1917, 6 per cent. certificates; \$2,133,000, principal amount, Big Four Railway equipment trust of 1917, 6 per cent certificates.

NEW YORK, CHICAGO & ST. LOUIS.—The New York Public Service Commission has issued an order authorizing this company to execute to the First Trust and Savings Company of Cleveland and Walter J. Riley, trustees, a mortgage to secure the \$25,000,000 issue of second and improvement mortgage bonds. The order authorizes at the present time the issuance of \$4,135,000 in bonds. The proceeds are to be applied to the payment of a note held by a Cleveland bank, to indebtedness to the director general of railroads, to reimburse the company's treasury for capital expenditure and pay current liabilities.

NEW YORK, NEW HAVEN & HARTFORD.—Federal Judge Manton, in the United States District Court of New York, on February 28, reserved decision on the motion of the minority stockholders' committee for the appointment of a limited receiver to prosecute pending litigation to recover \$150,000,000 from former directors of the road.

### Railway Construction

BURKEVILLE RAILWAY.—Incorporated in Texas, to build a 20-mile railroad connecting Burkeville, Texas and Wiergate. The incorporators include K. Johnson, T. R. Dickerson and H. C. Knight, all of Burkeville.

TANKS.—Bulletin 259 of the Walter A. Zelnicker Supply Company, St. Louis, Mo., contains a revised list of new and used tanks of all kinds and sizes that are for sale by this company.

RAILROAD BUILDING BOOK.—The Truscon Steel Company, railroad department, Chicago, Ill., has issued the cover and first leaves of a loose-leaf compilation of various data of use in railroad concrete construction. The book is made of a size that will fit the ordinary letter file and in addition to an introductory sheet, three sheets have been included to indicate the character of material to be expected in later issues. One concerns concrete and cement mortar quantities, another gives the sizes and weights of the various reinforcing bars and a third gives properties of collapsible column hooping and the dimensions for column footings.

# Railway Officers

## Railroad Administration

### Central

Oscar A. Price, assistant to the director general of railroads, has resigned, effective on April 1, to become president of the United Artists Corporation.

Luther M. Walters, assistant director of the division of public service and accounting, at Washington, D. C., has returned to active practice as a member of the law firm of Borders, Walters & Burchmore, at Chicago. Mr. Walters will handle railroad and public utility cases.

### Regional

The lines in the Southwestern Region have been regrouped, effective March 1, and changes have been made in the jurisdiction of the federal managers, as mentioned in this issue on page 552.

### Federal and General Managers

E. E. Calvin, federal manager of the Union Pacific, the Oregon Short Line, the Los Angeles & Salt Lake and the Gilmore & Pittsburgh, has had his jurisdiction extended over the St. Joseph (Mo.) terminal, with headquarters at Omaha, Neb.

LeRoy Kramer, who has resigned as federal manager of the Frisco-Katy lines north of Texas to become vice-president in charge of production of the Willys-Overland Company, Toledo, O., was born at Wichita, Kan., in 1875. He was educated in the Wichita grade and high schools and entered railway service in 1897 as stenographer and clerk in the offices of the St. Louis-San Francisco. From this time until 1907 he was consecutively in various clerkships in the division office and later became chief clerk to the general superintendent of transportation, to the general manager and vice-president and to the assistant to the vice-president. From 1907 to 1908 he was superintendent of the Kansas division and from 1908 to 1909 superintendent of the Central division of the same road. In 1909 he went to the Chicago, Rock Island & Pacific as assistant to the vice-president in charge of purchases and stores. In 1910 he was promoted to assistant to the vice-president of the same road and in 1912 was appointed assistant to the president of the Pullman Company, being elected vice-president of the same company at Chicago in March, 1915. Following the taking over of the railroads by the government, Mr. Kramer was appointed federal manager of the Kansas City, Clinton & Springfield, the Missouri, Kansas & Texas, the Missouri, Oklahoma & Gulf, the St. Louis-San Francisco and the Paris & Great Northern, which position he held until his resignation on February 28 to enter the automobile industry.

W. A. Winburn, federal manager of the Central of Georgia; the Louisville & Wadley; the Sylvania Central; the Wadley Southern, and the Wrightsville & Tennille, has been appointed federal manager also of the Gainesville Midland Railroad, with office at Savannah, Ga.

J. F. Murphy, general manager of the Missouri Pacific, the Arkansas Central, the Chicago, Rock Island & Pacific (lines from St. Louis to Kansas City), the Memphis, Dallas & Gulf, and the Natchez & Southern, has had the Illinois division of the Missouri Pacific and the Coal Belt Electric returned to his jurisdiction.

The jurisdiction of H. E. Byram, federal manager of the Chicago, Milwaukee & St. Paul, the Escanaba & Lake Superior, the Tacoma Eastern, the Seattle, Port Angeles & Western, the Port Townsend & Puget Sound, the Ontonagon, has been discontinued over the Port Townsend & Puget Sound as this line has been relinquished from government control.

C. G. Burnham, federal manager of the Chicago, Burlington & Quincy, the Davenport, Rock Island & Northwestern, the Hannibal Union Depot, the Illinois terminal, the Missouri & Illinois Bridge & Belt, the Paducah & Illinois, the Quincy, Omaha & Kansas, the Rapid City, Black Hills & Western, the Rockport, Langdon & Northern, and the Toledo, Peoria & Western, has had his jurisdiction extended over the St. Joseph, Mo., Union Depot, with headquarters at Chicago.

### Operating

J. B. McLaughlin has been appointed inspector of agencies of the Southern Railroad, Richmond division, with headquarters at Richmond, Va.

J. Cannon, general superintendent of the Eastern division, of the Missouri Pacific, has had his jurisdiction extended over the Illinois division of that road and also over the Coal Belt Electric.

### Engineering and Rolling Stock

L. W. Duffee, acting chief engineer of the Gulf, Mobile & Northern and the Meridian & Memphis, has been appointed chief engineer, maintenance of way department, with headquarters at Laurel, Miss.

Lieutenant Walter L. Lewis, 163rd Artillery Brigade, who recently returned from France, has received his honorable release from service and has resumed his work in the engineering department of the Great Northern.

E. W. Pratt, assistant superintendent, motive power and car departments of the Chicago & North Western, with headquarters at Chicago, retired from active service on March 1,

and has been granted an extended leave of absence. Although not 50 years of age, Mr. Pratt has served the Chicago & North Western for nearly 30 years, starting as a message boy and telegraph student when 14 years old, then working in the engineering department and on construction work to earn money to enable him to complete a course of mechanical engineering at Lehigh University, where he also specialized in chemistry and metallurgy. Having had practical work in both civil and mechanical engineering. Mr. Pratt specialized in electrical engineering for one year with the Western Electric Company of Chicago, and again entered the employ of the Chicago & North Western as general air brake inspector and instructor, being promoted successively to engine house foreman, general foreman, master mechanic and assistant superintendent of the motive power and car departments, in which latter capacity he has remained ten years. Mr. Pratt has been active in railway association work, having been president of the Western Railway Club, Chicago, in 1914-15; president of the American

Le Roy Kramer

E. W. Pratt

Railway Master Mechanics' Association in 1915-16 and president of the International Railway Fuel Association in 1917-18.

**R. H. Ford**, engineer of track elevation of the Chicago, Rock Island & Pacific, at Chicago, has been appointed principal assistant engineer, with headquarters in the same city, and the office of engineer of track elevation has been abolished.

**E. B. Hall**, assistant superintendent of the Wisconsin division of the Chicago & North Western, with headquarters at Milwaukee, has been appointed assistant superintendent of the motive power and car departments of the road, with headquarters at Chicago, to succeed **E. W. Pratt**, who is on leave of absence.

**Captain L. C. Dodge**, Engineers, U. S. A., with headquarters in the office of the director general of military railways at Washington, D. C., has received his honorable discharge from the army and has been appointed assistant engineer of bridges of the Baltimore & Ohio, western lines, with offices at Cincinnati, Ohio.

**E. B. Ford**, office engineer of the Great Northern, with headquarters at St. Paul, Minn., has been appointed assistant engineer of the Northwestern region, with office at Seattle, Wash., to succeed **T. G. Hastie**, who has resigned to become resident engineer of the Great Northern, with headquarters at Great Falls, Mont.

**T. O. Sechrist**, general master mechanic of the Louisville & Nashville, with office at Louisville, Ky., has been appointed assistant superintendent of machinery and the position of general master mechanic has been abolished. **C. J. Bodemer**, division master mechanic, with office at Albany, Ala., has been appointed assistant superintendent of machinery, vice **Millard F. Cox**, with headquarters at Louisville, Ky., resigned to engage in other business.

**J. H. Knowles**, whose appointment as chief engineer in charge of construction and maintenance of way and structures of the Western Pacific, the Tidewater Southern, and the Deep Creek was announced in the *Railway Age* of February 7 (page 379), was born on December 15, 1875, at Chicago. In 1899 Mr. Knowles graduated from the University of Wisconsin as a civil engineer, and entered the employment of the government in survey work and irrigation in the western states. In 1901, he began his railway career as a structural draftsman in the chief engineer's office of the Oregon Short Line, at Salt Lake City, Utah. Two years later he was appointed an assistant division engineer on the San Pedro, Los Angeles & Salt Lake, which position he held for seven years. From 1910 to 1912 he was a division engineer on the Western Pacific with headquarters at Elko, Nev., and the following six years he served in the capacity of bridge engineer of that road at San Francisco, which position he held until his appointment as chief engineer of the Western Pacific, with headquarters at San Francisco, Cal., to succeed **T. J. Wyche**, who has resigned to become chief engineer of the Western Pacific Railway Company.

J. H. Knowles

### Traffic

The title of **R. W. Davis** has been changed from general freight agent to freight traffic manager of the Buffalo, Rochester & Pittsburgh, with office at Rochester, N. Y.

**F. J. Woulfe**, assistant general freight agent of the Lehigh Valley, has been appointed general freight agent of the Le-

high Valley; the Susquehanna & New York, and the Buffalo Creek Railroad, with headquarters at New York.

## Corporate Operating

**Andrew McCulloch**, whose appointment as acting general superintendent of the Kettle Valley, with offices at Penticton, B. C., was announced in the *Railway Age* of February 14, page 423, was engaged in engineering work on both the Eastern and Western lines of the Canadian Pacific for a number of years until his appointment as chief engineer of the Kettle Valley on June 1, 1910, in which capacity he had charge of the location and construction of the road, later taking care of engineering matters on maintenance as well. On December 16, 1918, Mr. McCulloch was appointed acting general superintendent, combining the duties of that office with those of chief engineer.

### Engineering and Rolling Stock

**Harry J. Sargent**, formerly valuation engineer and later assistant to the chief engineer of the Boston & Maine, with office at Boston, Mass., under federal management, has been appointed corporate engineer, effective March 1,

## Obituary

**George Wesley Scott**, consulting engineer, Chicago, died on March 3 at Battle Creek, Mich. Mr. Scott was formerly with the Pullman Company, and was one of the pioneers in steel car construction.

**George R. White**, auditor of the Louisville & Nashville, for the corporation, with headquarters at Louisville, Ky., died on February 26, at his home in Louisville, at the age of 40. He was born in Jeffersonville, Ind., and in 1900, entered the service of the Louisville & Nashville as a stenographer. He subsequently was appointed assistant auditor of disbursements, and since the L. & N. has been under government control, served as auditor for the corporation.

**Frank F. Robb**, formerly superintendent of the Pennsylvania Railroad, died on March 3, at his home in Philadelphia, Pa., at the age of 60. He began railway work in 1879, as a rodman on the Pennsylvania Railroad, at Altoona, and subsequently served successively as assistant supervisor, supervisor and assistant engineer. In June, 1893, he was appointed superintendent of the Bedford division, and subsequently served in the same capacity on different divisions of the road, until December, 1903.

**George Pope Furber**, claims attorney of the Boston & Albany, died on February 27, in Eliot Hospital, Boston, Mass., at the age of 55. He had been in the continuous service of the Boston & Albany since December, 1892, having served in various capacities in the law department until he became claims attorney, and remained in the same position since the road was placed under government control. At the time of his death he was also a counsel, secretary and clerk for the directors of the corporation.

**Colonel William Bender Wilson**, formerly an officer of the Pennsylvania Railroad, and author of an elaborate history of the company, died at his home in Holmesburg, Pa., on March 27 at the age of 80. He was born at Harrisburg, Pa., April 5, 1839, and was a telegraph operator at an early age. In 1861 he entered the military telegraph service and was manager of the government office at Washington, where he enjoyed the friendship of President Lincoln. He has been one of the leading spirits in the Old Time Telegraphers' Association, and was president of the Society of the United States Military Telegraph Corps. In the railroad service he was an officer in the transportation department. He retired about twenty years ago. He was the author of numerous books, besides the railroad history, and had received from the legislature of the state of Pennsylvania a gold medal, awarded for patriotic services.

# EDITORIAL

The Grand Trunk Pacific has apparently been put into the hands of a receiver, without having defaulted on its outstanding obligations. The interest due March 1, was paid, but on March 6, the vice-president of the Grand Trunk Pacific notified Sir Thomas White, acting premier of Canada, that the company would, owing to the lack of funds, have to discontinue operation after March 10. An application for a receiver in the ordinary way, could not be made, but acting under the War Measures Act, orders in council were passed, appointing J. D. Reid, Minister of Railways, as receiver for the Grand Trunk Pacific. At present the Grand Trunk, which is a parent company to the Grand Trunk Pacific, and guarantor of its second mortgages and Lake Superior branch bonds, is conducting negotiations with the Canadian Government, looking to some settlement of the Grand Trunk Pacific situation. The first mortgage bonds of the Grand Trunk Pacific are guaranteed by the Canadian Government and some of its branch line bonds by the provinces. Advocates of government ownership in Canada have been urging the government to take over both the Grand Trunk Pacific and the Grand Trunk, and the present receivership of the Grand Trunk Pacific is apparently a countermove on the part of the government to a threat of its discontinuance of operation in the game which is being played out in Canada.

One of the most interesting stories that will be written about the participation of the United States in the World War will be the rapidity with which large numbers of our soldiers were given practical instruction in different vocations. An important part was taken in this work by several men who have been interested in industrial education in the railway and railway supply field. Railroad managements can well afford to study this development with a view to making use of it within their own organizations but to a much greater extent than was possible under the emergency conditions that confronted the upbuilding of the army. The *Railway Age* has, for a number of years, consistently advocated the necessity of giving more attention to the education and training of employees in all departments. The railroads of this country can well afford to be proud of the class of service they have given to their patrons in the past, and at fairly low rates compared with those of other countries. The higher wage scales, the greater cost of materials and a more exacting public promise to interfere with the continuance of this record unless steps can be taken to secure better service from each one of the individual employees. There is no question but what railroad men as a class want to do their work in a way that will reflect credit upon their performance. The difficulty is that they are so scattered and have had so little detailed instruction as to the best methods of performing their duties. The remarkable results that have been secured by safety first, loss and damage and conservation campaigns of various sorts give some promise of what might be accomplished if every man understood thoroughly and exactly how he was expected to do his work and

realized that some check was being placed upon his performance and that he would secure credit for giving the best possible service. The leaders of the more progressive industries and corporations have awakened to the necessity for training their employees more thoroughly and one of the most promising developments which is to be expected in the railroad field in the period immediately before us is in extending the work that has already been so well started in a few departments of some roads and has been carried forward to a greater or less degree by many of the larger industrial companies.

A few weeks ago suburban towns tributary to Chicago were holding meetings to denounce the proposed increases in the cost of commutation tickets. A short time later a serious grade crossing accident in one of these towns led to repeated and emphatic expression of the need for separating the grades of the streets from that of the railway supplying the rapid transit service. Of course it did not enter the minds of any of these indignant citizens that there could be any relation between such a non-income-producing investment and a fair rate for suburban tickets. Whether a public utility is controlled by government or by private parties the viewpoint of the average citizen is the same—that it is an opulent institution that can well afford to spend unlimited amounts for local improvements. Whether the desired end is a palatial post office or an extensive track elevation project, the doctrine of the pork barrel functions exactly the same. Under private management of the roads there is at least one obstacle to the unlimited operation of this demand for expenditures, namely, the "selfishly" interested owners, and any plan for the solution of the railway problem which does not introduce some factor vitally interested in the economical management of the properties, will lead to financial disaster.

### The Same Old Pork Barrel

However valuable may be any measures which the Railroad Administration may adopt to enable it to get along temporarily without another appropriation, the facts will still remain that these measures will be but palliatives and that there will continue to be great need for an early extra session of Congress to provide the Railroad Administration with funds and to find a final solution of the entire railroad problem. In spite of all the efforts the Railroad Administration is making, it is an indisputable fact that the existing railway situation is depressing industry and causing widespread unemployment. Railway purchases are very small while, for the welfare of the nation, they ought to be very large, and the amount of maintenance and improvement work being done is far less than it should be. A protraction of present conditions will be disastrous to the country during the period of readjustment, and perhaps even more disastrous when the time for a resumption of active business comes. There have been great mistakes made and great offenses committed under private operation of railways; but never did the private managements commit offenses so

### A Lesson in Efficiency

Efficiency

### No Palliatives Will Solve the Problem

inimical to the public welfare as are some of the things that have been done—and some that have not been done—under government control.

A series of interesting and practical road tests with a superheater locomotive was made by fuel supervisor F. P. Roesch on the Minneapolis, St. Paul & Sault Ste. Marie to determine the fuel loss occasioned by stopping up superheater flues. A Consolidation type locomotive, having an evaporating surface of 3,000 sq. ft. and a 36-unit superheater, was used for the tests. By means of an electric pyrometer with the thermo-couple inserted in the outside steam pipe about six inches above the steam chest, the amount of superheat in the steam was determined. Various tests were made with different numbers of superheater flues plugged and the amount of superheat noted. The results showed a constantly decreasing amount of superheat obtained for various numbers of flues plugged, amounting to as great a loss as 95 deg. superheat with 18 flues plugged, and showed that in general for every 10 deg. loss in superheat there was an accompanying  $2\frac{1}{2}$  per cent loss in fuel. With seven flues plugged there was a fuel loss of nearly three per cent and this increased at a nearly constant rate to about 25 per cent when 18 of the flues were plugged. These tests show quite clearly the losses occasioned by improperly maintained boilers and indicate the necessity for keeping superheater flues clean. The engine men operating locomotives equipped with pyrometers may readily determine the loss in fuel when the superheat is not being maintained to the proper degree. This information should be brought to their attention and to the attention of the roundhouse men, that they may better realize what dirty superheated flues mean.

## Tendency to Reduce Centralization

SINCE THE FIRST of the year, it has been apparent that the Railroad Administration has been trying to restore railway operation and service to a normal condition. In his recent testimony before one of the House committees, Director General Hines stated that this policy is being followed, and indicated that it is being done largely because the railways may in the near future be restored to their owners. Director of Operation Tyler has ordered the relocation of equipment more nearly in accordance with its ownership. The purchase of coal has been largely decentralized by putting it principally in the hands of the officers of the individual lines. Many of the inspectors who were sent out in such large numbers from Washington last year and who went behind the backs and over the heads of responsible operating officers, have been withdrawn or required to pay more regard to the wishes of the regional directors and federal managers. The regional directors are being given more complete authority in their respective territories, and are in turn giving more authority to the district managers and federal managers. While this general policy is wise because of the probable return of the railways to private operation, it would also be wise if government operation were to be continued. It would have been as wise last year as it is this year.

If Mr McAdoo had been less bent on carrying out his theory of "unification" and more bent on getting the best possible results by the use of tested and practical methods, the operating expenses of the railways in 1918 would have been some hundreds of millions less than they were. Lord Shaughnessy, chairman of the Canadian Pacific, issued a warning regarding the danger of over-centralization under

government control in this country immediately after it was adopted. We published his warning in our issue of January 11, 1918, and an editorial supplementing it in our issue of January 18, 1918. The policy which should have been carefully avoided was the very one which Mr. McAdoo adopted. Seldom was even a small railway system given a more over-centralized organization than that which Mr. McAdoo established on the railways of the United States. The results speak for themselves and speak loudly. Now that railway men are in practically complete charge, they naturally are trying to improve results by reducing centralization. They can do a great deal more decentralizing yet with great advantage.

## It Might Have Been Worse

THE FALLING OFF of railway traffic and the open winter have produced such a marked change in the relation between the amount of business offered the roads and their ability to handle it, that any representations made at the present time regarding the inadequacy of railway facilities in this country are somewhat discredited. In contemplating our part in the successful prosecution of the war, the demonstrated ability of the railroads to haul goods to port faster than they could be taken away by the shipping tends to bolster up a feeling of complacency. We muddled through all right, and, as we won't have another war for a long time, why worry?

Our experience in the European war failed, in a measure, as an object lesson on the need of larger railway transportation facilities from the fact that the emergent burden of war imposed on the railroads differed only in terms of magnitude from that of peace times. Points of maximum traffic density in pre-war times remained points of great traffic movement under war conditions. The business imposed was just the kind that the roads were best able to handle. It called for the least possible flexibility in the use of the transportation machine. The principal destination of all war traffic was the North Atlantic seaboard, which is far better provided with rail lines from the interior than any other frontier. Moreover, the center of manufacture is located closer to the Atlantic than to any other coast, so the train haul was far shorter than to any other border of the country.

How different would be the situation if we were compelled to despatch an enormous war traffic to any of our other frontiers! Some idea of the differences between the transportation facilities available on the Pacific coast or the Mexican border, for example, and on the North Atlantic seaboard may be gained from the table below showing miles of main line in the three groups of border States:

NORTH ATLANTIC COAST			
State	Mileage of lines	Area sq. mi.	Miles of line per 100 sq. mi.
New York	8,404	47,654	17.6
Massachusetts	2,139	8,039	26.6
Rhode Island	206	1,067	19.3
Connecticut	1,000	4,820	20.8
Pennsylvania	11,619	44,832	25.9
New Jersey	2,344	7,314	31.2
West Virginia	4,008	24,022	16.7
Virginia	4,792	40,262	11.9
Maryland	1,418	9,941	14.3
	35,930	188,151	19.1
PACIFIC COAST			
Washington	5,686	66,836	8.5
Oregon	3,226	95,607	3.4
California	8,439	155,652	5.4
	17,351	318,095	5.5
MEXICAN BORDER			
Texas	15,832	262,398	6.0
New Mexico	3,038	122,503	2.5
Arizona	2,416	113,810	2.1
	21,286	498,711	4.3

The territory tributary to the ports between Boston and Norfolk, inclusive, has 19.1 miles of rail lines per 100 miles of territory, while the Pacific Coast States have only 5.5 miles, and those on the Mexican border only 4.3 miles. But this is not the whole story. Most of the trunk lines running to the Atlantic Coast are multiple track lines with extensive trackage in sidings and yards, while the lines leading to other frontiers, with but few exceptions, are single track lines with but limited terminal development. Moreover, the delivery of the average ton of freight to these termini would entail an average haul many times as long as that for the war materials shipped to France or England last year.

It is clear from these considerations that the ability of the American railroads to handle the traffic of a military campaign of first magnitude to any other border of this country than the Atlantic seaboard cannot be measured by the ability they showed in handling the traffic of the European war. Under the policy to which the railroads of the country have been subjected, whereby they have not been able to earn reasonable returns on their investments, except during periods of great prosperity, the expansion of railway facilities has necessarily been limited. The Eastern lines have much greater capacity than the Southern or Western lines because they had reached a high state of development before the policy of restrictive regulation was adopted; and yet they still need a great enlargement of facilities. The capacity of the Western and Southern lines will be slow indeed, becoming equal to that of the Eastern lines under a studied policy of restriction; and yet failure adequately to develop them might prove some time to have been a colossal blunder from a military as well as an industrial point of view.

## Railway Labor Under Private Operation

IT IS EVIDENT that if needed legislation can be secured the railways will be restored to private operation in a comparatively short time. If the welfare of the nation is given paramount consideration they will be restored to both private control and operation before the end of this year. In anticipation of this change the Railroad Administration is adopting important measures to restore normal conditions of traffic movement and of operation.

Some of the most important and difficult problems which will have to be solved when private management is resumed will be presented by the necessity of establishing good working relations between the managements and the employees of the railways. Most of those who are now in direct charge of operation for the government will be continued in direct charge by the companies. It should be the policy of the operating executives, with the approval and support of the Railroad Administration, to take steps while the railways are still in the hands of the government to make it as easy as practicable after private operation is resumed for the managements and the employees to work together harmoniously and in such a way as will promote the best interests of the companies, the employees and the public.

When government control was adopted only a part of the employees were organized. Under government control practically all have become organized. This is a change which nobody should regret. The labor union is just as characteristic, as desirable, and even as necessary a development of modern industry as the corporation. One is an organization to promote the interests of labor; the other an organization to promote the interests of capital. In each case organization gives power. This power can be abused in either case with results that will be harmful to the public, or so used that it will promote the welfare of the public. If in either case the power is abused the results will in the long run be harmful to the public and to those who possess and abuse it. Recent devel-

opments throughout a large part of the world have indicated that strong and ably led labor unions will prove to be civilization's principal safeguard against the ruin and crimes of bolshevism. In any event, almost all classes of railway employees have become organized and their unions probably have come to stay. Future efforts of railway managements should be directed, not toward destroying the unions, either old or new, but toward reaching understandings with them which will protect and promote the interests of all concerned.

Labor on railways, like labor in other industries, is going to demand shorter hours of work and better working conditions. It is going to demand a voice in the settlement of all questions the determination of which will affect the welfare, and even the sensibilities, of working people. And why should it not have a voice in their settlement? The employing class, including both the owners of capital and the officers who have managed industries on behalf of the owners, has taken too narrow a view of the rights of labor in the past. Doubtless at the present time a large part of the workers have an exaggerated view of their rights and mistaken opinions regarding what will promote their welfare. But the employed class as well as the employing class is vitally affected by the way in which industry is managed. It is benefited if industry is well managed and injured if industry is ill managed; and, as a matter of fact, the principal criterion of whether an industry is well or ill managed should be the effects produced upon the workers in it, since they greatly outnumber those who own industry and those who represent the owners in the management.

Labor's demands for a more influential voice in the management of industry will have to be heeded in the long run whether employers wish to heed them or not. The exact means by which labor shall be given a more influential voice in management remain to be determined. Its representation may take the form of members of boards of directors. It may take the form of works committees representing the various unions. One of the principal tests of the ability of the manager of an industry in future will be the success he has in taking labor into the management, in getting its point of view, in distinguishing between what is reasonable and what is unreasonable in its demands, in making labor itself distinguish between the reasonable and unreasonable, and in gaining its confidence and support in carrying out policies which will inure to its benefit as well as to that of the owners of the industry. Perhaps in the long run labor itself will become the owner of many or most industries through the initiation of profit-sharing or other plans. Who knows?

The difficulty of solving the problem of restoring the railways to their owners is largely due to the immense advances in wages which have been granted under government control. The opposition of many employees to the restoration of private operation is chiefly due to the fear that the present wages will not be maintained. We have never known any representative of the owners of the railways to advocate, either in public or private, general reductions of the existing wages. It would appear, however, from the statistics of current earnings and expenses, that wages must be reduced, or rates must be advanced, or there must be a great increase in the efficiency of operation. From the standpoint of labor, which of these policies is preferable? Certainly not a reduction of wages. Also, certainly not another advance of rates. Advances of rates, like advances in prices, increase the cost of living of all classes of the people, including railway employees. The welfare of railway employees as well as of all other classes, will be best promoted by increased efficiency, and consequent increased economy, of operation.

In the past the securing of increases of efficiency has been regarded as solely the function of the managers—that is, of the owners and of the officers placed by them in charge of the properties. No such increases of efficiency as have been

gained in the past can be gained in future by the owners and officers alone. For them to attempt to gain them alone would be constantly to antagonize labor, and labor is becoming so strongly organized that methods to increase efficiency will become increasingly difficult to introduce over its opposition. The co-operation of labor must be secured, and this is the best of all reasons for adopting plans for giving it a voice in management. Labor does not understand the essentials of efficient operation. The main reason why it does not is that it has never had opportunity to take part in or study management and thereby learn the essentials of efficiency. Labor must be given opportunity to be taught these things by its own leaders and representatives, and its leaders and representatives can be equipped to teach them only by being brought in close contact with the problems of management and getting experience in their actual solution.

Labor has been given a larger part in railway management under government control than it formerly had under private control. It cannot be said that the results thus far produced have been good. The abolition of piece work and other measures have been adopted, which have tended to reduce efficiency and increase expenses. But undoubtedly these things have been mainly due to the fact that because of the want of study and experience labor has not understood the essentials of efficient operation or the injurious effects which in the long run inefficient operation must have upon labor itself. In the long run there will be only one way to prevent such results. This will be to give labor an opportunity to learn by actual experience.

Some years ago the "safety first" movement was started on the railroads by the organization of committees of both officers and employees to study and remedy the conditions which caused accidents. The results gained were not as great as could have been desired, but that substantial results were gained, and that they were good, is beyond question. Equally harmonious and energetic co-operation between the officers and employees to promote efficiency must be obtained if greatly increased efficiency is to be secured. The main problem of railroad management in the future will be to secure the harmonious and energetic co-operation of officers and employees in increasing efficiency. The owners and managers of the railways and the leaders of the employees cannot begin too soon, for the good of all concerned, to confer with each other regarding the best means of bringing this co-operation to pass.

## Mr. Hines' Immensely Difficult Task

**N**O PUBLIC OFFICIAL in the United States deserves and needs the assistance of all classes of people more, or perhaps so much, at the present time as the director general of railroads, Walker D. Hines. He deserves the support of all, because, at great personal sacrifice and in an effort to render a public service, he is trying not only with ability, but with rare courage and resolution, to carry the railways through a most trying and difficult period.

Mr. Hines needs the support of all, because without their support in the present emergency no man could perform successfully the task imposed upon him and for the developments of which he has not been responsible.

Mr. Hines expected, and had reason and a right to expect, that Congress would pass at its last session the bill creating a new revolving fund of \$750,000,000 for the Railroad Administration. Nobody seriously questioned that that fund ought to be provided. It was needed to enable the government to fulfill obligations which the Railroad Administration had assumed in conformity with law. The bill was defeated in an attempt to accomplish certain purposes which had no relationship to its intrinsic merits.

The director general was confronted already by a multiplicity of very difficult problems. The uncertainty regarding the future of the railways was destroying the morale of the railroad organizations. Operating expenses were rapidly increasing, largely because of policies adopted by Mr. Hines' predecessor, while traffic and earnings were declining. In consequence, net earnings had fallen to a very low basis. The train service employees, one of the strongest and most important groups of the employees of the railways, were pressing for a large advance in wages and for a settlement of the question of time and a half for overtime. Even if the railroad appropriation bill had been passed, the director general's task of operating the railways satisfactorily and at the same time carrying out even a small program of additions and betterments would have been extremely difficult.

The failure to pass the railroad appropriation bill, coming at a time when, even without this, the problems presented to the Railroad Administration were so numerous and so difficult, would result in a national calamity unless the director general should show enough ability and courage to meet the crisis presented and could get the support from various sources that he imperatively requires. He needs the support of railway labor, which has been very generously treated under government operation. He needs the support of every railway officer, for with prices and wages so high, the efficient operation of the railroads is almost as essential to the national welfare now as it was during the war. He especially needs the support of all the large financial interests of the country. The government is obligated to pay the railroad companies the standard returns guaranteed by the law. If the financial institutions will advance to the railroad companies the money required to provide for betterments and additions and the railway companies will in turn advance it to the government it will be possible to go on with the program of improvements which has been outlined and thereby prevent the railways from becoming a greater cause than they already are of industrial depression and unemployment.

But will the financial institutions advance the railroad companies the needed capital? They will advance capital to those whose credit is strong. The case of those whose credit is weak is more dubious. If the companies can and do borrow the needed money they will have to pay interest on it, and, in many cases, a high rate of interest. Will the government be willing to pay to the companies as high a rate of interest for advances they may make to it as the companies will have to pay to the banks? There has been a lot of squabbling about the rate of interest that the government should pay to the companies. It would be manifestly unfair for the government, under the peculiar conditions now existing, to ask the railway companies to borrow money and then loan it to the government to carry on the government's work at rates of interest less than the railway companies must pay for it.

The government took control of the railroads to solve the pressing railroad financial problem. It certainly is a striking fact that the companies probably will now have to go into the market and borrow money to enable the government to handle the business.

Since the railways are under government control, and since the problems presented are so numerous and difficult, the country is fortunate in having in the position of director general a man of Mr. Hines' resourcefulness, courage and ability, and with his valuable experience under private railway control in handling railway financial matters. If he does not succeed in solving all the problems presented in a way satisfactory to the public he will be entirely justified in saying that no man could have satisfactorily solved all of them. If he does succeed in solving them in a measurably satisfactory way it will be a great achievement, for which he will deserve the applause and thanks of the nation.

## Letters to the Editor

### Give the Weather Man His Due

CHICAGO, Ill.

TO THE EDITOR:

Under the heading "Annual Reports of the Regional Directors" there appears in the *Railway Age* of February 14, page 393, the annual report of the regional director of the Northwestern region for 1918 as made public by the Railroad Administration. In this report, under the subhead "Co-operative Action" is the following paragraph: "A manager was placed in charge of the Upper Lake Michigan and Lake Superior ports to supervise the handling of ore, grain and coal and to co-operate with a committee representing vessel and ore interests. Rerouting by this organization made a saving of 3,577,434 miles. The steaming of ore was almost entirely eliminated; saving, it is estimated \$197,000."

On what hypothesis this estimate of \$197,000 was based, or who did the hypothecating is unknown to the writer. It seems probable from the amount, \$197,000, that the estimator took the total amount expended in 1917 for steaming of ore at the head of the lakes as a basis of comparison.

The steaming of ore means the thawing of ice from ore frozen in cars, by means of steam, in order that the ore may be unloaded into the pockets of the ore docks. The steam used is obtained from locomotives held in ore yards for this purpose, the steam usually being piped into the loaded cars by means of lines of steam hose ending in perforated pipes, which pipes are thrust into the ore loads as steam is turned on. This process of steaming is expensive because it requires locomotives, fuel and crews, but special steaming plants for this purpose can only be erected and maintained at very considerable cost. Like snow handling equipment, the special steaming plant would be in use for only an uncertain few days per year, depending entirely on the weather.

It is obvious that if there is no frost during the season of navigation sufficiently severe to freeze ore in transit, there is no steaming of ore necessary. In case any ore freezes in pockets of the docks, hot water from locomotives is used to flush and clean the floors. Steaming is only needed for ore to be unloaded from cars.

Now it happens that the worst season in many years in this particular regard was experienced in 1917. Due to war needs, to the late date of beginning ore transportation and to strikes at the ore docks, a great traffic in ore was carried on at the head of the lakes in the late summer and autumn. This traffic was increased from week to week and kept going until the latest possible date in the autumn in order to fill war orders. In consequence a great deal of ore was frozen in cars toward the end of the season, and had to be steamed. In 1918, however, no iron ore in cars was frozen or steamed by either of the two principal ore carriers at the head of the lakes on account of the uniformly mild weather which continued long after the close of navigation. The same or nearly the same conditions apply to all railroads carrying ore at the head of the lakes in 1918.

The expense of steaming ore has been a matter of anxiety and investigation with a view to betterment by officers of individual railroads under corporate control for years. It seems that the federal management has at last solved the problem, by a method of co-operation with a committee of ore and vessel representatives, and by the mysterious and unacknowledged co-operation of Him who tempers the wind to the shorn lamb. Only Private Bill Brock, of "Dere Mabel" fame, so far as is known, has been able to so camouflage a horse as to really make him look just like a picket fence. All

abuse and no praise will in time discourage the most loyal co-operator. Would it not look better to give the weather man his due?  
OBSERVER.

### A Disclaimer

LONDON, Eng.

TO THE EDITOR:

In the *Railway Age* for January 31, I find Clifford Thorne reported as having stated before the Senate Committee on Interstate Commerce that "he had analyzed the rates on fifty commodities for representative hauls in Great Britain which had been selected by W. M. Acworth, and that on four-fifths of them the rates were lower than the rates in Official Classification Territory in this country."

I am at a loss to understand to what statement of mine Mr. Thorne can allude. I have never, so far as I know, except on one occasion nearly thirty years ago, selected rates for purposes of comparison between England and America. On the contrary, I have for years past publicly asserted again and again that representative hauls do not and cannot exist. Only last year in an official report to the government on the railways of Rhodesia I wrote, "Particular cases in my judgment prove little or nothing. \* \* \* It can hardly be that among half a million rates there are not a dozen or twenty or a hundred that can be impeached. \* \* \* It can hardly be but that a general manager can counter each case of alleged hardship with a dozen favorable rates."

It is true that in the year 1891 in my book *The Railways and The Traders*, which was, as I stated in the preface, a sketch of the railway rates question from the railway point of view, I inserted comparisons between certain English and American rates. I introduced them, however, by saying, "Let it be frankly confessed that in one sense the rates which follow cannot be asserted to be typical of American rates. \* \* \* They are rates actually in force. If they prove nothing else they at least prove this, that it is as easy to produce figures to show the moderation of English charges as it is to find others to convict them of being excessive and extortionate."

Is it to this thirty years old statement of mine so qualified that Mr. Clifford Thorne alludes, or has he fathered on me a comparison made by somebody else?

W. M. ACWORTH.

### Returning to à La Carte Service

CHICAGO, Ill.

TO THE EDITOR:

The resumption of à la carte dining car service recently ordered by the director general of railroads, as noted in the *Railway Age* of February 14, page 408, will be a matter for congratulation and relief on the part of the traveling public, who loyally "stood for anything" during the world war: who gave and saved and were inconvenienced in a thousand ways without any serious murmur. Beyond a shadow of doubt the traveler had, and still has, cause for complaint of the railroad administration's table d'hôte dining car service.

Traveling on heavy traffic trains west of Chicago the writer has found the table d'hôte dinner offered for one dollar to be equal to that obtainable in the better class cafés for two dollars. The service east of Chicago, though not quite so good, is still worth the money. In the sequel lies the cause of discontent.

On lighter traffic lines extending northward from Chicago, with the same general menu, there is worse than wartime service today. Is there any reason why a traveler should pay \$1 for a "compartment" plate of half portions of coarse

boiled beef, stringy, watery canned beans, and a thin dab of mashed potato, following as scant a fish course of creamed cod fish spread on a bit of cold toast, when traveling on a light traffic train; whereas, for the same price he can buy oysters on the half shell, turkey and cranberry sauce and all else that goes to make up a first-class \$2 dinner, served in first-class style and in generous portions on a heavy traffic train?

It would seem that either the individual railroads have been allowed to alter their dining car services for better or for worse at will, or that prices and profits and numbers of courses only have been standardized, while the standard of food provided in return for the dollar has not been taken into consideration. It is to be hoped that the light traffic lines which have undoubtedly made poor progress with the table d'hôte service and the financial returns therefrom, will at once reinstall their à la carte dining car service which before the war was in most cases admirable.

TRAVELER.

## The Prevention of Collisions

NEW YORK.

TO THE EDITOR:

Readers who are interested in the problem of reducing the disgraceful collision record of the railroads of this country must have taken fresh heart from your issue of February 28. Mr. Vanneman, of the New York State Public Service Commission, sweeps away some of the deadwood which has clogged most of the discussions on this subject. That feature of the report which may be more important than all the rest is found only by turning to the obscure item on page 515, which tells us that a general inquiry is to be held. This inquiry ought to be of great value. Investigations of particular accidents always leave much to be desired, for railroad officers are on the defensive and remain as reticent as they know how to be. The investigators or any parties adverse to the railroad company often seem to fall far short of a judicial frame of mind, and anything like a broad treatment of the general question of safety is almost impossible. The New York commissioners have here a fine opportunity to do some constructive work.

On one point Mr. Vanneman adopts the excessively cautious attitude of the railroad signal engineers (which caution has greatly retarded true progress). He says that an automatic stop (or a cab signal), if used, must be installed on the whole road; otherwise locomotives from branch lines, not equipped, must be kept off from those divisions on which the device is installed. This objection is not so important as it seems. The frequent use of engines off their regular divisions is unnecessary—it *should be made unnecessary*, even at considerable expense; but when such use does become necessary the thing to do is to make use of the absolute manual block system; and temporarily to keep trains two blocks apart, if necessary to afford the needed confidence. Every railroad is liable to have to run trains against the current of traffic, and should be prepared for the suspension of automatic-block-signal protection at any time. A road which is not prepared to protect trains by the space interval at any time, on the shortest notice, without any apparatus except the telegraph or the telephone, is very far from being an ideally equipped road.

And it may not be unfair to urge Mr. Vanneman to greater courage in another direction. He says that to instal locomotive apparatus it will be necessary to enter unexplored fields; though he refers briefly to English and French experience. But why not investigate thoroughly what Europe has done?

The Great Western Railway of England has used cab signals for a dozen years; and for five years these signals have

been in constant service on considerable numbers of locomotives. Why should not Mr. Vanneman go over and spend a few weeks in England and France?

An engineman can shut his eyes to the visual signals; he can even shut his mind to the signals when his physical eyes are wide open; but shutting his ears to an audible signal is far more difficult. Query: Do we fully appreciate the principle of the audible signal? We have been using torpedoes for half a century, but have we not neglected some of the lessons which they teach? Mr. Vanneman refers to the torpedo arrangements in Europe as "crude"; but some things that are crude still conduce powerfully to the safety of railroad operation—for example, broken stone ballast.

Your cold and condensed editorial on this report leaves out a lot of things which American railroad men ought to take to heart. You sympathize with the railroad president who has had difficulty in getting all the money needed to introduce necessary safeguards on his road. This sympathy is all right; everyone of us shares in it; but in the last analysis the railroad president *must take the risk*—as indeed he must with his whole financial problem. Is not this true? Congress does not intend to allow the railroads to increase their incomes until they actually starve. If this is mere pessimism and grumbling, you may make the most of it. Plain facts may as well be faced.

Mr. Vanneman, in his full report, printed since your paper came out, discusses the flagging rule, the practice of the New York Central in the management of tail lights, and other things. This is useful matter for railroad men who need it, but the dominant impression is, *Why do railroad men need it? Why is this past history useful? Why are we still discussing ways of perfecting the flagging rule when many years of experience have demonstrated that the task is hopeless?* The New York Central has changed its arrangement of tail lights, and the decision to do this was, no doubt, the result of much time spent in careful discussion; but we ought to be spending our time in discussing modern improvements; rather than ancient canal-boat methods. The real desideratum is to run trains (by means of the space interval) under such circumstances that they will be safe even though no tail light should be visible more than 500 feet away.

This proposed New York inquiry ought to be the starting point for a really progressive movement. Nearly or quite all of the informative discussion on the collision problem which has been promulgated so that the public could really get the benefit of it has been available only in fragments. We have various deliverances from the Interstate Commerce Commission, but none of them furnish an adequate view of the railroads' side of the question. If our railroad managements agree with the Interstate Commerce Commission no one knows it. If they disagree, there has been no clear setting forth of the facts. There ought to be a public debate, with strong men to present both sides. The signal manufacturers are supposed to be able to remedy all of our troubles, but they, as well as the Interstate Commerce Commission, seem satisfied to stand off and wait. Why do they not induce the railroads to make better progress? Or, if they have tried to do this and have failed, what is the reason for the failure? All public questions of real importance are made the subject of thoughtful public discussion in Congress, or in a legislature, or a court, or the pulpit, or some free forum. Is it or is it not correct to call this question of safeguarding passengers' lives an important public question?

V. P. O.

Five men arrested at Albany, N. Y., last week, by New York Central police are believed to have stolen mileage tickets from 75 small stations in New York state. More than 20 stations in the immediate vicinity of Albany have been broken into.

# Heavy Standard Mallet Type Locomotive

The First of the Government Order for Over 100 of These Engines Delivered to the Norfolk & Western

THE FIRST ORDER of 1,025 locomotives placed by the United States Railroad Administration included an order of 20 heavy (2-8-8-2) standard Mallets. This was later increased to over 100, 65 to be built by the American Locomotive Company and 41 by the Baldwin Locomotive Works. The American Locomotive Company has within the past month made the first delivery of these locomotives. While they were scheduled and lettered for the Virginian Railway they have been assigned for duty on the Norfolk & Western. These engines are the largest of the standard locomotives built for the Railroad Administration and represent the limit to which a locomotive can be built to come within the maximum clearance limitations set by the Railroad Administration (15 ft. 9 in. high and 10 ft. 9 in. over cylinders). These locomotives are smaller than those which can be used on the Virginian Railway, as evidenced by the 2-10-10-2 type Mallet locomotives which were recently built for that road by the American Locomotive Company. These latter engines have a width clearance of 12 ft. and a height clearance of 16 ft. 7½ in. On the other hand, the clearance limitations of these standard engines compare very favorably with the 2-8-8-2 Mallets recently built by the Norfolk & Western to that company's own design. Being limited by these clearance restrictions a very careful design had to be made to provide a locomotive of the power required.

In the matter of power these standard engines may be compared with locomotives of similar wheel arrangement built by the Norfolk & Western in its own shops, and for the Western Maryland by the Lima Locomotive Company. A table comparing the principal dimensions of these two

trates plainly one of the chief objections to standardization.

The standard 2-8-8-2 Mallet locomotive has a total engine weight of 531,000 lb., of which 28,000 lb. is on the leading truck, 237,000 lb. on the front or low pressure unit, 241,000 lb. on the high pressure unit and 25,000 lb. on the trailing truck. It is built for a permissible axle load of 60,000 lb.,

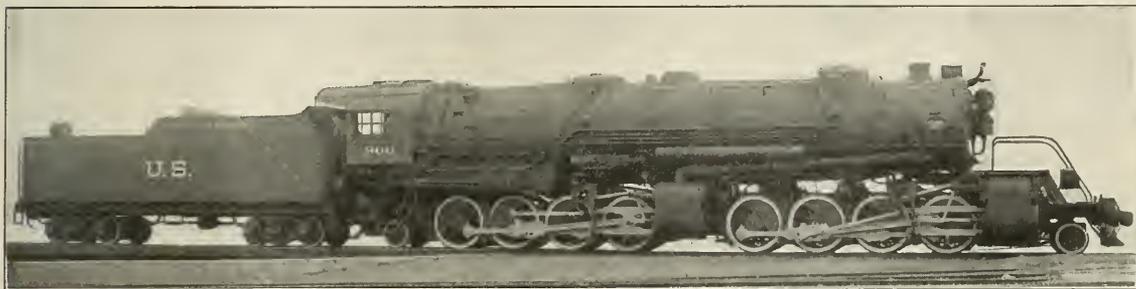

TABLE OF COMPARISON OF 2-8-8-2 TYPE LOCOMOTIVES

Name of road	U. S. Std.	Norfolk & Western 1918	Western Maryland 1915
When built	1919		
Tractive effort, compound, lb.	106,000	104,300	106,000
Weight, total, lb.	531,000	535,000	495,000
Weight on drivers, lb.	478,000	472,000	445,000
Diameter of drivers, in.	57	56	52
Cylinders, diameter and stroke, in.	25 and 39 by 32	24½ and 38 by 32	26 and 40 by 30
Steam pressure, lb., per sq. in.	240	230	210
Total heating surface, sq. ft.	6,120	6,316	5,669
Superheater heating surface, sq. ft.	1,475	1,510	1,264
Grate area, sq. ft.	496	96	80
Weight on drivers ÷ tractive effort, (compound)	4.7	4.5	4.2
Tractive effort × diameter drivers ÷ equivalent heating surface*	695.	680.6	726.3
Equivalent heating surface* ÷ grate area	86.6	89.4	94.9

\* Equivalent heating surface = total evaporative heating surface + 1.5 times the superheating surface.

† Gaines combustion chamber is used on this locomotive.

which is the same limit prescribed for the standard 2-6-6-2 locomotive. The cylinders are 25 in. and 39 in. by 32 in., and a working pressure of 240 lb. is carried on the boiler. The distribution of the weights amongst the various drivers is shown in the weight diagram, which was prepared by F. P.

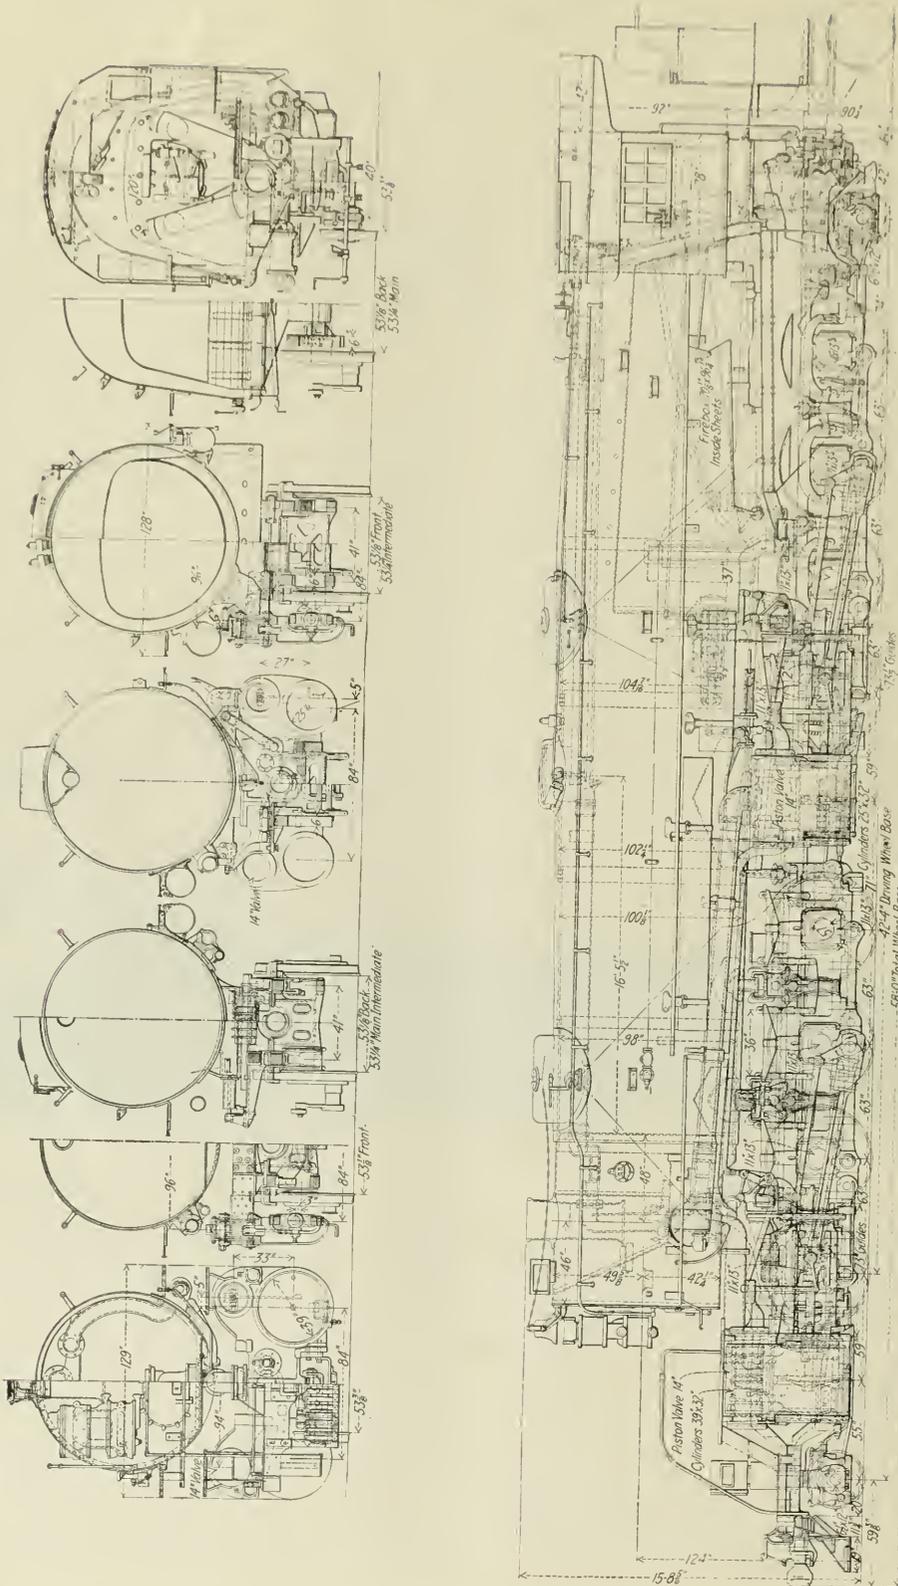

Standard 2-8-8-2 Type Locomotive for the U. S. Railroad Administration

locomotives is included. A description of the Norfolk & Western locomotive was published in the *Railway Age* of July 12, 1918, page 59. From this table of comparison it will be seen that the standard locomotive is 6,000 lb. heavier than that built by the Norfolk & Western, and 3,300 lb. heavier than that built for the Western Maryland. The working pressure on the standard locomotive is also 10 lb. greater than that of the Norfolk & Western locomotive and 30 lb. higher than that used on the Western Maryland locomotive. The boiler proportions of the standard locomotive and those of the Norfolk & Western compare very favorably. However, the Norfolk & Western design provides about 200 sq. ft. more heating surface and about 35 sq. ft. greater superheating surface. While these two engines are very nearly alike in proportions, they are of an entirely different class as far as the construction details are concerned, which will necessitate a different line of repair parts and illus-

Pfahler, chief mechanical engineer of the Mechanical Department, United States Railroad Administration. The clearance diagram, also prepared by Mr. Pfahler, is included in the illustrations.

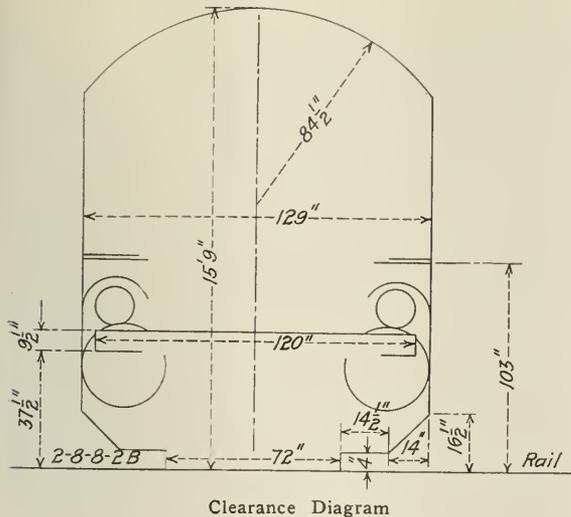

The boiler of these locomotives has an outside diameter at the first ring of 98 in. It is of the straight barrel type and has shell plates 1 1/16 in. thick. The dome is located on the third course and on account of the clearance limitation is only nine inches high. The boiler is equipped with a Gaines combustion chamber. The length of tubes is 24 ft. There are 274 2½-in. tubes and 53 5½-in. flues, which are of No. 8 gage, being one gage heavier than the general standard practice in the construction of Mallet locomotives, due to the fact that a working pressure of 240 lb. is carried on the boiler. The firebox is 170⅞ in. by 96¼ in., having an effective area of 96.2 sq. ft. The firebox sheets are ⅝ in. thick and the back tube sheet is ½ in. thick.

Elevation and Sections of the Standard Heavy Mallet Type Locomotive

The tube spacing is similar to that used on the standard 2-6-6-2 type Mallets.

The frames for these locomotives are 6 in. in width, the same as for the 2-6-6-2 locomotives and are 6¾ in. deep over the pedestals, having a minimum thickness of 5½ in. The lower rails are 4½ in. deep, with a minimum thickness of 4 in. The frames for the high and low pressure engines are connected with the Baldwin type of frame hinged casting. From the standpoint of design they are, with the

is 4½ in. in diameter for the 2-8-8-2 locomotive and 3¾ in. in diameter for the 2-6-6-2 locomotive. The pistons have a dished section and those for the high pressure cylinders are interchangeable with those used on the light standard Pacific and the Eight-wheel switchers. The specifications require that they be made of rolled steel or cast steel. They are provided with packing rings of Hunt-Spiller gun iron. The pistons for the low pressure cylinders are, of course, not interchangeable with any others used on the standard locomotives, although they are of the same general standard design. They are made of cast steel and are of dished section, having, as in the case of the high pressure cylinders, two packing rings of Hunt-Spiller gun iron. The piston rods for both the high and low pressure units are 4½ in. in diameter. Paxton-Mitchell piston and valve rod packing is used on these locomotives.

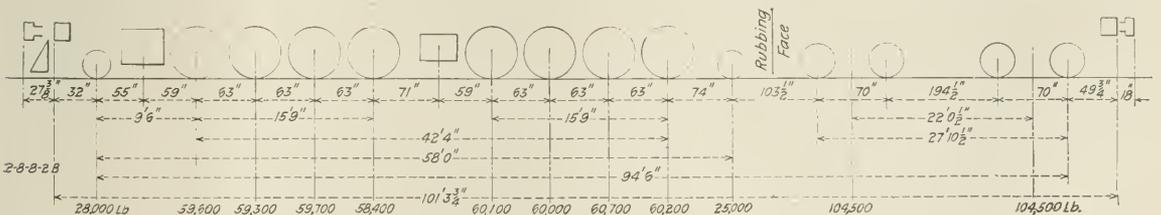

The main rods of both the high and low pressure cylinders are precisely the same. They are 118 in. long from center to center and are of I-section, being 3 in. wide and 6 in. deep, with 1½-in. flanges and a ½-in. web. They are of the same design as the main rods used on the 2-6-6-2 standard locomotive, the only difference being that they are one inch longer between centers and the flange is ½ in. deeper. Thus it will be seen that rods for both these locomotives can be manufactured from exactly the same size of stock material. The design of the strap end is exactly the same, the only difference being that the rods for the 2-8-8-2 type are a little heavier than for the 2-6-6-2 type locomotive.

Among the interchangeable details of these locomotives may be mentioned the dump grate rigging, which is the same as that used on the light and heavy Santa Fe locomotives; the pilot, which is standard for all except the switchers; tires, which are common to the 2-6-6-2 and the light Santa Fe; and engine truck and trailer axles, which are common to all of the standard locomotives. The engine truck box is the same as that used on both designs of Mikado and Santa Fe and the 2-6-6-2. The front bumper is the same as that used on all except the switchers and the frame pedestal shoe, wedge, and wedge bolt are the same on all locomotives except the switchers. In addition to this there are many other details which are common to the 2-6-6-2.

The specialties used on these locomotives as well as on

exception of differences in dimensions, practically exact duplicates of the frames built for the standard 2-6-6-2 locomotive.

As in the case of the 2-6-6-2 standard locomotive, both the high and low pressure cylinders are provided with piston valves. A larger diameter of valve is used, however, it being 14 in. The travel of the valve for the high pressure cylinders is 6½ in. and it is given a lap of 1 in., a lead of ¼ in. and an exhaust clearance of ¼ in. In the low pressure

Wheel Spacing and Loading for the Heavy Standard Mallet

cylinders the valve is double ported and has a travel of 6 in. with a lap of 1⅛ in., a lead of 3/16 in. and an exhaust clearance of 7/16 in. As in the case of all the standard locomotives the valves and cylinders are bushed with Hunt-Spiller gun iron. Both cylinders are spaced 84 in. between centers, whereas in the lighter Mallets the spacing is 85 in. As in the case of the 2-6-6-2 Mallet the Mellin type of by-pass and intercepting valve is used.

In the matter of general design the crosshead for the 2-8-8-2 locomotive is the same as that of all standard locomotives. The dimensions are also practically the same, with the exception of the piston fit, the diameter of the boss in the body of the crosshead being made eight inches instead of seven, on account of the heavier piston rod, which

the other standard engines were enumerated on page 91 of the January 3 issue of the *Railway Age*.

The following is a list of the general dimensions of these locomotives with the principal data:

General Data

Gage	4 ft. 8½ in.
Service	Freight
Fuel	Bit. coal
Tractive effort (compound)	101,300 lb.
Tractive effort (simple)	121,600 lb.
Weight in working order	531,000 lb.
Weight on drivers	478,000 lb.
Weight on leading truck	28,000 lb.
Weight on trailing truck	25,000 lb.
Weight of engine and tender in working order	740,100 lb.
Wheel base, driving	42 ft. 1 in.
Wheel base, rigid	15 ft. 6 in.
Wheel base, total	57 ft. 4 in.
Wheel base, engine and tender	93 ft. 3 in.

## Ratios

Weight on drivers ÷ tractive effort (simple).....	3.91
Total weight ÷ tractive effort (diam. simple).....	4.37
Tractive effort (compound) × diam. drivers ÷ equivalent heating surface.....	695.
Equivalent heating surface ÷ grate area.....	86.6
Firebox heating surface ÷ equivalent heating surface,* per cent.....	5.2
Weight on drivers ÷ equivalent heating surface*.....	57.5
Total weight ÷ equivalent heating surface*.....	63.8
Volume equivalent, simple cylinders, cu. ft.....	22.2
Equivalent heating surface* ÷ vol. cylinders.....	375.
Grate area ÷ vol. cylinders.....	4.33

## Cylinders

Kind.....	Compound
Diameter and stroke.....	25 in. and 30 in. by 32 in.

## Valves

Kind.....	Piston
Diameter.....	14 in.

## Wheels

Driving, diameter over tires.....	57 in.
Driving journals, diameter and length.....	11 in. by 13 in.
Engine truck wheels, diameter.....	30 in.
Engine truck, journals.....	6½ in. by 12 in.
Trailing truck wheels, diameter.....	30 in.
Trailing truck, journals.....	6½ in. by 12 in.

## Boiler

Style.....	Straight top
Working pressure.....	240 lb. per sq. in.
Outside diameter of first ring.....	98 in.
Firebox length and width.....	170 in. by 96½ in.
Firebox plates, thickness.....	¾ in.
Firebox, water space.....	5 in.
Tubes, number and outside diameter.....	274—2¼ in.
Flues, number and outside diameter.....	53—5½ in.
Tubes and flues, length.....	24 ft.
Heating surface, tubes.....	3,860 sq. ft.
Heating surface, flues.....	1,825 sq. ft.
Heating surface, firebox.....	435 sq. ft.
Heating surface, total.....	6,120 sq. ft.
Superheater heating surface.....	14.5 sq. ft.
Equivalent heating surface*.....	8,333 sq. ft.
Grate area (with Gaines wall).....	96 sq. ft.
Smokestack, height above rail.....	15 ft. 8½ in.
Center of boiler above rail.....	10 ft. 4 in.

## Tender

Tank.....	Water bottom
Frame.....	Cast steel
Weight.....	209,100 lb.
Wheels, diameter.....	33 in.
Water capacity.....	12,000 gal.
Coal capacity.....	16 tons

\* Equivalent heating surface = total evaporative heating surface + 1.5 times the superheating surface.

## Howard Elliott on Needed Regulation

IN AN ADDRESS before the Commercial Club of Chicago on March 8, Howard Elliott, chairman and president of the Northern Pacific Railway Company, said in part:

"It has been urged that government control and operation should be continued until January 1, 1924, instead of being limited to 21 months after the ratification of the treaty of peace, as fixed in the present law. This is on the theory that better results can be obtained for the nation and the railroads under such long time plan than to return the roads to the owners for operation. But does the record of government operation give any great promise of such better results?"

"Certainly private ownership and operation, while not perfect, have produced unusual results. Private owners created a system of railroads with less investment of capital for the service rendered, and had up to December 28, 1917, furnished better service to the public and at lower rates and has paid higher wages to employes, than in any civilized country. This was done when the citizen had for a considerable period "liberty" to exercise his "tireless energy" and his "individual responsibility and initiative."

"What is called the labor question is, of course, one of the most serious and difficult confronting the whole world, the railroads in particular, and there must be a broad view of it and a spirit of give and take by all classes of people. All good citizens desire to see the wages and living conditions improve, but there is a limit to what commerce and industry can pay, and survive. It is surely better to have reasonable wages and continuous employment rather than to force wages so high that industry languishes, for then the wage earners themselves will suffer most of all.

"The man who puts a dollar of his savings into the trans-

portation business does so knowing that his dollar is subject to the power of the government to make the rules and regulations governing the business. The man who decides to earn his dollar by working for the railroad should be willing to submit to reasonable wages, rules and regulations, just as much as does the man who puts in his dollar already earned. It is in the public interest to have the invested dollar regulated reasonably, and it is equally in the public interest that the dollar paid for service and the conditions of service should be regulated reasonably.

"And if employes can once be satisfied that a fair and impartial tribunal is in existence to hear important complaints that cannot be settled promptly on the "home road" between employes and employer, there should be no need of strikes, which are simply a form of war. The world has just lost millions of men and billions of treasure in a struggle whether force rather than justice and reason were to settle the affairs of the world. Surely the United States, the most enlightened and progressive nation in the world, can, if it takes up the question seriously, work out some plan for adjusting industrial disputes that will carry out the doctrine of 'live and let live' and save the loss, sorrow and anguish that comes to thousands of innocent people who have no part or voice in the controversy or its settlement.

"Capital may be timid but it was bold enough in the last 50 years to create our great American railway system. It will be willing to go on with that work if it can be assured that the policy of the government will be to sustain the railroads in the legitimate conduct of their business and allow reasonable liberty of action instead of repressing and hampering the work. The credit of the roads will come back when people understand that Congress has laid down the rule that a reasonable rate is also an adequate rate, sufficient to reflect changed costs, increased wages and rates for the use of money; when Congress insists that some reasonable method of adjudicating controversies about wages and working conditions shall be written into the law of the land; and when the nation insists that it is the duty of a President to preserve, protect and expand the transportation facilities of the country, just as much as agriculture, banks, manufacturers, commerce, or other forms of individual activity.

"Whether to put all the regulatory power in the hands of the Interstate Commerce Commission, or to relieve the pressure on that overburdened body by giving it help in the form of Regional Interstate Commerce Commissions which will be nearer the people and to the state commissions, and whether to recognize the great importance of the transportation business by having a cabinet officer to take charge of some of the executive work connected with regulation and to watch and protect the transportation agencies, are, of course, questions of individual judgment.

"An effective transportation machine is vital to the interests of the Nation in war and peace. Its importance justifies having a man in the cabinet to confer on an equality with other cabinet officers dealing with great national questions and resources, and to present the transportation needs of the nation directly to the President and his advisors.

"The charge is made that this plan injects the management of the railroads into politics—unfortunately you cannot divorce politics entirely from the situation if you admit the principle of regulation by the government, but in the long run with the President and the Secretary of Transportation directly interested in giving the country good service it has seemed to us that the highest standard of political action would be obtained."

The movement of freight last Sunday over the Pennsylvania Railroad was continued at full pressure. The expected order to send out no trains on Sunday except for live stock and perishable shipments was not issued, a number of derailments last week having caused serious congestion at several points.

# Will the Mexican Railway System "Come Back"?

The Carranza Government Has Established Railway Purchasing Agents at New York and Houston

By P. Harvey Middleton

Executive Assistant, Railway Business Association

UP ON THE THIRTY-FIFTH FLOOR of the Woolworth building, in New York, you will find Senor F. P. de Hoyos, general purchasing agent of the Mexican government railway administration, who has recently resumed the buying of equipment for the bandit-wrecked railroads of Mexico. Carranza's New York office has already spent \$764,581 for railway supplies, paid for with bank credits established in New York, all purchases being made f. o. b. There is constantly on hand in New York a bank credit of \$150,000, which is renewed as funds are used up. On the second floor of the Gulf building, in Houston, Texas, G. B. Aleman is also acting as purchasing agent for the Mexican government railways, but I am unable to learn the extent of his purchases to date.

Of course, three quarters of a million dollars or so in railway supplies spreads out pretty thin over 9000 miles of railways which have been systematically shot full of holes in revolutions, counter-revolutions and bandit raids for over five years, but the important thing is that Mexico has started to rehabilitate her railways, and that she is able to finance purchases of railway supplies through New York banks.

Senor Rafael Nieto, acting Minister of Finance for Mexico, visited New York the second week in February to arrange for the extension of a bank credit to Mexico, secured by customs revenues, to cover orders for railway supplies. It is understood that these orders will include 25 locomotives, 500 freight cars and a large tonnage of steel rails. Senor Nieto has engaged Lindley M. Garrison, former Secretary of War, and receiver of the Brooklyn Rapid Transit Company as counsel.

At 25 Broad street, New York, the dispossessed officials of the National Railways of Mexico Company, ejected by the Carranza decree of December 4, 1914, and denied access to their offices and archives in Mexico, sit around in the same uncomfortable ease that for a time afflicted some of our best-known American railroad corporation officers—with the rather important difference, however, that the National Railways of Mexico Company have not received any financial return from the Carranza government on its seized properties, a system comprising the National Railroad of Mexico, the Mexican Central, the Mexican International, the Hidalgo & Northeastern, the Vera Cruz & Isthmus, the Pan American, the Mexican Southern, and, under lease, the Interoceanic—in all, 8,038 miles of line, 51 per cent of the stock being controlled by the Mexican government, and the balance owned by Americans. The investment in road and equipment of the National Railways of Mexico at the time of their seizure was \$853,073,281.

## Damage to Railroads

Some idea of the field for railway supplies in Mexico may be gathered from the fact that during the revolution the tracks and roadbeds in almost every part of the republic were damaged or destroyed. The line of the Mexican Northwestern is almost a wreck from end to end. In some places on the Mexican Central the rebels used scrapers to obliterate the roadbed. From 35 to 40 per cent of the railroad bridges throughout the country were destroyed, and numerous stations between Monterey and Mexico City were burned. Fifteen

stations were damaged or utterly destroyed on the Interoceanic alone. During 1911-1917, 9,250 cars were lost on the National Railways, which would represent about 40 per cent of the rolling stock.

It was reported from Tampico in September last that the railroad equipment was so short in that region that when the single daily passenger train from Monterey was delayed there was no outgoing train the following morning. The line from San Luis to Potosi at that time was unsafe on account of roving bandits, who had frequently blown up sections of the track and dynamited trains. All crossies and much of the steel will have to be renewed before safe, fast and regular service can be relied upon. Practically none of the rolling stock is suitable for first-class traffic.

Attention should also be drawn to the statement of Felipe Pescador, general manager of the National Railways which appeared in the *Railway Age* of February 21, page 470 and to that of Manuel Aguirre Berlanza Secretario de Gubernacion which appeared in the *Railway Age* of February 28, page 518.

## Repairs Temporary

Recent reports indicate that the Mexican National is at present in a reasonably good condition, so, too, the lines from Matamoras to Monterey, Paredon to Saltillo, Tampico to San Luis Potosi, and Mexico to Toluca, Irapuato, Guadalajara and Aguascalientes. The Railways of Yucatan, the Southern Pacific of Mexico, the Vera Cruz, and the Mexican Railway are likewise reported as having been brought into fair condition. It is important to note, however, that so far much of the repairing that has been done is necessarily of a temporary nature, wooden bridges being substituted for steel structures.

Accidents provoked by rebels have diminished in number on the Tehuantepec, Pan American, and Alvarado lines. How much capital the Mexican government will actually devote to the rehabilitation of the railways is still undetermined. The Mexican Congress has, however, authorized the placing of three loans amounting to 300,000,000 gold pesos (about \$150,000,000), for the purpose of reorganizing the finances of the railroads and establishing a new bank of issue.

It is estimated that it will be necessary to spend at least \$50,000,000 to rehabilitate the railways of Mexico, if they are to be brought back to the state of efficiency existing under the American operating officers prior to the revolution. Under the Diaz government concessions granted to private companies for railway construction provided for the automatic return of the railways to the government after a stated period, usually 90 years, upon the payment by the government of compensation for rolling stock, buildings and material on hand at the date of the transfer.

When Carranza took over the National Railways of Mexico in 1914 the decree provided that an indemnity should be paid based on the average earnings for five years, plus 10 per cent, but up to the present time the Mexican government has been unable to meet the interest on its state bonded debt, interest in default on January 1, 1918, being \$12,047,807. In addition to this, interest is in default on \$50,747,925 general mortgage 4 per cent gold bonds of the National Railways

of Mexico, and on \$7,000,000 Vera Cruz & Pacific first 4½ per cents.

The mileage of the lines of the National Railways of Mexico consists of 6,410 standard gage and 388 narrow gage. Sidings and yards, 896 miles standard gage and 45 narrow gage. In addition, the National Railways system owned or controlled, prior to the Carranza edict, 162 miles of the Texas-Mexican line and 12 miles of Decauville construction. It had in 1914 15,700 standard gage freight cars of a total capacity of 521,957 metric tons; 1,779 narrow gage freight cars of a total capacity of 38,244 metric tons; 454 standard gage passenger cars, and 113 narrow gage passenger cars; 670 standard gage locomotives, and 92 narrow gage locomotives.

#### New Lines Built or Under Way

New lines projected by the Mexican National Railway administration include a line along the Gulf of Mexico from Matamoros on the border to Vera Cruz via Tampico and Tuxpam, with a branch to Honey which will afford connections to Mexico City, and an extension of the line on the Pacific side from Llano Grande to Mazatlan. A line is now under construction from Canitas to Durango, of which 250 miles have been completed. Another line is being built east of Saltillo. A line is also being built from Cuatro Ciénegas, State of Coahuila, to Chihuahua, via Sierra Mojada, approximately 450 miles. Another line is under construction from Durango to Mazatlan, about 135 miles, making a new transcontinental line across Mexico. The Cuatro-Ciénegas-Chihuahua route will tap large coal fields in Northern Mexico. The Durango-Ciénegas road will shorten the distance to the Mexican capital by some 200 miles and will open up rich mining areas.

Announcement was made in Mexico City on December 19, 1918, that construction work will shortly be commenced on a railway connecting the city of Merida, capital of the State of Yucatan, with Mexico City. A contract has been prepared with the Development Company of the Southeast for carrying out the work. The road will run from Merida through the southern portion of Yucatan, passing through the State of Campeche and Tabasco, and effecting a junction with the Pan American Railway at the station of Santa Lucrecia, State of Vera Cruz. This route will traverse a very rich agricultural region which is at present without rail communication. A large amount of rolling stock and other material for this line has already been landed at Progreso by steamer.

Newspapers in Mexico City have during the past month announced a great revival of interest in railway development. The steel works at Monterey have already made one delivery of 5,000 tons of steel rails for the line between Monterey and Tampico. Orders are in hand at the same plant for all lines under government control. Preparations are under way for the completion of the line of the Southern Pacific Railway of Mexico from its present terminus south of the city of Tepic with the existing lines from Guadaluajara west, and thence to Mexico City, thus giving direct rail communication with all the cities of the states of Sinaloa and Sonora, as well as with the Pacific coast of the United States.

Application has been made to the Mexican Government by a British syndicate for a concession to construct a railroad from San Geronimo on the Isthmus of Tehuantepec, to Campeche, a distance of about 450 miles. At San Geronimo the proposed road will connect with the National Tehuantepec Railroad, and at Campeche with the United Railways of Yucatan. The application really seeks to revive a concession that was granted by the Government several years ago for a railroad that was to be built along the same route as is now in view. Under the original concession the route for the proposed railroad was surveyed and was found to

be feasible from an engineering and construction standpoint.

#### America's Stake

Over one billion dollars of American capital is invested in Mexico, of which \$235,464,000 is in railway stocks and \$408,926,000 is in railway bonds. For this reason the ability of Mexico to "come back" is of vital interest to Americans, and especially to the American railway supply interests, for it is one of the few countries in the world where American railway investments far exceed those of Great Britain—a potent factor in securing orders for supplies. In the past Mexico has shown surprising ability to recuperate quickly from internal troubles. Since the beginning of 1918 real progress has been noted. The mines and smelters with a few important exceptions are running to capacity, the oil wells are producing freely, farms are being worked extensively, the government is distributing agricultural implements at cost, and the condition of the railroads is receiving serious study, although in certain sections bandit raids are still of frequent occurrence.

#### Existing Railways Inadequate

With a population of 15,000,000, spread over 101,000 square miles, the existing railway development of Mexico is entirely inadequate, and there are immense areas, rich in minerals or with very productive soil, practically isolated from the rest of the country. The present railways have come into existence to meet the needs of special interests. Mineral railways for the conveyance of ore from mines to convenient shipping points, for instance, have developed into important lines.

Of all the railways in Mexico those making up the National Railways group are by far the most important, for they have four points of entry on the United States border, their lines running south from Matamoros, Laredo, Eagle Pass and El Paso, and connecting with the important harbors of Tampico and Vera Cruz on the east coast and with Manzanillo on the Pacific.

At San Geronimo, on the Tehuantepec Railway, there is a branch line called the Pan American Railroad, which is a part of the National system. It runs along the Pacific coast to Tapachula on the borders of Guatemala, and is part of that great dream of American statesmen—a direct railway route from the United States to the southernmost republics of South America. It is hoped that when the world settles down to business again this project will be carried out, and then we shall be able to take a train from New York for Chile and Peru via Mexico, Guatemala, Salvador, Nicaragua, Costa Rica and Panama.

Other important lines include the British owned Mexican Railway, operating 402 miles of line between Mexico City and Vera Cruz, which has been twice confiscated, and is now operated by the Mexican government. It runs from the lowlands of Vera Cruz up through the mountains, and is a marvel of engineering, at one point reaching an altitude of 10,000 feet. In some places it runs along the mountain side on terraces hewn out of the solid rock. The cost of construction was \$125,000 per mile.

Then there is the Mexican Central, which has suffered so severely from the rebels, and which follows part of the ancient mountain trail used by the looting Spanish conquerors in passing to and fro between the oceans, from the Gulf of Mexico to the Pacific. The Tehuantepec Railway, with 305 miles of line, running across the isthmus from the Atlantic to the Pacific, spans the narrowest neck of land on the American continent with the exception of Panama, and has recently been brought completely under the control of the Mexican government.

In northern Mexico is the American owned Kansas City, Mexico & Orient, with 349 miles of line in Mexico, which

has so far not been disturbed by the Mexican government. This was the first direct line to cross the frontier between the United States and Mexico, extending from Kansas City to the Bay of Topolobampo, on the Mexican Pacific coast, opening up a magnificent country of immense area, rich in mineral and agricultural resources. The Mexican Northwestern Railway, a British enterprise, controls 496 miles of line between El Paso and Chihuahua and the Southern Pacific of Mexico, still in the hands of its American owners, with 1,246 miles of line, runs from Nogales on the border to Culiacan and Orendain. Part of the main line and several of the branches are out of business temporarily.

The urgency of the need for American railway supplies in Mexico is emphasized by a cablegram sent by the American Consul General in Mexico on February 21 announcing that a presidential decree in effect from February 20, 1919, permits the importation of the following railway supplies into Mexico free of duty for a period of six months: Switch points, iron and steel ties, turntables, iron and steel rails, frogs, and tie plates. The duties thereby remitted amount to 0.03 peso per kilo gross weight, or \$0.68 per 100 lb. According to the report submitted by the assistant director general of the Mexican Government Railways, total receipts for the last week in December, 1918, amounted to 1,607,680 pesos. This is a marked increase over the weekly receipts for the first six months of 1918, when the average was only 1,217,027 pesos. This refers only to the lines under government control.

#### Mexico to Report Progress

At a meeting arranged by the Council on Foreign Relations in the Hotel Astor, New York, on March 11, prominent Mexican business men gave accounts of the progress of Mexico in the last three years since the overthrow of the Diaz regime. The speakers included Ramon Prida, former President of the Chamber of Deputies of Mexico; Oscar Braniff, landowner; Garza Aldape, former Secretary of the Interior of Mexico, and Jose Castellot, Jr., son of a former Mexican senator. Meanwhile Rafael Nieto, acting Secretary of Finance of the Mexican government, and Dr. Alfredo Caturagli, fiscal agent of the Mexican republic in this country, are conferring with American bankers regarding the retiring of the Mexican national debt. According to the official statement of President Carranza, the amount of this debt in 1910 was about 450,000,000 pesos, Mexican currency, to which should be added the loan contracted by the Madero government in New York amounting to 100,000,000 pesos. No payments of interest have been made since May, 1914, when they were suspended by order of President Huerta. It is significant that National Railways of Mexico  $4\frac{1}{2}$  per cent bonds due 1957 sold on the New York Exchange on March 11 at an advance of 15 points over the last sale in December, 1918.

#### Bankers' Committee to Study Mexico

J. P. Morgan & Co. announced on February 24, that an international committee had been appointed for the purpose of protecting holders of securities of the Mexican Republic and of the various railway systems of Mexico, and to study conditions in Mexico with a view to evolving a plan to rehabilitate that country. The committee will number 20, 10 representing the United States, five Great Britain and five from France. The members of the committee are as follows:

J. P. Morgan, chairman; John J. Mitchell, president Illinois Trust & Savings Bank, Chicago; Walter T. Rosen, of Ladenburg, Thalmann & Co.; Charles H. Sabin, president Guaranty Trust Co., New York; Mortimer L. Schiff, of Kuhn, Loeb & Co.; James A. Stillman, chairman of the board, National City Bank, New York; James N. Wallace, president Central-Union Trust Co., New York; Albert H. Wiggin, chairman of the board, Chase National Bank, New

York; Robert Winsor, of Kidder, Peabody & Co., Boston; Laurence Currie, of Messrs. Glyn, Mills, Currie & Co., London; Sir Clarendon Hyde, of Messrs. S. Pearson & Son, Ltd., London; E. R. Peacock, chairman of the Bondholders' Committee of the Mexico Tramways and the Mexican Light & Power Group of Companies, London; Vivian H. Smith, of Morgan, Grenfel & Co., London; Vincent W. Yorke, chairman of the Mexican Railway Co., Ltd., London; William d'Eichthal, of Mirabaud & Co., Paris; Georges Heine, director of the Banque de l'Union Parisienne; Andre Honnorat, member of the Commission for the Protection of French Holders of Mexican Securities; Jaques Kulp, auditor of the Banque de Paris et des Pays-Bas, Paris; Joseph Simon, inspector of finance, general delegate of the Commission for the Protection of French Holders of Mexican Securities.

The Mexican government will appoint a committee to treat with this international bankers committee and it is believed that Robert Pesqueria, financial agent at El Paso will head the group.

Senor Nieto after several conferences with J. P. Morgan is said to feel very optimistic as to the outcome of the negotiations. Although final power rests with President Carranza, Senor Nieto may tentatively reach an agreement with the financiers. A well known banker whose name cannot be mentioned in discussing the situation is quoted as follows:

"I believe Carranza is in the same position as a man who has backed the wrong horse and is trying to recuperate his losses by playing the favorite. From all advices, he undoubtedly was playing with Germany, who is now put out of the running, and he plainly sees that the United States is now the only nation in the world that can finance him through his present difficulties.

"What Mexico needs is some definite financial plan. What she needs most is some Alexander Hamilton to lead her out of the financial wilderness into which she has wandered. I believe the Carranza officials are at last looking into the future and are beginning to realize that without the co-operation of foreign capital the country can never prosper, even with all her potential wealth.

"At present she is almost the pariah among nations. No other country in the world has enacted such atrocious legislation nor any other ruler dared to issue the confiscatory manifestoes and decrees that Carranza has put forth. However, this will all be in the past if the present government can give some form of guarantee that vested rights will be recognized and the interests of citizens of the United States given adequate protection. It is a consummation devoutly to be wished, not only for the benefit of the proletariat of Mexico, but for the enrichment of the world in general."

The new developments on the part of the present Mexican government has ordered the establishment of 23 commercial exhibits in North, South and Central America and Europe, and has appointed four commercial agents, who will be stationed in St. Louis, New Orleans and San Francisco and Barcelona, Spain. The exhibits will be housed as adjuncts of the Mexican Consulates in San Francisco, New Orleans, Tampa, New York, Los Angeles, Philadelphia, the West Indies, Central and South America and European cities.

The Bangor (Me.) Chamber of Commerce has adopted resolutions calling on public service commissioners to see that all public utilities are properly and efficiently run and declaring that every community should support commissions in seeing that public utilities have sufficient revenue to give good and safe service, and to make all needed further developments. All Boards of Trade are urged to agitate this question of the relations of the public to the welfare of essential utilities.

## Railway Freight Transference and Handling

By H. McL. Harding \*

**N**O ONE HAS DOUBTED but that the movements of package freight at railway terminals will be performed mechanically, as soon as the psychological time should arrive; that is, as soon as there is a sufficiently insistent demand, with conditions favorable in respect to education and finance. From an analysis of these movements based upon engineering experience they can be divided into inbound freight movements, outbound freight movements, a combination of these two, and the movements at transfer stations. In addition, there are the transfer movements at the combined marine and railway terminals. All of the above stations can be combined, but it is preferable to have the transfer stations separate.

The following movements refer to the outbound and inbound station movements, chiefly for l.c.l. freight. To the present time, improvements in these freight movements have consisted in refining existing methods of hand or motor truck conveying. To accomplish this, cars have been placed so as to reduce the length of the freight transference and the design of the freight station has been modified so as to make the travel shorter and the handling easier. These are all most praiseworthy, but it may be said that now there is little opportunity for further improvement in the design or in the operation by making further similar changes or a more intensive use of the congested floor areas.

It seems as though the usual operating facilities have been perfected as far as possible, and it is now necessary to look to other mechanical appliances or to other combinations of standard appliances to make any great and marked advances in this branch of railway terminal engineering. From many sources there come inquiries as to whether it is not possible to increase the freight transferring capacity of existing freight stations; that is, an increased tonnage moved per hour so as to obviate the necessity of purchasing additional land, and to reduce the time of car detention at the terminals and to save manual labor for a higher class of railway service. The stations, platforms and trackage spaces at the loading and unloading terminals have been worked to their limit and passageways on the surface are filled by an almost continuous line of trucks of various descriptions.

It will be advantageous first to enumerate the freight movements at the various simple and complex railway freight stations, and then to see what proven types of machinery manufactured by large companies in the United States can be readily and easily adapted to the various movements. By utilizing standard types of machinery, there is avoided any experimenting, and by installing the machinery of the largest manufacturers, adapted under the advice and the direction of experienced consulting engineers, there is a certainty of contract fulfilment and of commercially successful operation. Too often this latter has been neglected.

The movements at inbound freight stations consist (in general) in lifting the freight mechanically from within the sides of open cars or from the doors of closed cars and transferring the freight to within the inbound shed, and there assorting, distributing and tiering. By mechanical tiering a greatly increased temporary holding capacity is attained. The transference should be in the most direct line possible and then a longitudinal movement for the distributing and tiering according to the names or marks of the consignees.

These mechanical movements should be applicable to various designs of stations whether for through track or stub track stations. It should not be necessary to change the

ground plan of the station or of the platforms or the layout of the tracks or the general methods of operation.

### Inbound Freight Station

The movements should be in loops so that many loads can follow one another continually without congestion, with rapidity and without rehandling by manual labor. There should also be parallel movements of different freight loads. The machinery should be of such type that there can be an excess of transferring capacity; that is, that the freight can be moved from the cars as fast as it can be ready for the machinery and yet not depend upon crowded floor surface spaces.

In the inbound stations the freight can be piled by the mechanical appliances so as to be most conveniently arranged for the draymen of the consignees, or segregated for any form of transshipment. The freight can be delivered by the same machinery upon the drays or upon the tailpiece of the drays. The drays are thus more quickly loaded, more drays can back up and can be loaded in a given time. Better service can thus be given to the consignees.

### Outbound Freight Station

At the outbound freight station, the movements are from the dray to the outbound freight station, from the outbound station to the cars. In some cases the freight may be taken directly to the cars from the drays. As team freight is unloaded directly from car to dray at the inbound station, so at the outbound station cars are loaded directly from dray to car. The inbound station is in width from 60 ft. to 70 ft. and the outbound in width is about 30 ft. At the outbound station all movements can be performed mechanically. These consist in lifting from the dray, transferring to the floor of the outbound station, lifting mechanically from the floor and transferring upon the open cars and to the closed cars.

There should also be included within the scope of these movements the inspecting, the weighing and the routing. Often it may not be necessary that certain classes of l.c.l. freight should pass through the outbound shed.

The ancient methods of operation can supplement the later system. The old and the new can be operated simultaneously. Should it be desired to combine the inbound and the outbound stations, either together or at different places at the same station, then the same machinery can be used at the inbound as well as at the outbound station. At a transfer station, the number of strings of cars and number of cars in each string may be as desired.

If there should be nine strings of cars and twenty cars in each string, it is possible to transfer mechanically from any one car to any of the other 179 cars by a continual succession of rapid movements without congestion or confusion or rehandling by manual labor.

It is, however, necessary to have engineering advice as to the adaptation and adoption of the machinery so as to avoid possible mistakes. Such mistakes have too often occurred and in all cases are due to lack of engineering advice.

### Conclusions

At railway freight stations, all kinds of miscellaneous freight can be successfully transferred and handled mechanically, thereby more than doubling the transfer capacity of a given station area, reducing the time of car detention with a corresponding reduction in terminal expenses.

Attaining commercial success of such a terminal installation is based upon a knowledge of the operating conditions and the performance of different types of machinery. This knowledge should be combined with experience with all the various conditions of railway freight terminals. Its success is therefore not a manufacturing problem, but one of terminal engineering.

\*Former President, Society of Terminal Engineers. Consulting engineer of the State of New York on barge canal terminals.

# The Plans for New Railroad Legislation

## The Transportation Problem Will Not Be Lost Sight of While Congress Is Adjourned

REPUBLICAN LEADERS IN CONGRESS are already making plans for the extra session, which some of them say will be called by May 15, at which the question of permanent railroad legislation, as well as the appropriation for the Railroad Administration, will occupy an important place. It is assumed that the appropriation, along with the regular supply bills, will receive first consideration, but the committees on interstate commerce are planning early action on the problem of the disposition of the railroads after their relinquishment from federal control, and it is possible that hearings will be held before the Congress assembles. Senator Cummins, who will be chairman of the Senate Committee, has left Washington, but expects to return soon, and Representative Esch, who will be the chairman of the House Committee, has remained in Washington. Mr. Esch has given out an outline of a bill which he says represents his ideas as to what should be done, and which is in essentials the same as one he introduced in Congress a short time ago. It follows closely the suggestions made by the Interstate Commerce Commission, and it is reported that it was drafted at the commission's offices. A similar bill was also introduced by Senator Pomerene during the session. The fundamentals of the bill are as follows:

The return to private control of the railroads as soon as it can be accomplished without undue shock to the roads and the financial world. Government control would cease automatically on the enactment of the bill.

Increases in the powers of the Interstate Commerce Commission, especially in the power to initiate and fix maximum and minimum freight rates, including the power to determine rates on water transportation from port to port. This is designed to prevent railroads from destroying water competition.

Pooling of traffic and equipment under control of the Interstate Commerce Commission.

Complete federal control of the issuance of railroad securities.

Joint terminals wherever desired, compensation for owned terminals to be determined upon a fair and reasonable basis by the Interstate Commerce Commission.

Retention of state railway commissions, with power to sit with the Interstate Commerce Commission upon rate hearings, but without a vote upon decisions fixing rates.

Special designation of privately owned cars as common carriers, with especial reference to refrigerator cars owned by packing companies.

"The provision making private cars common carriers is far reaching in its effect," said Mr. Esch. "By making the refrigerator cars owned by the packing companies common carriers, at one stroke this would bring within the jurisdiction of the Interstate Commerce Commission all the alleged abuses complained of, arising out of the management of the refrigerator cars by the packing concerns. Given this power, it would seem to me that the Interstate Commerce Commission could adjust all matters relative to that situation."

Mr. Esch explained also that his proposed legislation will make it mandatory upon the Interstate Commerce Commission to take into consideration all labor costs in determining rates.

"I am clearly of the opinion that the state commissions should have unreserved control over what are termed police powers, and that on matters of purely local character their jurisdiction should outweigh the federal power," Mr. Esch said.

"It is highly desirable that Congress be reconvened at the earliest feasible day, not only in order to provide for financing the \$750,000,000 revolving fund which failed in the last Congress, but to define a permanent policy of government regulations."

A bill introduced by Senator Watson just before the adjournment of Congress (S. 5677) provides for rate making by the Interstate Commerce Commission on a basis to yield a return of 6½ per cent on the property investment of the carriers by groups with a provision for sharing with the government earnings above 7 per cent, for the avoidance of conflicts between state and interstate jurisdiction as to rate making, and for the enlargement of the powers of the Interstate Commerce Commission, to authorize it to compel joint use of railway properties where desirable, and to regulate the issuance of securities and to supervise the expenditure of the proceeds. The bill also provides for pooling and consolidations subject to the regulation of the Interstate Commerce Commission.

The bill provides that the rates now in effect at the termination of federal control shall continue to be the lawful rates until changed by order of the commission, both in respect of the service specified in the act to regulate commerce and in respect of service wholly within one state in cases where the relation between the intrastate rates and the interstate rates may affect interstate or foreign commerce, or subject it to discrimination, unreasonable prejudice or disadvantage. As soon as practicable after the termination of federal control, the commission would be authorized to prescribe and cause to be put into effect rates which may not be changed or departed from except by order of the commission. At the same time, the bill provides that the commission shall see to it that the rates for service within one state are not such as to injuriously affect interstate or foreign commerce and to that end the commission is authorized, whenever it deems necessary or proper, to prescribe the lawful rates for service wholly within one state. The commission is also required to make such changes in rates as will maintain the 6½ per cent return and to that end is authorized to prohibit rates which it shall find to affect injuriously interstate commerce, or which it shall find to be unreasonably low or unremunerative, and to prescribe minimum rates. The commission is also authorized to prescribe regulations to make adequate provision for depreciation and obsolescence of property.

Section 2 provides that whenever the net railway operating income shall for any fiscal year exceed 7 per cent, the commission shall within three calendar months ascertain the amount and the carrier shall within three additional months pay over to the treasury two-thirds of the amount so certified. Whenever the commission shall find that as to any carrier the income so fixed is or will be unfair or will deprive the carrier of just compensation because the property investment account does not adequately represent the value of the property, or for any other reason, the commission shall fix the just maximum income, it being the purpose of the act to raise and stabilize the credit of the carriers as a whole, but neither to raise nor to impair the financial standing of carriers whose credit is ample to furnish adequate facilities and service for the needs of the public. It is provided that no carrier shall from railway operating income increase the rate of dividends above the rate established prior to federal control unless it shall have expended or appropriated out of railway operating income for additions, betterments or improvements

PROPOSED RAILROAD PLANS

	RAILWAY EXECUTIVES	ASSOCIATION OF RAILWAY SECURITY OWNERS	INTERSTATE COMMERCE COMMISSION	WALKER D. HINES, DIRECTOR-GENERAL	BROTHERHOODS	VICTOR MORAWETZ	PAUL WAREBURG
OWNERSHIP AND OPERATION	Private	Private.	Private.	Private.	Government ownership. Operation by private corporation run by employees, which pays government rental out of the receipts of operation.	Private.	Private.
MERGERS	Federal incorporation with mergers allowed, subject to approval of Secretary of Transportation.		Mergers of existing companies may be made in the public interest.	Roads of each locality to be combined into regional systems, six to twelve in number.	Roads all to be operated by one central authority, which is to be held in trust for the exclusive benefit of the employees.	Roads to be consolidated into one or more Federal corporations. Present securities to be refunded by 4% debentures and stocks.	Under Federal franchise, mergers may be made, subject to supervision of Federal regulating body.
REGULATION OF SECURITIES	Federal control exclusively.	Under supervision of Regional and Interstate Commission.	Federal regulation of the issuance of securities.			Debentures and stock to be issued only as authorized by Federal Railway Board.	By Federal regulating body.
CONTROL	A cabinet officer "Secretary of Transportation" to be appointed. Interstate Commerce Commission should be relieved of executive and administrative duties, except as to matters of a judicial character, to act as quasi judicial body. Regional Commissions.	Federal regulation through Interstate Commerce Commission, as at present constituted, co-ordinating with six Regional Commissions. Co-ordination between State and Regional Commissions.	Better defined relationship between State and Federal control. A broadening of Federal control.	Five-year extension of Federal control. Modified private operation and control thereafter. Government representation on Boards of Directors.	No "Secretary of Transportation" continuation of powers of Interstate Commerce Commission. The Board headed by Cabinet Officer. Specified number of directors of Federal corporations, to be appointed by Federal Railway Board, one-third by appointed officers and employees, one-third by President, one-third by Board of regulation.	Federal corporations to be under regulation of a Federal Railway Board headed by Cabinet Officer.	Regional Board upon which State commissions might be represented with a reorganized Interstate Commerce Commission of 5 or 7, half judicial and half administrative in character at head.
RATES AND RETURN ON CAPITAL	Regulation of rates by Federal government exclusively. Carriers may initiate rates which shall become effective only if approved by Secretary of Transportation. State rate shall specifically provide for adequate rates, which must reflect cost of wages and other expenses. Rates may upon complaint be brought before J. C. C. for review. Power to prescribe minimum rates.	A minimum rate of return, fixed by Act of Congress, through rates adjusted as occasion may demand. Interstate rates to be held in hands of State Commissions.	Revenues should be "adequate" and "reasonable." No statement as to any change in the method of rate procedure.	Government to ascertain and guarantee railroads a fixed fair return.	Under regulation of Interstate Commerce Commission. When the government's share of the distribution of profits exceeds 5% of the gross operating revenues, it should absorb the 5%.	To be regulated by Federal Railway Board through central and regional boards; local rates to be referred to regional boards, through rates to central board.	Rates to be determined by Federal regulating body. Railroads accepting plan to be guaranteed 4 1/2% on Federal valuation.
DISTRIBUTION OF PROFITS	Earnings in excess of fixed reasonable return to be distributed among employees, railroads earning them, and for certain improvements not to be capitalized in rate making.		Profits above the specified fair return are to be moderately shared by the railroads and the government, possibly also by labor.		Government guarantees return on bonds issued in exchange for existing capital. Any balance over this is to be divided between operating corporation and the government in equal shares. Government option to buy stock at any time at \$35 per share.	Government to guarantee dividends of \$1.50, any distribution in excess of \$4 to be divided with government. Government to have option to buy stock at any time at \$35 per share.	Any return on capital between 6% and 4% to be divided with government and possibly with labor. All over 7% to go to government.
FINANCING	Provisions to be made for funding by the United States of indebtedness of carriers to it growing out of Federal control.	A Federal corporation directed by the nine Interstate Commerce Commissioners and eight railroad men to finance purchase of equipment, plant, and other improvements, and financing of the return of the roads to private control.	Comprehensive program of capital expenditure during five-year period; probably to be provided partly by government; partly by roads themselves where able to borrow.		All financing to be done by the government.	Debentures to be issued to an amount such that interest requires 40% of operating income. Balance of operating income to be capitalized at 6% in stock.	
JOINT USE OF TERMINALS, ETC.	Subject to direction of the Secretary of Transportation; also other similar matters.	To be arranged, also to routing of freight, etc., by above Federal Corporation.					
WAGES	This and similar questions to be settled by officers and representatives of individual employees affected, if possible, otherwise by a board under the Secretary of Transportation.	Regional Commissions to act as Boards of Conciliation. Appeal to Interstate Commission.			A committee of nine directors of operating company empowered to make binding and final decisions in all wage disputes.		

on an average of the preceding two years subsequent to December 31, 1917, an annual sum equal to one-half of one per cent of its property investment account, and beginning at the termination of federal control and averaging by three-year periods, no additions to property investment account shall be considered by the commission in establishing rates or in certifying excess income, except in so far as the sum applied to such additions, from such income, shall exceed one-half of one per cent on the property investment, nor shall such sums be capitalized except in so far as they exceed one-half of one per cent. The purpose is to establish and enforce, so far as practicable, the policy of paying out of income the cost of necessary additions, betterments and improvements to road and equipment that do not directly produce or increase income and thereby avoid increases in the bases of rates or in the capital charges.

Section 3 authorizes the pooling of equipment or traffic or consolidations after having received the approval of the Interstate Commerce Commission as necessary or desirable in the public interest, to prevent unnecessary additions to the property investment or to avoid unnecessary duplication of facilities.

Section 5 makes it the duty of each carrier to provide its fair relative share of freight car equipment, measured by its freight ton miles and the number of cars required to make its average ton mileage movement. This section also authorizes the commission to require reports regarding the movement of freight cars, etc., and whenever congestion is threatened to designate an agent or agents to co-operate with the carriers in order to remedy the conditions by embargo license, diversion or other efficient means.

Section 7 provides for the establishment of regional bureaus subordinate to the Interstate Commerce Commission.

#### Digest of Proposed Solutions of the Railroad Problem

The Equitable Trust Company of New York has prepared the accompanying digest of the principal plans proposed at the hearings before the Senate Committee, regarding which it says:

"The digest, when analyzed, yields a composite plan, which may be regarded as a combined solution evolved by the best brains of the country.

"In the first place, we find that government ownership is almost altogether without support, except from the railroad brotherhoods as represented by their counsel, Glenn E. Plumb. The predominance of opinion is for private control under restrictions, designed to promote better, more efficient service than was possible under the old system. The extension of government control to the five-year period proposed by ex-Director General McAdoo likewise meets with little favor. In opposition thereto, it is argued that it would merely postpone the date of determining a problem which must come up for solution sooner or later; that it would tend to make the return of the roads to their owners more difficult; that it would place them in such heavy debt to the government that liquidation or refunding would be practically impossible, and that there is nothing in the railway problem which cannot be solved in 21 months as well as in 60.

"There is substantial unanimity that mergers should be permitted when in the interest of the public, and that the issuance of securities should be subject to federal control. The latter subject is closely related to the question of government guarantee of capital, for if the government is to undertake the assuring to the roads of a specified minimum return, it is only logical that it should have something to say as to the creation of new securities, and accompanying new capital investment. The plans of the Association of Railway Security Owners, of Paul Warburg, and of Director General Hines, all contain provisions for such guarantee. The railway executives do not suggest any-

thing quite so specific, but insist that rates shall be adequate as well as reasonable.

"The rate question, which is perhaps the most difficult of all to determine, is variously approached. There is a tendency to concentrate the rate-making power in federal authority without, however, entirely destroying the power of the state commissions. This is in line with the sensible policy of eliminating, so far as possible, the conflicts which are inevitable where there is dual authority, or where the federal authority may be hampered and its orders nullified by state action. There is, moreover, a sentiment in favor of an attempt to arrive at some precise figure which will represent equitable compensation to the security holders. Several of the plans contain suggestions for profit sharing with labor, with the government, or with both, in case profits shall exceed this figure. Here we have the community of interest idea, which has received widespread application in industry, proposed for a new field—transportation. The justice and economic soundness of its adoption will scarcely be questioned, though there will doubtless be conflicting ideas to be reconciled in working out precise details. From the standpoint of the security holders, the important features of a guaranteed minimum return, together with a division of profits above a maximum, means at the same time the elimination of uncertainty as the possibility of reduction of one's income below a certain feature, and the loss of opportunity for very marked appreciation.

"In other words, it would greatly stabilize railway securities and minimize their speculative features.

"The views in connection with methods of financing the roads are not at all in agreement. Particularly interesting is the novel proposal of Mr. Morawetz, who advocates the refunding of all existing securities by means of a fixed and continuing proportion of debentures and bonds. This would apparently give the debentures a high investment standing, and would still leave the stock sufficient equity, together with the minimum guarantee of \$2.50 per share by the government, to assure it of an investment character only moderately tinged with speculation.

"The successful features of government operation are not to be lost with the return of the roads to private control, if the ideas of several of the authors of the various railway plans are carried out. The joint use of terminals, the elimination of competitive features which yield no additional public service, such as separate ticket offices, almost identical passenger train schedules, etc., may be eliminated in the interest of economy.

"Some thought has also been given to methods of settling wage disputes. Three of the plans quoted aim to set up permanent organizations for the handling of these questions. Presumably a regular line of procedure for obtaining hearings and appeals would be instituted. If found workable, this would provide the machinery for proper consideration of, and decisions upon, this very vital matter."

The National Association of Railroad Tie Producers, St. Louis, Mo., has issued a circular calling attention to the fact that never in the history of the industry have weather conditions been more ideal than have prevailed for the last 90 days. There has been a minimum of snow and rain in the Southwestern region, thereby permitting not only the making of ties, but their hauling, the latter being an extremely important item for the producer with limited capital. These conditions account for the large production of ties which ordinarily would not come out in this region at this season of the year. The labor surplus prevailing in many parts of the country, however, has not helped conditions in the tie camps where there still exists a shortage of experienced tie makers, although many producers have offered increased wages.

## Merchants' Association of New York Against Government Ownership

THE MERCHANTS' ASSOCIATION of New York City, one of the largest organizations of the kind in the country, adopting the report of a special committee recently appointed, has reaffirmed its position, taken on November 15, 1916, in opposition to government ownership of railroads and other public utilities. The special committee consisted of Frank R. Chambers, chairman; James G. White, Otto H. Kahn, Francis H. Sisson, H. H. Porter and Professor J. F. Johnson. Copies of the full report may be had on application to the secretary of the association, Woolworth building, New York City. Following are characteristic extracts:

Except under war conditions the sole plea that can be advanced to justify the operation by governments of public utilities is that governments can provide better service at less cost than can private operators—that is to say, the assumption that government operation is more efficient and less costly than private operation. We do not believe that this contention can be sustained. The fields of politics and economics are dissimilar and separate. The field of politics (meaning thereby the art of government) is mainly the regulation of conduct and the protection of rights. The field of economics is the production and utilization of material things. The principles, the methods and the machinery of political administration are wholly different from those of economic activities and not adapted nor adaptable to the latter. The differences are fundamental and cannot be reconciled. No business, whether public or private, can be operated efficiently and without great waste, under the constant injection at the top of new, untried and often unfit executives and managers; nor with the rank and file deprived, by lack of opportunity for advancement, of the incentive to zeal and energy.

In the case of private operation we find continuously brought into play the qualities and the conditions which tend to maximum business efficiency—experience, knowledge, special training, and the zeal arising from opportunity and self-interest. The successful management of any large business undertaking requires that the utmost freedom of action be granted to the executive. It is assumed as a condition of his employment that his experience, training and special skill will enable him to exercise a wide discretion so wisely as to promote the welfare of the business. His initiative is given full play and he is enabled, whenever occasion requires quick action, to do whatever is necessary to be done.

Public service plants publicly operated are frequently starved by reason of the failure or refusal of the public officials to approve the outlays, without which a high degree of efficiency cannot be maintained nor adequate service supplied. Long experience by this Nation in the distribution of money for public improvements has demonstrated beyond any question that the outlays for that purpose are largely determined by political influence, and but little by economic utility. Seven hundred million dollars have already been spent by the United States Government for the improvement of internal waterways, but there is no complete system; and most of the money has been expended for unrelated local improvements, entirely unwarranted by the possible benefits.

In New South Wales with the nationalizing of its railroads, employees, by reason of their organized political power, so far over-reached in their demands that a widespread public reaction was created, resulting in the disfranchising of government railroad employees, thus destroying entirely their political power by depriving them of their voting power. Wage-making for political rather than economic considerations is fraught with danger for all concerned. The multiplication of needless offices and superfluous employees is

universal in every branch of government service. The useless subdivision and the increase in officials in public management is mainly due to political causes, the obvious motive being to provide additional places for political henchmen. Because of these conditions the cost of performing the work is largely and wastefully increased. Under the present railroad control more than eleven hundred new officials are employed in the central administration at Washington in addition to an even greater number distributed in the offices of the regional directors. The aggregate expense of the present railroad administration has been increased by many millions of dollars annually, despite the widely heralded consolidation and unification whose purpose was to effect economy.

With the single exception of Prussia, State-owned railroads have been financial failures. In general, their rates are higher and their service poorer than those of privately operated railroads. The French State-owned railroads embody all the abuses referred to above. The French Government took over the Western system January 1, 1909. After five years of government operation, the gross revenue had increased by \$6,556,000. During the same period the operating expenses had increased by \$13,090,000.

As a result of their disillusioning experience several hundred American municipalities have discontinued their attempts to save money by carrying on a business undertaking through the machinery of politics. There are in America, apparent exceptions to the general rule of municipal inefficiency; but they are only apparent and not real. Seemingly excellent showings are frequently made. These usually cover only a short initial period. They generally only cover obvious current costs, and omit important factors of future costs. Loss in taxes, interest on investment, depreciation, amortization, extensions and betterments, rents and maintenance of public buildings whose costs are borne by other departments, are commonly ignored. By these omissions an apparently favorable financial showing is made, while a true accounting would show the reverse. Municipal operation has been successful in various European municipalities, notably Glasgow, but politics, in the American sense, does not enter into these municipal undertakings; municipal activities are in those cities regarded solely as business matters to be managed by business methods.

We are not unmindful of the defects that characterize the operation by corporations of public utilities, but we do not believe that those defects can be cured by substituting another method which in every respect of efficiency is much below the standards that generally prevail under private management. Other remedies than the substitution of methods abounding in greater evils should be found.

We believe that the public can best be served by utilizing the efficiency, enterprise and energy of private corporations for the continued operation of public utilities, under such public control as shall protect the public in its right to efficient service and fair rates; and at the same time assure to private capital invested in public utilities a fair return upon such capital. We do not find any change of conditions resulting from the war which warrant or require the previous position of The Association, in opposition to government ownership and operation, to be modified.

The Pacific Railway Club, San Francisco, Cal., has decided by unanimous vote to retain its present standard of membership, as set forth in its constitution; the club will admit to membership only persons actually engaged in railroad service, or those in the service of railroad regulatory bodies who have had at least three years of actual railroad service, and members of the faculty of colleges of recognized standing. Imposing these requirements the Pacific Railway Club continues to be the only club in the United States made up exclusively of railroad men.

# Modern Tendencies in the Design of Roundhouses\*

## Increased Size of Locomotives Is Effecting Marked Changes in Engine Terminal Structures

By Gustave E. Lemmerich

Layout Engineer, The Austin Company, Cleveland, Ohio

**R**OUNDHOUSE CONSTRUCTION during the past year has varied almost with every road. The trend has been toward reinforced concrete construction, although wooden frame, brick-wall houses have predominated. The delay in getting authority to proceed and the need for getting construction under way promptly did not permit as careful a study to be made of new types of construction as has been the case in the past.

Another feature of engine terminal progress has been the impetus given the roundhouse standardization idea. One or two important roads have designed standard stalls and applied them to houses of different sizes at as many as 12 locations. This greatly reduced the time required to produce working drawings and permitted construction to get under way at all terminals at about the same time. Practically all the newer designs have increased head room to improve ventilating and daylighting, and the continuous monitor type is being more generally used.

The depth of the house has now been increased to practically 120 ft. on several important railroads. On the Pennsylvania Lines West the new roundhouses have a depth of 118 ft. 3 in.

There is also an increasing tendency to equip houses with

to 200 tons, installed in a back shop, to which rank the machine shop has been raised.

### Size of the Roundhouse

The length of some of the latest locomotives is as follows:

Type of locomotive	Length over all, locomotive and tender
U. S. Standard, 6-wheel switch.....	66 ft. 9 in.
U. S. Standard, 8-wheel switch.....	70 ft. 0 in.
U. S. Standard, light Mikado type.....	82 ft. 0 in.
U. S. Standard, heavy Mikado type.....	82 ft. 4 in.
U. S. Standard, light Santa Fe type.....	87 ft. 4 in.
U. S. Standard, heavy mountain type.....	86 ft. 8 in.
U. S. Standard, tentative Mallet 2-6-6-2.....	about 99 ft. 5 in.
U. S. Standard, tentative Mallet 2-8-8-2.....	about 103 ft. 10 in.
Western Maryland Mallet, 2-8-8-2.....	102 ft. 10 in.
Virginian Mallet, 2-10-10-2.....	108 ft. 7 in.
Richmond, Fredericksburg & Potomac Pacific type.....	85 ft. 4 in.
Erie Triplex, 2-8-8-4.....	103 ft. 10 in.

There is hardly any doubt that the limit of the length of locomotives and tenders has not yet been reached. This is especially true of the length of the tender. This fact should be carefully considered for new roundhouses, where the status of the power in the engine district has not been fully developed.

Considering the foregoing points, the character of the road

A Three-Section Roundhouse with a Single-Section Monitor

bridge cranes and a number of roads have installed smoke exhaust systems. These serve two purposes—to eliminate the smoke nuisance and provide draft (in place of other means) for starting the fires.

These deep roundhouses, combined with the heavier and larger motive power will surely lead to a more careful analysis of the roundhouse situation. The unused area and the expensive roof construction will result in giving more consideration to the rectangular house. The heavy engines will also compel the more general replacing of the present method of raising engines with jacks, by the more up-to-date application of electric hoists. At more important points it is possible that this work will be done by cranes of capacities up

and the terminal in question, the following tentative stall lengths are recommended: 90 ft., 100 ft., 110 ft., and 120 ft.

- (a) For short line roads, branch lines where no heavy power is required, and where locomotive not much over 70 ft. in length are used the stall length recommended is 90 ft.
- (b) At unimportant terminals for smaller roads with comparatively light power and handling locomotives not over 80 ft. in length, the stall length recommended is 100 ft.
- (c) For more important terminals, handling Mikado, 2-10-2, and a few 2-6-6-2 Mallet locomotives, the stall length recommended is 110 ft.
- (d) For engine terminals, handling few 2-8-8-2 Mallets, besides the ones mentioned under paragraph (c), a combination of a 110-ft. house, with a few stalls of 120 ft. for the Mallets, is recommended. The section of the house should be such that extensions can be made readily.
- (e) For important engine terminals, where a crane installation is desired for locomotives under 85 ft. in length, a 110-ft. stall length is recommended. For locomotives over 85 ft. in length or where more working space is found desirable, a 120-ft. house is suggested.
- (f) At terminals where a few of the largest 2-10-10-2 type Mallets are handled, a similar combination to that outlined under (d) is suggested.

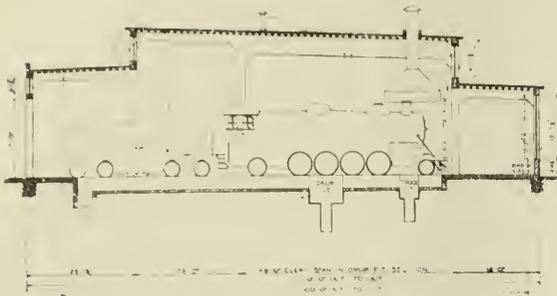

\*This is the second of two articles on engine terminals. The first installment appeared in the *Railway Age* of March 7.

The depth of the Mallet section in this case, however, should be 125 ft. for Mallets up to 105 ft. For Mallets over that length the stalls should be lengthened correspondingly.

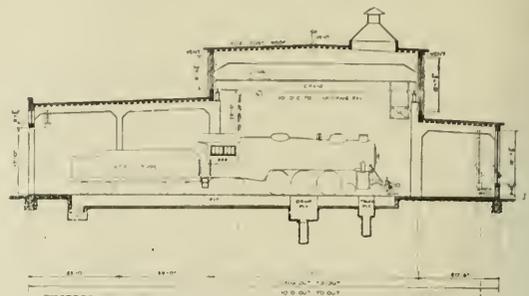

The number of stalls required for a roundhouse depends largely on the local traffic and other conditions existing at the terminal. These conditions are also subject to great fluctuation during the year and with the traffic seasons. For these reasons the ratio of the average number of engines handled

value of a well-heated and ventilated house at times when power is needed badly.

At important terminals a traveling crane of 10-tons capacity should be provided in the work section. It is a very useful appliance in these times when reliable man power is scarce. As a substitute a jib crane could be installed in each stall. A small self-propelled electric crane, designed

Copyrighted by The Austin Company, Cleveland, Ohio  
A 100-ft. Roundhouse Without a Crane

Copyrighted by The Austin Company, Cleveland, Ohio  
A 110-ft. Roundhouse With Provision for a Crane

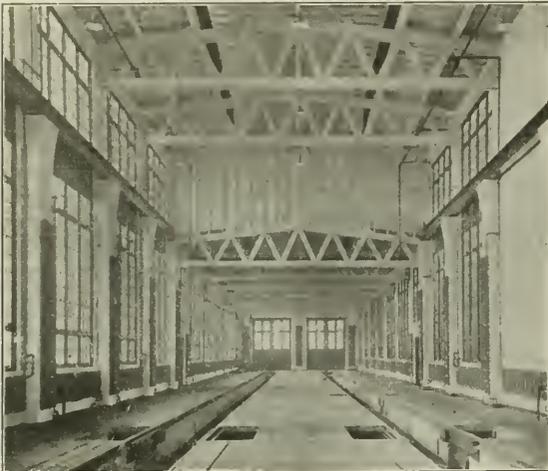

per day to the number of stalls in the roundhouse varies, say, from three to five or even seven to each stall.

The roundhouse should not be a storage place for engines. It is not designed for this purpose; it is too expensive; it is not in the right place nor under the right jurisdiction for this purpose. If covered storage should be found desirable,

on lines similar to a wrecking crane, and of about three tons capacity, would certainly prove to be a very economical appliance for transferring tools and machine parts between the roundhouse and the machine shop.

The pit walls should be three feet wide in the area where an engine is likely to be raised by jacks, and at other points a width of two feet will suffice. In case tracks should be extended beyond the pits, the rails should rest on concrete walls, to prevent breaking the pit walls. As a general rule the pit length is made about the same as the locomotive for which the house was designed.

Wooden swinging doors are generally preferred, although a number of recent houses have been fitted with steel or wooden slat rolling doors. At present doors are made about 14 ft. wide and 17 ft. high in the clear. Failure to provide substantially-built doors to withstand the rough handling

Interior of a Rectangular Engine House of the Longitudinal Type Recently Built

it can be provided in or near the engine storage tracks, in a partially open shed, designed for this function and of a cost in harmony with the purpose it has to fulfill.

**Appurtenances**

The roundhouse should be provided with as much glass surface as possible to provide liberal daylighting and it should be well heated and ventilated. For all practical purposes, the hot blast system seems to be best adapted to cope with roundhouse conditions. It will thaw out the engines quickly and provide a forced ventilating system, which is also desirable and economical. Such a heating plant must be installed on broad lines, with the full understanding of roundhouse conditions, and bearing in mind the immense

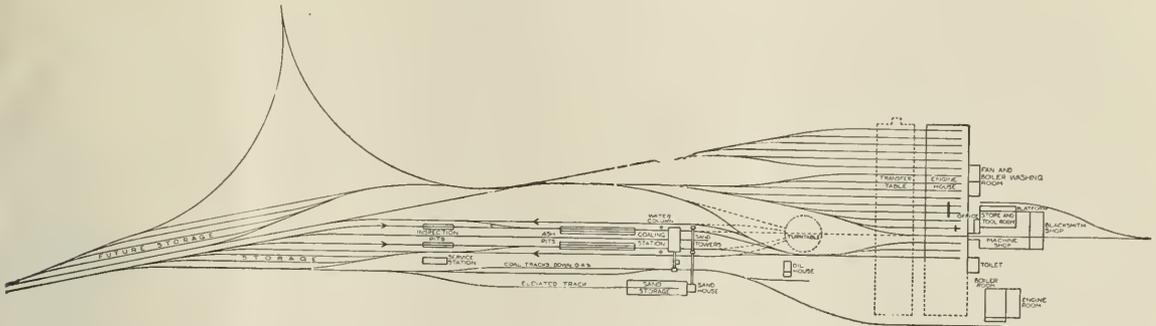

Exterior of Rectangular Engine House

to which they are subjected has resulted in larger repair bills than necessary. This latter point is responsible for limiting the glass area to 35 per cent in these doors, and on some roads no glass is used at all. A three inch door, heavily reinforced and trussed with steel angles and long strap hinges, is recommended. Another small but important feature is the latch post for holding the door open. In a reinforced concrete round house, it is good economy to design the girder

supporting the roof over the doors, so that if one post is hit by a derailed engine, the roof will be carried safely.

The rear wall of the roundhouse should be practically all windows. A height of at least 17 ft. from the top of the rail to the under side of the girder should be provided to clear a locomotive in case it should run through the rear wall. This wall as a rule is about 3 ft. 6 in. high and 9 in. thick.

Generally a transverse house is preferable to a longitudinal one, but local conditions may make the former out of the question. The rectangular house, owing to the parallel spacing of the pits, is much easier and cheaper to build than a roundhouse. A track spacing of about 20 ft. is recommended, and this will permit a large, high window to be placed between each set of doors. These windows will throw

Design of a Rectangular Engine House of the Transverse Type, Showing Relation to the Other Terminal Facilities

On some roads this wall is replaced in the center 12 ft. by a wooden or asbestos wall to simplify and reduce the cost of repairs.

**Rectangular Houses**

In some layouts the shape of the property makes a rectangular house fit better than a roundhouse. This is true for small as well as for large and important terminals. In small layouts a rectangular house is frequently selected, because a "Y" is already in place or easy to put in, thus saving the expense of a turntable.

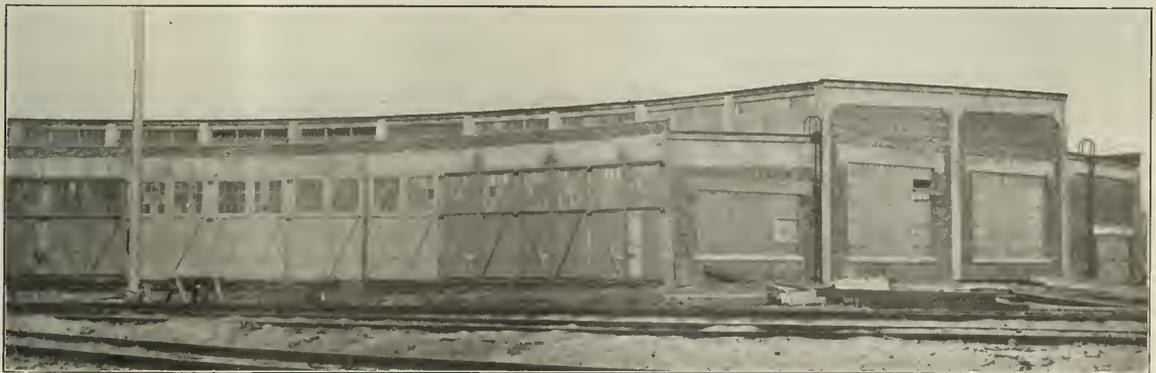

At large important layouts, the transfer table may be located between two transverse engine houses. In such a convenient and compact arrangement, it is possible to confine the very light overhauling to one house and place the

light in the working aisles and all glass may be omitted in the doors, where it does not belong.

**The Machine Shop**

The importance of the terminal and local conditions are the determining factors for the machine shop. There is a tendency toward a more liberally equipped shop and the size has been increased accordingly. Experience has shown that at least 3,200 sq. ft. of floor space should be provided at even small terminals. This should be divided about as follows:

Machine shop .....	1,600 sq. ft.
Tool and store room.....	600 " "
Office .....	300 " "
Blacksmith shop .....	700 " "

A Four-Section Roundhouse with a Two-Section Monitor

pits for the running repairs and the back shop in the other house. In a layout for some important terminals, the rectangular house will, in most cases, require the installation of both a turntable and a transfer table.

One disadvantage of a rectangular house layout lies in the number of switches required when a transfer table is not provided. These switches are objectionable on account of their high first cost and expensive maintenance. As the track entrance to the house is longer than one over a table, it also increases the running mileage of engines per year, but with proper design of the layout this may be greatly reduced.

The shop should be back of the drop and removal pits and it should be directly connected with the roundhouse by a passageway. At more important points the shop should consist of a light and heavy machinery section. The latter should be served by a 10-ton traveling crane, or by jib cranes placed where most needed. The electric locomotive hoist should also be located in this part of the shop. The light machinery section could also contain the tool and store room. At important terminals the store room is frequently housed in a separate building. A good location for the engine terminal foreman's office is adjoining the tool room, so that on

some shifts one man could attend to both. The proper location for the blacksmith shop seems to be in the rear bays of the machine shop building. Some provision should also be made for locker and toilet facilities, either in the machine shop or in a separate building.

### The Power House

In the new larger and higher roundhouses, especially those equipped with cranes, a better appreciation of good heating and ventilating and the increased application of air have added greatly to the importance of the power house. Consequently, the power house should be liberally dimensioned, as it is expensive and inconvenient to enlarge, and the surplus room for future needs is but a small percentage of the total cost. The boiler room should be served by an elevated track or a track hopper for coal delivery, and the plant should be located conveniently to the roundhouse fan room. At some of the more important points, it may be a paying proposition to install automatic stokers and coal hauling machinery to save man power. There should also be an ash conveyor, with a hoist to an ash storage bin, from which the cinders can be dumped into a cinder car.

The terminal should be well lighted, and an installation of

Interior of a Reinforced Concrete Roundhouse

high-efficiency incandescent lamps of the larger sizes is suggested.

A tentative scheme for lighting a roundhouse equipped with a crane, as illustrated in this article, is as follows:

No.	Lamp Size in watts	Location
1	75	Front section.
1	200	Second section.
3	200	Crane section.
1	200	Rear section.
1	200	Passageway.
2	200	Fan and boiler washing room.
1	200	Office.
6	200	Tool and storeroom.
4	200	Light machinery section.
11	200	Heavy machinery section.
8	200	Blacksmith shop.
5	200	In front of doors for a 20-stall house.

A sufficient number of portable 40-watt lamps for the pits, machine tools, etc.

The yard should be provided with a sufficient number of 500-watt lamps for flood lighting.

As a finishing touch to all engine terminals, convenient walks should be provided between the roundhouse, oilhouse, storehouse, powerhouse and other buildings. A driveway

from some outside approach leading to the storehouse and office is also desirable. In locating the driveway the question of fire protection should also be taken into account.

### General Plans

After the general layout and details have been approved, general plans should be prepared, covering:

**Drainage.**—This embraces such facilities as inspection and ash pits, washing pits (if installed), water columns, the track hopper of the coaling station, turntable pits, oil house basement, roundhouse pits, including drop and truck pits, heating duct, power house pits, tunnels, etc. It also includes the sanitary sewage system.

**Other facilities.**—This covers the complete water pipe line system for locomotive supply, sanitary purposes, fire protection, etc.; also air and steam lines; a pneumatic tube line from the inspection pits to the roundhouse office and all electric lines for lighting.

A layout plan is prepared for construction purposes, analyzing the full scope of the work in all its phases. This should give quantities, the number of carloads of the different materials needed, the material tracks required at the different stages of the work, and the sheds and storage places required. On one of the plans the construction program could be indicated, giving the number of men to be employed on the different buildings in the consecutive stages of the work. This plan should also cover the grading, showing the quantities, overhaul, etc., the underground work, that is, the quantities of piping, etc., and the concrete work, buildings, etc. If a record of the progress is shown on these plans and prints are issued at regular intervals it will serve as a check on the work and indicate where adjustments in the pre-arranged schedule should be made.

It Doesn't Happen to Be That Kind of Animal

# The Development of the Refrigerator Car Pool

## Unified Control Instituted By the Car Service Section Proves a Boon to Shipper and Carrier

FOR THE PURPOSE of promoting more expeditious and economical handling of the refrigerator equipment required for the movement of perishable commodities and with "elasticity of equipment" as the proposed remedial measure, the Refrigerator Department of the Car Service Section of the Railroad Administration was established on July 1, 1918. W. L. Barnes, assistant manager of the Car Service Section and formerly superintendent of transportation of the Chicago, Burlington & Quincy, was placed in charge of the new bureau with headquarters at Chicago and he immediately introduced a system whereby all refrigerator cars were placed under unified control for distribution.

The pooling of ordinary freight equipment has long been advocated by many transportation and operating men, but owing to the varying degrees of protection required by different commodities and the independent railroad ownership of refrigerator cars by comparatively few railroads their pooling has been deemed impractical in the past. Separate refrigerator lines have been developed to handle specific classes of commodities produced in certain localities and these private lines have taken care of these special districts well. However, there are other producing quarters which have constantly been retarded in their development by the lack of suitable transportation facilities for their commodities, where the carriers serving them have been forced either by their financial status or the seasonal character of the commodities to forego developing adequate means for bringing these commodities to the market.

At the time the refrigerator car pool was established several important lines were in operation, each one of which operated one of the three types of refrigerator cars used in the handling of perishable commodities. The most highly developed type of refrigerator car was used by the packing industry for handling fresh meats and similar commodities requiring low temperatures and no ventilation. These cars are equipped with brine tanks, highly insulated throughout, but there were no means of ventilation. These cars were therefore not suitable for handling shipments requiring ventilation and accordingly were used wholly between the various packing plants and eastern markets.

The second type of refrigerator car other than those operated by the packers is equipped with ice bunkers and ventilators, making it suitable for handling perishable freight (other than fresh meat) either under refrigeration or ventilation. Among the private car lines which developed and operated refrigerator cars of this type are the Pacific Fruit Express whose cars operated from California, Oregon, Washington, Idaho and Texas to all points, particularly in central and eastern territory; the Santa Fe Refrigerator Despatch whose cars operate principally from California, Colorado, Arizona, New Mexico and Texas to central and eastern territory; the American Refrigerator Transit whose cars operate from points in Texas, Arkansas, Oklahoma, Louisiana, Kansas, Missouri and Colorado to central and eastern territory; the Fruit Growers' Express, operating from southeastern and eastern territory to central territory in the fruit and vegetable service; the Union Refrigerator Transit, whose cars operate out of New Orleans, La., and Mobile, Ala., in the banana traffic; and the Frisco Refrigerator Line, operating principally from Missouri, Arkansas, Oklahoma and Texas to central and eastern points.

The third and lowest type of refrigerator cars are insulated only, not being equipped with ice bunkers, tanks or

ventilators and are suitable for handling beer and ice or for the protection of commodities from frost. Several of the lines mentioned have developed this class of car. The St. Louis Refrigerator Car Company especially operates this type of car in the beer traffic of the middle west. The difference in these types of cars is due to the fact that fruit and vegetables not only require refrigeration, but also a good circulation of air, whereas in the handling of meat and packing house products the reverse is the case and little other than insulation is required for such commodities as beer and ice. There are at the present time in the United States approximately 20,000 standard brine tank refrigerator cars, 95,000 standard refrigerator cars suitable for handling shipments under refrigeration and ventilation and 21,000 insulated refrigerator cars suitable for handling such commodities as beer and ice or for the protection of commodities against frost.

### Problems Confronting the Refrigerator Department

The problem confronting the new bureau was substantially the eradication of certain obvious defects in the existing methods of handling refrigerator cars. These defects fall into three general classes, all of which are the result of competitive conditions. The first of these and perhaps the most glaring from the viewpoint of efficient operation is the empty haul. Refrigerator cars loaded to distant markets over foreign lines had to be returned promptly to the owner roads under the old car service rules. For example, if the route of the loaded car was in the form of a zig-zag or if it included a wide detour to reach some particularly attractive market, the car if returned empty, had to pass over the same line which it followed in the loaded haul. If loading was available for the car at destination it had to be loaded to some road on the home route of the car. These restrictions necessarily limited the use of equipment.

Closely related to the empty haul problem is that of the availability of equipment. Under the old plan a railroad was not vitally interested in any shortage on other lines except possibly on its immediate connections; neither was a road under any obligation to render assistance in the way of equipment to other carriers. Cars returning empty over foreign roads to their owner roads might pass around localities where freight was waiting for shipment in the general home direction and this equipment might not be available for such business because of the necessity for following a specified route.

Another defect in the old system of operating refrigerator cars was the complex and inefficient method of handling the routine of car distribution. Cars unloaded on a foreign road had to be reported to the car accountant of the owner road who checked against the records to determine its return route and after an unavoidable delay issued orders for the disposition of the car, its route home and the instructions for getting it there. Meanwhile the per diem expense continued and the car was out of service.

This was the general status of refrigerator car distribution in all parts of the United States prior to February 21, 1917, when the car service rules were modified to some extent. The principle of the car pool, however, was not applied to refrigerator equipment until the creation of the Refrigerator Department of the Car Service Section. The establishment of unified control materially reduced the amount of empty haul. Railroads owning refrigerator cars no longer have their cars

returned directly to them. The aim of the Refrigerator Department has been to furnish all roads with enough cars, regardless of ownership, to fill their loading requirements at all times and if the equipment then on their own lines is not sufficient for their needs, the department has diverted enough cars from adjacent lines to cover the shortage. In the re-location and equalization of equipment, which is unavoidable under any scheme because of the seasonal character of some commodities, there still remains the problem of empty mileage, but these empty movements have been confined to the most direct route, thereby saving time and increasing the availability of equipment. The problem of the empty haul was still further met by the issuing of an order by the Refrigerator Department requiring the holding road to make not only such minor repairs to foreign equipment as were necessary to keep it in service, but to repair cars as the owner road would do had they been returned to it under the old plan. It can readily be seen that with the elimination of these two sources of delay, the work of the Refrigerator Department has proved advantageous to both the shippers and the carriers. In the execution of orders for the elimination of these two factors by the roads under federal control it was found that empty haulage was still further decreased by the removal of some of the chief causes for the bad ordering of cars and their consequent removal from service. Yard switching and classification have been minimized. Especially in the handling of empties in yards had this bad-ordering been prevalent, and any reduction in the necessity for such switching has consequently meant a proportional decrease in the number of cars injured.

In discussing this added availability under the new plan the points already stated, namely, the elimination of the empty haul due to the necessity for the return of cars to the owner road and the reduction in the bad-ordering constitute two of the main points in favor of centralized refrigerator car control. Obviously the enforcement of these measures meant more cars available for the carriers with which they could handle such increases in production of certain commodities as the producer might effect. Added to the increased availability already brought about by these changes was the ending of the delay incident to the reporting of cars to the owner road and the subsequent waiting for instructions as to their disposition. Instead, upon being unloaded, cars are immediately made available for further use according to rules promulgated by the Refrigerator Department. If no loading is available at destination the cars are moved immediately to other sections in need of cars. The car service representative at the unloading point has them reloaded promptly, providing commercial freight suitable to be placed in the car or a perishable commodity which the cars were suited to handle is available. Under all conditions they are kept moving in the general direction of a section in which commodities they are especially suited to handle are produced, for standing instructions sent out by the refrigerator bureau provide for the movement of specific types of cars in certain general directions. Exceptions to these rules are made from time to time by the bureau to meet certain conditions of supply and demand which arise.

The whole subject of car distribution was simplified and cleared by these directions. Agents of the car service sections know the probable time of the arrival of cars and either load them immediately or order them moved empty in the direction of their usefulness.

It can readily be seen that by the elimination of these operating losses it has been possible to give the shipper throughout the United States improved service in so far as car supply is concerned. Data compiled by the Car Service Section showing the percentage of cars supplied on loading orders during 1918, as compared with the previous year indicate that, since the organization of the Refrigerator Department in July, every railroad under federal control has been

able with few exceptions to offer its shippers all the cars they needed, whereas in the previous year in many cases the shippers were able to get but a small percentage of the necessary cars. Only 21 of the 105 roads covered in the report showed decreases in the percentages of cars supplied on loading orders during any month of this period and these decreases totaled but 42 road months or an average of two months per road for the 21 roads. These figures show merely the cars supplied on loading orders and do not show the relation between the number of cars ordered and those actually utilized, for it is often the case that the estimates of equipment requirements are in excess of the number of cars loaded.

This improvement in car supply has been made in the face of increased production of perishable product in nearly every part of the country. For example the production of apples in the Northwest was 25 per cent heavier than before, the New York Central traffic in perishable commodities was the heaviest in the history of the road, the Great Northern has handled 4,000 cars of potatoes and 2,000 cars of fruit in excess of the previous year's record, the production of Georgia peaches increased greatly, 1,000 more cars being handled than last year, and the Wisconsin lines have had an exceptionally heavy movement of cabbage and other perishables; yet the roads in these territories have been able to handle this added traffic easily.

#### The Opinion of Shippers and Carriers

Associations of shippers, at first skeptical of the pooling plan, have been convinced of its efficiency and have repeatedly complimented the Refrigerator Department. A majority of the carriers have also been pleased with the new plan and have co-operated with the refrigerator car bureau to the fullest extent. On the other hand there is a legitimate argument against the plan on the part of the larger railroads owning refrigerator cars for they have invested large sums in these cars and in creating an organization to handle them and they have pledged themselves to provide the producers in those parts of the country served by their lines with certain types of refrigerator cars and with a certain class of service. It is to their advantage if competitive conditions are to return to observe these understandings strictly. To avoid criticism from this source the Refrigerator Department has endeavored to keep certain types of cars in the same service they were formerly in, for instance, the cars of the Santa Fe Refrigerator Despatch and the Pacific Fruit Express, which have always been engaged in the moving of California and Colorado fruits are now loaded to or in the direction of or billed empty to California when they are released at their destination.

#### How the Refrigerator Department Works

The records of the Refrigerator Department show that there are approximately 136,600 refrigerator cars under their control in the United States. While the routine work in keeping track of these cars in one bureau appeared large at first, not only have accurate records of every movement of these cars been kept by a comparatively small force, but they have been so kept that the location of any types of cars can be told at a glance. Telegraphic reports are received from terminals showing the types of refrigerator cars loaded, delivered or received from day to day. Passing reports are also made by divisions on the movement of cars through their territories and these reports are entered on large sheets which show the location of each type of car by roads.

On another large sheet, the information sent in by agents of the bureau is summarized weekly by showing under the heading, "Preceding Week," the cars required by different roads and the cars loaded and under the heading, "Succeeding Week," the cars required (estimated on loading orders at the terminals) and the estimated cars available to fill these

orders. By intelligent study of these charts, orders for relocation and equalization of equipment are issued from the central office.

### The Future of the New Plan

The maintenance of this system leads logically toward the standard refrigerator car, applicable for the handling of any perishable commodity. In the past railroads have purchased refrigerator cars generally to suit the commodities in which they were principally interested and when loaded to various points throughout the country become badly scattered. Being equipped only for certain classes of perishable freight, they

frequently fail to meet the specific requirements of the roads on which they may be released, whereas if refrigerator cars were standardized, it would allow the arbitrary movement of all refrigerator equipment from roads which have a surplus, to those originating traffic.

Whether this new plan will be retained by the United States government direct or through the Railroad Administration or under the direction of a department created by the railroads themselves after the readjustment period cannot be foretold; nevertheless the problem and its solution is vitally interesting to the producer, the distributor, the carrier and even to the ultimate consumer.

## Southern Region—Operating Conditions

The Only Region Which Earned Net Income in 1918 Sufficient to Meet the Government's Guarantee of Rentals

THE CHARACTERISTIC of the south in normal times is the high proportion of railroad mileage to the amount of traffic to be carried. A period, therefore, of prosperity in the south and increased traffic movement has generally been reflected in comparatively large increases in net operating revenue of the southern railroads. The Southern region of the United States Railroad Administration which is under the direction of B. L. Winchell, is a natural unit. It includes the roads south of the Ohio and Potomac rivers and east of the Mississippi, with the exception of the three coal roads, the Norfolk & Western, Chesapeake & Ohio and Virginian, which were logically formed into a separate region, the Pocahontas. Of the roads placed under Mr. Winchell's direction, the Atlantic Coast Line, Louisville & Nashville, and Nashville, Chattanooga & St. Louis and the Illinois Central were strong financially and have the reputation of having been particularly well operated. The Southern Railway was by no means as strong financially, but great improvements have been made, both in operation and in the physical condition of the property, within recent years. The Seaboard Air Line is the weakest of the larger southern roads financially, but has been particularly well and economically operated since W. J. Harahan has been president.

The Southern Railway has been engaged for a number of years on one of the largest railroad improvement schedules undertaken by any road in the country in recent years. This is the double tracking and, in large part, relocating of the main line from Washington to Atlanta, Ga. The work has been going on for so many years and had at times to proceed so slowly that comparatively few people fully appreciate the magnitude of it. From an old, single-track crooked line, with innumerable six-degree curves and 1 per cent grades, this main trunk line into the south has been converted into a double track, rock-ballasted line

with maximum curves of four degrees and with a maximum grade of six-tenths of one per cent. This line is completed with the exception of a comparatively few miles near Toccoa, Ga. It would be hard to exaggerate the importance of the part played by it in the operation of the Southern region. It is probable that it would have been physically impossible to have handled the amount of traffic which the Southern region was called upon to handle in 1918 had the Southern Railway's double track line to Atlanta been much less nearly complete.

Charles H. Markham was appointed regional director of the Southern region with office at Atlanta, on January 18, 1918, and was succeeded, when he was transferred to the Allegheny region, June 1, by B. L. Winchell. The operating heads of the roads, under private operation, were in most cases made federal managers of the property, under government operation. Thus, E. H. Coapman, vice-president in charge of operation of the Southern, was made federal manager of the Southern Lines; C. M. Kittle, vice-president of the Illinois Central, was made federal manager of that property; W. J. Harahan, president of the Seaboard Air Line, was made federal manager of that property; J. P. Beckwith, vice-president of the Florida East Coast, was made federal manager of that property; W. L. Mapother, vice-president of the Louisville & Nashville, was made federal manager of that property and of the Nashville, Chattanooga & St. Louis. The Atlantic Coast Line was placed under Vice-president Lyman Delano as federal manager.

B. L. Winchell has had a very long career both as an operating and traffic man and, prior to his appointment as regional director, had been director of traffic of the Union Pacific.

The South has been a land of camps. There were 22 of them situated south of the Ohio river and east of the Mississippi. Not only did this necessitate a very large movement of materials, first for building the camps and then for supplying troops located therein, but it also disrupted the ordinary flow of traffic to a tremendous extent. There was, of course, a great troop movement and this was done on very short notice and, necessarily, absolutely regardless of cost. An order would be given for the movement of 25 troop trains, and 25 freight trains would be immediately placed on sidings or in yards and the locomotives so released would be used to move the troop trains. Passenger equipment had to be gathered up from all parts of the country; Pullman and tourist sleeping cars were by no means sufficient to supply the needs of such movement and it was necessary to send, in some cases, as far away as the northwest to get

B. L. Winchell  
Regional Director, Southern Region

coaches. In studying the financial results of the Southern region, this great movement of troops into and out of the camps must be borne in mind. Passenger business is seldom as profitable as freight business and besides the extraordinary expenses that are connected with troop movement there was the added expense of delays to freight trains through the commandeering of freight locomotives.

The Southern region as a whole paid a lower scale of wages than did some of the other regions prior to the wage increases made by the government. The increases, therefore, in the south were greater in proportion than they were on many northern and western roads. Notwithstanding this fact and the expenses incident to troop movement, the region earned more than \$12,000,000 in excess of the guaranteed standard return.

Some saving from the short routing of freight undoubtedly was made and some friction was caused to shippers by re-routing, but in general an attempt was made to give the shipper what he was accustomed to where this was not inconsistent with the general scheme of operating the region as a unit.

The fact that the Southern region had no great complicated problem such as each of the other three regions in the eastern part of the United States had, permitted concentration on operating problems which it is safe to say goes far toward explaining the success which the roads in this region had in holding down operating expenses. It may appear slightly fanciful to ascribe a large part of the increased net earnings to so intangible a thing as the state of mind of the operating forces of the southern roads, but, nevertheless, there is an inescapably large amount of evidence to this effect; each item, small in itself, but large in the aggregate, pointing to greatly increased efficiency due to more fully aroused interest in employees and officers. Especially is this so on the Southern Railway. There is a really remarkable general attitude of being up on their toes among operating men on the Southern. One phase of this deserves mention; the lengthening of schedules of passenger trains permitted and encouraged a drive for trains being on time. In times past, the south has suffered probably more than its share from trains being late. At present, a fine record is being made in this respect. What applies to passenger train movement also applies to the elimination of delays in freight service. Engines are turned more promptly; less time is lost in yards; it is apparently just a combination of all the little things that go to make up better railroading which explains the showing made by the Southern region.

By far the largest increase in gross earnings, proportionately, is in passenger earnings. The Illinois Central passenger earnings increased 20 per cent in 1918 over 1917; the Atlantic Coast Line 43 per cent; the Louisville & Nashville 50 per cent; the Southern Railway 68 per cent; and the Seaboard Air Line 69 per cent. While it is true that troop movement has to be carried out regardless of expense, nevertheless, such very great increases in passenger revenue, as was shown by these roads in 1918, were sufficient to offset pretty heavy increases in expenses and still carry over some contribution toward net earnings.

Freight revenue showed substantial increases but on no such scale as passenger revenue. The Seaboard Air Line freight revenue increased 14 per cent; the Atlantic Coast Line 26 per cent; the Illinois Central 26 per cent; the Louisville & Nashville 28 per cent; and the Southern Railway 30 per cent.

Maintenance expenses on all of the roads increased heavily, and especially was this so with maintenance of equipment. On the Louisville & Nashville, for instance, the increase in maintenance of equipment expenses in 1918 as compared with 1917 was 57 per cent, and on the Southern Railway it was 67 per cent.

The increases in transportation expenses were no more than proportionate to the increased wage scales and the larger volume of business. Thus, on the Atlantic Coast Line they amounted to 45 per cent; on the Southern Railway to 53 per cent; on the Louisville & Nashville to 55 per cent; and on the Seaboard Air Line to 50 per cent.

What will happen in the Southern region in 1919 is an interesting problem. The south, depending for its prosperity so largely on the price of cotton, is now in a state of great uncertainty. The bid price for cotton has taken a rather startling drop, but, on the other hand, the owners of cotton are holding on to it with grim determination. At times the buyer and seller of cotton are 15 cents apart in their estimate of the proper market price. When we think that up to 1916 the difference in price per pound of cotton between 10 cents and 15 cents made the difference between a year of depression and a year of great prosperity in the south, it is easy to realize the extent of the uncertainty which is reflected in a bid price of 20 cents and an asked price of 35 cents for cotton. Sales at present are taking place at Savannah at about 27 cents, but it is estimated that only a very small part of the cotton crop for 1918 has actually moved to market.

Although cotton carries a high freight rate, the importance of it as a commodity to the railroad companies is much less than the importance of the buying power which high-priced cotton gives the south, or lack of buying power because of low cotton prices. Nevertheless, the tonnage of cotton which the railroads can still count on having to move is considerable and will be a factor in 1919 earnings. If this cotton is sold at high prices, there is a good prospect of the south enjoying a continued period of prosperity which should be reflected in railroad earnings; but even great prosperity will hardly take the place of the traffic—passenger and freight—which was furnished by the military camps. The railroads of the south, like those of the rest of the country, have no immediate prospect of any important reduction in costs of labor or materials. The Southern region made an extraordinarily fine showing in 1918; the prospects for 1919 are not so good.

From the Baltimore Sun

A Fairy Godmother Appears on the Scene

# Doings of the United States Railroad Administration

## Director General Hines Is Using Every Effort to Arrange for Financial Aid to the Roads

WASHINGTON, D. C.

THE PROBLEM of how to get along without \$700,000,000 until the President sees fit to call an extra session of Congress at which the difficulty may be remedied has given Director General Hines a busy time since March 4, but progress has been made on expedients for tiding over the situation until Congress can act, and it is hoped that a definite plan may be announced in another week. After a series of conferences with the secretary of the treasury, the directors of the War Finance Corporation, members of the Railroad Administration Advisory Committee on Finance and a number of prominent bankers, a partial solution was suggested at a meeting with a committee of railroad executives on Tuesday when Mr. Hines announced that he was considering the advisability of having the Railroad Administration issue, under reasonable conditions and limitations, warrants for amounts due the railroad companies for their rental for 1918, in such a form as would serve as collateral for railroad companies desiring to make loans through banks, the warrants to be taken up by the Railroad Administration when Congress makes the appropriation needed to meet the situation.

The administration owed the railroad companies on account of their rental as of January 1, \$381,000,000, after making such deductions toward the cost of capital expenditures as it is authorized to make under the compensation contracts and after deducting sums due the government on open account, but outside of the 35 roads whose contracts are signed, the companies have nothing to show for it except a law which authorizes the government to guarantee them an amount "not exceeding a sum equivalent as nearly as may be" to their average net operating income for the three pre-war years. They know that the Interstate Commerce Commission has certified the amount of this "standard return" and they know that the contracts that have been executed provide for the payment of the full amount of the standard return in each case, but it is believed that an acknowledgment of indebtedness on the part of the government will afford them a more substantial basis of credit. Such warrants would not be discountable or negotiable, but they would be assignable as collateral, and the director general would require no specific authority to issue the warrants.

The situation of the equipment companies, to which the administration is obligated for \$286,000,000 for cars and locomotives ordered last year, payable as the equipment is delivered, was to be discussed at a conference with the manufacturers on Thursday. The warrants might also be used to pay for the equipment, as equipment trusts cannot be used until after the equipment is turned over to the railroads.

At the invitation of Mr. Hines a conference was held on Tuesday between the director general and a group of representative railroad corporation executives, members of the War Finance Corporation and members of the Advisory Finance Committee of the Railroad Administration to discuss the financial situation facing the Railroad Administration and the companies as a result of the failure of the Congress to pass the \$750,000,000 appropriation requested by the Railroad Administration.

In order to get the problem before the conference, the director general outlined the immediate necessities of the situation as follows:

### AMOUNT NEEDED UP TO JUNE 30

For interest and other corporate requirements of the railroad corporations	\$166,066,762
To meet amounts due equipment companies from the Railroad Administration	183,681,965
To pay for indispensable additions and betterments, including equipment ordered by railroad companies	110,000,000
To meet maturities of the railroad corporations	100,948,965
To meet excess of cash requirements to pay current vouchers over the probable receipts up to March 31	101,000,000
To bring cash balances in hands of federal treasurers up to \$200,000,000, which is the normal requirement for one month	40,000,000
Total	\$701,697,692

The item of \$166,000,000 includes dividends and is an estimate of what will be required in addition to what the companies can provide from other sources.

It was made clear that to a large extent it will be necessary for the railroad corporations to meet their requirements by obtaining loans from bankers, the resources of the War Finance Corporation to be reserved to protect special cases.

The War Finance Corporation has some \$300,000,000 available for loans, and it is reported that the banking interests had been inclined to take the position that these resources should be taken advantage of before private financing is resorted to, but the Shipping Board and other government departments also want some of the money, and moreover the ability of the War Finance Corporation to make loans is limited by the statutory requirements as to security. While some of the stronger railroad companies might be able to meet the requirements, the roads which are less able to borrow on their own account in many cases could not furnish the security required by the corporation.

Eugene Meyer, Jr., manager director of the War Finance Corporation, assured the director general and the conference that the corporation was desirous of doing everything possible to assist in meeting the situation, having in mind the interests of the government in protecting loans and the legal limits placed upon the corporation.

The director general and the conference generally proceeded on the view that it was highly desirable to devise ways to provide for payment of bills and have the situation met through financing rather than by a general suspension of work which would have a deterrent effect upon business generally.

Following the morning conference, the railroad executives met in the afternoon and adopted the following resolutions:

#### RESOLVED:

1. That it is the sense of this conference of railroad executives that the railroad companies will, in the present financial emergency, co-operate in every practicable and reasonable way with the Railroad Administration in its efforts to provide for financial requirements pending an appropriation by Congress to relieve the situation;

2. That, while the problems to be met are largely matters between the individual roads, the Railroad Administration, the War Finance Corporation and the bankers, it is deemed wise to have the general subject supervised, on behalf of the railroad companies, by a central committee, with power to consider the questions involved and to give such aid and co-operation, and to make such suggestions, as may be possible, to the individual roads, to the director general, to the War Finance Corporation and to the bankers; it being understood that such committee is not to have power to commit any individual company without its assent;

3. That the chair be, and hereby is, authorized and requested to appoint such committee, to consist of seven mem-

bers, of which Howard Elliott, the chairman of this meeting, shall be ex-officio, chairman.

The chair thereupon appointed the following committee: Howard Elliott, Albert H. Harris, Robert S. Lovett, Samuel Rea, Henry Ruhlender, Henry Walters, Daniel Willard, Alfred P. Thom, counsel; George M. Shriver, in charge of accounts, and E. G. Buckland, secretary.

This resolution was presented to the director general, who held a brief conference with the members of the committee and expressed his gratification over the attitude adopted by the executives, adding that he was very happy to have the committee to co-operate with the Railroad Administration. A further meeting was arranged for Thursday between the director general and the members of the committee of executives, and on Wednesday Mr. Hines discussed the subject further with the secretary of the treasury, the War Finance Corporation, the Federal Reserve Board and the comptroller of the currency.

The conference on Tuesday was attended by the following: Walker D. Hines, director general of railroads; Howard Elliott, chairman, Northern Pacific; R. S. Lovett, president, Union Pacific; Daniel Willard, president, Baltimore & Ohio; Samuel Rea, president, Pennsylvania; Woodward Hudson, president, Boston & Maine; Harry Bronner, president, Missouri Pacific; vice-president and general counsel, Great Northern; H. Walters, chairman, Atlantic Coast Line; Charles B. Perkins, president, Chicago, Burlington & Quincy; F. D. Underwood, president, Erie; W. H. Williams, chairman, Wabash; W. K. Vanderbilt, Jr., president, New York Central; A. H. Harris, vice-president, New York Central; Charles A. Peabody, president, Illinois Central; E. G. Buckland, president, New York, New Haven & Hartford; Agnew T. Dice, president, Philadelphia & Reading; William H. Findley, president, Chicago & Northwestern; L. E. Johnson, president, Norfolk & Western; representative and counsel, Seaboard Air Line; Henry Ruhlender, president, St. Louis-San Francisco; Charles E. Schaff, receiver, Missouri, Kansas & Texas; Fairfax Harrison, president, Southern; Alfred P. Thom, general counsel, Association of Railway Executives; Franklin Q. Brown, chairman, Finance Advisory Committee; Frederick W. Scott, member Finance Advisory Committee; James N. Wallace, member Finance Advisory Committee; Eugene Meyer, Jr., managing director, War Finance Corporation; Clifford M. Leonard, director, War Finance Corporation; Angus W. McLean, director, War Finance Corporation.

#### Division of Finance and Purchases Reorganized

John Skelton Williams has resigned as director of the Division of Finances and Purchases of the Railroad Administration, effective March 15, and the division will be divided into two new ones, the Division of Finance and the Division of Purchases. Swagar Sherley, chairman of the House Committee on Appropriations in the Sixty-fifth Congress, who had charge of the railroad appropriation bill which passed the House, has been appointed director of the Division of Finance, effective about April 15, and Henry B. Spencer, now chairman of the Central Advisory Purchasing Committee, has been appointed director of the Division of Purchases, effective on March 15. For the time being, Director General Hines will himself direct the work of the Division of Finance with the assistance of the associate director of the Division, Charles B. Eddy.

Mr. Williams will become chairman of an advisory finance committee, which will be expected to submit to the director general from time to time its advice on matters of financial policy and also to make to the director general preliminary reports on any proposed reorganizations which may require his approval. He will also become chairman of an advisory committee on purchases which will be charged

with authority to investigate and advise on important questions of policy involving the purchase of materials and supplies for the railroads. He will also remain on the staff of Director General Hines and will continue to preside at staff conferences in the absence of the director general.

Mr. Sherley is a native of Louisville, Ky., and is a lawyer by profession, having begun practice in 1891 in Louisville, following his graduation from the University of Virginia. He was a member of the House of Representatives in the 58th, 59th, 60th, 61st, 62nd, 63rd, 64th and 65th Congresses. For a number of years he has been a member of the House Appropriations Committee and succeeded Representative Fitzgerald of New York as chairman of that committee. Through his long service on the Appropriations Committee, he has become unusually familiar with government finances and has become an expert in extricating the essential facts from a great mass of financial details.

In announcing the appointment Director General Hines said:

"I have known Mr. Sherley personally for many years and have always had an unusually high regard for him as a lawyer and as a man. I deem myself very fortunate in having succeeded in persuading him to accept the appointment as Director of the Division of Finance of the Railroad Administration. I have been in intimate contact with him recently during the consideration before the Congress of the appropriation requested by the Railroad Administration and have been deeply impressed by his knowledge of financial and legal problems, the thoroughness of his methods and the accuracy of his insight. He strips away the unimportant and deals with the very heart of his problems."

Mr. Spencer was appointed chairman of the Central Advisory Purchasing Committee on its organization last year and has retained his office as vice-president of the Southern

H. B. Spencer  
Director of the Division of Purchases

Railway System, which he now resigns. He was born December 16, 1872, and after his graduation from Harvard University in 1895 he entered railway service as a clerk to the superintendent of the Elgin, Joliet & Eastern. In January, 1897, he was made chief clerk to the superintendent and in December, 1897, he was appointed assistant superintendent of the Alabama Great Southern. From September 1, 1898, to January 1, 1901, he was superintendent of the Louisville division of the Southern Railway,

from January 1 to February 1, 1901, assistant general manager of the St. Louis-Louisville lines and from February, 1901, to April 1, 1905, general manager of the same lines. On April 1, 1905, he was appointed general manager of the Southern Railway System and on November 1, 1906, he was elected vice-president.

Correspondence between Mr. Williams and the director general regarding this change was made public by the Railroad Administration. Mr. Hines, in his letter to Mr. Williams accepting the resignation, testifies in the most unqualified terms to the patriotism, integrity and self-sacrifice with which Mr. Williams has discharged the duties of his position and expresses satisfaction that he will still be able to give him the benefit of wise counsel, long experience in high standards of public service in an advisory capacity.

Mr. Williams' letter of resignation says the time has now come to put fully into effect changes in the organization which he had discussed with Mr. Hines on February 12, at which it was agreed that the business of the Division of Finance and Purchases had reached proportions to justify separation into two divisions, each receiving the entire time of an administrative head. The letter says that while arrangements were being made for the working out of this adjustment, Representative McFadden had introduced in the House of Representatives a resolution for the investigation of Mr. Williams' work, both as comptroller of the currency and director of the Division of Finance and Purchases. After discussing Mr. McFadden's charges, Mr. Williams says that as Congress has adjourned without further attention to the McFadden resolution, it is now possible for him to tender his resignation. Mr. Williams' reappointment as comptroller of the currency was not confirmed by the Senate, but he continues to hold the office through a Treasury Department appointment.

**Railroads Aided Mobilization**

Appreciation of the excellent work performed by the railroads and the Railroad Administration in handling the large troop movement when the work of mobilization was at its height, is included in a report of the Provost Marshal General to the Secretary of War on the operation of the selective service system. The report says the nationwide distribution of the camps to which the selectives were to be sent complicated the entraining problem and required the most careful handling. Before a call could issue the Railroad Administration required 14 days' notice, of which eight days were used for the compilation and printing of train schedules, and six days were needed by the local boards to notify registrants and to allow them sufficient time to arrange their affairs before leaving for camp. The schedules compiled and published by the Railroad Administration provided as carefully for a contingent of one man as for a contingent of 100. By working out every detail in advance the mobilization proceeded in a smooth and orderly manner. The report continues:

"It is a matter of duty and pleasure here to express admiration of the work of the United States Railway Administration in transporting selectives. No more difficult transportation problem could be conceived, involving as it did the simultaneous movement of small detachments in variant numbers from thousands of county seats and the concentration of their delivery at several hundred posts and stations. The arrangements for transporting and feeding these men were made by the railroads, and this work was so satisfactorily performed that less than a dozen complaints were received during the entire year. They have been called upon to handle as many as 50,000 selected men in one day; and to transport within a single month over 400,000 men for the selective service system alone. Their hearty co-operation at all times was one of the main assets of this office in the work of mobilization. Special attention is invited to their performance on November 11, 1918, the day on which the armistice was signed and hostilities ceased. Calls had issued and all arrangements had been made for some 250,000 men to be entrained during the five-day period beginning November 11. The United States Railroad Administration was advised by telephone at 10:25 a. m. on Monday, November 11, of the cancellation of these calls by order of the secretary of war. In 35 minutes they had notified all the railroads of the country; had stopped further entrainments; had reversed such contingents as were en route; and were restoring the men to the original points of entrainment. This achievement stands out as a marvel of efficiency, and is but an indication of the co-operation which they constantly tendered.

"The number of men called, to October 31, 1918, was

2,801,358. Of this number 45,882 did not travel over railroads under the control of the United States Railway Administration, due to the fact that they reported at mobilization camps within the immediate vicinity of their local boards. The remaining number, 2,755,476 men, were handled by the United States Railway Administration. The average number of miles per man traveled to a mobilization camp was 388; the entire mobilization, therefore, involved the equivalent of 1,069,124,688 miles of travel by one passenger.

"The relation of this mileage movement of selectives from local boards to camps, to the entire mileage for war department troop movements of all kinds, and to the total passenger mileage in the United States for the same period, is shown by the following table:

MOBILIZATION BY MILEAGE		Per cent of War	Per cent Depart-
Mobilization, by mileage	Number	of total	ment
		mileage	mileage
1. Total passenger mileage in United States, September 1, 1917, to November 1, 1918 (estimated).....	51,494,683,000	100.00	.....
2. For War Department troop movements of all kinds (estimated).....	4,440,000,000	8.62	100.00
3. For movements from boards to camps (estimated).....	1,069,124,688	.....	24.08
4. For movements' intercamp' and from camps to seaboard (estimated).....	3,370,875,312	.....	75.92

"It thus appears that the movements required for mobilization under the selective draft represented about one-fourth of the entire troop movement for the war department."

**Deficit as Compared with Standard Return in January**

The railroads started the year 1919 with a failure to earn the standard return, according to preliminary figures. Returns of 193 roads to the Interstate Commerce Commission, or only two roads less than are included in the commission's monthly tables, earned a net operating income of \$18,841,000, whereas the standard return for January for the Class I roads alone was something over \$55,000,000. The same roads in January, 1918, had an operating deficit of \$4,006,000. The operating revenues were \$394,974,000 as compared with \$284,371,000 in January, 1918, and the expenses were \$359,579,000, as compared with \$270,719,000, and this figure includes only a very small amount of back pay, as most of the back pay for 1918 was cleaned up in the December accounts.

**Wage Demands for 1919**

Now that most of the back pay for 1918 has been taken into the accounts, the processes which are expected to result in a new series of retroactive payments for 1919 are still being continued. The January accounts included no back pay except in the case of a few roads, but the request of the train service brotherhoods for an upward revision of their wage scales and time and one-half for overtime is still pending, on a recommendation of the Board of Wages and Working Conditions which is before the director general for a decision. The award when issued is expected to be retroactive to January 1, and the shop employees have asked for a new increase to become effective as of the same date.

It is understood that the Railroad Administration is holding out against the demand for a penalty rate for overtime in train service, but the brotherhood executives have been in Washington for some time making vigorous efforts to have it granted, and the subject has been discussed at length at a conference of the regional directors and federal managers which began last week. Most of the regional directors left on Saturday, but the federal managers remained over this week, going over the matter in detail to study the effect of such a change and possible alternatives.

A letter addressed to the director general by B. M. Jewell, acting president of the railway employees' department of the American Federation of Labor, and the executives of the in-

dividual organizations, says that great dissatisfaction has been manifested by the machinists, blacksmiths, boilermakers, sheet metal workers, electricians and car men, regular and helper apprentices and helpers, "due to the present inadequate wage rates," as contained in the awards made in 1918, and they desire to present a request for further increase "to place them in a position to meet the ever-rising cost of living and maintain a more equal differential between classes of railroad employees and those engaged in a similar capacity in other industries." The letter states that these employees have been very insistent in their demands for some time, but the request has been withheld until they have become so persistent that it has been deemed advisable to comply with their wishes. The letter also urges upon the director general the necessity of arranging a conference with the representatives of the shop crafts for the purpose of arriving at a thorough understanding of the award to be issued covering this request, prior to the issuance of the general order.

"If this is not done," the letter says, "you can but expect a repetition of the situation as it has existed after the issuance of each wage order thus far. We are sure that if the recognized representatives of the employees are permitted to have such a meeting with you they will be in possession of the necessary information to enable them to advise their membership as to the full provisions of the award, thereby insuring you, also our people, against the very unpleasant expressions of protest made by wire, letter and through newspapers, none of which are for the best interests of the service. Matters of this kind under private control have been handled in a very orderly manner by us and can still be handled in the same way if we are but permitted to understand the exact provisions of the award, being allowed sufficient time to advise our people through regular channels of their recognized organizations the best course to pursue regardless of whether or not the award is considered satisfactory to them."

The new scale of rates requested provides for a minimum hourly rate of 85 cents per hour, as compared with the present minimum of 68 cents, for machinists, blacksmiths, sheet metal workers, electrical workers, car men and boilermakers, a minimum hourly rate of 60 cents an hour for helpers, and differentials above the minimum hourly rate for certain classes of employees. Machinists working on valve motion work, tool room work, rod work, heavy machine operators, layers out, air men and federal inspection men ask an excess of 6 cents an hour above the machinists' rate. Certain classes of boilermakers ask an excess of 6 cents above the boilermakers' rate. Blacksmiths employed as hammersmiths ask an excess of 25 cents above the blacksmiths' rate. Electricians employed as armature winders ask an excess of 25 cents above the rate for electrical workers.

The request provides that general foremen, foremen, assistant foremen, and leaders shall be paid on an hourly basis and receive overtime compensation for all services rendered in excess of eight hours per day, with a minimum hourly rate of \$1 for general foremen, 95 cents for foremen, and 90 cents for assistant foremen, gang foremen and leaders; provided that all rates in excess of these shall be continued and monthly rates now in effect shall be the basis for establishing the hourly rates, the monthly rates to be divided by 200 to obtain the hourly rate.

The request also provides that operators of electric, acetylene, thermit or other improved welding processes or machines shall receive an hourly rate of 91 cents, that all employees performing the recognized work of any craft who have had one year's experience or less shall receive 67 cents an hour, who have had one year or less than two years' experience shall receive 70 cents an hour, two years' and less than three years', 74 cents an hour, over three years' and less than four years', 79 cents an hour. This does not include regular and helper apprentices. It is provided that should any of the

above leave the service, employees with not less than four years' experience shall be assigned to their positions and paid the minimum rate. Regular and helper apprentices assigned in connection with the work of their respective crafts are to receive as a starting rate 35 cents per hour, with an increase of 2½ cents per hour for each six months up to and including the first three years, and an increase of 5 cents per hour for the first six months of the fourth year and 7½ cents per hour for the last six months of the fourth year.

#### Improvements to Be Financed by Companies

For the purpose of emphasizing the fact that capital expenditures for this year must be financed generally by the railroad companies, T. C. Powell, director of the Division of Capital Expenditures, has issued D. C. E. Circular No. 19, which is sent to regional directors, with copies to federal managers, as follows:

In conferring with corporation officers and securing from them a definite statement for or against contemplated additions and betterments chargeable to capital account, you, of course, understand that it is not our purpose, generally speaking, to make such improvements unless the company finances the project.

Before forwarding to this office, therefore, D. C. E. Forms which carry the approval of the corporation, and before permitting the federal (general) manager to start work on any project costing more than \$1,000 chargeable to capital expense, please be careful to develop the exact scope of said corporate approval.

The corporation officer may desire to express general approval of the project without committing himself as to finances and in that case such projects should be submitted separately, with the comments of the corporation officer and your recommendations.

There appear to be four other phases in this matter:

(1) Those improvements which are approved by the corporation, and which the corporation is prepared to finance on its own credit without calling upon the Railroad Administration in any way.

(2) Those items which the corporation approves, but not being able to finance on its own credit, is prepared to furnish security to the Division of Finance of the Railroad Administration, by means of which the director of finance will be able to assist in securing funds.

(3) Those projects which are approved by the corporation, but which cannot be financed by the corporation on its own credit in the open market, and for which the corporation is not prepared to furnish security to the director of finance, and for which, therefore, the corporation must call upon the Railroad Administration to furnish all the funds on the notes of the corporation without security.

(4) Disapproval by the corporation.

To simplify the handling, please state the exact obligations by endorsing upon D. C. E. Form 4 any one of the notes described below which fits the case:

(1) Work covered by this form is approved by (corporate name of railroad company), which also agrees to finance from funds other than those received from the Railroad Administration the charges to its capital account required to complete the work.

(2) Work covered by this form is approved by (corporate name of railroad company), which also agrees to finance the charges to its capital account required to complete the work, by furnishing to division of finance satisfactory collateral.

(3) Work covered by this form is approved by (corporate name of railroad company), but the corporation is not prepared to finance from its own funds or to furnish the collateral whereby it may assume the charges to its capital account required to carry out the work.

(4) Work covered by this form is not approved by (corporate name of railroad company).

Mr. Powell has also issued the following Supplement 4 to D. C. E. Circular No. 1:

Since the issuance of Supplement 3 to D. C. E. Circular No. 1, dated December 31, 1918, it has developed that large expenditures were made during the year 1918 in connection with improvements chargeable to capital account which were not authorized nor the expenditures reported on D. C. E. Form 5.

It is necessary that any such expenditures shall be reported accurately and that D. C. E. Form 5 shall reflect not only expenditures for work specifically authorized, but all expenditures properly chargeable to capital account.

Supplement 3 to D. C. E. Circular No. 1 is hereby rescinded and effective as of *January 1, 1919*, the following instructions should be observed:

I. Paragraph "Sixth" of D. C. E. Circular No. 1, dated March 27, 1918, relating to the preparation of D. C. E. Form 5, a monthly report of authorizations and expenditures, is revised so as to read hereafter as follows:

*Sixth.*—A monthly report, commencing with the month of January, 1919, should be made on D. C. E. Form 5 Revised.

This report should include all unexpended balances in connection with uncompleted work contracted for or commenced prior to January 1, 1919, and all work authorized or commenced after that date which involves a charge to capital account.

The report should divide the work into classes according to the classification outlined in D. C. E. Circular 2, and printed on D. C. E. Form 5 Revised.

In preparing this statement, the following rules should be observed:

(a) In columns 2 and 3 should be reported the unexpended balance in connection with work authorized or commenced prior to January 1, 1919; and so far as the amount chargeable to capital account is involved should agree with column 14 of the subcapitulation "Uncompleted work" of the "carry-over." The figures reported in these columns must not be changed during the year 1919 without previous approval of this office.

(b) In columns 4 and 5 should be reported only the work specifically authorized during the year 1919 on D. C. E. Forms 2 or 4. No work except that reported on D. C. E. Form 2 should be included in these columns unless the approved D. C. E. Form 4 has been received.

(c) In column 6 should be reported the sum of columns 2 and 4, and in column 7 should be reported the sum of columns 3 and 5.

(d) In columns 8 and 9 should be reported all expenditures made during the month in connection with work chargeable to capital account whether specifically authorized or not.

(e) In columns 10 and 11 should be reported the cumulative expenditures made in connection with work chargeable to capital account whether the work has been specifically authorized or not.

(f) In column 12 should be reported only the aggregate of the unexpended balances in connection with work specifically authorized.

(g) In column 13 should be reported—

1. The aggregate of the expenditures made in excess of work specifically authorized.

2. Total expenditures made in connection with all work which has not been specifically authorized on D. C. E. Forms 2 or 4.

II. In preparing D. C. E. Form 5 Revised for January, 1919, it will be necessary to report the "unauthorized expenditures" made to December 31, 1918, as reported on special statement provided for in D. C. E. Circular 14, paragraph "Sixth." This should be done by reporting the amounts in columns 9 and 11, and the operating expenses in connection therewith in columns 8 and 10. Unless D. C. E. Forms 4 were approved for any of this work during

January, the entire amount should be also reported in column 13 (unauthorized expenditures) as provided for in paragraph (e).

III. I again wish to emphasize the necessity for the prompt rendition of this statement, and for the accuracy of its preparation. The statement should be mailed not later than the 25th of the succeeding month. In the event any federal manager finds it is impossible to mail the statement on the 25th day of the first succeeding month, he should telegraph the director Division of Capital Expenditures, to that effect, giving the reason therefor and the approximate date on which it will be sent.

**Rental Charges for Dining Cars, Locomotive Cranes, Lidgerwood Unloaders, etc.**

The director general has approved the following as rental charges to be applied between railroads for dining cars, locomotive cranes, Lidgerwood unloaders, etc., effective as of March 1:

	Rate per day
DINING CARS: Furnished (except provisions).....	\$40.00
LOCOMOTIVE CRANES:	
Five tons capacity or less.....	15.00
Over 5 tons capacity and less than 20 tons capacity.....	20.00
Over 20 tons capacity.....	25.00
WRECKING CRANES:	
Steam wrecking cranes, 75 tons capacity and less.....	40.00
Steam wrecking cranes, capacity more than 75 tons.....	55.00
LIDGERWOOD UNLOADERS:	
Without cable and plow.....	7.00
Including cable and plow.....	10.00
DITCHING MACHINE.....	10.00
PILE DRIVERS:	
Drop hammer.....	10.00
Steam driver.....	15.00
Self-propelled steam driver.....	22.50
STEAM SHOVELS:	
With dipper less than 2½ cubic yards capacity.....	15.00
With dipper 2½ cubic yards capacity or greater.....	20.00
OTHER WORK EQUIPMENT:	
Self-cleaning ballast cars.....	1.50
Equipment for tool cars.....	1.50
Trucks or water cars.....	1.50
Braking, bunk, commissary, or camp cars.....	1.50
(Provided that in no case shall the rates for "Other Work Equipment" be less than the per diem rates.)	
NOTE.—When necessary to haul this equipment over road owning it for delivery to borrowing road, or intermediate carrier, the following rates to apply:	
Cars enumerated under "Other Work Equipment".....	3½¢ per mile
Dining cars.....	10¢ per mile
Locomotives, Lidgerwood unloaders, pile drivers, steam shovels, unless otherwise provided by special arrangement. Tariff rates to apply.	

**Final Report of Exports Control Committee**

The Exports Control Committee, established June 11, 1918, for war purposes to control the flow of export traffic has just made its final report, the committee having been disbanded March 1 at its own suggestion. The report, which was for the week ended February 28, shows that in the South Atlantic and Gulf districts the permit control on all bulk grain, both export and domestic, and all sacked grain for export destined to or via the Gulf port elevators has been removed. In the future, carriers will not require permits for grain moving to or via any of the Gulf ports. The embargo restrictions calling for permit system on iron and steel articles when destined to South America, Central America, Mexico, Cuba and the West Indies have also been withdrawn, so that the only movement subject to permit control will be on iron and steel articles moving overseas.

The movement of overseas traffic for the week ending February 25 shows that receipts have again exceeded the deliveries to the extent of 1,737 cars at North Atlantic ports. There are 10,823 cars of food for export on hand at North Atlantic ports, which is 1,183 cars more than last week.

The report shows that there were 28,000,000 bushels of grain at Buffalo afloat for the Food Administration and Wheat Export Company, in addition to the grain in elevators. Applications will shortly be presented covering a movement of approximately 6,000,000 bushels of grain a week via North Atlantic ports, divided according to conditions at the ports, an ample shipping program being available to promptly take care of grain on arrival.

As to Gulf ports, the stock of grain at New Orleans is 4,345,000 bushels, with only one ship in port and six overdue with total grain allocations of 936,000 bushels.

### Passenger Traffic

Passenger traffic continues to show increases in various parts of the country, according to the latest weekly report of traffic conditions issued by the Railroad Administration, and to accommodate the travel the passenger service is gradually being restored to pre-war conditions in many places. Arrangements have been made to place several suburban club cars in service between New York and Plainfield, N. J. The New York Flyer between New York and Harrisburg, Pa., will shortly be re-established by the Philadelphia & Reading. Tri-weekly sleeping car service was established between Washington, D. C., and Hot Springs, Va., on March 3 by the Chesapeake & Ohio. Some additional passenger service has been put on by the Missouri Pacific. On March 1 all lines in the Central Western region, except the Atchison, Topeka & Santa Fe on its California Limited, resumed a la carte dining car service. A change in the special car tariff reducing the minimum requirement for use of a special car from 30 to 25 fares is to be made effective about March 15.

### Maintenance Program for 1919

A maintenance of way and structures program for 1919 which will be sufficient to make the average upkeep for 1918 and 1919 equal to that of the three-year test period before federal control, is to be made up by the federal and general managers and submitted to the Railroad Administration at Washington for approval by April 15, according to instructions issued to regional directors by C. A. Morse, assistant director, division of operation, in charge of engineering and maintenance. With the instructions was sent a special form to be filled out with the average amount expended during the three-year period under each subdivision of the maintenance of way and structures accounts equated on the basis of the increased wages and material prices, together with similar information for 1918 to show whether the amount expended in 1918 was greater or less than during the test period after making an allowance for the higher wages and prices in 1918. The program for 1919 will then be made up by taking the average for the test period and adding or subtracting the difference between that average and the expenditures for 1918. Extraordinary expenses and expenditures on account of renewals rather than upkeep are to be separated. According to the Interstate Commerce Commission's figures for 1918 the expenditures for maintenance of way and structures in 1918 were \$654,000,000 as compared with \$446,000,000 in 1917, an increase of \$208,000,000. According to an estimate made by the Railroad Administration, the increase in wages in the maintenance of way and structures account was \$96,290,000, or 29.9 per cent, and the estimated pay roll excluding increases was \$321,791,000.

### Increased Number of Employees Due to War Conditions

Walker D. Hines, director general of railroads, has authorized a reply to a statement by Howard Elliott, president of the Northern Pacific, in a recent address, that the Pennsylvania Railroad System had nearly 40,000, or about 16 2/3 per cent more employees on December 31, 1918, under federal control than on December 31, 1917, under private control. Mr. Hines' statement incidentally makes public the fact that the total number of railroad employees in January of this year, was 8.2 per cent greater than in December, 1917.

"For this comparison," the statement says, "Mr. Elliott selects a month of private control characterized by extraordinarily bad weather when maintenance of way and other outside work was at a standstill on the Pennsylvania System and when blockading of traffic largely diminished car repairs,

and selects a month under federal control in which unusually clear weather prevailed, when business was moving freely and when it was possible and advisable to go forward with maintenance of way and also with car repairs. Of itself the wide disparity between these two months produces an unfair comparison and accounts for a substantial part of the increased number of employees upon which Mr. Elliott dwells. But in addition there are two fundamental mistakes of treatment which vitiate Mr. Elliott's argument and emphasize its unfairness to the Railroad Administration.

"Mr. Elliott first makes the mistake of treating the Pennsylvania Railroad as typical of the entire country. This is not the case. Taking the railroads under federal control as a whole, the number of employees in January, 1919, as compared with December, 1917, shows an increase of only 8.2 per cent, much less than the increase on the Pennsylvania system. The increase in the number of employees under government control as compared with the number of employees when the roads were under private management is almost negligible except in the regions of intense war activity, and the most striking of these was the Allegheny region (which includes the Pennsylvania Railroad), where the essential coal and the steel were produced, and where many shipbuilding yards and other war industries were located.

"Mr. Elliott makes the further mistake of charging up as a necessary characteristic of federal control under peace conditions temporary features which were really due to war conditions. During the year 1918 the United States Railroad Administration organized the railroads of the country on a war basis to do the railroad part of the work of defeating the Germans. There was an extraordinary 'turnover' of railroad employees, due to the constant loss of employees to the military and naval service, to the service of operating the American railways in France and to other lines of work which were paying higher wages. This necessitated the employment of many untrained and inexperienced men and in the nature of things involved the necessity for having more men to do the same amount of work. Again, the transportation service under war conditions was in many respects much more burdensome than is indicated by the mere number of ton miles hauled. A vast number of special trains, both passenger and freight had to be run and an unusual empty car mileage had to be made.

"Again, the Railroad Administration had to keep organized up to its maximum capacity so as to be ready to put forth a constantly increasing effort and be ever ready, even if there might be an exceedingly severe winter, to do everything that ought to be done to carry on the work on an increasingly extensive scale and under an increasingly heavy strain. Thus the Railroad Administration had to be in a state of preparedness for the maximum war requirements in spite of the difficulties in securing trained employees; it, therefore, had to put forth every effort to have its forces sufficient as winter came on to meet any emergency.

"The armistice came so unexpectedly that it was impossible by the end of the year to readjust the organization so as to get rid of these war conditions and get down again to a peace basis. The problem was taken up promptly and has ever since been pursued with vigor in order to get back to a peace basis, but several months will still be required for that purpose. To seize on the war conditions which still existed in December, 1918, as an argument against the efficiency of the Railroad Administration even after readjustment to peace conditions is calculated to confuse, and is most unfair to the railroad officials of all ranks who have been trying so loyally and intelligently to bring the railroad conditions back to a normal peace basis.

"Nothing else in public or private control was conducted on a normal basis during the intense period of the great war. In all other sorts of enterprise it is assumed on all sides as

a matter of course that neither the war results nor the results of the readjustment period are to be taken as typical of peace results after readjustment can be accomplished. Yet Mr. Elliott singles out the Railroad Administration and treats it as an enterprise whose results under peace conditions and after an opportunity for readjustment can fairly be tested on the basis of what had to be done for the public safety under the stress and difficulty of the greatest war in history.

"The very facts that Mr. Elliott cites strongly emphasize that federal control has important opportunities under peace conditions to improve the situation through eliminating the extra costs which were due to war necessities. We are endeavoring to take advantage of all these opportunities and to bring about a readjustment in the public interest, having at the same time due consideration of the necessities of the general industrial situation. I welcome and am aided by understanding and discriminating criticisms of the situation, but I deprecate criticism which seeks to fasten on the Railroad Administration as a permanent characteristic of its policies and methods after readjustment to peace conditions, the things which were not due to federal control but which were due to the necessities of the war."

**Back Pay to Be Reported**

Several requests have been made upon the regional directors and federal auditors for information respecting the amount of back pay charged to operating expenses for the year 1918 arising out of the application of the provisions of General Order No. 27 or supplements thereto. Federal auditors were required to estimate a good portion of the data reported on this subject. The estimates, in many cases, were not comparable with the actuals subsequently determined, so that the results received were far from satisfactory. In order that the accounting division may properly answer the many inquiries made upon it respecting the subject of back pay, Accounting Circular No. 77 directs that federal auditors shall prepare a report showing the amount of back pay included in the operating expenses of each month of the year 1918 that is applicable to other months of that year, the amount in each month applicable to each other month to be shown in the month or months in which it is properly includable. After showing the full amount of back pay included in each month and the proper apportionment of that amount between the months to which it is applicable, a classification of the total amount assigned to each month is to be shown among the general accounts of operating expenses affected thereby.

If it is not reasonably possible to accurately assign the

amount of back pay to the month or months to which it is applicable, such amount shall be apportioned among the appropriate months on some reasonable basis of estimate, and a note shall be made on the report that the distribution was made on an estimated basis.

**Investigation of Wm. H. Wood Firebox**

The William H. Wood corrugated locomotive firebox is the subject of a report recently made to Frank McManamy, assistant director, Division of Operation, United States Railroad Administration, by a sub-committee of the Committee on Standards and published by the Railroad Administration. The committee made a thorough investigation of the service records of the five fireboxes of this construction actually applied to locomotives and examined the fireboxes, now all replaced by others of standard design. Its conclusions are "that the Railroad Administration should not apply any of these fireboxes for the following reasons:

"That the economy claims have not been proven.

"That the life to be expected, based on the best performances is very much less than that of the ordinary form of box.

"That the time out of service will be very much greater than with the ordinary box."

The committee does not believe that there is sufficient advantage in this form of construction to compensate for the added difficulty and expense involved in its repair and renewal.

**Board of Referees to Determine Compensation**

In accordance with provisions of the federal control act the Interstate Commerce Commission has appointed Commissioner Aitchison, M. O. Lorenz, statistician, and A. G. Hagerty, attorney examiner, as a board of referees for the purposes of determining the just compensation of the Chicago, Terre Haute & Southeastern and the San Antonio, Uvalde & Gulf, which have petitioned for the appointment of referees, because their compensation has not been adjusted as provided in Section 1 of the act.

**Trackmen's and Shopmen's Working Conditions**

Two representatives of each regional director and an equal number of representatives of the Brotherhood of Maintenance of Way Employees and Shop Men began a meeting at Washington on March 10 for the purpose of recommending to the Board of Wages and Working Conditions a set of uniform rules governing working conditions. A tentative draft was submitted to the board by the brotherhood some time ago.

## Orders of Regional Directors

**L**OCOMOTIVE DICTIONARY and *Master Car Builders' Dictionary*. A. H. Smith, regional director, Eastern region, by file 500-88A583, advises that the director general has authorized a continuance by the railroads of past practice with respect to the furnishing of the Locomotive Dictionary and the Master Car Builders' Dictionary to their mechanical and purchasing officers. The Southern regional director, file 1701-2-6, issues the same notice.

*International Railway Fuel Association*.—The regional director, Eastern region, by file, 1301-28A584, advises that the director of the division of operation desires a large attendance of railroad fuel men at the International Railway Fuel Association's annual meeting, at Hotel Sherman, Chicago, May 19, 20, 21 and 22. The convention will discuss the conservation of railroad fuel coal, and railroad fuel men ought to attend regardless of whether or not they hold membership in the association. Federal managers are asked to see that their lines are properly represented, more particularly by men connected with the transportation and mechanical departments; such delegates to go prepared, as far as possible, to take an active part in the work of the convention. The Southern regional director, file 520-6, and the Northwestern regional director make the same request.

*Interchange of Freight on Sundays*.—A. H. Smith, regional director, Eastern region, by file 1200-2-29A576, calls for advice as to how far it has been possible to discontinue the interchange of "dead" freight on Sundays, and as to whether any further work of this class can be eliminated.

*Automatic Train Control Devices*.—The regional director, Eastern region, by circular 500-87A571 calls for a statement of all automatic train control devices now in use or installed; and instructs federal managers to see that no new installations are authorized until approved by the Automatic Train Control Committee.

*Unsanitary Condition of Toilets*.—The regional director, Eastern region, by circular 1600-111A572, advises federal managers that complaints are being received concerning unsanitary toilets in coaches and in passenger stations. This matter must be given attention so as to reduce to the lowest possible point all just grounds for reasonable criticism. The Northwestern region, by file 100-1-4, and the Southwestern, by Circular 183, receive the same notice.

*Monthly Report of Fire Protection*.—The regional director, Eastern region, in circular 1801-97A570, says that this report is to include only the activities of the inspectors attached to the fire protection and inspection department; it must not include things done by shopmen and other employees.

*Issuance of Passes to Non-Government Roads*.—The Southern regional director lays down the rule concerning the issuance of trip transportation to independently operated railroads: Trip transportation may be furnished to independently operated railroads on the basis of that furnished in 1917; in addition, trip transportation is furnished to Washington when necessary on account of railroad business with the United States Railroad Administration or other governmental department (not to include passes for families). These Washington passes will be issued by the director of the division of operation, but it will be proper for the railroads to continue past practice with reference to furnishing other trip transportation to such lines. The Eastern regional director, by file 2100-26A578, issues a similar notice.

*Failures of Mechanical Stokers*.—The Southern regional director calls the attention of federal managers to numerous delays and failures of locomotives equipped with mechanical stokers, due to iron bolts, and other metallic substances, as well as rock and other foreign material, left in bottoms of coal cars. Instructions should be issued through purchasing department and fuel inspection forces to insure that empty

cars shall be thoroughly cleaned before loading, and every effort must be made to prevent any metal substance being loaded with coal. Supervisors and foremen in charge of coaling stations must be instructed that special effort be made to eliminate foreign matter, destructive to stoker equipment, when coal is loaded on locomotives. The Eastern regional director, by file 500-1-54A585 issues similar orders, and Order 170, Southwestern region, covers the same subject.

*Wages Due Operators from Western Union*.—The Eastern regional director, by file 1200-4-56A-582, calls attention to a complaint that on one railroad the Western Union Telegraph Company has withheld payment of bills for back pay due joint employees, linemen and others. The director of the Division of Operation advises that the federal managers should take a positive stand that the telegraph company be expected to pay its proportion of the increased wages granted by the Railroad Administration; that the contract between the telegraph company and the railroad does not require any previous agreement as to increases.

*Movement of Army Medical Corps*.—Circular 188 of the Southwestern regional director requires cars belonging to the United States army medical service to be returned promptly to Jersey City, N. J., and Newport News, Va.

*Fires Resulting from Derailments*.—The Southwestern regional director in Circular 189 calls attention to fires resulting from derailment of trains containing gasoline or other highly inflammable commodities. He cites the case of a freight train in which three freight cars were destroyed at an estimated loss of \$12,500, and the principal cause was violation of rules.

*War Saving Stamp Notices*.—Circular 112, Supplement 3, of the Southwestern regional director gives authority for the posting of War Saving Stamp notices in stations, shops, etc.

*Report of Classified Locomotive Repairs*.—The Southwestern regional director in Order 172 announces the adoption of Form MD-34 for uniform reports of locomotives receiving classification repairs. This report is mailed monthly to Frank McManamy, Washington, and a copy is sent to the regional director.

*Industry Tracks*.—Order 185, cancelling Circular 102, Supplement 1, to Circular 102, Circular 119 and Circular 146 of the Southwestern regional director, abstracts all letters of interpretation of General Order 15 issued on March 26, 1918, and Supplement 1 thereto covering the practice to be followed in the construction, maintenance and operation of industry tracks.

*Freight Cars; Cost Limit of Repairs*.—Supplement 1 to Circular 23 of the Northwestern regional director, in complying with paragraph 8 of Division of Operation Circular 20, includes a model for the report of inspection and estimated cost of repairs to freight cars recommended for retirement or application of betterments and states that after cars are inspected and reported on this form the federal manager of the using road will transmit the original and two copies, with his recommendation, to the federal manager of, the owning road, who will transmit one copy to the corporation, securing its approval; retain one copy and return the original to the federal manager of the using road, notifying him of the action taken.

*Second-Hand Rails*.—The regional director, Eastern region, by file 500-8-8A562, prescribes, for convenience in accounting, prices for different qualities of second-hand rail which may be carried in stock, to avoid the difficulty of following the fluctuations in market prices. Except where there is some very serious objection to the contrary, the new rail is to be charged at the invoice price at which purchased, and stock is to be calculated at the average price paid for such rail on hand or being purchased; and second-hand rail, for stock purposes is to be valued as follows: Re-layer, \$28; Sidings and Yard, \$25; Scrap, \$14. When material of this kind is to be sold, the sale is to be made at the

highest price obtainable; and periodically, say semi-annually, the Auditing Department can readjust the operating accounts to reconcile the actual situation with the monthly accruals.

*Sheds for Protection of Car Repairers.*—The regional director, Eastern region, by Circular No. 1800-133A567 calls for information concerning laws requiring the construction of sheds for this purpose. The director general has been asked by the brotherhood to adopt a policy and is anxious to pass upon the matter with as little delay as possible. Federal directors are asked to advise what States now have car shed laws, and their provisions; what railroads have adopted the policy generally of providing car sheds at the more important car repair points, and to recommend what the practice should be.

*Army Medical Cars.*—The regional director, Eastern region, by Circular No. 2000-38-86A563 calls attention to the importance of promptness in returning to their headquarters the cars belonging to the U. S. Army, Medical Service, when the wounded men and invalids have been removed therefrom. The personnel of the Medical Corps is attached to each car, and a necessity exists for moving the Army Medical trains upon passenger schedule back to the point of origin as soon as relieved at destination. These cars have their headquarters at Jersey City, N. J. (Pennsylvania Railroad), and Newport News, Va. (C. & O.)

*Development of Coal Mines.*—Order 173 of the Southwestern regional director cancels Order 134 relative to applications for coal mine tracks. Hereafter such applications should be handled the same as applications for industrial tracks.

*Freight Car Distribution.*—Supplement 8 to Circular 70 of the Northwestern regional director directs that cars at a junction point with the home road will only be delivered to owner as approved by the regional director. Approval will be given where such delivery is not contrary to the current trend of empty movement. Care must be exercised to avoid diverting the movement of empty cars from proper channels. Ordinarily, where there is a definite movement of traffic through certain gateways the empty return movement should be made via the same gateways. By Notice No. 6 the Northwestern regional director calls for better movement of *automobile cars* to eastern territory. Shortage of cars for loading, particularly in Michigan, is growing acute. All such cars east of the Missouri river should be moved east at once, empty if necessary; but so far as possible, some should be loaded for destinations west and north of a line drawn through Detroit, Cleveland and Indianapolis. Automobile cars that are in storage mixed with ordinary box cars and not readily accessible will be switched out only when convenient and economical. A canvass, however, must be made of stored cars with a view of getting such cars in service with the least possible delay consistent with economical operation. Automobile cars in bad order should be given preference over ordinary box cars in making repairs. On account of being less serviceable, 36-ft. cars will not be moved empty on this order; but should be supplied for eastbound loading. Orders will not be accepted from other roads for empty automobile cars, with the exception of cars for loading by short line roads, or in switching service, where the loading road has no car supply. These instructions will not interfere with giving full distribution of available cars on local orders for automobile loading.

*Stored Equipment.*—Circular 184, of the Southwestern regional director is similar to 557-1-27 of the Northwestern regional director, abstract of which was published in the *Railway Age* of March 7 (page 555).

*Taxation of Material.*—A. H. Smith, regional director, Eastern region, by circular 2002-4A252, quoting the general counsel of the Division of Law advises that government property not in use by a railroad is not taxable locally. The general counsel says:

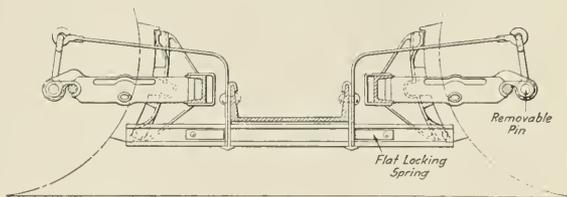

“Material and supplies of roads under Federal control on hand December 31, 1917, were taken over by the United States Railroad Administration and payment for the same made by the Government through credit entry on the books in favor of the corporation. In my opinion, such material and supplies became the property of the government; likewise material and supplies acquired since that date have been paid for by the government, thereby being the property of the United States government and not subject to taxation any more than army camp or post office supplies. Where material and supplies have been allocated to any particular road and used for maintenance, same became a part of the physical property of that particular road, and immediately subject to tax as such. Or, where material and supplies have been allocated to a particular road for use in connection with extensions or improvements, and charged to the corporation making such extensions or improvements, same became a part of the physical property of the road and subject to tax as such. Manifestly, it would be unfair for a state or community to assess taxes against a particular road for material and supplies, the property of the government, temporarily located at such point but perhaps designed by the Administration to be sent to some other state to be used by the government, in its operation of the railroads on an entirely different road at a distant point.

“It is impossible for me to determine in each specific instance the status of ownership of material and supplies, but there is no reason why this cannot be done in every instance by the proper officers of the road and the question of taxation handled accordingly.”

*Exchange of Passes with Steamships.*—The Southern regional director, file 1557-53-6, directs that past practice regarding the exchange of trip transportation with independently operated steamship companies be continued.

## Atlas Safety Guard and Third Point Support

FOR SOME TIME PAST the American Steel Foundries, Chicago, has been manufacturing a safety device for brake beams known as the Atlas safety guard. This consists of a bar of I-section fastened beneath the spring plank in such a position as it will support the brake beam in case the brake hanger should fail or the pins fall out. A further improvement has been made in this device by providing an additional support for the brake beam to insure even brake shoe wear. This is accomplished by extending arms up-

Atlas Safety Guard and Third Point Support

ward and outward from the safety bar support on the spring plank and fastening the brake beams to these arms by short links. In cases where one safety bar is used on each truck, these links are attached to the end of the brake beam strut; when two safety bars are applied the links are fastened to the tension member. The safety bars, as in the previous design, are held in place by flat springs and can readily be slid through the supports under the spring plank when it is desired to remove the brake beam. The arm and links being above the beam do not interfere with it in any way.

## Decreasing the "Man Mileage"

By O. E. Fisher

Comptroller, Kettle Valley Railway

THE STRESS OF THE TIMES has awakened us to a realization that economies which we never thought of in pre-war times are now possible. We have increased the car load and the train load, we have substituted cheaper and different materials that seem to answer the purpose as well as the more expensive kinds used in the past; we have decreased the train mileage, but what about decreasing the man mileage? Are we sufficiently interested in increasing the "efficiency lading" of officers and employeess?

Railway operation is essentially different from other commercial operations whose volume of business handled may be fully as large. It is necessary to maintain strict discipline and perhaps handle many things in a more exacting manner than would be required in most commercial enterprises, but in our ardor have we not sometimes sacrificed efficiency instead of adding to it? Look at a few instances coming under actual observation on different railways.

A young freight conductor, just promoted, in figuring a close meet delayed a comparatively unimportant passenger train five minutes—a loss that was made up within the next fifty miles—and by so doing saved thirty minutes' time for the slow freight he was handling. The letter he received the next morning fairly scorched the paper it was written on, with its burning invectives; and after two or three succeeding occurrences of a similar nature he quite naturally fell into the habit of losing an hour at meets, if necessary, rather than take any chance of getting similar criticisms.

How frequently we see an operating officer glance over a morning report and say to a clerk, "Run down those delays and let me have the result." Forthwith a series of letters of the following tenor go out: "Let me have at once the cause of the disgraceful delay at Pumpkin Centre yesterday. What do you mean by such work as this?" Or, "I want to know at once what was the reason for an hour and ten minutes' delay at Hoop Pole Junction yesterday; see that it doesn't happen again." In many cases there is a perfectly plausible reason for the delay. Why not say, "I notice you were delayed thirty minutes yesterday at Pumpkin Centre; what was the reason, please; and how could it have been avoided?" This, quite likely, would bring out some constructive information and the criticism could then have been applied if it were required.

The phrase, "Please let me have your explanation," is much overworked. In many cases, there is no explanation other than an admission of the fault. A common style of letter to agents reads, "Please explain why you failed to unload a case of canned goods for your station from car 36245 on the 7th," and the reply runs, "I have impressed on Warehouseman Jones that this must not happen again." Yet, Jones perhaps knows nothing about the affair. Why not write, "Your failure to unload a case of canned goods, etc., last Friday was the occasion of some inconvenience to our patrons and may result in a claim. Look into the matter." A little softening of this kind is worth a hundred times its cost.

On another road an officer, with several officers reporting to him, required that every detail should be submitted to him for personal approval. This killed all initiative in the subordinate officers, giving them first-class training for office boys, instead of railway officers. This was carried to the point that a section crew of several men was delayed two hours waiting for this "personal approval" to get seventy-five cents' worth of powder from the store to clear a rock from the track that was in danger of delaying an approaching passenger train. A lineman was delayed an

hour getting "personal approval" to his requisition for gasoline before getting out to repair a break in the telegraph line, when the approval of his immediate superior could have been secured in a few minutes.

On a certain railway, where, following the usual practice, it is necessary to secure a formal authority before doing any work charged to the cost of the road, a superintendent, who had been having considerable trouble with a water tank and had expended a considerable sum for maintenance, was in danger of losing the water supply and delaying important trains; and he hit upon a plan of ending the trouble for all time by an expenditure of \$16.50, which he properly charged to additions and betterments. He was severely censured for doing this work in advance of a proper authority and, being of a sensitive nature, this letter occupied his mind for several days to the exclusion of other work. It is because of instances like this that we still find cases of an officer having saved (?) a substantial amount by some subterfuge of passing a charge on to another department (and probably increasing the amount substantially in so doing).

One of the most vital questions in railway economics is the relations of the employees to the company; almost all branches of labor are becoming strongly organized, and in many instances their demands are quite unreasonable. In order to secure coal or other needed material we have to pay the market price and, once we purchase it, we try to conserve it and make it go as far as possible; surely we ought to give the conservation of man power no less attention. Some of the unreasonable demands of labor organizations take root in the defects of our methods. I could name two general offices, each employing a number of clerks. In the one, pay and advancement are governed purely by ability; the men start on a minimum basis, and if a clerk develops ability along special lines and handles his work better than ordinary, he will in due course find an increase in his pay check—perhaps the check itself being the first advice of the increase. There is nothing but team work in that office and the relative unit of cost of work turned out is very much lower than the average; and everybody is satisfied. It is not an infrequent occurrence to see three or four clerks working a half hour after quitting time because they are interested in finishing a particular piece of work. In the other office, the head of which is an officer drawing a salary of several thousand dollars a year, there is a fixed rate of pay for each desk, which can only be changed by an extensive process of approvals and super-approvals. At six o'clock, quitting time, an observer would think that a fire alarm had been sounded, making it necessary to get out of the building quickly; and at thirty seconds past six the room is empty. The head of this office said that he wished it were possible to dispense with ten men and take half the money and divide it among those remaining; by so doing, he felt sure that 20 per cent of the cost of running the office could be saved.

I can hear a chorus to the effect that this would not be uniform; it would break down our system, and so forth. But, granted this were the case, would not the system improve with a little breaking, or at least bending? As for uniformity, not many men are uniform.

If a man is really capable, the only way that capability can be developed is by giving him increased authority; holding him to a circumscribed path tends to petrify him. A closer understanding between officers and the men in the ranks (where we all came from) will, without doubt, result in an improvement in our man mileage.

The shops of the Altoona Northern, at Altoona, Pa., were destroyed by fire on the morning of March 5; the estimated loss, including damage to one locomotive and two cars, was \$75,000.

# General News Department

The Southern Pacific reports that it has carried 46,346,228 revenue passengers during the past year without the loss of a single life in a train accident, and in the last ten years has transported 380,837,002 revenue passengers 14,480,042,394 revenue passenger miles with safety average such that a passenger may travel the equivalent of 579,000 times around the world without loss of life in a train accident.

The East Bay Terminal is now the busiest railroad center on the Pacific Coast. Because of the shipbuilding activities at Vallejo, Cal., and Bay Point, and the joint use of the Oakland Pier by the Southern Pacific, the Western Pacific and the Atchison, Topeka & Santa Fe, there has been a great increase in traffic. Six passenger trains, with 72 cars, leave Oakland Pier within a 30-minute period in the morning and at night 11 trains, with 96 cars, arrive within one hour. There are three workmen's trains, not shown on the time table, that carry over 2,000 men night and morning between Oakland and Bay Point, and 1,400 men between Oakland and the Mare Island navy yard.

The conference of governors and mayors held in Washington last week adopted resolutions recommending that the railroads be retained by the government for 21 months after the proclamation of peace and that they be used during that time, so far as possible, to furnish "buffer" employment. "The government should not only provide for transportation necessities of property, but it should use the railroads as the means of helping private industry." The resolutions also recommended that the Railroad Administration immediately reduce the freight rates on all building material, especially road building material, and the Railroad Administration has announced that some reductions are contemplated.

The strike of boatmen and longshoremen at New York City was settled, so far as the railroad boats are concerned, on March 8, the Railroad Administration making large concessions to the strikers; but the non-railroad interests held out, and a number of important steamships, ready to sail to European ports, were delayed several days by their inability to get coal. Some of the liners proceeded with a partial supply, expecting to take coal at Halifax. On Wednesday of this week the Interborough Rapid Transit Company, using about 2,000 tons of coal daily, had on hand only four days' supply. Officers of the road appealed to the federal government at Washington for relief.

## A. R. E. A.

Because of the pressing nature of the problems imposed upon him by the failure of Congress to pass the railroad appropriation bill, Walker D. Hines, director general of railroads, has felt obliged to recall his acceptance of the invitation to speak at the annual dinner of the American Railway Engineering Association at Chicago next week.

Senator Atlee Pomereoy of Ohio, member of the Senate Committee on Interstate Commerce who has taken active part in the recent hearings on the railroad question, has accepted an invitation to speak at the dinner of the engineering convention next Wednesday.

## The Association of Railway Executives

The committee having in charge the presentation of this association's recommendations to Congress, consisting of Julius Kruttschnitt, Daniel Willard, Samuel Rea, Howard Elliott, Alfred P. Thom, and Thomas DeWitt Cuyler, has been enlarged by the addition of Judge Robert S. Lovett, president of the Union Pacific. The standing committee was

also enlarged by the addition of Carl R. Gray, president of the Western Maryland.

The Association of Railway Executives took under its general direction the Bureau of Railway Economics, the Association of Corporate Accounting Officers, and the Association of Railway Corporate Engineers.

## Slack Work in Shops

In the large repair shops of the New York, New Haven & Hartford, the working time has been reduced to forty hours a week. About 4,000 persons are affected. The Pennsylvania has reduced the working time at many shops. The Nashville, Chattanooga & St. Louis has made a reduction of ten per cent in the forces of its large shops.

## Railroad Library Sold

The library, consisting of 450 volumes containing early railroad history of England, America, and other countries, which was noticed in the *Railway Age* of February 28, page 514, as about to be sold in New York City, was disposed of, in a single lot, on the first day of the sale, to George D. Smith, of New York City, dealer in rare books, for \$5,500. The books are now at Mr. Smith's store, No. 8 East Forty-fifth street.

## Officers to Attend Engineering Convention

W. T. Tyler, director of the Division of Operation, has written to the regional directors regarding the twentieth annual convention of the American Railway Engineering Association to be held in Chicago next week, saying he will be glad to have officers and employees who can be spared from their duties attend the convention, take part in the discussion and see the exhibits. B. L. Winchell, regional director for the Southern region, has written to federal and general managers a similar letter saying: "These meetings always develop matters of interest and value. In view of the necessity at this time of utilizing in the most efficient manner both materials and labor, it is expected that this coming meeting will bring up matters of more than ordinary importance."

## "Railway Supply Men's Night"

A unique program has been arranged by the New York Railroad Club for its meeting at the Engineering Society's building in New York at eight o'clock on Friday evening, March 21. The club, like other railway clubs, includes in its membership a large number of railway supply men and it was felt by the subjects committee that it would be quite fitting to set aside one meeting which would be entirely devoted to a consideration of subjects of prime interest to the railway supply men but of hardly less interest to the railroad men because of the intimate relationship which must necessarily exist between the two parties. With this in mind, the following program has been arranged:

(1) The practical value and importance to the railways of the service departments maintained by railway supply companies will be discussed by A. L. Humphrey, vice-president of the Westinghouse Air Brake Company.

(2) The great contribution, in the direction of increasing the efficiency and capacity of railway operation, made by the engineering departments of the railway supply companies will be discussed by William E. Woodard, vice-president of the Lima Locomotive Works, Inc.

(3) The desirability of taking some steps looking toward insuring a more uniform rate of production of railway supplies will be considered by Dr. W. F. M. Goss, president of the Railway Car Manufacturers' Association.

**Industrial Board of the Department of Commerce**

The personnel of the Industrial Board of the Department of Commerce, which is seeking the co-operation of basic industries in an effort to readjust prices, is as follows: George N. Peek, formerly vice-president of Deere & Company, chairman; Samuel P. Bush, president of the Buckeye Steel Castings Company; Anthony Caminetti, commissioner general of immigration, Department of Labor; Thomas K. Glenn, president of the Atlantic Steel Company; George R. James, president of the William R. Moore Dry Goods Company; T. C. Powell, director of capital expenditures, Railroad Administration, and William M. Ritter, president of the W. M. Ritter Lumber Company.

The Railroad Administration is understood to be ready to place an order for 500,000 tons of rails if the price is adjusted to its satisfaction. The railroads are now receiving about 40,000 tons a month on orders placed before the period of federal control, and at that rate deliveries will be completed about July 1. Secretary Redfield has indicated that the first purpose is to reduce prices at the expense of excess profits without disturbing wages for the present.

**American Railway Engineering Association Program**

The following program has been prepared for the Twentieth Annual Convention of the American Railway Engineering Association to be held in the Florentine room of the Congress hotel, Chicago, on Tuesday, March 18, to Thursday, March 20, inclusive. Morning sessions will be held from 9:30 to 12:30 and afternoon sessions from 2 to 5. At the first session on Tuesday the president's opening address will be followed by reports of the secretary and treasurer and of standing and special committees after which the reports of the various regular committees will be taken up in the order indicated below.

As announced in last week's issue three meetings of interest to members of this association will take place on the evening of Monday, March 17, the day preceding the convention. The Railway Signal Association will hold its meeting at the Auditorium on Monday, March 17.

**TUESDAY**

Signals and Interlocking.	Records and Accounts.
Signs, Fences and Crossings.	Rules and Organization.
Conservation of Natural Resources.	Economics of Railway Labor.
Track.	

**TUESDAY EVENING**

Illustrated Use of Labor-Saving Devices.	Developments in the Study of Transverse Fissures.
--	---

**WEDNESDAY**

**Aviation Records**

Washington to New York in one hour twenty minutes is the latest 200-mile airplane record. This speed is said to have been made on March 6 by Col H. A. Dargue and Lieut. Philip Lucas, army aviators. They flew at a height of about 6,000 feet., in an airplane equipped with a 400 hp. Liberty motor.

On March 7, Major Fleet and Captain White flew from Dayton, Ohio, to Mineola, N. Y., in 4 hours 33 minutes. Mineola is 20 miles east of New York City. This is the time deducting a stop of about two hours for repairs at Newburgh, N. Y. The air-line distance between Dayton and New York is about 540 miles, but the distance flown can be stated only approximately as the flyers were driven 100 miles off their course by a storm. By reason of the snow and the fog they had to ascend to a height of about 10,000 ft., and they steered all of the way by compass.

Two large United States naval flying boats, of the F-5-L type, flew from Hampton Roads, Va., to New York City (Rockaway), on March 12, without a stop, in four hours thirty minutes, each machine carrying seven passengers with a gross load of about

13,000 lbs. The distance is about 300 miles. During the flight the A1070, one of the two flying boats, developed trouble in one of her 400 hp. Liberty motors. While the huge machine continued in the teeth of the stiff breeze Chief Mechanic Sacks overhauled the defective engine, and succeeded in repairing the fault in midair. After this the flight proceeded without further incident. Each of the two boats carried photographic apparatus, and photographs and moving pictures were taken during the flight. The A-1070 was piloted by Ensign Souther, and the A-4036 by Ensign Irvine. Wireless telegraph and telephone communication was maintained between the two ships and with the shore stations throughout the flight. These airplanes each measure 103 ft. 9 in. across the wings, and have an overall length of 74 ft. 3 in. Each is equipped with two twelve-cylinder 400 hp. Liberty motors. They are capable of eight hours' sustained flight.

**Railway Business Association**

The Railway Business Association announces that chairmen of all standing committees of the association for the present year have accepted appointment as follows: Railways After the War, W. W. Salmon, president, General Railway Signal Company; Government Purchasing Policies, Knox Taylor, president, Taylor-Wharton Iron & Steel Company; Action, A. H. Mulliken, president, Pettibone-Mulliken Company; Finance and Administration, W. G. Pearce, president, American Brake Shoe & Foundry Company. The secretary of the association in a recent bulletin says that the number of new members acquired thus far during 1919 is 43, which brings the roll up to 338, the greatest number yet reached by the association.

The secretary also quotes a telegram which President Alba B. Johnson of the association sent to Director General Hines. The telegram is as follows: "Congratulations on your courageous and manly spirit in facing difficult situation created by failure of revolving fund bill. You are quoted as expressing confidence in patriotic co-operation of equipment companies. Please regard the Railway Business Association as ready to name conferees to participate on behalf of the railway supply industry in development and execution of measures to stabilize employment."

Steps are under way, in which the Railway Business Association will participate, for co-operation among representatives of the several interests to meet the serious transportation and industrial situation immediately confronting the country.

**Thirteenth Engineer (Railway)**

**Regiment Sees Active Service**

The 13th Engineers Regiment, composed of railway men on roads running west from Chicago, which has been operating military railroads back of Verdun was scheduled to leave Fleury-sur-Aire on March 7, on the way to an embarkation port preliminary to its return home. According to a cable published in the Chicago Daily News, on March 6, it has the distinction of being the first American Engineer Regiment to enter active service in the war, and has an excellent record for the handling of men and supplies, and for the assistance given in the preparation for the American drive on the Meuse-Argonne.

Although engineer regiments are generally classed as non-combatant units, the 13th has been classed as a combat unit in orders from the American and French headquarters, with the instructions that on the discharge papers of each officer and man the words, "Took part in the Champagne, St. Mihiel and Meuse-Argonne offensives," be inserted. Another distinction of the 13th is the insignia of a blue square cloth patch with a red engineer castle in the center, surrounded by a circle of 13 white stars, which indicates the beginning of the American nation and the start of the American expedition. Usually a division is the smallest unit that has its own shoulder insignia.

On October 18, 1917, the 13th took over the operation of the railroads in the French advanced zone and was relieved on February 28, 1919. At the end of 1918 it had moved 1,777

trains, carrying millions of men, including many who were wounded, and 9,230,080 tons of freight, as well as the private trains of President Poincaré, General Pershing, Secretary Baker and others. The 13th was operating, on the day the armistice was signed, 229 kilometers (138 miles) of track supplying the Argonne, Verdun and St. Mihiel fronts.

As part of the railroad was within range of the German artillery and all of it within range of heavy explosives and machine guns of airplanes, the men were obliged to run the trains and repair the track under constant fire. Twenty-four immense railroad guns were firing along this line. One track was used for ammunition and the other for supplies.

Several members of this regiment received special recognition. In his letter forwarding the decorations, General Pershing said: "The cheerfulness, adaptability, loyalty and self-sacrificing devotion to duty uniformly displayed under trying circumstances by officers and men from the regimental commander to the most recently arrived private have added a new luster to the traditions of our railway service."

### American Welding Society to Be Organized

An association known as the American Welding Society will be organized at the Engineering Societies building, New York, at 10:30 a. m., March 28, 1919. This society will merge the welding committee of the Emergency Fleet Corporation and the National Welding Council, and its purpose is to provide a disinterested and dependable source of information on welding, not only for the benefit of the manufacturers of welding apparatus and supplies, but also to aid those who use welding in their production and those who purchase welded goods. The society will bring together in the manner usual for scientific societies persons from all branches of the industry, who may be interested in any of the welding processes. It is proposed that the society will create and assist in maintaining a Bureau of Welding which will be a separate organization designed to take advantage of the principle of co-operation in research and standardization. The American Bureau of Welding will consist of a joint board of directors, 30 from the American Welding Society and one each from the various scientific and engineering societies, including the American Railway Association, and one each from the United States Commerce, Navy and War Departments and the United States Shipping Board.

Membership in the American Welding Society is divided into five classes: Class A, sustaining members, annual dues \$100; open to one or more representatives from each corporation interested. Class B, annual dues \$20; open to individuals who may or may not be employed by corporations, and to consulting engineers, college professors, etc. Class C, annual dues \$10; open to members of existing societies which will become affiliated with the new society through the proposed Bureau of Welding. Class D, annual dues \$5; open to welding artisans. Class E, open to trade associations, putting them in the same category as corporations. Class F, honorary members. Class C and D memberships do not carry the privilege of voting or holding office.

The activities of the society will include the promotion of research work on problems of common interest to all or groups of the membership, including the financing of such projects; the consideration of questions of standardization, which it is proposed shall be handled in co-operation with the American Engineering Standards Committee through the agency of the Welding Bureau; the exertion of a steady and unifying influence on legislation affecting welding by supplying law makers with authentic information, and the study of proper methods of training autogenous welders.

It is reported that already a large number of corporations and engineers are interested in the project, including officers and members of many of the national technical and engineering societies, universities and engineering schools, government departments and bureaus, gas and electric welding companies, and shipbuilding, steel and automobile companies. Those interested in the proposed organization should address H. C. Forbes, secretary, American Welding Society—Temporary Association, Engineering Societies building, New York City.

## Traffic News

Coal loading for the week ended February 22 amounted to 155,935 cars, as compared with 230,599 for the corresponding week of 1918. Estimated reports for the week ended March 1 show a total of 162,666, as compared with 241,073.

A decrease of 33.9 per cent is reported in the number of cars loaded with grain during the month of February on the roads comprising the Central Western region, as compared with the records for the same period last year. During this period in 1919 29,668 cars of grain have been loaded, as compared with 44,907 cars during the corresponding month last year. There was also a decrease of 33.7 per cent in the number of cars of coal loaded, the cars totaling 82,219, as compared with 124,040 cars during the month of February, 1918. During the same period this year, 51,342 cars of livestock were loaded, as compared with 51,181 cars last year.

Hon. F. K. Lane, Secretary of the interior, announces further progress during the month of February in the classification of public lands by the Geological Survey. Under the stock-raising homestead law, permitting entries of lands chiefly valuable for grazing and the raising of stock in tracts of 640 acres or less, lands were designated during February as follows: Colorado, 87,540 acres; Idaho, 46,215 acres; Montana, 390,791 acres; Oregon, 92,686 acres; Wyoming, 525,662 acres. The total area designated for the month was 1,142,894 acres. Over a half million acres of land were designated under the enlarged-homestead act, permitting entry in areas of 320 acres or less. These areas lie in Colorado and North Dakota. By this action the total area classified as nonirrigable and designated for entry under this act was increased to more than 285,000,000 acres.

The Western Freight Traffic Committee has docketed with the St. Louis, and New Orleans district freight traffic committees the question of rates on packing house products and fresh meats in peddler cars from Oklahoma City, Okla., to Southern Pacific points in Louisiana. The action is taken on the request of interested shippers. The committee has also docketed with the Denver, Kansas City, and Dallas committees the question of rates on slack coal from Colorado and New Mexico producing points to El Paso, Tex. The request is for 75 per cent of the lump coal rates. Acting again on the request of interested shippers the committee has also docketed with the St. Louis committee the question of revising the rates on petroleum from the Ardmore-Lawton, group to northern destinations to the basis of 3½ cents instead of 5 cents over the rates from northern Oklahoma. The St. Louis District Freight Traffic Committee, in announcing synopses of its dockets of March 6 to be considered by the committee, includes one which provides for rates on steel rails, cross ties and track fastenings, in straight or mixed car loads. This committee will also consider the cancellation of loading, unloading and weighing charges on livestock at the Independent Stock Yards at St. Louis, Mo.

### Activities of the Traffic Clubs

The activities of the Traffic Club of Omaha, Neb., have been taken over by the Traffic Managers' committee of the Traffic Bureau of the Chamber of Commerce of Omaha and the former organization has ceased to exist.

The Traffic Club of the Cincinnati Chamber of Commerce has unanimously elected the following officers: P. J. McLaughlin, traffic manager for the Charles Boldt Glass Company, Cincinnati, chairman; E. H. Smith, vice-chairman, and H. B. Rubey, secretary.

At the meeting of the Akron Traffic Association on February 25, E. V. Conwell, counsel for the American Express Company at Akron, Ohio, spoke on "The Packing and Marking of Freight"; C. W. Barber, agent of the Akron, Canton & Youngstown Railway at Akron, Ohio, on "The Payment of Freight Charges"; R. A. Higham, traffic foreman of the In-

ternational Harvester Company at Akron on "Why is a Traffic Club," and E. C. Knox, traffic manager of the Firestone Tire & Rubber Company at Akron, on "Claims."

### Restoration of Export and Import Rates Asked

Restoration of the pre-war basis of export and import rates through Pacific ports was asked by a delegation of representatives of the Pacific coast cities, Seattle, Tacoma, Portland, Los Angeles and San Francisco, at a conference with Edward Chambers, director of the Division of Traffic, at Washington, on March 10. They pointed out that while during the war the cancellation of the rates had little effect, the effect since the signing of the armistice has been to divert a large amount of traffic for the Orient to New York and the Panama canal. Mr. Chambers promised some relief in 10 days.

### Chicago Traffic Club Advocates Private Ownership

The Traffic Club of Chicago at a special meeting held on February 25, adopted resolutions opposing government ownership or operation of railroads and favoring their return to private ownership as soon as possible, with legislation to protect the interests of the public and of the carriers. The resolutions also "favor the enactment of suitable legislation which will continue in effect, after the return of the railroads to their owners, the existing rates, fares, and charges pending, their change by the carriers or by proper authority." The resolutions were prepared and submitted by a committee composed of F. B. Montgomery, traffic manager of the International Harvester Company (chairman); Samuel O. Dunn, editor of the *Railway Age*; H. C. Barlow, traffic director of the Chicago Association of Commerce; Oscar F. Bell, traffic manager of the Crane Company; E. L. Dalton, traffic manager of Montgomery Ward & Company; Luther M. Walter, of the firm of Borders, Walter & Burchmore; H. A. Palmer, editor of the *Traffic World*; F. B. Houghton, traffic manager of the Atchison, Topeka & Santa Fe; F. Zimmerman, traffic assistant to the Chicago terminal manager; W. A. Terry, assistant traffic manager of the New York Central; S. H. Johnson, traffic manager of the Chicago, Rock Island & Pacific, and O. A. Constans, traffic manager of the Baltimore & Ohio.

In order that these resolutions may be properly presented to Congress and to complete arrangements to co-operate if possible with other traffic clubs in this matter a committee on public affairs has been appointed, with F. B. Montgomery as chairman, and Samuel O. Dunn and Oscar F. Bell as members.

### Freight Rates to the Orient

A delegation representing Pacific coast ports, Chicago business establishments and inland waterway cities held a conference last week at the Chicago Association of Commerce for the purpose of enlisting the aid of the Railroad Administration in promoting American competition with England in the matter of oriental trade. Resolutions adopted at the meeting urged the United States shipping board to put into effect the rates announced for trans-Pacific business by placing upon the Pacific ocean the vessels of the Emergency Fleet Corporation to carry cargoes at these rates and that the Shipping Board co-ordinate its work with that of the Railroad Administration. Another set of resolutions calls attention to the need of restoring the business of the nation to normal and urges the discontinuance of the "stringent permit system." Under the rates in effect before the government took possession of the railroads, Chicago shippers could send many commodities to the orient at \$1.50 per 100 lb. and it is the restoration of this rate that is now asked for.

H. H. Merrick, president of the Chicago Association of Commerce, and H. H. Garver, head of the association's Foreign Trade Bureau directed the course of the meeting. Among those who attended the session were Robert Bridges, president of the Port of Seattle, Wash., Harry Y. Saint, secretary of the Foreign Trade Bureau of the Chamber of Commerce and Commercial Club of Seattle, Samuel J. Wetrick, special counsel for the Seattle Chamber of Commerce, and the following Chicago men: Frank T. Bentley of the Illinois Steel Company, R. R. Hargis, of Wilson & Company, T. T. Bradford of the International Harvester Company, A. C. Owen of Swift & Company, and M. B. Howell, of Montgomery Ward & Company.

## Commission and Court News

### Interstate Commerce Commission

E. Morris and E. B. Boyd, agents, have filed with the commission a fifteenth section application for a revision of commodity rates from all points in central territory, including Illinois and Mississippi river east and west bank pro-rating points; also Madison and Beloit, Wis., and points grouped therewith, published in tariffs of individual carriers, to points in eastern trunk line and New England territory, including the Virginia cities and points in Canada subject to Boston rates, in order to restore relationships and differential bases existing prior to the issuance of General Order No. 28.

In *Commercial Club of Omaha v. Baltimore & Ohio, et al.*, the commission finds that the 1917 summer excursion fares between Omaha, Neb., and eastern points gave undue preference to Kansas City and St. Joseph, Mo., whence the Chicago & Alton reduced its fares below the normal basis from Kansas City and St. Louis to Chicago and other carriers met the reduction. The commission finds that there is nothing to show that the Omaha rates were unreasonable in themselves. No summer excursion fares were made in 1918, but the decision is expected to deter the carriers from a re-establishment of the unlawful adjustment in the future.

In the case of the *Chicago Live Stock Exchange vs. Atchison, Topeka & Santa Fe, et al.*, the Interstate Commerce Commission holds that the Union Stock Yard & Transit Company of Chicago is a common carrier subject to the provisions of the act to regulate commerce, and that the notice of cancellation of its tariff of charges for loading and unloading live stock in carloads at the Chicago Stock Yards has not been justified. The commission finds that the loading and unloading of livestock is the duty of the shipper, but may be assumed by the carriers in those instances in which their convenience is aided and their equipment conserved by so doing. In the absence of a showing of undue prejudice, how much, if any, of the loading and unloading charges at the Chicago Stock Yards may properly be absorbed by the line haul carriers is dependent upon the degree to which their interests are conserved in any particular instance; and the failure to absorb all of the charges at the Chicago yards, while absorbing such charges at certain other markets, has not been shown to produce undue prejudice.

### State Commissions

A "service bureau" has been created by the railroad commission of Texas, at Austin, Tex., in order that individuals, firms and cities may be rendered direct assistance in securing satisfactory railroad service, both freight and passenger.

The governor of New York has recommended and the legislature is expected to pass a law abolishing the Public Service Commission of five members for the first district (New York City), and establishing in its stead a commission of one member for the regulation of railroads and public utilities and another commission of one member to supervise the construction of new subways.

## Court News

### Employers' Liability Act

The Circuit Court of Appeals, Fourth Circuit, holds that an engine regularly hauling interstate passenger trains was used in interstate commerce when taken out of a train in order that a bolt might be repaired, being placed in the shop and sent out the same day on its regular run, and the employee injured in doing the work was injured while employed in interstate commerce.—*A. C. L. v. Woods*, 252 Fed. 428. Decided May 7, 1918.

## Foreign Railway News

The total number of passengers carried by the five companies controlled by the London Electric Railway Company—including the Metropolitan District, and the General Omnibus Company—last year, is estimated at 901,000,000. This is exclusive of passengers booked through from other railways.

### French Railway Striker Sentenced

Midol, secretary of the Railwaymen's Union of the Paris-Lyons-Mediterranean Railway, who, on January 25, caused a strike of one minute's duration on the entire system, has been sentenced to one year's imprisonment, with benefit of the First Offenders' Act.

### Rebuild Serb Railroad

Rapid progress is being made in the repair of the main Serbian railway which runs from Belgrade through Nish to Salonika, says a French wireless despatch from Salonika. It is hoped that the first trains will be able to run between the northern frontier and Nish before the end of March. All the bridges and many miles of rail were destroyed by the Germans and the Bulgarians. The repair of the telegraph lines paralleling the railway is nearly completed.

### Another Strike in Cuba

The general strike in Cuba has spread, according to advices to the State Department at Washington, last week, until transportation in fully half of the country is tied up. Practically all industries are reported at a standstill.

The latest demands of the unions, the advices said, are that all non-union railroad employees be discharged. In the Havana docks, 500 convicts now are employed as stevedores.

### Greece Wants Steel Ties

The Greek government is in the market for 500,000 steel railway ties of 242 pounds weight each, according to the official announcement made by the Canadian Trade Commission, Ottawa, Canadian firms contemplating bidding, the announcement says, must take immediate action as the demand is urgent. American firms are known to be already in the field. The Trade Commission has reason to believe that this may give Dominion manufacturers a chance to use surplus steel and the forging presses which were installed for munitions making, possibly at better rates than their competitors.

### Swiss Ocean Projects

The French minister for public works has approved a program adopted by the Superior Council for public works in connection with the improvements to be introduced in the communications by rail between Switzerland and ocean ports. This program includes especially the establishment of a new line between Limoges and St. Germain des Fosses, the improvement of the present express service from Bordeaux to Lyons by the strengthening of the line between St. Germain des Fosses and Lyons, and by the electrification and double tracking of the lines on the Paris-Orleans Railway, and, finally, the electrification of the difficult sections on the Tulle-Clermont-Ferrand line.

### Military Railways in France

Replying in the Senate recently to interpellations in regard to supplies, M. Clavelle, minister of public works and transports, stated that he had informed the British and United States Governments that the French Government intended to maintain the railway works which their allies had carried out on French territory, under financial condi-

tions which remain to be fixed. The minister also spoke of the work of restoring roads, of which it would be necessary to remake 65,000 miles, and waterways, on which 115 locks and 450 bridges have to be reconstructed, while 60 miles of canals have been entirely destroyed. He added that the Germans had delivered up to the middle of February between 36,000 and 37,000 freight cars and between 1,400 and 1,500 locomotives, or one-half of the material due to France.

### International Control of Railroads Proposed

The question of the internationalization of railways and international waterways has come into sudden importance, says a press despatch from Paris, through a report made to the Commission on Waterways, Ports and Railways by its drafting committee. The British desire to have the waterways used without discrimination, while the Americans, realizing the effect the application of this principle might have upon their great railway systems, are insistent upon confining the application of the principle of international use of such communications to special cases to be enumerated, and especially to new states.

The Czechoslovaks and the Poles are disposed to resist the international use of their communications unless reciprocal privileges are allowed to them.

### Equipment for Mexican Railroads

According to advices from the City of Mexico, the Carranza government has ordered the purchase of 200 passenger cars for the National Railways of Mexico. The cars will be bought in the United States and will be used to replace the equipment that was destroyed during the protracted revolutionary period. The government also plans to place a large order for freight cars in the United States in a short time. The shops of the railroad are building and repairing freight cars as rapidly as possible, but the additions do not begin to meet the demands of traffic. It is reported that the government will prohibit the operation of private freight trains upon the railroad lines of the country as soon as the shortage that now exists in equipment is filled. Several mining and other industrial companies have been operating their own trains for some time past.

### Chinese Railroad Problems

Associated Press despatches from Peking Monday report that influential Chinese interests which have been opposed to the plan for unification and internationalization of the Chinese railways are relaxing somewhat in their opposition to the plan. The Japanese official opposition, however, is still in evidence.

It was announced Monday, says the despatch, by the Chinese Minister of Communications that the government would agree to the internationalization of the Shantung and South Manchurian (Japanese); the Chinese Eastern (formerly Russian), and the French Yun-Nan railways, but would object to the internationalization of the railways under Chinese government control. Another suggestion is that China be admitted to the banking group, being credited with a certain proportion of the advances made as were Russia and Japan when they were first admitted to the coalition of interests.

### Danish Railways Need Equipment

No new railroads have been built in Denmark during the war, and no new lines or extensions planned, says Consul B. L. Agerton, writing from Copenhagen on January 8. Additional tracks are being laid in some places, but materials are not available for very much work of this kind. The track and roadbed of the Danish railways are in fairly good condition, but the rolling stock is insufficient and in bad repair. During the summer and fall, when traffic is heaviest, there is a great shortage of rolling stock, both of cars and of locomotives. These are normally purchased abroad, but during the war no deliveries have been possible. In November the State railway ordered 700 freight cars and 9 parcel-

post cars from the Danish factory "Scandia," of Randers, Denmark. This factory, however, is not yet in a position to complete any of the cars, because of a lack of materials. The railroads themselves have undertaken to purchase the wheels and axles elsewhere.

[The railroads of Denmark are almost entirely state owned. The State Railways operate about 1,300 miles, all of standard gage. The equipment consists of 625 locomotives, 2,234 passenger train cars, and 10,361 freight cars, as well as marine equipment in the form of 24 steam ferries and 7 steamboats.]

**Hoover to Be Made Director**

**General of Austrian Railroads**

The Supreme War Council, according to despatches from Paris Saturday, has decided to give Herbert C. Hoover, director general of Allied relief, practical control of all the railways in the old Austrian Empire and to make him the mandatary of the council in demanding locomotives and freight cars from each of the new states of old Austria with which to create a food and relief service. The relief train will run over all lines without political or military interference. The service will be under the relief administration, headed by Mr. Hoover.

Mr. Hoover has placed the matter in the hands of American army engineers for execution. The engineers have been detailed by General Pershing.

The decision of the council amounts in effect to making Mr. Hoover director general of the Austrian railway system in the carrying out of relief work.

Five new states have arisen within the area of old Austria, and all have agreed, says the despatch, to place the entire question of the distribution and management of the railway rolling stock in Mr. Hoover's hands.

Later despatches say that Col. Ryan of the American Army has been appointed executive officer in charge of the work. He formerly was a railway manager in the United States.

Col. Ryan will be assisted by liaison officers of various allied nationalities and will cooperate with the allied food mission at Trieste.

**English Channel Tunnel Project Revived**

The driving of the tunnel under the English Channel to France is being considered by the government as among its projects for after the war, according to announcement by Bonar Law, who speaking in the House of Commons Monday, said he was discussing the matter with Premier Lloyd George as a means of finding employment for discharged soldiers.

The Daily Mail claims to have definite information that the British and French governments have agreed to the construction of a tunnel under the Channel, and that the details are now being discussed by a special commission in Paris, which also is considering the building of tunnels under the Bosphorus and the Strait of Gibraltar.

The engineering plans for the Channel tunnel, according to the Daily Mail, are so far advanced that work could be begun immediately.

"It is proposed," says the Daily Mail, "to start the tunnel some distance inside both countries, instead of near the coast, as was originally intended, so as to avoid the risks of a fall of the cliffs, such as already has occurred on the British side near the point where the work would have been begun.

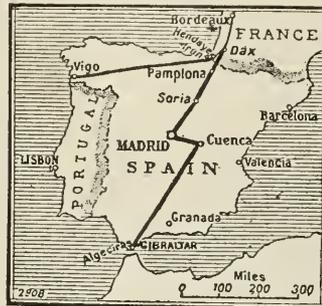

"In addition to tracks, the tunnel will carry telephone and telegraph wires, superseding the present sea-bed cables, and also pneumatic tubes for carrying letters and parcels. The French and British railroads concerned are willing to finance the scheme, but the two governments wish to exercise control and some sort of joint state finance for the work may be adopted."

Speaking of the tunnel the Railway Gazette (London), a few weeks ago, said: "Estimated to cost \$80,000,000, a mere trifle in these days of gigantic expenditure, there is no possible doubt that the capital would speedily be forthcoming on the project receiving government approval. It is to be hoped that constructional operations will soon commence, for this essentially important traffic link between England

and the continent has been too long delayed. The cross-channel train ferry service now running with success constitutes some little endeavor to improve the means of communication, but, even under the best conditions, a train ferry is a very poor substitute for a physical connection."

**London to Gibraltar via Spain**

Considerable interest is being manifested in Spain, says a correspondent to the Times (London) in two great railway projects. The first, already voted as a Bill by the Spanish Senate, is for a direct line from Dax, in Southern France, to Algeciras, near Gibraltar. This line is a project of the English and French Governments, and will form a link in the great railway from London to the Cape, the completion of which is now only a matter of time. This line across Spain will be of the international and not of the Spanish gage; it will be worked by electric

traction, and will take the shortest possible route.

Many schemes have been prepared, says the Times' correspondent, but, although the final decision has not yet been made on many points of detail, the broad principles have been agreed upon. The northern section of the line, from Dax to Madrid, to avoid unnecessary competition with the Norte Railway from Irun, will not touch the points of junction from which that line draws its chief goods traffic, and will pass direct through Pamplona and Soria. The southern section, in the plan which seems most likely to be approved, will for similar reasons take a straight course through a practically uninhabited part of the country.

It is proposed to make only one stop between Madrid and Algeciras, at Cuenca, where—as the line will be, at first at any rate, a single one—the trains from the north and south will cross. The northern journey will be made in six to seven hours, as against the present 13 from Irun to Madrid.

The other line is designed to run from Vigo to the French frontier, probably at Hendaye, and is part of a great American project for developing the port of Vigo by the building of docks, warehouses, and all the equipment of a great commercial harbor. By this scheme, the journey from New York to Paris can be shortened by 24 hours, and its importance can be measured by the fact that its realization will give America a commercial entrance to Europe. It is being warmly supported by Spanish capitalists and the industrial interests of the north.

The vast contracts connected with these schemes are already the subject of rival studies and investigations, and English firms, proposing to take a part, the correspondent says, should lose no time in getting into touch with the conditions on the spot.

[Further details concerning these projects will be given in early issues of the *Railway Age*.—Editor.]

**Revival of International Services**

The re-establishment of the Paris-Bucharest and Paris-Warsaw services, in addition to those between France and Belgium, not to mention the service now maintained to and from Cologne, for the use of the allied armies, serves, says the Railway Gazette (London), as a graphic reminder of the extent to which international routes which have been suspended for the duration of the war are now being brought into use again. Germany and Austria, from their central position, afforded the shortest and most convenient routes for many of the international European expresses running between west and east, and, as in the case of Switzerland, the international transit traffic represented an important source of revenue to their railways. The future of these

services represents a problem of the greatest interest, on which definite prediction would be dangerous at the moment, since so very much depends not only on the territorial adjustments, re-drawing of boundaries, and emergence of new states coming under the purview of the Peace Conference, but also on the future forms of government adopted by the German and Austrian States, which have hitherto enjoyed sovereign powers. One prediction seems, however, safe to make, and that is that within the next few years Italy will handle a larger proportion of the international transit traffic than has been the case in the past. Apart from the very obvious reasons for giving preference to an allied nation, one has to bear in mind the emergence of new routes to the near east, and the schemes for electrifying and otherwise improving traffic conditions on the Italian railways.

### Inter-Allied Committee for Trans-Siberian Formally Organized

Allied control of the trans-Siberian railway has been effected, says an associated press despatch from Vladivostok, by the formal organization of interallied, technical and military committee, the result of negotiations of more than six months. M. Oustrouff, minister of communications in the Omsk government, heads the interallied committee, and John F. Stevens, the American railway expert, the technical committee. The United States is represented on the interallied committee by C. H. Smith, once of the Missouri Pacific railroad, and on the military committee by Col. Gallagher, quartermaster of the American expeditionary forces.

Other representatives on the interallied and technical committees follow: Great Britain, M. Elliott, commissioner at Omsk, and Col. Jack; France, M. Bourgeois and Col. Le Veuve; Italy, Signor Gasco Mater and Signor Garibaldi; Japan, acting, Matsudaira, and Hampei Nagao; China, Iiu, former minister to Petrograd, and Dr. Jeme Tien-you.

The authority of Mr. Stevens is absolute concerning actual operation of the railroad. He is at liberty to employ American, Russian and allied operatives at his discretion and has a free hand in technical matters. The interallied committee is to control the rates and the economic policy. The military committee is charged solely with the co-ordination of military transportation and policing the line. It has no voice in the local management.

Advices to Washington report that American Ambassador Morris, who has been attending the sessions of the Inter-Allied Committee on the Supervision of Siberian Railways at Vladivostok, has returned to his post at Tokio.

Despatches to the State Department announcing his return said that Col. Emerson, inspector-general of the American engineers, had installed an improved system of telephone communication on the Siberian lines.

### Traffic and Rolling Stock Conditions in Germany

The same unsatisfactory, retrogressive conditions which at present prevail in most German industries manifest themselves in locomotive and wagon construction, says an article in *Engineering* (London).

The main and auxiliary workshops of the Prusso-Hessian railways employed before the war 70,300 hands, which number gradually was doubled during the war, amounting in the beginning of 1918 to 140,140 hands. In spite of this increase in the number of employees, the capacity of the works has materially decreased. It is stated that during the summer of 1918 as many as 950 locomotives were delivered duly repaired per week, while the number had receded to 680 per week in the beginning of 1919. The shortage of materials is not so pronounced at these works as at the private concerns, since the Railway Department still has considerable stocks. The lack of copper caused much difficulty during the war in the repair of locomotives, and certain parts which were formerly always made of copper had to be made of iron.

Demobilization has, to a great extent, mended matters and, besides, a fair amount of copper is said now to be available. The private concerns have had greatly to reduce their output. One of the largest undertakings in this branch in North

Germany was not able to deliver a single locomotive during December, although the number of hands employed had been materially increased. A number of new firms have taken up the repair of locomotives, but seem to have to contend against a considerable amount of technical difficulties. The Prussian Department for Public Works has placed contracts for an amount of 1,600,000,000 marks (about \$320,000,000), and altogether 3,300 locomotives and 71,000 wagons have been ordered.

The Berlin Tramways have recently contracted for a large number of cars and trailers, principally with the Hannover Wagon Company which, being outside the combine, accepts lower prices than the works within the ring. These works have orders for 100 driving cars and 100 trailers, the former being about 250 per cent and the latter 100 per cent dearer than before the war.

[The above will supplement information given in this column in the *Railway Age* of January 17, 1919, page 228.]

Speaking more particularly of traffic conditions, another item in the same issue of *Engineering* says: From all accounts the rolling-stock of the German State Railways is in a deplorable condition, which applies both to the engines, the passenger carriages and the goods wagons, and the revenue is at the same time dwindling down. For November, 1918, the passenger traffic certainly showed an increase in receipts of 10,485,000 marks, compared with the same month of the previous year, but the rates had in the meantime been raised 10 per cent. The receipts from the goods traffic showed a decrease of 40,950,000 marks, or 24.16 per cent, compared with November, 1917, in spite of the rates in the meantime having been raised 15 per cent. As a result, the receipts were, on the whole, 30,465,000 marks, or 12.86 per cent lower than for the corresponding month the previous year. Some minor receipts from other sources reduced the deficit, as compared with the same months the previous year, to 27,890,000 marks, or 10.49 per cent.

### The British Railway Labor Situation

The agreements which ended the strike on the London tube railways, on February 8, by no means settled the labor disputes on those lines and still less on the rest of the British railways. They were only temporary devices, says the *Times* (London), to bridge over the period between February 1, when the railwaymen's eight-hour day came into operation, and the time when a more permanent plan can be effected. What that permanent plan will be, no one can say. It has yet to be discussed, in connection with other far-reaching questions affecting the conditions of service and wages of railwaymen, at joint conferences between the Railway Executive Committee and the Executive Committees of the Railwaymen's Unions.

Though the cabinet has laid down that the eight-hour day which it conceded was to be a working day of eight hours, exclusive of meal times, the railwaymen's leaders still believe that the whole question of the exclusion or inclusion of meal times can be reopened.

Apart from the question of working hours, there are other issues of first importance which the railwaymen are raising in the conferences. They can best be stated in the form of summaries of the national programmes formulated by the three great unions of railway employees, the N. U. R. (with 400,000 members), the Locomotive Engineers and Firemen (40,000), and the Railway Clerks' Association (70,000).

The following summaries, taken from the *Times* (London), will outline the railwaymen's demands:

#### NATIONAL UNION OF RAILWAYMEN

- (1) That all advances given as war increases (originally called "bonuses" and later "war wages") be converted into permanent wages;
- (2) That eight hours constitute a working day, and 48 hours a working week;
- (3) That double time be paid for all overtime and for Sunday duty, and time and a half for night duty;
- (4) That the period of rest between each turn of duty be not less than 12 hours;
- (5) That 14 days' holiday with pay be allowed annually;
- (6) That conditions of service be standardized on all railways in the United Kingdom; and
- (7) That there be equal representation, both national and local, for the union on the management of all railways.

LOCOMOTIVE ENGINEERS AND FIREMEN

- (1) That the standard rates of pay be: Enginemen and electric motor-men, 14s. a day; firemen and electric trainmen, 10s.; cleaners and electric train gatemen, 7s.
- (2) That 10 per cent be added to the standard rates of every 10 per cent increase in the cost of living from June, 1917, and reductions to be on the same basis; but no reduction if the cost of living falls below the figure for June, 1917.
- (3) That a special rent allowance of 5s. a week be granted to men in London and other expensive centres.
- (4) Eight hours a day.
- (5) That time and a quarter be paid for overtime and night duty, and double time for Sunday duty.
- (6) At least 12 hours' rest between turns at home station; nine hours when booked away from home station.
- (7) Lodging allowances of 2s. or 3s. a day away from home.
- (8) That 14 days' annual holiday, with pay, be allowed after 12 months' service.

RAILWAY CLERKS' ASSOCIATION

- (1) A 38-hour week for day workers and a 34-hour week for night workers.
- (2) A scale of minimum salaries beginning at £70 a year for a boy of 16 and rising by regular increments to £230 for a man of 28, with an additional £20 throughout the scale for clerks employed in London.
- (3) A further scale, ranging from £250 to £1,000 a year, for station-masters, goods agents, and others holding positions of more than ordinary responsibility.

It should be explained, says the Times, that had the war not intervened, the hours, wages, and conditions of service of railwaymen would have come up for revision in the normal course four years ago. In October, 1914, however, a truce agreement was entered into by the N. U. R. and the Locomotive Engineers with the railway authorities, providing for the continuance of the 1911 Conciliation Scheme and a stereotyping of "all existing contracts and conditions of service" during the suspensory period. The truce agreement has now been determined. The position of the Conciliation Scheme is obscure, but presumably it has ended with the truce, and the Railway Executive Committee, under the authority of the Board of Trade, is to embark on the negotiation of the railwaymen's programs on a national basis.

The outstanding item in the programs, of course, is the demand of the N. U. R. that "war-wage" advances shall be made permanent. Those advances now aggregate 33s. a week. As they were made under the truce agreement, it could be contended by the Government that they cease with the agreement. There is, however, a clause in the agreement made on August 8, 1917 (when "war bonus" was converted into "war wages") which provides that the additional wages "are to be regarded as a war advance intended to assist in meeting the increased cost of living, and are to be recognized as due to and dependent on the existence of abnormal conditions now prevailing in consequence of the war."

The following table shows the various stages by which the "war wage" was raised to 33s. a week (16s. 6d. in the case of employees under 18 years of age):—

	Men		Boys	
	s.	d.	s.	d.
October, 1914.....	3	0	1	6*
October, 1915.....	2	0	1	0
September, 1916.....	5	0	2	6
April, 1917.....	5	0	2	6
November, 1917.....	6	0	3	0
April, 1918.....	5	0	2	6
September, 1918.....	5	0	2	6
November, 1918.....	3	0	1	6
Total.....	33	0	16	6

\*June, 1915.

On the occasion of the last advance a scheme was adopted, with the concurrence of the Board of Trade, under which the war wage should thereafter be regulated by a sliding scale based on the cost of living as shown in the official Board of Trade returns. The program of the Locomotive Engineers' Society, it will be noted, provides for a continuance of this scheme, and is a less extreme demand than that of the larger union.

Australia Bars Importation of Goods Not of British Origin

Press despatches from Melbourne, under date of March 8, report that the minister of customs of the Commonwealth of Australia has issued a proclamation prohibiting the importation into the Commonwealth of all goods other than those of British origin. The reason for this action is not explained in the despatches.

Equipment and Supplies

Representatives of car and locomotive companies who attended a conference with Director General Hines on Thursday morning included Andrew Fletcher, president, American Locomotive Company; S. M. Vauclain, vice-president, Baldwin Locomotive Works; Mr. Dixon, vice-president, and Mr. Larson, treasurer of the Lima Locomotive Company; W. W. Woodin, of the American Car & Foundry Company; J. W. Bettendorf, president, Bettendorf Company; D. B. Gehly, treasurer, Cambria Steel Company; C. A. Liddle, vice-president, Haskell & Barker Company; E. S. S. Keith, of the Keith Car & Manufacturing Company; J. E. Johnson, vice-president, Laconia Car Company; H. W. Miller, vice-president, Lenoir Car Works; Mr. Joyce, of the Liberty Car & Equipment Company; R. J. Magor, of the Magor Car Corporation; W. C. Arthurs, of the Mt. Vernon Car Manufacturing Company; Mr. Pigett, president, Pacific Car & Foundry Company; J. E. Ralston, president, Ralston Steel Car Company; J. N. Hansen, president, Standard Steel Car Company, also representatives of McGuire, Cummings Manufacturing Company; the Pressed Steel Car Company, and the Pullman Company.

At the conference, Director General Hines gave assurance that there was no cause for alarm and that the situation would be met, but he was not prepared to state just what plan would be adopted. Several of the representatives will stay over to discuss the matter with him later. While warrants could be issued to equipment builders, it is possible that an effort will be made to have the banks carry them so they can pay for the materials, labor and specialties.

Reduction in Steel Prices

A reduction in price of 4 per cent below the prices agreed upon last summer by the government and the American Iron & Steel Institute has been fixed for the steel castings used on the cars and locomotives ordered by the Railroad Administration, by the price-fixing committee of the War Industries Board, after negotiations with the steel casting manufacturers.

The prices as fixed are as follows:

Capacity car	DOLSTERS (BODY OR TRUCK)			
	Quoted price	Reduction	Revised price	
30-ton.....	\$87.50	\$3.50	\$84.00	
40-ton.....	99.50	3.98	95.52	
50-ton.....	108.50	4.34	104.16	
57½-ton.....	118.50	4.74	113.76	
62½-ton.....	130.00	5.20	124.80	
70-ton.....	165.00	6.62	158.88	

Capacity car	TRUCK SIDE FRAMES FREIGHT CARS AND LOCOMOTIVE TENDERS					
	Quoted price		Reduction		Revised price	
	A*	†	A*	†	A*	†
30-ton.....	\$118.50	\$124.50	\$4.74	\$4.98	\$113.76	\$119.52
40-ton.....	129.50	135.50	5.18	5.42	124.32	130.08
50-ton.....	139.50	151.50	5.58	6.06	133.92	145.44
57½-ton.....	154.50	166.50	6.18	6.66	148.32	159.84
62½-ton.....	170.00	181.00	6.80	7.24	163.20	173.76
70-ton.....	175.50	201.50	7.02	8.06	168.48	193.44

\*Andrews design. †Pedestal design.

Locomotive and Car Deliveries

New cars were accepted during the week ended March 1 as follows:

Road	Number	Type	Manufacturer	Total accepted for given roads
A. C. L.....	157	40 Ton D. S. Box...	Am. Car & Fdy. Co.	456
C. C. & St. L.....	33	40 Ton D. S. Box...	Am. Car & Fdy. Co.	250
P. McK. & Y.....	148	50 Ton S. S. Box...	Am. Car & Fdy. Co.	430
C. C. & O.....	61	50 Ton S. S. Box...	Bettendorf Co.	61
N. Y. C.....	147	50 Ton S. S. Box...	Haskell & Barker.	625
L. & N.....	33	50 Ton Comp. Gond.	Am. Car & Fdy. Co.	336
L. & N.....	21	50 Ton Comp. Gond.	Std. Steel Car.	200
N. C. & St. L.....	58	50 Ton Comp. Gond.	Am. Car & Fdy. Co.	58
N. Y. C.....	112	70 Ton L. S. Gond.	Pressed St. Car.	145
Total.....	770			

The following new locomotives were shipped during the week ended March 1:

Works	Road	Number	Type
American	Erie R. R.	4	USRA Santa Fe
	Penn. L. W.	5	Santa Fe
	Monongahela	10	USRA Mikado
	Chic. Great Western	2	USRA 6W. Sw.
	Grand Trunk	1	USRA 6W. Sw.
	Cent of Georgia	1	Mallet
		23	
Baldwin	A. T. & St. F.	3	Mikado
	Lehigh Valley	3	Pacific
	Great Northern	2	SW. Sw.
	Car. Clinch. & Ohio	3	Mikado
	B. & O.	2	USRA Mikado
	Phila. & Reading	1	Consol
	Great Northern	1	Mikado
	Chic. Burl. & Quincy	1	Mikado
	Hl. Cent.	1	Mikado
	Penn. R. R.	1	Mikado
		18	
Total		41	

127 locomotives were delivered during February to the railroads under federal control, in addition to eight miscellaneous domestic and 164 foreign locomotives.

### Freight Cars

THE LIBERTY STEEL PRODUCTS COMPANY, New York, is inquiring for 100 small industrial flat cars for 18 in. gage.

### Iron and Steel

THE PENNSYLVANIA EQUIPMENT COMPANY, Philadelphia, Pa., is in the market for 2,500 tons of 45-lb. relaying rails.

BRITISH INDIA is in the market for 800,000 tons of rails, also splices, bolts and angles, to be delivered in 1919, 1920 and 1921, according to a cable received by the Canadian Trade Commission in Ottawa, from the Canadian Mission in London, with which it is in co-operation. While this order will doubtless be filled largely by British and Canadian firms, it is interesting as indicating the transportation expansion and rehabilitation which is to come about in the most populous of British possessions.

### Signaling

LEHIGH VALLEY.—This company has ordered from the General Railway Signal Company, a mechanical interlocking, 16 levers, for Vosburg, Pa., and a smaller machine for Carney, Pa.

THE MONONGAHELA SOUTHERN has contracted with the Union Switch & Signal Company for the erection of two electro-pneumatic interlocking plants, one a 27-lever frame for controlling 40 functions to be located at Wilson, Pa., the other a 15-lever frame for controlling 18 functions to be located at Clairton Junction, about one mile from Wilson.

THE UNITED RAILWAYS & ELECTRIC COMPANY, Baltimore, Md., has awarded a contract to the Union Switch & Signal Company for the installation of an electro-pneumatic interlocking at Sparrows Point, Md., at a junction of its own lines and a crossing of one of these lines with the Pennsylvania. The machine will have a total of 11 levers for controlling 21 functions. Alternating current track circuits will be installed. The Electric Company's lines will have color light signals and the Pennsylvania will be equipped with position light signals.

THE HYDRO-ELECTRIC POWER COMMISSION of the Province of Ontario, Canada, has placed an order with the Union Switch & Signal Company, Swissvale, Pa., for the installation of a complete electro-pneumatic interlocking plant. The Power Commission is excavating for a canal to carry water from the Niagara river above Niagara Falls to a hydro-electric plant twelve miles away. The rock and earth from this excavation is being carried away by trolley trains, and it is on the trolley line that the interlocking is to be placed. It is estimated these trains will run through this interlocking at the rate of one every 90 seconds. Signal indications will be displayed by means of color light signals.

## Supply Trade News

Malcolm Gifford, president of the Gifford-Wood Company, manufacturers of ice harvesting machinery and elevator conveyances, died on Wednesday, March 5, at Hudson, N. Y.

A. G. Jablinski has been appointed chief engineer of the American Crane & Engineering Company, with headquarters in the Nasby building, Toledo, Ohio. Mr. Jablinski was formerly with the Browning Company, of Cleveland, Ohio.

J. E. Slimp, who has for many years been connected with the sales department of the Ohio Brass Company, Mansfield, Ohio, has resigned to become associated with H. C. Dodge, of Boston, who is at the head of several manufacturing companies in New England. Mr. Slimp will remain with the Ohio Brass Company until approximately April 1.

Edwin Besuden has been appointed eastern district manager of the railway department of the Chicago Varnish Company, in charge of steam and electric railway sales. His headquarters are at 50 Church street, New York. Mr. Besuden was formerly sales manager of the Jewett Car Company and was connected with that company for 16 years.

O. Edwin Berggren, whose appointment as Northwestern representative of the A. G. A. Railway Light & Signal Company, with headquarters at Chicago, was announced in the

*Railway Age* of March 7, (page 564), was born in Chicago on August 1, 1881, and received his education in the Chicago grammar schools and a business college at Chicago. Mr. Berggren began his business career in the passenger department of the Northern Pacific at Chicago in March, 1900, where he remained for two years and then entered the freight department of the Wisconsin Central, at Chicago. From 1904 to 1907 he was in the sales department of the Pullman Company, and the following five years

O. E. Berggren

was connected with the John Peirce Company, Chicago, in the construction of buildings, resigning from that company to enter the employment of the H. W. Johns-Manville Company in the railroad and contract departments, at Chicago. Later he became associated with the International Refrigerating Manufacturing Company as traveling representative, in which capacity he continued for two years, after which he was employed by the Ford Manufacturing Company in the same capacity. Previous to his appointment as Northwestern representative of the A. G. A. Railway Light & Signal Company, Mr. Berggren was in the service of the Construction Material Company at Chicago as traveling representative.

John B. Canfield, who since March 1 has been associated with the Harley Company of Springfield, Mass., as special representative and counsel, commenced work in mechanical lines with the Boston & Albany, at Boston, Mass., in 1885, as machinist apprentice. He continued with the railroad as foreman machine shop, general foreman locomotive department and master mechanic of the Albany and Boston divisions, severing his connection with railroad work in 1916, after a continuous service of 30 years. In 1906, while in the railroad service as master mechanic at Boston, Mass., Mr. Canfield enrolled as a law student in the Boston Evening Institute, now the Northeastern College of Law, graduating in June,

1910, with the degree of LL.B., and was admitted to the Massachusetts bar September 23, 1910. At the time of his coming to the Harley Company, he was actively engaged in the practice of his profession at Springfield, Mass. During the war he served as major of engineers, and was commanding officer of the Sixth Battalion, 21st Engineers, being honorably discharged in January of this year.

**George K. Heyer** is the new assistant telephone sales manager of the Western Electric Company, having been advanced from the position of railway sales engineer. He has been an employee of the company since 1902, and always has been in New York. He will remain there as his headquarters will be at 195 Broadway. **E. V. Adams** succeeds G. K. Heyer as railway sales engineer of the Western Electric Company. He has been a Western Electric man since 1910, when he began in the railway sales department of the Chicago house. He was transferred to St. Louis in 1912, and the following year went to New York, where his headquarters will remain.

**B. W. Matthews** has been elected a director and a vice-president of the Joseph Richards Company, advertising specialists, New York. Mr. Matthews was graduated from Stevens Institute of Technology in 1908, having obtained some business experience by spending his summer vacations in the office of the principal assistant engineer of the Pennsylvania Railroad, Jersey division. From 1908 to 1910 he was an assistant engineer in connection with the building of the Belmont Tunnel in New York. For the two following years he was connected with the Bausch & Lomb Optical Co., Rochester, N. Y., as advertising and sales manager of the engineering instrument department. The next year he was advertising manager of the Keuffel & Esser Co., Hoboken, N. J., and in 1913 joined the service staff of the Simmons-Boardman Publishing Co. During this period, Mr. Matthews made the best of an opportunity to study the economic utility of various railway supplies from an advertising and sales standpoint, especially machinery and shop equipment, his studies taking him into some of the largest industrial plants and railroad shops in the United States. In February, 1917, Mr. Matthews joined the staff of the Joseph Richards Company. In the analysis and plan for the advertising of almost any kind of product, the need of a trained technical mind is now generally accepted. Mr. Matthews' education and business experience has been very largely along these lines.

**LaSalle Portland Cement Company Sold**

The plant of the LaSalle Portland Cement Company, LaSalle, Ill., formerly the German-American Portland Cement Works, was sold on March 11 by representatives of A. Mitchell Palmer, alien property custodian. The controlling interest in the stock was bid in by a group of cement manufacturers headed by A. C. Dustin of the Sandusky Cement Company of Cleveland, O., plants and including other successful bidders were A. Y. Gowen, vice-president of the Lehigh Portland Cement Company, Chicago, Charles Voetcheer, president of the Cement Securities Company, Denver, Col., and C. H. McNiden, president and general manager of the Northwestern States Portland Cement Company, Mason City, Ia. The German-American Portland Cement Works was organized on December 5, 1899, with an authorized capital stock of \$450,000. The book value of the stock, as determined on January 31, by certified public accountants is about \$983,000 while the total value, according to the price paid at the sale is \$1,287,000 or about one third more than the book value. Of the 4,500 shares of stock, Mr. Dustin and the interests he represents purchased 3,687 shares.

**The Bucyrus Company**

According to the annual report of the Bucyrus Company of South Milwaukee, Wis., the net earnings for the year ending December 31, 1918, were \$658,403, after the deduction of a sum approximating the probable tax requirements under the war revenue act. During the year a one per cent dividend was paid quarterly on the preferred stock or a total paid during the year in dividends of \$160,000. The earned surplus at the end of the year was approximately 42 per cent of the preferred stock issued as compared with 30

per cent a year ago and the accumulated unpaid dividends thereon aggregated 25 per cent at the same date after deducting the dividend payable January 2, 1919.

W. W. Coleman in his statement to the stockholders said in part: "The high prices of materials, the relatively large volume of business and the necessity of financing the gold note issue authorized by the Board of Directors on May 29, 1917 (maturing June 15, 1918) at its maturity required the use of considerable sums of money and introduced larger problems of finance than the company has had occasion to deal with in previous years; the conservation of cash resources which has been the policy of this company made it possible to meet the requirements of the situation by current borrowing at favorable interest rates \* \* \* The total shipments for the year were slightly in excess of those of the previous year."

The company has been extensively engaged in war work, especially in the building of "mobile derricks" and locomotive cranes for the U. S. Engineer Department, and in the machining and assembling of light artillery for the government. The cancellation of government contracts after the signing of the armistice found most of the contracts held by the Bucyrus Company practically completed or in such condition that no extremely difficult complications or serious disorganizations of working forces were involved and therefore the claims for adjustments to be presented to the government are not considerable in amount.

The balance sheet is as follows:

ASSETS	
Cash .....	\$212,744
Accounts and bills receivable.....	1,704,760
Inventories .....	3,158,603
Payments made on company and employees' subscrip- tions to Fourth Liberty Loan, other Liberty Bonds and War-Savings Certificates.....	\$147,977
Less bank loans therefor.....	104,160
Dominion of Canada Victory Loan Bonds.....	43,817
Land, buildings, machinery, patterns, securities, patents, etc....	6,700,554
<b>Total .....</b>	<b>\$11,845,003</b>

<b>Total .....</b>	<b>\$11,845,003</b>

**Good Field Abroad for Electrical Machinery**

E. M. Herr, president of the Westinghouse Electric & Manufacturing Company, believes that a reduction in the present high scale of wages to make possible a reduction in prices is necessary if the manufacturers of this country are to retain and to expand their foreign trade. He says, in a statement issued Monday by the American Manufacturers' Export Association, of which he is a director, that in his industry the development of a large export business would be rapid if it were not for the high prices which must now be charged for electrical machinery.

"It is encouraging to note," Mr. Herr says, "that there have been some very substantial decreases in the cost of a few of our raw materials, and if some yielding in the very high labor costs can also be obtained we would soon find an expansion of the export demand for electrical machinery that would more than compensate labor for any sacrifices in hourly rates by the longer hours and more continuous work which would result.

"Plans are already matured for the development of larger central electrical power stations in some of the more important industrial countries, and extensive projects for the electrification of some of their railroads are under way. The smaller and less economical steam plants will in this way be displaced by larger ones, and the demand for transmission devices and electrical machinery will be greatly increased.

"The largest electrical manufacturing companies abroad are in Germany, and it will be some time before they can operate advantageously. This gives American companies an

unusual opportunity, if promptly seized, to bring our exports of electrical machinery to an amount and value which might not have been possible under normal conditions. We also have the financial situation in our favor, for whereas before the war countries such as South America, South Africa, Australia, India, and China looked to London, Berlin, and Paris for credits and loans, now these facilities of commerce must be obtained in the United States. And unless we arrange to invest our capital in those countries, we cannot command our fair share of their trade, even though our prices may be competitive.

"In seeking electrical machinery business in export territory our agents must make their principals realize that the machinery we sell these people must be designed and built for their requirements and not, as has in the past too often been the case, as we are accustomed to build it. Much effort has been expended in trying to convince the foreign buyer that our styles and construction were best and should be satisfactory to him, instead of making an effort to ascertain what he desired and then furnishing it.

"In addition to adapting our goods to export requirements we must arrange to give service in this trade at least as good as in our domestic market. Too often export shipments have been delayed and foreign customers disappointed on account of the domestic demand becoming suddenly unusually active, when export orders were made to wait while the rush of domestic orders was worked off."

### Westinghouse Electric Sells British Holdings

Announcement was made Monday that the Westinghouse Electric & Manufacturing Company has sold to British interests for approximately \$7,000,000 its holdings in Electric Holdings, Ltd., a concern which was organized in London in May, 1917, to take over the British Westinghouse Electric and Manufacturing Company.

In return for stock control of the latter the Westinghouse Electric received about half of the common stock of the Electric Holdings, Ltd., and \$6,500,000 of its ten-year 5 per cent prior lien bonds. These securities were sold in the transaction just completed as a result of negotiations conducted by Guy E. Tripp, chairman of the Westinghouse board, and a group of the company officials who sailed for England about a month ago.

The agreement of sale of control of the British Westinghouse Electric & Manufacturing Company to the London Interests was based on an alliance whereby the American concern was restricted to conducting business in the Western hemisphere and the Far East, while the European territory, Africa and Australia was given to the British.

### American Steel Foundries

The annual report of the American Steel Foundries for the year ending December 31, 1918, shows net profits of \$2,695,727 after deductions for depreciation of \$426,412 and interest charges of \$136,497. The gross sales were \$49,113,098 as compared with \$49,369,584 for the previous year. The earnings after the deduction of manufacturing, selling, administrative, head and district office expenses, were approximately half of those of the previous year, or \$4,442,237.21 as compared with \$8,718,296 for 1917. The federal taxes for 1918 were \$1,357,200, whereas for 1917 they were \$2,287,600. The undivided surplus now stands at \$7,182,846 as compared with \$6,429,228 in 1917. Capital additions during the year totaled \$670,747 which consisted chiefly of extensions made to the Alliance, Ohio, and Indiana Harbor, Ind., plants of the company. Dividends on the basis of seven per cent annually were paid, involving a total of \$1,202,880 and there was made in the third and fourth quarter an extra disbursement of \$429,600 in Liberty Loan bonds on the basis of 1¼ per cent for each quarter. Substantially the entire product of the company's plant was for government work.

R. H. Ripley, acting president, in his report states: "Great changes in our financial statement since that issued for the nine months ending September 30, 1918, were made by events occurring subsequent thereto. It was not until the

latter part of the year that action on war profit and income taxes took definite form, upon which conclusions could be based and our statement reflects this situation. The armistice in November resulted, as was to be expected, in cancellation of large tonnages of our products, preparation for the production of which had already been made. The basic materials and all stores became uncertain as to price and value and it, therefore, appeared the part of wisdom to make drastic reduction of our inventories, which were abnormally large by reason of the condition brought about by the state of war and the necessary preparation for our continued participation therein. We cannot say what the year 1919 may hold for the company. It was not to be expected that the pace of business could be maintained, and curtailment of operation and earnings are to be expected for the present and perhaps until such time as some of the vital questions now pressing for settlement be disposed of definitely. The tonnage now on our books would under pre-war conditions justify the hope of a satisfactory year. A large volume of repair and renewal business has been held back during the war which if now released would favorably affect our situation. If, however, the plan under which the railroads are to be operated is not soon and wisely determined, we can look for little buying from this source and a correspondingly quiet year."

The balance sheet is as follows:

ASSETS	
Real estate, buildings, plant, machinery, tools, equipment, patents and good will, plus additions during the year—less depreciation reserve	\$21,302,455
Miscellaneous securities, inventories, accounts and bills receivable (less reserves) and cash	15,127,168
Deferred charges to operations	53,571
	\$36,483,194
LIABILITIES	
Capital stock (authorized and issued)	\$17,184,000
Four per cent debentures	1,372,800
Accounts payable and payrolls accrued, provision for war profits, income and other taxes and accrued interest on debentures	4,633,144
Reserves	797,000
Appropriated surplus	5,313,403
Undivided surplus	7,182,846
	\$36,483,194

## Trade Publications

**GRAPHITE PRODUCTS.**—The Joseph Dixon Crucible Company, Jersey City, N. J., has issued a new pocket catalogue covering the various products handled by this concern. Several pages are devoted to lists of articles for special use in mills, on railroads, automobiles, etc., these lists being intended for reference to various subjects for which special pamphlets will be supplied.

**AIRCO SERVICE.**—The Air Reduction Sales Corporation, New York, has issued small folders illustrating and describing the work done by its equipment in repairing or building up broken or worn equipment used on railroads. Illustrations show the manner in which a broken locomotive cylinder casting has been restored and how worn track frogs are built up.

**BLAW FORMS.**—The Blaw-Knox Company, Pittsburgh, Pa., has issued a 24-page booklet describing and illustrating the forms manufactured by that company for use in building curbs, gutters, concrete pavements and sidewalks. Special designs are illustrated for each purpose named and illustrations show the adaptation of this equipment to different pieces of actual construction.

**BASCULE BRIDGES.**—The Strauss Bascule Bridge Company, Chicago, has issued a 70-page catalogue on the Strauss bridges, which contains a detailed exposition of the bascule and direct lift bridges developed by this company. The book also contains a partial list of the railway and highway bridges built according to these designs in various countries of the world and a list of 30 steam railways that have used the Strauss service.

**GRAPHITE PRODUCTS.**—A new pocket catalogue has been issued by the Joseph Dixon Crucible Company, Jersey City, N. J., entitled "Dixon's Graphite Products." While not a complete catalogue, it furnishes a good idea of the variety of products

made by this company. Pages are devoted to lists of articles especially for mills, railroads, automobiles, etc., with brief descriptions. Pamphlets dealing in detail with any one product may be had upon request.

**WRENCHES.**—The Coes Wrench Company, Worcester, Mass., has issued a 14-page catalogue dealing with the line of screw wrenches and accessories made by this company. These include steel, knife and hammer handle wrenches. Information is given regarding their construction, manufacture and strength compared with other wrenches, as shown by tests made at the Harvard University testing laboratory. The catalogue contains a number of illustrations.

**FLANGING.**—An attractive catalogue entitled "A Solution of Your Flanging Problems," containing 30 pages, 9 in. by 12 in., has been issued by the McCabe Manufacturing Company, Lawrence, Mass., illustrating and describing the wide range of work that can be done on the McCabe flanging machine, and showing economies that may be effected by its use. The greater part of the book is given over to illustrations showing finished products, such as various kinds of tanks, locomotive firebox and boiler sheets, steel car parts, etc.

**CRANES FOR SHOPS, ROUNDHOUSES AND YARDS.**—The Whiting Foundry Equipment Company, Harvey, Ill., has recently issued catalogue No. 135 superseding catalogue No. 127. This catalogue describes electric, pneumatic and hand power traveling cranes, locomotive and coach hoists, gantry traveling cranes, jib cranes and pillar cranes. It gives a general description not only of the cranes but also of the details such as cabs, trucks, brakes and electric equipment and discusses the field where the various types may be used to advantage. The illustrations show numerous typical installations on railroads.

**LAKEWOOD CLAM SHELLS.**—The Lakewood Engineering Company, Cleveland, Ohio, has published bulletin No. 26 containing 24 pages illustrative and descriptive of the Lakewood clam shell buckets. The first seven pages are devoted almost exclusively to large photographs showing a wide variety of the applications of these buckets to excavating and rehandling of material. Following this are several pages of drawings and tables showing the details of these buckets, the principal dimensions, etc. Two pages illustrate and list various classes of construction equipment manufactured by this company.

**LIGHTING.**—The National X-Ray Reflector Company, New York-Chicago, has issued a 246-page book, 8 in. by 10 in., bound in cloth, which is an exposition of the manner of lighting all kinds of interiors by the use of the X-Ray reflectors. This matter is divided into chapters dealing with such subjects as illumination from concealed sources, control of light, indirect lighting, direct lighting, etc. In each case general principles of illumination involved are presented first and followed by an explanation of the special application of the X-Ray equipment. A considerable portion of the book is devoted to descriptions of a large number of actual installations.

**ASH DISPOSAL.**—The American Steam Conveyor Corporation, New York, has issued a 160-page book on modern methods used in handling ashes in power plants. The first 32 pages are devoted to an exposition of the various methods in common use for the handling of ashes, including manual labor and the various mechanical and "current" methods. The remainder of the book is devoted to an explanation of the steam-jet conveyor method and its application to various types of boilers and furnaces together with a large number of descriptions and illustrations of actual installations of this equipment for office buildings, factories, railroads, etc.

**BELT FASTENERS.**—"The Crescent Principle of Belt Joining" is the title of a four-page bulletin issued by the Crescent Belt Fastener Company, New York, describing the fasteners made by this company for joining all kinds of belting. These are claimed to give a flush joint, allowing the belt to have continuous contact with the pulleys. Several illustrations show completed joints with the various kinds of fasteners. The method of making the joints is also explained and illustrated. A ready reference chart, by means of which a belt man or machinist can readily determine the correct type of belt fastener to use for any condition of service, is included in the bulletin.

## Financial and Construction

### Railway Financial News

**BUFFALO, ROCHESTER & PITTSBURGH.**—This company has applied to the New York Public Service Commission for approval of an issue of \$1,500,000 in 4½ per cent bonds, and authority to pledge the bonds, if not sold, as collateral to loans for extensions, betterments, improvements within the past five years.

**ERIE.**—Following a meeting of the executive committee, President F. D. Underwood announced that the company had concluded negotiations with the Railroad Administration by which it is assured an annual standard return of \$15,729,000. In addition the road will have an estimated non-operating income during 1919 of \$4,250,000, making its aggregate gross income for the current year \$19,974,000. On the above basis, after deducting interest charges, rentals, sinking fund requirements and other income, there should remain a surplus of \$5,320,000. With regard to the payment of \$15,000,000 Erie notes falling due April 1, Mr. Underwood stated that there were several plans under consideration with the Washington authorities and that a decision would probably be reached this week when it would be made public.

**GEORGIA COAST & PIEDMONT.**—The United District Court of Savannah has ordered the sale of this road May 6 on petition of David Loewenthal, of New York. A minimum price of \$300,000 has been set. The road, extending 100 miles from Collins, Ga., to Brunswick, has been in the hands of receivers since July 14, 1916.

**GRAND TRUNK PACIFIC.**—The receivership of this company is noticed in an editorial elsewhere in this issue.

**LEHIGH VALLEY.**—Henry S. Drinker, president of Lehigh University, who served as general solicitor of the Lehigh Valley Railroad from 1885 to 1905, has been elected a director to succeed William R. Butler, deceased.

**NEW YORK, CHICAGO & ST. LOUIS.**—This company has sold William A. Read & Co. \$4,000,000 second and improvement mortgage series A 6 per cent gold bonds. The new bonds are dated May 1, 1918, and mature on May 1, 1931. This is the first issue out of the total amount of \$25,000,000 authorized. Interest is payable semi-annually. An application will be made to list on the New York Stock Exchange, and the company agrees to pay the normal Federal income tax up to 2 per cent if exemption is not claimed by a bondholder. The new bonds are secured by direct mortgage lien upon the entire property of the company, subject to \$18,350,000 first mortgage sinking fund 4 per cent bonds due in 1937, outstanding, which cannot be increased in amount.

**PENNSYLVANIA RAILROAD.**—Stockholders of this company at their annual meeting on March 11 authorized an increase in indebtedness of \$75,000,000 and the acquisition of the Cumberland Valley Railroad. Directors of the railroad previously had approved the new issue, and while the stockholders ratified it, they also provided that a stock vote upon the increase in debt shall be taken March 25, the date of the annual election of officers. The \$75,000,000, it is proposed, will be raised in general mortgage bonds. The directors already had authority to increase the indebtedness of the company \$46,000,000, so that the action at this meeting and March 25 will raise the total to \$121,000,000.

### Railway Construction

**TEXAS ROADS.**—O. B. Colquitt, president of the Eastland, Wichita Falls & Gulf Railway Company, and associates, have raised \$156,000 for the purpose of financing the first link in a railroad which they plan to build through the oil fields of central west Texas. The first link of seven miles will be built between Eastland, Texas, and Mangum for the purpose of relieving existing traffic congestion in this district. The proposed road will afford a connecting link between the Texas & Pacific and the Missouri, Kansas & Texas.

## Railway Officers

### Railroad Administration

#### Regional

The St. Louis, Troy & Eastern has been relinquished from Federal control according to an order issued by **A. S. Johnson**, terminal manager at St. Louis, Mo., and approved by **B. F. Bush**, regional director of the Southwestern region.

#### Federal and General Managers

**William N. Neff**, who has been appointed federal manager of the St. Louis Southwestern System, the Dallas Terminal, the Eastern Texas, the Southern Illinois & Missouri Bridge, and the Louisiana & Arkansas, with headquarters at Tyler, Texas, as was announced in our issue of last week, was born in 1874 at Lawrence, Kan., where he received a public school education. He entered the employ of the Missouri Pacific in 1889 as baggage master and was consecutively to 1891 assistant agent and operator. In 1891 he was promoted to chief clerk to the division superintendent and in 1893 became clerk to the roadmaster of the same road. From 1895 to 1896 he was a road clerk in the superintendent's office of the Great Northern. Subsequently he entered the employ of the Montana Central as telegraph operator and in 1897 again became a road clerk in the general superintendent's office of the Montana Central. In 1897 he returned to the employ of the Great Northern as clerk in the general superintendent's office and in the same year was appointed chief clerk to the superintendent. In 1898 he became chief clerk to the general superintendent and in 1899 assistant superintendent of the same road. In 1900 he became superintendent of the St. Louis Southwestern, later becoming superintendent of the St. Louis Southwestern of Texas, which position he held with the exception of one year during which he was chief clerk to the president of the same road until 1911, when he was appointed first vice-president and general superintendent of the St. Louis Southwestern of Texas and also general superintendent of the St. Louis Southwestern. In 1914 he was granted a leave of absence but was later appointed superintendent of the Northwestern Pacific at Sausalito, Cal. In 1917 he was again appointed vice-president and general manager of the St. Louis Southwestern of Texas and general manager of the St. Louis Southwestern, with headquarters at Tyler, Tex., in which position he continued after the railroads were taken over by the government.

W. N. Neff

#### Operating

**John L. Wilkes** has been appointed superintendent of the Washington division, Washington Terminals, with office at Washington, D. C., vice **Robin W. Farrell**.

**F. Wear** has been appointed superintendent of the Butte division of the Great Northern, with headquarters at Great Falls, Mont., to succeed **D. F. Dixon**, who has been assigned to other duties.

**C. B. Dugan**, whose appointment as superintendent of dining car service of the Illinois Central, the Yazoo & Missis-

sippi Valley and the Chicago, Memphis & Gulf, with headquarters at Chicago, was announced in the *Railway Age* of February 21, page 475, was born in Owego, N. Y., on June 2, 1865, and received his education in the public schools and high schools of Owego. In 1900, he entered railway service as a dining car conductor with the Pullman Company, in which capacity he served three and one-half years, when he was appointed inspector on the Erie, which position he held for nine years. In 1912, Mr. Dugan entered the service of the Illinois Central as inspector in which capacity he served for six years until his promotion to assistant superintendent of dining car service which position he held until his recent appointment.

#### Financial, Legal and Accounting

**Charles H. Hueston** whose appointment as acting federal treasurer and paymaster of the Des Moines Union, the Iowa Transfer, the Des Moines Western and the Des Moines Terminal, with headquarters at Des Moines, Iowa, was announced in the *Railway Age* of February 28 (page 521), was born at Spring Valley, Minn., on August 11, 1864, and received his education in the public and high schools of Spring Valley. Mr. Hueston entered railway service with the Chicago & North Western on April 8, 1886, where he remained for 17 years. The following sixteen years he served in the capacity of general superintendent of the Des Moines Western and the Des Moines Terminal, which position he held until his recent appointment as acting federal treasurer and paymaster.

**Trace S. Ford**, whose appointment as federal auditor of the Des Moines Union, the Des Moines Western, the Des Moines Terminal and the Iowa Transfer was announced in the *Railway Age* of February 28, page 521, began his railroad career with the Iowa Central in 1885. After eight years of service with that road, he entered the accounting department of the Oregon Railroad & Navigation Company, later serving in the same departments of the Chicago & Alton and the Chicago Great Western as clerk and chief clerk. Later he became connected with the New York City Street Railway, where he was engaged for two years on special accounting work. In 1910 he was appointed auditor of the St. Paul & Des Moines, and when that road was absorbed by the Chicago, Rock Island & Pacific, he became auditor of the Wichita Falls & Northwestern at Wichita Falls, Tex., and reorganized their accounting departments. When the Wichita Falls & Northwestern were taken over by the Missouri, Kansas & Texas, he entered the service of the San Antonio, Uvalde & Gulf as auditor, with headquarters at San Antonio, Tex., where he remained for three years. The following two years he served in the capacity of auditor and treasurer of the Pittsburgh, Lisbon & Western, resigning at the end of that time to accept the appointment as auditor of the Des Moines Union in September, 1918, which position he held until his recent appointment as federal auditor of the Des Moines Union, the Des Moines Western, the Des Moines Terminal and the Iowa Transfer.

T. S. Ford

#### Traffic

**T. L. Peeler** has been appointed industrial agent of the Missouri, Kansas & Texas, the Missouri, Kansas & Texas of Texas, the Wichita Falls & Northwestern, the Oklahoma Belt and the Missouri, Oklahoma & Gulf, with headquarters at Dallas, Texas.

**D. M. Goodwyn**, assistant freight traffic manager of the Louisville & Nashville, has been promoted to freight traffic manager, with headquarters at Louisville, Ky., to succeed **C. B. Compton**, deceased. The office of assistant freight traffic manager has been abolished.

**M. J. Powers**, formerly general passenger agent of the Delaware & Hudson, has been released from military service, and has resumed his duties with the title of assistant general passenger agent of the Delaware & Hudson; the Greenwich & Johnsonville; the Schoharie Valley; the Champlain Transportation Company, and the Lake George Steamboat Company. **Walter C. Harden**, assistant general passenger agent, has been appointed district passenger agent in charge of dining car service, and performing such other duties as may be assigned to him; both with offices at Albany, N. Y.

**R. B. Robertson** has been appointed general freight agent of the Chicago, Indianapolis & Louisville, with headquarters at Chicago. Mr. Robertson was born in Milwaukee, Wis., on April 18, 1879, and began his railway career in the traffic department of the Wisconsin Central in 1898. In 1901, he entered the service of the Monon as soliciting agent, and the following ten years he served in the capacity of traveling freight agent and commercial agent with headquarters at Milwaukee when he was appointed general agent at Chicago on July 3, 1912. On January 1, 1915, he was promoted to division freight agent, and on March 1 of the same year he was appointed assistant general freight agent of the same road. Mr. Robertson was furloughed to the war department on May 1, 1918, receiving the title of assistant chief of inland traffic service, with headquarters at Chicago. In this capacity he had jurisdiction over the movement of troops and war department property in the middle west. He succeeds **J. A. Simmons**, who will confine his attention to freight traffic matters on the Cincinnati, Indianapolis & Western as general freight agent, with headquarters at Indianapolis, Ind.

**Norman W. Pringle**, assistant general passenger agent of the Lehigh Valley, has been promoted to general passenger agent, with headquarters at New York. He was born on

August 11, 1881, at Huntingdon, Que., and began railway work November 1, 1902, with the Rutland Railroad in the freight house at Rutland, Vt. Six months later he entered the passenger department, and subsequently was traveling passenger agent on the same road. In May, 1909, he went to the Lehigh Valley, and served as New England agent at New Haven, Conn., until December, 1914, when he was appointed division passenger agent, with office at Buffalo, N. Y. In October, 1916, he was

transferred in the same capacity to Ithaca, from which position he was promoted in December, 1917, to assistant general passenger agent, with office at New York, and now becomes general passenger agent of the same road, also the Susquehanna & New York, and the Buffalo Creek Railroad.

**Engineering and Rolling Stock**

**W. Y. Scott**, assistant signal engineer of the Boston & Maine, with office at Boston, Mass., has been appointed signal engineer, with the same headquarters, succeeding **J. V. Young**, deceased.

**O. H. Frick**, field engineer on valuation work with the Chicago, Milwaukee & St. Paul, has been appointed district engineer of the Middle district, with headquarters at Milwaukee, Wis., succeeding **Charles Lapham**.

The jurisdiction of **A. H. Yocum**, signal engineer of the Philadelphia & Reading, the Atlantic City Railroad and the Port Reading, has been extended over the Central of New Jersey and the New York & Long Branch, with office at Philadelphia, Pa.

**W. L. Webb**, district engineer of the Chicago, Milwaukee & St. Paul, with office at Chicago, has been assigned to special work in connection with the Chicago Union Station, and Lieutenant **C. F. Urbutt**, formerly in the construction quartermaster's department of the United States army, succeeds Mr. Webb as district engineer.

**C. W. Mathews**, master mechanic of the Cincinnati Terminals and Kentucky division of the Louisville & Nashville, with office at Covington, Ky., has been transferred to the Albany (Ala.) shops, vice **C. J. Bodemer**, assigned to other duties; **W. E. Hunter**, master mechanic of the Knoxville and Atlanta divisions, at Etowah, Tenn., has been transferred to the Cincinnati Terminals and Kentucky division, which office at Covington, vice Mr. Mathews, and **G. H. Berry**, succeeds Mr. Hunter.

**Robert H. Ford**, whose appointment as principal assistant engineer of the Chicago, Rock Island & Pacific, with headquarters at Chicago, was announced in the *Railway Age* of

R. H. Ford

March 7 (page 568), is a graduate of Norwich University, Northfield, Vt. He began his railway career with the Central Vermont with which road he was engaged in various roadway, engineering and construction capacities. In 1906 he went with the Missouri Pacific as maintenance of way inspector and the following year he was appointed principal assistant engineer of the system. In 1910 he resigned from the above road to become chief engineer of the Hodges-Downey Construction Company, general railway contractors, in which capacity he served for two years. He then entered the employ of the Chicago, Rock Island & Pacific as special engineer. Previous to his recent appointment as principal assistant engineer he was engineer of track elevation in charge of general construction and special work, principally in the Chicago district.

**Purchasing**

**George W. Snyder**, assistant engineer of maintenance of way on the Pennsylvania Railroad, at Philadelphia, has been appointed to the newly created position of general storekeeper for the Pennsylvania, lines east, with office at Philadelphia, Pa.

**Corporate**

**Executive, Financial, Legal and Accounting**

**W. F. Kennedy** has been appointed auditor of the Louisville & Nashville, for the corporation, and **R. J. Wagoner** has been appointed assistant auditor; both with offices at Louisville, Ky.

**Operating**

**Walter T. Moodie**, whose appointment as superintendent of Division No. 1 of the Central district of the Canadian National, was announced in the *Railway Age* of February 7, 1919, page 424, was born at Glasgow, Scotland, on March 10, 1882, and received his education in the Allen-Glen School at Glasgow and Scotland Technical College. He began his railway.

N. W. Pringle

service on March, 1903, as assistant engineer, with the Caledonian railway. From 1905 to 1908 he was engaged as assistant engineer on the location and construction of the Central South African Railway, and the following three years served as assistant engineer on the Canadian Northern, until he was appointed engineer of maintenance of way, in which capacity he continued for four years. In October, 1915, he was promoted to the office of district engineer in which position he remained until his recent appointment as superintendent of the Canadian National.

### Traffic

W. T. Marlow has been appointed general freight agent of the Canadian Pacific Ocean Services, Limited, in charge of freight traffic, Atlantic and Pacific services. G. D. Robinson has been appointed European freight agent, and G. C. Dew has been appointed Asiatic freight agent; all with offices at Montreal, Que.

George Stephen, who has been appointed freight traffic manager of the Canadian National Railways, with office at Toronto, Ont., as has already been announced in these columns, was born on July 5, 1876, and began railway work in June, 1889, as a junior clerk in the foreign freight department of the Canadian Pacific, at Montreal, Que. He remained in that department at Montreal and later at St. John, N. B., until August, 1899, and was then appointed chief clerk in the general freight office at Winnipeg, Man. From July, 1900, to the following January, he was traveling freight agent in the western provinces, and subsequently served as contracting freight agent, in British Columbia on the same road. From June, 1901, to December, 1906, he was chief clerk in the general freight office of the Canadian Northern, at Winnipeg, and then was assistant general freight agent. He was promoted to general freight agent in May, 1909, and in November, 1916, became freight traffic manager of the same road, in charge of the territory from Port Arthur to Duluth, west to the Pacific Coast, with office at Winnipeg, which position he held at the time of his recent appointment as freight traffic manager of the Canadian National Railways, as above noted.

R. E. Larmour, general agent of the freight department of the Canadian Pacific, with office at New York, has been promoted to general freight agent with headquarters at Montreal, Que. He was born on September 26, 1869, at Brantford, Ont., and began railway work on the Grand Trunk as a clerk in the office of his father, who was a division superintendent. He served on that road consecutively at London, at Windsor and at Detroit, until November, 1898, when he resigned to go to the Canadian Pacific as chief clerk in the freight office at Winnipeg, Man. He subsequently served consecutively as acting agent, general clerk in the superintendent's office at Ft. William, agent at Port Arthur, freight claim agent at Vancouver, B. C., and at Winnipeg, Man., and as general agent at Ft. William. From July, 1908, to June, 1909, he served as general freight agent of the Kootenay and Boundary districts, at Nelson, B. C., and the following June was transferred to the Central division, at Winnipeg. In June, 1911, he was appointed division freight agent, at Vancouver, B. C., and in July, 1914, was appointed assistant general freight agent at the same place. Since October, 1915, he has served as general agent of the freight department at New York, and now becomes general freight agent, with office at Montreal, of the same road, as above noted.

R. E. Larmour

### Obituary

Frank D. Hurst, division freight agent of the New York Central, with headquarters at Youngstown, Ohio, died on March 8, at Santa Fe, N. M., at the age of 49.

James Balkwill, superintendent of the Canada division of the Michigan Central, with headquarters at St. Thomas, Ont., died suddenly of heart disease while traveling from Fargo, N. D., to St. Thomas. Mr. Balkwill was 51 years of age.

A. F. Page, trainmaster of the Illinois Central, with office at Louisville, Ky., died on March 8, from the effects of injuries received when he jumped from a fast moving automobile which he thought was about to collide with a locomotive.

Sir Guy Calthrop, Lt., general manager of the London & North Western Railway of England, and (since 1917) controller of coal mines under the British government, died on February 23, in London, at the age of 49. In 1886 he began railway work as a junior at Euston Station, becoming in 1892 outdoor assistant to the superintendent, and in 1901, assistant to the general manager. In 1902 he went to the Caledonian Railway as general superintendent, and later until 1910 was general manager of that road. He was appointed general manager of the Buenos Ayres & Pacific Railway in 1910, and four years later returned to the service of the London & North Western as general manager.

John J. Harrower, for many years secretary of the Eastern Railroad Association, died at his home in Washington, D. C., on January 9, 1919, at the age of 78. His service began with the organization of the association, on February 6, 1867, and extended over more than 50 years. At that time, Mr. Harrower was a clerk in the office of Daniel L. Harris, president of the Connecticut River Railroad and the first secretary of the association. On January 1, 1879, when the office of the association was moved to Boston, he severed his connection with the Connecticut River Railroad and became an exclusive employee of the association. He was elected secretary in May, 1887, and filled that position until May, 1918.

Edward Francis Kearney, president of the Wabash, died at his home in St. Louis, Mo., after a few days' illness of pneumonia. He was born on March 27, 1865, and began railway work in 1882 as a telegraph operator for the Pennsylvania Lines. He remained with that road until February, 1903, being employed respectively as freight clerk, chief operator in the superintendent's office, train dispatcher, trainmaster's clerk, chief clerk to superintendent and trainmaster. The following year he was superintendent of the Terminal Railroad Association of St. Louis and the St. Louis Merchants' Bridge Terminal Railway, going to the Chicago, Rock Island & Pacific in February, 1904, as supervisor of mails. From April to October of that year he was superintendent of transportation on the St. Louis & San Francisco. In April, 1905, he was appointed superintendent of terminals of the Missouri Pacific at St. Louis and in February, 1908, was promoted to superintendent of transportation of that road and the St. Louis, Iron Mountain & Southern. He was made general superintendent of transportation in January, 1913, and three months later was elected first vice-president of the Texas & Pacific, with headquarters at New Orleans, La. Mr. Kearney held the latter office when he was appointed receiver of the Wabash in 1915, and was later elected president of that road, which position he held until the time of his death.

E. F. Kearney

DAILY EDITION

The first meeting of the Signal division of the American Railroad Association was successful to the point of exceeding the most earnest hopes of

### The Signal Division Attendance

those in charge, in so far as attendance was concerned. Perhaps this success might be attributed to the recent amalgamation with the A. R. A. and the desire of signalmen to see the actual results of this change; perhaps it was due to the shifting of personnel in the signal field during the past year or it may be the result of the uncertainty as to the fate of the railroads themselves, or the natural desire of all railroad men to exchange views on the subject. Whatever the cause, the fact remains that signalmen of all classes are taking an active interest in the conduct of the old Railway Signal Association this year and its new relations with other associations and with the railroads. Definitely, the registration yesterday showed there were 319 members of all classes in attendance as compared with 198 last year, an increase of 121 members.

The higher officers of the Railroad Administration have taken a very broad and intelligent view of the value of the conventions of railroad associations and of the exhibits of equipment and supplies made in connection with them. The regional directors, with the sanction of Director-General Hines and Director of Operation Tyler, sent out circular letters to the federal managers instructing them to cause as many of their engineering and maintenance officers to attend this year's Railway Engineering Association convention as could be spared from their other duties. Director-General Hines intended to be a speaker at the association's annual banquet on Wednesday evening, but will be prevented by pressure of work in Washington. Director of Operation Tyler intended also to attend the dinner, and it is still hoped that he will do so. It is probable also that some of the regional directors will be present. Formerly, under private operation, the executive officers of the railways did not take as much interest in and give as much encouragement to the meetings of the important association and the exhibits in connection with them as was desirable in the interest of the greatest efficiency of operation. The greater recognition given to the conventions by the higher officers under government control should cause gratification; and it should be continued after the railways are returned to private operation. Never in the history of America was there such need of the greatest attainable efficiency and economy of railway operation as there is now. The increased efficiency and economy needed must be attained, if at all, chiefly by means of the use of methods and devices which will save labor. The conventions of the technical associations and the exhibits given in connection with them afford among the very best means available for developing methods and seeing devices intended to increase efficiency, and especially to increase it by saving labor. The Railroad Administration is rendering a good service

to the railways and the country by giving the conventions and exhibits its powerful support.

at that time a year ago the Railway Signal Association, now the Signal division of the American Railroad Association, held its meeting under decidedly different conditions than exist at present. The winning of the war was then the all-important factor. Practically no one lay down his arms as soon as he did. Every thought, every act, in fact, everything that was done had therefore the one purpose in view—that of making victory possible. The R. S. A. did its bit; its records show that a number of its members joined some branch of the military or naval service. These men, some of whom have already returned and again engaged in their former occupations or other civil pursuits, have had experiences which they can look back upon as mile stones in their lives, which bear inscriptions of service and of which they can justly feel proud.

The railways of France, Belgium, Italy and the other countries in the fighting zones had to be operated and maintained in order that military operations could be carried on to the fullest extent. In that connection the signal engineer is as essential as he is in civil life, likewise the men under his leadership. In that capacity at least three of the R. S. A. honor roll men have served as officers or in the ranks of engineer companies in the field; still others in supply units, and in the forces at the fighting front. On another page is an article describing the activities of various members in the war. However, the struggle is over now and these men are returning with only a memory of the past. Some will undoubtedly renew their former activities and re-establish their standing under new conditions. As far as association work is concerned they will have to adjust themselves to the newly created Signal Division of the American Railroad Association, which adjustment will depend largely upon the spirit with which all members enter into the reorganized A. R. A., and must assume the responsibility for the success of all activities relative thereto.

In the reorganization of the American Railroad Association many of the technical railway associations are being merged with it. The discussion of the reorganizations at the meeting of the Railway Signal Association yesterday was one of many illustrations of the fact that there is by no means entire unanimity among railway officers regarding the effect on the work of the various railroad associations that the merger with the American Railroad Association is going to have. The determination of whether the change will have a good or a bad effect will be made chiefly by the American Railroad Association itself. The old American Railway Association

The A. R. A. Signal Division and the War

tion was criticised a great deal because, as was alleged, it did not assume its proper responsibilities and perform its duties. To a large extent this criticism was just. The way in which the American Railway Association conducted its business rendered it impossible for it to be an efficient and effective organization. Almost all its work was done by its various committees, including the executive committee. Its semi-annual meetings usually were perfunctory affairs. They ordinarily did not last more than three or four hours, and there was almost no discussion on the floor. The disposition of the reports recommended by the executive committee almost always was adopted in steam roller fashion.

In consequence, there was not the full and intelligent consideration of the various problems with which it was the duty of the association to deal that there should have been. Furthermore, the association ignored many problems with which it should have dealt. Finally, it failed to adopt means of giving general effect to the standards and recommended practice which it adopted.

If, after having assumed a wide control over the work of organizations in the engineering, mechanical, signaling, transportation and other fields, the American Railroad Association should transact business in the same way that the American Railway Association has in the past it will not only fail to accomplish anything substantial itself, but it will also prevent the organizations over which it has taken control from accomplishing as much as they have in the past. The members of the new American Railroad Association must make it an organization worthy to exercise the suzerainty over the other organizations which it has adopted. In order to do this it will be necessary for the American Railroad Association to meet at least twice a year, to continue its meetings through at least two days instead of through only three or four hours, and to adopt effective means of getting the railways to carry out the standards of practice which the association shall adopt. While the railways are under government control it will be the function of the director general to give effect to the association's decisions, but probably the A. R. A. will outlive the Railroad Administration.

By co-ordinating the work of the various technical organizations much good can be accomplished, but whether the good that can be accomplished actually will be accomplished remains to be seen.

## Effect of Passing Sidings on Capacity

AMONG THE PROBLEMS that confront many of the railroads today is that of increasing their capacity. Some lines are experiencing serious delays in moving trains, when, if the facts were known, a large portion or all of the difficulty might be eliminated. In connection with such problems Committee 10 of the Signal division of the American Railroad Association has made extensive investigations. Several years ago this committee, then known as Committee 1 of the Railway Signal Association, was assigned the work of making a study of the problems of signaling single track roads and of determining the influence of the proper location of passing sidings on the capacity of lines. As a result of such investigations, the committee one year ago, then known as Committee 10 of the R. S. A., submitted its report on the above subject to the association as information. Since then it has continued its study with a view of amplifying and analyzing the same problem when applied to two or more tracks. These studies have been combined into the report that was submitted at yesterday's meeting of the Signal division of the A. R. A.

Comparing the analysis of the single track with that of two or more tracks, it is evident that the problems are quite different even though time in both cases is the controlling factor in determining the number of trains that can be operated between two points. In the first case opposing trains are dealt with, while in the second case the predominating factor is following trains, with occasional layouts of opposing traffic on one or more tracks. The problem of the proper location of passing tracks resolves itself into an analysis of the particular layout under investigation, and the quantity and type of traffic involved. However, fundamental formulae can be applied to the various conditions and simple rules can be followed which will aid in the work of increasing the capacity of the roads.

For instance, it is quite evident that the location of passing tracks which will result in the minimum amount of delay to freight trains which are to be passed by passenger trains, will be their location so that the spacing between freight trains will be equal to the difference in running time of the freight and passenger trains between sidings. Other factors, of course, enter into a study of the capacity of the roads, such as signaling, and interlocking, additional main lines, etc. A comprehensive study was made of a piece of existing road in accordance with the prescribed method of analyzing multiple track lines, which would result, if proposed plans were adopted, in a reduction of 30 to 70 per cent in the interference on main tracks for freight service and an increase of 35 per cent in the number of freight trains that could be handled at exceptionally restricted points, besides a considerable reduction in the time required in moving over a division owing to a reduction in delays. The decided effect that the proper location of passing sidings, as well as proper signal and interlocking conditions, may have upon the capacity of main tracks is worthy of the most careful consideration by the railroad officers in charge of operation and if the analysis shows that a material increase can be effected at a cost that can perhaps be compensated for, in a reasonable length of time, the cost should be incurred.

## The Future of the R. S. A.

THE FUTURE OF THE Signal division of the Engineering section of the American Railroad Association will depend largely upon the attitude assumed by those comprising its membership. The old Railway Signal Association retains its original membership, among whom are those who have in the past been instrumental in advancing the association to its present high plane.

Excellent work has been done by the R. S. A. in the development of standards and practices for the signal field—a field assuming greater importance each year. It will be essential that the same or greater enthusiasm exist among the members in future in order to accomplish as good or better results as they have in the past. The Railway Signal Association having been a voluntary organization, has had its work largely carried on by voluntary efforts of the members, who have devoted to it such time as their duties permitted. Under the new organization the members, as representatives of their roads, will feel free to give the time required to committee work. This should tend to cause more and better work on their part. As the business of the Signal division will be carried on in the future as was the business of the R. S. A. in the past, the affiliated members will still have an important voice in the affairs of the division through committee assignments, and on the floor of the meetings, although they will not be privileged to vote by letter ballot. The enthusiasm and activities of the affiliated members in the

future will depend to a great extent upon the attitude of the representative or voting members. If the affiliated members find that their suggestions and activities are received with indifference their enthusiasm will be reduced and eventually killed, and the good results obtained from their work during the last 24 years will be lost.

Much good may be accomplished if more definite specifications are adopted in the future than has been the case in the past. In order to accomplish this each member should consider carefully what will be of the most benefit to all the railways, and not merely to his railway. There may be a tendency on the part of the members to restrict the expression of their views under the new organization because, as part of the American Railroad Association, they will be governed largely by the wishes of their superiors, while under the old R. S. A., as a voluntary association, they were not under this restraining influence. When a man gets up to voice an opinion in future he is apt to reflect the policy of his road, and for that reason he may be ultra-conservative. It is to be hoped, however, that the members will continue to express their personal opinions on their experience.

The dues of the members entitle them to the literature published by the division. A digest of the proceedings has been issued each year in the form of a bound volume. Such a digest is of great value to all interested in this branch of railroad work and should be continued, as the information so presented is in handy form for quick and ready reference.

A very spirited discussion took place after an outline of the work in connection with the amalgamation was presented to the meeting yesterday. It would appear desirable that signaling should be given a separate section of the A. R. E. A. instead of being made merely a division of a section.

### The Annual Dinner

Tickets for the annual dinner of the A. R. E. A. will be on sale in the corridor in front of the convention hall at the close of the morning session today. In view of the expected large demand for tickets those planning to attend are urged to secure their tickets as early as possible. They are sold at \$3.50 each. In view of the long program a special effort will be made to seat the guests promptly at 7 o'clock.

The speakers at the dinner will include United States Senator Atlee Pomerene, of Ohio, who will speak on "Some Phases of the Railroad Question;" Dr. George Adam, pastor of Emmanuel Congregational Church, Montreal, Quebec, who will speak on "Language and Ideals;" Hon. Clarence N. Goodwin, of Chicago, whose subject will be "Americanization in Connection With Maintenance of Way Labor on Railroads," and Robt. J. Cary, general counsel New York Central Lines, at Chicago, who will take for his topic "Noblesse Oblige—Our New Nationalism." Senator Pomerene is a member of the Senate committee on Interstate Commerce and has been present at all of the recent hearings at which the various solutions of the railroad problem have been presented. He is, therefore, particularly well qualified to discuss the subject.

### A.R.E.A. Board of Direction Meeting

A meeting of the board of direction of the American Railway Engineering Association was held in the English room of the Congress Hotel at 10 o'clock yesterday morning where a four-hour session was spent in the transaction of routine business and the completion of

plans for the convention. For the first time in the history of the association all of the 19 members of the board of direction were present.

### Secretary Fritch's Two Sons in Service

Secretary Fritch was much gratified to receive a message last Thursday from his son E. J. Fritch, announcing his safe arrival at Newport News from service overseas. He was a sergeant in the 75th regiment, Coast Artillery. Mr. Fritch has the distinction also of having had another son in the service, L. C. Fritch, who was in the medical department and who has received his discharge and returned to school.

### Hu and Wu

Among the recent members of the American Railway Engineering Association are T. C. Hu, chief technical secretary of the Chuchow-Chinchow railway, Peking, China, and Da-Chang Wu, formerly structural draftsman with the Santa Fe, who has recently returned to China.

### The A. R. E. A. Convention Program

The Twentieth Annual Convention of the American Railway Engineering Association was called to order at 9:30 this morning and will continue in session until Thursday afternoon. The sessions will convene at 9:30 a. m. and 2 p. m. Following the address of the president and the reports of the secretary and treasurer, the reports of standing and special committees will be presented as follows:

#### First Day—Tuesday, March 18—

- Signals and Interlocking.
- Signs, Fences and Crossings.
- Conservation of Natural Resources.
- Track.
- Records and Accounts.
- Rules and Organization.
- Economics of Railway Labor.

#### Evening Session—

- Illustrated Use of Labor-Saving Devices.
- Developments in Study of Transverse Fissures.

#### Second Day—Wednesday, March 19—

- Wood Preservation.
- Yards and Terminals.
- Electricity.
- Ties.
- Stresses in Railroad Track.
- Buildings.
- Ballast.
- Roadway.
- Rail.
- Annual Dinner at 6:30 p. m.

#### Third Day—Thursday, March 20—

- Iron and Steel Structures.
- Masonry.
- Water Service.
- Wooden Bridges and Trestles.
- Uniform General Contract Forms.
- Economics of Railway Operation.
- Economics of Railway Location.
- New Business.
- Election and Installation of Officers.
- Adjournment.

Signal Division in Session

## Stated Meeting of Signal Division of the A. R. A.

First Session Held Under the Changed Conditions—  
Abstracts of Reports With Discussion

THE MARCH STATED MEETING of the newly-created Signal division of the American Railroad Association was held in the Auditorium hotel, Chicago, on Monday, March 17. The morning's session was called to order at 9:55 a. m. by President R. E. Trout, signal engineer, St. Louis-San Francisco, and adjourned at 12:45 p. m. The meeting re-convened at 2 p. m. and continued until 7 p. m.

The first order of business was the approval of the minutes of the last meeting. As there was no unfinished business the new business before the Association was taken up. In this connection the circular letter covering the conditions leading up to the change, dated February 24, which had been forwarded to all members of the Association, was read.

The Secretary stated that beginning April 1 new members enrolled would be classed as affiliated members. Members who are railroad men and who have not been appointed by their railroads as members of the Signal division of the American Railroad Association will be required to pay \$3 per annum as dues. Others not railroad men who are admitted as affiliated members will be required to pay \$6 per annum. Up to April 1 the dues will be as they were formerly and members will be accepted in the association under the old arrangement until midnight March 31, 1919. The secretary stated that the securities of the association and the loving cup had been transferred to the care of the secretary and were held in trust. The secretary stated that the Committee on Direction, at a meeting held March 16, decided that the June meeting of the division will be held at Atlantic City, June 26 and 27. This time it was also decided to hold the annual meeting in Chicago on September 17, 18 and 19, 1919.

The regulations for the Signal division of the A. R. A. as of March 16, 1919, were then read. It was moved and seconded that these resolutions be accepted and this motion carried. The handling of committees in the future will be the same as in the past except that, on proper

notice, the secretary will be present in person or assign some one to act as recording secretary for the meetings. A resolution was presented before the meeting that it was the sense of the division that they be organized as a separate section of the American Railway Association.

After reading this resolution a number of points were brought out by members with reference to the effect the proposed change would have on certain meetings and upon the actions of the division. The resolution and the discussion covering these points is given below.

The secretary submitted the following resolution:

WHEREAS, The Signal Division of the American Railroad Association desires to be of the utmost value to the United States Railroad Administration and the railroads, and,

WHEREAS, The Division includes in its membership many officers occupying positions in the Signal departments of the railroads which are distinct in character from those of any other department, and,

WHEREAS, The inclusion of the activities of the Signal Division with those of any section of the association will prevent the rendering of the most efficient and valuable services, therefore, be it

*Resolved*, That the Committee of Direction of the Signal Division be instructed to bring to the attention of the executive committee the necessity and desirability of the creation of a separate section to cover the activities of the Signal Division.

WHEREAS, The Signal Division of the American Railroad Association desires to be of the utmost value to the United States Railroad Administration and the railroads, and,

WHEREAS, The division includes in its membership many officers occupying positions in the signal departments of the railroads which are distinct in character from those of any other department, and,

WHEREAS, The inclusion of the activities of the Signal

Division with those of any section of the association will prevent the rendering of the most efficient and valuable services, therefore, be it

*Resolved*, That the Committee of Direction of the Signal Division be instructed to bring to the attention of the executive committee the necessity and desirability of the creation of a separate section to cover the activities of the Signal Division.

(On a motion, duly made and seconded, the resolution was adopted.)

L. R. Mann (Mo. Pac.): Wouldn't it be well to say what the alternative would be, in case this does not come into effect?

T. S. Stevens (A., T. & S. F.): There is no alternative possible.

The President: It means, of course, that there will be a signal section instead of a signal division. We will be a separate section.

Frank Rhea: It seems to me that this resolution was passed before you had time to consider it. It occurred to me that the status of railroad men, and possibly of the United States Railroad Administration, was in doubt. What is the status of railway men in Canada in this Signal Section? Do they have any status at the present time, other than affiliated railway members?

The Secretary: Answering Mr. Rhea direct, any employee of any railroad in the world, which railroad belongs to the A. R. A., we hope will be an appointed member by the railroad, which means that that individual, or as many individuals as are appointed by any one property, will be what are termed representative members.

Mr. Rhea: That is, for the United States Railway Administration?

The Secretary: For the universe, if you please.

Mr. Rhea: How will they be appointed for anybody that is not under the jurisdiction of the Railway Administration?

The Secretary: Any one property which belongs to the A. R. A., which is international, becomes automatically, without the U. S. R. A. attached to it, a member of the Signal Division of the A. R. A.

Mr. Rhea: Are there other railroads that are members of the A. R. A.?

The Secretary: There are, including Canada and foreign countries.

Mr. Rhea: Under Order 70?

The Secretary: No, sir.

Mr. Rhea: I don't appreciate then how they can be.

The Secretary: Without hearing all the documents available, Mr. Rhea is speaking about the American Railway Association, and not the newly organized American Railroad Association. There is a difference in the technique of the two.

Mr. Rhea: Of course, I am not a mind reader.

The Secretary: I do not desire it understood that there is any secret code in the arrangement. The cards are all on the table, and if Mr. Rhea has not all the documents, we will be glad to produce them for him.

Mr. Rhea: This may be not pertinent to the situation, but there is another question I would like to ask now. This says that members are appointed by their respective

railroads. Now, does that eliminate dues, and if you do not want the proceedings, can you still continue a member?

The Secretary: All members of the R. S. A. are now members of the Signal Division automatically, whether they are active, junior, associate, life or honorary members. A member in the circular spoken about is an appointee of an American railroad, a member of the A. R. A. from a certain specific railroad, which specific railroad has appointed one or more men from its railroad as members of the signal division, as signal experts. That is a detail that has not been developed, because a railroad might appoint a signal engineer, assistant signal engineer, inspector, supervisor, and assistant supervisor, and another railroad might only appoint a signal engineer. Those men are non-producing members in the signal division, for they do not pay dues, because the parent railroad who appointed them as representative members pays dues for them, so they are deadheads. That leaves on

the active and junior list of the R. S. A. a certain number of employees who are not members or representative members, as we call them. Those people, if they desire, to continue in the Signal Division, are privileged to continue as affiliated members, because they are employed on railroads, international railroads, if you please, and they will pay \$3, as they have in the past, for the privilege of membership, and receive the literature. The \$3 is nominal, to reimburse our treasury for printing a lot of additional copies, which run into something like \$4,000 beyond our regular quota.

The next affiliated member is a non-occupant of a position on a railroad; not necessarily a supply man, for instance, Mr. Rhea himself. He may be an affiliated member of the signal division by paying \$6 per annum. This is after December 31, 1919, I am speaking about. All of these people that we have spoken of, whether they are R. S. A. tagged or signal division A. R. A. tagged, will come to our meeting, and they will

be on the floor doing everything that they have done in the past, and they will do as they did in the R. S. A.

Mr. Rhea: Can there be such a thing as anyone joining as an affiliated member in the future?

The Secretary: We hope that there is not one man who is today a member who will drop out, and we hope that we shall be able to bring in at least 10,000 more.

Mr. Rhea: I have had a peculiar interest in this situation. I am No. 52 on the membership list. I have had a feeling in the past that I had somewhat of an equity in the R. S. A. That may have been visionary and optimistic. In the proceeding which has taken place I have somewhat of a feeling, as a non-railroad member, that there has been some equity removed from me. I feel that my property has been confiscated.

The Secretary: I hope Mr. Rhea will disabuse his mind of any such feeling, or anyone who has a similar feeling. Under the new conditions, when we adopt standards, we are in a position now to have them accepted by the higher authorities in the railroad business, which in the past has been a thing almost impossible of accomplishment. A careful analysis discloses not one

R. E. Trout  
President of R. S. A.

thing in which this change is not to the advantage of the association, and if there is anyone who sees any indication for the modification or for the breaking down, instead of building up, we will certainly welcome the expression of that opinion, in any way that it may come to us.

Mr. Stevens: As I analyze this thing, in the old R. S. A. we had certain types of membership who had certain privileges and then we had representative memberships. It is true, I think, on a letter ballot the representative vote could carry the standard. The members came to the meeting just as they will do now, and presented matters for letter ballot on the floor, and if we did not agree to them we did not approve them, and we will be able to carry out the same action now. In the old days, if the membership thought well enough of the standard to submit it to letter ballot, the representative vote carried it, just as the membership, appointed by the railroads now, will carry it, if it is to be carried, or dispose of it otherwise.

As I view the situation, we will have no direct connection with the Railroad Administration, but the Railroad Administration will have sufficient confidence in what the Executive Committee of the A. R. A. does, if they are requested so to do, to make certain appliances standards of the railroads in the country, and that is the only function that the Railroad Administration intends to use in connection with our activities. We will go along recommending standards just as we have done. The members who were voting on the floor will still have the vote, and the only difference will be when a letter ballot is put out, those members will not have a vote, and that is practically what they have not been doing since we established the representative vote.

The Secretary: The railroads will appoint the representative member, and all other members are active members as they were in the R. S. A.—that is their status.

W. H. Arkenburgh (Can. Nat. Car. Co.): Under the old plan, representatives of manufacturers have been privileged to come to the meetings and pay our dues, but not vote on anything except the place of meeting. Under the new arrangement do we have the rights of members?

The Secretary: You have the right of voting on the floor—you have all the privileges of active membership.

P. M. Gault (I. C.): You have not said anything about company members. There are still a certain number of the members in the association who are employed by companies, and I would like to know what their status is.

The Secretary: Companies are corporations and corporations are members of the American Railroad Association, the same as in the case of the U. S. R. R. A.

J. C. Mock (M. C.): I want to ask whether all the formalities in the change of name have been properly gone through with? Ordinarily a change of name, a change of organization, including a change of dues, responsibilities, etc., would be a matter for the membership to decide rather than the board of direction.

The President: The board of direction did meet, and they called in as many members of the Association as they could get together. I believe Mr. Mock was invited but did not come. We tried to get as many members together as we could to pass on this subject.

Mr. Gault: Who is going to have the representative, the railroad administration or the owner? You cannot have both.

The Secretary: My understanding is that all corporate organizations which choose to be, are members of the A. R. A. All of the Administration railroads that desire to become members of the A. R. A. are members. Now, there cannot be any conflict.

W. H. Elliott (N. Y. C.): I will state in answer to Mr. Gault's question that the corporation membership in the A. R. A., and that the representative appointed to cast the vote of the railroad on the basis of one vote for each 1,000 miles, will be appointed by the railroad subject to the control of the Railroad Administration.

Mr. Stevens: I feel somewhat the same as Mr. Mock with regard to the action of the R. S. A. joining the A. R. A. You have heard the circular read today putting the matter before you, and it has been approved. I think, however, so far as the R. S. A. is concerned, the matter would be in better standing if the same circular was approved by the annual meeting and finally approved at the annual convention. I do not believe that the board of direction should have done anything so radical on its own initiative. The submission of this circular to the eastern meeting and the annual convention will bring out more good points than bad ones. It will be a good thing to do.

Mr. Rhea: I have studied the constitution and cannot find that the board has the authority for this action. Mr. Camp and Mr. Stevens also know that the active membership of the association had no voice in what has happened. I am of the opinion that this matter should have been submitted to the whole association for a vote before any action was taken.

Mr. Stevens: I want to take issue with that statement. The R. S. A. has not been confiscated by the A. R. A. They have not made any effort to do that. They formed a new association, the American Railroad Association, and they asked the R. S. A. to join, and the board has taken the best action it could so far as details are concerned. What I would like to see done is to have approval of the membership in our proceedings. I move that the R. S. A. circular presented at this meeting, dated February 24, be presented both at the Atlantic City meeting and the annual convention, for the approval of the members of the Railway Signal Association.

C. A. Dunham (G. N.): I feel called upon to disagree with what Mr. Rhea has said. As a member of the Board I fail to find where any alternative proposition was available. It may be, under the old R. S. A. constitution, that the Board has perhaps gone a little far in making the amalgamation or transfer, if you please, of this association as the Signal division of the A. R. A. But I feel this meeting is not disposed to criticize the board for doing the only thing that it could do.

Under the new organization, every member of the old association has acquired a membership in a much larger and stronger association than was true before. As a member of the Signal division of the A. R. A. he is going to have a great deal better status than was true under the old conditions. The findings of this Signal division, if you please, are going to have the force of executive adoption and approval, and the recommendations of the Signal division, when so approved, will be obligatory, not optional. We are going to be in a very much stronger position in the future than has been true in the past. I feel very sure that the Signal division is going to receive very cordial support from the A. R. A. and in a short time we will find ourselves very much better situated than has ever been true in the past.

A. G. Shaver (Consulting Engineer): I have been a member of the R. S. A. a number of years, and it has always been the practice, so far as I have been aware, when there has been in contemplation change of any kind, to let it be known to the membership of the association and the matter acted on as the constitution provides. I have not understood that the change now made at the whim, in a measure of a few railroad officers in this

country, has been submitted to the membership as the constitution provides. It is my understanding that the R. S. A. is an incorporated body, working under a constitution, and if that is so, the constitution provides the method of procedure, and unless such procedure has been followed, the R. S. A. still exists.

I have been interested in the proceedings of the R. S. A. for many years, and I dislike exceedingly that any change in its name or activities should be brought about. Primarily you are now providing something to accomplish what a few people in the country want, and it may be only temporary. You probably will have to make a change again later on. I am bringing this matter up, in the hope that some means may be found whereby an affiliation of the R. S. A. with the A. R. A., in some way, will accomplish what the Railroad Administration would like without taking too radical a step towards a consolidation with the A. R. A.

Mr. Dunham: Mr. Shaver struck a responsive chord in the hearts of a good many members. It is unquestionably true, as a matter of personal privilege, we would like to have retained many features of our old association. But that is not the question—under the situation the R. S. A. had no alternative. You will remember in 1917, through the American Railway Engineering Association the A. R. A. laid the foundation stone, if you please, of an amalgamation of all of the voluntary associations and we thought that ultimately we would be consolidated into the A. R. A.

As President of the association at that time it was my privilege to present the situation for the R. S. A. to the governing board of the A. R. E. A., and that association in turn transmitted the reports from all of the voluntary associations to the A. R. A. I make this statement rather with the idea we should be prepared to feel that we are not going back to the previous conditions. I believe I am violating no confidence when I state that the railroad executives of this country have felt for a long time that the activities of the various voluntary associations, while desirable in many respects, were not well co-ordinated, and that it was desirable to draw them into a closer and better working organization.

Mr. Rhea: Mr. Dunham made some of the points I had in mind. This has been a voluntary association and we had a constitution and an equity in the association. Under compulsory action the change was made, apparently the members had no vote in the matter—the board of direction, to save the situation, as he apparently puts it, has taken action which they thought was necessary, but it has not been done in conformity with the constitution of the R. S. A.

One of the reasons we have in America the great transportation machine which we have all been proud of is that we have had our voluntary associations and have had the benefit of the individual initiative of the members of those associations, and God help us if we lose that in whatever form it may come up.

A. G. Shaver: I agree with what Mr. Rhea has had to say. I still think the R. S. A. should be continued. I can see we are forced into a scheme of some kind to get the affiliation that certain individuals want, but the affiliation might come, it seems to me, in some manner that will still leave the R. S. A. as it has been in the past, with the membership having the right and privilege to express its will which it cannot do under the arrangement now proposed. The membership of the R. S. A. as part of the A. R. A. is going to kill the individual initiative as I see it.

W. M. Camp (Railway Review): The board is pleading that it did this thing under pressure and had no al-

ternative. I do not know whether that is true or not. The same proposition was put up to the A. R. E. A. and they took a vote of the membership on it, and the membership voted it would *not* go into the proposed amalgamation on the terms submitted. The American Railroad Association has submitted new terms and the expectation is now that the A. R. E. A. will come in. But I want to call your attention to the fact that the A. R. E. A. *did* take a vote and turned it down. This association, apparently, did not have the grit to do it.

Mr. Dunham: I think the action taken by the meeting this morning ratifies the action already taken by the board. There was a difference between R. S. A. and the A. R. E. A. The latter association was purely voluntary and was composed wholly of members who paid their own dues, with a few exceptions. There was no railroad membership in that association. Now, that was not distinctly true of the R. S. A. The railroad companies, through their representative membership in the R. S. A. had authority to adopt any standard or other proposition submitted to them, and that may be, in a sense at least, a direct representation of the railroads, as it was in fact, because the railroads paid for the representative voting power according to their mileage. It seems to me that that difference brought the R. S. A. well within the scope of the A. R. A.

The board does not lack courage in any sense of the word. There is not a signal engineer on the railroads who has not had a difficult time of it for the last 20 years, largely because he has not had proper backing, either through the railroads or through an association. I submit that that weakness has been removed by this change of organization. We are now going to be affiliated with a strong railroad organization that is going to give us a backing, and we will find that our recommendations will receive more careful attention and be given greater recognition. We are not going to be hanging to a shoe string as in the past.

W. J. Eck (Southern): I would like to assure the members that they have not been tricked. The board of direction has not put anything over anybody and it has not been a matter of lack of courage or anything of that sort. It has proceeded in an orderly manner. About a year ago the subject of the amalgamation of the various associations was discussed by the board for a long time and a report was presented and approved by the association by a viva voce vote, that should occasion come, where a universal railroad association should be established, the R. S. A. would become a part of it.

It is possible there are others who are in the same position as Mr. Mock, who said he did not realize what was going on, but as a matter of fact, it was open and above board, and when it came about that the Director-General of Railroads asked that the American Railroad Association be formed, the board of direction of the R. S. A. not only had the constitution to back them, but they also had the approval of the association to enter into such an arrangement. In case the arrangement should terminate the securities of the old R. S. A. are held intact by the board of direction and all the machinery is preserved so that the R. S. A. could be resurrected tomorrow if it was necessary.

F. W. Pflieger (U. P.): I object to any insinuation that the board of direction had the big stick held over them. In fact, the board put up the proposition, and outlined the work, and submitted it to the A. R. A. for adoption. I know that the committee of direction put up everything and no one told them to do it.

Mr. Fugina: I was notified of the original conference the board of direction had with reference to this mat-

ter about a year ago. Since that time until recently I was violently opposed to the action the board contemplated. There were other signal engineers who felt the same way. We discussed the matter at various times among ourselves and were much inclined to criticize the action of the board of direction. When a number of the members were told by the board of direction exactly the arrangement that was to be effected, they won over every one of us, and I believe the R. S. A. will fare better in the future than in the past. I do not believe that the board of direction has had any lack of courage, after they told me what they had done I felt they had a great deal of courage, and I believe the members of the association can thank them for it.

As to other points, I do not believe it is imperative for this association to take action—I believe that the board of direction had power to handle the matter—and I believe if the members will go into the matter fairly, they will be convinced that it is really a great thing for the advancement of the association. At the same time, I believe that the members of the association should have an opportunity of ratifying the plan; we should give them the privilege to vote on it.

The Secretary: Section IV of the constitution reads as follows:

"The board of direction shall manage the affairs of the association and shall have full power to control and regulate all matters not otherwise provided for under the constitution, except to make the association liable for debt to an amount greater than that which, at the time of contracting the same, shall be in the secretary-treasurer's hands, in cash, and not subject to prior liability."

It is a fact that there is nothing in the constitution to provide for such a transfer.

H. M. Sperry: If we review a few facts we may clear our minds on this subject. (1) The railroads are in the possession and control of the federal administration; (2) the R. S. A. was a railroad organization, as shown by its representative members, and, therefore, differs from the ordinary voluntary organization; (3) the change was a necessary change as a part of the railroad program, that is, the Administration program; (4) the action has been ratified by your board of direction and the plan put through and it was actually ratified at this meeting, and, therefore, in any action taken now you must upset your previous ratifications.

As to the position the directors were placed in in deciding this, they had a very difficult proposition. They were faced with precedent, and no one likes to go against precedent, but they had the courage to do what they had to do and did it well, and as we stand today the R. S. A. is not changed and put on the shelf, but it has changed its name and is a bigger and stronger association, and the proof is the attendance at this meeting. (Applause.)

Mr. Stevens: I want to support everything that has been said with reference to the approval of the board's action. I do not think we will ever go back, even voluntarily, to our old status. I have always been an advocate of co-ordination of the voluntary associations in this country, because we are connected together in a way, and the standards of one association will overlap with those of the others, and we cannot do the work we should do unless we have some co-ordination. I wish to withdraw my motion.

On motion by Mr. Elliot, discussion was concluded.

## Report of Committee III—Power Interlocking

THE COMMITTEE SUBMITTED a report on the following subjects: Specification for Electric Motor Switch Operating and Locking Mechanism, Specification for Electric Interlocking Machine. Only such sections of the specifications as have not been presented before are printed below. Regarding section 1-g. Tests made by various members of the committee and checked by other interested members of the association indicate the proposed specification will ordinarily provide a factor of safety of two, at the present maximum switch loading.

Other structures along railroads which must withstand shocks without failure ordinarily have factors of safety from three to six. The views of the members were desired on this point.

Section 2-e provides for R. S. A. lock and operating rods, which as yet are not standardized. Section 2-l also provides for an R. S. A. switch layout as regards centering of lock and operating rods.

Section 2-h with reference to unauthorized movement. The committee desires criticism on this point.

The adoption by the association of this specification will automatically change the following sections of the Electric Interlocking specifications now in the Manual. 300. Switch mechanisms.

(a) Switch operating and locking mechanism shall conform to R. S. A. specification for Electric Motor Switch Operating and Locking Mechanism.

(b) Switch motor shall conform to R. S. A. specification for Electric Switch Motor.

Sections 301 and 312 will be eliminated.

The committee recommended that the specification for electric motor switch operating and locking mechanism and that the one for electric interlocking machine be accepted for presentation to the annual meeting for approval and submission to letter ballot for inclusion in the Manual.

### Specification for Electric Motor, Switch Operating and Locking Mechanism

#### First and Second Range Voltage

##### 1. Operating Requirements

(a) Mechanism shall perform its normal operation in the following sequence: (1) Throw detector bar one-half stroke, and unlock switch. (2) Throw switch. (3) Lock switch and throw detector bar one-half stroke. (4) Indicate. 1919.

(b) Mechanism shall be so constructed and equipped with an efficient friction clutch that it can be stopped, reversed, or obstructed at any point of its movement without damage. 1919.

(c) Mechanism shall be so constructed that it will follow the movement of the controller at the point of control. 1919.

(d) Mechanism shall be so constructed that indication cannot take place nor locking device complete its movement, unless the lock rod has moved to the full normal or full reverse position and the position of the mechanism corresponds thereto. 1919.

(e) Circuit controlling device shall be so constructed that

it will, for proper operation, be dependent upon the movement of the lock rod. 1919.

(f) Normal operating voltage for: (1) First range voltage mechanism shall be 20 volts, and time of operation at this rating shall not exceed 30 sec., nor shall it exceed 40 sec. at a voltage 20 per cent below normal. 1919.

(2) Second range voltage mechanism shall be 110 volts and time of operation at this rating shall not exceed four seconds, nor shall it exceed five seconds at a voltage 10 per cent below normal. 1917.

(g) Mechanism shall normally be capable of delivering to either the operating rod or detector bar connection, an operating effort of not less than 4000 lb. at any point of the stroke. 1919.

2. General Design

(a) Mechanism shall be equipped with a terminal board constructed from moulded insulating material (approved by the purchaser) on which all wiring in the case, including motor wires, shall terminate. Such terminal board shall be readily accessible and be housed in a weather-proof compartment within the mechanism case and provided with a separate metallic cover. Each terminal thereon shall be unmarked by stencilled imprint or other equivalent method. The wiring, neatly arranged, shall be placed in fiber ducts or chases of ample capacity and shall form an integral part of the apparatus. R. S. A. rubber-insulated wire not less than No. 14 A. W. G. provided with eyelets, at each end, shall be used. 1919.

(b) Circuit controlling device shall be housed in a non-sweating, dirt-proof compartment within the mechanism case and be provided with a separate metallic cover. Four contacts shall be provided in addition to those necessary for the control of the mechanism, so designed that they will be positive in action and each can be adjusted to open or close at any part of the operation as required. Contact terminals shall be marked by stencilled imprint to correspond to the marking on the mechanism terminal board. 1919.

(c) Contact springs shall be made of non-corrosive material of sufficient mechanical strength and current carrying capacity to satisfactorily operate in connection with the circuits used. 1919.

(d) Switch box in accordance with R. S. A. specification { shall } be provided. Such switch box shall be housed { shall not } in the compartment with circuit controlling device. The contact terminals shall be marked by stencilled imprint to correspond to the marking on the mechanism of the terminal board. 1919.

(e) Mechanism and case shall be designated for use with lock rod, R. S. A. drawing....., and operating rod, R. S. A. drawing..... Ends of plungers or locking dogs and holes or notches in lock rod shall have square edges. Such holes or notches shall not be more than 1/16-in. larger than the plunger, measured on a line parallel to the travel of the lock rod. 1919.

(f) Mechanism, circuit controlling devices and terminal board shall be enclosed in a substantial metallic weather-proof case, designed for two tie supports, the cover of which shall be equipped with suitable fastenings for application of purchaser's padlock, and when opened, shall provide access to all parts. Means for readily draining oil and water accumulations shall be provided. 1919.

(g) Mechanism case shall be provided with wire opening for all wires entering case and equipped with couplings, adapter casting and armored hose connection, R. S. A. 1410. 1919.

(h) Mechanism shall be designed to prevent an unauthorized movement due to (a) unauthorized derangements; (b) external force applied to connections; (c) mechanical vibration. 1919.

(i) Mechanism shall be designed to permit an emergency operation by use of a hand crank which shall be furnished when specified as a part of such mechanism. 1919.

(j) Provision shall be made outside the mechanism case to hold hand crank and secure same against theft. The opening through which the crank is to be applied for hand operation shall be provided with a metallic weather-proof cover attached to the mechanism case, and equipped with suitable fastenings for application of purchaser's standard padlock. The location of such cover shall be conspicuously marked. 1919.

(k) Mechanism and case shall be so designed that they will be applicable to right or left-hand switch operation and can be readily changed from one to the other in the field. 1919.

(l) Mechanism and case shall be so designed that the centering of the lock and operating rods and the location and kind of fastenings to switch ties will conform to switch layout, R. S. A. drawing..... Mechanism operating rod shall have six-inch throw. 1919.

(m) Mechanism and case shall be designed for operation of detector bar R. S. A. 1098, and mechanism shall provide nine-inch total stroke for driving such bar. 1919.

(n) Mechanism case shall be designed so all unused openings may readily be securely closed. 1919.

(o) Mechanism case and motor assembled as applied to a switch, the ties of which have been adapted not more than two inches, shall not extend more than two inches above top of rail (A. R. A. clearance diagram). 1919.

3. Dielectric Tests

(b) Surface leakage space of not less than 3/4-in. shall be provided between any exposed metallic part of the apparatus carrying current and any other metallic part thereof. 1919.

(c) Windings shall withstand a potential test of twice their rating at a suitable frequency without an excess current indicating a short circuit. 1919.

6. Bearings

(a) Bearings shall be of ample dimensions to insure reasonable durability. 1919.

(b) Means shall be provided for necessary lubrication of bearing surfaces. 1919.

(c) All exposed oil holes shall be provided with weather-proof oil cups or covers. 1919.

8. Paint

(a) Mechanism and case, except finished parts, shall be painted one coat of red lead and raw linseed oil and two finishing coats of purchaser's standard paint. 1919.

(b) Finished parts shall be coated with manufacturer's recommended rust preventive. 1919.

9. Tests

(d) Switch mechanisms shall be subject to, and withstand without injury, the following tests:

1. Insulation test at place of manufacture of 3000 volts a. c. applied to the assembled electric apparatus for one minute. The potential shall be obtained from an a. c. generator or transformer of at least five k. w. capacity. 1919.

(a) Windings to ground. 1919.

(b) Between windings. 1919.

(c) Between any terminal post, or circuit controller and ground. 1919.

(d) Wiring to ground. 1919.

2. The application of sufficient power to motor connection of gear train so that a push or pull of 5000 lb. will be delivered throughout the stroke of the throw rod during normal time of operation. 1919.

3. The application of sufficient power to gear train so that a push or pull of 5000 lb. will be delivered throughout the stroke of the detector bar driving connection during normal time of operation. 1919.

Specification for Power Interlocking Machine

3. Drawings

(a) Purchaser's drawings. Drawings shall accompany the specifications and form an essential part thereof. 1919.

4. Design

(a) The machine frame and locking bed shall be composed of sections, each containing not more than 15 lever spaces, and shall be so designed that additional sections may be added on either end. 1919.

(b) Like parts of the machine shall be interchangeable. 1919.

5. Locking

(b) Locking required for insuring the proper sequence in the operation of working levers shall be installed with the machine. 1919.

(c) For each spare lever and each spare space, provisions shall be made in the locking bed to accommodate either:

1. One locking shaft with one cross locking bar and one longitudinal locking bar for the full length of the machine. 1919.

2. One tappet with one longitudinal locking bar for the full length of the machine. 1919.

(d) The machine shall be equipped complete with locking guides or brackets. 1919.

(c) Locking shall be distributed as uniformly as possible in the locking bed and so arranged as to be easily accessible. 1919.

6. Levers

(a) Levers shall be numbered from left to right, and be in accordance with requisite sheet. 1919.

(b) Levers shall be arranged so that they can be removed without interfering with the operation of other levers. 1919.

(c) Spare levers shall be furnished in place complete with magnets, standard circuit controllers, locking shaft and driver, or tappet, and connections and tappet complete for the operation and control of their respective units. 1919.

(d) All levers shall be equipped with reverse latches. 1919.

(e) All levers, except those of the horizontal slide type, shall be equipped with normal latches. 1919.

(f) Levers shall be designed to permit the application of electric locks independent of indication locks. 1919.

7. Case

Machine shall be enclosed in a case, which shall have separate removable doors or panels for each section to give access to all parts of the machine, and shall be provided with locks as provided for on requisition sheet. 1919.

8. Painting

Painting of the machine and case shall be in accordance with R. S. A. specification. 1919.

9. Dielectric Tests

(c) Separate windings, which are insulated from each other, shall withstand a potential test of 3000 volts a. c. for one minute between their terminals and other metal parts from which the windings are insulated. 1919.

(d) A potential of twice the normal operating requirement at a suitable frequency shall be impressed across the windings without any excessive flow of current indicating a short circuit. 1919.

11. Circuit Controllers

Machine shall be equipped with manufacturer's standard circuit controllers necessary for the control of the circuits shown on drawings listed on requisite sheet. 1919.

12. Indication.

(a) Levers for the control of switches, derails, movable frogs, crossing bars, drawbridge locks and bolt locks shall be equipped with devices to insure the locking of the units in a position corresponding to the position of the levers before the release of the mechanical locking can be effected. 1919.

(b) Levers for the control of signals shall be equipped with devices to prevent the release of the mechanical locking until the signals directly or indirectly controlled have assumed their normal position. 1919.

(c) Switch levers shall be free to move between their indicating positions. 1919.

13. Terminal Board

Machine shall be provided with a terminal board, constructed from insulating material, approved by the purchaser, and provided with terminal or binding posts for making all connections to the machine. 1919.

14. Lever Light Indicators

(a) Lever light indicators, when required, shall be located in front of the machine immediately above or below the levers. 1919.

(b) Electric lamps for lever indicators shall be in accordance with R. S. A. specification. 1919.

15. Contacts

(a) Contact springs shall be made of non-corrosive metal, or shall be protected against corrosion, and of sufficient strength and current carrying capacity to satisfactorily operate in connection with the arrangement of interlocking units for which the machine is furnished. 1919.

(b) Contact springs shall make sliding contact. 1919.

22. Requisites

(c) Machine shall be designed to operate in accordance with track and location plan....., dated..... 1919.

(d) Machine shall be as shown on contractor's general drawing....., dated....., or catalogue reference..... 1919.

(e) Upon the completion of the work called for by this specification the following contractor's { tracings, blueprints, Van Dyke prints }

shall become the property of the purchaser:

- 1. Track and location plan. 1919.
2. Locking sheet. 1919.
3. Dog chart. 1919.
4. Combination wiring. 1919.
5. Manipulation chart. 1919.
6. Track diagram. 1919.
7. Cable and wiring plans. 1919.

(f) Levers:

Table listing components for levers: Lever frame; Working levers, Signal, Switch; Spare levers, Signal, Switch; Spare spaces; Total. 1919.

(g) Machine shall be designed for the control of circuits, the maximum voltage of which will be.....volts { direct } current, and where special requirements are to be met, ..... amperes. 1919.

(h) Electric locks together with normally open latch circuit controllers in addition to the indication locks (magnets)

shall be provided for { section locking, approach locking, check locking, .....locking. 1919.

(i) Electric lock magnets shall be arranged for normal operation at.....volts { direct } current. 1919.

(j) Lever indicators shall of the { electric light } type for normal operation at ..... volts { direct } current. 1919.

(l) Levers controlling signals { shall } shall not } be provided with lever indicators. 1919.

(m) Auxiliary circuit controllers of the { spring } mechanical stick } type shall be provided for the following levers..... and shall have.....contacts. 1919.

(n) Automatic time release providing.....seconds retardation in lever movement shall be provided for the following levers..... 1919.

(o) Insulation of coils and windings, if not enameled wire or fabric covered wire, impregnated, shall be as follows..... 1919.

(p) Case:

Case shall be of { steel, enamel } wood..... } finish and equipped with { purchaser's standard } cabinet } locks. 1919.

Committee: F. B. Wiegand (N. Y. C.), chairman; J. S. Raymer (P. & L. E.), vice-chairman; F. W. Pflieger (U. P.), vice-chairman.

Sub-Committee "A."—F. W. Pflieger, chairman; F. J. Ackerman (K. C. T.), Daniel Cushing, A. B. DuBray (I. C. C.), N. S. Lynch (M. P.), J. W. MacCormack (K. C. T.), O. R. Unger (M. P.), J. B. Weigel (L. & N.), G. A. Ziehlke (U. P.).

Sub-Committee "B."—B. J. Schwendt (T. & O. C.), chairman; E. T. Ambach (B. & O.), S. J. Dewey (C. C. C. & St. L.), H. L. Kilian (N. Y. C.), J. H. Oppelt (N. Y. C. & St. L.), H. H. Orr (C. & E. I.), J. C. Seaman (N. Y. C.), T. C. Seifert (C. B. & Q.), W. C. Sibila (N. Y. C.).

Sub-Committee "C."—I. S. Raymer, chairman; G. H. Burnette (Monongahela), W. D. Carrol (B. & O.), G. A. Motry.

Sub-Committee "D."—Jacques Stoltz (N. Y. C.), chairman; L. E. Carpenter (P. R. R.), C. G. McCauley (W. T. Co.), Charles Soper (L. I.), Walter Tyler (L. I.), G. C. Whitney (N. Y. Mun. Ry.).

Discussion

F. B. Wiegand (Chairman), presented the preliminary part of the report and B. J. Schwendt (T. & O. C.) presented the portion of the report regarding the specification under operating requirements.

W. K. Howe (G. R. S.): While all signal companies are using friction clutch, in my opinion that paragraph would be fully complete if the words "with an efficient friction clutch" were omitted. It is conceivable that something other than a friction clutch might be used to equal or possibly better advantage. I would like to have inserted the words "or other suitable means" after the words "friction clutch."

Mr. Wiegand: The committee will accept that addition of the words "or other equivalent means."

Mr. Schwendt presented Sections (c), (d), (e) and (f-1) of the report regarding operating requirements.

W. H. Reichard (F. S.): It seems to me that it is necessary to add to paragraph F-1 the circumstances under which these times and voltages should apply, and I would suggest that there be appended "when connected to reasonably free working switch," and the size specified.

T. S. Stevens (A. T. & S. F.): I notice that in 1-G there is a maximum operating effort provided. Why not make this time dependent on the operating effort, being not greater than as provided for in 1-G.

Mr. Schwendt: That is what the committee had in mind, and the point brought out by Mr. Reichard was talked over. It would be pretty hard to say what would be a reasonably free working switch, and to specify the conditions, so we tried to confine it to the maximum operating effort.

Mr. Stevens: Why not tie them both together in some way by including in f-1 that fact, a voltage 20 per cent below normal when the operating effort is not greater than in 1-g, or some sentence of that kind?

Mr. Schwendt: The committee accepts the suggestion.

(Mr. Schwendt then submitted the portion of the report as to second range voltage mechanism.)

Mr. Reichard: I understand the paragraph about to be read now under g is going to be tied with the first and second range voltage times. Is that so?

Mr. Schwendt: We are simply going to tie them with an operating effort not exceeding that specified in 1-g.

Mr. Reichard: I think that the committee is of the opinion that the switch machine should develop then an operating effort of four thousand pounds through a stroke of six inches, as we will ultimately develop, in four seconds of time; is that so?

Mr. Schwendt: Shall be capable of doing that as a strength requirement.

Mr. Reichard: I think the horse power output of that effort is far beyond the present practice of any switch mechanism with which I am acquainted. It seems to me that is a very impracticable designation.

Mr. Schwendt: It is not brought out in this specification. The committee has not considered as part of the assignment the design of the motor, and made no specification regarding the motor. This leaves the switch machine then standing by itself, as far as strength requirement is concerned, and attempts to establish a factor of safety. It does not necessarily follow that the motor would have to be of equal strength if it is not required. If it is required, the same switch machine will really do.

Mr. Reichard: It would seem to me if there is no motor connected in this specification, the design of operation and the voltages expressed are inconsistent with the specifications.

Mr. Schwendt: The two necessarily have to be tied together on account of strength requirements, and that was the thought of the committee in putting in such things that would indicate the motor was included.

L. F. Howard (U. S. & S.): Do I understand this is merely a specification to insure the stresses of the switching movement without the stresses imposed by the motor?

That being the case, I suggest (g) be eliminated entirely, because I think (b), under Section 1, will impose all the stresses that are necessary to insure that you have a sufficiently strong mechanism. I am positive in switching mechanisms that the track-resisting phases of the mechanism are of great importance, and it is well known that impact tests are required for wheels that are subjected to shock as well as tests of tensile strength, and it does not seem to me that the report you read is any criterion on which to build a general specification for switch makers.

Mr. Schwendt: The committee before attempting to establish these figures made a number of tests to ascertain about what the different machines were doing—it did not attempt to break any machines, but in making those investigations we found a number of cases where 2,150 lb. were actually required on throw rod. We thought a factor of safety of two would not be too great, and we suggested the 4,000 lb. minimum.

At this point the discussion became lively as to the items in the specification covering the strength of the apparatus and various points were brought out by the members on the floor, and the manufacturers took issue with certain paragraphs presented on this subject. The type of insulation used was also discussed and suggestions made for the rewording of such paragraphs.

(Mr. Schwendt then read Par. (b), under general design, and several members offered criticisms that were submitted to the committee.)

Mr. Reichard (Fed. Sig. Co.): As to General Design 2 (d), I think that is another reason for the requisite sheet. "Switch-box in accordance with R. S. A. Specification." How can anyone tell to-day what that is going to be? A switch-box, I believe, should properly be termed a switch circuit controller. It is in committee at the present time. We may be able to conveniently house such a mechanism in the switch machine house. If this paragraph is left in, then every switch machine which is built in accordance with these specifications will have to have sufficient room in which the switch-box may be used. It would seem to me, perhaps, that more definite information should be given concerning the switch circuit controller.

Mr. Schwendt: It was the thought of the committee in placing that as it has in 2 (d) to make provision for the switch box in the mechanism case, so that it all can be self-contained. By making this provision, all the wires will go into just one point.

Mr. Stokes: I would say that in the switch circuit controller the R. S. A. specification would answer whether it was operated from the point or to the point and the lock. It seems that it has not left anything to the imagination as to whether this space is to be provided in the housing of the switch machine, or as to whether or not it shall be installed when the machine is ordered.

Mr. L. H. Howard: As to 2 (g), I would suggest the elimination of R. S. A. 1410. There are many cases where that connection would not be suitable.

Mr. Schwendt: The committee had in mind hose couplings in fixing it so it would be an easy matter to connect up to a movement from any angle in order to meet that condition and make it more universal.

Mr. Reichard: With regard to 2 (m) I would suggest the elimination of all reading matter after R. S. A. 1098, without the additional information that the mechanism shall provide nine inches total stroke.

C. F. Stoltz (C. C. C. & St. L.): 1 (a) provides that the movement under the sequence in which the mechanism performs shall operate the detector bar one-half inch stroke. If the detector bar is to operate but one-half inch stroke, why should the mechanism move nine inches?

Mr. Reichard: I don't think it is necessary to be specific with regard to nine inches.

Mr. Schwendt: The committee will take that.

Mr. Reichard: I could not comment on 3 (b) unless I am advised whether the motor is to be considered as part of this specification.

Mr. Schwendt: I assume eventually the motor will be considered as part of this specification, and I think remarks should be made on the assumption that it will.

Mr. Reichard: Then I think we should have the exception of  $\frac{1}{4}$  in. with respect to motor commutators.

Mr. Schwendt: Any objection to 8 (a)?

W. K. Howe: These machines are painted with this red lead and linseed oil, and it takes three or four days for them to dry. It is very expensive, and do you think it is necessary that all of the parts that you have mentioned be painted with red lead?

Mr. Schwendt: What would you suggest on that, as to the inside?

W. K. Howe: There are many mechanisms that are now being coated with linseed oil only, and cast iron parts seem to stand up pretty well when so treated. The thing that I have in mind is to get rid of that red lead and linseed oil that takes so long to dry.

Mr. Schwendt: The Signal division of the A. R. A. now has the A. R. A. specifications for painting, and I

would like to ask Mr. Howe if it would be satisfactory if we include a clause reading that the painting of the mechanism shall be in accordance with the R. S. A. specification for shop painting?

Mr. Howe: I don't believe I know what that is.

Mr. Saunders: At the time that R. S. A. specification was under discussion, the question of dipping castings was discussed, and I believe it was agreed that that was the preferred method, of dipping them in paint, not red lead. Specification 8 (a) as it now reads covers too much to be covered in one clause. I think you will have to split it up to cover various parts, and in all probability apply the R. S. A. specification for painting a majority of them.

(Mr. Weigand read R. S. A. Specification 1198.)

Mr. Howard: Doesn't that refer principally to wrought iron and steel? A great many of these mechanisms are cast iron, which is one of the most rust-resisting materials there is. Personally, I believe a dipping coat is absolutely as much as you ought to put on cast iron.

Mr. Schwendt: The committee will consider the suggestion made.

(Mr. Wiegand submitted specifications for power interlocking machine and after receiving suggestions from several members, the committee was excused with thanks.)

## Report of Committee II—Mechanical Interlocking

THE COMMITTEE presented a report on unit specifications for mechanical interlocking machines having S. & F. locking, and recommended that they be accepted for presentation to the annual meeting for approval and submission to letterballot for inclusion in the Manual. The specifications follow:

### 1. General

- (a) Machine shall be arranged for (vertical horizontal) leadout. 1919.
- (b) Machine shall have..... levers and ..... spare spaces, total..... 1919.
- (c) Levers shall be numbered and arranged in accordance with a track and signal plan, dog and locking sheet approved by the purchaser. 1919.
- (d) Levers ..... shall be equipped with counterweight of ..... pounds, to assist in moving them to normal position. 1919.
- (e) Machine legs, bottom girders, lever shoes, lever number plates, quadrants, top plates, rocking links, back, front and intermediate rails, and blocks, bearings and locking brackets shall be made of cast iron. 1919.
- (f) Latch shoes, latch handles, latch nuts, universal links, link blocks, drivers for end of locking shafts, locking shaft drivers for longitudinal locking bars, bottom girder caps, swing locking dogs and driving pieces for longitudinal locking bars shall be made of malleable iron. 1919.
- (g) Levers, tail levers, latch rods, end strips and locking bracket caps shall be made of open hearth steel. 1919.
- (h) Locking shafts, longitudinal locking bars, cross-locking, locking dogs and stops, driving piece blocks and all pins shall be made of cold drawn steel. 1919.
- (i) Latch springs shall be made of spring steel wire. 1919.
- (j) Trunnions shall be made of forged steel. 1919.
- (k) Machine shall consist of four and eight lever sections. 1919.
- (l) Levers shall be spaced five inch centers. 1919.

- (m) Height of machine for vertical leadout shall be 2 ft.  $8\frac{1}{2}$  in. from bottom of leg to top of finished top plate. 1919.

- (n) Height of machine for horizontal leadout shall be 3 ft.  $5\frac{1}{2}$  in. from bottom of leg to top of finished plate. 1919.

- (o) Like parts of machine shall be interchangeable. 1914.

- (p) Each spare space shall be equipped with lever shoe, pin and cap. 1919.

- (q) Bolts and screws shall have U. S. standard threads. 1919.

- (r) Nuts, bolt and cap screws shall be hexagonal unless otherwise specified. 1919.

- (s) Bolts and cap screws shall be provided with spring lock washers where practicable. 1919.

- (t) Taper dowel pins shall be standard taper one-fourth inch per foot. 1919.

- (u) When necessary to hold parts in fixed relation to each other, dowel pins or finished bolts shall be used. 1919.

- (v) Moving parts of machine shall work freely without lost motion. 1919.

- (w) Machine painting shall be in accordance with R. S. A. specifications for painting. 1919.

### 2. Machine Legs

- (a) Legs for vertical lead-out machine shall be 2 ft.  $7\frac{1}{4}$  in. in height and base of leg shall be provided with four holes for  $\frac{3}{4}$ -in. bolts. 1919.

- (b) Legs for horizontal lead-out machines shall be 3 ft. 5 in. in height and base of leg shall be provided with four holes for  $\frac{3}{4}$ -in. bolts. 1919.

### 3. Bottom Girders

- (a) Bottom girders shall be fastened to legs with two  $\frac{3}{4}$ -in. thin square head finished bolts. 1919.

- (b) Caps shall be fastened to bottom girders with two  $\frac{1}{2}$ -in. square head bolts. 1919.

### 4. Top Plates

- (a) Top plates shall be fastened to machine legs with six  $\frac{1}{2}$ -in. T head bolts, one  $\frac{1}{2}$ -in. cap screw and four 7-16-in. taper dowel pins. 1919.

- (b) End strips shall be fastened to top plates with two  $\frac{1}{2}$ -in. T head bolts. 1919.

### 5. Levers

- (a) Levers shall be numbered left to right. 1916.

- (b) Levers shall be 5 ft.  $10\frac{1}{8}$  in. from center of fulcrum to end of handle. 1911.

- (c) Levers shall have equal and uniform throw. 1919.

- (d) Tail levers shall be drilled to provide  $8\frac{3}{4}$ -in.,  $9\frac{3}{4}$ -in.,

10 $\frac{3}{4}$ -in. stroke and shall be interchangeable as front or back tail levers. 1919.

(e) Lever shoes for vertical lead-out machine shall provide approximately equal stroke above and below horizontal and so arranged that connections can be made to front or back tail levers. 1919.

(f) Two-position levers shall be latched in normal and reverse positions. 1914.

(g) Three-position levers shall be latched in normal, central and reverse positions. 1914.

(h) Levers and tail levers shall fit snugly into lever shoes and be fastened thereto with two  $\frac{3}{4}$ -in. finished bolts. 1919.

(i) Lever shoe pins shall be 1-in. diameter. 1919.

(j) Latch shoes shall provide for 4 $\frac{1}{2}$ -in. opening for latch springs and shall be fastened to levers with two  $\frac{1}{2}$ -in. tap bolts and one 7-16-taper dowel pin. The hole for dowel pin to be located below the hole for the lower tap bolt. 1919.

(k) Quadrants shall be fastened to top plates with three  $\frac{5}{8}$ -in. bolts. 1919.

(l) Rocker links shall be fastened to quadrants with one 1-in. diameter pin, pin to be held in place in quadrant with one  $\frac{3}{8}$ -in. headless set screw. 1919.

(m) Latch rods shall be straight  $\frac{5}{8}$  in. by 24 $\frac{3}{4}$  in. from end of block to end of thread, thread to be S.A.E. standard 2 $\frac{1}{4}$  in. long and supplied with hexagon check nuts. 1919.

(n) Latch nuts shall be designed with  $\frac{5}{8}$ -in. offset, to be 3 in. long from center of hole to end of nut and to be tapped with S.A.E. standard  $\frac{5}{8}$ -in. tap. 1919.

(o) Latch springs shall be 11-16 in. inside diameter and shall be of proper strength to operate the locking bars when the lever is at either end of quadrant and the latch is free to drop. 1919.

(p) Latch handles shall be 12 in. long from center of holes to end of handle and shall be connected to lever and latch rod with two  $\frac{1}{2}$ -in. cheese head pins. 1919.

(q) Lever number plates shall be fastened to levers with one  $\frac{1}{2}$ -in. cheese head pin. 1919.

(r) Universal links shall be 5 $\frac{3}{4}$  in. center to center, and connected to rocker links with one 1-in. flat swivel pin and one  $\frac{1}{2}$ -in. cheese head pin. 1919.

(s) Link blocks shall be 1 in. by 1 $\frac{1}{2}$  in. by 1 $\frac{1}{8}$  in. with a sliding fit, and to have 5-16 in. by 5-16 in. lip. 1919.

6. Locking

(a) Machine shall be provided with mechanical locking of a type which will be effective prior to the application of energy to the unit controlled. 1919.

(b) Machine shall be fully equipped with cross-locking brackets and locking shafts with cranks and drivers. For each spare lever and each spare space, one cross-locking bar, and one longitudinal locking bar for the full length of the machine shall be provided with operating connections complete. 1919.

(c) Locking shall be distributed as uniformly as possible without crowding in the locking bed and so arranged as to be easily accessible. 1919.

(d) Bearings for front, back and intermediate rails shall be fastened to machine legs with four  $\frac{1}{2}$ -in. bolts and two 7-16-in. taper dowel pins. 1919.

(e) Bearings for machines having locking beds wider than 24 way shall be provided with supports under outer end. 1919.

(f) Front and back rails shall be interchangeable. 1919.

(g) Intermediate rails shall be wide enough to accommodate two standard locking brackets. 1919.

(h) Front, back and intermediate rails shall be provided with one way caps. 1911.

(i) End blocks shall be fastened to rails with one  $\frac{3}{8}$ -in. cap screw. 1919.

(j) Ends of locking shafts shall be square and of like dimensions. 1914.

(k) Drivers for end of locking shafts shall be fastened to locking shafts with one  $\frac{1}{2}$ -in. bolt and connected to universal link with one  $\frac{1}{2}$ -in. cheese head pin. 1919.

(l) Drivers for longitudinal locking bars shall be of the clamp type with filler blocks and fastened to locking shafts with one  $\frac{3}{8}$ -in. bolt and nut through end of driver. 1919.

(m) Eight and 12 way locking brackets only shall be used. 1919.

(n) Locking brackets shall be planed out for longitudinal bars to a depth of 1 37-64 in. below finished top of bracket and shall be 11-16 in. wide and for cross-locking bars to a depth of 25-32 in. by 49-64 in. wide. One  $\frac{1}{4}$ -in. and two 7-16-in. holes shall be drilled with jig through end of bracket

and shall be fastened to rails with four  $\frac{3}{8}$ -in. cap screws and two  $\frac{1}{4}$ -in. straight dowel pins. 1919.

(o) Longitudinal locking bars shall have 1 $\frac{3}{4}$ -in. stroke and shall be provided with stops for normal and reverse positions of the bar. 1919.

(p) Splices in longitudinal locking bars shall be made by means of two channel clamp splices and fastened together with two  $\frac{1}{4}$ -in. bolts with nuts and cotters. 1919.

(q) Trunnions for swing dogs shall be reversible and shall be provided with washers and cotters. 1919.

(r) Swing dogs shall be straight and reversible. 1919.

(s) Straight locking dogs, Nos. 2 and 5 only, shall be used, and shall be drilled so that a normal drive dog can be made a reverse dog by turning it end for end, or a reverse dog can be made a normal dog in the same manner, or a double end dog, No. 5, can be made to take the place of either a normal or reverse dog. 1919.

(t) Locking drivers, dogs, swing dog trunnions and stops shall be riveted to longitudinal bars with  $\frac{1}{4}$ -in. rivets. 1919.

(u) Latches when locked shall have not more than 1-16-in. lift for direct locking between levers and an additional lift of not more than 1-64 in. for each special in the combination. 1919.

7. Material and Workmanship

(a) Material and workmanship shall be first class in every respect. (G. P. 9-a.) 1911.

(b) The contractor shall replace, at his own cost, any part or parts of the apparatus and material furnished by him, which shall, within a period of one year from date of acceptance of the installation, fail to perform its proper function because of any defect in the design, construction, application or erection of such apparatus. (G. P. 9-b.) 1915.

8. Inspection

(a) Purchaser will make such inspection of the completed product as to assure him that the requirements of the specification have been met. (S. S. I.-a.) 1917.

(b) Purchaser may make desired inspection at all stages of manufacture. (S. S. I.-b.) 1917.

(c) The manufacturer shall make such tests as may be necessary to demonstrate to the satisfaction of the purchaser that the apparatus is in accordance with the requirements of the specifications and contract. 1918.

9. Packing

(a) Material shall be packed to permit convenient handling and to prevent loss or damage during shipment. (S. S. P.) 1916.

10. Marking

(a) Purchaser's order and requisition number, name of consignor and name and address of consignee, shall be plainly marked on outside of package. (S. S. M.-a.) 1916.

(b) Detail list of loose pieces, containers and their contents shall be furnished for each shipment. Where carload shipments are made, show routing and car identification. (S. S. M.-b.) 1916.

Committee: C. J. Kelloway (A. C. L.), chairman; G. W. Chappell (N. Y., N. H. & H.), vice-chairman; Samuel Miskelly (C., R. I. & P.), vice-chairman; Larsen Brown (A., T. & S. F.), O. H. Eichblatt (S. P., Atlantic System), F. E. Jacobs (C. & W. I.), J. W. McClelland (P. & R.), W. B. Morrison (D., L. & W.), E. J. Relph (N. P.), R. W. Taylor (B. & O.), Wm. Dawson (N. Y. C.), Oswald Frantzen (N. Y., N. H. & H.), H. F. Lomas (I. C.), E. E. Mack (C. & E. I.) E. K. Post (P. R. R.), Chas. Stephens (C. & O.), J. I. Vernon (N. Y., N. H. & H.), W. F. Zane (C., B. & Q.).

Discussion

E. J. Relph (N. P.): In connection with (d) this is for vertical, how about horizontal?

Mr. Kelloway (Chairman): One could be provided if a weight is found necessary. There are only a few cases where counter weights are necessary, and the committee has provided for those few cases.

Mr. Relph: In (f) I propose they be made of cold drawn steel, the same to be held in place with a cotter pin.

Mr. Kelloway: That is a good point, and the committee will take that into consideration.

P. M. Gault (I. C.): In regard to the latch spring

that Mr. Relph mentioned, the specification is indefinite, and when you turn to levers, the size of the wire used for the spring is not mentioned. I think the spring should be so designed that we would get the same spring from each manufacturer and they would be interchangeable.

C. A. Dunham (G. N.): I ask the committee if it has given consideration to the question of increased lever ratios. If I am not mistaken, paragraph (n) contemplates practically the present-day machine, with a lever-ratio of about 1 to 5, I believe it is. It has been my experience that an increased lever-ratio would be a good thing. I believe some of the members would be interested in knowing that the practice abroad provides for a ratio of 2 to 7, giving the tower man more power and making a mechanical machine which works easier than the standard machine here.

Mr. Kelloway: That has been considered. Some of the companies manufacture such a machine today, and they are being used on the Pennsylvania Railroad and the Atlantic Coast Line, but we decided four years ago to go back to the standard machine, believing that the increased length of lever was not advantageous.

Caleb Drake (C. & N. W.): I think there should be something provided to take care of the end pin on each end of the machine from working out. I have looked at the detailed specification and cannot find it.

J. A. Peabody (C. & N. W.): We have had these pins come out. There should unquestionably be some provision made for taking care of them. It can be done by means of tap screws or otherwise.

Mr. Kelloway: The committee will consider that matter.

Mr. Gault: Nut locks should be added to that clasp, as we frequently have these come loose.

G. H. Dryden (B. & O.): I would suggest in (c) "levers shall have equal and uniform throw" the addition of, "and shall be in true alinement."

Mr. Kelloway: The committee will accept that.

Mr. Relph: Is the committee figuring on designing a new lever shoe for the horizontal step. The present lever shoe does not fit in the lever and is held in place by three bolts and a dowel pin. According to (h) a new lever shoe would have to be designed.

Mr. Kelloway: The committee did not deem it necessary to provide a new lever shoe for new horizontal machines, as you lead your pipe connections off from the horizontal, and therefore the old lever shoe was considered a proper design.

A. J. Kelly (C. C. & St. L.): We have had occasion to change our latch shoes and the dowel hole did not run up, and we should specify just how much below that is to come.

Mr. Kelloway: We will consider that point.

Mr. Gault: The specification by inches does not give an exact specification to dowel pins. That is something with which many of the section men have had trouble. They measure one end and the fellow who slips them out measures the other end, and if they were ordered by number, we would get what we wanted.

Mr. Kelloway: We simply state how the latch shoe is to be latched to the lever. We refer to dowel pins later on, and give specifications for them. The committee has spent considerable time on the matter of latch springs. Perhaps Mr. Howard will give us a statement on this subject.

L. F. Howard (U. S. & S. Co.): I said that the specification, as it appeared at the time of the annual meeting, was not sufficient. That is, if you want to draw up a specification of a spring you should specify the general

dimensions, and specify the compression to be given by different voltages and get something you want. In order to do that, you will have to first make experiments to find out what load you want to handle, and knowing the load, you can specify the compression. You can then determine the dimension of the latch shoe. We agree the way it is specified now will take care of the situation by putting in fillers where you want to get increased tension for the machines.

W. H. Elliott (N. Y. C.): I think the latter part of this specification should be revised along the lines stated by Mr. Howard, and between now and the time it is put to letter ballot, to make a positive requirement instead of leaving it to general investigation. We have made tests to determine what we believe is a proper load for a spring for the levers.

Mr. Kelloway: The committee will be glad to consider that matter.

Section (b) expresses the consensus of opinion at the New York meeting. Mr. Christofferson suggested, and it was approved by the association that we would have all locking brackets in the machine, and cross-locking bars, drivers and shafts for the spare levers and spare spaces, and we got it out in that way.

C. A. Christofferson (N. P.): I do not think there will be much trouble in fitting up a lock on our own machine. It might be that we might have to make a few changes, but it is much better to have a bar in and provide for it, than to have a lot of short bars in that you might have to take out.

Mr. Howard: I would suggest that in par. (m) that the words "not more" be inserted, so that it will read, "and not more than 12."

Mr. Kelloway: The committee will be glad to go into this matter.

Mr. Kelloway: The committee has given the matter of straight swing dogs (par. (r)) further consideration, and is prepared to recommend the present type of dog, except that it shall be  $\frac{3}{8}$  in. thick, and each dog shall be interchangeable.

Mr. Gault: Referring to paragraph (s), at the meeting in New York last fall, I believe Mr. Kelloway stated the number of dogs had been reduced to five or six.

Mr. Kelloway: The committee will re-write this paragraph and include additional dogs that we have found it is necessary to have, in respect to some of the larger machines.

Mr. Ralph: I don't think the size of the machine should determine what dog should be done away with. I see no reason why we should not use 1, 2, 3, 4, 5, 6, 7, 9, 11, and 13, doing away with 10, 12 and 8.

Mr. Kelloway: We can lock up all machines with the number of dogs that we have recommended. It may require a little additional labor in making up dog charts.

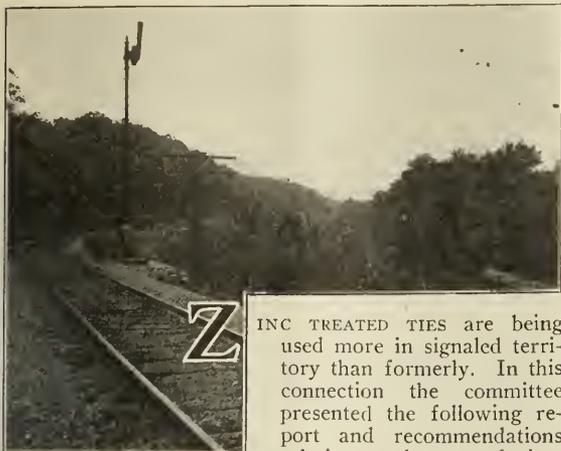

Mr. Stevens: I suggest the elimination of par. 7, and the addition of the warranty clause as provided in the proper specification.

Mr. Kelloway: We accept that.

Mr. Relph: Mr. Chairman, I have a clause: "All parts of machines that can be knocked down shall be marked with steel figures, and given the numbers which they take in the assembling machine. Locking brackets, cross-locking, longitudinal locking and swing dogs shall be marked to read from the back of the machine. Longitudinal bars shall have their letter numbers marked directly over their drivers. Swing dogs shall be marked with letter numbers at the trunnion end, and space bars at the nose end.

(The committee was dismissed with thanks.)

# Report of Committee IV—D. C. Automatic Block Signaling

**Z**INC TREATED TIES are being used more in signaled territory than formerly. In this connection the committee presented the following report and recommendations relative to the use of zinc-

treated ties in track circuits.

1. As the electrical conductivity of zinc-treated ties decreases with age during the first year, better results may be had by allowing the ties to season for a period of from two to six months before using in a circuited track, thus avoiding the use of the tie while its conductivity is greatest.

2. For good results, the number of zinc-treated ties installed per year in any track circuit should not be greater than 15 per cent of the total number of ties in that circuit.

3. (a) It is recommended that a maximum rail resistance not to exceed .1 ohm per 1,000 ft. of track be maintained. Ordinarily it will be lower. This resistance can and should be reduced to a minimum by using bonding wires of high conductivity or increasing the number of bonding wires per joint.

(b) Rail and bonding resistance may be determined by the following formulæ in which

- E—Volts at rail—battery end.
- e—Volts at rail—relay end.
- I—Amperes flow from battery.
- i—Amperes flow through relay.
- R—Rail and bonding resistance total in ohms.
- r—Rail and bonding resistance per 1,000 ft. of track in ohms.
- L—Length of track circuit in feet.

$$R = \frac{2(E-e)}{(I+i)} \quad r = \frac{2000(E-e)}{L(I+i)}$$

4. (a) The length of track circuit should be determined by the ballast resistance or the resistance from rail to rail through ties, ballast, and track insulation.

(b) The following table expresses in ohms per 1,000 ft. of track readings on various kinds of ties:

**Ballast Resistance in Ohms per 1,000 Ft. of Track**

Date, 1917	Section 1	Section 2	Section 3	Section 4	Section 5	Section 6	Temperature	Humidity
April 12....	4.27	5.36	48.02	44.55	24.87	13.37	40° F.	40%
May 17....	2.28	3.22	34.52	24.68	21.19	12.42	82° F.	73%
June 8....	1.91	2.76	15.66	15.72	9.50	5.82	58° F.	50%
Aug. 6....	3.48	6.42	32.82	26.99	12.65	16.05	78° F.	46%
Sept. 14....	2.56	3.15	14.64	14.27	9.67	6.55	77° F.	56%
Oct. 25....	4.85	6.06	28.92	28.92	15.96	7.77	41° F.	75%

Average. .323 4.49 29.09 25.85 15.64 10.33

- Key: Section 1—Zinc-treated red oak.  
 Section 2—Zinc-treated red oak soaked and scrubbed.  
 Section 3—Red oak treated with 25 per cent creosote, 75 per cent gas oil.  
 Section 4—Red oak treated with 10 per cent creosote, 90 per cent gas oil.

Section 5—White oak untreated.  
 Section 6—Various species—old ties in place for several years.

(c) Ballast resistance may be determined by the following formulæ in which

- E—Volts at rail—battery end.
  - e—Volts at rail—relay end.
  - I—Amperes flow from battery.
  - i—Amperes flow through relay.
  - Y—Ballast resistance total in ohms.
  - y—Ballast resistance per 1,000 ft. of track.
- $$Y = \frac{2(E+e)}{(I-i)} \quad y = \frac{2000(E+e)}{L(I-i)}$$

(d) Unless the ammeter with which the current readings are taken is of an extremely low resistance, such readings should be taken only for the purpose of determining the resistance of the unit and relay. The current flow should then be calculated from these resistances and the voltage drop across them, otherwise the error due to the resistance of the instrument will affect the results.

(e) When the rail resistance is equal to .1 ohm per 1,000 ft. of track, a 2-ohm relay used, and the ballast resistance per 1,000 ft. of track as determined by the above formulæ is as shown below, the track circuits should not exceed the lengths shown opposite the following resistances:

- 1 ohm —2,200 ft.
- 2 ohms—3,400 ft.
- 3 ohms—4,400 ft.
- 4 ohms—5,200 ft.

The lengths as above shown provide for the operation of the relay at 150 deg. F., under which condition, with .6 volts at the battery, 115 milamperes flows through the relay.

5. Because of a low ballast resistance in track circuits where zinc-treated ties are used, a 2-ohm relay should be used, as it will operate satisfactorily when a relay of higher resistance will not.

Committee: C. F. Stoltz (C. C. C. & St. L.), chairman; G. H. Dryden (B. & O.), vice-chairman; F. H. Bagley (L. & N.), M. A. Baird (Erie), E. E. Bradley (W. M.), J. H. Butridge (I. C.), T. N. Charles (Southern), J. J. Corcoran (N. Y. C.), A. R. Fugina (L. & N.), R. E. Green (M. C.), E. Hanson (G. C. & S. F.), Leroy Wyant (C. R. I. & P.), G. W. Hulsizer (C. & A.), Geo. A. Kirley (B. & A.), G. W. Kydd (B. & O.), B. A. Lundy (N. Y. C.), E. B. Pry (Penn. Lines West), G. W. Trout (P. M.), E. L. Watson (P. R. R.), E. P. Weatherby (T. & P.), E. E. Worthing (S. P. Lines Atlantic System), R. B. Arnold (C. & N. W.).

## Discussion

A. R. Fugina (L. & N.): There are a number of things in the report that I believe should have further consideration. I refer more particularly to Par. 1, in which it is stated that the period of seasoning ties should be from two to six months. I don't believe that two months is sufficient time for seasoning. I believe that the minimum should be six months. Par. 2, it seems to me, should be further qualified; that is to say, 15 per cent of the total number of ties in a circuit may be renewed each year. That depends a great deal upon the length of the track circuit, and it depends upon the track circuit conditions. With certain track circuits, under good track circuit conditions, you may be able to use more than 15 per cent, and on other track circuits it would not be practical to use as much as 15 per cent. In other words, the rail resistance and the ballast resistance of the track circuit will determine the number of zinc-treated ties that can be used in the circuit.

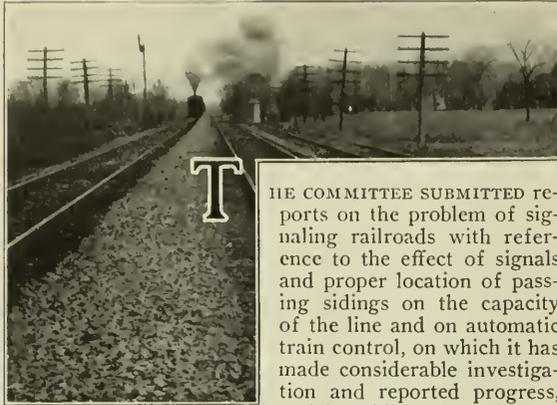

Under 4-e, I don't think that 115 milamperes is sufficient. In other words, that we would require at least 130 milamperes flowing through the relay. For that reason it may be that the information given is somewhat misleading.

We will now call for the report of Mr. C. F. Stoltz, Chairman.

Mr. Stoltz (Chairman): The committee's idea was that it should not require that all ties should wait for six months before being installed. It depends altogether on how much zinc is put into the ties, and that is something that railroads will have to settle for themselves. There

is another thing I want to lay emphasis on, and that is bonding resistance. The success, or rather the failure of the track work, is more often due to bad rail bonding than that it is to bad ballast, and anything that can be done to increase the conductivity of the rails will help a great deal more than anything else, and it can be done. (The committee was dismissed with thanks.)

## Report of Committee X—Signaling Practice

**T**HE COMMITTEE SUBMITTED reports on the problem of signaling railroads with reference to the effect of signals and proper location of passing sidings on the capacity of the line and on automatic train control, on which it has made considerable investigation and reported progress, and in addition submitted a

brief summary of some of the devices which are showing promises of development. These devices are: The American Train Control System; Shadle Automatic Train Control; National Safety Appliance Company, and Shweyer Automatic Train Control.

The committee recommended that the matter on location of sidings and that on automatic train control be accepted and presented to the association as information.

### Effect of Siding on Capacity of Two or More Tracks

In the study of the effect of signaling (block signaling) and the location of passing sidings on the capacity of a track with traffic in one direction, we have quite a different problem from that of a track with traffic in both directions, for while in both cases time is the governing feature in determining how many trains can be operated between two points, in the case of a track with traffic in both directions it is the time of opposing trains which controls; whereas on a track with traffic in one direction it is the time of following trains. The subject naturally divides itself into two parts: First, a proper location of passing tracks; second, capacity of a line without passing tracks.

### Proper Location of Passing Tracks

In order that we may have a concrete example on which to base the formulae and methods which we intend to produce, we will take a 100-mile division on which only two classes of trains are operated. First, freight trains whose running time over the division, including necessary stops for coal and water, is 6½ hr.; and second, passenger trains whose running time over the division is 2½ hr. The running time of the freight train we will assume to be as follows:

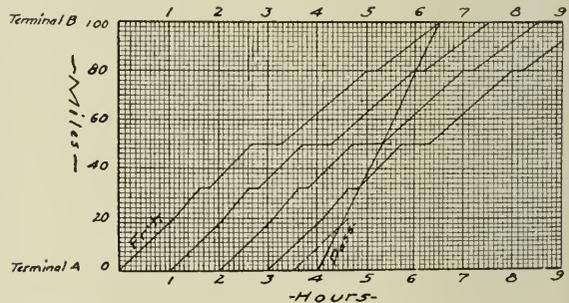

From terminal A to mile post 20.....	66 min.
From mile post 20 to mile post 32.....	30 min.
From mile post 32 to mile post 50.....	54 min.
From mile post 50 to mile post 80.....	105 min.
From mile post 80 to terminal B.....	78 min.

Total .....333 min.

The necessary stops for the freight train we will assume to be 12 min. at mile post 32 for water; 33 min. at mile post 50 for coal and water, and 12 min. at mile post 80 for water; total time for stops being 57 min., so that the total time consumed on the division, as before assumed, would be 390 min.

The accompanying diagram shows a freight train leaving terminal A at 12 midnight and arriving at terminal B at 6:30 a. m., and a passenger train leaving terminal A at 4 a. m., arriving at terminal B at 6:30 a. m. It is quite evident from an inspection of this diagram that if there were no passing tracks on the division, no freight trains could be operated between midnight and 4 a. m. In other words, the passenger train occupies the line for four hours. This time of four hours is equal to the difference between the running time of the freight train and the running time of the passenger train; or if we let T represent this interval of time, and tF and tP represent the total running time of the freight and passenger trains, respectively, we would have  $T = tF - tP$ .

If there were no passing tracks on the division, but one freight train could be operated during this interval

Graphic Method of Locating Passing Tracks on Double Track Lines

of time. If there was one passing track on the division of only one train capacity, then only one more freight train could be operated, and if there were two such passing tracks, then only two more freight trains could be operated. So, the number of trains that could be operated during this interval of time would be one more than the number of passing tracks. It is also quite evident that the maximum delay which could occur to a freight train at terminal A if there were no passing tracks would be four hours, for if it could not leave terminal A in time to reach terminal B before the passenger train, it would have to wait at terminal A until after the passenger train had left that terminal. Consequently, the maximum delay would also be equal to  $tF - tP$ . It is quite evident that the proper location of passing tracks would be one that would cause the minimum amount of delay to the freight trains when they are passed by the passenger train. In order to show the conditions under which such

a minimum delay will occur, we present the following diagram (Fig 2):

This diagram is a portion of the usual train diagram, and it shows two freight trains being passed by a passenger train at adjacent sidings. Freight train No. 1 arrives at siding B at such a time in advance of the passenger train that it can clear the main line in accordance with any rules that may be in effect relative to this particular train movement. Freight train No. 2 also arrives at siding A the same amount of time in advance of the passenger train. These would be the conditions under which the minimum amount of delay would be caused to the freight trains, and that delay would be only the actual time which it is necessary for a freight train to lose due to its entering a siding to be passed by another train. This loss of time, which we will call *a*, may be divided into three parts, as follows: (1) The time lost by the freight train due to stopping for switch and starting again and getting into clear on the siding, which time we will call *b*; (2) the time the freight train must remain at rest on the siding in order to be passed by another train, which time we will call *e*; and (3) the time lost by the freight train in starting from the siding and re-

siding B in advance of the passenger train in accordance with the rules which may be in effect, and in consequence thereof it has to wait at siding A until the passenger train had passed that siding, in which case the freight train would arrive at siding B on the time shown on the diagram for train 2. The time lost by such a delay to freight No. 1 would be as shown by the diagram, equal to *S*, which, as heretofore shown, is  $F - P$ . The maximum delay is then the difference between the running times of the freight and passenger trains between the sidings and this maximum delay will be found on a division at the point where this  $F - P$  is the greatest.

Coming back now to the train diagram of our concrete example, it is quite evident that the maximum  $F - P$  will be the smallest when this  $F - P$  is the same for the space between each of the passing points; or, in other words, the passing tracks should be so located that the difference between the running time of a freight train and passenger train between them would all be equal, or, what is the same thing, the spacing between freight trains which are to be passed by the passenger train should be all equal.

As there is always one more space than there are passing tracks, we can construct the following formulæ:

$$S = \frac{tF - tP}{N + 1}$$

in which *N* equals the number of passing tracks. For example, if there were to be three passing tracks on the 100-mile division of our concrete example, the proper spacing between freight trains would be  $\frac{390 - 150}{4}$

$$S = \frac{240}{4}, \text{ or, } S = 60 \text{ min.}$$

The proper location of this number of sidings can be easily determined graphically by laying out on the diagram freight trains leaving terminal A one hour apart, or at 1 o'clock, 2 o'clock and 3 o'clock, and the points where they intersect the passenger train line would be the proper location of the passing tracks, or on the diagram at mile posts 32, 50 and 80. It will be noted from this diagram with such a location of passing tracks that the running time of a freight train between each of the passing tracks, plus the time that it is either taking water or coal, minus the running time of the passenger train between the same sidings, is in each case equal to 60 min. We can, therefore, establish the general rule that the proper location of passing tracks on a double track line would be such that the difference between the running time of the freight trains, including necessary stops, and the running time of the passenger trains, including necessary stops, between them should all be equal. This analysis does not take into consideration the use of the second main track for passing trains.

From the foregoing it follows that the capacity of a division is increased as the value of the time  $F - P$  is decreased. The value of this term may be decreased by either decreasing *F*, which would be increasing the speed of the freight trains, or by increasing *P*, which would be decreasing the speed of the passenger trains, and it is quite evident that the actual maximum capacity can only be reached when the value of this term is zero, in which case passing tracks would not be needed and the spacing of trains would usually be governed only by the longest time which the train is obliged to remain at rest at any point upon the division.

When all trains are running at equal speed the capacity of a division can be expressed by the simple equation,  $Z = \frac{f}{T}$ , in which *Z* equals the number of trains, *T* an interval of time and *f* the interval of time between trains.

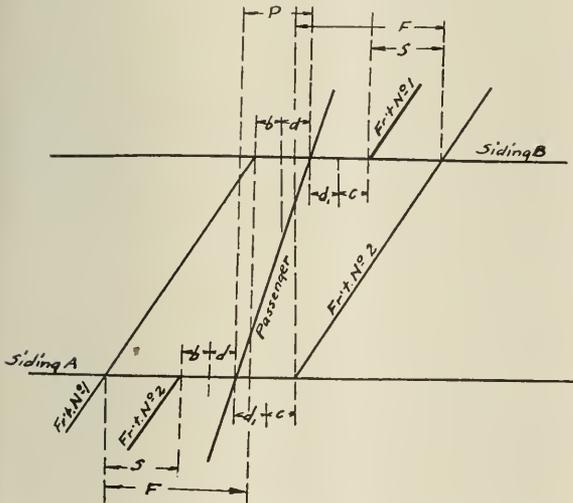

Figure 2. Location of Passing Tracks for Minimum Delay

gaining its normal speed, which time we will call *c*. The time *e* which a train must remain at rest on the siding is again divided into two parts. (1) The time which it must be into clear before the arrival of the passenger train as per rules which may be in force, and (2) the time which it must remain at rest after the passenger train has passed the siding. This time also being in accordance with rules which may be in force. These two subdivisions of the time *e* we will call *d* and *d*<sup>1</sup>, respectively, so we would have  $a = b + c + d + d^1$ .

Representing the running time of the freight train between sidings by *F*, and the running time of the passenger train between the same sidings by *P*, we would have from the diagram  $S = F + c + d^1 - P - d - c$ . Or,  $S = F + b + d - P - d - b$ . Or, in either case,  $S = F - P$ . *S* in this case being the spacing in time between the two freight trains.

From this we learn that the minimum delay will occur to a freight train when the spacing between freight trains is equal to the difference in running time of the freight and passenger trains between the sidings. The maximum delay would occur to a freight train when, for example, freight No. 1 arrived at siding A just too late to make

If no form of block signaling is employed, this time  $f$  is determined by the maximum length of time a train is obliged to stop at any point on the division for any purpose, such as for taking coal and water, in which event the time  $f$  is equal to the amount of time which the train remains at rest for such a purpose, and the equation for

capacity under these conditions becomes  $Z = \frac{f}{D}$ , in which  $D$  equals the length of time consumed at the stop.

If the rules or a form of block signaling is used which requires a definite time interval between trains, then the capacity is determined by the simple equation  $Z = \frac{f}{T}$ ,

but in no case can  $f$  be less than  $D$ .

In neither of these cases is the speed of trains or their length a factor in determining the capacity of a division,

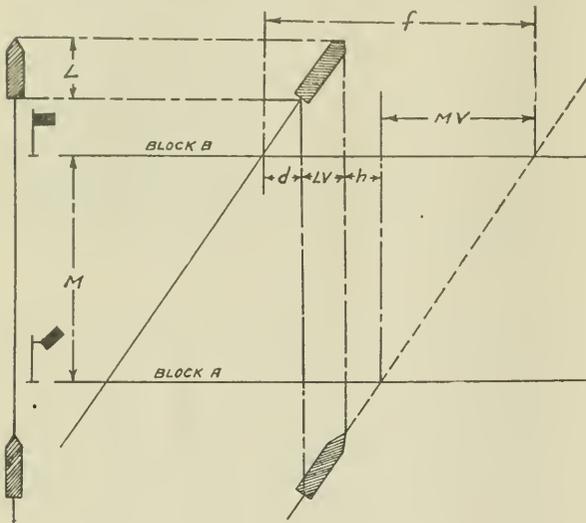

Figure 3. Diagram Showing Maximum Length of Block with Minimum Train Spacing

unless it should happen that  $D$  or  $f$  is less than the time it takes a train to travel its length. When, however, either rules, or a form of block signaling is used which requires a definite space between trains, then the term  $f$  depends not only upon the speed and length of trains, but also upon the length of time it requires the train to travel through the required space, and also upon two other factors which we will point out.

Capacity of a Line Without Passing Tracks

Figure 3 shows two trains running as close together as it is possible over a block signal territory. In this, figure  $M$  represents the maximum length of block in this territory and  $L$  represents the length of train. The time  $d$  is the time that must elapse after the rear end of the preceding train has passed block  $B$  before the signal at block  $A$  can be made to indicate "proceed." This time may be fixed by rule, in manual block operation or in automatic block operation it would be the time required for the signal at block  $A$  to assume a proceed position after the rear of a train had passed into the block governed by the signal  $B$ . The time  $h$ , which is commonly called "sighting time," is the time that must be allowed for the following train to observe the signal  $A$  after it has assumed the proceed position in order that the train  $A$

may continue at its normal speed. Representing the speed of the train in miles per minute by  $Lv$ , we would have for the value of  $f$ :  $f = h + Mv + d + Lv$ , and the equation for capacity would become

$$Z = \frac{f}{(M + L)v + h + d}$$

If for any reason there is a necessary stop in any block, such as a stop for coal or water, then the time lost by a train on account of such a stop must be included in the time  $f$ , and if the time  $f$  for which the block in which the stop occurs is the maximum  $f$  for the division, then this stop becomes a factor in determining the capacity of the division. In this case we would have  $f = h + Mv + d + Lv + D$ . In this equation  $M$  is not the maximum length of block, but it is the length of the block in which the delay represented by  $D$  occurs. The equation for capacity now becomes

$$Z = \frac{f}{(M + L)v + h + d + D}$$

To illustrate the use of these formulæ, let us determine the capacity of two pieces of road, over each of which only one class of trains is operated. One of these roads being equipped with manual and the other with automatic block signaling. Let it be assumed that the trains are  $\frac{1}{2}$  mi. long, and that they run at the rate of 3 min. per mile on both roads. On the manual block road assume that the maximum length of block is 7 mi., and for the automatic block territory assume that the maximum spacing of signals is 1 mi., so that the maximum length of block for trains running under proceed signals would be 2 mi. In both cases let  $h$  equal  $\frac{1}{2}$  min., and in manual block let  $d$  be 5 min. and in automatic block  $\frac{1}{4}$  min. We would have then as the capacity in trains per day: For manual block—

$$Z = \frac{1440}{(7 + .5)} \cdot 3 + .5 + 5 = 51.$$

$$Z = \frac{1440}{(2 + .5)} \cdot 3 + .5 + .25 = 174.$$

Analysis of Line Having Mixed Traffic

A method of analyzing the capacity of a double track line where mixed traffic is operated is to consider the passenger schedule as fixed and then determine the amount of time these passenger trains occupy the line, the remaining time being that which is available for freight traffic.

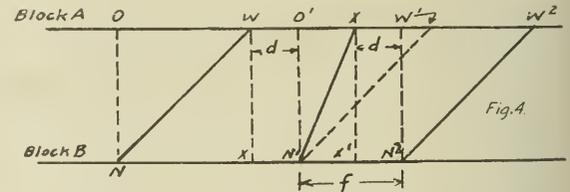

Fig. 4. Diagram of Mixed Traffic

In Fig. 4,  $NW$  represents a freight train,  $N^1W^1$  and  $N^2W^2$  representing other trains of equal speed.  $N^1X^1$  represents a passenger or other train running at a greater speed. It is obvious that  $f$  for the passenger train  $N^1X^1$  is all that the main track capacity is reduced

for freight purposes and that parallelogram  $N^1 W^1 W^2 N^2$  will represent this reduction in capacity due to a single high speed train. In Fig. 5 as in Fig. 4,  $N W$  represents a freight train  $N^1 W^1$  and  $N^2 W^2$  representing other trains of equal speed.  $N^1 X^1$  as in Fig. 4 represents a passenger train and  $N^4 X^2$  represents a second one. From this it is obvious that when the time between two passenger trains  $N^1 N^2$  is less than  $f$  for a freight train which in this case equals  $N^1 N^2$ , there is no time in which a freight train can enter the block; therefore, the total time that the main track capacity is reduced for freight purposes is passenger train time  $f$ , which equals  $N^4 X^2$  plus the time between the passenger trains  $N^1 N^4$  or  $N^1 N^2$  and the amount that the main track capacity is reduced for freight purposes, may be represented by the parallelogram  $N^1 W^1 W^2 N^2$ .

#### Application of Formulæ for Analyzing a Two or More Track Line

The report also included information concerning the application of formulæ on a double track line 122 mi. long having a heavy passenger business, with 36 regular passenger trains in each direction at the east end and 19 regular passenger trains in each direction at the west end. The line is equipped with automatic block signals.

The complete analysis includes a number of charts and explanatory matter concerning the present conditions and proposed changes, which included the addition of third and fourth tracks at certain points.

In order to obtain free use of the third and fourth tracks, 39 mi. of automatic signaling and 5 new interlocking plants besides the enlargement of some others

would be required. The effect of the change would be a reduction of from 30 to 70 per cent in the interference resulting from the use of main tracks for freight service in various territories, and an increase in the number of freight trains that could be handled at the most restricted point from 21 to 29 trains, or 35 per cent. In addition, the time of trains over the road would be considerably reduced on account of the reduction in delays; the capacity of the yards at three points would be greatly increased and the lost time of locomotives at these points greatly decreased on account of greater freedom and better distribution of time when trains could be received and dispatched from these points.

Committee: J. A. Peabody (C. & N. W.), chairman; W. J. Eck (Southern), vice-chairman; C. C. Anthony (Santa Rosa, Cal.), H. S. Balliet (Grand Central Terminal), C. A. Christoferson (N. P.), C. E. Denney (N. Y. C. & St. L.), C. A. Dunham (G. N.), W. H. Elliott (N. Y. C.), G. E. Ellis (I. C. C.), J. V. Hanna (K. C. T.), J. G. M. Leisenring (Ill. Traction), H. K. Lowry (C. R. I. & P.), J. C. Mock (M. C.), F. P. Patenall (B. & O.), A. H. Rudd (P. R. R.), W. B. Scott (Gulf Coast Lines), T. S. Stevens (A. T. & S. F.), E. G. Stradling (C. I. & L.), B. Wheelwright (G. T.).

#### Discussion

(J. A. Peabody (chairman) presented the report.)

The report is made as information, and your committee recommends that this matter on the location of sidings be accepted by the association as information, and I so move. (Motion carried.)

The second subject, report on automatic train control. This is also submitted as information and I move that it be so accepted. (Motion carried.)

(The committee was excused with thanks.)

## Report of Committee VI—Standard Designs

THE OUTLINE OF WORK assigned to the committee this year covers among other things the following:

(1) Prepare standard designs. (2) Prepare standard designs of switch fittings. (3) Check and criticize drawings which other committees are authorized to prepare, giving to each drawing a title and number. (4) Revise standard plans to meet unit specifications as approved.

The committee presented eight drawings, four of which are revisions of previous issues, two drawings are new, and two are presented for information and further discussion if found necessary:

R. S. A. 1014, One-Way Horizontal Pipe Compensator (Details and Assembly)—revised. Compensator base has been strengthened to avoid breakage in shipment and in service.

R. S. A. 1015, One-Inch Signal Pipe and Coupling (Details and Assembly)—revised. Rivet holes at one end transposed, to obtain more economical shop practice, and note "Slightly bevelled to remove burrs," added, after "ends faced."

R. S. A. 1070, Binding Post (Details and Assembly)—revised. Washer changed from No. 14 to No. 18 A. W. G. brass. Note changed from "Edges rounded" to "Sharp corners removed."

R. S. A. 1220, Cross-arm Bolts (Through and Double Arm)—revised. Square washer added, together with reference numbers.

R. S. A. 1409, Cotters (Size—Drilling—Location). Data Sheet—new.

R. S. A. 1459, Staff Tip Adapter—new.

Drawings S. K. 20, Movable Point Frog, and 21, Double Slip Switch, are submitted for reference and information, as confirming the discussion at the annual meeting in 1918, showing method recommended by Committee II as to disposition of rods and fittings.

The committee would like to have further discussion on the subject of "Fittings for Interlocked Switches," exhibits of which have been submitted to the association from time to time since 1914.

The committee was instructed by President Trout to follow up the matter of the standardization of lamps and in co-operation with the representatives of regional directors, meetings have been held with very satisfactory results, and it is thought that plans covering our recommendations will be presented at the next meeting.

Committee: F. P. Patenall (B. & O.), chairman; J. C. Mock (M. C.), vice-chairman; W. A. Hanert (N. Y. C.), C. J. Kelloway (A. C. L.), B. H. Mann (M. P.), F. W. Pflieger (U. P.), W. N. Spangler (P. R. R.), M. E. Smith (D. L. & W.), R. E. Trout (St. L.-S. F.).

Manufacturers' Representatives: J. J. Hubbard (F. S. Co.), W. P. Neubert (U. S. & S. Co.), H. B. Taylor (H. S. & S. Co.), S. N. Wight (G. R. S. Co.)

#### Discussion

In connection with the one way horizontal pipe compensator a few slight changes were suggested by some of the members. The same was true regarding the other designs submitted. The chairman of the committee was desirous of having the members discuss at length the fittings of interlocked switches as a guide in connection with future work on this subject.

# Report of Committee XII—Contracts

THE COMMITTEE submitted as a progress report the following proposed form of contract for block signal and interlocking work:

THIS AGREEMENT, made this ..... day of ..... in the year ..... by and between ....., party of the first part, hereinafter called the "Contractor," and ..... party of the second part, hereinafter called the "Company":

WITNESSETH, That, in consideration of the covenants and agreements hereinafter mentioned, to be performed by the parties hereto, and of the payments hereinafter agreed to be made, it is mutually agreed as follows:

The contractor shall furnish all materials, superintendence, labor, equipment and transportation, except as hereinafter specified, and shall execute, construct and finish, in an expeditious, substantial and workmanlike manner, to the satisfaction and acceptance of the ..... of the Company, hereinafter called the "Engineer".....

The work covered by this contract shall be commenced within ..... days after the execution of this contract and shall be completed on or before the ..... day of ....., 19..

In the event of failure to complete the work within the time specified, there shall be deducted from the contract price the sum of ....., which amount is agreed upon not as a penalty, but as liquidated damages.

And in consideration of the completion of the work described herein, and the fulfillment of all stipulations of this agreement to the satisfaction and acceptance of the Engineer of the Company, the said Company shall pay, or cause to be paid, to said Contractor, the amount due to the Contractor, based on the following prices:

.....  
 .....

### Bond

1. The Contractor agrees, at the time of the execution and delivery of this contract and before the taking effect of the same, to furnish and deliver to the Company a good and sufficient bond of indemnity to the amount of ..... dollars, as security for the faithful performance, by the Contractor, of all covenants and agreements on the part of the Contractor contained in this contract. The security in such bond of indemnity must be satisfactory and acceptable to the Company.

This bond shall remain in force and effect in such amount, not greater than that specified, as shall be determined by the Engineer.

### Understanding of Plans and Specifications

2. The Contractor hereby distinctly and expressly declares and acknowledges that, before the signing of this contract, he has carefully read the same, and the whole thereof, together with and in connection with said plans and specifications, and that he has made such examination of

this contract and of said plans and specifications, and the location where said work is to be done, and such investigation of the work required to be done, and in regard to the material required to be furnished, as to enable him to thoroughly understand the intention of the same, and the requirements, covenants, agreements, stipulations and restrictions contained in this contract and in said plans and specifications, and distinctly agrees that he will not hereafter make any claim or demand upon the Company, based upon or arising out of any alleged misunderstanding or misconception on his part of the said requirements, covenants, stipulations and restrictions.

### Plans and Specifications.

3. The work to be done is more fully described in the specifications dated.....and the following plans: ..... which specifications and plans are hereto attached and are hereby declared to be, and are accepted, as a part of this contract.

Work that may be called for in the specifications but not shown on the plans, or shown on the plans and not called for in the specifications, or anything not expressly set forth in either plans or specifications but which nevertheless is obviously necessary or implied, shall be furnished and performed the same as if specifically shown or mentioned in both.

### Rights of Various Interests

4. Wherever work being done by Company forces or by other contractors is contiguous to work covered by this contract, the respective rights of the various interests involved shall be established by the Engineer, to secure the completion of the various portions of the work in general harmony.

### Consent to Transfer

5. The Contractor shall not transfer this contract, nor sublet any part of the work without the written consent of the Engineer and such consent shall not relieve the Contractor of his liabilities under this contract.

### Inspection

6. All work and material shall be at all times open to inspection, acceptance or rejection of the Engineer or his duly authorized representative. The Contractor shall provide reasonable and necessary facilities for such inspection.

### Defective Work or Material

7. Any omissions or failure on the part of the Engineer to disapprove or reject any work or material shall not be construed to be an acceptance of any defective work or material. The Contractor shall remove, at his own expense, any work or material condemned by the Engineer, and shall rebuild and replace the same without extra charge, and in default thereof the same may be done by the Company at the Contractor's expense, or, in case the Engineer should not consider the defect of sufficient importance to require the Contractor to rebuild or replace any imperfect work or material, he shall have power, and is hereby authorized, to make an equitable deduction from the stipulated price.

### Indemnity

8. The Contractor shall indemnify and save harmless the Company from and against all losses and all claims, demands, payments, suits, actions, recoveries and judgments of every nature and description brought or recovered against it, by reason of any act or omission of the said Contractor, his agents or employees, in the execution of the work or in consequence of any negligence or carelessness in guarding the same.

### Settlement for Wages

9. Whenever, in the opinion of the Engineer, it may be necessary for the progress of the work to secure to any of the employes engaged on the work under this contract any wages which may then be due them, the Company is hereby authorized to pay said employes the amount due them or any lesser amount, and the amount so paid them, as shown by their receipts, shall be deducted from any moneys that may be or become payable to said Contractor.

### Liens

10. If at any time there shall be evidence of any lien of claim for which the Company might become liable, and which

is chargeable to the Contractor, the Company shall have the right to retain out of any payment then due or thereafter to become due, an amount sufficient to completely indemnify the Company against such lien or claim, and if such lien or claim be valid, the Company may pay and discharge the same and deduct the amount so paid from any moneys which may be or become due and payable to the Contractor.

**Risks**

11. The work under this contract in every respect shall be at the risk of the Contractor until finished and accepted, except damage or injury caused directly by Company's agents or employes.

**Order and Discipline**

12. The Contractor shall at all times enforce strict discipline and good order among his employes, and any employe of the Contractor who shall appear to be incompetent, disorderly or intemperate, or in any other way disqualified for or unfaithful to the work entrusted to him, shall be discharged immediately on the request of the Engineer, and he shall not again be employed on the work without the Engineer's written consent.

**Company's Employes**

13. The Contractor shall not employ or hire any of the Company's employes without the permission of the Engineer.

**Intoxicating Liquors.**

14. The Contractor, in so far as his authority extends, shall not permit the sale, distribution or use of any intoxicating liquors upon or adjacent to the work, or allow any such to be brought upon, to or near the line of the railway of the Company.

**Right of Company to Amplify Plans**

15. The Company shall have the right, during the progress of the work, to amplify the plans, to add explanatory specifications and to furnish additional specifications and drawings.

**Power of Engineer**

16. The Engineer shall decide controversies arising between the parties hereto as to the meaning or intent of the plans and specifications. He shall give such instructions and directions as may be necessary for the Contractor to properly carry out the work, and his interpretation of the plans and specifications shall be final and binding. The Engineer shall have power to reject or condemn all work or material which is imperfect, defective or unworkmanlike, or which, in any way, does not conform to this contract; to direct the application of forces to any portion of the work, which in his judgment requires it; to order the force increased or diminished and to decide questions which may arise between the parties relative to the execution of the work.

**Order of Completion. Use of Completed Portion**

17. The Contractor shall complete any portion or portions of the work in such order of time as the Engineer may require. The Company shall have the right to take possession of and use any completed or partially completed portions of the work, notwithstanding the time for completing the entire work or such portions may not have expired; but such taking possession and use shall not be deemed an acceptance of the work so taken or used or any part thereof.

**Changes**

18. The Company shall have the right to make alterations in, additions to, or deductions from, the work, without in any manner affecting or making void this contract.

No changes, additions or deductions shall be made except upon written order of the Engineer and the value of the work so changed, added or deducted, shall be agreed upon and added to or deducted from the contract price.

**Unavoidable Delays**

19. If the Contractor shall be delayed in the performance of the work by reason of fire, flood, strikes or other causes beyond his control, or if the Company shall be delayed in the performance of its covenants and agreements by causes beyond its control, then the time for completion of the work may be extended, as may be agreed upon, without in any way affecting the conditions of this contract or the liability of sureties on the bond.

**Suspension of Work**

20. The Company may at any time stop the work, or any part thereof, by giving.....days notice to the Contractor in writing. The work shall be resumed by the Contractor in.....days after the date fixed in the written notice from the Company to the Contractor so to do. The Company shall not be held liable for any damages or anticipated profits on account of the work being

stopped, or for any work done during the interval of suspension. It will, however, pay the Contractor for expense of men necessarily retained during the interval of suspension, provided the Contractor can show that it was not reasonably practicable to move these men to other points at which they could have been employed. The Company will further pay the Contractor for time necessarily lost during such suspension at the rate of.....per cent per annum on the estimate value of materials, equipment and fixtures furnished by the Contractor on the work which are necessarily idle during such suspension, said rate of.....per cent per annum being understood to include depreciation, interest and insurance, but if the work, or any part thereof, shall be stopped by the notice in writing aforesaid, and if the Company does not give notice in writing to the Contractor to resume work at a date with..... of the date fixed in the written notice to suspend, then the Contractor may abandon that portion of the work so suspended and he will be entitled to the estimates and payments for such work so abandoned, as provided in Section 25 of this contract.

**Forfeiture**

21. If at any time the work is not progressing to the satisfaction of the Engineer, he may so notify the Contractor in writing, and if the progress of the work fails to show an immediate improvement satisfactory to the said Engineer, he may, at his discretion, for the failure to prosecute the work with an adequate force, for non-compliance with orders as to the manner of performing it, or for any omission or neglect of, or failure to comply with any of the requirements of this agreement, on the part of the Contractor, declare this contract forfeited, which declaration of forfeiture, made in writing and served upon the Contractor, shall exonerate the Company from any and all liabilities and obligations arising under this contract, and any balance due the Contractor on account of work done shall be forfeited to the Company, and the Engineer shall have full power to enter upon and take possession of the work, and to contract with any other person or persons for its completion.

**Replacement of Defective Parts**

22. The Contractor shall replace promptly at his own expense any part or parts of the apparatus and material furnished under this contract which within a period of one year after the date of final acceptance of the work shall fail to perform its proper functions because of any defect in the design, construction or installation of said apparatus or material.

**Patents**

23. The Contractor hereby covenants and agrees to indemnify and save harmless the Company of and from all loss, damage, claims, suits, recoveries or judgments, which may arise or be made, had, brought or recovered by reason of or on account of the material, tools, implements, machinery, fixtures, or anything used in or about the work to be performed under the contract, being infringements, or being claimed to be infringements, of letters patent issued by the United States or any foreign country.

**Payments**

24. Payments for work covered by this contract shall be made in the following manner.....

**Final Payment**

25. Upon the completion of the work, the Engineer shall certify that all of the work comprehended under this contract has been completed and accepted by him under the terms and conditions thereof, whereupon the entire amount found to be due the Contractor shall be paid to the Contractor at.....within..... days after date of said certificate, provided, however, that before final payment is made, the Contractor shall submit evidence satisfactory to the Engineer that all payrolls, material bills, and outstanding indebtedness in connection with this work, have been paid.

This agreement shall inure to the benefit of and be binding upon the legal representatives and successors of the parties respectively.

In Witness Whereof, the parties hereto have executed this agreement in.....the day and year first above written.

Witness:

Committee: R. C. Johnson (B. R. T.), chairman; H. F.

Haag (U. S. R. A., Southwestern Region), vice-chairman; Hadley Baldwin (C. C. C. & St. L.), H. S. Balliet (Grand Central Ter.), George Boyce (C. St. P. M. & O.), R. L. Davis (M. C.), W. H. Elliott (N. Y. C.), A. R. Fugina (L. & H.), R. L. Huntley (U. P.), J. B. Latimer (C. B. & Q.), John Leisnering (Ill. Traction), H. F. Lomas (I. C.), J. A. Peabody (C. & N. W.), E. B. Pry (Penna. Lines West), J. M. Waldron (I. R. T.).

### Discussion

The Secretary: The committee on contracts has only a progress report to make, and the chairman is not present. At his request I suggest every member of the association who has any suggestions whatsoever on the proposed contract—a good many legal questions are involved—and in the absence of practically all of the leading members of this committee, write to the chairman of the committee directly, and to the vice-chairman, forwarding a carbon copy, between now and not later than March

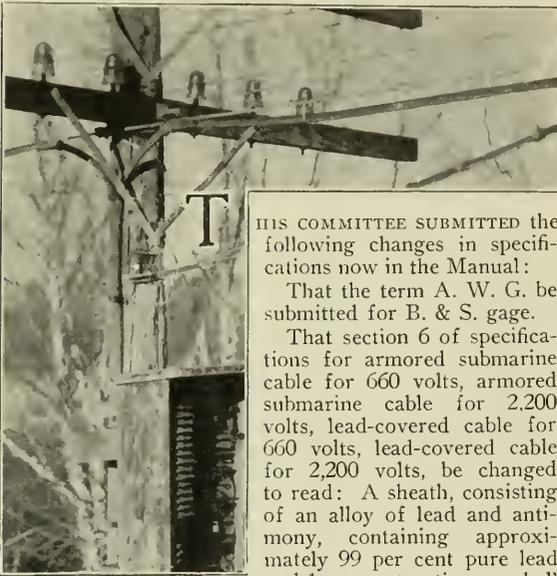

29, 1919, with any suggestions, objections or criticisms that any of the members have to make to this report.

W. H. Elliott (N. Y. C.): I object to the form of contract, for the reason that it represents only one side, the engineer or railroad company, leaving out any consideration for the contractors' interest.

L. F. Howard (U. S. & S. Co.): Are the manufacturers to have an opportunity to have a conference with the committee before the June meeting?

The Secretary: A careful study has been made by a number of gentlemen who have thought the matter over, and they felt they had not sufficient time to digest such a document. Now, the opportunity is given to every one interested to present their views between now and March 29, and immediately after that date the committee will hold another meeting and it is their desire to have present every one they can get hold of to assist in the discussion and develop these contracts into final form.

## Report of Committee IX—Wires and Cables

**T**HIS COMMITTEE SUBMITTED the following changes in specifications now in the Manual:

That the term A. W. G. be submitted for B. & S. gage.

That section 6 of specifications for armored submarine cable for 660 volts, armored submarine cable for 2,200 volts, lead-covered cable for 660 volts, lead-covered cable for 2,200 volts, be changed to read: A sheath, consisting of an alloy of lead and antimony, containing approximately 99 per cent pure lead and 1 per cent antimony, shall

be applied over the assembled and taped conductors, etc.

That the specification for friction tape be revised to read as follows:

### 1. General

(a) The tape shall be made of cotton sheeting which is thoroughly impregnated on both sides with a friction rubber compound. The edges of the tape shall be straight and the width even. No pin holes should be observable when the tape is held before a strong light. 1914.

(b) Unless otherwise specified, the tape shall be  $\frac{3}{4}$ -in. width. 1919.

### 2. Friction Rubber Compound

(a) The compound shall have a rubber base and be of the strength and insulating qualities required to meet the specified physical and electrical tests. 1914.

(b) The compound shall be free from active sulphur or other substances which will act injuriously on copper or the cotton tape. 1914.

### 3. Cotton Tape

The cotton tape shall be cut from sheeting well, evenly and firmly woven from good cotton and free from defects, dirt, knots, lumps and objectionable irregularities of twist. The warp of the fabric shall extend lengthwise of the tape

and the tape shall not ravel continuously when unwound from the original roll. 1914.

### 4. Tests

(a) Manufacturer shall give the purchaser sufficient notice of time when material will be ready for testing.

(S. S. T.-a.) 1916.

(b) Manufacturer shall provide, at point of production, apparatus and labor for making the required tests under the supervision of the purchaser. (S. S. T.-b.) 1916.

(c) Tests may be made at point of production, or on samples submitted, and may also be made at destination.

(S. S. T.-c.) 1916.

(d) Tests shall be made from samples taken from any part of any roll. 1919.

### 5. Physical Tests

(a) The finished tape shall be unwound from the original roll and wound in concentric layers for a distance of 12 in. at a rate not to exceed 2 ft. per minute upon a  $\frac{1}{4}$  in. mandrel under a tension of  $7\frac{1}{2}$  lb. for  $\frac{3}{4}$ -in. width. 1919.

(b) Tape shall then be unwound under a tension of 3 lb. for  $\frac{3}{4}$ -in. width. 1919.

(c) The adhesion between the plies shall be such that the rate of separation after 2 in. have been unwound shall not exceed 10 in. in 3 min. 1919.

### 6. Tensile Strength

(a) The tensile strength of the tape shall be not less than 30 lb. for  $\frac{3}{4}$ -in. width. 1914.

(b) The test for tensile strength shall be made on a piece of tape 12 in. in length between grips and stretched at the rate of 10 in. a min. 1919.

### 7. Heat Test

(a) Strips of tape 18 in. in length, taken from the original roll, shall be exposed to a dry heat of approximately 210 degrees F. for 16 hr. 1919.

(b) Immediately upon removal from the heat, the strips shall be wound in concentric layers for a distance of 12 in. upon a  $\frac{1}{4}$ -in. mandrel at a rate not to exceed 2 ft. a min. under a tension of  $7\frac{1}{2}$  lb. for  $\frac{3}{4}$ -in. width. 1919.

(c) Tape shall then be unwound under a tension of  $1\frac{1}{2}$  lb. for  $\frac{3}{4}$ -in. width. 1919.

(d) The adhesion between the plies shall be such that the rate of separation after 2 in. have been unwound shall not exceed 10 in. in 3 min. 1919.

### 8. Electrical Test

(a) The tape shall stand a potential strain of 1000 volts (effective value) 60 cycles applied for 1 min. by placing a section of tape between two brass ball electrodes each  $\frac{3}{4}$ -in. in diameter. The electrodes shall be spaced so that tape will just move between them. 1919.

(b) The voltage shall be gradually increased, after tape has been placed between electrodes, until limiting value is attained. 1919.

### 9. Inspection

(a) Purchaser will make such inspection of the completed product as to assure him that the requirements of the specification have been met. (S. S. I.-a.) 1916.

(b) Purchaser may make desired inspection at all stages of manufacture. (S. S. I.-b.) 1916.

(c) If, upon arrival at destination, the material does not meet the requirements of this specification, it may be rejected and returned to the manufacturer, who shall pay all freight charges. (S. S. I.-c.) 1916.

**10. Packing**

(a) Material shall be packed so as to permit convenient handling and to prevent loss or damage during shipment. (S. S. P.) 1916.

(b) The tape shall be furnished in rolled strips having the following dimensions and weight:

Width, Inches	Approximate Thickness	Minimum Length per Pound	Weight per Roll, Pounds
1/2	.015	135 ft.	0.33
3/4	.015	90 ft.	0.5
1	.015	67.5 ft.	0.67
1 1/2	.015	45 ft.	1.0
2	.015	33 ft.	1.34

1919.

(c) Each roll shall be enclosed in a tin box or wrapped in tin foil and enclosed in a box to secure and fully protect the contents. 1914.

(d) Each package shall contain the full specified weight of tape, exclusive of wrapping and boxes, and shall be marked with the manufacturer's name, the width of the tape and its weight. 1914.

**11. Marking**

Purchaser's order and requisition number, name of consignor and name and address of consignee, shall be plainly marked on outside of package. (S. S. M.-a.) 1916.

Committee: W. H. Elliott (N. Y. C.), chairman; C. D. Cronk (N. Y. C.), W. L. Dryden (S. I. Rap. Trans.), B. F. Oler (P. R. R.), A. H. Rice (D. & H.), D. W. Richards (N. & W.).

**Discussion**

W. H. Elliott (Chairman) presented the report. On motion, the substitution of the term "A. W. G." for "B. & G. gauge" in the specification was approved, and also the specifications for armored submarine cable, for 2 voltages, and lead-covered cable for 2 voltages. The specifications for friction tape was then put to vote and carried, and the committee was excused with thanks.

## Creosoting Wood Signal Trunking to Extend Its Life

The use of creosote for preserving trunking has been considered by the association in the past and the question is one requiring more attention at the present time. In this connection a paper was presented before the association by Kurt C. Barth, technical representative of the Barrett Company, Chicago. Several samples of trunking and capping treated as recommended were submitted at the March meeting of the association, together with the paper. This paper follows:

The purpose of this paper is to submit this subject for consideration and discussion; to make a brief mention of the available information, and particularly to suggest to the Railway Signal Association further careful study. No effort has been made to support certain statements or data, as it is expected that will be developed during committee sessions.

Briefly, the premises for discussion are:

First: It is known that wood trunking, capping and posts decay rapidly, obviously resulting in increased maintenance. The average physical life of untreated trunking can be said to approach four to five years for Douglas fir; two to six years for Southern yellow pine, depending upon grade, and as regards cypress, I would prefer to leave the value of its "eternal" qualities to the judgment of those who have used it.

Second: I have been informed that the average mechanical life of high grade signal wire is said to be about 12 years, varying from four to five years at interlocking plants, where laid adjacent to rails, from 18 to 20 years where not exposed to severe strain. Thus, it is obvious that an increase in the natural life of trunking to about that of the average mechanical life of wire is very desirable, and would mean a considerable saving.

Third: The logical remedy is to employ preservative treatment. The preservative to be considered is coal-tar creosote oil. The available methods are both pressure and non-pressure, although the latter is more adaptable because a refined oil is used and lighter treatments given.

Fourth: The use of coal-tar creosote oil has been seriously objected to because of the belief, based on experience to a certain extent, that creosoted trunking bleeds, and the free creosote oil which thus exudes will rapidly deteriorate the insulation of the wire, causing interruption to service, etc.

If this fact is substantiated, and no remedy found for the condition complained of, then the preservative treatment of trunking may be impracticable. I believe, how-

ever, that a surface treatment with refined coal-tar creosote oil would increase the life of the trunking and parts, without the slightest threat of injury to insulating compositions of good quality.

Fifth: Extracts of expressions from various sources are appended as appendix "A." It is evident that there exists considerable difference of opinion regarding this matter, but none sufficiently serious to preclude arriving at a practical solution. It is hoped in this connection that the co-operation of the wire manufacturers will be had, and that they will endeavor to aid rather than obstruct efforts which may be expended to solve the problem.

Sixth: Surface treatments with refined coal-tar creosote oil (conforming to specification No. R-828A, U. S. Railroad Administration) should be employed for signal trunking, capping and support posts, and when properly conducted, bleeding should not occur. Such treatment should consist of immersion of the trunking, after having been completely manufactured, in refined coal-tar creosote oil maintained at a temperature between the minimum and maximum limits of 150 degrees F. and 200 degrees F. for from 15 min. to 30 min., depending upon species and the grade of wood used. (Steam coils to be used for heating oil.)

Where strictly permanent work is under consideration, and the type of construction warrants the cost, and a more thorough impregnation of the trunking is desirable, and in that event treatment with refined coal-tar creosote oil by the open-tank process (hot and cold treatment) is recommended. The trunking should then be pitched, as heavy treatments may result in a slight bleeding, even of refined oil, although it is to be understood that refined creosote is far less likely to cause trouble or injure the insulation than when the commercial grades of creosote are used for trunking treated by the pressure process. The primary danger is not the treatment in itself, but the possibility that the lower boiling fractions of coal-tar creosote oil will bleed from the trunking as the result of supersaturation during treatment, and collect in sufficient quantities to act as a solvent on the insulation. As these lower boiling fractions are largely removed from the refined creosote, which is herein recommended for treatment of trunking, and as surface treatments do not thoroughly impregnate the lumber, but merely coat the surface, the danger of deterioration is minimized, while if the treatments recommended are properly con-

ducted, this is entirely eliminated. Where treatment is given in the field, a refined creosote shall be liquid at ordinary working temperature, and as it is practically non-volatile the usual difficulty of solidification of the oil and evaporation are removed. It is my belief, furthermore, that when the cut ends of the trunking are brushed in the field, and a little oil is accidentally splashed or dropped on the trunking, no harm will result, because of the exceptional purity of a proper refined creosote.

In conclusion I suggest that this matter be referred to a standing committee, or a special committee for further careful study, as it is quite self-evident that the economy resulting from preservative treatment with refined coal-tar creosote oil is decidedly worth while. In fact, the benefits are at least two-fold. First, extension of the period of service of trunking, of the wire, and practically everything else involved. Second, it is much cheaper to use refined creosote than the cheapest paint.

#### Extract From Proceedings of R. S. A. for 1908

Page 81.

#### Appendix "A."

Mr. B. H. Mann: In connection with Mr. Stevens' remarks I would like to ask if some one has not had some experience with treated conduit. My experience is that a conduit where it was not treated, particularly where it crosses a track and must be in the ground four or five years, that when renewing trunking you will have to handle the wire, that is, you will have to take your rubber tube out and bend it, which is not a good thing for that rubber tube at that age. Has not some one had some experience with creosoted conduits or some other treatment, particularly in connection with the rubber-covered wire, that we may have the advantage of it and still do something with Mr. Stevens on this trunking proposition?

The President: The Northwestern are using a great deal of the bituminous conduit.

Mr. Rosenberg: For Mr. Mann's information I would say that I have had considerable experience with creosoted trunking and will say that as it ages, it gets harder and firmer, the only objection that I find with it is, that after eight or ten years, when you undertake to take it apart, to get inside of the trunking, it is a hard matter to nail it together again; it will split, gets to be the nature of bone, but if it is left to remain without taking it out, it will never rot and will last fifty years or longer.

Mr. Mock: We had one time an installation that required an impregnated trunking. I am sure that it was creosoted, but we took it up with a wire manufacturer and he advised that he would not guarantee the wire, if we used that trunking, explaining that it would act on the rubber insulation in such a way as to reduce its life considerably. It is possible that there is something on the market now that would be better than treated lumber.

The President: I believe the experience of the Lackawanna was that the creosoting did interfere with the rubber insulation; made it punky.

Mr. Stevens: That is, if the wire was not protected by pitch.

The President: Yes, if you put creosoted trunking in and then pitch your wire in, you ought to have a good piece of work.

Mr. Stevens: Underground trunking properly treated, heavy enough to stand mechanical strains, and the wire laid in properly, the trunking pitched before the wires are laid in, and the trunking afterwards filled up with pitch will be the ultimate wire construction for all electric work, but I do not look to see that now.

#### Quotation From Letter Written by Commercial Creosoting Plant

We find a very prevalent impression that the insulation will deteriorate in contact with creosoted lumber, and it is, of course, a fact that rubber suffers in contact with liquid creosote oil.

It has never been proven to our satisfaction that there is sufficient free oil exuding from creosoted trunking or conduits to damage the ordinary insulation on signal wires, and on account of this fact we find the prevalence of this impression may be due to unwarranted statements made by competing firms of conduit.

#### Opinion of an Electric Illuminating Company

Question: Do you fear that the insulation of cable or wire would be affected by coming in contact with the creosoted conduit?

Answer: No.

#### Discussion

G. A. Guyer (N. Y. C.): I am told that it is almost impossible to obtain creosote oil at the present time in sufficient quantities to take care of all ties that are to be treated, and I wondered if the zinc treatment that is being used for preservation would in any way affect the insulation on our wires.

Mr. Barth: I don't see why there would be any objection to using zinc as long as it does not interfere with the operation of your apparatus. That is a question I cannot answer. As far as procuring creosote, you will understand that I have recommended surface treatment, of which I am primarily speaking, that oil meeting the specification of the United States Railroad Administration, and it can be obtained in reasonable quantities at the present time.

O. R. Unger (Mo. Pac.): I wish to state that the Missouri Pacific have renewed 42 miles with creosoted lumber, and practically used all new wire, and in eight months the result was that you could strip it off with your finger.

C. R. Hodgdon (C. P. R.): We have been using a refined creosote oil, putting it on with a brush. We have had some in service about two years, and we have seen no ill effects from it.

The President: I wish to extend a vote of thanks to Mr. Barth for his paper. (Applause.)

#### Santa Fe Signal Supervisors' Reunion

The fifth annual luncheon of the past and present members of the Santa Fe Signal Supervisors Committee was held in the French room of the Congress Hotel Monday noon. Those present were: T. S. Stevens, signal engineer; L. Brown, Sr., assistant signal engineer; G. K. Thomas, Jr., assistant signal engineer, and E. Hanson, signal supervisor, all of the Atchison, Topeka & Santa Fe; G. R. Cowherd, signal engineer, El Paso & Southwestern; B. T. Anderson, assistant signal engineer, Delaware, Lackawanna & Western; Harold K. Ferguson, Austin Company, and J. S. Hobson and J. E. Saunders of the Union Switch & Signal Company.

On the second page of the souvenir menu was a photograph of H. Hobson, signal supervisor of the Santa Fe at Topeka. The last page contained the following poem:

"What we have we'll hold," meant lands and gold,

When we strove in the days gone by.

But now we fight for freedom's right,

And we'll hold the right or die.

## Signal Division Registration

The registration of signal men at the meeting of the Signal section of the American Railroad Association yesterday aggregated 319, the largest in the history of the Association. It compares with 198 for the same day last year.

## Railway Signal Association Men Engaged in the War

A Comparative Statement and Classification of Members  
 Who Served, With Activities of Some

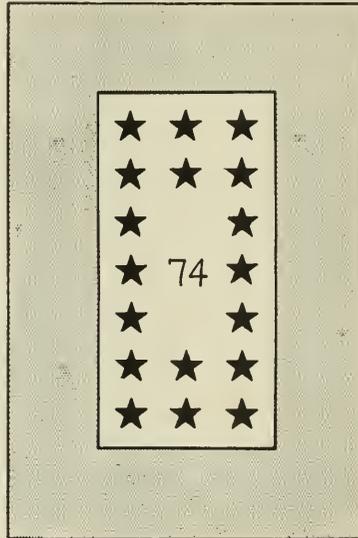

WHEN THE ARMISTICE was signed on November 11, 1918, there were 74 members of the Railway Signal Association in various branches of the military and naval service. These men on the R. S. A. honor roll who responded to their country's call represented about 5 per cent of the present membership of the association, which is approximately 1,250. At the present time the Railway Signal Association has 706 active, 202 junior and 332 associate members. The honor roll of 74 names includes 33 active, 22 junior and 19 associate members. These men have served in the past as committee chairmen or vice-chairmen and as members of various committees and have aided in other ways to promote the interests of the association. Their participation in the war has been none the less active, and the high quality of the service they have rendered is characteristic of their conduct in the R. S. A. A brief outline of the activities of those men in the war whose records we have received is of interest and is given below.

Capt. E. L. Adams, formerly senior signal engineer, Bureau of Valuation, Southern district, Interstate Commerce Commission, with headquarters at Chattanooga, Tenn., was called into military service as a captain of engineers in the Engineer Officers Reserve Corps on September 3, 1917. He was ordered to Fort Leavenworth, Kan., for training and on December 5 of that year was attached to the 112th Engineer Regiment at Camp Sheridan, Montgomery, Ala. In January, 1918, he received orders for overseas duty and arrived in France about one month later. He has since traveled over a large part of France in connection with his official duties and says, "I have been handed around to various outfits ever since I came over, making short stops with each." During his travels from place to place he had a chance to observe some of the signaling on part of the roads in central France. He says that the signals are op-

erated by wire with very elaborate compensating arrangements and that the switches are operated by pipes, but with no facing point locks or switch and lock movements. They also operate cross-overs from one end with nothing to indicate the movement of the switchpoints. All trains are operated on absolute block, and a rather simple and ineffective lock and block instrument is used.

Major Azel Ames, Jr., who recently resumed his associations with the Kerite Insulated Wire & Cable Company at New York after receiving his discharge on January 17, 1919, was called into military service on July 15, 1917, with the 8th Coast Defense Command, National Guard, New York. The following month he was transferred into the United States army and served at Fort Wadsworth, New York Harbor, until the end of the year, following which he attended a coast artillery school at Fortress Monroe, Va., during January and February, 1918, and helped organize heavy artillery regiments located at Fort Screven, Ga.; Fortress Monroe, Va., and Camp Abraham Eustis, Va. He served with the 61st, the 75th and the 41st Artillery, C. A. C.

Major R. F. Morkill, formerly signal engineer of the Grand Trunk at Montreal, Que., enlisted in the Canadian army as a supernumerary second lieutenant in the Canadian Engineers early in October, 1914. He had served previously in the South African war as lieutenant with the Canadian Mounted Rifles. Immediately following his enlistment he was sent to England and during the winter of 1914 and 1915 he helped build the camp at Salisbury Plain and did searchlight work along the English coast. Early in 1915 he was ordered to France and took part in the second battle of Ypres on April 22-24. Two months later he became a captain and was transferred to the Royal Engineers, following which he was ordered to England to command and train a company, and was so engaged until the latter part of December of

The R. S. A. Service Flag

the same year, when he again returned to the front with his company. In the New Year's honors of January, 1917, he was presented with the Military Cross. Later he was promoted to Major of the Royal Engineers and attached to the staff of the Director General of Transportation and given charge of the signaling with the title of signal engineer on the British railways in the occupied portions of France and Belgium. In this connection he put in something over 700 levers besides restoring and afterwards maintaining many plants which had been damaged by shell fire.

Lieut. Robert H. Phinney, formerly assistant engineer in the signal department of the Chicago & North Western, enlisted in the 415th Railway Telegraph Battalion in December, 1917. The battalion was mobilized in January, 1918, and was stationed in Chicago until the latter part of February, at which time it sailed for France via England, arriving there about the second week in March. He was in charge of supplies for the battalion and the latest reports indicate that he still serves in that capacity. The work of the battalion consists of building and maintaining military telegraph and telephone lines.

Lieut. C. D. Symes, formerly signal inspector on the Duluth, Winnipeg & Pacific, at Virginia, Minn., entered military service immediately after the United States declared war. Previous to coming from Great Britain to the United States in 1911 he had had considerable training in the London Volunteers, and when he offered his service in the United States army he received a commission as first lieutenant and was ordered to Fort Leavenworth for training. In February, 1918, he was sent overseas, where he soon became engaged in active service. He was awarded the Croix de Guerre and has twice been mentioned in divisional citations, these citations being as follows:

First Lieut. Clarence D. Symes, Company "D," 1st Engineers, displayed absolute disregard for personal danger in assisting in saving an ammunition dump that was burning. It was by his splendid example that the men worked fearlessly and succeeded in saving a great amount of ammunition. Between the Argonne and the Meuse.

First Lieut. Clarence D. Symes, Company "D," 1st Engineers, displayed splendid qualities of leadership and good judgment in handling his men and showed absolute disregard for personal danger throughout the advance, going ahead of the tanks in several instances in the face of heavy enemy machine gun fire. St. Mihiel Salient.

In the early part of this year Lieut. Symes was transferred from the 1st Engineers to the Inter Allied Railway Commission and was appointed signal engineer to the commission (American sector), American Army of Occupation.

Major W. M. Vandersluis received his commission as captain in the Engineer Officers Reserve Corps on June 13, 1917. He was ordered to the Fort Leavenworth training camp on September 5, 1917, and in December, 1917, he was attached to the 35th Engineers at Camp Grant, Rockford, Ill. The following month he was ordered to overseas duty and arrived in France on February 18, 1918. Most engineering officers received further training in a school operated by the 116th Engineers at Angers, France, and Major Vandersluis was stationed there for a time. For about two weeks in March, 1918, he was placed in charge of a casual company at Blois, France, and on April 2 he was assigned to work under the Chief of Utilities in the Motor Transport Corps, where he served continuously until his discharge on February 20, 1919. He also served about six weeks as signal engineer, in November and December, 1918, with the Transportation Corps. He received his appointment as Major in the Motor Transport Corps on October 7, 1918.

The following list of members are serving or have served in some branch of military or naval service. The

list includes the positions they held before entering the service:

#### Active Members

- E. L. Adams, senior signal engineer, Interstate Commerce Commission, Chattanooga, Tenn.  
 W. G. Atwood, assistant district engineer, Interstate Commerce Commission, Chattanooga, Tenn.  
 A. M. Bears, signal supervisor, Canadian Pacific, Winnipeg, Man.  
 Angus Beaton, acting signal supervisor, Canadian Pacific, Winnipeg, Man.  
 P. A. Bliss, signal supervisor, Southern Pacific, Ogden, Utah.  
 E. N. Bousquet, signal inspector, New York Central, Cleveland, Ohio.  
 C. W. Cochran, engineer maintenance of way, Cleveland, Cincinnati, Chicago & St. Louis, Galion, Ohio.  
 William Crawford, signal engineer, Oren Electric Lines, Salt Lake City, Utah.  
 A. C. Everham, terminal engineer, Union Pacific, Kansas City, Mo.  
 P. W. Gage, signal supervisor, Chicago, Burlington & Quincy, La Crosse, Wis.  
 R. C. Gardner.  
 M. L. Goehring, signal supervisor, Missouri Pacific, Nevada, Mo.  
 Wm. C. Lancaster, electrical engineer, Canadian Northern, Montreal, Que.  
 W. Landesberg, assistant traffic manager, Moscow-Kazan Railroad, Moscow, Russia.  
 Stanley W. Law, assistant signal engineer, Northern Pacific, St. Paul, Minn.  
 E. R. Lindsey, signal inspector, Chicago & Eastern Illinois, Chicago.  
 F. M. Loud, signal engineer, Public Service Railway, Newark, N. J.  
 C. A. Lyon, general signal inspector, New York Central & St. Louis, Nashville, Tenn.  
 M. P. Martin, signal inspector, Illinois Central, Chicago.  
 R. F. Morkill, signal engineer, Grand Trunk, Montreal, Que.  
 Wm. B. Nichol, assistant engineer, Boston & Albany, Boston, Mass.  
 E. T. Owens, associate editor, *Railway Signal Engineer*, Chicago.  
 G. C. Parsons, superintendent building construction, Twin City Rapid Transit Company, St. Paul, Minn.  
 A. J. Patterson, junior signal engineer, Interstate Commerce Commission, Washington, D. C.  
 L. M. Perrin, senior signal engineer, Interstate Commerce Commission, San Francisco, Cal.  
 R. M. Phinney, assistant engineer, Chicago & North Western, Chicago.  
 G. A. Rodgers, chief draftsman, Wabash, Decatur, Ill.  
 N. Roginsky, assistant superintendent telegraph, Moscow-Kazan Railway, Moscow, Russia.  
 O. B. Ruggles, signal supervisor, Boston & Maine, Salem, Mass.  
 Charles Stebbins, Jr., assistant supervisor, Richmond & Chesapeake Bay, Richmond, Va.  
 C. D. Symes, signal inspector, Duluth, Winnipeg & Pacific, Virginia, Minn.  
 W. M. Vandersluis, signal engineer, Illinois Central, Chicago.  
 A. J. Yarell, signal inspector, Chicago, Indianapolis & Louisville, Bloomington, Ind.

#### Junior Members

- Sam Black, signal shop foreman, Chicago & North Western, Madison, Wis.  
 E. Bouchet, signal foreman, Chicago, Milwaukee & St. Paul, Avery, Idaho.  
 Wm. H. Claus, draftsman, Illinois Central, Chicago.  
 D. K. Crawford, draftsman, Gulf, Colorado & Santa Fe, Topeka, Kan.  
 Homer Dunn, draftsman, Santa Fe Coast Lines, Los Angeles, Cal.  
 C. L. Falk, maintainer, Wabash, St. Louis, Mo.  
 Theo. Groth, maintainer, Chicago, Milwaukee & St. Paul, Tacoma, Wash.  
 John S. Hall, transportation student, Canadian Pacific, Montreal, Que.  
 Wm. Heard, signal foreman, Union Pacific, Green River, Wyo.  
 H. E. Johnson, signal foreman, Toledo & Ohio Central, Columbus, Ohio.  
 C. B. Keers, signal construction foreman, Atchison, Topeka & Santa Fe, Topeka, Kan.  
 Roy Kimple, draftsman, New York Central, Cleveland, Ohio.

Earl Perkins, wireman, St. Louis, Iron Mountain & Southern, Mineral Point, Mo.  
 S. F. Rollins, draftsman, Illinois Central, Chicago.  
 F. J. Ryans, signal draftsman, Illinois Central, Chicago.  
 D. A. Searnickia, draftsman, Grand Trunk, Montreal, Que.  
 W. A. Schrader, Wabash, Decatur, Ill.  
 A. M. Smith, signal maintenance foreman, Erie, Buffalo, N. Y.  
 L. C. Smith, assistant foreman, Long Island, Jamaica, N. Y.  
 W. G. Stansel, draftsman, Elgin, Joliet & Eastern, Joliet, Ill.  
 G. Stevens, construction foreman, Union Pacific, Cheyenne, Wyo.  
 J. F. Trimble, maintainer, Grand Trunk, Lansing, Mich.

#### Associate Members

Azel Ames, Kerite Insulated Wire & Cable Company, New York.  
 C. C. Bailey, signal accessories department, General Electric Company.  
 Wm. H. Bleecker, sales representative, Page Woven Wire Company.  
 P. E. Carter, sales engineer, General Railway Signal Company, New York.  
 P. H. Chapman, manager, National Electric Specialties Company, Toledo, Ohio.  
 C. M. Deardorff, sales engineer, General Railway Signal Company, Chicago.

E. B. Doane, sales representative, Chicago Railway Signal & Supply Company, New York.  
 John Featherston, sales department, Union Switch & Signal Company, Swissvale, Pa.  
 J. H. Finney, manager, Aluminum Company of America, Washington, D. C.  
 J. W. Hackett, sales engineer, Federal Signal Company, New York.  
 C. N. Johns, sales agent, Page Woven Wire Company.  
 R. B. Johnson, assistant engineer, General Railway Signal Company of Canada, LaSalle, Province of Quebec, Canada.  
 John F. Kelly, electrical engineer, Federal Signal Company, Albany, N. Y.  
 F. Kingsley, associate editor, Electric Railway Journal, New York.  
 Wm. J. Payne, inspector, Saxby & Farmer Company, Ltd., Montreal, Que.  
 Paul Renshaw, signal engineer, Federal Signal Company, New York.  
 E. A. Warner, Jr., commercial department, Union Switch & Signal Company, Swissvale, Pa.  
 W. W. Wenholz, General Railway Signal Company, Rochester, N. Y.  
 P. P. Williams, eastern representative, Chicago Railway Signal & Supply Company, New York.

## Annual Exhibit of the N. R. A. A. at the Coliseum

### The Post War Show Proves Attractive to Delegates and Visitors to the A. R. E. A. Convention

"WE WILL PLAY TO A crowded house this year," said C. W. Kelly, secretary of the National Railway Appliances Association and stage manager of the 11th annual exhibit of the association at the Coliseum, which opened yesterday morning. This was a week ago and during the seven days intervening wonders have been accomplished. Another show had been playing in the Coliseum, namely, an organization of Chicago's soldiers recently returned from overseas, which used the building during its sojourn in Chicago as a reception hall. Accordingly, Stage Manager Kelly had to literally "roll up his sleeves and fall to." He marshaled his forces, set the stage hands and decorators to the converting of the drab interior of the Coliseum into a spotless buff and old ivory stage and at the same time helped the principals in the four-day show in work on their convention costumes and in the rehearsal of their respective parts. The whole was welded into a co-ordinated production for the exhibition of appliances used in steam and electric railway operation, construction and maintenance.

There was no hitch in the official opening, as was sometimes the case in the past. The total registration of supply representatives at noon yesterday was 75 more than last year's total registration of 921. At the close of the first day this year there were 160 additional registrants. All exhibitors had their exhibits in place with the exception of one. This has not been the case in the past.

The show in its entirety is, as P. T. Barnum might say, "Bigger and better than ever." The number of active exhibitors continues to increase, five additional appliance companies being added to the total of last year, yet the N. R. A. A. still clings to their re-edited golden rule of "quality and not necessarily quantity." The exhibits themselves are mostly active service appliances, educational rather than showy and all a bit more tastefully arranged, perhaps, in order to show the busy railroad visitor the salient points of the appliances with the least possible expenditure of time. Needless to say, the devices exhibited are ones which have proven their efficiency and success in actual service.

No radical changes have been made in the arrangement

or management of the N. R. A. A. show, the acclaim which greeted the handling of last year's exhibit being sufficient to prove the success of the arrangement instituted at that time. However, there has been some change in spirit, due almost wholly to extraneous circumstances, from that of last year. The changes in railroad organization, especially in the personnel of railroad construction and maintenance of way departments, which began with the taking over of the railroads by the government has, of course, continued. Furthermore, the uncertainty of what is to become of the railroads eventually and the admitted precarious financial condition of the railroads has tended to instill in the minds of the engineering executives attending the convention the necessity of making what purchases they are able to make with extreme care. This in turn means a more rigorous investigation of the comparative efficiency and usefulness of different appliances which are necessary to railroad operation and maintenance and which the railroads must buy to a certain extent to maintain operation. All of this reverts to the N. R. A. A. in increased attendance and interest in the products exhibited. Continuing the successful practice of last year, the main entrance to the show is through the annex, which in turn is an integral part of the exhibit. The floor plan of the Coliseum is substantially the same as in previous years, with many firms occupying practically the same space as last year.

Mr. Kelly's statement concerning the expected attendance is not amiss, for the changes in railroad personnel already mentioned and the conditions back of the railroads and the railway supply fields accurately foretold the success of the N. R. A. A. show this year. The opinion, which has been developed during the past two years, that the appliances exhibited at the Coliseum are equally attractive to the executive and the subordinate is now producing results. A fair percentage of the visitors at the Coliseum yesterday were men who hold subordinate positions and certainly their interest in the appliances of the different supply companies is no less than that of the executive who is searching for the best means of extending the money allotted to his department, for it is the subordinate who must use the appliances and whose effi-

Officers of the National Railway Appliances Association

P. C. Jacobs, Vice-President  
 G. C. Isbester  
 L. W. Shugg

E. H. Bell, Honorary Director  
 Merle J. Trees, President  
 A. P. Van Schaich      T. W. Aishton

C. W. Kelly, Secretary-Treasurer  
 J. Alexander Brown  
 E. E. Hudson

ciency is dependent upon their appropriate selection.

The exhibition will, as usual, open every morning at 8:00 a. m., closing at 10:00 p. m., with the exception of the closing day, Thursday, March 20, when the closing hour is set at 6:00 p. m.

A new plan has been instituted this year in the issuing of tickets. This plan, which is essentially the placing of tickets in the hands of those who will be able to distribute them to the greatest advantage, is intended to weed out those who are really not interested in the N. R. A. A. exhibit or who are not in any way connected with the railway or railway supply business and consequently will give more opportunity to the representatives of the supply firms to devote their time to those who are vitally interested in their products. It is believed that before the convention opens tickets were placed in the hands of practically every railroad man who could possibly attend the show and who in any way would be interested in railway appliances and their use.

The officers and members of the Board of Directors of the National Railway Appliances Association for the past year were: President, Merle J. Trees, Chicago Bridge & Iron Works, Chicago; vice-president, P. C. Jacobs, H. W. Johns-Manville Co., Chicago; secretary-treasurer, C. W. Kelly, Kelly-Derby Co., Chicago; honorary director, E. H. Bell, Railroad Supply Company, Chicago. Directors: J. Alexander Brown, Pocket List of Railroad Officials, New York; G. C. Isbester, Rail Joint Company, Chicago; E. E. Hudson, Waterbury Battery Company, Waterbury, Conn.; T. W. Aishton, National Malleable Casting Company, Chicago; A. P. Van Schaick, Lackawanna Steel Company, Chicago; L. W. Shugg, General Electric Company, Schenectady, N. Y.

Merle J. Trees, president of the association, is vice-president and general manager of the Chicago Bridge & Iron Works, Chicago. He was born at Mayview, Ill., on June 14, 1883. After graduating from the University of Illinois in 1907, Mr. Trees entered the employ of the Chicago Bridge & Iron Works and his whole business career since that time has been with this company. In 1909 he was appointed sales engineer and in 1911 he became manager of the Chicago sales office. In 1913 he was appointed general sales manager and in June, 1917, was appointed vice-president and general manager, which position he holds at the present time.

#### List of Exhibitors

The following is a list of the firms presenting exhibits, with the devices on display and the names of the representatives present at their booths:

Adams Motor & Manufacturing Company, Chicago.—Gasoline inspection motor cars. Represented by W. E. Adams, R. A. Harris, L. Gerhardt and A. P. Grenier. Spaces 218 and 218½.

Adams & Westlake Company, Chicago.—Signal lamps; long time burners; switch locks; lanterns; railway station and platform lamps. Represented by W. H. Baldwin, A. S. Anderson, C. B. Carson, W. J. Pierson, H. G. Turney, J. F. Stender, Wm. S. Hamm and G. L. Walters. Spaces 87, 88, 106 and 107.

A. G. A. Railway Light & Signal Company, Elizabeth, N. J.—Railway grade crossing signal; highway danger signal; daylight signal; unison flash signal. Represented by J. K. Howard, A. G. Shaver, O. E. Berggren and H. J. Johnson. Spaces 39 and 40.

Air Reduction Sales Company, New York.—Oxy-acetylene generator; oxy-acetylene welding and cutting torches and apparatus; welding and cutting supplies; special apparatus for frog welding. Represented by E. L. Mills, A. S. Kinsey, R. A. Sossong, J. A. Warfel, B. N. Law, Fred Wyman, Sam Shayken, C. Wallin, M. M. Weist, W. W. Howard and F. G. Gorke. Spaces 7 and 8.

The Alexander Milburn Company, Baltimore, Md.—Portable carbide lights; oxy-acetylene welding and cutting apparatus. Represented by J. A. Schreiber, C. R. Pollard, E. C. McNutt and D. Bartlett. Space 14.

Alger Supply Company, Chicago.—Kerosene snow melting outfits; switch fittings; trunking supports; signal devices. Represented by O. S. Flath and J. M. Fitzgerald. Spaces 167, 167½ and 168.

American Abrasive Metals Company, Chicago.—"Feralun" anti-slip treads for passenger coach steps. Represented by H. W. Mowery, C. A. Barker, L. A. Hale and R. L. Brown. Space 15.

American Hoist & Derrick Company, St. Paul, Minn.—"American" railroad ditcher. Represented by F. J. Johnson, W. O. Washburn, Edward Coleman and C. J. Hook. Space 88½.

American Kron Scale Company, Chicago.—Kron dial freight house scale. Represented by E. Ohnell, W. W. Camp, C. F. Larson, J. Kirk Rowell, E. M. Abramson, J. Sykes, F. M. Franklin, J. Bjornson and John Kelly. Space 125.

American Malleable Castings Association, Cleveland, Ohio.—Malleable iron castings with machines for demonstrating the twisting test and tensile strength. Represented by S. H. Standish, J. S. Lewellyn, W. A. Draves, A. O. Buckius, Jr., G. A. Faltz, D. J. Maher and F. A. Kavanaugh. Spaces 221 and 222.

American Railway Bridges and Buildings Association, Chicago.—Represented by C. A. Lichty. Space 226.

Anchor Company, New York.—Efficiency rail anchor. Represented by T. B. Bowman, G. H. Chadwell and O. Metcalf. Space 192½.

American Railroad Signal Supervisory Association, Chicago.—Represented by R. R. Baker, C. Drake and H. R. Bills. Space 226.

American Steel & Wire Company, Chicago.—Right-of-way fencing; galvanized steel fence posts; steel gates; wire rope; rail bonds; electrical wires and cables; switching ropes; telephone wire; railroad spikes; nails; staples and tacks; barbed wire; concrete reinforcement; springs; screw stock; wire; pole steps. Represented by L. A. Dietrich, J. W. Meaker, A. W. Froude, M. A. Evans, J. W. Collins, J. F. Alexander, L. P. Shanahan and B. H. Ryder. Spaces 51½, 52, 70, 70½ and 71.

American Valve & Meter Company, Cincinnati, Ohio.—Poage water columns with telescopic spouts; Anderson economy switch stands; Anderson interlocking switch stands. Represented by J. T. McGarry, D. J. Higgins, F. C. Anderson and J. DePinal. Spaces 130, 131 and 132.

American Vulcanized Fibre Company, Wilmington, Del.—Vul-cot fibre for track insulation. Represented by C. C. Bell, H. C. Hackett, John Barron, Wm. Maxwell and H. M. Dexter. Space 126.

Armco Iron Culvert & Flume Manufacturers Association, Middletown, Ohio.—Represented by Fred Milhoan and G. W. Jenkins. Spaces 99 and 100.

Austin Company, Cleveland, Ohio.—Photographs and details of ten types of standard buildings and special railroad buildings. Represented by G. A. Bryant, W. L. Bailey, B. Hopkins, W. F. Chambers, P. W. Swern and E. M. Haas. Spaces 158 and 158½.

The Balkwill Manganese Crossing Company, Cleveland, Ohio.—Articulated cast manganese crossings. Represented by S. Balkwill. Space 115.

The Barrett Company, New York.—Barrett's specification roofs and waterproofing; Tar Rok sub floors; Everlastic shingles and prepared roofings; Elastigum elastic cement; Nox Aer Leak boiler covering; semaphore roofing; Holt roof connections; Tarvia and paving pitch filler; Carbosota grade one liquid creosote oil. Represented by W. S. Babcock, C. T. Bilyea, John J. Ross, G. R. McVay, F. W. Freeman and K. C. Barth. Spaces 107½ and 108.

Benjamin Electric Manufacturing Company, Chicago.—Industrial lighting fixtures; water tight, steam tight, and vapor proof fixtures; electrical lighting specialties; water tight, weather proof conduit fittings. Represented by C. B. Harlow, G. B. Weber, A. E. Lubeck, O. L. Johnson and W. J. Goodrich. Spaces 157 and 157½.

Bethlehem Steel Company, Bethlehem, Pa.—New Century switch stands; Steelton positive switch stand; U. S. Army and Navy standard switch stand for heavy and light rails; switch stands. Represented by E. S. Knisely, R. W. Gillespie, N. E. Salsick, R. E. Belknap, G. S. Vickery and John F. Hennessy. Spaces 199 and 216.

Blaw-Knox Company, Pittsburgh, Pa.—Models of Clamshell buckets and steel forms for concrete construction; concrete mixers; plate and structural steel work; water cooling devices for open hearth furnaces. Represented by R. L. Gannis, R. B. Randall and O. B. Potts. Space 170.

Boss Nut Company, Chicago.—Boss lock nuts. Represented by J. A. MacLean, J. W. Fogg and W. G. Willcoxson. Spaces 1 and 2.

Bryant Zinc Company, Chicago.—Highway crossing signals; batteries; bells; relays; signal accessories. Represented by Stanley C. Bryant, Jerre P. Costigan, Jno. Hensel and Theodore Cole. Spaces 154 and 155.

The Buda Company, Chicago.—Electric industrial trucks; "Hyduty" Paulus track drill; Buda-Wilson bonding drill, with Liberty clamp; car replacers; journal jack; Liberty tool grinder; switch stand; electric gate post; motor section cars; motor velocipedes; inspection car; ratchet jack; bumping post. Represented by J. L. Artmaier, H. C. Beebe, A. L. Bliss, Vaughan Y. Bell, G. E. Bryar, C. H. Bull, E. Conant, W. C. Dyer, M. A. Evans, R. B. Fisher, J. J. Gard, L. R. Griffin, H. J. Harkless, W. F. Hebard, G. W. Hoover, W. P. Hunt, Jr., H. L. Miller, P. G. Pendorf, F. E. Place, M. A. Ross, F. C. Tams, E. A. Thiele and L. M. Vilcs. Spaces 61, 62, 63, 64 and 65.

The Burden Iron Company, Troy, N. Y.—Staybolt iron; engine bolt iron; iron boiler rivets. Represented by John C. Kuhns. Space 10.

Camp Culvert Form Company, Denver, Colo.—Steel form for culvert construction. Represented by E. M. Camp. Space 225.

Carbic Manufacturing Company, Chicago.—Carbic cakes; portable acetylene lights; generators, oxy-acetylene cutting and welding equipment. Represented by D. C. Duncan, G. B. Van Buren and T. J. Hegland. Space 185.

Carnegie Steel Company, Pittsburgh, Pa.—36-in. passenger train car wheel; 36-in. engine truck wheel with large diameter

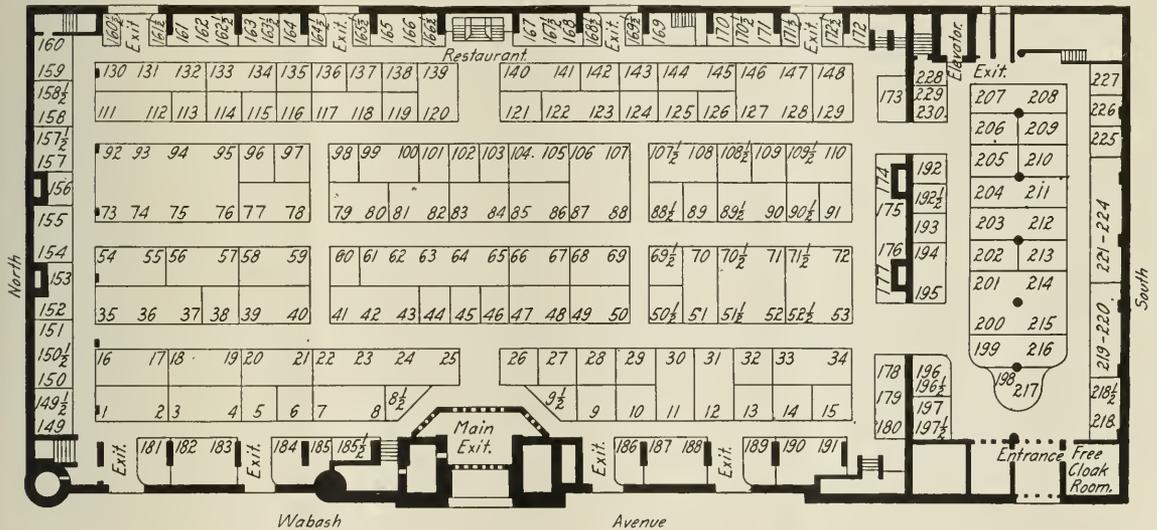

of sprinkling train. Represented by R. N. Chipman and E. D. Jackson. Space 135.

Clark Car Company, Pittsburgh, Pa.—Pictures and literature covering the Clark extension side dump cars. Represented by H. E. Chilcoat and H. G. Doran. Spaces 163 and 163½.

Cleveland Railway Supply Company, Cleveland, Ohio.—Switch stands; guard rails; "Safety" foot guards for guard rails and switches; malleable tie plates; flangeway guards for highway crossings and station platforms; automatic industrial truck couplers. Represented by F. A. Peck, J. S. Peck and E. G. Deucher. Spaces 207 and 208.

Crerar, Adams & Company, Chicago.—Calumet track drills; Calumet die starter; shovels; jacks; Hercules and Standard trucks; waste; hammers; railbenders; chain blocks. Represented by J. Arthur Martin, G. D. Bassett, W. I. Clock, C. W. Gregory, R. M. Bullard, E. C. Poehler and W. L. Reidell. Space 28.

Detroit Graphite Company, Detroit, Mich.—"Superior Graphite Paint" for structural iron; "Sta-white" for storehouse interiors, freight car paint. Represented by T. R. Wyles, L. D. Mitchell, W. C. Bradford, A. H. Kuerst, H. I. Miller, L. F. McFarland, W. D. Waugh, J. J. Hogan and Capt. A. B. Edge. Space 108½.

Floor Plan of the Coliseum

hub; rolled steel piston blanks and piston center blanks; gear blanks for cranes and other shop uses; steel cross ties; splice bars; Braddock joints; electrical tool steels. Represented by N. M. Hench, Samuel Fray, E. S. Mills, C. B. Friday, H. Van Zandt and G. W. Landrus. Spaces 52½, 53, 71½ and 72.

Cast Iron Pipe Association, New York.—Cast iron pipe. Represented by R. C. McWane, F. E. Hutchins and J. F. McClure. Space 200.

Chicago Bridge & Iron Works, Chicago.—Model steel tanks. Represented by Merle J. Trees, George T. Horton, H. B. Horton, H. B. Murphey, K. I. Small, F. L. Cook, H. C. Brown, C. M. Ladd, C. H. Scheman, L. McDonald, R. C. Campbell, S. A. Poyer, F. E. Lee, W. R. Manock and O. A. Bailey. Spaces 51 and 70.

The Chicago Flag and Decorating Company, Chicago.—Bunting signal flags; U. S. and foreign flags; tourist luncheon equipment. Represented by Geo. L. Glendon, Walter Glendon, Thos. Glendon, J. McArdle, L. G. Magnusson and L. C. Bergeron. Spaces 187 and 188.

Chicago Malleable Castings Company, Chicago.—Thomas rail anchor tie plates. Represented by J. S. Llewellyn and W. M. Osborn. Space 142.

Chicago Railway Signal & Supply Company, Chicago.—Mechanical and electrical railway signaling devices. Represented by E. W. Vogel, E. K. Brashears, A. C. Dunne, W. C. Martin, Carl Suhr, C. R. Ahrens, D. J. McCarthy, Wm. C. McClintock and W. H. Dayton. Spaces 77 and 78.

Chipman Chemical Engineering Company, Inc., New York.—Atlas "A" method of killing track vegetation, including method

Deeming-Endsley Company, Chicago.—Morrison switch-point hold-down. Represented by Herbert Deeming, Horace F. Endsley and P. O. Morrison. Space 184.

Diamond State Fibre Company, Chicago.—Rail insulation; fibre receptacles. Represented by Theo. Herbert, C. N. Reeves, H. P. Wilson and J. Esch. Space 13.

Paul Dickinson, Inc., Chicago.—Smoke jacks; ventilators and chimneys for engine house, shops, and small buildings. Represented by A. J. Filkins, E. B. Filkins, M. Carney and H. Knutson. Space 98.

The Duff Manufacturing Company, Pittsburgh, Pa.—Lifting jacks; high speed ball bearing for car and locomotive work. Represented by T. A. McGinley, E. A. Johnson, C. A. Methfessel and C. N. Thulin. Space 91.

Edison, Inc., Thos. A., Bloomfield, N. J.—Models of 1918, batteries; switchboard illustrating various methods of lighting automatic signals. Represented by L. W. McChesney, F. J. Lepreau, A. J. Loughran, I. P. Rodman, P. A. Garrity, E. A. Brown, E. W. Newcomb, O. P. Rose, R. I. Frost, B. F. Hines and Mr. Constable. Spaces 18 and 19.

Edison Storage Battery Company, Orange, N. J.—Edison alkaline storage batteries. Represented by H. G. Thompson, F. V. McGuinness and E. T. Sawyer. Space 636.

Electric Storage Battery Company, Philadelphia, Pa.—Chloride accumulator; "Ironclad" and "Exide" batteries for car lighting; interlocking and signal service; batteries used by Government during the war. Represented by G. H. Atkin, J. Lester Woodbridge, T. Milton, H. M. Beck, W. E. Dunn, W. Heritage and H. E. Hunt. Space 60.

Equipment Corporation of America, Chicago.—"Shop mule" industrial gasoline tractor. Represented by W. F. Helard, B. C. Hooper, C. H. Conrad, A. C. Sloss, H. D. Gumpfer, H. T. Rich, A. D. Moseby, H. M. Capron and L. F. Mead. Space 164½.

The Eymon Crossing Company, Marion, Ohio.—Continuous rail manganese crossing. Represented by Byron E. Wilson and James H. Eymon. Space 169½.

Fairbanks, Morse & Company, Chicago.—Oil engine, centrifugal pumps, steam pumps; motor cars; locomotive water crane; electric motors, generators and scales. Represented by L. H. Matthews, E. C. Golladay, D. K. Lee, F. J. Lee, C. B. Skelton, B. S. Spalding, F. M. Condit, W. F. Singer, A. A. Taylor, S. Smith, F. P. Drinker, J. F. Flanagan, H. E. Vogel, E. J. Coverdale, O. Tharle, C. W. E. Witter, G. J. Akers, F. M. Gardner, K. Jurgensen, G. Howard, E. Lang, C. H. Wilson, H. G. Balke, E. E. Pendray, H. E. Vergosen, J. D. Daggett, M. J. Kochendorfer, J. W. Ferguson and F. A. Moseley. Spaces 73, 74, 75, 76, 92, 93, 94 and 95.

The Fairbanks Company, Chicago.—Fairbanks trucks and barrows; Fairbanks valves; Star engine lathes; Loudon overhead carrier system; electro magnetic portable drills, hammers and Canton crane. Represented by N. Lansing De Long. Spaces 196 and 196½.

Fairmont Gas Engine & Railway Motor Car Company, Fairmont, Minn.—Featherweight inspection cars; standard section motor cars; motor car outfits. Represented by Harold E. Wade, W. F. Kasper, Ward G. Day, R. J. Sawyer, R. B. Ballard, C. S. White and H. D. Fitz. Spaces 41, 42 and 43.

Federal Signal Company, Albany, N. Y.—Represented by Paul Renshaw, Carl Henze, M. R. Brincey, H. C. Ware, C. N. Becker, W. H. Reichard and S. J. Turreff. Spaces 47 and 48.

Federal Sign System (Electric), Chicago.—Federal Safety First electric railroad lantern; Federal electric siren; Federal electric renewable fuse. Represented by F. T. Baird, O. S. Burke and F. J. Ffrench. Space 228.

H. K. Ferguson Company, Cleveland, Ohio.—Represented by H. K. Ferguson, A. J. Hollingshead, H. S. Jacoby, O. C. F. Randolph and J. M. Taylor. Spaces 152 and 153.

The Frictionless Rail, Boston, Mass.—Frictionless rail for track curves. Represented by F. A. Barbey, S. W. Simonds, T. F. Dwyer, Jr., and J. T. Chamberlain. Spaces 133 and 134.

General Electric Company, Schenectady, N. Y.—Turbo-generator headlight sets; battery charging sets; switchboards; resistance units; lantern slides and photographs of installations of electrical equipments; lead burning transformer. Represented by John Roberts, H. W. Stewart, H. M. Jacobs, W. H. Sigourney, C. Dorticco, A. P. Jenks, A. J. Francis and L. W. Shugg. Spaces 35, 36 and 37.

The General Railway Signal Company, Rochester, N. Y.—Represented by F. L. Dodgson, W. S. Henry, W. K. Howe, H. W. Lucia, L. Thomas, J. R. Wills, M. Wuerpel and W. R. Young. Spaces 45 and 50.

Gilbert & Barker Manufacturing Company, Springfield, Mass.—Combination pump and tank oil storage outfits. Battery "T 29" back geared lubrication outfit; "T 31" cabinet lubricating tanks; "T 6" gallon stroke lubricating pump. Represented by J. E. Ham and J. R. Field. Space 169.

Gould Storage Battery Company, New York.—Full sized submarine battery; 40 ampere hour R. S. A.; 400 ampere hour R. S. A.; plates; separators. Represented by T. Entz, T. O. Moriarty and G. Berger. Spaces 149 and 149½.

Wm. Graver Tank Works, Chicago.—Model of Graver type "K" water softener; water filters; steel, oil and water storage tanks; general steel plate work construction. Represented by W. R. Toppan, W. C. Curd and J. J. Felsecker. Spaces 144 and 145.

Grip Nut Company, Chicago.—Grip nuts. Represented by W. E. Sharp, B. H. Forsyth, H. E. Passmore, Albert Roberts, J. E. Weatherford, H. J. Tierney and C. J. Wymen. Spaces 190 and 191.

W. & L. E. Gurley, Troy, N. Y.—Engineering and surveying instruments; Gurley precise transits with patented one-piece truss standard. Represented by H. M. Dibert and Malcolm Butement. Space 69½.

Hall Switch & Signal Company, Garwood, N. J.—Reception booth. Represented by W. J. Gillingham, H. W. Wolf, J. A. Ritter, H. L. Hollister, C. J. Harvig, D. R. Day and O. B. Frink. Spaces 85 and 86.

The Hatfield Rail Joint Manufacturing Company, Macon, Ga.—Hatfield rail joints and Hatfield rail joint fastenings. Represented by Walter T. Johnson and U. R. Hatfield. Space 166½.

Hayes Track Appliance Company, Richmond, Ind.—Hayes derrails. Represented by S. W. Hayes, R. W. Slautterback, W. Harding Davis, Arthur Gemunder, E. L. Ruby, F. C. Stowell,

C. S. Drifill, R. H. Gausepohl, P. I. Harris, R. S. Carson and O. M. Kendall. Spaces 140 and 141.

Hazard Manufacturing Company, Wilkes-Barre, Pa.—Rubber insulated signal wires and cables; lead encased wires and cables; steel tape armored cables; circular loom cables; wire rope; galvanized strand. Represented by A. W. Gabriel, Geo. P. Cady, Leroy W. Allen, H. B. Pfisterer, Thomas A. Keeffe and Carl P. Brodhun. Spaces 3 and 4.

Hegeman-Castle Corporation, Chicago.—Clapp fire resisting paint; C. & C. electric welders; Anglo-American target enamel; tool steel gears and pinions. Represented by Chas. H. McCormick. Space 137.

Hubbard & Company, Pittsburgh, Pa.—Track tools and shovels. Represented by O. W. Youngquist, J. V. Smith and W. H. Remmel. Space 143.

Ingersoll-Rand Company, New York.—"Imperial" pneumatic tie tampers; portable compressor cars; pneumatic spike-driving hammer; screw spike drivers; portable pneumatic emery grinders; wood borers and drills for rail bonding. Represented by W. H. Armstrong, Charles Dougherty, C. W. Melcher and J. N. Thorpe. Space 206.

International Steel Tie Company, Cleveland, Ohio.—Steel ties for paved street track; steel crossing foundations and international paving guards. Represented by Wm. P. Day, W. C. Mahon, T. J. Lavan, V. E. Heglaw and W. S. Godwin. Space 189.

International Marine Welding Company, New York.—Roller lock nut. Represented by Cortlandt F. Ames and W. Craig Stone. Spaces 171½ and 172½.

H. W. Johns-Manville Company, New York.—Asbestos roofing; asbestos shingles; asbestos smoke jacks; pipe and boiler insulation. Represented by J. E. Meek, J. C. Younglove, G. A. Nicol, P. C. Jacobs, P. R. Austin, J. M. Borrowdale, H. M. Butters, H. Flannagan, D. L. Jennings, W. H. Lawrence, C. E. Murphy, H. G. Newman, J. H. Trent and E. H. Willard. Spaces 174, 175, 176 and 177.

O. F. Jordan Company, East Chicago, Ind.—Jordan spreader and ditching attachment. Represented by Walter J. Riley, Robert E. Bressler and Joseph A. Adley. Spaces 56 and 57.

The Joyce-Gridland Company, Dayton, Ohio.—Railroad jacks. Represented by Chas. D. Derby. Space 27.

Kalamazoo Railway Supply Company, Kalamazoo, Mich.—Hand, push and velocipede cars, motor cars, track drills, valve grinders, gauges, levels; railway appliances. Represented by Jno. McKinnon. Spaces 22, 23, 24 and 25.

Kaustine Company, Inc., Buffalo, N. Y.—Kaustine waterless toilets. Represented by G. W. Hambrook, F. B. Shalters and David A. Evans. Space 29.

Kelly-Derby Company, Inc., Chicago.—Ten H. P. oil-burning engine; Kaustine waterless chemical toilets; warehouse trucks; cast iron and semi-steel wheels. Represented by F. W. Adams, H. L. Bachman, W. H. Dvay, O. K. Fischer, W. B. Holcomb, C. W. Kelly and F. G. Koehler. Spaces 11 and 30.

The Kerite Insulated Wire & Cable Company, Inc., New York.—Insulated wire and cables. Represented by R. D. Brixey, Azel Ames, J. W. Young, P. W. Miller, J. A. Renton, C. R. R. Harris, B. L. Winchell, Jr., G. A. Graber, W. H. Fenley and J. A. Hamilton. Spaces 68 and 69.

Keystone Grinder & Manufacturing Company, Pittsburgh, Pa.—Railroad tool grinders. Represented by S. S. Newman and J. S. Wincrantz. Space 193.

The Kilbourne & Jacobs Manufacturing Company, Columbus, Ohio.—"K. & J." automatic air dump car. Represented by J. S. Mossgrove and David Greenc. Space 97.

Knickerbocker Roofing & Paving Company, Chicago.—Standard bridge water-proofing; pitch and felt roofing for railroads. Represented by Mark A. Cronin and Geo. W. Pulford. Space 183.

Lackawanna Steel Company, Buffalo, N. Y.—Sections cases; rail joints; splice bars, hook shoulder tie plates; Abbott rail joint plates and safety head angle bars. Represented by A. P. Van Schaick, J. L. Hench, G. O. Benson and F. E. Abbott. Spaces 33 and 34.

The Lehon Company, Chicago.—Membranes for reinforcing concrete waterproofing; composition roll roofing and asphalt shingles; mastic floors, waterproof insulating fabrics and papers for refrigerator cars; plastic car roofing; canvas coach and caboose roofing. Represented by Tom Lehon, D. B. Wright, Chas. V. Eades and Edward Leonard. Space 109.

Lipman Refrigerator Car & Manufacturing Company, Beloit, Wis.—Refrigerator compressors; special refrigerating equipment for railway cars. Represented by C. E. L. Lipman, E. Lipman and T. E. Lipman. Space 116.

Chas. R. Long, Jr., Company, Louisville, Ky.—Paint films; sample panels, sample plates. Represented by Chas. R. Long, Jr.,

Harry Visserin, G. S. Turner, M. E. Keig, W. H. Heckman and Samuel W. Russell. Space 90½.

John Lundie, New York.—Lundie tie plates, Represented by C. Z. Moore and John Lundie. Space 165½.

The Lufkin Rule Company, Saginaw, Mich.—Measuring tapes; rules. Represented by S. B. McGee, Frank G. Brown and Fred Hollingworth. Space 121.

Macomber & White Rope Company, Kenosha, Wis.—Wire ropes for all railroad use. Represented by R. E. Jacobs, E. E. Roibirds and J. Boope. Spaces 89½ and 90.

M. W. Supply Company, Philadelphia, Pa.—Vaughan switch heaters; Vaughan rail benders; Vaughan guard rail clamps; Anchor guard rail clamps; tie plate guard rail fasteners. Represented by David L. Vaughan and Chas. Z. Vaughan. Space 101.

MacRae's Blue Book Company, Chicago.—MacRae's Blue Book. Represented by Albert MacRae, T. H. MacRae, Lloyd Simonson, L. R. Rollins, E. B. Cooks, C. H. Hill, R. S. Lundy, Alex Smith, W. F. Miller and J. A. Walsh. Space 9½.

The Madden Company, Chicago.—Three men rail laying machine; derrick truck car; "Red Top" steel fence post; Richter blue flag derail; Blair tie spaces; Harris-Muff ballast screen; Wagner switch point straightener; Veerac motor car; Perfect rail brace. Represented by Wallace W. Glosser, R. V. Dawney and H. C. Holloway. Spaces 194 and 195.

Marsh & Truman Lumber Company, Chicago.—Bloxonend flooring. Represented by F. L. Bronez, C. J. Carter, I. R. Garrettson, A. B. McHenry, Mr. Mellier and M. G. Truman. Space 213.

Massey Concrete Products Corporation, Chicago.—Reinforced concrete products. Represented by C. F. Massey, F. V. Shannon, Lee Frank, J. E. Moody, R. G. Elicl, E. C. Alexander, Paul Kircher, Charles Gilman, J. E. Higgs, Jr., W. I. Creese, P. E. Longstreet and H. E. Burns. Spaces 54 and 55.

McGraw-Hill Company, New York.—Technical publications. Represented by Wm. Buxman. Space 8½.

Mercury Manufacturing Company, Chicago.—Electric storage battery tractors. Spaces 117 and 118.

Metal Hose & Tubing Company, Brooklyn, N. Y.—Gasoline, oil and paint spray hose and connections. Represented by J. M. Oden, R. S. Westcott, P. L. Tolerton, R. Berkowitz and U. J. Edwards. Space 96.

Metal and Thermit Corporation, New York.—Welded samples of rails and heavy sections; pipe welding by thermit process; carbon free alloys produced by thermit process. Represented by Henry S. Mann, C. D. Young, W. H. Moore and T. B. Skilton. Space 185½.

Miller Train Control Corporation, Danville, Ill.—Full size train-control equipment in operation. Represented by W. B. Murray, H. B. Miller, J. N. Garber and P. E. Herren. Spaces 197 and 197½.

Monroe Calculating Machine Company, Chicago.—Monroe calculating machines. Represented by Henry H. Doty, R. W. Peck, Jerome Kennedy, T. D. McElhiney and R. U. Preble. Space 9.

Mudge & Company, Chicago.—Mudge motor cars. Represented by Burton Mudge, Robert D. Sinclair, Karl J. Eklund, Jean K. Vanatta, Karl H. Leedom, Clyde P. Benning, Lloyd O. Stratton, Charles M. Mudge, George W. Bender, Loren Buchanan, W. J. Behlke, Jr., V. Pagett, Sherman C. Amsden, Fay E. Posson, Arthur L. Pearson, Albert C. Force and William B. Ross. Spaces 127, 128, 146 and 147.

National Carbon Company, Inc., Cleveland, Ohio.—Columbia track batteries; Columbia R. S. A. signal batteries; Columbia storage batteries; Columbia dry batteries; Hot Shot batteries; carbon brushes; lighting, moving picture and photographic carbons; welding and searchlight carbons; Columbia flashlights and flashlight batteries; carbon telephone specialties and special forms in carbons. Represented by Chas. S. Pfisterer, W. H. Arkenburgh, J. M. Spangler, W. R. Pfisterer, A. E. Pratt, R. J. Cox, W. G. Waitt, R. W. Erwin, C. W. Wilkins, L. W. Fischer and Wallace O'Connor. Spaces 150, 150½ and 151.

National Concrete Machinery Company, Madison, Wis.—Concrete posts, molds, reinforcements and signal signs; The Toohey timber dapper. Represented by S. T. Walker, Victor Rogers and A. H. Anderson. Space 164.

National Lead Company, New York.—Dutch Boy red-lead; Dutch Boy white-lead. Represented by F. M. Hartley, Jr., and Chas. B. Field. Space 113.

The National Lock Washer Company, Newark, N. J.—Lock washers and Hipower nut locks. Represented by C. H. Loutrel, F. B. Archibald, J. H. Horn, A. T. Thompson and R. L. Cairncross. Space 192.

The National Malleable Castings Company, Cleveland, Ohio.—Track devices. Represented by T. W. Aishton. Space 102.

National Surface Guard Company, Chicago.—Tie tongs; combination tie and rail tongs; rail saws; cattle guards. Rep-

resented by C. C. Zimmerman and H. A. Smith. Space 210. Nichols & Bros., Geo. P., Chicago.—Gas engine power plant for turntable tractor; electric tractor; transfer table model; two electric collector devices; air motor. Represented by Geo. P. Nichols, S. F. Nichols, R. M. Gaston and N. Fries. Space 173.

North American Engine Company, Algona, Iowa.—Section motor cars and engines. Represented by E. A. Adams, C. W. Nicoulin, C. H. Cretzmeier, J. Edward Murphy and Mrs. C. H. Cretzmeier. Spaces 170½ and 171.

Ogle Construction Company, Chicago.—Models, photographs and designs of locomotive coaling stations and coal handling machinery. Represented by R. A. Ogle, C. F. Bledsoe and M. W. Powell. Spaces 12 and 31.

The Okonite Company, New York.—Rubber-covered wires and cables. Represented by H. Durant Cheever, J. V. Underhill, F. J. White, W. R. Van Steenburgh, H. A. Hamilton, Charles A. Miller and J. W. Hackett. Spaces 16 and 17.

O'Malley-Bearé Valve Company, Chicago.—Globe, angle and check valves; medium and extra heavy; special valves; Duplex blow-off cocks; Perfection gauge cocks. Represented by Edward O'Malley, Thomas O'Malley, J. N. Gallagher, J. E. Brown, J. M. Pigott, W. H. Morris, F. A. Hitesman. Space 114.

The P. and M. Company, Chicago.—P. & M., Vaughan, Henggi, Ajax rail anti-creeper; bond wire rotectors. Represented by F. A. Poor, P. W. Moore, Fred A. Preston, F. N. Baylies, D. T. Hallberg, S. M. Clancey, George C. Clifford, J. D. Griswold, P. H. Hamilton, George E. Johnson, J. E. Mahoney, John Reagan, W. H. Reaves, John Ritchie, P. V. Samuelson, L. S. Walker and William A. Maxwell. Spaces 122 and 123.

Page Steel & Wire Company, New York.—Armco iron bond wires; "Copperweld" bond wires; Armco iron and "Copperweld" wire, single and strand, for electrical transmission; Armco iron welding wire. Represented by W. T. Kyle and C. A. McCune. Spaces 81 and 82.

Pittsburgh-Des Moines Steel Company, Pittsburgh, Pa.—Steel railway service tanks; railway bridges; signal bridges. Represented by Max Whitacre, W. W. Hendrix, M. P. Cogswell, E. J. Mershon, W. R. Workman, J. E. O'Leary, H. W. Ford, W. A. DaLee, C. L. Todd, A. C. Pearsall, Herbert Miller. Spaces 83 and 84.

The Pocket List of Railroad Officials, New York.—The Pocket List of Railroad Officials. Represented by J. Alexander Brown, Harold A. Brown and Charles L. Dinsmore. Space 26.

Positive Rail Anchor Company, Marion, Ind.—Rail anchors; guard rail; braces and plates; tie plates; rail braces; combination tie plates and rail braces. Represented by A. H. Told, J. A. Shoutly, L. C. Ferguson, E. A. LeBeau, W. H. Davis and C. H. Webb. Spaces 178, 179 and 180.

The Protective Signal Manufacturing Company, Denver, Colo.—Highway crossing and electric signaling equipment. Represented by Will C. Neahr, Raymond Ramage and Walter E. Wegner. Spaces 165 and 166.

Pyrene Manufacturing Company, New York.—Hand chemical fire extinguishers; hand drawn chemical fire engines; fire protection and prevention supplies. Represented by R. G. Henderson, B. K. Cosby, H. M. McCullen, R. M. La Barr, W. L. Krause, C. I. McCarthy, R. C. Houghton and Jirah D. Cole. Space 186.

The Q & C Company, New York.—Bonzano joints; rolled steel step joints; derails; replacers and clamps; rail benders; guard rail clamps. Represented by J. V. Westcott, E. M. Smith, F. F. Kister, E. R. Packer, C. M. Brennan, R. J. McComb and C. F. Quincy. Spaces 120 and 139.

The Rail Joint Company, New York.—Continuous standard, insulated and step joints; Weber standard and insulated joints; 100% joints. Represented by V. C. Armstrong, W. P. Thomson, B. G. Braine, J. A. Greer, R. W. Payne, McLeod Thomson, R. R. Seward, E. F. Schermerhorn, E. L. Van Dresar, F. C. Webb, E. A. Condit, Jr., W. S. Boyce, J. N. Meade, H. C. Hickey, Chas. Jenkinson, R. W. Smith, C. B. Griffin, J. H. Larson, Alex. Chapman, J. C. Barr and J. G. Miller. Spaces 79 and 80.

Railway Review, Chicago.—Railway publications. Represented by Willard A. Smith, Harold A. Smith, W. M. Camp, C. W. Parks, J. E. Gougeon, C. L. Bates and L. H. Lozier. Space 44.

The Railroad Supply Company, Chicago.—Tie plates; derailleurs; wig wag signals; relays; crossing bells; lightning arresters; annunciators; channel pins; electric measuring instruments; crossing gates; relay boxes; time relay; ground plates; terminals; cable posts; connectors. Represented by E. H. Bell, Paul W. Kohnen, H. M. Buck, M. J. Fox, R. S. Prentice, H. G. Van Nostrand, F. M. Hill, A. H. Smith, W. C. Irwin, Geo. T. Cook, F. C. Webb, Geo. M. Kenyon and R. D. Hawley. Spaces 104 and 105.

Ramapo Iron Works, Hillburn, N. Y.—Manganese switch points; switch stands; guard rail clamps; double shoulder solid

bottom switch riser plates. Represented by Thomas E. Akers, J. Edgar Davidson, Arthur Gemunder, W. C. Kidd, William Wait Snow and James B. Strong. Spaces 109½ and 110.

Reading Specialties Company, Reading, Pa.—Car and engine replacers; compromised rail joints; guard rail clamps; rail benders; derails; guard rails; rail straighteners; tie spacers; replacer clamps. Represented by B. J. Buell. Space 45.

Rice Manufacturing Company, Indianapolis, Ind.—Red Devil rivet cutter; Baby Devil rivet cutter. Represented by A. G. Rice, L. E. Miller and A. Ryder Dyer. Space 172.

Richards-Wilcox Manufacturing Company, Aurora, Ill.—“Overway” conveying systems; lift doors; door hangers; fire-door hardware; grindstones and hoists. Represented by J. V. Wise, J. H. Wise, A. J. Eggleston and E. J. G. Phillips. Spaces 159 and 160.

Rich Tool Company, Chicago.—High speed drills; reamers; countersinks; rivet sets. Represented by James L. Crowley. Space 182.

Roadmasters and Maintenance of Way Association of America, Sterling, Ill.—Represented by P. J. McAndrews. Space 227.

Rogers' Journal Packing Company, Inc., Chicago.—Rogers' Stecos journal packing for locomotives, passenger and freight cars. Represented by E. C. Hall and C. A. Elsy. Space 156.

Roberts and Schaefer Company, Chicago.—Photographs of reinforced concrete locomotive coaling plants; “RandS” gravity sand plants and cinder handling plants for railroads. Represented by Clyde P. Ross, M. V. Bailliere, C. C. Brackett and H. S. Shimizu. Space 89.

Safe Lock Switch Machine Company, Lexington, Ky.—Safe Lock switch machine. Represented by C. Daugherty, D. M. Case, C. F. Jones and Leo Jones. Space 168½.

Sellers Manufacturing Company, Chicago.—Sellers anchor bottom wrought iron tie plates. Represented by J. M. Sellers, G. M. Hogan, R. A. Van Houten, T. D. Crowley and R. J. Platt. Space 124.

Signal Accessories Company, New York.—Signal material. Represented by F. C. Lavarack and C. R. Ahrens. Space 119.

Simmons-Boardman Publishing Company, New York and Chicago.—Railway Age; Railway Maintenance Engineer; Railway Signal Engineer; Railway Mechanical Engineer; Railway Electrical Engineer. Represented by E. A. Simmons, L. B. Sherman, Henry Lee, C. R. Mills, F. S. Dinsmore, H. H. Simmons, H. H. Marsh, J. M. Rutherford, R. H. Smith, F. W. Lane, F. C. Koch, Samuel O. Dunn, R. V. Wright, E. T. Howson, W. S. Lacher, J. G. Little, A. F. Stuebing, K. E. Kellenberger, B. W. Meisel, H. Parkes, N. H. Crossland and T. E. Crossman. Space 46.

Southern Pine Association, New Orleans, La.—Structural yellow pine of interest to engineers; methods of prolonging life of ties and piling by preservatives; rail fastenings; model of unit of railroad shop; model of creosoted pine water tank; model of timber span; model of highway bridge; moving pictures showing various phases of lumber manufacturing. Represented by Alfred L. Kammerer. Spaces 203 and 212.

T. W. Snow Construction Company, Chicago.—Railway water crane; railway oil crane; railway coal hoist. Represented by T. W. Snow and R. E. Gurley. Space 50½.

Squire Cogswell Company, Chicago.—Volkhardt valves and hydrants; Hauck thawing burners and oil burning equipment. Represented by Willis C. Squire and C. P. Cogswell. Space 161½.

Standard Asphalt and Refining Company, Chicago.—Sarco mineral rubber mastic floors; Sarco mineral rubber refrigerator compound; Sarco waterproofing; Sarco mineral rubber roofing materials; Sarco mineral rubber coatings. Represented by R. F. Trumbull, E. L. Hedrick, George A. Thornton, E. P. Shipley, Charles Muller, J. M. Woodruff, H. C. Riehle and C. L. Gauthier. Spaces 161, 162 and 162½.

The Stuebing Lift Truck Company, Chicago.—Lift trucks; platform systems. Represented by Albert O. Kraemer. Space 230.

Templeton, Kenly & Company, Ltd., Chicago.—Simplex track, ballast and bridge jacks; Simplex emergency jacks; Simplex pole pulling jacks; Simplex auto and truck jacks. Represented by W. B. Templeton, H. B. Burlow and A. C. Lewis. Space 32.

Track Specialties Company, Inc., New York.—Guard rail clamp; guard rail brace; compromise joint; switch plate and brace; anchor plate; rail joints; tie plate; rail brace; derail; track shim bender. Represented by W. B. Lee. Space 205.

Train Control Appliance Company, El Paso, Tex.—Automatic train control. Represented by M. B. Bulla, H. S. Campbell and E. C. Monroe. Space 209.

Toledo Scale Company, Toledo, Ohio.—Scales; automatic portable; self-contained automatic dormant; section of 25

ton automobile scale. Represented by H. O. Hem, C. H. Haggood and Geo. W. Bollinger. Space 136.

Torchworld Equipment Company, Chicago.—Welding and cutting apparatus; oxy-acetylene regulators; welding torches; cutting torches. Represented by C. J. Nyquist, W. A. Slack, H. R. Fenstermaker, W. L. Schuert and N. Robel. Space 181.

Underwood Typewriter Company, New York.—Bookkeeping and billing machines. Represented by F. A. Robinson and F. W. Blake. Spaces 200, 201, 214 and 215.

Union Switch & Signal Company, Swissvale, Pa.—Represented by A. L. Humphrey, G. A. Blackmore, L. F. Howard, W. P. Neubert, J. P. Coleman, J. E. Saunders, C. O. Harrington, H. A. Wallace, J. F. Talbert, W. P. Allen, Aaron Dean, H. W. Griffin, J. J. Cozzens, J. L. Brastow, J. S. Hohson, W. W. Talbert, S. E. Gillespie, V. K. Spieer, J. L. Loucks, Geo. Marloff, J. D. Rocit and H. R. Sheenc. Spaces 66 and 67.

U. S. Wind Engine & Pump Company, Batavia, Ill.—Railway water columns; pumps; tanks; watering devices for locomotives; spouts; valves; switch stands. Represented by L. E. Wolcott, C. E. Ward, James P. Prindle, E. B. La Salle and F. E. Pearson. Spaces 111 and 112.

United States Switch Company, Eau Claire, Wis.—Automatic railway switch lock. Represented by J. W. Hubbard. Space 6.

Verona Tool Works, Pittsburgh, Pa.—Track tools; track jacks; levels; gauges; nut locks. Represented by H. S. Paul, E. Woodings, H. C. Mull and E. L. Ruby. Spaces 129 and 148.

Volkhardt Company, Inc., Stapleton, N. Y.—Railroad water hydrants. Represented by Wm. Volkhardt, Chas. P. Cogswell and W. C. Squire. Space 160½.

The Walls Frogless Switch & Manufacturing Company, Kansas City, Mo.—Complete railway frog. Represented by C. E. Ennis, J. J. Lutz, O. Leamon and J. J. Schimmel. Spaces 219, 219½ and 220.

The Waterbury Battery Company, Waterbury, Conn.—Waterbury unit cylinder primary batteries; Waterbury plate type primary batteries; Waterbury separate cylinder type primary batteries; Gordon primary batteries; Waterbury track batteries. Represented by E. E. Hudson, G. A. Nelson and S. T. Hough. Space 38.

Wayne Oil Tank and Pump Company, Fort Wayne, Ind.—Pumps for handling oils, gasoline, naphtha, lubricating oils and fuel oils; storage tanks; measuring devices and gauges. Represented by B. F. Geyer. Space 138.

West Coast Lumbermen's Association, Seattle, Wash.—Douglas fir, Sitka spruce, western hemlock and red cedar lumber. Represented by C. J. Hogue. Spaces 204 and 211.

Western Electric Company, Inc., New York.—Telephone train dispatching equipment; shop lights; electric drills and track tampers; incandescent lamps; storage battery power and light units; safety switch and steel towers; signal and code wires. Represented by John C. Binning, Geo. Hull Porter, G. K. Heyer, E. V. Adams, R. M. Campbell, A. L. Crater, W. O. Tuttle, F. M. Evans, W. J. Davis, Jr., Geo. Sherry, T. J. Rider, G. E. Cullinan, Walter P. Hoagland, C. H. Wharton and L. A. Muttart. Spaces 58 and 59.

Woolery Machine Company, Minneapolis, Minn.—Railway motor car and engines for railway motor cars. Represented by H. E. Woolery. Space 5.

The Wyoming Shovel Works, Wyoming, Pa.—Shovels. Represented by G. E. Geer and H. C. Emery. Space 103.

## Western Railway Club Meeting

W. S. Bartholomew, president of the Locomotive Stacker Company, Pittsburgh, Pa., made an illustrated address at the monthly meeting of the Western Railway Club last evening on the use of mechanical stokers in locomotives. He emphasized particularly the importance of the stoker in increasing the capacity of the locomotives and the advantages from an operating standpoint.

Lieutenant-Commander Dexter C. Buell of the United States Navy Bureau of Ordnance gave an illustrated address on the construction and use of the batteries of 14-in., 50-caliber naval rifles which were placed on railway mountings in such a way that they could be moved almost anywhere on the railways of France. These were assembled in record-breaking time and rendered good service at the front as early as last September. Lieutenant-Commander Buell is known to railway men as director of the Railway Educational Bureau at Omaha, Nebr.

# Meeting of the American Association of Engineers

A Report of the Railroad Conference Held Yesterday  
in the Gold Room at the Congress Hotel

A RAILROAD CONFERENCE under the auspices of the American Association of Engineers was held yesterday in the Congress hotel. Primarily the conference was called to discuss means of promoting the social and economic welfare of the railroad technical engineer and to formulate principles for the direction of the railroad committee of the association. Both afternoon and evening sessions were held.

The discussion, in the afternoon, was begun by H. P. Gillette, editor Engineering Contracting, who spoke on, "Shall Engineers Be Paid Overtime?" Mr. Gillette was of the opinion that the designer or supervisor of important work never ought to hold himself or be held to a time unit as a basis for payment for services rendered. He doubted, however, if it was just to require men holding positions of semi-mental, semi-muscular duties, such as ordinary drafting or surveying, to be oblivious to the length of the working day in the hope of being rewarded by advancement to the supervisor class.

After calling attention to the fact that there is no logical dividing line between subordinates and supervisory positions a practical way of meeting the difficulty suggested was to use the highest wage or salary paid to union labor employes on the line as a standard. All technical engineers receiving more than the sum determined as above would then be placed in the supervisor class and receive no pay for overtime.

This discussion was followed by a paper entitled "Principles and Procedure in Classification and Salaries of Railroad Engineers," which was presented by J. L. Jacobs of the Curtis Publishing Company. He said in part:

Essential features and underlying principles for sound classification and salary standardization have been developed as a result of intensive studies, experiences and observations of employment situations in many services. These essentials and principles are set out as measuring standards for the classification and standardization of the railroad professional engineering positions as well as for other professional engineering groups.

As the plan proposed for the railroad professional engineers measures up to these standards so will the broad purposes be attained. The program of service and standardization of all the professional engineers should be the program of the railroad professional engineering group and that program should include the following 14 essentials:

- (1) Equitable and logical basis for fixing and adjusting salaries in relation to duties and qualification requirements and cost and standard of living.
- (2) Definite wage differentials for different positions based on special work and qualification requirements, location and other special employment conditions.
- (3) Classification of positions into functional classes, all positions being placed into classes according to general character of duties and into grades according to responsibility and difficulty of work.
- (4) Standard and distinctive titles for all positions having similar duties and work requirements.
- (5) Definitions of duties and responsibilities for each position.
- (6) Definitions of qualification requirements for each position.
- (7) Definite and equitable plan for recognition of efficient service and seniority through periodic advancement—particularly applicable to the lower grade positions.
- (8) Definite lines of promotion for employes in the various groups and grades.

(9) Definite regulations for the determination, adjustment and control of salaries and working conditions.

(10) Standards of service for use as a basis of advancement, transfer and increases based on efficient service and seniority.

(11) Basis for the establishment of co-operative relations and measures between employes and management to improve social, economic and industrial conditions.

(12) Definite plan of administrative machinery for insuring equitable and orderly handling of problems of classification, salaries, working conditions and other matters of mutual interest.

(13) Definite formation of effective and fully representative associations for studying, developing and advising on the industrial, economic and public matters which are of common interest to all and for mutual support.

(14) Definite proposals for the next steps in the improvement of the status of professional engineering and the development of positive methods and ideals for service and employment.

The following general procedure could be successfully applied in connection with the broad program of classification and salary standardization for railroad professional engineering positions as well as for the other professional engineering groups:

(1) Establish co-operative relations with representatives of professional engineering groups and associations, employers and governmental agencies, with a view of obtaining common understanding, full-hearted consideration and support in the development and establishment of the standardization program.

(2) Determine the divisions of professional engineering groups and the order in which classification and salary standardization for the same are to be developed.

(3) Collect for analysis, information and data from reports and documents containing laws, rules and regulations and descriptions of the organization, work and qualification requirements of the positions under consideration.

(4) Collect for analysis information and data on cost and standard of living, hours of work and other working conditions for the respective positions by districts and for the country as a whole.

(5) Develop groups of occupations setting forth standard and distinct title designations, definition of duties and qualification requirements; character of occupations, and lines of advancement and promotion.

(6) Establish factors and standards for the determination of basic salaries and differentials dependent on educational requirements, cost and standards of living, working conditions and special qualifications.

(7) Develop standards of service as a basis for selection, assignment, transfer and advancement according to service and seniority.

(8) Prepare code of regulations and conditions as part of the general standardization plan.

(9) Hold conferences with representative of engineering groups and employers with a view of obtaining suggestions as to changes in classification standards and factors, and approval of the general plan.

(10) Prepare regulations and procedure on the manner and method of applying and administering the standardization program.

Mr. Jacobs' paper was followed by an open discussion of the schedule of monthly salaries for technical engineers: In submitting the schedule the committee stated that it had proceeded on the basis of fixing minimum rates for tapemen, division engineers, and chief engineers, considering that these positions were basic. The fixing of the intermediate rates was then largely mechanical. Adjustments were made, however, to ensure that the rate fixed for a particular position was commensurate to that paid to men of similar rank in other departments.

Summarized, my views as to the three prime requisites to obtaining greater recognition for the engineering pro-

profession may be stated as follows: (1) Organization, (2) licensing, (3) broader education, interest and activity in other than purely technical matters.

The movement of the day appears to be in the direction of organization by classes, and the engineering profession ought to be, and I trust is, alive to the movement. Therefore, let us invite the co-operation of all and use our influence in every direction to build up a national association which will embrace all branches of the profession and have as its object not only the advancement of technical research, but the economic, social and political welfare of the profession as a whole.

W. W. K. Sparrow, corporate chief engineer of the Chicago, Milwaukee & St. Paul, presented a paper entitled, "How Shall Proper Recognition of the Engineering Profession Be Obtained?" He said in part:

While I understand the question most of us are perhaps most interested in at this time is the economic welfare of the engineer and how to secure more adequate compensation for his services, yet I feel that we should not confine our discussion or energies to this phase of the question only, but should also endeavor to secure greater application and recognition of the profession socially and politically and in the problems of reconstruction, with which not only this country, but the whole world is today confronted.

After citing several striking instances of this lack of recognition and some of the causes contributing to this condition, he continued:

During the day the following schedule\* of monthly salaries was adopted:

	Minimum salaries per annum, depending upon extent and importance of duties	
Chief Engineer .....	\$15,000	\$9,000
Assistant Chief Engineer.....	9,000	7,200
District Engineer .....	6,000	4,800
Assistant District Engineer.....	5,400	4,200
Division Engineer .....	4,800	4,200
Assistant Division Engineer.....	3,600	2,750
Resident Engineer, Chief Engineer or District Engineer .....	4,200	3,000
Office Engineer—Field Engineer .....	5,400	3,600
Engineer of Bridges.....	7,500	6,000
Assistant Engineer of Bridges.....	5,400	4,800
Signal Engineer .....	7,200	4,200
Assistant Signal Engineer.....	4,800	3,000
Building Engineer .....	6,000	3,000
Valuation Engineer .....	8,400	7,200
Assistant Valuation Engineer.....	6,000	4,800
Chief Pilot Engineer.....	4,800	3,600
Pilot Engineer .....	3,600	3,000
Engineer Accountant .....	3,600	3,000
General Superintendent of Motive Power.....	15,000	9,000
Assistant General Superintendent of Motive Power .....	9,000	7,200
Mechanical Engineer .....	7,500	6,000
Assistant Mechanical Engineer .....	4,800	3,600
Engineer of Tests .....	7,500	6,000
Electrical Engineer .....	6,000	4,800
District Electrical Engineer.....	3,600	2,700
Shop Engineer .....	4,800	3,600
Chief Draftsman .....	3,600	3,000
	Minimum salaries per month	
Leading Draftsman or Designer.....	200	to 250
Draftsman .....	150	to 200
Junior Draftsman .....	125	to 150
Tracer .....	100	to 120
	Minimum salaries per month	
Engineer Inspectors .....	150	to 225
Instrument Man .....	200	to 225
Rodman .....	125	to 150
Tapeman .....	100	to 120

## New Signal Committee Chairman

The name of one new committee chairman appears upon this year's list of the standing committees of the A. R. A. Signal Division. Committee IV, Direct Current Automatic Block Signaling, is headed by C. F. Stoltz, signal engineer of the Cleveland, Cincinnati, Chicago & St. Louis. Under the direction of Mr. Stoltz, it will be the duty of this committee to prepare unit specifications for direct current motor operated signal mechanisms, including in such specifications the requirements for the maximum energy in watt-seconds to operate, and the minimum watts to hold the signal and minimum torque in lever arm foot pounds required to return the mechanism to the stop position with and without spectacle and blades. Instructions will also be prepared for making torque tests of electric motor signals, and unit specifications will be drawn up covering signals and their in-

C. F. Stoltz  
New Committee Chairman, Signal Division

stallation; rail bonding; wire lines; switch circuit controllers and resistance units.

Mr. Stoltz became a member of the Railway Signal Association in 1913 and in 1914 he was appointed a member of Committee IV, on which he has served continuously to date. In 1918 he was appointed vice-chairman of the committee.

In 1916 he was appointed to Committee VII, Direct Current Relays, and has served continuously on this committee to date. As a member of Committee VII, Mr. Stoltz has helped in the preparation of unit specifications for direct current relays; standard relay resistance table and recommended minimum allowable drop away point for relays of resistances named in the standard resistance table. The outline of the work for 1919 covers the preparation of specifications for coils, cores, armatures, etc., on relays and provides for the interchangeability of the parts.

After Mr. Stoltz graduated from Miami University in 1906 he entered the service of the Cleveland, Cincinnati, Chicago & St. Louis as a draftsman and served in this capacity until 1910. He was then appointed assistant signal engineer for the Big Four, which position he held until November 20, 1913, when he was appointed signal engineer for the system, the position which he now holds.

# The Amalgamation of the Railway Signal Association

## Its Relation to the American Railroad Association and the Manner in Which Its Activities Will Be Affected

WHAT RELATION WILL THE Railway Signal Association bear to the American Railroad Association?

Will its activities be curtailed or increased and what benefits will the members derive from the new arrangement? These are typical of many questions which are being asked by the members of the Railway Signal Association and indicate the wide difference of opinion which exists as to its future. Many members view with regret the loss of its identity, and rightly so, as this reflects the enthusiasm and *esprit de corps* existing among them which has been the means of placing the association on the present high plane it occupies today.

### A History of the Change in Status

In view of the above a brief history of the steps taken in the amalgamation plan may not be out of place at this time. The old Railway Signaling Club was founded on March 11, 1895, by George Basford, now president of the Locomotive Feed Water Heater Company of New York. At the March meeting of this organization in 1903, held in the Wayne hotel at Detroit, Mich., C. C. Rosenberg made the motion which resulted in changing the name of the Railway Signaling Club to the Railway Signal Association. At midnight on February 28, 1919, the affairs of the Railway Signal Association were terminated and the activities of the organization were transferred to the American Railroad Association. Thus there lacked but a few days of completing a period of 24 years of progress by the former association.

On January 28, 1918, the director general issued General Order No. 6 directing that carriers' operating revenues should not be expended for the payment of expenses of persons or agencies constituting associations of carriers unless such associations were approved in advance by the director general. The Railway Signal Association made application and received temporary approval for the use of funds already on hand to pay the current expenses of the association until April 30, 1918. The director general on April 26, 1918, approved the R. S. A. *until further orders*, and authorized the carriers to pay the necessary assessments needed for the current expenses of the association. On May 2, 1918, a conference of the presidents of some of the larger voluntary railroad organizations was held in New York on the call of Acting President Thompson of the American Railway Association, to comply with the suggestion of the director general that the several associations be amalgamated to form one congress of associations.

A meeting of the Board of Direction of the R. S. A. was next held at Chicago on May 9 and 10, 1918. In addition to the members of the Board of Direction, C. A. Christofferson, R. B. Elsworth, P. M. Gault, F. B. Patenall, J. A. Peabody, F. B. Wiegand, G. E. Ellis, A. R. Fugina, J. Leisenring, H. K. Lowry and B. H. Mann were present. A plan was outlined at this meeting which was later submitted to the joint conference of the several railroad organizations.

On January 10, 1919, the director general issued Circular No. 70 stating that during the period of Federal control and in order to provide a responsible channel through which the director general may obtain recommendations for the advancement of railroad practice, the American Railway Association has revised its articles of organization and by-laws and will change its name to the American Railroad Association. This association consists of

five sections, viz.: operating, engineering, mechanical, traffic and transportation. Its scope was enlarged to cover the former activities of a number of the associations, including the Railway Signal Association. This association becomes the signal division of the Engineering section. Railroads under Federal control may become members of the American Railroad Association and are directed to be represented and participate in the activities of each section through their proper officers.

On February 24, 1919, the Board of Direction of the R. S. A. held a meeting at Chicago, to comply with Circular No. 70 and arranged that the R. S. A. will be known as the Signal division of the Engineering Section of the American Railroad Association as indicated in the following resolutions:

*Resolved*, That in pursuance of Article VII, Section 4, of the Railway Signal Association constitution, reading—"The Board of Direction shall manage the affairs of the association and shall have full power to control and regulate all matters not otherwise provided for in the constitution, except to make the association liable for debt to an amount greater than that which, at the time of contracting the same, shall be in the secretary-treasurer's hands in cash and not subject to prior liabilities."—the affairs of this association are transferred to the Signal division of the American Railroad Association.

*Resolved*, That in pursuance of Circular No. 70 of the Director General of Railroads of the United States, issued under date of January 10, 1919, the affairs of the Railway Signal Association, effective midnight, February 28, 1919, are hereby terminated and the activities of that organization transferred to the American Railroad Association.

The necessary details in connection with the transfer of the activities, funds and securities of the R. S. A. have been consummated by the Board of Direction and the interests of the R. S. A. properly safeguarded.

### The Membership and Committee of Direction

The membership of the Signal division will consist of representative members and affiliated members. The representative members are appointed by their respective railroads and the affiliated members will consist of the former active, junior, associate, honorary and life members. All present memberships of the various classes as outlined above are transferred to the Signal division either as members, if they were representative members before, or as affiliated members. Future affiliated members may be appointed by the Committee of Direction. Each railroad affiliated member (the former active, other than those appointed as representative members, and junior members) will pay \$3 per annum and other affiliated members (the former associate members) will pay \$6 for such printed matter as may be provided by the Committee of Direction of the division.

The present organization provides for a chairman, two vice-chairmen, a secretary, a committee of direction and standing committees for the division. The chairman and vice-chairmen of the division will be elected annually by the section. The Committee of Direction will consist of 16 members, and its chairman and two vice-chairmen will be elected from among its members.

R. E. Trout, signal engineer of the St. Louis-San Francisco, was elected chairman of this committee, and C. J. Kelloway, superintendent of signals, Atlantic Coast Line, and F. W. Pflieger, signal engineer, Union Pacific, were elected the vice-chairmen. The other members on this committee are W. J. Eck, signal and electrical superintendent, Southern Railway; C. A. Dunham, signal engi-

neer, Great Northern; W. H. Elliott, signal engineer, New York Central, Lines East; A. H. Rice, signal engineer, Delaware & Hudson; J. H. Cornick, signal engineer, Canadian Northern; E. E. Worthing signal engineer, Southern Pacific Lines, Atlantic System; A. P. Hix, signal engineer, Terminal Railroad Association of St. Louis; E. G. Stradling, signal engineer, Chicago, Indianapolis & Louisville; G. E. Ellis, Division of Safety, Interstate Commerce Commission; H. K. Lowry, signal engineer, Chicago, Rock Island & Pacific; Barton Wheelwright, engineer maintenance of way, Grand Trunk New England Lines, and F. P. Patenall, signal engineer, Baltimore & Ohio.

The Committee of Direction will conduct the business of the division and it will be its duty to fix the number of and appoint the members to the committees that may be necessary to properly investigate and report on such subjects as may be assigned. It is proposed to hold regular meetings of the Committee of Direction in March, June and September, respectively, of each year, the date and place to be decided on by the chairman. These meetings will likely be held in advance of the stated meetings of the division. Special meetings may be held at the call of the chairman. The annual meeting of the division will be held in September of each year, the time and the place of meeting will be announced approximately three months in advance by the Committee of Direction.

### The Standing Committees

For the present the standing committees of the division are as follows:

- Committee on Committees
- Committee on Annual Meetings
- Committee on Editing
- Committee on Mechanical Interlocking
- Committee on Power Interlocking
- Committee on Direct Current Automatic Block Signaling
- Committee on Maintenance and Operation
- Committee on Direct Current Relays
- Committee on Standard Designs
- Committee on Alternating Current Automatic Block Signaling
- Committee on Wires and Cables
- Committee on Signaling Practice
- Committee on Batteries and Switchboards
- Committee on Contracts
- Committee on Electric Testing
- Committee on Lightning Protection
- Committee on Valuation
- Sectional Committees

The membership of the standing committees may consist of both representative and affiliated members of the division as no change in practice is contemplated from the methods followed in the past. This allows those especially qualified in scientific and engineering lines to be appointed to such committees. The reports of these committees will be presented to and open for discussion by all representative and affiliated members at the stated and annual meetings. The only change in practice made is in connection with the adoption of the recommendations made by the committees by letter-ballot. In the past all representative and active members voted on these recommendations. In the future only those representative members appointed by the railroads will vote by letter-ballot on recommendations for final adoption, but indirectly this vote will represent the consensus of opinion of the division as the views of the majority will likely be reflected in the letter-ballots of the representative members. Both representative and affiliated members can vote on subjects handled by the committees and presented before the meetings. The representative members will vote in the future as they have in the past, the number of votes depending upon the mileage and also upon the signals on their respective roads. A road may dele-

gate one man or a number of men as representative members to cast the number of ballots to which it is entitled.

### Roads Not Under Government Control

The question is often asked "Will railroads not now under government control or of less than 100 miles in length have the opportunity for proper representation in the work of this division?" It is the feeling among members of the R. S. A. who are on roads not under government control but who have given their time and efforts to the advancement of the association in the past, that they should be given an opportunity to continue their activities and to receive the benefits of membership in the division. As outlined above these members will have an opportunity to take part in the activities by serving on committees and by taking part in the discussions at the meetings. Furthermore, the railroads not under government control may appoint these men as their representative members and they will then be accorded the full privileges of such members.

The status of the railroads not under Federal control, including the Canadian and Mexican railroads, is exactly the same as in the past. No distinction will be made, as far as the American Railroad Association is concerned, between those roads under Federal control and those that are not.

In the past some railroads have sent their supervising signal officers (as the supervisors, inspectors, etc.) to the meetings of the R. S. A. and have paid their expenses. In the future the railroads can follow their past practice in this regard. Those members of the division in the military and naval service of the country whose dues were remitted while in the service will not be required to pay their dues for the time so employed, and on return to civil life they can resume their standing as representative or affiliated members, as the case may be. Regional committees of the Signal division will be continued in the future as in the past. In the future the Signal division will handle exclusively all work pertaining to signaling and rules for signaling. The recommendations made by this division can be made mandatory by order of the Director-General should he so desire.

### Signal Division Regulations

1. The division shall include those actively connected in official or supervisory capacities with the design, construction, maintenance and operation of railway signaling devices. Affiliated members may be appointed by the Committee of Direction.

2. There shall be a committee of direction, which shall consist of 16 members, including the chairman and vice-chairmen, and a committee on nominations of five members to be elected annually by the division.

The Committee of Direction shall conduct the business of the division, and shall authorize, order, define duties, fix the number of and appoint the members of such committees as may be necessary to investigate and report their findings and recommendations upon any subject considered by them.

For the present there shall be the following committees:

- Committee on Committees.
- Committee on Annual Meeting Arrangements.
- Committee on Editing.
- Committee on Mechanical Interlocking.
- Committee on Power Interlocking.
- Committee on Direct Current Automatic Block Signaling.
- Committee on Maintenance and Operation.
- Committee on Standard Designs.
- Committee on Direct Current Relays.

Committee on Alternating Current Automatic Block Signaling.

Committee on Wires and Cables.

Committee on Signaling Practice.

Committee on Batteries and Switchboards.

Committee on Contracts.

Committee on Electric Testing.

Committee on Lightning Protection.

Committee on Valuation.

Sectional Committees.

3. Regular meetings of the Committee of Direction shall be held in March, June and September, respectively, of each year, the date and place to be decided by the chairman. Special meetings of the committee may be held at the call of the chairman.

An annual meeting of the Signal division shall be held in September of each year, the time and place to be designated by the Committee of Direction, approximately three months in advance. Special meetings may be held at the call of the Committee of Direction.

4. The Committee of Direction shall offer the names of 10 representatives of members, not officers of the division, as candidates for the Committee on Nominations.

5. It shall be the duty of the Committee on Nominations to offer to the annual meeting of the division the names of one representative of a member as candidate for chairman and one for first vice-chairman and one for second vice-chairman, and the names of four representatives of members as candidates for the Committee of Direction. Every third year five representatives of members to be nominated as candidates for the Committee of Direction.

Nominations for officers or membership on the Committee of Direction or Committee on Nominations may be made by any representative of a member at the annual meeting at which such officers or members of committees are elected, provided such nominations have been endorsed by 25 representative members.

6. Officers, excepting as otherwise herein provided, shall be elected at the annual meeting of the division held in September each year, and the election shall not be postponed except by unanimous consent.

The chairman and the first and second vice-chairmen of the division shall be elected by printed ballot each year, the candidate receiving the majority of the votes cast shall be declared elected and shall hold office for one year or until his successor shall be elected.

Members of the Committee of Direction and the Committee on Nominations shall be elected by written or printed ballots; four members of the Committee of Direction shall be elected to serve for three years. Every three years five members of the Committee of Direction shall be elected; five members of the Committee on Nominations shall be elected annually.

### President's Annual Dinner

C. A. Morse, president of the American Railway Engineering Association, was host to the members of the board of direction, the past presidents of the association and the members of the committee on arrangements at a dinner in the English room of the Congress Hotel at 7 o'clock last night. The party numbered 26 and included ten past presidents of the A. R. E. A., John F. Wallace, first president of the association, Wm. McNab, Hunter McDonald, W. C. Cushing and Charles S. Churchill, in addition to the five past presidents who are members of the board of direction. Three past presidents of the American Society of Civil Engineers, John F. Wallace, Hunter McDonald and A. N. Talbot were among the guests.

### Rest in Peace (?)

IF WE HAD NO Manual for our needs  
Or Digests with their lengthy screeds,  
No standard circuits, cranks or studs,  
We'd all be unexploded, "duds."  
If it wasn't for the R. S. A.  
We'd clutter up the right o' way  
With experiments and hobbies punk  
And spend a million bucks for junk.

#### II

For this signal game's no easy graft  
And grief would now engulf the craft  
If every mother's son had tried  
To all his skill and knowledge hide,  
But R. S. A. (our worthy dad)  
Collected "kinks" both good and bad,  
Culled out the worst and kept the best,  
Adopting those that stood the test.

#### III

Since way back there in ninety-five,  
He gathered *hombres* who were *live*.  
A flock of green and vernal rubes,  
Strong and husky untrained boobs,  
Some brains mixed in; yes, quite a lot  
And poured all in the melting pot.  
The alloy of this motely clan  
Produced the present signal man.

#### IV

In spite of all the good he's done  
It looks as if his race was run,  
It seems at times there's no escape,  
We must go out and order crepe.  
We're told, a "step-dad" (A. R. A.)  
Has moved right in, prepared to stay.  
In line "us orphans" then must stand  
And jump sidewise at each command.

#### V

If our *real Pater* is laid out,  
Let us romp in and stand about  
And shed a salty, briny tear,  
As we gang around his somber bier.  
Go tell the bunch; let each one make  
An effort to attend the wake,  
For in the future, life will be  
Dry (two ways) for you and me.

#### VI

Our step-dad will feed us hash galore  
On handling scrap down at the store,  
He'll teach us how to ballast track,  
And high explosives—how to pack.  
We'll read of weights, airbrakes and claims  
'Till our mind gets like a pair of hames,  
And warped and bent we'll lose our grip,  
Our interest and our membership.

#### VII

Let's all buck up and keep our goat,  
And dodge that wooden overcoat.  
We children might be raw and crude,  
But to drown us now would be real rude.  
If time and thought to work we give,  
Old A. R. A. may let us live,  
And say and point to us with pride,  
"Them's some bright brats, dedgast their hide."

## VIII

Sometime the "Big Boss" U. S. A.  
Will call the Railroads in and say,  
This transportation job's no snap.  
For the love of Mike take back your scrap.  
And on that joyful judgment day,  
We'll resurrect old R. S. A.  
So cheer ye up, don't sit and mope,  
This hunch is good, let's live in hope.

## N. R. A. A. Annual Meeting

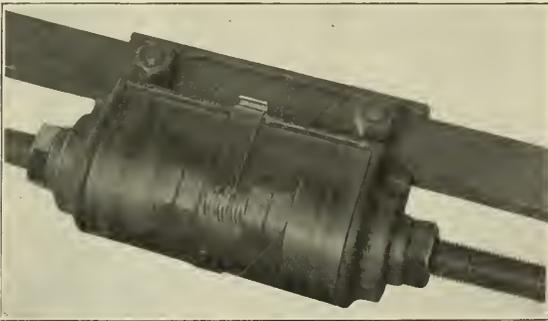

The annual meeting of the National Railway Appliances Association will be held in the dining room of the Coliseum at 11 o'clock this morning. Reports of the officers will be presented and new officers elected.

## Committee Meetings of the Signal Division

Several committees of the Signal division are to hold sessions to-day and to-morrow. Committee No. 8, Alternating Current Automatic Block Signaling, will meet at 9 a. m. to-day, in Room 260, Auditorium hotel. Committee No. 4, Direct Current Automatic Block Signaling, will convene in Room 1303 of the Blackstone hotel at 9:30 a. m.. The new Committee on Valuation will meet at 9 a. m. in Room 312 at the Auditorium hotel. Committee No. 2, Mechanical Interlocking, will meet Mr. Kelloway in the lobby of the Congress hotel at 10 a. m. On Wednesday, March 19, Committee No. 3 on Power Interlocking will hold a meeting at 10 a. m. in Room 312 of the Auditorium hotel.

## Weather-Proof Switch Adjustment

In order to provide protection against an accumulation of ice, snow, sand, or other extraneous substances between the sleeve shoulders and bracket of switch operating rod adjustments, the Union Switch & Signal Company, Swissvale, Pa., has designed a bracket with a cover as shown in accompanying phantom illustration. This switch adjustment bracket and cover are interchangeable with the standard bracket supplied by this company

New Switch Adjustment Bracket

for a number of years, so that no difficulty will be experienced in replacing the older brackets by the new one wherever trouble has been experienced, or is anticipated, due to various substances becoming attached to switch connecting rod adjustments. The sheet steel cover fits snugly over the sleeves and the nuts which limit their stroke. It is held in place by a tempered steel spring bent at both ends to latch over the shoulders of the bracket.

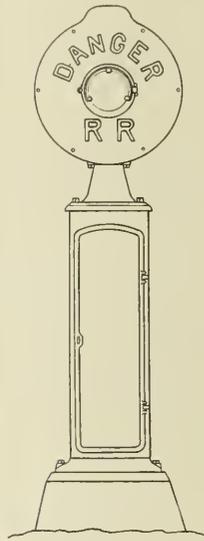

## Standard Signal and Marker Lamps

THE HANDLAN-BUCK MANUFACTURING COMPANY OF St. Louis, Mo., has placed on the market a number of new lamps in which all the parts are interchangeable, with the same size oil pots and lens, and with one length of shaft on all burners. The marker lamp brackets are adjustable to any location on the train. The series of new lamps includes semaphore and train order lamps, a switch lamp with or without enameled lens targets, engine classification markers with interior steel lens shields operated from the outside and a rear-end marker. The signal lamp conforms to the Railway Signal Association standard, while the other four lamps have been designed with the signal lamp as a basis. All the lamps have been designed to save space and to reduce the number of repair parts.

## A. G. A. Railway Light &amp; Signal

## Company's New and Improved Devices

THE HIGHWAY DANGER SIGNAL shown in the illustration consists of a flashing red light projected through  $8\frac{3}{8}$ -in. lenses located in the center of the disc on each side of the signal head. The same burner

The Flashing Signal

which produces the illumination through the lenses also illuminates the white letters of the sign on the signal head so as to permit them being seen from a distance at night. The source of light consists of dissolved acetylene gas in a steel cylinder located in the housing which also supports the signal head. One cylinder of gas will operate the signal, flashing continuously from 5 to 10 months, at a reasonable annual cost, depending upon the adjustment of the burner. The height of the flashing signal can be varied by introducing pipe of the proper size between the housing and the signal head. The particular signal illustrated shows the signal head on top of the housing without any pipe extension. This design is used on highways traveled largely by automobiles where it is necessary to have the flashing signal low enough to permit the operators of automobiles to see the flashing light underneath an automobile top.

An improvement has been made in the highway grade crossing signal lamp manufactured by this company, which consists in the adoption of an  $8\frac{3}{8}$ -in. lens, which gives a beam spread of 30 deg. and through which light is projected so that it can be seen at a distance of 400 to 600 ft. in bright sunlight.

This company has developed also a new electro-acetylene color light signal for railway purposes. The lights are projected through  $8\frac{3}{8}$ -in. lenses and may be operated with either a flashing or steady light. Electro-magnets are provided for controlling the gas supply to the burner. It is claimed that the indications of the signal are plainly visible in the day time and that the red light may be seen 1,800 to 2,000 ft. in bright sunlight. The electro-magnetic valve operates on about 1.8 volts and the resistance of the magnets is such that this voltage will permit a caustic soda battery to operate one valve for nearly two years.

DAILY EDITION

The twentieth annual convention of the American Railway Engineering Association promises to be the most successful meeting ever held by this association. One indication of this is the record attendance for the first day as evidenced by a registration of 368 members and 125 guests, and a capacity crowd in the Florentine room during most of the committee reports. The fact that so many more railway men are present this year is explained in part by the serious obstacles in the way of attendance at the two preceding conventions. Last year war conditions, war improvements and war labor shortages kept many at home. The year previous, the prospect of a nation-wide railroad strike had a like influence. However, no little credit for the presence of larger numbers is due to the Railroad Administration in encouraging attendance at the meeting and inspection of the supply exhibit.

### Record for Convention Attendance

One unfortunate circumstance introduced by the large attendance at the meetings is the bearing it has on the unsatisfactory acoustics of the convention hall. Knowing the faults of the room, seasoned members have discovered the portions of the hall in which the difficulty is least pronounced. But when it is filled nearly to capacity the auditor has no choice in the matter—he must take a seat where he finds it, which may or may not be in one of the “dead spots.” Just what the solution is, cannot be determined without some study. A change in the arrangement of the seating or the position of the rostrum from the side to the end of the room might improve matters. One thing is certain, however, the speakers, presiding officers, committee chairman, and others should pay more attention to their manner of speaking. Engineers as a rule are not orators, but they might try harder to make up for their shortcomings in this regard. This is one problem resulting from the growth of the association and as such it should be recognized.

### A Problem in Acoustics

C. A. Morse touched upon an important point in his presidential address yesterday morning when he referred to the importance of co-operation with the manufacturers in the development of standard designs for maintenance of way materials. This subject received further emphasis in the discussion of the report of the track committee yesterday afternoon when that committee presented designs for switches and frogs which had also received the approval of committees and manufacturers. The preliminary purpose in the preparation of designs of this character is, of course, to develop those plans which will best meet the demands made on them. If these plans can at the same time be made so as to afford maximum economy of production in the plants of the manufacturers, this is to the mutual advantage of the railways and the

### Cooperation With Manufacturers

makers. Engineers have too often been prone in the past to disregard shop problems in preparing their designs, with the result that their work has been needlessly expensive. If unit costs can be reduced without sacrificing quality this should by all means be done. Other committees of the association can well afford to follow the practice of the track committee in this respect.

The results of the instructions issued by officials of the Railroad Administration to federal managers to have as many of their engineering and maintenance of way officers as could be spared from their usual duties to attend the conventions and visit the exhibit this week were very apparent, both in the convention hall and at the Coliseum yesterday. The attendance at the sessions of the American Railway Engineering Association crowded the room throughout the day. At the Coliseum there were more railway officers inspecting the exhibit than probably ever was the case in any past year. Furthermore, it was evident that the railway men took a keener interest in the convention proceedings and in the exhibit than they probably ever did before. The large attendance is due not only to the support given by the Railroad Administration, but also to the fact that the amount of work being done by the engineering and maintenance of way departments is unusually small at this time. The best time for railway officers to attend conventions and examine railway appliances is when the demands on their time at home are the least, and the ultimate outcome cannot fail to be an increase in the efficiency with engineering, and maintenance work will be handled when more of such work is to be done.

### Large Attendance at Conventions and Exhibit

One of the chief benefits to be derived from the preparation of statistical records is that they provide the measuring stick for determining progress. They afford the best means which a department head can utilize in keeping in touch with affairs throughout his entire organization. And they go farther. They enable him, by comparison, to determine accurately the actual state of his organization and to ascertain whether it is progressing or standing still. In fact, it is rapidly becoming recognized that without proper regard for records and accounts a commercial concern cannot prosper. In consequence the old corner grocery methods are a thing of the past. The railroads are no exception to this rule and in their case they have a right to look to the A. R. E. A. for guidance in the matter of standard methods as well as standard forms. In consequence of the new conditions now obtaining in railroad matters as a result of which it is essential to know definitely just what is entering into the property, in both labor and materials, it seems that the development of the best means for the collection and tabulation of information, particularly insofar as the engineering departments of the railways are concerned, is the most important work

### An Important Assignment

663

with which the Committee of Records and Accounts is faced.

## Development of Unified Standards

IN the past the idea has generally prevailed among engineers that one of the chief requisites of any engineer was the ability to design. There is no question as to the importance of such ability, but in living up to what has been the ideal the practical side of their work has been in a degree lost sight of by the designers. In railway work this has led to a multiplicity of designs for similar articles and the placing of an undue burden on the manufacturer who must, in furnishing supplies, make the necessary provision in the equipment of his plant to meet the requirements of the various designs. To the manufacturer this practice results in large sums being tied up in equipment which is idle for long periods of time with consequent increased costs of production. The railroads in purchasing supplies, are required to absorb these increased costs in the purchase prices. From any angle the practice is wasteful. While new designs are, of course, encouraged by the American Railway Engineering Association, it goes further. It furnishes the means for unifying design while yet allowing for modifications that constitute real improvements. The development of these unified designs is important both to the railways and the manufacturers and the Association should have the best co-operation of both in their development.

## A Service for the Young Man

ONE OF THE DISTINCTIVE signs of the times is the increased consideration given by the various associations of professional and technical men to the welfare of the younger men. A large part of this has been directed to what might be termed material considerations—wages, working conditions, etc., subjects which have been of special interest during the last year or more because the advances in compensation accorded to the great mass of labor have necessarily exerted an influence on conditions in the lower ranks of the technical forces on the railroads.

However, there are other phases of this subject than those involving compensation and employment. The leaders in the professions are charged with certain responsibilities to the younger men in matters of technical attainment. In conformity with this thought, some associations have provided for junior memberships in order that the men in subordinate positions may derive certain of the benefits of memberships without need of any reduction in the qualifications for entrance for the corporate member. Thus the organization can perform a real service without detracting in any way from its high standards of personnel.

Are there no opportunities for the American Railway Engineering Association along these lines? Since its activities are limited to those of a technical association, it must be generally conceded that the matters of material welfare are rather outside of its province, although the development of studies in the economics of labor might lead eventually to that end. For the present, however, it would seem that the association could be of real help to the younger men from the educational standpoint. The high regard with which the work of the association is held by the outsider is demonstrated by the extended use recently made of the Manual by the federal government. The proceedings and bulletins are also standard works of reference.

This raises the question as to the possibility of providing some form of subordinate, limited qualification, mem-

bership that would enable the men in the ranks to receive the publications. The advantages accruing from this arrangement would be limited by no means to the men themselves, for the railroads would also derive benefits through the wider dissemination of the best practices. Supplemental to the wider use of the publications, it might be feasible to encourage attendance at the meetings, an arrangement that would be of further benefit to the subordinate technical men through the inspiration of contact with the leaders in their chosen branch of railway service.

## A Wise Decision

THE AMERICAN RAILWAY ENGINEERING ASSOCIATION is to be congratulated on the wisdom and ability displayed by its officers during the past year in their negotiations relative to the amalgamation of the leading railway technical societies into one composite organization. As the matter was originally presented by the American Railway Association, an organization of railway executives, it required courage for the officers of the engineering association to stand out for what they thought was best, contrary to the suggestions of their superiors. The spirited discussion at the meeting of the Railway Signal Association on Monday showed the resentment which many members of that association bear to the amalgamation even after that society has consented to the plan. Similar opposition has also been evidenced among some of the members of other organizations involved.

The amalgamated organization has possibilities for constructive work beyond those possessed by any of the individual organizations. At the same time it remains for that association to demonstrate that it will utilize these opportunities. The associations which have been invited to amalgamate have long records of constructive work behind them. The record of the American Railroad Association which fathers the new arrangement is not so favorable. Furthermore, as we have pointed out previously in these columns, the very nature of the amalgamation, including the official character of its management and of its conclusions, will naturally result in a certain loss of freedom in expression and in action which will detract from the value of the work done.

The arrangement which the American Railway Engineering Association suggested last spring and which it has been able to effect with the American Railroad Association, whereby harmony of action is assured while the engineering association retains its individual identity and initiative has much to commend it. After all, the value of association work is measured by the work of its individual members and this is promoted in a large measure by professional pride and interest rather than from direct assignment as a routine duty. The result of the two-fold experiment which is now being inaugurated—complete amalgamation in some instances and co-ordination and co-operation in the engineering section—will be watched with much interest.

## Record-Breaking Attendance at Coliseum

The attendance at the National Railway Appliances exhibit yesterday broke all records for a single day's gathering at this exhibit. Over 6,000 railway men visited the display yesterday as compared with approximately 4,900 on the same day one year ago. Among the visitors yesterday were a number of foreign railway representatives, including men from Japan, France and Dutch East Indies. This large attendance was recorded in spite of an unusually large attendance at the convention.

## Mr. Hooley on Engineers

*With apologies to Dunne (F. P.) and Dunn (S. O.)*

"D'ye mind me tillin' ye, Dinnissey, 'twas some years ago, about th' engineers that has a convintion ivery year at th' Congress Hotel?" asked Mr. Hooley last evening when Dinnissey, as usual, came into his place to see if there was anyone standing around who was likely to loosen.

"I mind ye sid somet'ing about th' min that run th' thrains, 'nd that as they were gittin' more pay thin anny other relrod imployay they was goin' t' try to get more pay thin th' orfcers av the road. D'ye mean that time?" inquired Dinnissey, with only a mild show of interest.

"Ye're incapacity f'r takin' in th' manin' av me remarks putts ye in one class by ye'rself," rejoined Mr. Hooley. "Ye'r thinkin' about th' min what drives th' injines, 'nd I'm talkin' about th' min that build th' thracks what th' injines runs on.

"I told ye thin that whin I'm talkin' about th' injineers that's holdin' a convintion at th' Congress, I'm manin' th' min that me old frind Jerry Sullivan called th' aljaybray min. Thim's th' wans that figure out on paper what th' min what do th' work's got to do. They lay out th' thracks, 'nd th' stations, 'nd th' switches, 'nd th' side thracks, 'nd th' bridges, 'nd kape watch av thim t' say that they're fit f'r t' run thrains over."

"I had a frind wance, I mind me now, what they called a siction boss, 'nd another what walked th' thracks by night," interrupted Mr. Dinnissey, brightening up as he thought he had caught his friend's meaning.

"O, Dinnissey, Dinnissey, wull ye niver learn anything afther arl me indeavors t' insthruet ye? I towld ye, 'twas tin years ago, in reference t' these same min how they laid out th' thracks 'nd built th' tunnels, 'nd I made ye an illustration av a tunnel through th' Rocky Mountains where f'r that th' injineer'd miscalculated, th' tunnel—th' hole through th' mountain—was made too long 'nd sthuck out av th' mountain at both inds. Th' injineer av that road covered up his mistake by buildin' snowshids over th' ind av th' hole where it sthuck out. T' make mistakes 's human, Dinnissey, but t' know how t' kiver 'em up reqnires spicial talent 'nd take-a-nickel ijication.

"Th' injineers 's arl ijicated min, Dinnissey, 'nd ye c'n say they're human by th' number av thim that's bin in th' militry service these last years. They're human 'nd they're ijicated, 'nd what's more, they're pathriotic. The prisident av this association what's holdin' th' convintion 's bin in th' service av his counthry directin' th' operation av th' relrods av th' counthry, 'nd he's made good at it, too. He's bin in charge av th' maintenance av the relrods 'nd th' injineering av arl av thim. 'Nd th' rigimints that wint t' France f'r t' build th' roads there. Thim was brave min, Dinnissey, 'nd was arlways a little ahid av th' front line."

"But what's arl this got to do wit' th' convintion that's on at th' Congress?" inquired Dinnissey, yawning.

"I don't know," answered Mr. Hooley.

"But 'tis these same min that's got together t' sthudy th' problims of thrack, 'nd roadway, 'nd bridges, 'nd th' like av that. I towld ye they was human, 'nd they make mistakes, 'nd they're arl th' time correctin' th' mistakes that's bin made by thim that's gone before, rist their sows, whither they're did or not. Whin they get together, as now in a convintion, wan man tills av th' mistakes another man has made, 'nd it serves 's a warnin' t' that man t' ijicate himsilf some more so as t' learn to civer thim up, 'nd t' th' others not t' make th' same."

"Cud ye till me av some av th' other misthakes that's

bin made besides th' tunnel that sthicks out bot' sides av th' mountain?" asked Dinnissey with interest.

"I cud, but I won't," answered Mr. Hooley, as he proceeded to close up the place.

## Today's Program

The program for today will include the presentation of the following reports:

- Wood Preservation
- Yards and Terminals
- Electricity
- Ties
- Stresses in Railroad Track (Special)
- Buildings
- Ballast
- Roadway
- Rail

The annual dinner is scheduled in the Gold room of the Congress Hotel at 6:30 o'clock.

## Prominent Speakers at Dinner Tonight

The annual dinner of the American Railway Engineering Association will be held in the Gold Room of the Congress Hotel tonight. The speakers will include Senator Atlee Pomerene of Ohio, Dr. George Adam, Judge Clarence N. Goodwin and Robert J. Cary.

Senator Pomerene is a member of the Senate Committee on Interstate Commerce which has conducted the recent hearings on the railroad situation. He is a close student of the railroad problem and will speak on "Some Phases of the Railroad Question." Dr. Adam is pastor of the Emmanuel Congregational Church, Montreal, Quebec, and will speak on "Language and Ideals." Mr. Goodwin was formerly a judge in Chicago and has made a close study of the immigrant and naturalization problems. His subject will be "Americanization in Connection With Maintenance of Way Labor on Railroads." Mr. Cary is general counsel of the New York Central Lines at Chicago and will take for his topic "Noblesse Obligee—Our New Nationalism."

Tickets for the dinner were placed on sale in the corridor outside the convention hall yesterday noon and the rapidity with which they were taken indicated an unusually large attendance.

## Wood Preservers Meet

The executive committee of the American Wood Preservers Association, which spent all day Monday in conference at the Hotel Sherman, will reconvene at noon today to conclude the business before it. The principal topic for consideration will be the change of the location and the date for the next convention, which is now scheduled to be held in Chicago the fourth week of January, 1920. Owing to the fact that the Automobile Show will be held in Chicago during the same week, difficulty is being found in arranging for satisfactory hotel accommodations.

## F. J. Lepreau Resigns

Frank J. Lepreau, vice-president and general sales manager of the Primary Battery Division of Thomas A. Edison, Inc., has resigned, effective April 1. Mr. Lepreau has been connected with Thomas A. Edison, Inc., since 1909, and with the Batteries Supply Company, now a part of the Edison company, since 1905. Prior to that time he was associated with the Western Electric Company and the Stromberg-Carlson Manufacturing Company.

*The American Railway Engineering Association Convention in Session*

# American Railway Engineering Association Proceedings

Report of Tuesday's Sessions, Including President's Address and  
Abstracts of Several Committee Reports and Discussions

**T**HE TWENTIETH ANNUAL convention of the A. R. E. A. was called to order in the Florentine Room of the Congress Hotel, at 10 o'clock yesterday morning by the president, Charles A. Morse, assistant director, Division of Operation, Engineering and Maintenance of the United States Railroad Administration. An unusually large number of men were present at the opening ses-

sion and many members and guests registered during the day. As the minutes of last year's meeting had been printed and distributed, their reading was dispensed with and the convention passed immediately to the president's address. Following this the reports of the secretary and treasurer were presented, after which the Association began the consideration of the reports of committees.

## Address of President Charles A. Morse

This is the twentieth annual convention of this Association, and if we look back over the period covered by the life of the Association, and see the changes that have taken place in the physical character of the railroads of the country, we recognize that this covers a period of general reconstruction of our railroads and of maintenance methods and requirements. This has been caused by the effort upon the part of the railroads to satisfy the demands of the public for better passenger service, more prompt freight service, better station facilities and, coupled with this, greater safety to the traveling public, and to employees.

In this reconstruction the American Railway Engineering Association has played an active part. Its organization, covering as it does the whole American continent, has been able to bring together men of a great variety of experience and to put out recommendations from time to time for the guidance of those having this work to do, based upon this experience.

That its efforts have met with success is shown by the fact that its manual of recommended practice is to-day the ready reference book of all railroad engineers and maintenance officers, and during the late war was so recognized by the government, which ordered over 2,800 copies for the use of its railroad and engineer officers.

The Association now has about 1,400 active members, about 1,000 of whom are in the employ of railroads, the balance comprising ex-railroad officers, professors of engineering, consulting engineers, and engineers employed by companies manufacturing or handling railroad supplies.

We have, up to this time, only attempted to give recommended practice. If we could through some means insure the carrying out of these practices great results would be secured. The arrangement by which this Association is to work in closer connection with the American Railroad Association should assist in securing more uniform practice by the railroads which are members of that Association. It would be a great step forward if that Association would establish standards that would be compulsory instead of recommendatory.

We have only started on the work that should be done by the American Railway Engineering Association. We have the big end of it ahead of us. We are to have a report from the Track committee at this convention, giving recommendations for standard frogs and switches, which report has been approved by a committee of manufacturers. In other words, the engineer and the manufacturer have gotten together and agreed upon a plan that combines the manufacturer's point of view and that

of the user. I hope this will lead to a more extended practice of bringing the manufacturer into the conference, for it must mean greater economy in the manufacture of the articles. We, as engineers, have been too prone to make plans without reference to shop practice, the result being unnecessary cost, with nothing to show for it.

It is to be regretted that many of the larger railroads do not follow all of the recommendations of this Association, notwithstanding the fact that the engineers of these roads have taken an active part in perfecting such recommended practices. A campaign should be started to see if we cannot get our recommendations adopted by all of the railroads, and especially by those whose engineers are members of the Association.

The chief engineer, as a rule, recommends the standards for maintenance of roadway and structures, and if we can get them interested in A. R. E. A. standards it will be an easy matter to have them adopted.

In the matter of forms for reports and records in connection with maintenance of way and structures, there is at present no uniformity of practice among the different railroads. Our committee on Records and Accounts has prepared certain forms for recording maintenance of way information, some are used by some railroads, but I doubt if they are all used on any railroad. I have had occasion during the past six months to try and secure various maintenance of way information from the railroads, and have been surprised at the lack of such information in shape to be furnished readily by the majority of the roads. Upon looking into the matter I have found that the rules of accounting as issued by the Interstate Commerce Commission were prepared from an accountant's point of view, and they evidently consulted no one familiar with maintenance of way matters, the result being that they stop in their instructions before they get down to enough detail to insure such uniformity as will give a proper comparison between different railroads of the various items that would be of great value in analyzing maintenance expenditures. A study of this matter should be made by our committee and forms and instructions compiled that will give such information. Much has been printed regarding details of cost of maintenance of equipment, and costs are fairly well known for certain items; but when we get below the cost per mile for maintenance of way we find nothing, and when we see the variation in accounting details we realize that the figures given out of cost of maintenance per mile are absolutely valueless for comparison as between railroads. With the maintenance of way and structures costing from 14 per cent to 20 per cent of the total cost of operation, there should be such records kept as will permit of greater study of detailed costs.

Of the information now called for by the Interstate Commerce Commission, little or no use is made, it is not even tabulated, and if one wants to use any of it, he has to go to the individual railroad reports filed in their office and dig it out, one railroad at a time. There should be some one in the employ of the commission to handle this information, who knows something about maintenance matters, and who could say what information

should be secured and who could properly analyze the information and tabulate it for the use of the railroads.

Our committee is best qualified to handle this matter properly, and when it has reached its conclusions we should ask the Interstate Commerce Commission to add to its instructions, so as to give the results that the committee on Records and Accounts decide desirable.

With the increase in the cost of labor there must be an awakening on the subject of maintenance methods. There should be a carefully worked out maintenance program prepared by every railroad, and followed, instead of the haphazard manner in which it is handled at this time.

There are many things in the way of talk of uniformity in practices of railroads that should be corrected, and one of these is the rail section. The subject of a properly designed rail section has been a live one for 30 years, it having been the subject of a study and report of a committee of the American Society of Civil Engineers, later of a committee of the American Railroad Association, and it has been a subject of special study by the Rail committee of this Association for the past ten years.

Recommendations were made to, and approved by, the American Railway Association about two years ago for but seven sections between the weights of 70 lb. and 130 lb. per yard, and yet there are being ordered and rolled to-day about 50 different sections of rail between these weights and there are 12 different sections of 100-lb. rail being rolled.

There is another practice that is, if anything, more absurd and unnecessary than the variety in rail sections; that is the variation in drilling of rail. We should all make an effort to get the drilling recommended by this Association adopted by the railroad with which we are connected. The Rail committee has been investigating the vertical location this year. The spacing longitudinally was recommended several years ago. Variation in drilling of rails also affects the joints, making it necessary to have joints drilled differently for each railroad's needs and thus requiring them to be made to order. With standard rail sections and uniform drilling, joints

could be carried in stock by the manufacturer and supplied as required, thus permitting them to be manufactured in bulk at odd times the same as other standard shapes.

The events of the past four years have brought about another change that will be far-reaching and will affect the engineer and his work. The gathering together of nearly four million soldiers from all stations in life, and the fact that, when these men were put in uniform and trained for soldiers, it was not a question of education, family connections or financial conditions that counted, but the *man*, and when it was shown that there were equally good men measured by courage and manliness developed from one class as another, it opened the eyes of all to the fact that, measured by the standard of red blood and physical ability, class disappeared, with the result that they will all return with greater respect for mankind.

The very fact that, when clothed, housed and fed alike, they produced the same results is proof that if paid fair

C. A. Morse  
President of the A. R. E. A.

wages, furnished with proper living quarters and surroundings, including good food, properly cooked and served, they will be equally good citizens. Environment is what gives a man or takes from him his self-respect. When he loses his self respect he loses his ambition, and with that gone he becomes only a machine.

President Betty of the Canadian Pacific, in a talk to a class of student apprentices, recently stated that a man from his head down was worth \$2.50 per day, and whatever more he was worth depended upon what he had in his head. Self-respect is one of the things that is located in a man's head and makes him ambitious and takes him out of the mere machine class. Many of these men are handicapped by not being able to read the English language and having little or no education in any language. There is a popular movement under way to arrange night schools for these men, whereby they may improve themselves. It is felt that if they can be provided comfortable quarters, where they can keep clean and have a place to read or amuse themselves after work, that many will gladly take the opportunity if offered them.

This is a part of what is known as the Americanization scheme, and as so large a proportion of the floating labor element is employed on public works, and as to-day the engineer is the one who plans all of the large industrial plants, this problem of Americanization of foreign laborers is being checked up to the engineers.

We have made some advances during the past two or three years toward improving this situation on the railroads. We must go at it on a much larger scale, not from a humanitarian point of view only, but from a business point of view. The high wage has come to stay, and it should be the aim of every one to try and give as much for the high wage as can be given. Whatever is given cheerfully is, as a rule, a benefit to the giver rather than an injury. What we must try to do is to improve the surroundings, the frame of mind and the physical condition of the worker, so that he gives in increased efficiency, because he wants to do so and because he is interested in the work he is doing.

## Reports of the Secretary and Treasurer

The following report on the general affairs of the Association for the past year is respectfully submitted:

Number of members last annual report.....	1,387
Admitted during the year.....	97
Deceased.....	13
Withdrawals.....	22
—	35
	62

Total membership.....	1,449
Members in military service.....	137

By reference to the financial statement it will be noted that the total receipts during the calendar year ending December 31, 1918, were \$37,540.88; disbursements, \$31,176.17; excess of receipts over disbursements, \$6,364.71. The dues of members in military service were remitted by the Board of Direction to the amount of \$1,739. The association has participated in the various war loans to the extent of \$12,000—\$11,000 being invested in United States Liberty Loans and \$1,000 in the Canadian Victory Loan.

The usual number of bulletins and the annual volume of the proceedings were issued during the year. The demand for the various publications of the association shows a gratifying increase. It is especially gratifying to record that the war department of the United States Government during the year purchased 2,818 copies of the Manual of the Association for the use of the United

States Army. A liberal discount was given the government on this large order.

## Financial Statement for Calendar Year Ending December 31, 1918

**Report on Records and Accounts**

The committee reports progress on the subject of Cost-Keeping Methods and Statistical Records. During the year the committee has received from the Bureau of Railway Economics and leading publishing houses information on the subject of cost-keeping methods as applying to railroads. In reply to a circular letter, sent to the different railroads on this subject, 35 answers were received, of which one-third were accompanied with information in the nature of blank forms used in accounting records; another third indicated interest in the subject, and the remaining third stated their records were kept in accordance with the I. C. C. classification.

In view of the changes taking place in the railroad situation during the past year—and we are still in the midst of this transition period—the committee suggests that this and all other subjects except that on the use of small cardboard or other suitable material for field men be re-assigned to it for the coming year.

Committee: W. A. Christian (I. C. C.), chairman; M. C. Byers (W. M.), vice-chairman; F. L. Beal (L. & A.), Lester Bernstein (B. & O.), H. Bortin (Cons. Eng.), J. W. Fox (C. of Ga.), B. B. Harris, R. C. Sattley (C. R. I. & P.), H. M. Stout (N. P.), G. D. Hill (N. Y. C.), G. T. Kuntz (U. P.), Henry Lehn (N. Y. C.), J. H. Milburn (B. & O.), J. C. Patterson (Erie), Huntington Smith (N. Y. C. & St. L.), W. D. Wiggins (Pa. Lines).

**Discussion**

Mr. Christian (Chairman): It will not be worth while for me to read all of these, because I wish to submit this report as one of progress only. I move that this be accepted as a report of progress only.

J. L. Campbell (E. P. S. W.): Before that motion is put, perhaps it would be proper to say just at this time, particularly within the last year, some new questions have arisen in connection with this matter of accounting, brought about primarily by the relations that exist between the railways and the government. In the agreement by which the government took over the railways there was a provision that the roads should be returned in as good condition as they were received. It developed immediately that the relative conditions of the roads in the two periods could not very well be measured in terms

of dollars and cents on account of the great change in the unit prices for labor and material. It may be well for this committee to consider some form of reporting units of material and units of labor going into the property. They will always be exact measures of what is being done with the property, as far as the record covering these two points is concerned.

R. C. Sattley (C. R. I. & P.): There are a good many railroads that are trying to get out of furnishing this to the Interstate Commerce Commission.

W. H. Courtenay (L. & N.): As to keeping a record of ballast, I took occasion some twenty years ago to ascertain how much ballast there was on a line of railroad completed in 1868. The L. & N. had kept very good accounts, that were instituted originally by the late Albert Fink, showing the quantities of materials used and the various expenditures. By merely ascertaining the amount of ballast purchased for this operating division I ascertained it was sufficient to provide a four-foot depth of ballast under the ties for the whole length of the division. I had known that division since 1879, and to my certain knowledge there had never been at any time sufficient ballast put under the ties.

It is impossible to tell how much effective ballast you have at any one time on railroads such as ours. Ballast is lost—it becomes dissipated—and to maintain a division properly you must have it ballasted every year, and every time the track is resurfaced a certain amount of ballasting is required.

It is impossible for the railroads to give you the complete details about the ballast. It cannot be done. I say that with a good deal of emphasis, because I know. In the first place, if you have all these reports, you have to rely on them, primarily, on the unfortunate section foreman, who must act as the original bookkeeper. I hope this matter of getting detail statistics, particularly with a view to determining whether the U. S. R. A. maintains the track as well as the corporation did in the three test years ending June 30, 1917, can be reached in some practicable way. There can be a great deal said on that subject.

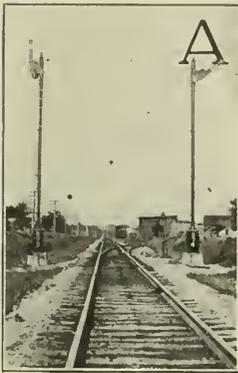

The President: I have been through about the same thing. As you were telling about the four feet of ballast I was wondering how many inches of leather we would have on our shoes if we added all that we had worn out in our lifetimes. This ballast is worn out, and, according to my notion we have to decide on a certain depth of standard ballast—the Pennsylvania Lines have decided on 24 in. This you may say is an arbitrary proposition, and no one has any right to do that, but there are many arbitrary things which are necessary, and if you are going to get comparisons you must have some arbitrary rules, and have the comparisons conform to these rules, instead of having 50 or 100 different standards of comparison. My thought is that you must get figures in some certain way in order to make comparisons. In regard to Mr. Sattley's remarks, I have received profiles for 230,000 miles of road, and I found it

would take me 230,000 years to go over that and dig out the information.

R. H. Ford (C. R. I. & P.): I think the greatest benefit of the work of this association would accrue to this country if we could get rid of a lot of records and accounts now being prepared by our maintenance people. I have been impressed with the tremendous number of useless accounts that are being promulgated. It seems to me if the committee would devote its attention to a simplification of accounts and records that seem to have been gradually accumulating on railroads for many years they could do more real benefit than specifying some particular form of accounting or what some particular item of accounting means.

(The motion made by the chairman of the committee was then put to vote and carried and the committee dismissed with thanks.)

## Report on Signals and Interlocking

REPORT was submitted by the committee on the following subjects:

2. The problem of signaling railroads with reference to the effect of signaling and the proper location of passing sidings on the capacity of the line.

3. The specifications adopted by the Railway Signal Association which warrant endorsement, conferring with Committees 5, 6, 15, or other appropriate committees, on appliances affecting track or structures.

4. The desirability of providing in connection with an automatic signal system: (a) An overlap. (b) Approach restricting speed indications.

5. The various types of light signals for day and night indications.

8. Automatic train control.

Progress reports were submitted on other subjects which had been assigned the committee.

Under item (2) the committee submitted its report in three parts. In the report of 1917 it stated that "our work on this subject will be in applying and testing formulas and methods on pieces of road with actual movements of trains."

In accordance with the above statement the committee submitted a report on a single track railroad (published on page 598 of March 19, 1918, issue of the *Railway Age*). Further work was done in the development of a method of analysis of two or more track railroads, and this method was tested on a piece of railroad (see March 17, 1919, issue of the *Railway Age*). Recommendations of the committee are given under the heading of conclusions.

Under item (3) the committee submitted a list of matters acted upon at the Railway Signal Association convention in 1918 and adopted by letter-ballot. Recommendations on this subject are given under the heading of conclusions.

Under item (4) the committee reported as follows:

(a) Overlaps are not desirable for following movements, as adequate advance information can be provided in the signal system.

(b) Overlaps are necessary for opposing movements where adequate advance information cannot otherwise be provided.

The action recommended will be found under the heading of conclusions.

In Appendix C the committee submitted a report on item (5) and recommendations on this subject are given under the heading of conclusions.

Item (8) on automatic train control is covered in Appendix D, while recommendations are given under the heading of conclusions.

### Conclusions

The committee recommended that the report on subject 2 be accepted as information.

That the list of Railway Signal Association specifications and standards submitted by this committee in its report in 1918 be published in the Manual as supplementary to the list heretofore inserted for the information of the members. Also that the submitted list of Railway Signal Association specifications and standards published in Appendix B be published in the Manual as supplementary to the list heretofore submitted or inserted for information of the members.

That the report on subject 4 be adopted and published in the Manual.

That the report on subject 5 submitted in Appendix C be accepted as information.

That the report on subject 8 given in Appendix D be accepted as information.

Committee: J. A. Peabody (C. & N. W.), chairman; W. J. Eck (Sou.), vice-chairman; Azel Ames, C. C. Anthony, H. E. Astley (N. Y. N. H. & H.), H. S. Balliet (N. Y. C.), A. M. Burt (N. P.), C. A. Christofferson (N. P.), C. E. Denney (N. Y. C. & St. L.), F. L. Dodgson, C. A. Dunham (G. N.), W. H. Elliott (N. Y. C.), G. E. Ellis (I. C. C.), Paul Jones (Penna. Lines), J. R. Leighty (M. P.), J. G. M. Leisenring (I. T. S.), H. K. Lowry (C. R. I. & P.), J. C. Mock (M. C.), F. P. Patentall (B. & O.), A. H. Rudd (P. R. R.), C. L. Rupert (C. R. I. & P.), Mott Sawyer (C. M. & St. P.), W. B. Scott (S. P.), A. G. Shaver (Cons. Engr.), Thos. S. Stevens (A. T. & S. F.), W. M. Vandersluis (I. C.), B. Wheelwright (G. T.), R. E. Woodruff (Eric).

### Appendix C—Light Signals for Day Indications

For the purpose of this report, the following definitions apply:

1. Position light signal: A signal on which the various indications are given by positions of white lights.

2. Color light signal: A signal on which indications are given by colored lights only.

3. Position color light signals: Signals on which the indications are given by the position and color of lights.

The report covered color-light and position-light signals for day and night use.

Three types of light signals have been designed to meet the requirements of railroads and traction lines satisfactorily and economically.

(1) A long-range signal for high speed traffic. This requires a concentrated light source, very efficient lenses and considerable care in installation and alignment.

(2) The majority of traction lines and interurban railways can use a light-signal of medium range, relatively inexpensive construction and having considerable spread to projected beam.

(3) There is another class of signaling where very short ranges are required, and where medium size and expense is the deciding factor.

In referring to these signals they were designated as long-range, medium-range, and short-range.

In broad daylight, under unfavorable sun and background conditions, there are two alternatives open for the light source for long-range signals. Either a very high wattage lamp must be used, or a lower wattage with a concentrated and accurately located filament. The long-range signal has a very small beam spread, on account of the concentrated filament employed. Consequently, these signals have been designed to facilitate accurate alignment by providing separate horizontal and vertical adjustments.

### Colored Light Signals

For long-range signals it has been found advisable, in order to increase efficiency and reduce the size of signals, to employ a double lens, by which means a large angle of the spherical candlepower of the lamp is intercepted. The outer lens used at present varies from 8 $\frac{3}{4}$  in. to 10 in. For medium-range signals the double lens is still employed to secure high efficiency, but standard lamps are used. The construction is relatively simple, as no accurate location of filament has to be provided. For short-range signals, to reduce cost, the double lens is omitted and a small lens, usually 5 $\frac{3}{8}$  in. in diameter, has been substituted. In practice a 40-watt lamp with filaments of different resistance, so that one will burn out before the other, or two 25-watt lamps in multiple, are used. If fixed lights are used, so as to locate the signal if the active light is extinguished, the second lamp might be dispensed with but would be used in the fixed light. In any event, on account of the colors cutting down the range, 35 to 50 watts per light are required.

### Position Light Signals

Only two ranges are provided: Long range, 4,000 to 5,000 ft. for high signals, and short range, 1,000 ft. more or less, for dwarf signals.

As colors are eliminated, the effective range per candlepower at the lamp is greatly increased, but special provisions have to be made for elimination of sun reflection and phantom lights; this is taken care of by special conical cover glasses, arrangement of reflectors and treatment of the inverted toric lenses, and by use and position of the spherical lamp bulb.

The short-range signals are not hooded, but are provided with chiffon screens and frosted cover glasses. These require two 20-watt lamps, burned under voltage, or a maximum of 34 watts per signal. Experiments are now being made with the view of using same type cover glass as the high signals and reducing the wattage per signal to 10.

The high signals are equipped with 5 $\frac{3}{8}$ -in. lenses and cover glasses, and the dwarfs with 4 in.

### Conclusions

(1) Colored and position-light signals, for day and night use, by elimination of all moving parts except the control relays, reduce the number of failures.

(2) Light-signal aspects have greater visibility and range under adverse weather and background conditions than the semaphore, while the close indications compare favorably.

(3) Light signals give uniform indications at all times. Other types of signals give the indication by position in daylight, by color at night, and by both during transition periods. The various aspects of the position-light signal are equal in intensity, range and visibility.

(4) In general practice, the number of aspects of any one arm of a semaphore is limited to three. With the position-light signal, four distinctive positions may be used, while the number of indications given by colored-light signals is limited only by the colors available.

(5) Where power is available, the cost of operating light signals is less than for operating motor signals.

(6) Current consumption under normal automatic signal conditions:

Position-light signals: 45-watt lamps—20 watts.  
One colored light: 35 to 50 watts.

For interlocking signals, consumption is increased depending upon the number of lights displayed, but the ratio holds.

(7) Cost of maintenance of light signals is considerably less than that of motor signals, and, as the colored-light signal has less lights to renew, it has an advantage in this respect over the position-light signal.

(8) The field for the economical use of light signals is limited, as noted above, to points where power is available. In this field the light signals have advantages over other types. The position-light signal can be installed at any location where clearance will permit the present standard semaphore to be erected. The colored-light signal can be used in more restricted clearances.

### Type of Signals

There are two general types of colored light signals:

(a) Indoor or tunnel type; (b) outdoor type.

The indoor type is comparatively simple, as it is used in dark or semi-light locations and only a limited range is required, hence the optical problem involved is easily solved. The outdoor type of colored light signal presents much greater difficulties from the optical standpoint, as it must give a distinctive indication under bright sunlight conditions. This must be discernible at a range of about 3,000 ft. for steam road or high speed interurban electric service. The indoor type of signal units are made up in 2 or 3-lens units to give the aspects required for two-position or three-position signaling. A two-arm signal is obtained by combining two 3-lens units.

There are two classes of outdoor type of signal units: (a) Long-range class—3,000 ft. range; (b) short-range class—1,000 ft. range.

The short-range class uses the same cast-iron case as the indoor or tunnel signal, but has a special lens arrangement known as the doublet lens combination and requires higher wattage lamps than the indoor signal.

The long-range signal has larger doublet lenses than the short-range signal and takes a larger size and larger wattage incandescent lamp.

The short-range class of outdoor colored light signal unit comprises two lenses, one mounted behind and close to the other. This is known as a doublet lens combination. The outer doublet lens receives the light from the inner doublet and refracts it so as to give parallel rays, as the rays of light from the inner doublet lens are not parallel.

In the long range class of outdoor type of colored light signal unit doublet lenses are employed. The outer doublet lens is 8½ in. in diameter and 4 in. focus, and is made of clear glass. The inner doublet lens is 5½ in. in diameter and has a focal length of ½ in. The color is as specified. The outer doublet lens can be furnished of half toric design if increased spread in one direction is required.

In the installation of colored light signals:

(a) Large numbers of indoor and short range outdoor colored light signals have been furnished to the New York Municipal Railways.

(b) Long range outdoor colored light signals have been furnished to the Chicago, Milwaukee & St. Paul for use on its electrified divisions, and to a number of high-speed interurban trolley lines in Indiana. Colored light signals have not been used to any extent on steam roads, being required by trolley lines or electrified steam roads where alternating current power and power transmission lines are usually available.

#### Appendix D. Automatic Train Control

The following data in regard to classification of devices and reports of official tests made by the Block Signal and Train Control Board and by the Bureau of Safety, Interstate Commerce Commission of train control devices, was given as information. The train control devices that have been tested and those that have been developed to the extent that models have been made or patents issued may be divided into the following classes or type:

1. Mechanical trip.
2. Electric contact rail.
3. Insulated track rail.
4. Magnetic inductive.
5. Inductive.
6. Hertzian wave or wireless.

#### Devices Tested

**ROWELL-POTTER SAFETY STOP.**—This included an automatic signal system, with signals operated by power stored by a passing train, and a mechanically operated train stop, tested on the C., B. & Q.

**HARRINGTON TRAIN CONTROL AND ALARM.**—An overhead mechanical trip, and audible cab signal, tested on the Erie.

**LACROIX TRAIN CONTROL SYSTEM.**—An automatic stop and cab signal system of the intermittent contact rail type, tested on the Staten Island Rapid Transit Railway.

**WARTHEN CAB SIGNAL AND TRAIN CONTROL SYSTEM.**—A cab signal and automatic train stop of the intermittent overhead contact type, tested on the B., R. & P.

**RAILWAY AUTOMATIC SAFETY APPLIANCE COMPANY.**—An automatic stop device, of the mechanical trip type, controlled electrically, tested on the P. M.

**JONES SIGNAL SYSTEM.**—An automatic train stop of the mechanical trip type, electrically controlled, tested on the N. Y. C.

**GRAY-THURBER TRAIN CONTROL SYSTEM.**—An automatic train control system using a short section of insulated track and an insulated portion of the train, tested on P., Ft. W. & C.

**AMERICAN TRAIN CONTROL COMPANY.**—An automatic train control system of the intermittent electrical contact type, tested on the Maryland & Pennsylvania.

**GOLLOS RAILWAY SIGNAL COMPANY.**—An automatic train control system of the intermittent electric contact type, tested on the C., B. & Q.

**WOODING TRAIN CONTROL SYSTEM.**—An automatic train control system of the intermittent electric contact type, tested on the D., L. & W.

**AMERICAN TRAIN CONTROL SYSTEM.** This has been installed on the C. & O. on seven miles of its single track main line between Gordonsville and Cobham, Va., and practically all the engines have been equipped that operate over that district. Plans are being made for some extension of the system. This is a ramp or intermittent contact type, and is a development of the Jones System tested by the Interstate Commerce Commission on the Maryland & Pennsylvania.

**SHADLE AUTOMATIC TRAIN CONTROL.**—This is a ramp or intermittent electrical contact type of train control, and was tried on the C., I. & W.

**NATIONAL SAFETY APPLIANCE COMPANY.** This company has made a small installation at Oroville, Calif., on the W. P., and is of the induction type.

**SCHWEYER AUTOMATIC TRAIN CONTROL.**—This system is an induction scheme on rather a different principle from the other schemes of this nature which have been proposed.

#### Discussion

J. A. Peabody (Chairman): It is recommended that this matter be accepted as information. I so move.

(The motion was carried.)

(Mr. Peabody then presented Subject 3.)

Mr. Peabody: You understand that this matter which we are reporting now was submitted to this association a year ago and turned back for further consideration on the part of this association.

C. E. Lindsay (U. S. R. A.): In the interest of the committee on Outline of Work, I want to ask if any conclusions have been arrived at by the Signal Association which would modify the work for next year.

Mr. Peabody: All we submit here has been passed on and approved by letter ballot by the Signal Association. I move that the first half of this matter (as given above under "Conclusions") be approved.

(The motion was carried.)

(Mr. Peabody then read the latter portion of this matter (under "Conclusions") and moved the adoption of that portion of the report.)

A number of members objected to the fact that the plans are not available for examination so that there is not an adequate opportunity to investigate them. Others contended that the lists of drawing numbers with references to the Signal Association Manual were valuable as information and could be of greater use if published in the Manual of the A. R. E. A. than if given only in the Proceedings.

(Mr. Peabody's motion to insert the information in Appendix B in the Manual was carried.)

(Mr. Peabody then read the matter relating to Subject 4 and moved its adoption.)

H. R. Safford (U. S. R. A.): Would it not be better if the second clause of that recommendation could be expanded to contain a little more to indicate the character and conditions under which other types of advance information can be substituted for this condition? It says: "Overlaps are necessary for opposing movements, where adequate advance information cannot otherwise be provided." Is that capable of being a little more definitely specified?

J. C. Mock (M. C.): The conclusion was reached after the consideration of the problem of protecting the train with proper advance information by using a second distant signal for some special cases for double track operation. For the single track operation it is a question whether the traffic will permit of a proper advance information of approach to the home signal. We cannot always move the trains over the road as we should like to do with a single track, and the overlap is quite necessary under those conditions, and about the only place

where we feel an overlap would be justified as against approach information. The committee does not advocate the overlap. As you will understand from our conclusion, the overlap as we regard it is the distance between home signals, plus the allowance beyond the second home signal for the stopping of a train under unusual conditions where the engineer cannot see far enough ahead of him in the same direction to stop the train. In single track that would be merely the distance between two opposing home signals—it is an overrun, really, beyond the stop signal.

W. C. Cushing (P. L. W.): Is not the distant signal indication or advance signal indication sufficient for that purpose?

Mr. Mock: We think so, and ordinarily the overlap is used in single track and formerly was used very extensively in double track signaling as a matter of extension, but it is regarded as poor practice to give only home signals—a home signal means stop, and it is realized that the home signal locations were so arranged that it is physically impossible for the trains to stop on that indication. Then they permit the train to overrun and protect them from the rear home signal by the overlap, which is simply the extension beyond the usual distance between two home signals which enables the train to hold the second home signal behind the engineer for a certain distance into the next block.

Mr. Cushing: I believe a stop signal, for the proper enforcing of discipline, should be used as such. A clause like this should not be put into our Manual without very careful consideration.

(This matter seemed to result in considerable confu-

sion of ideas, so Mr. Mock and A. G. Shaver (con. engr.) gave detailed explanations, using objects on the table to represent the trains, signals, etc. However, further difference of opinion developed and on a motion by Mr. Safford the subject was referred back to the committee.)

Mr. Peabody: Section 5, "Report on the Various Types of Light Signals for day and night indications." The report on this subject is submitted in Appendix C, and we move that this be accepted as information.

(The motion was carried.)

Mr. Peabody: "Report on automatic train control." I move that this be accepted as information.

(Motion carried.)

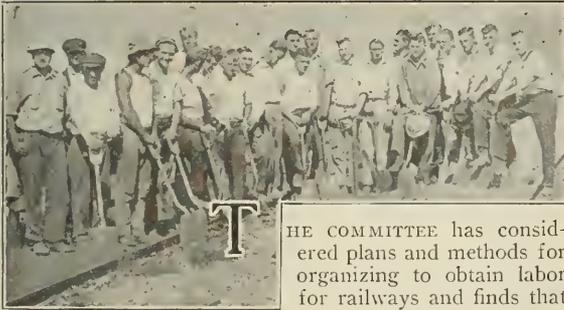

Mr. Lindsay: I think it would be in order for the chairman of the Block Signal and Train Control Board to make a statement as to the organization of that board, which has occurred since our last convention. The last train control board was in existence several years ago, and has been revived by the action of the United States Railroad Administration. That fact is not recorded in our proceedings.

The President: It seems to me that it is up to the committee to find out and report the fact that there is one in existence. It has just started to do some work, and that is all that could be said for it. It has simply been appointed and organized, and is starting into work along the line of proving, if possible, the practicability of automatic train control. Probably the Signal committee will be very busy before another year.

Mr. Peabody: On the other subjects the committee reports progress.

(The committee was discharged with thanks.)

## Report on Economics of Railway Labor

**T**HE COMMITTEE has considered plans and methods for organizing to obtain labor for railways and finds that under present circum-

stances it seems advisable to continue investigation before presenting any set plan of organization for your consideration. The committee reports progress on this subject.

The committee presents in Appendix "A" its report on the methods of equating track sections now in use.

The committee presented in Appendix "B" tentative outline plans for boarding cars and boarding houses for railway laborers, with a view to criticism before taking up detail drawings.

The committee presents in Appendix "C" a study of the problems of establishing proper relations between units of track expenditure and units per mile of line, for different classes of road for the purpose of determining a normal maintenance expense and to obtain, as far as possible, uniform conditions involving (a) separation of expenses as between road, signal and bridge and building departments; (b) the determination of the ratio of the labor cost to total cost as a progress report.

The committee presented in Appendix "D" a list of 60

labor-saving devices with short descriptions of these machines and their purposes.

### Conclusions

The committee recommends:

That the report on methods of equating track sections be accepted as information and printed in the Proceedings.

That the report on methods of equating track sections be accepted as information and printed in the Proceedings.

That the report on typical plans for boarding cars and boarding houses for railway laborers be received as a progress report. (To be considered further at the next convention.)

That the study of relations of units of track expenditure to units of mile of line with view of determining a normal maintenance expense and to obtain, as far as possible, uniform conditions involving (a) separation of expenses as between road, signal and bridge and building departments; (b) the determination of the ratio of labor cost to total cost, be received as a progress report.

Committee: E. R. Lewis (D. S. S. & A.), chairman; C. H. Stein (E. R. R. of N. J.), vice-chairman; W. J. Backes (N. Y., N. H. & H.), R. A. Baldwin (C. N.), J. Q. Barlow (Cons. Engr.), A. F. Blaess (I. C.), W. M. Camp, W. R. Dawson (N. & W.), R. C. Falconer (Erie), R. H. Ford (C. R. I. & P.), W. R. Hillary (Pa. Lines), C. B. Hoyt (N. Y. C. & St. L.), W. H. Hoyt (D. M. & N.), E. D. Jackson, C. M. James (A. C. L.), C. E. Johnston (K. C. S.), A. C. Mackenzie (C. P. R.), John C. Nelson, C. A. Paquette (C., C. C. & St. L.), J. W. Pfau (N. Y. C.), H. R. Safford (U. S. R. R. A.), Lieut.-Col. H. J. Shifer.

### Appendix A—Equating Track Sections

Labor constitutes the largest single item of maintenance of way expense; in fact, it is larger than all other

expenditures combined, aggregating approximately 56 per cent of all charges of this department. From its nature it is the expenditure in which there is the greatest opportunity for the display of economy and likewise the greatest danger of waste and efficiency. It would, therefore, naturally be expected that the distribution of this expenditure, aggregating over one-half million dollars a day, would be surrounded with elaborate safeguards to insure the greatest return. Yet investigation shows that the reverse is true. As a result, the allotments are commonly made on an arbitrary basis of so many men per section, with only very general consideration of the relative amounts of work to be done.

In the discussion of labor distribution the gang is the unit in the maintenance of way organization. As the larger part of the employees in this department are engaged in track maintenance and are employed in section gangs, the committee has confined its discussion to this class of work, although the general principles apply equally to other maintenance work.

In general, section limits have been established by giving each gang an equal mileage of main line with whatever auxiliary tracks come between these limits. The gangs are then allowed an equal number of men. The result is that some gangs have much more work to perform than others because of unequal mileages of sidetracks and special local conditions. With an unequal distribution of the work, it is evident that the greatest return is not being secured from the total expenditure and loss occurs.

The importance of equating sections on a more equitable basis has been recognized for years and some study has been given to its solution. As a result, certain more or less arbitrary ratios have been established on a few roads, and while perhaps crude and inaccurate, are a step in advance of the common practice.

Thus, on the New York Central two miles of sidetracks, or 15 switches, are considered equivalent to one mile of main track. Allowance is also made for special local conditions, such as soft subgrade, high rock cuts, excessive curvature, character of traffic, etc. An ordinary section is given about six equated miles of main track.

On the Southern Pacific two miles of branch lines, or four miles of sidings, are considered equivalent to one mile of main line. Sixteen switches are also considered equivalent to one mile of track of the kind in which the switches are placed. Consideration is also given to the nature of the rail, ballast, curvature, density of traffic, etc.

On the Cleveland, Cincinnati, Chicago & St. Louis track sections have been equated where the line has been double-tracked, the length of such sections being made equivalent to six miles of single track on the following basis: Second track, 85 per cent of main track; passing track, 50 per cent of main track; yard tracks in heavy terminal yards, 50 per cent; other sidetracks, 30 per cent; turnouts, each equivalent to 300 ft. of main track.

On the New York, New Haven & Hartford a mile of main track has been taken as a unit. Two miles of sidetrack, or 15 switches, are considered equivalent to one mile of main track. The various lines of this road have been classified between main line, secondary main line, and branches, partially on the basis of the tonnage passing over them and in part on the importance of the lines from a passenger standpoint where the tonnage alone is not sufficiently heavy to bring them into what is considered the proper class. Different allowances of men per equated track mile are made on the lines of these different classes, consideration being given to the fact that on divisions of two and four tracks the shorter distance sectionmen have to go compensating them slightly for the heavier traffic.

An equation was worked out on one division of the Michigan Central about five years ago, covering 300 miles of single main track and 500 miles of branch tracks and sidings. As the result of a 12 months' study of the actual distribution of work on this division, the following relations were established, one mile of single main track being considered as the unit:

	Per Ct.
One mile of single main track, Class "B".....	100
One mile of single branch track .....	65
One mile of passing track .....	46
One mile of yard track .....	32.4
One mile of industrial track.....	24
One main track turnout .....	3.4
One side track turnout .....	1.4
One railroad crossing (one track crossing only).....	3.1
One highway crossing (highway over one track).....	2.0
One mile of fence (one side) .....	2.7
One mile of right-of-way (100 ft. wide).....	4.2
One farm crossing (over one track only).....	0.4

On the Toledo division of the Pennsylvania Lines west of Pittsburgh, consisting almost entirely of single track, with only a small amount of second track, one mile of main track is considered equivalent to three miles of sidetracks, four miles of yard tracks, 25 main line turnouts, 40 turnouts in side and yard tracks, 25 railroad crossings, 40 public highway crossings and 60 private crossings.

The Baltimore & Ohio has given careful attention to the subject of equating track sections in connection with the development of its standard track work system, as the determination of standard performances is essential to the computation and payment of bonuses. The details of this system, including the determination of units of track work, were described in a monograph by Earl Stimson, published in the proceedings of this association for 1916.

The Grand Trunk has given careful consideration to this problem. Based upon its extended studies, the following basis has been approved for equating track forces:

2 miles of passing track .....	=	1 mile of main track
2½ miles all other sidings.....	=	" " " "
15 switches .....	=	" " " "
24 single derrails connected with tower or switch stand .....	=	" " " "
12 single track railway crossings.....	=	" " " "
15 single highway crossings (public roads) .....	=	" " " "
10 single highway crossings (city streets) .....	=	" " " "

#### Appendix B—Typical Plans for Housing Labor

The committee prepared and presented for consideration a number of tentative typical plans for housing maintenance of way labor, including bunk houses, camp cars, knockdown camps and permanent camps.

The camp car outfits are for gangs moving frequently. The question of ceiling or lining the cars will depend upon the class of labor and the locality, but the committee feels that the prevailing idea should be to make the quarters for the men comfortable and as attractive as consistent.

The knockdown portable camps are intended for use at points where large gangs will be required for a year or two, after which time they may be moved to other points. These camps may be provided with electric lights and sanitary sewage facilities where available. These features will, however, depend on the advantages and ordinances of the particular locality. In general this construction consists of building sections bolted together.

The bunk house plans do not show lockers. These can be provided, however, as shown in the plan for a permanent camp. The floors of these buildings, as well as the permanent camps, are placed about two feet above the ground for ventilation, and it is suggested that during

the winter months, if necessary, the opening be banked up with earth in order to make the building warmer.

#### Appendix C—Relations Between the Unit of Track Expenditure and the Unit Per Mile of Line

The necessity for a study of this kind is increasing rapidly, because standards of maintenance are constantly being more closely scrutinized and made the subject of discussion, and in the development of the entire railway problem this is getting to be a more and more important feature.

One of the roads represented on the committee has attempted a study of this subject as related to its own zone, and the committee presented an abstract of the results of that study.

In this study it was noted that:

(1) The ratio of road department expense to total maintenance of way expense varied from 76 per cent to 79.2 per cent.

(2) The ratio of bridge and building expense to total maintenance of way expense varied from 18.2 per cent to 22.5 per cent.

(3) The ratio of signal expense to total maintenance of way expense varied from 1.5 per cent to 2.6 per cent.

(4) The ratio of road department labor to total labor expense varied from 77.9 per cent to 79.1 per cent.

(5) The ratio of bridge and building department labor to total labor varied from 18.5 per cent to 19.8 per cent.

(6) The ratio of signal department labor to total labor varied from 2.2 per cent to 3.5 per cent.

(7) The ratio of road department labor to total road department expense varied from 54 per cent to 54.8 per cent.

(8) The ratio of bridge and building department labor to total bridge and building department expense varied from 46.8 per cent to 56.2 per cent.

(9) The ratio of signal department labor to total signal department expense varied from 68.2 per cent to 74.5 per cent.

These ratios, of course, are without regard to classification of line, and the figures cover the system as a whole.

The analysis extended over a three-year period during which time important and erratic increases occurred in the cost of labor and materials, and yet it is interesting to note that the relative percentages were not changed materially thereby.

Labor, of course, is the basis for all material costs, and if labor in all classes of industrial development increases in about the same ratio, and if a normal program of work is maintained, it follows that the proportions should not differ materially, but it was somewhat surprising that during the period under discussion, with all of the violent fluctuations in material costs, these relations were not vitally affected.

Of course, during the year 1918 it is quite probable that a similar analysis would establish different proportions as between labor cost and material cost because of the rather heavy increases in wages put in effect during the year in railway service, and yet it may be found that material costs followed about the same curve.

A further analysis of this data reflects a suggested method for attempting to establish a normal maintenance cost, having regard to two major conditions—first, class of road, and second, equated track units—the basic unit being one mile of main track of first-class railroad.

The railroad under consideration occupies a northern latitude and is subject to extremes of climate ranging from 20 deg. below zero to 100 deg. above zero, and embraces about 1,000 miles, which were divided into four classes, as follows:

Class A-1. Being a double track, heavy traffic density line on which the standard of maintenance provided for the laying of 100-lb. rail, and carrying a high speed passenger traffic and a heavy freight traffic with locomotives equivalent approximately to Cooper's E-50 loading.

Class A. Single track line handling similar traffic, except passenger train service was local, but engine loadings were the same. The standard of maintenance on this class of line called for the use of 90-lb. rail.

Class B. Medium light branch line, well ballasted and laid with relaying rail, and handling locomotives equivalent to about E-40.

Class C. Very light branch lines handling a limited traffic, not exceeding three or four passenger trains and three or four freight trains per day.

Certain assumptions had to be made for the purpose of equating track values, which were as follows:

One mile of main track is equivalent to 2 miles of passing track, 2½ miles sidetrack, 15 switches.

In this analysis the period under consideration was five years from 1912 to 1917, inclusive, during which period costs generally increased, but fairly stable proportions were maintained throughout the period.

Of course, this analysis does not cover other important features of the work, such as bridges and buildings, signals, etc., but any study of this kind necessarily must be progressive, and track expenditure being the larger proportion of total expenditure, logically should be taken first.

#### Discussion

E. R. Lewis (Chairman): Your committee was instructed first to report on plans and methods for organizing to obtain labor for railways.

Last year there were reported three resolutions which are practically accepted today as the sense of the committee upon this subject and progress is reported.

(Vice-President Stimson in the chair.)

The Chairman: I think from the manner in which the committee presents the subject of the method of equating track sections, and the fact that they have not asked for instructions to consider it for next year, that they consider the matter fully covered and closed. I think there are many of the members present here who probably have some ideas, and it might be well to get an expression from them.

W. H. Courtenay (L. & N.): It seems to me an improvement on the method suggested by the committee is to assign a given number of men to the operating division, and let the roadmaster exercise his discretion as to where they should be working. There may be one section where less men are required than another, and if the roadmaster is a good and intelligent man with discretion, do not tell him arbitrarily to put 1 or 1½ or 2 men on each mile, but give him the number of men for the whole division and let him distribute them as he pleases. It would be an intelligent solution of the problem.

Mr. Lewis: The practice of giving the roadmaster a little latitude in that matter, I think, has obtained for a good many years on many roads. Probably most of them have left it to the judgment of the roadmaster. Now, his judgment may be particularly good, or not so good, and it has been found in many instances proper results are not obtained. When the Committee on Track first started this subject, the idea was to get it reduced to a science, which I think it should and can do.

E. T. Howson (Ry. Age): I will say further in response to the point raised by Mr. Courtenay, that it was one the committee had in mind. The sub-committee working on this endeavored to assist the roadmaster by studying the effect of the various physical conditions of

his track, the number of turnouts, etc., giving him the benefit of that data, so that he could distribute this force allotted to him between the different sections to equate the number of men more nearly to the work to be performed.

Mr. Courtenay: In answer we have prepared data very similar to that given in the report.

The Chairman: While this equation given is a guide, it cannot always be followed in the distribution of the force. The actual condition of the track to be maintained is quite a vital determining feature in connection with this equation, so in addition to this factor of equivalent mileage there is what might be called "condition per cent" that ought to be considered in determining the proper distribution of the force.

C. C. Cook (B. & O.): The point brought out by Mr. Stimson is essential. There should be a condition per cent. If your condition on every section was the same to begin with, your equated mileage would be a proper basis, but that does not prevail. So in figuring up the amount of force that each section should have, it is necessary to take into account its condition. I think that it can be scientifically worked out. It only means a very close and detailed study of the actual track and structure conditions. I don't think we could establish it to the fraction of a per cent, but in working out the detail for certain conditions per cent, and taking the sum of the whole, we arrive at a better conclusion than by arbitrarily fixing a force for the roadmaster, or for each section gang. I think it is a subject that deserves more attention and detailed study.

W. M. Camp (Ry. Review): This has been a very practical question with the roadmasters for a good many years, if you look through the proceedings of the Roadmasters' Association for 30 years back. I think the roadmasters would be gratified to have these studies made through the engineering department. I don't think it is intended that they should be an exact guide in distributing men. There are a great many things in the maintenance of way department that are very useful if they can only serve as a rough guide or rule to go by.

Mr. Lewis: This is a problem that every man must work out for himself, taking into consideration the peculiar factors on his own road. Furthermore, percentages will vary to some extent from year to year. The committee has given percentages here that may be exact on some roads; on other roads they might not apply at all.

C. W. Baldrige (A. T. & S. F.): The equating of track values is something that every roadmaster ought to find by some rule other than by his own judgment, and an outline of this kind would unquestionably be a great advantage, especially to a new man.

(The report on the method of equating track sections was accepted as information. Mr. Lewis then presented the matter "Typical plans for housing labor.")

J. L. Campbell (E. P. & S. W.): This phase of the subject suggests an element of the problem that lies somewhat outside or beyond the obvious field of physical activity, and a solution of the physical problems in connection with the maintenance and operation of railways. Quite apart from the economics of railway labor, there is another field that I am sure will, if comprehended reasonably well by the association, add a great deal to the value of this organization.

The laborer is much more than a physical machine that we use in carrying out this part of the work. When we consider the housing of these employees, we at once face the human element, and there, whether we recognize it or not, and whether we are prepared to admit that which is before us, we then have the wonderful ele-

ment of the human heart, with all of its longings and its aspirations, noble or ignoble.

In so far as we can comprehend the human element; in so far as we can handle and cultivate it; in so far as by proper treatment of the man as a human, as a man like ourselves; in so far as we may properly and legitimately satisfy his ambitions, you will readily see that we are building up an *esprit de corps*, and any organization that will do that will find that it is a wonderful help, a wonderful strength, in the organization as a whole, in working out these physical problems and getting physical results. In so far as we can get together employers and employees, as directors of work and as those who obey directions, the closer we can get together as human beings on a common ground of understanding, the nearer we are going to get the solution of the really great problems before us.

I recognize we are not going to do that in a day. I don't know whether it will ever be accomplished or not. That element of the future is quite obscure to me, and I presume it is to you, but regardless of what we think of it now, of our preparation or lack of preparation to meet and handle it, there is the great problem of the future. There is the great problem that might be covered in a general way by the word socialism.

Aside from all those large questions, we can make a little beginning here in the matter of the housing of these employees, in the treatment that we can give them, and in the human touch that we can bring to them. To the extent that we do that we will be contributing something to the solution of the really great problem of the future, not only in the problems of business, but in all the conditions in this country and Europe and all over the world. The war has developed this great problem to an acute stage, and we must, whether we wish to or not, recognize the fact that we do not stand today where we stood yesterday on this question. It is becoming more and more acute every day, and I believe that it will be profitable to this association to think seriously about these things, as I have no doubt you are thinking, because in that common thought finally, perhaps, some solution will be found.

The Chairman: I think the manifestation of this human interest is shown in the designs that have been presented for providing these men with decent places to live in, and the committee certainly has provided some very satisfactory and adequate means to serve this end.

R. H. Ford (C. R. I. & P.): I think perhaps it may be of some interest to the convention to know what has been done along the line of Mr. Campbell's remarks by the railways generally. Of course, as we all know, we have gone from the 10-hr. to the 8-hr. day. I have no doubt but what all railroad men have endeavored to take care of their employees, and we have got to accomplish more work in the 8-hr. period or in the 10-hr. period. The great trouble with our laborers is that the ratio of efficiency is very low, and the cause of it is due to the wretched housing and feeding that we as railroads have permitted our men to continue in. There isn't any gain-saying the fact that as a business proposition we have not given attention to the fact that the old style methods of housing and feeding were bad.

There has been more progress made, I think, collectively, on the railroads during the past year in housing and caring for their men than there has been in the previous 10 years, but we have only made a very slight beginning. I look at this thing purely as a business proposition. There is no doubt that the humanitarian idea and element is an important factor, as I think some of us begin to understand. I do not believe that we have appre-

ciated the benefit of caring for the common laborer.

The committee received very little information from the members generally as to this labor question. If the committee is to do the work that I believe is so important they have got to hear more from the general body of the members than they have in the past year or two. I think Mr. Campbell is absolutely right. We have got to take up the matter from an entirely different angle. We have got to make an intensive study of the common labor problem from an altogether different angle than heretofore. As you all know, the result of the last year or two has changed the condition so that some action that is positive and direct will be necessary if we are going to continue.

Mr. Lewis: The committee recommends that this report on typical plans for housing labor be received as a proper report.

Mr. Stimson: If there is no objection, it will be so received.

(Mr. Lewis then presented Appendix C, which was accepted as a proper report.)

Mr. Lewis: We present Appendix D as a progress report, and desire its reassignment for further consideration.

The Chairman: If there is no objection, that will be the course taken.

(The committee was then excused with thanks, and the meeting adjourned.)

## Report on Rules and Organization

A large amount of work has been done on "Manual of Rules for the Guidance of Employees of the Maintenance of Way Department," but the data are not in shape to be presented at this meeting, and hence the committee asks for further time in which to complete this topic. Progress is also reported on the other subjects. The committee recommends that the same subjects be reassigned for the coming year.

Committee: W. H. Finley (C. & N. W.), chairman; F. D. Anthony (D. & H.), vice-chairman; O. F. Barnes (Erie), E. H. Barnhart (B. & O.), W. C. Barrett (L. V.), H. L. Browne (C. R. I. & P.), J. B. Crothers (C. F. & F. W.), S. E. Coombs (N. Y. C.), C. Dougherty (Soo), H. M. Edger-ton (C. G. W.), B. Herman (Soo), A. J. Himes (N. Y. C. & St. L.), F. D. Lakin (Erie), B. M. McDonald (N. Y. C.), Jos. Mullen, E. T. Reisler, W. H. Rupp, P. T. Simons, R. E. Warden (M. P.).

### Discussion

(In the absence of the chairman, W. H. Rupp presented the report.)

Mr. Rupp: The committee decided to make no recommendation in regard to rules and regulations because of the large number being put into effect by the Federal Management. With regard to fire protection, you probably know the government has taken over the insurance of the property, and the large force of inspectors put out by the government has made the rules for this particular department. This matter is in a state of transition, as the rules are changing from time to time, and we think that this subject should also be reassigned.

Subject 6: "Prepare rules for the inspection of bridges and culverts" is a very broad subject, and we recommend that you reassign these subjects for another year, and we will report progress over the whole subject. I move that this report be accepted as a progress report and the subjects reassigned to the committee.

(The motion was carried and the committee excused.)

## Report of the Committee on Track

**I**N APPENDIX A the committee presented a number of changes in the Manual made necessary by changes in plans for turnouts and crossovers, proposed in Appendix B.

In Appendix B the committee submitted typical plans of turnouts, crossovers, slip-switches and double crossovers and detail plans for such work and recommended their adoption.

In Appendix C the committee reported on the reduction of taper of tread of wheel to 1 in 38 and on canting the rail inward and submits the matter as information, in ad-

dition to the report the committee made on the same subject in 1918.

The committee has continued its investigations of tie-plates subject to brine drippings, but on account of the unsettled conditions during the past year has been unable to obtain reliable data in connection with its tests now being made on the tracks of the Chicago Junction Railway at Chicago. The committee expects to start new tests during the current year.

The committee has prepared a specification for relayer

rail for various uses, but it is not ready to submit it to the Association.

In Appendix D the committee reports on reducing the allowable flat spots on freight car wheels, and recommends that the report be received as information and referred to the Master Car Builders' Association with the recommendation that the allowable limit of flat spots be fixed at 1½ in.

The committee reported progress on the effect of fast trains upon cost of maintenance of way and equipment.

### Conclusions

The committee recommended for adoption and publication in the Manual plans for frogs and switches, as follows:

Sixteen ft. 6 in. split-switch with uniform risers; 16 ft. 6 in. split-switch with graduated risers; 11 ft. 0 in. split-switch with uniform risers; 11 ft. 0 in. split-switch with graduated risers; details of split-switch fixtures (general); details of split-switch fixtures (special features); detail of split-switch fixtures, heel plates and turnout plates; illustration bills of material for 11 ft. and 16 ft. 6 in. split-switches, in accordance with the above plans; plans for No. 6, No. 7, No. 8 and No. 10 rigid frogs and No. 10 spring rail frog.

Committee: W. P. Wiltsee (N. & W.), chairman; M. C. Blanchard (A. T. & S. F.), Geo. H. Brenner (I. C. C.), Garrett Davis (C. R. I. & P.), P. D. Fitzpatrick (C. V.), G. W. Hegel (C. J.), T. H. Hickey (M. C.), T. T. Irving (G. T.), J. B. Jenkins (B. & O.), H. A. Lloyd (Erie), J. R. Leighty (M. P.), F. H. McGuigan, Jr. (G. T.), J. V. Neubert (N. Y.

C.), R. M. Pearce (P. & L. E.), H. T. Porter (B. & L. E.), J. H. Reinholdt (M. & St. L.), E. M. Rhodes (B. & O.), J. R. Strong (Ramapo Iron Works).

### Appendix A—Revision of Manual

With the adoption of the plans shown in Appendix B, it will be necessary to eliminate the plans on pages 169, 170 and 171 in the 1915 Manual. The specifications for frogs, crossings and switches, on pages 172 to 181, will need revisions in paragraphs 10, 11, 18, 38, 43, 48, 52, 53, 61 and 62. The most important of these changes are, in the throw of the switch, the tie spacing at the heel of the joint, the angle of planing chamfer cut, the size of switch rods, the lengths of No. 6 and No. 8 rigid frogs, and material of fillers, riser blocks and spring covers.

The revision of the tie-plate specifications was carefully considered in connection with the specifications now being prepared by the American Society for Testing Materials, but as that tentative specification has again been revised, it was thought advisable to delay this matter and recommend that the next committee consider these specifications as well as other specifications in the Manual in connection with the committee of the American Society for Testing Materials, and if possible decide on a specification that has the approval of both associations.

### Appendix B—Typical Plans of Turnouts, Crossovers, Slip-Switches and Double Crossovers

The plans were made for 100-lb. rail, but the plans and specifications will apply for any standard rail section weighing 80 lbs. or over. No patented features have been specified, and all details shown are recommended as being good practice established by use in service on the railroads of America. Where alternates are detailed the parts have been made interchangeable in so far as possible by giving the essential dimensions. All alternates detailed are in extensive use by preference in some parts of this country.

The plans as submitted have the approval of both the Track committee and the switch and frog manufacturers of the Manganese Track Society. It has been found that there are in use at the present time not only a great variety of styles of switch fittings, but a variety of dimensions for the same style of fittings used on the railroads of America. The adoption of these plans will not only make the dimensions uniform for the same style of fittings, but will make the different styles of fittings largely interchangeable.

#### SLIP-SWITCHES

The Committee on Signals and Interlocking has suggested a change in the drilling of the first holes in the switch point to read  $2\frac{1}{2}$  in. by 5 in. by 5 in., but after a conference we were advised that the Committee on Signals and Interlocking is not unanimous on this question and can work to the present drilling, which is better suited to hand-thrown switches, and the interlocking details can be worked with the present drilling satisfactorily; so our committee has decided not to recommend any change in the spacing of holes from the end of the rail specified in the present Manual, page 179. The height of the holes, however, is not specified in the Manual. A height of  $1\frac{3}{4}$  in. above base of rail, measured on the face of reinforcing bar, is recommended so that the height may be uniform and the switch slips interchangeable.

Switch plates are detailed in two widths, 6 in. width and 7 in. width; the riser plates in two styles, solid base riser plates and pressed riser plates. In the 6-in. width the pressed riser plates are shown of  $\frac{5}{8}$  in. by 6 in. stock; the solid base riser plates of  $\frac{1}{2}$  in. by 6 in. stock, under base of stock rail; the 7-in. width of  $\frac{3}{4}$  in. by 7 in. stock. The 7-in. width as specified in the 1915 Manual is rec-

ommended for congested traffic conditions, but the lighter 6 in. width is desirable for use where there are less congested traffic conditions. The switch plates, in any case, being longer than standard tie plates as used for tangent track, should preferably be of heavier section. This should be taken into consideration in making up bills of material, especially for tie-plated turnouts.

Switch rods as specified in the 1915 Manual are recommended of rigid style when the throwing fixtures are provided with adjustment for wear and other causes. However, as there are a large number of throwing fixtures in use that do not provide these adjustments, three details of adjustable switch rods and clips are illustrated. The drilling in the switch points being the same, any of the switch rod and clip details can be applied.

Two styles of split switches are shown, one of uniform risers and one with graduated risers. For tie-plated turnouts, where equivalent plates and fixtures are used, the weight of material is approximately the same for the two styles of switches.

The split-switch with uniform risers is a development of the 16-ft. 6-in. switch shown on page 178 in the 1915 Manual. The elevation of the switch rail is run off in the lead rails. The heel plates have been detailed not only to provide for the run-off of the switch elevation, but also for shoulders for both the lead rails and the stock rails. A variable tie spacing is given so that the same detail of plates will apply to turnouts No. 7 to 10 inclusive. This construction provides shoulder tie plates from the heel of the switch back to where there is sufficient spread to permit the use of standard shoulder tie plates. With this style of switch the splice bars may be bolted up tight, and the play between the shoulders back of the switch heel allows sufficient flexibility for the throw of the switch.

The plan of the split-switch with graduated risers details a 16-ft. 6-in. split-switch with a vertical bend in the switch rail so that the heel joint is level with the stock rail. A heel block is illustrated with the bolts tightened on pipe thimbles, permitting a hinge motion for the throw of the switch. With this style of switch, the heel joint being level, additional heel or turnout plates are not required except when further tie plating is desired, as in a tie-plated turnout. Also, with this style of switch the equipment can be cut down to a minimum by omitting the heel block and heel plates for a cheaper switch for emergency or light traffic requirements.

#### RIGID FROGS

One style of rigid frogs is detailed for No. 6, 7, 8 and 10 frogs, in which the flare in the wing rail is machined from the head of the rail. This is recommended in preference to the bent flare, as it allows the use of shorter bolts and more rigid construction. The detail of point planing conforms to the 1915 Manual. The diameter of the bolts is specified to vary according to the height of the rail.

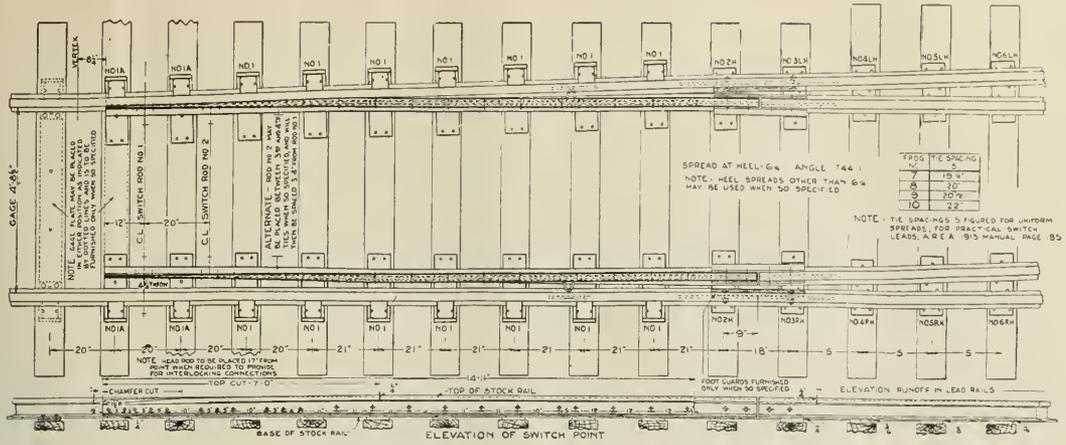

Two approved methods of plating are illustrated. The shorter three-tie base plate with tie plates beyond is recommended rather than the long base plate as illustrated in the 1915 Manual. For well-ballasted track individual tie plates throughout are recommended as good practice.

#### SPRING RAIL FROGS

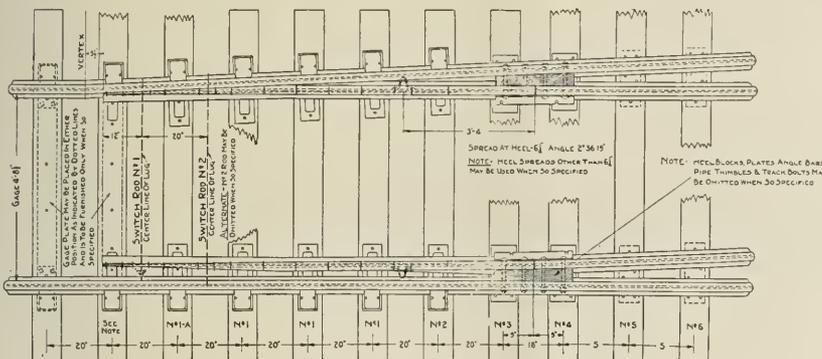

The spring rail frog is not customarily used except on the main line. A No. 10 frog is detailed to go with a 16-ft. 6-in. switch. The details, however, will apply in general to Nos. 8 and 11 frogs.

#### GENERAL NOTES

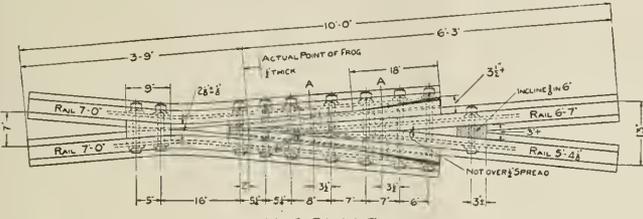

The throw of the switch is specified  $4\frac{3}{4}$  in. on the center line of switch rod No. 1. This will make the throw

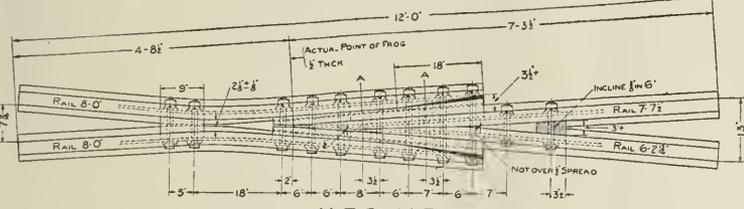

16 1/2 Ft. Split Switch with Uniform Riser.

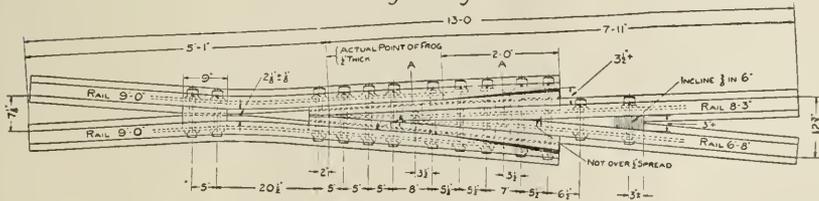

11 Ft. Split Switch with Graduated Risers.

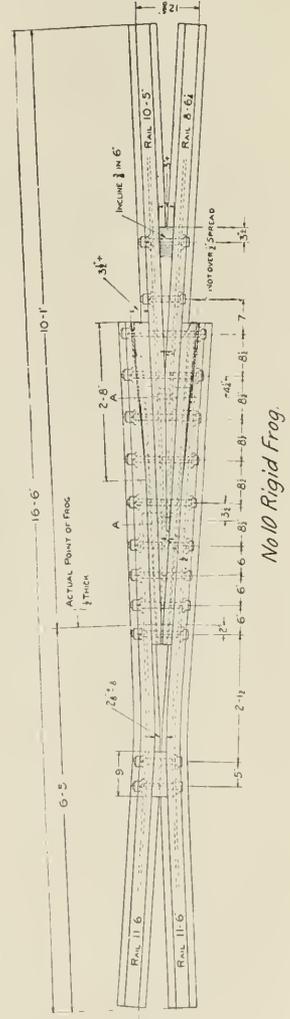

No. 6 Rigid Frog

No. 7 Rigid Frog

No. 8 Rigid Frog

No. 10 Rigid Frog

Standard Switch and Frog Designs

asking for information concerning the wheel taper and inclination of the rail.

**Appendix D—Reducing Allowable Flat Spots on Freight Car Wheels**

The committee is unanimously of the opinion that a 2½-in. flat spot under a modern heavy freight car creates a severe damaging stress in the rail and that the present allowable limit of flat spots is excessive. Forty years ago, in 1878, when the average freight car wheel load was but 8,250 lb., the Master Car Builders' Association fixed the allowable limit of flat spots at 2½ in., and although wheel loads have increased to 18,750 lb. (100,000-lb. capacity car) and as high as 30,000 lb., and the speed of trains is now much greater, the present Master Car Builders' rules retain the allowable limit at 2½ in.

In 1916 the committee endeavored to confer with the Master Car Builders' Association, but was informed that their executive committee were unanimously of the opinion that—

(a) Although maximum car capacity has greatly increased, there has been a corresponding increase in the strength and durability of cars and rails, so that relatively the 2½-in. limit remains quite safe.

(b) The corners of a 2½-in. flat spot soon become rounded so that the actual impact therefrom is much less than the theoretical; also the force of the blow is greatly diminished by the elasticity of car springs and roadbed.

(c) The reduction of the limit would mean tremendous expense for changing and scrapping flat wheels, and for these reasons the Master Car Builders' Association has steadfastly refused to consider suggestions from the American Railway Engineering Association that the allowable limit be reduced.

On the other hand, American Railway Engineering Association committees, while admitting the lack of accurate corroborative evidence, has consistently contended for reduced limit, because—

(a) The impact from a flat spot under the modern heavy car is many times greater than the impact from the car of 1878, when the present 2½-in. limit was fixed, due to much higher speeds and the fact that the maximum wheel load is now nearly four times heavier than in 1878.

(b) Actual tests have indicated that a 2½-in. flat spot delivers a serious blow to the rail.

(c) It is a fact that rails are broken by flat spots, though specific cases have been difficult to cite, because often the rail, while badly damaged, may not break until some time after the passage of the flat wheel.

(d) The reduction from 2½ in. to 1½ in. would not be very expensive, for the reason that very few additional car miles can be obtained before a 1½ in. flat has become 2½ in., and, further, the greatest damage to the track occurs while the wheel is making these last few miles.

The committee, as the results of studies during the past two years, offers the following additional reasons why the allowable limit of flat spots should be reduced from 2½ in. to 1½ in.

(a) Ordinarily, wheels having 2½ in. flat spots are removed from the axle and scrapped, whereas if the limit were fixed at 1½ in., it would be possible to reclaim such wheels and replace them in service by grinding out flat spots without removing them from the axle and at a cost of about \$0.60 per pair. Grinding is being done with excellent results on a number of roads and is recognized by authorities as good practice, provided, of course, that the wheel has not been burned during the process of flat-tening. Therefore, a reduction of the allowable limit from 2½ in. to 1½ in. would not only lessen the impact and damage to the rail, but should prove economical from the standpoint of service in life of wheels.

(b) While it is true that the strength and stiffness of rails has more than doubled (if we assume 60 lb. and 100 lb. A. S. C. E. section as the standards of 1878 and 1917 respectively) and as contended by the Master Car Builders' Association has almost kept pace with increasing wheel loads, it is a fact that this added stiffness of the rail and track structure actually augments the impact from a flat wheel, and this is especially true in winter. Recent tests on the Pennsylvania Railroad show that the average load from a flat wheel recorded on frozen roadbed was from 15 to 25 per cent greater than in warm weather tests.

Increasing the rigidity of the track structure reduces the distance in which a rail may deflect and absorb the energy of a blow from a flat wheel and consequently increases the impact.

Questionnaires were sent to 55 railroads for the purpose of securing data as to damage done to rails and opinions as to whether the present allowable limit should be reduced. Replies were received from 26 roads and may be summarized as follows:

No.	Roads.		Favor Less Than 2½" Limit.	Remarks.
	Miles.			
16	51,393		Yes.	Three roads (5,395 miles) report several hundred rail failures due wholly to 2½-in. flats spots. The remainder favor a reduction of limit, but have no specific data as to failures.
5	26,485		No.	Have no data to indicate that present limit should be changed.
2	3,705		No.	Regard present limit as O. K.
23	81,483			

**Conclusion**

The committee is of the opinion that the allowable limit of flat spots should be reduced from 2½ in. to 1½ in. as a means of securing greater service life of both rail and wheels. We, therefore, respectfully suggest that the Association refer the above-mentioned facts to the Master Car Builders' Association, with the recommendation that the allowable limit of flat spots be fixed at 1½ in.

**Discussion**

W. P. Wiltsee (Chairman): The committee has reported progress on a number of subjects and the principal one is No. 2, "Report on Typical Plan of Turnouts, Crossovers," etc.

(Mr. Wiltsee then read the matter under subjects 1 and 2 from the report, as found in appendices A and B.)

Since this report was prepared the committee has continued its work, and has prepared tentative plans for 22 and 30-ft. switches; Nos. 11 and 16 rigid frogs; Nos. 8 and 11 spring frogs; 8-ft. 3-in., 11-ft. and 16-ft. 6-in. guard rails, and also have considered plans for a No. 20 frog. They are not in shape to present at this meeting. It has been necessary to make plans that could be used under all traffic conditions. We have endeavored to keep the standards down to a minimum. This report is the report of practically the whole track committee. I move the adoption of these plans.

A. Montzheimer (E. J. & E.): I notice this report does not show the clamped frog. We have been using the clamped frog for over 12 yrs. and it has been very satisfactory. It would be a good thing if this report was so made that we could use the clamp frog and still be in line with this practice.

C. W. F. Felt (A. T. & S. F.): I second that suggestion, and it has occurred to me a good way to cover that would be to prepare an alternate plan.

Mr. Wiltsee: The committee had tentative plans drawn up on that matter. Because of the recommendations of some members of the committee we did not include clamped frogs.

A. H. Mulliken (Pettibone, Mulliken Co.): Standard

plans have been prepared for clamped frogs. We have alternates on switches and on spring rail frogs, and it would seem fair to the 60,000 miles of road that are using this clamped frog that there should be this alternate.

L. Yager (N. P.): We are using this frog.

R. S. Parsons (E. R. R.): I don't think the question at the present time is whether a clamped frog is a good one. The question is whether we shall adopt the report of this committee, and embody the essentials in the shape of this standard plan. This committee has spent a good deal of time on these plans, and they have taken into consideration other ideas. This is a peculiarly excellent time to have standards adopted throughout the United States. The whole tendency of the Railroad Administration has been to adopt standards. If we had these plans adopted and included in our Manual, the track man would find something tangible on this particular question, which is sometimes so troublesome. The clamped frog can be developed and introduced at the next meeting, if that is considered desirable.

C. W. Baldrige (A. T. & S. F.): In the matter of adopting the bolted frog as recommended practice, and not showing any alternate plan, or permissible plan, such as the clamped frog, I remember a year or two ago there was great criticism of various railways for not conforming to the recommended practice which is published in the Manual. It has been shown that a large mileage of the railways are using successfully and satisfactorily a clamped frog, and unless there is some real good reason for recommending against it, the committee should be instructed to select an alternate plan. I do not believe there is any argument which justifies a ruling against that type of frog.

J. E. Willoughby (A. C. L.): What governed the committee in determining the length recommended for the frog and switch point?

Mr. Wiltsee: The length of the frog is governed by the cutting of the rail. The different lengths of frogs work out better for a 33-ft. rail and there is no waste in material. The length of switch points was adopted by the association a number of years ago.

Mr. Willoughby: Is it the idea of the committee that the cutting of the rail is more important than any other feature of the design?

Mr. Wiltsee: No, sir. We met all other features of the design, such as length, width, yield, and every other point we could think of, and still saved the cutting of the rail.

John V. Hanna (K. C. T.): I looked into this question a few years ago. The manufacturer was asked what the advantage would be to the company in using 16.5-ft. points instead of 15-ft. and he said there was none. I would like to have information as to how the purchaser gets the benefit of economy in cutting up the rail.

Mr. Mulliken: In cutting rails and making frogs and switches the material is handled by machinery more rapidly than you gentlemen imagine. It is a great economy and convenience to cut a 33-ft. rail through the center. I do not think it is fair, in making 15-ft. switches, to charge the roads for 16.5-ft. of rail, because if it is necessary to make a 15-ft. switch, we could get 30-ft. rails from the mills.

Mr. Wiltsee: The association adopted a 11-ft. and a 15-ft. switch a number of years ago. It seems to me the advantage is purely with the railroad company. If you get a 16.5-ft. switch you get a better one with a better angle.

Mr. Hanna: How much advantage is there in the angle? It may be that the manufacturers now figure a little differently on the waste, but they told us we did not really make anything by taking the longer point.

The President: Naturally, the length of a frog, a guard rail or a switch point depends on the merchantable rail that it is made of. In the days of the 30-ft. rail we used a 7.5-ft. guard rail. When we used a 33-ft. rail it was divided into four pieces. In our frogs we used a 10-ft. switch point,  $\frac{1}{3}$  of a 30-ft. rail. My idea is you want good merchantable stuff, as there is no advantage in getting odds and ends.

The different reports from the mills show that they roll from 350 to 750 tons a week for frog and switch manufacturers.

Mr. Mulliken: Twelve concerns are making frogs and switches in the United States, and when they are running full time they will use over 400,000 tons of rail in 12 months for this purpose.

J. L. Campbell (E. P. & S. W.): I have no objection whatever to these plans or anything that they contain. I think the committee has submitted a very excellent set of plans as far as they go. My objection is on account of some of the things they do not contain. I believe before we get through with the plans and consider the matter settled for the time being, that they should include a plan for the clamp frog, and I believe, also, some additional adjustments of the connecting rod.

If the committee would consent to an addition to that motion, and have it include a direction to them that for the next year's work they recommend a plan for a rigid frog and make an additional study of the adjustment of the connecting rod, all of my objections to the matter as it now stands will be removed, and I would like to see the matter disposed of in that way. I would like to see these plans adopted at this time, as far as they go, with the understanding that the subject is not closed and we will have an additional report along these lines including the points I have mentioned, next year.

Mr. Wiltsee: The subject is not closed by any means. If it is the desire of the convention that we include a clamped frog, the committee is only too willing to do it.

Mr. Campbell: I move that the motion before the house, which is on the adoption of these plans, be amended to include a direction to this committee to bring in at the next annual convention a recommended plan for a clamped frog, and an additional report upon adjustments of the connecting rods.

(This motion was carried.)

Mr. Wiltsee: I move that the convention adopt the plans.

(Motion carried.)

Mr. Wiltsee: I move that Appendix C be received as information.

(Motion carried.)

Mr. Wiltsee: I move that the subject matter in Appendix D be accepted as information and referred to the Master Carbuilders' Association.

C. E. Lindsay (U. S. R. A.): I want to emphasize the fact that the weight on the wheel cuts a very great figure. A 1-in. flat spot on a locomotive or on a locomotive tender does more damage than we have any appreciation of, and I think that fact should be emphasized in presenting the matter to the Master Carbuilders' Association, or the mechanical section of the American Railroad Association. Their attention should be called to the fact so that they might differentiate if they consider it necessary in determining the limit of the flat spot under different loadings.

Mr. Wiltsee: The committee will modify the report to agree with the instructions of the Master Carbuilders' Association, and if they make a report limiting the flat spot to  $\frac{1}{2}$ -in. I think that will cover it.

(Mr. Wiltsee's motion was then put and carried.)

(The committee was excused with thanks.)

## Report on Conservation of Natural Resources

AT THE MOMENT when our country was engaged in the supreme effort of its lifetime to "make the world safe for democracy," when it was speeding up its war industries to the limit and straining every nerve to deliver a maximum of men and equipment to the battle line, there came a shortage of coal. While the signing of the armistice will relieve to a certain extent the demands abroad, the requirements at home will be as persistent as ever, for there must come a period of reconstruction. During this period the leading industries will simply change their product from a war to a rehabilitation basis and continue as active as they were before the armistice was signed. Those industries not necessary to the winning of the war that were obliged to curtail their production to economize on fuel will now seek to recuperate their interests by a speed-up program of production. On account of the shortage of coal brought on by the exigencies of war and which, no doubt, will continue on account of the reconstruction needs, the committee felt that it should confine all of its attention this year to a study of the conservation of fuel.

Of the total amount of coal used in the United States in 1917, 544,000,000 tons were bituminous and 77,000,000 were anthracite. As the railroads consumed 175,000,000 tons of this, or nearly one-third of the total output, their fuel question becomes one of huge proportions and demands the most serious thought and attention that they are able to give it.

There are three ways of relieving the situation: (1) By getting a better grade of coal from the mines. (2) By increasing our facilities for transportation. (3) By practicing conservation.

If the mines will see that better and cleaner coal is delivered to the railroads it will save them transporting thousands of tons of slate, rock, and other impurities commonly found in bituminous coal. These surplus materials are an additional burden, not only to the railroads that haul them, but also to the consumers that use them, for they decrease the efficiency of the power-plant and increase the size of the ashpile.

The Railroad Administration is ordering new equipment and is repairing that which it already has; but even then it cannot cope with the situation, for the roads must handle a heavier tonnage than they have ever handled before. They must haul raw material to the industries, they must carry foodstuffs and provisions for the Army and Navy, and they must move soldiers from the camps and the water-front.

The greatest possibility seems to lie in conservation. Statistics show that during 1917 the total equipment for handling coal constituted about one-third of all the traffic of the country. The transportation of fuel becomes then a problem of extraordinary magnitude and offers enormous opportunities for saving by the railroads and other industries of the country. As the railroads use nearly one-third of the total amount of coal consumed, a heavy responsibility rests with them in meeting the nation's need.

One-fifth of all coal burned in locomotives is used when the engines are not moving trains. Some of this is consumed at engine terminals and some on passing tracks waiting for trains to meet. Most of this coal is necessary, but it does present to the dispatcher, yardmaster and roundhouse foreman a splendid field for study in the economy of the use of fuel. They should see that trains move promptly, spending no more time in yards and on sidings than is necessary for safety in operation.

The trainmen should see that equipment and material entrusted to their care is handled to the best advantage

and they should put forth every effort to expedite train movements. Four-fifths of all the coal burned in locomotives is consumed while they are actually moving trains. For the use of this fuel the engine crew is largely responsible. If they could save only one per cent they would use 1,600,000 tons less a year. Their efforts would be greatly enhanced, however, if the equipment were in good condition.

The stationary boilers in shops, pumping stations and heating plants require a large amount of fuel, and present a great opportunity for saving in their construction and operation. This allows the maintenance of way and shopmen to serve in this great conservation program. Telegraph operators and towermen should be alert to clear their trains as soon as it is possible to do so, for every stop a train is obliged to make requires an additional amount of fuel. Conductors and brakemen should see that passenger trains do not become overheated and that cabooses do not burn more coal than is necessary for the comfort of the crew. Station agents can add their mite by saving a little each month. The efforts of each might seem insignificant, but the sum total would represent an amount that would well merit consideration.

For one reason or another, railroads are often obliged to store out-of-doors a great deal of the coal they use. Sometimes it is done to equalize traffic by using coal cars at a season when they are not in demand by the public, sometimes it is done to forestall shortage due to strikes or other interruptions at the mines; but unless proper care is exercised in the storing of such coal serious loss may result from physical and chemical deterioration.

As the Fuel Conservation Section of the Division of Operation of the U. S. Railroad Administration has given the subject a great deal of special study and attention and has prepared in condensed form a most thorough outline of the methods for conserving coal, the committee feels that it can do no better than to embody some of its recommendations in this report.

The report concludes with abstracts of these suggestions and discussions of the fuel situation in Canada and the possibilities of peat as fuel.

Committee: R. C. Young (L. S. & I.), chairman; S. N. Williams, vice-chairman; R. H. Aishton (U. S. R. R. A.), W. K. Barnard, C. B. Brown (Can. Govt. Rys.), Moses Burpee (Ba. & Ar.), C. H. Fisk, E. E. King (Ia. State Col.), William McNab (G. T.), W. F. Ogle (C. R. I. & P.), J. L. Pickles (D. W. & P.), J. W. Votey (Univ. of Va.), W. C. Willard.

### Discussion

R. C. Young (Chairman): This committee this year was obliged to change its report several times, because of the changes in existing conditions, but it has prepared a short report on conservation of fuel, thinking that was one of the most important things before us at this time. Prof. King is responsible for this report, and I will ask him to say a few words to the convention about it.

Prof. E. E. King (Univ. of Ill.): The matter that the committee presents is based and taken largely from recommendations of practice of the Fuel Conservation section of the Division of Operation, United States Railroad Administration. The committee felt that it could do no better on this occasion than to recommend, or simply incorporate in its report, the recommendations of this committee.

Wm. McNab (G. T.): The convention should understand that this report is merely one prepared and furnished gratuitously to the convention as information.

Mr. Young: I move that the report be accepted.

(The motion was carried, and the committee was excused with thanks.)

## Report of Committee on Signs, Fences and Crossings

A VERY MARKED IMPROVEMENT has been noted during the past two or three years in the matter of better protection of grade crossings. The great evolution in highway traffic which has taken place during the past 15 or 20 years, in which the horse-drawn vehicle has been largely supplanted by the much faster motor vehicle, has greatly complicated the grade crossing problem. The greater speed of the highway traffic to-day calls for a more comprehensive form of signal than was necessary under former conditions; for, as in train movements, there is need of definite early warnings. The motorist needs to be advised of the necessity of a stop in time to afford him ample opportunity to reduce his speed before reaching the point of danger. The old signs, calling upon the public to "stop, look and listen" before crossing tracks, are no longer adequate. In providing the necessary warning, the railroads have been confronted with a definite obstacle, since they must be installed at considerable distance from the track, and therefore usually outside the railroad property. They have therefore been without right to erect the signs or authority to maintain and protect them from injury.

The rational solution of this vexatious problem, therefore, seemed to be to place the responsibility for the cautionary signals on the state, county or municipal authorities, and this has been done in eight states. There should be no controversy as to the justice of this decision, as the matter of safety on public highways should be as carefully guarded by their properly constituted authorities as that provided by the railroads. The pioneer state in this movement was New Hampshire, which was later followed by Vermont, Massachusetts, Connecticut, Maine, California, Oklahoma and Illinois. Bills providing for similar laws have been presented to the legislatures of a number of other states, upon which action is still pending.

Most of the laws that have so far been passed contemplate locating these signs about 300 ft. from the tracks, when, in the judgment of the commission, the crossing involves such hazard as to require the installation of a "stop" sign at the crossing; and, with the exception of those of Connecticut, imposes the erection and maintenance of warning signs outside of the railroad right-of-way on the highway commissioners who have authority over the ground upon which the signs are installed, while the installation and maintenance of "stop" signs in close proximity to the tracks and therefore usually inside the right-of-way is imposed on the railroad.

In Connecticut the cautionary signs must be furnished by the railroads, but installed by the state, county or city authorities. In California the law requires vehicles approaching grade crossings of railroads to run at a speed not exceeding 15 miles per hour. Tennessee has a law requiring automobilists to come to a stop before crossing railroad tracks. Texas laws require them to reduce speed to 6 miles per hour at all crossings except those protected by gates or flagmen. The state of Washington has a law requiring automobiles carrying passengers to stop before crossing railroad tracks.

The order of the Public Utilities Commission of Illinois, issued on July 31, 1918, in the execution of statutes passed by the state legislature in June, 1917, prohibits the installation of any other signs or signals, such as advertising notices, within 300 ft. of any railroad grade crossing, to prevent any possibility of confusion with the regular crossing protection signs. This is an excellent provision, but does not go far enough. Rigid restrictions should be placed on the erection of unnecessary signs anywhere on the public highways. The motorist's attention is too often jaded by signs containing misleading

inscriptions, and until such notices and signs of fantastic design are prohibited, there will, of necessity, be more or less confusion with actual warning signs.

The commission's order included explicit specifications and drawings for both the "stop" and "approach" signs. They must be made of No. 16 gage porcelain-enameled metal, crimped backward at least  $\frac{1}{2}$  in. around the perimeter. The letters must be black on a white field and the rear of the sign is painted black. The supporting post may be either wood or iron, but must be of sufficient strength to make a solid and substantial support. The posts must be designed to permit a bracket or attachment to be installed for the purpose of supporting a light or signal at night, wherever, in the opinion of the commission, this may be necessary.

The painting of black and white diagonal stripes on crossing gates and the use of circular disks instead of flags by crossing watchmen have now become common on many railroads.

Over 110,000 grade crossings were reported by the National Association of Railroad and Utility Commissioners in the 22 states from which replies to a circular letter were received. Basing calculations on the above data, it is estimated there are about 200,000 grade crossings in the United States and that there are about 2,000 persons killed annually at these crossings. It further appears from the reports that in the above 22 states only about 10 per cent of the crossings are protected by gates, flagmen or bells.

In the matter of grade crossing elimination, considerable progress has been made in Connecticut, Illinois, Massachusetts, New Jersey, New York, Oklahoma, Oregon, South Carolina and Wisconsin. Massachusetts, with only about 2,000 miles of railroad, has spent in the past 30 years about \$42,000,000; Illinois, in a much shorter period, has done work involving an expenditure of over \$55,000,000, much of it in the city of Chicago; New York, with about 8,000 miles of railroad, has spent about \$44,000,000. Estimates of the cost of elimination of grade crossings have been prepared in a few states running into hundreds of millions of dollars. In California the average cost is estimated at \$30,000 each; in Colorado at \$40,000; in New York at \$48,000, and in Wisconsin at \$25,000.

Considerable information has already been presented to this association bearing on the division of cost as between the railroads and the public. It occurs to the committee that the most equitable plan for the division of cost is that of New York, where the burden is imposed equally on the railroads and the public.

### Types of Manufactured Posts

Early in September a circular letter was addressed to the officers of about 30 railroads soliciting information on concrete and steel posts. Only 19 replies were received—14 of which were to the effect that no concrete posts were used during the year and 10 to the effect that no steel posts had been used. From the remaining replies only two companies used concrete posts to any extent and that only one company used steel posts in quantity. This was, no doubt, due to the high price of steel in the case of steel posts, and to the high price of labor and material entering into the manufacture of concrete posts. This condition is likely to continue until normal prices are restored.

So far as the committee is able to judge from the replies received, those companies which have adopted concrete posts as standard, and have been large users of them, are continuing their use. Comparatively few steel

posts have been used during the year. Those roads on which wood posts are standard are not inclined to change to other types at present prices. In general, those roads using concrete and steel posts report satisfactory service.

One chief engineer, on whose road steel posts are standard, recommends that all steel posts should be set as other posts, and not be driven, in order to avoid damage to the tops of the posts. While the committee is aware that the tops of some steel posts are more or less crimped or battered in driving, it is believed to be due to some extent to careless driving, and to the use of a cap not properly designed. Especially large driving caps are now being furnished, which are claimed to be giving satisfaction. The committee therefore feels that the proposition to set all steel posts, except in the case of rock or other obstructions, would defeat the whole plan of economy in the use of certain types of steel posts, besides the difficulty of setting them with any degree of rigidity.

Committee: W. F. Strouse (B. & O.), chairman; Arthur Crumpton (G. T.), vice-chairman; F. D. Batchelder (B. & O.), H. E. Billman (M. P.), C. G. Bryan (I. C.), G. F. Black (Me. C.), A. S. Butterworth (G. F. & A.), B. J. Dalton (M. K. & T.), F. T. Darrow (C. B. & Q.), G. N. Edmonson (N. Y. C.), R. C. Gowdy (F. W. & D. C.), Paul Hamilton (C. C. & St. L.), Maro Johnson (I. C.), L. C. Lawton (A. T. & S. F.), S. L. McClanahan, L. A. Mitchell (Un. Tr. Co.), T. E. Rust, A. Swartz (T. & W.), W. D. Warren (N. Y. N. H. & H.), K. G. Williams (M. V.).

#### Discussion

Arthur Crumpton (Vice-chairman): Owing to war conditions, the committee has not reached any conclusions this year, but submits progress reports on two subjects, grade crossings and fence posts. No conclusions having been reached, the committee recommends that these reports be received as information.

(The committee was excused.)

### The Evening Session

A continuation of the report of the Committee on Economics of Railway Labor took place last evening when a series of slides illustrating the use of labor saving devices was presented by R. H. Ford, principal assistant engineer, Chicago, Rock Island & Pacific, Chicago. This was followed by a talk on transverse fissures by H. M. Wickhorst, expert of the Rail committee. In the discussion which followed, J. E. Howard, engineer-physicist of the Interstate Commerce Commission, gave illustrations to indicate that such failures are the result of fatigue of the metal. A number of other speakers questioned this theory and cited a number of examples which demonstrated that the quality of the material was at least partially responsible.

### Railroad Administration Approves Convention

The United States Railroad Administration has indicated its approval of the American Railway Engineering Association and encouraged the attendance of railway men. Circulars have been issued by the regional directors to this effect, the following from the Northwestern region being typical of those issued by the other directors:

"The twentieth annual convention of the American Railway Engineering Association will be held at the Congress Hotel, Chicago, March 18, 19 and 20, 1919. On account of the educational benefit accruing to employees attending these conventions, will you please arrange to have the members of this Association, as well as other officers and employees interested in the maintenance of way department, who can be spared from their duties, attend this convention, take part in the discussions, and see the exhibit of railway appliances."

Co-operation of this character has contributed largely to the attendance at the meeting of the A. R. E. A. as it did for the meeting of the Signal Association Monday.

### American Railway Signal

#### Supervisory Association

The American Railroad Signal Supervisory Association will hold its first annual meeting in the Elizabethan Room of the Congress Hotel at 9 o'clock this morning. The first hour will be devoted to an open meeting, following which the remainder of the day will be spent behind closed doors. Some of the subjects to be discussed will be the proposed rates of salary and definition of title. Election of officers for the next year will also take place. Fifty roads are at present represented.

### Division Foremen to Hold Meeting

The division signal foremen of the Chicago & North Western will hold a meeting on Wednesday, March 19. This meeting is a get-together for the foremen on the various parts of the system to permit them to become better acquainted and talk over their work.

### Personnel of New Signal Division Committee

Subsequent to the amalgamation of the R. S. A. with the A. R. A., a committee on valuation, to be part of the signal division, was appointed with T. M. Carley as chairman and P. M. Gault, assistant engineer in the Signal department of the Illinois Central, Chicago, as vice-chairman. The other members are as follows: F. H. Bagley, assistant signal engineer, Louisville & Nashville, Louisville, Ky.; G. E. Beck, assistant signal engineer in the valuation department, New York Central (West), Cleveland, O.; P. F. Canfield, signal pilot, New York, New Haven & Hartford, New Haven, Conn.; J. C. Finch, signal inspector, Missouri Pacific, St. Louis, Mo.; E. E. French; Caldwell Homewood, assistant supervisor of signals, Pennsylvania, Philadelphia, Pa.; W. F. Hudson, assistant engineer in the valuation department, New York Central (East), New York; George W. Kydd, signal pilot engineer, Baltimore & Ohio, Baltimore, Md.; F. F. Schaller, signal engineer, Bureau of Valuation, Interstate Commerce Commission, Washington, D. C.; T. E. Smith, supervisor bridges and buildings, Southern Lines West, Tuscaumbia, Ala.; G. K. Thomas, assistant signal engineer, Atchison, Topeka & Santa Fe, Topeka, Kan.; C. H. Wiegand, supervisor of signal construction, Atlantic Coast Line, Jacksonville, Fla., and E. E. Worthing, signal engineer, Southern Pacific (Atlantic System), Houston, Tex.

This committee has been instructed to: (1), report on the average life in years of the important units of the different types of signal installations, considering depreciation and obsolescence separately; (2), report on the government Bureau of Valuation method of applying depreciation; (3), prepare tables for the different types of signal installations which will show the percentage of material to be added to cover waste, contour, sag, loss, breakage, etc.; (4), prepare a typical construction program which will include the various types of interlocking, automatic signals, etc., for a single track railway following with additional tracks to increase the road to a double track, three-track and four-track railroad, and (5), extension of the joint Signal Committee of the President's conference committee study of labor costs to establish percentage to be added to material to arrive at total cost.

# Twenty Years of Progress in Railway Engineering

Some Facts About the Origin and Growth of This Body of  
Railway Men During the Last Two Decades

**A** LITTLE MORE THAN 20 years ago, October 21, 1898, to be exact, a little group of men met in the Auditorium Hotel, Chicago, and set on foot the preliminary arrangements for the organization of what is now known as the American Railway Engineering Association. Because of the important position which the association has since achieved and its present widespread influence in railway engineering affairs, it seems fitting to call attention to some of the earlier items of its history and to recall the names of its founders for the benefit of those who have become members of the association during the succeeding years. This, the twentieth annual convention, seems a peculiarly opportune time for gathering up some of these links that connect its present history with its past.

It is probable that few even of the most far-sighted of the founders of this association appreciated the magnitude of the movement which they were setting on foot.

As a matter of fact, some hesitancy was expressed, not as to the need of such an organization, but as to whether engineers in sufficient number would join its ranks to enable the association to assume that place in railway work which the importance of its interests demanded. Owing, however, to the indefatigable energy and competence of those who were elected to guide its destinies in the early years, the association almost immediately assumed an important position and at once assured its founders that they had made no mistake in shaping the preliminary organization and outlining plans for future work. From the very beginning the work of the association was directed along the same broad lines which have since characterized its course.

Even though their names form a part of the permanent records of the association, it is well to call especial attention to those pioneers to whom the association as at present constituted, owes so much. Those who attended the preliminary meeting on October 21, 1898, were the following:

H. A. Kennedy, general superintendent, Cleveland, Canton & Southern.

F. E. Paradis, chief engineer, Chicago Terminal Transfer.

C. Dougherty, roadmaster, Illinois Central.

G. W. Merrill, roadmaster, Chicago, Milwaukee & St. Paul.

W. S. Kinnear, principal assistant engineer, Michigan Central.

G. W. Taylor, St. Louis Terminal Association.

W. E. Emery, roadmaster, Chicago & North Western.

E. C. Macy, division engineer, Iowa Central.

W. M. Duane, roadmaster, Cleveland, Cincinnati, Chicago & St. Louis.

J. B. Dickson, roadmaster, Chicago & North Western.

L. C. Fritch, superintendent, Baltimore & Ohio Southwestern.

C. A. Wilson, chief engineer, Cincinnati, Hamilton & Dayton.

G. S. Cheyney, general roadmaster, Indianapolis, Decatur & Western.

H. W. Church, roadmaster, Lake Shore & Michigan Southern.

G. H. Bremner, assistant engineer, Chicago, Burlington & Quincy.

A. Torrey, chief engineer, Michigan Central.

Harry P. Robinson, editor *The Railway Age*.

The circular calling for this preliminary meeting was issued from the office of the *Railway Age*. It is a matter of some interest that it was the original expectation to graft this engineering association upon the existing Roadmasters' Association, which had formerly and has since

exerted considerable influence in matters pertaining to railway track maintenance. However, at its annual meeting at Denver, in September, 1898, the Roadmasters' Association by a close vote decided that it would remain a roadmasters' organization and not by a change of name constitute itself a possible nucleus for the proposed Engineering Association.

At the preliminary meeting a temporary organization was effected with the late Augustus Torrey, chief engineer of the Michigan Central, as chairman, and L. C. Fritch, then superintendent of the Baltimore & Ohio Southwestern, as secretary. The chairman appointed, as a committee to prepare a constitution and by-laws, John F. Wallace, then assistant second vice-president, Illinois Central, chairman; P. Alex. Peterson, then chief engineer, Canadian Pacific; Thomas Rodd, chief engineer, Pennsylvania Lines West of Pittsburgh; C. H. Hudson, chief engineer, Southern Railway, and W. G. Curtis, engineer maintenance of way, Southern Pacific.

At a meeting held in Buffalo on March 30, 1899, a permanent organization of what was then known as the American Railway Engineering and Maintenance of Way Association was effected with these officers:

President, John F. Wallace, assistant second vice-president, Illinois Central;

First vice-president, P. Alex. Peterson, chief engineer, Canadian Pacific;

Second vice-president, W. G. Curtis, engineer maintenance of way, Southern Pacific;

Treasurer, W. S. Dawley, chief engineer, Chicago & Eastern Illinois;

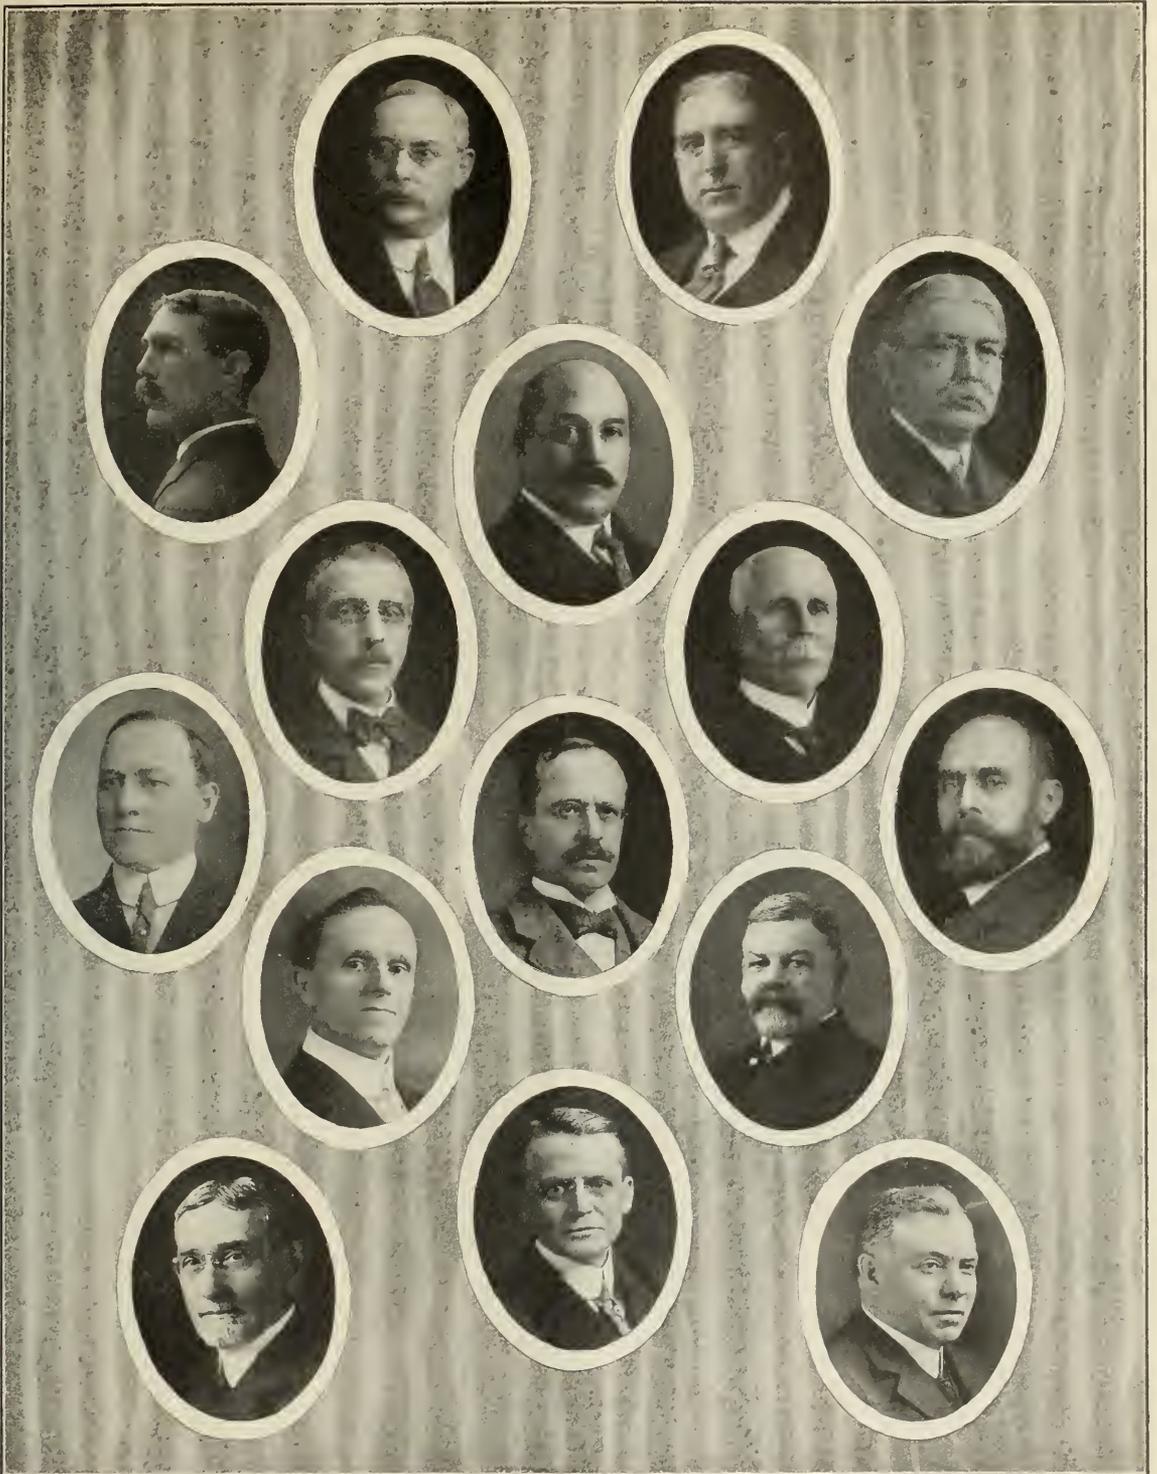

Secretary, L. C. Fritch, superintendent, Baltimore & Ohio Southwestern.

Directors—Augustus Torrey, chief engineer, Michigan Central; Thomas Rodd, chief engineer, Pennsylvania Lines West of Pittsburgh; D. J. Whittemore, chief engineer, Chicago, Milwaukee & St. Paul; F. H. McGuigan, superintendent, Grand Trunk; W. K. McFarlin, chief engineer, Chicago, Rock Island & Pacific; Hunter McDonald, chief engineer, Nashville, Chattanooga & St. Louis.

The first real convention of the association was held in Chicago on March 14 and 15, 1900. The success of this meeting is probably unparalleled in the history of new organizations and no small measure of the success with which the association started off is due to the great ability of John F. Wallace as presiding officer.

The association has in succeeding years honored itself as well as the chosen members in the selection of its presiding officers. Its earlier leaders were: Wallace, Kirtledge, Kelley, Johnston, Berg, McNab, Fritch, Cushing. Several of these have held office for two terms; Johnston declined re-election and Berg was removed by death less than two months after his election. McNab was elected to succeed him. In the more recent years the office has been ably filled by E. F. Wendt, W. B. Storey, Robert Trimble, A. S. Baldwin, J. G. Sullivan and now by C. A. Morse. The last named has had even more than ordinary opportunity to demonstrate his capacity, having been selected by the United States Railroad Administration as assistant director of operation in charge of engineering and maintenance.

At the convention in March of 1911 the name of the association was changed from the American Railway Engineering and Maintenance of Way Association to the American Railway Engineering Association, the old name having proved too awkward and unwieldy. The old name, however, has died hard and even to this day one

The Past-Presidents of the American Railway Engineering Association

- |                 |                 |               |                 |

still bears reference to the "Maintenance of Way Association."

The manual of the association, which, when it was first proposed was described as a means of "bottling up" the concentrated wisdom that had been squeezed out of a vast amount of individual investigation and the interchange of personal experiences—was first proposed by A. W. Sullivan, then general superintendent of the Illinois Central and later general manager of the Missouri Pacific. This first tentative consideration was crystallized at the fourth annual convention into a resolution presented by Mr. Berg, which, promptly adopted, became the foundation upon which the manual has grown to its present proportions and importance. The first edition was published in 1905. That this work has received widespread recognition as an authority is indicated by the purchase of over 2,800 copies of the last edition by the United States Government during the war. The association's specifications for steel bridges, the study of the effects of moving loads upon bridges, the work of its rail committee and the investigation now in progress on stresses in track are matters covered in the Manual or other publications of the association worthy of special mention. For much of this work the association has been indebted to representatives from the faculties of engineering schools who have from the first closely associated themselves in its work to the benefit of the association and with an influence upon their own work whose value can scarcely be overestimated.

### The Last Days of Hiram J. Slifer

News of the death of Col. Hiram J. Slifer at one of the base hospitals in France on February 4, 1919, was a shock to his many friends and acquaintances. Dying in the active service of his country at the mature age of 62, after an active railway career in this country, Mexico and the Canal Zone, his life was not one that ever placed him under Roosevelt's classification of the "men who lead soft lives." His name will go into the records of the association as one who did it honor. Because of his wide acquaintance among fellow members of the association, we welcome this opportunity to present a few facts concerning his last days, in the form of three letters received from France, one of which he wrote himself to his friend, G. E. Greer, which is abstracted below. This gives in Col. Slifer's own words a detailed account of the accident which eventually caused his death.

Col. H. J. Slifer

"Neufchateau (Vosges), France,  
"December 30, 1918.

"On November 13, two days after the Armistice was signed, I went into the German territory to make an inspection of some track where the Germans had mined and blown up an eight-foot embankment every couple hundred feet for possibly a quarter of a mile. I went on the inspection trip on one of our usual six-men gasoline inspection cars. These are just as high as the

standard car, but they are only two feet wide and subject to derailment. I had practically been living on one of these cars during October and November, and never had an accident, although many of our men were injured, but my turn came on November 13. The car was derailed near the town of Buzancy, at the point where the Germans had mined the embankment and track, and I was thrown down the bank, about eight feet high, and into a stream of running water, with the car on top of me. I have always made a habit of running inspection cars in duplicate, that is, running two cars, one following the other, so that in case one car gives out I will have the other to use, and I was very lucky to do so on this particular day, for the reason that the men on the second car discovered my absence and got me out of the water just in time and before I was drowned.

"I worked my way back to a field hospital and was later sent to an evacuation hospital, and I have been in Base Hospital No. 66 at Neufchateau since November 18. Was getting along very nicely when I was attacked with bronchial pneumonia, which affected every part of my system and my heart was very low. In fact, the doctors had some doubt as to whether I would pull through, but thanks to my constitution I am again on the mend, and am leaving here on January 2 for Cannes, on the French Riviera, where I will be at a convalescent camp until I get enough strength to rejoin the regiment, of which I am now in command, as our colonel has been relieved and is chief engineer of the First Army. I shall expect to join the regiment at its headquarters at Conflans and go back home with it, but I do not look for orders much before April or May.

"(Signed) HIRAM J. SLIFER,  
"Lieut.-Colonel, C. of E., U. S. A."

The following letter by Capt. John R. Thompson, addressed to J. Beaumont, of the division of valuation, Interstate Commerce Commission, Chicago, contains an impressive account of Col. Slifer's death and funeral:

"Commercy (Meuse), France,  
"A. P. O. 747,  
"February 5, 1919.

"Last Saturday I was in Conflans, headquarters of the 21st Engineers, and heard that Col. Slifer was in town. I went to his quarters and had a long visit with him. You probably know that he has been in the hospital since he was injured last fall, and he told me Saturday that it was a great burden to him to be in Conflans, but he wanted to see his old friends with the 21st Engineers, and he thought he could stand it, but the strain was telling upon him badly, and when I left him he said that he knew that he had made a mistake in making the effort. He stayed in Conflans over Sunday and on Monday started for the southern part of France, but got only as far as Neufchateau and was compelled to return to the hospital at that point. This morning Col. Howard, of the 13th Engineers, came into the office and told us that Col. Slifer died yesterday and the funeral would be at the hospital near Vertuzey at 12 o'clock today.

"I attended the funeral, and to me it was the most impressive ceremony I have ever attended. It was military, and, considering the circumstances, there was a large attendance. In addition to the prescribed military escort consisting of a firing squad of about 100, a full band, honorary pall bearers of lieut.-colonels and colonels and active pall bearers of captains, there was a large gathering of officers, both from his own regiment and friends. As the body was lowered into the grave in a casket in a large American flag, the firing squad fired three rounds and then the bugler blew taps. Occasional explosions of damaged ammunition in the distance, together with the surroundings, made the ceremony most impressive, and

I will always remember it. Among the officers present that you will know were Capt. Rowland, Capt. Stonp and Capt. J. V. Brown.

"From all I have heard of Col. Slifer's experience in France, he has made an excellent officer both from a military and railroad point of view. He is well liked by all his men, and his death was a great blow to them, as I have heard those who live in Chicago often speak of the time when they could parade through the Loop on their return to the States with their colonel.

"(Signed) JOHN R. THOMPSON."

Some details of the service which Col. Slifer rendered to his country from the time that he was commissioned as major in the Engineer Officers Reserve Corps until he was incapacitated by the accident that caused his death, and a tribute to his ability as an officer of the National Army, are contained in the following letter by M. E. Pumphrey, captain of engineers, United States Army, addressed to the *Railway Age*:

"Headquarters 21st Engineers, A. E. F.,

"February 11, 1919.

"The many friends of the late Lieut.-Colonel Hiram J. Slifer will no doubt be interested in his part of the Great War. Colonel Slifer was commissioned as Major E. O. R. C. on August 15, 1917, and was assigned to active duty with the 311th Engineers at Camp Grant, Rockford, Ill., September 12. On September 20 he was transferred to the 21st Engineers, Light Railway, with which regiment he was connected until the time of his death. On September 28, 1917, he was commissioned Lieut.-Colonel, Engineers, N. A.

"During the two months that this regiment was at Camp Grant he took charge of the picking of the special trained men for the work which this regiment was to do and ably assisted Col. E. D. Peek, regimental commander, in perfecting the organization of the regiment. He left the states with the regiment and arrived in France on January 10, 1918, and proceeded to Challuy (Nievre), near Nevers, France, where regimental headquarters were established. During the few weeks that he was located at this place he assisted in the preparation for construction of important works in this vicinity.

"On February 27 he proceeded with the regiment to Sorcy (Meuse), where he was located until July. It was here that Col. Slifer's experience and ability was to come into play. Sorcy was designated to be made into an important railhead for the American troops, which occupied the Toul Sector. It also was the headquarters of the American light railways in the Advance Zone. In April Col. Slifer was made chief engineer of the light railways, 21st Engineers, and inaugurated plans of construction, maintenance and operation which later proved to be of inestimable value.

"During the month of July, Col. Slifer was engaged in superintending and planning a light railway system to serve the American sector to the south of Luneville. Upon completion of this work he returned to Sorcy to find that preparations were in progress for an action which was afterward known as the St. Mihiel offensive. During the period of preparation Col. Slifer was at his office or in the field every day, working from 12 to 18 hr. out of the 24.

"After the close of the St. Mihiel offensive Col. Slifer was ordered to Vraincourt, Meuse, northwest of Verdun, with the regiment where they took station on October 12. At that time the light railways of that sector were in a deplorable condition and practically no service was being rendered to the combatant troops. By November 1 an immense amount of work had been done on the light railways and the ammunition and rations were being placed within one mile of the front on the Meuse-Ar-

gonne sector. On November 1, the date of the beginning of the final drive, Col. Slifer spent several hours visiting the various detachments which were working under shell fire and encouraged and helped them very materially. During the period from November 1 to November 13 he was constantly with his men under the most trying and dangerous conditions, and it was due primarily to him that the Services of Supply bore up under the strain in the Advance Zone. On November 13, while traveling on a light railway motor which was derailed, his arm was broken. He was taken to a near-by hospital and in the course of a few days evacuated to a base hospital, where he developed pneumonia. Upon his partial recovery from this sickness, he was evacuated to a hospital at Cannes (Mediterranean), where he rapidly recovered his strength. In the middle of January a medical board decided that he be sent home, as it was considered that he would be unable to stand the work under the trying climate where his regiment was located.

"In order to say good-bye to his men, he made a trip to Conflans (Meurthe et Moselle), where he arrived January 31; and on February 2 he started to Bordeaux. Upon arriving at Neufchateau (Vosges) his condition was such that the doctor ordered him to a hospital, where it was found that he had pneumonia a second time. Due to his enfeebled condition, he was unable to survive the second attack, and expired in one of the base hospitals on February 3. On February 5 he was buried at the American Cemetery near Sorcy (Meuse) with the rest of the members of his command who had been killed in action, or who had died in France.

"While Col. Slifer had had no previous military training before entering the National army, he was in every respect a soldier. His remarkable ability was of invaluable help in the transportation service of the advance zone. For practically eight months he lived within 10 miles of the front and spent considerable time within one or two miles of "No Man's Land." It is probable that no commanding officer of any unit in the A. E. F. was more respected or beloved by his officers and men than Col. Slifer. His loss is felt most keenly by all, and the Army lost the services of one of the finest types of Americans.

"(Signed) M. E. PUMPHREY,  
"Captain Engineers, U. S. A."

Col. Slifer was one of the earliest members of the A. R. E. A., being the twenty-first member. He had been active in its work throughout its history and was a member of the Committee on Economics of Railway Labor at the time of his death.

### An Inspection of Steel Ties

The Tri-City Steel Tie Corporation, St. Louis, is arranging to conduct a party to inspect an installation of 306 of its ties in a high speed main track of the Chicago & Alton, at Robey St., Chicago, leaving the Van Buren St. Station of the Illinois Central at 12:15 today. These ties were installed on this track over three years ago and an opportunity is now afforded to inspect them after this exacting service. The party will return to Van Buren St. by 1 o'clock. All interested railway men are invited to make this trip.

### Many Erie Men Attend Convention

The officers of the Erie have arranged for every division engineer and almost every supervisor on the system to visit the convention and exhibit for at least a day. Half of the division engineers and supervisors were present at the meeting yesterday and the remainder will come to-day.

## New Committee Chairmen of the A. R. E. A.

Only five of the 22 regular and 2 special committees of the American Railway Engineering Association have been under the leadership of new chairmen during the past year. In the case of one of these, the Committee on Track, the present chairman, W. P. Wiltsee, is completing the unexpired portion of the term of John R. Leighty, the regular chairman, appointed last spring, and who resigned during the year. Mr. Wiltsee was vice-chairman previously. He has taken an active interest in track

George J. Ray, the new chairman of the Committee on Rail, is essentially a student and one of his particular hobbies is improvement in the quality of rail. Consequently his selection as chairman of this important committee is a logical one. As chief engineer of the Delaware, Lackawanna & Western, he has been responsible for a large amount of constructive work in the study of rail wear and rail failures. One practice in particular for which he is responsible on that road is the segregation of

W. H. Hoyt  
W. P. Wiltsee

G. J. Ray  
B. H. Mann

W. H. Finley  
C. M. Taylor

New Committee Chairmen of the A. R. E. A.

work on the Norfolk & Western, on which road he is assistant to the chief engineer. His interest to track matters extends to the Roadmasters' and Maintenance of Way Association, in which he has taken an active part for some time. During the last two years he has served as an officer in that organization. Mr. Wiltsee has given considerable time to original studies of track matters, one of which has been to arrive at an analytical determination of rail renewals through measurements of rail wear.

the rails laid in the track according to heats, so that it is possible to keep a careful history of each heat of rails rolled for this road. Under his supervision the Lackawanna has been a pioneer in the use of screw spikes and heavy tie plates, his studies along this line having been the subject of an important bulletin published by the association. Although track matters seem to have taken a very large part of his attention, Mr. Ray commands no little distinction as the chief engineer of the Lackawanna during the inception, prosecution and completion of the

world famous Tunkhannock viaduct. At the present time he is on leave of absence in order to serve as engineering assistant to the director of the Eastern region. Aside from the important part he has taken in association committee work, he has served a term as director.

The appointment of C. M. Taylor as chairman of the Committee on Wood Preservation is another illustration of the close co-operation between the American Railway Engineering Association and other organizations specializing in different branches of work carried on by this Association. Mr. Taylor has been an active and valuable member of the American Wood Preservers' Association for a number of years, being one of its vice-presidents at the present time. His position as superintendent of treating plants for the Central Railroad of New Jersey and the Philadelphia & Reading at Port Reading, N. J., makes him eminently fit for leadership of the Committee on Wood Preservation at a time when that industry is passing through a marked transition.

The Committee on Yards and Terminals is headed this year by B. H. Mann, signal engineer of the Missouri Pacific. While his training has been largely along the line of signaling his railroad experience has been so varied, covering Eastern and Western roads both large and small, and he has always been given to studying his problems from a broad viewpoint, that he is in fact well chosen for leadership of this committee. He has, however, taken a very active interest in signal matters, having served as a member of the Railway Signal Association of which he was president in 1912.

The chairmanship of the rather prosaic Committee on Rules and Organization is held this year by W. H. Finley, formerly chief engineer of the Chicago & North Western, and now president of the corporate organization of that road. Mr. Finley's interests are varied and this is only one of a large number of activities in which he plays an important part.

The new chairman of the Committee on Wooden Bridges and Trestles is W. H. Hoyt, who succeeds to the leadership of the committee from the position of vice-chairman. He is assistant chief engineer of the Duluth, Missabe & Northern, where he has had an opportunity to obtain an extended experience in trestle work in connection with the design, construction and maintenance of large ore docks. Mr. Hoyt is an active member of the association, but his interest in engineering society matters is not restricted to this body, since he is also active in the work of the Duluth engineering societies.

### Orders for Steel Rails in Prospect

The committee representing the steel manufacturers will hold a conference in Washington on Wednesday with the Industrial Board of the Department of Commerce, which is seeking the co-operation of the industries in an effort to readjust prices. If a satisfactory price is agreed upon, the Railroad Administration will place an initial order for 500,000 tons of rails. Steel companies have already offered a reduction of \$5 under the prices set last year—\$55 for Bessemer and \$57 for open hearth—but the Railroad Administration wants lower prices.

Director-General Hines held a conference in New York on Monday with the regional directors and also with some of the bankers regarding the plans for financing the Railroad Administration's debts to the railroad companies. A further conference will be held with the railway executives in Washington when the director-general is expected to announce definitely the plan for issuing warrants for part of the amounts due to the railroad companies.

### A. R. E. A. Registration

The following is the registration of the members and guests at the convention of the American Railway Engineering Association on yesterday, the opening day:

#### Members

Abbott, F. E., Insp. Eng., Lackawanna Steel Co., Buffalo, N. Y.  
 Allen, L. J., Ch. Eng., Ann Arbor R. R. Co., Owosso, Mich.  
 Ambrose, J. R. W., Chief Eng., Toronto Term. Ry., Toronto, Ont., Canada.  
 Ames, Azel (in military service).  
 Angerer, Victor, Pres. Wm. Wharton Jr. & Co., Inc., Easton, Pa.  
 Angier, F. J., Supt. Tim. Pres., B. & O. R. R., Baltimore.  
 Armour, Robert, Mas. Eng., Grand Trunk Ry., Montreal, Can.  
 Armstrong, H. J., Asso. Prof. C. E., Armour Inst., Chicago, Ill.  
 Atwood, J. A. (Director), Chief Eng., P. & L. E. R. R., Pittsburgh, Pa.  
 Auten, J. C., Prin. Asst. Eng., Penna. R. R., Wilmington, Del.  
 Bailey, A. R., Asst. Prof., Univ. of Mich., Ann Arbor, Mich.  
 Baldridge, C. W., Asst. Eng., A. T. & S. F. Ry., Chicago.  
 Baldwin, A. S. (Past-President), Vice-Pres., I. C. R. R. Co., Chicago.  
 Baldwin, Hadley, Asst. Ch. Eng., C. C. C. & St. L. Ry., Cincinnati, O.  
 Baldwin, R. A., Asst. Eng., C. N. R., Toronto, Canada.  
 Ballard, E. E., Asst. Eng., A. T. & S. F. Ry., Chicago.  
 Balliet, H. S., Asst. Term. Mgr., Gr. Cen. Ter., and Sig. Eng., N. Y. C. R. R., New York.  
 Baluss, F. C., Eng. B. and B., D. M. & N. Ry., Duluth, Minn.  
 Bardwell, R. C., Asst. Eng., M. P. R. R., St. Louis, Mo.  
 Barnes, O. F., Div. Eng., Eric R. R., Jersey City, N. J.  
 Barrett, J. E., Supt. Trk. B. & B., L. & H. R. R., Warwick, N. Y.  
 Barrett, W. C., Div. Eng., Lehigh Valley R. R., Sayre, Pa.  
 Barry, G. R., Div. Eng., Penna. Lines, Chicago.  
 Barry, H. B., Dist. Eng., St. L.-S. F. R. R., Springfield, Mo.  
 Bates, Onward, Con. Eng., Chicago.  
 Beahan, Willard, First Asst. Eng., N. Y. C. R. R., Cleveland, Ohio.  
 Beall, L. L., Chief Eng., A. B. & A. R. R., Atlanta, Ga.  
 Beckett, F. T., Eng. M. of W., C. R. I. & P. Ry., El Reno, Okla.  
 Bell, Gilbert J., Eng. Western district, A. T. & S. F. Ry., Topeka, Kan.  
 Beugler, Edwin J., Con. Eng., Westinghouse, Church, Kerr & Co., New York.  
 Beye, John C., Oak Park, Ill.  
 Blum, Bernard, Div. Eng., Nor. Pac. Ry., St. Paul, Minn.  
 Boardman, Francis, Div. Eng., Elec. Div., N. Y. C. R. R., New York, N. Y.  
 Bond, F. L. C., Chief Eng., G. T. Ry., Montreal, Can.  
 Boyd, G. E., Div. Eng., D. L. & W. R. R., Buffalo, N. Y.  
 Breckinridge, W. L., Chief Eng., C. B. & Q. R. R., Chicago, Ill.  
 Brenner, Geo. H. (Treasurer), Dis. Eng., Bureau of Valuation, I. C. C., Chicago.  
 Brown, A. V., Eng. M. W., Lake Shore Electric Ry., Sandusky, Ohio.

### The Thirteenth Engineers (Railway)

Friends of officers and men in the 13th Engineers (railway), which was organized at Chicago early in 1917 and which includes a number of A. R. E. A. members, will be interested in the following account of the experiences of this regiment and the part it played in the great war. This was prepared from a memorandum written by Major W. G. Arn. The regiment is composed of men from roads running west and south from Chicago.

The 3d Reserve Engineers, afterwards the 13th Engineers (railway), was organized at Chicago and received preliminary training on the Municipal Pier in that city. On arrival in France the regiment was located in Châlons-sur-Marne for one month, where a preliminary study of French track maintenance of way methods was made. In September, 1917, the regiment was transferred to the Second French Army in the Department of the Meuse, with headquarters at Fleury-sur-Aire, to take over the maintenance and operation of the 6 Bis line of military railroad. The maintenance of this line was assumed in a period of very heavy rainfall, which caused a flooding of the Aire and other valleys in the territory covered by the 6 Bis line, and caused numerous washouts.

The 13th Engineers having been organized without track laborers, the French assigned to this service under the 13th Engineers two companies of Indo-Chinese troops from the French province of Tonkin. Being intelligent, these men quickly learned the various features of track maintenance and made an excellent force. They are very sober, industrious and amenable to discipline, but small of stature. The personal and camp cleanliness of these troops was remarkable.

At the time the 13th Engineers took over the 6 Bis line it consisted of a main line 60 kilometers long from Sommeille-Embranchment to Dugny-Grand-Vaux with 13 kilometers from Fleury to Souilly double tracked, and two single track branches, one from Fleury to Clermont-en-Argonne and the other from Souilly to Dombasle. At that time the work of constructing second track from Sommeille-Embranchment to Fleury was under way, this work being handled entirely by the 5th French Engineers.

The amount of railroad construction work in the Second French Army sector having increased to such an extent that the force of the 5th French Engineers in that territory were inadequate for all of the supervision, the 13th Engineers were assigned to take charge, under the direction of Commandant De Lastours of the 5th French Engineers, of some of the work, the labor to be furnished by the French Second Army.

For building an artillery loading and unloading yard at LaCousance, Madagascar negro labor troops of the French Colonial Army were assigned, the work being directed by experienced officers and men of the 13th Engi-

neers. The Madagascar negroes were of very low intelligence, extremely lazy and inefficient. After the work had partially completed the French Army found it necessary to take the Madagascar troops for other service and the job was finished by the band and all men of the 13th who could possibly be spared from other service.

Other construction work of a like nature carried on was the grading and construction of tracks for the ammunition yard at Evres, the grading for a railroad yard at Pierrefitte, the completion of grading for a military railroad between Gimcamp and Pierrefitte, and the erection of a station and camp buildings for the railroad from Loxeville to Pierrefitte.

The grading and track work on that part of the line of railroad from Loxeville to Pierrefitte, which was handled under American supervision, was performed by the Indo-Chinese troops, with the exception of the building erection, which was done exclusively by members of this regiment. At the time the 13th Engineers were asked to take charge of the completion of this work there was no force in the French Army available for the service, so it was decided to transfer the two companies of Indo-Chinese who had been serving on maintenance of way work on the 6 Bis line to this work and replace them on the 6 Bis line with Americans. In the meantime legislation having provided for increased strength in railway regiments, the 13th Engineers was increased to the extent authorized and from the increased force sufficient men were obtained to provide a maintenance force on the 6 Bis line.

During the period of training preliminary to taking over the 6 Bis line the members of the maintenance of way force assisted the French force in repairing cuts in the track caused by enemy shell fire, there being considerable activity of the German artillery and aeroplanes at that period which followed the French attack and advance of the August immediately preceding. During the fall and winter following there was a limited amount of shelling along the line, but in very few cases was the track cut.

The railroad operated and maintained by the 13th Engineers was increased from time to time by the addition of the old lines of the Est Railway from Clermont-en-Argonne to Verdun, from Clermont to St. Menhould, from St. Menhould to the trenches north of Vinne-la-Ville, from Ancemont to Verdun, from Verdun to Conflans, from Ancemont to Lerouville, from Verdun to Sedan, and the 19 Bis military line which, in connection with existing lines of the Est Railway, formed a belt line around the city of Verdun and its suburbs.

Immediately preceding and during the period of the American advance in the territory between the Argonne forest and Verdun the line was cut repeatedly in various places, especially in the Verdun terminal, where there were six separate places that the track was cut in one morning. The general rule in cases of shell fire was that repairs were not made until shelling ceased, except in cases of very urgent need for the track, and in such cases it was necessary to make the repairs under shell fire.

A letter from another member of this regiment, dated Feb. 24 and received last Saturday, indicated that this regiment would be moved from Fleury-sur-Aire about March 15. The record which this regiment has made for itself is indicated by the fact that 9 officers and 22 enlisted men have received the French Croix de Guerre. Since the departure of Col. N. L. Howard recently for America (he arrived in New York on March 12), Major Arn has been in command. Recent press reports indicated that the Thirteenth regiment itself may be expected to return within a few weeks for demobilization after an active service of nearly two years.

# Annual Meeting of Appliance Association

President Trees' Address; P. C. Jacobs Is Elected  
President; Change Made in By-laws

THE ELEVENTH ANNUAL MEETING of the National Railway Appliances Association was held in the Coliseum at 11 o'clock yesterday morning. M. J. Trees, president of the association, in opening the meeting, spoke briefly of the work of the past year and reviewed the developments of the past year. He said:

## President Trees' Address

The eleventh annual exhibition opened with every space filled. This would seem fully to justify the change in the floor plans made last year which gave 31 additional exhibit spaces. The registered attendance, including only those visitors who presented passes or railroad transportation cards at our exhibit on Monday, 1918, was 2,942, and on Monday, 1919, was 3,612. This would seem to indicate a large attendance of railroad men this year.

In further patriotic support of the government, your board of directors during the year authorized the purchase, from the surplus, of \$3,000 Third Liberty Loan Bonds and \$3,000 Fourth Liberty Loan Bonds.

It was decided best that the charge for exhibit spaces for this exhibition should remain the same as last year, notwithstanding the present higher cost of all commodities that enter into a display of this kind. This naturally resulted in absorbing a part of our surplus. In this connection your board of directors, after passing through the uncertain times of the last two years, is of the unanimous opinion that a substantial financial surplus should always be maintained to assure the stability of our organization. Our director of exhibits will explain to you briefly how you, as exhibitors of this association, can help to reduce the operating expenses and thus obviate the necessity of establishing abnormally high rates on exhibit spaces.

It has been suggested that some distinction be made between an exhibiting and a non-exhibiting member of our association. This change would necessitate an amendment to our present constitution and by-laws which is to be presented for such action as you may wish to take.

Our secretary mailed out this year more than 10,000 invitations and passes to railroad men and others who might be interested in our exhibition. The principal reason for using passes is to restrict the attendance as much as possible to those who may have some interest in the products of our exhibitors. In the past there has been some needless expense and duplication in the distribution of passes, due to a few of our members mailing a large number broadcast to lists of railroad men who, no doubt, have already been officially invited and furnished passes by our own secretary.

Invitations were also sent this year to a list of the foreign consuls located in Washington, as well as to a number of foreign commissions who are now traveling in this country studying railroad problems.

In closing, permit me to express to you the appreciation of your board of directors for the earnest co-operation that our members have shown during the past year. I also wish to thank personally the members of the board of directors and our most efficient secretary, Mr. Kelly, for the splendid way they have all worked together in handling the affairs of the association for this exhibition.

## Treasurer's Report

C. W. Kelly, the secretary-treasurer, made the following report: While this year will be operated at an esti-

mated loss of \$5,000, it is not unexpected, because while floor space and membership remained the same, the expenditures have been greatly increased in practically every channel. There is a marked advance on labor, on decorations and installation. There were also some exhibits which came in at a late hour which had to be handled on over-time and were further belated due to rainy, bad weather.

With the general high prices which are now in existence and have been during the formation and construction of this exhibition, the treasurer feels gratified indeed to be able to make a report with as little loss as herein indicated.

## Secretary's Report

Mr. Kelly also presented a report as secretary of the National Railway Appliances Association, in which he referred to the changes which had been made at the Coliseum this year in the handling of exhibits. He said, in part:

At the time of awarding space, the floor contained, as last year, 267 spaces, of which all were awarded with the exception of some 36. The entire floor plan, however, was filled by January 2. There were a few necessary changes which were occasioned due to business conditions and the floor plan was completely filled, as is now represented on the floor of the exhibition building, about the first of March.

There are at this time 36 non-exhibiting memberships and some 41 requests for space which do not hold either membership or space contracts. This is a very unusual showing to the credit of the association in the light of existing conditions.

We were successful this year in securing the Coliseum building so that we could locate the exhibits and fixtures on Tuesday, March 10, but due to lateness of shipment by a number of exhibitors, together with the lateness of the arrival of Chicago exhibits, there was received at the Coliseum building very few exhibits until Thursday noon, a greater part of these being exhibits which had arrived early and were held in storage for delivery to the Coliseum. The great bulk of our exhibits arrived Saturday morning and up to a late hour Sunday night. This occasioned a great deal of confusion and has been responsible for much additional unnecessary expense.

The enrollment has been carried out exactly along the lines of policies established last year and at noon on Monday we had registered and delivered badges to 65 more of our members than for the total enrollment of last year.

We have inaugurated this year a new style of door pass for checking incoming exhibits, which has been very successful, indeed, in handling the exhibits at the door. We will inaugurate a new exit pass which will allow the exhibitor to give a complete list of his several packages and parcels, and enable him to secure a receipt for his exhibit, and at the same time give to the association an original receipt with an attached coupon which may be used by the exhibitor in case some cartage company should have to call for the exhibit.

The arrangement for bills of lading, both for freight and express, will be handled exactly as heretofore, and the J. M. Taft Cartage Company, as well as the express officials, will occupy the present office of the secretary.

## A. R. E. A.—A. R. A.

where way bills for both freight and express may be properly filled out.

The secretary feels that the operation of our restaurant this year has been up to the standard of previous years and that the management has tried to render us favorable service. It must, however, be borne in mind that because of the few exhibitions held in the Coliseum this year it was necessary for the catering company to move in every article for this service on short notice.

### Report of Director of Exhibits

As director of exhibits Mr. Kelly made a number of suggestions as to how the handling of the exhibits at the Coliseum could be improved. Much trouble is now experienced by the fact that the exhibitors do not ship the exhibits in sufficient time. The bills-of-lading should be sent to the secretary's office and local exhibitors should be more prompt in getting their exhibits to the Coliseum. The delay in shipping the exhibits causes a heavy extra expense in delivering them and setting them up. Much expense could be avoided if exhibitors could study them out carefully in advance and advise the Association as to the exact amount of work that would be required. To improve the appearance of the exhibit it is important that standard signs be adhered to; the height of these should not exceed 5 ft. 4 in.

In closing his report Mr. Kelly directed attention to the fact that the Coliseum must be turned back "broom clean" for other occupancy on Saturday night, March 22. As the exhibit closes at 6 o'clock on Thursday evening, the management will require about one-half hour to remove the columns, floors and wires for electric work, after which the boxes will be furnished and work may proceed in crating as late as the exhibitors care to stay.

### Change in By-Laws

The action of the board of directors was approved in making certain changes to the by-laws defining the difference between associate and active members and recommending that the word "active" be inserted at various places in the by-laws. For instance, it is provided that the directors must be active members; active members shall be entitled to one vote; 25 per cent of the active members shall constitute a quorum; and the constitution may be amended by affirmative vote of the majority of all active members.

Article III relating to membership was changed to read as follows:

Section 1. The membership of this association shall be divided into two classes, active members and associate members, who shall be corporations, firms and individuals engaged in the manufacture or sale of railway materials, engineers or contractors engaged in railway construction and publishers of the technical press and others interested in railways.

Section 2. Active membership can only be held by an individual, firm or corporation who has applied for and has been assigned space for the annual exhibition of this association.

3. An associate membership shall have all the rights of members except that of voting and holding office.

### Election of Officers

The nominating committee, of which H. C. Holloway was chairman, reported the following nominations for officers; the nominees were unanimously elected: President, P. C. Jacobs, H. W. Johns-Manville Co., Chicago; vice-president, J. B. Strong, Ramapo Iron Works, Hillburn, N. Y.; treasurer, C. W. Kelly, Chicago, Ill.; directors, E. A. Johnson, Duff Mfg. Company, Pittsburgh, Pa.; and Lieutenant Commander G. C. Isbester, Rail Joint Co., Chicago.

The American Railway Engineering Association is the only one of the seven associations in the railway field which participated in the negotiations leading to the amalgamation of the primary organizations into the American Railroad Association, which still retains its individual identity. At the same time it is cooperating in the organization and work of the newly-formed composite association in every way possible. The fact that this has been accomplished successfully reflects to the credit of the officers of the engineering association who have represented that organization in the negotiations.

The suggestion that the leading organizations in the steam railway field coordinate their activities through one common association is not a new one. Three or four years ago a committee of the American Railway Association approached the American Railway Engineering Association in common with a number of similar societies with a plan leading to their voluntary affiliation with that association, but nothing came of the suggestion. Early last spring, following the passing of the roads under government control, the suggestion was revived and Arthur W. Thompson, acting president of the American Railway Association, called a conference of representatives of seven of the leading railway associations, including the A. R. E. A. and the R. S. A., at which it was stated that the government was favorable to the organization of one central railway association to which it could refer matters for expert information in diversified fields.

Although the American Railway Engineering Association was not the only organization approached on this subject whose membership was individual as contrasted with representative or official constituency, its officers emphasized the fact that they had no power to go into any arrangements which would merge their activities with those of any other association and take away its independence of action without expressed authorization from the members. Accordingly on July 25, C. A. Morse, as president of the American Railway Engineering Association, referred the question of the proposed amalgamation to the members of the society for an expression of opinion. Up to September 5, 1918, when the replies were tabulated, out of 668 replies received 577, or over 87 per cent, voted against the amalgamation, while among the 83 who voted in favor of the measure were several who qualified their votes with the notation "for the duration of the war."

With this expression of the attitude of the membership before it, the board of direction replied to the American Railway Association renewing the suggestion which it had made on May 14, 1918, that the associations now in existence constitute sections of a proposed American Railway Association or Congress; that each section should be responsible for work assigned and should report through its regular officers to the congress; that the congress should be organized with a director representing each section; that the president be either appointed by the Director-General or elected by the boards of direction, and that there be a general secretary of the congress with such assistance as may be necessary. It was further pointed out that as the American Railway Engineering Association is an individual organization, maintained from the dues of its members and from the sale of its publications and therefore self-supporting, no savings to the railway companies would be effected by the proposed amalgamation.

The plan which was suggested is in a general way the one which has been adopted in so far as the American Railway Engineering Association is concerned. In the

meantime the six other associations to whom the question had been presented had expressed their willingness to participate in the proposed amalgamation. As a result the Director-General issued Circular No. 70 on January 10, 1919, creating the American Railroad Association for the period of the war, "to provide a responsible channel through which the Director-General may obtain recommendation for the advancement of railroad practice."

The activities of the other organizations were merged with and made subsidiary to the American Railroad Association by the provisions of this circular. Membership in the amalgamated association is by roads. Active membership is limited to roads under federal control and 100 miles or over in length. A line is entitled to one membership for each 1,000 miles of road or fraction thereof. The American Railroad Association is divided into five sections, operating, engineering, mechanical, traffic and transportation. The engineering section is further subdivided into three divisions, (1) location, construction and maintenance, (2) signalling, (3) electrical working.

Thus officially the American Railway Engineering Association and the engineering section of the American Railroad Association are entirely separate. However, while the engineering section has been organized along the lines of the other sections, the personnel of its officers duplicates that of the American Railway Engineering Association to such an extent as to insure unity of work and to secure for the American Railroad Association the benefit of the united committee and association work of the A. R. E. A.

The by-laws of the American Railroad Association provide that each section shall be governed by a chairman, a vice chairman and a general committee. At a meeting of the engineering section in New York on February 20 a temporary organization was effected to function until the annual meeting of the American Railroad Association in November. At that meeting the following officers were selected: Earl Stimson, superintendent of maintenance, B. & O., chairman; R. E. Trout, signal engineer, S. L.-S. F., vice chairman; members of general committee, H. R. Safford, engineering assistant to regional director, Central Western region; R. E. Parsons, chief engineer, Erie; C. A. Morse, assistant director, division of operation (in charge of maintenance and engineering), U. S. Railroad Administration; C. F. W. Felt, chief engineer, A., T. & S. F.; J. T. Atwood, chief engineer, P. & L. E.; F. P. Patenall, signal engineer, B. & O.; W. H. Elliott, signal engineer, New York Central; George Gibbs, chief engineer electric traction, Long Island, and E. B. Katte, chief engineer electric traction, New York Central. Messrs. Stimson, Safford and Atwood were selected to represent the American Railway Engineering Association; Messrs. Parsons, Morse and Felt to represent the maintenance committee of the American Railway Association; Messrs. Trout, Patenall and Elliott to represent the Railway Signal Association, and Messrs. Gibbs and Katte to represent the Electrical Working Committee of the American Railway Association. Incidentally all of the members of the committee are members of the American Railway Engineering Association.

As an indication of the close cooperation which will exist between the American Railway Engineering Association and the engineering section of the American Railroad Association, E. H. Fritch, secretary of the former organization, will also become secretary of the engineering section of the composite association and will consolidate his office force with that of the larger organization in the Transportation Building, Chicago.

## The Chicago Terminal Situation \*

One of the important factors contributing to the failure of terminal operations to show the same degree of efficiency that has characterized some of the other departments of railroad operation has been the application of the competitive principle to terminal developments and operations. The railroad systems of our country have been built up on the competitive principle. It was the effort of each railroad company to place itself so that it would be on a parity with its competitors in terminal developments as well as in other matters.

But the application of such a principle as applied to large centers like Chicago falls of its own weight, since it is obvious that each of the railroads cannot secure, maintain and operate adequate terminal facilities in each and every section or district within metropolitan terminal areas where important freight traffic is to be had. The effort to do so has resulted in complications which have increased the cost of terminal operations and in developments which have retarded or placed obstacles in the way of the logical development of the city.

With the entry of our country into the European conflict and the necessity of coordinating all our resources in a manner to obtain a maximum of efficiency, it was early seen that it would be necessary to remedy the very serious condition presented in the competitive operation of our railroads. A sincere effort on the part of the railroads to cooperate on their own initiative was ineffective because of the limitations of existing laws and other conditions. It, therefore, became necessary for the government to take over the operation of the railroads during the emergency.

Theoretically, with all restrictions removed, the government should have been able—so far as existing facilities would permit—to approximate the ideal consolidation of our railroad properties. That this has not been done has been due to many factors, principal of which were the war conditions which had very much disturbed the normal orderly flow of business and traffic.

Nevertheless, out of the temporary control—and in the absence of legislation to the contrary we must assume it is temporary control—has grown a recognition of the desirability of retaining at least those particular features of cooperative operation that are consistent with private control of railroad properties. Certainly today the proposition of applying the cooperative principle to the solution of terminal problems is no longer received as visionary or impractical, and the fact that railroad officers are accepting this principle is in evidence.

From discussions so far published it would seem that the railroads would emerge from the present governmental control under one of the following forms of management:

A. The management of the entire transportation facilities of the country as a unit, somewhat after the manner the railroads are now being operated.

B. The forming of group managements within natural geographic or traffic divisions or regions with or without a central governing board to facilitate interchange between groups.

C. The return to the original individual managements, but with provisions for pooling earnings and expenses—under some form of governmental regulation.

D. The return of the railroads to their individual managements with the pre-war status unchanged.

The alternative treatments of the general transportation problem have been set down above, not in the order of personal preference, but in the order most desirable from the terminal standpoint. The theoretical correct

\*Abstract of a paper presented on March 17, 1919, before the Western Society of Engineers by E. J. Noonan, Chief Engineer, Chicago Terminal Commission.

solution of the terminal problem at Chicago in its entirety would only be possible under a condition in which the entire railroad system of the country was being operated as a whole under a central management—form A given above—because only under such a condition would it be possible to exercise control over a shipment from point of origin to point of destination.

By exercising control over a shipment from origin to destination it is possible to consolidate and route shipments so that a minimum of delay will be incurred in intermediary terminals, and in many instances the shipments may be consolidated and routed so as to entirely avoid large congested terminal areas like Chicago. This of course only applies to commodities which are handled in large volume and particularly to shipments originating in the West and Central West and destined to Atlantic Seaboard points. Where such traffic could not be routed around the Chicago terminal, it could be consolidated so that it would pass through the terminal in solid cuts with a minimum of delay. Even with such a method in operation there would still be a vast amount of freight originating in and destined to Chicago which would have to be handled within the terminal district and the proper coordination and interchange of facilities within the terminal district for the handling of this character of freight is a problem of the very greatest importance.

Should the ultimate treatment of our general transportation system take the form of either "B" or "C" outlined above, it would seem that only through the formation of a terminal company or the pooling of all terminal facilities under one management could a solution of the Chicago terminal problem be obtained. Even then, the same theoretical efficiency that would be possible under form "A" could not be obtained. Should the roads be returned to their individual managements on the pre-war status, it is believed that the impetus given to the idea of cooperative terminal operation has been such that the individual railroads will be willing to take advantage of the mutual benefits to be secured in jointly working out terminal developments especially in the more congested districts.

The railroads approach Chicago from all points of the compass except the Lake Michigan side and within the district there are terminal facilities from some twenty-six railroads which enter the district and some thirteen railroads which lie wholly within the district. During the past few years there has been in operation, at the southwest corner of the terminal area, one of the largest freight yards in the country, and the only yard that acts as a clearing between different railroads. This clearing yard is reached by both the Indiana Harbor Belt and the Western Indiana, over either of which it is possible to reach all of the railroads entering the terminal area. Inside these two belts the Chicago Junction Railroad acts as a partial belt for handling traffic to and from the stock yards and the manufacturing district.

It is believed that with these facilities and the existing facilities of the individual railroads there is sufficient trackage if properly coordinated and used efficiently under unified operations to meet immediate requirements for handling carload freight. Future yard developments on the separate lines entering the terminal district should be located along the outer margin of the terminal area and should be planned for an operation that will simplify switching movements and consolidate as much as possible both through freight and freight destined to points within the Chicago terminal.

#### Less Than Carload Freight

[The speaker described the area and facilities occupied by the railroads for handling L. C. L. freight and re-

ferred particularly to the area between the Union loop and Twelfth street.]

All of the railroad freight houses in this area are of an antiquated type, have practically reached a point where their reconstruction is required in order to afford increased shipping facilities and their operation and construction is such as to cause a maximum of congestion on the streets leading through and to this area. Another thing which impresses one in observing the railroad facilities in this area is the small area occupied by buildings as compared with the great area occupied by tracks. This emphasizes the necessity for a more intensive use of this valuable real estate.

Public interests, shipping interests and economy in railroad operation demand that this entire terminal area be revamped and modern freight house facilities be constructed that will provide adequate shipping facilities that can be operated without undue congestion on the city streets. Such a development would result in a saving in operating costs to the railroads and a utilization of property now superficially occupied. To bring this about it is necessary for the facilities to be constructed and operated along cooperative lines; in fact, it is practically impossible otherwise to bring about the improvement that is necessary in this area.

#### River Straightening

[The speaker outlined the plan for accomplishing a rearrangement of railroad property in connection with a project for straightening the Chicago River. He also described the progress made in passenger terminal improvements with particular reference to the Illinois Central project.]

#### Corrections in Report of American Association of Engineers

In the *Daily Railway Age* of Tuesday, March 18, in the report of the meeting of the American Association of Engineers, J. L. Jacobs, who presented a paper on "Principles and Procedure in Classification of Railroad Engineers," was referred to as being connected with the Curtis Publishing Company. This is wrong; Mr. Jacobs is a consulting industrial engineer with offices in Chicago.

In reporting the remarks of W. W. K. Sparrow on page 658 of the same issue, two paragraphs were omitted, thus making the report incomplete. These paragraphs follow:

I am a railroad man and am speaking, I presume, largely to railroad men and, of course, that is the branch of the profession which, as railroad men, we are most interested in. While urging complete organization of railroad engineers, I do not want anyone to go away with that as the goal in view. A small organization of one section of the profession will not accomplish the desired result. We must have an organization which, when it speaks through its duly elected representatives, will speak for the whole engineering profession of the United States. That voice, gentlemen, will be heard and listened to. We railroad engineers can, however, set the necessary example and strive to organize the railroad section of the National Association in such a manner that it will serve as an incentive to other branches of the profession to do likewise.

The movement of the day appears to be in the direction of organization by classes, and the engineering profession ought to be, and I trust is, alive to the movement. Therefore, let us invite the co-operation of all and use our influence in every direction to build up a National Association which will embrace all branches of the profession and have as its object not only the advancement of tech-

nical research, but the economic, social and political welfare of the profession as a whole.

### A Member of the French High Commission

Captain G. Vanneufville of the French High Commission, buyer of railway supplies for all French railways, visited the National Railway Appliances exhibit yesterday afternoon. He is stopping at the Blackstone Hotel and will remain in town for a day or so only. He is accompanied by C. P. Sanburgand, consulting and inspecting engineer of London, and Edward Lee, who is representing Mr. Sanburgand's interests in New York.

### New Signal Appointments

C. G. McCauley, formerly supervisor of signals and track for the Washington Terminal Company, Washington, D. C., has been appointed engineer of signal construction on the Jacksonville, Fla., terminals, effective March 1. Mr. McCauley reports to the signal engineer of the terminal company in connection with this construction work.

### American Railroad Signal Supervisory

This association held its first annual meeting yesterday in the Elizabethan room of the Congress Hotel. The morning session opened at 10 o'clock with a total registration of 85 members from 28 roads. Among the questions considered were the nomination of officers for 1920 to be elected by letter ballot. The adjustment of the wage situation was discussed in considerable detail with the thought of assisting in straightening out the differences which apparently exist.

### Roadmasters Executive Meeting

The executive committee of the Roadmasters and Maintenance of Way Association will meet at the Auditorium hotel at 10 o'clock this morning to discuss the work of the association and to make plans for the convention which will be held in Chicago next September.

### Supply Man's Son Received Croix de Guerre

Frank Lepreau, vice-president, Thomas A. Edison, Inc., Primary Battery Division, who is in attendance at the exhibit at the Coliseum, was greatly pleased yesterday to receive word that his son, Sergeant William N. Lepreau, with the U. S. Marines in France, has just been awarded the French Croix de Guerre with two palms. This honor was bestowed by Gen. Petain. The honor is the more unusual because of the fact that the recipient is only 18 years old at the present time.

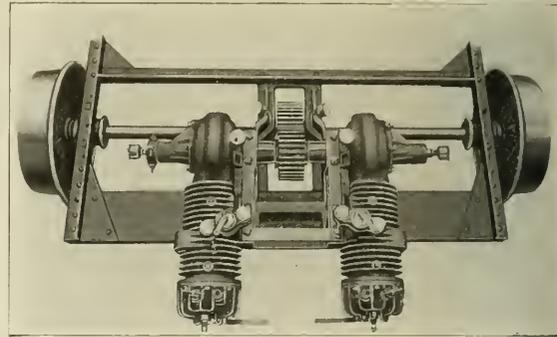

### Studying American Technical Universities

H. F. Streiff, a civil engineer from the Dutch East Indies, visited the convention yesterday and was much interested in its activities. He is now engaged in a detailed study of engineering colleges in the United States for his government. Mr. Streiff is a civil engineer graduate of the University of Delft, Holland, who went to the Dutch West Indies on the completion of his college course. After spending five years in the Bureau of Construction of the engineering department of the Government Railways in that country he was made an instructor in civil engineering in the Technical School at Batavia. In 1914 he was appointed director of this college. In March, 1918, the government appointed him to study the advisability of establishing a high grade engineering college. Mr. Streiff was made a member of that com-

mittee and the chairman of a sub-committee on foreign educational affairs. In that capacity he was sent by the governor to the United States, arriving at Seattle on February 10. After visiting the leading engineering universities in the Central West he will visit several colleges in the East and return to his country via San Francisco and the Philippines.

### A New Method of Applying Power Plants to Section Motor Cars

Mudge & Co., Chicago, has developed and is using a new method of applying the "E" and "G" power plants in the ES-2 and GS-2 section motor cars, which affords unusual accessibility to the entire power plant. This construction is patented and known as the sub-frame construction. The frame consists of a 6-in. 18-lb. channel in front and a 2-in. by 2-in. by 1/4-in. angle in the rear, both of which are riveted to 2-in. by 2-in. by 1/4-in. longitudinal angles. At the corners where the cross members join the side members, strength and rigidity have been secured by the use of gusset plates which are riveted to the cross and side members by four 3/8-in. rivets in each corner of the forward end and five 3/8 in. rivets in each

View of the Sub-Frame Construction

corner of the rear. The cast iron base is then bolted to the power plant frame, the entire arrangement being designed so that the greater part of the weight of the engine is carried directly on the channel.

The advantage of this construction is the distribution of the entire load on the Hyatt roller bearings and boxes which are bolted to the longitudinal angles by four bolts in each bearing. This is a safeguard against bending strain on the driving axle. Another advantage is the accessibility to the power plant, as, by removing the six bolts and nuts which attach the power plant frame to the car frame and disconnecting the throttle, timer controls and fuel lines, the cylinders, carburetors, wheel, axles, etc., can all be taken out from under the car in the same manner as a pair of trucks are removed from a box car.

### A New Type of Storage Tank

One of the shortcomings of the steel storage tank for the handling of bulk materials such as coal, ashes or sand, is the difficulty of maintaining the plates exposed to the contents since such materials, as a rule, have the effect of abrading the interior surfaces, making it practically impossible to maintain a coat of paint. As a result there is little or no protection against rusting and the life of the plates is considerably less than that of the rest of the structure. To overcome this difficulty the Green

Engineering Company, East Chicago, Ind., has developed a plan for combining structural steel with cast iron whereby the steel is used for the frame or load-carrying members, while the cast iron is applied in the form of plates and other parts that make up the container. By this means the load-carrying ability of structural steel is combined with the greater resistance to corrosion of cast iron. There is also the further advantage that the cast iron

made so that the parts exposed to the contents of the tank are all of cast iron. It is equipped with an easy rolling slide operated with a rack and pinion from a wheel and chain.

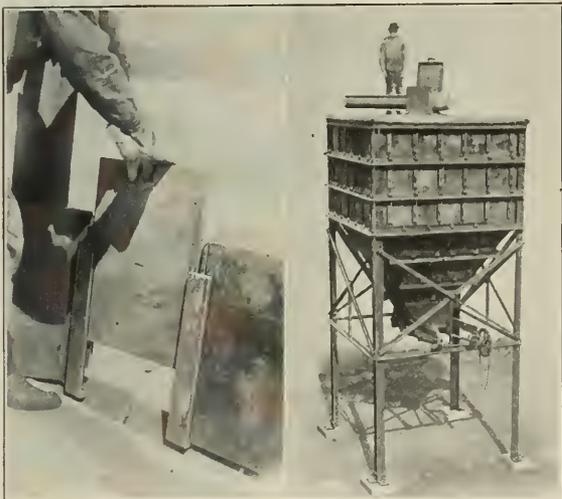

For economy of manufacture and rapid delivery these tanks are made on the standard unit construction basis, but with provision for three sizes—one 9 ft. 8 in. square, one 11 ft. 8 in. square and one 13 ft. 8 in. square. The height of each size may be varied by increments of 2 ft. and provision is made also for combining these unit tanks in batteries, so a large latitude of capacity is available. The lengths of the tower legs may be made to suit the requirements, while the height of the tank may be varied from minimum of 11 ft. for the smallest size to a maximum of 22 ft. 6 in. for the largest size. For railway installations, these tanks have special application for coal bunkers and ash pockets in power plants and for wet sand bins, etc.

Close View of the Hopper Gate

is used for these portions of the structure, namely, the plates, where in the steel erection is the most difficult. On the other hand, the erection of the simple structural steel angle frame and the assembling of the cast iron members is relatively simple.

The character of the construction and the method of erection are shown in the photographs. Structural steel is used for the tower and for the frame of the tank. Cast iron separators having an H-section are hung at proper intervals on horizontal members of the tank frame and form the vertical supporting members for the cast iron

Assembling the Plates

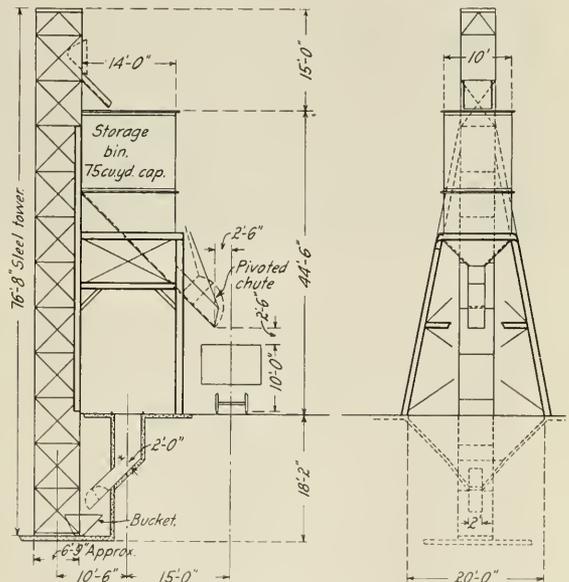

A Tank Complete

plates which are slid down into the grooves formed by the H-section of these separators. Adequate allowance is made for the horizontal lap of the cast iron plates so that the tank is sufficiently tight to hold common dry materials. The design provides for a cover of similar construction, but this may be omitted if the use to which the tank is put does not make this necessary or desirable.

Another feature of this form of construction is the gate provided at the bottom of the hopper. This is also

### Disposing of Locomotive Cinders

One of the most recent developments in engine terminal facilities is the application of equipment used for handling concrete to the disposal of cinders. The Insley Manufacturing Company, Indianapolis, Ind., producers

Side and End Elevation of the Cinder Plant

of towers and spouting for the transportation of concrete, has devised a combination of a track hopper pit with a steel hoisting tower and an overhead storage bin for handling cinders.

The plan provides for a cinder pit about 20 ft. long with a sloping bottom terminating in an opening leading into a hoisting pit of greater depth where a controllable gate is installed to discharge the cinders into a hoist bucket of the Insley roller hoist type. In the installation shown this bucket has a measured capacity of 30 cu. ft. or a net ash capacity of about  $\frac{3}{4}$  cu. yd. A steel tower approximately 77 ft. high elevates the ashes to an overhead storage bin of 75 cu. yd. capacity, this bin being carried on a frame the legs of which straddle the pit track. This bin is provided with a suitable gate and a pivoted chute for discharging cinders from the bin into a car on an adjoining track.

## An Interesting Application of the Concrete Atomizer

How a waterproof cement mortar may be applied to a leaky masonry surface through which water is seeping under a considerable hydrostatic head is illustrated by the results secured with the concrete atomizer in lining the soffit of a stone arch carrying a double-track line of the Pennsylvania Railroad as well as the Raritan canal over a brook near the passenger station of the Pennsylvania at Trenton, N. J. The situation was so serious as to require the repair work to be undertaken at a time when the government, which was using the canal, found it impossible to shut off the water. In consequence, the work had to be done under the head of water.

The concrete atomizer is a device for the application of

The Arch Soffit with the Concrete in Place

concrete, while in suspension in a stream of superheated steam. The concrete is mixed by means of paddles revolving in a steam-tight drum, from which it is discharged through a piston valve into an adjoining chamber, where it is combined with a blast of steam and discharged through a hose to a nozzle at the point of application. A complete description of this device appeared in the *Railway Age Gazette* of March 19, 1915, page 675.

On the arch at Trenton, the concrete was applied to a thickness varying from four to six inches. No attempt was made to trowel or finish the surface, the finished appearance being as illustrated in the photograph. Owing to the presence of water in the creek it was necessary to conduct the work from a float. A 35-hp. boiler, steaming at about 100 lb. per sq. in., was placed on the bank near the bridge and from this steam pipes were run to the concrete atomizer mounted on the float. Superheating was accomplished by a salamander with a 50-ft. coil of 2-in. double extra heavy pipe. The mode of operation was to apply a jet of steam to a few square feet of the stone surface for a sufficient time to heat the stones to a temperature that would vaporize the water leaking through. As soon as this condition was obtained the hot concrete was jetted on the surface with a pressure of about 50 lb. per sq. in.

In the course of the work it was found that if the pebbles were omitted from the jetted concrete, the material would not adhere to the surface through which the water was leaking. In other words, the small pebbles hammered the hot mortar into the crevices and checked the flow of water. Before the work was started it was feared that the steam released in the inclosed place un-

der the arch would interfere with the visibility of the work, especially on days when there was no wind, but by inclining the jet toward one end of the arch a current was produced which kept the work in sight of the operator, although it was invisible to bystanders.

One difficulty encountered in the work was that whereas it was intended to use a quick setting cement throughout this work, one shipment of cement received was of a kind that refused to set under the conditions imposed. This caused considerable trouble for some time. Other difficulties encountered in the conduct of this work included several rises of the creek level to such an extent as to submerge the float. Many stones in the arch had a vitreous surface of great smoothness, but this did not prevent the mortar from adhering and the work has been made waterproof except at the opening in the arch near the south end where an outlet had been provided for emptying the canal. All of the work was done by Harold P. Brown, New York, who was the originator of the concrete atomizer.

## A New Side Clearance Telltale

THE SIDE CLEARANCE telltale shown in the illustration has been in use on the Elgin, Joliet & Eastern for some time as a medium for warning trainmen and others, who happen to be on the sides of cars, of obstructions between or at the side of tracks. This device

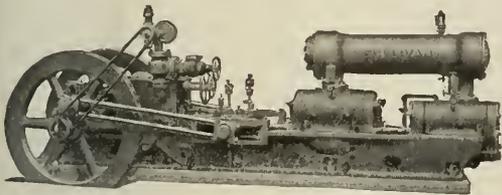

A New Side Clearance Telltale

which is manufactured and sold by Gifford & Co. of Chicago, consists of a vertical staff, at the top end of which are two flexible blades, similar to those used on dwarf signals, fastened at right angles to the staff. The staff is mounted on a metal frame, which serves as a base and also as a fulcrum, from which the staff swings like a pendulum. That portion of the staff above the staff consists of wood, while the part below is a metal bar provided with a counterweight which holds the staff normally, in the vertical position. This counterweight is adjustable so as to permit a variation in the swinging

qualities of the telltale to meet the requirements of the purchaser. This telltale can be used to give warning of the presence of bridges, girders, elevators, coal sheds and other obstructions, portions of which come within the clearance line formed by men hanging on the sides of cars. The flexible blades are intended to be of the same length as the portion of the obstruction within the clearance line; so that a man hanging on the side of a car will hit the blade. If his body comes in contact with the staff it will be deflected toward the horizontal, but will immediately assume the vertical position as soon as it is clear from contact with the man.

### Recent Improvements in Air Compressors

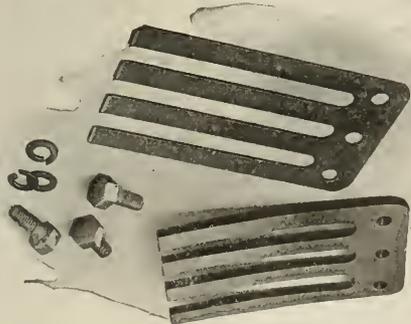

The large photograph shows a new model of steam-operated air compressor of a type applicable to installations supplying air to air-lift pumps, locomotive sanding plants, cinder conveyors, train charging pipe lines and other purposes for which a permanent installation is applicable. It was developed from an earlier type through the introduction of a number of improvements and the

The Type WB-3 Air Compressor

application of some new features. It is of the straight-line type with a single steam cylinder and two air cylinders for two-stage compression and is suitable for air consumptions ranging from 400 to 940 cu. ft. of free air per min. compressed to a maximum pressure of 100 lb. per sq. in.

One of the new features is a speed and pressure governor providing for three adjustments, namely, maximum speed, minimum speed and air pressure, each inde-

The Sullivan End Rolling Finger Valve and Guard

pendent of the other. The speed-controlling element is enclosed in a casing to protect it from dirt.

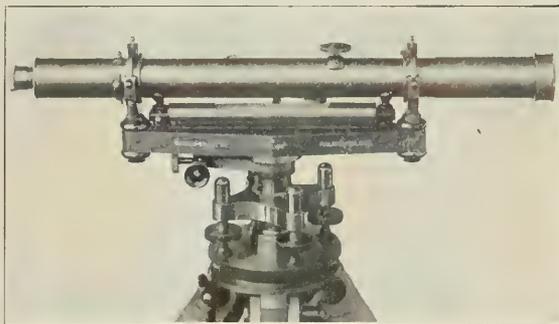

Another new application is the use of "end-rolling finger valves," as shown in the smaller photograph. The valves, which are in the air cylinder heads, consist of thin flat steel sheets cut to form four finger-like blades. These are bolted to the cylinder heads so that the fingers make seats over long, narrow ports, the ports being opened or closed according to whether the fingers are laid flat against the seats or bent backward away from them. To

protect the valves and prevent excessive lifting from the seats they are covered by steel guards having the same general shape as the valves, but made of a thicker material and given a definite curve away from the valve seat. In opening, the fingers impinge against these guards with a sort of rolling motion from which the name, "rolling finger valve," was derived. Advantages ascribed to these valves include rapidity of action, wide port opening with minimum wire drawing and a reduction in the number of moving parts. The end rolling effect also eliminates the hammering or slapping commonly occurring in the operation of air valves.

These pumps are made in two sizes, one with 12-in. by 14-in. steam cylinders and the other with 16-in. by 16-in. steam cylinders. They are designed to operate to a maximum air pressure of 100 lb. per sq. in. with an ample factor of safety for a steam pressure of 150 lb. per sq. in. The compressors are known as the "Sullivan WB-3" air compressors manufactured by the Sullivan Machinery Company, Chicago.

### A Wye Level With New Accessories

Engineers who at some time in their experience have done any appreciable amount of surveying have developed certain well defined ideas on the requirements of surveying instruments for accurate and efficient work. Aside from the necessary refinement of construction, a matter wherein the user is dependent on the reputation of the maker, the accuracy of the instrument is dependent on certain features which are readily subject to the buyer's observation, while the facility with which the instrument may be used in accomplishing rapid work is contingent in a measure upon certain accessories developed from time to time or upon the methods by which these accessories are applied to the instrument. For this rea-

The Sterling Model 16M Level

son a description (or what is commonly termed the "specifications") of an instrument are always matters of considerable interest to men who have used levels or transits or are responsible for their use by others.

The Sterling engineer's wye level, Model 16M, recently developed by the Warren-Knight Company, Philadelphia, embodies a number of features which warrant a rather detailed account of the specifications. The improvements consist in the use of a hardened steel center fitted in a socket of annealed iron, secured to a ribbed level bar of hard bronze. The leveling screws are fitted into replaceable bushings, the leveling head being so designed as to insure an absolutely non-cramping center.

The telescope is set low in the wyes, and the entire instrument is said to be extremely rigid and well balanced. The reflecting mirror on the far side of the telescope, shown in the illustration, may be detached or used on

either the right or left side of the instrument, as desired. The focusing slide and eyepiece are provided with dust guards and the telescope collars are of hard bell metal. A new type of lock screw for securing wye clips is used, and the clamp and tangent screws rotate with the level bar and are always in the same relative position to the operator.

### A Pneumatic Rivet Cutter

"Rivet busting" with a sledge and a cold cut or "buster" will "take the sap out" of a man about as quickly as anything, for it is very hard work. On the other hand, cutting rivets with a chisel bit in a pneumatic riveter is a slow job that has been compared to cutting down a big tree with a hatchet. In other words, there has been a real need for a tool to cut out rivets quickly, cheaply and safely.

One device which lays claim to this distinction is the Red Devil rivet cutter manufactured by the Rice Manufacturing Company, Indianapolis, Ind. This tool is in-

Using the Red Devil Rivet Cutter on Structural Steel Work

tended for removing defective rivets in connection with structural steel erection or repair work as well as for cutting apart old structural steel that is to be saved for re-erection at some other point. This rivet cutter is said to cut a  $1\frac{1}{4}$ -in. rivet in 10 sec. and to dispose of  $\frac{7}{8}$ -in. and 1-in. rivets with from three to five blows. An air pressure of 90 lb. gives the best results with this tool, although it can, if desired, be used with pressures as low as 40 lb.

The mechanical features of the device are simple. It consists essentially of a cold drawn, seamless tube about 5 ft. long with suitable fittings hydraulically pressed onto it at either end. The rear end is fitted with a valve by means of which air may be admitted into the rear end of the tube, while it is permitted to exhaust from the forward end of the tube through a rubber tube by-pass, or, by giving the valve a quarter turn, the air may be admitted through the by-pass to the forward end of the tube and exhausted from the rear end. The forward end of the tube is equipped with a bushing designed to give a good fit for a chisel bit. The interior of the tube is occupied by a plunger ground to fit the tube with just enough clearance to enable it to slip readily from end to end, yet allowing a minimum of air leakage.

As shown in the photograph, three men are required to operate the cutter. One stands at the forward end to guide the bit while two carry the rear ends by means of suitable handles, one of them manipulating the valve

lever. By replacing the valve in position to admit air to the rear of the tube, the plunger is driven swiftly against the chisel; then if the lever is given a quarter turn, air admitted through the by-pass returns the plunger to the rear end of the tube, while the air behind the plunger escapes through an open port. After a little practice the workman can operate the rivet cutter either fast or slow or strike heavy or light blows. This enables him to give a light blow when the rivet is almost cut off to prevent the head from flying. Springs in each end of the tube absorb all the shock of the plunger other than that given to the chisel, so it is not difficult to hold the device when in use. The rivet cutter weighs 65 lb. in an operating condition and has a total length of 58 in. Under average conditions three men operating the tool are said to cut from 25 to 33 times as many rivets as they could cut in the same time by hand. A smaller tool known as the Baby Devil is manufactured by the same company for use on rivets of  $\frac{5}{8}$  in. diameter and less, this machine being handled by two men instead of three.

### More Efficiency in Lighting Installations

One of the perplexing phases of the gradual introduction of high power illumination since the invention of the electric lamp was the long continued use of shades and reflectors of unscientific design. For many years these devices were constructed with little or no consideration of their efficiency in light distribution or of the detrimental effect upon the eye of the bright glare of the unshaded filaments. But gradually the closer study of illumination resulted in the introduction of lamp fixtures that effected a maximum use of the light available and whereas these principles were first applied only to the more expensive installations, consideration was given eventually to the improvement of fixtures of a type suit-

An Industrolite Fixture

able for industrial installations and other applications where efficiency had to be combined with moderate first cost and economical maintenance.

As an example of a type of lamp fixture adaptable to use in shops, roundhouses, freight houses, etc., the lamp shown in the illustration indicates how efficiency may be obtained in a moderate priced fixture. This is an all-steel porcelain enameled shade design for use with type "C" lamps. It consists of a shade over the lamp having a relatively flat reflecting surface with a guard suspended around the globe to shut off the brilliant glare of the filament. But the light thus intercepted is not lost, since it is reflected either to the shade above or to the working surface below the lamp. The open construction of the fixture also provides ventilation. All of the light from the lamp in a fixture of this kind is directed at angles below 90 deg. This fixture is known as the "Industrolite" and is manufactured by the Luminous Unit Company, St. Louis, Mo.

# EDITORIAL

DAILY EDITION

There are many difficulties to be overcome by committees in carrying their work to a successful conclusion. Probably as great a problem as any is that of deciding definitely, when standard practice is to be recommended to the convention, what shall be the scope of the report.

### Difficulties of Report Making

There is always the possibility, in arriving at this decision, of flying too high or too low. If the first is the case, the recommendation becomes theoretical and the man seeking guidance becomes discouraged when he finds that the suggestions cannot be applied to his difficulties in a practical manner. It is obvious that the results of the second alternative are even worse. The association is to be congratulated on the fact that the reports submitted are so universally free from either of these extremes.

One of the most formidable problems ever imposed on this association was the establishment of standards for what we are wont to call "clearance diagrams" for roadway structures. Difficulties have been encountered largely through a lack of co-ordination of the work of this and other organizations of railway men. Thus there are clearance diagrams for bridges and buildings, for third rails and for clearance diagrams for locomotives and cars, each without any relation to the other. As a result the real "clearance"—the actual space between the outside limits of the rolling stock and the nearest projection on the adjacent roadway structures—is a rather indefinite quantity, when, as a matter of fact, it is this clear space that is so important. Is not this objectionable condition caused in part by the inadequacy of the present terminology? "Clearance diagram" does not adequately express what we have in mind. A "limiting dimensions" diagram is awkward and does not express the full meaning. Some better term should be evolved.

### What Do We Mean by Clearance

The strenuousness of the times through which we have been passing during the past year has been reflected in the committee work of the American Railway Engineering Association. The withdrawal of many men from civil into military service has deprived the committees of their services while the demands made upon the time of those remaining at home have been so many and so urgent as to curtail their activities. As a result, the excellent reports which many of the committees have prepared have been due to unusual efforts. It was the experience of several committees that it was necessary to curtail the number of subjects reported on, while in at least three or four instances little or no progress was reported. Now that the war has ended, and the members of the association in military service are returning rapidly to their former positions, these handicaps should be removed in

### The War and Committee Work

a large measure. If the committees to be appointed make as much of their opportunities during the coming year as have those of the present, the association may well look forward to unusually high grade reports at the next convention.

The investigations made by the Committee on Ballast as to the use of reinforced concrete slabs in railroad roadbeds brought out interesting and widely differing opinions from more than 25 chief engineers. While it is true that adverse opinions were expressed by some, the fact that interest was expressed by the great majority is evidence that the studies into this problem should be continued. The use of concrete for this purpose is not new by any means, but its application has been localized largely to tunnels, etc. The investigations, however, indicate its possible adoption for more general use and the conclusions reached by the committee as to its possible field will be received with much interest.

### Further Possibilities for Concrete

One element responsible for the eminent success of this convention lies in the fact that C. A. Morse, president of the American Railway Engineering Association, is also the chief engineering officer of the United States Railroad Administration. In the course of the discussion on many of the subjects submitted by the committees on Tuesday there were not infrequent references to various dealings of the Administration with the railroads—matters concerning which there may have been some misunderstanding. Mr. Morse has evinced a happy faculty for explaining the Administration's point of view. In several cases by a straight forward statement, coupled perhaps with one or two homely illustrations, he was able to demonstrate the nature of the problems with which he is confronted as assistant director of the division of operation in a way that has cleared up the difficulties.

### C. A. Morse, Director of Maintenance

Railway maintenance men are now facing the problem of Americanization to an extent never before realized. It is becoming evident that the railroads, in justice to themselves, and for the welfare of the country as a whole, must do their share in helping the foreigner to gain a real conception of American ideals and to enroll him as a substantial and creditable citizen. The events of the past three years have awakened the nation to the vital necessity of doing this and of the grave danger of neglecting the foreigners among us and allowing them to live by themselves, and according to the traditions and ideals of their native countries—ideals which in many instances are at direct variance with those of this nation. The

### The Americanization Program

705

seriousness of the problem has been emphasized in no uncertain manner since the world war started in 1914, but the danger is that the necessity of improving conditions in this respect will be overlooked and forgotten, now that active warfare has ceased. Many of the large industries have made great strides in Americanizing their foreign-born employees; this they have done from business as well as patriotic motives. It has paid so well in the elimination of friction and misunderstandings, and in the better and more orderly government of the industrial communities in which they are located that they are being encouraged to go forward with still more elaborate plans. The Pennsylvania railroad has made excellent progress with its schools for Italian and other foreign-speaking employees and with its instruction in better citizenship; the results have been worth while and other roads can well afford to develop similar programs.

## A Service to the Country

THE YARDS AND TERMINALS COMMITTEE TOSE to the occasion in a splendid manner last summer when it prepared and issued several reports of timely value for immediate use. That on unit operation of terminals in large cities was of special service at the time when the Railroad Administration was endeavoring to co-ordinate such facilities in order to increase their effectiveness and capacity for the handling of the tremendous traffic of the country at a time when delay in the movement of a large proportion of the business could not be tolerated. The preparation of a series of fundamental principles by this committee whose members had given this subject special consideration for a considerable time, was highly valuable to men who had the new problem thrust upon them with little chance for preparation. The association published this report as soon as it was available. It can well afford to follow the same practice with respect to reports of other committees whenever early need for the information arises. The association can be of the greatest value to the railway industry by giving first consideration to the problems of greatest importance, and then by making the results of its investigations available at the earliest practical date.

## More Work to Be Done

THE A. R. E. A. IS NOW twenty years old and has brought forth more than a "three-foot bookshelf" of proceedings, bulletins and manuals during the two decades of effort. In view of these results it has been questioned whether there is enough work left to keep twenty or more committees busy for the next twenty years. After listening to yesterday's discussions the answer is unreservedly—yes. The discussion of the Tie Committee's report on screw spikes is a most eloquent confirmation of this view. Mr. Ray's lucid demonstration of the excellent results secured with screw spike track construction as opposed to the data accumulated by the committee and as borne out by the extended investigation made by officers of the Pennsylvania, goes to show that there are two schools of thought on this subject, each group being equally sincere in its views. In scientific matters such a divergence of opinion is not the result of prejudice, but shows a lack of complete data or a failure to appreciate the full significance of all the evidence at hand. More time and further study are necessary for an adequate correlation of the facts that will permit a sufficiently accurate analysis to disclose the real truth. Such matters as these will keep the association busy for many years to come.

## Mr. Hooley on the Coliseum Exhibit

By F. W. Lane

"THE EXHIBIT at th' Collyseum 's icipitionally good this year," casually remarked Mr. Hooley as he wiped off the bar and noticed that he was alone with his parasitic friend Dennissey.

"Exybit, what it is?" inquired Dennissey, desirous as ever of showing Mr. Hooley that species of gratitude which is a lively expectation of favors yet to come. "Ye towld me th' other day that Barnum & Bailey and Ringling's was consollyda-ated. 'S th' show at th' Collyseum agin now?"

"'Tis no circus, Dinnissey, iv we icipit th' times when two min ripsinting compating lines are manoeuvrin' t' attract th' fav'rable attintion av th' same man t' th' material they've got on exybition," replied Mr. Hooley, reflectively.

"No, Dinnissey, 'tis th' exybit av relrod thrack supplies that th' ingineers that's havin' a convintion at th' Congress hotel are supposed t' be intrusted in, 'nd some of thim do go t' say it, iv they don't have nothin' better to do. 'Twould pay ye t' git a tickut fr'm somebody that wud take ye fr'a thrack man 'nd go down 'nd see it. 'S I towld ye tin years ago on a sim'lar occasion, ye might be able t' tell a simmyfor fr'm a watherspout, or a whalebarrow fr'm a hand car. But ye cud shine in discussin' th' merits av th' picks 'nd shovels, fr', 's far's my knowledge goes, them's th' only tools ye've more thin a passin' acquaintance wit'.

"I wudn't advise ye t' thry t' get int' th' intricacies av th' signal systems, fr' that ye'er knowledge av such things, as dishplayed by ye whin I was tillin' ye about th' signal min indicates t' me obsarvin' mind that there's many things that beyant th' limmuts av ye'er philosophy, Horatio, t' quote me frind th' bard av Avon agin. But they's switches 'nd frogs—not th' kind ye eat the ligs av—'nd iv'erything th' relrod min use on th' right av way, icipit dagoes.

"But I stharked in t' till ye why th' exybit this year's bether than iver before. Ye see, 'tis this way: Fr' sivaral years th' relrods 've bin too poor to spind money on such things as kapin' th' thrack in first class shape, or iv they've had th' money they had to spind it in kapin' up th' wages av th' other departmints. Ye mind what I've towld ye about th' raises in wages av th' injinemin 'nd firemin. Will, ye see, iv th' relrods don't have money to spind fr' thrack maintenance they don't buy thrack tools, 'nd thrack supplies, 'nd that, I asshume, is wit'in ye'er comprehension. So th' manufacturin' companies that's ripsinted at th' Collyseum exybit have had time t' get up new 'nd timptin' appli'nces—that's what they call thim, relrod appli'nces—'gainst th' time whin th' roads begin again t' buy thim.

"It sthands t' rayson, Dinnissey, that th' thrack can't go on foriver wit'out some woruk bein' done on it, whither th' guv'mint kapes th' roads or not. Fr' that rayson, iv fr' no other, th' min that make th' tools th' relrods ought to use have got together a fine colliction. 'Tis a grea-at show, Dinnissey.

"'Tis th' time now, Dinnissey," observed Mr. Hooley, reflectively, by way of a snapper to his previous observations, "'tis th' time now fr' arl good min t' come t' th' aid av the parthy. Only, Dinnissey, th' parthy an't th' wan that generaly nades our assishtance. 'Tis th' thruue pathrite that putts th' good av his cuntry above mere parthy consid'rations. Now whin we've licked th' Boshe, th' thruue pathrite's thryin' t' hilp th' cuntry out av th' hole th' Boshe got it into, 'nd wan av th' bist ways to do

us is t' hilp th' relrods get on their bote fate. D'ye get my manin', Dinnessey?"

"Wud ut hilp anny iv I go t' the Collyseum?" inquired Dinnessey, with some show of feeling.

"It might show ye've got some pathrotic spirrut in ye, as well's th' other kind," answered Mr. Hooley, pushing forward the tools of his trade.

## Automatic Train Control Committee on Western Trip

THE AUTOMATIC TRAIN CONTROL COMMITTEE, appointed by the Railroad Administration on January 14 to investigate devices for automatically stopping a train in the event of failure of the engineer to obey signal indications, and so far as possible when the signal fails to indicate a condition requiring a stop, is beginning this week a trip to inspect several such devices which have been installed on western railroads, with a view to making recommendations to the Railroad Administration for further installation on a large scale of such devices as it deems practicable. The committee will leave Chicago Friday afternoon to inspect on Saturday the operation of the Miller Train Control System in service on the Chicago & Eastern Illinois between Chicago and Danville, Ill., and it will again leave Chicago on Sunday for Spokane, Wash., for an examination of an automatic stop on the Washington Water Power Company's railway. Thence it will proceed to San Francisco, where such a device is in service on the line of the Key Route Electric Railway, and to Oroville, Calif., where an installation has been made on the Western Pacific. Later it will look at other devices on eastern roads, including one in service on the Chesapeake & Ohio.

The committee's instructions from the Division of Operation of the Railroad Administration were "to proceed at once to make a study of, and report upon, the automatic train control devices now undergoing test upon various lines of railroad or available for test, with their recommendations for the installation and further practical test of any devices now or during their investigation made available for that purpose, which they may consider practicable and reasonably conforming to the purposes to be accomplished. The report of the committee will include recommendations upon the requisites of automatic train control and conclusions upon the mechanical or economic features of such of the devices as the committee may find available for practical use."

The Chicago & Eastern Illinois was a pioneer in the development of an automatic stop and now has the most extensive installation of the kind in the country. It has been in regular and satisfactory operation on the double track line from its Dolton Yard, in Chicago, to Danville, a distance of 106 miles, since the fall of 1914, after 3 or 4 years had previously been spent in experimenting, testing and developing the train control system. During the 4 years since the device was put in regular service particular attention has been given to perfecting its operating efficiency under all weather conditions and service requirements.

The first action of the Automatic Train Control Committee was to draw up a list of requisites for the design and construction of an adequate automatic train control system and at its meeting in Washington the committee passed on about 250 plans for automatic train control devices submitted to it, most of which had previously been examined and reported on by the Interstate Commerce Commission. After an examination of the plans the committee has eliminated all but 36 of the devices as not meeting the requirements, and it is now concentrating

on those that have proven their merit in service or which are regarded as worthy of more careful consideration, with a view to selecting one or more different types for further practical test.

The chairman of the committee is C. A. Morse, formerly chief engineer of the Chicago, Rock Island & Pacific at Chicago, now assistant director of the Division of Operation of the Railroad Administration and president of the American Railway Engineering Association. The other members are W. P. Borland, chief of the Safety Bureau of the Interstate Commerce Commission; C. E. Denney, assistant to the federal manager of the New York, Chicago & St. Louis; H. S. Balliet, signal engineer, electric division of the New York Central; Henry Bartlett, chief mechanical engineer, Boston & Maine; J. H. Gumbes, general superintendent of the Western Pennsylvania grand division of the Pennsylvania Railroad, and R. W. Bell, general superintendent of motive power of the Illinois Central. G. E. Ellis, heretofore signal engineer of the Interstate Commerce Commission, is secretary. The members of the committee are attending the convention.

### Today's Program

The program of the American Railway Engineering Association convention for today is as follows:

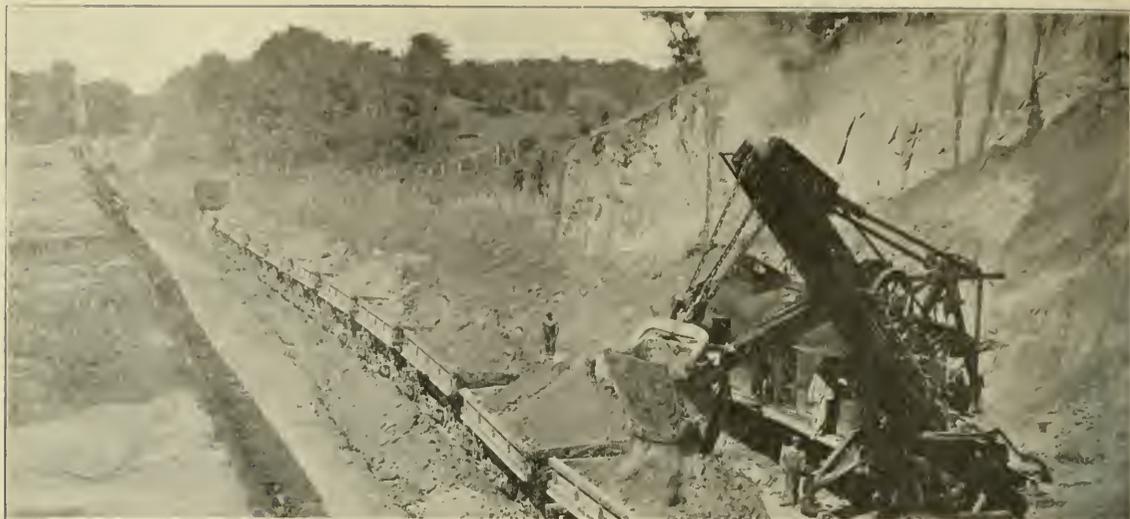

- Iron and Steel Structures.
- Masonry.
- Water Service.
- Wooden Bridges and Trestles.
- Uniform General Contract Forms.
- Economics of Railway Operation.
- Economics of Railway Location.

### Pennsylvania Railroad Recognizes A. R. E. A.

For the first time in the history of the American Railway Engineering Association, the Pennsylvania Railroad has sent a number of its officers to attend the meeting. Thirteen officers of the maintenance of way department arrived yesterday morning to spend several days in attendance at the conventions and the exhibit at the Coliseum. While officers of this road have attended the meetings in past years, they have done so as individuals and without official instructions; this year they are here under orders from their superior officers. Those composing the general managers' committee representing the Pennsylvania Railroad, Lines East, at the convention include: J. B. Baker, supervisor, general managers' office; J. C. Auten, principal assistant engineer, Southern division; J. H. Harris, principal assistant engineer, New Jersey division; G. H. Brown, principal assistant engineer, Eastern Pennsylvania division; J. O. Hackenberg, division engineer, Maryland division; T. J. Skillman, division engineer, New York division; H. H. Garrigues, division engineer, Philadelphia terminal division; J. H. Reading, division engineer, Middle division; E. B. Wiseman, division engineer, Buffalo, division; E. J. Ayars, division engineer, Williamsport division; C. W. Richey, assistant division engineer, Pittsburgh division; J. M. Fair, supervisor engineer maintenance of way office, and George Ehrenfeld, supervisor, Pittsburgh division.

### Japanese Officer Visits Convention

Baron Chuzo Mori, civil engineer with the Imperial Government Railways of Japan, with headquarters at Tokio, Japan, and temporarily stationed at New York City, has been an interested attendant at the convention and the exhibit at the Coliseum.

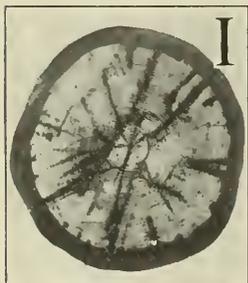

# American Railway Engineering Association Proceedings

A Report of Wednesday's Sessions Including Presentation of  
Nine Committee Reports With Discussions

**T**HE SECOND DAY'S SESSION of the convention of the A. R. E. A. was called to order at 10 o'clock by Vice-President Stimson in the absence of President Morse, who was confined to his room by illness. The room was unusually well filled throughout the entire day.

Reports were presented by the committees on Wood Preservation, Yards and Terminals, Electricity, Ties, Stresses in Railroad Track, Buildings, Ballast, Roadway and Rail. These reports and the discussion which they brought out are given below.

## Report of Committee on Wood Preservation

**I**N APPENDIX A the committee submits changes and additions on the following items and recommends their adoption under the heading of Conclusions.

- (a) Revised specifications for creosote oil.
- (b) Revised specification for creosote-coal-tar solution.
- (c) Revised title to include creosote-coal-tar solution with creosote oil under

methods for determining absorption.

(d) Revised wording and fuller details in the analysis of creosote oil.

(e) Revised specification for zinc chloride.

(f) New specification covering the method for determining the strength of zinc chloride solution.

In Appendix B the committee submits information concerning creosoted water tanks. The committee also submits the results of a very thorough investigation of the Burnettizing treatment and submits for information general conclusions relative to the value of zinc chloride and creosote oil and a mixture of the two. It submits a revised specification for the treatment of ties by the Burnettizing process, which is recommended for adoption under the heading of Conclusions.

In Appendix C, the committee submits as information an improvement of the Bateman method as proposed by the Forestry Service.

The committee reports progress on subjects (3) Water gas tar as a preservative; (4) Uniformity of practice and specifications with other associations; (5) Douglas Fir preservative treatment.

### Conclusions

The committee makes the following recommendations to the Association:

#### FOR ADOPTION AND PUBLICATION IN THE MANUAL

1—(a) Proposed revision of specifications for creosote oil.

(b) Proposed revision of specification for creosote-coal-tar solution.

(c) Proposed revision of title to include creosote-coal-tar solution with creosote oil under methods for determining absorption.

(d) Proposed revision of wording and fuller details in the analysis of creosote oil.

(e) Proposed revision of specification for zinc chloride.

(f) Proposed specification covering method for determining the strength of zinc chloride solution.

2—Proposed revision of specification for treatment of ties by the Burnettizing process.

## ACCEPT AS INFORMATION

Report on the creosoting of water tanks.

Report on the question of the treatment of ties with zinc chloride and the general recommendations and conclusions in connection therewith.

Report covering improved method for determining visually the penetration of ties treated with zinc chloride.

## RECOMMENDATIONS FOR FUTURE WORK

Your committee recommends for next year's work the continuation of the subjects now assigned, and as new subjects:

(1) Availability and use of sodium fluoride as a preservative for cross-ties.

(2) Creosote treatment to be used in the protection of piles in teredo infested water.

Committee: C. M. Taylor (P. & R.), chairman; Dr. Hermann von Schrenk (Cons. Timber Engr.), vice-chairman; F. J. Angier (B. & O.), F. L. C. Bond, E. H. Bowser (I. C.), W. A. Fisher, C. F. Ford (C. R. I. & P.), C. J. Graff (N. Y. C.), R. H. Howard (Wab.), C. H. R. Howe (B. & O.), J. E. Johnson (M. C.), G. E. Rex (A. T. & S. F.), Lowry Smith (N. P.), O. C. Steinmayer (S. L. & S. F.), H. Stephens, E. A. Sterling, C. H. Teesdale (Forest Products Lab.), J. H. Waterman (C. B. & Q.).

## Appendix A—Revision of Manual

A joint committee consisting of representatives of the Preservative Committee of the American Wood-Preservers' Association and of this committee conducted a further investigation on the question of "Water in Creosote" with special reference to the water content of oil shipped in tank cars and the sampling of such cars before being unloaded. The work to date strengthens our belief that the Zone Sampling Method, adopted as standard practice (see Vol. 18, A. R. E. A. Proceedings, page 1271), is correct in principle, but that it needs a further refinement for actual application. The committee suggests that this co-operative work be continued until the method is definitely determined for all conditions.

The committee, after a study of the specifications for creosote oil and creosote-coal-tar solution, finds that the specifications adopted in 1912 should be revised. This revision is necessary because increased safe-guards have been developed for enforcing the specifications. The specifications herewith recommended are the result of several years' work of committees of the American Railway Engineering Association, American Wood-Preservers' Association and American Society for Testing Materials. The three revised specifications differ from the specifications now printed in the Manual only in the addition of certain clauses to make the specifications more workable.

## STANDARD SPECIFICATION FOR CREOSOTE OIL

The oil shall be distillate of coal-gas or coke-oven tar. It shall comply with the following requirements:

1. It shall contain not more than 3 per cent of water.
2. It shall contain not more than 0.5 per cent of matter insoluble in benzol.
3. The specific gravity of the oil at 38 deg. /15.5 deg. C. shall be not less than 1.03.
4. The distillate based on water-free oil, shall be within the following limits:  
Up to 210 deg. C. not more than 5 per cent.  
Up to 235 deg. C. not more than 25 per cent.
5. The specific gravity of the fraction between 235 deg. C. grade and 315 deg. C. shall not be less than 1.03 at 38 deg. /15.5 deg. C.

The specific gravity of the fraction between 315 deg. C. and 355 deg. C. shall not be less than 1.10 at 38 deg. /15.5 deg. C.

6. The residue above 355 deg. C., if it exceeds 5 per cent, shall have a float test of not more than 50 sec. at 70 deg. C.

7. The oil shall yield not more than 2 per cent coke residue.

8. The foregoing test shall be made in accordance with

the standard methods of the American Railway Engineering Association.

In addition to the oil conforming to the above standard specification, the two grades specified below may be used when the higher grade oil cannot be procured. The specifications are the same as the standard except as noted below.

## SPECIFICATION FOR GRADE 2 CREOSOTE OIL

4. The distillate, based on water-free oil, shall be within the following limits:

- Up to 210 deg. C. not more than 8 per cent.
- Up to 235 deg. C. not more than 35 per cent.

## SPECIFICATION FOR GRADE 3 CREOSOTE OIL

4. The distillate, based on water-free oil, shall be within the following limits:

- Up to 210 deg. C. not more than 10 per cent.
- Up to 235 deg. C. not more than 40 per cent.

It is urged that when Grades 2 or 3 are used, consideration be given to the injection of a greater quantity of creosote oil per cubic foot.

## SPECIFICATION FOR CREOSOTE-COAL-TAR SOLUTION

The oil shall be a coal-tar product, of which at least 80 per cent shall be a distillate of coal-gas or coke-oven tar, and the remainder shall be refined or filtered coal-gas or coke-oven tar. It shall comply with the following requirements:

1. It shall contain not more than 3 per cent water.
2. It shall contain not more than 2 per cent of matter insoluble in benzol.
3. The specific gravity of the oil at 38 deg. /15.5 deg. C. shall not be less than 1.05 nor more than 1.12.
4. The distillate, based on water-free oil, shall be within the following limits:  
Up to 210 deg. C. not more than 5 per cent.  
Up to 235 deg. C. not more than 25 per cent.
5. The specific gravity of the fraction between 235 deg. C. and 315 deg. shall not be less than 1.03 at 38 deg. /15.5 deg. C.

The specific gravity of the fraction between 315 deg. C. and 355 deg. C. shall be not less than 1.10 at 38 deg. /15.5 deg. C.

6. The residue above 355 deg. C., if it exceeds 26 per cent, shall have a float test of not more than 50 sec. at 70 deg. C.

7. The oil shall yield not more than 6 per cent coke residue.

8. The foregoing tests shall be made in accordance with the standard methods of the American Railway Engineering Association.

The committee recommends that the precaution pertaining to inspection and precautions in the use of the creosote-coal-tar solution, as now appearing in the Manual, be changed to read as follows:

## PRECAUTIONS TO BE FOLLOWED IN THE PURCHASE AND USE OF THE CREOSOTE-COAL-TAR SOLUTION

1. The specifications for a creosote-coal-tar solution are submitted for the guidance of those desiring to use the coal tar addition to creosote.

2. There should be a distinct understanding between all concerned that a mixture is specified and used.

3. The refined coal-tar used shall be subject to inspection or analysis by the railway company at any time, such examination to be permitted upon request prior to the mixing of the solution.

4. In case the railway company makes its own solution of coal-tar and creosote, using crude tar for this purpose, it shall specify clearly as to the quality of the tar. Only low carbon coal-tar should be used, the amount of free carbon not to exceed 5 per cent.

5. The coal-tar may be added to the creosote at treating plants when suitable facilities for properly mixing the solutions are available, otherwise the solution should be mixed by the manufacturer, but subject to the inspection or supervision of the railway company. The coal-tar and creosote should be thoroughly mixed at a temperature of approximately 180 deg. F. before being applied to timber. The mixing should be done in tanks other than the regular working tanks, and the tanks containing the mixture should be heated and agitated thoroughly

each time before any oil is transferred to the working tanks.

6. In treating with the mixture the temperature of the solution in the cylinder should not be less than 180 deg. F.

The committee further recommends that the title on page 548 of the 1915 Manual, dealing with methods for determining absorption, now reading "Methods of Accurately Determining the Absorption of Creosote Oil," be changed to read "Methods of Accurately Determining the Absorption of Creosote Oil and Creosote-Coal-Tar Solution."

#### ANALYSIS OF CREOSOTE OILS

Since the adoption of the revised standard methods for analysis of creosote oil, as printed in the Supplement to the Manual for July, 1917, Bulletin 197, and as a result of co-operative work between committees of this Association, the American Wood-Preservers' Association, and the American Society for Testing Materials, certain slight corrections, changes and additions have been made. The committee recommended that these be embodied in the standard specifications for creosote analysis.

#### ZINC CHLORIDE

The specification of zinc chloride appearing in the 1915 Manual, page 551, is not present practice. It has been revised to conform with present usage, and it is recommended that the following revised specification be inserted in the Manual:

The zinc chloride shall be acid-free and shall not contain more than 0.1 per cent iron. Fused or solid zinc chloride shall contain at least 94 per cent soluble zinc chloride. Concentrated solutions shall contain at least 50 per cent soluble zinc chloride.

#### Appendix B—Service Test Records

The committee reported progress on this work and submitted for information this year the work that has been done by the Illinois Central in using creosoted water tanks as its standard. (*Railway Age*, Oct. 18, 1918, page 709.) The committee feels that other railroads could well afford to investigate the matter of creosoting water tanks, as the life of a water tank depends almost entirely on the prevention of rot, and if the tank and supports are properly framed and treated a very long life can be reasonably expected.

The sub-committee was also asked to make "A critical study of the records of service given by the zinc chloride treatment and state definitely the results which may be obtained from that treatment. The question as to what might be expected from treatment with zinc chloride is of very general interest, particularly under the present emergency conditions.

In the following report the committee presents such records as have been found available, together with discussions, and the conclusions drawn from track experience. It has formulated definite recommendations as to methods to be followed in order to obtain the best results with zinc chloride treatment, with general conclusions as to what may be expected of zinc chloride treated ties when treated and used according to these recommendations.

A careful study of the track records and personal conferences with those familiar with the use of zinc treated ties lead to the conclusion that proper treatment will, at least, double the life of an untreated tie in the same situation. The experience of roads which have used zinc chloride treated ties clearly shows that the best results are obtained only when thoroughly sound ties are treated. Undoubtedly, many of the poor

results obtained with zinc chloride treated ties were due to the fact that many ties were more or less rotten before they were treated. Decayed timber can never be expected to give good service. It is frequently stated that ties can be properly seasoned along the right-of-way or where cut, and that any deterioration can easily be detected by careful inspection. It has been demonstrated beyond all doubt that visual inspection of ties several months after cutting is not only impractical but frequently very misleading, because of the internal decay not evident on the outside. The successful preliminary preparation of ties is one of the most vital factors in obtaining successful service, and it is necessary that ties in all stages before treatment be kept in well-ventilated piles, free from every possible kind of infection. To help prevent these conditions, all ties should be shipped promptly after cutting to the seasoning yard at the treating plant. This means that all yards should be kept free from weeds, decayed wood and standing water.

The best results from the use of zinc chloride treated ties can only be obtained when the ties are thoroughly air seasoned before treatment. This calls for carefully constructed tie piles, care being taken to keep the stringers as far out towards the ends of the piles as possible and with sufficient air spaces between the piles.

Careful records should be kept of the ages of the tie piles, for it has been found far better to treat ties on the basis of age rather than on visual inspection. The time necessary to properly air season will vary, but in general the best results have been obtained by seasoning red oak ties twelve months and pine ties about four months.

In order to assure proper information as to the age of ties, the committee finds that some railroads have adopted the admirable system of end-branding the ties as they are taken up by the inspector, with a figure or paint mark, indicating the month of the year in which the ties were cut, which practice we strongly recommend.

The committee finds that the life of zinc chloride treated ties is greatly influenced by geographical factors, conditions of ballast, the amount of traffic, weight of rail, etc. The service obtained is to be ascribed more to these factors than to the kind of timber or the zinc chloride treatment. In other words, while softwoods like pine have generally given shorter service than hardwoods like oak, this difference is due to the fact that the pine ties rail-cut more rapidly than oak, thereby giving an opportunity for water to lodge under the rail bearings and leach out the zinc salt with the consequent more rapid decay of the pine ties.

Climatic influences undoubtedly have a large bearing on the possible length of life. A study of the tables clearly shows that in regions of low rainfall and dry atmospheric conditions, longer life has been obtained than in regions of high rainfall and high humidity. It is also true that the same holds for regions of low mean temperatures as compared with regions of high mean temperatures.

*Influence and Treatment.*—One of the most striking conclusions obtained, from the study made, is that the quality of treatment has the most direct bearing on the ultimate life obtained. It has been clearly demonstrated that poorly treated ties give short service and well-treated ties give longer service. The committee finds that poor treatment has been caused by: (1.) Excessive steaming of green or partially seasoned ties, in order to obtain any absorption at all. In many cases the absorption even after such steam treatment was very poor. (2.) The injection of an inadequate amount of zinc chloride. (3.) Paying no attention to the relation between the strength of the solution and the duration of pressure, resulting in a large amount of the zinc chloride solution being compacted in the outer layer of wood, when it should have

permeated the entire tie. (4.) The lack of intelligent and thorough supervision.

One of the criticisms of the zinc chloride treatment is that the preservative, being soluble in water, leaches out and, therefore, can not be expected to give permanent protection. A general investigation of the results clearly indicates that the leaching process does not take place as rapidly as has been assumed. We have determined from an examination of ties which have been in the track for a number of years that they still retain zinc chloride well distributed throughout the tie. This is more noticeable in drier climates. The committee finds that while zinc chloride is a water soluble salt, it leaves the wood very slowly and that sufficient is retained in the wood fiber to give protection that will at least double the life obtained from the untreated wood.

One of the results found by actual track inspection is that many zinc treated ties were taken out because of checking. The extent of checking varies with the climate, ballast conditions and the kind of wood, and appears to be peculiar to zinc treated ties and does not prevail with creosoted ties.

As already indicated, zinc chloride treated ties have failed because (1) partially decayed or improperly seasoned before treatment; (2) improperly treated, either from excessive steaming, insufficient absorption of preservative, or unequal distribution of preservative throughout the tie; (3) poorly protected against mechanical wear; and (4) for lack of careful supervision of the entire process of treatment.

These factors have undoubtedly contributed much to the severe criticism of zinc chloride treatment. The committee feels that too much stress cannot be placed upon a proper recognition of these facts. A thorough study has convinced us that many of the records of short life are unquestionably to be ascribed to either one or more of the reasons given above.

Lack of proper mechanical protection stands out strongly as another reason for frequent failure of zinc chloride treated ties. While proper mechanical protection is essential on any treated ties, it is especially important on those treated with zinc chloride. Very slight mechanical abrasion or injury permits the preservative to leach out of the tie. Hundreds of thousands of zinc chloride treated ties have been removed from track in which the ends and middle were perfectly sound, but which failed immediately under the rail base.

Improper inspection and supervision of treatment is frequently responsible for the failure of zinc chloride treated ties. The solution is colorless and gives in itself no indication of its strength, nor is it easy to determine penetration by borings. Visual inspection of penetration is difficult, and more reliance must be placed on volumetric absorption. Slight errors in determining the strength of the solutions may have serious results. Zinc chloride treatment, furthermore, requires judgment of the condition of the wood before treatment, and a complete appreciation of the many variable factors making for good treatment require technical inspection and supervision at all stages.

#### GENERAL RECOMMENDATIONS

As a result of the study made, we submit the following recommendations with reference to zinc chloride treatment and the use of zinc chloride treated ties. The specification submitted takes the place of the one given in 1915 Manual, page 551, headed Zinc Chloride Treatment.

1. *Handling Ties Before Treatment.*—Ties should be promptly brought to the seasoning yard. All piles should be marked showing the age of the ties, and the fitness of ties for treatment should be based on the number of months seasoned rather than on visual inspection. Under

all circumstances there should be absolute assurance that only sound ties are treated.

2. *Treatment.*—All ties should be treated according to the standard specification by the Burnettizing process, as follows:

#### *Specifications for the Treatment of Ties by Burnettizing Process*

*Seasoning.*—No ties shall be treated unless they are thoroughly air seasoned. The railway's representative shall at all times be the judge as to whether ties are seasoned sufficiently to obtain the required absorption of the preservative.

*Classification of Timbers.*—Only the same kind of wood, and, as far as possible, only the same sizes shall be treated in the same charge, unless permission is obtained from the railway's representative to treat certain specified kinds of wood or certain specified sizes in the same charge.

*Absorption.*—The amount of zinc chloride absorbed shall be on the basis of an average of  $\frac{1}{2}$  pound of dry zinc chloride per cubic foot of wood. In any one charge the minimum absorption allowed shall be 0.45 lb. per cu. ft. If the average absorption falls below this quantity, the charge will have to be retreated. The maximum absorption allowed in any one charge shall be 0.55 lb. per cu. ft. Deficiency in absorption in any one charge shall be made up in subsequent charges. Under no circumstances shall the actual solution used be stronger than 5 per cent. In all cases the solution shall be as weak as possible with the highest possible volumetric absorption.

For red oak ties the solution shall be approximately 4 per cent, or less, and at least 20 per cent by volume of the solution shall be injected. For pine and other coniferous woods, the strength of the solution shall be not more than 2 per cent, and at least 40 per cent by volume of the solution used shall be injected. For woods other than oak and pine the volumetric absorption shall be as high as possible. The exact figure to be used shall be determined by the railway's representative. After determining this figure, the solution to be used shall be as weak as possible, consistent with obtaining an absorption of  $\frac{1}{2}$  pound of dry zinc chloride per cu. ft. and the necessary volumetric absorption. The amount of solution absorbed shall be determined by calculations based on the gage readings of the working tanks. The gage or gages should frequently be tested as to their accuracy. This absorption should be checked occasionally by weighing an entire charge of ties before and after treatment on a suitable track scale. The weighing of one charge in ten shall be considered sufficient. The strength of the solution at all times and at all stages shall be carefully controlled by chemical titration, using a silver nitrate solution with potassium chromate indicator.

*Treatment.*—All ties after being placed in the cylinder shall be subject to a preliminary steam treatment for at least one hour and not more than two hours, at a pressure not exceeding 20 lb. After the steaming, a vacuum shall be drawn for one to two hours, and where it is necessary to break the vacuum in order to empty the cylinder of condensed water, a subsequent vacuum shall be drawn following the emptying of the cylinder. In all cases the most complete vacuum, consistent with the elevation of the treating plant, shall be obtained.

The zinc chloride solution shall then be introduced into the cylinder at a temperature not less than 130 deg. F. nor more than 180 deg. F., and a temperature of at least 150 deg. F. shall be maintained throughout the entire operation. A pressure of approximately 125 or more lb. per sq. in. shall be applied for a sufficient period to obtain the proper volumetric absorption.

Any ties, regardless of the amount of preservative in-

jected, shall be deemed completely treated when, at any time during the latter part of the pressure period, the pressure having been held at 165 or more lb. continuously for a half-hour period, the absorption during such a period is less than 5 per cent of the total volume of zinc chloride solution which is to be injected into the charge.

3. *Handling Subsequent to Treatment.*—Cross-ties treated with zinc chloride should be air seasoned, preferably at the treating plant after treatment, for at least 60 days before insertion in the track. We base this recommendation on the following factors:

1. Thorough air seasoning of treated ties will give increased strength to cross-breaking and increased spike-holding power. It will also result in reducing plate rail wear.

2. Air seasoned ties will show a saving in shipping weight.

3. By air seasoning ties either at the treating plant or at distributing yards a better distribution will be obtained than if they are scattered on the right-of-way.

4. Air seasoned ties will show a reduced tendency to leaching.

5. It is essential to air season zinc treated ties to prevent signal disturbance.

6. By air seasoning ties at storage yards, a shipping reserve will be established, to be drawn on when cars are available.

4. *Supervision and Inspection.*—All stages of the handling of ties both before and after treatment require careful supervision. It is strongly recommended that provision be made for the thorough supervision of all stages of the treating process by a competent technical man, preferably of chemical training, at the treating plant, under the direction of the railroad official in direct charge of wood preservation.

#### WHERE AND WHEN ZINC TREATED TIES CAN BE USED

The geographic region in which zinc chloride ties could be recommended was made the subject of study by the committee. Realizing that the present emergency conditions warrant the use of zinc chloride, in many regions where under normal conditions it would not be used, a meeting was called at Madison, Wisconsin, on October 10th to determine the best possible procedure, with the result that the following resolutions were unanimously adopted:

1. "That the line of demarcation for the present emergency practice as between zinc chloride and creosote oil in the treatment of cross-ties, north and west of which zinc chloride should be used, follow the line of 45-in. rainfall, starting on the coast of Texas and going north to the point where the south side of the extended line of the state of Tennessee would intersect the 45-in. line, follow the south side of Tennessee to the ridge of the Alleghenies, thence following the ridges of the Alleghenies until it intersects the 40-in. rainfall line and thence along the 40-in. line to the Canadian border."

2. "That where due to emergency conditions the supply of creosote oil is not available for ties in region south and east of this line, zinc chloride be used."

The committee recommends that these resolutions be submitted to the association for approval while the present emergency conditions prevail. The basic line upon which the use of zinc chloride treated ties has been drawn was developed from information submitted to the committee by the United States Forest Service and from information collected by the committee covering actual track service.

#### GENERAL CONCLUSIONS

The committee, recognizing that the conclusions to be drawn from track records and track tests may lead to a

too optimistic conclusion as to what could be expected on an average over the whole field, and perhaps obscure the possible result to be obtained from other preservatives, feels that misleading conclusions may be drawn, unless we present the general aspects of the whole situation after the study we have devoted to it, so we, therefore submit the following conclusions:

1. That creosote is the best timber preserving agent known for all purposes, and by reason that its composition is not affected by either rainfall or temperature, and in addition has a lubricating effect on the wood which diminishes the injury due to mechanical wear, and this combination of qualities places it at the head of all treating preservatives.

2. That where for economic reasons creosote oil is not available, or other conditions of maintenance will not justify the expense for creosote treatment, the adoption of zinc chloride is without question justified in the treatment for ties. Climatic conditions will go further in determining the economy of this treatment than in any other, and as one can unquestionably figure on doubling the life of the untreated timber by its use, and in dry climates this life will undoubtedly be extended.

3. That in localities where the rainfall is excessive and with a humid atmosphere, where good zinc chloride treatment would be unfavorably influenced by leaching, and in any climate where checking of the timber is likely to be excessive, or the mechanical abuse of the fiber is extreme, and it is not considered possible to secure a straight creosote treatment, the introduction of some lubricating agent with zinc chloride will have a beneficial effect in retarding the destruction of the timber from the above causes.

#### Appendix C—Indicators for Determining the Burntizing of Ties and Timbers

The basis for the investigation was the work done by E. Bateman, chemist on forest products, and his report issued by the United States Department of Agriculture, Forest Service, Circular 190, entitled "A Visual Method for Determining the Penetration of Inorganic Salts in Treated Wood."

In his method a representative disk of the treated wood is cut as a test piece. The freshly cut surface is dipped for an instant in a 1 per cent potassium ferrocyanide solution. The entire surface should be moistened, but the disk should remain in the solution not more than 10 seconds. After the disk has been thus moistened, the excess of the solution is removed from the face by blotting paper. The moistened block is then dipped into a 1 per cent solution of uranium acetate and allowed to dry. At first the whole block may have a reddish tinge, but, on drying, the untreated portions will have a dark red or maroon color, while the treated portions will be slightly whiter than the natural wood."

While this method has been in use for several years, many operators have found that the method of applying the test was not satisfactory, and also that the line of demarcation between the treated and untreated areas was not clear and distinct. The committee has therefore developed another method (described in the report) which continues to use the same chemicals as given by Bateman. The committee feels that these changes in the application of Mr. Bateman's method constitute a very decided improvement and should be used by all operators in checking the penetration of the preservative in the Burntizing process. The committee is working on a method for determining the penetration of zinc chloride in red oak and hopes to have this ready for next year.

### Discussion

C. M. Taylor (Chairman): The particular work before the committee this year was the revision of the creosote oil standards up to the present time. The revised specifications for creosote oil are given in Appendix A. The basic changes in the old specifications as now appearing in the Manual are not very great. Section 5 of each specification for creosote oil covers a new refinement for determining the purity of oil which says that: "The specific gravity of the fraction between 235 deg. C. and 315 deg. C. shall not be less than" a certain gravity. That clause has been added in order to tie down the high boiling point fractions. Further there has been added the process given under Sec. 6 of each specification. This is another guarding point to take care of high boiling point fractions, likewise, Sec. 7 of each specification. These specifications are proposed for adoption and publication in the Manual. I move their adoption.

J. L. Campbell (E. P. & S. W.): As a matter of information, I would like to ask the committee if in the preparation of these specifications it had any consultation with the manufacturers of creosote to ascertain if there would be any material difficulty or objection to compliance with the provisions of the specifications? We not infrequently run up against strenuous objections of the manufacturers to furnishing material according to the specifications for various reasons which they set up.

Mr. Taylor: The manufacturers assure us there is no reason why the specifications given here cannot be followed.

The Chairman: I ask the committee if these specifications as revised are the same as adopted by the American Wood Preservers' Association?

Mr. Taylor: They are the same as proposed for adoption by the American Wood Preservers' Association, so the two associations are proposing to have exactly the same specifications, so that we will have two oil specifications alike under which people may work, and they will both be the same if they are both adopted.

C. E. Lindsay (U. S. R. A.): Can the committee give us any information as to what increased quantity of creosote oil per cubic foot should be injected when grades 2 or 3 are used.

Mr. Taylor: The committee is not prepared to propose any standard for that. When you use grades 2 and 3, you are not using the best grade of creosote oil; conse-

quently, what one might consider a factor of safety might not appeal to another engineer.

(The motion was carried.)

(Mr. Taylor then presented for adoption and publication in the Manual the following: Specifications for creosote-coal-tar solution; precautions to be followed in the purchase and use of the creosote-coal-tar solution; that the heading in the Manual which covers the point, "Methods of accurately determining the absorption of creosote oil," be changed to read, "Methods of accurately determining the absorption of creosote oil and creosote-coal-tar solution"; extra instructions in the actual analysis of creosote oil; standard specifications for zinc chloride; a new method for determining the strength of zinc chloride solutions; the specification for the treatment of ties by the Burnettizing process.)

(The action on the above was favorable in each instance.)

Mr. Taylor: In connection with the report on zinc chloride treatment, the committee went into the discussion of it primarily from a war standpoint. The conclusion was that because of the scarcity of creosote oil there were certain territories where at that time it was not advisable to use anything but creosote oil if it was available, and that in the other parts of the country zinc chloride should be used. The line of demarcation between the territories that should use the zinc chloride and those which should use the creosote oil follows very closely the 40 in. rainfall. It starts in Texas and goes up to the Canadian border at a point very close to Maine. That line is one that possibly by future committees will be advanced further north and further west, and coincide with what has been the line previously between the roads that use zinc chloride and those that use creosote. In connection with this study they came to the conclusion that there were three general conclusions that should guide any railroad in determining what treatment should be used in their particular locality. These conclusions are merely submitted to you for your information.

The final part of our report is in connection with subject 5, "Report on indicators for determining the Burnettizing of ties and timbers." There is nothing new about this indicator for determining the penetration of zinc chloride in timbers, except we have taken what has been done by the Forest Service and improved it some.

(The committee was excused with thanks.)

## Progress Report on Stresses in Track

**D**URING THE YEAR the data of the tests to find the effect of counterweight of locomotive drivers made late in 1917 on the track of the St. Louis-San Francisco have been worked upon with very interesting results. Tests were also made on the track of the Illinois Central to find the effect of counterbalance of the Mikado locomotive. Other tests were made on the Illinois Central and the Chicago, Milwaukee & St. Paul to determine the distribution of pressure immediately under the tie and also the stresses in the tie, and considerable work has been done in reducing the data.

The committee plans to study the results of the experimental data now available and to take up the preparation of a report upon the part of the subject so covered. It is believed, too, that sufficient information has now been accumulated to begin the discussion of the relation of the results to the principles governing the design of railroad track. It is expected also that the test work will be continued during the coming year.

Committee: A. N. Talbot (Univ. of Ill.), chairman; W. M. Dawley (Eric), vice-chairman; A. S. Baldwin (I. C.), G. H.

Bremner (I. C. C.), John Brunner (Ill. Steel Co.), W. J. Burton (M. P.), Chas. S. Churchill (N. & W.), W. C. Cushing (Pa. Lines), Dr. P. H. Dudley (N. Y. C.), H. E. Hale, Robt. W. Hunt, J. B. Jenkins, George W. Kittredge (N. Y. C.), P. M. LaBach, C. G. E. Larsson (Am. Br. Co.), G. J. Gray (U. S. R. A.), Albert Reichmann (Am. Br. Co.), H. R. Safford (U. S. R. R. A.), Earl Stimson (B. & O.), F. E. Turneure (Univ. of Wis.), J. E. Willoughby (A. C. L.).

### Discussion

A. N. Talbot (Chairman): The tests made on the Frisco last year show that stresses in the rails under the main drivers were on the average nearly four times as great at a speed of 50 mi. an hour, as at 5 mi. an hour with the Santa Fe type of locomotive. The stresses found in the rail under the Pacific type of locomotive ranges from 60 to 70 per cent more at a speed of 60 mi. an hour than the stresses at 5 mi. an hour. Tests made on the Illinois Central during the summer with the Mikado type showed that at 45 mi. an hour a speed materially higher than is permitted on the road, stresses were about twice as great as at a speed of 5 mi. an hour.

In all these cases the trailer and even the front trucks of the locomotive showed an increase in stress at times corresponding to the position of the counter weight on the drivers which gave the highest stress. Under the main driver the maximum effect was reached when the counter weights were down.

In addition to this work with the locomotives and the effect of counterweights, tests have been made on ties in the track to determine from the flexure of the ties the effect produced in them of the distribution of pressure upon the ballast lengthwise of the tie. While it is a very difficult matter to get these bending movements and the distribution very closely, we shall have some information on these points. I can only say that the ordinary wooden cross-tie seems to be subjected to all kinds of stresses by bending in different directions.

The committee was disappointed last year because there was no opportunity for the members to study the report and to discuss it.

C. E. Lindsay (U. S. R. A.): I would like to ask the committee if in their experiments they have used 8-in. by 8-in. ties, and whether they have considered the use of a 7-in. by 9-in. tie with the long axis vertical at the joint?

Prof. Talbot: The committee has used 6-in. by 8-in. ties and 7-in. by 9-in. ties with the wide dimension horizontally, but not the 8-in. by 8-in. It has not been proven so far I think that a greater vertical dimension would be of advantage. There is nothing to indicate that a decrease in the amount of bending would be of advantage to the track. It may be that it is desirable.

C. P. Howard (I. C. C.): I would like to ask Prof. Talbot if the increase in the static pressure developed by these experiments does not coincide closely with what was found to be the case in short spans of bridges.

Prof. Talbot: I presume that the results would be much alike, but the conditions are considerably different. In the case of the short spans another element enters, namely the deflection of the structure. If a bridge has a solid floor, it may be expected that the condition then, aside from the deflection on the structure, will be very much the same as in the track.

W. M. Camp: Prof. Talbot touched on two or three matters that seemed to me to be a very practical application of those stresses in the track. One was the fact that where the end of a tie is not well supported by a bank outside, the flexure is greater than it is where there is a good bank to support the end of the tie and the ballast. I should think another very practical study would be economical length of ties. Another question which comes up is in regard to the weight of rail in relation to the length of tie.

Prof. Talbot: The committee has had in mind the study of the effect of the length of ties upon action in the track. These tests should be made some time after the tamping is done to see what the conditions become then, because it is quite evident that the conditions to which the tie is subjected immediately after the tamping may be far different from those which come upon the tie after a considerable time has elapsed.

(The committee was relieved with the thanks of the association.)

## Report of Committee on Roadway

THE COMMITTEE SUBMITTED AS information eight profiles of specific instances of shrinkage of embankments on the Atchison, Topeka & Santa Fe, giving the percentage of material required to restore the several embankments to their original width after a lapse of four years' time.

The prevention or cure of water pockets is a subject which has been before the committee for several years. In 1914 a circular letter was sent to the different members of the association, asking certain questions in regard there-

to. A large number of replies were received to this inquiry and the sub-committee of that year made a progress report. The committee at that time was not ready to form conclusions either as to the best method of preventing water pockets or the best method of curing water pockets that exist. We do not find that anything of particular interest along these lines has been developed since that report, except that of specially preparing the roadbed before laying track by means of rolling.

It is desired, however, to report on this subject, and we have condensed and tabulated the replies made to the circular letter above referred to, and attach a copy of the replies. From these replies and our own experience along this line, we would recommend the following conclusions be adopted for inclusion in the Manual:

### CONCLUSIONS

(1) Water pockets have existed for many years in certain localities since construction.

(2) They have increased and become more noticeable since the use of heavier equipment and greater density of traffic.

(3) In water pockets the ballast has generally been beaten down into the roadbed and formed troughs under the track, the sub-ballast and roadbed being pushed out laterally and sometimes raised, forming walls, to prevent the water draining from under the track.

(4) Water pockets exist in fills as well as cuts, but more generally in cuts of a clayey nature.

(5) They exist in localities where soil conditions are unfavorable to satisfactory maintenance, particularly in clay.

(6) Method of surfacing and tamping track has no particular effect in forming water pockets, but the class of material used as ballast does have considerable effect.

(7) Water pockets can be prevented in many cases by proper formation of roadbed and use of proper kind and depth of ballast, as follows:

(A) Where the roadbed, in either cuts or fills, is composed of a more or less clayey material, after the work has been brought to a sub-grade all construction tracks should be removed and the sub-grade rolled with a road roller weighing about ten tons, to a uniformly smooth surface with either sufficient crown or side slope to shed water; any resulting depressions below sub-grade being loosened up with a plow and brought up to sub-grade by the addition of material of the same kind as that composing the roadbed; and then rerolled. After several years' use under traffic it may be necessary to cut through the shoulder of the sub-grade at frequent intervals to afford drainage, as the sub-grade under the track will settle several inches lower than the shoulders.

(B) Sub-ballast should be of engine cinder, screenings or other similar material, so as to prevent the roadbed working up into the ballast proper. Stone ballast

should not be used directly on top of clay or loam roadbed.

(C) Sufficient depth of ballast should be provided to insure even distribution of the load on the roadbed.

(D) Construction trains should not be run, if possible to avoid, over track laid on new roadbed without ballast. This drives the ties into the roadbed and forms depressions, which later on develop into water pockets.

(E) In wet cuts, sub-soil drains of vitrified bell and sewer pipe should be laid on a 4-in. well-tamped bed of engine cinders in deep ditches, with uncemented joints, and the trench then back-filled with same material as removed if at all porous, otherwise back-fill with engine cinder.

(F) Wet cuts of clay should have sufficient crown to drain properly, and the surface should be smooth. Any back-filling necessary to make a smooth surface should be made of the same material as exists in the cut.

(G) In building new roadbed alongside existing tracks on same grades, care should be taken not to form new roadbed of impervious material at a higher elevation than the original roadbed, but the new roadbed should be kept at or below this level so as to provide an outlet for the drainage through the existing ballast. This is particularly important on hillside construction. If change in existing gradient is to be made, new roadbed for both tracks should be on same level.

(8) In curing water pockets the principal object is to provide proper drainage. This may be accomplished, according to localities, in several ways, as follows:

(a) In cuts, by means of sub-soil drains of vitrified bell and sewer pipe, laid in ditch or between tracks with uncemented joints. They should be laid at such depth as to be below any movement of the sub-grade and below the water to be drained. They should be below the frost line. Lateral drains of pipes or of cinder or stone may be made to tap the pockets if necessary. Pipe should be covered 12 in. or more with porous material, and then the trench should be back-filled with the same material as removed, if at all porous, otherwise use engine cinders for back-filling.

(b) In cuts where material is very soft to a considerable depth, a drain about 3 ft. square may be provided of large stone, either in the ditch line or between tracks, and of sufficient depth to take the drainage.

(c) In cuts where material is soft to a great depth, old ties or bridge timbers may be driven just outside the ends of the ties. These serve to hold the roadbed in place and to some extent lower the water level, leaving the top surface of the roadbed more firm.

(d) On fills, water pockets should be tapped by lateral ditches and filled with porous material so as to drain.

(e) In many cases the material will have to be excavated and a bed of old timber, cinder or other material spread over the surface to provide sufficient area to prevent the further penetration of the ballast into the roadbed, and the ballast should then be replaced with good, clean material.

Committee: W. M. Dawley (Erie), chairman; J. A. Spielmann (B. & O.), vice-chairman; J. R. W. Ambrose (Tor. Term.), H. E. Astley (N. Y. N. H. & H.), C. W. Brown (L. & N. E.), S. P. Brown, B. M. Cheney (C. B. & Q.), C. W. Cochran, W. C. Curd, Paul Didier (B. & O.), S. B. Fisher (M. K. & T.), W. C. Keger (C. C. & St. L.), H. W. McLeod (C. P. R.), C. M. McVay (K. & M.), F. M. Patterson (I. C. C.), W. H. Petersen (C. R. I. & P.), P. Petri (B. & O.), W. F. Purdy (Mon. Sou.), R. A. Rutledge (A. T. & S. F.), W. H. Sellow (M. C.), J. M. Sills (St. L.-S. F.), W. P. Wiltsee (N. & W.).

### Discussion

W. P. Wiltsee (representing the committee): Five subjects were assigned to the committee and we have

reported on two. It is the intention of the committee that the profiles presented be received as information. I so move.

C. P. Howard (I. C. C.): I would like to call attention to these profiles, that nothing is said about subsidence, and, therefore, we will assume that all the diminution in the size is shrinking and not subsidence. I wonder if the committee has found any of the settling was due to subsidence, and also if it made any effort to find out how the embankment was formed down toward the bottom. I ask if the committee knows how much material and excavation it took to make the banks, and whether the banks as finally shrunk were greater or less than the amount of material in the excavation.

Mr. Wiltsee: I do not think those points were considered, but the committee will consider them this year.

R. H. Ford (C. R. I. & P.): Before we receive these profiles, I would say that the amount of subsidence shown is very small. I think they are open to some question as to their thoroughness of preparation.

Mr. Wiltsee: This profile shows shrinking and not subsidence. The matter of subsidence does not enter into that.

Mr. Ford: I will substitute shrinkage for subsidence; it applies in either case. The shrinkage of these banks is much less than the experience of the average man.

W. H. Hoyt (D. M. & N.): These fills have been brought up to their original level by adding more material. Now, apparently that provides not only for shrinking, but also for any subsidence that may have occurred in these fills. As this question is an important one, and as these profiles do not show the class of material and many other points that might have an important bearing on the accuracy of the statements in the report, I do not think we will be justified in publishing them.

George H. Bremner (I. C. C.): I think it is important to indicate the part of the country to which these profiles apply, so that we would better understand the conditions surrounding them.

(After further discussion, the motion that the profile be received as information and published in the proceedings was carried. Mr. Wiltsee then read the matter on the curing of water pockets, including the conclusions, and moved its adoption and printing in the Manual of the association.)

J. G. Sullivan: I think that practically everything the committee has said there is thoroughly good practice. I would like to see it amplify one feature if possible, and that is the crowning of the roadbed. My experience has been that after we started crowning roadbeds we were getting a great deal better results in countries where material will hold water. There is some objection to it in a country where you lay track in the frost, but that is offset by the benefit you derive from the condition of the track afterwards.

One other feature that I should think might be added, although it is hard to control, and that is the time at which you lay track. If you lay track in the spring with the frost in the ground or just going, it causes more trouble in forming a pocket after the track is laid than any other one thing.

Mr. Ford: I think we all realize the force of what Mr. Sullivan has said about this. There is one thing which he has not alluded to, which I do not see covered in here. As an investment, it is very often desirable if the road can be graded a year previous and left to weather. The interest on the money that is expended for grading and letting it lie a year is a good investment. Some of the paragraphs which have been alluded to here might not be necessary, but I notice that they are not

made obligatory, but that they constitute a method where by work can be done.

The Chairman: Par. F has been changed to read "All roadbeds should have sufficient crown to drain properly, and the surface should be smooth." Does that cover it?

Mr. Sullivan: And it should be maintained in this condition until ballast is placed on it.

The Chairman: It now reads: "All roadbeds should have sufficient crown to drain properly, and the surface should be smooth, and maintained in this condition until the ballast is placed." The last word in the paragraph "cut" is changed to "roadbed."

C. W. Baldrige (A. T. & S. F.): It seems to me that Art. E, under (7), should be made to agree with Art. A, under (8). The object is exactly the same. Art. E does not provide for covering the pipe with positively porous material, and I would suggest that both articles be made to read: "All pipe should be covered 12 in. or more with engine cinders or equally porous material," and then the

trench be back filled with the same material as removed, if at all porous, etc."

Mr. Wiltsee: The committee will accept that amendment.

(Following this there was an extended discussion as to the practicability of applying these conclusions in actual work, it being the contention that they were too theoretical.)

A. S. Baldwin (I. C.): It is a very discouraging thing to a committee to submit a report of this kind, and not secure publication. I am quite sure that a number of years ago when I was doing such work, such information as is given in this report would have been very valuable. We cannot expect to have a perfect report under any conditions, and, therefore, I would like to see this report included just as it is written and printed in the Manual.

(After some further discussion Mr. Wiltsee's motion was put and carried.)

The committee was then dismissed with thanks.

## Report of Committee on Rail

THE SPECIFICATIONS for steel rails in the Manual are in need of revision in the light of knowledge gathered in recent years, and specifications were submitted in Appendix A for consideration and discussion during the coming year. A number of changes have been made from the present specifications in the Manual, all of which should be given careful thought, but mention may be made of the following:

a. The manganese is raised 10 per cent in both lower and upper limits in open-hearth rails, making the proposed requirement 0.70 to 1.00 per cent.

b. For open-hearth rails of 111 lb. per yd. and over the carbon is made 0.67 to 0.80 per cent, an increase of 0.05 per cent for the heaviest class of rails.

c. For open-hearth rails the acceptance analysis is made on a sample from the finished rail instead of the ladle test ingot.

d. The bending of the rail in the physical testing may be accomplished by either the drop test or the quick bend test (hydraulic bender), as agreed upon in the contract.

e. The elongation is required to be at least 8 per cent in 1 in. instead of 6 per cent.

f. Three test pieces for bending are selected from each heat of open-hearth rails and all three are required to meet the requirements.

In order to decrease the pressure required to gag a rail, Dr. P. H. Dudley has been making experiments at several mills with the supports in the gag press increased from the usual spacing of 42 in. to spans up to 60 in. Curves of the relation between the distance between supports and the load required to produce permanent set show that the load decreases as the span increases, and consequently the local pressure of the bending die and the distortion of the metal at the point of pressure would decrease. Some experimental work has been done in gagging rails with the longer spans and we hope to have some developments to report at a later date.

A standard method of testing rail joints is desirable

to enable the results of different laboratories to be compared with each other, which cannot now ordinarily be done, due to differences in the details of conducting the tests. The Committee submits in Appendix B a method of testing rail joints with the recommendation that it be adopted and included in the Manual. This method proposes a span of 4 ft. between supports, which is longer than has been used in most investigations of rail joints, but is done for the purpose of allowing the test to be made with a lighter load and thus allowing it to be made in a greater number of laboratories. This is also the span used in the hydraulic bend test of rails and in the drop test of sections of rail 111 lb. per yd. and over.

The Pennsylvania Railroad has continued work with the hydraulic or quick bend method of testing rails. This method seems to be preferable to the drop test, in that it gives more complete information, is quicker of operation and the breaks also are practically always normal tension breaks of the part in tension, which is frequently not the case in the drop test. For these reasons it has been included as an alternative method of testing rails in the proposed specifications for steel rails submitted with this report.

Another method that is being tried for the examination of the interior condition of rails is the process of deep etching of longitudinal sections, in strong acid. The Altoona Laboratory has examined some longitudinal slabs about  $\frac{1}{4}$  in. thick, cut from the interior of the head of transverse fissure rails, by keeping them for two hours in a hot mixture of hydrochloric and sulphuric acids. The committee has modified this method by taking a  $\frac{3}{4}$ -in. slab consisting of the top part of the head. This slab is etched or pickled for 30 to 45 min. in strong commercial hydrochloric or muriatic acid in a large porcelain dish and kept at a temperature of about 180 deg. F. The committee expects to have some results from these examinations to report at a later date.

### Recommendations

The committee submits the following recommendations:

1. That the method of testing rail joints submitted with this report be adopted by the Association and included in the Manual.

2. That the revised specifications for steel rails submitted with this report be printed in the Proceedings for consideration and discussion during the coming year.

Committee: G. J. Ray (D., L. & W.), chairman; H. B. MacFarland (A., T. & S. F.), vice-chairman; E. E. Adams (U. S. R. R. A.), J. A. Atwood (P. & L. E.), A. S. Baldwin (I. C.), W. C. Barnes (S. P.), Chas. S. Churchill (N. & W.), W. C. Cushing (Penn. Lines), G. M. Davidson (C. & N. W.), Dr. P. H. Dudley (N. Y. C.), J. M. R. Fairbairn (C. P. R.), L. C. Fritch (C., R. I. & P.), A. W. Gibbs (P. R. R.), J. D. Isaacs (S. P.), Howard G. Kelley (G. T.), R. Montfort (L. & N.), A. W. Newton (C., B. & Q.), J. R. Onderdonk (B. & O.), H. R. Safford (U. S. R. R. A.), J. P. Snow (Cons. Engr.), F. S. Stevens (P. & R.), E. Stimson (B. & O.), R. Trimble (Penn. Lines), F. M. Waring (P. R. R.), M. H. Wickhorst.

### Appendix B. Standard Test for Rail Joints

In order that comparison of results of different types of joint bars may be made, the uniform method of procedure for laboratory test shall be as follows:

**General Assembly.** Complete rail joints, full bolted, shall be used. Before joints are bolted the loose scale shall be removed from the contact surfaces of rails and joint bars so that there may be clean, dry surfaces for surface contact. Rail joints shall be then subjected to tests that will show the strength and deflection of the joint under transverse load with head up and also with head down. The results are to be compared with a test of a continuous rail of the same span for determination of rail joint efficiency and rigidity. The joints are to be bolted with heat-treated bolts, or if other bolts are used the quality and kind of bolt shall be stated. The rail used for test of joints shall be cut from the same piece of rail as rail for continuous span. Rails used for test pieces shall be preferably from the same rail, or at least from the same heat of rails. New rails and joint bars shall be used for test.

**Quality of Material.** Material for both rail and joint bars shall be subjected to standard tension tests, to hardness tests, to chemical analyses and, if heat-treated material, to microscopic examination. Measurements to be recorded for joint bars of the area sketch of section, moment of inertia, length, weight, location of bolt holes, camber if any. Measurements of rail section include area sketch of section, moment of inertia, weight per yard, location and size of bolt holes. Joints are to be bolted up so that there shall be a space of  $\frac{3}{8}$  in. between the ends of the adjoining rails. Bolts are to be applied so that they shall not be in contact with the sides of the bolt holes through the rails. If necessary ends of rails to be faced off to give required spacing and bolt clearance.

The supports shall be solid, flat bearing surfaces with vertical faces 48 in. apart, with the inner edges rounded off to  $\frac{1}{8}$  in. radius. The load to be applied midway between the supports by a block, having a radius of 16 $\frac{1}{2}$  in., and a width not less than the width of the base of the rail.

**Loading.** An initial load of 3,000 lb. shall be made at which load the deflectometer shall be set at zero. Uniform increments of load of such magnitude shall then be applied to accurately define the elastic limit. Maximum deflection and set to be determined for each increment of loading. Deflections and permanent sets to be measured to one-thousandths of an inch. Loading to continue until adjacent rail ends meet. Note is to be made of readings of the load at which the joint bars or rails commence to scale.

**Number of Tests.** Three concordant tests shall be made, and results shall be recorded in detail. Abnormal tests to be discarded.

**Efficiency.** The efficiency of a rail joint is expressed as the ratio of the elastic limit in pounds of the rail joint divided by the elastic limit of the continuous rail; this efficiency to be given first with head up, second with head down, using data to correspond to conditions imposed. Rail joint efficiencies shall be expressed in per cent.

**Rigidity.** The rigidity of a joint is a comparison of the deflections of the rail and the joint under the load that develops the elastic limit of the joint. It is the ratio expressed in per cent, of the deflection of the rail to the deflection of the joint at this loading; that is, the deflection of the rail divided by the deflection of the joint at the elastic limit of the joint.

The rigidity shall be expressed for the two conditions of test, with head up and with head down.

### Appendix I. Transverse Fissures

By DR. P. H. DUDLEY

Government investigators class interior transverse fissures as fatigue fractures of metal while railroad officers

have facts from their service records of rails which prove that they are not fatigue fractures of metal. The government investigators do not explain the origin, time and place of occurrence of the nuclei, nor the variation in size from  $\frac{1}{16}$  to  $\frac{3}{8}$  in. in diameter of the type of interior transverse fissures classified by me as intergranular. All fractures of this type show nuclei of considerable area, and that they are not points. These areas constituting the nuclei, rupture as a unit and not in detail, showing positively and conclusively that fracture was caused by the application of a rapidly applied blow of a pressure beyond the elastic limit, or even ultimate strength of this interior core of inferior metal.

The government investigators conclude that the fracture of the nucleus and the subsequent development constitutes a fatigue fracture of metal, but as they occur only in an occasional rail head of like design, under the same traffic conditions, railroad officers do not accept this statement. There is, however, no difference of opinion between the railroad officials and the government investigators about the growth in the track of the specular surfaces which start from and around the nuclei of interior transverse fissures.

I have mentioned in previous communications to the Rail committee that rails rolled from reheated blooms did not develop as many interior transverse fissures in the track as rails rolled direct from the ingots. I have collected the service records of eight railroads. These reported 559,644 tons by direct rolling for the years 1909 to 1915—given in detail per year—and 1054 interior transverse fissures were developed. The railroads also reported 322,593 tons from reheated blooms which developed only 59 interior transverse fissures. The rails were rolled at 11 different mills.

The railroads are to be congratulated that the Rail committee statistics of the service records of rails show at the present time a remedial method of manufacture of rails which at least reduce the interior transverse fissures 90 per cent in the output.

### Appendix J. Frictionless Rail

The committee made an investigation of the extent to which frictionless rail is in use on steam roads and the results following its installation. The committee ascertained that 27 steam and 7 electric roads had installations of this form of rail and presented abstracts of reports made to it regarding the service which this rail was rendering.

#### Discussion

G. J. Ray (chairman) submitted Subject No. 1 and (1) "Revision of Manual" and said: It is the recommendation of the committee that the revised specifications for steel rails, submitted with this report, be printed in the proceedings for consideration and discussion, during the coming year. I want to ask the chairman to grant rail manufacturers the privilege of the floor if they desire to discuss this matter at the present time. I move you that these revised specifications be accepted and published as information and for discussion.

The Chairman: If there are any members of the rail manufacturers present who wish to discuss this question, we will be glad to hear from them.

M. A. Weymouth: As secretary of the Manufacturers' Rail Committee, I have been asked to present this: "To the American Railway Engineering Association: The manufacturers have had no opportunity to properly consider the requirements given in this specification. They, understand, however, from Recommendation No. 2, of the Report of the Rail Committee, that these specifications, as presented, are to be considered as a study

only and not as practical specifications to be used for commercial purposes. It seems that in order to bring the rail specification into a practical form which can be used by the railroads in contracting for their rail requirements, it will be highly desirable for the Rail committee to have a consultation with the rail manufacturers."

Mr. Ray: It is the intention of the Rail committee to ask the manufacturers to a meeting, probably, in the near future.

The Chairman: The motion is that the revised specifications for steel rails submitted with this report be printed in the proceedings for consideration and discussion during the coming year.

(Motion carried.)

Mr. Ray: Subject 5, assigned to the committee, is as follows: "Make critical study of joint bars from the standpoint of design and material, together with laboratory tests, including strain-gage measurements after having established a uniform method of comparative testing." The committee asks that the association adopt the method of testing rail joints submitted with this report, and included in the Manual. In order to get this matter before the house, I move you that the proposed matter be adopted by the association and printed in the Manual.

C. E. Lindsay (U. S. R. A.): I do not know what is meant by "Transverse Load" in "general assembly." And I also feel that the length of rail should be specified. You would get different results if you use a full 33-ft. rail.

H. B. MacFarland (Santa Fe): The transverse load refers to the load or application in a vertical direction. You possibly had in mind that it should be in a horizontal direction?

C. W. Baldrige (Santa Fe): I found in examination of failed joints that there is an idea among track men at least, that a good many joint failures or bar failures in the head of the bar are started by the wire edge on the under side at the head of the rail in the end. In the matter of testing it might be advisable in the assembly to provide for the underside of the head of the rail at

the end, to be rounded off slightly, before the joint is assembled for the test.

Mr. MacFarland: It is not practicable, on account of there not being testing machines of various types throughout the country to take care of such a test. That would have to be a special test.

Mr. Baldrige: One reason I suggested the rounding off of the lower edge is that I think it would pay to have a man with a file to take off the feather edge on the lower side of the head of the rail at the end.

Mr. Ray: As a matter of information, I believe the trouble Mr. Baldrige speaks of can be overcome in an easier way by making some provision in the angle bar. There has already been done, and tests are under way at the present time, which indicate that there may be something in that.

The Chairman: The motion before the convention is that the method of testing rail joints submitted with this report, be adopted by the association and included in the Manual.

(The motion was carried.)

Mr. Ray: In connection with subject No. 7 I want to call the attention of the association to the data headed "special investigations."

(Mr. Ray then read from this section of the report.)

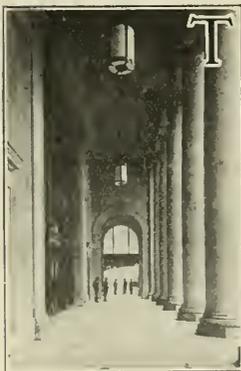

Mr. Ray: It is well for the association to bear this matter in mind, and any information that can be given that will either substantiate that argument or will change the results the other way, will be much appreciated.

Mr. Ray: At the time the report was gotten out, the report of the sub-committee on Intensity of Pressure due to wheel loads and resistance of rail steel to crushing and deformation had not been received. Since that time it has been received, but the chairman of the sub-committee is not here and he requested Mr. Bronson to say a few words, and I will let him tell you what has been done.

(C. B. Bronson (N. Y. C.) then described the tests made during the past year.)

The Chairman: In excusing this committee, with the thanks of the association, I will ask the members to send to the committee any data they may have on this subject.

## Report of Committee on Buildings

THE COMMITTEE RECOMMENDS in its report:

1. That the matter under "Revision of Manual" be approved.

2. That the conclusions under the heading "Design and merits of high and low platforms at passenger stations" be approved and published in the Manual.

3. That the conclusions under the heading "Umbrella versus Butterfly sheds" be approved and published in the Manual.

The committee recommends that the same subjects be re-assigned for the coming year.

Committee: M. A. Long (B. & O.), chairman; G. H. Gilbert (Southern), vice-chairman; G. W. Andrews (B. & O.), D. R. Collin, W. H. Cookman (P. R. R.), C. G. Delo (C. G. W.), W. T. Dorrance (N. Y. N. H. & H.), K. B. Duncan (G. C. & S. F.), C. H. Fake (M. R. & B. T.), A. T. Hawk (C. R. I. & P.), F. F. Harrington (Virginia), E. A. Harrison (A. T. & S. F.), A.

Larsen, J. W. Orrock (C. P. R.), S. B. Phillips (U. P.), R. V. Reamer (C. R. R. of N. J.), C. W. Richey (P. R. R.), John Schofield (C. N.), Z. H. Sikes (N. Y. C.), W. J. Watson (Cons. Engr.).

### Appendix A—Revision of Manual

#### Definition of Terms Published in the Manual and Supplements Thereto

Station.—An established location for the accommodation of passenger and freight traffic. (Manual 1915, page 187.)

Transfer Platform (Freight).—A platform approximately level with freight car floors used in transferring freight from car to car. (Manual 1915, page 207.)

Shop Buildings.—Various structures for the construction and repair of locomotives, cars and other railway equipment. (Manual 1915, page 188.)

Engine House.—A structure for housing and the general maintenance of engines in service. (Manual 1915, page 188.)

Turntable.—A revolving structure for turning locomotives or cars. (Manual 1915, page 188.)

Transfer Table.—A traveling structure with a track on which a locomotive or car can be run and transferred

from one parallel track to another. (Manual 1915, page 188.)

**Coaling Station.**—An established location for the storing and delivering of coal to locomotives. (Manual 1915, page 192.)

**Oil House.**—A building for the storage and distribution of oil and waste. (Manual 1915, page 194.)

**Section Tool House.**—A building for housing of section cars, tools and small track material. (Manual 1915, page 195.)

**Power House.**—A building for housing apparatus for supplying light, heat and power for various purposes. (Manual 1915, page 189.)

**Rest House.**—A building for the accommodation of employees, usually containing rest and recreation rooms, sleeping quarters, lunch room, lockers, bath, etc. (Manual 1915, page 208.)

**Butterfly Shed.**—A type of structure erected over platforms for protection from the weather with a central line of supports and roof sloped towards center for drainage. (Manual 1915, page 208.)

**Umbrella Shed.**—A type of structure erected over platforms for protection from the weather with a central line of supports and roof sloped to the sides for drainage.

**Ash Pits.**—A structure into which cinders are deposited from locomotives, for subsequent removal. (Supplement to Manual 1917, page 35.)

**Inbound Freight House.**—A building for the handling of freight for delivery to consignee. (Manual 1915, page 201.)

**Outbound Freight House.**—A building for the receiving of freight by the railroad for shipment. (Manual 1915, page 201.)

**Following Additions to the Manual**

**Coaling Stations.**—Where coal is stored in summer for use in locomotive stations in winter and where the amount stored is less than 75,000 tons, no special mechanical device is recommended, it being more economical to store it by unloading cars by hand or crane and reclaiming it by the use of tools that can be put to other use when not handling coal, such as locomotive crane, ditcher or steam shovel.

**Ash Pits.**—We wish to add an additional cut and description as follows:

A scheme for conveying and disposing of cinders through pipe by vacuum created by steam. In order to handle them by this method cinders must not be wet down.

**Scales.**—At terminal stations where scales can be given proper attention and where the volume of business will justify, dial scales are preferred for weighing mail, baggage and express.

**Appendix B—High and Low Platforms at Passenger Stations**

While very few railroads in this country have adopted platforms level with the car floors, they have always been the standard in use in Great Britain. One of the chief recommendations for raised platforms is the saving of time required for passengers boarding and leaving cars over that required for walking up and down steps at low platforms.

As the interchange of equipment is extensive, clearance must be provided for the widest equipment on the road involved. As passenger equipment is narrower than freight equipment, this arrangement leaves a void or space between the car and platform that might cause accidents to passengers who carelessly enter and leave trains. Some railroads are equipping their passenger cars with an extension flap to the trap door to bridge

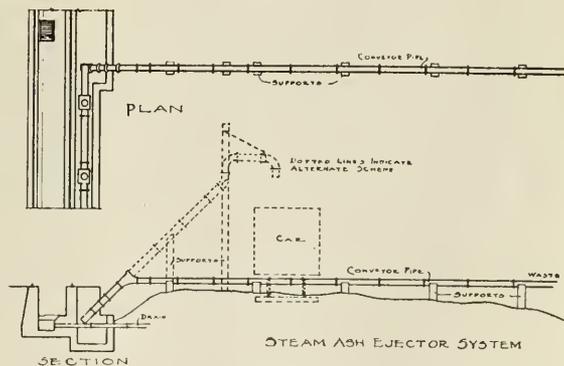

this opening; the operation of which is practically automatic. When the trap door is down the opening of the vestibule door causes the sliding portion to extend beyond the side of the car. Closing the door returns it to its normal position. When it is necessary to raise the trap at stations not equipped with high platforms it is not desirable for the trap to be extended. To provide for this feature a handle is set flush in the end of the car body by means of which a connection between the door and the trap may be disengaged. It is designed with a uniform extension to take care of a gap at platforms built on curves as sharp as 6 deg.

There are platforms in use in subways that have mechanical extensions moving out until they are practically touching the side of the car, so that there is practically no space between the side of the car and the platform.

Platforms are built either of wood, concrete or steel, or a combination of these materials. At important points, where traffic is heavy, they should be roofed over.

Where high platforms are used it is necessary to use a special design of baggage truck. One road having in use a great many high platforms is considering the construction of trucks on small wheels on which the baggage will be stored until the arrival of the train, the truck will then be pushed into the baggage car and left there with its load to be assorted while the train is traveling from one station to another. The baggage to be taken off at the next station will be loaded on this or a similar truck, so that an entire load can be taken out of the car as soon as the train stops. In this scheme the time consumed for handling baggage, express and mail at stations will be reduced considerably.

Low platforms are more universally used and consist of cinder fill, with or without wood or concrete curbs,

Plan and Section of an Ash Disposal System

brick with concrete curb, concrete with concrete curb, and concrete with a wearing surface of asphalt mastic.

In comparing high platforms with low platforms, the advantages in favor of the high platforms are as follows:

- 1st—Facility, rapidity and safety with which trains may be loaded or unloaded.
- 2nd—The prevention of the public crossing the tracks.
- 3rd—Where platforms are below the street level, a saving of about 3 feet in the vertical height to be traveled by passengers.
- 4th—Passenger, baggage, express and mail can be handled more rapidly, which means a reduction in the time of station stops.
- 5th—They afford convenient space for the housing of ducts, cables, signal equipment and sometimes elevator machinery.

6th—Where passenger traffic is heavy raised platforms permit the use of additional doors.

They have certain disadvantages:

1st—The cost of changing passenger equipment to serve both high and low platforms, and the cost of constructing subways or bridges for passengers' express and baggage.

2nd—Where freight trains must use the tracks adjacent to high platforms the restricted clearances may prevent the operation of certain cars and cause heavy expense for transfer of freight.

3rd—The necessity for special form of baggage truck having a low floor.

4th—It is impractical to place a switch within the limits of the platform, due to lack of clearance for equipment.

By canvass of various roads it is found that low platforms vary from 5 ft. to 5 ft. 6 in. from the center of track to the face of platform curb, and level with the top of rail to 6 in. above it.

It is recommended that low platforms be built to 5 ft. 6 in. from center of track to face of curb and to be 4 in. above top of rail at curb.

### Recommendations for the Manual

On account of the existence of high platforms at important terminal stations and the desirability of interchange of passenger equipment throughout the country, the committee suggests that the Association recommend to the M. C. B. Association that all passenger equipment in the future be so constructed that they can be used at either high or low platforms.

It is recommended that high platforms be provided only in connection with tracks devoted exclusively to passenger business.

### Appendix C—Umbrella Versus Butterfly Sheds at Through Stations

There is no choice between the umbrella shed and the butterfly shed, so far as protection from the elements is concerned, the edge of the gutter being in the same relative position on both types. Neither one successfully accomplishes what they are designed for, as the edge of the roof must be kept outside of the clearance diagram, and this places the protective feature so far from the coaches that the benefit to passengers is limited.

Where no waiting room is provided in connection with umbrella sheds, it is recommended that partitions be built between supporting columns; these partitions to be located at every third bay where traffic is heavy, and every fifth bay where traffic is light.

With the umbrella shed type, two gutters and two leaders from the gutters to the central post are necessary. With the butterfly type no gutters are required. This eliminates the first cost for gutters and means lower maintenance cost.

Some railroads use circular supporting columns for the butterfly type, making use of this column for the regular down-spout. On account of the prevalence of cinders the drains at the bottom of the columns are likely to be stopped up and in cold weather the columns will freeze and burst.

In either type of shed it is recommended that at or below the platform level of the down-spouts a trap with clean-out be installed. It is considered preferable to place the down-spouts outside the supporting column.

At umbrella sheds in some parts of the country snow collects in such quantity that it becomes necessary to shovel it off. Consideration should be given roofing sheds in such localities, with a roof having a hard surface, as a composition roof is easily ruined by laborers

digging into it with picks and shovels removing snow and ice.

A canvass of the representative roads shows that the cost of umbrella and butterfly sheds is very similar, an average pre-war cost being \$1.10 per sq. ft., exclusive of the paving and curb.

The average height from curb to eaves is 16 ft. The average spacing center to center of supports is 30 ft.

The above average price covers the cost of various types of sheds, including the following:

(1) Steel supporting structure covered with wood sheathing and composition roofing.

(2) Frame supporting structure covered with wood sheathing and composition roofing.

(3) Pre-cast concrete columns and roof slab covered with composition roofing.

### Conclusions

In that part of the country where heavy snow occurs the umbrella type of shed is preferable, though somewhat more expensive in first cost. In that part of the country where heavy snows are not a factor, the butterfly type of shed is preferable.

### Discussion

M. A. Long (Chairman): The work covers a review of the Manual. The first work was to give a definition of terms published in the Manual and supplements thereto. I move that these be accepted and published in the Manual.

(The motion was carried.)

Mr. Long: The committee has decided to add an additional item with reference to coaling stations. A great deal of consideration has been given to the storage of coal, and a number of roads have gone to much expense for mechanical equipments. The committee considered at what point it would be economical for the railroad to go to this expense. I move that this matter be published in the Manual.

R. S. Parsons (Erie): I think the recommendation should be modified somewhat and made to read, "Unless said coaling storage site shall be in connection with the handling of coal from cars to hopper." In many instances if you use the same hopper for unloading the coal and practically the same machinery, you can with very little expense store the coal, providing you have the space. The only additional expense is that of reclaiming machinery which in some cases is simple and inexpensive. We have some such plants on our line where, while the entire coaling station is an expensive one the additional expense of permitting us to store some 30,000 tons of coal is very slight, the advantage of being able to free cars and store what coal you do not put immediately into your coaling pockets and then reclaiming it from the storage pile is very great in the releasing of cars; in keeping at the coaling station an adequate supply of coal to save the transportation department the difficulty of keeping a large amount of coal in the yards, and the advantage of having the coal there for use whenever you want it.

Mr. Long: The committee considered that point, but we did not have any figures showing what the operating costs for coal would be. We were told the cost would be about 25 cents a ton, which made it look high, and we thought that we could reach the same end by recommending the use of a ditcher or locomotive crane. You can store a maximum of 20,000 tons, which could be reached by a locomotive crane boom and taken from the storage pile and put into the hopper of the coaling station. The question is one of cost per ton handled.

Mr. Parsons: I personally feel that reclaiming will not cost over five or six cents a ton from the storage pile.

R. H. Ford (C. R. I. & P.): The best device is the modern coaling plant with an auxiliary, a large storage pile so arranged that locomotive cranes can do the loading and the propelling as well. So far as the cost of 25 cents a ton is concerned, I don't know where the gentleman got his figures, but that is enormous. Ten cents ought to cover the operation if the coal is within a reasonable distance, that is, less than half a mile from the coaling plant.

Mr. Long: That cost is brought about by the investment in a special plant for distributing coal to the storage pile and reclaiming it. That may be exaggerated. (Mr. Long's motion was put to a vote and carried.)

Mr. Long: We would like to add to the Manual a paragraph with reference to scales. A question came up in regard to the report that is now in the Manual, stating that it did not cover scales for handling baggage. Mr. Lindsay raised the question as to why we preferred the dial scale. That is simply because we can handle so much more over a dial scale than over a beam scale, so that we felt it was proper to recommend the dial scale in preference to the beam scale. That requires a whole lot of attention, but it is more efficient in the end.

(Mr. Long's motion was put to a vote and carried.)

Mr. Long: We recommend with reference to Appendix B that the two paragraphs on platforms be accepted by the convention and published in the Manual, and that the balance of the report be published in the proceedings.

Mr. Ford: As I understand the purport of the chairman's remarks, it is suggested by the committee that all platforms at important terminal stations be made high platforms, and that we recommend that the M. C. B. Association change their passenger equipment to conform with that. That may be all right, but it occurs to me it will be better if this committee would confer with the M. C. B. Association before making this as a specific recommendation from this association. I don't think we are in a position to take a definite stand on it with the information that the committee has given us.

Mr. Long: The committee will withdraw that paragraph and recommend that the last one only be published in the Manual, and that the balance of the report be published in the proceedings.

(Mr. Long's motion was put to a vote and carried.)

Mr. Long: We recommend that the report on Appendix C be accepted and published in the proceedings, and that the conclusions be published in the Manual.

C. E. Lindsay (U. S. R. A.): It has been my experience that the principal essential to the proper operation of either type is a down-spout of ample dimensions, durable material, and provided with some means of cleaning and thawing it out when it becomes frozen. With such ample down-spout arrangement and such conveniences, the butterfly type is always preferable to the umbrella type.

(Mr. Long's motion was put to a vote and carried.)

(The committee was relieved with the thanks of the association.)

## Report on Yards and Terminals

IT WAS THE FEELING of the members that, on account of the war conditions and because of the Federal operation of railroads, "Unit Operation of Railroad Terminals in Large Cities," was of such importance that it could well engross the best efforts and thought of the committee. It was agreed that each member of the committee should familiarize himself with the work, methods and information obtained by the local unification committees in his vicinity, and from this and his own experience be prepared to unite in proposing a complete, logical and practical general method for the proper unification of terminals, as useful as the Committee's Catechism of last year on "War Emergency Yard Improvements." (This catechism was published in the *Railway Age* of Sept. 27, 1918, page 595.)

### Intermediate Sorting Yards

The committee is not able to offer anything new on the general subject of classification yards, but has made some inquiry as to practices and given the time of one meeting to the discussion of the particular subject of switching from classification yards to departure yards—especially as regards the use of a small sorting yard located between the classification yard and the departure yard. The committee finds some conflict of opinion as to the advisability of providing such an auxiliary yard, but in so far as it has information, up to this time, provision for such an intermediate yard has seldom been

made in yard designs or at any rate in the actual construction of yards.

In some classification yards the sorting of cars into station order or into other similar secondary groupings is accomplished more or less completely by the construction and use of a sorting yard tributary to the hump with its ladder next to the outside track of the main yard and with its short body tracks diagonal thereto. Another method of accomplishing the same thing might be the subdivision of a few of the main classification tracks at one side of the yard by means of intermediate ladders.

The committee thus far is impressed with the thought that generally the secondary sorting of cars into station order, etc., can be accomplished satisfactorily by supplementing the classification accomplished via the hump with flat switching performed by trimmer engines either at the foot of the hump or in the departure yard, thus saving the additional investment, the increased length of terminal district, and the delay to cars that would attend their delivery to and removal from the sorting yard, if such an auxiliary facility were provided.

Nevertheless, there may be situations where the construction of an auxiliary sorting yard will be necessary, because it may be impossible to provide sufficient tracks in the classification yard, or because the number of the cars requiring classification into "set out" or placement order may be too great to allow their switching at the departure end of the classification yard, or in the departure yard, without undue interference with the flow of traffic. Such an auxiliary yard should have a sufficient number of tracks of length to conform with the particular requirements of the situation, and where practicable, with assisting grades. In order to minimize the backward movement of cars this yard might be located between the classification yard and the departure yard at one side of the regular current of traffic between these

yards. In some cases it is probable an alternate location would be alongside the departure yard.

### Conclusions

The committee concludes:

1. That the preliminary report on Unit Operation of Railroad Terminals in Large Cities including the Catechism on Unit Operation of Railroad Terminals be published in the Manual of Recommended Practice.

2. That the matter under Subjects 5 and 6 be received as a progress report.

The committee recommends that the subjects of this year be continued for next year.

Committee: B. H. Mann (M. P.), chairman; A. Montzheimer (E. J. & E.), vice-chairman; W. G. Arn, Hadley Baldwin (C. C. & St. L.), Miles Bronson (N. Y. C.), G. H. Burgess (D. & H.), A. E. Clift (I. C.), L. G. Curtis (B. & O.), H. T. Douglas, Jr. (C. & A.), A. C. Everham, E. M. Hastings (R. F. & P.), Reuben Hayes (Pa. Lines), D. B. Johnston (Pa.

Lines), F. E. Lamphere, H. J. Pfeifer (T. R. R. of St. L.), S. S. Roberts (U. S. R. R. A.), C. H. Spencer (I. C. C.), E. B. Temple (U. S. R. R. A.), E. E. R. Tratman, E. P. Weatherly, W. L. Webb (C. M. & St. P.), A. J. Wharf (P. & P. V.), J. G. Wishart (C. R. I. & P.).

### Discussion

B. H. Mann (Chairman): The subject has been included in approximately 150 questions under about 57 sub-heads. It has been requested to include in this year's proceedings a skeleton of a sample organization of a unified terminal.

(H. S. Pfeifer (T. R. R. of St. L.) then read the plan and Mr. Mann moved its adoption. After considerable discussion, none of it relating to the subject matter of the report, but rather on the disposition to be made of it, Mr. Mann withdrew his motion and the report was received as information.)

(The committee was dismissed with thanks.)

## Report of Committee on Electricity

THE COMMITTEE last year submitted to the Association a list of technical definitions and the Association tentatively adopted and published them in the Proceedings with the understanding that the membership would have an opportunity to consider and offer suggestions to the committee. The following list of definitions has been revised and is now submitted for adoption and printing in the Manual. These definitions, so far as possible, conform with those in use by the U. S. Bureau of Standards and printed in the Nation

Electrical Code and those of the American Institute of Electrical Engineers. It will be noted that the definitions are arranged in alphabetical order rather than in logical sequence. This has been done with the view of conforming to common usage in the Manual. Words in parentheses after each definition indicate new definitions by the word "proposed" or the source of existing definitions.

### Electrical Definitions

**Bond.**—A metallic means for connecting conductors to permit passage of electric current. (Proposed.)

**Bonder.**—An employee assigned to install or maintain bonds and their appurtenances. (Proposed.)

**Bracket Support.**—An arm supporting the trolley wire or catenary. (Proposed.)

**Bridge Support.**—A rigid overhead structure supporting the trolley wire or catenary. (Proposed.)

**Cable Conductor.**—Wires bound together acting as a conductor. (Proposed.)

**Catenary Suspension.**—Any form of trolley construction supported by a longitudinal wire or cable. (Proposed.)

**Clearance Line (Equipment).**—The line beyond which no part of the equipment shall project. (Proposed.)

**Clearance Line (Third Rail).**—The line beyond which no part of the third rail structure shall project. (A. R. E. A. Manual.)

**Conductor.**—A metallic path for the flow of electricity. (Proposed.)

**Contact Conductor.**—That part of the distribution sys-

tem other than the traffic rails which is in immediate electrical contact with the circuits of the cars or locomotives. (A. I. E. E. 706.)

**Contact Rail.**—A rigid contact conductor. (A. I. E. E. 767.)

**Contact Rail (Overhead).**—A rigid contact conductor above the elevation of the maximum equipment line. (A. I. E. E. 768.)

**Cross-Span Support.**—Overhead wire or cable supporting the trolley wire or catenary. (Proposed.)

**Direct Suspension.**—Any form of overhead trolley construction in which the trolley wires are attached by insulating devices directly to the main supporting system. (A. I. E. E. 780.)

**Distributing System.**—That portion of the conductor system which carries current of the kind and voltage received by the cars or locomotives. (Proposed.)

**Duct Line.**—A structure consisting of one or more tubes and chambers for the housing of wires or cables. (Proposed.)

**Jumper.**—A cable used to connect the ends of two contact conductors. (A. R. E. A. Vol. 18, page 145.)

**Patrolmen.**—Employees assigned to inspect track and third rail structures, cables and wires. (Proposed.)

**Pulling Chamber.**—A chamber in a duct line provided for pulling cables and wires into ducts. (Proposed.)

**Splicing Chamber.**—A chamber in a duct line, in which cables are spliced and inspected. (A. R. E. A., Vol. 18, page 144.)

**Substation.**—A structure and its contained group of apparatus or machinery which receives current from a transmission system, changes its kind or voltage and delivers it to a distribution system. (A. I. E. E. 762.)

**Third Rail.**—A contact conductor placed at either side of the track, the contact surface of which is located a few inches above the level of the top of the track rails. (A. I. E. E. 769.)

**Third Rail Gage.**—Distance measured parallel to plane of top of both running rails between gage of nearest running rail and inside gage line of third rail. (A. R. E. A. Manual.)

**Traction Linemen.**—Employees assigned to install or maintain wires and cables and their appurtenances for all railroad voltages. (A. R. E. A. Manual.)

**Lineman (New).**—Employees assigned to install or maintain wires and cables and their appurtenances. (Proposed.)

**Transmission System.**—That portion of the conductor system carrying current of a kind or voltage different

from that received by the cars or locomotives. (Proposed.)

**Transmission Line.**—A system of towers or poles and cables or wires carrying current from the source of power to the substations. (Proposed.)

**Trolley Wire.**—A flexible contact conductor customarily supported above the cars. (A. I. E. E. 777.)

The sub-committee on water power has to some extent investigated the utilization of water power for electric railway operation and has collected some data to indicate to what extent water power is now used to generate electricity for the operation of steam railroads. In the table below are shown the principal steam roads which have been partially electrified, the source of power, and the approximate annual current consumption. In the case of those roads using current generated by steam, the reason why water power was not used is given so far as obtainable.

**Electrified Steam Railroads—1917**

The development of any water power for a certain kilowattage should require that the combination of stream flow and reservoir capacity is capable of developing the same kilowattage throughout the year. In the Middle Atlantic and New England states, within a reasonable distance—not to exceed 200 miles of any railroad having a dense traffic and excluding Niagara Falls—the streams where an appreciable head is available are erratic as to stream flow. A small amount of power can be developed economically, but to develop an amount reasonably to be expected from a central station requires either a reservoir or an auxiliary steam station. The result of this is usually a plant in which the capitalization is so excessive that, in spite of the low operating cost, electrical energy cannot be produced at a price to compete with that generated in an all-steam station of like capacity, and economy.

A concrete example of fuel saving by the substitution of electric for steam operation where comparable statistics are available is the electrification of the Chicago, Milwaukee & St. Paul between Avery, Idaho, and Harlowton, Montana, a distance of 440 miles and comprising an electrification of 600 miles of track. During 1917, 124,000,000 K.W.H. (equivalent to approximately 3,900,000,000 ton miles) were generated by water power for the operation of trains. Based upon actual records taken prior to electrification, 220,000 tons of coal and 453,000 barrels of oil (equivalent to a total of 350,000 tons of coal) were burned under locomotives for an equivalent steam service. In 1917 there were 2365 miles of steam railroad under electric operation in the United States and it has been reported to the committee that during the year there were 675,000,000 K.W.H. generated for the operation of trains over these electrified tracks. Ap-

plying the figures obtained from steam and electric operation of the Chicago, Milwaukee & St. Paul Railroad to all of the roads electrified, would result in a saving of 1,890,000 tons of coal per annum, had it been possible to produce all of this electrical energy by water power.

A concrete example of fuel saving, where coal is used to generate electric power, is furnished by the Norfolk & Western electrification of about 90 miles of track between Bluefield and Vivian. During the year 1917 there was generated 56,652,000 K.W.H. for the operation of trains, using 87,160 tons of coal at the power house. Based upon records of coal consumption on steam locomotives on the Norfolk & Western, 147,600 tons of coal would be required for an equivalent steam service. Applying a similar saving to the 2365 miles of electrified steam railroads would show a saving of 720,000 tons of coal per annum if all electric energy had been generated by steam power plants.

The total developed water power of the United States is reported by the Secretary of Agriculture in 1916 as 6,500,000 H.P. The undeveloped water power is reported in Senate Document 316, dated 1916, as 53,900,000 H.P., of which 39,200,000 H.P. is within the limits of the Rocky Mountains and Pacific Coast states.

Calvert Townley in a statement to a committee of the United States Chamber of Commerce on January 14, 1918, made in behalf of the Engineering Council, calls attention to the fact that the federal government still retains as proprietor more than two-thirds of the total area of the 13 western states in which the bulk of the undeveloped water power is located. If any parts of the public lands are needed for reservoirs, dams, transmission lines, etc., a permit of the Secretary of the Interior is required, which is revocable at any time, without cause. Other water powers are on navigable streams, and require an Act of Congress for their development. A revision of these laws is under consideration. Outside of the western water power states and the territory tributary to Niagara, water power generally should be developed with auxiliary steam power.

**Conclusions**

- (1) It is important to reduce the use of coal where possible by the development of water power.
- (2) Water power will show the greatest economy in the West on account of the higher cost of coal and minimum cost of water power development, but may show economy in other districts at present or future coal prices.
- (3) In general, auxiliary steam plants should be built, to develop the water power beyond its minimum capacity, and to secure reliability of service.
- (4) Laws should be modified to permit the development of water power on public lands and on navigable streams, under reasonable restrictions.
- (5) In its studies and investigations of this subject the committee have been impressed with the failure of some of the carriers to so keep their records as to permit the proper segregation of data which is necessary to calculate the tons of coal consumed in steam locomotives separated from coal consumed for other purposes on sections or divisions where electricity has been substituted for steam.

**Recommendations**

The committee recommend the following for your action:

- (1) The adoption and publication in the Proceedings and in the Manual of the electrical definitions, and continue the examination of the subject-matter in the Manual pertaining to Electricity.
- (2) Continue collecting statistical data relative to clearances of third rail and overhead working conductors, and submit revised tables at the next annual meeting.

(3) Continue the subject of the revision of joint specifications for transmission line crossings over railroad companies' right-of-way and send delegates to co-operate with committees of the American Railroad Association and of the American Electric Railway Engineering Association and the United States Bureau of Standards.

(4) Continue the subject of electrolysis and insulation and send delegates to co-operate with the American Committee on Electrolysis in the preparation of its future report.

(5) Continue the subject of maintenance organization and relation to track structures.

(6) Accept as information and publish in the Proceedings the report on water power. In this connection the committee desires to call attention to the fact that it has found but little data bearing on the cost of steam railroad operation applicable to divisions where electric operation has been established, and urge upon engineers and accounting officials the desirability of so arranging the accounts as to accurately show the cost of steam operation and that such accounts be available before attempting to compute the cost of electric operation.

(7) Accept as information and publish in the Proceedings the report on Electrical Interference, and continue the subject.

(8) Accept as information and publish in the Proceedings the committee's report on the National Electrical Safety Code, and continue co-operation with the United States Bureau of Standards in the preparation of Safety Codes.

(9) The acceptance and publication in the Proceedings of the report as a whole.

Committee: Edwin B. Katte (N. Y. C.), Chairman; A. G. Shaver (Cons. Engr.), Vice-Chairman; A. H. Armstrong (Gen. Elec.), H. M. Bassett (N. Y. C.), Z. M. Briggs (Pa. Lines),

D. J. Brumley (I. C.), H. M. Church (B. & O.), C. S. Churchill (N. & W.), R. D. Coombs (Cons. Engr.), Walt Dennis (Wab.), R. H. Ford (C. & R. I. & P.), W. F. Graves, G. W. Kittredge (N. Y. C.), C. E. Lindsay (U. S. R. R. A.), H. K. Lowry (C. & R. I. & P.), W. L. Morse (N. Y. C.), W. S. Murray (Cons. Engr.), Frank Rhea, J. R. Savage (L. I.), M. Schreiber, H. U. Wallace.

### Discussion

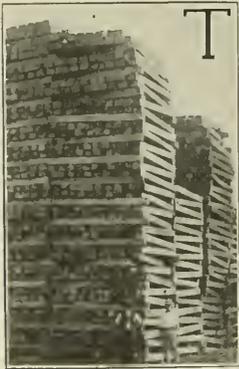

(E. B. Katte (Chairman) introduced the report and it was accepted as a whole for publication in the proceedings.)

(Mr. Katte then introduced Mr. Wagner of the Bureau of Standards.)

M. W. Wagner (U. S. Bureau of Standards): I would like to have everyone here today familiar with the present status of the National Electric Safety Code. We have a proposed revision of it, which deals with overhead and underground circuits of all kinds. We have submitted it from time to time to those who are vitally interested for suggestions as to positive changes to be included in this revised copy and we are receiving suggestions which are of great value. This proposed revision has been submitted to a number of conferees who are to go over it and give us the benefit of their criticism. We are about to receive these criticisms and comments, and as soon as they are in and the various suggestions have been boiled down, it is likely there will be a conference held in Washington or New York, or some other easily accessible place, where further discussion and criticism will be given. After that, a lithographic copy of the revision will be issued, which will show wherein changes are made. We hope to submit this to a general conferee list. If there are any members of this association who would like a copy of that report, we will send it.

(The committee was dismissed with thanks.)

## Report of Committee on Ties

THAT SCREW SPIKES prolong the life of ties over that obtained with cut spikes was the opinion on 27 out of 29 railroads that reported in 1914. Three years later a committee for the Pennsylvania Railroad finished an investigation on this subject, which it had conducted for 9 years, and agreed upon the following statement: Screw spikes have no advantage over nail spikes. When used with clips without tie plates, the cutting of the rail into the tie permits the rail to slip under the clip, thus widening the gage." As a result of these diverging opinions, the committee has tried to find the present general opinion among railroads on this subject, in the hope that it could summarize the practice and distinguish the conditions under which either form of track connection was the better as regards the durability of the ties.

For this purpose, a list of questions was sent to 75 railroads. From these, 58 have replied, and of these 58, 52 stated either that they had never used any screw spikes, or else that their trials had been so limited that no conclusions could be formed. Of the other 6 replies, 2 railroads believed that screw spikes permitted a longer life of tie than cut spikes. Three railroads reported that screw spikes did not permit longer life of tie than cut spikes. One electric elevated and subway road reports

that screw spikes do prolong the life of ties. Two railroads believed there was no reason for using screw spikes unless the ties were bored and treated before the screw spikes were applied. Six railroads considered this unnecessary. Eight railroads believed that a screw spike should not be used as an anchor, and that it should be kept free from the slots in the angle. Five railroads considered that it should be used as an anchor and put in the slots in the angle. One railroad used some device to put in the spike hole to make the screw spike secure again after it had become loose, or after the chamber around it had decayed. Eleven railroads used no such device.

As a result of these diverging opinions, it is the opinion of the committee—

(1) That there is not sufficient data available, due to lack of general use, to show that the use of screw spikes will increase the durability of ties, except under special conditions.

(2) That there may be specific forms of track construction where screw spikes prolong the life of ties such as on elevated structures, and so-called permanent track where there is a more substantial foundation provided than on ordinary tie and ballast track.

### Methods for Controlling Tie Renewals

Our study of the replies to inquiries in last year's investigation of methods for controlling tie renewals indicates a wide divergence of methods under apparent similarity of organization and physical conditions.

This suggests the possibility of developing a uniform method of determining the essentials necessary to control tie renewals, namely:

(1) Preliminary physical inspection of ties in track—based on a predetermined renewal standard.

(2) Field checks of the preliminary inspection in whole or in part.

(3) Utilization of statistics as a further check on tie renewals and the determination of final allotment.

(4) Checking results obtained.

The tabulations of replies received from 100 railroads with an aggregate mileage of 223,000 would indicate that there are three general methods for determining the number of ties to be renewed.

(a) Field inspection by section foremen, supervisor or roadmaster.

(b) Inspection by tie inspector.

(c) Determination by statistics.

Evidence should be obtained to disclose which method is best suited to local conditions and the type of organization to insure following predetermined standards of renewal and avoid divided responsibility for safe maintenance. The information at hand does not indicate the best methods of obtaining effective field checks to secure economy and safety. The question arises as to the relative importance of statistics as compared to field inspection as a further check on tie renewals. The best methods of final allotment of tie supply should be further developed. It is evident that an inspection of ties removed from track affords the best means of checking extravagance and placing the responsibility for same. This leads to the determination of the best method for making an independent check and devising means for determining and avoiding inadequate renewals.

The usual report on trials of substitute ties was included.

### Conclusions

(1) The committee recommends that forms Nos. M. W. 301, 302, 303, 304 be withdrawn from the Manual.

(2) That the report on the effect of the design of tie-plates and track spikes on the durability of cross-ties be received as information.

(3) That the report as to methods in use by various railroads for controlling tie renewals be received as information.

(4) That the report on substitute ties be received as information.

Committee: F. R. Layng (B. & L. E.), chairman; H. S. Wilgus (P. S. & N.), vice-chairman; W. C. Baisinger (A. T. & S. F.), M. S. Blaiklock (G. T.), F. T. Beckett (C. R. I. & P.), E. Boardman (N. Y. C.), W. J. Burton (M. P.), W. A. Clark (D. M. & N.), S. B. Clement (T. & N. O.), E. L. Crugar (I. C.), L. A. Downs (I. C.), G. F. Hand (N. Y. N. H. & H.), E. D. Jackson, A. J. Neafie (D. L. & W.), G. P. Palmer (B. & O.), Louis Yager (N. P.).

### Discussion

F. R. Layng (Chairman): The first subject which we report on is the effect of the design of tie plates and track spikes on the durability of cross-ties. The second subject is the methods in use by various railways for controlling tie renewals. Committee No. 6 gives a report on trials of substitute ties. This is offered as information. I move that these reports be received as information and published in the proceedings.

G. J. Ray (U. S. R. A.): We went into the screw spike proposition for the primary reason of saving ties. We thought we would be able to treat a certain class of ties and establish good long life. One thing which I mentioned in my report is that the use of an inferior class of pine tie is not advisable on a heavy-traffic road, and the screw spike does not materially lengthen the life of that tie. The standardization of the thread on the spike is another important thing. You realize if you put a

screw into wood and extract it immediately and insert another screw of the same diameter of shank but with a different thread, you immediately spoil the threads in the wood and after this has occurred a couple of times you can pull the screw out with your fingers. Some of the errors made in connection with the screw spike are due to that very cause, and some of the opinions expressed on its efficiency which this committee must pass on are based on such information. Two main points are whether screw spikes will increase the durability of the ties, on which there is not enough information available, and on the second point there is some doubt in the mind of the committee whether on a more or less yielding roadbed the screw spike is not a failure.

In the fall of 1911 the Lackawanna put into service what was known as the Hopatcong cut-off, 30 mi. of double track over which the main line traffic of the Lackawanna is hauled. The rail was laid on creosoted pine ties, red oak, maple, beech, gum, and a little of everything. We have taken out possibly 30 or 40, or perhaps 100 ties. We had ties in which we could remove the spikes with our fingers as they had a shell of a half inch and were rotten in the center. Outside of these cases there were no screw spikes that were loose after eight years of service. I do not feel that we will be able to give much definite information on the effect of the screw spike on the other ties for a matter of five or seven years.

When we first considered creosoting ties, the problem was to get the full benefit out of the additional expense of treating. From our experience with bridge ties and all sorts of flange plates, we came to the conclusion there was no use in putting a creosoted bridge tie on our railroad with a flanged plate. We would have torn the ties all to pieces before they were worn out, and we felt we must go to the flat-bottomed plate. We have a lot of curvature on the road and did not want to take any chances with the flat-bottom plate unless we had something else to hold the plate in place, and hold the rail, and we went to the screw spike to save the tie from mechanical wear. We put in machines and adzed and bored the ties before they were treated, to insure this protection beforehand and prevent the destruction of the timber by cutting wood which is not properly treated. We believe we are getting good results from using the screw spike.

On this particular line that I speak of we laid part of the line with 91-lb. Lackawanna rail, rolled in 1910. The rest of it was 101-lb. section rolled in 1911. We have had less rail failures on that line than on any other part of the railroad, notwithstanding the fact that we have settlements as great as three feet on some parts of this road. The question of settlement so far has not had any serious effect on the results on that particular line. Our present cost of maintenance is the best evidence in the world that we have made no mistake on the screw spike. During the first 10 months of the year 1918, figures given out by the Administration show that the Lackawanna was the only road which had not very materially increased its maintenance expense. That may not have been due to the screw spike altogether, but I am very sure it did not have any bad effect on the result.

F. Boardman (N. Y. C.): The committee was confronted with an almost unanimous report from the roads of whom they asked these questions that they did not believe in screw spikes. They had, on the other hand, the very successful installation on the D. L. & W. and on one or two other roads. In making these adverse criticisms in the report, there were a number of specific reasons given. It was the opinion of the committee that with the information before them, it was not proper to make a general statement that screw spikes were desirable in

spiking down ties unless standards of construction and maintenance were also specified. Among other things we asked for was a detailed report from the D. L. & W. road, which is now being gotten up to answer these specific objections.

Mr. Ray: I did not intend in what I said, any criticism of the committee's work. I expected just such a report. How are you going to plug a rotten tie, and that is one of the vital questions we have to face. If for any reason a spike does get loose we have two more holes in which to replace it. Our only difficulty has developed with reference to curved conditions. We have absolutely none on straight track.

C. W. Baldridge (A. T. & S. F.): The Santa Fe has put in probably 100 miles of track with screw spikes, and if you ask Mr. Rex of the tie department what results you get, you will get one answer, and if you ask me you will get another. This question has been pretty well handled by the committee up to the present time, and from their study there is nothing to prove that the screw spike is of any benefit in protecting the tie.

C. E. Lindsay (U. S. R. A.): The committee has submitted a report on methods in use which are comprised in field inspection and post-mortem examination. Certainly the conditions of the present season will necessitate an even greater use of preliminary field inspection if railroads are to be maintained in proper condition to approach the succeeding winter. I have always advocated preliminary field inspection, coupled with an arbitrary rule that no section foreman should be allowed to put in more than a designated number of ties per rail length without asking for inspection by his superior and I have had most excellent results from that method. The ordinary foreman will open up his track where he has a tie which he considers proper to remove, and will

find that the tie alongside it is getting soft, and while he is at it will think he might as well take out the two ties instead of one, unless some check is placed upon his action. I would seriously urge upon the committee the study for the succeeding report of the subject of definite methods that should be followed of preliminary inspection, rather than post-mortem examination.

(Mr. Layng's motion was then put to vote and carried.)

Mr. Layng: The committee last year canvassed the association and found that forms 301, 302, 303 and 304 were not being used by the members and it was further stated in these replies that there was no prospect of their being used. The committee therefore recommends that these forms be withdrawn from the Manual. Mr. Chairman, I so move.

Mr. Lindsay: I would like to ask if the committee discovered from their replies received what the objection was to these forms?

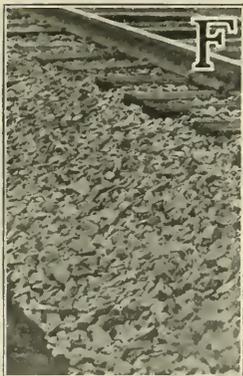

Mr. Layng: One reply that I recall suggested that it would be necessary to have a clerk on each section, in order to keep up the forms. Most of the replies simply said that they were not being used.

Mr. Safford: I would certainly vote no on that. I don't believe we should withdraw forms from the Manual that have been developed after some years of study by the committee, merely because we find that they are not in general use.

The Chairman: If that same principle was applied generally, we would not have much of our Manual left, I am afraid.

Mr. Lindsay: I move you that the forms be referred to the committee for reconsideration. (Motion carried, and the committee was relieved with the thanks of the association.)

## Report of Committee on Ballast

FOR SUBJECTS FOR the consideration of the Ballast committee in 1919, we recommend the following:

(1) Report on proper depth of ballast of various kinds to insure uniform distribution of loads on the roadbed, conferring with the special committee on Stresses in Track and the committee on Roadway.

(2) Report on methods and comparative cost of applying ballast, giving special attention to the organization of the ballast gang.

(3) Study and report on the design of gravel washing plants. Study and report on the design of stone crushing plants.

(4) The use of reinforced concrete slabs or other devices to assist the ballast in distributing the load on soft roadbed.

### Methods and Comparative Cost of Applying Ballast

Realizing the stress under which all railroad men would be working, the committee confined itself to the organization of the ballast raising gang, only touching incidentally upon cost or work preparatory for and subsequent to the putting in of the ballast.

A circular letter was sent out to the roads represented in the association to which letter was attached the ten-

tative diagram presented to the association at its last annual meeting in March. Representatives of the carriers were requested to furnish the committee with a diagram similar in form showing their typical ballast gang, together with a brief narrative description of the method of using the gang to the best advantage, and any cost figures they might have available. Some few replies have been received and they have led the committee to modify the tentative diagram, principally in the way of increasing the number of jacksmen, forkers and tampers and restating the flagging requirements.

Notes have been added calling attention to certain matters, among others the fact that upon old track in commercial service, another gang would be required to prepare the way for the ballast-raising gang. It is understood, of course, that a finishing gang will follow the ballast gang, after the ballast has been consolidated under traffic, to put the track in proper surface and line, dress the ballast section, dress shoulder, etc.

Some suggestions in the way of detail methods have been made, as follows:

It is helpful to number the men and chalk their numbers on the rail over the particular ties these men are to tamp. The New York Central and the Santa Fe both say it pays in the quality of work obtained.

The Norfolk & Western suggests that the head flagman, whose duties will be light, can tighten bolts and in some instances dig jack holes. The rear flagman can put on rail anchors and tidy up without interfering with his job. This presupposes that the flagging will be done by one of the ballast gang as would be the case on a new

line. If regular trainmen are used on an operated line, such work presumably could not be required from them.

Several comment that a tamping spade, heavy and narrow, is better than a pick or bar for the first tamping after a raise.

Agreement is pretty general that on an operated track, an advance gang digging out spent ballast, widening shoulder, renewing ties and making general preparation for the spreading of the new ballast, should be handled as a separate unit well in advance of the ballast gang. If track has to be lowered under overhead obstructions, bank widening is required or similar work has to be done. This preliminary work may require a large force and special facilities.

Opinion seems to be divided whether the lifting jacks should be worked in a bunch or in two sets a short distance apart as recommended by the committee.

The Pennsylvania Railroad suggests that on new construction the tampers should be spread out more than indicated on the diagram.

Suggestions have been made that the head jacks should be heavy No. 6's, which weigh 99 lb. and would require two men to a jack instead of one. The committee has accepted the suggestion and modified its diagram accordingly.

The committee realizes that circumstances must govern, and any typical organization must be modified to meet local conditions. The diagram is submitted as a guide and as representing good practice under average conditions.

### Conclusion

The diagram as presented should be published in the Manual as representing good practice in the organization of a gang to raise track on new ballast under normal conditions.

### Gravel Washing and Stone Crushing Plants

At first it was thought possible to design a general plan and give brief description or specifications for several typical stone crushing and ballast washing plants; but when local conditions were taken into consideration, it was found practically impossible to design such typical plants which would fit all local conditions.

It was, therefore, decided that probably the most helpful method of handling this subject would be to include in the Proceedings a general plan and brief description or specifications of any successful plants which could be obtained. Therefore, some 30 carriers were circularized with regard to the design of these plants, and 14 answers were received; but due to the conditions prevailing during the war, it was impossible to get much information upon this subject. Five plants were described and illustrated, which, together with other gravel washing and stone crushing plants, previously described, the committee considers the nucleus to which additional similar data may be added as acquired.

### Method of Cleaning Stone Ballast

The committee was fortunate in obtaining from W. C. Cushing, chief engineer of maintenance, Pennsylvania Lines West of Pittsburgh, a copy of the descriptive instructions of two methods of cleaning stone ballast, which were issued in 1915 to certain division engineers to be followed as a part of the regular ballast cleaning program of that year. Mr. Cushing advises that, due to unsatisfactory labor conditions, conclusions have not yet been reached, and until the supply of labor permits the railroads to return to a more normal condition, it is probable that very little can be learned from a comparative test of these methods.

The instructions in question follow:

### INSTRUCTIONS FOR CLEANING BALLAST

#### *Not in Connection with Tie Renewals*

The space between the ties (cribs) is to be cleaned to the bottom of the ties, the space between tracks to be cleaned to 6 in. below the bottom of the ties, and the shoulders outside of the ties to be cleaned down to the top of the sub-ballast, where any. Where there is no sub-ballast, clean to the sub-grade. Every 50 ft. one crib to be cleaned out to a line, on a uniform grade between the bottom of the center ditch and the sub-grade outside the track to form a cross drain from the center ditch.

Under the ordinary fork method, the ballast is to be cleaned in the usual manner by shaking the ballast on forks and throwing the cleaned ballast remaining on the forks back into the track, and the small particles of ballast and dirt which pass between the tines of the forks to be disposed of by throwing it over the bank, or by any other way that may be expedient. When the dirt can be disposed of by throwing over the bank, its cost may be included in with the cleaning. When it is necessary to move the dirt any distance it shall be thrown into piles and the cost of doing so included with the cost of cleaning, but the cost of removing it afterward shall be kept separate and not made a part of the cleaning cost.

Under this method of cleaning it will not be necessary to use a definite number of men in the gang, but it should not be extra large, nor very small. On double track there should be three men in each sub-gang; one on each berme and one in the center. The man in the center to work to the right or left as needed, and those on the sides to work in through the cribs to meet him. The sub-gangs to be started about 100 ft. apart. Thus, with a gang of 12 men they would be spread out over about 300 ft. of track. When starting, the ballast removed will have to be piled up until a space about 3 ft. is cleaned, after which the shaken ballast can be thrown directly back in the 3-ft. space.

For the Trench-Zepp method 3 screens are to be used with a force of 12 men and a foreman, distributed as follows: Two men to shovel from each shoulder to their respective screen; two from the center into the center screen, and one man in the center of each track shoveling into the screen most available; one man with a pick working ahead to loosen hardened ballast, and three men, one for each screen, to dress down the ballast on the center and shoulders, form a uniform ballast line and dispose of the dirt. When the dirt can be disposed of by throwing over the bank, its cost may be included in with the cleaning. When it is necessary to move the dirt any distance it shall be thrown into piles and the cost of doing so included with the cost of cleaning, but the cost of removing it afterward shall be kept separate and not made a part of the cleaning cost. When necessary, a water boy in addition to the twelve men can be employed. In operation, the center screen will work ahead of the side screens, and the man attached to this screen will work ahead of the side screens, and the men attached to this screen will clean out the cribs, to about one foot inside of the inside rails of the double track.

#### *In Connection with Tie Renewals*

Under the ordinary method such ties as are spotted are to be renewed in the ordinary manner with the ordinary sized force, but a record of the cost to be kept, for use in comparing this method with the screen method.

By the screen method such ties as are spotted are to be renewed by a force of eight men and a foreman with one screen, and a water boy if thought expedient. The force is to be distributed as follows:

- One man picking ballast loose ahead of the bank.
  - Three men digging the ballast out of the track and throwing it onto the screen.
  - One man removing the refuse and straightening up the ballast.
  - Two men removing the spikes, taking out the old tie, putting in the new tie and spiking.
  - One man following up about 300 to 400 ft. in the rear, putting ballast in around the tie and trimming up the track.
- All the ballast on the shoulder and in the cribs is to be taken out, but not from the center between tracks (this can be cleaned at another time). Where only one tie is to be renewed clean out the cribs on both sides of the tie. When two ties are to be renewed clean out the crib between the two ties and one crib on the outside of each tie or three cribs. When three ties are to be renewed clean out four cribs, etc.

The work to progress as follows: The first man with a pick will proceed to pick loose the ballast where ties are spotted. The three men cleaning out the ballast from track will follow about 12 ft. behind and shovel onto the screen. The one man in charge of the screen will see that the ballast falls onto the track, into pans, or on the outside shoulder, as may be deemed best in each case, for re-use in tamping the new ties. It is left in this shape until the two men who are putting in the ties come along. They will take out the spikes, remove the old tie, put in the new tie and tamp immediately, leveling off enough ballast into the cribs to make the track safe. The man who follows up in the rear is not started until the other force has proceeded far enough to allow as many trains to go over as may be deemed necessary by the foreman to settle the ties and permit of proper retamping, the idea being that the retamping after traffic has gone over it will all be done before the ballast is filled in to its proper section, so that it will not be in the way of tamping.

A record of progress and cost is to be kept and signed by the foreman.

Committee: H. E. Hale, chairman; J. M. Meade (A. T. & S. F.), vice-chairman; C. B. Baldrige (A. T. & S. F.), J. S. Bassett, W. J. Bergen (N. Y. C. & St. L.), Theo. Blocher, Jr. (B. & O.), H. E. Boardman (N. Y. C.), C. J. Coon (N. Y. C.), T. W. Fatherson, G. H. Harris (M. C.), F. A. Jones (M. P.), J. S. McBride (C. & E. I.), William McNab (G. T.), S. B. Rice (R. F. & P.), H. L. Ripley (N. Y. N. H. & H.), Paul Sterling (N. Y. N. H. & H.), B. B. Shaw (C. R. I. & P.), F. J. Stimson (Pa. Lines), D. W. Throver (I. C.), D. L. Sommerville (N. Y. C.), W. K. Walker, R. C. White (M. P.), W. D. Williams (Cin. Nor.).

### Discussion

H. E. Hale (Chairman): The diagram gives an outline of a proposed ballast gang. It is recommended that this diagram be published in the Manual as representing good practice in the organization of the gang to raise track on new ballast under normal conditions. I move the adoption of the diagram as a guide.

J. E. Willoughby (A. C. L.): The diagram provides for a force of 71 men, and a total force of 77 all told. That seems to be a pretty large force. We have got fairly good results out of a gang of 25, and I do not know whether the committee ascertained the fact that 71 men would be an economical gang to operate. I have no objection to the report, or the diagram, if the committee has ascertained that that number is the proper number, although I do not think it would be altogether suitable to some sections of the country.

Mr. Hale: The committee could not obtain data giving the most economical gang, largely due to the effect of different local conditions, and the methods of accounting made the figures such that it was difficult to compare them, but the committee felt that this size gang was in its opinion an economical gang, felt that it could be reduced if it was desirable to do so.

R. H. Ford (C. R. I. & P.): Does the committee recommend a total force of 71 men, irrespective of the weight of rail or track conditions?

Mr. Hale: We have made no difference as far as weight of rail is concerned, but we feel that local conditions would vary the conditions to some extent. The diagram is to be a guide or recommended practice. Probably local conditions will affect it materially.

Mr. Ford: I think the committee might change the title and make it—"A suggested diagram for a force of 77 men," without leaving the inference that a force of 77 men is the proper force for raising track.

Mr. Hale: The committee will accept a change in the title—a suggested diagram is what the committee really had in mind.

The Chairman: I would ask the members if it is desirable to put into the Manual a chart for a gang organization such as this, or should it not be adopted when it becomes a number of a series.

Mr. Hale: The suggestion of Chairman Stimson is

in the right direction, but in the absence of any diagram in the Manual, the committee would like to see at least one diagram put there.

C. E. Lindsay (U. S. R. A.): The instructions to the committee were: "Report on methods and comparative cost of applying ballast, giving special attention to the organization of the ballast gang." They have merely taken the organization and reported on that, without giving accompanying data of costs and methods. I believe one should not go into the Manual without the other.

Mr. Hale: The committee made an endeavor to get costs without much success. We appreciate the fact that the subject is not completed. This is in the nature of a progress report, and we want to carry it over. The committee felt there were two separate propositions, organization and cost. While they are related, they are distinct parts of the question referred to. The committee felt they had at least studied the subject enough to recommend one organization of a track gang.

(Motion to accept the recommendation of the committee carried.)

Mr. Hale: Two other subjects were assigned to the committee: study and report on design of gravel washing plants and study and report on design of stone crushing plants. Your committee thought at first they could probably design a typical plant, but as soon as we started we were confronted with the fact that the local conditions were so important we were unable to design anything along that line, and we thought possibly it would be more helpful to the association to pick out efficient plants, which were in operation, giving photographs or drawings sufficient to describe them and, if possible, the original cost and the cost of washing the gravel.

Mr. Ford: A more comprehensive study of the question of ballast is desirable, and we should have a specification as to what ballast is and what it consists of.

Mr. Hale: We were able to get from Mr. Cushing of the Pennsylvania Lines West, instructions for the cleaning of ballast. The committee thought they were interesting enough to bring to the attention of the association. We were also able to get information in connection with reinforced concrete slabs to assist the ballast in supporting the track on soft spots. We are indebted to Mr. Bowser of the Queen & Crescent for a copy of his report. The committee recommends that this be assigned as one of the subjects for further consideration.

(The committee was relieved with the thanks of the association.)

## Trade Acceptances for

### Railway Supply Companies

(From Our Washington Editor)

Representatives of the Railway Executives Committee have been conferring with the Railroad Administration regarding the form of the proposed warrants to be issued for money due to the railway companies; the subject will be considered further at a conference between Director-General Hines and the Railway Executives' Committee on Thursday, when it is hoped that a definite decision will be reached. This meeting was to have been held on Wednesday. Arrangements for paying for the \$286,000,000 worth of equipment ordered last year are practically complete. A committee headed by F. N. Hoffstot, president, Pressed Steel Car Company, is working on the details of trade acceptances to be given by the Railroad Administration and is arranging for the presentation of drafts by the equipment builders and specialty manufacturers.

Banquet of the American Railway Engineering Association

## Annual Dinner of the Engineering Association

Abstracts of Addresses at the Twentieth Annual Dinner Held in the Gold Room of the Congress Hotel Last Evening

THE TWENTIETH ANNUAL DINNER of the American Railway Engineering Association was held in the Gold Room of the Congress Hotel last evening with Vice-President Earl Stimson presiding in the absence of President C. A. Morse, who was confined to his room with a cold. The speakers included United States Senator Atlee Pomerene of Ohio; Dr. George Adam of Emmanuel Congregational Church, Montreal, Canada, and Robert J. Cary, general counsel, New York Central Lines, Chicago. Hon. Charles N. Goodwin of Chicago, who was scheduled to speak on the Americanization Problem of the Railroads, was detained at his home at the last minute by illness. Abstracts of the addresses are given below.

### Some Phases of the Railway Problem

Senator Pomerene, in speaking on this subject, said in part:

The ramifications of the railroads run into every activity of life. The public cannot do without them, and they cannot do without the public. The prosperity of the one means the prosperity of the other; the crippling of one, the crippling of the other. Vitally they are a part of us. They are the veins and arteries through which course the blood of commerce. When we come to treat with them, I submit that they should have the best thought, and the best skill, of the best-trained experts in the land, whether in the field of transportation, finance or legislation. Practical men are needed for the job—not dreamers, not the theorists, not the reactionary who always looks backward and never forward.

### LEGISLATION

In considering what ought to be done with the railroads, let us bear in mind the following well-established facts:

1. The three years preceding government control were the most prosperous in the history of our railroads.
2. Before the war period the railroads of the United States gave the public the best service in the world.

3. The per-ton-mile cost to the shipper was cheaper in this country than in any other country in the world.

4. The wages of the employees, though they were too low, were higher than the wages paid by any government-owned roads anywhere in the world. And lest this statement may be misunderstood, I want to make it perfectly clear that, generally speaking, the railway men were justified in asking the raise in their wages which they demanded prior to the period of government control, and which were given to them after government control began. Whether we shall hereafter have government ownership or private ownership, the same rate of wages, relatively speaking, as compared with living costs, should be maintained.

### SALARY REDUCTIONS

One of the sops to Cerberus which has been handed to the public is the fact that among the economies of government ownership the director-general's office has saved \$6,115,000 in salaries to officials and to counsel. We are told that many officers in the great campaign for economy were separated from their high salaries. That may be so. I assume it to be so. But I also know that the director-general has on his staff, among others, 72 officials drawing from \$10,000 to \$50,000 each per annum. Five draw \$50,000, two draw \$40,000 each, three \$35,000 each, two \$30,000 each, eight \$25,000 each, eleven \$20,000, and the 72 draw salaries aggregating \$1,398,000, or an average of \$19,418.05.

### SOME GENERAL ORDERS OF THE DIRECTOR-GENERAL

The Railroad Control Act provides that "actions at law and suits in equity may be brought by and against such carriers, and judgments rendered as now provided by law; and in any action at law or suit in equity against the carrier *no defense shall be made thereto upon the ground that the carrier is an instrumentality or agency for the Federal Government.*" The Congress believed this language was about as clear as it could be made. Nevertheless, the director-general of railroads issued the

famous, or rather infamous, order, the effect of which, if legal, is to set aside this act of the American Congress, as well as the Carmack Act. Another order, No. 50, is equally reprehensible.

Let me call your attention also to another order, No. 57, relating to the shipment of grain. It is a principle of law, not to say of common sense, that when a shipper calls for a car in which to ship grain, it will be reasonably fit for the purpose for which it is intended. There can be no doubt about that principle. Every railroad and every shipper have acted upon it; and yet the director-general's office issued Order No. 57 placing upon the shipper the burden to inspect the car and ascertain whether or not it has any leaks.

Granting that the director-general had the power to issue all of these orders, I submit that it was bad policy to issue any of them. Not one of them was issued out of regard for the convenience of the public. Not one of them helped to win the war. All of them added to arousing a spirit of discontent among the people. I deny that the director-general had the power to issue these orders repealing statutes, but if he had the power, right policy should have forbidden it. This is a democracy. We live in America. We do not live in Russia, and we will not submit either to the rule of the Czar or the Bolsheviks.

#### GOVERNMENT CONTROL

I submit, irrespective of whether you are a believer in government ownership or private ownership, to ask the right to hold the railroads five years without giving to the owners any assurance of what will be done, lacks the one fundamental principle that should control a government in all its actions, namely, to deal honestly and fairly with its people.

The following changes during government control seem to be generally approved:

1. The general advance in wages.
2. The joint use of terminals.
3. Greater interchange in use of equipment.
4. Greater control over the routing of freight.
5. Greater unification in the control and operation of the roads, or, to put it in another way, fewer railroad companies.

I believe the public recognizes these general changes necessary and proper. They have been advocated for several years by all students of the subject; and, speaking especially of greater unification of operation and control, believers in government ownership expect this result to follow if the roads are absorbed by the government. Those who are opposed to government ownership likewise believe it is necessary in order to bring about greater economies and better service for the shipping and traveling public. So far, then, as these particular changes in operation are concerned, government control under the director general has proven nothing new.

Every one concedes that the last year of government control has not been a fair test of government ownership, and every fair-minded man will admit that the last year of private operation, hampered as the railroads were by restrictive legislation and demands of the war, was not a fair test of the capacity or efficiency of private ownership and operation. I recognize the fact that there is revolution in the air. I know there is a very general feeling of unrest; but I submit that after the transportation systems have been developed to their present state under private ownership, and we have created a plan of regulation through the Interstate Commerce Commission and the various state commissions, common prudence will suggest that because its railroads do not properly function we should not tear down over night the old structures, stone from stone. Rather we should take

counsel together and where the present regulations do not suffice, amend them, drastically if need be; but don't destroy them and adopt some plan wholly new and untried in this country. Excepting those who have their personal advantages to gain, whether consciously or unconsciously, or theories which they want to reduce to practice, very few want it. It does not have the support of the practical men of to-day.

#### NEW LEGISLATION

It may be of interest to say a word on the subject of proposed changes in the law. On January 21, 1919, Congressman Esch in the House, and I in the Senate, introduced a bill to make certain changes in the "Act to Regulate Commerce." The principal changes are:

*First.* To extend its regulations to any common carrier or carriers engaged in the transportation of passengers or property, not only wholly by railroad, but also to those engaged in such transportation "wholly by boat between points on the rivers and lakes of the United States, and in such carriage of persons and property, partly by railroad and partly by water, whether or not both are used under a common control, management, or arrangement for a continuous carriage or shipment."

*Second.* That hereafter, in reaching its conclusions as to the reasonableness of any rate, fare, charge, classification, regulation or practice, the commission shall take into consideration the increased cost of labor and other operating costs, in so far as they become material, in any case under investigation.

*Third.* The commission is authorized and directed to require carriers to interchange and use all engines, cars, and other facilities owned or used by them in such manner as shall best serve the public interest in times of shortage of equipment in any section of the country, upon just and reasonable terms as between the carriers as the commission may prescribe; and the commission is authorized and directed, to provide by order for the use, in the public interest, of all terminals of carriers, upon such terms as between the carriers as the commission may find just and reasonable.

*Fourth.* The Commission is authorized, from time to time, upon application by carriers, or others, or upon its own initiative without such application, to permit, upon order, the pooling of traffic and facilities and the consolidation of two or more carriers, under such rules and regulations and under such terms as shall be just and reasonable, as in its opinion shall conduce to the public good; which arrangements shall continue so long as in the judgment of the commission the public interest may require.

*Fifth.* The Commission is authorized not only to fix the maximum rate as heretofore, but in case it finds such action just and reasonable, prescribe the minimum rate, fare or charge to be published and maintained by the carriers.

*Sixth.* Provision is made for doing away with the so-called twilight zone which exists between the federal and state authorities, and with a view to the preservation for the public welfare of the functions and efficiency of both federal and state commissions.

*Seventh.* The issuance of all securities by a common carrier is subject to control and regulation by the Interstate Commerce Commission, and is very carefully guarded.

There is nothing in the Commerce Act fixing the standard of return on the capital invested. Assuming that the standard of return is fixed at 6 per cent, one plan proposed may be outlined in brief as follows: Let the country be divided into regions, fixing the traffic rates sufficiently high so as to yield a net return in each

region of 6 per cent on the combined railroad property in that region. This, of course, would not be sufficient to yield 6 per cent on the new or poorly located or equipped roads, and it would yield more than 6 per cent on the better class roads. It is proposed that the surplus thus earned, over and above the 6 per cent on the total property investment, shall be applied in the public interest as follows:

(1) One-third for the benefit of the employes of the railroads.

(2) One-third to be retained by the railroad companies for such uses as they may determine.

(3) One-third to be held in a fund to be devoted to the purposes provided under the plan and under the direction of the Interstate Commerce Commission, or some other public agency.

I do not commit myself to the details of this suggestion, but I believe that out of it Congress can devise a plan which will at the same time prevent excessive earnings by some of the more prosperous roads, encourage by increased rates of fare some of the weaker roads, and

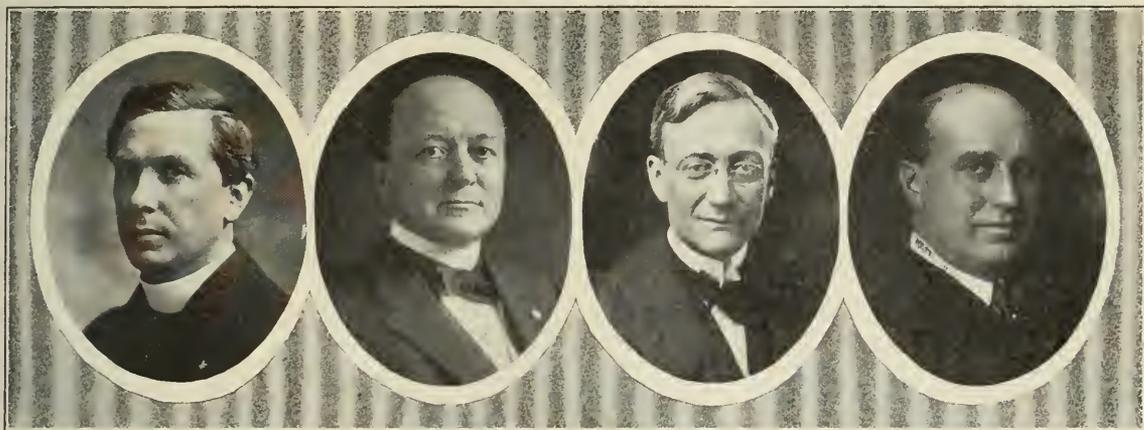

any revolutionary policy during this crisis in our country's affairs.

### Noblesse Oblige, Our New Nationalism

Robert J. Cary, in speaking on the above subject, said in part:

Ex-President Taft, in discussing the League of Nations, says that we are to create 20 nations where there were but 4. All of these people, in whom sense of self-reliance, initiative and decision has been stifled by generations of repression, will greet liberty with wild eyes and fly apart as do molecules of gas when relieved of pressure. Imagine our trade relations, our economic intercourse with such an undisciplined force; imagine regulating immigration among masses of such humanity; imagine a plague of such vast dimensions, unquarantined; imagine the menace to the world's society, and particularly to our own institutions, in the unguided activities of so large a portion of the world's population.

Can the issue then, be, as the short-sighted would have us believe, between an altruistic League of Nations, in

Rev. Geo. Adam

Sen. Atlee Pomerene

Judge Clarence N. Goodwin

Robt. J. Cary

### Speakers at the A. R. E. A. Dinner

fix a standard of return on the property invested which will induce new capital to embark in railroad enterprises.

### CONCLUSIONS

Let me conclude by saying—

(1) I am unalterably opposed to any extension of government control.

(2) Government control was intended for war purposes, and it ought not to be continued for peace purposes, unless some assured, not speculative or conjectural, advantage can be gained thereby.

(3) I deny the legal or the moral right of any man, or set of men, to ask that the government hold private property during peace for a period of five years in order to attempt experiments in management.

(4) If government ownership is desired, a spirit of fairness and of common honesty would seem to suggest that the property be returned to its owners, and the issue made thereafter. In any event, the change from private ownership and operation under proper restrictions, or government ownership and operation, should be undertaken, if at all, in normal times, and not during this period of social, financial, and industrial unrest.

(5) Corrective legislation along the lines discussed tonight should be attempted first, rather than to adopt

which we surrender our sovereignty for the universal brotherhood of man, on the one hand, and this country in splendid isolation wrapped in its own nationality for the purpose of saving and developing its material prosperity, on the other hand? I, for one, protest against the position in which the advocates of a League of Nations are permitting themselves to be unwittingly maneuvered. The primary issue is not now a question of avoiding entangling alliances, of refusing to embark on a voyage of idealism, but rather the highly expedient one of concluding a half-finished job to keep intact that for which we primarily entered the war, our own free institutions and our own prosperity.

We, of this generation, have been awkward patriots: for patriotism has always come to us with the impersonal touch; at best it has been recognized as a worthy abstraction taking concrete form in the romance of past achievement. But the material mobilization of this country, as the result of the war, tells only half of our recent story. The dynamic force of our progress in Europe, and by reflex in our own affairs, is found in the unlooked for spiritual mobilization of one hundred millions of people. The government, whether rightly or wrongly, is disintegrating the army, the air forces, the material resources of the war. Shall we also abandon, as no longer required in our national affairs, this greatest safeguard of liberty,

the present keen patriotism of the millions of the United States?

The Archbishop of York has told of hard gray days in England, of few doors that had not been visited by the Angel of Death, of men going to and fro with set faces and dry eyes, of thousands without resiliency, and then of the tremendous reaction sweeping through England, not alone because America had entered the war, but from the tremendous moral force of a united America entering the war. This land he pictured with its hundreds of millions in future generations as the chief world force to perpetuate human liberty, not by the old process of empire building, but by the reaction of its institutions throughout all other lands.

Our controversy is not whether we shall take our place in an international council. This is already predetermined by circumstance. Our insistence should be that criticism of the constitution of such a council shall be constructive, as coming from men eager to co-operate, but disputing only over ways and means of proper co-operation. This world's forces are put in play by unanimity of sentiment, not unanimity of opinion. Absence of controversy suggests the dead hand, but unanimity of sentiment is the moral force that has won the war. Millions, in response to this force, have already eagerly kept "Their Rendezvous with Death." It remains for us, the living, to finish the work.

#### "Language and Ideals"

Another speaker was Dr. George Adam, pastor of the Emmanuel Congregational Church of Montreal, Que., whose subject was "Language and Ideals." Dr. Adam's theme was the bond of language between the peoples of America and Great Britain. He paid a glowing tribute to the language which, he said, derived its worth from the best of other tongues. It took poetic feeling from the Greeks, law from Latins and democracy from the Angles. Much has been added to the language in forceful and direct speech by the Americans. Dr. Adam touched also on the bond of friendly relations brought about by the participation of these two nations in the great war, with its sacrifices for common ideals of democracy and regard for the rights of smaller nations.

### Revision of Capital Expenditures

(From Our Washington Editor)

**I**N VIEW of the financial situation imposed upon the Railroad Administration and the railroads by the failure of the \$750,000,000 appropriation bill, the entire program of capital expenditures for this year is to be reviewed. The Division of Capital Expenditures has given the railroad corporate officers an opportunity to reconsider under existing conditions any approvals which have heretofore been given by them for additions and betterments, whether carried over from last year or new work.

T. C. Powell, director of the Division of Capital Expenditures, after conference with Howard Elliott, acting chairman of the Railway Executives Committee, has issued D. C. E. Circular No. 20 directing the regional directors to instruct each federal manager to afford the proper corporate officer, upon application, full opportunity to review all projects chargeable to the capital account whether in progress or contemplated. If the corporate officer withdraws or withholds approval of any project for financial reasons or otherwise, the instructions are as follows:

"1—Work not started shall not be commenced without further approval by this division.

"2—As to projects already started and actually under way, please see that no further work is done except, (a) when necessary to insure safety; (b) where the project is so far complete that to stop work would be more ex-

pensive than to continue it; (c) where the job is covered by bona fide contract and to stop the work would seriously demoralize conditions, especially as to the working forces.

"In all cases where the federal manager and the regional director believe the work should be done, whether as to new work or as to continuing work now in progress, even though the railroad company withholds or withdraws this approval, a full report should be promptly made to the Division of Capital Expenditures with a copy to the president of the company stating the objections or disagreements that cannot be overcome, with the definite recommendation of the federal manager and regional director. Pending further approval by this division no such work should be started and except as provided in Section 2 above no such work in progress should be carried on."

### A. R. E. A. Men as

### Corporate Executives

**O**NE OF THE INTERESTING developments of the past year has been the induction of railway engineers, many of them members of the American Railway Engineering Association, into the corporate organizations of the roads, not alone as engineering officers, but as executives, namely, presidents, vice-presidents and chairmen. The creation of separate federal and corporate organizations on the roads, together with the selection of many presidents and vice-presidents of the various railroads for government positions as federal managers or as officers of the central or regional organizations of the Railroad Administration created many vacancies in the corporate organizations of the roads, and several members of the American Railway Engineering Association were named to fill such vacancies. Among these may be mentioned A. S. Baldwin, vice-president of the Illinois Central; L. C. Fritch, vice-president of the Chicago, Rock Island & Pacific, and Charles S. Churchill, vice-president of the Norfolk & Western; all three of them are past presidents of the A. R. E. A. Others on the list are E. H. Lee, president of the Chicago & Western Indiana; W. H. Finley, president of the Chicago & North Western, and Ralph Budd, chairman of the Executive committee, Chicago, Burlington & Quincy. While it may not have been entirely clear at the time that the separation of the corporate from the government managements of the railroads took place, subsequent events have clearly demonstrated the distinct need of strong corporate organizations to protect the interests of the properties and their owners.

In attempting to analyze the reasons for some of the earlier appointments of railway engineers to corporate executive positions, it was seen that there was a special need for engineering rather than operating talent in fulfilling these important stewardships because of the necessity for a check on the character of additions and betterments undertaken by the government as well as for a study of the degree to which the roads are being maintained according to the standards prevailing previous to the advent of government operation. The fact that valuation work was being continued was cited as a further reason for the need of officers in the corporate organizations who were thoroughly conversant with this problem. But as pointed out recently by one corporate officer, such engineering ability could very readily have been retained in the corporate organizations without need of appointments to executive positions. More than this, exactly the same qualifications for executive officers are demanded today as were required of men in like positions under

private managements of the roads. As a matter of fact, the only bearing which the present state of separate government and corporate organizations has on the matter is the fact that this separation created a large number of vacancies at one time.

A number of the men mentioned above were occupying executive or operating positions at the time that they were placed in the corporate organizations. Mr. Lee had been vice-president and chief engineer of the Chicago & Western Indiana; Mr. Budd, whose training had been largely in engineering, was executive vice-president of the Great Northern, and Mr. Fritch, who was formerly chief engineer of the Chicago Great Western, had more recently occupied operating positions on the Canadian Northern and the Seaboard Air Line. On the other hand, Mr. Finley, who had been chief engineer and for a long time bridge engineer, of the Chicago & North Western; Mr. Baldwin, who was chief engineer of the Illinois Central, and Mr. Churchill, formerly chief engineer and recently assistant to the president in charge of valuation on the Norfolk & Western, were occupying engineering rather than executive positions at the time of their advancement, although the fact that they were called into a broader field is positive proof that their duties as engineers had been demanding activities not limited to a narrow interpretation of the term "engineering." Appointments like those above mentioned testify to the ability of the engineers to develop along the broad lines and for the high standards set by the American Railway Engineering Association for its members and officers.

## A. R. E. A. Registration

Following is the registration of the members and guests at the convention of the American Railway Engineering Association on Wednesday:

### Members

Allen, Andrews, Consulting Engineer, Chicago.  
 Allee, O. P., Prest., Railway Concrete Supply Co., Kansas City, Kan.  
 Andrews, Geo. W., Asst. to Eng., M. W., B. & O. R. R., Baltimore, Md.  
 Andrews, J. T., Asst. Eng., B. & O. R. R., Baltimore, Md.  
 Barnhart, E. H., Asst. Eng., B. & O. R. R., Baltimore, Md.  
 Blanchard, A. M., Val. Dept., Grand Trunk Ry., Montreal, Can.  
 Blocher, Theo., Jr., Div. Eng., B. & O. R. R., Philadelphia, Pa.  
 Boardman, H. E., Asst. Eng., Val. Dept., N. Y. C. Lines, New York, N. Y.  
 Bohland, J. A., Bridge Eng., G. N. Ry., St. Paul, Minn.  
 Boots, E. W., Asst. Eng., P. & L. E. R. R., Pittsburgh, Pa.  
 Bowser, E. H., Supt., Timber Dept., I. C. R. R., Memphis, Tenn.  
 Brown, J. M., Corp. Eng. Maintenance and Construction, C. R. I. & P. Ry. Co., Chicago, Ill.  
 Browne, H. L., Asst. Eng., C. B. & Q. R. R., Galesburg, Ill.  
 Buck, C. M., Div. Eng., A. T. & S. F. Ry., Topeka, Kan.  
 Butterworth, A. S., Chief Eng., G. F. & A. Ry., Pensacola, Fla.  
 Cassil, H. A., Eng. M. of Way, P. M. R. R., Detroit, Mich.  
 Clapper, Leland, Eng. B. & B., D. & I. R. R., Two Harbors, Minn.  
 Clarke, A. C., Asst. to Chief Eng., B. & O. R. R., Baltimore, Md.  
 Cliff, A. E., Gen. Mgr., I. C. R. R., Chicago, Ill.  
 Connor, E. H., C. E., Mo. V. Br. & I. Co., Leavenworth, Kan.  
 Cook, R. A., Val. Eng., C. & A. R. R., Chicago, Ill.  
 Copland, A. C., Office Eng., C. & O. Ry., Richmond, Va.  
 Cronican, W. P., Asst. Eng., Illinois Cent. R. R., Chicago.  
 Cunningham, A. O., Chief Eng., Wabash Ry., St. Louis, Mo.  
 Darrow, F. T., Asst. Chief Eng., C. B. & O. R. R., Lincoln, Neb.  
 Delo, C. G., Chief Eng., C. G. W. R. R., Chicago, Ill.  
 Dewey, S. J., Asst. Sig. Eng., Big Four Ry., Cincinnati, O.  
 Dixon, J. M., St. Paul, Minn.  
 Doyle, T. L., Asst. Div. Eng., Pa. Lines, Logansport, Ind.  
 Edmondson, G. N., Div. Eng., N. Y. C. R. R., Rochester, N. Y.  
 Fisher, W. A., New York, N. Y.  
 Flora, G., Insp. Track Val., Grand Trunk Ry., Durand, Mich.  
 Goodell, John S., Asst. Eng., Santa Fe Ry., Hollyrood, Kan.

Gowdy, R. C., Chief Eng. for Corp., C. & S. Ry. Co., Denver, Colo.  
 Fritch, L. C. (Past-President), V. P. and Corp. Eng., C. R. I. & P. Ry. Co. and Minneapolis & St. Louis R. R. Co., Chicago.  
 Grant, E. W., Asst. Eng. Val., Santa Fe Ry., Topeka, Kan.  
 Gwyn, J. G., Chief Eng., D. & R. G. R., Denver, Colo.  
 Hadley, E. A., Engr. Asst. to Reg. Dir., U. S. R. A., St. Louis, Mo.  
 Haggander, G. A., Bridge Eng., C. B. & Q. R. R., Chicago, Ill.  
 Hamilton, H. F., Res. Eng., G. N. Ry., St. Paul, Minn.  
 Harris, L. G., Div. Eng., A. T. & S. F. Ry., San Marcial, N. M.  
 Harrison, E. A., Architect, A. T. & S. F. Ry., Chicago, Ill.  
 Hartley, L. C., Chief Eng., C. & E. I. R. R., Chicago, Ill.  
 Heidenthal, W. C., Eng. M. W., N. Y. O. & W. Ry., Middletown, N. Y.  
 Hewes, John, Jr., Div. Eng., B. & O. R. R., Flora, Ill.  
 Hogeland, A. H., Chief Eng., Great Nor. Ry., St. Paul, Minn.  
 Hunley, John B., Engr. Bridges and Str., Big Four Ry., Cincinnati, O.  
 Huntley, R. L., Chief Eng., U. P. R. R., Omaha, Neb.  
 Hynes, M. V., Gen. Supt., C. I. & W. R. R., Indianapolis, Ind.  
 Jacoby, H. S., Cleveland, Ohio.  
 Johns, C. W., Eng., Branch Lines, C. & O. Ry., Richmond, Va.  
 Johnson, Noah, Val. Eng., Wabash R. R., St. Louis, Mo.  
 Johnston, D. B., Div. Eng., Pa. Lines, Louisville, Ky.  
 Johtz, H. H., Div. Eng., M. K. & T. Ry., Parsons, Kan.  
 Khuen, Richard, Gen. Man. Erect., Am. Bridge Co., Pittsburgh, Pa.  
 Kissell, J. E., Eng. M. of Way, Big Four Ry., Mt. Carmel, Ill.  
 Kittredge, George W. (Past-President), Chief Eng., N. Y. C. R. R., New York City.  
 Lane, H. A., Chief Eng., B. & O. R. R., Baltimore, Md.  
 Larsen, Albert, Div. Eng., Miami Con. Dist., Dayton, Ohio.  
 Layng, F. R., Eng. Track, B. & L. E. R. R., Greenville, Pa.  
 Leisenring, J. G. M., Sig. Eng., Ill. Trac. Sys., Springfield, Ill.  
 Lonnblad, L. F., Special Eng., Brier Hill Steel Co., Youngstown, Ohio.  
 Manson, E. F., Master Carpenter, Rock Island Lines, Manly, Ia.  
 Markley, A. S., Master Carpenter, C. & E. I. R. R., Danville, Ill.  
 McKey, D. M., Loc. Eng., S. A. L., Plant City, Fla.  
 Merwin, C. E., Chief Eng., Detroit Ter. Ry., Detroit, Mich.  
 Milburn, J. H., Chief Draftsman, B. & O. R. R., Baltimore, Md.  
 Morrow, F. E., Chief Eng., C. & W. I. R. R., Chicago, Ill.  
 Murray, W. A., Div. Eng., N. Y. C. R. R., Albany, N. Y.  
 Myers, J. B., Eng. M. of W., B. & O. R. R., Eastern Lines, Baltimore, Md.  
 Nuelle, J. H., Gen. Man., N. Y. O. & W. Ry., Middletown, N. Y.  
 Nye, C. M., Prin. Asst. Eng., G. N. Ry., St. Paul, Minn.  
 Olson, E. H., Asst. Eng., A. T. & S. F. Ry., Chicago, Ill.  
 Patterson, J. C., Prin. Asst. Eng., Erie R. R., New York.  
 Paul, C. E., Prof. of Mech., Armour Inst. of Tech., Chicago, Ill.  
 Pedersen, H., Asst. Eng., M. St. P. & S. S. M. Ry., Minneapolis, Minn.  
 Peterson, W. H., Eng. M. W., C. R. I. & P. Ry., Des Moines, Iowa.  
 Pittman, T. M., Jr., Asst. Eng., Ill. Cent. R. R., McComb, Miss.  
 Puder, F. R., Asst. Eng., C. T. H. & S. E. Ry., Chicago, Ill.  
 Raymond, W. G., Dean. Colo. Appl. Sc., State Univ. Iowa, Iowa City, Iowa.  
 Reid, J. W., Str. Eng., Robins Conveying Belt Co., Chicago.  
 Rex, George E., Mgr., Treating Plants, Santa Fe Sys., Topeka, Kan.  
 Ringer, Frank, Vice-Pres., Joplin Union Depot Co., Dallas, Tex.  
 Roach, J. H., Val. Eng., N. Y. C. R. R., New York City.  
 Robinson, J. S., Div. Eng., C. & N. W. Ry., Chicago, Ill.  
 Rose, L. S., Asst. to Fed. Man., Big Four Ry., Cincinnati, O.  
 Schmid, R. L., Asst. Eng., N. C. & St. L. Ry., Nashville, Tenn.  
 Schnacke, A. D., Asst. Eng., A. T. & S. F. Ry., Topeka, Kan.  
 Scribner, C. J., Asst. Scale Eng., C. B. & Q. R. R., Chicago.  
 Sessions, O. H., Asst. Eng., G. T. Ry., Battle Creek, Mich.  
 Shaw, W. J., Jr., Div. Eng., M. C. R. R., St. Thomas, Ont.  
 Shillinger, J. G., Chief Eng., Rutland R. R., Rutland, Vt.  
 Simmons, I. L., Bridge Eng., C. R. I. & P. Ry., Chicago, Ill.  
 Skeels, E. B., 875 Old Colony Bldg., Chicago.  
 Smith, Lowry, Special Eng., Nor. Pac. Ry., Brainerd, Minn.  
 Soete, F. X., Val. Eng., N. Y. O. & W. Ry., Middletown, N. Y.  
 Sperry, H. M., New York.  
 Stimson, F. J., Supt., Pa. Lines, Richmond, Ind.  
 Storey, W. B. (Past-President), Federal Mgr., A. T. & S. F. Ry. System, Chicago, Ill.  
 Straver, L. W., Div. Eng., B. & O. R. R., New Castle, Pa.  
 Teal, J. E., Asst. Eng., B. & O. R. R., Baltimore, Md.  
 Tuthill, G. C., Acting Br. Eng., M. C. R. R., Detroit, Mich.

Van Hagan, L. F., Asso. Prof., U. of Wis., Madison, Wis.  
 Walker, W. K. (in military service).  
 Walling, V. R., Prin. Asst. Eng., C. & W. I. R. R., Chicago, Ill.  
 Waterman, J. H., Supt. Timber Pres., C. B. & Q. R. R., Galesburg, Ill.  
 Westfall, C. C., Eng. Bridges, I. C. R. R., Chicago, Ill.  
 Wiggins, W. D., Val. Eng., Pa. Lines West, Pittsburgh, Pa.  
 Williams, H. C., Chief Eng. Con., L. & N. R. R., Louisville, Ky.  
 Williams, K. G., Res. Eng., Union Ry. Co., Memphis, Tenn.  
 Williams, S. N., Professor-Emeritus of Civ. Eng. (Cornell College, Iowa), Oak Park, Ill.  
 Wilson, C. A., Consulting Engineer, Cincinnati, Ohio.  
 Wurzer, E. C., Div. Eng., M. C. R. R., Detroit, Mich.  
 Zinn, A. S., care Chief Eng. Office, M. P. R. R. Co., St. Louis, Mo.  
 Zook, M. A., Res. Eng., Bureau of Valuation, I. C. C., Washington, D. C.

#### Guests

Anderson, Burt T., Asst. Sig. Eng., D. L. & W. R. R., Hoboken, N. J.  
 Artmann, H. L., Asst. Engr., S. A. R. R. R., Atlanta, Ga.  
 Atwill, A. L., Asst. Engr., C. & W. I. R. R., Chicago.  
 Ayars, E. J., Div. Eng., Pa. R. R., Williamsport, Pa.  
 Barber, H. E., Gen. Mgr., M. & E. R. R., Marion, Ill.  
 Beauwheel, A., Roadmaster, Ottawa, Ontario.

 Dwyer, Edw. J., Supvr. Track, Eric R. R., Croxton, N. J.  
 Eddington, C. R., Galesburg, Ill.  
 Fithian, E. B., Mo. Pac., Poplar Bluff, Mo.  
 Hall, W. H., Supt. Tel., M. K. & T. R. R.  
 Harting, O. F., Asst. Ch. Eng., T. R. R. A. of St. L., St. Louis, Mo.  
 Hesselbusch, H. W., Asst. C. E., Southern R. R., Washington, D. C.  
 Horton, W. D., Patton Paint, Chicago.  
 Howe, Woodbury, Locating Eng., A. T. & S. F. Ry., Chicago.  
 Judd, Frank R., Engr. of Bldgs., I. C. R. R., Chicago, Ill.  
 Keig, J. R., Chief Prt. Inspr., Central Region, Purchasing Comm., U. S. R. R. A.  
 King, Coleman, Long Island R. R., Jamaica, N. Y.  
 LaRoy, H. A., Div. Engr., Portland Cement Assn.  
 Malloy, G. J., Asst. Div. Engr., Eric R. R., Jersey City, N. J.  
 Malone, J. F., Inspr. M. of W., Cincinnati, O.  
 Meriwether, David, Jr., Asst. to Ch. Eng. Const., Southern R. R., Washington, D. C.  
 Miner, K. S., Suprv. B. & B., N. Y. C. R. R., Ottawa, Ontario.  
 Ratliff, C. M., Asst. Engr., K. & I., Louisville, Ky.  
 Shermerhorn, A. D., Div. Engr., U. P. R. R., Omaha, Neb.  
 Van Antwerp, Eugene, G. T. Ry., Detroit, Mich.  
 Selden, M. C., Asst. Supt., C. & O. R. R., Newport News, Va.  
 Smith, R. M., Asst. Engr., Mo. Pac. R. R., Falls City, Neb.  
 Snyder, J. A., Roadmaster, M. C. R. R., Jackson, Mich.  
 Stewart, Frank J., Supvr. Track, Eric, Podjervis, N. J.  
 Viclland, L. F., Jamaica, N. J.  
 Wagner, W. H., Elec. Eng., Bur. of Standards, Washington, D. C.  
 Walker, John, Asst. Eng., G. T. Ry., Alandale, Ontario.

## Railroad Administration Collects Maintenance Data

FOR THE PURPOSE of affording a comparison of the expenditures for maintenance of way and structures to measure the amount of upkeep during the period of federal control and during the three-year test period, as well as to set the program of maintenance for 1919, the Division of Operation of the Railroad Administration has issued Circular No. 28, accompanied by five blank forms calling for information as to each property under federal control regarding the expenditures in the years ended June 30, 1915, 1916 and 1917 and December 31, 1918. The contracts between the government and the railroad companies specify that such an analysis of the maintenance of way and structures expenses may be made at the end of each year of federal control. It is also considered necessary to call for this data in order to set the program of maintenance which will be required during the current year. An explanation of the forms and instructions for furnishing the information, which is to be forwarded by May 1 to C. A. Morse, assistant director of the Division of Operation, is given in the circular as follows:

#### Explanation of Forms to Be Used in the Analysis of Yearly Expenses

##### Form EM2—Analysis of Total Maintenance of Way and Structures Expenses

This form is designed to show an analysis of total maintenance of way and structures expenses for the purpose of comparison between the test period and the federal control period. A report upon this form should be rendered for each year of both the test and federal control periods, by accounts and for each operating division as well as for the total operating property. Where the expenses are kept by accounting divisions instead of operating divisions, the expenditures of the accounting divisions embracing the operating division shall be combined. No separation of the expenses of an accounting division shall be made where it is included in two or more operating divisions, but it shall be included as a whole in the

operating divisions in which it has the greatest mileage. For the railroads having accounting divisions a sketch map should be furnished showing the relation of the accounting divisions as combined to the actual operating divisions, together with the mileage of the operating divisions as combined from the accounting divisions, for each year under consideration.

Column 1—*Accounting Number*. This is self-explanatory.

Column 2—*Maintenance of Way and Structures Expenses—Primary Accounts*. Contains the maintenance of way and structures accounts classified under groups. This classification is for the purpose of equating expenses in the test period to correspond to the basis of cost of labor and material during the federal control period. The joint facility accounts have been omitted from this column for the purpose of showing for each railroad the gross amount expended by it for the maintenance of way and structures upon the property covered by its contract. The account "No. 275 Insurance" has also been omitted in accordance with section 5 (a) of the contract.

Column 3—*Total Maintenance of Way and Structures Expenses*. The items to be included in this column should correspond with the railroad's report to the Interstate Commerce Commission.

Column 4—*Labor (Including Contract Labor Force Account)*. Under this head include the labor charges which are made directly from pay roll distributions and contractor's force account vouchers.

Column 5—*Net Material Charges*. Include under this head the amounts charged from material distributions and other sources, suitable deductions to be made to cover credits on account of material recovered, including scrap material.

Column 6—*Ledger Value of Property Retired and Replaced*. Include in this column charges to maintenance of way and structures expenses, representing the ledger value of property retired and replaced, as defined in Para-

graph 7 of General Instructions, page 13, Road and Equipment Classification.

**Column 7—Charges for Property Retired and Not Replaced.** Include in this column any charges which have been made to maintenance of way and structures expenses representing the value of property retired and not replaced.

**Column 8—Depreciation.** Include in this column any charges which may have been made to the depreciation accounts in the Interstate Commerce Commission Classification of Operating Expenses, where same has been kept by any road.

**Column 9—Miscellaneous Charges and Credits.** Include in this column all miscellaneous charges or credits, such as work train expenses (including labor and material when not directly distributed to primary accounts from pay roll and material distributions), miscellaneous vouchers, lump sum contracts, bill credits, etc.

**Form EM-3—Comparison of Labor Costs for the Test Period with the Federal Control Period.** This form is for the purpose of obtaining the factors for equating the amount of labor (including contract labor) for the test period upon the basis of labor costs for the federal control period. It will be prepared by operating divisions and total operating property.

**Column 1—Group.** Contains the groups under which the accounts are classified, as published in Column 2 of Form EM-2. Only groups which include labor charges are here shown.

**Column 2—Occupation.** Show the principal occupations of employees engaged in work classifiable under the respective groups. Opposite the designation "Others" give information for all occupations not specifically named in the form, it only being essential that opposite this caption there shall be included items for labor which are relatively large and will materially affect the general averages.

**Column 3—I. C. C. Classification of Employees—Numbers.** The number shown in this column corresponds to schedule 561, "Employees and their compensation" as reported to the Interstate Commerce Commission. There the items are prefixed with the word "All," both the units and compensation as reported to the commission should be taken. The items prefixed with the word "Part" should be distributed so as to include under each group only the units of service and compensation properly assignable.

**Column 4—Units of Service.** In this column the units of service should be given in hours. The service of monthly employees should be reduced to hours upon the basis of the assigned number of hours constituting a year's work.

**Column 5—Compensation.** In this column should be shown the compensation properly assignable to the units included in Column 4.

**Note.**—There should be included in Columns 4 and 5, the units of service and compensation for labor covered in vouchers when the amount of such labor is sufficiently large to materially affect the "Equation Factor" of any group.

**Column 6—Average Compensation Per Unit of Service.** Under this head show the quotient obtained by dividing items in Column 5 by those in Column 4.

**Note.**—In Columns 7, 8 and 9 show for the federal control period information similar to that required in Columns 4, 5 and 6 for the test period.

**Note.**—Columns 6, 9 and 10 require no entry except on the lines designated "Totals and Averages."

**Column 10—Equation Factor.** Show under this head the quotient obtained by dividing Column 9 by Column 6.

**Form EM-4—Comparative Cost of Principal Items of Maintenance of Way and Structures Materials.** This

form is designated for the purpose of obtaining the factors for equating the net material charges for the test period upon the basis of the cost of material during the federal control period. To be prepared only for total operating property.

**Column 1—Description of Material.** In this column should be listed, under the groups, the more important items of material properly assigned. A list of such material is at end of these instructions. Important items not included in the list are to be considered by individual railroads. In this column is also shown "Equation factor." Information for this item is only to be shown in Column 10. Group (3) "Rails," should be sub-divided (a) New Rails, (b) Second-hand Rails, (c) Scrap Rails.

**Column 2—Unit of Measure.** In this column should be included the appropriate units for the several classes of material shown.

**Column 3—Quantities Used for Three Years.** This column is provided to show the total quantities of the several classes of material used in maintenance during the test period.

**Column 4—Total Cost for Three Years.** Show the total costs of material used, the quantities of which are shown in Column 3.

**Column 5—Average Quantity Per Year.** The total quantity of each item of material should be shown in this column. These quantities are obtained by dividing quantities in Column 3 by three (years).

**Column 6—Average Total Cost Per Year.** The information in this column is obtained by dividing the information in Column 4 by three (years).

**Column 7—Quantities Used Year 1918.** The total quantity of each item of material used during the year 1918 should be shown in this column. For the purpose of this return the quantity of each class of material charged to accounts, "Ties," "Rails" and "Ballast," should be shown. With respect to other accounts it is intended that only the quantities of the important items of material should be shown. A general description of these items is given at the end of these instructions.

**Column 8—Total Cost Year 1918.** Show the total cost of material the quantities of which are shown in Column 7.

**Column 9—Average Unit Prices.** In this column should be shown the average unit prices at which the material of the several classes used for maintenance was charged in the accounts for the year. Where but one grade or kind of material is included in an item, the average disbursement price should be shown. Where an item includes several different grades or kinds of material divide the total charges for the material issued during the year by the number of units.

**Column 10—Cost Based on Average Quantities for Test Period.** The information required is obtained by multiplying the quantity shown in Column 5 by the prices shown in Column 9. In addition to the cost there is also to be shown in this column the equation factor. This factor is obtained by dividing the total for the group under Column 10 by a similar total in Column 6.

**Form EM-5—Comparison of Maintenance of Way and Structures Expenses (≥ Sheets).** This form is designed to show by accounts the labor, material and miscellaneous charges (Columns 4, 5 and 8, Form EM-2) for the test period (average), the year of federal control, the equated expenses for the test period and the increase or decrease in expenses in federal control period, compared with equated expenses for test period. This form is to be prepared by operating divisions and total operating property.

**Sheet 1—Column 1—Account Numbers.**

**Column 2—Maintenance of Way and Structures Expenses—Primary Accounts.** The accounts shown in this

column are the same as on Form EM-2, with the exception that on Sheet 1, Account 214, Rails, is sub-divided to show separately new, second-hand and scrap rails. This separation is made for the purpose of more accurately equating the expenses for rails used in maintenance during the test period to the basis cost of such material for the federal control period. This separation is not considered necessary on Sheet 2.

Column 3—*Average Expenses for Test Period—Labor.* The labor expenses shown in Column 4, Form EM-2, for each year of test period is to be totaled and divided by three to arrive at the average for test period.

Column 4—*Equation Factors.* The equation factors shown in Column 10, Form EM-3, are those to be shown in Column 4, the factor for the group being inserted opposite the various accounts of the group. As group 10 has no equation factor or Form EM-3 the factor for this group is obtained after the equated expenses for groups 1 to 9 have been totaled in column 9, sheet 2. The sum total of groups 1 to 9, column 9, sheet 2, should be divided by the sum total of these same groups for the "average of test period," column 8, sheet 2, which gives you the equation factor for group 10.

Column 5—*Equated Expenses—Test Period.* This information is obtained by multiplying column 3 by column 4.

Column 6—*Federal Control Expenses.* This information is taken from column 4, Form EM-2, for the year of federal control.

Column 7—*Increase or Decrease in Federal Control Expenses.* This information is obtained by deducting column 5 from column 6. Increases to be shown in red, decrease in black.

Columns 8 to 12—*Material Expenses.* The information for these columns is prepared from the same sources as columns 3 to 7. The equation factors, column 9, however, is taken from column 10, Form EM-4, except for group 10. These factors, while for total operating property, will be applied the same for each operating division.

Sheet 2—Column 2—*Maintenance of Way and Structures Expenses—Primary Accounts.* The accounts shown in this column are the same as on Form EM-2. At the bottom of this column, after the sum total is shown for groups 1 to 10, items are provided for the totals of columns 6, 7 and 8, Form EM-2, showing "Ledger Value of Property Retired and Replaced," "Charges for Property Retired and Not Replaced" and "Depreciation." The information for these three items are only to be shown in the total columns 8 to 11, as they are not subject to equation. In columns 8 and 9 show the same amounts, being the "average for test period."

Columns 3 to 7—*Miscellaneous Charges and Credits.* The information for these columns is obtained from same sources as columns 3 to 7 in sheet 1. The equation factors, however, are composite and obtained from the labor and material results on sheet 1 as follows: Divide the sum of columns 5 and 10 (sheet 1) by the sum of columns 3 and 8 (sheet 1) for each group except group 10.

Columns 8 to 11—*Totals—Labor, Material and Miscellaneous.* These columns are the totals of the preceding columns, namely, 3, 5, 6, 7, 8, 10, 11, 12 (sheet 1) and 3, 5, 6 and 7 (sheet 2).

Form EM-6—*Extraordinary Items of Maintenance of Way and Structures Expenses.* It is the object of this form to segregate each year those items of an extraordinary nature which impair a true analysis of the maintenance expenses of the property for the purpose of measuring the standard of upkeep. From an operating and engineering standpoint we are concerned with the fair distribution of the expenditures over the property and the return of the property in good repair and for

that reason we separate in this analysis the expenditures by divisions and try and arrive at those expenditures which reflect the comparative maintenance of the property during the test period and period of federal control. For test period use equated expenses.

Column 1—*Account Numbers.*

Column 2—*Maintenance of Way and Structures Expenses—Primary Account.* The accounts in this column are the same as Form EM-2.

Column 3—*Maintenance Expenses Incidental to Additions and Betterment Work.* In all improvement work there are maintenance of way and structures expenses incidental thereto, such as demolishing the property, rearranging or relocating existing tracks and structures (including in some instances a charge of line), maintaining traffic during the work, etc. As these expenditures have no direct bearing on the ordinary upkeep of the property, it is necessary that we set them aside in this column. The estimate for authority for capital expenditure will show these items and in many cases the estimate can be used in arriving at these incidental expenses; but for large improvements these estimates are, of course, often materially changed in the actual work done and should be checked in such cases.

Column 4—*Extraordinary Maintenance of Way and Structures Expenses From Floods, Explosions, Train Wrecks and Accidents.* These expenses when extraordinary are readily obtainable; the ordinary expenditures should not be accounted for in this column.

Column 5—*Salvage Credits in Connection with Property Retired.* On Form EM-2, column 6, we show the "Ledger Value of Property Retired and Replaced," but the salvage credits are included in column 9. These credits where they are sufficiently large to affect the yearly expenditures should be stated in this column.

Columns 6 to 9—These columns are left blank for the convenience of the individual roads for use in setting forth any other expenses entering into the yearly expenditures which are extraordinary, such as large adjustments, large credits not previously separated in this analysis, etc. Fire losses during federal control should be shown on this blank by accounts if they enter to any degree into the expenses, and in any case should be stated in total for the year.

General—The foregoing forms should bring out a true indication of the upkeep of the property, but the reporting official should supplement them with any additional information of conditions of which he is familiar that may aid in arriving at the correct situation as to the maintenance of the railroad.

#### Extracts From Contract—Section 5—"Upkeep"

Section 5—(a) During the period of federal control the director general shall, annually, as nearly as practicable, expend and charge to railway operating expenses such sums for the maintenance and repair of the property as may be requisite in order that such property may be returned to the companies at the end of the federal control in substantially as good repair as it was on January 1, 1918: Provided, however, that the annual expenditure and charges for such purposes during the period of federal control on such property and the fair distribution thereof, over the same, equal an amount in the aggregate to the average annual expenditure during the test period, less the cost of fire insurance included therein, except so far as the amount expended is subject to the adjustments provided in paragraph (c) of this section relating to the difference in cost of labor and material and the provisions of paragraph (e) of this section in regard to the destruction of property by fire.

(b) The director general may expend such sums, if any, in addition to those expended under paragraph (a)

of this section, subject to adjustments paragraph (c) as may be requisite for the safe operation of the property assuming a similar use to the use during the test period, and not substantially enhancing the cost of maintenance over the normal standard of maintenance of railroads of like character and business during said period, and the amount of such excess expenditure during federal control shall be made good by the companies.

(c) In comparing the amounts expended under paragraphs (a) and (b) of this section with the amounts expended during the test period due allowance shall be made for any difference that may exist between the cost of labor and materials and between the amount of property taken over and the average for the test period, and as to paragraph (a) for any difference in use between that of test period and during federal control, which, in the opinion of the commission, is substantial enough to be considered, so that the results shall be, as nearly as practicable, the same relative amount, character and durability of physical repairation.

(d) At the request of the director general or the company, there shall be an accounting of the amounts due by or to any of the parties under paragraphs (a) and (b) of this section, at the end of each year of federal control and at the end of federal control.

(e) If during federal control any of the property is destroyed or damaged otherwise than by fire or public enemies, and is not restored or replaced by the director general, he shall reimburse the companies the value of the property destroyed or the amount of the damage at the time of the loss, and the cost of restoration or replacement, or said value or damage, as the case may be, shall be charged to annual railway operating expenses, it being understood that extraordinary losses caused by floods, explosions, train wrecks or accident are included in the

matters covered by this paragraph, while ordinary losses due to such causes are included in the matters covered by paragraph (a) of this section.

If during federal control any of the property is destroyed or damaged by fire, and is not restored or replaced by the director general, he shall reimburse the companies the value of the property destroyed or the amount of the damage at the time of the fire; and the cost of restoration or replacement of said value or damage, as the case may be, shall be charged to annual railway operating expenses, but the same shall not be considered a charge to such expenses for the purposes specified in paragraph (a) of this section.

(f) If any addition, betterments or road extensions are made to the property taken over at the expense of the companies and with the approval or by the order of the director general during federal control, he shall expend and charge to railway operating expenses such sums for labor and materials as may be requisite for the proper maintenance and repair of such property until end of federal control.

The circular also quoted from section 5 of the standard form of compensation contract between the Railroad Administration and the railroad companies, which governs the matter up upkeep.

Because the preparation of the forms has required more time than was expected, Mr. Morse recently issued instructions in the form of a letter to regional directors for the preparation of the data required to make up a maintenance program for this year so that the average upkeep for 1918 and 1919 will be equal to that of the test period after equating for the increased prices for labor and materials, but the information required for that purpose is in much less detail than that called for by the circular and is to be submitted for approval by April 15.

## A. R. E. A. Men Identified With Railroad Administration

THE LARGE MEASURE OF recognition given to the American Railway Engineering Association through the appointment of its officers and members to important positions in the central and regional organizations of the United States Railroad Administration is a striking evidence of the high standing of the association. While these appointments have been made on the individual merits of the men selected, it is no reflection on them to say that identification with the activities of the association exerted no small influence in their selection for these positions. Of particular significance from the standpoint of the association was the selection of its president, C. A. Morse, formerly chief engineer of the Chicago, Rock Island & Pacific, for the position of assistant director of the division of operation in charge of maintenance, with headquarters at Washington. In this same connection attention is also directed to the fact that H. R. Safford, second vice-president of the association, is also in the government service, having been called from Canada, where he was chief engineer of the Grand Trunk, to the position of engineering assistant to Hale Holden, director of the Central Western region.

Probably the most important position held by any member of this association is that of director of the Northwestern region, occupied by R. H. Aishton, formerly president of the Chicago & North Western, who is member No. 237 of the A. R. E. A. and one of the first members to be identified with the Railroad Administration, when, as regional director of the Western region, later divided into three regions, he was in direct charge of all railways in the Western section of the United States.

Railway engineers were first used in a strictly engineering capacity in connection with the organization of the Railroad Administration in passing upon the budgets presented by the individual railroads for additions and betterments, work to be done as war measures during the construction season of 1918. This work was conducted largely by E. E. Adams as assistant to the director of the division of capital expenditures. The director of this department was until recently Robert S. Lovett, president of the Union Pacific, under whose direction Mr. Adams had worked for several years as consulting engineer for the Union Pacific system. Approval of additions and betterments budgets in the Eastern region was for a considerable period subject to the review of an engineering committee of which F. L. Stuart, consulting engineer, and H. A. Lane, chief engineer, of the Baltimore & Ohio, were members.

Following the promulgation of wage order No. 27, a Board of Wages and Working Conditions was appointed which has been largely responsible for the supplemental orders on wages, and this board includes in its members C. E. Lindsay, a director of the A. R. E. A., who was formerly division engineer of the New York Central at Albany.

While the Railroad Administration availed itself of the services of engineers early in the period of government control in connection with capital expenditures, it was not until quite late in the season that any steps were taken to centralize the supervision of maintenance of way. On July 1, following the organization of the

Southwestern region, E. A. Hadley, chief engineer of the Missouri Pacific, was appointed engineering assistant to B. F. Bush, director of the Southwestern region, this being the first recognition of the necessity for an officer of this kind in the regional organizations. The great step for the unification of the administration of maintenance was not taken until late in August, when Mr. Morse was given supervision over maintenance work throughout the entire country. Other regional maintenance officers were appointed about the same time to serve in advisory capacities under the regional directors and as a committee under the chairmanship of Mr. Morse on matters of national import. It is a significant fact that all of these regional maintenance officers with one exception are members of the American Railway Engineering Association. This list includes G. J. Ray, engineering assistant to the director of the Eastern region; E. B. Temple, engineering assistant to the director of the Allegheny region; J. E. Crawford, engineering assistant to the director of the Pocahontas region; H. R. Rodenbaugh, engineering assistant to the director of the South-

ern region, and Mr. Safford and Mr. Hadley, previously mentioned.

In addition to those members of the association specifically mentioned above as carrying out certain particular branches of the work of the Railroad Administration, quite a few of the members were retained individually for certain specific activities of a diversified nature that are incapable of definite grouping. This list includes the following: L. W. Baldwin, operating assistant to the regional director of the Allegheny region; A. T. Hardin, assistant regional director, Eastern region; Howard Elliott, member Joint Fuel Zone Committee; H. B. Spencer, chairman, Advisory Committee, purchasing section; Major Edward C. Schmidt, Fuel Conservation Section; A. W. Gibbs, member committee on mechanical standards, division of operation; W. J. Cunningham, manager, operating statistics section; S. S. Roberts, staff officer, engineering, Southern region; G. D. Brooke, on staff of regional director, Allegheny region, and Lester Bernstein, on the staff of the regional director, Eastern region.

## The A. R. E. A. Elects Officers

**S**HORTLY BEFORE the close of the afternoon session yesterday, Secretary Fritch announced the results of the balloting for officers for the ensuing year. The selection was as follows:

President, Earl Stimson, general superintendent maintenance of way, Baltimore & Ohio, Baltimore.

First vice-president, H. R. Safford, engineering assistant to regional director, Central Western region, Chicago.

J.; J. R. W. Ambrose, chief engineer, Toronto Terminal Railway, Toronto, Ont.

Earl Stimson, President

Earl Stimson, the new president of the American Railway Engineering Association, is not a rolling stone. Nevertheless he has gathered no moss on his back. While his entire engineering experience has been accumulated

Officers of the American Railway Engineering Association  
Earl Stimson, President

H. R. Safford, First Vice-President

J. A. Atwood, Second Vice-President

Second vice-president, J. A. Atwood, chief engineer, Pittsburgh & Lake Erie, Pittsburgh.

Treasurer, George H. Bremner, district engineer, Division of Valuation, Interstate Commerce Commission, Chicago.

Secretary, E. H. Fritch.

Directors, Charles F. Loweth, chief engineer, Chicago, Milwaukee & St. Paul, Chicago; F. L. Thompson, chief engineer, Illinois Central, Chicago; Hadley Baldwin, assistant chief engineer, Cleveland, Cincinnati, Chicago & St. Louis, Chicago.

Nominating Committee, C. F. W. Felt, chief engineer, Atchison, Topeka & Santa Fe, Chicago; G. J. Ray, chief engineer, Delaware, Lackawanna & Western, Hoboken, N.

in the course of the long period of employment with a single railway system, the Baltimore & Ohio, this fact has not curtailed his development into an engineer of broad views capable of appreciating the problems to be encountered under a wide variety of conditions.

As regards his relations with others he is of a quiet, retiring demeanor, ungiven to advertising his own merits, and above all extremely conscientious with regard to facts. This trait of his character can be illustrated no better than by relating the following incident: About six months ago there appeared in these columns a sketch

of his career, published in connection with the announcement of his appointment to the position of general superintendent maintenance of way and structures. This sketch contained an error as will be noted from the following excerpt from a letter received from Mr. Stimson: "I wish to call your attention to the fact that there is one mis-statement, which I would be very glad, indeed, to have you correct, and that is with reference to my graduating from Cornell University in 1895. While I attended Cornell University in 1893, 94 and 95, I did not graduate, and although I would consider it a great honor to graduate from that institution, I do not care to seemingly assume that honor unearned."

He is a hard worker and is universally liked by his men. His long years of service are the best proof of his ability, as the position of engineer maintenance of way is most tedious and not only requires the exercise of engineering ability but also a capacity for handling detail. He is also head of an interesting family, consisting of his wife and six children.

Mr. Stimson was born at Cincinnati, O., on September 2, 1874. He was educated at Cincinnati University and attended Cornell University during 1893, 94 and 95. He

entered railway service in June, 1905, as a rodman in the maintenance of way department of the Baltimore & Ohio Southwestern, with headquarters at Cincinnati. In 1896 he was promoted to assistant engineer, being transferred to Chillicothe, Ohio, in 1898. In 1899 he was promoted to resident engineer of construction, with headquarters at Osgood, Ind., where he remained until 1901, when he was advanced to the position of assistant division engineer at Chillicothe. His promotion to division engineer took place in April, 1902, when he was placed in charge of the engineering work of the Springfield division at Flora, Ill. He was transferred to Washington, Ind., in May of that year where he remained until 1905, when he was made engineer maintenance of way of the Baltimore & Ohio Southwestern. A further promotion to the position of chief engineer maintenance of way of the Baltimore & Ohio was given him in April, 1910. The title of this position was changed to engineer maintenance of way in 1912, and he held this position until August, 1918, when he was made general superintendent of maintenance of way for all lines grouped with the Baltimore & Ohio Eastern Lines, under the jurisdiction of C. W. Galloway, federal manager.

## The Service Record of the Appliances Association

**A**LTHOUGH THE National Railway Appliances Association is essentially a cold, businesslike organization, composed of companies banded together for the purpose of exhibiting railroad appliances to the proper representatives of the various railroads, the personality of the companies constituting this association is in reality the spirit of its existence. The personality of these component parts is in turn dependent upon the character of their executives and the men in their respective employ. Hence a story of the National Railway Appliances Association in the war is the history, or service records, of its members.

The war records of the past year have served to a large extent to classify all humanity and endeavors into those that did and those that didn't. The National Railway Appliances Association did. The various railroad supply firms which constitute the association did. And in turn the men forming these companies did. This is the record in general.

The National Railway Appliances Association, being an intangible thing with a list of officers and directors and a treasury substantial but once a year before the annual exhibit and as regularly emptied a few weeks later after the close of the exhibit, could consequently do its bit as an association only by purchasing an allotment of Liberty Loan Bonds by dint of stringent economy. The records of the association's companies and the individual record of their employees is a record, too, of the N. R. A. A.

The contributions of different companies to the winning of the war may be expressed in terms of their blue and gold starred service flags, the records of their purchases of Liberty Bonds, their contributions to the various charitable organizations and the converting of their producing plants to the filling of government contracts for war materials. Unfortunately, no record has been kept of the war activities of members of the association nor have many of these activities been published during the past year, nevertheless, bits of their work are brought to light in their annual statements, in the reports of the charitable organizations and now, with the relinquishing of many plants from war material fabrication in the return of these plants to the production of their usual products.

A few examples of the war records of the railway sup-

ply trade firms will suffice to show the character of the assistance rendered the government during the period of hostility.

The Chicago Bridge & Iron Works, Chicago, of which M. J. Trees, president of the National Railway Appliances Association, is vice-president, has turned its three plants to the making of war materials for the government to the exclusion of its own products. Its service flag contains 183 stars and among those who have made enviable records in the service of the government are George P. Horton, president, who was assistant general manager of the Submarine Boat Corporation until January, 1919; Robert Murray, vice-president and manager of operation, who is now a lieutenant-colonel in the 21st Engineers, 77th Division, a part of the Army of Occupation, and Charles S. Pillsbury, assistant general sales manager, who is now overseas in the Construction Department of the Signal Corps.

The Manganese Track Society, when the need arose for standards for special track work for use on the railways which the United States forces in France had taken over, assisted S. M. Felton, director general of railways of the United States army, in their preparation. A complete set of standards for special track work, including frogs, switches, crossings and crossovers, was developed and the magnitude of the requirements is indicated by the fact that 5,000 turnouts alone were specified in the first order. A. H. Mulliken, president of the Manganese Track Society, and other members of the society were actively engaged in this work.

As stated before, these examples illustrate the work that members of the N. R. A. A. have done as their bit. Practically every member of the association could boast of a similar record and to enumerate them would be to simply repeat with slight modifications. Of special interest in connection with the work of the railway supply companies is the history of the Railway Regiments Tobacco Fund, instituted in October, 1917. The list of contributors to this fund to provide "smokes" for the members of railway regiments in France is replete with the names of N. R. A. A. firms. No doubt, if lists of the contributors to other funds of a similar nature were compiled the N. R. A. A. would have an equally good representation.

Of the men prominent in the association, several were not content with being the man behind the gun and entered active service. For instance, George C. Isbester, a member of the board of directors of the National Railway Appliances Association and district sales agent of the Rail Joint Company, Chicago, entered the navy in June, 1917, with the rank of lieutenant-commander and acted as paymaster at the Great Lakes Naval Training Station, with headquarters in Chicago. For many years Lieut. Commander Isbester has been a member of the Naval Reserve. He served in this capacity until July, 1918, when he was assigned to more active duty on the staff of Admiral Sims in London. Word recently received from him indicates the possibility of his early return to Chicago.

Tom R. Wyles, prominent for the past ten years as either an officer or a member of the board of directors of the National Railway Appliances Association, entered the Quartermaster Corp of the United States army in May, 1917, with the rank of captain and was stationed at Madison Barracks, N. Y. He resigned from the army in September, 1917, to become director of the Central district of the Military Training Camps Association, with headquarters at Chicago. This association under Mr. Wyles' direction came to be recognized as the best means of obtaining proper material for officers fitted to serve in the army during the emergency. Army authorities were at first skeptical of the efficiency of this plan, but before the signing of the armistice complete recognition had been given to Mr. Wyles' committee and its jurisdiction extended to the examining and recruiting of men fit to become officers in all branches of the army. Much of the credit for the success of this plan is attributed to his efforts.

Among other men prominent in the N. R. A. A. and who have been actively engaged in war work are Fred A. Poor and Fred A. Preston, president and vice-president, respectively, of the P. & M. Company of Chicago. Mr. Poor for three months from September to December, 1918, was assistant director of personnel of the American Red Cross at the American Red Cross headquarters in Washington, in which position he had charge of the selection of Red Cross workers for overseas duty and also the representatives of the American Red Cross in the United States. Mr. Preston was commissioned as captain in the Air Service of the Signal Corps in October, 1917, and sailed for France in the same month.

## The Railway Engineering Association in the War

THE HONOR ROLL of the American Railway Engineering Association contains the names of 137 members who joined the armed forces of the United States, Canada or Great Britain. Coming as they did from a body of men whose training and experience fitted them especially for leadership and technical attainment, the service rendered by this group of men proved invaluable in the various lines of special activities to which they were assigned. Nor is the record of the association to be judged by mere number of its roll of members who joined the colors, for with repeated admonition regarding the extreme importance of transportation at home as a part of the military machine there is no question but that many of the members were deterred from action which their patriotism prompted by the demands made upon them for service in this country. Be that as it may, there is no substitute for the sacrifices of military service. The men who suffered loss of position and home and income to serve their country deserve special recognition to which no others can lay claim.

There he was stationed in Paris and connected with the Supply Section of the Air Service of the American Expeditionary force, being commissioned a major before his return to the United States in December, 1918. He received his honorable discharge at Washington on December 29, 1918.

Soon after the declaration of war, Warren R. Roberts of the firm of Roberts & Schaefer, Chicago, was commissioned a major in the construction division of the United States army, in which work he was identified with the building of several of the large cantonments in the United States. Later in 1918 he was promoted to the rank of lieutenant-colonel and attached to the Purchases, Stores and Traffic Division of the General Staff, with headquarters at Washington.

Facts concerning the activities of individuals connected with the N. R. A. A. are hard to obtain and doubtless there are many men whom the older members of the association will remember as having been actively engaged in government work and whose records have never been chronicled. A summary of the work of these men would be highly interesting yet almost impossible to obtain at the present time. Others of whom notice has been received of their entry into active service are: Azel Ames, Jr., of the Kerite Insulated Wire Company, and until a few weeks ago a major in the 63d Regiment of Coast Artillery, stationed at Fort Screven, Savannah, Ga.; C. H. Wilson, St. Louis railway representative of Fairbanks, Morse & Co., and formerly a first lieutenant in the Tank Corp; T. E. Carthers and C. M. Deardorff, formerly sales engineers with the General Railway Signal Company, N. Y.; R. P. Johnson, assistant engineer, with the General Railway Supply Company of Canada at Lachine, Que.; E. A. Warner, Jr., of the Union Switch & Signal Co.; Captain John M. Taylor, formerly with the H. K. Ferguson Company of Cleveland, Ohio; Major O. F. C. Randolph, with the same company, who has been an officer in the 16th Engineers (Railway) in France since August, 1917; Lieutenant Sherman C. Amsden, formerly sales manager of the Mudge & Co., Chicago, and now assistant to president of the same company; Lieutenant W. W. Glosser, who has been associated with the P. & M. Company and the Madden Company, both at Chicago, and Captain A. Fletcher Marsh, of the Marsh-Truman Lumber Company, Chicago, who was connected with the Lumber Production Division at Washington.

Two members of the association made the supreme sacrifice. Lieut. Colonel Hiram J. Slifer, who died in France, will be remembered by his many warm friends and it is with no little satisfaction that we present on another page of this issue some detailed information concerning his military service and the accident leading to his death, together with some notes on the last days of his life.

The first member to die in the service of his country was Capt. Louis Vincent Manspeaker, who died of pneumonia on February 9, 1918, while in training at Camp Lee, Va. Capt. Manspeaker had been commissioned on January 1, and was expecting early assignment to active service on the other side at the time of his death. He was buried with military honors at his old home in Champaign, Ill. Before his entrance into the service he had been an assistant engineer on the Chicago & Alton, with headquarters at Bloomington, Ill. His previous railway experience extended to the Missouri, Oklahoma & Gulf and the Madeira-Mamore Railway of Brazil. Capt. Man-

speaker was an engineer of ability, energy and high regard for duty. He had a pleasing personality that won him many devoted friends, who keenly felt the loss occasioned by his death.

The most conspicuous service rendered by any member of the association and which will go down in history with greatest emphasis is that of S. M. Felton, director general of military railways, whose energy, resourcefulness and wide knowledge of railway matters, coupled with his executive ability in organizing railway troops and assembling and forwarding railway supplies, were largely responsible for the success of the American railway transportation system in France. The remarkable feature of Mr. Felton's military career is the fact that he carried on the great work in close contact with the military establishment in the capacity of a civilian, for he persistently refused to accept a commission.

Linked with Mr. Felton's name is that of William J. Wigus, who was a member of the commission that went to France in May, 1917, to investigate the transportation needs of the American expeditionary forces. Later he collaborated with Mr. Felton in determining the equipment requirements and upon the perfection of a permanent organization was given a commission as colonel in the capacity of senior deputy to Brig. General W. W. Atterbury, the director general of transportation, in the Services of Supply.

It is interesting to note that seven other members of the association were officers in Gen. Atterbury's organization. In this number were included all three engineers of construction, namely, Col. H. C. Booz, now corporate chief engineer of the Pennsylvania Railroad; Col. H. M. Wait, formerly city manager of Dayton, Ohio, and Lieut. Col. A. W. Hudson, formerly engineer of construction on the Hell Gate bridge. Others on this list are Maj. W. M. Vandersluis, signal engineer of the military railways, who was formerly signal engineer of the Illinois Central; Lieut. Col. B. L. Bugg, one of the general superintendents, formerly general manager of the Atlanta, Birmingham & Atlantic; Col. F. W. Green, one of the port terminal superintendents and formerly assistant to the president of the St. Louis-Southwestern, and Lieut. Col. E. B. Cushing, director general of army transport service, who was formerly assistant general manager in charge of the maintenance of way department on the Sunset Central Lines.

Later Col. Cushing saw service in Italy and more recently with an important American commission appointed by Gen. Pershing for service in the Rhine valley, the North sea ports and other points where the possessions of the allies come in contact with the states of the German republic. In addition to the men mentioned above who were identified with the transportation forces of the Services of Supply, not a few members of the association were, and many of them still are, connected with various other branches of the service in important positions. Some of them, like Col. George H. Webb, formerly chief engineer of the Michigan Central, and Col. J. F. Jonah, who has recently returned to his position as chief engineer of the St. Louis-San Francisco, were officers in the various railway regiments organized early in 1917 to form a portion of the advance guard of the American troops that landed in France early after the declaration of war.

Some facts concerning Col. Jonah's experience are mentioned here as illustrating the nature of the services performed by American railway men in military activities somewhat more remote from railroad work than that connected with the operation of the military lines under the Services of Supply. Commissioned as a major on January 23, 1917, he was ordered into active service with

the 12th Engineers in June, and landed at Liverpool on August 12, taking part in the memorable parade of the four engineer regiments in London on August 15. Upon landing in France he was immediately assigned to duty back of British lines in Picardy on the location and construction of light railways serving the British. On October 17 he was detached from the 12th Engineers and appointed chief engineer, Department of Light Railways for the American Expeditionary Forces. This service occupied the greater part of the winter of 1917 and the early months of 1918 and involved the examination of trains, light railway systems, shops, etc., on the front from Verdun to the Swiss border, in addition to considerable construction work. In September 10, 1918, he was promoted to the rank of lieutenant-colonel and when the signing of the armistice removed the necessity for any further construction of light railways he was relieved from active duty and returned to the United States, where he arrived in January, 1919.

An account of this kind must not be restricted to men who were in the United States army. Among Canadian members who distinguished themselves in the war is Col. C. W. P. Ramsey, C. M. G., of the Canadian Overseas Railway Construction Corps, who was a member of the first construction battalion to leave Canada.

This organization left Canada in June, 1915, and after some time in England reached France in August. It was later attached to the English army and was engaged in all manner of railway construction work. The corps distinguished itself especially during the retreat in the spring of 1918, being turned into demolition parties to destroy the lines of communication in the face of the German advance. Col. Ramsey was awarded the C. M. G. (Commander of the Order of St. Michaels and St. George) and was promoted to colonel in April, 1917. Before entering military service he was engineer of construction of the Canadian Pacific and in association affairs was identified with the work of the committee on Economics of Railway Location. Colonel Ramsey has returned to Canada and has resumed his duties with the Canadian Pacific.

Maj. F. L. C. Bond, recently made chief engineer of the Grand Trunk, saw extended service in France. F. W. Thornton, general manager of the Great Eastern Railway of England, was commissioned a brigadier-general in the British army and served in a capacity somewhat analogous to that of Gen. Atterbury in the American army.

## Fifty Millions to Railroad Administration

*(Special Telegram to the Railway Age)*

WASHINGTON, D. C., March 19, 1919.

"The War Finance Corporation has loaned fifty million dollars to the Railroad Administration, which is to be used to replenish working capital in the hands of Federal treasurers to meet current requirements. One of these is for a large number of cross ties now being received, which are to be paid for on delivery. A large number of Federal treasurers have been in Washington this week. This sum represents all that the Administration itself can get from the War Finance Corporation, although individual railroad companies may make loans."

## Wood Preservers Change Convention Date

Owing to the fact that the Automobile Show will be held in Chicago during the fourth week of January, 1920, the Executive committee of the American Wood-Preservers' Association, at a meeting held in the Auditorium hotel yesterday, decided to postpone its convention two weeks. It will, therefore, meet at the Hotel Sherman, Chicago, the second week in February.

## Railroad Administration Closes Contracts

The Railroad Administration executed compensation contracts on Tuesday with the Salina Northern for \$15,000; the Louisville, Henderson & St. Louis for \$343,915, and the Louisville & Nashville for \$17,310,000.

## Baltimore & Ohio Luncheon

Engineering officers of the Baltimore & Ohio held a get-together luncheon at the Congress hotel yesterday, which was attended by about 55 members of the eastern and western organizations. L. G. Curtis, corporate engineer, Baltimore & Ohio, presided and a number of those present responded to toasts.

## Concrete Freight Car on Exhibition

A freight car with reinforced concrete floor, sides and ends has been designed and patented by Joseph B. Strauss, president of the Strauss Bascule Bridge Company, Chicago, and is on exhibition at the Central Station, at 12th St. and the Illinois Central tracks, during the convention. The first car built to this design was placed in service with appropriate ceremonies on Monday.

## Roadmaster's Committee Meeting

The members of the Executive committee of the Roadmasters' and Maintenance of Way Association spent most of yesterday at a meeting in the Auditorium hotel, planning for the next convention. The work of the committees was reviewed and other problems facing the association were discussed.

## Correction

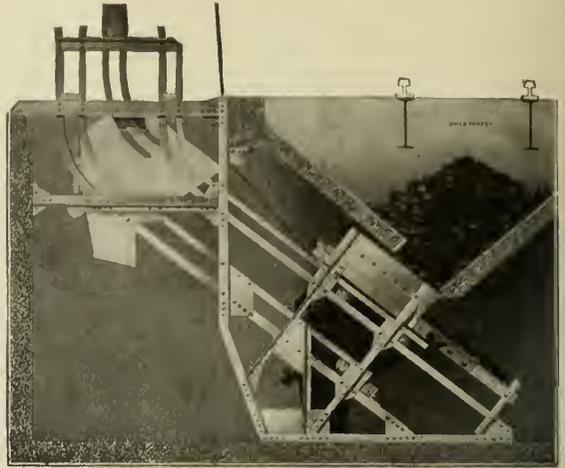

The statement was made in our Daily Edition on March 19 that General Petain had bestowed the French Croix de Guerre with two palms on Sergeant William N. Lepreau, son of Frank Lepreau, vice-president of Thomas A. Edison, Inc., Primary Battery Division. This statement was incorrect with respect to the bestowal of this honor by General Petain, as he confers such honors on commissioned officers only.

## A New Development in Coaling Station Design

THE COUNTERBALANCED bucket has been recognized for years as one of the most economic and efficient methods of hoisting coal. It has one disadvantage, however, the necessity for a deep pit placed beside the track hopper; that is, it is necessary to have a pit deep enough so that the coal deposited in any part of the track hopper pit will reach the bucket in a well adjacent to one side of the pit in addition to the vertical height occupied by the bucket itself. Whenever difficult foundation materials are encountered in the construction of a pit of this kind, the cost of a substructure for the station may be excessive.

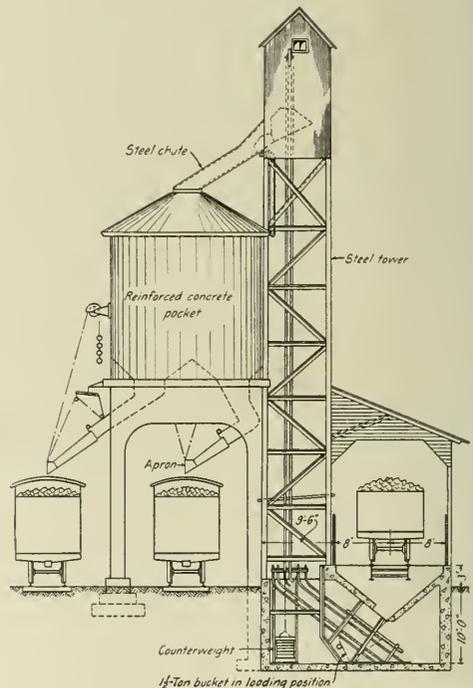

To meet the needs of difficult situations of this kind coaling plants have been built in which the coal was delivered to the hoisting bucket by means of an incline from a hopper under the center of the track pit at an angle of about 30 deg. from the horizontal. This plan necessarily involves the use of a separate feeding bucket with its added operating and maintenance costs. To eliminate this extra feature the Roberts & Schaefer Co., Chicago, has perfected and patented the design and con-

struction of a shallow pit counterbalanced bucket for handling coal from the track hopper to storage, this design being known as the "RandS" shallow pit elevating bucket. In this design the hoisting bucket, instead of

Enlarged View of the Incline Under the Track Hopper

descending into a pit vertically below the hoisting tower, passes down an incline to a point underneath the track hopper, where the coal may be received through a gate direct from the hopper. After receiving its load of coal

Sectional End Elevation of the Station

from the track hopper the bucket starts upon its upward journey along the incline, drawing with it the undercut gate until the aperture from the track hopper is completely closed when the gate is released and the bucket

continues on an incline until clear of the track hopper, as shown in the cut. At this point in the bucket travel, the ball-bearing rollers which guide the bucket in its vertical travel gradually glide into their guides and the rollers which guided the bucket in its inclined travel become disengaged. The bucket continues on its vertical travel until it comes to the top of the plant, where the apron is released, allowing the bucket to discharge its load.

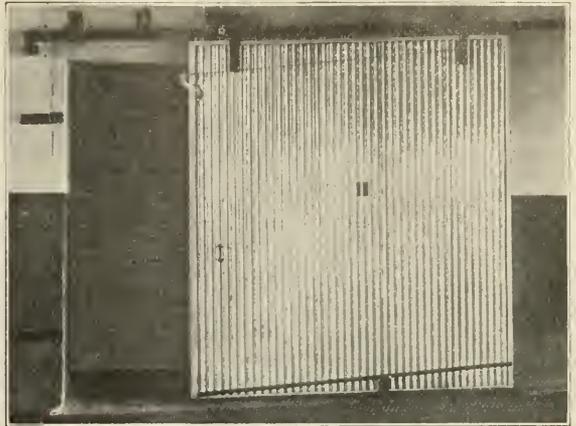

### A Recent Development in Fire Doors

THE IMPORTANCE to railroads of fire prevention and control is annually evidenced in the reports of the Railway Fire Protection Association. In a recent report of this Association the fact was disclosed that the average annual loss to railroads from fires closely approximates \$7,000,000. In buildings one of the principal methods for the prevention and control of fire is in the installation of fire doors in the division walls.

The photographs shown with this article are two of many types of fire doors manufactured by the Merchant & Evans Company of Philadelphia, Pa. These types are particularly applicable to railroad structures. The hinged doors operate with non-automatic hardware, but if de-

sq. ft. The absence of wood or other material subject to deterioration reduces maintenance charges to the minimum and the heavy steel binder on the edges prevents damage to the frame from trucking.

While these fire doors and fire shutters have been on

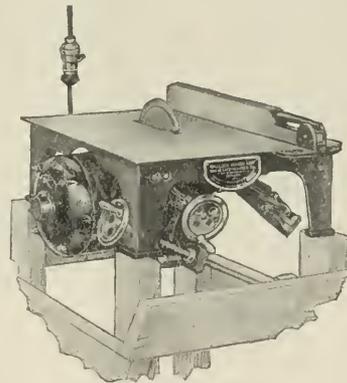

Sliding Door of Automatic Type

the market but a short time, they are in use extensively by railways, including the New Haven, the Pennsylvania and the Reading.

### Bench Saw for Woodworking Shops

A PORTABLE BENCH SAW, so designed that the saw can be raised or lowered and tilted to any angle up to 45 deg. with the table always remaining in a horizontal position, has recently been placed on the market. This machine is adapted for use in carpenter, cabinet and pattern shops.

Electric Driven Portable Saw

It can be operated on an electric light circuit still maintaining sufficient power to take a 2-in. cut through hardwood, making it possible to utilize it on at least 80 per cent of ordinary carpenter work. By its portable feature the time ordinarily lost in taking material from the bench to a saw located some distance away is saved.

The table is 17 in. by 20 in. and the saw is 7 in. in diameter. The saw may be tilted by means of a hand wheel and screw on the side of the machine. It is driven through cut gears from a 1/2 hp. motor fitted with a ball bearing to take up the thrust when the saw is tilted for

Hinged Fire Doors

sired automatic hardware may be used. The sliding door shown is, of course, automatic.

In construction the doors shown and other types manufactured are similar. Essentially they consist of a double panel of heavy corrugated galvanized steel, lined with sheet asbestos and bound in a rigid, continuous frame of 3/16-in. by 2 1/2-in. bar steel. The frame is reinforced on all edges by an extra heavy binder of galvanized steel, forming a box for the panel and thus preventing damage to it. Provision is made for expansion and contraction, so that distortion and warping of the door is impossible and the radiation of heat is reduced to a minimum by means of a series of regular air spaces, properly insulated, covering the entire area of the door.

The absence of a wood core reduces the weight of the doors, the average weight being not more than 5 lb. per

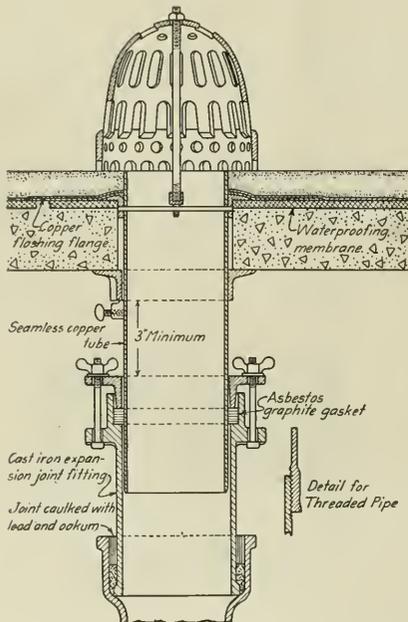

cutting at an angle. The advantage of this method of tilting over the ordinary tilting table is apparent, especially in cutting long stock which may be done without danger of breaking the angle by the stock coming in contact with the floor. The saw may be raised or lowered so as to cut or groove any depth up to 2 in.

The cross cut frame is adjustable to a 45-deg. angle and is an integral part of the machine, being swung under the table when not in use. The rip fence is of the box type and is clamped to the table by means of an eccentric lock. It is finished on both sides so that it may be used on either side of the saw. The saw is protected by a shutter guard which is held in place by a spring but slips back as the stock is fed into the machine.

This saw is a recent addition to the line of bench machines manufactured by J. D. Wallace & Co., Chicago.

## A Roof Connection Fixture

THE MOST EXPENSIVE and carefully placed roofing is of little value if the connections of the roof or roofing to the outlets for vents and down spots are faulty or develop defects during service. Especially serious conditions arise when down spouts which occasionally carry a considerable volume of water are carried down inside the building. One source of trouble with such roof connections is the settlement of the building, or the expansion and contraction of the riser pipe which tends to destroy the union between the roofing and the

A Holt Roof Connection Fixture in Place

flanges of the roof connection, or even pull apart the riser pipe at the joints.

One means designed to overcome difficulties of this kind is the Holt roof connection, handled by the Barrett Company, New York. Since its introduction several years ago several modifications of this device have been developed so that it has been made applicable to a variety of conditions and roof details. The essential feature of this device is a slip joint in the pipe, formed by a special asbestos graphite gasket surrounding a copper tube. In

some designs this slip joint forms a part of the roof connection itself, but in others it is located in a separate fitting just under the roof. The latter form is of more general application and is illustrated in the drawing. This shows the arrangement for a concrete roof or floor, but other arrangements provide for other forms of roof and roofing.

It will be seen in the drawing that a section of copper tubing is connected to the roof or floor by means of a flanged fitting and is covered with a cast iron strainer. The lower end of this tube fits into a special cast iron expansion joint. This fitting is arranged to connect at its lower end with bell and spigot cast iron pipe or with screw pipe, while its upper end provides the slip joint with the copper tube. The type of roof connection shown is available in 3-in., 4-in., 5-in., and 6-in. diameter pipes and other types are to be had in diameters as great as 8 in. Instruction sheets are issued which show how the joints may be applied to various forms of construction.

## Value of Special Rail

### Inspection Demonstrated

THE MANUFACTURER of a particular device, the inventor of a special design, or the originator of some particular method of doing a piece of work, all strive for opportunities to demonstrate the particular efficiency of their own methods or devices as compared to those produced by others. But as a rule results are only comparative and it is not often that conclusive statistics may be compiled which demonstrate the proposition in actual figures. As a striking exception to this rule the officers of Robert W. Hunt & Co. have been able to demonstrate the advantages of the special system of rail inspection instituted by this company through statistics compiled by others, namely, the rail statistics compiled by the American Railway Engineering Association. As these statistics show the results secured on the different railroads for the different makes and ages of rails it is a simple matter to segregate the statistics covering rails known to have been rolled under the special inspection from those rolled without it and compare the results secured from both classes.

Comparisons prepared in this manner from the rail failure statistics published in 1918, giving the returns on rails rolled in the United States in the five years 1913 to 1917, inclusive, give some interesting results. In brief they show that there were 30 per cent more failures per 100 miles of track laid with rails that did not receive the special inspection than on those which did have it. These comparisons are summarized in the table given below:

#### OPEN HEARTH STEEL ONLY—RAILS MADE IN U. S. ONLY

Total track miles reported .....	37,862.33
Total track miles covered by special inspection .....	17,154.65
Per cent of miles reported covered by special inspection .....	45.3
Number of failures per 100 track miles (all rails) .....	31.13
Number of failures per 100 track miles covered by special inspection .....	26.67
Number of failures per 100 track miles not covered by special inspection .....	34.83

To those unfamiliar with the nature of special inspection the following explanation defines the difference between so-called "special" inspection originated by Robert W. Hunt & Co., and what may be termed the ordinary inspection.

"Special inspection is, in short, inspection applied to the whole process of manufacture, while ordinary inspection consists especially of an examination of the finished rails to prove the accuracy of the section rolled, the me-

chanical finish and the final classification into first or second quality, etc., while, of course, the physical tests specified are also given attention. Special inspection, whereby inspectors are located in all important parts of the mill during manufacture, is supplemental to ordinary inspection and obviously requires the employment of more inspectors than does ordinary. Generally speaking, the actual number of men employed on special inspection is three times that of ordinary, but this feature depends on mill conditions and especially on its size and tonnage."

## A Recent Type of Air Dump Car

**A**N AIR DUMP CAR in which the locking and unlocking and the position of the bed of the car are controlled absolutely by air without the use of side chains and without any fixed connection between the bed and the underframe

Automatic Compression Lock Type

has recently been introduced by the Western Wheeled Scraper Company of Aurora, Ill., for use in classes of work where it is desirable to employ cars without side chains. The dumping and righting of the bed are accomplished by the use of two short, vertical cylinders, one on each side of the car, so placed that their piston rods engage with the underside of the bed through hinged connections, called push rod extensions. The strut or post is hinged at its bottom end to the body bolster. Its upper end moves in a guide attached to the floor of the car, so that the motion of the strut is controlled positively.

Type of Air Dump Car Used by the A. E. F. in France

To lock the car in the carrying position, a brace has been pivoted at the upper end of each strut which the lower end engages with a cam fastened to a rack shaft, which in turn is operated by the movement of the piston in the cylinder. By this method all the parts between the bed and the frame are in compression.

By engaging directly with the bottom of the car, the piston rods utilize the total power of the air pressure in the cylinders in dumping or righting the car, thus eliminating all losses due to cables and sheaves. The thrust of the piston is applied near the outer edge of the car bottom, giving the greatest possible leverage and reducing the amount of power needed.

This simplified form of dumping device has also been applied to cars fitted with side chains for controlling the position of the bed. This type of car was used extensively in war construction in France, where nearly 1,000 have been supplied. It is furnished in four sizes, 12-yd., 16-yd., 20-yd. and 30-yd. capacity.

## The Morrison Switch Point Hold Down

**A** DEVICE WHICH IS SAID to insure an easy throwing switch while at the same time always holding it in surface and eliminating all vertical motion in the points has recently been introduced by the Deeming-Endsley Company of Chicago. The device is known as the Morrison switch point hold down and consists of 4 parts; two attaching clamps which fit over any standard switch plate, a bolt, and a horizontal guide rod 1 in. in diameter, which is secured at one end to the attaching clamps, extends through a hole  $1\frac{1}{8}$  in. in diameter, drilled in the web of the switch point and turns up under the ball of the running rail.

It is applied readily, the work consisting of drilling a hole in the web  $\frac{1}{4}$  in. above the flange and 18 to 21 in. from the toe of the point; then the plate is raised on the inside of the point and a slot  $\frac{1}{2}$  in. deep is made in the

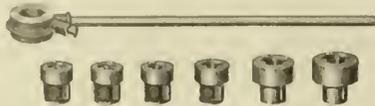

The Switch Point Hold Down in Service

tie the width of the attaching clamps; the lower lips of the clamp are then set under both sides of the tie plate and the curved end of the horizontal rod is inserted in the switch point and the other end is pressed down until it rests on the upper lips of the clamps. The application of the bolt completes the operation except for driving a small spike in a slot provided in the clamp to hold the rod firmly against the rail. These spikes permit of adjustment of the device as required.

Although this device has been on the market but a comparatively short time it is in extensive use on steam roads. Among the roads using the device are the Dallas Union Terminal, the Kansas City Southern and the Gulf, Colorado & Santa Fe. It is claimed for the device that it prevents derailments at switches and insures additional life to switch points.

## Some New Pipe Threading Tools

A NEW RATCHET HANDLED pipe cutter with quick changing units for different sizes of pipe is a convenient tool recently developed for working in tight places on pipes ranging from  $\frac{1}{8}$  in. to 1 in. in size. The device is also applicable to bench work. As shown in the illustration, it consists of a series of six die heads of  $\frac{1}{8}$  in.,  $\frac{1}{4}$  in.,

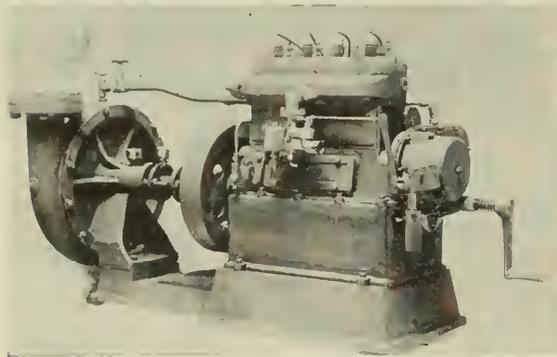

The Ratchet Handle and the Six Die Heads

$\frac{3}{8}$ -in.,  $\frac{1}{2}$ -in.,  $\frac{3}{4}$ -in. and 1-in. size, which are fitted into a socket containing a ratchet and also fitted with a handle. These heads can be changed quickly and have bosses on the sides that engage slots in the sides of the socket to keep them from turning independent of the socket. The ratchet is completely inclosed so that it is readily kept free from dust and grease and also eliminates possible loss of any loose parts. This device is manufactured by the Borden Company, Warren, Ohio, and is known as the No. 3 Beaver Junior ratchet.

## Pumping Outfit for

### Railway Water Supply

IN ITS UNIVERSAL TYPE F centrifugal pumping outfit designed for use in railway installations where a full head capacity is desired the University Motor Company of Oshkosh, Wis., has made a practical application of a gasoline motor direct connected to a centrifugal pump. The outfit has a capacity of 265 gal. per min. with a 55-ft. head. The important feature of this plant is the fact that the engine is designed and constructed to operate continuously with practically no attention or trouble. It will pump 150,000 gal. in a 10-hr. day, with a fuel consumption of about 9 gal. of gasoline. It is of the four-cylinder balanced type capable of operating at a normal speed of 1,000 r. p. m. It has a removable cylinder head,

A Full-Head Three-Inch Centrifugal Pumping Outfit

high tension ignition, automatic oil pump and generator, all parts being enclosed and running in oil.

The governor controls the speed, holding it to 1,000 r. p. m. regardless of the load, so that the water can be shut off at any time without adjusting the engine. The cylinders are  $2\frac{3}{8}$  in. by 4 in. and the crank shaft has a

diameter of  $1\frac{1}{2}$  in. and adjustable bearings. All the small parts are hardened steel, ground to interchangeable size.

The oil pump is of the plunger type, taking oil from the base and pumping it through the sight feed glass in the gear. The oil flows from this point to all interior parts, automatically lubricating them. It is removable by dismounting the discharge pipe union.

The engine is fitted with an Atwater-Kent ignitor or magneto and is wired up complete with spark plugs when shipped. The pump has a 3-in. discharge and a 4-in. suction and is equipped with a ball thrust bearing to take the end thrust of the runner. It is connected to the engine fly wheel by means of an arm coupling. The pump can be fitted with a foot valve so it may be primed.

## A Cylindrical Telephone Booth

A CONCRETE TELEPHONE BOOTH of cylindrical form has been developed recently as a substitute for the square or hexagonal shapes more commonly used in the past and over which it is said to have a number of advantages. The idea in developing this design was to supply the demand for a moderate priced booth of perma-

Two Views of the Booth

nent construction that can be transported readily, and will not be damaged when being shifted from place to place. As seen in the illustration, the booth consists essentially of a section of concrete pipe of three feet inside diameter with holes cut for a door and (if desired) for windows. The conical roof is cast separately and fits down over the cylindrical body.

Both the barrel and the roof are designed for the stresses occurring during transportation and erection. Owing to the cylindrical shape of the barrel of the booth, rolling is a most convenient method of moving it about. The booth has no floor since there seems to be a demand for a house in which a cinder floor can be placed. When used as a sentry box two windows are provided, but these are ordinarily omitted when it is used as a telephone booth and when used for this purpose a hole of one inch diameter is provided in the back for the entrance of a telephone cable and a ring is inserted in the roof to hold the slack in the cable. This type of concrete booth was developed and is being manufactured by the C. F. Massey Company, Chicago.

# EDITORIAL

## Railway Age

# EDITORIAL

As suggested in the *Railway Age* of March 14, the high wages to railway employees can only be maintained by either raising the freight and passenger rates, or by increasing the efficiency of the individual employees. The problem presented should be solved as far as possible by increasing efficiency. The

### How High Wages Can Be Maintained

Railroad Administration is therefore face to face with a tremendous problem which can only be solved by a thorough and intensive educational program. First and foremost, the managements and the men must be made to realize the vital necessity for cordial and hearty co-operation. This may sound academic, but it is a fundamental principle on which any sound solution of the railway problem must be based. It can be inspired by a large, broadminded expression and attitude toward this end on the part of those at the head of the Railroad Administration and its various subdivisions. In the second place, educational campaigns must be conducted in all departments and among every class of employees to show them exactly how they can best do their various tasks. In these days of highly specialized work, many of the men lose interest because of the monotony of their work, and look with fear and distrust upon any further tendency in that direction. This fact must be recognized and the training of the men must be broad enough so that they may occasionally be shifted and thus maintain their interest in the work. Good work, either as to quality or quantity, cannot be done by men who are not interested in it, and who are not working at it in the spirit of playing a game.

The brakeman, in the old story, who wanted a pass to go home at the end of the week was rebuffed by the cold-hearted superintendent with the question whether he would expect a farmer to hitch up a horse and buggy on Saturday night to carry home a hired man. "No," said the brakeman, "of course

### Reduced Demurrage Rates Called For

not; but he would be a darned mean farmer if he should refuse such a small favor when he had the team all hitched up and was going in that direction." The lumber dealers who are now demanding the reduction of demurrage charges on freight cars present to the railroads the same argument: Your cars are standing 'round earning nothing; why charge us for delaying them when you continue to delay them (empty) yourselves? It is the old question of maintaining a system, for the promotion of regularity and broad economy, even when the immediate evidence of economy is lacking. A demurrage charge is necessary to insure economical use of track room, regardless of the value of the car. To suspend or modify the charge every time the value of the car service changes, tends to defeat the main purpose of the rule. Experience has demonstrated this. Uniformity of rates is of value in itself in spite of minor or temporary unfairness. If the lumbermen could have the full benefit of the brakeman's argument their traffic sharps would soon be proposing that on descending grades as, for example, from Altoona to Harrisburg, lumber should be carried for nothing—at least in cases where a car might be needed to fill out a train to the standard length! The interesting feature about this request of the lumbermen is that in Washington it comes before Max

Thelen, director of the division of public service. Mr. Thelen formerly was a railroad commissioner in California, where a high demurrage charge has been in force for nearly ten years, producing marked economy in the use of freight cars; and in his answer he may be expected to set forth the true principles of demurrage rates, high or low, regular or irregular.

There are now about 5,000 locomotives equipped with mechanical stokers in this country. The rapid rate at which the stokers have been applied during

### What Locomotives Should Be Stoker Fired?

the last few years is due to the necessity for increasing the capacity of the individual locomotives and thus the amount of traffic that can be handled over a division in a given time. The question as to the dividing line between the hand-fired and the stoker-fired locomotives has been one of much debate and discussion. The size of the locomotive, within the questionable limits, is not nearly so important a factor as the capacity to which the locomotive is to be worked for long periods. W. S. Bartholomew, president of the Locomotive Stoker Company, gave it as his opinion at a meeting of the Western Railway Club on Monday evening that, in general, locomotives should be equipped with stokers which weigh 200,000 lb. or more on the drivers, have a tractive effort of 50,000 lb., a grate area of 60 sq. ft., and which require more than 4,000 lb. of coal per hour for long periods. Of course, there are cases where it is desirable to use mechanical stokers on locomotives below these limits. Lighter and less powerful locomotives, for instance, may be stoker fired to advantage when they are worked to the limit of their capacity for sustained periods. While stoker-fired locomotives may use more coal per locomotive mile—and undoubtedly they will if the best use is made of them—it does not follow that the rate per ton mile will be any higher, and even if it is the cost of moving the freight per ton mile will be decreased because of the larger tonnage per train or the more rapid rate at which it is moved over the division. It is true that the higher the rate of combustion the lower the efficiency of combustion. We must pay the price in fuel economy if we are to get the greatest horsepower output from a locomotive, but the increase in the train load and the greater amount of business that can be handled over a division in a given time will far more than offset any loss in this respect. As Mr. Bartholomew suggested, the important thing is to move the maximum amount of tonnage over a division in a minimum amount of time.

The government has announced its intention of issuing what amounts to due bills to the railroad companies for amounts owing on rental and accepting 90-day drafts for amounts owed for equipment. In this way the money received from freight and passenger revenues can be so conserved as to permit of the continued operation of the railroads until such time as Congress meets and passes a bill providing an additional \$750,000,000 or more for the Railroad Ad-

ministration's revolving fund. The total amount of such due bills will probably run up to some hundreds of millions of dollars, the exact amount depending on how far the roads fall behind in earning the rentals due and the length of time that will elapse before Congress is called in extra session. The railroad corporations are, therefore, thrown on their own resources to finance their corporate needs. The due bills will not be negotiable, but will be assignable and could presumably be used as collateral for railroad corporations' note issues. The sale, however, by the government of the Victory Loan bonds is about to begin and the strain on government credit will at best be severe, without having the added difficulty of competing with railroad collateral notes secured by government promises to pay. Bankers, railroad men and the Railroad Administration are now in conference. A plan is being worked out by which the due bills of the government and the accepted drafts can be taken by the railroads and equipment companies to their banks and discounted just as commercial paper would be discounted. It then should be possible for the banks to re-discount these due bills with the Federal Reserve banks, which in turn can issue currency against them. Under ordinary circumstances this would be an expansion of credit that might not be justifiable, but under present circumstances it would appear to be the best solution of a most difficult and complicated problem. There is, of course, the question of the legality of such a proceeding as here suggested, but the law giving the President the right to take over the railroads is so broad that, to the layman at least, its provisions appear to give the Railroad Administration ample authority to issue due bills which will be legal obligations and, therefore, acceptable for discount by the banks and re-discount by the Federal Reserve banks. Such an arrangement would interfere in the smallest possible degree with the successful flotation of the Victory Loan bonds.

### Freight Car Situation Serious

ONE OF THE CHIEF CRITICISMS of the railroads under private management has been that during periods of depression, it has been common practice to curtail expenses materially, thereby accentuating non-employment conditions and not using the opportunity for bringing the rolling stock up to a good condition of repair. This same criticism now applies most decidedly to the railroads under government operation. It is doubtful if the general condition of the more than 2,500,000 freight cars was ever as bad as it is today. While the government's statistics show a bad order car situation of a little over five per cent, they by no means represent the true condition of all the freight cars. Traffic has fallen off tremendously and quantities of freight cars are stored all over the country. Naturally, those cars that are in the worst condition are the ones chosen for the storage tracks and those which are better able to run are kept in service. The percentage of cars in bad order refers only to those cars that are in service and therefore the figure is low. If, on the other hand, traffic conditions were such as to require the use of all the cars the country would be in bad shape for equipment.

It is a well known fact that the cars are in a deplorable condition. One federal manager has ventured the statement that he has never seen them to be in worse condition. It is necessary that something be done and be done quickly to improve the situation. A general reduction in working hours and in labor forces is being made in the car departments all over the country. Such a policy is extremely shortsighted and does not adequately protect future business. Car Service Section Circular CS-53 and Circular No. 27, recently issued by W. T. Tyler, director of the Division of Operation, indicate that the bars are down now for returning the cars home to the owning lines. Every step should be

taken to get the cars home in order that they may be properly repaired and the betterment programs which have been suspended for such a long period continued. The war, of course, has been responsible for the present condition of cars, due primarily to the fact that business was excessively heavy and that a very small percentage of cars was on the home rails. If the Railroad Administration is out to make a showing in operating expenses in the same manner as the private corporations have done in the past, the cars will not be repaired, but if, on the other hand, it recognizes the excellent opportunity now, with traffic light, of getting these cars into the shop and putting them into first-class condition, our railways will be in shape to better handle any large increase in business which is very liable to come after peace negotiations have been closed.

### Advance of Rates Needed Under Either Government or Private Operation

THE SENTIMENT of the public and of Congress undoubtedly has crystallized in favor of the return of the railways to private operation. The continuance of government operation or the adoption of government ownership will not be seriously considered if it can be avoided.

But every month's statistics of earnings and expenses emphasize with increased force the fact that the return of the railways to private operation will be no simple and easy matter. In no month since the armistice was signed have the railways earned anywhere near enough to pay the standard returns guaranteed to the companies. In November their net operating income was \$57,000,000; in December, \$28,000,000; and in January, \$19,000,000; a total of \$104,000,000. The average operating net income earned in the same three months of the fiscal years 1915, 1916 and 1917—the years on whose income the guaranteed standard returns to the companies are based—was over \$215,000,000. In other words, during the last three months for which statistics are available the government's guarantees to the companies were approximately \$215,000,000; the net operating income actually earned was \$104,000,000; and the deficit incurred by the government was about \$110,000,000.

The statistics for January are relatively the worst of all. The total earnings made by railways under government control were \$109,826,000 more than in January, 1918. The freight business moved was 10 per cent more than in the terrible January of 1918. The weather conditions were as favorable to economy of operation as were ever known in winter. Nevertheless, the increase in the operating expenses of the roads over January, 1918—although only a small amount of retroactive advances in wages was included—was \$88,200,000, with the result that, as already shown, the net operating income made was only \$19,000,000. The average net operating income earned in January in the three years on which the returns guaranteed to the companies are based, was \$55,331,000. Thus, in the first month of the year the Railroad Administration shows a deficit of over \$36,000,000.

It does not seem reasonable to assume that either the freight movement will remain as small as it is now, or that operating expenses will remain relatively as high as they are now. Business will surely begin soon to show signs of recovery from the slump which followed the signing of the armistice. The operating officers, from Director of Operation Tyler down, are making the most energetic efforts to control and reduce expenses. But under the present system of government operation there are certain big special obstacles to the reduction of expenses which are extremely difficult to overcome. Besides, the train service employees are still to be given a large advance of wages, and the expenditures for maintenance must be increased, if the properties are to be kept in even as good condition as at present.

Undoubtedly if the railways were returned to private operation they would be more economically operated than they can be under the present system. But it is impossible to believe, in view of the statistics of earnings and expenses for recent months, that, with existing wages of labor, prices of fuel and materials and passenger and freight rates, they can be so operated under government control as to avoid another large deficit, or under private control as to enable them to earn enough to pay their interest and reasonable dividends.

There is no prospect of a reduction of wages. Prices of fuel and materials are weakening some, but not much. In the circumstances, there seems to be but one method available for restoring the balance between earnings and expenses, and that is to advance rates again.

It is impossible to see how, without another advance of rates, the railways could be restored to private operation without bankrupting many companies and forcing many others to suspend their dividends. It is also impossible to see how the government, without another advance of rates can avoid piling up a larger and larger deficit. Its deficit in the year 1918 was about \$225,000,000. This was increased to about \$260,000,000 by the deficit incurred in January, 1919.

The public must pay in taxes the entire deficit incurred in operating the railways. But there ought not to be any deficit incurred. Those who use transportation service should pay the entire cost incurred in rendering that service. The taxpayers should not be required to pay any part of it. The Railroad Administration ought to advance the rates at once enough to prevent any more deficit from being incurred. With the rates high enough to cover all railway costs, including the standard return to the companies, they would be high enough to enable the railways to be safely returned to private operation.

Would public opinion permit another advance in rates? We believe it would, if the facts were presented to the public clearly and fully. The price the public will have to pay if the railways are not returned to private operation will be greater, either in rates or taxes, or both, than the price it will have to pay if they are not returned to private operation, for our own experience, like that of every other country that has had experience, has shown that government operation inevitably is more expensive than private operation.

Public sentiment has crystallized in favor of returning the railways to private operation. But if this is to be done without endangering the entire financial fabric of the nation, the return must be made under conditions which will enable the companies to live. If the effect of the return of the railways to private operation is to be to increase the prosperity of the country, the return must be made under conditions which will enable the companies to prosper. Perhaps after the railways had been under private operation for some time rates no higher than those now in effect would be sufficient. But it will take months after private operation is resumed to restore operating conditions to normal and effect the improvements in operating methods which are needed to secure the greatest practicable economy. During this period of readjustment the companies will need higher rates to enable them to prosper, or even to live, almost as much as the government now needs them in order to stop the increase of its deficit.

It will not cost the public near as much to return the railways to private operation as it would to continue government operation; but it will cost something. Will the public willingly pay the price necessary to restore private operation, or will it refuse to pay it, and thereby in effect force itself to pay the much higher price that it will have to pay if it continues government operation? The public must answer this question. It is one of the most important and pressing questions now confronting it.

## The Public Learns When It Pays the Bill

THE PRESENT SYSTEM of government management of the railroads is sometimes described as "public" management, while the former system of corporate management is referred to as "private," but some of the important facts regarding railroad affairs are rather less public now than they were before. Railroad wages have been enormously increased during the past year. An estimate of the aggregate amount of this increase has received considerable publicity—with some assistance from those who were interested in letting it be known that government operation has been rather expensive. But only a very few people have much of an idea as to how the money was distributed, what relation the increase in wages bore to the increase in the cost of living, or the facts which determined the decisions which produced the wage awards. Wage orders, revisions, supplements, addenda and interpretations, expressed in terms of increases, percentages, minimum rates, or rates per month in place of former rates per hour, or vice versa, have followed each other with such bewildering rapidity that no one not in close touch with the facts knows whether or not to believe the stories that are passed around of call-boys receiving more than technically trained engineers, of sudden advances from \$65 to \$185 a month, of green "car knockers" being paid more than experienced passenger enginemen, etc.

Doubtless it is as yet too early for the complete statistics to be available, but in comparison with the amount of public discussion which accompanied the campaign of the brotherhoods for a basic eight-hour day in 1916, the wage increases of 1918 have passed almost unnoticed. The eight-hour day demand, which resulted in an increase of wages amounting to about \$65,000,000 a year, became a matter almost of public debate. Not only were its pros and cons fully discussed in the newspapers and on public platforms, but the conferences between the representatives of the employees and of managers were held in open session and were fully reported.

Most of the proceedings relating to the wage increases of 1918 have been conducted behind office doors. The very fact that large demands have been made by the employees' organizations, such as that of the brotherhoods last summer for further increases and time and one-half for overtime, which is now in the process of reaching a decision, and the recent demand of the federated shop crafts for a third increase within a year, are not made public. They are discovered by reporters weeks afterward. It is true that public hearings were held before the Railroad Wage Commission last winter and because a newspaper got a "scoop" on its findings they were later given out, but the recommendations of the commission were merely the prelude to the series of wage orders that has followed. The Board of Wages and Working Conditions also holds hearings in the preliminary stages of a wage controversy between the organizations and the Railroad Administration—there are still controversies, although they are managed with less propaganda than was used on both sides in 1916—but the board merely recommends and the settlements are the result of negotiation.

Some of the facts pertaining to the public operation of the railroads have been made public in the form of replies to the critics who have made what the Railroad Administration considers an unfair statement of them. For instance, Howard Elliott, by referring to the fact that there were 16 per cent more employees on the Pennsylvania after a year of government operation than in December, 1917, has brought out the fact that the increase in the number of employees on the railroads as a whole was only 8.2 per cent, whereas an impression had been created that there was a shortage of labor. Whether or not it was fair to point to the number of employees at the beginning and at the end of 1918 as an example

of the effect of government operation, after the railroads had been obliged to take on almost any kind of men they could get, such a comparison was needed to keep the government ownership advocates from claiming that labor has been more efficient under government operation and higher wages than it would have been under other circumstances; just as it has been necessary for some people outside of the Railroad Administration to call attention to the increase of \$1,140,000,000 in operating expenses in a year in order to let the public know that the government has not accomplished the ledgerdom of increasing wages \$800,000,000 a year merely by cutting railroad presidents off its payroll, consolidating ticket offices and standardizing locomotives.

## The Victory Liberty Loan

THESE ARE MANY REASONS why readers of the *Railway Age* should prepare now to make large subscriptions to the Victory Loan to be offered in April. One reason is that the government reached the peak load of its war expenditures after the Fourth Liberty Loan funds had all been exhausted. Another is that the Victory Loan bonds or notes will be an especially desirable investment.

The government will have to borrow about six billions from the public in order to fund its present floating indebtedness to the banks. The treasury has been forced to issue \$300,000,000 a week in Treasury Certificates in order to meet the extremely heavy outlays incident to liquidating the war machine. The governmental expenditures reached high tide in November, December and January, as shown by the table:

September .....	\$1,557,264,285
October .....	1,664,862,261
November .....	1,935,249,309
December .....	2,060,975,854
January .....	1,962,350,949
February .....	1,189,913,903

The drop in February should not be the cause of too much gratification, as there is an estimated \$2,500,000,000 in informal contracts awaiting disposition through Act of Congress. The government's real need of funds, therefore, is obvious.

As regards the investment merits of the new bonds or notes, their short maturity will make them the most popular security on the list for the investment of cash reserve funds. It is argued that their short maturity and the extremely active market that they will enjoy will protect the bonds or notes from market vicissitudes, and that they will be regarded everywhere as a cash asset.

The passage of the Victory Liberty Loan law by Congress creates an additional \$50,000 tax exemption that will prove valuable to many investors. Under the new act it will be possible for an individual who buys \$6,650 of the new bonds or notes, to hold a total of \$160,000 in war bonds in addition to the First 3½s, with entire exemption from surtaxes. The new exemptions are to carry, moreover, for five years and not for two, as in former bond acts.

## New Books

*Some Tests of Douglas Fir After Long Use.* By Arthur C. Alvarez, University of California Publications in Engineering, Vol. 2, No. 2, pages 57 to 118. Published by the University of California Press, Berkeley, Cal. Price, 70 cents.

This comprises a report on a series of about 1,200 tests of Douglas fir timbers taken from the old City Hall of Oakland, Cal., after about 36 years' use. The conclusions reached are that Douglas fir, properly housed, does not decay and that the strength of this material is not appreciably changed by this long use. However, the modulus of elasticity for compression parallel to the grain is nearly doubled, while the strength of beams under impact is only about 86 per cent of that in new timber.

## Letters to the Editor

### Salaries of Railroad Officers

NEW YORK CITY.

TO THE EDITOR:

The editorial on recent resignations of high railway officers in the *Railway Age* of January 24, recalls an agitation of several years ago, at which time some people were complaining of the large salaries paid to the more important men in the transportation field. Sober thinkers knew, then as now, that such criticism could not be justified on any logical grounds, or with any due regard for the bigger and broader issues involved.

I once told a newspaper editor that a good railroad president was easily worth \$100,000 a year to any company that expected to get anywhere. Nothing has occurred since then to change my view of the matter, but many things have tended to confirm it. The man who is worth a big salary will not work for a small one and would be a fool to do so.

With regard to the political view of the salary question, there is one point that has never been sufficiently stressed. This is the fact that the average public office-holder seeks a political career because he cannot earn a living in any of the recognized businesses or professions. To such a man, the petty salaries attached to the ordinary run of political "jobs" seem like a fortune, and it naturally follows that he has no idea of relative values in the business world. Impecunious himself, his view of the really big men of the country is narrow and envious, and his desire is to use his political position to injure them, if possible.

Instead of reducing the compensation to railroad officers, it should be greatly increased, and the liberality should go down at least as low as the office of division superintendent. A tactless or incompetent division superintendent can do the best of roads a great deal of damage. In fact, this office is entitled to far better men than it often receives, but the railroads, like other concerns, will only get what they pay for.

The day of the "rough-cut diamond" is over, and the managers of railroads must be gentlemen as well as officers. A man does not have to be a boor in order to be a railroad expert. As a matter of fact, most of the ill-mannered men that I have come across in the railroad field were of a distinctly inferior type even when judged by what they knew or didn't know of their chosen business. So much for that!

When the railroads are returned to their owners, the stockholders of the more prominent and prosperous lines should insist upon the election of capable general officers, pay them adequate salaries and instruct them to discharge every minor officer who does not measure up to the proper standards of his position. Peremptory and drastic treatment is the only cure for insolence and incapacity among divisional organizations. When we start reform, let us leave the \$100,000 president where he is, and "get after" the pugnacious young mischief-makers who antagonize the public out on the road. Let us visit the top lofty young "super," and make him take his feet off the desk or get out! Needless to say, there is more in this remark than meets the eye.

ARTHUR CURRAN.

The International Railway Fuel Association will hold its eleventh annual meeting at the Hotel Sherman, Chicago, on May 19, 20, 21 and 22. The work of the convention will, as heretofore, be directed exclusively to the conservation of railroad fuel coal.

# Compensation of Railroads Under Federal Control

## Less Than Justice Done by the Administration in Its Interpretation of the Law Taking Over the Roads

By J. M. Souby  
Solicitor, Kansas City Southern

WHAT MIGHT BE CALLED the official documents dealing with the compensation of railroads under federal control are five in number and consist of:

The President's proclamation of December 26, 1917.  
The President's statement accompanying his proclamation.  
The President's message to congress of January 4, 1918.  
The Federal Control Act of March 21, 1918.  
The standard form of contract, final draft of September 22, 1918.

It will be of interest to take up the various provisions of these five documents and see, first, to what extent the promises and recommendations of the President contained in the first three were sought to be made good by Congress in the Federal Control Act; and, second, to what extent the director general and his representatives have undertaken in the contract to give the railroads the full benefit of all that is granted or permitted by that act. For convenience, this inquiry will be conducted under separate, specific headings which are suggested by the subject matter involved and more particularly by the arrangement of the contract, as follows: the measure of the compensation itself, the question of maintenance of the property—tangible and intangible—during federal control, additions and betterments made thereto during such control, and miscellaneous matters which may be suggested in the course of our investigation.

### The Compensation

The proclamation states that the basis of compensation for each railroad will be "an annual guaranteed compensation \* \* \* equivalent, as nearly as may be, to the average of the net operating income thereof for the three-year period ending June 30, 1917." The statement contains a promise to recommend this basis to Congress, and the message does make such recommendation. The basis was adopted by Congress, and is embodied in the Federal Control Act (first paragraph of Section 1), with modification only (second paragraph of Section 1) with respect to the definition of operating income to include hire of equipment and joint facility rents and the requirement (third paragraph of Section 1) that the so-called war taxes accruing during federal control shall be paid by the railroads. The Contract provided (paragraph (d) of the preamble and paragraph (a) of Section 7), for the basis of compensation stipulated in the Act, with the additional modification (paragraph (f) of Section 4), which requires the railroads to pay all salaries and other expenses necessary to preserve their corporate existence during federal control, to protect their rights and carry out their obligations under the contract (paragraph (b) of Section 3), except such as may be specifically authorized by the director general, and the discretion of the latter in the premises is absolutely unlimited by the contract except as to a few specified expenditures which may be incurred in connection with the valuation of their properties under Section 19 (a) of the Act to Regulate Commerce.

This reduction of the stipulated compensation by the amount of expenditures which may be made by the railroads during federal control for corporate expenses of a character authorized by the commission's classification of accounts to be charged to operating expenses, and such as were actually incurred and so charged in their accounts during the test period, is contrary to the clear implication of the Federal Control Act, as well as being violative of all the utterances of the President dealing with this subject. In the second

paragraph of Section 1 of the Act, it is provided "that any railway operating income accruing during the period of federal control in excess of such just compensation shall remain the property of the United States." Such "operating income" is defined throughout the act to mean the same thing and to embrace the same items of receipt and expenditure during federal control as it is made to mean and embrace during the test period, with the exception of the single item of "war taxes." Still more clearly, however, it is provided in Section 12 of the Act:

"That moneys and other property derived from the operation of the carriers during federal control are hereby declared to be the property of the United States. Unless otherwise directed by the President, such moneys shall not be covered into the Treasury, but such moneys and property shall remain in the custody of the same officers, and the accounting thereof shall be in the same manner and form as before federal control. *Disbursements therefrom shall, without further appropriation, be made in the same manner as before federal control and for such purposes as under the Interstate Commerce Commission classification of accounts in force on December 27, 1917, are chargeable to operating expenses or to railway tax accruals and for such other purposes in connection with federal control as the President may direct, except that taxes under titles one and two of the act entitled 'An Act to Provide Revenue to Defray War Expenses, and for Other Purposes,' approved October 3, 1917, or any act in addition thereto or in amendment thereof, shall be paid by the carrier out of its own funds.*"

One of the guarantees which the President in his statement says he will recommend to Congress is that the railroads, while under federal control, "shall receive a *net operating income* equal in each case to the average net income of the three years preceding June 30, 1917." It is fairly to be presumed that it was the congressional intent, expressed in the Federal Control Act, to provide for this guarantee, except only as specifically otherwise provided therein. Any sum of money paid to a railroad as compensation during federal control, out of which any of its own regular operating expenses remain yet to be paid, falls short by that much of being "net operating income."

In view of the complete separation of the railroad corporations from the operation of their properties which has been brought about by the director general, which, while permitted by both the proclamation and the act, seems yet to have been actually contemplated by neither, the necessity is undoubtedly presented for the exercise of some discretion by the director general as to what expenditures made by the corporations shall be allowed as expenses of operation to be borne by the government; but the contract, by failing completely to limit that discretion, fails by that much to *guarantee* to each railroad the full compensation which the proclamation and the act warrant it in expecting.

Moreover, the bare "standard return," without modification, is not held out by any of the first four documents referred to above as the maximum compensation which any successfully operated railroad may hope to receive while under federal control. The proclamation, after stating the general basis of compensation, adds:

"But nothing herein contained, expressed or implied, or hereafter done or suffered hereunder, shall be deemed in any way to impair the rights of the stockholders, bondholders, creditors, and other persons having interests in said systems of transportation or in the profits thereof to receive just and adequate compensation for the use and control and operation of their property hereby assumed."

The statement also contains the following expressions:

"Investors in railway securities may rest assured that their rights and interests will be as scrupulously looked after by the government as they could be by the directors of the several railway systems \* \* \* I am entirely confident that the Congress will be disposed in this case, as in

others, I see that justice is done and full security assured to the owners and creditors of the great systems, which the government must now use under its own direction or else suffer serious embarrassment."

And in his message to Congress, the President states:

"It is, I am sure you will agree with me, right and necessary that the owners and creditors of the railways, the holders of their stocks and bonds, should receive from the government an *unqualified guarantee* that the several roads will receive under federal management such compensation as is equitable and just alike to their owners and to the general public. I would suggest the average net railway operating income for the three years ending June 30, 1917. I earnestly recommend that these guarantees be given by appropriate legislation."

It was apparently in an effort to make good the President's promise and to justify his confidence in it that Congress provided, in the sixth paragraph of Section 1 of the act:

"If the President shall find that the condition of any carrier was during all or a substantial portion of the period of three years ended June thirtieth, nineteen hundred and seventeen, because of non-operation, receivership, or where recent expenditures for additions or improvements or equipment were not fully reflected in the operating railway income of said three years or a substantial portion thereof, or because of any undeveloped or abnormal conditions, so exceptional as to make the basis of earnings heretofore provided for plainly inequitable as a fair measure of just compensation, then the President may make with the carrier such agreement for such amount as just compensation as under the circumstances of the particular case he shall find just."

Of course, a matter of this kind cannot be expected to be covered by a standard form of contract which is intended for application to all railroads generally, and until each individual contract is finally agreed upon we cannot know definitely to what extent the director general has given each railroad the full benefit of the foregoing provision of the act. If anything is to be inferred, however, from the attitude heretofore manifested in his negotiations with the railroads and from the contracts which have actually been entered into up to the present time, the standard return, as defined and modified by the standard form of contract, is the maximum which can be expected by any railroad which was in successful (i. e., solvent), operation during the test period. Of the various facts mentioned in the foregoing quotation from the act which might be taken into consideration in determining whether the standard return affords a fair, equitable and just measure of compensation, viz.: non-operation, receivership, recent capital expenditures not fully reflected in the earnings during the test period, and exceptional undeveloped or abnormal conditions affecting the earnings during that period, it is only the first two, non-operation and insolvency, which have as yet gained any special consideration at the hands of the government representatives. Non-operation is mentioned because it is only in connection with property actually under construction and not yet in operation during the test period that recent capital expenditures seem to be regarded as "not fully reflected" in the earnings of such period. Where such expenditures have been made on property that was actually in solvent operation during such period, they seem to be regarded always as so reflected, whether made prior to or during the test period or between the end thereof and the beginning of federal control. (See paragraph (c) of Section 4 of the contract.)

#### Maintenance During Federal Control

*Tangible Property.*—In giving the first quotation from the proclamation, in order to confine it to the specific subject under consideration, we purposely omitted the very significant words relating to maintenance. The full text at the place in question reads:

"The director shall, as soon as may be after having assumed such possession and control, enter upon negotiations with the several companies looking to agreements for just and reasonable compensation for the possession, use, and control of their respective properties on the basis of an annual guaranteed compensation *above accruing depreciation and the maintenance of their properties* equivalent, as nearly as may be, to the average," etc.

The following is one of the "definite guarantees" which the statement promises will be recommended that Congress give the railroads:

"First, of course, that the railway properties will be maintained during

the period of federal control in as good repair and as complete equipment as when taken over by the Government."

The President says in his message:

"It is, I am sure you will agree with me, right and necessary that the owners and creditors of the railways, the holders of their stocks and bonds, should receive from the government an *unqualified guarantee* that their properties will be maintained throughout the period of federal control in as good repair and as complete equipment as at present."

The fourth paragraph of Section 1 of the Act reads in part as follows:

"Every such agreement shall also contain adequate and appropriate provisions for the maintenance, repair, renewals, and depreciation of the property, for the creation of any reserves or reserve funds found necessary in connection therewith, and for such accounting and adjustments of charges and payments, both during and at the end of federal control as may be requisite, in order that the property of each carrier may be returned to it in substantially as good repair and in substantially as complete equipment as it was in at the beginning of federal control."

If Congress had been content to permit the foregoing to stand without qualification as its disposition of the question of maintenance during federal control, it would thus have given the railroads not a whit more than was promised and recommended by the President. It went further, however, and made indefinite the otherwise definite guarantee contained in the quotation, by adding a proviso as follows:

"In making such accounting and adjustments, due consideration shall be given to the amounts expended or reserved by each carrier for maintenance, repairs, renewals, and depreciation during the three years ended June thirtieth, nineteen hundred and seventeen, to the condition of the property at the beginning and at the end of federal control and to any other pertinent facts and circumstances."

The contract, on the other hand, goes a long way toward restoring the certainty destroyed by the foregoing proviso of the act, but such result is purchased wholly at the expense of the railroads. Disregarding entirely "the condition of the property at the beginning and at the end of federal control" and giving no consideration whatever "to any other pertinent facts and circumstances," or regarding all other facts and circumstances as wholly impertinent, it makes "the amounts expended or reserved by each carrier for maintenance, repairs, renewals, and depreciation during" the test period the absolute measure of the government's obligation in the premises. Reference is made to paragraph (a) of Section 5 of the contract, which reads as follows:

"During the period of federal control the director general shall, annually, as nearly as practicable, expend and charge to railway operating expenses, either in payments for labor and materials or by payments into funds, such sums for the maintenance, repair, renewal, retirement, and depreciation of the property described in paragraph (a) of section 2 hereof as may be requisite in order that such property may be returned to the company at the end of federal control in substantially as good repair and in substantially as complete equipment as it was on January 1, 1918: *Provided, however,* That the annual expenditure and charges for such purposes during the period of federal control on such property and the fair distribution thereof over the same, or the payment into funds of an amount equal in the aggregate (subject to the adjustments provided in paragraph (c) and to the provisions of paragraph (c) of this section) to the average annual expenditure and charges for such purposes included under the accounting rules of the commission in railway operating expenses during the test period, less the cost of fire insurance included therein, shall be taken as a full compliance with the foregoing covenant."

The adjustments provided in paragraph (c) of the same section, to which reference is made in the above quotation, are that in comparing the expenditures during the two periods allowances are to be made for any differences in the cost of material and labor obtaining therein. Paragraph (e) of the same section, to which reference is likewise made in the quotation, as that paragraph is apparently sought to be applied by the representatives of the government at the present time (see P. S. & A. Bulletin 5 of July 10, 1918), presents a much more serious qualification of the guarantee with respect to the maintenance of the property during federal control and its restoration to the railroad in as good condition as when taken over by the government than is contained in the above quotation. After providing that where railroad property is damaged or destroyed during federal control, otherwise than by public enemies, the director general shall have the option of restoring or replacing it or of reimbursing the railroad for

its value or the amount of its damage at the time of the loss, such paragraph goes on to provide:

"The foregoing parts of this paragraph are subject to the proviso that in case of loss or damage any additions and betterments made in connection with or as a part of the restoration or replacement of property damaged or destroyed and chargeable under the accounting rules of the commission in force December 31, 1917, to investment in road and equipment, shall be charged to and paid by the company."

As it seems to be sought to apply the foregoing provision in the accounting bulletin referred to above, the obligation of the government for property destroyed has no reference whatever to the value thereof at the time of its loss, but, whether the director general chooses to replace it (in kind or otherwise), or declines to replace it, the extent of his liability in the premises is the book value of the property, which means the amount charged to investment account on the books of the company, less any depreciation reserve which might be carried in its accounts, with respect to the property in question. On the other hand, it is sought to charge the company for the property used in replacing that which was destroyed at the actual cost of same at the time of the replacement, regardless of what its value may be relative to that which it replaces. In other words, it is sought to credit the railroad for property destroyed on the basis of pre-war prices and to charge it for all replacements of same at war prices. It seems hardly conceivable, however, that such a construction of the contract can prevail.

The contract, in one particular, however, even undertakes to go a step beyond what the President promised, or Congress granted, with respect to maintenance during federal control, and opens up to each carrier the possibility of having its property maintained during such period, and perhaps turned back to it at the end thereof in better repair and in more complete equipment than the company maintained it theretofore or might be able or willing to maintain it thereafter. The pleasure with which this possibility might otherwise be viewed by the railroads, however, is very materially mitigated by the certainty that it must be realized, if at all, at their own expense; for paragraph (b) of Section 5 of the contract provides:

"The director general may expend such sums, if any, in addition to those expended and charged under paragraph (a) of this section (subject to the adjustments provided in paragraph (c) of this section) as may be requisite for the safe operation of the property described in paragraph (a) of section 2 hereof, assuming a use similar to the use during the test period and not substantially enhancing the cost of maintenance over the normal standard of maintenance of railroads of like character and business during said period; and the amount, if any, of such excess expenditures during federal control shall be made good by the company as provided in paragraph (b) of section 7 hereof."

*Intangible Property.*—To a successful railroad, the most serious aspect of federal control is the possible effect upon its business of the manner in which its property may be operated by the government. Except perhaps by implication in some of the quotations which we have already given, we find nothing in any of the first four documents under consideration with reference to the maintenance of the intangible property of a railroad during federal control. The contract, however, as if with the purpose, generally laudable, of leaving absolutely nothing to implication, provides in paragraph (a) of Section 3, that the rental stipulated in paragraph (a) of Section 7 shall be accepted by the carrier as full compensation not only for the use of its property during federal control, but also for any and all loss and damage to its business or traffic by reason of the diversion thereof, or otherwise, which may be caused to it by the manner in which its property may be operated by the government.

The standard return of a particular railroad reflects, of course, the use of both its tangible and intangible property during the test period, and it might be willing to accept such operating results as fairly indicative of the proper amount to be received by it for the loss of the use of all of its property during federal control, but it would be actually plunging into the dark to accept such sum as also including fair and just compensation for losses which might result to

it from the abuse of its property during such period. The government is interested in the intangible property only in so far as it may have contributed to the increased efficiency of the physical property at the time same is taken under federal control, and a wholly proper use of the physical property as a part of the unified system of all the railroads under federal control might well prove to be an abuse of the intangible property from the standpoint of the railroad when it comes back into possession.

During the test period, the railroad not only received the amounts used in computing the standard return, but at the end of such period may have been in the possession of a better property than it had at the beginning, as reflected in the increasing earnings during the last year of the test period. Is it fair to ask it to accept the standard return as full compensation for all losses which may be sustained during federal control before it is possible to know what the condition of its property, both tangible and intangible, will be at the end of that new indeterminate period? The contract has undertaken to the extent which we have already shown, to take care of this uncertainty so far as the physical property is concerned, but refuses absolutely to give the carrier any assurance with respect to the maintenance of its intangible property, at the same time precluding it from making any claim for loss on account of a failure on the part of the government to provide for such maintenance.

#### Additions and Betterments

Neither the President's proclamation nor his statement contain any reference to the question of additions and betterments made to the railroad property during federal control, one of the most important and troublesome of all the questions involved in the proposed contract between the government and the railroads. His message to Congress refers to it only very briefly, in the following words:

"Only under that authority (i. e., government administration) can new terminals be constructed and developed without regard to the requirements or limitations of the particular roads."

The second paragraph of Section 6 of the act, however, provides specifically that:

"The President may also make or order any carrier to make any additions, betterments or road extensions, and to provide terminals, motive power, cars and other equipment necessary or desirable for war purposes or in the public interest or in connection with the property of any carrier. He may from said revolving fund advance to such carrier all or any part of the expense of such additions, betterments," etc.

Section 4 of the act provides for additional compensation in the way of reasonable interest on the cost of all additions and betterments made by the railroads with the approval or by order of the President. These provisions of the act are embodied in the Contract, in paragraph (c) of Section 4, and paragraph (d) of Section 7.

The third paragraph of Section 6 of the act provides:

"Any loss claimed by any carrier by reason of any such additions, betterments, or road extensions so ordered and constructed may be determined by agreement between the President and such carrier; failing such agreement, the amount of such loss shall be ascertained as provided in section three hereof."

This important and valuable right given the railroads to make claims for loss on account of additions and betterments made at their expense by order of the director general, and have such claims determined in accordance with the procedure provided in Section 3 of the act, is materially affected and restricted by various provisions of the Contract. For instance, in paragraph (e) of Section 5 of the contract, as we have already seen, the railroad is required to pay for any additions and betterments made by the director general in connection with or as a part of the restoration or replacement of property damaged or destroyed, which are chargeable to investment account under the commission's accounting rules. Paragraph (h) of the same section then provides:

"If any question shall arise, either during or at the end of federal control, as to whether the covenants or provisions in this section contained are being or have been observed, the matter in dispute shall, on the appli-

cation of either party, be referred to the commission, which, after hearing, shall make such findings and order as justice and right may require, which shall be final as to the questions submitted and be binding on and observed by both parties hereto, except that either party may take any question of law to the courts, if it so desires."

Obviously, one of the main grounds upon which a railroad claims a loss on certain additions and betterments may well happen to be that they are for war purposes, and not for the normal development of the company, yet, instead of giving the railroads the benefit in such cases of the proceedings provided in the act, the contract provides in paragraph (b) of Section 7:

"In the event of a difference as to the fact whether additions and betterments are for war purposes and not for the normal development of the company, or as to whether an addition is a road extension, the question may, on application of either party, be referred to and determined by the commission."

In paragraphs (b) and (c) of Section 8, while it is provided that in case of failure of the parties to the contract to agree with respect to any claim of the railroad for loss accruing to it by reason of expenditures for additions and betterments charged to it during federal control, resort may be had to the procedure provided in Section 3 of the act, there is an additional proviso, however, which materially modifies the rights of the railroad and limits its recovery in all such cases. This proviso is that:

"No loss shall be claimed by the company and no money shall be due to it in respect of such additions and betterments upon the ground that the actual cost thereof at the time of construction was greater than under other market and commercial conditions; and for the purpose of determining such controversy the amount paid for any addition or betterment shall be deemed the fair and reasonable cost thereof and shall be taken as the basis for such determination."

If an assertion by a railroad that loss has resulted to it by reason of abnormal prices paid by the government for the additions and betterments under consideration would not afford a valid basis for a claim under Section 6, paragraph four, of the act, then the above provision of the contract is wholly unnecessary. On the other hand, if such assertion does furnish ground for a valid claim under that section, then the contract undertakes to give the railroads something less than is guaranteed them by the act. No one appreciates more than do the railroads the advisability and desirability, in writing contracts, of avoiding so far as may be possible all probability of litigation thereunder, and of stipulating so far as possible the amount of damages to be recovered in case of litigation. At the same time, no one better realizes the impossibility, in the case of ordinary contracts voluntarily entered into between the parties, of securing such results always at the expense of one party to the contract. So far as the provisions in question, of the proposed contract, accomplish these results, they do so wholly by concessions required on the part of the railroad.

From the foregoing discussion, it will be observed that about the only material provisions of the act for the railroads' benefit which are not sought in the contract to be modified outright to its disadvantage, or reduced to the very narrowest limits permitted by the terms of their grant, are those of Sections 2 and 3, which relate to the situation presented when no contract is made. Stated in another way, it will be difficult to find any substantial right or benefit accruing to the railroad under the Contract which is not, to some extent at least, less than that which is specifically granted or is clearly permitted by the act.

The attitude of the government which is reflected by the standard clauses of the contract, seems to be maintained likewise with respect to the provision of Section 2 of the act to the effect that, pending the making of a contract or in case of failure of all negotiations for a contract, the President may, nevertheless, pay the railroad up to 90 per cent of its standard return. This provision is, of course, merely permissive in its terms; but if, as seems to be obvious, its purpose is to save the constitutionality of the act, then it should be regarded as mandatory in cases where the railroad would otherwise, for lack of funds, be unable to contest its claims

for compensation and thus be coerced into signing the contract offered by the government. Thus far, however, the representatives of the government have declined to offer assurance to any railroad that if it declines to execute the contract offered, it will receive any compensation whatever for the use of its property pending a proceeding under Section 3 of the act to determine whether or not it is justified in refusing to execute the document offered.

We do not propose to discuss the constitutionality of the act, but merely remark that such may well be doubted if full effect is given to the final sentence of Section 2, which provides that the acceptance of any of the benefits under that section shall constitute an acceptance by the railroad of all the provisions of the act. A railroad which finds itself unable to contest the validity of any of the provisions of the act without accepting benefits under Section 2, immediately finds itself precluded from such contest by its waiver of all claims of invalidity through its acceptance of such benefits.

At least one other matter of interest in connection with the act and the proposed contract is the question of the status of things after a railroad has originally declined to execute the agreement offered, has proceeded under Section 3 of the act and had its just compensation determined, we shall say finally, by the Supreme Court on an appeal from a decree of the court of claims. It doubtless will still remain for the railroad to secure a contract with the government into which shall be incorporated the amount of compensation thus determined in lieu of that originally offered. The question is whether, except for their ability to supply these figures in the blank spaces remaining in paragraph (d) of the preamble and paragraph (a) of Section 7 of the contract, the parties will be any nearer an agreement than they were before resort was had to the courts.

It is only in two instances that the act provides for resort to the procedure outlined in Section 3 to determine differences arising between the railroads and the government with respect to federal control. One is in Section 3 itself and the other is in Section 6. The latter refers to the disposition of claims for losses on additions and betterments made during such control, most of which must await the end of federal control for their determination. The first has reference only to the claim for just compensation, and while in the broad sense the question of just compensation embraces all matters covered by the contract, such as maintenance, additions and betterments, etc., as used in Section 3, it seems to be confined to the amount of rental *per se*. It is "all claims for just compensation not adjusted (as provided in section one)," that are to be so tried out. This would seem to refer only to the first two and the sixth paragraphs of Section 1, since other matters treated in that section, such as war taxes and maintenance, are dealt with therein as separate and distinct from the just compensation referred to in the first paragraph. Also, in Section 3, after providing for the proceedings before certain boards of referees, it is said:

"The President is authorized to enter into an agreement with such carrier for just compensation upon a basis not in excess of that reported by such board, and may include therein provisions similar to those authorized under section one. Failing such agreement, either the United States or such carrier may file a petition in the Court of Claims for the purpose of determining the amount of such just compensation, and in the proceedings in said court the report of said referees shall be prima facie evidence of the amount of just compensation and of the facts therein stated."

From the above quotation it would appear that after the finding has been made by the board of referees, the matters referred to in Section 1, other than the single one of just compensation, still remain the subject of negotiation between the parties, and it seems certain that nothing is to be litigated before the court which has not already been tried out before such board. It thus results that, as to some of the most important matters for consideration between the railroads and the government in the making of their contracts, no procedure is provided in the act for settling the differences that may develop between the parties.

# New Plan for a Union Station at Cleveland, Ohio

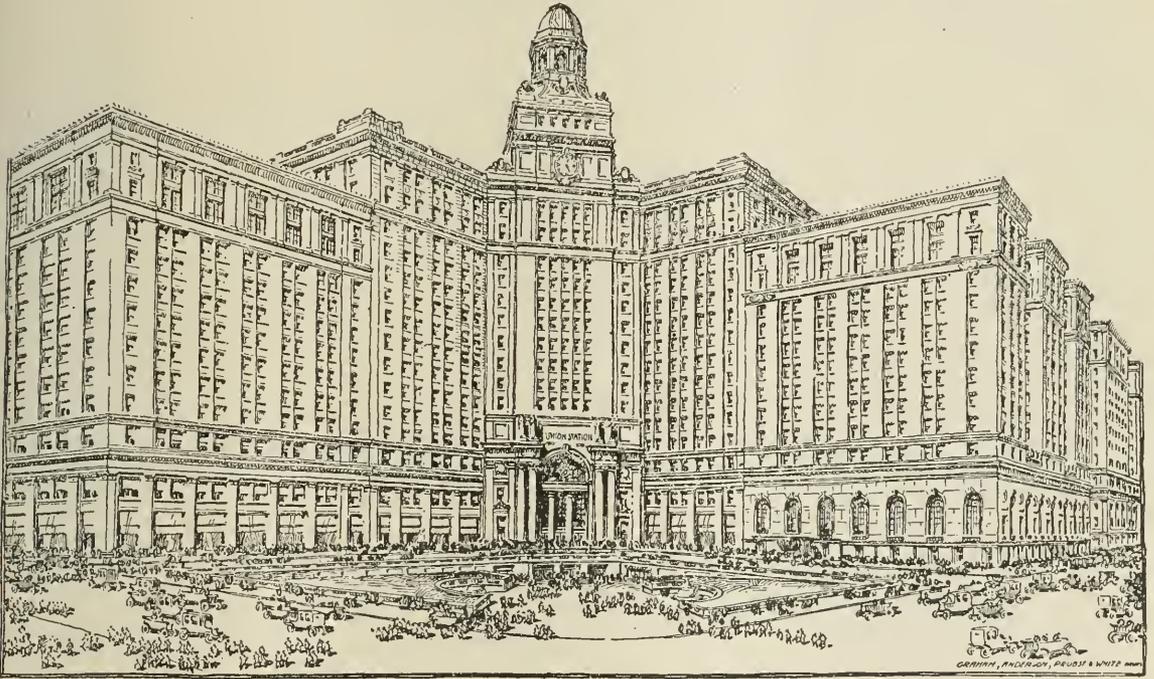

Terminal Ordinance Project Ratified by People of That City  
Is Subject to Railroads' Approval

**T**HROUGH THE RATIFICATION of an ordinance by a popular referendum the city of Cleveland has signified its approval of a new union station plan. This project is being promoted by the Cleveland Union Terminals Company, a corporation financed by local capital for the construction of a passenger station and freight terminal to be leased to the railroads entering the city. While neither the railroads nor the Railroad Administration are parties to the agreement, officers of the terminal company have assured the people of Cleveland that the railroads are favorable to the plan, and that it is expected to conclude agreements which will permit work to proceed soon on the fulfillment of the plan proposed.

The plan of the terminal company contemplates a passenger station for all through and local passenger trains of all of the steam railroads and interurban lines now entering the city,

vania Lines had previously entered into an agreement with the city. In 1903 plans were submitted to Tom L. Johnson, mayor of Cleveland, for the Mall, a municipal center involving a group plan for public buildings, with a recommendation that a plan including a railroad station on the lake front be adopted. In 1904 designs in conformity with this idea were started for a new courthouse and shortly afterward for several other public buildings. However, it was not until November, 1915, that a popular referendum, passed by a vote of 68,357 to 17,153, approved a contract ordinance for a union station, to be built in conformity with the city's plan for a civic center.

Under this contract the city agreed to sell to the railroads for \$1,400,000 certain land at the north end of the Mall and to grant the railroads permanent easements over certain adja-

Suggested Design for the Passenger Station with a Two-Level Street Entrance

in addition to facilities for considerable further development of electric interurban service in co-operation with the steam roads. It is proposed to place the head house of the station at the southwest corner of the Cleveland Public Square, with the station tracks forming the base of a great "U," the two legs of which will form the approaches to the station on the opposite sides of the Cuyahoga valley. The fulfillment of this plan involves a 3,500-ft. bridge with eight tracks across the Cuyahoga valley just west of the proposed station.

## Supersedes Lake Front Plan

This project is an alternative for the plan for a passenger station on the lake front for which the New York Central, the Cleveland, Cincinnati, Chicago & St. Louis and the Pennsyl-

cent city-owned lake front property. The city agreed to spend the \$1,400,000 to improve portions of the Mall, to pay a proportion of certain other expenses, and to acquire additional Mall lands. The railroads agreed to erect the station, to begin the construction of the station within six months after the deeds to the property had been delivered, and to complete the station within three years after the work was started. The city and railroads also agreed to co-operate in acquiring from the federal government rights in submerged lands and easements on government owned property.

The fulfillment of these conditions has been delayed and the only tangible evidences of progress are the completion of some public buildings and vacation of property for the Mall site. The new ordinance for the new terminal provides that

these three railroads are to be released of all obligations under the old contract as soon as they avail themselves of accommodations to be provided in the proposed public square terminal.

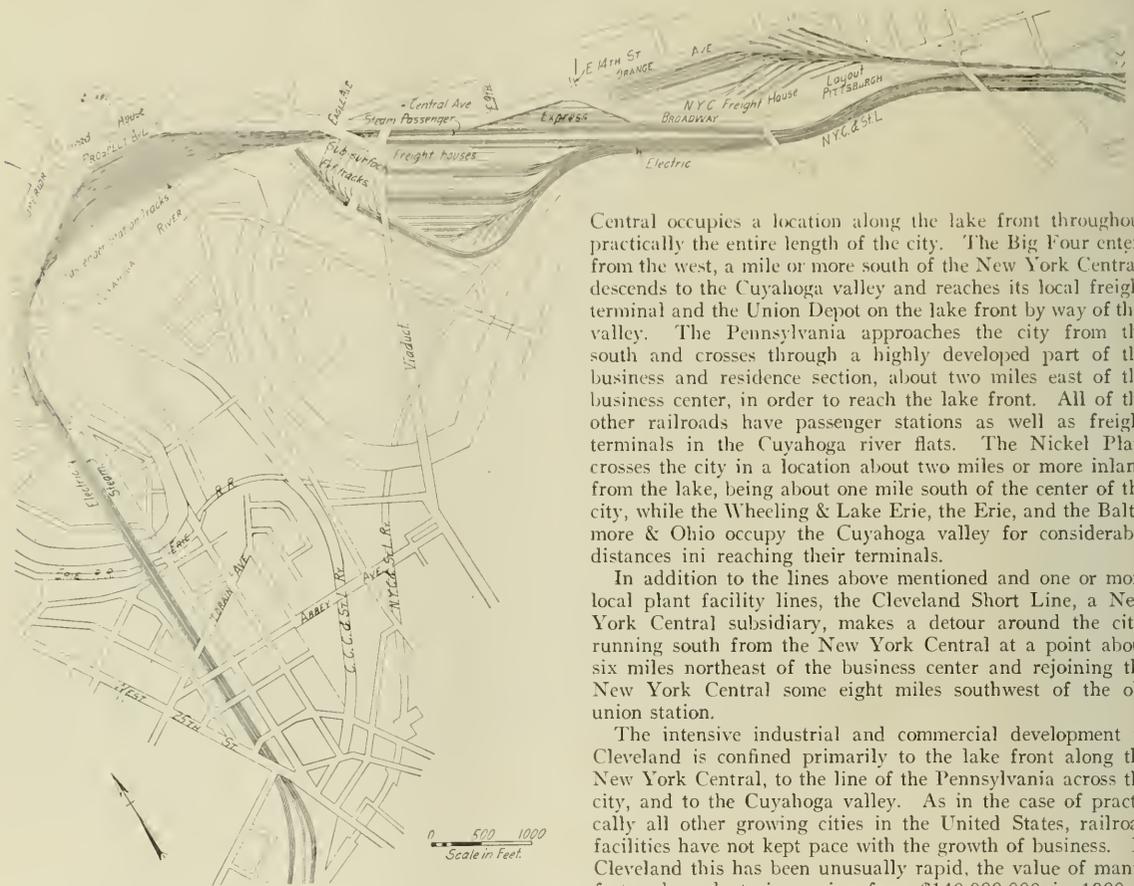

The proposed nullification of this earlier plan was the cause of considerable opposition to the new project. The fact that the city had made considerable expenditures along the lines of the old project was pointed out by a number of civic bodies who opposed the new plan, and by Bion J. Arnold, consulting engineer, Chicago, who was retained to make an investigation by the Cleveland Chamber of Commerce. He argued that the new plan should not be approved without studying the possibilities of providing accommodations for all the railroads on the lake front. However, notwithstanding this opposition the ordinance was ratified by a large majority.

The interests back of the new terminal plan are headed by O. P. Van Swearingen, president of the New York, Chicago & St. Louis and head of the Cleveland & Youngstown, which

The idea of the Union Terminal project was conceived in the course of developing further plans for the use of the Cleveland & Youngstown as a lead to freight and passenger terminals for the railroads entering Cleveland by way of the Cuyahoga valley. A common freight terminal was proposed in the vicinity of Broadway and Central avenue, with a stub-ended passenger station in approximately the location now proposed for the new station of the Union Terminal Company. When this plan was submitted to the Railroad Administration early in 1918 it was suggested that a through station with accommodations for all the railways would be preferable, and work was accordingly started on such a plan.

### The Railway Layout at Cleveland

Seven steam railroads enter the city. The New York Central, the Big Four and the Pennsylvania Lines use a station on the lake front at the foot of Ninth street. The New York

Map of the Proposed Passenger and Freight Terminals with the Approaches

is a line projected in 1912 to afford rapid transit to a considerable suburban area east of the city. A portion of the last named line has been constructed, the most important feature being the \$4,000,000 high level freight terminal built for the New York Central at Orange avenue and Broadway, which involved a  $3\frac{1}{2}$  mile approach line over the right-of-way of the Cleveland & Youngstown from a connection with the Cleveland Short Line Railway, a belt line owned by the New York Central.

Central occupies a location along the lake front throughout practically the entire length of the city. The Big Four enters from the west, a mile or more south of the New York Central, descends to the Cuyahoga valley and reaches its local freight terminal and the Union Depot on the lake front by way of this valley. The Pennsylvania approaches the city from the south and crosses through a highly developed part of the business and residence section, about two miles east of the business center, in order to reach the lake front. All of the other railroads have passenger stations as well as freight terminals in the Cuyahoga river flats. The Nickel Plate crosses the city in a location about two miles or more inland from the lake, being about one mile south of the center of the city, while the Wheeling & Lake Erie, the Erie, and the Baltimore & Ohio occupy the Cuyahoga valley for considerable distances in reaching their terminals.

In addition to the lines above mentioned and one or more local plant facility lines, the Cleveland Short Line, a New York Central subsidiary, makes a detour around the city, running south from the New York Central at a point about six miles northeast of the business center and rejoining the New York Central some eight miles southwest of the old union station.

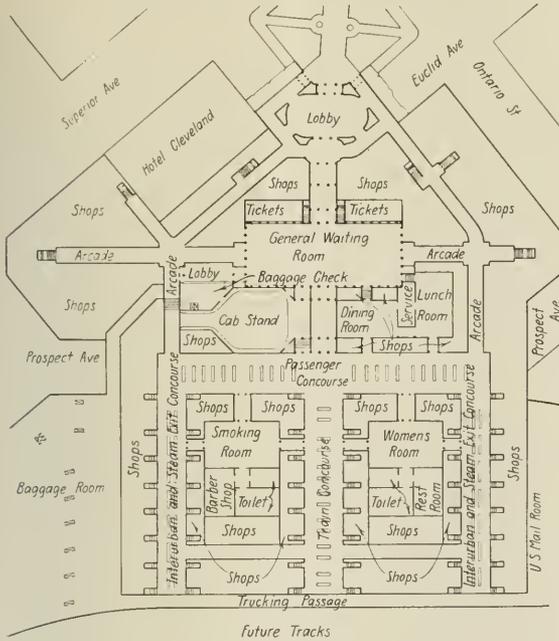

The intensive industrial and commercial development in Cleveland is confined primarily to the lake front along the New York Central, to the line of the Pennsylvania across the city, and to the Cuyahoga valley. As in the case of practically all other growing cities in the United States, railroad facilities have not kept pace with the growth of business. In Cleveland this has been unusually rapid, the value of manufactured products increasing from \$140,000,000 in 1900 to \$270,000,000 in 1910, a growth of 94 per cent. Owing to the inadequacy of railway facilities the roads have been unable to develop suburban traffic, as a result of which an undue burden has been placed upon the electric interurban lines which are ineffective because of the slow speed made on the city streets. A total of 157 passenger trains enter and leave the city on the steam roads in 24 hours, of which 50 are on the New York Central, 24 on the Pennsylvania, 29 on the Big Four, 16 on the Baltimore & Ohio, 12 on the Wheeling & Lake Erie, 6 on the Nickel Plate, and 20 on the Erie. All of the existing downtown passenger stations are antiquated and most of them inadequate for present traffic.

**Access to the Proposed Terminal**

Under the plan of the Union Terminals Company, access to the proposed freight and passenger stations will be obtained by the use of about three miles of approach line to be constructed by the terminal company, in addition to the re-routing of trains over existing properties of the various railroads. The Erie, the Nickel Plate and the Big Four will have virtually direct communication with the terminal tracks,

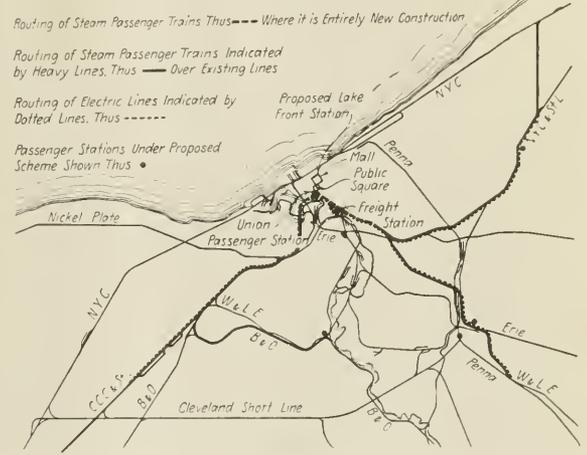

longer. In all other cases the distance by the proposed routing is the same as the old or shorter.

The contemplated electric interurban development provides for additional tracks adjoining those of the steam roads on three of the routes of entrance as shown by dotted lines on the map. By the construction of these lines all of the existing interurbans could be removed from the city streets and still provide for considerable further interurban development and thus increase the use of territory adjacent to Cleveland for residence and industrial purposes. Another pertinent feature of the ordinance is that the railroads will be required to use electric power for the operation of their passenger trains over

**Proposed Plan for the Main Floor Level of the Passenger Station**

while the Pennsylvania and the Wheeling & Lake Erie will use a route approximately four miles long over the Erie, but shortening their present routes from one-half to one and one-half miles. The New York Central will use the Cleveland Short Line and the Nickel Plate tracks from the east and

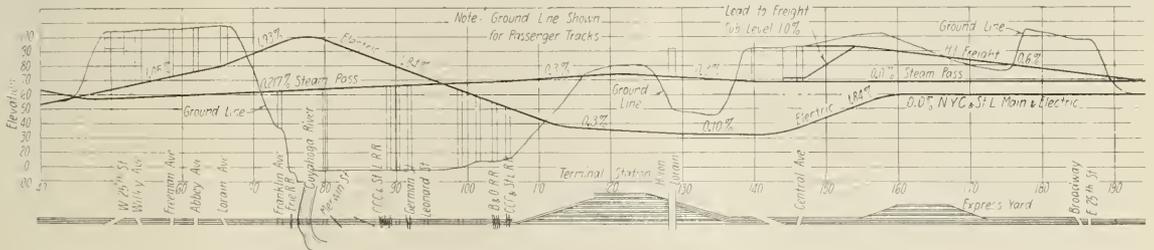

**Proposed Routing of the Various Roads Entering Cleveland**

the terminal lines within five years after the terminal facilities are placed in service.

**Formidable Engineering Problem**

The physical layout of the location of the terminal company's tracks and station is such as to present a formidable engineering problem. The east leg of the approach development, the freight terminal and the passenger station will occupy the rim of the bluff overlooking the Cuyahoga flats. The west leg consists largely of the 3,600-ft. bridge with the remaining portion depressed below the ground surface to afford

**Profile of the Proposed Terminal and Approaches**

the Big Four from the west, involving a total detour of 22 miles. The Baltimore & Ohio will use the Big Four for a distance of three miles, which will give the Sterling branch of the Baltimore & Ohio direct access, but will require the Akron line to operate in a reverse direction over about 3 1/2 miles of the Sterling line.

In the case of the Nickel Plate the new route will be about one mile longer than the old one, for the New York Central it will be about 2 1/2 miles longer than at present, and for the Akron line of the Baltimore & Ohio it will be about 3 1/2 miles

overcrossings for the city streets and the tracks of the Nickel Plate and the Big Four. Notwithstanding the adverse location, the plans provide for approach grades to the station not exceeding 0.3 per cent, which is considerably less than the grades of some of the existing lines to be used as main routes to the terminal.

The plans for the viaduct over the valley contemplate separate structures for the steam and electric lines. The former will cross on a grade of some 64 ft. above the normal water level in the river, necessitating provision for bascule spans

at the river crossing to satisfy navigation requirements. For the electric lines structure the river crossing is placed at an elevation of 100 ft. above the river to permit of the use of a fixed span, but this necessitates approach grades on either side of nearly 2 per cent.

### The Passenger Station

The passenger station plan provides for a building many stories in height, serving not only as a station structure, but also as an office building, retail shop, arcade and hotel. One unit, that of the hotel, is already completed and in use. The main entrance to the building is to be at the southwest corner of the Cleveland Public Square and will utilize a considerable portion of the southwest quarter of this area for developing the portal and approach ramp. Advantage of the topography will be taken to get a two-level entrance. The lower end of the square permits of a descending ramp to the main station floor level which is one story below the level of the streets. At the corner of the square there will be direct street entrances to the second floor level of the station building, but with ample provision for stairways down to the main floor. Another entrance to the second floor level is provided from Prospect avenue, which cuts through the station layout.

The main waiting room, about 100 ft. wide by 240 ft. long, will occupy the center of the block between Prospect avenue and the Square, with ticket offices, cab stand, restaurants and shops surrounding it. From this waiting room a main corridor will lead south on a 10 per cent descending ramp to a passenger concourse occupying the space directly under Prospect avenue. From this, three other concourses will extend to the south and occupy a level midway between the steam road tracks, which are to be located on an upper level, and the suburban tracks, which will occupy a lower level. The central concourse is to be used for passengers departing on the steam roads, and will have stairs on each side leading up to the steam-road level. The two side concourses are to be used for access to and from the interurban level. The interior areas on the concourse level will be devoted to space for a smoking room, a women's waiting room and toilet facilities, as well as a considerable number of arcade shops. To the east and west of the concourses, areas will be provided for mail and baggage rooms, respectively, with elevators communicating with the two track levels.

The ultimate development for the station tracks of the steam lines will be 30 tracks, but half that number is considered adequate for the needs of the present and immediate future. The average length of platform is about 1,000 ft., of which about 200 ft. at each end will be on the approach curves. The development on the interurban level will be somewhat smaller than on the steam road level.

### The Freight Terminals

As in the case of the passenger station, the plans for the freight terminals provide for an elastic development. The ultimate provision is for a series of multiple story freight houses, express buildings and warehouses extending along the west side of Broadway from the passenger station to the vicinity of the New York Central high level station. The track layout for the freight station is shown on the map. Freight houses for the various roads are to be located between Central avenue and Fourteenth street. These will be provided with tracks and driveways on the level of Broadway with a team track to the south on this same level. Between Eagle avenue and Central avenue a series of multiple-story warehouses are planned, to be served with tracks about 20 ft. below the level of those for the freight houses. One unit of this group has been completed and is now in use. The lead to these tracks is on a level with the proposed electric line tracks on the extreme outside of the layout, while the lead to the station for the steam roads will occupy a level midway between those of the surface freight houses and the subsurface

levels, and immediately adjacent to Broadway. Provision for handling express is contemplated along Broadway near Fourteenth street, with tracks leading off the passenger approach tracks.

The plans for the proposed terminal were developed under the direction of W. E. Pease, chief engineer of the Cleveland Union Terminals Company, Cleveland, Ohio, subject to criticism and suggestion by a committee of engineers appointed at the direction of A. H. Smith, regional director of the Eastern region, by each of the roads involved in the plan.

## Orders of Regional Directors

**F**REE PASSES TO STEAMSHIP COMPANIES.—Supplement 14 to Order 109 of the Southwestern regional director gives authority for continuing past practice in the issuance of exchange trip transportation with independently operated steamship companies. The Northwestern regional director, by Supplement 46, issues the same notice.

**Prohibition of Smoking in Mail Storage Cars.**—Order 174 of the Southwestern regional director quotes a postal regulation issued by the postmaster general, applicable to railroad employes when their duties require them to be in mail storage cars, which states that no person shall smoke or carry lighted cigars, cigarettes or pipes in mail storage cars while cars are being loaded or unloaded or while in transit.

**Freight Car Distribution.**—Order 175 of the Southwestern regional director gives instructions for the relocating of cars in accordance with Circular 27 of the director of the Division of Operation, dated February 15. These instructions are similar to those of the Northwestern director, noticed last week. Railroads desiring the return of certain cars for rebuilding or application of betterments must submit request to the regional director, who will arrange the necessary details with the Mechanical Department and the Car Service Section of the Railroad Administration.

**Rental Charge—Locomotives.**—The Southern regional director in Circular letter No. 429 says that from February 20, the rental charge for locomotives will be one mill per pound of tractive effort per day, with a minimum of \$15 a day.

**Color Blindness.**—The Eastern regional director has sent to the federal managers, for the benefit of the surgeons of the railroads, copies of Public Health Bulletin No. 92, entitled "Color Blindness," prepared by Dr. George L. Collins, and issued by the Treasury Department. Dr. Collins says that the classes of color blind persons which should not be permitted to serve as trainmen are (1) those possessing a color perception containing three or less units; (2) those possessing a greater number of units than three who have the red end of the spectrum so shortened as to prevent the recognition of a red light at a distance of two miles; and (3) those with a central scotoma for red and green.

**Standing Orders from Consignees.**—The Eastern regional director, file 5600-19A600, directs all federal managers to adopt, if not already in force, the rule that freight shall be delivered only to the consignee, or to the person or persons named in a written order. From business houses, the local freight agent should have a standing order containing the name or names and signature or signatures of the drayman or other person or persons to whom goods are to be delivered. Similar orders have been issued by the Central Western and the Northwestern regional directors.

**Loss and Damage.**—The Eastern regional director, file 5600-19A596, sends to federal managers the result of a study, on one of the Eastern roads, of the freight claim situation in the year 1918. Unlocated loss of entire packages accounts for 25 per cent of all freight claim payments, an increase of over 100 per cent over the preceding year. The principal causes are named. At points common to two or

more roads, the agents should maintain a regular exchange of over and short information. Furniture, glass and certain other commodities are constantly subject to excessive damage; damage to these and to perishable commodities is a matter requiring constant study. The duty of getting shippers to pack goods more securely ought to be attended to by the freight agent at the time of shipment, rather than by the claim department. Failure to attend to reicing, when cars are behind time, and failure to take special care at times of extreme low temperature, are among the causes of loss to perishables. Many other details are discussed. Federal managers are requested to take such action as may be deemed necessary and to send to the regional director copies of any instructions which they may issue.

*Studies of Traffic Conditions.*—The Eastern regional director, file 2000-16-201A598, calls on federal managers to supplement their reports of traffic conditions made last December, with advice as to how actual conditions have confirmed the estimates then made; and if at variance, how and to what extent. A new report is called for at this time, outlining the prospects as to business up to July 1, next, and also for the six months next following thereafter.

*Locomotives in Service.*—The Eastern regional director, file 1200-4-56A597, calls for a statement showing the number of locomotives in service on October 1, 1918, showing, for each class, the different weights on drivers. This is wanted for the Board of Railroad Wages and Working Conditions.

*Chinese Alien Passengers.*—The regional director, Eastern region, by file 1600-115A599, advises federal managers that carriers under federal control need not furnish the bond heretofore required as a condition precedent to transporting Chinese aliens through the United States. The carrier must strictly comply with the regulations of the Bureau of Immigration, and evidence that the passenger has made his trip within the prescribed time must be laid before the immigration officer at the proper port in due season. If a Chinese alien passenger should escape while in transit the fact must be reported at once, and any officer or employee permitting such escape will be disciplined.

*Shipping Day Arrangements.*—The regional director, Eastern region, by file 2000-7-9A604, advises that shipping day plans have been made out for the principal common points, and that federal managers should now appoint committees to work out these plans for local stations. These committees should consult freely, as may be necessary, with district chairmen, or with G. C. Woodruff, regional chairman, New York City.

*Estimates for New Ties.*—The regional director, Eastern region, by file 1800-83A605, calls attention to the fact that the requirements of the several roads for new ties for 1919, as received at Washington, indicate renewal programs far in excess of the average renewals during the test years; this, presumably, because of the necessity for restoring the normal stock on hand. Roadmasters, or supervisors, must make careful personal inspection of the track so as to see that no ties are replaced which can be carried over another year, while still keeping the tracks in safe condition.

*Free Lighterage, New York.*—Beginning April 1, the free lighterage of domestic carload freight at New York harbor will be resumed; but shipment can be made only under the system of permits now in force. Permits will be issued by the Freight Traffic Committee, 141 Broadway, New York City. Lighters are still in pressing demand for export traffic and consignees, to get the benefit of the new arrangement, must be prompt in unloading.

*Number of Employees to Be Reported Monthly.*—The regional director, Eastern region, by file 1801-124A606, gives instructions for the sending of monthly reports, beginning with February, to W. I. Cunningham, Washington, showing the number of employees in service on the 16th day of each

month, with the number of days or hours worked, the compensation, the class—which of the 68 classes prescribed by the Interstate Commerce Commission—and figures by which to make comparison with the same month of the preceding year.

*Posters of the Complaint Bureau.*—The Southwestern regional director, in order 176, instructs that posters relative to the bureau for suggestions and complaints should be displayed in waiting rooms, consolidated ticket offices, smoking and wash rooms in Pullman cars, and in coaches or chair cars where smoking and wash rooms are provided, but not in coaches or chair cars having neither smoking rooms nor wash rooms apart from the toilets. These posters must not be displayed in the body of any car nor in the toilet rooms. The new posters are to be substituted for those previously provided for distribution.

*Daily Situation Report.*—Circular 190 cancelling circular 29 of the Southwestern regional director, requires all roads to furnish a daily telegraphic SWD No. 2 report to cover only loads delayed or held 48 hours or more. This report will take the place of the CD-1 report. Code letters are given for the number of loads on hand awaiting movement on account of disability of the owning road, principal cause of delay, prospects for reducing accumulation in the next 24 hours, number of loads held for export and coastal boats, number of loads held at destined points on own line on account of formal embargoes, number of loads held for connections on account of their inability to accept, and any important general conditions on the line not included in the above. Unless there is a total accumulation of 200 loads or more on any one road, no additional information other than the first item for which there is a code letter need be sent.

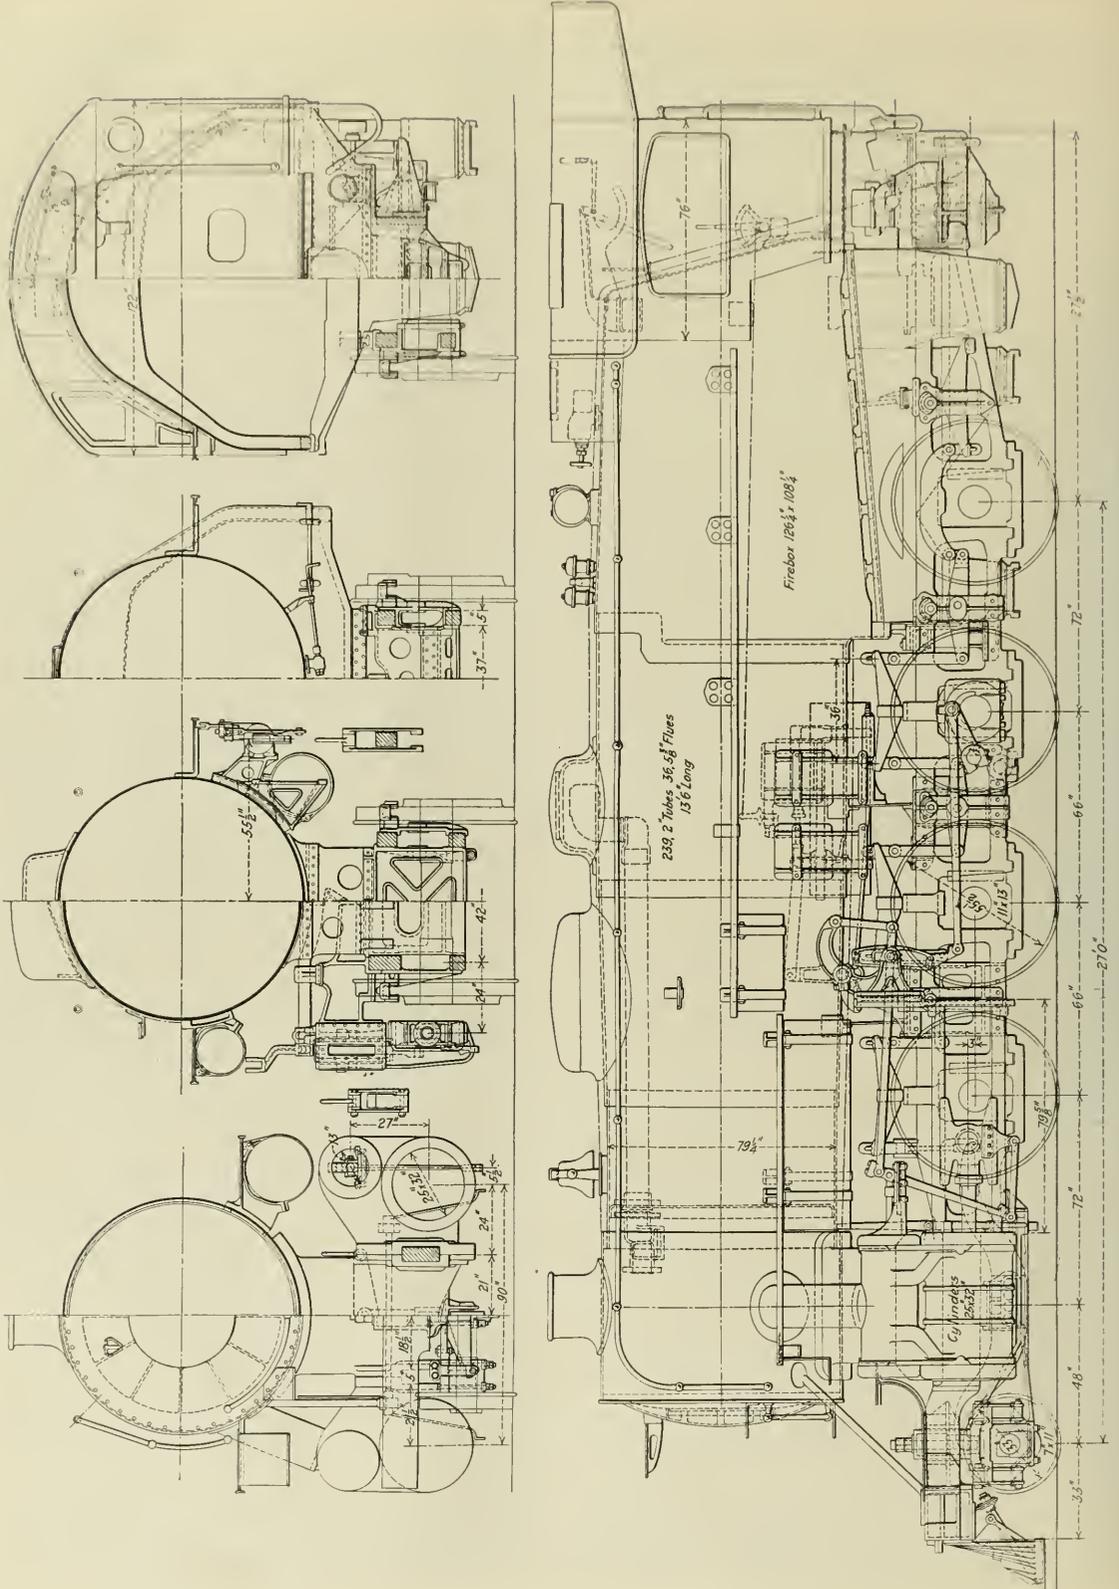

*Eastern Car Pool Gondolas.*—The Northwestern regional director in Freight Car Distribution Notice 8, cancelling Notice 2, states that roads which are members of the Eastern Coal Car Pool will now accept current home delivery of open top cars of their ownership from roads not members of the pool. Flat bottom coal cars of pool ownership may be continued in local service where convenient. Self-clearing hoppers and mill type gondolas should be sent home, but may be loaded as convenient to or in the direction of the home road.

*Protection of Cotton from Fire.*—Order 178 of the Southwestern regional director discusses the question whether roads using oil burning locomotives need apply stripping to cars for the protection of cotton, or whether this protection should be applied by a coal burning road upon receipt of the cotton from an oil burning road. It is held that the originating carrier should do whatever is necessary to cars to protect cotton and similar commodities in transit, as it would not be practicable to depend upon a connecting or intermediate road to furnish such protection.

*Distribution of Automobile Cars.*—Supplement 1 of Freight Car Distribution Notice 6 of the Northwestern regional director directs that 36-ft. automobile cars shall hereafter be moved east empty (except from territory west of the Missouri river) the same as automobile cars of larger size. It is imperative that the east-bound movement of automobile cars be expedited as much as possible, and the situation followed vigorously to prevent misuse or delay.

*Uniform Method for Handling Hog Shipments.*—Circular 191, cancelling Circular 149 of the Southwestern regional director states that on March 12, the embargo and allotment plan governing the movement of hogs to various markets was entirely lifted, therefore Circular 149, issued on December 24, outlining the method of handling hog shipments, is cancelled.

*Storehouse Devices and Practices.*—The Northwestern regional purchasing committee in bulletin 125 calls attention to a list of the special appliances, devices, profitable practices, etc., reported by the various regions to the stores section of the Central Advisory Purchasing Committee.

Elevation and Sections of the P. & R. Consolidation Type Freight Locomotive

# Large Consolidation Type Locomotive for the P. & R.

With Tractive Effort of 61,260 lb. and Small Drivers, They  
Are Adapted to Heavy Drag Service

THE PHILADELPHIA AND READING is now receiving from The Baldwin Locomotive Works a consignment of Consolidation type locomotives which are notable for their weight and hauling capacity, and also because they are the only engines built to a railroad company's design to be included in the 1,430 locomotives ordered last year by the Railroad Administration.

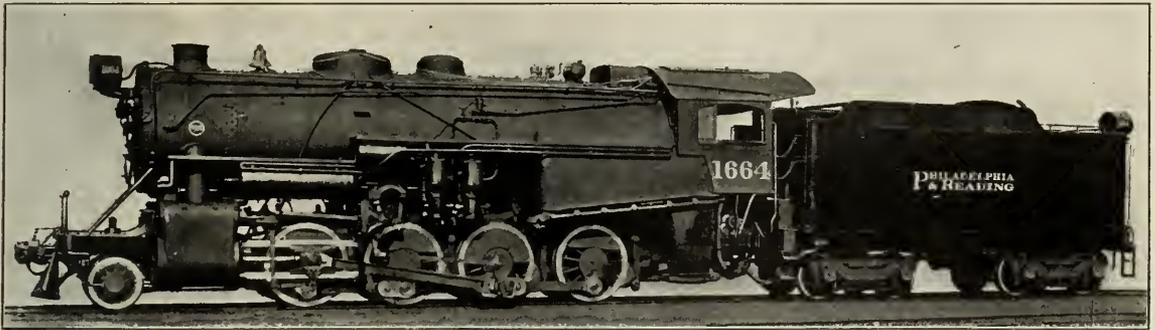

In the table will be found a comparison of the leading dimensions of these locomotives with the first Baldwin Consolidation type built for the Philadelphia & Reading:

Date built	Cylinders, in.	Drivers, diam., in.	Steam pressure lb. per sq. in.	Grate area, sq. ft.	Water heating surface, sq. ft.	Superheating surface, sq. ft.	Weight on drivers, lb.	Total weight, lb.	Tractive effort, lb.
1880.....	20 x 24	50	120	76	1,357	..	90,000	104,000	19,600
1918.....	25 x 32	55½	200	94.9	2,655	575	250,800	281,100	61,200

The locomotives built in 1884 had boilers of the Wootten type, equipped for burning fine anthracite, and this same type of boiler in a somewhat modified form and of greatly enlarged dimensions, is used in the new design. The fuel generally used today consists of a mixture of fine anthracite and bituminous coal, and this is burned on a rocking grate,

COMPARISON OF P. & R. CONSOLIDATION AND MIKADO TYPE LOCOMOTIVES		
Type .....	2-8-0	2-8-2
Tractive effort, lb.....	61,260	57,320
Total weight, lb.....	281,100	329,300
Weight on drivers, lb.....	250,800	246,600
Diameter of drivers, in.....	55½	61½
Cylinders, diameter and stroke, in.....	25 by 32	24 by 32
Steam pressure, lb. per sq. in.....	200	225
Heating surface, total evap., sq. ft.....	2,655	4,224
Heating surface, equivalent, sq. ft.....	3,518	5,264
Grate area, sq. ft.....	94.9	108
Tractive effort x dia. drivers ÷ equiv. heating surface .....	966.5	669.7
Firebox heating surface ÷ equiv. heating surface, per cent.....	8.4	6.2
Grate area ÷ vol. cylinders.....	5.2	6.4

The boiler has a conical ring in the middle of the barrel, which increases the diameter from 79¼ in. at the first ring to 85⅝ in. at the throat. The firebox has a combustion chamber 39 in. long, and a brick wall 26 in. high is built across the throat of the chamber. Flexible bolts are used almost exclusively in the water legs, and four rows of expansion stays support the front of the crown. The firebox has two oval fire-door openings, and the doors are power operated. A Standard stoker is applied. The mud ring is single riveted, except at the corners, where it is increased in depth to take two rows of rivets. A four-hopper ash-pan is applied with the two rear hoppers back of the wheels outside the frames. The equipment includes a power grate shaker.

Heavy Consolidation Type Locomotive Built for the Philadelphia & Reading

instead of on a combination of water tubes and pull-out bars, as applied to the earlier locomotives.

The new locomotives are designed for heavy drag service, and are in many respects similar to a group of Mikado type locomotives which preceded them. In consideration of the kind of fuel used, however, and the relatively small diameter of the wheels, a firebox of sufficient depth can be placed above the rear drivers without raising the boiler center to an excessive height. In the new Consolidations, the boiler center is placed 9 ft. 7½ in. above the rail.

In one of the tables will be found a comparison of the principal dimensions and ratios of the Consolidation and Mikado types. It will be seen that the new locomotives have smaller driving wheels and lower boiler pressure than the Mikados, but the cylinders are one inch larger in diameter and they have a starting tractive effort almost 4,000 lb. greater than the Mikados. It is evident that there is a considerable sacrifice in heating surface, there being eight less superheater units and 20 less tubes, which are 4 ft. 2 in. shorter than those in the Mikado type boiler. The difference in grate area is less marked. For heavy drag service, however, high tractive effort at slow speeds is the controlling factor rather than high sustained horsepower capacity.

The smokebox is comparatively short, and is equipped with the Economy front end arrangement, patented by I. A. Seiders, superintendent of motive power and rolling equipment of the railroad. A special feature of this arrangement is a breaker plate, which consists of a slotted plate fitted with deflecting vanes. This plate is placed under the superheater damper and in front of the tubes, and is very effective in breaking up the large sparks before they strike the netting. The netting frames are most substantial in construction, and the device has proved effective in preventing the setting of fires due to escaping sparks.

The cylinders are cast separate from the saddle, the right and left hand cylinders being interchangeable. They are made without bushings, and have barrel walls 2¼ in. thick. The cylinder castings and central saddle are made with suitable recesses through which the frames pass. The frame at this point has a single section, 5 in. wide by 13 in. deep—and the cylinder, frame and saddle, are held together on each side by a total of 59 horizontal bolts, 1⅝ in. in diameter. The saddle and cylinders are keyed to the frames at the front by vertical keys. The valve motions are of the Walschaert type, and are controlled by the Ragonnet power reverse gear.

The frames are of most substantial construction. They have a depth of 7½ in. above the pedestals, and the pedestal binders are held in place by three bolts in each end. The main pedestal wedges are self-adjusting. Strong transverse braces of cast steel are applied to the frames between adjacent pairs of driving-wheels. The brace back of the main drivers supports sliding bearings, which carry the front end of the mud ring. The rear end is supported by an expansion plate.

The cab, in accordance with the most recent practice for Wootton boiler locomotives on this road, is placed at the rear end instead of over the middle of the barrel. The sides of the cab are cut away in front in order to permit easy access to the stay-bolts.

Further particulars are presented in the following table of dimensions and data:

<i>General Data</i>	
Gage	4 ft. 8½ in.
Service	Freight
Fuel	Hard and soft coal, mixed
Tractive effort	61,260 lb.
Weight in working order	281,100 lb.
Weight on drivers	250,800 lb.
Weight on leading truck	30,300 lb.
Weight of engine and tender in working order	462,000 lb.
Wheel base, driving	17 ft.
Wheel base, total	27 ft.
Wheel base, engine and tender	63 ft. 11 in.
<i>Ratios</i>	
Weight on drivers ÷ tractive effort	4.1
Total weight ÷ tractive effort	4.6
Tractive effort × diam. drivers ÷ equivalent heating surface*	966.5
Equivalent heating surface* ÷ grate area	37.1
Firebox heating surface ÷ equivalent heating surface,* per cent.	8.4
Weight on drivers ÷ equivalent heating surface*	71.3

Total weight ÷ equivalent heating surface*	79.9
Volume both cylinders	18.2 cu. ft.
Equivalent heating surface* ÷ vol. cylinders	193.3
Grate area ÷ vol. cylinders	33.2

<i>Cylinders</i>	
Kind	Simple
Diameter and stroke	25 in. by 32 in.

<i>Valves</i>	
Kind	Piston
Diameter	13 in.

<i>Wheels</i>	
Driving, diameter over tires	55½ in.
Driving, thickness of tires	6½ in.
Driving journals, diameter and length	11 in. by 13 in.
Engine truck wheels, diameter	33 in.
Engine truck, journals	7 in. by 11 in.

<i>Boiler</i>	
Style	Wootton conical
Working pressure	200 lb. per sq. in.
Outside diameter of first ring	79½ in.
Firebox, length and width	126½ in. by 108½ in.
Firebox plates, thickness	Sides, back and crown, ¾ in.; tube, ¾ in.
Firebox, water space	Front, 5 in.; sides and back, 4 in.
Tubes, number and outside diameter	239—2 in.
Flues, number and outside diameter	36—5½ in.
Tubes and flues, length	13 ft. 6 in.
Heating surface, tubes and flues	2,359 sq. ft.
Heating surface, firebox†	296 sq. ft.
Heating surface, total	2,655 sq. ft.
Superheater heating surface	575 sq. ft.
Equivalent heating surface*	3,518 sq. ft.
Grate area	94.9 sq. ft.

<i>Tender</i>	
Tank	Water bottom
Wheels, diameter	36 in.
Journals, diameter and length	6 in. by 11 in.
Water capacity	9,500 gal.
Coal capacity	15 tons

\*Equivalent heating surface = total evaporative heating surface + 1.5 times the superheating surface.  
† Includes combustion chamber.

# War Situation and Service of European Railways

## Physical Condition of British and French Lines—Service Has Deteriorated—Great Crowding of Trains

By Samuel O. Dunn,  
Editor of the *Railway Age*

THE WAR IMPOSED heavy new burdens on the railways of all the countries involved in it, and at the same time made it impossible to maintain the physical properties as had been done before. It caused the private railways of Great Britain and France as well as of the United States to be taken under government control. It caused many of their most efficient employees to volunteer or be drafted for military service. These things produced marked effects upon the service and the physical condition of the railways.

To most of those who have used the service of American railways the deterioration of their physical condition has hardly been perceptible. There have been complaints regarding the service and regarding the decline in the efficiency of their employees.

For several weeks after the armistice was signed the writer traveled somewhat extensively upon the railways of Great Britain and France. While motoring along them, as well as riding upon them, he had opportunity to observe the effects of the war upon their physical condition. Since Great Britain and France were in the war much longer than the United States, and since a large part of the mileage of the French lines was actually within the zone of heavy fighting, the service and physical condition of the railways of Great Britain and France, especially the latter, show the effects of the war much more than have the service and physical condition of the railways of the United States. The writer was in both England and France, as well as in Germany and Switzerland, in 1914, having sailed from Liverpool for home only two weeks before the war began in Europe. Having returned

there just before the armistice was signed, and been there several weeks after it was signed, he had opportunity to observe the effects of the war upon the British and French railways, and also to compare and contrast railway service in Europe both in time of peace and in time of war with railway service in the United States.

### Comparison of European and American Service

Before the war the service of the railways of the leading countries of Europe was in some respects superior and in some respects inferior to that of the railways of the United States. The writer remarked after his first experience as a traveler in Europe that the most effective means the railways of the United States could adopt to cause the American people to stop criticizing their service would be to give them all a free ride through Europe. The first-class service of the railways of Great Britain, France and Germany before the war was quite comfortable. The third-class service in Great Britain and the second-class service in France and Germany were about equal to our ordinary day coach service. But the American traveler missed many comforts and luxuries to which he was accustomed at home. There were no observation cars or buffet smoking cars. Many of the European passenger cars were without vestibules, making it impossible on many trains to move from one car to another. In such cases if the traveler wished to go to a restaurant car he had to wait until the train stopped, run along the platform to reach the dining car, and then when he had finished his meal wait until the train stopped and run back along the platform to the car

in which he had been riding. In rainy or cold weather this was not pleasant.

Practically all the European passenger cars are divided into compartments. The so-called "corridor" cars are designed like our compartment sleeping cars. The passenger enters at the end of the car and goes down the corridor to the door of his compartment. There is always a toilet at one end of the compartment car. These cars are quite convenient and satisfactory. There are many cars in Europe which are divided into compartments that extend clear across the width of the car, there being doors into the compartments on each side of the car. When the traveler gets into one of these compartments and the train starts he is locked in and cannot leave his compartment until the train stops. There are no toilet accommodations in compartments of this kind, which ordinarily seat six to eight people, and to the American they seem extremely inconvenient.

What seemed inconvenience and discomfort before the war would have seemed like convenience and comfort during the war and since the signing of the armistice. The writer on his recent trip was in a party whose members were guests of the British government. The government, being in control of the British railways, spared no effort to provide good service for the members of this party. Seats on the trains in Great Britain always were reserved, and in some cases special cars were provided. Even in France the British, French and American army officers who took care of the wants of the party, spared no effort to provide every comfort and convenience for it. Therefore, nothing that is said herein is said in a spirit of complaint, because we had nothing to complain about and were placed under lasting obligations; but we took note of conditions, and the conditions of travel for those who were not especially favored were far from pleasant.

#### Great Overcrowding of Trains

During the war it was necessary, and during the subsequent period of demobilization it has continued to be necessary, for the governments to use a large part of the passenger train equipment for handling troops. Furthermore, thousands of individual soldiers on leave were constantly traveling to and from their homes. Finally, during the war, the civilian population, especially in Great Britain, took to traveling more than ever.

In France a substantial part of the mileage of the railways became entirely unavailable for ordinary passenger service. About 45 per cent of the mileage of the Northern, one of the principal lines, was at one time in the hands of the Germans. Literally hundreds of miles of railway was partially destroyed by bombing and shelling. For example, before the war the Eastern railway rendered good service on its direct line from Paris to Rheims. This line was so largely destroyed that in order to go from Paris to Rheims it became necessary to go over the main line of the Eastern railway to Epernay and thence over a branch from Epernay to Rheims. Of course, there were periods of heavy troop movements when commercial passenger traffic on the northern and eastern railways of France had to be practically or entirely suspended.

The result of the various conditions was that in Great Britain the passenger trains became terribly overcrowded. All the people who could be put into them were put into the compartments, and oftentimes the corridors of the corridor cars had people standing in them. The conditions in this respect were worse in France. The crowding on most passenger trains was almost as bad as it is during rush hours on the elevated railways of Chicago and the subways in New York. It was not uncommon to see all the compartments in a French train crowded with people and the corridors jammed with them, either sitting on their baggage or lying on the floor. Those who have complained about the crowding of trains in the United States have complained about conditions which to those who have recently been in Europe seem by comparison anything but imperfect.

#### No Heat in Passenger Cars

One thing which every traveler from the United States noticed as soon as he entered a train in Great Britain was that there was no heat. The coal shortage, owing to the decline in the production of coal and to the necessity for shipping a large part of that produced to the Continent, was so serious that it was necessary as a war measure to operate the trains entirely without heat. A passenger from America who got into a British train and took off his overcoat soon found it expedient to put it on again, and soon became accustomed to keeping it on. It was still more comfortable to wear not only an overcoat, but a sweater in addition. Many Europeans traveled with rugs which they spread over their legs and feet. Even with all this protection one's hands and feet often got very cold.

This absence of heat was also noticed in every hotel bedroom and private house. It is a notable fact that although the British were sending to France a substantial part of the coal they produced, there was more heat in trains and hotels in France than there was in Great Britain. Even on trains in Scotland and in hotel rooms in Edinburgh and Glasgow there was no heat. To the American who has been accustomed to steam-heated trains, hotels and houses, the absence of heat at first was very uncomfortable and disagreeable. However, travelers soon got used to it and after returning to the United States found the superheated trains and hotels in this country even more disagreeable than the unheated trains and hotels of Europe.

The slowness of the trains in France as compared with their speeds before the war was at once noticed. There had been a marked reduction of train speeds in Great Britain, and an even greater reduction in France. Before the war it was possible to leave Paris at about noon and reach London at about seven o'clock in the evening. As a result of the war it took about this long to go from Paris to Boulogne. This reduction of speeds was made partly to enable the locomotives to haul more cars and partly, in France, because deterioration of the physical properties rendered it desirable. The operation of all trains at something approaching uniform speed rendered it possible to handle a larger traffic.

#### Remarkable Passenger Train Loads

The number of passengers carried per train on some of the French and British railways during the war would make an American railway manager open his eyes. It became nothing uncommon for the principal British railways to carry 800 passengers in a train, and there were cases where as many as 1,500 passengers were carried in a single train running as two sections. Troop trains on the railways of the United States during the war often handled 500 men, but it is doubtful if there have been any instances where so many persons have been carried on single trains in this country as have been carried on single trains in Europe. Of course, the trains which have carried these large numbers of passengers have not only been crowded but have contained large numbers of cars. It was not uncommon to see trains containing 15 to 20 cars.

The passenger cars in Europe are much lighter than in the United States, both because they are smaller, especially narrower, and because comparatively little steel is used in their construction. Those who have advocated, and even attempted to force by law, the universal use by our railways of all-steel cars may be surprised to learn that the all-steel car is practically unknown in Europe. All-steel cars have been advocated and generally adopted in this country as a measure of safety. The railways of Europe continue to use wooden cars, and at the same time many of them, especially those of Great Britain and France, have an accident record which the railways of America may well envy. Of course, when there is a serious accident over there the wooden cars are often crushed and sometimes catch fire with disastrous

results, but wrecks are relatively less frequent than here. This is principally due to the superior discipline of the employees. The speeds of trains before the war were quite as fast in England and France as in the United States.

### Railways Have Stood Up Well

The railways of Great Britain and France were obliged during the war to reduce to the minimum their outlays for maintenance of track and equipment, and very little new equipment was bought. Neither the materials nor the labor required for adequate maintenance and replacements were available. The effects of these drastic economies are plainly visible, especially on the railways of France. In Great Britain stations, cars, and so on, look quite dilapidated as compared with their appearance before the war. This is partly due to the fact that it has been impracticable to get enough labor to keep things clean. In France the evidences of the destructive effects of war and of the inability to get labor and materials for maintenance and replacements are visible on every hand. In large areas the Germans destroyed the railway bridges, and these have been replaced only with temporary wooden structures. It was impossible to get enough glass, and many car windows which have been broken have not been repaired. The Germans bombed and shelled many railway lines which they were unable to take, and along such lines as that of the Northern from Boulogne to Paris, and that of the Eastern from Paris to Eprenay, one constantly sees shops which have been partly destroyed by bombs, pieces of track which have been destroyed by bombs and repaired, and stations which have been hit.

The most remarkable thing about the condition of both the British and French railways is not that they show some of the effects of war, but that outside the zone of actual fighting they show the effects of it as little as they do. While the effects of inadequate maintenance of tracks and equipment are visible, the tracks ride remarkably well and the equipment is in remarkably good condition considering how little has been done to maintain them. The fact that they are in relatively as good condition as they are bespeaks the skill with which they were originally constructed and with which they were maintained up to the time of the war. The British use the term "permanent way" where we use the term "roadway and structures." The manner in which their track has stood up during the war justifies the use of that term. Nevertheless there has been great deterioration in the railways of both countries which it will take years to offset.

While the British and French people bore patiently with the deterioration of railway service during the war there has been no lack of complaint since the signing of the armistice because the service has not been restored to normal. The complaints in Great Britain have been especially numerous and loud. It has been explained, however, that it will be months before the service can possibly be restored to normal. In the first place, the railways are short of equipment and it will take a long time to provide the needed additional equipment. In the second place, the railways ever since the armistice was signed have had to handle many thousands of troops which have been in process of demobilization.

### Advances in Passenger Rates

Both the British and French governments made special railway rates for soldiers who were traveling "on their own." In France these special rates were allowed to American soldiers. Therefore, the soldiers from the United States who have traveled in Europe probably have not thought much about the passenger rates they had to pay. As a result of advances in rates during the war, however, the rates which civilian travelers have to pay are relatively high. The first-class rate in Great Britain averaged before the war about three cents, and the third-class rate, on which a large majority of the people travel, about one and a half cents. Therefore, the advance of 50 per cent, which was made on

January 1, 1917, made the first-class rate about four and a half cents and the third-class rate about two and a half cents.

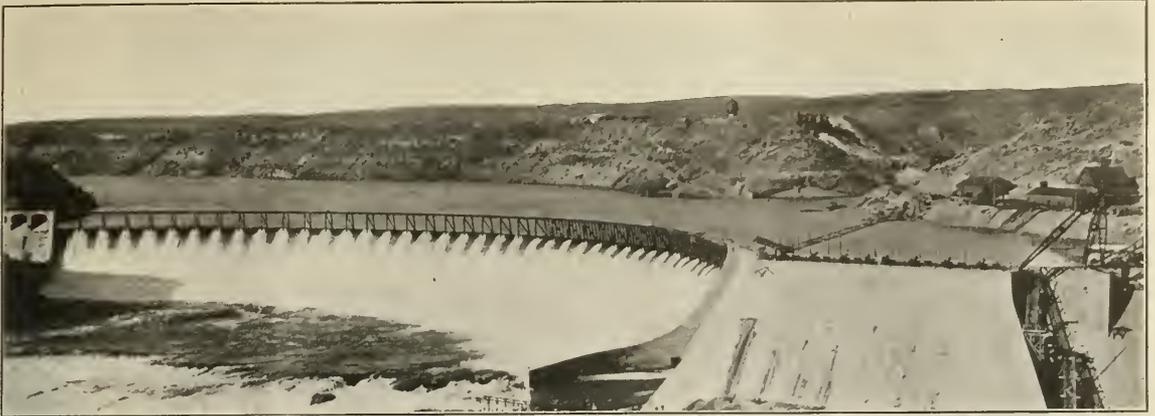

It is impossible to see how these rates can be reduced except at the expense of the taxpayers, whether government ownership is adopted or the railways are returned to private operation. The advance in passenger rates increased passenger earnings, but there has been no advance in freight rates, and the increase of operating expenses, mainly due to advances in wages, has been so much greater than the increase of earnings that at the present time, although no detailed official figures are available, it is safe to say that the British railways are paying out one dollar in operating expenses for every dollar they are earning. Premier Lloyd George said recently in a speech in the House of Commons that the increase of operating expenses of the British railways during the war was £90,000,000, or approximately \$450,000,000. Since the net earnings before the war were only \$250,000,000, it will be easily seen that British taxpayers already are paying a large deficit on the operation of the railways, and that to restore passenger rates to the old basis would largely increase this deficit. There have been large increases of both passenger and freight rates in France.

The service of the European railways before the war, as already indicated, was in some respects equal or superior to that of the railways of the United States. The trains in France and England were scheduled to make as good speeds as our trains and they were more regularly on time. With their lighter passenger equipment passengers were less frequently given violent shocks in setting and releasing the brakes on stopping and starting. The dining car service was table d'hote and many persons thought that the meals were better than the a la carte meals which were served under private operation in this country or the table d'hote meals which were served here under government operation. Most persons also liked the European system of issuing to passengers tickets giving the hour and the table at which they were to get their meals. The British sleeping cars, with their small compartment for each passenger, rendered a more satisfactory service than can be obtained on our sleeping cars, except in compartments and drawing rooms, and a passenger on the British railways can get a compartment by buying one railway ticket.

In many respects, however, our passenger service was superior to theirs before the war, and mainly because they went through four years of war while we went through only a year and a half of war, their service has deteriorated much more than ours. Probably it will take years to restore it to what it was before the war.

### Will Government Ownership Be Adopted?

Whether government ownership actually will be adopted is not yet settled. The British government has announced that it intends to keep the railways two years longer at least, and that meantime a solution of the problem will be worked out. It has been positively stated by Winston Churchill, who is a member of the Cabinet, that the government has decided on nationalization. On the other hand, Lord Claude Hamilton, chairman of the Great Eastern Railway, recently issued a statement, saying that he had conferred with officers of the government and that they had assured him no final decision regarding the government's railway policy has been reached. All reports indicate that there is less probability of the adoption of a permanent policy of government ownership and operation in France than in Great Britain. The French got some experience when the government took over the Western railway in 1908 and assumed its operation, and they have not relished the effects either on expenses or service. The five large private railways in France are still under government control, but apparently an attempt is being made to work out a program of readjusting their expenses and rates so that they can be restored to private operation.

Great Falls Dam at Volta; Chicago, Milwaukee & St. Paul Electrification

# The Real Problem of Railway Electrification\*

Exponents of Electrification Are Learning to See With the  
Eyes of the Railroad Man

By Calvert Townley

**E**LECTRICITY NOW PERFORMS every railroad service previously rendered exclusively by steam locomotives and in every case does it better than it was done before. But in order to use electricity a large investment in equipment and installation must be made and electrification has proceeded slowly because railroad executives were not convinced that the advantages to be gained are always worth the cost.

The progress of electrification has also been impeded, first, before the war by the difficulty in financing, due to conditions other than the merits of electrification, and second, since the war began, because every one has been too busy to consider any work that could be deferred and because the government's taking over the railroads has created an unsettled situation not conducive to the investment of new capital for future returns. Now, however, there seems to be ground for hoping that these bars to progress will be removed in the not distant future so that electrification can be again studied on its merits, therefore our consideration of the subject is timely.

In reviewing the past twenty years' history of this question, I cannot escape the conclusion that we electrical men, and not our steam road colleagues are responsible for the slow progress made. We have not known enough about either the science or the art of railroading. Our belief in, and our zeal for our own profession has led us, albeit with entire honesty of purpose, to make more or less extravagant claims as to what we could do and to underestimate the cost of doing it. The inevitable reaction of mind which followed an accurate determination of facts of course disturbed confidence in our judgment. But if at times we have injured the cause of electrification by claiming too much, strange as it may sound, we have injured it a great deal more by not claiming enough.

Electrical engineers not having always been railroad men have been unable to study railroad problems as they should have been studied, that is to say with only real and not with any arbitrary limitations before them. It has been

natural for the electrical man to ask the railroad man for a statement of the conditions he was expected to meet. It was equally natural for the railroad man to prescribe the conditions upon which his steam service was predicated. Under these circumstances the problem became largely one of replacing one sort of locomotive with another, and of balancing hoped-for economies in operation and maintenance on the one hand, against fixed charges for the additional investment required, on the other. Right there comes the mistake. A perfectly natural but a fundamental mistake, for which no individual or class should be censured but for which the unusual development of the art is responsible. We cannot blame railroad men for not being electrical engineers nor electrical engineers because they are not railroad men, but the progress of electrification has had to lag until both should be able to see, each with the eyes of both. It is only by combining the railroad man's knowledge of the fundamental requirements of his service with the electrical man's skill in applying electricity to perform that service that all the possibilities of any specific problem may be developed.

The electrification of a railroad is not simply the substitution of one kind of locomotive for another. It is far more than that. It is the adoption of a fundamentally different method of train propulsion. It is conservative to say that, within the bounds of ordinary practise, electricity can furnish every train with all the pulling power that can be used. The limitations of the steam locomotive in this respect disappear and ruling grades rule no longer. A strictly limited motive power is replaced by one that is practically unlimited.

## Kind of Equipment Not Important

There are a number of so-called "systems" of electric traction and heavy emphasis has been laid by the advocates of each upon its points of difference from every other. So much has been said about these differences and so little about the points of similarity as to create an entirely misleading impression. It is a fact that there are more kinds and types of steam locomotives in use many times over than there are

\*A paper presented at the 348th meeting of the American Institute of Electrical Engineers, Boston, Mass., March 14, 1919. Copyright, 1919, by A. I. E. E.

electric systems. It is a fact that except for the storage battery locomotive, which has but a limited field of application, all electric systems have many more common features than differences. It is a fact that they agree on fundamentals and differ in detail only. Their costs may not be the same, their efficiencies may vary, but they all do their work and do it successfully and well. The possibility of unlimited electric power is a characteristic not of any one system but of all. It is due to basic differences between steam and electric equipment. A steam locomotive is a complete independent unit which not only generates but also utilizes its power. The electric locomotive generates no power at all. It is only a translating device receiving energy from an outside and a remote source. The electric power house always having much greater capacity than any one locomotive, can supply ample power for the heaviest train on the steepest grade. The steam locomotive, which carries its own power house with it, is limited to the capacity of its one boiler. By the multiple unit principle, as many electric locomotives as may be needed can be coupled together and operated in synchronism by one crew from any cab. Any required tractive effort can thus be exerted without slipping the wheels, without imposing undue strains on the rails or bridges and without increasing the number of engine crews.

### Track Capacity Is Increased

The business of a railroad is to transport freight and passengers. I put freight first because on the average it produces 73 per cent of the revenue. Unlimited motive power permits longer trains and higher schedule speeds. On the Elkhorn grade of the Norfolk & Western the schedule speed was doubled. It cuts the operating cost by hauling more cars with the same or a smaller crew. The Norfolk & Western uses two electrics to do the work of three Mallets. These new opportunities at one fell swoop banish many of the railroad's time honored traditions. The traffic possibilities must be studied from a new angle and advantage taken of every facility. It is a new thought to realize that train length is limited not by motive power but by the yard tracks and length of sidings, or that all the trailing tonnage that the draw bars will stand can be hauled. Nor are these new limits fundamental. Sidings can be extended, draw bars can be made stronger, if it pays to do it. In a word electrification opens up tremendous possibilities of increasing the freight capacity of a road and without it being necessary to build additional tracks.

### Aerial Rights Made Valuable

While not as important as freight, passenger traffic likewise comes in for its share in the widened horizon and the vanishing tradition. Unlimited power of course is available but the absence of combustion is another basic advantage. Smoke and cinders disappear. Tunnel operation loses its terrors. Unobscured signals permit normal speeds with undiminished safety. Projects like the Pennsylvania terminal in New York, depending entirely on submarine tunnel operation and previously impracticable, become immediately possible. Railroads owning valuable realty in cities can erect buildings thereon, where before smoky locomotives made any structure above the ground level impracticable. The aerial rights are now valuable. Multiple unit operation has in fact made suburban traffic. The rapid acceleration made possible by electric traction has directed attention to the equal value of rapid retardation and has quickened the study of braking accordingly; also of modified coach design to bring about the more efficient loading and discharge of passengers. These combined possibilities secure increased schedule speeds and attract patronage. The people not only get over the line in a shorter time but as a corollary more people get over it in the same time. Again it is seen therefore that in passenger

as in freight traffic the ability to do something that could not be done before, rather than to do the same thing at a lower cost is the most valuable attribute of electrification, and again we find a greatly augmented capacity without the need of additional tracks.

It is not my purpose to make an exhaustive comparison of the relative advantages of steam and electric operation. That has been done often and well by others. What I have said about the expanding opportunities for electrified service is by way of illustration to emphasize my plea that the question should always be viewed in its broader aspect and not hampered and restricted within any narrower limitations than properly belong to it.

### Complete Electrification of All Roads Impossible

I am going to assume, then, the broadest possible treatment and to suppose that every electrification project is to have its pros and cons most fully examined. The real and vital question then is, "How far will this lead us?" "To what extent may we expect complete electrification of all our roads?" Parts of a number of them have already been equipped. Many of these are numbered among our prominent roads, successful corporations which have had the advice of the most highly skilled executives and engineers, and which are progressive. The service performed on the electrified sections comprises practically every kind of railroad transportation. The Bluefield division of the Norfolk & Western in West Virginia is an example of an important coal road operating through the mountains. The Chicago, Milwaukee & St. Paul 440-mile main line, through Idaho and Montana, demonstrates what can be done by a trans-continental carrier on a large scale with through traffic, both freight and passenger. The New York, New Haven & Hartford 73-mile stretch between New York and New Haven shows how through freight and a heavy passenger traffic can be taken care of on the most congested four track section of an important eastern carrier and what is possible for complicated freight yard operation, while the New York Central and the Pennsylvania out of New York city are splendid examples of our greatest modern passenger terminal electrifications. There are, of course, many other electrifications, but even if there were not, those named are of a character to command the respect and attention of the railroad world. Now, every one of these projects has been successful. Every one has justified itself. Nearly every one in its present scope represents an extension of the zone initially electrified, the most convincing evidence possible as to what views the operating companies hold regarding these several projects. Railroad officials are generally glad to give others the benefit of their experience so it is reasonably safe to say that operating statistics are available covering long enough periods so that the results to be expected from any proposed undertakings may be predicated on established facts and not upon theories. In the light of present day knowledge, therefore, what answer can we make to the question, "Should all railroads be electrified?"

Taken together in 1910 there were in the United States 240,000 miles of railroad main line regardless of the number of tracks. Of this mileage approximately 1,250, or one half of one per cent, has been electrified or is today in process. The remaining 99½ per cent comprises of course, roads performing every variety of service. They range from the back country branch line built by some over enthusiastic promoter and now perhaps, operated as part of a large system, only because operation cannot be avoided and regularly contributing its annual deficit, up to the most important through arteries of travel upon which the commerce and industry of the nation depend. Every sort of community is served; every kind of railroading has its place in this vast aggregation of effort and the variables in the problem are so

multitudinous and their nature often so profound as to well daunt the courage of one who seeks to formulate them for incorporation in a general statement.

Fortunately or unfortunately, depending on the point of view, it has been my lot to have to deal with the electrification problem from both sides. At one period from the standpoint of an intimate affiliation with the development and manufacture of electrical apparatus and at another from that of one charged with official responsibility on the railroad's behalf. I am a thorough believer in the virtues of electrification and an enthusiast about the wonders which it can accomplish but I also have a keen appreciation of the almost infinite variations in the railroad problem and a very wholesome respect for the dollar. I do not believe that all railroads will ever be electrified. I am not sanguine even that all the tracks of any one really big system will be so equipped in our time. It is a question of economics, and the results will not justify the expenditures even when considered with such broad vision as that which guided the Pennsylvania in spending millions to put their passenger terminal in New York City without the prospect of a direct return. Electrification will increase the track capacity. But there are thousands of miles of railroad that have sufficient capacity now, frequently several times over, and where the wildest stretch of imagination fails to picture a future need of this kind. Electrification works wonders in suburban and interurban passenger service. I have ridden for hours across the western prairies without seeing a single town, much less a city where these advantages would count. Electrification effects marked economies in fuel, in maintenance, in labor and otherwise through a long list; but electrification calls for a heavy investment and unless these economies bulk large enough, the interest on such investment will wipe them out and turn the enterprise into a losing venture. I do not believe the cause of electrification is helped by undue optimism on the part of its advocates. Rather should there be an enlightened partisanship, enthusiastic where enthusiasm is justified but tinged with the sober conservatism of the man who has to put his own dollars to work.

### Plenty of Work for Engineers

There need be no discouragement to the electrical engineer in the views just given, nor to the railroad man who has looked toward the new motive power for salvation. There are so many cases where electricity should be used, where its advantages are clear and conclusive, that once the railroads escape from the financial slough of despond in which they are now wallowing and are again able to get capital for their needs, there will not be enough engineers, there will not be enough electric factories in the country to serve them. Every big system has need of electricity somewhere. For some small roads it may mean the difference between solvency and bankruptcy. I electrified a short derelict line for the New Haven Road between Meriden and Middletown, long before given over into the one-train-a-day-annual-deficit class, and turned it into a good earner.

There can be no rule established. Generalities are sure to be misleading but electrification is now firmly entrenched and successful. It is recognized by railroads generally as an effective agency with great possibilities and one which is particularly valuable for certain specific purposes. Time alone will tell how broad its application is to be but I am confident we can await developments with tranquility assured that the art is in a healthy condition and that progress will be along the right lines.

### Discussion

The paper was discussed by representatives of the General Electric Company, the Westinghouse Electric & Manufacturing Company, and a number of men representing railroads

in the United States and Canada. All of those discussing the paper heartily endorsed Mr. Townley's attitude toward the problem and W. F. Murray of the Connecticut Light & Power Company outlined a plan for electrifying a large section, including lines on six eastern railroads. This plan has been given serious consideration at Washington. The substance of Mr. Murray's discussion was as follows:

### Plan for Electrification Proposed

We must not selfishly think of the electrification of one or two large roads. It is very true that we may reap a great money interest from that electrification, but it seems to me that this is not the right way to go after this matter. We must, if we are going to make electrification a success in this country, get after many roads, and we must do that on a district basis. In 1914, I had the pleasure of discussing with one of our prominent electrical engineers, a plan for electrification which I think will appeal to you. It involved six roads, Hudson River, Lehigh Valley, Central New Jersey, West Shore, Erie and Pennsylvania.

It seems to me that there was at that time a magnificent opportunity of what may have been called the formation of a power and equipment company with the idea in mind that a standard equipment be used on these railroads for service in the metropolitan districts, for freight service and for switching service in the large terminal yards in that section and for the distribution of power to that district for those railroads. At that time the railroads were tremendously embarrassed as they are now in the matter of finances. Yet if a standard equipment could be produced, the finances could be taken from the embarrassed railroad hands and smoothed out by bankers who would have jumped at the opportunity, and taken care of the purchase and equipment. Of course, the power house which would furnish the power would be compensated for by their contract for power and such profits as they would make would easily put them in a position for the bankers to finance these buildings. The shifts that would be necessary to take care of this equipment could also be taken care of in a financial scheme, and so the proposition could be financed. In fact, I have discussed the matter with several people in New York, who were very much interested in it and it seemed that a serious consideration would be possible when the war broke out in 1914. Naturally, it was then impossible to talk of these things.

### Government's Investigation for Transmission Line

We have been doing a very wonderful work for the government in connection with the investigation of a superior 150,000 volt power transmission line which would extend from Boston to Washington. The opportunity offered itself for development of large power stations at the mouths of mines, tidewater steam stations and water power stations. Into this transmission trunk line system therefore would be fed this highly economic power. You might say right away "what would be the advantage of such a line, and could we not on account of the very large stations we have developed produce power as economically, and therefore why go to this expense of investment of money in a superior power transmission line?"

Our investigations show that with units of from 25,000 to 40,000 kw. we can safely figure on being able to produce a kw.-hour with something between ten and fifteen pounds of steam, and be sure of it. I venture to say that in the district between Boston and Washington the amount of steam required to produce a kw.-hour as applied to the railroads and to the factories, will average 25 to 30 pounds, and consequently there is offered an enormous saving in production. This, however, is not to pre-empt any stations in central districts that are merely contributing their quota.

This was seriously considered in Washington, and I do not

know but what you may have all noticed in the papers the plan which Secretary Lane has proposed which comprehends practically what I have tried to describe. There was submitted through the secretary-treasurer to the Appropriation Committee of the Senate, a bill calling for the investigation of this matter—a bill reading "This amount of money to be appropriated for the investigation of the economies to be obtained by a power generation and transmission system covering the district between Boston and Washington." On account of the great number of bills being held up in Congress, this, together with others, has been laid over, but it is to be hoped that the new Congress will appropriate a sufficient amount of funds to make this investigation.

I want to leave with you this thought. In discussing this

matter of a superior power line with a number of engineers, I have not found a single dissenting voice. Some one may say that the idea is all imagination, but that is wrong. I must confess there is imagination in it; I think the man who has no imagination needs a guardian. Let us admit that there is some imagination. You must imagine a patent before you can make it. I claim that the scheme is practical. There is nothing in it that is impractical. Let us make the investigation and find out.

Do not let us get behind England, who is doing just this thing. We have as much area in this regional district as England has. If we have got to compete with the world's markets and maintain a world standard we must have some superior scheme by which these powers can be made and used.

## Progress Toward Financing Railroad Requirements

### Railroad Administration Borrows \$50,000,000—Arrangements for Warrants and Acceptances Being Worked Out

THE IMMEDIATE PROBLEM of temporarily financing the obligations of the Railroad Administration to the railroads and to the equipment companies appears now to be solved except for the working out of details. Conferences have been held between the administration, Howard Elliott as head of a committee of the railway executives, and the bankers. The Railroad Administration is to issue warrants to the railroad companies for part of the amounts due them to enable them to meet interest and dividend payments, and it is proposed that the bankers loan railroad companies money on the security of these warrants. The railroad companies' own credit, where this is good, will also be used. This would leave the War Finance Corporation free to help the weaker roads.

The War Finance Corporation has loaned \$50,000,000 to the Railroad Administration to replenish working capital in the hands of federal treasurers. This \$50,000,000 represents all that the administration, itself, can get from the War Finance Corporation, but individual companies may secure loans.

The Navy Department has made a payment of \$10,000,000 on account of the money it owes the Railroad Administration.

The War Department owes the administration about \$100,000,000. Efforts are being made to collect some of this.

#### Equipment to Be Financed by Trade Acceptances

The plan by which the equipment builders and those who furnished the materials and specialties are to receive their pay for the cars and locomotives ordered by the Railroad Administration last year, in the form of trade acceptances running for 90 days and bearing interest, has been practically completed except for the arrangement of details which is in charge of a committee headed by F. N. Hoffstot, president of the Pressed Steel Car Company and including J. E. Dixon, vice-president of the Lima Locomotive Works, W. H. Woodin, president of the American Car & Foundry Company, and Mr. Pigott, president of the Pacific Car & Foundry Company.

As briefly reported last week, Director General Hines conferred on March 13 with a group of representatives of the car and locomotive companies to which the Railroad Administration owes money for equipment already delivered and will owe additional amounts for cars and locomotives to be delivered during the current year. A preliminary meeting was held in the morning and a second one late in the afternoon, which was also attended by H. B. Spencer, director of the Division of Purchases, and C. B. Eddv, associate director of the Division of Finance, after which the Railroad

Administration issued a statement Thursday evening in substance saying that the director general is considering giving permission to the equipment companies to draw drafts on the director general for amounts due, the drafts to be accepted by the director general. The Federal Reserve Board holds that such drafts, running for not more than 90 days, are eligible for re-discount by the federal reserve banks at the prevailing rates of discount for trade acceptances.

It is estimated that the amount which will fall due to equipment and specialty manufacturers to June 30 will be \$183,681,965. The question of whether the specialty manufacturers should draw direct on the director general or on the locomotive builders has not been decided.

A statement of the contractual obligations of the Railroad Administration to the car and locomotive builders as of December 31, 1918, which, incidentally, gives the unit prices paid for the various types of locomotives and cars ordered, is given in the following table, which has been filed in the record of the hearings before the Senate Committee on Interstate Commerce and appears in the printed reports of the hearings, having been inserted following Mr. Hines' testimony before the committee on February 3, 4, 5 and 6. It shows the make-up of the \$286,000,000 which Mr. Hines has explained will become payable to the equipment companies during the year as fast as the cars and locomotives are delivered. A large part of this amount is payable in turn by the locomotive and car builders to the companies furnishing the materials and the specialties for the equipment. The statement is as follows:

Capital Expenditures Program to Be Reviewed

The entire program of capital expenditures for this year, including the carry-over from last year, is to be reviewed in the light of the financial situation caused by the failure of the railroad appropriation bill, and not only will new work not be started without further approval both by the corporate officers and the Division of Capital Expenditures but work already under way will be discontinued, except with their approval, except where necessary to insure safety or where it would cost more to stop it than to continue. This plan was

agreed upon at a conference held last week between T. C. Powell, director of the Division of Capital Expenditures, and Howard Elliott, chairman of the railway executives committee, which had previously conferred with Director General Hines.

Mr. Powell, in his D. C. E. circular No. 20, addressed to regional directors, dated March 13, says in part:

"Will you please instruct each federal manager to afford the proper corporate officer upon application full opportunity to review projects chargeable to capital account, whether in progress or contemplated, including not only the items in the 1919 budget and on D. C. E. Forms approved since January 1, 1919, but also all uncompleted items in the carry-over from 1918.

"If the corporate officer withdraws or withholds approval of any project for financial reasons or otherwise, please proceed as follows:

1. Work not started shall not be commenced without further approval by this division.
2. As to projects already started and actually under way, please see that no further work is done, except:
  - (a) When necessary to insure safety.
  - (b) Where the project is so far completed that to stop work would be more expensive than to continue it.
  - (c) Where a job is covered by bona fide contract and stopping the work would seriously demoralize conditions, especially as to working forces.

"In all cases where the federal manager and regional director believe the work should be done, whether as to new work or as to continuing work now in progress, even though the railroad company withholds or withdraws its approval, a full report should be promptly made to the Division of Capital Expenditures (with a copy thereof to the president of the company) stating the objections or disagreements that cannot be overcome, with the definite recommendation of the federal manager and regional director; and, pending further approval by this division, no such work should be started, and, except as provided in Section 2 above, no such work in progress should be carried on."

In addition to the temporary requirements, there are others

Director General Hines has filed with the Senate Committee on Interstate Commerce to be printed in connection with the report of his testimony before the committee in February the following approximate statement of cash receipts and disbursements for the year 1918, which shows that the amounts actually paid to the railroad companies on account of their compensation during the year was \$253,000,000, of which \$138,000,000 was taken from the revolving fund and \$115,000,000 from income from operation.

STATEMENT OF CASH RECEIPTS AND DISBURSEMENTS FOR THE YEAR 1918

Receipts—	Revolving fund	Operation	Total
Original appropriation .....	\$500,000,000		\$500,000,000
American Railway Express Co. ....		\$42,157,416	42,157,416
Wells, Fargo Co. Express. ....		4,759,000	4,759,000
Net operating income (note).....		785,397,956	785,397,956
Total .....	\$500,000,000	\$832,314,372	\$1,332,314,372
<hr/>			
Disbursements—			
Loans to railroad companies:			
Secured .....	\$110,317,500	\$34,185,460	\$144,502,960
Unsecured .....	15,500,250	34,932,863	50,433,113
Advances on compensation.....	138,331,660	114,946,140	253,277,800
Payment of corporate liabilities in excess of corporate assets received or collected .....		68,743,883	68,743,883
Additions and betterments expenditures .....		455,817,710	455,817,710
Purchase of standardized equipment .....	114,514,400		114,514,400
Advances to inland waterways... ..		4,361,486	4,361,486
Advanced to Federal managers... ..	74,791,000	(74,791,000)	
Miscellaneous (note) .....		(6,436,980)	(6,436,980)
Total .....	\$453,454,810	\$631,759,562	\$1,085,214,372
Balance .....	\$46,545,190	\$200,554,810	\$247,100,000

Note.—This statement presupposes that all the income was actually collected in cash; this is not actually the case, partly because substantial amounts of freight and passenger fares were not actually paid in cash, and in part materials and supplies have necessitated the employment of a part of the cash. The inclusion of the item of (\$6,436,980) (in parentheses) is a rough way of reflecting these and other similar factors.

STATEMENT OF ACCOUNT WITH RAILROAD COMPANIES WHOSE PROPERTIES WERE IN FEDERAL CONTROL AS OF DECEMBER 31, 1918

Credit to Companies	
Compensation—standard return.....	\$928,314,372
Less—	
Advances .....	\$253,277,800
Loans, excluding New Haven loan..	143,461,073

Balance due on compensation.....	\$531,575,499
<hr/>	
Deductions	
Other items in account with the corporations which may be retained in payment of balance of compensation:	
Surplus income which can be applied to additions and betterments .....	\$214,211,190
Balance due companies in open account which is estimated can be retained from compensation on settlement thereof.....	55,929,620
	<hr/>
	\$270,140,810
Less—	
Balance payable to companies on open account .....	\$20,372,215
Depreciation accruals payable to companies .....	100,000,000
	<hr/>
	\$120,372,215
Net amount to be retained.....	\$149,768,595
<hr/>	
Balance payable to companies in settlement of compensation for the year 1918, and on open account, and for additions and betterments to the companies' property to the extent that compensation suffices therefor.....	\$381,806,904

Note.—The figures with reference to open account are based on report as of September 30, 1918, the latest available; it is believed that those figures will not be materially changed December 31, 1918. All other figures shown are of December 31, 1918. The date as to amounts which can be retained from companies' income to apply on additions and betterments are, of necessity, estimated.

# 119 Roads Earned Less Than Standard Return

## Comparison of Net Operating Income for Last Year With Pre-War Results Shows Striking Changes

A TOTAL OF 119 RAILROADS out of a list of 184 Class I roads under federal control earned less than the amount of their standard return during the calendar year 1918, while 65 roads earned net operating income greater than their standard return and so contributed some \$80,000,000 toward making up the deficiency in meeting the standard return of the other roads, although the net result was a deficiency for all the Class I roads of \$202,135,602 as compared with the standard return for those roads of \$890,335,685.

The so-called "standard return" is approximately the average net operating income for the three years ending June 30, 1917, and, as certified by the Interstate Commerce Commission, is the basis for the rentals to be paid by the government for the use of the railway property. Thirty-seven of the roads had actual operating deficits for 1918, while only six of the 184 had average deficits during the three-year period. Most of the 37 are included in the 119, but two are not because their deficits were less than their average deficits for the three-year period.

In the eastern district 22 roads earned more and 52 less than their standard return; in the southern district 18 earned more and 17 earned less; in the western district 25 earned more and 50 less, while of the roads having deficits 15 were in the east, four in the south and 18 in the west.

The accompanying table, showing a comparison of the net operating income for 1918 with the standard return, has been compiled by the Bureau of Railway Economics. An examination of the figures shows some interesting facts regarding the effect on the net operating income of the changes in the character of traffic in 1918 as well as of the policy of the Railroad Administration in treating the roads as a single system and in diverting traffic to and from various lines either for the purpose of securing more direct routes or in order to confine certain lines largely to certain classes of traffic. In some instances the net operating income for 1918 greatly exceeds the standard return—frequently it is more than double; in other roads that had a large net operating income during the three-year period earned only a small percentage of the amount in 1918. The Erie is probably the most conspicuous example of the effect of a change in the character of its traffic, because whereas its standard return was \$15,503,939, it had an operating deficit in 1918 of \$1,079,618 or a reduction of \$16,583,557. The Chicago, Milwaukee & St. Paul earned only \$3,643,192, or \$23,511,359 less than its standard return of \$27,154,551. The Baltimore & Ohio, which had a standard return of \$25,611,892, earned net operating income in 1918 of only \$7,187,683, or a reduction of \$18,424,209, and the Pennsylvania Railroad earned only \$18,317,171, as compared with a standard return of \$151,361,262, while the Pennsylvania Company earned \$4,284,827 as compared with a standard return of \$14,992,785. On the other hand, the Southern Railway earned for the government \$29,291,870 or \$10,695,890 more than its standard return, while the Union Pacific earned \$35,616,554 as compared with a standard return of \$23,700,009.

The discrepancy between the net operating income for 1918 and the three-year average does not necessarily mean a diversion of traffic because increases in the case of roads serving the ports are frequently attributable to the increase in exports, and an unusually large increase in expenses, which might have been caused by an unusual amount of

maintenance work, would affect the comparison. In one case the increase in wages alone was twice the amount of the standard return. Therefore an analysis of the earnings and expenses in 1918 as compared with those in the test

COMPARISON OF 1918 EARNINGS WITH STANDARD RETURN—EASTERN DISTRICT

Wheeling & Lake Erie	1,586,037	1,048,583	—537,454

period is required to ascertain how much of the difference from the pre-war results was affected by changes in traffic.

The Southern district was the only one in which the number of roads earning the amount of their standard return or more exceeded the number that failed to do so. The Atlantic Coast Line earned \$1,445,215 more than its standard return of \$10,180,915. The Chesapeake & Ohio earned \$3,815,422 more than its standard return of \$13,226,983, the Louisville & Nashville earned \$2,057,137 more than its standard return of \$17,310,495. The Richmond, Fredericksburg &

Potomac and the Washington Southern, which handled an unusually large percentage of troop traffic, both earned greatly in excess of their pre-war average.

In the east more than two-thirds of the roads failed to earn the standard return, and in the west just two-thirds had a similar result. Some of the more conspicuous examples of the roads that exceeded the amount of the guarantee in the east were the Cleveland, Cincinnati, Chicago & St. Louis, the Elgin, Joliet & Eastern, the Michigan Central, and the New York, Chicago & St. Louis, while the Boston & Maine earned only \$1,733,008 or \$7,745,067 less than its standard return of \$9,478,075; the Delaware & Hudson earned only \$2,446,556 or \$4,963,044 less than its standard return of \$7,409,600 and the New York Central earned \$7,510,753

COMPARISON OF 1918 EARNINGS WITH STANDARD RETURN—WESTERN DISTRICT

less than its standard return of \$55,802,631. In the western district the Atchison, Topeka & Santa Fe earned \$3,114,578 more than its guarantee of \$38,443,725, the Duluth & Iron Range and the Duluth, Missabe & Northern earned amounts greatly in excess of the standard return; while the Chicago & North Western earned only \$12,441,437 as compared with \$23,201,016, the Chicago, Burlington & Quincy earned \$25,016,100 as compared with \$33,360,683, the Chicago, Great Western earned only \$21,457 as compared with \$2,953,450 and the Great Northern earned \$11,978,791 as compared with \$28,666,684.

The total standard return for the Class I roads amounts to \$890,335,685. Forty-three of the roads have executed contracts with the Railroad Administration providing for a total compensation of approximately \$485,000,000. Some of these contracts include several other Class I roads. A statement recently made by Director General Hines shows that \$253,277,800 was actually paid in 1918 on account of compensation, of which \$138,000,000 was taken from the revolving fund and \$115,000,000 from operating income. A total of \$214,000,000 was deducted from the rental to apply on capital expenditures and after various other adjustments between the companies and the Railroad Administration it owed the companies on January 1, \$381,806,904.

b Road operated as a lessor company prior to December 1, 1917.

# Unification of Car Inspection and Maintenance\*

## Backing of Operating Officers Needed by Car Department to Perform Its Functions Effectively

By J. J. Tatum

General Supervisor of Car Repairs, United States Railroad Administration

IT HAS GENERALLY been found by railroad managements that the inspection and maintenance of car equipment is not uniform and they have frequently urged unification of inspection and repairs, deeming it to be an important factor of safety, good performance and economical operation.

Unification of inspection and repairs to equipment was found by the United States Railroad Administration to be such an important requirement of good railroad performance that it soon began to lay plans and make instructions effective that would unify inspection and repairs, as well as to standardize equipment.

For this reason Circular No. 7 was issued, June 8, 1918, by C. R. Gray, former director of the division of operation, to insure that inspection and repairs would be properly made to car equipment. Mechanical Department Circular No. 7 was issued October 17, covering repairs to refrigerator cars for the purpose of standardizing the repairs to refrigerator cars to such extent that they would be suitable for the service they are intended to perform. Mechanical Department Circular No. 8 was issued November 1, 1918, for the purpose of standardizing materials for freight car repairs in order that repairs could be made promptly and uniformly.

Knowing that certain things must be done and issuing instructions to do them does not always mean they will be done, or that the instructions issued will be complied with. Something more is required. The men in charge should be capable not only of issuing instructions but capable of knowing when instructions are being complied with. They should also be capable of issuing workable instructions and selecting men who are capable of complying with their instructions.

If this statement is true then we should have thorough, capable and efficient men at the head of car departments, who know when a car is properly inspected and how to inspect it. They should know when a car is properly repaired and how to repair it. If they are capable of doing this, they should then be capable of selecting the right men to see that this work is properly performed. They should know that the foremen they have placed in charge of their repair shops are not only capable of repairing cars and knowing that they are properly repaired but that they are also capable of seeing that the men doing the work do it properly.

When selecting a man as foreman car inspector or leading inspector, it should be known that the man selected is not only capable of inspecting a car and knowing when it is properly inspected but that he is capable of selecting men as inspectors who are able to inspect cars properly.

After these requirements are met, we may look with confidence for unified inspection and maintenance of equipment, but not until then.

Even after this is done there will still continue to be improper inspection and maintenance of equipment and a variance from the unification requirements if those in charge of these men do not respect their action. I mean by this statement that inspectors should be given all trains to inspect and they should be permitted to hold them a sufficient length of time to give each car the needed inspection and repairs, or to shop the defective car out for repairs. After a car inspector has shopped a car for defects which make it unsafe to be

continued in service, no one should be permitted to cause such car to be placed back in service until the repairs for which the car was shopped have been made properly, or improper repairs corrected. One giving or assuming such authority, will by his act, become an enemy to safety and a promoter of disaster that may result in loss of life or limb and destruction of property.

It should be considered just as serious and dangerous for one to remove a shop card from a defective car and permit it to go into service without necessary repairs being made, or permit a car to go into service with a shop card on it without the repairs being made, as it would be for one to change a red signal to white before an approaching train, without knowing whether or not the block into which the train is to move is safe and clear. In my opinion, one act is just as serious and just as liable to cause disaster as the other.

Therefore, Mr. Railroad Manager, it is with you to see to it that your car inspectors are given your trains to inspect, with the time to make needed inspection and repairs. If this is not done you should be responsible for the failure of such cars and not the head of the car department or his inspector. It also lies with you to see that the car inspector's action, when shopping a car out for repairs, is given your full support, to the extent that, should anyone remove a shop card from a defective car and permit it to go into service before necessary repairs are made, or place a car in service with a shop card on it, such person should be relieved from the service for the good and safety of all concerned. If this is not done, then the motto we have established—"Safety First"—is only a mockery and you are deceiving yourself as well as the public, in your efforts to promote such a doctrine.

The protection of millions of passengers using the railroads of our country, as well as railroad employees, and the protection of billions of dollars' worth of railroad property and billions of dollars of freight hauled in cars operating over our railroads depends upon the thorough and careful inspection made to our cars. There also depends upon their careful inspection and the repairs to equipment the protection of foodstuffs needed to feed hundreds of millions of people. With this great responsibility upon the inspectors, their value cannot be discounted.

To bring about these desired conditions it is necessary that we first select for the heads of our car departments men who have been thoroughly trained and well experienced. They should see to it that inspectors selected are capable of making safe and proper inspection of car equipment. This can only be established by requiring inspectors to pass an examination that will insure that after once passing the examination they are capable of performing the work assigned to them.

They should also see that inspectors are given all trains to inspect and permitted to hold them until inspection is made. Cars once inspected and passed as being fit for service should be in such condition that, when inspected again at next inspection point, they will not be shopped out for defects that existed at the time of the previous inspection; neither should they fail while in movement due to such defects. In other words, should an inspector pass a car as being safe and fit for loading at St. Louis that car should be in condition to continue through to New York or any destination without being shopped out or breaking down in movement, due to

\*Abstract of a paper read before the Central Railway Club at Buffalo, N. Y., March 14, 1919.

defects existing when the car was inspected at St. Louis. When a car repaired on shop tracks at Chicago is moved to New York for loading it should not be necessary to shop it for defects that existed when it was placed on the shop tracks, or for improper repairs made at Chicago, on or before its arrival at New York. No car should be placed for loading until first inspected and given needed repairs.

Unless we are able to obtain these desirable conditions our inspection or our repairs are not uniform, or our supervisors are not capable and efficient, or someone is removing shop cards or causing cars to leave inspection points or repair yards before they are in proper condition for service.

Unless such practices are corrected (if they exist) we cannot expect to establish the unified requirements which would result in safe and economical operation. Unified inspection and repairs will mean to our railroads less loss of life and limb of passengers and trainmen, greater car mileage, fewer accidents, less destruction of equipment and property, less repeated shopping of cars, greater car supply, less need for purchase of new equipment, decrease in cost of operation, less maintenance cost, prompt handling of business, greater satisfaction to shippers, better earnings for railroads and a more satisfactory dividend for the stockholders.

### Discussion

In presenting his paper Mr. Tatum referred to the fact that of the more than two and a half million freight cars in the country about 125,000 cars are being held for repairs and more than 100,000 cars are being repaired per day. There are on 80 railroads, or about 57.6 per cent of the railroads reporting to the Railroad Administration, less than four per cent bad order cars. On February 15 there were 141,000 men employed in car repairs on 139 Class I railroads, which were holding an average of slightly over five per cent of their cars in bad order.

F. W. Brazier, superintendent rolling stock, New York Central, questioned the significance of the figures given by Mr. Tatum as to the number of cars actually in bad order condition, owing to the fact that instead of giving cars thorough repairs too many of them had only received sufficient repairs to get them temporarily back into service. He endorsed the requirements for unification outlined by Mr. Tatum, stating that the instructions are clear enough, but that little attention is paid to some of them; when business is rushing there is a great demand for equipment and only such repairs are made as will keep the cars running, instead of giving them the thorough repairs they need, when they are empty and on the repair track. M. C. B. Circular 4-A, now in effect, was quoted to show that it is not so much instructions that are needed as some way of securing their full observance. This circular alone, if carried out, would greatly improve the condition of equipment not now suitable to meet modern service conditions. In this connection Mr. Brazier stated that the New York Central on August 1, 1918, had 7,000 cars yet to be equipped with safety appliances. Since that time only eight cars have been reported as being equipped with the safety appliances on foreign lines, as compared with 370 foreign cars which have had the appliances brought up to standard on the New York Central Lines. The need of adequate force behind instructions, if they are to be carried out, was further emphasized by Mr. Brazier, who cited the case of the safety appliance standards now adopted and enforced by the Interstate Commerce Commission. The Master Car Builders' recommendations for the ladder location were complied with by about 85 per cent of the railroads, but the other 15 per cent of the roads persisted in applying their ladders in exactly the opposite location. The Interstate Commerce Commission did not formulate new standards, but it required the force behind the Safety Appliance Acts to bring about 100 per cent compliance with the standards formulated by the association.

The need of the highest type of supervision in the car department was emphasized, its importance being indicated by the fact that in 1917 the New York Central spent \$8,000,000 in the maintenance of locomotives, whereas the car department's expenditures totaled \$17,000,000. But labor conditions have been such during the past year that it has been difficult to keep men in the service long enough to develop good inspectors.

Commenting on Mr. Tatum's remarks as to the need of holding trains for thorough inspection, Mr. Brazier advocated that no car be placed for loading until it has passed a thorough inspection. Such inspection should apply particularly to the running gear, brake rigging and draft gear, which must be in first-class condition on all cars, while some other parts of the car need not necessarily be in perfect condition to receive certain classes of lading.

Mr. Brazier called attention to the air brake situation, which is one of the most serious conditions affecting the proper operation of freight cars. He suggested as a subject for investigation how many railroads have proper yard facilities for testing the brake equipment and making necessary repairs to it. Referring to this matter, Mr. Tatum mentioned an instance in which a railroad was endeavoring to economize in the purchase of material by reclaiming old cylinder gaskets, no new ones being purchased. An inspection was made of some of the brakes thus overhauled after the work had been completed and the brakes stenciled ready to return to service; the fact was disclosed that the brakes leaked off so fast that it was impossible for the inspector to read the gage quick enough to say whether they had applied or not. A question as to the proper life of air hose in its relation to brake conditions was raised by H. C. Woodbridge, regional supervisor of the Fuel Conservation Section of the Railroad Administration, who stated that it costs as much to stop a train as to renew an air hose. This was cited as an indication of the false economy of attempting to retain air hose in service beyond the period during which they may reasonably be expected to remain tight. It was suggested that if road foremen and enginemen would report excessive train line leakage these reports might serve as a means of keeping the car department advised as to tendencies in the condition of air brake equipment. L. D. Gillette, inspector of the Canadian Dominion Railway Commission, also referred to the question of porous hose as being a source of great danger to the safe movement of traffic,—the proper place to locate the porous hose being in the yard and not on the road. In reply, Mr. Tatum stated that he considered the safe life of an air hose to be about one year, and referred to the fact that the Master Car Builders' Association is now considering the formulation of rules covering the question of air brake maintenance.

R. S. Miller, master car builder of the New York, Chicago & St. Louis, raised the question as to what constitutes a serviceable car. Various interpretations of this expression are being adhered to in different localities, which causes difficulty under present conditions in the free movement of equipment. If a uniform interpretation were available it would materially assist in securing unified inspection. Mr. Miller also advocated the universal use of the Master Car Builders' rules for the examination of car inspectors rather than the individual sets of such rules instituted by various car department heads. In answer to the question as to what constitutes a serviceable car, Mr. Tatum stated that he considered a car serviceable when it was in condition to carry the class of freight for which it was built, but that this did not preclude the use of box cars not in serviceable condition for first-class merchandise to carry rough freight.

W. H. Sitterly, general car inspector, Pennsylvania Railroad, emphasized the air brake situation, stating that the brakes contribute very largely to bad car conditions. The one difficulty is that time enough is not given to the car inspector to properly do his work, and it is also necessary that

adequate time be given to making the needed repairs disclosed by the inspection. Cars should not be delivered in interchange with a clean bill of health merely to get rid of them. Facilities should be available for repairing the cars. There should be only about one and a half times the day's work ahead of the car repair forces and to keep within this figure adequate facilities and enough men must be provided. Great assistance in securing proper compliance with rules relating to car repairs in interchange has been rendered by the Railroad Administration in holding the individual responsible for failure to make needed repairs or for making improper repairs, instead of the matter being, as it formerly was, a subject for adjustment between the railroad companies involved. Mr. Sitterly referred to an analysis of 787 box cars which had been made at Buffalo to ascertain their suitability to be coopered for grain. Of these cars only 55 per cent were found fit to carry grain. He stated that this situation could be improved by using cars which were not suitable to be coopered for grain for loading such commodities as fertilizer, hides, oil, etc., which leave the car in a condition unsuitable for grain service.

In referring to Mr. Brazier's discussion Mr. Tatum called attention to Circular No. 20, which specified that when a car is repaired it should be put in service to give two years' service, barring accidents. In this connection he emphasized the need for more facilities. Operating officers and managers often complain about the condition of the equipment, but they seldom offer to furnish shop facilities adequate to carry out the amount of work which must be done to keep the cars from returning frequently to the repair tracks. It is not conducive to an ideal condition of rolling stock when a shop becomes somewhat congested with bad order cars to relieve the congestion by taking off the bad order cars without performing the work required.

T. J. O'Donnell, chief joint inspector, Niagara Frontier Car Inspection Association, referring to Mr. Tatum's statement that it should not be necessary to shop a car for defects that existed prior to the time of the last shopping, said that the Buffalo gateway had at least 1,000 loaded cars every morning, loaded from 24 to 48 hours earlier, which it was necessary to condemn, as high as 150 pairs of wheels having to be changed in one day. It is the endeavor at Buffalo to get cars through the terminal in three hours, but to do this the equipment must be in first-class condition.

A. R. Ayers, superintendent motive power, New York, Chicago & St. Louis, advocated the adoption of a regular periodical program of general overhauling of cars similar to that followed in the maintenance of locomotives. He also considered it best to allow the owning roads to handle the heavy repairs and betterments to their own equipment, as they are in a position to live up to the requirements of Circular No. 8. Furthermore, they are in a position to lay out the program for betterments to a whole class of their own equipment and then carry it out on a quantity basis rather than one car at a time. Mr. Ayers emphasized the need of carrying out such betterments by referring to a study which had indicated that steel cars or cars with steel frames came on the repair track on account of the draft gear less than once a year, whereas wood underframe cars appear on the repair track for the same class of repairs about two and a half times a year. In other words, it is a physical impossibility to repair a wood underframe car so that it will run two years, on account of draft timbers.

A question was raised if the Railroad Administration had any program in view for returning cars to the owner for such work. The difficulty of carrying out this work was indicated by the situation on the Delaware, Lackawanna & Western, which had less than six per cent of its own cars on its line, where formerly the average was 60 to 65 per cent. In answer to this Mr. Tatum called attention to the fact that cars can now be sent home at the owner's discretion when the cost of

making repairs exceeds \$200 and that cars on connecting lines can be sent to the home road for repairs. It is the policy of the Administration, however, that repairs be made wherever the cars are located when such repairs can be made in kind.

P. J. O'Dea, chief car inspector of the Erie Railroad, inquired as to what conditions had actually been found throughout the country and what might be expected in the future in the carrying out of betterment programs for equipment not now fully able to meet modern service conditions. In replying, Mr. Tatum called attention to the fact that the war had taxed the equipment as well as the other railroad facilities far beyond what has been considered its normal capacity. At the present time preparations are being made to carry out reinforcement programs on thousands of cars. It is, however, unreasonable to expect immediate results, as little of this work can actually be carried out within less than a year. Under present conditions it takes from three to six months to get together the material, such as center sills, bolsters, truck side frames, steel ends, etc., for a single lot of 1,000 cars. At the present time some 20 roads are preparing to reinforce about 20,000 to 25,000 cars, which will eventually result in an improvement in conditions.

## The Problem of the British Railways

**S**ALIENT FACTS AS TO THE PLIGHT of the English roads are given by Frank H. Fayant, assistant to the chairman of the Association of Railway Executives, who recently returned from Europe where he made an investigation of the effect of the war on the railways of England and France.

"The English railway employees, including workers in coal mines and industries supplying materials to the roads, have, in effect, confiscated the property," said Mr. Fayant. "The whole English railway system today is potentially bankrupt. The burden of meeting the deficit in operation and paying the rental to the owners is being carried by the public treasury; that is, the increased labor cost is being met by the English people through taxation.

"When the English government took control of the railways for war purposes in 1914, guaranteeing as rental to the owners the pre-war net income, the annual receipts were \$680,000,000 and the operating expenses were \$430,000,000—of which \$250,000,000 was the payroll, \$25,000,000 covered taxes, and \$155,000,000 paid for coal and materials. This left a net income of \$250,000,000 to pay interest and dividends on invested capital giving a return to the owners of less than 4 per cent.

"English railway wages before the war were very low—too low for decent living conditions. At that time the average annual wages earned per employee were less than \$350, while in this country our average was then more than \$800. The rapid rise in the cost of living and in wages paid munition workers created great unrest among the English railway men. The government attempted to deal with the problem by giving 'war bonuses' based on the rise in the cost of living. The workers gladly accepted the money but they objected to the way it was tagged. They wanted wages that would continue after the war and not bonuses. The government accordingly dropped the word.

"Instead of giving the larger increases to the less well paid men and smaller increases to the better paid as our Railroad Administration has been doing, the English government gave identical increases to all employees. Beginning in October, 1914, and running to November, 1918, there were eight successive wage increases varying from 3 shillings to 6 shillings a week, and totaling 33 shillings, or \$7.90. These increases in the weekly wage added \$275,000,000 to the payroll. Then at the end of the war, when Lloyd George appealed to the country for a vote of confidence, the

railway unions made a renewed demand for an eight-hour day. Lloyd George granted the demand, and this added \$125,000,000 more to the payroll, making the total increase in wages \$400,000,000 or 160 per cent.

"This brought the payroll up to \$650,000,000, as compared with total railway revenue before the war of \$680,000,000. There was also, as in this country, a very large increase in the cost of coal, steel and other materials, which added \$140,000,000 more to the operating expenses. The greater part of this item, of course, is made up of increases in wages to coal miners and steel workers. The increase in the cost of materials added to the increase in wages brings the operating expenses of the English roads up to \$970,000,000 a year; including the rental, or the interest on the investment, the total cost of producing transportation is now \$1,220,000,000 a year as compared with \$680,000,000 before the war—an increase of about 80 per cent. There has been no increase in freight rates in England to meet the great increase in the cost of operation. Passenger fares were raised 50 per cent early in the war, more for the purpose of reducing travel than for producing revenue. The increase in passenger rates, together with the increase in freight traffic, has probably added \$100,000,000 to the revenues, bringing them up to \$780,000,000.

"The gross receipts of the English roads therefore are \$190,000,000 less than the operating expenses and \$440,000,000 less than the total cost of producing transportation—the return on capital included. It is this \$440,000,000, amounting to about one and one-quarter million dollars a day, that Sir Eric Geddes referred to in Parliament in his

speech on Monday, when he showed that the war control had virtually bankrupted the roads. Included in this deficit met by the Treasury is, of course, the value to the government of carrying government traffic, which, before the end of the war, was estimated at \$150,000,000 a year. This item is now much less.

"The English government must continue under the war control act to operate the roads for two years more, and pay the rental to the owners. If returned to the private companies on their present basis of rates and costs, they could earn neither dividends nor interest, and most of them could not even earn their operating expenses. A freight rate increase of 100 per cent would be necessary to enable the companies to survive, and the feeling in England is that with rates already high, no government would have the courage to grant such a large increase to the private companies. For this reason it is believed that nationalization of the English roads will be the only way out of the muddle, and the general public, through taxation, will then make up the revenues unprovided by shippers and passengers.

"Fortunately, the American railways are in no such plight as the English roads. While England, at the beginning of the war, had high freight rates and low wages, we were fortunate in having low freight rates and high wages. In this country we were not obliged to make such an enormous percentage in wages, although our labor cost has risen greatly and we could raise freight rates. . . . Since 1915 the annual average earnings of American railway workers have been advanced from \$800 to \$1,400; in England they have risen from \$350 to \$900."

## Gondola Car of Reinforced Concrete Construction

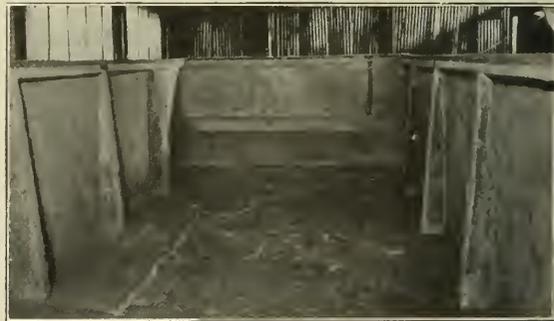

Design Incorporating Steel Center Sills With Concrete Floor, Sides and Ends—New Aggregate Used

**A**N INNOVATION in railway equipment is a reinforced concrete car of the gondola type, invented and designed by Joseph B. Strauss, C. E., president of the Strauss Bascule Bridge Co., and recently built by the R. F. Conway Company, Chicago. The plans for the car were drawn up several years ago and patents were secured covering the important features of the design. The actual construction was started during the war when it was thought that, due to the shortage of steel, it might be possible to relieve the car shortage materially by developing concrete construction.

The fundamental feature of the design is a steel skeleton body mounted upon the standard center sills and bolsters of the U. S. R. A. 40-ft., 50-ton gondola car. Concrete walls and floors are contained within the skeleton steel frame and together with the reinforcement in the floor are connected to the underframe in such a manner that the buffing and pulling stresses are distributed throughout the car body. The car was designed for a capacity of 100,000 lb. plus the usual 10 per cent overload. The end load was assumed at 200,000 lb. with an allowance of 25 per cent for impact, equivalent to an end load of 250,000 lb. The unit stresses in the steel were limited to 16,000 lb. per sq. in., and in the concrete to 1,000 lb. per sq. in. The gondola type was chosen for this experimental concrete car because equipment of this type is subjected to the severest handling. Dumping devices were omitted merely to simplify the construction, but this feature can be incorporated in the car without any difficulty of design or construction.

The car has an over-all length of 41 ft. 6½ in., and

over-all width of 10 ft. 2⅞ in., with sides 4 ft. 10½ in. high. The steel members of the underframe consist only of the center sill, which is of two 12-in. 35-lb. ship channels, with a ¼ in. by 20½ in. cover plate, and the body bolsters and diagonal corner braces, which conform to the U. S. R. A. standard design. There are six reinforced concrete cross

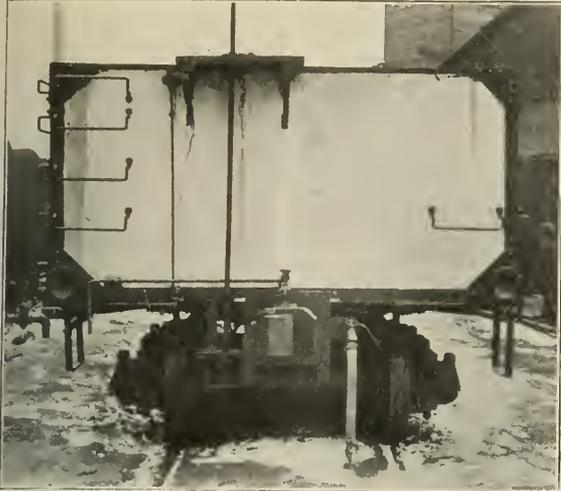

Interior of the Car Body

bearers in the car spaced approximately 4 ft. 6½ in. apart. The size of the section varies from 4 in. by 12 in. at the sides to 4 in. by 1 ft. 4⅞ in. at the center sill. The floor is 2⅞ in. thick, reinforced with longitudinal and transverse rods ¼ in. in diameter. Along the outer edge of the floor is a 3½ in. by 3½ in. angle and at the top of the sides there is a 4-in. channel.

This steel frame serves as the tension members of the truss and also furnishes a means of attachment for the reinforcing, the side reinforcing rods extending through holes drilled in the angles and channels. The sides are  $1\frac{3}{4}$  in. thick and are strengthened at the bolsters and at the cross bearers by

manufacturing process developed by Stephen J. Hayde, of Kansas City, Mo. The concrete sections in this car are thinner than have ever before been attempted in similar work and for that reason it was decided to use the cement gun for the walls and floors. The cross bearers, however, were poured in the usual manner. The forms were placed on the outside of the car and the skeleton frame and reinforcing were put in position as shown in the illustration. The concrete was then shot on from the interior. The resulting concrete was exceedingly dense and the finish remarkably smooth on the surface which was against the form. The interior surfaces were left practically as produced by the cement gun.

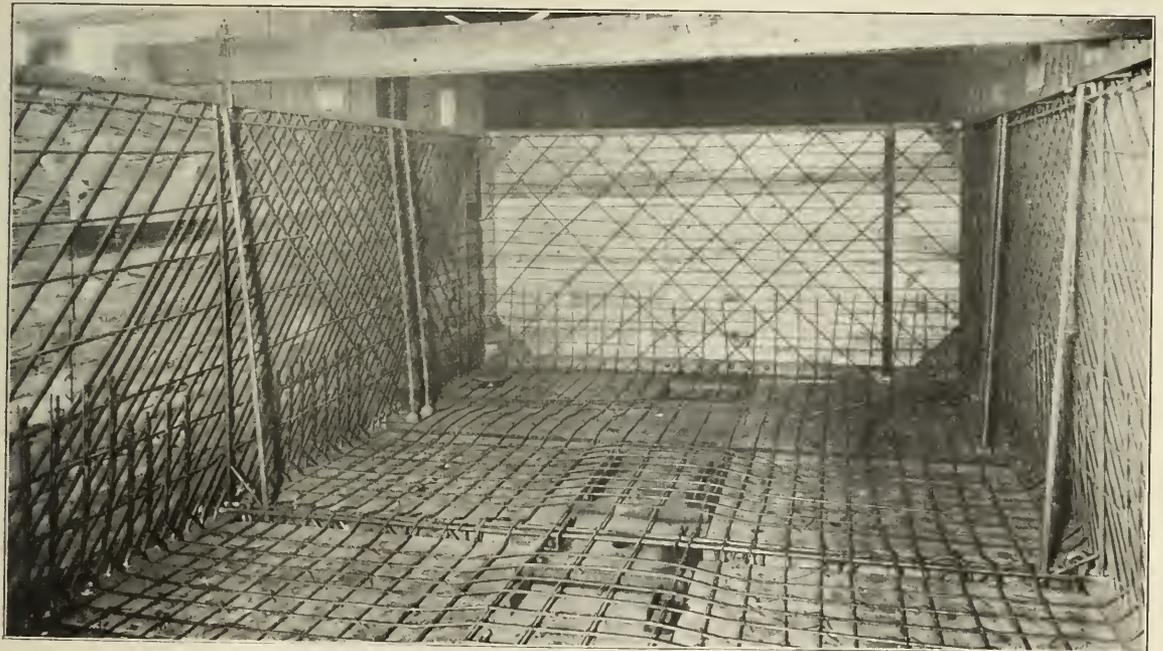

Brake Staff End of the Reinforced Concrete Car

reinforced concrete posts. Across the end of the car there is a reinforcing rib 6 in. by  $1\frac{1}{4}$  in. located 1 ft.  $11\frac{3}{4}$  in. from the floor. There is also a diagonal rib extending up to the end from the lower end of the body bolster.

The concrete work on this car represents the first com-

puted. This fact, together with the necessity for using heavier steel sections than required in some cases brought the total weight of the car up to 53,600 lb., or 3,600 lb. more than the computed weight. It is evident, however, that with proper facilities for construction another car of this size and design can be made to weigh between 46,000 and 48,000 lb. The conditions under which the first car was built did not permit of certain refinement of design and details of construction, but the plans as now developed for commercial production of such cars have been so advanced in these refinements that future cars will represent a reduction in weight, simplification of manufacture and lower cost.

This car was built with the sanction and co-operation of the United States Railroad Administration, and it was inspected during construction by J. J. Tatum, supervisor of car repairs. It was turned over to the Illinois Central Railroad on March 17, to be used on that line 30 days, after which it will be delivered to the United States Railroad Administration for such service as it may be desired to place it in. Meantime the further development of the concrete car will

Skeleton Steel Frame and Reinforcing in Position in the Forms

mercial application of a new light weight aggregate known as Haydite. This material produces a concrete having a weight of 104 lb. per cu. ft., and a compressive strength of 4,450 lb. per sq. in. in 28-day tests. It is the result of a

be handled by the Concrete Car Company of America, Chicago, which has plans completed for the various classes of cars with a view to manufacturing concrete cars on a commercial scale.

# Doings of the United States Railroad Administration

## Director General Will Issue His Own Statements of Earnings and Expenses With Explanation of Changes

WASHINGTON, D. C.

THE ESPECIAL INTEREST which has recently been displayed in the monthly statistics of railway revenues and expenses has led to a sort of three-cornered competition in statistics between the Railroad Administration, the Interstate Commerce Commission and the unofficial estimators. The commission gives out its monthly statement usually about six weeks after the close of the month. The commission has no press agent and its statement is in the form of a large table containing too many details for newspaper publication and without any interpretation. As a result, the idea which the public gets from these figures varies widely with the newspapers which the public reads the next morning. As it is always possible to get a pretty accurate estimate before the returns of all the roads are in, the newspaper reader may have received his impression from a preliminary estimate and not see the complete returns at all.

In an effort to improve this situation, the Railroad Administration recently decided to give out its own statement of earnings and expenses with some explanation thereof, and for the month of December we had two sets of statistics. As these reached the newspapers on different days the result was merely an addition to the confusion. For the month of January the commission gave out its figures at four o'clock in the afternoon of March 13, showing a net operating income of \$18,783,702, after preliminary estimates of approximately \$19,000,000 had been widely published. The Railroad Administration thereupon got out its own figures about eight o'clock in the evening and included with them the Interstate Commerce Commission statistics, so that the reading public or the newspaper man who edited the statements might take their choice.

The commission's figures cover 181 Class I roads (those having annual operating revenues above one million dollars), and 17 large switching and terminal companies. This includes a number of Class I roads and switching and terminal companies which are not under federal control. Ten of the Class I roads were relinquished. On the other hand, the statement does not include a large number of Class II and Class III roads and small switching and terminal companies which are under federal control. The Railroad Administration's statement, compiled by the Operating Statistics Section, covers the Class I railroads under federal control and excludes switching and terminal companies, representing a mileage of 230,262, as compared with 233,055 miles covered by the commission's statistics. The Interstate Commerce Commission figures, which are published herewith because they give the subdivisions of revenues and expenses not included in the Railroad Administration's statement, show a net operating income comparable to the standard return guaranteed by the government of \$18,783,702, as compared with a deficit of \$4,097,117 for the same roads in January, 1918. The term "standard return" does not apply to the roads included in this statement which are not under federal control, but the commission appends a note saying that the average railway operating income for the month of January in the three years 1915, 1916 and 1917 included in the test period of three years ended June 30, 1917, was \$254 per mile of line for the United States. Multiplying this by the operated mileage gives an item roughly corresponding to the standard return for the month of about \$60,000,000. The net operating income of the Class I railroads under federal control, representing approximately 95 per cent of the net revenues of all properties in federal operation, was \$19,350,-

354, as compared with a deficit of \$3,570,299 for the same roads in January, 1918. The standard return applicable to January was \$55,331,013, so that the government's deficit as compared with its guarantee to the railways was approximately \$36,000,000. The standard return for January is less than one-twelfth of the standard return for the year because traffic is usually lighter in January than in several of the other months, and expenses during the winter are likely to be higher than in some of the other months. The standard return for the Class I railroads for a year is \$890,000,000. For the Class I roads and large terminal companies, or approximately the list of roads covered by the Interstate Commerce Commission statistics, it is \$904,000,000. For all the roads under federal control it is \$928,000,000. The Railroad Administration's compilation for the Class I roads under federal control is as follows:

	January, 1919	January, 1918	Increase or Decrease	
			Amount	Per cent
Operating revenues....	\$390,745,075	\$280,919,510	\$109,825,565	39.1

\*Debit item.

The Railroad Administration's statement says that in comparing the results for January, 1919 and 1918, it should be borne in mind that the 1918 results were very adversely affected by the extreme weather conditions and the serious traffic congestion which obtained at that time; also that neither the increases in freight and passenger rates nor the increases in wages made effective during 1918 are included

in the January, 1918, figures, while both of these factors are present in the January, 1919, figures. Furthermore, the expenses for January this year included approximately \$1,500,000 back pay applicable to prior months.

The Railroad Administration's statement also gives a summary of the monthly reports of freight traffic movement and car performance compiled by the Operating Statistics Section for the month of January, showing an increase in the net ton miles of revenue and non-revenue freight of 10 per cent. The detailed statistics were published in the *Railway Age* of March 7. The statement notes that on account of better weather conditions and the relief in traffic congestion it was possible to handle 10 per cent more ton miles with no increase in train miles. There was an increase in the average train load of 58 tons, or 10.2 per cent. There was a slight decrease in carloading from 29.4 tons to 29 tons, which is attributed to the fact that there was a decrease in the percentage of the heaving loading coal tonnage to the total tonnage handled. The decrease in the percentage of loaded to total car miles of 5.4 per cent is ascribed to the freer movement of returning empties this year on account of better weather and traffic conditions.

### Railroad Administration and Department of Commerce Disagree on Rates

Contending that the Railroad Administration is operating a public service and is not organized for profit, Secretary Redfield of the Department of Commerce has filed a brief with the Interstate Commerce Commission intervening in behalf of the Solvay Process Company in a complaint against an increase in rates on limestone from Jamestown, N.Y., to Solvay on the Delaware, Lackawanna & Western. The brief, which establishes a precedent of one government department intervening on behalf of a private litigant against another government department, attacks the increased rate on the ground that it is excessive for the railroad and for the shipper, although authorized by the Railroad Administration because of the general need for greater revenues. On May 16, 1918, the 15 cent rate per gross ton was increased to 17 cents. On June 25, 1918, at the time of the general increase in rates, it was further increased to 40 cents, and on September 16 it was reduced to 30 cents per net ton. Secretary Redfield declares in the brief that the 15 cent rate per gross ton was profitable to the railroad, which, he says, has long been one of the most profitable in the United States, and that no complaint appears from either party to the transaction to the effect that the rates were not just and reasonable, and that the only possible reason for more than doubling the rate and the reason definitely stated to the Department of Commerce by the Railroad Administration was the need for greater revenue on the part of the railroads of the country as a whole. It is urged that the action of the administration in doubling a rate "which, in my belief, the testimony shows to be profitable, is an oppressive act, injurious not only to the parties directly concerned, but to the commerce of the country through its normal reactions; that it cannot be justified by the need of general revenues for the entire federal railroad system, and that it should be revoked and a rate substantially the same as the original rate should be established."

The secretary declares that it is the department's duty to foster transportation facilities as well as commerce, and that it is clearly its normal duty to take such steps as are within its power to insure that transportation is not encumbered with unjust and unreasonable restrictions and is facilitated as much as possible. The brief declares that the secretary appears for the whole people of the United States, and he says:

"It cannot be argued that it is the obligation of the Railroad Administration to operate at a profit. It has the support of public funds and has, as have other public services, the

basis of the taxing power on which to rest. It has, as a matter of fact, received a large sum from the public treasury. Its relation, therefore, to the commerce of the country is that of a servant of that commerce, and in so far as for the purpose of revenue it may take steps injurious to the commerce of the country it departs from its essential duty and it becomes the obligation of that branch of the government which is charged with the fostering and promotion of commerce to point out the facts and ask for their correction. It may not be justly pleaded on behalf of the Railroad Administration in the present cause that a sufficient reason for the act complained of is the need for revenue. The essential purpose of the Railroad Administration as a public service is not to get revenue, but to serve the commerce of the country."

Railroad Administration officers believe that Secretary Redfield has failed to read the provisions in section 10 of the federal control act, which authorizes the President to initiate rates, that in determining any question concerning rates initiated by the President the Interstate Commerce Commission "shall give due consideration to the fact that the transportation systems are being operated under a unified and co-ordinated national control and not in competition," and "that when the President shall find and certify to the Interstate Commerce Commission that in order to defray the expenses of federal control and operation fairly chargeable to railway operating expenses, and also to pay railway tax accruals other than war taxes, net rents for joint facilities and equipment, and compensation to the carriers, operating as a unit, it is necessary to increase the railway operating revenues, the Interstate Commerce Commission in determining the justness and reasonableness of any rate, fare, charge, classification, regulation, or practice shall take into consideration said finding and certificate by the President, together with such recommendations as he may make."

### Statement to Clerks Threatening Strike

Director General Hines issued a statement on March 13 regarding the threatened strike of clerks in the Southeast, saying in part:

"I regret to learn that efforts are being made to prevail on various railroad employees in the Southeast to quit the service of the government and thereby hamper the operation of the railroads because of a dispute which has arisen between certain clerks and their superior officers. I call attention to the employees to the fact that adequate machinery has been provided by the United States government through the Railroad Administration to deal with all cases of disputes and grievances and that employees ought to submit their grievances in accordance with this machinery and not otherwise.

"The trouble arose through certain local organizations of clerks on the Nashville, Chattanooga & St. Louis demanding the immediate discharge of the federal auditor of that railroad. These clerks did not resort to Board of Adjustment No. 3 in Washington, which consists of four representatives of the employees and four representatives of the management, and which has been created to deal with all such grievances. They refused to resort to this machinery notwithstanding the fact that the Brotherhood of Railway Clerks of which they are members agreed to submit all grievances to that board and has a representative on that board.

"It is indispensable that these problems shall be handled in an orderly way. It is of the highest importance to the employees themselves that this orderly procedure shall be adopted in all cases and that they shall exercise the patience and self-restraint necessary to permit of the carrying out of these orderly practices. If this is not done the effort which the United States Railroad Administration has made to recognize and promote the just interests of labor will be rendered unsuccessful and the employees who are responsible for interfering with these orderly processes will put themselves in a

position before the public which will react injuriously upon the employees and their future interests.

"I believe that any employee who will think over this matter will agree that during the last 10 months more progress has been made toward improving the wages and working conditions of railroad employees as a whole than was ever made before. This has been practicable because the railroads have been under a unified management, which has had as one of its leading purposes the recognition of the just interests of the employees and the provision of reasonable wages and conditions for them. Necessarily, conclusions must be reached in cases of dispute by the machinery thus provided. While in specific cases there may be some delay in dealing with such matters the delay is far less than would have been involved under former conditions. In fact, in the past labor movements have in many cases taken from one to two years, have involved enormous costs to the labor organizations, and even then have frequently produced exceedingly small benefits. Whatever delay is incident to the method of the central administration is relatively small compared with the delays which would have been experienced under other conditions. No business can be successfully conducted without the exercise of proper authority and discipline. This is true particularly of the railroad business. Ample machinery has been created by the central administration to correct instances of abuse of authority or the exercise of disciplinary measures in an unfair way. It is indispensable that these orderly methods of settling these questions shall be followed pending disposition of these matters in the reasonable ways which have been carefully worked out. There must be a recognition of authority and a submission to discipline. Otherwise the railroad business would become chaotic and the public, which in the last analysis has to pay the bill, would resent the resulting excessive costs and inefficient service and the reaction would be exceedingly unfavorable to the employees themselves."

**Passenger Traffic Statistics**

The Operating Statistics Section has also compiled its monthly statement showing the number of passengers carried one mile for the month of December and the calendar year 1918. The passenger mileage for December shows a decrease

Railroad	Average miles operated	PASSENGERS CARRIED ONE MILE				Twelve months ended December 31, 1918

d Decrease.

of 4 per cent. For the year there was an increase of 3,125,000,000 passenger miles or 7.9 per cent. The figures by regions and districts are as shown in the double-column table.

**Wage Increase for Railroad Police**

The director general has approved the recommendation of the Board of Railroad Wages and Working Conditions pertaining to patrolmen and others of the police department, effective as of January 1. A variety of police organizations on the railroads under federal control having been in effect, the first problem confronting the administration was to work out a uniform organization in order that adjustments in pay might be arrived at for corresponding positions; and also in order that the employees in this department might have their

pay adjusted to conform with the rates of pay in other departments.

The order provides a minimum hourly rate of 45 cents per hour and a maximum of 55 cents per hour for patrolmen who are assigned to a restricted territory, with a minimum of eight hours per day and overtime at the pro rata rate for the ninth and tenth hours and time and one-half thereafter. These men formerly received monthly wages ranging from \$60 to \$110. Under the new rate these men receive pay ranging from \$85 to \$112 a month on an eight-hour day basis. Proportionate increases, but on a monthly basis, are provided for lieutenants and for sergeants whose duties require traveling and whose hours cannot be regulated. The regional directors will have authority to apply the monthly wages according to the responsibility of the individual positions.

The order will apply to approximately 7,000 patrolmen and 1,000 lieutenants and sergeants.

**Signalmen Ask Wage Increase**

A request for further increases in wages and improved working conditions was submitted to Director General Hines on March 14 by representatives of the Brotherhood of Railroad Signalmen, claiming to represent 15,000 employees, after a convention held in Washington attended by about 100 delegates.

**Contracts Signed**

The Railroad Administration has signed a compensation contract with the Central of Georgia providing for an annual rental of \$3,444,158.

Contracts have also been executed this week with the Louisville & Nashville providing for a compensation of \$17,310,494, the Pennsylvania Lines West for \$15,154,719, the Louisville, Henderson & St. Louis for \$343,915, the Salina Northern for \$15,000 and also co-operative short line contracts with the South Manchester and the Greene County.

**Purchasing Division to Be Reorganized**

Following the resignation of John Skelton Williams as director of the Division of Finance and Purchases and the creation of two new divisions, the purchasing organization

of the Railroad Administration is being reorganized. An advisory committee on purchases will be created with Mr. Williams as chairman and R. S. Lovett, president of the Union Pacific, and Henry Walters, chairman of the Atlantic Coast Line, as the other members.

**Campaign Against Car Thefts**

The activity of the Railroad Administration in its campaign against car thefts is indicated in a report showing that in the 10 months ended February 1 a total of 14,114 arrests for car thefts were made by the railroad secret service. Of these, 5,475 were of railroad employees. There were 9,891 convictions and \$838,000 of the \$1,120,000 worth of stolen property was recovered.

# General News Department

**The Fourteenth Engineers**, a railroad regiment composed of men from the Boston & Maine, the Boston & Albany, and the New York, New Haven & Hartford, is expected to reach home from France about April 1.

**The American Train Dispatchers' Association**, D. L. Darling, secretary-treasurer, Northern Pacific Railway, Spokane, Wash., will hold its annual convention at the Hotel La Salle, Chicago, June 17, 18, 19 and 20.

**Thirteen new passenger trains** appear on the timetables of the Cleveland, Cincinnati, Chicago & St. Louis, which are to be put into effect on April 6. It is said that these trains will increase the annual train mileage by 412,224 miles.

**As a token of respect** to the memory of Edward F. Kearney, late president of the Wabash, all trains on that road were stopped for five minutes at 2 p. m., on March 13, at which hour his funeral was held at New Orleans, La.

**By a fire** at the Inman yard of the Southern Railway, near Atlanta, Ga., on the night of March 16, eighty loaded cars, twenty empty cars, the freight transfer shed, and other property were destroyed; estimated loss, \$1,500,000.

**The car repair shops** of the Delaware & Hudson at Carbondale, Pa.—two buildings known as No. 18 and No. 20—were destroyed by fire on March 15. About 200 men are out of work temporarily. These buildings were of brick, 400 ft. long and 40 ft. wide.

**Three hundred workmen**, engaged in laying a second track for the Cleveland, Cincinnati, Chicago & St. Louis, near Winchester, Ind., were dismissed by the contractors on March 13, for the reason, it is said, that the Railroad Administration has held up the appropriation for the work.

**Better looking uniforms** will be required of the passenger trainmen on the Pittsburgh Division of the Pennsylvania Railroad this season; in other words, according to a notice which has been issued by the trainmaster, inferior grades of cloth, which were tolerated last year, will not be acceptable this year.

**The State Tax Commission** of Minnesota reports that railroads operating in the state, paying under the state law a tax of 5 per cent on gross earnings, in lieu of other taxes, earned in 1918 a total of \$150,548,762 and are assessed a tax of \$7,527,438, as compared with \$124,505,394 earnings and a tax of \$6,225,270 in 1917.

**Excessive demurrage charges** is the subject of a letter which has been sent to the Division of Public Service, Washington, by the National Bureau of Wholesale Lumber Distributors, C. W. Campbell, secretary, Washington, D. C.; recommending the abolishment of the present demurrage charges, as promptly as possible, and "a reduction of the rates to the normal pre-war condition." The lumbermen believe that 75 per cent of the delays to cars are chargeable to inefficiency on the part of the railroads, or to embargoes, congested terminals, etc. They say that when cars of lumber are delayed the consignee frequently has to supply his needs in some other market, and then has to refuse the car; and the wholesale distributor has to dispose of it at a great disadvantage. These protestants submitted to the high rates during war wholly from the motive of patriotism; and they feel sure that now all other lumber interests will join them in the present requests.

**Thomas F. Blewitt**, division superintendent of the Brooklyn Rapid Transit Company, Brooklyn, N. Y., tried in the Supreme Court of the State on a charge of manslaughter in connection with the derailment on that road in Brooklyn, on November 1, last, when 92 passengers were killed, was acquitted on March 18, the jury having deliberated about three hours. The court (Jus-

tic Seeger), in charging the jury, said that Blewitt was charged with the responsibility of securing competent motormen by lawful means, but that a mere violation of the company's rules in this respect was not to be interpreted as a violation of statute. If the jury found that the passenger upon whose death the indictment was based, was killed because of Blewitt's failure to exercise the utmost care, so far as foresight could go, Blewitt should be found guilty. Blewitt was responsible for knowing whether Luciano (the motorman who ran at excessive speed, causing the derailment at a sharp curve) was competent, but could not be held responsible if Luciano, though generally competent, had been careless on this occasion. Evidence adduced by the prosecution to show that other motormen put on as strike-breakers were incompetent or inexperienced could not be taken into account in judging Luciano's competence.

## Folkestone to Paris in 74 Minutes

According to a press despatch of March 18, Major General John E. B. Seely, of the British War Office, on March 16, flying with a favorable wind, made an airplane trip from Folkestone, England, to Paris, France, 172 miles, in one hour, fourteen minutes.

## State R. R. Commissions

Following a conference of the railroad commissioners of Washington, Oregon, and Idaho, the Public Service Commission of the State of Washington has decided to bring suit at once against the Railroad Administration to test the legality of the administration's control of purely intra-state freight rates. W. D. Tanner, attorney general of the State of Washington has resigned from his office to take charge of this litigation.

## Railroad Clocks to Be Set Ahead March 30

Director General Hines has issued General Order No. 61, similar to that which was issued last year, ordering all railroad clocks to be set ahead one hour at 2 a. m. on Sunday, March 30, in accordance with the Daylight Saving Law. The instructions for making the change are so worded as to provide a standing rule for both Spring and Autumn as long as federal control continues.

## Employment for Soldiers

For the purpose of meeting the emergency caused by the radical curtailment of the machinery of the United States Employment Service because of lack of funds, the Council of National Defense has announced the formation of an Emergency Committee on Employment for Soldiers and Sailors, including representatives of the various government departments. The chairman of the committee is Col. Arthur Woods, and the secretary will be E. H. Greenwood, who has been associated with the Department of Labor in its employment work. A representative of the Railroad Administration probably will be added to the committee.

## Safety Rally at Detroit

Officers and employees of the Pere Marquette, the Grand Trunk, the Wabash and the Detroit & Toledo Shore Line had a safety rally at the Detroit (Mich.) Board of Commerce on February 25. The meeting was attended by about 1,750 railroad men and members of their families. There were three or more delegates from each of the 25 safety committees on the associated lines. S. M. Nowell, superintendent of the Wabash-Pere Marquette Joint Terminals, presided. Addresses were made by F. H. Alfred, federal manager, A. F.

Duffy, manager of the Safety Section of the Railroad Administration, R. S. Jarnagin, regional supervisor of safety, and other officers and employees of the above-named lines.

### General Foremen's Association

The annual convention of the International Railway General Foremen's Association will be held at the Hotel Sherman, Chicago, September 2, 3, 4 and 5. The topics to be discussed are as follows:

1. Welding of locomotive cylinders and other autogenous welding
2. Safety—first in shop and enginehouse service.
3. Draft gears.

The association has received permission from the Railroad Administration to hold this convention and a large attendance is to be desired from both the locomotive and the car departments.

### Space for June Convention Exhibit Well Taken

The Railway Supply Manufacturers' Association announces that at the assignment of space in Pittsburgh, February 14, there was sold and assigned over 80,000 square feet. The available space is a trifle less than 89,000 square feet, leaving less than 10 per cent for such exhibitors as will come in. This available space includes all of the space heretofore used in previous years together with a number of additions, which the committee found possible to use. The committee is looking over the pier with view of providing additional space if possible, as indications are that it can be sold to exhibitors if provided. Edmund H. Walker, president of the association, in announcing the above, says that "the success of the June meeting from an exhibition standpoint is assured."

### Rock Island Outlines Railroad Legislation

Charles Hayden, president of the Chicago, Rock Island & Pacific, has sent out, on behalf of the Board of Directors of the road, a circular letter calling on stockholders to embrace the present opportunity for the enactment of favorable railroad legislation and asking that they co-operate with their congressmen for the passage of legislation based upon the principles contained in Mr. Hayden's circular.

These principles are briefly as follows:

1. No necessity for extension of the present control beyond 21 months after the final declaration of peace, which should be ample time for the legislators of this country to pass such legislation as is necessary. Naturally, perfecting legislation should be passed from year to year thereafter, just as perfecting legislation has been passed in respect to the Federal Reserve Bank Act.
2. Private operation and ownership of the railroads rather than government ownership, but such private operation to be under efficient regulation, that shall be constructive rather than merely punitive.
3. The railroads should not be returned to their owners without new legislation looking to improved conditions, including:
  - (a) To avoid unnecessary and wasteful competition, the Sherman law should be amended to permit mergers, consolidations and the pooling of facilities, equipment and traffic, under supervision of the federal government.
  - (b) Federal control over rates and regulations should be in the same hands as control over wages, and the law should require that wages be taken into account in fixing rates.
  - (c) The federal government should have exclusive jurisdiction over the issue of securities necessary for improvements and refunding purposes; also over rates and other matters affecting carriers, leaving only strictly local matters to state regulation.
4. Owners of railroad securities should have representation on the federal governing body.
5. If private capital is to be depended upon for developing and extending the railroads, any scheme of legislation must be so framed that sufficient incentive will be offered to such private capital. It is necessary not only to protect private capital that already is invested, but to make it attractive for additional capital to seek railroad investments. In order to accomplish this double object it will be absolutely necessary either to guarantee a fixed interest return on investments or to establish and maintain a rate structure which will permanently assure an ample return on property investment of the railroads as a whole.
6. Federal government supervision should extend to water routes and other trade routes that compete with the railroads.

### Mrs. Calhoun

[Atlanta Constitution, March 15]

Defying alleged threats of strikers who Tuesday morning at 10 o'clock laid down their pens and closed up their typewriters when the Brotherhood of Railway Clerks walked out, Mrs. Lowndes Calhoun, the pretty little golden-haired clerk at the information desk at the Terminal station, is still on the job, directing thousands of puzzled travelers who daily

call at the desk. Keeping guard over her are several plain-clothes men, and backing her up in her stand is the Southern railway. Wednesday and Thursday when there were no ticket agents, no train callers and no gatekeepers as a result of the walkout, hundreds of worried passengers groped hopelessly about in the resulting chaos; and the little information lady, the only employee in the station, stood serenely behind her desk, directing, advising, assuring the masses who crowded about her. On Friday, though her face betrayed the fact that the extra work had wearied her, she was still directing and still smiling. The new workers who had been gathered from the passenger service to take the places of the strikers were in strange surroundings with strange tasks to perform and the only one to turn to for advice was the little woman at the information desk.

### Pointers for the Yard Master

[From a Paper by H. D. McKee.]

Be reasonable, respectful and considerate with your men and they will respect and obey you.

Have no favorites and permit no one to cater to you; and thereby avert petty animosities. Beware of the man that kow-tows and scrapes his feet; he can't be trusted.

There is no more important factor in the yard than your call boys. The call boy is frequently in position to add to or lessen your troubles. Respect the boy and make him feel that he is of some importance to you, and instead of being a boy he will prove up as one of your best men. See that the men treat him in like manner.

Make a big effort to cultivate friendly relations between all the members of your force and the roadmen entering your yard. You may wish a car picked up or set out after the train is made up and in charge of road crew at a time when yard engine is unavailable; it is at this particular time that trainmen are either your best or your worst friends.

Get on the inside with the roundhouse foreman and his men, particularly the car inspector; try to get your men inside with you also. If you succeed you will get your power faster and have fewer cars to throw out of the middle of made-up trains.

Be good to the engineers; many of them are good workmen and fine fellows; besides, you need them in your business.

### Strike of Clerks on the N. C. & St. L.

Clerks in the employ of the Nashville, Chattanooga & St. Louis, and the Tennessee Central, members of the Brotherhood of Railway Clerks, several hundred in number, left their work on Tuesday, March 11, at 10 a. m., striking because of the refusal of the federal manager to dismiss the federal auditor, A. P. Ottarson, who, the clerks claimed, had dealt unfairly with them in the interpretation of orders respecting increases in wages. Freight service was seriously interrupted and embargoes were issued against live stock and perishable freight. Officers of the road employed new men in place of the strikers so far as they could, and on Friday it was reported that many of the vacancies had been filled. At Nashville conditions were reported "improving."

In Atlanta the clerks of other roads struck in sympathy with those of the Nashville, Chattanooga & St. Louis; but on Monday, the 17th, it was reported that these other clerks, 1,500 of them, had returned to their desks. They had been out, however, two or three days and had caused serious disturbance to traffic, passenger as well as freight. Important ticket offices were without attendants for two days.

W. L. Mapother, federal manager of the road, issued a statement to the effect that the action of the clerks on his road was not approved by the chief officers of their brotherhood. A statement by Director General Hines admonishing the clerks to abandon their irregular proceedings and attend to their duties is printed in another column of this paper. At some small places strikers were reported as returning to work, but as to how many heeded Mr. Hines' appeal no information is available. On Wednesday and Thursday of this week representatives of the clerks were in conference with the director general and his lieutenants at Washington.

REVENUES AND EXPENSES OF RAILWAYS

MONTH OF JANUARY, 1919

Table with columns: Name of road, Average mileage operated during period, Freight, Passenger, Total (inc. misc.), Operating revenues, Maintenance of way and structures, Equipment, Traffic, Transportation, General, Total, Operating ratio, Net from railway operation, Railway tax accruals, Operating income (or loss), Increase (or decrease) comp. with last year.

REVENUES AND EXPENSES OF RAILWAYS

MONTH OF JANUARY, 1919—CONTINUED

Table with columns: Name of road, Average mileage operated during period, Operating revenues (Freight, Passenger, Total), Maintenance of way and structures, Equipment, Operating expenses (Traffic, Transportation), General, Total, Net railway operation, Operating ratio, Railway tax accruals, Operating income (or loss), Increase (or decrease) over last year.

## Commission and Court News

### State Commissions

The North Carolina Corporation Commission has filed with the Interstate Commerce Commission a complaint asking for the readjustment of freight rates in the southeastern territory, on the ground that North Carolina towns are discriminated against. Nearly two hundred different railroad companies are made defendants in the suit.

### Personnel of Commissions

Harold M. McClure, member of the Pennsylvania State Public Service Commission, died at his home in Lewisburg, Pa., on March 1, at the age of 59.

Clyde B. Aitchison has been elected chairman of the Interstate Commerce Commission in accordance with the custom of that body of rotating its members in the chairmanship in the order of seniority.

Mr. Aitchison was appointed a member of the commission by President Wilson on September 29, 1917, for a term ending in 1921 as one of the two additional commissioners authorized by the law of August 9, 1917, to increase the membership from seven to nine. Mr. Aitchison was born February 22, 1875, at Clinton, Ia. He practiced law at Council Bluffs, Ia., from 1896 to 1903 and at Portland, Ore., from 1903 to 1907. He was a clerk of the State Tax Commission of Oregon from June, 1905, to July 1, 1906, and was one of the joint authors of the Oregon Railroad Commission law, adopted February 18, 1907. He was appointed a member of the Railroad Commission of Oregon at that time for a short term, was elected a member in June, 1908, was elected chairman in January, 1911, and re-elected on November 5, 1912. In 1916 he resigned from the Oregon commission to become solicitor for the valuation committee of the National Association of Railway Commissioners, and in that office he maintained an office in Washington and took an active part in representing the interests of the state commissions in connection with the valuation of railroads being made by the Interstate Commerce Commission.

C. B. Aitchison

### Court News

#### Injury to Passenger—Lurching of Train

The Circuit Court of Appeals, Fourth Circuit, holds that the fact that a passenger on a fast train fell from her chair in the dressing room of a sleeping car from the mere movement of the car does not make out a prima facie case of negligence or of unskillful and careless handling of the train. The mere characterization by the passenger of the movement as a "terrific" or "violent" lurch adds nothing from which negligence can be legitimately inferred. After reviewing the cases on the subject, which contain no authority supporting the plaintiff's contention, the court said that "it was simply one of those unfortunate accidents which sometimes happen for which the law holds no one responsible. In our opinion a verdict should have been directed for the defendant, as was done in the almost identical case of Azaune v.

Illinois Central, 151 Fed. 900." Judgment for the plaintiff was reversed.—Norfolk & Western v. Birchett, 252 Fed. 512. Decided July 15, 1918.

#### Telegraph Lines on Right of Way

The Circuit Court of Appeals, Sixth Circuit, holds that where the Western Union Telegraph Company, after terminating the arrangement under which it maintained lines on the Louisville & Nashville's right of way, was denied the right of condemnation in Alabama, preliminary injunction against the railroad's interference with telegraph lines would not be granted because the government has assumed control of the railroads. It appeared that the Secretary of War had requested that nothing should be done to interfere with the operation of the telegraph system until he approves, and the railroad company had promised full observance of this request.—L. & N. v. Western Union, 252 Fed. 29. Decided June 4, 1918.

#### Safety Appliance Act—Grabirons

The Circuit Court of Appeals, Second Circuit, holds that section 4 of the federal Safety Appliance Act was not violated by using a car having a grabiron at each side at one corner for use while operating the pin-lifting lever, and grabirons on each end of the car on the side opposite to the pin-lifting lever. A railroad's failure to warn either an experienced brakeman or a green man that some cars of an older style had grabirons on only two corners, while others were equipped on all four corners, was held not negligence, as such warning would have added nothing to their observation, and as the railroad might assume either that they would not act without looking or had already learned that they could not rely on a safe support.—Boehmer v. Pennsylvania, 252 Fed. 553. Decided May 10, 1918.

### United States Supreme Court

#### Employers' Liability Act

A trackman on the New York Central was struck and killed by an engine attached to a passenger train moving along the main track, the man being engaged in shoveling snow between the track and a platform in Camden, N. Y. At this point the company's tracks are used for the purpose of transporting both interstate and intrastate cars and both interstate and intrastate commerce. On appeal from an award of compensation under the New York Workmen's Compensation Law the Supreme Court of the United States holds that when killed the deceased was employed in interstate commerce, and judgment affirming the award was reversed. N. Y. C. vs. Porter. Decided March 3, 1919.

#### Moving Lumber to Mill; When Interstate

In an appeal in a freight tariff case the question arose whether shipments of rough lumber from the forest to the milling point, followed by the forwarding of the finished product to points outside of the state, constituted interstate commerce. The Supreme Court of the United States holds that, upon the facts shown, the movement of the rough lumber from the woods to the milling point was intrastate, and not interstate, commerce. It was not merely that there was no continuous movement from the forest to the points without the state, but that when the rough material left the woods it was not intended that it should be transported out of the state, or elsewhere beyond the mill, until it had been subjected to a manufacturing process that materially changed its character, utility, and value. The raw material came to rest at the mill, and after the product was manufactured it remained stored there for an indefinite period—manufacture and storage occupying five months on the average—for the purpose of finding a market. Where it would eventually be sold no one knew. And the fact that previous experience indicated that 95 per cent of it must be marketed outside of the state, so that this entered into the purpose of the parties when shipping the rough material to the mill, did not alter the character of the movement. Hasty vs. St. Louis Southwestern and St. Louis, Iron Mountain & Southern. Decided March 3, 1919.

## Foreign Railway News

The reports of an Australian embargo on all imports not originating in Great Britain have proved untrue. The order which was at the base of the report, referred merely to dyestuffs and not to merchandise in general.

Exports from the port of New York in January, 1919, according to figures compiled by the National City Bank, included steam locomotives to the value of \$751,865, car wheels to the value of \$112,651 and steel rails valued at \$1,456,012.

A French commission which was appointed last September to study the subject of the Channel tunnel has begun its meetings to frame definite plans for a Franco-British agreement. Albert Claveille, French Minister of Public Works, presided.

Germany has completed the delivery to the Allies of 5,000 locomotives and 150,000 cars as provided for in the armistice, according to Associated Press despatches quoting from the Tages Zeitung. The value of the rolling stock, it is said, is 3,000,000,000 marks. The Prussian railways furnished three-fourths of the locomotives and cars.

### The British Labor Difficulties

The negotiations between the Board of Trade and the Railway Executive Committee on the one hand and the National Union of Railwaymen and the associated Society of Locomotive Engineers and Firemen on the other are continuing in London, but as yet without definite results.

Press despatches from London on March 15 referred to a statement by J. H. Thomas, general secretary of the National Union of Railway Men, to the effect that a serious situation had arisen in the negotiations. Mr. Thomas said, however, he was still working to reach a settlement. He also announced that so-called triple alliance representatives were to meet Friday for final decision as to co-operation of miners, transport workers and railway men.

### Personnel of Boards on Siberian Railroads

Complete lists of the members of the Inter-Allied Committee and the Technical and Military Boards, which have undertaken the rehabilitation of the Siberian Railway, were received by cable Wednesday by the state department. The American members are Charles H. Smith, on the Inter-Allied Committee; John F. Stevens, president of the Technical Commission, and Colonel Hugh J. Gallagher, on the Military Board. The work will be mainly in charge of Mr. Stevens.

Following is the complete personnel of the committees:

Inter-Allied Committee, to supervise the railway system: Oustrougoff, Russia (chairman); Charles H. Smith, United States; Liou Tsin Jen, China; G. Bourgeois, acting for De Martel, France; Sir Charles Eliot, Great Britain; Consul General Gasco, Italy, and Matsudaira, Japan.

Technical board in charge of the technical and economic management of the railways: John F. Stevens, United States (president); Dr. Hama Tien Yeu, China; Colonel Leverve, France; Colonel Jack, Great Britain; Major Garibaldi, Italy; H. Nabso, Japan, and Danielevsky, Russia.

Military board, to co-ordinate transportation matters concerning military forces of the United States, the Allies and Russia: Lieutenant Kia Tsien Chieh, China; Colonel Tessier, France; Colonel Jack, Great Britain; Captain Schiorilli, Italy; General Takeuchi, Japan; Major Vladimiroff, Russia, and Colonel Hugh J. Gallagher, United States.

### Differ on China's Railways

Japanese official disapproval of the contemplated internationalization of the Chinese railways, which has been recommended by other allied legations and the Chinese Government, is responsible for the development of a new plan aiming at the isolation of the Japanese railway interests in China according to a copyright despatch to the New York Times.

It is expected that the Shantung Railway, together with the German interest in the Tientsin-Pukow line, will be considered as indemnity and awarded either to Great Britain

or France. Such an award would undoubtedly offset Japanese projects in that province.

The American Siemens-Carey Company's possession of rights for the extension of the Peking-Suiyuan Railway, which antedates the Japanese contract, will be insisted upon, says the despatch, America will also insist, when further lines are needed in Manchuria, that the Kuhn, Loeb & Co. contract of 1909 shall have priority. Such a program would confine Japan to the Liaotung Peninsula.

Besides America, Britain, it is said, will decline to recognize the treaties extorted from China under the 21 demands of 1915. Consequently, if Japan does not yield the South Manchurian Railway to the consolidation scheme, China will be put in a position to redeem this line in 1933 according to the original agreement.

### American Machinery in Australia

The Far Eastern Division of the Bureau of Foreign and Domestic Commerce has issued Circular No. 13 on American machinery in Australia. The report is of particular interest to readers of this paper because of the fact that as brought out in Frank Rhea's report on markets for American railway materials in Australia, the railroad shops represent an important part of the market for American machine tools.

Australia, the circular says, is rapidly becoming a manufacturing country, and the demand for certain American machinery and machine tools is increasing. As a majority of the engineering establishments are also jobbing shops, the engineers in charge are averse to buying from catalogues, but desire actual demonstrations, especially of new machines, and the majority of sales are accordingly made after a sample machine has been received by the agent or importer. A substantial additional discount on introductory orders should be allowed, particularly in highly specialized lines, as otherwise there is not sufficient incentive to warrant the importer taking the risk of the machine not being a success. Types of American machines, which have subsequently enjoyed exceptional sales, have been kept off the Australian market for years because the manufacturers did not put a sample machine into the hands of a good agent and were finally introduced by the importer who took a chance on their success.

#### EXCLUSIVE AGENCY MOST ACCEPTABLE

The exclusive agency is accepted as the most satisfactory method of selling machinery and accessories in Australia. Some of the established agencies have a certain circle of customers, but progressive agencies make themselves of general service to all customers. Moreover, in a country like Australia, where vast distances must be traveled in seeking orders and where modern machinery is just being introduced, it is only fair to the agent who has stocked a machine, which may sometimes prove unsalable, that he be protected by an exclusive contract. If proper care is taken in the selection of a progressive house there is little fear that such an arrangement will be used to stifle competition, such firms generally being as anxious to develop business as the manufacturer.

#### METHOD OF FINANCING ORDERS

Since the war, Australian importers have arranged for cash payments against documents in New York, and there is little probability of an early return to the old method of sight drafts with documents.

The price list in almost universal use in Australia is made on a small loose sheet punched with three ¼-in. holes at 3-in. centers. The advantage of conforming to such styles of price lists and insuring the maintenance of complete files of prices is apparent. This same suggestion holds good with reference to delivery information sheets and sheets showing machines in stock.

#### AMERICAN WAR DELIVERIES

The Australian import agent seems to have legitimate fault to find with the American manufacturers' optimism in making delivery promises. It is, of course, open to question whether under the abnormal war conditions any industry can function with the same precision as in peace times, and now that peace is at hand, American manufacturers will be quick

to convince Australian importers that they are as ready and willing to make as satisfactory deliveries as other countries. All the Australian agent seems to request is that orders be delivered in the same rotation as received, any other treatment is not only unfair but a source of embarrassment and expense to the importer who has given his customer a specified date of delivery. Perhaps the importers would not complain if they were quoted definite dates of delivery even three times as long as those given, as they would then know what to expect and could explain to their customers, but a short-sighted policy of accepting all orders at delivery dates impossible of execution is to be avoided.

INFORMATION AND INSTRUCTIONS WANTED

Foundation plans, instructions for setting up, and information regarding the working of machines are all greatly desired. Such information is usually the sole guide of employees who work the machines, and in many cases newly introduced types of machines can be satisfactorily set up in no other way than by following printed instructions. In one instance a fairly intricate automatic gear cutting machine was ordered and instruction specifically requested, but no attention was paid to the request, and when five more of the machines were ordered the same thing occurred, so that the matter could not be attributed to oversight.

ADVERTISING AND CATALOGUES

The Australian importer is a close reader of the leading American machinery trade journals and information regarding new types of machines is often requested on the strength of these advertisements. Naturally the importer who writes for a particular machine is interested in other types and a sale of some other machine might be effected at once if other catalogues were sent, whereas the order for a similar machine is placed with a competitor of the manufacturer because of this lack of business foresight. This situation is better appreciated when it is realized that under present conditions it requires 10 weeks for a letter to reach Australia and a reply be received. For this reason it is sometimes advisable in case of unstable price conditions to state that prices will hold until a definite date so that the Australian merchant will be able to cable his order in case the letter is delayed.

Practically all machinery is subject to customs tariff in Australia and must undergo inspection, and for this reason it is preferable to leave one board on the top of the case not hoop ironed and nailed, but simply screwed down. This board should be located so as to allow a good view of the machine. The loading and warehousing facilities in Australia are not the best and few cranes are employed, so that strong packing is desirable.

LATHES IN DEMAND

Lathes are the most important essential in the machine shops which are springing up in Australia. As the majority of the work of these shops is jobbing, the machine tools should be universal. Gap lathes, for instance, permit one machine to cover a large range of work and are very popular in Australia. One American machine of this universal type has enjoyed a very large sale. Most of the American gap lathes before the introduction of this one were cheap, and light tools are not in demand. Another popular lathe of English manufacture has very large bearings and a rugged headstock which appeals strongly to the Australian market and is in more universal favor in large mining shops than any other tool.

PLANERS, PUNCHES, SHEARS AND ROLLS TOO HIGH PRICED

The price of American planers as compared with that of English makes is disproportionately high. Though the American planers are very high grade with a number of automatic and convenient feeds, these conveniences have made the price too high for the Australian market, and at present there are not half a dozen of these machines in use in that country. A moderate-priced simple planer could be introduced to advantage. This is equally true of punches, shears, rolls, and other tools used in shipbuilding and structural work, our price of which is out of all proportion to the prices of British makes.

AMERICAN IMPORTS INCREASED

The following statistics show the increase by countries in imports of machine tools since the beginning of the war:

Imported from	1914	1916-17
United Kingdom	\$265,039	\$424,846
United States	226,307	407,618
Germany	9,081	.....
Sweden	6,964	1,883
Belgium	4,993	.....
New Zealand	1,153	5,767
Canada	3,236	4,803
All other countries	346	8,370
Total	\$517,119	\$853,287

The statistics given with the circular also give figures as to imports of locomotives as follows:

1912	\$2,280,306
1913	2,070,185
1914	1,620,228
1915-16	534,609
1916-17	381,976

Of the total of \$381,976 imported in 1916-17, \$315,018 worth came from the United Kingdom, \$64,608 from the United States, and \$2,351 from other countries.

Of the total of all kinds of machinery amounting to \$15,317,304 in 1916-17, 50 per cent came from the United States, 36 per cent from the United Kingdom, 8 per cent from Canada, and 6 per cent from other countries.

PROMISING OUTLOOK FOR AMERICAN TRADE

The United States is, therefore, the report concludes, the leader in the machinery market of Australia, according to latest available statistics. Whether this leadership is maintained will of course depend upon a great many considerations, not the least important of which are closely related to the suggestions made above. The Australian machinery merchant is fully alive to the advantages and good points of American machinery, just as he appreciates most keenly the weakness in our export methods, the brunt of which eventually must be borne by him. The closest attention should be paid to his wishes if we are to encounter a full measure of success.

Ministry of Ways and Communications Proposed in England

The British Cabinet on February 27 introduced in Parliament, as briefly noted in this column in the issue of March 7, page 561, a bill providing for the establishment of a Ministry of Ways and Communications, to have entire charge of all means of transportation in the United Kingdom and providing for an extension of the government control of railways for an additional two years during which time their ultimate status may be considered. In introducing the bill in the House of Commons, Mr. Shortt explained the reasons for the bill. He contended that the day for unfettered railway competition had gone, and that the introduction of mechanical traction had made the highways essentially a national question. These were among the considerations which had weighed with the government in deciding to set up a ministry to co-ordinate the whole of these important means of transport. He made it clear at the start that the ministry would maintain for the two years during which the government guaranteed the receipts of the railways the control which they had during the war, and would be given power during that period to consider the whole question and to make such changes as and when it thought desirable. "Does that mean," he was asked by Sir Edward Carson, "that they can nationalize the railways?" "Not without the consent of this House," Mr. Shortt replied.

One of the important provisions of the bill gives the Ministry control over the supply of electricity.

Mr. Shortt admitted that there might be a considerable difference of opinion on this proposal. He suggested, however, that as transport was the greatest customer for electricity, and as it depended entirely for its successful management upon the development of the industries of the country, the House would recognize how important it was that the Ministry should have control of electricity.

Sir Eric Geddes, Minister without portfolio, speaking in favor

of the bill on March 17, and that with the exception of the street railways the transportation system of the country financially was in a semi-paralyzed state, and physically ill-equipped to meet the strain of the demands made upon them partly owing to lack of men and capital during the war. The country had to face the fact today that with the railways there would be a loss of over a quarter of a million pounds daily, while the government was pledged to continue its guarantees for two years.

If transportation was not to continue to run at the cost of the taxpayer, there must be a real transportation policy, and the government had come to the conclusion that some measure of unified control was necessary. There must be some body which should be responsible for the transportation policy.

In the present conditions, it would be criminal to permit the old system of competition. The government must have a say in the conditions under which labor worked and with regard to the discipline to be expected in trade unions. The state must step in at once and make possible an economic balance, which was impossible in the present condition of things.

In order to get rid of empty haulage, continued Sir Eric, the government would take over the power to acquire privately owned cars on the railways, which constituted nearly half the cars employed. During the next two years the same organization would be continued that existed during the war, but thereafter there was certain to be some central control—commissions on which the government and labor would be represented. It would also be necessary to have a central control over docks and canals. Nationalization of railways might care for the present conditions—he did not know. He looked upon nationalization as a means to an end, which might have to be adopted finally.

TEXT OF THE BILL

The complete text of the bill is given in the London Times of February 28, and some of the important sections of it are as follows:

1. For the purpose of improving the means of, and the facilities for, locomotion and transport, it shall be lawful for his Majesty to appoint a Minister of Ways and Communications. . . .

POWERS AND DUTIES

2. (1) It shall be the duty of the Minister to take steps to carry out the purposes aforesaid, and there shall as from such date or dates as his Majesty in Council may by Order determine, be transferred to the Minister all powers and duties of any Government Department in relation to—

- (a) railways;
- (b) light railways;
- (c) tramways;
- (d) canals, waterways, and inland navigations;
- (e) roads, bridges and ferries, and vehicles and traffic thereon;
- (f) harbors, docks and piers;
- (g) the supply of electricity;

including any powers and duties of any Government Department in relation to any railway, light railway, tramway, canal, inland navigation, harbor, dock, pier, electricity, or other undertaking concerned with any of the matters aforesaid, and any powers of any Government Department with respect to the appointment of members or the procedure of the Railway and Canal Commission or of any commissioners, conservancy board, or other body having jurisdiction with respect to any such matters as aforesaid:

POWER TO CONTROL TEMPORARILY RAILWAYS, ETC.

3. (1) With a view to affording time for the consideration and formation of the policy to be pursued as to the future position of undertakings to which this section applies, the following provisions shall have effect for a period of two years after the passing of this Act:

(a) Where at the passing of this Act possession has been taken of any railroad undertaking or part thereof in pursuance of section sixteen of the Regulation of the Forces Act, 1871, or otherwise, possession thereof may be retained without any renewal of the warrant granted by the Secretary of State in pursuance of that section upon the same terms as to payment as those heretofore in force, and the Minister may exercise over all such undertakings all such powers as have hitherto been exercised by the Board of Trade under the said Act or with the consent of the owners of the undertakings or otherwise, and such other powers as may be conferred by this section or agreed to by the railway companies concerned:

(b) The Minister may take possession in the name or on behalf of his Majesty of the whole or any part of any other railway undertaking or of any light railway, tramway, canal, inland navigation, harbor, dock or pier undertaking, or of any plant belonging thereto or used thereon, and of the railway wagons of any private owner required for use on any railway of

which possession has been taken, and of any barges, tugs, and other craft required for use on any canal, of which possession has been taken.

(c) The directors, officers, and servants, of any undertaking of which, or at the plant whereof, possession is retained or taken shall obey the directions of the Minister as to the user thereof and any directions of the Minister:

(i) as to the rates, fares, tolls, dues, and charges to be charged:

(ii) as to the salaries, wages, and remuneration and conditions of employment of persons employed on or in connection with any undertaking of which possession has been taken:

(iii) as to the working or discontinuance of the working of the undertaking or any part thereof including directions as to keeping open or closing of any stations:

(iv) for securing that the permanent way, rolling stock, plant, appliances, or equipment, whether fixed or moving, are satisfactory in type and design:

(v) as to the carrying out of alterations, improvements, and additions which the Minister considers necessary for the public safety or for the more efficient and economic working of the undertaking:

(vi) for securing co-operation between undertakings and for securing the common user of facilities, rolling stock and equipment whether fixed or movable:

(vii) for affording running powers over their system, or any part thereof, to the owners of any other undertaking:

(viii) for securing that manufacturing and repairing facilities, and auxiliary and ancillary services shall be used, and the purchase and distribution of stores shall be conducted, in such manner as may be most conducive to economy and efficiency:

(ix) as to the preparation and submission to the Minister at such times and in such form and manner as the Minister may require of statistics and other returns, and of accounts at such times and in such form and manner as the Minister, with the consent of the treasury, may, by regulations, prescribe:

(d) For enabling any directions given by the Minister as to alterations, and improvements and additions to be carried into effect the Minister may, by order, authorize the owners of any undertaking to acquire any land and to construct any works, and the order may incorporate the Lands Clauses Acts, subject to such modifications as may be specified in the order, being modifications of those acts made or authorized to be made by the Development and Road Improvement Funds Act, 1909, or any other enactment, and may incorporate or apply any of the provisions of any enactment relating to the construction, maintenance, or working of railways, light railways, tramways, canals, harbors, docks and piers:

(e) Any rates, fares, tolls, dues, and other charges directed by the Minister shall be deemed to be reasonable, and may be charged, notwithstanding any statutory provisions limiting the amount of such charges or increases therein.

(4) Where by reason of the exercise of the powers under this section the value of any undertaking has been depreciated or enhanced, the owners of the undertaking shall, so far as any loss is not provided for by the payments mentioned in paragraph a, be entitled to be recouped or liable to pay the amount by which that value has been so depreciated or enhanced, and if any question arises as to that amount or otherwise with respect to the financial relations between the Minister and any person affected by the exercise by the Minister of any of his powers under this section, the question shall be determined by the Railway and Canal Commission; and without prejudice to any other form of payment or satisfaction, the Treasury on the recommendation of the Minister may, as or as part of the consideration for exercising any powers of control under this section, guarantee the payment of any dividends on any stock or other securities issued by the owners of an undertaking up to such amount as may be agreed, or the payment of any working expenses of the undertaking, and any sums required to fulfill any such guarantee shall be paid out of moneys provided by Parliament.

4. (1) His Majesty in Council may at any time after the passing of this Act by order authorize the Minister—

(a) to purchase by agreement or compulsorily and work the whole or any part of any railway, light railway, tramway, canal, waterway or inland navigation, harbor or dock undertaking the acquisition of which is, in the opinion of the Minister, expedient for improving facilities for locomotion and transport:

(b) to enter into and carry into effect agreements with the owners of any such undertaking for the placing of the undertaking or any part thereof under the control of the Minister to such extent and subject to such financial arrangements as with the consent of the Treasury may be agreed:

(c) himself to establish any such undertaking and to work and maintain the same and for that purpose to acquire any lands either by agreement or compulsorily, and the order may incorporate the provisions of the Lands Clauses Acts, subject to such modifications as may be specified in the order, being modifications of those Acts made or authorized to be made by the Development and Road Improvement Funds Act, 1919, or any other enactment, and the Order may incorporate or apply any of the provisions of any enactment relating to the construction, maintenance, or working of railways, light railways, tramways, canals, harbors, docks and piers:

(d) to lease the whole or any part of any undertaking so acquired or established:

(e) to purchase or take on hire and lease railway wagons belonging to any private owners:

(f) to establish, maintain, and work transport services by land or water: and it shall be lawful for the owners of any undertaking to which any such Order applies to enter into and carry into effect

any agreement authorized by or required for the purposes of the Order.

(2) An order in Council under this section authorizing the purchase of any undertaking or part thereof may provide for vesting the undertaking or part in the Minister either subject to any mortgages, debentures, debenture stock, or other charges and obligations affecting the undertaking or discharged therefrom, or from any of them, and for preserving the rights and security of the persons entitled to such charges, or for giving them a substituted charge on the consideration paid for the undertaking.

(3) The consideration for the undertaking or property so acquired shall, in default of agreement, be determined by a court of arbitration constituted in accordance with the provisions of the Order authorizing the acquisition.

(4) Any capital sum payable under an agreement or award may be discharged in whole or in part, if the Treasury so direct, by the issue of securities, and the amount of such securities equivalent to such capital sum shall, in default of agreement, be determined by a court of arbitration constituted as aforesaid.

For that purpose the Treasury may create and issue securities the interest on which shall be charged on the revenues of the undertakings transferred after the payment thereof of working expenses, and if and so far as such revenues are insufficient on the Consolidation Fund of the United Kingdom, or the growing produce thereof, and which shall bear interest at such rate and shall be subject to such conditions and regulations as to repayment, redemption, or otherwise as the Treasury may direct or prescribe, and the regulations may apply with the necessary modifications and of the enactment relating to Local Loans Stock.

(7) Before an Order to Council is made under this section, a draft thereof shall be laid before each House of Parliament for a period of not less than 30 days during which that House is sitting, and if either of those Houses before the expiration of those 30 days presents an address to his Majesty against the draft, or any part thereof, no further proceedings shall be taken thereon without prejudice to the making of new draft order.

5. (1) The Minister may, subject to the approval of the Treasury, make advances out of the moneys provided by Parliament to any authority, company, or person, either by way of grant or by way of loan, or partly in one way and partly in another, and upon such terms and conditions as he thinks fit for any of the following purposes:—

(a) The construction, improvement, or maintenance of railways, light railways, or tramways;

and the power of the Treasury on the recommendation of the Development Commissioners to make advances for any of the purposes aforesaid shall cease and determine.

POWER TO REQUIRE STATISTICS AND RETURNS

6. It shall be the duty of the owners of any railway, light railway, tramway, canal, inland navigation, dock, harbor, pier or electricity undertaking, and the authority or person liable to maintain any road or bridge, to furnish to the Minister at such times and in such manner and form as he may require for the purposes of his powers and duties under the Act.

STAFF AND REMUNERATION.

8.—(1) The Minister may appoint such secretaries, officers, and servants of the Ministry as the Minister may, subject to the consent of the Treasury as to number, determine.

(2) There shall be paid out of moneys provided by Parliament to the Minister an annual salary not exceeding five thousand pounds, and to each of the Parliamentary secretaries of the Ministry an annual salary not exceeding fifteen hundred pounds, and to the other secretaries, officers, and servants of the Ministry such salaries or remuneration as the Treasury may from time to time determine.

10.—(1) The office of Minister of Ways and Communications, or of the secretary in the Ministry of Ways and Communications, shall not render the holder thereof incapable of being elected to or sitting or voting as a member of the Commons House of Parliament, but not more than two such secretaries shall sit as members of that house at the same time.

(2) The person who is first appointed to be Minister shall not by reason of such appointment, if a member of the Commons House of Parliament, vacate his seat as such member.

## Equipment and Supplies

The committee representing the steel interests conferred with the Industrial Board of the Department of Commerce, Washington, on Wednesday, in an effort to reach an agreement on steel prices. No definite agreement was reached at the first day's conference, but it was hoped it would be possible to announce a schedule of prices on Thursday.

### Locomotive Deliveries to March 8

The following new locomotives were shipped during the week ending March 8:

Works	Road	No.	Type
American...	Maine Central.....	6	USRA Mikado.
	Erie R. R.....	2	USRA St. Fe.
	Penn. L. W.....	3	Santa Fe.
	Central R. R. of Ga.....	2	Mallet.
	Chicago & North Western.....	2	USRA 6W. Sw.
	Chicago & North Western.....	1	Mikado.
	Ches. & Ohio.....	1	10-W. Sw.
	A. C. L.....	1	USRA Pacific.

## Freight Cars

THE UNITED STATES GOVERNMENT is inquiring for one flat car for the Navy Department.

MAYER & LAGE, New York, are inquiring for four to eight 20-ton, type E. S. T. platform cars for France.

THE DESCHANEL INTERNATIONAL CORPORATION, New York, is inquiring for 10-ton and 20-ton standard French type box cars for France.

## Iron and Steel

### Rail for Sale by War Department

The director general of military railways has 45,000 tons of steel rail, both Bessemer and open hearth, with the necessary angle bars, bolts, spikes, tie plates, rail braces, frogs, switches and crossings for sale. The rail is of the A. R. A. Type "B" 80 lb. section. The specification for the Bessemer rail is not given, but that for the open hearth is substantially the same as the A. R. E. A. specification as given in the 1915 edition of the manual. About one-third of this material is stored at New York (Kearney, N. J.), and the remainder at Norfolk, Va. Regional directors are asking the federal managers to see if any of the roads under their jurisdiction can use any of this material.

## Miscellaneous

COMMERCE REPORTS in a recent issue contained the following trade opportunity:

28712.—An American company about to open up an industry in Honduras proposes to reconstruct the present wharf of reinforced concrete, to reconstruct and maintain the roadbed of a railway, to build a new railway line, to erect one steel bridge, and to open up new lands. It desires to purchase machinery and supplies for this work. Quotations should be given f. o. b. New Orleans. References.

Further details may be obtained from the district or co-operative offices of the Bureau of Foreign and Domestic Commerce or from the head office in Washington.

## Supply Trade News

The Chicago Pneumatic Tool Company, Chicago, has opened offices and warehouses at Tulsa, Okla.

Clyde P. Benning, service manager of Mudge & Company, Chicago, has been appointed assistant general manager with headquarters at Chicago, in which position he will assist the railroad companies in developing motor car organizations. Mr. Benning was born at Atchison, Kan., on September 20, 1888, and received his education in the public schools of that city. His business career dates back to 1903, at which time he entered the employ of the Missouri Pacific, serving in several clerical positions with that company until April, 1905, when he entered the shops of that road as a machinist apprentice, later being promoted to machinist. In 1910 he resigned from the Missouri Pacific in order to accept a position with the Tool & Railway Specialty Company at Atchison, Kan., with which concern he remained until December 15, 1914, leaving at that time to enter the employment of Mudge & Company as shop inspector. Previous to his recent appointment as assistant general manager, Mr. Benning was service engineer and in 1916 western manager, with headquarters at San Francisco, Cal., and during the latter part of 1918 held the position as service manager, with headquarters at Chicago, until his appointment as stated above.

Jean K. Vanatta, mechanical engineer of Mudge & Company at Chicago, has been appointed service manager in which capacity he will have charge of the company's service engineers, who are working with the motor car men on the various railroads throughout the country, as well as the developing of the service idea. Mr. Vanatta was born at Colorado Springs, Colo., on June 2, 1888, and received his education in the Colorado Springs High School and the University of California, where he graduated from the College of Engineering in 1910. He began his business career immediately after his graduation as special apprentice of the Washington Air Brake & Machine Company. During the year 1914 he was supervisor of the engineering and development work of the Great Western Mining and Milling Company at Hayman, Colo., and the following year he was in the employ of the Bell Telephone Company on outside construction work. Mr. Vanatta joined the forces of Mudge & Company as shop and material inspector in September, 1916, which position he

C. P. Benning

J. K. Vanatta

held until his present promotion to the office of service manager.

Nelson B. Gadch has been appointed district manager of sales for the Chicago Pneumatic Tool Company, with headquarters in the Metropolitan Bank building, Minneapolis, Minn.

Fred H. Waldron, Minneapolis representative of the Chicago Pneumatic Tool Company, has been appointed manager of the pneumatic tool sales division, to succeed J. D. Osgood, who has resigned.

John W. Foyle, vice-president of the Gustin-Bacon Manufacturing Company, Kansas City, Mo., who has been a major in the United States Army, has been released from service and returned to his duties with his company on March 1.

J. I. Edwards has been appointed manager of the Rock Drill Sales division of the Chicago Pneumatic Tool Company, succeeding E. Eklund, who has been appointed special foreign representative, and who will leave shortly for Europe in the interest of that company.

J. A. Farris, who has been connected with the Whiting Foundry and Equipment Company, at Chicago, as crane engineer in the engineering department for the past ten years, has entered the employment of Scully-Jones & Co., at Chicago, as special sales engineer on cranes.

A. N. Willsie has resigned from the Chicago, Burlington & Quincy, with which company he has been connected for the past 29 years, to accept the position of district engineer of the Locomotive Stoker Company, with headquarters at Chicago. Mr. Willsie was born in Galesburg, Ill., where he received his primary school education. He entered the service of the Burlington on April 20, 1880, as an errand boy in the master mechanic's office, and later filled the position of chief clerk to the master mechanic in this same office. In 1890 he became a locomotive fireman, and then was engineman for six years when he became road foreman of engines, from which position he was promoted to division master mechanic at Brookfield, Mo., Aurora, Ill., and Omaha, Neb. Mr. Willsie left the mechanical department to take the position of division superintendent in the operating department, and for two years filled this position at St. Joseph, Mo., and three years at Hannibal, Mo. Since June, 1912, Mr. Willsie has been permanent chairman of the fuel economy committee and superintendent of fuel economy of the Burlington, with headquarters in Chicago, reporting direct to the general superintendent of motive power, and vice-president in charge of operation.

A. N. Willsie

### Chicago Pneumatic Tool Company

The Chicago Pneumatic Tool Company, Chicago, in its annual report for the year ending December 31, 1918, shows net earnings of \$535,833.56, which is equal to 8.32 per cent on the stock. The report for the year previous shows net earnings of \$1,169,390, or 18.3 per cent on the stock.

In discussing the financial status of the company, H. A. Jackson, the president, said in part:

"The great volume of business of an imperative nature which had accumulated on the company's books because of the country's war activities, produced a condition disclosing certain deficiencies which the directors took steps to correct. An entire reorganization was effected and was practically completed in June, 1918.

"In the meantime, the Emergency Fleet Corporation called upon the company for increased production. An inspection of the plant by the new management revealed that in order to obtain the additional output required, the equipment must be scientifically balanced, further facilities provided, and improved shop management applied. Considerable quantities of material, found to be obsolete, were disposed of. Moreover, an investigation of the company's accounting methods made by the new management indicated the desirability of certain substantial changes, especially in the basis of writing off depreciation.

"An immediate and general revision of the old methods of production was undertaken, resulting in a greatly increased volume of output, which more nearly met the requirements of the industry concerned in the government's war program. The company's cost and accounting systems were revised. There has been charged off on account of depreciation in inventories, machinery, etc., together with bad debts and shrinkages due to discrepancies in cost accounting and other items, an amount of \$872,413.16.

"Though a heavily increased production has been marketed at prevailing prices, the resultant earnings have been affected by the substantial increase in the cost of labor and materials.

"On account of depreciations necessary because of the transition from a war to a peace basis, the British and Canadian subsidiary companies are not showing a large return for the year. The British subsidiary was heavily involved in Russia, and the unfortunate developments in that country have made necessary the setting aside of relatively large reserves on the books of that company.

"The balance sheet of the company is as follows:

ASSETS	
Capital Assets:	
Lands, buildings, machinery, equipment, etc., plus additions during the year less reserve for depreciation.....	\$7,662,177
Investment in foreign subsidiary company.....	58,309
Special funds for redemption of 6 per cent bonds.....	31,161
Current Assets:	
Inventories, accounts and notes receivable, etc., cash.....	9,073,885
Deferred Charges:	
Discount on bonds, interest, insurance, etc., prepaid.....	393,306
LIABILITIES	
Capital Liabilities:	
Capital stock.....	\$6,448,800
First mortgage bonds.....	3,250,000
Current Liabilities:	
Notes payable, accounts payable, including payrolls, accrued liabilities, etc.....	2,329,771
Reserves:	
For contingencies and for first mortgage bond sinking fund..	408,162
Appropriated Surplus:	
For investment in additions to property and working capital..	2,000,000
Unappropriated surplus.....	2,782,107

## Trade Publications

**BLAW-KNOX PRODUCTS.**—The Blaw-Knox Company, Pittsburgh, Pa., has issued a diminutive booklet on its products, 2½ in. by 3¼ in. in size. There are eight pages printed in three colors illustrating and describing the fabricated steel work, plate work, transmission towers, furnace equipment, Blaw buckets, Blaw forms and Blaw mixers produced by this company.

THE BEST YARD MASTER is the man who knows human nature and who can do the things he would have his men do just a little better than they can, and do it just a little quicker than they can; also he is considerate of his men. Kind when kindness is needed, severe when it is necessary to be severe, and absolutely a tyrant when nothing else will bring results. The best yard master is one that instead of telling his men how to do switching or to handle certain trains in and out of his yard, will ask them how they are going to do it, pre-facing his request for knowledge with some pleasant remark, evidencing good will. If he is a good yard master he will listen to what his men propose to do, especially if it is a difficult task, and will carefully weigh what they suggest. If he knows no better way he will let them do it their way, though it may differ somewhat from his. By so doing he can feel assured that he has encouraged individuality in his men and will reap the benefit, as it becomes a matter of personal pride with the yardmen to make good their suggestion. Such a yardmaster gains the good will and loyalty of his men.—*H. D. McKee, Benwood, W. Va.*

# Financial and Construction

## Railway Financial News

**CHICAGO, ROCK ISLAND & PACIFIC.**—The New York Stock Exchange on March 12 listed this company's \$29,422,100 7 per cent preferred stock, \$25,108,100 6 per cent preferred stock and \$75,000,000 common stock.

**ERIE.**—J. P. Morgan & Co. have announced a new offering of \$15,000,000 three-year 6 per cent notes to refund an equal amount of two-year notes maturing April 1. Holders of the maturing notes will have the privilege of exchanging them for the new notes at 98 and interest, a price which will bring the owners a return of 6¼ per cent. The War Finance Corporation stands ready to take any amount of the notes which are left after the exchange privilege is closed and after the public offering has been concluded. The price to the corporation will also be 98 and the funds will be used to pay off holders of the two-year 5 per cent notes who elect to receive cash. The railroad company agrees to maintain collateral behind the issue with a market value of 125 per cent of the amount of the notes.

**GRAND TRUNK.**—The directors have decided that, owing to immensely increased expenses, caused by war conditions, the company was unable to earn any dividends on guaranteed or preference stocks for the past year. These dividends have not been paid since the first half of 1917.

**ILLINOIS CENTRAL.**—Robert S. Lovett has been elected a director to succeed R. W. Goelz.

**PENNSYLVANIA.**—President Samuel Rea has announced that the directors of the company had authorized him to borrow \$22,000,000 from bankers to be used in the payment of overdue federal vouchers for expenditures incurred in governmental operation of the Pennsylvania system, including purchases of fuel, materials and supplies, and expenditures for improvement and betterment work. The funds will be used exclusively in paying these vouchers. Arrangements have been made for immediate payment of the more pressing of these debts. Director General Hines has approved of the foregoing plan and is willing, upon appropriation by Congress of funds available for that purpose, to promptly make payment of the \$22,000,000, if then due the companies in the Pennsylvania system on account of compensation.

**TEXAS & PACIFIC.**—The stockholders have elected a new board of directors consisting of Henry A. Bishop, Harry Bronner, B. D. Caldwell, Kingdon Gould, George G. Haven, Alexander J. Hemphill, C. C. Huit, A. A. Jackson, Alvin W. Krech, J. H. McClement, N. S. Meldrum, Dunlevy Milbank, S. T. Morgan, Wm. Church Osborn, Finley J. Shepard, John I. Waterbury and Wm. H. Williams.

The election of a new board is the first step in a plan to effect a financial readjustment and release the property from receivership. Although a majority of the new directors have affiliations with the Missouri Pacific, the board is the result of a compromise of all interests. Of the Texas & Pacific's \$25,000,000 second mortgage income bonds, the Missouri Pacific owns \$23,703,000.

## Railway Construction

**QUEBEC CENTRAL RAILWAY.**—This road has awarded contracts for a car shop with concrete substructure and a brick and steel superstructure to be built at Newington, Que. It will be 75 ft. by 225 ft. and one-story high, cost about \$42,000.

**POINTS FOR THE YARDMASTER.**—If the company will afford a good wardroom for your switchmen, arrange for laborers to give it a good cleaning occasionally; have it provided with a stove, during cold weather, and have a good fire going when the men come to lunch. This requires but a little effort and the majority of the men will appreciate it; furthermore, they will have no occasion to leave work to prepare a fire.—*H. D. McKee.*

## Railway Officers

### Railroad Administration

#### Central

**W. A. Webb**, heretofore general manager of the Missouri, Kansas & Texas of Texas, has been appointed a member of Railway Board of Adjustment No. 1, with office at Washington, vice **John G. Walber**, who was recently appointed labor assistant to the director of operation.

#### Federal and General Managers

**George E. Johnson** has been appointed assistant to the general manager of the Denver & Rio Grande, the Rio Grande Southern, the Denver Union Terminal, the Pueblo Union Depot and the Salt Lake City Union Depot, with headquarters at Denver, Colo.

**Morris S. Hawkins** has been appointed federal manager for the Norfolk Southern, the Carolina Railroad and the Kinston Carolina Railroad, with office at Norfolk, Va., to succeed **J. H. Young**, who has been appointed senior assistant director of the division of operation, with office at Washington, D. C.

**Charles N. Whitehead**, general manager of the Northern lines of the Missouri, Kansas & Texas, who has been appointed federal manager of the Katy system, with headquarters at St. Louis, Mo.,

was born at Princeton, Ill., in 1876, and received his early education in the public schools of that city. In 1893 he entered the employ of the Missouri, Kansas & Texas as a messenger, after which he was consecutively to 1905 clerk and stenographer in the freight and ticket office, stenographer and clerk to the superintendent, stenographer and clerk to the general freight agent, stenographer and clerk to the general attorney, chief clerk to the superintendent, stenographer and clerk to the general counsel. In 1905 he was appointed assistant secretary, becoming secretary in 1909, and soon after secretary and treasurer of the same road. In April, 1913, he was appointed assistant to the president of the Missouri, Kansas & Texas, and in 1914 was elected vice-president, with headquarters at St. Louis, Mo. When the railroads came under government control, Mr. Whitehead was appointed general manager of the Missouri, Kansas & Texas, Northern Lines, with headquarters at St. Louis, which position he held until his recent appointment as federal manager of the Missouri, Kansas & Texas, the Missouri, Kansas & Texas of Texas (including the Trinity branch and the Beaumont & Great Northern), the Missouri, Oklahoma & Gulf, the Oklahoma Belt and the Wichita Falls & Northwestern.

C. N. Whitehead.

#### Operating

**J. G. Fitzhugh** has been appointed superintendent of safety and fire protection of the Gulf, Colorado & Santa Fe and associated lines, with headquarters at Galveston, Texas.

**John Connors** has been appointed trainmaster of the Racine and Southwestern division of the Chicago, Milwaukee & St.

Paul, with headquarters at Beloit, Wis., vice **C. E. Corcoran**, deceased.

**George E. Johnson** has been appointed assistant to general manager of the Denver & Rio Grande, the Rio Grande Southern, the Denver Union Terminal, the Pueblo Union Depot & Railroad, and the Salt Lake City Union Depot and Railroad, with headquarters at Denver, Colo.

**William Elmer**, acting superintendent of the Philadelphia division of the Pennsylvania Railroad, Eastern Lines, with office at Harrisburg, Pa., has been appointed superintendent of the same division, and **C. D. Young**, acting superintendent of the Schuylkill division, with office at Reading, has been appointed superintendent of the Schuylkill division.

#### Traffic

**William Warner**, assistant general freight and passenger agent of the Los Angeles & Salt Lake, has resigned, effective April 1. Mr. Warner's entire business career has been in the railroad service, beginning in 1900. Before joining the forces of the San Pedro, Los Angeles & Salt Lake, which is now the Los Angeles & Salt Lake, he was with the Chicago, Milwaukee & St. Paul, and later with the Kansas City Southern as contracting agent. He was general agent of the San Pedro, Los Angeles & Salt Lake, with headquarters at Chicago, for several years prior to his appointment as assistant general freight and passenger agent of the same road, with headquarters at Salt Lake City, Utah. Mr. Warner has accepted a position with Lederer & Dickson Company, grain commission merchants, Chicago.

#### Engineering and Rolling Stock

**Lieutenant William H. Hobbs**, 332nd Field Artillery, U. S. A., has returned from France and received his discharge from the army. On March 1, he resumed his position as assistant engineer on the Louisiana division of the Missouri Pacific, with headquarters at Monroe, La.

**Louis Warren Duffee**, whose appointment as chief engineer of the Gulf, Mobile & Northern, with headquarters at Laurel, Miss., has already been announced in these columns, was born in 1884, at Mobile, Ala., and was educated in the Alabama Polytechnic Institute. He began railway work in August, 1904, with the Bay Minette & Ft. Morgan Railroad. The following year he was appointed an assistant division engineer on the Louisville & Nashville, and then after three years of varied engineering work in Alabama and Indian Territory, he entered the service of the Mobile, Jackson & Kansas City, now part of the Gulf, Mobile & Northern, as resident engineer on maintenance and construction. In 1911, he was appointed locating engineer on the same road, which then became the New Orleans, Mobile & Chicago. Mr. Duffee was engaged in conducting new surveys and carrying out some construction work until 1917, excepting about two years, 1912 and 1913, when he was chief engineer of the Meridian & Memphis. In 1917, he was appointed special engineer of the Gulf, Mobile & Northern and had charge of federal valuation work and special engineering projects on that road. On December 1, 1918, he was made acting chief engineer, which position he held until his recent appointment as chief engineer of the same road as above noted.

**E. Bruce Ford**, whose appointment as assistant engineer in the Northwestern Region with office at Seattle, Wash., was announced in the *Railway Age* of March 7 (page 567), was born at Laceyville, Pa., on August 21, 1881, and received his education in the high school of that place and the State Normal School at Mansfield, Pa., later attending Lafayette College. Mr. Ford began railway work in July, 1902, as a tapperman and rodman on the Delaware, Lackawanna & Western, and one year later he entered the employ of the Pittsburgh, Shawmut & Northern and the Buffalo & Susquehanna as a draftsman. In 1905 he became a draftsman and masonry designer with the Syracuse Railroad Construction Company, at Syracuse, N. Y., and in 1906 was appointed assistant division engineer on the Cleveland, Cincinnati, Chicago & St. Louis, with headquarters at Middletown, Ohio. The following year he was employed on the Chicago, Milwaukee & Puget Sound

as a resident engineer, and in 1909 he went with the Grand Trunk Pacific as a construction foreman. From 1910 to March 1, 1919, he served consecutively on the Great Northern; as draftsman and assistant engineer, on the Marcus division; assistant engineer at Vancouver, B. C., on terminal developments at that place; and office engineer in the principal assistant engineer's office at Seattle, Wash., which latter position he held prior to his appointment as assistant engineer of the Northwestern Region.

**Warren Y. Scott**, who has been appointed signal engineer of the Boston & Maine, with office at Boston, Mass., as has already been announced in these columns, was born on September 23, 1877, at South Boston, Mass., and graduated from Hyde Park High School in 1894. From the spring of 1895 to 1896, he worked for the Union Switch & Signal Company, on the New York, New Haven & Hartford, during signal changes, on account of the New Haven changing from left to right hand running. On January 13, 1896, he entered the service of the Boston & Maine as a helper. He subsequently served consecutively as general helper, signalman, maintainer, foreman and general foreman. In April, 1907, he was appointed supervisor of electric signals, and in October, 1911, was appointed general inspector of signals. Since September 1, 1916, he has served as assistant signal engineer until his recent appointment as signal engineer of the same road and subsidiary lines.

W. Y. Scott

**E. L. Martin**, engineer of maintenance of way of the Missouri, Kansas & Texas, at Parsons, Kan., who has been appointed chief engineer of the Missouri, Kansas & Texas, the Oklahoma Belt and the Missouri, Oklahoma & Gulf, as was announced in the *Railway Age* of March 7 (page 553), graduated from the Agricultural and Mechanical College of Texas in June, 1899, and began his railway career as an axman on location work with the Texas & New Orleans. In September, 1899, he went to the Southern Pacific and served in various capacities in the engineering department until he became assistant engineer. In 1902, he was appointed assistant engineer on the Kansas City Southern, at Pittsburgh, Pa., and left that position in 1905 to become division engineer and assistant engineer on construction for the Gulf, Colorado & Santa Fe, in Texas. In 1912 he was appointed assistant superintendent of the Southern Pacific at Lafayette, La., and the following year was made division engineer on the Missouri, Kansas & Texas, at Denison, Texas. Later he was appointed engineer of the Missouri, Kansas & Texas in charge of the construction of the San Antonio terminals, which position he held until his appointment as engineer of maintenance of way for the same road in April, 1917. As chief engineer of the Missouri, Kansas & Texas, the Wichita Falls & Northwestern and the Missouri, Oklahoma & Gulf, with headquarters at Dallas, Texas, Mr. Martin succeeds **F. G. Jonah**, chief engineer of the Missouri, Kansas & Texas and the Missouri, Oklahoma & Gulf, and **F. Merritt**, chief engineer of the Missouri, Kansas & Texas Railway of Texas and the Wichita Falls & Northwestern, both of whom were assigned to other lines in connection with the regrouping of roads in the Southwestern Region, as mentioned in our issue of March 7, on page 552.

**Purchasing**

**George W. Snyder**, who has been appointed general storekeeper of the Pennsylvania Railroad, eastern lines, with headquarters at Philadelphia, Pa., as has already been an-

nounced in these columns, was born at Pottsville, Pa., on January 9, 1866, and was educated in the public schools of Pottsville and at Lehigh University. Mr. Snyder began railway work with the Pennsylvania Railroad on November 1, 1884, as rodman on the Renovo division. He was appointed assistant supervisor of the same division on January 1, 1886, and in August, 1890, was promoted to supervisor. On June 10, 1897, he was appointed supervisor on the Northern Central at Baltimore, and three years later was transferred to the Altoona yard. He was promoted to division engineer of the Monongahela division in January, 1901, and in June, 1903, was transferred to the Pittsburgh division. On April 1, 1907, he was appointed principal assistant engineer of the Western Pennsylvania division; in October, 1917, he was made assistant engineer, maintenance of way, in charge of bridges and structures, and served in that position until his recent appointment as general storekeeper of the Pennsylvania Railroad, eastern lines, as above noted.

**Corporate  
Operating**

**J. J. Horn**, whose appointment as superintendent of the Kenora division of the Canadian Pacific, with headquarters at Kenora, Ont., was announced in the *Railway Age* of February 28 (page 522), was born at Carleton Junction, Ont., on November 26, 1873, and began railway work on January 12, 1892, with the Canadian Pacific in the capacity of agent and operator on the Lake Superior and Manitoba division. Previous to his recent appointment as superintendent of the Kenora division, Mr. Horn served from 1895 to 1911 as train despatcher of the Fort William and Kenora division; from 1911 to 1912 as chief despatcher of the Kenora division and from 1912 to 1913 as inspector of transportation, with headquarters at Winnipeg, Man. From 1913 to 1915 he was chief despatcher of the Kenora division; then to 1916 was trainmaster, and from 1916 to the date of his recent appointment was chief train despatcher of the Kenora division of the same road.

J. J. Horn

**F. A. Rutherford** has been appointed trainmaster on the Grand Trunk, with office at London, Ont.; **H. R. McLennan**, chief despatcher at Brantford, has been appointed trainmaster with office at Brantford, succeeding **R. E. Newcomer**, resigned, and **W. K. Rogers** has been appointed chief despatcher with office at Brantford, succeeding Mr. McLennan.

**Executive, Financial, Legal and Accounting**

**Colonel E. M. Heigho**, president of the Pacific & Idaho Northern, has resigned on account of ill health. Mr. Heigho was born at Grays, Essex, England, on October 23, 1867, and began railway work in 1882 as an office boy in the general freight office of the Michigan Central at Detroit, Mich., since which he was employed consecutively to 1886 in various clerical capacities in the local offices of the Erie & North Shore Dispatch, the Wabash, St. Louis & Pacific, and the Michigan Central, all at Detroit, Mich. In 1887 he was made chief clerk to the assistant freight claim agent of the Union Pacific at Kansas City, Mo., and later clerk in the freight auditor's office of the same road at Omaha, Neb. From 1887 to 1890 he served as chief clerk to the superintendent of the Idaho Central at Boise City, Idaho. In 1892 he was a rate

clerk in the freight traffic manager's office of the Missouri Pacific at St. Louis, Mo., leaving that position to become chief bookkeeper for a laundry company at Detroit, Mich. He returned to railway service as clerk in the freight traffic department of the Oregon Short Line at Salt Lake City, Utah, in 1899. Early in 1904 he was made auditor of the Pacific & Idaho Northern. In July of that year he was elected vice-president, general manager and treasurer of the same road, and in December, 1909, he was elected president, general manager and traffic manager. In September, 1915, he was appointed receiver of the Pacific & Idaho Northern, at which time he combined the duties of the offices of the general manager, traffic manager, treasurer and purchasing agent, with those outlined above. Mr. Heigho suffered a severe stroke of paralysis in November, 1917, but continued in intimate touch with his duties as president and general manager until October, 1918, when he resigned as general manager, but retained the presidency.

### Purchasing

**J. M. Velasco**, local purchasing agent of the National Railways of Mexico, at New York, has been appointed assistant to the general purchasing agent, with office at Mexico City, Mex., and **F. P. de Hoyos**, general agent of the traffic department, at New York, is now also local purchasing agent, with office at New York.

## Railway Officers in Military Service

**Major C. P. Stembel**, who was general superintendent on the Virginian Railway during 1917 and 1918, is now American delegate of a sub-commission, with headquarters at Saarbrücken, Germany, in the French zone of occupation.

## Obituary

**William H. Pleasants**, president of the Ocean Steamship Company, with office at New York, died on March 18, at the age of 56. Mr. Pleasants served several years as general freight agent at Jacksonville, Fla., on the Florida Central & Peninsular, now a part of the Seaboard Air Line.

**M. J. Greeney**, supervisor of the Lehigh Valley, with office at Buffalo, N. Y., died on February 28, at the age of 55. He was born at Reading, Pa., in June, 1864, and entered the service of the Lehigh Valley as a water boy at White Haven, Pa., in 1880. He was appointed roadmaster, at Sayre, in 1896, and since 1899 served as supervisor of track at Buffalo.

**V. T. Kissinger**, formerly superintendent of telegraph for the Chicago, Burlington & Quincy, and later connected with the Western Union Telegraph Company, died, on March 13, of heart failure at his home at Siloam Springs, Ark., at the age of 60 years. Mr. Kissinger was connected with the Western Union for many years as chief operator at St. Paul, Minn., and in 1890 he was appointed general wire chief and electrician, with headquarters at Chicago. In 1904 he entered the service of the Chicago, Burlington & Quincy as assistant superintendent of telegraph, at Lincoln, Neb., and later was advanced to the position which he held at the time of his death. He was retired on a pension by the Western Union Telegraph Company on last October.

**J. P. Bradfield**, formerly assistant general manager of the New York Central, died in Buffalo, N. Y., on March 12 at the age of 66. He was born at St. Catharines, Ont., and previous to November, 1882, served as despatcher on the Wallkill Valley, now part of the West Shore, and as agent and operator on the Lake Shore & Michigan Southern. He was then to March, 1885, train despatcher on the Hudson River division of the West Shore. In March, 1885, he was appointed superintendent of the same division and held that position until November 1890. He later served as superintendent of the New York, Ontario & Western and in February, 1895, was appointed superintendent of the Western di-

vision of the New York Central & Hudson River. From January to July, 1903, he was assistant general superintendent, and from July, 1903, to June, 1906, was general superintendent. He was promoted to assistant general manager of the same road in June, 1906, remaining in that position until March, 1907. He had been in poor health since his retirement from active service.

**Thomas Fletcher Oakes**, formerly president of the Northern Pacific, died at Seattle, Wash., on March 14, at the age of 76 years. Mr. Oakes was born at Boston, Mass., on July 16, 1843, and entered railway service on June 1, 1863, as purchasing agent on the Kansas Pacific, which position he held for two years when he became purchasing agent and assistant treasurer. The following six years he was general freight agent of the same road when he was elected vice-president, in which capacity he served one year, until his appointment as general superintendent. From April, 1879, to May, 1880, he was general superintendent of the Kansas City, Fort Scott & Gulf and the Kansas City, Lawrence & Southern, and from May, 1880, he was vice-president and general manager of the Oregon Railroad & Navigation Company for one year. The next two years he acted in the capacity of vice-president of the Northern Pacific, and the following five years he held the position of vice-president and general manager of the same road. On September 20, 1888, he was elected president of the Northern Pacific, combining the duties of the general manager with his office from the date of his appointment to May 16, 1889. On August 15, 1893, he was appointed receiver of the Northern Pacific in which capacity he acted until October 25, 1895.

**George Hodges**, manager of the troop movement section of the Division of Operation of the Railroad Administration, died suddenly at Washington on March 14, of pneumonia.

G. Hodges

Before the taking over of the railroads by the government, Mr. Hodges was general secretary of the Railroads War Board, and was also in general charge of the troop movement for the railroads. He has also been for several years chairman of the Committee on Relations between Railroads and affiliated committees of the American Railway Association, and he was recently appointed chairman of a temporary war committee of the transportation section of the reorganized American Railroad As-

sociation. Mr. Hodges entered railway service in 1886, with the Erie and remained with that road until 1903, when he entered the service of the Baltimore & Ohio. In 1908 he was appointed assistant agent for the receivers of the Seaboard Air Line, and in 1910 he became connected with the Special Committee on Relations of Railway Operation to Legislation, of which he became secretary and later chairman. In 1912 he was also appointed assistant general agent of the American Railway Association, with headquarters in Chicago, and in April, 1916, he was elected chairman of the Committee on Relations between Railroads.

**POINTERS FOR THE YARDMASTER.**—Train your men to keep their eyes open for cars of perishable or important freight when moving about the yard. They often can spare a few minutes to place or switch out an important car when you are not about; and when they do so give them credit for it. If they should ever make a mistake and get out the wrong car don't look wise and raise trouble, but pass it over in a tactful manner; there are two sides to the ledger.—H. D. McKee.

# EDITORIAL

Railway Age

DAILY EDITION

It is to be hoped that the American Railway Engineering Association will not adopt the suggestion which has been

## The Value of Large Committees

made that it follow the practice of the old American Railway Association in the appointment of small committees. Much of the success of the committee work of the Engineering Association has resulted from the exchange of ideas between the relatively large number of men on the committees incident to the consideration of their subjects and the preparation of their reports. It has been said that it is generally the case that a few members of a committee do most of the work. Even though this may be true the detrimental results of inactive members is much greater on a small than on a large committee. Furthermore, the active identification of a large proportion of the members of an organization doing committee work is a source of great strength to that organization. It is also of educational value to the members who have the opportunity of serving on the committees and participating in the discussions.

The reports submitted to the convention year after year by the Committee on Water Service are the best possible evidence of the necessity for a radical change in attitude towards this department on the part of many of the railroads. Each year the reports are evidence of the fact that

## Water Service Organization

they are the work of experts and that experts must necessarily be employed if the railroads are to derive the benefits that should accrue to them as a consequence of the work and findings of the committees. In the face of these facts it is surprising to note that the common practice of railroads is to organize the water service department as an addition to some other department or branch of the service, and without a responsible directing head. When the importance of the water service to the other departments, notably the motive power and operating departments, is considered it seems that common prudence would suggest the placing of this department on the plane its importance warrants.

The discussion of the report of the Committee on Iron and Steel Structures developed emphatic opposition to the continuation, in the new rules, of the prevailing method of proportioning structures through the use of low unit stresses in combination with moderate live loadings. The

## Low Unit Stresses

committee made very clear what its reasons were for adhering to this practice, namely, to avoid setting up a high unit stress as standard usage by persons who may or may not be qualified to assume the responsibility thereby incurred. This position is probably justified by the committee's realization of the exceedingly wide use which its specifications have received in the past. However, it is well to call attention to the fact that the prac-

tice of making due allowances for future ultimate loadings is not uncommon among railway bridge engineers in their individual practice, and as regards the specific method suggested by Messrs. Irwin and Motley, it is but just to recall that the late C. A. Carlidge, once chairman of this same committee, put this idea into actual use on his greatest work, the Metropolis bridge.

The Committee on Economics of Railway Operation presented an interesting and valuable discussion of the economic length of operating districts in its report submitted yesterday. By implication it approves districts considerably in excess of 100 miles in length. This is in contrast with

## The Length of Engine Districts

the marked tendency towards the shortening of engine runs. In the early days of railway operation, particularly on the Western prairie roads, runs of 200 miles were not uncommon. The passage of the 16-hour law, the increasing density of traffic and resulting delays to trains and other influences have tended to shorten these districts until on many of the lines built in recent years, such as the Western Pacific and the Pacific Coast extension of the St. Paul, the average length of district is approximately 110 miles. The present tendency is distinctly towards the shortening of hours of work and this in turn leads to shorter engine districts. For this reason the attitude of the committee is somewhat surprising.

The preparation of specifications for maintenance of way practices and materials is one of the most important and valuable functions of the American Railway Engineering Association. At the same time it is one which the association must perform with the utmost care, for many of the specifications tend to establish fundamental principles of practice whose influence is far-reaching. For this reason every effort should be made to secure the most complete discussion and consideration of specifications before their final adoption. This in turn requires that the membership be given an adequate opportunity to study the specifications before they are required to pass upon them.

## Prompt Publication of Specifications

The association was called to pass upon no more important question this year than the specifications for steel bridges presented by the committee on Iron and Steel Structures, yet many members of the association were unprepared to pass upon them yesterday owing to the fact that they had received these specifications only a few days in advance of their departure for the meeting, and in many instances they had no opportunity to consider them at all. This is a mistake which has led frequently in the past to action by the association referring the recommendations of committees back for reconsideration and resubmission the following year, owing to the desire of the members to play safe and take no action which further consideration might show to be unwise. Some associations require all matters on which action by the

association is desired to be distributed to the membership at least 60 days before the meeting. Such a provision may or may not be wise, but it has much to commend it. The past year presented many difficulties to committees in the conduct and completion of their work and an unnecessarily heavy load has been thrust upon the secretary's office because of the late receipt of reports. The committees can promote the interests of the association in no more effective way than by completing their reports in ample time for their distribution to the membership well in advance of the annual meeting.

### Senator Pomerene's Address

THE PROGRESS WHICH has been made within recent years in the education of leading public men regarding the railway question was very well illustrated by the address which Senator Pomerene of Ohio delivered at the dinner of the American Railway Engineering Association on Wednesday evening.

With some criticisms of the Railroad Administration which Senator Pomerene made, it is impossible to agree. The senator evidently had placed too much reliance upon alleged information regarding the advance in rates which had been furnished to the Senate committee by Clifford Thorne. He evidently had also accepted Mr. Thorne's well known views regarding the purpose and effect of some other things the Railroad Administration has done. The public man who takes either Mr. Thorne's information or views at their face value is pretty sure to go wrong regarding the particular matters to which they relate.

Senator Pomerene's address made it clear, however, that he has got a comprehensive grasp of the railroad problem and if the minds of the majority of the members of Congress are moving in the same direction that his is, a satisfactory solution of the problem should be reached in a comparatively short time in case Congress is convened early in extra session. Senator Pomerene very properly criticised the attempt to continue government operation for the purpose of making an experiment when government control was adopted, not to prove or disprove the advantages of government operation, but solely as a war measure. He recognized the fact that the laws need to be changed so as to permit such agreements and consolidations between the railways in the same territory as the Interstate Commerce Commission may deem not prejudicial to the public interest.

He advocated government regulation of the issuance of railway security issues, a policy which all students of the subject now favor. He implied that he would favor similar provision which would establish a definite standard by which the regulating bodies in fixing rates should be required to measure their reasonableness and adequacy and it seems reasonable to infer from his address that he would be in favor of requiring the railways to be permitted to earn an average of six per cent upon the investment of their properties. There was little criticism of private management of the railways in his address and much criticism of government management.

Senator Pomerene is a Democrat, but he and many of the other leading Democrats in Congress agree with the leading Republicans in opposing government ownership and in favoring the return of the railways to private operation under legislation which will enable them to render better service and operate more efficiently and at the same time adequately increase their facilities. There is a striking difference between the addresses on the railroad question which were being made by leading public men a few years ago and the addresses which are being made now. This change must, and in fact does, reflect a great change in

public opinion and with public opinion what it is now, there is good grounds for hoping that a satisfactory solution of the railroad problem will soon be found in spite of the fact that the situation existing at this particular time is the worst, as a whole, that has existed for 25 years.

### Automatic Train Control

THE AUTOMATIC TRAIN CONTROL COMMITTEE appointed by the Railroad Administration has been in attendance at both the stated meeting of the Signal division of the A. R. A. and the annual meeting of the A. R. E. A. The instructions to the committee were to make a study of and report upon automatic train control devices which have been installed or which may be practicable. The work of the committee includes among other things the study of plans covering such devices; the drawing up of requisites as a guide for such study; the inspection of such devices as have been installed, and the making of recommendations covering the installation and further test of such apparatus. Certain requisites in the past have been so drawn that they have hampered the development of devices of this character, but it has been realized to be a mistake to attempt to draw up stringent requisites on theoretical assumptions which are not backed by practical experience.

The tentative requisites presented by the present committee are along more proper lines and instead of restricting should tend to encourage development work. They may perhaps not include all that is desired and may appear to be conflicting in certain instances, but they are good as a basis for a start and can be revised or added to as occasion demands. The committee inspected the automatic train control exhibits at the Coliseum yesterday afternoon and to-day it starts on the first of its inspections of the automatic stops already installed.

### Progress in Scientific Knowledge

THE MATERIAL presented by the Committee on Masonry on considerations affecting the strength of concrete, when considered in the light of other information brought forth during the past 20 years, drives home the fact that the pioneers in the use of concrete were compelled to proceed in their work with extremely limited knowledge of the materials with which they were dealing. As the result of facts developed from time to time, practices in construction have gone through numerous transitions. We have turned from dry concrete to wet concrete and now appear to be turning again to dry concrete. In view of some of the startling developments brought out in the course of experimentation, one is inclined to wonder at the courage of the early builders in concrete. Perhaps they enjoyed a condition of blissful ignorance. At any rate most of their structures have withstood the tests of use and time, but the large factors of safety which their caution (in the absence of exact data) urged them to use, may be largely responsible for their success. This raises the question of the justification for proceeding with such limited information that efficient designs were not practicable. Has an economic waste resulted from the use of what we now consider wasteful designs? The answer is that more economic waste would have resulted if engineers had refrained from using concrete until more of its real properties were known. In fact, the properties would never have become known had men been too cautious in the use of the material. Progress comes from using the resources at hand, however imperfect, since the ideal will never be attained.

# American Railway Engineering Association Proceedings

A Report of Thursday's Sessions, Including the Presentation of  
Seven Committee Reports and Closing Business

THE TWENTIETH ANNUAL CONVENTION of the American Railway Engineering Association drew to a close on Thursday. The morning session was called to order at 10 o'clock by Vice-President Stimson, President C. A. Morse still being confined to his room by illness. Reports were presented on Iron and Steel Structures, Masonry, Water Service, Wooden Bridges and

Trestles, Uniform General Contract Forms, Economics of Railway Operation and Economics of Railway Location. These were followed by routine business and the installation of the new president, Earl Stimson. Abstracts of the reports and the discussions are given below.

## Report of Committee on Masonry

THE COMMITTEE has no recommendations to make at this time. The question of revising the definitions in the Manual has received consideration and it was decided to completely revise this portion of the Manual next year.

A report on different methods of depositing concrete under water is given in Appendix B.

A report on specifications for slag aggregate is given in Appendix D.

A report on: (1) The effect upon the strength and durability of concrete not having a

Scribner Jr., F. P. Sisson (G. T.), J. E. Smith (Univ. of Ill.), Job Tuthill (P. M).

### Appendix B—Depositing Concrete Under Water

The committee does not feel that any definite conclusions can be presented at this time. There is, however, some data which it believes desirable to present as representing its opinion as to the best practices to be followed in depositing concrete under water.

In general, where it is possible, the depositing of concrete under water should be avoided, even if such action results in additional expense and possible delay to the work. The need of close supervision by men competent to handle this class of work is of the utmost importance, and concrete should never be deposited under water without experienced supervision. Many failures which have occurred in concrete deposited under water, especially where the structure is located in sea water, can be directly traced either to ignorance or lack of supervision.

Of the methods used, the following seem to give the best results:

1. The concrete is lowered in large buckets having a hinged bottom which sets sufficiently far above the lower edge of the bucket so that it may open freely downward when the bucket reaches the surface upon which the concrete is to be deposited. The top of the bucket is left open, and care is taken to see that the bucket is completely filled before lowering.

2. The concrete may be passed through a vertical tube or tremie reaching down to the surface upon which the concrete is to be deposited.

3. Jute or cloth bags, from two-thirds to three-fourths

sufficiency of moisture present throughout the period of hardening as compared with concrete fully supplied with moisture. (2) Methods of providing moisture during the period of hardening and (3) Remedy for concrete hardened with insufficient moisture, is given in Appendix E.

Committee: F. J. Thompson (I. C.), chairman; J. J. Yates (C. R. R. of N. J.), vice-chairman; R. Armour (G. T.), G. E. Boyd (D. L. & W.), H. A. Cassil (P. M.), C. S. Coc, T. L. Condon (Cons. Engr.), J. K. Conner (L. E. & W.), C. S. Davis (Pa. Lines), J. L. Harrington (Cons. Engr.), W. K. Hatt (Purdue Univ.), L. J. Hotchkiss (Cons. Engr.), Richard L. Humphrey (Cons. Engr.), Noah Johnson (Wab.), M. S. Ketchum (Univ. of Colo.), W. M. Kinney, W. S. Lacher (Ry. Age), A. E. Owen (C. R. R. of N. J.), W. M. Ray (B. & O.), C. P. Richardson (C. R. I. & P.), G. H.

filled, have been used successfully. These are placed in a header and stretcher system so that the whole mass is interlocked.

4. Where it is difficult to construct a cofferdam or monolithic work is not required, premolded concrete blocks of large dimensions have been used successfully.

5. A concrete depositing bag made of canvas or other suitable material is a variation of the bucket system. This is filled and the mouth of the bag closed by one turn of a line so looped that a pull on the line will release it. The bag is lowered mouth down to the surface upon which the concrete is to be deposited, and a sharp pull on the line opens the bag and permits the concrete to be deposited. This method does not have the disadvantage of the closed top bucket, since the bag will collapse as the concrete flows out.

There are a number of other methods that have been used, such as depositing directly through the water; depositing a portion of the concrete by one of the above methods in the corner of the form and the balance progressively from wheelbarrows or buckets on the sloping surface, thus gradually filling the form; allowing the concrete to partially set in air and then depositing it in a plastic condition; depositing the concrete dry without the use of water; attempting to grout a foundation composed of riprap or coarse gravel by means of pipes sunk at intervals into the foundation. Although occasionally fair results have been obtained, all of these methods are dangerous, as they almost uniformly result in segregation of the materials or the washing out of the cement.

In depositing with drop bottom buckets, the drop bottom bucket should be so arranged as not to discharge the load until the bucket reaches the surface upon which the concrete is to be deposited. In lowering the bucket, care should be taken that unnecessary wash is not produced. This may be avoided by slowing up the operation when the bucket is passing through the water. The bucket, when the load is discharged, should be withdrawn slowly until clear of the concrete. In depositing concrete under water by this method it is imperative that the work be continuous and sufficiently rapid to insure bonding of the successive layers.

In depositing through tremie or vertical tubes the device should be about 14 or 16 in. in diameter, made up in sections so that the length may be adjusted to the depth of the water. The joints should be made flanged and the tube put together with gaskets, in order to avoid leakage of the water into the tube. The top should be flared, in order to receive the concrete properly. The tube should be suspended in such manner that it may be moved laterally as required. The upper end is placed near the level of the working platform, while its lower end rests on the surface upon which the concrete is to be deposited. When the operation starts the tube should be filled in such manner that the concrete is not permitted to drop down through the water. This is accomplished in several ways: One is to place the bottom of the tube in a box, partially filling it with concrete so as to seal the bottom, then lowering the box into the position in which it is to be used. One requisite of this method is that the tube must at all times be kept filled with concrete and the greatest care exercised to see that the charge is not lost in moving it about the bottom.

While the bagging method insures good concrete and will prevent the formation of laitance, it is open to the objection that a monolithic foundation is not secured. Where the walls of the foundation formed by the bags will not be exposed to scour, the opinion is that the method will give satisfactory results. This method can be used to advantage in sealing the foundations of cofferdams where it is impracticable to prevent inflow of

water through crevices in the bottom. In using this method it must be borne in mind that satisfactory results cannot be obtained unless the bags are carefully placed by hand.

Premolded concrete blocks can be used to advantage on a prepared foundation in any heavy construction where the units can be large enough not to require bonding.

Concrete to be deposited in water should be of a richer mixture than when deposited in air, and a leaner mixture than 1-2-4 should not be used. It is the opinion of the committee that only so much water should be used as will make the concrete of a plastic consistency. It is the opinion of the committee that washed gravel of somewhat smaller size than used in the open air concrete will give the best results. The aggregate should be capable of producing dense concrete.

In depositing concrete under water it is imperative that the water be still and that the concrete shall not be exposed to current until it is fully set. One of the essentials of depositing concrete by any of the above methods is that the concrete be disturbed as little as practicable during the depositing, thus avoiding the formation of laitance. When a job is started the concrete should be deposited continuously until the finished surface is reached or the concrete brought above the water level so that the laitance may be removed in the air. The formation of horizontal construction joints under water should be avoided. Concrete should be thoroughly mixed before it is deposited in water and, therefore, hand mixing should never be permitted.

#### Appendix D—Specifications for Slag Aggregate

After a study of the data available on the properties of slag and of specifications for slag as an aggregate in concrete, your committee does not feel warranted in submitting a specification for adoption by the Association. The following discussion of this subject is submitted as information. This applies to the use of slag as the *coarse* aggregate only.

The committee believes that the general requirements for coarse aggregates for use in concrete as specified in paragraph 4, page 282, of the Manual, may be applied to blast furnace slag without modification.

Further requirements for slag in current specifications examined cover such matters as origin, method of cooling, age, weight, strength and chemical limitations. At the end of this report a table is presented which lists the requirements of ten specifications for slag to be used in concrete and which demonstrates a marked lack of uniformity. We offer the following comments:

As to origin, only two specifications definitely called for blast furnace slag, all others read so as to permit the products of the steel furnace as well as the blast furnace.

Air cooling is general and represents the type of material desired. This can be required without causing any commercial difficulties. When it comes to the matter of age or time of seasoning, the case is not so clear and the requirements vary. Some specifications demand a year's seasoning, others permit the use of the material after two or three weeks. The necessity for this depends on the nature of the slag. According to Sanford E. Thompson, a limestone slag (one containing only 1 to 2 per cent of magnesia) is not stable until seasoned for considerable periods, while a magnesia slag (one containing 4 per cent or more of magnesia) is commonly used within two or three weeks after banking, as no chemical change is apparent on exposure.

The weight is the most definite requirement and concerning which there is the greatest uniformity. Seventy pounds per cu. ft. would seem to be a conservative yet reasonable figure.

Strength requirements are considered as impractical and without adequate precedent. Those discovered apply only to materials to be used in pavements where resistance to abrasion or surface impact is important.

Chemical limitations are placed in specifications for slag presumably to exclude materials containing unstable compounds or elements of a disintegrating or corrosive nature. The content of sulphur receives the widest attention in this regard and the limitation has been variously stated at from 1 to 2 per cent where it is covered in the specification.

The presence of unslaked lime seems to be of more vital importance since the presence of this material would obviously tend toward unsoundness of the slag on exposure to moisture unless neutralized by acid ingredients. It is because of this that some specifications place the limitations on the lime content and specify a minimum amount of silica to insure that enough of the SiO<sub>2</sub> radical shall be present to stabilize the CaO. As some users of slag are of the opinion that the seasoning of the material in a bank exposed to the weather would insure the elimination of any free lime and as there appear to be no test data available tending to demonstrate the adequacy and efficacy of these chemical requirements for sulphur, lime or silica, the committee does not feel qualified to make any definite recommendation in this regard.

In using slag in concrete it is necessary to include a requirement in the specification for the concrete that will insure proper proportions. Very strong concrete may be made with slag if the proportion of cement and fine and coarse aggregates are such as to provide high density, but owing to the porous nature of most slags, somewhat larger quantities of cement and fine aggregate will be required to obtain the desired density than is the case of most ordinary materials used as coarse aggregates.

**Specification Requirements for Slag**

Authority	Strength	Origin	Air Cooled	Age	Weight lb. per cu. ft.	Sulphur Not Over Per Cent	Lime, Not Over Per Cent	Silica, Not Less Than Per Cent
New York Central		Blast Furnace	Yes	2 mo.	70	1.7*	48	33½
Sanford E. Thompson			Yes		65†	1.7	48	32
Central of Georgia				1 yr.				
Viaduct Cuyahoga County, Ohio					74			
Bldg. Spec. Philadelphia		Blast Furnace	Yes		75	1.3		
Ohio State Highways A	Toughness not less than five				70	1.5	45	32
Ohio State Highways B	Toughness not less than five				65	2.0	45	32
Ohio State Highways C						2.0	45	30
Youngstown City Engineer			Yes	Lime slag 3 months Mag. slag less	68			
U. S. Department of Agriculture					70			

\*No free sulphur, chemical analysis every 2,000 cu. yd.  
 †After shaking to refusal.  
 ‡Abrasion loss not more than ten. Factor of hardness not less than twelve. Factor of toughness not less than six.

**Appendix E—Effect of Quantity of Mixing Water and Curing Conditions on the Strength and Wear of Concrete**

A series of tests made by Professor D. A. Abrams at the Structural Materials Research Laboratory, Lewis Institute, Chicago, show the importance of proper storage during the early hardening period, both on the wearing qualities and strength. The results of these tests indicate that with small specimens a few days' moisture is help-

ful to the strength and wearing qualities, while provision for moisture for several weeks will produce results almost equal to those which would be obtained with continuous favorable storage conditions.

While the results on small specimens only approximate the results to be expected where large masses of concrete are used, it is not unreasonable to assume that particularly where the concrete is to be used as a wearing surface, great improvement in the strength and wearing qualities can be obtained by providing moisture to the hardening concrete for several weeks after the concrete is mixed and placed. In mass concrete, while provision for moisture is desirable and should be encouraged where practicable, it is not absolutely imperative as mass rather than high strength is sought.

In all reinforced concrete structures, however, some provision should be made to prevent the rapid drying out of the concrete, which almost invariably occurs during the summer months. All concrete should be protected from the direct rays of the sun and unless the expense is absolutely prohibitive, sprinkled for from several days to several weeks, depending upon the character of structure.

Moisture can best be provided to hardening concrete by covering the concrete with earth, sand, straw or other moisture-retaining material and sprinkling this covering at least night and morning for from one to two weeks after the concrete has been placed. If the days are real hot, additional sprinklings during the day will be required and the covering should be thicker so that drying out will take place less rapidly.

Concrete which has hardened with insufficient moisture can be improved somewhat by sprinkling even after it is several weeks old. The most serious result from failure to provide moisture occurs with sidewalks, floors, station platforms, etc.

**Discussion**

(F. L. Thompson (chairman) presented the report.)

Prof. A. N. Talbot (U. of Ill.): Concrete is a complex material. There are many elements entering into its strength and quality. I have jotted down a few items concerning some of the elements which go into the making of concrete at the beginning, and I want to present them to you. They may seem elemental to some, and yet it does seem to be worth while to give consideration to the question as to why additional water gives reduced strength, why voids in the aggregate reduce strength, why surface area of the aggregate itself, a larger amount of that, will tend to reduce strength. Here are the items.

1. The cement and the mixing water may be considered together to form a paste, which becomes the glue that holds the particles of aggregate together.
2. The volume of the paste is approximately equal to the sum of the volume of the particles of the cement and the volume of the mixing water.
3. The strength given this paste is dependent upon its concentration; the more dilute the paste, the lower its strength; the less dilute, the greater its strength.
4. The paste coats or covers the particles of aggregate partially or wholly and also goes to fill the voids of the aggregate partially or wholly. Full coating of the surface and complete filling of the voids are not usually obtained.
5. The coating or layer of paste over the particles forms the lubricating material which makes the mass workable; that is, makes it mobile and easily placed to fill a space compactly.
6. The requisite mobility or plasticity is obtained only when there is sufficient paste to give a thickness of film or layer of paste over the surface of the particles of aggregate and between the particles sufficient to lubricate these particles.
7. Increase in mobility may be obtained by increasing the thickness of the layer of paste; this may be accomplished either by adding water (resulting in a weaker paste) or by adding cement up to a certain point (resulting in a stronger paste).
8. Factors contributing to the strength of concrete are then the amount of cement, the amount of mixing water, the amount of voids in the combination of fine and coarse aggregate, and the area of surface of the aggregate.

9. For a given kind of aggregate the strength of the concrete is largely dependent upon the strength of the cement paste used in the mix, which forms the gluing material between the particles of aggregate.

10. For the same amount of cement and same voids in the aggregate, that aggregate (or combination of fine and coarse aggregates) will give the higher strength which has the smallest total area of surface of particles.

11. For the same amount of cement and the same surface of aggregate, that aggregate will give the higher strength which has the less voids, since additional pore space will involve a more dilute paste.

12. Any element which carries with it a dilution of the cement paste may in general be expected to weaken the concrete—smaller amounts of cement, the use of additional mixing water to secure increased mobility in the mass, increased surface of aggregate, and increased voids in the aggregate all operate to lower the strength of the product.

A certain degree of mobility is necessary in order to place concrete in the forms in a compact and solid mass, the degree varying considerably with the nature of the work; and we must accept it as true that generally it will be found necessary to sacrifice strength to secure the requisite mobility.

More thorough mixing not only mixes the paste and better coats the particles, but it makes the mass mobile with a smaller percentage of mixing water and this results in higher strength. Any improvement in method of mixing which increases the mobility of the mass will permit the use of less dilute paste and thereby secure increased strength.

B. R. Leffler (N. Y. C.): The report recommends one minute and a half as the time for mixing the concrete. We tried that on a large job. We finally compromised by cutting it down to a minute. Our observation showed that under the ordinary loose methods the time of mixing was ordinarily about 15 or 20 sec. The time of mixing is an important feature in regard to the lubrication of the particles of the aggregate, so as to produce plasticity and ready flowing of the concrete. I think within certain limits it will be found that the desired plasticity can be attained with the least amount of water and the proper time of the mixing. The use of excess water is purely a contractor's method of placing the concrete with the least expense. The question of the proper time of mixing is dependent on the kind of concrete mixer used, and I think that is an important subject for investigation.

G. W. Kittridge (N. Y. C.): I want to say a word in commendation of the report and the discussion by Prof. Talbot. I think such a discussion as Prof. Talbot has given is what makes the proceedings of this association of such great value to its members and the public generally.

(The committee was dismissed with thanks.)

## Report on Wooden Bridges and Trestles

THE COMMITTEE HAS NO recommendations to make as to the subject-matter in the Manual except in the way of intensive revision and re-writing of the entire chapter on Wooden Bridges and Trestles. It is not thought expedient to advise such revision at this time or at least until a new edition of the Manual is issued.

The especial consideration of expanding the table of allowable stresses on page 244 to include treated timber has been given extensive study during the past year. An investigation of experiments for

determining the comparative strength values of untreated and treated timber in large sticks discloses the fact that there are extant only two published records of such experimental tests. One of these is to be found in Bulletin Number 286 of the United States Department of Agriculture, and the other consists of a monograph by H. B. McFarland, engineer of tests for the Atchison, Topeka & Santa Fe, beginning on page 281, Volume 17, of the Proceedings of the Association.

Until further experiments have been conducted in the way of comparing treated and untreated timber in large sticks, it is perhaps best for each engineer to use his own judgment as to the lower values of allowable stresses which should be applied in the design of treated timber trestles, keeping in mind that such values may be as much as one-third lower than for untreated material.

### Specifications for Timber and Building Lumber

Our investigations and studies during the past year lead us to believe that an entire rearrangement of the chapter on Wooden Bridges and Trestles, as now published in the Manual, would be profitable. We also are of the opinion that a separate chapter to be headed "Timber and Lumber," which should contain general specifications and classification and grading rules for all kinds

of timber and lumber to be used for each of the different classes of work on railways, might well be published in the Manual.

To this end the committee submitted tentative general specifications and classification and grading rules developed during the study of this work for the past year. These specifications have been drawn up after careful consideration and a thorough study of the work now standing in the Manual; recommendations and reports of committees as published in the Proceedings, especially the Special Committee on Classification and Grading Rules; the specifications of the American Society of Testing Materials; the work of the United States Forestry Board; reports of laboratory studies from various scientific institutions; a detailed study of the Standard Specification and Grading Rules of all the lumber manufacturers' associations, and various other sources.

It has been the attempt to draw up such general specifications that they might be referred to as standard for material of this kind under all circumstances. Special attention has been given to standard manufacturing processes so that no decided changes will be necessary in the best practices now followed by the manufacturers, yet satisfactory material may be obtained by the railways at reasonable prices. (These suggested tentative specifications were then presented as information.)

Committee: W. H. Hoyt (D. M. & N.), chairman; A. O. Ridgway (D. R. & G.), vice-chairman; H. Austill, F. Auryansen (L. I.), A. D. Case, E. A. Frink (S. A. L.), W. L. Darden (S. A. L.), E. A. Hadley (U. S. R. R. A.), G. A. Haggander (C. B. & Q.), F. F. Hanly (B. & O.), H. T. Hazen (C. N.), C. S. Heritage (K. C. S.), F. S. Schwinn (I. & G. N.), C. S. Sheldon (P. M.), I. L. Simmons (C. R. J. & P.), D. W. Smith (H. V.), A. M. VanAuken (B. & O. C. T.), W. H. Vance (St. L. S. W.), D. R. Young (D. L. & W.).

### Discussion

W. H. Hoyt (Chairman): With regard to the report of the sub-committee considering the question of unit stresses for treated timber. I wish to bring out the fact that there have not yet been at this time any extensive tests made anywhere upon large-sized sticks, comparing the treated timber with untreated timber. We found we

had only two sets of tests and these varied considerably. In the matter of a unified form of specifications for construction timbers and building lumber for use on railways, the question was raised as to just what was meant or how this question should be handled. The committee attempted to draw up a general specification that might be used as a basis for drawing up any particular specification that might be needed. This was for the purpose of trying to keep down in volume the size of the specification as published in the Manual. In other words, we tried to standardize the specification. The thing that we wanted to do was not to draw details that would be hard to manufacture, or would be subject to and require special arrangements, and consequently higher cost. Therefore, we consulted carefully the specifications of all the manufacturers' associations and tried to embody in this general specification a basis from which we could draw any particular specification required. One can very easily see that if we attempted to draw up a special specification for every kind of timber and lumber being used,

a specification complete in itself, it would make a much larger book than our present Manual.

W. H. Courtenay (L. & N.): The committee points out that some railways use one kind of timber, supposed to be convenient to them, and have specifications for that particular kind of timber. Other railroads may use various kinds of timber.

Mr. Hoyt: Of course, that is true. In different parts of the country different kinds of timber are used on different railroads. If we were to attempt to draw up a detailed specification of each kind of timber, it would not only be bulky, but would only cover particular locations. It was that point of view that the committee had in mind in trying to concentrate and draw a general specification that might be used as a basis from which detailed specifications could be drawn to cover particular locations and particular roads. The committee simply submits this report for this year as a progress report and study, and hopes to continue it next year.

(The committee was dismissed with thanks.)

## Report of Committee on Water Service

in the Manual.

2. That the report on progress of regulations with reference to purity of drinking water furnished on trains and premises of railroads (Appendix B), be received as information.

3. That the final report on impounding reservoirs (Appendix C) be received as information.

4. That the matter of plans and specifications for typical water station layouts be given more definite title.

5. That the report on meters (Appendix D) be received as information.

6. That the report on locomotive flue failures and methods of correcting water conditions (Appendix E) be received as information.

7. That the report on rules and examination questions for care of pumping stations (Appendix F) be adopted by the association and inserted in the Manual.

### SUGGESTED SUBJECTS FOR NEXT YEAR'S STUDY AND REPORT

1. Report on suitable methods for chemical storage at water softening plants.

2. Report on progress of regulations and methods for supplying pure water for drinking purposes on trains and premises of railroads.

3. Study of economies to be derived from impounding reservoirs.

4. Report on methods of supplying drinking water to passenger equipment with smallest possible opportunities for contamination.

Committee: A. F. Dorley (M. P.), chairman; J. L. Campbell (E. P. & S. W.), vice-chairman; J. T. Andrews (B. &

O.), R. C. Bardwell (M. P.), J. M. Brown (C. R. I. & P.), C. Bucholtz (Eric), E. M. Grime (N. P.), W. C. Harvey (C. G. W.), C. R. Knowles (I. C.), E. G. Lane (B. & O.), E. H. Olson (A. T. & S. F.), W. A. Parker (St. J. & G. I.), H. N. Rodenbaugh (Sou.), R. W. Willis (C. B. & Q.).

### Appendix A—Revision of Manual

PAGES 450 AND 451—SUGGESTED REVISION: FOAMING AND PRIMING

“Foaming” is the term applied to the action of a boiler when the steam bubbles up over the surface of the water to such extent that the steam space and dome are filled, and syphoning action is started which causes water to be carried over with the steam into the engine cylinders. Under these conditions steam loses much of its expansion properties and the effective operation of the locomotive is thereby materially impaired.

This action is due primarily to the presence of suspended matter in the water. The suspended matter gives a mechanical strength or tenacity to the liquid in the thin films over the steam bubbles, which, rising to the surface, retain their films and collect to produce foam. It is aggravated by the concentration of alkali salts present in the natural waters or added by the process of water softening, which increases the viscosity of the surface films.

The concentration of foaming salts reaches a critical point between 100 and 200 grains per gallon, depending upon the character of the alkali salts and the amount of suspended matter in the water. To prevent foaming the concentration must be kept below this point. The best results are obtained by the systematic and frequent blowing off of the boilers, and occasional complete blowing down and washing boilers at terminals. The cost of maintaining the concentration below the critical point equals the cost of pumping, treating, and heating to boiler temperature the amount of water necessary to be blown out.

When the unavoidable concentration of foaming salts is so great that the required amount of blowing off is impractical or uneconomical, anti-foaming compounds can be used with good results.

“Priming” is the sudden evolution of steam from a heating surface which throws water in sudden, large volumes up into steam space, and is due either to poor design of the boiler and to its being worked beyond capacity, or to the sudden opening of the throttle. While the effect upon the locomotive is temporarily the same, priming is different from foaming and can be mechanically

controlled to large extent by proper handling of the engine.

### Appendix C—Design of Impounding Reservoirs and Conditions Under Which They Are Economical

Reservoirs used for supplying water for railroad purposes generally require comparatively small drainage areas and obviously stream flow operations are very limited and probably in the majority of cases entirely lacking, consequently the application of some method based on other obtainable physical data is highly desirable; but this should be supplemented by at least some short term stream flow records. Generally impounding water supply reservoirs are economical and justified at such points or places where the cost of the water so furnished does not exceed that of any other usable and equally dependable supply. They are the chief source of water supply in localities where the surface streams have intermittent flow, where the water in surface streams is too bad for treatment, where the sub-surface supply is insufficient or untreatable, and where there is sufficient rainfall to produce an adequate surface run-off.

The classes of impounding reservoirs referred to in this article relate to those situated in draws or small valleys supplied by surface run-off only and having comparatively small drainage areas, and where the watershed contains no bodies of water other than the reservoir. If possible a site should be chosen for the reservoir which is higher than the point at which the water is to be delivered, thereby securing the much-desired gravity pipe line. The gravity feature of a reservoir is worth the capitalized value of pumping which can either be put in pipe line or reservoir.

In general no site should be selected which has a drainage area of less than 2.50 square miles, with a deep and steep storage basin permitting a water depth of at least 25 ft. However, local conditions may vary this. The ratio between the land area of a watershed and the high water contour in a proposed reservoir should be not less than 35, preferably not less than 40. The surface character of the watershed should be such that a maximum surface run-off is secured. This condition in general calls for a drainage area of rather steep slopes of impervious material and non-cultivated surface and of principally short grass vegetation, thereby reducing silt to a minimum. Matters of watershed jurisdiction, possible water pollution and water diversion should be carefully considered, as well as favorable dam and spillway sites.

The capitalized value of the cost of furnishing water should be ascertained both for present consumption and twice and three times present supply, being sure to take all cost items into consideration, the following being suggested items, viz.: Cost of present plant and equipment. Cost of future additions. Interest on cost. Renewals. Maintenance. Operation (includes treatment). Cost of water when purchased. Economical benefits from improved quality.

Knowing the actual total present cost of water and having estimated the cost of double and three times the present consumption, we will then have figures serving as guides in determining the approximate limiting permissible expense that might be profitably invested in an impounding reservoir.

Approximate estimates should now be prepared and if the project is found to be feasible, more detailed study should be made of all contributory factors in somewhat the following order:

The maximum present and near future demands should be known. The history of the increase in traffic on the particular line on which the water station is to be located

should be known. If traffic history is not available, it is reasonably legitimate practice to design the reservoir for at least twice the immediate or near future demands for intermediate main line stations and at least three times for terminals. On some main lines the terminals or division points double their water requirements about every ten years, while at intermediate points this occurs every 20 to 25 years. No reservoir (even on branch lines) should be constructed that is not capable of supplying at least twice the present or near future demands.

The size and character of the drainage area will necessarily be largely governed by the local topography and precipitation. The surface should be of non-porous soil and steep slopes, as previously mentioned, thereby securing a high rate surface run-off. The watershed should include no closely inhabited area. The sub-surface run-off is neglected in this discussion as far as it pertains to the furnishing of a water supply to the reservoir. Excessive drainage area should be avoided as this is conducive to lack of control or jurisdiction, thereby increasing liability to pollution; also an excessive watershed may entail a large and costly spillway. The size of the drainage area should be carefully ascertained. The elevation of the water table should be determined at several places, including a point near the dam site.

The site should be as close as possible to the point of consumption. Its shape should be such that a minimum water surface is exposed to evaporation. It would be desirable to have it surrounded with timber to break up the winds and throw a maximum amount of shade on the water surface. The reservoir should be carefully examined as to the impervious character and dip of the strata of material that constitute its bed and banks, having in mind the securing of as nearly as possible a water-tight storage basin. Its shape should be deep and contracted with steep banks and flat bottom, generally the minimum water depth should be three times the water evaporation plus the seepage, but in no event less than 25 feet. This gives a little leeway for silting.

One of the first things to do is to establish a relation between rainfall and surface run-off to serve a check on the computations. Some method of gaging the discharge from the particular drainage area should be maintained during at least several successive rains. Get the average and the annual rainfalls from the oldest weather station in the district. Examine for occurrences of two successive or single drought years and whether they were preceded by one or two or more years of average rainfall, then do likewise for several of the nearest surrounding weather stations. Then compare the monthly rainfalls at the same stations for the prospective period to be studied. Now select from the data collected two successive years having average rainfall and succeeded by one or two drought years and if there is reasonable agreement between the several stations get the daily rainfall records from the one nearest to the watershed and most likely to be in the path of the rainstorms reaching the drainage area for the two average years and the drought period. It is generally a good plan to go back one extra year and to include the year succeeding the drought period.

The evaporation from land areas usually is the most important factor in determining run-off from a watershed. It varies with the rainfall, season, temperature, slope, humidity, vegetal cover, wind, topography, surface and subsoils. Of these, temperature is the most important factor governing the rate of evaporation, as the rate of evaporation from land varies closely with the temperature.

Frequent light rains keep the surface soil and vegetation moist, thus favoring greatest evaporation, while

slow, steady rains favor ground percolation. Torrential rains favor surface run-off. All forms of vegetation reduce the rate of evaporation of free moisture, particularly due to the shading produced. The annual land evaporation loss varies from about one-quarter to two-thirds of the yearly rainfall.

Transpiration is a process of evaporation of water from the breathing pores of leaves and other vegetable surfaces. It is practically limited to daylight hours and to the growing season. The amount of water used by plants during the growing season depends mainly on the quantity available within reach of the root system. In estimating the transpiration loss from a watershed the exact character of the vegetation is not as important a factor as it might first appear except for lands in arid and semi-arid regions. Nearly all watersheds have mixed vegetation and consequently it does not vary between considerable limits. For tentative purposes 6 to 10 in. may be used for the entire area for the season.

Heavy rates of precipitation cause large surface flow. Substantially all of the rain falling upon frozen, ice-covered ground will run off into the water course and when carrying ice and snow with it in sufficient quantities the surface flow may exceed the rainfall.

In spring and fall when the land evaporation and transpiration losses are small all soils, as a rule, carry substantially the entire possible amount of capillary water, between rains. Under such conditions the capacity of sand for gravity water is about four in. per vertical ft., while the capacity of heavy clay is but a little more than one in. per vertical ft. In consequence of which clay soils quickly become saturated and thereby permit large surface flow. Tilled land will facilitate ground absorption of the rainfall, thus reducing the surface flow. Surface flow resulting from moderate rains is retarded and to some extent diminished by lakes, ponds or holes no matter how small they are.

On the Mississippi River watershed (except possibly near the Gulf of Mexico) and throughout the greater part of the United States, the normal rainfall is insufficient to supply the needs of transpiration and land evaporation at the prevailing temperatures; consequently, a large portion of any increased rainfall goes to supply unsatisfied needs of transpiration and land evaporation and hence a comparatively small portion of the increased rainfall, within certain limits, appears as run-off.

The water contributed to streams as seepage flow consists of ground water supplied by percolation. Not all the percolating water, however, reaches the streams; portions are lost through evaporation, transpiration and a small varying amount to deep seepage. When the capillary water has become wholly or partly depleted through evaporation and transpiration, percolation must first replenish the capillary water before the soil will permit gravity to draw water down into the ground water reservoir which supplies the seepage flow of streams. Capillary water amounts to about  $\frac{1}{2}$  in. sand and 3 in. in heavy clay per foot in depth. Clay soils retard percolation and facilitates surface run-off.

When the rainfall is insufficient to keep the ground continually moist, which is usually the case, the character and rate of rainfall are the factors which most largely influence seepage flow. When there is no frost in the ground, or the ground was relatively dry when it froze, slowly melting snow permits of the greatest percolation. On the whole, a greater proportion of snowfall than rainfall eventually percolates into the ground to supply seepage flow. Next to snowfall in effectiveness in replenishing the ground water supply are the slow, drizzling rains that occur over large portions of the country during spring and fall, when both evaporation and transpiration demands are relatively small.

The increase in seepage flow which will result from a given increase in the ground water supply, through percolation, will depend upon the slope of the ground water surface and the resistance of the subsoil to the flow of water. Fine grained subsoil will maintain a steeper water table than coarse grained material, due to the difference in resistance to flow.

#### Appendix D—Suitable Types of Water Meters for Use in Railway Water Service

Many devices have been proposed for measuring water. Some devices measure water by volume, that is to say, a chamber of a given size is filled and emptied continually, and the number of times it is filled and emptied. A second class of meters is that known as "current" meters. These meters measure water by recording the velocity of the fluid as it flows through a passage of a definite size, this velocity being indicated by a recording device. A third class of meters is that known as "proportional" meters. These meters measure a definite portion of the main stream by passing it through a measuring device, and by thus measuring a percentage of the total flow, the whole is known and recorded on the counter.

Each of these various classes of meters has advantages peculiar to itself, and no one class will meet the requirements of all kinds of service; therefore, they are each used largely for those conditions of service for which they are found to be the best adapted. The displacement type of meters may be divided into several classes. In one class the displacing member is a reciprocating piston, while in another the piston has a continuous or rotary motion; in another the piston has a motion of oscillation, and in another class the displacing member is a disc and has a motion called one of nutation.

The placing of meters on private fire service lines should be avoided if possible, where such lines are used exclusively for fire protection, as there is danger of interrupted service if a meter is installed with any mechanism whatever that will obstruct the free flow of the water. It is assumed that there will be no charge for water used for extinguishing fires; therefore, if the service is used for fire protection alone there is no necessity for installing a meter, unless the owner of the private fire service is suspected of using the water dishonestly. The illegitimate use of water through private fire lines appears to be the exception rather than the rule, and should be controlled by proper inspection.

Meter reading is the foundation of water bills and too much emphasis cannot be placed upon the importance of knowing that the meter readings are correct. Only familiarity with the work and with the appearance of the dials under various conditions of moisture, dirt, etc., will enable the meter reader to do his work accurately, and accuracy is of the greatest importance in meter reading.

Whenever possible or practical to do so a railroad should standardize its water meters, as by so doing employees are enabled to familiarize and perfect themselves in the knowledge of the mechanical construction which is necessary to maintain a system of meters at least expense, and greatest efficiency. It also permits of carrying a smaller stock of repair parts than would be the case where different types of meters were used.

#### Appendix E—Flue Failures Due to Improper Water Conditions

The operating efficiency of the modern locomotive is largely dependent upon the condition of its boiler, and to derive full service from the boiler it is necessary that water of such quality be used as will permit no liability of flue failures.

The arbitrary limit of time now allowed between flue renewals by the Federal boiler inspection regulations has

been raised from three to four years. This period is, at present, much longer than the ordinary life of flues, especially in the Central and Middle West territory. With the increase in size of power and the larger evaporating capacities per unit of heating surface with the greater water consumption, the flue failures caused by mineral and other agencies in the water have become more pronounced. Not only are the immediate effects of the failures serious with respect to the increased cost for boiler repairs and overtime to crews, but the intangible expense due to delays to traffic, immediate and en route, are considerable.

The most common failures experienced are those due to leaking. These are caused principally by scale collecting at the joints of the flues and the flue sheet and hardening while the metal is hot and expanded. Consequently when cooling takes place and the sheets contract, there will be no contraction in the hard scale and the joints are opened. Other failures which are becoming increasingly frequent of late are those due to pitting. These are usually the result of "scab-pitts" or local corrosion working through the metal in spots. As a rule they are not sufficiently serious to cause a complete failure on the line, but the expense of delays and inconvenience to traffic is considerable. In the case of water tube boilers at stationary plants the most common flue failure is the result of bagging and blowouts. This is usually caused by sludge or sediment settling into the lower rows of tubes, baking on the bottom section, and causing a mud burn or blowout through overheating of the metal.

In general, all waters contain similar substances in solution, although varying considerably in amounts and proportions. These are usually divided for identification purposes as incrusting and non-incrusting solids. In occasional instances from mine drainage regions, free acid waters may be found. At times surface supplies carry sufficient mud and suspended matter to cause trouble. In some waters the dissolved gases, usually carbon dioxide or oxygen, but occasionally hydrogen sulphide, demand attention. However, the common constituents of the incrusting solids, namely, the carbonates and sulphates of calcium and magnesium, are those responsible for the large majority of flue failures attributed to water conditions.

The scale formed on the flues is of considerably varying quality, depending upon the total amount of incrusting solids and the ratio of the component radicles, together with the rate of evaporation. It is known that if the incrusting sulphate content is high, especially with a large magnesium ratio, the scale formed will be, as a rule, hard and tenacious, and very destructive to the boiler. If, on the other hand, the predominate part is calcium carbonate, especially with slow evaporation, the scale will be soft and porous and more easily removed by mechanical means with less damage to the flues and boiler. A muddy water or one high in suspended matter causes trouble from baking and mud burning, but in cases of high mud and suspended matter the visible evidence of prospective trouble is continually present, urging suitable corrective steps of either filtration, sedimentation, or abandonment of the supply. High rate of evaporation will tend to bake any incrustants into a hard scale.

The cure of boiler troubles is, in a great measure, similar to the cure of diseases, in that each problem has a specific remedy and it is impossible to lay down general directions which will fit all cases. Boiler compounds of all natures have been exploited, some acting mechanically, others supposedly mechanically, while others are definitely chemical. A few manufacturers of boiler compounds have gone into the matter on a scientific and legiti-

mate basis and have had considerable success in altering the scaling solids into loose non-crystalline, non-adhering sludge. However, except in exceptional instances, it is poor practice and uneconomical to make a sludge tank out of the boiler.

Where flue failures are common the water conditions should be thoroughly investigated, and it is a good general rule that at points where trouble originates the water should be properly softened and the objectionable constituents absolutely removed before the water is delivered to locomotives for steam purposes. At present prices it has been found that lime and soda ash are the least expensive chemicals which can be used to advantage, and with a water treating plant, properly operated, the harmful impurities can be precipitated and removed as sludge in the softener with a clear, soft, safe water delivered for steam purposes.

It has been found generally advisable to so adjust the treatment that a slight excess of hydrate alkalinity due to caustic soda be maintained in the boiler at all times. This precludes the formation of any hard sulphate scale; neutralizes any acid tendencies; assures absence of magnesium compounds due to the insolubility of magnesium hydrate; neutralizes carbon dioxide, and minimizes the effects of galvanic action.

#### Appendix F—Instructions for the Care of Water Stations

The committee presented a detailed set of instructions for the care of water stations. These were practically the same as those submitted last year and published in the daily edition of the *Railway Age* for March 20, 1918, page 634. They were followed by a series of examination questions on the care of boilers, internal combustion engines and electrically operated pumps.

#### Discussion

A. F. Dorley (Chairman): There is one paragraph in the Manual which the committee wishes to revise, and that is the section on "Foaming and Priming." The committee feels that the explanation of the phenomenon commonly called foaming, which causes so much trouble in locomotive boilers is not quite satisfactory, and there is a revision given under "Appendix A."

In addition to this, this section of the Manual is unsatisfactory, in that it does not differentiate between what is called "foaming" and "priming." I move, Mr. Chairman, that this revision of the Manual be adopted.

(Motion carried.)

Mr. Dorley: The report on subject 3 will be found in Appendix C: "Design of impounding reservoirs and conditions under which they are economical."

The committee feels that there is great need of information on the subject of the design of reservoirs. There is a great amount of data available in the literature on the subject of rainfall and run-off and percolation and transpiration, and other factors that have to be considered in designing a reservoir, but the committee does not know of any definitely outlined method for assigning values for these various factors and an attempt is being made by the sub-committee, to work out such a method. This report is one of progress and we consider it a splendid start in that direction. We hope to have the report in final shape for next year.

Subject No. 4, "Plans and specifications for typical water station layouts," will be assigned during the coming year to the Committee on Yards and Terminals. This is a progress report also.

Subject No. 5 is simply a report of progress. The title of this subject is "Suitable types of meters for use in railroad water service, methods followed in testing

and reading meters, and checking the consumption of city water.

Subject No. 6 is: "Locomotive flue failures which may be due to improper water conditions and methods of treatment to correct such conditions." The committee feels that there is need of some information on this subject. As we all know, flue failures are becoming an increasingly troublesome and expensive part of locomotive maintenance. As a matter of fact, there is an epidemic of flue failures on practically all roads.

A part of these failures which really result in the reduced life of flues, is undoubtedly due to the change from the old style charcoal iron flue to the spellerized steel flue, which is now in use, part of it due to the higher steam pressure that is being carried in modern locomotives as compared with the lower pressure in smaller locomotives; but the committee is prepared to admit that a part of this reduced life is undoubtedly due to harmful and deleterious impurities in the water, and the present epidemic is probably due to these three causes combined. Mr. Bardwell, who has had charge of this sub-committee, has given us the chemistry of these flue failures, so far as they are due to water conditions.

The Chairman: If there is no objection, the report on subjects 2, 3, 4, 5 and 6 will be received as information, as a progress report.

Mr. Dorley: I move that the report on instructions for the care of water stations be inserted in the Manual.

(The motion was carried and the committee was dismissed with thanks.)

## Report on Iron and Steel Structures

**T**HE ASSOCIATION'S General Specifications for Steel Railway Bridges were adopted in 1906, and are printed in the Manual, pp. 482 to 505, inclusive. The Specifications for Erection were adopted in 1912 and are printed in the Manual, pp. 508 to 513, inclusive.

The revised specifications (Appendix A to this report) are submitted by the committee as a conclusion, to be printed in the Manual in place of the specifications referred to above.

The rules and unit stresses for classifying and rating the

capacity of existing bridges are given in the Manual, pp. 506 and 507. The committee is not ready to report any changes, but expects to be able to report at the next convention revised rules for rating based upon the live load diagram used in the specifications and with details of unit stresses, impact, etc. The committee invites suggestions from the members of the association and others on this subject.

The committee has under observation some experimental applications of plastic compounds for the protection of structures of steel and concrete exposed to direct action of the blast from locomotive stacks, but has no report to make to this convention.

Specifications for movable bridges were submitted to the 1918 convention and printed in the Proceedings, Vol. 19, pp. 814 to 866, inclusive. The committee is engaged in a revision of these specifications and expects to submit them to the 1920 convention for adoption and printing in the Manual. The committee invites suggestions and criticisms of these specifications for movable bridges in order that the revision, when submitted to the convention, may be as satisfactory as possible.

The conclusions of the committee with reference to secondary stresses are embodied in the specifications. No experimental work on impact has been done during the past year and none is contemplated. The conclusions from the experimental work already done have been presented to the association from time to time, and the association has adopted an impact formula based upon them. The conclusions already reached have been based upon a large amount of experimental work, and are not likely to be modified by any further work of that kind which the committee might be able to do in the near future. The sub-committee on this subject has been discharged, effect-

ive with the presentation of this report to the convention, and the committee requests that this subject be discontinued by the Board of Direction.

On account of war conditions the committee has been unable to make any further tests on columns, and the committee requests the Board of Direction to continue the subject in order that further study may be made when the conditions will allow it.

A report on the principles for detailed design of flashing, drainage and reinforcement for waterproofing purposes is being worked upon by the sub-committee and is expected to be ready to present to the convention with the report of 1920.

In the report of the Committee on Yards and Terminals to the 1918 convention the Committee on Iron and Steel Structures was asked to approve the data of scale superstructures contained in Tables 1 and 2 on pp. 330 and 331 of the Proceedings, Vol. 19. These tables contain the data for designing and the resultant recommended girder section for weigh-bridge girders and transverse floor beams for track scales of three different standard sectional capacities.

After conference with the Yards and Terminals committee and careful study of the sections proposed, the committee approves the recommended sections.

### RECOMMENDATIONS

The committee recommends:

1. That the Revision of the General Specifications for Steel Railway Bridges, be adopted and the Specifications, Appendix A, printed in the Manual.

2. That the approval of the sections for track scales, weigh-bridge girders, and transverse floor beams recommended by the Committee on Yards and Terminals be recorded in the Proceedings.

Committee: O. E. Selby (C. C. C. & St. L.), chairman; F. E. Turneure (Univ. of Wis.), vice-chairman; F. Auryansen (L. I.), J. A. Bohland (G. & N.), W. S. Bouton (B. & O.), A. W. Carpenter (N. Y. C.), Charles Chandler (I. C.), J. E. Crawford (N. & W.), F. O. Dufour, W. R. Edwards (I. C. C.), A. Chas. Irwin, B. R. Leffler (N. Y. C.), W. H. Moore (N. Y. N. H. & H.), P. B. Motley (C. P. R.), C. D. Purdon (St. L. S. W.), Albert Reichmann (Am. Br. Co.), J. W. Reid, A. F. Robinson (A. T. & S. F.), H. N. Rodenbaugh (U. S. R. R. A.), H. B. Seaman (Cons. Engr.), C. E. Smith (Cons. Engr.), I. F. Stern (Cons. Engr.), H. B. Stuart (G. T.), G. E. Tebbets, L. F. VanHagan (Univ. of Wis.), J. A. L. Waddell (Cons. Engr.), H. T. Welty (N. Y. C.).

### Appendix A—General Specifications for Steel Railway Bridges

(For Fixed Spans Less Than 300 Ft. in Length.)  
1919

#### PROPOSALS AND DRAWINGS

1. **Definitions of Terms.** The term "Engineer" refers to the Chief Engineer of the Company or his subordinates in

authority. The term "Inspector" refers to the inspector or inspectors representing the Company. The term "Company" refers to the Railway Company or Railroad Company party to the contract. The term "Contractor" refers to the manufacturing or fabricating contractor party to the contract. The term "Fractor" refers to the erecting contractor party to the contract.

2. **Proposals.** Bidders shall submit proposals to conform with the terms in the letter of invitation. The proposals preferably shall be based upon plans and specifications furnished by the Company showing the general dimensions necessary for designing the structure, the stresses and the general or typical details. Invitations covering work to be erected by the Contractor shall state the general conditions at the site, such as character of foundations, traffic conditions, etc.

3. **Drawings to Govern.** Where the drawings and the specifications differ, the drawings shall govern.

4. **Patented Devices.** The Contractor shall protect the Company against claims on account of patented devices or parts.

5. **Drawings.** After the contract has been awarded and before any shop work is commenced, the Contractor shall submit to the Engineer for approval duplicate prints of stress sheets and shop drawings, unless such drawings have been prepared by the Company. The tracings of these drawings shall be the property of and be delivered to the Company after the completion of the contract. Shop drawings shall be made on the dull side of the tracing cloth, 24 by 36 in. in size, including margins. The margin at the left end shall be 1½ in. wide, and the others ½-in. The title shall be in the lower right-hand corner. No changes shall be made on any approved drawing without the consent, in writing, of the Engineer.

6. The Contractor shall be responsible for the correctness of his drawings, and for shop fits and field connections, although the drawings may have been approved by the Engineer.

7. Any material ordered by the Contractor prior to the approval of the drawings shall be at his risk.

**GENERAL FEATURES OF DESIGN**

8. **Materials Used.** Structures shall be made wholly of structural steel except where otherwise specified. Cast steel may be used for shoes and bearings. Cast iron may be used only where specifically authorized by the Engineer.

9. **Types of Bridges.** The different types of bridges may be used as follows:

- Rolled beams for spans up to 35 feet.
  - Plate girders for spans from 30 feet to 125 feet.
  - Riveted trusses for spans from 100 feet to 300 feet.
  - Pin-connected trusses for spans from 150 feet to 300 feet.
10. **Number of Trusses.** Unless otherwise specified, double-track through bridges shall have only two trusses or girders, and four-track bridges three.

11. **Dimensions for Calculation.** The dimensions for the calculation of stresses shall be as follows:

*Span Length*

For trusses and girders, the distance center to center of end bearings.

For floor beams, the distance center to center of trusses or girders.

For stringers, the distance center to center of floor beams.

*Depth*

For riveted trusses, the distance between centers of gravity of chord sections.

For pin-connected trusses, the distance center to center of chord pins.

For plate girders, floor beams and stringers, the distance between centers of gravity of flanges, but not to exceed the distance back to back of the flange angles.

12. **Spacing of Trusses, Girders and Floorbeams.** The width center to center of girders or trusses shall not be

less than one-twentieth of the effective span, and not less than is necessary to prevent overturning under the assumed lateral loading. Panel lengths shall not exceed 1½ times the width c. to c. of trusses or girders.

13. **Clearances.** If the alignment is straight, clearances shall be not less than shown on the diagram, Fig. 1. If the alignment is curved, the width of the diagram shall be increased so as to provide the same minimum clearances for a car 80 ft. long, 14 ft. high and 60 ft. center to center of trucks, allowance being made for curvature and super-elevation of rails. The height of rail shall be assumed as 6 in.

14. **Deck Spans on Curves.** Deck spans on curves shall have the center line of the span placed, usually, so as to bisect the middle ordinate of and be parallel with the chord of the curve.

15. **Skew Bridges.** In skew bridges without ballasted floors, the backwalls for each track shall be square with the track.

16. **Ambiguity of Stress.** Structures shall be designed so as to avoid, as far as practicable, ambiguity in the determination of the stresses.

*Loads*

17. **Loads.** The structures shall be proportioned for the following loads:

- a. The dead load.
- b. The live load.
- c. The lateral load.

Stresses due to these loads, as hereinafter specified, shall be shown separately on the stress sheets.

18. Members shall be proportioned for that combination of stresses which gives the maximum total stress, except as otherwise provided.

19. **Dead Load.** The dead load shall consist of the estimated weight of the entire suspended structure. Timber shall be assumed to weigh 4½ lb. per foot B. M., ballast 120 lb. per cu. ft., reinforced concrete 150 lb. per cu. ft., waterproofing 150 lb. per cu. ft., and rails and fastenings 150 lb. per linear foot of track. If ballast is used, it shall be assumed level with the base of rail and the weight of ties neglected.

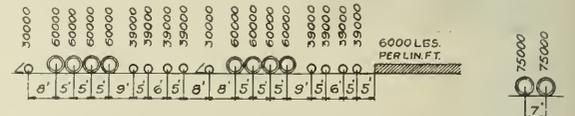

Fig. 2

Fig. 3

20. **Live Load.** The minimum live load for each track shall be as shown in Figs. 2 and 3.

The loading that gives the larger stresses shall be used.

21. **Heavier Loading.** Heavier loadings shall be proportional to the specified minimum loadings with the same wheel spacing.

22. In calculating the maximum stresses due to live load and centrifugal force when two, three or four tracks are simultaneously loaded, use the following percentages of the specified live load:

- For two tracks loaded, 95 per cent.
- For three tracks loaded, 90 per cent.
- For four tracks loaded, 85 per cent.

23. **Floors.** Wooden ties shall be designed for the maximum wheel load specified distributed over three ties and with 100 per cent impact added. The fiber stress shall not exceed 2,000 lb. per sq. in. Wooden tie floors shall be secured to the stringers or girders. The ties shall be not less than 10 ft. in length. They shall be placed with openings not to exceed 4 in. in width and shall be secured against bunching. The maximum dap of ties shall be 1½ in.

24. Floors consisting of beams transverse to the axis of the structure shall be designed for a uniform live load of 15,000 lb. per linear foot for each track, when the minimum live load specified is used. When heavier loadings are used, this uniform load shall be increased proportionately. Floors consisting of longitudinal beams shall be designed for the wheel loads specified.

25. In ballasted floor bridges, the live load shall be considered as uniformly distributed laterally over a width of 10 ft.

26. Ballasted floors shall have at least 6 in. of ballast under the ties.

27. **Reduced Dead Load for Solid Floors.** In bridges with ballasted floors, only three-fourths of the computed dead weight of the floors shall be considered.

28. **Impact.** The dynamic increment of the live load shall be added to the maximum computed live load stresses and shall be determined by the formula,

$$I = S \frac{300}{300 + \frac{L^2}{100}}, \text{ in which}$$

$I$  = impact or dynamic increment to be added to the live-load stress.

$S$  = computed maximum live-load stress.

$L$  = the following values in feet:

- a. For spans, the distance center to center of end bearings.
- b. For stringers, the distance center to center of floor beams.
- c. For hip verticals and similar suspenders, floor beams, and transverse girders and their supports, the sum of the adjacent panel or span lengths.
- d. For floors with transverse beams, zero.

29. For bridges designed exclusively for electric locomotives, the impact stresses shall be taken as one-half of those given by the formula in paragraph 28.

30. Impact shall not be added to stresses produced by longitudinal or lateral forces.

31. **Eccentricity of Load on Curves.** For bridges on curves, provision shall be made for the increased load carried by any truss, girder or stringer due to the eccentricity of the load.

32. **Lateral Forces.** The lateral force shall consist of a moving load equal to 30 lb. per sq. ft. on 1½ times the vertical projection of the structure on a plane parallel with its axis (but never less than 200 lb. per linear foot at the loaded chord, and 150 lb. per linear foot at the unloaded chord), and a moving load of 600 lb. per linear foot applied 8 ft. above the base of rail.

33. In calculating the stresses in viaduct towers due to lateral force, the viaduct shall be considered as loaded on either one or both tracks, with empty cars weighing 1,200 lb. per linear foot.

34. If a moving load of 50 lb. per square foot on 1½ times the vertical projection of the unloaded structure on a plane parallel with its axis produces greater stresses than the lateral force defined in paragraph 32, it shall be provided for.

35. The bracing between chords or flanges shall be capable of resisting a transverse shear in any panel equal to 2 per cent of the total axial stress in the two chords in that panel.

36. **Centrifugal Force.** On curves, the centrifugal force (assumed to act 6 ft. above the rail) shall be taken equal to a percentage of the live load according to the following table:

Degree of Curve..	0° 20'	0° 40'	1°	2°	3°	4°	5°	6°	7°	8°	9°	10°	11°	12°
Percentage of live load.....	2½	5	7½	10	10	10	10	10	10	10	10	10	10	10
Speed in miles per hour.....	80	80	80	65	53	46	41	38	35	33	31	29	28	27

37. **Longitudinal Force.** Provision shall be made in the design for the effect of a longitudinal force of 20 per cent of the live load on one track only, applied 6 ft. above the top of the rail. Where, by reason of continuity of members or frictional resistance, the longitudinal force will be largely absorbed before it reaches supporting members, its effect on such members shall be taken as one-half that specified above.

38. **Applications of Live Load.** The stresses shall be shown for the following applications of the live load:

a. As a dynamic load acting vertically, the static stresses and the dynamic increments or impact stresses being shown separately and designated as the live-load static stresses and the live-load impact stresses respectively.

b. As a state longitudinal force, due to tractive effort or braking, the stresses being designated as longitudinal force stresses.

c. As a lateral force on curves, the stresses being shown separately for this force acting as a static load and designated as the centrifugal force stresses.

**Unit Stresses and Proportioning of Parts**

39. The several parts of structures shall be so proportioned that the unit stresses will not exceed the following, except as modified in paragraphs 47 and 48:

Pounds per sq. inch

Axial tension, net section .....	16,000	1	$\left\{ \frac{l}{r} \right\}^2$
Axial compression, gross section.....	13,000	—	
$l$ = the length of the member in inches.			
$r$ = the least radius of gyration of the member in inches.			

Tension in extreme fibers of rolled shapes, built sections and girders, net section....16,000

Tension in extreme fibers of pins.....24,000

Shear in plate girder webs, gross section....10,000

Shear in power-driven rivets and pins.....12,000

Bearing on power-driven rivets, pins, outstanding legs of stiffener angles, and other steel parts in contact.....24,000

The above mentioned values for shear and bearing shall be reduced 25 per cent for countersunk rivets, hand-driven rivets, floor-connection rivets, and turned bolts.

Bearing on expansion rollers, per linear inch.....600d  
d = the diameter of rollers in inches.

Pounds per sq. inch

Bearing on granite masonry .....

Bearing on sandstone and limestone masonry.....

Bearing on concrete masonry .....

40. For cast steel in shoes and bearings, the above mentioned unit stresses shall apply.

41. The diagonal tension in webs of girders and rolled beams at sections where maximum shear and bending occur simultaneously, shall not exceed 16,000 lb. per square inch.

42. **Effective Bearing Area.** The effective bearing area of a pin, a bolt or a rivet shall be its diameter multiplied by the thickness of the piece, except that for countersunk rivets half the depth of the countersink shall be omitted.

43. **Effective Diameter of Rivets.** In proportioning rivets, the nominal diameter of the rivet shall be used.

44. **Reversal of Stress.** Members subject to reversal of stress under the passage of the live load shall be proportioned as follows:

Determine the resultant tensile stress and the resultant compressive stress and increase each by 50 per cent of the smaller; then proportion the member so that it will be capable of resisting either increased resultant stress. The connections shall be proportioned for the sum of the resultant stresses.

45. **Stresses in Web Members.** In proportioning web members of trusses, use two-thirds of the dead load stress plus one and one-sixth times the live load stress, including impact, where this sum is greater than the sum of the dead load stress and the live load stress, including impact.

46. **Combined Stresses.** Members subject to both axial and bending stresses (including bending due to floor beam deflection) shall be proportioned so that the combined fiber stresses will not exceed the allowed axial stress. In members continuous over panel points, only three-fourths of the bending stress computed as for simple beams shall be added to the axial stress.

47. Members subject to stresses produced by a combination of dead load, live load, impact and centrifugal force, with either lateral or longitudinal forces, or bending due to lateral action, may be proportioned for unit stresses 25 per cent greater than those specified in paragraph 39; but the section shall not be less than that required for dead load, live load, impact and centrifugal force.

48. **Secondary Stresses.** Designing and detailing shall be done so as to avoid secondary stresses as far as possible. In ordinary trusses without subpanelling, no account usually need be taken of the secondary stresses in any member whose width measured in the plane of the truss is less than one-tenth of its length. Where this ratio is exceeded, or where subpanelling is used, secondary stresses due to deflection of the truss shall be computed. The specified unit stresses may be increased one-third for a combination of the secondary stresses with the axial stresses.

49. **Compression Flanges.** The gross area of the compression flanges of plate girders shall not be less than the gross area of the tension flanges, but the stress per square inch shall not exceed

$$14,000 - 200 \frac{l}{b}, \text{ in which}$$

$l$  = the length of the unsupported flange, between lateral connections or knee braces.

$b$  = the flange width.

### Details of Design

50. **Limiting Lengths of Members.** The ratio of length to least radius of gyration shall not exceed 100 for main compression members nor 120 for wind and sway bracing.

51. The lengths of riveted tension members shall not exceed 200 times their least radius of gyration.

52. **Depth Ratios.** The depth of trusses preferably shall be not less than one-tenth of the span. The depth of plate girders preferably shall be not less than one-twelfth of the span. The depth of rolled beams used as girders and the depth of solid floors preferably shall be not less than one-fifteenth of the span.

53. **Parts Accessible.** Details shall be designed so that all parts will be accessible for inspection, cleaning and painting. Closed sections shall be avoided wherever possible.

54. **Pockets.** Pockets or depressions which would hold water shall have efficient drain holes, or shall be filled with concrete.

55. **Eccentric Connections.** Members shall be connected so that their gravity axes will intersect in a point. Eccentric connections shall be avoided if practicable, but, if unavoidable, the members shall be proportioned to resist the additional stresses so produced.

56. **Counters.** Riveted counters are preferred. If counters are subject to reversal of stress, their end connections preferably shall be riveted. Adjustable counters shall have open turnbuckles.

57. **Strength of Connections.** Connections shall have a strength at least equal to that of the members connected, regardless of the computed stress. Connections shall be made, as nearly as practicable, symmetrical about the axis of the members.

58. **Limiting Thickness of Metal.** Metal shall not be less than  $\frac{3}{8}$ -inch thick, except for fillers. Metal subject to marked corrosive influences shall be increased in thickness or protected against such influences.

59. **Effective Area of Angles.** The effective area of single angles in tension shall be assumed as the net area of the connected leg plus 50 per cent of the area of the unconnected leg. The effective area of double angle members connected by both legs shall be assumed as 90 per cent of the net area of the angles. Single angles connected by lug angles shall be considered as connected by one leg.

60. **Sizes of Rivets.** Rivets shall be  $\frac{7}{8}$ -in. in diameter unless otherwise specified.

61. **Pitch of Rivets.** The minimum distance between centers of rivet holes shall be three diameters of the rivet, but the distance preferably shall be not less than  $3\frac{1}{2}$ -in. for 1-in. rivets, 3 in. for  $\frac{7}{8}$ -in. rivets and  $2\frac{1}{2}$  in. for  $\frac{3}{4}$ -in. rivets. The maximum pitch in the line of stress for members composed of plates and shapes shall be 7 in. for 1 in. rivets, 6 in. for  $\frac{7}{8}$ -in. rivets and 5 in. for  $\frac{3}{4}$ -in. rivets. For angles with two gage lines and rivets staggered, the maximum pitch in each line shall be twice the amounts given above. If two or more web plates are used in contact, stitch rivets 12 in. in gage and pitch shall be provided to make them act in unison. In tension members composed of two angles in contact, a pitch of 12 in. may be used for riveting the angles together.

62. **Edge Distance.** The minimum distance from the center of any rivet hole to a sheared edge shall be:  $1\frac{3}{4}$  in. for 1 in. rivets,  $1\frac{1}{2}$  in. for  $\frac{7}{8}$ -in. rivets and  $1\frac{1}{4}$  in. for  $\frac{3}{4}$ -in. rivets; to a rolled edge  $1\frac{1}{2}$  in.,  $1\frac{1}{4}$  in. and  $1\frac{1}{8}$  in., respectively. The maximum distance from any edge shall be eight times the thickness of the plate, but shall not exceed 6 in.

63. **Size of Rivets in Angles.** The diameter of the rivets in any angle whose size is determined by calculated stress shall not exceed one-fourth of the width of the leg in which they are driven. In angles whose size is not so determined 1 in. rivets may be used in  $3\frac{1}{2}$  in. legs,  $\frac{7}{8}$ -in. rivets in 3 in. legs, and  $\frac{3}{4}$ -in. rivets in  $2\frac{1}{2}$  in. legs.

64. **Long Rivets.** Rivets which carry calculated stress and whose grip exceeds four diameters shall be increased in number at least one per cent for each additional  $\frac{1}{16}$ -in. of grip. If the grip exceeds six times the diameter of the rivet, specially designed rivets shall be used.

65. **Pitch of Rivets at Ends.** The pitch of rivets at the ends of built compression members shall not exceed four diameters of the rivet for a distance equal to one and one-half times the maximum width of the member.

66. **Compression Members.** In built compression members, the metal shall be concentrated in the webs and flanges. The thickness of each web shall be not less than one-thirtieth of the distance between the lines of rivets connecting it to the flanges. The thickness of cover plates shall be not less than one-fortieth of the distance between the nearest rivet lines.

67. **Outstanding Legs of Angles.** The width of the outstanding legs of angles in compression (except when reinforced by plates) shall not exceed the following:

- For stringer flange angles, ten times the thickness.
- For main members carrying axial stress, twelve times the thickness.
- For bracing and other secondary members, fourteen times the thickness.

68. **Stay Plates.** The open sides of compression members shall be provided with lacing bars and shall have stay plates as near each end as practicable. Stay plates shall be provided at intermediate points where the lacing is interrupted. In main members, the length of the stay plates shall be not less than  $1\frac{1}{4}$  times the distance between the nearest lines of rivets connecting them to the flanges, and the length of intermediate stay plates shall be not less than three-quarters of that distance. Their thickness shall be not less than one-fiftieth of the same distance.

69. Tension members composed of shapes shall have their separate segments stayed together. The stay plates shall have a length not less than two-thirds of the lengths specified for stay plates on compression members.

70. **Lacing.** The lacing of compression members shall be proportioned to resist a shearing stress of 2 per cent of the direct stress. The minimum width of lacing bars shall be 3 in. for 1 in. rivets,  $2\frac{3}{4}$  in. for  $\frac{7}{8}$ -in. rivets,  $2\frac{1}{2}$  in. for  $\frac{3}{4}$ -in. rivets, and 2 in. for  $\frac{5}{8}$ -in. rivets. The thickness shall be made as required by paragraph 39, in which "l" shall be taken as the distance between connections to the main sections.

71. In members composed of side segments and a cover plate, with the open side laced, one-half the shear shall be considered as taken by the lacing. Where double lacing is used, the shear in the plane of the lacing shall be equally distributed between the two systems.

72. In connecting lacing bars to flanges,  $\frac{5}{8}$ -in. rivets shall be used for flanges less than  $2\frac{1}{2}$  in. wide,  $\frac{3}{4}$ -in. rivets for flanges from  $2\frac{1}{2}$  to  $3\frac{1}{2}$  in. wide, and  $\frac{7}{8}$ -in. rivets for flanges  $3\frac{1}{2}$  or more in. wide. Lacing bars with at least two rivets in each end shall be used for flanges over 5 in. wide.

73. The angle of lacing bars with the axis of the member shall be not less than 45 deg. for double lacing, and 60 deg. for single lacing. If the distance between rivet lines in the flanges is more than 15 in. and a single rivet bar is used, the lacing shall be double and riveted at the intersections.

74. Lacing bars shall be so spaced that the  $\frac{l}{r}$  of the portion of the flange included between their connections will be not greater than 40.

75. **Splices.** Abutting joints in compression members faced for bearing shall be spliced on four sides. The gross area of the splice material shall be not less than 50 per cent of the gross area of the member.

76. Joints in riveted work not faced for bearing, whether in tension or compression, shall be fully spliced.

77. **Net Section at Pins.** In riveted tension members in pin-connected trusses, the net section across the pin hole shall be 135 per cent and the net section back of the pin hole 100 per cent of the net section of the body of the member, and there shall be sufficient rivets to make the material effective.

78. **Net Section Defined.** The net section of riveted members shall be the least area which can be obtained by deducting from the gross sectional area the areas of holes cut by any plane perpendicular to the axis of the member and parts of the areas of other holes on one side of the plane within a distance of 4 in., which are on gage lines 1 in. or more from those of the holes cut by the plane, the parts being determined by the formula:

$$A \left[ 1 - \frac{P}{4} \right], \text{ in which}$$

$A$  = the area of the hole.

$P$  = the distance in inches of the center of the hole from the plane.

79. In determining the net section, the diameter of the rivet hole shall be taken  $\frac{1}{8}$  in. larger than the nominal diameter of the rivet.

80. **Pin Plates.** Where necessary to give the required section or bearing area, pin holes shall be reinforced on both sides of each segment by plates, one of which on each side must be as wide as the outstanding flanges will permit. These plates shall contain enough rivets to transmit and distribute the bearing pressure uniformly over the full cross section. At least one full-width plate on each segment shall extend to the far edge of the stay plate and the others not less than 6 in. beyond the near edge.

81. **Indirect Splices.** If splice plates are not in direct contact with the parts which they connect, rivets shall be used on each side of the joint in excess of the number required in the case of direct contact to the extent of two extra lines for each intervening plate.

82. **Fillers.** Where rivets carrying stress pass through fillers, the fillers shall be extended beyond the connected member and the extension secured by additional rivets sufficient to develop the value of the filler.

83. **Forked Ends.** Forked ends on compression members will be permitted only where unavoidable. Where forked ends are used, a sufficient number of pin plates shall be provided to make the jaws of twice the sectional area of the member and they shall be extended as far as necessary in order to carry the stress of the main member into the jaws, but shall not be shorter than required by paragraph 80.

84. **Pins.** Pins shall be long enough to secure a full bearing of all parts connected upon the turned body of the pin. They shall be secured by chambered nuts or be provided with washers if solid nuts are used. The screw ends shall be long enough to admit of burring the threads.

85. Pin connected members shall be held against lateral movement on the pins.

86. **Bolts.** Where members are connected by bolts, the turned bodies of the bolts shall be long enough to extend through the metal. A washer at least  $\frac{1}{4}$  in. thick shall be used under the nut. Bolts shall not be used except by special permission.

87. **Upset Ends.** Bars with screw ends shall be upset so that the area at the root of the thread will be at least 15 per cent larger than in the body of the bar.

88. **Sleeve Nuts.** Sleeve nuts shall not be used.

89. **Expansion.** Provision shall be made for expansion and contraction at the rate of 1 in. for every 100 ft. in length. The expansion ends shall be secured against lateral movement. In spans over 250 ft. in length, provision shall be made for expansion in the floor.

90. **Expansion Bearings.** Spans 70 ft. or more in length shall have turned rollers or rockers at one end. Spans of less length shall be arranged to slide on smooth surfaces. Expansion bearings shall be designed to permit longitudinal motion only.

91. **Fixed Bearings.** Fixed bearings shall be firmly anchored to the supports.

92. **Rollers.** Expansion rollers shall be not less than 6 in. in diameter. They shall be coupled together with substantial side bars, which shall be so arranged that the rollers can be cleaned readily. Rollers shall be geared to the upper and lower plates.

93. **Pedestals and Shoes.** Pedestals and shoes shall be made of plates and angles, or cast steel. The difference between the top and bottom bearing widths shall not exceed twice the depth. For hinged bearings, the depth shall be measured from the center of the pin. The web plates and the angles connecting them to the base plate shall be not less than  $\frac{3}{4}$  in. thick. If the size of the pedestal permits, the webs shall be rigidly connected transversely. The minimum thickness of the metal in cast steel pedestals shall be 1 in. Pedestals and shoes shall be so constructed that the load will be distributed uniformly over the entire bearing. Spans 70 ft. or more in length shall have hinged bearings at each end.

94. **Inclined Bearings.** For spans on an inclined grade and without hinged bearings the sole or masonry plates shall be beveled so that the masonry surfaces will be level.

95. **Name Plates.** There shall be a name plate, showing in raised letters and figures the name of the manufacturer and the year of construction, bolted to the bridge near each end at a point convenient for inspection.

## Floors

96. **Types of Floors.** The floors may consist of steel floor-beams and stringers, with timber cross-ties supporting the rails, or of one of the solid floor types with ballast.

97. **Floor Members.** Floor members shall be designed with special reference to stiffness, and the depth of floor-beams and stringers shall, as a rule, be not less than one-eighth of their length.

98. Specifications for plate girders shall also apply to floor-beams and stringers.

99. **Spacing of Stringers.** Stringers usually shall be spaced 6 ft. 6 in. center to center. If four stringers are used under one track, each pair shall be spaced symmetrically about the rail.

100. **Stop Angles.** Stringers which frame into floor-beams shall have an angle riveted to the top flange at each

end to space the end ties at least 1 in. from the flanges of the floor-beams.

101. **1-Beam Girders.** Rolled beams supporting timber decks shall be arranged with not less than two nor more than four beams under each rail. The beams in each group shall be placed symmetrically about the rail, and shall be spaced sufficiently far apart to permit cleaning and painting. They shall be connected by solid web diaphragms near the ends and at intermediate points, spaced not over twelve times the flange width. Bearing plates shall be continuous under each group of beams. End stiffeners shall be used if required by the provisions of paragraph 39.

102. **Floor-Beam Connections.** Floor-beams preferably shall be square to the girders or trusses. They shall be riveted directly to the girders or between the posts of through and deck truss spans. End floor-beams shall be used in square end bridges.

103. **End Connection Angles.** The legs of stringer connection angles shall be not less than 4 in. in width, and not less than  $\frac{5}{8}$  in. in thickness. Shelf angles shall be provided to support the stringers during erection, but the connection angles shall be sufficient to carry the whole load. Stringers preferably shall be riveted between the floor-beams. Rivets in connection angles shall be spaced closer at the bottom of the angles than at the top.

104. **Stringer Frames.** Where two lines of stringers are used under each track in panels more than 30 ft. in length, they shall be connected by cross frames.

105. **Solid Floor Connections.** Solid floors shall be connected to the girders or trusses by angles not less than  $\frac{1}{2}$  in. thick; one angle on each side of the web of I-beams and one on each of the vertical members of troughs.

106. **Proportioning Solid Floors.** Solid floors shall be proportioned by the moments of inertia of the sections, using the net areas of the component parts.

## Bracing

107. **Design of Bracing.** Lateral, longitudinal and transverse bracing shall be composed of shapes with riveted connections. Lateral bracing shall have concentric connections to chords at end joints, and preferably throughout. The connections between the lateral bracing and the chords shall be designed to avoid, as far as practicable, any bending stress in the truss members.

108. When a double system of bracing is used, both systems may be considered simultaneously effective if the members meet the requirements, both as tension and compression members.

109. **Lateral Bracing.** Bottom lateral bracing shall be provided in all bridges except deck plate girder spans less than 70 ft. long from which it may be omitted.

110. Top lateral bracing shall be provided in deck spans and in through spans having sufficient head room.

111. **Portal and Sway Bracing.** Deck truss spans shall have vertical sway bracing at each panel point. They shall also have bracing in the planes of the end posts, proportioned to transfer the end reaction of the top lateral system to the masonry.

112. Through truss spans shall have portal bracing, with knee braces, as deep as the specified clearance will allow.

113. Through truss spans shall have sway bracing at each intermediate panel point if the height of the trusses is such as to permit of a depth of 6 ft. or more for the bracing. When the height of the trusses will not permit of such depth, the top lateral struts shall be of the same depth as the chord and shall have knee braces.

114. **Cross-Frames.** Deck plate girder spans shall be provided with cross-frames at each end proportioned to resist centrifugal and lateral forces, and shall have intermediate cross-frames at intervals not exceeding 18 ft.

115. **Laterals.** The smallest angle to be used in lateral bracing shall be  $3\frac{1}{2}$  by 3 by  $\frac{3}{8}$  in. There shall be not less than three rivets at each end connection of the angles. Angles shall be connected at their intersection by plates.

116. **Clearance.** Lateral bracing beneath the track shall be low enough to clear the ties.

117. **Tower Struts.** The struts at the base of viaduct towers shall be strong enough to slide the movable shoes when the track is unloaded.

## Plate Girders

118. **Spacing of Girders.** The girders of deck bridges shall be spaced 6 ft. 6 in. between centers, except that:

a. In single-track deck spans 75 or more ft. in length, the girders shall be spaced in accordance with paragraph 12, but not less than 7 ft. 6 in. between centers.

b. In bridges on curves, the girders shall be spaced as shown on the plans.

119. **Design of Plate Girders.** Plate girders shall be proportioned either by the moment of inertia of their net section including compression side, or by assuming that the flanges are concentrated at their centers of gravity. In the latter case, one eighth of the gross section of the web, if properly spliced, may be used as flange section.

120. **Flange Sections.** The flange angles shall form as large a part of the gross area of the flange as practicable. Side plates shall not be used except when flange angles exceeding 1 in. in thickness otherwise would be required.

121. Flange plates shall be equal in thickness to the flange angles or shall diminish in thickness from the flange angles outward. No plate shall have a thickness greater than that of the flange angles.

122. Where flange cover plates are used, one cover plate of the top flange shall extend the full length of each girder. Other flange plates shall extend at least 18 in. beyond the theoretical end.

123. **Thickness of Web Plates.** The thickness of web plates shall be not less than  $\frac{1}{20} \sqrt{D}$ , where "D" represents the distance between flanges in inches.

124. **Flange Rivets.** The flanges of plate girders shall be connected to the web with a sufficient number of rivets to transfer to the flange section the horizontal shear at any point combined with any load that is applied directly on the flange. One wheel load, where ties rest on the flange, shall be assumed to be distributed over 3 ft.

125. **Flange Splices.** Splices in flange members shall not be used except by special permission of the Engineer. Two members shall not be spliced at the same cross-section and, if practicable, splices shall be located at points where there is an excess of section. The net section of the splice shall exceed by 10 per cent the net section of the member spliced. Flange angle splices shall consist of two angles, one on each side.

126. **Web Splices.** Web plates shall be symmetrically spliced by plates on each side. The splice plates for shear shall be the full depth of the girders between flange angles. The splice shall be equal to the web in strength in both shear and moment. There shall be not less than two rows of rivets, staggered, on each side of the joint.

127. **End Stiffeners.** Plate girders shall have stiffener angles over end bearings, the outstanding legs of which will extend as nearly as practicable to the outer edge of the flange angles. These end stiffeners shall be proportioned for bearing on the flange angles, and shall be arranged to transmit the end reaction to the pedestals or distribute it over the masonry bearings. They shall be connected to the web by enough rivets to transmit the reaction. End stiffeners shall not be crimped.

128. **Intermediate Stiffeners.** The webs of plate girders shall be stiffened by angles at intervals not greater than:

- (a) Six feet.
- (b) The depth of the web.
- (c) The distance given by the formula.

$$d = 50t \left[ 6 - k(4k + 1) \right], \text{ in which}$$

$d$  = the distance between rivet lines of stiffeners in in.  
 $t$  = the thickness of the web in inches.  
 $M$   
 $k$  = the ratio  $\frac{M}{L}$ , shown in Fig. 4, but never less than 0.5.

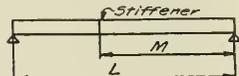

Fig. 4

129. For girders in which the load is applied to the girders at floor-panel points, the stiffener intervals in any panel shall be uniform and based on the value of "k" at the end of the panel toward the nearer support.

130. If the depth of the web between the flange angles or side plates is less than 50 times the thickness of the web, intermediate stiffeners may be omitted.

131. Stiffener angles shall be placed at points of concentrated loading. Such angles shall not be crimped.

132. Intermediate stiffeners shall be riveted in pairs to the web of the girder. The outstanding leg of each angle shall not be less than 2 in. plus one-thirtieth of the depth of the girder, nor more than 14 times its thickness.

133. **Gusset Plates in Through Girders.** In through plate girder spans, the top flanges shall be braced by means of gusset plates or knee braces with solid webs connected to the floor-beams and extending usually to the clearance line. If the unsupported length of the inclined edge of the gusset plate exceeds 18 in. the gusset plate shall have one or two stiffening angles riveted along its edge. The gusset plate

shall be riveted to a stiffener angle on the girder. Preferably it shall form no part of the floor-beam web.

134. In through plate girder spans with solid floors there shall be knee-braces with  $\frac{3}{8}$ -in. webs, extending usually to the clearance line, at intervals of about 12 ft. Each knee-brace shall be well riveted to the floor and the girder, especially at the top, and shall have its edge reinforced by one or two angles.

135. **Ends of Through Girders.** If through plate girders project two feet or more above the base of the rail, the upper corners shall be rounded to a radius of about one-third of the depth of the girder, but not less than 18 in., the radius to be a multiple of 6 in. In multiple span bridges only the extreme ends shall be rounded. If adjacent spans have different depths and the difference in depth does not exceed 18 in., the top flanges of the deeper girders shall be curved at the ends to a radius equal to one and one-half times the depth of the girder, so that the depth of the ends will be the same as that of the adjacent girders. If the difference exceeds 18 in., the corners of the higher girders shall be rounded to a radius not greater than the difference in depth and not greater than one-third of the depth of the deeper girder. Exposed ends of through girders shall be neatly finished with end plates.

136. **Spans Shipped Riveted.** Deck plate girder spans less than 50 ft. in length shall be shipped riveted complete, unless otherwise specified.

137. **Central Bearings.** Plate girders 50 ft. or more in length shall be designed with central bearings.

138. **Masonry Bearings.** End bearings on masonry shall preferably be raised above the coping by metal pedestals.

139. Sole plates shall be not less than  $\frac{3}{4}$  in. thick and not less in thickness than the flange angles plus  $\frac{1}{8}$  in.

140. **Anchor Bolts.** Anchor bolts shall be  $1\frac{1}{4}$  in. in diameter and shall extend 12 in. into the masonry. There shall be washers under the nuts. Anchor bolt holes in pedestals and sole plates shall be  $1\frac{5}{8}$  in. in diameter, except that at expansion points the holes in the sole plates shall be slotted.

**Trusses**

141. **Type of Truss and Sections of Members.** Trusses shall have single intersection web systems and, preferably, inclined end posts. The top chords and end posts shall be made usually of two side segments with one cover plate and with stay plates and lacing on the open side. The bottom chords of riveted trusses shall be symmetrically made, usually of vertical side plates with flange angles. Web members shall be made of symmetrical sections. In pin-connected trusses, the tension chords shall be non-continuous for bending at pin joints.

142. **Camber.** The length of members of truss spans shall be such that the camber will be equal to the deflection produced by the combined dead and static live loads.

143. **Riveted Members in Pin-Connected Trusses.** Hip verticals (and members performing similar functions) and the two end panels of the bottom chords of pin-connected trusses shall be riveted members.

144. **Eye-Bars.** The cross sectional area of the head through the center of the pin hole shall exceed that of the body of the eye-bar by at least 40 per cent. The thickness of the bar shall be not less than one-eighth of the width nor less than 1 in., and not greater than  $2\frac{1}{2}$  in. The form of the head shall be submitted to the Engineer for approval before the bars are made. The diameter of the pin shall be not less than seven-eighths of the width of the widest bar attached.

145. **Packing.** The eye-bars of a set shall be packed symmetrically about the plane of the truss and as nearly parallel as practicable, but in no case shall the inclination of any bar to the plane of the truss exceed 1-16 in. per foot. They shall be packed as closely as practicable and arranged so as to produce the least bending moment on the pin. They shall be held against lateral movement, and arranged so that adjacent bars in the same panel will not be in contact.

146. **Gusset Plates.** The thickness of gusset plates connecting the various members of the truss shall be proportionate to the stress to be transferred, but shall not be less than  $\frac{1}{2}$  in.

147. **Facilities for Jacking.** The end pins of trusses shall project a sufficient distance outside of the faces of the chords to permit making attachments for jacking the span.

148. **Masonry Plates.** Masonry plates shall not be less than 1 in. thick.

**Viaducts**

149. **Type of Viaduct.** Viaducts shall consist usually of alternate tower spans and free spans of plate girders or

riveted trusses supported on bents. The tower spans usually shall be not less than 30 ft. long.

150. **Bents and Towers.** Viaduct bents shall be composed preferably of two supporting columns, and the bents usually shall be united in pairs to form towers. Towers shall be braced, both transversely and longitudinally, with riveted members. In double track towers, riveted diagonal bracing in a horizontal plane shall be used at the top.

151. **Single Bents.** Single bents shall have hinged ends, or else have their columns proportioned to resist the bending stresses produced by changes in temperature.

152. **Bottom Struts.** The bottom struts of viaduct towers shall be proportioned for the calculated stresses, but in no case for less than one-fourth of the dead load reaction on one pedestal.

153. **Batter.** The columns usually shall have a batter transversely of one horizontal to six vertical for single track viaducts, or one horizontal to eight vertical for double track viaducts.

154. **Spacing of Girders.** In single track viaducts, the girder spacing usually shall be uniform throughout, and shall be determined by the spacing for the longest span in the viaduct, according to the rules specified for deck plate girder spans.

155. In double track viaducts, the girders under each track shall be spaced 6 ft. 6 in. between centers, and the inner lines of girders shall be supported by cross-girders framed between and riveted to the posts.

156. **Girder Connections and Bracing.** Girders of tower spans shall be riveted at each end to the tops of the posts or cross-girders. Girders between towers shall have one end riveted, and shall be provided with an efficient expansion joint at the other end. No bracing or sway frame shall be common to abutting spans.

157. If neither of the girders under a track rests directly over a tower post, bracing shall be provided to carry the longitudinal force into the tower bracing without producing lateral bending stress in the cross-girders or posts.

158. **Sole and Masonry Plates.** Sole and masonry plates shall not be less than  $\frac{3}{4}$  in. thick.

159. **Anchorage for Towers.** Anchor bolts for viaduct towers and similar structures shall be designed to engage a mass of masonry the weight of which is at least one and one-half times the uplift.

160. Anchor bolts, washers and other anchorage or grillage materials shall be furnished by the Contractor in time for them to be built into the masonry.

These specifications were followed by detailed specifications for materials, including structural and rivet steel, cast steel and cast iron; workmanship; weighing and shipping; painting; inspection; full size tests and erection.

### Discussion

O. E. Selby (Chairman): The secretary tells me there is a great demand for these specifications for steel bridges. It has become known, of course, that they are under revision, and naturally people will demand the revised specifications. For that reason we ought to have the specifications as revised adopted in form to promulgate. Furthermore, there is every probability that the Engineering section of the A. R. A. will, under the relations newly established, be calling upon this association through this committee for specifications for the use of the U. S. R. A. I move the adoption of the conclusion, which includes the specifications printed.

F. E. Schall (L. V.): I find the old specifications had 163 paragraphs, and that the new ones have 317 paragraphs. It is impossible to form a correct idea of the great number of changes that were made in the specifications bearing on the sections required or the design of the bridges. It seems to me there are some things which must be changed before we adopt them. I move as an amendment that the specifications be discussed on the floor as long as possible, and that the rest be handled by correspondence, and the whole matter laid over until the next annual meeting.

Mr. Selby: I might give briefly the features in which the specifications proposed differ from the old ones. In the first place, they have been greatly amplified, as pointed out by Mr. Schall, and the number of paragraphs has

about doubled. The amplification consists largely in parts covering workmanship and details of design. Those are not adequately covered in the old specifications. Specifications for erection have been added, so that the separate specifications for fabrication and erection which the association adopted at different times have been combined into one complete specification. In the matter of loads, there has been no change in the form of the loading, but we have specified E-60 loading as the minimum. In the column formula there is a change. We have introduced a parabolic column formula which is not self-limiting, and which has many advantages over the straight line formula in use in the old specifications. The impact formula is the one adopted by the convention a year ago. The clearance diagram is the general clearance diagram adopted by the convention two years ago. Those are the principal features that I think of which have been radically changed. Aside from that, however, a great many details have been amplified and some have been changed.

A. C. Irwin (Port. Cem. Assoc.): The specifications for steel railway bridges of the American Railway Engineering Association have had a wider and more universal use than any other specialized work produced by the association. However, the fact that we have never had a bridge failure is not proof that our designs have been economical and of the best. Very few railway bridges erected 25 or 30 years ago are now in service where they were originally constructed. Wheel loads in that time have so increased on main lines that the safe carrying capacity of parts of the structures was surpassed long before the physical condition of the bridges required their relegation to the scrap heap. This situation has brought about a very thorough investigation of the strength of what we choose to call old bridges. It was desired to retain the bridges in service at their original locations as long as practicable and we therefore began to apply to them *maximum safe unit stresses* and the heavy loading which it was desired to run over the line. And indeed for what ultimate purpose was the bridge design in the first place? We say to carry safely the heaviest loads that would be allowed to pass over it. Truly, but what was this load, and the answer is Cooper's E-40, 50 or 60, as the case may be. And what was the unit stress which was used in proportioning the various parts? The reply will range anywhere from 12,000 to 18,000 lb. per sq. in. with an "explanation" to the effect that this low unit stress was used to allow for a very considerable future increase in the live load. Then, after all, the bridge wasn't designed in the first place to fulfill the ultimate purpose of carrying safely the heaviest loads that were expected to pass over it.

The practical result of this logical or psychological error is almost humiliating to the engineering profession. You have had to move, scrap or sell many bridges whose chords were amply strong to carry the augmented loads, simply because of weakness in some web members or the absence of counters or because the floor beams or stringers or connections were not equally strong with the chords. In other words, you evolved an unbalanced design.

Now there is a cure for this, but the specifications presented here for your adoption do not give it. That cure is to design the bridge in the first place for the fulfillment of its ultimate purpose, namely, to carry maximum load, that is, use the maximum loading and the maximum unit stress in proportioning the various parts of the bridge—not two-thirds of the expected load or two-thirds of the maximum unit stress, but all of them.

Mr. Selby: The committee gave careful consideration to the points raised by Mr. Irwin in meetings at which Mr. Irwin was not present. It is recognized that the low unit stress design does not give a balanced uniform margin for increase in live loads. Both the technical and psychological aspects of that feature and the feature of design for an enormous increase over the existing live loads were carefully considered, and Prof. Turneaure is better prepared to tell why the specifications were presented in this form.

E. A. Frink (S. A. L.): There are a number of things in the specification that do not seem to be right, the principal one being the loading. The committee has proposed as a minimum live loading Cooper's E-60 loading. If we use an E-60 loading for the engines that are in use to-day, we get too much metal in the super-structure, and too little metal in proportion in the floor system for structures of fairly long span; the Cooper loading is so entirely different from the engines in use to-day that it is no longer a fair measure by which to design the strength of our bridges. It seems to me that the time has come when this association should attempt at least to devise a standard load. Perhaps that is more of a problem than it might seem, but still I think we ought to attempt it.

As to prescribing a minimum of Cooper's E-60 for bridges when this specification goes into our Manual, it almost has the effect of a law. Any company which departs from this specification materially in designing its bridges might find the after-effects decidedly adverse. Therefore, we should be very cautious what loading we specify for our bridges.

J. R. Ambrose (Toronto Ter. Ry.): It is only fair to the members that they have sufficient time to express their views before you ask them to vote. I think it would be very interesting if you should ask Mr. Motley to let us know if there is any great difference between this specification which you are proposing now and the one which was proposed in the Engineering Institute of Canada.

P. B. Motley (C. P. R.): The Canadian Society's attempts at a specification are considerably different from this in various ways, in general principles. It is different in its order; it has completely revised its previous specifications in order of proceeding. For instance, loadings are mentioned first after general clauses, and then each process of design is allowed to rule in using the order of the various clauses. This specification does not apparently do that completely. In detail, it differs in many points, and I do not think it necessary to take up the time of this meeting in going into too many of those. As far as principles are concerned, I must say that I am in full accord, or mostly in full accord, with Mr. Irwin. We are not yet down to brass tacks in the method of applying our design. The Cooper's system of loading scarcely answers the condition of all locomotives to-day, but if we change to something like a Mallet, for instance, in 10 years we will have something different. It seems to me—this is my personal opinion only—that we will have to lean towards the European system of using a wisely arrived at uniform load. It seems to me that that is the tendency of our various thoughts and discussions. Probably the committee will discuss that in the next year's work.

Prof. A. N. Talbot (U. of Ill.): Mr. Chairman, it seems that all members of the Association and engineers generally will agree that it would be very undesirable to adopt specifications which have been in the hands of the members only two or three days. I feel the motion made by Mr. Schall is, therefore, one that should be adopted, the first part of it at least. As I understand, he put in at

the end something considering these as tentative specifications during the year. It hardly seems that we should take these as tentative specifications, for they have no standing in the association for that term.

Mr. Schall: Mr. Chairman, with your permission, I will withdraw that second part of the motion that Prof. Talbot refers to, with the consent of my second.

Prof. F. E. Turneaure (U. of Wis.): Mr. Irwin's suggestion goes to the point of designing structures, having in mind more exactly the ultimate safe stress to which bridges may be subjected, and in proportioning the structure so that it will be what is called a balanced design when loaded to its maximum safe load.

In the rules for the examination of old structures adopted by the association some years ago an ultimate safe stress of 26,000 lb. was suggested as the stress up to which a structure might be loaded if the details were in satisfactory condition, and if the bridge showed no signs of over-stress. In accordance with that idea of ultimate safe stress, the committee discussed this particular method of arriving at a design, assuming that 24,000 lb. might be considered a safe stress with details all satisfactory and the load a perfectly static load. Should such a method be adopted, it would amount to this, that for a dead load we would design for that stress of 24,000 lb. per sq. in., or possibly 22,000 lb. per sq. in., and that for the live load we would take, not the load as indicated in the specification that is now passing over the structure, or that is anticipated in the near future, but the load that we would estimate might pass over the structure 30 or 40 years hence, and use 24,000 lb. for that live load, increased by the proper amount for impact, and in that way get a structure which would carry that load 30 years hence, say with a stress of 24,000 lb. per sq. in.

Is 24,000 lb. per sq. in. a satisfactory stress to put before the association, before engineers generally and before the public as a safe stress for all kinds of structures subjected to static load only? At the present time 16,000 lb. per sq. in. is the common ordinary stress used in a great variety of structures. I think any experienced engineer would be perfectly willing to design a structure, if he had supervision of all the details for a load perfectly static, which never would increase, using an ultimate safe stress of 22,000 to 24,000 lb. per sq. in., and be able to sleep nights.

The committee did not feel that it was desirable to set forth 24,000 lb. per sq. in. as a safe stress for dead loads. That line of argument was carried on in the committee with reference not only to 24,000 lb. per sq. in., but with reference to 18,000 to 20,000 lb. per sq. in. as a basic dead load stress. The result that the committee arrived at after a good deal of discussion is indicated in the specifications. The difficulty, of course, arising from that method of design is well known, and many structures have been analyzed for increased live loads which have shown that the web members are the weakest elements in the structure when it comes to permitting the passage of an extremely heavy live load. That difficulty is met fairly well, in the minds of the committee, by Article 45, which provides just this: If we take 24,000 lb. as the ultimate safe stress for an overloaded structure, this rule will provide precisely 75 per cent overload capacity for the live load part of the load. That is practically the same percentage of overload capacity that is provided in the chord members of a 200-ft. span.

B. R. Leffler (N. Y. C.): Mr. Chairman, I wish to call the attention of the members of the association to the first line in this specification, "These specifications are limited to spans of less than 300 ft." One of the reasons for that was, that it was recognized that when long

spans are to be designed some method of using higher unit stresses must be used, and such long spans also require special engineering features. Another paragraph that has not been mentioned as tending to make a balanced structure is paragraph 27. It was recognized that in heavy ballasted floor bridges this load was of such great importance that some adjustment should be made to take care of it.

Mr. Irwin: I agree entirely with Mr. Lefler that these are steps in advance. They are attempts to cure this proposition of an unbalanced design that have met every man who has had to figure out whether or not such and such a locomotive could pass over such and such portions of the line, and it is an attempt to relieve him of the embarrassment that he meets when he finds that because of certain small weaknesses in this bridge the large expense incurred in building it in the first place must be largely thrown away, because the man who designed the bridge did not have in mind the fulfillment of the things that that bridge was supposed to do with the biggest load that ever came upon it. These are steps in the right direction, but if you consider the fact that your bridges will have spans from very small ones up to 300 ft. according to this specification, you will have a perfectly enormous problem. There is just one way to do it, that is to consider and proceed from the fundamental proposition of designing the bridge for the maximum load and maximum unit stress.

(The original motion as amended by Mr. Schall was put to a vote and carried.)

The Chairman: The report is received as a progress report.

Mr. Selby: I talked with a member of the Bureau of

Standards yesterday and asked him what the prospects were for a continuation of the column tests in the Bureau of Standards now that the war conditions have passed. Mr. Brooks told me he was in touch with that part of the work of the bureau and he felt sure that some progress could be made this year on those tests. The work of making the tests is in the hands of the subcommittee, headed by W. H. Moore, and we are only waiting for an opportunity to conclude the tests.

(Mr. Selby then read the matter on design of turntables and recommended that the subject be dropped.)

Mr. Frink: Why should the subject be dropped?

Mr. Selby: For the reason that the principal materials for turntable rollers and disc bearings are steel for the rollers and phosphor bronze for the disc. The phosphor bronze specifications have been carefully considered and adopted by the association and the matter of steel for the rollers is included in the movable bridge specifications which have been printed in the proceedings and will be offered next year for adoption.

(Mr. Selby read the matter on ballast floor bridges.)

Mr. Selby: The details under this heading are expected to be presented to the convention in the report of 1920.

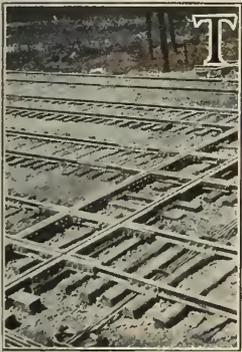

(Mr. Selby read the matter on track scales.)

Mr. Selby: The committee will ask that this subject be continued, for the reason that the track scale question is a very live one and has been referred to this association by the Railroad Administration, and this committee would like to keep in touch with the structural features, at least, of the track scale.

I move the adoption of Sec. 2 of the recommendations.

(The motion was carried and the committee dismissed with thanks.)

## Report on Uniform General Contract Forms

THE COMMITTEE CONSIDERED the form of agreement for railway crossings at several meetings. The Form of Agreement for Railway Grade Crossings herewith submitted is the result of action taken at these various meetings. No attempt has been made to specify a basis upon which the expense for construction, maintenance and operation shall be divided. In this respect the submitted Form of Agreement conforms with the

Form of Agreement for Interlocking Plant, submitted by this committee and approved by the Association at the last annual meeting. Similarly while articles covering liability and arbitration are incorporated in the submitted form in order to complete the same, it is recognized that these two articles will doubtless be modified in many cases to meet local conditions and the views of various legal departments of railroads.

It will be noted that seniority as between companies has been given no specific recognition in the submitted form. The committee has assumed that seniority will be given due weight in concluding the bargain which will be made in each case. The committee further assumes that in general the senior company will prefer to retain the actual work of constructing, maintaining and operating the grade crossing in its own hands.

Committee: E. H. Lee (C. & W. I.), chairman; C. A. Wilson (Cons. Engr.), vice-chairman; C. Frank Allen, O. P. Chamberlain, A. O. Cunningham (Wabash), Thos. Earle (Beth. Steel Br. Corp.), W. D. Fauette (S. A. L.), G. E. Gifford, J. C. Irwin (B. & A.), R. G. Kenly (M. & St. L.), A. S. Kent (C. I. & L.), H. A. Palmer (G. T.), C. J. Parker (N. Y. C.).

### Appendix A. Agreement for Grade Crossing

THIS AGREEMENT, made this.....day of..... in the year....., by and between..... party of the first part, hereinafter called..... and....., party of the second part, hereinafter called.....

(Note.—During Federal control terminology should conform to requirements of Federal Administration.)

HISTORICAL. WHEREAS, .....

(Note.—Include brief description of conditions, including the location of existing or proposed grade crossing, an enumeration of all existing agreements, if any, the name of the companies between which agreements are made, their dates, their purpose, et cetera.)

WHEREAS, ..... desires the right to construct, maintain, use and operate a grade crossing across the tracks and right-of-way of..... to permit the passage of its trains over and across the right-of-way and tracks of ..... and ..... is willing to grant said right; the location of said crossing and its proposed arrangement being shown upon a blueprint marked "Exhibit A," dated ....., identified by the signature of the ..... of ..... and of ..... of ..... hereto attached and hereby made a part of this agreement; and

WHEREAS, The parties hereto have agreed upon the

terms and conditions upon which said crossing as shown upon said "Exhibit A" shall be constructed, maintained and operated.

Now, TELLITORE, In consideration of the premises and in further consideration of the mutual covenants and agreements hereinafter stipulated to be kept and performed, it is mutually agreed between the parties hereto, for the purpose of defining the terms and conditions upon which said crossing shall be constructed, maintained, renewed and operated, as follows:

1. DEFINITION. The term crossing as herein contained shall include rail, crossing frogs, track fastenings, crossing timbers, and other track appliances, included between the outer joints of one or more crossings installed or hereafter installed; together with ballast, drainage, side ditches, subdrainage, and other substructure appliances, devices or supports on the right-of-way ..... Company in so far as affected by said crossing; all necessary buildings, including flagmen's houses, shanties or towers; gates, semaphores and other safety devices or appliances; all as may be required to keep said crossing in safe and suitable condition for the operation of trains, as required by ..... Company or by lawfully constituted public authority.

2. GRANT. .... hereby grants to ..... subject to the conditions and stipulations of this agreement, the right to construct, maintain, renew and operate at grade, ..... track ..... of the ..... Railroad, over and across the right-of-way and tracks of ..... at the point of crossing, as shown on "Exhibit A."

3. CONSTRUCTION. The ..... Company agrees to construct a grade crossing as shown upon said "Exhibit A" and according to detail plans and specifications, which have been approved by the ..... Engineer of the ..... and identified by ..... signature. The said ..... Company agrees to begin the construction of said crossing within ..... days after the execution of this agreement and to carry the same forward continuously to prompt completion.

4. APPORTIONMENT OF COST. The cost of constructing, maintaining, renewing and operating said crossing shall be borne by the respective parties hereto as follows: .....

In the cost of maintaining and renewing said crossing shall be included the expense for taxes, assessments, and insurance; any losses by fire, floods and other damage caused by the elements; also any change made necessary by an act or ordinance of a lawfully constituted public authority, except as herein otherwise provided.

5. EXTENSIONS AND CHANGES. (a) The ..... Company reserves the right to construct, maintain, renew and operate upon its right-of-way from time to time such other additional track or tracks as it may deem necessary or desirable crossing the track or tracks of the ..... Company, the right to construct which is herein granted, and all the provisions and stipulations herein contained shall apply to such other additional track or tracks.

(b) The ..... Company reserves the right to change the grade of its track or tracks as shown on said "Exhibit A" not to exceed ..... feet, and the grade of the crossing shall be changed to conform thereto. The expense of so changing shall be borne as follows: .....

(c) Either company shall have the right at its own expense to make minor changes in alinement at said crossing, provided that this shall not materially interfere with the tracks of the other party, but nothing herein contained shall be interpreted to cover major changes in grade or alinement, such as separation of grade or eleva-

tion of tracks required or brought about by laws or ordinances of properly constituted public authorities.

(d) Improvements or devices which may be necessary in order to conform to the standard practice of the ..... Company shall be provided as required by that Company, and the expense shall be borne in accordance with the provisions of Section No. 4 hereof.

(e) The privileges hereinbefore granted are granted upon the further express condition that whenever anything may be done or may be required to be done by the Chief Engineer of ..... Company, or under and in pursuance of any of the laws of the State of ....., or of any lawful action of proper public authorities in respect to the said crossing, including the installation of gates, signals or interlocking, the ..... Company shall make all changes at said crossing and in present or future tracks of both companies and their appliances, necessary to comply with or carry out the requirements of the Chief Engineer of the ..... Company or of law, or action of such authorities, and the cost thereof shall be apportioned in accordance with Article 4 hereof.

(f) It is further understood and agreed that the ..... Company will pay the cost of any connecting or transfer track or tracks that may, at any time, be required at or near the point of the crossing aforesaid, whether such track or tracks be ordered by competent authority, or put in by agreement between the parties hereto. If the junction switches of the said connecting track or tracks in the main track or tracks of either of the parties hereto shall be or come to be within the limits of an existing interlocking plant, said junction switches shall be taken into the protection of said interlocking plant and the cost shall be borne as follows: .....

6. MAINTENANCE AND RENEWAL. The crossing shall be maintained by the ..... Company. In case ..... Company shall remove its tracks or any of them at said crossing, the track or tracks of the ..... Company shall be restored by the ..... Company to their original condition, to the satisfaction of the Chief Engineer of the ..... Company, and at the sole cost and expense of the ..... Company.

7. CONTROL. The maintenance, renewal, operation and protection of said crossing shall be under the sole charge and control of the ..... Company, and it shall employ competent persons to maintain, renew and protect the same, and such parties from time to time so employed shall be removed for good and sufficient reason upon request in writing of a general managing officer of the ..... Company.

Each of the parties hereto, through its authorized employes and representatives, shall have the right at all times to inspect said crossing, as well as the accounts covering the construction, maintenance, renewal and operation of the same; and in the event that the ..... Company shall notify the ..... Company in writing of renewals and repairs that may be necessary for the safe and proper operation of said crossing, and if the ..... Company neglects for a period of thirty days to make said necessary renewals and repairs, then the ..... Company shall have the right to make such renewals and repairs, and the ..... Company shall, upon presentation of proper bills, and within the time provided in Section 11 hereof, pay its proportion of the amount so expended.

8. PROTECTION. During construction and thereafter, flagmen or signalmen shall be furnished for the proper protection of said crossing, and such persons from time to time so employed shall be removed for good and sufficient reasons, upon request in writing of a general managing officer of the ..... Company. The expense

for their wages, together with the cost of materials and supplies required in connection with their work, shall be apportioned as herein in Article 4 provided. Until interlocking protection shall have been provided, all trains shall approach said crossing under full control, and shall come to a full stop within . . . . . feet from said crossing, and shall not proceed until the receipt of a proper signal so to do.

9. PRECEDENCE. In the use of said crossing, passenger, mail and express trains shall have precedence over freight or work trains and light engines, and freight or work trains shall have precedence over light engines. The trains and engines of the . . . . . Company shall have precedence over the trains and engines of like class of the . . . . . Company.

10. OWNERSHIP. Each of the respective parties hereto shall participate in the ownership of the crossing in the proportion which the payments made by it for construction of same bear to the total cost of construction.

11. PAYMENT OF BILLS. The payment of all bills under this agreement shall be made not later than the twenty-fifth day of the month following the month in which said bills are rendered. The bills for expense of construction shall be made as a final bill, unless otherwise mutually agreed and understood.

Bills covering maintenance, renewals and operation, taxes and assessments shall show total expenditures, and proportions chargeable to each of the respective parties hereto, and shall be rendered monthly; those covering insurance, taxes and assessments annually.

Should any dispute arise as to the correctness of any of the items included in bills rendered, under this agreement, the party against which any such bill is rendered, shall pay as herein provided, an amount equal to the sum of all items in said bill, the correctness of which is unquestioned. The remainder, covering disputed items, shall be paid promptly as herein provided, upon an adjustment of the dispute.

12. ADDED PERCENTAGES. In making bills for the cost and expense of constructing, renewing, maintaining, operating and protecting said crossing, all labor and material shall be charged for at actual cost, plus . . . . . per cent added to material, and . . . . . per cent to labor to cover freight charges or accruals, handling, superintendence, use of tools and accounting, except that work done by contract shall have no percentages added.

Such of said bills as are based upon payroll cost of labor and stock prices of material shall include a fair arbitrary charge to cover supervision, inspection, handling, transportation, accounting and similar undistributed items of expense. Such fair arbitrary charge shall be agreed to by the parties, or determined by arbitration as herein provided.

The provision as to actual cost herein contained shall not be considered or held as a warrant for charging excessive prices or freight rates on material, for hauling the same unreasonable distances, nor for the payment of unreasonable arbitrary charges of any kind.

13. LIABILITY. Each party hereto assumes for itself the responsibility and risk of using and operating its own trains and engines over the space covered by the said crossing, and also responsibility for the negligent acts and omissions or the alleged negligent acts or omissions of its own officers, agents, servants and employes engaged in connection therewith; and in performance of any of its separate duties under this contract; and will pay to the other party and to third persons all damages which may arise and for which it may be liable arising from such negligence and in such operation.

The party having special charge of the management and operation of said crossing shall not be liable to the

other party for the negligent acts or the omissions, or the alleged negligent acts or omissions of any person employed in the operation, maintenance or repair of said crossing, but all persons so employed shall, as respects any injury caused by such negligence, be regarded and treated as the agents or servants of each party hereto, and each of said parties hereby assumes the responsibility for all damages resulting from the negligence of such agents or servants in the operation of its own engines, cars and trains, and those of its tenants, lessees and licensees, at the said crossing, and shall indemnify and save each of the other parties harmless therefrom. Any expense caused or growing out of the injury of any workman or employe engaged upon the construction of said crossing shall be held and considered to be a construction expense, and shall be divided as herein in Section 4 provided.

14. ARBITRATION. In case of any differences or dispute arising under this agreement or concerning the subject matter thereof, the parties hereto agree to submit such difference or dispute to three arbitrators, one of whom shall be appointed by the . . . . . Company, and another by the . . . . . Company, and each party shall give to the other party written notice of appointment of its arbitrator, together with his name and address. The two arbitrators so chosen shall select a third arbitrator. If either party shall fail to choose an arbitrator as herein provided, the arbitrator selected by the other party hereto, at the expiration of . . . . . days after the date of its said written notice, shall select a second arbitrator, and the two arbitrators so chosen shall select a third arbitrator. If within . . . . . days after the appointment of a second arbitrator, as herein provided, the two so chosen shall have failed to select a third arbitrator, either party hereto may apply to any judge of the District Court of the United States for the District which shall then include . . . . . or who shall thereupon appoint the third arbitrator. The three arbitrators so chosen in any manner as herein provided, or a majority of them, shall hear and decide said difference or dispute, and their decision, or that of a majority of them, shall be final and binding on the parties hereto.

The expense of an arbitration under the terms hereof shall be borne by the parties hereto in the proportions fixed by the arbitrators.

15. CANCELLATION OF CONFLICTING AGREEMENTS. It is mutually understood and agreed that any and all agreements relative to said crossing, existing between the parties hereto or their predecessors, so far as they conflict, or are inconsistent with the terms and provisions of this agreement, are hereby annulled, but in all other respects they shall continue in full force and effect.

16. DURATION AND SUCCESSION. This agreement shall remain in full force and effect as long as the tracks of the respective parties cross at grade at the location shown upon "Exhibit A."

The provisions of this agreement shall be binding upon and inure to the benefit of the parties hereto, their successors, lessees and assigns.

IN WITNESS WHEREOF, the parties have caused these presents to be executed in duplicate by their respective officers as of the day and year first above written.

ATTEST: . . . . . Company

### Discussion

E. H. Lee (Chairman): The agreement which the committee offers to the association is shown in Appendix A, and we wish to add two additional sections to that agreement. Your committee feels that under all the conditions, taking the country over, a really uniform contract form is difficult to provide, one which will adequately meet all the various conditions in the various sections of the country. Some of the provisions must be suggested and with that in mind, these two additional paragraphs which we wish to offer, are to be incorporated in the agreement as shown in Appendix A, as sections 9 and 10, covering two matters which should be covered in certain cases. It might be well to run through the "Agreement for grade crossings," which is submitted.

(Mr. Lee then read Appendix A, down to and including "Protection.")

Mr. Lee: At this point we wish to offer to the association two additional paragraphs, one to cover the cattle guards and fence, and another to cover the question of electrification of lines as follows:

Section 9—The ..... Company reserves the right so long as it maintains fence up to the point of intersection of the ..... company's track with the respective boundary lines of the ..... company's premises, to require the ..... company to build and maintain in good order, proper cattle guards at the point of intersection aforesaid, for the purpose of preventing trespass upon said company's premises from the track or grounds of said ..... company.

Section 10—If the ..... company shall (during the life of this contract) electrify its railroad at the said crossing,

upon ..... days written notice to the ..... company, the said ..... company agrees to furnish, maintain and install such electric appliances, fixtures and appurtenances at said point of crossing as many be necessary for the safe and convenient operation of said crossing, and to the satisfaction of the company's engineer.

If there is no objection, that will be incorporated. With those two additions, and with the further stipulation that Articles 9 to 16, inclusive, be set further back so that they shall be 11 to 18, inclusive, your committee wishes to offer the form submitted in Appendix A. I move that this form be adopted by this association for incorporation in the Manual.

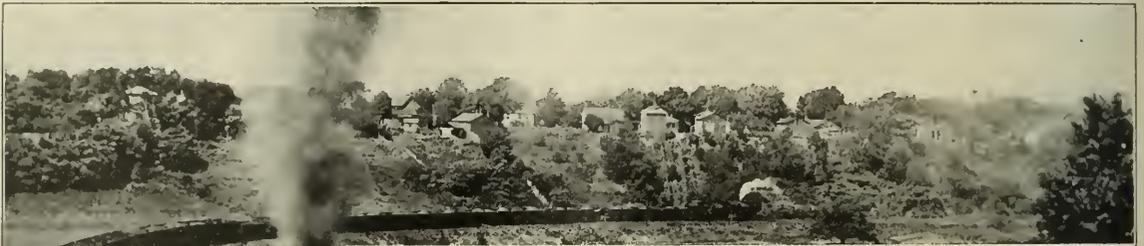

G. W. Kittridge (N. Y. C.): I have been making contracts a good many years. The day before I left home to come here I had submitted a contract which read the same as this one does, in one particular, and it came back. They told me that if I wanted to make a blue print and have it identified by signature of the blue print hereto attached, it should not appear in the whereas, but after "It is mutually agreed." There may be some legal reason why that should come after "Therefore it is mutually agreed" than to put it in one of the whereases.

Mr. Lee: The committee would like to take this under consideration.

The Chairman: The motion before the house is the adoption of this tentative form of report, and insertion in the Manual.

(The motion was carried and the committee was dismissed with thanks.)

## Report on Economics of Railway Operation

**T**HOROUGH STUDY of existing cost data to determine how applicable they are to the solution of special problems with which this committee is concerned would require a large force and a material expenditure, and the committee feels that it should study the methods of analyzing costs rather than the costs themselves.

The Minnesota Rate Case made an epoch in cost accounting by insisting on more accurate information as a basis for rates. The "Arkansas Formula" was developed as a result of the decision, and was first used to find the cost of handling intrastate freight business. The "Formula" is a detailed method of assigning operating costs to the different services performed. Records are kept of

actual work done by employees handling different kinds of business, and no expense is spared to make the results accurate and complete. General expenses are distributed on the basis of the other apportioned expenses. This method has been widely used in rate cases.

With these complete investigations, there were collected various operating statistics, as well as cost figures—statistics which will be of value even though the cost data may not be applicable under present conditions. We may find these figures of value when we have a definite problem in view.

Since these studies were made, an attempt has been made to develop simpler and less expensive methods, and formulas have been prepared which, while they cover only about one-third of the primary accounts, take care of about 85 per cent of the expense. The items which are omitted are mainly the unimportant ones which cannot be easily classified and which can fairly be divided on the basis of other costs.

New operating statistics are being prepared under the direction of the U. S. Railroad Administration. It seems probable that the methods adopted will lead to valuable results, and it is to be hoped that the work may be continued and where found to be an improvement over old

methods, it should be adopted by the Interstate Commerce Commission. It is not thought necessary here to discuss these new statistics. Reference is made to the article by William J. Cunningham, in the *Railway Age* of January 3, 1919, page 43.

**Economic Length of Operating Districts**

**OPERATING DISTRICT**—The section of a railroad extending between terminals where yard and enginehouse facilities are provided which is covered by slow freight trains in single runs, trips, turns or day's work.

The economic length or lengths of operating districts of a given railroad are those with which the sum of interest on first cost, depreciation and maintenance of road and equipment, and cost of operation, may be the minimum.

On account of varying speeds the economic length of engine districts for (a) through passenger trains, (b) local passenger trains, (c) preference or quick dispatch freight trains, (d) local and pick-up freight trains, and (e) slow freight trains handling full engine rating, are not always the same, and for this reason it is essential to draw a distinction between engine districts and operating districts. To a large extent the present practice is for passenger engines and engine and train crews to cover more than one operating district in a turn or day's work, either by longer straight-away runs or by doubling one or more operating districts or portions thereof. To a considerably less extent the same is true of fast freight trains, and local and pick-up freight trains frequently have runs shorter than the operating districts. Therefore, in determining the economic length of operating districts it will be sufficient to consider the term "operating district" as applying only to slow freight trains.

The factors affecting the length of operating districts of existing lines are:

- (1) Location of existing yard and enginehouse facilities.
- (2) Topographical conditions affecting the construction of new yards and enginehouse facilities.
- (3) Character of grade line.
- (4) Capacity of railroad for handling business to be moved.
- (5) Density of (a) passenger traffic; (b) fast freight traffic; (c) slow freight traffic.
- (6) Location of labor supply and of housing facilities of employees.
- (7) Location of connections with important feeders where there is heavy transfer of traffic from one to another, commonly termed "gateways."

All of these except No. 1 apply equally to new lines to be constructed except that the quantity of traffic frequently has to be estimated rather than determined from actual records.

The change in length of operating districts on existing lines has in the past been brought about by existing yard and terminal facilities being outgrown and on account of their inadequacy causing serious congestions of traffic rather than by any other cause. There are very few cases, if any, of new terminals on existing lines having been established solely for the purpose of changing the length of operating districts to promote economy. Usually a terminal becomes congested and topographical conditions are such that it is not practicable to increase its capacity. After a study of the situation it is found advisable to build a terminal in a new location, and this changes the lengths of the operating districts.

The disposal of existing terminal properties, the cost of new terminals and the breaking-up of established places of residence of employees are questions of such importance that it is rarely the case that any considerable

change in the length of operating districts on an existing road has been justified alone by the resulting economies, and it is not possible to establish any rules or formulas which can be followed with any degree of certainty.

Aside from the questions of providing facilities for increased business, the principal items of operating and maintenance expense affected by the length of operating districts are: (1) Wages of train and engine crews. (2) Fuel and supplies for engines. (3) Cost of dispatching engines. (4) Cost of switching at additional terminals.

(5) Train dispatching and telegraph expenses. (6) Maintenance of yards and engine terminals. (7) Maintenance of locomotives (locomotives required, both road and yard, increase as the number of operating districts increase). (8) Inspection and maintenance of cars, as affected by switching at additional terminals.

Take as a simple example a railroad of 500 miles operated under

Scheme A—Four operating districts of 125 miles each.

Scheme B—Five operating districts of 100 miles each.

(1) Under favorable conditions many freight trains will cover the 100-mile districts in from six to eight hours and a part of the wages of train and engine crews will be for "constructive" hours, and hence unproductive. With 125-mile districts this will not be so, or there will be less of it, and the wages of train and engine crews will be reduced accordingly, excepting as to such overtime as might be made on a longer district.

(2) Then if freight trains move at an average speed of 12½ miles per hour between terminals it will take a locomotive

$$\text{Scheme A—} \frac{500}{125} + 6 \times 4 = 64 \text{ hours}$$

$$\text{Scheme B—} \frac{500}{125} + 6 \times 5 = 70 \text{ hours}$$

to move a train over the 500 miles, one way. It will therefore require

$$\frac{70 - 64}{64} = .09375 = 10 \text{ per cent (approximately)}$$

more road locomotives with Scheme B. Switching at the additional terminal will require at least two switch engines, so that if 60 road engines are required with scheme A, then 60 + .10 × 2 = 8 additional engines will be required with scheme B and the cost of fuel and supplies for these engines will be additional expense with this scheme.

(3) With scheme B there will be 6 terminals, 4 intermediate, while with scheme A there will be 5 terminals, 3 intermediate. The number of engine dispatchments under scheme B will be approximately one-fifth more than under scheme A and an additional supervisory and working force will be required, embracing ashpit, engine house, coal dock, power house and miscellaneous labor.

(4) Incident to the additional intermediate terminal under scheme B there will be a certain amount of switching and a force of yardmasters, yard-clerks, switchmen, etc., required, adding to the expense of operation under this scheme.

(5) On account of there being an additional operating district another set of train dispatchers will be required under scheme B and the additional terminal will add at least one telegraph office.

(6) The yard tracks, buildings and appurtenances of the additional terminal under scheme B will have to be maintained and will add to this expense approximately one-fifth.

(7) There will be, as developed above, 6 road and 2 yard locomotives more required under scheme B. These will have to be maintained at approximately the average cost of maintenance of all locomotives under scheme A.

(8) A force of car inspectors will be required at the additional terminal and there will be a certain amount of damage to equipment in switching there, requiring repairs to the cars. This will add to the cost of repairs to cars under scheme B.

This indicates briefly the result on the cost of operation of the establishment of additional terminals, so long as the lengths of the operating districts are held within practicable limits. However, the exercise of care and good judgment is necessary in making the decision between very long or moderately long districts. If the districts are very long, the average time of the crews on the road will be too great and there will be great likelihood of having to relieve them to avoid violations of the Hours of Service law. Moreover, the factors affecting the length of operating districts Nos. 2 to 7, inclusive, have such an important bearing on the location of terminals and the economic length of operating districts that it is plainly evident that each case presents a problem in itself, which can be solved correctly only after a careful study of its own peculiar conditions. There are, however, certain principles which should be kept clearly in mind in determining the economic length of operating districts. These may be stated as follows:

(a) The number of terminals at which trains are switched and engines dispatched has a direct bearing on the cost of operation and should be a practicable minimum.

(b) It is advantageous to so locate terminals that locomotives will haul full tonnage rating over the entire operating district.

(c) It is advantageous to locate terminals at the intersections of natural railroad routes which will develop into important gateways.

### Conclusions

The committee recommends the acceptance of this report as information, it being considered unnecessary to insert any portion of the report in the Manual at this time.

The committee recommends the assignment for the coming year of four subjects, as follows:

(1) Report on methods for increasing the capacity of a railroad, collaborating with the committee on Signals and Interlocking.

(2) Report on method of analyzing costs, for the solution of special problems with which this committee is concerned.

(3) Effect of speed of trains upon cost of operation. (This year's subject covered effect upon track maintenance only.)

(4) Report upon the allocation of maintenance of way expense to passenger and freight service.

Committee: F. W. Green chairman; V. K. Hendricks (St. L.-S. F.), vice-chairman; H. H. Brewer (G. T. P.), G. D. Brooke (B. & O.), Ralph Budd (G. N.), M. Coburn (Pa. Lines), C. E. Denney (N. Y. C. & St. L.), J. M. Egan (I. C.), L. C. Fritch (C. R. I. & P.), U. E. Gillen (G. T.), M. V. Hynes (C. I. & W.), C. M. Himmelberger (C. R. R. of N. J.), W. J. Jenks (N. & W.), P. M. LaBach, Frank Lee (C. P. R.), J. de N. Macomb (A. T. & S. F.), Jos. Mullen, H. A. Osgood, R. J. Parker (A. T. & S. F.), J. H. Prior (Cons. Eng.), W. G. Raymond (Univ. of Ia.), H. E. Riggs (Univ. of Mich.), S. S. Roberts (U. S. R. R. A.), L. S. Rose (C. C. & St. L.), E. F. Robinson (B. R. & P.), Mott Sawyer (C. M. & St. P.), Edward C. Schmidt, J. E. Teal (B. & O.), G. S. Ward (S. P.), C. C. Williams (Univ. of Kan.).

### Discussion

V. K. Hendricks (Vice-Chairman): The report of the committee is merely a report of progress on subjects (1) methods of increasing the capacity of a railroad, (3) effect of speed of trains upon cost of track maintenance, and (5) allocation of maintenance of way expenses to passenger and freight service. The investigation on the collection of data on operating costs indicates that a thorough study of existing cost data would be a very expensive proposition. It would require a paid force to make it, and while the committee recommended last year that such study should be made, it feels that the cost data would be of questionable value, on account of the changing in unit prices, and that it would be better to study the methods and analyzing costs, rather than to study costs themselves, and on this subject merely report progress.

On Subject No. 4, "Report on the economic length of operating districts," the question has been gone into at some length, but it seemed that this question was dependent on a full consideration of all the varying features entering into it, and the application of good judgment, and no definite recommendation is made.

J. L. Campbell (E. P. & S. W.): It is doubtless true that this is a subject in which the association should have the benefit of the co-operation and experience of distinctly operating men, and I suppose that they are properly represented on this committee. If they are not, the committee might be enlarged so that the strictly operating men who are members of the association could work on this subject. I believe that it is going to be recognized by this association that this is perhaps one of the very important, perhaps the most important, of committees.

Mr. Hendricks: In this connection the personnel of the committee does include a good many operating men, but unfortunately during the past year the conditions have been such that they could not devote time to this work, and I am sure that we all regret that they have not been able to do so to a greater extent.

Col. F. W. Green (Chairman): The speaker regrets that his military obligations were such that he has had no time to give consideration to these matters heretofore. It seems to him that just at the present time the work of this committee is going to be especially difficult, for several reasons; First, we are in a period of flux, as we all know, labor costs and material costs are reaching unheard of figures and it is almost impossible for anyone to estimate today with any degree of accuracy what these costs will be tomorrow, or a year from now, or three years from now.

The true significance of the term "economics of railway operation" is, of course, to secure that combination of facilities and the operating organization which will result in the least total expenditure of money. Both of these items will be variable and uncertain, and it seems to me for the next year or two, possibly, the work of this committee will have to be confined to the establishment of principles, rather than the development of any definite method for ascertaining costs.

Mr. Hendricks: I move that the report be received as information.

(The motion was carried, and the committee dismissed with thanks.)

## Report on Economics of Railway Location

Sub-committees were appointed to consider each of the five subjects assigned to the committee for study, but four of the chairmen of the sub-committees asked to be relieved and only one advised that he would undertake the work. As a result, only one sub-committee did any work. This committee made a study of the effect of curvature on the cost of maintenance of way and equipment. A letter of inquiry was addressed to the officers of a few lines asking for information bearing upon this subject. Several replies were received, but the only information obtained was from the Pennsylvania Lines (published in the *Railway Age*, November 8, 1918, page 813). This data showed that the average increase in rail wear on curves as compared with tangent is about 100 per cent for a 6 deg. curve, 25 per cent for a 3 deg. curve, etc., or approximately as the square of the degree of curve. The importance of this information is evident when it is remembered that heretofore it has been customary to estimate curve expenses directly with the central angle or with the degree of curve when a given length is considered.

Committee: R. N. Begien (B. & O.), chairman; C. P. Howard (I. C. C.), vice-chairman; F. H. Alfred (P. M.), A. S. Baldwin (I. C.), Willard Beahan (N. Y. C.), E. J. Beugler, Ralph Budd (G. H.), W. J. Cunningham (U. S. R. F. A.), C. F. W. Felt (A., T. & S. F.), R. D. Garner (Soo N. E.), A. S. Going (G. T.), A. J. Himes (N. Y. C. & St. L.), H. C. Ives (Wov. Pdy. Inst.), W. A. James (C. P. R.), J. A. Lahmer (M. P.), Fred Lavis (Cons. Engr.), E. H. McHenry, G. A. Mountain (Can. Ry. Cons.), Edward C. Schmidt, A. K. Shurtleff (Asst. Secy.), C. H. Splitstone (Erie), M. F. Steinberger (B. & O.), A. F. Stewart (C. N.), L. L. Tallyn (D., L. & W.), Robt. Trimble (Pa. Lines), W. F. Tye (Cons. Engr.), W. L. Webb (Cons. Engr.), H. C. Williams (L. & N.), M. A. Zook (I. C. C.).

### Discussion

C. P. Howard (Vice-chairman): Five subjects were assigned to this committee, but only one sub-committee submitted a report—Subject 3 (a) "Effect of curvature on cost of maintenance of way."

(Mr. Howard here read the report of the committee.)

I would like to call attention to the fact that though the text of this report is brief, the conclusion indicated by the data submitted is entirely new and altogether different from the theory heretofore accepted, that curve expenses, including rail wear generally, vary directly with the degrees of central angle, irrespective of the degree of curve. It has been known a long time that sharp curves were very objectionable, Wellington to the contrary notwithstanding; but this is the first time as far as known that any data has ever been submitted tending to show that excess rail wear on curves and perhaps some other curve expenses, vary with the square of the degree of curve.

This data and the conclusion that might be drawn from it would necessitate a radical change in the ordinary rules for the negative value of curvature, and it is hoped that discussion of the subject and especially the submission of additional data from the railroads will throw further light on the subject and enable us to reach a positive conclusion in the matter.

G. J. Ray (U. S. R. A.): I would like to ask whether in considering the data received any attention was paid to the question of elevation in the curves in making comparison. That has a very vital influence in considering the matter for this reason. In the case of all freight traffic you would have very low elevation. In the case of combined freight and passenger traffic, if you have a high elevation with freight trains, probably moving at a slow rate of speed, which is the worst possible condition,

we know that the rail wear has a very damaging effect.

Mr. Howard: This does not give the elevation on curves. It covers two divisions of the Pennsylvania, and I suppose the elevation is such as is usual. We have only been able to get data from one railroad, though we have circularized various roads.

C. E. Lindsay (U. S. R. A.): I happen to know that these particular tracks are used for both freight and passenger, and are probably elevated for about forty miles per hour.

Mr. Howard: It is not so much the amount of wear as the fact that it increases as the square of the degree of curve.

W. H. Courtenay (L. & N.): I appreciate the very great value to all railroad men of getting as precise data as is possible pertaining to the wear of rails on different curves, but in the ordinary maintenance and operation of a railroad it is difficult to get data which is scientifically precise for the simple reason that rails are sometimes renewed on a given railroad in a less state of wear than they are on another railroad. Our experience on coal-carrying lines with 10-deg. curves is that the rail on the curves ought to be renewed at intervals of about four years. On 6-deg. curves we can count on a life of eight years, and for straight track about twelve or thirteen years. While those are very rough figures, I apprehend it will be very difficult to get figures which are so nearly correct as to be reasonably scientifically precise upon which this association could base any general conclusion.

E. B. Katte (N. Y. C.): In studying this question of rail wear I should think that co-operation with the motive power engineers might be helpful. We know that the flange wear on certain types of electrical locomotives is very much greater than on other types.

Mr. Courtenay: There is one other thing that I omitted. The wear on the curves was so great that we went to oiling the flanges, and at certain curves we actually oiled the gauge of the outer rail. That is a laborious undertaking, but it apparently reduced the wear. To what extent I cannot say.

Mr. Howard: I might say for Mr. Courtenay's information that this report from the Pennsylvania was originally made on just that subject, to find out whether or not it paid to oil rails, and this data and the study of the rail wear was gotten from that investigation. All that part about oiling the rail has been left out of this report. As to ascertaining the time a rail has lasted in a curve, the Interstate Commerce Commission is doing that now every day. They go over miles of railroad and look at the brand on the rail to find out how long it has been there on a curve or on a tangent. And it is not a difficult matter to find out how long it has been there.

Mr. Ray: It is difficult to tell exactly how long rail will wear on a curve. It must be remembered that you must have the same identical kind of rail on the curves that you are comparing. On the Lackawanna we have several curves that we use as test curves, and we make comparison by laying alternate rails around the curves, 10 of one kind, 10 of another and 10 of another. We find, for example, that 10 rails of one sort will wear off about half as fast as the next 10 rails, and you can readily see, if you are going to make a fine calculation, the rate of wear on different degrees of curvature. You have got to have the conditions the same, you have got to have the same kind of rails.

Mr. Howard: We did not intend to offer that as a conclusion. We simply stated that the data submitted by the Pennsylvania Railroad seemed to indicate that,

and we have asked for additional data which will either corroborate or disprove it. That is the only data we have, and that is what it seems to indicate.

J. L. Campbell (E. P. & S. W.): I don't believe that the case for this diagram is quite as uncertain or bad as Mr. Ray seems to think, for the reason that, as I understand, it is the result of observations on two operating divisions and a variety of curves, and no doubt a variety of rails and quality of rails; but in so far as this data has been correctly gathered and studied it helps to get the result of the whole thing, consequently it does have some value.

J. G. Sullivan: When I was making a little study of curve resistance and tried to find out about what percentage of ordinary freight car wheels were removed from the cars for sharp flanges, in cases where one flange only was sharp, I got that information and it averaged about 75 per cent. In connection with that study, it would lead me to believe that the friction wear is a little less on high elevated track than on lower, contrary to what a good many of us, at least what I had in mind, there was not sufficient coning of the wheels to take up the difference in length say of a 12 or 14 or 16 deg. curve.

Mr. Campbell: Just as a matter of information, I may say on the subject of lubricating the rail that we have a branch line going up a mountain about 4,000 ft. in 26 miles. It is built on a 5 per cent grade and has about 230 curves in it. That road was built twenty years ago, and 60-lb. rail were laid there. That original rail is still in the track. When the road was put into operation the rail began wearing so fast that it attracted attention. Since that time, the rails of that track have been lubricated with water. After that had been in operation for perhaps ten years, the management ordered the lubrication discontinued. Immediately the wear of the rail became aggravated with constant derailments. The result was that we put the lubricator back on the engine, and it is working there today with very satisfactory results.

(Mr. Howard's motion was then put to a vote and carried, and the committee was excused with the thanks of the association.)

## Closing Business

The Chairman: The chair will announce the ballot preliminary to the installation of officers. (The Chairman then read the result of the ballot.)

The Chairman: I will ask Mr. Wendt and Mr. Sullivan to escort the newly-elected president to the platform. (Applause.)

Mr. Stimson was then escorted to the chair and installed. After a few remarks, he declared the convention adjourned.

## W. A. Webb on Board of Adjustment

W. A. Webb, until recently general manager of the Missouri, Kansas & Texas Railroad of Texas, has been appointed a member of the Railroad Administration Board of Adjustment with office in Washington.

## Conference on Steel Prices

A committee representing the steel interests was in conference with the Industrial Board of the United States Department of Commerce at Washington on Wednesday and Thursday in an endeavor to reach an agreement on steel prices. No definite agreement was reached on Wednesday, but an early conclusion of the negotiations is expected.

## A. R. E. A. Registration

Following is the registration of the members and guests at the convention of the American Railway Engineering Association on Thursday:

### Members

Bachelder, F. J., Consulting Engineer, Chicago, Ill.  
 Bettle, F. W., Gen. Roadmaster, Texas & Pacific Ry., Marshall, Tex.  
 Busch, Harry E., District Eng., St. L. S. F. Ry., Springfield, Mo.  
 Dawley, W. S., St. Louis, Mo.  
 Hawthorne, F. M., Asst. Div. Eng., Penn. Lines, Pittsburgh, Pa.  
 Hegge, W. G., Office Engineer, Grand Trunk Ry., Western Lines, Detroit, Mich.  
 Hopkins, A. T., Field Eng., Val. Dept., M. C. R. R., Detroit, Mich.  
 Sarvey, A. L., Val. Eng., M. C. R. R., Detroit, Mich.  
 Smith, C. E. (In military service.)  
 Snyder, G. D. (In military service.)  
 Stradling, D. W., Asst. Val. Eng., D. T. & I. R. R., Springfield, Ohio.  
 Taylor, D. M., Asst. Val. Eng., W. & L. E. R. R., Cleveland, O.  
 Tutthill, G. C., Acting Br. Eng., M. C. R. R., Detroit, Mich.  
 White, R. C., Asst. Ch. Eng., M. P. R. R., St. Louis, Mo.  
 Wonson, S. L., Bridge Eng., M. P. R. R., St. Louis, Mo.  
 Wood, B. A., Chief Engineer, M. & O. R. R., Mobile, Ala.

### Guests

Austill, H., Br. Eng., M. & O. R. R., Mobile, Ala.  
 Stewart, Geo. H., Supvr., P. R. R., Greensburg, Pa.  
 Andrews, A. G., Supvr., Penna. R. R., Osceola Mills, Pa.  
 Tefft, J. F., Asst. Eng., P. M. R. R., Saginaw, Mich.  
 Abrams, D. A., Lewis Institute, Chicago.

## Record Breaking Convention Attendance

President Stimson announced at the close of the session yesterday afternoon that the total registration of members aggregated 509. This is the largest number which has ever been present at a convention, the previous record being 425.

## Coliseum Attendance

The attendance at the Coliseum aggregated 23,295, by far the largest in the history of the Appliances Association. It was divided as follows: Monday, 2,612; Tuesday, 6,457; Wednesday, 7,246; Thursday, 5,980.

## Col. F. W. Green Returns

Interest was added to the presentation of the report of the Committee on Economics of Railway Operation yesterday, when its chairman, Col. F. W. Green, presented the report. He has been overseas 19 months and only landed in this country on March 7. In the course of his remarks he took occasion to comment on the prestige which the American Railway Engineering Association has built up for itself in France. He stated that in his talks with French engineers he used to ask them if they read any engineering literature published in America, and he did not find one who was not a regular reader of the proceedings of the association. In their estimation the A. R. E. A. is the outstanding and prominent association in the United States.

## C. & N. W. Division Signal Foremen Banquet

On Wednesday evening 21 division signal foremen of the C. & N. W. participated in a banquet and get-together meeting at the Winter Gardens, Chicago. Many of these men were heretofore unknown to each other, so that the meeting was planned for the purpose of enabling them to become acquainted with one another and discussing problems of mutual interest.

# EDITORIAL

## Railway Age

# EDITORIAL

Americans have assumed for many years that the application of labor-saving equipment has been much more general in this country than in Europe. In fact, they have been inclined to take this condition for granted, assuming it to be a natural consequence of American progressiveness in overcoming the higher cost of

### Freight House Equipment

American labor. It will, therefore, be a matter of no little surprise to most railway men in this country to note, as outlined on another page of this issue, the extent to which power freight handling equipment has been applied in a new freight terminal in Glasgow, Scotland. Obviously, that station has been designed to meet British conditions, and there is probably much in the installation that would not apply to an American freight house. Nevertheless, the article should give food for thought on the character of equipment that would be applicable to the needs here. In this country, the pioneer work in freight terminal facilities has been confined to a few roads, the others being content to adopt what the few have perfected. As a consequence, power devices in freight houses are restricted to one or two types of transportation or lifting equipment. More independent thinking and experimentation along these lines may bring forth other labor- and time-saving machinery that will repay the development costs many times over.

The Pennsylvania, some weeks ago, sent to stockholders a brief financial statement for the year, 1918, accompanied by an announcement that the customary complete statistical report for the year was not within the province of the owning corporation since the road was being operated under lease by the govern-

### Railroad Annual Reports for 1918

ment. The Boston & Maine has now followed with a somewhat similar announcement, and it may be that there are compelling reasons which will prevent the corporations from obtaining and compiling the usual statistical statements which are sent to the stockholder with the annual report. If this is so, however, it is most unfortunate for railroad security owners, and a holder of securities of a railroad corporation owes it to himself to make every effort to obtain a knowledge of the detailed operating expenses, the average train and car loading, the ton and passenger mileage handled, tonnage of commodities carried, etc., of the roads in which he is interested. Never has it been more important for the individual investor to study the figures showing the character of maintenance, cost of handling freight and passengers, and efficiency of operation than it is now. The corporate officers of the railroad companies have, to the best of their ability, been watching out for the interests of the security holders and for this purpose have been keeping in close touch with the federal managements of their properties; but it should be borne in mind, however, that in many instances there has been shown, on the part of the Railroad Administration when under Mr. McAdoo, a suspicion of the corporation officers. The administration has pursued a policy of secrecy about many matters, especially in regard to labor, and even if a corporation officer had good reason to believe that certain unfavorable developments had taken place in the management of the property which he was, in duty

bound to his stockholders, required to protect, he could not make a full, frank statement of his opinion to the general public. There is another thing of great importance; where a property has been under the management of one man for a number of years, the annual reports naturally reflect something of the way in which this man views the operations of the property. Furthermore, it reflects the conditions which are, to a certain extent, the outcome of the will and desire of the board of directors and the president. Now, however, we have had a year of operation of railroad properties without this artificial molding of conditions. Of course, there are numerous temporary conditions which affected a particular railroad property because of the war, which must be allowed for, but the fact remains that this year a security holder who studies the statistics of operation of his railroad will get a view of the property from an entirely new angle. He has a chance to apply new tests unhampered by any desire on the part of the compiler of the annual report to follow traditions.

It is most unfortunate that the Railroad Administration should have been forced, by the failure of Congress to pass the revolving fund appropriation, to issue orders for drastic curtailment of improvement work just at the time that the steel manufacturers announced important reductions in the prices of their

### Important Reduction in Steel Prices

products. The railways are among the largest users of steel, and under ordinary conditions reductions in the costs of these materials such as those made last week would have led to greatly increased activity. For instance, it has been understood that the Railroad Administration has been prepared for some time to place orders for over one-half million tons of rails as soon as its demands for concessions in price have been made. Similarly large tonnages of track fastenings, bridge materials and other steel products are urgently needed. The problem of reconstruction is now a critical one for the entire country. At the same time the railways are urgently in need of repair and improvement work. It is therefore to be hoped that the Railroad Administration may find some way of overcoming its financial difficulties so that the roads may take advantage of the lower costs of construction and at the same time provide employment directly and in the plants of the supply companies for the surplus labor now available.

The elaborate series of tests of the Automatic Straight Air brake system conducted by the Bureau of Safety of the Interstate Commerce Commission, has, according to the report abstracted elsewhere in this issue, demonstrated to the satisfaction of the Bureau the substantial accomplishment of the functions for which the equipment was designed. There were several features of the equipment as furnished for these tests which were not considered ideal for the best results. None of these, however, was considered inherent in the principles of the design or functions of the brake. Among these are the ratio of cylinder pressure rise to brake pipe reduction, which

### Report on A. S. A. Brake Tests

should be higher than the two to-one ratio of the equipment tested; the requirement of practically full depletion of brake pipe pressure before obtaining the automatic emergency application; the difficulty of securing proper emergency action with the compensating valve, and the design of the equipment. The first two difficulties mentioned were considered to be matters of adjustment, and their elimination is contemplated in a simplified design. A modification of the engine equipment during the tests removed the third difficulty, and with the redesigned equipment it is proposed to demonstrate the ability to perform its functions without the use of the compensating valve on the locomotive. Aside from the comprehensive nature of the tests, they are remarkable from the fact that a complete graphic record was taken of the performance on the brake on every car in each of the trains tested, and when its formal presentation to Congress makes the entire report available it will offer an unusually complete fund of data on the subject of train control.

## Contributions to Railroad Efficiency by the Railway Supply Industry

THE NEW YORK RAILWAY CLUB performed a most important service at its meeting last week in outlining clearly and forcefully the intimate relationship that must necessarily exist between the railway managements and the railway supply interests in the matter of improving the efficiency and economy of railway operation. It is well that the important—indeed, almost immeasurable—contributions which have been made by the railway supply companies toward this end should be more generally and more fully appreciated.

The railway supply companies are in sharp competition, one with another. To live and prosper they must constantly strive to produce better products than their competitors and at the lowest possible prices. This requires them to keep in intimate contact with the requirements of the roads and with the development of that phase of railroading in which they are particularly interested. Not only is it necessary to build up strong engineering departments but, in many cases, it has been found desirable and even absolutely necessary to install service departments to follow the devices or equipment after they have been placed in service and see that they are properly operated and maintained. These service departments have had to carry on extensive and intensive educational programs; this fact is not sufficiently appreciated by the railways. It is not uncommon, for instance, for a railway supply engineer or expert to be called upon for advice on problems which have little, if anything, to do with the devices or equipment in which he is specially interested. The air brake expert is not infrequently called upon for advice as to train operation—questions which are not always directly related to the use of the air brakes but which he is usually competent to answer because of his broad experience and his contact with the practices on other roads. Experts having to do with devices to produce better combustion often make valuable practical suggestions as to factors involved in combustion as a whole which have little, or nothing, to do with the particular device in which they are specially interested, but which do contribute to the securing of better results.

The engineer on a railway must necessarily cover a wide range of activities; there are comparatively few railway designers or experts that can give an unlimited amount of time for concentration on one particular problem. The railway supply engineer or expert, on the other hand, can give his undivided attention to the development or improvement of one particular device and may even find it necessary to build up a strong staff of experts about him. This staff finds it necessary to study conditions on many roads having

widely varying characteristics. Any improvement that may be suggested by special conditions at one place can be followed up and studied critically. It may be found wise to incorporate the new feature as a permanent improvement in the device, thus making it more valuable for use even under ordinary conditions.

It is well that railroad men should understand the value and extent of these services. It is exceedingly important that those in charge of purchasing should realize what these things mean to the railroads and should take them into consideration. There is an impression on the part of many of the railway supply men that those in authority, had they thoroughly understood these matters, would, in many cases, have adopted a somewhat different attitude in dealing with the railway supply men during the past year. It is well, therefore, that the New York Railroad Club focused attention upon the matter as well as on the necessity of a closer co-operation between the railroads and the supply companies looking toward a more uniform production of material, thus aiming to make it possible to maintain more uniform and stronger manufacturing organizations, increasing the efficiency of production and, of course, reducing the cost of the equipment to the railroads to a minimum.

## Railroad Men's Terms of Subscription to the Victory Loan

THE RAILROAD ADMINISTRATION has announced that railroad officers and employees may subscribe to the Victory Loan through the federal treasurers of their companies on a 10 per cent per month installment plan. Walker D. Hines director general, has issued a circular (No. 63) urging officers and employees to subscribe to the loan either through the railroad federal treasurers or through any local bank. Interest will be allowed on installments at the same rate as the interest carried on the Victory Loan.

The railroad organization for handling the loan consists of a general committee headed by the federal manager for each road, assisted by a general office committee, divisional committees, terminal committees, and shop committees. The committees are to report daily to the general committee, which in turn is to report to the regional director. Every officer and employee of the roads under federal management will be solicited personally, but the director general especially cautions against allowing any employee to feel that his action is influenced by fear of coercion or of criticism. The loan drive begins on April 21 and lasts until May 10.

As previously announced, the loan is to be divided into four classes, presumably bearing different rates of interest, the lowest rate being for a class of notes entirely tax free, except for inheritance taxes, while the highest rate of interest, the fourth class, is for notes tax free from income taxes only, and from these taxes only up to \$40,000. Secretary Glass recently said, "We are not going to approach the last popular war loan strictly in a commercial spirit. . . . We must and will appeal to the patriotism of the American people. . . ." It is well to remember that our country's obligations are our obligations and that the raising of the Victory Loan is merely carrying out obligations already entered into.

Put purely on a commercial basis, however, the Victory Loan should appeal particularly to railroad men. There are thousands of railroad employees and probably hundreds of junior officers of railroads who have been successfully and systematically saving money—becoming capitalists—for the first time in their lives through their purchase, on the installment plan, of the various issues of Liberty Loans. The terms offered by the Railroad Administration are very

liberal. When a man stops to think how large a proportion of his first premium payments on life insurance goes to pay the cost of soliciting the policyholder—commissions to solicitors—he can appreciate better the liberality of the Railroad Administration now, and of the railroad companies in the past, in undertaking, free of all charge or commission, this work of solicitation.

Every subscriber to the Liberty Loans on the installment plan knows that, except for emergencies, the regular saving, month by month, of a fixed percentage of his pay is a habit not hard to acquire and one which gives a feeling of satisfaction and self-respect that is priceless.

In making the first four Liberty Loans the great successes that they were, certain classes of citizens gave of their time and energy more than others, but no amount of giving on the part of bankers and a few other restricted classes would have made the bond sales the success that they were had not all classes of citizens, consciously or unconsciously, aided in the distribution of these bonds. There were 21,000,000 subscribers to the \$7,000,000,000 Fourth Liberty Loan, and it cost the government just \$8,727,658 for the campaign, a cost of less than  $\frac{1}{3}$  of 1 per cent of the total amount.

Such a great majority of all the railroad men in the country were subscribers to one or more of the Liberty Loans that the work of introducing the investment to them should, in the case of the Victory Loan, be almost nil. It is rather a question of arousing enlightened self-interest and yet this should not be difficult. Systematic saving is an absolute requirement for success in life whether a man be earning \$100 a month or \$1,000 a month. Never before has there been such an opportunity to save on such advantageous terms, or in so easy a way.

## The Price of Development

NO ONE WILL QUESTION the statement that the path of the promoter of automatic train control devices has been a hard one. Each recurring collision has brought a demand for devices which will make their repetition impossible, but up to the present time the devices of this kind have with few exceptions received scant recognition and support from railway men. Instead, the general attitude has been such as to discourage the development of such devices rather than to lend sympathetic co-operation sufficient to demonstrate their possibilities or weaknesses. It is true that many of the devices have been so evidently impracticable as to render demonstration unnecessary, but on the other hand the railways have set up requirements so rigid as to be almost if not entirely impossible of fulfillment with a new and necessarily imperfect device.

The Railroad Administration is to be commended for its recent action appointing a committee to investigate the devices which have been developed, while the committee itself has shown a laudable desire to accomplish real results by drawing up a set of requirements, which, while rigid, are within the possibility of attainment in the present state of development of automatic train control apparatus. The committee has also indicated that it does not expect to find a perfect and practical form of control at once, but it is looking for those systems which most nearly approach this ideal. With this in view, it is now making an inspection of those systems which are in actual use.

In connection with its first inspection, which was made of the installation on the C. & E. I. last week, attention may also well be called to the necessity of complete co-operation on the part of the railways, for this support is essential to the development of a device the practicability of which must be demonstrated, not in the laboratory or shop, but under actual service conditions in the track. In this instance the management of the C. & E. I. has co-operated

fully, both in the four-year period of initial experiments and in the four years following, during which the apparatus has been perfected in actual service on a complete engine district. Not only has the road lent its sympathetic support to this development, but it has suffered interferences to traffic and other conditions inherent in the early stages of important developments of this character. For this contribution to the science of railroading the management of the C. & E. I. deserves commendation.

## New Books

*American Methods in Foreign Trade.* By George C. Vedder. Size  $5\frac{1}{2}$  in. by 8 in., 205 pages. Bound in cloth. Published by McGraw-Hill Book Company, 239 West 39th Street, New York. Price, \$2.00.

If this book did nothing more, it would make itself worth while for the emphasis it places on the idea that the American manufacturer who engages in foreign trade will make the most of his opportunities by following out the same policies that brought him success at home. When all is said about German or other competition, says Mr. Vedder, the fact remains that the successful American manufacturer in foreign trade has come out the better because, unlike his competitors, he has sold not on a price or quantity basis, but on the basis of quality and service which characterizes the most successful businesses in domestic industry. Mr. Vedder in his book has outlined in readable fashion the best methods to be followed in developing a foreign trade.

He is more or less iconoclastic in his views, but most of his readers will agree with him that most of the obstacles that have been alleged to exist against American export trade are chimerical. Mr. Vedder, in particular, demolishes the idea that the Germans were excellent exporters. He says that many American concerns were competing successfully against German merchants before the war. He has no respect whatever to express in favor of the much vaunted German foreign banking system which he says made more ill-feeling than good will with those with whom it dealt.

There will be those who will disagree, however, with some of Mr. Vedder's ideas, and particularly with his views on the Webb-Pomerene bill permitting combination in export trade. He says that it is contrary to our own beliefs as expressed in the anti-trust laws in this country. "That two measures (this and the Sherman Law), so contradictory morally can long remain on the books and be effective, is incredible." In his chapter on this subject, Mr. Vedder seemingly misses the point that the reason the Webb-Pomerene bill was passed was not so much to relieve exporters from the operation of the Sherman law, although that, of course, was intended, as to clear up the darkness and uncertainty surrounding the operation of that bill. Mr. Vedder also apparently misses one of the big points of all our anti-trust legislation. He will admit that it has been directed at restraint of trade but apparently forgets that one of its biggest aims has been also to restrict monopoly. He does not see that the Webb-Pomerene bill has much in common with this legislation. It is aimed to encourage, not restrain export trade, by permitting the manufacturer to go out into the markets of the world fully armed in an organization of manufacturers like himself not hindered at every step by fear of persecution under a statute of very uncertain interpretation. As for monopoly, America cannot achieve monopoly while England, France, and other countries are selling in the same market, no matter if the American manufacturers are all combined. And does Mr. Vedder forget the fact that before the war for lack, among other things, of a Webb-Pomerene bill, the copper market was controlled outside instead of in the country?

## Letters to the Editor

### Wages in the Signal Department

WEST-OF-THE MISSISSIPPI.

TO THE EDITOR:

How is it that in some departments of the service very good railroads pay very poor wages? I have worked for several railroads in the West and at present am working for one of the best lines in the Pacific Northwest; it is a road with the best co-operation between officers and employees that I have seen anywhere; it has better cars and locomotives, better safety efforts, better harmony between the railroad and its patrons, and good conditions all around. I have boasted about the road and its service; have got some good men to come here from other roads, and I have now and then promoted the business of the company by getting a passenger to take a long trip over its lines. Nevertheless I do not get enough pay. The increases which have been granted, and which are so thoroughly enjoyed by most everybody else in the service have not hit the signal department to amount to anything. A year ago last spring I received, as maintainer, \$92.50 a month, with 10 per cent bonus. About a year ago I was appointed acting signal inspector at \$110, with 10 per cent bonus. Now I get but little more than a maintainer. They receive \$123.25, while I receive \$146. There is some talk of an increase, but I cannot find anybody who will tell me what it is to be, or anything definite.

Among the powers that be there seem to be none who appreciate the difference between an inspector and a maintainer. The maintainers live in small towns where expenses are not so high as in cities. Some of them even live in dwellings made from old box cars, furnished by the company. In these small places a maintainer can go out after working hours and get in his wood, old ties and old building material being plenty; and in the timber country logs are exceedingly cheap. The maintainer who prefers to buy his fuel, instead of wielding the axe after hours, can usually buy from the farmers at \$1.50 to \$1.75 per rick; but I, living in a city, have to pay \$10 a cord for four-foot wood and \$11.50 a ton for coal. A five-room house fit for a decent family to live in costs \$22.50 a month. I have to have a telephone, which costs \$2.50 a month on a two-party line. The high prices of food are already familiar to you and I need not make the comparisons; but it is proper to remark that, even when working, I have to wear presentable clothes and shoes, a point which is not important with many employees who get much higher pay, proportionately, than I do. My wife is a marvel of economy, while at the same time she maintains a neat house and presents a reasonably stylish appearance. I have to forego some things which I really need, but I cannot lay this condition to my wife. This winter she is wearing for the third winter a plush coat, fur trimmed, that cost us \$45.

I do not object to the payment of high wages to the maintainers, but I do think that the inspector should at least be allowed enough to take care of the unavoidable extra expenses incident to his position. From the employer's viewpoint it is no more than fair to say that he ought to take into consideration the extra effort which a careful and conscientious inspector ought to be expected to put into his work.

Sometimes I am tempted to listen to the fellows who are all the time saying, "Get into something else." Speaking generally, it seems to me that the signal department employees do not enjoy as good treatment as those in other departments. There seems to be an impression among some officers that anybody can be a signal man. A railroad officer was mentioned to me lately by name—I do not know him—who said that he could go around with a maintainer for two weeks and

then would be competent to take up his work. Any man who knows the conditions would say that this officer would be absolutely unsafe with that limited experience; he could not even learn to take proper care of the lamps of the semaphores in several times two weeks. In the winter the running and repair of a maintainer's motor car is a job that no green man can take up. I have run a motor car over my territory for four summers and five winters without accident; but I am free to confess that to do this implies a good deal of care as well as experience.

The maintainers in this territory are a conscientious lot of workers. They have to hop onto their gas car at any time, day or night, regardless of the weather, and chase trouble—many times trouble which is not really chargeable to their department. I have had charge of twenty of these men now for about a year; have assisted the officers at investigations, have helped clear up wrecks, and have attended safety committee meetings, where I found officers who, with regard to a great many questions, lacked many kinds of information. I spent three years as a locomotive fireman and thereby acquired, I believe, many points which the signalman coming from outside does not understand.

And when payday comes around and I get my pay and deduct the necessary expenses I have less money to put in the bank than does the maintainer.

PETE BOGG.

### The Railroad Question

CHICAGO.

TO THE EDITOR:

The main thing is to have transportation furnished. Without question, transportation, next to the monetary system, is the most important facility that is in civilization.

Before rail transportation was well developed, people could only live in communities along the edge of water. Rail transportation has developed the interior of whole continents, resulting in millions of people being able to carry on their activities and develop their resources wherever they might be. Cheap and plentiful rail transportation has resulted in these people being able greatly to extend their markets and enlarge their activities.

Without a constant growth in railroad facilities, and a constant increase in their efficiency, the life of all the people is seriously affected. It may be that there is a way to keep an activity of this kind in advance better than with the constant spur that rivalry and profit provides, but no such a better way has been brought out yet. No human activity of a large kind has so far been carried forward strongly without the spur of rivalry and profit, and there is no rivalry in the operation of all the railroads in a country as one unit.

This reasoning and this conclusion are either correct or incorrect. If they are correct, then the rivalry should be extended as far as practicable to the point where it will not produce destructive effects on those involved. There is no good thing but that can be carried to the extremes that result in death.

If the reasoning is incorrect, then all the railroads should be operated together by one man, and some means presumably will have to be found eventually to have some control over him. If there is to be a proper and healthful rivalry, it should be carried on with organisms that exist, and any radical changes in such organisms should not be made. They could only result in loss to the people.

An immense number of theories are being indulged in now, as to what should be done with this most vital of our material activities. It is not something to be experimented with. The life of the nation depends upon it. Surgical operations at the present time to remodel this body are not needed simply because it is stretched on the operating table at the mercy of those who have knives and somebody has not been well pleased with the appearance of the body in the past.

Masonry Viaduct on One of the Spanish Lines

# An Important Development in the Railways of Spain

With an Account of a Project for a Proposed New Trunk Line  
from France to the Straits of Gibraltar

By F. Lavis \*

IN THREE PARTS: PART I.—GENERAL DESCRIPTION.

FOR MANY YEARS the project has been talked of for a trunk line from France through Spain, with a connection by car ferry or otherwise across the Straits of Gibraltar to Africa and thence through Morocco to Dakar, from whence a short ocean trip would enable connection to

This ambitious project is hardly likely to be realized in the immediate future, but the northern section of the line from Madrid to the French frontier was studied by the writer a year or so ago and some account of this is given farther on. In connection with these studies, data in regard to the existing railways and the country generally were obtained, and these with some account of the topography and the in-

Fig. 1—Masonry Viaduct

Fig. 2—Masonry Retaining Wall and Culvert at Jaca on the Line to Canfranc

be made with Pernambuco, in Brazil, and from that city eventually, through railroad connections, with all points in Brazil, the Argentine and Chile—in fact to all South America.

\*Consulting engineer, 120 Broadway, New York City. This article has been prepared by Mr. Lavis at our request, and is a résumé of a report by him, printed in Spanish, entitled "El Ferrocarril Directo, de Madrid a la frontera de Francia," which was specially prepared for the king of Spain, for members of the Spanish government and for private circulation.—EDITOR.

dustrial development of Spain will be briefly touched on to give some idea of the general railway situation.

## Topography

Generally speaking, the interior of Spain is an elevated plateau, about 1,500 to 2,000 feet above sea level, crossed

by several mountain ranges and deep river valleys, presenting an accidented terrain, not very densely populated. The transportation problem is, therefore, difficult and the cost of transportation high, by reason of the necessarily high cost of railway construction compared with the volume of traffic. Most of the important cities of Spain, the most densely populated districts, and the manufacturing centers are on or near the coast, so that distribution by water is natural and convenient; hence there has been little if any

gradients and small capacity cars and locomotives, were absolutely unable to meet the emergency.

**Industries**

Sketched very roughly, the principal industries of Spain are distributed as follows: Manufacturing of textiles in Catalonia around Barcelona, and iron and steel along the north coast near Bilbao. Mining of coal and iron principally in the north, near Bilbao, Santander and Gijon, and iron all

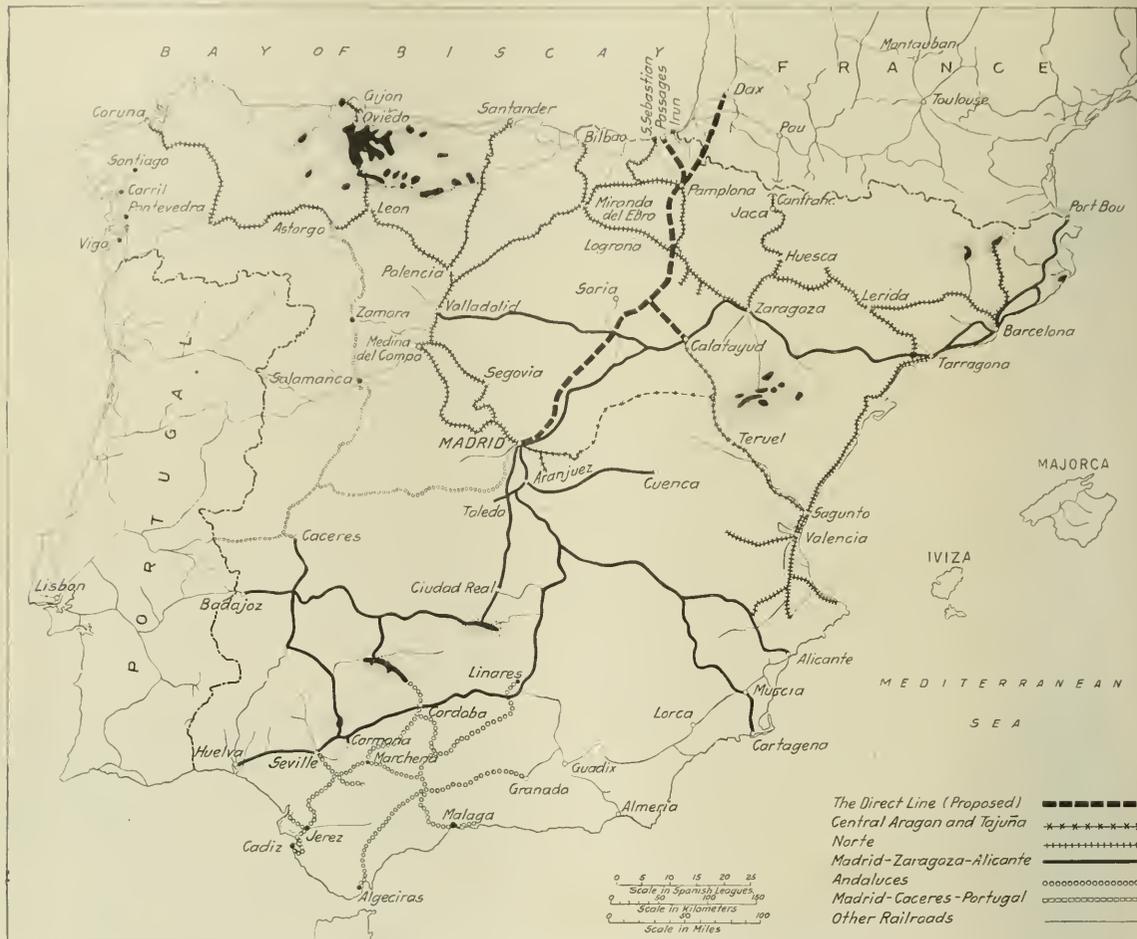

Fig. 3—General Map of Spain Showing Railways and Coal Areas

need for lines adapted to heavy freight traffic. It will be remembered that Spain is almost entirely surrounded by water and has a coast line with many good harbors.

**Coal Supplies**

These features have a considerable bearing on one important item of transportation, namely, coal. Spain has many mines of coal of good quality but it is, or was with some few exceptions, before the war, as cheap or cheaper to bring coal from England to the coast towns than to mine it in Spain and transport it by rail. Of a total consumption of about 7,000,000 tons per annum, about 2,500,000 were imported from England. The Spanish coal was largely distributed by sea, and when the effect of the war on shipping was realized, the railroads, with their heavy

along the south coast to a smaller extent. Large mines of copper, iron pyrites, and quicksilver in the southwest, around Seville. Fruits and vegetables on the east coast in the vicinity of Valencia, and wines in many parts.

Wine to the value of \$12,000,000 to \$15,000,000 is exported annually to France; Valencia, among other things, exported in 1912: onions, 140,000 tons (16,000 tons to the United States); oranges 87,000 tons, etc., besides olives, olive oil, almonds and other nuts. The values of the principal minerals exported from Spain in 1915 were, roughly:

Iron ore .....	\$12,000,000
Iron pyrites .....	7,000,000
Iron metallic .....	8,000,000
Copper .....	9,000,000
Lead .....	13,000,000
Mercury .....	1,500,000
Silver .....	500,000

Generally speaking, Spain is not a manufacturing country, and probably manufacturing will not play a large part in the development of the country in the near future. Agriculturally, Spain produces wines and fruits for export; could, but does not quite, produce enough cereals for its own use; has a large and only partially developed mineral wealth.

The country has recovered rapidly under the enlightened and progressive guidance of the present king, Alphonse XIII, and since the war with America relieved her of the drain of both men and money in her colonies. The following

and with no burden of a large war debt. With the continuance in power of a steady and progressive government, which now seems reasonably well assured, Spain today seems likely to be well along the road to resume her place among the important nations of Europe before many decades.

The population of Spain was about 20,000,000 in 1910, and the principal cities are as follows:

Population 1910		Population 1910	
Madrid	599,807	Valladolid	71,066
Barcelona	587,411	Palma de Mallorca	67,544
Valencia	233,348	Cadiz	67,174
Seville	158,287	Cordova	66,831
Malaga	136,365	Santander	63,046
Murcia	125,027	Alicante	53,300
Zaragoza	111,704	Oviedo	53,269
Vizcaya	93,536	San Sebastian	49,008
Granada	80,511	Almeria	48,407

The Railways

During the latter part of 1917 the railway transportation system practically collapsed under the added burden of the

Fig. 4—A Station on the Central Aragon—Typical of the Ordinary Station for Small Towns

Fig. 6—Freight Train on the Madrid, Zaragoza & Alicante

figures show its progress previously to the war, and since 1914 Spain has materially benefited from the high prices received for her mineral products, which have been vitally necessary to the Allies. The values of the imports and exports before the war were as follows:

	Imports	Exports
1903	\$195,200,000	\$189,200,000
1913	283,000,000	239,000,000

distribution of coal, made necessary on account of the interruption of maritime traffic, and there was a general demand for more railways, double tracks, more rolling stock, etc. It was known that the commerce of Spain had increased 50 per cent or more during the preceding ten years, and the railway mileage less than 5 per cent during that period, and this was considered to be all that was necessary to show the need of new lines and more tracks on the old ones; interest was also revived in the proposed "Direct" line to France.

It may be worth noting in this connection that European engineers do not seem to give that consideration and study which American engineers and traffic men do, to the possibilities of increasing the capacity of railways by introducing heavier or different motive power, or the better utilization of

Fig. 5—Passenger Train Leaving Cadiz on the Andaluces Railway

During the war the imports of gold and silver bullion and coin to even up the trade balances have been as follows:

1915	\$41,000,000
1916	65,000,000
1917	117,800,000
	\$223,800,000

Spain, therefore, finds herself, at the end of the war, over \$200,000,000 richer in actual cash, richer still in credits

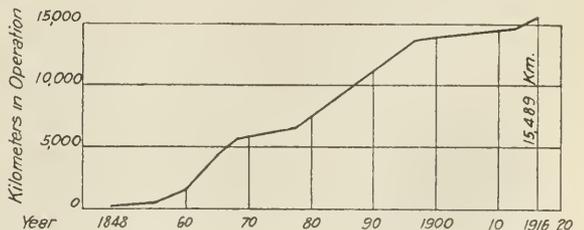

Fig. 7—Progress of Railway Construction in Spain

rolling stock, and double tracking is advocated long before the single track lines attain the capacity which many single track lines have in the United States.

The progress of railway construction in Spain is shown by the diagram in Fig. 7.

Besides the fact that railway development in Spain has not kept pace with the really considerable commercial development, it is to be noted also that it is less than that of any country of importance in the world on the basis of population and area, as is shown by the following table:

COMPARISON OF RAILWAY MILEAGE OF VARIOUS COUNTRIES ON BASIS OF AREA AND POPULATION

Country	Per 1,000 square kilometres	Kilometres of railway per 10,000 population
Belgium	298	12.3
France	120	16.8
Great Britain	119	9.6
Germany	118	12.2
Switzerland	117	16.3
Holland	99	6.9
Denmark	96	16.3
Austria-Hungary	69	10.3
Italy	62	5.6
Portugal	34	5.8
Sweden	32	29.5
Spain	30	8.6
United States	45	59.4
Canada	5	92.4
Mexico	13	20.6
Argentina	11	71.1
Brazil	3	15.3
Chile	8	16.9

There are several reasons for this lack of railway development in Spain besides the generally accepted, off-hand one,

ness of railway development, are the difficulties of the topography in the interior, making construction difficult and expensive, and the character of the commercial development. This latter has been largely along the coast where water transportation is available, thus making the need of interior lines of communication less necessary in Spain than in many other countries.

A third reason has been an apparent lack of appreciation on the part of the government of the economic principles governing the construction and operation of railways, which

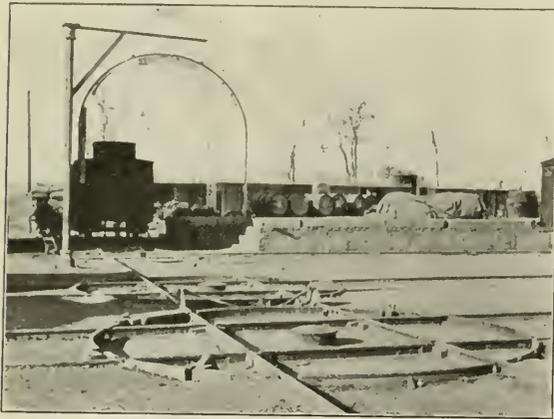

Fig. 8—Transfer Tables for Shifting Freight Cars at Stations

that Spain is one of the most backward countries in Europe in matters of modern commercial development. This was, to some extent, true up to the end of the 19th century, but

Fig. 9—Water Tank and Water Softening Apparatus

has resulted in the construction of unnecessarily expensive lines, even for the somewhat difficult country in which they have been built, and especially, in view of the comparatively small volume of traffic, many of them are called upon to handle, and expensive in ways which do not result in corresponding efficiency of operation.

The first railways in Spain were of 5 ft. 6 in. gage and this and the type of rolling stock used, caused regulations to be

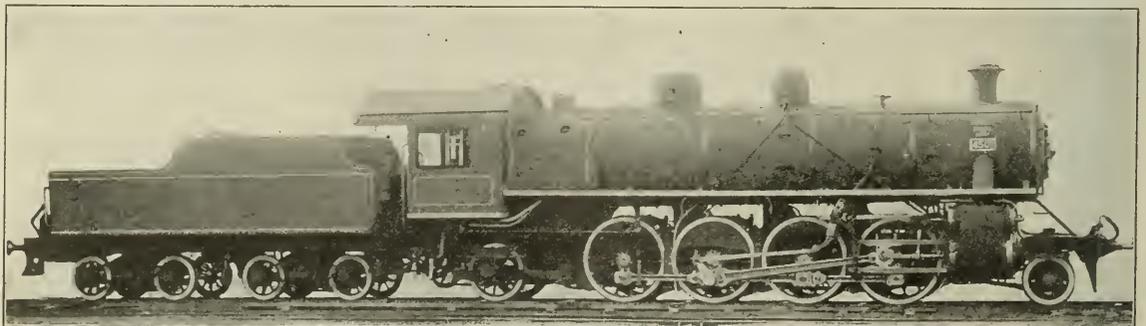

Fig. 10—One of the Locomotives Recently Built by the American Locomotive Company for the Northern Railway

since then there has been an awakening and a very considerable increase in commercial activity and a general development along certain lines as has been indicated above.

The two most important of these reasons for the backward-

adopted limiting the curvature, and requiring stone ballast and certain expensive types of structures which considerably increased the cost without adequate, compensating advantages. This caused the usual reaction to a narrower

gage\* to decrease the cost, and although the first cost of these narrow gage lines has been decreased by the use of sharp curvature and steep gradients, these have so increased the cost of operation that the resulting ton mile cost is as great or even greater than on the lines of wider gage. There is also the great disadvantage of not only two different gages, but also that of two gages, both different from the general European standard (4 ft.-8½ in.).

The realization of the difficulties of this situation and the desire for a more intelligent appreciation of the economic relation between first cost and cost of operation, have led to

Fig. 12—Passenger Coach on the Central Aragon

the proposal by certain engineers and others for the adoption of the European gage and the desire for the introduction of American methods of design and operation for the railways of Spain.

Generally speaking, the track is well built, the better lines—of fairly heavy traffic—with rails of 80 to 90 lb., using screw spikes and tie plates on untreated oak ties. Ties are of about the same dimensions as ours, but usually a little thinner and with wider face. They are quite expensive and so fewer are used. The rolling stock is much lighter than ours, but the usually heavier rail compensates for the fewer ties (1,500-1,800 per mile). Stone ballast is used almost invariably. The bridges, stations and structures are generally of stone masonry, which costs very little. (See Figs. 1, 2 and 4.) Where steel bridges are used they are usually designed for lighter loadings, (E35 to E40 about), than is customary in the United States.

Photographs of typical passenger and freight train equipment are shown in Figs. 5, 6 and 8. The freight cars, as well

cars with bogie trucks, but many are of the rigid 3 axle type. The transfer tables shown in Fig. 8 are used for shifting the cars from one track to another in the station yards. Fig. 5 shows an "express" train ready to pull out of the station at Cadiz on the Andalusian Railway, but Figs. 10 and 11 show the modern American locomotives built for the Norte and M. Z. A. during the last 3 or 4 years, their principal dimensions being as follows:

	Norte	M. Z. A.
Engine weight in working order tons metric.....	87.5	85.3
Tender weight in working order tons metric.....	55.8	46.7
Driving wheel base, milimetres.....	57.00	49.50
Cylinders hp. diam., milimetres.....	4.20	5.84
Cylinders l.p. diam., milimetres.....	6.40	...
Cylinders stroke diam., milimetres.....	6.50	6.40
Tractive power, kg.....	161.00	150.60

The two most important systems are those of the "Norte" (Compania de Caminos de Hierro del Norte) and the M. Z. A. or Mediodia (Compania de los Ferrocarriles de Madrid á Zaragoza y á Alicante).

The Norte covers practically the whole of the territory to the north and west of Madrid, and has also an important line running from Miranda down the valley of the Ebro to Zaragoza and from there, by a line through Huesca to Jaca and Canfranc, where connection will eventually be made to France by the Somport tunnel, a line through Lerida to Barcelona, and another line from this latter city to Tarragona and from there all along the coast to Valencia.

The M. Z. A. has a main line from Madrid to Barcelona, with a line to the west from Ariza to Valladolid through the valley of the Duero, towards the southeast a line from Madrid to Valencia, Alicante and Cartagena, and towards the south the main line to Linares, Cordoba and Seville and another to Ciudad Real and Badajoz for Portugal.

These two systems, therefore, cover practically the whole of Spain except the extreme south, in which the Ferrocarriles Andaluces, a comparatively small system, operates. Both were originally quite largely developed by French capital—the Norte through the Periers and the M. Z. A. through the Rothschilds, but since the war, control is said to have been obtained by Spanish interests.

**The Northern Railroad**

The lines of the Norte, which are of most interest in connection with the study of the "Direct" line to France, are: the main line from Madrid to Irun and the branches from this to Bilbao, Santander and Gijon (Oviedo).

Leaving Madrid, (elevation 2,000 ft.), the main line of the Norte runs directly towards the west and almost immediately crosses the Guadarama Mountains by two lines, which

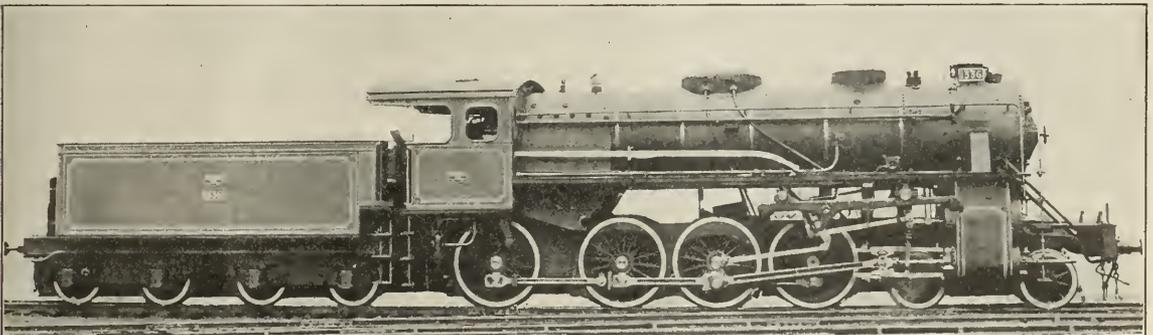

Fig. 11—One of the American Locomotive Company's Engines Built for the Madrid, Zaragoza & Alicante

be noted, are of the usual European type of 10 to 15 tons capacity. Some of the passenger trains have fairly modern

\*There are now 4,000 kilometres (2,480 miles) of metre gage out of a total of 15,500 kilometres (9,610 miles) of railway, the rest being all 5 feet 6 inches.

units at Medina del Campo. These crossings are at elevations of approximately 1,350 meters (4,460 ft.). This mountain barrier which separates the "Plains of Old Castile" from Madrid and all the east and south of Spain, must be

kept in mind in comparing the route of the Norte with that of the "Direct" line.

From Medina del Campo the Norte follows across the plains through Valladolid and Burgos with good alignment and easy work until just before reaching the valley of the

Plateau on the south. This is shown by the comparative profiles, Fig. 15, of the four lines of the Norte across the mountains to the coast, and for convenient reference the

Fig. 13—In the Cantabrian Mountains Between Pamplona and San Sebastian

Fig. 14—Another View on the Line Between Pamplona and San Sebastian

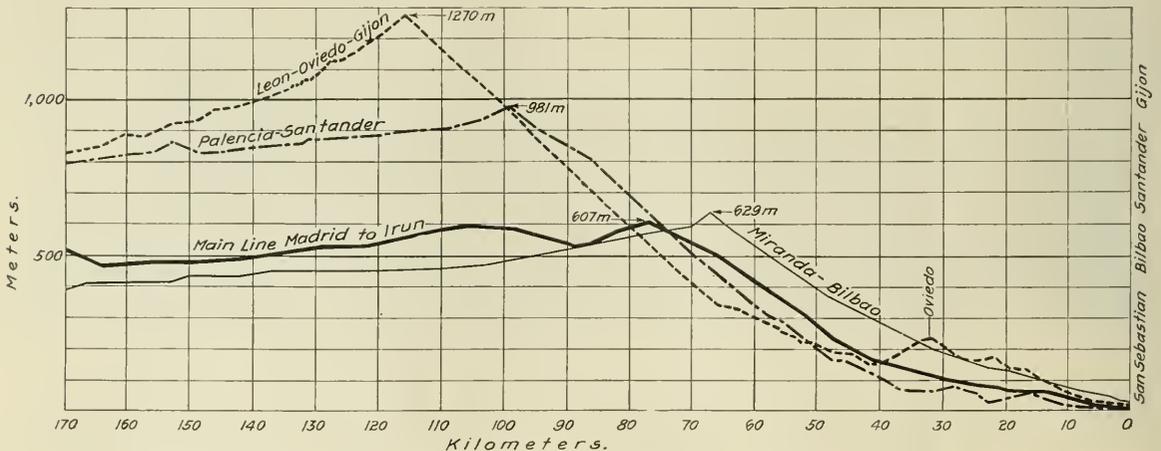

Ebro, but from there on to the frontier the work is fairly heavy.

The plains of Old Castile are separated from the North Coast of Spain by the Cantabrian Mountains, which are a continuation of the Pyrenees. Both ranges are generally much steeper and the elevation to be overcome greater on their northern sides, on account of the elevation of the Central

heights of the passes are given in feet as well as in meters in the following table:

	Metres	Feet
Main line to San Sebastian.....	607	2,003
Line to Bilbao.....	629	2,076
Line to Santander.....	981	3,237
Line to Gijon (Oviedo).....	1,172	3,868

Typical scenes showing a line in the Cantabrian Moun-

Note that the lines are shown from the coast inland to points 170 km. distant

Fig. 15—Profiles of the Lines of the Northern Railway Across the Cantabrian Mountains

tains are shown in the photographs in Figs. 13 and 14.

Bilbao is the center of the steel industry of Spain, the blast furnaces and rolling mills being located there. Much iron ore is exported from Santander, and Gijon and Oviedo are the centers of the Asturias coal fields. There is also a large steel plant at Mieres near Oviedo.

### The Madrid, Zaragoza & Alicante

The only line of the M. Z. A. which is of much interest in connection with the investigation of the "Direct" line to France is the line between Madrid and Zaragoza, at which latter place connection is made with the line of the Norte to Huesca and Jaca. Beyond Jaca the new line across the Pyrenees through the Somport tunnel is nearing completion and this will open up a new route to France by connections through Pau and Tarbes.

The distance from Madrid to the frontier by this route is, however, some 555 kilometers and the connections on the French side are not very good. The elevation of the Somport

tunnel is 1,200 metres (4,000 ft.), and the gradients on the French side are 4 per cent (3.4 per cent in the tunnel). It seems unlikely, therefore, that this route will ever be a serious competitor for through travel and will have only a local benefit. The gage is 5 ft. 6 in. on the Spanish side and 4 ft. 8½ in. in France.

The Somport (Canfranc) tunnel is 8 kilometers long and the frontier is almost in the center of it. The international station at Canfranc is wholly in Spain, and the French are to operate through the tunnel into the international station. Figs. 3 and 4 show some of the masonry structures on this line.

On the main lines of both the Norte and M. Z. A. some first class express trains are operated, with diners and sleepers of the Wagons Lit Co. The Andalusian Rys. are, however, generally speaking, rather poorly equipped and maintained, with light rails and rolling stock adapted only for a light traffic. The daily express leaving Cadiz for Seville is shown in Fig. 5 and is typical of the rolling stock of this system.

## A Possible Solution of the Railroad Problem

### Weak and Strong Roads Combined End to End So as to Increase Competition and Greatly Strengthen All Railroad Credit

By F. J. Lisman

**T**HIS PLAN IS INTENDED to accomplish the following:

1. Provide for the immediate return of the railroads to the companies on a basis which will protect the companies.

2. Assure the government of a return within a reasonable time of any advances made by it to the railroad companies.

3. Provide for supervision of all railroad securities.

4. Provide for proper railroad regulation.

5. Provide for fair valuation which is just to the public and to the companies.

6. Provide ample competition; in fact, more than previously existing, but will prevent same from being wasteful.

7. Very important, it will put all the railroads immediately on a basis of excellent credit.

8. Stimulate rehabilitation work on part of the railroads and thus stimulate business in general.

To accomplish these results, it is proposed that an act of Congress be passed providing that railroad companies agreeing to consolidate with other railroad companies, in accordance with the instructions of the Interstate Commerce Commission, as explained later, shall receive back their properties and shall receive a federal charter which will protect them against rate regulation of any kind on the part of the states, and which will provide that they shall be entitled to earn 6 per cent on their legitimized value, when this is ascertained, and, in the meantime, to receive the present standard return.

To arrive at a valuation it is proposed to create a valuation commission, with headquarters at Washington, which can determine on broad principles of valuation to be carried out by regional valuation boards. These regional boards should be composed of representatives of the different interests of their respective sections; that is, farming, labor, etc., and are to determine promptly the "legitimized value" of properties in their district on a basis of fair, physical value and earning capacity.

The Interstate Commerce Commission's functions should be made largely judicial and six regional commissions should be created, each to be composed of representatives of different

interests in the region, and to have a mandate authorizing the railroad companies to fix rates so as to enable them to earn not less than 6 per cent on their legitimized value. The Interstate Commerce Commission, through a separate bureau on which there should be representatives of the railroad companies, would determine which railroad companies are to be consolidated so as to form from six to twelve national railroad systems.

It is proposed that a new United States Railroad Court of Appeals be created to deal with all litigation under the railroad control law of March 25, 1918, as well as that arising under the new laws.

### Consolidation

By consolidating the various railroad companies and merging the weak companies with the strong systems, the credit of all railroad companies as a whole, as well as in detail, is promptly rehabilitated and put on a very sound basis. Practically all railroad securities, especially bonds, will as a sequence become readily marketable. This will help not only with the financing of government loans, but will also greatly help in the rehabilitation of business. The new national railway systems will promptly strengthen the weak part of their properties and will want a large amount of material and labor for that purpose. The public's position will be greatly improved because all communities now located on weak roads will hereafter be on strong roads. The plan provides for competition and creates some new through routes not now existing.

Companies taking out federal charters must consolidate with such other companies in accordance with instructions of a special bureau of the Interstate Commerce Commission. Companies on consolidating shall issue certificates of beneficial interest to the stockholders and junior bondholders of the corporations which join in a consolidation. These holders of certificates of beneficial interest are to be entitled out of earnings to the same payment of interest and dividends which they have received as the standard return under the law of March 25, 1918, and after the necessary valuation of

each property has been completed they are to be entitled to stock in the consolidated company in accordance with the legitimized value as then determined. To give an example, if the Chicago, Burlington & Quincy, the Great Northern and Erie should be merged, the stockholders of the Great Northern would receive for their stock beneficial certificates of interest and would be entitled to a continuance of 7 per cent dividends out of earnings the same as received hitherto. If their equity as represented by \$250,000,000 of Great Northern preferred stock now outstanding should, when valuation is completed, be certified as representing a legitimized value of \$150,000,000, then the Great Northern stockholders would be entitled to 60 per cent in the capital stock of the consolidated corporation. If, on the other hand, the legitimized value should be \$300,000,000, then the stockholders of the Great Northern would become entitled to 120 per cent in the stock of the new company.

Bond issues the interest charges of which require more than 70 per cent of the standard return shall be exchanged for beneficial certificates of interest, so that their status may be changed in case the valuation of the property on which they are a lien shall be found to be insufficient to cover such issue, and also that money spent for rehabilitation of the property may be given priority in lien to such an issue.

The holders of stock of the Erie Railroad, as well as junior bond issues, would also have to exchange their securities for beneficial certificates, and if, after the valuation is completed, it shall be determined that the properties are worth less than the entire bonded debt, then the junior mortgage would receive only its pro rata of stock of the consolidated company. If, on the other hand, the physical value should be in excess of the entire bonded debt, but less than the total amount of capital stock outstanding, then the bonds shall be left undisturbed and the proportion which each class of stock should receive of the new stock shall be left to an arbitration committee which shall be composed as follows: A member of the Interstate Commerce Commission and a representative of each of the different classes of stock involved. If this committee cannot agree on the distribution the matter is to be submitted to the United States railroad court of appeals, the decision of which shall be final.

Any money spent for the rehabilitation of a weak company between the time of the organization of the consolidated company and the final determination of legitimized value shall be an obligation of the new consolidated company and a lien prior to the junior securities of the weaker company, which will be represented by certificates of beneficial interest. The intent of this is to protect the consolidated company for expenditures for prompt rehabilitation of its weaker parts, so as to encourage it to proceed with this work promptly, thus stimulating industries and assuring better transportation facilities to the public located along the weak lines.

### Valuation

The public and Congress still want a physical valuation, as they have the idea that railroads are over-capitalized. Physical valuation will therefore have to go on; but it should be on fair basis. The valuation problem is such an important one that a special board of valuation should be created with headquarters in Washington. The country should be divided into, say, twelve districts, to be in charge of regional boards, which should be selected very much in the manner in which the board of the Federal Reserve bank is selected; that is, each valuation board should consist of, say, seven members, to be selected in the following manner. Each one of the following interests shall submit three names to the president:

1. The wholesale and retail merchants of the region, say, through the chambers of commerce.
2. The manufacturers of the region, say, through the manufacturers' associations.
3. The farmers, say, through farmers' alliances.

4. The banking interests, through the Federal Reserve bank or the bankers' associations.

5. The laboring interests, through the labor unions.

6. The railroads themselves, say, through the presidents of the corporations, voting in proportion to mileage, with the proviso that the roads having 1,000 miles or more should be entitled to cast a vote for not exceeding 1,000 miles.

7. The state railroad commissions within the district.

The president shall nominate one from each of these classes to act as a valuation board. The regional valuation board is to value the companies' properties in each region, taking all factors of cost into consideration. The central valuation board in Washington shall be selected in a similar manner from the country at large. It shall be the function of the central valuation board to lay down rules for the regional valuation boards, pass on doubtful questions, and to see that the valuation boards carry on everywhere the valuation work on the same principles.

The present valuation act of Congress provides that the railroads should be valued on a basis of what it would cost to reproduce same as of July 1, 1914, plus cost of additions since that date. Large sums of money have been expended under this act, and there has been much friction over the valuation of the few properties where this work has been completed.

Under the right of eminent domain the government must pay a fair value for property. A determination of a fair value for railroad property as of July 1, 1914, has no bearing on the fair value of this property at this time. The new valuation work should be entirely separate from the work of the Interstate Commerce Commission, because the commission is, under this proposed plan, to have a mandate permitting the railroad companies to earn fair interest on their value, and, therefore, should not, at the same time also, determine that value. The present officials in charge of the valuation work have construed the law very literally and have, for example, refused to allow the railroads for the cost of cutting down trees because there were no trees on the right of way on July 1, 1914, on the theory that if the road were to be rebuilt on July 1, 1914, no trees would have to be removed. Similarly, there have been cases where a railroad moved a highway from one side of the right of way to the other side in order to avoid two grade crossings of the same highway. The valuation engineers have refused to allow the railroads for the cost of this work because these highway crossings did not exist as of July 1, 1914. In another case a railroad which was being valued had erected a heavy overhead bridge and passed underneath in order to avoid a crossing with an important line. The valuation engineers would not give the credit to the railroad which built this bridge, stating this was part of the property of the other company. Valuations of real estate have in many cases been on a par in intelligence and breadth of view with these decisions. It certainly is not surprising that the companies have objected. No business man would think of valuing properties on this basis.

Final legitimized valuation should be the mean or average between the developed earning capacity, capitalized at 6 per cent, and the fair physical value; that is to say, that if a company's physical property is determined to be worth \$125,000,000, and it is earning 6 per cent interest on \$100,000,000, it should be taken over on a basis of \$112,500,000. If, on the other hand, it is earning 6 per cent interest on \$140,000,000 and its physical valuation is \$125,000,000 it should be taken over on a basis of \$132,500,000. Companies which have no earning capacity whatsoever shall be taken over at one-half of their physical value, provided the valuation board and the Interstate Commerce Commission deem the property necessary in order to serve the adjacent communities.

Future earning capacity shall also be taken into consideration by the valuation board, provided that no company which

heretofore has failed to earn 6 per cent interest on its cost shall be allowed for earning capacity an amount which would bring its total legitimized value to a sum in excess of its physical value. If the valuation board should determine that a company has a certain undeveloped earning capacity which it will take ten years to develop, such company should be allowed an increase of one-tenth of this expected development for each year for ten years. For example, if a property has a physical valuation of \$10,000,000, and its standard return should be \$400,000, and if it should be determined it has an undeveloped earning capacity of \$100,000 additional, the company should be entitled to issue securities as follows:

\$400,000 capitalized at 6 per cent would be a valuation of.....	\$6,666,660
Average of earnings and physical value.....	8,333,333
Interest on this amount at 6 per cent.....	500,000

If the valuation board should find that the company has strong probabilities of developing its business sufficiently to develop a net earning capacity in excess of \$500,000, say, up to \$580,000, then this \$80,000 expected increase in earnings might be represented by an additional stock issue of \$1,333,000, which shall be issuable to the stockholders of the existing company at the rate of \$133,000 per annum.

Differences of opinion as to valuation between companies and valuation boards shall be submitted to an arbitration committee, consisting of two railroad officials, two members of the regional valuation board, and a United States district judge. Either side, however, should have the right of appealing from this arbitration committee to the central valuation board, and also to the railroad court.

The valuation board shall go out of existence as soon as the work of valuing and appraising the various railroad properties is completed.

### Regulation

The function of the regional interstate commerce commissions shall be as follows:

To approve of capital expenditures and of all future security issues.  
To regulate competition between the railroad systems, preventing an excess of competition but at the same time securing ample competition in service and facilities.

Pooling among the systems shall be permitted, but any pooling agreement must be subject to the approval of the regional interstate commerce commission.

Appoint arbitrators whenever questions arise between the railroad companies; for instance as to the rental payable by railroad companies for terminal facilities belonging to each other and to terminal companies, or for trackage rights which railroads may rent from each other; divisions of rates, etc.

Listen to and pass on appeals of rates whenever arbitration committees, hereinafter mentioned, cannot agree on rates.

They shall have a mandate in accordance with which the general rate structure must provide a revenue which will be sufficient to enable the companies to earn the standard return, and after valuation is completed not less than 6 per cent interest on the legitimized value, plus a reasonable amount to take care of depreciation and obsolescence.

Arrange the settlement of questions arising between the railroad companies and state authorities.

Deal with other problems as same may arise from time to time.

The function of the Interstate Commerce Commission in Washington shall be:

To pass on appeals from the rulings of the Regional Commissions.

Pass on questions arising between the state commissions and the regional commissions.

Pass on all questions where more than one region is involved.

Lay down general rules so that all regional commissions will deal with their problems in a similar manner.

The special bureau of the Interstate Commerce Commission which is to determine which railroad companies are to consolidate with each other is to be composed of seven members, of which three shall be appointees or members of the Interstate Commerce Commission, three shall be appointees of the railroad companies, and the seventh member shall be from time to time selected by the other six, or be nominated by the United States railroad court of appeals.

### Other Provisions

A United States railroad court of appeal does not need any elaboration. It might be pointed out, however, that the court of claims will rapidly become clogged with suits arising out of the war, and the new court would, on the other hand, soon familiarize itself with railroad matters.

Each railroad company should have nine directors, of which five should be nominated by the stockholders and two by the government and two by the employees of the railroad companies, the same as in the case of the regional valuation board and commerce boards.

The five directors representing the stockholders shall select two each of these classes from the six names suggested to be directors to represent the government and the employees. Any director representing the employees must have been a railroad employee continuously for at least ten years, except for absence on account of the war or ill health, and an employee of the company for which he is to be a director for at least five years.

Each director shall be entitled to an annual salary of \$2,000 as long as the company pays only the minimum dividends guaranteed by the government, and shall be entitled to \$1,000 additional salary for every 1/4 per cent increase in dividend which the company may disburse to stockholders.

Provisions should be made under which the companies must keep separate accounts of all earnings and expenses in each region.

Provisions should also be made for the joint use of terminals of all the systems under the regulation of the regional and federal commerce commissions. Independent terminal companies in each of the various cities should be consolidated and the interest on their bonds and dividends on their stocks, according to the proper valuation, shall be paid pro rata by the various railroad companies, according to their use. For instance, in the Chicago district there might be a consolidation of the Chicago terminals of the Chicago & Western Indiana, the Chicago Junction Railway, the terminal property of the Baltimore & Ohio, and some of the other lines and included therein might also be some of the outer belt lines, like the Chicago, Milwaukee & Gary, and the Elgin, Joliet & Eastern.

In congested cities like Cincinnati and Pittsburgh the construction of a proper belt line should be promptly taken up, existing lines to be used as far as possible.

Disputes as to the fairness of rates should be submitted to arbitration. Parties interested in rate reduction should select from their line of business two men to represent them, the railroad companies to select two men, who shall endeavor to settle the matter. If they are unable to do so they shall select as a fifth man some member of the regional commerce commission and if they fail to agree on some man the United States district judge shall select a fifth man.

Any decision of such an arbitration committee, however, may be appealable to the regional commerce commission, to the federal commerce commission in Washington and to the railroad court of appeals.

Labor disputes as to wages should be settled in a similar manner.

A pension system for all employees is to be established at once and is to go into full effect within five years; the cost of this system to be fairly prorated between the companies and the employees.

Net earnings above 6 per cent on the legitimized value, after allowing a proper amount for non-productive improvements or obsolescence, to be used as follows:

One per cent per annum may be set aside in a reserve fund to meet any deficiency below 6 per cent during any subsequent year; any surplus above that to be divided to the extent of one-third to the company, one-third to the employees and one-third to the government.

After a surplus fund of 5 per cent has been accumulated, all earnings above 6 per cent are to be divided on the basis of one-third each to the company, the government and the employees.

If the earnings in any one region have averaged above 7 per cent for two years in succession, but not before then, the regional commission may at its option take up the matter

of rate reduction so as to reduce the average incomes of the companies to 6 per cent.

On the other hand, if the average return of the companies should fall below 6 per cent for two years in succession the railroads may at their own initiative advance rates. If the income should fall below 5 per cent in any one year the companies need not wait two years, but may advance rates after the expiration of one year, so as to be sure of an income of 6 per cent.

(To Be Concluded Next Week.)

## Orders of Regional Directors

**CHINESE ALIEN PASSENGERS.**—File 60-1-12 of the Northwestern regional director similar to file 1600-115A599, of the Eastern Regional director, abstract of which was published in the *Railway Age* of March 21 (page 759). The Southwestern regional director, in Order 180, has issued similar instructions.

**Standing Orders from Consignees.**—Order 177 of the Southwestern regional director similar to file 5600-19-A600 of the Eastern regional director, abstract of which was published in the *Railway Age* of March 21, (page 758).

**Regulations for the Movement of Cotton.**—Order 182 of the Southwestern regional director cancelling Order 82 and supplements, gives instructions for the handling of cotton to avoid accumulation at compresses and to secure proper loading of cars.

**Issuance of Passes to Non-Government Roads.**—Supplement 15 to Order 109 of the Southwestern regional director, quotes a letter from W. T. Tyler, director of the Division of Operation, to the regional directors, abstracted in the *Railway Age* of March 14 (page 602), and adds that it is the intention of the latter order that independently operated railroads shall obtain trip transportation over other than their own connection in accordance with past practice.

**Classification of Material.**—Northwestern Regional Purchasing Committee Circular 66 contains the material classification which has been adopted for use on roads under federal control. Roads which now use a classified form of accounting for material should substitute this classification for the work now in use before taking the next material inventory. There is in course of preparation a standard form of monthly classified stock report or balance sheet for use in connection with this classification of material, which can be supplied railroads to serve as a guide in the making of monthly stock reports.

**Intensive Loading of Fertilizer and Agricultural Lime.**—Circular 192 of the Southwestern regional director cancels a letter of February 17, similar to Supplement 1 of Circular 67 of the Northwestern regional director, abstract of which was published in the *Railway Age* of February 28 (page 486), relative to securing a copy of the bill-of-lading covering fertilizer and agricultural lime shipments from manufacturers to be forwarded by railroad agents to the Car Service Section. Where it is not possible to secure an extra copy of the bill-of-lading from the shipper, the railroad agent should forward direct to the Car Service Section at Washington on the 7th, 14th and 21st and last day of each month, beginning March 21, either a copy of the way-bill, bill-of-lading or abstract giving the following information covering every carload shipment of fertilizer and agricultural lime when not loaded to the minimum of 60,000 lb.; date, car initial, number of consignor, consignee, destination, contents, weight and car capacity.

**Loading and Unloading of Tank Cars.**—Order 181 cancelling Order 123 of the Southwestern regional director, states that instructions regarding switching service Sundays, holidays and Saturday afternoons for loading and unloading

tank cars is canceled. The Oil Division of the Fuel Administration advises necessity for this service no longer exists.

**Cotton Embargo.**—Order S. D. No. 21 of the Southern regional director, which cancels Order S. D. No. 14, provides that hereafter, cotton (except when moving under transportation orders of the War Department), from points west of Chattanooga, Birmingham, Montgomery and Pensacola, destined to Jacksonville, Fla., Brunswick, Ga., Savannah, Ga., Charleston, S. C., and Wilmington, N. C., proper, or for export through these ports, will not be moved except under permits from the Southern Export Committee.

**Handling of Automobile Cars.**—In Circular Letter No. 430, the Southern regional director calls attention to the universal scarcity of freight cars for automobiles. Special care must be taken on each railroad to conserve the use of automobile cars for the purpose for which they were built, and to get them into the territory where most needed. In loading these cars in their return movement care must be observed to permit loading only when it will serve the purpose of expediting the return movement of the car to automobile loading points. If any question exists as to the territory to which empty cars should be forwarded, information should be requested of the regional director.

**Return of Cars to Non-Federal and Canadian Roads.**—The Northwestern regional director in Freight Car Distribution Notice 7 cancelling Freight Car Distribution Notice 3, augments the later notice, abstract of which was published in the *Railway Age* of February 28 (page 486) by stating that under an arrangement between the Canadian War Board and the Car Service Section, Canadian roads will accept the home delivery of any Canadian owned freight car of any kind at any junction point, regardless of home route. And in a similar manner, railroads under Federal control will accept from Canadian roads at any junction point any cars belonging in the United States or Mexico, including both federal controlled and non-federal controlled cars. Cars so received belonging to non-federal or Mexican roads will be moved home in accordance with the above instructions.

The Railroader—"Never Again"

# Pocahontas Region—Study of Operating Conditions

Converted a Condition of the Acute Coal Famine Into a Condition of Ample Reserves and Growing Surplus

**T**HERE WERE FOUR immediate tasks that were undertaken by the roads now in the Pocahontas region when war was declared. New England was in direst need of coal, and this need was becoming more unendurable every day; materials and supplies had to be brought to Hampton Roads for the construction of the great naval base established there; troops had to be moved to Norfolk, Va., the port of embarkation next in importance to New York, and materials and supplies brought for an embarkation camp; and the United States Navy in home waters had to be coaled.

When the Pocahontas region was created it was felt both in New England and at Washington that if New England could be furnished with a sufficiency of coal by January, 1919, the situation would be saved, but there was a hope only for such a happy ending. By October, New England had plenty of coal, and was full up with coal by January.

The Naval Base at Sewalls point on Hampton roads was constructed to have a capacity of 20,000 sailors, this being on the site of the old Jamestown exposition, and afterwards the government authorized an extension to a capacity of 30,000 sailors. The work being done there by the government, making this a permanent naval base, required a large amount of construction material. Permanent tracks have been laid into it, connected with the Virginian and the Norfolk & Portsmouth Belt Line. A large quartermaster's terminal on Hampton roads

N. D. Maher  
Regional Director, Pocahontas Region

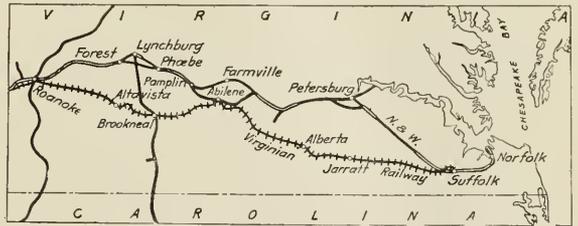

waterfront, with large and well equipped warehouses, docks, and open piers, has also been constructed, with classification yards inside and a classification yard outside into which the railroads delivered the construction material for the piers and warehouses, and which will be used for the war department's supplies so long as forces are kept in France. The Norfolk navy yard was large increased in capacity, and considering all of the war activities at Hampton Roads on the north side from Old Point Comfort to the upper end of the Elizabeth river, and on the south side from Willoughby Spit to Norfolk, Hampton roads has been established as one of the best land-locked harbors on the Atlantic coast, with every facility for shipping, including coaling facilities.

The Pocahontas region was carved off from the Eastern region in June, 1918, and was placed under the jurisdiction of N. D. Maher, formerly president of the Norfolk & Western and federal manager. A. C. Needles, vice president (operation) of the Norfolk & Western, succeeded Mr. Maher as federal manager, and George W. Stevens, president of the Chesapeake & Ohio continued as federal manager of the Chesapeake & Ohio. The region includes the Norfolk & Western, the Chesapeake & Ohio, and the Virginian—the three carriers of bituminous coal from the West Virginia

coal fields to Norfolk, Newport News and Hampton roads.

The Virginian, having no western outlet for its coal, and no western connections for the interchange of other traffic, was before the war almost exclusively a carrier of tidewater coal. Nearly all of this coal has to be hauled up over Clark's Gap, a very heavy grade which, with its numerous single track tunnels, limited the capacity of the whole road. East from the summit of Clark's Gap, however, the grade is slightly descending. It was obvious that the western side of Clark's Gap must be double-tracked if the full capacity of the mines on the Virginian was to be developed.

There was presented here a clear-cut case of capital expenditures required by war conditions, and which would be required in the course of time under the ordinary conditions of the development of the country. The work was undertaken by the administration and the necessary funds

The Norfolk & Western and the Virginian East of Roanoke

were advanced to the corporation. The greater part of this double track work has now been done, but after the signing of the armistice further expenditures stopped. The corporation is left, therefore, with the burden of interest charges on capital expenditures made to meet war conditions, and presumably without the credit to complete the double track work and thus derive the full operating advantages and economies of completed improvement. The case well illustrates how necessary it will be for the government to take a broad and generous attitude toward the corporations when the roads are returned to them. The Railroad Administration was entirely justified in making the capital expenditures it did on the Virginian in view of the paramount importance of increasing the coal output, but in so doing forced the corporation into a difficult financial situation.

Both the Chesapeake & Ohio and the Norfolk & Western were very highly developed trunk line railroads capable of carrying coal either west or to tidewater at remarkably low cost—three to four mills per ton mile. The Chesapeake & Ohio had spent large sums for double tracking, heavier rail, etc., and especially for reducing the cost of hauling coal west. When the European war broke out, hauling coal east became of first importance, and a certain amount of readjustment became necessary, but this was soon made. It was only necessary for the Railroad Administration, when it took hold, to complete the new coal pier at tidewater, which it did.

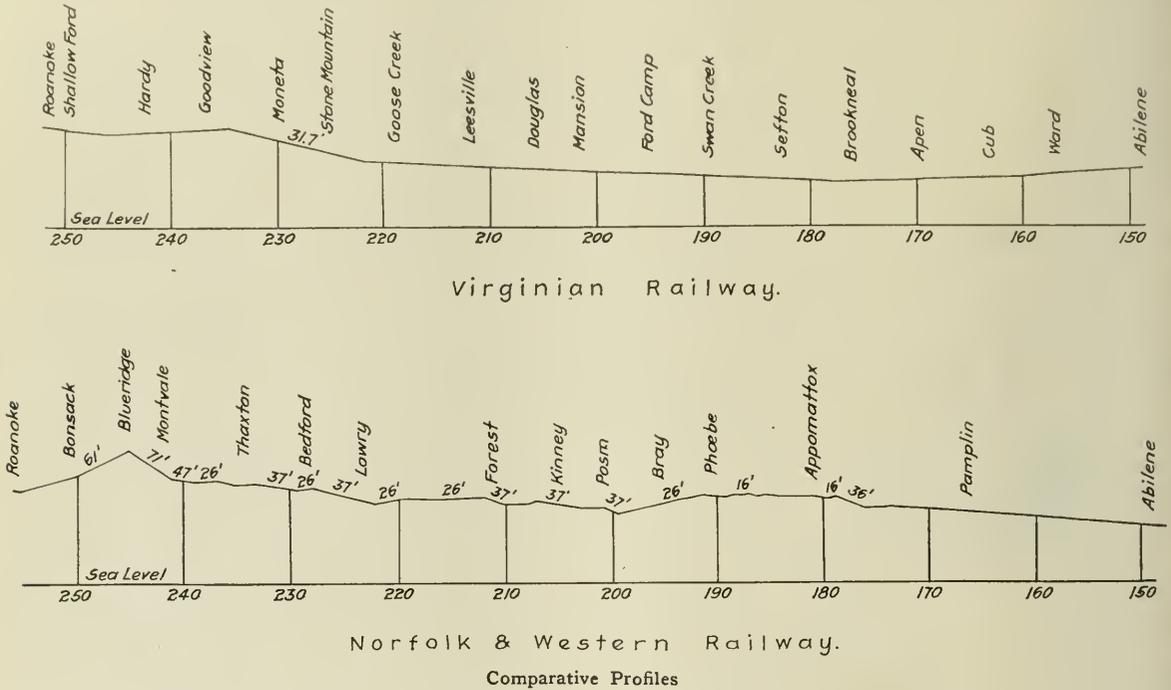

The Chicago line of the Chesapeake & Ohio was taken away from it and placed in the Ohio-Indiana district of the Eastern region. This line from Cincinnati to Chicago is not of very great importance and it is probable that the Chesapeake & Ohio did not greatly need it under war conditions. However, the reasons for separating it from the main lines

east are not very obvious and the separation worked a hardship on the corporation. It has now been restored to the Chesapeake & Ohio and is, therefore, in the Pocahontas region.

The Norfolk & Western had just completed a fifteen-year program of development and improvement when the United States entered the war. It was one of the most evenly developed properties in the country, comparing in this respect with the Atchison, Topeka & Santa Fe and the Union Pacific. Its ore dock was the first of its kind built at Norfolk, and it has proved thoroughly satisfactory, and the indispensability of some such dock is now everywhere recognized. Not only did the government find in the Norfolk & Western a perfected tool of enormous capacity, but it found even some of its own extraordinary needs forestalled. The company had just completed two large docks and warehouses outside of Norfolk. These were taken over as part of the storage plant

point of destination of the first operator's coal. Under the pooling arrangement a few telegrams and a bookkeeping entry permitted the coal on the ground to be delivered to the purchaser, the completion of the transaction and the immediate release of ten coal cars. The power to do this sort of thing added at tidewater and the lakes almost 100,000 cars to the car capacity of the country.

Pooling of coal necessitated the mixing of coals and regrading. While the war lasted the coal operators stood it fairly patiently from a sense of patriotism. Pressure is now being brought to put an end to this great economy. The point of view of the coal operator is easy enough to understand. To get an order in the open market he must convince the buyer that his coal is better than that of his competitors at the same price. He cannot do this under present conditions where the buyer may have his order filled from any of a dozen different operators' coal.

which the army built under the direction of Colonel Samuel Felton.

Here, then, were as good tools as could be asked for by the new regional director; nor was there any elaborate superstructure of organization that had to be created. Mr. Maher took jurisdiction without getting up from his desk. The new power to pool facilities, cars, and, above all, coal, increased the potential capacity of the roads brought into the new arrangement to an extent that can hardly be appreciated.

A glance at a large scale map of the region will show the great number of tendril-like branches of the railroads into different coal fields, but will hardly give an adequate idea of the number of separate mines operated by independent operators and by a multiplicity of companies. The so-called zone orders restricted the field in which these mine operators could seek a market for their coal. There still remained the fact that while one operator might have an order for ten cars of coal at a certain point which would be unloaded immediately on arrival, but which coal he was just beginning to load onto cars at his mines, another two or three operators would have an aggregate of ten cars within a few miles of

The most important and most interesting joint use of main line facilities in the Pocahontas region is the routing of freight trains, principally coal trains, over the Virginian from Roanoke to Abilene, eastbound, and the routing of empties, westbound, over the Norfolk & Western. The map and profile show plainly the advantages of this arrangement. The distance is about 105 miles on the Norfolk & Western and a little shorter on the Virginian. When the Norfolk & Western was originally built it was carried through Lynchburg, the most important city in that section of the country, and the junction with the main line of the Southern Railway. There is a big dip down at Lynchburg into the valley of the James river. Later a freight cut-off was made between Clay and Phoebe, and it is the profile of this freight line which is shown herewith. Later, also, a freight line was built from Pamplin through Abilene, rejoining the old main line near Burkeville.

The Virginian, built with the primary purpose of getting the best possible grade from the coal fields to tidewater, was run slightly south of east from Roanoke, crossing the main line of the Southern at Altavista, thus leaving Lynchburg

far to the north. The joint use of the two main lines makes for a very considerable economy. They are just the right length for a freight-train crew run and deadheading can be very largely eliminated. The difference in grades against eastbound traffic is very large. Such a cut-off as this could, of course, have been built by the Norfolk & Western, but it would have been difficult to have justified so large an expenditure to give the Norfolk & Western additional and more economical facilities alone; but, actually, the line is a part of a through road from the coal fields to tidewater, the existence of which and the expenditures on which are justified by reasons other than that simply of bettering the grades

between Roanoke and Abilene. The joint use of it is a pure gain in the economy of railroad operation. About ten trains of the Norfolk & Western eastbound are now being sent each day over this piece of the Virginian.

As we look back now with the coal bins of industrial New England full, the needs of the army at Norfolk completely satisfied and the coaling of the navy no longer a war problem, the operation of the Pocahontas region, with its three low-grade bituminous coal roads, seems a comparatively simple piece of railroading; if we go back to the state of mind of a feeble Monday last January we get a clearer conception of how successful operation of the Pocahontas region has been.

## National Industrial Traffic League Spring Meeting

Max Thelen, Director of Public Service, Tells Delegates of Plans of the Railroad Administration

THE NATIONAL INDUSTRIAL TRAFFIC LEAGUE held its spring meeting at the Hotel Grunewald, New Orleans, La., on March 11 and 12, with R. D. Sangster, vice-president, presiding in the absence of G. M. Freer, president, whose new duties as secretary of the Central Coal Association would not permit him to attend. Mr. Freer, however, will complete his term as president. The meeting was attended by 200 representatives from the largest boards of trade and chambers of commerce in various parts of the country.

### Max Thelen Speaks

Max Thelen, director of public service, was the principal speaker at the convention, addressing the delegates at the Tuesday morning session. He stated that though he might not always be able to do for them what they wanted, he wanted them to tell him their troubles, and that he could at least promise them sympathetic attention. He said the function of the Railroad Administration had changed, now that the war was over, and its purpose should be to give the public the best service possible. In his explanation of the veto power in the matter of rates now held by the director of public service, he stated that, while it could not give shippers the rates they wanted, it could at least prevent rates they do not want from going into effect, unless overruled by the director general himself, and that the making of general advances or readjustments that might disturb business conditions at this critical time was against the policy of the Railroad Administration.

Using the changes that have recently been made in General Order No. 57 as reference, he informed the members that other general orders were also under scrutiny, and that other changes might be expected. Consideration was now being given to the matter of import and export rates, and that of differentials between water and rail rates, and that some conclusion might be expected soon. He advised the shippers that whatever plan they might present as to off-line agencies would be considered carefully; that the so-called "sailing day" plan would be a subject of further study with the view of forming a definite plan that would be satisfactory, and to accomplish this he suggested the appointing of a committee by the league to assist the Railroad Administration with advice as to what should be done.

Referring to the freight traffic committees, he stated that his mind was open on the question of whether this plan of making rates ought to be continued, and he pointed out that there might be consideration as to whether the representation of the shipper of these commodities ought not to be increased so as to give them an even chance.

In his statement regarding the recent action by the Railroad Administration to improve conditions he brought out especially the proposed reform in the policy of handling claims, and asked the league to give him their constructive suggestions, that the work of the committee, of which he is chairman, charged with the duty of working out a new policy, may have the best possible results.

### Sailing Day Plan

The "sailing day" plan was the subject of a lively discussion, which finally resulted in the adoption of a resolution, a substitute for the executive committee resolution on the same subject, and offered by C. E. Childe, of Omaha, Neb., which stated that the attitude of the league was opposed to the plan as at present administered, and, in accordance with the suggestion of Mr. Thelen to work in co-operation with him, made provisions for the appointment of a committee to present the views of the league on this subject to the proper officials of the Railroad Administration. The Childe resolution was an attempt to satisfy the delegates from all sections of the country whose views were divergent. Mr. Childe's sailing day resolution stated that the sailing day plan is a restriction upon commerce and causes the carriers to fail in their legal obligations of receiving and forwarding freight with all reasonable despatch; that this failure lays a heavy burden of extra expense upon the shipping public, and that the operation of this plan causes undue discrimination between markets. The resolution further stated that the league endorses the establishment of through package car service on schedule days throughout the country whenever traffic and commercial conditions reasonably warrant it; provided, however, that the lawful right of the shipper to deliver freight to any carrier for transportation on any day during business hours be in no way curtailed and that the committee to be appointed be instructed to take up immediately with each member of the league and obtain all possible information as to the working of the "sailing day" plan throughout the country and the practicability and necessity of providing through package car service where such is warranted.

Continuing the report of the executive committee, Mr. Barlow, on the subject of passing reports on the l. c. l. and c. l. freight and transfer records at junction points said that the plan of the Western Freight Traffic Committee for off-line representation had just been approved at Washington. His motion that the subject be referred to the special committee to be appointed on the "sailing day" plan was adopted. That committee was also made the agent of the league to take up

at Washington a number of other matters treated in the reports of the executive committee.

Four other resolutions were presented by Mr. Barlow and adopted by the league. On the matter of closing of freight stations, resolutions were adopted asking that the Railroad Administration be requested to issue an order immediately requiring a restoration of the pre-war opening and closing time at all freight stations, and that investigations be initiated by the Railroad Administration at points where congestion of less than carload freight obtain, and where it is found that terminals are not being used to maximum efficiency and capacity, that the hours for the delivery and the forwarding of freight be increased so as to utilize such freight stations to the maximum capacity and furnish maximum facilities for the convenience of the public.

The resolution adopted with respect to the shipper's right to route freight stated that the director general of railroads be requested to withdraw, cancel and annul any and all instructions or restrictions as to the routing or diversion of freight shipments that are at variance with published tariff provisions. A copy of these resolutions will be presented to the Director General of Railroads, with the urgent request that he give the matter his prompt consideration. The resolution maintains that there is no longer any necessity for the arbitrary routing and diversion of freight traffic by the Railroad Administration, and that it is of vital importance to the shipper that he should have control of the routing of his shipments so as to be able to direct the movement of them.

#### Rates on Export Traffic

The subject of export rates was handled by the league by the adoption of resolutions which indorse the principle of making lower rates on export traffic than are made on domestic traffic when such rates are necessary to enable industries in the United States to compete in foreign markets.

#### Mileage Scales

In regard to mileage scales, Mr. Barlow said that in the western and southern territories not much vitality had been observed in the last two or three months though they might still be alive. As to trunk-line territories, where mileage scales have also been out, he said it might be advisable to consolidate the half-dozen distance tariffs into one. Mr. Williamson, chairman of the committee on rate construction and tariffs, moved that this resolution as offered by the executive committee be deferred until after his committee had reported. After some discussion Mr. Williamson's motion prevailed. Mr. Barlow's committee offered a resolution opposing the submission of any further mileage scales, either class or commodity, for consideration by regional or district committees, or the adoption of any such scales by the Railroad Administration which will increase charges now in effect.

Mr. Barlow closed his report for the executive committee by stating that 59 new members had been received since the meeting last November, and reported, as a member of the Western Freight Traffic Committee, that the whole subject of increased minimum waste on foodstuff had been removed from docket, but that there would be some consideration given to the subject in individual cases.

#### Demurrage Rules

Charles Rippin, traffic commissioner of the Merchants Exchange of St. Louis, Mo., and chairman of the committee on car demurrage and storage, submitted a report of his committee on the recodification of demurrage rules. The report shows the result of much work by this committee in conjunction with a committee representing the American Railroad Association. The league adopted the report with slight exceptions. The purpose of this recodification is to bring the existing instructions, explanations and interpretations into the rules themselves, to clarify the rules in accordance with lawful practice,

to obviate the necessity for future interpretations and to insure uniform application, but it is not intended to change or modify any of the principles in the present rules.

#### Mr. Ripley's Resolution

Paul Ripley, traffic manager of the American Sugar Refining Company of New York, offered resolutions bearing on the league's attitude with respect to the railroad problem, which had been presented by President Freer (after action by a special committee approved by the executive committee) to the Senate Committee on Interstate Commerce. Mr. Ripley's proposal did not agree, in some respects, with the action of the league, especially with respect to pooling.

A special meeting to consider the subject will be called when it is learned when Congress will be called into session. This meeting is to be called in time so that its deliberations can be presented to the proper committee of Congress.

Mr. Ripley's resolution stated that the National Industrial Traffic League has recorded unqualified opposition to government ownership, management or operation of railroads, has expressed disapproval of any extension of federal control beyond the limited period now prescribed by law, and has declared itself in favor of the prompt enactment by Congress of such legislation as will provide a uniform system of regulation in essential matters, safeguard the public interest, ensure adequate revenue to provide for equitable treatment of all questions affecting wages and working conditions of employees and attract sufficient capital to maintain and develop transportation facilities which shall meet the necessities of the commercial, manufacturing and agricultural interests of the country and proposed the following plan of procedure be recommended in regard to the future status of railroads.

(1) That the policy of the Government shall be manifested by restoring the individual organization of each system to operate the property for account of the Government, subject only to such supervision by the Director General of Railroads as may be necessary to protect the interests of the Government.

(2) That the final relinquishment of the properties should not be delayed longer than is absolutely necessary for the enactment of remedial legislation, and that such legislation should be expedited by an extra session of the Congress to be convened at the earliest practicable date.

(3) That remedial legislation to be enacted should recognize the following principles:

(a) That all rates, regulations and practices of carriers under Federal control which shall have been filed with the Interstate Commerce Commission, whether on interstate or intrastate traffic, and which have not been superseded by action of the Interstate Commerce Commission or of the Director General of Railroads on the date on which Federal control of said carriers shall be relinquished, shall remain in effect on the lines of all carriers subject to the Interstate Commerce Act until changed by action subsequently taken according to law.

(b) That a guarantee to the carriers of a specified return upon either capital or investment should not be undertaken because it would discourage individual initiative, stifle incentive to efficient management and destroy competition, but that the regulating agency shall take into consideration the cost of labor and other operating costs in reaching a conclusion as to the reasonableness of rates, and that the carriers shall be permitted to earn sufficient revenue to provide safe and sufficient service, to protect existing investment and to attract new capital necessary in the public interest.

(c) That any undue discrimination between state and interstate rates, rules, regulations or practices, that places an undue burden upon Interstate traffic shall be declared unlawful and that the Interstate Commerce Commission shall be authorized and required, upon complaint of shipper, State Railroad or Public Utility Commission, carrier, or any other interested party, to determine the propriety of the relation existing or contemplated between the rates, rules, or practices upon traffic wholly within one State and upon interstate traffic, and make final decision with respect thereto.

(d) That the carriers shall be authorized to make such agreements for the co-ordination of their practices and facilities as may be in the public interest when approved by a national governmental agency.

(e) That the exclusive jurisdiction over the issuance of securities shall be vested in the same national governmental agency by which rates are controlled and regulated.

On Tuesday night an informal dinner was given by the league at the Hotel Grunewald. Among the speakers were Francis B. James, of Washington, D. C., who gave a talk on the interpretation of laws in general bearing particularly on common law, and M. J. Sanders, of New Orleans, federal manager of the Mississippi-Warrior River Section of the Inland Waterway Section of the Railroad Administration, who spoke on the developments of river traffic.

General Pershing and Brigadier General Atterbury

## General Pershing Compliments Work of the Railway Men

Congratulations Expressed in Letter to Brigadier General Atterbury—The Latter's Reply

FRANCE, February 20, 1919.

BRIGADIER GENERAL WM. W. ATTERBURY,  
Director General of Transportation,  
Headquarters, S. O. S., American E. F.

MY DEAR GENERAL ATTERBURY:

Permit me to take this opportunity of expressing to you, to your officers and soldiers of the Transportation Corps my appreciation of their services to the American Expeditionary Forces.

From its inception in September, 1917, I have watched with the greatest interest the progress you have made. You have been called upon to organize base ports and to operate them in connection with the terminal yards and the necessary road train service connecting these yards; to instruct and assign railway transportation officers at all important stations in France; to erect cars and locomotives; to arrange and perfect details for troop movements and to maintain through all a most varied and difficult liaison service with the French.

All this you have done with a shortage of personnel, equipment, and with facilities that were lacking, due to unavoidable delays in construction.

Please convey to your officers and enlisted men my personal congratulations and appreciation, and that of their comrades of the American Expeditionary Forces for the splendid work they have done.

Each member of the Transportation Corps, whether stationed at a base port or at an advanced railhead, has contributed to the victory of our armies, and I want each man to understand my full appreciation of this.

Sincerely yours,

(Signed) JOHN J. PERSHING.  
24 February, 1919.

GENERAL JOHN J. PERSHING,  
Commander-in-Chief,  
American Expeditionary Forces,  
General Headquarters, France.

MY DEAR GENERAL PERSHING:

It is a pleasure to acknowledge the receipt of your letter of February 20th.

Needless to say, it is highly gratifying to me—as it will be, I am sure, to the officers and soldiers of the Transportation Corps as a whole, each of whom will be furnished a copy of your letter—to note the generous terms in which you speak of the service that has been rendered by the Transportation Corps toward the success of the American Expeditionary Forces.

To know that their Commander-in-Chief is familiar with the work they have done, and gives due credit to the part they have played in helping to win the war, will be to both officers and soldiers full reward for their efforts, and at the same time will stimulate them to maintain during the remainder of their service in France the zeal and energy that uniformly has characterized their performance.

No body of men has worked harder, nor with a keener spirit of intelligence, energy and patriotism, and I am more than proud to have been in charge of such an organization.

Personally and on behalf of the entire Transportation Corps I desire to express to you our grateful appreciation of the tribute that you have paid the Corps.

Yours very sincerely,

(Signed) W. W. ATTERBURY,  
Brigadier General, U. S. A.

# Report on the Automatic Straight Air Brake

## Synchronous Operation With Brake Apparatus Now in Common Use Secured in Extensive Tests

THE INTERSTATE COMMERCE COMMISSION on March 4 submitted to Congress the report of a series of tests conducted by the Bureau of Safety of the air brake system of the Automatic Straight Air Brake Company of New York, as a result of which the bureau submitted the following conclusion: "In the tests of the automatic straight air brake system, both Westinghouse and automatic straight air locomotive apparatus was used with trains made up of various arrangements of Westinghouse and automatic straight air triple valve equipment, and the tests were made under varied operating conditions. Synchronous operation of the automatic straight air brake system with brake apparatus now in common use was secured in all of these tests. On trains equipped entirely with automatic straight air triple valves the reliability and flexibility of the automatic straight air brake system were sufficiently demonstrated." This conclusion, together with a report submitted to Congress June 29, 1916, is the result of a study and test of this system during a period of several years, beginning in 1910, when the triple valve was presented to the Block Signal and Train Control Board, and including experimental tests on the Atchison, Topeka & Santa Fe in 1915 and extensive rack tests and service tests on the Virginian Railway during the period from March to July, 1918.

The apparatus recently tested is a development of that formerly controlled by the California Valve & Air Brake Company of Los Angeles, Cal., tests of which were made by the bureau in November, 1915, which were the subject of the report to Congress in 1916. The tests which are the subject of the new report were made first with the apparatus installed on a 100-car test rack in New York City and later on the Virginian Railway with the same brake apparatus installed on cars used in coal service between the mines in West Virginia and the docks at Sewalls Point, Va.

As presented to the commission for test, the apparatus comprises a triple valve, a high volume feed valve and a compensating valve. The triple valve tested is of the 3-unit type,\* the three units being a service section, an emergency section and a change-over section; the equipment also includes a quick action reservoir and a service reservoir in addition to the present auxiliary reservoir and brake cylinder.

This apparatus is designed to produce essentially the following operating results:

- (1) Rapid serial action in service applications and in quick release.
- (2) The maintenance of uniform and constant brake cylinder pressure, irrespective of piston travel or cylinder leakage. The cylinder is fed from the brake pipe, the pressure in which in turn is maintained by the compensating valve while the brake valve is in lap position.
- (3) Graduated release, permitting a variation of brake cylinder pressure at the will of the engineman.
- (4) Quick release when desired.
- (5) Emergency applications of the brake available at any time during or after any service application, and an automatic emergency application on depletion of train pipe pressure to approximately five pounds.

As is suggested by the name, the design of this system combines features of the automatic air brake and the straight air brake. Apart from its use to obtain quick release of brakes, auxiliary reservoir air is used only in emergency application. In service application brake cylinder air is

obtained from the brake pipe and service reservoir, the auxiliary reservoir serving as a constant pressure chamber to regulate and govern brake cylinder pressure in proportion to brake pipe reduction. The design of the triple valve is such that in a service application the build-up of brake cylinder pressure as compared with the reduction of brake pipe pressure is in the ratio of 2 to 1.

The high volume feed valve and the compensating valve of this system form a part of the brake equipment installed on the locomotive. The high volume feed valve performs the functions and takes the place of the feed valve commonly used, the purpose of this valve being to remove any restriction between brake valve and brake pipe when brake pipe pressure is below the pressure for which the feed valve is adjusted. The compensating valve is designed to compensate for brake pipe leakage during service application, as well as for depletion of brake pipe pressure by action of the triple valves in automatically compensating for brake cylinder leakage; its function is to maintain brake pipe pressure equal to the equalizing reservoir or chamber *D* pressure. It may also be used to perform the functions of the equalizing discharge valve.

### Tests on Virginian

The report includes a description and analysis of standing and running tests on the Virginian Railway from June 4 to July 9, 1919.\* In the first tests, series A, the entire 100 cars were used and tests were made before the brake equipment was changed in any respect. When the A. S. A. equipment had been installed on 10 cars, standing and running tests were made, series B, with a train of 50 cars, 40 equipped with the original Westinghouse equipment and 10 with A. S. A. equipment in blocks of four Westinghouse and one A. S. A. In series C, standing tests only were made with 90 cars, 81 equipped with Westinghouse triple valves and 9 with A. S. A. equipment, in blocks of nine Westinghouse and one A. S. A. In series D, E and F a 50-car train was used, 25 cars having each type of triple valve equipment. In series D the cars were arranged in blocks of five Westinghouse and five A. S. A.; in series E and F, the cars of each kind were grouped together, in one case with the A. S. A. ahead and in the other with the Westinghouse ahead. For the standing tests, series G, a 100-car train was used, 81 cars equipped with A. S. A. apparatus and 19 with Westinghouse, with the latter on every tenth car and on cars 20 to 30 inclusive. In series H all cars were equipped with A. S. A. triples, and standing tests were made with two trains consisting of 50 and 100 cars, respectively, and running tests were made with a 50-car train. In series I, 100 cars were equipped with A. S. A. apparatus; standing tests were made and the train was run from Princeton to Roanoke. At Roanoke the A. S. A. triples were removed from 50 cars and replaced by the original Westinghouse K-2 triples for the series K tests, which consisted of a test trip from Roanoke to Victoria with the first 49 cars and the rear car equipped with A. S. A. apparatus. Series L consisted of a trip from Victoria to Sewalls Point with the Westinghouse cars on the head end. In all, the schedule included about 70 tests, standing, terminal and running.

In series A, brake cylinder leakage tests and retaining valve tests were made for the purpose of securing a record

\*For a detail description of this equipment see the *Railway Age Gazette* for October 19, 1917, page 697.

\*For a description of the test equipment and an account of the final test runs from Princeton to Sewalls Point, see the *Railway Age* for July 26, 1918, page 173.

of the condition of the brake equipment. The purpose of the tests in series B, C, D, E, F and G was to demonstrate the operation of both types of triple valves in trains of mixed brake equipment, with and without the A. S. A. engine equipment.

The purpose of the test run from Princeton to Roanoke was to demonstrate the ability of the A. S. A. brake equipment to control a long train on heavy grades, as well as the flexibility of the system for controlling a train on undulating and level grades.

Leaving Princeton, the A. S. A. locomotive apparatus was in service, and on all cars the brakes were operated in graduated release. In making the first brake application after starting down the grade, three brake pipe reductions were made, the total reduction being from 87 to 70 pounds, as indicated by gages on the locomotive; as a result brake cylinder pressures of 36, 29, 35 and 38 pounds were developed on the 1st, 29th, 60th and 95th cars. Following these reductions, the brake valve was not moved to release position in time to restore brake pipe pressure quickly enough and the train stopped before the brakes were released. As soon as pressure was restored the train was again started and a speed of 10 or 11 miles per hour had been attained when an emergency application occurred, due to an air hose being blown off from the 94th car. The train did not part, and was stopped without shock on either end. When the hose had been replaced and pressure restored, the train was started and a reduction of brake pipe pressure from 86 to 70 pounds was made for the purpose of controlling speed. Following this application, as the brakes were being graduated off when speed had been considerably reduced, the train parted, due to the coupler on the 85th car slipping over the top of the coupler on the 84th car, the carrier iron having fallen. This caused an emergency application, and although the speed was very low both portions of the train stopped without shock. Repairs were made and the train proceeded to Kelleysville without stop; the brakes were applied and graduated off and on as required to control the speed, which varied from 16 to 22 miles per hour. No difficulty was experienced in controlling the rate of speed, and the operation of the train was notably free from shock.

At Kelleysville the brakes on all cars were placed in quick release and the train was operated with brakes in that condition from Kelleysville to Whitethorne. Approaching the New River bridge as the brakes were being released following an application, the train parted between the 66th and 67th cars on account of a broken knuckle. The emergency brake application brought both portions of the train to a stop without damage or shock. Again, approaching Rich Creek the train parted between the 89th and 90th cars, due to a broken knuckle, while the brakes were being released, and the brakes on the head end back to about the 60th car had been released. Brake pipe pressure having been restored at the head end, higher brake cylinder pressure on the cars at the head end was built up in the emergency application than on the cars farther back. Notwithstanding this emergency application originated near the rear end, serial action of the brakes from that point to the head end was so rapid that the higher brake cylinder pressure developed on the head end stopped that end of the train first, causing a rather severe run-in of slack. However, the shock was not severe enough to cause any damage and when the coupler had been repaired the train proceeded.

At Whitethorne the brakes of all cars were again placed in graduated release. After passing Merrimac the first two applications of the brakes which were made on the grade east of that point were heavy, and each time the train was stopped before the brakes were released. Subsequently lighter brake applications were made and the speed of the train was controlled properly.

At Roanoke the A. S. A. triple valves were removed from 50 cars and the Westinghouse triples were replaced. On the trip from Roanoke to Victoria the train was made up with the first 49 test cars and the rear test car equipped with A. S. A. apparatus and cars 50 to 99, inclusive, were equipped with Westinghouse triple valves; from Victoria to Sewalls Point the first 50 test cars were equipped with Westinghouse triples and the last 50 with A. S. A. The purpose of these arrangements was primarily to determine what, if any, slack action there would be between cars with different types of brake apparatus grouped together in large numbers in different parts of the train and whether proper synchronous and serial action would be obtained under varied braking conditions encountered.

The trip from Roanoke to Victoria was made on July 8. Leaving Roanoke the brakes on 49 A. S. A. cars were operated in graduated release. On the grade between Goodview and Huddleston very light brake pipe reductions were made for the purpose of controlling speed, the reductions varying from two to four pounds each. At Stone Mountain approximately half-way down the grade the train was brought to a stop to meet an opposing train. From that point it proceeded to the bottom of the grade without a stop, the operation being remarkably smooth and free from shock.

At Taber, 54 miles east of Roanoke, the brakes on the A. S. A. cars, except the first 25, were placed in quick release and the trip from Taber to Victoria was completed with the brake apparatus in that condition. Near mile post 129, about 9 miles west of Victoria, while running at a speed of about 20 miles per hour, the train parted between the 99th and 100th test car, due to a short knuckle pin and the top coupler lug being broken off. Before the break-in-two the brakes were not applied. The emergency brake application brought it to a stop without damage or shock.

The run from Victoria to Sewalls Point was made on July 9. A box car loaded with equipment and tools was hauled next to the locomotive, and there were four cabooses on the rear end; the brakes on the cabooses were not used. Approaching Purdy, approximately 40 miles east of Victoria, there is an ascending grade eastbound of .2 per cent followed by a descending grade of .21 per cent for a short distance and then by a descending grade of .5 per cent. Approaching Purdy an application of the brakes was made and before the rear end had reached the crest of the ascending grade, the head end being on the descending grade, the brake valve was placed in full release position for a period of nine seconds and then returned to running position. The train parted between the 82nd and 83rd cars, the knuckle on the rear end of the 82nd car being broken. Trainagraph charts indicated that prior to the break-in-two the brakes had been released back to about the 50th car, and it is apparent that the contour of the line, together with the short release period and a bad flaw in the knuckle caused the break-in-two. After the knuckle had been repaired the trip to Sewalls Point was completed without noteworthy incident.

### Discussion

In the discussion of the tests, the report says the A. S. A. brake equipment is considered, first, as used in mixed trains with other types of brake apparatus now in common use, and, second, when A. S. A. brake equipment exclusively was used in the test trains. In mixed trains, in both standing and running tests, synchronous operation with the Westinghouse apparatus was obtained, and the control of mixed trains having a large percentage of A. S. A. triple valve equipment under varied braking conditions, including heavy, undulating and level grades, was, with but one or two exceptions, notably free from shock.

The design and construction of the A. S. A. triple valves used in the Virginian tests provided for low brake cylinder

pressure for a given brake pipe reduction, as compared with the Westinghouse triple values, particularly in view of the short piston travel maintained on the Virginian Railway. In mixed trains better braking conditions would be provided and more harmonious operation with other types of brake apparatus if the A. S. A. brake provided higher brake cylinder pressure in proportion to brake pipe reduction. It is noted that this is merely a detail of construction and an increase in the present ratio can easily be obtained.

In mixed trains with the A. S. A. triple valve equipment on the head end the functions of graduated release were accomplished and tests demonstrated that the graduated release feature of the A. S. A. triple when used on the head end of mixed trains is very desirable under operating conditions similar to those encountered on the Virginian Railway, also emergency operation of the A. S. A. cars on the head end of mixed trains was obtained following a service application when the initial reduction was not too great. The use of A. S. A. triple valves in mixed trains on account of locally reducing and increasing brake pipe pressure results in some degree in more positive operation and an improvement in serial action both in applications and in releasing the brakes, the degree being dependent upon the number and location of the A. S. A. triple valves in the train.

On cars equipped with A. S. A. apparatus, the A. S. A. triple valves supplied comparatively uniform brake cylinder pressure which was not affected by piston travel, brake cylinder leakage or pressure retained in the brake cylinder at the beginning of an application; but under present practices of controlling trains the brakes ordinarily are not held applied long enough to obtain the full advantage in mixed trains of the feature of compensating for brake cylinder leakage.

In the standing tests with trains having all cars equipped with A. S. A. triple valves, practically all the intended functions were accomplished. In general, proper serial action in both application and release was obtained; when operating in graduated release the brakes were graduated on and off as desired, being fully released as intended when normal brake pipe pressure was restored. Comparatively uniform brake cylinder pressure was obtained regardless of piston travel or of pressure retained in the brake cylinders by the retaining valves, and it was maintained notwithstanding ordinary brake cylinder leakage. Emergency operation following a service application was not secured in every case when desired; after the installation of the special emergency valve on the locomotive, emergency operation was secured when the initial service reduction was 20 pounds or less. The emergency tests demonstrated that after a full service reduction followed by a full release period as short as 10 seconds emergency operation of the triples throughout the train can be secured. The automatic emergency feature of the triple valves tested, which becomes effective when the brake pipe pressure had been depleted to five pounds or less, was so much delayed as to be of little or no practical value; to make this feature of the brake system useful the period of time required before the automatic emergency operation occurs must be materially decreased, which can be accomplished by making this function operative at a higher brake pipe pressure. In the test providing for an angle cock on the rear end of the train to be opened with the brake valve in running position, the emergency operation carried to the head end of the 100-car train.

In the running tests on the grade between Princeton and Kelleysville with 50 and 100-car trains equipped exclusively with A. S. A. triple valves the operation of the brakes was precise and uniform and the control of the slack action during application and release of the brakes was practically ideal. The speed restriction for freight trains on this grade is 12 miles per hour, but was not observed in common practice. The test trains were in several cases permitted to

attain speeds more than double the maximum authorized before the brakes were applied, necessitating a heavy brake application to control them. The pressure developed in the brake cylinder was comparatively uniform except on the head end, where high brake cylinder pressure resulted from an overcharge of the brake pipe while the brake valve was in full release position. The release of the brakes even at as low speed as two miles per hour resulted in no bad effects from slack action, but, on the contrary, was very uniform.

In the two cases when the train parted between Kelleysville and Rich Creek the brakes had been released on the forward portion of the train and the break-in-tvos occurred between cars farther back in the train on which the brakes were still applied. In neither case was there any noticeable shock or slack action at either end of the train prior to the break-in-two. At the time of these break-in-tvos all of the triple valves were operated in quick release and no retaining valves were used. None of the emergency operations on the 100-car train on the trip from Princeton to Roanoke, originating at different points in the train, caused excessive shock and no damage to train or equipment resulted, notwithstanding the low rate of speed in the first two instances. After turning the summit of the grade at Merrimac, all cars being in graduated release, an excessive brake pipe reduction was made; in attempting to release the brakes the brake valve was held in full release position long enough to fully release the brakes on the head end, but the train was stopped before release on the rear end was secured. This resulted in slack running out, and a comparatively severe shock on the rear end, but this shock was not severe enough to cause any damage. When the break-in-two occurred at Purdy the brakes had been released on the first half of the train only and the rise in brake pipe pressure had barely reached the first A. S. A. car when the train parted; this break-in-two was also clearly due to improper manipulation of the brake valve rather than to any arrangement or feature of the triple valve equipment.

The A. S. A. feed valve and the compensating valve included in the A. S. A. locomotive equipment operated as designed and intended. The tests demonstrated that it was not necessary to use any special locomotive brake equipment in order to secure proper action of the A. S. A. triple valve, but the maintaining and compensating functions of the A. S. A. triple valves can be more fully accomplished and utilized when the compensating valve on the locomotive is used. Some alteration in the detail arrangement of the compensating valve on the locomotive as used in these tests is necessary in order not to interfere with emergency operation following a service application. When the compensating valve is in service in case of the train parting or a break in train line the engineer's brake valve must be placed in emergency position in order to prevent depletion of the main reservoir pressure.

In the tests of the A. S. A. brake system particular attention was devoted to principles of design and the functions accomplished. Some improvements, particularly in regard to the feature of securing emergency operation following a service application, can be effected and the construction of the A. S. A. triple valve can be materially simplified. An application of the principle of automatic straight air brake valves to meet the conditions of passenger train breaking was not considered in connection with these tests, which were entirely with freight equipment.

The removal of the purchasing office of Morgan's Louisiana & Texas Railroad & Steamship Company from New Orleans, La., to Houston, Texas, "smacks of inexcusable favoritism" by the Railroad Administration, according to a telegram sent by Martin Behrman, mayor of New Orleans to the director general of railroads.

Exterior View of the Station Before Completion

# North British Railway Improvements at Glasgow

The New Central Freight Yard and House Is the Largest and Best Equipped Terminal in Scotland

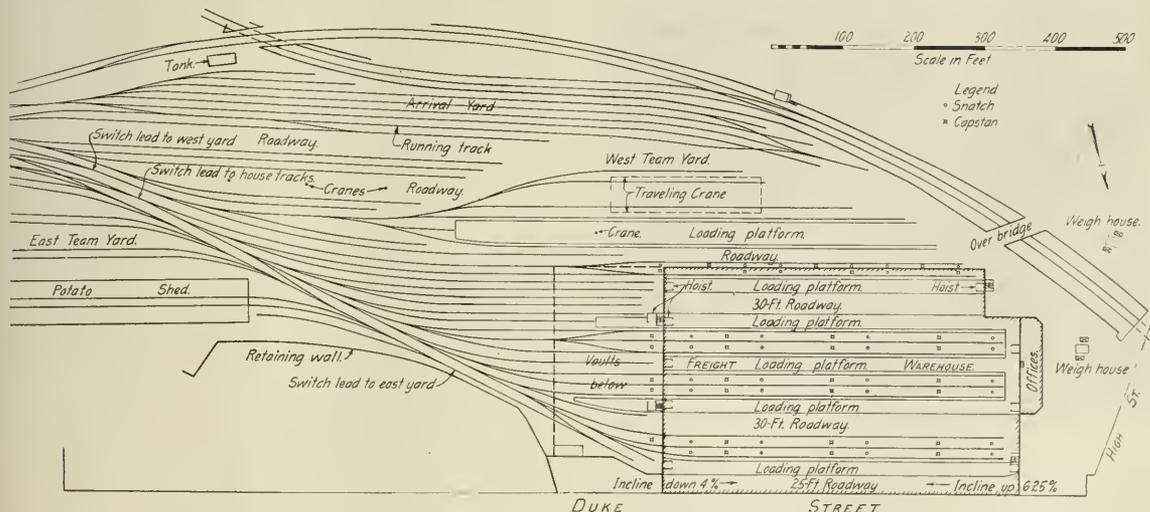

By Frederick C. Coleman

TRANSPORTATION FACILITIES throughout the Glasgow district of Scotland have been materially improved by the opening by the North British Railway of a new freight yard and warehouse at High street, Glasgow. This large and modern development utilizes mechanical equipment to such a large extent to handle the freight that it provides interesting precedent for similar freight house design in this country. For that reason it is described in detail below.

This project involved an outlay exceeding \$3,400,000 and

tions as well as the facilities for handling the general daily freight traffic. Half a million tons of traffic are now being handled monthly at the new station, the total number of cars in and out being approximately 400 each way daily, while 600 cars are exchanged daily with the Glasgow & South Western railway.

The building, the location of which is shown in the map, is 499 ft. long and 315 ft. wide. It consists of three floors and basement. The two upper floors and the basement are re-

Layout of the Freight House and Team Yards

comprises the entire reconstruction and the considerable extension of the old freight station and terminal yard at that point; the establishment on an adjoining site of a new coal yard, and the widening for a distance of two miles of the approach lines to the new terminal; that is to say, as far on the Coatbridge line as Parkhead station. The new freight station, which is the largest and best equipped freight terminal in Scotland, provides extensive storage accommoda-

tion for storage purposes, while the track level floor is used solely for the general daily station traffic. This floor is served by 10 tracks inside the warehouse, as well as 5 double-sided loading platforms, with a standing capacity for 160 cars and having a superficial area of about 31,950 sq. ft., and three roadways providing 2,340 lin. ft. of standing room for the loading and unloading of trucks. The roadway area exceeds one acre.

The storage accommodations on the two upper floors and the basement are on the same liberal lines, the area of the second floor being 130,356 sq. ft., while that of the third floor is 142,830 sq. ft., or nearly  $3\frac{1}{3}$  acres. The basement is more extensive, as it has been carried beyond the east end of the warehouse proper by means of arched vaults under the yard tracks. The area of this floor is 185,310 sq. ft.

In order to facilitate team traffic to and from these storage floors special driveways, independent of the general station accesses, have been provided. That to the basement is brought in on a descending grade from Duke street, at the east end of the warehouse, while that to the upper floors enters at the west end, rising from the junction of Duke and High streets to the required level, and being continued along inside the north wall of the warehouse for its full length on the level of the second floor. A series of large openings in these upper floors serve to give light and ventilation over the entire area of the building.

For the purpose of comparison it may be said that the total area occupied by the new yard and warehouse is 16 acres as against  $12\frac{1}{2}$  acres occupied by the old yard and warehouse; that in the old building there were only 18,000 sq. ft. of loading platform area as compared with 155,070 sq. ft. provided on the track level floor of the new warehouse and that the old yard provided capacity for 56 cars only while in the new one provision is made for 81 cars.

The outstanding feature of this warehouse is its equipment for the handling of traffic, and the unusually large electrical plant which is provided with a view to the rapid and easy disposal of a heavy volume of freight. The tracks inside the building are arranged in sets of three, the two outside tracks of each set being used for loading purposes, while the center track is used for removing the empty cars from or feeding the loaded cars to the outer tracks.

As no locomotives are permitted inside the warehouse building the cars are handled by 30 electric capstans, each

parallel to each other and at right angles to the railway tracks, so that whenever the necessity arises a number of cranes may be concentrated on one line of cars, insuring a rapid discharge with a minimum number of cranes. Each crane consists of a traveling gantry of 24-ft. 10 in. span, from which is suspended the balancing revolving jib, having a radius of 23 ft. Lateral, vertical and horizontal movements are provided in the cranes and each movement is controlled by separate electric motors at the following speeds:

*Three-ton Cranes.*—Lifting 3 tons at 50 ft. per min.; motor  $17\frac{1}{2}$  hp. at 400 r. p. m. Horizontal, 3 tons at two r. p. m.; motor  $2\frac{3}{4}$  hp. at 670 r. p. m. Traveling, 3 tons at 300 ft. per min.; motor  $7\frac{1}{2}$  hp. at 625 r. p. m.

*One and one-half-Ton Cranes.*—Lifting  $1\frac{1}{2}$  tons at 100 ft. per

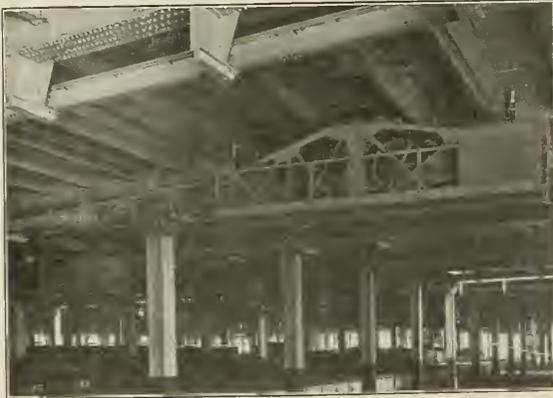

The Goliath Yard Crane

min.; motor  $17\frac{1}{2}$  hp. at 400 r. p. m. Horizontal,  $1\frac{1}{2}$  tons at 2.3 r. p. m.; motor 2 hp. at 800 r. p. m. Traveling,  $1\frac{1}{2}$  tons at 360 ft. per min.; motor  $4\frac{1}{2}$  hp. at 650 r. p. m.

The framework of the cranes, including the jib and gantry, is of steel. The jib is connected to the gantry by means of a steel center pillar rigidly fixed in the steel center framing on the gantry. The dead weight of the jib is carried on a ball bearing fixed at the bottom of the pillar, while the horizontal thrust is taken on the rollers located at the top of the jib framing. A cage for the operator is provided immediately in front of the pillar, where he has an uninterrupted view of the operations and is within easy reach of the various controller handles. The lifting and traveling motions are fitted with automatic limit switches. By means of a series of trap doors in the loading platforms, freight arriving by rail for storage in the basement can be lowered readily by the cranes, while freight in the basement requiring shipping by rail can be similarly handled.

Facilities are also provided on the upper floors for the rapid handling of freight by means of electric traveling cranes mounted on a runway suspended from the roof girders. The loads are lifted from the railway trucks in the loading way through wells in the floors, and are distributed by the travelers over the area of the floor covered by the respective tracks. Each track is 280 ft. long. There are four of these cranes for each floor, each capable of lifting 3,000 lb. The hoisting speed under full load is 100 ft. per min., accelerating to about double this speed for light loads, and the traveling speed is 350 ft. per min. The height of lift for the cranes on the first floor is 34 ft., and for those on the second floor 50 ft. The motors are of the totally enclosed series-wound type, of 17 and 2 hp. respectively. The travelers are under the control of an operator, who is accommodated in a small cage attached to one end of the framework. An emergency switch is provided in each operator's cage. The framework of the travelers consists of rolled steel channels and angles.

The vertical motion is fitted with the Royce patented auto-

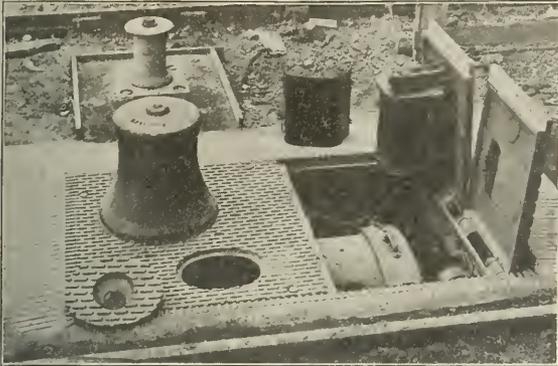

The Revolving Electric Crane

capable of exerting a pull of one ton and hauling about 100 tons on the level at a speed of 250 ft. per min. Each capstan is worked by a 26-hp. motor running at 400 r. p. m., driving the capstan head through a worm gear reduction. An automatic solenoid brake is fitted on the armature shaft, capable of stopping the capstan instantly when the current has been cut off. The controller, of the capstan type, is worked from the ground level by means of a foot plunger.

Thirteen  $1\frac{1}{2}$ -ton and two 3-ton overhead revolving cranes have been provided, all arranged to work over the ground floor, and used for loading and unloading both cars and trucks and for general lifting and transport purposes about the various loading platforms. The cranes are placed

matic governor lowering gear, a safety device by which the speed of lowering of all loads is automatically prevented from exceeding a safe limit, and which thus provides an additional safeguard in the event of an accident occurring to the solenoid brake provided on the first motion shaft of the hoisting motion. The normal position of the brake is always "on" and is released only when the motor is started. An oil dashpot is provided for the brake to regulate its rate of operation. A special hand release device is provided for the brake by which it can be released by hand by the operators from the cage, thus allowing loads to be lowered by gravity without the expenditure of current.

The hoisting motion is fitted with an overwinding safe-

One of the Electric Capstans

guard, consisting of a striker rod connected to a circuit-breaker, by which, in the event of the load being lifted too high, the circuit is broken, the hoisting motor is stopped, and the brake applied. A further safeguard is provided by the fitting of one of the wheels on the hoisting motion with a special slipper device, which permits the hook being lifted against a dead stop on the crane framework, although at the same time it prevents any load on either the hoisting motor or gearing. So if the hook, when being lifted, catches in the side of the wells in the floor, no damage to any part of the crane results. This device is also fitted on the traveling motion, so that in the event of the traveler getting "jammed" through any cause, the motor and gearing will not be damaged by overload.

To prevent the over-running of the travelers a circuit breaker is used which is actuated by stops fixed at each end of the tracks at a safe distance from the end. The circuit breaker is fixed immediately over the operator's cage, so that after over-running it can be reset by the operator and the machine restarted.

Six jiggers or short-travel cranes, also of 3,000-lb. capacity, are provided on the upper floor. These serve the roadway on the floor below along the north side of the warehouse, through the trap doors in the floor, while three others placed in outside walls on the south side of the building are used for raising goods from the yard to either floor, and conversely. The general design of these is similar to that of the travelers, with the exception that the controllers are fixed on the warehouse floor near each track, and the operator's cage is thereby dispensed with. Furthermore, the travel is only 10 ft., and the height of lift 50 ft. The hoisting speed for the full load of 3,000 lb. is 100 ft. per min., and the traveling speed 200 ft. per min. The motors are similar in size to those in use on the cranes.

In addition to these appliances, nine electric hoists, each of 3,000 lb. capacity, have also been provided, four at the west and five at the east end of the building, and are avail-

able for use on all the floors, communicating directly with the loading tables on the rail floor. Two other hoists of the same capacity have been added for the use of the portion of the basement lying to the east of the building proper under the yard; they communicate directly with two loading platforms provided with special siding accommodations, apart altogether from the warehouse platforms and sidings. All of these lifts are arranged to carry the maximum load at a speed of 150 ft. per min. and are each driven by 26-hp. motors running at 400 r. p. m. The cages are steel framed, lined with timber, and kept in position by suitable guides fixed to the sides of the lift shaft. Automatic safety gear is provided and so arranged that in the event of the lifting rope breaking, the cage will be held in the guides safely. The lifting gear is driven through machine cut spur gear, and is provided with an automatic solenoid brake and a mechanical brake to control the lowering speed, either brake being capable of holding the full load independently. The dead weight of the cage is partly counterbalanced by the cast iron weights which run in separate guides fixed in the shaft. The controllers, which are of special lift type, can be worked from the cage in any position.

Originally, the movement of cars from the outer road to the center road and vice versa was effected by means of electric traversers running on rails laid at right angles to the tracks. The cars were placed on to the traversers by means of the electric capstans, one at a time, and traversed across to the required track, where they were then run off, the traverser thereafter being removed back out of the way. Eleven of these machines were provided at the rail level, but experience proved that the electric crane equipment was able to deal with all loads from cars inside the warehouse.

The traversers were of the surface type, 12 ft. long exclusive of the ramps, and were arranged to travel on three lines of rails. The traverser frame was constructed entirely of steel, and mounted on nine cast steel wheels. The driving gear consisted of two sets of enclosed worm gears

One of the Traversers

driven direct from the motors and provided with an automatic solenoid brake. The return pulleys, situated under the opposite platforms, were fitted with straining and adjusting gear. Suitable means were provided to enable the traverser to be stopped readily in line with the rails on either side. The traversers were capable of carrying loads of 20 tons at a speed of 100 ft. per min., and they were driven by 10-hp. motors, running at 400 r. p. m.

Structurally the warehouse building is of steel, and the floors are constructed of concrete. The danger of fire has thus been minimized but as a precautionary measure, a system of hydrants complete with hose and nozzles has been

fitted throughout the building, and a liberal supply of water buckets and chemical fire extinguishers has been provided.

In addition to the warehouse, which is the outstanding feature of this improvement scheme, extensive facilities have been provided in the yard for dealing with other than warehouse traffic. The general loading platform, capable of accommodating more than 60 cars at one time, is located to the south of the warehouse. A considerable portion of this platform is roofed over, so that to all intents and purposes it forms an extension of the warehouse proper. A 40-ton Goliath electric traveling crane has been provided for dealing with heavy machinery and special loads, while small loads, requiring the use of crane power, are handled by means of hand cranes having capacities of from 5 tons downwards.

The Goliath crane is of the 4-motor type with a span of 50 ft. The height from the floor to the underside of the crane girders is 22 ft., and the length of track 200 ft. The hoisting speed with the full load of 40 tons is 7 ft. per min., accelerating to 14 ft. for light loads, and the hoisting speed on the auxiliary barrel for 6 tons is at the rate of 50 ft. per min. The traveling speed for the full load is 150 ft. per min. and the traversing speed 100 ft. per min. Both hoisting motors are of 31½ hp., while the traveling and traversing motors are of 21 and 6½ hp. respectively. The full load speed of all the motors is 400 r. p. m. The special feature of the crane is that it is provided with one leg only, the end of the crane being carried on an end carriage similar to what is adopted for an ordinary overhead traveling crane.

The crane is driven by a motor fixed in the center of the span of the crane girders, thus giving an equal driving power at each end. The bottom traveling carriage is connected to the cross shaft by means of cast steel bevel bearing enclosed by cast iron covers. The traveling wheels are of rolled wrought steel and have a diameter of 39 in. They are forced on their axles under pressure, and turned on their threads to exact diameters.

A shed has been provided at the east end of the yard for the accommodation of potato traffic. This has a track capacity for 40 cars and ample loading platform space for the handling and sorting of vegetables. Access is had by an entrance from Hunter street.

In order that this new yard and warehouse might be reserved exclusively for merchandise, a new yard, known as Barracks Yard, occupying the site of the old barracks at Glasgow, has been provided for the mineral traffic. Public entrance to this yard is by way of Gallowgate.

This scheme for the improvement of its freight terminal facilities in the city of Glasgow has been in hand by the North British Railway for more than 30 years, the land to the old college warehouse facing Duke street, now taken up by the new building, being acquired in 1875. The design and construction of the plant were carried out under the di-

rection of James Bell, the late engineer-in-chief of the railway company. The contractors were Robert McAlpine & Sons of Glasgow. The details of the electrical plant in the yard and warehouse were worked out by A. W. Stewart, of Glasgow, under whose supervision the various machines were constructed. The electrical equipment of the new warehouse buildings, including the revolving cranes, capstans, 3,000-lb. lifts, and freight car traversers, were constructed by Cowans, Sheldon & Co., Ltd., of Carlisle, England, and the eight 3,000-lb. traveling cranes, the six 3,000-lb. jiggers, and the 40-ton overhead Goliath crane were supplied by Royce, Ltd., of Manchester, England. The writer is indebted to James Calder, general manager of the railway company, for the information given above and for the illustrations.

## Exhibition of Automatic Train Stop on the Chesapeake & Ohio

**B**ETWEEN GORDONSVILLE and Charlottesville on the main line of the Chesapeake & Ohio on Tuesday, March 25, the automatic stop and cab signal of the American Train Control Company, of Baltimore, Md., was demonstrated before a party of railroad men, bankers and other visitors. This portion of the line is single-track and is operated by the manual block system, but in connection with the installation of the train control apparatus, three-position automatic visual block signals (light signals) have been installed. The track circuits and control wires, as developed by Charles Stephens, signal engineer of the road (and patented by him) are arranged on the "absolute permissive

Ramps for Automatic Train Stop and Cab Signal, Chesapeake & Ohio

block" plan and the test runs which were made were designed to demonstrate the adequacy of the apparatus for all required conditions.

Two trains were used, each consisting of a Pacific type locomotive with one passenger car. The first test was to show the behavior of the apparatus in the case of one train following another, the runs being made from signal 1732

Visual "Light" Roadside Signals: Ramps for Cautionary Visual Indications in Cab, and for Applying Brakes at Stop Signals

### Automatic Block Signals, Chesapeake & Ohio

rection of James Bell, the late engineer-in-chief of the railway company. The contractors were Robert McAlpine & Sons of Glasgow. The details of the electrical plant in the yard and warehouse were worked out by A. W. Stewart, of Glasgow, under whose supervision the various machines were constructed. The electrical equipment of the new warehouse buildings, including the revolving cranes, capstans,

eastward to Cobham. The second demonstration was to show the behavior of the apparatus with the locomotive running backward. The third was to demonstrate absolute protection through the block section from meeting point to meeting point.

The fourth test was with two trains running toward each other so timed that they would meet at Campbell. Each

train was instructed to pass the roadside signal indicating stop, at the approach to the passing track at Campbell, and each was stopped by the automatic apparatus at the ramp adjacent to the visual roadside stop signal.

All of the tests went off in satisfactory shape. The length of road which has been equipped aggregates about six miles, and the number of locomotives fitted with the apparatus is 32, half of them freight and half passenger. The system is being extended westward to Charlottesville.

This apparatus was first developed on the Maryland & Pennsylvania Railroad and was brought before the Interstate Commerce Commission in 1907. It was not fully developed, however, until the apparatus was installed on the Chesapeake & Ohio. The first complete tests made on that road were carried out in March, 1916. The committee

Light Signal, Chesapeake & Ohio

appointed by the president of the road to take charge of the matter, drew up a list of requirements, the first one of which was that a satisfactory service application of the brakes should be made, either on a passenger train or a freight, and up to train lengths of 100 cars. In the cab these requirements call for both an audible and a visual signal. Following the tests of three years ago numerous modifications and improvements were made by the railroad company; and the officers appear to be satisfied that their requirements have been met. Tests have been made under service conditions of all kinds and during cold weather. The apparatus has worked well when the shoe on the locomotive was encased in ice, and on three occasions broken rails have been detected.

The system is of the "intermittent contact" or ramp type. The ramp is fixed to the ties 27½ in. outside the gage line of the running rail. On the right hand side of the track all of the ramps are arranged to apply the brakes (when the block ahead is not clear); while on the left hand side all of the ramps are arranged to give only the cautionary indication in the cab. In connection with each three-indication signal, there are two ramps, one on the left hand side corresponding to the cautionary indication of the signal and one on the right corresponding to the stop indication of the signal.

The engine apparatus or "shoe" is fixed to the frame of the front truck of the tender, each ramp causing an upward movement of the "shoe." A battery on the roadside conveys current to the ramp, and, with the ramp energized, this

current is carried by the shoe to the apparatus on the locomotive; and by controlling electric magnets it prevents the application of the brakes at the stop ramps and the giving of the cautionary signal in the cab at cautionary ramps. With the ramp de-energized, the lifting of the shoe opens a circuit, de-energizing a magnet; and thus air is exhausted from the train line so as to apply the brakes. The bottom of the contact shoe is in the form of a circular disk, and is arranged so as to make contact even when a little out of line. The ramp rail is of inverted T shape.

Two of the locomotives have automatic AD equipment, 17 have ET 5 equipment, five have combined automatic and straight air equipment, five have New York air brake, No. 6, and three have the ET 6 Westinghouse equipment. The train stop apparatus was connected to all these different designs without difficulty.

A vibrating bell in the cab is arranged to sound whenever the shoe rises as much as ¼ inch, so that the engineman thus receives notice every time a shoe goes over a ramp, without regard to whether the indication is or is not against him. If the vertical movable member of the shoe is broken there is provision made for opening the train line and applying the brakes; if it is bent the first contact with a ramp will tend to cause it to stick in its upward position, thus causing a continual ringing of the bell in the cab. If the shoe should be broken off completely the electrical connections would be broken so as to cause application of the brakes.

To provide for running in either direction and also to provide for using the left hand apparatus in place of the right hand, or vice versa, all of the wires on the locomotive are run through a box containing circuit reversers. Thus in case either shoe is lost or disabled the engineman, by a single operation, can change all of the circuits and substitute either shoe for the other.

The cab signal has a proceed light and a cautionary light, but none for stop; but always on the dropping of the stop valve both lights go out, thus indicating that an automatic stop contact has been made.

After the brakes have been applied the apparatus can be restored to normal position only by lifting the armature of the stop valve; and this must be done by pushing a knob which can be reached only by a person standing on the ground.

The circuits from the engine are fed from an Edison storage battery, B4, of eighty ampere hours capacity. The normal voltage is from 10 to 12 volts, furnished by 10 cells of this battery.

## The Railroad Problem\*

By Walker D. Hines

Director General of Railroads

**B**Y THE GOVERNMENT taking possession of the railroads as a war emergency in December, 1917, three important results were accomplished:

The elimination of conflicting priorities and the unified control of traffic even to the extent of preventing shipments except when they could be disposed of at destination averted serious congestion. Despite the enormous volume of traffic in the fall of 1918 there was practically no congestion and in this respect the condition was radically different from what it had been in previous years. This was of material assistance in the conduct of the war, and prevented tremendous delay and injury to commerce and industry.

In December, 1917, railroad labor regarded itself as grossly underpaid because of the tremendous increase in the cost of living and because of the very high wages paid in nearly every other industry. The demand was insistent for radical increases in wages and improvement in working conditions. No adequate machinery existed to deal with these demands. Suspicion and distrust on the part of railroad labor towards railroad companies was at its high water mark. There appeared no reasonable hope of getting an adequate solution of this fundamental problem without government control. By means of government control and the assurances which were given to labor and later carried out, uninterrupted carrying on of the work in a cordial spirit was assured.

The financial situation of the railroads was most favorable. Their costs were mounting rapidly and any possible solution of the labor problems under private management would have created an enormous additional burden. At the same time the difficulties in obtaining corresponding increases in rates were almost insurmountable on account of the different jurisdictions, interstate and state, which had to deal with the subject and on account of the general public distrust of the necessity for substantial increases in rates. This financial situation was restored by government control and the consequent guaranty of adequate rentals.

I believe there will be general assent that these three important objects could not have been adequately dealt with except through government control. But even if there is dissent on that proposition it is still true that government control has become a fact. Moreover, the railroad wages which have been established as a result of the war constitute a fact which will exert a continuing influence upon the railroad situation. Nobody can deny that, broadly speaking, the wage increase and also the eight-hour day would have taken place under any circumstances. Industries under private control were not immune from heavy increases in wages and great improvement in working conditions. These were things toward which the world was moving and the war merely made the world move faster in that direction and brought about in 12 months what otherwise might have taken a longer time.

I believe thoughtful people, no matter what they think about the abstract principles of permanent government ownership, will realize that it was fortunate in the extreme for railroad investors that the government was in position to step into the breach and temporarily stand the shock of this great and inevitable improvement of railroad wages and working conditions.

My appeal is for support and understanding in the vastly difficult task of rendering an adequate public service during the temporary period of federal control. I believe that support and understanding will be forthcoming more completely if the public appreciates the important respects in which the government control promoted the objects of the war and also protected temporarily railroad investors. With these inev-

itable conditions understood, the way ought to be open for a more friendly appreciation of the earnest efforts which my associates and I are making to discharge to the satisfaction of the public the heavy responsibility temporarily placed upon us. I wish to assure this audience that I am doing all in my power to promote a good and adequate service, and to stimulate efficiency on the part of both officials and employees, and I am encouraged to hope for important improvements in these directions.

Our efforts in this direction are being pressed to the limit of our strength regardless of the embarrassment which suddenly confronted us by the failure of the railroad appropriation. The fact that we are temporarily meeting this difficulty does not, however, mean that the appropriation is not sorely needed, and everyone who has an interest in the welfare of the railroads or in the welfare of the country should support the necessary appropriation so that it will be passed at the earliest possible moment after Congress meets.

Meanwhile the financial situation resulting from the failure of the appropriation is being dealt with as adequately as possible and every effort is being made not to interfere with the industrial and financial equilibrium. Unfortunately the impression has gone out that the Railroad Administration has decided to cut off all improvement work, including additions and betterments and maintenance. This is not a fact. What has happened is that we are taking steps to give the railroad corporations full opportunity to determine whether they should assent to the work which they must finance. It is the intention of the Railroad Administration to carry forward just as much additions and betterments and maintenance work as possible in order that labor may not be thrown out of employment unnecessarily and in order that the railroads be kept in good repair and extended to meet the needs of the situation.

I wish to submit the following suggestions bearing on the subject of a permanent solution of the railroad problem:

I do not believe in government ownership as a permanent policy and I wish to see a policy adopted which will preserve, if possible, the advantages and economies of private initiative while meeting the public necessities for adequate control.

A great many arguments on this subject seem to proceed on the assumption that we have an unlimited choice of methods and that it is easy to find a satisfactory solution. It requires only a little thought to realize that this is not the case. We cannot go back to unrestricted private management and we ought not to go back to a method of regulation that proved unsuccessful. The condition of railroad regulation prior to federal control was so far from satisfactory as to be almost hopeless. This indicates that there was something fundamentally wrong and therefore we cannot expect an adequate solution without fundamental changes.

The object which any successful plan of regulation must accomplish is to attract adequate capital for the great development which must yet be brought about in order to meet the wonderful expansion which the commerce of this country is likely to have. No plan which fails to accomplish this result will successfully deal with the situation. There is no use in urging some makeshift treatment when we are forced to admit that such treatment will fail to accomplish the result.

We cannot accomplish this by resorting to the old method with merely a series of patches put upon the especially noticeable holes which have been worn in it. Under the old method there is the difficulty that no standard whatever is prescribed by which to measure the return to be given upon capital invested in the railroads. The question of return was always subject to dispute. There was no agreement as to the investment, not even an agreement as to a proper rate of return, and what would produce an ample return on one railroad meant poverty or bankruptcy for another. Moreover, under the old form of regulation, there was no sufficient contact between the regulating body and the business regulated.

\*Abstract of address before the Traffic Club, Pittsburgh, Pa., on March 26.

The managers would see adverse conditions develop and would appreciate the necessity for prompt action. But the regulating body was not in position to have a corresponding insight into the situation and could not act until after the conditions had been developed and then proved in a formal controversy and then argued and briefed and conferred about and decided, and perhaps by that time conditions had begun to change so that the relief which had been badly needed and not accorded might be denied because not still needed for the future. Such uncertainties defeated any adequate assurance to the capital in the railroads. All the conditions favored delay and hesitation and non-action except in extreme cases.

We must not deceive ourselves as to how things worked in the past and as to how they will work in the future unless there is a fundamental change. Consider the public utilities throughout the country. Doubtless in every city the public has a reasonably good intention and the people in office do not desire to destroy the utilities. But there is suspicion as to capitalization, distrust as to the necessity for the expense, extreme hesitation on the part of the people to increase their own expenses by making the necessary increase in rates, and consequently there is non-action. This illustrates in a small way the same conditions which operated in the country as a whole with respect to the railroads. Unless there can be fundamental changes which will change these conditions, there can be no reasonable and continuing assurance of an adequate return for capital.

One of the fundamentals is a standard of return so that the regulating body will have a definite statutory protection for any action taken on this subject. Whenever you get to the point of prescribing a standard of return which must be realized, you have created a sort of government guaranty. To my mind, the great problem is whether to have this guar-

anty certain or uncertain. Of course the more certain the guaranty, the less initiative on the part of the management. On the other hand, while a less certain guaranty stimulates initiative, it also is less promising to capital and tends to defeat the ultimate objective which is the attraction of adequate capital into the business.

The combination of these great factors is the thing to be accomplished. It is far from easy. It cannot be dealt with by a reproduction of the old conditions with a few palliating amendments. We have got to decide upon how definite we shall make the governmental assurance of an adequate return and how we can accomplish this to a sufficient extent while preserving a sufficient measure of private initiative.

My own view is that a moderate guaranty on capital should be prescribed, so as to give a reasonable assurance to capital; and that there should be a right to participation in any profits made in excess of that guaranty so as to furnish the needed stimulus to private initiative.

I further believe that the government should be strongly represented on the boards of directors and that these government directors should constitute an important part of the regulating body which prescribes the rates so that this regulating body will know as necessities develop that the necessities are developing and will be able to meet the needs of the situation much more nearly at the time the needs arise than is possible at present.

I do not believe these fundamental changes can be successfully carried through except by the construction of a comparatively few great railroad corporations each of which will so combine the prosperous and unprosperous roads as to present a fair average result and get away from the hopeless diversity in earnings which has existed in the past; and upon each of which it will be practicable to have ample governmental representation.

## Waterproofing Railway Ties to Preserve Them\*

New Method of Treatment Contemplates Thorough Drying  
and Then Sealing Against Moisture

By H. K. Wicsteed

Chief Locating Engineer, Canadian National Railways

**D**RY WOODS OR CELLULOSE are almost indestructible by any ordinary agency such as a tie is exposed to. The bacterial growth requires moisture and oxygen for its development. It would appear, therefore, that if we thoroughly dry a piece of timber, and keep it dry, it will last indefinitely. We know from actual experience that this is so. Everyone has used or seen old timber in the form of beams and joists taken from buildings two or three centuries old and perfectly sound. In these cases moisture has been excluded. Again, every one has seen, or at any rate read, of piles and foundation timber many centuries old in a perfect state of preservation. In these cases oxygen has been excluded. We all know that exposed timber will generally last longer when coated with paint or tar or some waterproofing material. The exceptions are where the timber has been waterproofed before it was seasoned, with the effect of retaining the moisture already in the stick and preventing its evaporation. Timber, even when air-dried for a considerable length of time, still contains 15 per cent or more of moisture, the percentage varying with the nature of the material and the size of the stick.

Another point not so well recognized or understood is that

seasoning timber increases its strength by as much as 80 to 100 per cent in some cases over that of the green stick. It will be seen at once that, consistent with reasonable expense and loss of time, it is well worth while to dry not only ties, but timber of any kind used as a beam or strut, where strength is necessary. If we increase the strength by even 60 per cent, we require only 62 per cent of the amount of material, and, as this percentage is dry, while the other contains a very large amount of moisture, the saving in freight is very much more than the apparent 38 per cent. In Eastern Canada, at any rate, transportation is a very large item in the cost of our timber and is compelling us, as a matter of expediency, to use steel and concrete where we should use timber if it were readily available.

It being granted that drying or seasoning is extremely desirable, the question is as to the means. In the case of ordinary lumber, air-drying supplemented by a few hours in a kiln is fairly satisfactory. In that of dimension timber this is not so. First, because the air-drying in the case of large sticks takes years to accomplish, because the temperatures used in the ordinary kiln are so high as to injure the strength of the timber; third, because, even when carried on with the greatest care and deliberation, the outside laminae dry first

\*Abstract of a paper read before the Canadian Railway Club, Montreal, Canada.

and shrink before the heart of the stick has any chance, and this shrinkage causes checks and cracks which, for many purposes, render the stick useless.

When the "wooden walls of England" were a reality, the seasoning of large sticks was carried on by immersion in sea water for a period of three years, more or less, the saps and resins were dissolved and washed out, and the pores of the wood left open and filled only by water. The subsequent drying was then easily, quickly and uniformly carried on throughout the stick, and the resultant deposits of salt acted as antiseptics just as the creosote does in the modern process. This was perhaps the most perfect seasoning possible, or ever accomplished.

In experiments made in the last two years involving an entirely new process of drying timber an effort was made to use the same process that nature does, and dissolve, neutralize or wash out the sap and other liquids or semi-liquids which obstruct and close the pores, and to do this within a reasonable time, much faster than nature unassisted can accomplish the work. Hot water is more effective than cold water, and hot vapor of water is, in some cases, still more so. In the new process, which is simplicity itself in theory, although the best form of mechanical application took much time and thought to study out, warm vapor, or in other words, warm air, saturated with moisture, is circulated among the ties. This opens and cleans the pores of the wood just as a Turkish bath does in the case of a man. The liquid components of the saps and resins filling the vesicles themselves, expand with the heat and force their way out, to be diluted and carried away by the warm vapor. After some hours of this treatment, the amount of moisture is reduced by very slow degrees, until, at the end, it is practically dry and the timber is removed with not more than 5 per cent of moisture left in it. The rapidity with which this is done depends upon the size of the sticks and the nature of the timber, just as it does in other methods, but no subject has yet been found which did not, in the end, yield to treatment. Care is taken not to let the temperature of the kiln get above 160 deg. F. so that no injury may be done to the fiber of the wood.

Timber so treated is, I believe, indestructible, except by fire, so long as it is kept dry. Even without further treatment, it will undoubtedly long outlast unseasoned material. It is, in this shape, in pre-eminently good condition to receive creosote, but we believe that creosote is absolutely unnecessary and that the elements of decay being altogether removed from the inside, all that is necessary is to keep them from entering the outside. Some waterproofing coating is desirable, and in the case of ties a cheap one is the only one which can be used economically. In the experiments conducted a heavy oil tar was found which is an almost worthless by-product of refineries. The ties were merely dipped in a hot bath of this material for a few minutes and, on coming out, were sanded by a sand blast to absorb any superfluous stickiness and make them easier to handle.

As a result of our experiments with these ties we concluded that they were in the right direction in the main, but that the asphaltic waterproofings were imperfect. They melted and ran under a strong hot sun; and when abraded, as was inevitable in the case of ties, the waterproofing was gone. Some of the more tarry products which penetrated the grain of the wood were much better, and we believe them to be very good.

We are unable to give accurate figures on the cost but estimate it about 30 cents. It may be that this could be brought down, but the cost of the plant would be much higher now than before the war. One of the principal items of cost is for fuel for drying and we all know the price of coal at present. I have some figures of the tests made at Trenton to show the weight of the ties and the amount of moisture that has been absorbed. The whole problem was

whether or not we could successfully waterproof the tie and keep it dry. We tried asphalt, also coal tar pitch. We found that the asphalt was useless in many cases. Some poplar ties treated with it are rotten now, but poplar ties that had pitch applied are all right. The pitch has a penetrating quality which the asphalt does not possess. The ties now under test have been over three years in service. After 8 months ties examined had increased in weight about 2½ per cent. The next tie, taken out after 14 months, had been treated with asphalt. It had increased 13 per cent, while two pitch-treated ties taken out at the same time had increased 1½ per cent and 7 per cent. This last was a spruce tie. When in for two years two pitch-treated ties had increased 7½ per cent and 2.9 per cent, while a couple of asphalt-treated ties had increased 14 per cent and 16 per cent, showing the difference in the two treatments.

In November, 1917, one pitch-treated tie had gone up 7 per cent and another 17 per cent, but in this last case there had been a strip of bark left on one side of the tie, which allowed it to become exposed. In May, 1918, one had increased 12 per cent, one 5 per cent and one 10 per cent. In our kiln dried ties the moisture is down to 5 to 8 per cent, so that apparently we have, up to the present, kept most of the ties down below 15 per cent moisture, which we figure is required to even start bacterial action.

The prospect which is opened up by this process is something more than merely getting the equivalent of the creosoted tie at a less cost. It is, besides, the potentiality of using for ties timbers which are now useless for the purpose, or nearly so. The northern birch, for instance, is a strong reliable wood, used by the Indians for every purpose requiring a hard wood, but unavailable for ties or bridge timbers on account of its superabundant sap and its consequent tendency to rot rapidly. The poplar and balsam are others for which there is at present practically no demand. These timbers are particularly interesting to us just now on account of the recent opening up by the railways of thousands of square miles of northern forests, of which, with spruce and jack pine, these are the main constituents. The use of these woods for commercial purposes means millions of dollars to the railways in reduced cost of ties and in freight.

A number of these ties have been put in the Canadian Northern track. Some of them have been taken up and tested for absorption of moisture and for signs of rot. I have one sample of a tie dug up only a few days ago which has been under the track in the Trenton yard for over three years. and I have also another sample of a birch tie which has never been under the track at all, but which shows how perfect the drying part of the process is and what a valuable timber birch is. All of you probably know what an absolutely worthless timber it is if used in outside work without seasoning, and the reason is unquestionably the amount of sap which it contains. If this is dried out and the wood sterilized it is as strong and lasting as most other hardwoods and better than some. It is incidentally the only hardwood in Northern Ontario and Quebec.

The Chamber of Commerce of the State of New York has adopted resolutions asking Congress to have the railroads returned to their owners as soon as it will be safe to do so; to allow private capital to earn more than a minimum in order to preserve the spirit of enterprise, and to provide federal regulation of wages as well as of transportation rates. The resolution recites seven principles which Congress is urged to adopt. The Chamber also went on record in favor of increasing fares on New York City railroads. The Traffic Club of New York city has adopted a resolution disapproving government ownership, management or operation of railroads, and has sent copies of it to traffic interests throughout the country.

# Railway Supply Industry and the Railroads

## What the Railway Supply and Equipment Companies Have Done to Improve Railway Operation

A UNIQUE and interesting program was provided at the March 21 meeting of the New York Railroad Club. An innovation was introduced in the form of an opportunity for the "Railway Supplymen" to tell what they have done and are attempting to do in improving the service and efficiency of the railways. Abstracts of the papers presented follow:

### The Work of the Supply Engineer

By W. E. Woodard

Vice-president, Lima Locomotive Works, Inc.

Any attempt adequately to review the contribution of the engineers of the railway equipment and supply companies to the railways of the country leads into all branches of engineering activities. Engineers and specialists in every line have aided in the wonderful advance of the past few years, from the steel makers, who have worked upon the problem of improved rail production, to the electrical engineers who have given us electrical locomotives, train lighting, signal apparatus, and even train wireless. One single development alone, that of the air brake, has been so far-reaching in its influence that the steps in its evolution and perfection have very largely controlled progress in heavier trains, larger locomotives and higher speeds.

Steel car developments have come so quickly and so far as the general public is concerned, with such apparent ease, that the vast amount of engineering work involved is apt to be overlooked. With it came electric car lighting, a noteworthy development in itself, the introduction of rolled steel wheels, the all-steel car trucks, vestibules, and improved brake beams and shoes.

The debt of the public to the art of railway signaling is almost equal to that it owes to the air brake. Signaling has more than doubled the capacity of many roads in this country, to say nothing about the element of safety. A signal engineer of wide experience has said that the Grand Central Terminal without interlocking and signals would require ten times the number of tracks it now has simply to accommodate the traffic without any consideration of the safety element.

No branch of railroad engineering has had a more noteworthy advance than that of locomotive designing, and probably a greater number of individual organizations contributed to the results than in any other single field of railroad work. This development is the best example of a group of supply and equipment companies working together to refine and perfect one of the most essential elements in railroad operation. To the locomotive builder belongs the credit for improved designs and increased capacity of locomotives as a whole. To them is also due the credit for starting some of the improvements made for increased capacity and for improved economy. But to the supply concerns is due a larger degree of credit for the patience and courage which has been required to put many individual improvements in the position which they now occupy. A review of the advance in locomotive building will show that the engineering work of the builders has been most closely related to and dependent upon the engineering activities of the supply and equipment companies.

In certain lines entirely new developments have been projected and carried out by the supply and equipment com-

panies, as for example, the locomotive stoker, and the use of pulverized fuel. Thus we have come to see the supply and equipment companies no longer simply building and selling accessories, but occupying a much broader and more important field. Some of the railway supply concerns have spent enormous sums of money to build up fine engineering organizations, with a view not only to refine their developments to the highest degree, but also to forward the art from an entirely scientific standpoint. There is a question whether the public appreciates the spirit and energy back of the majority of these large supply companies. Both the builder and the supply companies have been working toward one end: increased safety of operation; improved efficiency and greater capacity for our locomotives.

A measure of what has been accomplished is a history of locomotive developments in the past few years. Weights of typical passenger locomotives have increased 50 to 75 per cent since 1900 and freight engines in about the same proportion. Such advances would have been out of the question had it not been possible to have taken advantage of engineering developments effecting increased economies which have more than kept pace with the increase in the size of the engines. Perhaps it would be more accurate to say that the engineering developments in the past few years have effected such economy of operation as to make possible these increases in size. This is the real measure of the advance; it is due to the combined engineering experience and work of the supply and equipment companies and locomotive builders.

Let me illustrate my statement by some test plant figures obtained from a good design of Consolidation locomotive of about 1904, and a modern design of Mikado locomotive built in 1915. We may regard 5,000 pounds of coal an hour as about the limit of a fireman for continuous work—I will take this as a basis for comparison. The Consolidation required 4,700 pounds of coal per hour to obtain an output of 1,050 hp. and this was about the limit of the engine. With the same amount of coal, the Mikado engine produces 1,900 hp. These are actual test plant figures, but the everyday experience of the railway men bear them out. It is because of this that railroads recognize that it pays to scrap light and obsolete locomotives or to reconstruct them on modern lines, using the refinements and developments which have brought about these improvements.

This class of developments can be grouped under three general heads: Improvements affecting the combustion of the fuel, steam generation, and cylinder performance. The improvements under these heads are as follows:

#### COMBUSTION OF FUEL.

Introduction of wide fireboxes with grate areas sufficiently large to keep the rate of combustion within economical figures.

Provision of proper air openings into the ash pan—an item which was for many years given little attention, but one of vital importance.

A better knowledge of the principles of combustion which has led to the wide use of the brick arch and the proper proportioning of combustion spaces to grate area, the latter item involving the use of combustion chambers.

Better draft conditions largely made possible by the use of outside steam pipes, which came in with the superheater.

Improved front ends, stack and nozzle designs.

#### STEAM GENERATION.

Greater care in proportioning boilers to suit the cylinder horse power. The boilers of many older locomotives under normal operating conditions were overtaxed and were consequently inefficient.

Improved design of water spaces which insure good circulation of water in the boiler, in which result arch tubes are a material help.

A better understanding of the relation of tube lengths to diameters which has eliminated inefficient tube heating surface and promoted the use of combustion chambers.

Feed water heating, which is just now being introduced upon locomotives, the saving from which is not included in the test figures mentioned above.

#### CYLINDER PERFORMANCE.

Superheating, the most important single element in the list.

Mallet locomotives.

Superheating aided very materially in bringing Mallet locomotives into favor.

Valves and valve motions.

Better proportions of steam and exhaust passages, particularly the latter.

The importance of these improvements is evident by the following figures taken from the same engines as mentioned above. For every 5,000 lb. of coal the boiler of the typical Consolidation of 1904 delivered to the cylinders 26,000 lb. of steam. The Mikado locomotive, for the same amount of coal delivered 38,000 lb. of steam. The Consolidation locomotive, to develop 1,500 hp. in the cylinders, required 26,000 lb. of steam per hour, whereas the Mikado developed the same horsepower with only 19,000 lb. of steam.

Even with these improvements there was a well defined limit to locomotive capacity set by the physical limitations of the fireman. The stoker and pulverized fuel gave the answer. Both of these developments have had and will have a far-reaching influence on locomotive designs. They have made possible sizes of locomotives not thought of before their introduction. At no distant date the importance of pulverized fuel will become more evident as this country is forced to practice greater coal conservation.

Locomotives having a tractive power of 147,000 lb. compound and 176,000 lb. simple have been built and several designs are in operation in road service having a tractive power of over 100,000 lb. Such work calls for coal, the demand at times running as high as 12,000 lb. per hour. Locomotives of the latter class are hauling 3,100-ton trains over a division of 113 miles having 1.2 per cent grades at an average running speed of 18.7 m. p. h. These figures prove better than any amount of argument the vital importance of the stoker on locomotive design and the possibilities of pulverized fuel.

Along with these developments, directly affecting economy of operation and increased capacity, comes another class of improvements of no less importance, i. e., those which aim at increasing the safety and ease of operation and reducing the maintenance. Many developments in this class also more or less directly improve the economy of operation. For example; power reverse gears which permit the engineman easily to adjust the cut-off at any speed, while with the old style of reverse gear he would not dare to make a change. Also, automatic firedoors and grate shakers contribute directly to improving the firing conditions and thus promote the economy of coal. In the safety class of developments may be mentioned electric headlights, improved connection between engine and tender, flexible stay-bolts, bell ringers, low water alarms, water glasses and improved cab fittings. In the class directly affecting maintenance are improved lubrication for cylinders and journals, self-adjusting driving box wedges, throttles, drifting valves and the application of cast steel parts. The use of cast steel has been extended to cover many elements in the locomotive which were previously built up of a number of parts. For example: truck frames, both engine and tender, engine frame cradles, tender frames and bumpers, and even the two main engine frames have been made in one casting. Cast steel cylinders were produced some time ago. This extended use of cast steel is not only working toward the betterment of maintenance on ac-

count of the reduction in the number of parts and connections, but also means a saving of weight. Every pound of material which can be taken out of the running gear goes into the boiler where it is of the maximum use.

In about 1900 apparently the limit of permissible rigid driving wheel base had been reached and progress by the addition of driving wheels seemed stopped. This was met in two ways: by the articulated locomotive and by the lateral motion driving box used with engine trucks capable of large displacements, but with sufficient resistance properly to guide the heaviest engines.

Thus one by one limitations have been removed, and one by one new elements effecting economy of operation, promoting safety or reducing maintenance have been introduced.

To some the commercial side of these developments may seem to have obscured the engineering side but without the spur of competition and the possibilities of a fair recompense the results would never have been obtained. The same is true of every great industrial development and does not detract from the engineering significance of what has been done. The same is true of railroad building.

In the light of what has been accomplished, what are to be the future developments? I have already mentioned the possibilities of pulverized coal, but in addition to the economic side it permits of certain design developments not possible with coal fired locomotives. The firebox can be placed over the drivers, the ash pan space reduced and a driving wheel arrangement secured which for coal-burning engines would be unsatisfactory if not entirely impracticable. In the matter of boiler capacity, we have available the economy which the feed water heater offers by its conservation of heat that is now wasted. We will always have limitations of wheel loads, but so far as driving wheel loads are concerned there are certain possibilities which so far have only been touched. These limitations have always been stated in terms of the allowable static weights, without reference to the effect of the rotating and reciprocating parts due to speed. This question is beginning to receive some of the attention which it deserves, and enough has already been done to show that we can materially increase the power of the locomotive by the use of reciprocating and rotating parts, and still keep the dynamic weights within the limitations which now obtain. Ten per cent increase is a conservative figure for heavy freight locomotives. Consider what this means in increased capacity of locomotives and in conservation of track and bridges.

The railway companies have contributed much to these developments, broad-minded and far-seeing railway men have pointed out the requirements to be met. They have given their time and facilities for experiment and trial, but the major credit is due to the inspiration, the perseverance and the courage of the men who kept pushing the developments on to the point where the railways of the country have seen their importance and could not afford to be without them. They had to meet discouragements and sometimes even opposition, but they never lost faith in what they were striving to accomplish for the betterment of the railways. These men say little about obstacles, about discouraging years and about the almost superhuman efforts which were required to bring a new idea to fruition.

What have been the impelling forces back of these improvements? The absolute need on the part of the individual railroad companies to meet the increasing transportation demands of the country and not "go broke"; on the part of the supply companies, a group of men of highly specialized experience, many of them with railroad training, who are devoting their lives and energies to aid in the solving of these problems. Are the advances to stop because of the lack of incentives or because the demands for economy from the railroad companies may not be so insistent as in the past?

The situation requires a broad-minded, clearly defined policy which will encourage the trial of new devices, the perfecting of those under development and will justify venturing the money which is needed.

New conditions confront the transportation interests of the country. The help of the same men who have been active in the developments of the past is needed now as never before. They have contributed brains, time and money to the art of railroading. Their contributions should be recognized and acknowledged and the same relations between the railroads and the supply companies which have produced the developments of the past should be continued and greatly strengthened. In this way only will the experience and energy of these men be made fully available in solving the problems of the future.

In the opinion of your speaker the steam locomotive has not by any means reached its limit of capacity or economy. The wonderful improvements of the recent past themselves suggest further possibilities that will put past and present achievements in the shade. Like a deposit in a strong bank these prospective improvements lie ready to hand. These are the means wherewith to meet the transportation problems of the future, the like of which have never before been faced.

## The Consulting Specialist and Service

By A. L. Humphreys

Vice-president, Westinghouse Air Brake Company

Prior to the opening of the War in August, 1914, the railroads of the United States were able to demonstrate, and had demonstrated for many years, their ability to operate at a lower cost per ton mile than the railroads of any other country in the world. It is with this enormously important fact that I wish to begin, for beyond any question the low cost of transportation which prevailed prior to the war—an economic fact of the greatest influence and value to every business interest in this country—was largely the result of two factors. First: railroad managers of enterprise and ability, with vision, initiative and courage, on the one hand; and, second, the tireless energy, persistence and understanding of conditions limiting development on the part of the railroad man's greatest ally, the so-called railroad "supply-man."

In analyzing the problems that attach to railroad operation, we touch upon more principles vital to our national prosperity and we influence and affect a larger proportion of the population than in any other line of business activity—agriculture alone excepted. Successful railroad management and operation is a complex and highly specialized business in itself, requiring long experience, training and skill. It has been true always, but more so today than ever before, that railroad officials have full use for all their resources of mind and body to carry the responsibilities arising exclusively in connection with freight and passenger traffic handling. But a thousand separate and independent arts and sciences enter into, and are absolutely essential to, the most successful solution of railroad problems.

Nothing is more striking than that business and human activity in every form grows constantly more complex—and with a larger and more intensive specialization. The natural and inevitable result is—and this has been emphasized in recent years—the physical impossibility of the railroad man acquiring on his own account the same detailed specialized knowledge, practical experience and research information that the manufacturers possess in their respective lines of business.

If this conception of the situation is accurate, it follows absolutely that if transportation efficiency in this country is to continue to lead the world as was the case prior to 1914, there must also continue to be a comprehensive and far-reach-

ing appreciation on the part of both the railroad man and the supply man of their mutual and reciprocal functions and responsibilities in improving railroad practice, railroad service, railroad costs, and railroad revenues. On the one hand we must have the trained, skilled, experienced and specialized railroad man, and on the other, the trained, skilled, experienced, and specialized railroad supply man, or manufacturer, whose part is indeed that of the "Consulting Specialist."

There is in fact no department of railroad work to which the consulting specialist has not contributed large value, and my experience as a railroad executive for long years has convinced me that the railroad man of understanding and vision, wide-awake and alert to the utmost possibilities of his opportunities, has been first and foremost to take advantage of what the consulting specialist has to offer as applied to his own local conditions and the first to express his appreciation and to encourage the specialist to further progress in his line.

Speaking from the standpoint of the consulting specialist—may I mention a few of the concrete forms of service rendered the railroads:

*Wheels:* One of the most important evolutions in railroad practice during the past 20 years has been to produce cast iron and steel wheels capable of standing up under tremendously greater loaded car weights, when subjected to heat developed from brake shoe friction on long mountain grades.

*Brake Shoes:* A vast amount of research and endless experiments have been made by manufacturers of brake shoes. The making of brake shoes, simple as it may appear to the uninformed, is a fine art requiring a precision of process few appreciate, to produce shoes for different brake pressures and service conditions.

*Air Brake and Block Signals:* The development in these two separate but related arts has gone far to expand old limits of operation, referring particularly to traffic density. Economy of operation and safety in handling life and property are insured by modern braking and up-to-date block signal equipment, entirely beyond what was previously possible. A hint of what is involved in the art of braking, for example, is contained in the simple statement that acceleration of a heavy railroad train from rest to 60 m. p. h.—in about six minutes of time—is due to an enormous flow of energy (from heat to motion). The modern brake is required to return this train to rest in 20 seconds. To do so, the flow of energy, from motion to heat, *must be eighteen times faster.*

*Superheaters:* In recent years the rising cost of fuel has led to the development of superheaters by which locomotive horsepower is materially increased for a given fuel consumption. The fuel bill for the railroads of this country is the largest single item of expense and second only to the cost of labor. Savings possible by the use of superheaters are therefore enormous in the aggregate.

*Automatic Stokers:* This is another illustration of a development which has contributed largely to railroad tonnage capacity through ability to develop the maximum tractive power of the locomotive.

I have selected these particular illustrations, out of many, chiefly to show the inter-dependence and inter-relation of many separate developments. Wheels make possible modern large capacity cars; superheaters increase locomotive horsepower per unit of fuel consumption; mechanical stokers insure maximum capacity of the locomotive as designed; both are required to haul long trains of heavy cars—freight, and at high speed, passenger.

The necessity of co-operating with the railroads on some systematic basis has brought about naturally and inevitably the organization of service departments by some of our larger consulting specialists. These departments are made up of men trained in the particular business in which they are

engaged, with duties confined to inspection, analysis, the study of service conditions, suggesting and developing ways and means for improvement, and in general by a close and specialized study of railroad problems, demonstrating to the railroad man how to make the most efficient use of his equipment in service. The possibilities that attach to a properly trained and organized service department are without limit as to the value to the railroad.

If you will pardon what may appear to be a personal reference—but mentioned by way of illustration simply because it is the field with which I am most familiar—I would refer to some of the activities of the service organizations of the companies with which I am connected.

*Organization.* The companies to which I refer have developed an organization of trained specialists who are not only thoroughly familiar with designs and construction, but who are experienced in the very much larger and more important problem of the practical application of the apparatus we manufacture to the control of moving trains. The value of this organization to the railroads lies not alone in the fact of their long and experienced training in an important industry and art, but in the ability to assist the railroads in securing the most efficient and therefore the most economical results possible from train control as accomplished by the air brake and kindred devices in both freight and passenger service. The personnel of such an organization—and this is true of any properly developed service department—must not only include a scientific and expert practical knowledge of the business concerned, but must have the further vital faculty of being able to teach others and to secure a friendly interest and co-operation in attaining the results desired.

It is, I believe, permissible to state that this organization is not commercial in any sense; that is to say, the specialists attached to the service departments do not approach their problems from the commercial point of view, but primarily and first of all on the basis of the facts involved and what can be accomplished by scientific or mechanical ingenuity to improve conditions.

*Laboratory and Experimental Equipment:* In any engineering organization that is a pioneer in a particular field, a very considerable element of expense is involved in laboratory and experimental organization and equipment. The facilities comprised in this division of our organization are both directly and indirectly at the service of the railroads; that is, directly in that individual inspections, demonstrations and tests can be made at any time by arrangement; and indirectly, because the invention and development originating in this department are adding betterments constantly to our product as a whole.

*Field Equipment:* The service department of the companies to which I refer also includes, as an extension of these other divisions of the organization, special forms of service; as, for example:—

(a) An instruction car completely equipped with brake apparatus and related devices and arranged for the purpose of instructing railroad employees, not so much in the details of construction, but in the broad principles of train handling; to avoid break-in-tuos; to eliminate damage to rolling stock and lading; to get trains over the road on time, etc., etc. This instruction car has been over practically every railroad in this country—and on many roads more than once—and is credited with a record of 150,284 miles travelled and nearly 400,000 railroad employees instructed.

(b) A dynamometer car completely equipped with the most intricate and modern apparatus for recording stresses in buff and stretch; drawbar pull; brake pressures and action in both application and release; and other information invaluable to the railroad man who is making a scientific study of his own particular conditions. This car has been used in developing data and establishing proper tonnage ratings for locomotives on many of the leading railways of the country.

*Instructions:* Not the least important work of our service organization as distinguished from the commercial side, is the division devoted to the preparation of printed instruction matter, isometric diagrams, charts and other guides to the study of equipment and the proper use of such equipment in service. Prior to 1914 the practice was becoming general on the part of the larger roads of issuing instruction matter in their own way and under their own authority. In this, our educational division has collaborated to such extent as desired by the railroads.

Government control of railroad operation has of course brought changed conditions in many respects. Whatever else may be said by fair minded critics, we believe temporary government operation during the war period has resulted in benefit in the direction of emphasis on standardization, on simplicity, on the value of interchange, on the necessity of co-ordinating not only the efforts of the railroads themselves, but the relations to the railroads of the army of consulting specialists. The world war was won by unity of purpose and co-ordination of material forces, and present railroad problems will not be solved satisfactorily until and unless the railroad man and the consulting specialist combine and co-operate as in the days of the past; and every education of all of us along that line, every written article, every meeting of this kind, cannot fail to be helpful and constructive in the direction desired, and which is important not only to the railroads, not alone to the business of the consulting specialist, but to our whole people.

### Irregularities in Rate of Purchasing Equipment

Dr. W. F. M. Goss, president of the Railway Car Manufacturers Association, spoke of the difficulties encountered by the railway equipment manufacturers because of the unscientific way in which railway purchases are made. The railways flock to the market in times of prosperity and in times of depression orders for equipment very materially decrease. He referred to this particular feature as waves of business and illustrated the amplitude of these waves by saying that, considering the crest as 100, the trough would not amount to more than 30. Such fluctuations in volume of business disrupt the organization of the manufacturers and greatly affect the employment situation. It is a case of feast or famine, and under such conditions maximum efficiency in equipment manufacture cannot be obtained.

The car and locomotive builders are primarily assembling concerns. The ramifications of the business are extensive and many industries draw from the equipment manufacturers. Therefore variations in rates of purchase not only affect the companies directly related to the railroads, but all the allied industries, such as steel manufacturers, lumber merchants, etc. Doctor Goss emphasized the harmful effect of all this on the development of business, on the relations to labor, and on the educational and social service that every employer should supply.

While it is difficult to suggest a remedy for this irregular flow of business, Doctor Goss said there are some constant factors that have a very large bearing on the subject. The two most important factors are depreciation and increased needs of the country. It has been found that in the neighborhood of 100,000 freight cars must be built each year to make good the depreciation losses and, further, that there is a need for new cars each year to meet the increased demands of the country. While it is hard to say just what number of cars will take care of this increased demand, it is believed to be between 100,000 and 150,000 cars per year. Inasmuch as both of these factors are constant and have become fairly well established, it is easy to determine that there should be a demand which would average, say, 16,000 cars per month. If it were possible to let the car manufacturers

proceed with the construction of cars at this as a minimum program, it would do much to improve working conditions. It would permit greater efficiency in the operation of the car building plants and the allied industries and it would maintain the organizations of these industries in effective operation, so that any sudden increase in demands could be well taken care of. It is to be hoped, he said, that with changed conditions some solution of the problem will be found in order to accomplish these ends.

**Discussion**

W. G. Besler, president and general manager of the Central Railroad of New Jersey, said railway men should be willing to give credit and praise to the railway supply men for what they have done to improve and investigate methods for more efficient railroading. They have done a great deal to improve railroad conditions and the more progressive roads have like-

wise been of great assistance to them in trying out their devices in actual service. He said that the railway supply companies have done all that the speakers have said and more; they have spent a large amount of money in developing their particular devices, and in a number of cases only to find their inventions or materials impractical for railroad use. In commenting on the cycles of depression and prosperity in the supply business he said that this was common to all industries. When the roads needed equipment, business was good and they had money to spend, and many times when they did not need equipment they did not have the money to spend. Those roads that could spend money in times of depression made some very profitable purchases, as the equipment companies were glad of the opportunity to keep their organizations together and their shops going. He spoke particularly of the Philadelphia & Reading and the Central Railroad of New Jersey as having followed this practice.

# Doings of the United States Railroad Administration

## Director General on Trip of Inspection—Issuance of Certificates of Indebtedness Begun

WASHINGTON, D. C.

**DIRECTOR GENERAL HINES** and several members of his staff left Washington on March 25 for a week's trip of inspection over several railroads and for conferences with the regional and local officers at Pittsburgh, Chicago and Atlanta. Mr. Hines addressed the Pittsburgh Traffic Club on Wednesday and was to reach Chicago on Friday. He was accompanied by W. T. Tyler, director, and Frank McManamy, assistant director, of the Division of Operation; Edward Chambers, director, and Gerrit Fort, assistant director, of the Division of Traffic; W. S. Carter, director of the Division of Labor; Max Thelen, director of the Division of Public Service, and Brice Clagett, assistant to the director general.

### Certificates Issued for April 1 Requirements

Certificates of indebtedness of the Railroad Administration have been issued this week to the railroad companies for part of what is due them on account of rental and other transactions arising out of federal control sufficient to take care of the April 1 requirements of the companies for interest, dividends and other corporate needs. On the security of these certificates the War Finance Corporation is making advances to the railroad companies payable at the Federal Reserve Bank at New York on demand notes of the railroad companies at 6 per cent for 80 per cent of the face of the certificates or 100 per cent if acceptable collateral is added for the amount of the difference, and a number of roads were expected to receive their money on Thursday. This is in accordance with a plan announced by Director General Hines after a conference with the committee representing the Association of Railway Executives on March 20. The April 1 requirements are estimated at approximately \$70,000,000. The certificates are payable "when and as soon as the director general shall have funds available."

Applications amounting to something over \$44,000,000 had been received by the Railroad Administration from railroad companies up to March 21 and additional applications were made from day to day this week as the necessary formalities were complied with. Up to Wednesday certificates had been issued to the Boston & Maine for \$910,000, the Nashville, Chattanooga & St. Louis for \$250,000, the Philadelphia & Reading for \$500,000, the Maine Central for \$312,000, the New York Central for \$2,500,000, the Missouri Pacific for \$1,400,000, the Atchison, Topeka &

Santa Fe for \$6,625,000, the Northwestern Pacific for \$675,000, Western Maryland \$1,165,000, Washington Southern \$100,000, Richmond, Fredericksburg & Potomac \$180,000 and Chicago, Burlington & Quincy \$4,972,000. Certificates were ready to be issued to the Lake Erie & Western for \$78,000, Cleveland, Cincinnati, Chicago & St. Louis \$425,000, Michigan Central \$1,240,000, Great Northern \$480,000 and Erie \$3,125,000. In addition, applications had been received from the following roads:

Chesapeake & Ohio for.....	\$1,000,000
Alabama & Vicksburg.....	200,000
Bangor & Aroostook.....	475,000
Colorado & Southern.....	177,000
Lehigh Valley.....	3,125,000
Minneapolis, St. Paul & Sault Ste. Marie.....	510,000
St. Louis, Brownsville & Mexico.....	475,000
Southern Pacific.....	7,875,000
Ocean Steamship Co.....	138,000
New England Steamship Co.....	313,000
San Antonio & Aransas Pass.....	67,000
St. Louis-San Francisco.....	1,875,000
Perkionien.....	280,000
Central of New Jersey.....	969,000
Buñalo, Rochester & Pittsburg.....	261,000
Georgia Railroad.....	388,000
Chicago, Milwaukee & St. Paul.....	2,000,000
Vicksburg, Shreveport & Pacific.....	197,000
Mississippi, Louisiana Railroad & Transfer Co.....	52,000
Wheeling & Lake Erie.....	773,000
Baltimore & Ohio.....	5,750,000
Chicago, Rock Island & Pacific.....	3,332,000

The matter of preparing applications, resolutions to be passed by the directors of the various railroad companies, and information as to obtaining certificates from the director general of railroads is in charge of Alfred P. Thom, secretary of the railroad executives' committee. A form of certificate which is acceptable to the War Finance Corporation was prepared by Alfred A. Cook, Esq., special counsel for the War Finance Corporation, and this form has been approved by the railroad committee and by the general counsel for the director general. A statement issued by the War Finance Corporation said in part:

"As each application is presented to the War Finance Corporation it will be considered by the directors of that corporation upon its merits and in strict compliance with the provisions of the War Finance Corporation act as to adequacy of security, margin of security and in all other respects. The policy of lending money to railroads is by no means a new one for the War Finance Corporation. As early as March, 1918, when the bill to create the War Finance Corporation was pending in Congress, the Secretary of the Treasury, Mr. McAdoo, expressly pointed out in his

testimony before the committee that loans to railroads would be among the functions of the War Finance Corporation. In fact, section 9 which was passed on April 15, 1918, expressly contemplates that advances will be made by the War Finance Corporation to railroads while in the possession and under the control of the President. In pursuance of this authority the War Finance Corporation, beginning with the autumn of 1918, began to lend money on a large scale to railroads on their offering of adequate security, and in this way a material part of the War Finance Corporation was engaged in railroad loans, even before January 1, 1919.

"The policy, therefore, which is now being pursued in loaning funds for the operation of railroads is entirely in line with the original intention of Congress, as expressed by the statute, and also in line with the settled procedure of the Finance Corporation throughout the course of its brief history. The number of applications from railroads for advances has been greatly augmented by the failure of Congress to provide the appropriation asked by the director general just before the adjournment of Congress."

The form of application states that the advance is required for the purpose of enabling the company to meet its obligations and other pressing corporate needs in amounts approved by the director general of railroads, that the railroad company is unable at this time to obtain the funds requested on reasonable terms through banking channels or from the general public and the railroad company agrees to repay the advance as soon as it can obtain funds elsewhere on reasonable terms without any demand for payment by the War Finance Corporation. The form also states that any and all sums that shall be paid by the director general upon or with respect to the certificate are to be collected by the War Finance Corporation and applied by it in reduction of the principal; also that the War Finance Corporation shall have the right to sell the certificate through banking channels or in the general market at its option, at not less than the principal amount and accrued interest, retaining from the proceeds an amount sufficient to pay the principal of the note and paying over any excess to the railroad company and delivering to the company the collateral remaining, if any. A certificate of approval of the director general is appended and the statement also includes a form of resolutions of the executive committee or board of directors of the company.

The instructions to the railroads for filling out applications for advances were as follows:

"The company should if possible give as security certificates to the principal amount of 125 per cent of the sums requested as an advance. If certificates to the amount of 125 per cent of the advance requested are not available, the balance should be supplied by additional collateral, preferably in the form of bonds or other securities with a quoted market value, so as to make the total collateral worth, accepting the certificates at par and the additional collateral at market value, 125 per cent of the advance desired.

"Market value should be construed as the latest bid price, or in the event of recent sales, one or two points under the last sale. In case securities without quoted market are offered, the estimated value based on market quotations for securities of similar character should be given.

"The additional collateral furnished by the company should be worth not less than the price used in valuing it, and the belief of the company as to such worth must be stated.

"Applications and resolutions of the board should be filed in triplicate."

The question of meeting the further requirements of the railroads after April 1 needs have been met will be considered later and consideration is still being given to the details of the methods to be adopted for meeting obligations due from the Railroad Administration to the equipment com-

panies by the use of trade acceptances. No announcement on this subject was made by Mr. Hines before he left for a western trip Tuesday evening, and the committee representing the equipment companies is still negotiating on the matter with officials of the Division of Finance and with the specialty and material companies, some of whom are understood to have expressed some reluctance to receiving their pay in acceptances from the Railroad Administration, with which they had no contracts, instead of in cash from the equipment companies who had the contracts.

The cash situation of the Railroad Administration has been materially improved by the receipt of \$10,000,000 from the Navy Department and \$100,000,000 from the War Department on account of bills for freight and passenger transportation and by the loan of \$50,000,000 from the War Finance Corporation. This money is being apportioned by the Railroad Administration among the federal treasurers and will put them in a better position to meet their current bills, with some of which they had fallen behind.

The Railroad Administration has as yet displayed no activity in the direction of entering the market for rails or other steel products in spite of the agreement reached between the Industrial Board of the Department of Commerce and the representatives of the steel industry on reduced prices for steel. The theory of the agreement was that prices should be fixed which should apply to purchases by the government and set a precedent for general application but the Railroad Administration, which represents the largest consumer of steel, is not in a position to do much toward starting a buying movement. T. C. Powell, director of the Division of Capital Expenditures, was a member of the Industrial Board which accepted the revised steel prices and presumably consented to the price fixed for rails, which is \$10 a ton less than that of last year, but \$10 a ton above the prices of the last railroad orders. It has been understood that the Railroad Administration would at least place an initial order for 500,000 tons and the matter is under consideration but no decision has been announced.

### Progress Toward Restoration of Normal Conditions

Considerable progress has been made in many directions by the Railroad Administration in restoring the transportation service to the normal basis which existed before the war. The most noticeable changes naturally are in the way of increased and improved passenger service, because during the war it was necessary to subordinate the comfort and convenience of passengers to a considerable extent to the demands of the freight traffic. In his testimony before the House Appropriations Committee in February, Director General Hines stated that since the armistice was signed it had been the policy of the Railroad Administration to try to get the service back to normal as to convenience and adequacy, the purpose being to meet the necessities of the situation. While the purpose still is to view the operations as a whole, he said, and to try to get the best results, it is necessary to give more consideration to what is done on a particular railroad than during the war period. Also, he said, realizing the probability that in the reasonably near future the railroads may go back to their owners, the administration is endeavoring to pursue a policy of considerateness so as not to needlessly interfere with the sort of traffic that would be handled by the corporation if it were in control of its own lines.

The statistics published in last week's issue of the *Railway Age*, comparing the net operating income of the railroads in 1918 with the standard return representing the net operating income for the three years before the war, indicated some marked changes in the volume or character of the traffic of many roads after they were taken over by the government, although a part of the difference between the results for 1918 and those for the pre-war period must be

attributed to increases in expenses. Apparently the Railroad Administration, while not taking active steps to restore to a railroad traffic which might have been diverted from it during the war period, is doing little in the direction of further diversion and is rather letting the traffic follow its own channels. At the hearing a question was addressed to Mr. Hines as to whether the shippers are being left free in the matter of routing their freight. C. A. Prouty, then director of the Division of Public Service and Accounting, who was present, was called upon to answer the question and said that theoretically they are not, but as a practical matter in most cases they are.

While the Railroad Administration has announced no change in the instructions to route freight by the most direct routes, it is understood that shippers are being given more discretion than they were last year as to the routing of their freight and where a preference is expressed it is not interfered with except for some special reason. The volume of export traffic is now in some cases greater than it was during the war and it is still necessary to exercise supervision to prevent congestion. Mr. Prouty said that usually all the shipper asks is a certain terminal delivery and when that is given he is usually satisfied. In some cases, as in the routing of perishable commodities, such as vegetables, citrus fruits, etc., from Florida, the shipper has insisted on routing the traffic through a certain Ohio river gateway and in one case that was denied. Subsequently, the subject was reconsidered and the shipper was given the privilege. In some instances the fact that terminals have been unified has made it unnecessary for the shipper to route by certain lines in order to secure the desired terminal delivery. A number of roads that formerly increased their proportion of the traffic by solicitation have lost traffic by the discontinuance of solicitation to some other road and many railroads apparently are worrying as to the condition they would be in if the railroads were restored to their owners without any steps having been taken to restore the former traffic conditions, because after shippers have acquired the habit of routing in a certain way great efforts would have to be exerted by some roads to recover the traffic which they had enjoyed under the former competitive condition.

The reduction in the amount of expedited traffic required for war purposes has of itself restored more normal conditions in the freight service, particularly as to the service accorded to kinds of freight which were classified as non-essentials. Many of the restrictions formerly enforced by the embargo and permit systems have also been gradually withdrawn, as has the zone routing system for coal shipments. In the passenger service the principal change in the direction of the restoration of normal conditions has consisted of putting additional trains in service, restoring observation, lounge and club cars, and increasing the amount of service to winter resorts such as Hot Springs and Florida. A limited campaign of advertising for winter tourist traffic was inaugurated on January 1 and the director general recently announced the intention to engage in a limited advertising campaign in newspapers and national magazines for the purpose of promoting travel to the national parks and principal health and pleasure resorts. This will be accompanied by the restoration of reduced summer tourist rates to many points where they were not in effect last year. The a la carte dining service was restored on a large number of trains in various parts of the country during the month of March replacing the table d'hote service which was put into effect as a war measure. The use of special and private cars which was discontinued during the war has again been permitted and the minimum requirement for a special car has been reduced from 30 to 25 fares. Passenger schedules in many parts of the country have been readjusted in view of the new conditions and service has been increased in many instances where it appeared necessary. Additional lines of

sleeping car service has been put on. Some of the recent changes in this direction, include the restoration of a special parlor car with an extra fare of \$1.00 between New York and Atlantic City, the restoration of observation lounge cars on the Chicago, Burlington & Quincy train between Chicago and Lincoln and Chicago and Denver, the restoration of observation cars on the Burlington and Northern Pacific between Chicago and St. Paul and St. Paul and the Pacific Coast, the restoration of the New York Flyer between New York and Harrisburg, club cars being placed in service between New York and Plainfield, replacing of parlor cars on through trains between Richmond and Norfolk, additional dining car service on the Pennsylvania Limited between New York and Pittsburgh, and in many other places where a specific announcement has not been made. The winter tourist travel to Florida resorts has been unusually heavy and appears to have been well taken care of and passenger traffic has been generally heavy in most parts of the country.

Aside from matters of service, the Railroad Administration has taken several other steps in the direction of restoring former conditions. The Division of Capital Expenditures had given up a large amount of its control over capital expenditures and had announced a general policy of not undertaking capital improvements without the approval of the corporations before the failure of the railroad appropriation bill and before the acute financial condition of both the railroad companies and the Railroad Administration caused by the inability of the latter to meet all of its obligations promptly had developed.

There has been some "unscrambling" of railroads by transferring parts of systems from one region to another so as to bring the entire system into the same region in several instances. The most noteworthy changes of this kind were in the Allegheny and Eastern regions and the transference effective on March 1 of the Illinois Central line north of Cairo to the Southern region and of several other railroads from the Southwestern to the Central Western region, accompanied by a regrouping of the lines in the Southwestern region.

A circular recently issued by the director of the Division of Operation providing for a relocation of equipment more in accord with ownership than has been practicable during war conditions and providing to a greater extent for use by the owner of equipment of its accepted standards was also in the direction of restoration of pre-war conditions.

### Passenger Fares

A large part of the general revision of local passenger fares which has been in progress for several months was completed with tariffs filed to become effective on March 15 or on April 1. When the general advance of passenger fares to 3 cents was put into effect last June temporary tariffs were used at first and the more permanent tariffs have been filed from time to time, using the new distance table which was worked out last summer. In the new rates less attention is paid to the competitive influence which affected passenger fares before the period of federal control and rates via circuitous routes which were formerly made to meet the short line fares have in a large number of instances been increased in proportion to the mileage, although between common points where the difference in mileage of various lines is slight the rates are made the same. The Railroad Administration has announced its intention of making a campaign to cultivate passenger traffic, particularly during the summer, now that passenger equipment is more plentiful than last year and, as announced in last week's issue, reduced summer tourist rates will be made to the Pacific Coast and to summer resort points. However, the former practice of publishing special convention fares, which was gradually being eliminated by the railroads even before federal control, is not to be re-established this year, although

travelers to conventions will be given the advantage of the summer tourist rates. A large number of reduced convention fares were formerly allowed because one railroad which saw an opportunity to develop a considerable business would agree to make a reduced rate and the others would follow in line. Under government control it is felt that there should be no discrimination between the various organizations or classes of organizations which petition for special fares and to grant a special reduced basis of fares for all conventions would unduly deplete the passenger revenues. This is an important consideration because the cost of operation has not been materially reduced since the cessation of the war.

The Railroad Administration has been besieged by shippers for reductions in rates on the theory that the traffic cannot stand the increases imposed as a war necessity and some reductions in rates have been allowed, as in the case of the export rates to the Orient via the Pacific Coast, to meet particular situations, but the administration has naturally declined to give consideration to any idea of reducing the general level of rates, taking the position that the higher rate level imposed during the war is necessary to meet the decreased purchasing power of money. The extra fare charged for Pullman passengers was taken off shortly after the signing of the armistice, but apparently no consideration has been given to any idea of reducing the general level of passenger fares.

#### Reorganization of Divisions of Finance and Purchases

As previously announced, the Division of Finance and Purchases is being reorganized as two divisions.

A finance committee has been appointed consisting of: John Skelton Williams, chairman; Franklin Q. Brown, Harry Bronner, Frederick W. Scott and James N. Wallace. This committee will submit to the director general from time to time its advice on matters of financial policy and will also make to the director general preliminary reports on any proposed railroad reorganizations which may require his approval. Mr. Brown, Mr. Scott and Mr. Wallace have heretofore been members of an advisory committee in the finance section.

Also an advisory committee has been appointed consisting of John Skelton Williams, chairman; Robert S. Lovett and Henry Walters. This committee will submit to the director general from time to time its advice regarding matters of policy with respect to purchases and for that purpose is authorized to make the necessary investigations.

Circular No. 1 of the Division of Purchases announces that Samuel Porcher and George G. Yeomans, heretofore members of the Central Advisory Purchasing Committee, are appointed assistant directors of the Division of Purchases, and William W. Morris, heretofore secretary of the Central Advisory Purchasing Committee, is appointed assistant to the director, Division of Purchases.

H. C. Pearce, manager, Procurement Section; M. E. Towner, manager, Forest Products Section; E. J. Roth, manager, Stores Section; and B. P. Phillippe, fuel distributor heretofore reporting to the chairman of the Central Advisory Purchasing Committee, will report to the director of the Division of Purchases.

#### Agricultural Section Plans Development Work

The Railroad Administration's agricultural section, in cooperation with the Department of Agriculture, is making plans to resume its agricultural development work throughout the country, which, on account of the war, was, of necessity, curtailed to a great extent.

A call has been issued for a general meeting of some 200 representatives of railroads engaged in this particular class of endeavor, who will assemble at Memphis, Tenn., on April 2, for a three days' session. Agents of the Department of Agriculture have been invited to take part in

the deliberations. The problems to come before the gathering will include those of marketing, agricultural extension methods, raising of more and better livestock and poultry, dairying, fruit growing, information for homeseekers, best methods for assisting new settlers, farm credits, and co-operation of local organizations.

During the war railroad agricultural agents were engaged principally in helping to increase the food production of the country. When hostilities ceased the Railroad Administration arranged for a reorganization of the forces of the individual roads which did so much to help in building up the country before the outbreak of the war. A more thorough co-operation with the Department of Agriculture than previously had obtained was also brought about.

Reports from chambers of commerce, bankers, associations of farmers, newspapers, and business men received by the Railroad Administration indicate that there is a strong sentiment manifest throughout the country toward better farming, which means heavier and more economic production, with improved marketing conditions.

At the Memphis meeting a program will be adopted for utilizing this sentiment to the best advantage in order that the general development of the agricultural resources of the country may be carried on with even greater energy than was displayed before the war.

#### Advertising Campaign and Reduced Fares to Promote Passenger Travel

Director General Hines has announced the intention of the railroads under federal control to engage in a limited advertising campaign in newspapers and national magazines for the purpose of promoting travel to the National Parks and principal health and pleasure resorts. This campaign, which will be nation-wide in its scope, will be supervised in every detail by the three Committees of Passenger Traffic Officers, located in New York, Chicago and Atlanta, respectively.

#### Reductions in Rates on Road and Building Materials

In a statement issued on March 20, the director general said:

"Various inquiries have been received as to whether the Railroad Administration contemplates a reduction in freight rates on materials used in construction of buildings and therefore it becomes important to make it clear that no such reductions are in contemplation.

"The Railroad Administration is, however, giving consideration to the question of making reduced rates on crushed rock, stone, sand and gravel for road construction when consigned to and the freight thereon is paid by a federal, state, county, parish or township government.

"Before the matter can or will be definitely determined, it is intended to ascertain what, if any, reduction necessary to establish a stable price, will be made in the price by those producing and supplying the materials."

#### Four Standard Forms of Waybills Prescribed

General Orders Nos. 11 and 21 provide for the adoption of universal interline waybill. A standard form of waybill was prescribed in General Order No. 11, which is now amended, and General Order No. 60 has been issued prescribing four forms of waybills.

A—Single consignments.  
B—More than one consignment.  
C—Astray freight.  
D—Live stock.

Form AC No. 506 is for all single c. l. or l. c. l. consignments, local or interline; but a single waybill may be made for a special train moving at a lump-sum charge or for shipments which, on account of their length, require more than one car. The size of this waybill is 8½ ins. by 11 ins., but for special classes of traffic may be 8½ ins. by 22 ins. Paper

must be equal to 60 lb. (or heavier), No. 1 manila, 24 in. by 36 in.

Form AC No. 507 is for blanket waybilling of more than one consignment of l. c. l. freight, local or interline, sizes same as preceding; paper equal to 40 lb. (or heavier), No. 1 manila, 24 in. by 36 in.

Form AC No. 508 is for waybilling astray freight; size 8½ in. by 11 in.; paper equal to 40 lb.

Form AC No. 509 for livestock c. l. when special stub is required at destination stock yards; size 8½ in. by 11 in., to be printed in two parts, the additional part for the use of destination agents at livestock centers in collecting transportation charges; paper equal to 60 lb.

Necessary copies of waybills may be made on forms like those or on plain paper, but on paper of lighter weight. All waybills must be prepared with typewriter, pen and ink, or indelible pencil. The practices and blanks used by carriers in preparing underlying forms at the time of making the waybill must be adjusted to meet the arrangement and requirements of the new forms.

Regulations are prescribed for notations at transfer stations. Paster scale tickets must not be larger than 2 in. by 4 in.

These new forms must be used not later than June 1, 1919, but may begin earlier. The astray freight waybill must be used not later than June 1, 1919.

Stocks of old waybills on hand may be used after June 1 in waybilling local l. c. l. shipments.

Where weight of a carload shipment cannot be given at the time of making waybill, and it is not desired to complete waybill by using an estimated weight, 110 per cent of marked car capacity should be used; and in proper space show the point where car is to be weighed.

This order does not discontinue the so-called mani-bill, uni-bill, or the consolidated billing and abstracting plan. These forms of billing when they are economical and efficient in their operation, may, until further advised, be continued in use for l. c. l. local traffic.

### Conditions in Eastern Region

In marked contrast to conditions which prevailed in the Eastern region during the month of January and February, 1918, when the most severe winter weather in history was experienced, the railroads in this territory during the first two months of 1919 were in a position to handle a much larger traffic than was offered, according to a report from A. H. Smith, regional director for the Eastern region, to Walker D. Hines, director general of railroads. While there was a falling off in business, due to the signing of the armistice, 1,105 special export trains were handled from western termini during the first two months of 1919, containing 28,116 cars of export freight. During the month of January 15,092 cars of export freight were delivered to steamers at New York, and in February 12,590 cars, a total of 27,682, of which 5,802 were flour.

The movement of livestock, dressed beef, provisions and other perishables from the west was heavy, the average daily movement for the first 20 days of January being 1,118 cars, the highest average for any similar period except October, 1918. On February 13, 1,146 cars were handled east from Chicago, the largest day's movement of which there is any record.

Mr. Smith reports that 100 per cent car supply was furnished for all business offering in the two months mentioned. He also states that approximately 85 per cent in January and 96 per cent in February of all passenger trains arrived at terminals less than 30 minutes late. Applications for export permits have been heavy throughout February, particularly on provisions and foodstuffs, and a total of 16,341 cars of foodstuffs were permitted, the indications being for a continued heavy movement of this character. Outside of food-

stuffs, iron and steel are moving in the heaviest volume, February permits totaling 9,594 cars to New York.

A change in the shipping conditions with the assignment of ships for commercial export business has resulted in a rapid increase in commercial export shipments, 18,719 cars of commercial export freight being permitted during January and 20,709 in February for movement through the ports of New York and Boston. Through the re-routing of carload traffic to eliminate circuitous routes for the period from January 1 to February 7, 4,531 cars have been diverted, resulting in a saving of approximately 301,714 car miles in the region.

A shipping day guide for New York City was issued to take effect March 10, the plan having received the unanimous approval of the Merchants' Association of New York. Preliminary figures indicate that at New York alone approximately 1,000 tons per day formerly loaded transfers will be loaded direct to destination with attendant saving in transfer expense and improved service.

### Accounting Circular

In Accounting Circular No. 81 the Division of Accounting says that consideration is being given to the need for establishing a uniform date for stating operating revenues, operating expenses and other income accounts, and for closing the accounts monthly, so that reports of results shall reach the division and be tabulated within the month succeeding that for which the reports are made. To the end that such a date may be ascertained and fixed, federal auditors of Class I roads are directed to promptly make reply to the following queries:

(1) What is the earliest date after the end of the month that revenues, expenses and other income items can be stated from the accounts as they are now kept?

(2) What is the earliest date after the end of the month that revenues, expenses and other income items can be stated from accounts built up from estimates based on data reasonably consistent and safe for making such estimates?

(3) If statements of expenses, revenues and income items are required to be reported to this division by the tenth of the month following that for which they are made, what is your opinion of the reasonableness and feasibility of basing such statements upon accounts, closed if necessary, at the end of the month upon estimates and adjusting the difference between estimates and regularly ascertained figures in the subsequent months' accounts and reports?

(4) What changes in your system of accounting will be necessary if you were obliged to state the accounts and determine the revenues, expenses and other income items by the 10th of the month following that for which the report is made?

(5) What would be the additional cost, if any, to close the accounts in time to submit therefrom a statement of income not later than the 10th of the month following that for which the report is made?

(6) Are you now making for the information of your federal manager or other officers, estimates, either weekly or monthly, of revenues, expenses, and other income items, and how do such estimates compare with the recorded figures when ascertained? If you were making such estimates prior to January, 1918, and have since abandoned them, what was the reason for so doing?

### Freight in Central Western Region Moves Freely

According to a report from Hale Holden, regional director for the Central Western Region, to the director general, conditions generally were favorable to all railroad operation during the month of February and all traffic moved currently. The equipment of all classes in this region was plentiful during the month and a surplus of box and coal cars has accumulated. Mr. Holden states that the hog movement in the region is rapidly returning to a normal basis, which will

make possible the removal of embargoes at all primary markets within the near future. The Kansas City market handled a total of 10,906 cars of livestock inbound, an increase compared with February, 1918, of 769 cars. A total of 3,390 cars moved outbound, an increase of 723 cars for February, 1919, over the corresponding month last year. Four hundred and thirty-six special oil trains were operated from the Mid Continent field during the month with 10,904 cars, an average of 25 cars per train. One hundred and six special trains were employed in the transportation of troops, a total of 45,790 men being handled.

Terminal managers report favorable conditions with a free movement and interchange of traffic through all terminals. The Illinois Central railroad made several readjustments in its passenger train schedule in Illinois during the month in the interest of "on time" service, and was authorized to add an additional train between Clinton, Illinois, and St. Louis, Mo., which resulted in an increase of 105,850 passenger train miles per annum.

**Export Rates to Orient to Be Reduced**

Director General Hines has announced the purpose of the Railroad Administration to put into effect as soon as the tariffs can be prepared and filed, new rates on export traffic to China, Japan, Australia and Philippine Islands, applying from territory adjacent Missouri River and east through Pacific Coast ports. The new rates are reductions from the existing rates, but somewhat higher than those in effect before the export rates were cancelled last year. The proposed rates follow:

Commodity	Rate per 100 lb.	Commodity	Rate per 100 lb.
Articles described in Item 5 Trans-Continental Tariff		Chocolate	\$1.50
29-B	\$1.75	Cotton piece goods	1.20
Agricultural implements	1.00	Glass, window, etc.	1.10
Iron articles (general mixture)	.60	Glass, plate, no limit as to measurement not exceeding 120 united inches	1.40
Car wheels and axles attached	.60	Iron, pig	.55
Boiler iron	.60	Iron castings	.70
Cast iron pipe	.60	Lime, acetate of	.65
Wrought iron pipe	.60	Milk, condensed	1.00
Roofing iron	.60	Paint, etc.	.70
Machinery, including grading and road making machinery	1.00	Paper, etc.	.90
Sewing machines	1.10	Pig lead	.75
Oil, lubricating	.90	Plumbers' goods	1.50
Oil well supplies	1.00	Roofing, etc.	.90
Railway equipment (axles, wheels, couplers, etc., comb.)	.75	Wire rope	.70
Railway equipment (cars, passenger and freight)	.75	Soap	1.00
Railway equipment (locomotives, etc.)	.75	Soda ash, caustic soda, etc.	.60
Tobacco, manufactured	1.35	Spelter	.75
Tobacco, unmanufactured	1.40	Starch	.90
Automobiles and parts—		Steam or hot water heating apparatus	1.25
Passenger	3.75	Wheelbarrows	1.10
Freight	3.00	Wood pulp and wood pulp board	.75
Canned goods	1.00	Zinc plates and sheets	.80
		Vehicles	1.40
		Wax, paraffine	.90

**War Department Pays \$100,000,000 on Account**

The Railroad Administration on March 21 received from the War Department \$100,000,000 on account for freight and passenger transportation services heretofore rendered by the railroads under federal control for the War Department. In ordinary course these payments would have been spread over the next three months. While ordinarily such payments would have been made directly by the War Department to the federal treasurers of the various railroads which rendered this service, it was arranged in order to meet more conveniently the present financial situation that the money be paid directly to the Railroad Administration at Washington. The sum thus received will therefore in substance be subtracted from what the railroads would otherwise have received in approximately the next three months, and hence must be distributed by the central administration to meet the current cash requirements of the federal treasurers.

**Offices of Managers of Inland Traffic Being Discontinued**

The offices of manager of inland traffic in the various government departments, created by the appointment of traffic

representatives of the Railroad Administration last year for the purpose of co-ordinating the traffic requirements of the government, have now been discontinued, and the officers have been assigned to other positions in the Railroad Administration or are returning to their former positions. H. P. Anwalt, who has been manager of inland traffic of the Navy Department, has been appointed assistant director of the Division of Traffic, succeeding C. B. Buxton, resigned to return to his former position as vice-president of H. L. Edwards & Co., of Dallas, Tex. F. M. Whittaker, manager inland traffic of the Fuel Administration, will return to his office of traffic manager of the Chesapeake & Ohio; H. M. Adams, manager inland traffic of the War Department, has been appointed traffic assistant to the regional director of the Southwestern region, at St. Louis, succeeding W. B. Biddle; D. L. Gray, manager inland traffic for the Shipping Board, will become traffic assistant to the regional director of the Eastern region at New York; O. M. Conley, manager inland traffic of the oil division of the Fuel Administration, has returned to his former position on the St. Louis-San Francisco; C. E. Spens, manager inland traffic of the Food Administration, became assistant director of the Division of Traffic on March 1, and T. C. Powell, manager of inland traffic of the War Industries Board, became director of the Division of Capital Expenditures in January.

**Contracts Executed**

The Railroad Administration has executed compensation contracts as follows: St. Joseph & Grand Island, \$373,-811; Louisiana & Mississippi Railroad & Transfer Company, \$41,689; Georgia, Florida & Alabama, \$57,637; Bangor & Aroostook, \$1,575,171, and Detroit, Bay City & Western, \$85,967, also cooperative short line contracts with the Randolph & Cumberland, Ironton, the Oneida & Western, Williamsport & North Branch, and St. Louis, Kennett & Southwestern.

**Conditions During February in Allegheny Region**

According to a report from C. H. Markham, regional director for the Allegheny region, transportation conditions in that region for the month of February showed continued improvement. Owing to the mild winter experienced, coal loadings in the region decreased 61,804 cars compared with February of last year. Tidewater coal dumped amounted to 1,660,730 tons, an increase of 104,494 tons compared with February, 1918.

This region was practically clear of all embargoes on domestic freight by the end of February, and permits were freely issued for grain coming from the West on account of the resumption of overseas movement.

The railroads in this region received 10 locomotives built in their own shops during February, 1919, 13 from the locomotive builders to be applied against the 1918 program and 15 from builders to be applied against the 1919 program, a total of 38 locomotives during the month.

**Posters to Illustrate Firing Methods**

The Fuel Conservation Section has prepared two colored posters showing the interior of a locomotive firebox for the purpose of illustrating the effects of irregular firing methods, to be posted in roundhouses, foremen's offices, Y. M. C. A. buildings and other places where they may readily come to the attention of railroad engineers. The method of illustration was employed in the presentation of a paper by D. C. Buell on "The Proper Method of Firing Locomotives" at the fourth annual convention of the International Railway Fuel Association and was amplified and enlarged upon by the University of Illinois engineering experiment station in a circular from which the illustrations were taken.

# The British Transport Bill Severely Criticized

## Proposed Establishment of Ministry of Ways and Communications Meets Strong Opposition by Many Interests

THE BILL to establish a ministry of ways and communications which was introduced in the British House of Commons on February 27, as noted with the abstract of the bill in last week's issue of the *Railway Age*, page 787, has resulted in an amount of discussion in the British press in keeping with the broad provisions of the bill and its somewhat striking proposals.

The discussion of the bill, at least in the papers that have reached the office of the *Railway Age*, shows that much opposition by influential interests has already developed. Opinion is divided as to the general idea of combining under one head all the means of transport in the United Kingdom, but all those who treat of the subject bring out points in the measure that they think need correction.

### Sir Eric Geddes Expected to Be Minister

All those who discuss the matter agree that the first minister to be chosen will be Sir Eric Geddes. All recognize his ability as an organizer, but several doubt whether as a railroad man he will not treat the other means of transport with a railroad man's point of view only, while others fear that a change of government may result in the appointment as minister of ways and communications of a man of much smaller calibre.

Sir Eric Geddes was formerly deputy general manager of the North Eastern Railway of England. In the early part of the war he was engaged in organizing the supply of munitions. Thereafter he became director-general of military railways, and then director-general of transportation. In March, 1917, he was appointed inspector-general of transportation in all theatres of war, following which, in May, 1917, he became vice-admiral and controller of the Navy, and in July, 1917, first Lord of the Admiralty. He is at present in the cabinet as Minister Without Portfolio.

The thing in the bill that has received the most consideration, of course, is its all-inclusive nature, whereby control is vested in one man, the Minister of Ways and Communications over railways, light railways; tramways; canals, waterways, and inland navigations; roads, bridges and ferries, and vehicles and traffic thereon; harbors, docks and piers; and the supply of electricity.

### Drawbacks Likely to Be Serious, Says the Statist

"Theoretically there is a very great deal to commend such a proposal as that the whole transportation traffic of the country should be supervised by one instead of by many bodies," says the Statist in its issue of March 8. "But, the drawbacks in practice are likely to prove very numerous and very serious. It is not surprising that very considerable opposition has been aroused to such a sweeping proposal, which may be counted upon to have far-reaching consequences, whether for good or for ill. If one could imagine such a department being under the control of a passionless, absolutely impartial being, possibly the placing of the control of the whole transport business of the country in one hand would be an ideal solution of an admittedly difficult problem. It has to be remembered, however, that such a Board has to be administered by human beings very much like the rest of us; and, consequently, absolute impartiality, however honestly it may be aimed at, is not likely to be attained in practice.

"The most serious objection so far raised has been the placing of the control of the railways and the roads under one single authority. A careful examination of the facts

will, we think, disclose to the reader that the interests of the railways and the interests of the roads are very far from being identical, and that in all probability, if they are controlled by one single authority, the interests of one will be sacrificed to those of the other. It may not prove to be so; but it is certainly desirable to bear the probability in mind."

### Bill Said Not to Be Inclusive Enough

The *Railway Gazette* (London), takes an entirely opposite view as to the scope of the bill, but it is one of those that fears that a less able man than Sir Eric Geddes may become minister before the expiration of the two years provided as the term of the bill's provisions. "The one serious omission," it says in its issue of March 7, "appears to be that, whilst the cross-channel steamship services of railway companies come under its control, coastwise shipping is not included. In an island country such as this coastwise shipping has had a greater effect on railway policy and the flow of traffic than is generally realized. But despite this apparent omission, the powers vested in the proposed new ministry are tremendous. To accomplish all that could be achieved under the wide powers it is intended to vest in this ministry will require not only a great staff, but many men with big brains, practical experience, much tact and much imagination as consultants and directing heads of departments.

"If the bill is not spoiled in its passage through Parliament by whittling down its scope, much may be accomplished with Sir Eric Geddes as Minister of Ways and Communications. He has big ideas, much courage, and can get things done. He is a keen judge of men and will select his staff with a single eye to their suitability for the posts he wishes them to fill. One danger to be faced is that, as a result of opposition by those who are temperamentally incapable of taking big views of anything, the Act may be such an emasculated edition of the bill, and the powers of the proposed ministry so crabbed and confined, that Sir Eric Geddes may see that there is no possibility of 'delivering the goods' and, at the eleventh hour, refrain from embarking on this great adventure. But even if Parliament does not spoil the measure, there is the ever present danger that a change of government may mean a less progressive Minister of Ways and Communications. The task is so great and its possibilities so tremendous, that to have this office filled in a year or two's time by a small-minded politician would be calamitous. We can only hope that these risks will not materialize. The greatest danger lies in a change taking place in the early years before the new Ministry had got properly to work. Once a concern is organized and running smoothly it is easier to find others who can carry on. Nevertheless, there will be difficulty in the avoidance of the bureaucratic environment which stifles enterprise and initiative.

"To remove such transport, docks and harbors, or the generation of electrical power from the control of the new ministry, would at once frustrate any attempt to co-ordinate and improve the country's transportation facilities. If canals were not included they would be the greater losers. Much has been written about the wasteful competition between railways in the past. To avoid a repetition of this with mechanical road transport is presumably one of the reasons for placing roads and road transport under the Ministry of Ways and Communications. We understand that great de-

velopments are contemplated in the extension of electric traction, and the super-power plants can be utilized for supplying electric power to the railways, to the factories adjacent thereto, to barges for the canals, and for charging electrically-propelled road vehicles."

#### Bill Will Encourage New Construction

The Engineer (London), finds much of value in the bill but is much opposed to the great power that is given to the minister, and also expresses its belief that a minister less able than Sir Eric Geddes might do much harm. "Opposition to the bill is appearing in many quarters," it says, "and we shall be surprised indeed if various modifications are not introduced before it finds its way to the statute book."

In speaking of the good points of the bill it says: "The situation of British railways today is hopeless. In 1913 the railways of the United Kingdom distributed fifteen million pounds in interest on debenture stock and other miscellaneous fixed charges, and thirty-five millions in dividends on guaranteed, preference and ordinary stock. As last year, the expenditure was about sixty millions more than in 1913, the whole surplus is more than wiped out. It must be observed, too, that before the war, capitalists had little sympathy for the railway market, and the companies were, therefore, afraid to embark on necessary new works, and consequently waited for the better days that have not materialized. It is obvious then that the companies cannot return to the status quo.

"The bill cannot be said definitely to propose nationalization. The minister may, under clause a of sub-section 1 of section 4, purchase any railway or part of a railway, but under clause d of the same sub-section he may, on the other hand, lease the whole or any part of any undertaking so acquired or established. Thus a similar condition to what prevails and is admittedly successful, in India, would be brought about. Our deduction that the railways will not be nationalized in the usual acceptance of the term is further confirmed by section 5, which authorizes the minister to make grants for the construction, improvement and maintenance of railways—other forms of transport are mentioned similarly, but here and elsewhere we allude to railways in particular, as they are the principal means of transport. Yet another gleam of hope is seen in the opening words of section 3, wherein we find the words: 'With a view to affording time for the consideration and formulation of the policy to be pursued as to the future position of undertakings.' These are features that should appeal to the railway interests, which may find also some comfort in the paragraphs V, VI, VII and VIII of clause c of sub-section 1 of section 3. The railways are instructed there to obey the directions of the minister as to alterations, improvements and additions for the more efficient and economical working of the undertakings; for securing the common user of facilities, rolling stock and equipment; for securing running powers over other undertakings, and that the purchase of stores shall be conducted in such a manner as may be most conducive to economy and efficiency. These betterments begin at once—after the act is passed—and may be continued for the two-year period during which the government guarantees the net receipts on the 1913 basis. What a splendid opportunity is thus offered for getting necessary new works done, obtaining improved equipment for goods stations, electrifying busy passenger sections, and so on. Again, clause IV would allow the permanent way, rolling stock, plant, appliances and equipment to be modernized, seeing that the railways have to take any directions of the minister as to these things being satisfactory in type and design. It is true that many of these concessions have to be bought at a price. No longer, for instance, will directors be able to appoint, promote, or advance the salaries of officers, nor will officers be able to do these things for their staff. A company in a favored position as to route or in its station facilities must share these ad-

vantages with its less favored neighbor. Yet another point the companies must remember is that after the two-year period the minister is not bound to take them over. A company which may have been set on its feet during the two-year period may not wish to be taken over, and, apparently, if the minister does not insist in absorbing it, it will not be disturbed. Lastly, there is the shareholder. He has no new cause for complaint. By the present bill he gets for two years the same guaranteed net receipts as in 1913, and should his undertaking be absorbed he will be entitled to just as much as under the act of 1844. Were the purchase made under that act, the terms would, no doubt, be the amount awarded by arbitration; and the new bill they would be fixed by agreement, or, failing agreement, by arbitration."

#### TO RUSH MEASURE UNJUSTIFIABLE

Engineering, (London), finds much to oppose in the bill. "To rush through Parliament a measure which not only confuses control with purchase, but is calculated to extend governmental bureaucratic methods to the transport industry, is, in our opinion, wholly unjustifiable," it says.
