#### WEDNESDAY, MAY 21

Address by Frank McManamy, assistant director, mechanical department, Division of Operation, Railroad Administration.  
Certain Essentials, by Eugene McAuliffe, manager, Fuel Conservation Section, U. S. Railroad Administration.  
Fuel Department Organization, by T. Duff Smith, fuel agent, Grand Trunk.  
Co-operative Research and the Railway Fuel Problem, by Captain O. S. Beyer, Jr.  
Internal Combustion vs. Steam Engines for Small Stationary Plants, by C. A. Lichty, secretary-treasurer, American Railway Bridge & Building Association.

#### THURSDAY, MAY 22

Report of Standing Committee on Front Ends, Grates and Ashpans, chairman, H. B. MacFarland, engineer of tests, Atchison, Topeka & Santa Fe.  
Results of Tests Showing Losses Due to Front End Air Leaks, by E. P. Resch, supervisor, Fuel Conservation Section, Northwestern region, Railroad Administration.  
Reports of standing and special committees.  
Election of officers.

### New York Railroad Club

The meeting of the New York Railroad Club on Friday evening, May 16, will be different from anything that has heretofore been attempted by that club. There is a considerable number of foreign railroad officers in this country, a number of them associated with purchasing commissions. Several of these gentlemen will make brief addresses explaining something of railroad conditions in their own countries.

### Association of Railway Chief Surgeons

This association held its annual meeting at the Hotel Commodore, New York city, on Monday and Tuesday of this week. Dr. C. W. Hopkins (C. & N. W.) was elected president for the ensuing year; Dr. Duncan Evans (N. C. & St. L.), vice-president; Dr. L. J. Mitchell, 29 East Madison street, Chicago, treasurer.

### B. R. T. Convention

The Brotherhood of Railroad Trainmen will hold its triennial convention at Columbus, Ohio, beginning on May 14. The convention is expected to last at least a month and it is planned to give consideration to the reconstruction work among members who have returned from active service with the army or navy. Director General Walker D. Hines will address the convention but the date of his appearance has not been announced.

# Traffic News

An attractive booklet, setting forth the advantages of the state of North Carolina to the homeseeker, has been issued by the Agricultural Section of the United States Railway Administration. It contains full information about production of all kinds, transportation, markets, roads and climate. The statistical information was furnished by the commissioner of agriculture for North Carolina.

For soldiers and sailors attending the first convention of World's War Veterans, which will be held at St. Louis, Mo., on May 8, the Railroad Administration has announced a general fare of two cents a mile, with a minimum charge of \$2 for the round trip. For the Grand Army of the Republic a fare and one-third for the round trip has been made from stations on the Texas & Pacific and the Southern Pacific to Houston, Tex., for the encampment and meetings of allied societies held at Houston, on May 8, 9 and 10.

## Export Traffic

The weekly report for the week ended April 30, shows at North Atlantic ports a total of 31,567 carloads of export freight on hand, compared with 32,566 cars the preceding week (exclusive of bulk grain and coal). On the same date there were 7,469 cars of export food on hand, compared with 8,206 cars for the week previous. There were 18,893,111 bushels of grain in elevators at North Atlantic ports, 7,952,878 being received during the week while 8,356,278 bushels were cleared. At South Atlantic and Gulf ports there were 2,922,144 bushels of grain on hand for the period mentioned.

## Transcontinental Rates on Oriental Goods

Director General Hines has announced reductions in freight rates from Pacific coast ports to all eastern territory on a large number of commodities which are imported from the Orient. Some of the commodities and the proposed rates thereon are shown below. The effective dates of these new rates cannot yet be announced, but they will be published at the earliest practicable date on three days' notice. Most of the rates are reductions of from 10 to 25 per cent.

### New Import Rates

	C. L. Per 100 lb.	L. C. L. Per 100 lb.
Eggs, dried, etc.	\$2.00	....
Bagging burlap, etc.	.75	....

Silk waste	....	....

## The Trans-Canada Express

The Canadian Pacific is to run a regular train through from Montreal to Vancouver in 93 hours, 30 minutes. The new train is to begin running on June 1 and is to be called the Trans-Canada, and it will be in addition to the two regular through trains now in service. The announcement in Montreal papers calls attention to the fact that the best time across the continent in the United States is 98 hours, 50 minutes; but no mention is made of the fact that the distance by the American roads is considerably greater. From Montreal to Vancouver the distance is 2,886 miles, making the rate of speed of the new train about 31 miles an hour; where-

as from New York to San Francisco by way of the New York Central, the Chicago & North Western, the Union Pacific and the Southern Pacific, the distance is 3,225 miles, or 339 miles more than the length of the Canadian Pacific route; and the time from New York to San Francisco, 98 hours, 50 minutes, makes the rate of speed 32.63 miles an hour.

## Advance in Passenger Fares in Michigan

By a law which has been passed by the legislature of Michigan and which goes into effect on August 14, next, all railroads and interurban roads in that state having gross annual earnings of less than \$8,000 a mile, may increase their passenger fares to the basis of 2½ cents a mile. Roads earning \$8,000 or more must continue to carry passengers at 2 cents a mile.

## Vicissitudes of the Express Business

According to the New York Sun all parties holding claims against the Adams Express Company for goods lost prior to July 1, 1918, will be paid 60 cents on the dollar without question. Announcement to that effect has been made by C. W. Stockton, counsel for the company. The offer is for claims in cases in which the company received the goods and there is no record of delivery. It is estimated that the company faces an accumulation of \$100,000 such claims. Most of them resulted from the freight and express congestion when freight service broke down.

"There was perhaps no public utility that was affected more by the war than the express companies," said Mr. Stockton. "They operated on a very close margin before the costs of virtually every factor in the service rose and it is a matter of record that no increases in rates were granted before the merger of the companies in July, 1918. The Adams Express Company lost about \$10,000,000 between July 1, 1917, and July 1, 1918, a deficit equal to the capital stock. If it had not been for a reserve stowed away in its sock the company would have been bankrupt. The employees of the company were young men who were hefty and virile. They had to move heavy freight. When the war came virtually all of them were lost to the company through enlistment or the draft. Commercial companies, able to pay higher wages than the express companies, grabbed the others. The Government took away our railway express cars for its movement of troops and military stores. When the freight service broke down we were deluged with business. This had to be handled in box cars, which were neither heated nor lighted. It was necessary to load and unload frequently and this caused more labor and greater losses from breakage. The clerical costs soared and help, being inexperienced, billed goods by the wrong routes, failed to keep records carefully and caused an avalanche of claims to pile up against us. Owing to resultant disorganization we have been unable to investigate claims promptly and there are perhaps outstanding \$100,000 on goods shipped prior to July 1, 1918. Shippers have flocked to our offices desiring settlement, and we have explained some of the difficulties involved. The claims are being investigated by local agents of the American Railway Express and, as it is inexpedient to have the tons of records sent here, there is, consequently, much delay.

"In a number of cases shippers are insistent on immediate settlement, for, as they state, some of the claims are of ten months' standing. Therefore we have decided to offer 60 per cent on all claims where we know we have received the goods and have not a record of delivery, or haven't yet finished the investigation to establish delivery. It is a gambler's chance, but a considerable number of firms holding claims have agreed upon the settlement at this figure. On our behalf, it should be stated that not all the claims made are valid and the percentage of valid claims will be just about 60 per cent of the number presented. If the persons holding claims want to wait until the investigations are complete and we have opportunity to check up our records, they will be paid in full. They can get 100 per cent if they will bide their time, and we think that the Adams Express Company, despite losses during war, will be able to meet all of its valid debts. This statement is based upon a study of the balance sheet and the assets of the company."

## Commission and Court News

### Interstate Commerce Commission

The Commission has denied the petition of Director General Lines that the Michigan percentage rate case be reopened.

The commission has awarded a hearing at Washington on May 15 on the petition of the Arkansas & Louisiana for the appointment of a board of referees to determine its compensation under the federal control act.

### Classification of Lumber

The commission has announced a decision after an investigation on its own motion that:

The commission is empowered, under sections 1, 3, and 15 of the act, to prescribe a classification of lumber and lumber products. Classification should rest in the first instance upon those factors which are definite and readily ascertainable, such as value, risk, and car loading. The range of values of common lumber to such an extent embraces the values of the other article under consideration as to make impracticable and unjust a differentiation in rates based on value. This element should be considered only in fixing the basic lumber rate and its relationship to rates on commodities not so intimately related to lumber as those here under consideration. The car loading of lumber and lumber products constitutes to a considerable extent the determinative factor in their classification. A percentage relationship between lumber and articles which should take related rates will effect a fairer distribution of transportation costs than the observance of flat differentials. The present record affords no basis for prescribing different rates for different minima. Rates on lumber products should not exceed commodity rates contemporaneously maintained on lumber by more than is indicated in the lumber list suggested herein. Poles and piling from the north Pacific coast and the "inland empire" should take rates no higher than are contemporaneously applied on fir lumber.

### Personnel of Commissions

W. D. Humphrey, member of the Oklahoma Corporation Commission, has resigned. In his letter Mr. Humphrey tells the governor that his resignation was due to his desire to fight the agitation for government ownership and control of public utilities without the handicap of a state office.

The Public Service Commissioner of the State of New York, for the First District (New York City), under the new law, (which reduces the number of commissioners from five to one) is Lewis Nixon, who is promoted from the position of state superintendent of public works. Mr. Nixon will temporarily also fill the office of the other commissioner who, under the law, is to supervise the construction of subway and elevated railroads in New York City. This office has been declined by Col. William Barclay Parsons. Mr. Nixon was president of the East River Bridge Commission at the time of the construction of the Manhattan bridge (1901), and has been commissioner of public works for the Borough of Richmond. He was graduated from the United States Naval Academy at Annapolis in 1882 and is known as a naval contractor, and a shipbuilder. The old Public Service commission as it goes out of office, consists of only three members, Messrs. Travis H. Whitney, F. J. H. Kracke and Charles S. Hervey.

The Miami Valley Paper Manufacturers' Association, with a membership of 20 paper companies, has adopted resolutions opposing government ownership, operation or management of the railroads, and favoring the prompt enactment by Congress of remedial legislation as advocated by Director General Walker D. Hines.

## Equipment and Supplies

### Locomotives

THE DAYTON & TENNESSEE RIVER RAILWAY expects to purchase shortly a standard gage oil burning locomotive. This is a new line. Jake Benkovitz may be addressed at Dayton, Tenn.

### Locomotive Deliveries Week Ended April 26

Locomotives were shipped to railroads under federal control during the week ended April 26, as follows:

Works	Road	Number	Type
American	C. M. & St. P.	2	USRA Mikado
	Penn. L. & W.	12	USRA St. F.
	N. & W.	9	USRA Mallet
	N. Y. N. H. & H.	4	USRA Lt. Mount.
	A. C. L.	2	USRA 6W. Sw.
Baldwin	Sou. Ry.	1	USRA Lt. Mount.
	C. B. & Q.	4	USRA 6W. Sw.
	A. T. & S. F.	3	Mountain.
	C. V. & O.	1	Mallet.

The Philadelphia & Reading has resumed the shipment of coal by water from Port Richmond, Philadelphia, to New England points. This traffic was discontinued last year when German submarines became active off the Jersey coast, and since then the company's barges have been loaded at Port Reading. In the New England service the Reading uses twelve tugs and 73 barges.

## Supply Trade News

The **Joseph Dixon Crucible Company**, of Jersey City, N. J., has moved its Philadelphia, Pa., sales office from 1020 Arch street to the Finance building, South Penn Square.

**F. J. Foley**, recently appointed general sales agent of the **Railway Steel-Spring Company**, New York, as has already been announced in these columns, was born in Chillicothe,

F. J. Foley

Ohio, on May 14, 1879. He entered the service of the Baltimore & Ohio at Newark, Ohio, as a messenger in 1892, and then until 1897, was telegraph operator and despatcher on various roads in the West. He entered the manufacturing department of the Pullman Company at Pullman, Ill., in 1897, where he remained until 1900, when he became connected with the Steel Tired Wheel Company, which company was subsequently absorbed by the Railway Steel-Spring Company in 1902. Mr. Foley has been successively

manager of all of its various spring plants, and while he has occupied the position of general superintendent of the company since 1912, during much of this time he was closely associated with the sales department.

The **R. W. Young Manufacturing Company**, Chicago, has moved its offices from 14 East Jackson boulevard to Room 620, Railway Exchange building, Chicago.

**E. R. Lewis**, chief engineer of the Duluth, South Shore & Atlantic, with headquarters at Duluth, Minn., has resigned from that position to become associated with the editorial department of the Simmons-Boardman Publishing Company as an editor of the **Maintenance of Way Cyclo-**

E. R. Lewis

**pedia**. Mr. Lewis was born on November 20, 1869, at Raritan, N. J., and graduated from the University of Iowa in 1890. He began railway work in 1885 with the Missouri Pacific with which road he was consecutively axman and rodman on construction, levelman, clerk in the timber department, levelman on bridge location and from 1891 to 1892 division engineer. He was reclamation engineer in

Wyoming from 1893 to 1895, and was then for two years division engineer on the United States Government Leves on the Mississippi River improvement work. From 1897 to 1901 and again from 1903 to 1905, he was with the state government railways in South Africa, first as locating engineer in Cape Colony, and during the last year as district engineer of maintenance at Maeking and Port Elizabeth.

During 1901 and 1902, he was engineer in charge of construction on the White River division of the Missouri-Pacific, at Batesville, Ark., and division engineer on location and construction of the Fort Smith & Western in Oklahoma. He was made assistant engineer of the Keweenaw Central in 1905 and from August, 1906, to June, 1912, he was division engineer of the Michigan Central at Bay City, Mich. In July, 1912, he was appointed assistant to the general manager of the Duluth, South Shore & Atlantic, with headquarters at Duluth, Minn., and when this road was taken over by the government, he was made chief engineer, which position he held until his association with the Simmons-Boardman Publishing Company.

As briefly noted in last week's issue, **Frank J. Tone** has been elected president and **George R. Rayner** has been elected vice president of the **Carborundum Company**,

F. J. Tone

Niagara Falls, N. Y. Mr. Tone, who now becomes executive head of this Niagara Falls company and its five foreign plants, was formerly works manager, having been in charge of manufacturing operations since the establishment of the works at Niagara Falls in 1895. He was previously engaged in electric railway work in Pittsburgh. He is well known for his work in the electric furnace field on artificial abrasives, refractories and silicon alloys, and is past president of the American Electrochem-

ical Society. Mr. Tone graduated from Cornell University in 1891. **George R. Rayner**, the new vice-president of the Carborundum Company, was born in Springfield, Mass. He served for a period of time as a member of the sales force of the Hampden Wheel Company, and in June, 1898, he was appointed manager of the Chicago branch of the Carborundum Company. In August of the same year he was transferred to Niagara Falls, and was appointed secretary and general sales manager of the company. Mr. Rayner is a past president of the American Foundry & Supply Association and is a member of the board of directors of the Chamber of Commerce, at Niagara Falls.

G. R. Rayner

The **Van Dorn Electric Tool Company**, Cleveland, Ohio, has opened a Chicago office at 527 South Dearborn street, in charge of **William Cottrell**, sales manager.

**L. V. Estes, Incorporated**, industrial engineers and accountants, Chicago, has removed its offices from the McCormick building to the Century building, 202 South State street.

The **Van Dorn & Dutton Company**, Cleveland, Ohio, has opened branch offices at New York and Chicago. **Harry F. Keegan** will manage the Chicago branch, with office at 1241

First National Bank building, and his brother, **John Keegan**, will manage the New York branch, with office at Room 317, 30 Church street.

**H. M. Davison**, for the past 14 years connected with the sales organization of the Hayward Company, has left that company to become sales manager of the **Ohio Locomotive Crane Company**, Bucyrus, Ohio.

**Frank E. Wade**, president of the **Fairmont Gas Engine & Railway Motor Car Company**, Fairmont, Minn., and mayor of that city, died after a short illness at his home in Fairmont on March 3. He was born at Whitehall, Wis., March 6, 1862, and received his education in the Curtis Business College, at St. Paul, Minn. He received considerable engineering training under C. F. Loweth, now chief engineer of the Chicago, Milwaukee & St. Paul, and in 1881 entered the employment of the G. W. Sherwood Co., at St. Paul, as superintendent in charge of bridge construction. With this firm he was connected with the building of bridges along the Mississippi river. Later, he entered the employ of Fairbanks, Morse & Co., Chicago, as general salesman. From 1902 to 1906 he was interested in mining properties in the Black Hills district of North Dakota, returning to Fairmont in 1906, where he became interested in the Fairmont Gas Engine & Railway Motor Car Company several years later. Mr. Wade was also interested in many banking projects in the Northwest, and in Florida and Mexico lands.

F. E. Wade

The **Standard Car Wheel Company**, Cleveland, Ohio, has increased its preferred capital stock by \$100,000 for the purpose of capitalizing the 1917-1918 enlargements to its plant, at Cleveland. No construction is contemplated at this time.

**Donald M. Ryerson**, who for the past two years has been in the United States Navy, has received his discharge from the service and has returned to his duties as vice-president in charge of purchases and sales of the **Joseph T. Ryerson & Son Company**, Chicago.

**J. N. Ebling**, recently returned from France, after having spent 13 months with the American Expeditionary Forces, has resumed his position as president of the **Railway Specialties Corporation**, New York. **D. A. Munro**, formerly secretary, is no longer connected with the corporation.

**Edwin R. Webster**, until recently assistant engineer on the Iowa, Dubuque, Des Moines and Dakota divisions of the Chicago, Milwaukee & St. Paul, with headquarters at Chicago, has taken up private practice in general, civil, sanitary and structural engineering, with offices in the Webster building, Chicago.

The **Chicago Pneumatic Tool Company**, Chicago, has sold its Giant truck department, consisting of the Chicago Heights plant, stock of trucks finished and in process of construction, and the agencies and branches with their stock. The truck business will be continued by the purchasers, probably under the title of the **Giant Truck Corporation**.

**Marcel E. Cartier**, sales engineer of the **Joseph T. Ryerson & Son Company**, Chicago, with headquarters at Paris, France, has returned to France after a few weeks' visit in this country. He will be joined in Paris by **John H. Romann**, sales engineer of the same firm. Messrs. Cartier and Romann will have charge of the company's business in France, Belgium, Holland, Switzerland, Italy, Spain and Portugal.

The manufacturing facilities of the **U. S. Light & Heat Corporation**, Niagara Falls, N. Y., are to be increased by the addition of several buildings. The plant space now covers about nine acres and consists of 22 buildings. Recently, two structures of brick and concrete were added. Contracts have been let and construction is already under way on the new buildings which will be of reinforced concrete and brick.

### Stone Franklin Company

The Stone Franklin Company has been organized to market the Stone Franklin car lighting system in the United States and Canada. This system was introduced into this country by the Franklin Railway Supply Company. The new company has elected the following officers: **Joel S. Coffin**, chairman of the board of directors; **Ralph G. Coburn**, president; **C. E. Walker**, vice-president; **H. D. Rohman**, chief engineer, and **W. Truelove**, secretary, with offices at 18 East Forty-first street, New York.

**Ralph G. Coburn**, president of the new company, has been identified with the Franklin Railway Supply Company. He was born at Boston in 1882, and graduated from Harvard in 1904. From 1904 to 1909 he was in the service of the American Glue Company, having charge of its western factories with his headquarters at Des Moines, Ia., and Chicago. On May 1, 1909, he opened the Chicago office of the Franklin Railway Supply Company as resident sales manager. On June 1, 1911, he was made assistant to the vice-president, in charge of eastern-southern territory, with headquarters at New York. In December, 1913, he was appointed eastern sales manager of the Franklin Railway Supply Company, which position he held until his appointment with the Stone Franklin Company.

**Charles C. Walker**, vice-president of the new company, has had a broad experience in industrial manufacturing, sales and railroad work both in this country and abroad. He is a graduate of the engineering course of the University College, of Bristol, England. He served as an apprentice with the Bristol Railway Carriage Company and as junior assistant on the staff of the Newcastle Electric Supply Company. He later went to South America on the mechanical constructional staff of the Buenos Ayres & Pacific Railroad. While in South America he joined **J. Stone & Co., Ltd.**, as technical adviser and sales manager with office in Buenos Ayres. In the latter part of 1912 he went to England to take charge of foreign sales in the main office at London. When war was declared he joined the British army and saw active service at the front for nearly three years. Receiving the order of the British Empire in February, 1917, he was returned to England to take charge of

R. G. Coburn

C. E. Walker

the manufacture of anti-submarine devices, which is the work he leaves to take up the position of vice-president of the Stone Franklin Company.

Harry D. Rohman, chief engineer of the Stone Franklin Company, New York, is a graduate of the technical schools of Zurich, Switzerland. Upon graduation he entered the

H. D. Rohman

works of the Oerlikon Electrical Construction Company, and in 1903 qualified as an electrical engineer, with experience in high and low tension and a. c. and d. c. work, especially electrical traction. Later he entered the service of J. Stone & Co., London, and in 1910 was appointed chief of the testing and experimental departments. In 1914 he was appointed chief assistant electrical engineer, and held that position until October 1, 1915, when he entered the service of the Franklin Railway Supply Company

as chief electrical engineer, which position he held at the time of his recent appointment. Mr. Rohman speaks several languages and has had an extensive experience in all European countries, as well as in South Africa and the Belgian Congo. He has a broad experience in car lighting engineering, obtained by many years of active work in that field.

### Sale of Surplus Property by the Government

The general policies of the War Department in the disposal of surplus property, were enunciated by C. W. Hare, Director of Sales, to a committee representing the trade and technical papers of the country, at a recent meeting in Washington.

Mr. Hare stated that the War Department would dispose of its surplus materials by first consulting with the various branches of the government to ascertain what, if any, could be utilized in regular government work. After the government requirements have been satisfied, the producers of each particular commodity will be called into conference to advise with the Director of Sales as to the best method of getting the remaining amount of the commodity back into the usual channels of trade.

If, as has been the case in the disposal of copper, sulphur, lead, wool and lumber surplus stocks, the industry is able to contract with the government to dispose of its surplus within a reasonable length of time, paying the government the current market prices, it would be the policy of the government to make such an arrangement.

Should both of the methods mentioned fail, the surplus property will be offered to the general public through auction sales, or by sealed bids, or in any other manner which will enable the government to obtain the best prices.

A Sales Promotion Section has been established under the supervision of T. R. Elcock, Jr., to collect all information pertaining to the disposition of surplus property and to see that appropriate information reaches interested industries through the proper trade and technical papers.

### Trade Publications

**EXPLOSIVES.**—E. I. du Pont de Nemours & Co., Wilmington, Del., manufacturers of explosives, have issued an interesting and instructive eight-page booklet on the use of explosives in blasting concrete. It describes in detail new and economical methods of removing old walls, breaking up engine beds and excavating concrete foundations. One page is devoted to short descriptions of the actual application of explosives to work of this character and the illustrations show in a graphic way the contrast between the old and new methods.

## Financial and Construction

### Railway Financial News

**ANN ARBOR.**—President Newman Erb announced recently that arrangements have been completed with the War Finance Corporation under which two alternative proposals are made to the holders of the company's \$622,000 notes maturing May 1. The offers are made through F. J. Lisman & Co., as follows:

(a) Cash payment of 20 per cent of the face amount of notes with an extension of the balance for a further period of two years at 6 per cent plus a payment of 2½ per cent in cash on such extended portion.

(b) Extension of the full face amount of the notes for a further period of two years at 6 per cent interest, with a payment of 2½ per cent in cash on said notes.

In addition to their present collateral the notes are to be further secured by the deposit of \$500,000 face value of the company's improvement and extension 5 per cent bonds. Noteholders wishing to avail themselves of either offer are asked to deposit their notes with the Empire Trust Company.

**DELAWARE & HUDSON.**—See editorial elsewhere in this issue.

**MISSOURI, KANSAS & TEXAS.**—James Speyer has been elected a director to succeed Horace E. Andrews, deceased, and Samuel E. Kilner, of New York, has been elected a member of the board to represent the English interests in the company.

**NEW YORK CENTRAL.**—The United States Supreme Court on Monday declined to review the decision of a lower court which had failed to sustain the petition of Clarence H. Venner, a stockholder, attacking the consolidation of the New York Central & Hudson River Railroad with the Lake Shore & Michigan Southern and nine other subsidiary railroads.

**NEW YORK, NEW HAVEN & HARTFORD.**—The list of stockholders of this road on April 16 shows that many of the large corporations, as well as individual stockholders of a year ago, have disposed of a large part of their holdings. Among the most important changes are the American Express Company, which this year held only 625 shares of stock, as compared with 20,324 in 1918, and the Adams Express Company, which reduced its block of 24,730 shares in 1918 to 14,730 in 1919.

**WESTERN PACIFIC.**—Director General Hines has authorized this company to declare and pay a dividend of 1 per cent on its preferred stock. This is the dividend which would ordinarily have been paid on April 1.

### Railway Construction

**SIoux CITY STOCK YARDS COMPANY.**—Two new terminal yards costing approximately \$150,000 will be built at Sioux City, Iowa, this spring to facilitate the delivery of livestock. The terminals will have a combined capacity of 600 cars.

**SOUTHERN RAILROAD.**—This road is carrying out improvements to the bridge near Spencer, N. C., over the Yadkin river, at mile post 330.8, to consist of four single track deck riveted steel spans about 160 ft. long for Cooper's E-60 loading. Repairs will be made to some of the present masonry; estimated cost for the entire work is about \$170,000. The American Bridge Company has the contract for fabricating and erecting the superstructure.

**ERIE RAILROAD, THE BALTIMORE & OHIO LINES AND THE PENNSYLVANIA LINES WEST.**—These roads have entered into an agreement with the city of Akron, Ohio, for the elimination of certain grade crossings in that city. The first step provided for in the agreement is the construction of a temporary structure over the East Miller avenue crossing to cost about \$135,000. The whole of this work will cost about \$4,000,000, to be divided on the basis of 65 per cent to the railroads and 35 per cent to the city.

# ANNUAL REPORT

## The Delaware and Hudson Company.

New York, N. Y., April 1, 1919.

To the Stockholders:

The Delaware and Hudson Company.

The following presents the income account of your Company for the year 1918, arranged in accordance with the rules promulgated by the Interstate Commerce Commission, with comparative results for the year 1917:

	Comparison with 1917.		
	1918.	Increase. Decrease.	
Compensation accrued under Federal Control (on basis of Standard Return) for possession, use and control of railway property of the Company and its leased and operated lines .....	\$7,415,148.72	\$1,805,761.95	.....
Other Corporate Income:			
Miscellaneous rent income .....	\$137,197.51	.....	\$649.88
Income from lease of road .....	102,822.97	.....	7,682.35
Miscellaneous non-operating physical property .....	22,501.10	6,529.18	.....
Dividend income .....	938,163.10	.....	54,243.17
Income from funded securities .....	225,232.83	59,272.77	.....
Income from unfunded securities and accounts .....	447,099.95	207,217.83	.....
Income from sinking and other reserve funds .....	162,168.13	53,005.80	.....
Miscellaneous Income .....	1,152,446.28	.....	1,560,079.49
Total Other Corporate Income .....	\$3,187,631.87	.....	\$1,296,629.31
Gross Income .....	\$10,602,780.59	\$509,132.64	.....
Deductions from Gross Income:			
Railway operating expenses .....	\$95,770.45	\$95,770.45	.....
War taxes .....	127,027.52	112,899.30	.....
Miscellaneous tax accruals .....	17,636.27	1,518.12	.....
Rent for leased roads .....	1,946,986.08	.....	\$9,075.63
Miscellaneous rents .....	.....	.....	2,658.71
Interest on funded debt .....	2,938,318.26	12,959.92	.....
Interest on unfunded debt .....	142,728.01	.....	26,371.16
Miscellaneous income charges .....	619,521.57	602,077.47	.....
Total Deductions from Gross Income .....	\$5,887,988.16	\$787,119.76	.....
Net Income—The D. & H. Co. carried to general profit and loss .....	\$4,714,792.43	.....	\$277,987.12
Percentage to capital stock .....	11.09	.....	.66

### FINANCIAL.

The capital stock of The Delaware and Hudson Company on December 31, 1918, was \$42,503,000, there having been no change during the year.

The total funded debt on December 31, 1918, was \$66,010,000, a reduction of \$452,000 having been effected during the year by the purchase and cancellation of that amount of First Lien Equipment bonds through the sinking fund established in connection with their issue.

The sum of \$395,040, being one per cent of the par value of the First and Refunding Mortgage Gold Bonds outstanding on June 1, 1918, was paid during the year to the trustee under the First and Refunding Mortgage, making the total paid to December 31, 1918, \$2,846,150. This amount has been expended in additions and betterments to the mortgaged property in accordance with the trust agreement.

There was accumulated in the Coal Department Sinking Fund during the year, in accordance with the ordinance passed on May 9, 1899, and amended on May 10, 1910, \$384,195.56, which has been applied to reimburse the treasury for coal lands and unmined coal in Pennsylvania.

The usual payment of \$650,000, required under the terms of the First Lien Equipment Trust indenture, was made, making the total paid to date \$7,150,000. This has been increased by accumulations of interest on balances and investments. During the year 1918, \$1,288,703.65 was expended for new equipment, which was made subject to the indenture, leaving in the hands of the Trustee, securities and cash to the amount of \$2,387,393.83.

During the year there was received from the United States, in partial payment of compensation for the taking over of the company's property in December, 1917, and its subsequent occupation and use by the United States, the sum of \$4,190,000, and the company borrowed from the Railroad Administration, without security, \$2,100,000, making a total of \$6,290,000. The Interstate Commerce Commission has certified to the President, under the Act of March 21, 1918, that the average income of this company for the three years that ended with June 30, 1917, was \$7,409,600.12. If the latter sum is all to which your company is entitled, which is by no means admitted, it has received \$1,119,600.12, or 15.11 per cent less than it should have received to December 31, 1918.

The changes in Current Assets and Current Liabilities are largely due to the Government taking possession and control of the Company's railway property as a going concern, the Government collecting the major portion of the current assets and paying the major portion of the current liabilities.

### COAL MINING DEPARTMENT.

The anthracite produced by The Hudson Coal Company during 1918, including the product of washeries, aggregated 9,059,228 long tons, an increase of 415,505 tons, or 4.81 per cent over 1917. The year's output was 11.82 per cent of the total output of Pennsylvania mines and washeries, which was 76,649,918 long tons. The number of breaker-hours required for the preparation of this coal was 55,191.

Throughout 1918, the United States Fuel Administration continued to urge the maximum possible production and those in charge of your operations made every practicable effort to meet their wishes. Underground development was carried on during the year and the properties were fully maintained.

The wages agreements effected during 1917 and explained fully in the report for last year made full provision, according to their terms, for the whole period to March 31, 1920. Nevertheless, during 1918, a further increase was urged upon the operators and after conferences in which the Fuel Administration, as representative of the Federal government, and the employees, participated, a supplementary agreement providing for very heavy increases in wages rates and effective from November 1, 1918, to the end of the war or until March 31, 1920, if peace is not declared prior to that date, was effected. In consideration of the effect of these increases in wages upon the cost of production, the Fuel Administration authorized an increase of \$1.05 per ton in the price of pea coal and all larger sizes.

A statement, in regard to prices, issued by the Fuel Administration during February, 1919, when about to relinquish most of its functions, states plainly its conclusion that the prices of anthracite are still too low. The following is quoted:

"By his executive order of August 23, 1917, the President adopted as maximum prices for anthracite coal, the schedule of prices which had been acquiesced in by the industry while under investigation by the Federal Trade Commission under the so-called 'Calder' resolution of the Senate. This involved one price for the railroad-controlled coal companies and a price 75 cents higher for the individuals. With the exception of a reduction of 60 cents a ton in the prices for pea coal made October 1, 1917, and two adjustments to cover increases in miners' wages, the Fuel Administration allowed the prices fixed by the President to stand pending examination of costs such as were made in the case of bituminous coal.

For the purpose of arriving at a fair increase in price to cover the increase in wages, recommended by the War Labor Board last October, an examination was made to determine the costs of the various anthracite-producing companies. The result of this examination showed that the general increases in the price of materials and labor had raised the cost of mining anthracite to such an extent that many of the companies were not receiving a fair return and that some producers of necessary coal were actually sustaining a loss on the sale of coal at the government prices, in spite of two increases allowed on account of advances to labor.

"At the time this situation was discovered every indication pointed to an early peace and it was deemed unwise to increase the maximum prices so near the time when, on account of the end of the war, price restrictions would, in the natural course of events, be lifted entirely.

"The above statement is made at this time, when price restrictions are about to be lifted, out of fairness to those companies who have patriotically kept up their production to war needs, even at a cost which resulted in many instances in a loss, not only by the individuals, but also by some of the railroad companies, so that the impression shall not exist that the government prices of anthracite coal in existence at the time of the lifting of restrictions were prices which the Fuel Administration had fixed on the basis of cost to the operators.

"Had the Fuel Administration's active control over maximum prices on anthracite coal been continued, the cost examination above referred to shows that it would have been necessary, on the basis of the present wage scale, to raise these maximum prices possibly as much as 50 cents a ton above those last fixed by the government in order to prevent financial embarrassment and perhaps the closing of companies producing a substantial per cent of the necessary anthracite output.

"Such a curtailment of production would eventually result in the demand exceeding the supply to such an extent as to increase the prices much higher than they would be if that supply were continued." The increase in prices suggested by the Fuel Administration, relates solely to domestic sizes. The reduction in prices of other fuels which compete with anthracite steam sizes have necessitated some reduction in the latter. Therefore, an increase of fifty cents per ton in the price of domestic sizes will secure to The Delaware and Hudson Company and The Hudson Coal Company an increase of only 23.55 cents per ton of all sizes produced and marketed.

### RAILROAD DEPARTMENT.

Late in December, 1917, the President of the United States conceived it to be his duty to take possession of substantial railroads engaged in interstate transportation, together with affiliated boat lines. Your railway property, and that of your system corporations in the United States, with the boats operated on Lake Champlain and Lake George, were included in this exercise of power and passed out of your control at noon on December 28, 1917. Since that date these properties have been operated in accordance with the President's proclamation of December 26, 1917, and the Act of Congress of March 21, 1918, for the account of the United States, which have assumed responsibility for all expenses of operation, including maintenance, and all taxes, except war taxes, and have become liable to your company for whatever just compensation may be provided for in any contract negotiated in pursuance of the Act, or otherwise determined in accordance with the statutes and the Constitution.

Under this condition the income account of your company for 1918 was not affected by the operating revenues, operating expenses or the ordinary exactions of the taxing authorities. Your interest in the operating results obtained by the Railroad Administration is, therefore, indirect and restricted to their implications as to operations after the anticipated restoration of the properties to your direct control.

Data supplied by the Railroad Administration indicate that the operating revenues of The Delaware and Hudson Company's Railway for 1918 amounted to \$34,789,864, an increase of \$4,800,465, or 16.01 per cent over 1917. Freight receipts increased \$4,757,563, or 18.77 per cent and passenger receipts decreased \$232,007 or 7.64 per cent.

Freight movement increased from 3,954,096,760 ton miles, in 1917, to 4,062,078,074 ton miles, in 1918; a gain of 107,981,314 ton miles or 2.73 per cent, while the average receipts per ton per mile increased from 6.41 mills to 7.41 mills, a gain of 15.60 per cent.

The increased freight movement was principally in anthracite, food products and munitions of war. The Railroad Administration assumed a control over routing of traffic never exercised by railroads under corporate management, generally refusing to permit shippers to select routes or to choose the delivering lines and not only diverted to your railway, in order to relieve actual or threatened congestion at New York harbor, and elsewhere, considerable traffic that would otherwise have moved differently but, also, diverted from your lines numerous shipments which they would normally have received.

Several changes, of which the following are considered the most important, contributed to the increase in the average receipts per ton per mile:

(1) Advances in freight rates applicable to anthracite moving to Canadian destinations, cement, stone, sand and similar commodities, asked for in 1917, were sanctioned by the Interstate Commerce Commission and permitted to go into effect on April 1, 1918.

(2) On June 25, 1918, the Railroad Administration began to enforce an increase of twenty-five per cent applicable to all classified freight with increases roughly corresponding to that percentage on all other articles. Coal rates, for both anthracite and bituminous coal, were advanced on a scale commencing with fifteen cents per ton as to rates formerly under forty-nine cents per ton and ending with fifty cents per ton as to all rates formerly \$3.00 per ton or higher. Rates applicable to coke took a scale of advances running from fifteen cents to seventy-five cents per ton, the minimum increase applying where the former rate was forty-nine cents or less and the maximum where it was \$3.00 or more. Rates on ores, except ex-lake ores, were increased thirty cents per ton; cement and stone rates, two cents per hundred pounds; lumber rates, twenty-five per cent but not over six cents per hundred pounds; cotton rates, fifteen cents per hundred pounds. All commodity rates not specifically indicated were increased twenty-five per cent. The minimum charge for any less than carload shipment was raised to fifty cents; the previous minima had been twenty-five, thirty and forty cents for different kinds of shipments. The minimum charge for a carload shipment was increased to \$15.00, superseding many much lower minima. Before these increases were made an estimate, based on 1917 traffic, indicated that they would add about \$5,900,000 to annual gross receipts.

(3) The Railroad Administration adopted and has applied since May 1, 1918, a basis for the apportionment of interline revenues, differing from the former system resting upon contractual relations between connecting carriers. While primarily adopted to reduce the labor of accounting, this change is understood to have increased the revenue attributed to your railway under Federal operation. Other changes in interline relations, such as the discontinuance of adjusting overcharges and undercharges in settlements, are considered to have had similar results.

From data furnished by the United States Railroad Administration, it would appear that the movement of passengers over your lines decreased 13.45 per cent, the passenger mileage being 112,180,679 compared with 129,620,729 in 1917, and the average receipts per passenger mile increased 6.75 per cent from 2.342 cents in 1917 to 2.500 cents in 1918. Passenger train mileage was, however, reduced 22.57 per cent from 2,660,310 in 1917 to 2,059,990 in 1918, and passenger car miles 24.59 per cent from 13,080,801 to 9,864,219. Passenger receipts per passenger train mile increased 19.30 per cent from \$1.14 to \$1.36, and receipts per passenger car mile increased 22.49 per cent from 23.21 cents to 28.43 cents.

The decrease in passenger travel indicated by the foregoing is probably attributable to direct efforts to discourage unnecessary passenger movement, as well as to increased charges and withdrawal of facilities furnished under corporate management. One aspect of the reduction of facilities is indicated by the increase in revenue from parlor and chair car service from \$10,340 in 1917 to \$3,954 in 1918.

The increase in the average rate per passenger mile resulted from the increase of the basic mileage rate to three cents, effective on June 10, 1918, modified, however, by the allowance of a special rate of one cent per mile to soldiers and sailors on furlough.

There was a considerable increase in miscellaneous transportation revenues due to augmented switching charges, and incidental revenues were increased by a gain of 109.98 per cent in the demurrage charges collected, which amounted to \$345,925 as compared with \$164,744 in 1917. Prior to February 10, 1918, the original rate for demurrage of \$1.00 per day, regardless of the length of detention, had been superseded by a rate of \$2.00 per day for the first five days, with a rate of \$5.00 per day thereafter. On the date named the rates were increased to \$3.00 per day for the first four days, \$6.00 per day for the next three days, and \$10.00 per day thereafter. These increased charges had a beneficial effect in expediting the movement of cars when a shortage of equipment appeared imminent, and tend strongly toward the elimination of a misuse of facilities that is at all times wasteful.

Operating expenses amounted to \$31,353,784, as compared with \$23,449,953 in 1917, an increase of \$7,903,831, or 33.71 per cent. Subtracting the increase in revenues of \$4,800,465 leaves a decrease in operating income, before the deduction for taxes, of \$3,103,366. Expenditures for maintenance of way and structures increased \$1,215,554; for maintenance of equipment, \$2,873,831; for transportation, \$3,809,887.

The following figures, which should be understood as approximate only, indicate, as closely as computations now practicable permit, the relation of the various changes in operating conditions to the total increase of \$7,903,831 in expenses:

Increase due to	Amount	Per cent of total increase	Per cent of total operating expenses
Higher wage rates	\$4,345,025	54.97	13.86
Increased number of employees	1,700,000	21.51	5.42
Higher prices of materials	1,043,183	13.20	3.33
Increased quantities of materials and miscellaneous	815,623	10.32	2.60
<b>Total</b>	<b>\$7,903,831</b>	<b>100.00</b>	<b>25.21</b>

Considerably more than one-half the increase in expenses, and almost one-seventh of the total operating cost of the year, is attributable, therefore, to higher rates of wages than were in force in 1917. The new scale of wages, with changes in hours and working conditions, which has been the result, was in force under General Order No. 27 issued by the Railroad Administration. This order established eight hours as the basic day for

all classes of labor and in many instances provided bonuses for time in excess of eight hours or in excess of the number of hours which had theretofore constituted a day. The following table shows some of the typical and controlling rates in comparison with those in force in 1917:

Employees	Rate per Hour, in Cents	
	1917	1918
Machinists	40	68
Boilermakers	45	68
Blacksmiths	43	68
Tinsmiths	43.25	68
Pipe fitters	43	68
Car repairers	27.25	58
Carpenters, locomotive and coach	30 to 34	68
Car inspectors	29.75	58
Laborers	23	35
Section foremen	77.50*	102.49*
Sectionmen	22.5 to 23.5	40
Carpenters, bridge and building	30	53
Signal repairers	34	68
Station laborers	23	35.5
Engineers:‡		
Freight	63	73
Passenger	74	87
Mixed	62.5	73
Yard	54	67
Firemen:‡		
Freight	41.5	56
Passenger	45	63
Mixed	40.5	52.6
Yard	34	47.2
Conductors:‡		
Freight	52.6	63
Passenger	68.7	83.5
Mixed	58	77
Yard	48.7	63.6
Brakemen:‡		
Freight	35	49
Passenger	41	59
Mixed	39	55
Yard	45	60

\* Dollars per month. † Includes other trainmen.  
‡ Averages for all classes of engines and service.

Increases of \$25.00 per month over the pay received on January 1, 1918, with a minimum of \$87.50 per month, were also granted to all employees who were receiving on January 1, 1918, prior to the application of General Order No. 27, a basic rate of \$62.50 per month and devoting major portions of their time to clerical work of any character, including not only clerks, but also train announcers, gatemen, checkers, baggage and parcel-room employees, callers for train and engine crew, etc. Substantially all the increases noted were made retroactive to January 1, 1918, and requiring heavy payments to adjust the wages actually paid during the early months to the new standards.

Apparently the operating expenses thus stated are still subject to increases on account of further wage increases which are under discussion, and that are likely to be made retroactive to at least September 1, 1918. These projects include an increase of approximately 15 per cent in favor of engine and train crews with, in addition, provision for payment at one and one-half times the standard rates, instead of proportionately, for all time in excess of eight hours, and an increase in favor of telegraphers.

INDUSTRIAL DEPARTMENT.

Fifty-nine new industries were located on the tracks of your Company during 1918, as compared with one hundred in 1917. Twenty-six extensions to old industries and seventeen industrial side tracks were constructed; the corresponding numbers for 1917 were forty-nine and thirty-eight, respectively. During the year the Federal management cancelled the contracts for most of the work in progress at the site of the particular exception, however, of the new third track between Schenectady and Richmondville Summit, which was under construction as a principal feature of the general grade revision between Oneonta and Mohawk Yard. The omission of this portion of the plan for adapting this part of your railway to the movement of trains of heavier tonnage would so seriously reduce the benefits obtained by heavy capital expenditures at other points, in addition to rendering useless the considerable outlay upon the particular project, that it was deemed necessary to request a rehearing, which was accorded. Upon this rehearing the former action was reversed. But before this occurred the contractors had been paid and the work stopped. The completion of the work during 1918 was, therefore, held to be impracticable, and nothing was done toward its resumption. To the end of 1917 the total expenditure on this third track was \$414,555.74, and the amount paid in the settlement with the contractor when the work was suspended was \$125,770.09, so that it now represents a capital investment of \$490,785.83, all of which remains idle and unproductive. The suspension of this improvement has also involved losses in the necessary adjustments with contractors and the natural deterioration resulting from the exposure to erosion of unfinished grading. This interruption of the development program led to the postponement of the grade reduction between Cobleskill and Barnerville, which was authorized in 1917, but could not be placed in operation until the completion of this section of the third track. The Railroad Administration also determined not to continue during 1918

ADDITIONS AND BETTERMENTS.

One of the early decisions of the Railroad Administration was to provide for a reconsideration, by an agency of its own, of every program for additions and betterments that had been approved and adopted by the owners of the properties which had been taken under Federal control. As applied to your railway, this reconsideration resulted in determination to continue most of the work in progress at the site of the particular exception, however, of the new third track between Schenectady and Richmondville Summit, which was under construction as a principal feature of the general grade revision between Oneonta and Mohawk Yard. The omission of this portion of the plan for adapting this part of your railway to the movement of trains of heavier tonnage would so seriously reduce the benefits obtained by heavy capital expenditures at other points, in addition to rendering useless the considerable outlay upon the particular project, that it was deemed necessary to request a rehearing, which was accorded. Upon this rehearing the former action was reversed. But before this occurred the contractors had been paid and the work stopped. The completion of the work during 1918 was, therefore, held to be impracticable, and nothing was done toward its resumption. To the end of 1917 the total expenditure on this third track was \$414,555.74, and the amount paid in the settlement with the contractor when the work was suspended was \$125,770.09, so that it now represents a capital investment of \$490,785.83, all of which remains idle and unproductive. The suspension of this improvement has also involved losses in the necessary adjustments with contractors and the natural deterioration resulting from the exposure to erosion of unfinished grading. This interruption of the development program led to the postponement of the grade reduction between Cobleskill and Barnerville, which was authorized in 1917, but could not be placed in operation until the completion of this section of the third track. The Railroad Administration also determined not to continue during 1918

the creation of new stations at the elimination of grade crossings in accordance with the ordinary program for the general development of your property.

From Nineveh to Windsor, a distance of nine and one-half miles on the Nineveh branch, a new second track was completed and placed in operation during June. During the year \$305,031.63 was expended on this work, of which \$97,371.30 was charged to cost of property and \$7,658.43 to operating expenses. A new second track between Lanesboro and State Lane, a distance of 2.3 miles, was undertaken and the grading completed, at a cost of \$93,122.26, of which \$86,522.21 was for new capital and \$6,600.05 for operating expenses. Bridge-work and track laying should be completed early in 1919.

The new third track between Oneonta and Cooperstown Junction, six miles, and the revision of grades between Schenectus and Cooperstown Junction, nine miles, referred to in last year's report, were finished during 1918. The cost, \$540,325.83, included \$511,775.28, chargeable to cost of property and \$28,550.55 chargeable to operating expenses.

The enlargement and rearrangement of the Carbondale Yard, in progress for several years, was substantially advanced and placed in operation during the year. Changes yet to be made at the southern end, near Dundaff Street, will be undertaken when the grade crossing at that point can be eliminated. An enlarged yard office is now under construction. This yard now has a capacity of 3,139 cars, an increase of substantially 50 per cent over the former capacity of 2,100 cars. The expenditure during the year was \$29,481.33, of which \$66,317.97 was a capital expense and \$23,163.41 a charge to operating expenses.

At Whitehall, three sidings with capacity for eighty cars each, were completed during October, providing storage space that was greatly needed. The expense was \$41,925.22, of which \$39,929.45 was charged to cost of property and \$1,995.77 to operating expenses.

At Rouses Point additional yard tracks are under construction. The grading was practically completed during October and they should be in service early in 1919. The expenditure was \$24,535.95.

At Fort Edward additional land was purchased, the engine house enlarged, a new ash pit and coaling platform constructed, and a rearrangement of tracks is in progress. The expenditure of \$18,856.69 was distributed in the sum of \$17,970.10 to cost of property and \$886.50 to operating expenses.

At the Colosse shops the installation of two new 400 horse-power boilers, mentioned in 1917, was completed at a total cost of \$22,956.18, of which \$22,922.93 represents new capital and \$33.25 operating expenses.

The addition to the general office building at Albany was completed during 1918 and occupation began in May. The whole building, modern in construction and equipment, and suitable for your corporate purposes, now supplies office space for 189,079 square feet. The addition to its cost during 1918 was \$50,516.19.

Other improvements to your property include new water tanks for locomotives, with capacity for 100,000 gallons each, at Central Bridge and Rouses Point; a restaurant and women's rest-room at Colonic shops; a "Wye" track for turning locomotives at Delanson; a new freight station at Glens Falls; reconstruction of heating systems in round houses at Wilkes-Barre, Green Ridge, Carbondale, Oneonta, Mohawk, Whitehall and Rouses Point and in other buildings at Green Ridge, Carbondale and Oneonta, this reconstruction to be completed early in 1919.

Heavy repairs to 3,434 freight train cars, including the application of Economy draft arms, 5 x 7 couplers and heavy friction springs, referred to in the report for 1917, were completed during 1918 and are approximately two-thirds completed. The equipment of two hundred steel underframe flat cars with temporary sides and removable drop-ends was completed. All freight train cars must be equipped with safety appliances approved by the Interstate Commerce Commission not later than September 1, 1919; of 18,794 cars, 18,534, or 98.62 per cent, have received this equipment. A statute requiring the equipment of locomotives with electric headlights by July 1, 1920, was the occasion of the equipment in that manner of 123 locomotives. By the same date all cabooses operated in New York must have eight wheels and steel underframes; 84 out of 212 such cars have received this equipment and 72 are to be provided for during 1919. The conversion of 135 wooden underframe gondolas into company service gondolas is in progress and about 38 per cent completed. Application of "Z" bar reinforcement to 506 box cars is in progress and about one-third completed, and the raising of the sides and ends of 500 low-side gondolas is proceeding and about 82 per cent completed.

FEDERAL VALUATION.

The valuation of your railway property in accordance with the statute of 1913, by the Interstate Commerce Commission, progressed during the year somewhat more slowly than in 1917. The deduction for the office force of the Commission owing to military necessities is assigned as the reason for reduced effort. Most of the field work, except the building and equipment inventory and the appraisal of lands has been completed. The completion of all inventories before the end of 1919 and a final report from the Commission during the ensuing twelve months are considered possible—perhaps probable. The cost of this work, to the end of 1918, amounted to \$362,342.15, of which \$302,934.56 was charged to corporate operating expenses to December 31, 1918, and \$59,407.59 to the operating expenses of the Railroad Administration during 1918.

LITIGATION.

In the suit of Katherine S. Weld and others, for an accounting of royalties under the lease of coal lands made to the company in 1859 by Henry B. Rockwell, the decision of the referee, on which judgment was entered on September 24, 1918, awarded the sum of \$429,153.60 to the plaintiffs. Appeal was taken but, pending the appeal, a proposal for settlement was received and negotiations are in progress which may lead to a settlement.

The proceeding instituted by The Rensselaer and Saratoga Railroad Company, referred to in the report for 1917, against the United States Collector of Internal Revenue and your company for the purpose of requiring the deduction from the dividend payments which your company is required to make to the stockholders of the former corporation, as a part of the rental or royalty, the amount of the duty and right of way income tax thereon, was dismissed by the United States District Court. Appeal to the Circuit Court of Appeals was taken and has been argued and is now awaiting decision.

The action begun in August, 1916, by the Mechanicville and Fort Edward Railroad Company, a subsidiary of your company, against the Fitchburg Railroad Company and its lessee, the Boston and Maine Railroad Company, to determine the title to the railway and right of way extending northward from Mechanicville, in Saratoga County, and decided adversely to your company by the trial court, is now awaiting argument on the appeal to the Appellate Division.

In the suit of The Ticonderoga Railroad Company against your company for an accounting under the contract for the operation of the former, referred to in the report for 1917, the referee determined on December 3, 1914, to be \$186,221.31. An appeal from this award has been taken by your company and there is a cross-appeal on the part of the plaintiff. Determination of these appeals by the Appellate Division is anticipated during the year 1919.

GENERAL REMARKS.

The temporary relinquishment of possession of your railway property to the Federal Government suggests a review of the eleven years period of development which began in 1907. Within a brief period which ended with the year 1906 or early in 1907, there had been acquired in your interest additional coal lands in Schoharie County of large extent, your present Canadian railway holdings, as well as additional railway properties in New York, and your interests in street and interurban electric railways, greatly expanding your several interests. This expansion had not been currently financed, and adequate provision therefor, as well as for future development, was the first problem which confronted your present management. It was met by the issue of the First Lien Equipment Bonds of 1922, bearing date as of July 1, 1907, the First and Refunding Mortgage Gold Bonds of 1943, issued as of July, 1908. These provisions made it practicable to consider the improvement and better adaptation of your railway to the economic potentialities of the communities and industries which it serves.

While your company was the first to operate a steam locomotive on the American continent, and in 1917 was probably the oldest American corporation operating a railway under its original charter, its common carrier functions were, until a few years ago, secondary to its function as a producer of fuel. Its railway system was inaugurated as an agency for the marketing of its anthracite, and the common carrier duties which it undertook were merely incidental to this principal purpose. As deciding the matter of *Interstate Commerce Commission v. Chesapeake & Ohio Railway* (200 U. S. 361), the Supreme Court of the United States determined that a corporation which was at once a common carrier and an extensive owner of coal lands could not be charged with unjust discrimination in respect to any transportation undertaken for its own account as a producer, and although the commodities clause of the Hepburn law was made by its terms to take effect on May 1, 1908, it was at first held to be unconstitutional (164 Fed. 215) and did not become actually effective until after the decision of the Supreme Court in *United States v. Delaware and Hudson Company* (213 U. S. 366), which was rendered on May 3, 1909. This decision sanctioned the relations then existing between your railroad and coal departments although for the first time it was held, in that case, that your company is a "railroad company" within the intendment of such a statute (213 U. S. 417-8). From the date of the last mentioned decision it became desirable to develop the common carrier functions of your railway upon lines wholly independent of your interest as a coal-producing enterprise.

Modernization of motive power began in 1907 with the adoption of a new and heavier type of freight locomotive, known as the E-5 locomotive, which is of the consolidation type with a weight on the drivers of 227,000 pounds. Nine of these locomotives are now in service. In 1910, six Mallet articulated locomotives were purchased and fifteen are now owned and in use. The following locomotives have been bought since 1906:

YEAR	NUMBER	TYPE
1907	18	E-5
1908	30	E-5
1910	6	Mallet
1911	4	Mallet
1911	6	Ten-wheel
1911	1	Oil-burning consolidation
1911	12	E-5
1912	3	Mallet
1913	15	E-5
1914	15	E-5
1914	10	Pacific
1915	1	E-6
1917	2	Mallet
1918	20	E-6

(Ordered in 1917)

The E-6 locomotive, shown above, purchased in 1915, was for experimental purposes, and it was in consequence of this experimentation that twenty more of the same character were ordered in 1917 and received during 1918. Commencing in 1911, specifications for new locomotives required that they should be equipped with superheaters. In 1914 the equipment with superheaters of the locomotives purchased prior to the adoption of this policy was begun and prosecuted as rapidly as the engines could be spared from service or as they were shopped for general overhauling. The following authorizations for equipment with superheaters were made and largely completed before the end of the year 1917:

YEAR	NUMBER	TYPE
1914	10	E-5 Locomotives
1915	38	E-5 Locomotives
1915	6	H Locomotives
1915	4	E-3-A Locomotives
1915	4	D-3 locomotives
1916	12	E-3-A Locomotives
1917	30	E-3 and E-3-A Locomotives

By the end of 1917 this work had resulted in greatly increasing the efficiency of the power equipment, enabling the movement of equal tonnage at materially lower operating cost. The increase in tractive power of locomotives between 1907 and 1917 affords a measure of the augmented efficiency which had been obtained.

YEAR	AVERAGE TRACTIVE POWER OF ALL LOCOMOTIVES IN POUNDS
1907	28,876
1917	38,616
Increase, per cent	33.73

At the beginning of 1907, the number of freight cars in service was 13,783; on December 31, 1917, the number was 18,302, an increase of 32.79 per cent. The mere numbers fail, however, to state the actual increase in car capacity. The increase in the number of cars has been by the addition of larger cars and has been accompanied by the retirement of many cars which were below average capacity and their replacement by cars of greater than average capacity. The average capacity of all freight cars in 1909 was 35.77 net tons, while the average of the year 1917 was 37.69 tons, an increase of 5.3 per cent. In order further to increase the efficiency of freight equipment, a program of substitution of steel underframes for wooden underframes was inaugurated in 1909 with an authorization covering 500 cars. This was followed in 1910 by an authorization of 400 cars; in 1911, 400 were authorized; in 1912, 800, and in 1917, 1,000. On December 1, 1917, there were, as already stated, 18,302 freight cars, of which 8,543, or 46.7 per cent, had steel underframes and 9,888, or 54.0 per cent, had each a capacity of 85,000 pounds or greater.

The principal increase in passenger equipment after 1906 was by the purchase, in 1916, of twenty-four steel passenger cars and three steel mail and baggage cars. In addition a number of baggage and mail cars were equipped with steel underframes. The steel passenger cars added in 1916 are provided with sleeping compartments and their use frequently enables a single car of this type to perform services for which two cars of the former type were necessary.

Additional main tracks constructed during the period under review include the following:

**Delawno to Schenectady.**—A second track, over a new line, was constructed between these points during 1907 and 1908. The location was determined by a southbound grade and it is operated as a southbound track, thus materially reducing the grade against southbound traffic between these points and greatly increasing the capacity of the railroad over this distance.

**Waterlot to Waterford Junction.**—A second track between these points was authorized in 1907 and the work was prosecuted during 1907 and 1908 and finally completed early in 1910. Owing to the heavy passenger traffic between Albany and Saratoga, traffic between these points had formerly been greatly congested and this improvement greatly facilitated operation.

**Green Ridge to Carbondale.**—Third and fourth tracks between these points were authorized during 1907 and completed in 1909. The frequent passenger service between Scranton and Carbondale and the large volume of coal traffic originating at breakers in this territory had rendered operation with the double-track line extremely difficult. The two added tracks have largely eliminated delays, and enable the railroad to handle increased tonnage between these points.

**Binghamton.**—A second track, one mile long, was constructed on Bevier Street, in this City during 1911. This permits freight trains to advance out of the Binghamton yard without blocking the main track or interfering with yard operations and has materially augmented efficiency at this point.

**Schoharie Junction to Delawno.**—As part of a plan of grade revision between these points, a third track became necessary in order to permit slow-moving freight trains to advance without interference with faster moving passenger trains travelling in the same direction. This track was put into service on December 1, 1916, and has materially benefited operation.

**Oneonta to Schenectady.**—Construction of a third track between these points was authorized in 1917 and a portion between Oneonta and Schoharie Junction was put in operation during October, 1917. This additional track was also provided for as a part of the general plan for reduction of grades between Oneonta and Richmondville Summit. The ruling grade between the two points last named is now 0.8 per cent; when the plan is complete the maximum grade will be 0.5 per cent. This work was not entirely completed at the end of 1917, but the additional track now enables heavy freight trains from the Oneonta yard to advance a considerable distance without interference with passenger trains and has greatly improved yard operations.

**Schenectady to Kischmondville Summit.**—A third track with a maximum grade of 0.5 per cent between these points is a part of the general plan for grade revision and was partly constructed during 1917.

**Nineveh Branch.**—A second track on this branch was authorized late in 1917 and construction was continued during 1918. No benefit to operations resulted from this work prior to January 1, 1918. All the heavy coal trains moving out of the Anthracite Region are operated over this branch and the single track heretofore existing was the cause of serious congestion in the past. The second track was necessary in order to increase the capacity of this portion of the road and thus to remove difficulties which tended to restrict the capacity of the whole system.

The Wilkes-Barre Connecting Railroad Company was organized in 1912, by the joint action of your company and the Pennsylvania Railroad Company for the purpose of establishing a connection between the lines of the respective companies, near Wilkes-Barre. Right of way was acquired and construction commenced during 1913, and the line was opened for operation, although not entirely completed, on March 29, 1915. This line is used to handle traffic which was formerly moved, under trackage rights, over a line owned by the Lehigh Valley Railroad Company and in addition to saving an expenditure, has greatly expedited the movement of trains. The question of grade crossings, which promised to be a very troublesome one, has also been avoided by this construction. Prior to Federal control it was operated by your company under an agreement with the other parties in interest. The cost of the one half interest secured by your company has been \$1,131,838.65.

From 1906 improvements in yard facilities were made at many points upon the system. The yard at Oneonta was remodeled and enlarged during 1906. At Glenville, N. Y., a new yard was constructed in 1907. The yard at Binghamton was enlarged in 1908. During 1909 new yards were constructed at Bluff Point, N. Y., and Jermy, Pennsylvania, the latter for use as an interchange yard with the New York, Ontario and Western Railway. The yards at Plattsburg and Rouses Point were enlarged during 1912 and that at Mechanicville was remodeled and enlarged in 1913.

A principal improvement of this character, in progress throughout the years from 1913 to 1917, inclusive, was the reconstruction and enlargement of the yard at Carbondale. This yard is one of the most important facilities in the operation of the Company's railroad as it is located at the concentration point of all northward bound anthracite passing over the lines, and the chief distribution for empty cars returning to the colliers for reloading with coal. Carbondale is located at substantially the extreme north end of the Lackawanna Coal Basin, only one anthracite mining operation, that at Forest City, Pennsylvania, being further north. All but one of the mines of The Delaware and Hudson Company's system are within the region between Plymouth and Carbondale, in the Susquehanna and Lackawanna Valleys, and are well distributed over the intervening distance of about thirty-eight miles. Empty cars, destined to the anthracite mines, are taken out of the Carbondale yard by road engines which deliver them at the breakers and, picking up the cars which have been loaded, return to the yard. In the yard, these loaded cars are sorted and arranged in trains with regard to convenience in delivery at destination and junction points. In addition there is handled in this yard, a considerable tonnage of general freight traffic, and a considerable tonnage consisting of trailer moving in car loads, which is interchanged with the Pennsylvania Railroad at Wilkes-Barre. This yard is also used for handling business of the Erie Railroad from and to anthracite mines in the same region. That company owns the railroad extending northward from Carbondale, which is used by The Delaware and Hudson Company as far as Jefferson Junction, under a long term agreement, and in consideration of the payment of trackage charges. The Erie Railroad has no direct connection with trailer moving over its own rails and has, therefore, arranged to use The Delaware and Hudson Company's railroad between Carbondale and Avoca, handling thereover a considerable tonnage which passes through Carbondale yard and is there sorted and arranged in trains substantially as this Company's own traffic is handled. This yard was established in 1872 and successively enlarged during 1888, 1893, 1895 and 1899. The growth of the work there accomplished is indicated by the following which shows the average tonnage, during each period, moving northward out of this yard on which this Company has paid trackage charges to the Erie Railroad for use of the Jefferson Branch.

Period.	Average Tons Moved Per Year
Years 1874 to 1879.....	287,750
Years 1880 to 1889.....	1,076,164
Years 1890 to 1899.....	1,819,000
Years 1900 to 1909.....	4,713,499
Years 1910 to 1917.....	8,621,985

Previous to 1910 the expansion of this yard had been by the addition of new tracks wherever the topography permitted and there had been, apparently, no well considered plan of development. It was not properly co-ordinated with the balance of the system, its capacity was insufficient and it was not economical in operation. The tracks were too short to hold entire trains. The railroad had also constructed a yard, of limited capacity, on land leased from this Company and this yard was of inadequate capacity and unsatisfactory design. In these circumstances a study of the situation, locally and as related to the entire operation of the Company's railroad, was undertaken in 1910 and a comprehensive plan, contemplating progressive development over a considerable period and with the minimum interference with regular operations was ultimately formulated and adopted.

The initial step was the reconstruction of the engine terminal in co-ordination with the general plan for the development of the whole railroad. The old roundhouse, tuntable and coal and ash-handling facilities were too small for the motive power contemplated by this development, particularly for the Mallet locomotives intended for use as pushers on the heavy grade immediately north of Carbondale. These Mallet locomotives are ninety-two feet long, while those for which provision had formerly been made were about seventy-three feet long, and the weight of this new power exceeded that of the old by about fifty per cent. This part of the work was authorized in 1910 and completed during 1911. At the time of this authorization, the officers were empowered to purchase the land necessary to the entire plan of the yard and purchase and remove the whole area necessary was not immediately obtained owing to difficulties in dealing with certain of the owners and those incident to the elimination of certain grade crossings. A further step in the program, the construction of storage tracks for locomotives, car repair tracks and the rearrangement of water-tanks and water supply lines was completed in 1914. The earliest authorization covering reconstruction of the actual yard itself was granted during October, 1914, and covered the construction of two new pushers on the western limits of the yard as it then existed and of certain new tracks within the existing yard. To obtain space for the new tracks it was necessary to level a large section of the hill lying west of the yard and to remove the old yard of the Erie Railroad. The latter was provided for by permitting the Erie to use the new yard upon paying part of the cost of its operation and maintenance. This work was prosecuted throughout the whole of the calendar year 1915. The new facilities were provided for use during that year and the work interfered somewhat with the operation of the old facilities as the material taken from the hill had to be moved southward through the southern end of the yard and about one and one-half miles on the main tracks to "Duffy's Field," where it was planned to erect a new plant for the storage of anthracite. The new coal storage plant at Duffy's Field was a part of the general plan of reconstruction. In 1899, a "storage" plant for coal had been provided on a location just north of the yard as it then existed and east of the Lackawanna River. To straighten the channel of the river in order to permit the lengthening of the yard tracks it was necessary to utilize this space and therefore to remove and reconstruct the storage plant upon another location. Authority to do this was issued in May, 1915, and the work completed during December, 1916. Every effort was made to accomplish this removal with the minimum interference with the use of the plant but a heavy reduction in its capacity during a portion of the time was unavoidable. As an incident of this yard improvement it was necessary to eliminate a grade-crossing by constructing a highway bridge over "Simpson's Road." The final plan of the yard required two additional main tracks across this road for which the consent of the local authorities was required. The highway was occupied by a street railway track and the traffic on both the street railway and on the highway was heavy so that the continuance of the grade-crossing, with additional railway tracks, was considered, by the authorities, exceedingly dangerous. An overhead bridge, to carry the street railway and the highway, was constructed under an agreement by which its cost, together with that of the necessary approaches, was unequally divided by the Scranton Railway Company, and The Delaware and Hudson Company. A portion borne by the latter company was provided as part of the cost of the yard improvement. The work was completed and the overhead structure placed in use on December 7, 1917.

The completion of the yard improvements was provided for by an authorization issued during October, 1916, and the final work progressed throughout the whole of the year 1917. The new main tracks were placed in operation in October, 1917, and some of the new yard tracks became available during the preceding summer. Actual repairs to the new tracks from these heavy outlays until the new main tracks could be utilized and full use of the improved yard could not be attained during the brief remainder of the calendar year. During December, 1917, however, the new facilities began greatly to facilitate the operation of the property as a whole. The cost of these improvements to the Carbondale yard exceeded \$1,500,000. Before the work began in 1910, the yard had an approximate length of 5,000 feet and an aggregate capacity of 2,100 cars. The new yard run over to the Railroad Administration on January 1, 1918, has an extreme length of 7,200 feet and capacity for 3,139 cars, an increase in car capacity of 49.48 per cent. This, however, by no means measures the gain accruing from this expenditure. Not only has nominal capacity been greatly increased, but an uneconomical yard, difficult and costly to operate, has been replaced by one thoroughly modern and efficient in design and arrangement. The relation of the old yard to the railway system was such that its inadequacy was reflected over the entire system; that of the enlarged and improved yard is such that its operation increases the capacity and efficiency of the entire railroad.

The development of the railroad required new locomotive shops. Previous to 1911 heavy repairs to locomotives were distributed between shops at Carbondale and Scranton. The number of locomotives and in the size and weight of the power units these shops became inadequate. It was considered necessary to locate shops of much greater capacity at a single point as near as possible to the center of locomotive distribution. Such shops were erected at Colonie, a short distance north of Albany, during 1911 and 1912. The design of these shops was new and presents many novel features in shop economy. As required by the transfer of engine work to the new shops, the place of the old style transfer-table and is located in the centre of the shop. It has bays on both sides for erecting pits, behind which are bays for machine tools, the light tools being placed in galleries. When first made available for use these shops were considered to be the most advanced and complete of their kind in the country. In order to provide for their erection, the Company acquired 111.87 acres of additional land, of which 100 acres are situated by the transfer of engine work to the new shops, the balance available for expansion. The buildings are so located that they may be doubled in size by end extension. The total cost has been \$2,592,856.63. The new shops have effected a considerable saving in expense by (1) concentrating this kind of labor under proper and unified supervision and (2) by reducing the time required for repairs and more promptly returning locomotives to service. In connection with this development, the company provided a yard for passenger cars, which is equipped with the same machinery district, including facilities for the repair of passenger and freight cars.

Proper handling of the larger and heavier locomotives, particularly at the ends of runs, has made necessary the replacement of many of the

older enginehouses by structures of greater size, many of the old turntables were too short and of insufficient strength, while ash-pit and coaling facilities, and quite under former conditions, became obsolete. At Oneonta 75 foot turntable and fifty two stalls was built in 1906, together with a built as those in existence were too short and caused serious delay. In 1916 this roundhouse was further enlarged and a plant for the storage of locomotive fuel was erected in order to avoid delays in times of coal shortage. Binghamton was provided with a new 10-stall roundhouse, 40 foot turntable, modern ash-pit and mechanical locomotive fuel table, ash-pits and coaling station with a new 41-stall roundhouse, a 90-foot turntable, 90 foot turntable, ash-pits and locomotive fueling plant were erected at the Colonial shops in 1911. In 1913, a new 5-stall roundhouse with a 40-foot turntable, ash-pits and mechanical locomotive fueling plant were erected at Mechanicville. All these structures are of the most modern design and capacity sufficient for the longest locomotives.

Motive power of greater capacity of course increased the normal length of trains and passing sidings which sufficed with lighter power were rendered inadequate. Additional sidings of sufficient length were necessary and became necessary in the co-ordination of a railroad of the heaviest traffic. New sidings were constructed at Schenectady, Sidney, Wells Bridge, Cambridge and Cobleskill in 1909; at Castleton and Cambridge in 1910; at Fort Edward, Summit (two), Dog Ann (two) and Ballston (two) in 1911; at Montclair Landing, Crown Point, Wadhams and Canada Junction in 1912; at Cobleskill and West Richmondville in 1915. Old sidings were removed, West Pawlet, Tunnel, Schenectady and East End.

The earliest work on a comprehensive scale, to obtain more favorable grades, was the reduction of the grades against north-bound traffic between Nineveh and Oneonta. This was accomplished in 1911 with the result of 0.3 per cent. With this reduction it became possible to move full length trains from Carbondale to Oneonta without, in any way, breaking the load and on one locomotive to haul from the summit north of Carbondale to the end of the division any train which can be taken to the summit by a single locomotive reinforced by a Mallet pusher. Work was next undertaken by the attainment of a maximum of 0.5 per cent, the ultimate object in view, to adjust the program in such a way as to obtain, as was practicable, a maximum of 0.8. The adverse grades formerly encountered averaged as high as 1.6 per cent. This work was in progress during 1916, the work of that year including the section between Worcester and Richmond-lans. These portions of the improvement became available for service on December 1, 1916, and have resulted in considerable economies since that date. The completion of this work so as to obtain the 0.5 per cent maximum, in accordance with a plan developed after a great deal of study, was authorized in 1917. This will require revisions of grades on the sections between Oneonta and Schenectady and Cobleskill and Barnerville and the construction of a new line on an entirely new location from Schenectady. During 1917, part of the work between Oneonta and Schenectady was accomplished and the new line from Schenectady to Richmondville was completed and placed under construction but not completed. With the completion of this phase of the work, the tonnage capacity of locomotives on the Susque-operating expenses. With the maximum of 0.5 attained it will be possible to haul trains of the maximum tonnage from Oneonta to Schenectady with only one use of a pusher locomotive between Schoharie Junction and Esperance.

The grade revisions referred to are all upon the Susquehanna Division which extends from Binghamton to Albany and Mechanicville. This is the area of greatest traffic density for the railroad as it is traversed not only by the greater portion of the anthracite shipments originating at the mines adjacent to its tracks and the bituminous coal and its merchandise traffic interchange with the Pennsylvania Railroad and Central Railroad of New Jersey at Workes-Barre, but also by heavy general merchandise and bituminous coal traffic interchanged with the Erie and Lackawanna railroads at Binghamton, and with the Lehigh Valley at Owego. This commodity tonnage is moved to Oneonta on through trains either from Binghamton or from the Pennsylvania Division via Nineveh. At Oneonta the traffic is sorted and moved northward, through Delanson, to Albany and Mechanicville, or southward through Saratoga into Canada. Local business, while considerable, constitutes but a relatively small proportion of the total tonnage and under normal conditions the north-bound business greatly exceeds that moving southward. Consequently there is a heavy southward movement of empty cars, the preponderating portion of the anthracite cars going back to the coal region without loads. Except under extraordinary conditions the greater part of the power moving toward the south is on a single-track road in 1865 and, in conformity with the custom and necessities of that period, was located with the custom and necessities and expenditures rather than to the economies in operation which might have been gained with a greater first cost and more attention to securing a low-grade line. Later this was made a double track line but without reduction or reduction of grades. Oneonta lies in the valley of the Susquehanna River and to reach Delanson it is necessary to cross two water ways, first, that separating the Susquehanna and Schoharie Valleys, next dividing the latter from the valley of the Hudson River. Exhaustive studies of the topography and possibilities of this region were necessary before actual work was undertaken.

On June 30, 1913, an agreement was made with the City of Albany in pursuance of which the company's terminal facilities in that city for both passengers and freight have been greatly enlarged and improved and a new office building and freight terminal obtained. This contract was the result of long consideration and represented the desire of the municipality to improve the appearance of the water-front and the lower portion of State Street, as well as the wish of the company to obtain enlarged facilities. Prior to these changes the operation of the property was hampered by grade crossings, inadequate truckage, badly located freight terminals and insufficient office room under its own ownership. Not only have these defects been remedied by the improvements, but provision has also been made for further expansion to meet additional requirements of the future. It is necessary to understand that all the foregoing improvements were obtained until all were completed. The problem was to increase freight-train efficiency. This involved, primarily, better grades, locomotives of greater tractive power and larger cars. Larger locomotives required better road bed and stronger bridges as well as larger enginehouses, turntables and ash-pits. Longer trains, made possible by better grades, turntable and ash-pits, required larger and more capacious terminal and assorting yards, longer passing tracks and more second and third tracks. New and additional power and cars required new shops. All these

changes and improvements had to be balanced and co-ordinated so that the completed property would function efficiently as an entity. It was a process of construction and development resulting at the end of December, 1917, which was of much greater capacity and entirely different from that which was operated during the period of development.

#### FEDERAL CONTROL.

To the end of May, 1918, the railway properties under Federal control were operated through their managing boards and the officers selected by these boards or directly by the owners. At the beginning of June, however, the Director General, without assuming any definite reasons therefor, appointed "Federal Managers," who were required to separate themselves wholly from relations with the owning and formerly operating corporations. Your former Vice-President and General Manager, operating corporations, was designated as the Federal Manager of your railway and its related railway and boat lines in the United States, and immediately assumed to be an officer of your corporation, and immediately coincident with this change, a complete separation of the railway and its subsidiary corporations, corporate managements was required involving a rigid classification of the personnel and in some instances the distribution of duties formerly performed by single officers. No comment upon the wisdom of these requirements is made or intended. It must be noted, however, that it adds another to the problem of readjustment, the solution of which must accompany or precede the restoration of the properties to their owners.

The act of March 21, 1918, under which the railways are now operated, the "proclamation by the President of the exchange of ratifications of the treaty of peace." Notwithstanding certain efforts to prolong the period and an apparent desire on the part of a numerically slight section of the public to utilize the emergency action, in violation of solemn pledges at the time it was taken, as a means to permanent ownership by the Government, it is plain that the great majority of the public desires as prompt return as possible to normal methods and conditions. Independent and true of those who, as travellers and shippers, have most frequent occasion to require railway services. The discussion of the legislative changes which should accompany the return of the properties to their owners, is now in progress, many and varied programs have been suggested, and within a short time the consideration of measures is likely to become detailed and initial recognition that the solitary basis of necessity for the radical action and methods that had been resorted to, rather than developed, up to that time, it was the financial weakness of the carrier corporations caused the proclamation of December 26, 1917. On the side of financial resources the conflicting authorities, none of them with definite or recognized responsibility for obtaining new conditions between regulated expenses and permitted reflecting rates of wages), upward, while rates of fare and freight were regulated in the opposite direction or held nominally stationary while the medium of payment was rapidly declining in purchasing power. The war had merely threatened, but with the enormous inflation of the war period and with the sudden pressure upon the reduced supply of labor and only relief lay in the direction of a prompt adjustment of rate schedules. The new conditions and between such an adjustment of the corporate managers, machinery of regulation seemed to interpose as an insurmountable obstacle. By means of Federal possession, the President conceived that an adequate adjustment of rates could be obtained without excessive delay and that, pending such adjustment, the inevitable losses of operation could be, in the main, shifted to the public treasury. If the former could have been accomplished without Federal possession, the latter would have been unnecessary.

The principle of the elimination of the conditions of which this weakness in face of emergency, the inevitable result. The mere form of the regulations system determined upon is of minor consequence. The essential is that it should be complete and systematized, prompt and sympathetic. If rates of wages are to be controlled by public authority, in consideration of the obligation of employees as well as owners not to interfere with the public services rendered by the facilities they operate, it is necessary that there should be co-ordination between the regulation of wages and the regulation of rates. Otherwise, the carriers are not unlikely to be required to pay wages in amounts in excess of any income available for that purpose, in effect out of capital, with the early result of impairment of service and the ultimate consequence, if uncorrected, of its discontinuance. There have, in recent years, been many instances in which one public or quasi-public authority has coupled with a direction to increase wages the declaration that to meet the added expenses there must be compensatory changes in rates, only to have the proposed compensation rethused by a second authority actually constituted by the same public—that is deriving its powers from the same source. For immediate returns to their owners and these returns secured by but narrow margins of safety. Such has been the public attitude in the more recent past, where it has not appeared to be even less favorable, and there is no evidence of a change of temper in this respect. If this attitude were to be fatal to private management of the railroads, it would destroy the margin between solvency and insolvency and must, if unabsorbed, be remedied must always be applied before the margin has been which the past has shown to be insufficient. This implies a degree of rapidity in the processes of regulation service enterprises have been compelled to wait for justice until action which, if promptly taken, would have sufficed, has been wholly insufficient. The correction of this defect is among the plainest and most imperative of all that must be applied by the public interest. Moreover, regulation to be consistent with the public interest needs of the industry. The scales of justice must be held in balance and without partiality to the purchasers of transportation and with adequate comprehension that, in the long run, the interests of those who desire transportation services and those who are equipped to render such services are identical. Economic efficiency reposes in ability and intention to create and dispose of some commodity or service on terms which afford a profit to both parties to each transaction, the seller and the buyer. If either the railways or the purchasers of railway services fall below this standard the condition must speedily be corrected or the whole industry fabric will be unfavorably affected.

By order of the Board of Managers,

L. F. LORÉE,  
President.

## Railway Officers

### Railroad Administration

#### Regional

**Horace Epes**, of the Washington office of the Associated Press, has been appointed special assistant to **B. L. Winchell**, regional director of the Southern region, with office at Atlanta, Ga.

#### Federal and General Managers

**K. B. Conger**, general manager of the Hudson & Manhattan, has been appointed federal manager, with headquarters at New York.

**W. H. Edmondson** has been appointed assistant to the federal manager of the Grand Trunk, Western Lines, with headquarters at Detroit, Mich.

**J. P. Main**, assistant to the federal manager of the Ann Arbor and the Detroit & Toledo Shore Line, with headquarters at Detroit, Mich., has been appointed assistant to the federal manager of the latter line and the Toledo, St. Louis & Western, with headquarters at Toledo, Ohio.

**Alfred M. Darlow**, whose appointment as federal manager of the Buffalo & Susquehanna, with headquarters at Wellsville, N. Y., has already been announced in these columns,

was born on November 29, 1884, at St. Louis, Mo. He began railway work in June, 1902, as a rodman on the Vandalia Railroad, and later went to college. He graduated from Cornell University with the degree of M. E. in 1906, and the same year entered the service of the Chicago & Eastern Illinois as a special apprentice at the Danville (Ill.) shops. In 1909 he was made round-house foreman and served at Dolton and at Danville, on the same road. He was appointed mechanical engineer of the Buffalo &

Susquehanna, at Galeton, Pa., in 1911, and later assumed also the duties of general storekeeper. From 1912 to 1916 he was superintendent of motive power at Galeton in charge of stores and mechanical departments, and then, to 1918, served as assistant to president and superintendent of motive power in charge of operation. On June 13, 1918, he was appointed general manager under the United States Railroad Administration, which position he held until his promotion, on April 7, as federal manager of the same road, as above noted.

#### Operating

**T. H. Hervey** has been appointed superintendent of car service of the Ann Arbor Railroad, with headquarters at Toledo, Ohio.

**F. Schaefer**, district freight agent of the San Francisco & Portland Steamship lines, with headquarters at San Francisco, Cal., has been promoted to manager, with the same headquarters, succeeding **G. L. Blair**, general manager, deceased.

**H. M. Williams**, recently discharged from the army, has been appointed terminal superintendent for the New York, Chicago & St. Louis, with headquarters at Chicago. **Ogden**

**Pierce**, acting terminal superintendent, has been appointed terminal trainmaster, with the same headquarters. **E. S. Kirby**, acting terminal trainmaster, has been assigned to other duties.

**R. B. White**, superintendent of the Philadelphia division of the Baltimore & Ohio, with office at Philadelphia, Pa., has been appointed superintendent of the Baltimore division, with headquarters at Baltimore Md. On May 1 the Philadelphia and Baltimore divisions, exclusive of the Baltimore Terminal division, were consolidated and are now known as the Baltimore division.

**William C. Bevington**, whose appointment as superintendent of the Joplin division of the Missouri Pacific, with headquarters at Nevada, Mo., was announced in the *Railway Age*

W. C. Bevington

of April 18, was born in New Lenox, Ill., in 1868, and received his education in the high school of that city. He entered railway service in 1885 with the Chicago & North Western as operator, since which he was consecutively, until 1897, despatcher, chief despatcher and terminal trainmaster. The following two years he was in the employ of the Union Pacific, and from 1899 until 1905 he served on the Chicago, Rock Island & Pacific as despatcher, chief despatcher and trainmaster on the Kansas and

Colorado divisions. From the latter date to 1907, he was in the employ of the Chicago, Burlington & Quincy as assistant chief despatcher and chief despatcher, resigning from that road to enter the employ of the Missouri Pacific as chief despatcher, which position he held until 1911, when he was promoted to trainmaster of the Joplin division, with headquarters at Nevada, Mo., in which capacity he served until his recent appointment.

#### Financial, Legal and Accounting

The following appointments have been announced by **E. F. Blomeyer**, federal manager of the Ann Arbor Railroad, effective May 1: **Joseph Goldbaum**, auditor, has been appointed federal auditor, and **Alexander L. Smith**, general attorney, has been appointed general solicitor; both with offices at Toledo, Ohio.

**B. C. Stevenson**, who was appointed federal manager of the Toledo, St. Louis & Western and the Detroit & Toledo Shore Line, as announced in the *Railway Age* of May 2, has made the following appointments: **W. A. Eversman** becomes solicitor, with headquarters at Toledo; **L. T. Williams** becomes assistant general solicitor, with headquarters at Toledo; **R. Larmer**, assistant auditor of the Toledo, St. Louis & Western, with headquarters at Toledo, becomes federal auditor, with the same headquarters; **G. S. Ross**, assistant federal treasurer of the Toledo, St. Louis & Western, with headquarters at Toledo, becomes federal treasurer, with the same headquarters.

The following appointments have been made on the Grand Trunk, Western Lines, following the appointment of **H. E. Wittenberger** as federal manager: **W. K. Williams**, general attorney of the Grand Trunk, Western Lines, with headquarters at Detroit, Mich., has been made general solicitor, with the same headquarters; **N. C. Foss**, purchasing agent of the Ann Arbor, with headquarters at Toledo, Ohio, has been made purchasing agent of the Grand Trunk, with headquarters at Detroit; **William A. Geer** has been appointed general attorney, with headquarters at Detroit; **E. J. Cooper** has been made general claim agent, with headquarters at Detroit;

L. R. Flanders becomes freight claim agent, with headquarters at Detroit; J. O. Talbott, federal auditor of the Grand Trunk, Western Lines, and the Pere Marquette, with headquarters at Detroit, has been appointed federal auditor of the Grand Trunk, with the same headquarters; J. L. Cramer, federal treasurer of the Grand Trunk, Western Lines, and the Pere Marquette, with headquarters at Detroit, has been appointed to be federal treasurer of the Grand Trunk, with the same headquarters.

### Traffic

H. S. Bradley has been appointed traffic manager of the Ann Arbor Railroad, with office at Toledo, Ohio.

F. S. Ross has been appointed general freight agent of the Detroit & Toledo Shore Line, with headquarters at Detroit, Mich.

C. E. Rose, assistant general passenger agent of the Toledo, St. Louis & Western, with headquarters at Toledo, Ohio, has been promoted to general passenger agent with the same headquarters.

G. J. Vizard, heretofore assistant general freight agent of the Erie, with headquarters at Chicago, has been appointed manager of the traffic bureau of the Little Rock (Ark.) Board of Commerce.

The jurisdiction of R. R. Mitchell, general freight agent; S. G. Warner, general passenger agent; H. A. Weaver and J. R. Mills, assistant general freight agents, and F. D. Downie, general baggage agent has been withdrawn from the Midland Valley, the Kansas City, Mexico & Orient and the Missouri & North Arkansas. Eugene Mock of the St. Louis (Mo.) District Freight Traffic Committee has been appointed general freight and passenger agent of the Midland Valley with headquarters at Muskogee, Okla. E. H. Shaufler, general freight agent of the Kansas City, Mexico & Orient has been promoted to general freight and passenger agent with headquarters at Wichita, Kan. C. E. Veatch has been appointed general freight and passenger agent of the Missouri & North Arkansas with headquarters at Harrison, Ark. Percy Talbot, acting division freight and passenger agent of the Midland Valley at Muskogee, has been promoted to division freight and passenger agent with headquarters at Tulsa, Okla. J. R. Holcomb has been appointed division freight and passenger agent of the Kansas City, Mexico & Orient with headquarters at San Angelo, Tex.

### Engineering and Rolling Stock

F. R. Ramsey, engineer maintenance of way of the Toledo, St. Louis & Western, with headquarters at Frankfort, Ind., has been promoted to chief engineer, with the same headquarters.

C. E. Allen, general master mechanic of the Northern Pacific, at Livingston, Mont., has been appointed general master mechanic of the lines east of Mandan, N. D., with headquarters at St. Paul, Minn., vice T. J. Cutler, transferred.

A. M. Traugott, division engineer of the Virginian Railroad, with office at Princeton, W. Va., has been appointed acting chief engineer, with office at Norfolk, Va., vice F. L. Nicholson, who is resuming full service with the Norfolk Southern Railroad.

R. B. Robinson, whose appointment as engineer maintenance of way of the Union Pacific, with headquarters at Omaha, Neb., was announced in the *Railway Age* of May 2, began railway work with the Union Pacific, with which road he served in various minor engineering positions for six years. For the past 15 years he has been in the employment of the Oregon Short Line in various engineering positions leading up to that of engineer maintenance of way in which capacity he served until his recent promotion.

J. O'Connor, special roadmaster of the Minneapolis, St. Paul & Sault Ste. Marie with headquarters at Minneapolis, Minn., has been appointed general roadmaster of this road, the Duluth, South Shore & Atlantic and the Mineral Range with the same headquarters. The position of special roadmaster has been abolished. J. B. Kelly, roadmaster on the

Minneapolis, St. Paul & Sault Ste. Marie with headquarters at Minneapolis, Minn., has been promoted to assistant general roadmaster with the same headquarters. H. P. Stafford, general roadmaster of the Duluth, South Shore & Atlantic with headquarters at Marquette, Mich., has been promoted to assistant general roadmaster of this road and the Mineral Range with same headquarters.

J. W. Oplinger, superintendent of motive power of the second and third divisions of the Atlantic Coast Line, with headquarters at Waycross, Ga., resigned, effective, May 1. He entered the service of the Central of New Jersey on March 1, 1874, as a machinist apprentice and after completing his apprenticeship in 1878, served as a machinist until 1880 on the same road. He then went to the Lehigh Valley as a machinist at Wilkes-Barre, Pa., and four years later left that road to go to the Atchison, Topeka & Santa Fe, in New Mexico, remaining in the service of that road until 1887. He then returned to the Central of New Jersey as gang foreman, and later was erecting foreman on that road. In 1894 he served as general foreman on the New York, Susquehanna & Western, and in 1900 was appointed master mechanic on the Atlantic Coast Line. Four years later he was promoted to superintendent of motive power of the second and third divisions, with office at Savannah, Ga., and since 1910 at Waycross, Ga., from which position he now resigns to retire to his farm in Pennsylvania.

### Purchasing

C. Z. Hughes has been appointed purchasing agent of the Ann Arbor Railroad, with office at Toledo, Ohio.

Dwight C. Curtis, inspector of stores on the Chicago, Burlington & Quincy, with headquarters at Chicago, has been promoted to supervisor of stores of the Northwestern region, with the same headquarters, succeeding J. E. Mahaney, resigned to accept service elsewhere.

### Corporate

#### Executive, Financial, Legal and Accounting

J. F. Aitchison, acting auditor of disbursements on the Grand Trunk and the Grand Trunk Pacific, has been appointed auditor of disbursements, with headquarters at Montreal, Que., and the title of acting auditor of disbursements has been abolished.

### Operating

W. C. Ramsay, auditor of the Dayton, Toledo & Chicago Railway Company, has been appointed assistant general manager, with headquarters at Dayton, Ohio.

W. E. Brown, general manager of the Dayton, Toledo & Chicago Railway Company, with headquarters at Dayton, Ohio, has been appointed general manager also of the Oklahoma, New Mexico & Pacific Railway Company, with headquarters at Ardmore, Okla.

### Traffic

W. G. Roche has been appointed general agent of the freight department of the Canadian Pacific Ocean Services, Limited, with office at Chicago, and J. R. Clancy has been appointed general agent of the freight department for Ontario, with office at Toronto, Ont.

H. L. Blackstone, general agent of the Sacramento Northern, with headquarters at San Francisco, Cal., has been promoted to assistant general freight agent, with headquarters at Sacramento, Cal. He was born in Shullsburg, Wis., in 1875, and entered railway service in 1899 with the Chicago, Milwaukee & St. Paul. In the same year he entered the employ of the Great Northern as traveling freight agent, at Butte, Mont. He remained in this position until 1904, when he was appointed agent, with headquarters at Fernie, B. C. From 1909 to 1914 he was in the employ of the Western Pacific as traveling freight agent at San Francisco, Cal., remaining with that road for five years and then entering the employ of the Sacramento Northern as general agent at San Francisco, in which capacity he served until his recent promotion.

# EDITORIAL

## Railway Age

# EDITORIAL

The salaries of many railway general officers have been reduced under government operation. The average compensation of those receiving more than \$3,000 a year is 20 per cent less than it was when the government took the railways over. On the other hand, the wages of train service employees recently have been advanced again, and now average about 40 per cent more than a year ago. An incident illustrating the effects upon the mode of living of the officers and the employees which the reduced salaries and increased wages are producing has come to our attention. The general manager of a certain railroad who has had his salary reduced advertised a Packard automobile for sale. He received in reply a letter from one of the freight conductors on his railroad seeking to buy the car. The general manager has sent us the original letter for our edification. Now that general managers, in order to reduce their expenses, have to sell their high priced automobiles, and their freight conductors offer to buy them, we think the time has about come for railway officers to organize themselves into a trade union. We note that in Europe the bourgeoisie have begun to organize to protect themselves from exploitation by the proletariat. If government operation were continued, and railway officers did not form themselves into a union, it would apparently be but a matter of time until all the officers would be looking with envy upon the automobiles owned by the employees.

The Railroad Y. M. C. A., after a long period of careful preparation, is about to inaugurate a continental extension program that has a number of unique features and promises to very greatly enlarge and extend the efforts of that organization. The 300 Associations in this country and Canada are carrying forward this movement as a unit; the railroad men, themselves, have done a large part of the planning and will do the greater part of the work, the secretaries or employed officers being utilized largely in an advisory capacity. During the coming week, May 18-24, efforts will be concentrated on increasing the membership. Every Association will be divided into two parts, each of which will strive to make a better record than its opponent in renewing memberships and securing new members. In the same way, different parts of a railroad system will be pitted against each other. Different railway systems will also engage in friendly rivalry. This idea has been extended even to having different regions of the Railroad Administration challenge each other. During the next few months, the new members will be assimilated, and in the fall there will be a series of programs of service which will be participated in simultaneously by all of the associations. For instance, one week will be devoted to making plans and putting into effect educational programs for the year. In a similar way, a week will be devoted to religious work, another to thrift, and others to patriotism and sociability, and health and happiness. The Railroad Y. M. C. A. has been a most important factor in improving the conditions under which the enginemen and trainmen and others have had to work, thus adding to the safety and efficiency of operation. It has, however, largely

limited its efforts to serving the road men and has not been as active as it might be in trying to reach all of the railroad men with a service program. The movement which it is entering would seem to be a long step in that direction, and it is to be hoped that it will receive the most cordial co-operation from all railroad men who are interested in the welfare of their fellows.

## Making the Railroads Pay for the Waterways

ONE INFLUENCE that has served to make railroad transportation, or at least the privilege of owning railway securities, more expensive than it should be is the zeal with which the United States War Department has protected the potential waterways of the country for a waterway traffic which may come some time in the distant future. Much of this zealous solicitude has worked a burden on the railroads which have been forced to spend vast sums for draw-bridges that have never opened to pass a ton of freight, or in high bridges whose expensive channel spans are rarely smutted by the smoke of a passing steamer. Notwithstanding the decadence of inland waterway traffic the demand for larger and more expensive structures keeps ever apace with the advancement of the art in bridge engineering. Where 400-ft. clear spans were considered adequate 40 years ago, 600-ft. spans are now being demanded.

One especially unreasonable exaction of the government in its solicitude for a waterway traffic that is not, but some time may be, was the order for the raising of the Pennsylvania Lines bridge over the Allegheny river at Pittsburgh. In March, 1917, this four-track (two-level) structure was ordered raised 12.5 ft. and the road was given just one year in which to complete the work. Since the demand for this difficult and expensive project came just at our entrance into the world war it is to be inferred that this was a war measure. However, it is of interest to note that the Pennsylvania Lines bridge is the fifth bridge over the Allegheny river above its confluence with the Monongahela, there being four city bridges connecting the Pittsburgh side of the river with the Allegheny side within this distance under which any river traffic coming up from the Ohio river must pass before encountering the railroad bridge. The city bridges were also ordered raised, but the interesting detail of the whole story is that while the railroad was required to raise its bridge within a year's time, the city was allowed 2½ years in which to complete the work on its structures.

The change in the Pennsylvania Lines bridge cost \$800,000, while necessary alterations to approaches made the total expenditure considerably over a million dollars. The work has now been completed for over a year, yet not even a beginning has been made in the raising of the city bridges. So while the river traffic is still subject to the headroom restrictions the Pennsylvania Lines are paying the interest on a million dollars additional investment. Whether measures such as this will ever be effective in developing the inland waterway traffic which will be so potent in solving all of our economic and social ills, we cannot say, but meantime the public will be paying the excess cost of railway transportation due to requirements such as this.

## Industrial Board's Exit Does Not Restore Normal Conditions

DIRECTOR GENERAL HINES' refusal to pay the steel prices fixed by the Industrial Board has had one good effect. It has caused the board to go out of existence. The board's chairman, George N. Peck, had demonstrated his unfitness for his position. Throughout the negotiations he assumed an attitude well calculated to destroy the confidence and arouse the ire of officials of the Railroad Administration. Besides, it was very doubtful from the board's inception whether it was desirable for the government to continue to try to fix prices, since the war was ended. If it had performed its functions in an intelligent and reasonable way it might have aided in the transition of prices from a war to a peace basis. But government boards, experience has shown, seldom perform their functions intelligently and reasonably. The passing of the Industrial Board is welcome as the removal of one more governmental obstruction to the return of the country to normal industrial conditions and business methods.

The director general of railroads has recently tried, by direct negotiations with the steel companies, to get better prices than those fixed by the Industrial Board. These negotiations have failed, and it is announced that the Railroad Administration will advertise for competitive bids on 200,000 tons of rails. It does not seem highly probable that substantially better prices will be obtained in this way than already have been offered, although the outcome may be different from what now appears likely. The retirement of the Industrial Board from the scene has not restored normal conditions of doing business, in either the iron and steel field, or any other field, in which the railways are large purchasers. There was mighty little competition in prices among manufacturers of steel rails for years before government operation of railways was adopted; and the very fact that the government is now operating the railways affords those who sell materials and supplies to the railways a strong incentive to refrain from very active competition in prices for their business.

Government control gives the Railroad Administration a virtual monopoly of purchases for the railroads, and the Railroad Administration, when W. G. McAdoo was director general and John Skelton Williams was director of purchases, assumed an attitude and adopted a policy regarding purchases which indicated a purpose to use the monopoly power of the Railroad Administration almost regardless of the consequences to concerns from which they bought goods. It centralized control of purchases in such a way as to make it practically impossible for any concern to make a different price to one railway from what it made to all others. Its spokesmen talked about the pooling of patents and the foregoing of royalties. Mr. Williams' treatment of representatives of the supply concerns was not considerate or sometimes even civil, and in many cases goods were bought mainly on the basis of price and almost regardless of quality. The Railroad Administration did not finally drive as hard bargains as apparently it originally intended to, but the former director of purchases succeeded in making almost every class of concerns from which it made purchases feel that it was an unreasonable and disagreeable customer to deal with. This feeling still prevails, in spite of modifications of policy which have been made since Mr. McAdoo retired as director general and Mr. Williams as director of purchases, and as long as it exists concerns that sell materials and supplies to the Railroad Administration will be on their guard, and will not be disposed to risk engaging in very active competition.

The continued existence of the Industrial Board would have been an obstruction to the return of business to normal conditions and methods. But the same thing may be said

of the continued existence of the Railroad Administration, and especially of its highly centralized purchasing organization. A monopoly of railroad purchases is an abnormal thing in itself, and the highly centralized purchasing organization adds to the abnormality of the situation. Before normal conditions of competition in price among the sellers of railroad equipment and supplies can be, or indeed probably ought to be, restored normal conditions of competition among the buyers of railroad equipment and supplies should be restored.

The Railroad Administration has made large purchases since it has been in existence, although not as large as were ordinarily made by the railway companies in equal periods. These, we believe, have not included any purchases of rails. All the rail laid under government operation was ordered by the companies under private operation. In other words, the Railroad Administration has not heretofore had to bargain for rails. There had been almost no bargaining regarding rail prices for some years under private operation, the steel companies having fixed the prices, and, in effect, told the railway companies they must pay these prices, or go to some other country for their rail. It will be highly interesting to see how the Railroad Administration, with its position of a practical monopoly of purchases, finally comes out in dealing with the steel companies. One thing is certain. This is, that the railroads need large quantities of rail, and that the welfare of the country demands that the mills be set to work making it.

There are reasonable men among both those who represent the Railroad Administration and those who represent the steel companies; and it is inconceivable that with reasonable men on both sides, the present deadlock regarding prices, which is doing so much harm to the interests directly affected and to the public, will be allowed to last much longer. But, in view of the policy of the steel companies when the railways were privately operated, and when there was competition among the buyers of rail, it does not seem probable that there will develop very active competition between the steel companies for railroad business while the railways are in the hands of the government, and while in consequence there is no competition among the buyers.

## Government Control of Railroad Labor

WILLIAM CHURCH OSBORN in a recent address which we publish elsewhere in this issue, undertook to show that the government has not taken entire control of the railroad industry, but of only one-half of it. Railway labor, he said, gets 50 per cent. of railway earnings, but the government has not taken control of the employees.

The case is at present even worse, in a way, than Mr. Osborn said. In December, 1917, the last month of private operation, the railway employees received as wages 61 cents out of every dollar of operating expenses and 45.4 cents out of every dollar which the railways earned. In January, 1919, under government operation, railway employees received as wages 64 cents out of every dollar of operating expenses and 58 cents out of every dollar which the railways earn. While, however, the total earnings in December, 1917, represented all that the public paid for transportation, the total earnings in January, 1919, failed by about \$40,000,000 to represent all that the public must pay, this being approximately the amount of the deficit which was incurred and which must be defrayed by the taxpayers. The railway employees received as wages about 52 cents out of each dollar that was collected by the government for railway purposes in the form of both rates and taxes.

How far the government has fallen short of taking control of railway labor is indicated by certain significant facts. As we recently pointed out, the railway employees last year asked for changes in wages and working conditions which

it was estimated would cost one billion dollars a year, and they have now been given changes in their wages and working conditions which are costing at the rate of about one billion dollars a year. The government has permitted and even encouraged all classes of employees to organize. We do not criticize this, but merely call attention to the fact. When the question of whether piece work in the shops should be abolished came up the government submitted the determination of it to a vote of the employees concerned; and because they voted for its abolition piece work was abolished, regardless of the views of a large majority of the officers of the roads. To say that the government has not taken control of the employees is stating the case very mildly, indeed.

During recent months many persons have been energetically applying themselves to a study of the question of what shall be done with the railroads. Public sentiment favors their return to private operation. Upon the policy adopted by the government regarding the settlement of controversies arising between the railway companies and their employees will very largely depend the success of private operation if it is resumed. Under government operation labor troubles have been prevented mainly by the simple expedient of giving labor practically everything it has asked for, and then passing the burden along to the public in the form of increased rates and taxes. Private companies cannot advance rates easily, nor can they have recourse to the taxpayers. If the government should return the railroads to private operation without providing means of settling labor disputes fairly and without resort to strikes and without providing means for enabling the companies promptly to recoup themselves for increases in their payrolls, past and future, the results would be disastrous both to the companies and the public. Nevertheless, there is a marked tendency on the part of commercial bodies and public men that are studying the railroad problems to side-step this vitally important labor question.

The railway labor organizations are not side-stepping it. Under the plan which is being advocated on their behalf by Glenn E. Plumb, the government would buy the railroads with the taxpayers' money, and then turn them over to be operated by a board of directors, three of whose members would be appointed by the President of the United States, three by the railway officials and three by the railway employees. All wages and salaries would be fixed by a board composed equally of officers and employees. Under this plan an "officer" would be merely an employee of high rank. Therefore, the railway employees would solve the railway problem, including the labor part of it, by having the public furnish the money to buy the roads and pay the interest on the purchase price, and then turn them over to be operated by and chiefly for the benefit of the employees. This would solve the labor part of the problem—at least from the employees' standpoint. How could there be any dissatisfaction on the part of labor if labor was allowed to run the roads and fix its own working conditions and pay? The experience of the last year, when labor has demanded and got an increase of one billion dollars a year at the expense of the public may cause the public to suspect that this method of solving the problem might prove rather expensive for it. But Mr. Plumb can prove the contrary. He is the greatest magician in effecting paper railroad economies that has yet appeared—greater than William Randolph Hearst, Clifford Thorne, S. W. Brookhart or William G. McAdoo. None of the miracles these gentlemen have predicted would be worked by government operation has been wrought; but Mr. Plumb is undaunted by their experience and shows with airy facility how under his plan of "operatives' management" there could be effected a saving of a billion dollars a year. The old rule still holds good—the less a man knows about the railroad business the more oriental are his dreams as to what could be done with it.

In view of the fact that labor has been so influential under government operation and has profited so enormously by it, it is not surprising to find labor asking the public to now buy the railroads and turn them over to the complete and avowed management of the employees. Recent experience affords some apparent justification for the belief of many employees that they can get anything they ask for and insist upon having. It is this very attitude on their part which makes it so necessary that the labor problem on the railways shall be squarely faced and fairly but firmly dealt with. The government will never under private operation cease strictly to regulate the conduct of the companies which own the roads and the officers who manage them. Unless it asserts a corresponding authority over the relations between the employees, on the one side, and the companies and the public on the other, no policy of regulation which it may adopt will more than very temporarily serve its purpose.

## New Books

*Government Ownership of Public Utilities in the United States.*  
By Leon Cammen, M. A. Distributors: McDewitt-Wilson, 30 Church Street, New York, N. Y.; Price \$1.50.

By public utilities, Mr. Cammen, apparently, refers to the railroads, telephone and telegraph lines. He confines himself to a study of the effect that government ownership would have on American institutions other than the railroads themselves. This is not primarily a discussion of whether government ownership would lead to more efficient and satisfactory movement of freight and passengers, but rather a discussion of the effect that it would have on the public, the political parties, the control of industries, the legal relations between the federal government and the states, and on labor. An argument that is sometimes used in favor of government ownership of railroads is that they are so powerful to make or break industries and they affect so vitally the interests of all classes of citizens that they cannot safely be entrusted to the management of private individuals. Mr. Cammen undertakes to show that, whereas under public regulation the private citizen, the owner of a small factory, or the aggrieved traveler, can meet the railroad company in the courts on an equal footing—in a loss and damage claim in advantage generally is all with the claimant against the railroad—if the government owned and managed the roads a suit against the government would be almost prohibitively expensive and nearly hopeless. Most people who have disinterestedly watched the experiment in government operation which has been going on in the past year and a half will be inclined to thoroughly agree with Mr. Cammen.

Railroad labor would at the start, at least, Mr. Cammen believes, get higher wages from the government than it could get from private corporations, but, even if railroad labor, itself, benefited to some extent from uneconomically high wages, all other labor in the country would be taxed to pay this uneconomically high wage to the railroad men. Mr. Cammen figures that labor, including agricultural labor, constitutes 80 per cent of the population. If taxes are raised either through increased costs of transportation passed along to the consumer or directly, in order to meet a deficit in the government operation of railroads, the 4 or 5 per cent of the population which is represented by railroad labor and its dependents would profit to some extent but the other 75 per cent, which is labor other than railroad labor, would have to foot the bill. Mr. Cammen's book is logical, well written and his arguments are non-technical and clear. Treating the subject from a purely American point of view as he does and from an angle somewhat different than that from which it is generally discussed, he has made a distinct contribution to the literature on this subject.

## Letters to the Editor

### Deferred Railroad Maintenance — An Increasing Public Debt

HOUSTON, Texas.

TO THE EDITOR:

Volumes have been written by those associated with the United States Railroad Administration, and lengthy reports have been rendered, to illustrate reductions in expenses and various savings accomplished during the federal management of railroads, resulting from centralizing control, unifying terminal facilities, direct routing of car-load freight and other similar activities.

But of the work left undone, of the non-performance of duties resting upon them—duties to the public and to the owners of the railroads alike, the spokesmen for the Railroad Administration say nothing. Not a word from them, or their assistants, or from the assistants to the assistants. These unaccomplished obligations exist on every railroad, and deferring their performance does not eliminate the government's liability to eventually meet them, either by the physical performance of this deferred work at a later date and increased cost or by the payment of its value to the owners of the railroads.

One of the most important subjects resulting from the control and operation of the railroads of the United States, through the agency of the director general, is that of maintenance, in its practical application, so that the railroads may be returned to their owners unimpaired, and without deterioration, upon the termination of federal control. Under the provisions of Section 5, (Upkeep), of the standard contract covering the operation of the railroads by the director general, certain sums shall be expended for the maintenance, repair, renewal, retirement and depreciation of the properties of the railroads, in order that such properties may be returned to the owners in substantially as good repair and in substantially as complete equipment as it was on January 1, 1918, the date when federal control became operative.

The expenditures to be made during federal control are to be predicated upon the annual average of similar expenditures made by the railroads during the test period—that is, the three years ending June 30, 1917; making due allowances for any differences in the costs of labor and material, which have actually advanced to an abnormal degree. Briefly stated, the duties of maintenance are to expend an equal amount of labor and an equal quantity of material, during any year of federal control, as was expended during the annual average of the test period. A mere comparison of the money expended would lead to the belief that this had been done; the final total of operating expenses chargeable to maintenance of way and structures for the year ending December 31, 1918, will probably be as much as 50 per cent in excess of the average for the test period. But this does not reflect excess maintenance or even equal maintenance during federal control; as a matter of fact, there has been allowed to accumulate an alarming amount of deferred maintenance. This represents work which should have been performed in the interest of public safety and to eliminate deterioration of the most vital factor of the nation's existence—the national arteries of commerce and communication.

Under the stimulus of a desire to gratify the employees, increases in salaries, entirely out of proportion with the increases in living costs, were granted. To have met the increased living expenses, in awarding increased wages, would have been reasonable and expected. But, as an example, the

average retail prices of foods increased 43 per cent during 1918 as compared with the test period, while the wages of section men increased 82 per cent, or very nearly twice as much, and while the cost of food in 1919 has not materially changed, the wages of section men are more than double what they were during the test period. Equally exorbitant increases were granted in other departments; and while the nation, as a whole, was denying itself, in a patriotic effort to bear the burdens of the great war, the average railroad employee was enjoying a better existence than he had ever dared to imagine; an enjoyment of life at the public's expense and increasing the public's burden.

While the government's expenditures for labor during 1918 were far in excess of what had been spent during previous years, the results attained were equally far below the normal. A very severe labor shortage existed, and many railroads were maintained with less than 60 per cent of their normal maintenance forces. This shortage became so acute at one time that it developed the necessity, in many instances, of employing women and boys on the track, the result being an inferior amount and quality of service at a greatly increased cost.

Material values also increased, for varying causes, the advance for steel rails approximating 100 per cent, track fastenings 75 per cent, track ties 80 per cent, bridge lumber 45 per cent and building material over 60 per cent. Coupled with these advances in cost, there was a grave shortage in all of the principal classes of materials. A large portion of the steel output was required for war purposes, lumber was needed for shipbuilding, and the railroads were left with but a small portion of their requirements. In the case of track ties, the Railroad Administration could have secured sufficient for their needs, but, while they increased the prices paid for ties, they instituted an entirely new set of specifications which, coupled with slow payments, seriously reduced the tie supply.

The wearing away of the rails in the track continued during 1918 just as it had in previous years—there was no reduction made in this wear. At the same time only a small percentage of their requirements was furnished. In the case of ties, the rotting, breaking and wearing out of track timber was not decreased in the least during 1918, although the roads under federal control were given less than 75 per cent of these requirements during 1918. The condition with respect to other classes of material was the same. And while the Railroad Administration paid more for material during 1918 than had been spent by the railroad companies during any previous year, they have not maintained the property of the railroads; they have not offset the annual wear and tear with its equivalent in new life.

The result of this failure to perform the duty of maintenance—this failure on the part of those charged with the maintenance of the railroads for the government and as agents of the public—is found in the physical condition of these railroads today. It is represented by the deferred maintenance of the property, the value of which, translated into dollars, has not been saved to the public, but must inevitably be faced and overcome by the expenditure of the required amount of labor and material.

And the longer this work is deferred, the more it will cost when finally undertaken. It is estimated that the present cost of doing the maintenance work, deferred during 1918, will vary from \$100 to over \$300 per mile and will average in excess of \$160 per mile, or over \$36,720,000. This is but another item on the debit side of Uncle Sam's books, and while not seeming so very large to us who have learned to think of costs in billions of dollars, it is a tidy sum, owed to the railroads by the Railroad Administration, and which the public must liquidate.

F. S. SCHWINN,

Corporate Engineer, International & Great Northern.

# Plan of Price Stabilization Abandoned

## The Railroad Administration Has Asked for Competitive Bids for Rails and Other Steel Products

WASHINGTON, D. C.

THE GOVERNMENT'S PLAN of "stabilizing" prices through the efforts of the Industrial Board of the Department of Commerce has finally collapsed and the resignations of the members of the board which had been submitted on April 22, were accepted by Secretary Redfield on May 9, thus leaving prices subject to the law of supply and demand.

After having failed to reach any agreement with the steel interests on lower prices than those announced by the board, the Railroad Administration has asked for competitive bids on 200,000 tons of rails and presently a demonstration will be afforded as to whether it can purchase at lower prices than those approved by the board. The requests for bids went out Saturday. They ask prices on both open hearth and Bessemer steel, 80 to 135 lb. sections, f. o. b. cars at mills, to be submitted this week, Saturday, May 17, to the Division of Purchases, delivery to be completed by July 1. The quantity named is a smaller tonnage than would have been asked for if a satisfactory price had been proposed and probably is to be regarded as a test of the market\*. Henry B. Spencer, director of the Division of Purchases, and T. C. Powell, director of the Division of Capital Expenditures, represented the Railroad Administration at the conference with the steel people at New York on May 8, and suggested a price of \$41.37 for rail, but the steel interests insisted that further reductions cannot be made without decreases in costs of production which would necessitate a lowering of wage rates. After the meeting Director General Hines, who was also in New York, issued a statement explaining his position, in part as follows:

### Mr. Hines' Statement

"Messrs. Spencer and Powell offered specific criticisms of the steel prices heretofore proposed and suggested maximum prices which the Railroad Administration would feel justified in paying. It was made clear that the Railroad Administration did not wish to obtain preferential prices as compared with the general public. The conferences on this subject are at an end and the Railroad Administration will, in accordance with its settled purpose, proceed as rapidly as it needs steel materials of any kind to ask for competitive bids and purchase accordingly.

"By way of comment on the prices proposed in March, as well as in support of the prices suggested by the Railroad Administration, the following views were expressed by Messrs. Spencer and Powell.

"The reduction since the war in a single element of cost is so great as to make the prices proposed practically as profitable as were the higher prices that prevailed during the war upon the basis of which the steel interests made enormous profits. This is the price of scrap materials, which is not a controlled commodity, but the price of which fluctuates according to supply and demand, and which, of course, can be and is used very largely in the making of steel products. The fall in the price of scrap material (from \$30 per ton to about \$15 per ton) has been so great that the resulting decrease in the cost of steel products is practically as great as the total proposed reduction in the

prices. Therefore, the prices proposed for steel products represent no concessions whatever from wartime profits.

"That the steel interests have made profits so large as to make substantial concessions practicable under existing conditions without affecting the wages is strikingly illustrated by a consideration of the profits for the calendar year 1918.

"The United States Steel Corporation for the year 1918 reports the net earnings from all rolled tonnage, before deducting income tax, excess profits tax, etc., a profit of about .....\$33 per ton

"The Midvale Steel Company for the same period shows a profit of approximately.....\$35 per ton

"This statistical information for other steel producing companies is not yet published, but their financial statements indicate results which were correspondingly favorable.

"The arguments which have been presented in the effort to support the prices proposed by the steel interests and the Industrial Board have rested upon costs incurred during the war period. Even those costs show exceedingly handsome profits to the low cost producers. But it is obvious that these, without reduction in wages, will, on account of the termination of the war, be subject to very important reductions.

"The war costs appear in many instances to involve a heavy increase in the royalty for ore, or the assumed value of the ore in the ground. This increase did not represent an actual increase in cost so far as the producers of the ore were concerned, but simply represented a heavy additional profit. Yet this increased profit in ore appears to be included in the war costs upon which the figures have been based. The cost of coke has fallen substantially from \$3 to \$4 per ton, representing a saving of from \$3 to \$5 per ton of iron.

"The steel interests and the Industrial Board have proposed a price of \$38.50 for steel billets and yet they have proposed prices for finished steel products which are wholly out of line with the price for steel billets. The differentials which the steel interests and the Industrial Board propose for the finished products as compared with steel billets are so great as to make the prices for the finished products altogether unattractive and altogether unjustifiable.

"If the average differentials for finished products as compared with steel billets during the 16 years preceding 1917, be increased by 50 per cent (to insure against any adverse effect upon the wages paid to labor), the resulting differentials and prices for the finished products would be as follows as compared with the prices actually proposed (per ton of 2,240 lb.):

	After adding 50 per cent to differential	Suggested new price based on 50 per cent increase in differential plus billet price of \$38.50	Price fixed March 21, 1919, by Peck committee
Bars.....	\$10.32	\$48.82	\$52.64
Bessemer steel rails.....	2.87	41.37	45.00
Galvanized sheets, No. 28.....	81.48	119.98	127.68
Beams.....	13.04	51.54	54.88
Wire rods.....	9.81	48.31	52.00
Tank plates.....	13.28	51.78	59.36
Black sheets, No. 28.....	40.67	75.17	97.44
Tin plate.....	83.84	122.34	156.80
Nails.....	23.69	62.19	72.80

"Messrs. Spencer and Powell pointed out that the cost of open-hearth rail was no greater than the cost of Bessemer rail since the cost and price of both sorts of billets were the same and, therefore, that the price of open-hearth rail should

\* The Navy Department on May 13 opened bids from 11 steel companies on 14,000 tons of plates and shapes and found that the basic prices were all alike and corresponded to the prices announced by the Peck Committee. The Navy had rejected bids on this material submitted on April 4 because they were not on a competitive basis.

be no higher than the price of \$41.37 above indicated for Bessemer rail, and that if the steel interests wished to encourage the purchase of Bessemer rail they should do so by making the price of Bessemer a differential under the price so arrived at for open-hearth rail rather than through increasing the price of open-hearth rail by \$2, the amount of the old differential.

"The actual differentials during the year ending June 30, 1917, which represent as nearly as possible the conditions immediately prevailing prior to the great assumption of war activity by this government, are even less than the differentials for the 10-year period. The best estimates as to the actual operating costs of converting steel billets into finished products, even under war conditions, indicate that the differentials on the basis of 150 per cent of the 16-year period average shown above, will fully cover that additional cost and a substantial profit.

"Messrs. Spencer and Powell indicated a willingness on the part of the Railroad Administration to purchase for the time being at the suggested new prices based on 50 per cent increase in differential plus the billet price of \$38.50 announced in March.

"The steel interests were unwilling to make any reduction in their price, and, in order to repel the argument that the prices for all other products were out of line with the billet prices, manifested a disposition now to claim that their own billet price of \$38.50 was lower than it ought to have been.

"Another fact which the Railroad Administration regards as a significant indication of the unreliability of using war costs as a basis for current prices is that one important element in the war costs was the cost of the water carriage of ore, and this was especially burdensome with respect to some of the high cost producers. This condition has radically changed since the termination of hostilities has released so much shipping. As an illustration, the Bethlehem Steel Company has filed a claim against the Shipping Board for the use by the latter, during the war, of the former's ships which were desired by the steel company to carry ore from Cuba to the plant near Baltimore. The steel company claims that the actual cost of transporting ore was \$1.96 per ton during 1918, while the Shipping Board's rate which the Bethlehem Steel Company paid during 1918 was \$9.50 per ton. Hence, by the Bethlehem Steel Company's ability to get back its ships, there appears to be a saving of approximately \$7.50 a ton for delivery of ore, which represents at least \$15 per ton on pig iron, since it requires two tons of ore or more to make a ton of pig iron.

"The steel interests urged that their costs in March were unusually heavy notwithstanding the cessation of hostilities, but the representatives of the Railroad Administration claimed that these abnormally high costs at the present moment were due to temporary conditions of readjustment and ought not to be taken as a basis for prices designed to stimulate a general buying movement. It should be remembered in this connection that the Industrial Board justified its approval of the steel interests' costs for the month of October involving the elements which, as above pointed out, have so radically changed.

"After the most prolonged discussion, the representatives of the Railroad Administration still remained entirely satisfied that the reduced prices indicated by them could, and ought to be, adopted without affecting the wages paid labor in the steel industry.

"The uncertainty and hesitation which have been injected into this situation would never have arisen if at the outset Chairman Peek had been willing to accept as final the position which the Railroad Administration stated before the

Industrial Board made its public announcement and which it has at all times felt forced to maintain.

But Chairman Peek has been so bent on justifying his own mistaken conception of his functions that he has been trying for weeks to get them accepted; and yet he has never succeeded in getting the support of the President or the cabinet, or the attorney general.

"In closing the discussions it is important that the totally erroneous impressions created by him, particularly in a recent speech before the United States Chamber of Commerce at St. Louis, be removed. The plan on which the board was supposed to operate was thoroughly discussed at a special meeting of the cabinet on February 3, and Mr. Peek stated in his speech that that meeting approved the plan of having the board determine prices and make them effective by the authorization of a governmental announcement. In this he is in error. The meeting distinctly declined to approve any plan for announcing prices at which the general public would buy, and the only plan which was approved, was a plan to bring about by voluntary action, a reduced level of prices at which the Railroad Administration would be justified in buying freely, and therefore the plan actually approved specifically contemplated that the board would act as a mediator between the producers and the Railroad Administration. The meeting of the members of the cabinet on February 3 was called and presided over by Secretary Glass of the Treasury Department and as indicating Mr. Peek's erroneous conception of the plan approved at that meeting, Secretary Glass telegraphed to the director general after reading Mr. Peek's address in St. Louis, sharply contradicting Mr. Peek's assumption that the President and the cabinet ever sanctioned the policy of price fixing engaged in by the Industrial Board.

"Mr. Glass stated that Mr. Peek had conveyed the impression that the Industrial Board pursued the exact course suggested by Mr. Glass' first cable to the President, whereas, quite the contrary was true; and the Industrial Board, under Mr. Peek's leadership, utterly perverted the suggested policy of those who initiated the movement for resumption of business activities, and brought the scheme into direct conflict with the federal statutes against unlawful agreements. Mr. Glass called attention to the fact that this was the very thing against which the President at the outset gave warning and precisely the thing that the members of the cabinet who had part in the initial conference refuse to countenance. Mr. Glass concluded by stating that although Mr. Peek had made it appear that his advocacy of unsatisfactory prices had the sanction of the President and cabinet and has been opposed solely by the Railroad Administration, the very reverse is true."

#### Judge Gary's Comment

Elbert H. Gary, chairman of the United States Steel Corporation, in commenting on Mr. Hines' statement, said:

"The statement of the director general, if it had been made after full acquaintance with the facts and figures and had been accurate in all respects, would not, in my opinion, have any bearing upon the exact present situation.

"On the present basis, cost of production, as shown on the books of the manufacturers, verified by the Federal Trade Commission, would not permit any further reductions in the present selling prices, without lowering the wage rate. Our subsidiary companies are strictly maintaining the scale of prices approved by the Industrial Board, and it seems to me that will be the attitude of other manufacturers, for the reason, if for no other, that the cost of production will not allow any further reductions in selling prices. They have voluntarily made two substantial reductions since the armistice was signed.

"I regret that opinions between the Railroad Administration and the iron and steel industry should have differed. The business relationship has always been pleasant, and we should like to see it continued without interruption."

Prior to the New York conference Secretary Redfield of the Department of Commerce had made public a letter to Mr. Hines stating that he had asked the Industrial Board to convey to the steel representatives the desire of the board, in which he joined, that nothing should be allowed to prevent an agreement and that if it was in their power to make reductions that would be acceptable to the Railroad Administration without disturbing labor or increasing prices to the public, the board would welcome such a conclusion, as it would relieve the tension on the business of the country. He also expressed the hope that Mr. Hines would do all in his power to bring about a definite agreement with the steel industry.

The acceptance of the resignations of the board members closed the chapter of the efforts of the Department of Commerce to assist in the readjustment of prices from a war to a peace basis. The coal, cement, and lumber interests had expressed a readiness to make price concessions through the medium of the board, but negotiations were postponed until it could be learned whether the Railroad Administration would buy at the prices announced. Since it has declined to do so in the case of steel the whole plan has been abandoned.

Chairman Peek of the board on May 10 issued a statement releasing all industries that had submitted themselves to the board, on the latter's invitation, from any obligation to the board. In this statement he said:

"In conducting its investigations the board found that very much higher costs of production, resulting from conditions brought about by the war, precluded the possibility of immediately making as large reductions as were thought possible without disturbing labor rates. Labor rates have increased from 85 per cent to as high as 140 per cent in the steel industry, and labor costs in even greater ratio, and as labor either directly or indirectly constitutes approximately 85 per cent of the total cost in many industries, it will be seen that as compared with pre-war levels, prices must necessarily be very much higher than formerly, unless a general liquidation of all values were effected, which is considered impracticable at this time or so long as the high cost of the necessities of life prevails."

#### Plan Called Illegal

After the resignations of the board members had been accepted there was made public an opinion submitted by Attorney General Palmer in a letter to Secretary Redfield dated April 1, that the proposed plan of the board, "viewed in any aspect" was "unauthorized by law." This is now expected to serve as a warning against the submission of uniform bids by the steel producers. The plan was called illegal by the attorney general on the ground that it constituted price-fixing in violation of the anti-trust law.

The attorney general said in part:

"Of all forms of restraint of trade price-fixing agreements have been the most common. No rule of law is better established than that such agreements are illegal and void. \* \* \* To bring a price fixing agreement within the condemnation of the law it is not necessary that it be in writing or that it be an express agreement. \* \* \* Nor is it necessary, to make such an agreement unlawful, that the parties should be under compulsion by penalty or otherwise to observe it. Finally, it is no defense that such an agreement was induced by good intentions and may have some good effect.

"The foregoing considerations lead irresistibly to the con-

clusion that the proposed plan, viewed simply as an arrangement between private producers, would be in violation of the anti-trust laws. The Industrial Board, not being a creature of statute, has not been clothed by Congress with any powers which would remove contracts made by it from the operation of the Sherman act. It follows, therefore, that the legal defect of the proposed plan is not altered by the fact that it would be carried out through the Industrial Board.

"Lastly," said the attorney general, "in no less than 30 statutory provisions Congress has announced its purpose that the purchase of government supplies shall be governed by the competitive system.

"I am of opinion, therefore, that the proposed plan of the industrial board of the Department of Commerce, viewed in any aspect, is unauthorized by law."

In accepting the resignations of the board members Secretary Redfield, the only cabinet officer who has supported the board, said:

"That board was conceived in the spirit of unselfish public service and has so acted from the beginning. There has been no change in its viewpoint, policy or attitude from the beginning. No statement nor inference to the contrary has a basis of fact. It has had the widespread support of industry and commerce throughout the country. It has sought merely to serve and has been ready to consider all figures, to respect all facts and to reconsider any statement or conclusion in the light of further knowledge. Its mind has been open and its purpose was directed not to winning a controversy but solely and simply to serving the country. I believe it has developed standards of public co-operation which will be of permanent value."

#### Chairman Peek's Statement

Mr. Peek issued a statement criticising the administration for failure to support the stabilization plan after it had been approved and declaring it inconceivable that the Railroad Administration's objection was sufficient to justify the abandonment of the policy.

Mr. Peek said in part: "The plan to make an immediate reduction in the cost of living, to remove the cloud of buying uncertainty and to anticipate by several months the return to normal business conditions has been abandoned. The plan was very simple—'In voluntary co-operation with business interests to arrive at a level of prices upon which business activities would be more actively resumed, and the Railroad Administration and other spending agencies of the government would be justified in buying liberally.' In so doing it planned to study costs of production, to add reasonable profits, and to announce the resulting price as a fair basis for buying.

"Weary of the details of the controversy between the Railroad Administration and the board, the public will yet demand an explanation of the wrecking, apparently on the obstinacy of a single official, of a plan of such apparent national value.

"Throughout the baffling controversy the board has found itself checked by forces in opposition which it could neither understand, reason with, nor overcome, but which grew in strength until they rendered further progress impossible and forced abandonment of the plan. It is inconceivable that the unsubstantial objection to the price of rails alone was sufficient to justify the abandonment of a policy of such importance. Nor has the director general been alone in thwarting the purpose of the board. The secretary of the treasury has taken a stand in direct contradiction with his message to the President urging the creation of the board. The attorney general has rendered an opinion that the plan of the board contravenes the Sherman act, but the facts assumed as the basis of that opinion are so inconsistent with

the actual course of conduct of the board as to render the opinion inapplicable.

"In all this opposition the board has sought in vain for a substantial reason. It has urged the Railroad Administration, first to aid it by one single fact, or argument, to arrive at a lower price for steel, and second to name a price which the Railroad Administration would consider fair. The first suggestion has been met with a stubborn and haughty silence, the second with a suggestion of absolutism: 'We will name you the price only on condition that you agree in advance to urge it on the steel producers'—and this in the face of the unimpeached cost studies of the board. Acceptance of such a suggestion would shame the manhood of the board.

"The only answer has been that the steel price announced by the board is 'too high.' If 'too high' means that the Railroad Administration can force lower prices, by smashing industry, smashing labor, smashing the public interest and throwing production into the hands of the most powerful and lowest cost producers, the board agrees that the price is 'too high.' But it was precisely these results the board was set up to prevent and the case stands proved that lower prices without these results are impossible. Still the Railroad Administration persists and announces specifically that its only view of a low price is one that shall, by inherent attractiveness, induce buying not by the Railroad Administration alone but *also by the old railroad corporations* who are so ably represented in the administration by the director general himself and by Messrs. Lovett and Walters, who have headed the opposition to the board.

"That the administration would commit itself against the public interest merely to support the ancient and discredited railroad slogan, 'the public be damned,' is unthinkable. Yet after all it is the administration, not the director general alone, who had power to thwart the board. Thus, there is no question that the board was set up to do exactly what it has done, and was set up with the full knowledge and assent of the administration and was given godspeed upon its way by Mr. Glass.

"The irrelevant opinion of the attorney general is dragged in. Persistently the activities of the board are referred to as 'price fixing' and 'agreement on prices with the steel producers.' Price fixing has never been attempted by the board. In co-operation with industry it has studied costs, added reasonable profits and promulgated the result. No one was under the slightest obligation to demand or to accede to these prices. Nor was any agreement by the steel producers to sell at these prices ever sought. Distortion of this course of conduct to make it appear a 'combination in restraint of trade' is little short of absurd and is only a further confusion of the issue.

"Members of the Industrial Board are experienced business men untrained in the devious ways of partisan politics. They came to their present task without hope of reward or advancement, believing that the war-time adjournment of politics in national affairs of economic importance had been extended to cover the period of reconstruction. Acclimated to the wholesome air of that adjournment by service on the War Industries Board, they have become stifled by the impregnated atmosphere that has come with the armistice, and are leaving gainers only by the conclusion that the inspiration of the war was not sufficient to induce the administration to give over the business of politics for the business of government.

"They have been unable to penetrate the inky cloud in which the political squid has concealed its escape from support of the board in a position which for some unstated reason was politically undesirable. I can only admit the public to my own perplexity among the following conjectures:

"In the beginning, did the present opponents of the board fail to foresee the far-reaching results to be achieved and was the growing importance and power of the board's policy too powerful a political engine to leave outside the administration's arsenal and in the hands of a non-partisan board? Does the administration plan for 1920 a platform of state-socialism which it now finds inconsistent with the results achieved by the board? Or, after all, am I giving too much credit for an acumen that does not exist and is what the board has encountered merely the machinations of the old railroad guard as represented by Messrs. Lovett and Walters and imposed on a too-complacent director general, or on a director general too jealous of his own prerogatives to see beyond the confines of his little czarism?

"The board cannot answer. It can only depart more in sorrow than in anger, and in great disappointment, from a lost opportunity to serve the country by a simple and sensible plan to reduce the cost of living and to return prosperity. In doing so it leaves a single message. The plan of the board was good. It is capable of accomplishing what it promised. The administration owes it to the nation to put that plan into immediate execution at the hands of some agency in which it can feel political confidence and sympathy."

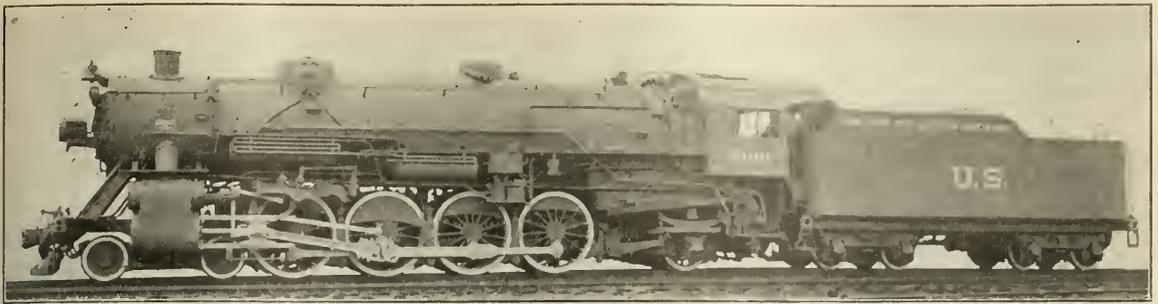

#### Statement by Secretary Glass

Secretary Glass also issued a statement saying that the attempt made to fix minimum prices for the public seemed to him wholly indefensible and contrary to fundamental principles of economics, of public policy and of the law.

"Surely the healthy restoration of industrial life and activity is not to be found in the perpetuation and exaggeration, months after the cessation of hostilities, of the artificial conditions which in war-time were tolerated as necessary evils," he said. "The original plan, which in its general features had my approval, was to endeavor to bring about a meeting of the minds, between the producers and those governmental agencies which had large purchases to make, upon bed-rock prices which would carry conviction that new enterprises might be undertaken with safety and the hope of profit. The Industrial Board, having failed to bring about such a meeting of the minds with governmental buying agencies, attempted to fix minimum prices for the general public, and thus did precisely that which it had been warned not to do. This action was promptly repudiated by me and the board was fully advised of the reasons and urged to mend its ways. Its subsequent efforts to force these minimum prices upon the railroad administration and its failure to recede from the action taken in attempting to fix minimum prices for the general public for a year, confirmed me in the view that the board was hopelessly committed to an unsound and dangerous policy.

There is scarcely one accurate assertion or sane deduction in all of Mr. Peek's intemperate screed; and to me it is now perfectly clear why there has been a sad ending of the movement which had its initial meetings in the Treasury, and which had for its purpose the revival of industrial activity through agencies and by methods that were not contrary to the statutes nor obnoxious to the elementary principles of economics."

The Chicago & North Western, before the Wisconsin Tax Commission, argues for the reduction of its preliminary assessment of \$135,000,000 by \$20,000,000. Unless this is done, declares T. A. Polleys, the road's tax commissioner, the state authorities will be exacting from the federal government approximately \$300,000 of taxes not justly due to the state. A similar claim was submitted on behalf of the Chicago, St. Paul, Minneapolis & Omaha.

The U. S. R. A. Standard Light Mountain Type Locomotive

# The Administration Standard Light Mountain Type

The Last of the Government Designs to be Constructed;  
Weight 327,000 lbs., Tractive Effort 53,900 lbs.

THE FIRST of the Railroad Administration standard light Mountain type locomotives has recently been turned out at the Richmond works of the American Locomotive Company and assigned for service on the New York, New Haven & Hartford. This is the last of the standard designs prepared by the Railroad Administration from which locomotives have been built and locomotives of each of the twelve standards are, therefore, now in service.

These locomotives were designed on the basis of rail loads of 55,000 lb. on each driving axle. The actual weight in working order is 327,000 lb., of which 224,500 lb. is on the drivers. The engines produce a tractive effort of 53,900 lb., with a factor of adhesion of 4.2. In the table is presented a comparison of some of the more important dimensions and ratios of the standard light Mountain type with other moderate size locomotives of this type designed to meet conditions which would not permit of the use of maximum axle loads. With the exception of the Canadian Pacific loco-

set on the third course. The firebox includes a combustion chamber extending forward 60 in. from the throat sheet, leaving for the tubes a length of 20 ft. 6 in. There are 216, 2¼-in. tubes and 40, 5½-in. flues for the elements of the type A superheater. The same number of tubes and flues are also used in the boiler of the heavy Pacific type locomotive, the length of which, however, is 19 ft., with a 38-in. combustion chamber. The size of firebox at the mudring is the same for both boilers. The boiler of the light Mountain type is fitted with a Shoemaker power operated firedoor.

The frames are similar in design to those of other single unit standard types. The width is six inches and the top rail has a maximum depth of 7⅞ in. over the pedestals, with a minimum of six inches between the pedestals. The lower rail has maximum and minimum depths of 4¾ in. and 4¼ in., respectively. The cylinders are carried on a single front rail of slab section, cast integral with the main frame. This rail tapers under the cylinder fit from a depth of 10⅝ in. at the rear to a depth of 9⅝ in. at the front, the width being 6 in. under the cylinders and to a point 30 in. back from the front end of the casting. Unit steel cradle castings are spliced to the rear of the main frames, the joint being of the same type used on all of the other designs which are fitted with trailer frames.

The cylinders, pistons and valves are similar in details to those on practically all of the other locomotives, the valves being of the piston type and 14 in. in diameter. The front and back cylinder heads are interchangeable between this locomotive and others having cylinders 27 in. in diameter, including the heavy Mikado, the light Santa Fe and the heavy Pacific types. The cylinder and valve chamber bushings, valve bull rings and packing rings, piston bull ring and packing rings and crosshead shoes are all of Hunt-Spiller gun iron.

The main and side rods differ in no essential from those on any of the other locomotives. The side rods are of slab section, this being the rule the only exceptions to which are in the case of the two Pacific type locomotives, which have I-section side rods. There is a considerable degree of interchangeability in the side and main rod bearings between the various classes of standard locomotives. The back end main rod brasses of the light Mountain type interchange with those of the heavy Mikado, light Santa Fe and heavy Pacific types, while the front end main rod brasses interchange with both Mikado type locomotives, the eight-wheel switcher, the light Santa Fe and both Pacific types. Similar, although

Firebox heating surface ÷ equivalent heating surface	6.2	5.8	3.4	5.5

few Mountain type locomotives designed for passenger service have been built with piston strokes greater than 28 in. It will be seen that the light Mountain type has cylinders of 30 in. stroke, which is also the case with the standard heavy Mountain type locomotive. Except for its greater tractive effort, partly due to the increased cylinder stroke and partly to the greater boiler pressure, the standard light Mountain type compares closely with the Chicago, Rock Island & Pacific Mountain type built in 1913. The heating surfaces compare closely, although the standard locomotive has a considerably larger grate than the earlier built locomotive.

In design the light Mountain type locomotive is essentially the same as the other standard types, following closely the lines of the heavy Mountain and the two Pacific types.

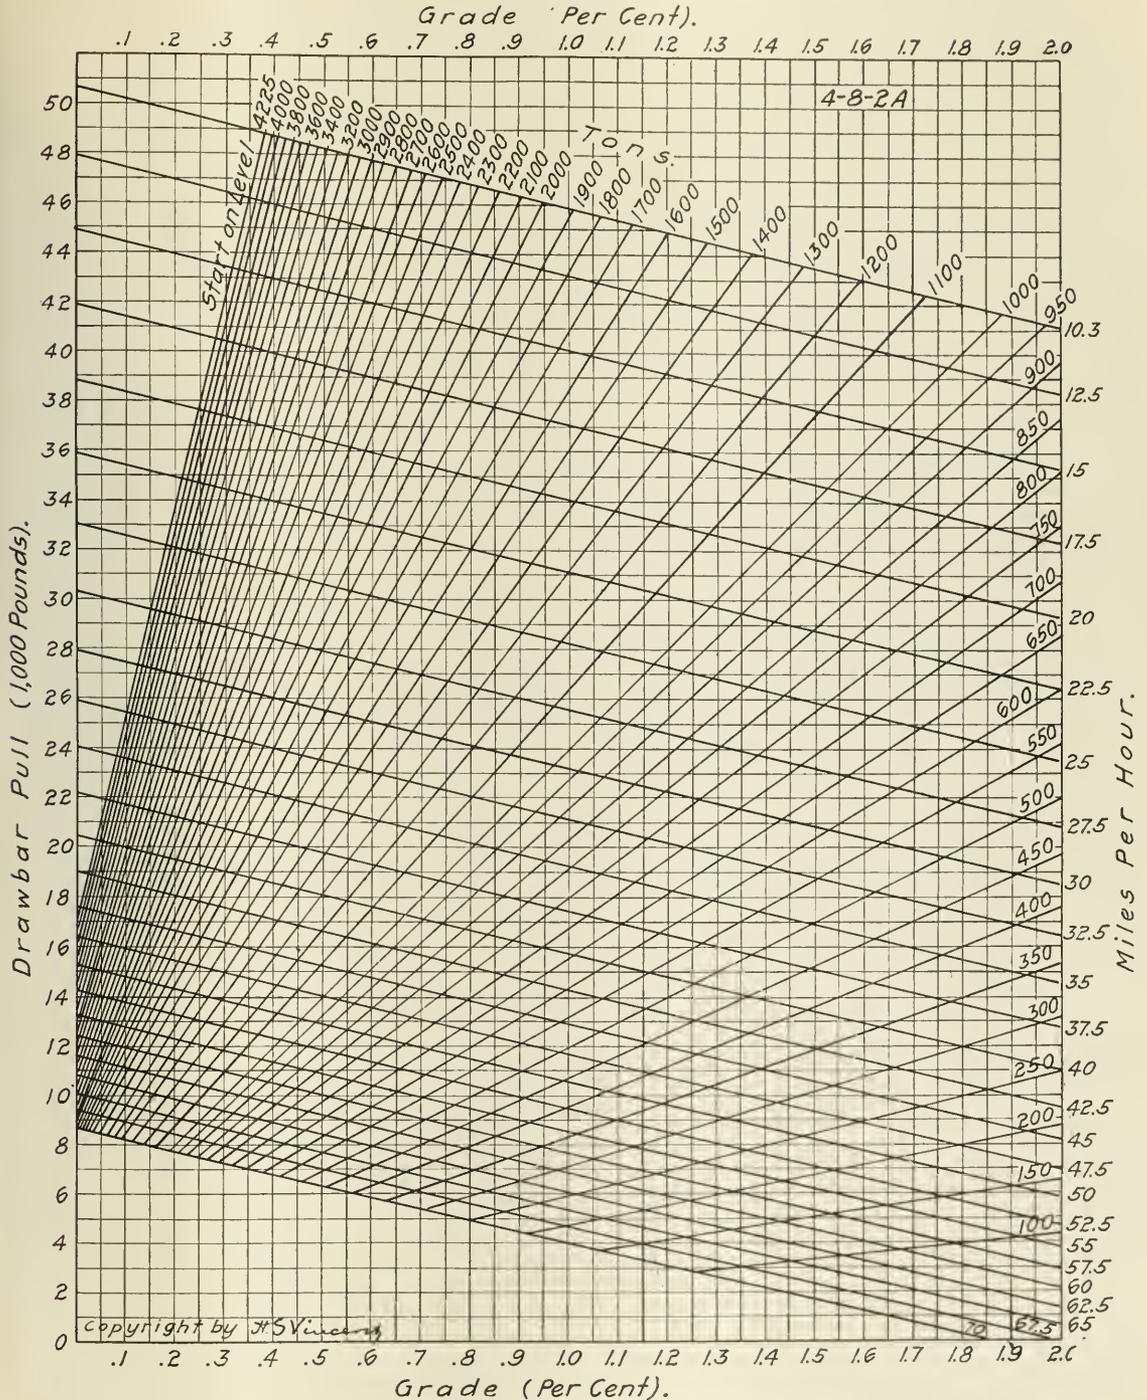

The boiler is of the conical wagon top type, with the dome

not exactly the same interchangeability applies to the side rod bearings.

Driving boxes and axles are also of interchangeable design to a very considerable degree. The journal sizes on the front, intermediate and back pairs of drivers of the light

Mountain type are 10 in. in diameter by 13 in. in length. With the exception of the main journals, those of the light Pacific, both Mikado types and both Santa Fe types have the same size and both axles and driving boxes interchange. The main journals of the light and heavy Mountain, heavy

Tonnage Rating Chart for the Standard Light Mountain Type Locomotive

Mikado, heavy Pacific and light Santa Fe types are interchangeable.

The tenders have Commonwealth unit frame castings and are carried on Commonwealth equalized four-wheel trucks. The tank has a capacity of 10,000 gallons, carries 16 tons of coal and is fitted with the Locomotive Stoker Company's coal pusher. The tanks are built up of 1/4-in. and 5/16 in. plate with 2 1/2-in. by 2 1/2 in. by 3/8-in. angles at the corners, for the attachment of the splash plates and for the crosssties. Two T-irons of 4-in. by 3-in. by 3/8-in. section are used as horizontal stiffeners on each side of the water space and to these the ends of the crosssties are attached. The cistern opening has a length of 96 in. across the tank and a width of 18 in.

The clearance diagram and wheel loading diagrams which are included were prepared by F. P. Pfahler, chief mechanical engineer of the Division of Operation, of the Railroad Administration. Actual weights are shown on the wheel loading diagram. The tonnage rating diagram was prepared and is copyrighted by H. S. Vincent. The curves of hauling capacity are constructed for a car resistance of four pounds per ton. The chart may be used for any other car resistance or for any combination of resistances by converting them into terms of grade.

- 1 lb. car resistance = .05 per cent grade
- 1 deg. curve uncompensated = .04 per cent grade

For example, find the tonnage which can be hauled in passenger service on 0.5 per cent grade combined with a five degree uncompensated curve at 40 m. p. h. The resistance of passenger coaches at 40 m. p. h. is 6.65 lb. per ton.\* The equivalent grade is then:

$$0.5 + (5 \times .04) + (2.65 \times .05) = 0.8325 \text{ per cent.}$$

At the intersection of the ordinate for 0.8325 per cent grade with the drawbar pull curve for 40 m. p. h., we find 800 tons as the capacity of the locomotive.

A list of the specialties on all of the standard locomotives was published in the January 3, 1919 issue of the *Railway*

# Some Phases of Government Control\*

## Shall Railroad Labor Be Considered to Be Affected with a Public Interest as Is Railroad Capital

By Wm. Church Osborn

IT IS GENERALLY BELIEVED that the government took control of the transportation organization of the United States on January 1, 1918. Such is not the case. The control bill gave the government real control of only a part of the organization. It is true that the government assumed control of the physical property and the money of the railroads; the right to change rates, etc., at its pleasure. The government freed itself completely from the restrictions of the Sherman act and the Hepburn bill as to pooling, consolidations, etc., including the regulations of the Interstate Commerce Commission, all of which had for years been the accepted policy of the country in managing the transportation interests, but the government did not assume control of railroad labor.

A transportation system is a living organism. It gets its life from the men who run it and it works well or ill according as the men constituting the organization conduct themselves. It is a mistake to think of a railroad as the right of way, the rail, the engines, the cars, the terminals and the financial management with the bonds, stocks and balances in bank. As a fact, these things are less than half of a railroad. The other half is the working organization of men—from the president to the gate tender, from the traffic manager to the advertising agent—which runs the road. The flight of the Twentieth Century from New York to Chicago is made possible because each one of some thousand men performs his appointed duties at the stated minute. The people of the country will get good or bad transportation; will pay more or less for it, in direct ratio as the two million or more of ordinary railroad employees perform their duties well or ill.

The total operating revenues of the railroads for 1918 were \$4,800,000,000; of this \$2,400,000,000 was paid to labor, the rest went in materials, taxes and the rental. The dominating fact of government operation is therefore, that although the government took actual control of about 50 per cent. cost value of the transportation organization of the country it remained in the position of a private employer with reference to the remaining 50 per cent. of the transportation business, i. e., the human organization of the system. Mr. Kruttschnitt, president of the Southern Pacific lines, is reported to have said that if he had to choose between the return of a railroad without an organization, or of an organization without a railroad, he would take the organization. The control bill granted to the government no special powers of arbitration of differences with the railroad employees. It made no prohibition upon leaving the government railroad service without notice and without cause; it granted no coercive authority such as enlistment or the fixing of a penalty for failure in duties. It left the "right to strike" in full effect. It is therefore a misstatement to say that we have had government control of the railroads since January 1, 1918.

The cost of materials and supplies, the maintenance of the organization and the necessary payments for capital and taxes absorb to-day about 50 per cent. of the gross annual revenues. The remaining 50 per cent. is paid directly to labor. We have, therefore, about 50 per cent. of the railroad business under regulation and control and about 50 per

cent. free. The question is whether an organization half regulated and half unregulated can endure.

The problem before the American people in settling our transportation question is no longer to check the rapacity of capital, or to control the autocratic tendencies of the operating officials, or to fix the nature of the facilities to be given to the public. Capital no longer regards a railroad investment as a profit maker and will be thankful if its existing investments shall return a moderate income. The once haughty managers of railroads now know their masters and agree to requests of national and state commissions on all sorts of details, from placing unnecessary brakemen on a train, down to the character of drinking cups permitted in the cars. They are ready to install steel equipment, terminals, block signals and any other desirable railroad facilities, provided they can obtain the money to pay for them. The great body of financial sentiment approves government supervision of the issues of railroad securities and is prepared fully to endorse the government making of rates, provided they will make a return upon the existing investment. The people may therefore feel that as to 50 per cent. of their transportation no serious obstacle stands in the way of a full control; as to the remaining 50 per cent. of transportation the situation is different. From the passage of the Adamson law, raising wages by Congress, under threat of a nation-wide strike, in the month of January, 1917, down to the settlement of the harbor strike in New York City in 1919 by the acceptance of the strikers' terms by the railroad administration, there has not been an instance where the demand for increased pay and reduced hours by the railroad employees has not been granted.

Since the passage of the Adamson law, viz., the period from January 1, 1917, to date, the pay of railroad men has been increased by successive stages so that the actual increase in pay in the year 1918 over the year 1916 would amount to over \$900,000,000 and the estimated increase in 1919 over 1916 would be approximately \$1,000,000,000. In order to understand these figures they may be contrasted with various other railroad items; for instance, the increase in freight and passenger rates in 1918 produced the sum of approximately \$800,000,000. It is estimated that these excess rates, 25 per cent. on freight and 50 per cent. on passenger, will produce in the fiscal year from July 1, 1918, to June 30, 1919, the sum of \$1,000,000,000. In other words, practically all of the increase in rates has been absorbed by the increased labor charges on the roads. Contrast again the payments to labor with the payments on account of capital and we find that the increase alone in labor is equal to the entire annual rental of the properties. That rental is fixed under the Control Bill at approximately \$920,000,000 a year.

There is no mystery about who pays the railroad freight rates. They are paid first by the farmers, the manufacturers and the dealers, but they are passed on to the consumers and make part of the cost of living. The people pay the freight. The people pay excess labor charges just as they pay excess capital charges. A general railroad strike is therefore a strike to make the people pay more or grant easier conditions. A railroad strike stops industry and the food supply. Hence we are all afraid of it.

One great result of government operation has been to

\*An address read before the National Institute of Social Sciences, April 25, 1919.

make it clear to the public that they have not to deal with an ordinary conflict between capital and labor. Capital is not at present involved or interested in the subject. It is probable that the readjustment will give capital little or no voice in rates or management. The question before the country is a larger one, viz., whether the 50 per cent. of railroad earnings going to labor shall be subject to regulation and control as is the remaining 50 per cent., or whether it shall be left to the laws of supply and demand and subject to the "right to strike." The government management has shown itself to be helpless in the face of an organized demand by a large number of voters and that tendency of government, being equally apparent both in England and France, may be taken to be a general characteristic and we must consider any plans for the future management of transportation with that feature in mind.

It is the general statement in Washington by senators and others in interest, that the roads may be turned back to private management but under far greater control than has existed heretofore. The labor question is an inconvenient question, certain to stir up trouble and arouse anger, but if the people are to have satisfactory transportation conditions, they must face the problem of the control of railroad labor as well as that of the control of railroad capital and operation. This is not a question for capital. As I have pointed out, capital for railroad enterprise has ceased to be speculative and profit making and is merely interest bearing. New capital can be had at market rates by making it secure. The subject of future capital requirements, however, is not germane to this paper.

There is a common assumption that the roads will be turned back to private owners without action upon the labor problem. As the roads are operated at a heavy loss under the existing conditions that proposal would mean placing upon private management the burden of exacting efficient service from labor and reducing payrolls to a point at least of transportation solvency. The result will be unco-ordinated efforts of a great number of different railroad managers, some strong, some weak, some vindictive, some easy, each considering his business as a separate problem and solving it as a special railroad problem without reference to the general labor requirements and conditions of the country. Doubtless, such a readjustment would be accompanied by costly and exasperating strikes. The public would be inflamed against the railroad management and much injustice and suffering would result to the men and to their families.

A more ideal way, and one more consonant with the views of an idealistic administration, would be to require the Interstate Commerce Commission to inquire into and regulate the surroundings and proper compensation of railroad labor, both wages and hours, as compared with the general labor conditions in the country. Upon that commission should sit men familiar with the conditions of railroad labor and also men familiar with the interests of the shippers using the railroads, such as members of chambers of commerce and the agricultural industry of the country. If possible, some members should be found who really represented the consuming public upon whose broad shoulders ultimately rests the burden of supporting the transportation of the country. Indeed, the balance of power on the commission should rest with those who have no interest except to second the general welfare, who can carry a just proportion between the special interest of the railroad employees and the general interest of the farmers, the laboring classes and the salaried people throughout the country. If the public desires to control its transportation interests, and has determined through the commission what is a fair return for railroad labor in its different classes, and has made provision for a just revision of the scale from time to time as may be required

by general conditions in the country and in the industry, the public must, to be consistent if for no other reason, face the question of how the award of the commission shall be enforced.

Shall railroad labor be considered to be "affected with a public interest" as is railroad capital? Shall entry into the service be made subject to certain fixed conditions with regard to leaving the service, such as thirty days' notice, the refusal of re-engagement in case service is terminated without adequate cause? Shall compulsory arbitration be adopted? Shall it be a misdemeanor to leave the service in a strike against an award adopted fairly and after due consideration? How can the railroad service be made attractive by way of old age pensions, better facilities for living, etc.? Such are the problems which the American people face in settling their transportation question. If we attempt to turn over the management of the 50 per cent. of the problem to private control, we must face difficulties of a character far more serious since the changes brought about by the war, than those which existed previously. The owners of the railroads do not wish to take them back under existing conditions. There are many who think that the proposal to leave the readjustment of these matters to private control would bring about a general bankruptcy of the transportation systems of the country. As a matter of fact, the government control is bankrupt to-day. In spite of the fact that it has raised railroad rates a billion dollars, its management is a half billion dollars behind its obligations. Government operation will require a billion appropriation by July. About a quarter of the war tax levy for this year besides another billion in transportation tax are thus due to government operation. Were it not for the taxing power, the government administration would have to seek refuge in a receivership. This condition is largely caused by the increased cost and the growing inefficiency of labor under government control, and makes plain the necessity of attacking with moderation and fairness but determinedly the problem of securing effective regulation of railroad labor in the United States.

The problem is not one of labor and capital. It is one of the relation of one branch of labor to the other labor, industries and interests of the country, for railroad rates touch everyone in the United States. There is no work in which men take such an intense and loyal interest as the railroad men take in their jobs. There is no class from whom loyal service is so essential to the public interest, because of their direct touch with the public both in passenger and freight transportation. There is no class of labor for which the strike is so tempting and so potent a weapon. A transportation strike is a blow at the food supply of the country and paralyzes all industry by withholding material and shipments. It would be an indictment of our courage and our collective intelligence to leave this desperate remedy of a transportation strike as a temptation to the railroad workers and as a menace to the general public.

The discussions in Congress and in the press have avoided the subject of railroad labor. There is a general readiness to let some one else bell the cat.

Railroad operatives are a very fine body of men. Their work takes them away from home and involves some risk. They are well entitled to good pay and good hours. But in the interest of the public they must submit to steady discipline and be held to it. The same interest requires that its food and material supply be not interrupted, and that its freight charges be not unduly raised.

Surely some method can be found, fair alike to the railroad employees and to the general public, which will solve the question indicated in the foregoing pages, upon the grounds of absolute justice and equitable treatment relatively to other industries and interests in the country.

# Some Modern Tendencies in Roundhouse Design\*

## Economic Studies of Engine Terminals Demonstrate the Advantages of Permanent Construction

By Exum M. Haas

Railroad Specialist, The Austin Company, Cleveland, Ohio

**A**n engine terminal is a clearing house for motive power, hence anything done to obviate delays tends to increase the traffic-carrying capacity of the road without increasing the fixed charges. The tremendous increases in traffic, operating charges, and hauling capacity of locomotives and their cost have proportionately increased the demand for full utilization of a locomotive's earning power. Mere minutes saved on each locomotive handled, when multiplied by the total number of locomotives of a given road, and reduced to money, will finance unbelievable improvements.

I refer to this phase of the engine terminal problem to indicate that a road can afford to pay for the most efficient facilities. As a matter of fact, a 100-engine terminal can be built at present day prices, and fully equipped, for \$660,000. This would result in annual fixed charges of about \$69,300, at 10½ per cent for interest and depreciation, or at about \$2 per engine per day. For a terminal of this size, a 20 to 25-stall roundhouse would be required. Assuming 24 stalls, the house would cost about \$220,000, or about one-third of the terminal cost. This amount would provide a roundhouse, equipped with all the modern labor-saving facilities, and it could be so constructed as to reduce depreciation to a minimum. For instance, a reinforced concrete structure would carry a rate of about 2½ per cent for depreciation, whereas a brick wall, wooden frame and roof structure would carry at least a rate of 5 per cent.

While the weight of locomotives has increased about 100 per cent, the cost has doubled. This also emphasizes the need for better facilities for the protection of the motive power. A locomotive is not a fire risk in itself, but when it is placed in a wooden roof roundhouse it certainly becomes one.

Some roundhouses are quite important running repair shops; hence anything incorporated in the design that will reduce the time to clear a locomotive should be adopted. Of course, there is an economical limit to the amount that can be spent, but that need not worry most of us, because there is so much room for improvement at most terminals that we would find it difficult to reach the limit of cost. For instance, engine terminal costs varied in 1918, so far as my knowledge goes, from \$25,000 to \$50,000 per stall of house capacity. The roundhouse proper has varied in cost from \$6,000 per stall, with lighting, heating and plumbing, to \$22,000 per stall. Both of these figures are high for the types of construction used, because of the abnormal labor and material market conditions prevailing in 1918, but the cost relation would hold even in normal times. On the other hand, from what I know of the labor-saving facilities provided in the higher-priced terminal and the permanence of its construction, I believe the mechanical department will have no difficulty in justifying the greater investment.

### The Question of Labor

Another of the broader questions affecting roundhouse design at present is labor. This concerns the quantity and class of help available, and the working conditions and wages. Under prevailing industrial conditions intelligent labor has

obtained employment at higher wages and with more satisfactory working conditions than are commonly found in and about a roundhouse. The roundhouse design must meet this form of competition or the quality of labor will fall below its present standard, and roundhouse labor is none too intelligent now.

Conditions in the average roundhouse built 20 years ago were not conducive to efficiency or economy. Poor day and night illumination and a lack of proper handling and machine tool equipment not only reduced the capacity of the house for clearing locomotives, but resulted in serious delays. On the other hand, the shortage of desirable help and the correspondingly higher prices that must be paid to obtain good men, make it important that all the facilities necessary and consistent with economy be provided to increase the production per man. The increased use of bridge and jib cranes in roundhouses is evidence of an appreciation of this fact. The substitution of the electric hoist for the truck and driver drop pits is another example. Improved daylighting in the working areas, and better heating and ventilation are also examples of the tendency to improve roundhouse conditions. Paved floors and walks, attention to good drainage, all add to engine terminal efficiency, and do not materially increase the fixed charges.

### Modern Types of Construction

Modern roundhouses divide themselves into three classes—the brick wall, wood frame and roof; reinforced concrete frame and roof, and a combination of steel frame and reinforced concrete structure. In one or two instances, concrete frames with wooden roofs have been built to reduce first cost, and in others reinforced concrete unit construction was adopted. The brick wall, wooden frame and roof construction has been most generally used because of its cheapness.

A roundhouse located at an unimportant terminal, housing engines that are comparatively small, is usually of simple design. The present tendency, however, is to increase the height to improve daylighting and ventilation. Houses of this type should be built of slow burning construction throughout—nothing less than 2-in. sheathing, and preferably 3-in. on 6 in. by 12 in. rafters—and all S-4-S and heavily coated with a fire-resisting paint.

On many roads the frequent post spacing has been found objectionable. This was the case with the New York Central Lines, and a 64-ft. truss has been substituted in the working area for the columns and beams. These trusses were formerly of heavy timber construction, but are now built up of bolted planks. The reason for this change was to cheapen the construction without reducing the quality of the lumber. This house has a one-bay portal way, with a lean-to at the back of the house. The lean-to in the rear not only provides a working aisle, but also permits the locomotives to be shifted over the driver and truck drop pits. There is some difference of opinion regarding the lean-to, but it is undoubtedly a cheaper construction than if the trusses had been carried the full width of the house.

In but comparatively few instances have the reinforced concrete houses, which are now being quite generally used, followed the same section as the wooden frame roundhouses.

\*Abstracted from a paper presented before the Western Society of Engineers, Chicago, May 12, 1919.

Generally speaking, however, they have been of the monitor-type construction, varying principally in the number and spacing of the columns. For instance, Philadelphia & Reading has built a house of three-bay construction, two low bays on each side of a monitor section. The interior columns are all structural steel encased in concrete. The reason for adopting this type of column was to permit the installation of a jib crane. The roof is a combination floor tile, T-beam construction to form an insulating medium against temperature changes and condensation. All sashes are of steel with pivoted ventilating sections. As an aid in ventilation, five permanent slot openings were provided at the ceiling line between each set of columns in both sides of the monitor and through the back wall. In addition, of course, there is the smoke jack and the opening around it.

I believe the first instance where a bridge crane was installed in a roundhouse was that in one built by the Baldwin Locomotive Company at Philadelphia. This was built for repairing locomotives, and is equipped with two cranes, the larger of which is of 50 tons capacity. Among the first of the bridge crane types of houses built by a railroad was that of the Pennsylvania Railroad at Altoona, Pa. It was constructed in 1902 and consists of 52 stalls, handling an average of between 250 and 350 locomotives daily. The head room in the crane section is about 30 ft. and the crane capacity is 12½ tons. It is interesting to note that an analysis of roundhouse crane requirements on the Pennsylvania Railroad made recently developed the fact that the maximum load that a crane would be required to handle was about 8½ tons. This meant that a 10-ton crane would be adequate for all purposes.

Another house along similar lines, and one which has been described quite frequently in technical journals, and railroad engineers' hand-books is that of the Western Maryland at Hagerstown, Md. This house is a steel frame construction, encased in concrete. Woven wire mesh was wrapped about the steel, and the concrete put in place by the Gunite system. The roof slab is 3-in. concrete with Hryl reinforcing. It is of double monitor construction, permitting daylight to enter at three points in addition to the back wall. In connection with steel frame houses, I would call your attention to the fact that built-up columns, girders of heavy section, are being used as the frame in the new houses recently built by the Pittsburgh & Lake Erie. This company believes that proper attention to painting will give unusually long life to these steel frames.

The type of house recommended where repairs are light has a reinforced concrete frame with a column spacing that results in economical concrete beam construction. The roof slab is flat on the under side, and is formed with 8 in. by 24 in. floor tile, and 4 in. concrete T-beams. This provides an insulated roof and one which is just as cheap to construct as the plain slab. The location of the monitor windows is such that it will throw daylight into the working area. In addition, the sash area in the lean-to at the back of the house is large. Provision has been made for omitting one set of columns in the drop pit section. This is done to provide a clear floor area between the pits for removing wheels from the drop pits to the back of the house. Permanent openings 4 in. by 18 in. in section at the front and rear of the monitor and just below the roof slab will take off the gases which collect at those points.

So far as we can learn, the life of steel sash in a roundhouse is somewhat longer than of wooden sash in the same location, and it is just about as cheap. If it is kept well painted, steel sash has the additional advantage of not swelling under excessive moisture, and the ventilators are just as readily operated in the winter months as in the summer.

In houses where heavy repairs are made a crane of approximately 50 ft. span should be provided which, with a slight

shifting of the locomotive, will reach any of the heavy repair parts which have to be handled. The height of the crane rail should be 26 ft. 6 in. above the floor line, which is sufficient to permit of the crane removing the cab without striking other parts of the locomotive. This height also greatly facilitates all crane movements. In a house with a crantry the objection may be raised to the fact that smoke and gases flow freely from the locomotive and fill the entire monitor section. In other words, the crane installation does permit the installation of the usual smoke jack. It has been found in houses of this section that the high monitor and the installation of a large ventilator or jack in the roof over each stall does not result in an objectionable accumulation of gases and smoke. In the winter time, and even in the summer, the fan in the hot blast heating system can be kept running to force out the gases.

I also want to call attention to the growing tendency to substitute the electric hoist for the truck and driver drop pit. In addition to reducing liability of accidents it removes wheels more quickly and cheaply. While this hoist is sometimes installed in the roundhouse, its proper location is in the back shop. In any case, the back shop should be connected with the roundhouse by a passageway, lined up with the turn-table, so that the dead locomotive can be pushed through the house into the back shop. With the electric hoist in the shop section, the removal of wheels is under proper supervision, and the handling of repair parts to and from the various machine tools is for but a short distance. Placing the hoist in the back shop also releases a stall for regular roundhouse service. Serious objection to the drop pit has developed in recent years, owing to the extremely heavy locomotives and to the declining quality of roundhouse help. While accidents due to jacking up the locomotives for the removal of wheels do not occur frequently, there is always the liability, and it has greatly increased with the failure to obtain intelligent labor.

#### Other Details

With the curved roof in a roundhouse the valley construction does not collect drifting snow like it does in a rectangular building. The wind has a sweep at the house from practically every direction, and those who have had long experience in roundhouse maintenance advise that they have never seen a great accumulation of snow on the roof. By pitching the monitor section to the rear of the house, as well as the lean-to to the back, practically all of the roof drainage is carried to a point where it does not interfere with the operation of the house.

Two types of roundhouse doors are quite generally used—a two-leaf steel-frame, wooden swinging door, and a rolling wood slat door. The former is the most popular because repairs are more readily made. The question is frequently raised whether or not it is desirable to provide sash in the door or in a transom over the door. Sash in the door permits lowering the roof level, but to some it is objectionable because the rough usage results in frequently broken glass. Daylight at the front of the house is not so essential, and all that is really needed may be had through small transom sash. On the other hand, it has been found that most of the blows which would break the glass in the door would break a wooden panel, and the glass is more readily replaced than the wood. For that reason, the glass area in the doors is made quite liberal in the houses built by a number of roads.

Another tendency in roundhouse design and construction which has come into more general use in the past few years is the substitution of the hot blast heating system for the pipe coils or other forms of direct radiation. A hot blast heating system installation costs very little more than a direct system, and it has the additional advantage of providing forced ventilation in the house, which is often very neces-

sary. At first the selection of too low fan and radiation capacity resulted in the indirect system being unsatisfactory. This has been corrected, and the fan may be speeded up in extremely cold weather to raise the temperature for thawing out frozen locomotives quickly.

whistles until the parade had passed from Victory Way on Michigan boulevard into the loop district. The din created completely silenced the famous band of the 13th Engineers. Flower wreaths were hung over the shoulders of Colonel C. L. Whiting, in command of the regiment, battalion commanders and company officers, and a company of girls seat-

## Thirteenth Engineers Returns to Chicago

THE GREATEST RECEPTION given to any organization of returning soldiers at Chicago was given to the 13th Railway Engineers on May 12. Its welcome to its home town was unequalled in point of enthusiasm and spectacular expression in the after-war history of the city. Approximately 100,000 people banked Michigan boulevard on both sides and maintained a bedlam of noise as the regiment paraded in platoon formation. Employees of the six railroads centering in Chicago, from which the 13th Engineers was mainly recruited, were organized in groups along Michigan boulevard to welcome the men. Major General William M. Black, chief of the United States Engineer Corps; Colonel R. D. Black, general staff, one of the organizers of the 13th Engineers; S. M. Felton, president of the Chicago Great Western and father of the 13th Engineers; W. L. Park, federal manager of the Chicago Great Western and chairman of the reception committee; the federal managers of the six roads from which the regiment was recruited and other prominent railroad men in Chicago occupied the reviewing stand on Victory Way. Major General Leonard Wood, who was to have reviewed the troops, was caught in the crowd at one of the street intersections and was unable to pass.

A majority of the regiment arrived in Chicago on Sunday night and after being permitted to go to their homes as-

Officers in Command of the Regiment

tered roses on the pavement in advance of the men. Immediately after the parade the men were taken to one of the large hotels where they were dined and entertained.

Major General Wood in addressing the men after this banquet made an appeal for the formation of a strong national

Photograph copyright by the International Film Service, Inc.

Thirteenth Engineers Passing Victory Way on Michigan Boulevard

sembled at dawn and marched to the Coliseum where thousands of relatives and friends welcomed them home. At 11:30 the men were again assembled and as they turned into Michigan boulevard for their parade, engineers on the Illinois Central and other railroads in Chicago opened their

policy of preparedness and urged the men to establish conditions to prevent another war.

Mr. Park, after welcoming the men on behalf of the middle west railroads, read a letter from Governor Lowden of Illinois, whose illness prevented him from attending and

added that every man in the 15th Engineers has his position on his old railroad waiting for him. A cordial welcome was also extended to the men by Major General Black and S. M. Felton and praise for the work the men had done in France was voiced by Colonel Whiting. Colonel Black, who was transferred from the regiment soon after their arrival in France, was then called upon by the men for a speech and told of his pride in having once been a member of the regiment.

The men entrained at three o'clock for Camp Grant where they will be demobilized.

The history of the regiment incorporated in the main report written by Captain L. E. Warner, regimental historian, to the Engineer Staff, American Expeditionary Forces, has been printed by the reception committee and is to be distributed to the men. A silk embroidered replica of the

providing for the assignment of non-federal controlled roads to roads under federal control for the purpose of settling car hire accounts does not apply to the following classes: (a) roads found to be plant facilities, (b) roads receiving allowances on a plant facility basis under Section 15 of the Act to Regulate Commerce, (c) roads which do not participate in joint through rates either directly or through absorption of regularly published and filed switching charges and which do not receive any allowances, and 2, roads found to be industrial common carriers. Instructions are provided for handling the per diem settlement with roads which fall under these classes.

*Distribution of Light Capacity Box Cars.*—Supplement 1 to Freight Car Distribution Notice 10 of the Northwestern regional director states that box cars of less than 30 tons capacity may be utilized as follows: (a) cars belonging to

#### On State Street

official regimental insignia with each man's name embroidered thereon is also to be sent to the men as soon as it can be prepared.

Permanent organizations to preserve the 13th Engineers have already been started, one for the officers of the regiment and the other for the enlisted men.

### Orders of Regional Directors

**STOREHOUSE DEVICES AND PRACTICES.**—Supplement 2 to Circular 85 of the Central Western Regional Purchasing Committee outlines a list of special appliances, devices and profitable practices reported by various regions to the Stores Section of the Division of Purchases.

*Weekly Report of Delayed Loads.*—Order 199 of the Southwestern regional director orders a weekly report showing all loaded cars on hand on each Wednesday, which cars have been on hand 15 days or more. This report will show point of origin, contents, consignee, etc., and the reason for the delay.

*Free Transportation for Witnesses.*—Supplement 50 to Circular 20 of the Northwestern regional director authorizes interstate passes for witnesses appearing on behalf of the director general in any case against the railroads under federal control in which the director general is interested.

*Per Diem Settlement.*—Supplement 3 to Circular 78 of the Northwestern regional director states that previous circulars

other regions may be loaded to or in the direction of the home road and accepted in interchange provided the load takes the car directly to the home road or to a road in the same region; (b) cars belonging to railroads in the Northwestern region may be loaded and accepted in interchange provided the load takes the car directly to a point on the home road and (c) cars belonging to roads not under federal control may be loaded and accepted in interchange when consigned to any point on or in the direction of the home road.

*Interstate Commerce Commission—Defense in Handling of Formal Complaints.*—Circular 209 of the Southwestern regional director states that henceforth the responsibility for the defense of rate cases before the Interstate Commerce Commission, also the compliance or otherwise with the orders of the commission, is placed with the traffic assistants of the several regions, and outlines a plan for defense of these formal complaints.

*Interest on New Work During Construction.*—Circular 207 of the Southwestern regional director gives directions similar to those in Eastern Region Circular 2700A714, noticed in the issue of the *Railway Age* for May 9, 1919, page 1138.

*Improper Billing of "Order" Shipments.*—Order 200 cancelling Order 125 of the Southwestern regional director calls attention to improper billing of shippers' order shipments. Grain, lumber and other commodities are being sent to the principal markets without sufficient information as to the person who is to be notified.

# Japan Desires American Co-operation in the Far East

## An Interview With Baron Goto, One of Japan's Leading Statesmen and Formerly Head of Its Railways

"IF BY SECURING PRIVILEGES and succeeding to the German rights over the railroads in the Shantung province of China, Japan could be called aggressive, there is no nation which could not have been called aggressive toward China. The development of China's natural resources for the mutual benefit of China and Japan cannot properly be called aggressive in any way." This is the translation of a statement in Japanese by Baron Goto, one of Japan's leading statesmen, to a representative of the *Railway Age*, who called on him at his hotel in Washington on Tuesday last. In speaking to the representative of the *Railway Age* through an able interpreter, Akio Kasama, of the Japanese foreign office, the Baron sought to emphasize two things—one, the idea that Japan is trying to carry out a plan of assisting China to make the most of her tremendous resources of coal and iron and in the way that will prove of most benefit to China and Japan, and second that Japan is trying to work out this problem with the co-operation of the only other nation that is at present on a firm foundation in the Far East, the United States.

Baron Shimtei Goto is one of Japan's leaders in every sense of the term. He has been a member of the Japanese cabinet on a number of occasions and as president of the Japanese Imperial Railways was the man who perhaps did the most to bring that railway system to the point where it is now classed as one of the best operated in the world. The Baron is now on his second visit to this country—the first visit having taken place about 18 years ago. He is traveling at present in a private capacity, principally to investigate America's mobilization for war and its demobilization after the war. He has been especially impressed by America's industrial mobilization and is of the opinion that this was perhaps the most important factor in attaining the final victory in the war.

### President of the Japanese Railways

The Baron was, about 18 years ago, civil governor of Formosa, and as such built the railways of that island. He was later president of the South Manchurian system and in his year of office there rehabilitated those lines. One of the large parts of this work was to change to standard gage the 5-ft. gage railways which were taken over after the Russo-Japanese war as well as the light railway feeders which now form an important part of the South Manchurian Railways. It is of special interest to Americans that in rehabilitating the lines he introduced American standards almost throughout to such an extent that Americans traveling over the Chinese Eastern and changing to the South Manchurian lines at Changchun, almost get the impression that they have come upon a section of United States.

Baron Goto then returned to Japan and soon entered the Japanese cabinet as minister of commerce and was also chosen president of the Japanese railways—a position which he held for nearly 10 years. Still retaining his position as head of the railways, he was later made minister of home affairs and then was given the important portfolio of minister of foreign affairs. He resigned from the cabinet about a year ago, but continued in an advisory capacity as a member of the supreme council of foreign affairs—a temporary body made necessary by the war. That the Baron will again return to the cabinet on his return to Japan there seems no question. It is in fact not unlikely that he will eventually attain the premiership, itself.

Japan, the Baron said, is endeavoring to co-operate in its work in China with the United States—Japan and the United States being the only two countries that are at present in a strong position in that part of the world, now that Russia has collapsed and China is in a state of revolution. This co-operation has already been manifested in a number of ways not the least important of which is the agreement made between Japan and the United States concerning the Chinese Eastern Railway or that part of the Trans-Siberian which crosses Manchuria to Vladivostok. This agreement was brought about largely through the efforts of Baron Goto who conferred on the subject with Mr. Morris, the American ambassador to Japan. Baron Goto emphasized the importance of this agreement as helping to preserve the peace of the Orient and as being one step to show the world how eager Japan and the United States are to stick to their mission of co-operation in the Orient.

### The Development of China

The Baron in the interview devoted no small amount of attention to the work Japan is now carrying out in developing China. He pointed out that the northern part of China had tremendous resources in iron and coal, and did not try to conceal his opinion that Japan was in the best position of any country to bring them into use for China and the rest of the world. He emphasized again and again, however, Japan's keen desire for American co-operation in China and the Far East. It has been noted above that he had strong opinions that Japan could not properly be called aggressive in its dealings with China, and he pointed out a number of things that would tend to show the opposite. For one thing, he said, Japan was about to give up its privilege of extra-territoriality in China whereby foreigners have the right to be tried in their own courts and under their own laws. Japan is the first nation to take this step, and it will also essay to bring about a codification of Chinese laws and regulations, so that by means of China's having a more efficient legal system, extra-territoriality will not be necessary.

The world has always been impressed by the manner in which the United States returned the Boxer indemnity in the form of a fund to encourage the education of China's youths. Japan, said Baron Goto, is now considering taking the same step and hopes to work out the same plan in the near future. Japan in assisting to develop China has invested in the railways of the latter country some \$25,000,000 during the last three or four years. This money, the Baron emphasized, however, has not been loaned in a general way, but covers particular railway projects. These have been mentioned in detail in the *Railway Age* from time to time, and it is only necessary to point out that the lines in question are extensions of present systems meant primarily to reach the iron and coal resources of northern China.

Japan already has a large mileage of railways in Manchuria and by the war came into possession of the Shantung Railway, formerly owned by the Germans. These lines are absolutely controlled by the Japanese. The new lines, for which the loans have been made, the Baron emphasized, are quite different. They are to be operated not by the Japanese, but to be under the control of the Chinese Ministry of Communications, which will operate them with the assistance of Japanese advisers and supervisors. One most important factor is that there is no requirement that supplies must be bought in Japan. Many of the British, French and Belgian

concessions have a requirement that equipment must be bought from the country from which the loans are obtained—a provision that proved of great hardship during the war when cars and locomotives could not be bought in Europe. The lack of this provision will no doubt prove of great value to the United States, for China and Japan alike have shown a great favor for American railway supplies.

America has supplied great numbers of cars and locomotives for the railways under the control of the Chinese Ministry of Communications. Not only have American car and locomotive manufacturers supplied equipment in quantity for the South Manchurian Railways, but that system, as noted above, is largely built and equipped to American standards.

The *Railway Age* representative did not question Baron Goto in any degree concerning the railways of Japan because Mr. Kasama has already covered that factor in an interview in the *Railway Age* last year (February 22, 1918, page 409). He did ask, however, concerning the status of the project to convert Japan's roads to standard gage, an idea which was worked out and fathered by Baron Goto. The project is now being held in abeyance. Large sections of Japan's lines have their right of way and bridges made to 4 ft. 8½ in. gage standards largely through the efforts of Baron Goto and there seems to be no doubt that the change from 3 ft. 6 in. to standard will be carried out eventually. This will give Japan the same gage as its other lines in Manchuria and Chosen, which were converted to standard gage a number of years ago.

In closing his interview the Baron expressed his appreciation of America's railroads and their equipment and added that Japan in railway matters came to us as a pupil. The Japanese railways are well operated, he admitted, but they still needed a great deal to bring them up to American railroad standards physically.

### Rail Production in 1918

THE PRODUCTION OF RAILS in the United States for 1918 was 2,533,675 gross tons or a reduction of 410,486 tons as compared to 1917, and 1,444,212 tons less than the record production of 1906. These statistics are given in a special bulletin issued by the American Iron and Steel Institute, New York, from which the following table giving the production of rails by processes for the years 1902 to 1918, inclusive, was taken:

PRODUCTION OF RAILS BY PROCESSES, IN GROSS TONS.

Years	Open hearth	Bessemer	Rerolled*	Electric	Iron	Total
1902.....	6,029	2,935,392	.....	.....	6,512	2,947,933
1903.....	45,054	2,946,756	.....	667	667	2,992,477
1904.....	145,883	2,137,957	.....	.....	871	2,284,711
1905.....	183,264	3,192,347	.....	.....	318	3,375,929
1906.....	186,413	3,791,459	.....	.....	15	3,977,887
1907.....	252,704	3,380,025	.....	.....	925	3,633,654
1908.....	571,791	1,349,153	.....	.....	71	1,921,015
1909.....	1,256,674	1,767,171	.....	.....	.....	3,023,845
1910.....	1,751,359	1,884,442	.....	.....	230	3,636,031
1911.....	1,676,923	1,053,420	.....	.....	462	2,822,790
1912.....	2,105,144	1,099,926	.....	.....	3,455	3,327,915
1913.....	2,527,710	817,591	.....	.....	2,436	3,502,780
1914.....	1,525,851	323,897	.....	.....	178	1,945,095
1915.....	1,775,168	326,952	.....	.....	.....	2,204,203
1916.....	2,269,600	440,092	.....	.....	.....	2,854,518
1917.....	2,292,197	533,325	.....	.....	.....	2,944,161
1918.....	1,938,226	494,193	.....	.....	.....	2,533,675

\* Rerolled from old steel rails. Included with Bessemer and open-hearth steel rails from 1902 to 1910 inclusive.

† Small tonnages rolled in 1909 and 1910 but included with Bessemer and open-hearth rails for these years.

These production figures include rails rolled for export, which tonnage was unusually high last year, owing to the quantities shipped to our forces and those of our allies overseas. Another evidence of the abnormal conditions during the last year is to be seen in the further increase in the relative production of Bessemer rails, the proportion being 19.5 per

cent in 1918 as compared to 18.11 per cent in 1917, 15.42 in 1916 and 14.82 in 1915.

In spite of the unusual relation of the demand to the supply of rails last year, it is to be noticed that the tonnage of rails rerolled has decreased progressively in the last three years. This tonnage aggregated only 101,256 tons in 1918 as compared to 118,639 tons in 1917, and 144,826 tons in 1916. The production of renewed and rerolled rails in 1911 to 1918, inclusive, is given in detail in the following table:

PRODUCTION OF RENEWED AND REROLLED RAILS, 1911-1918

Years	Rerolled from new seconds, new defective rails, etc.			Rolled from old rails	Total rerolled
	Open-hearth	Bessemer	Total		
1911.....	2,631	19,379	22,010	91,751	113,761
1912.....	13,140	29,446	42,586	119,390	161,976
1913.....	13,052	30,741	43,793	155,043	198,836
1914.....	13,538	13,234	26,772	95,169	121,941
1915.....	6,477	2,652	9,129	102,083	111,212
1916.....	1,711	2,149	3,860	144,826	148,686
1917.....	1,825	7,182	9,007	118,639	127,646
1918.....	13,296	19,462	32,758	101,256	134,014

Another indication of the deficiency of rail production and purchasing during the past year is given by the table below showing the production of rails by weights per yard in the years 1902 to 1918, inclusive. This goes to show that the production of rails in sections weighing 100 lb. or over has decreased far more than most of the other classes of weights, indicating that the limited tonnage of steel available for rails made it necessary to dispense with the heavier sections in considerable measure.

PRODUCTION OF RAILS BY WEIGHT PER YARD, 1902-1918

Years	Under 45 pounds	45 and less than 85	85 and less than 100	100 pounds and over	Total Gross tons
1902.....	261,887	2,040,884	.....	645,162	2,947,933
1903.....	221,262	1,603,088	.....	1,168,127	2,992,477
1904.....	291,883	1,320,677	.....	672,151	2,284,711
1905.....	228,252	1,601,264	.....	1,546,053	3,375,929
1906.....	284,612	1,749,650	.....	1,943,625	3,977,887
1907.....	295,838	1,569,958	.....	1,767,831	3,633,654
1908.....	183,869	687,632	.....	1,049,514	1,921,015
1909.....	255,726	1,024,856	.....	1,743,263	3,023,845

Loading American Wounded in France for Carriage to Debarkation Points

# Railway Mounted Artillery in the War\*

Use of Mobile Guns Had Reached High Stage of Development  
When Armistice Was Signed

AS SOON AS WAR was declared against Germany the American Ordnance Department, in its search for an immediate equipment of strong artillery, surveyed the ordnance supplies of the country and discovered some 464 heavy guns which might be spared from the seacoast defenses, obtained from the Navy, or commandeered at private ordnance plants where they were being manufactured for foreign governments. There were six guns of this last-named class—powerful 12-in. weapons which had been produced for the Chilean government. It was seen that if all, or if a large part, of these guns could be made available for service in France, America would quickly provide for herself a heavy artillery equipment of formidable proportions.

The Ordnance Department conceived that the only way to make these guns available for use abroad would be to mount them on railway cars. These guns were not vital in the defense of our coast under the conditions of the war with Germany, but it was evident that they would make a valuable type of long-range artillery when placed on satisfactory railway mounts.

The guns thus available for mounting on railway cars ranged in size from the 7-in. guns of the Navy to the single enormous 16-in. howitzer which had been built experimentally by the American Ordnance Department prior to 1917. In addition there was the 16-in. howitzer, 20 calibers in length, which had been built by the Ordnance Department before 1917. The expression 14-in. guns, 50 calibers, means that the gun has a barrel diameter of 14 in. and that the gun body is 50 times the caliber of 14 in., or 700 inches (58 ft. 4 in.) long.

## Origin of Railway Artillery

Mounting heavy artillery on railway cars, however, was not an idea born of the recent war. The idea was probably originally American. The Union forces at the siege of Richmond in 1863 mounted a 13-in. cast-iron mortar on a reinforced flat car, this being the first authenticated record of the use of heavy railway artillery.

In 1913 the commanding officer of the defenses of the Potomac, which comprise Forts Washington and Hunt, was called upon to report on the condition of these defenses. In reply, he advised that no further expenditure be made on any one of the fixed defenses, but recommended that a "strategic railroad" be built along the backbone of the peninsula from Point Lookout to Washington, with spurs leading to predetermined positions both on Chesapeake bay and the Potomac river, so placed as to command approaches to Washington and Baltimore.

Further, he recommended that 4 major-caliber guns, 16 medium-caliber guns, and 24 mine-defense guns be mounted on railroad platforms, with ammunition, range finding, and repair cars making up complete units, so that this armament could be quickly transported at any time to the place where most needed. He suggested that this scheme be made applicable to any portion of the coast line of the United States. His argument was based upon the fact that guns in fixed positions, of whatever caliber or place, violate the cardinal military principle of mobility.

The nations engaged in the war now ending developed to a high stage the use of heavy artillery mounted on railway cars, bringing about a combination of the necessary rigidity with great mobility considering the weight of this material.

Railway artillery came to be as varied in its design as field artillery. Each type of railway mount had certain tactical uses, and it was not considered desirable to use the different types interchangeably. The three types of cannon used on railway mounts were mortars, howitzers and guns. It was not practicable to use the same type of railway mounts for the different kinds of cannon. Moreover, these mounts differed radically from the mounts for such weapons at the seacoast defenses.

The three general types of railway mounts adopted were those which gave the gun all-around fire (360-degree traverse), those which provided limited traverse for the gun, and those which allowed no lateral movement for the gun on the carriage but were used on curved track, or epis, to give the weapons traverse aim.

The smaller weapons, such as the 7-in. and the 8-in. guns and the 12-in. mortars, were placed on mounts affording 360-degree traverse. The limited traverse mounts were used for the moderately long-range guns and howitzers. The fixed type of mount was used for long-range guns only, and included the sliding railway mounts, such as the American 12-in. and 14-in. sliding mounts and the French Schneider *à glissement* mounts.

The work of providing railway artillery—that is, taking the big, fixed-position guns already in existence within the United States and similar guns being produced and designing and manufacturing suitable mounts for them on railway cars—grew into such an important undertaking that it enlisted the exclusive attention of a large section within the Ordnance Department. This organization eventually found itself engaged in 10 major construction projects, which, in time, had the war continued, would have delivered more than 300 of these monster weapons to the field in France and, to a lesser extent, to the railway coast defenses of the United States.

As it was, so much of the construction—the machining of parts, and so on—was complete at the date of the armistice, that it was decided to go ahead just the same with all of the projects except three, these involving the mounting of 16 guns of 14-in. size, 50 calibers long, the production of 25 long-range, 8-in. guns, 50 calibers, and their mounting on railway cars, and the mounting of 18 coast defense, 10-in. guns, 34 calibers long, on the French Batignolles type of railway mount.

The barbette carriage revolves about a central pintle, or axis, and turns the gun around with it. When it was decided to put coast defense guns on railway cars, the guns were taken from their emplacements, barbette carriages manufactured for them, and the whole mounted upon special cars. The barbette mount revolves on a support of rollers traveling upon a circular base ring. In the railway mount the base ring is attached to the dropped central portion of the railway car. The barbette railway mount is provided with struts and plates by which the car is braced against the ground.

The Schneider railway mount is named after the French ordnance concern Schneider et Cie, which designed it. In this mount the gun and its carriage are fastened rigidly parallel to the long axis of the railway car. Thus the gun itself, independently of any movement of the car, can be

\*From an advance proof of a report on "American Munitions," by Benedict Crowell, Assistant Secretary of War.  
NOTE: Previous articles briefly describing and illustrating some of the railway mounted artillery have been published in the *Railway Age* of November 29, 1918, page 967, and December 20, 1918, page 1113.

pointed only up and down in a vertical plane, having no traverse or swing from left to right and vice versa. In order to give the weapon traverse for its aim, special railway curved tracks, called epis, are prepared at the position where it is to be fired. The car is then run along the curve until its traverse aim is correct, and the vertical aim is achieved by the movement of the gun itself. In the Schneider mount there is no recoil mechanism, but the recoil is absorbed by the retrograde movement of the car itself along the rails after the gun is fired. This movement, of course, puts the gun out of aim, and the entire unit must then be pushed by hand power back to the proper point.

In the Batignolles type, gun and cradle are mounted on a so-called pot carriage that permits of small changes in horizontal pointing right and left. Thus with the railway artillery of the Batignolles type also track curves, or epis, are necessary for the accurate aiming. The Batignolles mount partially cushions the recoil by the movement of the gun itself in the cradle. But, in addition, a special track is provided at the firing point, and the entire gun car is run on this track and bolted to it with spades driven into the ground to resist what recoil is not taken up in the cradle. The unit is thus stationary in action, and the gun can be more readily returned to aim than can a gun on a Schneider mount.

The conditions under which the war with Germany was fought virtually precluded any chance of a naval attack on our shores which would engage our fixed coast defenses. The British grand fleet, with the assistance of fleets of the other allies and America, had the German battle fleet securely bottled. On the other hand, there was the prowling submarine able at all times to go to sea and even to cross the ocean, and some of the latest of these submarines were armed with long-range medium-caliber guns. It was not beyond possibility that some sort of an attack would be made on our shores by submarines of this character, yet it was safe to believe that these craft would keep well out of range of the guns at our stationary coast defenses.

To protect our coast from such attack the Ordnance Department conceived the plan of mounting heavy guns on railway cars. They might then be moved quickly to places on the seacoast needing defense. For this purpose the Navy turned 12 of its 7-in. rifles over to the Ordnance Department for mounting. Meanwhile our ordnance officers had designed certain standard railway artillery cars, known as models 1918, 1918 Mark I, and 1918 Mark II, for 7-in. and 8-in. guns and 12-in. mortars, respectively. These cars all had the same general features.

The model 1918 car was selected for the converted 7-in. Navy rifle. The rifle was mounted on a pedestal set on the gun car in such a manner as to give all-around fire, or 360-degree traverse. The pedestal mount permitted the gun to be depressed at an angle suitable for firing from high places along the coast down upon the low-lying submarines.

### Manufacture

Contracts for the various parts for these cars and the pedestal gun mounts were let to concerns engaged in heavy steel manufacture, but the assembling was done by the American Car & Foundry Company at Berwick, Pa. Twelve of the 7-in. rifles were so mounted. As this equipment was intended exclusively for use in this country, the gun cars were equipped with the American type of car couplings.

For the 8-in. guns taken from seacoast fortifications the Ordnance Department designed a barbette mount giving complete, 360-degree, traverse, thus providing for fire in any direction. There were 96 such guns available for railway mounts. Orders for 47 gun cars with carriages for mounting the weapons were placed with three concerns—the Morgan Engineering Company of Alliance, Ohio, the Harrisburg

Manufacturing & Boiler Company of Harrisburg, Pa., and the American Car & Foundry Company of Berwick. Two of the three contractors found it necessary to provide additional facilities and machine-tool equipment at their plants in order to handle this job.

The first railway mount for the 8-in. gun was completed and sent to the Aberdeen proving ground for test in May, 1918. In early June the test had shown that the weapon was efficient and entirely satisfactory. Before the end of the year 1918 a total of 24 complete units, with ammunition cars for standard-gage track, shell cars for narrow-gage track, transportation cars, tools, spare parts, and all the other necessary appurtenances of a unit of this character, had been completed. Three complete 8-in. units were shipped overseas before the armistice was signed.

When the armistice came the Harrisburg company had delivered 9 of these mounts and the Morgan Engineering Company an equal number, making 18 in all. The former concern had reached an output of 5 mounts per month and the latter 10 per month.

An interesting feature of this mount is that it can be used either on standard-gage or on narrow-gage railroad track. The narrow-gage adopted was that in standard use in the fighting zones in France, the distance between the rails being 60 centimeters, or the approximate equivalent of 24 inches. Each gun car was provided with interchangeable trucks to fit either gage. The artillery train necessary for the maneuvering of the weapon was also similarly equipped to travel on either sort of track.

As a rule, the longer the barrel of a cannon, the greater its range. The 8-in. seacoast guns thus mounted were 35 calibers in length; that is, 35 times 8 in., or 23 ft. 4 in. The requirements of our forces in the field in France called for guns of this same size but of longer range. Consequently an 8-in. gun of 50 calibers—that is, 10 ft. longer than the seacoast 8-in. gun—was designed, and 25 of them were ordered. This project came as a later development in the war, the guns being intended for use abroad in 1920. The railway mounts for the weapons had not been placed in production when the armistice came. Because of the incomplete status of this project in the autumn of 1918, the whole undertaking was abandoned.

There were at the seacoast defenses and in the stores of the Army a large number of 10-in. guns of 34 calibers. Of these 129 were available for mounting on railway cars. It was proposed to mount these weapons on two types of French railway mounts—the Schneider and the Batignolles.

The project to mount 36 of these weapons on Schneider mounts was taken up as a joint operation of the United States and French governments, the heavy forging and rough machining to be done in this country and the finishing and assembling in the French shops. The American contractors were three. The Harrisburg Manufacturing & Boiler Company undertook to furnish the major portion of the fabricated materials for the carriages and cars. The Pullman Company contracted to produce the necessary trucks for the gun cars, while the American Car & Foundry Company engaged to build the ammunition cars.

Eight sets of fabricated parts to be assembled in France had been produced before the armistice was signed. General Pershing had requested the delivery in France of the 36 sets of parts by March 2, 1919. After the armistice was signed there was a natural let-down in speed in nearly all ordnance factories, but even without the spur of military necessity the contracting concerns were able by April 7, 1919, to deliver 22 of the 36 sets ordered. Had the war continued through the winter there is little question but that all 36 sets of parts would have been in France on the date specified.

The 10-in. seacoast gun, Batignolles mount project, was placed exclusively in the hands of the Marion Steam Shovel

Company of Marion, Ohio. It had been proposed also to mount 12-in. seacoast guns on this same type of equipment, and this work, too, went to the Marion concern. There were to be produced 18 of the 10-in. units and 12 of the larger ones.

The Marion Steam Shovel Company had had a large experience in producing heavy construction and road-building equipment. The concern encountered numerous difficulties at the start in translating the French drawings and in substituting the American standard materials for those specified by the French. These difficulties, combined with struggles to obtain raw materials and the equipment for the increased facilities which had to be provided at the factory, so delayed production that no mount for either the 10-in. or 12-in. guns had been delivered at the time of the armistice. The first mount of these classes—one with a 12-in. gun—reached the Aberdeen proving ground about April 1, 1919. The 10-in. project, calling for 18 mounts, was cancelled soon after November 11, 1918. The work on the dozen mounts for 12-in. guns, however, had progressed so far that the Ordnance Department ordered the completion of the entire equipment.

As has been stated, the government found in this country six 12-in. guns being made for the Republic of Chile. Their length of 50 calibers gave them a specially long range. It was decided to place the Chilean guns on a sliding mount. In a mount of this type the retrograde movement of the car along the track as and after the gun is fired takes up and absorbs the energy of fire.

### Types

The first sliding railway mount used on the Allied side in the great war was of French design. But our manufacturers had so much trouble with French designs that when the project came up of mounting the Chilean guns in this fashion it was decided that it would be quicker to design our own mount. Consequently the French design was taken in hand by our ordnance engineers and re-designed to conform to American practice, with the inclusion in the design of all original ideas developed by the Ordnance Department in its creative work during the war period up to that time. The manufacturers who looked at the French design of the sliding railway mount estimated that it would take from 12 to 18 months before the unit could be duplicated in this country and first deliveries made. They looked at the American design and estimated that they could build it in 3 months.

It was decided to build three mounts of this character and thus have a reserve of one gun for each mount to reserve as replacement when the original guns were worn out. Contracts were placed in the early summer of 1918, and all three mounts were delivered before the armistice was signed, the first mount being completed within 85 days after the order was placed. For these mounts the American Bridge Company furnished the main girders or side pieces, the Baldwin Locomotive Company built the railway trucks and the Morgan Engineering Company manufactured the many other parts and assembled the complete units. The speed in manufacture was made possible by the fact that the plant engineers of the three companies helped the ordnance officers in designing the details. With such intimate co-operation, the concerns were able to begin the manufacture of component parts while the drawings were being made.

All three weapons with their entire equipment, including supplies, spare parts, ammunition cars, and the whole trains that make up such units, were ready for shipment to France in November, 1918. Each mount as it stands today is 105 ft. long and weighs 600,000 pounds. The load of the gun and the peak load put on the carriage when the gun is fired are so great that it requires four trucks of 8 wheels

each, 32 car wheels in all, to distribute the load safely over ordinary standard-gage track.

In years past the Ordnance Department had procured a large number of 12-in. mortars for use at seacoast defenses. These great weapons are 10 calibers in length, or 10 ft. in linear measurement, the diameter of the barrel being just an even foot. Of the number stationed at the coastal forts and in reserve it was decided that 150 could be safely withdrawn and prepared for use against Germany. When General Pershing was informed of the proposal, he asked that 40 of these weapons mounted on railway cars should be delivered to the American Expeditionary Forces for use in the planned campaign of 1919. In order that there might be an adequate supply of them, the Ordnance Department let contracts for the mounting of 91 of these mortars on railway equipment, a project which would give the United States a formidable armament and still provide a reserve of 59 mortars to replace the service mortars on the carriages after repeated firing had worn them out.

This job proved to be one of the largest in the whole artillery program. The entire contract was let to the Morgan Engineering Company of Alliance, Ohio. In order to handle the contract a special ordnance plant, costing \$1,700,000 for the building alone, had to be constructed at the company's works at Alliance. The work was so highly specialized that machine tools designed for the particular purpose had to be produced. The government itself bought these tools at a cost of \$1,800,000. Although work on this plant was not started until December 10, 1917, and although thereafter followed weeks and weeks of the severest winter weather known in recent years, with all the delays in the deliveries of materials which such weather conditions bring about, the plant was entirely complete on June 1, 1918, not only, but the work of producing the mounts had started in it long before that, some machines getting to work as early as April.

The gun car used for mounting the mortar carriage was of the same design as that for the 7-in. and 8-in. guns, except that each truck had six wheels. The carriage built upon this car was of the barbette type, and it allowed the gun to be pointed upward to an angle as high as 65 degrees and provided complete traverse, so that the mortar could be fired in any direction from the car. A hydropneumatic system for absorbing the recoil of the mortar after firing was adopted. This recuperator in itself was a difficult problem for the manufacturer to solve, being the first hydropneumatic recuperator of the size ever built in this country.

In spite of the weight and elaborate character of this unit it was put into production in an astonishingly short space of time. The pilot mount came through on August 22, 1918, less than nine months after the spade was first struck in the ground to begin the erection of the ordnance plant. By the end of August the pilot mortar had successfully passed its firing tests at Aberdeen, functioning properly at angles of elevation from 22 degrees to 65 degrees and in any direction from the mount. While this unit was put through hurriedly for these tests, the preparation for the rest of the deliveries was made on a grand scale, looking toward quantity production later on. When the armistice was signed, every casting, forging and structural part for every one of the 91 railway mounts was on hand and completed at the works of the Morgan Engineering Company, and thereafter the process was merely one of assembling, although in a unit of such size the assembling job alone was one of great magnitude. Even at the reduced rate of production incident to the relaxation of tension after the armistice was signed, the company delivered 45 complete units to the government up to April 7, 1919, or five more than General Pershing said he would require during the whole campaign of 1919. Careful estimates show that if the war had con-

tinued the company would have delivered the mounts at the rate of 15 per month beginning on December 15, 1918, a rate which would have completed the entire project for 91 mounts by the middle of June, 1919.

As in the case of the 8-in. railway guns, the 12-in. mortars were provided with interchangeable wheel trucks allowing the unit to travel and work either on standard gage track or on the 60-centimeter, narrow-gage track of the war zone in France.

The War Department did not have any 14-in. guns which could be spared from the seacoast defenses for use abroad. The Ordnance Department, therefore, inaugurated the project for the construction of 60 guns of 14-in. caliber. For the construction of such guns complete new plants were required, as all available facilities were already taken over for other projects considered more important. This contract was to have been turned out by the Neville Island ordnance plant. The Navy Department in May, 1918, expressed willingness to turn over to the Army certain 14-in. guns, 50 calibers, then under construction and of which it was estimated that 30 would be completed by March, 1919.

It was decided to place some of these 14-in. guns on American sliding railway mounts, and 16 such mounts were ordered from the Baldwin Locomotive Works, deliveries to begin February 1, 1919. The 16 units were to be delivered prior to April, 1919, but due to the signing of the armistice work was suspended on the contracts, since the mounts were designed for use in France. The contract was cancelled in March, 1919.

The Navy itself placed five of these guns on railway mounts of another design to be operated in France by naval forces on shore. Eleven such mounts were built by the Baldwin Locomotive Works under the supervision of the Navy Ordnance Bureau, and six of them were afterwards turned over to the Army.

Without discussing here the 12-in. howitzers, 20 ft. long, which the Ordnance Department ordered produced and mounted on a railway truck, a development for use abroad in 1920, we come, finally to the largest weapon of all in the railway artillery program, the 16-in. howitzer, the barrel of this mighty weapon being 26 ft. 6 in. long. The American 16-in. howitzer had been forged out and finished prior to the date of America's entrance into the war. It was proposed to place this weapon on a railway mount and make it available for use on the western front.

The Ordnance Department completed the design for the mount on February 10, 1918. In order to turn out the unit in the shortest possible time, the project was placed with three manufacturers, each of whom was to produce different parts. The American Bridge Company received the order to build the structural parts, the Baldwin Locomotive Works contracted for the trucks, while the Morgan Engineering Company undertook to assemble the unit and also to build the top carriage and other mechanical parts. The contractors did a speedy job in producing the mount for this howitzer.

In nearly all railway artillery of this size it is necessary to provide bracing when the gun is set up in position for firing. The 16-in. howitzer mount was unique in that the weapon could be fired from the trucks without any track preparation whatsoever. An exhaustive test at the Aberdeen proving grounds demonstrated that this piece of artillery ranked with the highest types of ordnance in use by any country in the world.

In the meantime orders had been placed for 61 additional howitzers. The American Expeditionary Forces asked that 12 of these enormous weapons be sent overseas as soon as they could be produced, a job which naturally would have extended over a period of months, if not years. Since none of the additional howitzers had been produced when the

armistice was signed, the project of building mounts for them never got under way. The pilot howitzer and mount were not shipped abroad.

Operation

In the design of railway equipment for high-angle weapons such as howitzers, two loads must be considered by the builders in order to provide a gun car of sufficient strength to hold its freight. One of these loads, the lighter one, consists merely of the ordinary weight of the gun and its carriage upon the car wheels. The other load, the so-called firing load, consists of the weight of the unit plus the additional weight of the downthrust of the howitzer when it recoils. In the case of the 16-in. howitzer the firing load is approximately 748,231 pounds. The weight of 748,231 pounds must be distributed along the tracks by the numerous sets of wheels at the instant the gun is fired.

The mount for the howitzer is so constructed that this load is partly taken up by the slide of the gun car along the

RAILWAY ARTILLERY PROJECT

<sup>1</sup>Sets fabricated parts.

track. In addition, the howitzer is equipped with a hydraulic recoil cylinder. Thus the unit has a double recoil system. The car trucks in the tests comfortably transmitted, through a series of equalizer springs, this enormous load upon an ordinary rock-ballast track, without any distortion to the track or roadbed or impairment to the working parts of the unit. After each discharge the whole huge mount moves backward along the track for a distance of 20 or 30 feet.

Each railway artillery project called for the manufacture of a great equipment of ammunition cars, fire-control cars, spare-parts cars, supply cars, and the like, a complete unit being a heavy train in itself. Such armament-train cars, together with numerous other accessories and necessary equipment, were designed by the Ordnance Department and produced for each mount. In all, 530 ammunition cars were produced up to April, 1919. Most of them were

shipped abroad, but 118 were retained for use in this country.

Since the overseas cars were to be used with French railway equipment, it was necessary to fit them out with French standard screw couplers, air brakes and other appliances for connecting up with French railway cars.

The matter of traction power for these gun and armament trains near the front set a problem for the Ordnance Department to solve. It was out of the question to use steam engines near the enemy's lines, since the steam and smoke would betray the location of artillery trains at great distances. The Ordnance Department adopted a gas-electric locomotive of 400 horsepower to be used to pull railway artillery trains at the front, and was on the point of letting a contract to the General Electric Company for the manufacture of 50 of them when the armistice was signed, making further equipment unnecessary.

The Neville Island ordnance plant, on an island in the Ohio River near Pittsburgh, would have produced weapons of the character of those used with railway mounts and would have turned them out in large numbers had the armistice not come to put an end to this enormous arsenal project. The plant was being erected for the government by the United States Steel Corporation without profit to itself. The estimated cost of this plant when finished was \$150,000,000. Designed to supply the needs of the Army for artillery of the heaviest types, the Neville Island plant was being constructed on such a scale that it would surpass in size and capacity any of the famous gun works of Europe, including the Krupp's.

It was being equipped to handle huge ordnance undertakings, such as the monthly completion of 15 great 14-in. guns and the production of 40,000 projectiles monthly for 14-in. and 16-in. guns. The plans of the government contemplated the production of 14-in. guns to the number of 165 in all and their shipment to France in time to be in the field before May 1, 1920. An initial order for 90 of these weapons had been placed at the arsenal while it was being erected.

Besides 14-in. guns the plant was being equipped to turn out 16-in. and even 18-in. weapons. The immense size of the machinery necessary for such production can be understood when it is noted that an 18-in. gun weighs 510,000 pounds and a 14-in. gun 180,000 pounds. It requires from 12 to 18 months to produce guns of this size, yet Neville Island was being developed on a scale to build hundreds of them simultaneously. The entire plant was to cover 573 acres and was to employ 20,000 workmen when in full operation.

At the signing of the armistice work was suspended at Neville Island, and four months later the whole project was abandoned.

## Objections to Proposed Rules for Competitive Bids Under Clayton Law

A SPECIAL COMMITTEE appointed by the American Railway Association in 1916 has filed with the Interstate Commerce Commission a series of objections and suggestions for changes in the proposed regulations issued by the commission on April 10 to govern the method of securing competitive bids as required by Section 10 of the Clayton anti-trust law in connection with dealings in securities or purchases or contracts between companies having an interlocking interest.

The attention of the commission is called to the fact that on June 20, 1916, a hearing was had before the commission in respect to the matter of rules proposed at that time, at which the carriers, after making their objections to the rules tentatively proposed by the commission, requested the commission to appoint a committee to act on its behalf in conference with a committee representing the carriers for the purpose of reporting rules and regulations recommended for adoption.

The commission appointed such a committee and the American Railway Association also appointed a committee, including Julius Kruttschnitt, W. W. Atterbury, W. G. Belser and Alfred P. Thom, W. A. Worthington representing Mr. Kruttschnitt and S. Porcher representing Mr. Atterbury. The two committees held conferences but no final report was announced because Congress suspended the operation of the law. The railroad committee now urges that as the matter is being taken up anew, a similar conference between representatives of the carriers and such representatives of the commission as it may appoint, may be permitted.

The statement filed for the committee by Mr. Thom as its counsel says the question is how far it is safe in the public interest to put the carriers in "the straight jacket of unyielding rules" in respect to their purchases, and while the policy of the law must, of course, be carried out, much will depend upon the character of the regulations which are adopted because it is of the utmost importance that while protecting the interests of the public these regulations be made sufficiently elastic to adapt themselves properly to the economic conditions which surround purchases and to the needs of the carriers. It is, therefore, urged upon the commission that the matter of the formulation of these rules be taken up now where it was left off when the law was suspended and that conferences shall be resumed. In the event that the commission does not see its way clear to do this without further consideration the committee asks for an opportunity of presenting orally to the commission its views on the subject. A copy of the suggestions made by the carriers to the conference committee is attached and the commission is asked to give careful consideration to the suggestions then made. The tentative regulations proposed by the commission, to which any objections were to be filed by May 15, were published in the *Railway Age* of April 18, page 1009.

Pending a determination of the request above made, the committee makes a preliminary return to the order of the commission of April 7, in part as follows:

It is most important that doubts which will arise as to the meaning of the law and as to its scope and application, shall be cleared up by conference rulings and we, therefore, respectfully urge that the commission make such conference rulings and adopt the rules set forth in Exhibit A hereto attached.

1. Section 10 of the Clayton act should not be construed to apply to dealings between a corporation and its subsidiaries. The reasons for this were given in detail by carriers' counsel in proceedings before the commission on June 20, 1916. It is manifest that a ruling of this kind is neces-

sary to preserve the integrity of the carriers' organizations and that such a ruling is in the public interest.

2. Section 10 should not apply to dealings in respect to which there can be no competition, such as patented articles, purchases of water, gas, electricity, maintenance of company standards, etc.

3. The commission should make some definition of the expression "substantial interest," as, if that is left to individual judgment, there can be no uniform interpretation of this expression and no way of knowing when, in this respect, the act becomes applicable.

4. The commission should define the expression "most favorable bid" in such a way that carriers may be permitted to exercise an honest business discretion as to what bid in all the circumstances of the case is most favorable to its interest.

In the rules now proposed by the commission two tests alone are permitted in respect to what constitutes the most favorable bid:

(1) That the bid must be the lowest price for material purchased and the highest price for securities sold.

(2) The ability and reliability of the bidder financially and otherwise.

We submit that this is too narrow a definition. The definition as now proposed does not give sufficient latitude in respect to the reliance any particular carrier may have on dealers in regard to the special materials they furnish, the character of the article which is to be delivered, or with respect to the bearing that this particular transaction may have on other transactions with the same party, nor to the broader and perfectly honest business considerations which frequently affect the judgment of men in business as to what is the most favorable transaction. It likewise takes no note of the necessity which a carrier is frequently under to apportion its purchases among several for the purpose of keeping labor employed along its lines and available quickly for pressing needs in the manufacture or production of articles. As submitted in the brief, an honest business discretion seems to be the only proper criterion of what should be applied in determining what is the most favorable bid.

For example, it is most important for a railroad at times to keep certain coal mines on its road open for fuel purposes. This is also in the public interest. It is also frequently necessary for them to keep certain tie concerns on its road in operation. This applies also in the matter of equipment where it is necessary to have the manufacture of equipment continued at separated points, and where it is necessary to make an apportionment in order to get early deliveries. Many of these very desirable things would be prevented if the rule is restricted within the narrow limits as now proposed.

It will be observed that the latitude respecting delivery contained in the proposed rules doubtless is confined to deliveries contemplated when the advertisement is made, whereas conditions may change, and an honest business discretion would require the railroad to accept some bid, not quite the lowest, because it afterwards transpired that very much more favorable deliveries can be obtained.

5. The act should be construed so as to cover only dealings and transactions which take place subsequent to the effective date of Section 10; that is to say, it should not apply to dealings previous to 1919, although delivery under such dealings may be made during 1919.

6. In ascertaining whether or not dealings amount in the aggregate to more than \$50,000 in any one year, the measure should be the time when the dealings are had and not the time of performance or of deliveries. Some conference ruling of this kind is manifestly needed to avoid difference in understanding.

7. It should be made clear that the expression "dealings in securities" does not apply to the borrowing of money for

a period of not exceeding one year nor to the renewal thereof for like periods, nor to the pledge, as security for money borrowed, of securities. This is very important.

8. It would also be well to make clear that the act begins to operate only with the transaction which brings the sum above \$50,000.

#### Remarks as to Regulations Presented by

#### Commission for Consideration May 15

The proposed rules represent a considerable improvement over those originally suggested and with the foregoing conference rulings would represent a better working plan. The new regulations are, however, objectionable in certain respects, notably in the following:

Referring to page 3, line 4, of the regulations, publication is required in at least two newspapers, one at operating headquarters and the other in certain cities. It may be in some cases that the operating headquarters will also be at one of the cities especially designated. In such case there should be necessity for publication in only one newspaper instead of two.

The provision in paragraph 3 of the regulations affording to each bidder an opportunity of examining each bid and of furnishing each bidder with a tabulation of the proposals, is a very objectionable feature and should be entirely eliminated from the regulations. This feature will tend to deter some potential competitors from bidding at all and almost certainly would cause responsible bidders to refrain from naming the lowest price which they are willing to accept, as they do not wish their competitors to know exactly what they are doing in the matter of prices. The proposal invites collective bidding, furnishes notice to the lowest or most favorable bidder that no revision of his formal bid is necessary to secure the business, and entirely prevents successful negotiation after bids are opened for a still lower price, which is very frequently obtainable. It is felt that the public interest would be safeguarded without public opening of bids so long as the Interstate Commerce Commission may require the furnishing of desired information and always has access to the carriers' records.

We also call special attention to the rule suggested by us as Item No. 6 of the memorandum. Large sums of money are annually saved to each carrier by the power to negotiate with the lowest bidder for a still lower bid. If a new advertisement is necessary in order to do this, an additional charge of unknown proportions, but great in amount, will be added to the carriers' expense and execution of work will be needlessly delayed. It does not seem to us that any harm can come to the public from making the rule read as we have suggested. On the contrary, immense advantage will come to the carriers and will thus be reflected in its beneficial influence on the public.

A method for conducting emergency purchases should be provided, otherwise considerable hardship may be imposed upon the carriers.

To allow time for thorough understanding it would be desirable if the commission's rules would become effective not earlier than July 1, 1919.

Other objections will appear by comparison of the regulations now proposed by the commission with those contained in Exhibit A.

The carriers present the above views in writing, as requested in the order of April 7, but would be glad of an opportunity to supplement them with oral testimony if the commission so desires or to co-operate, as above suggested, in revising the regulations with a special committee if the commission will grant our request to have the matter so handled.

The Railroad Administration has filed a statement with

the commission as a disclaimer, taking the position that the law does not apply to transactions of the railroads operated by the government. The short line railroads have filed no statement with the commission but intend to ask Congress to repeal the law.

## National Parks and Monuments Advertising Appears

**R**AILROAD LITERATURE, such as the traveling public was accustomed to see before the elimination of advertising as a war measure by the Railroad Administration, has again made its appearance in the ticket offices, travel bureaus and tourist agencies. Magazines and newspapers which formerly reaped a neat revenue from advertisements inserted by railroad companies concerning points of interest reached by their lines are again carrying "See America First" displays. All this is part of the Railroad Administration's advertising campaigns, the purpose of which is to stimulate travel. Much of this advertising is substantially the same as that familiar to tourists in pre-war days, with the exception that there is no mention made of the carriers reaching these places nor is anything said of preferred routes.

This campaign, in so far as the western district is concerned—and it is this district to which a large percentage of the annual summer tourist traffic goes,—is well under way and 10 of 18 books, each dealing with some national park, national monument or resort region in the west, have been prepared and are now being distributed. These books, ranging in size from 16 to 80 pages, and dealing with a particular region, have been written more as an advertisement of the particular region than as an advertisement of the carrier which reaches that place. With vivid descriptions and profuse illustrations the beauties are enumerated of Arizona and the New Mexico Rockies, California, Colorado and the Utah Rockies, Crater Lake National Park, Oregon; Glacier National Park, Montana; Grand Canyon National Park, Arizona; Hawaii National Park, Hawaiian Islands; Hot Springs National Park, Arkansas; Mesa Verde National Park, Colorado; Mt. Rainier National Park, Washington; the Pacific Northwest and Alaska; the Petrified Forest National Monument, Arizona; Rocky Mountain National Park, Colorado; Sequoia and General Grant National Parks, California; Yellowstone National Park, Wyoming; Yosemite National Park, California; the Zion National Monument, Utah, and the Northern Lakes of the Central West.

An innovation in the composing of books of this type is the inclusion of an introduction written by a well-known writer whose familiarity with the section advertised is nationally known. Enumerating the writers who are interested in this work sounds much like an American literary Hall of Fame—Mary Roberts Rinehart wrote the introduction for the book on Glacier National Park; Emerson Hough for Yellowstone National Park; Winston Churchill for Crater Lake National Park; Gilbert H. Grosvenor, editor of the National Geographic Magazine, for Mt. Rainier National Park; Enos A. Mills for Rocky Mountain National Park; Jack Lait for the Zion National Monument; Opie Read for Hot Springs National Park; Edwin Markham for California; Edwin L. Sabin for Colorado and Utah; Doctor J. Walter Fewkes, chief of the Bureau of American Ethnology, Smithsonian Institute, for Mesa Verde National Park; Charles F. Lummis for Grand Canyon National Park and the Petrified Forest National Monument; Harriet Monroe for Yosemite National Park; E. A. Newman for Hawaii National Park; Hamlin Garland for the Pacific Northwest and Alaska; Zane Grey for Arizona and New Mexico, and

Albert Britt, editor of the *Outing Magazine*, for the Northern Lakes.

As stated before, ten of these books already have been compiled and are now being distributed. The work of preparing this advertising matter has been done by the Western Passenger Traffic Committee and under the direct supervision of W. H. Simpson, chairman of the advertising committee appointed to handle this work for the Western district. The actual work of compiling statistics and facts, selecting photos, etc., concerning the different parks and regions, was assigned to subcommittees composed of representatives of different railroads serving the particular places to be advertised. Distribution of the books has been placed in the hands of the Travel Bureau—Western Lines, Chicago, of which Howard H. Hays is manager. This bureau has made arrangements to have the books on western points shipped to passenger traffic officers for distribution to important ticket offices other than consolidated ticket offices; to passenger traffic officers, who in turn will furnish supplies to union station ticket offices and to offices interested; to consolidated ticket offices, and to tourist agencies and travel bureaus. While the work of distribution of the first copies of these books was only begun during the past week, they have already received extensive circulation.

The magazine and newspaper advertising already mentioned is still in the embryonic state, but it is planned to have this matter before the public before the annual tourist season to western resorts opens, which is usually about June 1. This work likewise has been placed in the hands of the Western Passenger Traffic Committee, and under the supervision of Mr. Simpson.

To further the "See America First" campaign, the Bureau of Service, National Parks and Monuments, has obtained a stock of lantern slides and motion picture films, featuring the national parks and monuments already mentioned. These slides and films are to be loaned for exhibition purposes without cost excepting, of course, the express charges in both directions. The lantern slides, which are accompanied by adequate lecture notes, include as subjects the following National Parks: Glacier, Grand Canyon, Mesa Verde, Mt. Rainier, Rocky Mountain, Yellowstone, Yosemite, Sequoia, and General Grant. Among the motion picture films obtained and available at this bureau are reels featuring the Crater National Park, Glacier National Park, Grand Canyon National Park, Mesa Verde National Park, Mt. Rainier National Park, Rocky Mountain National Park, Yellowstone National Park and the Yosemite National Park. Added to this collection are several reels of films featuring Alaska, the Columbia River Scenic Highway, the Dawn of Electrical Era in Railroading, Central Wyoming, Idaho, Portland Rose Festival, Royal Gorge and the California Scenes.

Although the tourist travel in the west during the summer is greatly in excess of that in the east the committee handling this advertising matter for the eastern district has issued similar books concerning the Adirondack mountains and Thousand Islands, the Blue Ridge and Allegheny mountains, the Catskill mountains and Sullivan County, New York; Long Island, New York; New England lakes and mountains, New England shores north and east of Boston, New England shores south of Boston, New Jersey seashore, Niagara Falls and the Highland of Ontario, Saratoga Springs, Lake George and Lake Champlain, summer resorts in the south, the Pocomos, Delaware Water Gap, Mauch Chunk and Chautauqua Lake. This work is being done by the Eastern Passenger Traffic Committee, under the supervision of its advertising committee, of which Mr. P. V. D. Lockwood is chairman. The newspaper and magazine advertising campaign is similar to that of the western lines.

The Southern Passenger Traffic Committee has issued one booklet for summer resorts of the south. Its advertising will be confined to newspapers.

Present plans of the committees both in the east, west and south, provide for the continuing of this form of advertising throughout the summer and the succeeding winter.

## Closing Sessions of the Air Brake Association

**A** REPORT of the greater part of the twenty-sixth annual convention of the Air Brake Association was given in last week's *Railway Age*, page 1165. Other papers which were presented include the following:

### How Can Enginemen and Trainmen

#### Assist in Air Brake Maintenance?

By H. A. Glick

Air Brake Inspector, Bangor and Aroostook

While locomotive engineers are not primarily responsible for air brake design and maintenance, they can, nevertheless, aid materially by making careful and specific reports about air brake conditions on their locomotives requiring attention. Many of the defects that may arise in the course of a trip, especially leakage in the numerous pipe connections that contain air pressure, due to vibration or improperly connected pipe joints, can be discovered better by the engineer while the locomotive is under steam and air pressure and in his charge. His co-operation in reporting intelligently and reliably all air brake troubles is essential to good air brake maintenance.

Whenever trouble arises with any air brake part on an engine, the man that delivers the engine should properly book on the work report the actual defect that exists, but should not book non-essential or imaginary defects; for by so doing he causes a great deal of unnecessary work on the part of the roundhouse force. The time so used is simply wasted and might be used to good advantage performing essential work on this and other engines. Before taking an engine out the engineman should know that all air brake parts perform their functions, and not take it for granted that they do; that is, he should make the necessary tests to convince himself that they are in good condition.

The trainman can assist and he should be duty bound to do so, by following the general air brake instructions now existing on all railroads, by taking greater interest in them, and consequently, in his own welfare. If he does not follow the general instructions, he should be made to do so by proper measures from his superiors, and also by the urging of his fellow workmen. He should be made to recognize the right and wrong of his part in air brake maintenance. There are times when the brake is cut out for no reason. No brake should be cut out of service unless a defect exists; then whoever cuts the brake out should specify the trouble on a proper air brake defect card and tie the card to the cross-over pipe on the car, so that when this car reaches an inspection point it can be repaired.

Trainmen should do everything possible to stop brake pipe leakage, as this leakage causes hardship on the air compressor, takes away from the engineer the ability to properly control the amount of the application, contributes to brakes sticking and prevents the maintenance of sufficient brake pipe pressure. The practice when separating cars of closing but one angle cock, allowing the brakes on cars back of the separation to apply in emergency, should be discontinued. When separating cars, both angle cocks should always be closed and hose should always be separated by hand. When opening

angle cocks on the charged portion of train, they should be opened slowly to prevent brakes from applying in emergency. When switching cars they should not be allowed to strike any harder than three miles per hour. Coupling cars at a greater speed creates shocks, which in turn are absorbed by the unions in brake pipe connections, causing brake pipe leakage. The cordial co-operation of enginemen and trainmen in the matter of air brake maintenance is very necessary in order to get the best results.

### DISCUSSION

The necessity for co-operation between the trainmen and enginemen and the air brake repair men in order to promote proper maintenance, was emphasized by several speakers. One road reported good results by requiring trainmen to pass an examination on the proper handling of brakes.

### The Air Brake Supervisor's Responsibilities to the Store Department

By W. H. Clegg

Air Brake Supervisor, Canadian National

The air brake supervisor's interest in this question starts with his discovery that some standard practice or regulation relative to air brake maintenance is not being adhered to, or that a locomotive or car is being held out of service awaiting the arrival of certain repair parts by reason of lack of knowledge or failure of the local officers to anticipate the requirements, and this in spite of the fact that less important stations are overstocked with the very parts that are needed to release the locomotive or car in question, or permit of adherence to standard practice covering repairs. Thus it appears that the supervisor in order to help himself must of necessity assist the stores department. The following should form the basis of the air brake supervisor's assistance to the storekeeper: (1) Providing suitable places for the care and preservation of repair parts in stock. (2) Advising as to the various repair parts and quantities required to be carried in stock at general stores. (3) Approving of sub-requisitions placed with general stores. (4) Periodical inspection of divisional stores and assistance to divisional storekeepers. (5) Preventing the accumulation of a surplus stock of repair parts that are seldom used. (6) Advising the general storekeeper where a surplus of repair parts are found so that same may be transferred to other terminals or returned to general stores.

The recommended assistance as outlined above requires but a very small portion of the supervisor's time and those who become interested in this matter can effect a very material saving to the railroad company without neglecting their other numerous duties and the often unsolicited efforts will eventually be fully appreciated.

### Address of F. W. Brazier

At the Wednesday session F. W. Brazier, superintendent of rolling stock, New York Central Lines East, gave an inspiring address in which he counseled the younger members to devote their energies whole-heartedly to their work. He condemned the lax enforcement of the rules governing the maintenance of brake equipment to which he attributed in large measure the present unsatisfactory conditions. As an indication of the efforts the New York Central has made to maintain cars in good condition he cited the fact that as many as 800 men had been employed on air brake work alone and in 1917 the expenditure for freight car repairs had been over twice as much as for locomotive repairs.

### Fuel Supervisors Addressed the Convention

At the Thursday session L. R. Pyle and F. P. Roesch, fuel supervisors of the Central Western and Northwestern

Regional Districts, respectively, delivered addresses in which they pointed out the way in which the air brake men could assist the Fuel Conservation Section. Mr. Pyle stated there has been a marked improvement in air brake conditions during the past few months, especially as regards brake pipe leakage. He urged the association to continue its support of the Fuel Conservation Section particularly by giving publicity to the magnitude of the waste of fuel caused by train line leaks. Mr. Roesch spoke of the necessity for reducing the cost of operation on the railroads now that normal conditions are being restored. As it appeared impossible to reduce wages or cut the cost of material more efficient service was the only means of effecting economies that was left. He urged all the employees to justify the large increases in wages by greater efficiency in their work.

**Other Business**

On Thursday morning a report was presented on damage to car brake equipment by thawing plants. The practice of thawing loads of coal and ore in buildings heated to a high temperature destroys the packing leathers, gaskets

and air holes. The removal of the triple valves, hose and brake cylinder piston, before thawing, was recommended. No objection was raised to thawing by inserting steam pipes into the lading.

A paper was also submitted by the Northwest Air Brake Club advocating a braking ratio of 40 per cent. and an inside release valve for caboose cars; the Central Air Brake Club also presented a report advocating large radiating surface between the compressor and the main reservoir.

The secretary reported a membership of 1,050 with a registration at the convention of 650.

The following officers were elected: President, T. F. Lyons, New York Central; first vice-president, L. P. Streeter, Illinois Central; second vice-president, Mark Purcell, Northern Pacific; third vice-president, G. H. Wood, Atchison, Topeka & Santa Fe; secretary, F. M. Nellis, Westinghouse Air Brake Company; and treasurer, Otto Best, Nathan Manufacturing Company. Newly elected members to the Executive Committee are C. M. Kidd, Norfolk & Western; R. C. Burns, Pennsylvania; H. A. Clark, Soo Line; and H. A. Sandhas, Central of New Jersey.

# Doings of the United States Railroad Administration

## Nearly 19,000 Standard Cars Stored Because They Have Not Been Accepted by the Railroad Companies

WASHINGTON, D. C.

**D**IRECTOR GENERAL HINES and members of his staff left Washington Tuesday night for an inspection trip over the railroads in the Southwest. Mr. Hines expected to be at Memphis and Little Rock on May 15, at Dallas and Fort Worth on May 16, at Houston and Austin on May 17, at St. Louis on May 19, at Cincinnati and Columbus on May 20 and to return to Washington on May 21. He is to speak at St. Louis at the convention of the Order of Railway Conductors, at Cincinnati at the convention of the Brotherhood of Railway Clerks and at Columbus at the convention of the Brotherhood of Railroad Trainmen.

### Nearly 19,000 Standard Cars Stored

The Railroad Administration has given out the following statement showing the number of U. S. R. A. standard freight cars stored as of April 30, 1919, because they have not been accepted by the railroad companies:

Type of cars	Number of cars
40 ton double sheath box cars.....	3,702
50 ton single sheath box cars.....	1,169
50 ton composite gondolas.....	6,043
55 ton steel hopper.....	8,057
70 ton low side gondolas.....	1
<b>Total .....</b>	<b>18,972</b>

### Earnings, Expenses and Traffic

#### for March and Three Months

The Operating Statistics Section has published complete figures covering the financial results of operation for the month of March for the large railroads in federal operation. 231,466 miles of road are included out of a total of 240,944 miles actually federally operated; comprising 96 per cent of the mileage and 98 per cent of the revenues.

Month of March	1919	1918	Increase or Decrease	
			Amount	Per cent
Operating revenues .....	\$371,520,077	\$361,054,326	\$10,465,751	2.9
Operating expenses .....	342,152,207	279,047,313	63,104,894	22.6
Net operating revenues.....	29,367,870	22,007,013	d 7,360,857	33.4
Taxes, rents, etc. ....	15,272,048	18,287,109	d 3,015,061	19.8
Net Federal income.....	14,095,822	63,719,904	d 49,624,082	352.3
Operating ratio .....	92.2	77.3	d 14.9	19.4

d represents decreases.

One-twelfth of the annual rental due the companies covered by the report amounts to \$74,047,939, so that the net loss to the government for the month was \$59,952,117.

It is stated that inasmuch as present rates are about 25 per cent higher than they were last year, the increase in operating revenues of only 2.9 per cent means that total traffic has fallen off approximately 18 per cent. The falling off in freight traffic alone has exceeded this figure. This has been partially counterbalanced by a small increase in passenger travel due to the demobilization of troops, but the passenger returns are not yet complete enough to give out any figures for March. The freight business shows a slight increase over last month, but this is not as large as is usual at this time of year under normal industrial conditions.

Comparison with 1918 is difficult because the increased rates were not in effect in March, 1918, and the increased wages for March, 1918, were not charged into operating expenses until subsequent months.

The expenses for March, 1918, do not include the increases in wages allowed by the director general in May, 1918, and subsequently in that year and retroactive to January 1, 1918. It is estimated that about \$40,000,000 of such back pay was applicable to March, 1918. The expenses for March, 1919, include about \$5,300,000 back pay applicable to prior months but do not include the increases recently granted to the enginemen and trainmen and the dining car employees which it is estimated will amount to about \$6,000,000 per month.

It is stated that the freight train performance of March, 1919, does not compare favorably with last year, because of the severe loss in the volume of traffic, which made it difficult to maintain the trainload and carload to the higher averages which were possible while the abnormal conditions due to the war created a large volume of additional traffic, much of which was of a nature which tended to increase both the carload and the trainload. The heavy loss this year in coal traffic adversely affected both the average trainload and the average carload. In view of the heavy loss in traffic the

slight decreases in the trainload and carload are said to indicate close attention to this important feature of operation.

The summary of passenger train performance for March, 1919, shows a decrease of 1.4 per cent in passenger train miles compared with March, 1918, with an increase of 0.2 per cent in passenger train car miles. The average cars per train were 6.2 this year against 6.1 last year.

The figures for the three months' period ending March 31, 1919, are as follows:

INCOME ACCOUNT			Increase or Decrease	
3 Months	1919	1918	Amount	Per cent
Landing March 31	231,442			
Miles of road operated	231,442			
Operating revenues	\$1,109,614,242	\$928,403,776	\$181,210,466	19.5
Operating expenses	1,015,977,653	802,210,045	213,767,608	26.6
Net operating revenue	93,636,589	126,193,731	d 32,557,142	...
Taxes, rents, et cetera	47,658,837	50,512,243	d 2,853,406	...
Net financial income	45,977,752	75,681,488	d 29,703,736	...
2 1/2 % of annual rental	22,143,817	22,143,817		
Operating loss	176,166,065	146,462,329	29,703,736	...
Operating ratio	91.5	86.5		5.0

FREIGHT TRAFFIC MOVEMENT			Increase or Decrease	
3 Months	1919	1918	Amount	Per cent
Landing March 31				
Net ton miles	85,035,399,000	95,032,526,000	d 9,997,127,000	d 10.5
Freight train miles	133,328,000	153,287,000	d 19,959,000	d 13.0
Train load (net tons)	638	620	18	2.9
Car load (net tons)	28.1	28.5	d 0.4	d 1.4
Loaded car miles	3,026,149,000	3,336,347,000	d 310,198,000	d 9.3
Total car miles	4,500,992,000	4,707,875,000	d 206,883,000	d 4.4
Per cent of loaded to total car miles	67.2	70.9		d 3.7

### Uniform Rules and Working

#### Conditions for Telegraphers, Etc.

In Supplement No. 21 to General Order No. 27, Director General Hines has prescribed, effective May 1, rules and working conditions to apply to employees herein named in the service of railroads in federal operation where agreements are not in existence, namely, telegraphers, telephone operators (except switchboard operators), agents (except those specified in Article IV of Supplement No. 13 to General Order No. 27), agent-telegraphers, agent-telephoners, towermen, levermen, tower and train directors, block operators and staffmen. The supplement provides in part:

Employees shall be paid on the hourly basis in accordance with the terms of Supplement No. 13 to General Order No. 27.

The entering of employees in the positions occupied in the service, or changing their classification or work, shall not operate to establish a less favorable rate of pay or condition of employment, than is herein provided.

Where existing payroll classification does not conform to the preamble hereof, employees performing service in the classes specified therein shall be classified in accordance therewith.

When new positions are created, compensation will be fixed in conformity with that of existing positions of similar work and responsibility in the same seniority district.

Eight consecutive hours, exclusive of the meal hour, shall constitute a day's work, except that where two or more shifts are worked, eight consecutive hours, with no allowance for meals, shall constitute a day's work.

Overtime shall be computed at the rate of time and one-half time; even hours shall be paid for at the end of each pay period; fractions thereof will be carried forward.

When notified or called to work outside of established hours, employees will be paid a minimum allowance of two hours at overtime rate.

Employees will not be required to suspend work during regular hours, or to absorb overtime.

When the carrying of United States mail and parcel post by the employees herein specified become unduly burdensome, or interferes with the proper operation of trains, they will be relieved from such work.

An employee disciplined, or who considers himself unjustly treated, shall have a fair and impartial hearing, provided written request is presented to his immediate superior within five days of the date of the advice of discipline, and the hearing shall be granted within ten days thereafter. A decision will be rendered within ten days after completion of the hearing.

If an appeal is taken, it must be filed with the next higher official and a copy furnished the official whose decision is appealed within ten days after date of decision. The hearing and decision on the appeal shall be governed by the time limits of the preceding section.

At the hearing, or on the appeal, the employees may be assisted by a committee of employees, or by one or more duly accredited representatives.

If the final decision decrees that charges against the employee were not sustained, the record shall be cleared of the charge; if suspended or dismissed, the employee will be returned to former position and paid for all time lost.

Committees of employees shall be granted leave of absence and free transportation for the adjustment of differences between the railroad and the employees.

Employees will be in line of promotion, and where ability and qualifications are sufficient, seniority will prevail.

When vacancies occur or new positions are created, they will be advertised to all employees on that division between the first and the tenth of each month (or more frequently if mutually agreed upon), and accepted within ten days thereafter. The position must be permanently filled within 30 days after advertisement.

An employee applying for and being assigned to an advertised position will not be eligible to the position vacated by him until same shall have been declined by all employees on that division, or is advertised a second time.

Unless otherwise mutually agreed upon, office seniority will prevail for telegraphers or telephone operators in dispatching, relay and division offices. When vacancies occur in these offices they will be filled by advancing the regular force, and the last trick left vacant will be advertised to all employees on that division.

Regular relief employees will be allowed \$2.00 per calendar day for expenses while away from their headquarters. This article does not apply to extra men.

Typewriters will be furnished at offices where the railroads require their use.

Controversies arising under the application of this schedule of wages and working conditions shall be referred to Railway Board of Adjustment No. 3, in accordance with the provisions of General Order No. 53.

### Pullman Annual Passes for General

#### Chairman of Shop Crafts

Approval has been given to issuance of Pullman annual passes to general chairmen of shop crafts, to be made good on railroad or railroads over which such general chairmen have jurisdiction, and also on such foreign lines as they may hold railroad transportation over, which has been furnished to them for the purpose of enabling them to make short cuts between points on the lines over which they have jurisdiction.

Application for these passes should be made by the federal managers to the director, Division of Operation, at Washington.

### War Department Desires Information as to

#### Railroad Men With Foreign Experience

As a part of the information which the War Department requires in its records, the chief of transportation, rail transportation branch, United States War Department, Washington, has asked for the following information:

(1) Names and addresses of all employees connected with railroads under federal control who have at any time been employed in an *operating* capacity as engineers, conductors, or higher rating or grades on railroads in any foreign country.

(2) In addition to the names and addresses, information as to the capacity in which employed while on duty with a foreign railroad company, and name of such railroad and its location.

(3) Information as to the qualifications of the persons named for special occupations.

The regional directors are asking the various roads for this information for the War Department, including the employees who served abroad in the war from which we are just emerging.

### Search of Baggage of Interstate

#### Passengers by State Prohibition Officers

John Barton Payne, general counsel of the Railroad Administration has issued a circular saying:

"The Railroad Administration has been greatly embarrassed by the efforts of state prohibition officers to enforce prohibition laws, the prohibition commissioners insisting upon the right to search the baggage of interstate passengers while such passengers were passing through prohibition states. The Supreme Court has now decided this can not be done; that interstate passengers are entitled to pass through a prohibition state with liquor in their possession. I have called the attention of the prohibition officers to the opinion of the Supreme Court, and asked them to instruct their officers to comply with the law as now settled."

### Railroad Administration Departments

#### Moving to New Building

Most of the departments and sections of the Railroad Administration that have been located during the past year in the Southern Railway building in Washington are moving into the new Hurley-Wright building, across the street from the Interstate Commerce Commission building at Eighteenth street and Pennsylvania avenue. The offices of the divi-

February 28 the number of passengers carried one mile was 6,598,643,073, an increase of 9.8 per cent.

### Rates for Yard Foremen Acting as Yardmasters

Supplement No. 22 to General Order No. 27 provides that, effective January 1, 1919, where there is no existing agreement or practice more favorable to the employees, the wages for yard foremen who also act as yardmasters (designated in some schedules as "foot board" yardmasters) will be not less than 40 cents per day in excess of the yard foremen's rates. The same rules for the basic day and overtime shall apply to such employees as applies to other yardmen.

## The Effect of Cinder Fill on Locomotive Water Supply

By William M. Barr

Consulting Chemist, Union Pacific System, Omaha, Nebr.

**W**ATER PERCOLATING through cinders dissolves large quantities of scale-forming material and increases the corrosive properties of the water. Steel pipe laid in cinder fill is soon destroyed, and even cast-iron pipe under the same conditions is short-lived.

Distilled water which had been poured over cold fresh cinders and allowed to stand for 48 hrs. contained 123 grains of dissolved solids per gallon, 42 grains of this being calcium sulphate. Large quantities of other calcium compounds were present, and a natural water coming in contact

Samples of Scale Produced by Water That Had Seeped Through the Cinder Fill

sions of accounting, capital expenditures and public service are already located there and the offices of the Division of Purchases, the engineering and maintenance department, the Operating Statistics Section, and the Safety Section, are also to move from the Southern Railway building.

### Passenger Traffic

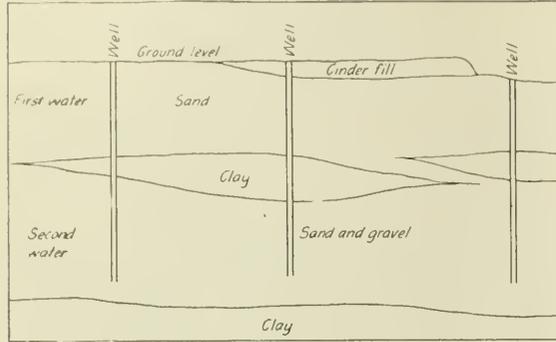

Passenger traffic during the month of February showed an increase of 8.1 per cent over that of February, 1918, according to the report of the Operating Statistics Section. The number of passengers carried one mile was 3,139,935,739. In the Pocahontas region the increase was 30.3 per cent and in the Eastern region it was 14.2 per cent. None of the regions showed a decrease. For the two months ended

with such material would have both the temporary and permanent hardness greatly increased.

Several cases have been reported where water percolating through cinder fill has increased the hardness of surface water supplies. Such water has been made unfit for boiler purposes because of the very hard scale that it would deposit on the flues. The writer has observed a case where water at a depth of 65 to 75 ft. has been changed by cinders at the surface, and it is interesting to note that this is the second water sheet and not the normal surface supply. The second water in this region is cut off from the first or surface water by impervious clay sheets which in places are several feet thick. Drilling a large number of test holes developed the fact that these clay sheets are lenticular, and drilling

showed but four or five inches of clay in places. As this sheet appeared to be constantly thinning in one direction, it is probable that it runs out entirely, thus letting the top water down to mix with the second water, which occurs at a depth of 60 to 75 ft. The underground flow in this region is from northwest to southeast.

Analyses Nos. 1, 2, 3, 4 and 5 represent the normal water of the region as it occurs below the first clay sheets. Nos. 1 and 2 are about 4,000 ft. north of the wells that show the effect of cinder fill. No. 3 is two miles west, and No. 4 is approximately 3,500 ft. east, while No. 5 is about 4,000 ft. west. There has been a considerable quantity of cinders spread in the region of No. 5, and the effect is shown in the analysis of No. 6 which is from the same well. Sample

Sketch Showing Probable Form of the Clay Sheets that Permits the Second Water to Be Contaminated by the Seepage from the Cinder Fill

No. 5 was taken in 1894 and No. 6 was taken in 1916, indicating the increase in incrusting solids which has developed.

In the region most affected, there has been from 10 to 20 ft. of cinders filled into the low ground. Analysis No. 7 is a mixture of water from twelve wells in this region, and 8, 9, 10 and 11 are from four of these wells selected at random. All show heavy increases in calcium sulphate and

operating at this station, before and after the change was made in water supply.

This illustrates the importance that should be attached to local ground conditions when developing new water supplies, even when the water comes from a considerable depth.

## Tonnage Rating Charts for Standard Pacific Type Locomotives

IN THE *Railway Age* of October 4, 1918, was begun the publication of a series of charts prepared by H. S. Vincent, from which the tonnage rating of the United States Railroad Administration standard locomotives can be determined for any condition of grade, curvature or frictional resistance.

In this issue are given charts for the light and heavy standard Pacific type locomotives, description of which appeared in the *Railway Age* of April 11, page 951.

The tonnage rating charts are so designed that the maxi-

TABLE I.—FRICTIONAL RESISTANCE OF FREIGHT CARS  
Speeds 5 to 30 M.P.H.

Weight in tons		Resistance, lb. per ton	
Loaded	Empty	Loaded	Empty
15	6.0	6.40	10.30
20	7.8	5.91	9.60
25	9.5	5.44	9.05
30	11.1	5.07	8.45
35	12.6	4.74	8.05
40	14.0	4.40	7.65
45	15.3	4.18	7.26
50	16.5	3.90	6.85
55	17.6	3.65	6.50
60	18.6	3.43	6.26
65	19.5	3.24	6.00
70	20.3	3.07	5.82
75	21.0	2.90	5.63

mum hauling capacity of the locomotives in tons of 2,000 lb. can be read directly from them for any combination of speed and grade within the given limits.

The drawbar pull, which varies with the resistance, is shown on the charts by the inclined parallel lines, and is read on the left margin. On straight, level track this equals the tractive effort of the locomotive less the frictional resistance of engine and tender. The tonnage curves are based

Analyses shown in grains per U. S. gallon.

magnesium sulphate, as well as some increase in calcium carbonate. All of the wells are approximately the same depth if due allowance is made for the surface contour.

Water from these 12 wells was used in locomotives for many years until the consumption at times reached 1,000,000 gals. per day. The use of this water resulted in heavy hard scale on flues and fireboxes, with constant leaks in the flue sheets and much pitting. The water shown in Analysis No. 1 was then developed and pumped into the tank through 4,000 ft. of 10-in. pipe line. The result is that scale is light, leaks have stopped, and there is practically no corrosion resulting from the new water.

The photograph shows scale removed from switch engines

on a frictional car resistance of four pounds per ton, which is a good average for the usual mixed freight trains with varying weight of cars and loading, with the rolling stock and roadbed well maintained.

The tonnage can be read from the charts for any other car resistance factor or for any combination of resistances, simply by converting them into terms of grade on the following basis:

One pound car resistance = .05 per cent grade.  
One degree curve uncompensated = .04 per cent grade.

While the frictional car resistance of four pounds per ton applies only to freight service, to avoid confusion the charts for passenger and express service locomotives have

also been based on a resistance of four pounds per ton, and in every case adjustment must be made for the increased resistance of passenger and express cars.

For example: Find the tonnage which can be hauled in passenger service by the standard light Pacific type locomotive on a 0.5 per cent grade combined with a four degree uncompensated curve at 40 m. p. h.

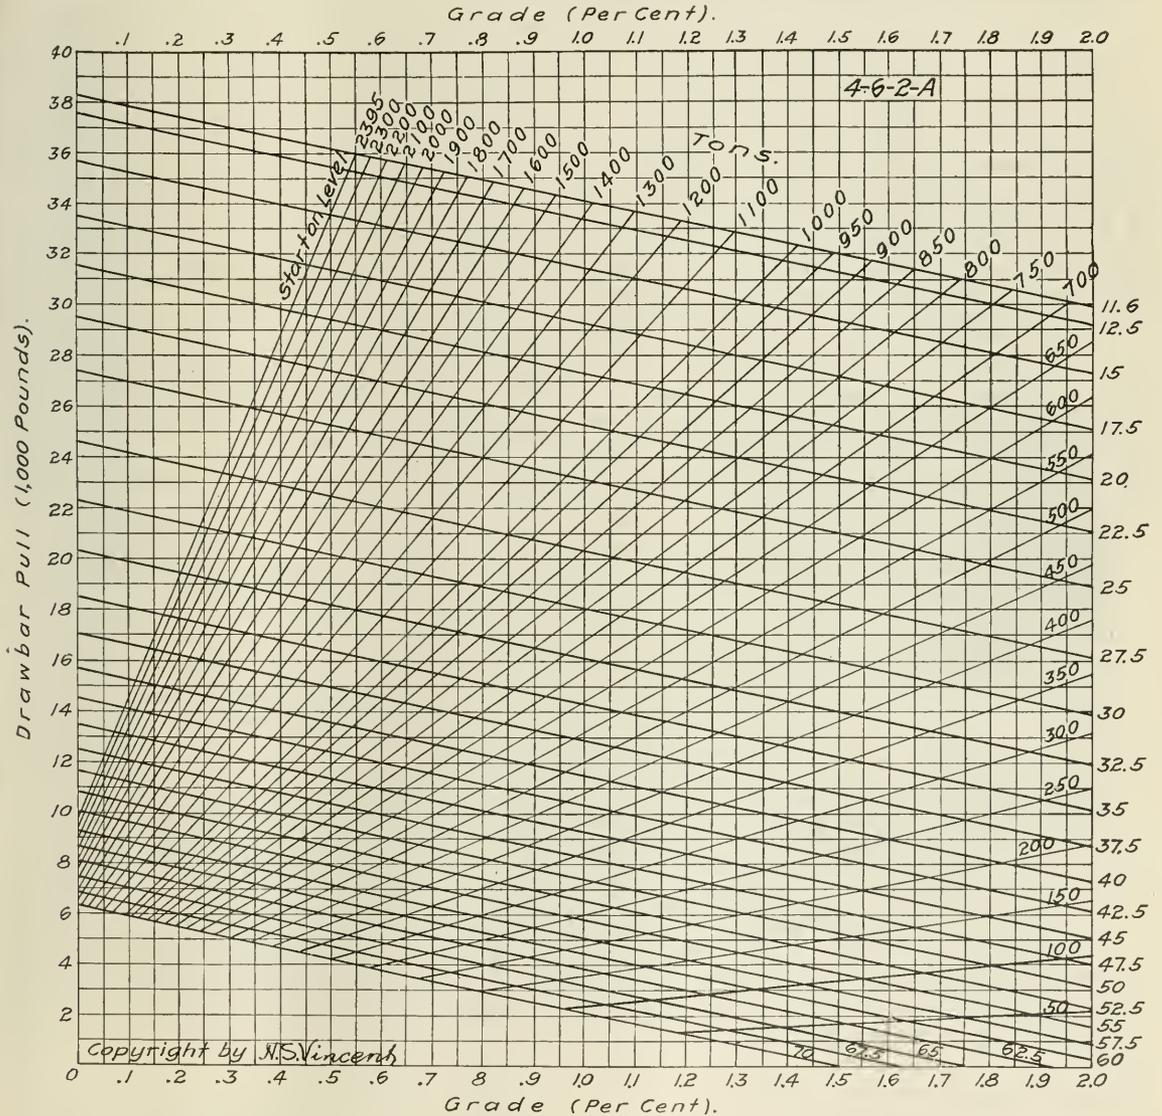

From Table III it is found that the resistance of passen-

Tonnage Rating Diagram for the United States Railroad Administration Standard Light Pacific Type Locomotive

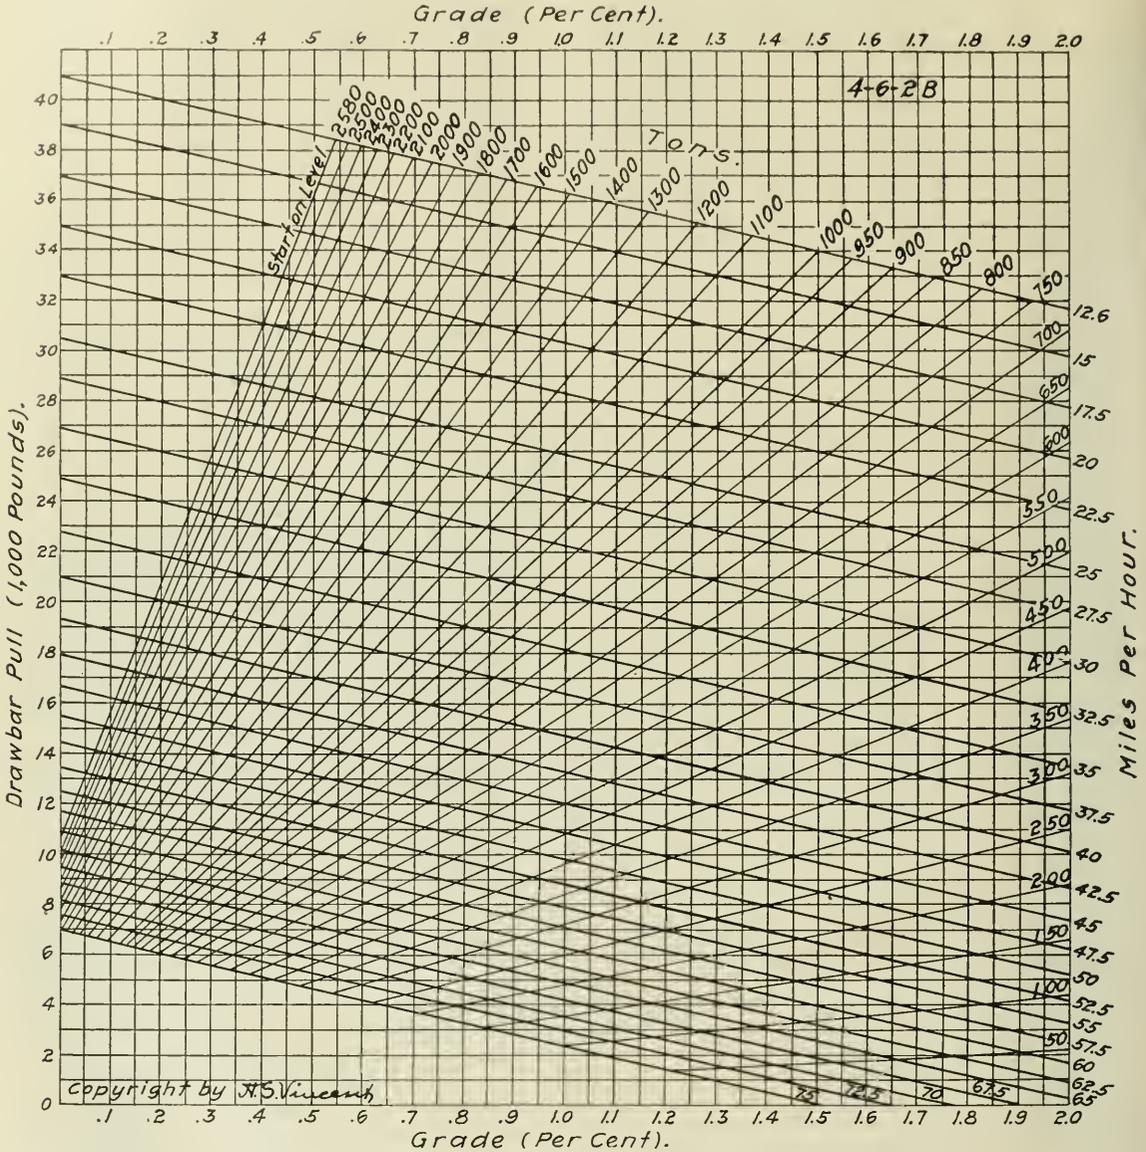

ger coaches at 40 m. p. h. is 6.65 lb. per ton. The equivalent grade therefore is:

$$0.5 + (4 \times .01) + (6.65 - 4) \times .05 = 0.7925 \text{ per cent.}$$

From the chart for the light Pacific type locomotive, at the intersection of the ordinate for 0.7925 per cent grade

Referring to the chart for the heavy Pacific type locomotive, at the intersection of the ordinate for 0.62 per cent grade with the drawbar pull curve for 45 m. p. h., it will be found that the capacity of the locomotive is 845 tons.

No allowance has been made for weather or temperature conditions or for drop in boiler pressure. In rating the

Copyright, 1919, by H. S. Vincent

Tonnage Rating Diagram for the Standard Heavy Pacific Type Locomotive

with the drawbar pull curve for 40 m. p. h., we find a rating of 625 tons.

Similarly for the standard heavy Pacific type locomotive operating on 0.3 per cent grade combined with a four degree uncompensated curve at a speed of 45 m. p. h., Table III shows for this speed a resistance of 7.20 lb. per ton, and the equivalent grade is:

$$0.3 + (4 \times .04) + (7.20 - 4) \times .05 = 0.62 \text{ per cent grade.}$$

locomotive a deduction should be made from the maximum capacity as given in the charts to suit local conditions.

The American Electric Railway Association will hold its thirty-sixth annual convention at Young's Million Dollar Pier, Atlantic City, N. J., on October 6, 7, 8, 9 and 10. The chairman of the convention committee is L. S. Storrs, president of the Connecticut Company, New Haven, Conn.

# Railway Developments in Foreign Countries

\$20,000,000 for Trans-Siberian; Electrification in France;  
Earnings of Chinese Railways

**I**TALIAN RAILWAY EMPLOYEES, according to a Havas press despatch, have been granted by ministerial decree an eight hour day with one day off in seven.

A French commission sent to this country to investigate electrification of steam railroads has recently visited the Norfolk & Western to inspect that railroad's electrified line. The commission comprises thirteen railway officials and electrical experts, headed by Professor Mauduit, of the University of Nancy, and Major d'Anglards, representing the Ministry of Transports. Special study will be made of a number of lines.

## A Tunnel Under Gibraltar

A committee of financiers, with headquarters in Barcelona, Spain, has been formed recently to carry out the necessary soundings and other preliminary work in connection with a tunnel under the Straits of Gibraltar. It is proposed that the tunnel should start at a point just west of Tarifa, in Spain, and end to the east of Tangiers, in Africa.

## The Electrification of French Railways

M. Cels, under-secretary for public works and transports, stated recently that he will introduce in the French Chamber a bill for the utilization of water power in France by absorbing all private undertakings into one combination. The greater part of the power thus obtained will be allotted for the electrification of the main railway systems of France. The electrification of the Midi has already been begun, the water power of the Pyrenees being brought into use. For the Paris-Lyons-Mediterranean Railway the power will be found in the Alps. The bill has also in view the improvement of lighting, tramway traction, and a system of pumping for feeding agricultural irrigation and local industries.

## Trans-Australian Needs Equipment

It is announced in Australia that owing to the increasing volume of traffic on the recently completed Trans-Australian Railway (which links up Western Australia with the Eastern States of the Commonwealth), the rolling stock is in-

sufficient for further requirements. Additional sleeping cars will be acquired and possibly other equipment. Presumably the cars in question will be built in Australia, although parts may be purchased elsewhere, possibly in the United States.

## \$20,000,000 for Trans-Siberian

The United States and Allied governments have decided to lend to the interallied commission administering the Trans-Siberian Railroad \$20,000,000 for operating the line, according to a statement issued by the State Department at Washington, Monday.

It has not been determined what proportion of the loan each of the governments will assume, but it is believed that the United States, Japan and Great Britain each will furnish \$5,000,000, and that France and Italy each will be invited to supply \$2,500,000.

By making the loan direct to the interallied commission, the governments evade the question of recognition of the Omsk government. It was deemed inadvisable, in the absence of recognition, to make the loan to the Omsk government, and the arrangement agreed upon does not raise the question of recognition in any sense.

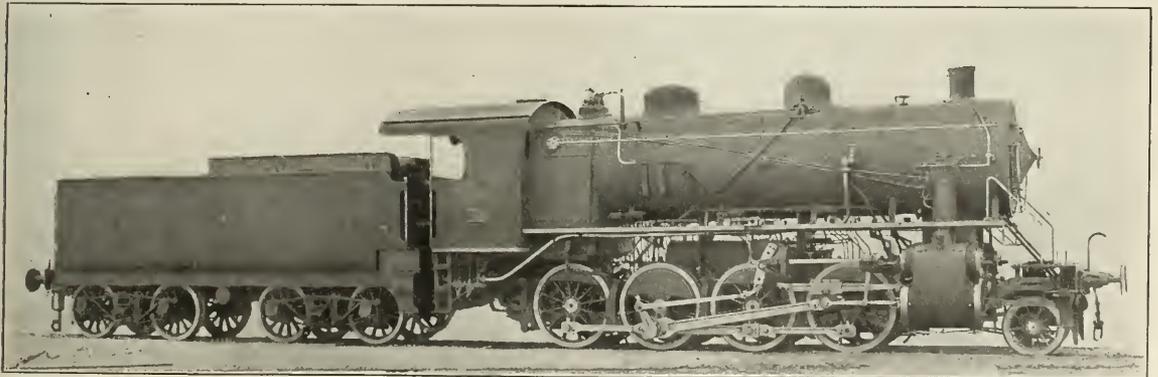

The absence of guarantee excluded participation by private bankers in the loan. It is stated that the loan will not be made as an investment, but to assure the continued operations of the trans-Siberian line. It is thought that the refunding of the loan will be requested later.

## Paris-Constantinople Railway Service

The announcement of the resumption of the Paris-Constantinople service by the International Sleeping Car Company, which appeared in a recent issue of the *Railway Age*, is supplemented by some additional facts from a recent issue of the *Near East*, which says:

The reestablishment of the Orient Express between Paris and Bucharest is a foretaste of the facilities for reaching all parts of the Near East that will be provided in due course of time by the International Sleeping Car Company. H. M. Snow, agent general for the company, discussing this latest development, said that at present the trains are running twice weekly and that direct connections with Warsaw and Prague have been made.

The route, he pointed out, is from Paris to Basle, Zurich, Vienna, Budapest and Bucharest. A section is detached at Linz for Prague, and another

Consolidation Locomotive for the Italian State Railways

The American Locomotive Company has this week received orders for 150 more of these locomotives, making a total of 400 ordered of that company by Italy since the first order in 1916. The locomotives are superheated and have 21¼ in. by 27½ in. cylinders; 53½ in. driving wheels; a total weight in working order of 146,000 lb.; a weight on drivers of 128,000 lb., and a maximum tractive effort of 33,400 lb.

nection at Vienna for Warsaw. The time required for the journey from Paris to Vienna is now 38 hours, as against 35 when the route crossed the corner of Germany. Of course the speed is necessarily very limited as the railways have suffered severely as the result of more than four years of war. No doubt when normal conditions obtain, this new service will be at least as good as formerly, and the route will have the advantage of avoiding German territory. The trip from Vienna to Bucharest takes another 11 hours, making the time for the whole journey 49 hours. With regard to passenger facilities, the service at present exists primarily for officials, and no one can travel by the train without special permission from the French Ministry of War.

After peace is signed, Mr. Snow continued, the Orient Express may be running all right to Constantinople, but at present the only method of reaching there is by way of Constantza. We can get now only as far as Fetesti, and there the river must be crossed in boats. When the Orient Express service is resumed to Constantinople it will be established on the old routes via Belgrade and Sofia.

As regards the connections with Greece, a section will be detached at Nish and will run via Uskub to Salonika, Larissa and Athens. Then there are numerous connections in Bulgaria and elsewhere that will presently be restored.

This covers the immediate developments contemplated by the company as regards the Near East, but Mr. Snow pointed out that only time and settled conditions were required for much wider schemes. The time is certainly not far distant, he said, when Constantinople will no longer be the terminus of the Orient Express. Steamers will be used to take the trains across the Bosphorus, and a service will be established to Aleppo and from there to Bagdad. At Aleppo a section will be detached for the Syria and Palestine service, and eventually the trains on this route will be able to go as far as Egypt.

### Exports of Steel Rails and Other Railway Track Material

(Prepared by the Division of Statistics, Bureau of Foreign and Domestic Commerce.)

Another chapter in the story of American steel and the part it will play in reconstruction and in the extension of lines of communication throughout the world is written in the export statistics of rails, railroad spikes, and other iron and steel railway track materials, such as switches, frogs, fishplates, splice bars, etc., shipped to foreign countries since the armistice was declared. The quantity and value of these products exported during the four months ended with March, the average monthly price thereof in December of each year, and the shipments during the calendar years 1911 to 1918 are given below:

Calendar year	Steel rails		Railroad spikes a		Other railway track material (value) <sup>a</sup>
	Tons	Value	Pounds	Value	
1911	420,874	\$12,229,045	\$29.11	.....	.....
1912	446,473	13,053,774	29.62	.....	.....
1913	460,553	13,979,549	31.23	25,375,827	\$483,283
1914	174,680	5,103,918	27.05	15,489,687	258,808
1915	391,379	12,095,170	32.65	29,693,252	591,752
1916	540,828	20,417,582	38.43	53,428,813	1,489,091

March, 1919...	48,955	3,051,611	62.30	4,185,816	193,987

<sup>a</sup> Not separately stated prior to July 30, 1912.

### COUNTRIES OF SHIPMENT

An analysis of the advance figures for March shows a distribution of American steel rails extending to 23 countries, about 18,000 tons, or over one-third the total exportation, going to France. Cuba, Japan and Canada were also large purchasers during recent months.

Early in the history of the steel industry there arose the foreign demand for American steel rails, developing from an average annual exportation of less than 300 tons in the period 1867-1870 to an average of 474,705 tons during the four calendar years of the war period 1915-1918, although the exports did not reach six figures until near the end of the century. From 1900 the volume increased, with slight fluctuations, from year to year, until the record-breaking shipments of 540,828 tons, valued at \$20,417,582, occurred in the calendar year 1916. The total shipments of steel rails for the four-year war period were 1,898,820 tons, invoiced at \$82,976,622, as compared with 1,502,580 tons, worth \$44,366,286, exported during the pre-war period of four calendar years, 1911-1914, representing an increase of 26 per cent in tonnage and 86 per cent in value of the total shipments during the war period over the exports for the previous four years.

Like other great staple commodities, the value of steel has soared to unprecedented heights during the war and since the armistice, the average monthly export price of steel rails during the war culminated in the record figure of \$62.20 per ton in November, 1918, \$68.94 per ton being reached in February, while the advance figures for March would indicate a price of \$62.30 per ton on foreign shipments.

In addition to \$82,976,622 worth of steel rails shipped during the four-year war period, railroad spikes valued at \$5,319,734 and other track material valued at \$25,138,473 were exported; or a total of \$113,434,829 for all iron and steel railway track materials.

While a greater quantity of these products was shipped to France than to any other country during the war, it is noted that with this single exception Cuba has recently become the leading market for steel rails exported from the United States. From comparatively modest purchases prior to the war, Cuban imports of this commodity during the last three calendar years reached a total tonnage of 187,798, valued at \$8,146,383; as compared with 159,335 tons, invoiced at \$9,812,418, shipped to Japan; 155,932 tons, worth \$6,565,708, to Canada, and less amounts to other countries during the same period.

### Railway Notes From China

[From Our Special Correspondent in Peking]

A short time ago, the allied ministers made a representation to the Chinese government demanding that the interference with the Peking-Mukden railway by Chinese soldiers be abated, and that all such forces stationed along the railway between Peking and Shanhaikuan be removed. This action was taken under the authority of the Boxer protocol which provides that the Peking-Mukden railway shall be open from Peking to the sea, and that the allied nations may establish garrisons at several points to enforce the provision. While allied garrisons have been maintained at several points ever since 1900, during the past five years, no objection has been made to Chinese garrisons also. As a result, the line was broken for several days during the attempted Imperial restoration during 1917. The recent abuse of freight equipment by Chinese soldiery, and the constant threat which these troops represent to the authority of the central government of China, has resulted in consideration of ways and means to put the Boxer protocol back into force. This consideration was brought to a decision by recent rough handling given some of the foreign staff of the Peking-Mukden line by Chinese soldiers at Tientsin.

The Chinese Ministry of Communications has given out the following condensed operating and income statement covering the year 1917:

	1917	Comparison with 1916	
		Increase	Decrease
Operating revenues	\$63,873,704	\$1,111,983	.....
Operating expenses	30,040,565	1,198,287	.....
Net operating revenues	33,833,139	33,833,139	\$86,303
Income debits	13,303,911	.....	663,975
Income credits	1,101,028	325,769	.....
Net income debits	12,202,943	.....	989,744
Surplus for the year	21,630,196	903,440	.....

These operating expenses contain charges to the amount of \$1,837,819 to cover depreciation on rolling stock. Data from the Canton-Samshui line is not contained in the above, for the reason that this line was in the hands of the rebellious southern authorities. Its surplus is annually in excess of \$400,000. It should be remembered in this connection that two important lines were seriously interfered with by floods. Through trains could not be run on the Peking-Hankow from July 27 to October 29, and the north end of the Tientsin-Pukow together with considerable equipment was similarly cut off from August 8 to November 26. Several other lines had lesser interference from the same cause.

Income charges above stated contain slightly over \$10,-

400,000 interest and \$2,100,000 loss on depreciated currency. In gaging the above results it must be remembered that favorable rates of exchange reduce interest charges to about 3½ per cent upon the nominal debt outstanding, while revenues contain a large quantity of depreciated bank notes which are included at par. Expenses, on the other hand, are paid almost entirely in silver. The result is that after a nominally prosperous year the more important lines found themselves hard up for ready cash.

Nominal net operating revenue represents a return upon cost of road and equipment of 8.2 per cent. The Peking-Mukden and the Peking-Hankow, the two oldest lines, had returns of 17.1 and 11.8, respectively, stated on this basis. The operating ratio was 47. The two lines just mentioned had operating ratios of 38 and 37, respectively. This compares very favorably with American experience, as well as with other countries. Note the following for the year 1913: Austria, 76 per cent; France, 63 per cent; Germany 70 per cent; India, 52 per cent; Japan, 48 per cent; United States of America, 69 per cent.

Three full years are now available for comparison under the uniform classification of accounts. The final surplus for each of these three years is as follows:

	Surplus	Increase over 1915
1915 .....	\$9,671,535	
1916 .....	20,726,755	\$11,055,220
1917 .....	21,630,196	11,958,661

The surplus remaining after all charges for the year had been paid in 1916 was equivalent to 9 per cent upon the investment made by the government in these lines. In 1916 it jumped to 17.7 per cent, and in 1917 amounted to 18.8 per cent.

Announcement is also made of the approximate return of traffic for the year 1918. Total revenues are stated at \$75,539,739. These include revenues from a section of the Canton-Hankow line, which was put into restricted operation during the year. These amount to \$323,042, so that the lines reporting in 1917 had a revenue of \$75,216,697 in 1918. This is an increase of \$11,300,000 in round numbers. While operating expenses will naturally show considerable increase also, it is not believed that such increase will be more than one-fourth of the increase in revenue. The Peking-Mukden, which has closed its books for 1918, reports an increase in revenue of \$3,857,000 with an increase of only \$374,000 in expenses, bringing about a reduction of operating ratio to 33 per cent.

Japanese interests are pressing surveys and preliminary work for an extension of the Sspingkaï-Chenchiatun railway westward to Ha-ma-til-ya. This extension will carry Japanese construction westward of the American Aigun-Chinchow route. The considerations which motivate this activity are almost entirely political, for there is no population to speak of, no industries nor mines to be served by the extension. But if the Aigun line should be built first, the American concessionaires would be in a position to demand all minor westward lines as branches, and thus definitely confine Japanese activity to the eastern portion of Manchuria. Japanese activities in Mongolia are such that it is very apparent that such a limitation to her field of influence is furthest from her thoughts. In order to preserve her connection with this hinterland and if possible establish a plausible claim to a broad zone between Siberia and the Eighteen Provinces of China, Japan must drive her rail lines westward. Once in the field she will also be in a better position to support her objection to the construction of the Aigun Chinchow line by the Americans, and if successful will be entirely free to oppose the unification movement and to work her will on north China.

Preparations are being made to double track a short section of the Peking Hankow line, just south of Peking.

## Some Comments on the Lisman Plan

THE SUGGESTION by F. J. Lisman that railroads of the country be combined end to end so as to form light strong competitive systems was published in the *Railway Age* in the issues of March 28 and April 4.

The *Globe* (New York) on April 29 published an interview by Brice Bliven with Walker D. Hines, director general of railroads, which contained the following:

I had the privilege the other day of hearing Mr. Hines explain his idea as to what should be done with the railroads.

Here in a nutshell is the Hines plan:

Return the railroads to private ownership, but limit the profits to a certain percentage—probably 6 per cent—and give the government part of all earnings above that amount.

Create out of the 170 railroads which the government took over not more than ten or twelve big new railroad systems. Make each system a combination of some strong and some weak roads.

Get a new basis for valuation of the lines, based partly on their actual physical worth and partly on their proven earning power. Give the stock and bondholders new stock or bonds in accordance with the resulting capitalization of the railroads. Let the government guarantee to the stockholders a moderate rate of interest on their investment. Have the government represented on every board of directors, and let these government directors form part of the rate-making body, whatever it may be (not the present Interstate Commerce Commission, probably).

Many of the plans Mr. Hines has for disposal of the railroads are taken from the general scheme drawn up by F. J. Lisman of F. J. Lisman & Co. I don't know Mr. Lisman from Adam, but I think it is only fair to say that as a demonstration of sheer power to think I have rarely seen anything more interesting than his plan, which he calls "A Possible Solution of the Railroad Problem." Since Mr. Hines is showing more and more inclination to go over to this plan in its entirety, it is worth while to describe some of its features. \* \* \* \* \*

### An Executive Point of View

The following is an abstract of some letters exchanged between Mr. Lisman and an executive officer of one of the large eastern trunk lines:

Dear Mr. Lisman:—

I had the pleasure last night of reading over carefully your plan for the rehabilitation of the railroads. It is extremely interesting and of real constructive value and will be useful to the commission which I hope the new Congress will appoint, as soon as it is organized, to study the railroad situation and recommend a plan.

I don't agree entirely with some of your conclusions; especially that it would be wise to consolidate all the railroads of the country into a few big systems, because it will result, which appears to be part of your plan, in the strong systems being loaded with the weak sisters and every corporation that would naturally be able to earn a good dividend would be consolidated with a lot of bankrupt properties, so that the whole railroad system of the country would be reduced to the dead level of being barely able to live, unless the rates were made pretty high.

My experience in corporations is that no corporation as big as the ones you provide for can be managed to the best advantage, because the work and responsibility placed on each officer would be so great that it would largely have to be done by assistants and clerks and would lose the personal touch. \* \* \* \* \* The weakest point in the United States Railroad Administration is that the officers are trying to do more than they can do properly, with the result that the roads are being run on "General Orders" with no pos-

sibility of their being adjusted to fit each particular case. The result is the most ridiculous overpayment in some cases and insufficient payment in others, and also the inability to recognize superior efficiency by promotions and increasing wages or of getting rid of inefficient help by demotions or discharge.

Whatever plan is adopted, it seems to me, must provide for allowing the initiative on the part of the corporations to remain and for some regards for careful operation. If the government guarantee a dividend those roads that could not ordinarily earn such a dividend will sit down quietly and live on it, with no hope of making anything extra. To get the best results the rewards offered for economical and efficient operation and the use of the best possible brains and judgment should be large enough to enable the corporation to pay good salaries and secure the most competent men. It seems to me that in your plan the amount of excess earnings to be divided to labor in bonuses is too large and the amount to go to the corporations too small to insure the best results.

EXECUTIVE OFFICER.

DEAR MR. EXECUTIVE:—

Your particular criticism can be put under two heads

1. The proposed systems are too large for proper supervision.

2. The incentive to do good work is taken away by putting all companies more or less on a dead level.

I admit there is much force to the criticism that the systems are too large. I should have preferred to have kept the proposed systems down so they would not exceed 20,000 miles, but under my plan I somehow had to take care of the roads in the Southwest as there are practically no strong roads in that region, outside of the Southern Pacific and the Atchison, Topeka & Santa Fe. It was, therefore, necessary to link a number of lines with very weak credit to strong lines in the Northwest and Northeast. Besides, there are a number of systems with a substantial capitalization in other sections of the country, which are weak and their burden therefore had to be pro rated among several strong lines. The systems are so very large, however, that they really have to be divided into regional districts, both for the purpose of more efficient operation and in order to enable the Interstate Commerce Commission to keep a record of the earnings, or rather of the result of rates, as same may prevail from time to time.

It seems to me such sub-division after all, should be no more difficult than the present sub-division, under which the Santa Fe System keeps separate accounts for its Gulf, Colorado & Santa Fe and its Pacific Coast Lines. The Southern Pacific keeps a separate account for many companies; in fact for many more than would become necessary hereafter.

The Pennsylvania System up to now, has kept up its separate organization for the lines east and west of Pittsburgh, and I believe that it is the intention to keep up this separate organization in spite of the fact that the Pennsylvania Company, which operates the lines west of Pittsburgh, is to be or has been liquidated.

As to the incentive being taken away, it is quite true that if the companies are practically going to be limited to 6 per cent dividends the incentive for great improvements or great efficiency is not quite as great as it has been heretofore. In order to overcome this, I have worked out the following:

1. The directors personally are to receive additional compensation for increased dividends.

2. A substantial proportion of increased net results are to go to labor.

3. The Board of Directors is in no way restrained from paying good salaries to efficient men.

Let us assume some such plan as mine were to be put into effect. We would then have, say, eight national railway systems, with probably an average of five sub-divisions or districts. The Northern, Central and the Union Railways would compete with each other; they would each have their Atlantic, Central, Western, Pacific and other divisions. The results of the operation of these divisions would continue to be published and compared with each other, the same as now. The officials in charge of these divisions, as well as their sub-divisions, would still each be keen to show good results in the expectation of recognition of their work by increased salary or promotion.

The gist of the proposition is that the Government cannot have full control; the public cannot have competition and close regulation, and at the same time get the fullest benefits of the previous system of private management and personal incentive. It should be possible though to arrive at some compromise by which the best features of private management can be combined with the desires of the public.

F. J. LISMAN.

## Movement of Troops for New York Parade

FOR THE PARADE of the 77th Division of the army, which took place in New York City on Tuesday, May 6, the soldiers had to be moved from and to the camp 20 miles east of New York, by the Long Island Railroad, and the total train movement over the company's lines between New York and Camp Upton for the week of May 4-10, was one of the heaviest on record—and exceedingly heavy records have been common on this road ever since this country first entered the war.

A total of 19,288 men were carried westward—Camp Mills to Long Island City—on Monday, the 5th, in 28 trains of 11 cars each. The first of these trains left the camp at 7 a. m. and the last one at 1:50 p. m. The running time (20 miles) is about 40 minutes. The trains carried from 500 to 800 men each, but on one there were 952—16 officers and 936 men.

The troops were taken from Long Island City across the East River to Manhattan in the railroad company's ferry-boats, each boat carrying two or three trainloads.

This part of the Long Island road is traversed by large numbers of regular trains, about three-fourths of the distance between Long Island City and Camp Mills being a three-track or four-track line. For the rest of the distance the line is two-track.

In the movement from the city (eastward) on Wednesday, the 7th, 21 trains were run to Camp Upton, 60 miles from Long Island City, and 8 to Camp Mills; the number of coaches used was 324, as compared with 308 on Monday. The movement was spread over a longer time, the first train starting at 7:57 a. m., and the last one 7:10 p. m. The trains from and to Camp Mills were electrically propelled while those from and to Camp Upton were hauled by steam locomotives.

The total troop movements to and from Camp Upton and Camp Mills, for the whole week, seven days, amounted to 172 trains carrying 100,238 men, equal to an average daily movement of 25 trains and 14,320 men. The number of trains moved each day, including both eastbound and westbound, was: Sunday, 22; Monday, 37; Tuesday, 27; Wednesday, 37; Thursday, 11; Friday, 26; Saturday, 12.

All of these special trains had to be made up at the yard in Jamaica, situated about half-way between the western terminus and Camp Mills, so that the actual train mileage (empty and loaded) incident to the movement of troops was about double that indicated in the second and fifth paragraphs, above.

# General News Department

The Association of Railway Executives, T. DeWitt Cuyler, chairman, meets in New York city today, Friday.

The Brotherhood of Railroad Trainmen began its triennial convention at Columbus, Ohio, on May 14. The service flag unfurled contains 840 gold stars. Director General Walker D. Hines is announced to address the convention on Tuesday, May 20.

The State of Texas has secured a temporary injunction prohibiting the Galveston, Harrisburg & San Antonio from further removing and abandoning its track between Blodgett, Texas, and West Junction, a distance of 6 miles. The attorney general also asked for a mandamus to require the restoration of tracks already taken up and to pay a \$5,000 fine.

The Order of Railway Conductors is holding its triennial convention at St. Louis, Mo., and, according to St. Louis papers, the convention brings 6,000 visitors to the city. Tomorrow (Saturday) the conductors and their families will go by special train to French Lick Springs, West Baden, Ind., 230 miles from St. Louis, where they will be the guests, over Sunday, of Thomas Taggart.

Col. Frederic A. Delano, formerly president of the Wabash and later of the Chicago, Indianapolis & Louisville, who resigned as member of the Federal Reserve Board to go into the army, has been made a Chevalier of the Legion of Honor, in recognition of his services as deputy director general of transportation for the A. E. F. He entered the service as a major and was promoted to lieutenant colonel and later to colonel.

Regular airplane mail service is announced to begin this week between Cleveland and Chicago, a distance of about 350 miles. Airplanes are to start from each city at 9:30 a. m., and will be scheduled to arrive at destination at 2 p. m. The post office department plans to transfer mails to and from railroad mail cars at Cleveland, so as to give the benefit of the quick time to letters from Chicago to New York, Boston and other eastern cities, and vice versa.

The Canadian Pacific Railway has applied to the Canadian Government for authority to operate airplanes between such points as may be found desirable. An officer of the road is quoted as saying that no immediate action is contemplated, the company simply means to be prepared for future developments. In speaking of the prospective importance of aerial transportation he called attention to the fact that there is a regular daily airplane service between London and Paris, by a Handley-Page machine which can carry 17 passengers. He said that the estimates of the British Government for the coming year include for air service no less than three hundred million dollars, of which ten million will be set aside for experimental research and civic aviation.

Cleveland, Ohio, by action of its city government, has ordered clocks to be changed from Eastern to Central Standard Time. Using Eastern or 75th Meridian time, as has been done in the winter, Cleveland keeps its clocks about 27 minutes faster than local time; and now, with the daylight saving law in operation, these timepieces are 87 minutes too fast; and this evidently causes the people to rise in the morning earlier than is agreeable to them. The railroads, being required to regulate their time according to the law, as prescribed by Congress through the Interstate Commerce Commission, continue to use Eastern time, with the exception of the Cleveland, Cincinnati, Chicago & St. Louis, which uses Central time. The interurban electric roads have changed from Eastern to Central Standard.

The St. Louis & Hannibal Railroad Company has made application for permission to cease operation and junk its entire property. The petition prepared to this end declares that the road was started toward bankruptcy by the inconsistent orders of the government railway management. (This road is not operated by the government.) From January 1, 1918, to March 31, 1919, the operation of the road resulted in a net loss of \$26,620. The petition declares the company is facing certain bankruptcy and asks that it be permitted to cease operation, take up the track and sell the equipment. The original cost of property is given as \$1,118,894. It was sold at a trustee sale in 1917 for \$620,000. This is a single track railroad, 86 miles in length, extending from Hannibal, Mo., south by east, to Gilmore, where it connects with the Wabash, which makes a connection to St. Louis, 42 miles east.

The Victory Loan Subscriptions of the railway supply industry in Chicago amounted to \$5,500,000. The railway supply trade went "over the top" in splendid fashion, oversubscribing its quota by a round million. This record was made by Committee Number 26, Railway Supplies. C. K. Knickerbocker, of the Griffin Wheel Company, was chairman, with T. W. Aishton, of the National Malleable Castings Company; Robert F. Carr, of the Dearborn Chemical Company; L. B. Sherman, of the *Railway Age*; Herbert W. Wolf, of the American Car & Foundry Company; Thomas Finnigan, American Brake Shoe & Foundry Company; R. H. Ripley, American Steel Foundries Company; H. L. Monroe, General Electric Company; James M. Hopkins, the Camel Company, and Frederick T. Vaux, of Adams & Westlake. C. S. Boggs, of Halsey, Stuart & Company, was captain.

The airplane mail service between New York and Washington has now been in operation one year, and the event was celebrated in Washington on Thursday, May 15. The airline distance between New York and Washington is calculated at 218 miles, and the trips have been made with a high percentage of punctuality, one trip each way each day except Sunday. One of the fliers, making 191 flights, made only seven forced landings and failed to complete his trip only five times. Another, making 138 flights, completed 129 of them without landing. There were 10 or more fliers in all, and others made equally good records. The aggregate mileage flown was 128,037 miles; aggregate weight of mail 193,021 lb. The same six airplanes that began the service are still in operation, with the same engines. It is stated that there has been but one serious injury to a machine, and but one serious accident to a pilot.

According to a statement issued by Otto Praeger, second assistant Postmaster General, the sale of airplane mail stamps has amounted to \$159,700. He says that there was a saving in railroad mail transportation of \$2,264, and that the airplane operating expenses amounted to \$142,861.

## Change in M. C. B. Rules

The American Railroad Association, Mechanical Section, has issued Circular 37, reestablishing delivering lines' responsibility and the use of defect cards between railroads under federal control, all circulars and interpretations to the contrary being abrogated. In view of accounting division Circular 86, articles 1, 2, 3 and 4 of the 1918 code of the Master Car Builders' rules for freight cars and modifications A to C inclusive of the 1918 code for passenger cars have been withdrawn and new rules have been formulated to govern the inspection and interchange of cars between roads under federal control.

REVENUES AND EXPENSES OF RAILWAYS

MONTH OF MARCH, 1919

Table with columns: Name of road, Average mileage operated during period, Freight, Passenger, Total Operating revenues (inc. misc.), Maintenance of way and structures, Equipment, Traffic, Transportation, General, Total, Operating ratio, Net railway operation, Railway tax accruals, Operating income (or loss), Increase comp. with last year.

REVENUES AND EXPENSES OF RAILWAYS

MONTH OF MARCH, 1919—CONTINUED

Main table with columns: Name of road, Average mileage operated during period, Freight, Passenger, Total operating revenues, Maintenance of way and equipment, Traffic, Trans-shipment, General, Total, Operating ratio, Net railway operating, Railway tax accruals, Operating income (or loss), Increase (or decrease) last year.

THREE MONTHS OF CALENDAR YEAR 1919

Summary table for three months of calendar year 1919, with columns: Name of road, Freight, Passenger, Total operating revenues, Maintenance of way and equipment, Traffic, Trans-shipment, General, Total, Operating ratio, Net railway operating, Railway tax accruals, Operating income (or loss), Increase (or decrease) last year.

**Strike of Express Company Employees**

A strike of wagon drivers and other employees of the American Railway Express Company, in and around New York city, which was settled on Monday of this week, had blockaded the merchandise traffic of the company badly for nearly a week. The men struck for recognition of their newly formed union, and for a further increase in pay, the increase recently granted by the Railroad Administration being declared unsatisfactory; and double-time for Sunday and holiday work, time and one-half for all overtime, and ten holidays a year, were also asked for. Most of the strikers have joined the International Brotherhood of Teamsters; and members of that brotherhood, representatives of the company, and W. S. Carter, representing the Railroad Administration, are to settle the grievances of the men, a large meeting of the strikers having voted unanimously to agree to this. About 10,000 men left their work. Notwithstanding the extent and the completeness of this strike, the delays to traffic which resulted seem to have been much less troublesome than usually is the case in such a condition; the apparent explanation of which is that enormous quantities of merchandise in packages weighing 70 lb. or less were sent by parcel post, while large quantities of other merchandise, which usually go by express, were sent by freight.

**Explosion in C. P. R. Tunnel**

The five-mile tunnel on the Canadian Pacific near Connaught, B. C., which was being lined by Carter-Halls-Aldinger Company, contractor of Winnipeg, Man., was filled with poisonous gas caused by the explosion of thirty drums of gasoline and kerosene used for the operation of a concrete mixer. A watchman was suffocated in a telephone booth where he had stopped to escape the gas. A slight fire occurred, following the explosion, and the extent of damage was approximately \$6,000.

**Reorganization of the U. S. Chamber of Commerce**

At the recent meeting of the Chamber of Commerce of the United States the delegates approved a recommendation by the board of directors that structural changes be made in the organization of the Chamber to permit an expansion of its activities. The proposed plan contemplates establishment within the chamber of departments designed to deal with the following: Industrial production; domestic distribution; foreign commerce; transportation and communication; finance; insurance; civic development.

**Railroad Employees' Subscriptions to Victory Loan**

The director general had received to May 13 the following reports regarding the progress of the Victory Loan among the officers and employees of the United States Railroad Administration:

Region—	Employees on roll	Employees Subscribing	Amount Subscribed	Employees Subscribing

**Derailment and Blockade at Sabula, Pa.**

By the derailment of a freight train on the Pennsylvania Railroad in a tunnel at Sabula, Pa., on April 30, thirteen freight cars and a large quantity of freight were destroyed, the tunnel for a length of 145 ft. caved in, and the road was blocked so that probably two months will be required for its restoration.

In the train derailed there were 34 loaded and 10 empty

cars. A car was derailed in the tunnel, apparently because of the falling of a brake beam, and the train was stopped; fire soon broke out, and nine cars with their contents were entirely destroyed. Most of the rest of the train was considerably damaged. The cause of the fire is not known, but presumably it was started by the ignition of two cars of gasoline which were derailed. The flames were unsubdued for 42 hours and the estimated total damage is \$125,000. Sabula is five miles east of Dubois, on the line from Red Bank, Pa. to Driftwood; and all trains are running temporarily over the Buffalo & Susquehanna between Dubois and Driftwood, 45 miles.

**Chicago Union Station**

Federal government, railroad and city officers of Chicago recently held a conference at which the pushing of the Chicago Union passenger station project was discussed. As a result of this conference it was announced that work on the new station will be rushed and it is expected that more than 3,000 men will be employed on the work within 30 days. The purpose of this conference was to develop cooperation between the city and the railroads and a number of contracts will probably be let in the near future for work on the station and its approaches.

The foundations for the headhouse of the station are at present approximately 50 per cent completed. The Butler Brothers building, which the Union Station Company will have to build in order to get room for tracks, is well under way, the foundation being in and work is now being done on the superstructure for which the John Griffith & Son Company, Chicago, hold the contract. Work is now being done on the substructure of the Harrison street viaduct by the W. J. Newman Company, Chicago, and is approximately 40 per cent completed. The Taylor street viaduct is also approximately 50 per cent completed, the Underground Construction Company having the contract for the substructure and the Strobel Steel Construction Company, Chicago, holding the contract for the superstructure. This part of the work will be finished at an early date. Bids for the twelfth street viaduct are now in the hands of the Chicago Union Station Company and the contracts for this part of the work will be let in the near future. The steel for the Polk street viaduct has been completed and will be on the ground within 30 days. Rails and ties for the tracks from Van Buren to Twelfth street have been bought and it is planned to contract the grading and track work on this approach within ten days. The steel for the raising of the Harrison street bridge has also been delivered and on this the work will be started soon.

**Golden Spike Celebration**

The fiftieth anniversary of the driving of the golden spike which marked the completion of the first American transcontinental railroad was celebrated at Ogden, Utah, on May 10. Veteran railroad men who were connected with the construction of the Union Pacific or the Central Pacific were in Ogden as guests of the city. There was a great parade, in which was a replica of engine No. 60, the "Jupiter," which was used in the building of the Central Pacific, and George Lashus, of Ogden, who was engineer of the original engine, was at the throttle of the replica, which was mounted on an automobile truck. There were small sized models of the two engines which met at Promontory on May 10, 1869, and which appear in the well-known picture of the driving of the golden spike.

The building of the "Pacific Railroad" was begun at Omaha, Neb., by the Union Pacific and at Sacramento, Cal., by the Central Pacific, in 1863. The race between the two roads to lay the largest mileage of track ended on May 10, 1869, at Promontory, Utah, 50 miles west of Ogden, at which time trains from the Union Pacific and Central (now Southern) Pacific met. Governor Leland Stanford of California, representing the Central Pacific, completed the physical connection of the two roads by driving a golden spike, and T. C. Durant, president of the Union Pacific, took part in the ceremonies. In the last year of the construction work, the two railroads were employing approximately 25,000 men and using 6,000 teams. Many of the men engaged in this work were present at the celebration, and included in these were three

Chinese, each over 90 years old, who began railroad work in California about 1849. These three men, Ging Cui, Wong Fok and Lee Cho, were in the gang that laid the last rail of the Central Pacific up to the point where the golden spike was driven. They came from Susanville, Cal., where they were in the service up to three years ago in gang No. 28.

**Reception to Fourteenth Engineers**

The Fourteenth Engineers, made up of employees of the principal New England railroads, were guests at a banquet in Boston on Thursday of last week (May 8), which is said to have been the most successful affair of the kind that has been held in any part of New England. The Fourteenth Engineers arrived in Boston on April 27, thirty officers and 1,486 men. Companies A and B were made up of men from the Boston & Maine, C from the Maine Central, D from the Boston & Albany, and companies E and F from the New York, New Haven & Hartford. Prior to the day of the general reception, each road had had an entertainment for companies connected with that road, and the general reception on the 8th filled a whole day, a picnic being held at Riverside, 11 miles from Boston, in the daytime. The banquet in the evening was at Symphony Hall. While the banquet was in progress there was what might be called an overflow meeting, across the street, for the families of the soldiers, a luncheon being served. After the banquet there was a dance.

Robert H. Newcomb, secretary to the federal manager of the Boston & Maine, was chairman of the executive committee which provided these entertainments. This committee represented, not only the railroads and their employees, but also the "Association of Friends of the Fourteenth Engineers."

**American Short Line Railroad Association**

The American Short Line Railroad Association has issued the call for a meeting at the New Willard Hotel, Washington, on June 3, 4 and 5, which will be attended by five or six hundred representatives of the short line railroads, and also a large number of trunk line executives as guests. The special object to be considered is the legislation necessary to increase and protect transportation facilities. The meeting will be divided into six sessions, each of which will be addressed by a prominent speaker, including Walker D. Hines, director general of railroads, Senators Cummins and Underwood, Representative Esch and possibly Commissioner Hall of the Interstate Commerce Commission.

All short line railroad companies are authorized and requested to send one or more of their officers as delegates, and all such delegates will be urged to participate in the proceedings. The call for the meeting states the object as follows:

"The conditions surrounding the railroads generally, and especially the short lines, are not only serious, but appalling, and Congress must act, and act wisely, to prevent wholesale bankruptcy. While operating the main line railroads, the government has imposed many hardships upon, and in many instances has done great injustice to, the short lines, and it is now a serious question whether it is possible for the Railroad Administration to do adequate justice to such lines. The only real hope is to look to Congress; hence, it is vitally important that all short lines participate in the convention. The legislation to be enacted must be based upon broad, true and equitable principles. It must be fair to the public as well as to the railroads, and to the railroads as well as to the public. It must be such as to enable the main line railroads to become prosperous, otherwise the short lines cannot be, and it must safeguard the rights of the latter class so that they may not be unjustly treated by any interest or community in the future.

"The problem is not sectional, hence, it is most important that the short lines in all sections of the country participate in the plans that are adopted.

"We have invited about 150 of the presidents of the main line companies to attend the convention as our guests, and there is every reason to believe that more than 100 of the leading officials of that class will be present. We think it wise to have these officials present for two reasons: First, the convention must consider the railroad problem as a whole. Second, the short lines must deal with the main lines when they are returned by the government, hence, it will be most desirable to know these officials and take them into consideration."

W. T. Tyler, director of operation of the Railroad Administration, has authorized the issue of necessary transportation for delegates and their families.

**Railway Revenues and Expenses for**

**March and Three Months of 1919**

The Interstate Commerce Commission's monthly statement of railway revenues and expenses, covering the operations of 183 Class I roads and 17 switching and terminal roads is as follows:

Item	March				Three months ending March 31			
	Amount		Per mile of road operated		Amount		Per mile of road operated	
	1919	1918	1919	1918	1919	1918	1919	1918
1. Average number miles operated.....	1919	1918	1919	1918	1919	1918	1919	1918

## Atlantic City Mechanical Convention

The American Railroad Association has issued the calendar for the first annual convention of Section III—Mechanical, which is to be held at Atlantic City, N. J., June 18 to 25. The order of business is as follows:

*Wednesday, June 18, 9:30 A. M. to 1:30 P. M.*

Prayer; address of welcome by the mayor of Atlantic City; address by the chairman.

Action on Minutes of Annual Meeting of 1918 (M. C. B.); Report of Secretary and Treasurer (M. C. B.).

Appointment of Committees on Subjects, Resolutions, Correspondence, Obituaries, etc.; Unfinished business; New business.

Report of General Committee, including announcement of nominations for members of Nominating Committee; Discussion of Reports on Nominations; Standards and Recommended Practice (M. C. B.); Train Brake and Signal Equipment; Brake Shoe and Brake Beam Equipment.

*Wednesday, 3 P. M.*

Revision of the Rules of Interchange, including consideration of the following reports of committees: (1) Arbitration; (2) Revision of Prices for Labor and Material; (3) Depreciation for Freight Cars; (4) Revision of Passenger Car Rules of Interchange.

*Thursday, 9:30 A. M. to 1:30 P. M.*

Discussion of Reports on Car Wheels; Standard Blocking for Cradles of Car Dumping Machines; Specifications and Tests for Materials (M. C. B.); Welding Truck Side Frames, Bolsters and Arch Bars; Couplers; Draft Gear.

Question proposed by members.

*Friday, 9:30 to 1:30*

Discussion of Reports on Safety Appliances; Loading Rules; Car Construction; Car Trucks; Train Lighting and Equipment; Tank Cars.

Questions proposed by members.

*Saturday, 9:30 to noon*

Consideration of Rules of Order, Election of Officers, General Committee and Nominating Committee, Presentation of badges to retiring officers, etc.

*Monday, June 23, 9:30 to 1:30*

Address of Vice-Chairman; Action on minutes of 1918 Annual Meeting (M. M.); Reports of Secretary and Treasurer (M. M.).

Discussion of Reports on Standards and Recommended Practice (M. M.); Mechanical Stokers.

Paper on "Standardization," by Frank McManamy.

Questions proposed by members.

*Tuesday, 9:30 to 1:30*

Discussion of Reports on Fuel Economy and Smoke Prevention; Specifications and Tests for Materials (M. M.); Design and Maintenance of Locomotive Boilers; Locomotive Headlights; Superheater Locomotives.

Paper on Carbonization in Valve Chambers and Cylinders of Superheated Steam Locomotives, by F. P. Roesch.

Amalgamation of other Mechanical Associations with Section III, A. R. A.

Questions proposed by members.

*Wednesday, 9:30 to 1:30*

Discussion of Reports on Design, Maintenance and Operation of Electric Rolling Stock.

Paper on The Use of Bronze for Valve Snap Rings and Piston Surfaces, and for Bull Rings in Large Cylinders, by C. E. Fuller.

Discussion of Reports on Train Resistance and Tonnage Rating; on Subjects: on Resolutions, Correspondence, etc.

Unfinished business: questions proposed by members and closing exercises.

## American Association of Engineers

The annual convention of the American Association of Engineers was held at Chicago on May 12 and 13. The officers of the association elected at the convention are as follows: President, F. H. Newell; first vice-president, W. W. DeBerard; second vice-president, T. A. Evans. Among those elected as members of the board of directors are W. W. K. Sparrow, corporate chief engineer of the Chicago, Milwaukee & St. Paul; A. A. Mathews, chief engineer of the St. Louis-Southwestern System, and E. F. Collins, valuation engineer of the St. Louis-San Francisco.

## Traffic News

The El Paso (Tex.) Chamber of Commerce now has a traffic bureau, under the direction of A. E. Tadlock.

The Dallas (Tex.) Embargo Bureau has been discontinued and embargo advices affecting any line of the Southwestern region should hereafter be addressed to the regional director.

The Traffic Club of Chicago gave a farewell luncheon to William Gourlay, general agent at Chicago for the American Railway Express Company and vice-president of the Traffic Club of Chicago, on May 6. Mr. Gourlay leaves shortly for London, England, where he will act as manager of the American Express Company.

Frank M. Williams, of Albany, N. Y., New York state engineer, under whose supervision the New York State barge canal was completed, addressed the Toledo (Ohio) Commercial Club at a meeting at Toledo, May 8, for the purpose of creating interest in the proposed barge canal from Toledo to Cincinnati with a branch to Lake Michigan.

The director general reports 9,147 cars of export freight, exclusive of bulk grain and coal, as received at North Atlantic ports for the week ended May 7, while 9,393 cars had been delivered. On May 7 there were 17,720,670 bu. of grain in elevators at North Atlantic ports; received during the week 7,307,905 bu.; 8,241,393 bu. cleared. At South Atlantic and Gulf ports there were 10,216 carloads of export freight on hand on May 7, as compared with 10,582 cars for the week previous.

The Southern Traffic League at a recent meeting at Augusta, Ga., elected the following officers: W. E. Gardner, president, Jacksonville, Fla.; J. T. Slatter, vice-president, Columbia, S. C.; Howard H. Stafford, vice-president, Augusta, Ga.; C. W. Hayward, secretary-treasurer, Meridian, Miss. Recommendations were adopted for the appointment of shippers to places on freight traffic committees as follows: Southern Regional Committee, M. M. Caskie, Montgomery, Ala.; New Orleans Eastern Committee, C. W. Hayward, Meridian, Miss.; Birmingham district, R. G. Cobb, Mobile; Atlanta, Geo. W. Forrester, Atlanta; Louisville, A. F. Vandergrift, Louisville, and E. DeL. Wood, Chattanooga; Richmond district, W. D. Nelson, Jacksonville, Fla. Resolutions were adopted urging municipalities, boards of trade and chambers of commerce to propose traffic committees for their respective cities and recommending the employment of traffic managers and the maintenance of traffic bureaus. Resolutions were adopted stating that the Southern Traffic League is opposed to the sailing day plan as proposed for general application and that the league is opposed to the four o'clock closing hour for freight receiving stations. Resolutions were also adopted opposing rate increases as shown in General Order 28 and calling for a committee to investigate the Southern Weighing and Inspection Bureau and report to the league as to the advisability of filing a formal complaint with the Interstate Commerce Commission asking for an investigation of the bureau.

## Opportunities for Home-Seekers

The United States Railroad Administration, through its Agricultural Section, has issued a booklet giving in detail the opportunities offered to home-seekers in Wisconsin and upper Michigan. The material was collected by the agricultural representatives of the railroads under federal control in these two states, in co-operation with the officers of the states. The booklet contains information about production, markets, transportation facilities, climate, schools, churches, roads and living conditions. Opportunities for homeseekers are found especially in the "cut-over lands" of upper Wisconsin and the upper peninsula of Michigan, and the booklet gives detailed information about how the homeseeker can make a success in the locality described.

## Commission and Court News

### Interstate Commerce Commission

The Interstate Commerce Commission on the petition of the Midland Valley, has appointed Commissioner H. C. Hall, Attorney Examiner A. G. Hagerty and W. H. Carleton, assistant chief examiner of accounts, as a board of referees for the purpose of determining the company's just compensation under the federal control act.

### Court News

#### Employers' Liability Act

The Circuit Court of Appeals, Fourth Circuit, holds that a railroad employee, who cleaned and iced intrastate and interstate cars, and who was proceeding to get the ice when injured, was not engaged in interstate commerce authorizing suit under the act.—*Southern vs. Pitchford*, 253 Fed. 736.

#### Tank Cars

The obligation to carry goods safely often requires that special kinds of cars be supplied for the transportation of goods which the carrier has accepted. But where articles of an extraordinary character are offered, a carrier is not bound to accept them or to provide facilities of a different kind from those usually furnished for transportation. For this reason a carrier may be excused from acceptance of explosives or of goods that are improperly packed. There are other limitations of the carrier's duty to accept goods, growing out of the usual course of business and the limitations of convenience; so carriers are not bound to accept as baggage articles that by reason of bulk or value transcend their customary limitations. The ordinary freight cars of the railroads, because of their dimensions, impose restrictions of length, width, and height to commodities that may be carried, and they are wholly unsuitable for the transportation of articles such as acids, oils and gases, which are not packed in containers. In the case of *U. S. vs. Pennsylvania*, 242 U. S. 208, 37 Sup. Ct. 95, the Supreme Court of the United States recognizes the fact that a tank car is not only a car but a package for the goods. If the producer of oil may demand of the carrier a specially constructed car suitable as a container of the article produced by him, there is no reason why the producers of the various forms of gases, liquids, and solids may not also require peculiar cars suitable for such unpacked products. In the private car case (50 I. C. C. 652, July 31, 1918) the Interstate Commerce Commission found that there are 59 varieties of liquids that are regularly transported in tank cars; also that very few railroads in the United States furnish tank cars for the use of shippers (see also *U. S. vs. Penn.* 242 U. S. 208) and that railroad tariffs usually provide that the carriers assume no obligation to furnish tank cars. There is an economic waste in the use of tank cars, because usually they are returned empty. Under the rules of interchange, a railroad may own a large supply of such cars, and yet have none available on its own lines. The rule is a reasonable one that if the shipper wishes to compel the carrier to accept his goods he must properly prepare and pack his product to suit the cars that the carrier assumes to supply, and which are ordinarily furnished by carriers for such products, and that it is not the usual practice of railroads to furnish tank cars for shippers. Applying these principles, the Circuit Court of Appeals, Eighth Circuit, holds that a railroad company is not required to furnish tank cars to carry the oils of a refinery; and where the tariffs of a railroad which owned no tank cars did not purport that tank cars would be furnished, and the railroad had leased tank cars, some of which it allowed a refinery to use, it might withdraw the use of the cars from the refinery when they were needed to carry water to supply its engines, etc.—*Rock Island vs. Lawton Refining Co.*, 253 Fed. 705.

## Equipment and Supplies

### Tests of Locomotive Specialties

The Inspection and Test Section of the Railroad Administration is considering the question of tests of locomotive specialties, such as bell ringers, fire-doors, electric headlights, and would be glad to receive full information from the various manufacturers desiring to participate in the tests. Communications should be addressed to C. B. Young, manager, Room 709, 1800 Pennsylvania avenue, Washington, D. C.

### Regional Director Inquiring Into

#### Possibilities of Locomotive Orders

R. H. Aishton, regional director of the Northwestern region, in a telegram to Northwestern roads states that locomotive builders are urging the placing of orders for locomotives in order that they may keep their shops in operation, and also keep down the overhead cost of the locomotives that have been or will be built. The telegram asks for information as to the number and type of additional U. S. standard locomotives that will be required on lines in this region and whether or not approved by the railroad corporation. If the corporations are not willing to buy the United States standard type they are asked to give the number and the type or types that they will be willing to purchase of their own standard.

### Locomotives

THE ITALIAN STATE RAILWAYS have ordered 150 superheated consolidation locomotives from the American Locomotive Company. These locomotives will have 21¼ in. by 27½ in. cylinders and a total weight in working order of 149,600 lb. These engines will be duplicates of an order of 150 locomotives ordered last year and bring the total number of engines ordered since the first orders placed by Italy in this country in 1916, to 400.

### Freight Cars

THE GREGG COMPANY, Hackensack, N. J., is inquiring for one storage battery truck.

THE PENNSYLVANIA COAL COMPANY, New York, has placed an order for 100 mine cars.

THE UNITED STATES IRON & STEEL COMPANY, New York, is inquiring for 6 small motor cars.

THE H. KOPPERS COMPANY, Pittsburgh, Pa., is inquiring for one 50-ton, coke quenching car and one 5-ton lorry car.

OSCAR C. SINTAS, Havana, Cuba, has ordered 60 cane, and 10 40-ton, 6,500-gal. tank cars, from the American Car & Foundry Company.

THE BUENOS AIRES RAILWAY, has ordered 12, 10,000-gal. tank cars and mountings from the American Car & Foundry Company.

THE LIBERTY COAL MINING COMPANY, Osceola Mills, Pa., has ordered one wooden mine car from the American Car & Foundry Company.

THE REPUBLIC TRADING COMPANY, New York, is inquiring for 10 36-in. gage cane cars and a number of 36-in. gage dump cars for export to Nicaragua.

VIELE, BLACKWELL & BUCK, New York, are inquiring for 40, 20-ton capacity ore cars, 4 flat cars, 3 dump cars, and 200 cars of 22 different types, for export to China.

THE RAILWAYS OF THE UNION OF SOUTH AFRICA are asking bids on 650 goods wagons and will probably want more. They are seeking American bidders as well as others.

# Supply Trade News

**Geo. L. Fowler**, consulting mechanical engineer, has moved his office from 83 Fulton street to 120 Liberty street, New York.

**Captain J. A. McIntosh**, who has been in the service overseas with the Tank Corps, has returned to his former position in the engineering department of the Ohio Brass Company, Mansfield, Ohio.

**Charles Gilman**, whose election as vice-president of the **Massey Concrete Products Corporation**, with headquarters in New York, was announced in the *Railway Age* of April 25, was born in 1882 at Cambridge, Mass., and received his education at Harvard University, graduating in 1904. His first construction experience was obtained in connection with building of the Harvard stadium in 1903. The following two years he was engaged in work on the New York subways. In 1911, Mr. Gilman became identified with the concrete products business as assistant to the vice-president of the American Concrete Pile & Pipe Company, and when this organization was taken over by the C. F.

C. Gilman

Massey Company in 1912 he was appointed Eastern engineer. The following year he was advanced to Eastern manager, which position he held until his recent election as vice-president in which capacity he will have charge of sales in the Eastern territory of the corporation, comprising the New York, Pittsburgh, Southern and Canadian districts.

**A. P. Van Schaick**, district sales manager of the Lackawanna Steel Company, at Chicago, has resigned to become special representative, with headquarters in Chicago, of the **American Chain Company, Inc.**, Bridgeport, Conn., effective May 15. Mr. Van Schaick began his business career in 1903, at which time he left Williams College, Williamstown, Mass., to enter the railroad sales department of the Pittsburgh Plate Glass Company, with headquarters in Chicago. From 1906 to 1910 he was in the employ of the Universal Railway Supply Company, with headquarters in the same city, resigning from that position during the latter year to become district sales manager of the Lackawanna

A. P. Van Schaick

Steel Company at Chicago. Mr. Van Schaick has been active in the work of railway supply organizations and especially of the National Railway Appliance Association. He was elected a member of the executive committee of this association in 1910,

vice-president in 1911, and president the following year. He is still a member of the executive committee.

The **Baldwin Locomotive Works** has recently established a separate department for handling foreign sales in charge of **F. de St. Phalle**, recently elected vice-president and with **Reeves K. Johnson** as manager of foreign sales.

The **American Steam Conveyor Corporation**, Chicago, has appointed **N. B. Stewart** district representative in charge of its St. Louis territory. Offices have been opened at 708 Merchants-LaCledde building, St. Louis, Mo.

**Mudge & Co.**, Chicago, have awarded contracts for the erection of a one-story factory 190 ft. by 194 ft., at West 16th street, Chicago. The superstructure of the new building will be of steel and brick. It will cost approximately \$75,000.

**Captain Charles S. Pillsbury**, who was assistant sales manager of the **Chicago Bridge & Iron Works**, Chicago, prior to his entrance into military service, has been promoted to major and decorated with the French Legion of Honor. Major Pillsbury is in the construction division of the U. S. Army overseas.

**Judge S. E. DeHaven**, LaGrange, Ky., has resigned as county judge of the fiscal court of Oldham county to become traveling salesman in Kentucky of the **Canton Culvert & Silo Company**, Canton, Ohio, and **L. W. Hurley**, of Lansing, Mich., has joined the sales force of the same company as Michigan culvert salesman.

**Frank H. Clark**, formerly general superintendent of motive power of the Baltimore & Ohio, has opened offices at 15 Park Row, New York, and will undertake engineering investigations, report upon railway conditions and operations and prepare or co-operate in the preparation of plans and specifications for railway equipment and materials. He will also act in an advisory capacity to export firms and to foreign railway or other concerns purchasing equipment or material from manufacturers in the United States, and make such inspections as may be desired. Mr. Clark was associated for four years with **David L. Barnes**, consulting engineer, of Chicago, after which he entered

F. H. Clark

the service of the Chicago, Burlington & Quincy, where he held successively the positions of chief draftsman, mechanical engineer, superintendent of motive power and general superintendent of motive power. He resigned his position with that company on December 30, 1910, to enter the service of the Baltimore & Ohio as general superintendent of motive power and held that position for eight years. He is a member of the American Society of Mechanical Engineers, the Franklin Institute and other technical societies. He is also a member of the American Railway Master Mechanics' Association and of the Master Car Builders' Association. He served as president of the M. M. Association for the early part of the term 1918-1919, and of the M. C. B. Association for the term 1910-1911.

**J. Stanley McCormack**, formerly sales manager of the **Bell Locomotive Works, Inc.**, New York City, will return to resume his old position as soon as he receives his discharge from the Naval Aviation Corps. Mr. McCormack enlisted at the outbreak of the war, received his commission, training as a naval aviator, and was detailed to special experimental aviation development. His discharge is expected within the next two weeks.

Frank H. De Brun has been appointed mechanical engineer in charge of design and improvement for **Mudge & Co.**, Chicago, effective May 15. Mr. De Brun was born in Switzerland in 1883 and received his education in the Higher Polytechnic University of Geneva. After graduation from that institution he served three years as an apprentice in mechanical and electrical laboratories in Switzerland and the following two years as a mechanical draftsman for the Coventry Motor Works, Ltd., at Coventry, England. The next seven years he was in the employ of the Royal Automobile Club of London, England, as superintendent in charge of garage and repairs, resigning from that position to come to the United States as manager of the Universal Auto Training School in New York City, where he remained for two years. In the fall of 1917 Mr. De Brun became associated with the Detroit Institute of Technology, where he had charge of the automotive engineering laboratories works, electrical equipment and battery works and special courses in the maintenance and repair of tractors.

F. H. De Brun

**E. Roy Gordon** has been appointed service engineer of **Mudge & Co.**, in which capacity he will have charge of investigating service given by the products manufactured by that firm and the successful handling, care and operation. He was born on January 17, 1893, at Galveston, Tex., and after graduation from the public schools entered Purdue University, Lafayette, Ind., where he remained for three years, at the end of which time he entered the service of the Pennsylvania at Fort Wayne, Ind., as a special apprentice in the shops of that road. The following year he returned to Purdue University, graduating from that institution as a mechanical engineer in June, 1915. In the fall of the same year he entered the employ of the Atchison, Topeka & Santa Fe in the test department where he remained until December, 1917, at which date he was commissioned a second lieutenant in the ordnance department of the United States army and sent to France. On February 13, 1919, he received his honorable release from the service and returned to the testing department of the Atchison, Topeka & Santa Fe, which position he held prior to his appointment as service engineer of Mudge & Co. on May 1.

E. R. Gordon

**Paul H. Schatzmann**, foreign representative of the **Joseph T. Ryerson & Son Company**, sailed for Rio de Janeiro, Brazil, April 10, to take charge of the company's interests in Brazil, Argentina and Peru temporarily. In August Mr. Schatzmann will sail for Europe, thence to India, China and Japan. **A. L. G. Gentles** will establish headquarters in London to take care of the interests of this firm in Great Britain and Scandinavia and will leave the United States in May.

The incorporation of the firm of **Oscar F. Ostby & Co.** is announced with **Oscar F. Ostby** as president with office, as hitherto, at 1044 Grand Central Terminal, New York. The new company will continue to handle the lines of railway supplies hitherto handled by Mr. Ostby, and in addition Mr. Ostby has been appointed exclusive railway distributor for **Davidson high speed steel and tools**, manufactured by the **Davidson Tool Manufacturing Corporation**, New York.

The **Clark Equipment Company**, manufacturers of "Celfor" drills and precision tools, has just completed a modern hospital at its plant in Buchanan, Mich. The hospital is intended primarily for the use of employees, but is also open to citizens of the community at cost. It contains private rooms and wards, modern operating and x-ray rooms, sterilizers and laboratory equipment. The operation of the hospital is directed by the **Clark Hospital Association**, a volunteer organization of employees and residents.

**John Stevenson, Jr.**, Sharon, Pa., has acquired a controlling interest in the capital stock of the **Standard Car Construction Company** at Masury, Pa. Mr. Stevenson has purchased the holdings of **Bioren & Co.**, bankers and brokers of Philadelphia, and the holdings of other Philadelphia stockholders. The **Standard Car Construction Company** is capitalized at \$1,400,000, and the original plant was built three years ago. Since then it has been substantially enlarged. When working at capacity it employs 700 men and has a daily production of 20 tank cars.

### Surplus Military Railway Equipment in the United States

The War Department has given out the following statement of the amount and value of property on hand or on order available for sale. The figures are as of May 1.

The locomotive and raised pier cranes will be turned over to the Railroad Administration, by arrangement with the director general of railroads, for sale to the railroads.

	Number	Average unit cost	Total cost
Standard gage locomotives.....	197*	\$38,275	\$7,540,175
Standard gage cars—			
Box .....	75	\$2,650	\$198,750
Gondolas, high side.....	8,600	2,237	19,235,475
Gondolas, low side.....	2,850	2,159	6,153,750
Flat .....	479	1,959	938,361
Tank .....	400	2,738	1,095,200
Total .....	12,404†	\$2,227	\$27,621,536
Locomotive cranes—			
10-ton .....	38	\$12,400	\$471,200
15-ton .....	101	18,992	1,918,226
20-ton .....	13	19,699	256,092
25-ton .....	15	26,475	397,122
30-ton .....	6	25,700	154,200
35-ton .....	4	34,132	136,528
50-ton .....	18	32,865	591,570
Total .....	195‡	\$20,128	\$3,924,938
Raised pier cranes—			
10-ton 2.4 meter gage.....	15	\$16,884	\$253,260
10-ton standard gage .....	10	21,700	217,000
15-ton 2.4 meter gage .....	9	20,300	182,700
Total .....	34‡	\$19,205	\$652,960

‡Forty-six not yet delivered.

Under the arrangement with the Railroad Administration the director general will use every effort to dispose of the property to the several railroads at market prices at the time and place at which disposition is made. The incidental expenses incident to the care of the material are to be taken from the proceeds of the sale.

This arrangement also covers the transfer of all 80-pound A. R. A. type B. rail which has been declared surplus by the War Department and about 1,366 tank cars purchased by the Ordnance Department, 100 twelve-yard and 1,320 twenty-yard side dump cars, all of which are fitted to comply with **Master Car Builders' and Interstate Commerce Com-**

mission standards. In the event of termination of federal control of the railroads before this material is entirely disposed of, the material remaining at the time is to revert to the War Department's possession but in all cases where the material has been sold by the Railroad Administration on the deferred payment plan the War Department will protect such arrangements after the federal control of the railroads ceases.

This entire transfer covers approximately \$18,000,000 worth of material. The distribution of the property to the railroads will be handled by the director of the Division of Purchases.

The sales of surplus supplies by the department of military railways, as reported to the director of sales up to April 25, amounted to \$71,104,130, of which \$68,993,837 represented rolling stock. The prices received represented the actual original cost.

The **Blaw-Knox Company** has taken over the manufacture and field operation of the Uni-Form system of reinforced concrete floor and roof construction, and the Uni-Form system is now incorporated in the Steel Forms department of the Blaw-Knox Company and will be known as "Blaw-forms." **Nils F. Ambursen**, chief engineer of the Ambursen Hydraulic Construction Company, and the developer of the Ambursen dam, assumes the duties of chief engineer of the Building Form department of the Blaw-Knox Company, and **W. L. Church**, formerly of Westinghouse, Church, Kerr Company, and Lockwood, Greene & Co., engineers, is retained as consulting engineer on the operation of the Uni-Form system.

The **Detroit Seamless Tubes Company** has begun the construction of a new plant, in Detroit, Mich., which it is estimated will cost \$3,000,000, on a tract of 66 acres. The plant will be equipped with the latest types of modern labor saving devices and machines. The first section, costing \$1,000,000, will be completed by January 1, 1920, at which time the company will move from its present place of business at West Jefferson avenue and Nineteenth street, Detroit. A subdivision will be created in the vicinity of the building and 150 houses erected for workmen of the company. The entire construction and financing of these homes will be done by the company to assist its employees in their housing problems.

The following changes in the organization of the **Western Electric Company**, New York, will become effective on June 1; **J. M. Skinkle**, formerly in the engineering department, has been appointed assistant manager of the government department with headquarters at New York; **J. A. Pizzini**, sales manager at New York, has been appointed assistant manager at the same place; **W. J. Drury**, until recently manager of the Cleveland branch, has been appointed sales manager at New York, to succeed Mr. Pizzini; **A. M. Collins**, formerly sales manager at the Detroit office, succeeds Mr. Drury as manager of the Cleveland branch, and **A. R. Maynard**, until recently connected with the sales department in Chicago, has been appointed sales manager at Detroit, succeeding Mr. Collins.

**The Safety Car Heating & Lighting Co. Elects New Officers**

At the annual election by the board of directors of the Safety Car Heating and Lighting Company, **W. L. Conwell** was made president of the company; **J. A. Dixon**, **Randolph Parmly** and **James P. Soper**, vice-presidents; **C. W. Walton**, secretary and treasurer; **Wm. Stewart**, assistant secretary and assistant treasurer. Mr. Conwell came with the company January 1, 1916, as assistant to the president. Upon the death of **R. M. Dixon**, former president of this company, October 16, 1918, Mr. Conwell was made acting president.

At the annual stockholders' meeting, held on May 8, **F. F. Fitzpatrick**, president of the Railway Steel Spring Company, was elected to the board of directors. The board of directors is now made up of the following: **Chellis A. Austin**, president, Mercantile Trust Co.; **Robert Barbour**, president, Barbour Flax Spinning Co.; **E. M. Bulkley**, **Spencer Trask & Com-**

**pany**; **Henry R. Carse**, president, Submarine Boat Corporation; **W. L. Conwell**; **J. A. Dixon**; **F. F. Fitzpatrick**, president, Railway Steel Spring Company; **E. LeB. Gardner**, president, New Jersey General Security Co.; **A. B. Hepburn**, chairman, advisory board, Chase Natl. Bank; **R. Parmly**; **G. D. Pope**, capitalist; **Alex. C. Soper**, capitalist; **Henry H. Wehrhane**, **Hallgarten & Company**, and **Jas. P. Soper**, president, **Soper Lumber Co.**

**Vauclain Succeeds Johnson as Head of Baldwin Locomotive Works**

**Alba B. Johnson**, president of the Baldwin Locomotive Works, has resigned from that position and has been succeeded by **Samuel M. Vauclain**, hitherto senior vice-president.

A. B. Johnson

Mr. Johnson, who had been contemplating the step for a considerable time, presented his resignation at a special meeting of the board of directors in Philadelphia, May 9. He will retain his extensive interests in the company and will remain a director. In connection with the resignation and the election of Mr. Vauclain as president, there were rumors of friction between different interests in the company, but the existence of such friction has been emphatically denied by Mr. Johnson and Mr. Vauclain alike.

Following the meeting of the board of directors, Mr. Johnson issued a statement in which he explained that he had desired to withdraw from the presidency of the company in order to devote his time to his extensive personal and public interests and in which he expressed his wishes for the success of Mr. Vauclain. The statement said:

S. M. Vauclain

"For a long time I have contemplated a withdrawal from active business to be free to devote myself to matters of personal and public interest. For a time it seemed desirable to postpone this until the business and resources of the Baldwin Locomotive Works could be more firmly established. When the war broke out in Europe, and especially when our country engaged in war it became

a patriotic duty to continue until assured that the war was over.

"Peace has now come and the financial strength of the works has been placed upon an assured basis. I feel that the time has now arrived when my responsibility to the stockholders can be laid aside without prejudice to any interest which has been confided to me.

"My connection with these works has extended now over the whole of the lifetime which I can remember. My father entered the employ of **Mathias W. Baldwin & Co.** in the spring of 1863, and continued in it for 29 years until 1892. My own service began May 14, 1877, forty-two years ago, and the entire energies of my active business life have been de-

voted to upbuilding the properties and reputation of the works.

"The extent to which this has been accomplished is a source of pride and gratification. It has not been the work of any one man. Our honored predecessors laid the strong foundation on which we have builded, and the structure that has been raised upon those foundations is the work of many. I hope that what has already been accomplished may be only the beginning of their growth and prosperity in the future.

"To Mr. S. M. Vauclain, with whom I have been associated so long, and who succeeds me as president, I wish all possible success and I hope that he will enjoy the same measure of co-operation and loyalty that has been given me through all these years."

Mr. Vauclain declined to issue any statement, but said in answer to a question that there would be no change in the policy of the company.

Mr. Johnson has been connected with the Baldwin Locomotive Works since 1877 and its president since 1911. He was born at Pittsburgh, Pa., February 8, 1858, and upon his graduation from the Central High School of Philadelphia entered the employ of Burnham, Parry, Williams & Co., as the present Baldwin Locomotive Works was then known, as a junior clerk in May, 1877. On the advice of John H. Converse he studied stenography and then for about 20 months was in the employ of William Sellers of the Edge Moor Iron Works, Wilmington, Del. Upon returning to the Baldwin Works he became secretary to Mr. Converse and served in that capacity for 33 years, gradually working up in the company and taking over Mr. Converse's work. In 1896 he was made a partner in the firm of Burnham, Williams & Co., as the firm had then become known, and was in charge, first of sales and later, on the withdrawal of George Burnham, Jr., of sales and finances. Upon the incorporation of the company under the name of the Baldwin Locomotive Works on July 1, 1909, he was elected vice-president and treasurer and succeeded to the position of president on July 1, 1911.

In the period in which Mr. Johnson was president the company had what may truly be called a phenomenal growth, its gross sales having increased from a total of \$29,000,000 in 1912, the first full year after he became the head of the company, to over \$98,000,000 in the year ended December, 1918. The total undivided profits over the same period increased from \$4,470,000 in 1912 to \$5,752,000 in 1918, while in 1917 a total was reached of \$8,306,000, excluding the return from the Standard Steel Works Company and the Southwark Foundry & Machine Company.

Mr. Johnson has extensive personal and public interests, and is one of the country's leaders in export trade. He is president of the Railway Business Association; a member of the National Foreign Trade Council, having acted as president of all the National Foreign Trade Conventions with the exception of the one in Cincinnati last year; president of the Pennsylvania State Chamber of Commerce; vice-president of the Philadelphia Chamber of Commerce. In addition to these he was formerly president of the American Manufacturers' Export Association and is now acting president of the Jefferson Medical College and Hospital and a leading member in a number of other organizations.

Samuel M. Vauclain, the new president of the Baldwin Locomotive Works, has been connected with the company or its predecessors since 1883, and its senior vice-president since 1911. He entered the employ of the plant in 1883 as a foreman. In November, 1885, he was promoted to superintendent of equipment, and in 1886 was advanced to general superintendent. He became a member of the firm of Burnham, Williams & Co., in 1896 and in 1911 was elected a vice-president of the Baldwin Locomotive Works. It is through his work as manager of operations in the Baldwin Works that Mr. Vauclain is generally recognized as one of the leaders in shop management in the country.

Mr. Vauclain's greatest work, however, was during the war, not only in connection with the work of the Baldwin Locomotive Works in supplying locomotives for the allied armies overseas, but also in connection with the great shell making plant of the Eddystone Munitions Company at Eddystone, Pa. Mr. Vauclain was on a number of occasions

called into consultation with various of the allied governments and so well was his work regarded that he was made a chevalier of the Legion of Honor by the French Government. In connection with our own part in the war, he served with the Council of National Defense, first in an advisory capacity and later as chairman of the committee on ordnance and as chairman of the committee on cars. After the War Industries Board was organized he became chairman of that body's special committee on plants and munitions and was also the head of the committee of car and locomotive builders.

### General Miller Heads New Oil Company

General Charles Miller, of Franklin, Pa., is to assume the chairmanship of the board of directors of the Home Oil Refining Company of Texas, on June 1. General Miller occupies

General Charles Miller

a unique position in the history of American railroads. He was the first man to recognize the great importance of scientific study of oil and lubrication problems in transportation, and he taught the railroads the best ways and means to efficient economical use of lubricating oils. Prior to 1869 the railroads began using what was known as pure West Virginia oil (a mineral oil from 28 to 29 gravity with a cold test of 10 below zero and a fire test of 175). This oil displaced all the fatty oils and tallow previously in use. In July, 1869, General

Miller formed a partnership with three associates and began to manufacture an oil in all appearances like pure West Virginia oil and meeting the same tests. The product was, however, superior because of the addition of certain materials. The company made a specialty of supplying railways with cylinder, engine and freight car oils. General Miller studied the subject of railway lubrication in all its aspects. His company was the first to formulate a plan of furnishing railway oils under contracts guaranteeing the cost per thousand miles on locomotives and freight cars. It was the first to organize a department of lubrication experts, whose services were given to the railroads, teaching all ranks of employees how to use oil economically.

In 1878 the Galena Signal Oil Company was shipping 12,000 barrels per year, supplying about 15 per cent of the railroad mileage in the country. In 1918 its product was said to be standard upon approximately 98 per cent of the entire railway mileage of the United States and Canada, with a large export trade to France and South America. With the advent of electric railways the company developed special oils to meet their requirements, making contracts on the same basis which had proved so satisfactory to the steam railroads. Not only did the company furnish lubricants to the railways but also signal oil, long time burner oil, headlight oil and other illuminating oils.

General Miller severed his connection with the Galena Signal Oil Company some months ago because of differences of opinion as to policy. The Home Oil Refining Company which he is to head as chairman of the board has large oil contracts covering a production of 7,500 barrels per day in the Ranger and Burkburnett (Texas) fields. It also holds leases on approximately 200,000 acres of oil lands exceptionally well located and now in process of development. The company owns a refinery at Yale, Oklahoma, now operating at 2,500 barrels daily capacity. It is constructing a large refinery at Fort Worth which will be in operation in a few weeks. Nearly 600 men are now engaged in the construction work on the site of 165 acres located on the St. Louis-San Francisco Railway in the outskirts of Fort Worth. Recently the Home Oil Refining Company purchased a convenient site of 50 acres at Franklin, Pa., for the erection of a large plant to be devoted to the production of railroad oil.

In assuming the chairmanship of the Home Oil Refining Company of Texas, General Miller heads an organization which covers the entire field of oil production, manufacture and sales. The present list of officers and directors of the Home Oil Refining Company, is as follows: President, **W. M. Babcock**, formerly Mid-Continent manager of the Humble Oil & Refining Company; operating vice-president and general manager, **M. A. Isaacs**, Tulsa, Oklahoma; assistant operating vice-president and general manager, **John B. Given**, formerly associated with General Miller in the Galena Signal Oil Company; vice-president, **Sam Davidson**, Fort Worth; vice-president, **William Churchill**, formerly sales manager of Corning Glass Works; treasurer, **Benjamin J. Tillar**, Fort Worth; secretary **Harry M. Bronner**, New York. The board of directors headed by General Charles Miller, as chairman, consists of the officers of the company and nine other members of whom the following have already been appointed: **W. C. Stripling**, Fort Worth; **Sam Levy**, Fort Worth; **G. H. Golvin**, Fort Worth; **Paul D. Langdon**, New York.

## Westinghouse Company Establishes

### Memorial Scholarships

As a war memorial to the more than 8,000 employees of the Westinghouse Electric & Manufacturing Company who have entered the service of the government in the war, the company has decided to establish a number of technical scholarships. The details of the plan by which this will be done have been given out by President **E. M. Herr** as follows:

Four War Memorial Scholarships will be established each year under the following general conditions:

(a) Candidates will be limited to sons of employees of the Westinghouse Electric & Mfg. Company and its subsidiaries, who shall have been employees in good standing for a period of five years.

(b) Two of such annual scholarships may be open to the younger employees of the company or its subsidiaries who have been in their service for a period of at least two years and who do not exceed the age of 23.

(c) The selection is to be determined by competitive examination, to be conducted annually by the company's educational department under the direction of the committee hereinafter provided. The examination is to take into account not only the applicant's academic training and preparedness, but due consideration will be given to personal qualifications, general character and aptitude.

(d) Scholarships will entitle the successful candidate to pursue a four year's course in any technical school or college that he may select with the approval of the committee. The scholar may pursue a course in any branch of engineering that he may select.

(e) Scholarships will be granted for one year only but will be continued for the full four years provided the scholar pursues a course in any branch of engineering that he may select.

(e) Scholarships will be granted for one year only but will be continued for the full four years, provided the scholar maintains the academic and other standards required by the college or institution in which he elects to pursue his course of study.

(f) Each scholarship carries with it an annual payment of \$500, to be made in two installments and the number of new scholarships will be four each year.

(g) The company will establish a memorial scholarship committee consisting of three vice-presidents of the company, to whom shall be referred the names and records of the candidates, and who will select therefrom the four successful persons who, in its judgment, have most satisfactory met the tests applied. The said committee will also be charged with the duty of establishing the detailed rules and regulations and such other matters of administration as have to do with this particular matter.

It is the intention of the company to continue these memorial scholarships from year to year but the company reserves the right to recognize changing conditions and to modify the plan or discontinue it entirely if, in its judgment, it seems wise and expedient to do so.

## Trade Publications

**CROSSING FROG COSTS.**—The International Steel Tie Company, Cleveland, Ohio, has issued a folder describing the crossing foundations manufactured by that company, and giving a list of the railroads which have used these foundations and an exposition on the economies accruing from the use of this construction.

**CABLEWAYS.**—The Lidgerwood Manufacturing Company, New York, has issued a 10-page booklet describing its various types of cableways and transfers for storing and reclaiming coal, handling ashes and similar materials. These include the stationary cableway, the traveling cableway, the radial cableway and Lidgerwood transfer. All of these types are illustrated by means of diagrams showing clearly the character of work performed by each type. Three pages of the booklet are devoted to particular installations.

# Financial and Construction

## Railway Financial News

**BOSTON & MAINE.**—James L. Doherty of Springfield, Mass., and the other trustees named in the government's dissolution suit against the New York, New Haven & Hartford have petitioned the Federal District Court to extend until July 1, 1921, the time to sell the stock of the Boston & Maine. There are 251,480 shares of the preferred stock of the company and 250,254 shares of the common stock that must be sold. In their petition the trustees assert that since the date of their appointment the financial condition of the Boston & Maine has been such that it has been impossible to dispose of these large quantities of stock without a great and unreasonable sacrifice.

**CANADIAN NORTHERN.**—William A. Read & Co. are offering an issue of \$7,500,000 6 per cent equipment trust certificates at prices yielding from 5½ to 6 per cent. The certificates are issued against new railway equipment costing \$10,724,705, the company making an initial payment of \$3,224,705, or 30 per cent of the cash contract cost.

**DELAWARE & HUDSON.**—President L. F. Loree told stockholders at their annual meeting on Tuesday that maintenance of way has been inadequate both as to quality and quantity in the year just passed. He said in part: "The President, in taking over your property, gave assurance that your property would be maintained during the period of federal control in as good repair and as complete equipment as when it was taken over by the government." In the matter of locomotive power you need feel no present apprehension. Your shop equipment is ample and it has been used to keep in repair not only your own locomotives, but as well some owned by connecting lines. The situation in regard to your freight cars is not so reassuring. Where, as formerly, the great majority were on your own rails, and the balance were returned thereto at frequent intervals, now nearly 90 per cent are on foreign lines. No clear idea can be had of their condition. During the past year 131 freight cars were dismantled by the Railroad Administration for various causes, and none of these vacancies has as yet been filled. In the matter of maintenance of way there has been a serious falling off in the application of material."

**NORFOLK & WESTERN.**—Bernhard, Scholle & Co., the Bankers Trust Company of New York and the Union Trust Company of Pittsburgh are offering for subscription, at the market, \$2,500,000 Norfolk & Western convertible ten-year 6 per cent bonds dated September 1, 1919, and maturing September 1, 1929. They are a part of a total authorized and outstanding issue of \$17,945,000 represented by subscription receipts exchangeable on September 1, 1919, for definitive bonds and are convertible at par into common stock of the company at the option of the holder at any time between September 1, 1919, and September 1, 1929.

## Railway Construction

**CHICAGO & NORTHWESTERN.**—Work has been authorized and will be started at an early date upon the construction of a new passenger station at Clinton, Ia. The new structure will be of brick, one story high, 28 x 287 ft., with a tile roof and a concrete substructure. A small power house, 47 x 57 ft., one story high, of brick construction will be built in conjunction with the new station and the total cost with necessary improvements will be approximately \$250,000. The contracts for the work have not been let.

Chicago & North Western is completing an addition to its division shops at Kaukauna, Wis., to be used exclusively for the production and compression of acetylene gas for welding and cutting tools used at its various shops in central and northern Wisconsin, heretofore supplied from Chicago. These new plants and equipment represent an investment of about \$5,000.

## Railway Officers

### Railroad Administration

#### Regional

The office of **E. J. Henry** supervisor of rail-and-lake traffic, with jurisdiction over the Lehigh Valley Transportation Line and the interchange of business of other lake lines with railroads of the United States Railroad Administration, has been transferred from Buffalo, N. Y., to Chicago, Ill. (La Salle Street Station).

#### Federal and General Managers

**N. L. Howard**, until recently colonel in command of the Thirtieth Engineers (Railway) regiment and formerly division superintendent on the Chicago, Burlington & Quincy, with headquarters at Hannibal, Mo., has been appointed assistant to the federal manager of this road, with headquarters at Chicago.

#### Operating

**John F. Clark**, trainmaster on the Northern Pacific, with headquarters at Missoula, Mont., has resigned.

The headquarters of **F. W. Kelsey**, superintendent of the Chattanooga division of the Nashville, Chattanooga & St. Louis, have been moved from Nashville, Tenn., to Chattanooga.

**R. E. Hoard**, trainmaster on the Champlain division of the Delaware & Hudson, at Plattsburg, N. Y., has been transferred to the Saratoga division, with headquarters at Albany, vice **L. A. Crouse**, assigned to other duties, and **J. J. Rounds**, assistant trainmaster on the Saratoga division, with headquarters at Albany, succeeds Mr. Hoard.

#### Financial, Legal and Accounting

**H. A. St. John**, auditor of the Lake Superior & Ishpeming and the Munising, Marquette & Southeastern, with headquarters at Marquette, Mich., has been promoted to acting federal auditor, with the same headquarters. **G. F. St. John**, cashier of the same lines, with headquarters at Marquette, has been promoted to acting federal treasurer, with the same headquarters.

#### Traffic

**B. C. Prince**, assistant to traffic manager of the Seaboard Air Line, at Norfolk, Va., has been appointed assistant traffic manager, and the position of assistant to traffic manager has been abolished.

**L. B. Burford**, assistant to general traffic manager on the Erie, at Chicago, has been appointed assistant general freight agent on the Erie Railroad Lines—Buffalo, Salamanca, N. Y., and east thereof, with office at New York, N. Y.

**G. C. Manning**, assistant general freight agent of the Erie, with headquarters at Youngstown, Ohio, has been transferred to Chicago. He succeeds **G. J. Vizard**, who has resigned to engage in other business; **D. L. Wells**, division freight agent at Meadville, Pa., succeeds Mr. Manning, and **E. W. Vail** succeeds Mr. Wells.

#### Engineering and Rolling Stock

**S. A. Chamberlain** has been appointed superintendent of motive power of the Lake Superior & Ishpeming and the Munising, Marquette & Southeastern, with headquarters at Marquette, Mich.

**J. D'Esposito**, assistant chief engineer of the Chicago Union Station Company, Chicago, has been promoted to chief engineer, effective May 1, succeeding **Thomas Rodd**, who has been appointed consulting engineer.

**R. L. Schmid** has been appointed assistant division engineer of the Nashville, Chattanooga & St. Louis, with office at Nashville, Tenn., vice **J. L. Fergus**, who has been appointed assistant engineer. The headquarters of **D. E. Counts**, supervisor of bridges and buildings, have been moved from Atlanta to Chattanooga.

**T. J. Cutler**, general master mechanic on the Northern Pacific, with headquarters at St. Paul, Minn., has been transferred to Livingston, Mont., with jurisdiction over the lines from Mandan, N. D., to Paradise, Mont., succeeding **C. E. Allen**, whose appointment as general master mechanic of the lines east of Mandan, N. D., was noted in the *Railway Age* of May 9.

**J. J. Corcoran**, assistant engineer on the New York Central, with headquarters at Albany, N. Y., has been promoted to chief signal inspector East of Buffalo, N. Y., with the same headquarters. Mr. Corcoran will act as a general field assistant to the engineer maintenance of signals and give special attention to the maintenance of relays, signal mechanisms and storage batteries. A graduate of the Worcester Polytechnic Institute, Mass., Mr. Corcoran entered the service of the New York Central as signal helper at Buffalo in June, 1911, since which time he has been, consecutively, assistant maintainer, maintainer, maintenance inspector and construction inspector, draftsman, chief draftsman and assistant engineer.

### Corporate

#### Executive, Financial, Legal and Accounting

**Charles C. Rose** has been elected corporate treasurer of the Spokane, Portland & Seattle, the Oregon Trunk, the Oregon Electric, and the United Railways Company, with headquarters at Portland, Ore., vice **Paul McKay**, resigned to accept service with the United States Railroad Administration.

#### Operating

**A. L. Smith** has been appointed superintendent of the Toronto (Can.) Union station, succeeding **J. J. Beck**, deceased.

#### Traffic

**John Bickel**, commercial agent of the Duluth, South Shore & Atlantic, with headquarters at Chicago, has resigned to enter the employ of the Canadian National as traveling agent, with headquarters at Chicago.

**H. L. Blackstone**, general agent of the Sacramento Northern, at San Francisco, Cal., has been promoted to assistant general freight agent in charge of solicitation, with headquarters at Sacramento, Cal., and the office of general agent at San Francisco has been abolished.

**M. A. Thomson**, division freight agent of the Canadian National Railways at Ottawa, Ont., having resigned, **George Collins**, special representative of the freight traffic department, will also, until further advised, assume the duties of acting division freight agent, with office at Ottawa, Ont.

### Obituary

**Thomas W. Barrett**, terminal trainmaster on the Pittsburgh district of the Baltimore & Ohio, with headquarters at Glenwood, Pa., was killed in a derailment on May 9.

**P. C. Eldredge**, formerly general superintendent of the Chicago, Milwaukee & St. Paul, died at his home in Oconomowoc, Wis., on May 8, at the age of 63 years. Mr. Eldredge was born in Sharon Springs, N. Y., in 1856 and entered railway service on October 1, 1879, as an operator on the Chicago, Milwaukee & St. Paul, with which road he served 39 years as chief dispatcher, trainmaster, division superintendent, assistant general superintendent and general superintendent, which position he held until August 1, 1918, at which time he resigned to accept a position with the Carnation Milk Products Company, Chicago.

### Opening of Our London Office

THE SIMMONS-BOARDMAN Publishing Company, publisher of the *Railway Age*, has opened a new office at No. 85 Fleet Street, London, England. It has been placed in charge of Robert E. Thayer, who becomes European editor of all the publications of this company, including the *Railway Age*, the *Railway Mechanical Engineer*, the *Railway Maintenance Engineer*, the *Railway Electrical Engineer* and the *Railway Signal Engineer*.

Mr. Thayer, until his recent transfer to London, was located in our New York office and was mechanical department editor of the *Railway Age* and managing editor of the *Railway Mechanical Engineer*. The imperative necessity that the publications of this company should be represented in Europe by a member of our own editorial staff was created largely by the war. As a result of the war the people of the United States, including the officers of railways and of railway equipment and supply concerns, have become keenly interested in foreign economic and industrial affairs. The railway developments in foreign countries will in future be especially interesting to our American readers. While the people of this country are engaged in solving their railroad problem they will be interested in what the people of other countries are doing with their railroad problems. The war almost stopped the development and caused the deterioration of railways throughout the world and especially in Europe, and this has opened up a large foreign market for American railway equipment and supplies. It is believed that the *Railway Age* and other publications of this company can render an important and valuable service to the railway and the railway supply industries of the United States by furnishing to them full, up-to-date and correct information regarding the conditions of and developments on railways in other countries.

Mr. Thayer has a technical education, a railroad training and a ripe journalistic experience. We have located him in London because it is the best point in Europe from which to gather information regarding foreign railways. But London will be merely his headquarters, and he will travel extensively in Europe in quest of the kind of material which will be of interest and value to our readers and patrons.

Mr. Thayer was graduated from the Massachusetts Institute of Technology in June, 1907. For some time he was employed by the American Locomotive Company as special apprentice and in the calculating department at Schenectady. He then entered the service of the Boston & Maine in the test department and was later instructor in mechanical engineering at the Massachusetts Institute of Technology. He became connected with the *Railway Age* editorial staff in January, 1911.

Frank McManamy, the assistant director of the Division of Operation, is to be congratulated upon the letter which he

### Getting the Most Out of the Conventions

has sent to the regional directors and which was noted in our issue of May 9, page 1161, suggesting that they urge the roads to send as many representatives as possible to the June mechanical department conventions, and also suggesting that each member below the rank of superintendent of motive power should render to his superior a written report of those things which specially attracted his attention at the convention and appeared to him to be of value to his particular road. The railroads have not been getting as much from the various conventions as they should, simply because they have not been prepared to take advantage of them in a scientific way. There is no question but what the larger number of officers who have gone to the conventions have earnestly tried to make the best use of their time. There is an added incentive, however, in going to the meetings with a definite object in view and of having to prepare a report in writing on new practices that may have been described or suggested at the meetings or of noteworthy devices in the exhibit. Then, too, there is the added importance of informal discussions with men holding similar positions coming from all over this country. It is now up to the mechanical department officers to do their part in earnestly trying to make the best possible use of their time in Atlantic City and of demonstrating to their superior officers that the investment in time and money is well merited. The Railway Supply Manufacturers' Association is planning on co-operating in this movement by arranging for a supply of note books specially adapted to the convenience of railroad officers in making notes.

Railway officers and railway supply men alike are vitally interested in the attitude which Congress will take toward

### Stagnation in Improvement Work

the railway problems that are presented to it for solution. The first and most pressing problem is that of passing the deficiency appropriations to enable the Railroad Administration to meet its obligations already contracted and to proceed with the expenditures necessary for the proper maintenance, improvement and operation of the roads. At no time in the history of American railways has the development of our transportation facilities to meet increasing demands been so nearly at a complete standstill as within recent weeks. Less than forty million dollars worth of improvement work chargeable to additions and betterments was authorized during the first four months of this year, or only a fraction of the appropriations normally made at this season. After deducting almost one third of this amount for supplementary appropriations for work done last year and which exceeded the authorizations and an equal amount for work done last year without authority, it appears that less than fifteen million dollars worth of improvement work has been authorized for completion this year and this is confined very largely to the construction of industry tracks tending to develop new traffic and other small improvements. The roads were also permitted to proceed with approximately four hundred million

dollars worth of work authorized last year and carried over. This work is being finished at the rate of about 10 per cent per month or at a rate much greater than that at which new work is being undertaken. Therefore, unless additional work were authorized it would be a matter of only a short time until the development of our railway facilities would almost entirely stop. The history of our country has shown that the demand for transportation is always increasing except during short intervals of time, therefore the dam which has been created artificially must be broken and in the very near future. When broken, the stream of improvement work should be greater than normal in order that the facilities may catch up with the demands made upon them.

## Financing the Standard Equipment Purchase

SOMETIME AGO the Railroad Administration suggested that the standard equipment, which was ordered under war conditions and is being allocated to the different roads in accordance with the judgment of the Administration, be paid for through the issuance of one joint block of equipment trust certificates. The railway executives have approved of this suggestion, and at the meeting of the standing committee of the Association of Railway Executives on Friday morning last, and later at the afternoon meeting of the association itself, this proposal was discussed at some length. Details of the plan have not as yet been worked out. The purchases of equipment by the Administration amount to about \$400,000,000. Some of the railroads have refused to accept that which the Administration has assigned to them. Others are in a financial position which would hardly permit of their issuing equipment trust certificates at a reasonable interest rate. Whether or not the equipment is required, it has been ordered and in part delivered and must be paid for.

The Railroad Administration has its hands more than full providing working capital for the railroads it is operating, and paying the rental due the corporations. Equipment trust certificates of railroad companies with sound credit are selling at comparatively high prices. These notes, running generally for ten years, and occasionally for 15 years, have a broad market. Whether this market is broad enough to absorb \$400,000,000 new certificates so soon after the sale of the government's short term notes, it is impossible to say. If the notes are issued under what is called the Philadelphia plan, title to the equipment will be vested in a trust company and the notes will be in the form of certificates of participation in a leasehold. If they are secured simply by a pledge of the equipment with a provision for the payment of interest and a part of the principal each year from the rental received for the use of the equipment, the security will be only fair even if 10 or 15 per cent of the cost of the equipment is paid in cash and the notes outstanding represent only 90 or 85 per cent of the cost. The equipment was purchased at abnormally high prices and there might be serious difficulty in persuading the roads to rent that which has been arbitrarily assigned to them.

On the other hand, if the notes are secured by the equipment and, in addition, are guaranteed jointly by the railroad companies, they will have the best of security and ought to sell at a high price compared with other short term notes in proportion to the rate of interest paid upon them. It would seem much better to have the railroad companies guarantee the notes than to have the government do so. A government guarantee might be an entering wedge for trouble after the roads are returned to their owners. The railroads will have to meet the interest charges in any case. No road will be putting a severe strain on its credit by participating in a joint guarantee of these notes.

## Four Things That Are Needed

CONGRESS MET in special session this week. It is expected to begin considering at once the legislation to be passed before the railways are returned to private operation. President Wilson has announced in his message that the railways will be returned to their owners at the end of the present year. There are at least four important things which must be done if the railways are to be returned to their owners under conditions which will enable private operation to succeed.

First, a larger part of the traffic must be got back to normal channels. Wholesale diversion of traffic was necessary while the railways were being operated primarily as an instrumentality for helping to carry on the war. Necessarily this diversion was done regardless of the effects upon individual lines. When traffic once has been turned into new channels it will not return to the old without special efforts being made to restore it to them. Of course, if there are to be wholesale changes in the ownership of the railways and they are to be grouped into entirely new systems before they are returned to private operation, it would serve no purpose to try at present to restore their traffic to the old channels. But probably there will be no wholesale changes in ownership before the return to private operation. If it becomes evident that there are not going to be, the Railroad Administration ought, in co-operation with the railroad corporations, to use its power to cause traffic to move as formerly. Otherwise some railway companies will profit enormously and some will be hurt greatly for a long time as a result of the diversions of traffic which have occurred.

Second, every effort should be made by officers of the Railroad Administration, and especially by the officers of individual lines, to increase the efficiency and economy of operation. The statistics of operation demonstrate beyond question that the railways are not being as efficiently and economically operated as they could be. There is a good deal of "passing the buck" between the managers of the individual lines and the officers of the Railroad Administration at Washington as to the reasons for this. One thing is certain, however, and this is, that if efficiency is to be restored it must be done mainly by the managers of the individual lines. It cannot be done by a few men located in Washington, however able they may be. The managers of the individual lines can do it only by each manager exercising his own initiative and using the methods and making the changes which he sees the local conditions on his own line demand. The managers of many lines say that whenever they begin to try to do this they get into trouble with some bureau or division in Washington. The officers of the Railroad Administration in Washington say the managers of the individual lines have all the authority they need. It is clear that the managers of the individual lines should exercise all the authority they possess in order to increase efficiency and that the central administration should interfere with them as little as possible. The present disparity between railway income and outgo is enormous. It is doubtful if an advance in rates sufficient completely to remedy it can be secured. A great increase in the efficiency and economy of operation is needed.

Third, rates should be advanced. While the efficiency of operation can and ought to be increased, no conceivable increase of efficiency and of traffic will be sufficient to make net earnings adequate. It is the duty of the Railroad Administration to ascertain how large the advance in rates should be and to make it before the railways are returned to private operation.

Fourth, constructive legislation should be passed by Congress, and its main purpose should be to assure to the railway companies the opportunity to earn a net return sufficient to enable them adequately to develop their facilities. Any

legislation which may be enacted will be practically valueless unless it contains provisions specifically directed to this purpose and skilfully adapted to accomplishing it. The greatest danger in the present situation is not that the railways will not be returned to private operation, but that they will be returned to private operation under conditions and laws which will make successful private management impossible. If, in spite of the experience of the last ten years, and especially the last two years, Congress is not ready now to adopt legislation which will enable the railways to be successfully operated and developed under private ownership, the conclusion will have to be accepted that government ownership sooner or later is inevitable, and that it will be better to accept it sooner rather than later.

## Cost of Reproduction in 1920

THE DIVISION OF VALUATION expects to complete its inventory of the railroads some time late in 1920, and judging by the preliminary reports on a few of the smaller roads which the division has made public, its final report to the Interstate Commerce Commission will consist essentially of figures regarding the cost of reproduction new, less depreciation, for each of the properties. The results presented thus far have been based on unit prices purported to be representative of conditions on June 30, 1914, and obtained in the main from an average of unit costs of work done during the five years 1910 to 1914, inclusive. Presumably these 1914 prices were selected because they afforded the latest information available at the inception of this momentous undertaking, and it has been contended that these same prices should, in fairness, be applied to all properties alike, regardless of the time that the inventories are completed.

Just what significance is to be placed in 1920 on a cost of reproduction based on unit prices applicable in 1914, has not been made clear. Although the valuation act does not so state, it is to be presumed that the data accumulated by the Division of Valuation are to be used for the placing of physical valuation on the railroads, and if a valuation so determined is to serve any useful purpose it must be based on evidence admissible at the time that the valuation is to be used. In other words, any estimate cost of reproducing property new on a given date must be obtained by applying the inventory quantities unit prices that are typical at that date. Unit prices selected in 1914, except as they represented the latest information available at the time the valuation work was started, will have no more real relation to the cost of reproduction in 1920 than the prices of 1904, or 1894, of any earlier year that might be arbitrarily selected.

Had there been no radical change in price levels in the years subsequent to 1914 this question would be of no particular importance, but actually there has been a most pronounced change. Four years of the European war have produced such an inflation of currency and other changes that the wages of labor and prices of many commodities probably average close to 100 per cent higher than in 1914, and economists hold out scant hope for any appreciable reductions from the present levels. In the words of Professor Irving Fisher of Yale University, "To talk reverently of 1913-14 prices is to speak a dead language today."

Notwithstanding these considerations, there are current references to a value of the railway properties of the United States in the neighborhood of seventeen billion dollars—a figure obviously based on past costs—whereas the use of present unit costs of labor and materials probably would produce a valuation fully 50 per cent higher than those of 1914. This must of necessity be the case if cost of reproduction, the only real fruit of the valuation division's labors, is to be a prime factor in placing a valuation on the carriers. This experience in the evaluation of the railroad properties has been a most illuminating object lesson regarding the use

of cost of reproduction as the principal factor in valuation. In five years' time, on the basis of cost of reproduction, the railroads have increased enormously in physical value—at least \$5,000,000,000 and probably much more—while their net earnings have woefully decreased. With continuing high prices the physical valuation would be maintained on the high basis due to high cost of reproduction, while with varying unit costs it would fluctuate up or down, and in a manner entirely independent of earning capacity. Of what use can such a valuation be in the establishment of rates? A valuation based on present unit costs certainly would not amount to less than \$22,000,000,000, while the book cost of road and equipment of the carriers is only about \$18,000,000,000, and their net capitalization only about \$17,000,000,000.

If the public still insists on basing rates on valuation and on basing valuation mainly on the cost of reproduction of the properties, the railway owners will hardly object, since the result would be to make the rates and net earnings far higher than any railway manager ever had the temerity to suggest. Spokesmen of the railways are modestly suggesting that the book cost of road and equipment be used as the basis for regulating future rates and earnings. The public would better accept this basis than go on with its valuation; for if the valuation is not used all the money spent in making it will be wasted; while if, as apparently is intended, the valuation is based chiefly on cost of reproduction, and if, as apparently must be done, up-to-date unit costs must be used, the valuation will be so enormous that its use as a basis for regulating rates and earnings would cost the public more than any other basis that could be used.

## Lehigh Valley

THE RESULTS of federal operation of the Lehigh Valley in 1918 were remarkably good. Total operating revenues amounted to \$65,587,000, an increase of \$12,228,000 over the previous year. Operating expenses amounted to \$57,346,000, an increase of \$15,520,000. This left, after the payment of rentals, etc., net income of \$6,821,000, a decrease of \$2,867,000, as compared with 1917. The government guarantee to the owning corporation is \$11,321,000. To say that the results of operation were good when the government fell behind earning the rental which it had to pay by \$4,500,000, seems rather a contradiction, but the totals of operating expenses and net revenue do not tell the whole story.

The total tonnage of all freight carried one mile amounted to 7,138,000,000 in 1918, an increase of 474,000,000 ton miles, or 7.11 per cent over the previous year. Nearly the entire increase was due to a greater tonnage of merchandise freight carried. The ton mileage of merchandise freight amounted to 4,033,000,000 in 1918, an increase of 12.65 per cent over the previous year. The revenue passengers carried totaled 7,630,000 in 1918, an increase of 6.91 per cent over the previous year, and since the average passenger journey was nearly 4 per cent longer, the passengers carried one mile totaled 270,000,000 in 1918, an increase of 10.85 per cent.

Transportation expenses, the out-of-pocket cost of moving the business, amounted to \$30,010,000, an increase of \$6,667,000, or between 28 and 29 per cent. Taking into consideration the increase in wages, this is not a particularly large increase in transportation expenses, even had the volume of business remained the same in the two years.

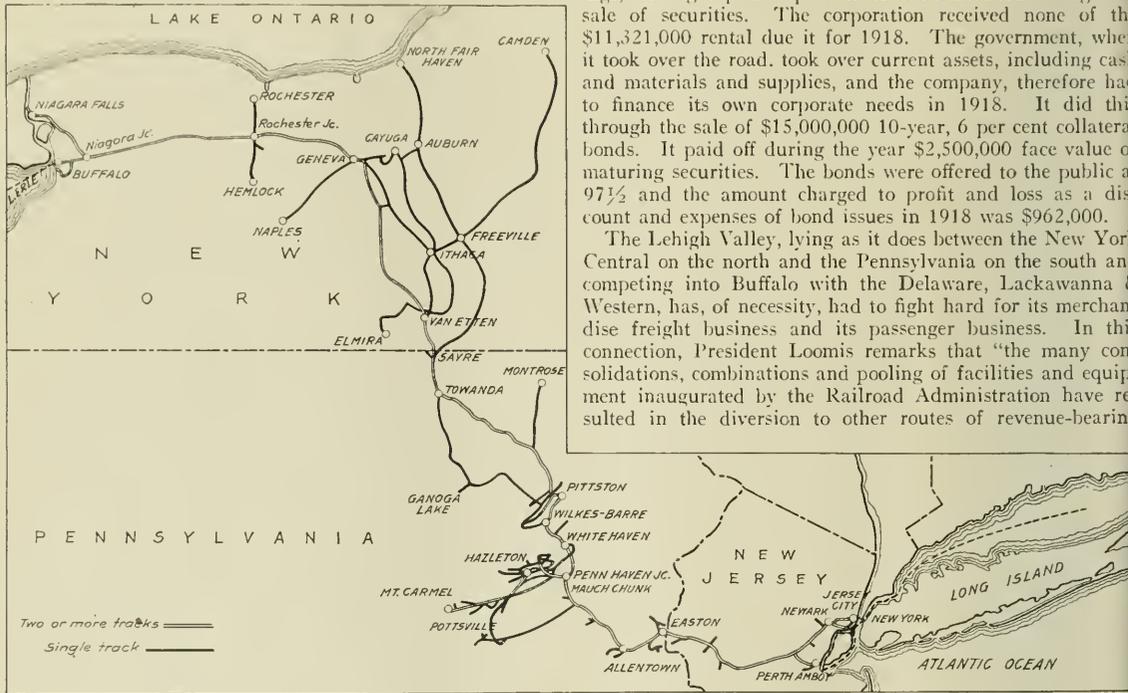

With an increase, however, of more than 7 per cent in the ton mileage of freight, revenue freight train miles totaled but 7,583,000 in 1918, a decrease of 10.25 per cent. The average train load, including company freight, was 920 tons in 1918, an increase of 143 tons, or more than 18 per cent over 1917. Traffic was not as well balanced in 1918 as in 1917, the percentage of loaded car mileage to total car mileage being 66.92 in 1918 and 68.65 in 1917. There was a large

gain in average car loading, the average number of tons of all freight per loaded car being 32.97 in 1918, comparing with 29.10 in 1917, a gain of 13.30 per cent. There was an increase in tonnage of anthracite and bituminous coal carried, the total tonnage of bituminous in 1918 being 4,726,000 tons and in 1917 3,785,000 tons and the total for anthracite being 15,523,000 in 1918 and 14,917,000 in 1917. The percentage of the total tonnage furnished by the different classes of commodities remained about the same; there was a slightly smaller proportion of anthracite, but this was balanced by a larger proportion of bituminous coal. As noted above, the ton mileage of merchandise freight increased very much more than the ton mileage of coal; the Lehigh Valley therefore evidently got a shorter haul on its coal in 1918 than in 1917, due probably to the effect of the zone system order, and got a much longer haul on the average on its merchandise freight. Under the zone order, the markets of the various coal mines

that the company has a larger equipment for its gross business and per mile of road, with one exception (as to per mile of road) than any other railroad in the eastern territory. It is a fact that the Lehigh Valley was one of the few coal roads in the eastern territory which was able to supply during the entire year 1917 a full quota of cars to its mine operators. This, of itself, is strong evidence of the amplitude of its car supply, and, with the falling off in output of both bituminous coal and anthracite that has taken place in 1918 and threatens to extend far into 1919, it is not strange that the Lehigh Valley stockholders hesitate to take on a capital charge of nearly \$10,000,000 for equipment which the government thought it was going to need.

The Lehigh Valley is in strongly competitive territory. It has been a particularly conservatively managed road for many years, although its 10 per cent dividends absorbed in the years prior to 1918 nearly the entire amount of surplus earnings, leaving capital expenditures to be financed through the sale of securities. The corporation received none of the \$11,321,000 rental due it for 1918. The government, when it took over the road, took over current assets, including cash and materials and supplies, and the company, therefore had to finance its own corporate needs in 1918. It did this through the sale of \$15,000,000 10-year, 6 per cent collateral bonds. It paid off during the year \$2,500,000 face value of maturing securities. The bonds were offered to the public at 97½ and the amount charged to profit and loss as a discount and expenses of bond issues in 1918 was \$962,000.

The Lehigh Valley, lying as it does between the New York Central on the north and the Pennsylvania on the south and competing into Buffalo with the Delaware, Lackawanna & Western, has, of necessity, had to fight hard for its merchandise freight business and its passenger business. In this connection, President Loomis remarks that "the many consolidations, combinations and pooling of facilities and equipment inaugurated by the Railroad Administration have resulted in the diversion to other routes of revenue-bearing

The Lehigh Valley

were restricted to territory situated within a comparatively short haul of the mine.

In 1917, 52 freight locomotives were bought and 23 two-wheel freight locomotives and 10 Pacific type locomotives were rebuilt. A part, therefore, of the remarkably good showing made in heavier train load may be credited to the new and heavier locomotives.

The federal administration spent \$7,818,000 for maintenance of way in 1918, comparing with \$5,353,000 spent in 1917; and the administration spent \$17,004,000 for maintenance of equipment in 1918, as against \$10,000,000 spent in 1917. This increase in maintenance of equipment costs looks exceedingly large.

The administration assigned 1,000 box cars, 1,300 coal cars, 500 low-side gondola cars, and 500 drop-bottom gondolas to the Lehigh, but the company has refused to accept this equipment, the cost of which is \$9,648,000. As President E. E. Loomis points out in his annual report to stockholders, 98 per cent of the freight cars of the Lehigh Valley are steel or steel underframe. President Loomis says

traffic which your company had enjoyed."

The following table shows the principal figures for operation of the property under federal management. This is not the income account of the corporation.

	1918	1917
Mileage operated .....	1,441	1,443
Anthracite freight revenue.....	\$21,225,341	\$18,201,495
Bituminous coal freight revenue.....	2,892,992	2,200,731
Merchandise freight revenue.....	29,155,590	22,705,556
Passenger revenue .....	6,234,935	4,894,990
Total operating revenues.....	65,586,769	53,358,446
Maintenance of way and structures..	7,818,030	5,353,466
Maintenance of equipment.....	17,004,251	9,999,610
Traffic expenses .....	654,982	1,013,395
Transportation expenses .....	30,009,870	23,343,165
Total operating expenses.....	57,346,025	41,826,166
Taxes .....	1,874,237	1,953,954
Operating income .....	6,364,382	9,575,996
Net income .....	6,821,130	9,688,471

CORPORATE INCOME ACCOUNT		1918
Rental from government.....		\$11,321,233*
Other corporate income.....		3,026,425
Gross income .....		14,347,658
Interest and rentals.....		7,754,824
Net income .....		6,592,834
Dividends .....		6,060,800
Surplus .....		532,034

\*No part of this rental had, up to the close of 1918, been received from the government.

# End of Year Set for Return of Railroads

## President Says They Will Be Handed Back to Owners and Congress Prepares for Permanent Legislation

WASHINGTON, D. C.

THE FLAT STATEMENT made by President Wilson in his message to Congress on Tuesday that "the railroads will be handed back to their owners at the end of the calendar year," creates at least one factor of certainty in the complicated railroad situation that has been lacking since December 26, 1917. The President spoke specifically and with authority because he is authorized by the federal control law to relinquish the roads "at any time he shall deem such action needful or desirable," although Congress could take away that power if it felt that more time should be allowed to work out its legislative solution.

While December 31 has been the date most commonly assumed for the termination of federal operation of the railroads, there have been some fears that the time of the transfer back to corporate control might be made dependent upon the degree of success attained by Congress in its efforts to enact legislation for the future regulation of the roads, and that the period of debate might thus be prolonged to extend into next year.

The President's statement, therefore, serves notice upon Congress, unless circumstances should be allowed to change his mind, or unless Congress should change the present law, that there is a time limit upon its endeavors if it is to act in season to accomplish the desired result of placing the country's transportation system on a secure foundation. It should also serve to induce some conservation of breath and words on the part of those who are inclined to wax rhetorical in demanding the return of private management without offering practical suggestions as to the conditions under which the companies are to be allowed to operate. The practical question is no longer "Shall the roads be returned?" or "When will they be turned back?" but, "How shall the transfer be effected with the least disturbance to the economic welfare of the country?"

The telegraph and telephone lines "will, of course, be returned to their owners as soon as the transfer can be made without administrative confusion," the President said; adding that if he were in immediate contact with the administrative questions which must govern the transfer he could name the date for their return also. Meanwhile he only suggested that in the case of the wire systems, "as in the case of the railways," it is "clearly desirable in the public interest that some legislation should be considered which may tend to make of these indispensable instrumentalities of our modern life a uniform and co-ordinated system which will afford those who use them as complete and certain means of communication with all parts of the country as has so long been afforded by the postal system of the government, and at rates as uniform and intelligible."

The President gave no further details of his ideas regarding the railroad situation, saying he hesitated to venture any opinion with regard to domestic legislation while out of daily touch with the problems, but in his latest previous statement on the subject, in his message to Congress in December, he said that the one conclusion he was ready to state with confidence was that "it would be a disservice alike to the country and to the owners of the railroads to return to the old conditions unmodified," because "those are conditions of restraint without development. There is nothing affirmative or helpful about them." As a general agreement with this sentiment has been expressed both within Congress and elsewhere, attention is now directed to the form of the modifications to be made in the old conditions, as the result

of the efforts of those of both conservative and radical views which will be brought to bear on the subject.

The President's statement may also be regarded as placing a definite period to the idea of an experiment with government operation, which, while ostensibly not a part of the purpose for which the railroads were taken over, was undoubtedly an active element in the celebrations of some of the men placed in charge of the transportation system last year. As a practical matter the experiment was ended when Congress tabled Mr. McAdoo's proposal for a five-year extension of government operation, which was then said to have been approved by the President. Mr. Hines, upon succeeding Mr. McAdoo in the office of director general, took up and supported for a time the ideas of his former chief as to the desirability of a further test of government operation, but he has not manifested any tendency to cry about spilt milk since it was made apparent that the public was not receptive toward the five-year plan. He has rather turned his attention to the complicated problems immediately before him and to formulating suggestions for a permanent reorganization of the railroads under private management. The transfer of the activities of the Railroad Administration from experimentation to the work of restoration and readjustment has been very perceptible and there has been more "railroading at home."

Announcement of a definite date for the return of the railroads brought great joy to many, if not most, of the railroad officers in the Railroad Administration organization, who have long been anxious for the opportunity to return to their homes and to their old jobs. While some may feel the loss of their present authority or may regret the passage of the opportunities for carrying out their ideas which operation of the roads as a single system afforded, most of them give an impression that they share in the feelings of the soldier who was more than willing to make any sacrifice for his country, but who wanted his discharge mighty quick after the armistice was signed.

Some of the members of the organization who are not railroad men may feel differently about the matter, because many of them are holding bigger jobs and receiving better pay than they ever have before. This is not true of most of the railroad men, and even when exercising a higher degree of authority, some of them have felt a certain circumscription while serving as parts of the huge governmental machine which they did not feel in their former positions.

The Republican leaders showed no disposition to quarrel with the President's announcement that he would return the roads. Senator Cummins expressed confidence that a bill could be passed before the end of the year but he predicted that if the bill is not passed by that time the roads would not be returned without legislation.

Chambers of commerce, boards of trade, and state legislatures and commissions are also expected to rejoice in the prospect of a return of the roads, but there is reason to believe that some of them are inspired by a desire to get the roads out into the open, from behind the protection of the federal control law, where they can get at them once more.

The Sixty-sixth Congress assembled in extra session on Monday, May 19, and after the preliminaries of organization prepared to take up as speedily as possible the appropriation bills which failed at the last session, including the appropriation for an additional revolving fund for the Railroad Administration to meet its deficit and to enable it to

assist the railroads in financing capital expenditures. Instead of the \$750,000,000 asked at the last session, the amount now required is estimated at over a billion dollars. While permanent railroad legislation is expected to take a prominent part in the activities of the session, the railroad question will first come up in connection with the appropriation bill.

Chairman Good of the House appropriations committee, promptly called a meeting to consider the general deficiency bill, in which the railroad appropriation was included at the last session and it is understood there will be a separate bill covering the railroad requirements, but Director General Hines has not yet submitted his estimate. Appropriations for the Interstate Commerce Commission and for the Alaska railroad are also to be passed upon.

The interstate commerce committees of both the House and the Senate are planning to take up the subject of permanent railroad legislation as early as possible, but no dates for hearings have yet been announced. Representative Sims reintroduced his former bill to extend the period of federal control until 1924.

A conference of the Republican members of the House adopted a legislative program which promised early consideration of the return of the telephone, telegraph and cable lines to their owners, and also of "railway legislation and development of transportation facilities."

Senator A. B. Cummins of Iowa, who was also elected president pro tempore of the Senate, has been selected as chairman of the committee on interstate commerce, and J. J. Esch of Wisconsin was made chairman of the House committee on interstate and foreign commerce. The other Republican members of the House committee are: E. L. Hamilton, Michigan; Samuel E. Winslow, Massachusetts; James S. Parker, New York; Burton E. Sweet, Iowa; Walter R. Stines, Rhode Island; John G. Cooper, Ohio; Henry W. Watson, Pennsylvania; F. F. Ellsworth, Minnesota; E. E. Denison, Illinois; Everett Sanders, Indiana; Schuyler Merritt, Connecticut, and J. S. Webster, Washington. Mr. Esch has prepared a comprehensive railroad bill, amplifying the provisions of a bill he introduced at the last session, which represents in general the ideas of the Interstate Commerce Commission. He expects to introduce it probably by next week.

One of the first measures introduced was a resolution providing for a return of the wire systems to their owners and definite action on that subject is likely to precede the more complicated question of the disposition of the railroads.

A number of bills dealing with the railroad question have already been introduced but in most cases they represent the reintroduction of bills presented at the last session. Senator King introduced a bill, S. 31, to repeal the federal valuation act. S. 67, introduced by Senator Thomas, provides for the creation of federal railroad companies and is intended to establish more effective supervision of railroads. Senator Gronna introduced a bill, S. 113, providing for reduced rates for the transportation of laborers when traveling under the direction and control of the Department of Labor. Senator Poindexter re-introduced as S. 360 his proposed amendment to Section 4 of the commerce act to provide a rigid long and short haul clause; also a bill, S. 361, to provide for the regulation of security issues. Several bills were introduced to repeal the Daylight Saving law.

Senator Gronna of South Dakota filed resolutions adopted by the South Dakota legislature petitioning for additional passenger service in the state and also urging Congress to enact legislation necessary to authorize the continuance of government control for five years. Senator Myers of Montana presented a petition from the Montana legislature urging the prompt return of the railroads and also urging an inquiry as to the possibility of additional railroad construction in Carter County.

## Transportation Must Be Put on Sound Basis

THOMAS DEWITT CUYLER, chairman of the Association of Railway Executives, in commenting upon the President's statement to Congress that the railroads would be returned to owners at the end of this year, said:

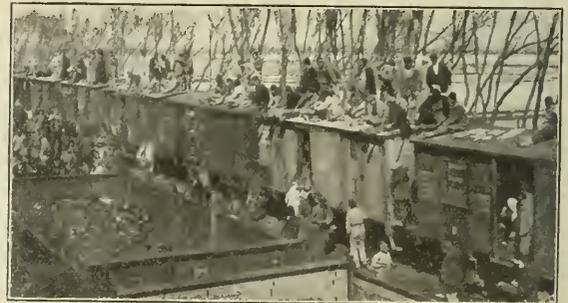

"It is to be assumed, of course, that the President believes that Congress will be able to frame in the next seven months the legislation that it will be necessary to enact before the government returns the roads to their owners. The members of the Senate and House who have this legislation in charge are apparently hopeful that, with the unmistakable general agreement over the country as to the basic principles of necessary railroad legislation, a non-partisan bill, embodying these principles, can be placed in the President's hands for his signature within the next few months.

"To return the railroads to their owners under the old system of regulation—a system that had failed—would invite disaster. As Senator Cummins has so well expressed it, this is the psychological time to correct the evils in our pre-war system of railroad control.

"The problem of putting our transportation system on a sound basis for the future is not nearly so complex as it seemed two or three years ago. The public demands, first, adequate, efficient, safe transportation, economically produced—second, new railroad facilities and improvements to meet the needs of a growing country, without wasteful or unnecessary construction; third, fair wages and working conditions for employees, with insurance against a paralysis of the railroads by strikes.

"In order that these public needs may be met by the railroads when they are returned to private management, certain things are indispensable: First, a continuous investment of new capital for additions and betterments, from \$750,000,000 to a billion dollars a year; second, rates for carrying freight and passengers that will pay for the labor and material consumed in operation, and that will provide a fair return on the value of the property devoted to the public use—that is, an income on the capital that will attract the necessary new capital; third, responsible regulation by the national government that will protect the interests alike of the owners, the workers and the general public.

"The legislation to make these things possible, and to insure the future growth of our transportation facilities, does not have to be very complicated. On most of the principles involved there is a general understanding and agreement over the country, and the honest differences of opinion are mainly as to details. But this certainly is the time to lay a sure foundation for the future, and to perform the same public service for our transportation system as was performed seven years ago by Congress for the banking system.

# Railway Stockholders: December 31, 1917

Total of 647,689 Understates Number of Individuals Who  
Have Interest in Financial Ownership

THE BUREAU OF RAILWAY ECONOMICS has issued Bulletin No. 140, giving statistics regarding railway stockholders as of December 31, 1917. In Bulletin No. 94 the bureau gave a compilation of the number of holdings of railway stockholders on June 30, 1915. A similar compilation was prepared by the bureau as of December 31, 1916, but publication was held up by the war. The present bulletin not only incorporates the unpublished data for 1916, but brings the record down to December 31, 1917.

This bulletin is based on reports to the commission of operating and non-operating companies of all classes, except switching and terminal companies. The statistics are virtually complete for each class, although it has been necessary to omit a few of the smaller roads that filed incomplete returns or no returns at all. Such omissions are so unimportant as to be virtually negligible for practical and comparative purposes.

Railway stockholders numbered 647,689 on December 31, 1917, as compared with 612,880 on December 31, 1916, and 626,122 on June 30, 1915. This covers the steam railways of the United States, operating in 1917 259,485 miles of line. The average holdings per stockholder, par value, amounted to \$13,966 in 1917, as compared with \$14,321 in 1916 and \$13,796 in 1915.

The foregoing statements apply to all roads. For roads of Class I and Class II, operating 250,804 miles (96.6 per cent of the total), it is possible to exclude to a considerable extent capital stock held by or for other railway companies. Making this exclusion, the approximate amount of railway stock in the hands of the general public on December 31, 1917, was \$6,377,551,082. The number of holders of this net stock was 636,208, and the average amount of their holdings \$10,024. The corresponding returns for 1916 were \$6,202,673,485 of net capital stock, 600,671 stockholders, and average holdings of \$10,326; for 1915, \$6,004,496,162 of net capital stock 607,630 stockholders, and average holdings of \$9,882.

Table I shows the number of roads, operated mileage, and total number of stockholders on December 31, 1917, grouped by class and district.

TABLE I  
NUMBER OF STOCKHOLDERS  
Railways of the United States, December 31, 1917

Class and District	Number of roads	Miles of line operated	Number of stockholders
All classes:			
United States.....	1,272	259,485	647,689
Eastern District.....	534	64,829	340,586
Southern District.....	275	50,378	58,301
Western District.....	463	144,278	248,802
Class I (operat. and non-operat.):			
United States.....	572	232,798	627,930
Eastern District.....	333	59,089	332,624
Southern District.....	78	42,852	53,226
Western District.....	161	130,857	242,080
Class II (operat. and non-operat.):			
United States.....	272	18,006	8,947
Eastern District.....	88	4,067	3,470
Southern District.....	62	4,650	2,659
Western District.....	122	9,289	2,818
Class III (operat. and non-operat.):			
United States.....	428	8,681	10,812
Eastern District.....	113	1,673	4,492
Southern District.....	135	2,876	2,416
Western District.....	180	4,132	3,904

It should be borne in mind that the number of stockholders shown in Table I is the number of distinct holdings of stock, and does not necessarily represent the number of separate individual owners. On the one hand, the aggregate contains duplications arising from the fact that a person may own stock in two or more railway companies; on the other

hand, and of much greater significance, blocks of stock are often held in trust for multiple beneficiaries, or are held as investments by banks, insurance companies, and educational, benevolent, or other institutions in which many individuals have an interest, although not directly.

The Interstate Commerce Commission recently issued a statement giving the number of stockholders as 627,930, but this covered only 572 Class I roads and their non-operating subsidiaries. The commission also gave an analysis of the 20 largest holders in each road, aggregating 8,301 names, holding 50,873,322 shares, without regard to whether they were \$50 or \$100 shares, from which it drew the conclusion that stock ownership is largely concentrated in a few holdings. This point is further analyzed in the bureau's bulletin to show that while this is a fact the large holdings represent the interest of many individuals. On this point the bulletin says:

"To say that there were 647,689 railway stockholders in 1917 is therefore very much to understate the total number of individuals who had a direct or indirect interest in the financial status of the railways, and in the equities represented by railway ownership. This fact is strikingly brought out in a statement recently issued by the Interstate Commerce Commission, showing that 8,301 out of the 627,930 stockholders of railways of Class I held about one-half the outstanding stock of those railways. At first sight this appears to indicate great concentration of railway stock in the hands of a relatively small number of holders, but further analysis shows that more than five-sixths of the total number of shares held by the 8,301 large stockholders were in the hands of railway and other corporations, voting trustees, and estates, the remaining shares being individual holdings. These individual holdings comprised 8.2 per cent of the total number of shares outstanding. It may safely be assumed that the great bulk, if not the whole, of the stock held by corporations, trustees, and estates represented the kind of holdings described above, namely, blocks held in trust or for corporate investment, in which many individuals had an indirect interest. In the light of this analysis, the seeming concentration of railway stock in the hands of a few individual holders is largely contradicted by the actual fact that only 8 per cent of the total outstanding stock is concentrated in large individual holdings, while the remaining 92 per cent is distributed among hundreds of thousands of small holdings, or is held in trust for, or for the benefit of, many millions of individuals."

There were 847 operating roads, with 560,621 stockholders, and 425 non-operating companies, with 87,068 stockholders. The number of stockholders per company averaged 509.

## Holdings Per Stockholder

Table II shows the par value of gross capital stock outstanding on December 31, 1917, the total number of stockholders, and the average amount of stock per stockholder.

The capital stock of the Eastern railways represented \$3,559,686,211, or 39.4 per cent of the total; of the Southern railways \$1,203,202,068, or 13.3 per cent; of the Western railways \$4,282,543,530, or 47.3 per cent.

As in earlier years, the average holdings for railway companies of Class II were considerably larger throughout than those for Class I. This was due to the relatively small number of stockholders per company, a considerable number of companies of this class being controlled by other corporations and their stock being held in large blocks. The same thing

is true of companies of Class III, but the comparatively low capitalization per company results in a small average holding per stockholder. In the case of many controlled railway companies, the number of stockholders on their books is the sum of the number of directors (holding one qualifying share of stock each) and the controlling corporation.

TABLE II  
AVERAGE HOLDINGS PER STOCKHOLDER  
Railways of the United States, December 31, 1917

Class and District	Capital stock outstanding, par value	Number of stockholders	Average amount of stock per stockholder
All classes:			
United States.....	\$9,045,431,809	647,689	\$11,966
Eastern District.....	3,559,686,211	340,586	10,452
Southern District.....	1,001,202,068	58,301	20,638
Western District.....	4,282,543,530	248,802	17,213
Class I (operat. and nonoperat.):			
United States.....	8,661,190,028	627,930	13,701
Eastern District.....	3,433,734,454	332,624	10,323
Southern District.....	1,089,848,118	53,226	20,476
Western District.....	4,079,607,456	242,080	16,852
Class II (operat. and non operat.):			
United States.....	335,471,297	8,947	37,495
Eastern District.....	107,702,407	3,470	31,038
Southern District.....	80,707,610	2,659	30,353
Western District.....	147,061,280	2,818	52,186
Class III (operat. and non-operat.):			
United States.....	166,770,484	10,812	9,875
Eastern District.....	18,249,350	4,492	4,063
Southern District.....	32,646,340	2,416	13,513
Western District.....	55,874,794	3,904	14,312

To obviate the duplications resulting from intercorporate holdings, Table III eliminates them as far as practicable.

Since 1915 the Interstate Commerce Commission has required roads of Classes I and II to report the names and holdings of their 20 largest stockholders. Generally speaking, wherever one railway company has a controlling interest in another railway company through stock ownership, its name will appear in the list of the twenty largest stockholders of the controlled company. By eliminating such holders and their holdings, so far as they may be railway companies or trustees holding for railway companies, it is possible roughly to approximate the amount of stock held by the public, and the number of stockholders owning such stock. The result

Deducting from the aggregate amount of stock and number of stockholders, respectively, the \$2,561,110,243 held by or for other railway companies, and the 669 railway companies by or for whom held, the approximate net amount of stock in the hands of the public becomes \$6,377,551,082, while the number of holders of net stock was 636,208. This reduces the average holding per stockholder to \$10,024. The corresponding average in the East was \$7,584, in the South \$16,543, and in the West \$11,886.

TABLE III  
RAILWAY STOCK IN THE HANDS OF THE PUBLIC, DECEMBER 31, 1917  
(Roads of Classes I and II, with annual operating revenues above \$100,000)

\*Approximate.

Table IV compares the statistics of Tables I and II, all classes of roads for the United States combined, with corresponding statistics for December 31, 1916, and June 30, 1915. The statistics for 1915 are from Bureau of Railway Economics Bulletin 94, while those for 1916 are from hitherto unpublished tabulations.

Average holdings per stockholder were \$13,966 in 1917, compared with \$14,321 in 1916 and \$13,796 in 1915. The average for 1917 was lower than in 1916 by \$355, or 2.5 per

TABLE IV  
COMPARATIVE STATISTICS: 1915, 1916, AND 1917  
United States—all classes

Item	December, 31, 1917	December, 31, 1916	June 30, 1915	Increase or decrease, 1917 compared with			
				1916		1915	
				Amount	Per cent	Amount	Per cent
Miles operated.....	259,485	259,509	257,211				
Capital stock.....	\$9,045,431,809	\$8,777,032,011	\$8,638,286,892	\$268,379,798	3.1	\$407,144,917	4.7
Number of stockholders.....	647,689	612,880	626,122	34,809	5.7	21,567	3.4
Average holdings per stockholder.....	\$13,966	\$14,321	\$13,796	d 355	d 2.5	\$170	1.2

is only an approximation, as it necessarily can take no account of small holdings by railway companies, but a large part of the duplication due to intercorporate railway holdings can certainly be eliminated by the method outlined. Table III gives the results of such an elimination.

Railways of Classes I and II operated 250,804 miles of line on December 31, 1917, or 96.6 per cent of the total operated mileage on that date. Table III shows, first, the outstanding stock and total number of stockholders of railway companies of Classes I and II; second, the number of cases of stock held by or for other railway companies, reported as among the 20 largest holdings of each company's stock, and the amount of stock so held; deduction of railway holdings and number of stockholders from the total produces as a result, third, the stock in the hands of the public and the number of stockholders corresponding to such stock.

cent, but greater than in 1915 by \$170, or 1.2 per cent.

Table V reduces the comparative statistics of Table IV to the basis of stock in the hands of the public and the number of holders thereof. For the reasons already given above, the table applies only to companies of Classes I and II.

Capital stock in the hands of the public approximated \$6,377,551,082 in 1917, which was greater by \$174,877,597, or 2.8 per cent, than in 1916, and \$373,054,920, or 6.2 per cent, greater than in 1915. The number of stockholders was 636,208, which was greater by 35,537, or 5.9 per cent, than in 1916, and 28,578, or 4.7 per cent, greater than in 1915.

The average amount of net stock per stockholder was \$10,024 in 1917, compared with \$10,326 in 1916 and \$9,882 in 1915. This was a decrease of \$302, or 2.9 per cent, as compared with 1916, and an increase of \$142, or 1.4 per cent, as compared with 1915.

# The Heating and Ventilation of Engine Houses

A Detailed Exposition of Approved Methods of Application to  
Either New or Old Structures

By T. W. Reynolds

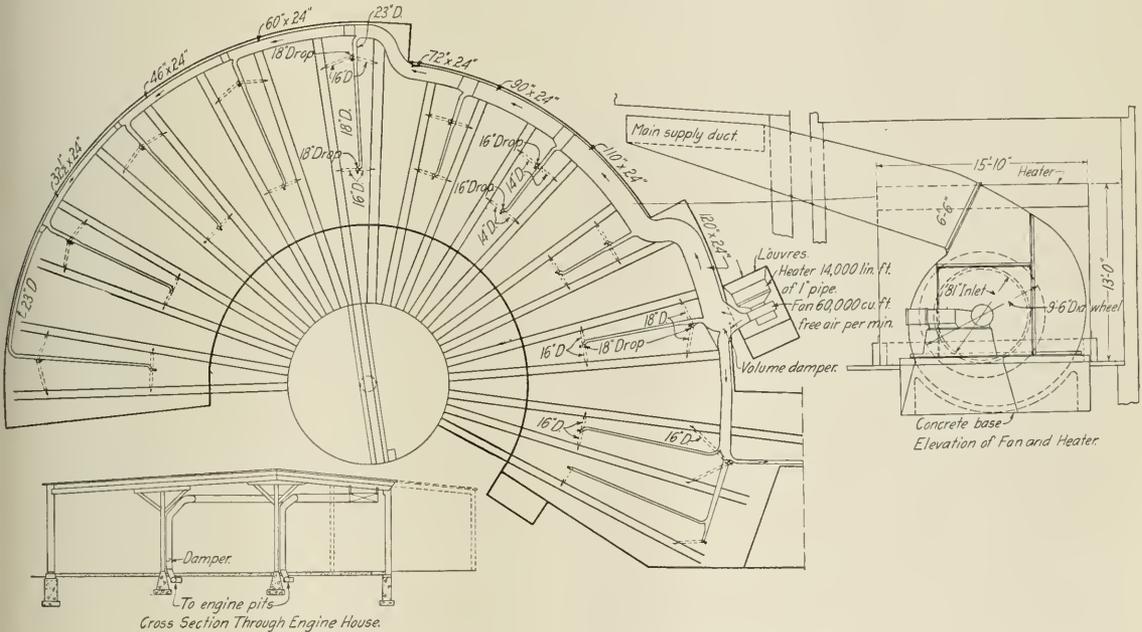

THE HEATING and ventilating of engine houses by means of air propelled by a steam driven fan, through adjustable louvres and heaters, and discharge ducts to the engine pits of the various stalls, is common practice. The ducts may be of concrete run under ground or of sheet metal carried overhead. The underground ducts are the more desirable and are the type generally provided in new structures, but in installing the system in old houses the cost of the underground duct is prohibitive.

This article discusses the use of underground concrete air ducts as applied to a new 30-stall engine house, having concrete floors and engine pits, brick walls and timber frame

and capacities of apparatus will be required; there being two similar sets of equal capacities, one of which is described.

**Heaters:** 16,500 lin. ft. of 1-in. wrought iron pipe in coils of the mitre type, arranged in two groups of five sections each, and having a free area through the coils of 80 sq. ft. The length of the shortest coil is 4 ft., longest 19 ft., height of heater 9 ft. 2 in., weight 49,500 lb., size of manifold connection 8 in., main return connection 3 1/2 in.

**Fans:** three quarter housed bottom horizontal discharge, of the steel plate type, having a capacity of 80,000 cu. ft. of air per min. at 3/4-oz. pressure per sq. in. 140 r. p. m. for the above capacity and 2,250 ft. per min. for the velocity of

Layout of a Heating System with Overhead Sheet Metal Ducts

and roof, but the use of ducts of sheet metal is also referred to. The cubical content of the house under discussion is 1,700,000 cu. ft.; the glass area is 10,000 sq. ft.; the exposed area of brick wall is 15,720 sq. ft.; and of wooden wall, 9,520 sq. ft.; the concrete floor area is 73,930 sq. ft.; the roof area is 57,730 sq. ft.; and the area of the yellow pine doors is 5,300 sq. ft.

The installation is to maintain an even temperature of 65 deg. F., when the temperature of the external air is -10 deg. F., and when fresh air only is supplied to the fans; and to have a capacity to change the entire contents of the house once every 12 min. The installation is also to keep the house free from fog and steam at all times. The temperature of 65 deg. is to be obtained after the doors have been closed five minutes, all temperatures being measured five feet above the floor.

For these average or typical conditions the following sizes

air at the fan outlet; size of the latter 78 in. by 66 in. with a fan inlet diameter of 94 in. The weight of the fan is 7,500 lb., diameter of the fan wheel 132 in., width of blade at inlet 63 in., and periphery, 54 in.

**Engines:** direct-connected 12 in. by 16 in. simple horizontal side crank of 45 i. h. p., having a throttle valve of 3 1/2 in. size and exhaust outlet of 4 1/2 in., set on a cast iron base 26 in. high, weight 6,650 lb., engine to operate with 80 lb. steam pressure.

**Condensation return pumps:** horizontal duplex, piston type, brass fitted, size 6 in. by 4 in. by 6 in. automatic hot water return pump with cast iron receiver in combination, designed to operate with a steam pressure of 80 lb. per sq. in. and a back pressure of 3 lb. or less.

The required boiler horse-power for both sets of engines, pumps and coils as above described is 390.

An arrangement of engine or motor direct connected to the

fan is preferable, flexibility and exact alinement being procured by means of a flexible coupling connecting the shafts of the engine or motor with that of the fan. Proper alinement is most important and may be obtained where care is used with simple flange couplings. Space conditions (where length is considered) make the direct connection the more desirable. Such an arrangement eliminates the loss due to slippage of belts and the cost of maintaining them, and is safer because of their elimination. The cost, however, is greater, since it is necessary to select larger engines or motors to obtain the same power at a less speed.

Belt drive is necessary where alternating current motors are used, since the available minimum speed is in excess of fan requirements. The fan and engine pulleys are placed on not less than 8-ft. centers. Where impossible to arrange for this distance a drive by means of the so-called silent chain may be used. The use of a motor requires a base of the sliding type adjusted from time to time by screws to conform with the stretching of the belt.

The most economical prime mover is the steam engine since it is possible to use the exhaust steam from the steam using machinery, such as the engines and pumps. By cross connection with like apparatus in the boiler and engine plants, the exhaust from all such units is made available at either the feed water heater or heater coils.

#### Arrangement of Blast Heaters

Blast heaters are indirect and may be of the all cast iron type, such as the Vento, or they may be constructed of pipes set in rows and staggered with ends screwed into cast iron sectional bases. Some manufacturers divide these bases by means of partitions into two compartments, one for steam, the other for air. Fewer difficulties are encountered with the mitre type of coil in the way of air binding. In these, the pipes run horizontal from the top of the coil and, fitted with 90 deg. elbows, connect to the return base at the bottom of the coil. Pipe coils may be operated under atmospheric pressure and, where steam pressures in excess of 15 lb. must be used, they are particularly desirable. The horizontal pipes of the coils should have a slope of not less than  $\frac{1}{4}$  in. in 10 ft. to drain them.

The steam pressure being less than that in the boilers, some mechanical means is required for returning the condensate to the boilers, a return pump being used for this purpose and the exhaust utilized in the heating system after passing through an oil separator.

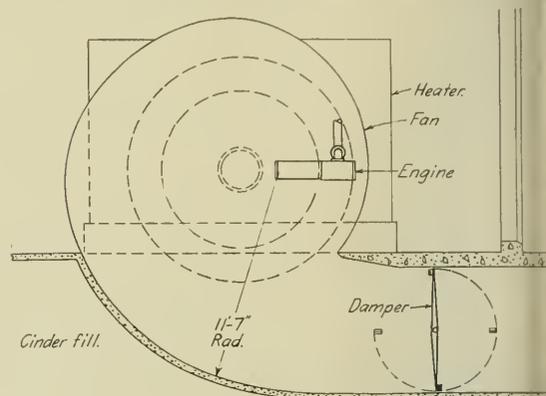

#### Design of Air Ducts

The heating requirements for an engine house are roughly and quickly determined by multiplying the total number of stalls by the average amount in square feet of radiation usually required per stall. Other requirements are a final temperature of 140 deg. for the air with a velocity of 600 ft. per min. at outlets, each pit having four outlets. Due to practical conditions of building construction, the widths of ducts are practically standard, the height being variable, as required, to obtain the necessary cross section.

Referring to the plan, a duct  $6\frac{1}{2}$  ft. square is extended from each fan and connected into one having an area of 67 sq. ft. just inside the engine house. It is obvious that economy and a better distribution are furthered by the extension of this duct through the center of the house to its front wall, and then dividing and branching each way. Furthermore, it is often impossible to run these by any other method. Each of the two main branches is 7 ft. wide and about 34 sq. ft. in cross section, the branches and outlets to pits being 2 ft. 4 in. wide and 4.66 sq. ft. in area. Ducts are of concrete or of brick, smooth-finished on the inside. Those of smaller size may be of glazed sewer pipe installed in the usual manner.

#### Ventilation Augmented By Smoke Jacks

Ventilation is aided by the exhaust through smoke jack from the stacks on locomotives. Some types of smoke jack are made with horizontal and vertical adjustments so as to enshroud the locomotive stacks more completely, thereby carrying off all of the smoke and gas and avoiding the necessity for exact spotting of locomotives. There have been a few recent and successful installations in which the discharge from locomotive stack is collected by means of ducts run above the roof. This is in addition to the ventilation system and necessitates an exhauster which forces the smoke into a stack. Metal parts are avoided because of the sulphuric acid resulting from soot and water in combination, and a special type of non-corrosive fan is required. Should the fan a

Horizontal Bottom—Discharge Fan Used with Underground Concrete Ducts

any time be inoperative, the smoke jacks are arranged with bypasses, so that they may be discharged directly into the atmosphere. In general, these installations are provided where local laws make their use compulsory.

#### Course of the Ventilating Air

In the system of ventilation under description the air discharged into the engine pits and assists in ridding the running gear of the locomotive from snow and ice quickly. The steam passes rapidly upward beyond the breathing zone and out of the smoke jacks, while the working level is maintained free of all objectionable smoke and gases.

The distribution of air to the various branch ducts is effected by means of volume deflectors. These consist essentially of a door made of a steel plate braced by angle and securely hinged to the duct, adjustments being made along a  $\frac{3}{8}$ -in. by  $1\frac{1}{4}$ -in. strap iron punched on  $1\frac{1}{2}$  in. centers. When the pressure of air into each branch duct under normal working conditions is approximately the same the deflectors are permanently fastened into position. Operating and locking devices are also installed in the duct leading from each fan, and conveniently near the same, an adjustable damper. The damper is bottom heavy and comes to rest on angle stops. A stationary deflector or divider is also installed at the point where the main underground duct divides near the middle of the engine house. This deflector is constructed of No. 12 steel, bent to an easy radius and braced.

The heating and ventilation apparatus is divided into two equal sets which is an advantage in many ways and allows for a greater economy of operation. While the exhaust steam should be utilized in the heating system during the winter months, any excess may be used for heating the water of the locomotive boiler washout and reclaiming sys-

m or for boiler feed water. An outboard exhaust pipe must be provided to carry off the exhaust steam in warm weather when it cannot be used in the heating system or otherwise. To regulate the back pressure carried on the engines a back-pressure valve is connected to this pipe, and from this point the line is extended through the roof with spiral riveted pipe, terminating in an exhaust head. This valve also holds the steam within the heating system when it cannot be used, automatically opening for the pressure set and releasing the exhaust steam through the exhaust head until the excess pressure has been discharged.

### The Use of Sheet Metal Ducts

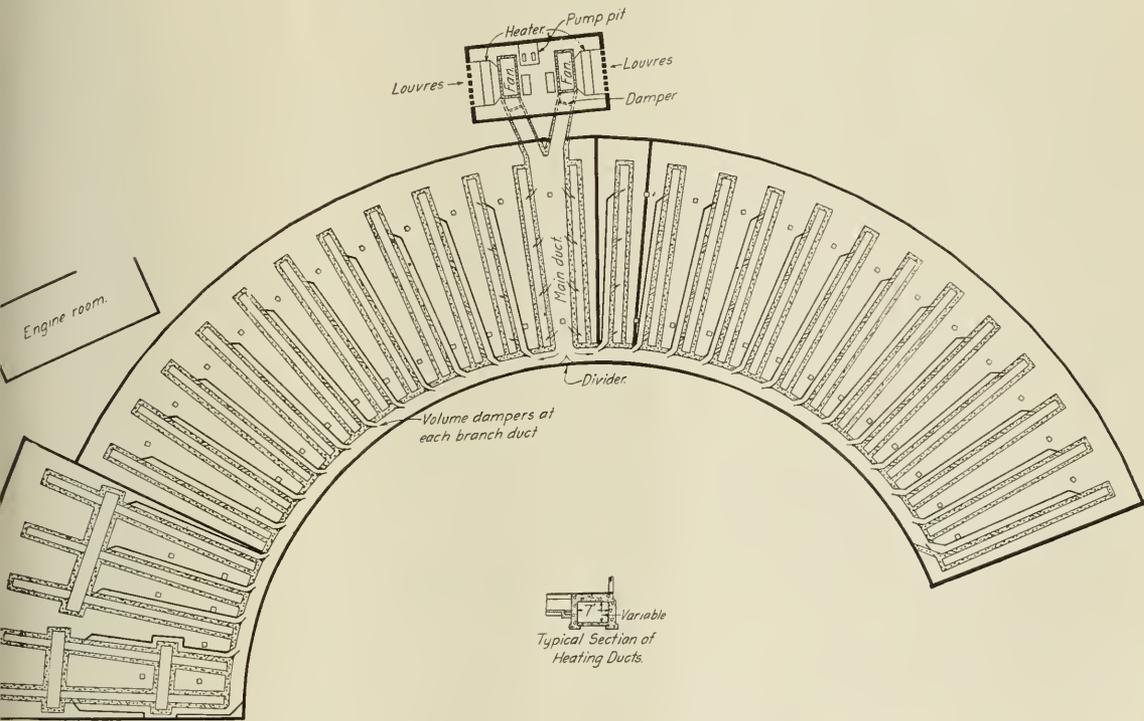

While concrete ducts are better, though requiring a greater expenditure in first cost, they are prohibitive through greatly increased costs, if applied to a house existing prior to its installation. Concrete ducts require but little or practically

should only be permitted where applied to an existing house.

As a practical illustration of an installation of sheet metal ducts, take the case of an old roundhouse originally built with 11 stalls to which in course of time an addition of 10 stalls was made, making 21 stalls in all. These were made of greater length to accommodate the increasing length of locomotives. Six of the original stalls were similarly lengthened and when it was decided to install a heating system a fan house was erected at the rear for housing the one set of indirect heating apparatus.

The sheet metal ducts were installed overhead. The trunk duct is rectangular in shape because of limited headroom, being run close along the rear wall so as to avoid coming in contact with stacks when locomotives are run too far forward.

Supports for the trunk duct are of two 1/2-in. rods secured to one 1 1/2 in. by 1 1/2 in. by 3/16 in. angles passing under-

Layout of a Heating System with Underground Concrete Ducts

o maintenance, whereas with ducts of sheet metal renewals must be made from within one to two years from date of installation. The smoke and gases are the more conspicuous in the older type of houses, and the presence of moisture from the many locomotive safety valves combines with these to form sulphuric acid acting as would an accelerated test upon light sheet metal.

The conditions are the worst for corrosion, alternate wetting and drying. Melting snow and ice on locomotives, along with the escape of steam greatly assist in this corrosion. This is more rapid at some points than at others, as, in accordance with the overhead building construction, the ducts may of necessity be run in locations near the safety valves and smoke stacks of the locomotives. The only advantage of sheet metal ducts is in their low first cost, the ease of construction and their adaptability to turns and deformations. The use of any kind of sheet metal ducts

neath the duct. Round ducts are supported by means of 3/8 in. bent rods. The branches are taken off and run along the roof trusses, most of the branches having two down pipes. These are carried down at building uprights and are divided beneath the floor so as to serve the engine pits, each pit having two outlets.

Starting from the fan the main duct is divided into two branches, one 120 in. by 24 in., the other 56 in. by 24 in., the first having a ratio of five to one for length and depth, so that the friction losses are of course somewhat increased. Branch ducts are sized according to the cubature and the length of stall. They vary from 19 in. to 23 in. in diameter with down pipes, mainly of 18 in. diameter. The latter are divided into two 16 in. pipes and extended with rectangular shapes transforming to the 12 in. by 24 in. outlets in the pits. Down pipes in the machine shop terminate with open ends seven feet above the floor and are each fitted with

dampers, quadrant and locking device; as are all others throughout the engine house.

Gages for the ducts are as follows:

Gages	Sizes, in. diam., for round shapes
26	3 to 12
24	13 to 24
22	25 to 34
20	35 to 50
18	51 up
Gages	For rectangular shapes, referring to width of greatest dimensions
26	3 to 18
24	19 to 24
22	25 to 36
20	37 to 72
18	73 up

It is necessary to protect the down pipes from mechanical injury. Failure to do so will soon result in bent and damaged ducts. A sheet metal shield of heavy gage is fitted snugly around each down pipe for a distance of five feet above the floor and secured by 1/4 in. bolts at the front and at the rear by 4 in. lag screws to the posts, bolts and screws being on 10-in. centers. The space between the pipe and the shield is grouted for 3 in. above the floor line and sloped so as to drain to the post. Shields are painted two coats inside and outside before erection.

The screens which are fitted to openings at the duct outlets in engine pits are made up of an angle iron frame with corner plates which encloses a screen of 2 in. mesh No. 11 B. W. G. galvanized poultry wire. Of late these screens have been constructed of locomotive wire mesh, since the ordinary wire quickly deteriorates and in a short time totally disappears.

### Standard Time Zones Modified

THE Interstate Commerce Commission has issued a supplemental report modifying its original order prescribing the boundaries of standard time zones, as reported in the *Railway Age* of November 22, 1918, page 917, and September 13, 1918, page 525. Changes are made in the boundaries between eastern and central time, in Ohio, to meet complaints from various towns, and similar changes between the 90th and 105th meridians to meet the wishes of certain towns in Montana, all to take effect June 1, at 2 A. M.

The Hocking Valley, the Toledo & Ohio Central, the Kanawha & Michigan and the Pennsylvania, have various joint track arrangements, covering in all many miles, which make it essential that the Hocking Valley south of Columbus, the Toledo & Ohio Central between Columbus and Corning, the Pennsylvania between Bremen and New Lexington, and the Kanawha & Michigan between Corning and Charlestown, be operated under the same standard time. To do this, and to best accommodate commerce, the order now puts the four roads first named in the central time zone. The Kanawha & Michigan will, under this order, use central time to Gauley Bridge, W. Va., but will be required in eastern territory to use eastern time on its public time-tables and announcements.

When the daylight saving law went into effect, in March, numerous towns in Ohio left their clocks unchanged, thereby virtually taking themselves out of the eastern zone and placing themselves within the central zone. These towns, located on the boundary line are allowed to consider themselves within the central zone; they are Bellevue, Monroeville, Plymouth, Shelby, Mansfield, Butler, Mount Vernon, Chicago Junction, Utica and Galion. Requests from places further east are denied.

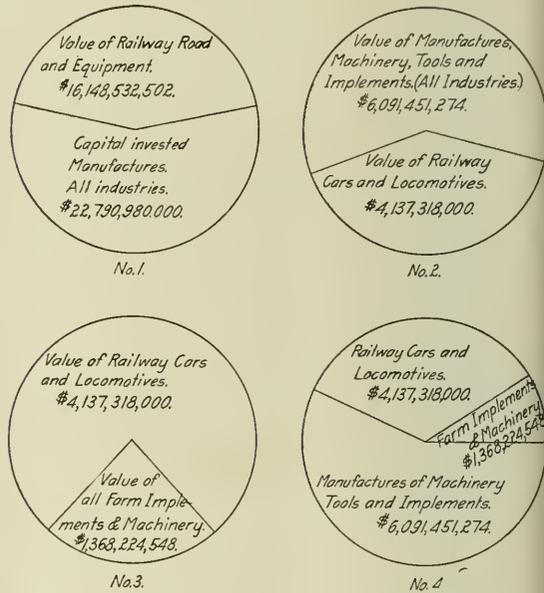

The city of Toledo, as represented by the Toledo Commerce Club, requested to be changed from the central to the eastern zone; but the commission finds that the citizens are unable to agree among themselves, and the petition is denied. The New York Central and the Wheeling & Lake Erie, using

eastern time at Toledo, are permitted to continue so, but public time-tables must show arrivals and departures with reference to central time. At Albany, Ga., the use of central time has already been authorized.

In Helena, Butte, Deer Lodge, Missoula, and other places in western Montana, the citizens have never observed Pacific time, as prescribed by the commission, and the whole state of Montana will now be allowed to use Mountain time. The Great Northern, however, will be allowed to use Pacific time as far east as Troy, Mont., and the Northern Pacific as far east as Paradise, Mont. Corresponding changes will be made on the Milwaukee road.

### Value of Railway Plant Compared with That of Other Industry

THE ACCOMPANYING ILLUSTRATIONS were prepared by E. B. Leigh, president of the Chicago Railway Equipment Company, for the purpose of showing clearly the value represented by the railway plant of the United States as compared with that represented by the investment in manufacturing industries generally; also the value of railway locomotives and cars only as compared with the value of the machinery, tools and implements used in all

Comparative Value of Railway Plant and Equipment

manufacturing industries; and also the value of locomotives and cars as compared with that of all agricultural machinery, tools and implements. Mr. Leigh's specific purpose was to emphasize the large purchases which are or ought to be made by the railways as compared with other industries.

The statistics on which the illustrations are based were taken from the United States Census report for the year 1914, the latest official compilation which gives comparable data. They were first used in graphic form by Mr. Leigh in an address, entitled "Railway Buying and Industrial Readjustment," which was delivered at the recent business conference held under the joint auspices of the Beloit (Wis.) Chamber of Commerce and Beloit College. The essential features of Mr. Leigh's address were published under the same general heading in the *Railway Age* of April 4.

# Fuel Association Holds Eleventh Annual Convention

## Tackles Fuel Conservation Problem in a Big Way From Both Operating and Mechanical Standpoints

WITH AN ATTENDANCE rivaling that at the memorable convention of last year, the International Railway Fuel Association opened its eleventh annual meeting on Monday at the Hotel Sherman, Chicago.

### Address of President L. R. Pyle

Mr. Pyle in his opening address made a plea for economy in fuel during the period of reconstruction. He spoke in part as follows: Those who have not had a practical working knowledge of the conditions under which the railroads labored during the past year have no conception of the task which has confronted all connected with the movement of transportation. The railroads have been the backbone of our war preparation and without them we would have failed miserably.

If the railroads have been the backbone of our country under war conditions they will also be the backbone of our country during the reconstruction period. Such being the fact, it behooves every man connected with the American railroads seriously to consider just what part he is to perform during this period. We are going to be called upon to do things which at first glance appear almost impossible of accomplishment, not because what we will be asked to do is impractical, but because of the difficulty of getting others to put these things into practice. If we are the men for the job during the reconstruction period we must of necessity get results. This is going to be the measure of our ability as railroad men. Regardless of who operates the railroads during the coming year this fact is clear and unequivocal. It is going to be necessary to produce better transportation facilities, both freight and passenger, at a lower cost than ever before. Wages are at the highest point ever known. All supplies entering into the operation and construction of a railroad are higher than ever before. To offset this increase in the cost of operation, we must of necessity eliminate waste wherever it appears. You, individually, are responsible to the Railroad Administration and to your individual corporations to deliver to the best of your ability a service which will result in decreased operating costs.

There is a wide field for discussion as to how economy can be realized on the locomotive, in the roundhouse or stationary plant, by the transportation man in more efficient methods of train handling, by the mechanical man through better maintenance of locomotives and cars, by the maintenance-of-way man through better track conditions and fewer slow orders, or by the car and air brake man in maintaining the air brake system and so taking care of lubrication on railroads that we can eliminate to a great degree hot boxes, or by the yardmaster in making up trains efficiently.

The results obtained through effecting economies in fuel are far reaching and if by better locomotive maintenance we save fuel, we also assist in speeding up the movement of transportation which in turn effects other economies. We should bear in mind that practically everything done to save coal has a beneficial effect on all other angles of railroad operation. Even now operating officials do not fully realize the tremendous opportunity for a material reduction in the cost of transportation by specializing on the second largest item of expense on a railroad, namely that of fuel.

For years this association has agitated fuel conservation and although some roads have and are eliminating fuel waste

through systematic efforts, we have as yet barely scratched the surface. To get the real reduction in cost that is possible and absolutely necessary for the well-being of the railroads, a more practical interest has to be shown by general operating officials and a more sincere co-operation must exist between the heads of the different departments. This does not mean that there is no interest shown by general officials or that there is no co-operation between the heads of the different departments, but there is still a disposition to continue the campaign of fuel conservation in a haphazard manner and under such conditions the maximum economy can never be attained and waste will go on continuously.

One of the fundamental principles of fuel conservation is co-operation. The manifold duties of operating a railroad are so closely associated and so delicately interwoven that even the slightest error in one department often disturbs the entire organization. A chain is no stronger than its weakest link and a federal manager can have ever so good a fuel organization but if a superintendent fails to co-operate fully there is a break in the chain and the railroad suffers. It is not so much individual effort that is needed as a practical give-and-take co-operation from the chief operating official to the smallest individual on a road.

Hale Holden, regional director of the Central Western Region, was to have delivered an address at the opening session but was unable to attend. W. B. Storey, federal manager of the Atchison, Topeka & Santa Fe, addressed the convention instead. Mr. Storey spoke in part as follows:—

### Address of W. B. Storey

We who are handling the railroads are vitally interested in saving fuel. Today we must save fuel in order to get back to normal conditions. On the Atchison, Topeka & Santa Fe the fuel bill for engines alone was one third of the total transportation expenses and one seventh of the total operating expenses during 1918.

There are many difficult phases to the fuel conservation problem. If we could make fuel economy the prime consideration, the matter would be greatly simplified, but service to the public must receive the first attention. Another serious phase is the labor condition. We must handle labor differently from what we did in the past. We must get the men to do what we want by suasion. We must get them interested in these problems, keep them before the men as matters that concern them and the railroads with which they are connected. The man who succeeds is the man who runs the railroads in spite of unfavorable conditions.

### Report on Pulverized Fuel

The progress report which the committee has to offer will on account of the unusual conditions which have existed consist of a summary of some results, comments and suggestions. These are offered solely with the idea that they may bring out pertinent frank discussion and constructive criticism on a very interesting engineering subject. All deeply appreciate the earnest work that has been done thus far to progress the art of burning pulverized coal by both manufacturers and those interested in effecting steam economy. There are many things about pulverized coal that we are satisfied with. There are some things that we are

not satisfied with. It is of the utmost importance that accurate analysis of this subject be made in order that progress may proceed along correct lines.

As railroad interest in pulverized coal at this time lies principally in its value as a steam producer, the subject will be considered from that angle only. To date five different American railroads—the Atchison, Topeka & Santa Fe, Chicago & North Western, Delaware & Hudson, Missouri, Kansas & Texas, and New York Central—have successfully operated during test periods individual locomotives equipped for and burning pulverized coal. These tests were all made under regular service conditions, and have demonstrated that locomotives burning pulverized coal will meet the train handling conditions imposed by the different classes of service. None of the locomotives tested is in service at this time, it being necessary in most instances on account of war activity and the demand for power to remove the pulverized fuel equipment and discontinue the experiments.

Requests by your committee for information on results obtained from the tests made on locomotives were complied with. The following points from replies received are of interest:

(a) "A carefully conducted test between two engines of the same class, one burning pulverized coal and the other hand fired, showed that a saving of 23 per cent in fuel burned could be made by burning pulverized coal. The main difficulties encountered were the slagging over of the flue sheet and burning out of the brick arch. The slagging was largely overcome by an air jet to blow off the slag accumulations. A number of burner arrangements were tried, but it was found impossible to overcome the rapid burning out of the brick arch. The cost of replacing the arch brick largely overcame the saving in fuel. The delay to locomotive, replacing arch brick, was also a decided drawback.

"A comparison of total costs of hand firing versus pulverized coal firing on the locomotives tested, which include cost of pulverizing, cost of handling, cost of arch maintenance, interest and depreciation, showed the hand firing to be most economical. In fairness to the pulverized coal it was possible to design a firebox that would eliminate such troubles as burning out of the brick arch and show an advantage in favor of the pulverized coal."

(b) "Burning pulverized fuel was very satisfactory, had all the steam that was wanted with splendid control all the time, burning 60 per cent anthracite and 40 per cent bituminous, the bituminous being necessary to increase the volatile. The question of economy is quite another thing and unless a poor or by-product coal can be purchased at a price that will absorb carrying charges, operation, etc., of a pulverizing plant and not exceed the price of a satisfactory lump coal, it should be given careful thought. There is no saving in the quantity of fuel used when pulverized, in fact the difference is in favor of the lump coal. Pulverizing costs between 45 cents and 50 cents per ton.

(c) "The burning of pulverized coal in a locomotive was quite an easy proposition, and with us was very satisfactory. The only difficulties were with the drying, pulverizing and handling of the coal, and also the danger in connection with it. In case of a large number of engines being equipped to burn pulverized coal, were the plant to be blown up, burned or otherwise made inoperative, the locomotives would be tied up until the plant was in service again."

(d) One foreign railroad, the "Central Railway of Brazil," has made marked progress in burning pulverized coal. (See *Railway Age*, Oct. 26, 1917, page 767.)

Something like 200 pulverized fuel installations on stationary plants are in operation throughout the country, comprising central power and lighting stations, street railway

power stations, power stations of various manufacturing industries, railroads, mining companies, smelters, sugar refineries, office buildings, hotels, schools, laundries, etc. These plants are reported as successfully burning all grades and classifications of anthracite, bituminous, sub-bituminous and lignite coals in the pulverized form.

The following is a quotation from the reply to inquiries sent to different parts of the country by your committee asking for results obtained from stationary plants, received from a southwestern railroad. "Our stationary boiler plant

FUEL		
Kind	Wyoming Lignite	
State	Powdered	
ANALYSIS OF COAL		
	As fired	As received
Moisture	2.83%	19.2%
Volatile	42.77%	34.3%
Fixed Carbon	49.90%	42.5%
Ash	4.50%	4.0%
B. T. U. per lb.	11,849	
11. Total amount of coal fired		13,821 lbs.
12. Dry coal fired		13,430 lbs.
13. Combustible fired		12,808 lbs.
14. Total coal fired per hour		2,032 lbs.
15. Dry coal fired per hour		1,975 lbs.
16. Combustible fired per hour		1,884 lbs.

QUALITY OF STEAM	
Percentage of moisture in steam	3.3%
Quality of steam	96.7%
Degrees of superheat	0.

WATER	
Total water fed to boiler	99,679 lbs.
Total water actually evaporated	96,390 lbs.
Total water evaporated from and at 212 deg. F.	115,547 lbs.
Water actually evaporated per hour	14,659 lbs.
Equivalent water evaporated per hour from and at 212 deg. F.	16,992 lbs.
Lbs. of water fed to boiler per lb. of coal fired	7.21
Lbs. of water evaporated per lb. of coal fired	6.97
Lbs. of water evaporated per lb. of dry coal	7.18
Lbs. of water evaporated from and at 212 deg. per lb. of coal	8.36
Lbs. of water evaporated from and at 212 deg. per lb. of dry combustible	9.02
Lbs. of water evaporated from and at 212 deg. per lb. of dry coal	8.60
Average heat in coal 11,849 B. t. u. per lb. of coal as fired—	
Heat produced per hour	24,077,168 B.t.u.
Heat required to evaporate a lb. of steam as discharged from the boilers = 0.967 (1195.1 — 32.0) + 0.033 (338.7 — 32)	
= 1124.7 + 10.1 = 1134.8	
Total heat given to the boilers per hour = 14,659 × 1134.8 =	16,635,000 B.t.u.
Efficiency of boiler = $\frac{16,635,000}{24,077,000}$	= 69.1.
Horsepower developed = $\frac{16,635,000}{33,479}$	= 497.
Per cent of horsepower rating developed = $\frac{497}{330}$	= 151%.

that uses pulverized fuel has during the past year been compelled to use a considerable amount of oil, this on account of breakdowns and other troubles, and also the mixing of oil and powdered coal. The manufacturers have for some time, in fact most all winter, been changing, overhauling and remodeling their equipment, and on two boilers we have had very little service on this account.

"I am not going to give you any figures as to the cost of using pulverized coal at our plant here for the reason that our pulverizing and drying plant has not sufficient capacity to properly take care of the demands upon it, and this requires more labor than would otherwise be necessary, hence the cost is greater and would not be a fair comparison. We have, however, kept the plant going on pulverized coal most of the time, but it has been a forced proposition."

From the above summary the following conclusions may be deduced: The development of the art of burning pulverized coal during the past two years has shown marked progress in that the experimental work done and tests made, although still incomplete, have demonstrated the apparent soundness of the principle of burning coal in a finely divided form in suspension, and that the complete commercial success depends upon the further careful working out of such details as correct determinations of proper fineness of the

rious grades of coals and economical and efficient methods and apparatus for preparing, storing and transporting the pulverized coal to the stationary plant or locomotive furnace.

It has not been clearly established that coal ground to an extreme fineness and dried to the extent recommended by most of the supporters of pulverized coal best meets the conditions of the practical user operating under widely diversified conditions. The tendency of explosion and spontaneous combustion, which is always present in coal of this character, should be eliminated entirely if possible to do so. The tendency of reabsorption of moisture in containers and transmission piping in stationary plants and at coaling stations of railroads will always be a problem in climates having extreme variations of temperature and humidity. Experiments should be made to determine if thoroughly air-dried coal ground to the fineness of say coarse granulated gar and burned in suspension in specially designed furnaces will not produce greater overall economies.

Further, in so far as the use of this kind of fuel on locomotives is concerned, it seems advisable to give more careful consideration to the individuality of the flexible steam locomotive as it exists today. It is not without the remotest possibility that a pulverizing and stoking device might be arranged that would prepare any grade of coal on the spot and deliver it to the firebox in the pulverized form, thus eliminating all of the expense incident to preparing and transporting pulverized coal from a central plant, which arrangements create a great deal of doubt about the success of pulverized fuel at the present time. The same thing would so apply to a stationary plant in a modified form.

Much ill-advised engineering work and experimenting has been done and some snap conclusions have been rendered without careful analysis of the problem and without doing the very essential laboratory work necessary to establish fundamental facts. Some hurriedly prepared and conducted tests with incomplete and inadequate facilities and equipment have been made, particularly on locomotives on busy railroads during periods of heavy traffic movement. Such tests are more or less void of results, not only from lack of preparation and facilities, but also because employees cannot give them proper attention. For these reasons also adverse opinions and doubt about pulverized fuel prevail in the minds of many.

It does not seem that we are using the laboratories of our great universities to a sufficient extent. Many of these universities have very thoroughly equipped laboratories, and would and gladly would thoroughly thrash out all of the technical questions and lay the foundation for reasonably creative devices before making field applications.

It is particularly noticeable in the reports of pulverized fuel tests received by the committee that practically all dealt with fuel economy only and with a deluge of figures and heat balances" conclusively proved fuel economy to everybody's satisfaction. Not enough has been said about "cash balances." In this respect conclusive evidence is lacking about pulverized coal, at least in so far as your committee has been able to develop after careful inquiry. This has been disappointing. We hope for some reliable statistics in the near future that will dispel all doubt that now exists on this important matter.

There is little or no question about the ultimate practicality, efficiency and economy of burning coal in a finely divided form, both in stationary plants and locomotives. To develop this fact to a practical conclusion requires thorough co-operation of both manufacturer and user and it is suggested that in view of the immense supply of bituminous, sub-bituminous and other grades of coals of various characteristics particularly adapted to the pulverized method of burning, that as soon as business conditions again adjust themselves,

the railroads, with the assistance of manufacturers and universities, make the necessary conclusive and exhaustive tests and develop the fixed principles of methods and apparatus necessary to successfully meet the very urgent demands for vastly more economical burning of coal. This is not a question of self-interest of either manufacturer or particular industry. It is one of national interest and urgency.

The report was signed by W. J. Bohan (N. P.), chairman; H. T. Bentley (C. & N. W.), H. B. Brown (L. V.), R. R. Hibben (M., K. & T.), D. R. MacBain (N. Y. C.), J. H. Manning (D. & H.), H. C. Oviatt (N. Y., N. H. & H.), John Purcell (A. T. & S. F.) and L. R. Pyle (U. S. R. A.)

## Discussion

J. E. Muhlfeld (Pulverized Fuel Equipment Corporation) submitted a written discussion in which he took issue with some of the statements in the committee's report. He stated that the practicability of burning powdered coal had been established, and asserted that it was necessary to develop it in order to increase the efficiency and the capacity of the locomotive, to decrease the cost of fuel, to permit of using coal of poor quality and to eliminate smoke and soot.

A. G. Kinyon (Fuller Engineering Company) submitted records of numerous pulverized coal installations and reports of tests showing the high efficiency of boilers fired in this manner. Several speakers called attention to the fact that troubles similar to those experienced with pulverized fuel had been encountered in the period of development of practically all the accessories used on locomotives.

M. C. M. Hatch (Pulverized Fuel Equipment Corporation) expressed the opinion that the crux of the matter lay in the design of the locomotive furnace. Large furnace volume is needed for burning pulverized fuel and no locomotive has yet been built with the proper design of furnace for this fuel. Stationary installations, where proper care is taken in designing the furnace, are uniformly successful.

The association decided that an effort be made to secure co-operation from Purdue University, the University of Illinois and the Bureau of Mines with a view to solving the problem of burning pulverized coal.

## Teamwork of Enginemen and Firemen

By M. A. Daly

General Fuel Supervisor, Northern Pacific Railroad

Engine crews dispose of nearly all of the coal used on the railroads of the United States. Approximately 95 per cent of all railroad coal passes through their hands. Nearly 130,000,000 tons of coal will this year be mined, hauled and placed on the tenders of locomotives. Into the locomotive fireboxes about \$434,000,000 worth of coal will be shoveled.

Some of the coal mined for the locomotives will not be delivered to the tenders, some of the coal delivered to the tenders will not be thrown into the fireboxes, and some thrown into the fireboxes will not be burned. Coal will be lost from cars en route from mines to coal docks, coal will be lost off the side rails, decks and end sills of the tenders, and unburned coal will be lost through the grates and through the smokestacks. A large percentage of those losses are avoidable. Just how much, however, may always be an unknown quantity. Nevertheless, many railroads are now recognizing that such losses are enormous, and that partial prevention is easily possible.

The value of a ton of coal may be carelessly considered in railroad operation, but the cost of each ton will inevitably take its deliberate bite out of the current operating revenues. Each morning in the United States 65,000 locomotives stand ready for service. At the close of each day \$1,190,000

worth of locomotive coal has been turned to ashes. Every ton of the coal contains a definite amount of potential draw-bar pull. How much of it is actually utilized in pulling cars will depend largely on the condition of the locomotive, the manner in which it is operated, and the skill with which the coal is placed on the firebed.

When a locomotive is properly maintained, properly operated and properly fired, it will not only require the least possible amount of fuel, but it will also deliver the highest possible character of service. All three of these points are of direct concern to road foremen and traveling engineers. In fact, these points embody the chief part of the work of those officers, for most railroad executives now hold that the principal duties of road foremen and traveling engineers are to develop economy in the use of fuel. Economical fuel operation is a mark of good railroading. It may be possible, perhaps, to have economical fuel operation without good railroading, but no more is it considered to be good railroading unless there be economical fuel operation.

The locomotive is not a one-man machine. Its operation requires two men. One is occupied in converting water into steam, while the other is manipulating valves which permit the steam to do the work desired. The two men work at the same time. It may almost be said that the steam is being used at the same time that it is being made. There being a limit to the steam storing capacity of the locomotive, when the engineman stops using steam the fireman stops making it. At least such should be the firemen's aim. The fireman should have advance information of the approximate time of closing the throttle, so that he may control the fire accordingly. The engineer should know that the fireman has this information and that he is guided by it.

Similar information should be common knowledge before starting trains. In this case coal should be placed on the fire a short interval before the locomotive is worked heavily. The successful engineer closely supervises the firing of the locomotive, especially at this time of the trip. The fire must be properly prepared and built up to anticipate the conditions to be met.

This business of fire preparation and fire control, like preventing the waste of coal that works out and drops off end sills of tenders, is the work of the fireman, but it is the engineer's responsibility to see that he does it. When you have an engineer who sympathetically and intelligently supervises the firing of a locomotive, you soon have a fireman who becomes more careful in his work. This, of course, is teamwork. Perfect teamwork is easy to recognize, but difficult to develop. First of all it requires the proper state of mind in the engineer. The engineer must be made to feel his authority and responsibility in directing the work of the fireman. This assumes the full support of his immediate superiors, especially road foremen and master mechanics, and in addition, the full support of their superiors.

It is common knowledge that locomotives make trips on which several tons of coal more are consumed than on other locomotives of the same class, on similar runs, in the same service, over the same piece of track, by other crews. The difference in consumption is in the condition of the locomotive or in the work of the engineer or fireman. Habitually close supervision of the fireman makes it much easier for an engineman to suspect that an engine is getting a little "off" on steaming qualities, when he may proceed to locate the trouble and have it remedied.

There is nothing new about these considerations. Teamwork is universally desired. To realize it is the thing for accomplishment. We all acknowledge the existence of irregularities in practice. These should be removed. This paper was written to ask you to give your opinions and convictions as to how these irregularities may best be removed, after we go back to our respective railroads.

## Locomotive Fuel Losses at Terminals

By J. M. Nicholson

Fuel Supervisor, Atchison, Topeka & Santa Fe Railroad

The fuel consumed by locomotives while in terminals is an incident of operation which requires a variable amount of fuel and has been given too little consideration for the quantity involved. The engineer and fireman, who are with the locomotive while from 75 to 90 per cent of the fuel is burned, have been charged with being very wasteful. The remaining 10 to 25 per cent is burned at the terminal in getting the locomotive ready for service and taking it to the enginehouse, much of which is the result of wasteful methods and practices.

Locomotives must be moved from yards to cinder pits, have the fires knocked, and be put in the house in order that necessary repairs can be made. They must be fired up and tests of locomotive auxiliary appliances properly made, after which they must be moved from the roundhouse to the train. These essential activities of operation require the use of fuel, but the fuel used in addition to that required for these purposes must be considered as waste.

When a locomotive is brought to a terminal the fire should be burned down to such a point that it will not be necessary to rebuild the fire in order to get the water level in the boiler to the proper height before knocking the fire. The dampers on oil burning locomotives and also coal burning locomotives, so equipped, should be closed as soon as the work at the cinder pit is completed and the blower shut off to reduce circulation of air through the boiler.

The roundhouse capacity should be such that no delay will be caused in getting the locomotive into the house. When a locomotive reaches the house a competent inspector should enter the firebox and see that the flues are clean and free from leaks. The arches must be clean and in repair. The grates must be thoroughly cleaned, and grates having broken fingers or excessive openings repaired or removed. The ash pans must be thoroughly cleaned and special attention given to see that the air opening under the mud ring is cleaned. The front end should be inspected to see that it is self-cleaning and free from air leaks.

As soon as the boiler and grate work is completed the grates should be bedded down with from three to four inches of coal evenly distributed over the entire grate area. The coal which falls through while bedding down the grates should be reclaimed. Tests show the coal reclaimed will vary from 80 to 200 lb. per locomotive, depending on the size of coal used and the amount of surface moisture on the coal. The coal can be reclaimed by collecting it in a bag fastened to the ash pan slide and removing the bag as soon as the grates are bedded down, or at larger terminals a pit on the outgoing track can be used for dumping this coal and conveying it into the car. A terminal handling fifty locomotives per day will conserve from fifty to one hundred tons per month by reclaiming this coal.

In case the boiler is to be washed, the heat in the boiler is entirely wasted unless the roundhouse is equipped with a hot water boiler washout system. A plant of sufficient capacity, if properly maintained and operated, will reduce the time consumed in the operations of washing boiler from 25 to 50 per cent and reduce the amount of fuel used in firing up from 25 to 30 per cent. The saving of from two to three hours' time in getting the locomotive back in service is an important factor under present operating conditions, as is also the saving of from 600 to 700 lb. of coal per locomotive.

In many cases where boilers are not due to be washed out engines are allowed to stand in the roundhouse twelve to fifteen hours before the time set for the locomotive to leave the roundhouse. During this time the heat in the boiler has been passed out through the stack unless a stack cover

is used or the dampers closed to prevent circulation of air through the boiler. This heat waste can be found in practically every roundhouse, and results in several tons of coal per locomotive being wasted each month. The time required to furnish a locomotive is greatly influenced by the pressure maintained in the roundhouse blower steam line. Insufficient pressure results in the use of more coal in firing up a locomotive and decreases operating efficiency. The use of old ties, old car material, shavings, etc., will reduce the amount of coal consumed and should be used where practicable.

The chief dispatcher should furnish the roundhouse foreman with a list of trains that he expects to run and the roundhouse foreman should furnish the dispatcher with a list of locomotives he expects to have ready. The exchange of these lists three times in twenty-four hours is advisable, after which the locomotives should be ordered for a scheduled leaving time, giving the roundhouse the necessary time to fire up the locomotive and call the engine crew. This will avoid holding locomotives under steam in cases where trains are set back or cannot be run according to the lineup. In cases where locomotives are fired up as soon as the work is completed and allowed to stand under steam for seven hours, the fuel wasted is equal to the amount of fuel that is necessary to furnish the locomotive for service. This is not an uncommon occurrence where dispatching schedules are not in effect and given close supervision.

The wages paid for one hour's terminal delay on a freight train is a loss equivalent to the cost of one ton of coal, also eight locomotive hours under steam in addition to the time actually necessary to get the locomotive ready for service is a loss equal to the value of a ton of coal. Every locomotive on a division is burning some fuel at the terminals that is unnecessary, and many locomotives are burning before each trip fuel of greater value than the loss of wages paid for one hour's terminal delay. If this loss were given as close supervision as is given the wages paid for terminal delay, the cost of transportation would be reduced. Superintendents should know personally that locomotives are not being held under steam unnecessarily on their division and that co-operation in dispatching locomotives does exist.

The fuel that is consumed as a result of lack of facilities for handling is a costly proposition, and adequate roundhouse and shop facilities should be provided. Repairs to turntables, roundhouses, coal chutes and tracks at the terminal should be made before cold weather sets in, as it may result in congested single track movement at coal chutes and cinder pits or tie up the entire roundhouse, all of which waste fuel. Proper care of a fire in the roundhouse contributes to economic locomotive performance on the road and also reduces the amount of fuel used at the terminal. The locomotive appliances should be tested out before leaving the roundhouse for the train to see that they are in the best possible condition to do their work, which means a saving of fuel on the road that, in most cases, cannot be accomplished after leaving the terminal. The train line leakage should be determined and the leaks repaired at the terminal. Train line air leaks cost a railroad company much more than it costs to repair them.

Locomotives should be maintained to prevent serious steam, air and water leaks. Throttles leaking, pops leaking and air pumps running in the house are to be avoided. All of the operations at a roundhouse contribute to fuel economy, and men should be impressed that neglect on their part often results in a waste of fuel greater than their day's wages before the locomotive reaches the next terminal where proper repairs can be made.

The amount of coal required for the period of firing up a locomotive and getting it ready for service under careful handling should be determined. The actual consumption

against the required consumption is the fuel efficiency of the dispatchers and the roundhouse organization. This efficiency is not a maximum, even on the best managed and best equipped roads. The magnitude of the amount of fuel involved in these losses should provide a strong incentive to renewed effort in fuel conservation as these conditions of fuel waste are decreasing operating efficiency and increasing the cost of transportation.

### Discussion

Considerable discussion was brought out relative to the maintaining, banking and knocking or dumping the fires in locomotives brought into terminals, and also the use of covers or dampers on locomotives for fuel saving purposes. F. P. Roesch, fuel supervisor of the Northwestern region, stated that tests which were made on roads in the Northwestern region showed a saving in fuel by maintaining the fire in the locomotives brought into terminals when they remained for a period of eight hours. For locomotives remaining in for a period of 16 hours, a saving was accomplished by banking the fires. For those locomotives remaining in for a period of 24 hours or more, the fires should be dumped or knocked. He said further that good results had been obtained on some roads by using stack covers, but these should be provided with holes to permit some circulation.

S. Bisbee, fuel supervisor on the Boston & Albany, stated that his experience showed that the locomotives had to be turned over so rapidly for further use that they were not able to dump the fire and that he did not believe in dumping fires unless the locomotive remained in for a period greater than 30 or 36 hours. He also rather questioned the advisability of stopping the stack with a cover or damper with a fire in the locomotive. He further stated that firemen should estimate the amount of fire required in the locomotive for the maximum amount of work the locomotive may be expected to do when brought into a terminal. Another speaker stated that it was the practice of one road to prepare a weekly statement to show an estimate of how much coal would have been burned had the fires not been dumped or banked. Recent estimates showed that approximately 2,-000,000 lb. per week would have been burned.

J. J. McNeill, supervisor locomotive operation on the Erie, stated that fires should be banked when locomotives are in the terminal less than 20 hours and dumped when they are to remain in for a longer period and also that considerable saving in fuel could be had by proper banking. He further stated that in making tests the results should be reported not only to the officers but also to the men who help to make the tests. In this way a system of co-operation of considerable benefit is brought about.

### What Can a General Operating Officer Do to Promote Fuel Economy?

By F. H. Hammill

General Superintendent, Northern District, Union Pacific Railroad

This country in the last century has made wonderful progress along all lines, and no phase of this development has been of greater magnitude or of more importance than that of transportation. When we stop to think that within practically a lifetime there have grown up lines of transportation extending over 260,000 miles, spreading through nearly every county in every state in the Union; when we stop to analyze the tonnage that must be handled over these lines, and that the figures indicate that the increase in tonnage handled in one month of the year 1917, over that of the corresponding month of the previous year, was greater than the total gross tonnage handled by the railroads of England, France, Germany and Switzerland, it brings out somewhat the

magnitude of the transportation problem in this country.

At our last annual meeting one of the prominent mechanical men of the country, while addressing this society, stated that we "were to be congratulated for the privilege of living in this age and at this particular time. There never was a time when history was being made so rapidly, when men were doing so much, nor when so much was required of them." When we stop to fully analyze this statement, how truly it applies to the transportation problem! The founders of our government, when encouraging the enterprise of linking the ends of this country together, little appreciated the great value, especially in times such as we have just passed through, of adequate transportation facilities, manned by well trained, experienced officers and men. Until this critical time arrived, the coal producer hardly appreciated the value toward increased production and the financial success of his property, of a well equipped and well managed transportation department. This same thing was true of the manufacturer, the wholesaler, the retailer and the producer of every known commodity.

The past few months have been very profitable in bringing home to those requiring transportation its value in the development of their business. Likewise, the same recent months' experience should, and I feel has, brought closely to the mind of those directly in charge of transportation their responsibility for transportation, and their duty toward the public in giving the benefit of their years of experience toward developing the maximum transportation facilities.

It is an unquestionable fact that during the past few years men in charge of transportation properties in this country have been confronted with many difficulties and sometimes most discouraging problems. They knew from their years of experience and their ability to anticipate just what would be required in the way of added facilities, effort and financial requirements. On the other hand, they were confronted by difficult problems, which prevented them from conducting their plans as their experience and knowledge best dictated. We, therefore, confidently feel that the past few months have been of great benefit, not only in the development of a realization of the importance of reliable transportation facilities but also in bringing out what each individual connected with transportation owed to the public and to his country in developing the best, most reliable and yet cheapest transportation facilities that could be produced, in order that business might expand and our country continue to prosper.

The future, as we see it, is going to present even greater problems to the management of our railroads. Expenses in the way of labor charges are pretty well fixed and will permit of little reduction for economy. Prices of material will continue on a much higher level than in previous years. On the other hand, the public has learned the value of and the need for the best of transportation, and is going to be insistent on its requirements being met. The problem must resolve itself, therefore, into the development of every avenue of legitimate economy through more detailed study of every item of expense of railroad operation.

Records clearly show that next in importance to labor expense is that of fuel. When we recall that in the year 1917 there was produced in the United States approximately 621,000,000 tons of bituminous and anthracite coal, of which about 175,000,000 tons, or 28 per cent, was consumed by railroads, this statement cannot but bring home very forcibly the duty of the general transportation officer in promoting fuel economy.

A properly organized fuel department, having the lively interest and co-operation of the operating department, can, through careful study of all the details, be productive of very noticeable financial returns. It is our judgment that the question of fuel conservation presents one of the most important and necessary avenues for needed economy. It should and properly does bring forcibly to the minds of

general operating officers what they can and must do to study this problem in order that we may avail ourselves of this needed economy.

### Discussion

The discussion of this paper dealt largely with the question of establishing co-operation between the various departments and the men in the ranks by means of educational and co-operative meetings. A. D'Heur, manager fuel oil department, Southern Pacific, stated that staff meetings are being held on that road every 30 or 60 days which are attended by the enginemen who have the best fuel records according to the performance sheets. He stated that the tendency has been to create better co-operation and a greater interest among the men in their work. He presented the following figures to show fuel savings during the past few months on one division: January, \$9,321.00; February, \$12,950.00; March, \$17,485.00.

### Certain Essentials

By Eugene McAuliffe

Manager, Division of Operation, Fuel Conservation Section  
United States Railroad Administration

I wish today to say a few words on certain compelling features, which if attended to will accomplish more in one year towards effecting fuel and operating economies than has been accomplished in the past five years. Briefly, the outstanding essentials of the railway fuel problem, as I see such, are:

*Clean Coal.* Buy clean coal, get clean coal. There is not a coal contract in existence that does not suppose the delivery of the cleanest coal that the particular mine from which the purchase is made is capable of producing. Do not ask from the coal producer the impossible, but insist on the possible. Tests have proved that with coal containing 12.5 per cent of ash taken as 100 per cent, the relative efficiency falls as the ash increases until coal with 40 per cent of ash marks a total lack of efficiency. At the mine face or on the mine tippie, is the place to clean coal. The excess and removable non-combustible matter can be separated cheaper there than in the locomotive fire box. Let the producer do the cleaning, such is a proper part of the cost of production. I have found on a majority of roads an insufficient and frequently untrained inspection force. The roads which most need an inspection force are most lacking in this respect. Ninety-nine per cent of the coal operators, all that are worth considering, will appreciate the help that an intelligent inspection force can give them. Good inspection supposes many things, including contract, quality, weights, clean equipment and proper class of equipment.

*Distorted Valve Motion.* The next cheapest thing we can do is to organize the work of establishing and maintaining a proper distribution of the steam made from the coal purchased. I commend to your attention the paper written by J. W. Hardy, on fuel losses due to defective valve motion, then read the circular just issued and immediately proceed to carry out the simple recommendations therein contained.

*Air Leaks in Locomotive Front Ends.* On August 1, 1918, the Fuel Conservation Section issued Circular No. 8 calling the attention of motive power men to the fuel losses that result from air leaks in locomotive front ends, particularly, those that surround the steam pipes where they leave the front end. The recommendations contained in this circular were followed in some instances; in others, ignored. A locomotive suffering from front end leaks invariably fails unless her guardians have compromised with her cost of keep and earning power by choking the nozzle.

*Distorted Draft Apparatus.* A limited survey of the interior of locomotive front ends can be easily made by looking down into the stack when the engine is cool, using a common flash light. This casual inspection, if made, will astonish many of you. Here again we lack organization and method. Distorted draft apparatus invariably indicates shiftlessness.

*Stopped Up Flues, Grates and Ash Pans.* Another essential has been covered briefly by the recent Fuel Conservation Section circular dealing with stopped up flues and choked superheater unit tubes, choked air openings in grates, and restricted air inlets in ash pans. An insufficient air opening in the ash pan represents a defect in design; the rest represents defects in execution. These conditions again result in the application of the well known remedy, choking the exhaust nozzle, with the result that the engine struggles part, or all the way over the division, at the expense of the fuel bill, delaying the reduced tonnage handled, with corresponding delays to opposing trains which are sidetracked at meeting points to wait for the crippled engine.

*The Superheater.* Another essential I wish to speak of relates to the proper maintenance and handling of what is the most substantial fuel saver ever put on the American locomotive, i. e., the superheater. The purpose of the superheater is to conserve fuel and water, and to increase the general efficiency of the locomotive. In some instances, this result is obtained to the extent of 100 per cent, the measure of efficiency shading off in other cases until the apparatus is frequently not able to absorb the load of improper locomotive maintenance put on its shoulders. Certain engineers carry water levels so high as to transform the superheater into an evaporator, getting the train over the road at the expense of much fuel and a few additional tanks of water. We have found superheater units not only improperly installed, but poorly maintained, and often they are not tested with sufficient frequency to locate the steam leaks that occur in the front end when the engine is working. The Fuel Conservation Section recently issued a circular on superheater losses; they deserve your best attention.

*Back Pressure Losses.* A condenser cannot be used on a locomotive and the limitations that surround the locomotive necessitate a restricted exhaust in order that a sufficient rate of combustion can be maintained with a relatively small boiler, generating many hundreds of horse power. Under the conditions that commonly obtain, of all the fuel that is used in the locomotive, only about six per cent is available for use in moving freight or passengers. Excess back pressure losses, therefore, apply against the 6 per cent saved for tractive purposes. Under the circumstances, why cripple the locomotive by choking the exhaust to offset lack of proper adjustment of draft apparatus, the closing of air leaks in front ends, the cleaning of tubes, super-heater flues, etc.?

*The Old Type of Locomotive.* Many of us began with the Eight wheel type of locomotive with low steam pressure and small firebox and grate area. These little engines had no fuel saving devices but they played their part in the greatest peaceful drama the world ever saw, the building of the Western Empire. Too many light locomotives have been scrapped in the past, instead they should have been modernized and kept in service suited to their capacity. In many instances locomotives too heavy for the job are employed to the detriment of train mile costs and the permanent way. The fuel saving attachments developed in recent years, with the exception of the compound air pump, only earn when the locomotive is moving, and it is very probable that improvements of the above character, if applied to the existing light locomotives now lacking them, would pay an equal or greater return than is being received from their application to the more modern locomotives. We frequently overlook the fact that the heavier types of loco-

motives, of which these devices are considered an essential part, makes a lower average mileage than the lighter, and consequently more mobile type of locomotive.

In conclusion, I wish to suggest the absolute importance of bringing every locomotive now in service, or that will be required for the service, up to the maximum standard of efficiency. I have been told that the work of applying superheaters and brick arches under order, and in some cases, in stock, has been held up on certain roads because of insufficient funds to apply them. This is unfortunate, and I trust the condition will be quickly remedied.

### Dirt in Coal

By L. J. Joffray

General Fuel Inspector, Illinois Central Railroad

The ash content in coal varies widely in different localities and frequently there is considerable variation in the same locality under different conditions of mining and preparation. The normal amount of ash may be considered as that found in the face sample of the seam proper; the excess ash is that which is added to the coal from the roof or bottom in the process of mining and which is not eliminated before the coal leaves the mine.

Lump coal made over an inch and a quarter (1¼ inch) screen usually shows the normal per cent of ash, while the inch and a quarter (1¼ inch) screenings in most cases shows one and one-half times the percentage of ash contained in the lump.

The ash content in screenings can be reduced nearly to that of the screened lump by the use of a jig gravity washer, with an ample water supply and a convenient place to deposit the refuse. However, the washing of screenings has been considered too expensive while the price of all coal was low, but since prices have gone 60 per cent and more higher, and will probably remain so, it may be well, and at the same time profitable, to eliminate the excess ash by washing in the vicinity of the mines, thereby saving the use of cars for and the long haul on inert material to points where coal is finally consumed, the cost of which would be about six mills per ton mile.

The following table showing ash and B. t. u. content of coal from a bituminous mine in the central west district illustrates how the ash content of screenings can be reduced by washing:

Coal from one mine in Central West—	Ash	B.t.u.
Dry or unwashed screenings.....	22.61%	8,895
Washed screenings.....	14.05%	10,085
Lump.....	12.39%	10,499

The excess ash in mine run and prepared sizes, made over an inch and a quarter screen can easily be removed by hand by the miner at the working face when loading into mine cars, or by having men or boys working on picking tables or belts while the coal is passing to the railroad car.

The performance of this work can be looked after by a regularly assigned fuel inspector. We are using a system of close inspection with suggestions to the mine superintendents on the ground while the coal is being loaded. As a result of this effort, the impurities removable by hand picking and based on actual carload tests have been reduced from an average of 2.733 per cent in the year 1911 to an average of 1.535 per cent in the year 1917, or a net reduction of 1.198 per cent which applied to a consumption of 4,000,000 tons of coal used annually represents 47,920 tons less ash, requiring the use of 958 fifty-ton cars to move it. The transportation cost of moving this excess ash an average distance of 266 miles, based on an "out of pocket" cost of five mills per net ton mile, equals \$63,733.60 per annum. This, however, is but the lesser saving.

Taking the established estimate of increase in efficiency of 1½ per cent for each reduction of 1 per cent in ash, the saving from this source, i.e., increased evaporative efficiency, with coal at a delivered price of \$3.68 per ton equals \$264,-518.40, or a total saving of \$328,252 per annum. What the measure of the economies following from reduced engine failures and reduction in enginehouse expense amount to are difficult of computation.

### Elements of Ash

The effective combustion of coal depends largely on the nature and per cent of impurities it contains, especially so if the ash has a tendency to clinker, which is dependent on the percentage of silica, iron and lime in its composition. Tables I and II give analyses of coal and ash used in ten burning tests from ten different mines in Illinois and Indiana.

TABLE NO. I  
ANALYSES OF COALS

Test number	Moisture, per cent	Volatile matter, per cent	Fixed carbon, per cent	Ash, per cent	Sulphur, per cent	B. t. u.	Clinker?
1	3.37	31.31	55.19	9.63	.64	12,325	No
2	6.02	30.00	53.59	10.30	1.30	12,136	No
3	4.61	31.35	54.05	10.00	1.19	12,368	No
4	2.92	33.10	51.25	12.73	2.96	12,389	Yes
5	4.99	39.22	43.99	11.80	4.43	11,768	Slightly
6	3.41	37.12	45.62	13.85	4.02	11,842	Yes
7	5.13	37.70	44.31	12.80	4.52	11,693	Yes
8	2.86	36.04	43.14	17.96	4.58	11,124	Yes
9	8.49	34.87	48.16	8.48	1.47	12,251	No
10	4.68	38.59	44.24	12.49	4.50	11,921	Yes

TABLE NO. II  
ANALYSES OF ASH

Test number	Sulphur per cent	Silica Oxide (SiO <sub>2</sub> ) per cent	Iron Oxide (Fe <sub>2</sub> O <sub>3</sub> ) per cent	Alu- minum Oxide (Al <sub>2</sub> O <sub>3</sub> ) per cent	Calcium Oxide (lime) (CaO) per cent	Mag- nesium Oxide (MgO) per cent	Color of ash
1	.64	59.0	3.1	31.0	5.6	1.3	White
2	1.30	55.2	8.3	26.6	7.3	1.3	White
3	1.19	56.1	8.1	27.2	5.4	.9	Light gray
4	2.96	45.4	25.3	16.9	11.6	.8	Reddish gray
5	4.43	49.1	32.2	13.5	4.5	1.4	Reddish gray
6	4.02	35.1	22.4	10.7	30.8	1.5	Reddish gray
7	4.52	43.3	24.1	9.0	19.9	1.2	Reddish gray
8	4.58	44.8	20.3	18.6	16.4	1.5	Reddish gray
9	1.47	45.8	20.2	28.3	5.4	0.0	White
10	4.50	27.1	52.3	14.1	4.4	1.2	Dark gray

Fusing tem. deg. F.	239	3227	2840	3416	3452	3882	.....
---------------------	-----	------	------	------	------	------	-------

Table I gives the usual proximate analyses of the coals. Table II gives analyses of the ash. By referring to the column showing the clinkering and non-clinkering coals and then making a review of the ash table, we observe that the coals with non-clinkering ash are low in both sulphur and lime. In burning they did not clinker in a dazzling white fire of an approximate temperature of 2,900 degrees F., while the ash in the clinkering coals fused at a firebox temperature of approximately 2,200 degrees F., which indicates clearly that when the sulphur and lime content exist in high proportion to the silica, iron and aluminum oxides, it is the direct cause of the ash fusing at the lower temperature.

The bottom line of Table II shows the fusing point of the sulphur and the different oxides. From this it will be seen that by taking each element separately the fusing point is at a higher temperature than is usually obtained in the furnace of a boiler. However, by combining these elements in proper proportion with the sulphur, fusion at a much lower temperature will take place.

The conditions of these ten experiments as to draught, etc., was identical in each case. However, I have since observed that either one of the coals containing the clinkering ash will give better results both as to combustion and reduction of slag in the ash by increasing the draught, which increases the flow of air through the fire bed and has a tendency to keep the temperature of the fire below the fusing point of the ash. Hence it is always good policy to assign the clinkering coals to a lower class of service, as switch engine, local freight, and other light runs.

### Address of Frank McManamy

Under the law the position of the Railroad Administration is in many ways analogous to that of a tenant, the landlord being represented by the corporate interests. The landlord whose rental is fixed (in this case by Act of Congress) naturally hesitates to make extensive and expensive improvements which do not have the effect of increasing his revenue regardless of the saving they may effect for the tenant; for that reason more than for any other it is necessary for us to do our very best to make our savings with the equipment, with the facilities and with the organization we now have.

It is comparatively easy to make a substantial saving in the cost of locomotive fuel by wholesale application of recognized fuel saving devices as for example, the brick arch and the superheater, and the Railroad Administration is in favor of such improvements and has worked out a very definite program along that line. Unfortunately, however, the application of these devices involves charges to capital which must be borne by the railroad corporations and probably for the reasons stated, the acceptance of these charges by the corporation is not always easily obtained; therefore, the progress being made in this direction is not entirely satisfactory. But even if we are denied the privilege of installing those improvements which we know will effect fuel economy there is no reason why we should not maintain in as thoroughly good condition as we know how these devices with which locomotives are equipped, nor is there any reason why we should not make every effort to save fuel by eliminating all waste of steam and water.

Broadly speaking conservation of fuel from the Railroad Administration standpoint requires careful supervision by the Fuel Conservation Section and close co-operation on the part of practically every department in the Railroad Administration, and in this the International Railway Fuel Association can be especially helpful. Fuel economy like practically all other economies is not as a rule accomplished by saving one huge sum, but the huge sum which it is possible to save is made up of the accumulated results of many small and what may sometimes appear as insignificant items. We gain nothing from conventions unless we make use of the knowledge obtained. It is comparatively easy to attend a convention of this kind, participate in the discussion and bring out some of the most valuable points in connection with conservation of fuel during a three or four days' session, but it requires real courage and perseverance as well as enthusiasm to go back home and for the remaining 360 days of the year consistently and persistently practice what we preach here.

Conservation of fuel is one of the important matters before the Railroad Administration during the period of government control and will be no less important when that period has passed. It is the desire of the administration to have the sympathetic co-operation of the International Railway Fuel Association and all of its members as individuals in effecting what will make for the conservation of fuel. It is the desire of the administration to co-operate with the members of the International Railway Fuel Association in everything that relates to the purchase, inspection, weighing, distribution, handling and accounting for fuel, as well as in its economical use to bring about the greatest possible saving.

The Railroad Administration will aid in every possible way by urging the proper maintenance of locomotives, the application of fuel saving devices and otherwise modernizing them and will be helpful in every other way that a central organization can be helpful under the present method of operation, but if we are to be successful we must have team work in getting the very best we can out of what we have got.

[The report of the proceedings of the convention will be continued in next week's issue.]

# New York Railroad Club Has Foreign Night

Papers Presented by Heads of Russian and Japanese Railway Commissions and on the Lines in Bolivia

THE NEW YORK RAILROAD CLUB at its monthly meeting on May 16, introduced a new idea in railroad club activities by having a program of speakers on railway conditions in other lands. Papers were presented on railway conditions in Russia by A. I. Lipetz, chief of the Russian Ministry of Ways and Communications in this country; on the railways of Bolivia by Philip W. Henry, vice-president of the American International Corporation, who was at one time president of a company which constructed many miles of railway in that country; on Japan by K. Yamaguchi, an officer of the Japanese Imperial Government Railways and at present the resident representative of that system in New York, and by Fred Lavis, consulting engineer of the American International Corporation who presented stereopticon views illustrating railways in Spain, Mexico, Argentina, and Colombia, in all of which countries Mr. Lavis has been engaged in railway construction work. A large attendance at the meeting evidenced the interest which railway and railway supply men are showing in export trade.

Abstracts of the papers follow:

## The General Railway Situation in Russia

By A. I. Lipetz

Chief, Russian Ministry of Ways and Communications in the United States

The Russian Railway system, before the war, comprised 43,810 miles of line, or only a little more than one-sixth of the mileage of the railways in the United States. It is noteworthy, however, that it had the second largest mileage of any country in the world. Of the 43,810 miles in Russia, 36,540 was in European Russia and 7,270 miles in Asiatic Russia. The latter mileage included four principle roads—the Trans-Siberian, the Amur Railroad, the Tashkent and the Middle Asiatic Railroad. In addition, there were a few roads of lesser importance, such as the Orsk, Troitzk, Altai, Kooloondine, Kolchooghin, Atchinsk-Minoosinsk and Southern Siberian. These roads are each from 120 to 450 miles in length and some of them are under construction. In using the expression "of lesser importance," I mean to say that they are not trunk lines as are the first four mentioned. Still they are of great value as feeding lines and for connecting the trunk lines with rich territories in Siberia.

The greater part of the mileage—36,540 miles, as above noted—is in European Russia, excluding Finland, but including Russia proper, part of Poland (so-called Russian Poland), Lithuania, Ukraine, Crimea and Caucasus. About two-thirds of the entire Russian system belong to the government and one-third to private companies, but even the privately managed roads have been under government control, in so far as the technical operation and the tariff regulations are concerned, and, to a certain extent in regard to administration and financial operations.

During the six years just preceding the war (1908-1914), the Russian railroads were very much improved. From a system which was a burden to the government treasury, it was turned into a system making a considerable profit. Many new lines, governmental and private, were constructed during that time and very considerable improvements were made in the rolling stock, in the methods of operation, and in the

regulation of traffic. Since 1912, all new railroads have been constructed in accordance with a plan which had been very carefully worked out in advance and which took into consideration the proper development of the country and of its rich territories and also such problems as the colonization of uninhabited regions in Russia. In 1916, during the war and a few months before the revolution, a new plan was adopted, including provision for railroads which were to be built in the five-year period (1917-1922), and in a succeeding five-year period from 1922-1927, and also railroads for strategical purposes. An appropriation of three billion roubles (one and a half billion dollars) was made by the Duma for the railroad construction during the first five-year period.

## Equipment

The Russian railroads had 22,700 locomotives which were of good design and workmanship, as heavy as the bridges and the roadbed would permit, and equipped with the more modern improvements which have been generally adopted. For instance, in 1910, 570 locomotives or 2.5 per cent of the total number of locomotives were equipped with superheaters, while in the United States only 360 locomotives or 0.6 per cent were thus equipped. In 1893, we started to build standard types of locomotives and in 1914 there were 7,376 locomotives or 32.5 per cent of the total number, which were of practically one type, the so-called "normal" slow freight engine. Of standard fast freight engines, there were 1,300 or 5.7 per cent of all the locomotives in service. Then there were 600 slow heavy freight locomotives. In 1915, we designed and had built in this country 1,075 Decapods, the standard fast heavy freight engine.

Practically all freight cars were of a standard type—the so-called "normal" freight car—which has proved quite satisfactory for local conditions on Russian Railroads, for over three decades. The dead weight of this car is only 42 per cent of its capacity. This, I believe, is the lowest ratio of any freight car ever built in such great numbers.

All of these cars are pooled over the entire system. Every railroad possesses a certain number of cars but this does not mean that specific cars are in its actual control, but rather that that number of cars is assigned to it. The idea is that each railroad is entitled to the use of 100 per cent of the cars owned by it; if, therefore, one railroad delivers a certain number of cars to another road, the receiving road is obligated to deliver to the first road at the same point and on the same date, from midnight to midnight, an equal number of cars. If it delivers less, a penalty of \$1.50 for each 24 hours is charged against the delivering road by the receiving road and the difference must be offset by the delivery of extra cars on the following day. If the road fails to do so, day after day, the question is referred to the operation department of the Central Railroad Administration and relief is extended by commandeering cars from another railroad or by increasing the number of cars owned by the railroad which is short and supplying the new cars from the builders. The periodical inspection and repairs take place wherever the cars happen to be at the particular time and the cost is charged to the railroad which owns the cars at a certain schedule of rates. This system, which has been in general use in Russia for more than 30 years, is aimed to reduce the waste of car transportation and reloading and to simplify car accounting. A member of the American Railway Commis-

sion to Russia states that "having served on the Committee of Regulation between Railroads for 10 years, I have no hesitancy in saying that the Russian pooling arrangement is far advanced over the American method of handling freight cars."

### Results of the War

War conditions have changed the Russian railroads very considerably. The traffic has changed entirely. Before the war, grain was carried from central European Russia and the Southeastern granary to the Baltic and Black Sea ports; coal moved from the Baltic ports and Southern Russia to Central Russia; manufactured goods from Western, Northern and Southern Russia to Central Russia, Siberia and Middle Asiatic Russia; Siberia had very little traffic as compared with European Russia. With the beginning of the war, the traffic to and from the Baltic and Black Sea ports ceased to exist; coal had to be carried from southern Russia all over the country; huge quantities of ammunitions and foodstuffs had to be moved from all portions of the country to the extreme West—the battle lines; and Trans-Siberian railroads from Vladivostok and railroads running from the northern ports—Archangel and Murmansk (constructed during the latter part of the war) became very active because of the immense new import business. The number of locomotive miles and car miles increased by 22 per cent as compared with the pre-war times. The number of locomotives had increased only 1.5 per cent and the number of cars 3 per cent more than before the war, but the number of cars and locomotives in good order in 1916 was from 3 to 8 per cent less because of the shortage of material and skilled help in the works and shops—conditions which were also experienced in this country during the war. As we all know, a continued orderly traffic is possible when the requirements of movements of goods, the necessary rolling stock for the required movement, the facilities for the manufacturing of material and spare parts for the upkeep of the railroads, and the movements of goods for industry balance each other. Within reasonable limits, there may be fluctuations when one or the other of the above-mentioned factors can be overstrained for a certain period of time; when this strain is extended beyond a reasonable limit, transportation is subjected to a disturbance and later to a disorganization. This happened just before the revolution in March, 1917, and during the revolution, and whatever was saved was later destroyed by the general disorganization and demoralization of the whole economic life of Russia under the Bolshevik regime.

### Present Conditions in Bolshevik Russia

For further consideration of the Russian railroad situation, it is advisable to consider the country as divided into two parts—one under the Bolshevik control and the other, including Siberia and parts of Russia, under the control of the anti-Bolsheviks. We have no recent information about the railroad situation in European Russia but such information as we had received indicates that the situation is indeed desperate. The railroads are disorganized to the limit, the trains run only occasionally when a roundhouse can supply a locomotive and there is sufficient coal. On some roads trains are not moving at all, and on others all ordinary train movement is suspended in order to give precedence to trains with food supplies for the cities. The total number of locomotives now in operation is below 4,000, out of a total of 21,000 in European Russia; in other words, 82 per cent of the locomotives are in bad order. Locomotives cannot be overhauled because of the lack of material and spare parts. They cannot be replaced by new locomotives as the locomotive works are practically at a stand-still.

Passenger cars are so badly worn out that very few of them are suitable for carrying passengers; indeed, such pas-

senger traffic as is handled is largely in freight cars, or in so-called "teplooshkas." The latter is practically a standard freight car equipped with a stove and having double walls to retain the heat. These cars are always overcrowded and traveling in Russia for long distances is accompanied by great inconvenience and distress. The last information that reached us was to the effect that the Bolshevik regime managed to introduce some order on the Nicholas Railroad between Petrograd and Moscow and on a few other roads and that there is now on some roads a regular service of one or two good passenger trains daily; this, however, is an exception which proves the general rule. There are no financial or similar problems on the railroads. The wages are as high as the workmen's committees are pleased to make them and the expenses, no matter how large they are, are covered by paper money from the state banks. The result of this is that Russia, which exported yearly about 8,000,000 tons of grain or 12 per cent of its total production, now faces general starvation in large cities because of the disorganization of the transportation system.

### Better Conditions in Siberia

The situation in Siberia is very different. The railroad in that section have been considerably disorganized by the Bolshevik but about a year ago the loyal Russian forces drove out the Bolshevik from the territory served by the Trans-Siberian railroad and the reorganization of the transportation system started at once. Fortunately, the Russian Deputy Minister of Ways of Communication, L. A. Oustrugov, happened to be in Siberia at that time and a new Ministry of Ways and Communications was organized at Omsk. As soon as communication was established through Siberia the Russian Mission of Ways and Communication in America started to ship material from Seattle and New York to Vladivostok. This included rails, locomotives, cars, various kinds of machinery, and large quantities of spare parts for locomotives and cars. From November, 1918, to the present time, we have sent to Russia nine complete ship loads and partial shipments on other ships. All together we have shipped 43,600 tons and we have about 20,000 tons waiting for future shipments.

The news we receive from Siberia indicates a general improvement in the situation. New railroads have been built or are under construction as, for instance, the Semipalatinsk-Sergiopol and the Petropavlovsk-Kokchetava or the South Siberian Railroad from Orsk to Semipalatinsk, the construction of which was stopped during the revolution but has now been resumed. A new department at least for Russia, is a colonization department, which is developing plans for the colonization of Siberia. Trains are running on regular schedules; the once famous weekly Siberian express, made up of eight passenger cars and dining car, is running again from Chelabinsk (Ural Mountains) to Vladivostok, covering a distance of about 4,800 miles in nine days. Service is not as good as it was before the revolution, but it is better than it was in 1918. The Omsk Ministry of Ways of Communication is now considering the addition of another weekly express train from Omsk to Vladivostok. The other passenger trains and freight movement are now fairly regular—about 4 or 5 trains daily in each direction according to the latest advice in March, 1919. In other words, about 150 cars leave daily from Vladivostok for the interior of Siberia. This is even more than the traffic before the war and 50 per cent of the traffic during 1915-16. It is true that this schedule is not ample for the traffic demands as, of the 150 cars, only 10 can carry private shipments; the remainder of the cars are loaded with goods for the account of the war department, railways, zemstvos, cities and municipalities; these have preference over private shipments. Such were the conditions in March.

The winter was a very cold one in Siberia and the railroads suffered greatly from this and from the lack of coal which could not be delivered. When the weather became milder in March, the Omsk Railway Administration renewed its activities in re-establishing full service and also in rebuilding the railroad bridges which had been destroyed by the retreating Bolshevik and were recaptured by the Omsk government on its drive toward Perm and the northern part of European Russia. The organization of the Trans-Siberian railroad is as follows: There is in Omsk a Ministry of Ways of Communications with Mr. Oustrougoo, whose name I have already mentioned as Minister. He is also chairman of the Inter-Allied Committee for the Supervision of the Trans-Siberian Railways in the zone in which the Allied military forces are operating. Under the control of the Inter-Allied Committee is a technical board with John F. Stevens as president. A Russian manager or director with other Russian officials remains at the head of each railway under the authority of the existing Russian law. In matters of a technical operation, the president may issue instruction to the Russian and other officials on the railroads and may assign, if necessary, corps of railway experts to the offices and the more important stations. The experts are chosen from the Russian Railway Service Corps, which is composed of American railroad men, sent to Russia in 1917. At that time there were 220 men under Colonel George Emerson, but the number has since been reduced to 150.

#### The Loan of \$20,000,000

The activities of the Interallied Committee began formally last February. Up to that time John F. Stevens, with Colonel Emerson and the men of the Russian Railway Service Corps, did practically the same work as is now being done by the committee. They were making use of the material we have shipped and of what they could get in Russia. Now a loan of \$20,000,000 is under consideration, to be extended by the Allies for purchasing material necessary for the upkeep of the Siberian Railways. As the railways are in good condition—many new locomotives and cars and spare parts for this new equipment are being shipped—the loan will help very materially to improve the situation by supplying the railroads with spare parts for existing equipment and with material for running trains. The situation will be relieved, I hope, during this summer, and this will help to accelerate the regeneration of Russia by way of Siberia; this was predicted by many Russians over a year ago.

#### The Railways of Bolivia

By Philip W. Henry

Vice-President, American International Corporation

The first railway connection of Bolivia with the outside world was through what is known as the Antofagasta (Chile) Bolivia Railway, one of the best paying railways in South America, owned and operated by British capital, controlling practically the entire railway system of Bolivia, and terminating at Antofagasta, now one of the principal ports of Chile, but, prior to the war of 1879 between Peru and Bolivia against Chile, a port of Bolivia. One interesting thing about this railway is that its main line, extending from Antofagasta to Oruro, Bolivia, 573 miles, was constructed of 30 in. gage, and is still operated at that gage, although between Uyuni and Oruro, 195 miles, a third rail was placed several years ago in accordance with an agreement with the Bolivian government to adopt on that section the same gage (one metre) as the lines of the Bolivia Railway, which it had recently acquired.

Notwithstanding this narrow gage, the railway company has a very comfortable dining and sleeping car service. In

fact, from personal experience, I can testify that, for comfort in traveling, the through train between La Paz and Antofagasta, 718 miles, is equal to that of first class trains in the United States, although the running time is very slow, the schedule being 43½ hours up and 39½ hours down, with a through train running only once a week. This, however, is not uncommon in South America, for the through service three years ago when I made the trip between Buenos Aires and Santiago, Chile, was only once a week. Many trains are scheduled for two or three trips a week.

#### Rising 13,050 Feet in 223 Miles with

#### Only 2 Per Cent Maximum Grades

From a physical point of view the most astonishing thing about this railway is, that starting at sea-level and passing over a summit of 13,050 ft., 223 miles from Antofagasta, the grade is so regular that the maximum is only 2 per cent, and this pertains only to the first 18 miles out from Antofagasta, where the ascent in that distance is 1,800 ft. Beyond that to the summit there is almost a continuous grade of little more than one per cent. Another surprising thing is the fact that from Antofagasta to La Paz, 718 miles (with the exception of the last six miles) the grading was remarkably light, with few bridges over 100 ft. span, one of these being a high, but short viaduct, over the Loa river, 148 miles out from Antofagasta. I doubt if there is any railway in the United States of this length with so little grading and so few bridges, with no tunnels whatever.

Going into La Paz itself for a distance of six miles, with a drop of nearly 1,000 ft., there is some very heavy work, but on the other 712 miles the work is extraordinarily light. Another interesting feature is that for the first 200 miles it passes through territory which practically has no rain, and therefore the drainage problem is reduced to a minimum. As there is good ballast along the line, with practically no culverts or bridges, the maintenance of way gives little concern. Seventy miles from Antofagasta, at an elevation of 5,000 ft., the railway enters the nitrate district and continues for the next 30 miles. Of this material it carries a million tons a year (pre-war conditions) to Antofagasta, a haul averaging 87 miles, all down grade, for which it obtains \$1.82 per ton or somewhat over 2 cents per ton per mile. This, of course, is very profitable traffic, and one reason why the Antofagasta is one of the best paying railways in South America. The average earnings of the entire system, before the war, were around \$11,500 gross per mile with an operating ratio of from 50 to 55 per cent.

Next to nitrate in tonnage comes coal carried from the seaboard to the interior, and then come ores of silver, copper, tin, bismuth, tungsten, antimony, with such general merchandise, supplies and machinery as are needed for the railways, nitrate plants, mines and for personal consumption.

Although the freight rates over this railway (2 cents per ton per mile) and over all the railways of South America, are considerably higher than in the United States, passenger fares are no higher, and as there are second class cars, people can travel for less than in this country.

As Antofagasta and the country through which the railway runs for 200 miles is practically without water, the railway was forced to develop not only a supply for itself, but also for the industries and towns along its line, as well as for Antofagasta, a city of 70,000 population. The railway is therefore bringing water 193 miles to Antofagasta from an elevation of 10,700 ft. This water being somewhat brackish, it was necessary to go still further, 229 miles, to an elevation of 14,500 ft., in order to find suitable drinking water to supply the towns and industries along its line. Incidentally, the furnishing of water is quite profitable to the railway.

The construction of this railway, like so many of those

of the United States, was a matter of development. It was first projected to reach the nitrate fields, which it did in 1874, when 72 miles were constructed. From the nitrate fields, it was extended 378 miles from Antofagasta to Uyuni, Bolivia, in order to reach the very rich silver mines at Pula-cayo near that city. The final extension came in 1892 when it reached Oruro, 573 miles from Antofagasta, the center of the principal tin district of Bolivia. Its further extension to La Paz was through its acquisition in 1909 of the Bolivia Railway, an American corporation, formed in 1907 to build a system of railways for the Bolivian government; and this brings me to the construction of this system, which reflects so great credit upon the Bolivian government which, in its settlement of a boundary dispute, received \$10,000,000 from the Brazilian government. With this sum as a nucleus, the Bolivian government, under the presidency of General Ismael Montes (now the delegate of Bolivia at the Peace Conference, and one of the great statesmen of South America) decided to develop a system of railways which would bring La Paz, its capital, in touch with the outlying departments and afford means of transporting the minerals which so abound in that country.

### Comprehensive Development

It must be understood that in many undeveloped countries it is impossible to interest private capital in the construction of railways without some kind of a government guarantee or subsidy. The conditions in those countries are usually quite different from those in the United States where the population is apt to follow the railway without much urging, and the resources along the line are quickly developed by private capital. In countries like Bolivia where the population (2,500,000, of which the great majority are Indians, in a territory more than twice the size of Texas) is scattered, with little attraction for immigration, the building up of the country is of very slow growth, so that the economic features of railway construction give way to those of political importance. For political reasons it is necessary to have transportation between different parts of the country, and particularly so is this true of Bolivia, where the white population is sparse and where there is no one city of great size. With the knitting of the country through railway construction, the national feeling is intensified and the dangers of revolutions diminished.

The Bolivian government, having decided on a program of railway construction, entered into negotiations in 1906, through its minister in Washington, with certain American bankers, by which the latter agreed to put up \$15,000,000 for which they would receive first mortgage bonds of the railway, interest guaranteed for 20 years by the Bolivian government, which in turn agreed to put up its \$10,000,000 cash for which it would receive income bonds. As a result of this agreement, all of this money, and in fact more, totalling \$35,000,000, has been spent, with the result that today the three important commercial cities of Bolivia, Oruro, 25,000 population; Cochabamba, 30,000; and Potosi, 30,000, are connected with the capital, La Paz, 90,000 population, and with the outside world; and upon 60 miles of new construction, La Paz will be united with Buenos Aires, the capital of Argentina, 2,300 miles distant, forming the longest link south of the Rio Grande, in the much talked of Pan American Railway. For this latter piece of construction, the Bolivian government now has a representative in New York, trying to raise the necessary money, as all the funds under the former agreement have been expended.

### From American to British Control

I might state, however, that all these funds were not expended by the American bankers. Soon after this construction program was under way, it occurred to the Antofagasta

Railway, which up to that time had dominated the railway transportation of Bolivia, that the Americans might make serious competition if allowed to complete this new system of railway. It therefore entered into negotiations with the American bankers, who, with consent of the Bolivian government, sold out to the Antofagasta interests. This was after the first line from Viacha to Oruro, 125 miles, had been built. While to Americans in general and to myself in particular—for I was president of the company formed to construct this system of railways—it was a disappointment to see American capital retire from the Bolivian field, it was really better that the work should be done by such a strong organization as the Antofagasta Railway, which could afford to operate these lines of low earning capacity until such time as they were able to pay their own way. It was also able to advance funds beyond the original agreement, which another company depending entirely upon its Bolivia business could not afford to do. Even now, the Bolivia Railway is earning less than half of the interest charges on its first mortgage bonds, but the government has promptly paid the balance. During the past two years gross earnings have nearly doubled owing to the war demand for tin, copper, tungsten, silver and other metals in which Bolivia so abounds. While under post-war conditions earnings may fall, it is not likely that they will reach the low figures before the war, as additional mines have been developed due to high prices, and Bolivia, with its greater buying power, will need more goods from the outside world.

As a result of the contract of 1906 made with the American bankers, assigned later to the Antofagasta Railway, the following lines have been constructed:

	Miles
Viacha to Oruro, opened in 1909.....	126
Rio Mulato to Potosi, opened in 1913.....	108
Oruro to Cochabamba, opened in 1917.....	127
Uyuni to Atocha, opened in 1913.....	55
Total .....	416

In addition, the Antofagasta is operating its own lines in Bolivia from

	Miles
Ollague to Uyuni, opened in 1889.....	107
Uyuni to Oruro, opened in 1892.....	195
Viacha to La Paz, opened in 1918.....	20
Total .....	322
Total miles controlled by Antofagasta Railway.....	738

Outside of the Antofagasta interests, there are three other railways in Bolivia:

1st.—The Guaquí & La Paz, 59 miles, operated by the Peruvian Corporation, connecting the capital with Lake Titicaca (elevation 12,500 ft., the highest body of water in the world on which steamers are regularly operated), whence a line of steamers connects with the Southern Railway of Peru with an outlet on the Pacific at Mollendo;

2nd.—The Arica-La Paz Railway, finished in 1913, owned and operated by the Chilean government, 278 miles in length (of which 149 are in Bolivia), connecting the capital with Arica, Chile, and affording the shortest route to the Pacific;

3rd.—The line, 25 miles long, running southeast from Oruro, serving a tin district and built and operated by private Bolivian capital.

As a total, therefore, Bolivia has within its border 971 miles of railway linking up such important points as Ollague, Uyuni, Oruro, Potosi and Cochabamba with the capital and affording an outlet to the Pacific at three different points, Mollendo, Arica and Antofagasta. The completion of a contract now under way between Tupiza and the Argentine border for 60 miles, and a new construction contract for a like amount between Atocha and Tupiza will give Bolivia an outlet to the Atlantic at Santa Fe, Rosario and Buenos Aires, and will afford an interchange between the mineral products of Bolivia and the agricultural products of Argentina.

Not all of these lines are like the main line of the Antofagasta Railway in finding so few natural difficulties to overcome. That to Arica has 10 per cent of its length in track railway of 6 per cent grade. That to Cochabamba descending from the plateau to the watershed of the Atlantic has experienced great difficulties with washouts brought about by storms, infrequent but approaching in intensity to cloudbursts.

Practically all of these railways in Bolivia are at an elevation of 12,000 ft. and over, lying in the great plateau between the eastern and western ranges of the Andes. The line to Potosi crosses the divide at an elevation of 15,814 ft., said in Bolivia to be the highest point reached by any railway in the world, but really exceeded by the line to Cerro de Pasco, Peru, where the elevation is 15,865 ft., 51 ft. greater.

### The Conduct of Railway Enterprises

#### in Foreign Countries

Having thus discussed specifically the railway situation in Bolivia, it may be in order to say something about the conduct of railway and other enterprises in foreign countries. In this I have been fortunate, for 25 years ago, while general manager of a large paving company, I was called upon to send an organization to lay the first asphalt pavements in Buenos Aires. From that experience I have deduced certain principles about carrying on work in foreign countries, from which I have profited ever since.

In order to carry out this contract in Buenos Aires, we sent a complete organization made up of a superintendent to take charge of the work, a competent accountant to take charge of the office, with various foremen to look after the grading, concrete, laying and mixing of the asphalt, as well as laborers skilled in the art.

It soon developed that many of those men were unadaptable, became dissatisfied, so that in time most of them returned home. Meanwhile the superintendent had been breaking in local men, so that within three or four years, the only Americans remaining on the job were the superintendent and chief accountant, all the other positions being filled acceptably by men found locally. Not only did this result in a less expensive, and just as efficient an organization, but it created a friendly sentiment with those with whom we were doing business. Naturally in all countries, there is a prejudice against foreigners and it is advisable to use local talent as far as possible. At the outset it may be necessary to have an organization of Americans, but later on it will be found, that with a few Americans at the top, the balance of the organization can be made up locally.

The same experience met me in Haiti some years later in operating a railway of which I was president, when we found that a native locomotive driver gave just as good service as a much more expensive white man from the States. An American master mechanic, however, was found indispensable, and in fact where initiative and executive ability are required, an American may be necessary. In recent railway and canal surveys in China, with which I have been connected, the only Americans have been the chief engineer and chiefs of parties, all the others, including instrument-men, being Chinese.

Another point should be emphasized, and that is to consider not only the technical qualifications of the men sent to the foreign field, but more particularly their temperamental qualities. Very often the strong energetic type of American, who does so well in this country, does not fit in so well with the people of other countries. It is especially dangerous to send a man, no matter how great his technical ability may be, who regards the inhabitants of the country to which he is sent as "dagoes," as I have heard more than one American say. Unless the American really feels in his heart that he can do business with these men as equals, it

would be better for him to stay at home. While we may admit that the point of view of those of other countries may be different from our own, and while they may lack certain qualities of business energy and judgment in which we take pride, they are more than likely to excel us in other qualities which, outside of business, may be more worth while than our own.

Another important point is to spend a great deal of time and thought in picking out the man who temperamentally and technically will fill the position, then, after outlining your general policy, give him full authority to handle local problems. If you are not willing to trust his judgment in such matters, better not send him—or, better still—confine your energies at home and let some one else tackle the foreign field. My experience has taught me that on local problems the judgment of a mediocre man on the ground is worth more than that of the most talented man in New York, who is more than likely to form a judgment based on conditions which exist only in his mind, while the judgment of the man on the spot is based on conditions which actually exist.

### American Leaders in South

#### American Railway Development

Reverting to the prominent part played in the past by Americans in foreign development, one is surprised to see in Valparaiso, Chile, a monument in the business section to an American, William Wheelwright; and in going to Argentina we find another monument to the same man. Upon inquiry, we find that this American was a native of Newburyport, Mass., born in 1798, shipwrecked on the Argentina coast when 28 years of age and prominent later in the development of Argentina and Chile. He was the founder of the Pacific Steam Navigation Company, recently acquired by the Royal Mail Steam Packet Company, and built the first important railway line in Argentina extending from Rosario to Cordoba, 246 miles, commenced in 1863, completed in 1870. Earlier than that, in 1849 he built a railway in Chile from Caldera to the coal mines at Copiapo, the oldest, with one exception (in British Guiana), in South America.

Another American, famous in the railway building of South America, was Henry Meigs, born at Catskill, N. Y., in 1811, who began his South American career by finishing in 1863 the line between Valparaiso and Santiago started by Wheelwright a few years earlier. Then he undertook in 1870 the construction of the Oroya (now Central of Peru) Railway, which reaches the highest point in the world, 15,865 ft., only 106 miles from the seaport of Callao. Under the stress of carrying on this great work, Meigs died in 1877, four years after Wheelwright, leaving the completion of the line to William Thorndike, another American.

These men worked with European capital—a condition not possible at the present time. The future activity of Americans in the foreign field of construction and development will therefore depend upon American capital, which in turn will depend upon the attitude of the American investor.

### The Necessity for American Investments

It is not the province of bankers to make permanent investments. Their function is to furnish the initial money and take at first hand securities which may be issued in payment of any construction which is done. Unless the bankers in turn can sell these securities to the private investor, they will soon come to an end of their available resources, and the work of construction will soon come to an abrupt end. The investor must therefore be educated to believe that there are foreign securities of just as true value as those of our own country, especially when brought out by bankers of good standing. Not only will these foreign securities afford a profitable field for investment, but the con-

struction and operation of these properties will afford a favorable market for our manufactured products. The railways owned by British capital in South America have been great absorbers of their manufactured goods. In fact, such railways seldom, if ever, even ask for American bids. In this connection, it is interesting to note that a company, of which I have knowledge, under American ownership bought all its materials and equipment in the United States; under British ownership it bought them in England. Also the American engineers and operating men who were employed at the start were soon displaced by English. This is not said in criticism, but only to emphasize the fact that business follows investment—whatever may be its position with respect to the flag.

## The Railways of Japan

K. Yamaguchi

Resident Representative, Japanese Government Railways

Japan is far apart from here geographically, separated by the Pacific Ocean, but industrially and economically the United States and Japan are very closely related, and it seems to me as though there were no ocean dividing us.

In 1872 the line between Tokio and Yokohama, the mileage of which was about 17 miles, was constructed, managed and operated by our government. In the years following, many other lines were constructed throughout the country, some operated by the government while others were run by private companies, their total mileage being in 1906 approximately 5,000 miles.

In the course of time we began to feel the difficulties naturally arising from the two forms of management, there being lack of unification and various complications. After close investigation the government finally took over the main lines of the country through the passage of a bill by Parliament in 1906. By this new law the government purchased 17 lines which had previously been owned by private companies, running through the main parts of the country, leaving a few branch lines to private companies. At present the total mileage of government lines is about 6,082 miles and about 1,200 miles are under construction, the mileage owned by private companies being 1,916 miles.

Besides those there are in Formosa, Manchuria, and Korea, 2,383 miles of line, but these are controlled by their own governor general and are not included in the details which follow.

We have on the railways of Japan itself 2,917 locomotives, of which 700 are superheated, and 62 are Mallet articulated locomotives, the heaviest being 95 tons. Passenger cars are classified as first, second, and third class, and we have also sleeping, dining and observation cars. The total number of passenger cars is about 7,058; nearly half have bogie trucks, the other half being four-wheeled cars. All new cars, however, are to be of the bogie type.

As to freight cars we can boast 47,570, the capacity of 15-ton cars being our standard. They are nearly all four-wheeled, but there are some coal cars having a capacity of 24 tons of all-steel construction and with bogie trucks.

The Japanese islands being mountainous, it is somewhat difficult to construct railroads, and we have been obliged to build many tunnels and bridges. It is therefore impossible to make straight roads. The sharpest curve on the main lines is 15 chains (nearly 10,000 ft. radius), and the steepest gradient is 1 in 40 or 2.5 per cent. The gage of our railroads is 3 ft. 6 in., and the rails are 60 lb. usually, but we also have 75 lb. rails on heavy traffic or mountainous lines, and these rails are to be put in general use.

We use the chain and screw couplings, except on Hokkaido Island. That island being 60 miles from the main island

the automatic center couplers were originated there and have continued to be used after the American practice. We have found these automatic center couplers much safer and more economical and I am glad to inform you that we are going to place them in operation on all lines instead of our former chain and screw couplers.

Owing to Japan's industrial development our railroads were pressed by extraordinary increasing traffic and to meet these demands we have been forced to increase the supply of cars and locomotives and make vast improvements in our roads and terminals.

Last year we purchased 150 locomotives, 2,500 freight cars and 200 passenger cars, all of which were built in our own country. Unfortunately, it was not possible for us to secure all the necessary materials for construction and improvement of roads, terminals and repairs of equipment, so we recently made purchases in this country amounting to about \$10,000,000.

We are always endeavoring to improve our management and operation in general in order to keep transportation facilities adequate to the development of the country. To gain this object our government railways despatch every year several officials and engineers to this country and Europe for the purpose of investigating and studying railroad systems and management.

## Important Revision of M. C. B. Rules

THE PROMULGATION of circular No. 37 by the Mechanical Section of the American Railroad Association was briefly noted in the *Railway Age* of May 16. The text of this circular is as follows: "This circular re-establishes delivering line responsibility and the practice of defect carding as between roads under U. S. Federal Control, and all circulars and interpretations to the contrary are hereby abrogated.

"In view of United States Railroad Administration Accounting Division Circular No. 86, issued April 15, 1919, effective the date of that circular, Articles 1, 2, 3 and 4 of the 1918 Code of M. C. B. rules for freight cars and modifications A to C, inclusive, of the 1918 Code of Rules for Passenger Cars are hereby abrogated and the following will apply to railroads under U. S. Federal Control:

"To the end that interchange inspection work may not be duplicated under U. S. Federal operation of railroads, so that more repair work and less unnecessary inspection will result, it is ordered—

"(1.) That joint arrangements shall be made to prevent such duplication in inspection by arranging all inspection forces at interchange points with a lead or chief joint inspector as conditions require, to supervise the forces and see that inspection and repairs are properly made to car equipment.

"(2.) M. C. B. Rule 2 is modified as follows: (a) Loaded cars offered in interchange (except those having defective safety appliances) must be accepted by the receiving line which may either run, repair or transfer lading from car; (b) the repairs to car or transfer of lading is to be done by the railroad having facilities nearest available. If facilities are equally available by both railroads, the car will be moved to facilities located in the direction car is moving.

"(3.) If car is shopped for repairs due to: (a) old defects that existed before car was loaded; (b) lading requiring transfer or readjustment, account of not being in accordance with M. C. B. loading rules; (c) overload requiring transfer of lading; (d) not being within clearance dimensions over route it is to pass; (e) not meeting A. R. A. third rail clearance. In each case above mentioned, the facilities

nearest to car will be used in making repairs to car or transfer of lading.

"(4.) Should the location of facilities require a receiving line to make transfer or readjustment of lading, the cost of such transfer or readjustment of lading will be billed against the delivering line as per Rule 2 of the 1918 Code. The chief joint or lead inspector will make report and forward to the head of the mechanical department of both railroads, showing all cars transferred or shopped for old defects, whose duty it will be to impose discipline for willful and inexcusable violation of the M. C. B. rules of interchange and loading rules, the same as instructed in Director General's Order No. 8 for the violation of the safety appliance law.

"(5.) Cars, whether loaded or empty, having safety appliance defects will have such defects repaired immediately upon discovery and will not be offered in interchange. If necessary to move car to shops for repairs of safety appliance

defects, it must be moved to shops of the company upon whose line it became defective.

"(6.) Empty cars offered in interchange, if in safe and serviceable condition, must be accepted.

"(7.) Bad order cars which previously had been delivered in bad order under load must be repaired by the road making transfer, if they have facilities and material; if not, the nearest repair point on any line, having material and facilities, should make the repairs.

"(8.) Owners must receive their own cars when offered home for repairs at any point on their line.

"Rule No. 92 is amended to read as follows: 'In rendering bills cars shall be treated as belonging to companies or individuals whose name or initials they bear, except that bills for repairs to leased cars or cars of other ownership shall be rendered direct if so directed in the billing instructions in the Official Railway Equipment Register.'"

## The Menace of a Concentrated Buying Power\*

### The Secretary of Commerce Discusses the Effects of Railway Purchases on Industry

By William C. Redfield

**I** SOMETIMES THINK of buying power as a force which *can* be used constructively, *is* commonly used with regard confined wholly to the immediate transaction, and which *may* be used destructively. Would not a great industry do well to use its purchasing power to develop new sources of supply, either looking to the increase of production of the articles it needs or to the development of satisfactory substitutes, or to making the certainty and security of its supply sure beyond doubt? Is it not possible to so extend the science of buying that it shall become a promotive force?

Out of the helpful experience the nation has had during the war and the readjustment period with government operation of our great systems of intercommunication, whether on sea, land or by wire, a fact has clearly emerged which has peculiar interest for this assembly and which points a finger of warning for the whole country. I do not recall that this special phase of government control of communication of all kinds was seriously discussed prior to the war, yet to my mind it is of basic importance. It has by itself settled my own judgment adversely to government operation, in a country as large as this, of the great enterprises involved in our railways, our merchant marine, and our telegraph and telephone systems. I have called our experience helpful because through the work of the able and conscientious men who have handled all these activities more has been learned of the essential factors of the problems than was possible by pure theorizing. Nor is there in the background of my thought the smallest element of controversy. I wish to express my full confidence in the honor, uprightness, and conscientiousness of gentlemen with whom I have recently differed. They acted as they believed was right and wise and are so to be esteemed and regarded. That water has run under the mill. Nothing in what follows has reference to recent discussions or is to be interpreted save in the most cordial spirit of good will. I firmly believe that throughout the gentlemen from whom I differed acted with an eye single to the public good and without undue bias of any kind, political or otherwise.

The factor of which I speak is the necessary combination when under government direction of so large a part—a controlling part—of the purchasing power of the country into a

few hands or, regarding the government as a unit, into one compact control. The various transportation elements named include as I have said a controlling purchasing power over our industries and through them over our labor and our producers of raw material. It would lie in their power to injure or even destroy not one but many industries simply by either refusing to buy or by delaying buying at a critical period or by insisting upon impossible prices, or impracticable terms. Most business men will, I think, agree that it might make relatively little difference to industry who administered the laws or even what the nature of those laws might be if power over the life and death of industry lay in the hands of a few men because of their ability to purchase or to refuse to purchase its output.

This power, which is not so much by purpose as by its very nature autocratic would be peculiarly difficult to reach and control by law because it is impracticable to regulate by statute when or how buying must be done. Procedure can indeed be fixed. Publicity can be provided and competition secured in form. The danger suggested, however, comes not from paying excessive prices but from the reverse, from forcing by the pressure of enormous buying power prices, terms, and conditions of such a character as substantially to put our industrial fabric into the hands of masters of almost imperial power. Let there be given any one of you ability substantially to control one-third or more of the coal purchases of the United States through your predominant power in buying fuel and that industry becomes plastic in your hands. Let there be placed in the hands of another of you the power to purchase from one-third to one-half or possibly more of the products of the steel industries or of certain portions thereof and that industry becomes your servant, to do substantially as you will. The same is true of other great industries like copper, the shipyards and the builders of machinery. It will, I am sure, become clear to your thought after reflecting upon the incidental creation through government operation of a unified buying power that there would be established an enormous force so mighty as to work its will with industry and labor and to make them its creatures. It is not assumed that there would be intent to do harm. The reverse is undoubtedly true. It may indeed be taken as certain that as in the past and present

\*From an address before the Purchasing Agents' Association of New York, Hotel Pennsylvania, New York, May 20, 1919.

so in the future conscientious and careful men would do the work. Ruin, however, can well be wrought by want of thought, by absence of social vision, by incomplete knowledge, by partisanship—involving either a party or directed to a service or a person, by the sense of irresponsibility arising from possible brief tenure of office or by the loss of balance arising from the intoxication of power. Years are not required to cripple an industry. It can be done in months or even weeks. There seem to be involved, also, the principle of democracy in commerce as against autocracy, with all that both imply, and the deeper one's thought goes into the matter the more one questions whether there would not be created an empire within the state which, however free in form the state might be, would of necessity control it from inside.

Consider the position of an industry that strove to be independent under such conditions. The circumstances are not frequent in which trade conditions are such as to constitute for a long period what is known as a seller's market. More frequently it is the case that the seller is more or less of a suppliant and the buyer has a great deal to say. We may not assume, on the contrary, that conditions always favor a buyer's market but there is commonly an intermediate state between the latter condition and that in which everything favors the seller; there is a middle ground in which the seller is far from being free from need and in which the buyer has a potent force. If a single purchaser uses one-half or nearly one-half the entire output of an industry and that purchaser refrains from buying for reasons that are satisfactory to him, where is your individual producer to find his market? Clearly the fraction of distributed purchasing power that remains must be divided over the entire industry, and so far as competitive conditions may prevail this means that quantity production on any continuous basis is impossible and that the high-cost producer, that is to say usually the smaller producer, must go to the wall. It is interesting to think what your position as buyers would be under such conditions.

Few would on reflection venture to favor the creation in this country of a condition in which such absolute power could be exerted over industry and therefore over the employees of industry as would be the fact if the government held in its hands the power to buy for the railroads, the merchant marine, the telegraph and the telephone systems and possibly other factors of our industrial life. Here would be in outward form what one might think a socialistic condition which would in its normal operations tend to become an imperialistic one. Here would be created a power within the state which might at any time exercise, even almost unconsciously exercise, a controlling power over it. The very existence of such a power would seem to involve the necessity of state-controlled industry in order that industry might be adequately defended against the state itself.

It throws light upon the possibilities that are suggested to read facts submitted by Mr. E. B. Leigh in his address before the National Industrial Conference Board in February last, in which he urges that railroad purchases measure general business prosperity.\* His pamphlet is accompanied by a chart covering a period of 18 years which clearly indicates the relation of railway purchases to general business conditions and reaches the conclusion that:

"Our iron and steel industries have been developed to meet the railways' enormous requirements, and hence the railways have constituted the one industry whose purchases are upon such a scale as necessarily to affect the great barometer of iron and steel."

He proceeds to point out that buying is contagious and when initial buying takes place upon a large scale it stimulates greater buying. The current, as he suggests, proceeds out from the railways to car building plants, thence on to iron and steel plants and to the large number of railway supply industries. By these it is again directed to other in-

dustries which in turn influence a highly increased number of contributory interests, until the entire industrial machinery and the labor employed in connection with it have been set at work.

The possibility of favorable buying action thus existing in our railways becomes concentrated in the hands of a few when these great buying factors are unified under government control and this power becomes again enlarged if to it are added the other great operating systems which are today or have recently been under government management. It is evident that this power, mighty for usefulness, may be exerted either directly or merely by reason of its inaction as a destructive as well as a constructive force. In short, there here exists almost unnoticed heretofore a power before which the greatest trust is helpless, a controlling, restraining force in trade, beside which the greatest combinations are petty. It would be, or has been, country-wide, reaching into every city and by its infinite ramifications stretching out into substantially every industry and branch of commerce.

Furthermore, it is the fact that purchasing power even in free-acting corporate hands has operated not of course deliberately but none the less directly to cause serious injury to industry and so as to constitute within its sphere one of the fundamental bases of wasteful business practice. Continuity of operation in industry is essential to effectiveness and low cost. From the human standpoint it is more important still. It is essential to continued employment and to regular earning power on the part of labor.

An interesting illustration of the effect of large purchasing power on an industry appears in the chart which I am permitted to show you herewith. It is furnished by a large industrial concern and covers a period of 13 continuous years, from 1906 to 1918, inclusive, by calendar years. It shows the normal capacity of the plant in tons, the orders received in tons, the production in tons, and the number of men employed, and indicates the increase in cost arising from the fluctuation in orders placed by the railroads of the country, chiefly while under private control. The sharp fluctuations shown by the irregular exercise of purchasing power will be evident at a glance. Let us summarize a few of them. The increase of cost varies always upward with the decrease of orders. It rises in one case 25 per cent, in another 37.5 per cent, in another 86.9 per cent, in another 89 per cent. The force employed varies from 990 to 325, from 1,360 to 445, from 1,570 to 440, and rises as high as 2,110. The item of orders received shows most extraordinary peaks. It would not be quite correct to describe the line as showing curves; it is high summits and low valleys.

A brief study of this chart indicates the indirect but practical control of an important industry over a period of years by railroad buying under private auspices. It is not argued that that control is intentional. It may be freely admitted that it may have been meant to be helpful. It can hardly be denied that it is a fact. It would seem obvious that it would have been wise management on the part of the buyers to have so distributed their purchases as to provide a more reasonable continuity of operation with a corresponding decrease in the cost of the goods and more continuous employment for labor. This may have meant using reserve funds and accumulating reserves of materials. The difficulties involved in both are, of course, real, but the study of the results from the methods actually used makes it evident that the course followed was productive of waste, a waste hurtful to labor, injurious to industry and to the buyer alike. I am advised that the particular chart is typical of other industries as well as of the one to which it directly relates. There is a clear mutuality of interest between these buyers, these sellers, and the employees of both as well as the public which seems ignored and to develop which no provision is made.

It bears, however, more directly upon my theme to point out that if under private auspices the operations of separate

\*Abstracted in the *Railway Age* of April 4, 1919, page 879.

railroad corporations did under private control exercise over the industries of the country so forceful a power as is shown in Mr. Leigh's pamphlet and by the chart now submitted to you, it follows as of course that if this power be exercised as a unit instead of separately and if to it be added other similar extensive powers, then a force is created the power of which over the industries of the country is so obvious as to need little explanation.

We ought not to leave the subject without presenting some considerations on the other side. For years prior to the war our industries with or without full knowledge exploited the railroads for their own benefit. We were favored with the cheapest freight rates in the world and even after advances were made that were strongly resisted our rates remained such as would have filled any competing European manufacturer with envy. A single illustration lies before me. One manufacturing concern which produces on both sides of the Atlantic paid a rate from Hull to London, 198 miles, of 6 cents per 100 lb. and in this country paid on similar goods a rate, from Buffalo to New York, 450 miles, of 16 cents. The same goods were, therefore, transported more than double the distance at the same price in this country. It has been perfectly well known to students of the subject for years past that American freight rates were the lowest in the world and yet our industries have resisted, not to say resisted, any attempt at even moderate percentages of advance.

The trouble has been that the vision of the industries in this respect has been inward, not outward. They have, in this as in other matters, mistaken cheapness for economy and have not regarded sufficiently the real mutuality of interest between the transportation systems and themselves. They were keen, as respects their own goods, to obtain prices sufficient to carry overhead expenses, to amortize equipment according to due standards of depreciation, to provide working capital for necessary improvements, but they failed to recognize that the railroads were entitled to the same consideration of these matters as they themselves exacted in their own figures. It was thought wisdom to be suspicious of the railways and to disregard the candid and outspoken pleas of experienced railroad officers for sufficient income to maintain their borrowing power. For this suspicion a fearful price has been paid, for when the pressure came and the railroads were unable to meet it the whole country suffered.

It is the merest common sense to say that the shipper does himself wrong when he brings such pressure on the railways as forces it to operate at rates below those which will enable it to maintain its plant and its credit as the shipper is himself obliged to do. There is needed here a social sense, a business vision which shall go a great deal further than the personal purse or profits of the industry making the goods, as respects single or grouped transactions, and which shall take into account the permanent interests alike of the railways and the industries using them.

## Final Valuation of the Winston-Salem Southbound

Single Sum as the Value of Property to Be Stated Later;  
 Exceptions to Tentative Valuation Considered

THE INTERSTATE COMMERCE COMMISSION has issued its final valuation of the property of the Winston-Salem Southbound Railway, after considering the protests of the carrier to the tentative valuation made by the commission's bureau of valuation, giving findings as to underlying facts upon which the commission will ultimately state a single sum as the value of the common carrier property of the company for purposes under the act to regulate commerce. The carrier and other parties may, if so advised, apply to be heard upon the undetermined question as to what sum shall be stated. Otherwise, in due course, the commission will state its conclusion and complete the final valuation.

The valuation is as of June 30, 1915. The investment in road and equipment after making certain adjustments is stated as \$5,598,999.65. The original cost to date of the property other than lands is stated as \$5,197,452. The cost of reproduction new as \$5,428,444 and the cost of reproduction less depreciation as \$5,033,875. The original cost of the lands is stated as \$401,547 and the present value at \$565,256.

On many points the decision follows the decision in the Texas Midland case, and an appendix to the report in that case is referred to for a statement as to the methods of valuation employed and as to the reasons for the differences between the cost values mentioned in the first and third paragraphs of the valuation amendment. The railroad operates 89.99 miles of road wholly within the state of North Carolina, single track with the exception of 3.02 miles. Its construction was financed by the Atlantic Coast Line and the Norfolk & Western, which on June 30, 1915, each owned one-half of all outstanding stock of the carrier other than directors' shares. An abstract of the report is as follows:

### Original Cost to Date

The tentative valuation finds the original cost to date of the common-carrier property of the carrier, as of June 30, 1915, as follows:

Road, excluding lands.....	\$4,637,819
Equipment .....	293,881
General expenditures .....	222,296
	\$5,153,996

It is found in the tentative report that the original cost of carrier and non-carrier lands can not be stated separately, but the original cost of all lands is stated as \$401,546. The accounting report appended to the tentative valuation apportions the cost of lands upon a basis necessarily somewhat arbitrary, as follows: Carrier lands, \$372,189; and non-carrier lands, \$29,357. The total original cost to date of the road and equipment, including carrier lands, is set out as \$5,526,186.

It is claimed by the carrier in its protest that the amount of original cost to date stated is less than should be shown by reason of the failure to include certain items of actual expenditure.

The amounts claimed for preliminary surveys and for the services of officers of the proprietor companies are not stated nor is the protest supported by evidence explanatory of such matters. It is shown in the accounting report that the carrier presented a claim that the survey in question was made in 1892, some 13 years before the carrier was chartered. It does not appear that the use of this survey saved any expenditure by the carrier; and it is conceded that the expenditure was made, not by the Southbound company, but by its proprietor companies. Many years have intervened since these claimed costs were incurred; they have never

become an account stated, although the proprietor companies have made settlements with the carrier involving reimbursement for millions of dollars advanced by them on its behalf. Nor, as far as this record shows, have either of the proprietor companies ever presented a claim against the carrier for any part of the sums stated. We see no reason to set aside the contemporaneous interpretation placed upon the transaction by the parties.

The carrier protests an adjustment of \$441.92 in respect to equipment retired, set forth in the accounting report. The adjustment made increased the amount of original cost claimed by the carrier, was not controverted upon the hearing, and is to be taken as correct.

The original cost figures contained in the tentative report do not include the cost of materials and supplies on hand, but the cost is stated separately as \$5,180.56. That amount represents the sum shown upon the carrier's records upon valuation date; but on that date the carrier in fact had on hand materials and supplies of a cost of \$43,067, of which \$37,886.44 had not been taken into the carrier's books of accounts. The carrier protests the tentative valuation in this regard; and upon the facts found as above stated, appropriate changes will be made in the tentative valuation.

The carrier and the bureau have agreed that the general balance sheet of the carrier shall be carried over into the final valuation; and this will be done. As the general balance sheet reflects what appears upon the books of the carrier, the amount of materials and supplies on hand will be shown therein as carried on the carrier's records, kept in obedience to the requirements of statute and the orders of this commission.

It is protested that the tentative valuation excludes any allowance for working capital, and that \$70,000 should be included for this purpose. Apparently the protest differentiates between working capital and material and supplies, which are often confounded or considered together in appraisals of public service properties.

The carrier's testimony is to the effect that it is necessary and desirable that the carrier should have on hand a sum of money as working capital, which it is claimed should be at least \$70,000.

The accounting report, which is a part of the tentative valuation, shows that on valuation date the carrier had on hand \$58,468.25. The character and amount of the carrier's other current assets also appears in the general balance sheet, which we will carry from the accounting report into the final valuation.

The tentative valuation, as herein amended, reports fully and sufficiently the facts with respect to the working capital of the carrier.

As modified the original cost to date will appear thus, fractions of a dollar being disregarded:

Carrier property (other than materials and supplies):	
Road, including lands.....	\$5,053,465
Equipment .....	293,881
General expenditures .....	222,296
<b>Total carrier property.....</b>	<b>\$5,569,642</b>
Noncarrier property, land.....	29,357
<b>Total, carrier and noncarrier.....</b>	<b>\$5,598,999</b>
Material and supplies:	
Carried on company's records.....	\$5,181
Not on carrier's records.....	37,886
<b>Total material and supplies.....</b>	<b>\$43,067</b>

### Cost of Reproduction

*Quantities and Unit Prices.*—The carrier took numerous exceptions to the tentative valuation with respect to the matters contained in the estimate as to cost of reproduction now from which for the purposes of this statement lands are presently excluded and will be dealt with separately. While the case was upon hearing the respondent carrier and the bureau of valuation carefully reviewed these questions of

fact in conferences which culminated in agreement upon the major differences, and a joint recommendation to the commission that the matters so agreed upon be adopted in the final valuation. The agreement upon the part of the carrier was predicated upon the acceptance by the commission of the recommendation made; and the offer was coupled with a statement which would have been evident in any event that the adoption of particular unit prices for the respondent should not bind other carriers nor parties to the record or require the commission to use such prices in any future appraisal of other railroad properties.

We are, of course, not bound by the admission or stipulation of the bureau, as the duty of ascertaining the facts with accuracy in this proceeding rests upon us; but we give proper weight to these recommendations of our bureau and the carrier, and as they seem fair we shall adopt them. The tentative valuation will be changed in accordance with the stipulation.

The written joint recommendation contemplates that as to Account 26, telegraph and telephone lines, the unit prices ultimately established for the Western Union Telegraph Company should be applied. However, the carrier conceded that the final valuation of its property should not be delayed and agreed to accept the conclusions reached by our bureau of valuation after conference.

Certain items in the estimate of the cost of reproduction new, excepted to by the carrier, were not covered by the joint recommendation, but are reserved for our consideration. These include the issues respecting railroad crossings, signals and interlockers, interest during construction, appreciation, depreciation and certain specific contingencies. The claims of the carrier as to development cost and working capital were likewise specially reserved for submission to the commission; the former will be discussed subsequently herein, and the latter has previously been disposed of under the heading, "Original cost to date."

Unit prices were determined by the bureau of valuation as of June 30, 1914, although the inventory was taken as of June 30, 1915. The present value of lands appears as of June 30, 1915. The carrier protests the use of quantities as of 1915, in connection with unit prices as in 1914.

The prices employed by the bureau of valuation are not the exact prices which were necessarily in effect upon the precise date, June 30, 1914, but were fixed with relation to that date in such a way as to produce normal prices for periods ranging from 5 to 10 years prior thereto. The use of such unit prices upon items entering into the cost of reproduction of road and equipment (other than land) will permit consideration of the carriers upon a uniform basis as to time, so that as the normal trend of prices of material and labor may go upward or downward correction factors can readily be applied from time to time, as by law required, to the end that all appraisals may be kept to date upon a comparable basis.

We can not shut our eyes to the fact that the effect of the breaking out of the European war was to demoralize the markets for labor and material, so that prices current on that precise date, June 30, 1915, or over a period of time which would reflect the effect of a war which has largely monopolized the labor and material market to the exclusion of private industry, can not in any sense be said to represent normal or fair values.

With respect to lands, however, as to which the cost-of-reproduction theory is not applied, the values of which do not fluctuate wildly with war, and as to which present value is the criterion, a different situation is presented, and we have employed values as of the date of valuation.

*Railroad Crossings.*—It is protested by the carrier that the tentative valuation omits certain items of property owned or used by the carrier. These are detailed as (1) property owned or used, constructed at the carrier's expense, such as

overhead crossings with other railroads, 50 per cent of the grade crossings with another carrier, and a certain spur and coal trestle, and (2) property owned or used, but not constructed at carrier's expense, of which the tracks and facilities of other carriers at certain points, equipment of other carriers, private car lines, etc., are specified.

As the Southbound company was the junior carrier, the expense of these crossings was wholly borne by it. In the tentative valuation all costs borne by the Southbound company have been included in the statement of original cost to date.

It has been the practice of the bureau of valuation to apportion the estimated costs of reproduction in accordance with any agreement as to ownership of property of this character which the interested carriers may make. Failing such agreement, the cost of reproduction estimates of the junior carrier omit, in the case of under-crossings, anything for the assumed reproduction of structures used entirely for the passage of the trains of the senior companies; but the cost of reproduction estimates of every junior carrier includes the estimated cost of reproducing the property exclusively used by it. One-half of the estimated cost of reproducing property commonly used by both carriers, such as crossing frogs, is carried into the tentative valuation of the Southbound company. Such practice has been followed in the tentative report in this case.

The carrier contends that if it be assumed for purposes of determining the cost of reproduction that other railroads exist as of valuation date, then as a matter of theory it must be assumed that the identical structures which the Southbound company as the junior carrier was obliged to construct would likewise have to be constructed in reproduction.

The method followed in the tentative valuation does in fact contemplate the assumed existence of the railroads as crossed, and gives full credit in the cost of reproduction estimates for whatever is shown to be owned by a carrier, or occupied and used by it, while showing, as a historical fact for whatever it may be worth, the expenditures in fact made by the carrier in original construction. The method commends itself as involving the minimum of conjecture, and as the only plan which in all its aspects is feasible and certain in practical application.

In *Texas Midland Railroad, supra*, we have considered the treatment of property used but not owned, and of industrial tracks constructed in part only by the carrier. Claims of the second class specified are disposed of in the present case in conformity with the principles we there announced.

Certain changes have been made by us in the quantities and prices under Account 15, crossings and signs, and Account 16, station and office buildings, to carry out the joint recommendation of the carrier and the bureau that the claims of the carrier should be checked by the bureau and the results accepted by the commission.

*Contingencies.*—The carrier concedes that as its line is new a blanket allowance for contingencies such as is often claimed is not necessary; but it contends that several items of cost which were incurred in construction were not included in the estimate of cost of reproduction new. All these items are included in the report as to original cost to date. The general nature of the contingencies for which claims are made may thus be stated:

(1) Amounts paid the contractor for a release of contracts when, after construction had begun, the manner of doing the work was changed; (2) disputed items of yardage not calculated in certain cases; (3) yardage of earth rehandled because an apparently suitable borrow pit, partially utilized, was found to be unsuitable; (4) change in alignment found desirable after work had been started on the location originally fixed; (5) grading commenced, but not completed, for connection with another carrier, upon

land owned by the carrier, the project being indefinitely deferred; (6) a trestle which was started for drainage purposes and which the carrier was afterwards permitted to fill. The protest also excepts to the omission to take into consideration as a necessary item in the reproduction program property which in fact was acquired in original construction but was abandoned by reason of proper and reasonable changes of plans due to changed conditions during construction. It is not contended by the carrier that all such items, so far as they relate to the construction of the carrier's property, are not taken into account in the statement of original cost to date.

Obviously it can not be assumed that in theoretical reproduction of the property these contingencies would occur, and no sum should be included in the estimate of cost of reproduction new in the valuation, because of such past occurrences. See *Texas Midland Railroad, supra*.

*Appreciation.*—It is protested that the tentative valuation fails to include appreciation as an item necessary to be considered in any rational method for the reproduction of the carrier's property, and that the minimum amount which should be included therefor in estimating the cost of reproduction would be not less than \$32,400. No specific evidence was introduced in support of this claim. However, the carrier was permitted to make of record herein the general evidence which was before us in *Texas Midland Railroad, supra*, and certain other proceedings as to appreciation of roadbed.

The character of appreciation in roadbed claimed by the carrier, as shown in the record, is the equivalent of an over-coming of depreciation in roadbed items. We have reported the various items of roadbed substantially without depreciation, although, by the processes for which the carrier claims an allowance, the original or ideal form of the roadbed has been considerably altered. In not depreciating roadbed we have, in fact, taken into consideration the effects of these processes of operation, the lapse of time, and the elements, which the carrier terms appreciation. Again, what the carrier claims as appreciation can not be produced merely by the expenditure of money, and therefore can not be reproduced new. We have already pointed out that the valuation amendment contemplates the ascertainment of the cost of reproduction new, and not the cost of reproduction in the present condition.

For these reasons, and for the reasons already stated in *Texas Midland Railroad, supra*, no separate sum can, in this case, be stated as representing the value of appreciation.

*Interest During Construction.*—The carrier protests that the engineering program for reproduction, adopted as the basis for the tentative valuation, is too short. The length of the construction program assumed bears directly upon the amount which is to be included in the reproduction estimates for interest during construction. The following sums show in contrast the amounts reported in the tentative valuation under Account 76, interest during construction, and the claim of the carrier:

Tentative valuation:	
Original cost to date (Interest on expenditures for lands included) .....	\$163,358
Cost of reproduction new (lands excluded) .....	277,475
Cost of reproduction less depreciation (lands excluded) .....	259,103
Carrier's protest:	
Minimum claim (lands included) .....	413,170

This railroad has a main line about 88 miles in length, with a branch approximately 2 miles long. The carrier claims two years and three months as the construction period from the letting of contract to the beginning of regular operation. Construction was in fact completed in about two years. It appears from the record that except for reconnaissance and preliminary surveys, for which nine months was estimated as necessary, the road could be constructed, from the letting of contracts to the putting into operation,

within two years. Certain minor construction would be carried on after regular operation was commenced, such as the laying of permanent ballast, and the erection of some minor buildings and laying down of industrial tracks. But railroads are regarded as completed for operation, for all practical purposes, in advance of such construction, and we so treat this carrier.

The interest shown in the reproduction estimates in the tentative report was reckoned at 6 per cent for one-half of the construction period assumed by the engineers of the commission, upon road Accounts 1 to 48, inclusive (except 2, 39, 40, 41 and 42), and upon general expenditures Accounts 71 to 75, inclusive, and 77. Interest was computed on the equipment accounts at the same rate for a period of three months. The present record raises no question as to the rate at which interest has been computed.

Subsequent to the service of the tentative valuation, in view of the desirability of a railroad under construction having on hand a certain amount of money upon which to draw for its expenditures during such process, the bureau of valuation recommended that interest during construction should be computed upon the road accounts enumerated and general expenditures at the full rate for half the construction period plus three months. Equipment being usually purchased only when the road is practically completed interest was estimated in the tentative valuation for three months, and the recommendation of the bureau did not change this amount.

The construction circumstances surrounding the carrier's railroad are not in any respect abnormal, and, as modified by the acceptance of the recommendation of the bureau, the estimate for interest contained in the reproduction estimates in the tentative valuation is ample.

No interest has been included in the reproduction estimates contained in the tentative report on account of the cost of land. The non-allowance of interest on the present value of land in the reproduction estimate conforms to the holding of the Supreme Court in the *Minnesota Rate Cases*, 230 U. S., 352, 455.

The disposition we have indicated as to the disputed items of interest conforms to our finding in *Texas Midland Railroad, supra*, and what was there said by way of discussion need not be repeated.

The protest questions the adequacy of the sum reported for interest in the statement of original cost to date in the tentative valuation, with respect to the omission of sums said to have been advanced by proprietor companies on account of road and equipment accounts, and certain expenses in connection with the acquisition of land and rights of way and in settlement of damages to abutting property. As is otherwise shown herein, the record does not support the claim as to the principal items mentioned and therefore does not warrant us in estimating interest thereon. The carrier's records, kept presumably in conformity with law and the requirements of this commission, contain nothing with respect to interest during construction on such items, and the carrier and the proprietor companies, while adjusting claims on account of advances amounting to millions of dollars, did not treat these particular matters as constituting a debt from the carrier to its proprietor companies. The protest in this regard is not sustained.

*Development Cost.*—It is contended by the carrier that in correctly estimating the cost of constructing, completing and equipping a going railroad there must be added to the cost of construction and assembling an amount to cover the cost of developing the business. Computations were presented which purported to show that after the road was opened to traffic in 1911 until the date of valuation, June 30, 1915, the results of operation had been a deficit of more than \$410,000, which deficit did not include all the interest actually paid. Computations were also presented on behalf of

the carrier made along the following line: For each of the years prior to the year of valuation, as of June 30, the total cost of the road to date was taken less the cost of new work done during the year, which gave the amount invested and in service during the whole of that year; the deficit from operations during the year was added to this sum, and on the total so obtained interest at 6 per cent was computed as representing the cost to the investors for each year. This item of interest, added to operating expenses, taxes and other expenses for the year, diminished by operating revenues and other income, gave a remainder which the carrier terms the real deficit for the year. The sums of the deficits for the year are computed for the years 1911 to 1915, inclusive, representing the total development cost claimed by the carrier, amounting to \$853,591. It is insisted that this figure must be added to the cost of reproduction, in order that the result will reflect the true cost of reproducing the property in the condition existing on valuation date.

The valuation amendment requires us to ascertain the cost of reproduction new, and not the cost of reproduction in any other condition. We should not overlook that by the method pursued by the bureau of valuation in ascertaining quantities, such costs during the early years of the enterprise as resulted in permanent increases to the property, are all discovered and taken into account. Additions to embankment, the widening of cuts, enlargement of ditches, etc., are examples.

It appears from the offer of testimony by the carrier as to development costs that all the data requisite to the computation thereof appear in the accounting report appended to the tentative valuation. In ascertaining the original cost to date of the property of the common carrier we have investigated and reported upon the history and organization of the carrier corporation, upon its net and gross earnings, and upon the expenditure of all moneys and the purposes for which the same were expended.

Our final valuation herein shows original cost to date, as well as the cost of reproduction new and the cost of reproduction less depreciation. It therefore embodies all of the underlying matters of fact, from which the carrier asks us to report a development cost.

Whether, in fixing a value for purposes under the act to regulate commerce, we should increase the cost of reproduction by the amount of deficit which the carrier may have incurred during the early years of the enterprise, will be a proper consideration when we come to state a single sum as value of the common-carrier property for such purposes. That question we leave intact. As stated, in the final valuation herein made we have the basic facts. The record herein shows no other values or elements of value.

#### Cost of Reproduction Less Depreciation

In the tentative valuation the cost of reproduction less depreciation was estimated by application of the same principles which were applied in *Texas Midland Railroad, supra*. Vigorous attack is made in the protest, in evidence, and in argument upon the soundness of those principles. We examined this question in *Texas Midland Railroad, supra*, and there sustained the soundness of the general theory employed in the estimate of cost of reproduction less depreciation. In the attempt to demonstrate the underlying unsoundness of the general theory of depreciation applied by our bureau of valuation, the carrier cited a number of instances in which it was claimed the methods employed gave incorrect results. We have examined these specific claims, and while they tend to show estimates somewhat different from those made by our bureau, the differences are not extreme, when adjusted to a common basis.

Certain changes in the tentative valuation will be made under this head, required by changes in the reported cost of reproduction new.

**Lands**

The protest excepts to a treatment of the lands of the carrier different from that given to other physical properties. The gist of the objection is that as to properties other than land the tentative valuation shows the original cost, and the costs of reproduction new and less depreciation, while as to land, what is termed a "present value" is reported, but no figures appear which represent the cost of reproduction.

It also is objected that the figures of present value were determined without reference to and without including the costs, damages and expenses that would be incurred in their acquisition. Numerous errors in methods and principles are alleged to have occurred in the determination of the present value. Among these errors the following are enumerated: (1) That the reported present value has been limited to the estimated unit of value for general purposes, not including railway purposes, of adjoining and adjacent lands, without taking into account the true value or actual cost of acquiring the same; (2) certain essential elements were not considered in the determination, e. g., the actual incidental costs of acquisition; rights which the carrier had to acquire, not measured by the value of a similar area of contiguous lands for general purposes; damages paid to original landowners by reason of the decrease of the rights of such owners and the increase of property rights of the carrier, such as severance and proximity damages, adaptability and availability of the lands acquired for then present needs; cost of buildings and other improvements; cost of removal and relocation of highways and other structures; and taxes accrued and assumed. It is protested that the recent experiences of the carriers generally in the acquisition of carrier lands, showing the amounts which carriers must pay in acquisition in comparison with the value of similar lands for general purposes, were not given consideration.

These protests raise the same question which was stated and decided in *Texas Midland Railroad, supra*, viz.: Shall the commission ascertain and report the present cost of condemnation and damages or of purchase of the carrier's lands? For the reasons stated in our report in that case, the tentative valuation herein, which bases the present value of lands upon the normal fair value of similar lands in the vicinity, ascertained in the manner employed and stated in the *Texas Midland Case*, must be approved in principle.

To abbreviate the record, it was stipulated that in the event the present cost of acquisition or reproduction cost of lands is to be ascertained and reported, certain multiples or percentages of present value as agreed upon should be applied. The disposition made of the principal question makes it unnecessary to give force to this stipulation.

In the carrier's protest exception is taken to the computations of the area of certain tracts of land, and to the classification of certain parcels as non-carrier instead of carrier. By agreement upon the hearing these matters were re-examined by the bureau of valuation, and as the carrier and bureau are now in substantial accord thereon the recommendations made by the bureau and accepted by the carrier will be incorporated in the final report. The protests of the carrier as to such matters will be treated as withdrawn.

As to the present value of lands, agreement has likewise been reached by the carrier and the bureau of valuation, and the carrier's protest is waived. The sums recommended are approved and will be included in the final report. The carrier's agreement as to these amounts does not, of course, waive its claim as to the ascertainment of the reproduction cost or present cost of acquisition of its lands.

There remain for our consideration the questions raised by the carrier's protest as to the omission from the tentative valuation of areas in streets, at grade crossings of public highways, at railroad crossings, and lands upon which industrial sidings are located. The same questions of principle

were presented by the protest of the carrier in *Texas Midland Railroad, supra*, and have been carefully considered by us in that case. For the reasons there assigned, the protest herein is not sustained as to the land areas the omission of which is protested by this carrier, and the principles applied in the tentative valuation are approved, except as to streets and highways, as to which the tentative valuation has been corrected in accordance with the rule in the case cited.

The formal order includes the following:

*Investment in Road and Equipment.*—The investment in road and equipment as stated in the books of the carrier on June 30, 1915, was \$5,598,557.73. By certain adjustments detailed in Appendix 2, this amount was altered to \$5,569,642.45, for road and equipment, including land, and \$29,357.20 representing miscellaneous physical property, viz., non-carrier land, a total of \$5,598,999.65.

*Original Cost to Date, Cost of Reproduction New, and Cost of Reproduction Less Depreciation.*—The original cost of property other than land owned or used by the carrier for its purposes as a common carrier, is shown in the subjoined statement, which also shows the cost of reproduction new and cost of reproduction less depreciation.

The amounts of original cost to date may not in every instance represent the exact cost of property units now in place, as some renewals have doubtless been made.

	Original cost to date	Cost of reproduction	
		New	Less depreciation
Road, excluding lands.....	\$4,681,275	\$4,703,308	\$4,397,031
Equipment .....	293,881	292,165	232,626
General expenditures .....	222,296	432,971	404,218
Total .....	\$5,197,452	\$5,428,444	\$5,033,875

Reference will be made later herein as to the classification of such property in conformity with the classification of expenditures for road and equipment prescribed by us.

*Cost of Lands, Rights of Way and Terminals at the Time of Their Dedication to Public Use, and Present Value of the same.*—There can be no statement made showing the cost of the carrier and non-carrier lands of the Southbound company separately, without employing apportionments of costs which were incurred partly for one such class of property and partly for the other.

The following statement shows the original cost and present value of all lands, apportioning the original cost of lands as between carrier lands and non-carrier lands upon the relative area as constituting the best basis available:

	Acres	Original cost	Present value
Carrier lands:			
Urban .....	145,283	.....	\$347,394.02
Rural .....	1,280,269	.....	163,260.74
Total, carrier lands....*	1,425,552	\$372,190	\$510,654.76
Noncarrier lands:			
Urban .....	2,380	.....	\$34,531.50
Rural .....	326,152	.....	20,069.94
Total, noncarrier lands	328,532	29,357	†\$54,601.44
Grand total .....	1,754,084	\$401,547	\$565,256.20

\* Included in the carrier lands are 273,223 acres acquired through aids, gifts, grants of right of way and donations, having a present value of \$63,398.77.

† The present value of noncarrier lands includes the value of any structures located on the lands.

*Present Cost of Condemnation or Purchase of Lands.*—Following the views previously expressed, no attempt is made to state what would be the present cost of acquiring either by purchase or by condemnation the lands of the carrier devoted to public use.

*Physical Property Held for Purposes Other Than Those of a Common Carrier.*—The amount, original cost, and present value of lands held for purposes other than those of a common carrier have been stated.

*Materials and Supplies.*—As shown in the general balance sheet, the value of the materials and supplies on hand is

shown by the carrier's records to have been, upon valuation date, \$5,180.56. The materials and supplies on hand, as shown by inventory, were of the value and cost of \$43,067, and the difference between the amount shown in the balance sheet and the carrier's records, \$37,886.44, was due to sums which had not yet been taken into account.

*Aids, Gifts, Grants and Donations.*—Certain carrier lands were acquired by the Southbound company through aids, gifts, grants of right of way, or donation. Such lands mounted in the aggregate to 273,223 acres, of a present value of \$63,398.27.

*Other Values and Elements of Value.*—No other values or elements of value were found to exist.

*Appendices.*—Appended hereto as Appendix 1 are the summary sheets and explanatory text showing the classification of the cost of reproduction net and cost of reproduction less depreciation above stated, in conformity with the classification of expenditures for road, exclusive of lands, and equipment prescribed by us. Appendix 2 hereto states the details as to the corporate and financial history, original cost to date, investment, capitalization, gross and net earnings, expenditures of money and purposes for which expended, of the carrier.

The engineering, land and accounting reports give the details respecting these figures and are on file in the bureau of valuation of the commission, open to public inspection, and subject to the direction of Congress, and such reports are referred to for greater particularity as to the matters herein stated.

This order will be supplemented by such further findings and order with respect to the value of the carrier property as may be deemed appropriate.

### Portland Cement Production in 1918

COMPLETE STATISTICS of the output of hydraulic cement in 1918 compiled under the direction of Ernest F. Burchard, of the United States Geological Survey, Department of the Interior, indicate a marked decrease from the output in 1917 and show that the production of Portland and other cements in 1918 was the lowest since 1909. The shipments of Portland cement in 1918 amounted to 70,915,508 bbl., valued at \$113,153,513, compared with 90,703,474 bbl., valued at \$122,775,088, in 1917, a decrease in quantity of 21.8 per cent and in value of 7.8 per cent. The production in 1918 was 71,081,663 bbl., compared with 92,814,202 bbl. in 1917, a decrease of 23.4 per cent. The stocks at the mills increased from 10,353,838 bbl. in 1917 to 10,453,950 bbl. in 1918, or 1 per cent.

The average factory price per barrel for the whole country was \$1.596 in 1918, compared with \$1.354 in 1917, an increase of 24.2 cents, or 17.9 per cent. The prices in these two war years are the highest that have been realized for Portland cement since 1898 and 1899, when they were re-

### Embargo Bureau of the N. W. Region

A PLAN has been instituted and put into operation in the Northwestern region for the distribution of embargo information which is an advance over methods previously used and is proving satisfactory to roads in this region. It will be recalled that the Car Service Section recently issued revised regulations in Circular CS-57 for the handling of embargoes, to become effective April 1. Briefly, they placed the issuance of embargoes under the direction of the regional directors, thus abolishing the zone embargo committees which formerly handled their distribution. The circular further stated that when embargoes have been approved by the regional director they should be transmitted by the regional director's office to all Federal controlled roads in the region, to the Car Service Section and to other regional embargo offices interested. The federal controlled roads in turn were instructed to notify their agents and the non-federal controlled roads which were assigned to them. In addition, the reason for each embargo must be stated, the embargo must be given an identifying number and a complete file of outstanding embargoes must be maintained at all freight loading stations for the guidance of the shipping public. These regulations made necessary the installation of a complete new system of handling embargoes, and in the Northwestern region the task of developing a workable plan was assumed by L. M. Betts, supervisor of car service.

The plan adopted for use in the Northwestern region has accomplished the dissemination of up-to-date embargo information in simple, compact form.

This was brought about by the compilation and publication of a monthly pamphlet containing in skeleton statement form all embargoes in effect on all railroads of the United States, Canada and Mexico that would be likely to affect business originating on railroads in the Northwestern region. The information is shown by roads arranged alphabetically in regional groups. Convenient reference is provided by an index both of the railroads involved and also of all local stations affected by the embargoes. Arranged in successive columns, the pamphlet shows information concerning the destination, consignee, commodity and gateway affected, together with a full statement of the exceptions that may apply. A sample entry is shown at the bottom of this page.

This pamphlet quite naturally would not answer the requirements of the Car Service Section as to the completeness of the embargo file at freight loading stations. To obviate this there was conceived, along with the method of issuing the bulletin of embargoes monthly, the plan of issuing a series of daily supplements. These supplements are mailed each night with a complete summary of all additions, cancellations and modifications received during the day, and sufficient copies are provided each road so they can be distributed immediately and directly to all local

PENNSYLVANIA RAILROAD, LINES EAST

N. W. R. embargo number	Originating R. R. embargo number	Destination	Consignee	Commodity	Exceptions	Gateways	Reason for embargo

A SPECIMEN FORM OF EMBARGO

spectively \$1.62 and \$1.43 a barrel. The lowest average price, \$0.813, was recorded in 1909 and 1912. The exports of hydraulic cement from the United States in 1918 were 2,252,446 bbl., valued at \$5,912,166, or \$2.62 per barrel, compared with 2,586,215 bbl., valued at \$5,328,536, or \$2.06 per barrel, in 1917. This represents a decrease in quantity of 12.9 per cent and an increase in value of 11 per cent.

agents without the delay and expense of reproduction. They are so arranged that additions and corrections can be clipped and inserted in their proper places in the current month's issue of the embargo bulletin, and thus with very little labor the record can be maintained up-to-date at all times. One of the most satisfactory features of the system is that, regardless of the attention paid by the local agent to the daily

supplements, there is placed in his hands on the first of each month a complete and up-to-date revision of all embargoes then in effect.

Telegraph transmission of important embargo changes is continued, but by reason of the prompt distribution to the local agents of the daily supplements it is possible to reduce the use of the wires to a great extent.

While the expense involved in printing and distributing the monthly bulletins and supplements is a considerable item, it has been more than offset by the savings made by roads in the Northwestern region in the reproduction and distribution of embargo information formerly received by them from the zone offices, and by the saving secured through discontinuing the zone embargo offices.

Progress is being made by the Car Service Section on a plan to consolidate embargoes applying via various roads to a common point. In lieu of half a dozen or more separate embargoes, identical in their provisions, from as many different roads, one embargo only, applying via all lines, is being issued. This plan is entirely practicable under the present system of handling embargoes by the regional directors, but could not have been installed under the former plan where each road issued and transmitted its embargoes without central supervision. It is expected that as the new system of regional direction develops it will greatly simplify the embargo situation, and thus reduce the annoyances and difficulties that have made embargoes one of the nightmares of the long-suffering railroad agent.

## Doings of the United States Railroad Administration

### Many Roads Badly in Need of Rail. When Is a Railroad Under Federal Control Question Before I. C. C.

WASHINGTON, D. C.

**B**IDS WERE RECEIVED by the Railroad Administration up to May 17 on 200,000 tons of rail, but announcement was withheld until Mr. Hines' return from his trip to the Southwest as to whether the prices quoted are more favorable than those of \$45 per ton for Bessemer and \$47 for open hearth announced by the Industrial Board of the Department of Commerce in March. The fact that no announcement was made has given an impression that the bids are not regarded as satisfactory, because the Railroad Administration needs the rail. While the records show that an average of approximately 1,500,000 tons of rail were used for renewals during the 10 years before federal control, and approximately 1,350,000 tons during the three-year test period, only about 1,100,000 tons were used in 1918 and the Railroad Administration has not placed any orders for rail since it took over the roads nearly a year and a half ago. While some of the orders were redistributed so as to make delivery to railroads whose companies had not placed orders, that practice was discontinued after January 1 this year and the steel companies have declined to deliver rails ordered by one company to other railroads. To take the rail after it has been delivered for use on another line is impracticable in most cases because of the difference in rail standards. Where different roads agree as to the rail section there are usually differences in the drillings. As a result, while the steel companies have been delivering rail this year at the rate of 35,000 to 40,000 tons a week, it is going to the roads which originally ordered it, and many of the roads which have not placed orders in advance are said to be badly in need of rail. On May 1 there were outstanding orders for approximately 435,000 tons, and three of the steel companies, the Carnegie, the Lackawanna and the Cambria, were out of orders.

#### Maintenance Problems Discussed

Problems connected with the 1919 maintenance of way program constituted one of the principal topics for discussion at a conference held at St. Louis on May 19 between Director General Hines, who has been making an inspection trip into the Southwest, and the seven regional directors. C. A. Morse, assistant director of the Division of Operation, in charge of maintenance of way matters, was also present at the meeting, which took up among other things, the available figures showing the rail and tie renewals in 1918 as compared with the test period and with the 10 years preceding federal control in connection with the requirements for this year.

The latest instructions regarding the preparation of the 1919 maintenance budgets are contained in a letter addressed by W. T. Tyler, director of the Division of Operation, to the regional directors in part as follows:

"I presume that in pursuance of the director general's letter of February 25 you have carefully studied the maintenance on each railroad for the test period and for 1918. Please have each federal manager as soon as possible submit to you the 1919 program for his railroad, on the basis that the maintenance of road and structures shall conform as closely as possible in the amount of labor and material used to the established average annual maintenance during the three year test period, but with regard to safe operation of properties under your charge, and to that end ask him to report promptly his program for calendar year 1919, divided as follows:

1. Number of ties.
2. Cubic yards of ballast.
3. Tons of rail and fastenings.
4. Value in dollars of ties, ballast, rail and fastenings renewals.
5. Value in dollars of renewals or necessary replacement of bridges, trestles or culverts.
6. Value in dollars of work necessary in connection with proper maintenance under present conditions of track, buildings, fences, ditches, signals, telegraph and telephone lines and other items of maintenance. The cost under this item to be expressed in one sum and generally should not exceed the average spent for the purpose during the annual average of the test period equated as to values of labor and material determined by each road."

#### When Is a Railroad Under Federal Control?

Some railroads were taken under the protection of the federal government; some railroads had federal operation thrust upon them; some were relinquished, and taken back, and several hundred other railroads do not know whether they have ever been under federal control or not. All these are some of the results of the President's proclamation of December 26, 1917, and the law of March 21, 1918, which were so worded that the several hundred think they know they were taken over but thus far some of them have been unable to make their convictions effective.

The questions as to who is to decide whether a railroad has been under federal control and by what process a final decision can most readily be reached became a perplexing problem at a hearing held before the Interstate Commerce

Commission at Washington last week on a petition of the Arkansas & Louisiana Midland, a railroad 102 miles long but apparently not a "system of transportation" as construed by the Railroad Administration, for the appointment by the commission of a board of referees to determine its just compensation under the federal control act. Incidentally the hearing brought out the fact that it is also a serious question how any of the several boards of referees already appointed by the commission may perform their functions as the comptroller of the treasury has ruled that the commission may not pay their expenses from any of its appropriations, and the Railroad Administration, the custodian of the revolving fund appropriated by Congress to defray the expenses of federal control, naturally is reluctant to pay the expenses of a board to decide how much it owes to a company which it claims it owes nothing.

The case presents a situation typical of that of a large number of the short line railroads, which, after having supposed they had been taken over, were relinquished by order of the director general on June 29, 1918, and now claim compensation as having been under federal control, while the Railroad Administration takes the position that no direct control was exercised over them and that they are not entitled to compensation. E. Ford, president of the Arkansas & Louisiana Midland, testified on Thursday that he had received and obeyed many orders from the Railroad Administration during the first six months of 1918, although he admitted that they had not required any important change in the operation of his road and that he had been in some doubt as to his status. He said, however, that much of his traffic was diverted. He did not recall any orders that had had any important effect, although he said that on instructions from Washington he had postponed any action on requests of employees for increased wages until after the general wage advance order had been issued and he found his road was not included. Then he had to advance wages out of the company's funds. He also remembered having received a long telegram which was delivered at his house about midnight, giving instructions as to how to comply with the daylight saving law. He had also been ordered to advance money out of the slender cash resources to help the employees buy Liberty Bonds which they expected to pay for out of a retroactive wage increase, and he had advanced his rates in accordance with General Order No. 28.

The Railroad Administration was represented by R. V. Fletcher, general solicitor, who had no witnesses ready and asked for a continuance of the hearing in order that he might present witnesses after he had learned the character of the testimony presented by the railroad. After some discussion the hearing was adjourned until Saturday, May 17. Mr. Fletcher had spoken of getting R. H. Aishton, regional director for the Western region during the time the road was receiving orders from the Railroad Administration, to testify, and Commissioner McChord had suggested that General Counsel Payne would make a good witness, but on Saturday Mr. Fletcher appeared again without witnesses, saying he had been unable to get Mr. Aishton. On cross-examination Mr. Fletcher attempted to show that the Arkansas & Louisiana Midland had failed to observe promptly some of the accounting instructions, such as those about opening a set of separate books for federal accounts. Mr. Ford said he could not claim to have followed all of the instructions because of insufficient clerical help and because many orders did not reach him till long after their effective dates; also he had frequently received a cancellation or modification of an order before he received the original order; but he made the point that many of the big roads had not been able to comply with the order to open separate books until months after the required date. The hearing was adjourned for half an hour while Mr. Fletcher went to find a witness on this point but the assistant director of accounting had just

received a telegram summoning him to St. Louis to meet the director general and so he could not appear. By this time the commission showed some signs of impatience and it allowed the usual procedure to be varied sufficiently to allow counsel for both sides to explain in their oral argument some of the evidence that would have been testified to if witnesses had been present or if documents had not been delayed.

The argument of John S. Burchmore, representing the Arkansas & Louisiana Midland, brought out some of the circumstances attending the relinquishment of the short line railroads last June. He read a memorandum from C. R. Gray, then director of operation, to General Counsel Payne, dated June 28, the day before the general relinquishment, giving a list of railroads, including the A. & L. M., which he said required considerate treatment because they were in competition with larger roads and which he recommended the relinquishment of in order to give an opportunity to negotiate with them "on a fair basis," but he said it would probably be necessary to take them back later. This memo was headed "Retention or Relinquishment," which Mr. Burchmore thought was rather conclusive evidence that the roads were at the time under federal control. He also quoted from one of the form letters of relinquishment sent out by Mr. Payne, saying that while there was some doubt as to whether they had ever been under federal control they would be formally relinquished to remove any doubt.

Mr. Burchmore said that a federal manager had never been appointed for the A. & L. M. but that federal managers for the larger roads in its territory had not been appointed until after the date it was relinquished. Mr. McAdoo had issued an order appointing the corporate officers as his agents and this had been received and acted on by the president of the A. & L. M. just as he had received and acted on the other orders sent to him as to the other roads. After the relinquishment Mr. Payne had written to Mr. Ford saying that if his company felt damaged by not being under federal control he would be glad to discuss the terms of a contract for taking it back. Mr. Ford, however, had refused to sign one of the co-operative short line contracts, which do not provide for compensation.

Mr. Fletcher argued that as the road had not been under federal control its remedy lies in a suit in the Court of Claims rather than in the appointment of a board of referees, but said that if the commission should find otherwise he would join in the request for the appointment of a board. Mr. Burchmore said the act provides that "any claim" for just compensation not adjusted by the Railroad Administration must be referred to a board and that until that is done he could not apply to the court without waiving his claim that the road was under federal control.

At this point Commissioner Daniels raised the practical question as to what a board could do if the commission cannot pay its expenses and the Railroad Administration will not. The act provides that members of the Interstate Commerce Commission organization shall serve on such boards without additional compensation, but this does not provide for the reporters' fees for taking the record. Mr. Fletcher said he had not been advised of the Railroad Administration's attitude on this point. Then followed a general discussion as to who should decide whether the road had been under federal control. It was apparently agreed that the commission had no function except to appoint the referees, but that the boards would have no jurisdiction to decide anything but the amount of compensation. Mr. Fletcher thought time and litigation might be saved if the whole thing were put up to the Court of Claims but Mr. Burchmore suggested that he would prefer to ask a District of Columbia court to mandamus the commission to appoint the board.

The hearing was closed with an understanding that Mr. Fletcher would file a memorandum on the functions of the Court of Claims.

**385,000 Surplus Freight Cars**

The net surplus of freight cars on May 1 was 385,447, including nearly 20,000 on Canadian roads, according to reports compiled by the Car Service Section. This represents a larger number of idle cars than has been recorded at any time since April, 1908, except on March 1 and April 1 of this year. On March 1 the net surplus stood at 473,080 and on April 1 it was 446,685, so there was a reduction dur-

inability to finance the equipment, some on the statement that the cars or engines are not needed, and some are based on the types, although the Railroad Administration has allowed the roads to exchange one type for another where it can be done before the builders have progressed too far with the building or the ordering of materials to make the change.

The circulars sent out by the regional directors asking for information as to the number and types of locomotives that

\*Principally automobile cars.

ing April of 61,000. As shown by the following table, there were more idle box cars than any other class, including a large number stored in the western regions in readiness for handling the grain traffic but there was also a large proportion of surplus coal cars, due to the slack conditions in the coal trade.

**Train Control Committee**

The Committee on Automatic Train Control returned last week from its western trip after having inspected automatic stop installations at Spokane, Wash., and San Francisco and Oroville, Cal. The members of the committee were able to hold almost a continuous meeting in their car and made much progress in their study of the various plans and reports of service conditions that are before them for consideration. The next meeting of the committee will be held in New York on June 3, at which time the members will inspect automatic stops in the Interborough Subway, on the Brooklyn Rapid Transit system and in the tunnels of the Hudson & Manhattan and the Pennsylvania terminal. An inspector representing the committee has been observing and making reports for several weeks on the operation of the Miller train control system on the Chicago & Eastern Illinois, and an inspector will probably be sent to report on the installation of the American train control system on the Chesapeake & Ohio. The committee will on later trips examine 15 or 20 installations, models or laboratory sets in the East, and will hardly be in a position to make recommendations to the Railroad Administration before fall.

**Single Equipment Trust Proposed**

Plans for the creation of an equipment trust to finance the 100,000 freight cars and 1,930 locomotives ordered by the Railroad Administration by a single issue of equipment trust obligations amounting to approximately \$400,000,000, instead of having individual securities issued by each of the roads, are under consideration by the Association of Railway Executives and the Railroad Administration.

Of the 100,000 freight cars ordered, 44,542 had been built up to April 30 and 92,750 had been assigned to various companies, but only 25,570 had been accepted, while 18,972 were in storage at the car-building plants. Of the 1,930 locomotives ordered, all but 41 had been assigned, but all the assignments had not been accepted. The locomotives have been accepted as fast as they have been built, but various companies have objected to the assignments just as they have to the cars. Some of the objections are based on the

will be required and whether the corporations will be willing to purchase locomotives of their own standards represent an effort to place some of the unaccepted locomotives, but it will not be possible to substitute individual or "made-to-order" designs for the standard types in many instances because the work on the parts for the standard types has been so far advanced.

**Contracts Executed**

The Railroad Administration has executed compensation contracts as follows: Central Vermont, \$835,000; Lehigh & New England, \$1,135,760; and Atlantic & Western, \$12,660; also co-operative short line contracts with the Kalamazoo, Lake Shore & Chicago; Erie & Michigan Railway & Navigation Company, and the Bowdon Railway.

The Railroad Administration has signed co-operative short line contracts with the Pecos Valley Southern, Chesapeake & Western, Akron, Canton & Youngstown, Arcade & Attica, Marion & Eastern and the Preston Railroad.

**Conference on Equipment Allocation**

The special committee appointed by the Association of Railway Executives to confer with the Railroad Administration regarding the allocation of the standard freight cars to the various companies has been in Washington this week and has discussed the matter with Director Shirley of the Division of Finance.

**Demurrage Up to Director General**

The question of reduction in demurrage rates which has been persistently demanded by the shippers is now before Director General Hines for decision on recommendations which have been made to him by the divisions of traffic and of operation.

The American Society of Civil Engineers will hold its forty-ninth annual convention at St. Paul and Minneapolis, June 17, 18, 19 and 20, with headquarters at the Radisson Hotel, Minneapolis. Tuesday, the 17th, will be devoted to business sessions in the morning and afternoon with a reception in the evening. Wednesday will be devoted to sightseeing trips by automobile about the city. On Thursday a trip will be made by automobile to the plant of the Northern States Power Company at Taylors Falls, Minn. On Friday afternoon the party will go by special train to Duluth and on the following day will tour the iron mines on the Missabe range.

## Orders of Regional Directors

**PROCEEDINGS BEFORE I. C. C.**—The regional director Eastern region, by circular 1500-116A726, sends to federal managers regulations and suggestions, prepared by the Director of the Division of Traffic and the general counsel, at Washington, for defending before the Interstate Commerce Commission complaints against the railroads made to that body. The traffic assistants to the regional directors are to supervise these matters, and they are to look after compliance, by the railroads, with the various orders of the commission.

**Superheaters.**—The Eastern regional director, by circular 500-1-97A728, authorizes the application of superheaters to locomotives where all of the needed material is already on hand. The corporations must be consulted, but if material is on hand such consultation need not cause delay.

**The Pocket List.**—The Eastern regional director, by circular 1500-1-3-19A729, advises federal managers of a suggestion from the director general that in giving information to the Pocket List of Railroad Officials, or in correcting data in that periodical, care be taken to furnish full and correct post office addresses.

**Maintenance Budget.**—The regional director, Eastern region, by circular 2700A733, instructs federal managers as to detail requirements connected with preparation of maintenance budgets for 1919.

**New Tracks for Industries.**—The Eastern regional director, by circular 2700A734, advises federal managers that important propositions for industrial sidings should be dealt with by wire. The regional director should be informed how long a time will be needed to lay the track, and how soon it will begin to furnish revenue. This for the purpose of determining whether the improvement will produce profit during the present year. In connection with larger projects, requiring a longer time, the railroad corporation should be consulted.

**Intoxicated Soldiers.**—The Eastern regional director, by circular 2900-66A735, calls attention to complaints of the presence of intoxicated soldiers and sailors on railroad trains. Federal managers should see that trainmen and other employees enforce proper conduct, and especially in territory where drinking intoxicating liquors on trains by civilians is a violation of local laws.

**Operating Statistics.**—The regional director, Eastern region, by circular 1801-22A736, gives further instructions as to preparing, for the operating statistics section, data concerning worktrain cars moving in revenue trains.

**Tinners' Convention.**—The regional director, Eastern region, by circular 102-36A738, and the Northwestern director, by circular 77-1-93, announce approval of the convention which is to be held by the American Railroad Master Tinners', Coppersmiths', and Pipefitters' Association in June. Federal managers exercise their own judgment as to granting leave of absence and giving passes.

**Heavy Loading.**—A. H. Smith, regional director, Eastern region, by circular 500-13-1A741, sends to federal managers a letter from the director of the Division of Traffic, calling for continued efforts to have freight cars loaded to capacity. To increase minimum weights in tariffs would be a slow and difficult process, but it is believed that traffic representatives can continue to do good work with shippers and receivers. Shippers should be shown the economy of full loading and be reminded that voluntary action on their part will tend to stave off the day when arbitrary rules will have to be adopted. Where orders from consignees are alleged to be the cause for light loading, those consignees should be seen.

**Tracers and Passing Reports.**—A. H. Smith, regional director, Eastern region, by circular 600-1-6-A742, calls on federal managers for information as to their practice, and

their recommendations, in regard to giving shippers fuller information concerning the progress of shipments. At the recent conference in Washington with the National Industrial Traffic League, shippers asked for passing reports of I. C. I. freight at transfer stations and for permission to ask information directly from local agents. Mr. Smith finds that present practice is not uniform; he desires advice as to improvement in practice and as to the probable cost of keeping the proposed records at transfer points, and of establishing a manifest system for keeping track of carload shipments.

**Transportation of Liquor for Diplomats.**—The regional director, Eastern region, by circular 600-174A743, calls attention to the legal aspects of the transportation of intoxicating liquors from a foreign country consigned to a diplomatic representative residing in the District of Columbia. The seller of liquor and the carrier are ordinarily liable to the penalty of the Reed law; but liquor sent from abroad to diplomatic representatives of foreign governments in this country may be transported by freight or express to its destination.

**Operating Statistics.**—The Eastern regional director, by circular 1801-22A744, promulgates additional instructions concerning revised statements of expenses after making adjustment for back pay, and for reporting locomotive and train costs on form OS6 and form OS7. By circular 1801-22A747 he calls for monthly statements of freight and passenger revenue, to be made on form OS8; this is the same information which is required annually by the Interstate Commerce Commission.

**Blacksmiths' Convention.**—The regional director, Eastern region, by circular 102-37A745, approves the annual convention of the International Master Blacksmiths' Association, to be held at Chicago, August 19, 20 and 21. Each road will follow its usual practice in regard to allowing blacksmiths to attend.

**Diversion of Freight—Notice to Consignees.**—The Eastern regional director, by circular 600-43-4A746, prescribes a form by which notice is to be mailed to consignees when a carload of freight is diverted in transit.

**Record of Work at Enginehouses.**—The Eastern regional director, by circular 1801-127A748, sends to federal managers revised instructions for reporting, monthly, the number of man hours worked at enginehouses. This report goes to Frank McManamy, Washington.

**Annual Passes for Employees.**—The Eastern regional director, by circular 2100-9A750, advises federal managers that where an employee requires an annual pass over other than his home road, that pass should include also his transportation over the home road, so that he will carry only one pass for all.

**Preparations for Wheat Crops.**—The Southwestern regional director, in circular 210, quotes an article which appeared in a weekly news letter issued by the United States Department of Agriculture concerning the possibility of the coming wheat crop congesting storage facilities and suggests that at interior points a canvass be made of the situation. The construction by farmers and shippers of additional storage facilities should be encouraged.

**Consignments to Shipper's Order.**—The Northwestern region, file 88-1-75, states that the provisions of circular, file 88-1-75, issued by the Northwestern regional director (*Railway Age*, February 7, page 349), apply only to shipments destined to points in Western Classification territory, Northwestern, Central Western, and Southwestern regions.

**Report on Reclamation of Materials.**—The Northwestern Regional Purchasing Committee, in supplement 7 to circular 10, gives a list of items of material being reclaimed by various roads in this region. The list is long and detailed, containing about 800 items.

# Distinguished Service Medal for George Hodges

## Record of His Work as Manager of Railroad Troop Movements Throughout the War

ANNOUNCEMENT was made on May 16 by Walker D. Hines, director general of railroads, that the distinguished service medal has been posthumously awarded to George Hodges, late manager of the Troop Movement Section of the Division of Operation of the Railroad Administration, who had organized and had charge of the troop movement work from the start.

The information was contained in a letter from Newton D. Baker, secretary of war, to the director general, under date of May 13, as follows:

"It is with sincere regret that I learn of the death of Mr. George Hodges, manager of the Troop Movement Section of the Division of Operation of the United States Railroad Administration.

"The services of the railroads during the great war are gratefully remembered, and I thank you for the suggestion that some suitable recognition of the work of the man who was largely responsible for their success might be made by the War Department. I take pleasure in advising you that, by direction of the President, and under the provisions of the act of Congress of July 9, 1917, the Distinguished Service Medal has been posthumously awarded to Mr. George Hodges for especially meritorious and conspicuous service as manager of the Troop Movement Section of the Division of Operation of the United States Railroad Administration. Mr. Hodges arranged all the details of the movement of troops from local draft boards to mobilization camps, between camps, or from mobilization camps to the ports of embarkation for shipment overseas. Troops in large numbers were moved on short notice and he was responsible for the successful co-ordination and carrying out of these movements."

At the beginning of the trouble with Mexico he was placed in charge of the American Railway Association special committee for co-operation with the military authorities. With the declaration of war against Germany in April, 1917, he was appointed assistant to the chairman of the Railroads' War Board. After the taking over of the railroads by the government, the organization under Mr. Hodges was made part of the United States Railroad Administration. On May 24, of the same year, he was put in charge of the Troop Movement Section of the Division of Operation.

He died very suddenly in Washington on March 14.

A brief account of the work of the Troop Movement Section was published in connection with the report of the Division of Operation in the *Railway Age* of January 10, which gave figures showing the extent of the troop movement from May 17 to November 10, the day before the signing of the armistice. C. F. Stewart, Mr. Hodges' successor as manager of the Troop Movement Section, has issued a circular containing a copy of Secretary Baker's letter, saying, "This splendid tribute to Mr. Hodges will be appreciated by all those who have so ably assisted the movement of the troops and through whose co-operation such a success was made possible." The circular also encloses a copy of the record to November 11, which was prepared by Mr. Hodges, and also a supplemental report showing the movement from November 11, 1918, to April 30, 1919, during which time there have been moved a total of 3,389,665 men, of which 1,583,942 were moved on regular trains and 1,805,723 on special troop trains. This is an average of 635,959 per month.

From May, 1917, to April 30, 1919, the Troop Movement Section has been responsible for the movement of a total of

over 14,000,000 men, nearly half of whom have been moved on special trains. The maximum for any month of the entire period was 1,147,000 in July, 1918. This entire movement has been accomplished with only 16 accidents involving death or injury. The number of men killed was 39 and the number of men injured 335. The table gives the consolidated statistics regarding the movement from May, 1917, to April 30 of this year:

### TROOP MOVEMENTS MAY, 1917, TO APRIL 30, 1919

1. Troops Moved:			
(a) Drafted men from their homes.....	2,287,926		
(b) On regular trains.....	5,252,432		
(c) On special troop trains.....	6,851,915		
Total .....			14,392,273
(d) Average per month.....	504,343		
(e) Maximum July, 1918.....	1,147,013		
2. Cars Furnished:			
(a) Pullman, standard and tourist.....	90,773		
(b) Coaches for special troop trains.....	87,984		
Estimated coaches for draft and regular train movements .....	69,802		248,559
(c) Baggage and express cars for special troop trains.....	16,084		
Estimated baggage and express cars for drafted men .....	4,576		
(d) Freight cars for special troop trains.....			20,660
Total .....			24,029
3. Special Troop Trains:			
(a) Number run .....	16,393		
Estimated number required for drafted men .....	4,576		
Total .....			20,969
4. Average Special Troop Trains:			
(a) Number cars per train.....	12		
(b) Distance per train.....	803		
(c) Number hours per train.....	40		
(d) Miles per hour.....	22		
(e) Men per train.....	418		
5. Accommodations:			
(a) Number carried in Pullman cars.....	3,440,173		
(b) Number in coaches.....	8,664,074		
(c) Percentage in Pullman cars.....	28.4		

The following description of the work of the section outlining briefly its organization and methods was prepared by Mr. Hodges:

When diplomatic relations with Germany were severed, steps were at once taken to put together the machinery to handle troop movements upon a large scale, based upon the experience gained in the movement of troops to the Mexican border in 1916.

At the declaration of war on April 6, 1917, the skeleton of the organization was complete, and it only remained to supplement it as occasion arose for its development.

This skeleton consisted of a central office in Washington in constant communication with the War Department, a general agent with his staff at the four (afterward six) department headquarters, and a general agent in each state to superintend the railroad movement of the National Guard.

As necessity presented itself there were added successively a general agent at the headquarters of the construction division of the quartermaster corps, general agents at the increment camps and in charge of the railroad end of the construction of the cantonments and the National Guard camps (who remained in charge after the troops had occupied them), as well as others at embarkation camps and at ports.

The duties of these general agents have been to keep in touch with the officers to whom each was accredited, to ascertain what was desired to be done and to arrange through the appropriate channel in each case to do it; to see that trains and cars were provided at the time required; that the loading was done properly, and, in general, to translate into terms of action the necessities of the army.

There have been in service 127 of these; the closing of

some camps and the movement of the National Guard from their respective states have relieved a number from duty, and there remain 64.

It became early evident that to move successfully such large numbers of men would entail unprecedented use of telegraph wires, and that the brief cipher used in 1916 would not answer the purpose. To meet the necessity for secrecy and brevity, a cipher expert, J. Edwin Dempsey, was called in to devise an efficient code. This he did; the code work being his personal contribution; the railroads paying the necessarily heavy expense of publication. This code was also adopted by the quartermaster general for use in his department. It was later supplemented by a route code book, by which all routes were coded into one cipher word regardless of how many roads or junction points were included.

The movement of troops with their impedimenta and of selective draft men and recruits may be generally divided as follows: (1) The movement of the regular army to its increment camps. (2) The movement of the National Guard to its camps. (3) The movement of the National Army from their homes to their cantonments. (4) The movement of men from one camp to another to meet the needs of the service.

In addition to these there has been a constant stream of recruits moving from depots to camps and continuous movements of bodies of organized troops to camps or ports.

The movement of the regular army to increment camps was performed with great ease by reason of the relatively small number of men involved and their experience in travel.

Before speaking of further movements it should be noted that on June 1, 1917, none of the camps to which the National Guard or National Army were destined were more than just begun, and in some cases the locations had not been fixed.

The problem of bringing the material to these 32 large camps, as well as to the 15 or 18 aviation schools also under construction, that the work might proceed at top speed, was satisfactorily solved by successful co-operation between our Washington organization and the force of the construction quartermaster, General Littell, the liaison officer being C. E. Denney, general agent of this association, who was attached to General Littell's staff.

Altogether this construction work involved bringing to the various sites 139,905 cars of materials. This was accomplished by ordinary means and practically without setting up any priorities in movement. Although an extraordinarily large commercial and allied tonnage was also moving, it was before any large volume of government tonnage was under way with the confusion and congestion caused by the indiscriminate forwarding of such freight without regard to physical limitations or to the necessity for its orderly transportation and prompt release at destination.

The movement of the National Guard involved about 343,223 men. The guards of the several states were not as in 1916 mobilized in one place, but in many instances were picked up company by company at home stations, necessitating elaborate schedules to bring a regiment together before despatching it upon its long journey to the Southern camps. The entire movement was, however, made upon the schedule as outlined by the War Department. At our suggestion, it was twice suspended pending the movement of increments of the National Army.

The movement of the National Army was a most complicated one. Originating at upwards of 4,500 points in every county of every state, the men had to be brought within a given period of time to their cantonments. To do this involved scheduling every movement of every train, regular or special, on which any of these men traveled, placing these schedules in the hands not only of the railroads concerned but also in the possession of every one of the local exemption boards at points of origin. That it was done on schedule and without disorder or accident is noteworthy.

All our suggestions as to dates were accepted by the War Department; when these dates were set, all details were turned over to us. The schedules were prepared by the several passenger associations, and a competent representative was placed by the association in the office of the governor or adjutant general of each state during the movement to adjust any difficulties that might present themselves. We also were obliged to undertake the feeding of these men. This was done in some cases by using dining cars, in others in eating houses, and in others by supplying lunches on the trains.

Almost immediately upon the arrival of the National Army at its camps there began an inter-camp movement of large proportions. During a portion of this time, organizations of the National Guard were moving South. It was therefore frequently necessary to make suggestions as to appropriate dates for such movements to avoid overcrowding of roads and gateways. These suggestions were cordially accepted.

A review of the troop movements would not be complete without a reference to the extremely heavy demands made upon the railroads by the furloughs granted at the divisional camps. In many instances thousands have been furloughed for Saturdays or Sundays, and at Thanksgiving and at Christmas the number of men on leave was well above 100,000 in each case. The requirement in power to meet this has been serious in its effect.

The organization in Washington as it has been built up consists of:

A routing section under C. F. Stewart, which arranges the routes by which the troops travel subject to the approval of the quartermaster general. This section represents the passenger department of the railroads. It has an employee in the office of the quartermaster general.

A transportation section under J. W. Smith, which controls the arrangements for actual movement over the railroads involved, and keeps in touch with all necessary features of transportation.

A pullman section under C. W. Henry, placed with us by the Pullman Company, which apportions the available tourist cars under authorization for their use from the quartermaster general.

To these was added a liaison officer, Major R. E. Shannon, U. S. R. A., who acts as a point of contact with the War Department to acquaint us with its desires and it with our needs and preferences.

The concentration of these several functions in one place has reduced lost motion to a minimum and has secured the maximum of information being available at all times. As a result all the difficulties inherent in any scheme of co-operation have been removed as they appeared and a smoothly running machine is in operation which has been able to take care of any situation which has presented itself. It is sufficiently flexible to enable us to make the greatest possible use of the facilities of parallel lines in order to avoid overburdening any; to throw troops around congested areas, or, in fact, as it is now organized and related to the War Department, it is possible for us to so handle the movements as may best serve the physical necessities of the moment, except, of course, where an actual military necessity must govern.

This service has been made possible only by the cordial co-operation of officers of the army, and particularly those of the general staff, the adjutant general's office, the provost marshal general's office and of the quartermaster's corps.

Street railway conditions in cities where approval of rate advances has been refused or deferred, are to be investigated soon by a new government commission. President Wilson has cabled his sanction for creation of the commission. Fifty or more street railways are already in receivers' hands and many others are threatened with a similar situation.

# Railway Developments in Foreign Countries

Officer of Southern Mexican Roads on Visit to United States;  
Export Figures for March

COLONEL PAULINO FONTES, general manager of the southern railways of Mexico under government control, is at present visiting the United States to arrange for the purchase of a larger volume of railway supplies. After visiting St. Louis and Chicago, he will arrive in New York on May 28. Colonel Fontes, who is a native of the state of Sonora, entered the railroad service in 1899 as a brakeman on the Southern Pacific Railway, lines south of Nogales, Sonora. He was promoted in a few years to freight conductor, and then was given a passenger run. In 1910 he left the Southern Pacific to join the revolution against the Diaz Government, and was given charge of all the military trains during the pre-Constitutional Administration of President Carranza. Then he became general superintendent of the Constitutionalist Railways, and later was appointed general manager of all the lines south of Mexico City, which position he now holds. Colonel Fontes is a graduate of the University of California and speaks English fluently. He is regarded in Mexico as one of the ablest men in government railway circles.

Col. P. Fontes

## Belgian Inland Waterways Commission

A Belgian Waterways Commission has been established, the functions of which will be to prepare a program for the exploitation and organization of navigable waterways. The commission will work under the Ministry of Railways, Marine, Posts and Telegraphs, and will complete the work of the Inter-Allied Waterways Commission.

## German Cars Turned Over to the Allies

No statistics are as yet available giving the exact amount of German railway stock handed over under the armistice conditions, says the Railway Gazette (London), in its issue of April 25, but it may be said that the amount of restitution to date is on a far larger and more satisfactory scale than the average newspaper reader might imagine. This is particularly noticeable in regard to freight cars. At practically every station and siding of importance throughout Belgium and northern France one sees today strings of German freight cars, which in fact seem to outnumber the native cars, and a very large percentage of the merchandise traffic now being handled is moved in enemy equipment. German locomotives are not so conspicuous, but they are also to be seen to a noticeable extent, and their external appearance is on the whole no worse than that of the average French and Belgian locomotive today. Passenger cars of all kinds have also been delivered in large numbers, ranging from the oldest type of third-class coach to the most modern corridor car de luxe. The German corridor equipment is being operated on the fast express services, and it was on a train largely made up

of these former enemy vehicles that Lloyd George recently travelled from Boulogne to Paris. The corridor cars are in remarkably good condition.

## Railway Construction in Mexico

According to the announcement of the Department of Communications and Public Works of the Mexican government, the Cananea Copper company and other American interests have filed application for a concession to construct a railroad from Cananea to Bahia Roca, a prospective deep-water port on the Gulf of California. The route of the prospective line is through a part of the state of Sonora that is rich in undeveloped mineral resources. The distance between Cananea and Bahia Roca is about 175 miles. At present the only railroad reaching Cananea is the one which runs down from the Arizona border. By obtaining connection with the deep-water port it will be possible for the big mining camp to receive supplies at lower cost, it is claimed. It will also afford means for shipping the smelter products by water.

## Finland's Arctic Railway

The realization of the projected railway from Rovaniemi, on the Arctic Circle, north of the Gulf of Bothnia, to Petschenga, Finland's road to the Arctic Ocean, has been left in abeyance for some time, but is now to be proceeded with. The scheme originally emanated from the Russian Government, which urged or ordered Finland to construct a railway along the Pasvik to Petschenga, or in any case to make the necessary preparations. The North Railway went only as far as Rovaniemi, whence there remains a distance of about 300 miles to Petschenga, 120 miles as far as Kyyro, and 180 miles on to Petschenga. The preliminary road, which was to precede the railway, has been almost completed from Rovaniemi, past Sodankyla to Kyyro. It has a breadth of about 35 ft. half of which is intended for the future railway. The section from Nautsjoki to Tolleoi and Petschenga is built in an unsatisfactory manner, and the revolution stopped progress, at least as far as this Russian section is concerned. Finland, however, proceeded with the work, after the country's occupation by German troops, under the management of German officers, and a light railway was constructed as far as Kyyro. The part played by the Germans in Finland then came to an end, but there is now a possibility that England will step in and help Finland to complete this important railway, which has possibilities from the industrial and commercial point of view. In this connection reference should be made to the contemplated Norwegian free port in East Finmark. Opinions have been divided as to where this port should be located, but advantages are claimed for Kirkenaes, both for sea and land traffic, and as regards timber and iron ore.

## Europe to Build Own Railroad Equipment

American car builders are not basing their estimates of future business on prospects of big orders from either France or Great Britain, according to the opinion of W. H. Woodin, president of the American Car & Foundry Company as expressed to a representative of the New York Tribune.

"France, England and even Germany," said Mr. Woodin, "will probably be in a position before long where they will be able to supply their own needs in the railroad equipment

line. England, if necessary, can turn over to Canadian manufacturers for additional supplies.

"There should be an excellent market, however, for American-built cars in other parts of the world, particularly in South America, where the railroads are in need of equipment, but large orders are dependent on the ability of these countries to finance their purchases in this market. In my opinion the way this should be done is to offer the securities of the South American railroads direct to American investors. This method is better than to have the securities offered indirectly through some buffer corporation or syndicate which would demand a substantial profit for its work."

The American Car & Foundry Company has not taken any recent orders for foreign delivery, Mr. Woodin said. Substantial progress is being made on orders for freight cars placed with the company by the Italian government and India shortly after the signing of the armistice. A total of 13,250 cars is involved, of which 10,000 are to go to Italy and 3,250 to India. These contracts are valued at about \$25,000,000.

Exports of Railway Track Material in March

Exports of railway track material in March totaling \$193,987 for spikes, \$3,051,611 for rails and \$515,535 for switches, frogs, etc., were not as great as in January or February. Of the 48,955 tons of rails in March (comparing with 65,024 tons in January and 66,900 tons in February), 18,131 tons were destined for France and 6,060 tons for Japan. The figures, as compiled by the Division of Statistics of the Bureau of Foreign and Domestic Commerce, follow:

Countries	Railroad spikes		Rails of steel		Switches, frogs, splice bars, etc.
	Pounds		Tons		
Belgium			6,354	\$353,712	\$18,806
France	1,934,500	\$78,678	18,131	1,074,519	209,190
Italy			2,258	201,400	44,030
Norway			215	10,500	10
Canada	383,300	11,570	2,773	109,658	17,649
Costa Rica					99
Guatemala	10,090	560			
Honduras			1,386	78,572	7,390
Nicaragua					96
Panama					2,713
Salvador	875	58			10
Mexico	79,576	5,314	4,413	25,229	22,973
Barbados	11,600	551	140	9,514	2,313
Jamaica			4	300	
Other Br. W. Indies (except Trinidad and Tobago)	8,510	478	20	2,213	674
Cuba	368,606	18,292	2,314	149,047	66,901
Dominican Republic	9,060	514	54	3,022	2,158
Argentina	30,030	3,303			
Brazil	338,100	15,549			7,193
Chile	71,980	4,319	2,249	115,811	15,831
Colombia	11,700	739	447	31,561	3,053
Ecuador					295
Peru	16,200	805	395	39,955	4,742
China			1,584	113,688	2,884
Chosen	6,720	420			
British India			12	2,700	819
Straits Settlements	19,800	1,385			
Dutch East Indies	130,324	6,019	2,266	164,387	20,605
Japan	319,103	16,504	6,060	464,735	43,468
Russia in Asia	108,192	3,494	655	30,944	5,003
Siam	242,000	20,084	50	4,032	145
Australia					7,697
Philippine Islands	84,000	5,264	54	4,200	7,319
British West Africa	1,200	86			
British South Africa			881	61,887	1,479
Total	4,185,816	\$193,987	48,955	\$3,051,611	\$515,535

Exports of Locomotives in March

The exports of locomotives in March totaled only 27 with a value of \$852,224 as compared with 87 in January valued at \$3,076,543 and 85 in February valued at \$2,584,269. Of the March exports over half from the standpoint of value, namely 12 locomotives valued at \$681,204 were exported to Chosen. The figures in detail as compiled by the Division of Statistics of the Bureau of Foreign and Domestic Commerce are as follows:

Countries	Number	
Canada	5	\$18,000
Mexico	2	21,495
Cuba	3	52,125

Peru	2	39,700
Chosen	12	681,204
Straits Settlements	1	31,200
Dutch East Indies	1	5,500
Philippine Islands	1	3,000
Total	27	\$852,224

Exports of Car Wheels and Axles in March

Exports of car wheels and axles in March totaled \$686,281, a considerable increase over the total of \$278,393 in January and of \$541,630 in February. Shipments to Japan totaling \$255,308 made up the largest item in the whole while Japanese China was second with \$93,410. The figures in detail as compiled by the Division of Statistics of the Bureau of Foreign and Domestic Commerce follow:

Countries	
France	\$31,387
Iceland and Faeroe Islands	653
Italy	61,468
Norway	178
Canada	77,668
Costa Rica	2,490
Guatemala	111
Panama	779
Mexico	11,907
Jamaica	2,188
Other British West Indies (except Bermuda, Trinidad and Tobago)	268
Cuba	12,355
Dominican Republic	850
Argentina	11,331
Brazil	12,792
Chile	390
Colombia	1,755
Ecuador	2,198
China	10,758
Japanese China	93,410
Chosen	6,200
Dutch East Indies	63,236
Japan	255,308
Australia	25,096
British West Africa	500
British South Africa	1,005
Total	\$686,281

Orders Placed in U. S. Alarm British

Recent announcement of big orders placed in the United States when British factories were anxious for work has caused the nation some alarm, according to a communication to the Journal of Commerce, New York, from Liverpool, under date of May 1. With unemployment growing, the English manufacturers admit that they are suffering from competition with the Americans and point to the instance where an order for steel rails was placed by a Birmingham corporation in the United States. Fear is expressed that a \$1,775,000 contract for locomotives has been lost to a United States firm, and discontent is growing as to the policies of reconstruction.

Reviewing the situation the Liverpool Journal deals with what it terms "unpleasant realities":

"The placing of an order for steel rails in the United States by the Birmingham Corporation is only one and perhaps the least striking instance of the kind. France also requires rails and recently offered contracts to English and American manufacturers for 750,000 tons of them. When the English manufacturers got down to absolute bare net cost, with no profit at all, they were still 30s per ton outside the price quoted by the American manufacturers. Orders for the first 500,000 tons have already gone to the United States. The remaining 250,000 tons were held over for English manufacturers, but the latter could make no certain promise of delivery owing to threats of strikes, and if they have not already gone they are likely to follow the first 500,000 tons to the United States. An order for about £375,000 (about \$1,875,000) for locomotives was offered to the North British Locomotive Company. This is believed also to have been lost to the United States. It is a matter of common knowledge in the iron and steel and engineering industries that reconstruction orders for France and Belgium are going to the United States far more than they are coming to this country, although British manufacturers want the work.

"It may be asked why this state of affairs should exist, and we believe the explanation will be found in the statement of A. J. Robson of Sheffield, the chairman of several of the largest steel-making concerns in the North of England, that 'without a larger and cheaper production, home and export trade will be crippled.' If we are to preserve for the nation 'the position and influence and authority which they have gained by their sacrifices and efforts in the cause of human liberty and progress, and to bring into being such conditions of living for the inhabitants of the British Isles as will secure plenty and opportunity to all,' no further time must be lost in applying these economic principles which have enabled us during the past four and a half years to maintain production at the high level demanded by the circumstances and to insure security for the workers."

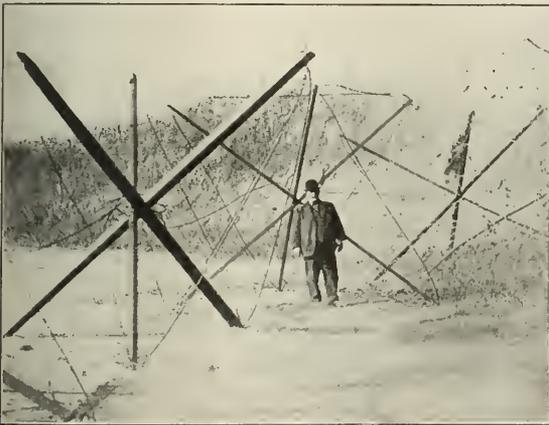

## A New Form of River Bank Protection

By F. T. Morse

Office Engineer, Atchison, Topeka & Santa Fe, Topeka, Kansas

THERE ARE VARIOUS MEANS for fighting a river that is cutting its banks and many thousands of dollars have been spent by the railroads in protecting their properties from encroachment through various methods of protection, all of which involve the expenditure of considerable sums of money. For this reason attention is directed to a form of protection recently developed and put into service locally along the Kansas or "Kaw" river in the vicinity of Topeka, Kans.

This is a jetty which consists of one or more units, prefer-

One of the Steel Jetties Just After Placing

ably at least four, and each unit consists of three structural steel angles, 16 ft. long, properly fastened together in the centre in the form of a jack stone, such as children use in playing jacks. The extreme ends of these three angles are fastened one to another with half-inch wire cable. Various sizes of angles have been used. The four or more units are fastened one to another by wire cable, attached to the centre of each unit, and this cable is fastened to a dead man some distance from the bank. The material is shipped in a knocked-down condition to the point of use. There each unit is assembled on the bank, the several units are properly tied together with one end anchored to the shore, and the whole jetty is rolled into place in the stream.

At first sight it appears that there is little in this affair to protect the bank, but its apparent efficiency would seem

to be due to the fact that the jetty decreases the velocity of the water passing through it sufficiently to deposit some of the sand being carried down stream by the swift current, and once a deposit is started it continues rapidly. Of course, brush catches in the prongs of the affair, but the jetty is not dependent upon this brush for results. In fact the builders claim better results where no brush interferes. Should brush lodge, and overturn the jetty, it is in the same position as before and unharmed.

The advantages of this jetty lie largely in its relatively cheap installation cost and to the short time required to place it, as compared with other means of bank protection. Experience with this construction indicates that the results are satisfactory. Then, too, the effect of this jetty in pushing

Deposit of Sediment Resulting from the Presence of Two Jetties

the river away from the point of cutting is only moderate, so that the current is not turned sharply away only to have it do even greater damage at some point further down stream.

The pictures show the form of construction and indicate possible results. One photo shows a jetty just after installation. The other picture shows clearly that a bar or deposit is forming below the point where two jetties had been placed. The river had given more or less trouble here, and considerable money had been spent in a small way without much success until this jetty was placed in the fall of 1918. The picture was taken just after the heavy rains, and high water of March, 1919. In all of 37 places where jetties of this kind have been installed the river has stopped cutting.

If the protection is required for some distance along the river, it is necessary to place the jetties at intervals of from two hundred to three hundred feet. These jetties were developed by J. W. Kellner, manager of the Steel Jetty Company, Silver Lake, Kans., and are covered by patents.

At Galveston, Tex., on May 5, representatives of various grain organizations, the United States Railway Administration and the Department of Agriculture began an investigation of the inspection, grading and handling of grain at terminal points, the object of the meeting being to look into demurrage rates and delays in unloading. Among those who took part were W. J. Niergarth, St. Louis; J. W. Shorthill, York, Neb.; R. S. Hurd, Wichita, Kan.; Elmer Hutchinson, Arlington, Ind.; C. W. Crawford and N. J. Manley, representing the United States Railway Administration, and R. T. Miles, of Chicago, representing the Bureau of Markets, United States Department of Agriculture.

## Additional Objections to Proposed Rules for Competitive Bidding

IN ADDITION to the statement outlining suggestions and objections to the rules for competitive bidding proposed by the Interstate Commerce Commission under the Clayton law, which were filed with the commission by a special committee appointed by the American Railroad Association, as reported in last week's issue, separate statements have been filed on behalf of the Baltimore & Ohio and Union Pacific railroad companies. George M. Shriver, vice-president of the Baltimore & Ohio, in a letter, expressed the opinion that the proposed regulations should not become effective because they seek to frame a single provision which will apply both to ordinary contracts for construction and supplies and also to financial transactions, and the proposed regulations as applied to financial transactions are impracticable. Mr. Shriver said that in a tender for bonds, stocks or securities the time for acceptance must in practice be very short and notice of acceptance must in practice close the transaction immediately. The proposed regulations provide 10 days for acceptance and 10 for the bidder to accept the contract and this after disclosure of the price at which the bidder would be willing to buy and the seller would be willing to sell. The company submits that to meet the ordinary conditions of the market it is practically necessary in the sale of securities that there be a definite closing of the transaction on the day bids are opened.

H. W. Clark, counsel for the Union Pacific, submitted that the subject matters are so different in nature and incidents that similar treatment of them is impracticable. There is no need, he said, in the case of proposed sales of securities for the requirement that specifications, drawings and the form of contract be prepared and copy offered for examination. All necessary description of the securities can be embodied in advertising or a more complete description can be printed for free distribution. The provisions of the tentative regulations in respect to advertising, he said, are in every respect inappropriate to the case of the sale of securities; particularly a requirement of two weeks' advertising is intolerable. Bankers, he said, cannot take the risk of making a bid for securities to remain good for any substantial period. Forty-eight hours would probably be ample notice. The time within which the most favorable bid must be accepted must be much less than 10 days and a provision for allowing another 10 days for the accepted bidder to sign the contract is quite impracticable. It was earnestly submitted that in the case of offerings of securities the regulations should permit a somewhat limited invitation for bids as an alternative to the general offering to the public. It was appreciated that under the act no person can be prevented from making a bid who learned of the offering and desired to submit a bid, but to require that offering of securities shall be made upon public advertising, inviting the whole world to bid, Mr. Clark said, would put a premium on the making of irresponsible bids by small and irresponsible bankers gambling upon the chance of their being able to form a syndicate in the event of the acceptance of their bid.

G. S. Fernald, general counsel of the Pullman Company, submitted a letter joining in the statement filed for the railroad committee.

The letter filed by Director General Hines said in part: "The director general, disclaiming any intention to express an opinion as to the character of the regulations proposed to be adopted, respectfully gives the commission to understand that the director general is not affected by the proposed regulations, since the Clayton act and particularly Section 10 thereof, has no application to the director general nor to

railroads operated by him during the period of federal control. The language of the Clayton act, as well as of the provisions of the federal control act render this conclusion inescapable." For the information of the commission he presented a brief statement outlining the purchasing methods of the Railroad Administration, showing that purchases of cars, locomotives and rail are made by the central purchasing organization and that other purchases are made by the purchasing officers of the individual roads acting under the supervision of the regional purchasing committees, but that all purchases of materials and supplies are made by the federal railroad organization.

## Activities of Engineering Council

INFORMATION concerning the activities of Engineering Council was given by J. Parke Channing, chairman of the conference held in Chicago a couple of weeks ago, and has been amplified by data from other sources. Engineering Council was created three years ago by the four national societies of civil, mechanical, electrical and mining engineers, to which has since been added the American Society for Testing Materials, to represent these societies and the engineering profession in matters of common interest.

Since its organization it has furnished the government with approximately 4,000 names of engineers for service in the war. It co-operated with the Naval Consulting Board and the Army General Staff in reviewing 135,000 suggestions and inventions for war devices. It organized an employment bureau ten days after the armistice was signed, which has filed 2,500 applications for employment since December 1, 1918, and has placed 500 engineers in positions. It has created a National Service Committee with a chairman permanently established in an office at Washington, giving his time to work at the national capitol to service for engineers in all parts of the country, including a bureau to supply information concerning congressional and departmental activities. It co-operated with the fuel administrator and the Bureau of Mines in their campaign on fuel conservation and with the United States Chamber of Commerce in presenting information concerning water power while bills were before Congress.

Engineering Council joined with other organizations in securing from the War Department the exemption of engineering students from military service until their training was sufficiently advanced to make them valuable in the various technical services of the Army and Navy. It appeared before the Board of Railway Wages and Working Conditions at Washington in an effort to secure better classification and compensation of engineers in railroad employment. It has organized a committee on classification and compensation of engineers. It also has committees studying the problems of Americanization, curricula of engineering schools, the international affiliation of engineers, the licensing of engineers, patents and public affairs.

Engineering Council has participated in conferences regarding the organization of all fighting units so as to have a definite proportion of engineers and construction foremen among the officers to direct the necessary construction at the front, and the organization and establishment of the student army training corps. It appeared before a Senate Committee on invitation to explain the possibilities of a National Department of Public Works. It participated in the organization of a National Board for Jurisdictional Award, and will appoint one of the eight members of that body. It conducted a conference in Chicago from April 23 to 25 to determine whether it should advocate a National Department of Public Works as a result of which it has since organized to promote such a department.

# General News Department

A record movement of troop trains was made last month—April—when the railroads of the country handled 1,009 special trains occupied by 720,623 soldiers.

The Fuel Administration has issued an order abolishing all of its rules relating to business in crude oil, fuel oil, gas oil, kerosene, gasoline and natural gas.

The Maryland Bankers' Association, at its convention at Atlantic City, N. J., on May 21, unanimously endorsed the "Warfield Plan" for the return of railroads to their owners and for permanent legislation relating to railroad regulation.

The Order of Railway Telegraphers is holding its national convention at St. Louis, Mo. Delegates and friends attending this convention numbered about 1,200. Walker D. Hines, director general of railroads, addressed the convention on Monday of this week.

The Tennessee Bankers' Association, the junior United States senator from New Jersey (former Governor Walter E. Edge), and the Louisiana division of the Travelers' Protective Association have declared in favor of returning to private ownership all railroads now operated by the government.

The Veteran Employees' Association of the Pittsburgh Division of the Pennsylvania Railroad held its annual reunion at Pittsburgh on May 16, with about 400 members in attendance. Among the enginemen present was Frederick Fleck, 90 years old, who entered the service of the railroad in 1854.

The Broadway Limited express of the Pennsylvania Railroad, running between New York and Chicago, 906 miles, in twenty hours, is to be restored on Sunday next. This train was discontinued on December 1, 1917, to relieve the congestion of traffic and to facilitate prompt movement of troops and government supplies.

The Brotherhood of Railroad Trainmen, at its convention at Columbus, Ohio, has adopted resolutions endorsing the proposed League of Nations, and requesting a new trial for Thomas J. Mooney, convicted in the San Francisco bomb plot. Among the speakers scheduled to address the convention was D. G. Robertson, Canadian Minister of Labor.

Damages to the amount of \$900,060.34 were awarded in the suit of the Bethlehem Steel Company, tried at Jersey City, N. J., last week, to recover \$2,900,000 for loss of ammunition destroyed by the explosion at "Black Tom," July 30, 1916. The defendant was the Lehigh Valley Railroad Company, and the trial was before Judge William H. Spear, of the Supreme Court. The damages granted were for the ammunition contained in sixteen cars, the jury not allowing damages of about \$2,000,000 for explosives on barges.

The Brotherhood of Railway Clerks, in convention at Cincinnati, has adopted resolutions in favor of the establishment of a union of all railroad workers; also one in favor of government ownership of railroads. The name of the organization has been changed so as to include express and steamship clerks, and it now reads "The Brotherhood of Railway and Steamship Clerks, Freight Handlers, Express and Station House Employees." The convention voted to pay the grand president ten thousand dollars a year; the grand secretary \$7,500; the grand vice-presidents, \$4,000 each; organizers, \$3,600 each; editor of *The Clerk*, \$3,600. The salary of the grand president heretofore has been \$3,500. Charles M. Owens, of Cincinnati, has been elected grand secretary. On Tuesday of this week, Walker D. Hines, director general of railroads, addressed the convention. In Portland, Me., on May 20, "The Brotherhood of Railroad Station Employees" opened its biennial convention.

The first sleeping cars in America—in the world—were those which were run on the Cumberland Valley between Chambersburg, Pa., and Harrisburg, in 1836 or 1837. This fact, stated for the purpose of correcting an error, is brought out in an interesting letter to the *Philadelphia Record* by M. C. Kennedy, president of the Cumberland Valley. And he calls attention to the fact that those two sleeping cars were kept in service more than 10 years, or until 1848. Chambersburg and Harrisburg are only about 52 miles apart, but by running a train at night, the Cumberland Valley accommodated passengers arriving in Chambersburg by stage in the evening from the west who wished to take the early train the next morning from Harrisburg to Philadelphia. Another historical date which is frequently misstated is that of the first mail car. In connection with the recent hearing at Washington on the subject of railway mail pay, it was stated that no attempt was made to distribute letters on the cars until 1862; but the fact is that a mail car was running between Boston and Albany in 1853. W. A. Davis, the clerk who is credited with having distributed letters between Quincy and St. Joseph, in 1862, is said to have copied the idea from England, by way of Canada, and it may be that the English post office sorted letters on the cars before 1853.

## Atlantic City Exhibit

Secretary J. D. Conway, of the Railway Supply Manufacturers' Association, advises that the following firms have been allotted space in the exhibit for the mechanical conventions at Atlantic City, June 18-25. These are in addition to lists given in the *Railway Age* of April 18 and May 2:

American Car & Foundry Company.....	New York.
Brosius, Edgar E.....	Pittsburgh, Pa.
Detroit Graphite Co.....	Detroit, Mich.
Dixon Valve & Coupling Co.....	Philadelphia, Pa.
Kaustine Company, Inc.....	Buffalo, N. Y.
Loco, The, Light Co.....	Indianapolis, Ind.
Macbeth-Evans Glass Co.....	Pittsburgh, Pa.
Pulverized Fuel Equipment Corp.....	New York.
Safety, The, Nut & Bolt Co.....	Cleveland, O.

## Special Train from Chicago to Mechanical Convention

Arrangements have been made for a special train to accommodate railroad men from Chicago and points west who will attend the convention of the mechanical section of the American Railroad Association at Atlantic City, N. J., June 18 to 25 inclusive. The train will leave Chicago at 3 p. m., June 16, and will arrive at Atlantic City about 5 p. m., June 17. The train will have club and dining cars, 12-section drawing room sleepers and 7-compartment drawing room cars. The diagrams are now open, and requests for reservations should be addressed to C. L. Kimball, 175 W. Jackson boulevard, Chicago.

## Michigan Railroad Commission Abolished

The Lemire-Brower bill abolishing the railroad commission and creating in its stead a public utilities commission has been signed by Governor A. E. Sleeper of Michigan. The railroad commission automatically went out of existence with the signing of this bill. The members of the railroad commission were C. L. Glasgow of Nashville, A. A. Keiser of Ludington, and Charles S. Cunningham of Detroit. Four of the five members of the new commission have been appointed, as follows: William M. Smith of St. Johns, Chairman of the Industrial Accident Board; Samuel Odell of Shelby, state treasurer; William Potter of Hastings, and Sherman Handy of Sault Ste. Marie. The salaries of the commissioners are \$7,000 a year, while the railroad commissioners received only \$3,000.

### Freight Car Economy—Revised

R. H. Aishton, regional director of the Northwestern region, in a recent letter stated that since the Food Administration has released its control over the loading of certain food stuffs, requiring cars to be loaded to full capacity, but 85 per cent of the capacity of cars in his region has been utilized in flour loading. "Had cars been loaded in March," said Mr. Aishton, "on the same basis as in December, the flour sent out from Minneapolis could have been carried in 1,207 fewer cars; that is to say, a saving of 20 per cent in cars; and the cost of movement was, of course, increased."

### Society of Terminal Engineers

At the annual meeting of the Society of Terminal Engineers, held in New York on May 20, Francis Lee Stuart, who at various times has been chief engineer of the Erie and of the Baltimore & Ohio, and who was until recently chairman of the Engineering Committee of the Railroad Administration, was elected president for 1919 and 1920. The other officers elected were: Vice-presidents, John Meigs, E. H. Lee, Calvin Tomkins, Charles Whiting Baker and Maurice W. Williams; treasurer, W. Joshua Barney, and secretary, J. H. Leonard. The directors elected were General William H. Bixby, U. S. A.; B. F. Cresson, Jr.; Harwood Frost, H. McL. Harding, Richard Devens, George H. Kimball, M. A. Long, S. H. Libby, George E. Titcomb, T. Kennard Thomson, Edward Anderberg, Charles A. Rohr, H. C. Yost, Charles C. Hurlbut, R. H. McLain and R. H. Marriner.

### Shipping Day Notice

The Pennsylvania Railroad has issued a revised list of shipping days for freight brought, for transportation by rail, to its five receiving stations in New York City, and on the first page prints the following notice:

"Shipping days provided herein for the receipt and forwarding of less than carload freight are established as a Preferred Service Schedule. Shippers have the right to route shipments over any line at the legal rates applicable, and of delivering freight at point of origin to such carrier on any week day, except holidays, during the established hours of service. It should be understood, however, that more satisfactory service will be obtained by delivering shipments on the shipping days specified, as if delivered on other days, freight cannot be given the full benefit of the preferred service schedule."

### Winnipeg Strike

A strike of metal workers at Winnipeg, Man., at the beginning of last week, was followed on Thursday, May 15, by sympathetic strikes in numerous other lines of work, so that 30,000 men and women were out; and among the strikers were the city firemen, and employees of the gas and water-works. More than sixty unions joined in the movement on one day. A general suspension of business resulted, but committees of strikers allowed delivery of bread and milk, and refrained from interfering with certain other essentials. This week reports indicated that railroad shopmen, clerks in railroad shops, dining-car conductors, and some other railroad employees had joined in the movement; and striking operators blocked business in the telegraph offices so completely that reporters went to other towns to send out news of what was going on. Railroad brotherhoods, not only at Winnipeg, but at other places in Canada, held meetings and adopted votes of sympathy, but no definite action of large bodies of railroad men has yet been reported.

Press despatches are contradictory and confusing. As we go to press the Associated Press says:

"Both labor leaders and employers believe that the critical period in the general strike has passed and that a settlement of the differences is in sight. Mayor Charles F. Gray is endeavoring to arrange for a meeting of union representatives and heads of the iron industry. A delegation of 24 men, representing the railway trainmen, on Wednesday urged the

Provincial Government to act as conciliator and bring about industrial peace as soon as possible. There was no difficulty in maintaining order when, on Wednesday, many business concerns resumed activity. The strong force of mounted police on duty and thousands of troops mobilized in barracks has restrained any semblance of disorder. Hundreds of citizens have signed for vigilance service."

### Order of Railroad Station Agents

The Order of Railroad Station Agents held its annual meeting at Washington this week, about 100 delegates being present. Resolutions were adopted asking Congress to retain the railroads under government control for the full period of 21 months after the proclamation of peace. Another resolution was adopted authorizing E. H. Morton, of Boston, president of the organization, to confer with other railroad labor organizations in an effort to unite all railroad labor organizations into one body to be known as the United States Railroad Federation or by some similar title.

Officers of various railroad labor organizations addressed the convention. A resolution was adopted demanding that a request be made of the director general that an early ruling be made as to what constitutes a supervisory agent, that the railroads may make a uniform adjustment. It was further resolved that as Supplement No. 13 recognizes the supervisory agent, the director general should order an adjustment made retroactive to the effective date of that supplement as of October 1, 1918.

### Railroad Y. M. C. A. Membership Week

Reports received just as we are going to press indicate that the membership campaign of the Railroad Y. M. C. A., which is being carried on this week, will go "over the top." The following message was sent by Director General Hines to W. E. S. Griswold, one of the members of the International Committee, Railroad Department:

"I have recently learned that the Railroad Y. M. C. A. has set apart the week from May 18 to 24 as membership week, when they plan to increase their membership from about 110,000 to 150,000 railroad men. I also understand that following this membership campaign, the railroad department of the Y. M. C. A. is planning a movement among railroad men, including among other admirable features emphasis upon patriotism, thrift and health. I am very strongly of the opinion that the Railroad Y. M. C. A. is rendering a practical and helpful service which is appreciated by railroad men, railroad managements and the United States Railroad Administration. It affords me pleasure, therefore, to endorse the program in contemplation, and I will await with real interest further information as to its success."

To make things interesting, Elisha Lee, federal manager of the Pennsylvania Railroad, who is at the head of the Railroad Y. M. C. A. extension movement on that system, challenged C. W. Galloway, federal manager of the Baltimore & Ohio, as follows:

"At a meeting of the executive committee of the Pennsylvania Railroad, Eastern Lines, in connection with continental extension program of the Railroad Department Y. M. C. A., I, as system chairman, was directed to issue to the Baltimore & Ohio Railroad lines under your charge a challenge that the lines under my jurisdiction as system chairman will fill their quota before the lines under your jurisdiction. Please wire me if you accept the challenge."

Mr. Galloway, who is at the head of the Y. M. C. A. extension movement on the Baltimore & Ohio, replied to this challenge with this telegram:

"Answering your telegram 12th. With such friendly rivalry, contest becomes interesting, and we cheerfully accept your challenge. Your usual high speed will have to be increased to catch us."

The quota on the Baltimore & Ohio is 5,500 men, and this means that it will be necessary to renew the present membership of 3,000 and secure not less than 2,500 new members. The Pennsylvania Railroad has an equally difficult task to perform.

**Railroad Employees' Subscriptions to Victory Loan**

Officers and employees on railroads under government control throughout the United States subscribed a total of \$138,637,250 to the Victory Liberty Loan. The returns from the seven regional directors show that out of a total of 1,841,267 employees, 1,417,042, or 77 per cent., subscribed to the loan. Employees on 13 roads showed subscriptions of 100 per cent. The Lehigh Valley, with a total of 20,295 employees, shows 100 per cent. Railroad officials and employees subscribed a total of \$184,868,300 to the Fourth Liberty Loan. General offices of regional directors of Southern, Pocahontas, Allegheny, Southwestern and Northwestern regions subscribed 100 per cent. The general office of the Central Western region 99 per cent, and the general office of the Eastern region 96.8 per cent. Details are shown in the table:

Region	Officers and general office employes		Agents and station employes		Engineers and firemen		Conductors		Other trainmen	
	Per cent	Amount	Per cent	Amount	Per cent	Amount	Per cent	Amount	Per cent	Amount
Eastern	89.8	\$5,739,200	85.9	\$5,203,150	77.9	\$2,505,750	87.4	\$1,416,750	70.4	\$1,734,150

Doctor H. Herves, of San Francisco, and was made from 23 twenty-dollar gold pieces.

A prominent feature of the celebration was a great open air meeting for the pioneer railroad men at which addresses were given by Governor Simon Bamberger, of Utah; Paul Shoup, vice-president of the Southern Pacific Company, and William Hood, chief engineer of the Southern Pacific Company. Mr. Hood is a veteran of the trans-continental line, having entered the service of the Central Pacific in May, 1867, two years before the completion of the main line.

**Exhibitors at Fuel Convention**

Following is a list of the exhibits at the convention of the International Railway Fuel Association, which was held in Chicago this week at the Hotel Sherman:

American Arch Company, New York, N. Y.—Security sectional arch.

**Golden Spike Celebration**

The celebration at Ogden, Utah, on May 10, of the fiftieth anniversary of the completion of the first trans-continental railway in the United States was noticed in the *Railway Age* last week, page 1227. It drew together hundreds of veteran railroad men who were connected with the project and who related their recollections of the disappointments and discouragements met in the construction of the line and of its final success. These veterans were all guests of the city, and it was around them that the plans for the celebration were built.

The celebration was planned to be fully in keeping with the historical event, news of which, at 2:47 p. m., May 10, 1869, was flashed to Washington from Promontory, Utah, by the one word, "Done." This message was followed by three taps on the telegraph key, each given as the maul struck the golden spike; and these were repeated on the bell in the capitol at Washington proclaiming to the nation that the American continent had been successfully spanned. The message confirming this preliminary signal was signed by Leland Stanford, governor of Colorado; T. C. Durant, then president of the Union Pacific; Sidney Dillon, and John Duff, and said:

"The last rail is laid! The last spike is driven! The Pacific Railroad is completed! The point of junction is 1,086 miles west of the Missouri river and 690 east of Sacramento City." This message and many other relics of the event were lent to the city of Ogden by the Union Pacific Railroad Company and were on exhibition.

The building of the Pacific Railroad was begun at Omaha by the Union Pacific and at Sacramento by the Central Pacific on January 8, 1863. The large government subsidies stimulated all concerned to the highest speed, and the laying of the track became a race between the Union Pacific and the Central Pacific. The Golden Spike was presented by

Represented by W. L. Allison, John Neff, R. J. Himmelright, A. W. Clokey, C. T. Pfeiffer, J. T. Anthony, J. L. Nicholson, Minot R. Smith and W. E. Salisbury.

Anchor Packing Company, Chicago.—Packing for locomotives and power plants. Represented by John Landreth.

Barco Manufacturing Company, Chicago.—Three-V type metallic connections between engine and tender for air, steam and water; metallic steam heat connections between passenger cars; air reservoir joints, headlight generator joints, automatic smokebox blower fitting, joints for roundhouse blower and blow-off, coach yard and station metallic sets, and joints for expansion. Represented by F. W. Bard, C. L. Mellor and E. K. Carl.

Bird-Archer Company, The, New York.—Harder circulator plate and boiler chemicals. Represented by P. B. Bird, L. F. Wilson, J. A. McFarland, C. A. Bird, John Callahan and C. J. McGurn.

Broschart Threadless Pipe Coupling Company, Trenton, Mo.—Emergency train-line repair coupling. Represented by J. L. Broschart.

Detroit Lubricator Company, Detroit, Mich.—Lubricators and flame oiler. Represented by A. D. Homnard.

Dixon Crucible Company, Joseph, Jersey City, N. J.—Graphite and graphite products for railroad service. Represented by H. E. Hewson and F. R. Brandon.

Edna Brass Manufacturing Company, Cincinnati, O.—Lubricators, injectors and boiler checks. Represented by H. A. Glenn, D. B. Joseph and M. J. Mullen.

Fairbanks, Morse & Co., Chicago.—Literature on locomotive coal handling and storage plants.

Franciare Company, Chicago.—Hand-fired, self-cleaning stoker for power plants. Represented by C. H. Buck, Mr. Varney and Mr. Miller.

Franklin Railway Supply Company, New York.—Franklin butterfly door, engine and tender trucks, radial buffer and adjustable driving box wedge. Represented by W. C. Coyle, J. L. Randolph, C. W. Floyd Coffin, J. Sinkler, S. D. Rosenfeit and H. M. Evans.

Fuller Engineering Company, Allentown, Pa.—Literature on pulverized coal equipment.

Garlock Packing Company, The, Palmyra, N. Y.—Special packings for general railroad uses. Represented by W. G. Cook and C. W. Sullivan.

Gillespie, A. W., & Co., Chicago.—Economy locomotive firedoor. Represented by A. W. Gillespie and J. S. Seelye.

Hunt-Spiller Manufacturing Corporation, Boston, Mass.—Cylinder bushings, cylinder packing, valve packing, piston bull-rings, valve bushings, rod bushings and crosshead shoes. Represented by V. W. Ellet and E. J. Fuller.

Johns-Manville Company, H. W., New York.—Asbestos pipe and boiler insulation, steam traps, monolithic baffle walls, boiler wall coating, refractory cements, packings. Represented by J. C. Younglove, G. A. Nicol,

P. C. Jacobs, H. M. Butters, E. H. Willard, D. L. Jennings and P. R. Austin.

Leslie Company, The, Lyndhurst, N. Y.—Steam heat regulators and removable injector coupling nuts. Represented by S. I. Leslie and J. J. Cizek.

Locomotive Feedwater Heater Company, New York.—Represented by W. L. Allison, E. A. Averill and W. T. Hennison.

Locomotive Firebox Company, Chicago, Ill.—Nicholson Thermic syphons. Represented by John L. Nicholson, Charles E. Hawley, Stuart Hawley and J. T. Anthony.

Locomotive Pulverized Fuel Company, New York.—Represented by Col. Donald McKay and C. M. Hatch.

Locomotive Stoker Company, Pittsburgh, Pa.—Photographs of duplex locomotive stoker. Represented by D. F. Crawford, W. G. Clark, A. N. Wilsie, O. B. Capps, D. T. Carlisle, J. J. Byrne, E. F. Milbank, C. E. Petersen, Ira Jordan, Eugene Prouty, R. G. Kelly and E. R. Funk.

Locomotive Superheater Company, New York.—Represented by R. M. Osteenman, R. R. Porterfield, George Fogg, B. G. Lynch, H. J. Spicer, R. J. Van Mater and G. E. Ryder.

Manning, Maxwell & Moore, Inc., New York.

Nathan Manufacturing Company, New York.—Injectors, lubricators, boiler check, cage cocks, non-lifting coal sprinkler. Represented by Otto Best, Richard Welch, W. R. Walsh and F. C. Davern.

National Railway Devices Company, Chicago.—Shoemaker vertical fire-door. Represented by Jay G. Robinson and A. F. Lind.

Ohio Injector Company, Chicago.—U. S. Standard injector, Chicago non-lifting injector, Ohio injector, Ohio water glass protector, Ohio boiler checks and Ohio feed hose strainer. Represented by A. C. Beckwith.

Okadee Company, The, Chicago.—Okadee blow-off valve, water glass protector, tank hose coupler, blower valve, front end hinge. Represented by A. G. Hollingshead, Harry Vissering, Charles R. Long, Jr., G. S. Turner and W. H. Heckman.

Pocket List of Railroad Officials, New York.—Represented by Charles L. Dinsmore.

Pyle-National Company, The, Chicago.—Incandescent electric lighting, turbo-generators, headlight cases and accessories. Represented by George E. Haas, William Miller and J. Will Johnson.

Reordway Company, The, Chicago.—Detrick suspended arch, Drake non clinking furnace blocks, Hogan ash conveyor. Represented by Tom Gaughan and R. C. Warner.

Roberts & Schaefer Company, Chicago.—Photographs of coaling stations and sanding plants. Represented by Clyde P. Ross.

Signalite Manufacturing Company, Chicago.—Kerosene carburetors. Represented by G. A. Bauer.

Simmons-Boardman Publishing Company, New York.—*Railway Age* and *Railway Mechanical Engineer*. Represented by A. F. Stuebing, L. B. Sherman, J. M. Rutherford and N. H. Crossland.

W. S. Tyler Company, The, Cleveland, O.—Draftac spark arrester. Represented by J. H. Jackson and A. D. Busch.

U. S. Metallic Packing Company, Philadelphia, Pa.—Models of single and tandem Kink type packing. Represented by M. B. Brewster and H. E. Hyslop.

Vissering Company, Harry, Chicago.—Viloco fire-door, Leacy and Viloco sanders, Crescent metallic piston rod and valve stem packing, steam compression governor. Represented by G. S. Turner, Harry Vissering, Charles R. Long, Jr., and W. H. Heckman.

Vulcan Fuel Economy Company, Chicago.—Line of combustion instruments, Vulcan-Lastite boiler coating and metal protector. Represented by F. A. Moreland.

Vulcan Soot Cleaner Company, Du Bois, Pa.

### Western Railway Club

The Western Railway Club on May 19 elected the following officers: President, G. S. Goodwin, mechanical engineer, C., R. I. & P.; first vice-president, J. Purcell, assistant to federal manager, A., T. & S. P.; second vice-president, E. J. Brennan, superintendent of motive power, C., M. & St. P.; secretary-treasurer, J. M. Byrne, chief clerk to mechanical assistant, Central Western Region; directors, E. B. Hall, assistant superintendent of motive power and car department, C. & N. W.; L. S. Kinniard, superintendent of motive power, C. & E. I.; W. H. Flynn, superintendent of motive power, Michigan Central.

### Purchasing Agents' Section

The general committee of the newly organized Section 6 of the American Railroad Association (purchasing and distribution of supplies), held a meeting at New York on Friday, May 16, for the purpose of electing officers. H. S. Burr, superintendent of stores, Erie railroad, and formerly president of the Railway Storekeepers' Association, was elected chairman of the Section. E. J. Roth, manager, stores section, Division of Purchases of the Railroad Administration and formerly vice-president of the Storekeepers' Association, was elected vice-chairman of the Section, and J. P. Murphy, general storekeeper, New York Central (Lines West) and former secretary of the old association, was elected secretary for Section 6. Sixteen committees were organized to carry out the work of this section.

## Traffic News

G. J. Vizard, heretofore assistant general freight agent of the Erie, at Chicago, has been appointed manager of the traffic bureau of the Little Rock (Ark.) Board of Commerce.

J. S. Thompson has been appointed district manager of the Southern Hard Wood Traffic Association in charge of the branch office at Louisville, Ky., effective June 1, to succeed R. F. May, resigned.

The peach crop of Georgia is expected to furnish for the Central of Georgia Railroad this year 6,000 carloads. Not much fruit will be shipped before June 1.

### Reduced Fares for Conventions

Special rates of two-thirds of the usual round trip fares will be put into effect soon by the Railroad Administration for religious, fraternal and educational meetings. Regional directors will decide as to each convention, whether it is truly religious, fraternal or educational in nature.

### A Self-Adjusting Time Table

[From the Alaska Railroad Record.]

New schedules for trains on the Alaska government railroad are announced to go into effect on Monday, April 21.

Service between Anchorage and Chickaloon will be twice weekly. Trains will leave Anchorage at 8:30 a. m. Mondays and Fridays; arrive at Chickaloon 4:15 p. m. Returning from Chickaloon, . . . Tuesdays and Saturdays. Service will be given once a week between Anchorage and Talkeetna; leave Anchorage at 8 a. m., Wednesday, and arrive at Montana the afternoon of the same day. At Montana, without delay, passengers, mail and baggage will be transferred to a motor passenger car, which will proceed to Talkeetna, arriving there the same afternoon. The motor car will return to Montana later in the afternoon, and the next morning the steam train will leave Montana for Anchorage \* \* \*. The service between Anchorage and stations on Turnagain Arm will be given once a week. The train will not be operated on any definite day of the week, but whenever traffic warrants service.

### Engineering Council Calls for

#### Water-Power Legislation

Engineering Council, through its National Service Committee, M. O. Leighton, chairman, Washington, D. C., is urging upon engineers the importance of exerting influence to promote legislation by Congress to open up for development the water power sites of the United States. These sites are of two classes: (1) those privately owned on non-navigable streams, and (2) those on public lands or on navigable streams. The first class can be developed by the owners after complying with local laws, and over 25 per cent of these possible sites have been developed. Those of the second class cannot be developed without a permit from the United States, and less than 4 per cent of them are being utilized today. Bills to remedy this situation have been introduced in Congress at every session since 1910. Twice bills have been passed in different forms by both houses of Congress and sent to conference, and once (in the last Congress) an agreement was reached by the Conference Committee. These bills have given rise to extensive debate and a large amount of testimony and information is available in printed form, constituting an exhaustive study of the entire subject of hydro-electric development in this country and the laws relating thereto.

Engineers are asked to urge this matter on their Congressmen with a view to conserving fuel and labor. If engineers will show sufficient interest in this subject Congress may be expected to give it attention at the session now opening.

## Commission and Court News

## Equipment and Supplies

### Increase in Rates Made in

#### Competition With Water Routes

By the Act to Regulate Commerce, Sec. 4, "whenever a railroad in competition with a water route reduces a rate on freight to or from competitive points, it must not increase such rate unless the Interstate Commerce Commission finds that the proposed increase rests upon changed conditions other than the elimination of water competition." On August 21, 1916, a suit was brought in Oregon to enjoin an increase in rates on iron and steel from Pittsburgh to Seattle. The United States, the Commission and 16 railroads were joined as defendants. On appeal to the Supreme Court of the United States from judgment in the district court for Oregon dismissing the bill, the shipper's main contention was that, as the railroads had in 1916 reduced the rate from 80 cents to 65 cents, neither they nor the Commission had power to increase the rate without a prior finding by the Commission upon proper hearing "that such proposed increase rests upon changed conditions other than the elimination of water competition," and that no such hearing had been had or finding made.

In affirming the judgment of the district court, the United States Supreme Court, by Mr. Justice Brandeis, says that despite the original Act to Regulate Commerce and all amendments, railroads still have power to fix rates as low as they choose. The Commission's power over them in this respect extends no further than to discourage the making of unduly low rates by applying deterrents. It may forbid unjust discrimination, but the carrier under such an order may either raise the lower rate or lower the high one.

The last paragraph of section four (the long and short haul section) which was added by the Act of 1910, was designed to prevent the railroads from killing water competition by making excessively low rates. But Congress refrained from forbidding the carrier to reduce the rate and declined to confer upon the Commission power to prevent a direct action by reduction. The act still leaves the carrier absolutely free to make as low a rate as it chooses. This provision may become operative in any case where there has been competition between a railroad and a water line, inland or coastwise. But the question here is whether the prohibition applies where the rates were reduced with the approval of the Commission, given after hearing, by order entered on application of the carrier for relief from the operation of the fourth section (to meet competition via Panama canal).

It is held that the construction contended for by the plaintiff would rather ensure monopoly than preserve competition. If, contrary to the Commission's expectation, a rail rate reduced in competition with a water route for the avowed purpose of preserving competition by rail should result in eliminating the water competition, because so low as to drive the water carrier out of business, then the prohibitively low rate would have to be continued permanently and other water competition be thereby prevented from arising; unless, perchance, some changed condition should develop which might make removal of the bar possible. Or, if the reduction in the rail rate, sanctioned by the Commission under the fourth section as not unjustly discriminating against intermediate points, because forced upon the rail carrier by oppressive water competition designed to destroy its business to the port, should become thereafter unjustly discriminatory, because the water carrier, destroyed by its own rate cutting, abandoned the route, still the low rail rate and resulting discrimination would have to continue. Only compelling language could cause the court to impute to Congress the intention to produce results so absurd; and the language of the last paragraph is held to be clearly susceptible of the more reasonable construction contended for by the defendant carriers. *Skinner & Eddy Corporation v. United States*. Decided May 5, 1919.

### Cars Accepted

The Pittsburgh, McKeesport & Youghiogheny has accepted 194 of the U. S. R. A. 70-ton gondola cars built by the Pressed Steel Car Company, making a total of 500 of these cars which it has accepted. These are the only standard cars accepted during the three weeks ended May 10.

### Locomotives

THE NORWEGIAN STATE RAILWAYS are reported as having ordered 16 locomotives from the Baldwin Locomotive Works, and as having placed orders in this country also for a quantity of car wheels and axles.

### Passenger Cars

THE PENNSYLVANIA EQUIPMENT COMPANY, 1420 Chestnut street, Philadelphia, Pa., is in the market for several electrically lighted passenger coaches of modern construction, with toilets and water tanks, seating capacity of 48 or more, and weighing about 15 tons. The coaches must operate around a 28 deg. curve.

### Locomotive Deliveries Week Ended May 3

New locomotives were shipped to railroads under federal control during the week ended May 3, as follows:

Works	Road	Number	Type

Supply Trade News

Julius Alsberg, consulting engineer, has removed his office from the Tribune building, Chicago, to the Marquette building, 140 South Dearborn street.

The Nathan Manufacturing Company, New York, has opened new offices in Chicago in the Great Northern building, 20 West Jackson boulevard, room 707, with R. Welsh in charge.

In announcing the appointment of E. Roy Borden as service engineer of Mudge & Co., Chicago, in the Railway Age of May 16 (page 1232), the name was incorrectly published as E. Roy Gorden.

Vernon T. Brauns, manager of the railroad valuation department of the American Blue Print Company, Chicago, was promoted to general manager of all departments for this company, effective May 8.

Joseph Douglas Gallagher, director, vice-president and general counsel of the American Brake Shoe & Foundry Company, New York, died at his home in Glen Ridge, N. J., on May 20, at the age of 65. He was educated at Princeton University and at Ohio Wesleyan University, Delaware, Ohio. He was engaged in the practice of law in Newark, entering the firm of Whitehead & Gallagher, which later became Gallagher & Richardson. Mr. Gallagher became director and vice-president of the American Brake Shoe & Foundry Company when it was organized about eighteen years ago, and during the last four years was also its general counsel. This company did much work on munitions for the United States Government during the war, and overwork in this connection probably hastened Mr. Gallagher's death, which followed an operation in the Morningside Hospital.

J. D. Gallagher

Paul W. Koch & Company, Chicago, have opened Pacific coast offices in the San Fernando building at Los Angeles, Cal., the Rialto building, at San Francisco, Cal., and the Sherlock building, at Portland, Ore.

J. L. Phillips has been appointed a sales engineer of the Okonite Company, Passaic, N. J. Mr. Phillips for the last nine years has been with the General Railway Signal Company, and before that served in the signal department of the Northern Pacific, for eleven years.

The Duntley-Dayton Company, Chicago, has opened a branch office in the Century building, Cleveland, Ohio, under the management of J. C. Sague. This company has also opened a branch office in the Home Trust building, Pittsburgh, Pa., under the management of W. M. Hankey.

F. X. Meehan has been appointed advertising manager of the Walter A. Zelnicker Supply Company, St. Louis, Mo. Mr. Meehan was associated in various executive capacities with Fairbanks Morse & Co., for six years; the Atchison, Topeka & Santa Fe Railroad, Coast Lines, for two years and the St. Louis Smelting & Refining Works of the National Lead Company for two years.

The American Railway Equipment Company, Pittsburgh, Pa., on May 26, located its general offices in the Liberty building, Philadelphia, Pa., where G. W. Mings, president of the company, will have his office. The company will retain an office in the Diamond Bank building, Pittsburgh, in charge of R. C. Crawford.

Ross F. Hayes has been appointed general sales manager of the Curtain Supply Company, Chicago. Mr. Hayes has been eastern manager of the company for 12 years, with headquarters at 50 Church street, New York, and will continue to act as eastern manager and retain his office in New York.

R. F. Hayes

Mr. Hayes was born at Lewiston, Me. He entered the service of the Boston Woven Hose & Rubber Company in 1888, remaining with that company for 16 years. He was a salesman in the rubber goods department in New England and New York state until 1893; and then served consecutively as city sales manager of the St. Louis branch for two years; New England representative of the bicycle tire department for two years; southern representative of the mechanical rubber goods department for two years, and as manager of the Philadelphia office until 1904. He then entered the service of the Curtain Supply Company, Chicago, as western representative, and since 1907 has served as eastern manager of the company, as above noted.

W. L. Conwell, whose election as president of the Safety Car Heating & Lighting Company, with headquarters at New York, was announced in last week's issue, has been connected with that company since January, 1916. He was born at Covington, Ky., on January 25, 1877. He received his education in the public schools of Philadelphia and at the University of Pennsylvania, from which he graduated in 1898 with the degree of electrical engineer. He then passed the examination for first assistant engineer for the United States Navy, but received no appointment because of the close of the war with Spain. He was employed in contracting work as a

W. L. Conwell

timekeeper for the Tennis Construction Company, Philadelphia, becoming later chief engineer and secretary of the company. In 1901 he resigned to become city salesman of the Westinghouse Electric & Manufacturing Company in New York. He was later placed in charge of the isolated plant department of the company, and for five years, ending in 1911, was engaged in railway work. In that year he became vice-president of the Transportation Utilities Company, and later became also treasurer of the same company. In January, 1916, he was appointed assistant to the president of the Safety Car Heating & Lighting Company, and upon the

death of R. M. Dixon, former president of that company in October, 1918, Mr. Conwell was made acting president.

S. Gordon Hyde, who recently received his honorable discharge from service, has been appointed advertising manager of the Buda Company, Chicago, with headquarters at Harvey, Ill., to succeed C. O. Powell, who has accepted the position of assistant commissioner with the Association of Metal Lathe Manufacturers, Chicago.

J. R. Wilson, whose resignation as traffic manager of the Sacramento Northern with headquarters at Sacramento, Cal., was announced in the *Railway Age* of April 11 (page 975), has been appointed vice-president and assistant manager of the Latourrette-Fical Company, mechanical contractor at Sacramento, with headquarters in that city.

The Massey Concrete Products Corporation, Chicago, has opened a new office at 1405 Oliver building, Pittsburgh, Pa., in charge of A. F. Humphrey, resident manager, effective June 1, and J. A. Higgs, Jr., has been appointed resident manager of the Southeastern district in charge of all sales in that territory, with headquarters at the Chandler Annex, Atlanta, Ga.

Oscar F. Ostby, president of the new firm of Oscar F. Ostby & Co., recently incorporated, with offices at 1044 Grand Central Terminal, New York, as announced in last

O. F. Ostby

week's issue, was born on March 5, 1883, and received his education in the public schools of Providence, R. I. From 1901 to November, 1904, he was engaged in publicity work, following which he was connected with the Commercial Acetylene Railway Light & Signal Company, serving as president of the International Acetylene Association during 1910-11. Later, with the Refrigerator, Heater & Ventilator Car Company, serving with the latter as general manager. He has for some time represented the White American Locomotive Sander Company of Roanoke, Va., and since September, 1918, he has served as vice-president of the Glazier Manufacturing Company of Rochester, N. Y. The new firm will continue to handle the railway supplies hitherto handled by Mr. Ostby, and in addition, Mr. Ostby has been appointed exclusive railway distributor for Davidson high speed steel and tools, made by the Davidson Tool Manufacturing Company, New York. Mr. Ostby has been one of the leading members of the Railway Supply Manufacturers' Association and was its president in 1915-1916.

**Allied Machinery Company**

The Allied Machinery Company of America has increased its capital stock to \$5,000,000. This was made necessary by the decision of the American International Corporation to group all of its machinery export selling subsidiaries under one head. This move contemplates the complete absorption of the Allied Construction Machinery Corporation by the Allied Machinery Company of America. The Allied Machinery Company de France and the Allied Machinery Company d'Italia will retain their corporate entities, but their parent corporation will be the Allied Machinery Company of America rather than the American International Corporation as before. This is also true of the Horne Company, Ltd., of Japan, which was purchased early in the year by the American International Corporation.

All shares of the Allied Machinery Company of America

will, as before, be owned by the American International Corporation.

The Allied Machinery Company of America was formed in 1911 by interests associated with the National City Bank of New York to sell machine tools in Europe. In 1916 it was taken over by the American International Corporation, which immediately set about to expand and organize the business on a large scale. The business has increased rapidly, and today the company is operating in fourteen countries.

J. W. Hook will continue as president of the Allied Machinery Company of America, in general charge of the business. F. A. Monroe, S. T. Henry and T. G. Nee have been elected vice-presidents. Mr. Monroe is in charge of the administrative affairs of the company. Mr. Henry is in charge of sales and advertising, and Mr. Nee is at present in Japan, devoting his attention to the affairs of the Horne Company, Ltd. R. P. Redier is general sales manager of the company, with headquarters at Paris.

### Samuel M. Vauclain Awarded

#### Distinguished Service Medal

At a banquet given in his honor at the Bellevue-Stratford Hotel in Philadelphia on Saturday last, Samuel M. Vauclain, newly elected president of the Baldwin Locomotive Works, was presented by Benedict Crowell, assistant secretary of war, with the Distinguished Service Medal for the part he played in America's mobilization for war. The banquet was attended by some 600. Isaac Johnson, presiding judge of the Delaware County Court, presided, and addresses were made by Governor Sproul, General Muir, General Price, William I. Schaffer, attorney general of the state of Pennsylvania; Frank B. McClain, formerly lieutenant governor of the state, and by Mr. Vauclain.

### Newly Elected President of Pulverized

#### Fuel Equipment Corporation

Colonel Douglas I. McKay has been elected president of the Pulverized Fuel Equipment Corporation, New York, to succeed John E. Muhlfeld, who retires to return to consulting engineering practice.

Since July, 1917, Colonel McKay has been engaged in war work. He was commissioned major in the Ordnance Department in charge of the raw materials branch of the gun division and purchased all raw and semi-finished materials used by the ordnance department and contractors for the ordnance department. Between August and December, 1917, these purchases amounted to \$268,000,000.

In January, 1918, he was promoted to lieutenant-colonel in the National Army and appointed assistant director of purchase and supply. Here he had supervision over the purchasing operations of the several supply corps of the War Department, including the ordnance department, the quartermaster department, the medical corps, the corps of engineers and the signal corps. He was subsequently promoted to colonel, and continued in this capacity until he returned to civil life after the armistice was signed.

Colonel McKay is a graduate of West Point. Upon graduation he spent three years in the army, resigning to take the position of deputy chief of the aqueduct police, and six months later was made chief. Three years later he was

Col. D. I. McKay

called to New York City as first deputy police commissioner, in charge of the business administration of the department, and two years later was appointed police commissioner of New York.

He resigned the commissionership a year later to become assistant to the president of J. G. White Co., Inc., and two years later was elected vice-president and director, which position he held at the time he entered the United States army.

In addition to his duties as president of the Pulverized Fuel Equipment Corporation, Colonel McKay is also vice-president and director of the Chemical Foundation, Inc., director of the International Agriculture Corporation and director of the Botany Worsted Mills.

### Railway & Industrial Engineers, Inc.

John E. Muhlfeld, president of the Pulverized Fuel Equipment Corporation, has resigned, and has associated with him several other engineers to form the Railway & Industrial Engineers, Inc., with offices at 25 Broad street, New York, to act as consulting and advisory engineers between the bankers, railroad and industrial corporations. Mr. Muhlfeld for the past five years has been specializing in the development of the "Lopulco" system for burning pulverized fuel in locomotives, stationary boilers and metallurgical and chemical furnaces, and for the past three and one-half years has been president of the Pulverized Fuel Equipment Corporation and the International Pulverized Fuel Corporation, has resigned as president of these corporations to devote his entire time to engineering work. Mr. Muhlfeld retains his interests in and remains a director of the Pulverized Fuel Equipment Corporation.

J. E. Muhlfeld

### Trade Publications

**STEAM JET AIR PUMPS.**—Preliminary bulletin No. 113, illustrating and describing the Wheeler steam jet air pump is now being distributed by the Wheeler Condenser & Engineering Company, Carteret, N. J. This steam jet air pump has two or more steam jets working in series with a condenser between the jets, which permits more efficient operation. The pump is applicable to jet condensers, as well as to surface condensers. The bulletin explains the operating principles, gives reasons for high efficiency, describes the inter-condenser and shows an operating test curve. It includes a cross sectional drawing and shows how to connect double machines or triple machines to surface condensers.

**STEEL TANKS AND BOILERS.**—A cloth bound book of 96 pages, 6 in. by 9¼ in., has been published by the Coatesville Boiler Works of Coatesville, Pa., manufacturers of steel tanks for a large variety of uses, A. S. M. E. boilers and stacks, open hearth furnaces, blast furnaces, cement kilns, regenerators, etc., to show the vast scope of the business and the great variety of heavy steel plate work manufactured in the shops of this company. This is indicated in over 100 illustrations. Included in the book are the specifications for steam boilers formulated by a committee appointed by the American Society of Mechanical Engineers, in accordance with which Coatesville boilers are made. The book is designated as General Catalogue No. 240.

## Railway Officers

### Railroad Administration

#### Central

**W. E. Rosenbaum**, chief clerk of the St. Louis Eastern District Freight Traffic Committee of the division of traffic—Eastern Territory, has been promoted to secretary, with headquarters at St. Louis, Mo., to succeed **Edward Hart, Jr.**, who has resumed his duties as assistant general freight agent on the Baltimore & Ohio, with headquarters at St. Louis.

#### Federal and General Managers

**J. D. Hawks**, general manager of the Detroit & Mackinac, with headquarters at Detroit, Mich., has been appointed federal manager. This road has been released from the jurisdiction of **F. H. Alfred**, federal manager.

#### Operating

**R. H. Waters** has been appointed trainmaster of the Salt Lake Division of the Denver & Rio Grande, with headquarters at Thistle, Utah.

**Wm. H. Duwe**, inspector of train despatching on the Northern Pacific, at Spokane, Wash., has been promoted to trainmaster, with headquarters at Missoula, Mont.

**J. D. Haydon**, roadmaster of the Louisville & Nashville with headquarters at Louisville, Ky., has been promoted to superintendent of the Atlanta division with headquarters at Etowah, Tenn., vice **A. B. Bayless**, resigned.

**J. E. Craver**, superintendent of the Seattle division of the Northern Pacific, at Seattle, Wash., has been appointed acting general superintendent of the Western district, with headquarters at Tacoma, Wash., vice **I. B. Richards**, granted a temporary leave of absence, and **J. E. Campbell**, trainmaster at Seattle, has been appointed acting superintendent of the Seattle division, with headquarters at Seattle, Wash., vice Mr. Craver.

#### Financial, Legal and Accounting

**Paul McKay**, corporate treasurer of the Spokane, Portland & Seattle; the Oregon Trunk, and the Oregon Electric Railroad, has been appointed federal treasurer of these roads, with headquarters at Portland, Ore., vice **F. A. Smith**, resigned to accept service elsewhere.

**A. H. Mongin**, acting federal treasurer of the Green Bay & Western with headquarters at Green Bay, Wis., has been promoted to federal treasurer of this road, the Kewaunee, Green Bay & Western, the Ahnapee & Western and the Waupaca-Green Bay with the same headquarters.

#### Traffic

**H. E. Whittenberger**, whose appointment as federal manager of the Grand Trunk, Western Lines, was noted in the *Railway Age* of May 2, has made the following appointments on the Grand Trunk, Western Lines: **Robert L. Burnap**, assistant general freight agent of the Ann Arbor, the Detroit & Mackinac, the Detroit, Bay City & Western, the Grand Trunk, Western Lines, and the Pere Marquette, with headquarters at Chicago, becomes traffic manager of the Grand Trunk, with the same headquarters; **J. D. McDonald** becomes general passenger and baggage agent with headquarters at Chicago; **C. A. Gormaly** becomes division freight agent, with headquarters at Chicago, and **A. Z. Mullins** has been appointed division freight agent, with headquarters at Grand Rapids, Mich.

**G. M. Riley**, service agent on the Kansas City Southern, with headquarters at Houston, Tex., has been promoted to division freight agent, with headquarters at Shreveport, La.

He was born in Houston, Tex., and began his railway career as a stenographer in the Houston office of the commercial agent of the Southern Pacific at Houston, later working in the auditor's and the superintendent's offices, at the same place. On January 5, 1909, he was promoted to soliciting freight agent for the Kansas City Southern, with headquarters at Houston, which position he held for two years until his appointment as general agent, with the same headquarters. He served in that capacity until the railroads were taken over by the government and the office of general agent was abolished at which time he was appointed service agent for the Kansas City Southern. This office he held until his recent promotion to division freight agent.

**Lawrence B. Burford**, who has been appointed assistant general freight agent of the Erie Railroad, with headquarters at New York, as has already been announced in these columns, was born in Washington, D. C., and graduated from the high school of his native town in 1897. Four years later he began railway work with the Erie Railroad as a clerk in the car record department of the local freight station at Chicago. He then held various positions in the local and general freight departments until 1907, when he was promoted to chief of tariff bureau, at Chicago, and in 1910 was transferred to New York. He was promoted to general agent in charge of the Baltimore agency in 1911, and four years later was appointed assistant to general traffic manager at New York. In 1917 he was furloughed and served under the British Ministry of Shipping at New York as assistant director until this year. He organized its grain traffic department and directed the inland transportation of supplies of grain and cereals for the Allied governments. He now returns to the service of the Erie as assistant general freight agent, with headquarters at New York.

**Benjamin Clifton Prince**, whose appointment as assistant traffic manager of the Seaboard Air Line, with headquarters at Norfolk, Va., has already been announced in these columns, was born on August 17, 1877, at Americus, Ga., and in 1894-1895 was a student at Kentucky University, Lexington, Ky. He began railway work on September 1, 1891, as junior clerk to the auditor on the Savannah, Americus & Montgomery, now a part of the Seaboard Air Line. He subsequently served, with the exception of the time spent at college, consecutively in the traffic manager's office on the Chattanooga, Rome & Columbus, and then in the general freight office at Savannah, Ga., of its successor, the Central of Georgia. From 1897 to 1901 he was chief clerk to the traffic manager on the Florida East Coast, at St. Augustine, Fla., and then to 1906 was chief clerk to the division freight and passenger agent on the Central of Georgia, at Chattanooga, Tenn. In 1906 he served as commercial agent on the same road, at Atlanta, Ga. From 1907 to 1911 he was traffic manager of the Georgia, Florida & Alabama, at Bainbridge, Ga., and then to 1914 was assistant general freight agent on the Seaboard Air Line, at Jacksonville, Fla. He was then for four years, assistant to first vice-president, at Norfolk, Va., and since 1918 was assistant to traffic manager, until his recent appointment as assistant traffic manager, of the same road.

#### Engineering and Rolling Stock

**B. H. Prater** has been appointed engineer maintenance of way of the Oregon Short Line, with headquarters at Pocatello, Idaho, to succeed **R. B. Robinson**, whose appointment as engineer maintenance of way of the Union Pacific was announced in the *Railway Age* of May 9.

**A. A. Woods**, superintendent of the New Orleans & North-eastern Railroad and the New Orleans Terminal Company, with headquarters at New Orleans, La., who was appointed chief engineer maintenance of way and structures on the Southern Railway System, Lines West, with headquarters at Cincinnati, Ohio, as announced in the *Railway Age* of April 18, page 1027, was born at New Orleans, La. He graduated from Tulane University at New Orleans, La., in 1895, and entered railway service in July of that year with the New Orleans & Western (New Orleans Terminal Company) as

a rodman on location work. In October of that year he returned to Tulane University to take a post-graduate course. From July 1890, to July, 1897, he was employed as a draftsman in the maintenance of way department of the New Orleans & Northeastern, with headquarters at New Orleans, La., and was later employed as a draftsman in the mechanical department of that road, with headquarters at Meridian, Miss. In January, 1898, he was made assistant engineer on the Alabama & Vicksburg and the Vicksburg, Shreveport & Pacific, with office at Vicksburg, Miss., and from September, 1899, to November, 1901, he was assistant engineer of the New Orleans & Northeastern with office at New Orleans, La. In November, 1901, he left that road, again entering the service of the Alabama & Vicksburg and the Vicksburg, Shreveport & Pacific as engineer maintenance of way. From July, 1913, to February, 1915, he was engineer maintenance of way of the New Orleans & Northeastern, and in February, 1915, he was promoted to superintendent of that road, with headquarters at New Orleans, La. In January, 1917, he became superintendent also of the New Orleans Terminal Company, which position he held until he was appointed chief of the Southern Railway, Western Lines, in April, 1919, succeeding Curtis Dougherty, deceased.

**Joshua D'Esposito**, whose promotion to chief engineer of the Chicago Union Station Company, Chicago, was announced in the *Railway Age* of May 16 (page 1236), was born at Sorrento, Italy, on July 30, 1878. He received his education in naval architecture and marine engineering in the Nautical State School of Italy from which institution he graduated in 1897. Upon his arrival in this country he entered the service of the Pittsburgh Railway Company as a designing engineer, which position he held until the spring of 1904. He entered the service of the Pennsylvania Lines in March, 1905, as a designing engineer, in which capacity he served for two years, being made chief draftsman in 1907. In 1910 he began working on Chicago problems, being transferred to that city in 1913, at the time of the commencement of negotiations with the city of Chicago, which led up to the passage of the ordinances for the Chicago Union station. The following year he was promoted to assistant chief engineer of the Chicago Union Station Company, which position he held until November, 1917, when he was called into the service of the government as assistant manager of the Wood Ship division of the Emergency Fleet Corporation, in charge of the installation of machinery in wooden ships, with headquarters at Philadelphia, Pa. On January 1, 1919, he severed his connection with the Emergency Fleet Corporation and again took up his duties as assistant chief engineer of the Chicago Union Station Company, which position he held until his promotion to chief engineer on May 1.

### Purchasing

**W. H. Clifton**, lumber agent on the Baltimore & Ohio, Eastern lines, has been appointed assistant purchasing agent on the Baltimore & Ohio, Eastern lines; the Coal & Coke, the Morgantown & Kingwood, the Western Maryland, the Cumberland Valley and the Cumberland & Pennsylvania; **D. A. Williams**, general storekeeper of the Baltimore & Ohio, Eastern and Western lines, and the Western Maryland, has been appointed to assistant purchasing agent on all the above-named roads, and **H. P. McQuilkin**, assistant general storekeeper on the Balti-

more & Ohio, Eastern lines, has been promoted to general storekeeper on all the above-named roads; all with headquarters at Baltimore, Md.

## Corporate Traffic

**M. O. Bicknell**, whose promotion to traffic manager of the Sacramento Northern, with headquarters at San Francisco, Cal., was announced in the *Railway Age* of April 25, was born at Vincennes, Ind., on March 22, 1869. He began railway work in January, 1888, with the Evansville & Terre Haute, at Vincennes, as bill clerk in the local freight office. The following year he was promoted to agent of the same road at Patoka, Ind. In November, 1891, he went to the Southern Pacific as operator and ticket clerk at Deming, N. M., since which he has been consecutively traveling freight and passenger agent with headquarters at El Paso, Texas, until August, 1895; general freight and passenger agent of the Maricopa & Phoenix at Phoenix, Ariz., until January, 1898; superintendent of the same road until January, 1902; general freight and passenger agent of the Arizona Eastern and Southern Pacific until 1907; assistant general freight and passenger agent of the Southern Pacific, Pacific System, with headquarters at Tucson, Ariz.; chairman Arizona Railway Commission at Phoenix, Ariz., until 1909; chairman trans-continental bureau at San Francisco, Cal., until 1910; assistant to the president of the Sacramento Northern which position he held until his recent appointment.

## Obituary

**James W. Leonard**, formerly, from January, 1911, to 1915, assistant to vice-president on the Canadian Pacific, at Montreal, Que., died on April 28, at Brampton, Ont. He was born in 1858 at Epsom, Ont., and began railway work in 1872 as a telegraph operator and agent on the Midland Railway of Canada. He later served on a number of different roads, until May, 1884, when he was appointed superintendent of the Canadian Pacific, and subsequently was consecutively general superintendent, Western division; manager of construction; assistant general manager, Eastern lines; general manager of the same lines, and assistant to vice-president of the same road. On January 1, 1915, he left the service of the Canadian Pacific to assume the general management of the Toronto Terminal Railway, at Toronto, Ont.

**C. E. Dewey**, freight traffic manager of the Grand Trunk Railway System, with headquarters at Montreal, Que., died on May 15, at Atlantic City, N. J. He was born in 1873, at Cheshunt, England, and in 1888 entered the service of the Grand Trunk as an apprentice clerk in the freight agent's office at Toronto, Ont. After serving as chief clerk to the division freight agent at Stratford and at Hamilton, he was appointed district freight agent at Stratford in 1899, and was promoted to district freight agent at Toronto in 1902. He went to Montreal in 1907 as assistant general freight agent, and in the following year was made general freight agent of the Central Vermont. In 1911, he was appointed general freight agent of the Grand Trunk Pacific at Winnipeg, and two years later he returned to Montreal and was appointed freight traffic manager of the Grand Trunk Railway System.

# EDITORIAL

Table of Contents will be found on Page 5 of the Advertising Section

A mistake in compiling statistics caused the *Railway Age* to make a misleading comparison in the editorial in its issue

### Correction of a Statistical Error

of May 9, entitled "The Railroads—a Bankrupt Industry," between the traffic handled in the first three months of 1916 and the first three months of 1919. It was stated in the editorial in

question that in the first three months of 1919 the freight traffic of the railways was 85,000,000,000 ton-miles, while in the first three months of 1916 it was only 80,000,000,000 ton-miles, an increase in 1919 over 1916 of over 6 per cent. A recheck of the statistics shows that the total mileage in the first three months of 1916 was almost 90,000,000,000. With this correction, the statistics show that the ton mileage in the first three months of 1919 was 5 per cent less than in the first three months of 1916, while the total earnings of the railways were 38 per cent greater and the operating expenses 85 per cent greater.

The Pennsylvania's twenty-hour train from New York to Chicago, which was voluntarily discontinued before the roads

### Broadway Limited and 20th Century

had been taken over by the government, has now been restored. During this period of discontinuance, the two new west side subways in New York have been opened. This means that it is

now more convenient to get from west side uptown New York City to the Pennsylvania Station than it is to Grand Central Terminal. It is now equally convenient to get from the downtown district to the Pennsylvania Station and to Grand Central; it is more convenient to get from a large part of Brooklyn to the Pennsylvania than to the Grand Central. Heretofore, the New Yorker leaving his home in almost any part of Manhattan or Brooklyn or leaving from his office could get more easily and quickly to the Grand Central Terminal than to the Pennsylvania Station. In the same way, travelers from Chicago have found the Grand Central the more convenient station at which to arrive in New York. All this has given the Twentieth Century a considerable advantage over the Pennsylvania's twenty-hour train. It would seem now that the situation is partly reversed. Will this in time enable the Pennsylvania to carry as many or more passengers on its fast New York-Chicago train as does the New York Central or will tradition of the Twentieth Century enable it to hold its own large business despite changed conditions in New York? In Chicago the situation still favors the Twentieth Century, the La Salle Station, which is used by the New York Central, being more accessible than the Union Station, which is used by the Pennsylvania.

Every concern or person that does business with the Post Office department nowadays has its or his grievance, while

### The Zone Postal Rate System

all persons and concerns that do business with it share in certain general grievances. All have a grievance because the service has so greatly deteriorated under the regime of Postmaster General Burleson. The postal employees have a grievance because of Mr. Burleson's autocratic methods. The railways have a grievance because the postal department,

with the assistance of Congress, has so fixed their compensation for carrying the mails as to cause them to carry it at a loss. Publishers have a grievance because Congress, at the instance of the postal department, has established a zone system of charges for carrying newspapers and magazines. The readers of many newspapers and magazines will soon have a grievance because the zone postal rates are forcing many publishers to adopt zone subscription rates. We have just received an announcement that Collier's Weekly will continue to cost five cents a copy east of the Mississippi River but will be advanced to ten cents a copy west of the Mississippi River. Heretofore newspapers and magazines of all kinds have made the same subscription rates to all points within the United States and higher rates to foreign countries. As a result of the zone postal rate system the territory west of the Mississippi River has, so far as Collier's is concerned, been legislated out of the United States. The *Railway Age* and other papers published by the Simmons-Boardman Publishing Company have not yet adopted zone subscription rates, but if the existing zone postal law remains in effect it will become necessary to do so. Most publications with national circulations will be forced to discontinue charging flat subscription rates and to charge higher rates to subscribers living in parts of the country remote from the offices of publication.

At the "ordinary general meeting" of the Grand Trunk, held in London recently, the chairman, Alfred W. Smithers, mentioned the fact that a third offer had

### The Grand Trunk Difficulties

been made by the Grand Trunk to the Canadian government for terms under which the government could acquire the Grand Trunk and the Grand Trunk Pacific on the basis of an annual sum to be paid by the government, to be distributed by the directors. In January, 1918, the dominion government of Canada asked the directors of the Grand Trunk to name their terms. An offer was made by the company, was rejected by the government, which then made a counter offer; this counter offer was rejected and, after long negotiations a second offer was made by the company to the government but this also was refused. The situation as it is at present is absolutely unsatisfactory to everybody concerned. The government obtained the appointment of a so-called "receiver" for the Grand Trunk Pacific but this does not relieve either the Grand Trunk or the government from its guarantees of Grand Trunk Pacific securities. Worse than this, however, in a way, is the situation of the Grand Trunk, itself. Its subsidiary lines in the United States are being operated by the United States Railroad Administration and it is receiving, therefore, rental for these lines. The Grand Trunk in Canada, however, is being operated without government aid or guarantees. As Mr. Smithers points out, the railways of both the United States and of Great Britain are being operated under government guarantees but were it not for these guarantees, most of them would be in financial difficulties. The Canadian Pacific has been able to preserve its credit and to continue paying its dividends because it is financially the strongest great railroad company in the world and because it has, besides its railroad, many other profitable activities, including the operation of ocean steamship lines. The Grand,

Trunk, on the other hand, has a financial structure comparable to that of most of the moderately strong roads in the United States. What has happened and is happening to the Grand Trunk is a good example of what would happen to many railroad companies in the United States were the government guarantees to be withdrawn without some readjustment in the relations between expenses and income.

While the general results of government operation of railroads have not been satisfactory, some improved methods

#### The Permit System of Handling Grain

have been introduced which by all means should be retained. One of these is the permit system of handling grain. It was used with highly beneficial results last year, and Director General

Hines has announced it will be used again this year. While it takes some machinery to operate it, the purpose and effect of the system are simply to prevent grain from being shipped from the farms in larger volume than it is possible for the railways satisfactorily to handle it. When the grain pours in to the central markets and the ports faster than it can be unloaded congestion at railroad terminals develops. Congestion renders it impossible for the railways to handle as much grain and other traffic as they could in the absence of congestion. Under the permit system the shipper is required to get a permit before he ships his grain and permission to ship is given only as fast as the railways can handle the grain and it can be unloaded at the terminals and ports. The use of the permit system is especially necessary when, as at present, the price of wheat is fixed by the government, and no farmer has any incentive to hold it after it is harvested. The use of the permit system would be beneficial to the farmers, the railways and the general public, however, even in years when the price of wheat was not fixed. In the framing of legislation for the regulation of the railways after they are returned to private operation power ought to be given to the Interstate Commerce Commission, or some other governmental body, to authorize, or even require, the railways, under the regulating body's supervision, to use the permit system in times of heavy traffic movement. Benefits might be derived at such times from extending the use of the permit system to commodities besides grain.

### Outcome of the Steel Price Controversy

THE OUTCOME of the controversy over the prices of steel rails was not unexpected. The director general of railroads refused to accept prices fixed by the Industrial Board and advertised for bids. All the steel companies which responded, except one, bid the prices which had been indorsed by the Industrial Board. The one company which did not bid them asked for higher prices. The director general, under protest, has placed orders for 200,000 tons of rail with six companies at the lower prices bid. Director General Hines unquestionably has sincerely believed that the prices asked have been too high, and has made a vigorous effort to effect a railroad economy by getting them reduced.

On the other hand, there is no reason to doubt that the officers of the steel companies and the members of the Industrial Board were just as sincere in the belief that the prices offered were fair; and the steel companies could not reasonably have been expected to offer lower prices than those the Industrial Board had approved. So far as the public is concerned, it has not been given information sufficient to enable it to form an intelligent opinion as to the merits of the controversy. The tendency of business men generally

has been to side with the steel companies, largely, no doubt, because of the general distaste of most business men for government operation of railroads. Future developments regarding rail prices will be watched with interest. About 1,600,000 tons of rail are required annually for the normal maintenance of the railroads under government control. Therefore, the orders which the director general has placed will provide for only about one-eighth of their annual requirements. In order to secure the greatest practicable economy in steel production and provide for the normal maintenance of the railroads and for taking up deferred maintenance, other and much larger orders ought to be placed soon.

Looking at the matter from the standpoint of national welfare, it would seem that they ought to be placed on a basis of price which will tend to enable the entire iron and steel industry to prosper, just as railway rates ought to be so fixed as to yield a reasonable average return to all the railroads. If railway rates were so fixed that only the roads which can handle traffic the cheapest could prosper the railroad industry of the country as a whole would soon be on the rocks; and the same principle which should cause railway rates to be so fixed as to be fair to both the "high cost" and the "low cost" railways should cause steel prices to be so fixed as to be fair to both the "high cost" and the "low cost" steel mills.

### Mr. Brisbane Is Disappointed

ARTHUR BRISBANE, who receives a larger salary for writing in a plausible and emphatic style what Hearst would like to have the people believe than he could probably earn by writing what he knows to be the truth, rejoiced greatly when the government took over the railroads, because it represented at least one step toward following his advice that the government take the railroads for keeps. He expressed considerable worry for a time lest the government spend "millions of the people's money" to put the roads in "gilt-edge condition," as he called it, and then return them to their owners, but he found much to praise until the experiment had progressed sufficiently to demonstrate that Mr. McAdoo was not fulfilling all of his rosy predictions of what the government could accomplish that private management could not.

Now that the President has announced that the roads will be returned at the end of the year Mr. Brisbane finds that "nothing more outrageous is in the history of using public money for private benefit than the management of American railroads." This is based on his statement that the \$1,200,000,000 appropriation asked by the Railroad Administration is "to meet the deficit, which means to patch up and rebuild the run-down properties," and that "the government admits that hundreds of millions spent on the roads will not be repaid to the taxpayers." Of course, Mr. Brisbane knows, even if many of his readers do not, the difference between upkeep and capital expenditures, and he knows that the \$486,000,000 deficit, the part of the appropriation which Director General Hines admits will not be repaid, was incurred in following Mr. Brisbane's own advice to raise wages. He also knows that whatever patching up and rebuilding of the railroad properties is being done is also being charged up to the companies, and that the \$775,000,000 which Mr. Hines says has been or will be advanced to the railroad companies for capital improvements represents the part of the appropriation which will be paid back to the government because the latter has good security for it. If the government should so regulate the railroads as to make it impossible for them to pay back the sum thus charged against them and the government has to foreclose on its lien, then Mr.

Brisbane will be given an opportunity to boast that Mr. Hearst brought about government ownership which he is not likely to be given except in that way.

Mr. Brisbane also objects because Mr. Hines has found it necessary to buy the comparatively small quantity of 200,000 tons of rail. He asks why the Railroad Administration, after having lived nearly a year and a half on the rail ordered before 1918, does not postpone this order and make the railroad companies buy the rail after they get their roads back. It would not, of course, be a part of the Hearst policy to tell the people that even government operation produces a certain amount of wear on the rail which it is necessary for safe operation to replace as a part of current upkeep expense.

## Expedite the Railroad Appropriation

THERE IS NOTHING Congress can do which will produce a better effect upon general business than to pass promptly a bill providing the \$1,200,000,000 fund for the Railroad Administration, for which Director General Hines has asked. A bill to appropriate \$750,000,000 was introduced at the last session of Congress, but was defeated by a filibuster. The Railroad Administration was nearly out of money at that time. This was due to the deficit which it had incurred, to expenditures which it had made for additions and betterments and equipment and to advances and loans to the railway companies. Because of the failure to make an appropriation for it at the last session, it has had to borrow money from the War Finance Committee, to issue certificates of indebtedness for large sums, to leave large amounts of its debts unpaid, and to curtail sharply its expenditures for maintenance and improvements.

The skill and courage Director General Hines has shown in dealing with the conditions the want of funds presented to him have been admirable; but Congress ought not to allow the existing situation to last any longer than is unavoidable. The inability of the Railroad Administration to carry on needed maintenance and improvement work is having a very depressing effect upon industry. Its issuance of certificates of indebtedness to meet some of its debts and its failure to meet large amounts of them at all, have helped to increase the inflation of credits, which is becoming a menace to the country's welfare. The railway and railway supply companies to which it owes money have been obliged to borrow heavily from banks when they should have had the money the Railroad Administration owes them to carry on their businesses. Justice to those to whom the Railroad Administration, as an agency of the government, is indebted and the welfare of the country require that it shall be enabled as soon as practicable to pay its bills.

The letter Director General Hines wrote to Secretary of the Treasury Glass on May 24 discloses that of the \$1,200,000,000 for which he asks, \$486,184,940 is needed because of deficits which the government has incurred in its operation of the railroads. Of this, \$236,184,940, it is shown, is the amount of the deficit incurred in the year 1918. This figure is \$10,000,000 larger than the last official estimate of the deficit for 1918, and apparently is arrived at by adding to the expenses of the individual railways under government control the expenses incurred by the overhead organization of the Railroad Administration. The estimate of the deficit for the first four months of 1919 is \$250,000,000. The original revolving fund provided for the Railroad Administration amounted to \$500,000,000. It will be seen, therefore, that the deficit for 1918 and the first four months of 1919 practically consumed all of this.

Of the \$1,200,000,000 additional for which Mr. Hines

now asks, about three-quarters of a billion dollars represents amounts advanced or to be advanced for the account of the railroad corporations and \$425,000,000 is temporarily tied up in working capital. If no more deficits should be incurred under government operation, this entire \$1,200,000,000 would ultimately be returned to the government. But it appears probable that large deficits will continue to be incurred during the rest of the year unless rates are advanced.

The Railroad Administration should be enabled, not only to pay its outstanding debts, but to increase its expenditures for maintenance in order to bring the railways up to the physical condition they were in when it took them over, and it should also be spending more money for improvements. These things are needed, not only to put the railways in good shape, but for the welfare of the country during the period of transition from a war to a peace basis. The railroad appropriation bill introduced in the last Congress should not have been defeated. The one introduced in this Congress should be passed immediately.

## The Case of the Engineer

TWO LETTERS to the editor appearing in this issue discuss the editorial published in the issue of May 2 concerning probable effects of wage standardization in railway engineering positions. Regardless of the merits of the recent campaign to increase the pay of technical men, the history of all collective bargaining goes to show that the success of employees in wresting standard wage concessions from their employers is almost always followed by a leveling of compensation rates, for two reasons: The employer usually will not pay more than the established minimum, and the organizations of employees usually strive to reduce the distinction between the efficient, intelligent workman and the drone.

However, the problem that confronts engineers today is not one of theories but of facts. Though organized efforts for material gain may have some unfortunate consequences such as the ones alluded to above, it is futile to dodge the fact that educated salaried men are confronted by an economic menace. "Something must be done," are the words on every engineer's lips. The situation is not one of a day's making. Engineers on railways, especially in the lower ranks, have been hampered by inadequate salaries for a period reaching back ten years or more. How long and clearly this situation has been recognized is shown by the discussion of the subject appearing in the *Railway Age Gazette* of March 16, 1917, page 437, in which a number of engineering educators expressed the attitude of the technical graduates toward railway positions.

But the subject is broader than railway employment. It is broader than the engineering profession. It touches the entire class of brain workers. For, while this important and ambitious stratum of society has given immediate compensation secondary consideration in its desire to secure the necessary training and experience for future advancement, labor, organized in many of its branches, has wrested concessions from capital in the form of increased wages and shorter hours. As a consequence the unorganized salaried worker finds himself doubly embarrassed. His income has not been advanced in proportion to that of the laborer, while the cost of living has greatly increased, largely owing to the fact that the productive efficiency of labor has not increased in proportion to the advances in its wages.

The overwhelming success of union labor, directly or indirectly resulting from the war, in getting higher wages, together with the contemporaneous upheaval in money values have served but to aggravate the condition, and the brain worker has come to feel that he is being ground between the

upper and nether millstones of capital and labor. No wonder that his mind turns to thoughts of organization.

If engineers must organize to promote their material interests, what form shall their organization take—or to put it on a more practical basis, what organization shall they join? For, as stated in our previous editorial, there are two well defined schools of thought on this subject, represented by those who believe that the "Founder Societies" of engineers should represent the engineer in his economic struggle and those who favor a strictly business organization like the American Association of Engineers. It is not within our province to answer this question. The individual must decide that for himself. However, it does not seem out of place to point to some of the considerations to be taken into account in making this decision.

The older associations and their common body, Engineering Council, have the advantage of numbers, resources, weight. They include a personnel which embraces the widest, most renowned and most respected of the professions. With all these advantages theirs is the opportunity of the time, if they have the foresight to seize it. Their disadvantages are mainly those arising from the inertia of large and old institutions given to using established methods and to following time-tried lines of thought. The fact that they represent the older and more thoroughly established members of the profession will insure that no false steps are taken. However, it may also tend to make the steps taken slow and few in number. A still further consideration is the doubt in the minds of the younger men as to whether their older brethren who have "arrived" are willing to recognize the young man's plight in full and sympathetic measure.

The American Association of Engineers represents itself as a business organization having the single purpose of furthering the material interests of the profession as a whole and of its members individually. It denies emphatically that it is a labor union or that its policies are to be remotely associated with those of organized labor. This view is borne out by the fact that its membership includes men in the highest as well as the lowest ranks of the profession, that not a few railway officers are included within its numbers and, furthermore, by the formation recently of several draftsmen's and engineers' unions affiliated with the American Federation of Labor and composed of men who, presumably, were not attracted by the outlook and policies of the American Association. In opposition to this view it must be recognized that this association includes among its members the more radical men of the profession, these being perhaps not so much its younger members as older men who have not been very successful. Moreover, there has been more than one attempt to stampede the organization into the American Federation of Labor, and into the adoption of union labor policies and methods.

While the prospects of the success of such attempts may be small, it is but fair to call attention to them, since it would be most unfortunate if commonly adopted by labor organizations should be introduced into the engineering profession. Seniority, limitation of output and the strike should have no place in engineering. Doubtless many members of the American Association of Engineers would make so earnest a fight against the adoption of these objectionable methods of labor unions that there is little prospect of their being adopted, in the near future at least. The tendency, however, is there and it must be carefully watched.

The older associations are also on trial. Their future is contingent largely on their retaining the interest and sympathy of the young men. The outcome will depend upon the extent to which these established institutions can turn their united and enthusiastic efforts to solving the problems of the present. It is true that they have undertaken the task but they must register progress in no uncertain terms.

## Letters to the Editor

### Conductors and Bull Dogs

CINCINNATI, Ohio.

TO THE EDITOR:

The article on Harmony and Safety published in the *Railway Age* of May 2, page 1104, sets forth a much needed lesson. I have been identified with railroads in the capacity of brakeman, freight and passenger conductor, train master and superintendent since the good old days of the link and pin and the hand brake, and have met with all dispositions from the mild angelic to the continual grouch, and have administered treatment from mild to heroic. Mild discipline will effect a permanent cure if properly administered. About three years ago I received a wire from Conductor Smith advising me that he would not take rear brakeman Jones out another trip. At about the same time I received one from Jones advising me that he would not go out with Smith another trip. I called them to the office and inquired as to the nature of their trouble. Smith said Jones would not answer when given instructions, and so on. Jones said Smith would not talk to him or show him their train orders. Both confirmed their messages, refusing to go out another trip on the same train. I then asked them if they knew why the bulldog and the striped hyena are the most vicious of fighters. Both replied that they did not. "Because they are the most ignorant," said I. "Both get a neck hold and won't let go." Smith and Jones smiled and said they did not want to be looked upon by their fellow employees and superior officers as human bulldogs and hyenas. "Then shake hands," said I, "and promise to be gentlemen in the future; be brothers in fact as well as in name." This mild treatment effected a permanent cure. It was harmony in the concrete. J. S. M.

### Effects of Punitive Overtime

ST. LOUIS, Mo.

TO THE EDITOR:

Your editorial in the *Railway Age* of May 2 on the results that would obtain if train and enginemen were granted "punitive overtime" fails in my opinion to mention the most important thing that would result.

Every one knows that train and enginemen are just like any other class of workmen, some being very efficient, some passably so, others very inefficient, and a few disloyal to their employers. Some of them figure only on getting by as easily as possible and securing the most money possible, and in no other occupation that I know of can men hold on as easily as in the train and engine service, for the reason that it is very hard to give it close supervision. So many things can happen on a train that can be used as an excuse for delays that it is hard to locate the employees who are inefficient or disloyal; and to discharge a man for inefficiency or disloyalty good proof must be available.

On account of the things mentioned, I think the granting of punitive overtime to these men would be the most disastrous thing that was ever done.

All railroads have many men who take pride in taking a tonnage train over a 100-mile division in from five to eight hours, and do it almost every day. There are others who cannot do this; not because they do not wish to, but because it is not in them. There are still others who will not do it if it suits them better to make a little extra money by making a little overtime.

The result will be that the efficient and loyal crew will draw straight time, while the inefficient and disloyal crew will draw from 30 per cent to 60 per cent more for overtime, thereby putting a premium on inefficiency and disloyalty. This in my opinion will, sooner or later, ruin the efficient and loyal man in train and engine service.

There should be some way provided whereby loyalty and efficiency will be rewarded, instead of disloyalty and inefficiency.

GENERAL MANAGER.

## Engineering, a Profession or a Trade

PITTSBURGH, PA.

TO THE EDITOR:

The editorial in the *Railway Age* of May 2, 1919, entitled "Shall Engineering Be a Profession or a Trade," contained certain statements which the writer believes will be misleading to those of your readers who are not familiar with the recent activities of the American Association of Engineers, and he begs leave, therefore, to submit the following observations:

A profession or a trade is such when it is considered to be so by society. Any group of men who have a common specialized knowledge may claim its vocation to be a profession; but only when its specialized knowledge has been raised high above the attainments of most vocations, and when its fitness to carry out a particular, difficult, necessary work has been proven, will men generally concede its right to be dignified by the title of profession. The right of engineers to the use of this word is a comparatively recent acquisition. It was not until the requirements of engineering work compelled the development of a high order of engineer, and until the engineer had raised his capacity for service to society above the abilities of the trades, that engineers were so rewarded.

The assertion that this attainment may be lost by standardization of wages and positions, such as is proposed, and by collective bargaining, seems unfounded. So long as engineers expand their activities and develop their abilities to meet the ever increasing demands of society, just so long will they retain their standing as professional men; and whatever steps they may take toward improving their social welfare will not have a tendency to reduce the professional standard, providing there is no violation of the trust reposed in the profession by society.

Men everywhere concede the right of everyone to receive a compensation commensurate with his services; and since the compensation of engineers is obviously inferior to that received by other workers, the writer does not believe that any fair methods which may be used to bring it to a proper level will result in censure of the profession or loss of professional standing. Collective bargaining is not inconsistent with professional principles, provided one of the parties does not use unfairly any advantage he may possess. Surely a bargain consummated after a fair bidding between the contracting parties is less open to criticism than price-fixing by a group maintaining a monopoly; and yet the price-fixing method is the one used by the legal and medical professions. It is pertinent to remark, perhaps, that such price-fixing is scarcely different from the essential rules of action of trades-unions, but has met with little opposition, because the clients of the lawyers and physicians have not been organized to resist its application as the employers of labor have been able to resist the prices proposed by the trades.

Standardization of positions and working conditions may result in stifling individual ability and initiative if carried to the point where methods, operations, and processes are standardized. Nothing of this sort has been proposed, however, nor will it be; the only standardization proposed is of the

titles used in railroad service, in order that a wage increase may be applied fairly.

Standard wages already exist in individual railroad organizations without causing a loss in professional standing; although at present the maximum wage for certain positions is standard, while the proposed schedule calls for a minimum wage. Knowing this to be true, the writer cannot see that if the Railroad Administration adopts the schedule proposed by the American Association of Engineers it will have the results you submit.

Railroad engineers do not propose to use trades-union tactics. This was evidenced by the sympathetic enthusiasm shown at the railroad engineers' conference in Chicago on March 17 at the reply of W. W. K. Sparrow, corporate chief engineer of the Chicago, Milwaukee & St. Paul, to the question as to what he would do should the railroads refuse to consider the schedule of wages proposed, when he said, "I would not strike." Those who witnessed that incident came away with the feeling that what was to be done could be accomplished, and would be, by no sacrifice of professional ethics.

You are right in saying that "present conditions call for sober thinking on the part of all engineers in railway service." It requires little thought, however, to decide to avoid trades-union methods—professional instinct will prevent that; but the question to be given serious thought is this: Is the pride in one's profession, and the pleasure of doing railroad work, worth the difference between the compensation offered to railroad engineers and that enjoyed by men of similar qualifications in other work? The writer can assure you that very many railroad engineers have already decided this question in the negative.

CEDRIC B. SMITH.

## The American Association of Engineers

CHICAGO.

TO THE EDITOR:

In an editorial appearing in your issue of May 2 you ask the question "Shall Engineering Be a Profession or a Trade?" You clearly indicate in your reply that it is your opinion the American Association of Engineers would make it a trade, while the older technical societies represented by Engineering Council would not. You say the American Association is patterned in many ways after the trade unions. Before deciding to join the American Association I studied this very carefully as I am strongly—I might say violently—opposed to the introduction of trade union methods into an engineering organization. I was thoroughly satisfied that the American Association, beyond being a business organization, as is the United States Chamber of Commerce, had nothing in common with trade unionism and had no intention of adopting trade union methods.

You say the membership of the American Association is apparently among the younger men in the field. If that is true, and it well may be, it is a good thing for the association and speaks well for its future. The American Association does not believe in its policy or its government being limited to those of the profession occupying high positions. It believes, as all pay the same entrance fee and annual dues, its governing council should be representative of all and it should be neither ruled by the rank and file or members of its superior grades, and that each and every one should be endowed with the same rights and privileges. In other words, its policy and its governing council are in the control of its members and are intended to express their desires and not, as is often the case, the desires and opinions of a select few who really represent but a very small minority of the profession as a whole.

You say the association has advocated standardization of

salaries and presented a standard wage scale to the wage board. Permit me to correct you; the association did nothing of the sort. It presented a sliding minimum scale for various positions, which is a very different thing. There is nothing in the association's recommendations, nor does it desire or believe in, restricting initiative or higher reward for ability or in making a position the measure of the compensation, but it does advocate a minimum within certain limits for certain positions, believing that if a man cannot earn that minimum he is not entitled to the position and should make room for some one who can.

I do not think, in view of the rapid monthly increase in its membership, that the American Association of Engineers requires a brief in its behalf, but as I believe your paper does not desire to intentionally mislead its readers I wish to correct what I believe is a wrong impression of the organization of the American Association.

W. W. K. SPARROW,

Corporate Chief Engineer, Chicago, Milwaukee & St. Paul; director, American Association of Engineers.

## Heavy Loading of Cars

PITTSBURGH, Pa.

TO THE EDITOR:

The United States Railroad Administration, through its Car Service Section, has recently issued an appeal to the shipping public, inviting attention to the accomplishments and the policy of the Railroad Administration with regard to freight car conservation, urging shippers to continue their efforts towards bringing about improved transportation conditions by continued heavy loading and pointing out that this co-operation of shippers has been a very material factor in compassing: 1. An increased car supply; 2., lessened congestion on the railroads, particularly at terminal points; and 3., improved service made possible by such lessened congestion.

The 13 shipping companies of the United States Steel Corporation have conducted a vigorous campaign for the heavier loading of cars, and during 1918 the average carload shipments of these companies was 91,500 lb. per car. The average marked capacity per freight car in this country is only 80,000 lb., and the average carload of all railroads throughout the country on all shipments, including the traffic referred to, was only 58,200 lb. per loaded car, or an average of 33,300 lb. per car less than the record made by the subsidiary companies of the United States Steel Corporation.

While the 13 shipping companies referred to increased the average carload on outbound shipments during 1918 only 3,600 lb. per car, there was effected an actual saving of 63,828 cars, as compared with the loading for the year 1917, when the average was 87,900 lb. per loaded car. This does not include the cars loaded with iron ore by the Oliver Iron Mining Co.,—also a Steel Corporation subsidiary—all of which were loaded to the average of 50 tons per car. To include these would have tended to increase the average load, but would have been misleading.

Taking the average haul per ton of revenue freight throughout the country of the individual railroad as 166 miles, and the loaded freight cars per train as 25 cars, the railroads throughout the United States were saved 10,595,448 car miles, or 423,818 train miles; the 63,828 fewer cars used means that these cars were in other service and at the average freight revenue of 16.13 ct. the saving of this number of cars actually resulted in increased earnings to the railroads of \$1,709,045.76 without any increased operating expense.

During the last seven years, the 13 shipping companies of the United States Steel Corporation have increased the average carload from 69,200 lb. per car in the year 1911 to 91,500 lb. per car in the year 1918, an increase of 22,300

lb. per car, or 32 per cent, effecting a saving of 339,736 cars through the heavier loading of equipment.

The railroads, consignees and shippers themselves have been greatly benefited in the fewer number of cars switched and weighed, to say nothing of the relief from congestion on the railroads, particularly at terminal points, improved service made possible by lessened congestion, and the great saving in operating expenses that was brought about by the fewer cars, both empties and loads, that were kept out of the various classification and interchange yards of the railroads from point of shipment to destination.

This record proves conclusively the real value of conserving freight car equipment at all times, and if the shipping public generally would note the enormous saving in equipment that has been created by these companies with only 32 per cent increase in the average load in the period of seven years, how much could be accomplished if all shippers would adopt the United States Railroad Administration's rule of loading to 10 per cent above the stenciled capacity, or to firmly fix the rule to load to 100 per cent of the carrying capacity whenever possible.

J. FRED TOWNSEND,

Traffic Manager, National Tube Company.

## Inequitable Sick-Leave Rules

NEW YORK CITY.

TO THE EDITOR:

I see no mention in your paper of an order which has just gone into effect on prominent roads affecting the compensation of employees who are paid by salary. These employees—draughtsmen, and clerks in engineering offices, clerks in other offices at headquarters, and many others—have had various benefits conferred on them by the supplements to the general wage order, but now a good deal of this is knocked over by a sweeping order providing that a deduction shall be made for any absence on account of sickness.

The justification for this order is, presumably, that a man who is allowed extra compensation when he works more than the normal hours, should equally be "docked" when he works less than the normal hours. To this the answer is that for nearly all salaried men the overtime provision is of no benefit; they never work overtime; while the deduction for illness in many cases will be a very costly matter. The net effect is a general reduction of salary.

Government employees, I understand, lose pay when off because of illness, but are allowed, in addition to the annual vacation, one day off a month. Railroad employees, under the new order, get the unfavorable end of this arrangement (the docking) and not the favorable end of it (the monthly allowance of a day off).

Consider the case of a salaried man who stays home for a couple of days with a cold, and for the next two weeks comes an hour early each morning and works on Saturday afternoon, to catch up with his work. Under the old arrangement, the usual American plan, his salary went on without interruption. Under the new order, he is docked for the days he is ill, and receives no allowance for the extra time he works to catch up; for under one of the "jokers" in the existing rules, there is no overtime allowance for the first hour of extra time in any day, nor for the first five hours of extra time on Saturday afternoon, in an office working the usual 38 hours a week.

Under the new rule, as anybody can easily predict, many a man with a cold or a slight digestive disorder will come to the office and mope around half sick, doing little work, for a week, instead of staying home for a day, as he would have done under the old arrangement, and getting cured up. The text of the order has not been given out, so far as I have seen. The persons to whom it applies are in general unorganized, and without means of making an effective protest against it,

## A Trip Over the Railway Lines of Mexico

Situation Much Improved. Large Amount to be Spent to Replace Destroyed and Worn Out Equipment.

By P. Harvey Middleton

Executive Assistant, Railway Business Association

### PART 1. GROWTH OF RAILWAYS AND PRESENT NEEDS

IT IS AN UNFORTUNATE FACT that the principal items of news from Mexico are reports of the activities of Villistas, Zapatistas, and Felicistas and of other rebels and bandits who infest certain portions of Mexico, and that the average American is convinced that Mexico is an industrial, physical, political and financial ruin. That this is far from the truth was strikingly emphasized to me on my trip through Mexico from April 11 to May 10.

When I was invited to make a trip over the railway lines

*The Station at San Luis Potosi.*

of Mexico under government control, I gladly availed myself of the opportunity to obtain at first hand facts and figures regarding transportation conditions. Leaving New York on April 8, we reached Laredo, Texas, on the morning of April 11. Here we laid over for a day. The Pullman Company will not at present allow any of its cars to cross the Rio Grande, and none of the American railway companies will permit their passenger or freight cars to go into Mexico. So on the morning of April 12 we crossed the river in an automobile to Nuevo Laredo and boarded the train of the National Railways of Mexico.

Our Pullman was a duplicate of the one we had traveled in from San Antonio to Laredo, and we began our journey

to the Mexican capital at 11 a. m. through a country which differed but little from that on the American side, for this stretch of territory is one of the few in the Mexican republic that does not show mountains against the skyline. The line traversed the deserts of the great plateau and passed through hundreds of miles of dry and treeless plains. En route we passed many freight cars in bad order, with holes roughly patched with pieces of wood or tin, and at Monterey, which we reached in the late afternoon, we saw 30 locomotive frames standing within the steel skeleton of what was apparently once a repair shop. Our military guard of 40 soldiers, which we had taken on at Nuevo Laredo, was changed here for a fresh set. These traveled with us as far as San Luis Potosi, and here the guard was again changed for the run to the capital.

The journey by rail from Laredo to Mexico City was made with no other delay than that occasioned by locomotive troubles on steep grades, requiring in consequence a few more hours than in the old days of almost clock-like precision of operation, when the roads were in perfect condition and rolling stock was abundant. The arable land in the northern portion of the republic, confined to narrow limits at best, is either under cultivation or being put into condition for production, and as the central portion of the plateau was reached, and the fertile valleys of San Luis Potosi, Queretaro, Guanajuato, and other states were traversed, a scene of agricultural activity was observed. Piles of ore at various stations indicated that mining is active.

The railway from Laredo to Mexico City was originally a narrow gage line, built under American auspices. It was opened for traffic in November, 1888, and the widening to standard gage was completed in 1903. The length of the main line to the capital is 803 miles, and it is the shortest route between the frontier and the capital. On the journey the train crosses the states of Tamaulipas, Nuevo Leon, Coahuila, San Luis Potosi, Guanajuato, Queretaro, Hidalgo, and penetrates the state of Mexico.

Many stations and a great deal of rolling stock were destroyed on this line during the revolution, but the government has rebuilt tracks, bridges and stations, has repaired

and purchased rolling stock, and is still repairing and purchasing more as the income warrants. The heavy expenses have been met with no other source of revenue than the ordinary business of the line, with the necessity of carrying military guards on all trains at heavy cost.

**Mexico's Shortage of Railway Equipment**

We arrived at Mexico City at 2 a. m. on Monday, April 14, and on the following day I began an investigation at the offices of the Mexican Government Railway Administration with the object of ascertaining the extent of the deterioration of the physical equipment of the railways under government control. At the end of three weeks I was able to construct a table showing the shrinkage in the railway equipment of Mexico since 1913, as the result of revolutions and the lack of material with which to repair rolling stock. This table is given below:

SHRINKAGE IN MEXICAN RAILWAY EQUIPMENT

	Number destroyed or condemned since 1913	
	Metric tons	
Standard gage box cars.....	13.6	41
	18.2	67
	22.7	62
	27.2	1,673

Narrow gage passenger cars, second class.....		44
Standard gage combination, baggage, mail and express.....		38
Narrow gage combination, baggage, mail and express.....		19

Merely to bring the Mexican railways back to the state of efficiency existing under the American operating officials prior to the revolution it will be necessary to replace all the rolling stock mentioned above. In addition, it is estimated that there will be needed 87,500 tons of rails, accessories and supplies. Since 1910 revolutions have resulted in the destruction of over 10,000 freight cars. At the present

moment on the lines north of Mexico City there are 5,000 freight cars laid up awaiting material with which to repair them, as well as 400 locomotives and 225 tank cars.

In view of this situation, large purchases of supplies must be made within the next twelve months to keep the railways running. Purchases are being made constantly by the New York office of the Mexican Government Railway Administration, which has a bank credit of about \$250,000 a month for this purpose. Col. Paulino Fontes, general manager of the government lines south of Mexico City, is at the

**This Section Car Is All That Was Left of the Equipment of the San Jorges Bay & Eastern, Sonora After a Rebel Raid**

time of writing in New York with the object of increasing the funds available for this purpose, and in June V. L. Blanco, general purchasing agent of the lines north of Mexico City, will also visit New York to obtain prices for a large list of materials.

**Growth of Railways**

It may be well here to give a brief review of the development of Mexico railways prior to the Carranza regime.

**The Remains of the Round House of the San Jorges Bay and Eastern**

Railway construction in Mexico started in 1854, when a line of ten miles was placed in operation between Vera Cruz and Tejeria. This line was gradually extended to the capital which was reached in 1873. From 1877 to 1882 Mexico built more miles of railroad than any other Latin-American country, the average yearly construction during that period being 428 miles. In 1905 the railway mileage

of Mexico amounted to 10,557, and in 1910 it was 15,260. There has been very little new mileage built since that date. Most of these railways have received subsidies from the Mexican government ranging from \$6,000 to \$10,000 per kilometer, according to the difficulty of the work.

In 1903 the Mexican minister of finance, Limantour, purchased \$5,000,000 of 4½ per cent second debenture stock of the Inter-oceanic Railway. This purchase led soon afterwards to a further investment by the Mexican gov-

In 1908 the National Railways of Mexico was incorporated in the United States to take over and unite the properties of the National Railroad of Mexico and the Mexican Central.

The latter system, which thus became part of the National system, was incorporated in Massachusetts in 1880. The Mexican Government offered a subsidy of \$15,200 a mile, and the right was granted to import all materials for construction, repair and operation free of duty for 15 years, with the further right of exemption from taxation for 50 years, dating from the completion of the line.

The main line was built from Mexico City to Ciudad Juarez, 1,224 kilometers, branches and subsidiary lines bringing the total mileage up to 3,426 kilometers. The Central claimed that there were but four cities in the whole republic possessing anything over 5,000 inhabitants which were not served by one or other of its systems, main line branches, divisions or extensions. The largest and most important places outside of Mexico City itself which this railway serves are: Guadalajara, 125,000 inhabitants; Leon, with 70,000; Aguascalientes and Zacatecas, each with 40,000; Guanajuato and Queretaro, each with 45,000, and numerous other towns with populations ranging from 35,000 down to 1,000.

This railway serves the most fertile and productive portion of Mexico, carrying a great mineral traffic, and passing through the enormously valuable silver belt which formerly yielded one-third of the entire silver production of the world. It reaches manufacturing districts such as Jimenez, the cotton producing district of Lerdo, Torreon, where there are cotton mills; Aguascalientes, with woolen mills, silver and copper smelters, and also the location of the largest railway machine shops, and San Luis Potosi, with its population of about 60,000.

The International Railroad, now also a part of the National system, was started in 1882 by that great American

How the Rebels Leave an Engine—Stripped of Its Brass and Other Metal

ernment in railway stock, this time with the express object of exerting its interests both on the policy and routine of the National Railroad Company, the stock of which was acquired by the government. Limantour visited New York and Europe in 1903, and while in the former concluded with Speyer & Co. an arrangement whereby the Mexican government became the owner of a block of shares of the National Railway which gave it a preponderating influence.

The Railways of Mexico

railroad pioneer, Collis P. Huntington at Ciudad Porfirio Diaz, and in six years it had reached Torreon. The next extension was to Durango, center of a rich mineral district, which was reached in 1902. Huntington surveyed the line from Durango to the Pacific port of Mazatlan, but it was never finished. The Mexican government has at present under consideration the completion of this line. Eighty miles have already been built west of Durango, but the remainder is in a mountainous region, where some 20 tunnels of various lengths and 30 large bridges will be required. It is estimated that the cost of the extension will be about \$15,000,000, but the expenditure will be warranted by the opening of a rich agricultural, mining, and timber region. The International at present serves the rich coal fields of Coahuila, and furnishes the outlet for the coal and coke of the famous San Esperanza mines. Two-thirds of the revenue of the mines is derived from its mineral traffic.

On these northern lines, all standard gage, trains are being run without interruption except in a few districts, notably the line from Chihuahua to Ciudad Juarez, where the Villistas are operating. At the time I was in Mexico (April 11 to May 10) trains between Monterey and Matamoros, Monterey and Tampico, and Monterey and Torreon, were being operated without interruption, although a train was blown up by bandits between Monterey and Tampico, and traffic suspended for one day on April 11. Freight and passenger traffic has been augmented to a large extent. From Saltillo to Piedras Negras the coal traffic has increased

Maltrata Mountain on the Mexican Railway Between Mexico City and Vera Cruz. The White Line on the Hill Is the Railway

greatly, while passenger traffic is large and regular. The line from Tampico to San Luis Potosi, which had been temporarily interrupted, had been restored to operation. From this city to Laredo traffic is normal and has been for an extended period.

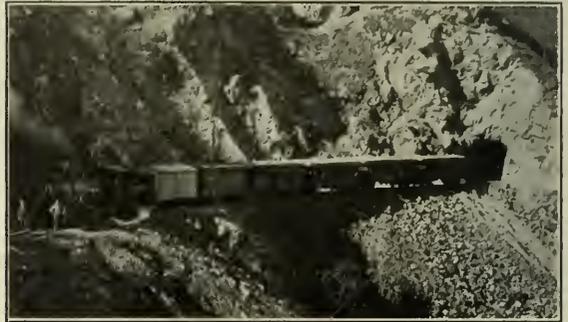

The lines south of Mexico City under government control are: The Mexican Railway from the capital to Vera Cruz; the Vera Cruz and Isthmus; the Tehuantepec National, the Alvarado Railway, the Pan American, the Inter-

oceanic, the Mexican Southern, and several smaller lines. The most important of these is the Mexican Railway, the first line to put Mexico in touch with the outside world, length 264 miles.

The Mexican Railway is operated today under conditions absolutely unique in railroading. Running through the rebel-infested state of Vera Cruz, it is protected throughout its length by a system of forts, or block houses. There are 70 of these block houses, each connected by telephone, one about every four miles, built close to the track, on raised ground, with watch towers, manned with Carranza soldiers. Ditches are excavated around each fort, and these ditches are protected by barbed wire entanglements strung at a reasonable distance from the trenches and around them.

**A Trip Through the Danger Zone**

Owing to rebel activities no trains are operated on this line at night. I boarded the train at the Buenavista station, Mexico City, on the night of May 7, and we pulled out at

Train and Tunnel on the Mexican Southern

5 a. m. with a military guard and made an uneventful run across the central plateau to Esperanza. On leaving this station we soon struck the most perilous part of the run through the mountains, a mile and a half above sea level, from Esperanza to Maltrata. The line is almost unsurpassed from a scenic point of view, ascending from the valley of Mexico to the summit of the Sierra Madre, reaching its highest point at Acocotla, near San Marcos, an elevation of 8,310 feet. At one point, at Alta-Luz, the train is 2,919 feet higher than the topmost point of Mount Washington, and we looked down upon the valley spread out like a chessboard thousands of feet below, as the train plunged around dizzy barrancas, over spidery bridges spanning profound cañons, or along the curving roadbed cut in the solid rock of the mountain side.

All the way down the mountains we could trace the road, its serpentine trail drawn in and out of the valley and along the ridges, ever and anon doubling upon itself, but ever descending. At the Maltrata Incline the scenery is indescribable, the eye dominating a thousand square miles of mountain ridge and tropical valley, and from the car window it looks for all the world like the view from an aeroplane. One's mind shudders at the possibilities of a stick of dynamite carefully placed by a bandit at this point. A few days before at Las Vegas, in these same mountains, on the narrow gage Interoceanic Railway, a train was dynamited by Felicistas and a number of persons killed.

Reaching Orizaba, we notice for a mile or so along the line great piles of wrecked railway equipment, the twisted frames of cars of every description, engine frames, wheels by the hundred with and without trucks, eloquent testimony to past revolutionary activity. Here we were joined by what they call the "explorers' train" to protect us from rebel attacks through the heavily wooded sections between

this point and Vera Cruz. This train consists of a locomotive and four cars filled with soldiers, with soldiers also riding on the car roofs, fully armed, and ready for instant action. Our train followed behind, with another carload of soldiers on the rear. We soon reach the most dangerous pass on the line, going through a series of tunnels and then

A Carranzista Guard at Boka Station on the Mexican Railway Waiting for the Train They Are to Protect Between Mexico City and Vera Cruz

creeping gingerly across the Metlac Bridge, 350 ft. long, built upon a curve of 325 ft. radius, on a 3 per cent grade, 92 ft. above the river. Eight cast and wrought iron pillars on masonry bases uphold it, and when a long train is winding across it the horseshoe effect is very striking. Shortly after this we reached Cordoba, and from here to the coast the run was through level country, Vera Cruz being reached

being to construct a line from Vera Cruz on the Gulf to Acapulco on the Pacific, but the line, which is narrow gage, is still far short of its ultimate destination.

The Tehuantepec National, recently purchased from the Pearsons of London by the Mexican government, was completed in 1907. The total length of the line, which crosses the Isthmus of Tehuantepec from the Gulf of Mexico to the Pacific, is 190 miles. There is also a small branch line. Fine harbors have been constructed at the ports of Salina Cruz on the Pacific and Puerto Mexico on the Atlantic. Large warehouses have been erected for the storage of freight. At both places trains are run up to the ship's side, where there are electric cranes for loading and unloading. There is a fine dry dock at Salina Cruz.

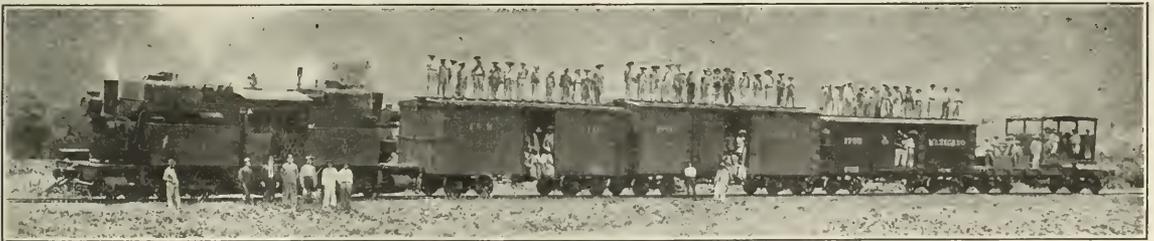

A large amount of traffic which formerly went around Cape Horn or across the Panama Railway now goes via Tehuantepec. This route is 1,200 miles shorter between New York and San Francisco than the Panama canal. Not only is it a shorter route to the Pacific ports of the United States, but to the Orient and Australia. Sugar cargoes, for instance, can be carried from Hawaii to New York via Tehuantepec, a distance of 5,305 miles, instead of carrying them around Cape Horn, over 12,000 miles. In the rebuilding of the Tehuantepec Railway and the improvement of the two ports \$65,000,000 has already been spent.

**Equipment in Service**

The following equipment is at present in use on the lines under government control:

Railways		Standard gage	Narrow gage
National Railways	Locomotives	767	295
	Passenger cars	497	258
	Freight cars	11,062	2,778
National Tehuantepec	Locomotives	47	...
	Passenger cars	12	...
	Freight cars	1,008	...
Vera Cruz & Isthmus	Locomotives	16	...
	Passenger cars	10	...
	Freight cars	193	...
Pan American	Locomotives	7	...
	Freight car	1	...
Vera Cruz to Alvarado	Freight cars	40	...
	Locomotives	...	7
	Passenger car	...	1
Mexican Railway	Freight cars	...	40
	Locomotives	54	11
	Passenger cars	58	13
Owned by shippers or rented to shippers	Freight cars	569	105
	Locomotives	158	...
	Freight cars	3,263	...

The Central Railway was among the first in Mexico to

The "Explorers Train" Which Runs Ahead of the Passenger Train Between Mexico City and Vera Cruz

at 6:15 p. m., the journey from the capital having taken a little over 13 hours.

**Other Southern Lines**

The Mexican Southern Railway, also operated by the government, runs from the city of Puebla to the city of Oaxaca, and was built with British capital. Two years were spent in completing the line, which passes through an exceedingly difficult country. The track parallels the Interoceanic line as far as Amozoc. The Interoceanic Railway was incorporated in 1888 by a special charter, the idea

adopt oil burning engines, and today practically all the Mexican railways use them. There are a large number of storage tanks, and special oil tank cars used for carrying petroleum from the wells to these tanks.

The number of employees on the railways under government control in Mexico is 31,588, of which only 69 are foreigners. Gross receipts for the year ended June 30, 1918, of the government lines (8,119 miles), amounted to \$29,-240,485 U. S. currency, and the operating expenses were \$19,151,808, net operating income therefore being \$10,-088,677.

# A Frank Talk on Railroad Labor Questions

Owners of Railroad Securities Should Be Prevented  
from Getting Undue Share of the Profits

By Walker D. Hines  
Director General of Railroads\*

**T**O START WITH I want to tell you that my views with respect to the importance and advantage of organization in labor, have gone through a process of evolution. As you can well understand, with my early training I was naturally brought up to have serious doubts as to the desirability of labor organization at all. But long before I terminated my connection with the railroad companies my own powers of reasoning had led me to see that it was an inevitable and indeed a desirable evolution of civilization that there should be labor organizations to represent in a collective way the interest of the individuals who really do the work and produce the wealth of this world in which we live.

And I have come more and more to the conviction that it is the right thing and the advantageous thing, not only for the man who belongs to the particular labor order, but also for society in general, and indeed for business itself, that there shall be this effective method of representation for such an important element in the production of the wealth of the country. So that I approach the problems that have confronted me as director general in connection with labor matters with a spirit of entire cordiality toward the handling of these matters through labor organizations, and I am satisfied that they cannot be effectively handled either from the standpoint of the management or from the standpoint of society in any other way.

When we are dealing with such large problems as must be dealt with in the great industrial enterprise of the country, it has come to me by degrees, as I have thought over these things, that the classes whose interest needs to be considered primarily are made up of the human beings who do the work in this world, and of the human beings who are the ultimate consumers of the things produced in this world, and I don't think their interest can properly be represented except through the orderly processes of organization.

It is particularly a pleasure to me to have this opportunity to address one of the oldest of the labor organizations, and one which has been characterized throughout by a systematic and business-like method of procedure and particularly by strict observance of its own laws. And so I come before you to discuss the matters in a spirit of appreciation of the importance of labor organization in general, and especially in a spirit of admiration for the organization to which you gentlemen belong.

I feel that it is a part of the development of civilization that there must be an increasing participation on the part of the employees in any great enterprise in the management of the business of that enterprise. The old-fashioned idea that nobody was concerned in the business except those who furnished the capital has largely disappeared, and, of course, will have to disappear altogether because the people who furnish the work and who do the work are of the greatest importance in accomplishing the result and the business that is done is their business just as much as it is the business of the people who have furnished the capital. And there must, therefore, be a participation—there must be a voice on what is done on both sides on behalf of the people who do the work as well as on behalf of the people who furnish the money.

So that, believing that there will be that increasing participation on the part of the employees on these matters, I want to take advantage of this opportunity to tell you briefly some of the problems of this business in which, in a way, you are partners; and I think it will be of interest to you and it will be helpful to me to explain this situation.

With respect to the calendar year 1919, so far we have the tentative reports for three months, January, February and March, and even in those three months it appears that we have fallen \$192,000,000 short of earning enough to pay the rental for the three months. The public sees this deficit and it sees the fact of federal control, and it says the deficit is due to government control. I think the public is mistaken in reaching that conclusion. The conditions of this year are somewhat different from the conditions last year, but the reason for this deficit, as I see it, can be fairly stated in this way:

In the first place, the increase in the cost of materials and supplies has been felt to a much greater extent in these early months of 1919 than in the early months of 1918. In the second place, the weather has been unusually favorable, and an exceptionally large amount of maintenance work has been done. In the third place, the increase in wages has shown more fully in these three months than in the three months a year ago, and the increase in the operating cost, due partly to wages and partly to increase in cost of materials has been very much more than the increase in the rates.

I should say broadly, that our increased costs would vary on the different railroads from 50 per cent to 80 per cent or 90 per cent, or more, taking materials, labor, and everything that goes to make up operating cost, whereas the transportation rates have been increased a little less than 25 per cent.

The fact is that every one of us knows in his own domestic affairs, and in every other relationship, that the purchasing power of the dollar has been greatly diminished by the high cost which has been the outgrowth of the war conditions. The purchasing power of the dollar has been diminished to such an extent that the dollar and a quarter which the Railroad Administration now gets for transportation service for which the railroad formerly received one dollar, goes much less far in meeting its cost than the dollar did before.

That, though, is not the whole story. To a very large extent this unsatisfactory condition for the first three months of 1919 has been due to a falling off in business. The passenger business has kept up pretty well, and in some parts of the country has shown an improvement.

Generally speaking, the freight business has fallen off seriously. That has differed in different parts of the country. I just came back from Texas, where they are not only very optimistic about prospects of large crops, but they are also feeling the effect of an extraordinary oil development in the northern part of the state, and the result is that in some parts of Texas there is an increase in the freight business as well as in the passenger business. But taking the country as a whole, there is a very considerable loss in the freight business, and that has gone far to create this large deficit.

I find a disposition on the part of some elements of the

\*From an address before the grand division of the Brotherhood of Railroad Conductors, St. Louis, May 19, 1919.

public to think that there ought to be an immediate increase in transportation rates in order to take care of this deficit, but we see sometimes a peculiar inconsistency on the part of the gentlemen who urge that. They say, on the one hand, that the increase in cost is due to government control and will not happen under private management; but they say, on the other hand, that we ought to have the increase in rates so that when the private managements do get the railroads back they will be able to take care of these increased costs. I find that inconsistency running through the minds of a great many people.

My own judgment is that there are too many temporary conditions to justify any definite action at the moment in increasing rates. We are going to get some additional economy in operation, a reduction in the cost of material, and undoubtedly a very large increase in business, and these things are going to operate to make the conditions more favorable. And my own judgment has been that until we can make a better survey of that situation we ought not to make an increase in transportation rates, and the reason I feel that particularly is that I feel that an increase in transportation rates will immediately be reflected in an increase in the cost of living.

Whenever there arises any reason for an increase in cost of anything, the public has to pay the amount of the increase, and the amount of the increase in the price is several times as big as the reason justifies. So, if after study of the matter, it is discovered that the government ought to have \$300,000,000 additional per year to pay the operation and rental, and increases the rates accordingly, there would be serious danger that after the increase had been passed along to the ultimate consumer of food and clothes and other things which we all have to buy, the public would pay a billion or a billion and a half on account of the \$300,000,000 the government would be getting, because the prices would be increased by the manufacturer and the wholesaler and the retailer. Hence I feel that in the interest of the general consuming public we ought to be exceedingly cautious about making the increase in transportation rates. While an increase of rates beyond the 25 per cent may be necessary to take care of increased costs running from 50 to 80 or 90 per cent, yet improvements in conditions may accomplish a great deal in wiping out the deficit without any increase in the transportation rates.

About a month or so ago, when the responsibility came to me of deciding upon the issuance of Supplements 15 and 16 to General Order 27, I was aware of the attitude that a large part of the public would take. With that tendency to quick and short-cut reasoning, I knew there would be a general disposition to say that the railroads were running at a loss and therefore under no circumstances should there be an increase in wages.

I felt, however, that this was a case where the government was bound to do equity and justice, and that if the conclusion was reached that an increase was necessary in order to give the employees, whom you and the other trainmen's organizations represent, a reasonable equality with other railroad employees, it was the duty of the government to do it; so I made those orders. And I undertook as far as I could to explain the situation to the public. My observation of the public has been that it has always failed to appreciate the important conditions which apply to the wages of the members of trainmen's organizations and to think that wages are all right, which are, in fact, decidedly below what they ought to be. And in the statement I made to the public I tried to point out the reason which I believe justified the stand that was taken.

There is a matter that is of very great interest to you that I want to speak on briefly, and that is the matter of punitive overtime in road service; of course, you under-

stand when Supplements 15 and 16 to General Order 27 were issued I explained that I wanted that matter considered by the Board of Adjustment No. 1. Accordingly, the matter was referred to the Board of Adjustment No. 1 for a report, and I had hoped there would be a report from that board which would be exceedingly useful to me in reaching a conclusion. The Board, however, was not able to agree on a report and has submitted two separate reports which do not aid me in reaching a conclusion on this important subject. So that I have the responsibility, without the aid of the advice I had hoped to get from the board, to decide this very important question, and I will have to exercise that responsibility and make a decision.

#### Punitive Overtime

I want you gentlemen to bear in mind that that is a very serious responsibility. On the one hand, it is my duty, and I have in mind to see that justice is done to you gentlemen and your associates in the train service.

On the other hand, it is a question in which the general public also is interested. In view of the deficit which I pointed out to you, the condition is such that, in all probability, if there should be any increased cost on this account it would have to be met by an increase in rates, and therefore, whatever I do, I must be in a position to justify myself before the public which will have to pay those increased costs. I could not decide this matter without saying that I had investigated it and saying that I knew what it was going to cost. I must make such an investigation as will enable me to go before the public just as I did in regard to Supplements 15 and 16, knowing what the prospect was as to what it would cost and the reasons why it ought to be done.

Now that investigation is going forward and it is not going to be allowed to drag, and just as soon as possible, I am going to meet this very important and very difficult problem and announce a decision. In that connection I would like to remind you that the advantages which have come from government control of the railroads, to the employees of the railroads, have also been accompanied with some disadvantages. We never can in anything have the advantages without the disadvantages.

Now, as I look at it, more progress has been made in the recognition of the just rights of labor since federal control of railroads began, than was made in 20 or 25 years before that. I think it is one of the great milestones in the progress of civilization.

That has come about because the government could deal with the matter in a unified way and because the government felt that it must deal with these matters in a just and nondiscriminating way as far as possible. The fact that the matter is dealt with in that way does involve some delay, but after all it does not begin to equal the delay that was encountered under old conditions, and the results produced have been vastly greater. But still it is true that in any particular matter which the government has to deal with here, there might be what may be regarded as delay. That is partly due to the fact that when we try to deal with a matter for the entire United States, it is indispensable that report shall be obtained from many different railroads and shall be considered by the various agencies that we have created, and it takes some time to get the views of the different men that are to be consulted, because no one man has the physical power or the mental power to deal with all these matters. And in addition to that, when it gets to the director general, there is a question of physical limitation on his part. It is a question of how many hours there are in the day and how much can be done.

In general, I want to tell you that we are working all the time to try to get a more expeditious settlement of the

current labor problems that arrive. The work is tremendous. It had to be organized in a very hurried way. Nothing like it had ever happened before. Here are 2,000,000 employees, all their rights and grievances were concentrated on one responsibility, that responsibility being that of the general government. We had to organize various agencies to deal with these matters, because no one agency could deal with all of them. The organization of those agencies has been an experimental matter. We had to experiment and feel our way and find that some organization was not as good as we thought it was going to be, and that perhaps a different organization would be better. We have to try to avoid one clashing with another to some extent, and it is difficult to define their separate functions, so we have had to feel our way in this matter. We are still very much alive to the necessity of developing still further the organization which we have to deal with these problems, and this has been a matter of great consideration to me on this trip which I am now finishing, and I am hoping that by degrees we will perfect still more the agencies we have created to deal with these labor matters.

While I have dealt with these practical details, I hope you will appreciate a thing that is very clear to me, and that is, my cordial support of this great movement which was inaugurated under federal control and which has already made such progress in the recognition of the rights of the employees to operate the railroads. I think it is a great achievement of civilization, and I am glad to have had a part in it, and I hope that I can continue to promote that movement and to see the realization of further important results in the protection of the just interests of the employees of the railroads.

Now, in conclusion, gentlemen, I want to ask your help in another matter. I have been, as I have had the occasion to do so, appealing to the railroad employees to do everything in their power to increase the efficiency and productiveness of the Railroad Administration because I feel so strongly that whatever can be accomplished in that work is something gained for the people in general.

Of course, under federal control, if there are any profits, they belong to the government, and if there are any losses they have to be sustained by the government and eventually be paid by an increase in the rates which the public has to pay. My own judgment is that, however this general railroad question shall be solved by the Congress, there will be a solution which will make sure that in the future the profits earned by the railroads will be so regulated as to prevent any undue share of those profits going to the owners of railroad securities.

I think that two things, broadly, should be secured. One is a reasonable assurance of a net return to protect the situation, and another is an equally effective assurance that any additional return shall not go entirely to the holders of the railroad securities but shall be shared with the public in some proper form.

So that whatever can be done by railroad employees in increasing the efficiency of railroad operation will not only help in this period of federal control to protect the public, but, in my opinion, will continue to protect the public after that, because it will help to keep down the rates of transportation, and whatever can be done to keep down the rates of transportation will go far towards keeping down the cost of living and helping it get down from its high level. So that anything you gentlemen can do, either by your own work or by presenting an example to other employees, to increase the efficiency and to save waste, will lay a foundation for further protection of the general public through the prevention of unnecessary increases in rates, which, as I say, will be translated into several times that increase in the cost of living.

## Orders of Regional Directors

**PASSENGER Fares for War Industry Workmen.**—Order 204 canceling Order 50 of the Southwestern regional director states that the current basis and authority for these fares is contained in the Western Passenger Traffic Committee's circular B-190, issued January 6, 1919.

**Peddling in Cars by Soldiers.**—The regional director, Eastern region, by circular 1600-158A751, promulgates a warning, received from the War Department, that men in uniform, presumably discharged soldiers are peddling and panhandling on trains. Such practice must be stopped.

**Pass Restriction, Pennsylvania Trains.**—By circular 215 the Southwestern regional director advises that only white passes issued personally by the director general will be honored on the "Broadway Limited" and trip passes will not be honored on that train unless specially authorized.

**Railroad Business Mail.**—Circular 212 of the Southwestern regional director refers to Circular S. V. 9 of the American Railroad Association. Under this it is permissible for one railroad under federal operation to carry traingrams for a second railroad under federal operation even though such traingrams pertain only to the business of the second railroad.

**Car Hire Accounts.**—The regional director, Eastern region, by circular 600-2—37A753, gives supplementary instructions for the settlement of passenger and freight car hire accounts, especially with the so-called "short line" railroads. Industrial railroads should not be considered as industrial common carriers, unless they have been definitely determined to be such by the Interstate Commerce Commission.

**Tax on Service for Telegraph Company.**—Order 205 of the Southwestern regional director calls attention to a letter from the manager of the telegraph section which states that the treasury department has ruled that the tax imposed by Section 500C of the revenue act of 1917 concerning interchange services performed by railroad and telegraph companies does not apply to railroad and telegraph companies furnishing for each other services which are necessary in the conduct of the business of each as a public utility.

**Exchange of Telegrams with Short Line Railroads.**—The Southern regional director, File 1635-14-6, directs that the cost of sending telegrams to short line railroads in connection with business in which the federal operated railroad and the short line railroad are mutually interested, shall be assumed by the sending line. This policy is to be observed by railroads charging telegrams to free telegraph allowance or by paying for them at commercial rates. Where a railroad has no free telegraph allowance available, arrangements should be made to send messages over railroad wires.

**Bills of Lading for Shipments for Cuba.**—The Southern regional director in circular 437, says that shipments of freight consigned to Cuban destinations may be taken under through export bills of lading via South Atlantic or Gulf ports, or under domestic bills of lading applying to one of these ports "for export." A domestic bill of lading applying through to Cuban destinations must not be used.

**Prepayment of Watermelons.**—The Southern regional director, in circular 438, calls attention to the Department of Agriculture's action in starting a campaign against the watermelon disease known as the stem-end rot. The fungus is prevalent in the South Atlantic states, and nearly 3,000 cars of melons were lost in 1918. A simple bluestone treatment applied to the cut stem at the time of picking or loading is found to be a preventive. The Department of Agriculture has asked the carriers to issue instructions that all shipments of watermelons from Florida, Georgia and South Carolina be required to be prepaid through to destination unless treated for the stem-end rot.

# Recent Developments in Railroad Tie Situation

## Large Deliveries Are Rapidly Eliminating Acute Shortage of a Few Months Ago. Present Outlook Promising

**A**RE THE ROADS going to be able to secure enough ties for their requirements this year? This is the question which has given maintenance of way officers most serious concern during recent months. That there has been a shortage, so acute as to be alarming, few will deny. That this condition has been relieved greatly in many areas during the last few weeks, is equally certain. However, this recovery is so recent and the shortage is still so serious on a number of roads that it is felt by many railway men that all danger has not yet been removed.

### Shortages of Basic Track Materials

Ties and rails are the two basic and most essential materials in track construction. With adequate supplies of these, tracks can be maintained in safe condition; without them this is impossible. Following the inauguration of federal control of the roads, the railroad administration took over the purchase of both of these supplies. Their delivery to the roads has therefore been the province and problem of the Division of Finances and Purchases.

At the time the Government assumed the control and operation of the roads, the steel mills were behind in their deliveries of rails, while large tonnages were on order for delivery in 1918 and 1919. At the same time we were in the midst of the war, and the steel mills were diverting their maximum output to meet military requirements. This led to a marked reduction in the tonnage of rails rolled. As a result only 1,097,277 tons or 7,431 track miles of new rails were laid in 1918, as compared with 1,233,031 tons, or 8,233 track miles laid in 1917; 1,450,952 tons or 9,831 track miles laid in 1916, and a normal average of about 1,600,000 tons.

A similar deficiency has been experienced with reference to ties, although it has been brought about largely by other causes. In 1918, the number of ties placed in tracks was 78,958,224, as compared with 81,154,529 in 1917 and 90,140,076 in 1916. In other words the tie renewals in 1918 were only 88 per cent of those in 1916, while only 76 per cent as much rail was relaid. The tie situation is even more serious than is indicated by these figures, because of the depletion of the surplus normally carried in stock. It requires several months to season a tie ready for use, and some roads which treat their supply normally carry a year's requirements on hand. With the curtailment in production which occurred last year, this reserve stock was drawn on heavily and on many roads practically to the point of exhaustion to make the renewals shown above. On January 1, 1918, the roads under Federal control had on hand 38,528,530 ties, while one year later this stock had been reduced to 29,576,958, a decrease of 26 per cent.

It is because of these conditions that those in charge of track maintenance have shown so much concern over these deficiencies in the supplies of rails and ties. This is particularly true of ties for while rails can be produced quickly if occasion demands several months are required to get out and season a tie after it is cut in the forest, and even longer if it is to be treated. Because of this concern we present the following discussion of the present tie situation and the causes contributing to it.

### Early Activities of Central Purchasing Division

Prior to the inauguration of federal control and the centralization of purchases of ties in the Division of Finance and Purchases, the roads negotiated directly for their ties

with a variety of classes of sellers. Many roads bought all or a part of their ties from small producers on their lines. Where they had to go beyond their own lines they usually negotiated with contractors of larger output, although the Baltimore & Ohio sent its own tie agents onto foreign lines to purchase direct from the small producers. In the states along the Pacific coast, the production was secured almost entirely from the large operators who made their own ties. In the Appalachian, Ozark and Arkansas areas, probably 50 per cent of the production was handled by brokers who collected the output of small producers and sold these ties to the roads, some firms being both brokers and producers. In many instances these brokers advanced the money for the purchase of timber or supplies, taking their pay in ties. Again some contractors served primarily as tie purchasing agents for the roads, others had exclusive contracts, while still others sold their ties on specific contracts for definite numbers at a fixed price or on a cost plus basis.

These were the conditions prevailing when the Government took over the roads on January 1, 1918. At this time, following decreasing deliveries, prices were advancing rapidly, being raised as much as 25 cents per tie at a time in some instances. There was also active competition between roads for ties and some of the more prosperous lines were out-bidding the smaller roads for the ties produced along the latter lines, thereby taking from them their normal supplies. This also materially increased the cross hauling of ties. The situation was rapidly approaching confusion when about February 1, 1918, one of the smaller roads in the Southern region protested to the regional director regarding the action of a larger road in buying ties away from it along its lines. The regional director presented this protest to a meeting of his staff at which it was referred to the regional purchasing committee for consideration. About the same time a similar protest originated in the Western district where one road purchased all the ties off the lines of another road at an increase of 75 cents per tie in prices.

Before the regional purchasing committee had taken any action, the situation came to the attention of the director general, and he issued arbitrary instructions on March 13 to the effect that no road could pay more for ties than it was paying on December 31, previous. In view of the increases which had taken place in the interval between these dates, compliance with this order brought the purchase of ties to a standstill and many roads canceled all orders, although some roads disregarded this instruction insofar as purchases along their own lines were concerned. This order threw consternation into the ranks of the tie producers for no consideration was given to the ties produced on contracts or other assurance of higher prices and not delivered on the date of the order. Therefore all production of ties was also stopped. Impressed by the acuteness of the situation, the purchasing agents in the Eastern region met to consider the problem and decided to interpret this order as permitting the continuance of payment of the prices in effect on March 13 for ties produced along the lines of the purchasing road.

About this time the Forest Products section of the Central Purchasing Committee was created to handle the purchase of all ties and timbers required by the roads under Federal control. One of its early acts was the issuance of 12 basic principles to govern the purchase of ties, among which were the following:

No railroad under control of the Director General may

purchase ties on any railroad not under its control with which such road connects.

Any railroad under control of the Director General may purchase ties on any railroad not under his control with which such railroad connects.

The prices shall be fixed on the various lines by the individual railroad companies, subject to approval by the Regional Purchasing committee, and at such figures as will cause the production of a sufficient number of ties to meet the requirements of all the railroads.

Every railroad should endeavor to secure the maximum output of ties on its line, so that its own requirements can be met with the minimum amount of transportation.

Ties on railroads which produce more than are needed for their own use, should be transferred under the supervision of the regional committees to railroads on which a shortage exists.

Prior to this time data were compiled relative to all unfilled orders for ties held by contractors. This investigation showed that it was a common practice with some contractors to allow certain orders to remain unfilled if they were able to negotiate new contracts at higher prices on which they concentrated their output. The Central Advisory Purchasing Committee therefore arranged to take over all outstanding contracts and issued the following instructions early in May:

"1. All contracts or orders for cross ties placed prior to government action March 13, 1918, must be handled on their merits. Roads having such contracts or orders unfilled should immediately take up with the contractors the questions of completing shipment by June 15.

"2. There may be old contracts made at low prices that should be revised. In such cases the committee will consider such recommendations as the roads submit. In the event of any question as to adjustment of price, the matter should be taken up direct with the contractor and if an increase is warranted, the recommendation of the road interested should be submitted for approval to the Regional Purchasing Committee with full explanation.

"3. The receiving roads will continue to take up and inspect the ties the same as heretofore. It is hoped that all such contracts or orders as are not completed by June 15 should be given special consideration at that time as to the best means of handling and completing them.

"4. All embargoes on ties to be shipped from one road to another should be lifted and the ties moved as soon as possible.

"5. The road on which ties are produced will give every assistance possible to secure prompt completion of such orders and contracts.

"6. If there is any shortage of cars for moving ties, the matter should be brought to the attention of the regional director."

In June further instructions were issued canceling contracts for ties produced on foreign lines where this could be done, the local roads taking them over and accepting the ties.

### Uniform Specifications and Prices

Up to this time ties were being purchased in accordance with the specifications of the different roads and in accordance with their inspection. There were therefore almost as many specifications as there were roads in the market, while there was an equal diversity of practices in the enforcement of inspection. The result was an entire lack of uniformity as to standards of manufacture, one road accepting as of relatively high-grade ties which another road rejected.

With the concentration of purchases of ties in the Central Purchasing Committee, it was a logical step to introduce standard specifications and standard inspection. Accordingly on June 11, standard specifications were issued, effective July 1, accompanied by uniform instructions for inspection. These specifications, which were published in the *Railway Age* of July 12, 1918, established five grades of both sawed

and hewn ties and included ties for use with and without treatment. Their principal differences were in the revision of the order of classification in common use, so that a No. 1 tie is now the smallest accepted, and in the establishment of a 6-in. by 6-in. pole tie or a 6-in. by 7-in. sawed tie as the smallest complying with the specifications.

Following the preparation of standard specifications and as a corollary to this step, was the establishment of uniform prices for the different classes of ties. These prices were established by the regional purchasing committees, subject to the approval of the Central Purchasing Committee, and are in general uniform for a given class of ties throughout a region, although they are being revised from time to time to meet changing market conditions. These prices have been fixed largely on the basis of the relative service life of the different classes of timber, a practice somewhat at variance with that of some roads which had accepted certain woods to the exclusion of others. These prices are paid alike to the large contractor producing many ties and to the small farmer cutting a few. To protect the producer during the interval between the cutting of a tie and its delivery, he has recently been assured of the maintenance of the present prices to June 30 in the far west, to September 30 in the Eastern region, and to December 31 elsewhere.

Following the establishment of uniform prices, they were posted throughout the tie producing areas in an effort to stimulate production among the small woodsmen. By this step the broker was largely put out of business for the producer, knowing the Government price, was not inclined to sell to another party at a lower figure. As a further aid in stimulating production, steps were taken to pay for ties promptly on delivery and acceptance.

In distributing the ties to the roads, the aim is to deliver them at the point of use as cheaply as possible, all factors, including transportation considered. All ties are inspected by the forces of the road along whose lines they are produced. A road requiring more ties than are produced along its lines makes requisition on its regional purchasing committee which places it with other roads in its region if possible or if not, forwards it to the Central Purchasing Committee which refers it to a purchasing committee in another region. As far as possible the Central Administration distributes the surplus ties of one region through the engineering assistants to the regional directors, although in some regions they are distributed to the individual roads direct from Washington.

Early in its activities, the Forest Products Section recognized the value of tie treatment and arranged for the continuance of this practice where it had been followed under private control and for its gradual extension to other roads. One of the early effects of the war was to shut off the importation of creosote oil from Europe. This resulted in a shortage of preservative materials in this country which forced many plants to close down. To maintain the output of treated ties at the maximum, the Forest Products Section took over the distribution of creosote late last fall, and since that time it has been allotting it to those commercial and railway-owned treating plants prepared to treat cross ties. It has also prepared and put into effect standard specifications for the treatment of ties by the different processes in common use. In this way it has been possible to operate more plants and more nearly to their capacity.

### Attitude of Tie Producers

It is not to be expected that such radical innovations as have been introduced in the tie industry could be put into effect without criticism from those affected by these changes. The criticism has been very acute from the tie brokers, who are largely put out of business. It has also come from many tie contractors who have had to revise certain of their meth-

ods, and from railway men who blame the Central Purchasing Committee for the failure to receive the ties they require for the proper maintenance of their tracks.

The hostility of the tie producers was incurred first by the issuance of the order on March 13, referred to above, limiting the prices which could be paid for ties to those which had been in force on December 31, previous. Coming as this did without previous announcement and in the face of rapidly rising prices for practically all commodities, its result was to bring tie production practically to a standstill and to confront producers, who had incurred higher costs with the knowledge and consent of the purchasing roads, with the prospects of large financial losses. While this order has since been superseded, this sudden and arbitrary action, which is now generally admitted to have been ill-advised, served to create an antagonism towards the Central Purchasing Committee which has resulted in hostility to many of its later acts, more acute than those measures themselves warranted and has contributed directly to the curtailment of production.

One of the points at issue between the railroad administration and the tie producers is the recognition of the small producer. The tie contractors believe the practice of the Railroad Administration to be unfair towards them when it pays the same price to the small farmer who brings out a wagon load of ties produced during spare time as to the contractor who has invested a large amount of money in timber holdings, in equipment and in an organization. Furthermore, looking into the future, when the ties are cut from the wood lots along the tracks the farmers' source of supply is exhausted, while the tie contractor has the organization to go further back to new areas and get out ties. Also in the absence of a contract as at present, a contractor hesitates to organize on a big scale even though prices may be guaranteed for some time in advance as has recently been done.

The contractors and particularly the brokers, also criticize the action of the Railroad Administration in appealing to the small producer. By posting the prices paid all through the timber, it became impossible for the brokers to purchase ties from the small producers at prices which would enable them to make a profit. Many of these small producers in the Southern states were dependent for credit for timber holdings and for supplies on these brokers and with the removal of this credit they were forced into other work, and this output has been lost.

In justifying its attempts to stimulate production by appealing to the small producers, the Railroad Administration points to the large number of unfilled contracts in existence a year ago, and to the steadily decreasing output in practically all regions prior to the period of Federal control. It is further pointed out that in the Cumberland and Tennessee river areas and in the Pocahontas region where no changes in purchasing methods were introduced in 1918, the contractors were able to produce but little over 50 per cent of a normal supply. From the standpoint of the Central Administration it was therefore necessary to develop new channels of production.

Another point of difference lies in the fixing of prices uniformly over large areas or entire regions in disregard of freight rates. The contractors urge the establishment of prices at certain primary receiving points as at St. Louis and the Ohio river, the prices in the interior being below these figures by the amount of the freight. They maintain that competition buying in the past has been on this basis and has fixed the value of their stumpage. Now with uniform prices in the timber a foreign road is paying prices for ties varying as much as 25 cents, owing to the difference in freight charges. Furthermore, with various prices prevailing in the different regions, there may be a difference in

price of several cents per tie between nearby points in adjoining regions.

Although there was considerable opposition at first to the standard specifications this was largely due to the underlying hostility previously engendered and has now largely disappeared. It was increased in some instances by the unwise or over-zealous interpretation of their provisions, a problem inherent to the training of a corps of 2,500 inspectors to a new system of operation. A point of controversy at first was the raising of the dimensions of the smallest tie coming within the limits of the specifications, the contractors protesting that this increased the wastage in the forests. When it was explained that the intent of the specifications was to discourage the cutting of small trees, and that ties smaller than No. 1 cut from the tops of trees producing larger ties would be accepted as usable rejects; this objection largely disappeared. At the present time, the majority of the tie producers feel that the uniform specifications are working to their benefit as well as that of the roads.

The position of the tie producers on the entire situation as expressed by a committee of their organization, the National Association of Tie Producers, in a recent appearance before the Division of Purchases at Washington is that roads on which ties are produced should continue to purchase at present prices such ties as are offered up to November 1; that any railroad may immediately enter into contracts with individual tie producers at prices not to exceed those now in effect at point of shipment up to November 1, provided the quantities and kinds of ties contracted for are approved by the Railroad Administration; that all cross ties should be inspected by regional inspectors at the point of shipment, and that the purchase of cross ties for delivery after November 1 should be made in accordance with the following plan:

1. The railroads should register their annual cross tie requirements with the Division of Purchases and all ties should be purchased in accordance with national standard specifications.
2. All ties should be inspected by regional inspectors in accordance with standard rules for application of the specifications.
3. Individual roads should enter into contracts for their tie requirements direct with responsible tie producers, filing copies of the contracts with the Railroad Administration.
4. All contracts should be awarded only after fair and open competition has developed the lowest price per tie obtainable from responsible tie producers.

### Present Situation Is Encouraging

So much for the past and the causes contributing to the shortage. What is the situation at present? This can best be indicated by the statistics of ties purchased for recent months. Those for August, 1918, to March, 1919, inclusive, are as follows:

August, 1918 .....	3,700,009	December, 1918 .....	5,652,572
September, 1918 .....	3,827,974	January, 1919 .....	5,827,769
October, 1918 .....	4,522,580	February, 1919 .....	7,994,000
November, 1918 .....	4,830,871	March, 1919 .....	10,150,000

In the six months ending with March of this year, the purchases by regions have been:

Eastern region .....	2,793,792	Northwestern region.....	10,847,977
Pocahontas region .....	1,155,171	Central Western region..	2,265,079
Southern region .....	11,143,048	Southwestern region ....	7,607,463

An interesting feature of this improvement is the large increase in the local production in the eastern states which were not commonly considered tie producing areas. A conspicuous example of this is the production which has been developed on the Pennsylvania Lines West of Pittsburgh where 199,377 ties were purchased in the first four months of this year as compared with a total of 68,563 ties purchased during the entire year of 1918, and 19,311 ties in 1917. In the first three months of this year the purchases in the

Eastern region were 260 per cent of those for the same period of the preceding year, although in fairness to this comparison it must be recalled that this period of this year was one in which there were favorable weather conditions, while at the same time a year ago the winter was one of unusual severity.

In general the ties have not been diverted far from their natural channels, although because of the acute shortage on the Eastern roads and an over-production of Douglas fir ties in the far west, approximately two million ties have been ordered from that region, one-half of which are being moved to points along the Atlantic seaboard, by water, and the remainder are coming by rail for distribution to the eastern central states.

With normal annual requirements for renewal purposes of approximately 90,000,000 ties or a monthly average of 7,500,000 ties, it would appear that the crisis has been passed and that we are now assured of an adequate supply of ties. In fact, it is the hope of the Forest Products Section that not only will the roads receive all of their ties which they require for normal maintenance, but that they may also be able to replenish their depleted stocks. Others, equally gratified at the purchases of the last two months but less optimistic, point to the fact that the large deliveries during February and March have been facilitated by a number of conditions which may or may not continue. In most of the tie producing areas the past winter has been one of the most favorable ever encountered in the history of the industry with the result that it has been possible to make and to haul out to the railroads larger numbers of ties than ever before. Furthermore, although several weeks and frequently months normally elapse from the time ties are cut until they are delivered to the railroads, this period has been greatly decreased during recent months, because of the fear that the present high prices might be lowered at any time. Likewise, the conclusion of the war and the return of large numbers of men to civil life has created a surplus of labor in many regions, and this labor has been diverted temporarily to the production of ties. However, the evidence leads strongly to the conclusion that at least the urgent needs will be met.

The influence of these increased deliveries is being felt rapidly by the roads to whom the ties are being sent. One road which was in a bad way for ties early in March reported late in April that the deliveries during the intervening weeks were sufficient to relieve the situation materially. Another road using treated ties, the officers of which were equally alarmed last winter now state that the only alarm now existing is that there may be an over-production of treatable ties beyond the capacity of the treating plants to treat them.

In the Northwestern region the situation on April 1, 1919, has been tabulated as follows:

PRODUCTION	
Ties placed in track since January 1, 1919.....	1,200,000
On right of way available for immediate use.....	9,300,000
At treating plants awaiting seasoning and treatment.....	1,900,000
Estimated production for balance of year.....	14,700,000
Oak ties due from other regions.....	4,000,000
<b>Total available ties in Northwestern region for 1919.....</b>	<b>31,100,000</b>
DISPOSITION	
Renewals—Northwestern region.....	17,200,000
New side tracks and other construction.....	1,000,000
For seasoning and treatment at treating plants and for carry over for 1920.....	6,200,000
Export to other roads.....	6,700,000
<b>Total.....</b>	<b>31,100,000</b>

In the Southern region which is one of the principal tie producing regions it is estimated that the production in 1919 will be about 35,000,000 ties, or in excess of that of

any previous year, although this is considerably short of fulfilling the program of the Forest Products Section for 44,000,000 ties, about one-half of which are scheduled for use on roads within the region and the remainder for shipment to other regions.

Large as the production of ties is in this region, this in itself is creating a special problem because of the large percentage of the ties now being produced which require treatment before insertion in the tracks. Nearly all of the roads in this region have been using ties untreated and they have neither the facilities, or in general, the desire to go to treated ties. In past years a large part of the ties shipped to roads in other regions have been of white oak and heart pine which were used untreated. This condition combined with the present demand for ties for immediate insertion in the tracks has depleted the supply of ties which can be used without treatment, while it is creating a surplus of treatment ties which will not be available for use until late this fall or early next spring, because of the time required for their seasoning and treatment. This condition is causing the Forest Products Section of the Railroad Administration and others to give serious attention to the encouragement of the use of treated ties.

Favorable as recent developments are the fact that the acuteness of the situation has not been relieved universally is indicated by the report from another road whose annual requirements are in excess of 2,500,000 ties and which was able to insert less than 1,500,000 ties last year, while at the same time reducing its surplus 500,000. For the first four months of this year only 20 per cent of its 1919 requirements had been received, while only 4 per cent of its renewals had been completed on April 1. This condition exists in spite of strenuous efforts which have been exerted by officers of the roads and others to promote local production with marked success, over 60 per cent of the ties secured since January 1 coming from its own local sources of supply.

One interesting development of the centralized purchase of ties has been evident on some of the smaller roads in the tie producing regions. In the past it has been the common experience that the larger and more prosperous roads would buy the better grades of ties from their lines, leaving to these roads the poorer ties which they could secure at cheaper prices. Under common control these roads are now receiving the same grades of ties as other lines, and as a result they are being placed in better condition than at any previous time in their history.

### Conclusion

Although the tie situation is still complicated by wide differences of opinion many of these differences are being ironed out. The acute shortage of a few months ago is rapidly being relieved, and while the present high production may not possibly be maintained, it may confidently be expected that a sufficient number of ties will be secured to meet the ordinary needs of the roads for current maintenance and for such new work as may be undertaken this year, although deliveries will be delayed later in the season than usual. The placing in effect of standard specifications for ties, their inspection and treatment, is resulting to the mutual benefit of the producer and the user. The present specifications are a marked improvement and are producing a tie of superior quality.

While some of the actions of the Railroad Administration have been ill-advised and have resulted in unnecessarily disturbing the established methods of tie production, many of the innovations introduced will be of permanent benefit to the roads, and to the industry once they have become firmly established, and those in the field have an opportunity to adjust themselves thereto.

# Fuel Association Convention a Big Success

Characterized by Large Attendance, Strong Addresses,  
Timely Reports and Lively Discussions

THE FIRST SESSIONS of the eleventh annual convention of the International Railway Fuel Association were reported in the *Railway Age* of May 23, 1919, page 1249. A list of the exhibitors was also given on page 1283 of that number. This article covers an account of the proceedings for the closing sessions of the convention.

The following officers were elected at the last session: President, H. B. MacFarland, Atchison, Topeka & Santa Fe; vice-presidents, W. J. Bohan (Northern Pacific), J. B. Hurley (Wabash) and W. L. Robinson (Baltimore & Ohio Western Lines); executive committee, J. W. Hardy (U. S. R. R. Adm.), M. A. Daly (Northern Pacific), C. M. Butler (Atlantic Coast Line), L. J. Joffray (Illinois Central), C. C. Higgins (St. Louis-San Francisco), and J. M. Nicholson (Atchison, Topeka & Santa Fe).

## Equated Tonnage and Its Relation to Fuel Consumption

By R. N. Begien

Federal Manager, Baltimore & Ohio Railroad, Western Lines

Equated tonnage has a certain relation to fuel consumption. However, this relation is established through the medium of the trainload. The fuel consumption per gross ton mile decreases as the trainload increases, provided the speed of the movement does not suffer to such an extent as to increase the time on the road materially. The purpose of equated tonnage is to secure uniform loading of power, regardless of the kind of equipment or number of cars involved. It is a well known fact that an empty car has a much higher resistance per ton of weight than a loaded car. For example, a 20-ton empty will show a resistance in the neighborhood of 8 lb. per ton of weight, or 160 lb. total resistance to traction on a level. On the other hand, a 70-ton car shows a resistance of approximately 4 lb. per ton of weight, or 280 lb. of resistance to traction on a level. These figures are approximate, but for practical use are correct. Of course many other features enter into the question, such as temperature, wind, rate of grade, curvature, type of car, etc.

In order to make practical standards which can be placed in the hands of yardmasters, it is necessary to use certain adjustments in building up trains, and to modify them as is necessary in the judgment of the chief train dispatcher to suit conditions under which the operation is conducted. If a locomotive is able to produce 30,000 pounds of effective tractive power behind the tender at rating speed, the train should have a combined resistance of 30,000 lb., irrespective of the character of the cars, and in order to accomplish this a certain arbitrary adjustment is added to the weight of each car, and the effect of this arbitrary adjustment is to automatically compensate the different weights of cars. This adjustment varies with the rate of grade, being about 15 tons per car on a .3 per cent grade, and about 2 tons per car on a 2½ per cent grade.

Building up a train tonnage, composed of the dead weights of cars, plus an adjustment, so that the combined resistance of the cars is equal to the effective tractive power behind the tender, give a tonnage which is known as an equated tonnage. The object is to secure uniformity of rating in order that the trains will always have a rated tonnage, irrespective of the kind of cars. There are a number of different ways of applying this principle, but unless some kind of equated

tonnage is used it is not possible to rate trains accurately.

It is safe to say that any road which has not used the equated tonnage system, and which has through freight to haul, has not built up its trainload to the best possible advantage. Full trainload at uniform speed spells efficiency in fuel consumption, and the relation of equated tonnage to fuel consumption is evidenced through the trainload.

Proper train loading contemplates each locomotive handling the maximum trainload which it can move on the ruling grade at the economic speed. At such speed the locomotive is working most efficiently. An increased speed, which may be brought about by reduced trainload, will result in inefficient locomotive performance, while a reduced speed, brought about by overloading, will produce the same result. With all trains moving at the economic speed, the locomotives operating at maximum effort and hauling the uniform trains under these conditions, the fuel consumption, when measured on the ton mileage basis, will be minimum.

## Discussion

All who discussed the paper agreed with the statements made. Representatives of three roads talked to some extent on the problem and stated that adjustment in tonnage is successful and productive of excellent results.

## Lame Engines and Their Effect on Fuel Consumption

By J. W. Hardy

Fuel Supervisor, United States Railroad Administration

The purpose of this paper is to show in a practical way how fuel is wasted by lame engines (engines with valves out of adjustment). With this end in view, tests were made on the Southern Pacific between Houston and Galveston.

The engines used were of the following dimensions: Engine 267 was of the 4-4-0 type, having a total weight of 137,425 lb.; weight on drivers of 91,675 lb., and tractive effort of 21,240 lb. The cylinders were 20 in. by 24 in.; the valves 12 in. diameter inside admission piston type; the valve motion was the Stephenson link, set as follows: Valve travel 6 in., 1½-in. lap, 3/32-in. exhaust clearance, line and line in front motion, and 1/8-in. lead in back motion. The engines were equipped with superheaters and burned fuel oil.

Engine 265 was of practically the same design and dimensions, with the exception that the cylinders were formerly equipped with slide valves, which were replaced with piston valves, simplified steam chests with 10 in. diameter valve outside admission, 1-in. lap, 1/32-in. lead in forward motion, 1/32-in. back, and 1/16-in. exhaust clearance.

The engines in these tests were run eight trips in each case with one exception, test No. 2. The test was conducted with engine 267, which had considerable lost motion in its valve gear, and had made 16,700 miles since last shopping. Engine 265 was in the best of condition, having been turned out of the shops after being generally overhauled and superheated. The same engineer and fireman were used throughout the entire test.

The tests made numbered from 1 to 6 inclusive—Test Nos. 1 to 3 with engine 267 and 4 to 6 with engine 265. There were many places where we could get the lame engine, but we could not get the other conditions, necessary to prove waste due to improper valve adjustment. We thought it was easier, better and more reliable to make changes on the

engine than to attempt to work out the other conditions, many of which we had no control over.

The objects of the tests were to determine the fuel wasted by locomotives with valves out of adjustment (lame engines), and to see how lame a locomotive could be without loss of time or complaint on its condition. Where an engine is so lame it cannot make time or handle its tonnage, it immediately attracts the attention of the transportation department and is taken in and repaired. It is only in rare cases that engines go lame all at once. When this occurs, there is usually something lost, slipped or broken. This is noticed at once and is taken care of at the earliest possible moment; but, where the change takes place slowly and gradually, as it does by age and wear, we become more and more accustomed to it, and it is allowed to go on day after day and week after week wasting fuel all the time.

An oil burner was selected because a more accurate check could be made of the fuel used than with the coal burner. Measurements were taken just before starting, and on arrival, so that oil and water used represents what was actually used in pulling the train and making station stops. All conditions of engines and service were kept as near the same as possible, except the valve adjustment, which is shown at the heading of each test made.

There was a total of 5/16 in. lost motion in the valve gear of engine 267, but this was pretty well distributed, the engine not lame enough in any case to affect the schedule of the train. There was a noticeable kick in the engine when lame that was not there when squared.

With the slight change in valve adjustment shown between tests 1 and 3, there was a difference of 18.33 per cent in the fuel consumed; no other charge can be made of this loss of fuel than to the condition of valves. The waste would undoubtedly increase with heavier service or more distorted valve condition, this is proved by test No. 6 with engine 265. Test No. 2 is not recorded for the purpose of comparison, but to show the condition of valves after the engine was squared up by the travel at full stroke and pronounced O. K. More throttle had to be used with the engine in this condition than when the valves were as in Test No. 3.

The valves govern the application of the power of steam to the locomotive and are of great importance to fuel consumption. It takes fuel to generate power, and it means a waste of fuel if this power is improperly used in the cylinders of our locomotives. The exhaust action is different when the engine is lame, causing a pulsating draft instead of a regular and constant pull on the fire. This wastes fuel in addition to the improper application of the power to the machine. Square engines steam better than lame ones, although these engines steamed well in both cases.

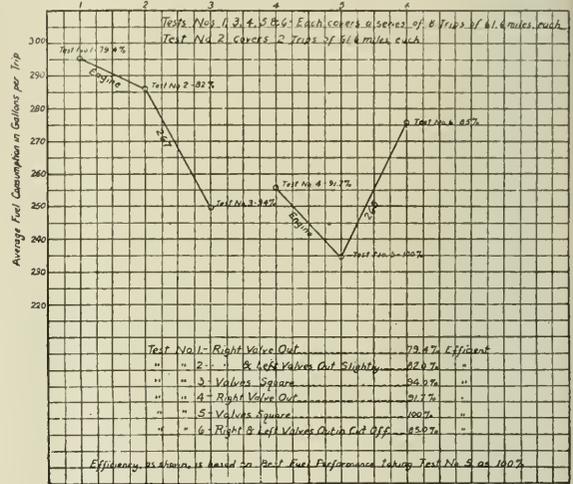

Valves out of square in a measure take the economical operation of the locomotive out of the hands of the crew. Their hands are practically tied because they are robbed of the control of the power applied to the locomotive in their charge. With an indifferent crew this loss will increase.

There is no way that we know of where we can get as good returns, and get them as quickly and at as little cost, as by squaring valves. It only costs a few dollars more to do this work well; it only costs a few dollars to do it at a time when it is needed and should be done, and it will often begin to pay dividends the first trip after it is done. Transportation people should want it done because the engine will pull more and pull out less draw bars when square than when lame, because the power is more evenly distributed in the cylinders and helps to prevent lunging and jerking when starting. The mechanical department people should do it because it cuts down fuel waste and the cost of locomotive maintenance. The crew should want it done because it makes their work easier and more pleasant.

There is liable to be less complaint on a lame oil burner, especially if she steams, than on a coal burner on account

of less manual labor to fire the oil burner. Why spend money for brick arches, superheaters, etc., and then waste as much with valves out as we can save with both of them? Why spend money to generate steam and then not control its use? You can go to any union station or large freight yard and hear engines pulling out every day on long, hard and heavy runs that sound worse than either of these engines did. The question of proper valve adjustment is so important that it should be specialized on.

The cut-off and steam distribution on test No. 2 with engine 267 merits careful study. This engine was run over at full stroke; in fact, was more carefully gone over than this work is usually done; pronounced O. K., and, no doubt, under ordinary circumstances, would have run possibly for months in this condition. But note how much better this

Relation of Fuel Consumption to Valve Setting

engine did in Test No. 3 with valves properly adjusted and a little of the lost motion taken up.

The difference in the performance of engine 267 with valves lame and square was so much we decided to make a test with an engine having as little lost motion in the valve gear as possible. We therefore arranged for a test with engine 265. This engine was new, and when broken in the right go ahead blade was changed so the cut-off was as shown in test No. 4. This engine was quite lame only on one side, and this low down in the quadrant, and, as the lever was hooked up, it got better. As the engine did most of its work at close cut-off, this change only made a difference of about 9/4 per cent in the fuel used, but the engine had a very disagreeable kick on the right side when run at high speed and short cut-off.

Certain kinds of lameness are more wasteful than other kinds. The engine that is lame where it uses the most of its steam is the most wasteful. This is clearly brought out by test No. 6 with engine 265 which was made lame in the cut-off where it did most of its work by changing the back motion blades so the engine cut-off in the forward motion as shown above test No. 6.

In all tests where the engines were lame, the lameness was aggravated by its being more difficult to keep the valves lubricated, and both engines rode much harder while lame than when squared. An engine can sound square and still have valves improperly set. A condition of this kind can only be discovered by careful measurements.

My conclusions from these tests are that a waste of as much as 25 per cent of the fuel could be made by further

distortion of valves before the engines would begin to lose time or affect the train service.

VALVE SETTING AND FUEL CONSUMPTION FOR TESTS NOS. 1 TO 6 INCLUSIVE, WITH CUT-OFF AT 6 INCH PISTON TRAVEL

Test No. 1, Engine No. 267. Right valve out—cut-off—right side, front  $5\frac{1}{2}$  in., back  $10\frac{1}{2}$  in. Left side, front  $7\frac{1}{4}$  in., back  $7\frac{3}{4}$  in.  
 Test No. 2, Engine No. 267. Both valves out—cut-off—right side, front  $7\frac{1}{2}$  in., back  $5\frac{1}{2}$  in. Left side, front  $7\frac{1}{4}$  in., back  $5\frac{1}{2}$  in.  
 Test No. 3, Engine No. 267. Both valves square.  
 Test No. 4, Engine No. 265. Right valve out—cut-off—right side, front  $8\frac{1}{2}$  in., back  $3\frac{1}{2}$  in. Left side, front  $6\frac{1}{2}$  in., back  $6\frac{1}{8}$  in.  
 Test No. 5, Engine No. 265. Both valves square.  
 Test No. 6, Engine No. 265. Both valves out—cut-off—right side, front  $3\frac{1}{2}$  in., back  $8\frac{1}{2}$  in. Left side, front  $4\frac{1}{2}$  in., back  $7\frac{1}{8}$  in.  
 Per cent increase in fuel consumption Test No. 1—18.33 per cent.  
 Per cent increase in fuel consumption Test No. 2—14.63 per cent.  
 Per cent efficiency of engine in Test No. 1, considering engine in Test No. 3 as 100 per cent—84.5 per cent.  
 Per cent efficiency of engine in Test No. 2, considering engine in Test No. 3 as 100 per cent—87.25 per cent.  
 Per cent increase in fuel consumption Test No. 4—9.12 per cent.  
 Per cent increase in fuel consumption Test No. 6—17.70 per cent.  
 Per cent efficiency of engine in Test No. 4, considering engine in Test No. 5 as 100 per cent—91.6 per cent.  
 Per cent efficiency of engine in Test No. 6, considering engine in Test No. 6 as 100 per cent—84.9 per cent.

### Discussion

Discussion brought out the fact that considerable saving in fuel could be made by proper setting and squaring of valves so that the maximum energy delivered by the steam could be given up at the proper time. One speaker expressed surprise that mechanical engineers have not paid more attention to the proper setting of valves and stated that the defect was a comparatively easy one to correct. He also stated that in many shops not enough attention had been paid to the qualification of the men who adjust the valves. Another speaker brought out the point in regard to lubrication that it is not the question of quantity of oil but of regular and uniform distribution. The same speaker advocated the use of indicators, but Mr. Hardy, in his closing remarks, pointed out that the use of indicators was not practical since so few knew how to apply the principle. He thought the use of standard trams for setting valves instead of indicators would be found more in line with practical methods.

## Russian Method of Testing Locomotives

The methods of testing locomotives used on Russian railroads was described in detail by G. E. Ledegeff, assistant chief of locomotive department, Russian Mission of Ways of Communication. The first locomotive testing laboratory of the world was installed at Kieff in 1882. During the next year the first attempts were made to determine the performance by establishing constant condition in actual service. This method has been developed to a high degree in Russia. It is now possible by means of road tests to draw up terms showing the tractive effort, steam consumption and the efficiency of the boiler and machinery for various conditions of speed, throttle opening and cut-off.

## Storage of Coal by Railroads During 1918

By H. H. Stoek

Professor of Mining Engineering, University of Illinois

About two years ago the writer sent out a questionnaire to several hundred parties storing coal in quantities varying from a few tons stored in the ordinary house cellar to hundreds of thousands of tons as stored on the docks along the Great Lakes and by some of the large industrial concerns. The replies to this questionnaire were studied and a tentative set of conclusions drawn up, and sent to the parties who had answered the original questionnaire, with the request that they be thoroughly criticized. As a result of these criticisms, a revised set of conclusions was drawn up and published in Circular 6 of the Engineering Experiment Station of the University of Illinois, together with all of the data upon which the conclusions were based.

Realizing that during the period of the war the conditions

under which coal was stored were unusual, because of the pooling of coal and because the coal furnished was dirtier and less carefully sized than under normal conditions, another questionnaire was sent out during the fall of 1918 to practically the same list of persons as the previous one, asking for the experiences of those who had stored coal during the year 1918 and for a criticism of the conclusions published in Circular 6. A similar questionnaire was sent to a large number of power plants in the State of Illinois, and a large number of fires in coal piles were studied during the summer and fall of 1918. In these several studies, railroad storage was only one of the problems included and furthermore, the study had particular reference to Illinois and Middle West coals.

On March 11 a conference was held in Chicago at which the general subject of railroad storage was discussed and the general conclusions in Circular 6 were endorsed. Each one was asked to furnish the writer his own conclusions upon railroad storage and copies of all instructions issued by railroads in his territory to be studied and summarized by a sub-committee consisting of Messrs. McAuliffe, Roesch, Collett, Hardy and the writer, at a meeting held in Urbana, March 25. At that meeting certain general conclusions were drawn up as representing what in the opinion of the committee represents safe practice at the present time and these preliminary conclusions were issued by Mr. McAuliffe in a circular addressed to the railroads of the country as a guide to them in storing coal during the spring and summer of 1919.

*Why Should Railroads Store Coal?*—The insurance feature of coal storage is so self-evident as not to need discussion, and the equalization of equipment throughout the year has been fully discussed in the reports of the several coal storage committees. (See also Railway Administration circular.)

Coal stored in summer costs less to transport than would the same amount hauled during the winter. By relieving the railroads of transporting so much coal during the season of peak load and high transportation cost, general freight traffic is helped.

Other reasons for storing coal by the producer or by the consumer need not be considered here, as the railroad is a transporting agent and not a producer of raw products or a consumer of finished products, excepting for its own needs.

The railroads are also interested in the storage of coal, because they are the largest users of it, using more than 25 per cent of the total output for their own uses, and since the transportation of the coal output forms about 34 per cent of the freight carried by the railroads of the United States, the railroads should, therefore, not only protect their own interests by storing coal, but should encourage both the mine operators and consumers to store coal so as to help stabilize the coal industry in order that it can be conducted more nearly up to its full time efficiency and thus decrease the present excessive but absolutely necessary overhead charge due to the fact that the miners of the country work only about 200 days per year.

*Suggestions Regarding Storage of Coal by Railroads.*—The replies to the questionnaire sent out in 1918 asking for experiences in storing coal during 1918 and for a criticism of the conclusions published in Circular 6, show that the experience of the past year has confirmed these conclusions in very great part.

(The conclusions included detailed instructions regarding the storage of coal as regards location of piles, season when coal should be stored, kinds and sizes which may be safely stored, methods of piling, ventilation and precautions to be taken to avoid spontaneous combustion.)

Summarizing these suggestions:

Each railroad should study its own storage problem in great detail. Get ready to store before it is time to begin

the actual storing by outlining a definite policy far enough in advance so that every one who will have to do with the storing can receive *definite* instructions, not merely suggestions. Then when storing begins, see that the instructions are carried out to the letter. Many failures have been due not to faulty instructions from the head office, but to the fact that they have not been followed.

When it is time to store, prepare a place carefully. Do not wait until the coal to be stored is on the track and then dump it anywhere to get it out of the cars. Specify the kind of coal that is to be stored and see that the specifications are carried out by having an inspector at each storage pile who is competent not only to inspect the coal furnished and reject it if not according to specifications, but who has authority to see that the storage instructions are carried out to the letter.

Prepare definite instructions as to the sizes of piles for different coals and for the different kinds of storage appliances that may be available.

Watch the stored coal carefully for any evidence of heating and if the temperature rises sufficiently, begin to move it in time. See that adequate machinery for handling the coal is available and always in condition to be used. Do not store coal unless you are prepared to do it properly and to watch it thoroughly after it has been placed in storage.

Attention to these details will very largely prevent heating of coal or if heating occurs will prevent a loss of coal from dangerous fires.

It should be understood that each coal storage is a distinct proposition, and while it is believed that the suggestions in this paper will be helpful to any one wishing to store coal, they are suggestions and guides only, based upon the experience of those who have stored coal. They are not absolute facts and subsequent experience may show changes to be advisable.

*Effect of Storage Upon the Properties of Coal.*—The heating value of coal as expressed in B. t. u. has been shown by experiments of the United States Bureau of Mines and by Professor S. W. Parr of the University of Illinois, to be very little decreased by storage. It must be admitted, however, that the opinion is very wide-spread that storage coal burns less freely than fresh coal. This opinion is by no means universal amongst railroad men, for in the latter pages of this paper giving the opinion of railroad men storing coal, it is distinctly stated by some that the storage coal burns better than the fresh coal.

Experiments at the University of Illinois have indicated that coal that has been in storage can be burned as readily as fresh coal if a thinner bed is kept on the grate and the draft properly regulated. This, of course, applies particularly to stationary plants as draft cannot be as well regulated in locomotive practice.

*Insurance Adjustments.*—An attempt has been made to obtain information regarding the adjustment of insurance in connection with the storage of coal but very incomplete information had been received at the time of writing. It is suggested that this subject is worthy of much more careful and extended study, possibly by a subcommittee of the Fuel Association.

### Storage Systems

*Choice of a Storage System.*—In the choice of a storage system, the following points should be considered:

- (1) The location, size, and topography of the available storage ground.
- (2) The capacity of the desired installation, that is, the amount of coal which it is desired to load and unload in a given time.
- (3) The cost of the plant.
- (4) The cost of maintenance.
- (5) The cost of operation.

(6) The amount of breakage to be permitted in handling the coal.

(7) The way in which the coal is received, in open or box cars, or in boats.

(8) The length of time the coal must be kept in storage.

(9) Climate: A dry climate with cold nights such as is found in Colorado, for instance, may give different conditions than will be found in Illinois, where there is a great deal of moisture in the air and the summer nights are almost as hot as the days.

The requirements of an ideal plant are:

(1) Adequate ground area, so that different kinds of coal may be stored separately if necessary.

(2) Adequate facilities for rapidly and economically transferring coal from cars or from boats into storage.

(3) Adequate facilities for rapidly and economically reclaiming the coal and for rapidly moving any part of the pile which shows evidences of taking fire.

(4) Adequate track facilities, with gravity facilities, if possible, for handling cars.

(5) Means for preventing undue breakage in handling.

(6) Adequate available water supply.

(7) Low cost of installation, maintenance, and operation per ton of capacity. A storage plant is in operation very irregularly and costs are likely to be correspondingly higher because of the heavy fixed charges, especially interest and depreciation.

(The paper gave detailed analyses of the advantages and disadvantages of methods of storage particularly applicable to railroad conditions. Replies to questionnaires summarizing the current practice and opinion regarding railway storage were also included.)

### Discussion

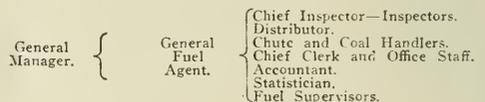

The discussion hinged largely on bituminous coal storage fires. Several pointed out that such fires may occur to any kind of coal when stored under different conditions, but to aid in preventing fire proper preparation should be made for storage facilities. Dry high ground, if possible, should be chosen and clean even grade coal should be stored in the same pile. Dust veins should not be permitted. Different kinds of coal should not be mixed and use of water in small quantity was discouraged.

## Fuel Department Organization

By T. Duff Smith

Fuel Agent, Grand Trunk Pacific

When one stops to consider the enormous amount of money spent by the railroads of the United States and Canada for fuel, it does seem strange that every road has not a fuel department. I will speak only of an up-to-date fuel department, and the duties and qualifications of its staff. I do not expect you all to agree with me, especially in many of the details, and trust that a full and frank discussion will enable the association to formulate a standard fuel organization which it can recommend for adoption on all roads. My organization plan would be as follows:

You will note the order in which I have taken them—from the production to final usage.

Taking them in the order shown on chart:

*General Manager.*—As the general manager is responsible for the economical operation of the road, I take it for granted that he is the one who is most interested in fuel economy, and therefore the general fuel agent should report direct to him.

*General Fuel Agent.*—The general fuel agent should be responsible for the purchase, distribution and accounting for all fuel. He should have a thorough knowledge of all fuels on his own line, and adjacent thereto, also keeping in touch with all new development, and in these days of labor unrest, he should keep well informed of the situation so that on any indications of approaching trouble causing closing of the mines, he will have sufficient stock on hand to protect his road. He should be familiar with the characteristics of the various coals, such as slacks, lignites, etc., by the use of which great economies can be made in fuel used in roundhouse plants, stations, tanks, etc.

He should have a knowledge of the various systems of handling and storing coals, so as to meet any contingency that may arise, and keep his actual handling costs to minimum. He should keep a close watch on his supplies and stocks protecting against any possible shortage by reason of unforeseen delays, wrecks, washouts, strikes, etc., at the same time being careful not to carry too heavy a stock in cars, thus causing extra cost by shrinkage, extra handling and interest on idle money.

The general fuel agent should purchase all fuel, under the direction of the general manager, after consultation with the superintendent of motive power, as to the merits and economic aspects of fuel required for various purposes. This I take to be very necessary on account of the multiplicity of designs of locomotives and boiler plants. We all know that a coal which proves economical on one type of locomotive or boiler is the very opposite on another type, yet we have to supply fuel for them all.

He should keep in touch with general superintendents, so that they may facilitate movement of cars, both loaded and empty, and also get advance notice of any extra supplies required on account of rushes of traffic, opening ballast pits, etc. He must also consult with them as to any permanent or temporary alterations required at coaling plants, especially when arranging to dump storage coal.

He should especially consult with the superintendent of motive power, as this is the department using by far the larger proportion of our fuel, and it is only by close co-operation of these two departments that we can make our best results in economy. On most roads we also have to rely on the motive power department to make all our tests, as we are not all in a position to maintain an organized testing department with all the necessary equipment. Where a performance sheet is compiled, it will not be possible to get any improvement in results unless these two departments are working closely together.

The general fuel agent should not spend too much time in his office, as all routine work there can be taken care of by his clerical staff. He should be out on the line as much as possible, getting in close touch with coal operators, his inspectors, master mechanics, in fact with every one who is at all interested in fuel, and thus gain information which will enable him to inaugurate new methods, thus making economies.

*Inspectors.*—As we cannot use the coal unless it is properly produced, the next to deal with are the inspectors. As I have often stated, I prefer practical miners for these positions. A practical miner, after a little outside training, is able to judge as to whether the coal is up to the proper standard of the mine, and in cases where coal is being tendered for loading which is not up to standard, is able to detect the cause of the trouble and apply a remedy.

The inspector's duties are principally to inspect the coal as delivered, but he also sees that cars are clean and in fit condition for loading, inspects the weighing and notes any differences between actual and marked tare. He should also report daily the number of cars of company coal loaded with destination, and the number of cars of commercial coal

loaded, and should send a weekly report of local conditions at the mine.

*Distributor.*—After receiving the coal at the mine, it is necessary to properly distribute it, which is done by the fuel distributor. His title implies his work, and he must watch daily stocks on hand and in transit closely so as not to overstock or run short, also so as to get his coal carried without causing any holding back of revenue traffic on account of requiring coal rushed to any particular point.

*Chute and Coal Handlers.*—Having the coal at destination it is necessary to get it on locomotives or in boiler rooms by means of coal chutes or handling in some other economical manner. These are so closely connected with fuel costs that the handling of all fuel should be taken care of by the general fuel agent, either by contractor or men on the fuel payroll. By this means he has a constant and efficient check on the cost of this work.

*Chief Clerk and Office Staff.*—The office routine and records are taken care of by the chief clerk and staff and this does not require any explanation.

*Accountant.*—The accountant is responsible for passing all invoices and vouchers, making all charges of fuel issues and keeping the fuel stocks account.

*Statistician.*—The statistician's chief work is in compiling performance records, and any other similar reports required. I find myself unable to compile any coal performance reports from the fact that we have no means of obtaining accurate data as to the amount of coal supplied to any particular engine. It is all guesswork, so that to attempt to compile any comparative report of performance would be ridiculous and only a waste of time. I hope that the day is not far distant when every coal chute will be equipped with an automatic device, either weighing or measuring, so that we may know the exact amount of coal taken by each engine, but until such is installed I feel that all our efforts at comparisons are of no avail.

*Fuel Supervisors.*—The coal now having been mined, distributed and placed on the engines, the fuel supervisor comes in, and by his skill and training as an engineer develops the highest training and practice possible in his engineers and firemen, always looking to the little things that count so much and taking for his text "The most 100 ton miles for the lowest actual cost."

Such, in my opinion, is the complete organization of a fuel department, and such an organization with the motto "Service and Co-operation," with everybody living up to it, could make great savings for any road.

## Co-operative Research and the Railway Fuel Problem

By Captain O. S. Beyer, Jr., U. S. A.

The influence of such fundamental items of railway operating expense as the cost of fuel and labor on the direction of developments, both mechanical and economical, in the industry has always struck me as a most important subject for consideration. When practices of locomotive and car construction or train operation of America are compared with those of Europe, striking differences are revealed. Intensive studies of the effect of basic cost items indicate more clearly than anything else the reasons why, for instance, the superheater, the mechanical stoker, the brick arch, the feed water heater, as well as the composite modern types of American locomotives themselves, assume tendencies in this country differing quite markedly from analogous tendencies in other countries. In fact, I do not think it an exaggeration to say that the whole course of American railway development is greatly influenced by the cost of fuel and labor. The problems created by the railway labor and fuel situa-

tion have a large economic background, which is very fundamental in its relation to the whole transportation industry. An analysis of this phase of the problem is a big subject in itself and cannot be elaborated here. Certain elements of the problem, however, are amenable to certain forms of solution which are becoming more and more important. Briefly, these particular solutions may be characterized as possible methods for increasing the productivity of the agencies creating the operating cost in question. To increase, as it were, the yield of fuel, to get more out of every pound, to utilize it more efficiently, is of more importance today than it ever was, and will become more and more so as each increment added to its cost places an additional premium on its efficient use.

The time has come, in my estimation, to survey the railway fuel situation, its problems and possibilities, with a thoroughness never attempted before. This association has succeeded, after several years of strenuous effort, in effecting a co-operation between many interests, whereby a piece of fuel research was accomplished which undoubtedly some day will be considered the inception of a movement contributing most extensively to the solution of the present-day railway fuel problem.

Since the committee on Fuel Tests handed in its report on the Test of Six Grades of Coal from a Franklin County, Illinois, Mine, at the 1917 convention, much has transpired. We have come to realize, as never before, the true significance of the scientific method in the solution of the problems in our industries, as compared with the slow, dull, expensive practices of cut and try, rule-of-thumb, or by whatever other term the awkwardness of much of the industrial progress of the past might be characterized. Perhaps no other event of international importance than the war for democracy has served to emphasize this so well. A new realization has developed among scientists, engineers, administrators, statesmen, concerning the value of the *scientific method* in the solution of industrial problems.

It is my intention to point out as far as this association is concerned that its greatest opportunity lies in the direction of continuing and developing as rapidly as possible the lead it took when, through its Committee on Fuel Tests, it brought together the many interests and secured the necessary funds which eventually made possible the report already mentioned. This was but a beginning and a beginning under most adverse circumstances.

As all this is indicative of what co-operation in research really means, the question which arises is, what can be done in this direction on behalf of contributing to the solution of the railway fuel problem? The Fuel Conservation Section of the United States Railroad Administration thoroughly appreciates the activities of this association. The extensive fuel and locomotive test facilities, but so meagerly used, at the Illinois, Iowa and Purdue experiment stations need but to be referred to. It seems, therefore, that the whole question reduces itself to one of initiative with the International Railway Fuel Association.

All these remarks would perhaps have little appeal were there not many important railway fuel problems pressing for solution. Consequently, in support of the remarks I have made above, the following fuel investigations, which can only be carried on in a sufficiently comprehensive way by co-operative research, are submitted for consideration by way of conclusion:

(a) *The Chemistry of Combustion.*—The theory of combustion as it exists today, applied to the burning of locomotive fuel, is incomplete, and fails to explain the occurrence of some very important phenomena, especially with reference to fires of varying thicknesses, clinkering, coking, the nature of the higher hydrocarbon products of combustion, etc.

(b) *Firing Practices.*—The purpose of this should be to

determine the most economical combination of practice, devices and kinds of fuel in different territories possible. Maximum boiler capacities resulting from these combinations as well as relative smoke production should be determined.

(c) *Heat Absorption.*—A detailed experimental, as well as mathematical study of the process of heat transfer in the locomotive boiler should be made, especially with reference to the distribution of the heating surfaces between tubes, flues, combustion chamber and firebox.

(d) *Chemical and Physical Nature of Exhaust Gases.*—A splendid opportunity exists to investigate the products of combustion as they appear in the locomotive front end after they have done their work. The results might go a long way towards explaining the mysterious "unaccounted for" losses in the heat balance.

(e) *Accurate Smoke Measuring and Indicating Devices.*—Jointly with the foregoing investigation, attempts should be made to develop accurate smoke measuring and indicating devices.

(f) *The Drafting System.*—An investigation of the entire drafting system of the modern locomotive cannot be made too soon. The proportioning of ash pan opening, grate opening, gas areas between the end of the arch and the door sheet, of flues, tubes, and superheater damper, the space under the smoke box diaphragm, and the smokestack should all be carefully determined and general values for them expressed in empirical formulae having a wide range of application. This is far from accomplished today.

(g) *The Law of Resistance to Flow of Gases.*—Detailed study of the flow of gases through the locomotive boiler reveal possibilities for reducing their resistance to flow and perhaps at the same time suggest ways for effecting greater interchange of heat between these gases and the heating surfaces.

(h) *Radiation Losses.*—Very little is known about this important item, and in consequence losses resulting therefrom are thrown in with those considered as "unaccounted for." It is entirely possible to develop data on this point, especially with the perfected methods of pyrometry now in existence.

(i) *Locomotive Feed Water Heating.*—After a long period of development, the locomotive feed water heater is at last becoming available. As it stands today, it is perhaps one of the finest examples of the results of scientific experimentation applied to the solution of locomotive problems. The good work, however, should not stop. As long as feed water can be heated to still higher temperatures, as long as there are heat units still going up the stack which might be saved, the feed water heater investigation should continue.

(j) *Locomotive Boiler Performance.*—The whole general subject of locomotive boiler performance needs more study. Unfortunately the available reliable test data covering a sufficient range of performance is entirely too limited for this purpose. Consequently little opportunity exists for developing an extensive and well founded theory for locomotive boiler design.

(k) *Further Study of the Superheater.*—The superheater deserves further investigation. The work done at Purdue and especially at Altoona with varying lengths and diameters of superheater units has certainly contributed most valuable knowledge on this subject. As a continuation of this work the correlation between degree of superheat and boiler pressure as reflected in the steam economy of the engine should be worked out over wider ranges and mathematical determinations verified. Another very important question coming within this field is the effect of varying degrees of moisture in the steam entering the superheater.

(l) *Fuel.*—Investigation concerning fuel should primarily contemplate securing data on the relative steaming values of the fuel used in the railway service as determined

from a complete series of boiler performances as well as maximum evaporative capacity tests. The data should also include information on the spark and smoke production of the various coals and their clinking and honeycombing qualities, in order, if possible, to tie up practical performances of coals with the characteristics indicated by proximate and ultimate analyses and other laboratory tests of selected samples. The fuels which should thus be investigated are: (1) Typical coals from all important mining districts. (2) Various commercial sized and some specially sized coals. (3) Land stored, water stored and freshly mined coals. (4) Powdered bituminous, anthracite, lignite and peat, together with combinations thereof. (5) Oil, lignite, anthracite and bituminous coals, coke, peat, briquets and possible mixtures of these fuels.

Complete information as outlined would enable the railroads more clearly to specify desirable and necessary characteristics of fuel and to select fuels with far more intelligence than can now be done. It would enable them to determine with much greater accuracy the actual value of the various fuels available instead of solving this vital question by the unscientific methods now employed of "collective bargaining" between coal salesmen and fuel or purchasing agents. Some tests have been made to determine the relative steaming value of and the maximum capacity obtainable from certain typical locomotive coals and a limited number of different sized coals. One railroad, which has developed this data for coal used on its lines, has effected economies which have paid in one year over tenfold the cost of making the experiments.

It is entirely possible mechanically to prepare fuel in a highly pulverized form and burn it in a locomotive furnace. The machinery for doing this has been developed and used with success. The next logical step is to determine accurately just what is the complete economic value of the utilization of pulverized fuel. The many general advantages which are bound to follow its use are, of course, recognized, but it is not known how much, for instance, the evaporation per pound of coal is increased at different rates of combustion. The heat balances over the complete range of boiler capacities of a few typical boilers fired with pulverized fuel have yet to be compared with the balances of these same boilers fired with ordinary fuel. And lastly, values as exactly as possible of the increase in capacity of the pulverized fuel fired boiler should be established. It is not yet possible completely and finally to judge the wisdom of either attempting to perfect or of widely introducing this system of combustion.

**Discussion**

S. C. R. Richards, director Engineering Experiment Station, University of Illinois, told of investigations conducted by that institution. The scope of the work is limited because of lack of funds. He hoped arrangements could be made to secure co-operation from railroads in carrying on work. J. M. Anthony spoke of the need for a scientific investigation to determine proper proportions of locomotive boilers, the design of which had been along empirical lines. W. J. Bohan advocated the formation of a committee representing the railroads to co-operate with universities in research work.

**Front Ends, Grates and Ash Pans**

During the past few years much attention has been given to results obtained from the performance of heavy Mikado and Santa Fe type locomotives. The committee felt that an analysis of some of the apparatus pertaining to the designs of front ends, grates and ash pans was pertinent, and accordingly sent a letter to the mechanical engineers of some of the larger railroads of the country, reading in part as follows:

"In connection with work by the Standing Committee on

Front Ends, Grates and Ash Pans of the International Railway Fuel Association, we wish to compile data in regard to improvements in designs of front ends, grates and ash pans which some of the more important railroads have found to produce a saving in fuel. We would like to have this data in connection with the larger type locomotives, preferably the Santa Fe or the Mikado types.

"If your railroad has found a change in design within the last two or three years which is proving to be a more economical design than you originally had on front end arrangements, on grates or on ash pans, also if the designs you now use are giving very good economy, will you please send drawings showing the old and new designs and also advise as to the size of the locomotive, the class of service, the grade of fuel burned and any further information which you see fit to give regarding both old and new designs."

The response to these letters, together with information submitted by individual committeemen, has suggested a comparison of present practice with the practice of some fifteen years ago, particularly in reference to front end design when the Master Mechanics' Association in 1906 endorsed the Purdue University tests on front ends.

*Front Ends:*

The fundamental principle of the Master Mechanics' standard front end is that the height, H, of the portion of the stack extending above the smoke box and the distance, h, that the exhaust nozzle is below the horizontal center line of the smoke box be, for best results, as great as practicable. This being done, dimensions of certain importance are ascertained in accordance with the following formulae in which D is the diameter of the smoke box, P the distance the stack extends below the top of the smoke box, d the diameter at the choke of the stack, b the diameter of the base of the stack, and h the distance from the base of the stack to the choke or smallest dimension of the stack.

$$\begin{aligned} d &= .21D + .16h \\ b &= .2d \text{ or } .5D \\ P &= .32D \\ p &= .22D \end{aligned}$$

It is to be remembered that the diameter of the smoke box on which tests were made in establishing the design factors for the standard front end was 74 inches, and that the maximum back pressure of the exhaust blast that produced the draft on this oil burning locomotive was only a little more than 4 pounds. These are conditions which do not prevail in general practice today. The diameter of the smoke box on the majority of larger engines is from 80 to 91 inches, and the back pressure is, far in excess of a maximum of 4½ pounds.

The function of the stack is a very important one in its relations to the drafting of the locomotive and its fuel economy. The diameter at the choke of the stack, as determined by the standard formula, is made a function of the diameter of the smoke box, as well as the distance of the exhaust nozzle below the center line of the smoke box. The question arises whether or not this is a proper basis of design with present-day practice with large locomotives, either using saturated or superheated steam, hand fired or stoker fired. Is this the proper equation to give maximum fuel economy? Does it give a stack that is large enough to take care of the exhaust steam and the exhaust gases and to deliver them properly and with such a degree of freedom that good fuel economy results?

By comparing the formulae with the practice on present prominent railroads, we find that the maximum calculated diameter of the stack at the choke is 23 inches and that the actual diameter is 21 inches. In this case the minimum area of the actual stack is 17 per cent below that required by the formula; no data have been established by experiment on this coal-burning Santa Fe type superheater locomotive

to show that a 23-inch or larger stack might not be used.

This railroad in question is notably a leader in the large size of its stacks. Another railroad in an adjacent territory is using a 17-inch stack on this same type of locomotive.

An analysis of all the design dimensions referred to by the formulae is of great interest as a matter of comparison, and one might possibly draw the conclusion that the dimensions were made to suit other conditions and not made to follow the formulae in that they vary as much as 100 per cent in several instances.

What then is the state of the standard master mechanics' front end? It may possibly be expressed in the words of a prominent mechanical engineer when he said recently: "So far as present large power is concerned, there is no such thing as a standard master mechanic front end. On present-day power, using superheater steam, the arrangement will not permit such a front end."

The master mechanics' front end did not provide a front end netting which is common to most locomotives of today, so located as to extend from the table plate at an angle of about 40 degrees to the forward part of the smoke box. This location of the netting for interception of the exhaust gases makes accessibility of the front end rather difficult, and many designers have expended their efforts in developing a different arrangement of the netting or spark arrester.

The Chicago & North Western has had for several years a box arrangement known as the Slater front end which is claimed to give very satisfactory results. The Burlington has an arrangement differing widely from that of other railroads so far as form is concerned, having a basket form over the exhaust pot. The Rock Island has a cylindrical spark arrester. (See *Railway Age* December 6, 1918, page 993).

This road reports that it has several hundred locomotives fitted with this device, with the most gratifying results.

With these variations of designs of front ends the question arises with this committee as to what should be endorsed as the best form of arrangement of a standard front end and what should be the basis of design of the stack under present-day conditions. At this time the committee is unable to make recommendations.

#### Grates:

In studying the grates in use on large locomotives, we find that they are for the most part of the finger type, and are divided into four sections. During the past few years power shakers have been introduced on a considerable number of the larger locomotives. In such case the arrangement is such that the grates can be shaken either by power or by hand, and, of course, in a very much shorter time than by the former method.

There is a tendency on the part of several railroads to change from the finger type grates to the table type. Tests recently made on one road show a decided saving in fuel due to the change from the finger to the table grates.

#### Ash Pans:

The general design of ash pans must necessarily be adapted to the particular class of locomotives, some locomotives permitting a different arrangement than others. In general it would appear that the ash pan is designed to fill a space that has been left over after other parts of the locomotive have been utilized to the best advantage. So far as the type of hopper is concerned, it seems that the duplex hopper type is in most general use, although there are a considerable number of multiple hopper type ash pans in service.

In general the ash pan doors open so as to dump the ashes towards the back end, although on a few railroads the two doors open, the one towards the front and the other towards the back of the locomotive.

In many instances the mechanical engineers are not co-ordinate in their actions; the designs that are satisfactory

on one railroad are sometimes discontinued on another. This is particularly true with reference to the sliding versus the hinged door.

The report was signed by H. B. MacFarland (A. T. & S. F.), Chairman; W. J. Bohan (N. P.), E. B. DeVilbiss (Penn. Lines), J. P. Neff (Am. Arch. Co.), and Frank Zeleny (C. B. & Q.).

## The Effect of Reducing Exhaust Nozzles to Overcome Front End Air Leaks

By F. P. Roesch

Supervisor, Fuel Conservation Section, Northwestern Region

The manager of the Fuel Conservation Section, United States Railroad Administration, under date of August 1, 1918, sent out Fuel Conservation Circular No. 8, addressed to all motive power officials concerned with locomotive maintenance. The circular called particular attention to the prevalence of air leaks around the outside steam pipes on superheated steam locomotives at the point where these pipes enter the smoke arch, and advised how these leaks could be detected by means of an ordinary torch test.

While in some instances the recommendations embodied in circular No. 8 were fully complied with, in other cases it was found that proper measures were not used, due, no doubt, to the fact that those interested in the maintenance of the locomotives did not realize the importance of the proposition.

The usual methods pursued in taking care of the air leaks around these steam pipes was to pack the opening between the pipe and gland with fibrous asbestos packing, either rope asbestos or plaster being used. Tests have proven that through the action of the exhaust this packing is gradually pulled into the front end, eventually leaving a clear opening. Where all of the packing in this manner becomes so pulled out, it leaves a combined opening around the two steam pipes in the average construction, equal to an orifice  $8\frac{1}{2}$  in. in diameter.

These air leaks, of course, do not occur suddenly, consequently the effect on the draft is gradual, and this in turn gradually reduces the steaming qualities of the locomotive. It is because locomotives gradually fail for steam that nozzle bushing is eventually resorted to, as did the steam failures occur suddenly no doubt the cause would be investigated and corrected.

In order to determine the exact effect of reducing nozzles and disarranging front end apparatus to overcome the effects of these leaks and to improve the gradually failing steaming qualities of the locomotive, the Fuel Conservation Section authorized a series of tests to be conducted to see what the losses amounted to in increased fuel consumption and decreased locomotive efficiency.

In conducting these tests no particular locomotive was selected, the locomotive tested being one in regular chain gang freight service and assumed by all concerned to be in good condition. Draft gauges were used in front and behind the diaphragm, in the firebox and in the ash pan. In addition to the draft readings, pyrometer readings were also taken at stated intervals as well as cylinder indicator cards at various speeds and cut-off. A dynamometer car was employed in order to register the draw bar pull under varying conditions so that the results obtained would not be based on the tonnage alone, but equated on the train resistance. The tender was cut off, drained and weighed prior to taking coal on each trip. Only the coal consumed in actually pulling the train was taken into consideration, all coal used on sidings and at other stops being used from a separate source.

The locomotive tested was of the light Mikado type and superheated, having cylinders 26 x 30 in., 63-in. driving wheels, 200 lb. steam pressure, with a calculated tractive

effort of 54,720 lb. The tests were conducted over a double track freight division, 91 miles long, having a maximum grade of .67 per cent, the same engine crew being used throughout all tests.

The first trip was made with the locomotive as found. On the completion of this trip, the openings around the steam pipes were packed with rope asbestos, and it was found that the average draft in the front end was raised two inches, as shown by the draft gage. As this now gave a vacuum in the front end greater than necessary, to produce the desired vacuum in the firebox it was decided to open the nozzle a sufficient amount to reduce this.

On the first trip it was found that the draft gage in front of the diaphragm registered practically double the height of the column of water as registered by the draft gage behind the diaphragm, indicating that the draft plate was so adjusted as to offer quite an obstruction to the flow of gases from the firebox to the atmosphere. It was, therefore, decided to raise this plate in order to better equalize the draft.

On the next trip the openings around the steam pipes were again packed with asbestos and front end cement, as inspection on arrival showed that the greater part of the packing applied on the previous trip had pulled out. The nozzle was enlarged 1/8 inch in diameter, and the draft plate raised as noted in the preceding paragraph. On this trip the locomotive showed a marked decrease in the consumption of coal per 1,000 gross ton miles equated on the draw bar pull as registered by the dynamometer car. It also showed a decrease in cylinder back pressure at the same speed and cut off, due, of course, to the enlarging of the nozzle.

As the front end vacuum was still greater than necessary in order to maintain the proper firebox vacuum, it was decided to further increase the diameter of the nozzle on the following trip.

On the next trip the nozzle was enlarged 1/8 inch more in diameter, or a total of 1/4 inch above the size originally carried. The draft sheet was left as adjusted on the previous trip. Finding, however, that the packing around the steam pipes had again partially pulled out, it was decided to seal these openings by means of plates made of No. 10 gage steel, slightly corrugated, the outer circumference of these plates being welded to the smoke arch on the inside of the arch and the inner circumference of the plates welded to the steam pipes. An electric welder was used, thereby permanently sealing these openings. On this trip, while the locomotive did not show any decrease in fuel consumption per 1,000 gross ton miles over the previous trip, it did show an increase in locomotive efficiency, due to the further increase in the size of the exhaust nozzle, and as a point had now been reached where the fuel consumption and locomotive efficiency practically balanced, and it having been decided that any further increase in the size of the exhaust nozzle would affect the steaming of the locomotive to such an extent as to increase the coal consumption and thereby offset anything that might be gained through a further reduction in back pressure the tests were concluded on the basis of the last test run.

The final results can be briefly summarized in the following statement: Opening the nozzle 1/4 inch or 4.5 per cent of the diameter, giving an increase of 9.3 per cent in area, resulted in a decrease in fuel consumption of 14.3 to 21.17 per cent, the comparisons as shown for the different trips wherein the larger nozzle was used being 14.3, 17.2, 18.2 and 21.17 per cent, the difference being due to variations in the quality of coal, weather conditions, etc. The efficiency of the locomotive was increased from 8.1 to 16.5 per cent, based on the averages at various speeds and cut off, as shown by indicator cards and dynamometer records. The locomotive steamed equally as well with the larger nozzle as with the one originally used. The raising of the diaphragm resulted in a better distribution of the draft over the fire, and

this in turn decreased the fuel consumption approximately 3 per cent.

On the whole, the tests brought out forcibly the necessity of maintaining nozzles with the largest possible diameter consistent with good steaming; of maintaining air-tight front ends in order that the large nozzle can be successfully used, and of so adjusting the draft plate as to maintain an even distribution of draft over the entire grate surface, as well as to carry it at such a height as to provide ample area for the free flow of gases from the firebox to the stack.

Discussion

Good results in eliminating leaks around steam pipes were reported by using stuffing boxes. Rope asbestos was found to be more satisfactory than cements, but no material could be found that would remain tight for a week.

Other Papers

A paper was also read on Internal Combustion versus Steam Engine for Small Stationary Plants; by C. A. Lichty, inspector, purchasing department, Chicago & North Western.

Train Accidents In April<sup>1</sup>

THE FOLLOWING is a list of the most notable train accidents that occurred on the railways of the United States in the month of April, 1919:

Collisions

Date	Road	Place	Kind of accident	Kind of train	Kil'd	Inj'd

The train involved in the collision near Locust Summit, Pa., on the 10th of April was a through freight, consisting of locomotive 1050 and 35 loaded cars. Because of the breaking of a drawhead the engine and eight cars were moved forward to Gordon, where the eight cars were set off; and the engine, returning to its train, collided with the rear portion, which had been left standing on a grade but had started down the grade because of the leaking of the air cylinders. The train had been standing about 45 minutes, and none of the hand brakes had been set. Eighteen cars were badly damaged, and the conductor, one brakeman and the fireman were killed.

The trains in collision near Memphis, Tenn., on the 26th, were an employees' train, carrying men to work, about 7. a. m., and a locomotive without train; a butting collision in a dense fog. Both engines were damaged. This collision was not on the main track. Five employees were killed, and six were injured.

The trains in collision at Walshville, Ill., on the 29th (at 2:40 a. m.) were southbound freight No. 6.102 and northbound freight No. 6.122. Both engines and several cars were badly damaged. The southbound train had run

<sup>1</sup> Abbreviations and marks used in Accident List:

rc, Rear collision—bc, Butting collision—xc, Other collisions—b, Broken—d, Defective—unf, Unforeseen obstruction—unx, Unexplained—derail, Open derailing switch—ms, Misplaced switch—acc, obst., Accidental obstruction—malice, Malicious obstruction of track, etc.—boiler, Explosion of locomotive on road—fire, Cars burned while running—P, or Pass., Passenger train—F, or Ft., Freight train (including empty engines, work trains, etc.)—Asterisk, Wreck wholly or partly destroyed by fire—Dagger, One or more passengers killed.

past the appointed meeting place, train orders having been overlooked. The road was blocked twelve hours. Two trainmen were injured.

The trains in collision at Taylor, Pa., on the night of the 29th of April were a yard freight of ten cars, standing motionless on a yard running track, and a train of three locomotives and one caboose, the engines moving backward and pushing the caboose. Of the five trainmen on the caboose, four were killed and one was injured. A switch tender had been directed to forbid the entrance of the train of locomotives on the track occupied by the standing cars, but neglected to do so, and is held responsible; also the man in charge of the standing freight is held responsible for failing to protect, either by a red light on the end car or by hand lantern.

The train derailed near White, S. D., on the 8th was westbound passenger No. 417. The engine was overturned, and the engineman fatally injured. The cause of the derailment is believed to have been a broken rail.

The train derailed near Halford, Kan., on the 10th was eastbound No. 186, a mixed train with two engines and a snowplow. Moving at about 20 miles an hour, the plow was overturned in a drift and both engines were derailed. One engineman and one fireman were killed, and the other fireman was injured.

The passenger train derailed at Emsworth, Pa., on the 11th of April was west bound express No. 1,007. The line of road at this point is four-track. A westbound freight had been derailed by the automatic application of the brakes, and several cars were thrown afool of an eastbound track. These cars caused the derailment of an eastbound freight which came along within a few minutes. The path of the passenger train was also blocked, and this was the cause of the derailment of that train, only the engine and the baggage car being thrown off the rails.

The train derailed near Gillespie, Ill., on the 13th was westbound passenger No. 5. The engine and first three cars were thrown off the track and partly overturned. Two mail clerks were injured.

The train derailed near Hunter, Tex., on the 14th was a northbound stock train. Fourteen cars were ditched and about 300 animals were killed, part of them steers and part sheep. The derailment was caused by a broken wheel.

The train derailed on the St. Louis-San Francisco near Lawton, Okla., on the 22nd of April was extra freight No. 734, consisting of one locomotive and 21 cars, including 19 cars of oil. Fire broke out in the wreck and 9 cars of oil, the caboose and a pile bridge, about 300 ft. long, were burnt up. Estimated loss \$27,000. One drover and two trainmen were slightly injured. The cause of the derailment was not determined.

The train derailed near Cimarron, Col., on the 27th was westbound passenger No. 315. Three coaches were overturned. Thirty-four passengers were injured, most of them not seriously. This section of the road is narrow gage. The baggage car, heavily loaded, was thrown off the track on a ten degree curve by the body side-bearings fouling bolts on the front truck.

The train derailed at Newport, Pa., on the 29th was an eastbound passenger ascending a steep grade at low speed. The second of the two locomotives hauling the train ran off the track, and with its tender, the first two cars and the tender of the leading locomotive, fell into the ditch. Twenty-three passengers were slightly injured. The cause of the derailment was a broken journal.

The train derailed at Sabula, Pa., on the 30th was an extra freight consisting of 44 cars. One or more cars in this train were derailed in Sabula tunnel, presumably by the fall of a brake beam, and the derailment was followed by a fire which destroyed 13 cars and contents, and damaged much other freight. Estimated loss \$125,000. The fire

raged 42 hours, and it is expected that the road through the tunnel will not be passable before July 1.

*Electric Car Accidents.*—At Muncie, Ind., on the 9th, a street car was struck by a freight train of the Lake Erie & Western, and three passengers in the car were killed and four injured.

## Railway Affairs in Congress

WASHINGTON, D. C.

THE HOUSE COMMITTEE on appropriations was expected to take up this week consideration of the \$1,-200,000,000 appropriation asked by the Railroad Administration and to give Director General Hines an opportunity to explain it. The debate on the bill in Congress is expected also to give many members an opportunity to air their views on the subject of the government's management of the railroads.

Senator A. B. Cummins of Iowa has been made chairman of the Senate Committee on Interstate Commerce as expected. The other Republican members are C. E. Townsend, Michigan; Robert M. LaFollette, Wisconsin; Miles Poindexter, Washington; James E. Watson, Indiana; F. B. Kellogg, Minnesota; George P. McLean, Connecticut, and the following new members: B. M. Fernald, Maine; J. S. Frelinghuysen, New Jersey, and S. B. Elkins, West Virginia. The Democratic members have not yet been selected.

The Democratic members of the House Committee on interstate and foreign commerce are as follows: T. W. Sims, Tennessee; F. E. Doremus, Michigan; A. W. Barkley, Kentucky; Sam Rayburn, Texas; A. L. Montague, Virginia; Charles P. Coady, Maryland; A. G. DeWalt, Pennsylvania, and J. Y. Sanders, Louisiana. The names of the Republican members were published last week.

Senator Cummins announced that the Senate Committee on Interstate Commerce would be called together immediately and that the probable order of action would be as follows: First, the bill to restore the telegraph and telephone lines; second, the bill to restore the Interstate Commerce Commission's authority over rates; third, the Poindexter long and short haul bill, and finally the general railroad question. He said that after a concrete plan has been decided upon by the committee he planned to hold further hearings to allow the suggestion of changes considered advisable. Chairman Esch of the House committee expects to begin by holding a series of hearings.

It is reported that many members of Congress are preparing to discuss the action of the six leading steel companies in submitting identical bids on rail to the Railroad Administration and that there will be a demand for an inquiry by the Department of Justice.

The House appropriations committee has decided to include an appropriation of \$2,000,000 for the Alaska railroad in the general deficiency bill.

Bills introduced in Congress affecting the railroads include the following: By Representative French, a bill, H. R. 1438, to promote the safety of travelers and employees by compelling common carriers to adopt uniform rules for the operation of trains and to use a uniform system of signals for authorizing the movement of trains. By senator Jones of Washington, S. 632, to prohibit trespassing. By Senator Townsend of Michigan, S. 647, to provide for federal incorporation of railroads, and S. 648, to amend the powers of the Interstate Commerce Commission. Senator Nugent of Idaho has presented to Congress resolutions adopted by the Idaho Legislature favoring the return of the railroads to private management as soon as it can be accomplished without confusion or losses.

# Railway Developments in Foreign Countries

## Head of England's Largest Railway Union on Visit Here; Reduced Fares in England Defeated.

**J.** *H. Thomas*, general secretary of the National Union of Railwaymen (Great Britain) and a member of Parliament, is on a visit to the United States, having arrived in New York on Saturday last. Mr. Thomas is a leader in British railway labor matters and conducted the negotiations with the British Board of Trade and the Railway Executive Committee which recently resulted in important concessions to the railwaymen.

### German State Railways

The Constitutional Committee in Weimar, by an almost unanimous decision, recently laid down the principle of a united German State railway system. The Bavarian Government representatives alone protested. According to despatches the taking over of the whole of the railway systems by the State Government by means of an agreement until April, 1921, has been decided upon.

### Simplon-Orient Express

The new Simplon-Orient Express left Paris on its first journey about the middle of April. The train will run daily via Dijon, Vallorbe, Lausanne, the Simplon Tunnel, Milan, Verona, Venice and Trieste. At Vincovce the train is divided, one section, on Sundays, Tuesdays, Thursdays and Saturdays, going via Verciorova to Bukarest; and the other, on Mondays, Wednesdays and Fridays, direct to Belgrade and eventually to Nish, Sofia and Constantinople.

### London Traffic Congestion

The London members of the British Parliament decided May 6 to ask the cabinet to appoint a select committee to inquire into the question of London traffic and the steps that are necessary to relieve the present severe congestion. They took this step after hearing important evidence from the so-called "combine" which controls the London District Railway, the tube railways and the motor omnibus services. One of the difficulties presented was a shortage of money to effect additions and improvements to the services in the way of building extensions to the tubes, purchasing more equipment, etc.

### Prominent British Steel Men Not

#### Worried Over American Competition

The bogey of American competition in the British iron and steel trades is regarded by one of Britain's foremost iron and steel men as undoubtedly exaggerated, says the American Chamber of Commerce in London.

Although the British prices have gone up as the result of the removal of the government subsidies, this expert says there is a tremendous demand among the neutral countries for iron and steel at almost any price, and expects this demand to take care of the British export production.

The American Chamber of Commerce in London understands on the other hand that British interests themselves are making extensive purchases of American iron and steel.

### Another Mexican Railway Project

Several of the larger American and other foreign oil companies which are operating in the Gulf coast region of Mexico have joined in the project of constructing a rail-

road between Tampico and Tuxpam, a distance of about 125 miles. Among the corporations that are interested in the building of the proposed line are the Mexican Petroleum Company and the Eagle or Aguila Oil Company. Application for a concession to build and operate the road has been made to the department of communications and public works of the Mexican government. While the line will be primarily for the purpose of affording transportation for supplies and materials for the different oil fields it will do a general freight and passenger business.

### Increase in Exports Over Pre-War Period

The increase in exports of railway supplies and of manufactures in general is clearly shown in a compilation recently issued by the National City Bank of New York. The compilation gives the figures of exports for the nine months ended March, 1919, as compared with those for the nine months ended March, 1914. The figures for locomotives and for rails are as follows:

	Nine months ended	
	March, 1919	March, 1914
Locomotives—		
Number .....	657	308
Value .....	\$16,775,710	\$2,918,714
Rails—		
Tons .....	422,046	282,621
Value .....	\$27,693,550	\$8,637,346

### Australian Railway Development

A proposal is being considered in Australia of building a railway from the Northern Territory to the border of Queensland or continuing the Great Northern Railway to Camowael or Lake Nash. The Queensland line is now at Dajarra. The route has not been surveyed, but the distance would probably be about from 120 to 150 miles, and with the exception of the first 10 miles from Dajarra the country presents no engineering difficulties. It may perhaps be found preferable to connect from the Great Northern line from Dobbyn by an extension through Mount Oxide, and Gregory Downs to the border north of Camowael. Either of the proposals mentioned would fill the conditions of the proposal made by Lord Forrest to the Queensland Government in the early part of 1914, which was that Queensland should continue its railway to the border in the vicinity of Camowael, so that the Commonwealth Government might extend the Pine River railway from Katherine to Newcastle, and through the Barclay tableland.

### New Canals for Finland

Several important canal schemes are at present being put forward in Finland, with a view to extending the existing canals and establishing new connections between the many inland lakes and the Finnish and Bothnian Gulfs. The most important proposals before the Finnish Senate are those for connecting the lake of Paijanne with Safma Lake and with the Gulf of Finland. The route to be followed is along the Kymene River. Another project is a canal from Wiborg to the River Vuoksen and thence to the harbor of Kivisalmi, north of Kexholm, suitable for ships of 1,000 tons. The towns of Tammerfors and Bjorneborg and the communes on the Kuno River are agitating for a canal from the Bothnian Gulf to Lake Paijanne via Pyhajarvi Lempaala, and Valkeakoski. The old Saima Canal

may also be modernized by extending the width of the locks to 68m., thus enabling ships of 709-800 tons from the inland waterways of Russia to pass through. With regard to the new railways some 650 km. are at present under construction at a cost of 250,000,000 Finnish marks.

### New Railways Projected in Colombia

The Assembly of Antioquia, says a special correspondent to the Latin American section of the New York Sun, has approved the first project law, which orders the outline of the railway between a point on the Amaga Railway and the Department of Caldas, passing through Fredonia and other municipalities of the southwest, where agriculture thrives greatly. This project law authorizes the governor to arrange a loan of 5,000,000 pesos.

The national executive, says the same correspondent, has approved the provision of the departmental government for the reorganization of the work on the Puerto Wilches Railway. In Santander it has been agreed to receive at par (as they are not received in other parts) the bonds that the government issued, and the value of these, or \$120,000, is to be used to prolong as far as possible the line of the existing railway. For handling the fund and reorganization of the work a commission has been created whose members are the Governor, the secretary of finance and Victor M. Ogliastris. Pedro E. Novoa and Ambrosio Mantilla.

### Railway Extensions in Sweden

After some three or four years' work, the Special Commission appointed to draw up a scheme for a complete reorganization of the railway connections of Stockholm has now prepared a full and comprehensive plan, involving an outlay of from \$25,000,000 to \$30,000,000. The proposal is based upon the probable traffic 30 or 40 years hence. So far as the passenger traffic is concerned, a new line of access is placed east of the existing one, and will proceed across the Arstaviken (the future Hammarbyleden, a new and important harbor) on a bridge so constructed as to give a clear height of about 85 ft. above ordinary water level. The west trunk line will run in an almost straight line through part of Soder-malm, where a large station is to be constructed. From this station the railway will run in a northerly direction through a tunnel under the Maria Hill to the southern shore of Lake Malaren, which will be crossed on a viaduct, and thence will pass the western shore of the Riddarholmen, crossing the Norrström on another bridge, which joins the Klara shore to the west of the present line, the new line gradually falling as it approaches the Klara shore. The central station is to occupy the site of the present main station, and the departure and arrival passengers are to be kept entirely apart. The station, it is believed, could be finished in 1927.

### Belgian Light Railway Construction

During the war a certain amount of information was available as to the damage inflicted by the Germans on the Belgian national light railways, and it is now possible, says the Railway Gazette (London) to supplement this by details gleaned on the spot. The damage falls under three heads: The taking up of tracks that could be used to better advantage elsewhere, which is a legitimate military action; the destruction or damage of lines to hamper the movements of the Allied forces after the armistice, and purely wanton damage undertaken out of spite or malice. Examples of all three abound, although it is often very difficult to determine under which category any individual damage falls. On certain routes one motor past mile after mile of light railway on which the ballasting, overhead wires, notice boards, etc., have been left entirely intact, but from which every rail and sleeper has been removed. Such lines seem without any doubt to have

been removed in order to be employed by the Germans for legitimate purposes in districts nearer the scene of actual military operations. Elsewhere one sees miles of track partially damaged, one set of rails being more or less intact, while the other has been wrenched from its foundations and twisted. On other sections, lines have been rendered useless for miles on end by the dynamiting of every rail joint, so that the ends of each rail are curved upwards. There is a good deal of this particular destruction near the French frontier, and most of it seems to fall within the category of purely spiteful damage.

### Publicity Department for Belgian Railways

The Belgian Ministry of Railways, Marine, Post, Telegraph and Telephone, has established a special department for press and publicity in charge of C. Joset as director with headquarters at Brussels. The establishment of the new department, says Consul Charles Roy Nasmith, Brussels, was brought about by a royal decree resulting from a report to the King by the Minister of Railways. This report, outlining the functions of the bureau, reads almost as if it had been written by an American, or, at least, by someone who had made a study of American conditions. It said:

The advantage derived from publicity in commercial enterprises needs no longer any proof, and in order to be convinced of this it is only necessary to look around and see what is being done in other countries by public organizations and by private firms.

The Ministry of Railways, Marine, Post, Telegraph and Telephone would increase by this means the income of its different departments.

Also the public would be informed regularly and systematically of all the regulations, changes and reforms introduced from time to time to improve the different services in the interests of the population and to present, by means of an intelligent propaganda and publicity, the advantages derived from the changes.

On the other hand the department possesses a wonderful means of publicity in its official publications, such as its railway time-tables, telephone directories, also in its thousands of waiting rooms, platforms, post offices, railway cars, steamers, where the public can find an excellent opportunity to advertise.

Here is a source of considerable revenue which can be derived for the government if this means of advertising is made use of in centralizing all the services which have to do with this and suppressing the system of exploiting these opportunities through private sources.

Last of all, in the interest of a good operation of the administration, it is most desirable to give continually in the public press all the criticism made concerning the organization and operation of the different public services of the Ministry of Railways, Marine, Post, Telegraph and Telephone, and these criticisms should be examined thoroughly without delay to see whether they are well founded, and, if so, remedies should be adopted at once as far as possible.

For the above reasons I have the honor to propose to your Majesty the creating of a department for the press and publicity, whose action will extend to all the departments and administrations of the Ministry of Railways, Marine, Post, Telegraph and Telephone, and which will systematically put to profit all the advantages to be derived from the press and publicity.

### Bill for Lower Passenger Fares on

#### British Railways Defeated

The British House of Commons on May 7 defeated a bill introduced by a private member calling for the restoration of pre-war passenger fares and for the reduction of the 50 per cent increase introduced during the war. In the discussion considerable objection was made also to the "scandalous overcrowding" on the railways.

Mr. Bridgeman, parliamentary secretary to the Board of Trade, in opposing the measure on the part of the government introduced some interesting figures by way of explanation of the overcrowding. He showed that there was a serious shortage of equipment and explained that to reduce fares would encourage travel and result in greater congestion.

The present conditions of things, he said, made it quite impossible to do what was asked. There had been taken for the purposes of the war overseas, 1,600 passenger coaches and 700 locomotives. Of the locomotives, about 300, he thought, had now been returned to this country. Not one of these 300 was in action; every one was undergoing repairs. Of the 1,600 coaches, not one had yet been returned to this country. Owing to the war, the ordinary repairs and new construction had fallen seriously into arrears. In normal times in Great Britain 3 per cent of the

rolling stock was under repair, and something like 10 per cent of the locomotives. At the present time 10½ per cent of the passenger coaches and 20 per cent of the locomotives were under repair. The ordinary annual requirements to keep up stock in normal times was 600 or 700 new engines per year. During the war something like 100 or 200 engines had been constructed annually. That meant that during the years of the war there had been a loss of new engines, and those of the most modern and largest type, of 2,000. The normal new construction in coach building was something like 6,000 new coaches a year. During the war there had been practically none. The fact that England had thus lost a huge quantity of passenger coaches which ought to have been serving the public was no fault of the Board of Trade or the Railway Executive Committee. If fault there was, it should be placed on the Germans.

With regard to cheap fares he also said the companies'

expenses were more than double what they were before the war. The public should be very thankful that the companies were only asking 50 per cent increase for what cost them over 100 per cent more. If the 50 per cent were taken off, the companies would be involved in a loss calculated at \$100,000,000.

Sir Auckland Geddes, minister of national service and reconstruction (not to be confused with Sir Eric), acting in the absence of Sir Albert Stanley, president of the Board of Trade, who also spoke against the bill and showed that conditions were being remedied as fast as possible. He said that 2,677 trains had been restored within a few weeks. The Caledonian Railway of Scotland had added 250; the London & North Western, 650, in spite of the fact that the railway lines were still pressed with the necessity for carrying returning soldiers and still suffering for lack of men and supplies.

## Missouri Pacific Saves \$279,843 By Water Treatment

This Result is Equivalent to a Return of 181 Per Cent on  
Investment in 52 Plants

By R. C. Bardwell,

Chief Chemist, Missouri Pacific, St. Louis

**D**URING 1918, the water softening plants on the Missouri Pacific treated 1,368,305,000 gal. of water, removing from this water 3,589,473 lb. of scale forming matter. There are 52 water treating plants on this system, the majority being in the hard water district of the plains west of Kansas City, although the plant of largest capacity is situated at North Little Rock, Arkansas. These plants, which represent an investment of \$154,300, have been in service from 2 to 13 years. On the basis of a saving of 11 cents per pound of incrusting matter eliminated before the water was delivered to the locomotives, as outlined by the Water Service committee of the American Railway Engineering Association in 1914 and corrected to conform with present high prices for labor and material, the total saving to the railroad from the removal of this scaling material amounted to \$369,716. The cost of treatment, including labor, chemicals, maintenance, and 10 per cent on the investment to cover depreciation in treating facilities, was \$89,873, leaving a net saving of \$279,843 or 181 per cent on the amount invested.

The benefits resulting from water treatment are numerous but mostly of an intangible nature and difficult to convert into direct financial returns. However, values were placed on four items, the saving of fuel resulting from the removal of the insulating effect of the scale, the increased life of flues, the decreased repair work on flues and boilers in the roundhouse, and the saving in engine time while down for repairs. The average cost of coal was increased \$0.90 per ton, a set of flues \$216, engine time \$12 per day, and roundhouse flue repairs 135 per cent over the prices used by the committee in 1914. The saving brought about by the reduction in engine failures and delays to traffic, and also the quicker turning of locomotives with the increased service is much greater, owing to the large increase in overtime rates for employees as well as stringent power shortage during this period.

Approximately 700 of the 1094 locomotives operated by this company were directly effected by the use of the treated water. The total gross saving of \$369,716 is equivalent to

a gross saving of \$529 per engine or a net saving of \$400, which appears reasonable in view of the generally improved performance.

The 3,589,743 lb. of scaling matter removed from the water would be equivalent to 36 carloads of 50 tons each. If this scale had been allowed to go into the locomotives a conservative estimate of the portion adhering to the tubes and sheets would not have been below 25 per cent. This means that with the untreated water an average of 1282 lb. of scale would have been deposited in each of the 700 engines, forming an insulating coating about ⅛ in. thick on all exposed boiler surfaces. As a matter of fact the scale would have been much thicker and heavier in some districts, as, on several divisions, ⅜ in. scale was not uncommon after 6 to 8 months' service before the installation of softening plants which caused large loss in locomotive operation.

The best available data indicates that an insulating scale of ⅛ in. thickness causes an increase of between 15 and 20 per cent in fuel consumption. Using the average rate of six pounds of water per pound of coal burned, 946,411 tons of coal were required to evaporate the 1,368,305,000 gal. of water into steam at boiler temperatures. It is safe to presume that at least 10 per cent more coal would have been consumed if the scale originally present had been allowed to accumulate on the tubes and sheets instead of having been removed before the water was given to the locomotives. The increased fuel consumption which would have followed the use of untreated water would have amounted to about 100,000 tons for the year 1918, which is an important item for the period, particularly when the general shortage of coal and cars is considered.

Of the 52 water treating plants on the system, 31 are of the intermittent type and 21 continuous. The majority were installed by company forces on designs furnished by the engineering department. The plants were designed to afford all possible use of facilities already existing at a minimum expense. Where convenient, an additional roadside tank was

installed with necessary air pipes for agitation and a steam jet or ejector for adding the chemicals. At small stations where the rate of pumping is low, a small inside tank with filter and mixing box was placed in the roadside tank and chemicals added continuously with the water. In large standpipe-type steel tanks good success has been secured by putting the chemicals and water through cylindrical down-take tube and drawing off the water at proper height after sufficient time has allowed clarification without use of filter. Good results have been secured in a large capacity con-

sitate an explanation. Frequent inspections are made at points where trouble is indicated or expected and inconsistencies corrected.

It has been found that an important item in securing satisfactory results from water treatment lies in adequate supervision. Any type of treating plant conforming to the three essential principles, proper chemical proportioning, suitable mixing and agitation, and sufficient settling period, will give satisfactory results with proper attention. Not only must the chemical formula and treatment be checked, but the satisfactory operation and condition of the facilities must be assured by frequent inspection. Lax attention may easily result in loss many times in excess of cost for adequate supervision. This supervision should not be confined to treatment alone but extends from inspection of quality and condition of chemicals through the operation of plant and to final action of the water as indicated by locomotive performance.

The accompanying chart shows the record of operation at each of the 52 plants. The source of supply and hardness of the raw water are noted. Figures are given for each plant showing the consumption, the amount of scale-forming solids removed, the cost of treating facilities, the cost of operation including chemicals, labor, maintenance, and 10 per cent for depreciation, and also the estimated saving secured.

The most serious trouble now encountered in locomotive operation and upkeep from the effect, or in conjunction with the use of water, is pitting. Its action is irregular in appearance and frequency variable, so that considerable difficulty is met in tracing cause or source. However, experience and records thus far made indicate that pitting on non-treated water districts has become more noticeable and severe than on districts where treated water is used. Investigations and experiments tend to indicate that water carrying a slight caustic soda alkalinity, which would also mean but a slight amount of scale, gives the best results in service. On two engine districts in Western Kansas and Eastern Colorado treating plants have been installed at all water stations so that this condition may be assured all water given to locomotives. These 25 plants have now been in service about two years and although the entire elimination of pitting has not been secured to date, the attack on fireboxes appears to have been stopped and the greatly improved condition and service of the flues would indicate that the small amount of pitting taking place may be due to scab pits on old flues which have been replaced in the boilers.

Summarizing the benefits of treated water as noted to date:

- 1.—A large saving has been made in fuel consumption owing to the elimination of heavy insulating scale.
- 2.—Roundhouse boiler repairs have been reduced on treated water districts from 30 to 60 per cent.
- 3.—Life of flues has been increased from 30 to 300 per cent with corresponding betterment of general boiler conditions.
- 4.—Pitting has been materially reduced with increased life of flues and fireboxes.
- 5.—Engine failures from boiler troubles on treated water districts have been very materially reduced with corresponding improvement in general traffic conditions.

The regular quarterly dividend of 1½ per cent of the Pennsylvania, payable March 31, goes to 110,374 stockholders. This compares with 108,546 stockholders on the Pennsylvania books last February, and with 103,003 stockholders in May, 1918, and with 93,639 in May, 1917. Only two per cent of the Pennsylvania dividends now goes abroad, comparing with 15 per cent of the total which was sent abroad before the war. This means that about \$65,000,000 Pennsylvania stock has been returned to America since 1914.

RESULTS OF WATER TREATMENT ON MISSOURI PACIFIC

tinuous plant with constant head and float regulator for the chemical proportioning.

The plants are operated by the regular pumpmen and maintained by the division water service forces. The treatment is regulated and general supervision given by chemists located at Little Rock, Ark., and Kansas City, Mo., these being convenient central points. Semi-weekly samples of both the raw and treated water are furnished these laboratories and results of these tests are reported to division as well as general headquarters. A limit of six grains per gallon for hardness remaining in the water after treatment is allowed for satisfactory results and all results above this limit neces-

# Doings of the United States Railroad Administration

## Orders for Open Hearth Rail Have Been Placed With Six Steel Companies; Price Protested.

WASHINGTON, D. C.

**A**N APPROPRIATION OF \$1,200,000,000, instead of the \$750,000,000 held up by the Senate filibuster at the last session, which the Railroad Administration got along without for a time by issuing certificates of indebtedness, is now required by the Railroad Administration to restore its "revolving fund" to a state of animation and to carry out through the balance of this year the purposes for which that fund was intended. This added to the \$500,000,000 originally appropriated for a revolving fund would make a total of \$1,700,000,000, of which practically all except the amount temporarily tied up for working capital has been expended or represents an obligation of the government, but \$1,214,000,000 should eventually be repaid.

The estimate was transmitted by Director General Hines to the Secretary of the Treasury and by him submitted to Congress on May 24.

The amount now asked for includes \$486,000,000 to cover the operating deficit for the 16 months of government operation of the railroads up to April 30, which alone is nearly enough to wipe out the original fund. In addition \$425,000,000 is desired for working capital, which represents what the original appropriation has in fact been largely used for, because the deficit is more than covered by the amounts as yet unpaid to the railroad companies for rental. Another \$775,000,000 represents amounts advanced or to be advanced for the account of the companies and which they will have to pay back. About \$14,000,000 is for expenditures for inland waterways. Therefore \$1,214,000,000 of the \$1,700,000,000 which would be represented by the two appropriations should eventually be returned to the government.

The \$486,000,000, representing the deficit shown by the figures now available up to April 30, Mr. Hines believes should be treated as loss due to the war and paid out of the treasury, which means by the taxpayers rather than by the shippers and passengers. Beyond that point he attempts no forecast but his recent speeches indicate that he hopes an increase in traffic, together with what economies in operation are found possible, will pull the roads through the remainder of the year. Until better information as to the tendency of future months is available he declines to decide the question of an advance in rates but presumably that would be the next step if the deficits should continue, unless these should be small enough to be absorbed from the working capital, although Mr. Hines does not promise that he will never ask for another appropriation.

In his letter to Secretary Glass Mr. Hines said:

"I have the honor to submit herewith an estimate in the sum of \$1,200,000,000, to be immediately available and to remain available until expended, and to be added to and considered a part of the 'revolving fund,' provided for in Section 6 of the act approved March 21, 1918. This additional sum would be expended in the same manner and for the same purpose and under the same conditions as the amount appropriated in the above mentioned section.

"This appropriation is needed for:

### Requirements for 1918

Amount necessary to defray operating deficit—the difference between the standard rental payable to the railroad companies, and the net operating income, for the year 1918..	\$236,184,940
For net excess of current assets over current liabilities, partly available for the immediate working capital requirements .....	201,938,198
Improvements on inland waterways.....	2,641,886
Amounts advanced for account of railroad companies to enable them to pay in part their current liabilities.....	100,000,000

Amount of additions and betterments' expenditures, including equipment, made to the railroad companies' properties during 1918, which must be carried by the Railroad Administration for the time being.....	352,553,455
Loans during 1918 to railroad companies not immediately repayable .....	48,483,959
Total requirements for 1918.....	941,802,438
Less amount heretofore appropriated.....	500,000,000
Balance required for 1918.....	\$441,802,438

### Estimated Requirements for 1919

For amount of additions and betterments' expenditures, including equipment, made and to be made to the railroad companies' properties during 1919, which it is believed will have to be carried by the Railroad Administration for the time being.....	253,435,760
For improvements to develop inland waterways.....	11,700,000
For financing Boston & Maine Railroad Company reorganization .....	20,000,000
For operating deficit for first four months of 1919.....	250,000,000
For additional working capital.....	223,061,802
Total estimated requirements for 1919.....	\$758,197,562
Grand total requirements for 1918 and 1919.....	1,200,000,000

"The operating deficit of \$236,184,940 for the year 1918 was due largely to two facts: First, the winter of 1918 was unprecedented in its severity and in its costly effect on railroad operations; and, second, the increases in passenger and freight rates averaging about 25 per cent were in effect for only a few days in excess of six months, while heavily increased expenses due to war conditions were effective on an ascending scale throughout the twelve months.

"The operating deficit of approximately \$250,000,000 for the first four months of 1919 is due in part to the cumulative high levels of cost, brought about by the war, for labor and materials and in part to the sudden and abnormal falling off of business as a result of the cessation of war activities, the sudden drop in the demand for fuel and for other basic commodities, and the general state of hesitancy due to the transition from war conditions to peace conditions. The fact that the present period is transitional and apparently on the eve of important changes has made it expedient to defer, until the matter can be more accurately measured, the consideration of the question, now frequently raised, of an increase in rates.

"In my judgment, the deficits for 1918 and for the readjustment period of 1919 are clearly losses due to the war and ought to be treated as such. By reason of the abnormal after-the-war factors tending to important changes in the situation, the estimate herewith submitted does not attempt to forecast results beyond the first four months of this calendar year.

"If the amount here requested shall be appropriated the total appropriation for the Railroad Administration will have been \$1,700,000,000. Of this amount \$1,214,000,000 will represent amounts which should be returned to the government, \$425,000,000 thereof being temporarily tied up in working capital and \$775,000,000 thereof representing amounts which have been and will be advanced for the account of the railroad corporations and which it will be their duty to repay as rapidly as practicable. About \$14,000,000 will represent expenditures for equipment on Inland Waterways.

"Of the entire \$1,700,000,000, \$486,000,000 represents the aggregate loss to the government up to April 30, 1919, on account of the two deficits above explained.

"The sum of approximately \$223,000,000 for increased working capital is requested because experience has demonstrated that the amount of working capital actually available for current use on December 31, 1918, was insufficient to admit of the free and unrestricted payment of payrolls

and vouchers for materials and supplies throughout the country. There is manifestly great advantage both in the economical purchase of materials and supplies, and the handling of such transactions to the satisfaction of the business public in having an ample supply of working cash."

That the Railroad Administration really needs the money, if any one is inclined to doubt it, can be made readily apparent by regrouping Mr. Hines' figures as follows:

Of the total of \$1,700,000,000, at least \$990,000,000 has already been actually expended or become payable:

Deficit .....	\$486,185,000
Additions and betterments in 1918.....	352,553,000
Advances to railroads.....	100,000,000
Loans.....	48,484,000
Inland waterway improvements in 1918.....	2,642,000
	\$989,864,000

Adding to this \$425,000,000 for working capital makes \$1,415,000,000, leaving to be expended in 1919 not more than the balance of \$285,000,000, divided as follows:

Additions and betterments.....	\$253,436,000
Inland waterway improvements.....	11,700,000
Boston & Maine reorganization.....	20,000,000
	\$285,136,000
Grand total .....	\$1,700,000,000

Some of the \$253,000,000 has already been expended since the first of the year, but no report has been issued of the expenditures for capital account since January 1.

Up to April 30 the Railroad Administration had paid to the railroad companies on account of rental \$494,913,615. As the total rental for 16 months amounts to about \$1,237,000,000, this left a balance of \$742,000,000 unpaid. Also \$403,000,000 of standard equipment had been ordered, of which \$164,000,000 had been paid for after delivery, leaving a balance of over \$239,000,000 to be paid. This the Railroad Administration is still trying to make the railroads finance, and it is allowing them \$100,000,000 on depreciation account to pay the first 25 per cent on it. About \$149,000,000 of certificates of indebtedness had been issued up to April 30 on account of compensation and for equipment, but this amount is included in the \$742,000,000 unpaid compensation and the balance payable for equipment.

The estimate now is \$450,000,000 greater than that submitted by Mr. Hines on January 24. As the deficit estimated at that time was \$196,000,000, and it is now \$290,000,000 greater than that, only \$160,000,000 of the increase is for other purposes. The \$750,000,000 was made up of \$382,000,000 required to settle accounts for 1918, and \$368,000,000 to be used toward financing capital expenditures for 1919, of which \$286,000,000 was for equipment, \$12,000,000 was for waterways and \$20,000,000 for the Boston & Maine, leaving \$50,000,000 for additions and betterments. As only \$285,000,000 of capital expenditures is provided for in the new estimate for 1919, the \$1,200,000,000 apparently provides \$83,000,000 less for capital expenditures than did the former estimate. The former estimate of the amount required to settle the accounts for 1918 is increased by \$60,000,000 from \$382,000,000 to \$442,000,000, and the amount required for 1919 is increased from \$368,000,000 to \$758,000,000 or \$390,000,000, of which increase \$250,000,000 is for deficit and \$223,000,000 for additional working capital, so the amount provided specifically for capital expenditures is \$83,000,000 less than before.

The two estimates may be compared as follows:

Former estimate:	
To settle accounts for 1918, including \$196,000,000 deficit	\$382,000,000
For capital purposes in 1919.....	368,000,000
Total .....	\$750,000,000
New estimate:	
To settle accounts for 1918, including \$236,000,000 deficit	\$442,000,000
Four months' deficit in 1919.....	250,000,000
For additional working capital.....	223,000,000
For capital purposes in 1919.....	285,000,000
	\$1,200,000,000

The amount expended for capital improvements in 1918 was \$575,000,000, and the amount carried over into 1919 of the budget authorized last year was \$683,000,000, which was reduced by revision to \$607,000,000, including \$290,000,000 for standard equipment. Almost no new work has thus far been authorized since the first of the year. Therefore, as Mr. Hines estimates the amount of additions and betterments which will have to be carried by the Railroad Administration at \$253,000,000, it would seem that if much new work is undertaken it will have to be financed by the companies. In connection with his former estimate, Mr. Hines calculated that the railroad companies would have to borrow \$291,000,000 for capital improvements, while about \$150,000,000 could be deducted from the companies' rental toward capital expenditures. This \$150,000,000 plus the \$253,000,000, which the Railroad Administration proposes to carry, would leave \$204,000,000 for the companies to finance of the carry-over from last year, and this would be reduced by the \$100,000,000 depreciation payment. Last year's capital expenditures were chiefly financed by the Railroad Administration, except that \$214,000,000 was paid for by deductions from the companies' rentals in accordance with the provisions of the compensation contracts.

It is expected, however, that the passage of the appropriation, making possible the payment of the large amounts due the companies for rental, together with the prospect of the return to corporate management, would so improve the credit of the roads that the companies will undertake to finance a considerable program of improvements on their own account by way of preparation for the resumption of operation by the companies, especially as any improvement work undertaken now would hardly be completed much before the date set for the return of the properties.

#### Rail Orders Placed—Price Protested

The Railroad Administration on May 23 placed its first rail order since the railroads were taken over by the government; it was for 200,000 tons of open hearth rail, which was divided between the six leading steel companies, the Carnegie Steel Company, the Illinois Steel Company, the Tennessee Coal & Iron Company, the Colorado Fuel & Iron Company, the Bethlehem Steel Company and the Lackawanna Steel Company. The first three are subsidiaries of the United States Steel Corporation. The price is \$47 a ton, which was the price proposed to and approved by the Industrial Board of the Department of Commerce. These six companies, according to a statement issued by Director General Hines, in response to the Railroad Administration's request for bids, submitted bids which are uniform in all respects as to price and conditions of manufacture and are in strict accordance with those proposed to and approved by the Industrial Board. A seventh company, the Midvale Steel & Ordnance Company, proposed prices \$10 greater; in other words, \$55 for Bessemer and \$57 for open hearth.

Mr. Hines said the orders were placed in view of the immediate need for rail and "not only without approval of the prices, but for the reasons shown below, with emphatic disapproval of the prices and the manner in which they have been established." Mr. Hines said that when the Industrial Board approved the prices proposed by the steel interests it became at once apparent to him, and he so indicated in various discussions with representatives of the government, that that approval would encourage the steel interests to stand together on those prices, even though governmental approval was withheld. He felt, however, that "even so it would be far more in the public interest for the government to withhold approval and, if necessary, pay such prices for the time being under protest rather than endorse the prices, and that, too, for the entire calendar year, as was proposed

by the Industrial Board, and thereby give an official sanction to prices which were unreasonably high and which would merely serve as a starting point for still higher prices later on." "The result," he says, "has been in exact accordance with this forecast. That the action of these six companies in making uniform bids was taken under the leadership of the United States Steel Corporation is clear from the fact that immediately after the Railroad Administration announced finally that it would not approve the prices fixed by the Industrial Board, Judge Gary for the Steel Corporation took the initiative in announcing publicly that the Steel Corporation was strictly maintaining the prices approved by the Industrial Board, and that it seemed to him that would be the attitude of other manufacturers. The subsequent action of the Steel Corporation and the other manufacturers in submitting their bids has accorded completely with Judge Gary's announcement."

Apparently Mr. Hines feels that it is no longer possible to delay placing orders because of the controversy as to prices. He expected that, after the position taken by the steel companies in the negotiations while the Industrial Board was still in existence, they would not at first make any concessions in the price then offered, but apparently he hopes for a different result when bids are asked for an additional tonnage of rail. The present order is to be delivered by August 1 and will just about keep the mills going at the rate they have been delivering rails thus far this year. While the price represents a reduction of \$10 as compared with the price named last year by the War Industries Board, which was never officially approved by the President, because of the opposition of Director General McAdoo, no orders were placed at that price by the railroads. Some orders were placed by the War and Navy Departments, and the same figure was applied to some export orders. The rail which has been delivered during 1918 and this year on orders placed before federal control has been at prices ranging up to \$40 a ton, and the standard open hearth price prior to the war was \$30, so that the present price represents an increase of 56 per cent.

In his statement announcing the order, Mr. Hines pointed to the large profits of the steel companies, saying:

"The Steel Corporation's annual report to its stockholders shows that after paying all wages and other operating and maintenance expenses and allowing most liberally for renewals and paying interest on debt of subsidiary companies, and also taxes other than war taxes and excess profits taxes, it had net earnings on all rolled steel products of \$21.58 per ton in 1916, \$35.73 per ton in 1917, and \$33.53 in 1918. It is a remarkable fact that in the calendar years 1917 and 1918 the net earnings of the Steel Corporation aggregated approximately \$1,000,000,000, being in excess of the annual rental which Congress has sanctioned as reasonable for practically the entire railroad mileage in the United States. It is true the Steel Corporation had to pay out of these net earnings heavy excess profits taxes to the government, but even after paying these taxes, making liberal allowance for depreciation, and extraordinary replacement funds, and after paying interest on bonds and 7 per cent on preferred stock there remained an earning of 39.2 per cent on its common stock in 1917 and of 22.0 per cent on its common stock in 1918. The fact that excess profits taxes were paid out of the net earnings in 1917 and 1918 does not in any way detract from the accuracy of those net earnings as a measure of the productivity of the war prices which were charged by the Steel Corporation.

"These figures of actual net earnings per ton on the entire output of the Steel Corporation are much more convincing than estimated costs of rolling a particular steel product at a particular mill. The estimated costs may show the greatest variation, but the ultimate result is an enormous profit to the stockholders of the corporation. The claim that the wages of labor would be endangered by a reasonable price on steel is therefore not convincing.

"Heavy profits are not confined to the Steel Corporation. It

appears that the net earnings of the Lackawanna Steel Company were \$12.40 per ton in 1916, \$24.81 in 1917, and \$19.88 in 1918; of the Republic Iron and Steel were \$13.88 per ton in 1916 and \$25.92 in 1917, and its profits for 1918 are not yet available; of the Colorado Fuel and Iron Company were \$9.57 per ton in the year ending June 30, 1916, and \$13.91 per ton in the year ending June 30, 1917. The Bethlehem Steel Company furnished no reports that give any information as to the profits per ton. In considering all these profits it must be remembered that the reductions from war prices which were proposed by the steel interests and are now being adhered to by them as the greatest reductions they are willing to make, are practically completely offset by the great fall in the price of scrap iron alone (which can be and is used largely as a substitute for pig iron in the manufacture of steel), without regard to the various other reductions in cost which are coming about as a result of readjustment to peace conditions.

"A seventh steel company, the Midvale Steel & Ordnance Company, in response to the request of the Railroad Administration for bids, proposed prices \$10 in excess of the prices proposed by the other six companies. It is interesting to note that the company which made this proposal showed on all its steel products net earnings in 1916 of \$24.62 per ton, in 1917 of \$44.23 per ton and in 1918 of \$35.93 per ton. Its apparent position now is that it cannot afford to make any reduction in the price of steel rail without reducing the wages of labor.

"It is important to remember that the present policy of the steel interests in adhering to high prices on the ground that the present high costs necessitate these prices, is a policy that does not work both ways. It is a policy to keep prices from going lower as business increases and costs diminish. It will be remembered that the Industrial Board announced that the public could not expect prices to be lower during this calendar year, but it gave the public no hope that they would not go higher. The resumption of business in the country will probably result in the substantial diminution in the cost of steel production, but unless the attention of the public is constantly centered on the situation there is danger that the steel interests will take advantage of the increased demand to increase the prices of steel still further, even in the face of declining costs.

"The situation in the steel industry is of greatest moment to the American public. The United States Steel Corporation is the largest producer and controls approximately 50 per cent of the output. It takes the lead in maintaining a price which, if its reports to stockholders are reliable, indicates a grossly excessive profit, and it does this for the avowed purpose of protecting alleged high cost producers, which, however, so far as they make detailed reports on the subject to their stockholders, also indicate large profits. In other words, the Steel Corporation appears to take the position that for the protection of other prosperous steel producers it is unwilling to initiate any competition in the steel industry and naturally these other producers are glad to follow this lead, and incidentally this position enables it to continue the enjoyment of very high profits. This condition operates to suspend the law of supply and demand when it could work in favor of the consumer, but it leaves that law free to operate with the greatest effect when it can work in favor of the manufacturer. This situation also works to deprive the public of the benefits of the increased efficiency due to the great combinations in the steel business. Those combinations are the result of public acquiescence, and yet all the benefits of them go not to the public, but to the private owners. The more powerful the combinations become the more successful they are in keeping up prices.

"These reasons lead me to reiterate that the prices in question are unreasonably high at present and will become progressively more unreasonable as business improves and conditions become more nearly normal."

Commenting upon Mr. Hines' statement, George N. Peek, formerly chairman of the Industrial Board, issued a statement saying that the board had brought about a \$5 greater reduction than had previously been offered to the Railroad Administration. He said:

"The statement of the director general of railroads is perhaps misleading in that he uses as a basis for his deductions the profit showing of the past three years when steel mills were crowded to capacity on account of war demands.

and during a considerable part of which period prices were fixed by the government with the idea that production must be stimulated to the limit.

"If the director general desires to be fair, why does he not take selling prices for the pre-war period on rails, for example, and admit that to the pre-war price of rails, \$30 a ton, there must be added approximately \$20 per ton on account of the increase in direct labor cost alone, exclusive of the increase in cost of labor in transportation? And further, why does he ignore the fact that since the signing of the armistice steel prices generally have been reduced between 15 and 25 per cent?"

"The statement is further misleading in that Mr. Hines neglects to inform the public that the price at which he finally concludes to purchase rails, \$47 per ton (the figure approved by the Industrial Board) is \$5 per ton lower than the best the Railroad Administration was able to secure for itself before the Industrial Board considered present costs of production.

"I quote the following from page 27 of the minutes of the meeting of April 5 between the Industrial Board and Mr. Hines' representatives, Judge Lovett and Henry Walters, and H. B. Spencer, director of the Division of Purchases of the Railroad Administration:

"Mr. Peek—I understand the best price you were able to secure three weeks ago was \$52 a ton. This price is \$5 under that.

"Mr. Spencer—True."

The division of the order gives 100,000 tons to the three subsidiaries of the Steel Corporation; 40,000 to the Bethlehem Steel Company, and 20,000 to the Colorado Fuel & Iron Company. The exact division between the Carnegie, Illinois and Tennessee companies was to be adjusted in relation to the present capacity of the mills in order to get the quickest delivery and in order to give the preponderance to eastern mills. The tonnage has been apportioned to the seven regions as follows: Eastern, 40,000 tons; Southern, 28,400; Allegheny, 50,000; Pocahontas, 15,000; Southwestern, 29,000; Central Western, 28,600, and Northwestern, 9,000.

The allocation by roads is being made by the regional directors. About 45 roads are scheduled to receive the rail, which will be rolled and drilled in accordance with the individual specifications of each road.

#### Automatic Train Control Committee

E. L. Adams, formerly in the signal department of the Lake Shore & Michigan Southern, and for the last few years connected with the bureau of valuation of the Interstate Commerce Commission, has been appointed assistant to G. E. Ellis, executive secretary of the Committee on Automatic Train Control of the Railroad Administration.

#### Preparations for Handling Bumper Grain Crops

Director General Hines announces that the Railroad Administration is giving careful consideration to the measures necessary for the satisfactory transportation of the anticipated large crops of grains. The Department of Agriculture has estimated that the yield of winter wheat will exceed 900,000,000 bushels. A fair estimate of the yield of spring wheat approximates 300,000,000 bushels. The total yield of wheat this year will in all probability exceed the total of last year by from three to four hundred millions of bushels. No estimate of other grains is, of course, possible at this time, but barring unusual climatic conditions, it can perhaps be properly expected that the tonnage in grain that will be produced this year will exceed that of last year by a considerable margin.

The stable price fixed last year by the government on wheat naturally provoked a desire on the part of producer to realize his earnings as quickly as possible, and since a

stable price has again been fixed by the government for this year's crop, it is assumed a similar condition will obtain. Last year this economic condition, coupled with more or less disarrangement in ocean tonnage and consequent disruption in shipping, resulted in such an acute situation at the interior grain markets and at seaports, that it became necessary to install the so-called "permit system," which was early made operative at the ports, and in September, 1918, at the principal interior markets. Arrangements are now being made to apply the same system this year.

The permit system, Mr. Hines says, is a highly beneficial system of controlling traffic at the sources to prevent serious congestion on the road and at destination. This system prevented in the fall of 1918 the serious transportation paralysis which had been experienced in former years due to widespread congestion of traffic which had been shipped but which could not be disposed of at destination. This was most apparent in the East, but its injurious effects were felt throughout the country. It was the principal cause of car shortages in every part of the country and slowed down the movement of traffic and impaired the transportation service everywhere.

While the permit system at the ports is still in operation, it was suspended a few months ago at the interior markets, due to improved ocean shipping and the fact that the bulk of the grain had been moved. It is, however, to be expected that the system will again be inaugurated with the opening of the new wheat season, and in view of that probability the Railroad Administration is already preparing the necessary machinery so that it may be prepared to act without delay at the proper time. Conferences have already been held with representatives of the grain corporation.

As graphically illustrating the necessity of regulating the transportation of this tonnage, and the results obtained from such regulation, the following facts are of value and interesting: For the nine months of the crop year, July 1, 1918, to May 1, 1919, there passed through the grain handling facilities of the country—elevators and mills—a total of 3,440,236,000 bushels of all grains, although the highest point of grain storage of all kinds, at any one time in that period, was 480,000,000 bushels. That is, in nine months the flow of grain was seven times the quantity which accumulated in storage at the highest point during that period. This is a direct illustration of the necessity of keeping the grain handling facilities of the country liquid, to avoid the distress to all interests that would follow the blocking of this flow of grain.

The permit system as operated last year contemplated the closest co-operation between the Railroad Administration and the United States Food Administration-Grain Corporation. The local representatives of the grain corporation were in daily contact with the grain control committees at each market, and in view of the very comprehensive data and information in their possession as to storage facilities, anticipated movements out of markets, the needs of different sections of the county, not only as to wheat but as to others cereals that flow co-incidentally with wheat, etc., were of invaluable aid in the accomplishment of the permit system with a minimum economic disturbance. The same character of assistance is being arranged for from the grain corporation, or the wheat director, in anticipation that it will be necessary to inaugurate the permit plan within the next one or two months.

The wheat director is as vitally interested as the Railroad Administration that the grain tonnage shall be handled with the least possible friction as between all interests concerned, and is in entire harmony with the Railroad Administration as to the plans proposed in that direction.

It is stated to be the intention to keep the public fully in-

formed of the plans for the transportation of the enormous grain crop, and that through the co-operation of all interests concerned it should be possible to meet what otherwise might prove a difficult situation.

**Regional Directors Congratulated  
on Victory Loan Showing**

Walker D. Hines, director general of railroads, has sent the following telegram of congratulation to all regional directors:

"I desire to congratulate officers and employees of railroads under government control for the splendidly patriotic response made by them in the Victory Liberty Loan campaign. Out of a total of 1,841,267 employees, 1,417,042, or 77 per cent, subscribed for Victory Liberty Loan notes, a total of \$138,627,250. Employees of 16 roads showed subscriptions of 100 per cent. This is a renewed demonstration of the loyalty of the railroad men of America."

**Cost of Train and Locomotive  
Service Shows Gain in Efficiency**

The total cost of train service, including locomotive service, in March was 119.5 cents per 1,000 gross ton miles, according to a monthly report compiled by the Operating Statistics Section, which shows that results are being obtained from the Railroad Administration's campaign for more economical operation. No comparative figure for 1918 is given but the cost in March represents a decrease as compared with February, when it was 126.5 cents. The cost of locomotive service per locomotive mile in March was 119.2 cents as compared with 100.1 cents in March, 1918. This also represents a decrease as compared with February of this year, when the figure was 120.7 cents. The cost of train service per train mile was 167.5 cents in March, as compared with 145.1 cents in March, 1918, and 169.3 cents in February of this year. The increase in cost of locomotive service in March this year over March last year was 19.1 per cent, and the increase in cost of train service was 15.4 per cent. All items of cost show increases as compared with last year except that of train enginemen, which was 18.8 cents in both years per locomotive mile and 21.3 cents, as compared with 21.8 cents per train mile. The item of trainmen shows an increase from 24.4 cents to 25.6 cents. The combined cost for trainmen and enginemen per 1,000 gross ton miles was 33.5 cents. The figures are reported by roads and by regions and districts. The combined figures are as follows:

	March, 1919	March, 1918
Cost of locomotive service per locomotive mile.....	119.2	100.1
Locomotive repairs.....	40.1	30.7
Enginehouse expenses.....	10.2	6.7
Train enginemen.....	18.8	18.8
Locomotive fuel.....	46.3	41.0
Other locomotive supplies.....	3.8	2.9
Cost of train service per train mile.....	167.5	145.1
Locomotive repairs.....	57.1	43.4
Enginehouse expenses.....	52.6	47.6
Locomotive fuel.....	4.4	3.3
Other locomotive supplies.....	21.3	21.8
Train enginemen.....	25.6	24.4
Trainmen.....	6.5	4.6
Train supplies and expenses.....		
February, 1919		
Cost of train service per 1,000 gross ton miles.....	119.5	126.5
Locomotive repairs.....	40.8	43.1
Enginehouse expenses.....	37.5	40.3
Locomotive fuel.....	3.1	3.4
Other locomotive supplies.....	33.3	34.8
Enginemen and trainmen.....	4.6	4.8
Train supplies and expenses.....		

The comparisons with last year are disturbed to some extent by the factor of back pay being included in this year's figures, while last year's figures do not include the increases in wages which became effective later in the year. Most of the figures, however, show decreases as compared with Feb-

ruary. Locomotive repairs and enginehouse expenses cost 2.3 cents less per 1,000 gross ton miles in March than in February, locomotive fuel 2.8 cents less, other locomotive supplies .3 cents less, enginemen and trainmen 1.3 cents less, and train supplies and expenses .2 cents less.

The January figures were shown only for individual roads, with no combined totals by regions or for the roads, as a whole.

**Suits Against Director General**

In General Order No. 18-B issued by the director general, General Order No. 18, issued April 9, 1918, as amended by General Order No. 18-A, issued April 18, 1918, is further amended to read as follows:

"It is therefore ordered that all suits against the director general of railroads as authorized by General Order No. 50 must be brought in the county or district where the plaintiff resided at the time of the accrual of the cause of action or in the county or district where the cause of action arose; or where the cause of action would, but for federal control, accrue against the initial carrier (as under Section 20, paragraph 11), of the act to regulate commerce, such action may be brought in the county or district where the property was received for transportation."

Director General Hines has issued General Order No. 26-A, setting aside General Order No. 26 issued last May by Director General McAdoo as a war emergency order, which provided that suits against carriers for personal injury and freight damage claims brought in remote jurisdiction should not be tried during the period of federal control.

**Punitive Overtime Up to Director General**

The question as to whether the train service employees are to be allowed a punitive rate for overtime is again up to Director General Hines for decision. The brotherhoods have reiterated since the Railroad Administration has been in control their demands for time and a half for overtime which was waived during the negotiations which preceded the enactment of the Adamson law. When Supplements 15 and 16 to General Order No. 27 were issued by Director General Hines in April the matter was referred to Board of Adjustment No. 1 for a report. The board, however, was not able to agree, and has submitted two separate reports, one of which presumably represents the views of the brotherhood representatives on the board, while the other represents the views of the managers of the roads. Before deciding, Director General Hines has ordered an investigation as to the cost of paying punitive overtime in road service.

**Contracts Executed**

The Railroad Administration has executed compensation contracts with the Wiggins Ferry Company providing for an annual payment of \$416,675.60, the St. Louis Merchants' Bridge & Terminal Railway for \$412,427.56, the Wrightsville & Tennille, for \$41,027, and the Louisville & Wadley, \$5,367.

**Ignes Fatui on the Track**

[From the Omaha Bee.]

A thousand or more dollars' worth of automobile tires was stolen from a car in the North Western yards in Council Bluffs late Thursday night. A freight train was held up as it was approaching the Union Pacific transfer. Half a dozen red lights, were strung along the track, and when the conductor and his men went forward to investigate, after the train was brought to a sudden stop, they found nothing but the red lights. They were strung half a mile down the track, and it took several minutes to investigate. The delay gave the thieves all the time needed to break into the car containing the tires and get a truck load of them.

# Convention of Master Boiler Makers' Association

## Location of Brick Arches, Ash Pan Design and Best Method of Bracing Tenders Discussed

THE MASTER BOILER MAKERS' ASSOCIATION opened its eleventh convention at the Olympic Theater, Chicago, on May 26. Several hundred members were in attendance at the meeting which was the first this association has held since 1916. At the opening session an address was made by Frank McManamy, assistant director, Division of Operation, U. S. R. A. Mr. McManamy spoke of the benefit to be derived from a full discussion of new methods and practices at conventions and mentioned particularly the importance of some of the topics which had been made the subject of reports to be presented at this meeting. In closing he dwelt on the necessity for thorough workmanship in locomotive repairs.

Following Mr. McManamy's talk D. A. Lucas, president of the association, delivered the presidential address. The remainder of the first day's session was taken up by the reports of the secretary and treasurer and the transaction of routine business.

On Tuesday morning, addresses were made by A. G. Pack, chief inspector of locomotive boilers, and R. H. Aish-ton, regional director of the Northwestern Region.

### Application of Brick Arches to Fireboxes

The minimum distance between the grates and the lower part of the arch at the throat sheet for different classes of locomotives depends upon the local conditions; that is, the grade of coal being used, whether it fills up badly or not; and whether the firemen have been taught to shake grates and keep the fire worked down. There are a great many engines which have eight inches as a minimum distance between the grates and the lower part of the arch, and the railroads are getting along very successfully with it.

The proper distance from the door sheet to the top of the brick arch and from the crown sheet to the top of the brick arch for various classes of locomotives is also a local condition. Arches have been run in a great many cases as close to the crown sheet as 11 in. with good results, but some railroads insist that the arch shall not be closer than 16 to 18 in. The distance from the door sheet to the top of the arch is a distance varying greatly, depending upon the length of the firebox. The arch should be run as long as possible in all cases and the top of the arch should be up higher than the top of the door.

The report was signed by L. M. Stewart (A. C. L.), chairman.

An individual report on this subject was submitted by E. W. Young, general boiler inspector, C. M. & St. P., an abstract of which is given below.

It is impossible to set any figure for the minimum distance between grates and the lower part of arch tubes for different classes of locomotives, as so many variables must be taken into account. The distance from the grates to the lower part of the arch tube may be less with a throat sheet that sets back at an angle from the vertical than for a throat sheet which is vertical. It may be less where the grate is flat, than where there is a steep pitch of the front end of the grate, or it may be less in a short firebox than in a long firebox.

The distance from the grates to the lower part of the arch tube may be less in a compound locomotive with its mild draft than in a simple locomotive with its sharp draft. It may be less with one grade of coal than with some other grade.

On account of the variable conditions, it is impossible to set any figure. A good rule and a simple one may be stated as follows: Locate the arch tubes as high above the grates as the design of the firebox will permit. In some cases the arch tubes have had to be located as near as 8 in. to the grate, and yet satisfactory results have been accomplished; however, better results will be obtained if the throat sheet be such that the distance of 18 in. can be obtained between the grates and the arch tubes. The proper distance from the door sheet to the brick arch in various classes of locomotives is just as difficult to determine as it is to answer the first question. One answer might be stated as follows: The brick arch should approach the door sheet as near as possible without restricting the area between the arch and the door sheet, to a figure below the gas area through the flues. It is very seldom, however, that we find a case where the arch can be run as close to the door sheet as the above rule would dictate, due to the fact that under such a condition the gas area between the arch and the crown sheet is unduly restricted. It might be stated that an arch may be built back to within 24 in. of the door sheet, provided conditions other than the relation of the arch to the door sheet will permit.

A good rule in connection with arch designs is that an arch should be as long as conditions will permit, and it is usually the case that these conditions must be studied from two or three angles before we can decide just what the length of the arch shall be, or what the distance shall be between the arch and the door sheet. It would be very much easier to get an ideal arch if the arch were first designed and then the firebox built around it. If the latter condition existed, it would be very easy to answer the two questions, and they would read about as follows: The grates should be placed 18 in. below the front end of the arch tubes. The door sheet should be placed about 24 in. from the back end of the arch. It should be understood, however, that the above two specifications can rarely be made use of for the very reason that arches are built into fireboxes instead of fireboxes built around arches.

Arch tubes must be so located in the flue sheet that there will be access to the front end of the arch tube through the waterleg. In order to get this access through the waterleg, and through a plug hole in the outside throat sheet, arch tube

CHICAGO, MILWAUKEE & ST. PAUL RAILWAY.

2-10-2-B	15	59

locations are often found to be impracticably low and in such instances the special spacer block is used to elevate the front

course of arch brick, so that practical firing clearance is obtained.

The distances discussed above as found on the different types of locomotives used on the Chicago, Milwaukee & St. Paul, and also on the United States Standard Locomotives, are shown in the following table.

The use of syphons in the place of arch tubes will, in very many cases permit of considerably better firing clearance, than can be obtained where arch tubes are used. There may be many cases of firebox construction, in which an arch on syphons will be practical, while arches on arch tubes would be impracticable. Syphons make a good foundation for a brick arch, and on account of being so substantial they make a practical device to take the place of arch tubes.

#### Discussion

The discussion developed the fact that there was considerable difference of opinion regarding the proper location of the arch. The point was brought out, however, that it is largely governed by local conditions. It is considered necessary to have the area between the arch and the crown or door sheet from 10 to 25 per cent greater than the area through the tubes.

#### Design of Ash Pan and Draft Appliances

Your committee has failed to locate a recognized rule for designing ash pans. The result of our investigations indicates that methods are largely the result of experiments which have developed designs which seem best suited to the type of locomotive and condition of service. The objective to be attained was a self-cleaning arrangement of sufficient storage capacity to prevent the necessity of dumping the ashes except at regular ash pan cleaning points; and to prevent the cinders from burning and warping the pan. The lower parts are designed to be practically air tight, air for draft being admitted at the upper parts only. Ash pan air inlets of eight classes of locomotives averaged 14 per cent of the grate area which, from information obtainable, seems to be about the average air opening in ash pans for coal burning engines.

With the modern wide firebox, pans are made wide at the top, projecting several inches beyond the mud ring with vertical sides to prevent sparks from falling or being blown out by side winds. These upper plates are sloped toward the hopper or storage part so that cinders will slide to the hopper. There seems to be a tendency to sacrifice this slope to obtain greater draft opening, which has resulted in some instances in the cinders piling up on the wings and shutting off the draft, as well as causing stuck grates and burned grates and connecting bars. Therefore the slope from the hopper to the edge of the pan should be not less than 30 degrees and rather than lose this slope, it is better policy, if possible, to get increased air opening from back or front.

When locomotives are being designed, the ash pan should be considered and provided for as an important part of the machine, and not as something to be hung on after the locomotive has been set up. The modern ash pan is expensive to construct and still more expensive to maintain, and the greatest possibility of improvement seems to be in the designers who may find it practicable to change the frame lines or other parts sufficiently to give relief where it is greatly needed.

#### Maintenance of Ash Pan

Slides, hoppers and dumps should be maintained in an operative condition. Grates should be maintained in first-class condition. Broken, burned, or warped grates should not be allowed in service. One bad grate often causes damage to a whole section and also causes waste of fuel and damage to the ash pan.

No air openings should be allowed in the ash pans except those provided for in the design. This is particularly important in the case of oil burning locomotive draft pans, for the reason that air leaks permitted at other points than those designed usually result in brick work troubles as well as interfering with the proper steaming of the locomotive.

Air leaks at the lower parts of coal burning locomotive ash pans are extremely undesirable and annoying, not only on account of burning and warping the plates of the ash pan, but particularly on account of sparks dropping and causing fires along the right of way. It is a mooted point whether fires set from locomotives are not more frequently from the pans rather than the stack.

#### Front End Draft Appliances

The method of determining the design of front end draft appliances has, no doubt, as its basic principle, what was known as the master mechanics' front end, and like other parts, constant experiments and experience develop a type of front or setting to suit the conditions.

All parts of ash pan and front end appliances should be carefully fitted and securely bolted in place so that there is no reasonable probability of any part becoming displaced, and should be maintained at all times in first-class condition, each part performing its full function strictly in accordance with the design, particularly draft openings and passages which govern the flow of air and gases through the firebox flues and smoke arch. Dampers which are designed to be operated should be maintained in an operative condition and air admitted only at such points as the drawings provide for. Draft passages should be maintained so that all the drafts will pass through those channels, which is not the case if loose or poor fitting plates are allowed. Draft appliances, which include deflecting plates, nozzle, petticoat pipe and stack, may be designed and adjusted to thoroughly clean cinders from front ends, and because plates were not well fitted, leaks direct to the stack may be sufficient to defeat the object of the design, causing cinders to accumulate in the front end, sometimes resulting in burning and warping front end rings and doors and overheating the lower joints of exhaust and steam pipes and developing leaks at those parts.

#### Front End Leaks

The committee is of the opinion that positively no air leaks should be permitted and that where front ends show indications of burning on account of the combustion of cinders, it is just as often the result of poor fitting plates and air leaks as it is of faulty design or of wrong adjustment of draft appliances. We also incline to the opinion that we should make use of the autogenous welding process to secure permanently to the smoke arch and flue sheet a suitable sheet iron border to which to bolt deflecting plates. This border may be spot welded when being applied or welded in solid. At any rate, it can be an absolutely tight fit, in fact, air tight, if desired. An arrangement of this kind will expedite the work of applying or removing deflecting plates and simplify front end inspection. Petticoat pipes should be maintained to practically a true circle free from holes or indentations, and be securely held in central position between nozzle and stack.

As an item of interest to this association, and to give an idea of the general dimensions of draft openings, the following is given. We find in eight different classes of coal burning locomotives the following comparative dimensions of draft passages:

*Eight Coal Burning Locomotives.*—Ash pan air inlets equal 14 per cent of grate area, or 39.5 per cent of grate opening, and is 4 per cent more than flue opening area. From this it would appear that pan opening and flue open-

ing are practically the same, while stack area is about 10 per cent of flue opening area.

*Seven Oil Burning Locomotives.*—These have the same stack opening, flue opening and grate area. They have no grates, but the air inlets through the fire or brick pan, also called the draft pan, are 28 per cent less than the flue opening area and are 69 per cent, or a little more than twice the stack opening. The comparatively small air openings to the fire in oil burning engines compared to coal may raise the question of whether or not we are allowing too much air to the coal burner, especially with a clean fire. We are of the opinion that the size and location of these openings have been worked out principally by experimental process and, while perfection may not have been attained, when we observe a good steaming oil burner at work one is pretty apt to conclude that there is not much room for improvement.

The effect of proper upkeep of ash pan and front end appliances is to save fuel and maintaining a high standard of condition of those parts saves labor, and effects an economy. Like many other economies not reducible to plain figures, we must accept the above statement because we know that well maintained draft appliances and ash pans do fully perform their functions of furnishing the necessary drafts for economical combustion of the fuel and prevent fires being set out and the destruction and loss of property, which is an important economical consideration. Well fitted and well secured parts of the draft appliances reduce the liability of displacement and failure on account of not steaming and loss of fuel due to poor steaming, and also reduce the necessity of constant changing of front end draft appliances, which is another considerable economy. Finally, well maintained draft appliances may well be considered the difference between a satisfactory, efficient locomotive, which everyone appreciates, and a poor steaming inefficient machine that no engineer wants to run.

The report was signed by Geo. Austin (A. T. & S. F.),

results were said to be secured by welding a plate around the opening.

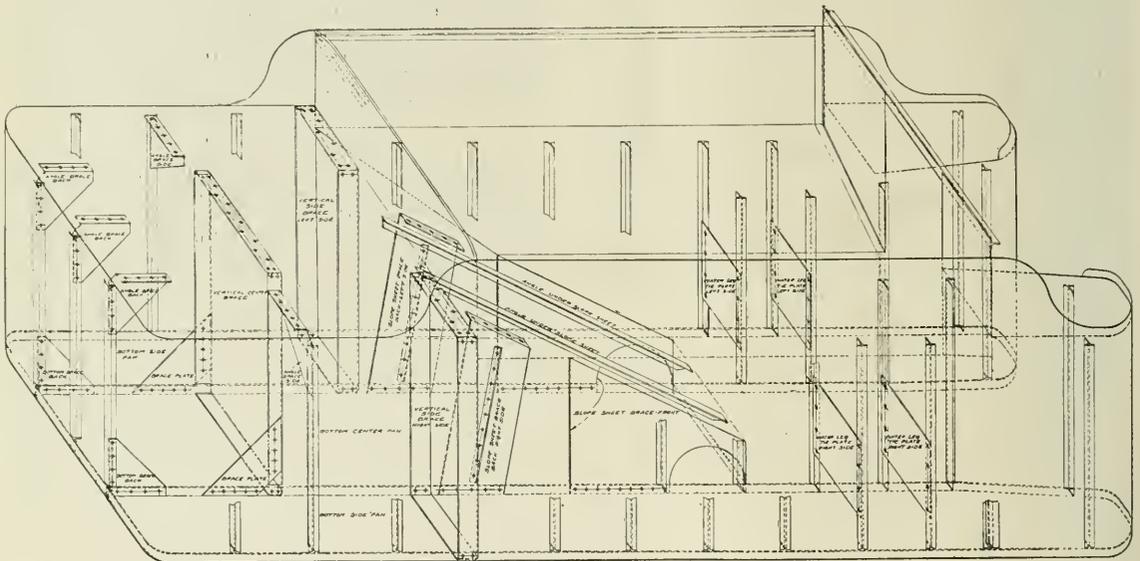

One member told of results which had been secured by the use of cast steel ashpans. He submitted an estimate of costs showing the expense of applying and maintaining sheet steel pans for 15 years to be \$915, while the corresponding cost for cast steel pans was \$214.

## Bracing Locomotive Tenders

The object of bracing locomotive tenders is to make them strong to stand the stresses that take place when the engine is in motion and to prevent the sides and back of the tank from bulging outward. To do this braces are applied on the interior of the tank, and anchor lugs are provided to stop the tank from moving on the tender frame.

What then is the best method of doing this work? Our opinion is the application of T-bars 3 in. by 3 in. by  $\frac{3}{8}$  in. on sides and back spaced about 24 in. apart in a vertical position, the length of the bars to be equal to the height of the tank from bottom to top, these bars to be rivetted with not less than  $\frac{5}{8}$  in. diameter rivets spaced about six inches apart, zigzag.

The top of the tank at the rear end is braced by the application of T bars rivetted to the under side with gusset plates rivetted on the ends. The slope sheet in the coal space is braced by the application of two T bars rivetted to the under side, also supported by stay plates placed vertically and rivetted to slope sheet and the tank bottom reinforced by angle bars. Dasher or splash plates of  $\frac{7}{4}$  in. or  $\frac{5}{16}$  in. thickness are used for the purpose of frustrating the rush of water in the tank; they also form a brace for the top and bottom of the tank. One plate is placed in the center between the coal slope sheet and the back of the tank. Two plates are placed on each side, these are rivetted to the top and bottom of the tank. The center dasher plate is flanged

Recommended Method of Bracing Rectangular Tenders

chairman; E. J. Nicholson (C. & N. W.), F. Beyer (Penn. Lines), H. F. Weldin (Penn.) and H. B. Nelson (Mo. Pac.).

### Discussion

Methods of eliminating the leaks around the steam pipe holes in the front ends were discussed at length. The best

on the sides and rivetted to the top of the tank, also gusset plates are applied at the bottom and rivetted, which gives the dasher plate added strength. In order to make a permanent job all braces used in the construction should be rivetted and not bolted.

This method of bracing is recommended for all rectangular

tanks made from steel plates of 5/16 in. thickness or less, because it gives better service than the old method of applying longitudinal angle iron bars with cross stays. Also it has the tendency to eliminate leaky rivets in anchor lugs. We are of the opinion that when *weight* is not taken in account when designing locomotive tenders if the tanks were made from heavier material, say steel sheets  $\frac{3}{8}$  in. thick, it would greatly simplify the matter of bracing as heavier material could be used which no doubt would be more satisfactory. However, with  $\frac{1}{4}$  in. plates for tank sides and top, and 5/16 in. plates for the bottom of the tank this is the best method of bracing, as it braces the tank in all its principal parts, and still leaves plenty of space on the interior so that the inspector can move around easily to make his inspection or repairs when necessary.

The report was signed by Thomas Lewis (L. V.), chairman; E. J. Sweeney (N. Y. C.), J. J. Orr (D. L. & W.), J. P. Malley (St. L. & S. F.) and J. T. Johnson (A. T. & S. F.).

### Discussion

The superiority of vertical over horizontal braces was generally conceded. One of the principal sources of trouble reported was the loosening of the transverse braces. This can only be overcome by good workmanship and by substituting rivets for bolts in these parts.

### Acetylene Welding

The committee in presenting this paper realized that this topic has been before the convention for several years and has been thoroughly threshed out by the members. We find it at this time very difficult to write up any new facts on this subject, however, we believe the following information will be beneficial.

### Apparatus

Many shops a few years back were equipped with portable generators, using what is termed "high pressure." Later, new apparatus was installed and shops were piped throughout for the acetylene and oxygen, using low pressure, which at this time is in pretty general use throughout the United States. There are a number of shops that still use the oxygen and acetylene gas furnished in holders with the oxygen holders containing 1,800 to 2,000 lb., and the acetylene holders from 200 to 250 lbs. pressure. Where this method is used it is necessary to have the different regulators for the oxygen as well as the gas for each welder. But where the low pressure system is used, it is only necessary to have the regulators where the gas is generated and the oxygen manifolded. It is the opinion of the committee that the low pressure system piped throughout the different departments, both oxygen and acetylene, will give the best results.

### Welding Torches

There are several different makes of welding torches on the market today, and while they will all do good work with an experienced operator, some torches are more quickly regulated and do not back-fire as readily as some other makes. In most all cases the welding tips are made up of copper and give much better results than the brass.

### Cutting Torches

Many different styles of cutting torches are on the market. Some will back-fire readily, where with others it is almost impossible to make them back-fire, and in some cases both with the welding and cutting torches where they do back-fire, they can be ignited quickly from the heated iron without re-adjusting; while, with other makes, it is necessary to shut off and start all over. This causes a loss of time as well as a waste of material.

Different shops have different methods and are seemingly getting good results. On the Chicago, Milwaukee & St. Paul we are and have been welding in all our side sheets, bolting up securely, and applying stay bolts and rivets before welding. We are also welding all our cross-seams by removing rivets, scarfing down, and welding up all holes and are not removing any stay bolts, and are getting first-class results. We are welding in all our door collars, inside and out; three-quarter door sheets, one-half flue sheets, top or bottom; full flue sheets; front sections of crown sheet; welding in bottom patches of front flue sheet, 12 in. to 20 in. high and cutting off all our stay bolts and radial stays with the torch. In fact, we are doing everything in the line of welding we may find to do, and the sheets we are welding are standing up good and giving us no trouble. The only trouble we do have at times is welding in patches in old side sheets, or where side sheets go to pieces rapidly due to poor water conditions. Where engines are in bad water territory, sheets do bulge between the bolts and at times the weld is pulled in two.

In visiting the different railroad shops, I find that on firebox work, such as applying fireboxes, side sheets and door sheets, the welding in most cases is being done with the acetylene torch. Shops visited had both the acetylene and electric welding outfits, but were using the electric outfit mostly for welding flues, mud ring corners and roundhouse work, where I believe the portable electric welding outfit will give good results.

At this time we have just installed the electric welding outfits and figure on welding in all flues, mud ring corners, side sheets, cutting out the center and welding in new without removing mud ring rivets. We also figure on doing considerable firebox and boiler work with the electric welder, where flanges on front or back flue sheet are still good, cutting out the center and welding in new.

The report was signed by Henry J. Wandberg (C. M. & St. P.), chairman; L. M. Stewart (A. C. L.), J. J. Davey (Nor. Pac.), John Harthill (N. Y. C.), P. F. Gallagher (B. & O.) and T. F. Powers (C. & N. W.).

### Discussion

The discussion developed the fact that there was a great diversity of opinion regarding the advisability of welding firebox seams. Some condemned the practice as unsafe while others contended that with proper care welded seams could be made stronger than riveted seams.

Some roads reported good results from welded tubes while others reported that the use of this practice had been a failure because of cracks in the bridges of tube sheets. All agreed that experience was essential for the production of satisfactory work. Some roads check the ability of welders by requiring weld specimens regularly each month; these specimens are then broken in a testing machine.

### Exhibitors at Master

#### Boiler Makers' Convention

Following is a list of the companies exhibiting at the convention of the Master Boiler Makers' Association, Chicago, May 26 to 29, together with their representatives:

Air Reduction Sales Company, New York.—Automatic acetylene generators, compressed acetylene gas welding apparatus and supplies. Represented by E. L. Mills, B. N. Law, A. S. Kinsey, R. T. Peabody, A. C. LeQuellec.

American Arch Company, New York.—Security sectional arch. Represented by R. J. Himmelright, W. L. Allison, T. F. Kilecoyne, H. Darby, T. Mahor, G. C. Denney, G. Wagstaff, E. S. Nicholas, A. W. Clokey, J. P. Neff, J. T. Anthony.

American Flexible Staybolt Company, Pittsburgh, Pa.—American bolt, American plain radial stay, American reduced body staybolt, hollow iron staybolts, American rivet. Represented by R. F. Benson, C. A. Seley, L. W. Wedmeier, J. A. Trainer, M. M. McAllister, W. F. Heacock.

Besly & Co., Chas. H., Chicago.—Taps, dies and reamers. Represented by E. P. W-lls.

Bird-Archer Company, The, New York.—Boiler chemicals, Harter cir-

culator plate. Represented by A. A. Bird, I. B. Bird, I. F. Wilson, H. L. Wheeler, I. L. Callahan, W. F. Richmond, I. D. Bush.

Boss Nut Company, Chicago.—Bolts, nuts and rivets, and Boss lock nuts. Represented by I. A. MacLean, A. W. Foger, W. Wilcoxen.

W. L. Baulaker & Bros., New York.—Taps, dies and reamers. Represented by W. L. Baulaker, W. S. Rose.

Castle & Co., A. M., Chicago.—Representing Lukens Steel Company, American Rolling Mill Company, Champion Rivet Company, Reading Iron Company, Detroit Seamless Steel Tubes Company, Lennox shears. Represented by G. R. Hayce.

Central Iron & Steel Co., Harrisburg, Pa.—Photographs of steel products. Represented by W. I. Moore.

Chicago Pneumatic Tool Company, Chicago.—Air and electric tools. Represented by A. C. Andersen, A. E. Conrow, N. Thulin, H. J. Smith.

Cleveland Pneumatic Tool Company, Cleveland, Ohio.—Pneumatic tools, pressure seated valves, Bowes air hose couplings. Represented by H. S. Covey, A. Scott, H. C. Newton, R. E. Ahern.

Cleveland Punch & Shear Works Company, Cleveland, Ohio.

Cleveland Steel Tool Company, Cleveland, Ohio.—Punches, dies, pneumatic hammer rivet sets, chisel blanks. Represented by H. W. Leighton, Jr., W. S. Barnes, R. J. Venning, J. E. Stenger, T. B. Everts.

Dearborn Chemical Company, Chicago.—Represented by G. R. Carr, J. D. Purcell, L. B. Bowen, T. H. Price, J. F. Roddy, I. H. Bowen, H. Rehaeyer, W. S. Reid.

Draper Manufacturing Company, Port Huron, Mich.—Double flue welder. Represented by T. Draper, J. A. McDonald.

Duntley-Dayton Company, Chicago.—Exhibiting—Pneumatic tools, Duntley-Dayton riveting and clipping hammers, "Red Devil" rivet cutter. Represented by H. P. Arnold, George Bardon, A. G. Rice.

Fassler Manufacturing Company, J., Moberly, Mo.—Boiler tube expanders and tube cutters. Represented by J. W. Fassler, G. R. Maupin.

Gary Screw & Bolt Company.

Globe Seamless Steel Tubes Company, Milwaukee, Wis.—Exhibiting—Seamless steel drawn mechanical tubing.

Hauk Manufacturing Company, Brooklyn, N. Y.

Hilles & Jones Company, Wilmington, Del.—Punching and shearing machinery. Represented by W. H. Connell, Jr.

Imperial Appliance Company Chicago.—Oxy-acetylene welding and cutting apparatus. Represented by R. B. McIntosh, E. N. Stevens.

Ingersoll-Rand Company, New York.—Pneumatic tools. Represented by W. Johnson, C. J. Little.

Keller Pneumatic Tool Co., Grand Haven, Mich.—Pneumatic tools. Represented by Mr. McCabe.

Key Boiler Equipment Company, St. Louis, Mo.—Key safety hand hold cap, tube plugs, master hold plates and tools. Represented by E. Key.

Key-Bolt Appliance Company.

Locomotive Superheater Company, New York. Represented by G. E. Ryder.

Lowjoy Tool Works, Chicago, Ill.

MacLeod Company, Cincinnati, O.—Compressed air oil burner, oil burner rivet forge, oxy-acetylene welding and cutting outfit. Represented by A. G. Hauck.

Mahr Manufacturing Company, Minneapolis, Minn.—Rivet forge, oil fired-oil burning torches. Represented by H. H. Warner, A. E. Stenzel.

McCabe Manufacturing Company, Lawrence, Mass.—Pneumatic flanging machines. Represented by F. H. McCabe.

Nathan Manufacturing Company, New York City.—Exhibiting—Injectors, lubricators, boiler checks, boiler washer and tester, gage cocks, coal sprinkler. Represented by Otto Best, F. C. Davern, W. R. Walsh, R. Welsh.

National Railway Devices Company, Chicago.—Shoemaker vertical fire door. Represented by J. G. Robinson, E. J. Genderson, A. F. Lind.

National Tube Company, Pittsburgh, Pa.

Oxwold Railroad Service Company, Chicago.—Represented by C. B. Moore, G. W. Crownover, M. W. Leighton, F. Hasse, C. H. Hanson, J. F. Farker, W. Jones, F. Furbeck, W. A. Champieux, H. C. Reid, H. W. Schulze, A. West, H. E. Bemer, J. W. Evanston, R. B. Alfante, F. W. Shupert, S. Daffer, F. W. Frey, H. V. Gigandet, C. E. Allen, E. S. Richardson, O. F. Ladtkow, W. Robertson, W. Hogan.

Page Steel & Wire Company.

Parkesburg Iron Company, Parkesburg, Pa.—Charcoal iron boiler tubes.

Rego Welding Apparatus.

Rivet Cutting Gem Company, Cincinnati, O.

Rome Iron Mills, Inc., Rome, N. Y.—"Rome superior" staybolt iron, "Rome perfection" engine bolt, Rome hollow iron. Represented by B. A. Clements, C. C. Osterhout, E. Buker.

Ryerson & Co., Joseph T., Chicago.—Ulster special seamless hollow staybolt iron. Represented by H. Gray, J. P. Moses, J. Ponic, H. B. Hensch, J. McGrath, E. W. Kavanaugh, E. S. Pike.

Scully Steel & Iron Company, Chicago, Ill.—Machinery small tools and everlasting blow-off valves. Represented by J. W. Patterson, J. A. Lindsley, M. Linkentelzer, Jr., Clark.

Torchweld Company, Chicago.—Welding and cutting equipment, portable and stationary plants, accessories and supplies. Represented by W. A. Slack, C. J. Nyquist, N. L. Fenstemaker.

Vulcan Engineering Sales Company, Chicago.—Hanna pneumatic riveters. Represented by J. T. Lee, J. O. Clark.

Welding Engineer, The.

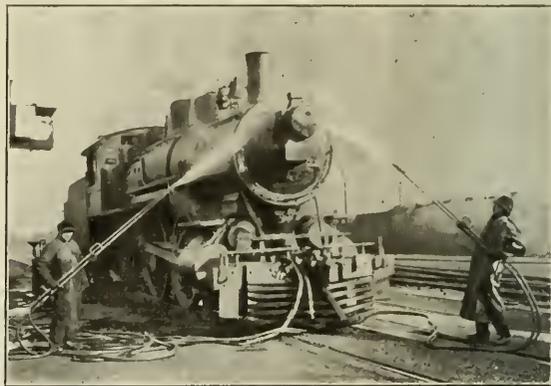

Western Welding Equipment Company, Chicago.—Exhibiting K-G welding and cutting apparatus. Lincoln arc welders, electric and oxy-acetylene supplies. Represented by R. V. Gardner.

Wilson Welder & Metal Company.

## A New Process for Cleaning Engines

**T**HE cost of wiping locomotives with oil and waste under present conditions is very high, and there are now few roads on which the engines are thoroughly wiped at the end of each trip. Furthermore, cleaning by hand forces the oil and dirt into cracks and fillets and leaves a coating of oil to which dust adheres very quickly. A method of cleaning locomotives which reduces the cost of the work and also eliminates the objectionable features mentioned is now being installed on railroads by the D. & M. Cleaning Process, Chicago. By this process a mixture of air, oil and water is sprayed onto the locomotive at a uniform pressure of about 90 lb. The nozzle discharges the mixture in a spray which is directed against the surface to be cleaned at an angle of about 45 deg. from a distance of about 18 in.

One gallon of oil is used to about 300 gal. of water, the proper mixture being secured by regulating valves attached to a special oil tank. The mixture of oil and water is carried to the nozzle by a  $\frac{3}{4}$  in. rubber hose, the stream being

Cleaning Locomotives by the D. & M. Process

broken up at the nozzle by air supplied through a  $\frac{1}{2}$ -in. nipple. The air and water pressure should be as nearly equal as possible and approximately 90 lb. per sq. in. The temperature of the water should be about 100 to 120 deg. F. as cooler water does not produce as good results. The oil used is a light straw colored gas oil or petroleum distillate having a paraffine base and ranging in gravity from 32 to 36 deg. The cleaning can be done inside the roundhouse if desired, but is more conveniently handled at some point on the track by which the engines reach the house. No difficulty is experienced in using the process in severe winter weather, and it has been operated with entire success at zero temperature.

When the D. & M. process is regularly used, locomotives can be thoroughly cleaned by two men in from 10 to 12 min. The cost, including labor, material and up-keep of equipment will not exceed 30 to 40 cents per cleaning. The first cleaning requires more time, as it is necessary to remove the accumulated dirt and oil. The advantages of the process as compared with hand wiping are: greatly decreased cost due to the saving in labor and wiping waste, a saving in time both in cleaning and repairing and a more complete cleansing of the surfaces, which makes thorough inspection possible.

The John Fritz Medal for the current year has been awarded to Major-General George W. Goethals, U. S. A., in recognition of his work as builder of the Panama Canal.

Shipments of silver from the mint at Philadelphia to San Francisco during the past year, a part of the movement by which 265 million silver dollars were melted and transferred from this country to India, took 18 special trains, each train carrying from \$5,000,000 to \$10,000,000 in value. All of these movements were conducted in great secrecy.

# General News Department

The shops of the Pullman Company at Ludlow, Ky., were destroyed by fire on the night of May 20, together with six sleeping cars; estimated loss, \$225,000.

Prison terms of from five to eight years were imposed by the United States Court at St. Louis on May 24 as punishment for robberies of freight cars committed by eight former employees of the Wabash Railroad at Brooklyn, Ill. The trial in the court lasted five days. The men were a yardmaster, an assistant yardmaster, a chief clerk, two other clerks, a switchman, a watchman and the watchman's brother.

The Public Service Commission of New York (Second District, headquarters, Albany), announces that its inquiry into the general subject of the prevention of collisions, decided upon in connection with the investigation of the rear collision at South Byron, N. Y., last January, will be begun in New York City on Wednesday, June 18. There will be a public hearing at the office of the commission in the Hall of Records, on Chambers street, near the City Hall.

## Short Line Meeting

Walker D. Hines, director general of railroads, will address the meeting called by the American Short Line Railroad Association to be held at Washington next week. He will speak at noon of the first day's session, Tuesday, June 3. In addition to the several hundred short line and trunk line railroad officers who will attend, an effort is being made to secure the presence of as many Congressmen as possible as guests.

## Railroad Y. M. C. A. Membership Drive

Just as we go to press word is received that the Railroad Y. M. C. A. Continental Membership Drive which was held last week has gone well over the top. Some districts have not yet sent in their reports and it will be some days before the final figures are announced.

## Safety in Track Work

On the Pittsburgh division of the Pennsylvania Railroad, by general order, track foremen, signal foremen, and carpenter foreman are directed never to obstruct the main track so as to interfere with the safe passage of trains at full speed without first having permission from the superintendent in writing. When any such work is done flagmen must be sent in both directions. Automatic block signals, if such are in use, must be set in the stop position, and after the work is done the foreman must see that the track circuit has been restored so that the automatic signals will work properly. When permission to disturb the track is sent to a foreman by telephone he must write down the message and repeat it, as would be done in the case of a train order.

## Broadway Limited Restored

The Broadway Limited, the 20-hour New York-Chicago express train of the Pennsylvania Railroad, was put in service last Sunday, in accordance with the announcement made last week, after a suspension of 18 months. President Samuel Rea, in congratulating the regional director on having recognized the rights and the insistent demands of Philadelphia, Baltimore and Washington, said that in 1917 no less than 38 per cent of the passengers on this train came from those three cities. For the first trip (May 25) it was necessary to put on an additional sleeping car in both directions to accommodate the travel.

The Post Office Department announces that mail will be carried on this train; and that in the lower part of New York City, letters can be posted considerably later than hereto-

fore, the mail bags being sent by way of the Hudson tunnel to Manhattan Transfer, 7 miles west of New York, where the through train is stopped to have the steam locomotive attached in place of the electric engine. The Post Office Department expects to pay for this service at the rate of \$75,000 a year.

## Training Disabled Soldiers for Railroad Work

The Federal Board for Vocational Education has issued a 35-page pamphlet, for the benefit of disabled soldiers, sailors and marines, telling what kinds of work they may be able to find in the field of transportation, including steam railroads, street railways, wagons, automobiles and ocean steamships and harbor craft. The government stands ready to educate and re-educate disabled men, and the educational department in the military and naval hospitals will give inquirers all needed information. This pamphlet is designed to aid individuals in choosing a vocation. It tells what kind of work must be done, and what qualifications are required, in the case of telegraphers, train despatchers, station agents and other station workers, yardmasters, clerks, ticket examiners and traffic department employees; shop work, boiler making, blacksmithing, electrical work and car repairs; track work and train work—the engineman, the fireman, the brakeman and the conductor. The work on electric railways and on ocean and harbor vessels is described in the same way. The Federal Board for Vocational Education, which is ready to give all possible aid to disabled soldiers, has offices in Boston, New York, Philadelphia, Pittsburgh, Baltimore, Washington, Atlanta, New Orleans, Dallas, St. Louis, Cincinnati, Chicago, Detroit, Kansas City, Minneapolis, Denver, San Francisco and Seattle.

## A Waterway Discussion

"Inland Waterway Transportation—Is Our Policy Right or Wrong?" was the subject of a discussion before the City Club of Chicago and the Western Society of Engineers at the rooms of the City Club on Monday noon, May 19. Theodore Brent, traffic manager of the Mississippi-Warrior Waterways Barge Commission, United States Railroad Administration, took the affirmative and Professor Harold G. Moulton, of the Department of Political Economy, University of Chicago, the negative.

After outlining briefly the history of waterway development in this country and its decadence in recent years, Mr. Brent described the activities of the Railroad Administration during the past year in establishing barge service on the lower Mississippi river and elsewhere, and told of the nature of the service now offered and the amount and extent of the traffic carried. He advocated the extension of the deep waterway through the Illinois river to Chicago.

Professor Moulton opened his argument with the statement that in order to place the cost of waterway transportation on a basis comparable with that of railway service it is necessary to include the fixed charges in waterway improvements and also the maintenance costs, which is rarely done. On the basis of such a complete record of cost he had found that none of the larger inland waterways of Germany (commonly cited as the most successful) affords as cheap transportation as the railroads, with the exception of the Rhine river. He also criticized the common practice of comparing the cost of water transportation on the oceans and the great lakes with that on the railways as not being comparable with the cost of transportation on the inland waterways. He maintained that a careful analysis of complete costs would show rail transportation to be more economical than that on the inland waterways in nearly all cases and criticized the waterway advocates for their failure to present such analyses instead of general arguments.

REVENUES AND EXPENSES OF RAILWAYS

THREE MONTHS OF CALENDAR YEAR 1919

Table with columns: Name of road, Average mileage operated during period, Operating revenues (Freight, Passenger, Inc. misc.), Total revenues, Maintenance of way and structures, Equipment, Traffic, Trans-shipment, General, Total, Operating ratio, Net from railway operation, Railway tax accruals, Operating income (or loss), Increase (or decrease) last year.

REVENUES AND EXPENSES OF RAILWAYS

THREE MONTHS OF CALENDAR YEAR 1919—CONTINUED

Table with columns: Name of road, Average mileage operated during period, Freight, Passenger-, Operating revenues, Total revenues, Way and structures, Equipment, Traffic, Trans- portation, General, Total, Operating, Net from railway operation, Railway tax accruals, Operating income (or loss), Increase (or decr.) last year.

### The \$400,000,000 Car Trust Certificates

A joint meeting of members of the Association of Railway Executives, bankers, the War Finance Corporation and the Railroad Administration was held on May 27 to discuss the further plans for issuing a joint series of car trust certificates, covering the 100,000 freight cars and 1,930 locomotives ordered by the government. The bankers present at the meeting included Pierrepont V. Davis, vice-president of the National City Company; Arthur M. Anderson, of J. P. Morgan & Co.; Jerome Hanauer, of Kuhn, Loeb & Co.; Francis M. Weld, of White, Weld & Co.; E. B. Sweezy, vice-president of the First National Bank; George W. Davison, vice-president of the Central Union Trust Company; E. V. R. Thayer, president of the Chase National Bank; James Speyer, of Speyer & Co.; Harold Stanley, vice-president of the Guaranty Trust Company; A. A. Tilney, vice-president of the Bankers' Trust Company; Charles S. Speare, of Brown Bros. & Co.; and G. Frederick Hawkins, of Kissel, Kinnicutt & Co.

Eugene Meyer, Jr., managing director, and Alfred A. Cook, counsel, were present in behalf of the War Finance Corporation. Swager Shirley, F. Q. Brown and Sanford H. E. Freund represented the railroad administration.

Members of the Association of Railway Executives who attended included T. De Witt Cuyler, chairman; Alfred P. Thom, counsel; Howard Elliott, W. W. Finley, Charles Hayden, W. G. Besler, C. A. Peabody, Mark W. Potter, Daniel Willard, E. G. Buckland, E. M. Hyzer and Marvin Hughitt.

### Aviation

The United States Navy seaplane, NC-4, completed a trip across the Atlantic Ocean on Tuesday, May 27. Lieutenant-Commander A. C. Reid, with a crew of five men, landed at Lisbon, Portugal, the evening of that day in 9 hours 43 minutes, from Ponta Delgada, Azores, 800 miles. The NC-4 left Trepassey, Newfoundland, on May 16, and reached the Azores in about 17 hours, but had to wait there until the 27th for favorable weather before continuing the journey. The total flying time from Newfoundland to Lisbon, about 2,000 miles, is given as 26 hours 41 minutes.

The United States Post Office Department announces that in the first week of the airplane mail service between Cleveland, Ohio, and Chicago, Ill., 28 of the 30 possible trips were successful. The distance, about 350 miles, was made on one trip in less than three hours. One of the pilots, Frank McCusker, was killed by an accident to his airplane at Cleveland on May 25.

On May 27, four airplanes of the War Department completed a cross country flight of 3,300 miles from Texas to the Pacific Coast and return. These fliers, for considerable distances, made speeds of 140 miles an hour and higher. Two of the airplanes flew over the Grand Canyon. One of these flew at an altitude of 13,000 ft., while the other flew down into the Canyon, about 600 ft. below the edge.

## Traffic News

Charles E. Wallington, an attorney, has been elected president of the Toledo Transportation Club.

The number of vessels passing through the Cape Cod canal, from August, 1918, to April, 1919, averaged 468 a month, as compared with an average during the corresponding months one year ago of 235 vessels. The increase in tonnage of cargoes was 185 per cent.

Freight loading of railroads in the Northwestern region for week ending May 20, compared with the corresponding period last year shows a decrease of approximately 9.5 per cent, 149,125 cars being loaded in the week ending May 20, 1919, as compared with 164,635 for the same period last year.

The recent order of the director general authorizing a rate of one and one-third fare for the round-trip for conventions of religious, fraternal, educational, charitable and military organizations involves so much detail that it is found impossible to make it effective for meetings convening earlier than June 10. It is necessary to print and distribute several million certificates to 50,000 or more ticket offices, and to correspond with various organizations for the purpose of establishing regulations as well as to prepare tariffs and file them with the Interstate Commerce Commission.

Montana, its advantages and possibilities, is the subject of the latest illustrated booklet issued by the Agricultural Section of the Railroad Administration for distribution among homeseekers and others. S. V. Stewart, governor of the State, contributes a foreword to the booklet: Montana is no longer to be considered a mining and grazing state with little agricultural land. In the past ten years 30,000,000 acres of public lands within the state have been filed upon for homesteads, and there are 83,000 farms in the state. Unirrigated farms with wheat production records of from twelve to forty bushels an acre and which are within a reasonable distance of a railroad and a town with school facilities may be bought for \$15 to \$40 an acre, while irrigated land sells for \$40 to \$150 an acre.

### Minnesota Drinking-Cup Law

The Minnesota legislature has passed a law requiring individual drinking cups on all cars used for transportation of passengers. There must be pure drinking water and a sufficient number of cups, or a fountain. The law becomes effective on June 1, 1919. A fine of not less than \$25 nor more than \$100 is prescribed as the penalty for failure to comply with the law. Cups and fixtures must be kept in a sanitary condition.

### Dry Canada

[From the Buffalo Courier]

That it is still dangerous to smuggle booze through Canada was shown at St. Thomas on May 20, in the trial of employees of the Pullman company, accused of smuggling whisky from Buffalo into Canada in a parlor car. The men, mostly of a dusky hue, trembled visibly when they appeared in court, the judge having ruled that it was just as much an offense to smuggle whisky through dry Canada as it is to import it into dry Canada. The contention was set forth that the liquor was being carried in a parlor car of Buffalo to Detroit train No. 45, and not for delivery within the Dominion; but the three men were fined \$200 apiece and costs. The whisky was discovered when the authorities at St. Thomas got a tip that a shipment was on its way to Detroit. That city is as dry as Sahara, and it is a very high-paying business at the present time, a quart of good whisky bringing as high as ten dollars.

Repairing the Railway Cut by the Rioters Near Cairo, Egypt

## Commission and Court News

### Interstate Commerce Commission

The Commission has announced its intention of investigating the rates, charges, rules, regulations and practices applicable to freight transportation in Illinois as compared with those applicable in Ohio and Michigan, and also those in Central Freight Association territory.

#### Rates on Coal from Western Kentucky

Ohio Valley Coal Operators Association v. Illinois Central Railroad Company, Director General, et al.

Upon complaint attacking the rates on bituminous coal, in carloads, from mines in western Kentucky on the Illinois Central, Louisville & Nashville, and Kentucky Midland railroads, to points in Mississippi Valley and southwestern territories, Illinois, and various other northern and western states, the Interstate Commerce Commission finds:

The rates assailed are not shown to be unreasonable *per se*, nor are they shown to be unduly prejudicial except to the extent stated in the following:

The rates from mines on the Illinois Central to points in Texas by way of Mississippi River crossings south of East St. Louis are unduly prejudicial to the extent that they exceed the rates from mines on the Illinois Central in southern Illinois to the same points through the same crossings.

The rates from mines on the Illinois Central and the Louisville & Nashville to East St. Louis and St. Louis, proper, are unduly prejudicial to the extent that they exceed by more than 57.5 cents per ton the rates from mines in the Illinois Central's inner group and the Louisville & Nashville's Belleville group, respectively, in southern Illinois to the same destinations.

The rates from mines on the Illinois Central and Louisville & Nashville to East St. Louis, as applied on traffic for beyond, are unduly prejudicial to the extent that they are not lower than the rates from the same mines to East St. Louis, proper, by at least 12.5 cents per ton.

The rates from mines on the Illinois Central to Chicago, to points in the northwest as defined in this report, and to points in Illinois north of and including Mattoon and Decatur, are unduly prejudicial to the extent that they exceed the rates from mines on the Illinois Central in the southern Illinois group by more than 25 cents per ton.

The rates from mines on the Louisville & Nashville to Chicago are unduly prejudicial to the extent that they exceed the rates from mines on that road in the Eldorado group in southern Illinois to Chicago by more than 25 cents per ton.

The rates from mines on the Kentucky Midland Railroad are unduly prejudicial to the extent that they exceed the rates from mines on the Illinois Central in western Kentucky to the same destinations. (Decided May 1.)

### Personnel of Commissions

John H. Delaney has been appointed rapid transit construction commissioner for New York City. This office takes over the functions of the former Public Service Commission in connection with the construction of new subway and elevated railroads in New York City. The single commissioner, to perform the other functions of the Public Service Commission, Lewis Nixon, was appointed several weeks ago.

### Court News

#### Causes of Action While Under Federal Control

The federal district court for the Northern District of Nebraska holds that General Order No. 50, providing for the substitution of the Director General of Railroads in case of

actions against railroads for causes arising since government control was assumed, is warranted, notwithstanding Section 10 of the Act of March 21, 1918, C. 25, providing that actions or suits may be brought against such carriers, for the Director General is the carrier, being analogous to a receiver, and it is proper that he be substituted in place of the railroad company.—Rutherford v. Union Pacific, 254 Fed. 880. Decided January 11, 1919.

#### Substitution of Director General as Defendant

The federal district court for the Southern District of New York holds that the provision of General Order No. 50 of October 28, 1918, that pleadings in pending actions against a railroad company for injuries "may" be amended by substituting the Director General, and dismissing the company as defendant, must be construed as permissive only, in view of the Federal Control Act provision that carriers, while under federal control, shall be subject to all laws and liabilities as common carriers, and that actions may be brought against them, "and judgments rendered as now provided by law," and such substitution of parties will not be made on motion of the defendant.—Jensen v. Lehigh Valley, 255 Fed. 795. Decided February 1, 1919.

### United States Supreme Court

#### Effect of Misdescription of Lost Goods in Bill of Lading

In an action to recover the value of furs lost in transit in interstate commerce, the railroad resisted the claim on the ground that the goods were misdescribed in the bill of lading as "one case D. G." (dry goods). This was done by a mistake of the local expressman, and not with the intention of fraudulently misrepresenting the nature of the shipment. The filed freight rates were first class (65 cents) for dry goods and double first class for furs. The Supreme Court of the United States refused to sustain the railroad's contention, for the reason that a clause in the bill of lading provided for the contingency of misdescription as follows: "If upon inspection it is ascertained that the articles shipped are not those described in this bill of lading, the freight charges must be paid upon the articles actually shipped." The court holds that the effect of this provision is that a misdescription of the character of the goods, not attributable to fraud, does not affect the liability of the carrier for a failure to deliver the goods.—N. Y. Central v. Goldberg. Decided May 19, 1919.

#### Federal Employers' Liability Act Decisions

The Supreme Court of the United States, reversing a judgment of the Supreme Court of Idaho, holds that an employee of a railroad which was engaged in interstate commerce, injured while filling with earth a wooden trestle bridge, 1200 ft. in length, was himself engaged in interstate commerce. The court considers the state Supreme Court fell into error in regarding the fill as new construction so unrelated to the conduct of interstate commerce over the bridge at the time the accident occurred that the work being done might be regarded as not related to or necessary to the safe conduct of that commerce.—Kenzell v. Chicago, M. & St. P. Decided May 19, 1919.

The Supreme Court of the United States holds that an employee of an interstate railroad, injured while engaged in taking care of a camp car used by a gang of bridge carpenters who were employed by the railroad in the repair of the bridges and bridge abutments upon the line, and who cooked the meals for himself and the other members of the gang, was engaged in interstate commerce within the Federal Employers' Liability Act. The significant thing, in the court's opinion, was that the employee was employed by the railroad to assist, and was assisting, the work of the bridge carpenters by keeping their bed and board close to their place of work, thus rendering it easier for the railroad to maintain a proper organization of the bridge gang and forwarding their work by reducing the time lost in going to and from their meals and their lodging place.—P. B. & W. v. Smith. Decided May 19, 1919.

## Equipment and Supplies

### Locomotive Deliveries Week Ended May 17

The following locomotives were shipped to railroads under federal control during the week ended May 17:

Works	Road	Number	Type
American	Penn. L. W.	1	USRA Santa Fe
	L. & N.	5	USRA Pacific
	N. & W.	2	USRA Mount.
	Penn. L. W.	2	USRA 6W. Sw.
		10	
Baldwin	Ft. Worth & D. C.	1	USRA Mikado
	Sout. Pac.	3	Santa Fe
	Southern	1	USRA Mount.
	B. & O.	2	USRA 8W. Sw.
	I. H. B.	4	USRA 8W. Sw.
	Tex. & Pac.	1	Santa Fe
	A. T. & S. P.	1	Mikado
	C. R. & O.	1	Santa Fe
	A. T. & S. P.	1	Pacific
		15	
Total		25	

### Locomotives

THE NORTHERN RAILROAD OF FRANCE has ordered 50 Mikado locomotives from the Baldwin Locomotive Works.

THE NORWEGIAN STATE RAILWAYS, noted in last week's issue as reported to have ordered 16 locomotives from the Baldwin Locomotive Works, placed orders for 18 locomotives with that company, including 2 ten-wheel, 6 Consolidation, 7 Prairie and 3 six-wheel switching locomotives.

### Freight Cars

THE SOUTH PORTO RICO SUGAR COMPANY has ordered 65, 30-ton, all-steel cane cars from the American Car & Foundry Company.

THE H. & H. REFINING COMPANY, Kansas City, Mo., has ordered 20, 40-ton, 8,000-gal. tank cars from the American Car & Foundry Company.

THE ROBERT DOLLAR STEAMSHIP COMPANY, San Francisco, Cal., has ordered from the American Car & Foundry Company 100 high-side gondola cars for export to China.

### Signaling

THE PARIS, LYONS & MEDITERRANEAN has under consideration the question of installing automatic block signals on 500 miles of its lines.

THE CENTRAL RAILROAD OF NEW JERSEY has ordered a 36-lever improved Saxby & Farmer interlocking machine from the Union Switch & Signal Company, for installation at Elizabethport, N. J.

THE NORFOLK & PORTSMOUTH BELT LINE has placed an order with the Union Switch & Signal Company, Swissvale, Pa., for the necessary material to be used in an interlocking to protect traffic over the Elizabeth river drawbridge at Norfolk, Va.

A special meeting of the National Industrial Traffic League will be held in Milwaukee, Wis., on June 11, 12 and 13, to finish business left over from the New Orleans meeting and to take action on the resolutions submitted at that meeting looking toward the forming of a program for the regulation of railroads.

## Supply Trade News

Colonel Frederic A. Molitor has returned from military service abroad and has resumed his practice of engineering at 34 Nassau street, New York.

L. M. Sawyer, vice-president of the Chicago Steel Tape Company, Chicago, has been elected president, succeeding Lewis A. Nichols, deceased.

W. L. Garland, manager of the Philadelphia (Pa.) office of the Safety Car Heating & Lighting Company, has been elected a vice-president, with headquarters at Philadelphia, Pa.

Fred H. Jones, resident manager of the General Railway Signal Company at New York City, has resigned that position, effective June 1. He is to engage in the manufacture and sale of railway appliances in Chicago.

The Pollak Steel Company, Cincinnati, announces the appointment of the B. W. Parsons Company, 1001 Pioneer building, St. Paul, Minn., northwestern sales representative, in St. Paul, Minneapolis, Duluth and the Iron Range district.

The Massey Concrete Products Corporation, Chicago, has appointed P. E. Longstreet resident manager of the Western district. Mr. Longstreet is in charge of all sales in that territory with headquarters at 925 South Sixth street, West, Salt Lake City, Utah.

The North American Car Company, Chicago, has purchased a 23-acre tract at 135th street on a joint right of way of the Indiana Harbor Belt, the Baltimore & Ohio Chicago Terminal and the Chicago, Rock Island & Pacific, upon which a car construction and car repair plant will be built in the near future.

W. J. Crombie on May 1 became associated with the Gustin Bacon Manufacturing Company, 1021 Filbert street, Philadelphia, Pa. Mr. Crombie formerly served with the Baltimore & Ohio, the Delaware, Lackawanna & Western and of late years with the Belmont Packing & Rubber Company, Philadelphia.

George Shields, who was purchasing agent of the American Car Company, St. Louis, for ten years, and later served with the National Safety Car & Equipment Company since its organization, has become associated with The Dayton Manufacturing Company as sales representative, with headquarters at Dayton, Ohio.

The Bay City Foundry & Machine Company, Bay City, Mich., manufacturer of coal conveyors, saw mill machinery and hoists, has purchased the business of the Howlett Construction Company, Moline, Ill., manufacturer and builder of the Williams, White & Co., coaling stations. W. E. Howlett, manager and engineer of the Howlett Construction Company, will be manager of the railroad coaling station department of the consolidated company. This consolidation will unite the engineering facilities of the two companies and enable them to manufacture their own machinery.

### Westinghouse Electric & Manufacturing Company

The report of the Westinghouse Electric & Manufacturing Company for the year ended March 31, 1919, shows gross business amounting to \$160,379,942, an increase of nearly \$65,000,000 over the preceding year. This is the greatest volume ever reported in the history of the company, and compares with a gross business of \$43,733,646 in the year preceding the war, 1914. After the deduction of operating expenses of \$129,271,556, the net manufacturing profit for the year was \$31,408,386, or more than double the net manufacturing profit, in the year ended in March, 1918, and approximately seven times the net manufacturing profit of 1914.

Other income brought the gross income to \$32,731,648. After all charges and the deduction of Federal taxes, amounting to \$15,395,846, there was a surplus available for dividends of \$15,059,097, or the equivalent of \$10.63 a share on the outstanding common shares of \$50 par value after providing for preferred dividends. In the preceding year the earnings applicable to the common were equal to \$10.68 a share.

The gross earnings, the report says, include the earnings of the J. Stevens Arms Company and the New England Westinghouse Company. The latter plant will hereafter be devoted to the manufacture of industrial motors and automobile starting and lighting apparatus, thus relieving a crowded condition at Newark and certain departments at East Pittsburgh. Negotiations are in progress for the sale of the company's holdings of 5 per cent prior lien debenture bonds of Electric Holdings of London, which were received in payment for the holdings of the British Westinghouse Electric & Manufacturing Company. Inventories were approximately \$1,000,000 less than in the report of the preceding year. The report shows orders on hand as of April 1, amounting to \$76,248,000, excluding the orders canceled as a result of the armistice.

The general balance sheet follows:

ASSETS	
Property and plant.....	\$41,806,414
Investments.....	21,592,258
Current assets:	
Cash.....	14,127,249
Cash with agents and others.....	675,342
Cash on deposit for redemption of debentures, bonds, notes and for interest and dividends.....	154,264
Notes receivable.....	2,980,343
Accounts receivable.....	38,500,133
Working and trading assets:	
Raw materials and supplies, finished parts and machines, work in progress, goods on consignment and apparatus with customers, inventoried at cost or less.....	59,550,261
Other assets:	
Patents, charters and franchises.....	5,137,421
Insurance, taxes, etc., paid in advance.....	361,573
Deferred charges to operations.....	8,225
<b>Total.....</b>	<b>\$184,893,483</b>
LIABILITIES	
Capital stock:	
Preferred.....	\$3,998,700
Common.....	70,813,950
Funded debt.....	6,305,000
Fifteen year five per cent notes.....	10,000
One year notes, due February 1, 1920.....	15,000,000
Real estate purchase money mortgages.....	120,000
Current liabilities:	
Notes payable—current bank loans.....	5,280,000
Subscriptions to Liberty Loan bonds.....	8,186,782
Accounts payable.....	10,905,700
Interest, taxes, royalties, etc., accrued, not due.....	15,843,338
Dividend on preferred stock, payable in April.....	69,977
Dividend on common stock, payable in April.....	1,239,244
Advance payments on contracts.....	4,613,675
Unpaid debenture certificates, bonds, notes and interest and dividends.....	154,264
Reserve:	
Against inventories, notes and accounts receivable, etc.....	6,145,120
Profit and loss—Surplus.....	36,207,733
<b>Total.....</b>	<b>\$184,893,483</b>

## Financial and Construction

### Railway Financial News

**BOSTON & MAINE.**—Judge Julius M. Mayer, in the Federal District Court, signed a decree, upon the consent of Frank M. Swacker, Assistant United States District Attorney, granting permission to James L. Doherty and other federal trustees, to postpone from October 1, 1919, to October 1, 1920, the sale of the stock of the Boston & Maine standing in the name of the Boston Railroad Holding Company, and the securities of the various leased companies, which was ordered disposed of by the decree of dissolution obtained by the government on October 17, 1914, in its Sherman anti-trust suit against the New York, New Haven & Hartford.

**CINCINNATI, HAMILTON & DAYTON.**—By a Cincinnati court order all of the unmortgaged securities held by this company in outside corporations are to be auctioned to help satisfy creditors' claims amounting to about \$55,000,000.

**GEORGIA COAST & PIEDMONT.**—This road, which was to have been sold at Brunswick, Georgia, on May 6, but had no bidders on the ground, will be again offered for sale on Tuesday, July 1.

**GRAND TRUNK.**—See editorial elsewhere in this issue.

**LOUISIANA & NORTHWEST.**—This property will be offered for sale at public auction on June 19 at the court house in Homer, La., by W. P. Leary, special master in chancery. The road operates 121 miles of line between Magnolia, Ark., and Natchitoches, Louisiana.

**NEW YORK, NEW HAVEN & HARTFORD.**—Judge Manton in the Federal District Court of New York has denied the application of Harold Norris and other minority stockholders for the appointment of a limited receiver to prosecute liability and restitution suits against the former directors of this road. Because of the filing of this opinion the proceedings for the appointment of a permanent receiver were put over to the June term.

### Railway Construction

**TEXAS & PACIFIC.**—Plans have been prepared by this road for the construction of a divisional terminal at Eastman, Texas, at an approximate cost of \$500,000, but as yet no authority has been issued for their construction.

**LIVE OAK, PERRY & GULF.**—Contracts have been given recently to J. D. Donnahoo, Jacksonville, Fla., to build four miles of the Econfena river extension west, and to build a bridge across the Aucilla river. The company now has work completed on about five miles of the total extension, which is to be about ten miles long.

### Trade Publications

**PNEUMATIC TOOLS.**—In a temporary catalogue, containing 48 pages, issued pending the publication of a larger book, the Keller Pneumatic Tool Company, Grand Haven, Mich., shows briefly its line of pneumatic tools, including valve and valveless types of rotary and piston drills, which are new additions to the line. All models of Keller-made master-built clipping hammers, riveting hammers, holders-on, dolly bars, jam riveters and sand rammers are illustrated and described, with detailed specifications and information as to the uses for which each is designed. This company has also published a four-page folder containing a list of its special tool making and production equipment, with a few illustrations of representative operations and productions.

## Railway Officers

### Railroad Administration

#### Federal and General Managers

Colonel N. L. Howard, whose appointment as assistant to the federal manager of the Chicago, Burlington & Quincy, with headquarters at Chicago, was announced in the *Railway*

*Age* of May 16 (page 1236), was born at Fairfield, Iowa, and received his education in the United States Military Academy at West Point, N. Y., from which institution he graduated in 1907. Shortly after his graduation from West Point he entered the service of the Chicago, Burlington & Quincy as a civil engineer. Later he was transferred to the operating department as trainmaster at Centerville, Iowa. He next acted in the capacity of assistant superintendent at Galesburg, Ill., and then as superintendent of the Burlington division, at Burlington, Iowa, until 1916, when he was transferred to the Hannibal division at Hannibal, Mo. In June, 1917, he was recommended for a commission as lieutenant-colonel in the Chicago railway regiment, the 3rd Reserve Engineers, and in July of the same year entered military service as lieutenant-colonel in the 3rd Reserve Engineers stationed at Chicago. In May, 1917, he joined the 13th Engineers, and in July of the same year was sent abroad, landing in France in August. Upon his arrival in France he was detached from the 13th Engineers and placed on duty with the director general of transportation until the spring of 1918, when he was returned to the command of the 13th Engineers, then stationed in the Verdun sector. On July 8, 1918, Lieutenant Colonel Howard was promoted to colonel. While in command of the 13th Engineers he saw service in the Champagne, St. Mihiel and Meuse-Argonne offensive, and on February 22, 1919, he was awarded the Croix-de-Guerre by the French High Command. On February 28, 1919, he was relieved of his command and returned to this country in March, when he entered the services of the Chicago, Burlington & Quincy as assistant to the federal manager.

Col. N. L. Howard

#### Operating

E. K. Merkle, trainmaster on the Colorado lines of the Denver & Rio Grande with headquarters at Pueblo, Colo., has been transferred to the Salt Lake division with headquarters at Thistle, Utah, succeeding J. W. Barrett, who has been transferred to Helper, Utah, in place of M. J. Ruland, who has been moved to Provo, Utah, to take the place of E. S. Wright, who has been transferred to the Colorado lines of the Denver & Rio Grande.

#### Engineering and Rolling Stock

George H. Webb, colonel of the 16th Engineers (Railway regiment), has resumed his former duties as chief engineer of the Michigan Central, the Chicago, Kalamazoo & Saginaw and the Detroit Terminal, with headquarters at Detroit, Mich.; J. F. Deimling, acting chief engineer of these roads has resumed his former duties as assistant chief engineer, with headquarters at Detroit, to succeed George H. Harris,

who has been performing the duties of assistant chief engineer and will now assume the duties of special engineer on these roads.

#### Purchasing

H. P. McQuilkin, whose appointment as general storekeeper of the Baltimore & Ohio, the Cumberland Valley, the Western Maryland and the Cumberland & Pennsylvania, with headquarters at Baltimore, Md., has already been announced in these columns, was born on February 6, 1887, at Martinsburg, W. Va., and was educated in the public and high schools of his native town. He began railway work on April 1, 1905, as distributor in the stores department of the Baltimore & Ohio at Cumberland, Md., and the following year served as clerk in the motive power department. He was out of railway work from October, 1906, to September, 1910, and then became storekeeper on the Baltimore & Ohio, at Connellsville, Pa. He was later storekeeper at Washington, Ind., and from April, 1914, to December, 1916, was district storekeeper for the Baltimore & Ohio and the Cincinnati, Hamilton & Dayton at Cincinnati. He was then, to April, 1918, chief clerk to the general storekeeper on the Baltimore & Ohio at Baltimore, and subsequently served consecutively as chief clerk to the purchasing agent until June, 1918, and assistant general storekeeper, until his promotion to general storekeeper on the same road.

### Corporate

#### Executive, Financial, Legal and Accounting

James L. Minnis, vice-president and general solicitor of the Wabash, with headquarters at St. Louis, Mo., has resigned to engage in the practice of law in St. Louis.

H. A. Dixon, district engineer of the Pacific district of the Canadian National, with headquarters at Vancouver, B. C., has been appointed chief engineer, Western lines, with headquarters at Winnipeg, Man., to succeed A. T. Fraser, deceased.

#### Operating

G. E. MacDonald, of the MacDonald-Marpole Company, Ltd., Vancouver, B. C., has been appointed general manager of the Pacific Great Eastern, with headquarters at Vancouver, B. C., to succeed G. L. Courtney, who has resigned.

#### Traffic

S. J. Witt has been appointed general freight agent of the Akron, Canton & Youngstown Railway Company, with offices at Akron, Ohio.

#### Engineering and Rolling Stock

W. F. Connal has been appointed mechanical engineer of the Canadian National, with headquarters at Toronto, Ont., to succeed H. D. Cameron, who recently resigned to enter the employment of the Robinson Connector Company, Montreal, Que.

## Railway Age

Table of Contents will be found on Page 5 of the Advertising Section

A striking example of the economy of a high standard of equipment maintenance is to be found in the report on the air consumption of locomotive auxiliary devices presented at the recent convention of the Air Brake Association. To one who has not made a special study of the situation, the air used by these

### The Cost of Neglecting Auxiliaries

devices would seem negligible, yet tests under actual working conditions demonstrated that the cost of the fuel required to supply air for their operation ranged from \$100 to \$300 per year per locomotive, depending upon the type of air compressor used. Furthermore, it was found that the maximum air consumption under certain conditions was so great that it taxed the capacity of the compressor and resulted in a shortage of air to supply the train line which might easily prove disastrous. If to the cost of fuel for air supply is added the increased wear and tear on the equipment and the probable loss due to delays and engine failures, no further evidence is needed to prove that the additional expenditures required to maintain auxiliaries in first-class condition will result in a substantial saving.

THE CURRENT AGITATION for the re-organization of industry has resulted in the formulation of various theories designed to improve the relations between employers and employees. Both parties are, beyond doubt, putting their best thought into the problem, but, in the main, the results have been discouraging. Generally speaking, the plans advanced by the employers depend for their efficacy on so-called welfare work, and those advanced by the employees, which usually aim chiefly at advances in wages and reduction of hours, are presented through their organizations. Both fall short of the mark for the same reason, the lack of personal contact between the interested parties. Many employers have for a long time realized that the best of plans, no matter how well thought out or how feasible they look on paper, will not work in practice owing to the lack of a sympathetic understanding. Consequently some of them are proceeding on another tack. Instead of following a predetermined plan they are making it their business to learn the viewpoint of the other fellow and, based on the knowledge gained, undertake improvements. Many of these improvements seem minor on their face, but often good results are obtained by them. To be concrete, a foreman is a comparatively small cog in a large organization. Investigation has proved, however, that he is in many cases a barrier rather than a connecting link between the employer and the men. The conception the men have of the company is dependent on the attitude of the foreman. To them he represents the company. If he is of the wrong type and is permitted to carry prejudice into his relations with the men he discourages ambition, discharges good men or keeps them in unsuitable positions and keeps the employer ignorant of the true conditions. Denying a foreman the right to discharge may seem to be of little consequence. But where it has been tried, on the railroads or in industrial plants, and the power given to someone higher up known to be fair to both sides, benefits

### The Barriers Should Be Removed

have sometimes resulted. A plan providing that no man on the permanent forces of the engineering department may be discharged or reduced in rank or pay without the approval of the chief engineer is in effect on a certain eastern road. The improvement which has resulted in this instance is sufficient to warrant further trials in this and other departments.

In the first four months of this year less than forty million dollars' worth of new work, chargeable to additions and betterments, was authorized by the Railroad Administration. This is far below normal, leaving a corresponding accumulation to be authorized and carried out in the near future. When contemplating any program of construction the question of man power is important. For this reason it is interesting to note that in the four years ending December 31, approximately one million immigrants came into this country, although the number arriving each year steadily decreased during this period and in 1918 the net increase to this country's population through immigration was only about 16,000. It was announced recently, that in the six months since the armistice was signed, nearly 400,000 emigrants have left the country through the port of New York alone. Nearly 1,400 requests for passports to Europe are now being received daily at New York, most of the applicants being immigrants of short residence in this country, Italians predominating. From these figures it seems apparent that in the five months of this year the country has sustained a net loss of 250,000 in population or a decrease of 50,000 monthly, by far the greater proportion being of the class from which railroad and industrial labor is largely recruited. These figures suggest that the worries over the construction and maintenance programs will not be over when the money for carrying them out is made available.

### Emigration Now Exceeds Immigration

Mr. Gray on Government Operation

ONE OF THE MOST INTERESTING and instructive addresses which have been delivered on our government's experience in operating the railways is that which was made by C. R. Gray, formerly director of operation of the Railroad Administration, before the St. Louis Railway Club on April 22. An abstract of Mr. Gray's address is published elsewhere in this issue.

Mr. Gray told of a number of vital problems, such as that of getting food to the Allies and coal to New England, with which the Railroad Administration was confronted and the way in which they were solved. It is easy for anybody who heard or who reads his address to understand why it was impossible for the railways to handle the essential war business of the country and at the same time be economically operated.

Mr. Gray's comments upon the labor situation were especially interesting. He showed clearly that the wage advances made as a result of the recommendations of the Railroad Wage Commission so completely disrupted all the old relationships between the wages of different classes of employees that immediate readjustments became absolutely neces-

sary. At the same time, he sees clearly the disabilities under which the government works in the handling of labor problems. One of these disabilities, as he pointed out, is that the government must make uniform scales of wages throughout the country regardless of differences of conditions; and the law of supply and demand, which, to a large extent, governs the wages paid by private concerns, cannot operate in the case of a business under government management. If in a certain district there happen to be conditions which force up the wages of men employed by private concerns in a particular line of work the government has only two alternatives. First, it may refrain from advancing wages to this special class of men in that particular territory; in that case it will not get enough men. Second, it may advance the wages to that special class of men in that particular territory. In that case it will be forced, regardless of differences in conditions in different parts of the country, to make a similar advance in wages to all workers of that particular class throughout the country. "Of the different things which I encountered which satisfied me that federal operation of all of the railroads would be an economic mistake," said Mr. Gray, "that was the most effective." He might have added that of all the things which have tended to increase railway expenses under government operation more than they would have been increased under private operation none has produced such potent effects as this real, or apparent, necessity for the Railroad Administration paying the same wages and prices throughout the country regardless of differences of conditions.

Mr. Gray paid high tribute to the loyalty with which railway officers have worked under government operation. He said that after Mr. McAdoo "had made trips over the country and had met these officers, with the greatest gratification he told me that in all his life he had never met a set of men who so measured up to what the emergency required as the railroad officers of this country." And of the men who entered the service of the government none rendered more tactful, loyal, arduous and effective service than Mr. Gray himself. It was fortunate for the railway officers of the country that when the demands made upon them under government operation were the greatest, and when the criticisms being heaped upon them were the most malignant, Director General McAdoo had associated with him as one of his principal lieutenants as fine and representative a type of the American railway operating officer as C. R. Gray.

Mr. Gray did not exaggerate, but spoke the simple truth, when he said, "that the men who stood behind this movement and supported it in every way, and worked themselves beyond everything that they had ever done before to hold up the highest traditions of the profession, were the railroad officers."

### Michigan Central

**I**N 1918 the Michigan Central earned a profit over and above the rental which the government had to pay for it of over \$7,000,000. This profit, of course, accrues to the government. The rental which the government paid to the corporation was \$8,052,000. The amount which the property earned through operation was \$68,520,000, or \$15,641,000 more than the property earned in 1917. The Michigan Central consists of 1,862 miles of line, of which the main line, as will be seen on the map, runs from Buffalo along the north shore of Lake Erie to Detroit and from there across the southern end of the state of Michigan to Chicago. It formed one of the northern routes over which traffic was sent from the West to Atlantic seaboard points, avoiding the congestion of the Pittsburgh gateway. In 1918 the road handled 29,653,000 tons of revenue freight, an increase over

1917 of 2,412,000 tons. The average length of haul was a little longer in 1918—175 miles, as compared with 171 miles in 1917. Thus, the total ton mileage of revenue freight was 5,203,000,000, an increase over 1917 of 10 per cent. The number of passengers carried one mile was 588,696,000, an increase of 13,596,000, or about 2 per cent.

Total operating expenses amounted to \$51,070,000, an increase of \$12,781,000. The Michigan Central operating ratio was 74.53 in 1918, comparing with 72.41 in 1917.

The maintenance costs of the Michigan Central increased about in proportion to the increased maintenance costs on other roads. Thus, maintenance of way and structures cost \$7,705,000 in 1918, an increase of \$2,315,000; maintenance of equipment cost \$12,382,000, an increase of \$4,356,000. Sometimes it is well to pause a moment to get a full realization of what the increases in unit costs of repairs and renewals to a railroad property have amounted to in the last few years. We used to think of \$2,500 as a fair amount for cost of repairs per locomotive, \$900 per passenger car, \$75 per freight car, and \$1,500 for maintenance of a mile of road. The following table shows the unit maintenance costs on the Michigan Central for 1917 and 1918:

	1918	1917
Maintenance of way per mile.....	\$4,116	\$2,817
Repairs, exclusive of renewals and depreciation per locomotive .....	5,365	3,550
Repairs, exclusive of renewals and depreciation per passenger car .....	1,382	757
Repairs, exclusive of renewals and depreciation per freight car .....	132	77

With an increase of 10 per cent in freight business and with an increase in labor hour costs and unit of material costs, commensurate with that on other roads, the transportation expenses of the Michigan Central increased by only 27 per cent and amounted, in 1918, to \$28,214,000. If there were very many other roads in the country which had made such a showing as the Michigan Central did in 1918, the American railroad problem would be far less alarming than it now is.

In 1918 the average trainload of revenue freight amounted to 698 tons, an increase over the previous year of 43 tons. Car loading was much better in 1918 than in 1917, the average tonnage per loaded car being 22.39, an increase of two tons over 1917. The Michigan Central carried a much larger proportion of bituminous coal in 1918 than in 1917. Of the total 29,653,000 tons of all revenue freight carried in 1918, 7,848,000 tons were bituminous coal, whereas in 1917, of the total 27,240,000 tons carried, 6,340,000 tons were bituminous coal. It is rather interesting to note that the tonnage of dressed meats, amounting in 1917 to only 184,000 tons, amounted in 1918 to 421,000 tons, and the tonnage of other packing house products, amounting in 1917 to only 189,000 tons, amounted in 1918 to 502,000 tons.

Like the other principal New York Central lines, the Michigan Central will have to do some permanent financing when the roads are turned back to their owners, but there is this much to be said, if any American railroad is to have its credit fully restored, on a basis of its earning power under present labor and material costs, the Michigan Central ought to stand high in the ranks of the roads bidding for money. The corporation, at the end of 1918, had on hand \$1,398,000 cash and the government owed it \$5,056,000 for rental due, \$2,713,000 for cash taken over on January 1, 1918, \$5,488,000 for agents' and conductors' balances of that date; and \$8,070,000 for materials and supplies. The agents' and conductors' balances can, of course, be disregarded since that item will presumably balance itself when the roads are returned. The Michigan Central had outstanding at the end of 1918 \$22,885,000 loans and bills payable. It owed the government \$4,362,000 for additions and betterments, \$2,943,000 for "corporate transactions," and \$10,365,000 for liabilities as of December 31, 1917, paid by the government.

Can the Michigan Central keep up under present conditions the profitable operation as shown in 1918? In the first three months of 1919 the property earned \$16,764,000 gross and operated on a ratio of 80.52 and had an operating income of \$2,785,000. This operating income is more than the operating income for the first three months of 1918 by \$1,089,000.

The following figures show the results of operation under the government. This is not the corporate income account:

	1918	1917
Mileage operated .....	1,862	1,862
Freight revenue .....	\$45,949,560	\$33,898,247
Passenger revenue .....	15,901,585	12,859,299

Surplus .....	1,820,107

Cleveland, Cincinnati, Chicago & St. Louis

HAD THE Cleveland, Cincinnati, Chicago & St. Louis been an independent company without strong banking support, it would quite probably have had to go through a receivership in 1913 or '14. At the end of 1913 the company had outstanding \$91,943,000 of funded debt and \$57,067,000 of stock, of which \$10,000,000 was preferred. It had loans and bills payable of \$7,454,000, and total current liabilities, including these loans, of \$14,416,000. There was but \$3,646,000 cash on hand, and, including this cash, but \$11,093,000 current assets. In 1913 the road had failed to earn its fixed charges by \$2,698,000, which debit to profit and loss wiped out the small previously existing surplus and left a debit to be carried to the balance sheet of \$1,390,000. The funded debt was at the rate of about \$46,000 a mile, and gross earnings amounted to less than \$17,000 per mile.

The road had been seriously damaged by unprecedented floods, with the prospect that not only would considerable expenditures on capital account be needed in the immediate future, but that there would be attendant heavy charges for maintenance. Making a full allowance for a loss of \$1,200,000 in revenues on account of the flood (which now seems unduly high), and \$400,000 added to operating expenses, the road had an operating ratio of 83.2 per cent. It would have been exceedingly difficult to have gone to a disinterested banking house, either on the basis of these figures or of a physical inspection of the property, and to have raised the necessary funds for continued solvent operation.

The Big Four, being a subsidiary of the New York Central, was enabled to escape financial disaster and was thus given a chance to pull itself out of its difficulties by increased earnings, accompanied by economies in operation. In 1914, \$1,500,000 was spent for additions and betterments to roadway and \$4,949,000 was expended for new equipment. In 1915, \$1,045,000 was spent on additions to roadway and \$3,689,000 for equipment; but against this equipment charge there was a credit for equipment retired of \$1,390,000, leaving a net increase in investment in equipment of \$2,299,000. In 1916, \$1,605,000 was spent for additions and betterments to road, and \$1,408,000 for equipment, less \$1,809,000, value of equipment retired, leaving a net decrease in investment in equipment of \$401,000. In 1917, \$2,222,000 was spent for additions and betterments to road, and \$5,616,000 for equipment, less \$1,525,000 value

of equipment retired, leaving a net increase in investment in equipment of \$4,092,000. During the years 1913 to the end of 1917, the outstanding funded debt increased from \$91,943,000 to \$105,248,000, but in the meantime the mileage had increased from 2,014 miles to 2,387 miles, so that funded debt was at the rate of only \$44,000 per mile, as against \$46,000 per mile in 1913. The increase in funded debt of approximately \$13,000,000 was the result of a decrease in outstanding debentures and an increase in outstanding equipment trust certificates, miscellaneous obligations and the establishment of a debt of \$6,017,000 to affiliated companies.

During this time loans and bills payable were reduced from \$7,454,000 to \$3,763,000, and cash on hand remained around \$3,000,000.

The total of \$6,372,000 for additions and betterments to road and of \$10,939,000 for equipment was provided for, partly through the increase in debt to affiliated companies, and partly through surplus earnings put back into the property. In 1914 there was still a deficit after the payment of interest charges, but in 1915 there was net income of \$3,405,000 and in 1916 of \$8,332,000, from which, however, \$750,000 was charged off for equipment depreciation not taken up through adequate charges to maintenance in previous years, and there was also \$375,000 paid out in dividends on the preferred stock. In 1917 there was \$5,258,000 net income available for dividends, and the full 5 per cent, calling for approximately \$500,000, was paid on the preferred stock. This left, after sinking fund charges, \$4,657,000 to be transferred to the credit of profit and loss. The 1916 and '17 surplus wiped out the previous debit to profit and loss and left a credit balance, December 31, 1917, of \$9,661,000.

Under government operation the Big Four continued its remarkably fine showing. In 1918 the property earned \$71,404,000, an increase over 1917 of \$18,753,000. It is an astounding fact that the operating ratio was within a fraction of one per cent as low in 1918 as in 1917 (72.68 in 1918 and 72.29 in 1917). The ratio of transportation expenses (the out-of-pocket cost of moving the business) was actually less—39.52 in 1918 and 40.76 in 1917. The rental which the government is to pay is \$9,939,000. The net income which the government received in 1917 was \$14,689,000; this is after paying expenses and rentals.

In 1918 the Big Four handled 43,056,000 tons of freight, an increase of 3,385,000 tons over 1917, and the average haul per ton was 178.8 miles, as against 178.0 miles in 1917. The ton mileage handled, therefore, amounted to 7,010,000,000 in 1918, an increase of 638,000,000 ton miles. The average receipts per ton per mile were 7.12 mills in 1918, as against 5.66 mills in 1917.

The average revenue trainload was 779 tons; this compares with 691 tons in 1917 and 457 in 1913, the year before the flood. The average load of revenue freight per loaded car mile was 27.4 in 1918, as against 25.0 tons in 1917.

Of the many factors which have gone to make up this history of the imminently successful rehabilitation of a road under conditions which were dragging many other railroads on the way to bankruptcy, notwithstanding the fact that they appeared in 1914 to be in a far better condition than the Big Four, one or two stand out beyond all the others.

One of these is the wonderful spirit of co-operation and teamwork which was infused into the organization. In all lines of human endeavor, it is possible for a born leader of men to use a desperate situation as a stimulus to efforts that would be unthinkable under ordinary conditions. The Big Four was in a desperate situation, but the organization came back with a united effort that is worth admiration. The other feature about this remarkable story of rehabilitation is the courage shown in providing facilities in addition to

repairing flood damages. It takes no ordinary brand of courage to order new locomotives and rolling stock when the road faces possible receivership and when the market for equipment trust certificates is extraordinarily bad, but this is what the management of the Big Four did, and the results in 1918 are a monument of justification.

The following figures show the results of operation under the government. This is not the corporate income account:

	1918	1917
Mileage operated .....	2,396	2,396
Freight revenue .....	\$49,934,631	\$36,077,390
Passenger revenue .....	15,359,128	12,009,346
Total operating revenues .....	71,403,970	52,650,920
Maintenance of way and structures .....	7,298,040	4,378,438
Maintenance of equipment .....	13,894,337	9,808,408

## New York Central

THE RESULTS of operation of a railroad under government control in the calendar year 1918 are not necessarily a criterion of the net earning power of the property under private operation and with competitive conditions. On the other hand, in the east the year's operations were, generally speaking, an acid test of the ability of a property and the organization to handle a greatly increased business satisfactorily. Where a road had superimposed on it a management not intimately familiar with its problems or not necessarily sympathetic with its particular line of development, or where it was called upon to handle a character of traffic which it was not naturally best fitted to handle, 1918 operating results were hardly a fair criterion of what may be expected of the property in the future. On the other hand, where a property showed up remarkably well under the conditions in 1918, it is fairly safe to assume that that property had been put in remarkably good shape prior to 1918 and that its chances of profitable operation in the immediate future are more than fairly good. This latter is the case with the New York Central.

Up until ten years or so ago the eastern end of the New York Central (what was then the New York Central & Hudson River) was looked upon as a high class passenger road with a large proportion of fast and bulky, but light freight business, more comparable in its operating problems to some of the English roads than any of the other trunk line railroads. When the Lake Shore & Michigan Southern and the New York Central & Hudson River were merged, the Lake Shore's heavier train load and larger proportion of coal and ore pulled up the average train load for the whole system, but even in 1914 the revenue freight train load averaged for the system only 642 tons. In the calendar year 1918, with operating conditions in the first three months of the year that were unprecedentedly unfavorable, the New York Central had an average revenue train load of 891 tons and the train load including company freight averaged 970 tons. The gain over 1917 in revenue train load was 47 tons. The average tonnage of revenue freight per loaded car was 26.36 tons in 1918 as against 24.15 tons in 1917. It is notable that while the average number of loaded cars per train mile was 33.80 in 1918 as against 34.94 in 1917, the average number of empty cars per train was 18.05 as against 16.59, so

that the gross tonnage hauled behind the drawbar increased much more than is indicated by the increase of 47 tons in revenue train load.

These figures for operation are cited before discussing the financial results of the year's operation because they are so essential to an understanding of the financial showing made.

When the roads were taken over by the government, A. H. Smith, president of the New York Central, was appointed regional director of the Eastern region, but remained also president of the corporation. In June Railroad Administration officers severed their connection with the corporations, and for the last seven months of the year, therefore, the property was operated under P. E. Crowley, federal manager in the Eastern region, acting under A. H. Smith as regional director.

To repeat once more, the financial results of operation of the railroad properties under federal control do not affect the amount available for interest and dividends on the corporation's securities. The New York Central's rental due from the government was fixed at \$55,803,000. This left, after the payment of interest, corporate expenses, etc., and war taxes \$24,465,000. From this, on the New York Central's books, is subtracted \$6,548,000 for expenses applicable to the period prior to January 1, 1918, and settled for the account of the corporation by the United States Railroad Administration. This left \$17,917,000 net corporate income. The five per cent dividends call for \$12,480,000. So much for the corporation income account.

The property—5,682 miles—earned in 1918 from its operation as a railroad \$269,271,000, or \$53,003,000 more than in 1917. After paying operating expenses and taxes there was \$47,342,000 railway operating income in 1918, as against \$52,068,000 railway operating income in 1917. Against the expenses of 1918, however, had been charged the \$6,195,000 lap-over expenses accrued prior to January 1, 1918. Making the necessary adjustments and figuring in rent and hire of equipment there was a net income of \$52,230,000, comparing with \$55,803,000 rental due to the corporation from the government. Had the property been operated on its own account it would have had after paying interest charges, approximately \$14,300,000 available for dividends, with dividend requirements of \$12,480,000. When we compare this with the financial showing of some of the other eastern roads it looks exceptionally good.

Unfortunately the balance sheet statement of the New York Central (the corporation) is not so encouraging, but this is primarily due to the fact that the New York Central has a heavy proportion of funded debt to stock and has not in recent years been able to do the long term financing which it wanted to do. The corporation has approximately \$250,000,000 of stock and \$688,000,000 of long term debt. At the end of 1918 the company had \$41,963,000 loans and bills payable and owed the government \$16,651,000 for additions and betterments and \$21,512,000 for liabilities of December 31, 1917, paid by the government. There was on hand at the end of 1918, \$8,993,000 cash and the government owed the company \$27,672,000 on account of rental, \$13,407,000 for cash taken over January 1, 1918, \$9,617,000 agents' and conductors' balances, \$34,240,000 materials and supplies and \$6,919,000 assets as of December 31, 1917, collected by the government. The totals are \$73,342,000 current liabilities and \$73,927,000 deferred liabilities, with \$48,917,000 current assets and \$74,477,000 deferred assets.

Were the railroads to be handed back to their owners tomorrow, from an operating point of view the New York Central would be in a strong position comparatively. The organization is intact, the physical condition of the property is good, and owing to its ability to handle increased traffic during the first trying months of 1918, it has gained rather than lost, from a traffic point of view, through being operated by the government. In regard to the condition of the property a

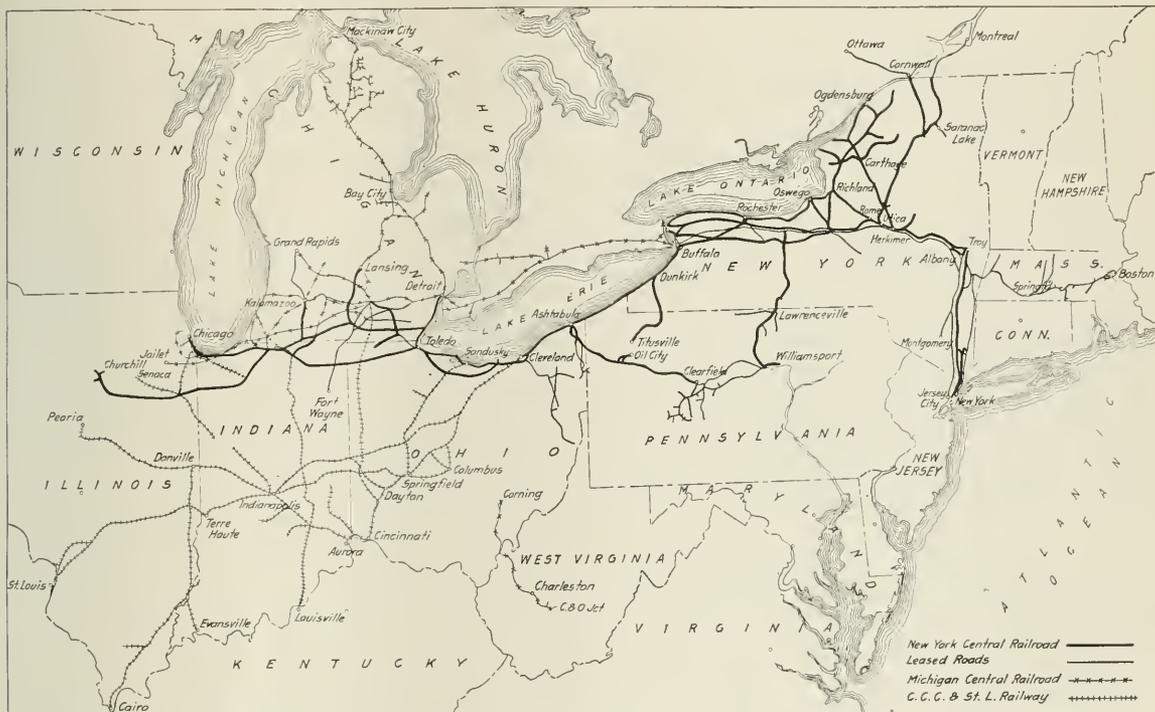

word should be said about maintenance expenses in 1918. Total maintenance of way expenses amounted to \$31,868,000, an increase of \$11,163,000 over 1917. Maintenance of equipment expenses amounted to \$57,313,000, an increase over 1917 of \$18,866,000. These increases in maintenance of way expenses reflect no more than the increased unit costs of labor and material. As a matter of fact, however, the physical condition of the New York Central would indicate that the federal officers have been able to pretty well keep up the old standard of maintenance and especially is this so in regard to maintenance of way.

In 1918 a net total of \$40,735,000 was spent for additions and betterments. Of this amount \$11,433,000 was expenditures made by the federal manager, \$13,002,000 was the cost of equipment assigned to the New York Central by the United States Railroad Administration, \$8,511,000 was expenditures by the corporation for additional equipment and \$4,783,000 was expenditures by the federal manager on leased property.

strated probably to the satisfaction of most of the federal officers in charge the wisdom of prompt replacement of obsolete equipment and the absolute necessity, if American railroads are to meet the ever progressing needs of the country, of the continued purchase of new equipment before the need for such equipment becomes desperately pressing. The financial results on the New York Central in 1918, although not affecting the pocketbook in that year, at least of security holders, probably demonstrated very clearly to most of the corporation's directors the wisdom of the policy in regard to purchasing equipment.

The following table shows the principal figures for operation of the property of the New York Central under federal operation. This is not the corporation income account:

	1918	1917
Mileage operated .....	5,682	5,685
Freight revenue .....	\$175,869,945	\$135,979,337
Passenger revenue .....	60,370,139	49,987,343
Total operating revenues.....	269,270,957	216,267,517

The New York Central, the Cleveland, Cincinnati, Chicago & St. Louis and the Michigan Central

The policy pursued by the New York Central in regard to purchases of equipment in recent years is of especial interest in the light of operations in 1918. On January 1, 1915, there were 1,774 locomotives on hand in freight service, 795 in passenger service and 680 in switching service. During 1915 forty-six freight locomotives were added and 142 freight locomotives, 34 passenger locomotives and 15 switching locomotives retired. In 1916 there were added 123 freight locomotives, 11 passenger locomotives and 26 switching locomotives; there were retired 140 freight, 44 passenger and 33 switching locomotives. In 1917 there were added 64 freight, eight passenger, 113 switching and 10 electric locomotives, and there were retired 81 freight, 19 passenger and 17 switching locomotives. In 1918 there were added 231 freight, 43 passenger and 86 switching locomotives, while 26 freight, 13 passenger and 3 switching were retired. This is a total of 464 freight locomotives added and 399 retired. The operation of the New York Central in 1918 demon-

Maintenance of way and structures..	31,867,769	20,704,306
Maintenance of equipment.....	57,312,738	38,446,594

## Eastern Region Under A. H. Smith as Director

### The Complicated Problem Caused by Congestion in 1917-18 Completely Worked Out

**A**LFRÉD H. SMITH, director of the Eastern region of the Railroad Administration, has resigned to return to the presidency of the New York Central. Mr. Smith was the first regional director appointed by William G. McAdoo, and at the outset had under his jurisdiction the territory now included not only in the Eastern region but in the Allegheny and Pocahontas regions as well. He faced a situation of great difficulty requiring firmness and the ability to make quick decisions. Mr. Smith possesses these qualifications to a marked degree. Throughout his handling of the Eastern territory, he showed entire fearlessness and took the initiative to an extent that has seldom been equalled in government service.

A. T. Hardin, who has been assistant regional director and also director of the Central District of the Eastern region, has been appointed regional director of the Eastern region. Mr. Hardin has worked with Mr. Smith for many years. When Mr. Smith became general manager of the New York Central & Hudson River in 1903, Mr. Hardin was engineer of maintenance of way, and in 1905 was appointed assistant to the general manager. A year later, Mr. Smith was elected vice-president and Mr. Hardin was made assistant general manager and his authority was extended over the other New York Central lines at the time of the extension of Mr. Smith's authority; when Mr. Smith became president, he was elected vice-president in charge of operation, maintenance and engineering.

The eastern railroad situation has now been straightened out; there is no congestion; the roads are seeking traffic; the Pittsburgh gateway is opened; New England is supplied with coal; and the old familiar problems of holding down expenses and securing additional business are again to the fore. When, however, A. H. Smith was appointed regional director of the Eastern region in January, 1918, the Pittsburgh gateway was completely blocked; there were lines of loaded cars extending back from the Atlantic seaboard for many miles; the thermometer varied between 5 deg. below zero to 30 deg. below zero; one storm after another buried yards and main lines deep under thick frozen snow; New York harbor froze up; a coal famine threatened everywhere in the east; and government priority orders had so interfered with each other

that only with the utmost difficulty and the exercise of extraordinarily sound judgment could any superintendent tell what traffic he should try to move first. Passenger trains were stalled; trainmen and yard and switchmen fought the cold and wind, rising sometimes to 70 miles an hour, but a day's work under such conditions as these accomplished less, often, than would two hours' work under normal conditions.

The Eastern ports—Norfolk, Baltimore, Philadelphia, New York and Boston—were the crucial points in the situation both as regards supplies and munitions for the Allies and for getting our own army overseas.

The best that the new regional director could hope to do was to quickly form a loyal organization of the men actually on the ground and so direct and co-ordinate this organization as to bring order out of chaos. The president of each railroad in the Eastern region was directly responsible for the operation of his road to the regional director, but an advisory organization was formed which consisted of six presidents' committees as follows: New England district, James H. Hustis, receiver of the Boston & Maine, chairman; New York, Niagara and Frontier district, W. H. Truesdale, president of the Delaware, Lackawanna & Western, chairman; Central Traffic district, J. J. Turner, vice-president of the Pennsylvania lines west, chairman; Philadelphia, Baltimore and Pittsburgh district, Samuel Rea, president of the Pennsylvania Railroad, chairman; Hampton Roads district, N. D. Maher, president of the Norfolk & Western, chairman; and the Michigan and International Boundary district, F. H. Alfred, president of the Pere Marquette, chairman.

This organization endured until June, 1918, when federal and general managers were appointed in place of the presidents of the roads. When this change took place, Mr. Smith recommended the appointment of the president or the operating vice-president, in charge of the property in each case, as federal or general manager.

Thus, since A. T. Hardin, vice-president of the New York Central, had been taken into the organization of the region, P. E. Crowley, vice-president of the New York Central, was made federal manager of the New York Central; E. J. Pearson, president of the New Haven, was made federal manager of that property; A. J. Stone, vice-president in

charge of operation of the Erie, was made federal manager of that property; H. M. Biscoe, vice-president of the Boston & Albany, was made federal manager of that property; E. M. Costin, general superintendent of the Cleveland, Cincinnati, Chicago & St. Louis, was made federal manager of that property; and this policy was pursued even to the appointment of separate general managers for the Central of Vermont and for the Canadian Pacific lines extending into New England.

The line of action taken in regard to personnel had probably a very important effect on operating conditions. The size of the region made it necessary to subdivide it into districts and each district director, himself familiar from long experience with conditions in his district, was surrounded with federal and general managers, operating properties with which they were thoroughly familiar and in sympathy with. It might have been perfectly logical and feasible to have combined a number of the roads in some of the districts, certainly in the New England district, under one general manager or federal manager, but it was felt that it would be a grievous mistake to make a change under the tremendous stress of last year's railroad conditions which, however logical in itself, would, for the time being, deprive any property of the man most familiar and most sympathetic with its problems.

Prior to the assumption of government control, there was competition for through business between the New York Central, the Erie, the Lackawanna, Lehigh Valley, Pennsylvania and Baltimore & Ohio. With the placing of the first four within the Central district of the Eastern region, not only was competition eliminated between these roads but a choice of routes was made available by which it became possible to segregate certain classes of shipments to one or other of the roads and to so arrange freight schedules as to permit of a quick shifting of traffic from one route to the other to meet temporarily abnormal conditions. Furthermore, the fact that all of the roads were under government control eliminated competition with the two important roads in what later became the Allegheny region—the Baltimore & Ohio and the Pennsylvania.

The New York Central, in so far as its trackage, exclusive of terminals, is concerned, probably had, in 1917, a larger margin of safety in so far as actual road movement of freight was concerned than had any of its important competitors. The other three roads had a considerable margin of capacity in road movement of freight, and the joint utilization of all of these roads is thought to have very considerably increased the total of this margin of capacity.

The New York Central had been foresighted and courageous in buying both cars and locomotives in 1916 and 1917. At the time, the cost of this equipment had seemed very high and naturally purchases were entered upon only after the most careful consideration. The bitter weather of December, January and February crippled the locomotives, especially of the Pennsylvania, to a dangerous extent. For a while, the problem was one of diverting both east and westbound business from the Pittsburgh gateway and especially from the railroads between Pittsburgh and Philadelphia and Baltimore.

### Peculiar Difficulties of the Situation

The situation was not one for punctilious niceties or sensitive fear of criticism. Mr. Smith was a New York Central man, and the competition between the New York Central, the Pennsylvania and other eastern trunk lines had, in times past, been keen. While it was true that the government was guaranteeing a rental to each road on a basis of business handled under free competition, there was, even under the regional system adopted, the possibility that some roads would look with suspicion on anything that was done to divert traffic from their lines. On the other hand, the operating

officers of the lines from which it was necessary to divert traffic, themselves, apparently, were fully aware of the needs of the situation. Up until May 31, when the Allegheny and Pocahontas regions were formed, it is probable that everyone in authority concerned with the operation of the roads in the Eastern region felt the urgent necessity of turning traffic away from the Pittsburgh district. The Pennsylvania Railroad, itself, had cars above normal on its lines amounting to 19,000 in January, to 27,000 in the early part of February, and to 10,000 in the latter part of February. Car movement, because of the severe weather, was far below normal, as far even as 50 per cent below normal at times.

The Allegheny and Pocahontas regions were formed out of the Eastern region in June, and the problems of these two regions have already been described at some length in the *Railway Age*. The carving out of these two new regions, left the Eastern region a somewhat oddly formed territory. This territory was divided into three districts: the New England district, under James H. Hustis as district director; the Ohio-Indiana district, which included both the Cleveland, Cincinnati, Chicago & St. Louis and the Pennsylvania lines west, under H. A. Worcester, formerly vice-president of the Cleveland, Cincinnati, Chicago & St. Louis; and the Central district, under A. T. Hardin. This left, of course, former New York Central officers predominating in the regional organization. The Pennsylvania lines west and the Pennsylvania Railroad, itself, were still, in June, July and August, under very heavy pressure. Even as late as August 27, 1918, the traffic officers of the Pennsylvania lines west issued a circular approved by G. L. Peck, federal manager, as follows:

"The volume of raw materials and finished products essential to the war program has reached such immense proportions in the Pittsburgh district that there is no transportation capacity left for the handling of other car load traffic through the district, either eastbound or westbound, which it is possible to divert via other routes.

"Beginning at once, eastbound car load traffic should, to the fullest extent possible, be diverted to other available routes, and, where practicable, shippers should be requested to use other initial lines, the routes of which will avoid the Pittsburgh gateway.

"The use of the Pittsburgh gateway should be similarly restricted on traffic originating on connecting lines.

"The general rule contained in the book of general instructions for the government of agents, which instructs agents, when routing is not otherwise ordered, to forward freight via the route paying the Pennsylvania system roads the most revenue, is superseded with respect to the traffic referred to herein, and available routes via short-haul junctions should be utilized."

### The Central District

During the entire year, 1918, the New York Central made a very good showing comparatively. In the editorial review of the annual report of this company, appearing elsewhere, an attempt is made to analyze the reasons for this, but it is proper to say here that the generous provisions which had been made for motive power and rolling stock for the New York Central were a most important factor. During the severe winter weather, the northern lines were not so completely prostrated as were the southern lines of the Eastern region. Officers and employees were, apparently, more accustomed to the very low temperatures and high winds than were the railroad men of the southern lines. This, of itself, was a help to the New York Central, and, coupled with the fact that they had a greater margin of equipment to fall back on, gave the organization a feeling of reliance that may have been lacking on a road like the Erie, for instance, which was short of power.

### The Erie

The Erie situation is particularly interesting. Under F. D. Underwood, a crooked, high-grade, single track, run-down railroad was transformed into a New York-Chicago double-track, modern, fairly low-grade trunk line. The financial difficulties that had to be overcome were appalling; and the road was on the verge of bankruptcy more than once. A transportation machine was built up, capable of handling, except for locomotives, much more traffic than the road was getting in 1910 to 1913. In the working out of keen competition for freight, the Erie, with its uncongested through line, bid for and received a very large share of the fast freight between Chicago and New York. Refrigerator business, both fruit and dressed meats, came to it in large quantities. This is an expensive business to handle, both because of the speed required and the large proportion of tare weight (also empty car movement) which it involves. Had conditions remained normal, the Erie might have succeeded in building up a freight business to fill in its capacity and profitably retain a good part of its fast freight business. War conditions intervened, however; the Erie had become known as a fast freight line. Business, which had to be moved at great expense, was dumped on to it at first by the manufacturers of munitions and supplies for the Allies, and later when the United States government took over the roads, the Erie had to carry a large proportion of perishable freight and other traffic which required high speed and a high proportion of tare weight to load.

The amount of freight which the Erie has handled, as reflected in its gross earnings, was very large, but this does not begin to show the increase in gross tonnage (revenue tonnage and weight of equipment) which the road handled.

### New England District

New England has often been likened to a great receiving yard, and the simile is a good one. To every hundred loaded cars received, only about 75 are sent out. The greatest problem was to get coal into New England for the great number of munition and arms factories in that district and for the vast number of other industries of the district engaged in war work. For a period of two years, the coal tonnage brought into New England was doubled. This, in itself, is an achievement which the railroads of that district may feel justly proud of.

There was little roundabout routing of freight within New England, even before government control. The Boston & Maine was being gotten into good shape before the beginning of 1918; the smaller roads were in general in quite good shape as compared with the character of traffic they were called on to handle. The Boston & Albany was in fine shape, but the New York, New Haven & Hartford was still in a process of rehabilitation after years of operation as an adjunct to banking schemes and plans of consolidation, all of which may have been for the good of New England in the long run, but which had so overshadowed the operating necessities of the road as to make the problem of the successors to former President Mellen a difficult one. A serious congestion in this great receiving yard would have tied up New England industries to a disastrous extent.

The problem of preventing congestion within New England was met in what appears now, in the light of more than a year's experience, the only safe and practical way. Permits were issued to shippers outside of New England to ship to New England ports, only when there was a reasonable certainty of boat accommodations being provided to handle expeditiously the freight that was so consigned. The New England district management took upon itself the task and responsibility of ascertaining the capacity of ships due and sailing dates, nature of cargo, etc., and permits were issued for freight to move into New England for export in the light of this information. The Railroad Administration was

helped by the fact that little, if any, United States government freight was shipped through the port of Boston. In the first years of the European war, large shipments came down to Boston from the Canadian roads, but by the time the New England district was formed, the Canadian roads were in shape to handle the business for export largely through their own ports, although all during 1918 considerable Canadian traffic found its way out through Portland.

It was not, therefore, a hard thing, so far as physical elements went, to control the flow of traffic into New England. The very fact that the district director had, what might be called a strangle hold on the manufacturers of New England, made the exercise of his authority liable to be particularly irritating. It is a remarkable tribute to the personality of the district director that a free and quite drastic exercise of this authority did not, to any alarming extent, stir up antagonism in New England. Without repetition, or without going at great length into details, it is impossible to draw a clear picture of the extent and intensity of the difficulties which were overcome in handling this New England situation. The people of New England are prone to be severe critics, as presidents of New England railroads have found in the past. On the other hand, they are amenable to reason and have a strong sense of fair play. They have had, in the past, some examples of poor railroading, but showed themselves, during 1918, capable of understanding and appreciating good railroading.

The record made in handling the situation in New England with the New Haven still under the cloud of the Mellen regime and the Boston & Maine in receivers' hands, with a dangerous coal shortage and unprecedented business activities, should go down in the history of American railroading as one of the achievements of which railroad men may well be proud.

### The Ohio-Indiana District

On June 1, the committee at Pittsburgh, mentioned heretofore, of which J. J. Turner of the Pennsylvania was chairman, was abolished; and H. A. Worcester was appointed district director. At this time, the Pennsylvania lines west had an accumulation above normal of about 15,000 cars eastbound and 500 cars westbound. The problem before the district director, therefore, was one of immediately relieving this situation. Both the Baltimore & Ohio and the Erie were used to divert cars; the Baltimore & Ohio at Columbus for movement to Harrisburg, and the Erie and the New York Central for westbound business. By July 8, the situation had been cleared up and embargoes were lifted. The Cleveland, Cincinnati, Chicago & St. Louis during the whole of 1918, was in particularly good shape. Some account is given elsewhere of the rehabilitation of this road following the floods of 1913. Heavy purchases of equipment in 1916 and 1917 were a very important factor in the operation of the property under its federal manager, and the ability of the road to handle increased business was an important factor in the operation of the entire Ohio-Indiana district.

### Conclusion

It should be said in conclusion that the organization which the eastern regional director formed immediately on taking charge, contained every evidence of a desire to handle the situation with as little disturbance of the rights of each of the individual roads in this territory as was possible. Drastic measures were needed and no hesitancy was shown in applying these measures. A. H. Smith, in accepting the eastern regional directorship, took upon himself war duties of a peculiarly trying nature where failure might have meant unspeakable disaster. He carried these duties out with a fearlessness that has won admiration from railroad men all over the country as well as government officers with whom he has dealt and with whom he has been on the best of terms.

# Some Interesting Features of Federal Operation\*

## Some of the Critical Situations Which Confronted the Railway Administration in Meeting War Time Needs

By Carl R. Gray

President Western Maryland Railroad Company; Formerly Director of Operation, U. S. Railroad Administration

**W**HY were the railroads taken over by the government? The reasons were three-fold: The first was financial, the second was because of the necessity for a stabilization of the labor situation, and the third was because of the utter impossibility of their functioning as corporations in the matter in which the government demanded and needed.

Three serious situations confronted us at that time. The volume of business late in 1917 was very great, while about December 1 we went into the longest continued, and most severe weather conditions of which the Weather Bureau has any record. This continued until practically the latter part of March. We had at Hampton Roads (Norfolk and Newport News), for nearly three months, frozen coal in the cars, where they never had a frozen car of coal in all the history of that part of the country.

### Coal Situation Serious

The coal situation was the most serious. The stock had been largely used up. New England ordinarily depends upon coastwise shipping for its coal, and the coastwise ships had been taken for overseas traffic. That presented the most serious single situation at that time, because, in addition to the industrial danger, there was absolute fear of suffering. For several months we were on the verge of real suffering in that northern part of the country. The production of the year previous had been the record one up to that time, larger by 12 per cent than the preceding year and aggregating 544,000,000 tons of soft coal.

The Fuel Administration advised us that, to meet absolute necessities, there had to be produced 635,000,000 tons of soft coal. The Railroad Administration took hold on the 28th day of December, 1917. At that time, weather conditions were frightful, beyond comparison. We had a passenger train, as I recall, stuck in the snow in the streets of Syracuse. Up to that time, the northern lines from Buffalo were subjected to the least strain from the war conditions, and had been our safety valve; but with the severe weather conditions, they, too, became affected, so that in the month of January we fell behind 79,000 carloads of coal.

The most drastic measures had to be adopted, and the use for other purposes, of that class of cars which would load coal, had to be denied to everybody. The railroads which had the greatest potentialities in the production and transportation of soft coal had to be isolated as trunk lines. It became necessary to cut in two the great Pennsylvania line, and the Baltimore & Ohio system, so as to enable them to devote their entire energies to the movement of soft coal.

In the month of February, we got on our feet with the production of soft coal. In that month we increased over the record year 24,366 cars. In March 13,000; April, 64,000; May, 27,000; June, 92,000; July, 150,000; August, 160,000; September, 128,000.

Now, what was done in the handling of coal was also reflecting itself in the production of steel. The steel curve commenced to go downward in September, 1917; it went down at an alarming rate; the curve of actual coal production went down from October, 1917, even more radically. Of course,

the one depended absolutely upon the other. Seventeen per cent of the blast furnaces were shut down in January for want of fuel and before that situation could be gotten in hand 22 per cent was reached on February 1. The blast furnace is the basis of steel production and of course steel is the most essential of all products used in connection with the war.

### Allies Food Shortage Threatened to End War

The food situation can hardly be overstated; we had to watch New England, but in some way the seriousness as affecting the European situation had not been fully appreciated. On the night of February 8, the director general told me that a committee from the Council of National Defense had asked to see him at nine o'clock the next morning; but that he had to go to the capital, so he had asked them to see me. At nine o'clock two cabinet ministers, the chairman of the Shipping Board, the food administrator and the fuel administrator came in. They had cablegrams from the three Premiers of Great Britain, France and Italy to their respective ambassadors, stating that unless the food program promised by Mr. Hoover was not only maintained, but the deficiency made up, that the war would be over on April 1. I asked Mr. Hoover what he had promised, and he said 1,160,000 tons a month, commencing with January 1.

I said: "How much have you furnished?" He said: "In January 750,000 tons; February is one-third gone, and we are going at the rate of 500,000 tons; so unless the situation is remedied, we will reach the first day of March over 1,000,000 tons short. There is just one month between that time and the time these gentlemen have given as the ultimate date." The message from the French Premier said that the French rations had been reduced to the armies in the field; the Italian message said that the rations had been reduced twice to the armies in the field, and could not be again reduced. Mr. McAdoo approved the action that was recommended, and that night an order was sent out which absolutely forbade the loading of box cars, except at freight houses, for anything except food. That was carried to the extreme that we went into the large industries in the East and in the Southeast, and pulled out the empty cars where they had been placed to load. We set out trains of loads, and we moved those empties in preference to everything. While this condition existed, from February 9, with all its rigor until March 1, and in a more elastic form until the 15th of March, there was not one single complaint made by anybody in the United States that reached Washington with regard to it. That order remained in effect, the only exceptions being on behalf of the War Department, until about March 1. Then it was relaxed somewhat. On March 15, we had every elevator on the Atlantic coast filled with grain, and we had 6,615 cars of other food up against the seaboard. I don't believe I ever dictated a letter in which I took so much genuine satisfaction as I did the letter which I dictated for Mr. McAdoo's signature, to the three ambassadors, in which I called attention to this former call of theirs, and to the representations made at that time, and called their attention to the 6,615 cars up against the water-front. And then, as a sort of a stinger, I added to the letter that while we would regard with the most serious concern the placing of an embargo on food

\*Abstracted from an address delivered before the St. Louis Railway Club on April 22, 1919.

for the Allies, unless they could improve the situation, we would be compelled to take that action. From then until the armistice was signed, which, of course, means for all time, there never was a moment when there was a lack of a large surplus of food for the Allies against our seaboard.

### Congestion on Eastern Lines

Another interesting feature was the movement of troops. At the time we were struggling with the coal and food, we were at the same time facing a most acute situation which arose with regard to transportation of troops. We were advised by the military authorities that they had arranged for the immediate movement overseas of 1,000,000 of troops.

I would like you to visualize that situation for a minute; the congestion in the United States was all in one locality. Everything else in the shape of blockades was a reflex of that condition. If you draw a line from Portland, Me., to Albany, N. Y., and over to Rochester, down to Harrisburg, and over to Baltimore, east of that line, you have it all.

There were, when the Railroad Administration took hold, in the territory east of Chicago and St. Louis and north of the Ohio and Potomac Rivers, 62,247 delayed loads; that means loads delayed short of their destination and which it was not possible to move, and which had not moved within 24 hours. There was held at and west of St. Louis 31,421 cars; at and west of Chicago 24,000 odd; at and south of the Ohio River gateways 14,000 odd; south of the Potomac River gateways 15,000 odd. There was a total of 148,810 delayed loads; nearly all for the limited territory I have outlined. The War Department decided to move practically all of those troops to New York, and therefore it meant an added load in this congested territory. From the first of January to the time of the armistice, the railroads moved a total of 6,496,000 troops, and the maximum was in July, when we moved 1,147,013 men, an average of 748 miles each. That is the largest troop movement ever made in the history of the world. A large proportion of these men were brought entirely across the continent. It takes 59 trains of passenger and 59 trains of impedimenta to move a division of troops.

One of the difficulties that brought the railroads into the congestion, in the first place, was the peculiarity of their responsibilities as common carriers. Now, when that was complicated by the war power of the government to require its freight to be moved in absolute preference and priority, and then when you turn loose a swarm of young men clothed in uniform, invested with the power of the United States government on the railroad men of this country who are, in themselves, taught to respect authority, and each one of those officers functioning with respect only to his individual interests, you can very readily see one of the causes of congestion of the railroads.

We tried, at Pittsburgh, before federal control, to carry out instructions; and we put a switch engine at work there at Pitcairn, on the Pennsylvania, to carry out the instructions with respect to strict priority. That engine switched an entire day—and got out seven loads. That is just a sample of what was done in a yard which ordinarily handled from five thousand to seven thousand cars. So that it was absolutely impossible to carry out our work under those circumstances. We hear a great deal of discussion of the question of whether or not the handling of the railroads was economical. I do not need to tell you that there was not anything economical about it; there is nothing economical about war; war itself is a waste, as is everything connected with it. Transportation was wasted; it had to be wasted, to do these things which this government needed to have done.

### The Labor Situation

The other situation that I referred to was the matter of labor. Railroad men, as a class, have never been equitably paid; there is not a man of us who has had to handle large

numbers of railroad employees who has not felt that, outside of the specialized classes of railroad men, we were a training school for the other industrial activities of this country. When the Wage Commission was appointed by the director general to go into this question it found that of 2,000,000 employees, 51 per cent received under \$75 a month; and that 80 per cent, 1,600,000 of the 2,000,000, got less than \$100.

The Lane Commission was appointed, and made its findings admittedly on the ground of justice, as distinguished from the equitable arrangements and relationships as between wages which had grown up in the railroad business. They took the man's earnings, instead of his rating. Where a man in a certain class was working longer than any other, you can see that his average earnings would be larger, while their rating would be the same. For instance, a fireman would work ordinarily more regularly than a brakeman. While the rates were relatively the same, the average earning of the fireman was greater; that penalized the firemen, in that award, because they started in with the \$50 earnings basis; all earnings of \$50 or lower were given a flat increase, I think of about 45 per cent; from that it went up in the shape of a cone, until it reached \$250 a month and higher, where they allowed no increase. It resulted in giving conductors 12½ per cent increase and brakemen 39½ per cent increase, thereby overturning the relationship between those classes of employees which had always been adjusted with respect to each other. The firemen were raised 34½ per cent; the engineers 11½ per cent, so the firemen went out of relationship with the engineers; the firemen went out of relationship to the brakemen; the engineers were out of relationship to the conductors. One of the grotesque results was that we had in the West, firemen earning more money than the engineers on the same engines; and there were other applications of rates on these different bases.

The Wage Commission recognized that this would happen as a result of these readjustments, and it also left for future consideration any question of the competition that we had to meet with respect to other industries—notably the Shipping Board. With regard to the mechanical crafts, we were paying all the way from 35 cents an hour on some railroads to 53 cents an hour, the highest rate for skilled mechanics. The Shipping Board and the ship-building companies were paying from a minimum of 74 cents up to 93 cents—and there was no question of skill. A man who could learn to run a riveting hammer or who could drive a nail and handle a saw was a mechanic, and got those rates.

Now, the result was that most of the best men had been drawn out of our shops; only the older men, and those with strong home ties remained. In fact, the more or less inefficient men were left to us. That was the first adjustment which had to be made.

When the rate was put up to 68 cents it was still 6 cents under the lowest rate paid by the ship builders, and it was worthy of note that their rate was almost immediately increased to a minimum of 80½ cents.

The government has a great many disabilities to work under when it comes to the handling of labor. One is that it must be consistent. You cannot say to a man when you have one employed who is repairing a Maine Central car on the Florida East Coast that he should be paid any differently or under any different conditions from a man who is repairing a New York Central car on the Grand Trunk; so that the government, after all, was forced to an even level with those things. The law of supply and demand which can obtain where there is individual employment is almost eliminated in this case, on the part of the government. It also means this—it is one of the most striking features, it seems to me, of the inadequacy of government operation,—that it has to be on a dead level. And, if you are short of men in a competitive territory, you have to let it go; otherwise, it means that you

have got to make a raise over the whole country. Of the different things which I encountered which satisfied me that federal operation of all of the railroads would be an economic mistake, that was the most effective.

There was another peculiar development: When the director general took hold, he said to the railroad employees, "You must not strike; it is unspeakable—it is unthinkable that men engaged in transportation shall be permitted to strike against their government."

They very promptly said to him: "What are you going to give us in place of this right? Because there is where our protection comes; our contracts provide that we shall carry our grievances through to a certain designated officer of the railroad, and then in default of an equitable adjustment we have a right to strike; now you take that away, and you leave us absolutely at the mercy of the railroad officers."

The result of that was the selection, first, of Board of Adjustment No. 1 for train and enginemen, which was a bi-partisan board; there were four railroad officers, all expert in the handling of labor matters; they were geographically selected from the different branches of railway service, and there were four labor men, one from each of the four big organizations.

When these men were selected, Mr. Carter, the Director of the Division of Labor, and I spoke to them; we told them that they were expected to construe as would a supreme court the contracts which each of the different railroad companies had with the employees in that service. The manner in which it should be handled was stipulated; it was to be presented in an orderly way, and satisfactorily to all sides, and it supplied this agency in place of the right to strike, which had been arbitrarily withdrawn.

The result of that is very interesting. When I left Washington, Board of Adjustment No. 1 had rendered 210 decisions, and not in one single case had there been a dissenting vote. It had been absolutely unanimous.

It seems to me that men have to be pretty dumb if they let an object lesson like this pass by. Out of all this is certainly going to come some advantage—from this experience we have had with an even balanced bi-partisan appellate court.

The point about it is that one side or the other does not dare to bring a matter in there without having a very strong element of justice involved. One of the difficulties that we observed was that the railroad officers themselves were not as careful about preparing their cases as the men were. This is a thing, of course, which very easily adjusts itself; but I have believed that under such a system employed in the United States, there could be better discipline, and that the subordinate officer, if he conceived this thing in the right spirit, would feel impelled to apply discipline under this principle

very much more than he would under the old plan, because he never knew then, whether above him, somewhere, might not be an officer who would be weak enough to give way and practically nullify his use and value. Here is an evenly balanced court of final resort, and you have to win over one side or the other—one, at least, before you can get a decision.

I would be very derelict in my duty if I did not say that the men who stood behind this movement and supported it in every way, who worked themselves beyond anything that they had ever done before, to hold up the highest traditions of the profession, were the railroad officers. By a strange fate, in this case, they were the last to be recognized.

I wish I could tell you many of the things that came to the surface when the Railroad Administration was forming—all the complaints that came to Washington, personally and generally, in which the director general was solemnly advised that the railroad officials were laying down on him—cases in which he was told that they purposed to deliberately defeat all the plans of the Administration.

Anybody but a man eminently well poised would have been stampeded by the situation. But the time came, after he had made trips over the country and had met these officers, when, with the greatest gratification, he told me that in all his life he had never met a set of men who so measured up to what the emergency required as the railroad officers of this country.

## Railway Administration Collects Tie Statistics

C. A. MORSE, assistant director maintenance in charge of engineering and division of operation, United States Railroad Administration, has collected statistics showing the number of ties inserted for maintenance purposes by the roads under federal control separately for the three years of the test period, for the ten fiscal years from 1908 to 1917, inclusive, and for the calendar years 1917 and 1918, on the basis of which he has prepared an estimated program of renewals for this year. From the summary of this information, given herewith, it is noted that the average renewal of ties per mile of track for all roads under federal control for ten-year period (258) varies by only one per cent from that of the test period (261). The serious handicap under which the maintenance department labored in 1917 is indicated by the fact that a renewal of only 224 ties is shown, a decrease of 14 per cent, while in 1918 this figure was only 214, or a decrease of 18 per cent from the standard of the test period. To take up this deficiency the estimated program for 1919 contemplates the replacement of 282 ties per mile or eight per cent above the standard established by the test period.

STATISTICS OF TIE RENEWALS ON ROADS UNDER FEDERAL CONTROL

Region	Mileage			Test period					Average, ten fiscal years
	Main tracks	All tracks	Per cent sidings to all tracks	Years ended			Average test period		
				June, 1915	June, 1916	June, 1917			
Eastern	45,093	68,795	34	21,418,229	15,437,157	14,477,924	17,046,906	17,439,624	
Allegheny	28,222	44,056	36	12,365,703	11,203,789	10,250,718	11,279,377	10,356,666	
Pocahontas	6,060	8,887	32	3,467,486	3,629,486	3,175,235	3,432,515	2,532,878	
Southern	41,316	55,420	25	18,436,374	18,710,978	16,166,189	17,782,366	16,879,416	
Southwestern	32,808	43,622	25	12,905,094	14,530,062	10,936,410	12,765,499	13,089,762	
Central Western	53,956	71,818	25	17,518,794	18,044,571	15,011,501	16,850,922	17,201,663	
Northwestern	52,370	71,130	26	15,820,199	16,655,411	14,592,271	15,657,858	14,793,386	
Total, All Regions	259,825	363,728	29	101,931,879	98,211,454	84,610,248	94,835,443	92,293,395	

Region	Average ties per mile—all tracks				
	Test period (Average)	Ten years (Average)	Calendar year 1917	Calendar year 1918	Estimate year 1919
Eastern	248	254	214	211	276
Allegheny	256	237	182	173	278
Pocahontas	387	287	335	389	352
Southern	321	315	282	262	267
Southwestern	293	309	245	221	278
Central Western	235	243	203	220	251
Northwestern	220	208	209	183	243
Total, All Regions	261	258	224	214	282

Mileage as of December 31, 1918, and is mileage maintained. Total "Average Test Period" includes eighty-four small roads with 6,847 miles and 1,625,896 ties, which roads do not enter total "Average Ten Years" because of incomplete reports.

## Federal Control of Rates Upheld by Supreme Court

THE POWER OF THE PRESIDENT, exercised through the director general of railroads, to establish rates for application to intrastate as well as to interstate traffic, superseding the authority of the states, was upheld by unanimous decision of the United States Supreme Court rendered on Monday. The decision specifically upheld the freight and passenger rate increases made by order of Director General McAdoo last June, and decrees of the North Dakota Supreme Court enjoining the Northern Pacific Railroad and Director General Hines from enforcing the order in that state were reversed. The court ruled against the decision of the lower court that held that the existing intrastate rates and regulations were left in effect as the exercise of police power. The federal authority was sustained on the ground that it was the exercise of a war power and that to construe it as being limited by state authority would be but to deny its existence. In a similar opinion the court sustained the federal government in establishing telegraph and telephone rates for intrastate business, but from this opinion Justice Brandeis dissented. The opinion of the court in the railroad case was given by Chief Justice White.

"No elaboration," Chief Justice White said, in rendering the opinion, "could make clearer than do the act of Congress of 1916, the proclamation of the President exerting the powers given, and the act of 1918 dealing with the situation created by the exercise of such authority, that no divided but a complete possession and control were given the United States for all purposes as to the railroads in question.

"But, if it be conceded that, despite the absolute clarity of the provisions concerning the control given the United States, and the all-embracing scope of that control, there is room for some doubt, consideration of the general context completely dispels hesitancy. How can any other conclusion be reached, if consideration be given the comprehensive provisions concerning the administration by the United States of the property which it was authorized to take, the final obligations under which it came, and all the other duties and exactions which the act imposed, contemplating one control, one administration, one power for the accomplishment of the one purpose, the complete possession by governmental authority to replace for the period provided the private ownership theretofore existing? This being true, it must follow that there is no basis for the contention that the power to make rates and enforce them, which was plainly essential to the authority given, was not included in it.

"Conclusive as are these inferences they are superfluous, since the portion of Section 10 in express terms confers the complete and undivided powers to fix rates.

"A brief consideration of the contentions relied upon to the contrary will at once show the mistaken premises upon which they rest. Besides, the presumption in question but denied the power exerted in the adoption of the statute and displaced by an imaginary hypothesis the dominant presumption which arose by operation of the Constitution as an inevitable effect of the adoption of the statute, as shown by the following:

"(A) The complete and undivided character of the war power of the United States is not disputable. On the face of the statutes it is manifest that they were in terms based upon the war power, since the authority they gave arose only because of the existence of war, and the right to exert such authority was to cease upon the war's termination. To interpret, therefore, the exercise of the power by a presumption of the continuance of a state of war limiting and controlling the national authority was but to deny its existence.

"(B) The elementary principle that under the Constitution

the authority of the government of the United States is paramount when exerted as to subjects concerning which it has the power to control, is indisputable. This being true it results that, although authority to regulate within a given sphere may exist in both the United States and in the states, when the former calls into play constitutional authority within such general sphere the necessary effect of doing so is that, to the extent that any conflict arises, the state power is limited, since in case of conflict that which is paramount necessarily controls that which is subordinate.

"Again, as the power which was exerted was supreme, to interpret it upon the basis that its exercise must be presumed to be limited was to deny the power itself.

"Thus, while admitting that the power which was conferred to initiate rates, when considered in and of itself, included all rates, it is nevertheless said that such power must be presumed to be limited to the only character of rates which under the prior law the Interstate Commerce Commission had the power to consider, that is, interstate rates, because the new rates, when initiated, were to be acted upon by that body. As, however, the statute in terms gives power to the Interstate Commerce Commission to consider the new rates in the light of the new and unified control which it creates, the error in the contention becomes manifest, even putting out of view the fact that by the effect of the duty imposed and the new control created the new rates applying to the new conditions were within the purview of the power which the Interstate Commerce Commission previously possessed.

"The relief afforded against the officer of the United States proceeded upon the basis that he was exerting a power not conferred by the statute, to the detriment of the rights and duties of the state authority, and was subject therefore to be restrained by state power within the limits of the statute. Upon the premise upon which it rests, that is, the unlawful acts of the officer, the proposition is undoubted, but in view of our conclusion the acts of the officers complained of were authorized by the law of the United States."

The court lost little time in arriving at a conclusion in these cases, which were argued on May 5. The railroad case was selected as a test to determine a difference of opinion between the director general and the state authorities.

L. E. Shepherd, heretofore vice-president, was elected grand president of the Order of Railroad Conductors, at the convention of that brotherhood in St. Louis, on May 29, succeeding A. B. Garretson.

# Compilation of Operating Statistics Reports

The Value of These Reports Depends on Promptness and Care in Obtaining the Basic Figures

THE SEVEN REPORTS called for by the Operating Statistics Section of the Division of Operation of the United States Railroad Administration have been in use since August, 1918. Although the forms used for making these reports are standard for all roads, there is a considerable difference in the methods used in gathering the figures and working these figures up. Where the names of roads are used in this article, it is not meant to imply that other roads may not be using just as good or better methods.

While the operating statistics are for use by the central and

8:00 A.M. 5:00 P.M.

Method of Handling Statistical Reports in Delaware & Hudson Office.

regional administrations as a check on each road under a federal or general manager, it is the consensus of opinion of the operating officers, with whom the *Railway Age* has been corresponding on this subject, that these statistics are of great direct value to division superintendents, general superintendents and general managers.

The first five forms deal with freight and passenger train performance, locomotive performance, and car performance. Locomotive performance is supplemented by a report O.S.-4

On some roads the conductors' wheel reports are mailed directly to the car accountant's office, where the necessary mileage and tonnage information and potential tonnage are added and the multiplications and divisions are made generally by some kind of mechanical calculating device. On other roads the train dispatchers' sheets and conductors' wheel reports are received in the superintendent's office and the figures transferred there to daily reports of train performance with weekly or monthly summaries of these reports.

For instance, on the Lehigh Valley the statistics for OS-1, except light locomotive mileage, are compiled in the division offices daily, where a report is made showing individual train performance. This report is forwarded to the superintendent of transportation, where it is checked and the locomotive mileage entered to the credit of individual locomotives. Totals of the daily reports are transferred in the superintendent's office to a summary sheet covering four periods, the first three of seven days each and the fourth the remainder of the month. These summary sheets are sent to the superintendent of transportation's office at the end of each period and are checked and returned to the division office to have the next period entered. When the month is complete the sheets are retained by the superintendent of transportation.

The Illinois Central is another example of a road working up the original data in the superintendent's office. On the Illinois Central all the figures for OS-1, OS-2 and OS-3, with the exception of items 5, 16 and 26, and OS-5, with the exception of items 1-6, inclusive, are worked up in the division superintendent's office from conductors' wheel reports, dispatchers' train sheets, time slips, and master mechanics' or foremen's reports. The forms OS-1 to OS-5, inclusive, are actually filled out in the car accountant's office, to which

on the distribution of locomotive hours. The basic information which is required, in regard to freight train performance, is the train mileage divided as between east and west, together with the locomotive miles and car miles, the gross and net ton mileage and the train hours. All of this information may be obtained from conductors' wheel reports, or these reports may be supplemented by train dispatchers' sheets and enginemen's time slips. A number of roads use train conductors' wheel reports only, and these reports are checked against a train roster to check against errors in not reporting trains in.

the reports mentioned above are sent. Thus freight conductors arriving at the end of their run detach the narrow sheets from the broad copies of their wheel reports (the broad or large sheet is shown herewith) and forward them to the car accountant so that there may be no delay in posting the movements of cars. The conductors then send the large copies to the superintendent's office, where the basic data is drawn off, as shown on Illinois Central form 1038; the large copies are then sent to the car accountant's office to be filed.

the number of hours locomotives are awaiting repairs, undergoing repairs and are stored or awaiting sale.

On the Missouri Pacific this OS-4 report is compiled in the chief dispatcher's office from train sheets, and this is balanced against the reports furnished by enginehouse forces and a complete accounting for the entire 24 hours is required for each locomotive. On the Erie the report is prepared by the general mechanical superintendent. On the Pere Marquette the information for OS-4 is obtained from special reports rendered by each roundhouse foreman. Where the

covers time of locomotives in hands of or awaiting orders of mechanical department for repairs, when held more than 24 hours on that account; locomotives in shops or enginehouse undergoing repairs, when held more than 24 hours on that account; and locomotives stored or awaiting sale, including vacated or condemned locomotives. This information is then assembled and reported by each division to the accounting department on Form OS-4, where reports for the ten divisions are consolidated.

On the Delaware & Hudson the preparation of the figures

yard office is located near the roundhouse, the report is rendered jointly by the roundhouse foreman and the yard master.

On the Southern Pacific form OS-4 is compiled for each of the ten operating divisions, report for each division being made in the office of the division superintendent. A separate sheet is used to assemble the time of each locomotive, a separate line on the report being used for each day of the month. Columns are provided for class of service, time on road, terminal delay, time in enginehouse (separately for mechanical and transportation departments), awaiting repairs and undergoing repairs, with separate column for time off

for OS-4 is carried out through the medium of chronological record of distribution of locomotive hours for each individual locomotive, Exhibit "C." The road time is obtained from the engineers' time slips, from which they receive their pay, these being available (loaned to Bureau of Operating Statistics by Auditor's office) currently through the month. The terminal and in-enginehouse time is derived from the daily record of movement of engines at terminals, which is received daily from each engine terminal. Stored and unserviceable time is derived from daily advices from the superintendent of motive power. The coal consumed is derived from the daily report made by each coaling station and for-

Holerith Card of the Minneapolis, St. Paul & Sault Ste. Marie

division, thus allowing for a balance of 24 hours for each locomotive. Information for the first two items is obtained from the dispatchers' sheets. Terminal delay is taken from dispatchers' sheets used in conjunction with the turning power record, described below. The other information is taken from special forms made at each enginehouse or point of layover and termed, turning power record and locomotive shop hours for OS-4. The turning power record covers time of each locomotive handled in the enginehouse in one day, showing time in, time out, hours awaiting or undergoing repairs, and awaiting service. Report of locomotive shop hours

warded daily. It will be noted that the form for distribution of locomotive hours provides space for inserting, by symbols, the division and direction over which engines are moving, as well as terminals at which they are held. Space is also provided for entering through the medium of a symbol record the principal causes of terminal delay.

The particular advantage seen in the chronological record of the individual locomotive is that the failure of any engine's daily hours, including road service and at terminals, to total 24 indicates an error or the non-receipt of some essential report, and a blank space in the day's record points the way

reports accumulated in each train dispatcher's office and forwarded to the superintendent of transportation's office, who furnishes this data daily by divisions to car accountant. The net ton miles and total car miles shown on this report are figures direct from conductors' freight wheel reports in car accountant's office.

One fundamental difference between different roads, in compiling operating statistics, is the use or non-use of the Hollerith machine. The Chicago, Rock Island & Pacific appears to have tackled this question of the use of this machine for these operating statistics in a common sense and fearless way. It will be noticed that the figures are put on a Hollerith card in pencil and then punched on the card by Hollerith operators, and the holes are punched where necessary through the written-on figures.

Nearly all of the roads use some kind of mechanical devices for checking totals and for performing divisions and multiplications. The comptometer is the most commonly used machine, but some roads are using Burroughs non-listing machines in its place and others are using the Monroe calculating machine, the Millionaire, the Brunsviga and the Midget calculating machines.

## Department of Transportation Proposed by Railway Executives

**A** REVISED PLAN of railroad regulation proposed by the Association of Railway Executives was outlined by Alfred P. Thom, counsel for the association, in an address at the meeting of the American Short Line Railroad Association on June 4. The plan provides for the creation of a department of transportation, consisting of three men appointed by the President, who would be charged with the duty of determining the public policy as to the requirements of the public in the way of transportation facilities and service and the financial requirements of the carriers necessary to meet the public demand, and would present the situation to the rate-making tribunal as the representative of the public. This plan, Mr. Thom said, has been adopted by the railway executives as a substitute for the proposed appointment of a secretary of transportation as a cabinet officer, which is regarded as unwise because of the danger of too much political influence. It would remove the settlement of railroad questions from the domain of controversies between the railroads on one side and the public on the other and would also promote a feeling of confidence among investors. The department, he said, should consist of the best men in the country, to be paid salaries of, say, \$25,000 a year, and to be appointed for long terms of office, except that he suggested that the first appointees be selected for terms of two, three and four years, respectively.

It is proposed that the country be divided into rate-making districts and that the department should study the amount of operating revenues the carriers in each district should have to pay: (1) all expenses for operation and maintenance, including labor; (2) a fair return on the value of the property devoted to the public service, and (3) a surplus sufficient to afford a basis of credit and attract the investment of new capital; this amount to be certified to the commission, which would be required to accept it unless good cause were shown to the contrary, as a basis for its rate decisions.

The plan also provides for the creation of regional commissions, consisting of one representative from each state, to decide local questions. The railway executives also propose a permissive system of consolidation, under federal authority, and the supervision of security issues by the Interstate Commerce Commission, while the police powers and taxing powers of the several states would not be interfered with.

"The railway executives have arrived at very definite conclusions as to the solution of the railroad problem," Mr. Thom said. "We regard it primarily as a problem of finances. We have every other element needed except the assurance of the financial strength necessary to make the railroad service adequate to the public needs. The government can no longer regulate the railroads with reference mainly to the restriction of their charges; it must look to what is necessary to provide adequate service."

He opposed the plan of a guaranteed return as leading inevitably to government ownership, because, he said, the government is not going to take the responsibility of a guarantee without taking control. He also opposed the proposal for what he termed "a guarantee out of the pockets of the shippers," in other words, a rule that rates be made sufficient to provide a return of 6 or 6½ per cent on the investment, because the fixed percentage would not be adjustable to changing economic conditions. The percentage, he said, would have to be fixed with relation to the economic conditions of today and if these were so changed as to leave it too high, the reaction would probably sweep private ownership off the earth. Also, he said that no matter where the percentage starts, when Congress gets through with it, it will not be so high that Congressmen will not feel easy in going home to defend it, and any percentage they would feel ready to defend would be too low for the railroads to live on. Moreover, the exact percentage could be argued but once, before Congress, and the rate once determined would remain until changed by another act of Congress.

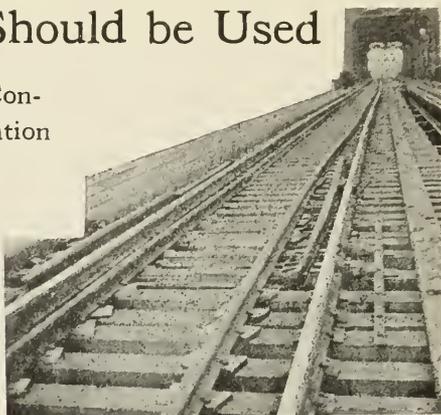

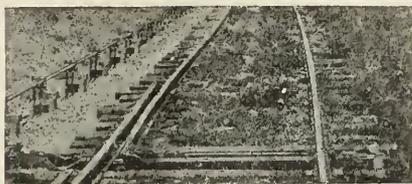

"The principle we adopt must be adjustable," he said. "Regulating bodies heretofore have gone on the principle of making rates as low as they could. Can we expect a body that has spent its official life in trying to keep down rates to have the confidence of the investing public? Regulating bodies are in an exposed condition, always subject to political pressure which they must resist before taking any action toward advancing rates. Something must be done to remove the settlement of this question from the controversial atmosphere of litigation in which the selfish interests of the railroads appear to be arrayed against the public. We cannot win in a controversy with the public. We must have a public body to determine as a public question the needs of the public for service and the amount of money which will be provided for those needs and then become a party before the rate-making body as the representative of the public and not of either side."

Mr. Thom declared also that provision must be made for the transition of the railroads back to private management. This cannot be done, he said, without some preparation, because the railroads are not in the condition in which the government took them over. At that time operating expenses were consuming 70 to 72 cents out of every dollar of railroad earnings, while the government has found it necessary to add to the expenses, as one item, the increased labor cost of approximately \$1,000,000,000 a year until in recent months operating expenses have taken 95 to 97 cents out of every dollar of earnings.

"The government is not in a position to return today what it took over," Mr. Thom said. "The law ought to provide a definite date for the return to private management, and there should be an inquiry by some governmental authority as to what should be done to restore the conditions which the government has disturbed, and especially the proper relationship between revenues and expenses. The government has no right to restore the railroads in a bankrupt condition. We therefore propose that until the Interstate Commerce Commission or other government authority can establish an earning capacity in keeping with the expense account, the present guarantee of compensation should, in morals and in right, be continued."

# Derails and Where They Should be Used

A Study of the Types Used, the Conditions Governing Their Application and the Results Obtained.

Three Types of Derails

**D**ERAILS ARE EMPLOYED so universally and are so common a part of the present roadway construction that but a passing thought is ordinarily given to their use. Railway men are familiar with the common practice on their own lines and seldom realize the wide variance in the use of this device on other roads. For instance, some roads like the New York Central, Lines East, make it a practice to install derails on passing tracks, while others like the Long Island are abandoning them for this purpose. The Illinois Central and the Chicago, Rock Island & Pacific make it a practice to install derails on all tracks that lead out to the main line on which cars may stand, while the Chicago, Milwaukee & St. Paul and the Chicago, Burlington & Quincy use them in such tracks only where adverse grades or other conditions warrant. On some lines it is the practice to place derails in turntable leads, while many other roads do not require protection at such points but may install derails at special locations such as at the foot of coal chute inclines, on breaker tracks or on tracks running through shop buildings for the protection of the buildings.

It is the general practice on the Lehigh Valley to use pipe-connected derails, while the Long Island prefers the hand throw type. Some roads use the pipe-connected type in automatic signal territory only, while others use the hand throw type irrespective of signals. Again some lines like the Philadelphia & Reading connect up all derails with the signal circuits through switch circuit controllers whether the derails are pipe connected or hand thrown, while other roads like the Delaware & Hudson use the switch circuit controller on hand throw derails, but not on the pipe connected type in automatic signal territory.

Again the tendency toward the more general use of derails varies greatly. The Rock Island, for example, is extending their use, while the Chicago Great Western has recently removed them from passing tracks. Practice again varies regarding the use of the split point or the block type of derail. Some roads use the split point in special cases only, others like the Northern Pacific make the split point type the standard, while the general tendency of many other roads is toward the use of the block derail.

As indicated above, the frequency and the conditions under which derails are used vary greatly. For this reason the *Railway Age* has secured and tabulated data covering the practices on 48 representative railroads in all parts of the United States and Canada in order to ascertain the conditions governing their installation at other than interlocking plants. In this investigation the following questions were asked:

(1) Are derails placed on all passing and other tracks

connecting with main tracks or on only those with particularly adverse conditions as to grade, vision, etc., or are they omitted from all such tracks? Is any distinction made between passing and industry tracks in this connection?

(2) Are derails commonly installed in tracks leading to turntables or at other special locations apart from the main track?

(3) Is the split point or block derail used?

(4) To what extent is the use of derails modified in automatic signal territory? Are derails in automatic signal territory equipped with switch circuit controllers?

(5) To what extent are the derails pipe-connected to the switch stand or hand thrown?

(6) Is the tendency toward the more general use of the derail, and if so under what conditions?

(7) Have any recent instances occurred where the use of derails has demonstrated the worth of their application?

The information received was tabulated in the table accompanying this article, but in studying this table it is to be understood that it indicates the general practice of individual roads, numerous exceptions to which will be found in the discussion following.

Sixteen of the 48 roads replying to the circular of inquiry install derails on both passing and industry tracks; 13 install them only on industry tracks, while 19 install them only at locations where particularly adverse conditions as to grade, vision, etc., prevail.

## Installation on Both Passing and Industry Tracks

In considering the installation of derails on both passing and industry tracks many different practices again exist. Some roads place derails on both classes of tracks irrespective of the conditions existing, while others make exceptions to this rule and use derails only where adverse conditions are present. Again derails may be omitted at certain points on lines on which the general practice is to equip all sidings with derails because grade conditions may not warrant their use, while still other roads will protect all main line turnouts and omit this protection on branch lines where traffic is light. Derails are omitted on passing tracks by some roads because these tracks are only used for the purpose indicated and it is felt that, with a train in the clear, there is no need of derails as the cars are under the control of the engineman. However, on other lines the management feels that it is as important to place derails on these tracks as on industry and business tracks because the derail definitely marks the clearance point and forces obedience in observing it, thus preventing a train stopping at a point of limited clearance.

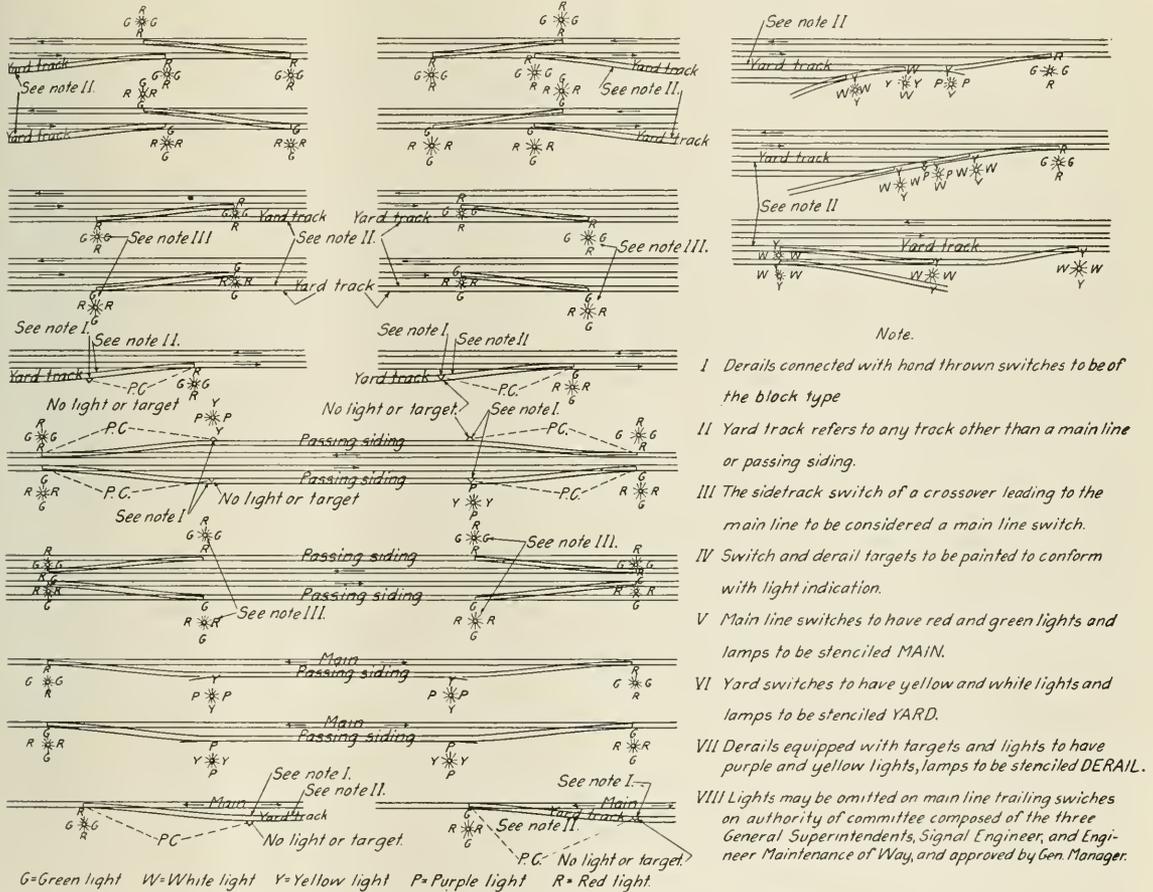

Many roads make it a practice to install derails on both passing and industry tracks, including the Pennsylvania Rail-

exist. The Lehigh Valley places derails at the fouling points on all passing sidings and industrial tracks where there may be danger of cars dropping and fouling other tracks.

The Long Island no longer requires the use of derails on passing sidings and is abandoning them for this purpose, while the Missouri, Kansas & Texas and the Minneapolis & St. Louis do not make it a practice to install derails on such tracks. The Chicago Great Western has a few derails on passing tracks, but this is not the general practice, and recently a number of derails have been removed from passing tracks because with only a few such places so equipped there was a

Western, the Lehigh Valley, the Long Island, the Boston & Maine, the Louisville & Nashville, the Norfolk & Western, the Missouri, Kansas & Texas, the Seaboard Air Line and the Minneapolis & St. Louis. It is the practice of the Lackawanna to install derails on all industrial sidings, while the Atlantic Coast Line occasionally omits their installation where the grade of the industry track falls from the main line. On the Boston & Maine it is now the standard practice to use derails on all new industry tracks, and the same practice applies on the Nashville, Chattanooga & St. Louis. While the entire road is not equipped at the present time this work is being

**The Use of Derails Under Different Conditions on the New York, New Haven & Hartford**

liability of oversight on the part of trainmen and this condition caused more frequent derailments than if the derails were entirely dispensed with.

**The Use of Derails on Industry Tracks**

The conditions governing the installation of derails on industry tracks vary considerably on the different roads using them for protection at such points. Some lines make it a practice to place derails on all industrial tracks, irrespective of grade or speed conditions, while others omit them at points where the grade of the industry track falls from the main line. Still other lines place derails only on tracks where there is a possibility of cars being blown or pinched out to foul the main track.

Among the roads installing derails on station, industry, business and private tracks are the Delaware, Lackawanna &

done gradually and the places where derails are needed the worst are being equipped first. Road G, located in the central part of the country, installs a derail, derailing in both directions on station and industrial sidings.

The practice on the Union Pacific is to place derails on all tracks where cars are set out if these tracks are connected with the main line or if they are branch tracks, derails are then placed somewhere between such tracks and the main line for its protection. Other lines make it a practice to place derails at the fouling points on all industrial tracks where grade conditions warrant and on all tracks where cars are left standing if there is the slightest possibility of their being blown out or pinched out where they might foul the main line. Some roads following this practice are the Lehigh Valley, the Rock Island, the Illinois Central and the Mobile & Ohio.

The use of derails on the Central of Georgia is in line with

the following maintenance of way rule: "Main track must be protected by approved derailing devices so located that derailed cars will clear the main line on all tracks leading therefrom excepting passing sidings. They must be set and locked for derailment at all times except when in use."

### The Use of Derails Under Special Conditions

The managements of some roads feel that proper protection is provided, not by the universal application of derails, but by their location at places where grade or other adverse conditions warrant. For example, on some roads derails are placed on sidings on which the grade descends toward the main line, while others place them at points where high winds exist which may blow cars out of the sidings. Again some states have recognized the necessity of derail installations under certain conditions and have passed legislation accordingly. In such cases the practice on the various roads in the states is more or less uniform. In Texas the following requirements are prescribed by law: "It shall be the duty of every railway corporation operating any line of railway in the state of Texas within six months after the passing of this act to place good and safe derailing switches on all of its sidings connecting with the main line of such railways and upon which sidings cars are left standing; provided, that no derailing switches shall be required where the sidings connect with the main line on an upgrade in the direction of the main line of one-half of one per cent or over; provided, further, that no derailing switches shall be required on inside tracks at terminal points where regular switching crews are employed."

Among the railroads installing derails on tracks where grade or other conditions warrant may be mentioned the Atchison, Topeka & Santa Fe, the Northern Pacific, the Union Pacific, the Delaware & Hudson, the Southern Pacific, the Chicago, Burlington & Quincy, the Chicago, Milwaukee & St. Paul, the Canadian Pacific, the Chicago & Alton, the Chesapeake & Ohio, the Pere Marquette, the Minneapolis, St. Paul & Sault Ste. Marie, the New York, Chicago & St. Louis, the Los Angeles & Salt Lake, the Chicago Great Western, the Denver & Rio Grande and the Colorado & Southern.

The practice on the Atchison, Topeka & Santa Fe, the Southern Pacific, Atlantic System and the Canadian Pacific is to install derails according to the grade conditions; the Santa Fe installs them at the ends of all tracks (excepting the passing tracks and wyes) where the grade ascending toward the main line is less than 0.5 per cent, while the Southern Pacific Lines install them on all tracks connecting with the main line except yard or other tracks on which switch engines are used, provided such tracks are not on a descending grade of 0.5 per cent or over. The Canadian Pacific protects the main track by derails where a siding may be used for storing cars having a gradient of 0.2 per cent or over toward the main line so located that there is danger of a runaway car getting either directly or through an intervening siding to the main track. These derails are placed on tracks coming off the main track or any other one leading to it.

The Northern Pacific places derails only on these tracks where particularly adverse conditions exist as to grade, vision, etc. Ordinarily derails are not placed on passing tracks unless they are also at times used as storage tracks. They are placed on all industry tracks where the grade toward the main line is such that a car could move when the brakes are off. Through the prairie country, which is subject to very high winds, this road places derails on all tracks where there is danger of cars being blown out on the main line, the entire matter being left to a considerable extent to the judgment of local officers. It is not the practice of the Southern Pacific to place derails on passing tracks and other tracks connected with the main line, but they are installed on such tracks wherever these are on a grade approaching a main line

or at points in level territory where unusual conditions such as high winds prevail. It is also its practice to put in derails on short spur tracks where cars that are set out for loading ordinarily come close to clearance points to prevent cars moved by the shipper from fouling the main track. The Chicago, Milwaukee & St. Paul makes it a point to install derails generally on main line turn-outs only and restricts their use to points where grades are such that cars could easily run out on the main line or be blown out by heavy winds.

### Installation of Derails at Turntables,

### Drawbridges and Other Locations

The general tendency of the railroads is not to install derails in turntable leads or at other special locations in yards or points not connected directly with the main line. However, in this respect the practice varies considerably on different roads, some installing derails in turntable leads, others at the foot of tracks leading from coal chutes, at box car loaders, around breaker tracks or for the protection of shop buildings.

Among the roads making it a general practice to install derails on tracks leading to turntables and like places involving risks are the Illinois Central, the Erie and the Missouri, Kansas & Texas. Other roads using them to a limited extent at such locations include the Lehigh Valley, the Chicago, Rock Island & Pacific, the Boston & Maine, the Baltimore & Ohio, and the Colorado & Southern. The Lehigh Valley, the Rock Island and the Boston & Maine make it a practice to install derails on tracks leading to turntables and other special locations where the grade is unfavorable, where there is a possibility of engines running out on the main track or at points where accidents have occurred or are liable to happen.

The Baltimore & Ohio and the Colorado & Southern have installed derails in a few special locations on tracks leading to turntables and at other points.

The New York, New Haven & Hartford makes it a practice to place derails at drawbridges. At these locations they are placed in tracks both with and against the direction of traffic. It is the practice of the Chicago, Burlington & Quincy to also use derails on tracks approaching drawbridges.

Some roads make it a practice to protect box car loaders, coal chutes and repair tracks. The only special locations apart from the main track on which derails are used on the Delaware & Hudson are at box car loaders and around some of the breaker tracks, but this is indirectly a protection to the main track. A road in the central part of the country, road *A* in the table, installs derails on tracks leading to elevated coal chutes whether these tracks are connected into the main track or otherwise, but it is not the regular practice to treat other special locations in a similar manner. The Minneapolis & St. Louis uses derails to protect shop buildings beyond car repair tracks where these tracks run through the buildings, and a road in the Southwest, road *B* in the table, uses derails on repair tracks.

Among the roads installing derails at special locations apart from the main track such as industrial tracks or similar spurs which are located on bad grades or at points where cars are liable to foul the running tracks, may be mentioned the New York, New Haven & Hartford, the Delaware, Lackawanna & Western, the Southern Pacific Lines, the Philadelphia & Reading and the Nashville, Chattanooga & St. Louis.

In general, derails are not installed on tracks leading to turntables but in a number of cases they are used to protect other special locations on the Delaware, Lackawanna & Western, the Southern Pacific, the Delaware & Hudson, the Chicago, Burlington & Quincy and the Canadian Pacific Railways.

### The Use of Split Point and Block Derails

Three classes of derails are used by the railroads replying to the circular. These types are the split point, the block and the lifting rail derail. The split point derail is used at places where high speed conditions prevail or on curves of a certain degree and at points where there must be no possibility of a train or car getting by. One objection to the use of this type is that a break is made in the track. The lifting rail derail is another type of high speed derail which can be installed without breaking the track, but it is used mostly within the limits of interlocking plants. The block derail is one that can be applied at almost any location without cutting the track and can be used advantageously in a large number of places where speed or curve conditions are not too severe, or when not prohibited by law. Some roads report the split point as standard and others the block type, but practically all use both kinds, depending on conditions such as their location on a curve, their use on important passing tracks in high speed territory, the speed of trains, and where the type of derail is specified by law. In some cases the type of derail used on a siding is determined by whether it is a permanent or a temporary one.

Some of the roads make it a practice to use the split point type on main line tracks and on all tracks immediately connected with the main line and where high speed movements occur. Among these roads may be mentioned the Santa Fe, the Lackawanna, the New York, New Haven & Hartford, and the Louisville & Nashville. On these lines the block type derail is used for other locations. The Norfolk & Western uses the block derail except at places where it is prohibited by law, in which case the split point type is used, while the Los Angeles & Salt Lake uses a split point derail in locations that are particularly hazardous, while the block derail is used at other places. A road in the Southwest, road *H* in the table, uses a block derail except at the foot of coal chute inclines, when the split point derail is installed.

The Baltimore & Ohio uses a derail of the lifting rail type on main tracks and at the outlet of important passing tracks in high speed territory, but the block derail is used elsewhere. In some cases the Louisville & Nashville uses the lifting rail type derail for locations in high speed territory, while the Burlington uses this type on the main track, but the block derail is being used for all new installations and replacements for side tracks.

The New York Central, Lines East, the Southern Pacific and a road in the central part of the country, road *A* in the table, make it a practice to use the split point derail on the inside of curves or where grade conditions may warrant.

The New York Central, Lines East, uses the split point on the inside of curves where they are sharper than one degree, while road *A* does not specify any certain curvature for its use at such locations. On the Southern Pacific the block derail is used only where grades are less than one per cent; at points where grades are greater, the split point type is employed.

The standard derail on the Northern Pacific is the split point, but the block derail is used in special locations. The split point derail was adopted as standard because the conditions are a little different from those existing on roads in other parts of the country, as in the timber regions along the Northern Pacific a great many temporary tracks are built and remain in for a year or two. After they have served their purpose they are then removed. This road found difficulty in matching up material recovered from the derails used in the temporary tracks, and many times the recovered material went to the scrap pile because of some missing parts. As these tracks are frequently needed in a hurry and many delays were experienced in getting and installing the derails, it was felt to be better practice to use the split point, as this

is always available. Under other circumstances the block derail would likely have been favored as a standard. The practice of a road in the Southwest, road *B* in the table, is to use the split point derail with the low pony switch stand to operate it, similar to the one used for back track switches. The standard practices and the types of derails used by other roads are as listed in the table.

### Derails in Automatic Signal Territory

Considerable variation exists in the application of derails to sidings connected to the main line in automatic signal territory. Some roads make it a practice to use switch circuit controllers connected up with the derails whether they are pipe connected or hand thrown; other roads use the circuit controller only in connection with hand thrown derails, while still others make it a practice to use pipe-connected derails in such territory without connecting them up to the signal system. The reports received indicated that 14 railroads use both pipe connected and hand thrown derails in automatic signal territory, 7 roads use pipe-connected derails, and 16 use hand thrown, while 11 report no automatic signal territory.

Where a pipe-connected derail is used in automatic signal territory, some roads do not make it a practice to use the circuit controller operated by the derail, inasmuch as the signal system is controlled through one located at the main line switch which operates the derail. In this connection it is the general practice to install pipe-connected derails without circuit controllers on the Atchison, Topeka & Santa Fe, the Pennsylvania Railroad, the New York, New Haven & Hartford, the Chicago, Rock Island & Pacific, the Delaware & Hudson, the Louisville & Nashville, the Lehigh Valley, the Boston & Maine, the Cleveland, Cincinnati, Chicago & St. Louis, the Pere Marquette, and the Nashville, Chattanooga & St. Louis.

As a safety measure and in order to indicate the position of the derail when it is not connected to the main line switch but is handled separately, a number of the roads use switch circuit controllers attached to the derails. Some of the roads following this practice are the New York Central, Lines East, the New York, New Haven & Hartford, the Santa Fe, the Rock Island, the Boston & Maine, the Delaware & Hudson, the Lehigh Valley, the Big Four, the Pere Marquette, and the Nashville, Chattanooga & St. Louis.

As an additional safeguard circuit controllers are connected to all derails in automatic signal territory whether these derails are pipe-connected or hand thrown on a number of roads, among which are the Baltimore & Ohio, the Delaware, Lackawanna & Western, the Long Island, the Union Pacific, the Southern Pacific, the Philadelphia & Reading, the Chicago, Milwaukee & St. Paul, the Norfolk & Western, the Chesapeake & Ohio, the Erie and the Central of Georgia. While the Nashville, Chattanooga & St. Louis has no derails in automatic signal territory, which is limited, were derails to be installed in such territory they would be equipped with circuit controllers.

Those roads not using the circuit controllers on derails, whether pipe-connected or hand thrown, in automatic signal territory, include the Chicago & Alton, the Southern Pacific Lines, the Canadian Pacific, the Los Angeles & Salt Lake, and the Chicago Great Western, while the Northern Pacific uses them to a very limited extent. It has not been the practice of the Illinois Central to use circuit controllers on derails in automatic signal territory in the past, but on new signal installations made in the past two years they have been installed and the practice will be continued on future work. The Missouri, Kansas & Texas uses the block derail in automatic signal territory in the majority of cases, but when it is necessary to use the split point this type is then equipped with the circuit controllers.

### The Use of Pipe-Connected and Hand Thrown Derails

The practice of using a pipe-connected or a hand thrown derail, like the use of the split point or block type varies greatly on the different roads, as revealed in their answers to the questionnaire. The standard practice on some roads is toward the pipe-connected type, while others incline toward the hand thrown derail. Again some roads have about an equal number of both types in service with no preference expressed, while the use of pipe-connected derails on other systems has been discontinued for certain locations. Practically all the roads, however, have both types of derails in service.

Among the roads making it a standard practice to pipe-connect all derails where they operate with main line switches are the Lehigh Valley, the Erie, and the Burlington. All derails installed since 1916 on the Chicago, Rock Island & Pacific have pipe connections to the main line switch stands on all tracks connecting with the main line. The general practice on a line in the central part of the country, road G in the table, is to connect derails by pipe lines to the main track switches on passing sidings and yard leads leading to the main track except in the State of Indiana. Derails on station and industry sidings connected with the main track are hand thrown. In the State of Indiana the law requires lights on non-interlocked derails on passing sidings and on yard leads connected with the main track, and on this road these derails are not pipe-connected to the main line switch but are hand thrown.

The New York, New Haven & Hartford and the Atchison, Topeka & Santa Fe make it a general practice to pipe-connect all new installations to the main line switch stands. There are, however, exceptions in special cases and both types are employed.

The Pennsylvania Railroad, the Baltimore & Ohio and the Cleveland, Cincinnati, Chicago & St. Louis make it a standard practice to pipe-connect all derails to switch stands where these protect main track movements except on unimportant branch lines or where tracks are infrequently used. At such locations the hand thrown derail is employed.

The New York Central, Lines East, has about 80 per cent of its derails pipe-connected to and operated by the switch stands, 14 per cent connected to and operated by a separate lever working a facing point lock, 5 per cent interlocked, while 1 per cent are hand thrown. Approximately 75 per cent of the derails on the Delaware & Hudson and on the Pere Marquette are pipe-connected, while on the Delaware & Hudson about 18 per cent are thrown with an ordinary switch stand instead of by hand.

On the Boston & Maine the majority of the derails are thrown by independent switch stands, but these are gradually being replaced by the pipe-connected type. The Louisville & Nashville connects derails in automatic signal territory with pipes to the switch stands, while those outside this territory are hand thrown.

The general practice of the Illinois Central is to use a hand thrown derail and only in a few cases are the derails connected with the switch stands by pipes, while on the Missouri, Kansas & Texas the derails are all hand thrown and a derail sign is also used to indicate their location. A very small percentage of the derails on the Union Pacific and the Southern Pacific are pipe-connected; it is not the practice of the Union Pacific to operate them in this manner, while the practice of pipe-connecting them on the Southern Pacific has been discontinued. The Long Island has approximately 50 per cent of its derails still pipe-connected, but on all new work they are no longer connected in this manner, while the Chicago Great Western has taken out all pipe-connected derails and maintains only those that are thrown by hand.

Approximately 95 per cent of the derails on the Northern Pacific are of the hand thrown type, while on the Chesapeake

& Ohio and the Minneapolis, St. Paul & Sault Ste. Marie probably 50 per cent of the derails installed are pipe-connected, the rest being hand thrown. The general practice of the Chicago & Alton is to use the hand thrown split point derail except on side tracks, having a heavy grade descending to a passing track or main line, in which case the pipe-connected derail is installed. The practice of the Canadian Pacific is to use a hand thrown derail except in the vicinity of interlocking plants or in other locations where it may be felt desirable to pipe-connect them to switch stands.

### The Use of Derails and the Value of Their Application

In view of the very general use of derails as expressed above, the general opinion of the railroads is that the derail is a desirable safety device and while many of the roads have had no recent occurrences showing the worth of their application, derails have, however, demonstrated their value in the past. The installation of derails on the roads has prevented cars from moving out of sidings due to wind or grade or because the brakes were not properly set, or at locations where cars were moved by outside parties as at coal mines and like industries. The value received in protecting traffic and preventing damage in the past makes their use fully justified, in the opinion of a number of the roads.

Many of the roads report instances having occurred as demonstrating the value of derail installations. The Delaware & Hudson has recently had four instances where cars started to move out of sidings because the brakes were not properly set and the cars were derailed, preventing more serious damage occurring. Many instances have happened on the Rock Island where the use of derails has demonstrated the wisdom of their application, while other accidents have occurred where the failure to put derails on certain tracks has shown the necessity for such a device. On the Northern Pacific derails have quite often prevented the main track from being fouled by cars, while the Canadian Pacific reports that many instances have occurred where the lack of derails has proved their necessity. Cases have occurred on the Nashville, Chattanooga & St. Louis where cars have been started out of sidings from various causes and were derailed before causing trouble, while the Minneapolis & St. Louis in the last several years has had cars blown out of the side tracks by wind storms which have run for some distance on the main track. Derails are felt to be an effective safeguard in such occurrences.

There is a tendency on some lines to extend or make more general the use of derails; among these roads may be mentioned the New York Central, Lines East; the Baltimore & Ohio; the Delaware, Lackawanna & Western; the Chicago, Milwaukee & St. Paul; the Chicago, Rock Island & Pacific; the Lehigh Valley; the Illinois Central, the Boston & Maine; the Union Pacific, and the Nashville, Chattanooga & St. Louis. It is the intention of the New York Central to install derails on all connections of side tracks and main tracks, while the tendency of the Baltimore & Ohio is toward their general use to prevent the fouling of main tracks, runaways down steep grades, over running into open draws and to some extent into pits, such as turntable pits, etc. The Delaware, Lackawanna & Western and the Boston & Maine, in connection with recent construction work, equip all new tracks with derails. The Lackawanna places them on tracks regardless of grade, while the Boston & Maine is equipping existing tracks as rapidly as labor and material conditions will permit. It is the general practice on the Lehigh Valley, the Union Pacific, the Delaware & Hudson and the Illinois Central to install them at all danger points or where conditions may require. The number of derails in service is increasing each year on the Chicago, Milwaukee & St. Paul, but no recent instances have occurred demonstrating the wisdom of their application. This road reports daily derailments having occurred due to

the installation of derails which would not happen if the tracks were not protected with them. However, the damage done by such derailments is generally not great and greater damage could result were the derails omitted at such points. The tendency of the Rock Island is to have all tracks leading

to the main line on which cars are placed properly equipped with derails, while the Nashville, Chattanooga & St. Louis is extending their use and feels that their application on industrial tracks to prevent shippers from pushing cars beyond the clearance point alone justifies their use.

## Esch-Pomerene Bill to Increase Commission's Powers

### Many Amendments to Commerce Act Proposed But Few Radical Changes in System of Regulation

WASHINGTON, D. C.

CHAIRMAN JOHN J. ESCH, of the House Committee on Interstate and Foreign Commerce, introduced in the House on Monday, June 1, a bill to further amend the act to regulate commerce, embodying ideas for the regulation of the railroads after their return to private management. This bill, which was also introduced in the Senate by Senator Pomerene, represents what may be termed the conservative school that favors a minimum of disturbance of the interstate commerce law while bringing about a greater degree of co-operation and of joint use of facilities between railroads, as opposed to the more radical ideas which have been expressed and will be embodied in a bill by Chairman Cummins, of the Senate committee, and which have been advocated by Director General Hines, providing for a government guaranty and a reorganization of the railroads. Mr. Esch is known to have consulted closely with the legislative committee of the Interstate Commerce Commission in drafting the bill, and it represents in general the ideas expressed on behalf of the commission by Commissioner Clark during the Senate committee hearings in January and by Commissioner McChord in a personal statement published on Monday morning. The powers and duties of the commission are considerably increased; it is given a freer hand in several ways along lines on which it has repeatedly made recommendations to Congress. Both because it represents the views of the commission and because of Mr. Esch's position and his high standing and long experience in matters of railway legislation, the bill is expected to have strong support in Congress.

#### Changes in Rate Sections

The authors of the bill evidently do not agree with those who believe it necessary that the Interstate Commerce Commission should be given a specific mandate to make rates adequate from the standpoint of a return on the investment, but the proposed rule of rate-making goes so far as to say that "the commission in reaching its conclusion as to the justness and reasonableness of any rate, fare, charge, classification, regulation or practice shall take into consideration the cost of labor and other operating costs in so far as they become material in any case under investigation," which is what the commission has always claimed it has done. The bill, however, gives the commission power to prescribe minimum or absolute rates, and, while leaving undisturbed the rate-making powers of the states, it gives the commission a power of joint action with state commissions in proceedings bringing state rates into issue and authorizes the commission to remove undue preference or prejudice or any undue burden upon interstate or foreign commerce which may be caused by state action.

The period of suspension of a rate is limited to 120 days by eliminating the provision for a re-suspension for six months, and if the hearing cannot be concluded within the period of suspension it is provided that the proposed rate shall go into effect, but in case of an increased freight rate or charge the commission may require the interested carriers

to keep an accurate account of the amounts received and upon the conclusion of the hearing and decision may require the carriers to refund with interest such portion of the increase as shall be found not justified. The prohibition of pooling in section 5 of the act is qualified by the words "except upon specific approval by order of the commission," and it is provided that the commission may approve the unification, consolidation or merger by purchase, lease, stock control or otherwise of two or more carriers, or the pooling of their traffic, earnings or facilities, under terms to be prescribed by it.

Provision for the supervision of security issues and the expenditure of the proceeds is made substantially in the language of the Rayburn bill, passed by the House in 1914, and the authority of the commission, by the issuance of certificates of public convenience and necessity, is required for the construction of new lines or extensions or the abandonment of a line of railroad.

#### Increased Powers

The regulating powers of the commission are also proposed to be increased by giving it jurisdiction to require a carrier to provide safe and adequate facilities or to extend its line or lines, and whenever the commission shall be of opinion that shortage of equipment, congestion of traffic or other emergency requiring immediate action exists in any section of the country, it is authorized to suspend the carriers' rules and make its own directions with respect to car service and the interchange and use of locomotives, cars and other vehicles, without regard to ownership, during such emergency. This broadens the provisions of the Esch-Pomerene car service act. The commission is also authorized to require joint or common use of terminals upon such terms as it may prescribe and to give directions for preference or priority in transportation, embargoes, or movement of traffic under permits, and in time of war or threatened war the President may certify to the commission that it is essential that certain traffic shall have preference and the commission shall give the necessary directions.

Aside from this emergency power the commission is authorized to require the terminals of any carrier to be open to the traffic of other carriers upon such just and reasonable terms and conditions, including just compensation to the owners, as it may prescribe. It may also require railroads and water carriers to construct suitable docks and terminal connections for the interchange of freight or passengers. The commission is given a freer hand in dealing with complicated rate adjustments by a provision that whenever it is of the opinion, after full hearing, that any rate, fare or charge, classification, regulation or practice "is or will be" unjust, unreasonable, or otherwise unlawful, it may prescribe what will be the reasonable rate, fare, or charge, etc., or the maximum or minimum to be thereafter observed. This is apparently to meet such cases as are often encountered by the commission in which it is difficult to make the change desired without disturbing other rates not immediately involved,

and it would seem as if the language was broad enough to give the commission almost complete authority over rates. The present rule giving the commission's orders a life of two years is changed to provide that they shall remain in force for a specified period or until further order.

The commission is authorized to prescribe the divisions of joint rates or fares and in time of car shortage, congestion or other emergency may establish temporarily such through routes as in its opinion are necessary or desirable in the public interest, regardless of the general provision against requiring railroads to "short-haul" themselves.

The case involving the commission's efforts to examine correspondence of the Louisville & Nashville is recalled by a provision that the commission may have access to all documents, papers and correspondence.

The provisions of the act are extended by the proposed amendments to cover companies engaged in the transmission of intelligence by wire or wireless and to water carriers and all pipe line companies, telegraph, telephone and cable companies operating by wire or wireless and "all persons, natural or artificial, engaged in such transportation or transmission as aforesaid as common carriers for hire" are declared to be common carriers.

The term "water" is to include the lakes, rivers, canals and other inland waterways within or bordering on the United States or the territory of Alaska, the Panama Canal, and all waters within or without the three-mile limit from the coast of the United States or the territory of Alaska traversed by vessels permitted to engage in the coastwise trade. The definition of the term "railroad" is broadened to include car floats, lighters, terminals, and of "transportation" to include locomotives and vessels.

The term "car service" is defined to include the "use, control, supply, movement, distribution, exchange, interchange and return of locomotives, cars and other vehicles used in the transportation of property, and the supply, movement and operation of trains by any carrier subject to this act," and it is made the duty of every carrier by railroad subject to the act "to furnish safe and adequate car service" and to establish just and reasonable rules, regulations and practice with respect to car service, and the commission is given discretionary power to prescribe such rules and regulations, including the compensation to be paid by carriers for the use of each other's locomotives or other vehicles as well as cars.

Mr. Esch has prepared a synopsis of his bill in which he says, in part:

"The prohibition imposed by the Panama canal act upon railroad-owned vessels is modified to permit such vessels to continue in service, even when competition may be excluded, prevented, or reduced, if the commission finds such service in the public interest.

"The commission can order docks and tracks of carriers to be connected and suitable docks to be constructed by either the rail or water carrier and determine the sums to be paid by either.

"To prevent destruction of inland water transportation and for other purposes, the commission is given power to prescribe 'joint rates or maximum or minimum or maximum and minimum' joint rates, and also proportionate rates.

"The commission is authorized to fix the division of rates between carriers. Under the exercise of this power it will be possible for weak lines or so-called independent short lines to receive such share of the joint rate as will enable them to live.

"Pooling of freight and earnings, unification, consolidation or merger may be permitted by the commission upon complaint, or upon its own initiative without complaint, provided it finds these 'to be in the interest of better service or greater economy in operation.' The absorption of the so-called 'weak sisters' may thus largely be met without resort

to compulsion, federal incorporation, or other complicated, protracted, and probably unconstitutional methods.

"One of the evils of the past has been the construction of parallel or unwarranted lines, resulting in weak, unprofitable and speculative roads. The bill requires that, before there can be any extension or construction of new lines, or acquisition or operation of any line, a 'certificate of convenience and necessity' must be secured from the State regulating body of New York, Wisconsin and other States.

"The 'transmission of intelligence,' as effected by wire or wireless system, is to be more fully placed under the commission. The interstate commerce act omitted to give the commission authority for complete regulation of these systems. The bill seeks to do this, except as to business wholly intra-state. To this end the commission can order extensions of lines, if in the public interest, prohibit rebates and discriminations require the filing and publication of rates and schedules, prohibit the doing of business or the collection of charges unless and until such publication has been made, and require transmission to be continuous from place of origin to destination.

"The practice of state commissions in reducing intra-state rates and thereby placing an undue burden upon interstate traffic has created a growing sentiment in favor of placing the rate-making wholly under the Interstate Commerce Commission. The bill does not do this, but prescribes a method of adjusting differences by allowing the state commissions to sit with the Interstate Commerce Commission and participate in the hearings, but the latter is to make the findings. Any undue burden placed upon interstate or foreign commerce is, under the bill and following the decision of the Supreme Court in the United States in the Shreveport cases, declared to be unlawful. The findings of the commission and orders based thereon 'shall be observed, any act, decision or order of any state or state authority to the contrary notwithstanding.'"

Some of the principal changes in the law proposed by the Esch bill are shown in the following paragraphs, the new language being printed in italics.

*"From and after \_\_\_\_\_, 19\_\_\_\_, no carrier by railroad subject to this act shall undertake the extension of its line of railroad, or the construction of a new line of railroad, or shall acquire or operate any line of railroad, or extension thereof, or shall engage in transportation under this act over or by means of such line of railroad, or extension thereof, unless and until there shall first have been obtained from the commission a certificate that the present or future public convenience and necessity require or will require the construction, or operation, or construction and operation, of such line of railroad, or extension thereof, and no carrier by railroad subject to this act shall abandon any portion or all of its line of railroad, or the operation thereof, unless and until there shall first have been obtained from the commission a certificate that the present or future public convenience and necessity permit of such abandonment.*

*"The application for and issuance of any such certificate shall be under such rules and regulations as to hearings and other matters as the commission may from time to time prescribe, and the provisions of this act shall apply to all such proceedings. Upon receipt of any application for such certificate the commission shall cause notice thereof to be given to the railroad commission, or public service or utilities commission, or other appropriate authority, of each state in which such line of railroad, or extension thereof, is proposed to be constructed or operated, or any portion or all of such line of railroad, or the operation thereof, is proposed to be abandoned, with the right to be heard as hereinafter provided with respect to the hearing of complaints or the issuance of securities.*

*"The commission shall have power to issue such certificate as prayed for, or to refuse to issue it, or to issue it for a portion or portions of a line of railroad, or extension thereof.*

described in the application, or for the partial exercise only of such right or privilege, and may attach to the issuance of said certificate such terms and conditions as in its judgment the public convenience and necessity may require. From and after issuance of such certificate, and not before, said carrier by railroad may comply with the terms and conditions of such certificate or attached to the issuance thereof and proceed with the construction, operation, or abandonment, covered thereby. Any construction, operation or abandonment contrary to the foregoing provisions of this section may be enjoined by any court of contempt jurisdiction at the suit of the United States, the commission, any commission or regulating body of the state or states affected, or any party in interest, and any carrier knowingly violating any of the foregoing provisions shall be guilty of a misdemeanor and upon conviction shall be liable to the penalties provided for violation of this act.

"The commission may, after hearing, in a proceeding upon complaint or upon its own initiative without complaint, authorize or require by order any carrier by railroad subject to this act, party to such proceeding, to provide itself with safe and adequate facilities for performing as a common carrier its car service as that term is used in this act, and to extend its line or lines, and any carrier subject to this act engaged in the transmission of intelligence, party to such proceeding, to provide itself with safe and adequate facilities for performing as a common carrier its service of transmission as that term is used in this act, and to extend its line or lines; Provided, That the commission shall find that such provision of facilities or extension, is reasonably necessary in the interest of public convenience and will not impair the ability of the carrier to perform its duty to the public."

Sec. 5. That the first paragraph of section five of the commerce act be amended to read as follows:

"That, except upon specific approval by order of the commission as in this section provided, it shall be unlawful for any common carrier subject to this act to enter into any contract, agreement or combination with any other common carrier or carriers for the pooling of freights of different and competing railroads, or to divide between them the aggregate or net proceeds of the earnings of such railroads, or any portion thereof; and in any case of an agreement for the pooling of freights as aforesaid, each day of its continuance shall be deemed a separate offense: Provided, That whenever the commission shall be of opinion, after hearing upon application of any carrier or carriers subject to this act, or upon its own initiative, that the unification, consolidation or merger by purchase, lease, stock control, or in any other way, similar or dissimilar, of two or more carriers subject to this act, or of the ownership or operation of their properties, or of designated portions thereof, or that the pooling of their traffic, earnings or facilities to the extent indicated by the commission, will be in the interest of better service to the public, or economy in operation, or otherwise of advantage to the convenience and commerce of the people, the commission shall have authority by order to approve and authorize such unification, consolidation, merger, or pooling, under such rules and regulations, and for such consideration as between the said carriers and upon such terms and conditions, as shall be found by the commission to be just and reasonable in the premises.

"The commission may from time to time, for good cause shown, make such supplemental orders in the premises as it may deem necessary or appropriate, and may by any such supplemental order modify or set aside the provisions of any previous order as to the extent of the pooling, or as to the rules, regulations, terms, conditions or consideration currently moving in respect of any unification or consolidation of operation and not of ownership, or of pooling, so heretofore approved and authorized.

"The carriers affected by any such order shall be, and they are hereby, relieved from the operation of the 'anti-trust laws,'

as designated in section one of the act approved October 15, 1914, entitled 'An act to supplement existing laws against unlawful restraints and monopolies, and for other purposes,' and of all other restraints or prohibitions by law, in so far as may be necessary to enable them to effect any unification, consolidation, merger or pooling so approved by order under and pursuant to the foregoing provisions of this section."

Sec. 6. That the fourth paragraph of section five of the commerce act be amended by adding at the end thereof the following:

"Provided further, That the commission may in like manner extend the time during which such service by water may continue to be operated until its further order after hearing, even where it finds that competition may be excluded, prevented, or reduced, if it also finds that the service is in the interest of the public and of advantage to the convenience and commerce of the people, and that a discontinuance thereof would be substantially injurious to the commerce or localities affected."

Sec. 13. That section thirteen of the commerce act be amended by adding at the end thereof two new paragraphs reading as follows:

"Whenever in any investigation under the provisions of this act there shall be brought in issue the lawfulness of any rate, fare, charge, classification, regulation, or practice made or imposed by authority of any state, the commission, before proceeding to hear and dispose of such issue, shall cause such state or states to be notified of the proceeding. The commission may confer with the authorities of any state having regulatory jurisdiction over the class of persons and corporations subject to this act with respect to the relationship between rate structures and practices of carriers subject to the jurisdiction of such state bodies and of the commission; and to that end is authorized and empowered, under rules to be prescribed by it, and which may be modified from time to time, to hold joint hearings with any such state regulating bodies on any matters wherein the commission is empowered to act and where the rate-making authority of a state is or may be affected by the action taken by the commission. The commission is also authorized to avail itself of the cooperation, services, records and facilities of such state authorities in the enforcement of any provision of this act.

"The commission shall have authority, after full hearing, to make such findings and orders as may in its judgment tend to remove any undue preference or prejudice as between persons or localities in state and interstate or foreign commerce, or any undue burden upon interstate or foreign commerce, which is hereby forbidden and declared to be unlawful, and such findings or orders shall be observed while in effect by the carriers parties to such proceeding affected thereby, any act, decision, or order of any state or state authority to the contrary notwithstanding."

### Other Bills

The question of getting the telegraph and telephone lines returned to their owners was given precedence for the time being over the more complicated matter of railroad legislation by both the House and the Senate committees on interstate commerce, both of which began hearings on the situation regarding the wire companies last week. The Senate committee on Tuesday ordered a favorable report on the bill providing for the immediate return of the wire companies. The House committee switched on Monday to the daylight saving law which apparently has divided the country into two opposing camps, that of the farmers, who prefer to have the law repealed to adjusting themselves to a new relation between clock time and sun time, and that of the urban population that is getting the benefit of an additional daylight hour.

Chairman Esch of the House committee is planning to use his bill as a mark to shoot at at the railroad hearings which he proposes to hold as soon as the committee's docket is cleared of some of the less intricate questions, and Chairman Cum-

mins of the Senate committee has not yet introduced the bill embodying his plan of railroad reorganization which he plans to have his committee work on before holding hearings.

Director General Hines and Swagar Sherley, director of the Division of Finance of the Railroad Administration, were given a hearing before the House appropriations committee on Tuesday on the \$1,200,000,000 appropriation asked by the Railroad Administration.

Senator Cummins has reintroduced as S. 641 the bill he introduced at the last session limiting the President in his rate-making power to the powers formerly possessed by the railroads before federal control by restoring the complete jurisdiction of the Interstate Commerce Commission, which is now limited to a review of rates after they are put into effect by the President, and making it clear that the carriers while under federal control shall be subject to all laws and liabilities as common carriers. The Senate committee on Tuesday ordered the bill to be reported favorably.

Senator Cummins has also reintroduced his concurrent resolution to provide for the creation of six joint congressional committees on reconstruction, one of which would be known as the joint congressional committee on interstate transportation, for the purpose of investigating and reporting on the permanent relation which the government should sustain to the common carriers, whether the railroads should be returned to their former owners and operated as heretofore, or whether government operation should continue with or without government ownership; or if private ownership is to continue and private operation resumed, what system of regulation and control will be best adapted to secure efficiency in service, reasonable rates and fairness to the capital invested. The committee would also study the relation which should be established between inland water transportation and the railroads.

Senator McKellar has introduced a bill providing that where freight is offered to a common carrier to be transported by it to some foreign port, the initial carrier shall be required to issue a through bill of lading and all steamship carriers designated in such bill of lading shall carry out the contract entered into by the initial carrier under penalty of not being permitted to use the ports of the United States should they be guilty of non-compliance.

Senator Cummins has also introduced a bill, S. 1025, making it unlawful for any common carrier to charge a higher rate over the same line and in the same direction for the interstate transportation of any article or commodity having been grown, produced or manufactured in the United States than it charges for a like article or of a substantially similar article or commodity when imported into the United States from a foreign country and that the proportion of all through rates received by carriers transporting such imported articles or commodities shall be held to be the rate or charge made and received for the transportation thereof in this country. It is also provided that no common carrier in conforming to the foregoing provision shall increase any rate without the approval of the Interstate Commerce Commission entered after a full hearing upon an application for such increase.

Another bill introduced by Senator Cummins, S. 1026, provides that carriers shall receive and transport with each passenger tendering the same baggage, including the sample baggage of such passenger, not exceeding 150 pounds for an adult and 75 pounds for a minor less than 12 years old, without compensation other than the passenger transportation charge. Baggage in excess of the weight specified is declared to be excess baggage and the carriers are required to carry such excess baggage with the passenger, provided that carriers shall be required to carry baggage only on trains equipped with a baggage car. Samples, goods, wares, appliances and catalogues of commercial travelers or their employers used both for the purpose of transacting their business and carried

with them solely for that purpose, when securely packed and locked in substantial trunks or sample cases of convenient shape and weight for handling, are declared to be sample baggage within the meaning of the act. It is also provided that in the case of the loss or damage to such sample baggage the carrier shall not be liable for any greater proportion of the value or of the damages than the excess baggage fare bears to the current rate of freight nor for any greater amount than the value.

## Overwhelming Sentiment Against Government Ownership

**B**Y A QUESTIONNAIRE conducted recently by the Association of Railway Executives (61 Broadway, New York) it is shown that the general public, as estimated by editors all over the country, would vote seven to one against government ownership of railroads. The questionnaire was answered by nearly 6,000 editors of daily and weekly newspapers throughout the country. It was sent to every editor in the country (13,424) and brought replies from 44 per cent; and 83 per cent of those replying reported their communities in favor of a resumption of private management.

The questionnaire was completed before President Wilson announced in his recent message to Congress that the government would relinquish control of the railways at the end of the year. Editors were asked not to give their personal opinions, but to appraise the sentiment in their communities. The four chief questions were as follows:

1. Does public opinion in your judgment seem to favor the return of railroads to private ownership and operation as soon as this can properly be accomplished?
2. If so, is this opinion in part based on the desire to see competition in service and facilities restored?
3. What is the present sentiment in your community on government ownership and operation of railroads?
4. What has been the feeling regarding the proposal to extend the period of government operation for five years?

On the first question 83 per cent voted yes, 11 per cent voted no, 4 per cent doubtful and 2 per cent expressed no opinion.

On the second question 75 per cent voted yes, 6 per cent no, with 5 and 14 per cent doubtful and blank respectively. On the third, 78 per cent estimated public sentiment as against government ownership, 11 per cent for, with 7 per cent doubtful and 4 per cent blank. On the fourth, the vote was: Against, 74 per cent; for, 10 per cent; doubtful, 9 per cent; blank, 7 per cent.

Canvass of the replies from different states, north, south, east and west, showed that sentiment on this subject was not divided on party lines, Texas and Pennsylvania, Maine and Tennessee showing similar percentages. The strongest sentiment against government ownership was found to be in New England and the south, sections widely apart in political sentiment. Only 4 per cent of New England editors and 7 per cent of southern editors reported their people favoring government ownership.

**The Trans-Canada Limited**, the new through express train of the Canadian Pacific, which was put in service on June 1, runs every day in the week and will run from Toronto as well as from Montreal. From both Montreal and Toronto the train has compartment cars, and ordinary sleeping cars. It has no coaches. On the first day the train left Montreal with seven cars, and about 85 passengers. For all of the trains making this four-day run the equipment required is 59 sleeping cars, 15 dining cars, 12 observation cars, 5 compartment cars, 12 baggage cars, and 24 locomotives. The estimated value of this equipment is \$6,000,000.

# Railway Developments in Foreign Countries

## Materials Required for Mexican and Siberian Railways; Problem of Railway Transportation in Italy.

**T**HERE IS a hard fight going on, says George Mallet in a recent issue of the Weekly Bulletin of the Canadian Department of Trade and Commerce, between the owners of vested and prospective interests in the neighborhood of the projected routes of the next Transandinian railway.

While a party of government engineers are busy surveying the Lonquimay route, which is designed to open up important international intercourse between the Atlantic port of Bahia Blanca and the Pacific port of Lebu, running through the heart of the Chilean coal mining zone, a determined attempt is being made to counterattract public attention to the Noble route, which runs through San Carlos and San Fabian.

### Extensions of Kansas City, Mexico & Orient

According to announcement by the department of communications and public works of the Mexican government, the Kansas City, Mexico & Orient system in this country is to be greatly extended just as soon as provisions can be made by the company for resuming construction work. At the time the revolutionary period began, nearly nine years ago, the main line of the Kansas City, Mexico & Orient was getting well along toward completion. Two unfinished gaps in Mexico and a 50-mile stretch of country in Texas are all that are lacking to make the line complete between Kansas City, Mo., and the port of Topolobampo, on the Pacific coast. The division which runs from Chihuahua to Marquez lacks only 75 miles of reaching the Rio Grande. From Chihuahua the track of the Mexico Northwestern is used as far as Sanchez. The next division is from Ojo del Buey to Los Hornillos. Then follows another unfinished gap to Fuerte. From Fuerte to Topolobampo the road has been in regular operation for several years.

The company has made application to the department of communications and public works for a concession to construct branch lines to Guadalajara, San Luis Potosi, Aguas Calientes and a number of other cities and towns.

### Demand for Locomotives and

#### Structural Steel in France

Reconstruction of industry or "reconstitution," as the French prefer to term it, for the word implies the genesis of a new order of things rather than a resettlement of the old, is undoubtedly the most vital problem which faces France today, says the Bulletin of the Federation of British Industries in a recent issue. It is a question which presents enormous difficulties by reason of its various possible solutions.

In some quarters it is strongly felt that if France is to retain what monetary wealth remains to her, the production of the materials required must of necessity be undertaken within her own borders. On the other hand the impatient producer, whose works in the war-damaged area have been destroyed, maintains that the industrial renaissance is of sufficient urgency to warrant unrestricted importation from foreign sources of all materials not immediately obtainable from the home manufacturer.

As a third illustration may be cited the case of the manufacturer whose business, so far from suffering injury has actually been expanded by the demands of the war added to the fact that the destruction of industry in the northeastern area

has considerably contracted the productive resources of the country. From his point of view unrestricted importation is directly opposed to the interests of French industry.

Whatever may be the best policy for France as a whole, all authorities are agreed that the first undertaking in the redevelopment of industry in the devastated area must be the building and equipment of new railways. The embankments and cuttings of the old railways have not been greatly harmed. Steel rails are plentiful and there is no great shortage of sleepers or permanent way material.

It is however in the matter of structural steel-work for bridges that a want is felt and it is doubtful whether that want can be supplied by French steel works alone during the forthcoming summer.

### Military Railways in France

It is common knowledge that the railway network laid down in France by the British military authorities, and including both standard gage heavy lines and narrow gage light tracks, amounts to a total of hundreds of miles, says the Railway Gazette (London) in a recent issue. Considerable construction was also carried out by the American Army. Among the problems connected with the "clearing-up" of the war areas is that of the disposal of these railways. Both the British and American authorities have been willing to allow France to retain such lines as may be required for ordinary commercial purposes or would be of use during the period of reconstruction, but a good deal of the mileage is not required by the French Government. This applies to both standard and narrow gage track. For example, one section of main line which before the war was only a double track line has been quadrupled by the British, and the extra tracks are now being taken up, since local opinion considers them unnecessary for the normal gage light railway, which were extremely useful for hauling men and materials within the actual war zone, but are laid in districts where the commercial traffic which would now offer would be of so slight and unremunerative a nature as to render their retention quite unnecessary, while lines of this nature are not always suited to civilian requirements. An Allied Commission is now to investigate the whole question. This commission will have plenary powers to decide on the future of all the railways constructed in France by the British and American armies for war purposes, and the surplus track, etc., will be offered to the world's buyers.

### The Fourth Lyons Fair

The Lyons Fair which took place from March 1 to 15 was most successful not only from the standpoint of the number of exhibitors which was considerably over that of any preceding year, but also from the point of view of the diversification of the products shown.

So many were the applications for space that the fair will henceforth be held in two sections, one in the spring from March 1 to 15 and one in the fall, from October 1 to 15. Machinery, transport materials, and similar products will be included in the latter.

At the fair this spring there were 618 American firms represented, as compared with 527 in 1918; 25 in 1917 and only 4 at the first fair in 1916. Canada was represented by 55

concerns and the Canadian National Railways and the Canadian Pacific Railway each had considerable space.

**Belgium Needs Telephone and Telegraph Material**

During the German occupation a great quantity of material and accessories belonging to the Belgian government-owned telegraph and telephone systems, says Consul Charles R. Nasmith, Brussels, was destroyed or taken away by the enemy, so there is a great need of material at the present time.

American firms who wish to make offers for the sale of electrical apparatus or other material for telegraph or telephone installations might be interested to know, he says, that bids should be submitted to the Administration des Telegraphes et des Telephones, Hotel des Postes et des Telegraphes, Place de la Monnaie, Brussels. Each bid, according to official information just received at the consulate, should be accompanied with descriptions, photographs, etc., when it has to do with apparatus. As for the cables, specifications must be given, and whenever possible samples should be sent.

**Railway Extensions in Siberia**

The Times (London) in a recent issue prints a telegram from Omsk, the seat of the Kolchak government, saying that the government of Admiral Kolchak has decided to begin the construction of a railway from Krasnoufimsk (west of the Urals) to Tomsk, western Siberia (a distance of over 800 miles).

This line, which is intended to relieve the Siberian Perm-Samara Railways, should greatly contribute to the development of the productive forces of Siberia and the Urals.

**What the Siberian Railways Need**

L. D. Wilgress, Canadian trade commissioner at Vladivostok, has sent to the Weekly Bulletin of the Canadian Department of Trade and Commerce a long list of materials, giving an idea of what was needed for the Siberian railways for the first four months of 1919.

In speaking of the Siberian railway situation, Mr. Wilgress says that the hope is expressed by those competent to express an opinion that the new inter-allied control will be able to restore the normal railway facilities to normal working order in from five to six months.

The plan for the inter-allied control of the Siberian railways, as noted in the *Railway Age* of March 14, page 612, gives the Chinese Eastern Railway and the various railway systems in Siberia over to the control of two boards: (1) Technical; (2) Military, under the general supervision of a special inter-allied committee. Mr. John F. Stevens, chief of the American Railway Commission in Siberia, is appointed president of the Technical Board, and he is to be assisted by the special corps of American railway engineers, who have been investigating conditions for over a year. The Russian personnel of the railways is to be retained.

"It remains yet to be seen as to whether this plan will prove workable," says Mr. Wilgress. "The railway situation is the fundamental problem in the economic restoration of Siberia. The re-establishment of normal transport will bring about a resumption of trade with foreign countries.

"At the present time it is practically impossible for the co-operative societies and private firms to ship goods into the interior in the ordinary way, and the port of Vladivostok is congested with supplies which it will take several months to clear. It is estimated that over 1,000,000 tons of goods are lying at Vladivostok awaiting transport into the interior, while nearly 1,000,000 tons of Siberian products are also lying at points along the railway line awaiting transport to ocean ports for shipment abroad. It may be said that the

railway facilities are completely disorganized, and it is with great difficulty that military and other essential supplies are transported to destination.

"The greatest need is for new locomotives, spare parts for the repair of the existing rolling stock, lubricating oil, and other supplies essential for the operation of a railway system. The British and American governments have already, through their respective commissions, begun to take energetic measures for the relief of the situation. A consignment of locomotives is being imported by the British Railway Commission, and supplies of lubricating oil and other materials are coming forward from the United States.

"One of the objects of the agreement just concluded is to co-ordinate these various activities of the principal powers interested in the relief of the Siberian Railway system."

The list forwarded by Mr. Wilgress is given below. The difficulty of securing the materials noted, he says, is largely instrumental in the present disorganization and breakdown of the Siberian railway facilities.

**Materials Required for the Siberian Railways**

Classification	Quantity
Petrol .....	*poods 100,000
Benzine .....	" 2,600
Mineral oil, also naphtha .....	" 20,000
Cylinder oil, viscosin type for super-heaters .....	" 10,000
Car axle oil .....	" 250,000
Indigo copying paper .....	reams 500
Graphite in powder for foundry works .....	poods 300
Muriatic acid for soldering .....	" 1,000
Sal ammoniac, in lumps .....	" 50
Sal ammoniac, in powder .....	" 50
Glue for joiner's works .....	" 200
Glue for painting works .....	" 200
Asbestos packing, width from 1/10 in. up to 1 1/2 in. ....	" 300
Steatite packing, width from 3/8 in. up to 1 1/2 in. ....	" 900
Glass paper from No. 0000 to No. 4 .....	sheets 60,000
Emery paper from No. 00 to No. 5 .....	" 30,000
Paper from No. 0000 to No. 5 .....	" 20,000
Emery cloth from No. 0 to No. 4 .....	" 20,000
Cloth from No. 000 to No. 7 .....	" 50,000
In powder, large, intermediate, small .....	poods 30
In lumps from 4 1/2 in. to 12 in.—	
Section square, semi-circular, circular, flat and	
trihedral .....	pieces 200
Powder, large, middle, small and dust .....	poods 100
Rings of special dimensions by sketches .....	pieces 600
Rubber hoses between locomotive and tender of different	
dimensions .....	" 1,200
Rubber hoses for Westinghouse brakes—	
Length, 610 mm. ....	" 3,000
Length, 760 mm. ....	" 1,000
Rubber packing rings for Westinghouse brakes—	
No. 2 .....	" 3,500
No. 3 .....	" 3,000
Rubber rings for gage glasses of different sizes .....	" 10,000
Rubber rings for passenger engines .....	" 1,000
Rubber cloth of different width without layers .....	poods 80
Rubber with one layer .....	" 100
Rubber with two layers .....	" 30
Gage glasses for boilers and tanks from—	
3/8 in. to 3/4 in. and from 12 in. to 18 in. ....	pieces 12,000
Safety glass, Klinger .....	" 200
Iron gas pipes, d. from 1/2 in. to 4 in. ....	1 foot 140,000
Connecting parts for gas pipes (counter screws, crosses, nip-	
ples, branch pipes, three-way pipes, set-square, flanges) ..	" 20,000
Smoke-consuming pipes for boilers .....	" 30,000
Gun metal pipes int. d. 1 3/16 in. to 2 7/8 in. ....	poods 3,000
Wire iron netting of simple and diagonal plaiting with holes	
from 1 mm. to 10 mm. .... sq. meshes	" 10,000
Steel balls d. from 5/32 in. to 1/2 in. ....	pieces 2,000
Engine, tender and car tires, by sketches .....	" 10,000
Babbitts for cars .....	poods 4,000
Babbitts for engines .....	" 4,000
Lead .....	" 21,000
Tin .....	" 5,000
Zinc in plates .....	" 500

\* 1 pood = 36 pounds.

**British Railway Costs Under Government Control**

Continued requests for information on the part of the British Parliament and promises on the part of the government brought out on May 14 an official statement by the Board of Trade "showing the cost of running the railways of Great Britain during the period of government control" and covering the period from August 5, 1914 to December 31, 1918.

The statement shows a balance of receipts over expenditures and in excess of the guarantee of the compensation paid to the railroad companies. The receipts, however, include a

total of £112,000,000 as an estimate covering government traffic if charged at authorized pre-war rates.

The statement was prepared by Sir Albert Wyon and Sir William Plender, and is supplemented by a Board of Trade statement signed by Sir Auckland Geddes, minister of national service and reconstruction.

According to the accounts the receipts and expenditures were as follows:

	Receipts	Expenditure	Balance
1913.....	£118,700,935	£75,127,210	£43,573,725
1914.....	47,918,188	31,782,832	16,135,356
(Aug. 5 to Dec. 31.)			
1915.....	130,358,044	85,028,262	45,329,782
1916.....	145,871,085	95,756,706	50,114,379
1917.....	164,279,430	108,877,932	55,401,498
1918.....	177,584,321	131,326,295	46,258,026

The revenue includes not only the receipts from the ordinary passenger and goods traffic, but the estimated value (reckoned at authorized pre-war rates) of government traffic during the war. For each year of control this value is:

1914 (from Aug. 5).....	£3,500,000
1915.....	10,279,104
1916.....	20,649,126
1917.....	35,698,554
1918.....	41,917,024
Total.....	£112,043,808

These figures do not include the value of additional services performed by means of steamboats, docks, canals, etc., which may be estimated roughly at from £10,000,000 to £15,000,000.

#### £95,313,607 IN COMPENSATION

The compensation payable to the railway companies in respect of control periods is limited to the net receipts of the year 1913, with the addition of 4 per cent on capital expenditure brought into use since the beginning of the war. The compensation actually so paid is given in Sir Auckland Geddes' statement as:

1914 (from Aug. 5).....	£15,946,839
1916.....	14,039,674
1917.....	24,075,768
1918.....	41,251,326
Total.....	£95,313,607

The above figures, states Sir A. Geddes, include provisional allowances for deferred maintenance of permanent way, rolling stock, and plant; but do not include any provision for "extra wear and tear." This item cannot be ascertained at present; but the auditors advise that the cost of making good the "extra wear and tear" will be considerable.

Sir A. Geddes also gives a revised estimate of costs for the current financial year. The figures of £90,000,000 to £100,000,000, he says, were quoted by the minister-designate (Sir Eric Geddes) in moving the second reading of the ministry of ways and communications bill. These figures were the best estimate then available of the increased cost of working during the two years of extended government guarantee, as compared with the cost in 1913. The following is the present estimate of increased cost in working during the financial year ending March 31, 1920, as compared with 1913:

War wage and other concessions, £57,000,000; eight-hour day, concessions recently granted or under consideration, £20,000,000 to £25,000,000; extra cost of materials and coal, £27,000,000; total, £104,000,000 to £109,000,000.

#### The Problem of Railway Transportation in Italy

In response to the criticism of the Italian railway service at the present time, a statement has recently been made public by the director general of the Italian State Railways, which outlines some of the difficulties with which the railway administration has been confronted and the steps that have been and will be taken for improvement. The report, which has been translated and sent to Commerce Reports by Trade Commissioner H. C. MacLean at Rome, is of special interest

to American readers for the emphasis it places on the assistance rendered by the American railway supply field and for the outline it gives concerning future requirements. It will be borne in mind that the Italian State Railways have recently ordered 150 more locomotives in the United States (from the American Locomotive Company) in addition to the 150 mentioned.

The abstract forwarded by Mr. MacLean follows:

Special emphasis is laid on the fact that since the signing of the armistice the requirements of the military authorities in the matter of railway transportation have not been reduced to the extent that the general public expected. During October, 1918, the last month of the war, 22,592 trains were operated for the transport of troops and various military supplies; in March, 1919, the military authorities still required 16,251 trains. In the matter of supplies, the average number of freight cars loaded daily with war materials in October, 1918, was 6,300, while the number averaged only 3,000 in March, 1919. This reduction made possible a large increase in the transportation of goods for the general public. In October, 1918, the average number of cars loaded at the ports with merchandise for the public was only 450 per day, whereas in March, 1919, it reached an average of 2,300 cars. For grain, rice and flour, 700 cars per day were loaded in March, as against 400 in October. For wine, there are loaded to-day 260 cars, as against 50 in the same period of the former year.

#### PROMPT DELIVERY OF AMERICAN ORDERS

The most serious obstacle which must be overcome if the railroad administration is to furnish the service maintained previous to the war arises from the fact that the rolling stock employed on the Italian railways is in bad condition. This is because the Italian firms specializing in the construction of railway materials were obliged during the war to devote practically all of their energies to the manufacture of munitions, and little could be done in the matter of new construction or repairs. The railroad administration did, however, succeed in obtaining the delivery of most of the material ordered before the war which was in process of construction in July, 1914, amounting to 300 locomotives, 570 passenger cars, 550 baggage cars, and 5,300 freight cars. In addition, orders were placed in the United States for 3,000 freight cars and 100 locomotives, and in Italy additional orders for 114 steam locomotives, 76 electric locomotives and 6,100 freight cars. The director general states that it was possible to obtain prompt delivery of the material ordered in America, which contributed materially to the solution of the railway problem during the war, and adds that the locomotives were especially useful, being well adapted to hauling heavy military trains. On the other hand, he calls attention to the fact that the delivery of the equipment ordered in Italy was held up, so that up to the present time it has been possible to obtain only 24 steam locomotives, 38 electric and about 1,200 cars.

In addition to the orders placed by the railroad administration during the war, the ministry of arms and munitions and the commission for national fuels, appreciating the lack of transportation facilities, endeavored to obtain for their own use a considerable number of railway cars in order to facilitate the movement of military supplies and fuel for the army. In November, 1917, the ministry of arms and munitions placed an order for 1,000 freight cars, and in June, 1918, the commission for national fuels ordered 10,000 cars. These orders were given to Italian firms, who were assured by both the ministry and commission that the question of furnishing the materials required for the construction of the cars would be taken care of. In spite of this assurance, serious delays occurred, and at the present time only the first

1,000 cars ordered in 1917 by the ministry of arms and munitions, and about 120 cars of the 10,000 ordered by the commission for national fuels, have been delivered.

Owing to the difficulty in obtaining deliveries from Italian manufacturers toward the end of the war, the railroad administration placed additional orders in America for 150 locomotives and 10,000 cars. Of these locomotives, 35 have already reached Italy, 80 are in transit or in process of being delivered in America, and the remainder will probably be delivered during April. Of the cars, about 1,000 have already been delivered, and as deliveries are being made with regularity, it is believed that the entire number will be available before the end of 1919.

#### NEEDS OF ITALIAN RAILWAYS FOR FIVE YEARS

At the end of the war the railroad administration, realizing the urgent necessity for a betterment in the matter of rolling stock, and to insure the continuance of activity on the part of the Italian firms which had been exclusively engaged in the manufacture of military supplies, immediately took up the question of placing new orders for equipment with Italian firms, and a program covering the needs of the railways for the five years following the war was presented to the inter-ministerial committee charged with promoting and co-ordinating the action of the various branches of the government during the transition period following the cessation of actual hostilities. This program included the purchase of 524 steam and electric locomotives, 1,200 passenger cars, 600 baggage cars, and 5,000 freight cars, of which, however, it has only been possible to place orders for 520 locomotives, 640 passenger cars, 300 baggage cars, and 2,850 freight cars, distributed among the different Italian manufacturers according to their capacity.

There are therefore actually in construction 770 steam and electric locomotives, 640 passenger cars, 300 baggage cars, and 27,700 freight cars, to which will soon be added additional orders which are in process of distribution among Italian firms, covering 560 passenger cars, 300 baggage cars, and 2,150 freight cars, which are still needed to complete the five-year program mentioned above.

#### EQUIPMENT FOUND IN RECOVERED TERRITORY

Regarding recovered territories, the director general states that on the railroads of the Trentino and of Julian Venezia 350 locomotives, 700 passenger and baggage cars, and 9,260 freight cars were found, to which should be added 123 locomotives, 100 passenger cars, and 2,360 freight cars which the Italian Armistice Commission at Vienna has decided should be delivered as compensation for equipment which was removed at the time of the armistice. It has also leased 64 locomotives from the Austrian and Czecho-Slovak railroads for the transportation of food trains, which are being operated for Austria and Bohemia. From the number of locomotives which Germany must deliver to the Allies, 200 former German locomotives have been allotted to Italy by France.

#### TRAFFIC ADJUSTING ITSELF TO PEACE CONDITIONS

The acute period in railway transportation seems to have passed, and the director general is of the opinion that from now on a gradual improvement may be expected. It is stated that the lines in the invaded regions and in the newly recovered territories have, with few exceptions, been put in such shape that, although conditions are not normal, the regular traffic is possible. The report upon the service at the port of Trieste shows that in March, 1919, an average of 239 cars per day were loaded, which approaches the average for the year 1913, when the traffic was considered unusually heavy. On the entire Italian system those lines which during the war suffered sudden changes which interfered with the regular operation of trains are having their former service

gradually restored, and traffic as a whole is slowly becoming adjusted to the peace-time conditions. As has been stated the military requirements are gradually diminishing. During December, 1918, the average number of cars loaded daily was 8,610. This number was increased March, 1919, to 11,110, and in April it is expected that it will reach an average of 12,000 cars.

#### BOTH COAL AND ROLLING STOCK NEEDED

An improvement in Italian railway service will depend upon two factors—an adequate supply of coal and an increase in the amount of rolling stock available. The hope is expressed that the matter of fuel will be benefited by the settlement of labor troubles in England, which so materially reduced the amount which Italy had expected to receive from this source, and by the urgent representations made by the Italian delegation at Paris, which have caused the Allies to give serious consideration to the problem of overcoming Italy's lack of fuel. With respect to rolling stock, a total of 10,600 passenger cars, 4,160 must be repaired, and the repair shops, instead of the largest possible production, are making little progress. This is due not only to the difficulties which surround the transition from war to peace activities, but especially to labor conditions. Every effort is being made by the railroad administration to stimulate the activity of both the State and private shops, and in this connection a meeting was recently held at Rome to discuss the matter. This conference was attended by the government officials and by all the manufacturers of railway materials.

#### ADDITIONAL PASSENGER TRAINS

During the last months of the war, the total average mileage of passenger trains for the public was about 80,000 kilometers (49,710 miles) per day. This average has been gradually increased until 89,000 train kilometers (55,302 miles) was the average at the end of March, 1919, without including the service established on the lines of the recovered territory in Venito and in the Trentino and Julian Venezia. Beginning May 1, 1919, a further increase of 7,000 kilometers (4,350 miles) per day will be made by the provision of additional trains on the lines which need them the most, among which are included additional through trains on the Rome-Florence-Milan and Rome-Genoa-Turin routes.

#### Railway Supplies in Mexico

The Railway Business Association has issued in pamphlet form an article by P. Harvey Middleton, executive assistant of the association, on his recent trip to Mexico to investigate railway conditions in that country. The article parallels to an extent the two articles by Mr. Middleton in the *Railway Age* of last week and this week, respectively, and in addition is supplemented by an extended list of materials which are to be purchased by the Mexican Government Railways for the lines south of Mexico City. The list is given in great detail and includes a wide variety of supplies. Requisition numbers are added to facilitate its use by those who may desire to submit quotations.

The list in detail is as follows:

#### LIST OF MATERIALS REQUIRED BY RAILWAY LINES SOUTH OF MEXICO CITY

Quotations for these items will be requested either by Mr. Silvano Prunedá, Purchasing Agent, Estación Buenavista, Ferrocarril Mexicano, Mexico, D. F. or by Mr. F. P. de Hoyos, General Agent, Mexican Government Railway Administration, Woolworth Building, New York.

#### Requisition numbers

1,000 car wheels, 33-in. diameter.....	AG-693, AC-2316
1,000 car wheels, 30-in., narrow gage.....	CE-75, AC-4163
2,000 car wheels, 33-in., standard gage.....	CE-75, AC-4163
6,500 tie plates.....	113-CV, AC-2751
Locomotive tires.....	AG-776, AC-2771
Locomotive tires.....	AG-778, AC-2772
Channels, plates, tank sheets.....	AG-824, AC-2773
Bars, bolts, clamps, drills.....	AG-830, AC-2787
Boiler flues.....	AG-886, AC-2890
2,000,000 sq. ft. pine.....	CE-75, AC-4163
1,000,000 sq. ft. oak.....	CE-75, AC-4163

1,000,000 sq. ft. miscellaneous lumber	CE-75, AC-4163
Locomotive tires	CE-75, AC-4163
Steel firebox plate	CE-75, AC-4163
Steel plates for tank cars	CE-75, AC-4163
Air gates	AG-33, AC-4163
80 60-gal. casks for water	628-CV, AC-4162
10 rolls wire and 250 kilos of nails	628-CV, AC-4162
10 tons lime	AG-370, AC-4132
5 tons lime	621-CV, AC-4123
*1,000,000 cross ties, standard gage	CV-519, AC-3761
*500,000 cross ties, narrow gage	CE-75, AC-4163
Accessories for Pintsch gas	CE-75, AC-4163
100 pairs catches, deck sash, A. & W. Co., No. 35	AG-42, AC-183
20 kilos chalk white, lump	AG-42, AC-183
50 kilos cords, belt, hemp, 7/8-in. x 40-in.	AG-42, AC-183
30 kilos rivets, deck sash, o. 3, 3/4 W.	AG-42, AC-183
70 kilos rivets, tinned, iron, various sizes	AG-42, AC-183
76 gross screws flat head, brass, various sizes	AG-42, AC-183
6 wheel "Barnes" pipe cutters, No. 3	AG-42, AC-183
240 kilos wire, copper, soft drawn, various sizes	AG-42, AC-183
5 kilos wire, brass spring, 1/32-in.	AG-42, AC-183
2 sheets asbestos millboard, 16-in. x 40-in.	AG-42, AC-183
24 sheets asbestos millboard, sheets 1/2-in. thick, 40-in. wide	AG-42, AC-183
160 kilos asbestos rope, 1/2-in.	AG-42, AC-183
24 pieces burners, acetylene, 1/4-in., Colonial No. 2	AG-42, AC-183
144 pieces burners, "Dual" No. 2	AG-42, AC-183
144 pieces burners, "Dual" No. 3	AG-42, AC-183
36 kilos carbonyl lamp	AG-42, AC-183
Carborundum wheels	AG-826, AC-2769
144 pieces gaskets lubricator, 3/8-in. hole, 1 1/2-in. diam.	41-B, AG-42, AC-183
144 pieces gaskets lubricator, for Detroit No. 21, Bull Eye Lubricator	AG-42, AC-183
Packing cloth insertion, various sizes	AG-42, AC-183
50 kilos putty, Commercial, in bladders	AG-42, AC-183
790 mts. bolts, straight, link iron, 3/4-in.	AG-42, AC-183
100 mts. chain, straight, link iron, 1 1/2-in.	AG-42, AC-183
100 mts. chain, straight, link iron, 1 1/2-in.	AG-42, AC-183
108 packages cotters spring, various sizes	AG-42, AC-183
2 kegs nuts, hexagon, tapped U. S. S., 3/8-in.	AG-42, AC-183
2 kegs nuts, hexagon, tapped, 1 1/8-in.	AG-42, AC-183
2 kegs nuts, square, tapped, 3/8-in.	AG-42, AC-183
3 kegs rivets, cone-head, boiler burden, iron, 3/4-in. x 2-in.	AG-42, AC-183
3 kegs rivets, cone-head, boiler burden, iron, 3/4-in. x 3 1/2-in.	AG-42, AC-183
1 keg washers, cut, 3/8-in.	AG-42, AC-183
1 keg washers, cut, 1/2-in.	AG-42, AC-183
1 keg washers, cut, 3/4-in.	AG-42, AC-183
1 keg washers, cut, 7/8-in.	AG-42, AC-183
50 pieces bushings, 1/2-in. x 3/8-in.	AG-42, AC-183
50 pieces bushings, 3/4-in. x 1/2-in.	AG-42, AC-183
50 pieces couplings, reducing, 3/8-in. to 1/2-in.	AG-42, AC-183
50 pieces couplings, reducing, 1/2-in. to 3/4-in.	AG-42, AC-183
50 pieces couplings, reducing, 3/4-in. to 1-in.	AG-42, AC-183
50 pieces couplings, wrot, 1/2-in.	AG-42, AC-183
100 pieces couplings, wrot, 3/4-in.	AG-42, AC-183
50 pieces elbows, malleable, beaded, 1/2-in.	AG-42, AC-183
50 pieces couplings, wrot, 1-in.	AG-42, AC-183
100 pieces elbows, malleable, beaded, 3/4-in.	AG-42, AC-183
50 pieces pipe, wrot iron, 1-in.	AG-42, AC-183
50 pieces couplings, wrot, 1 1/4-in.	AG-42, AC-183
50 pieces pipe, wrot iron, 1 1/2-in.	AG-42, AC-183
50 pieces pipe, wrot iron, 2-in.	AG-42, AC-183
50 pieces plugs, cast for screw pipe, 1/2-in.	AG-42, AC-183
25 pieces plugs, cast for screw pipe, 3/4-in.	AG-42, AC-183
25 pieces plugs, cast for screw pipe, 1-in.	AG-42, AC-183
25 pieces plugs, cast for screw pipe, 1 1/4-in.	AG-42, AC-183
25 pieces plugs, cast for screw pipe, 1 1/2-in.	AG-42, AC-183
25 pieces tees, malleable, beaded for screw pipe, 1/2-in.	AG-42, AC-183
50 pieces tees, malleable, beaded for screw pipe, 3/4-in.	AG-42, AC-183
50 pieces unions, common, malleable, 1/2-in.	AG-42, AC-183
50 pieces unions, common, malleable, 3/4-in.	AG-42, AC-183
25 pieces unions, common, malleable, 1 1/4-in.	AG-42, AC-183
25 pieces unions, common, malleable, 1 1/2-in.	AG-42, AC-183
10 pieces Globe valves, brass, screwed, 1/4-in.	AG-42, AC-183
12 pieces Globe valves, brass, screwed, 3/8-in.	AG-43, AC-183
12 pieces Globe valves, brass, screwed, 1/2-in.	AG-42, AC-183
12 pieces Globe valves, brass, screwed, 3/4-in.	AG-42, AC-183
12 pieces Globe valves, brass, screwed, 1-in.	AG-32, AC-183
1 piece gage, steam locomotive, brass, 6 3/4-in. black drail	AG-42, AC-183
white figures 300-lb. pressure	AG-42, AC-183
24 mts. tubing, copper, seamless, 3/8-in., O. D. 3/32-in.	AG-42, AC-183
24 mts. tubing, copper, seamless, 1/2-in., O. D. 5/32-in.	AG-42, AC-183
1 thick, 15 ft. length, seamless, 2-in., O. D. 5/32-in.	AG-42, AC-183
24 mts. tubing, copper, seamless, 2 1/4-in., O. D. 7/8-in. thick, 12 ft. 6 in. length	AG-42, AC-183
50 lbs. Euchrelyptum	AG-42, AC-183
3 rolls gold leaf ribbon, XX, 1/2-in.	AG-42, AC-183
5 rolls gold leaf ribbon, XX, 1/2-in.	AG-42, AC-183
1000 kilos plaster of paris	AG-42, AC-183
2 pieces crucibles, No. 80	AG-42, AC-183
50 sheets iron, planished, No. 22, U. S., sheets, 28-in. x 72-in.	AG-42, AC-183
2 sheets lead, sheets 7/8-in.	AG-42, AC-183
500 kilos steel angle, 3/4-in. x 3/4-in. x 3/4-in.	AG-42, AC-183
500 kilos steel angle, 7/8-in. x 3/4-in. x 3/4-in.	AG-42, AC-183
500 kilos steel angle, 1-in. x 3/4-in. x 3/4-in.	AG-42, AC-183
500 kilos steel angle, 1 1/2-in. x 3/4-in. x 3/4-in.	AG-42, AC-183
2 sheets steel fire box, sheet 7/8-in. x 52-in. x 92-in.	AG-42, AC-183
1 sheet steel fire box, sheet 7/8-in. x 80-in. x 80-in.	AG-42, AC-183
200 kilos steel machine, round, 1/2-in.	AG-42, AC-183
3,000 kilos steel, spring 3/4-in. x 7-in.	AG-42, AC-183
500 kilos steel, spring, 7/8-in. x 7-in.	AG-42, AC-183
4 sheets steel tank, 1 1/2-in. x 48-in. x 120-in.	AG-42, AC-183
6 sheets steel, tank, 1 1/2-in. x 48-in. x 120-in.	AG-43, AC-183
6 sheets steel, tank, 1 1/2-in. x 48-in. x 120-in.	AG-42, AC-183
6 sheets steel, tank, 1 1/2-in. x 48-in. x 240-in.	AG-42, AC-183
400 pieces brake beams, R. H. Acme I. H.	AG-42, AC-183
600 pieces flues, boiler, charcoal	AG-42, AC-183
123 wheels, cast iron, for freight cars	AG-42, AC-183
72 wheels, handcar	AG-42, AC-183
16 sets taps, hand machinists, U. S. S.	AG-309, AC-3945
190 pieces pneumatic material	AG-42, AC-183
20 taps, patch bolts	AG-42, AC-183
60 mts. burlap	AG-42, AC-183
3 rolls canvas	AG-42, AC-183
80 kilos hair, curled F. M. Black, grade of Armour Curled Hair Works	AG-42, AC-183
100 ft. walk, quality "E." red.	AG-42, AC-183
100 pieces lamps, incandescent	AG-42, AC-183
10,000 pairs baggage checks	518-CV, AC-3778
800 chisel points	155-AC, 3784
200 separators for accumulators	AG-543, AC-2008
10 tons rabbitt metal	AG-297, AC-1145
100,000 car seals	AG-328, AC-4019
500 towels for Pullman	CD-46, AC-4005
5 ton antimony	AG-358, AC-4058
15,300 hose pipe air brake	AG-279, AC-3817
3,150 hose for air brake	AG-360, AC-4063
5,000 paritions	610-CV, AC-4064
20,000 kilos of lime	610-CV, AC-4064
500 kilos of oox	AG-338, AC-4064
50 water barrels	AG-359, AC-4059
Picks, bars, jacks, etc.	363, AC-4062
300 boxes of carbide	AG-349, AC-4037
Electrical material	169, AC-4048
52 manometers	AG-368, AC-4131
15 windows various sizes	589-V, AC-405
15,000 incandescent lamps	AG-261, AC-3742
854 Pac. burners, 2 barrels of globes	AG-211, AC-3681
2,100 pieces pipe air brake, lap welded	AG-210, AC-3680
50 cases pure turpentine	AG-379, AC-4142
Adzes, axes and handles	AG-346, AC-4003
Narrow gage freight cars	78-CV, AC-2653
Blocks and tackle	AG-793, AC-4079
tires, 5 1/2-in. wide, rough rolled, 43 3/4-in.	AG-596, AC-2179
700 galvanized plates	AG-47, AC-3232
50 pieces brake beam heads	AG-181, AC-3589
45 window glasses of various sizes	451-CV, AC-3523
20 machetes	179-AG, 4130
American yellow pine, various sizes	AG-345, AC-2951
Bengal lights and torpedoes	AG-4, AC-226
50 electric lanterns	AG-182, AC-3590
48 rules of interchange books	AG-653, AC-2235
Stationery	38-LA, AC-2720
Transparent curtains	607-CV, AC-4077
Padlocks	171-AC, 3980
Wire netting	AG-31, AC-206
380 pieces steel spring	AG-336, AG-4013

\*Ties are usually bought in the Mexican market. Quotations are also required for air brake equipment and tank cars. All material for repair of locomotives and cars must be in accordance with the specifications of Master Car Builders. Competitive bids are obtained and ordered are placed on basis of quality as well as price.

### Return of Brigadier General Atterbury

BRIGADIER GENERAL WILLIAM W. ATTERBURY arrived at Hoboken, N. J., from France on May 31, and was at once discharged from the army; after a short vacation he will resume his duties as vice-president of the Pennsylvania Railroad.

General Atterbury wears three decorations, the Distinguished Service Medal of the United States Army, the French Legion of Honor, and the British Order of the Companion of the Bath. With him on his return were the following members of his staff: Captain J. A. Appleton, formerly yardmaster at West Philadelphia; Captain J. V. Reath, formerly secretary to Mr. Atterbury as vice-president of the Pennsylvania Railroad; Lieutenant W. H. Myers; A. J. Bonsall, and R. E. Nichols. Captain Appleton was general superintendent at Gievres; Captain Reath was adjutant general, and Lieutenant Myers was the representative of the transportation corps at Angiers.

In a brief review of his experience of 21 months in France, General Atterbury said:

It was perfectly clear from the very outset that, to take care of the tonnage the A. E. F. would bring into France, it would be necessary to utilize to the maximum every berthage accommodation not already in use and that in addition to all of this it would be necessary to provide new port facilities; and the splendid dock project at what we called American Basens, just outside of Bordeaux, was undertaken and carried out to completion. Here was erected out of the mud bank of the Garonne river a modern ten-berth dock, with 40 electric gantry cranes. This project constitutes one of the distinctive achievements of the A. E. F. in France.

The personnel on the French railroads when America entered the war was becoming serious. By reason of the war, there was no source of supply from which could be recruited an adequate number of suitable employees, the strain of three

years of work under war conditions was telling on the men, and the calibre of the personnel on an average was not so high as in peace times. The A. E. F. had to provide transportation forces commensurate with the added burden which it placed upon the French railroads, and in addition, such supplemental forces in the way of car and locomotive repairmen, track men, etc., as could be brought over from the States consistent with the requirements of the combatant troop program. In equipment, likewise, the French had reached a rather serious stage when the Americans began to arrive in France. A considerable percentage of the cars and engines had been captured by the Germans in the big drive at the beginning of the war, and an excessive number of bad-order cars and locomotives had accumulated. One of the first steps taken on behalf of the A. E. F. was to send to France experienced car and locomotive repair forces. A car-erecting plant was built at LaRochele, to take care of cars coming in a knocked-down condition from the States, and for a locomotive-erecting plant at St. Nazaire to take care of knocked-down locomotives arriving at that port.

In addition, the plan was developed of having locomotives sent to us from the States in a practically completed state on special ships, thus involving but little work in assembling when they reached us, and, what was much more important, relieving the port of St. Nazaire to that extent, as we could take care of the partially erected locomotives at Brest. Throughout the war the car and locomotive situation was one of the vital factors entering into the conduct of combatant operations. There never was a time when it was not essential to produce the greatest practicable efficiency out of the equipment available. To give an idea of what the program to have 4,000,000 men in France by the Summer of 1919 meant, it may be stated that we were arranging to have in France by that time 4,000 locomotives and 98,000 cars. To supply an army of that size we were planning for the reception and discharge of 101,000 tons of cargo per day at the ports. The condition of the French railroads when I reached France in September, 1917, was surprisingly good, considering the fact that they had been operating more than three years under war conditions, that no new rail had been laid within that time, and that the force they had been able to keep on maintenance of way was practically negligible. For the manner in which the French railroads met the requirements of the Allied Armies I have nothing but the highest commendation. At no time was there the semblance of a breakdown in the transportation machinery of the country, despite the great overload placed upon it, and the results achieved are a splendid tribute to the efforts of the French transportation authorities.

To expand adequately the capacity of the French railroads involved the planning and construction of immense storage yards and additional engine houses; the laying of supplemental tracks, the rearranging and extension of existing tracks and, in general, everything that goes into the enlargement and expansion of a railroad to meet greater needs. Behind each of the main ports we had stupendous storage layouts; then we had what we called our intermediate storage—about midway between the ports and the army zone—and then came our storage developments in the Advance Section.

Several of these yards are the largest in the world and in general they represent the last word in modern yard construction. The plans for the development at Gievres called for 264 miles of track, 1,152 turnouts, 4,410,000 square feet of covered storage and 10,387,000 square feet of open storage. At the time of the armistice 132 miles of track, 3,552,000 square feet of covered storage and 6,000,000 square feet of open storage had been completed. The project covers an area of 2,600 acres.

It is hardly necessary to say much about the performance

of the Army Transport Service in France, which is a branch of the Transportation Corps, because I think the performance of that department has spoken for itself and that its achievements are perhaps the best known of any of the branches of the Transportation Corps. It may be interesting, however, to state that we hope to reach the figure of 340,000 as the number of Americans shipped back to the United States during the month of May, as compared with the record figure of approximately 312,000 reached in September, 1918, in connection with the movement of troops to France. The Transportation Corps as authorized provides for 6,000 officers and 200,000 soldiers. This was the force we figured would be needed properly to meet the requirements of an American Army in France of 4,000,000. At the time of the armistice we had in the corps 1,810 officers and 46,976 soldiers.

I cannot speak too highly of the work of our transportation men in France. No body of men worked harder or more industriously and no body of men is entitled to greater credit. In the Corps we had some of the leading railroad and shipping men of America. These men came to France at great personal sacrifice, and in the development of the organization of the Corps worked more strenuously than they had ever done before in their lives. I have never seen a more hearty spirit of co-operation than that manifested by these officers in the carrying out of the assignments that fell to their lot in the army life, and there is nothing of which I am more proud than to have been associated with them in the work in France.

Our relations with the French and the British were of the most pleasant and harmonious character. They made it perfectly clear right from the start that they were at all times at our service for the benefit of any advice or suggestions they might be able to offer by reason of their longer experience in the war, and we availed of their assistance to great advantage. This spirit prevailed not alone in connection with the respective staff organizations, but extended throughout the entire working of our transportation relationship. In addition they rendered us valuable service in connection with the loan of facilities at times when, pending the provision of our own, we otherwise should have been greatly handicapped.

#### Note From "Rails and Sails"

General Atterbury's departure from France on May 21 was the occasion of a notice in *Rails and Sails*, the service periodical published by army men, which said in part:

"With this issue *Rails and Sails*, on behalf of the officers and men of the Transportation Corps, takes leave of Brigadier General W. W. Atterbury, Director General of Transportation. . . . It is given to few men to step out of civil life and become immediately one of the important leaders of a great army in an epoch-making struggle of the world and to become one of the most prominent figures in the preservation of civilization. To do this and to perform the task ably and adequately is the severest test that can come to any American. General Atterbury met this test successfully and performed the task set for him in a manner to win the highest encomiums of his own Commander-in-Chief and of the great leaders of the Allied Armies. He has won the esteem of his brothers-in-arms and of his subordinates. The name of Atterbury will be linked with that of Pershing as the name of Knox is linked with that of Washington and Scott with that of Grant. General Atterbury's return to civil life means the severing of an official tie that easily became a personal one. It is a great thing to be a soldier and a great thing to be a military leader, but the greatest thing of all is to be a kind, able and patriotic civilian. When General Atterbury takes off khaki and puts on the garb of a plain American he will be uniforming himself for even greater tasks. Vale, duce magno! Ave, civitate majore!"

# Short Line Problems Discussed at Washington

## Demand Adequate Rates and Fair Divisions, Also Special Provision in Appropriation Bill

THE TROUBLES AND PROBLEMS of the short line railroads as well as the situation confronting the railroads generally were discussed at a meeting of about 200 short line railroad officers, which was attended also by a number of officers of the larger roads, held at Washington on Tuesday, Wednesday and Thursday of this week at the call of the American Short Line Railroad Association. Bird M. Robinson, president of the association, presided, and addresses were made by John J. Esch, chairman, and Thetus W. Sims, former chairman of the House committee on interstate and foreign commerce; Walker D. Hines, director general of railroads; Senator Oscar A. Underwood of the Senate committee on interstate commerce; H. C. Hall of the Interstate Commerce Commission; T. De Witt Cuyler, chairman, and Alfred P. Thom, counsel, of the Association of Railway Executives, and others, after which the delegates present considered the particular problems of the short lines informally with a view to adopting a plan of action.

### President Robinson's Address

President Robinson in his address said in part:

The condition now confronting the rail transportation companies of the country, especially the short line railroads, is not only distressing but appalling. That deplorable condition is chargeable almost wholly to agencies and influences beyond their control, and it demands the undivided attention of all concerned. The return of the railroads on January 1 accentuates the necessity for Congress to act before that time, and the serious condition confronting the roads makes it imperative that the laws to be enacted must be helpful and constructive. That can be accomplished only in one way, and that is for the people engaged in the business to aid the Senators and Representatives in arriving at correct conclusions. The acute situation confronting us not only justifies but demands that delegates to this meeting carefully consider all questions involved, for the subject cannot be dealt with from the limited point of the short lines only, and decide upon what should be done for the good of all concerned, after which the delegates can and should confer fully with their respective Senators and Representatives and give them accurate, intelligent and necessary information so as to aid them in enacting a law that will protect the transportation business and at the same time properly safeguard the interest of the public.

As a war measure, the government took actual possession of all of the main line railroads, and a part of the short lines, at the beginning of 1918, and it is now operating such lines, leaving the balance of the roads to battle with the constantly rising tide of adverse and ruinous conditions, most of which are caused by government regulation and restrictions, and as a direct result of the operation by the government of a part of the lines.

In view of all of the facts we must recognize that the government is the all overshadowing and all dominant power with which the owners of the railroads must deal in the future. Under the circumstances, we have deemed it wise to ask some of the leading government officials to appear before this meeting and present their views as to what should be done with your properties. Our invitations have been accepted, and you are therefore to have the pleasure of hearing from representatives from each of the three branches of the government having to do with the control and operation of our rail transportation system.

We realize that the short line railroads cannot hope to be prosperous if the main lines are not in that condition, and for that reason we should do all that we can to induce the government to relax its strangling hold upon all roads and permit them to proceed with their business in an orderly and profitable way. In view of the fact that we must take into consideration the condition of the main line roads, we have extended an invitation to the members of the Association of Railway Executives, and to members of the National Association of Owners of Railroad Securities to be present at this meeting and participate in its proceedings.

We find from investigation that members of Congress are somewhat confused by the great variety of suggestions and plans that have been offered, and there is considerable comment, some of it critical, over the fact that the people interested in the railroads do not agree among themselves as to what should be done, and we feel that there is justification for that criticism. We fear that that condition, if not corrected, will result in one of two things—either that Congress will finally do nothing more than adopt a few amendments to the existing interstate commerce act, in other words, do some patch work, or that it will enact some radical legislation that will be detrimental, possibly seriously so, to the railroads and their owners, and to the public as well.

We feel that the people interested in rail transportation business should make every effort to harmonize their different points of view, and join in presenting to Congress suggestions for constructive, helpful legislation.

The President, by his proclamation, and the director general, by notices served by wire, took over all of the railroads, including the short lines. Subsequently, it was announced in behalf of the director general that he did not intend to take or to retain practically all of the short lines.

Congress, in the federal control act, definitely included the independently owned and operated short line railroads engaged in public transportation, and thereupon the administration announced that it would exercise, what we regarded as a very doubtful authority contained in the act, and relinquish practically all of the short lines. Thereupon Congress passed a joint resolution, definitely including under government control the short lines involved, but while that joint resolution was being considered, the administration hastily issued letters, giving notice that the respective roads had been relinquished from government control.

President Wilson, on July 11, 1918, vetoed the joint resolution and said in his message to Congress:

"I quite agree that practically all of these should be retained and that they should not only be retained, but that they should be accorded a fair division of joint rates—a fairer division than some of them have been accorded hitherto—an equitable allotment of cars, and motive power, and fair routing arrangements."

That promise has not been met, either in letter or spirit. Director General McAdoo openly and notoriously disregarded it in every way, and his administration not only did not give a fair division of joint rates, allotments of cars and motive power and fair routing arrangements, but he actually and ruthlessly took from the short lines practically all of their competitive business and attempted to decrease their divisions.

We finally succeeded, after months of effort, in inducing Director General McAdoo to agree upon a standard form of contract which the government was to make with the short

lines, but we found it most difficult to induce the administration to actually make the contracts with the individual lines. The policy pursued was to procrastinate, and when a contract was made, to limit the benefits that would go to the short line making it. In every case presented in which any substantial benefit would move to the respective short lines, the administration would in some way and for some reason decline to enter into the contract. In the meantime, it continued the practice of diverting the competitive business, of forcing up the wages of employees, in increasing the prices of cross ties and other material produced on the short lines, and in many other ways inflicting heavy losses without giving any consideration or benefit in return.

Director General Hines has exhibited a much more considerate and favorable disposition towards the short lines, but when he came into office the die was cast. The assistants and employees, especially a large part of the traffic and operating officials, located in various parts of the country, had had instilled into them the belief that the rights of the short lines were to be disregarded, and while Director General Hines no doubt desires to correct that situation, he has not taken hold of it in that vigorous way which is necessary to reverse all that has been done.

It has become apparent that former employees of several of the main line companies, now the representatives of the Railroad Administration in the various sections, are constantly and effectively diverting the business of the short lines and taking from them their just and equitable rights. In fact, some of us are convinced that there is a conspiracy to so cripple the short lines at this time as to render them helpless, if not to make them bankrupt. We have called attention of the administration to this apparent combination, but unfortunately have not succeeded in inducing them to stop such activities. It is quite apparent that a large part of the administration's traffic and operating officials in the various sections of the country are secretly but certainly working for the future good and protection of the companies with which they were formerly respectively connected, and with which most of them expect to become re-associated after the roads are returned to their owners, hence the incentive to absorb all things possible from the short lines and possibly others.

The lot of the short line railroads, which aggregate about 35,000 miles, has been a sad one. As a rule, the owners were encouraged to construct them by the connecting main line, and especially by the communities which they penetrate, and as a rule the connecting lines promised to co-operate with and aid them, supplying cars free of charge, and promising adequate divisions of joint rates. Unfortunately, those promises have, to a large extent, not been fulfilled, notwithstanding the large volume of business produced by such lines and the great service rendered to the people on the line.

The states in which these roads were built frequently made alluring promises, and in most cases promptly after the road was completed sought to reduce charges for services rendered to the lowest possible amount. As a result of these two factors, many of the short lines have been prevented from becoming a financial success. In other words, they were not permitted to earn sufficient to make an adequate return to the capital invested, and they were thereupon thrown into bankruptcy and condemned as failures. In fact, it is frequently said that a particular line "ought never to have been built," and that reason is assigned why the respective line shall not be permitted to increase its charges and divisions.

If present conditions are to be the standard by which we are to measure the propriety of the construction and efforts in the past, we will be forced to condemn the establishment of a large number of business enterprises that have not succeeded to the extent expected, and must recognize that a large numbers of the Senators, Representatives, members of state

legislatures, as well as a large part of the government officials, ought never to have been elected. That standard will also force us to recognize that a large part of the legislation affecting railroads and other lines of business ought never to have been passed.

We must deal with existing conditions and recognize that the people who have constructed the short line railroads must be permitted to charge a sufficient amount for the services rendered and must receive out of the joint rates such a division as will enable them to conduct the business and have a reasonable return on the funds invested, or if they are not to have such a right they must be accorded the privilege of removing the rails and recover the funds invested as far as that is possible.

The right to remove railroads of that character is universally contested on the ground that the people in the various communities are vested with certain rights. In weighing the two rights involved, the government should recognize the fact that as a rule those roads penetrate undeveloped sections where the value of property is low and the coming of the road instantly causes a very substantial advance in values. In the event the railroad is not permitted to earn a living, the owners should be permitted to remove it, and the local citizens will, to all intents and purposes, be restored to their former status.

Justice demands that rates and divisions of these lines shall be such as to enable them to live, or that they shall be permitted to discontinue the business and remove the property.

Competitive conditions are such that the interline or joint rates from points on the short lines to points beyond cannot, as a rule, exceed the rates from points on the connecting lines in that district or zone. If the rates from such short line points are higher, it will decrease the volume, if it does not prevent the movement of the traffic. These conditions make it necessary that the short line roads shall be accorded a very substantial proportion of the joint rate. In fact, the short lines must at once receive from the government a very substantial increase in the divisions. That increase should in some instances run at least 100 per cent, and possibly more, to enable the respective lines to meet the greatly increased burdens and losses that have been incurred as the direct result of the illegal act of the Railroad Administration in excluding them from federal control, and because of the rank injustice inflicted in the operation of the main lines by the administration.

Congress will, without doubt, pass an act prior to July 1 appropriating for the Railroad Administration, from one billion to one billion two hundred million dollars for the purpose of paying the amount due the roads under federal control and meeting other obligations. The owners and officers of the short lines should immediately present to Congress full information as to the unjust treatment that has been administered to them. They should show the losses that have been incurred and that the administration is not only continuing to divert their business, but is resolutely refusing to give them adequate and necessary divisions of the joint rates. Without any attempt to be vindictive, these representatives of the short lines should show that they are being deliberately deprived of their just rights, hence should urge and insist that Congress allocate and set aside at least \$50,000,000 of its appropriation to be used exclusively in adjusting and paying to the short lines the amount legally and equitably due them.

We should insist that Congress, in that appropriation act, shall include mandatory instructions to the Interstate Commerce Commission to immediately take into consideration the existing status of the short line railroads, the injury and injustice done them as a result of the government control of certain lines, and that said commission, without delay, authorize and direct in such cases as may be brought before them, such increase of the division of joint rates as will

enable said lines to meet the losses that have been incurred, to render adequate transportation facilities to communities served and to receive such reasonable returns on the investment therein as the commission may determine; the instructions to the commission to include directions to make the increased divisions effective as of such date prior to January 1, 1919, as the condition of the respective line may require.

The owners and operators of the short lines should give prompt and great consideration to the various propositions now pending before the interstate commerce committees of Congress. They should aid in the preparation and securing the adoption of helpful, beneficial legislation for the transportation systems at large, and they should give special attention to the provisions in the proposed law affecting the rights of the short lines.

The permanent legislation to be enacted must contain definite provisions conferring upon the Interstate Commerce Commission not only the power but the duty of determining the proportion of joint rates going to the respective short lines. The act should provide that the commission must act promptly, in the event the lines interested do not agree as between themselves, and that it shall award to the short lines such increase of the divisions of joint rates as will enable said lines to meet their expenses, render adequate transportation facilities to the communities served, and receive just compensation for the use of their property.

We should recognize that the entire transportation system of the country should be placed in a healthy condition; that the main lines should receive rates sufficient to meet all of their legitimate expenses, including the necessary liberal divisions to short lines, and an amount sufficient to meet all other charges, including an adequate return on their properties. The time is opportune. The very seriousness of the present situation is our strength, hence let us take counsel together. Let us determine what will be fair and just, and then go forth and fight until we win.

#### Other Addresses

Mr. Esch discussed his bill to provide for the regulation of the railroads after their return by the government, which he said is not a perfected bill, but represents an effort to crystallize public opinion along definite lines. His statement that the bill does not propose a government guarantee elicited applause. Mr. Esch said he believed a plan of guaranteeing a fixed return would inevitably lead to government ownership, and that the railroads should be allowed to work out their own destiny, under proper regulation but without shackles. He also opposed the idea of a regional consolidation of railroads, saying he wished to preserve competition and the enterprise and initiative that have made the American railroads the greatest in the world, and the idea of a secretary of transportation, because such a plan, he said, would be too susceptible of political influence. Mr. Esch said that it was his opinion, and he thought it was the intention of Congress, that the short line railroads should have been included in the system under federal operation.

Mr. Sims, chairman of the House committee during the last Congress, said he did not believe any of the proposed plans for dealing with the railroads would be unaccompanied by difficulties in operation. He thought the completion of the commission's valuation of the railroads would be of great value in the solution of the problem, but he was afraid that the constant increase of value due to the growth of communities would lead to constantly higher rates, and said that if that is going to happen it may be necessary for the government to buy the right of way and terminals and lease them to companies for operation. Mr. Sims said the short lines were "short on mileage but long on political influence"; he told of his unsuccessful efforts to get the joint resolution intended to prevent the relinquishment of the short lines passed last June in time to head off the order of relinquishment.

Director General Hines discussed his ideas for a permanent solution of the railroad problem by consolidating the railroads into a few competing systems, made up of strong and weak roads and providing some workable standard of what railroad regulation ought to produce so that each company could have rates that would enable it to earn a designated return on an official valuation and an additional amount to be put back into the property without capitalization, any excess earnings to be divided between the company and the government. He said he believed increased costs have come to stay, and that unless some such plan is worked out it will become more and more difficult for the roads to get along. It is most important, he said, that the problem be promptly dealt with because general business conditions are suffering until it is settled, because the government is not in position to put large amounts of money into improvements that cannot be completed for several years, and the railroad corporations are not in a position to furnish large amounts of capital till they know where they are coming out. Mr. Hines said that his thought was that the short lines should be provided for and should be included in the general plan of consolidation.

Senator Underwood declared that the proper solution of the railroad question represented the most important problem now before the country after the conclusion of the peace treaty. He said that while surface conditions indicate prosperity in the country no permanent business prosperity can be expected when there is no demand for builders' supplies, and at the present time there are idle furnaces, idle factories and idle freight cars. The war industry has been demobilized, but the peace industry is not yet mobilized, and we are being carried by confidence and credit which alone cannot last long. There must be a remobilization of peace industry or disaster will lie in our path. Business cannot function in the future with its hands tied and business is waiting for Congress to take the wartime shackles from its hands. The railroad problem, he said, goes into every business office in America. The value of their securities is uncertain, and the railroads cannot consume builders' supplies when they have no credit. Business is slowed down until this great problem is solved. He felt confident that Congress has the ability and the judgment to solve the problem if the people will give it a chance, but the job will be done better if rocks are not thrown at it while it is engaged on the task. The key to the arch, he said, is the financial situation. When that is solved the other problems take care of themselves. The railroads must have an earning capacity not only sufficient to take care of the existing capital, but to attract new capital for development, and no one can make that possible but the government. He thought the people had never been in a better humor to do the right thing by the railroads than now, but that the railroads must make some concessions, and one of them is the speculative profit.

Mr. Cuyler said the railroads ought to go back to private management very much as before, so far as corporate organization is concerned, and as untrammelled as is possible consistent with proper regulation. The railroads do not expect to return to former conditions without change, he said, but the shackles should be broken and cast aside, and they should have greater authority for consolidation and coordinated action and a rule of rate-making that will place it beyond peradventure that rates shall be sufficient to meet the wages and the costs of operation and maintenance. He believed that such a rule could be enacted without a government guarantee. He said the federal government should supervise the issuance of securities and that all necessary regulation should be provided for.

"There never was a more mistaken idea," Mr. Cuyler said, "than that the railroads broke down of their own inertia. They were given the wrong kind of medicine by way of regulations, and if the proper medicine is applied the patient

will become stronger than ever. I believe the American people are going to insist on the preservation of private initiative and ownership and public protection for private ownership."

Mr. Cuyler and Mr. Thom both expressed a desire to bring about complete co-operation between the big companies and the short lines, saying that the fundamental problems are the same.

The session on Wednesday afternoon was addressed by S. Davies Warfield, president, and Luther M. Walter, general counsel, of the National Association of Owners of Railroad Securities, and by Commissioner H. C. Hall, of the Interstate Commerce Commission.

Mr. Warfield and Mr. Walter explained the terms of the Warfield plan for future railroad regulation and showed in what manner it would prove of benefit to the short lines. Both expressed their confidence in the Interstate Commerce Commission and pointed out that its work would no doubt be assisted by a definite directory principle established by Congress as to rates and the return allowed under them. They explained how the provision in the Warfield plan for rates sufficient to give a 6 per cent return on the property investment as a whole combined with the division of earnings in excess of that amount on the part of the larger roads would on the one hand provide sufficient return for all roads and on the other provide also for a similar return for the smaller and short line roads. They also pointed out the advantages that might accrue from the provisions of the plan in the way of supplying equipment, in securing proper divisions of interline rates, in unification of terminals, etc.

In bringing to the attention of the meeting the salient principles of the Esch-Pomerene Bill introduced in both houses of Congress on Monday, Commissioner Hall said that it represented the views of the commission and was felt to be the best plan offered because it was simplest. It would require the least amount of charge and gave the best opportunity to use forces of regulation already in existence. He sketched briefly the progress towards the provisions embodied in the bill and spent some time in pointing out the advantages in it from the standpoint of the short lines.

Mr. Hall spoke at some length concerning the lessons derived from the war and showed how an attempt had been made to embody them in the proposed bill. "I am not among those," he said, "who believe that the Railroads' War Board was a failure," and added that in his opinion the War Board accomplished more than the railroads had ever accomplished in this or in any other country. It was handicapped by laws meant to discourage exactly the unification it was trying to bring about. Also he said that he took part in the preparation of the report of the Commission to the President relative to the control of the railroads during the war, but that he had had no idea of segregating the short lines.

Among the advantages he thought would accrue to the short lines through the proposed bill, Mr. Hall instanced the provision relative to the Commission's authority over divisions of interline rates; the equal opportunity the act will offer to every carrier "to earn its own living," the provision that consolidations of roads, joint use of terminals, pooling of tonnage, etc., would be under the control of the Commission. "If I interpret this right," he said, "this would mean that the short lines cannot be starved down and then become absorbed at a price the absorber road chooses to pay."

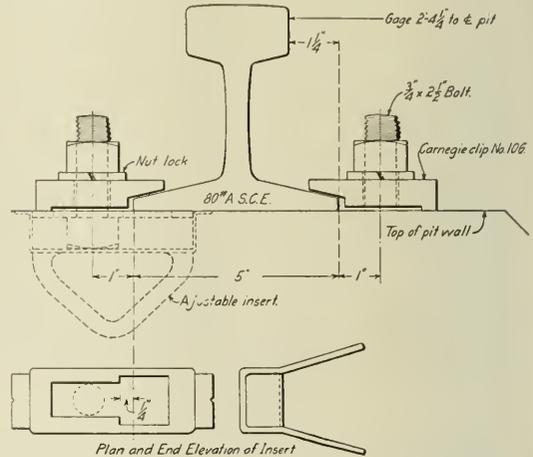

The meeting gave a rising vote of confidence in the Commerce Commission.

In the general discussion the short line officers had a good deal of complaint to make of their treatment by the government and the Railroad Administration and considerable satisfaction was expressed at the prospect of a termination of federal control. Some placed the blame on the officers of the trunk lines and some on the government. An officer of a California line said that on most of the rates the big lines had

not allowed him any part of the increase in rates ordered last year. A number of resolutions were expected to be introduced and acted upon at the session on Thursday.

### Use of Bolt Inserts for Rail Fastenings in Roundhouse

THE FASTENING of rails to the walls of track pits in the new roundhouse of the Toledo & Ohio Central at Columbus, Ohio, was accomplished in an effective manner by the use of bolt inserts embedded in the tops of the concrete walls. Instead of embedding timber blocks in the walls to which the rails could be spiked in the ordinary manner or embedding bolts head down, direct in the concrete, metal inserts were used as shown in the drawing. These inserts are essentially metal boxes containing a receptacle for a bolt head with

Details of the Bolt Insert and Manner of Application

a suitable slot for inserting the bolt and with wings extending into the concrete for the necessary anchorage. The particular advantage of this method of fastening the rails lies in the fact that the bolts may be renewed whenever damaged by a derailment or otherwise. The inserts are made by the Truscon Steel Company, Detroit, Mich., and were placed in pairs as indicated in the drawing, the pairs being spaced 4 ft. center to center along the pit walls.

# Doings of the United States Railroad Administration

## Director General Hines and Staff Now on Inspection Trip; Prospects of Additional Rail Orders

WASHINGTON, D. C.

**D**IRECTOR GENERAL HINES and members of his staff left Washington on Thursday for another inspection and speaking trip, via the New York, New Haven & Hartford to Boston, the Boston & Albany to Albany, the New York Central to Chicago, the Rock Island to Denver, the Burlington back to St. Louis, the Illinois Central to Birmingham, and the Seaboard Air Line from Birmingham back to Washington. Mr. Hines expected to return to Washington on June 14.

### Accounting Circulars

On the ground that federal control constitutes all railroads operated by the government as a single system the Division of Accounting, in Accounting Circular 94, directs that the assessment and collection of war taxes on shipments of company material transported by one carrier under federal control for another carrier under federal control shall be discontinued at once. If it is decided that this rule shall be made retroactive further instructions will be issued.

Accounting Circular 88 (revised) cancels P. S. & A. Circular 33 prescribing rules for the settlement of per diem between railroads under federal control and roads not under federal control and directs that the rules prescribed in Circular C. S. 59 issued by the Car Service Section, effective May 1, shall be followed.

### Rate Advance Possible

The possibility of an advance in rates was again discussed by Director General Hines when he appeared before the appropriations committee of the House on Tuesday to explain the need for a \$1,200,000,000 appropriation, but he said he was not ready to decide the question until the conditions to be expected of the latter part of the year are more definitely known. Mr. Hines pointed out, however, that rates are relatively very low because the percentage of increase made last year was much less than the percentage of increase in expenses and in the prices of wages and commodities generally and that the government is merely protecting the public against the higher prices that would result from an increase in rates. He showed that during the first four months of this year wages were 50 or 52 per cent higher than in the corresponding period of 1917, but declared that a similar situation existed in most industries, and that the costs of materials and supplies have increased from 55 to 70 per cent. He felt, however, that if a decision to advance rates were reached now the amount might either be made too high or too low, which would require still another advance and, therefore, the decision should be deferred. Mr. Hines also appeared before the committee on Wednesday.

### Freight Traffic Movement and Car

#### Performance for April

The volume of freight traffic showed an even greater decline in April than in March, according to the monthly report of freight traffic movement and car performance compiled by the Operating Statistics Section. The net ton miles of revenue and non-revenue freight amounted to 28,629,739,000, a decrease of 24.6 per cent. The net ton miles per mile of road per day were 4,134, as compared with 5,471 in April, 1918. Train miles decreased 23.4 per cent; car miles decreased 19.1 per cent. The average number of freight cars on line daily

was 2,445,731, a decrease of 2 per cent. Of these 2,288,988 were reported as serviceable, the percentage of unserviceable cars being 6.4 per cent, as compared with 5.2 per cent. The report shows clearly that with the reduction in traffic the loading of cars and trains is being decreased. The net ton miles per train mile (tons per train) averaged 674, as compared with 685 in April, 1918, a decrease of 1.6 per cent. The net ton miles per loaded car mile also show a decrease, from 29.3 to 27.3, or 6.8 per cent. The percentage of loaded to total car miles was 68.1, as against 68 last year. The average miles per car per day also show a decrease, from 25.5 to 21.1, a loss of 17.6 per cent, and the net ton miles per car day in April averaged 390 against 507, a decrease of 23.1 per cent.

### Policy of the Railroad Administration as to Public Improvements

Walker D. Hines, director general of railroads, has sent the following letter to the regional directors respecting relations with public bodies as to public projects resulting in charges to capital account, or in charges to operating expenses in connection with capital expenditures; or with respect to taxes and assessments:

"The Railroad Administration is disposed in favor of the resumption or development of public works and improvements. In cases where the only objection thereto is to the present comparative cost of labor and material, no protest will be made on behalf of the Railroad Administration. Even where the burden upon the Railroad Administration in a particular district would be relatively a large part of the total cost, the mere difference between the cost of work being done now and being done somewhat later is not sufficient to justify an attitude of opposition by the Railroad Administration to a policy of resumption or prosecution of public works.

"The Railroad Administration should not identify itself with opposition to proposals looking to such development or resumption of public works unless the case is exceptional and it is clear that the expenditure will be improvident, or that the project is actually in a private interest and involves the public interest only to a slight degree and the private interest involved will not assume the expense of the work. Nothing herein shall be construed to relate to facilities covered by General Order No. 15.

"Representatives of the Railroad Administration should at all times make it clear to the public authorities that responsibility for capital expenditures rests upon the railroad corporations and not upon the Railroad Administration, and unless specifically authorized by the Division of Law, shall speak only for the Railroad Administration in proceedings before public service or state railroad commissions, or officials of cities, counties or municipalities.

"The Railroad Administration may use its moral suasion to get the railroad corporations to consent to go ahead with public improvements and to finance improvements. However, no federal administration officer should take any action or make any committal, the effect of which would be to deprive a corporation of an opportunity to present its objection to the expenditure.

"In view of the fact that the amount of money available for capital expenditures is always limited, if a project will not be beneficial to the public in proportion to the expense, or can better be postponed pending the completion of more im-

portant capital expenditures, the railroad corporation, which will have to supply the capital, should present the conditions to the proper authorities.

*Bond Issues or Special Assessments.*—"Railroad administration officials will not take any action for or against any proceeding, the purpose of which is to authorize a bond issue or special assessment, but will as fully as practicable keep the corporate officer of each interested railroad advised so that if the corporation desires to take any action, it may do so.

"In cases involving a special assessment chargeable to capital account in which the corporation does not make financial arrangements to pay the assessment, there is no obligation upon the director general to furnish the money. In such case the question is one between the public authorities and the railroad corporation.

*Projects Which Involve Charges to Capital Account that the Corporation Agrees to Assume, But Which Also Involve Charges to Operation.*—"If such a project is agreed to between the corporation and the public body and the financial arrangements have been satisfactorily disposed of, the Railroad Administration will assume, as to operating expenses, the amount properly chargeable to it, but this policy should not prevent the federal officer from presenting the objections, if any, which may develop to the project from an operating standpoint, nor from designating, wherever possible, the most economical method of carrying out any such project whenever there is more than one way of providing the proposed facility, or improving the existing facility, or from designating a better method of reaching the result if there is one available.

*Discussions With, or Proceedings Before, Public Service or State Railroad Commissions, or Officials of States, Counties or Municipalities.*—"The general practices in connection with negotiations with, or before such public authorities preceding the issuance of an order, either formal or informal, should be along the following lines:

"(a) Immediately upon receiving notice that any question affecting capital expenditures is to be taken up, notice should be given as information, to the proper officer of the corporation so that the corporation may participate in the consideration or hearing before the public authority, and where such projects involve the consideration of existing franchises or charters, unusual care in protecting the rights of the corporation, to notice should be exercised.

"The United States Railroad Administration representatives should assure themselves that the public authorities have given the corporation the notice required by law.

"(b) The representatives of the United States Railroad Administration will in such proceedings handle to the best advantage all matters involving maintenance, transportation and other items included under operation, and may be called as witnesses for the public, or the corporation, as well as for the Railroad Administration.

"(c) It will be entirely proper to respond to any requests from a municipality, county or state for information in regard to material and labor costs, and to volunteer such data so that all concerned may get the benefit of the information in the hands of the Railroad Administration officials.

"(d) Single complete items involving a charge to capital expenditures of \$1,000 or less should be promptly reported to the corporation to give the corporation the opportunity of handling the matter with the public authority, but in the discretion of the federal manager the work should not be delayed if, and when, in his opinion, a prompt disposition of the matter will be the proper action under all circumstances.

*Compliance with Orders Issued by Public Authorities.*—"If and when a proceeding before the public authority has resulted in a definite order involving a charge to capital expense, the matter should be promptly reported to the Division of Capital Expenditures, with the position of the corporation officer clearly expressed, together with the recommendations of the federal manager and regional director."

## Operation of the Permit System

Walker D. Hines, director general of railroads, has authorized the following statement regarding the application of the permit system:

"Several days ago the Railroad Administration advised the interested shipping public of the plans in contemplation for the handling of the anticipated large grain crops, and stated that it was expected that the permit system would be re-inaugurated with the opening of the new wheat season. Experience last year demonstrated that the permit system of handling traffic was by far the most efficient, and indeed the only way of protecting the shipping public from the car shortages and transportation failures which arose when the eastern terminals were clogged with traffic. Embargoes without the permit feature have proved highly unsatisfactory, disrupting not only operating conditions of the railroads, but also the trade arrangements of shippers.

"The results of the operation of the permit system at the ports had proved so beneficial to all interests that the plan was adopted last year as a means to control shipments to the interior grain markets as quickly as it developed that some control of movement was necessary in order to keep the railroads in a position to do business continuously. Considering the immense territory and the importance and volume of the commodity involved, the results were satisfactory to all interests.

"An embargo temporarily stops all traffic, or all traffic in certain commodities. It is wave-like in its operation. It lacks flexibility. The permit system as applied to grain movement contemplates a regular flow of grain to each market to the maximum ability of the consignees' facilities at the terminal to unload. It also regulates the current movement according to the ability of the railroad to handle. It contemplates a more equitable distribution of equipment with consequently greater benefit to all shippers. It avoids congestion at terminals and in transit, and it consequently results in a freer and heavier movement of grain from the farms because it is restricted only by the available unloading facilities at the markets.

"The permit system will be applied this year the same as last year. A grain control committee will be selected to operate at each primary or terminal market. Each committee will be composed of three members, two representing the operating and traffic departments, respectively, of the Railroad Administration, and the third the transportation division of the United States Grain Corporation. A shipper desiring to ship to any particular market will apply through the railroad agent at point of origin, to the grain control committee at such market, for the necessary permit, which will be promptly issued if conditions admit of the prompt delivery to and acceptance by consignee at destination. A copy of the permit when issued will also be transmitted by the grain control committee to the proper transportation officer of the railroad via which the shipment is to be made so that necessary action may be taken with respect to the furnishing of equipment.

"It will be readily appreciated that not only will producers and shippers of grain be benefited by this regulation in transportation, but the entire shipping public will be benefited in that the channels of commerce will be kept free of congestion, car detention largely eliminated, and the maximum use of all equipment more highly developed."

## Contracts Executed

The Railroad Administration has executed a standard compensation contract with the Terminal Railroad Association of St. Louis for \$2,574,510, and also co-operative short line contracts with the Minneapolis, Red Lake & Manitoba, the Flint River & Eastern, and the Roscoe, Snyder & Pacific.

### General Order 59 Revoked

Director General Hines has issued General Order 59-A, revoking General Order 59, issued on February 26, which required the railroads to file monthly reports of traffic statistics covering 58 principal commodities.

### B. & O. Chicago Terminal Transferred

Effective on June 1, 1919, the Baltimore & Ohio Chicago Terminal Railroad was transferred from the Northwestern region to the Allegheny region, according to Circular No. 84 issued by the director general.

### Prospects for Additional Rail Orders

The Railroad Administration is not planning on immediately placing additional orders for rail, although it is recognized that more will be needed and it will probably be necessary to place orders by August 1, when the 200,000 tons just ordered will be delivered. Although the annual requirements of the railroads are usually figured at above 1,500,000 tons for renewals only and not including any new construction, and this figure represents approximately the average of the 10 years ending with 1917, the average rail renewals during the three-year test period ending June 30, 1917, amounted to only about 1,350,000 a year and this is the amount which the Railroad Administration, under the law and its contracts with the railroad companies, is obligated to provide for the years 1918 and 1919. Last year about 1,100,000 tons was used for renewals, so there was a shortage of about 250,000, which would make the requirement for this year 1,600,000. To meet this there was on order on January 1, of the old orders placed by the railroad companies, about 1,100,000 and the recent order makes a total of 1,300,000 to be delivered this year. This apparently would require an additional order of 300,000 tons merely to keep even and it is understood that before the negotiations with the Peek committee were undertaken the Railroad Administration had contemplated an initial order of 500,000 tons. There is also an additional requirement of about 90,000 tons to make the carry-over into 1920 equal to the tonnage on hand at the end of 1917. This amounted to 460,865 tons. On January 1 there was on hand only 369,223 tons, and if the roads are to be returned on December 31 the Railroad Administration would doubtless be obligated to turn over the equivalent of the carry-over into 1917. This would indicate that 390,000 tons is the minimum that must be ordered for this year for upkeep alone, to say nothing of any new work.

During the negotiations between the corporations and the administration over the terms of the standard compensation contract some apprehension was expressed on behalf of the railroads that they might be called upon to pay, by deduction from their rental, for so-called "excess maintenance" which the Railroad Administration might find necessary. Most of such apprehension has doubtless disappeared during recent months, but it would seem that if the administration simply provides for meeting its contract obligations any deferred maintenance accruing during the three years before federal control will be accumulated proportionately during the two years of government control. Moreover, the companies which took advantage of the option afforded them, at the time the old standard price of rails was raised, of saving part of the increase by placing orders for future delivery, will have been deprived of the benefit of their foresight. An interesting question may be raised when the accounts are unscrambled after the end of the year as to whether the government is indebted to the railroads merely for the price of the rail delivered on advance orders of the companies which it has used, or whether it will owe them an equivalent tonnage of rails at the increased prices.

### Maintenance Expenditures to Be Checked More Closely

Changes in the organization of the Division of Operation made on June 1, by which W. J. Cunningham and A. M. Burt were appointed assistant directors, are understood to indicate that special attention is to be given to the problem of maintenance expenditures involved in the obligation of government to return railroad properties in as good condition as when taken over, or to perform same amount of upkeep as during the test period. Professor Cunningham has been appointed chairman of the committee on maintenance expenditures, which also includes Mr. Burt, in charge of engineering and maintenance of way, and Frank McManamy, in charge of mechanical matters. Director General Hines has issued an order to the regional directors to limit maintenance of way expenditures for June, in general, to the average ratio to the operation expenses of the test period. This is to afford an opportunity for a closer check and will be followed by more definite instructions for the balance of the year. The order is not a hard and fast one, and is not intended to curtail necessary work. Regional directors are given authority to exceed the limit in emergency cases. The Administration has been proceeding on the plan of measuring upkeep by expenditures during the test period, but the government also has the option of returning the railroad property in as good repair and with as complete equipment as on January 1, 1918, and on this basis there has been some over maintenance on some of the properties which it may be necessary to check in order to expend the proper amount on others.

### Orders of Regional Directors

**CLAIMS AGAINST WAR DEPARTMENT.**—A. H. Smith, regional director, Eastern region, by Circular 401-14A765, advises federal managers to file with the War Department, promptly, all claims for cost of construction or maintenance of tracks which have been laid for the accommodation of the War Department. Under the act of March 2, 1919, these claims must be presented before June 30. Where claims are pending for work of this kind done prior to January 1, 1918, such claims may be combined, in a joint claim, with bills for similar work done since that date.

**Intensive Loading of Freight Cars.**—The southern regional director, in Circular Letter No. 439, urges continued efforts toward heavy loading of freight cars. See *Railway Age*, May 23, page 1274 (order of Eastern regional director). The need of the meeting of competition will frequently be urged by shippers as a reason for light loading, but where orders from consignees are given as the cause for such, the shippers will nearly always be willing to join in efforts to induce consignees to so arrange their affairs as to order the maximum amounts possible, for the interests of the shipper and the carrier in the matter are identical.

**Sodium Nitrate; Hazards in Storage.**—A. H. Smith, regional director, Eastern region, by circular 600-179A766, promulgates a special report, received from the Fire Loss and Protection Section, covering hazards in the storage and handling of nitrate of soda in bulk at railroad terminals. When this substance is stored in a frame building it may be better, in case of fire, to allow the building to be destroyed rather than to use much water.

**Safety Appliances on Freight Cars; Time Limit September 1.**—A. H. Smith, regional director, Eastern region, by Circular 500-92A767, calls the attention of federal managers to the laws of Congress, the orders of the Interstate Commerce Commission and the rules of the Master Car Builders' Association, designed to insure the complete equipment of all freight cars with the legal safety appliances by September

1, 1919. Foreign as well as owned cars should be equipped under certain regulations.

*Capital Expenditures on Maintenance Work.*—A. H. Smith, regional director, Eastern region, by Circular 2700-A662A, gives further details in connection with D. C. E. Circular 20, in relation to securing the consent of corporations for certain expenditures. For work of any nature, if delays occur in securing the corporation's attitude, the federal manager should wire the regional director for authority to proceed, giving the circumstances necessary to explain the need of special despatch.

*Advertising.*—Order 208 of the Southwestern regional director quotes instructions with respect to expenditures for advertising issued originally by the regional director of Western railroads in Circular 50, dated March 23, 1918, and adds amendments to these instructions authorizing the exploitation of local excursions and the promotion of travel to local tourist resorts. In cases where two or more roads are interested in a given resort publicity expenditures should in every case be joint. All plans for promotive advertising, after approval by the federal manager, will be referred to the Western Passenger Traffic Committee for review and approval.

*Rental Charges on Cars.*—Order 207 of the Southwestern regional director cancels Orders 183 and 185 previously issued by the Southwestern regional director pertaining to rental charges on locomotives and other equipment and outlines new rates for locomotives, dining cars, locomotive cranes, etc., effective March 1. These rates do not abrogate those named in any contracts which have been executed prior to the effective date.

*Navy Department Recruiting Posters.*—Supplement 2 to Circular 201 of the Southwestern regional director directs that the army and the navy be treated alike in the posting of notices in stations. (*Railway Age*, April 18, page 984.)

*War Savings Posters.*—Supplement 6 to Circular 39 of the Northwestern regional director states that permission has been given the United States Treasury Department to display one War Savings poster in each railroad station.

*Transportation of Employees of Steamship Lines.*—The Northwestern regional director in Supplement 51 to Circular 20 states that it will not be the policy of the Railroad Administration to issue transportation to officers and employees of ocean steamship lines.

*War Risk Insurance Posters.*—The Northwestern regional director in Supplement 5 to Circular 39 states that permission has been granted the Public Health Service of the Treasury Department to place a poster in each railroad station, informing the beneficiaries of the War Risk Insurance where medical and surgical care for soldiers, sailors, marines and nurses discharged from military duties can be obtained.

*Freight Car Distribution.*—The regional director, Eastern region, by a circular dated May 3, calls renewed attention to the instructions concerning the loading of freight cars to points off the loading road. The average percentage of home cars on owning lines is not increasing as fast as it should, and federal managers are now called upon to prohibit the use of system cars, except open-top pool cars, for off-line loading if other suitable cars are available.

*Sailing Day Plan.*—The Northwestern regional director gives instructions for the handling of schedules for the movement of less than carload freight superseding circular 70 (*Railway Age*, May 2, page 1100).

*Gasoline in Wrecks.*—The regional director, Eastern region, by circular 602-31A701A, promulgates further advices from the Bureau of Explosives as to precautions to be taken after the occurrence of a train accident where tank cars of gasoline are involved. Wrecking outfits usually have a power pump to transfer liquids, but the use of this involves some risk of fire, and it is suggested that in transferring

oil the wreckers should use a portable pump that can be operated by connecting to the air brake line.

*Inspection of Fruits and Vegetables.*—A. T. Hardin, regional director, Eastern region, by circular 600-172A737A, advises that the extent to which railroads shall make use of the services of the Department of Agriculture in the inspection of fruits and vegetables is left to the discretion of the federal manager. Information concerning the activities of the Department of Agriculture has been sent to the federal managers to enable them to avail themselves of this service if it is more efficient than that already in effect.

*M. W. Expenditures; Ten-Year Comparisons.*—A. T. Hardin, regional director, Eastern region, by circular 2700A768, calls upon federal managers for tabulated statements, from all roads in class 1, giving expenditures, by years, for maintenance of way and structures from 1908 to 1917 inclusive; also calendar years 1917 and 1918. The blanks for this data are OS 10-A and OS 10-B. Blueprint copies will be acceptable for the purposes of the Central Administration.

*Locomotive Fuel Contracts.*—Supplement 17 to Northwestern Regional Purchasing Committee Circular 3 contains the following clause which will be incorporated in all contracts for locomotive fuel: "In the event the railroad is released from federal control before the expiration of this contract, it is understood that the corporate owners have the option to be exercised at their pleasure, of being substituted for the director general of railroads, as to the benefits and obligations of this contract, effective upon the date the owners assume control." This will not require the approval of the corporate companies at this time.

*Embargoes, Eastern Region.*—A. T. Hardin, regional director, Eastern Region, by circular 2000-15A642A, issues revised rules governing embargoes, taking effect June 10. The New England Embargo Bureau is abolished, and instructions are given for exchanging information between the office of the regional director at New York and that of the district director at Cincinnati. All embargoes are to be promulgated to all interested by wire and confirmed by mail on the same day.

*Wages of Trainmen.*—The regional director, Eastern Region, by circular 1200-4-56A770 interprets supplement No. 15 to the rules defining local freight services. The term pick-up train includes any freight train running on a through freight schedule which picks up or sets off cars at five or more places.

*Cars Rented to War Department.*—The regional director, Eastern Region, by circular 500-51A773 promulgates an order from the Division of Operation to the effect that where freight cars are furnished for the War Department, the rental rate is to be uniformly \$3 a day, beginning with June 1. Various rates have heretofore prevailed.

*Discipline.*—The regional director, Eastern Region, by circular 1200-362A772, promulgates an order from the Division of Operation, that in all cases, and regardless of the wording of agreements upon the subject, employees in train and engine service must be granted a complete investigation before final application of discipline. A man may be held out of service for the investigation, but the investigation in every case must be given before action is taken. The employee should be confronted with the evidence presented against him and in such a way that he may be enabled to meet it and make a defense.

The boatmen in New York harbor, by the result of the agreement reached a month ago, following the general strike, have had their pay increased from \$5 to \$15 a month, with overtime for all work in excess of ten hours a day. The agreement, if ratified by the unions, will run for one year from April 21, 1919. It affects about 4,500 men.

## The Second Pan-American Commercial Conference

THAT THE DEVELOPMENT of trade between the United States and the countries of Central and South America is going to depend in no small degree upon the extension of railway lines financed by capital from the United States was one of the strong points among the many brought out at the Second Pan-American Commercial Conference in Washington this week. The leading representatives of many of these countries in the United States were among the speakers and they, as well as others, brought out the necessity of railroad transportation to make available the tremendous natural resources of these countries. They emphasized that much, if not most, of the capital needed for this railway development must come from this country and showed the opportunity that was awaiting the investor in them as well as the trader who would exchange American made goods for the commodities that such new railways would make available.

The conference opened its sessions at the Pan-American building, in Washington, Monday afternoon with about 1,000 diplomatic, commercial and trade representatives of the United States and Latin America in attendance. The conference is the second of its kind (the first having been held in 1911). It lasted five days, with morning, afternoon and evening sessions, at which were discussed all aspects of trade between the United States and Central and South America.

The first session on Monday afternoon was called to order by John Barrett, director general of the Pan-American Union, and presided over by William C. Phillips, assistant secretary of state, in the absence of Frank L. Polk, acting secretary of state and acting chairman of the governing board of the Union. Addresses were made by Thomas R. Marshall, vice-president of the United States; by Beltrán Mathieu, ambassador from Chile; by Ignacio Calderón, minister from Bolivia; by F. H. Gillett, speaker of the House of Representatives, and by Homer L. Ferguson, president of the Chamber of Commerce of the United States.

Beginning with the Monday evening session and continuing over the three sessions on Tuesday, the several Central and South American countries were discussed by representatives of the respective countries, the countries being taken up in alphabetical order and opportunity being afforded for the asking and answering of questions. At the evening sessions stereopticon and motion pictures were shown of the countries then under consideration.

At the Tuesday morning session, in addition, the conference was addressed by Dr. Francisco Tudela y Varela, ambassador of Peru, and by William C. Redfield, secretary of commerce. The Tuesday afternoon session was similarly addressed by Henry P. Fletcher, United States ambassador to Mexico.

The Wednesday morning session was devoted to shipping and other transportation, including aviation; that of Wednesday afternoon to trading methods, including merchandising, business ethics, export and import combinations; and that of Wednesday afternoon to such matters as parcel post, trade marks, trade regulations, packing, etc.

The morning session on Thursday was devoted to financing, investments, credits, government aid to commerce; Thursday afternoon session was devoted to engineering aids to commerce, including railways and highways, waterways, harbors, etc.

The Friday morning session was planned to be devoted to commercial intelligence, including advertising, publicity, etc. Friday afternoon to educational and social auxiliaries to commerce, to be followed on Friday evening by a reception

and garden party on the grounds of the Pan-American Union.

Secretary of Commerce William C. Redfield in his address at the Tuesday morning session pointed out the new facilities made available for Latin American trade in the last few years, and referred particularly to shipping, banking, the growth of our productive capacity and the capital available for investment in other countries. He pointed out that even before the war there were times when there was overproduction and expressed the view that with the increased capacity now existing, export trade was an absolute necessity. He stated his hope that in the future our commerce with foreign countries would be on a permanent and instructive basis and of a kind that would prove of mutual benefit to buyer and seller. The country, he said, is now suffering from an "overdose of prosperity" and he pointed out that as a creditor nation we must be prepared to invest large sums abroad to compensate for the large balances in our favor. This investment he hoped would prove of three-fold value: (1) through the direct return on the investment, (2) as assisting the normal flow of trade, and (3) through the development of wealth by the use of capital as, for instance, in the case of railways, which would open up new regions and make available the great resources now impossible of access.

The minister from Bolivia and the ambassador from Peru both referred to the advantages to be gained by the investment of United States capital in railways in those countries.

"The United States," said Ignacio Calderon, minister from Bolivia, "is now in a position to provide the necessary capital for the construction of railroads and the development of the industries and resources of the southern nations, and besides helping their progress acquire economically the same preponderating position that its policy of right and justice has given to it throughout the world. The investment of American capital would foster our common interests and contribute more than any other thing to the increase of commerce and of our friendly relations."

## A Large Timber Treating Retort

THE CONSTRUCTION of what are believed to be the largest timber treating retorts ever installed in the United States has just been completed for the Chicago & North Western by the Wm. Graver Tank Works, Chicago, and they have been shipped to the wood preservation plant of

Timber Treating Retort Ready for Shipment

that road at Escanaba, Mich. These retorts are 113 ft. long and 6 ft. 2 in. in diameter. Their combined weight is approximately 180 tons. They are built to withstand a working pressure of 175 lb. The doors, which weigh 6 tons each, swing on roller bearing hinges.

The Universal Aviation Company is the name of a concern announced as having been organized at Detroit, Mich., to establish regular airplane transportation between that city and Cleveland. The distance between these two cities in an air line is only about 80 miles, or less than half the shortest route by railroad.

## Internal Combustion vs. Steam Engines for Small Plants\*

By C. A. Lichty

Inspector, Purchasing Department, C. & W. W. W., Chicago

THE SUBJECT of the Internal Combustion versus Steam Engines for Small Stationary Plants permits a wide field of survey. It is assumed that the subject should be limited here primarily to plants for railroad purposes and in sizes not to exceed 40 to 50 hp.

Upon the advent of the gasoline engine it was predicted by many that it would soon put the steam plant out of business, especially at the smaller power stations. But steam was the old reliable for so many years when it was the only power available that where it was once established it has not always been the policy to substitute the newer type of engine during the natural lifetime of the old plant, especially where coal and labor were cheap and where the quality of the water was good for steaming purposes. At some of the important water supply stations steam pumps have been in use ever since the road was built, some of them continuing for years after it was definitely determined that other power was more economical and equally reliable. Some authorities maintain that the larger and more important pumping stations can be operated most successfully by steam, while others are substituting internal combustion engines, even in the immediate vicinity of the coal fields. Many, especially on the northern roads, maintain steam plants, making use of the exhaust steam by running it into the water to keep it from freezing in the tank; besides, when the pump is not in service live steam can be used for the same purpose, as well as to thaw ice from spouts, valves, etc. In most of the states steam plants are subject to a rigid inspection. For instance, in the state of Illinois boilers must be inspected and tested four times per year, and operated only by a licensed engineman.

One of the principal reasons for getting away from the steam pumping plant, in many places, and this may also apply to other steam plants, is on account of frequent renewals of boiler sheets and flues. In some cases boilers have to be changed out in from six months to a year, depending on the nature of the water, necessitating the boilers to go to the shop for repairs. This entails considerable annoyance and expense. The expense for the maintenance of the internal combustion engine is perhaps slightly in excess of that required for the steam engine, but it is seldom necessary to send either type to the shop unless the entire apparatus is in need of overhauling.

Tests for efficiency as far back as 1882 showed that the gasoline unit was an active competitor with the steam plant for small installations, and about 10 years later it was generally conceded that it had gained the supremacy, but just about that time the rapid development of the multi-cylinder, small type of engine used so extensively for propelling automobiles, trucks, motorcycles, airplanes, etc., created such a demand for gasoline as to give the larger sizes of internal combustion engines a temporary setback until it could be arranged to operate them successfully with kerosene and the cheaper grades of fuel oil, since which time they have again made considerable progress.

The cost of installation of the two types of plants under consideration, of like proportions, may differ but little except for plants ranging from 1 to 10 hp., where the oil equipment would be much less. In fact, for plants of this size steam can scarcely be considered a competitor. In some installations of from 20 to 50 hp. the oil engine may be more expensive than the steam engine and boiler. When the additional

space for the housing of the latter and its fuel is taken into consideration, it is doubtful if, in many instances, the steam plant has any advantage in cost.

There is little room for doubt but that the oil engine is much more economical in the matter of attendance. The steam boiler requires nearly an hour to get up steam and almost constant attention thereafter for firing and all of the other necessary requirements, while the oil engine can be started in an instant, and when properly installed and adjusted the attention required is only nominal. It is well known that many of the smaller pumping stations are successfully operated by agents, baggagemen, sectionmen, etc., when conveniently located, in connection with their other duties, requiring but a small share of their time.

A steam plant necessitates about six times the space for transportation and storage of coal that oil does; besides the latter may be conveniently stored underground, where it is entirely out of the way. For reasons just stated the labor required for the handling of coal and ashes is several times that for oil. Some roads require coal to be delivered to small power plants in considerable quantities during certain seasons of the year in order to render cars and labor available for other purposes when they are most needed. The result is that the coal is most always stored outside, where it deteriorates to some extent and is liable to be stolen or may catch fire from spontaneous combustion. A leading authority from one of the prominent railroads estimates that the loss of fuel from all sources in connection with a steam plant sometimes runs as high as 40 per cent, while in the case of oil it is very slight.

The Diesel type of oil engine has reached such a stage of economical operation, together with the small amount of space required for engine and fuel as to come into general use for boats and ships and all kinds of stationary plants from 6 to 500 hp. They operate successfully with all of the cheaper grades of oils except those having a decided asphaltic base, and the manufacturers now claim that they will soon be able to operate on such oils as well.

The thermo-dynamic efficiency of the semi-Diesel and true Diesel engines range roughly from 20 to 35 per cent. The economy in fuel consumption therefore is large when compared with the consumption for ordinary steam engines when it is recalled that the efficiency of the small 4-valve Corliss engine is about 6 per cent; the Corliss compound 9 per cent, and the triple-expansion engine rarely reaches 18 per cent. It is a well-known fact that the simpler types of steam pumps are the most wasteful.

The cost of the different fuels varies, of course, in the different localities, but there is scarcely any place in this country where oil can not enter into competition with coal for the purpose outlined in this subject, while, on the other hand, in many localities the steam plant can not enter into competition. A concrete instance of the relative merits of the two types is cited in the case of a steam plant in a small town which was recently replaced with a modern type of oil engine for operating a small electric lighting plant, where it is stated that the former cost of operation of 20 cents per kw. has been reduced to 4 cents by the new installation. It is not known whether the total difference was due to the change, but no doubt much of it was. In this particular case both coal and oil were produced within 100 miles of the plant. One of our prominent railroads recently installed an oil engine at a pumping station where steam had been in use many years, and a total saving of fuel and labor has effected a saving of from 30 to 40 per cent. Both types of plants are in such general use and their characteristics so well known that when all of the conditions are taken into consideration it should not be difficult to determine which should be selected for any particular locality.

\*Abstract of a paper presented at the convention of the International Railway Fuel Association.

# General News Department

W. G. Lee has been re-elected president of the Brotherhood of Railroad Trainmen.

The Railway Fire Protection Association will hold its annual meeting at the La Salle Hotel, Chicago, on October 21, 22 and 23.

The Baltimore & Ohio Chicago Terminal has been transferred from the Northwestern region to the Allegheny region, according to Circular 84 issued by the Director General. The change became effective June 1.

The Spokane & Inland Empire, in co-operation with farmers of Spokane county, Wash., has agreed to engage men to patrol the right of way on all its lines outside of the city of Spokane in an effort to exterminate the squirrels which annually destroy great quantities of grain raised on farms adjacent to the railroad. These men will plant poison in squirrel holes on the railroad's property and poison will also be sold to the farmers, who will apply it in a similar manner on their farms.

Five hundred miles in five hours, 40 minutes, 42 seconds, was the speed of Wilcox, the victor in an automobile race on a track at Indianapolis, Ind., on May 31. This speed is at the rate of 87.12 miles an hour. For the first 275 miles the average was 91.34 miles an hour; but some of the contesting cars had accidents, and two of these resulted in fatal injuries to the occupants, three men being killed, two of them by being burned to death; and thereafter the speed of the survivors was not quite so high. Of the large number of contestants, three were very close behind the winner at the end.

The "No-Accident Campaign" on the railroads of the Southwestern Region for the month of May, has resulted in a marked improvement, speaking generally, but in the oil fields of Texas the number of casualties shows a large increase. For the first twenty days of the month, the general result, throughout the region, is a decrease of 60 per cent in the number of casualties to employees; but in the oil districts a number of roads showed large increases, many new and inexperienced men having been employed since last year.

Officers and clerks of the general offices of the International & Great Northern, moving from Houston, Tex., to Palestine, because of the contract between the railroad company and the city requiring the maintenance of general offices in Palestine, arrived in the latter city on Thursday morning last, in a special train. Other departments follow this week and later. Many clerks in Houston resigned their positions rather than move away from the city. The traffic manager, and the general freight agent will retain their headquarters at Houston.

A. H. Smith, Regional Director of the Eastern Region, in bidding official farewell to the federal managers, expressed his thanks to the officers and employees "for the great assistance and loyal effort afforded me and the co-operation displayed between everyone through the very trying months when hostilities were in progress. The prompt movement of troops in such large volume and the efficient handling of traffic is truly a commendable accomplishment. During the unification of the railroads, as was necessary, there has been no feeling whatever. This indicates a breadth of view and loyalty to the Government. The co-operation of every man has been hearty. . . ."

The "Safety-First Movement" on railroads includes, of course, the interests not only of employees but of all other persons as well; and especially persons driving automobiles

over railroad crossings. Robert Scott, chairman of the General Safety Committee of the Atlantic Coast Line, has addressed a special letter to the clergymen in the towns along the lines of his road asking their assistance and co-operation in warning automobile drivers of the importance of the rule to stop, look and listen before crossing a railroad track. The clergymen are especially appealed to because, says Mr. Scott, "the majority of automobile owners in each community are of the best type of citizens, and it is this class, which, as a rule, attend some church regularly."

Chicago railroads, on the occasion of the recent arrival of part of the 33d Division of the army from France, demonstrated the efficiency of their terminal facilities. A total of thirteen special troop trains were moved from New York to Camp Grant, Rockford, Ill., on schedule time without disarranging the customary traffic of the roads. Of the thirteen trains, three arrived at Chicago over the New York Central, three over the Pennsylvania, three over the Baltimore & Ohio, two over the Grand Trunk, and two over the New York, Chicago & St. Louis. Five trains departed from Chicago over the Chicago & North Western, three over the Chicago, Milwaukee & St. Paul, three over the Chicago Great Western, and two over the Illinois Central. The results were obtained through absolute holding to schedule by the Chicago terminal manager's office, the War Department and the hotels where the men were entertained.

The American Association of Engineers has announced a plan of organization for the formation of railroad sections. It provides for the formation of such sections on any railroad where there are 10 or more members or prospective members of the association. In general there should be only one section of any one railroad system, but when the system is large and is divided for general operation and administration by the railroad itself into two or more parts, there can be more than one section if those railroad members so desire. Each railroad section will elect its own officers and may establish its headquarters at any point on the lines of the road, but preferably at the location of the general engineering offices.

The Pennsylvania Railroad Section of the Association will hold its first convention at Pittsburgh, Pa., on June 28. It is planned to have a business meeting in the forenoon and a banquet in the evening. The headquarters of this section will be at the Fulton building, Pittsburgh.

## Western Society of Engineers

J. H. Waterman, superintendent of timber preservation, Chicago, Burlington & Quincy, Galesburg, Ill., will present a paper before the Western Society of Engineers, Chicago, on Monday evening, June 9, on "Results Obtained from Treatment of Track Ties and Bridge Timbers."

## Utah Central Anniversary Celebration

The Utah State Historical Society has started a movement for a celebration commemorating the laying of the last rail of the first railroad to reach Salt Lake City from the Missouri River, to be held at Salt Lake City on January 12, 1920. Business and social organizations in the city have been invited to participate and the plans, as tentatively prepared, are similar to those for the celebration recently held at Ogden, commemorating the driving of the Golden Spike which completed the first trans-continental railroad. Andrew Jensen, president of the Historical Society, worked on the Utah Central at the time of its building. The Utah Central was completed on January 10, 1870, the last spike being driven

by President Brigham Young in the presence of 15,000 people. The road was 36 miles long from Ogden to Salt Lake, connecting the city with the recently completed Union Pacific. The road is now a part of the Denver & Rio Grande. Salt Lake City had existed for 22 years as a lone community in the midst of the great American desert.

### Export Traffic

According to a report on overseas traffic for the week ended May 28 at the North Atlantic ports, there were 27,924 cars of export freight on hand, exclusive of bulk grain and coal, compared with 28,443 cars for the same day of the preceding week. There were 7,998 carloads of export food on hand at these ports, compared with 7,890 carloads as of May 21. The export situation at the port of New York continues to show improvement. The British government has cleaned up practically all the steel on the ground for its account and will commence to bring in steel from interior points. There were 1,574 cars of provisions on hand on the morning of May 29 consigned to the British, French and Italian governments, the Belgian Relief Committee, Food Administration and Packers Relief. There were stored in elevators at North Atlantic ports on May 28, 13,751,076 bushels of grain. There was received during the week 6,620,496 bushels, while 7,081,201 bushels were cleared. At South Atlantic and Gulf ports as of May 24, there were 10,550 carloads of export freight on hand, as against 9,751 cars as of May 17. There were 5,331,475 bushels of grain stored in elevators at the same ports on May 17.

### Advances to Railroads By War Finance Corporation

Advances to railroad companies and the Railroad Administration by the War Finance Corporation up to May 14 amounted to \$181,710,090. The advances from April 23 to May 14 were as follows:

Central Railroad of New Jersey, \$1,468,800; Philadelphia & Reading, \$1,000,000; Lehigh Valley, \$240,000; Baltimore & Ohio, \$1,700,000; Boston & Maine, \$216,800; Buffalo, Rochester & Pittsburgh, \$449,600; Central Vermont, \$128,800; Chesapeake & Ohio, \$400,000; Chicago, Burlington & Quincy, \$1,520,000; Chicago, Rock Island & Pacific, \$436,800; Delaware & Hudson, \$753,000; Hocking Valley, \$100,000; Illinois Central, \$1,700,000; International & Great Northern, \$387,200; Missouri, Kansas & Texas, \$342,000; New York, New Haven & Hartford, \$1,312,000; New York, Susquehanna & Western, \$100,000; Pere Marquette, \$140,000; San Antonio & Aransas Pass, \$53,000; Spokane, Portland & Seattle, \$100,000; Virginian Railway Co., \$775,000; Wabash, \$976,000, and Western Maryland, \$213,600.

### Prevention of Collisions

The secretary of the New York Public Service Commission, Second District, advises that among the men who are expected to attend the hearing on the collision problem in New York City next week (announced in the *Railway Age* last week, page 1333), are Major Azel Ames, New York; Frank Rhea, New York; C. H. Morrison, New Haven; Daniel Wildard, Baltimore; Julius Kruttschnitt, New York; E. W. McKenna, New York; S. M. Felton, Chicago; W. L. Derr, Clarion, Ia.; J. B. Fisher, Philadelphia; G. L. Peck, Pittsburgh; A. R. Whaley, New York; J. O. Young, Newark, N. J.; D. H. Schwyer, Easton, Pa.; Frank J. Sprague, New York; James L. Truden, Boston.

The hearing will be conducted by the commission, Charles B. Hill (chairman), Frank Irvine, John A. Barhite, Thomas F. Fennell and J. A. Kellogg; with C. R. Vanneman, chief of the division of steam railroads. It will be held in the Hall of Records, Chambers street, near the City Hall, beginning at 10 a. m. on Wednesday, the 18th.

### Honor to British Dead

[From the *Railway Gazette*, London]

St. Paul's Cathedral was filled with a congregation of about 4,000 persons at the memorial service on Wednesday afternoon last, when honor was shown to nearly 19,000 railway men who, in the service of their country, have made the great sacrifice.

There were many characteristics in the service that will make it memorable to those who had the privilege of being present. There was the presence of the king, thus signifying once more the interest shown by his majesty in the railway service; the large number of railway chairmen, directors and chief officers, together with representatives of the Board of Trade and other government departments, of the naval and military forces, of the men's widows, and the over 3,000 relatives of those railwaymen who have fallen. The exquisite and appropriate music provided by the orchestra under Colonel Galloway was, in itself, a marked feature. The address of the Bishop of Peterborough was in keeping with the spirit of the occasion—one of gratitude to those who have fought, and of determination that there shall be a new permanent way of peace and good-will built on righteousness, justice and fellowship among men.

### Progress on Alaskan Railway Construction

Figures showing the total amount of work done in the construction of the Alaskan Government Railway from the beginning of activities to April 30, 1919, were published in the Alaskan Railroad Record of May 13. On the main line 148.02 miles of track, 8.28 miles of sidings, 0.92 miles of spur tracks and 8.05 miles of terminal yard tracks have been laid, while on branch lines 37.72 miles of track, 2.36 miles of sidings, and 6.97 miles of spur tracks have been built. A total of 8,502,847 cu. yd. of material has been placed in embankments, 554,750 lin. ft. of piling has been placed in temporary and permanent structures, 3,000 cu. yd. of concrete has been deposited, 9½ miles of wagon road have been built, and 243 miles of temporary and permanent telegraph lines have been erected.

Alaska has warm sunshine and grass, and the Spring is not so backward as might be imagined, nevertheless the operation of railways has its peculiarities. The Alaska Railroad Record of May 13, says that work had just been undertaken to open a section of the line which has been closed by snow slides for some time, sluicing being resorted to to remove a heavy snow bank lying across the track at mile 76. At another point on the line a ditcher has been working, removing mud slides from the track.

### Telegraph Superintendents' Convention

The Telegraph and Telephone Division of the American Railway Association—formerly the Association of Railway Telegraph Superintendents—will hold its annual meeting at La Salle Hotel, Chicago, on June 11, 12 and 13. There are six committees. Committee No. 1, on construction and maintenance, will present four reports by four sub-committees. (1) Preliminary draft of a pole line specification. (2) A progress report on a crossing specification. (3) Complete specification for installation of underground conduits. (4) Complete specification for transposition of telephone circuits.

Other committees will report on (a) preliminary draft of specification for installation of telegraph and telephone equipment in railroad offices. (b) Protection against electrolysis. (c) Preliminary draft of specification for protection against lightning and against high power circuits. (d) Advances and development in the telegraph and telephone field. (e) Report on message traffic, mailgrams, censoring, etc.

There will be an election of officers and members of certain committees. On the evening of June 12 there will be a banquet at the La Salle Hotel.

The chairman of this division is Martin H. Clapp, manager of the Telegraph Section of the United States Railroad Administration, 18th street and Pennsylvania avenue N. W., Washington, D. C.

### Manufacturers of Mechanical Handling Equipment

All manufacturers of mechanical handling machinery and equipment and accessories in the United States are invited to attend the coalition meeting of the Material Handling Machinery Manufacturers' Association (35 West 39th street, New York City), which will be held at the Hotel Astor, New York City, on Wednesday, June 11, morning, afternoon and evening. This includes makers of cranes, winches and hoists; elevators; gravity and power conveying machinery and ap-

paratus; industrial truck, tractors and trailers; bulk handling machinery, and all makers of equipment and accessories such as storage batteries, bearings, ropes for hoists, buckets, electric controllers and apparatus, etc.

The advertising managers of the companies manufacturing these products are also invited to hold a preliminary conference at Hotel Astor the evening before, at which time it is planned to form an advertising council.

Among the speakers for the day meeting are James H. Collins and Francis Holley. Mr. Holley will tell how educational and industrial moving picture films are distributed throughout the world so that they reach millions of people. At the evening meeting, addresses will be made by former Senator Theodore Burton and Murray Hulbert, Commissioner of Docks of New York City.

The committee having the meeting plans in charge consists of W. J. L. Banham (chairman), Otis Elevator Company; Frederick Stadelman, of Wellman-Seaver-Morgan Company, and E. Logan Hill, of Heyl & Patterson.

### The Canadian Strike Situation

The general strike at Winnipeg continues, although executives of the railway brotherhoods, acting as strike mediators, have succeeded in obtaining proposals of settlement both from the Metal Trades Council which started the strike, and from Winnipeg employers. The negotiations, which have been conducted by the brotherhood mediators, have been strictly secret, but it is understood that the principle of collective bargaining, one of the planks in the strikers' platform, was recognized in both settlement proposals. The next step, insofar as the brotherhoods are concerned, is to submit a compromised plan to the two factions. No extensive disorders have been reported, the strikers being inclined to avoid open breaks which would result in the calling in of the military forces which have been mobilized and are ready for immediate action.

Railway mail clerks of the Winnipeg division who have been on a sympathetic strike, have returned to work. The strikers appeared before Gideon Robertson, federal minister of labor, and asked permission to resume their work. Having made their application before the expiration of a 24-hour ultimatum issued by the government, they were allowed to return to their former positions.

The Winnipeg police force has not been called out on a sympathetic strike, although the men have refused to sign an agreement not to affiliate with any organization that might be called out on a sympathetic strike in the future. However, the men have not indicated that they intend to join in the general strike.

At Toronto, where a general strike has also been in progress for several days, the Metal Trades Council, again the instigator of the strike, has issued an appeal urging other workers who have inaugurated sympathetic strikes in its behalf to return to their jobs. No trouble has been reported at Toronto with railroad employees. General strikes called in sympathy with the Winnipeg strikers at other points in Canada do not appear to be serious and business at such points as Vancouver, B. C., Edmonton, Alta., Calgary and Lethbridge where sympathy strikes have been called is continuing as usual.

Latest reports indicate that at Winnipeg railroad shopmen and commercial telegraph operators were returning to work, and that at Toronto the general strike had lost its vitality.

### "Cut Off One from the Hind End"

Leaving a passenger car while continuing the train at full speed is a custom which American passenger conductors have long since outgrown (and which, indeed, many of them probably never heard of); but in England the fashion is still favored, as will be seen by the following note from the Railway Gazette of London:

"One of the welcome signs of the return of our railways to more normal conditions is found in the new Great Western timetable where 'slips' are shown off the 10:30 a. m. Paddington at Taunton and the 8:30 a. m. Plymouth at Westbury. When war conditions began to press heavily upon the country the system of slipping coaches from express and other through trains had to be abandoned. The Great Western employ a very safe and simple

mechanism for slipping coaches, and had for many years developed a most important series of services to branch lines by means of slip coaches which offered many advantages over the alternative arrangement of stopping the through train and either putting off coaches or causing the passengers to change into the branch train. In pre-war days the 'Limited' 10:30 a. m. ex Paddington had a through run to Plymouth, doing the journey in 4 hours 7 minutes, and three slips were dropped at Westbury, Taunton and Exeter respectively. To give the same branch connections without the slips would have prolonged the journey to the West at least 30 minutes—a serious delay to an important train. We have no doubt that as opportunity offers these slip services will be resumed. They have been greatly missed, and their resumption will materially add to the comfort of the travelling public."

## Meetings and Conventions

*The following list gives names of secretaries, dates of next or regular meetings and places of meetings:*

- AIR BRAKE ASSOCIATION.—F. M. Nellis, 165 Broadway, New York City.
- AMERICAN ASSOCIATION OF DEMURRAGE OFFICERS.—F. A. Pontius, Supervisors of Demurrage and Storage, C. & N. W. Ry., Chicago.
- AMERICAN ASSOCIATION OF DINING CAR SUPERINTENDENTS.—E. H. Thayer, St. Louis-San Francisco R. R., St. Louis, Mo.
- AMERICAN ASSOCIATION OF FREIGHT AGENTS.—R. O. Wells, Illinois Central, Chicago. Next meeting, June 17-20, Cleveland, Ohio.
- AMERICAN ASSOCIATION OF GENERAL BAGGAGE AGENTS.—J. E. Quick, Port Huron, Mich.
- AMERICAN ASSOCIATION OF PASSENGER TRAFFIC OFFICERS.—W. C. Hope, C. R. R. of N. J., 143 Liberty St., New York.
- AMERICAN ASSOCIATION OF RAILROAD SUPERINTENDENTS.—J. Rothschild, Union Station, St. Louis, Mo.
- AMERICAN ELECTRIC RAILWAY ASSOCIATION.—E. B. BUFFI, 8 W. 40th St., New York. Next convention, October 6-10, Atlantic City, N. J.
- AMERICAN ELECTRIC RAILWAY MANUFACTURERS' ASSOCIATION.—C. F. J. Dell, 50 E. 42nd St., New York.
- AMERICAN RAILROAD MASTER TINNERS', COPPERSMITHS' AND PIPE FITTERS' ASSOCIATION.—Otto E. Schlinck, 485 W. 5th St., Peru, Ind.
- AMERICAN RAILROAD ASSOCIATION.—J. E. Fairbanks, 75 Church St., New York.
- Operating Section (including former activities of Association of Railway Telegraph Superintendents' and Railway Storekeepers' Association).
- Engineering Section (including former activities of Railway Signal Association).
- Mechanical Section (including former activities of Master Car Builders' and Master Mechanics' Association).
- Traffic Section (including former activities of Freight Claim Association).
- Transportation Section (including former activities of Association of Transportation and Car Accounting Officers).
- AMERICAN RAILWAY BRIDGE AND BUILDING ASSOCIATION.—C. A. Lichty, C. & N. W. Ry., 319 N. Waller Ave., Austin Station, Chicago. Next convention, October 21-23, 1919, Cleveland, O.
- AMERICAN RAILWAY ENGINEERING ASSOCIATION.—E. H. Fritch, 431 South Dearborn St., Chicago.
- AMERICAN RAILWAY MASTER MECHANICS' ASSOCIATION (see American Railroad Association, Mechanical Section).—Acting Secretary, V. R. Hawthorne, 431 South Dearborn St., Chicago. Next annual convention, June 23-25, 1919, Atlantic City, N. J.
- AMERICAN RAILWAY PERISHABLE FREIGHT ASSOCIATION.—E. F. McPike, 135 E. 14th St., Chicago. Regular meetings, 2d Wednesday in March and September.
- AMERICAN RAILWAY TOOL FOREMEN'S ASSOCIATION.—R. D. Fletcher, 6202 Greenwood Ave., Chicago. Next convention, August 27-29, Hotel Sherman, Chicago.
- AMERICAN SOCIETY FOR TESTING MATERIALS.—C. L. Warwick, University of Pennsylvania, Philadelphia, Pa. Next meeting, June 24-27, 1919, Hotel Traymore, Atlantic City, N. J.
- AMERICAN SOCIETY OF CIVIL ENGINEERS.—Charles W. Hunt, Engineering Societies Building, 33 W. 39th St., New York. Regular meetings, 1st and 3d Wednesday in month except July and August, 220 W. 5th St., New York. Next annual convention, June 17-20, Hotel Radisson, Minneapolis, Minn.
- AMERICAN SOCIETY OF MECHANICAL ENGINEERS.—Calvin W. Rice, 29 W. 39th St., New York.
- AMERICAN SHORT LINE RAILROAD ASSOCIATION.—T. F. Whittlesey, 708 Union Trust Bldg., Washington, D. C.
- AMERICAN TRAIN DESPATCHERS' ASSOCIATION.—D. L. Darling, Northern Pacific Ry. Spokane, Wash. Next convention, June 17-20, Hotel La Salle, Chicago.
- AMERICAN WOOD PRESERVERS' ASSOCIATION.—F. J. Angier, B. & O., Mt. Royal Sta., Baltimore, Md.
- ASSOCIATION OF MANUFACTURERS OF CHILLED CAR WHEELS.—George W. Lyndon, 1214 McCormick Bldg., Chicago. Semi-annual meeting with Master Car Builders' Association.
- ASSOCIATION OF RAILWAY CLAIM AGENTS.—Willis H. Failing, C. R. R. of N. J., Jersey City, N. J.
- ASSOCIATION OF RAILWAY ELECTRICAL ENGINEERS.—Jos. A. Andreuccetti, C. & N. W. Ry. C. & N. W. Sta., Chicago. Next meeting, October, 1919, Chicago.
- ASSOCIATION OF RAILWAY TELEGRAPH SUPERINTENDENTS (see American Railroad Association, Operating Section).—W. L. Connelly, N. Y. C. R. R., Gibson, Ind.
- ASSOCIATION OF TRANSPORTATION AND CAR ACCOUNTING OFFICERS (see American Railroad Association, Transportation Section).—G. P. Conard, 75 Church St., New York.
- BRIDGE AND BUILDING SUFFLY MEN'S ASSOCIATION.—M. J. Trees, Chicago, Bridge & Iron Company, Chicago. Next annual convention, October 21-23, 1919, Cleveland, O.
- CANADIAN RAILWAY CLUBS.—James Powell, 46 Aberdeen Ave., St. Lambert (near Montreal), Que.
- CAR FOREMEN'S ASSOCIATION OF CHICAGO.—Aaron Kline, 841 Lawler Ave., Chicago. Regular meetings, 2d Monday in month, except June, July and August, New Morrison Hotel, Chicago.

**CENTRAL RAILWAY CLUB.**—Harry D. Vought, 95 Liberty St., New York. Regular meetings, 2d Thursday in November, and 2d Friday in January, March, May and September, Hotel Staller, Buffalo, N. Y.

**CHIEF INTERCHANGE CAR INSPECTORS' AND CAR FOREMEN'S ASSOCIATION.**—W. R. McMillin, New York Central, New York.

**CHIEF INTERCHANGE CAR INSPECTORS' AND CAR FOREMEN'S SUPPLY MEN'S ASSOCIATION.**—D. B. Wright, Lehon Company, 45th and Oakley Sts., Chicago.

**EASTERN RAILROAD ASSOCIATION.**—D. G. Stuart, Washington, D. C.

**FREIGHT CLAIM ASSOCIATION** (see American Railroad Association, Traffic Section), Lewis & Clark, R. F. & P., Richmond, Va.

**GENERAL SUPERINTENDENTS' ASSOCIATION OF CHICAGO.**—A. M. Hunter, 321 Grand Central Sta., Chicago. Regular meetings, Wednesday preceding 3d Friday in month, Room 856, Insurance Exchange Bldg., Chicago.

**INTERNATIONAL RAILROAD MASTER BLACKSMITHS' ASSOCIATION.**—A. L. Woodworth, H. & O., Lima, Ohio. Next convention, August 19-21, Hotel Sherman, Chicago.

**INTERNATIONAL RAILWAY FUEL ASSOCIATION.**—J. G. Crawford, 702 E. 51st St., Chicago.

**INTERNATIONAL RAILROAD GENERAL FOREMEN'S ASSOCIATION.**—Wm. Hall, 1001 W. Walsh Ave., Winona, Minn. Next convention, October 21-23, 1919, American Annex Hotel, St. Louis, Mo.

**MAINTENANCE OF WAY AND MASTER PAINTERS' ASSOCIATION.**—F. W. Haeger, 1323 Hurley Ave., Ft. Worth, Tex. Next annual convention, October 21-23, 1919, American Annex Hotel, St. Louis, Mo.

**MASTER BOILER MAKERS' ASSOCIATION.**—Harry D. Vought, 95 Liberty St., New York.

**MASTER CAR AND LOCOMOTIVE PAINTERS' ASSOCIATION OF THE UNITED STATES AND CANADA.**—J. H. Lane, H. & M., Reading, Mass. Next meeting, September, 1919, Chicago.

**MASTER CAR BUILDERS' ASSOCIATION** (see American Railroad Association, Mechanical Section).—Acting Secretary, V. R. Hawthorne, 431 South Dearborn St., Chicago. Next annual meeting, June 18-21, Atlantic City, N. J.

**NATIONAL ASSOCIATION OF RAILWAY AND UTILITIES' COMMISSIONERS.**—James B. Walker, 49 Lafayette St., New York. Next annual convention, October 14, 1919, Indianapolis, Ind.

**NATIONAL FOREIGN TRADE COUNCIL.**—O. K. Davis, 1 Hanover Square, New York.

**NATIONAL RAILWAY APPLIANCES ASSOCIATION.**—C. W. Kelly, Kelly-Derby Co., Peoples Gas Bldg., Chicago.

**NEW ENGLAND RAILROAD CLUB.**—W. E. Cade, Jr., 683 Atlantic Ave., Boston, Mass. Regular meetings, 2d Tuesday in month, excepting months of June, July, August and September.

**NEW YORK RAILROAD CLUB.**—Harry D. Vought, 95 Liberty St., New York. Regular meeting, 3d Friday in month, except June, July and August, 29 W. 39th St., New York.

**NIAGARA FRONTIER CAR MEN'S ASSOCIATION.**—George A. J. Hochgrebe, 623 Brisbane Bldg., Buffalo, N. Y. Regular meetings, 3d Tuesday in each month, Tenjost Hall, Buffalo, N. Y.

**PACIFIC RAILWAY CLUB.**—W. S. Wollner, 64 Pine St., San Francisco, Cal.

**RAILWAY ACCOUNTING OFFICERS' ASSOCIATION.**—E. R. Woodson, 1116 Woodward Bldg., Washington, D. C. Next annual meeting, June 11, 1919, Hotel Commodore, New York.

**RAILWAY BUSINESS ASSOCIATION.**—Frank W. Noxon, 30 Church St., New York. Next annual meeting, December, 1919, Buffalo, N. Y.

**RAILWAY CLUB OF PITTSBURGH.**—J. D. Conway, 515 Grandview Ave., Pittsburgh, Pa. Regular meetings, 4th Thursday in month except June, July and August, Colonial Annex Hotel, Pittsburgh, Pa.

**RAILWAY DEVELOPMENT ASSOCIATION.**—D. C. Welty, Missouri Pacific R. R., St. Louis, Mo.

**RAILWAY ELECTRIC SUPPLY MANUFACTURERS' ASSOCIATION.**—J. Scribner, General Electric Co., Chicago. Annual meeting with Association of Railway Electrical Engineers.

**RAILWAY EQUIPMENT MANUFACTURERS' ASSOCIATION.**—D. L. Eubank, Galena Signal Oil Company, Richmond, Va. Next annual meeting, September, 1919, Hotel Sherman, Chicago.

**RAILWAY FIRE PROTECTION ASSOCIATION.**—G. L. Ball, St. Louis-San Francisco Ry., St. Louis, Mo.

**RAILWAY REAL ESTATE ASSOCIATION.**—James P. Nelson, President, C. & O., Richmond, Va.

**RAILWAY SIGNAL ASSOCIATION** (American Railroad Association, Engineering Section, Signal Division), H. S. Ballet, Bethlehem, Pa., 75 Church St., New York. Next meeting, June 26 and 27, "The Breakers", Atlantic City, N. J.

**RAILWAY STOREKEEPERS' ASSOCIATION.**—J. P. Murphy, N. Y. C. R. R., Box C, Collinwood, Ohio.

**RAILWAY SUPPLY MANUFACTURERS' ASSOCIATION.**—J. D. Cenway, 1841 Oliver Bldg., Pittsburgh, Pa. Next annual meeting, June 18-25, 1919, Atlantic City, N. J.

**RAILWAY TELEGRAPH AND TELEPHONE APPLIANCE ASSOCIATION.**—G. A. Nelson, Waterbury Battery Co., 30 Church St., New York.

**ROADMASTERS' AND MAINTENANCE OF WAY ASSOCIATION.**—P. J. McAndrews, C. & N. W. Ry., Sterling, Ill. Next annual convention, September 16-18, 1919, Chicago.

**ST. LOUIS RAILWAY CLUB.**—B. W. Frauenthal, Union Station, St. Louis, Mo. Regular meetings, 2d Friday in month, except June, July and August.

**SIGNAL APPLIANCE ASSOCIATION.**—F. W. Edmunds, West Nyack, Rockland County, New York.

**SOCIETY OF RAILWAY FINANCIAL OFFICERS.**—L. W. Cox, 1217 Commercial Trust Bldg., Philadelphia, Pa.

**SOUTHERN AND NORTHWESTERN RAILWAY CLUB.**—A. J. Merrill, P. O. Box 1205, Atlanta, Ga. Regular meetings, 3d Thursday in January, March, May, July, September and November, Piedmont Hotel, Atlanta.

**SOUTHERN ASSOCIATION OF CAR SERVICE OFFICERS.**—E. W. Sandwich, Western Ry., of Ala., Atlanta, Ga.

**SUPPLY ASSOCIATION OF AMERICAN RAILWAY TOOL FOREMEN'S ASSOCIATION.**—C. N. Thulin, Duff Manufacturing Company, 935 Peoples Gas Bldg., Chicago. Next convention, August 27-29, Hotel Sherman, Chicago.

**TRACK SUPPLY ASSOCIATION.**—W. C. Kidd, Ramapo Iron Works, Hillburn, N. Y. Next annual convention, September 16-18, 1919, Auditorium Hotel, Chicago.

**TRAVELING ENGINEERS ASSOCIATION.**—W. O. Thompson, N. Y. C. R. R., Cleveland, O. Next annual meeting, September 9-12, 1919, Hotel Sherman, Chicago.

**WESTERN ASSOCIATION OF SHORT LINE RAILROADS.**—Clarence M. Oddie, Mills Bldg., San Francisco.

**WESTERN RAILWAY CLUB.**—J. M. Byrne, Chief Clerk to Mechanical Assistant, Central Western Region, 547 Jackson Bldg., Chicago. Regular meetings, 3d Monday in month, except June, July and August.

**WESTERN SOCIETY OF ENGINEERS.**—Edgar S. Nethercut, 1735 Monadnock Block, Chicago. Regular meetings, 1st Monday in month, except July and August.

## Traffic News

The Montana Freight Rate Association asks for interline freight rates upon both class and commodity rates. At the present time Montana has no interline rates except on coal and cement, and it is claimed that the present system of rate making confines business of Montana cities almost exclusively to the railroads upon which they are situated and to the advantage of outside competition.

Changes in passenger train service between San Francisco, Cal., and Goldfield, Nev., cutting the time between the two cities by nearly 12 hours and providing night travel across the desert in both directions have been announced by W. R. Scott, federal manager of the Southern Pacific. The new service begins on June 8, and follows a conference held before the Nevada State Railroad Commission to devise means of accommodating the increased travel to the new gold fields.

Loading of freight in the Northwestern region for the week ending May 27, shows a decrease of 8,077 cars from the records established for the corresponding week last year. The comparative size of the present wheat crop as compared with that of last year is shown by an increase of 5,725 cars of grain and grain products loaded. The number of cars of livestock and miscellaneous freight loaded show slight increases while the number of cars of coal and coke, lumber and forest products and ore loaded during this period show a decrease from the records established last year.

The William Graver Tank Works, East Chicago, Ind., has petitioned the Chicago Eastern District Freight Traffic Committee for a fabrication-in-transit arrangement at East Chicago, Ind., in lieu of the existing arrangement which permits only fabrication of iron and steel framework or sections for bridges and buildings. It is desired to extend the application of this arrangement to cover iron and steel in carloads, fabricated into iron and steel framework or sections for bridges, buildings, towers, tanks, stand pipes, steel riveted pipes and smoke stacks. The petition is based on the fact that competitors now enjoy such an arrangement in connection with fabrication-in-transit privilege at Greenville and Sharon, Pa.

The report of the Market Survey Committee, composed of representatives of various organizations of the grain trade, the Bureau of Markets of the Department of Agriculture and the Car Service Section of the Railroad Administration and formed to study conditions of grain markets east of the Rocky mountains to the end that greater uniformity may be had in the inspection of grain and greater efficiency in the handling of grain cars, contains several interesting conclusions and recommendations concerning the transportation phase of the problem. It is suggested in the report that railroads assign certain designated tracks as a "grain hold yard" and so far as possible place all of the grain cars that arrive upon these tracks. During periods when there is an unusual rush of grain, making it necessary to hold some of the cars on other tracks, the railroads should give the grain inspection officials a location notice of the cars. Regarding the unification of terminals under the Railroad Administration the report states that this unification has made it possible for carriers to adopt practices which have materially increased efficiency in the handling of grain and it is recommended that these practices be continued when the railroads are returned to private control. To decrease the necessity for embargoes or the use of a permit system the committee suggests that prompt inspection be made upon inbound and outbound cars and that disposition orders be given promptly. To further increase the efficiency of this work it is recommended that the railroads should provide some central location for the receipt of such orders and should also arrange to have them promptly executed after they are received.

## Commission and Court News

### Interstate Commerce Commission

Oral arguments in the railroad valuation cases set by the Interstate Commerce Commission for May 26 at Washington have been postponed, at the request of the President's Conference Committee on Valuation.

The Commission has issued a supplemental order in the 15 per cent case allowing carriers to preserve the groupings of points of origin and destination in Central Freight Association territory which have heretofore been observed in making joint rates between that territory and the southwest. Joint through rates applying in both directions between Central Freight Association territory and the southwest may be increased, subject to the western classification, by amounts applying to the various sections prescribed in the order. This is because the joint through rates between C. F. A. territory and the southwest have been maintained for many years on a relationship which would be seriously modified by a strict compliance with the commission's previous orders in this case and that such orders would further result in breaking up the method of grouping points of origin which has existed for a series of years.

### Referees to Determine Compensation

#### of Arkansas & Louisiana Midland

The Interstate Commerce Commission, without deciding whether or not the Arkansas & Louisiana Midland was ever under federal control, has announced its decision to appoint a board of referees, as petitioned for by the company, to determine its just compensation in accordance with the provisions of the federal control law. The board consists of Commissioner C. C. McChord, P. J. Farrell, general counsel, and A. G. Hagerty, attorney-examiner. The appointment of the board was opposed by the Railroad Administration on the ground that the road had been relinquished and that no direct control had ever been exercised over it. The hearing before the commission on the application for the appointment of a board was reported in the *Railway Age* of May 23.

### State Commissions

The Railroad Commission of Georgia has completed its 46th annual report. It shows a decrease of 53 miles in the length of railroad in the state, a large decrease in the number of persons killed on steam railroads, but an increase in the casualties on street railroads. Although the activities of the commission have been limited by federal control of railroads, especially as relates to mandatory orders, the work of the commission has been heavy. It has been continually necessary for the commission to handle matters with the federal authorities, the proceedings frequently involving more time and labor than would have been necessary under former conditions. During 1918 the number of subjects handled was less than in 1917, but in the first three months of 1919 the number was larger than in the same period of any previous year.

### Court News

#### Knowledge of Real Character of Shipment

A corporation is not chargeable with knowledge of facts which become known to its agent unless the agent in the line of his duty ought and would reasonably be expected to communicate the knowledge to his principal. Applying this rule, the Circuit Court of Appeals, Seventh Circuit, holds that the knowledge of the real character of a shipment, by an employee, such as a car repairer or trackman, who has no function whatever with respect to receiving or classifying

freight, would not ordinarily be the knowledge of the company.—*Elgin J. & E. vs. U. S.*, 253 Fed. 907.

#### Safety Appliance Act

The Circuit Court of Appeals, Third Circuit, holds that an employee of an interstate railroad whose injury was caused by the failure of the company to comply with the requirements of the Safety Appliance Act as to automatic couplers, may recover therefor, although not himself employed in interstate commerce.—*Devine vs. B. R. & P.*, 253 Fed. 948.

#### Federal Control—District of Suit

The federal district court in Nebraska holds that under Sections 8 and 10 of the Act of Congress of March 21, 1918, and despite Section 9 thereof, orders of the Director General that suits against carriers while under federal control should be brought in the county or district where the plaintiff resided at the time of the accrual of the action, were not effective to limit that right, and, where authorized by state law, a plaintiff might sue in a district other than that in which he resided at the time of such accrual upon a cause of action not arising out of the railroad company's duties as a common carrier.—*Friesen v. Rock Island*, 254 Fed. 875.

#### Doing Business in a State

The Circuit Court of Appeals, Fifth Circuit, holds that a foreign railroad company, not undertaking to do within the state any of those things for which it is incorporated, although it has managers in the state who direct its operations in other states, and which employs only the clerical force necessary for that purpose and uses the mails and interstate telegraphs in transmitting orders, is not to be regarded as doing that character of business which renders it subject to personal judgment in the courts of the state for a tort committed in another state.—*Atchison, T. & S. F. Co. v. Weeks*, 254 Fed. 513. Decided December 20, 1918.

#### Stay of Action Under General Order No. 26

The federal district court for the Southern District of New York holds that General Order No. 26, dated May 28, 1918, providing that "upon a showing by the defendant carrier that the just interests of the government would be prejudiced by a present trial of any suit against a carrier under federal control \* \* \* the suit shall not be tried during the period of federal control" is within the powers conferred by Congress and the President, but an application for a stay is addressed to the discretion of the court, and the burden rests on the defendant to show that its interests would be substantially prejudiced by a present trial.—*Marnick v. Pennsylvania*, 254 Fed. 748. Decided June 12, 1918.

#### Joint Use of Railroad Property—

##### Injuries to Servants of Other Road

While the law of Illinois requires each company, in case of the joint use of railroad property, to exercise ordinary care for the safety of employees of the other company, the Circuit Court of Appeals, Eighth Circuit, holds, in an action against one company by an employee of the other for personal injuries, that the defendant, which owned its own right of way, was under no duty to guard it for employees of the other company, whose terminal facilities it used; there being no usage of the defendant's right of way by such employees.—*Friedman v. Vandalia*, 254 Fed. 292. Decided October 28, 1918.

#### Actions Against Railroads Under Federal Control

The federal district court for the Eastern District of Missouri holds that the amended regulation No. 18a, promulgated by the Director General of Railroads, April 18, 1918, providing that "all suits against carriers while under federal control must be brought in the county or district where the plaintiff resided at the time of the accrual of the

cause of action or in the county or district where the cause of action arose," as applied to suits in the federal courts, is within the authority conferred on the President by Act March 21, 1918, providing for federal control of railroads during the war and authorizing the President to make regulations therefor. It is also held that the act is within the war powers of Congress and constitutional.—Wainwright vs. Pennsylvania, 253 Fed. 459.

**Severance of Railroad Property for Foreclosure Sale**

The Circuit Court of Appeals, Seventh Circuit, holds that in the separation of a railroad into parcels for sale under the foreclosure of divisional mortgages, a court of equity is not bound by any hard and fast rule to fix the division to correspond absolutely with the several mortgage grants, but the division should be made so as to leave each parcel as nearly as may be in a situation to be operated as a railroad. Applying this rule in the foreclosure of constituent mortgages on the property of a consolidated railroad company, the court held that the division located in Indiana should be given a line to Chicago, and that it was proper, other creditors and lienholders being protected, to sell, with one of the constituent parcels, equipment used for the operation of that parcel, though it was not subject to the mortgage or the lien. A railroad without equipment can serve no function.—Metropolitan Trust Co., vs. C. & E. I., 253 Fed. 868.

**Action Against Railroads Under Federal Control**

In an action by a switchman against his employer railroad for personal injuries, the Texas Court of Civil Appeals holds that General Orders Nos. 18 and 18a of the Director General of Railroads, dated April 9 and 18, 1918, in so far as they require all suits against carriers under federal control to be brought in the county or district where the plaintiff resides or resided at the time of the accrual of the cause or in the county or district where the cause arose, is inconsistent with and contrary to section 10 of the Act of Congress of March 21, 1918, providing that "actions at law or suits in equity may be brought by and against such carriers and judgments rendered as now provided by law"; and that the General Order No. 26 of the Director General, dated May 23, 1918, ordering that actions and suits under General Order No. 18 should abate during federal control, is inconsistent with and contrary to the same section.—El Paso & S. W. v. Lovick (Tex.), 240 S. W. 283. Decided March 27, 1919.

**Discriminations While Embargo is in Force**

Under the statute declaring it a misdemeanor to knowingly offer, grant, solicit, or receive, rebates, etc., the mere offer by a carrier is held by the federal district court for the Southern District of New York to be an offense. But indictments charging that, while an embargo on transportation of hay was in force, a railroad did unlawfully offer and give permits for transportation to certain shippers, while others similarly situated did not receive certain permits, were held insufficient to charge the offense of discrimination, it not being alleged that there was any transportation. If there is no transportation, the mere giving of a permit is an idle act, although the case might be different if the railroad "offered" to transport. Transportation pursuant to authorization to one shipper, and denials to others similarly situated is a violation of the statute. Although the embargo was illegal, that does not make discriminatory transportation under it legal.—U. S. L. V., 254 Fed. 332. Decided January 29, 1919.

The federal district court for the District of New Jersey holds that, where defendant shippers by misrepresentations, etc., obtained transportation despite an embargo, prosecution could not be defeated because the embargo had not been submitted to the Interstate Commerce Commission and its reasonableness ascertained and adjudicated. The defendants were charged, not with having secured discriminations by means of the embargo, but in violation of it; therefore, the reasonableness of the embargo was not in question. Carriers by railroad have, of course, the power to lay embargoes for the proper conduct of their business.—U. S. v. Metropolitan Lumber Co., 254 Fed. 335. Decided November 30, 1918.

**Equipment and Supplies**

**Equipment Requirements for Canadian Northern**

Officers of the Canadian Northern estimate that \$35,000,000 will be spent for new equipment during 1919. Presumably this includes new locomotives, cars and track material.

**British Railways Buying Ties in America**

Sir James Bail, chief engineer of the London, Brighton & South Coast, who has been in charge of timber production in Great Britain during the war, is in the United States purchasing cross-ties for the British railways. He has placed orders for 2,000,000 redwood, Oregon fir and long leaf pine ties and has taken options on about 1,500,000 oak ties. The annual tie requirements of the British railways are about 5,000,000 ties.

**Cars Built in Railroad Shops**

New cars were constructed in railroad shops during the month of April as follows:

Freight—					
Stock	.....	7	.....	7	.....

**Locomotives**

THE PENNSYLVANIA EQUIPMENT COMPANY, Philadelphia, Pa., is in the market for a locomotive of about 12 tons, and 40-in. gage.

THE KOREAN GOVERNMENT has ordered 12 Mikado type locomotives from the American Locomotive Company. These locomotives will have 25 in. by 28 in. cylinders, 160,000 lb. weight on drivers, and a total weight in working order of 206,000 lb.

THE PENNSYLVANIA EQUIPMENT COMPANY, 1420 Chestnut street, Philadelphia, Pa., is in the market for a second-hand Mogul type locomotive, weighing 60 tons, with wheel centers of 44 in., and 18, 19 or 20 in. by 24 in. cylinders, to be in first-class condition, for southern delivery.

## Supply Trade News

Harold E. Wade has been appointed president of the Fairmont Gas Engine & Railway Motor Car Company, Fairmont, Minn., succeeding Frank E. Wade, deceased.

Edward Walters, sales engineer for the American Steel Foundries, Chicago, has resigned to enter the employ of the Keyoke Railway Equipment Company, Chicago, as salesman, with headquarters at Chicago.

E. C. Ryan, representative of the Electric Controller & Manufacturing Company with headquarters in New York, has been promoted to manager of the Chicago branch with office in the Monadnock building, Chicago.

W. L. Garland, who has been elected a vice-president of the Safety Car Heating & Lighting Company, with headquarters at Philadelphia, Pa., as was briefly noted in our issue

of May 30, was born in Blair county, Pennsylvania. He completed his apprenticeship at the Altoona shops of the Pennsylvania Railroad in 1892; he then served in various departments of the shops for five years, and later took up locomotive and car design. In 1901 he was appointed chief car inspector on the Pennsylvania Railroad. In 1907 he was appointed general agent of the Safety Car Heating & Lighting Company, and in 1909, was promoted to manager. Mr. Garland was commissioned a major in the Corps of

Engineers and was assigned to the 87th Battalion, Military Railroads. He was released from active service on the signing of the armistice.

The Duntley-Dayton Company, Chicago, has taken over the sales agency for the Red Devil rivet cutting guns, made by the Rice Manufacturing Company, Indianapolis, Ind., for all territory east of the Rocky mountains.

The Bordon Company, Warren, Ohio, manufacturers of the Beaver die stocks and die cutters, has opened a downtown Chicago office at 549 West Washington street, in charge of Charles A. Green, Chicago representative.

Lieut. E. D. Stearns, who served in the aviation corps of the United States Army, has been appointed sales manager of the H. K. Ferguson Company, Cleveland, Ohio. Before entering military service, Lieut. Stearns was a partner of the Fort Pitt Engineering Company, Pittsburgh.

The Pollak Steel Company, Cincinnati, Ohio, has appointed D. E. Sawyer general manager of sales, with headquarters at 120 Broadway, New York, effective July 1. Mr. Sawyer was formerly connected with the Illinois Steel Company, and assistant steel director of purchases of the War Industries Board.

The Stark Rolling Mill Company, Canton, O., has appointed George W. Scott district manager for the Chicago territory, with headquarters at 1119 Marquette building. Mr. Scott was formerly Chicago representative of the Pittsburgh Steel Company. Thomas F. Murphy has been appointed district manager for the Canton territory. He was formerly connected with the American Sheet & Tin Plate Company.

Jno. T. Mahoney, purchasing agent of the Buda Company, Chicago, with headquarters at Harvey, Ill., has been promoted to sales manager of the truck and tractor engine department, to succeed Lon R. Smith, who has resigned to become general sales manager of the Midwest Engine Company, Indianapolis, Ind.

The International Oxygen Company, Newark, N. J., has appointed Preston Belvin district sales engineer, in charge of the Pittsburgh district sales work, with office at 1310 First National Bank building, Pittsburgh, Pa. The Chicago office, in charge of Philip G. Wesley, has been removed from 223 Railway Exchange building to 817-820 Chicago Stock Exchange building, 30 North La Salle street.

The Haywood Company (T. G. Haywood and M. L. Bugbee) has opened offices in the Alaska Commercial building, San Francisco, Cal. The company will do an importing and exporting business, particularly in steel products, machinery, contractors' and railroad equipment and engineering specialties. Mr. Haywood was formerly manager of the Pacific Car & Foundry Company, with headquarters at Portland, Ore.

Major J. L. Terry, formerly of the St. Louis office of the Q and C Company, New York, and now with the American Expeditionary Forces, Transportation Service, with headquarters at Rennes division, France, expects to return home in the near future. Lieut. L. T. Burwell and E. C. Zimmerman, both of the New York office, are out of military service and back in their old positions traveling out of New York and Lieut. C. M. Brennan is also out of the service and is again located with the Chicago office.

Vernon T. Brauns, whose promotion to general manager of all departments of the American Blue Print Paper Company, Chicago, was announced in the *Railway Age* of May 23

(page 1286), was born at Port Chester, N. Y., on August 22, 1879. At the age of 19 years he entered the employment of Whitston & Little, Chicago, as a salesman, dealing especially with specialty sales work. In February, 1915, he entered the employ of the American Blue Print Paper Company as a sales representative, and while in the services of that firm he promoted with success the newer photostat and ambucolitho processes. In the summer of 1918 he entered the government service at Camp Custer, Battle

Creek, Michigan, as chief clerk in the supervising engineer's office of the Camp Custer extension, in which capacity he served until January, 1919, when he again re-entered the employment of the American Blue Print Paper Company as manager of the railroad valuation department, which position he held until his recent promotion as general manager of all departments on May 8.

R. P. Lamont, president of the American Steel Foundries, Chicago, has authorized the announcement that the contract for the purchase of the Griffin Wheel Company has been signed. Negotiations for the taking over of the latter property by the American Steel Foundries have been under way for some time and many reports of the completion of these negotiations have been circulated, all of which have been unfounded. According to Mr. Lamont no further information is available at this time as to the details of the purchase but a statement will be issued in the near future.

W. L. Garland

V. T. Brauns

The Buffalo Forge Company, Buffalo, N. Y., announces that Lieut. C. C. Cheyney has returned from service in the United States Navy, and is now in charge of its Chicago office and store. Lieut. Cheyney had charge of the mechanical repair shops at the naval aviation station, Pensacola, Fla., where from 500 to 1,200 men were employed during the war. Captain H. H. Downes, 12th U. S. Engineers (Railway), has returned from France, and after receiving his discharge expects to take charge of the Buffalo Forge Company's interests in the St. Louis territory. Captain Downes' regiment was one of the first to go to France, sailing in July, 1917.

E. L. Ryerson, Jr., has received his honorable discharge from the army and has returned to the Joseph T. Ryerson & Son Company, Chicago, as vice-president and works manager after nearly two years of absence. Mr. Ryerson left early in 1917 to handle production engineering work, as a civilian, with the Aircraft Production Board at Washington, D. C. He was later commissioned first lieutenant in the Signal Corps, U. S. Army, Aviation Section, and was subsequently promoted to captain at which time he was transferred to the Division of Military Aeronautics as engineer officer and assigned to March Field, Riverside, Cal., at which place he qualified as a pilot, receiving the rating of reserve military aviator.

Stanley J. Quinn, secretary of the American Manufacturers' Export Association, has resigned to accept a position with one of the members of the association, effective May 31. He has been succeeded by Robert F. Volentine, who for the last several months has been associated with the Brooklyn Chamber of Commerce. The newly elected secretary, in addition to his activities in connection with the Brooklyn Chamber of Commerce, served during the war as district director of the Northeastern Division of the War Department's Commission on Training Camp Activities. In 1917 he was named by Mayor Mitchel as president of the Park Board, City of New York. Prior to that he served as secretary of the Department of Parks and as a member of the staff of the New York Bureau of Municipal Research.

Jay L. Hench, assistant district sales manager of the Lackawanna Steel Company, at Chicago, has been promoted to district sales manager, with headquarters at the same point. Mr. Hench was born at Hinsdale, Ill., on April 11, 1885, and after graduation from the high school of that place entered Cornell University in 1903, in which institution he specialized in iron and steel metallurgy. He began his business career in the fall of 1905, at which time he entered the employ of the Illinois Steel Company in its south works at South Chicago, Ill., where he was engaged for one year in practical work in the open-hearth and Bessemer departments of that plant. The following five years he was in the employ of Joseph T. Ryerson & Son, Chicago, most of which time he was acting in the capacity of sales representative in Indiana and Michigan, with headquarters at Chicago. He resigned from that position in 1911 to enter the service of the Lackawanna Steel Company, with which company he was assistant district sales manager, with headquarters at Chicago, prior to his recent promotion.

J. L. Hench

Victor E. Karminski & Company, New York, has been incorporated to engage in export merchandising of iron and steel products, with the followings officers: Victor E. Karminski, president; H. L. Landau, first vice-president in charge of sales; J. H. Allen, vice-president in charge of purchases; Alexander Karminski, treasurer, and M. Frank, secretary.

The offices of the company are at 291 Broadway. Victor E. Karminski was one of the founders of the W. J. Crouch Company, which later merged with Rowison, Drew & Clydesdale, Inc. Mr. Karminski became secretary and joint general manager of the combined companies, from which position he recently resigned. Mr. Landau served as expert sales manager of the Buffalo Specialty Company and then for the Baker-Vawter Company. He later became connected with the Vulcan Steel Export Company which he left to become associated with Mr. Karminski in the W. J. Crouch Company, and after the merger he acted as assistant and general sales manager for Rowison, Drew & Clydesdale. Mr. Allen has had 19 years' experience in the steel business. He organized the Manhattan Rail Joint Company which was later sold to the Elyria Iron & Steel Company. He also served the Vulcan Steel Products Company and then became purchasing agent for the W. J. Crouch Company, later becoming vice-president and general purchasing agent for Rowison, Drew & Clydesdale. Alexander Karminski, treasurer, was for 12 years connected with the banking house of Asiel & Company.

## Trade Publications

**IRON CEMENT.**—The Smooth-On Manufacturing Company, Jersey City, N. J., has issued a revised edition of Smooth-On Instruction Book No. 16. This edition, like its predecessors, is made up of descriptions of engine and boiler room repairs of all kinds. These are described by the men who made them in such a way that similar problems can be quickly solved by others. The book is well illustrated by actual photographs and drawings. Among the subjects covered are engine repairs, pump repairs, boiler and tank repairs, valve repairs, wheel pit and engine bed construction, etc.

**ELECTRIC HEADLIGHTS.**—The second edition of an instruction book covering the installation, care and operation of Sunbeam turbo-generators and headlights has been published by the Schroeder Headlight & Generator Company, Evansville, Ind. The information given in this book is quite extensive and not only deals with the Sunbeam turbo-generators and headlights, but contains considerable information pertaining to incandescent headlights in general, as well as many useful tables and formulae. It also contains many drawings and photographs showing detail parts and wiring arrangements.

**ELECTRIC FURNACES.**—Booklet 5-B, published by the Electric Furnace Company, Alliance, Ohio, is an attractive 24-page catalogue describing the Baily types of electric furnaces for melting non-ferrous metals. These types embrace pusher type continuous furnaces for heating and annealing steel, copper, brass and aluminum, automatic control type continuous furnaces for heat treating steel castings and forgings, and car type furnaces for annealing steel, copper, brass and aluminum, and have electrical capacities of from 150 kw. to 1,500 kw., and furnace capacities of 1,000 lb. to 10 tons per hour. These furnaces are all of the resistance type and have several distinct features. The booklet contains illustrations of a number of actual installations and records of tests made with the equipment in several industrial plants.

**STOKER FIRED LOCOMOTIVES.**—The Locomotive Stoker Company, Pittsburgh, Pa., has published an attractive booklet of 96 pages, bound in heavy cardboard covers, illustrating some of the principal types of locomotives that have been equipped with mechanical stokers by the Locomotive Stoker Company, which include the largest and most powerful locomotives constructed, as well as the standard locomotives of the United States Railroad Administration. The various types of locomotives considered to be in the stoker class are grouped in sections, each page containing an illustration of a representative locomotive of different railroads, with a table of the principal dimensions. After each section is a tabulation which permits of a direct comparison of the like dimensions of all locomotives of that class. These tables should be of special interest to mechanical engineers designing new locomotives, as well as to those contemplating installing stokers on old locomotives.

## Railway Financial News

**BROOKLYN RAPID TRANSIT.**—Receiver Lindley M. Garrison has been authorized by the Federal District Court of New York to issue \$20,000,000 of receiver's certificates.

**CENTRAL OF GEORGIA.**—This company has sold to Kuhn, Loeb & Co. \$8,000,000 ten-year 6 per cent collateral trust bonds. They were offered to investors at 99, or at 6½ per cent basis.

In a letter to the company's bankers, President Lawton, of the Central of Georgia, calls attention to the fact that the company has paid continuously since July 1, 1912, 6 per cent dividends on its \$15,000,000 preferred stock and 5 per cent upon the \$5,000,000 common stock. All the stock of both classes, except directors' qualifying shares, is owned by the Illinois Central. Proceeds of the \$8,000,000 bonds just sold are to be used to pay off temporary loans made for capital purposes and to pay for such expenditures to be made. Except for a small issue of equipment certificates in 1916, this is the first bond issue of the road since 1907. The bonds are to be secured by deposit of \$11,000,000 par value 6 per cent refunding and general mortgage bonds, series A. This is a new mortgage to be created, authorizing bonds limited to three times the capital stock, including bonds reserved for refunding of existing issues, and maturing April 1, 1959.

**CLEVELAND, CINCINNATI, CHICAGO & ST. LOUIS.**—See editorial elsewhere in this issue.

**DENVER & RIO GRANDE.**—The Equitable Trust Company of New York has issued the following notice: "The receiver of the Denver & Rio Grande finds himself unable to pay the interest on the 5 per cent improvement bond mortgage due June 1. The necessary appropriation bill not yet having passed Congress, the government has failed to pay to the receiver sufficient of the actual earnings of the road and the court is disinclined to permit the receiver to borrow on warrants showing earnings. It is expected, however, that within the sixty-day period of grace allowed by the mortgage the necessary appropriation will have been passed and the receiver thus placed in funds to take up the June 1 coupons. Meanwhile these coupons will be purchased from holders desiring to sell the same by the Equitable Trust Company on account of the Western Pacific Railroad Corporation on presentation at the office of the trust company."

**LEHIGH VALLEY.**—The directors on Wednesday declared the regular quarterly dividend of 2½ per cent on the preferred stock, but the common dividend was cut from 2½ per cent to 1¾ per cent. These two disbursements will be made July 5 to stockholders on record June 14 provided the company receives payment from the United States Government, now due.

In connection with the dividend cut, President E. E. Loomis said: "This action has been taken because we believe it is the conservative thing to do at this time. Paying 10 per cent dividends under existing conditions leaves too small a margin of safety for careful management. If the future earnings of the Lehigh Valley Railroad and its controlled properties should justify it, the board will give careful consideration to an increased distribution to stockholders."

**MICHIGAN CENTRAL.**—See editorial elsewhere in this issue.

**NEW YORK CENTRAL.**—See editorial elsewhere in this issue.

**READING COMPANY.**—Alfred H. Smith has been elected a director to succeed William K. Vanderbilt, Jr.

The week beginning June 22 and ending June 28, has been designated as "no accident" week on all railroads in the Northwestern region. The campaign will be conducted by the Safety Section and detailed instructions are to be issued to all safety supervisors on each road in an effort to maintain a 100 per cent safety record during this week.

## Railway Officers

### Railroad Administration

#### Federal and General Managers

R. N. Hudson, general superintendent of the Louisville, Henderson & St. Louis, with headquarters at Louisville, Ky., has been appointed general manager, and the office of general superintendent has been abolished.

#### Operating

D. R. MacBain, superintendent of motive power of the New York Central, Lines West of Buffalo, has been appointed assistant general manager of the Lines West, with headquarters at Cleveland, Ohio.

F. G. Hoskins has been appointed superintendent of the Baltimore Terminal division of the Baltimore & Ohio Eastern Lines, and the Western Maryland, with headquarters at Baltimore, Md., vice R. A. Grammes, resigned.

B. F. Van Vliet, division superintendent of the Chicago, Milwaukee & St. Paul, with headquarters at Milwaukee, Wis., has been appointed superintendent of the Des Moines division with headquarters at Des Moines, Iowa, vice E. W. Lollis, transferred.

C. L. Fike, acting assistant superintendent of the Eastern division of the Western Pacific with headquarters at Elko, Nev., has been promoted to assistant superintendent of the Eastern division with jurisdiction over the Deep Creek Railroad. Mr. Fike will retain the same headquarters.

Ralph Peters, Jr., who was granted a furlough for service with the Railway Transportation Corps of the American Expeditionary Force in France, has returned and will resume his position as assistant superintendent of the Long Island Railroad. E. B. Kessler, assistant superintendent at Jamaica, N. Y., will resume his former position as freight trainmaster, and John Roe, acting freight trainmaster, has been granted indefinite leave of absence on account of sickness.

#### Financial, Legal and Accounting

G. A. Leber has been appointed auditor of the Trans-Mississippi Terminal Railroad, with headquarters at New Orleans, La.

#### Traffic

G. S. Trowbridge has been appointed assistant general freight agent of the St. Louis-Southwestern, with headquarters at St. Louis, Mo., succeeding J. E. Allen, who has resigned to engage in other business.

Walter S. Williams, traveling freight agent of the Chicago, Rock Island & Pacific with headquarters at Des Moines, Iowa, has been promoted to division freight agent with the same headquarters succeeding George W. Williams who has resigned to engage in other business.

J. S. Henney has been appointed assistant general freight agent of the Toledo, St. Louis & Western, with headquarters at St. Louis, Mo., vice B. H. Coyle, division freight agent, resigned, and R. L. Dore, assistant general freight agent, has been appointed division freight agent with headquarters at Frankfort, Ind.

#### Engineering and Rolling Stock

George T. Anderson, roadmaster on the Kansas City Southern, with headquarters at Spiro, Okla., has been promoted to general roadmaster of the Midland Valley, with jurisdiction over the road, bridge and building, and engineering departments, with headquarters at Muskogee, Okla., succeeding Charles Kaighn, who has been promoted to valu-

ation engineer of the Midland Valley with headquarters at Muskogee. The jurisdiction of **V. V. Kirkpatrick**, valuation engineer of the Missouri & North Arkansas and the Midland Valley has been withdrawn from the latter road.

**E. G. Lane**, chief engineer of the Baltimore & Ohio, Western Lines, and the Dayton & Union, with headquarters at Cincinnati, Ohio, has had his jurisdiction extended over the maintenance of way department of these roads.

**Joseph Chidley**, assistant superintendent of motive power on the New York Central, Lines West of Buffalo, at Cleveland, Ohio, has been appointed superintendent of motive power of the Lines West, vice **D. R. MacBain**, promoted.

### Purchasing

**C. R. Couchman**, tie and timber agent on the Pere Marquette, has been appointed assistant purchasing agent and general storekeeper, vice **N. C. Foss**, who has entered the service of the Grand Trunk Western Lines, and **W. W. Bracy**, stationer, has been appointed tie and timber agent vice **Mr. Couchman**, both with headquarters at Detroit, Mich.

### Special

**W. J. Flynn** has resigned as chief of Secret Service and Police Section, Railroad Administration, to become chief of Bureau of Investigation, Department of Justice.

## Corporate

### Executive, Financial, Legal and Accounting

**E. W. Meyer** has been appointed assistant to the receiver of the Denver & Salt Lake, with headquarters at Denver, Colo.

**William Sharpe**, formerly statistician in the president's office of the Chicago & Alton and later in charge of the insurance department at Chicago, has been appointed auditor with the same headquarters.

### Traffic

**H. C. Martin**, general freight agent of the Grand Trunk, with headquarters at Montreal, Que., has been promoted to freight traffic manager, vice **C. E. Dewey**, deceased. Mr. Martin entered the service of the Grand Trunk in 1888, and served in the local freight office in Chicago. He subsequently was consecutively agent of the Lackawanna and Grand Trunk fast freight line, chief of the tariff bureau, and assistant general freight agent, all on the western lines of the Grand Trunk. In 1911 he was appointed general freight agent of the Grand Trunk System, with headquarters at Montreal, and on June 1 was promoted to freight traffic manager with jurisdiction over the lines east of the Detroit and St. Clair rivers.

H. C. Martin

**Lorne Macdonald**, division freight agent on the Grand Trunk, with office at Toronto, Ont., has been promoted to assistant general freight agent, with office at Montreal, Que., vice **F. J. Watson**, promoted. Mr. Macdonald entered the service of the Grand Trunk in 1887, as apprentice clerk at Montreal. Two years later he was appointed secretary to the general traffic manager and in 1901 became secretary to the freight traffic manager. In 1903, he was appointed di-

vision freight agent at Hamilton, and in 1907 was transferred to Toronto, which position he held until his promotion on June 1, to assistant general freight agent in charge of the lines east of the Detroit and St. Clair rivers.

**Frank J. Watson**, assistant general freight agent on the Grand Trunk, with office at Montreal, Que., has been promoted to general freight agent vice **H. C. Martin**, promoted, effective June 1. Mr. Watson entered the service of the Grand Trunk in 1884, in the freight traffic office, at Toronto, Ont. In 1892, he was appointed traveling freight agent, with office at Montreal, and four years later became chief clerk to the district freight agent at Hamilton. The following year he was transferred to Stratford. He later served as district freight agent at Montreal, and in 1911 was appointed assistant general freight agent on the Grand Trunk System, from which position he is now promoted to general freight agent, with jurisdiction over the lines east of the Detroit and St. Clair rivers.

F. J. Watson

### Purchasing

**Horacio V. Garza** has been appointed assistant purchasing agent of the National Railways of Mexico, with office at New York, vice **F. P. de Hoyos**, who was local purchasing agent. Mr. de Hoyos remains as general agent of the National Railways of Mexico as well as purchasing and general agent of the Southeastern Lines of Mexico.

## Obituary

**E. Hampton Coombs**, formerly general eastern passenger and freight agent of the St. Louis-Southwestern, with headquarters at New York City, died at Bowling Green, Ky., on May 23, at the age of 50 years.

**George W. Hulsizer**, superintendent of telegraph and signal engineer of the Chicago & Alton, the Chicago, Peoria & St. Louis, the Peoria & Pekin Union and the Peoria Railroad Terminal with headquarters at Bloomington, Ill., died in that city on May 30 of heart failure, following an attack of acute indigestion. Mr. Hulsizer was born at Clinton, N. J., on September 1, 1872. He began railway work in 1893 in the engineering department of the Lehigh Valley. Shortly afterward he learned telegraphy and entered the employ of the Chicago & Alton with which company he remained until 1900 in the capacity of telegraph operator and agent. He returned to the Lehigh Valley in 1900 and after a few months on construction work he was assigned to the maintenance staff. In October, 1901, he became assistant foreman of signal construction in which position he remained until the following summer when he entered the service of the signal department of the Chicago & North Western as a repairman on pneumatic work with headquarters at Chicago. Two and a half years later he was appointed signal supervisor of the Iowa division with headquarters at Boone, Iowa. In September, 1907, he resigned to enter the employ of the Southern as assistant to the electrical and signal engineer at Washington, D. C. On November 1, 1909, he was appointed signal engineer of the Chicago & Alton with headquarters at Bloomington, Ill., and on April 1, 1914, when the signal and telegraph departments were consolidated he was appointed superintendent of telegraph and signal engineer. In July, 1918, his jurisdiction as superintendent of telegraph and signal engineer was extended to include the Chicago, Peoria & St. Louis, the Peoria & Pekin Union and the Peoria Railroad Terminal.

## Railway Age

Table of Contents will be found on Page 5 of the Advertising Section

Since a year ago this June, there has been a sharp cleavage between federal railroad officers and corporate railroad officers. This cleavage has been carried

**Government Control and Accounting Officers** even to the various associations, whose primary object is the advancement of the science of particular branches of railroad work. Not so, however, with

the Railway Accounting Officers' Association. This association, which is composed of railway accounting officers not only from the United States, Canada and Mexico, but from the principal foreign countries of the world, has drawn no distinction between federal accounting officers and corporate accounting officers. It was recognized both by the Railroad Administration and the corporations, as well as by the accounting officers, themselves, that the interests of the corporations and of the government, in so far as accounting was concerned, were identical. What was wanted by both was the most economical, scientific and broadly intelligent accounting that could be procured. This could be arrived at only by co-operation and a full understanding between federal and corporation auditors, and a strict adherence to professional ethics comparable to the ideals of the bar association and the federal courts. This has been worked out splendidly; there has been thorough co-operation between the administration and both federal and corporation auditors. The Railway Accounting Officers' Association, which held its annual convention at New York this week, is to be congratulated on the part it has played in acting as the medium through which this co-operation and understanding could be achieved.

Wooden turntables of the A-frame type have become objects of curiosity. They were turned by hand, by a few men

### Turntables Past and Present

usually, and sometimes by the entire roundhouse force. Later, turntables were built of steel. The use of man power for turning them was continued for a time, but various forms of tractors were experimented with. Man power is still used in some places, but it is not common practice. Steam and air operated tractors were used with various degrees of success. They did succeed in relieving many men detailed for moving the tables, but eventually electric power was found to be most suitable. Then came the problem of the best way to apply the power. A single tractor attached to one end of the table running on the circle rail was looked upon for a time as best practice. It was found, however, that the sand used for increasing traction caused trouble, as the turntable trucks had to run over it. To obviate this difficulty, a second circle rail was added and in a few cases a circular rack was used in connection with a gear on the tractor. All of these developments were applied to tables of the balanced type. It was necessary to spot the locomotive before the table could be turned. Spotting takes time, and such tables are apt to get a permanent twist or set which makes it impossible to line up the table at both ends with a through track, and has caused derailments. The Pennsylvania has developed a table supported at the center and at both ends. It does not pitch when a locomotive is moved on or off. It is

not necessary to spot the locomotive, and it may be turned end for end in 60 seconds. The manner in which this has been accomplished is described elsewhere in this issue.

The Pocket List of Railroad Officials has always listed the accounting officers in the same classification as executive officers, but accounting officers, themselves, have not always taken both the

### The Accounting Officer as an Executive

authority and responsibility which go with such a classification. There has been a great change, however, in the last ten years. Since accounting is a profession rather than a business, the foundations for a broader view of authority and responsibility were present in this department long before any but a few of the individual officers thought of themselves as other than confidential bookkeepers. The change that has taken place, however, since 1907 has been significant. The chief accounting officers of railroad companies no longer feel that their sole responsibility is to a single officer or group of directors, who assure them their position and salary. They recognize a fiduciary responsibility to the security holders of the company which gives them an added duty and a new self-respect. More than this, however, the accounting officer is not only beginning to realize—for many of them have theoretically accepted the fact for years—but actually puts in practice a function of his work which is more adequately suggested by the word "executive" than by the words "accounting" or "auditing." It is possible for a chief accounting officer of a railroad to be the confidant and adviser of the heads of all of the other departments. For such a work as this, no mere bookkeeping machine, accurate as it may be to the hundredth part of a mill, is adequate. Such a man must be a living, individual personality, sympathetic with the problems of his associates, ready to help through suggestion rather than through purely destructive criticism, ready to give out information rather than to merely absorb. Such is the newer ideal of an accounting officer, and such is the ideal that the Railway Accounting Officers' Association is attempting to cultivate.

Despite the great wealth of material presented during the five-day session of the Second Pan-American Commercial

### Pan-American Commercial Conference

Conference in Washington last week, none of those who attended the conference could have come away without a clear idea that one of the most important necessities for trade between the two continents is transportation, both by water and railroads. The need for new railway construction was especially brought into evidence by those who spoke for the west coast, particularly Peru and Bolivia, and the hope was expressed that it would be through the investment of American capital that these extensions would be made. The *Railway Age* trusts that no one who has been following its articles on the railways of foreign countries during the last few months has failed to realize the advantage that American investments in foreign railroads will bring in the way of purchases of equipment and supplies for the construction

and maintenance of these railroads. Those who spoke on the subject in Washington, however, brought out another important point, namely, that the construction of these railroads is going to open up important areas and make available tremendous resources of raw materials urgently needed in the United States and which will help us in trade in many lines with the countries in which these investments may be made. During the last few months the major part of our railway supply exports has been principally to European countries, and to a large extent also to Japan or to Japanese controlled railroads in China. This business, most of the big manufacturers have had the vision to see, is to a certain extent temporary. It is necessary to help the recently warring nations to get on their feet, as was clearly brought out by Mr. Vanderlip in his address before the conference, but these countries when they have gotten on their feet will be builders and possibly exporters of railway materials themselves. It is in the new countries, such as those of Latin America, that the more permanent and lasting export business will develop. It is clearly in order to hope, therefore, that American bankers and investors will find it to their interest to make the most of the big opportunities that lie before them in the Latin-American countries.

### Railroading by Appropriation

THE REPORT of the Railroad Committee of the Chamber of Commerce of the United States, whose recommendations are being submitted to a referendum vote, gives as its first argument against government ownership the statement that under government ownership the development of railroad facilities would depend upon Congressional appropriation, which would prevent the anticipation of the transportation needs of the country. It says that appropriations would not be made in the amount and at the time needed to insure adequate development of the railroads, and that "political considerations might also control the amount of appropriations and the objects for which they were made."

A striking illustration of this point has been given not only by the failure of the railroad appropriation at the last session, but also this week by the action of the House of Representatives in reducing the appropriation asked by the Railroad Administration from \$1,200,000,000 to \$750,000,000, because the appropriations committee, only five of whose members heard the testimony offered by Mr. Hines and Mr. Sherley, disagreed with them as to the requirements. Possibly the general unpopularity of the Railroad Administration contributed to some extent to the passage of the bill for the reduced amount, but the fact that the vote was so large—305 to 4—indicates that the members followed the advice of the committee. None of the members of the committee pretended to have any better understanding of the situation than Mr. Hines and Mr. Sherley; they were merely following a general rule of trying to reduce appropriations, and they apparently felt that Mr. Hines would be less generous with Uncle Sam's money if they limited the amount he can have at one time, because the committee's report held forth a prospect of granting more later in the year.

The chairman of the committee expresses the opinion that the future needs of the Railroad Administration are problematical, but there is nothing problematical about its needs to date. He also says the Railroad Administration should not have ordered so many cars and locomotives, but that is not ordinarily considered a good business reason why cars and engines that have been contracted for should not be paid for. A good many other people criticize the Railroad Administration's deficit, but that does not afford a good argument as to why the government should not pay, or pay without undue delay, the rentals it has promised to the owners of the properties that were commandeered by the govern-

ment, especially since they were firmly removed from any possible influence on the factors contributing to the deficit.

Another bad feature about railroading by appropriation is that it sometimes leads to the practice of spending the money before it is appropriated. In this case the fact of the war excuses many things which would not otherwise have been justified, but now that hostilities have ceased many Congressmen who voted for the bill were inclined to overlook the fact that most of the money was spent last year by Director General McAdoo, although some of the bills did not become payable till this year. About half of the deficit has accrued under Mr. Hines' administration, but it had its origin last year.

The members of the committee apparently were somewhat alarmed at the size of the capital expenditures made by the government to be charged against the railroad companies, although the appropriation asked for would provide only about \$8,000,000 in addition to what the government has already contracted for or committed itself to and the reduction of the amount allowed now can have little or no influence on that amount. It also indicated a belief that a reduction in the appropriation would hasten their efforts to pay back the amounts the government has charged against them, to a considerable extent against their volition, and it is possible that the result will be in that direction, but only a Congressional committee would be expected to calculate that permanent financing to repay the government for capital expenditures may be appreciably expedited by withholding the payment of the amounts which the government owes concurrently.

### Prospects of Improved Regulation

THE APPARENT TREND of opinion in Washington regarding railway legislation indicates that neither the Interstate Commerce Commission nor Congress has learned much from the country's past experience with railway regulation. The sentiment there, which reflects the general sentiment of the nation, is overwhelmingly in favor of a return to private operation. But the fact that a return to private operation, without a thorough reform of our system of regulation, will not solve the railway problem, does not seem to have been grasped. A few months ago the nation seemed to be moving toward a solution of the railway problem. Today it seems to be moving away from it.

Probably the best available index of the sentiment in Washington regarding future regulation is afforded by the Esch-Pomerene bill, the salient provisions of which were published in the *Railway Age* last week. This bill is understood to express the ideas of a majority of the Interstate Commerce Commission as to the railway legislation which should be passed. There is reason to believe that it also expresses the present views of a majority of those members of Congress who are convinced that the railways ought to be permanently restored to private operation. The bill, on its face, admits the justice of almost every criticism which those who strongly believe in private management have in the past directed against the policy of regulation. Furthermore, almost every one of its provisions would, if adopted, tend to cause some improvement. But the bill deals adequately with hardly one of the things which it touches. Furthermore, it fails to deal at all with some of the most important parts of the railway problem.

For many years it has been pointed out that the prohibitions of the anti-trust law and the anti-pooling law against railway agreements and consolidations are contrary to the public interest. The Esch-Pomerene bill concedes the justice of this criticism. Instead, however, of providing that the railways may make any agreement or consolidation which the regulatory authority may not hold prejudicial to the public interest, it prohibits any agreement or combination

except such as the Interstate Commerce Commission may hold will be to the public interest. This puts the entire burden of proving the desirability of an agreement or combination upon the carriers instead of putting it upon those who may oppose an agreement or combination. It proceeds upon the false assumption that every agreement or combination must be wrong which cannot be proved to be right.

The real crux of the whole railroad problem is the question of credit. The Esch-Pomerene bill proposes to give the Interstate Commerce Commission authority to fix not only maximum but also minimum rates, and even the exact rates which the carriers must charge. This is a move in the right direction. Such a provision would not only help the Commission to correct unfair discriminations, but might even enable it to order advances in rates which it might consider needed from a revenue standpoint. The bill also provides that in fixing rates the Commission shall take into consideration the cost of labor and other operating costs, and it limits the suspension of advances in rates to 120 days. These are all good provisions. But they do not go far enough. They concede, in effect, that past regulation has denied the railway companies adequate revenues, but give no assurance that opportunity will be given in future to earn adequate revenues. Surely there is no good reason why, in regulating rates, the Commission should fail to consider also the cost of capital as well as the cost of operation. Nevertheless, the bill ignores the fact that in order to provide good service and adequate facilities, the railway companies must be able to raise adequate capital; that in order to raise adequate capital they must be able to pay as much for it as other classes of concerns do; and that they cannot pay the going rate for capital unless they are allowed to earn adequate net operating income.

Some of the worst shortcomings of regulation in the past have grown out of the attempts of state authorities to further the supposed selfish interests of the people of their own states at the cost of the railways and the rest of the nation. There is need for a clear-cut provision prohibiting the states from adopting any regulation which will interfere with federal regulation or burden interstate commerce. The Esch-Pomerene bill contains no such provision. It prescribes a method of adjusting differences between the state and interstate authorities by allowing the state commissions to sit with the Interstate Commerce Commission and participate in hearings, the latter, however, to make the findings. It is impossible from the wording of the bill to determine whether it takes any real authority from the states or gives any real authority to the Interstate Commerce Commission.

While the bill is so drawn as to exclude the thought that its authors contemplate giving the railway companies much more opportunity to prosper in the future than they had under the old system of regulation, it is generous in enlarging the powers of the Interstate Commerce Commission. It gives the Commission exclusive authority to regulate the issuance of railroad securities, and also large authority to regulate railroad operation. In other words, the Commission, under this bill, would resume its regulation of the railways with increased power. But there is no provision in the bill which would tend to make it a fairer or abler regulating body. The salaries of its members were fixed at \$10,000 some years ago. There is no provision for increasing this. The members of the Commission have seldom been selected because of their special qualifications. There is no provision which is intended or adapted to cause better qualified men to be appointed in future.

One of the most vital parts of the railroad problem is the labor part. Under government operation all classes of employees have become organized. The railroad problem will not be solved under either private or government operation without legislation providing definitely for the just settlement of railroad labor controversies without strikes or lock-

outs. The Esch-Pomerene bill ignores the labor problem.

The success of regulation under such a measure as the Esch-Pomerene bill would depend very largely upon the policy of the Interstate Commerce Commission. But railway managers and financiers lost confidence in the Commission before government operation was adopted, and there is no reason for believing, and nobody does believe, that it has had any change of mind or heart. The utterances of its members do not indicate that it has. Therefore, it cannot be assumed that any regulatory legislation the success of which would be dependent almost entirely upon the way in which the Commission administered it would command confidence where confidence is most needed or be of much benefit. The greatest need of the country from a transportation standpoint is the renewal of the expansion of railway facilities. The old policy of regulation practically stopped the expansion of facilities before government operation was adopted. There is no reason for hoping that legislation such as the Esch-Pomerene bill would cause a substantial revival of railroad development. It is all right as far as it goes; but it does not go far. It would put a patch here and there upon the old system of regulation, but would not adequately reform it.

## Why an Advance in Rates Will Be Necessary

THE *Railway Age* has been contending for some time that the railways cannot be returned to private operation with safety to the companies or the public without either a temporary continuance of the present guarantees of standard return or a substantial advance in rates. An advance in rates before government operation is terminated would be preferable to a temporary continuance of the guarantees because the latter would render it necessary for the companies later to seek an advance in rates rendered necessary by government operation and which the government itself ought to make.

Commissioner McChord, of the Interstate Commerce Commission, in a recent statement, has indicated that the companies have nothing to fear from a return to private operation because, as he implies, the Commission will, in future, as in the past, permit the railways to earn adequate net returns. This statement affords more ground for pessimism than optimism. The Commission has not in the past let the railways earn adequate returns.

There are many persons who favor a return to private operation, but who try to show that a substantial advance in rates will not be necessary. They imply there will be an increase in traffic and in operating efficiency, which will enable the railways to get along on present rates.

Facts speak louder than theories. In the first four months of the three "test years" the net operating income earned, on which the guarantees of standard return are based, averaged \$239,000,000. In the first four months of 1919 the net operating income earned was \$65,000,000, or only 28 per cent of what it averaged in the "test years." The guarantees to the companies amount to \$936,000,000 per year. If the railways should do as badly in proportion in the entire 12 months of the year as they did in the first four months, the government's deficit for the year would be approximately \$675,000,000.

Let us see what kind of showing it may be assumed the railways could make if they should have a very large increase of traffic. The largest increase of freight traffic they ever had was in the year ended on June 30, 1916. It was 24 per cent and the increase in freight earnings which resulted was 21 per cent. This enormous increase in freight traffic was handled with an increase of only 9 per cent in operating expenses. The increase in operating expenses was

unprecedentedly small in proportion to the increase in traffic and total earnings, and in consequence the increase in net earnings was unprecedentedly large.

Let us suppose now—having in mind the actual experience of 1916—that in the first four months of 1919 the freight traffic had been 24 per cent larger than it actually was; the freight earnings 21 per cent larger, and the operating expenses only 9 per cent larger. What would have been the outcome? The freight earnings would have been \$219,500,000 more than they were, the operating expenses \$124,000,000 more, and the net earnings \$95,500,000 more. Assuming that all other things had remained the same, this entire \$95,500,000 would have been carried to net operating income. In that case, instead of having only \$65,000,000 net operating income in the first four months of 1919, the railways would have had \$160,000,000. This would have been only 67 per cent as much as the net operating income actually earned on the average in the first four months of 1915, 1916 and 1917, on which the guarantees are based. If the railways should throughout the entire year earn only 67 per cent of the government's guarantees to the companies, the government's deficit for the year would be about \$310,000,000.

But, for many reasons, it is wholly irrational to base an estimate on the assumption of any such enormous increase of traffic as occurred in 1916. Let us make an estimate on the assumption of a total traffic equal to that of the first four months of 1918, which was approximately 17 per cent greater than that actually handled in the first four months of 1919. If the same relationships had prevailed between the different factors as did prevail in 1916, a 17 per cent larger freight traffic in 1919 would have yielded about 15 per cent larger freight earnings and caused 6½ per cent greater operating expenses. Freight earnings in the first four months of 1919 would then have been \$157,000,000 greater than they actually were, operating expenses \$89,500,000 greater, and net earnings about \$67,500,000 greater. If all this larger amount of net earnings had been carried to net operating income, the net operating income for the four months would have been \$132,500,000. This would have been only 56 per cent of the amount of net operating income which the railways earned on the average in the "test years." If in the entire year the railways should earn only 56 per cent of the guaranteed standard return, the government's deficit for the year would be about \$412,000,000.

The foregoing estimates demonstrate, as conclusively as any estimates can, that no increase in traffic which is at all likely, and which it is conceivable existing railway facilities could cope with, would be anywhere near sufficient by itself to make the net earnings of the railways adequate. But, it is said, there will be a great increase of efficiency and economy under private operation. The high opinion which certain persons have acquired of the efficiency of private operation is as astonishing as it is extraordinary. A few years ago the principal argument made against advances in rates was that the railways under private management were inefficiently operated and before asking for advances in rates should increase the efficiency of their operations. Now many of the very persons who formerly based their opposition to advances in rates on the alleged inefficiency of private operation are opposing advances in rates upon the ground that when the railways are returned to private operation there will be a great increase in the efficiency of their management!

The *Railway Age* quite gladly concedes the superiority of private management. It was engaged in defending the efficiency of private management when these same people were attacking it. But the reduction in expenses which the companies would have to effect in order to make both ends meet would be at the very least one-third of a billion dollars a year and, in the absence of a large increase of traffic, prob-

ably would be three-quarters of a billion dollars. We submit that those who contend the railway companies can, in a very brief time, reduce expenses so enormously do too great honor to private management. Their conversion to belief in the great efficiency of private management has been so sudden and complete as to suggest that it may not be wholly sincere and disinterested.

Furthermore, be it remembered that in 1916, when the big increase in traffic came, the railways were being privately operated; that it was efficient private operation which enabled them to handle 24 per cent more freight with only 9 per cent more expenses; and that, as the foregoing estimates are based on the actual experience of 1916, they assume an increase in economy as great as that of 1916. And in spite of all this, the estimates indicate that with an increase of 17 per cent, or even 24 per cent, in freight, the railway companies could not live on the present rates.

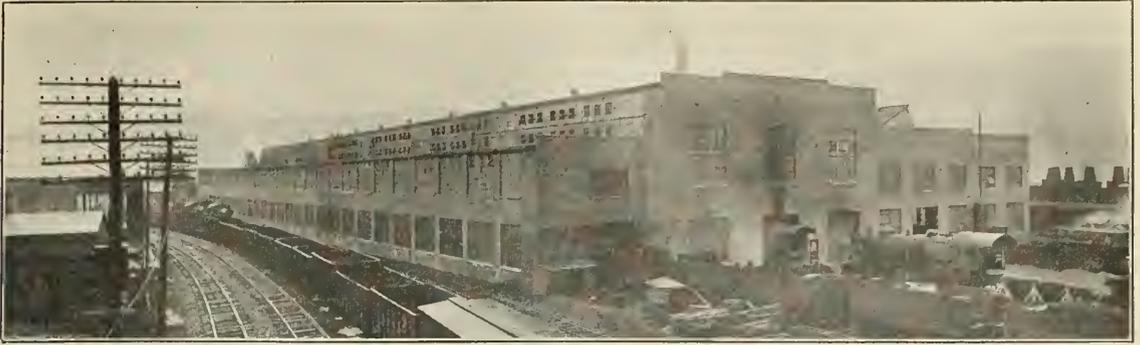

Experience has shown that it is far easier to talk about vast economies than it is to make them. It was in the railway fiscal year 1911 that Louis D. Brandeis made famous the proposition that by "scientific management" the railways could save one million dollars a day in operating expenses. At that time the operating expenses of the railways were \$5,250,000 a day, wages being \$3,311,000 a day. Six years later, in the last month of private operation—December, 1917—operating expenses had increased to \$8,120,000 a day, wages being \$4,940,000 a day. One year later, in the last month of government operation, for which we have wage statistics—January, 1919—operating expenses had grown to \$11,300,000 a day, wages being \$7,500,000 a day; and both expenses and wages are still about the same per day as in January. It will be noted that the increase in expenses per day in the six years, 1911 to 1917, was \$2,870,000 a day, while in the single year 1918 it was \$3,180,000 a day.

Mr. Hines estimates the government's deficit for the first four months of this year at \$250,000,000. On his basis of calculation the deficit was just \$2,500,000 a day. Why not page Mr. Brandeis? If ever there was a time when the savings he said could be effected were needed, it is now. But, instead, the public is paging the companies whose alleged inefficiency he criticised. The companies undoubtedly can operate the railways much cheaper than the government; but the margin between necessary outgo and needed income has become, under government operation, very large, and to act on the assumption that it can be bridged without a substantial advance in rates would be ruinous.

## New Books

*Government Ownership of Railroads.* Compiled by Edith M. Phelps. 200 pages, non illustrated, 5½ in. by 7¾ in. Bound in cloth. Published by the H. W. Wilson Company, New York. Price \$1.25.

This compilation of addresses on the subject of government ownership of railroads, one of the Debators' Handbook Series published by this company, contains, in addition to representative addresses on the subject, a complete brief of both the negative and affirmative of the subject and an extensive bibliography which carries the subject beyond the articles included in the volume. The addresses included in the book are divided into three classes, namely, general discussion, affirmative discussion and negative discussion, and under each of these three heads are included reprints of addresses made by prominent railroad men and students of the railroad situation in the United States at the present time. The articles included in this compilation have been selected with great care and present the principles set forth by both advocates and opponents of federal ownership of railroads.

Exterior of the Shop Building

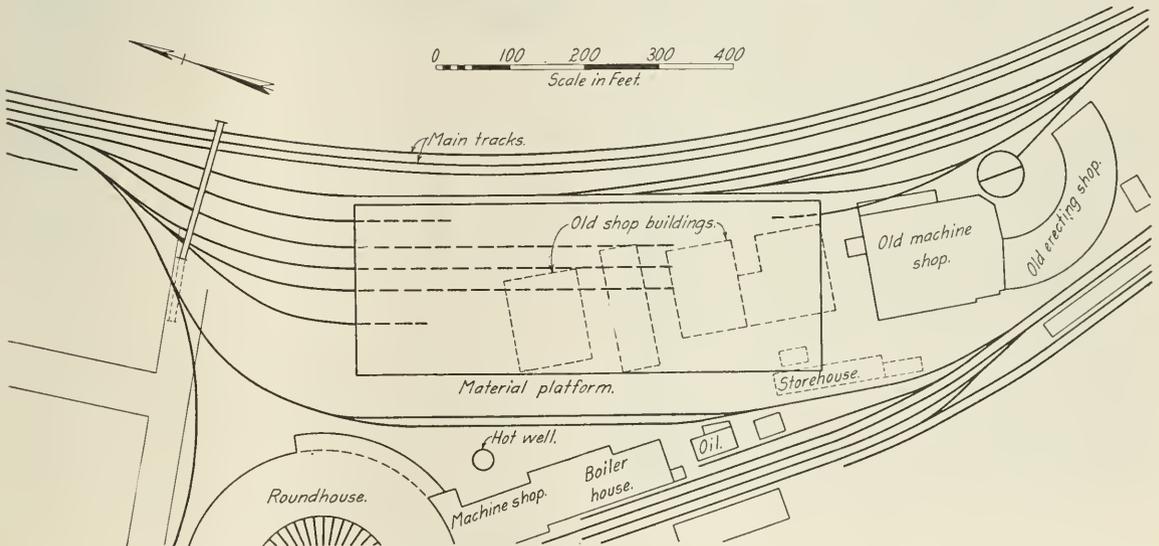

## A New Locomotive Repair Shop Built for the B. & O.

The Plant Typifies the Most Modern and Advanced Ideas in  
Design of Facilities of This Character

WORKING UNDER THE NECESSITY of continuing the old facilities in operation during construction and in a district where a general relocation was precluded through the lack of available space which made it necessary to erect the new building around and over certain of the old ones, the Baltimore & Ohio has completed the construction of a locomotive heavy repair shop at Glenwood, Pa., which embodies many interesting features. Including equip-

shop buildings remain, the former being converted into a tank shop, while the latter will be used for tank shop machinery. The new plant provides space under one roof for the facilities formerly housed in the converted and abandoned buildings.

The construction of the Glenwood shop and a similar one at Cumberland, Md., marks an important step in the development of the operating facilities of this road. For years prior to the war its shop facilities had been inadequate to meet the

Layout Map Showing the Relative Location of the New and Old Buildings

ment the new plant represents an expenditure of more than \$1,700,000. It replaces an old roundhouse (which had been used as an erecting shop), a machine shop and three steel frame buildings with corrugated siding, which had been used respectively as a blacksmith shop, boiler shop and tank shop. The last three buildings occupied parts of the site of the new structure and were kept in operation while the new shop was constructed above them. The old erecting and machine

demands of traffic and the road regularly contracted for certain heavy repairs to its engines to be made at the Baldwin Locomotive Works because of the lack of space in its own shops. In the winter of 1917-1918 this lack added materially to the congested conditions existing on the road and the necessity for relief became imperative. As a result of the studies made to determine the means of relief, the construction of two shops was authorized, one at Cumberland, Md.,

which is intended for the care of the heavy power used on the mountain divisions and expected to have an output of 30 engines per month, and the other at Glenwood, for handling other than mountain power, which is expected to have an output of 45 engines per month.

Each of these new shops has a monthly capacity in excess of any of the old shops on the system, the largest of which is located at Mt. Clare (Baltimore), with smaller shops at Washington, Ind., and Newark, Ohio. The Glenwood shop is typical of the new departures in design and, being the larger of the two new shops, is described in detail below.

### The Shop Is of Longitudinal Type

Differing radically from the usual shop of this character, space is provided in the new building for a store house for mechanical stores which is complete in every detail. This store house is of reinforced concrete construction, and is designed for six stories, five of which have been built. It is located in the southwest corner of the shop building, occupying five 22-ft. panels in the length of the building and 42 ft. in width. The first four floors are devoted to storage purposes. They are equipped with all modern conveniences for storing and handling material and for the comfort of the employees. The fifth floor is devoted to offices occupied by the store-keeper and the superintendent of the shop. Two elevators, one for freight and one for passengers, have been provided, both of which were furnished by the Otis Elevator Company, New York.

The shop building is of steel frame construction with brick curtain walls supported on concrete foundations. It has a total length of 635 ft., center to center of outside columns, and a width of 232 ft. 6 in. Longitudinally the shop contains 29 panels with the columns spaced 22 ft. center to center. Transversely the column spacing from east to

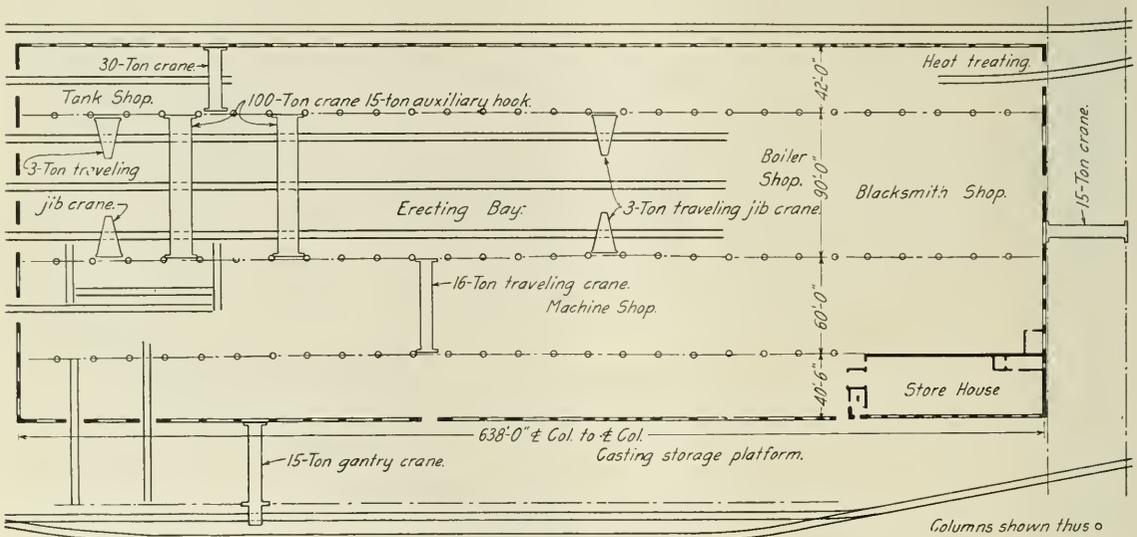

The two west bays adjoining the erecting shop contain the machine shop. Generally speaking, the heavy work is grouped in the inside west bay where crane service is available. The bench work is also located in this bay on the side adjoining the erecting shop. Crossheads, pistons, driving boxes and car wheels are handled in the outside west bay towards the north end of the building. The serving tool room, toilet

Typical View of the Store House Equipment

and wash rooms and shower baths are housed in the six panels of this bay adjoining the spring shop.

The boiler shop occupies the four panels adjoining the end of the erecting shop on the south, with the flue repairing department in the east bay and the heavy boiler shop tools in the inside west bay. The spring repair shop is located in

Arrangement of the Shop Facilities

west is 42 ft., 90 ft., 62 ft., and 40 ft. 6 in., dividing the building into an east bay, a clear story and two west bays. From north to south the first 20 panels of the clear story are devoted to the erecting shop. The east bay adjoining the erecting shop contains the tank shop; the welding department which includes space for superheater pipe work; the cab shop and the tin shop. These departments are located in the order named with the tank shop at the north end of the building.

the outside west bay adjoining the boiler shop. The remaining five panels in the south end of the building are occupied by the blacksmith shop with the exception of the outside east bay which is taken up by the store house.

A gallery floor extends along the west side of the shop for the full length between the store house and the north wall. It is 40 ft. wide, occupying the west bay of the building. This floor provides space for a manufacturing tool room; facilities for electrical repairs; millwrights and machine tool repairs on

the north end and for stokers, air pumps, injectors, etc., on the end adjoining the store house. It also provides space for an apprentice school; offices for the assistant shop superintendent, the general foreman and the supervisor of shop schedules and his clerks, and toilets for men and women. The comfort facilities also include a women's rest room.

Access to the gallery floor may be had from the main shop floor by means of elevators and stairs, two of each being provided, or directly from the store house. In addition, two

View of the Machinery

landing platforms served by the 15-ton crane in the inside west bay are provided for handling materials between the shop floor and the gallery.

Provision for handling castings and heavy materials outside the building has been made by means of a platform 50 ft. wide which extends all along the west and south walls of the building. The south platform is equipped with a 15-ton crane and the west platform with a 15-ton half gantry crane. Two lye vats with a drain table and shears are also provided on these platforms.

The planning of the layout for the new facilities was complicated by the condition that the only available site was occupied in part by three of the old shop buildings, none of which could be dispensed with during construction and by the necessity of locating the building clear of the limits of a future four-track project through this territory. In the final location determined upon, as may be seen on the map, the new building was placed at an angle with the old ones, leaving space to the east for four main tracks and a shop track.

The building rests on a gravel and clay foundation figured to have a bearing value of 6,000 lb. per sq. ft., making piling unnecessary. The concrete in the foundations and in the reinforced concrete store house was placed by means of distributing towers, one week being required in the construction of each floor of the store house.

Beginning at the north end the steel frame of the main shop was erected with a locomotive crane up to column 22, south of which the presence of the old buildings made this method impractical. From this point stiff leg derricks mounted on each main column line raised the columns through the roofs of the old buildings and swung the new roof trusses to place

over the roofs of the old buildings. In the east bay it was possible to use the locomotive cranes for the full length of the building.

The building is heated by hot air, the system consisting of two 200-in. fans, furnished by the Consolidated Engineering Company, New York, direct connected to two 11-in. by 10-in. horizontal Erie Victor engines. The plant is a so-called twin system with one fan at each end of the building. Before passing through the fan the air is heated by 72-in. vento-stacks, furnished by the American Radiator Company, placed two tiers high and 6 stacks wide. The fans discharge into concrete heating ducts, forcing the air to outlet boxes at the columns and along the side walls of the building. Each fan supplies heat to one half of the shop.

Three concrete engine pits are provided in the erecting shop. These are equipped with plug outlets every 44 ft. for direct current arc welding purposes. A pipe trench along the center pit with connections to all the pits, carries air, water and steam lines. A blow-off line is also provided, making it possible to run a locomotive into the shop for repairs under its own steam.

The shop doors are the Kinnear wooden rolling type. The material used in the floor varies with the location and the requirements. Buffalo asphalt blocks on a concrete base are used in the machine tool bay, and in the wheel and tank shops. H. W. Johns-Manville mastic is provided in the main erecting bay and cinders in the blacksmith, boiler and spring

The Erecting Bay

shops. The roof consists of Barrett Specification roofing laid on 3-in. yellow pine sheathing. Particular attention has been given to the provision of special equipment for the comfort and convenience of the employees. Toilets, sinks and shower baths have been provided on each floor; individual steel lockers for personal belongings have been installed, and 21 double drinking fountains have also been provided at convenient points.

The operation of the machines, cranes, etc., is all electrical. The power is received from the Duquesne Light & Power Company through a transformer station at 11,000

volts where it is reduced to 440 and 110 volts. The new substation equipment comprises a complete switchboard for the distribution of the power to the old and new shops with 300-kw. motor generator sets for furnishing direct current to the cranes, elevators and tools.

### Shop Equipment

Approximately 200 tools are provided in the shop, 65 of which are new, the remainder being those transferred from the old blacksmith and machine shops. Most of the tools are direct motor driven, although group drives are used in some cases.

A feature of the erecting shop is the use of two 100-ton cranes for unwheeling locomotives. These cranes span the three engine pits, thus making them available for locomotives on all three tracks. Four 3-ton traveling jib cranes are

also provided in this shop. A 30-ton crane in the tank shop and a 15-ton traveling crane in the inside machine shop bay completes the crane equipment inside the shop. The crane equipment on the platforms has already been mentioned.

The track layout for the plant consists of a shop track which parallels the building on the east, stub tracks into the heat treating, the tank, and the wheel shops, the three pit tracks in the erecting shop and two tracks serving the storage platform.

Work was begun in May, 1918, and completed in April of this year.

The construction of these shops was in charge of H. A. Lane, chief engineer of the Baltimore & Ohio, assisted by M. A. Long, assistant to the chief engineer and architect. Westinghouse, Church, Kerr & Co., Inc., were the contractors.

## Railroad Appropriation Cut to \$750,000,000

### House Believes Additional Amount Can Await More Definite Information; Mr. Hines' Testimony

WASHINGTON, D. C.

THE APPROPRIATION of \$1,200,000,000 asked of Congress by Director General Hines to enable him to pay his bills and temporarily finance the capital expenditures of the railroad companies, was reduced to \$750,000,000 by the House appropriations committee on Monday, and the bill was passed on Tuesday by a vote of 305 to 4.

In reporting the bill, the committee cut the figure to that arrived at by Mr. Hines in his request of the previous Congress, on the ground that the estimates of the requirements were so indefinite and uncertain that any additional amount may well await future action by Congress. The committee stated in its report that the sum it recommended will meet the situation until the latter part of the year, when the needs are more clearly apparent, and "when the Railroad Administration will be in a much better position to state what further amount the government will be called upon to appropriate to fulfill the provisions of the federal control act." The report said the committee felt that much depended on the extent to which the railroads are able to finance themselves and upon operations for the remainder of the year and expressed a belief that \$750,000,000 will make suitable provision for the present and immediate future needs. In this connection the committee considered the ability of the War Finance Corporation to render some assistance.

Apparently Mr. Hines and his finance director in their testimony before the committee last week failed fully to impress upon the members the extent to which they were being asked to pay for a "dead horse." It is understood that the administration estimates its requirements up to the end of July at \$1,000,000,000. Mr. Hines expressed some uncertainty as to whether the situation during the remainder of the year would be such that it would be good policy to increase rates, although he said that present rates are not sufficient to offset the costs, but his entire testimony appeared rather conclusive that most of the sum asked for had already been spent. The \$486,000,000 deficit has already been incurred, the \$425,000,000 for working capital, Mr. Hines says is tied up in the business, and of the \$775,000,000 to be advanced to the railroad companies \$352,500,000 was expended in 1918, \$100,000,000 was advanced to them last year to meet current liabilities, \$48,500,000 was loaned to the New Haven last year, and of the \$253,000,000 to be advanced for this year, \$245,000,000 represents equipment already ordered. That makes a total of

\$1,657,000,000. In addition, \$14,000,000 was asked principally for equipment already ordered for the inland waterways and \$20,000,000 which Mr. McAdoo promised to finance the Boston & Maine reorganization, leaving less than \$9,000,000 for new railroad capital expenditures.

Practically the only possibility of shrinkage is in the item for working capital, but the requirements of the Railroad Administration would be reduced if the railroad companies could finance and promptly pay back to it the amounts already expended for capital improvements and part of the equipment payments will not become due till the latter part of the year. The committee apparently depended largely on the possibility of railroad financing and the proposed plan of financing the equipment by a general equipment trust.

Also, after hearing Mr. Sherley's account of the expedients the Railroad Administration was forced to adopt in order to get along without an appropriation since the first of the year, the committee may have figured that the speed of the revolving fund might be increased if there is less of it.

### Mr. Hines Before the Committee

In discussing this question before the committee, Mr. Hines said: "It is my definite policy, and I certainly will be warmly supported in that by the director of the Division of Finance, to use every means to get the railroad companies to reimburse us as rapidly as possible for that entire \$775,000,000, but I do not think we can make a successful start on that until we are able to clear the decks with them and get them in a position where they can no longer claim that they are unable to finance, because they had to use their credit so largely to borrow money with which to pay their current liabilities that ought to be taken care of by the government. The minute we can clear that up, we can then begin to bring pressure to bear to make them reimburse us and their general credit situation will be improved by the fact that we have paid them off, and we can, as the year progresses, more and more bring about a reimbursement to the government. But the important fact, as I look at it, is not that we are asking for this \$775,000,000, or any part of it, to enable us to give more moneys to the companies, but we are asking it to enable us to carry what we have either already spent or are directly committed for. The \$245,000,000 that we are committed for to the equipment companies and the \$20,000,000 to the Boston &

Maine, and everything else, is already absolutely out of pocket."

"This appropriation requested does not undertake to forecast the situation beyond April 30. I felt that the conditions were so speculative that the situation cannot be forecast with any degree of accuracy. The prospect is that it will change from month to month, and the reasonable indications are that it will change for the better rather than for the worse. The appropriation made undoubtedly would enable us to carry the situation on until we have a much more correct measure as to what is involved in the way of additional loss, assuming that we do not make an increase in rates. I have felt at the moment that the Railroad Administration ought not to make an increase in rates and thereby set in motion the influences on the cost of living and the cost of doing business that I have mentioned, but to wait until they could get a better idea of the situation, and, since the thing was entirely speculative and since the present appropriation would adequately protect the situation for several months to come, the wise course was not to attempt to forecast what would be needed beyond April 30, but to simply ask for the appropriation up to that date."

The votes against the bill were cast by Representatives Anthony, Ramseyer, Woodward and Thomas. There was no serious opposition to the bill and several members urged an increase in the amount but did not press an amendment. Chairman Good of the appropriation committee defended the reduction on the ground that the future needs were problematical and he joined with some of the other members in criticizing the expenditures of the Railroad Administration. Congressmen seemed to have some difficulty in appreciating the difference between operating and capital charges or the fact that much of the money owed by the Railroad Administration for rental and equipment is due now while the capital charges against the railroads are expected to be permanently financed. Mr. Cannon, who spoke for the bill and expressed great confidence in Mr. Hines, said that the \$750,000,000 will not be expended immediately. Others seemed to think that the 100,000 cars ordered last year represented an unusually large order, savoring of extravagance, and many members took delight in criticising the administration as one of the creations of the Democratic party.

There is a belief that some at least of the members of the committee felt that if there is to be an increase in rates it ought to come soon, in order that the government may get the benefit of it, rather than be postponed for the benefit of the corporations next year. But at the same time the House was trimming the appropriation an effort was being made in the Senate to take away the director general's arbitrary power to make rates by restoring the former authority of the Interstate Commerce Commission, which would make it more difficult to raise rates.

One of the most prolific sources of information regarding the operations of the Railroad Administration and the views of the director general is Mr. Hines' testimony before various Congressional committees and the statistical statements which are filed with the committees in connection with his testimony. The hearings before the appropriations committees are in executive session, but are made public when the printed reports of the hearings are given out. Director General Hines and Swagar Sherley, director of the Division of Finance of the Railroad Administration, appeared before a sub-committee of the House Appropriations Committee on Tuesday, Wednesday and Thursday of last week to explain the need for a \$1,200,000,000 appropriation. Mr. Hines was pressed by members of the committee to explain the reason for the increase. Chairman Good asked what condition the administration would have been in if the original appropriation had been made and there had been no additional session of Congress. Mr. Hines replied that, as

things have turned out, the Railroad Administration would have been greatly hampered, but he pointed out that the information available at that time was necessarily based on estimates, and that the extent of the falling off in traffic was not fully realized, and also that his expectations of a reduction in expenses had not been fully realized. Some of his statements ought to make interesting reading for one W. G. McAdoo.

"The fact is," he said, "that this situation is so abnormal and so fundamental in character that I believe it is beyond the capacity of the human intellect to absorb it all at once. The things dawn upon us by degrees. The whole scope of the developments which are the outgrowth of the war did not begin to impress themselves fully on me until I had an opportunity after the adjournment of Congress to travel around over the country and come into personal contact with the federal managers. I am not sure it has fully dawned on me yet."

#### Situation Underestimated

Mr. Hines said that when the January figures were received it seemed reasonable to assume that the heavy operating costs were due to a very large extent to the fact that they had not got away from the war basis, and that the saving in operating costs for subsequent months would be decidedly pronounced. The result has not shown that, he said. It has indicated that the costs are due much more to the fact that the increase in cost has been entirely out of proportion to the increase in rates than to any temporary condition of being on a war basis.

Mr. Cannon asked why the business should not be conducted either by increasing the rates or decreasing the expenses, as to make one hand wash the other.

"As a permanent policy, that is undoubtedly the proper policy," replied Mr. Hines. "The question is whether it is wise to increase the rate level enough now before we can measure better the results that will come from an enlarged business. I think it would be much better to hold this situation where it is until we get more light on how it is going to work." Mr. Hines said that the expenses were not reduced during the first four months of the year because the increasing costs were manifesting themselves to a greater extent right along and the maintenance expenses have been increased because of the weather being favorable for maintenance work.

#### Possibility of a Rate Increase

The discussion repeatedly led to the question of an increase in rates, but Mr. Hines said his judgment is that a satisfactory idea of operations on the basis of the new conditions which have been created by the war cannot be formed before the latter part of this year. Chairman Good asked if it would not have to be done before the roads are turned back to private ownership.

"That would be a very proper time to do it, undoubtedly," said Mr. Hines. He declared that he did not find that the increased expenses can be accounted for by any fundamental difference in the method of operation, that the men who are now operating the roads would, perhaps in 99 cases out of 100, continue to operate them under private control and would continue to employ the same methods they are free to employ now in getting economies. He estimated the increased cost of labor as compared with 1917 as 50 to 52 per cent, and the increased cost of materials at about 35 per cent, and he declared that the increase in wages has been proper and ought not and cannot be reduced, and should be accepted simply as one of the developments of the war. He did not believe that anybody who will study the facts will take the responsibility of saying that the costs are substantially greater than they ought to be.

"It is perfectly clear to me," he said, "that a 25 per

cent increase in rates is not going to offset the increase of something over 50 per cent in wages and, anywhere from 35 to 40 per cent in the cost of materials. The only possible hope will be through a large increase of business which we would do at a relatively large net profit. How far that will be the case it is impossible to forecast. Certainly, however, there is a very strong argument that could be made for the view that that increase in business could not possibly produce enough additional net profit to make up for this loss in the purchasing power of the dollar. The railroads get \$1.25 in revenues where they used to get \$1.00, and they have to pay out from \$1.50 to \$1.70 where they used to have to pay out \$1.00.

"It seems to me that this deficit of \$250,000,000 for the first four months of 1919 is not due to unnecessary or improper expenses, but is simply due to the fact that the government for the time being is keeping down the transportation rates to the public. The expense cannot be reduced, but the government has kept down the rates to the public, and that is the cause of this deficit. That raises a very important question of policy as to what ought to be the government's attitude on that subject. My own judgment is that for the moment the transportation rates ought not to be increased, because there are various factors that promise to work in the direction of cutting down this deficit as the months go by. If we make an increase now which would take care of the deficit on the present volume of business, I think it would clearly be more than necessary when business resumes under normal conditions unless, of course, the very making of the increase would set in motion so many increases in railroad costs as to offset the value of it, and, of course, that would happen to some extent."

Mr. Hines said if the government should undertake to raise \$300,000,000 or \$400,000,000 to take care of the situation it would probably result in the consumer paying three or four times that much in the last analysis, whereas the costs are already on such a high basis as to be detrimental to the active resumption of business. In addition to the expected increase in traffic, Mr. Hines said that there promises to be some decrease in the cost of materials and supplies, and that many federal managers hope to get a greater degree of efficiency from labor because railroad employment has been made more attractive. This, he said, however, was speculative.

Chairman Good pointed out that the deficit of \$250,000,000 for four months is calculated by comparison with four-twelfths of the standard return, which is greater than the proportion naturally expected to accrue during the first part of the year. Mr. Hines said he felt it was better to put it on the basis of one-twelfth of the rental per month because the contract so provides, than to be in the attitude of having understated the loss, but that if \$250,000,000 is appropriated on account of the deficit up to April 30 it undoubtedly will all be absorbed before the most profitable part of the year is reached.

"I think in all probability," he said, "with the large business that we will make a much more favorable showing in the latter part of the year, but I have no idea that that showing will be such that we will then have no deficit at all, except such deficit as would be indicated for the first four months on the basis of apportioning the rental suggested by your figures."

"But in assuming \$250,000,000 as your deficit for four months," said the chairman, "you have assumed that for the rest of the year the railroads will not any more than break even."

"I think I am justified in making that assumption," said Mr. Hines. "It is speculative, but it is my best judgment that even with favorable conditions the operating income for the last eight months of the year will not be more than the rental for the last eight months of the year."

Mr. Hines also presented some estimates based on the conditions of 1917. Assuming the same number of employees working the same number of hours in 1919 as they worked in the calendar year 1917, he estimated the increased pay chargeable to operating expenses, as compared with the rates in effect in December, 1917, would be \$852,000,000. He thought the prospects were very good for moving as many ton miles of freight in 1919 as were moved on the average during the three pre-war test years, and he estimated that, assuming the same volume of traffic as in 1917, the 25 per cent increase in rates, both freight and passenger, would bring in about \$906,000,000; in other words, leaving only \$44,000,000 to cover increases in material costs.

"The conclusion cannot be drawn from that statement," said Chairman Good, "that the total increase in rates will pay all the increased cost of operation of the railroads?"

"No," said Mr. Hines, "if we do not have a larger business than we had in 1917, I do not think it will. We cannot expect that the increase in rates will pay the increased cost. That is my best judgment." He added that the increased cost of materials and supplies would consume a great deal more than the \$44,000,000.

The chairman asked about the possibility of economies resulting from unification.

"I do not recall that I spoke of any additional results from unification," said Mr. Hines. "I think we have already gotten the benefit both last year and the early part of this year of the economies from unification."

The chairman asked why, with the Railroad Administration running behind each month the \$50,000,000 of annual income paid for the privilege of riding in Pullman cars was cut off. Mr. Hines replied that Director General McAdoo was of the opinion that with the signing of the armistice it was desirable to get away from any distinctly war burden, and he added that one effect of the removal of the charge has been to bring about a great deal more travel in Pullman cars and to increase a good deal the ordinary revenue from the use of Pullman cars.

#### Unification Economies in the Past

The chairman also asked as to whether there would be any additional drain on the treasury to make good for deferred maintenance. Mr. Hines said he had been giving that matter a great deal of thought and that a very careful analysis was being made of the situation, which probably would be different as to different roads, but his best judgment of the situation as a whole was that at the present time the administration is fully up to its contract obligations in respect of maintenance of roadway and structures and equipment. The chairman asked if the Railroad Administration had fortified itself in any way to provide for any contingency that might arise with regard to maintenance.

"We have fortified ourselves only in this way," replied Mr. Hines. "We have done so much that if anything we are ahead of the contract instead of behind it, but we have set up no additional fund on that account."

Asked regarding the number of men employed in 1918 as compared with that during the test period, Mr. Hines said it was very difficult to get satisfactory figures. He said the railroads had employed no more men than were necessary to produce the results, except that it was necessary to use some inexperienced labor during the war, but that, generally speaking, the increase in employees, when there has been any, has been due largely to the adoption of the eight-hour day.

#### Railroad Officers Loyal

Chairman Good asked Mr. Hines about reported charges that some railroad men had been doing everything in their power to discredit government operation of the railroads. Mr. Hines said a great many charges of that sort were cur-

rent during 1918, especially during the early part of the year, and every time a specific charge of that sort came up an endeavor was made to investigate it, but, he said, "I do not recall a single instance where we found any evidence of bad faith on the part of any railroad official. In many cases we found evidence of what appeared to be extraordinary bad judgment or inattention to a particular situation, but considering the extent of the railroad business, that percentage has been very small. My best judgment is that they are all honestly trying to give a perfectly successful and proper service under federal control."

**Corporations Must Finance New Capital Expenditures**

Mr. Hines pointed out that the biggest item in the appropriation is \$775,000,000, which has been or will be invested for the account of the railroad corporations and will be returnable by them from time to time, as they are able to return it. He said that the settled policy of the Railroad Administration is that for the future it will make no improvements on railroad properties unless the railroad companies undertake to finance them, except in extreme cases, and he pointed out that while the estimate provides for \$352,000,000 for capital expenditures for last year, it only provides for \$253,000,000 for this year, of which \$245,000,000 is for the equipment ordered by the Railroad Administration, and while there is an estimate for capital expenditures for the year of \$653,000,000 either the corporations will have to finance the difference or the improvements will not be made unless there is some extreme urgency. He also said that the policy is going to be, as soon as the government is able to pay the railroads their rental, to force the corporations to reimburse the government for what they owe it "before they go ahead and make a lot of additional improvements on their property." "No important new work should be undertaken through corporate financing," he said, "before the corporation has satisfied us as to what it owes us."

In connection with the equipment, Mr. Hines brought out the fact that the equipment being built this year will cost only \$245,000,000, instead of \$286,000,000, as previously estimated, because it was bought on a basis subject to diminution if the builders' costs were less than their estimates, and the government is getting some benefit from that. He also showed that to May 28 a total of 1,257 of the 1,930 locomotives ordered had been delivered, and 52,954 of the 100,000 standard freight cars. It is estimated that the car deliveries will be completed by October 1 and the locomotives by December 1.

**Standard Return \$940,000,000**

Mr. Hines' testimony also showed that the estimated amount of the standard return guaranteed to the railroads has been increased from \$928,000,000, the estimate used in his previous testimony, to \$940,669,104 for all roads under federal control. For the Class I roads and switching and terminal companies, the standard return is \$905,035,136. He explained that the \$940,000,000 figure was based on the actual compensation agreed on in each case where an agreement has been reached and the standard return without any addition where an agreement has not been reached, plus an allowance of \$1,500,000 as a reserve to take care of additions to compensation that might be made in other cases. He gave a statement showing the claims for compensation in addition to the standard return which had been allowed, as follows:

Baltimore & Ohio.....	\$2,136,932.00
Chicago, Milwaukee & St. Paul.....	440,082.39
Carolina, Clinchfield & Ohio.....	173,798.41
Northwestern Pacific.....	172,479.59
Missouri & North Arkansas.....	161,230.00
Kansas City, Mexico & Orient.....	140,926.61
Georgia & Florida Railroad (including Augusta Southern)	116,000.00
Western Pacific.....	86,229.76
St. Louis Southwestern.....	67,303.78
Cumberland & Pennsylvania.....	19,885.50
New York, Susquehanna & Western.....	19,807.00

Wrightsville & Tennille.....	16,531.21
Salina Northern.....	15,000.00
Van Buren Bridge Co.....	11,126.47
Louisville & Wadley.....	2,819.57
Trinity & Brazos Valley.....	160,000.00
Gulf, Texas & Western.....	29,734.80
Total.....	\$3,709,887.09

In addition, claims amounting to \$38,474,095 had been denied to June 1, claims amounting to \$546,796 had been withdrawn, claims for \$26,285,606 were pending on June 1, and claims amounting to \$798,843 had been denied and were pending before the Interstate Commerce Commission boards of referees.

Mr. Hines showed that his estimate of \$236,000,000 for the deficit for 1918 was made up of \$216,328,314 for the steam roads, \$4,597,503 for sleeping car lines, \$2,685,730 for carriers by water, \$1,143,358 for inland waterways, \$3,647,143 for the expenses of the director general's organization, \$9,500,000 for the deficit of the American Railway Express Company, and other miscellaneous items. The electric railways had an income of \$319,231.

The estimated deficit of \$250,000,000 for the first four months of 1919 includes \$236,000,000 for steam roads and also deficits for the carriers by water and inland waterways, and an estimated deficit of \$10,000,000 for the express company. The electric railways and sleeping car lines showed some income. The expenses of the director general's organization for four months were given as \$2,849,000. This would be at the rate of \$8,547,000 for a year, as compared with \$3,647,000 last year. Mr. Hines, at the request of the committee, filed a statement of the pay-roll of the Railroad Administration as of May 31, 1919. The pay-roll as of December 31, 1918, was published in the *Railway Age* of May 2, but some changes have since been made.

**Mr. Sherley's Testimony**

Further details of the Railroad Administration's finances were explained by Swagar Sherley, director of the Division of Finance, who was chairman of the appropriations committee during the last Congress. Mr. Sherley said that of the \$563,782,324 expended in 1918 for capital expenditures, \$149,814,794 was deducted from the rental and \$61,514,076 was offset by amounts due the companies on open account. This left a balance of \$352,553,455, which must be carried for the benefit of the companies. Of this \$117,000,000 was for standard equipment. The cost of the equipment ordered by the Railroad Administration was estimated at \$402,221,468, but it is believed this will be reduced to \$363,373,335, which leaves \$245,585,643 to be paid for this year. The railroads have insisted this ought to be paid for by the government, but it is the expectation that they will ultimately accept most of it. Of the cars, Mr. Sherley said, 48,800 have been accepted by the roads and of the locomotives 947, in the sense that the companies have indicated how they propose to finance the equipment, and in addition many roads have indicated their willingness to accept the allocations. None of the companies has finally closed the financial transaction.

Some of the companies felt very bitterly about the allocation of equipment but Mr. Sherley had tried to adjust the matter by arranging a plan for assisting the companies to finance it, and he has been holding conferences with the executives on a plan by which the administration would apply \$121,000,000 of depreciation funds due the companies at the end of federal control to the payment of the initial 25 per cent and general equipment trusts would be floated for the balance payable in 15 annual instalments. This plan, he said, had not progressed to the point where he could say it would go through or not and it might take two months to work out the details. Meanwhile some of the stronger roads that are prepared to finance their part of the equipment at once are being held off so that their credit may strengthen the entire plan. Failing an amicable arrangement, the Railroad

Administration will distribute the cars to the railroads and treat them as their property.

For 1919 the estimate of capital expenditures is \$830,051,665, of which it is expected the railroads will themselves finance \$576,615,905, leaving \$253,000,000 that the government will have to carry for the present. The \$830,000,000 is made up of \$317,229,011, the revised carry-over from the 1918 budget (exclusive of standard equipment), \$267,237,011 estimated new work for 1919, and \$245,000,000 for standard equipment.

The chairman expressed surprise that it should be necessary to carry capital expenditures for the stronger companies. Mr. Sherley explained, however, that it was merely temporary, sometimes to keep the company from borrowing at excessive rates, and that in the case of the stronger companies it was expected they would be able to pay back very soon, but that it was necessary for the government to pay the money in the first instance, especially while the government was nearly monopolizing the investment markets.

"To the extent then to which the committee would feel that these roads which are perfectly solvent can finance their own expenditures, just to that extent, your estimate could be reduced," said the chairman.

"I think not," replied Mr. Sherley. "Your question implies that what can be done in the future can be done now."

### The Skimping Process

In reply to a question as to how the Railroad Administration has financed its activities since the adjournment of Congress, Mr. Sherley gave an interesting description of the agility of the "revolving fund" representing what was left of the original \$500,000,000 appropriation and the operating income. The available money in the hands of federal treasurers, he said, was "simply pooled and then distributed as best we could to the various roads, having to skimp all of them."

On January 1 there was in the treasury of the Railroad Administration \$78,188,531, but by calling upon the various federal treasurers about \$14,000,000 more was obtained in January. Then various railroad companies were called on to repay loans and \$57,000,000 more was received, and some money was received from the express company, making a total of \$81,000,000. In February \$31,000,000 more was taken in, but in the two months \$89,000,000 was paid out in loans and compensation, \$36,000,000 was advanced to federal treasurers who needed it, and \$48,000,000 was paid for cars and locomotives. This ran down the balance to \$14,795,000 at the end of February, and at the same time the federal treasurers had outstanding vouchers and payroll checks aggregating approximately \$258,000,000 but only \$129,500,000 of cash.

Then when Congress adjourned without passing the appropriation some drastic effort was necessary. The War Department paid \$100,000,000 for services rendered but not all vouchered. The Navy Department paid \$10,000,000. Then \$50,000,000 was borrowed from the War Finance Corporation largely on the collateral of the New Haven note and its collateral. The Pennsylvania Railroad also came to the relief of the Railroad Administration by advancing \$22,000,000 to pay bills owed by the federal management of its line in order to protect its credit and permitted the administration to credit upon money due for compensation, applying it against additions and betterments. These payments, however, did not provide sufficient cash and the expedient of issuing certificates of indebtedness was adopted. Of these \$47,842,500 were issued to railroads in March, \$79,517,300 in April, and \$57,831,500 in May, a total of \$185,191,300. In addition, \$49,118,146 of certificates were issued to equipment companies.

As a result of the pooling, Mr. Sherley said, there was called into the central treasury from all sources from Janu-

ary 1 to the end of May, \$355,000,000 and \$350,000,000 was paid out in cash, so that at the end of May "we had managed, by skipping and not paying bills except as we had to, to improve our balance a little bit," to \$76,000,000, but there were in the treasurer's office vouchers for \$46,714,000 covering amounts due equipment companies and on May 21 the federal treasurers had \$156,673,000 cash on hand and vouchers and payroll checks outstanding amounting to \$174,000,000. In other words, if the administration had undertaken to liquidate it would have had only about \$12,000,000 except agents' and conductors' balances, against certificates amounting to \$234,600,000. "In other words," he said, "the Railroad Administration has gone along by getting everybody who owed it any money to pay as promptly as possible, giving its promise to pay when necessary, and by not paying a lot of its vouchers outstanding."

Mr. Sherley filed a statement of the disbursements and expenditures from January to May, inclusive, which included under the head of administration expenses \$848,471 for general expenses and \$2,670,712 for its payroll.

### Compensation

Regarding the payment to railroads for rental, Mr. Sherley said that while some roads have received compensation in advance of what was due them for 1918, "speaking by and large, we have not yet gotten up to the point where we have paid for 1918" and \$441,000,000 is owing to them for 1918, plus \$230,000,000 for the first quarter of 1919, or a total of about \$671,000,000, although the amount for 1919 is subject to some deductions.

A. W. McLean, acting managing director of the War Finance Corporation, testified that the total railroad loans made by the War Finance Corporation to May 31 amounted to \$198,785,890, of which \$6,870,480 has been repaid, leaving a balance outstanding of \$191,915,410. This includes \$50,000,000 advanced to the director general. Of the total, \$59,566,200 was secured by certificates of indebtedness of the director general. In addition, \$1,000,000 was advanced to the Bettendorf Company on certificates. He expressed the opinion that conditions probably will arise under which the corporation would feel that it was not justified in making any more loans to railroads.

### Passed By Senate

The Senate passed the railroad appropriation bill of \$750,000,000 with no debate and with no effort to increase the amount. The bill now only requires the President's signature to make it effective.

# Referendum on Remedial Railroad Legislation

## National Chamber of Commerce Asks Votes of Its Members on Recommendations of Its Committee

THE CHAMBER OF COMMERCE of the United States has submitted to its members ballots for a referendum vote on a series of 10 recommendations of its Committee on Railroads on remedial railroad legislation. In order to inform the members as fully as practicable on subjects submitted to referendum, a carefully selected committee is appointed by the chamber to analyze each question and report its conclusions. The purpose of the referendum is to ascertain the opinion of the commercial organizations of the country, not to secure the approval of the recommendations voiced in the report. The board of directors in authorizing the submission of the report to referendum neither approves the report nor dissents from it. Only the vote of the member organizations can commit the chamber for or against any of the recommendations submitted by the committee, and until such vote is taken the report rests solely upon the authority of those who have signed it. The list of recommendations on which the members are asked to vote for or against, submitting their ballots on or before July 24, is as follows:

1. The committee recommends adherence to the policy of corporate ownership and operation, with comprehensive regulation.
2. The committee recommends return of roads to corporate operation as soon as remedial legislation can be enacted.
3. The committee recommends adherence to the period of federal control as now fixed unless and until impossibility of remedial legislation in this period clearly appears.
4. The committee recommends permission for consolidation in the public interest, with prior approval by government authority, in a limited number of strong competing systems.
5. The committee recommends a requirement that railroad companies engaging in interstate commerce become federal corporations, with rights of taxation and police regulation reserved for states.
6. The committee recommends exclusive federal regulation of capital expenditures and security issues of railroads engaged in interstate commerce, with provision for notice and hearing for state authorities.
7. The committee recommends federal regulation of intrastate rates affecting interstate commerce.
8. The committee recommends a statutory rule providing that rates in each traffic section shall yield an adequate return on a fair value of the property as determined by public authority.
9. The committee recommends payment into a fund of a share of the excess earned by any railroad system under application of the above statutory rule over an equitable minimum return upon fair value of property, this fund to be used as Congress directs for strengthening general railroad credit and increasing general railroad efficiency.
10. The committee recommends a federal transportation board to promote development of a national system of rail, water, and highway transportation and articulation of all transportation facilities.

The pamphlet which accompanies the ballots contains the report of the Committee on Railroads and also a statement of the arguments in the negative on its recommendations. As an appendix to the report there is presented an analysis of the various plans for remedial railroad legislation that have been proposed in the hearings before the

Senate Committee on Interstate Commerce and through other channels. There is also a special statement of unusual interest regarding the plan of the committee for carrying out its recommendation that railroads engaged in interstate commerce shall be required to change from state to federal corporations. The report of the committee is as follows:

### Report of the Committee on Railroads

The committee is opposed to government ownership and operation of the railroads in the United States. It is also opposed to their purchase by the government for lease to private corporations to operate. The committee favors a comprehensive system of government regulation and believes that more adequate facilities, a more progressive and economical service and lower rates can be secured from corporate than from government ownership and operation of the railroads. The committee is opposed to government ownership and operation because:

*First:* Under government ownership the development of railroad facilities would depend upon congressional appropriations which would prevent the anticipation of the transportation needs of the country. Appropriations would not be made in the amount and at the time needed to insure adequate development of the railroads. Political considerations might also control the amount of appropriations and the objects for which they were made.

*Second:* The interest rate which the government would have to pay to secure railroad capital would not be lower than the rate paid by corporations. To acquire the railroads the government would have to pledge its credit for eighteen to twenty billions of dollars, at a time when other large financing must be done. It would be difficult for the government to dispose of the securities required to purchase the railroads, and it would be necessary for the government to secure from five hundred million to one billion dollars of new capital each year. If the government were to assume the burden of financing the railroads at the present time when the war debt is so large, its interest rate would necessarily be as high as, if not higher than, the rate at which corporations could secure capital.

*Third:* Government operation is seldom, if ever, as efficient as corporate management. Competition, the incentive to efficiency and progress in private enterprises, is absent from the government administration of affairs. Individual initiative is less, bureaucratic methods are more characteristic, and the services rendered are less progressively efficient.

*Fourth:* While the government would presumably select officers and employees by means of efficiency tests, political influences would almost certainly be given weight in selecting men for official positions.

*Fifth:* Unless the government adopted the policy of fixing low rates and fares with the intention that any resulting deficit from operations should be placed as an increased burden of taxes upon the general public, rates and fares would be higher under government than under private operation. Under government operation expenses rise in relation to income and the charges imposed by the government, if a deficit is to be avoided, must be higher than those which it would be necessary to permit railroad corporations to make.

*Sixth:* The political effect of government ownership and operation of railroads in the United States might be serious. There are now about 500,000 civil employees of the government. The addition to the public services of 2,000,000 rail-

road employees, the majority of whom are voters, would constitute a force of about 2,500,000 government employees interested in controlling the policy of the government as regards wages, hours and conditions of service. Such a body of employees might easily exercise a controlling influence upon state and national politics.

The committee is convinced that it would be unwise for the government to retain the railroads longer than is necessary to enact the legislation required for the return of the properties under conditions that will be just to the owners and will insure to the public adequate transportation facilities by properly financed railroads. This legislation should be enacted as soon as possible and before the government retires from railroad operation. It would be a hardship to the public and unjust to the owners of the roads were the government to return the properties without first removing the obstacles to efficient and economical operation of the railroads by their owners, without revising past methods and agencies of government regulation, or without adopting measures that will enable the carriers to obtain revenues sufficient to provide the public with adequate facilities and efficient service. As soon as this legislation has been enacted, government operation of railroads should end.

The director general of railroads has recommended that the period of possible government operation of railroads be extended until January 1, 1924, in order that a test may be made of the possibilities of government operation of railroads in peace time and that the government may carry on the work it has begun of developing the use of waterways, of connecting them with the railroads and of articulating rail and water traffic. The director general presents a picture of a national transportation system resulting from the balanced development and the traffic articulation of waterways and railroads.

The Railroad Administration is to be commended for having sought to increase the use of waterways and to organize their traffic, to bring about a development of port terminal facilities and to unite rail lines and water channels into a general system of transportation. This work so wisely begun should be continued by the government until accomplished, even though it is advisable to return the railroads to their owners at an early date. Suggestions for the development of a unified national system of rail, water and highway transportation are embodied in this report.

The committee hopes that legislation for the return of the railroads can be enacted during the present calendar year. Every effort should be made to frame and pass the necessary laws, and it is believed that the necessary legislation can be enacted within 21 months after the proclamation of peace—the period of possible government operation of railroads under the act of March 21, 1918.

To press upon Congress that it shall declare its inability to enact the necessary legislation within a given period, before it has undertaken the task, would be unwise. It is the belief of the committee that Congress, confronted by the grave railroad situation now existent, will apply itself energetically to the consideration of the legislative measures required for its cure, and will be able to accomplish its task within the statutory period now prescribed for federal control. If Congress should find its task impossible of accomplishment within the time prescribed, then, and not until then, should an extension of the period of federal control be made.

It is the opinion of the committee that legislation should be enacted that will facilitate the early grouping and the ultimate consolidation of the railroads in the United States into a limited number of strong competitive systems. The grouping should be about the present large systems and not by territorial subdivisions of the country.

The existence of so many railroad systems as there now are increases the difficulty of co-ordinating their facilities

and services to the extent necessary to secure the most economical operation. Moreover, some of the present roads are financially weak and their continuance as separate systems complicates the government's problems of rate-making, of the common or joint use of equipment and facilities, of the regulation of security issues and of re-establishing the financial credit of the railroads as a whole. If the railroad systems that are financially unstable and the many systems of minor importance can (subject to the approval of the government, and under conditions which it may prescribe) be grouped, or consolidated, with a limited number of strong systems, a better service can be rendered and a larger development of lines, terminals and other facilities will be possible.

Without sacrificing the benefits of competition in service, the government should facilitate the co-ordination of railroad facilities and services, the common use of equipment, and the joint use and development of terminal facilities, when in the public interest.

The consolidation of railroads, as well as the co-ordination of their facilities, should be subject to the approval of the government; and, with such authorization required, the railroads should be encouraged to work out the natural grouping of systems and to combine their facilities in the interest of traffic economy and of financial stability.

Many states have laws against the combination of railroads, and in the constitutions of several states there are provisions prohibiting the acquisition by a railroad of another competing line. The obstacles which these state laws and constitutional provisions place in the way of the associated activities and the consolidation of railroads may be removed by changing the status of railroad companies from state to federal corporations, as recommended in this report.

While favoring the early grouping and ultimate consolidation of the railroads in the United States into a limited number of strong systems, which shall be built upon the large systems which have developed in response to commercial needs, the committee feels that competition among these systems, in service (not in rates), is desirable from the standpoint of the public and will lead to greater efficiency of operation on the part of the railroads. *In all kinds of business the most effective incentive to improvement and to economy of operation is competition.* In the case of the railroads the same charges must be made for similar services. The rates, and, to a large extent, the practices of carriers must be regulated by the government, but regulation does not preclude the possibility of active competition in service. In facilitating railroad consolidation, the government need not, and in the interest of the public should not, eliminate railroad competition.

By Referendum 21, which was submitted by the Chamber of Commerce in September, 1917, the commercial organizations of the country, with comparatively few dissenting votes, declared themselves in favor of the enactment of a federal incorporation law and also a law requiring all carriers now subject to the jurisdiction of the Interstate Commerce Commission, or which may hereafter be created, to organize under a federal incorporation act.

It has been represented to the committee by jurists who have given the matter careful consideration that Congress can enact a statute that will provide a simple process of converting state railroad companies engaged in interstate commerce into federal corporations by methods similar to those followed in changing state banks into national banks.

If such a plan shall be found by Congress to be constitutional and feasible, the committee recommends the nationalizing of railroad corporations engaging in interstate commerce, by the enactment of a statute similar in principle to that of the national bank act which provides a direct method of converting state banks into federal institutions.

In requiring railroad companies to change from state to

federal corporations, Congress should provide that the states shall retain the power of taxation and police regulation of the property of the federal railroad corporations.

The organization members of the Chamber of Commerce of the United States, in acting upon Referendum 21, voted almost unanimously in favor of federal regulation of the issuance of the securities of railroad companies engaged in interstate commerce. It is the opinion of your committee that federal authority should also regulate large capital expenditures.

In acting upon applications of the railroads for the approval of security issues and capital expenditures in federal agency will need to inquire as to the public necessity for the work proposed to be done, the amount of capital that will need to be expended, and, if securities are to be issued, what amount thereof will need to be authorized to enable the carriers to obtain the funds required for the execution of the work which the government may find to be of public necessity.

In order that the state authorities may assist the federal agency to obtain as complete knowledge as possible of the local needs for additional railroad facilities and of the expenditures required to meet those needs, the federal agency should require a railroad company, applying for permission to issue securities or to make a large expenditure of capital, to file with the authorities of the states in which the railroad in question is located copies of the original petition to the federal agency which should notify the interested state authorities of the hearings upon applications for approval of securities issues and capital expenditures in order that they may have full opportunity to advise as to the actions they favor.

This recommendation was approved by the organization members of the Chamber of Commerce of the United States in November, 1917, with comparatively few dissenting votes. This action having been taken shortly before the United States took over the operation of the railroads, Congress has had no opportunity to act upon the question. It is therefore deemed necessary and important by the committee that this recommendation shall be included in its present report as a part of the plan for remedial railroad legislation.

The experience of the past two years has confirmed the committee in its conviction that regulation by the several states of such intrastate rates as affect interstate commerce interferes with the effective and uniform regulation of interstate rates by the United States government. Indeed, conflict, detrimental to the public interest, has arisen with respect to the jurisdiction of the state commissions and the Interstate Commerce Commission over intrastate rates even when it was clear that such rates affected the interstate rates subject to the regulatory power of the federal government.

For these reasons the committee feels it a requirement of the existing situation that the organization members of the Chamber of Commerce should again declare their opinion upon this question, in the light of the developments since November, 1917.

The interests of the public require that the income of the railroad companies shall be sufficient to enable them to secure readily and economically the capital necessary to provide adequate facilities. In carrying out this principle special difficulty results from the fact that the same rates will yield the more prosperous companies greater revenue than they need while the less prosperous companies, due to their unfortunate situation or to their past history, are unable to secure income sufficient to enable them either to develop their facilities in proportion to the needs of the public, or to perform the services required by the section of the country in which the roads are located.

Your committee believes that the most practicable way to provide the railroads of the United States, as a whole, with adequate revenue, and thus to re-establish railroad credit, is

to authorize the Interstate Commerce Commission to divide the country into such traffic sections as may seem to the commission wise, and to direct the commission by a statutory rule to fix such rates and fares as will yield the railroad companies, in each of such traffic sections as shall be designated by the commission, aggregate revenues which will provide—after allotment has been made for renewals and depreciation—a net return that will enable the carriers to furnish the public with adequate facilities and efficient and economical service.

The committee is not in favor of a government guarantee of a minimum return to each railroad company, either upon its capitalization or upon the property which it devotes to the public service. A government guarantee would tend to lessen initiative and to cause both the prosperous and the unprosperous roads to feel less responsibility for efficient management.

While not favoring a government guarantee of a minimum return, the committee believes that Congress ought to adopt a statutory rule providing that the public authority which fixes the railroad rates assure reasonable revenues to the railroads as a whole and in each of the natural traffic sections of the country. The committee is of the opinion that such a statutory rule can be enforced without placing an unjust burden upon the public and without causing individual railroad companies to obtain excessive profits.

For the purpose of securing an equitable enforcement of a statutory rule of rate making and of enabling the railroads of the United States as a whole and by natural traffic sections to secure adequate revenues without permitting individual companies to obtain excessive profits, your committee recommends the enactment of a statutory rule providing that individual railroad systems, that may obtain from rates fixed by public authority net corporate income in excess of an equitable minimum return upon their property devoted to the public service, shall turn over such share (one-half or one-third) of their excess profits to a fund to be employed, as Congress may direct, to strengthen the credit of the railroads as a whole and to enable them to serve the public with greater efficiency.

The proposed statutory rule would deprive none of the present prosperous roads of an equitable or even a liberal return upon their property devoted to the public service, nor would it take away from them the incentive to economical and efficient management. At the same time, it is believed that the excess profits of the more prosperous companies will be sufficient to create a fund by means of which the credit of the railroads as a whole can be substantially strengthened. Your committee believes it will be possible for the Interstate Commerce Commission to establish general schedules of rates and fares that will provide the railroads of the United States as a whole with adequate revenues, and that will prove effective in re-establishing railroad credit.

The development of a national system of transportation is a public necessity. Up to the present time the steam and electric railways, the waterways and highways have been developed separately without reference to a common plan and without thought of creating, from the various agencies of transportation, a unified system.

The time has come when the waterways of the country as a whole should be systematically developed according to a definite plan. Their larger use should be made possible by connecting them with the railroads at river, lake and ocean ports and by enabling shippers to send their traffic by the most economical combination of rail and water routes.

The work which the Railroad Administration has so happily begun of providing for the traffic use of important rivers and canals, and of articulating the railroads with the waterways in a traffic sense, should be continued after the railroads have been returned to their owners.

The development of highway transport should be facili-

tated with a view to the co-ordinated use of all transportation agencies. While the people of the United States have been creating an exceptionally economical system of transportation by rail, highways have been relatively neglected and the expenses of carrying freight to and from the railroads are, in most instances, greater than the cost of the railroad haul. The systematic development and the organized use of hard surface highways greatly reduce the transportation burdens borne by the people of the United States.

It is especially important that provision should be made for the common use and construction of terminal and transfer facilities at all the larger traffic centers of the country; but, unless some federal authority is vested with power to bring about the common use of terminal and transfer facilities, and their joint construction by the carriers (in so far as that may be in the public interest), it is practically certain that the present expensive methods of terminal operation will be indefinitely continued.

The development of a unified national system of transportation is an executive task that can be performed only by creating a board primarily administrative in purpose and organization. The Interstate Commerce Commission, in the regulation of rates and in the supervision of the capital expenditures and the security issues of railroads, will have as much work as it can successfully perform. Your committee has not suggested taking from the Interstate Commerce Commission any of the functions it has thus far exercised, but has recommended a large addition to the duties of the commission. It would be unwise to impose upon that body the large and exacting task of guiding and facilitating the development of a national system of rail, water, and highway transportation. That work should be undertaken by an especially created Federal Transportation Board.

The members of the Committee on Railroads are: George A. Post, chairman; Walter S. Dickey, F. C. Dillard, Stephen A. Foster, Edward J. Frost, Thomas F. Gailor, Emory R. Johnson, Charles E. Lee, W. Z. Ripley, Alexander W. Smith and Charles F. Wright.

### Compulsory Federal Incorporation for Consolidated Railroad Systems

The committee recommends "that railroad companies engaging in interstate commerce shall be required to change from state to federal corporations" and says in its report, "It has been represented to the committee that Congress can enact a statute that will provide a simple process of converting state railroad companies engaged in interstate commerce into federal corporations by methods similar to those followed in changing state banks into national banks." At the request of the committee, Alexander W. Smith, of Atlanta, Ga., has prepared the following statement of the plan referred to in this recommendation:

Various plans have been suggested for improving the transportation systems of the United States. For instance, it is proposed that the government shall authorize the consolidation of individual railroads into large systems which necessarily involves interference with competition in local territory between lines that were previously competitive. If that is undertaken in some states under the present corporate organization of railroads, it will run counter to constitutional inhibitions. Has the federal government power to override the constitution of a state by undertaking to authorize such railroads to consolidate, so long as they are creatures of the state and subject to the provisions of its constitution?

A corporation is a fictitious person. It has many attributes of a living being. It contracts, incurs obligations, owes duties to the government that creates it, and is subject to the constitutional control of that government. When we consider things desirable to be done in connection with our transportation systems, it is well to investigate some of the

legal aspects involved; take a view of the range-lights and shoal stakes, so to speak, that mark out the legal channels through which we can safely travel, else we may run on the rocks.

The National Association of Owners of Railroad Securities and their counsel appear to have considered the subject of federal incorporation solely on the basis of creating new federal corporations, and undertaking to transfer into them existing state corporations, and their assets and liabilities. That is practically impossible. Take the Southern Railway Company as a concrete example. It is a system made up of more than 100 separate railroad corporations. It owns some of them; it controls others under long leases, and others by majority stockholding. It has effected their merger by all the known methods of putting one railroad under the operative control of another. Their obligations under the kaleidoscopic arrangements it has made in bringing the system together could not be transformed and lifted out of the several state corporations and set down in a new federal corporation. As a business proposition, it would be impracticable.

In view of these difficulties, the railroad executives have thus far turned away from the proposition of federal incorporation. But there lies right on the surface a method to accomplish the same result in a perfectly simple way, viz., the passage by Congress of a general federal incorporation act along lines parallel to the laws for incorporating national banks, and nationalizing state banks. If a state bank desires to become a national bank, it makes application to the comptroller of the currency on certain forms supported by proper vote of its stockholders and directors, and a certificate is issued authorizing it to be thereafter a national bank. The Supreme Court of the United States has decided that when a state bank is thus converted into a national bank, there is no change in its identity or corporate existence, and no interruption of the continuity of its business. Its allegiance by that act is transferred from the state to the nation, but the corporation is the same; its assets and liabilities are the same; and no transfer is necessary from the one to the other, because there never is but one corporate creature. (*Metro-politan Bank v. Claggett*, 141 U. S., 520.)

What a simple plan that would be if it is deemed necessary for the interstate railroad systems to become national corporations!

While Congress has no power to compel a state bank to become a national bank, because a state bank is no part of the fiscal machinery of the nation, it is submitted that it does have the power to compel a railroad system that is now engaged in interstate commerce to become a federal corporation.

The power of Congress to create a bank at all was contested until it was settled by the Supreme Court that such power was implicit in the power delegated to Congress to issue money and handle its finances. Jurisdiction of Congress over a railroad engaged in interstate commerce is delegated in a specific, plain, explicit, all-inclusive and plenary paragraph of the Constitution committing to it control over interstate commerce and all its instrumentalities.

If it be true that Congress has only implied power to charter a bank as a piece of machinery in its fiscal system it must be true that if Congress finds in the development of transportation that state lines have been wiped out, and that commerce disregards artificial obstructions, and that necessary machinery in carrying on interstate commerce is a railroad corporation, the express grant of exclusive jurisdiction over such commerce carries with it the power to create such a corporation.

If that is true, can it *compel* a state railroad company engaged in interstate commerce to become a federal corporation? No one questions its power to create such corporations, *ab initio*.

It has been decided by the Supreme Court of the United

States that no single state can create a railroad company and endow it, as a matter of law, with the right to operate its lines in any other state. Indiana and Ohio tried to do this conjointly. They created two railroad companies, each endowed with the same name, and having the same officers, directors and stockholders. The tracks owned by these two companies came together at the state line. Every effort was made to create a single corporation with the right to do business in both states. The Supreme Court held that there were two separate and distinct corporations and that, in the very nature of the case, one state could not give the power to its creature to go into the domain of another sovereignty of equal dignity and do business there, except by permission of the other state. Hence it is that all roads that cross state lines do business outside their native state by comity between the states. Comity is a privilege merely and not a legal right. (*O. and M. R. R. Co. v. Wheeler*, 1 Black, 286.)

The Southern Railway Company was able to merge its constituent lines running through 11 states by reason of the voluntary, but not necessarily concurrent, action of the several states and their corporate creatures. First, the states either by special acts or by general laws gave statutory permission for the railroad corporations to combine. Second, all constituent corporations had to take appropriate corporate action, through stockholders and directors according to by-laws and charter provisions, authorizing the particular step necessary to a merger. So that each of the constituent corporations was put into the combination by virtue of its own action taken by permission of its creator. Thus, by virtue of the express consent of the several corporations and of the express legislative sanction of the 11 states in which the Southern Railway system operates, something was created different from the aggregate of corporate powers previously vested in the subsidiary companies. The Virginia corporation known as the Southern Railway Company became an instrumentality of interstate commerce, not by virtue of comity among these 11 states, but because it crosses the lines of said states and hauls interstate commerce through them as a single entity and by virtue of the action of each of the states, and of the concurrent or supplemental action of the owners of each of the properties. Whether they intended it or not, it is a fact that every one of those states, and every one of those corporations, by such action, voluntarily submitted themselves to the jurisdiction of Congress through its exclusive control of interstate commerce, whenever it sees fit to act.

Congress has never exercised that power, but with all due respect to the eminent counsel who have raised legal objection to compulsory federal incorporation, no satisfactory reply has yet been made to the legal conclusion involved, viz., that Congress has the power, if it chooses to exercise it, to say that every system of railroads engaged in interstate commerce by virtue of consolidating constituent lines (and no other such system can legally exist unless originally created by Congress): "You are now an instrumentality of interstate commerce, and in the development of the commerce of this country it has become necessary that full jurisdiction of your functions shall be vested in the federal government. Therefore, you are required to transfer your allegiance from the state of your incorporation to the United States of America, in order that the federal government may take such steps hereafter in the control of your business and in the promotion of the interests of interstate commerce as from time to time it sees fit." Congress could then establish consistent and uniform control of all systems of interstate carriers.

If federal incorporation is made permissive only it is questionable whether Congress will not be embarrassed by some of the lines declining to accept federal charters. Many of them have tax exemptions and special charter privileges which they would hesitate to imperil. Voluntary action

would certainly destroy these privileges, while, under compulsory action, these property rights might be preserved under other provisions of the Constitution not necessary to be here elaborated.

It should be repeated that this argument is confined to those lines which, by voluntary action, have been consolidated into interstate systems. They have thereby waived the right (if it exists) to object to Congress doing anything with them that it may desire to do if they expect to continue in interstate commerce.

As to the necessity of federal incorporation, there does not seem to be any room for argument. If the federal government is to vise and control the issuance of railroad securities, upon what principle, without the voluntary cooperation of the state corporation, can Congress interfere with its issue of stocks and bonds expressly authorized under its state charter? They may be not necessarily connected with its interstate commerce. Their proceeds may be needed for other purposes. Many railroad corporations engage in business other than transportation. The exercise of control over the securities of a state corporation by Congress is much harder to justify under existing law than the power to compel federal incorporation by interstate systems. The basis of the securities, especially the original issues, is the charter of the constituent companies, and not of the holding or operating company. Rights in these are vested and protected by the federal Constitution itself. But when the corporation operating the interstate system is compelled to transfer its allegiance to the federal government, subsequent issues of its capital stock and bonds may be regulated as Congress directs.

The contractual relation between a state and its corporate creature presents no obstacle to compulsory federal incorporation of interstate systems hereinbefore described, because the state has consented in advance that that may happen. When the state gave permission to its corporation to become a part of the instrumentalities of interstate commerce by virtue of its legal merger into an interstate system, it relinquished its right to object to any sort of control over that corporation which Congress might choose to exercise. Of course, until Congress exercises control the allegiance of the corporation remains with the state that created it. The argument is that both the states and the corporations, by virtue of the necessities of the consolidation that produced the interstate system, have contracted in advance that Congress may exercise jurisdiction over this legally established instrumentality of interstate commerce if, in its discretion, such action will promote the interests of interstate commerce. Such jurisdiction has been exercised in numberless ways. If, without destroying the corporation itself, it may be converted from a state corporation to a federal corporation, there is no legal reason why Congress may not constitutionally require it to make the change.

The national transportation conference called by the Railroad Committee of the chamber held its final meeting at Washington on June 5 and 6 and adopted a plan of remedial railroad legislation which it is expected will be presented at the first opportunity before the Congressional committees.

---

Careless marking and packing of goods sent by express, an evil which has been the cause of many delays and losses, has been in large degree cured, according to statements of officers of the American Railway Express Company, by the "drive" which has been made by that company during the past few weeks. Meetings of employees have been held in all of the principal cities and towns, and the men have been lectured on their duties in this respect; and large shippers are said to have aided the reform by seeing that their shipping departments paid better attention to the rules.

## Railroad Y. M. C. A. Membership Drive

By John Moore

General Secretary, Railroad Department, International Committee, Y. M. C. A.

**T**HE MEMBERSHIP WEEK drive of the Railroad Young Men's Christian Associations exceeded expectations.

The goal was 40,000 new members, while the total secured exceeded 48,000. Some railroad associations made remarkable records. Albany, N. Y., for example, lifted its membership from 500 to over 1,500 men; Atlanta, Ga., from 682 to 1,665; Portsmouth, Ohio, from 680 to 1,140; Ennis, Tex., from 208 to 498; Derry, Pa., from 148 to 742; East Youngstown, Ohio, from 300 to 990; West Albany, from 260 to 794; Jersey City, N. J., which already had a total membership of 2,457, raised its membership to 3,000; the Pennsylvania Railroad Department at Baltimore, Md., secured 1,724 new members, while at Altoona, Pa., 953 were obtained. On the Pennsylvania Railroad alone nearly 14,000 new members were secured, and from all parts of the country come interesting stories of the remarkable work of individual men. To illustrate, at Secaucus, N. J., an Italian machinist, working in conjunction with two waitresses in the Association restaurant, secured over 100 members.

Among the beneficial results of Membership Week, apart from the total of new members secured, were:

*First*—The organization of more than 10,000 workers who not only obtained the 48,000 new members, but while so doing valiantly and successfully defended the Association against the charges of the prejudiced, the unreasoning and the malicious.

*Second*—The unusually large number of important operating officials who gave to Membership Week not alone their sympathetic co-operation, but also their practical leadership, giving time, strength and interest without stint. Among a long list of such men might be mentioned J. H. Hustis, district director of the New England District of the United States Railroad Administration; Elisha Lee, federal manager of the Pennsylvania Railroad; W. J. Fripp, general manager, New York Central Lines; C. W. Galloway, federal manager, Baltimore & Ohio; Chas. H. Ewing, federal manager, Philadelphia & Reading; G. R. Loyall, assistant federal manager, Southern Railroad Lines; E. W. Grice, manager purchases, stores and safety, Chesapeake & Ohio.

*Third*—There was a fine response by railroad men, for not only did nearly 50,000 of them join but many other thousands who for reasons beyond their control could not do so at present expressed the warmest sympathy for what the Association has done and is doing. Leaders of the international and local brotherhoods stood by the organization royally. Many of the most effective workers during the week were those high in the councils of the labor organizations. While the drive was in progress the Order of Railway Telegraphers, holding its annual convention in St. Louis, passed a resolution of cordial endorsement of the work of the Railroad Young Men's Christian Association.

*Fourth*—There was the heartiest co-operation from the Washington Administration. No clearer evidence of this fact could be given than the following telegram received from Director General Hines on the first morning of the week:

I have recently learned that Railroad Young Men's Christian Association has set apart the week May 18 to 24 as Membership Week, when they plan to increase their membership from about 110,000 to 150,000 railroad men. I also understand that following this Membership Campaign, the Railroad Department of the Y. M. C. A. is planning a movement among railroad men, including among other admirable features, emphasis upon patriotism, thrift and health. I am very strongly of the opinion that the Railroad Y. M. C. A. is rendering a practical and helpful service which is appreciated by railroad men, railroad managements and the U. S. Railroad Administration. It affords me pleasure, therefore, to endorse the program in contemplation and I will await with real interest further information as to its success.

*Fifth*—It was a demonstration to the railroad world that the Railroad Young Men's Christian Association was equal

to a great task. It is safe to say that this organization was never in the eye of the railroad world in its history as during these days. More than two score of family and technical railway journals gave large space to the Railroad Young Men's Christian Association, its plans, methods and ideals. They carried the story of Membership Week, and all it stood for, into the homes of literally hundreds of thousands of railroad men.

*Sixth*—It meant a steadying of the forces, both secretarial and lay, of the organization; the railroad associations have now learned by experience, after having put the question to its constituency that they are strengthened and not weakened by the vicissitudes of the past year; that there are tens and hundreds of thousands of men who believe in this important work all the more when it is under fire and put to the test. Membership Week added to the confidence of those who, while unshaken, were still somewhat troubled by the evanescent clamor of these turbulent days.

*Seventh*—Membership Week paved the way for the greater things to follow. It was not an end of itself, but only a means to an end—it was but the beginning of the larger developments to follow. In the near future equally well organized comprehensive and universal campaigns will be operated for the promotion of activities programs. Definite weeks will be set apart for the wider and more thorough organization of religious work, educational work, work for boys in railroad communities, and for new emphasis upon such vital features as health, happiness, Americanization and thrift. What the Railroad Department has demonstrated it can do in securing members it can also do in serving members. The only excuse for Membership Week was that it prepared the way for what is to follow.

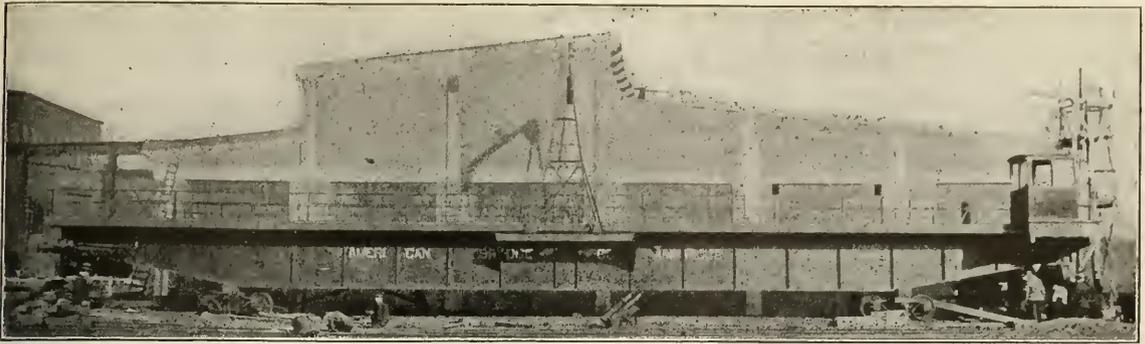

*Eighth*—These memorable days opened the way for new associations. To illustrate, at one point where there is no railroad association 600 men agreed to join provided an association could be organized there; while at a number of other points seed was sown that will mean the springing up of new associations to serve railroad men.

*Ninth*—Membership Week also brought new possibilities of extension to many existing railroad associations. For example, Albany, N. Y., even before the week had closed, had decided upon improvements and alterations costing \$15,000 so that the association might more adequately care for the large number of new men who had joined. Elsewhere throughout the country secretaries and directors are now employed in making a study of how to adapt and enlarge present equipment so as to meet the new and pressing demands.

*Tenth*—Membership Week brought the Railroad Department to the attention of many leading foreign railroad officials who are in America at present, and who expressed the keenest interest in Membership Week while in progress, and surprise and appreciation at the remarkable results.

This drive, resulting in securing nearly 50,000 new members, was conducted in the face of unusual difficulties. For example, first, the unsettled conditions of the railroad world at present; second, the fact that large numbers of men had been dropped from the payroll during the usual spring dismissal; third, the still embarrassing though rapidly dying criticism of Association work overseas; fourth, the fact that it followed hard upon the Victory Loan and was conducted during the week when the Salvation Army and Methodist Centenary were conducting nation-wide campaigns, while there were also in operation numberless local campaigns of one sort or another.

The executive committee in charge of Membership Week was composed of the following railroad men: E. W. Grice, Chesapeake & Ohio; G. E. Chance, Illinois Central; C. A. Skeele, Pennsylvania Lines West; C. A. Merrill, Boston & Maine; J. T. Sleeman, P. & L. E.; R. V. Carter, Louisville & Nashville; Tull C. Waters, Southern, and C. Manning, Grand Trunk.

The Turntable

## New 110-Ft. Turntable Built for the Pennsylvania

### An Adjustable Center Permitted the Adoption of a Continuous Three-Point Supported Type Table

**A** CENTER BEARING, adjustable vertically over a range of one inch by means of screw-operated wedges, is one of the main features in the 110-ft turntables recently designed by the Pennsylvania Railroad and which are now being installed at certain of its more important engine terminals. This vertical adjustment has permitted the development of plans for tables of the three-point supported type, the design of which includes many novel and interesting features, especially in the avoidance of the use of tables of the usual balanced type with their objectionable features, particularly in tables of such extreme length.

These 110-ft. turntables were designed in anticipation of the increased requirements at engine terminals incident to the impending introduction into service of new Mallet engines of the HC1's type, one of which is now under construction in the company's Juniata shops. These locomotives have a wheel base of 97 ft. 3 $\frac{3}{4}$  in., an over-all length of 105 ft. 9 $\frac{1}{4}$  in., and an estimated weight of 555,000 lb., exclusive of the tank, which weighs 219,000 lb., or a total weight complete of 774,000 lb. Owing to the extreme depth of the turntable girder required for a balanced table of such great length, and further because of the operating conditions which make it difficult to spot a locomotive of this size and weight with any degree of accuracy, it was deemed inadvisable to construct the turntable along the usual lines of the balanced type of table. Furthermore, the teetering action of the balanced type table has an undesirable effect on the approach rails and outside trucks, due to pounding, which is augmented seriously as the length increases. It was therefore decided that the new tables should be of the continuous girder three-point supported type, with the weight of the table and its load distributed over the center and the four end trucks. Exclusive of the tractors and center the table complete with the end trucks has a weight of 75 tons.

Reliability of service, together with low maintenance costs, were the main objectives of the design while in the preliminary studies particular attention was given to the requirements of traction. Time studies were made of the various turntable operations at existing tables and the information thus secured was utilized in the design of the 110-ft. turntable tractors to insure that the operating cycles of the new table, with its greater loads, would not exceed those at the smaller tables and that the new tables would be able to turn an engine end for end in 60 sec. Special attention was given

to starting and stopping the table in order to avoid excessive whip action, with the result that the maximum acceleration does not exceed 0.35 ft. per sec. with a maximum circumferential speed of the table of 240 ft. per min.

Reliability of service has been further provided for by the utilization of two tractors, either of which is capable of turning the table under emergency conditions. These two tractors are provided with sufficient traction to eliminate the use of sand for traction purposes and the consequent hard running of the turntable trucks due to increased rolling resistance. These two tractors travel on the same circle rail as the turntable trucks.

Low maintenance costs are further ensured by the permanent character of construction employed through the foundation, the circle rail, the bridge, the deck, and the electrical apparatus. In the design of all parts simplicity, accessibility and interchangeability are the chief objectives. Cast iron was utilized wherever possible because of its resistance to corrosive action. For the same reason galvanized iron was used for hand rails.

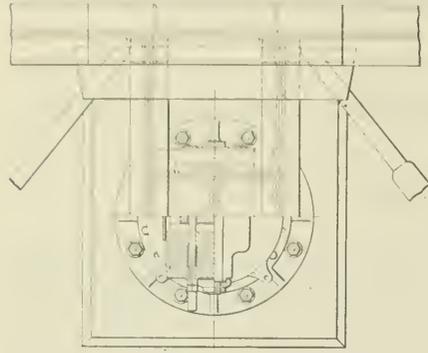

To eliminate the pounding out of the approach rails and approach rail supports at the table ends and at the approach rails, cast steel end ties were installed at the ends of the turntable bridge and cast iron coping castings were used on the coping wall, the cast steel end ties being lined to the exact center line of the turntable bridge and brought to alignment and level by means of stereotype lining between the end tie and the girder flange plate and secured to the turntable bridge by means of eight one-inch bolts. Diametrically opposite tracks to the turntable are also perfectly lined. The same permanent character of construction is employed in the pit, where the circle rail of 150-lb. section, bent cold, is held in place on 33 cast iron support castings firmly secured to the concrete. The adoption of the three-point supported type table permitted of the use of girders only 6 ft.  $\frac{1}{2}$  in. deep, reducing materially the depth of pit required. These pits are drained from the center to a sump from which the discharge is by gravity or a syphon according to conditions.

#### The Center

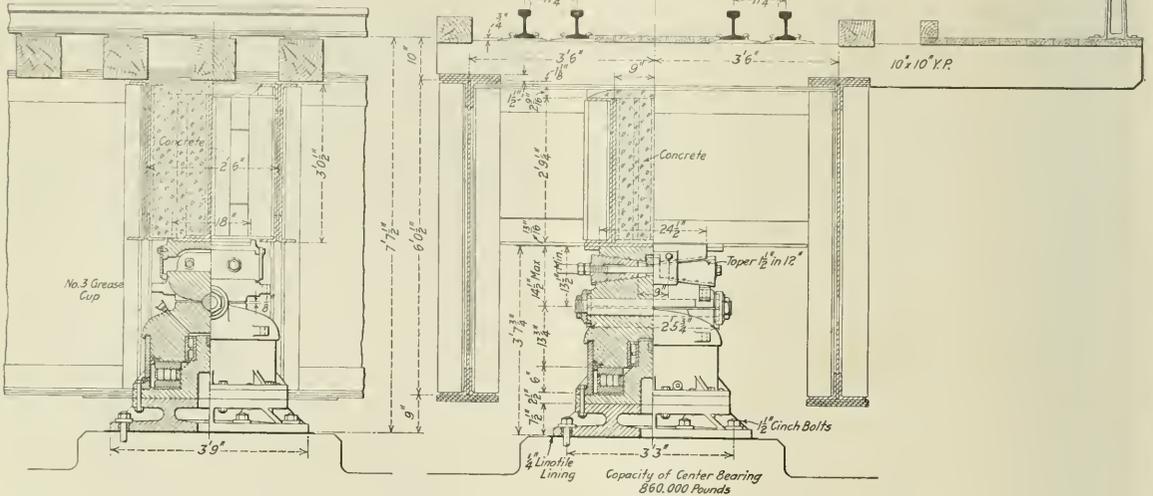

In order that this table should function properly on its three points of support it is necessary that one of the supports be adjustable so far as vertical alignment is concerned. This adjustment is accomplished in the center by means of

screw-operated wedges, the total range of adjustment being one inch. As the load of the table comes down on the sole plate it bears on wedges, which in turn, through their wedge castings, bear on the equalizing hinge pin, thence on the thrust bearing proper. This thrust bearing is of the roller type with a babbit liner between the lower roller race and the center casting to insure uniformity of bearing pressure. The load from the turntable center is transmitted to the concrete center pier through a 1/4-in. linotile liner, which insures a uniform resilient bearing for the steel casting on the concrete.

The capacity of the center bearing is 860,000 lb. and it is fully grease lubricated. It has been designed and built with a view of making it accessible for inspection or repairs.

Section on Wedge Center Line. Section on Saddle Center Line.

General Arrangement of the Turntable Center

of the table must necessarily oscillate back and forth over a considerable distance, when the locomotive is moving on or off the table. Since stability in this direction is secured in these tables through three points of support, and the table does not rock on the center bearing, the collector is bolted securely to the center of the portal.

The collector in itself is of interest in that it is of the sectional type, made up of standard parts, and may be used for direct current, or one, two or three phase alternating current collection as required. It is weather, gas and steam proof.

Structural steel poles placed on opposite sides of the engine house circle, support the overhead wire. One messenger wire is provided instead of the usual two and it is not required to support the current collector. The only function of the messenger is to support the current-carrying wires and to prevent movement of the stationary part of the collector. One end of the messenger is supported rigidly at one tower and the other end is fastened to a bell crank used to compensate tension due to temperature. This bell crank supports a series of weights which insure uniform tension on the messenger at all temperatures.

**Tractors and Tractor Control**

Two tractors are used on each table to give uniform torque action on the table in starting and stopping as well as to afford reserve power to meet emergency demands. They

The upper half of the center proper can be removed from the base casting and the entire center slid out of position and passed up through the deck of the table; to perform this operation it is only necessary to jack up the table approximately three inches. All the adjustment wedges and the wedge screws are thoroughly protected against corrosion and grit. The center is all of steel except for the housing shell which is of cast iron.

**Current Collector**

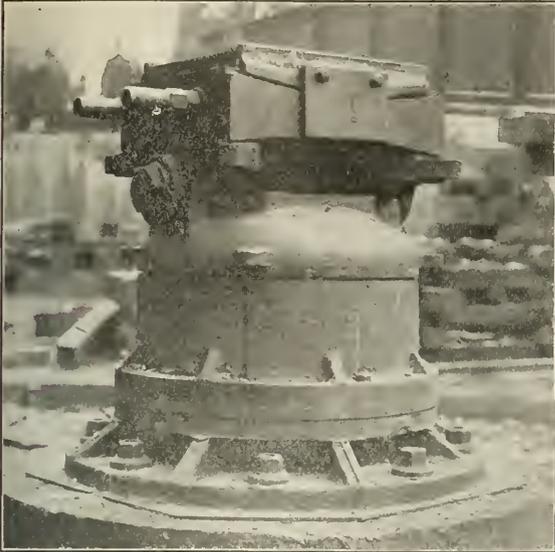

Overhead current collectors for the usual type of balanced turntables, must be suspended from the overhead wires, owing to the fact that any portal construction over the center

are operated in multiple from one controller located in a cab on one end of the table.

There are three points of particular interest in connection with the tractors and their control. The first is that two motors are used, one on each tractor, of approximately 30 hp. each. This is considerably more power than is used on the ordinary type of table but since a table of this kind does require more power for operation than one in which the locomotive is balanced on the center bearing, and since the operation is fast and must always be dependable, one tractor working alone, can be used to operate the table in an emergency.

The second point of interest is the controller. A type of

controller has been developed which is used to control one or both motors, and which may be used on any table of this type without regard to the kind of electric power available. The same controller may be used for direct current,

The Center Is Adjustable by Means of Screw Operated Wedges

single phase, alternating current, three phase alternating current, and three-wire or four-wire two phase current.

The third point of interest lies in the fact that the motors are equipped with solenoid brakes. The brakes are applied

table without any of the so-called locking devices to hold the table in alinement with the approach tracks.

For direct current, 27½-hp. motors are used and 30-hp. motors have been adopted as standard for alternating current. Power is transmitted from the motor to the driving wheels through two sets of gears and intermediate shaft, with a total gear reduction of 25 to 1. As the tractor is provided with plain cylindrical tires, it was necessary to include in the design a suitable thrust bearing to care for lateral thrust on the drive wheel and the tractor. This thrust bearing is located on the inner side of the tractor.

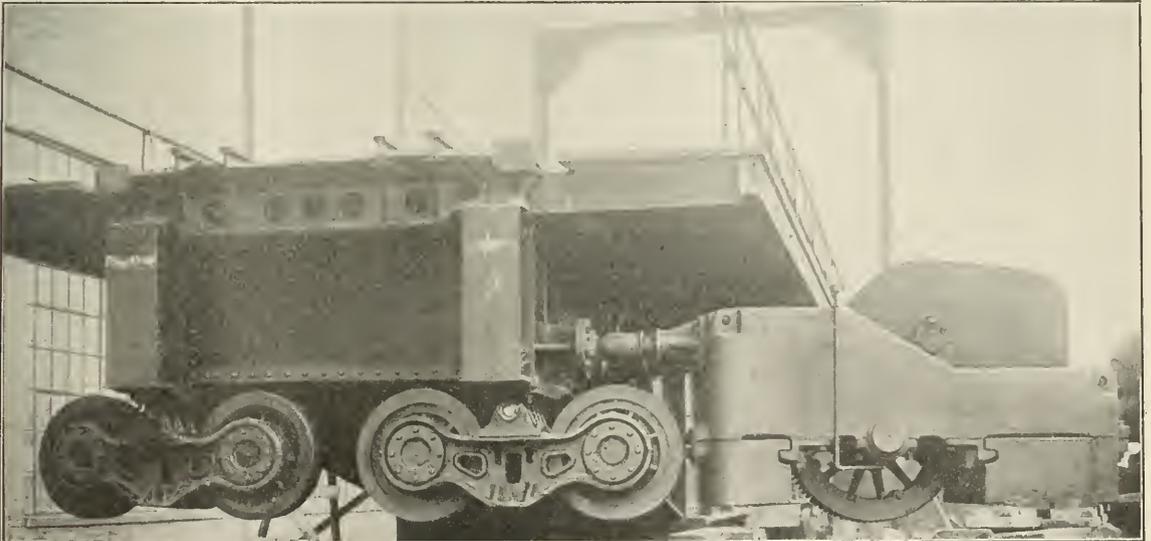

In case of accident to either motor or to any part of the driving mechanism, electrical cutouts are provided for cutting the damaged motor out of service without affecting the operation of the other motor, while the solenoid brakes can be blocked in the "off" position. A motor may be disconnected mechanically by removing the split main gear or by removing the motor itself.

The two tractors engage the table through ball and socket connections located at the end of the stabilizing arms. All bearings of the tractors are grease lubricated. The tractor weighs approximately 23,000 lb. in working order, giving a total tractive effort of 12,000 lb. per table.

The tractor frames, on account of the weight required, are made of solid cast iron with suitable ballast weights suspended from the lower surfaces. Special attention is given to the machining up of all mechanical parts with a view to insuring absolute interchangeability for repairs. All gears are fully enclosed against the weather. The tractor wheels have cast iron centers and steel tires and are provided with cast steel cut gears. The bearings are all of brass.

When operating at night the table is lighted by floodlights on each end which illuminate the approach rail ends. The operator's cab is electrically heated and is lighted with a small, well shaded lamp to keep down the reflection.

The end trucks on the table are of the cast steel frame type with hinge connection centers. The hinge casting is

The Trucks and Tractor

instantly when the controller is moved to the "off" position and are released automatically when power is applied. The brakes are adjusted so that the braking effort corresponds to the maximum torque of the motor. With this type of table the solenoid brakes make it possible to operate the

provided with a compound angle in order to give proper angularity in all directions. The center line of hinge pins are in radial planes intersecting at the common center of rotation. All truck wheels are 30 in. in diameter, coned, with steel tired treads and cast iron centers. They are pro-

vided with roller bearing centers with the bearing enclosed in a labyrinth casing, the details of which will be clear from an inspection of the truck drawing. The trucks are fully grease lubricated.

The truck hinge castings as well as the end steel ties on top of the girder are lined to the girder flanges by means of stereotype metal. The trucks each have a capacity of 186,000 lb. and travel on the same circle rail as the tractors. They may be removed by taking out the hinge pins located in the hinge casting at the girder.

### Coping Wall

In order to insure that there will be no settlement at the coping wall on account of pounding due to the engines, cast iron coping castings were employed instead of wooden sills. These castings are arranged one for each approach track and are thoroughly embedded in concrete and bolted thereto.

## Restoration of I. C. C.

### Rate Power Proposed

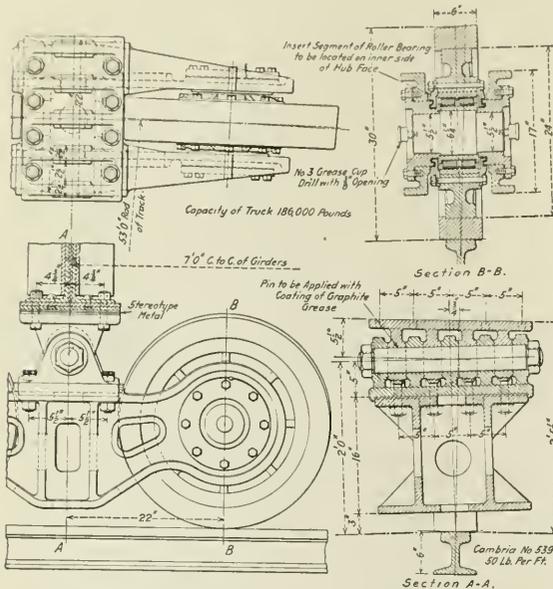

THIS HAS BEEN a hard week for the Railroad Administration in Congress. After the House had reduced its appropriation by \$450,000,000, thereby renewing interest in the prospect for a rate advance, which Mr. Hines says seems necessary, but which he desires to postpone as long as possible, an effort was made in the Senate to pass Senator Cummins' bill to restore the former jurisdiction of the Interstate Commerce Commission over rate-making by depriving the director general of the authority to initiate rates without suspension by the commission, which would interpose an obstacle to a rate advance. The bill was taken up in the Senate on June 10 and was debated on the following day. It was introduced by Senator Cummins at the last session, but failed of passage. In its report on the bill, the Senate Committee on Interstate Commerce said: "It failed only because it was impossible to secure a vote upon it in view of the expiration of the Congress. It is believed that substantially all the members of Congress and the people of the country desire its prompt enactment into law."

The bill provides that during the period of federal control the right to initiate or change rates, fares, charges, classifications, regulations and practices, exercised by the carriers now under federal control prior to December 29, 1917, shall hereafter be exercised by the President or by the director general of railroads, but such right as to interstate commerce shall be exercised under all the limitations and conditions which were imposed upon said right by the act to regulate commerce. Senator Cummins said the purpose is to restore to the commission its full and complete authority over the railway rate structure. The war is now over, he said, and he thought it was the desire of every person, the Railroad Administration included, that the jurisdiction which the commission formerly had should be restored.

"I am led to make that remark," he said, "not from any communication which I have had with the officers of the administration, but because it has become the policy of the Railroad Administration to refer these matters largely to the Interstate Commerce Commission. The Railroad Administration has discovered the impossibility of dealing with railroad rates in a way just to the public, to the shipper and to the government itself. The bill does nothing more than put the President and the director general in the stead of the railway companies, so far as initiating rates is concerned, and when the rates have been initiated the commission has the same authority over them for suspension, for revision and for investigation that it formerly had over the railway companies."

Senator King, expressing sympathy for the bill, asked whether those in charge of the railroads might not attempt to lay the blame for the future losses and deficits upon this legislation. He said that government operation will be a failure and will involve expense and extravagance no matter who is in control of it, and he did not want to impose restrictions which would make it more difficult.

Senator Nelson of Minnesota strenuously opposed the bill because he said, while it restores to the Interstate Commerce Commission the full control of interstate rates, it leaves intrastate rates absolutely under the control of the Railroad Administration. Senator Cummins said that was the judgment of the committee as to what ought to be done during the balance of the war control period because to transfer to one branch of the federal government the right to revise or suspend rates which have been initiated or published by another branch of the federal government is a very different thing from restoring to the several states their power over intrastate commerce. He said the bill will

Details of the Truck Construction

These coping castings are accurately alined to the approach tracks and weigh about 9,000 lb., are 5 ft. 6 in. long, 12 in. deep and 30 in. high. They are made of one-inch material.

The circle rail on which the trucks and tractors run is 106 ft. in diameter and is supported on 33 support castings, each 9 ft. 4 in. long, 10 in. high and 12 in. wide and made of  $\frac{7}{8}$ -in. material. The end cast steel ties on the bridge have a maximum depth of 12 in., a minimum width of  $8\frac{3}{8}$  in. and a flange width of 5 in., and are made of one-inch material. They support both the traction rail and the guard rails and are lined to the bridge girders by means of  $\frac{3}{8}$ -in. stereotype lining.

The design of this table was developed under the direction of A. S. Vogt, mechanical engineer, now retired on age. Tables of this type have been installed at Pitcairn, South Philadelphia, Eric, Kane and Renovo, Pa., and at Garden-ville, N. Y. Others will be installed in the near future at Wilmington, Del., Youngwood, Pa., Pitcairn, emergency table, and at East Altoona.

The number of cars of grain loaded in the Central Western region in May increased 30.6 per cent over the records for May, 1918; coal increased 40.3 per cent, and livestock 7.7 per cent.

stand upon its necessity as a war measure and that if the rates which have been made by the director general are to be reduced in the various 48 states of the Union without any possibility of co-operation and without any possibility of relating the rates to each other, the railroad losses at the end of the present year may reach \$750,000,000. While many of the advocates of the bill have been inspired by the thought that it would prevent the director general from a further increase in rates, Senator Cummins said that was not his purpose.

"I think," he said, "that rates will have to be very much increased all over the country. I am sorry to say that; no one regrets to say it more than I do, but unless a miracle happens our total loss at the end of the year cannot be fairly estimated at less than \$600,000,000 or \$650,000,000. Somehow we must bring the expenses of the railroads and the revenues of the railroads into closer relation with each other. If we do not we are lost in hopeless bankruptcy. We will not only have imposed upon the United States a vast doubt, but we will have so impaired our transportation facilities that they will not answer the demands of commerce. There is no man who is so anxious to return these properties to private operation as I am, but if we were at this moment to pass a bill such as the telegraph bill, there is not a railroad, possibly save two or three, that would not be in the hands of a receiver within 30 days."

Senator Pomerene expressed himself in hearty accord with respect to getting the rate-making power out of the hands

of the director general's office, but said that it was necessary that there should be some general legislation bearing on the subject. He had consented to the report of the bill in its present form because the director general had increased rates inequitably and had attempted to formulate a committee or commission which was operating independently of the Interstate Commerce Commission. He pointed to some of the very large increases in rates in the middle west and said he wanted to get as much as possible of the rate-making powers taken away from the director general's office "out of the hands of some of the incompetents" and restored to the Interstate Commerce Commission.

The Senate committee held hearings on Tuesday and Wednesday on the Poindexter bill for a rigid long and short haul clause. H. C. Barlow of the Chicago Association of Commerce, J. C. Lincoln of the New York Merchants' Association, and C. L. Chandler of the Boston Chamber of Commerce, vigorously opposed the bill, which has strong support in the committee. A large number of western Congressmen have also introduced similar bills.

Chairman Esch of the House Committee on Interstate Commerce is hoping to begin public hearings on the proposed general railroad legislation either next week or the following week, to continue perhaps for two months. The Senate committee is planning to tackle the problem in executive sessions, working on a draft of a bill and calling in various men to advise it from time to time, although Senator Cummins may introduce his bill as a starter.

## The Second Pan-American Commercial Conference

### Need for Railway Extensions and Investment of American Capital Among Points Considered

"YOU TO THE SOUTH of us must help to restore European industry," said Frank M. Vanderlip, until recently president of the National City Bank, to the thousand or more delegates in attendance at the Second Pan-American Commercial Conference which ended its sessions in Washington on Friday evening of last week. "This does not mean financial advances," he continued. "I believe there should be a group of nations, including those which are here represented and some of the neutrals of Europe and possibly England, which should lend not money in the form of credits but materials, equipment"—and in this Mr. Vanderlip included railway supplies as an important factor—"and food necessary to start those industries. Charity is not needed nor loans by one government to another. I believe that securities can be created and floated in these several countries in proportion to the amount in which the loans are made and I believe that this expedient will avert the great catastrophe."

The conference was addressed also by Edward N. Hurley, chairman of the shipping board; Charles M. Schwab, president of the Bethlehem Steel Corporation; Thomas R. Marshall, vice-president of the United States; F. H. Gillett, speaker of the House of Representatives; by several trade and diplomatic representatives of the Latin American countries as well as by other leaders of North and Latin America, and there were few aspects of trade and commercial relations that did not receive careful and detailed consideration in the five days of the conference from Monday to Friday.

As briefly noted in last week's issue, page 1385, several speakers pointed out the need of railway development in Latin America and the advisability of investment of American capital with the end of bringing the building of these

railroads and making accessible the great mineral and other resources of these countries.

The Thursday afternoon session was entirely devoted to the subject of engineering aids to commerce and at this session papers were read on railroads, roads, etc., one of the more important of these being an address by Percival Farquhar, who has been a leader in South American railway development.

#### Peru

"If the development of its commerce is of the greatest importance to Peru, the investment of capital in productive undertakings is of still greater moment," said Dr. Francisco Tudela y Varela, ambassador from Peru, who addressed the conference on Tuesday. "Few countries offer a better field for remunerative investments than Peru. Irrigation, the building of railways and good roads, as well as mining, are especially to be recommended. \* \* \*

"With regard to railways, it is enough to state that the whole future of Peru is bound up in the construction of railroads, and that all those which have been projected offer returns of absolute security for the capital which may be invested in them. Several mining zones of great richness would be at once available by the construction of a few hundred miles of railway lines. To mention coal alone, although Peru possesses immense layers in different regions of the country, this article is still imported from abroad to complete the deficiency of home production. A railway of only 15 miles, branching from the one which starts from the splendid port of Chimbote, would solve the problem of coal supply sufficient for the needs of all the republic and

would initiate an era of domestic prosperity of almost incalculable value."

### Venezuela

"I should like very much to apprise this conference of the legislative efforts Venezuela has made in the last few years in order to be ready for the full development of her immense and untold resources and to offer inducements to foreign capital and to industrial enterprises," said José Santiago Rodríguez, of the special financial mission from Venezuela. "The law of railroad concessions, for instance, is conceived in a very generous spirit. Concessions of this kind are granted to Venezuelan or foreign companies and also to private individuals. The privilege for the exploitation of railroads may be extended to cover a period of 4 years, and during that time no concession is granted for the establishment of another line or the construction of aerial cables which may compete with such railroad, within a zone of 20 km. on each side of the line. It is sufficient, however, that an option be reserved in the contract in order that the extension of the road may be lengthened if the contractor should desire. The companies entering into such contracts are not subject to the payment of any special taxes; they are granted the full title of the national waste lands (belonging to the nation) for their lines, stations, offices and depots. The railroad proper may be built within a line 60 metres wide. Railroad companies wishing to build a railway in Venezuela may also obtain lots of land still larger for the purpose of establishing colonies thereon and this may include grants of 100 hectares of land for each kilometer of railroad constructed. As these enterprises are considered of public utility, the law recognizes their right of expropriation of private land where the railroad line offices and depots are to be located. Besides these advantages they are granted the following franchises: Free introduction for the first 25 years of the material, machinery, tools and other apparatus necessary for the construction, exploitation and maintenance of the lines; the right to cut from the national forests, without any indemnity whatsoever, the necessary lumber for the construction and maintenance of the lines; the right to use from the national lands the necessary material for the same purposes; permission to build telegraphic and telephonic lines for the service of the company and lastly; the privilege that the employees and working men employed by the company shall not be liable for military service except in case of international war."

### Mexico

Information concerning the railways of Mexico was given by Juan B. Rojo, charge d'affaires, and Francisco de Hoyos, purchasing agent in New York for the Mexican Government Railways. Señor Rojo said that conditions in Mexico were much better than people in the United States were inclined to believe. He said that earnings on the Mexican railways were greater than they had ever been despite the loss of 10,000 cars and a very severe shortage of motive power, although he did admit that traffic was running "with more or less regularity." He also said that efforts were being made to come to agreement with the United States Railroad Administration relative to through traffic arrangements and that Mexico was trying to secure power from railroads in the United States.

### Bolivia's Need for Railways

An informative paper on the railways of Bolivia by Julio Lamora, financial agent of the Bolivian Government, was read at the Thursday morning session, and a detailed printed report covering somewhat the same ground was

presented to the delegates by Joel Manuel Gutierrez, Bolivian consul general at New York. Bolivia has tremendous natural resources, to a great extent inaccessible for lack of railway connections, and Senor Zamora is now in this country as the representative of his government endeavoring to secure a loan of some \$7,500,000 for new railway construction. In speaking of this situation, Senor Zamora said in part:

The Bolivian people have realized that the most sensible thing to do in order to be in readiness for the natural development of its unexploited riches is to construct railroads; therefore, the collective effort of the republic has been directed to their construction. Bolivia not only produces silver, gold, tin, tungsten, antimony, bismuth, copper, etc., as is generally known at the present time, but she also possesses fertile regions suitable for agriculture, wonderful plains for cattle raising on the north and northeastern territory, and vast forests which produce all fruits and woods known to the world. Unfortunately exploitation on a larger scale cannot now be effected, due to the enormous distances separating these regions from the consuming towns or seaports.

With the desire to reach by rail the most distant and wealthiest places of the republic, a plan was inaugurated in 1916 and a contract entered into with the National City Bank and Speyer & Co. to construct a system of railroads by means of a construction company, capitalized with five and a half million pounds and secured as follows: The American firms contributed three million pounds in first mortgage debenture notes on the railroad to be constructed, and two and a half million pounds were subscribed by the Bolivian Government on income bonds issued on second mortgage, which are to be cancelled in the year 1932. This contract was duly carried out by both parties. The roads were constructed and the capital entirely expended. These roads are now in full operation and their profits are increasing daily, thus confirming the expectations which originally induced the capitalists to undertake the work.

The railroad system now completed and in operation comprises the following lines: Oruro-La Paz, Oruro-Cochabamba, Potosi-Rio Mulato to join the main trunk line of the Antofagasta-Oruro, and the line from Uyuni, another station of the main system, towards the Argentine Republic, joining the Central Norte Argentino, which has the same standard 3 ft. gage as the Bolivian railroads, and which is also the gage of the Arica-La Paz Railway.

The completed system will link the Atlantic and Pacific oceans by a railway starting in Buenos Aires, and terminating in the Pacific port of Arica.

The above shows the great international importance of this work in the completion of which the Bolivian Government is so keenly interested and for which it is seeking a million and a half pounds loan which will be explained further on.

The capital obtained through the Speyer contract was only enough to carry out the work of those lines as above stated and it is the aim of the Bolivian Government to continue the extension of the railroad system securing fresh capital and new contractors. Those lines to be constructed, or in the course of construction, are:

(a) Atocha-Tupiza Railroad, with an estimated cost of one million pounds sterling, to join to the Argentine System. I have stated before the international significance of this road and I shall only add that it goes through a region of unexhausted wealth where the "Quechisla" and "Oploca" mines are located.

(b) Potosi-Sucre Railroad, now under construction by the government. It is estimated that one million pounds will be necessary for its completion. This line has industrial significance as it is the first to be extended into the productive eastern agricultural and petroleum districts.

(c) Cochabamba-Santa Cruz Railroad; surveys on this

line are actually being made, and it is also very important, as it will connect the Speyer System with the wealthiest district of Bolivia, a zone which produces rice, sugar, woods and similar tropical products, and also cattle. The actual production of which is now very limited, due to lack of cheap transportation facilities.

(d) Railway from La Paz to a navigable point on the Beni River. This itself means a very important route running through vast and wealthy agricultural regions to the heart of rubber plantations. It is now under construction by the government with American capital. To start this work Bolivia secured a loan of five hundred thousand pounds, through the banking house of Chandler & Co., and this sum will only suffice to reach the Yungas zone. Its principal production consists of cocoa, coffee, tobacco, fruits and woods. We now require the necessary capital to extend this line to the Beni.

Here, to interest American capital on the loan required by the Bolivian Government, I want to point out the following:

The Speyer System, which runs through the heart of Bolivia, has been constructed with American capital, and will be the exclusive property of Americans the moment they return to the Bolivian Republic the two and a half million of pounds which represents the share of the Bolivian government on second mortgage bonds.

All the benefits of these railroads, and the increased value that they will attain through the development of the country, will also benefit the owners. There is no doubt that these four lines will ultimately be joined to the South American system of railroads, and that they will bring into closer contact regions now far distant. These facts will be of such interest to American capitalists that the necessary funds that Bolivia needs for the extension of these lines will assuredly be forthcoming.

## Railways in the Americas

BY PERCIVAL FARQUHAR

In the Americas railways have preceded wagon roads and have been the means of transportation and development of the interior in a sense not true with the eastern hemisphere.

There is a general similarity of conditions between South America and the United States as distinguished from Europe outside of Russia, in that transportation averages large distances to the seaports owing to the great bulk of the countries, compelling attention to grades, train loads, etc., not necessary in western Europe where no portion of any country is distant more than a few hundred miles from a seaport on the Atlantic or on the North, the Baltic, the Mediterranean, the Adriatic and the Black Seas, penetrating the continent in so many places.

In the United States railways have been constructed by private initiative and capital with the one exception practically of the mountain and desert link of the first trans-continental line, and their location and construction were carried out with a view to operating results, as the only expectation of remuneration was from the net earnings to be obtained through the transportation of freight and passengers. Trunk lines with low grades, capable of carrying heavy train loads, have enabled transportation in the United States to be carried at the lowest rates of any part of the world. The well distributed, cheaply mined coal of good quality has contributed to this also. As a result railways in United States paralleling river and canal navigation have largely superseded the latter in the economical handling of freight.

One great problem that railways in new countries have to meet is the opening of sparsely settled, undeveloped territory in order to permit of its settlement and development. Here, unless railways come first, the development may be long de-

layed, and this has led many South American countries to foment the construction of railways by a guarantee of interest on the capital necessary to construct them. Where this has taken the form of a guarantee per kilometer or mile of railway construction, it has led to the location of the railway with a view to cheap construction for such unit of length and a constant use in both directions of the maximum of grade allowed in the concession; with the result usually that such railways cannot transport the produce of the country from more than a hundred miles in the interior, and can never be made into an efficient apparatus of transportation no matter how much money may be spent on them. This character of construction should be limited to branches of well located trunk lines and in cases where they themselves could not become trunk lines or have a heavy traffic. In many cases the temptation of the meter gage railway has been yielded to owing largely to the sharper curves of which it admits and some small economies of construction. But the penalty paid in the operation of the narrow gage railway increases with its length and the lessened stability of the trains requires much better upkeep of the track than is the case with the standard gage, and for obvious reasons, when once fastened on a country, the narrow gage is difficult to be gotten rid of. In a country like Argentine, where in general there are no cuts, no fills and no bridges, the narrow gage adopted by some foreign railway interests and by the Argentine Government lines has the less defense. The bulk, of the railways of Argentine are 10 inches wider than the standard gage and yet the cars and locomotives are no wider than American standard gage cars, which deprives these railways of the great advantage of the heavier train loads which the wider gage should give them.

The largest of the European countries and one which at present would hardly be considered a guide for anything in the economical sense, Russia, has successfully used a formula for railway construction which not only is theoretically sound, but has worked unusually well in practice. Under this the so-called private railways were constituted with somewhat less than one-half of the railway mileage in European Russia and gave an efficient transportation system with the next lowest rates in the world to those of the United States. The principle was that of enabling capital to be raised at the lowest rate of interest possible by loan of government credit, at the same time securing efficiency in the expenditure of this capital in the construction of the railways and in their operation afterwards through private management with a sufficient financial stake in the results. The state furnished 19/20 of the capital in the form of guaranteed bonds and private capital 1/20 in the form of stock. The net earnings went somewhat as follows: 2 per cent on the guaranteed  $4\frac{1}{2}$  per cent bonds, then, say, 2 per cent on the stock, then 1 per cent on the bonds, and then 2 per cent on the stock, then the balance  $1\frac{1}{2}$  per cent on the bonds, completing the  $4\frac{1}{2}$  per cent interest guaranteed, and then 2 per cent on the stock, completing 8 per cent dividends, after which the surplus net earnings were divided in some cases four-fifths to the state and one-fifth to the stock, or in some cases 9/10 to the state and 1/10 to the stock, that is, in a proportion either four-fold or two-fold greater to the stock than the proportion of money represented by it.

The directors were elected by the stockholders of the company and the railway was operated with a keen sense of the advantage of valorizing the property in the interest of the stockholders. As a matter of fact, before the war the stocks of these private railways earned so well even at the lowest rates of transportation of any railways in Europe, that they sold from 200 per cent to 500 per cent on their invested capital and no one grudged their returns and the state fared well on its proportion.

The feature of this plan is to make it at all times the

interest of the private capital and its managers to locate and construct the railway with a view to its operation and to manage its operation efficiently, and this is one of the reasons the government gives the stock some of its results before it gets its full returns on the bond capital.

This formula, with some variations, might well suit the conditions of the railway development in the Americas, especially South America. In fuel South America has been handicapped compared with the United States and with Europe. The further increase of miners' wages and reduction of the hours of labor in Wales, hitherto South America's chief source of supply, emphasize her need to develop local fuel, possibly powdered Brazilian and Chilean coal which gives good efficiency, and there are great areas of oil in the Andean slopes both east and west. Oil is the widest distributed of fuels and is found in quantity where formerly geologists considered it impossible to exist, and is not unlikely to be found in other areas of South America where it is not now known. Cheap fuel is a key to the problem of cheap transportation in South America, and cheap fuel is not likely to be obtained from another hemisphere.

New railway construction in the Americas now confronts special difficulties in the high cost of rails, rolling stock, material, supplies and labor for some construction and also fuel for operation, likely to continue indefinitely; and the indisposition on the part of the public authorities and public sentiment in all countries to allow railways to make much profit even in the rare cases where their rates and concessions would permit them to do so, to say nothing of the present unusual demands from so many sources converging on the money markets of the world. It is not easy to foresee just how the requirements for railway development of the Americas in the near future are to be met.

This is a grave enough problem in the United States concerning the danger of not meeting demands upon transportation of which we have had repeated warning from one of our greatest railway authorities, James J. Hill, but it is even more serious for our South American neighbors whose total railway mileage is 45,000 compared with 270,000 in the United States, half the area of South America. This disproportion is even greater than it seems, as half the area of the United States is arid, semi-arid or roughly mountainous, which is several times the proportion of South America, which must be subtracted from possible area of development.

In addition to the new construction, there is a vast amount of deferred betterments on the existing railways in the Americas, rolling stock, sidings, new rails, additional terminal facilities, etc. The legislation of the Congress of the United States in connection with turning back the railways here will determine to what extent these betterments here can be financed and carried out.

The railways in Latin America have been financed practically entirely with European, especially with British, capital, and the railway companies concerned have been organized as a rule in the countries furnishing this capital. It cannot now be determined to what extent Great Britain and other European countries will be able to finance the requirements of their railway companies in this hemisphere, but it would seem that the demands on them for capital at home and from their colonies might not leave available sufficient funds for their railways in Latin America, so that they may wish the United States to join in this financing which will run into large figures. This, at the same time, would aid materially in the interest of the stability of the investment.

In such case some formula must be worked out which would enable the United States to join. As the world's peace depends largely upon the ability of the present principal allies to continue to work closely together, industrial co-operation in investment in foreign fields would be helpful.

## Short Line Convention

**A** DEMAND THAT CONGRESS give immediate and intensive consideration to the general railroad problem with the object of stabilizing the transportation system and allowing an adequate basis of rates, was voiced in resolutions adopted at the convention called by the American Short Line Railroad Association held in Washington last week.

Most of the time during the first two days of the meeting was devoted to speeches, which were reported in last week's issue. At the concluding session on Thursday afternoon there was a general discussion of resolutions presented by a committee on resolutions, together with others presented by individual members.

The meeting expressed great confidence in the Interstate Commerce Commission, and it was recommended that the commission should be given the power to establish divisions of rates as well as the general level of rates on an adequate basis. The resolutions also favored the consolidation of railroads with adequate protection to the short lines, increasing the power of the commission over intrastate rates and the continuation of rates established by the director general until changed by the commission. It was also recommended that the benefits given to the lines that have signed the co-operative contract shall be applied to other short lines.

It was proposed that the President appoint a committee to devote itself to securing proper legislation for the short lines and a special assessment to meet the increased expenses of the association was voted. The proposal was made that one or more members of experience in the management of short line railroads should be appointed to the Interstate Commerce Commission and that in any appropriation which Congress might make for taking care of the railroads while under federal control at least \$50,000,000 should be set apart to pay the operating deficit of the short lines since March 21, 1918, and to reimburse them for losses occasioned through federal control of the railroad system. It was the sense of the convention that Congress should immediately restore the rate-making powers of the commission with instructions to establish such rates as will meet all the obligations of the government under the federal control act.

The officers of the association were re-elected as follows: President, Bird M. Robinson, Washington, D. C.; assistants to the president, Ben B. Cain, W. M. Blount and L. S. Cass; secretary and treasurer, T. F. Whittelsey, Washington, D. C.

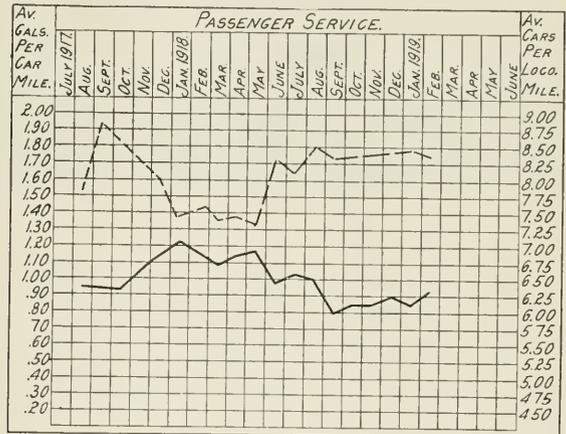

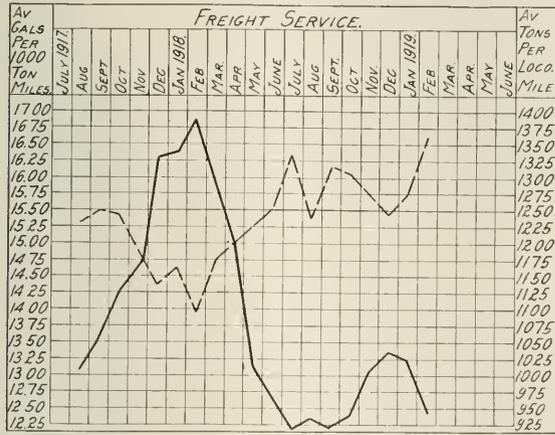

Senator A. B. Cummins, chairman of the Senate Committee on Interstate Commerce, and Senator E. D. Smith, chairman of the committee during the recent session, also addressed the meeting on June 5. Senator Cummins expressed sympathy for the condition of the short lines, saying they had been the victims of "the most grievous injustice ever practiced by a civilized government upon its people," and "a monument to the stupidity of those who controlled the Railroad Administration," but that Congress would do all in its power to remedy their condition. He also outlined his plan for dealing with the railroad situation generally, providing for a government guaranty of a specified percentage above which railroads might be allowed to earn with good management and efficiency, and a consolidation of the railroads into 18 or 20 systems. He dwelt especially on the idea that railroads cannot compete successfully at the same rates without increasing the rates for the weaker lines to a point which would create universal revolt against the profits of the stronger lines, and declared that consolidations and a government guaranty presented the only feasible solution. He spoke of the government's operation of the railways as a lamentable failure, and while admitting that the "experiment" had not been conducted under the most favorable circumstances, he asserted a firm conviction that government operation of any business would inevitably be less economical than private management.

## Combining Statistics of Fuel Performance and Locomotive Loading

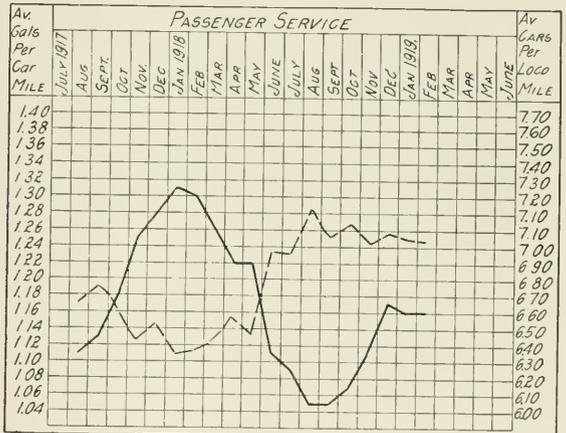

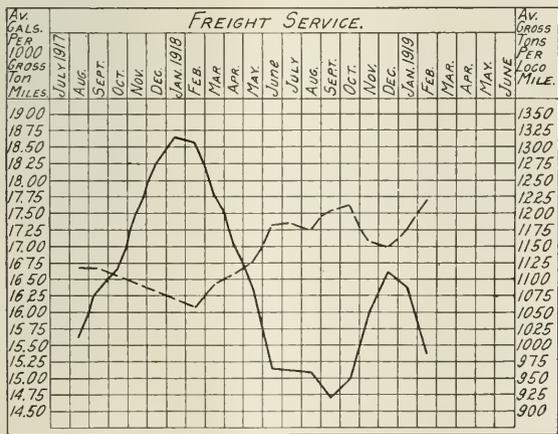

THE WAGES of train and engine crews and the cost of locomotive fuel are the largest items of expenditure on railroads. The fuel bureau of the Southern Pacific had adopted an unusual method of bringing to the attention of the officers and employees the fluctuation in the average tons or cars per locomotive mile, the average fuel consumption and also the inter-relation of these two important factors which so largely affect the cost of fuel and wages. The performance from month to month is shown on charts of the

form reproduced below. These permit of ready comparisons between different months for the same district or between different divisions or districts for a corresponding period. It will be noticed that an increase in the trainload is accompanied in almost every instance by a decrease in the consumption of fuel per thousand ton miles. Below the chart for the Tucson division are comparative statistics for the last month for which results are shown and for the corresponding month of the previous year. The reduction in the fuel consumption during the month of February effected a saving of \$60,767 on this division alone.

The second set of charts shows the performance secured on the Southern Pacific lines south of Ashland, Oregon. In this

Monthly Records of Fuel Consumption and Train Load, Tucson Division. Solid Lines Indicate Fuel Consumption. Dotted Lines Indicate Train Load

Monthly Records of Fuel Consumption and Train Load, Southern Pacific Lines South of Ashland, Ore. Solid Lines Indicate Fuel Consumption. Dotted Lines Indicate Train Load.

### COMPARATIVE FUEL CONSUMPTION, TUCSON DIVISION, SOUTHERN PACIFIC

Month and year	Service	Locomotive miles	Gross ton miles (thousands)	Gallons fuel oil consumed	Average gallons per 1,000 gross T. M.	Average gross tons per loco. motive mile	Compared with February, 1918		Value fuel oil
							Loss	Gain	
February, 1918	Freight	351,552	384,561	6,470,891	16.83	1,094	.....	.....	.....
February, 1919	Freight	237,514	324,524	4,644,783	12.46	1,366	.....	1,416,956	.....
		Car miles							
February, 1918	Passenger	150,090	1,135,407	1,302,759	1.15	7.56	.....	.....	.....
February, 1919	Passenger	118,760	989,230	914,798	.92	8.33	.....	219,849	.....
Total							.....	1,636,805	\$60,767

Price fuel February, 1918, \$1.30 per barrel. Price fuel February, 1919, \$1.56 per barrel.

district the fuel saving for February, 1919, compared with the same month of the previous year amounted to 3,325,824 gal. of fuel oil in freight service and 1,100,630 gal. in passenger service, making a total for the month of 4,426,454 gal. of fuel oil valued at \$161,190.

## Railway Electrification in Brazil

THAT THE AMERICAN railway supply manufacturer is going to do a large and successful business in Brazil is beyond all doubt in the mind of Dr. Francisco de Monlevade, of the Paulista Railway of Brazil, who is now in this country investigating the possibility of electrifying 75 miles of the main line of the important railroad system of which he is the general superintendent.

Brazil, said Dr. de Monlevade to a *Railway Age* representative, imported even before the war a large portion of its railway supplies from the United States. Its imports of locomotives from the United States were more than from all other countries combined in 1912 and 1913, for example, while in 1912 total imports of railway supplies from the United States were exceeded by those from only one country—Belgium—while Germany supplied only one-half as much as the railway supply imports from this country.

Dr. de Monlevade in pointing out the splendid opportunity for American railway supply manufacturers instanced the fact that the United States was now better fitted than ever to do a big business in Brazil and in the markets of the world, while at the same time, the other countries which formerly supplied large quantities of railway supplies were short of materials; in some cases their industry was paralyzed and at any rate they would have to work to fill the demands in their own countries before they could regain their former position in the world in general.

Dr. de Monlevade has been in this country for a number of weeks. It is by no means his first visit here. He is, in fact, a well traveled man and counts many friends whom he has visited in this country and abroad. His present trip, as noted above, is to investigate the possibilities of electrifying some 75 miles of the main line of the Paulista Railway, the richest and one of the most important railroads in Brazil.

The Paulista Railway, Dr. de Monlevade explained, serves the important coffee growing district of Sao Paulo and handles 75 per cent of the total production of that commodity from the district in question. It was built some 50 years ago and was in reality an extension of the far-famed Sao Paulo Railway with which it connects at Jundiacy and over which its trains reach the sea coast at Santos. The line was built by Brazilian capital, and is still in Brazilian control, although some 30 per cent of its capital stock is owned by the Brazil Railway interests. It, today, is a system of 1,850 miles, capitalized a \$25,000,000 with a funded debt of only \$5,000,000, but so well has it earned money for its owners that it is valued at nearer \$100,000,000. It has gross earnings of \$8,000,000 yearly, an operating ratio of only 47 per cent and has paid its stockholders from 10 to 12 per cent annually for the past 20 years. After hearing these facts, one is not surprised to hear also that the railway is in the same physical condition as the better railroads in our own country or that its track is stone ballasted, that the line has all modern stations and that it operates a high grade Pullman and restaurant car service, etc.

Dr. de Monlevade took particular pleasure in pointing out in the interview with the *Railway Age* representative that the larger part of the locomotives on the line are of American build and that the shops are equipped with American machine tools. The road builds most of its freight and passenger sars in its own shops; although it has to import iron-work and accessories from other countries.

It has been noted that the line carries 75 per cent of the coffee produced in Sao Paulo, the total production being 11,000,000 bags of 60 kilos (about 130 lb.) each, annually. Ten years ago this made up about three-quarters of the total revenue of the Paulista Railway, but so great has the general development of the territory served by the road been that today coffee makes up only about 38 per cent of the total revenue.

The importance of the electrification of a road of this kind can therefore readily be seen, for as Dr. de Monlevade pointed out, the Paulista Railway is a leader in railroad development in Brazil and in addition to extensions of electrification on its own line, there is little doubt that other lines may also adopt electrification.

The reasons for electrification in Brazil, said Dr. de Monlevade, are explained principally by the country's severe shortage of coal combined with great possibilities of hydro-electric development. Coal, before the war, cost about \$12 a ton delivered at Santos and Jundiacy, but to day it costs nearer \$30 and during the latter part of the war could hardly be obtained at any price. The Paulista Railway, in fact, was so hard pressed, that it had to burn wood on its locomotives and used no less than 30,000,000 cubic feet of wood last year. And yet with wood as fuel the road for months handled 400-ton passenger trains with Pacific type locomotives at 40 miles an hour over two per cent grades, and its wood-burning Consolidations pulled over these grades trains weighing 700 tons.

Dr. de Monlevade has made a very careful investigation of this fuel situation and found himself confronted with the necessity of securing wood from sources further and further in the interior and the probability that on the return to normal conditions coal would at best approximate \$20 a ton. This is the reason he is going to electrify his line in part now and to a much greater extent later. The first section to be electrified will be the main line from Jundiacy inland to Cordeiro. He has three available supplies of electrical power in the power companies in Sao Paulo, and in fact there are developments already aggregating 200,000 hp. in the state by that name. In addition to the possibility of securing power thus, the Paulista Railway has itself secured water rights near its line aggregating some 35,000 hp. Dr. de Monlevade in speaking of these matters emphasized that the Paulista Railway will itself be well able to finance this electrification project and extensions in the future if the plans work out as hoped, and that it will not be necessary to secure loans or credit outside to help pay for them.

Dr. de Monlevade spoke of the promise of Brazil as a nation. The development of Brazil, he said, has hardly begun. There are tremendous and immensely rich areas in northern Brazil that at present are almost inaccessible, but which in the course of time will be opened and made available. The present development is in the southern part of the country. No less than two-thirds the population of Brazil, he said, is in the south, namely in the states of Minas Geraes, Rio de Janeiro, Sao Paulo, Parana and Rio Grande do Sul. Nearly all the railway development amounting to some 20,000 miles is in the south and centers in the main around the cities of Rio de Janeiro and Santos. It will be many years, possibly decades, before the development of the great northern areas takes place, he said, but the potentialities of development in the Amazon valley are limitless.

"No accident week," in the Central Western region will be from June 22 to June 28, inclusive. Arrangements have been made for issuing special bulletins and holding rallies and moving picture exhibits, and safety committee men will plan to appeal personally to each one of the 305,000 employees in the region.

*The Thirty-first Annual Meeting of the Railway Accounting Officers' Association*

## Railway Accounting Officers Association

### Annual Meeting of Unusual Interest Because of Inter-Related Problems of Federal and Corporation Accounting

**T**HE THIRTY-FIRST annual meeting of the Association of Railway Accounting Officers was held at the Hotel Commodore, New York, June 11 and 12. There was the largest attendance of any convention ever held.

By unanimous consent the regular order of business was set aside on Wednesday morning and the association listened to an informal address by Charles A. Prouty, director of the division of accounting of the United States Railroad Administration.

Mr. Prouty briefly reviewed his own connection with railroads as a lawyer, as a member of the Interstate Commerce Commission, dealing with traffic men, as director of the division of valuation dealing with engineering officers, and now as director of the division of accounting dealing with accounting officers.

He said that he had frequently heard lately the opinion expressed that government management of railroads was a dead issue; that the experiment which had been tried had proved a failure. He cited the instance of a congressman who said that he had been in favor of government ownership of railroads all his life but he was now utterly opposed to it. Mr. Prouty explained this change of front as due to the fact that the congressman's train had been two hours late. He cited the instance of another man who had discussed the question of government ownership for many years, and who now freely expressed the opinion that the subject would not be open to discussion for the next 25 years. With all of these, former Commissioner Prouty disagreed entirely. He said that he believed that the experiment of government operation had been tried out under circumstances which precluded its being a conclusive experiment; he believed that the economies to be gained by a central organization had not been given any chance under war conditions to show themselves in their true values.

Mr. Prouty expressed the opinion that it was only a question of time, and not a very long time, either, when the people would demand a real try-out of government operation of railroads.

Mr. Prouty concluded his remarks with a sincere expression of thanks to the accounting officers with whom he had had been associated for the last two years.

Mr. Prouty's address was followed by the committees' reports.

#### The Executive Committee

The committee has held two meetings since last annual meeting of the association. C. B. Seger, formerly president and controller of the Union Pacific, resigned January 31, 1919, after 37 years' continuous railroad service, to become president of the United States Rubber Company. The executive committee unanimously recommended that honorary membership be extended to Mr. Seger.

#### RECOGNITION OF THE ASSOCIATION

The committee authorized the president to write a letter to Professor Henry C. Adams, expressing appreciation on behalf of the association for the recognition which he has given to the association in his book, "American Railway Accounting," which carries this dedication:

To the members of the American Association of Railway Accounting Officers in remembrance of their efficient co-operation in working out a system of accounts for American Railways is this commentary respectfully dedicated.

#### ACCOUNTING CIRCULARS AND GENERAL ORDERS RELATING TO ACCOUNTING

On December 12, 1918, President Berger wrote the Secretary as follows:

Sometime ago we discussed the question of preparing a synopsis, through the various committees, of rulings relating to accounting matters that are covered by the various general orders and P. S. & A. circulars, issued by the United States Railroad Administration, the idea being to incorporate this matter as information in our next year's agenda and annual report.

After considering the matter further, it would seem to me

to be a better plan to reproduce such general orders and circulars in their entirety, grouping each order or circular with the amendments that may have been issued to it.

It occurs to me this information will serve two useful purposes.

(a) As a great convenience to all members of the association as a book of ready reference.

(b) It will perpetuate as a part of our association file and record all actions affecting accounting methods taken, by the United States Railroad Administration during the period of Federal control.

The committee directed that such circulars and general orders as relate to accounting be incorporated in the agenda and report, but separated in an appropriate manner from the text of committee reports.

#### MEMBERSHIP CHANGES

During the current year the committee has admitted into the association 97 new members. As of April 21, 1919, the association has 780 active members, representing 310,712 miles of railroad, also certain express companies and water carriers—an increase (as compared with April 21, 1918) of 62 active members. The association is now carrying the names of 65 persons on its honorary rolls.

The report was signed by R. E. Berger, president.

#### General Accounts

The committee held one meeting during the year.

#### ANNUAL REPORT TO I. C. C.

It is the opinion of the committee that it will be impracticable during the period of federal control to make one report on behalf of a road under federal control, covering both corporate and federal matters. The committee believes that two separate and distinct reports should be made if it is decided that the operating results of the Railroad Administration are to be reported to the commission.

#### EXPENSE OF CORPORATE ORGANIZATION, AND LAP-OVERS

The committee recommended that salaries and expenses of corporate general officers, their clerks and attendants shall be charged to the appropriate primary accounts under the commission's classification of operating expenses.

Lap-Over items of revenues clearly applicable to the period prior to January 1, 1918, shall be credited to income account No. 519, "Miscellaneous income," and charged to general balance sheet account No. 722, "Other deferred assets."

Lap-Over items of expense clearly applicable to the period prior to January 1, 1918, shall be charged to income account No. 551, "Miscellaneous income charges," and credited to general balance sheet account No. 770, "Other deferred liabilities."

Alexander Wylie, chief examiner of accounts, approved—on behalf of the Bureau of Carriers' Accounts Interstate Commerce Commission—the foregoing.

#### SCRAP RAIL SOLD IN EXCESS OF ORIGINAL COST.

The committee adopted the following resolution, but suggested that the whole matter, together with this resolution, should be taken up by the Interstate Commerce Commission's representatives with the railroad administration:

Whereas, The principles which should govern the credits for scrap rail released are no different than those which should govern the credits for other scrap derived from renewals and replacements. To attempt to ascertain or estimate carefully the original cost of scrap removed in each instance would involve a large amount of labor at a time when the demand for conserving man-power is at the maximum and tests our patriotism, and

Whereas, The increases in the prices of scrap are, in a large degree, consistent with the increases in the prices of corresponding new material, and

Whereas, The apparent abnormal conditions with regard to scrap rail are due to the fact that because many carriers had

wisely contracted ahead for new rail requirements, the prices of scrap have temporarily advanced ahead of the advance in the prices of new rail purchased, therefore, be it

Resolved, That no change should be made at this time in the existing methods of accounting for the scrap rail derived from renewals or replacements.

#### CAR REPAIR BILLS

Under date of December 14, 1917, J. Kruttschnitt, chairman of the executive committee of the Southern Pacific, wrote A. D. McDonald, second vice president, as follows:

Referring to reports of the M. C. B. Association committee which is investigating bills for car repairs, might corrective measures not to be developed by joint action of the M. C. B. Association and the association of accounting officers? The M. C. B. rules covering repairs chargeable to owners are extremely complicated and overtax the intelligence of the man actually doing the work. His records are usually grimy and hard to decipher, and a good deal of guess work must be done by those making repair bills when in doubt as to the original crude records. Bills are frequently of such small amount that the cost of preparation and mailing exceeds the amount involved. The work would be greatly simplified, would be more accurate and subject to a better check, if M. C. B. rules could be changed so that car users should assume liability for small repair items, say those under \$2. This would greatly reduce the number of bills and expenses of accounting, and seems worthy of trial. These small items would probably be equalized on one line by the assumption of corresponding items on those of its connections.

On December 18, 1917, Mr. McDonald replied to Mr. Kruttschnitt as follows:

I am of the opinion that the plan which you suggest would simplify matters. It occurs to me that it would be advisable to agree upon certain classes of small repair items, the handling line to assume all such expenses. With a flat minimum of \$2 applied to all classes of repairs, it apparently would be necessary to make a record of the cost in each case in order to determine whether the amount exceeded the prescribed minimum.

I am forwarding your letter to the president of the association and copy to Mr. Plant, and will advise you of the action taken.

The committee recommends that this matter be left with it for further consideration and report.

#### COMPILATION OF NET-TON MILES

The committee expressed itself as being in favor of the compilation of net ton-miles from wheel reports.

The report was signed by A. H. Plant, chairman.

#### Freight Accounts

The committee held three meetings during the year.

#### OVERCHARGE AND AGENCY RELIEF CLAIM RULES

Inasmuch as overcharge and agency relief claims are generally handled by accounting officers, your committee believes that the Railway Accounting Officers Association should adopt methods and rules for the handling of such claims. Therefore, in accordance with article XI of the constitution, notice is hereby given of proposed amendments to the constitution for action at the 1920 meeting of the association. The intent and purpose of the proposed amendments being:

To make rules in connection with overcharge and agency relief claims mandatory and binding.

To confine the voting power in connection with such rules to the chief accounting officers, or the members of the association directly in charge of overcharge claims and agency relief claims.

To provide for the imposition of penalties upon members who fail to adjust claims in accordance with such rules and requirements.

It is intended that these provisions shall not in any way

interfere with the present procedure, rules and voting power of the Railway Accounting Officers Association relating to other accounting matters.

As a means of putting into effect, voluntarily, the overcharge and agency relief claim rules, pending action on the constitutional amendments at the 1920 annual meeting, your committee recommends that the association now adopt the following resolutions:

Resolved, that the president shall forthwith appoint two special committees, each to be composed of three members. One such committee shall be known as the special arbitration committee; the other such committee shall be known as the special appeal committee. The personnel of each such committee shall be of one member from the eastern territory, one member from the western territory, and one member from the southern territory.

The secretary of the association shall forthwith ascertain by circular from each road represented in the association whether it will or will not voluntarily follow the rules recommended by the Committee on Freight Accounts for disposition of Overcharge and agency relief claims for the period up to the 1920 meeting of the association.

#### CORRECTION MINIMUM

The committee has given the matter further consideration, and is of the opinion that the \$1.00 minimum should be substituted for the 25-cent minimum where the latter appears in the recommendations of the association, but that paragraph 19 of the 1917 synopsis, page 12, should be amended commencing with the word "provided," sixth line, so that it will read as follows:

Provided, however that corrections in the freight, advances, prepaid or proportions which collectively amount to a net sum of less than \$1 shall not be included in statements of differences or correction accounts, except that if such differences affect the settlement with at least one of the interested carriers, including the settling carrier, to the extent of \$1 or more, adjustment shall be made with all carriers interested.

#### WAYBILLS FOR ASTRAY FREIGHT

The committee has given the matter further consideration, and is of the opinion that the proposed plan, while embodying features that are theoretically desirable, is more elaborate than will be found practicable for general use, for the reason that the present R. A. O. A. plan, if observed by all carriers, will substantially accomplish all necessary results. It is recommended that in the event the revenue waybill reference is not shown and the settling carrier has at the time initiated a tracing file, reference to that file should be shown on the interline abstract.

#### WAYBILLS FOR FREIGHT CHECKED SHORT

The committee is of the opinion that when waybills covering less than carload shipments become separated from the freight, they shall be promptly mailed to billed destination by the agent at the junction, transfer, or other station where shortage is discovered, after noting thereon by whom and to whom mailed. In the event that waybills apparently cover an entire carload, the agent discovering the shortage may hold the waybills not to exceed 48 hours, in an effort to locate the car.

#### TRACING UNREPORTED WAYBILLS

By reason of the frequent diversion of traffic, freight reaches destination, in many instances, via other roads than those to which waybilled, and also, by reason of the inefficiency of station forces, improper information is frequently shown on the forwarded reports.

The committee is of the opinion that no tracing for waybills should be made until the abstracts of the current and succeeding month of all other carriers, who might have received such freight, have been checked, and that two copies

of the waybill should accompany the first tracer, and such waybills to be accounted for in accordance with paragraphs 41 and 42, 1917 Synopsis.

#### APPLICATION OF \$1.00 CORRECTION MINIMUM

The committee is of the opinion that all waybills voided, regardless of the minimum, should be reported. If the waybill has been reported at original figures and subsequently voided, correction minimum should govern.

#### SIZE OF STAMPS TO BE PLACED ON WAYBILLS

Your committee recommends that paragraph 168 of the 1917 synopsis be revised to read:

All stamps placed on the face of waybills shall not exceed 1x1½ inches; round stamps not to exceed 1½ inches in diameter.

#### UNIFORM APPLICATION OF GENERAL ORDER NO. 30.

General Order No. 30 provides that:

Effective July 1, 1918, the following regulations shall govern the settlement of all inter-road bills, statements and accounts rendered by one carrier under Federal control against or for account of another carrier under such control.

(1) Settlements by vouchers and the drawing of drafts in settlement of individual inter-road bills, statements and accounts rendered by one carrier under Federal control against another carrier under such control, except as provided for in paragraph (2) hereof, shall be discontinued.

(2) The regulations herein prescribed shall not include:

(a) Settlement of accounts between a carrier under Federal control and a carrier not under such control.

(b) Settlement of accounts between carriers under Federal control for transactions which do not properly belong on the Federal books of either carrier interested.

The director, Division of Accounting, has ruled that "It is entirely proper to settle all items through the medium of the inter-road settlement, provided by General Order No. 30, regardless of whether they accrued prior or subsequent to January 1, 1918."

It is the opinion of the committee that, in order to insure uniformity in practice, all items subject to junction settlement, should be covered by a monthly certificate of settlement, R. A. O. A. Standard Form No. 119, in full for the amount due each railroad, prepared in triplicate. The creditor carrier shall state the account and issue the certificates, two for the use of the creditor carrier and one for the use of the debtor carrier, such certificates to be signed by each agent involved, and preparatory thereto, bills for the various classes of service, subject to junction settlement, must be exchanged currently for approval as has been the practice heretofore. The agent of the creditor carrier shall send the certificates in duplicate to his auditor; one to be retained for record and the other to be stamped, indicating the month included in settlement, and forwarded to the auditor of the debtor carrier.

The committee is of the further opinion that the classification of accounts, as provided for in P. S. & A. Circular No. 67, statement of settlement of inter-road bills and accounts, should be amended to include junction settlements.

Definition of astray freight, less than carload freight which is marked for destination and which has become separated from the regular revenue waybill.

The report was signed by J. A. Robinson, chairman.

#### Passenger Accounts

The committee has held three meetings for the consideration of accounts during the year.

When this work reaches the point warranting report to the association, the committee will submit such a report.

## CODE CLASSIFICATION AND REMARKS DATA

The committee recommends the adoption of the following code as a substitute for certain common terms:

CLASS		CLASS	
DS	Discharged Soldier	Exch	Exchange
FS	Furlough	HS	Home Seekers
Cy	Clergy	AYT	All Year Tourist
Ch	Charity	WT	Winter Tourist
Emp	Employee	ST	Summer Tourist
Col	Colonist	SpI	Special Excursion
Gv	Government	Dvt	Diverted
LG	Land Grant		

## CORRECTION REPORT—REMARKS

ED	Error in Division
EA	Error in Apportionment
Rd	Redeemed
TT	Ticket Tracer
CI	Claim for Increased Proportion
CnE	Coupon Enclosed (Never appears on regular report)
UR	Unreported

## EXCESS CHARGES ON BAGGAGE

The committee recommends that in order to guard against failure on account of oversight or otherwise of collecting agent to account for prepaid check on which the valuation charges are collected, issuing carrier should report the check number to the terminal carrier, with notation "Excess value," and when not reported, the terminal carrier should trace issuing carrier.

## DISPOSITION OF TICKET STOCK

Director C. A. Prouty requested the committee to express its opinion as to the proper manner of handling ticket stock when an agency is either closed temporarily or permanently or when stock is returned for cancellation.

The committee is of the opinion that ticket stock recalled for cancellation, or turned in on account of an agency being closed permanently or temporarily, should be forwarded to the passenger accounting department. Such ticket stock should be destroyed if there is no reasonable prospect of its further use.

The report was signed by C. G. Weaver, chairman.

## Disbursement Accounts

The committee has held two meetings during the year.

## FORMS FOR ADDITIONS AND BETTERMENTS

As directed by the association, the committee has given the matter further consideration, and recommends that this subject be left with it for further consideration, pending final decision by the director, division of valuation, Interstate Commerce Commission, regarding revised Circular No. 3, and the determination of the information desired by him.

## DINING AND SLEEPING CAR EXPENSES

The committee is of the opinion that the difference in classification of the expense of outside and inside cleaning of dining cars is clearly provided for in account No. 402, "Train Supplies and Expenses," and account 441, "Dining and Buffet Service—Other Expenses." The latter expense is consistently chargeable to the operation of dining cars for the reason that the work of inside cleaning is a necessary part of the conduct of the service usually performed by the dining car department employees, except at terminals, where the cost can be readily determined. The work is incident to a special service not related to the appearance or handling of the train.

With respect to dining car provisions destroyed or damaged in wrecks, the committee is of the opinion that in

conformity with the rules and practice for the disposition of losses through destruction or damage of supplies, material, etc., by charging the account which would have been charged had the supplies or material been used for the purposes for which they were provided, it is proper that the value of such provisions should be charged as a part of the expense of the operation of dining cars.

## MECHANICAL DEVICES

The committee recommends that the association receive, as information, the following article appearing in the Santa Fe Magazine for November, in regard to conserving manpower through the use of mechanical devices in disbursement accounting work, which represents the development of machine and bureau work in the several offices of the Santa Fe accounting department extending over a period of years.

It is the policy of the Santa Fe to have each office or department of the company originate and finally complete all accounting work pertaining to its own department. It is also required that each office or department certify to the accuracy of accounting work performed by it, thus insuring that all payrolls, bills, vouchers, distributions, statistics and other documents reach the audit office in proper form for final audit.

Under this arrangement the work falling to the disbursements division of the accounting department consists mainly of:

- (1) The final proof of all accounting work.
- (2) Recording accounts receivable and accounts payable, and effecting settlement thereof.
- (3) Assembling distribution of expenditures for final entry in the accounts and records, and preparation of statistics.

Each of the foregoing operations involves more or less routine mechanical labor in the verification of figures, the recording of documents and the preparation of statistics.

With a view to increasing the accuracy of the work and economizing in cost, a critical review of all clerical work has been made from time to time during the past ten years, with the object of segregating from other work the work of a routine character, which may be taken care of through the medium of mechanical devices, with assigned women operators.

In this time of national need it is highly important that man-power be conserved to the greatest possible extent. Therefore it behooves us to employ women in office work wherever possible. This has been accomplished in a considerable degree by the disbursements division of the accounting department in the following manner:

- (1) By the full utilization of mechanical devices, with assigned women operators, as hereinafter described.
- (2) By a studied discrimination of clerical work as between that of major importance and of a routine nature, and the assignment of the latter to junior clerks and women.
- (3) Through a method of arriving at the relative efficiency of operators of mechanical devices, with a view to increasing the output by equalizing the work among the several operators.
- (4) By careful planning, making intensive time studies and establishing standard unit costs of work for comparison with the actual unit cost.
- (5) By centralizing the work assigned to operators of mechanical devices and placing the operators in charge of a head clerk, as more fully described hereunder.

Chiefly, the value in centralizing mechanical devices, such as typewriters, non-listing adding machines and bookkeeping machines, lies in the fact that the services of the operators may be utilized as a whole rather than individually. In the case of the operators being scattered over the main office in

the various departments, at times the two or three operators assigned to each department may become overloaded with work or they may be without work entirely. It is extremely difficult either to give them help from other operators or to furnish, through them, assistance to other departments. The same holds true in the event of sickness or vacations. By having a central organization other operators may be used to perform the work which would otherwise have been done by the absent operator. Then, too, in the case of a large rush job, all or as many of the operators as are necessary may be drafted to hurry the job to completion.

The supervisory feature of the organized bureau, with a regularly assigned head of department and assistants, is all-important and highly beneficial. Instead of the individual operator working for several clerks, none of whom is particularly interested in the development of the operator, each clerk clamoring for his work first, all operators are working for one man, who, through his assistants, is enabled to distribute the work to the operators in such manner as to complete all the work assigned to the bureau according to its relative importance.

The good results of such an organization are further enhanced through the ability of the head clerk and his head operators or assistants to train the machine operators thoroughly in the most efficient methods, short cuts, general knowledge of the work and their machines, closer application on the part of the operators to the work to be done, neatness and accuracy of the finished product; also, the initiative of the operator may be developed and the responsibility attendant to her position impressed upon her, to the ultimate benefit of both herself and employer. On the other hand, many an operator, slow, backward, apparently unable to grasp details or to follow ordinary instructions, may be coached and developed into a first-class operator; otherwise she might plug along and finally be dismissed from service on account of general inefficiency. The truly "hopeless" may be weeded out; thus the personnel of the department or bureau becomes one of increased efficiency and output, one of greater intelligence and more value in dollars and cents.

Prior to the introduction of any considerable number of calculating machines in connection with disbursement work, it was the practice to have stenographers, with their typewriters, located on the main working floor of the office, also such calculating machines as were then in use, such as adding machines and crank calculating machines, all located and used indiscriminately on the main working floor. Needless to say, they were the cause of considerable annoyance to men performing mental labor.

With the foregoing in mind, and following the introduction of dictating machines, it was concluded to segregate all operators using mechanical devices of every nature, placing them in one part of the room, this room being partitioned from the main office with double windows, with air space between which has had the effect of entirely eliminating all noise from the main working floor. This has tended to materially increase the efficiency of the clerical force and has enabled the concentration of all work of a mechanical nature in the machine bureau.

While the double partition just mentioned eliminated the noise and confusion of the typewriters and other mechanical devices so far as the outside clerical force was concerned, the volume of noise in the bureau was so great that it seriously affected the more nervous operators and materially affected the concentrative ability of the members of the department as a whole. Consequently, after much investigation, it was decided to treat the ceiling of the machine-room acoustically, this consisting simply of lining the ceiling with a felt preparation, which absorbs or neutralizes the noise and reduces reverberation to a minimum. The whole is covered with a porous cloth, which makes a neat finish in appearance.

This, together with the use of a pad made of the same material and placed under each machine, has, it is estimated, eliminated 60 to 70 per cent of the noise. As a result the operators are better able to concentrate their minds on the work and are free from the irritability and nerve-racking feeling resulting from the constant noise and confusion.

There recently has been installed a counter arrangement between the machine bureau and the main working floor, approximately 35 feet in length, over which windows have been placed which can be raised or lowered from either the inside or outside and under which a number of compartments have been placed which can be pulled from either side. This counter is used for the purpose of transmitting to and from the bureau the work which has to be performed. The counter is situated about the center of the working floor of the office, which makes it readily accessible to the clerks using the loose leaf records, voucher indexes and so forth, which are prepared in the bureau. Another result of the counter arrangement is the elimination of confusion and interruptions resulting from clerks being compelled so often to enter the machine room. A set of "instruction tickets" has been provided to indicate the work to be performed, various colors, representing the degree of "rush" desired for the work. This counter, coupled with a carefully studied program for distributing the work by messengers, results in a considerable saving in the time of the clerks and machine operators.

The more important mechanical devices and the classes of work being performed therewith are herewith briefly described:

*Sorting and Tabulating Machines.*—A punched card is used in connection with these machines as a medium for condensing distributions of payrolls, bills, vouchers, journal entries and so forth, according to Interstate Commerce Commission primary account numbers, classes of service, operating divisions, accounting districts, and states, also charges to additions and betterments by jobs covered by authorities for expenditures, and wage statistics for the annual report to the Interstate Commerce Commission. The distribution of vouchers and bills are condensed in the audit office instead of in the offices of the various departments where such documents are prepared.

These machines are electrically operated and assemble the punched cards by account numbers, etc., and finally summarize the totals according to the manner desired. Through the use of these machines all intermediate condensing sheets are dispensed with. At the same time the initial and final records are complete and intact and the cards are available at any and all times for quick sorting and tabulating for special information, such as the distribution by accounting districts, which information may not be required for current use. The punching of the cards is all proof-read, which affords absolutely accurate basis data, as a mechanical error on the part of the machines in sorting and tabulating is impossible.

Other machines, such as calculating machines, operated by crank, and slide rules, are used in proving averages in performance statistics, initially computed on key-driven non-listing machines in the machine-room.

*Non-Listing Computing Machines.*—These machines come first in importance as time-savers. There is no comparison to be made between the key-driven non-listing machines as computers and the old-style method of mental calculation. It has been found by experience that an operator on these machines is able to turn out from 300 to 350 per cent more work.

All mechanical computations encountered in verifying the footings and extensions of bills, vouchers, payrolls and other documents are made with these machines. The first ma-

chine of this type was introduced in the disbursements department in Topeka in 1909, since which time eleven additional machines have been installed. Experience also has demonstrated that, in addition to being far more rapid than mental calculating, the machine work is more accurate, particularly when women operators are assigned to the machines. Practically every class of work which it is possible to do on these machines has been assigned to them. The operators are taught the most up-to-date short-cut methods of manipulating the machines, thus obtaining full efficiency of operation.

*Bookkeeping Machines.*—The introduction of bookkeeping machines in connection with disbursement work is more or less an innovation; in fact, the Santa Fe is pioneering in this respect in this section of the railroad world. After having assigned all routine mechanical calculating work, such as proving footings, extensions and averages, to machines, our attention was next directed to the preparation of records by the use of mechanical devices, such as

- (1) Register of audited bills and vouchers.
- (2) Ledger of bills collectible—miscellaneous and car repairs.
- (3) Index of audited vouchers.
- (4) Record of foreign roads' bills payable.
- (5) Record of charges to additions and betterments by Interstate Commerce Commission accounts and by authorities for expenditure.

By using loose leaf forms it is possible to prepare all of the foregoing records with computing typewriters or other mechanical devices. There is just as much time to be saved in the preparation of records by the use of typewriters as is saved in conducting correspondence. A typewritten record is far more economical and neater than a record prepared with pen. The indexes and other records used are very similar to those being installed in a great many banks and are of the so-called "rapid-fire index" variety.

It might be said in regard to the ledger of bills collectible that the second month the scheme was in vogue the operator, who had never before operated a bookkeeping machine and who had had no previous experience in ledger posting, secured her balance after 52 hours of actual work, without making an error, whereas under the old method 90 to 100 hours were required.

*Transcribing Car Repair Bills.*—A very great saving in time has been effected through the use of typewriters equipped with adding devices in the complete preparation of M. C. B. bills for car repairs, the name of the railroad being inserted and the totals of the bills secured as they are written. These totalizers save the time of a non-listing machine operator adding, and the time of the same operator or another verifying the work of the first, as in accounting work every computation is verified.

A word might be said regarding the keyboard of these machines. The figure keys are placed on the bottom row of the machine, immediately above the space bar. The tabulating keys are hung to the frame just below the space bar. Thus we have all three in a close, compact space. While this may seem a small matter, the actual saving in time is very great. This is applicable only to work wherein but little or no descriptive matter has to be written.

As a matter of convenience, a rack for holding repair cards has been provided for the use of the operator in connection with transcribing these bills, aiding both accuracy and speed. All work in connection with the preparation of car repair bills and the issuing of vouchers in payment of foreign roads' car repair bills for the Santa Fe system is taken care of in the office of the auditor of disbursements at Topeka by the use of two machines.

*Dictating Machines.*—Dictating machines are used in connection with routine correspondence. These machines

have proven particularly valuable in making it possible to locate all transcribers in the machine bureau. A considerable saving also is made in that none of the transcribers' time is consumed in taking dictation.

*Line-a-Time.*—To further assist statement writers in accuracy and speed in operation, a device known as the line-a-time has been installed for each typewriter used for transcribing statements. It does away with the use of a ruler in following the line across the page, and through its use a great saving is made in not having to rewrite statements on account of "getting off the line."

*Duplicating Work.*—When several copies of a statement or circular letter are desired, hectograph or stencil originals are made on the typewriter, and an office boy runs the desired number of copies off on a duplicator or mimeograph, thus saving several writings on the typewriter that would otherwise be necessary.

This work is very closely supervised by the head clerk in charge of the machine bureau; in fact, the boys handling this class of work are directly under his supervision. The original or master copies of all hectograph or stencil work are inspected by the head clerk personally before being turned over to the boys to be run off.

*Other Labor-Saving Practices.*—To further conserve clerical man-power a number of other practices have been adopted, such as an intercommunicating telephone system, whereby the auditor, chief clerk or head clerks may talk with each other without the need of calling a central station; a file-room for all working records has been provided and placed in charge of a junior clerk, who, with one assistant, also has charge of all office stationery and attends to the opening of the mail and distribution thereof to the various heads of departments.

The file-room is connected with the main office by a window, which makes it unnecessary for the clerks to go into the file-room. A number of office boys are employed as messengers to distribute mail, stationery and records directly to the various desks and other offices in the building, also documents for verification, transcribing or recording to and from the machine bureau counter, thereby making it unnecessary for clerks to leave their desks for any reason excepting that of transacting business with each other.

*Relative Efficiency of Operators.*—As the number of operators in the machine bureau began to increase it was realized that some record should be had of the output of each operator, with a view to equalizing the amount of work turned out by the various operators. The work in the machine bureau naturally divides itself into two principal classes:

- (a) That performed on calculating machines of the non-listing type.
- (b) Correspondence, records, bills, statements, etc., prepared on the typewriter.

In the absence of any mechanical means of securing a record of the output of the non-listing calculating machines, it was arranged to secure the relative efficiency of the operators by the assignment of a fair average standard time for the most important operations, based on previous time studies and tests of the work of all operators. A record is secured of the actual work performed by means of so-called job tickets, similar to those used in printing shops and in manufacturing plants and by the use of a stamp with an electric clock attachment which automatically records the hour and minute the work was turned over by the head operator to the individual operator, and when completed and returned.

All work is distributed to the non-listing machine operators by a head operator, who also makes the clock record referred to. The number of units of work are counted by a student operator. Special separate job tickets have been provided for

all the more important classes of work. Consequently very little of the time of the head operator is required in making a record of the class of work and of the time the work is turned over to the individual operators, and when completed.

A monthly statement is prepared by the head clerk of the machine bureau, showing the relative efficiency of all non-listing machine operators and of operators on each and all of the more important classes of work. When these records were first started a very marked difference existed in the relative efficiency of the various operators. However, the efficiency has been brought up to a fair average excepting for the new student operators, who show a relatively lower efficiency. About 75 per cent of the time of the computing machine operators is taken on regular scheduled work, the balance being on miscellaneous or work of such character that it is impracticable to assign standard or schedule time.

A cyclometer especially manufactured for the purpose is attached to each typewriter, which affords a mechanical means of securing the output of such machines. This device records the number of key or space bar strokes, through the operation of the escapement wheel at the back of the typewriter. A certain number of key punches or space bar strokes (180) registers one unit on the machine. By taking a record of the reading of the cyclometer at the beginning of the month and at the close and multiplying the difference between the two readings by 180 affords a record of the aggregate number of units of work turned out. This, divided by the actual number of hours on the machine, gives the average number of units per hour.

For comparative purposes typewriter work has been divided into four classes, viz.: Correspondence, statements, car repair bills, bookkeeping.

A standard number of units per hour has been allotted for each of these classes of work, and the relative efficiency of each operator is secured by dividing the actual number of units per hour by the standard number of units allowed per hour.

On certain statements and classes of work on which it is desired to obtain the cost of preparation and writing separately, in the typewriting division of the bureau, a clock ticket is used, this being originated by the clerk preparing the statement. All data, with the exception of the name of the operator, cyclometer reading and time, is filled in by the originating clerk. The head statement operator assigns the work and stamps the time, she also having a time clock similar to the one in the non-listing machine division. The operator performing the work inserts the cyclometer reading.

When the work is completed, all information being shown on the ticket, the head operator detaches the time portion each day and turns the accumulated slips over to the timekeeper, who condenses the data as required. It should be stated that the timekeeper just mentioned is a non-listing machine operator, who devotes all her time not required on timekeeping work to regular non-listing machine work. The computations made by her in the timekeeping work are practically all made with the aid of her machine. When all efficiency records and time reports for the month are completed by her they are handed to the head clerk in charge; thus, through the utilization of mechanical devices, a great deal of the time of the head clerk is saved in preparing such documents.

To illustrate better the efficiency records afforded for the machine bureau, forms are herewith submitted.

All operators employed are occasionally given set tests for the purpose of ascertaining their accuracy, speed and knowledge of necessary operations and their relative efficiency as to accuracy and speed on identically the same work. A similar test is given student graduates prior to their permanent employment.

*Students.* Two students are kept in training at all times

for non-listing machine work. In addition to a regular course of study allotted them they are drilled on actual work, in order that when a vacancy occurs an operator comparatively familiar with the work to be performed will be ready to step into the position. The course is free of cost to the students and within a short time affords a fair salary on work which involves but little fatigue.

One typewriter operator and stenographer is kept in training to fill any vacancy which may occur in the regular force. An inexperienced graduate of a business college is selected and placed on actual work, being paid a salary therefor commensurate with the work performed, the minimum, however, being what is considered a living wage. As she develops, her salary is increased, and, when a vacancy occurs, such as mentioned, she is assigned to the regular force as junior operator, and another student is selected to succeed her. This method guards against being compelled to employ an operator inexperienced in the work of this department.

Any student, before being accepted as such, is rigidly examined in the essential subjects, such as arithmetic, writing, spelling, and, in the case of typewriter operators and stenographers, the additional subjects of typewriting and shorthand also are given, and it is ascertained if the "touch" system was followed in learning to operate the machine.

*General.* Recently a woman operator has been assigned to a listing adding machine, which is used only for the purpose of drawing off balances in various ledger accounts. A woman also calls figures to the typewriter operators where necessary to do so on account of the size of the statements and to expedite the work on rush statements.

The number of women employed on mechanical devices and in other respects, except that of doing clerical labor, constitutes approximately 30 per cent of the total disbursements department office force. The number of office boys, file clerks, etc., constitutes about 5 per cent of the force, making a total of something over 35 per cent of the force engaged on mechanical devices and office-boy work, thereby taking care of work which was at one time in part assigned to higher priced male talent.

Experience thus far gained indicates that women in our employ in the capacities mentioned are superior to men, and at the same time, by relieving the men of routine and mechanical labor involved in extensions, footings, pen postings of records, etc., the latter have a greater amount of time for the application of mental effort, thereby affording them greater opportunities for study and advancement and consequently more pleasure in their work.

*Time Studies and Classification of Work.* With a view to conserving the time of higher priced clerks and reducing the cost of accounting, intensive time studies are being made of all the more important classes of work handled in the disbursements department. For this purpose the work has been segregated into five general classes:

- (1) Executive (supervision).
- (2) Inspection (traveling accountants and recheck work).
- (3) Work of importance (requiring mature judgment, experience and expert ability).
- (4) Routine (work which can be assigned to junior clerks and female help).
- (5) Mechanical (all work involving mechanical computations, transcribing and posting records).

For the purpose of securing the distribution of time of all men employed on clerical work, time study blanks have been provided. The distribution of time is secured in units of tenths of hours. For convenience a time study clock has been provided which at a glance gives the time in hours and tenths of hours. It is the object ultimately to provide a standard unit cost for all of the more important operations or classes of accounting work for comparison with actual unit costs, thereby to ascertain the gain or loss resulting from

the actual unit cost being higher or lower than the standard unit cost. A form of unit cost and efficiency report reflecting unit cost information is prepared semi-annually. This report is particularly valuable in connection with subsequent changes in methods and practices to ascertain thereby what may have been the effect of such changes on the unit costs.

*Computing Machines for Use in Division Offices and the General and Division Stores.* Realizing the need of improving the character of basic accounting data at the source, computing machines are at present being installed in local and division offices and the general store and division stores, under the supervision of the accounting department.

After a very thorough investigation a combination computing and non-listing adding machine was selected for division office use. The type of machine secured was selected owing to its ready use by unassigned inexperienced operators. These machines have proven particularly valuable in division office work in connection with time records and the preparation of payrolls, payroll distributions, vouchers, bills, statements, etc., originated in the offices of superintendents, master mechanics, general and division stores and others.

A number of assigned women operators on key-driven non-listing calculating machines also have been employed in division offices with very satisfactory results.

In connection with the preparation of payrolls, distributions, statements and basic data for completion reports required under Valuation Order No. 3, it is thought that very extensive use can be made of typewriters or bookkeeping machines, equipped with adding and cross-adding devices, so that, upon the figures being transcribed, totals and balances will have been secured. A number of these machines are now on trial in superintendents' offices.

The work of extending the use of mechanical devices in connection with store and division accounting and in generally improving the methods and character of accounting work at the source is being supervised by accounting department representatives. Ultimately accounting work in all outside offices of the company will be systematized, the cost measured and more extensive use made of mechanical devices, corresponding to the practices now followed in the general office. This will not only tend to conserve clerical manpower, but will economize in the cost and insure more accurate basic data.

#### CLEANING ENGINEMEN'S REST HOUSES

The committee is of the opinion that the expenses incident to cleaning and care of enginemen's rest houses at division points should be charged to account No. 402, "Train Supplies and Expenses."

#### WORK EQUIPMENT IN TRANSPORTATION SERVICE

The committee is of the opinion that the mileage of work equipment moved in transportation service trains shall be classified as "transportation service" car miles, under the appropriate account. Pay cars and other business cars, for purposes of the classification of car miles, are to be considered as other passenger train cars and accounted for under accounts 822, "Passenger Train Car Miles," 823, "Mixed Train Car Miles," or 824, "Special Train Car Miles," as may be appropriate. The miles run by commercial and work equipment moved in freight, mixed and special trains in transportation service, when loaded with company or commercial material, shall be included as miles run by loaded freight cars. When cars designed for carrying commercial or other material are moved in transportation service trains without load, they shall be classified as miles run by empty freight cars. Miles run in transportation service trains by exclusive work equipment which is not designed to carry load, such as snow plows, flangers, derricks, pile drivers, wrecking cranes, tool cars, camp outfit cars, shall be appropriately included, according to the class of trains in which

moved under accounts 821, "Freight Train Car Miles," 823, "Mixed Train Car Miles," or 824, "Special Train Car Miles," under a sub-heading "Exclusive Work Equipment."

The report was signed by A. P. Disbrow, chairman.

#### Address by President R. E. Berger

The history of the Railway Accounting Officers' Association and its achievements have been referred to in more or less detail from year to year, and although it is not my purpose to go over the same ground, your indulgence is asked for a moment while I touch upon what may be termed its sentimental side.

For after all, it is in the sentimental phase of life we find the inspiration that gives us breadth of vision and a better grasp of things worth while; that causes us to be forgetful of self, therefore, considerate of others; that makes this old world of ours seem good to live in; that enables us to fit, the better, into the duties and the perplexities which crowd the days and that helps us to be better men and cheerier companions.

Of such a nature is the general spirit of friendliness and goodfellowship that for so many years has been gathering strength within our ranks, until today it constitutes a force, immeasurable by ordinary standards and silent of operation, yet entering as a powerful influence into all of our dealings with each other and with the Association. It is this feature that has particularly impressed me as being one of the most fortunate, as well as valuable possessions of our organization.

One of the fundamental purposes of our Association was to obtain the benefits that might be expected to follow from a free interchange of business ideas. The discussions and comparisons of methods, early paved the way for the transaction of business in a more neighborly manner. The old style of correspondence, too often acrimonious and at times to the point of discourtesy, soon became a thing of the past, giving way to association influences under which strong and lasting friendships were formed. In the old days nearly all communications were addressed to strangers, men whom we did not know and perhaps had never seen, while today practically every letter is addressed to a "friend" and the transaction of business by comparison, has indeed become a pleasure.

The natural outcome of such a change in the personal relations between accounting men was to engender a desire for co-operation.

Now, the full benefits of co-operation cannot be realized, unless there exist a spirit of friendliness among those who have come together to work for the common good of all. Not much can be accomplished with a man who persists in believing himself always right, for to him it is the whole human race that's wrong. Co-operation means that individually-cherished ideas must at times be shattered and abandoned and give way to the will of the majority. There must be, so to speak, losers where there are winners of a proposition, and no matter how pleasant it may be to be called a "good loser," there are few men who do not better enjoy saying it of the other fellow. Then again, a "good winner" is as admirable as a "good loser," poise being extremely valuable in either case. Unquestionably one of the hardest things for a man of conviction to acquire is that degree of self-discipline that will make it possible for him to carry out with absolute loyalty, plans of the majority which run counter to his own ideas.

The good-fellowship, the atmosphere of friendliness, together with the broad principle of democracy embodied in our Constitution which accords equal rights to every member regardless of rank are the underlying and sentimental forces that lend to our Association the charm that brings to it the loyal support and the affectionate regard of its members with a willingness to sink personal preferences; forces that have been potent influences for its success.

The past year has been an exceptional one in that it embraces practically the first twelve months of the period of active Federal control of the common carriers of the United States, a new situation created by the exigencies of the war. Special conditions had to be constantly met and important changes of methods worked out in detail and installed.

Through the wisdom and foresight of its founders and the able conduct of its affairs during the many years of its existence, the Railway Accounting Officers' Association, as it is constituted today, is an organization whose methods of procedure are so flexible and possess such a high degree of adaptability, that it has found but little difficulty in adjusting itself to the extraordinary conditions which presented themselves. Its aim is to initiate, as well as to promote methods that are considered to be for the best interest of railway accounting as a science and as a profession. It is inconceivable, therefore, that there should ever arise any situation, no matter how unusual in character, if it come within the scope of railway accounting, that could not and would not be successfully handled by our association.

From the date the United States Railroad Administration was created and assumed the supervision of the carriers, our association has, with the hearty support of its executive and other committees, concentrated its energies in an endeavor to co-operate to the fullest extent with the Railroad Administration, through the medium of the division of accounting. Let me add that this action is in conformity with and a continuance of the established policy of at all times and under any conditions rendering the utmost possible service in connection with railway accounting matters. The division of accounting was invited to make all practical use of our facilities in Washington and of the committees of our association. It affords me much gratification to be able to advise you that our proposals have been met in a fine spirit of co-operation by Mr. C. A. Prouty, director, division of accounting, and that the most cordial relations now exist between the Administration officers and our organization.

Your attention is directed to pages 143 to 250 inclusive of the Agenda wherein are reproduced in their entirety all of the General Orders and Circulars, relating to accounting matters, issued by the United States Railroad Administration up to the date the Agenda was printed.

Aside from the convenience afforded our members by this book of ready reference, it was considered both desirable and consistent that these orders and accounting circulars should be thus perpetuated in the records of our Association, as they cover many important questions and innovations, in the determination of which our several committees gave their time without stint to the Railroad Administration.

I am sure it will be of interest to you all to know that our association represents 310,712 miles of railroad; also all of the express companies operating in North America and most of the inland and coastwise steamship lines. That it can no longer be looked upon as an "American" body only, but stands out prominently as an international organization, exercising a world-wide influence in railway accounting affairs, is evidenced by the fact that its present total membership—790—comprises practically every important railroad, not only in the United States, but also in Canada, Mexico, Panama, Brazil, Argentine, Ecuador, Cuba, Hawaii, Philippine Islands, England, New Zealand and Japan; in fact, there is hardly an important nation in the world that has not at some time had occasion to make use of our association or some of the data compiled by it.

Since our last annual meeting, 127 new members have been admitted. This is a high-water mark, and represents the largest increase in membership in any one year of our association's existence.

From time to time during the year, inquiries with reference to the record, experience and qualifications of some of

our members have been received by the secretary from commercial concerns and others, who were seeking the services of men experienced along special lines of accounting work.

Your president in his official capacity has likewise been approached by members who for various reasons were seeking new locations and engagements.

The association is to be congratulated upon being thus recognized as standing in such a relation to the members themselves and with the business public. Believing that it should place itself in a position to serve its members in whatever way it can best be of use, I recommend that the secretary be authorized to collect and keep up currently data of a biographical and business experience nature in connection with each member. Such a record would enable the secretary to promptly and intelligently respond to inquiries received, and to him members should also be made to feel free to apply for information, in a confidential way, if desired.

This record would be found of considerable value in other features of our association work, particularly in making readily available reliable data regarding the experience of members under consideration for committee assignments, where heretofore we have been largely dependent upon personal knowledge. In connection with the work of the standardization of forms and methods, it has devolved upon me to appoint quite a number of special sub-committees. In making these committee assignments, their membership was drawn in about equal proportion from the eastern, southern and western carriers, the interests of the New England, Southwestern, Northwestern and Transcontinental carriers being taken care of in one or the other of these groups.

This grouping as to geographical locations was decided upon with the thought that the members of sub-committees so constituted could get together with the least inconvenience and would be better equipped to arrive at conclusions more nearly representative of the needs of the carriers in all sections of the country. Might we not with advantage make provision to apply the same principle in the appointment of our standing committees, for example, the committees on freight, passenger and disbursement accounts?

With equal representation as between the east, south and west, each regular committee could resolve itself into three regional sub-committees of equal number, with a chairman, to whom subjects might be referred for consideration and report to the general committee. The members of each regional sub-committee would be able to get together for conference, with a minimum amount of traveling, loss of time and expense, and I believe that local conditions and the interests of the carriers generally would be better served.

A change of especial importance, one that will increase the responsibilities and add to the prestige of our organization, has resulted from placing the settlement of overcharge and agency relief claims under the supervision of accounting officers. It seems proper that the rules and regulations governing such matters should be formulated by this body and the report submitted in this connection by the Committee on Freight Accounts is, therefore, of more than ordinary interest.

It affords me pleasure to speak of the co-operation of the officers and the high order of the work of the several committees, in connection with the various matters referred to them.

Special mention is also made of the versatility, the energy, and the efficient services of our secretary, Mr. Woodson. He is one of the mainstays of the association and has been a right-arm to the president.

Officers were elected as follows: A. D. McDonald, president; J. G. Drew, first vice-president; E. R. Woodson, second vice-president, and J. J. Ekin, third vice-president. H. H. Laughton, C. D. Branderif and C. P. Crawford were elected members of the executive committee.

## Railway Wages and Freight Rates

**T**HEDORE PRICE, actuary of the United States Railroad Administration under Director General McAdoo, presented a study of railway rates and costs of living in the Outlook for April 30, in which he argued that the large deficit in government operation of the roads is due to the fact that present rates are insufficient to meet the high cost of operation, particularly the high labor costs. In his article, Mr. Price stated that as we look back over the records since 1896, we are driven to the conclusion that railroading is the only business in the United States in which the charge for the service rendered or the article sold does not bear some relation to the cost of production. In the case of transportation, the cost of production is in the last analysis the cost of the labor employed, for whether this cost of labor is reflected directly in the wages paid, or indirectly in the cost of the materials (fuel, oil, steel, etc.) purchased, makes little or no difference. If coal costs more, it is because the miners are better paid. If steel rails are higher, the advance reflects the higher wages paid for their fabrication. If oil has increased in price, the enhancement is due to the greater cost of the human energy required for its production; and so it is all along the line.

The cost of providing transportation is almost entirely made up of the cost of labor. There may be some who will take exception to this statement and claim that since the interest paid on the capital invested or borrowed does not go into the wage-earner's pocket, it is not accurate to assert that this element of cost fluctuates in relation to the cost of labor or the cost of living, which have latterly become terms that mean nearly the same thing.

This might be true, were it not for the fact that all parts of a railway are constantly wearing out and have constantly to be renewed. The amount of the original investment and the rate of interest thereon may be static, but the material or labor used in necessary replacement as the rails or bridges first purchased wear out represents human energy that must be paid for at the market rates. It is therefore clear that, except as to the profits paid out in dividends or carried to surplus account (which aggregate hardly more than 10 per cent of the entire gross revenue), the railway business is simply one of buying and selling human energy, either physical or mental.

In the light of this statement it would be natural to expect that railway rates, railway wages, and the cost of living would fluctuate in unison, but this has not been the case. Since 1896, until Mr. McAdoo raised them last summer, freight and passenger rates have been practically unchanged and wages were advanced but little, while the cost of living has steadily increased. A careful study will show that, even including the advances established last summer, freight and passenger rates are but 12 and 20 per cent higher, respectively, than they were in 1896, while the cost of living has risen over 200 per cent.

It is not surprising that under such conditions the railway employees were impelled to use every means at their command to secure an increase in their pay, and that the railway managers resisted their demands because the Interstate Commerce Commission would not permit an advance in rates.

Discontent, strikes, reluctant concessions to the wage-earners, impaired efficiency, and the near bankruptcy of the railways were the consequence, complete insolvency being averted only by the action of the Government in taking over the transportation industry on January 1, 1918.

When this was done, it immediately became clear that a substantial advance in the wages of railway employees was necessary in order to retain their services and enable them to live. It was granted, and freight and passenger rates were afterward advanced by 25 and 50 per cent, re-

spectively, in the hope that the increased revenue secured would offset the increased cost of labor.

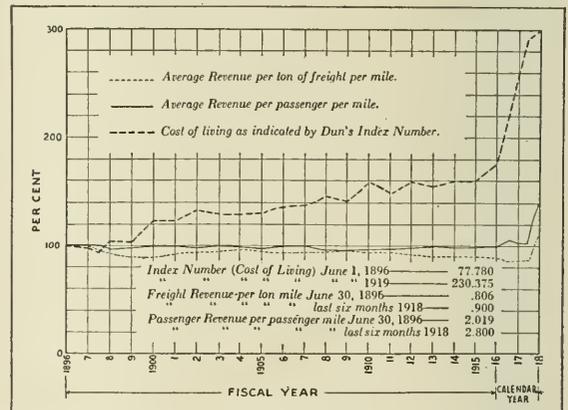

The advance in wages allowed, plus the advance in the cost of supplies, has, however, proved to be greater than the increase in revenue, resulting from the advance of rates, and a deficit of approximately \$200,000,000 for the first year of government operation is the result.

This deficit is plainly due to the previous maladjustment or lack of adjustment between costs and rates.

If in 1896 it had been practicable to establish, and there had been established, an index number wage and an index number freight and passenger rate in the railway business, how much trouble and distress would have been avoided!

Now that the railways are under a single management, is it not practicable to do something of the kind? It should not be necessary to advance rates in the same proportion that wages were increased. Allowance should properly be made for the greater operating efficiency that is the result of scientific progress and the reduction in overhead costs that is possible with an increased density of traffic, but the experience of the last twelve months shows that the public do not object to paying higher rates when there is good reason for them; and no clearer *demonstrandum ad hominem* of their reasonableness can be furnished than the evidence of increased cost of living and of labor that the index number supplies.

The editors of the Outlook, commenting on Mr. Price's argument, conclude that "it is a mathematical deduction that railway rates must go up also to meet this necessary rise in wages or else the railways will be bankrupt." Reproducing a chart showing the relation of rates to the cost of living, they say: This table and chart give in graphic form facts

A Cartographic Comparison Between Railway Rates and Cost of Living

discussed in Mr. Price's article. A glance at the chart shows at once that the cost of living has steadily, and in the last two or three years enormously, risen. This is indicated by the upper black broken line. The solid black line shows that from 1896 to 1917 passenger rates remained practically stationary. The dotted line indicates that during the same period freight rates decreased.

A combination of commodities, for instance, which cost \$77.77 on January 1, 1896, cost on October 1, 1918, \$233.22, and on March 1 of this year \$217.3. But passenger rates were the same in the early part of 1918 that they were in 1896, and freight rates were a trifle less.

It is perfectly clear that the wages of employees must go up with the cost of living. It is equally a mathematical deduction that railway rates must go up also to meet this necessary rise in wages or else the railways will be bankrupt.

# Doings of the United States Railroad Administration

## Director General Hines Says Maintenance Is Up to Contract Obligations. Earnings for April

WASHINGTON, D. C.

NOT THE LEAST of the many complicated problems confronting the Railroad Administration has been that of establishing and putting into effect a program of maintenance expenditures. While many railroad corporation officers as well as many officers of the operating organization have been expressing concern that their roads were not being properly maintained, the Railroad Administration organization, because of its duty to protect the government, apparently has a worry of another kind, fearing that it will spend more for maintenance than is called for by its contracts with the companies. Therefore, it has issued orders for the month of June intended to control the situation until a check can be made and Director General Hines, in testifying last week before a Congressional committee, expressed the opinion that, broadly speaking, on April 30 the roadway and structures were in fully as good condition as on January 1, 1918, and that the equipment was in as good condition and as a whole, probably in better condition than it was on January 1, 1918.

"My best judgment of the situation as a whole is that at the present time we are fully up to our contract obligations in respect of maintenance of roadway and structures and equipment; that taking the whole thing together for all the roads together, we are fully up to our contract requirements," he said.

The problem includes two phases, the operating or engineering problem of getting the necessary work done and the accounting problem of ascertaining and reporting the condition of the property or the amount of upkeep performed during the period of federal control as compared with the condition at the beginning of federal control or the upkeep during the test period. As the prospects for an early return of the roads have become more definite, the necessity for having the accounting data as a measure for the amount of work to be performed this year has assumed a new importance, but the detailed accounting work has been so vast that it was found impossible to secure the necessary information by the time the year's maintenance work was started.

During the first part of the year both the maintenance department of the Division of Operation and the Accounting Division were engaged in a co-operative effort to develop a system of uniform records for preparing and recording data relating to the degree of maintenance of the roads during the test period and the period of federal control, but in order to furnish instructions to the regional directors and federal managers the maintenance department got its directions out first. These were first put in the form of a letter from C. A. Morse, assistant director of the Division of Operation, to the regional directors directing the preparation of a maintenance program and budget for 1919 on each railroad based on the amount of upkeep necessary to make the average for 1918 and 1919 equal to the average for the test period after equating for differences in labor and material costs.

This was followed by the issuance in March of Circular No. 28 of the Division of Operation, which was accompanied by five forms on which to record the comparative data for the two periods, both for the purpose of complying with the provision in the contracts for an analysis of the maintenance expenditures at the end of each year of federal control and to set the program for the current year. Compliance with this circular, however, would require so

much clerical work and possibly duplication of the data to be asked by the accounting department that it was suspended for a time and instructions were issued to have budgets prepared that would carry out the general idea of matching the maintenance for 1919 and 1918 with that of the test period. Because the general standard was known it was thought that maintenance work need not be delayed while the elaborate data required to measure it accurately was being gathered.

Meanwhile, there has been a wide apparent discrepancy between statements of many railroad men that the maintenance on their roads was being kept below standard and those of officers of the Railroad Administration who have been talking about the large amount of maintenance work being prosecuted. The latter take the position that, taking everything into consideration, a large number of roads have been maintained to better than the required standard, and that while there may have been under-maintenance of way and structures on some properties, there has been over-maintenance on others, particularly in maintenance of equipment. Because an excess on one road cannot be used as an offset against the obligations of the government to another property, and would be difficult if not impossible to collect, Director General Hines found it necessary to issue an order, as briefly noted in last week's issue, limiting the maintenance of way expenditures for the month of June to the percentage of operating revenues, which the same expenses bore to total revenues of each road during the test period, pending more explicit instructions as to the program for the balance of the year. Mr. Hines explained in his instructions that this was not a hard and fast rule, and that it was not intended to stop any necessary work, but the regional directors were given authority to exceed the limit where necessary to meet emergencies, and the order has been somewhat modified.

Whereas, in the instructions heretofore issued the amount of maintenance during the test period has been used as the standard or yardstick for the maintenance during federal control, the new instructions will combine this standard with that of the condition of the property when taken over on January 1.

The contracts between the railroads and the government provide as the standard of upkeep the expenditure or payment into funds of such sums as may be requisite in order that the property "may be returned to the company in substantially as good repair and in substantially as complete equipment as it was on January 1, 1918," and there is a proviso that the annual expenditure and charges for such purposes during the period of federal control of an amount equal to the average annual expenditure and charges during the test period, with some adjustments and allowances for differences in the cost of labor and materials, shall be taken as a full compliance with the foregoing covenant.

In other words, the obligation of the government is to return the properties in as good condition as when taken over, not to equal the average of the test period, and while equalling the average of the test period has been regarded as representing a full compliance with that obligation, it has been found by experience that the test period standard is not always an equitable or practical one, and that in some cases would represent a greater expenditure than would be required to keep the property in the condition of January 1, 1918. For example, a railroad may have made such

large expenditures for improvements and maintenance during the test period that an equivalent operating charge for 1918 and 1919 is not necessary to keep up to the condition in which the property was taken over. Or it may have deferred maintenance to such an extent during the last half of 1917 that an amount less than the test period standard will meet the obligation. On the other hand, many railroads had deferred maintenance during the test period which, it is stated, has been more than made up during the period of federal control, but this does not assist the government greatly in making up any deferred maintenance that may have accrued since January 1, 1918, on other roads.

The contract does provide that excess maintenance requisite for the safe operation of the property shall be made good by the company by deduction from its rental, but the power to make such deductions is practically very much limited. It is stated that the operating officers of some roads that have earned sufficiently to do so without calling on Washington for the cash have taken advantage of the opportunity to put their roads in better condition in many respects than they were during the test period or even before, and that even where there has been a shortage of ties or of rail there has been an opportunity to do perhaps more of some other kind of work.

With the close of the accounts only a little over six months away the administration is preparing to devote special attention to maintenance expenditures, and to the budgets which are coming in with a view to coming out as nearly even as possible at the end of the year, and the question of whether the condition as of January 1, or the standard of the test period is to be used as the mark to be attained will be taken up with the corporations for determination in accordance with the circumstances in each case.

In 1918 the expenditures of the Class I roads for maintenance of way and structures were \$653,868,000, an increase of 46.7 per cent over those of 1917. The expenditures for maintenance of equipment were \$1,108,030,000, an increase of 60.4 per cent, while the total operating expenses increased 40.2 per cent. For the three months ending March 31, 1919, the maintenance of way and structures expenses were \$171,787,000, an increase of 38.8 per cent over 1918, while the maintenance of equipment expenses were \$285,846,000, an increase of 37.4 per cent. Total operating expenses increased only 26.3 per cent. Both in 1918 and in the first three months of 1919 the maintenance of way expenses were about 16 per cent of total operating expenses and maintenance of equipment consumed 27 per cent. The maintenance of way expenditures for the first three months of this year were 15.3 per cent of the operating revenues as compared with 13.3 per cent for the entire year 1918 and 11.1 per cent for the test period. The maintenance of equipment expenses for the three months were 25 per cent of operating revenues as compared with 22 per cent for the year 1918, and 16.7 per cent for the test period.

The subject of maintenance expenditures was rather fully discussed by Director General Hines in his testimony before the House appropriations committee, in reply to a question from the chairman of the committee regarding the claim that the maintenance has not been kept up to standard, and that there will be a considerable loss to the government in order to make good deferred maintenance. Mr. Hines said that the Railroad Administration had received, so far as he knew, no specific complaint from any company with regard to maintenance of equipment, that undoubtedly as to locomotives the condition is far better than it was when the government took over the railroads because, generally speaking, they were not in good condition on January 1, 1918, and they are in very good condition now.

He would not undertake to say that the condition of the roadway and structures was in all respects on January 1, 1919, as it was on January 1, 1918. He thought in many respects it was a good deal better, but in some respects it

might not have been as good, because probably less rail and cross ties were put into the property last year than usually, and there was some shortage of labor. But, he said, taking the roadway and structures and equipment together, the average condition of the property as a whole is as well off as it was on January 1, 1919. He said the favorable weather had made it possible to make up for work not done last year, that a good deal of rail that was not put in last year has already been put in this year, and that as of April 30, the Railroad Administration could claim that the roadway and structures by themselves were in as good condition as on January 1, 1918, in addition to the balance in its favor on the equipment.

Mr. Hines said he thought the railroad companies had fallen into two or three errors. They assume, he said, that the standard contract obligates the government to put into the property each year of federal control, on an average, the quantities of material and labor that were put into the property on an average per year during the test period. That is not the case, he said. The obligation is to turn the property back in substantially as good condition, and it will be practicable on many railroads to do that without expending as large quantities of labor and material as were expended during the test period on an average, and where it is practicable the government does not have to put in a larger amount. The provision that the same quantities of labor and material may be used is not an obligation, but is an option which the government may take if it is more favorable than the other standard. Again, he said, the companies have attached great importance to the fact that the shortage of rail and ties proved a deterioration in the property as a whole. He thought that was not true, because it was frequently made up in other ways. He mentioned that many railroads in the test period were building up their property, while generally the railroads did not keep up their property in the last six months of 1917 as well as they did during the test period.

"It has been the tradition of the subordinate official," Mr. Hines said, "as against his own superior officer or as against any one else, that he wanted to maintain his property just as well as he could, and if he could maintain his property better than the corporation wanted it maintained he would do it because he just naturally wants his property in the best condition he can have it, and I take it that the subordinate officials will be just as anxious to do that under federal control as they were under private control, and that they will spend all the money on maintenance that they can get to spend.

"Now, since the interest of the government is very distinct from the interest of the corporation, and since the government interest is to see that he does not spend any more than the contract requires, it becomes necessary to look with special care on the perfectly natural tendency of all subordinate railroad officials to build up their property; but they would not do it out of disloyalty to the government. It is out of loyalty to the property they are holding, and they build the property up regardless of the policy of their own corporation, if they can get the money to do it. I do not regard that as any reflection, but I do mean it is a matter that the government must look after very closely in order to see that the property is not over-maintained through the enthusiasm of the subordinate officials to have the best property they can have."

Mr. Hines also put in the record the following statement regarding the materials and supplies on hand and purchased last year:

1. The total of material and supplies on hand January 1, 1918, for Class I railroads was \$493,071,344, as follows:	
Fuel .....	\$35,843,843
Rail .....	31,516,292
Ties .....	28,989,691
Other material .....	396,721,528
Total .....	\$493,071,344

2 The total of purchases during the calendar year of 1918, was \$1,676,928,525, as follows:

Freight	\$59,536,491
Rail	48,803,940
Ties	28,989,681
Other material	396,721,528
<b>Total</b>	<b>\$1,676,928,525</b>

3. Figures showing the average purchases made during the test period are not available at this time.

**Earnings and Expenses for April and Four Months**

The net operating income of the railroads for April, according to the Interstate Commerce Commission report covering 184 Class I roads and 17 switching and terminal companies, was \$26,115,214, as compared with \$71,407,370 in April, 1918, and \$78,000,000, which is one-twelfth of the standard return. Director General Hines has issued a statement estimating the deficit for April as \$58,000,000, but this takes into account the expenses of the Railroad Administration and some other items. For four months of this year the net operating income was \$65,916,807, which is \$247,000,000 less than the total rental for all roads for four months. The commission's figures follow:

unlike these other enterprises in that the latter have made corresponding increases in the prices of what they sell while the Railroad Administration has made an increase in transportation rates of only 25 per cent, which is a far less percentage than the increase in wages and costs of materials. As I stated a month ago, my judgment is that the present conditions are too abnormal to serve as a basis for any general change in the level of rates, and that it is preferable to defer action on that subject until there shall have been a fuller opportunity to get a more reliable, and possibly a more normal, measure of the conditions, meanwhile resorting to every practicable economy, studying the situation with the greatest care, and keeping the public fully informed as to developments."

The commission has also issued a statement giving the revenues and expenses for April and four months of the individual roads having operating revenues above \$25,000,000 for 1918, representing 79.5 per cent of the Class I roads. Of these 7 had deficits in April and 11 had deficits for the combined four months. The combined net operating

d—Debit item.

Director General Hines authorized a statement saying that by reason of this unfavorable operating income for the month of April the Railroad Administration will incur a deficit for the month of April of approximately \$58,000,000 after deducting one-twelfth of the annual rental due the railroad companies, making the total deficit for the four months of January, February, March and April approximately \$250,000,000, after deducting four-twelfths of the annual rental. This estimate of deficit includes not only the large railroads but all other railroads under federal control, the expenses of the central and regional administrations, the operation of inland waterways under control of the Railroad Administration, as well as some incidental and miscellaneous items.

"In April, as in January, February and March," he says, "this unfavorable showing is due in large part to the falling off of business. It is also due in part to the heavy increases in wages and costs of materials. The Railroad Administration is not unlike other industrial undertakings in the increases in wages and costs of materials, but is

income for April was \$22,288,705 as compared with \$56,000,771 in April, 1918, and for four months it was \$59,864,300 as compared with \$107,976,968.

**Railroad Administration Expenses**

The total expenses and payroll of the Railroad Administration are now running at the rate of \$703,000 a month, or \$8,436,000 a year, as compared with \$3,647,143 in 1918, according to information given by the Railroad Administration to the House appropriations committee last week. One statement filed with the committee gave the expenses for the first four months of this year as \$2,849,000. Another statement gave separately the general expenses and payrolls by months from January to May, inclusive, \$848,472 for general expenses and \$2,670,712 for payrolls, or a total of \$3,519,184 for five months. At this rate the payroll for a year would be \$6,432,000. For the month of April the general expenses were \$110,785 and the payroll \$529,020. For May the figures cover payment for one and one-half months and include \$262,482 for general

expenses and \$807,641 for payroll. For January the figures cover only half a month. The force of the Railroad Administration increased considerably during the latter half of last year, and some additions have been made this year by changes in organization. The figures include both the central and regional organizations.

**Committee on Automatic Train Control**

A. M. Burt, heretofore assistant general manager of the Northern Pacific, who was appointed on June 1 assistant director of the Division of Operation, has also been appointed chairman of the Committee on Automatic Train Control, succeeding C. A. Morse, resigned. The committee spent four days last week in New York inspecting the operation of automatic stops in the subways and tunnels of the Interborough Rapid Transit Company, the Brooklyn Rapid Transit Company, the Hudson & Manhattan and the Pennsylvania terminal, also the experimental apparatus of Frank J. Sprague and one or two other devices. The trips in use in the subways are of the Kinsman type, using apparatus furnished by the signal companies and circuits designed to meet local conditions. The committee found that the conditions under which these are used are very special and quite different from those of a steam railroad with mixed traffic. The committee will probably make another inspection trip next month.

**War Department Locomotives**

**Turned Over to Railroads**

The director general has accepted from the War Department the custody of 200 locomotives which were originally constructed for the Russian government, and has arranged until further notice to continue the operation of that equipment on federally operated lines.

Prior to the present arrangements, the lines using these locomotives were obligated to the War Department for a rental based upon \$45 per locomotive per day. The amount payable was considerably in excess of that required under the present agreement, which is 6 per cent per annum upon a valuation of \$55,000 per locomotive, or an annual rental of \$3,300 per locomotive from the date it went into service, or pro rata for any fractional part of a year. The agreement for the use of these locomotives provides that they shall be fully maintained at the expense of the director general.

**Orders of Regional Directors**

**U. S. R. A. STANDARD CARS; REPAIRS.**—The regional director, Eastern Region, by circular 500-101A771 promulgates a notice from the Division of Purchases that when it becomes necessary to make repairs on standard freight cars, or standard locomotives, orders for material, before being placed, should be referred to the director of the division, H. B. Spencer, Washington, so that any surplus material accumulating at the car plants can be properly distributed.

**Atlantic City Conventions.**—A. T. Hardin, regional director, Eastern Region, by circular 1301-75A731A, advises federal managers of a letter from Frank McManamy, assistant director, division of operation, calling attention to the importance of sending mechanical officers to the conventions to be held June 18-25. Mr. McManamy says: "Information has been received from various railroads indicating that instructions in my letter of May 3 are not fully understood. These instructions were not simply permission for representative members of Section 3, Mechanical, American Railroad Association, to attend the convention at Atlantic City, if they desired to do so, but was intended to be instructions for them to attend a business meeting of this association.

There are many matters of importance to come before that meeting, therefore it is desired that representative members be directed to attend."

**Bulletin Boards for Brotherhoods.**—The regional director, Eastern Region, by circular 1500-80A777, instructs federal managers to provide places at shops for the posting of circulars and notifications issued by employees or their organizations.

**Capital Expenditures less than \$1,000.**—A. T. Hardin, regional director, Eastern Region, by circular 2700-A776, quotes a letter from Washington calling attention to apparent violations of the spirit of the rule which allows federal managers to make expenditures, chargeable to capital, without first consulting the corporation, provided the total expenditure is less than \$1,000. Corporations have made protests that many items coming within the limit are really parts of a general program, and do not properly stand by themselves. Among such items are:

- (1) Office facilities—typewriters, tabulating machines, desks, etc., spread over eight or ten months.
- (2) Machine tools evidently part of a general improvement of shop facilities but split up into single purchases.
- (3) Expenditures incidental to heavier rail, divided up into monthly charges, giving no indication of the scope of the program.
- (4) Fencing, divided up into short sections \* \* \*
- (5) Tie plates and rail anchors, divided up into short sections.
- (6) Rebuilding freight cars reported under the heading of the individual car number. Federal managers are advised to refer such matters, where possible, to the corporate officer, to avoid these objections.

**Pay of Claim Agents.**—A. T. Hardin, regional director, Eastern Region, by circular 1200-4-56A774, promulgates the views, not mandatory, of the administration as to salaries suitable for employees in the personal injuries claim department. These rates, following conferences with the National Order of Railroad Claimmen, are quoted as follows:

Position	Minimum	Maximum	
Investigators—those who investigate personal injuries, fires, killing of stock, etc.	\$125	\$150	first year
Adjusters or claim agents—those charged with responsibility of making investigations and adjustments.	135	165	second year
	150	200	first year
	200	225	second year
	225	250	third year

After service of five years, salary may be graded up to maximum of \$4,000 yearly, according to capacity, territory and general responsibility.

Mr. Hardin thinks that in the Eastern Region the salaries already compare favorably with the scale here quoted; but where this is not the case the federal manager is called upon to submit his recommendations.

**Preparations for 1919 Cotton Crop.**—Circular 217 of the Southwestern regional director quotes a circular issued May 22, by W. S. Turner, secretary of the Arkansas Cotton Trade Association, Little Rock, Ark., relative to preparations which should be made for the movement of the 1919 cotton crop similar to circulars which have been issued concerning the 1919 wheat crop.

**Bills of Lading for Shipments to Cuba.**—Circular 264 of the Central Western regional director similar to Circular 437 of the Southern regional director (*Railway Age*, May 30, page 1304).

**Claims Against War Department.**—The regional director, Eastern Region, by circular 401-14A765C, gives further instructions concerning the presentation to the War Department of claims for expenditures in the construction of side tracks, and for other things. A "Claims Board, transportation service, War Department," in charge of Brigadier General F. T. Hines, has been established to attend to all disputed claims. Federal managers should send to him not only claims concerning the construction of side tracks, but also any disputed claims, whether for freight charges, demurrage, storage, passenger cars, baggage cars, engines, derricks, or other facilities.

# Railway Developments in Foreign Countries

## Construction Projects Under Consideration in Several Places. Conditions in Belgium

THE PRESIDENT OF PERU has been authorized by Congress to obtain a loan of \$1,500,000, gold, at 7 per cent annual interest and an accumulative annual amortization of one per cent to be used in the construction of the Jatunhuasi Railroad.

The Venezuelan department of public works has recently signed a contract with Senor Jose Antonio Redondo, by which the National Government leases to him the Santa Barbara-El Vigia Railway, a national property in the states of Zulia and Merida.

Several capitalists of the United States are reported to be interested in a project for constructing a railway which, extending from the port of Manzanillo in the Dominican Republic, shall traverse the northwestern territory, passing near Santiago and along the southern part of the Yaque and extending nearly to the pines region, terminating at La Vega.

### New Trans-Australian Line

Mr. Watt, acting prime minister of Australia, has informed Mr. Peake, premier of South Australia, says a correspondent in the Times (London), that the administration of the Federal Railways is studying schemes to connect north and south by a line from Hergott Springs to Port Darwin.

The proposed line would have a total length of about 1,600 miles. At Hergott Springs, in the south, it would connect with the existing line to Adelaide, which is 200 miles farther south. Port Darwin, the northern terminal, is in the Northern Territory.

### "Squatters" Hold Siberian Cars

The technical board in charge of operations on the Trans-Siberian Railroad, says an Associated Press despatch from Omsk, has completed an inspection of the line between Omsk and Perm and has returned. It is awaiting the arrival in Omsk of John F. Stevens, chairman of the board, who is on his way to Omsk from Harbin.

Members of the board believe that the most serious problem before them in the rehabilitation of the Trans-Siberian lies in the ousting of some 14,000 persons who have taken possession of freight and passenger cars along the road. These people are holding the cars, hoping that they will soon be able to return home, and are not disposed to relinquish the rolling stock which they have seized.

### Transandine Line Blocked

The heaviest snowstorms in recent years have probably stopped communication between Argentina and the west coast, by way of the Transandine Railway, until spring.

Snow slides have torn up the Transandine Railway at points and wrecked the bridges, making it impossible to operate the bi-weekly train between Buenos Aires and Valparaiso.

Several prominent North American business men were among those caught in the snows of the Andes and forced to return to Buenos Aires to resume their journey northward by the east coast route.

Officials of the Transandine Railway state that it will hardly be possible to repair the road before the spring months of September or October.

The blocking of the Transandine Railway by snow slides is practically an annual occurrence. In 1912, 1914 and 1915 the road was inoperative for 140, 188 and 141 days, respectively.

### Exports of Cars in April

Exports of freight cars in April, numbering 1,005, with a value of \$1,913,728, were double those of February, when 583, valued at \$957,128, were shipped. Nearly half the cars exported in April were destined for Italy, and the larger part of the other half to France. The detailed figures compiled by the Division of Statistics of the Bureau of Foreign and Domestic Commerce follow:

Countries	Passenger cars for steam railways		Freight and other cars for steam railways	
	Number	Dollars	Number	Dollars
France .....	.....	.....	350	827,730
Italy .....	.....	.....	550	943,800
Canada .....	5	120,141	7	15,961
Mexico .....	.....	.....	27	24,911
Trinidad and Tobago.....	.....	.....	2	7,200
Cuba .....	3	25,000	69	94,126
Total.....	8	145,141	1,005	1,913,728

### Carranza Urges Building of Railroads in Mexico

President Carranza on June 6 sent a message to the Mexican senate asking Congress to authorize the national executive to construct three railways connecting undeveloped regions of Mexico with those already developed.

The first railway suggested by the president would connect a point between Magdalena and Hermosillo, in the State of Sonora with Ensenada, in lower California. The second would unite the town of Peto, Yucatan, with Bacalar and Santa Cruz, in the territory of Quintana Roo. The third line suggested would connect Santa Lucrecia, in the State of Vera Cruz, with the State of Campeche, which has no railways.

In the introduction to his message, the president says that the government hopes to form a centralized railway system by which both the northern and southern frontiers of Mexico will be connected with Central Mexico, thereby "opening rich undeveloped regions, uniting national thought and ideals and ending the present isolation."

### French Commission Visits Westinghouse Works

The French Commission now in this country to investigate railway electrification projects has arrived at Pittsburgh, after having visited Altoona. It will spend several days there to inspect the works of the Westinghouse Electric & Manufacturing Company at East Pittsburgh, and to examine the electric locomotives now under construction for operation on the Hell Gate route of the New Haven, and the new electric passenger locomotives being built for the Chicago, Milwaukee & St. Paul.

The commission is headed by Professor Mauduit, professor of electrical engineering of the University of Nancy, and Major D'Anglarde, representative of the Minister of Public Works, and in addition consists of Parodi, chief electrical engineer of the Paris-Orleans Railway; Sabouret, assistant manager of the Paris-Orleans; Japiot, chief mechanical engineer of the Paris, Lyons & Mediterranean; Ferrand, electrical engineer of the Paris, Lyons & Mediterranean; Debray, electrical engineer of the French State Railways; Barillot, electrical engineer of the French State

Railways; Bachelery, assistant manager of the Midi Railway; Leboucher, assistant motive power superintendent of the Midi Railway, and Balling, chief engineer of the Paris-Orleans.

The commission will be the guests of E. M. Herr, president of the Westinghouse Electric & Manufacturing Company, during its stay in Pittsburgh.

### Exports of Car Wheels and Axles in April

The exports of car wheels and axles in April, valued at \$946,304, were considerably in excess of the shipments of \$686,281 in March, and were the largest for any month so far this year. Japan and Japanese China were the largest customers, while considerable quantities were exported to Canada and the Straits Settlements. The figures in detail as compiled by the Division of Statistics of the Bureau of Foreign and Domestic Commerce are as follows:

Countries	Car wheels and axles Dollars
France	22,789
Gibraltar	930
Italy	94,909
Russia in Europe	2,050
England	207
Scotland	4,000
Canada	169,422
Guatemala	397
Panama	9,600
Mexico	6,384
Trinidad and Tobago	133
Cuba	18,624
Dominican Republic	254
Brazil	5,165
Chile	1,298
Ecuador	8,789
Peru	1,416
China	125,874
Japanese China	1,280
British India	109,500
Straits Settlements	53,803
Dutch East Indies	278,834
Japan	26,831
Russia in Asia	3,222
Australia	22
New Zealand	95
Egypt	
Total	946,304

### Greek Railway Improvements

In view of the proposed linking-up of the Greek and European railway systems in Macedonia, according to reports from Athens, the Greek Government has sanctioned the construction of certain work and other improvements on the Piraeus-Athens-Larissa and Salonika railway, which will cost 35,000,000 fr. (\$7,000,000). The work has already begun, under the supervision of a competent staff of Greek and European engineers. A number of short tunnels, the length of which in all is about 1,300 metres, and eight or ten bridges, each 10 metres in length, are being constructed to improve the section between Athens and Larissa; while the bridges between Papapouli and Topsin, on the Larissa-Salonika line, will be made of iron and reinforced concrete, at an expenditure of 4,000,000 fr. (\$800,000). These bridges, it is estimated, will require 1,000 tons of iron, and will be constructed in Greece with the exception of two, one for the River Bistrizza (Haliakmon) and one for the River Kara-su (Navroneri), which have been ordered in Europe (the country is not mentioned). Four hundred large houses will be built along the line for the railway officers, attendants and workmen; also workshops and engine sheds at the Piraeus, Lianocliadi and Larissa. M. Venizelos is particularly interested in the completion of all these works, taking an active part and supervising the orders given for the necessary materials. As regards the material, it is stated that the Greek Government will buy the railway material belonging to the British Headquarters in Macedonia, which a committee of experts has already gone to value, while large quantities of iron and implements for the works are being sent from France. Offers for the supply of railway passenger cars at reasonable prices were made (it is said)

direct to M. Venizelos from Canada; while sleeping and dining cars will be sent in due time by the respective companies. In the meantime the reconstruction and repairs of the Serbian railways, so badly damaged or destroyed by the war, are progressing. The trains run now as far as Uskub, and it is hoped that within a month or two the remainder of this line will have been repaired and thus the union of the Greek and European railways will be effected.

### Railway Extensions in Brazil

Plans are under consideration for the construction of a new railroad in the state of Sao Paulo, Brazil. The proposed line is to extend from Pederneiras through Agua Limpa, Saturno, and Poco Alcalino de Quilombo to the Batalga River at Rainha dos Anjos do Batalha, thence northwest to Miguel Calmon, traversing about 70 miles through a very fertile region, rich in woods.

It is also planned to run a railroad line which will connect the three mountain towns, Petropolis, Therezopolis and Friburg. The route will be one of the most picturesque and fascinating in the country.

The president of Brazil recently specified the dates for the construction and delivery of the following railway lines: From Sao Sebastiao do Paraíso to Passos, December, 1920; the Biguatinga to Jaculy extension, February 24, 1921; and November 15, 1921, for the Pratinha to Santa Rita de Cassia branch, and the extension from Passos to kilometer 24.5 toward Sao Jose de la Barra.

### What Happened to Belgium's Railroads

A clear idea of the thorough use of the Belgian railway lines by the Germans during their occupation of that country, of the attempts to Germanize the system completely and information concerning the preparations made by the Germans to destroy the system completely before their departure, are given in an article in the Belgian Reconstruction Section of the Times (London) Engineering Supplement for April.

The enemy, the article says, made the fullest possible use of the Belgian railway and light railway system during his advance, his period of occupation, and his retreat from the country. The main line tracks were under enemy control and operation immediately and worked by men of the railway corps largely recruited from the German railway staffs. Complete plans for taking over and controlling the railways had been worked out before the invasion, which even contained schemes for "improving" certain portions and connections of the system for the benefit of the invading armies. These were immediately put in hand as he advanced, and were carried out as rapidly as possible. Control was so complete and effective that when his period of occupation was near an end the Belgian railway system was completely Germanized. Signalling systems were altered or reinstalled to bring them into line with the German system, and other sweeping alterations were made. The Belgian and French locomotives and rolling stock which had fallen into the hands of the enemy were worked to destruction, and, finally, elaborate plans were made for a systematic destruction of the whole main railway system in preparation for a possible hasty retreat. Stations, railway buildings, signal boxes, viaducts, and stretches of the permanent way were mined, and destruction gangs were ready to cut telegraph and telephone wires and put all signalling apparatus out of gear.

When the retreat began the enemy carried out many of his schemes of destruction, but, happily, not all of them. It was possible to resume certain services immediately after the armistice, and the work of re-establishing the principal routes was at once put in hand and is being carried on with all available resources of labor and material. A manifest

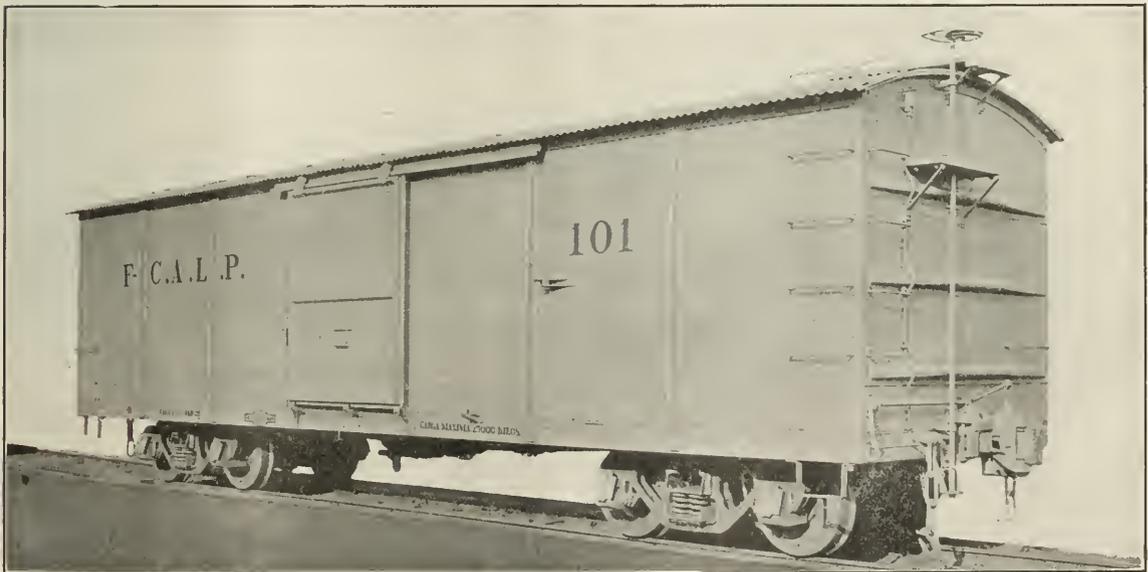

improvement was visible even during a three weeks' visit to the country, and every week new trains are put into operation and running times accelerated. The Central Industrial Committee's estimate of supplies immediately needed includes 500 kilometres of rails, 23 kilogrammes per metre weight; 250 sets of points; 250 17-ton locomotives; 200 10-ton box trucks, 6,000 tipping wagons of various capacities, and 1,000 ordinary goods trucks, and this estimate has only been drawn up from the transport point of view in connection with Belgian industries. The actual requirements of the Belgian State Railways for reconstruction are enormous. They have, however, been met to some extent by German material—principally locomotives and rolling stock—delivered in accordance with the armistice terms. The Belgian rolling stock left in the country is almost unusable, and that returned from Germany is worn out and dilapidated to the point of uselessness. It is for that reason that rolling stock—both for passengers and goods—throughout Belgium is nearly entirely of German origin.

Two interesting projects are mentioned in connection with the future reconstruction of the Belgian railways. One provides for a universal electrification of the whole system, the power to be supplied from high-tension, polyphase generating stations erected in the coal-producing areas, which will feed converter sub-stations established at the necessary places along the line. The other is to denationalize the railways and place them in the hands of a company, State-controlled and State-guaranteed, which will operate them to the best advantage of the nation. Both these are plans in the air at present, but they open up interesting possibilities for the future.

#### LIGHT RAILWAYS

For its size Belgium had a larger and more highly efficient system of light railways than any other country in Europe. The enemy took the fullest advantage of this

during his period of occupation. For a time the light railways were left alone, and were the only means of traveling available for the civilian population of the country. At a time when they needed means of light transport in the area behind their front line the Germans began to levy heavy contributions upon the permanent way and rolling stock belonging to the light railway systems. The most important part of these systems is controlled by the Société Nationale des Chemins de Fer Vicinaux, whose chief inspector reports that at least 1,700km. of track were taken up from the light railway systems during the German occupation and laid down again in places where the Germans had need of transport. All the locomotives and rolling stock were commandeered and shifted to various parts of France and Belgium. The enemy's need for light transport at one time became so acute that he linked his Belgian light railway systems up with similar systems in the occupied portions of France, notwithstanding the fact that the gage of the French system is two cm. less in width. The inspection staff of the S. N. C. V. has made a tour of investigation and has succeeded in discovering a good deal of the commandeered rolling stock in the front line areas. Much of this, however, is not available for immediate return, as it is being used by the military authorities for their own purposes. The permanent way material torn up and relaid in other parts of the country is being repaired to some extent, but traffic congestion is causing delay and there is naturally only a certain proportion of the material which is useful, much of it being very badly worn. Orders for new rails have already been placed, and it is hoped to get quick delivery of 1,000,000 lengths. Reconstruction of the light railway system, which is a vital factor for quick distribution and collection of light goods in Belgium, is being pushed forward as quickly as possible, and the first important line is expected to be completely opened for traffic in six weeks' time.

This car is of all-steel construction and follows American principles of design with automatic couplers, Buckeye Pedestal trucks, Westinghouse air brakes, etc. It is of metre gage. Its inside dimensions are: length 32 ft. 6 in.; width, 7 ft. 9 in., and height, 6 ft. 2 3/16 in. The car weighs 12,719 kilos (28,000 lb.) and its maximum capacity is 25,000 kilos (55,000 lb.).

One of 100 Steel Box Cars Recently Built by the Pullman Company for the Arica-La Paz Railway of the Chilean Government System.

# General News Department

E. J. Manion, of the New York, New Haven & Hartford, New Haven, Conn., has been elected president of the Order of Railroad Telegraphers, in place of H. B. Perham.

In Louisiana the business hours for freight houses are from 8 a. m. to 5 p. m. with an intermission from noon to 1 p. m.; but any carrier may open at 7 a. m. if it so desires. This is a rule which has just been issued by the railroad commission of the state, in place of its former rule; the commission holding that to keep the houses open longer would conflict with the principle of the eight-hour day.

## A Correction

In the issue of June 6, page 1385, reference was made to two timber treating retorts made for installation at the C. & N. W. treating plant at Escanaba, Mich., and the statement was made that these retorts, which were 113 ft. long and 6 ft. 2 in. in diameter, were believed to be the largest timber treating retorts ever installed in the United States. Investigation has since shown that this statement is wrong and that there are numerous retorts in operation in this country larger than those mentioned above.

## Senate Passes Cummins' Bill

Just as we are going to press, word is received that the Senate has passed the Cummins' bill which gives the Interstate Commerce Commission jurisdiction over interstate rates, but leaves the matter of state rates in the hands of the director general of railroads. The bill was amended providing that no change can be made in intrastate rates without 30 days' notice. An amendment was also made requiring the Railroad Administration to pay out of the compensation due to the railroads judgments based on claims that accrued before federal control.

## Burlington Relief Department

The thirtieth annual report of the Relief Department of the Chicago, Burlington & Quincy Railroad Company covering the fiscal year ending December 31, 1918, shows an excess of disbursements over receipts of \$110,583. The net contributions of members and income from investments totaled \$620,295, whereas the benefit orders carried by the treasurer and the interest on cash advanced by the railroad totaled \$730,888. However, the operation of the relief department since its inception in 1889 show that receipts have been in excess of benefit orders paid to the total of \$329,799. The payments made by the railroad company from its own funds in establishing, operating and maintaining the relief department from 1889 to 1918 inclusive totaled \$2,189,234. Records of the benefits paid out show that the average number of cases of accidents equals 10.4 per 1,000 members, the average number of cases of disability equals 53.3 per 1,000 members and the death rate for each 1,000 members averages 15.4 per cent.

## Railroad Men Wanted in Russia

A request has been received at the office of the chief of engineers, War Department, Washington, from the Russian Railway Service Corps for additional men to serve on Russian railroads. At the present time there is need for first class accountants, store and material men, stenographers, shop superintendents, trainmasters, traveling engineers, roundhouse foremen, car foremen and foundry superintendents. These men will not be in the United States Army but will wear a uniform and be members of the Russian Railway Service Corps, a separate service formed for the specific purpose of handling railway matters in Russia. Accountants and store and material men will receive from \$2,000 to \$2,500 a

year, shop superintendents approximately \$5,000 a year, trainmasters and traveling engineers \$2,500, roundhouse foremen and car foremen \$2,000, and foundry superintendents \$3,000. Col. J. M. Wright, Director General of Military Railways, Office of Chief of Engineers, Washington, D. C., is handling inquiries concerning the service.

## Social Status of Railway Men

Statement by Lord Shaughnessy, Chairman of the Board of Directors of the Canadian Pacific Railway.

I have just returned from England. There the situation of labor is a cause of anxiety. Nominally the problem between labor and employers is a question of hours and rates of pay. To my mind, and it will be so here, there is something beyond that now. It is not only a question of hours and rates of pay, but of the actual status of men who are performing such a large portion of the work of building up industries and making themselves as strong an influence as the capitalists and employers. It is a question of what their social status is to be in the future. We may take it for granted beyond question that the working man of the future, the working man of today, must be permitted and enabled and assisted, he and his wife and children, to lead quite a different existence to that of the past. They must not be confined to the narrow, sordid lives that have been theirs hitherto. They must have the opportunity to enjoy the good things of life that those in higher positions have enjoyed.

## "Bunk"

H. M. Mayo, superintendent of safety of the Southern Pacific lines in Texas, the Gulf Coast Lines, and other roads, in bulletin No. 19, issues a little homily on the remark of an employee, after the adjournment of a safety meeting at which he was a visitor, that the safety work was "bunk." Do you believe it? says Mr. Mayo; "personally I should hate to think so, if only for the sake of our twenty-three odd thousand employees who need safe and steady jobs because of the wives and babies, particularly when it comes high to live at all. Why knock? It would be an impossible task to please everybody; yet if an earnest work to save lives and prevent injury is "bunk," then it will have to go at that.

"From January 1 to March 31 members of safety committees and others have made nearly 1,200 safety recommendations of which over 60 per cent have been adopted, and conditions and practices which threatened the safety of our men have been corrected. Is this bunk? Who gets the benefit of the safety work? . . . I wish the chap who does not sympathize with the safety work would talk to a member of one of the safety committees. Safety means life, happiness, efficiency and satisfaction. Get the safety habit and don't knock."

## Thanks to British Railways

A report by the American Red Cross, recently issued, gives warm praise to the railroads of England for their courtesies during the war. The report says:

"Supplies valued at about \$15,000,000 were handled by the London headquarters of the American Red Cross during the war. To the railroads of Great Britain, the American Red Cross owes a great debt of thanks, for not withstanding their depleted staff and the terrific strain upon their roads, they always gave ample space and careful attention to our supplies. When the railroads were laying embargoes for weeks at a time on all classes of material except war supplies, they never refused our shipments. They carried Red Cross supplies at half rates and the unloading of Red Cross freight always received preferential treatment; and every possible courtesy was shown by the staffs of the railways. The Port

of London Authority granted all its dock privileges free of charge, and every possible accommodation was granted even when the docks were greatly pressed for space. The English customs also gave unusual privileges to the American Red Cross. No duty was charged on tobacco, cigarettes, chocolates and other supplies of a dutiable nature which were brought into the country for hospital and canteen distribution. The facilities given us for shipping goods in bond were very exceptional. . . ."

### Winnipeg Strike

Although the Central Strike Committee at Winnipeg, which is in general charge of the strike in that city, maintains that the general strike will continue and will even be extended, the situation seems to be gradually adjusting itself, and the general strike called in support of the metal trades union seems to be losing force. Great pressure has been exerted by international unions, conservative trades union men and representatives of the railway brotherhoods, the latter acting as mediators at Winnipeg to bring the strikers and employers together for a settlement of their differences, but this pressure has not caused any great changes in the plans of the radical leaders of the strike. Latest reports indicate that the negotiations of the representatives conducted by the railway brotherhoods have come to naught because of the stand taken by the employers.

The attitude of the returned Canadian soldiers at Winnipeg has been instrumental in alienating sympathy from the strikers, and their action has prevented a show of violence on the part of the strikers.

The Brotherhood of Railroad Car Men has revoked the charters of two of its local unions at Winnipeg and that of a third at Edmonton. The American Federation of Labor has disapproved of appropriating money for organizing "one big union." Other heads of international unions are preparing to issue similar orders, it is said.

On Thursday of this week, Mayor Gray, of Winnipeg, gave notice that at the next sign of disorder among strikers he would ask for troops to keep order.

### Telegraph and Telephone Lines Returned to Private Operation—Strike of Operators

Control of the operations of the telegraph and telephone lines, which were taken over by the government in July, 1918, was restored suddenly to the owners of the properties by an order issued by Postmaster General Burleson on June 5. The order, however, retains a degree of federal control over the companies. The rates fixed by the government, the financial relations between the companies and the government, and the order prohibiting discrimination against employees because of union affiliations will be continued, unless Congress orders otherwise, or until federal control is finally terminated by the proclamation of peace. Immediately after the issuance of the order the president of the Commercial Telegraphers' Union issued orders extending the strike of Western Union operators at Atlanta to the entire southeastern section, predicting that it would be extended later to the entire Western Union system and to other companies. The postmaster general stated that his action was taken because the President had recommended the return of the properties and in view of the action of the Senate and House committees looking to a return. The companies, he said, are now "free to formulate and put into effect their own policies unrestricted by government control, which is to continue in any case a few weeks, and thus be able to prepare themselves for a complete resumption of the management of their properties." The Senate committee had voted to report a bill, introduced by Senator Kellogg, to return the properties of their properties." The Senate committee had voted a bill, introduced by Senator Kellogg, to return the properties to their owners immediately after its passage and the House committee was holding hearings on a similar bill. Only a few hours before the announcement, J. C. Koons, first assistant postmaster general, and chairman of the wire control board, had testified before the House committee, suggesting June 30 as a good date for the restoration of private management. The operating board created to direct the manage-

ment of the wire lines is relieved of its operating duties and directed to wind up its affairs.

The Kellogg bill was passed by the Senate on June 10 after a brief debate and without a roll call. It provides that the present rates shall be continued for 90 days.

The strike of telegraph operators was ordered to go into effect on Wednesday morning, June 11, but at this writing (Thursday) seems to have caused but little disturbance. Some cities report from 10 to 30 per cent of the operators out, but at most of the important points the message service appears to be going on about as usual. The Postal Company appears to have suffered more than the Western Union, but in the offices of both companies strikers were returning to work. Among the operators of the Western Union there is a separate organization of employees which seems to be friendly to the management; and the company this week announced that \$1,000,000 in back pay was to be distributed to loyal employees.

New agreements have been signed with the operators by the Federal Telegraph Company, a combination of land and radio telegraphs on the Pacific Coast.

### American Association of Railroad Ticket Agents

The American Association of Railroad Ticket Agents held its first annual convention at Chicago, June 9 and 10. The opening session of the convention was to be addressed by R. H. Aishton, regional director of the Northwestern region, but Director General Walker D. Hines, who was passing through Chicago on an inspection trip, spoke in place of Mr. Aishton, telling the members of the association of his approval of the objects for which the association was formed and discussing the relation of efficiency on the part of employees, especially ticket agents, to the present railroad situation. Mr. Hines said, in part:

"The railroads of the country are in a very serious need at the present time of any additional efficiency that can be effected, and any additional economies that can be adopted in the use of supplies and in the carrying on of the business. The increase in wages and the increase in cost of materials has been very much in excess of the increase in rates, and that condition, coupled with the temporary falling-off in freight business, has produced a very serious deficit. We ought to consider very carefully just how much can be accomplished through the introduction of more efficient methods. I feel the very greatest interest in keeping down the increase in rates just as far as possible, because I think the great thing to accomplish is to keep down as far as we can the cost of living to the American public; to you, to me and to all the rest of the public. What you can do in making your work more productive, and in the minor economies you can practice in the matter of railroad supplies, will, in the aggregate, represent an enormous saving which will be an important factor in reducing the amount of increase which must be made in rates."

### Echoes of the War at the Atlantic City Conventions

Several innovations have been introduced in the evening programs at the mechanical conventions, which will be held at Atlantic City, June 18-25. The program on Saturday evening will be in the nature of an appreciation of the railroad and railroad supply men who went into the service. Josephus Daniels, secretary of the navy, will make an address, expressing such appreciation. It is expected that Brigadier General W. W. Atterbury, who has just returned from France, and who was director general of transportation under General Pershing, will be present and make an address. Other speakers will be Col. Henry W. Hodge, senior member of the firm of Boller, Hodge & Baird. Col. Hodge will speak particularly on the achievements of our railroad regiments in France. Senator Walter E. Edge, New Jersey's war governor, will also make an address.

On Monday evening, June 23, an address will be made by Major E. D. Campbell, Railway and Seacoast Section, Artillery Division, Ordnance Department, United States Army, Washington, D. C., on Railway Artillery, at the Hippodrome, from 8:30 to 10:00 o'clock. The address will be illustrated by motion pictures and lantern slides.

REVENUES AND EXPENSES OF RAILWAYS

THREE MONTHS OF CALENDAR YEAR 1919

Table with columns: Name of road, Average mileage operated during period, Freight, Passenger, Operating revenues, Total (inc. misc.), Way and structures, Maintenance of equip., Traffic, Operating ratio, Net from operation, Railway tax accruals, Operating income (or loss), Increase comp. with last year. Rows include Lehigh & New England, Alabama & Vicksburg, etc.

REVENUES AND EXPENSES OF RAILWAYS

## Commission and Court News

### Interstate Commerce Commission

The Commission has issued an order making numerous amendments to its regulations for the transportation of explosives and inflammable and other dangerous articles.

### State Commissions

The Public Service Commission of Pennsylvania, acting on complaints of the State Highway Department has ordered the abolition of six highway grade crossings, one each at Girard, at Martin's Creek Junction, at Port Clinton, and at Youngsville, Warren county, and two at Dallas. In each case the commission apportions the shares of the expense to be borne respectively by the county, the state, the township and the railroad company.

### United States Supreme Court

#### Apportionment of Cost of Joint Interlocking

The Puget Sound & Willapa Harbor found it necessary, in the construction of a new line in 1914, to cross at grade, at two places, tracks which had been laid in 1890-92 by the Northern Pacific. The Willapa is organized under Washington laws, the Northern Pacific under Wisconsin laws. The Washington Public Service Commission granted the required permission, subject to the condition that suitable interlocking signals, of a type to be agreed upon by the two companies, should be installed at the crossings. The companies agreed on all the conditions, except as to the cost of installing and maintaining. On submission of the question to the Commission, it decided that the entire expense should be borne by the Willapa. The Supreme Court of the State reversed this decision, and ruled that the expense should be divided equally between the two companies. The Northern Pacific argued that when it entered the state of Washington and constructed its line, an act of the Legislature, passed in 1888, was in effect which gave to railroad companies formed under the act the right to cross any other railroad theretofore constructed, but subject to conditions which the State Supreme Court held, in 1908, in *State v. Northern Pacific*, 49 Wash. 78, required the junior company to pay the entire cost of the crossing, including the installing and maintaining of interlocking where necessary; that this constituted a vested right of property in the senior company, and that the later statute of 1913, which the Supreme Court held, in this case, required it to bear one-half of the cost of installing and maintaining the apparatus, deprived of its property without due process of law.

The Supreme Court of the United States holds that at most the earlier statute, and the interpretation which the State Supreme Court placed upon it, was a rule of law applicable to the assessment of damages in a proceeding to appropriate a crossing to which a junior company was entitled by the statute. It was no part of the charter of the Northern Pacific, which was organized under the Wisconsin law, and that company had no vested right to insist that the rule should not be changed by statute or by court decision. While that was sufficient to dispose of the case, the court added that the act of 1913 was passed in an obviously legitimate and customary exercise of the police power of the State to protect travelers and employees from injury and death at such crossings. It has long been settled law that the imposing of uncompensated charges, involved in obeying a law, passed in a reasonable exercise of the police power, is not a taking of property without due process of law within the meaning of the 14th Amendment. The judgment of the Supreme Court of Washington was therefore affirmed.—*Northern Pacific v. Puget Sound & Willapa Harbor*. Decided June 2, 1919.

## Equipment and Supplies

### Locomotives

THE DANISH STATE RAILWAYS have ordered 16 Mogul locomotives from the Baldwin Locomotive Works.

LOURENCO MARQUES (Portuguese East Africa). The Baldwin Locomotive Works recently received an order from these interests for five Santa Fe and three Pacific type locomotives.

FEDERATED MALAY STATES.—The Railway Gazette, London, reports, in a recent issue, that the Crown Agents for the Colonies are considering tenders for 20 engines and tenders for the Federated Malay States Railways.

THE NIGERIAN RAILWAYS have ordered 10 Mountain type locomotives from the American Locomotive Company. These locomotives will have 18-in. by 23-in. cylinders, 42¾-in. diameter drivers, 89,500 lb. weight on drivers, and a total weight in working order of 133,000 lb. They are equipped with superheaters.

ITALY.—Commerce Reports in its issue of June 4 contained the following foreign trade opportunity: "29580—The purchase of a number of locomotives is desired by an importer in Italy. Correspondence should be in French or Italian. References." Further details may be obtained from the Bureau of Foreign and Domestic Commerce at Washington or from any of its district and co-operative offices.

### Freight Cars

W. R. GRACE & Co., San Francisco, Cal., desire to lease on long time fifty 8,000-gal. tank cars.

THE PEKING SUI YUAN RAILWAY, China, is inquiring for 100 40-ton, high side gondola cars with steel underframes.

THE ABOY & M. HERNANDEZ COMPANY, New York, is inquiring for one gasoline electric passenger car for export to the Netherlands.

THE SOERABOYA MACHINERY TRADING COMPANY, New York, is inquiring for one trolley freight car for export to the Dutch East Indies.

THE LIVE POULTRY TRANSIT COMPANY, Chicago, has ordered 100 poultry cars from the Mount Vernon Car & Manufacturing Company.

THE KENDALL REFINING COMPANY, Bradford, Pa., has ordered three 40-ton, 8,000-gal. tank cars from the American Car & Foundry Company, Chicago.

THE D. E. HEWITT LUMBER COMPANY, Huntington, W. Va., has ordered six 10-ton logging cars from the American Car & Foundry Company, Chicago.

### Iron and Steel

CHICAGO UNION STATION.—Contracts have been let to the Bethlehem Steel Company, South Bethlehem, Pa., by the Chicago Union Station Company for a quantity of frogs, switches and approximately 200 tons of 130-lb. rail. The total value of the contract is approximately \$50,000. The Joliet Bridge & Iron Company, Joliet, Ill., has also been awarded a contract for approximately 650 tons of steel to be used for the construction of the superstructure of a foot subway in connection with the South Canal street viaduct. The contract for the construction of the Taylor street superstructure was awarded the George A. Fuller Company, New York, last week.

## Supply Trade News

W. R. Gillies has resigned as mechanical engineer of the Oregon Short Line, with headquarters at Pocatello, Idaho, to enter the employ of the **Union Asbestos & Rubber Company**, Chicago, as assistant to the president.

P. Harvey Middleton, for seven years executive assistant of the **Railway Business Association**, has resigned to accept a position with the foreign trade department of the **Guaranty Trust Company**, New York. Mr. Middleton takes up his new duties on June 16.

Major Charles E. Sholes has been elected vice-president, director and general sales manager of the **Edison Storage Battery Company** to succeed Harrison G. Thompson, who has resigned to organize and conduct the **Transportation Engineering Corporation** of New York. Major Sholes has heretofore been identified with the construction, operation and management of chemical industries. He was the active member of the **Creditors' Committee** of the **Aetna Explosives, Inc.**, during the receivership. During the war he served as major in ordnance, first as chief of the chemical branch, which attended procurements of platinum, cotton linters, alcohol, acids, etc., and as army representative before the **War Industries Board**, and numerous other committees and boards. He was subsequently made contracting officer for the United States on the staff of Col. Lamont, and retains his rank in the **Officers' Reserve Corps**. He is also chairman of the **Society of Chemical Industry**.

Major C. E. Sholes

E. G. Buckwell, secretary and manager of sales of the **Cleveland Twist Drill Company**, Cleveland, Ohio, sailed on May 12, for a three or four-month tour of Europe. He will make an investigation of trade conditions throughout England and the continent.

The **Allied Steel Castings Company**, Harvey, Ill., which is controlled by the **Chicago Malleable Castings Company** and the **Universal Draft Gear Attachment Company**, Chicago, will install a 10-ton open hearth furnace to supplement the present **Wellman-Seaver-Morgan** 5-ton tilting furnace, which will be enlarged.

Joseph Robinson, formerly president of the **Robinson Connector Company, Inc.**, announces that he is no longer connected with that company in any managerial capacity and has no supervision over the mechanical details of construction of the automatic hose connector, of which he is the inventor and which bears his name.

The **McMyler Interstate Company**, Cleveland, Ohio, makers of car dumpers, locomotive cranes, ore and coal handling machinery, scraper and railroad equipment, with works at Bedford, Ohio and at Warren, Ohio, has opened a branch office in the **Merchants Exchange building**, San Francisco, Cal., with L. A. Somers as district representative.

The **National Steel Car Company**, Hamilton, Ont., will not be purchased by the **American Car & Foundry Company**. Negotiations looking toward the absorption of the former

by the latter at one time looked promising, but have now been broken off for the reason, it is said, that the **American company** was unable to offer terms that were satisfactory to the **National Steel Car Company**.

The manufacture and sale of **Lundie tie plates** up to this time handled by **John Lundie**, 52 Broadway, New York, has been taken over by the **Lundie Engineering Corporation**, at the same address, with the following officers: **John Lundie**, president; **Percy Holbrook**, vice-president; **Eugene Brandeis**, treasurer, and **R. W. Crawford**, secretary. The **Chicago office** at 30 North La Salle street, is in charge of **C. Z. Moore**, manager of sales.

Col. E. J. Hall, first-vice-president of the **Hall-Scott Motor Car Company**, San Francisco, Cal., recently received the distinguished service medal from the government, by reason of his having designed the major portion of the liberty motor and also having an excellent record as chief of the **Technical Section, Air Service**, in charge of aviation engineering, inspection, and acceptance of airplane parts and equipment with the **A. E. F.** in France, England and Italy.

E. A. Hitchcock has been elected vice-president of the **Bailey Meter Company**, Cleveland, Ohio. He will supervise the training of technical graduates for the company's service and sales departments. During the past six years he has been connected with the **E. W. Clark & Co. Management Corporation**, as advisory, consulting and power sales engineer. Previous to that time he was professor of experimental engineering at **Ohio State University**.

J. W. McCabe, until recently district manager of sales at Buffalo, N. Y., for the **Chicago Pneumatic Tool Company**, Chicago, has been appointed special representative for the company's foreign trade department and will leave shortly for an extended trip throughout the Orient, the **Philippine Islands**, and **Australia**. **W. H. White**, has been appointed acting district manager of sales at Buffalo to take charge of that territory during Mr. McCabe's absence.

The **Gary Screw & Bolt Company**, Chicago, has awarded contracts to the **Folwell-Ahlskog Company**, Chicago, for the repairing of its mill buildings at Gary, Ind., which were recently damaged by fire, and for the erection of an additional steel and concrete warehouse which will cost approximately \$40,000. The repairing of the mill buildings will be completed not later than June 15, and the new warehouse building will be completed and ready for occupancy not later than August 1.

W. G. Balph has been appointed manager of the **Safety Switch Section** of the **Westinghouse Krantz Factory**, Brooklyn, New York. As head of this section, Mr. Balph will have entire responsibility for the sale of all **Krantz products**, and, in addition, will have charge of the extension and development of this company's line of safety switches. Prior to working as salesman in the New York office, Mr. Balph was head of the **Fan Motor Division** with offices at **East Pittsburgh, Pa.**

The **Standard Car Construction Company** and the **Standard Car Equipment Company** were merged on June 4, under the name of the **Standard Tank Car Company**, with head office and works at **Sharon, Pa.**, and branch offices at **New York, St. Louis** and **Chicago**. **John Stevenson, Jr.**, is president and **G. F. Wood-Smith** is vice-president of the new company, which will continue all the functions of the two companies, both as to the building and leasing of tank cars and all forms of steel plate construction.

O. D. Conover, formerly vice-president and chief engineer of the **T. W. Price Engineering Company** of New York and production manager of the **Ludlum Electric Furnace Corporation**, has resigned to become production and sales engineer on foundries and steel plants of the **Austin Company**, Cleveland, Ohio. Mr. Conover has had broad experience as engineer in charge of the design and construction of a large number of steel plants, foundries, electric furnaces and other equipment both in this country and abroad. His headquarters will be at Cleveland.

## Transportation Engineering Corporation Organized

Harrison G. Thompson, who on June 1, 1919, resigned from his position as vice president and general sales manager of the Edison Storage Battery Company, has incorporated the Transportation Engineering Corporation, with offices at 200 Fifth avenue, New York. The officers are as follows: H. G. Thompson, president; F. V. McGinness, vice-president, and Harold H. Smith, secretary-treasurer. The new corporation will act as railway distributors for the Edison Storage Battery Company and for the Automatic Transportation Company, of Buffalo, New York. It will handle the Edison Storage Battery for train lights, railway signaling, multiple unit control, and for other purposes to which storage batteries may be applied. It will also handle the complete line of industrial trucks, tractors, and industrial engines as manufactured by the Automatic Transportation Company, with such apparatus as charging equipment, incident to the above lines.

Mr. Thompson became associated with the Edison Storage Battery Company in 1910, and was elected a vice-president in 1913. He was born at Weston, Mass., in 1875. In 1896 he entered the service of the Pullman Company, and after having been with that company for two years was made foreman of electricians. In 1900 he resigned to become foreman of the battery department of the Riker Motor Vehicle Company, but left the latter at the time of its absorption by the General Vehicle Company, of Hartford, Conn., to become associated with W. L. Bliss, one of the pioneers in electric car lighting development. In 1905 he entered the service of the Pennsylvania Railroad and was placed in charge of electric car lighting, with headquarters at Jersey City, N. J. About one year later he became electrical superintendent of the Safety Car Heating & Lighting Company, New York, and was in charge of that company's electrical laboratories during the development of its first electric car lighting system. In December, 1909, he was appointed manager of the railroad department of the Westinghouse Storage Battery Company and later for a short time, was in the employ of the United States Light & Heating Company, New York. In July, 1910, he became manager of the railway department of the Edison Storage Battery Company; in July, 1915, he was appointed general sales manager, and became also vice-president of the company in July, 1918.

Francis V. McGinness, who recently resigned as railway sales manager of the Edison Storage Battery Company, is vice-president of the new corporation. He graduated from Columbia University, School of Engineering, with the degree of electrical engineer in 1910, and then spent a short time in the engineering departments of the New York Telephone Company and the New York & Queens Light & Power Company. He became connected with the Edison forces in 1911,

being then engaged in experimental work in Mr. Edison's laboratory. At this time he also received a thorough training in the manufacture of the Edison battery. He was later appointed assistant manager of the railway department of the Edison Storage Battery Company, and in March, 1916, he was promoted to manager of the same department.

Harold H. Smith, electrical engineer of the Edison Storage Battery Company, becomes secretary-treasurer of the newly formed Transportation Engineering Corporation. Mr. Smith graduated from the Polytechnic Institute, Brooklyn, N. Y., in 1909, with the degree of E.E. For one year thereafter he was employed by the Pennsylvania Tunnel & Terminal Railroad, in the office of the chief engineer of electric traction, in connection with the New York electrification of the Pennsylvania Railroad. He then joined the staff of the laboratory, of Thomas A. Edison, at Orange, and for several years was engaged in research work in connection with the Edison Storage battery. Later he became connected with the selling department of the Edison Storage Battery Company in the capacity of engineer and retained that position up to the time of his recent resignation.

F. V. McGinness

## Material Handling Machinery Manufacturers' Assn.

The semi-annual meeting of the Material Handling Machinery Manufacturers' Association was held Wednesday, June 11, at the Hotel Astor, New York. The aims of the organization are to obtain co-operative publicity for the manufacturers and users of material handling machinery and to show the general public that such machinery is a benefit to them. The manner in which these aims are to be realized was outlined and discussed, and it was decided that technical magazines and moving pictures would afford the desired means.

The Engineering Committee has been at work investigating conditions and methods used for handling materials in various parts in the United States and foreign countries, and has collected a large fund of information pertaining to what kind of machinery is available. Articles containing this information will be submitted to technical magazines. Particular stress will be laid upon the handling of freight between cars and ships, and at freight transfers.

Moving pictures are being taken of all kinds of material handling machinery, and these will be assembled in composite films to be sent to any one who cares to use them. A buyer or a manufacturer can see all manner of machinery in operation in this way, without traveling to various parts of the country. These films will also be sent to educational and civic organizations. The Y. M. C. A. has applied for the use of these films in the United States and abroad, and the Bureau of Commercial Economics, Washington, D. C., has offered to add these to the films they exhibit in all countries.

In the way of educational work, the association will show, by the same means, how such machinery promotes public welfare. They will show that labor is not replaced by the machinery, but that the laboring man is retained to operate the machine, and his standard of work and his wage are thus increased.

Any manufacturer who wishes to have moving pictures taken of his handling machinery can have this done by the association photographers, and any one who wishes can make arrangements for using the composite films. All communications should be addressed to Zenas W. Carter, secretary and manager, the Material Handling Machinery Manufacturers' Association, 35 West 39th street, New York.

## Railway Construction

**ATHABASCA, GRANDE PRAIRIE & FORT VERMILLION.**—Incorporated in Canada with \$1,500,000 capital to build a railway from some point at or near the junction of the Solomon river with the Athabasca in the province of Alberta northwest to a point near the junction of the Smoky river with the Muskeg river in the same province and passing through the Grande Prairie district north to Peace River Landing and terminating at Old Fort Vermillion, about 60 miles. The incorporators are Charles A. Barnard, William K. McKeown, Lorne C. Herdman, Thomas G. Potter and George E. Chart, all residents of Montreal, Que.

**CHICAGO, BURLINGTON & QUINCY.**—A contract has been let to the Wells Brothers Construction Company, Chicago, for the construction of the superstructure of a viaduct in Canal street, Chicago, in conjunction with the building of the new Union Station. Three team tracks will be placed under Canal street and the street traffic will be carried for 800 ft. on a viaduct over these tracks. The viaduct will be 100 ft. wide with a 70 ft. roadway and 20 ft. and 10 ft. sidewalks at the sides. Work on the caissons for this structure was started November 15, 1917, and completed May 15, 1918, involving the construction of 120 caissons.

**EASTLAND, WICHITA FALLS & GULF.**—Maney Brothers & Company, Oklahoma City, Okla., have been awarded the contract for the construction of a road approximately 100 miles long from May, Brown county, Texas, to New Castle, Young county, Texas, passing through Rising Star, Mangam, Eastland, Wayland, Park Field, Breckenridge, Crystal Falls and Murray. Grading for the new road is now in progress north and south from Eastland, the grading contracts calling for 18,000 cu. yd. per mile. The road will have maximum grades of 0.75 per cent south of Eastland and 1 per cent north of Eastland. At the present time approximately 140,000 cu. yd. of the grading has been completed. The line passes through what promises to be a large paraffin base oil producing territory. There is now in the district to be served by the road a large truck and wagon traffic over very bad roads which are often impassable. The principal commodities which will comprise the road's traffic are oil, cotton, merchandise, machinery for oil wells, wheat and other farm products and also some coal. O. B. Colquitt, Dallas, Texas, former governor of Texas, is president of the new road, and C. H. Chamberlin, Eastland, Texas, formerly chief engineer of the Texas & Pacific, is chief engineer.

**NORTH-WEST ROUTE LIMITED.**—A bill has recently been passed in the Canadian House of Commons authorizing the incorporation of this new railway company with \$1,000,000 capital to build a line in the Canadian Northwest. The incorporators are Sir John Keltie, Thomas L. Gilmur, Bernerd Spring-Wright, Ernest S. Hulmwood, all Englishmen. The headquarters of the new company will be in London, Eng. The plans call for building a railway from Baker Lake, North West Territory, northwest to Schultz Lake and from a point near the junction of the Hanbury and Thelon rivers in a westerly and southwesterly direction to a point at or near Old Fort Reliance at the eastern end of Great Slave lake, a distance of about 100 miles.

**Charles E. Elmquist**, president of the National Association of Railway & Utilities Commissioners, has been elected chairman of the federal electric railways commission appointed by President Wilson to investigate the financial and operating conditions of electric railways. Other members are: Edwin F. Sweet, assistant secretary of commerce; Royal Meeker, commissioner of labor statistics; Louis B. Whele, general counsel of the War Finance Corporation; Charles W. Beall of the Investment Bankers' Association; P. H. Gadsden of the American Electric Railway Association and W. D. Mahon, president of the Amalgamated Association of Street and Electric Railway Employees.

## Railway Financial News

**BOSTON & MAINE.**—The annual meeting, which is regularly held early in April, has been adjourned again until July 17. Election of directors was due to come before the meeting but this has been deferred owing to the fact that if the consolidation goes through as anticipated, it would be manifestly unfair to have directors for the entire system elected solely by the Boston & Maine stockholders and without representation from the present leased lines.

The Supreme Court of Boston on June 10 dismissed the petition of Edward F. Brown, of Ipswich, and other minority stockholders of the Boston & Maine, for annulment or amendment of a decree of the Massachusetts Public Service Commission authorizing consolidation of the unfunded debt of the company with that of its leased lines. The petitioners gave notice of an appeal.

**CHICAGO & EASTERN ILLINOIS.**—The public sale of this road at Danville, Ill., has been postponed until September 9.

**CHICAGO, ROCK ISLAND & PACIFIC.**—At a meeting of the directors on Tuesday, no action was taken on the preferred dividends. After the meeting the following announcement was made:

"The company made application some time ago to the director general of railroads for the approval of the regular semi-annual dividend upon the preferred stocks, without which approval the directors cannot declare a dividend, but the director general has refused to approve the payment of such dividend at this time, basing his refusal upon the statement that the road has not signed its contract with the government, has not accepted the allocation of equipment made to it by the director general, and has not through its corporate channels financed the additions and betterments made by the federal administration.

"The standard return of the Rock Island is approximately \$16,000,000, which is sufficient for all fixed charges and the full dividends upon the 7 per cent and 6 per cent preferred stocks and a margin of some 2 per cent upon the common stock. The company has not signed the contract with the government because its claims for additional compensation have so far been declined, and it considers the allocation of equipment unreasonable. The directors have not been willing to assume the responsibility of waiving these claims until they have exhausted every possible legitimate effort to have them recognized. These matters are having the active attention of the officers, and the board is hopeful that the dividend on both classes of preferred shares can be declared at an early date."

**PITTSBURGH, CINCINNATI, CHICAGO & ST. LOUIS.**—The Ohio Public Utilities Commission has authorized this company to issue \$20,000,000 of its 15-year 6 per cent debenture gold bonds, dated January 1, 1919, and due January 1, 1934. The proceeds will be used in paying the Railroad Administration for improvements made and to reimburse the company's treasury for funds expended for improvements.

**SOUTHERN PACIFIC.**—There has been a total conversion to June 2, 1919, of \$27,272,310 face value of this company's 4 per cent convertible gold bonds. These were converted into common stock of the Southern Pacific at the rate of \$130 par in bonds for \$100 par in stock. These conversions amount to substantially one-third of the issue, and leave issued and outstanding \$54,541,690 of these bonds. The conversions called for the issuance of \$20,928,700 stock, and, as nearly all of them were made after December 31, 1917, the amount of stock outstanding is now greater by \$20,000,000 than shown in the last annual report when the company had issued \$272,000,000. The net reduction in liabilities through the conversions amounts to \$6,293,610. On the other hand, total disbursements will be slightly increased. With a diminution of \$1,090,892 in fixed charges will come an increase of \$1,258,722 in dividend requirements, or a net increase of \$167,830.

## Railway Officers

### Railroad Administration

#### Central

**W. J. Cunningham**, who has been manager of the Operating Statistics Section of the Division of Operation since its organization last spring, has been appointed assistant director of the Division of Operation and also chairman of a special committee on maintenance expenditures. **V. P. Turnburke**, assistant manager of the Operating Statistics Section and formerly statistician of the Great Northern, has been appointed manager of the section to succeed Mr. Cunningham, and **F. L. Sears**, heretofore chief clerk of the section, has been appointed assistant manager.

**A. M. Burt**, assistant general manager of the Northern Pacific, has been appointed assistant director of the Division of Operation of the United States Railroad Administration at Washington, D. C., in charge of engineering and maintenance, succeeding **Charles A. Morse**, resigned to resume his former position as chief engineer, Chicago, Rock Island & Pacific, effective on June 1. Mr. Burt was born at Syracuse, N. Y., on May 1, 1866. He began railway work as a rodman on the Colorado Midland in 1885. In 1889 he went with the Northern Pacific as an instrument man, later being appointed assistant engineer. From 1892 to 1897 he was assistant engineer on the Adirondack & St. Lawrence, the Wisconsin Central and the Chicago & North Western. On January 1, 1897, he re-entered the service of the Northern Pacific, as supervisor of bridges and buildings, and in March, 1901, was appointed assistant superintendent. From October, 1902, to January 1, 1914, he was superintendent of various divisions in Dakota, Montana and Washington. From the latter date until April 1, 1918, he was chief engineer maintenance of way, with headquarters at St. Paul, Minn.; he then was appointed acting general manager of the lines east of Paradise, Mont., and later became assistant general manager of the same road, with office at St. Paul, Minn.

A. M. Burt

#### Regional

**G. H. Ingalls**, traffic assistant of the Eastern Region, has been appointed senior traffic assistant to the regional director, Eastern Region, with offices at Chicago.

#### Federal and General Managers

**W. J. Harahan**, federal manager of the Seaboard Air Line and associated roads, has been appointed federal manager also for the Atlantic & Western Railroad, with office at Norfolk, Va.

#### Operating

**J. H. Johnson**, assistant to general superintendent on the Northern Pacific, has been appointed acting superintendent of the St. Paul division with headquarters at Minneapolis, Minn.

**C. L. Nichols**, general superintendent on the Northern Pacific, with headquarters at St. Paul, Minn., has been appointed

assistant general manager, with headquarters at St. Paul, vice **A. M. Burt**, who has been appointed assistant director, Division of Operation, United States Railroad Administration, Washington, D. C.

**F. G. Minnick**, operating assistant of the Monongahela Railroad, the Pittsburgh & Lake Erie, and the Pittsburgh & West Virginia, with headquarters at Pittsburgh, Pa., has been appointed assistant federal manager of these roads, also of the Lake Erie & Eastern and the West Side Belt Railroad. The office of operating assistant has been abolished.

#### Financial, Legal and Accounting

**Paul C. Hamlin** has been appointed general solicitor of the Lehigh & New England, with office at Philadelphia, Pa., vice **Leroy E. Reed**, deceased.

#### Traffic

**William A. Holley**, assistant general freight agent in charge of coal traffic for the Chicago, Burlington & Quincy, with headquarters in Chicago, has resigned to accept the position of traffic manager for the Central Illinois Coal Traffic Bureau, with headquarters at the same point. This bureau was recently organized by a group of large coal operators in Illinois for the purpose of handling in a uniform manner all traffic matters of interest to the members and their customers.

#### Engineering and Rolling Stock

**W. L. Robinson**, superintendent of fuel and locomotive performance of the Baltimore & Ohio with headquarters at Cincinnati, Ohio, has been promoted to division master mechanic of the Illinois division, with headquarters at Washington, Ind.

**S. U. Rhymer**, general signal inspector of the Chicago & Alton, has been appointed signal engineer and superintendent of telegraph, with headquarters at Bloomington, Ill., succeeding **George W. Hulsizer**, notice of whose death appeared in the *Railway Age* of June 6, page 1396. Mr. Rhymer's appointment became effective June 4.

**Lieutenant-Colonel William G. Arn**, formerly assistant engineer, maintenance of way, of the Illinois Central, with headquarters at Chicago, has returned to his former position after 22 months' service with the 13th Engineers (Railway) Regiment. Lieutenant-Colonel Arn went overseas in July, 1917, as a captain and served in the St. Mihiel and the Meuse-Argonne offensives. While in France he was promoted to major and later to lieutenant-colonel, returning to this country in April, 1919. **L. H. Bond**, who has been acting as assistant engineer, maintenance of way, during Lieutenant-Colonel Arn's absence, has been assigned to other duties.

### Corporate

#### Executive, Financial, Legal and Accounting

**Charles H. Godfrey** has been appointed special auditor of the Grand Trunk with office at Montreal, Que., to fill the vacancy caused by the death of **Charles Percy**.

#### Traffic

**Gordon A. McGuire** has been appointed commercial agent of the Grand Trunk, with headquarters at Buffalo, N. Y., vice **E. J. Hilliard**, promoted.

#### Engineering and Rolling Stock

**C. S. Gzowski, Jr.**, has been appointed special engineer to vice-president of the Canadian National Railways, with office at Toronto, Ont.

**E. C. Johnson**, acting chief engineer of the Pacific Electric Railway Company, with office at Los Angeles, Cal., has been appointed chief engineer, vice **George E. Pillsbury**, retired, and the position of assistant chief engineer has been abolished.

Entered at the Post Office at New York, N. Y., as mail matter of the second class.

Subscriptions, including 52 regular weekly issues and special daily editions published from time to time in New York, or in places other than New York, payable in advance and postage free; United States and Mexico, \$5.00; Canada, \$6.00; Foreign Countries (excepting daily editions), \$8.00 (£.15s.0d.); single copies, 15 cents each. Subscription Agents for Great Britain and Egypt: The Dorland Agency, Ltd., 16 Regent Street, London, S. W. 1.

WE GUARANTEE that of this issue, 17,000 copies were printed; that of these 17,000 copies, 15,406 were mailed to regular paid subscribers to the Railway Age and the Railway Mechanical Engineer; 119 were mailed to advertisers, 300 were provided for counter and news companies' sales, new subscriptions, bound volumes, copies lost in the mail and office use; and 1,175 copies for distribution at Atlantic City.

THE RAILWAY AGE is a member of the Audit Bureau of Circulations (A. B. C.) and the Associated Business Papers. (A. B. P.)

The 301 exhibits this year occupy about 93,500 square feet of floor space. This is a very considerable increase over the record exhibit of 1913,

## A Record-Breaking Exhibit

when 277 exhibits required a floor space of 87,360 square feet. Noteworthy features this year are

the large machinery exhibits with many of the machine tools in actual operation and the high standard of the exhibits from an educational standpoint. Many new devices have been developed since the last convention and are shown on the pier. This, with the fact that the number of railroad men at the convention this year will be very much larger than usual, means that those who are demonstrating the advantages of their devices will have an extremely busy time. The track exhibits have a number of unusual features, including the Pennsylvania Railroad exhibit of a simple Mallet locomotive and hopper and gondola cars of over 100 tons capacity. The Railway Supply Manufacturers' Association is to be commended for taking advantage of a splendid opportunity to co-operate with the Railroad Administration in helping railroad visitors to get the most out of the exhibits. Assistant Director of Operation McManamy has asked that those who attend the convention report back in writing to their superiors on those things which specially attracted their attention as being of practical value to meet the peculiar conditions on their road. Mr. McManamy does not wish to check up or criticize those who are attending the conventions, but is simply desirous of using these means of helping the men to get the best practical results from their attendance at the conventions.

The Pennsylvania hopper and gondola cars which are being exhibited at the convention this year, a description of which appears on another page in this issue, mark another step in the extension of the use of cars of over 100 tons capacity for mineral traffic.

## The Maximum Capacity of Freight Cars

The first 100-ton car to be built was that of the Woodward Iron Company, which went into service in 1916. Since that time the Virginian Railway has built four 120-ton experimental cars, and the Norfolk & Western has built both hopper and gondola cars of 180,000-lb. capacity. All of these cars are carried on six-wheel trucks, and most of them, including the Pennsylvania cars, are designed to take full advantage of the loading capacity of 6-in. by 11-in. axles. At the present time this is the largest standard M. C. B. axle, and it is evident that any material increase in capacity above 120 tons must require a larger axle, or trucks with more than three axles. It is a serious question whether wheel loads greater than those permissible with 6-in. by 11-in. axles concentrated on the small area of contact between the rail and wheels of 33-in. diameter will be acceptable from the standpoint of track maintenance. Furthermore, unloading facilities for open-top cars are an important factor in determining the size and capacity of these cars, and will probably not be universally adapted, even to cars in the 100-ton class, for some time to come. The use of trucks with more than three axles, while not inherently impossible, would probably involve an increase in weight which might largely offset the advantage of the increased capacity which such a truck would make possible, thereby keeping the ratio of paying load to full load at a figure which would show no advantage for the larger car over cars with six-wheel trucks. It seems probable, therefore, that no serious attempt will be made to develop freight cars of more than 100 to 120 tons capacity, at least for many years to come.

The railway supply industry is gradually working around to a peace time basis in export trade, although possibly

## Exports of Railway Supplies.

not as rapidly as many enthusiasts might have wished. Within the past few months, large and important orders have been received from a wide range of countries. Locomotive orders have been received from France, China, Italy, South Africa, South Manchuria, Korea, Nigeria, the Federated Malay States, Argentina, Norway and Denmark, while not long since an order for cars was received from India, which is usually regarded as exclusively a British market. The export trade in railway supplies is apparently in its second stage; the first being to meet war-time demands, and the second to meet the demands of reconstruction—the third will be that in which the permanent peace-time market will be dealt with. Railway supply concerns are now furnishing the equipment which Mr. Vanderlip includes among the necessities that we must send to help the countries of Europe get on their feet industrially, and filling in here and there for the railways of other countries that cannot buy in their regular markets but that must have equipment to operate their railroads. In fact, as has been emphasized before, the business that we are now doing is in many cases to countries that will, in normal times, be our competitors as manufacturers of railway supplies themselves. The point is that the real work still lies ahead, namely, in securing business in the neutral countries or in the countries of the new world that, as a rule, do not manufacture railway equipment themselves. The business that is naturally to be expected from these countries has as yet hardly begun to materialize, presumably because of lack of credits and diffi-

culties of financing; but that it is coming is as certain as it is that nearly all these countries have almost had to do without new railway materials and supplies for five years, and that in consequence their railways are exceedingly short of cars, locomotives and accessories of all kinds.

## Amalgamation of the Associations

THE MERGING OF THE MASTER CAR BUILDERS' ASSOCIATION and the American Railway Master Mechanics' Association, which has repeatedly been proposed and discussed at past conventions, is now an accomplished fact. By the action of the Executive Committees of the two organizations, their amalgamation as Section 3 of the American Railroad Association was effected several months ago and this action will be submitted to the members for their approval during the convention. To review the successive steps which lead up to the amalgamation would be superfluous, as the report of the General Committee covers this subject.

In a way the present arrangement is on trial, as it was adopted by order of the director general and might be terminated at the expiration of the period of government control. In view of the fact that the merger of the two associations has in the past been rejected by vote of the members whenever it has been proposed, the attitude that will be assumed in this instance is not easy to forecast. The matter will have to be decided, probably in the near future, and while the present arrangement is in effect the members should consider its advantages and disadvantages in order that they may be able to judge whether its continuation would prove desirable or undesirable. In the past the members have been unwilling to see either association lose its identity. The same objection will no doubt be raised again and the question to be decided is whether the practical advantages to be gained by the amalgamation will outweigh these sentimental objections.

It is significant that the officers and members who have been working most actively under the new order are heartily in favor of it, because of the many advantages that have become apparent during the time it has been in force. In general the benefits are those secured through a more logical organization. An example is found in the work of the Committee on Car Trucks, which, through the co-ordination of the Mechanical Section with the other sections of the American Railroad Association, has been able to complete work which otherwise would probably have been carried over until the next convention, if not longer. The desirability of a means of securing co-operation with associations representing other departments of the railroads has been evident, but in the past there has been no way of bringing together the conflicting interests. Another advantage accruing from the new arrangement is the elimination of duplication in the work of committees.

The achievements of the Master Car Builders' Association and the Master Mechanics' Association have been so important in improving the design and construction of cars and locomotives that these organizations should not be allowed to pass out of existence unless some other agency is provided for carrying on the work they have so ably prosecuted. The consolidation of the associations as the Mechanical Section of the American Railroad Association promises to effect a broadening of their activities. None of the work carried on heretofore will be curtailed and, with the active support of the executives assured, further investigation can be carried on under the most favorable conditions. The mechanical department is facing big problems and the new organization promises to

afford better opportunities than have existed for working out their solutions.

At least, this is the way the matter looks now. More experience may possibly develop objections to the present arrangement which are not now apparent.

## A Justified Spirit of Optimism

THE PRESENT CONDITIONS in the railway and railway supply fields are anything but satisfactory. Railways having more than 90 per cent. of the mileage in the country are in the hands of the government, and their expenses are so high in proportion to their earnings that thus far this year they have incurred a deficit averaging more than \$60,000,000 a month. Because they are in the hands of the government, their financial management is largely dependent upon appropriations made by Congress. At its last session Congress failed to pass a bill making an appropriation of \$750,000,000 for the Railroad Administration, which was needed. When the Director General, at the present session, asked for an appropriation of \$1,200,000,000, Congress, without any good reason, provided only \$750,000,000. The roads will be returned to private operation within a comparatively few months, and, because of this and its shortage of funds, the Railroad Administration is making no expenditures for additions and betterments which the companies will not authorize and finance. The companies, not being in possession of their properties and most of them being unsatisfactorily situated financially, are holding down their appropriations for additions and betterments as much as they can. In consequence of this combination of circumstances, the orders being placed by the railways with railway supply companies are comparatively small, those for materials and equipment to be used in additions and betterments being unprecedentedly small.

The foregoing facts do not make a picture contemplation of which is adapted to inspire optimism on the part of railway men and railway supply concerns. Nevertheless, there is being manifested by them a very marked spirit of optimism. The exhibit of the railway supply manufacturers at the June conventions, which begin today, is the largest and best ever known.

There is good ground for the spirit of optimism being displayed. In the first place, it is evident, as already indicated, that the railways are going to be returned to private operation soon. The threat of government ownership of railroads, which has hung over the railway and railway supply fields for years, and especially for the last year and a half, no longer exists. It has ceased to exist because the public has seen the experiment of government operation tried and does not like the results. The public may appraise the results correctly or incorrectly, but there is no doubt it has decided that they are unsatisfactory.

Not only are the railways going back to private operation, but they undoubtedly are going back under a system of regulation which will be fairer and wiser than that which prevailed before government control was adopted. The new policy may not and probably will not be entirely just and satisfactory from the railway point of view, but that it will be an improvement over the old system there can be no doubt, since every bill that has been introduced in Congress which has any chance of passage would result in improvements in regulation.

The main purpose for which improvements in regulation are needed is to so rehabilitate the credit of the railways as to enable them to raise sufficient capital adequately to develop their facilities. This fact is not quite as clearly recognized in Washington as it should be, but

it is recognized by many Senators and Representatives who will have a leading part in framing the new railway legislation, and there is very good reason for hoping that the legislation finally passed will have as its main purpose and effect the enabling of the railways to earn adequate revenues. The fact that the country has had an experience with government operation and greatly dislikes it promises in the long run to be of the greatest help in securing the establishment of a fair and wise system of regulation.

If the railways are returned to private operation under regulation which assures to them opportunity to earn adequate revenues, there is certain to be an important revival of the expansion of railway facilities and of the purchase of materials and equipment incidental to such a revival. The railways today, because of the recent heavy decline of freight traffic, have nominally a large surplus capacity; but, as a matter of fact, under normal conditions of business, they would be entirely unable, with their present capacity, to satisfactorily handle the country's business. They will have to make vast expenditures for additions and improvements to make their capacity equal to the productive capacity of the country, and they will have to make very large expenditures to take up the deferred maintenance which has been accruing for some years. The large expenditures for supplies and equipment which the railways ought to make and which it appears probable that they will make, once they begin to get on their feet again after they have been returned to private operation, should result in the placing of a large business with the railway supply and equipment manufacturers.

There is, besides, a prospect that the railway equipment and supply manufacturers of the United States will be able to do a larger business abroad than they have in the past. American manufacturers have not been able to increase their export business as much in proportion since the Armistice as it was expected that they would be. This has been true of manufacturers of railway supplies and equipment among others, but in anticipating the orders to be received from abroad not enough allowance was made for the drastic readjustments which would have to occur before the countries which have been at war could get down to a normal economic basis; and, furthermore, it was not anticipated that the deliberations and negotiations concerning the Treaty of Peace would be dragged out as they have been. Economic conditions throughout the world are bound to remain very abnormal until peace finally has been signed. Every economic and financial expert who has investigated conditions abroad since the war has returned with the conviction that American manufacturers, including manufacturers of railway equipment and supplies, will be able after peace has been signed to do a much larger business abroad than heretofore, provided our banking concerns show enterprise and skill in making the needed credit arrangements and our manufacturers show enterprise and skill in going after the business.

On the whole, therefore, while the present situation in the railway and railway supply fields is far from satisfactory, the general outlook in those fields is favorable. Before the railways can get on their feet, there will have to be a revival of freight traffic, a substantial advance in rates and legislation reforming the old system of regulation. The revival of traffic will unquestionably begin when this year's large crops commence to move. The fact that an advance in rates will have to be made seems now to be generally recognized. The needed legislation is on the way. There is justification for the spirit of enthusiasm and optimism being manifested in the railway and railway supply fields.

## Program for the Week

THE SESSIONS OF THE CONVENTION will be held in the Greek Temple on the Million Dollar Pier. The headquarters will be at the Marlborough-Blenheim Hotel, where the office of the president, secretary and executive committee will be located.

The Enrollment Committee will be located at the entrance to the pier. Each member of the Association, immediately on arrival, should go to the enrollment booth, register and procure his membership button. Members will also be furnished with badges for their families. Cards for registration will be furnished at the enrollment booth at the entrance to the Pier.

Members are requested to be in their seats promptly at 9.30 A. M.

### Wednesday, June 18, 1919

#### MORNING SESSION—9.30 A. M. TO 1.30 P. M.

Prayer .....	9.30 A. M. to 9.35 A. M.
Address of Welcome by Mayor of Atlantic City .....	9.35 A. M. to 10.00 A. M.
Address by the Chairman .....	10.00 A. M. to 10.30 A. M.
Action on Minutes of Annual Meeting of 1918 (M. C. B.) .....	10.30 A. M. to 10.35 A. M.
Report of Secretary and Treasurer (M. C. B.) .....	10.35 A. M. to 10.50 A. M.
Appointment of Committees on Subjects, Resolutions, Correspondence, Obituaries, etc. ....	10.50 A. M. to 11.00 A. M.
Unfinished Business .....	11.00 A. M. to 11.05 A. M.
New Business .....	11.05 A. M. to 11.15 A. M.
Report of General Committee, including Announcement of Nominations for Members of Nominating Committee .....	11.15 A. M. to 11.30 A. M.
Discussion of Reports:	
Nominations .....	11.30 A. M. to 11.40 A. M.
Standards and Recommended Practice (M. C. B.) .....	11.40 A. M. to 12.10 P. M.
Train Brake and Signal Equipment .....	12.10 P. M. to 12.40 P. M.
Brake Shoe and Brake Beam Equipment .....	12.40 P. M. to 1.30 P. M.

#### AFTERNOON SESSION—3.00 P. M.

The General Committee decided that it would be advisable to have a session devoted exclusively to a discussion of the revision of the Rules of Interchange and that it form a part of the proceedings.

At this session the following reports of committees will be considered:

1. Arbitration
2. Revision of Prices for Labor and Material.
3. Depreciation for Freight Cars.
4. Revision of Passenger Car Rules of Interchange.

#### ENTERTAINMENT.

10.30 A. M.—Band Concert at Entrance Hall, Million Dollar Pier. Royal Scotch Highlanders' Band.

3.30 P. M.—Orchestra Concert and Impromptu Dancing, Entrance Hall, Million Dollar Pier. Fry Philharmonic Orchestra. Tea will be served at 4.30 P. M. in Entrance Hall.

9.00 P. M.—Informal Dance. Ball Room, Million Dollar Pier. Royal Scotch Highlanders Band.

### Thursday, June 19, 1919

#### 9.30 A. M. TO 1.30 P. M.

Discussion of Reports on:	
Car Wheels .....	9.30 A. M. to 10.00 A. M.
Standard Blocking for Cradles of Car Dumping Machines .....	10.00 A. M. to 10.30 A. M.
Specifications and Tests for Materials (M. C. B.) .....	10.30 A. M. to 11.30 A. M.
Welding Truck Side Frames, Bolsters and Arch Bars .....	11.00 A. M. to 11.30 A. M.

Caulkers ..... 11.30 A. M. to 12.00 M.  
 Draft Gear ..... 12.00 M. to 12.30 P. M.  
 Questions proposed by Members .. 12.30 P. M. to 1.30 P. M.

ENTERTAINMENT

10.30 A. M.—Band Concert, Entrance Hall, Million Dollar Pier. Royal Scotch Highlanders' Band.

3.30 P. M.—Orchestral Concert and Impromptu Dancing, Entrance Hall, Million Dollar Pier. Fry Philharmonic Orchestra. Tea will be served at 4.30 P. M. in Entrance Hall.

9.30 P. M.—Carnival Night. Special Features. Ball Room, Million Dollar Pier. Royal Scotch Highlanders' Band.

Friday, June 20, 1919

9.30 A. M. TO 1.30 P. M.

Discussion of Reports on:  
 Safety Appliances..... 9.30 A. M. to 9.45 A. M.  
 Loading Rules ..... 9.45 A. M. to 10.15 A. M.  
 Car Construction ..... 10.15 A. M. to 10.45 A. M.  
 Car Trucks ..... 10.45 A. M. to 11.30 A. M.  
 Train Lighting and Equipment..... 11.30 A. M. to 12.00 M.  
 Tank Cars ..... 12.00 M. to 12.30 P. M.  
 Questions Proposed by Members... 12.30 P. M. to 1.30 P. M.

ENTERTAINMENT

10.30 A. M.—Orchestral Concert at Entrance Hall, Million Dollar Pier. Fry Philharmonic Orchestra.

3.30 P. M.—Band Concert and Impromptu Dancing, Entrance Hall, Million Dollar Pier. Royal Scotch Highlanders' Band. Tea will be served at 4.30 P. M. in Entrance Hall.

9.30 P. M.—Grand Ball, Ball Room, Million Dollar Pier. Royal Scotch Highlanders' Band.

Saturday, June 21, 1919

9.30 A. M. TO 12.00 M.

Consideration of Rules of Order..... 9.30 A. M. to 10.00 A. M.  
 Election of Officers, General Committee and Nominating Committee—  
 Presentation of Badges to Retiring  
 Officers, Etc..... 10.00 A. M. to 12.00 M.

ENTERTAINMENT

10.30 A. M.—Band Concert at Entrance Hall, Million Dollar Pier. Royal Scotch Highlanders' Band.

8.30 P. M.—A special program has been prepared in appreciation of the railway and railway supply men who went into the service during the war. The speakers will be Hon. Josephus Daniels, Secretary of the Navy; Brigadier-General W. W. Atterbury, Col. Henry W. Hodge, and Senator Walter E. Edge, New Jersey's war governor.

Sunday, June 22, 1919

3.30 P. M.—Sacred Concert. Music Rooms of Marlborough-Blenheim. Fry Philharmonic Orchestra.

Monday, June 23, 1919

9.30 A. M. TO 1.30 P. M.

Address of Vice-Chairman ..... 9.30 A. M. to 10.30 A. M.  
 Action of Minutes of 1918 Annual Meeting (M. M.) ..... 10.30 A. M. to 10.35 A. M.  
 Reports of Secretary and Treasurer (M. M.) ..... 10.35 A. M. to 10.50 A. M.  
 Discussion of Reports on: Standards Recommended Practice (M. M.).. 10.50 A. M. to 11.20 A. M.  
 Mechanical Stokers ..... 11.20 A. M. to 11.50 A. M.  
 Individual Paper on "Standardization," by Mr. Frank McManamy ..... 11.50 A. M. to 12.30 P. M.  
 Questions Proposed by Members .. 12.30 P. M. to 1.30 P. M.

10.30 A. M.—Band Concert. Entrance Hall, Million Dollar Pier. Royal Scotch Highlanders' Band.

3.30 P. M.—Orchestral Concert and Impromptu Dancing. Entrance Hall, Million Dollar Pier. Fry Philhar-

monic Orchestra. Tea will be served at 4.30 P. M. in Entrance Hall.

9.00 P. M.—Major E. D. Campbell, Railway and Seacoast Section, Artillery Division, Ordnance Department, United States Navy, will make an address in the Hippodrome on "Railway Artillery." There will be an Informal Dance in the Ball Room, Million Dollar Pier. Royal Scotch Highlanders' Band.

Tuesday, June 24, 1919

9.30 A. M. TO 1.30 P. M.

Discussion of Reports on: Fuel Economy and Smoke Prevention .. 9.30 A. M. to 10.00 A. M.  
 Specifications and Tests Materials (M. M.) ..... 10.00 A. M. to 10.30 A. M.  
 Design and Maintenance of Locomotive Boilers ..... 10.30 A. M. to 11.00 A. M.  
 Locomotive Headlights ..... 11.00 A. M. to 11.30 A. M.  
 Superheater Locomotives ..... 11.30 A. M. to 12.00 A. M.  
 Individual Paper on Carbonization in Valve Chambers and Cylinders of Superheated Steam Locomotives; Its Cause, Effect on Lubrication and Maintenance, and Proper Measures to Overcome Same, by Mr. F. P. Roesch.... 12.00 A. M. to 12.30 P. M.  
 Amalgamation of other Mechanical Associations with Section III—Mechanical of the American Railroad Association ..... 12.30 P. M. to 1.00 P. M.  
 Questions Proposed by Members.... 1.00 P. M. to 1.30 P. M.

ENTERTAINMENT

10.30 A. M.—Orchestral Concert. Entrance Hall, Million Dollar Pier. Fry Philharmonic Orchestra.

3.30 P. M.—Band Concert and Impromptu Dancing. Entrance Hall, Million Dollar Pier. Royal Scotch Highlanders' Band. Tea will be served at 4.30 P. M. in Entrance Hall.

9.30 P. M.—Mardi Gras Dance. Ball Room, Million Dollar Pier. Royal Scotch Highlanders' Band.

Wednesday, June 25, 1919

9.30 A. M. TO 1.30 P. M.

Discussing of Reports on:  
 Design, Maintenance and Operation of Electric Rolling Stock..... 9.30 A. M. to 10.00 A. M.  
 Individual Paper on "The Use of Bronze for Valve Snap Rings and Piston Surfaces, and Bull Rings in Large Cylinders, to Prevent Rapid Wear and Cutting of Cylinders and Valve Bushings"..... 10.00 A. M. to 10.30 A. M.  
 by Mr. C. E. Fuller.  
 Discussion of Reports on:  
 Train Resistance and Tonnage Rating ..... 10.30 A. M. to 10.45 A. M.  
 Subjects ..... 10.45 A. M. to 11.15 A. M.  
 Powdered Fuel ..... 11.15 A. M. to 11.25 A. M.  
 Resolutions, Correspondence, Etc... 11.25 A. M. to 11.35 A. M.  
 Auditing ..... 11.35 A. M. to 11.40 A. M.  
 Unfinished Business ..... 11.40 A. M. to 11.45 A. M.  
 Questions Proposed by Members.. 11.45 A. M. to 12.30 P. M.  
 Closing Exercises ..... 12.30 P. M. to 1.00 P. M.

Special Train from Chicago

A large number of friends greeted the arrival from Chicago to Atlantic City, on Tuesday, of the Special Convention Train. The train left Chicago Monday afternoon, at 3.00 o'clock, and arrived here at 5.37 o'clock Tuesday afternoon. It consisted of ten standard Pullman cars, two dining cars and one club smoker. There were 148 passengers aboard. The trip was made with no particular incident.

## Railway Supply Manufacturers' Association

Has Come Through the War Stronger Than Ever and  
Has Prepared a Record-Breaking Exhibit

**T**HE RAILWAY SUPPLY MANUFACTURERS' ASSOCIATION which has charge of the exhibits and the social features at the conventions, has been remarkably successful this year in arranging for the largest and most complete exhibit that has ever been shown.

The officers and the executive committee are to be heartily congratulated upon the results of their work.

These officers, by the way, were elected in 1916, but have had to hold over during the war period because of the fact that no meetings of the associations were held during that time. Their task during this period has been no easy one. It was expected that a convention would be held in 1917, and it was not until our country actually entered the World War, on April 6 of that year, that the final decision was made not to hold the meeting. The casual observer may not realize the great amount of detail work that is required to set up an exhibit on the Million Dollar Pier, and possibly very few of the attendants at the conventions realize that a large part of the work of preparing the booths and getting the material into shape must, of necessity, be done weeks and weeks before the meetings are actually held. On April 1, 1917, the officers of the Railway Supply Manufacturers' Association realized that there was a possibility of postponing the June conventions, and the progress of the work at Atlantic City was slowed up as much as possible. It was not until April 6 of that year, however, that a definite decision was reached that the conventions would not be held.

A large part of the material which had been used could, of course, be salvaged, but all of the labor in preparing the booth structures and taking them down and storing them was lost. It soon became apparent that the war would last for an indefinite period and that it would not be possible to arrange for any exhibitions during war times. Under these conditions, the association practically

closed its office at Pittsburgh and practically became inactive until the end of the war.

Immediately after the signing of the armistice the officers realized that the present year would undoubtedly see a record-breaking convention, and they immediately got in touch with the officers of the mechanical associations and with the Railroad Administration representatives and started active work in preparing for the present exhibit. Every possible bit of space on the Million Dollar Pier has been made available that could be used for exhibits without going to an unreasonable expenditure. For instance, if additional space could be added without paying out more than the exhibitor would regularly pay for it, it was done. Reference to the diagram on another

E. H. Walker  
President

page in connection with the detail information for the exhibits will indicate how successfully every bit of space on the pier has been taken advantage of. Even at this, however, it has been necessary for exhibitors in many cases to double up.

It is noteworthy that the representatives of the mechanical department of the Railroad Administration have

R. S. M. A. Officers  
Executive Committee Members  
and  
Committee Chairmen

George A. Cooper

G. R. Carr

Wm. McConway, Jr.

given very cordial and hearty co-operation to the officers of the Railway Supply Manufacturers' Association in helping to make this year's exhibit a success. The entertainment features this year are of a most simple nature, and the convention promises to be one of the most business like that has ever been held. The Railway Supply Manufacturers' Association has co-operated in trying to make it so, and incidentally has prepared for distribution among railroad men specially designed note-books which will enable them easily to note those things which they see or hear on the pier that they may wish to report back to their managements.

The work of the association is in the hands of the officers, consisting of the president, vice-president and secretary-treasurer, and the executive committee, consisting of twelve members. The chairman of several of the sub-committees are members of the executive committee, although three of the most important committees—the entertainment, the enrollment and the transportation—are headed by men who are not on the executive committee.

The president of the association, who was elected at the 1916 convention and who has had to give a very large amount of his time to the affairs of the association during the interim, is Edmund H. Walker, vice-president of the Standard Coupler Company, New York. Mr. Walker was born in Kingston, Ohio, December 10, 1871. He has had a varied experience in several departments of a number of western roads, and became connected with the Standard Coupler Company in February, 1905. He has been active in the Supply Association for many years.

The vice-president of the association is LeGrand Parish, president of the American Arch Company and of the Lima Locomotive Works, Inc.

John D. Conway, of Pittsburgh, has been secretary-treasurer of the association for several years.

#### Executive Committee

The twelve members of the executive committee come from seven geographical districts as follows: First district (New England states and Canada), one member: J. G. Platt, Hunt-Spiller Mfg. Corporation, Boston, Mass. Second district (New York and New Jersey), three members: C. D. Eaton, American Car & Foundry Company, New York; C. W. Beaver, Yale & Towne Mfg. Company, New York, and H. G. Thompson, Transportation Engineering Corporation. Third district (Pennsylvania), two members: Philip S. Mitchell, Philip S. Justice & Co., Philadelphia, Pa., and W. McConway, Jr., McConway & Torley Company, Pittsburgh, Pa. Fourth district (Ohio, Indiana and Michigan), two members: J. F. Schurch, the T. H. Symington Company, Rochester, N. Y., and G. A. Cooper, Frost Railway Supply Company, Detroit, Mich. Fifth district (Illinois, Wisconsin, Iowa and Minnesota), two members: G. H. Porter, Western Electric Company, Chicago, Ill., and G. E. Carr, Dearborn Chemical Company, Chicago, Ill. Sixth district (Delaware, Maryland, District of Columbia, Virginia, West Virginia, North Carolina, South Carolina, Georgia, Florida, Alabama, Mississippi, Kentucky and Tennessee), one member: F. E. Beal, Magnus Co., Inc., Atlanta, Ga. Seventh district (states west of the Mississippi river, including Louisiana, but excepting Iowa and Minnesota), one member: C. P. Cass, Westinghouse Air Brake Company, St. Louis, Mo.

The members of this committee who were elected at the 1916 convention were Messrs. Beaver, Cooper and Thompson. Wm. McConway, Jr., was elected to fill the unexpired term of C. E. Postlethwaite, who moved out of the Pittsburgh district. The members who retire this

year and whose places will be filled at the election next Saturday are Messrs. Beal (Sixth district), Messrs. McConway and Mitchell (Third district) and Porter (Fifth district).

#### Exhibit Committee

All of the members of the exhibit committee are on the executive committee. J. G. Platt is chairman, and the other two members are G. R. Carr and C. W. Beaver.

#### Entertainment Committee

This committee has charge of all entertainment features. E. H. Bankard, Jr., general sales agent of the Globe Seamless Steel Tubes Company, Chicago, is chairman. The other members are E. C. Brown, Dearborn Chemical Company, Chicago, Ill.; J. M. Brown, Elwell Parker Electrical Co., Chicago, Ill.; L. O. Cameron, Railway Supplies, Washington, D. C.; F. T. Connor, Carbon Steel Company, Chicago, Ill.; J. R. Forney, Ralston Steel Car Co., Washington, D. C.; R. H. Gwaltney, T. H. Symington Co., New York, N. Y.; Ellsworth Haring, Railway Supplies, New York, N. Y.; R. J. Himmelfright, American Arch Co., New York, N. Y.; J. C. C. Holding, Midvale Steel & Ordnance Co., Philadelphia, Pa.; Langley Ingraham, Yarnall Paint Co., Philadelphia, Pa.; W. K. Krepps, Crucible Steel Co. of America, New York, N. Y.; W. M. Melcher, Massachusetts Mohair Plush Co., Boston, Mass.; A. C. Moore, Safety Car Heating & Lighting Co., Chicago, Ill.; N. C. Naylor, Railway Steel Spring Co., Chicago, Ill.; G. A. Nicol, H. W. Johnsonville Co., New York, N. Y.; W. H. Oliver, Republic Iron & Steel Co., Philadelphia, Pa.; H. E. Passmore, Grip Nut Co., Columbus, Ohio; J. L. Paxton, Paxton-Mitchell Co., Omaha, Neb.; S. W. Sargent, American Steel Foundries, Philadelphia, Pa.; H. N. Scott, Griffin Wheel Co., Chicago, Ill.; L. B. Sherman, Railway Age Gazette, Chicago, Ill.; J. E. Stimp, Unit Railway Car Co., Boston, Mass., and W. M. Wilson, Flannery Bolt Co., Chicago, Ill.

#### Transportation Committee

The purpose of the Transportation Committee is to oversee and assist in the handling of the roller chairs, automobile service and other local transportation features at Atlantic City during the conventions.

The chairman of this committee is L. S. Wright, of the railway sales department of the National Malleable Castings Company, Chicago. The other members of the committee are A. W. Brown, Griffin Wheel Co., Chicago; C. J. W. Clasen, The Bettendorf Co., Bettendorf, Iowa; W. G. Cook, Garlock Packing Co., Chicago; H. E. Greer, Camel Co., Chicago; H. E. Daniels, West Disinfecting Co., Chicago; L. R. Dewey, American Brake Shoe & Foundry Co., Chicago; Charles Derby, Joyce-Cridland Co., Dayton, O.; F. A. Elmquist, Sherwin-Williams Co., Cleveland, O.; George Fogg, Locomotive Superheater Co., Chicago; J. W. Fogg, Boss Nut Co., Chicago; B. H. Forsythe, Grip Nut Co., Chicago; W. H. Foster, Galena Signal Oil Co., Bay Side, L. I.; E. L. Georger, Pratt & Lambert, Chicago; B. C. Hopper, American Steel Foundries, St. Paul, Minn.; J. C. Kuhns, The Burden Iron Co., Chicago; J. P. Landreth, Anchor Packing Co., Chicago; A. L. McNeil, Central Electric Co., Chicago; Thomas Mahar, American Arch Co., Chicago; Bruce Owens, Magnus Company, Chicago; L. S. Peabody, Railway Steel Spring Co., New York; J. H. Rodger, Safety Car Heating & Lighting Co., Chicago; R. J. Sheridan, Chicago Railway Equipment Co., New York; J. E. Tarelton, Union Draft Gear Co., Chicago; J. G. Tawse, Spencer-Otis Co., Chicago, and C. N. Thulin, Duff Mfg. Co., Chicago.

**Enrollment Committee**

This committee has charge of the enrollment of members for both the railway and the supply associations. The task is a difficult one and requires that the members of the committee be on the job for long periods during the conventions.

The chairman of the committee is C. H. Gayetty, who is with the Quaker City Rubber Company, Philadelphia. The other members of the committee are: G. A. Barden, Duntley-Dayton Co., Philadelphia; J. E. Brown, O'Malley-Bear Valve Co., Chicago; S. H. Campbell, Western Railway Equipment Co., St. Louis, Mo.; G. W. Denyven, Parkesburg Iron Co., Boston, Mass.; W. S. Edger, Midvale Steel Co., Philadelphia; Harry Jacques, Simmons Hardware Company, St. Louis, Mo.; S. I. Leslie, The Leslie Company, Lyndhurst, N. J.; L. D. Mitchell, Detroit Graphite Co., Chicago; F. V. McGinness, Transportation Engineering Company, New York; Gilbert E. Ryder, Locomotive Superheater Co., New York; James A. Stevens, Devoe-Reynolds Co., New York; and F. H. Smith, Gold Car Heating & Lighting Co., New York.

**Other Committees**

There are several other committees which are made up entirely from members of the Executive Committee. These include the Finance Committee, J. F. Schurch, chairman; George H. Porter and William McConway, Jr. The Hotel Committee is composed of George H. Porter, chairman; C. P. Cass and H. G. Thompson. The Committee on By-Laws and Resolutions has as its chairman P. J. Mitchell; the other two members are F. E. Beal and C. P. Cass.

**Post Office**

UNITED STATES MAIL addressed care of Secretary's Office, Million Dollar Pier, Atlantic City, N. J., will be taken care of and distributed to exhibitors' booths.

Members are requested not to send general circular matter for distribution to other exhibitors, as this is a violation of the Association Rules.

**Railway Supply Manufacturers' Annual Meeting**

THE ANNUAL MEETING of the Railway Supply Manufacturers' Association will be held in the Convention Hall, on Young's Million Dollar Pier, Saturday, June 21. The hour of the meeting will be announced by bulletin.

The meetings for the election of the executive committee will be announced by special poster.

**Registration**

THE REGISTRATION was specially heavy yesterday. During the convention the enrollment booth will be operated in accordance with the following schedule:

Wednesday, June 18.....	9 A. M. to 1 P. M.	2 to 6 and 7 to 8 P. M.
Thursday, June 19.....	9 A. M. to 1 P. M.	2 to 6 and 7 to 8 P. M.
Friday, June 20.....	9 A. M. to 1 P. M.	2 to 6 and 7 to 8 P. M.
Saturday, June 21.....	9 A. M. to 12 M.	7 to 8 P. M.
Sunday, June 22.....	11 A. M. to 12 M.	2 to 4 P. M.
Monday, June 23.....	9 A. M. to 1 P. M.	2 to 6 P. M.
Tuesday, June 24.....	9 A. M. to 12 M.	2 to 5 P. M.
Wednesday, June 25.....	9 A. M. to 11 P. M.	

**Telephones**

A DISTINCT IMPROVEMENT has been made in the telephone service this year. A central switchboard, with necessary operators, has been established on the Pier in connection with fifteen long-distance booths, conveniently located in as many sections of the Pier.

**Shopmen on Canadian Roads to Strike To-day**

PRESS DISPATCHES indicate that all relations between the officials of Division No. 4, Railway Shopmen of America, and the Canadian Railway War Board have been severed, and that a strike has been called to begin to-day. The union officials claim that 40,000 men will be involved.

**The Entertainment Features**

A GLANCE AT THE ENTERTAINMENT program will indicate the unpretentiousness of its features. Except for the special event of Saturday night, the program consists largely of dancing. The simplified form of organized entertainment was deemed advisable after mature deliberation.

**High Officers of Railroad Administration Coming**

AS A RESULT OF A MEETING which is to be held in Atlantic City on Thursday, more of the principal operating executives of the railways of the United States will be here where they can attend the conventions and see the exhibits than ever was the case before in the history of the mechanical conventions.

The special occasion, aside from the conventions, which will bring them here, will be a meeting of the Executive Committee of the American Railroad Association. J. E. Fairbank, general secretary of the American Railroad Association, arrived here yesterday to make arrangements for the Executive Committee meeting. The members of the Executive Committee include three heads of divisions of the United States Railroad Administration and all the regional directors, and are as follows:

W. T. Tyler, Director, Division of Operation, United States Railroad Administration; Charles A. Prouty, Director, Division of Accounting; T. C. Powell, Director, Division of Capital Expenditures; A. T. Hardin, Regional Director, Eastern Region; C. H. Markham, Regional Director, Allegheny Region; N. D. Maher, Regional Director, Central Western Region; B. F. Bush, Regional Director, Southern Region; Hale Holden, Regional Director, Central Western Region; B. F. Bush, Regional Director, Southwestern Region; R. H. Aishton, Regional Director, Northwestern Region; W. J. Jackson, Federal Manager, Chicago & Eastern Illinois; E. H. Coapman, Federal Manager, Southern Railroad; E. E. Calvin, Federal Manager, Union Pacific; H. E. Byram, Federal Manager, Chicago, Milwaukee & St. Paul; J. M. Hannaford, Federal Manager, Northern Pacific; G. L. Peck, Federal Manager, Pennsylvania Lines West of Pittsburgh; J. E. Gorman, Federal Manager, Chicago, Rock Island & Pacific; A. J. Stone, Federal Manager, Erie Railroad; H. G. Kelley, President, Grand Trunk Railway, Montreal, Que.

The executive committee is constituted as above as a result of the recent reorganization of the association under government control. At the meeting this week the committee will elect a new president of the association and transact a large amount of other important business incidental to the reorganization.

General Secretary Fairbanks visited the convention exhibition yesterday in company with Secretary Hawthorne, of the Mechanical Section.

### Rolling Chairs

THE TRANSPORTATION COMMITTEE will provide rolling chairs for members and guests of the convention wearing official badges, from the following stations, between the hours indicated, from June 18 to June 25, inclusive:

	A. M.	P. M.
The Pier	9.00 to	6.00
Marlborough-Blenheim	9.00 to	6.00
Traymore	9.00 to	6.00
Chalfonte Hotel	9.00 to	6.00
Chelsea Hotel	9.00 to	6.00
Young's Hotel	9.00 to	6.00
St. Charles Hotel	9.00 to	6.00
The Breakers	9.00 to	6.00
	P. M.	P. M.
All entertainments on Pier	8.30 to	10.00

Unoccupied chairs may be stopped at any point on the Boardwalk, except between the Marlborough-Blenheim and the Pier, and they may be used in either direction.

Convention chairs are not allowed to wait more than fifteen minutes. The Transportation Committee will consider it a favor if members or guests of the Association will report to the committee any inattention on the part of an attendant. If the number on the chair is given, it will facilitate checking the complaint.

No rolling chairs will be allowed on the pier during the convention. The aisles will be pretty well filled with the large number of visitors, and the rolling chairs would cause an undesirable congestion.

105-Ton Hopper Car Built by the Pennsylvania Railroad

## P. R. R. Maximum Tonnage Hopper and Gondola Cars

Designed for Maximum Loading of Six 6-in. by 11-in.

M. C. B. Axles; Will Carry About 120 Tons

INCLUDED IN THE PENNSYLVANIA RAILROAD track exhibit, which is located on the Reading tracks near the Boardwalk, are two open top cars of all-steel construction, one a self-clearing hopper and the other a drop bottom gondola, both of which are carried on six-wheel trucks. The hopper car has a marked capacity of 105 tons and the gondola 110 tons.

The railroad had designed a maximum tonnage mineral traffic car prior to Federal control, and with the consent of the Railroad Administration the two cars were recently completely at the company's car shops, Altoona, Pa. The six-wheel trucks have M.C.B. 6-in. by 11-in. axles, with a maximum loading at the rail of 52,500 lb. each, or 157,000 lbs. per truck. The cars are so designed as not to exceed Cooper's E60 loading of 6,000 lb. per lineal foot.

The hopper car, which is known as Class H-26, has a light weight of 83,600 lb. and a marked capacity of 210,000 lb., which with the customary allowance of 10 per cent. for overload gives a ratio of paying load to gross load of 73.4 per cent. The space capacity is 3,500

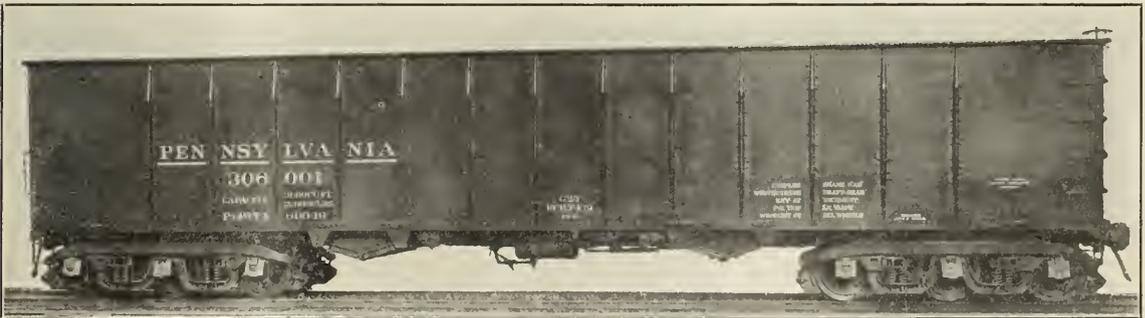

holds 4,000 cu. ft. The gross weight of each type when loaded to capacity is such that the axles are fully loaded to the M.C.B. rating of 50,000 lb. each, or 52,500 lb. at the rail.

The principal dimensions of the two cars are shown in the following table:

	Hopper Class H-26	Gondola Class G-23
Light weight	83,600 lb.	74,600 lb.
Length over end sills	55 ft. 6 in.	50 ft. 0 in.
Length inside	53 ft. 8 in.	48 ft. 6 in.
Distance from center to center of trucks	42 ft. 0 in.	36 ft. 6 in.
Width over all	10 ft. 2 in.	10 ft. 2 in.
Width inside	9 ft. 4 $\frac{1}{2}$ in.	9 ft. 4 $\frac{1}{2}$ in.
Height above rail	11 ft. 6 in.	11 ft. 6 in.
Height inside	9 ft. 0 in.	8 ft. 1 $\frac{1}{2}$ in.
Truck wheel base	9 ft. 0 in.	9 ft. 0 in.
Truck journals	6 in. by 11 in.	6 in. by 11 in.
Truck weight	17,200 lb.	17,200 lb.
Marked capacity	210,000 lb.	220,000 lb.
Cubical capacity, level full	3,500 cu. ft.	3,660 cu. ft.
Additional contents, heaped	375 cu. ft.	340 cu. ft.

### The Trucks

The most interesting feature of these cars is the six-wheel truck design. The arrangement of this truck provides for double the number of sets of bolster springs

Pennsylvania 110-Ton Gondola Car

cu. ft. level, with about 375 cu. ft. added when heaped, or a total of 3,875 cu. ft.

The gondola, known as Class G-23, has a light weight of 74,600 lb., with a marked capacity of 220,000 lb. Allowing 10 per cent for overload, this car has a ratio of paying load to gross load of 76.5 per cent. The cubical capacity as stenciled is 3,660 cu. ft.; when heaped the car

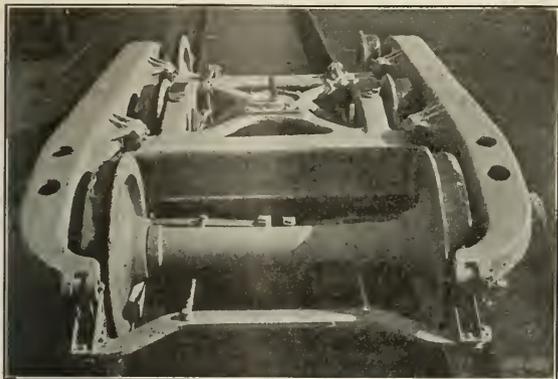

used with the four-wheel truck, thus making possible the use of the class D spring of 50-ton cars with four wheel trucks and 5 $\frac{1}{2}$ -in. by 10-in. axles on 100-ton cars with six wheel trucks and 6-in by 11-in. axles.

The trucks are equalized on a principle similar to that employed in the design of the Pennsylvania standard six-wheel passenger truck. The middle axle, however, is

practically floating and is restrained in service only by the equalizers. Vertical projections on the ends of the equalizers resting on the middle pair of journal boxes extend up through openings in the bottom of the side frame casting, the size of which limits the lateral motion of this axle to a maximum of  $\frac{7}{8}$  inch in either direction.

A clear idea of the design of this truck may be obtained from an inspection of the photographs and drawings. It will be seen that the side frames are steel cast-

The End of the Six-Wheel Truck Showing the Bolster Casting

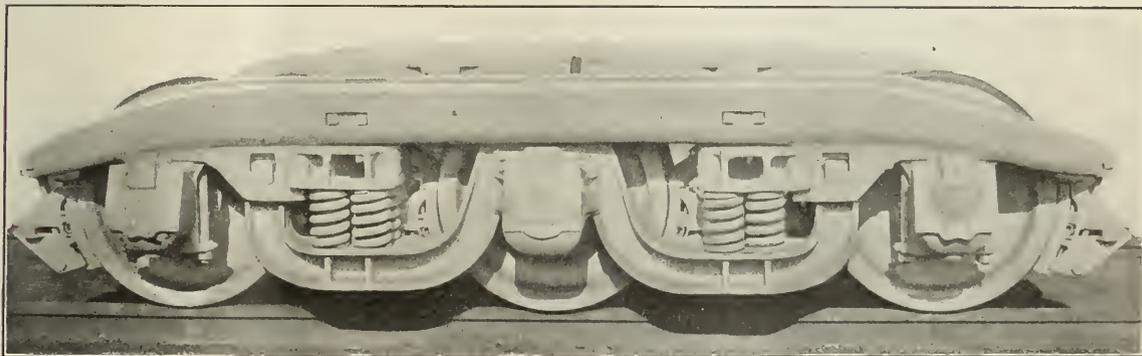

ings of the box girder type, to which the standard journal boxes of the two outer axles are bolted. On each side frame just inside of the two outer journal boxes are pockets in each of which the end of the equalizers is secured by a gib, an offset on the under side of which holds it in position laterally. The top surfaces of the gibs are slightly crowned laterally, while the corresponding surfaces in the top of the holes through the equalizers are slightly crowned longitudinally to provide in effect a one-point bearing between the equalizer and the gib

ends of which are the bolster spring seats. These are tied together by longitudinal members which span the middle axle and are closed with binders below the axle, applied after the truck is assembled. These binders form the longitudinal tension members and also retain the middle axle in case the truck should be lifted. The side bearings are bolted to the top surfaces of the longitudinal members of the casting. The load on the center plate is supported by diagonals of channel section, which join the sides of the opening for the middle axle near the bottom of the longitudinal members. The whole structure is further stiffened by diagonal braces across the top. The outer faces of the four bolster spring seats are provided with flanges between which fit the equalizer support projections on the side frames. The two sides of the truck are thus held in alignment at right angles to the axles.

### The Hopper Car

In general, the design of the Class H-26 hopper car is similar to that of the Class H-24, 85-ton hopper cars, a description of which has previously been published.\* The design embodies continuous center sills of uniform section, which take the buffing stress, while a considerable portion of the load is carried by the side construction. The center sills are 10-in., 30-lb. channels spaced  $12\frac{7}{8}$  in. back to back. From a point 4 ft. 1 in. in front of the bolster, extending back under the end of the ridge sheet in the hopper, a cover plate  $\frac{3}{8}$  in. thick is riveted to the top flanges of the channels. At the end of this plate the center sills are secured to the ridge sheet by a flanged connection designed to provide for uniform strength. The ridge sheet, which is secured to the center sills between each pair of hoppers at the diaphragm connections and to the bottom flanges of the sills at the center of each hopper, performs the functions of a cover plate throughout the length of the hopper.

The bolster is of the vertical web plate type and is placed above the center sills under the slope floor sheet. It is made up of a  $\frac{1}{4}$ -in. web plate with two 5-in. by 3-in. by  $\frac{3}{8}$ -in. angle flanges both at the top and bottom, the

The Pennsylvania Six-Wheel Freight Truck

and thus permit the equalizer freely to adapt itself to any position the middle axle may assume in service. The journal boxes on the middle axle are of the pedestal type and, in addition to resting on the tops of the boxes, the equalizers are designed to fit between the pedestal flanges on the sides of the boxes.

The bolster is a unit steel casting, which spans the middle axle and rests on four sets of springs, each of which is seated on one of the equalizers. This casting is made up of two transverse members of I-section, on the

flanges of the upper angles being riveted directly to the slope floor sheet, while the lower ones extend across the car above the center sill cover plate, and at the ends are secured to the bottom members of the side frame. The bolster web plate is stiffened by six  $2\frac{1}{2}$ -in. by  $2\frac{1}{2}$ -in. by  $\frac{1}{4}$ -in. vertical angles. The side bearings are carried by castings framed into the center sill channels on either side

\*See the *Railway Mechanical Engineer* for April, 1917, page 191.

and tied together by a 1/2-in. plate tension member extending across the bottom of the center sills. Between the sills is a filler casting which supports the center plate and extends forward to form the rear draft gear stop.

The bottom member of the side frame is a 4-in. by 6-in. by 3/4-in. angle, which is continuous from corner post to corner post. The end sills are of pressed steel 3/8 in. thick of Z-section, with the inner flange turned up. The end sills are tapered and have a maximum width at the center of 11 1/8 in.

There are four intermediate diaphragms located be-

End View of the Hopper Car

tween the hoppers, which transfer the major portion of the load from the center to the side construction. The diaphragms, like the bolsters, are of the single plate type with 1/4-in. web plates, reinforced at the bottom by two 4-in. by 3 1/2-in. by 1/16-in. angles, the vertical flanges of which are broached out at the center sills, while the horizontal flanges are continuous and are riveted to the bottom flanges of the center sills. The top of the web plates terminate between the bottom flanges of diamond section crossies of pressed steel, which extend across the car just above the center sill ridge sheets. Between the top flanges of these crossies are riveted gusset sheets, the tops of which in turn terminate between the bottom flanges of another set of diamond shaped crossies, the center lines of which are located 26 in. below the top of the car.

The transverse hopper slope sheets are riveted to the web of the intermediate diaphragms and to the bottom of these sheets are riveted the door hinge castings. The outer sides of the hoppers are formed of slope sheets which are riveted at the top to the sheets of the side construction. To the bottom of each of these sheets, which are flanged down vertically, is riveted a stiffening angle, against which the doors close. The insides of the hopper are formed by a continuation of the ridge sheets, which are riveted for a distance of 11 in. on either side of the

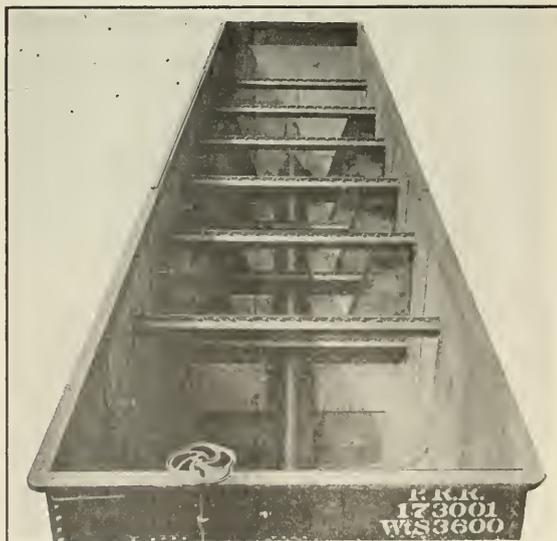

center of the hopper to a sheared angle, the horizontal flange of which is riveted to the lower flange of the center sills. The bottom of this sheet is stiffened on the inside by a 1/4-in. plate 2 1/2 in. wide, against which the doors close.

The door operating mechanism is a device which is standard on Pennsylvania hopper cars. The doors for each pair of hoppers are operated separately by a shaft extending from the side to the center of the car under the hopper slope sheet, driving by means of a chain connection a toggle link lifting device which is located between the center sills over the center line of the hopper openings.

The side construction is made up of four component parts, consisting of a 5-in., 19.3-lb. bulb angle top member, the 4-in. by 6-in. by 3/4-in. angle side sill previously mentioned, 13 pressed steel posts of flanged U-section on each side of the car, and the 3/16-in. side sheets. Alternate posts, together with inside butt strips, form the joint for the adjacent side sheets, these joints being located over the centers of the hoppers, so that the sheets are continuous at the intermediate diaphragms. The end construction is composed of a bulb angle at the top, of the same section as that along the sides of the car, the vertical portion of the 1/4-in. hopper end sheet, 3 1/2-in. by 3 1/2-in. by 1/2-in. angle corner posts and three intermediate vertical ties of pressed steel channel section, riveted to the end sheet at the top and to the vertical flange of the pressed steel end sill at the bottom. The bulb angle at the top of the side construction is reinforced for a distance of 20 ft. at the middle of the car by a piece of 2 1/2 in. by 1/2 in. section riveted along the top.

The Gondola

The gondola car, which has a rated capacity of 110 tons, while differing in length and necessarily in other

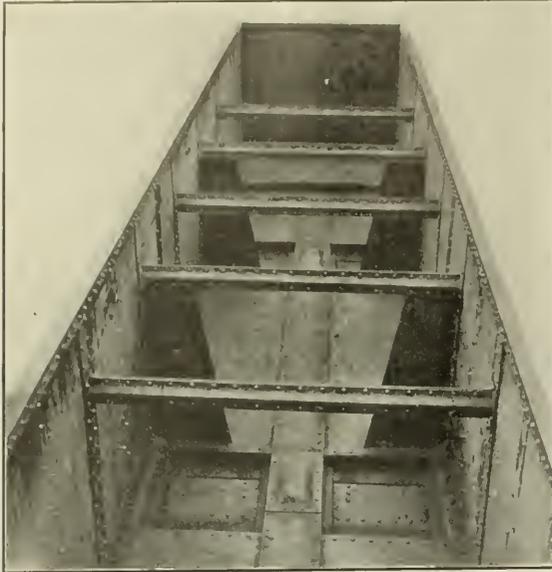

Interior of the Hopper Car

features due to the difference in the type of the car body, follows essentially the same general features of design as the hopper car. Like that of the hopper car, the underframe is built up on center sills of 10-in., 30-lb. channel section and 4-in. by 6-in. by 3/4-in. angle side sills. The

same type of pressed steel end sill is also used. The center sill is reinforced by a  $\frac{3}{8}$ -in. top cover plate, which is continuous between the bolsters and is riveted over the floor plates.

In order to keep the interior of the lading space free from obstructions, it was necessary to employ a different type of bolster construction from that incorporated in the hopper car. The bolster is built up of two cast steel arms of wide U-section, one on either side of the center sills. To secure adequate strength the depth of these castings is such that the tops are six inches above the top of the center sill flanges. As shown in the illustrations, the

Interior of the Pennsylvania 110-Ton Gondola Car

floor plates from the inside of the bolsters to the end of the car are raised to pass over the top of the bolster, to avoid pockets at the ends of the car. The two bolster castings are tied together at the top by a  $\frac{1}{2}$ -in. cover plate 4 ft. 11 in. long, which is placed above the  $\frac{1}{4}$ -in. floor sheets. The compression member of the bolsters is completed by the center sill filling casting which, like that in the hopper car, extends forward to form the draft gear back stop and a  $\frac{1}{2}$ -in. bottom cover plate, extending across under the center sills is riveted to the bottom of the bolster castings.

In the floor of the car are two pairs of hoppers closed by doors and door operating mechanism of the same type employed on the hopper car. The center line of these hoppers is located 8 ft.  $3\frac{1}{2}$  in. on either side of the transverse center of the car. Two single plate intermediate diaphragms of  $\frac{1}{2}$ -in. pressed channel section are located at the inner ends of the hopper openings. These diaphragms are of uniform section, 10 in. deep. To the lower flange of each diaphragm is riveted a  $\frac{1}{8}$  in. reinforcing plate which extends across the car under the center sills. Since the bottom of the side sills is at floor level, the outer ends of these diaphragms extend below the side of the car and are secured to the side sills by a gusset plate, the lower end of which is flanged under the diaphragm.

Pressed steel members of similar shape, but of  $\frac{1}{4}$ -in. material, are employed to form the outside hopper end

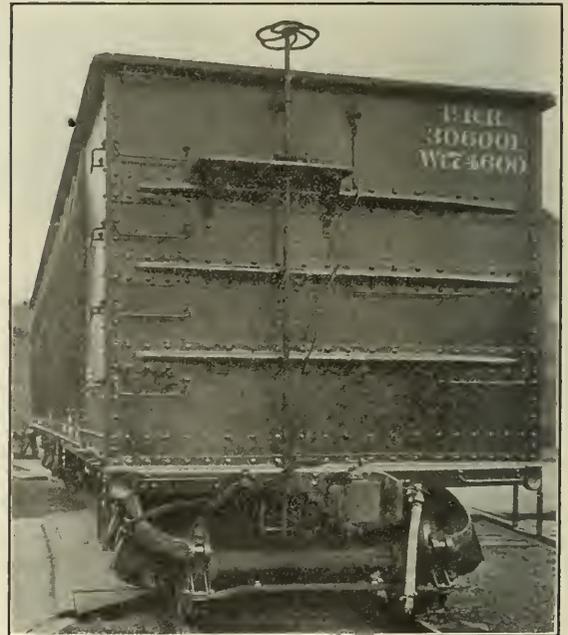

sheets and are secured to the side of the car in the same manner as the intermediate diaphragms. The drop door hinge castings are riveted to the inside of the diaphragms. The hopper side sheets are secured to the center sills, on the inside, and to the vertical flange of the side sills, at the sides of the car.

The body design is similar in the type of members employed to that of the hopper car. It is composed of a 4-in. by 6-in. by  $\frac{3}{4}$ -in. side sill at the bottom, a 5-in., 19.3-lb. bulb angle at the top, pressed steel side posts of U-section and the  $\frac{3}{4}$ -in. side sheets.

The side sheets are joined at alternate posts and the joints are covered by butt strips on the inside, riveted through the flanges of the posts. There are five pressed steel cross-ties of diamond section, which are located  $26\frac{3}{4}$  in. below the top of the car. Gusset sheets are placed over the intermediate diaphragms to which they are riveted through the floor sheets. The tops of these plates are riveted between the lower flanges of two of the cross-ties, and at the sides they are riveted through the sheets and butt strips to the side posts.

The ends of the car are built up of  $\frac{1}{4}$ -in. sheets riveted at the bottom to the flange of the pressed steel end sill, at the corners to the  $3\frac{1}{2}$ -in. by  $3\frac{1}{2}$ -in. by  $\frac{1}{2}$ -in. angle corner posts, and are finished at the top with a bulb angle of the same section as that used on the sides of the car. They are reinforced by three horizontal stiffening members of flanged U-section, similar to the side posts.

The trucks on both cars are fitted with clasp brakes, which are operated by 14-in. by 12-in. brake cylinders.

The End of the Gondola

On the hopper car advantage has been taken of the space under the slope sheet to raise the air brake cylinder so that an easy connection for the hand brake is obtained with a short brake staff. Connection from the cylinder to the foundation gear is made through a system of vertical and horizontal levers located just in front of and below the brake cylinder

## Cutler and the Red Cross

**F**RIENDS OF OTIS H. CUTLER, who is well known among convention attendants because of his connection as a director with a number of important railway supply companies, are pointing with pride to the unique and responsible position which he now holds as acting chairman of the board of governors of the League of Red Cross Societies. While the delegates to the Peace Conference were discussing the final form of the terms of peace to be handed to the German plenipotentiaries, five men, representing the Red Cross Societies of America, England, France, Italy and Japan, meeting nearby, affixed their signatures to the articles governing a new league formed to combat disease and human suffering throughout the world. These five men were Henry B. Davison, chairman, representing the American Red Cross; Sir Arthur Stanley of England, Comte de Kergorlay of France, Count Frascars of Italy, and Prof. Ninagawa of Japan.

Undoubtedly the League of Red Cross Societies will be more or less intimately related to the League of Nations. The organization is voluntary, non-political, non-governmental, and non-sectarian. Mr. Davison was elected chairman of the board of governors, the league having been conceived by him and being made possible by the support given to the movement by the American Red Cross. Sir Arthur Stanley, in addressing the board, made this statement: "It would not have been possible to call this League of Red Cross Societies into existence if it had not been for the generosity with which the American Red Cross gave us the money in order to start operations, but it would have been even more impossible to launch this league if it had not been for the splendid enthusiasm and initiative of our first chairman, Mr. Davison. \* \* \* I believe that the bringing together of the humanitarian interests of every country in the world will go very far toward the establishment of permanent peace and will do much to place the League of Nations on a firm foundation."

Left to Right—Lieutenant-General Sir David Henderson, Director-General of the League; Otis H. Cutler, Acting Chairman of the Board of Governors; Professor Ninagawa, of the Japanese Red Cross; Sir Arthur Stanley, of the British Red Cross; Henry Davison, Chairman of the Board of Governors; Count Frascara, of the Italian Red Cross; Count de Kergorlay, of the French Red Cross; Dr. Stockton Axson, Secretary-General of the League.

### Board of Governors and Directing Officers of the League of Red Cross Societies

The objects of the league are: First, to encourage and promote in every country in the world the establishment and development of a duly authorized voluntary, national Red Cross organization, having as purposes the improvement of health, the prevention of disease and the mitigation of suffering throughout the world, and to secure the co-operation of such organizations for these purposes. Second, to promote the welfare of mankind by furnishing a medium for bringing within the reach of all peoples the benefits to be derived from present well-known facts and new contributions to science and medical knowledge and their application. Third, to furnish a medium for co-ordinating relief work in case of great national or international calamities.

It became necessary for Mr. Davison to return to America in the interests of the league immediately after its formation, and Otis H. Cutler was appointed acting chairman of the board of governors to represent Mr. Davison in his absence. This will make it necessary for Mr. Cutler to remain abroad for some weeks. Mr. Cutler has been active in the development of the American Red Cross, and during the war was manager of the Insular and Foreign Division of the American Red Cross. Mr. Davison, in announcing the appointment of Mr. Cutler, spoke in the highest terms of his services during the war and added that but for Mr. Cutler's remaining to represent him at Paris, it would not have been possible for him to leave Europe at this time.

## Conventionalities

Among the early arrivals to attend the conventions were Alexander Turner, president Bronze Metal Co.; Horace Parker, president Bradford Draft Gear Company, and Frank H. Clark, president Chambers Valley Company and Elyin Mechanical Stoker Company. They motored down from New York Sunday.

Many of those who have been attending the conventions regularly at Atlantic City will be saddened by the death of Miss Lulu Hubbard Marvel. Miss Marvel died at the home of her brother, Joseph H. Marvel, 1925 Pacific Avenue, Atlantic City, on March 27 last. She had been ill eighteen months. She was an expert stenographer and usually was in charge of the official stenographic forces at the conventions held at Atlantic City.

Cuba has commenced to subscribe her quota of the convention attendants in the arrival of probably one of the best-known railroaders on the Island, Juan Henderson, general inspector of locomotives of the United Railways of Havana, who is stopping in Philadelphia until the arrival of some of his compañeros. Juan reflects the spirit of the modern Latin-American's quest of knowledge in his statement that a few months' leave of absence granted by his company will be spent in the U. S. A. studying American railroad practice and the English language.

The dean of Superintendents of Motive Power, W. H. Lewis, of Norfolk & Western fame—a westerner originally—received a refreshing breath of western air when he met at the convention, his old protege, Dan Cunningham, whom he raised, now assistant superintendent of motive power of the Denver & Rio Grande. Mr. Lewis says he is proud of the job—probably referring to Mr. Cunningham. Mr. Lewis retired from active service on the Norfolk & Western since the conventions were last held in Atlantic City, but he arrived early this year, looking as happy and hearty as ever.

The excellent work of E. Hoover Bankard, Jr., Chairman of the Entertainment Committee, in planning and arranging the entertainment features for this year's gathering, is deserving of more than passing notice. In many ways the conditions this year have been quite unusual and difficult of meeting. During the late winter months Mr. Bankard devoted considerable time to the affairs of the Entertainment Committee, and later on he found it necessary to be "on the job" in Atlantic City a week or more before the arrival of the convention people.

Has anybody been attending these conventions longer than 37 years? If not, Frank W. Edmunds, general eastern sales manager of the Schroeder Headlight and Generator Company, New York, holds the long-distance record. He and Mrs. Edmunds came in from New York yesterday and will stay throughout this convention and the railway signal convention, which is held in Atlantic City on the 26th and 27th. This is Mrs. Edmunds' first mechanical convention, although at the signal convention she is one of the advance guard and is affectionately known as "Mother" to almost the entire attendance.

Have you noticed that each year there are more and more "farmers" among us? No, not "farmers," but

rather, as applied specifically to railway and supply men, agriculturists. Of course, you know the difference between a farmer and an agriculturist, the former making his money in the country and spending it in the city and the latter making his money in the city and spending it in the country. Many of our people are taking their troubles to the country and commingling with nature. The latest addition to the ranks is "Farmer" Charlie Jenks, of Cleveland, who has acquired a farm just outside the limits of his home city. In business life he is Charles D. Jenks, president of the Damascus Brake Beam Company. Mrs. Jenks accompanied her husband to Atlantic City this year.

The Joliet Railway Supply Company business family is indeed well represented at the convention this year. It consists of Mr. and Mrs. Frederick L. Sivyver and Miss Sivyver, Mr. and Mrs. J. H. Slawson and daughter, Mr. and Mrs. Charles A. Carscadin, Mr. and Mrs. R. W. Burnett and Mr. and Mrs. J. E. Simons. This, by the way, is Mr. Simons's twenty-sixth M. C. B. and M. M. Convention without a miss. The party is quartered at the Traymore, with the exception of the Carscadians, who are stopping at the Marlborough-Blenheim. Mr. Sivyver is president of the Joliet Railway Supply Company, Sivyver Steel Casting Company, North Western Malleable Iron Company and a stockholder in the Chain Belt Company and the Natural Car Equipment Company.

Mr. and Mrs. R. H. Weatherly, who motored down from New York on Monday to attend the convention, were accompanied here by Mrs. Weatherly's sister, Mrs. George E. Alt, also of New York City. Mrs. Alt was made a widow by the war. Her husband was of English birth, and came to this country when he was quite a young man. They were living on a large estate near Charlottesville, Va., when the war began in Europe in 1914. Mr. Alt was a loyal Britisher, and as soon as hostilities commenced he sailed for England, entered the British army and became a captain. He was killed while participating in the heavy fighting about Ypres in the spring of 1915. Captain Alt's father was a business man in his later life, but was formerly a colonel in the British army, so the Captain came of a family which had a military tradition which he well maintained. Mrs. Alt returned to New York Tuesday Evening.

Major E. A. Simmons, president of the Simmons-Boardman Publishing Company, publishers of the *Railway Age*, and Mrs. Simmons, expected to be here throughout the convention, but have not arrived yet. Major Simmons, accompanied by his wife and their little daughter, went to Europe, early in April, to open a new European office for this company in London. They expected to be back before this, but the sailing dates of the steamship Caronia, on which they were to have come, was changed. They are now expected to arrive on the Aquitania late this week or early next week. They were accompanied to Europe by Robert E. Thayer, until recently Mechanical Department Editor of the *Railway Age*, and managing editor of the *Railway Mechanical Engineer*, who has gone abroad to remain as European editor of the *Railway Age* and the other Simmons-Boardman publications. Mr. Thayer will make his home and headquarters in London. During the war, Major Simmons was in the Emergency Construction Division of the Quartermaster's Department of the United States Army, but secured his discharge just before going to Europe, and is now back in civilian life. He and Mrs. Simmons will come down to the convention if they get back in time.

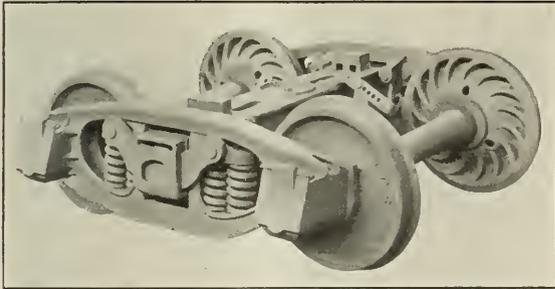

# New Devices Among the Exhibits

## Truck For Cars of 70 Ton Capacity

**T**HIS TRUCK WAS PRODUCED by the Bettendorf Company, Bettendorf, Iowa, to meet the growing demand for cars of greater carrying capacity than those having trucks with 5½-in. by 10-in. journals and is structurally different from the present type of trucks. It is constructed for cars of 70 tons capacity using axles with 6-in. by 11-in. journals, and although the capacity of the truck is limited only by the size of the axles, the heights are no greater and might even be less than those of the ordinary trucks of lesser capacity.

Especial attention has been given to the design of the springs and because of the heavier spring steel required to sustain the load, with a consequent lesser deflection per coil, a greater length was necessary than heretofore employed. The method of bolster suspension not only permits the application of longer springs, but allows a greater depth of bolster ends as well. It also applies the load on the side frames near the journal boxes instead of at the center of the frames, thereby greatly reducing the stresses in the side frames.

The manner of guiding the bolster is another feature worthy of note and is accomplished by providing slots in the ends of the bolster both forward and behind the columns, through which the carrier bars pass and rest on the trunions of the spring caps, thereby forming the

Truck for 70-Ton Capacity Car

support for the bolster and locking the side frames securely into position. These equalizer or carrier bars passing through the bolster at a point on a level with the journal bearings deliver all side thrust to the frames without any tendency to tilt the side frames, thereby eliminating the necessity for a spring plank.

As above stated the springs are located away from the center of the side frame; this construction produces stresses at the points of load application that give a factor of safety of from 45 to 50 per cent greater than if the load were applied at the center of the side frame as is the case with the usual truck construction.

The bolster ends may be made 12 in. or even more in depth without increasing the height of the trucks over present construction, with the consequent increase in strength due to the greater depth.

The absence of the spring plank and also of all bolts, nuts and rivets, together with the reduction in number of parts, is worthy of note, as well as the fact that even

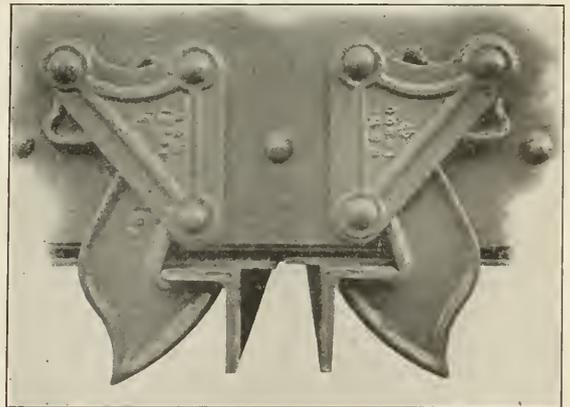

with springs of unusual length and bolster ends of great depth, the height overall is not increased, nor the clearance above the rail encroached upon.

In designing this truck care has been taken to provide for the necessary flexibility and strength. It may be dismantled or assembled quite as readily as any other type. The truck is of unusually neat appearance with great strength, light weight, easy riding qualities, more clearance above the rail and lesser total height than usual.

Other products displayed by the Bettendorf Company comprise a comparison between the United States Railroad Administration type of truck side frame and the regular Bettendorf type, and a new type of Bettendorf frame of U-cross section, all interchangeable with each other. Two samples of each are on display, one of each with comparative parts in position mounted on automatic weighing scales to show the differences in weights, and one of each after having been subjected to test loads showing comparative strengths.

## Drop Door Mechanism

**A** DROP DOOR LATCH and lock of simple and effective design is exhibited by the Wine Railway Appliance Company, Toledo, Ohio. It may be applied to bottom doors; all the parts are on the outside and are easily accessible for operation or for repairs. The latch is in the form of a hook secured to the car at each side, which engages an angle iron forming the door stiffener and projecting beyond the side sheets. The locking device consists of a dog secured to the side of the car, which falls in the locking position when the latch is closed. No winding shaft is used, the doors being raised

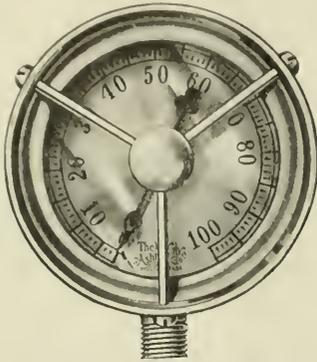

Hopper Doors Closed and the Device in Locked Position

by hand, the latch and lock falling into place by gravity. The door may be opened easily by disengaging the latch, which can be done easily and quickly. A saving in weight of from 200 lb. to 2,000 lb. is said to be effected

by the use of this device, dependent on the design of the old mechanism and the number of doors in the car.

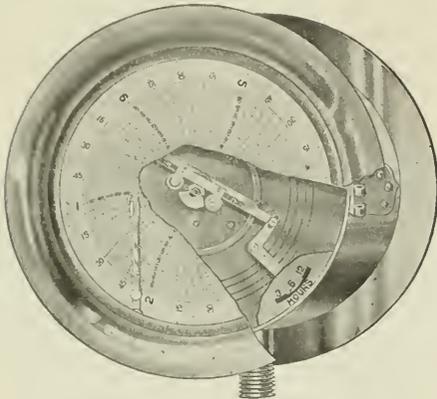

### Air Pressure Gages and Testers

THE EXHIBIT of the Ashton Valve Company, Boston, Mass., contains several new features. A protected dial air pressure gage has been devised for use in conjunction with the ordinary rear end train brake cock, or for use by air brake inspectors. The dial and the glass

Protected Dial Gage

are set considerably below the surface of the gage rim and are protected by three bars secured to the rim and at the center of the gage. These bars protect the gage from injury by coming in contact with any of the small projections on the railings of cars and they may be struck

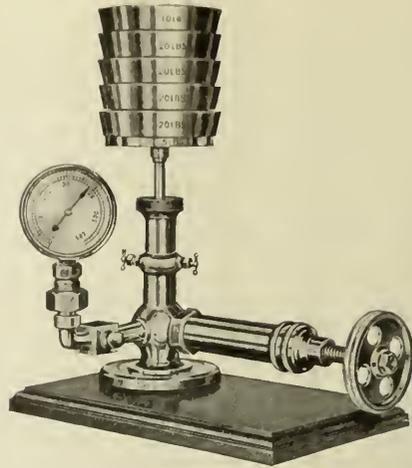

Three-Speed Air Brake Recording Gage

with sufficient force to bend the bars without damage to the glass.

The three-speed air brake recording gage is designed for the use of air brake inspectors in making tests or for recording the operation of air brakes, as may be desired. It consists of a rotating chart and a capillary glass pen with a platinum tube point, operated by a high grade clock movement. A specially designed tube eliminates excessive vibration and the pen may be refilled or cleaned without being taken apart or detached from the gage. This gage is especially adapted for use where a variable speed is desired for the chart.

An improved dead weight pressure gage tester has

an adjustable double area piston, which permits both high and low pressure testing up to a maximum of 1,000 lb. pressure with only one-quarter of the usual number

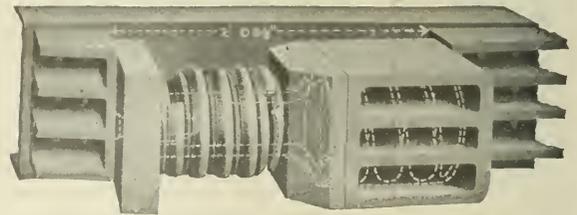

Double Area Pressure Gage Tester

of weights. Two small valves placed on opposite sides of the vertical cylinder provide means of adjustment from the double area piston for low pressure work to the single area piston for high pressure work. These valves may be operated as desired, while the tester is in use, and without removing any of the parts. This machine is said to be equal in accuracy to a mercury column and much more convenient to use.

### Interchange Casting for Spring Draft Gear

A SPECIAL DRAFT CASTING designed by George L. Harvey for the Frost Railway Supply Company, Detroit, Mich., is on exhibition. The purpose of this casting is to fill the space of 2 ft.  $\frac{5}{8}$  in. by 12  $\frac{7}{8}$  in. specified by the United States Railroad Administration for the new standard freight cars, and at the same time permit the use of the Harvey friction spring gear together with one standard M. C. B. spring.

The arrangement consists of a rectangular casting enclosing any desired capacity of the standard M. C. B. springs, with a follower plate having a circular opening

Harvey Spring Draft Gear with the Interchange Casting

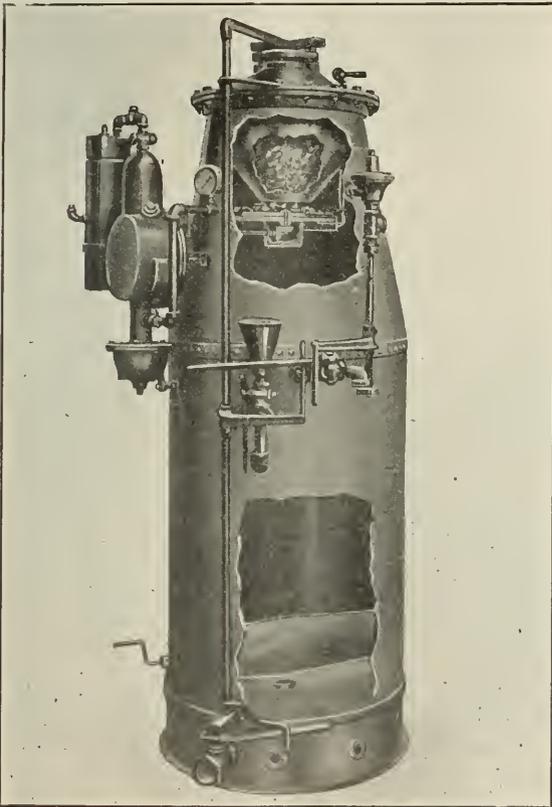

through which protrudes a hollow bar or arm. The back end of this bar is enlarged and is in contact with the M. C. B. spring; at the front end it bears against and is supported at the front follower plate by a suitable pin and bulb and carries the Harvey friction spring. Under

a buffing stress the force of the blow is transmitted through the front follower and the bar to the M. C. B. spring and as they travel backward the Harvey friction spring gear comes into action between the follower plates.

This casting is not sold by the Frost Railway Supply Company, but was designed for them by Mr. Harvey to permit the application of the friction spring draft gear; it may be used by the railroads without charge or royalty.

### The Airco Acetylene Generator

**A**N ACETYLENE GENERATOR of the carbide to water type is exhibited by the Air Reduction Sales Company, New York. The generation of the acetylene is regulated by means of a water motor which is operated by the gas passing through it to the service pipe. This type of feed gives an even distribution of carbide over the entire surface of the water in the generating chamber and prevents overheating of the water, thus producing cool gas of a high quality. Carbide 1¼ in. by ¾ in.

The Airco Generator Complete

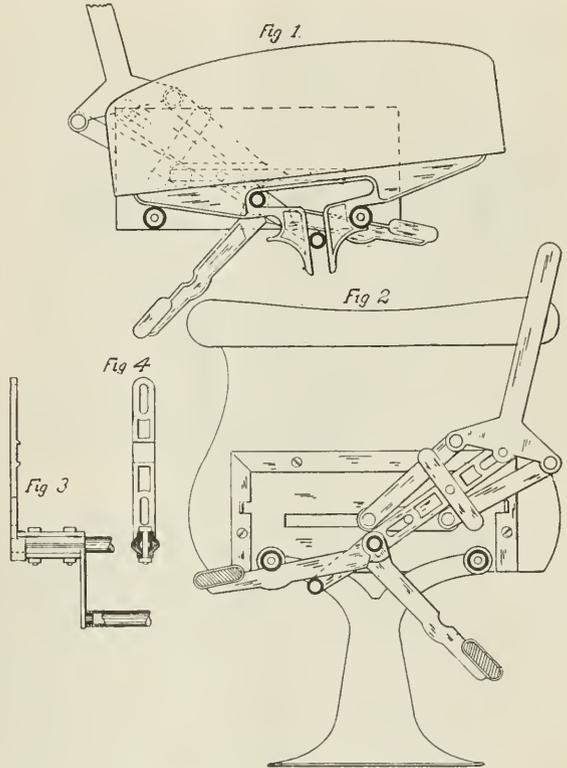

is used and gives a maximum gas yield with low even generation without material pressure fluctuation.

The acetylene is generated only when gas passes through the motor and any derangement of the feeding mechanism or leaks in the generator automatically prevent further feeding of the carbide, thus providing unusual safety of operation. The carbide is fed into the water only as gas is used, making it impossible to build

up excessive pressure. This gives a uniform pressure in the service line at all times. Interlocking safety devices insure safe operation and there are no springs, clock work, weights or other intricate mechanism to get out of order.

### Scarritt Simplex Coach Seat

**A**N IMPROVEMENT in the pull-over type of coach seat is exhibited by the Southern Railway Supply and Equipment Company, St. Louis, Mo., who are the general sales agents of the makers, the Scarritt Car Seat and Manufacturing Company. The distinctive fea-

Details of the Simplex Coach Seat

tures of the Simplex pull-over mechanism are the short reversing levers which eliminate lateral motion and the center righting lever which moves the base or fulcrum, to which the reversing levers are attached, from side to side. The details of construction are shown in the illustration.

Fig. 1 shows a cross section with the seat carrier and foot rest in position; Fig. 2 the aisle end, inside, reversing lever with sliding base and the hinged foot rest; Figs. 3 and 4 show the center lever and method of attaching, and the righting and foot rest lever tri-bar. Any of the parts may be easily detached for repairs.

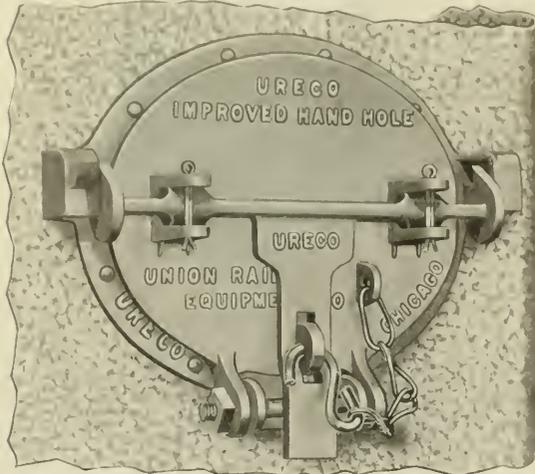

The wall and aisle plates are connected by two steel tubes. The pull-over mechanism is attached to steel rods passing through these tubes, while the pedestal is attached to the tubes and is adjustable so that it may be securely bolted to the floor girder. The head roll is smooth on top and the tilt of the seat is comfortable. The seat cushions are constructed of Scarritt double

springs with sprung edge all around, and a muslin inner cover with genuine black curled hair. All of the metal parts are of malleable iron or steel.

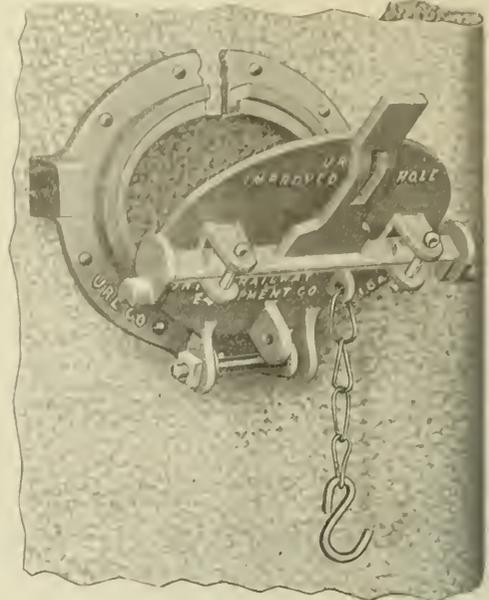

in the brackets at the sides, and the handle is pushed down, compressing the cover against a rubber gasket, which makes the device leak proof. The handhole is made of malleable iron, fully galvanized.

### Refrigerator Car Specialties

**A** BRINE TANK HANDHOLE which can be quickly opened without mutilation of the gasket, with consequent leakage of brine on the car floor, is shown in the illustration. It is designed to avoid any possible leakage when the tanks are filled with brine and for convenience in exposing the opening in the tank when it is desired to clean the tank. The operation of the Ureco

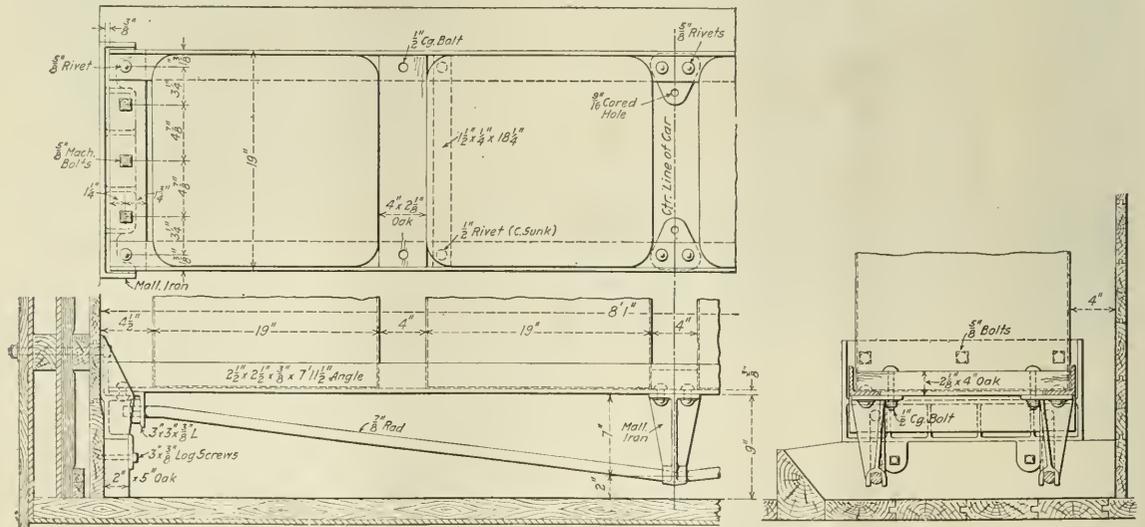

Hand Hole Cover Closed

Hand Hole Cover Open

handhole, as it is called, requires only that the hook be removed from the lug holding the lever, after which the lever is raised up, which disengages the lugs on the end of the bar and allows the cover to drop down, the operation requiring but a moment's time. To close the handhole the cover is raised, the lugs on the crossbar engaging

The tank supports illustrated in the drawing are designed for convenience in removing brine tanks when necessary, and eliminating all bearing of metal in the drip pan beneath the tanks. Heavy expense has been experienced in maintaining the drip pans because of the corrosion resulting from metal supports for the tanks resting on the pan. The Ureco support is formed with a truss arrangement which has ample carrying capacity for the tanks when loaded with ice and avoids any bearing points on the pans. The refrigerator car specialties described are the products of the Union Railway Equipment Company, Chicago.

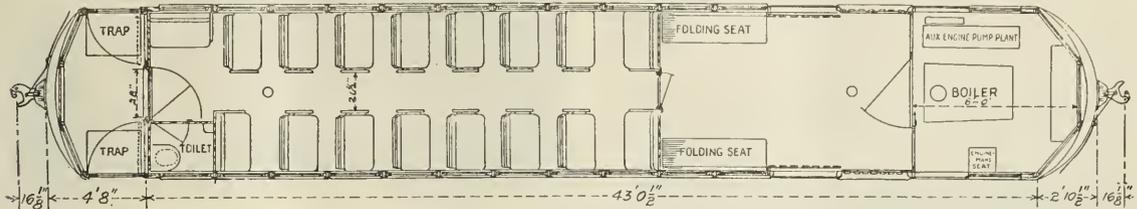

Ureco Brine Tank Support

## An Oil-Burning, Steam-Propelled Unit Railway Car

THE UNIT RAILWAY CAR COMPANY, Boston, Mass., has on exhibition the Unit car, which is steam-propelled with direct drive on the front axle of the forward truck, which also carries the engine or motor. This car is of all-steel construction and is designed for single end operation. It is arranged with a boiler room and baggage and passenger compartments.

The side windows are fitted with single two-part sash, arranged so that the lower part may be raised, and the end windows have single sash arranged to lower inside the sheathing. The vestibule has platform trap doors over the steps at each side and side doors which swing back against the car body, providing ample room for entrance to the passenger compartment.

The passenger compartment has Agasote headlining, Agasote side lining down to the heater pipes and Transite board behind the heater, all secured to the car body with suitable battens and molding. The baggage com-

Floor Plan of the Unit Railway Car

The superstructure is of the side girder type, having side posts of twin T-iron, with a wood filler, extending from the sills to the top plates and securely riveted to the sills, steel side sheathing, belt rail and top plates. The roof is of the plain arch or "turtleback" type on steel carlines and ash furring. It is built up of 1/2-in. narrow tongued and grooved poplar and covered with No. 8 cotton duck, well stretched and with an application of white lead under and on top of the canvas. The baggage

partment and the inside of the boiler room partition are lined with sheet steel.

The flooring is of yellow pine laid double, with paper insulation between the two layers and securely fastened to yellow pine nailing strips which are bolted to the underframe. In the boiler room the floor is covered with No. 16 gage sheet steel.

Ample ventilation is provided by modern ventilators in the roof of the car. The seats are of the high back, head

The Fully Equipped Unit Railway Car

### GENERAL DIMENSIONS

Length over bumper .....	50 ft. 7 in.	Truck centers .....	28 ft. 0 in.
Length over dasher .....	49 ft. 7 in.	Height from rail to center of draw-bar .....	2 ft. 10 1/2 in.
Length of main passenger compartment .....	24 ft. 4 in.	Height from rail to bottom of side sill .....	3 ft. 2 3/4 in.
Length of platform .....	4 ft. 8 in.	Height from rail to top of roof .....	11 ft. 11 1/2 in.
Length of boiler compartment .....	8 ft. 0 in.	Height from rail to top of radiator .....	14 ft. 6 in.
Length of baggage compartment .....	12 ft. 0 in.	Height of rear entrance door opening .....	6 ft. 6 in.
Center to center of side posts .....	2 ft. 8 in.	Seating capacity of passenger compartment .....	34
Width over side sheathing .....	8 ft. 6 in.	Seating capacity of baggage compartment .....	8
Width of aisle .....	1 ft. 9 1/2 in.	Total seating capacity .....	42
Length of cross seats .....	3 ft. 2 in.		

compartment side doors are of the single sliding type and single swing doors give entrance to the baggage compartment and from the vestibule to the passenger com-

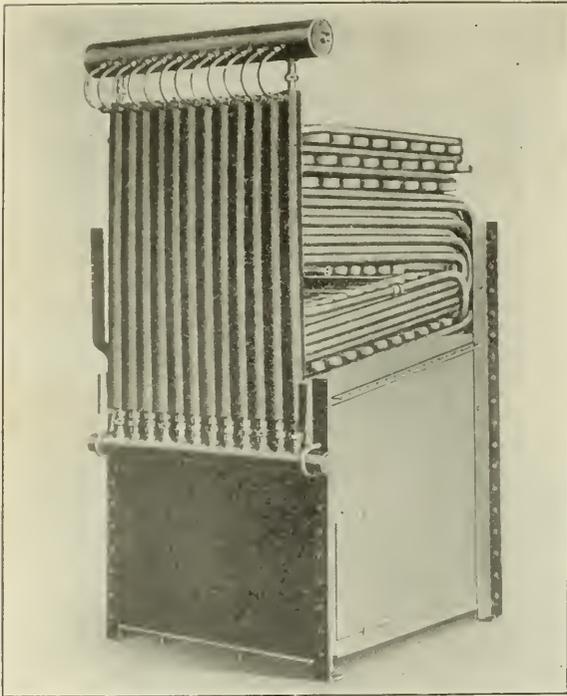

partment. There are 17 seats in the passenger compartment, seating 34 passengers, 13 of the cross seats being reversible and three cross seats and one longitud-

inal seat being stationary. There are also two folding seats in the baggage compartment, each seating four persons.

The underframe is of all steel construction, having side sills of rolled steel plate, bumpers of six-inch rolled steel channels and pressed steel bolster of M. C. B. design. The entire underframe is strongly braced with angles and gusset plates.

#### Sectional Water Tube Boiler

The boiler consists of water tubes, a superheater and an economizer. Each section of the boiler consists of a vertical header into which U-shaped Shelby cold drawn seamless steel tubes are welded. The header of these sections is connected to a steam drum at the top by seamless tubing bent to a parabolic form and connected to the steam drum by a special stub end connection. The lower end of the vertical header connects with a mud

Sectional Water Tube Boiler

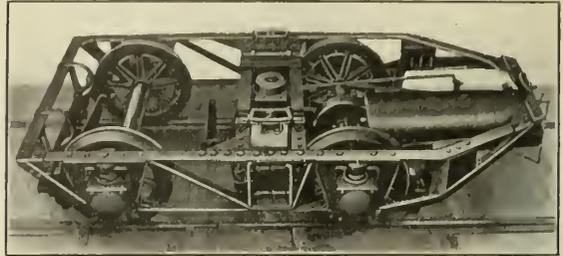

drum of 2 $\frac{3}{4}$ -in. steel tubing, the connection being made by a special  $\frac{3}{4}$ -in. Monel metal union. This construction permits the removal of any of the sections for repairs and the boiler may be continued in use by plugging the holes until repairs are made and the section replaced. Each section of the boiler contains 22.2 sq. ft. of heating surface. A stay rod made from cold drawn steel tubing passes through the center of the steam drum and serves as a dry pipe from which the steam may pass from either end to the superheater.

The superheater is constructed of 1 $\frac{1}{4}$ -in. outside diameter, 13-gage seamless tubing and is placed within the loop formed by the U-shaped boiler tubes. It contains 63.8 sq. ft. of heating surface and superheats the steam to a temperature of 650 deg. F. It can also be removed easily for inspection or repairs.

The economizer is constructed in a manner similar to that of the superheater and is placed directly above the

U-shaped boiler tubes. It contains 90 sq. ft. of heating surface.

The firebox or combustion chamber is directly below the boiler tubes and is constructed of hot rolled No. 16 gage sheet steel, riveted to the angle irons supporting the boiler. The combustion chamber is lined with firebrick, covered with a wash of high temperature cement, and covered on the outside with insulating material 2 $\frac{1}{2}$

Front Truck with the Engine Installed

in. thick. This insulating material is extended over the tubes in varying thicknesses and the entire boiler and combustion chamber is enclosed in a jacket of hot rolled No. 16 gage sheet steel. A special combustion tile is inserted in the front wall at the bottom of the chamber, through which the air and the atomized fuel enters. The fuel oil is atomized by a special atomizer and mixer and is maintained at an incandescent temperature by a pilot burner, thus giving a constant and efficient supply of steam under all normal conditions. Either crude or refined oils may be used as fuel.

The construction of this boiler insures the rapid gen-

Interior of the Passenger Compartment

eration of steam and a steam pressure of approximately 700 lb. may be obtained in from 10 to 20 minutes, depending on the atmospheric conditions.

#### The Engine

A double cylinder engine with valves of the balanced piston type is mounted on the front truck and is direct connected to the forward axle. The cylinders are of cast iron with cast steel cylinder heads and are accurately bored and finished. The piston rods are integral with the crosshead and are of drop forged steel. The cylinders

are lagged and jacketed to prevent condensation as much as possible. The crank shaft is of chrome nickel steel and runs in roller bearings. The valve gear is of the Stephenson link type and the control is automatic except at starting and stopping, when it is controlled by the throttle valve, and in the reverse which is accomplished by the Stephenson link motion. The entire engine is enclosed in an axle housing and sheet metal jacket. The drive gear runs in oil, which is thrown by the gear to all parts of the gear case, insuring thorough lubrication to all the running parts. A radiator conforming to the shape of the arch is installed on the roof of the car. This engine develops 60 hp. under normal conditions but in an emergency this may be materially increased.

The trucks are of the modified arch bar type with swing bolsters, double coil springs over the journal boxes, bolsters of  $\frac{7}{16}$ -in. pressed steel plate with malleable iron spring seats and pressed steel end stops and side wear plates. The front or driver truck has a wheel base of 6 ft. 1 in. and the trailer truck has a wheel base of 5 ft. 6 in. The wheels have malleable iron centers with steel tires, 34 in. in diameter, and of M. C. B. contour. The bolster of the driving truck is off center 25 in. toward the driven axle, thus making about two-thirds of the entire weight of the car effective for traction.

The lighting system was installed by the U. S. Light & Heat Corporation, the current being supplied by a small direct-current generator driven by an auxiliary engine located in the boiler room and in the forward part of the car. Storage batteries are provided and are carried under the car in a suitable wood and steel box. The passenger compartment is lighted by Mazda lamps with Holophane reflectors located over the center aisle, and the vestibule with similar lamps located over the side steps. The headlight is equipped with a 250-watt Goldenglow lamp. The car is heated by the exhaust steam from the auxiliary engine, which passes through a system of piping extending along the sides of the car, the steam rising from the pipe coil to a condenser located on the roof of the car. The condensation flows from the condenser to a tank located under the car from which it is again pumped to the boiler for use in generating steam.

The car is equipped with an air compressor driven by the auxiliary engine and the Westinghouse A. M. M. air brake equipment. A high power drop-handle geared hand brake is also provided. The brake rigging, couplers and other parts of the equipment conform to M. C. B. standards. This car was in successful operation for several months, but was withdrawn from service for the purpose of installing an improved boiler and engine and placing it on exhibition at this convention.

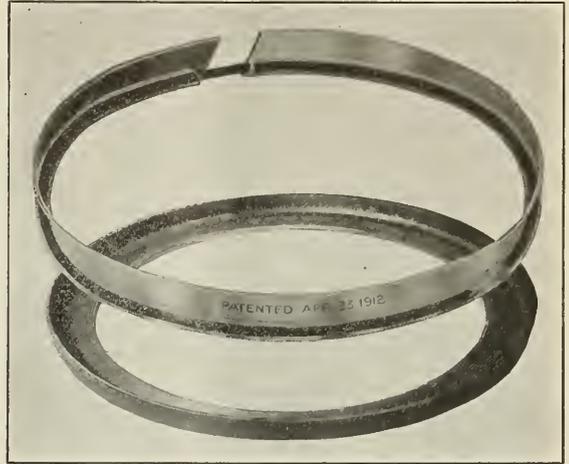

### Air Brake Cylinder Packing Set

**A**N AIR BRAKE CYLINDER PACKING SET designed to overcome the objectionable features of a leather packing has been developed by the H. W. Johns-Manville Company, New York, and is part of its exhibit.

This packing set consists of an asbestos packing cup with a spring steel expander ring. The packing cup conforms to the bore of the cylinder and being constructed of layers of impregnated asbestos it is proof against heat, pressure and condensate and does not become porous. These advantages are of great importance as the brake cylinders are usually so located that the packing is subjected to intense heat, which rapidly dries out leather packing, leaving it in a porous and consequently a leaky condition.

The expander ring is formed of flat cold rolled spring steel, with one edge rolled over a spring steel wire ex-

pander, and gives a flat contact surface of one-half inch. This ring is placed inside of the asbestos packing cup which it holds in close contact with the cylinder for the full width of the ring. The ring is a marked improvement over the old style round ring expander, as it gives a flat contact against the packing and the cylinder wall

Packing Cup and Expander Ring

of about four times that of a round ring and practically eliminates air leakage.

This packing set was applied on the United States Railroad Administration standard cars and locomotives and has been made standard on a number of railroads for locomotive tenders and water scoop air cylinders.

### Creco Reversible Chair Casting

**T**HE CHICAGO RAILWAY EQUIPMENT COMPANY, Chicago, is showing a new reversible Creco four-point support chair casting. This casting may be applied to either side of the brake beam strut, thus eliminating the use of a right and left hand casting, and is of par-

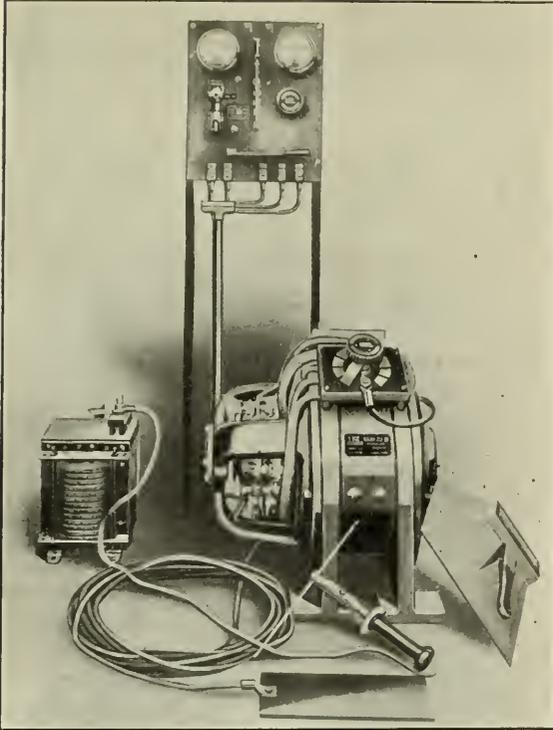

Reversible Chair Casting for Creco Four-Point Support

ticular value when the four-point support is being applied to old equipment.

The Creco four-point support and safety device is adaptable to practically every type of truck and modern brake beam, and this design of chair casting greatly simplifies the application of the four-point device to the varied designs of trucks and brake rigging.

## Portable and Stationary Electric Arc Welders

THE U. S. LIGHT AND HEAT CORPORATION, Niagara Falls, N. Y., has developed two electric arc welding machines, either of which may be used as portable or stationary equipment. These machines have been designed particularly to meet the requirements of railroad work. For shops where it is practicable to bring the parts to be welded to within 50 or 75 ft. of the welding apparatus, the welding machines with their auxiliary equipment are made up for stationary mounting on floors or platforms. The same machine, mounted on a truck, and equipped with more compact auxiliary apparatus provides a portable welding outfit which may be taken

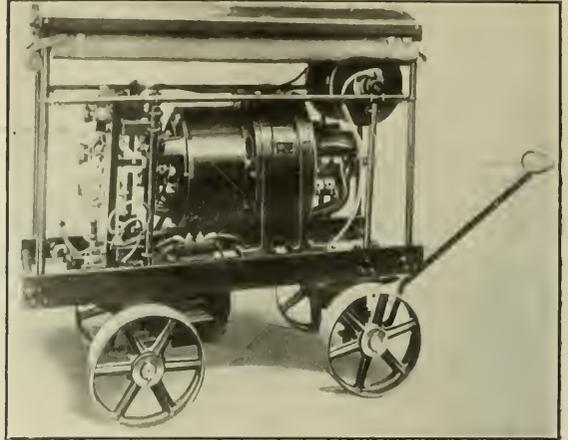

Converter Type Welder for Stationary Mounting

directly to the work, whether it be in the shop or yard. With a rated capacity of 4 kw. the machines give 200 amperes direct current, or less, with an arc voltage of 17 to 22 volts and an open circuit voltage of from 35 to 65 volts.

For use on 100 to 125 volt d. c. circuit the machine is made in the form of a convertor. The convertor weighs 665 lb., and delivers current at the arc through the stabilizing reactor with an efficiency of from 65 to 70 per cent.

On all other kinds of electric supply circuits, the welding machine is made in the form of a motor generator. This machine consists of a  $7\frac{1}{2}$  hp. alternating current or direct current motor with a 4 kw. welding generator. The generator is inherently regulated, compound wound, self excited and has a drooping voltage characteristic. It is claimed that both the generator and the convertor produce an arc particularly suited to arc welding.

For portable use, either machine is mounted on a truck, and equipped with a panel, reactor, cover and cable reel.

Motor-Generator Type Welder Mounted on Truck for Portable Service

The truck is 28 in. wide, 55 in. high, over all, 54 in. long and weighs, with complete equipment, about 1500 lb.

## Cincinnati Rivet Head Catcher

AN ATTACHMENT to the Cincinnati rivet cutting gun, for the purpose of catching the rivet head as it is cut off, thus eliminating the possibility of flying rivet heads injuring persons nearby, is shown by the Rivet Cutting Gun Company, Cincinnati, Ohio.

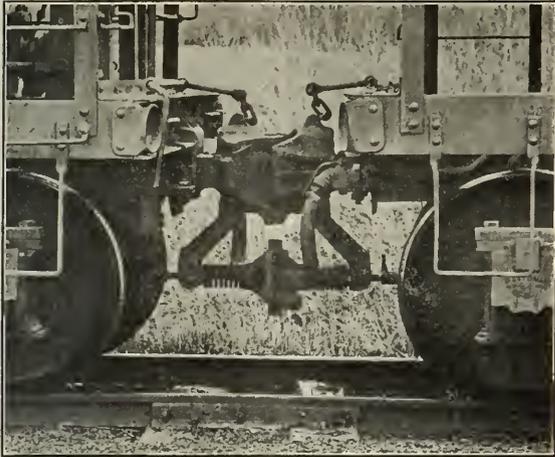

Rivet Catcher in Use and (in the insert) the Pocket Exposed

This device is simple, is easily applied to the cutting gun and is inexpensive and effective. The catcher consists of a metal receptacle which slips over the end of the cutting bar and has a pocket fitting over the rivet head, and into which it falls when it is cut off. The use of this

rivet head catcher makes it unnecessary for workmen in the vicinity of a rivet cutting operation to guard against flying rivet heads and consequently enables them to give closer attention to the particular work in which they may be engaged.

### American Automatic Hose Connector

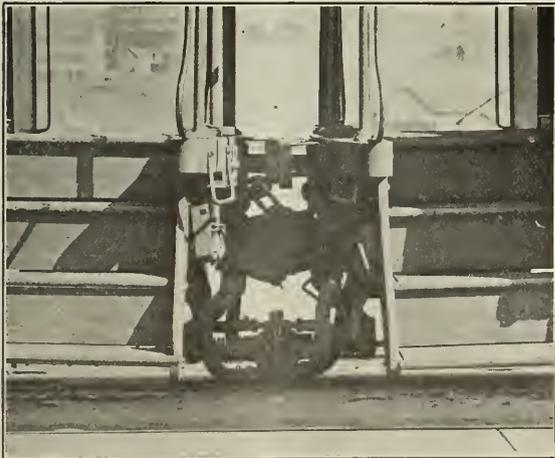

**A**N AUTOMATIC DEVICE for connecting air and steam hose between cars has been developed and is exhibited at the booth of the American Automatic Connector Company, Cleveland, Ohio. This connector is

Air Line Connector on Freight Equipment

of the butt face type with an inclined guide at one side and a recess or opening at the other, the guide being hollowed out on one side.

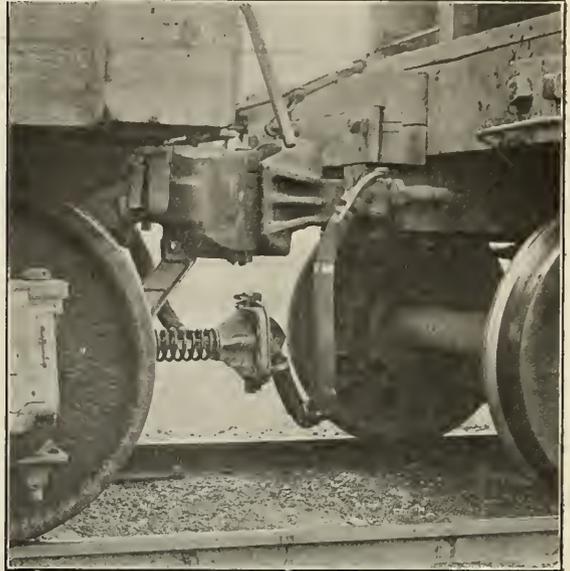

The air brake port is located in the center, the signal line

Air, Steam and Signal Connector for Passenger Equipment

3½ in. above and the steam line 4 in. below the center in the vertical center line of the connector face. The bottom end of the connector bracket and the back of the spring seat form a universal joint which permits vertical and lateral movement of the device on curves or under

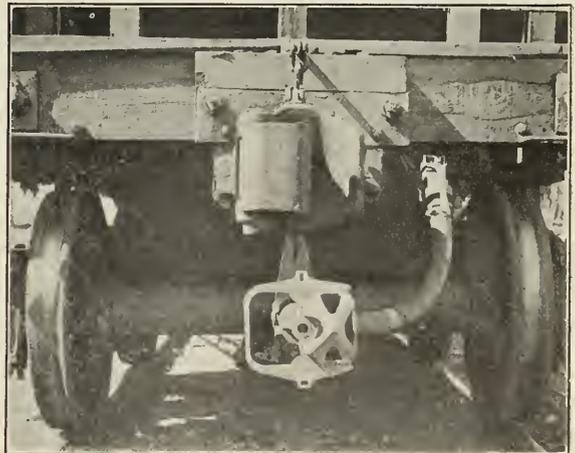

bad track conditions. The connectors when coupled are kept in close contact by a compression spring having a resistance of 900 lb., which, with the gaskets at each of

Connector With Interchange Attachment

the ports of the connector insures a constant contact and a safe hose connection. The gathering range or scope of the device in the coupling operation is 7½ in. vertically and 7 in. horizontally, and it will couple on high and low cars with equal facility, the bearing face when coupled being 12 in. by 11 in.

The connector consists of six parts, five malleable iron castings and one steel spring, and weighs 50 lbs. It is attached to a lug cast or welded to the car coupling with two bolts and can be attached or removed by one man in

Face of Connector With Air Line Port for Freight Equipment

a few minutes. An interchange attachment is provided for use where some cars in the train are not equipped with the automatic connectors, and it can be quickly attached to the device by means of a lug and a pin inserted through slots at the top and bottom of the con-

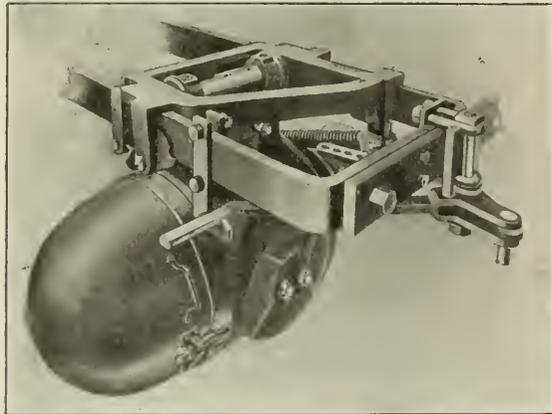

nector face on the vertical center line. The lowest point of the connector when coupled or uncoupled is 12 in. above the top of the rail.

This connector has been in service on the Temiscouata Railway, Province of Quebec, Canada, on a passenger train and has traveled 200,000 miles with excellent results. The Copper Range Railroad has also applied these connectors to eight locomotives, 18 passenger cars and 100 ore cars of 40 to 50 tons capacity having both friction and spring types of draft gear. Under severe weather and road conditions and on tracks having maximum curves of 19 deg. and 3.8 per cent grades, the connectors are reported to have proved very efficient and are especially adapted to service requiring frequent coupling and uncoupling.

### Car Lighting Equipment

**T**HE ELECTRIC STORAGE BATTERY COMPANY, Philadelphia, Pa., has introduced into the car lighting field a new type of battery jar and cover and a new type of belt tightening device for its body-hung generators.

The battery tank consists of a compound rubber jar with a double flanged alloy cover. It has been designed to eliminate the troubles which have been experienced

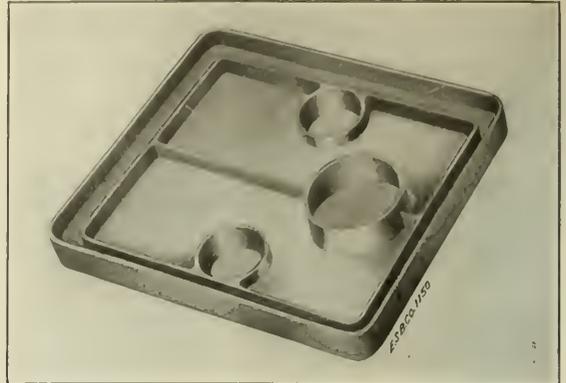

Body Hung Suspension, Showing Belt Tension Release Lever and Tension Adjuster

in the past with the lead lined tanks, due to the development of leaks in the lead lining. These leaks are largely caused by electrolytic action of current escaping from a grounded cell, the effect of which is to corrode the lining. The rubber jar is not subject to this corrosive action. These jars are made of "Giant" compound, which was furnished to the United States Government on a large scale during the war. This compound has been used extensively for storage batteries in mining locomotives and other conditions probably more severe than those to be met in train lighting service.

The double flanged alloy cover protects both the inside and outside of the upper edge of the jar. This cover is sealed with a newly developed sealing compound, which the makers claim permits the cover to be removed and applied again without the application of heat and at the same time forms a perfect seal and will not run at the highest operating temperature encountered. The cells are assembled in two-compartment, solid wood crates and are held in place with paraffin treated wooden shims.

The belt tightening device has been developed for body-hung generators. In the former design of the body-hung suspension, the belt tension was adjusted by means of an adjusting screw. The new device has a lever by which the suspension carriage may be moved forward to the operating position, or may be moved back

Double Flanged Cover for Rubber Jar

quickly toward the truck to release the belt when necessary. An adjustment is provided for taking up the stretch of the belt so that the proper belt tension may

Cell Complete in Compound Rubber Jar with Double Flanged Cover

be maintained without the necessity of cutting the belt. The generator may be mounted right hand or left hand; the generator terminal box, safety chain and spring mounting are reversible, and a right hand or left hand suspension carriage may be had as desired.

THE NUMBER OF WOMEN employed in the metal-working industries in Germany increased from 12,968 in 1914 to 624,688 in 1917.—*Machinery*.

## The Railway Supply Manufacturers' Association Exhibit

Both the Number of Exhibitors and the Space Occupied  
Far Surpass All Previous Records

**T**HE EXHIBITS THIS YEAR have smashed all records, not only in relation to the number of exhibitors and the square feet of space occupied, but also in the character of the exhibits. Never has there been so much care taken to emphasize the educational features of the exhibit and to make preparation for giving the railroad men a comprehensive, clear-cut idea of the various devices and their advantages. There are 301 exhibitors, and the exhibits occupy 93,467 square feet of space. There would have been more exhibitors had the space been available. The exhibit committee has utilized every bit of available floor space for exhibition purposes; the track exhibit is exceptionally large.

A study of the diagram of the pier will indicate that the space facing the Boardwalk, which has hitherto been used for lounging purposes, has been divided up into nine different exhibit spaces. The main building

or ball room has had additional exhibits placed in it, the most notable of which is the artillery and munitions exhibit at the main entrance. Additional exhibit spaces have been added at the ends of the Aquarium Court, as the space between the Main Building and Exhibition Hall is termed. Exhibition Hall, which was only partially occupied in 1916, is completely filled this year, and the passage through its center connecting to the Machinery Hall extension has been closed up, and is used for exhibit spaces. Additional booths have been placed between the two incline ways leading to the Annex, and a large additional space has been placed alongside of Convention Hall.

A complete list of the exhibitors, together with details of their exhibits and the list of their representatives, follows:

### List of Exhibitors

Acme Machine Tool Company, The, Cincinnati, Ohio.—Cincinnati Acme No. 3 universal flat turret lathe. Represented by Fred E. Winkelman and other company officials. Space 162.

AGA Railway Light & Signal Company, Elizabeth, N. J.—Car lighting equipment. Represented by J. K. Howard. Space 380.

Air Reduction Sales Company, New York, N. Y.—Oxy-acetylene apparatus and gases. Represented by A. R. Ludlow, A. S. Kinsey, C. D. Trout, J. A. Warfel, H. F. Weldin, R. T. Peabody and E. L. Mills. Space 614.

American Abrasive Metals Company, New York, N. Y.—Feralun anti-slip treads, as car steps, door saddles and floor plates; Feralun brake shoes; Feralun rubber blades. Represented by H. Weaver Mowery, Ellsworth Burger and R. C. Davison. Space 626.

American Arch Company, New York, N. Y.—Model of locomotive firebox with a double set of 4-inch arch tubes supporting a set of model Security arch brick; all to scale of 1/4 size. Represented by Le Grand Parish, John P. Neff, W. L. Allison, J. T. Anthony, R. J. Himmelright, George Wagstaff, T. Mahar, W. W. Neale and T. F. Kilcoyne. Spaces 414-416-422-424.

American Automatic Connector Company, Cleveland, Ohio.—American automatic connector; Cleveland low water alarm; Talmage hand brakes; steam chest and cylinder lubricating drifting valve; blow-off valves; diverting valves. Represented by J. G. Talmage, M. A. Barker, Frank M. Roby, J. Frank Walker and Alfred F. Letherer. Spaces 354-361.

American Brake Company, St. Louis, Mo.—Reception booth.—Represented by R. E. Adreon. Space 19 to 29.

American Brake Shoe & Foundry Company, New York, N. Y.—Reinforced brake shoes for locomotives and cars; malleable iron locomotive and car brake heads and keys. Represented by F. W. Sargent, W. S. McGowan, C. D. Pettis, John Hoffhine, A. H. Elliot, E. A. Gregory, W. L. Heinz, M. N. Trainer and E. L. Janes. Space 418.

American Car & Foundry Company, New York, N. Y.—In booth and on cars on the exhibit tracks will be shown field and railway artillery, projectiles, tractors and interesting material supplied by the U. S. Ordnance Department. Represented by Clark D. Eaton, Scott H. Blewett, J. M. Keller and M. H. Connelly. Space 3.

American Flexible Bolt Company, Pittsburgh, Pa.—American staybolts; rivets; hollow iron; reduced body solid bolts; marine staybolts, hollow or solid, reduced bodies. Represented by C. A. Seley, R. W. Benson, J. A. Trainor, W. F. Heacock, L. W. Widmeier and M. M. McCallister. Space 543.

American Insulation Company, Philadelphia, Pa.—Magnesia pipe and boiler coverings; asbestos and high temperature cement; asbestos paper and millboard; asphalt slate shingles; Carey flexible cement roofing; built up asphalt and asbestos roofs; Carey Elastite expansion joint; Ezola mats; rubber roofings; Carey wallboards and other Carey products. Represented by John W. Latchum, Benjamin T. Conwell, Jr., Harry E. Rowell, H. A. Burkley, A. H. Wilson and E. S. Walls. Space 322.

American Locomotive Company, New York, N. Y.—Flexible staybolts; power reverse gear; intercepting valve; piston valve. Represented by J. D. Sawyer, W. P. Steele, J. B. Lums, C. K. Lassiter, G. H. Weiler, G. P. Robinson, C. M. Muehnic, F. J. Cole, C. J. Mellin, J. G. Blunt, W. F. Weller and I. Partington. Space 623.

American Malleable Castings Association, The, Cleveland, Ohio.—A collection of malleable iron castings, illustrating the uses of the metal in car construction. Testing machines will be operated, to show the physical properties of malleable iron. Represented by S. H. Standish, James S. Llewellyn, A. O. Buckins, Jr., F. A. Kavanaugh, W. R. Dean and F. J. Buckley. Space 189.

American Mason Safety Tread Company, Boston, Mass.—Mason safety tread; Stanwood car step; Karbolith car flooring. Represented by Henry C. King and Edward F. Kuenmerle. Space 542.

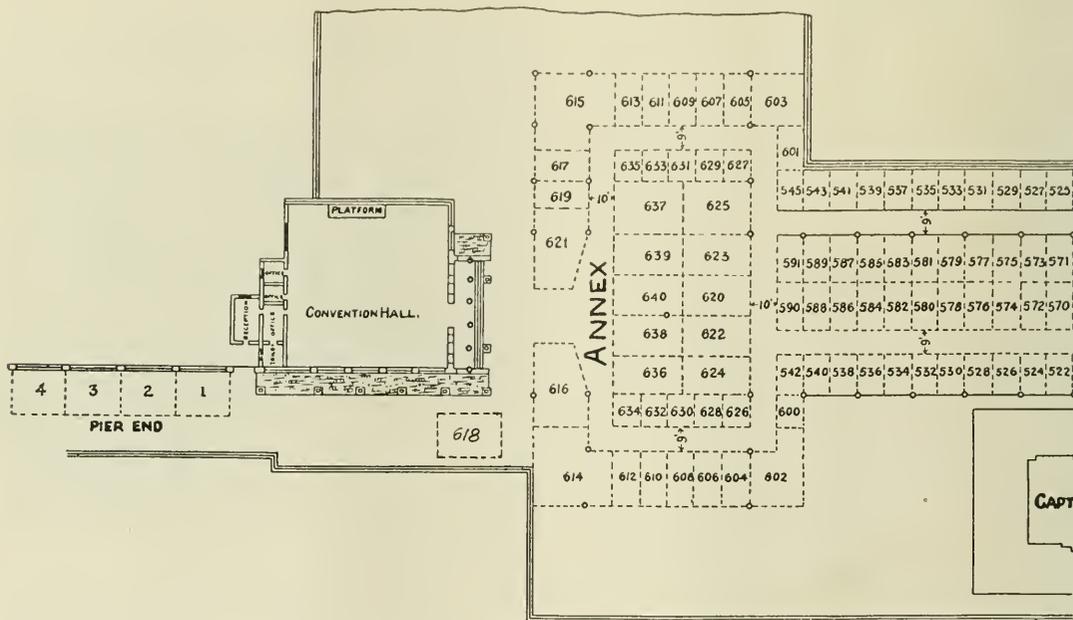

American Rolling Mill Company, The, Middletown, Ohio.—Corrosion resisting iron sheets; Armeo polished sheets of locomotive jackets; Armeo alloy coated sheets for passenger car roofing and other purposes; microscopical exhibit, showing structure of iron and steel sheets and plates. Represented by G. F. Ahlbraudt, T. Wade Jenkins, R. O. Griffin, J. A. Aupperle and W. J. Beck. Spaces 586-587.
